Catalyst 4500 Series IOS Commands

New Commands for IOS XE 3.4.2SG
license right-to-use activate
license right-to-use deactivate
show license

New Commands for IOS XE 3.4.0SG
debug device-sensor
device-sensor filter-list
device-sensor filter-list dhcp
device-sensor filter-spec
device-sensor notify
profile flow
show device-sensor cache

VSS Commands
dual-active detection (virtual switch)
dual-active recovery ip address
interface (virtual switch)
mac-address (virtual switch)
show interfaces (virtual switch)
show interfaces counters (virtual switch)
show pagp dual-active (virtual switch)
show switch virtual (virtual switch)
show vslp (virtual switch)
switch (virtual switch)
switch convert mode (virtual switch)
switch virtual domain (virtual switch)
switch virtual link (virtual switch)
vslp interval (virtual switch)

Revised Commands

A Commands

aaa accounting dot1x default start-stop group radius
aaa accounting system default start-stop group radius clear mac-address-table
access-group mode
access-list hardware capture mode
access-list hardware entries
access-list hardware region
action
apply
ancp client server
ancp mode client
apply
arp access-list
attach module
authentication control-direction
authentication critical recovery delay
authentication event
authentication fallback
authentication host-mode
authentication open
authentication order
authentication periodic
authentication port-control
authentication priority
authentication timer
authentication violation
auto qos classify
auto qos classify police
auto qos srd4
auto qos trust
auto qos video
auto qos voip
auto qos voip cisco-softphone
auto-sync
average-packet-size (netflow-lite monitor submode)

C Commands

call-home (global configuration)
call-home request
call-home send
call-home send alert-group
call-home test
channel-group
channel-protocol
cisp enable
class-map
clear counters
clear errdisable
clear hw-module slot password
clear interface gigabitethernet
clear interface vlan
clear ip access-template
clear ip arp inspection log
clear ip arp inspection statistics
clear ip dhcp snooping binding
clear ip dhcp snooping database
clear ip dhcp snooping database statistics
clear ip igmp group
clear ip mfib counters
clear ip mfib fastdrop
clear ip wccp
clear lacp counters
clear netflow-lite exporter statistics
clear netflow-lite monitor statistics interface
clear nmwp statistics
clear mac-address-table dynamic
clear pagp
clear port-security
clear pppoe intermediate-agent statistics
clear qos
clear vlan counters
clear vmps statistics
control-plane
cos (netflow-lite exporter submode)
counter

D Commands
debug adjacency
debug backup
debug condition interface
debug condition standby
debug condition vlan
debug device-sensor
debug dot1x
debug etherchnl
debug interface
debug ip dhcp snooping event
debug ip dhcp snooping packet
debug ip verify source packet
debug ipc
debug lacp
debug monitor
debug nmsp
debug nvram
debug pagp
debug platform packet protocol lacp
debug platform packet protocol pagp
debug pm
debug port-security
debug pppoe intermediate-agent
debug redundancy
debug spanning-tree
debug spanning-tree backbonefast
debug spanning-tree switch
debug spanning-tree uplinkfast
debug sw-vlan
debug sw-vlan ifs
debug sw-vlan notification
display sw-vlan vtp
display udld
display vqpc
define interface-range
deny
destination (netflow-lite exporter submode)
device-sensor filter-list
device-sensor filter-list dhcp
device-sensor filter-spec
device-sensor notify
diagnostic fpga soft-error recover
diagnostic monitor action
diagnostic start
dot1x auth-fail max-attempts
dot1x auth-fail vlan
dot1x credentials (global configuration)
dot1x critical
dot1x critical eapol
dot1x critical recovery delay
dot1x critical vlan
dot1x control-direction
dot1x guest-vlan
dot1x guest-vlan supplicant
dot1x host-mode
dot1x initialize
dot1x mac-auth-bypass
dot1x max-reauth-req
dot1x max-req
dot1x port-control
dot1x re-authenticate
dot1x re-authentication
dot1x system-auth-control
dot1x timeout
dscp (netflow-lite exporter submode)
dual-active detection (virtual switch)
duplex
dual-active recovery ip address
duplex

E Commands
erase
errdisable detect
errdisable recovery
export-protocol (netflow-lite exporter submode)
exporter (netflow-lite monitor submode)

F Commands
flowcontrol

H Commands
hardware statistics
hw-module beacon
hw-module module start
hw-module module stop
hw-module port-group
hw-module power
hw-module system max-queue-limit
hw-module uplink mode
hw-module uplink select

I Commands
instance
interface
interface (virtual switch)
interface port-channel
interface range
interface vlan
ip admission proxy http refresh-all
ip arp inspection filter vlan
ip arp inspection limit (interface)
ip arp inspection log-buffer
Chapter

ip arp inspection trust
ip arp inspection validate
ip arp inspection vlan
ip arp inspection vlan logging
ip cef load-sharing algorithm
ip dhcp snooping
ip dhcp snooping binding
ip dhcp snooping database
ip dhcp snooping information option
ip dhcp snooping information option allow-untrusted
ip dhcp snooping limit rate
ip dhcp snooping trust
ip dhcp snooping vlan
ip device tracking maximum
ip igmp filter
ip igmp max-groups
ip igmp profile
ip igmp query-interval
ip igmp snooping
ip igmp snooping report-suppression
ip igmp snooping vlan
ip igmp snooping vlan explicit-tracking
ip igmp snooping vlan immediate-leave
ip igmp snooping vlan mrouter
ip igmp snooping vlan static
ip local-proxy-arp
ip mfib fastdrop
ip route-cache flow
ip source binding
ip sticky-arp
ip verify header vlan all
ip verify source
ip verify unicast source reachable-via
ip wccp
ip wccp check services all
ip wccp group-listen
ip wccp redirect
ip wccp redirect exclude in
ipv6 mld snooping
ipv6 mld snooping last-listener-query-count
ipv6 mld snooping last-listener-query-interval
ipv6 mld snooping listener-message-suppression
ipv6 mld snooping robustness-variable
ipv6 mld snooping tcn
ipv6 mld snooping vlan
issu abortversion
issu acceptversion
issu commitversion
redundancy config-sync mismatched-commands
issu loadversion
issu runversion
issu set rollback-timer

L Commands
l2protocol-tunnel
l2protocol-tunnel cos
l2protocol-tunnel drop-threshold
l2protocol-tunnel shutdown-threshold
lacp port-priority
lacp system-priority
lldp tlv-select power-management
logging event trunk-status global (global configuration)
logging event link-status global (global configuration)
logging event trunk-status global (global configuration)
logging event link-status global (global configuration)
logging event link-status (interface configuration)
logging event trunk-status (interface configuration)

M Commands
mac access-list extended
mac-address (virtual switch)
mac-address-table aging-time
mac-address-table dynamic group protocols
mac-address-table learning vlan
mac-address-table notification
mac-address-table static
macro apply cisco-desktop
macro apply cisco-phone
macro apply cisco-router
macro apply cisco-switch
macro auto device
macro auto execute (built-in function)
macro auto execute (remotely-defined trigger)
macro auto execute (user-defined function)
macro auto global processing
macro auto mac-address-group
macro auto monitor
macro auto processing
macro auto sticky
macro global apply cisco-global
macro global apply system-cpp
macro global description
main-cpu
match
match flow ip
mdix auto
media-type
mode
monitor capture {access-list | class-map}
monitor capture [clear | export]
monitor capture [interface | vlan | control-plane]
monitor capture file location buffer-size
monitor capture limit
monitor capture mycap match
monitor capture start
monitor session
mtu

N Commands
name
netflow-lite exporter
netflow-lite monitor
netflow-lite sampler
nmsp
nmsp attachment suppress

**O Commands**
options timeout (netflow-lite exporter submode)

**P Commands**
packet-offset (netflow-lite sampler submode)
packet-rate (netflow-lite sampler submode)
packet-section size (netflow-lite sampler submode)
pagp learn-method
pagp port-priority
passive-interface
permit
policy-map
power efficient-ethernet auto
port-channel load-balance
port-channel standalone-disable
port-security mac-address
port-security mac-address sticky
port-security maximum
power dc input
power inline
power inline consumption
power inline four-pair forced
power inline logging global
power inline police
power redundancy combined max inputs
power redundancy-mode
pppoe intermediate-agent (global)
pppoe intermediate-agent (interface)
pppoe intermediate-agent (interface vlan-range)
pppoe intermediate-agent format-type (global)
pppoe intermediate-agent limit rate
pppoe intermediate-agent trust
pppoe intermediate-agent vendor-tag strip
priority
private-vlan
private-vlan mapping
private-vlan synchronize
profile
profile flow

**Q Commands**
qos account layer-all encapsulation
qos account layer2 encapsulation
qos trust
queue-limit

**R Commands**
redundancy
redundancy force-switchover
redundancy reload
remote login module
remote-span
renew ip dhcp snooping database
reset
revision

**S Commands**
sampler (netflow-lite monitor submode)
service-policy (interface configuration)
service-policy (policy-map class)
service-policy input (control-plane)
session module
set
set cos
set dscp
set precedence
set qos-group
shape (interface configuration)
shell trigger
show monitor capture
show netflow-lite exporter
show netflow-lite monitor
show netflow-lite sampler
snmp ifindex clear
snmp ifindex persist
snmp-server enable traps
snmp-server ifindex persist
snmp-server ifindex persist compress
snmp trap mac-notification change
source (netflow-lite exporter submode)
spanning-tree backbonefast
spanning-tree bpdufilter
spanning-tree bpduguard
spanning-tree cost
spanning-tree etherchannel guard misconfig
spanning-tree extend system-id
spanning-tree guard
spanning-tree link-type
spanning-tree loopguard default
spanning-tree mode
spanning-tree mst
spanning-tree mst configuration
spanning-tree mst forward-time
spanning-tree mst hello-time
spanning-tree mst max-age
spanning-tree mst max-hops
spanning-tree mst root
spanning-tree pathcost method
spanning-tree portfast (interface configuration mode)
spanning-tree portfast bpdufilter default
spanning-tree portfast bpduguard default
spanning-tree portfast default
spanning-tree port-priority
spanning-tree uplinkfast
spanning-tree vlan
speed
storm-control
storm-control
storm-control broadcast include multicast
switch (virtual switch)
switch convert mode (virtual switch)
switch virtual domain (virtual switch)
switch virtual link (virtual switch)
switchport
switchport access vlan
switchport autostate exclude
switchport block
switchport mode
switchport port-security
switchport private-vlan association trunk
switchport private-vlan host-association
switchport private-vlan mapping
switchport private-vlan trunk allowed vlan
switchport private-vlan trunk native vlan tag
switchport trunk
switchport vlan mapping
system mtu

Show Commands
show access-group mode interface
show adjacency
show ancp multicast
show arp access-list
show authentication
show auto install status
show auto qos
show bootflash:
show bootvar

show vlan access-map
show vlan counters
show vlan dot1q tag native
show vlan group
show vlan internal usage
show vlan mapping
show vlan mtu
show vlan private-vlan
show vlan remote-span
show vmps
show vslp (virtual switch)
show vtp

T Commands
template data timeout (netflow-lite exporter submode)
test cable-diagnostics tdr
traceroute mac
traceroute mac ip
transport udp (netflow-lite exporter submode)
trust
ttl (netflow-lite exporter submode)
rx-queue

U Commands
udld (global configuration mode)
udld (interface configuration mode)
udld reset
unidirectional
username

V Commands
verify
vlan (VLAN Database mode)
vlan access-map
vlan configuration
vlan database
vlan dot1q tag native
vlan filter
vlan group
vlan internal allocation policy
vmps reconfirm (global configuration)
vmp s reconfirm (privileged EXEC)
vmp s retry
vmps server
vrf (netflow-lite exporter submode)
vslp interval (virtual switch)
vt p (global configuration mode)
vtp client
vtp domain
vtp password
vtp pruning
vtp server
vtp transparent
vtp v2-mode

APPENDIX A

Abbreviations A-1
Preface

This preface describes the audience, organization, and conventions of this publication, and provides information on how to obtain related documentation.

Audience

This publication is for experienced network administrators who are responsible for configuring and maintaining Catalyst 4500 series switches.

Organization

This publication is organized as follows:

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>Command-Line Interface</td>
<td>Describes the Catalyst 4500 series switch CLI.</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>Cisco IOS Commands for the Catalyst 4500 Series Switches</td>
<td>Lists all Catalyst 4500 series Cisco IOS commands alphabetically and provides detailed information on each command.</td>
</tr>
<tr>
<td>Appendix A</td>
<td>Abbreviations</td>
<td>Defines the acronyms used in this publication.</td>
</tr>
</tbody>
</table>

Related Documentation

The Catalyst 4500 series Cisco IOS documentation set includes these publications:

- Catalyst 4500 Series Switch Installation Guide
- Catalyst 4500 Series Switch Supervisor Engine Installation Note
- Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide
- Catalyst 4500 Series Switch Cisco IOS System Message Guide
- Release Notes for Catalyst 4500 Series Switch Software
Access the Catalyst 4500 Series Switch documentation library at the URL http://www.cisco.com/go/cat4500/docs

Other documents in the Cisco IOS documentation set include:

- Cisco IOS Release 12.2 Configuration Guides
- Cisco IOS Release 12.2 Command References

For information about MIBs, refer to this URL:

Conventions

This document uses these conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong> font</td>
<td>Boldface text indicates commands and keywords that you enter literally as shown.</td>
</tr>
<tr>
<td><em>italic</em> font</td>
<td><em>Italic</em> text indicates arguments for which you supply values.</td>
</tr>
<tr>
<td>[x]</td>
<td>Square brackets enclose an optional element (keyword or argument).</td>
</tr>
<tr>
<td></td>
<td>A vertical line indicates a choice within an optional or required set of keywords or arguments.</td>
</tr>
<tr>
<td>[x</td>
<td>y]</td>
</tr>
<tr>
<td>{x</td>
<td>y}</td>
</tr>
<tr>
<td>[x {y</td>
<td>z}]</td>
</tr>
<tr>
<td>string</td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
<tr>
<td><strong>screen</strong> font</td>
<td>Terminal sessions and information the system displays are in <strong>screen</strong> font.</td>
</tr>
<tr>
<td><strong>boldface screen</strong> font</td>
<td>Information you must enter is in <strong>boldface screen</strong> font.</td>
</tr>
<tr>
<td><em>italic screen</em> font</td>
<td>Arguments for which you supply values are in <em>italic screen</em> font.</td>
</tr>
<tr>
<td>^</td>
<td>The symbol ^ represents the key labeled Control—for example, the key combination ^D in a screen display means hold down the Control key while you press the D key.</td>
</tr>
<tr>
<td>&lt; &gt;</td>
<td>Nonprinting characters, such as passwords, are in angle brackets.</td>
</tr>
</tbody>
</table>
Notes use this convention:

**Note**

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the publication.

Cautions use this convention:

**Caution**

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

## Notices

The following notices pertain to this software license.

### OpenSSL/Open SSL Project

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

### License Issues

The OpenSSL toolkit stays under a dual license, i.e. both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact openssl-core@openssl.org.

**OpenSSL License:**

Copyright © 1998-2007 The OpenSSL Project. All rights reserved.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following
acknowledgment: “This product includes software developed by the OpenSSL Project for use in the

CHAPTER

Command-Line Interface

This chapter provides information for understanding and using the Cisco IOS command-line interface (CLI) on the Catalyst 4500 series switch. This chapter includes the following sections:

- Getting Help, page 1-1
- How to Find Command Options, page 1-2
- Understanding Command Modes, page 1-5
- Using the No and Default Forms of Commands, page 1-6
- Using the CLI String Search, page 1-6
- Saving Configuration Changes, page 1-11

For an overview of the Catalyst 4500 series switch Cisco IOS configuration, refer to the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide.

Getting Help

To display a list of commands that you can use within a command mode, enter a question mark (?) at the system prompt. You also can display keywords and arguments for each command with this context-sensitive help feature.

Table 1-1 lists commands you can enter to get help that is specific to a command mode, a command, a keyword, or an argument.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>abbreviated-command-entry?</td>
<td>Displays a list of commands that begin with a particular character string. (Do not leave a space between the command and question mark.)</td>
</tr>
<tr>
<td>abbreviated-command-entry&lt;Tab&gt;</td>
<td>Completes a partial command name.</td>
</tr>
<tr>
<td>?</td>
<td>Lists all commands for the command mode.</td>
</tr>
<tr>
<td>command ?</td>
<td>Lists all keywords for the command. Leave a space between the command and the question mark.</td>
</tr>
<tr>
<td>command keyword ?</td>
<td>Lists all arguments for the keyword. Leave a space between the keyword and the question mark.</td>
</tr>
</tbody>
</table>
How to Find Command Options

This section provides an example of how to display syntax for a command. The syntax can consist of optional or required keywords. To display keywords for a command, enter a question mark (?) at the command prompt or after entering part of a command followed by a space. The Catalyst 4500 series switch software displays a list of available keywords along with a brief description of the keywords. For example, if you are in global configuration mode and want to see all the keywords for the `arap` command, you enter `arap ?`.

Table 1-2 shows examples of how you can use the question mark (?) to assist you in entering commands and also guides you through entering the following commands:

- `interface gigabitethernet 1/1`
- `channel-group 1 mode auto`

### Table 1-2 How to Find Command Options

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch&gt; <code>enable</code></td>
<td>Enter the <code>enable</code> command and password to access privileged EXEC commands. You are in privileged EXEC mode when the prompt changes to <code>Switch#</code>.</td>
</tr>
<tr>
<td>Switch# <code>configure terminal</code></td>
<td>Enter global configuration mode. You are in global configuration mode when the prompt changes to <code>Switch(config)#</code>.</td>
</tr>
<tr>
<td>Switch(config)# <code>interface gigabitethernet ?</code></td>
<td>Enter interface configuration mode by specifying the Gigabit Ethernet interface that you want to configure using the <code>interface gigabitethernet</code> global configuration command. Enter a ? to display what you must enter next on the command line. In this example, you must enter an interface number from 1 to 9 in the format <code>module-number/port-number</code>. You are in interface configuration mode when the prompt changes to <code>Switch(config-if)#</code>.</td>
</tr>
</tbody>
</table>
Switch(config-if)#?

Interface configuration commands:
access-expression  Build a bridge boolean access expression
apollo             Apollo interface subcommands
appletalk          Appletalk interface subcommands
arp                Set arp type (arpa, probe, snap) or timeout
backup             Modify backup parameters
bandwidth          Set bandwidth informational parameter
bgp-policy         Apply policy propagated by bgp community string
bridge-group       Transparent bridging interface parameters
carrier-delay      Specify delay for interface transitions
cdp                CDP interface subcommands
channel-group      Etherchannel/port bundling configuration
clns               CLNS interface subcommands
cmns               OSI CMNS
custom-queue-list  Assign a custom queue list to an interface
decnet             Interface DECnet config commands
default            Set a command to its defaults
delay              Specify interface throughput delay
description       Interface specific description
dlsw               DLSw interface subcommands
dspu               Down Stream PU
exit               Exit from interface configuration mode
fair-queue         Enable Fair Queuing on an Interface
flowcontrol        Configure flow operation.
fras               DLC Switch Interface Command
help               Description of the interactive help system
hold-queue         Set hold queue depth
ip                  Interface Internet Protocol config commands
ipx                Novell/IPX interface subcommands
isis               IS-IS commands
iso-igrp           ISO-IGRP interface subcommands

Switch(config-if)#

Switch(config-if)# channel-group ?
  group  channel-group of the interface

Switch(config-if)#channel-group

Enter a ? to display a list of all the interface configuration commands available for the Gigabit Ethernet interface.

Enter the command that you want to configure for the controller. In this example, the channel-group command is used.

Enter a ? to display what you must enter next on the command line. In this example, you must enter the group keyword.

Because a <cr> is not displayed, it indicates that you must enter more information to complete the command.
How to Find Command Options

Table 1-2  How to Find Command Options (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# channel-group ? &lt;1-256&gt; Channel group number</td>
<td>After you enter the group keyword, enter a ? to display what you must enter next on the command line. In this example, you must enter a channel group number from 1 to 256. Because a &lt;cr&gt; is not displayed, it indicates that you must enter more information to complete the command.</td>
</tr>
<tr>
<td>Switch(config-if)#channel-group</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# channel-group 1 ? mode Etherchannel Mode of the interface</td>
<td>After you enter the channel group number, enter a ? to display what you must enter next on the command line. In this example, you must enter the mode keyword. Because a &lt;cr&gt; is not displayed, it indicates that you must enter more information to complete the command.</td>
</tr>
<tr>
<td>Switch(config-if)#</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# channel-group 1 mode ? auto Enable PAgP only if a PAgP device is detected desirable Enable PAgP unconditionally on Enable Etherchannel only</td>
<td>After you enter the mode keyword, enter a ? to display what you must enter next on the command line. In this example, you must enter the auto, desirable, or on keyword. Because a &lt;cr&gt; is not displayed, it indicates that you must enter more information to complete the command.</td>
</tr>
<tr>
<td>Switch(config-if)#</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# channel-group 1 mode auto ? &lt;cr&gt;</td>
<td>In this example, the auto keyword is entered. After you enter the auto keyword, enter a ? to display what you must enter next on the command line. Because a &lt;cr&gt; is displayed, it indicates that you can press Return to complete the command. If additional keywords are listed, you can enter more keywords or press Return to complete the command.</td>
</tr>
<tr>
<td>Switch(config-if)#</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# channel-group 1 mode auto</td>
<td>In this example, press Return to complete the command.</td>
</tr>
</tbody>
</table>
Understanding Command Modes

The Cisco IOS user interface on the Catalyst 4500 series switch has many different modes. The commands that are available to you depend on which mode you are currently in. You can obtain a list of commands available for each command mode by entering a question mark (?) at the system prompt.

When you start a session on the Catalyst 4500 series switch, you begin in user mode, often called EXEC mode. Only a limited subset of the commands are available in EXEC mode. In order to have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From privileged EXEC mode, you can enter any EXEC command or enter global configuration mode. Most EXEC commands are one-time commands, such as show commands, which show the current status of a given item, and clear commands, which clear counters or interfaces. The EXEC commands are not saved across reboots of the Catalyst 4500 series switch.

The configuration modes provide a way for you to make changes to the running configuration. When you save changes to the configuration, the changes remain intact when the Catalyst 4500 series switch reboots. From global configuration mode, you can enter interface configuration mode, subinterface configuration mode, and other protocol-specific modes.

ROM-monitor mode is a separate mode used when the Catalyst 4500 series switch cannot boot properly. If your Catalyst 4500 series switch or access server does not find a valid system image when it is booting, or if its configuration file is corrupted at startup, the system might enter ROM-monitor mode.

Table 1-3 provides a summary of the main command modes.

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC mode</td>
<td>Log in.</td>
<td>Switch&gt;</td>
<td>Use the logout command.</td>
</tr>
<tr>
<td>Privileged EXEC mode</td>
<td>From user EXEC mode, enter the enable EXEC command.</td>
<td>Switch#</td>
<td>To exit to user EXEC mode, enter the disable command.</td>
</tr>
<tr>
<td>Global configuration mode</td>
<td>From privileged EXEC mode, enter the configure terminal privileged EXEC command.</td>
<td>Switch(config)#</td>
<td>To exit to privileged EXEC mode, enter the exit or end command or press Ctrl-Z.</td>
</tr>
<tr>
<td>Interface configuration mode</td>
<td>From global configuration mode, enter by specifying an interface with an interface command.</td>
<td>Switch(config-if)#</td>
<td>To exit to global configuration mode, enter the exit command.</td>
</tr>
</tbody>
</table>
Using the No and Default Forms of Commands

Almost every configuration command has a no form. In general, enter the no form to disable a function. Use the command without the keyword no to reenable a disabled function or to enable a function that is disabled by default. For example, IP routing is enabled by default. To disable IP routing, specify the no ip routing command and specify ip routing to reenable it. This publication provides the complete syntax for the configuration commands and describes what the no form of a command does.

Some configuration commands have a default form. The default form of a command returns the command setting to its default settings. Most commands are disabled by default, so the default form is the same as the no form. However, some commands are enabled by default, with variables set to certain default values. In these cases, the default form of the command enables the command and returns its variables to their default values.

Using the CLI String Search

The pattern in the command output is referred to as a string. The CLI string search feature allows you to search or filter any show or more command output and allows you to search and filter at --More-- prompts. This feature is useful when you need to sort though large amounts of output, or if you want to exclude output that you do not need to see.

With the search function, you can begin unfiltered output at the first line that contains a regular expression you specify. You can then specify a maximum of one filter per command or start a new search from the --More-- prompt.

A regular expression is a pattern (a phrase, number, or more complex pattern) software uses to match against show or more command output. Regular expressions are case sensitive and allow for complex matching requirements. Examples of simple regular expressions are Serial, misses, and 138. Examples of complex regular expressions are 00210..., ( is ), and [Oo]utput.
You can perform three types of filtering:

- Use the `begin` keyword to begin output with the line that contains a specified regular expression.
- Use the `include` keyword to include output lines that contain a specified regular expression.
- Use the `exclude` keyword to exclude output lines that contain a specified regular expression.

You can then search this filtered output at the --More-- prompts.

---

**Note**
The CLI string search function does not allow you to search or filter backward through previous output; filtering cannot be specified using HTTP access to the CLI.

---

## Regular Expressions

A regular expression can be a single character that matches the same single character in the command output or multiple characters that match the same multiple characters in the command output. This section describes how to create both single-character patterns and multiple-character patterns and how to create more complex regular expressions using multipliers, alternation, anchoring, and parentheses.

### Single-Character Patterns

The simplest regular expression is a single character that matches the same single character in the command output. You can use any letter (A-Z, a-z) or digit (0-9) as a single-character pattern. You can also use other keyboard characters (such as ! or ~) as single-character patterns, but certain keyboard characters have special meaning when used in regular expressions. Table 1-4 lists the keyboard characters that have special meaning.

<table>
<thead>
<tr>
<th>Character</th>
<th>Special Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any single character, including white space.</td>
</tr>
<tr>
<td>*</td>
<td>Matches 0 or more sequences of the pattern.</td>
</tr>
<tr>
<td>+</td>
<td>Matches 1 or more sequences of the pattern.</td>
</tr>
<tr>
<td>?</td>
<td>Matches 0 or 1 occurrences of the pattern.</td>
</tr>
<tr>
<td>^</td>
<td>Matches the beginning of the string.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of the string.</td>
</tr>
<tr>
<td>_ (underscore)</td>
<td>Matches a comma (,), left brace ({}), right brace ({}), left parenthesis ( () ), right parenthesis ( ) ), the beginning of the string, the end of the string, or a space.</td>
</tr>
</tbody>
</table>

To enter these special characters as single-character patterns, remove the special meaning by preceding each character with a backslash (\). These examples are single-character patterns matching a dollar sign, an underscore, and a plus sign, respectively.

\$ \\_ \\+
You can specify a range of single-character patterns to match against command output. For example, you can create a regular expression that matches a string containing one of the following letters: a, e, i, o, or u. One and only one of these characters must exist in the string for pattern matching to succeed. To specify a range of single-character patterns, enclose the single-character patterns in square brackets ([ ]). For example,

\[aeiou\]

matches any one of the five vowels of the lowercase alphabet, while

\[abcdABCD\]

matches any one of the first four letters of the lower- or uppercase alphabet.

You can simplify ranges by entering only the end points of the range separated by a dash (-). Simplify the previous range as follows:

\[a-dA-D\]

To add a dash as a single-character pattern in your range, include another dash and precede it with a backslash:

\[a-dA-D-\]

You can also include a right square bracket (]) as a single-character pattern in your range. To do so, enter the following:

\[a-dA-D]\]

The previous example matches any one of the first four letters of the lower- or uppercase alphabet, a dash, or a right square bracket.

You can reverse the matching of the range by including a caret (^) at the start of the range. This example matches any letter except the ones listed:

\[^a-dqsv\]

This example matches anything except a right square bracket (]) or the letter d:

\[^\]d\]

Multiple-Character Patterns

When creating regular expressions, you can also specify a pattern containing multiple characters. You create multiple-character regular expressions by joining letters, digits, or keyboard characters that do not have special meaning. For example, a4% is a multiple-character regular expression. Put a backslash in front of the keyboard characters that have special meaning when you want to remove their special meaning.

With multiple-character patterns, order is important. The regular expression a4% matches the character a followed by a 4 followed by a % sign. If the string does not have a4%, in that order, pattern matching fails. This multiple-character regular expression:

\a.

uses the special meaning of the period character to match the letter a followed by any single character. With this example, the strings ab, a!, or a2 are all valid matches for the regular expression.

You can remove the special meaning of the period character by putting a backslash in front of it. In the following expression:

\a\.

only the string a. matches this regular expression.
You can create a multiple-character regular expression containing all letters, all digits, all keyboard characters, or a combination of letters, digits, and other keyboard characters. These examples are all valid regular expressions:

**telebit 3107 v32bis**

### Multipliers

You can create more complex regular expressions to match multiple occurrences of a specified regular expression by using some special characters with your single- and multiple-character patterns. Table 1-5 lists the special characters that specify “multiples” of a regular expression.

**Table 1-5** Special Characters Used as Multipliers

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Matches 0 or more single- or multiple-character patterns.</td>
</tr>
<tr>
<td>+</td>
<td>Matches 1 or more single- or multiple-character patterns.</td>
</tr>
<tr>
<td>?</td>
<td>Matches 0 or 1 occurrences of the single- or multiple-character patterns.</td>
</tr>
</tbody>
</table>

This example matches any number of occurrences of the letter a, including none:

\[ a^* \]

This pattern requires that at least one letter a in the string is matched:

\[ a^+ \]

This pattern matches the string bb or bab:

\[ ba?b \]

This string matches any number of asterisks (*):

\[ \\*\*\* \]

To use multipliers with multiple-character patterns, you enclose the pattern in parentheses. In the following example, the pattern matches any number of the multiple-character string ab:

\[ (ab)^* \]

As a more complex example, this pattern matches one or more instances of alphanumeric pairs (but not none; that is, an empty string is not a match):

\[ ([A-Za-z][0-9]+) \]

The order for matches using multipliers (*, +, or ?) is to put the longest construct first. Nested constructs are matched from outside to inside. Concatenated constructs are matched beginning at the left side of the construct. Thus, the regular expression matches A9b3, but not 9Ab3 because the letters are specified before the numbers.
Alternation

Alternation allows you to specify alternative patterns to match against a string. You separate the alternative patterns with a vertical bar (|). Exactly one of the alternatives can match the string. For example, the regular expression

```
codex | telebit
```

matches the string codex or the string telebit, but not both codex and telebit.

anchoring

You can match a regular expression pattern against the beginning or the end of the string. That is, you can specify that the beginning or end of a string contains a specific pattern. You “anchor” these regular expressions to a portion of the string using the special characters shown in Table 1-6.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches the beginning of the string.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of the string.</td>
</tr>
</tbody>
</table>

This regular expression matches a string only if the string starts with abcd:

```
^abcd
```

In contrast, this expression is in a range that matches any single letter, as long as it is not the letters a, b, c, or d:

```
[^abcd]
```

With this example, the regular expression matches a string that ends with .12:

```
$\12
```

Contrast these anchoring characters with the special character underscore (_). The underscore matches the beginning of a string (^), the end of a string ($), parentheses ( ), space ( ), braces { }, comma (,), or underscore (_). With the underscore character, you can specify that a pattern exist anywhere in the string. For example:

```
_1300_
```

matches any string that has 1300 somewhere in the string. The string’s 1300 can be preceded by or end with a space, brace, comma, or underscore. For example:

```
{1300_
```

matches the regular expression, but 21300 and 13000 do not.

Using the underscore character, you can replace long regular expression lists, such as the following:

```
^1300$ ^1300(space) (space)1300 {1300, ,1300, {1300},1300, (1300 with
```

```
_1300_
```

Parentheses for Recall

As shown in the “Multipliers” section on page 1-9, you use parentheses with multiple-character regular expressions to multiply the occurrence of a pattern. You can also use parentheses around a single- or multiple-character pattern to remember a pattern for use elsewhere in the regular expression.

To create a regular expression that recalls a previous pattern, you use parentheses to indicate a remembered specific pattern and a backslash (\) followed by an integer to reuse the remembered pattern. The integer specifies the occurrence of the parentheses in the regular expression pattern. If you have more than one remembered pattern in your regular expression, then \1 indicates the first remembered pattern, \2 indicates the second remembered pattern, and so on.

This regular expression uses parentheses for recall:

```
a(.)bc(.)\1\2
```

This regular expression matches an a followed by any character (call it character 1), followed by bc followed by any character (character 2), followed by character 1 again, followed by character 2 again. So, the regular expression can match aZbcTzT. The software remembers that character 1 is Z and character 2 is T and then uses Z and T again later in the regular expression.

Saving Configuration Changes

To save your configuration changes to your startup configuration so that they will not be lost if there is a system reload or power outage, enter the following command:

```
Switch# copy system:running-config nvram:startup-config
```

Building configuration...

It might take a minute or two to save the configuration. After the configuration has been saved, the following output appears:

```
[OK]
Switch#
```

On most platforms, this step saves the configuration to NVRAM. On the Class A Flash file system platforms, this step saves the configuration to the location specified by the CONFIG_FILE environment variable. The CONFIG_FILE environment variable defaults to NVRAM.

show platform Commands

You should use these commands only when you are working directly with your technical support representative, while troubleshooting a problem. Do not use these commands unless your technical support representative asks you to do so.

**Note**

The show platform commands are not described in this document.
This chapter contains an alphabetical listing of Cisco IOS commands for the Catalyst 4500 series switches. For information about Cisco IOS commands that are not included in this publication, refer to Cisco IOS Release 12.2 configuration guides and command references at this URL:

#macro keywords

To specify the help string for the macro keywords, use the #macro keywords command.

```
#macro keywords [keyword1] [keyword2] [keyword3]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>keyword 1</th>
<th>(Optional) Specifies a keyword that is needed while applying a macro to an interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyword 2</td>
<td>(Optional) Specifies a keyword that is needed while applying a macro to an interface.</td>
</tr>
<tr>
<td>keyword 3</td>
<td>(Optional) Specifies a keyword that is needed while applying a macro to an interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify the mandatory keywords for a macro, the macro is to be considered invalid and fails when you attempt to apply it. By entering the #macro keywords command, you will receive a message indicating what you need to include to make the syntax valid.

**Examples**

This example shows how to specify the help string for keywords associated with a macro named test:

```
Switch(config)# macro name test
macro name test
Enter macro commands one per line. End with the character '@'.
#macro keywords $VLAN $MAX
switchport
@

Switch(config)# int gi1/1
Switch(config-if)# macro apply test ?
WORD  Keyword to replace with a value e.g $VLAN, $MAX  << It is shown as help
<cr>
```

aaa accounting dot1x default start-stop group radius

To enable accounting for 802.1X authentication sessions, use the `aaa accounting dot1x default start-stop group radius` command. To disable accounting, use the `no` form of this command.

```
aaa accounting dot1x default start-stop group radius
no aaa accounting dot1x default start-stop group radius
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
Accounting is disabled.

### Command Modes
Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
802.1X accounting requires a RADIUS server.

This command enables the Authentication, Authorization, and Accounting (AAA) client’s accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

### Examples
This example shows how to configure 802.1X accounting:

```
Switch(config)# aaa accounting dot1x default start-stop group radius
```

### Note
The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

aaa accounting system default start-stop group radius

To receive the session termination messages after the switch reboots, use the `aaa accounting system default start-stop group radius` command. To disable accounting, use the `no` form of this command.

```
aaa accounting system default start-stop group radius
no aaa accounting system default start-stop group radius
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Accounting is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

802.1X accounting requires the RADIUS server.

This command enables the AAA client’s accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

**Examples**

This example shows how to generate a logoff after a switch reboots:

```
Switch(config)# aaa accounting system default start-stop group radius
```

**Note**

The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

**Related Commands**

<table>

access-group mode

To specify the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode), use the `access-group mode` command. To return to preferred port mode, use the `no` form of this command.

```
access-group mode {prefer {port | vlan} | merge}
no access-group mode {prefer {port | vlan} | merge}
```

**Syntax Description**

- **prefer port**
  Specifies that the PACL mode take precedence if PACLs are configured. If no PACL features are configured on the port, other features applicable to the interface are merged and applied on the interface.

- **prefer vlan**
  Specifies that the VLAN-based ACL mode take precedence. If no VLAN-based ACL features are configured on the port’s VLAN, the PACL features on the port are applied.

- **merge**
  Merges applicable ACL features before they are programmed into the hardware.

**Defaults**

PACL override mode

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On the Layer 2 interface, prefer port, prefer VLAN, and merge modes are supported. A Layer 2 interface can have one IP ACL applied in either direction (one inbound and one outbound).

**Examples**

This example shows how to make the PACL mode on the switch take effect:

```
(config-if)# access-group mode prefer port
```

This example shows how to merge applicable ACL features:

```
(config-if)# access-group mode merge
```
<table>

access-list hardware capture mode

To select the mode of capturing control packets, use the `access-list hardware capture mode` command.

```
access-list hardware capture mode {global | vlan}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>global</td>
<td>Specifies the capture of control packets globally on all VLANs.</td>
</tr>
<tr>
<td>vlan</td>
<td>Specifies the capture of control packets on a specific VLAN.</td>
</tr>
</tbody>
</table>

**Defaults**

The control packets are globally captured.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

Before configuring the capture mode, it is best to examine and modify your configuration to globally disable features such as DHCP snooping or IGMP snooping, and instead enable them on specific VLANs.

When changing to path managed mode, be aware that control traffic may be bridged in hardware or dropped initially until the per-vlan CAM entries are programmed in hardware.

You must ensure that any access control configuration on a member port or VLAN does not deny or drop the control packets from being forwarded to the CPU for the features which are enabled on the VLAN. If control packets are not permitted then the specific feature does not function.

**Examples**

This example shows how to configure the switch to capture control packets on VLANs that are configured to enable capturing control packets:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode vlan
Switch(config)# end
Switch#
```

This example shows how to configure the switch to capture control packets globally across all VLANs (using a static ACL):

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode global
Switch(config)# end
Switch#
```
This example shows another way to configure the switch to capture control packets globally across all VLANs:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# no access-list hardware capture mode vlan
Switch(config)# end
Switch#
access-list hardware entries

To designate how ACLs are programmed into the switch hardware, use the `access-list hardware entries` command.

```
access-list hardware entries {packed | scattered}
```

**Syntax Description**

- **packed**: Directs the software to use the first entry with a matching mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.
- **scattered**: Directs the software to use the first entry with a free mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.

**Defaults**

The ACLs are programmed as packed.

**Command Modes**

Global configuration mode

**Command History**

```
Release       Modification
------------- --------------------------
12.2(20)EW     Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

Two types of hardware resources are used when ACLs are programmed: entries and masks. If one of these resources is consumed, no additional ACLs can be programmed into the hardware. If the masks are consumed, but the entries are available, change the programming algorithm from `packed` to `scattered` to make the masks available. This action allows additional ACLs to be programmed into the hardware.

The goal is to use TCAM resources more efficiently; that is, to minimize the number of masks per ACL entries. To compare TCAM utilization when using the `scattered` or `packed` algorithms, use the `show platform hardware acl statistics utilization brief` command. To change the algorithm from `packed` to `scattered`, use the `access-list hardware entries` command.

**Examples**

This example shows how to program ACLs into the hardware as packed. After they are programmed, you will need 89 percent of the masks to program only 49 percent of the ACL entries.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries packed
Switch(config)# end
Switch# 01:15:34: %SYS-5-CONFIG_I: Configured from console by console
Switch# Switch# Switch# show platform hardware acl statistics utilization brief
Entries/Total(%)  Masks/Total(%)  
-----------------  ---------------
Input  Acl(PortAndVlan)  2016 / 4096 ( 49)  460 / 512  ( 89)
Input  Acl(PortOrVlan)   6 / 4096 ( 0)      4 / 512 ( 0)
Input  Qos(PortAndVlan)  0 / 4096 ( 0)      0 / 512 ( 0)
Input  Qos(PortOrVlan)   0 / 4096 ( 0)      0 / 512 ( 0)
```
This example shows how to reserve space (scatter) between ACL entries in the hardware. The number of masks required to program 49 percent of the entries has decreased to 49 percent.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries scattered
Switch(config)# end
Switch#
01:39:37: %SYS-5-CONFIG_I: Configured from console by console
Switch#
Switch# show platform hardware acl statistics utilization brief

Entries/Total(%) Masks/Total(%)
----------------- ---------------
Input Acl(PortAndVlan) 2016 / 4096 (49) 252 / 512 (49)
Input Acl(PortOrVlan) 6 / 4096 (0) 5 / 512 (0)
Input Qos(PortAndVlan) 0 / 4096 (0) 0 / 512 (0)
Input Qos(PortOrVlan) 0 / 4096 (0) 0 / 512 (0)
Output Acl(PortAndVlan) 0 / 4096 (0) 0 / 512 (0)
Output Acl(PortOrVlan) 0 / 4096 (0) 0 / 512 (0)
Output Qos(PortAndVlan) 0 / 4096 (0) 0 / 512 (0)
Output Qos(PortOrVlan) 0 / 4096 (0) 0 / 512 (0)

L4Ops: used 2 out of 64

Switch#
access-list hardware region

To modify the balance between TCAM regions in hardware, use the **access-list hardware region** command.

```
access-list hardware region {feature | qos} {input | output} balance {bal-num}
```

**Syntax Description**

- **feature** Specifies adjustment of region balance for ACLs.
- **qos** Specifies adjustment of region balance for QoS.
- **input** Specifies adjustment of region balance for input ACL and QoS.
- **output** Specifies adjustment of region balance for output ACL and QoS.
- **balance bal-num** Specifies relative sizes of the PandV and PorV regions in the TCAM; valid values are between 1 and 99.

**Defaults**

The default region balance for each TCAM is 50.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

PandV is a TCAM region containing entries which mask in both the port and VLAN tag portions of the flow label.

PorV is a TCAM region containing entries which mask in either the port or VLAN tag portion of the flow label, but not both.

A balance of 1 allocates the minimum number of PandV region entries and the maximum number of PorV region entries. A balance of 99 allocates the maximum number of PandV region entries and the minimum number of PorV region entries. A balance of 50 allocates equal numbers of PandV and PorV region entries in the specified TCAM.

Balances for the four TCAMs can be modified independently.

**Examples**

This example shows how to enable the MAC notification trap when a MAC address is added to a port:

```
Switch# configure terminal
Switch(config)# access-list hardware region feature input balance 75
Switch(config)#
```
action

To specify an action to be taken when a match occurs in a VACL, use the `action` command. To remove an action clause, use the `no` form of this command.

```
action {drop | forward}
no action {drop | forward}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>drop</td>
<td>Sets the action to drop packets.</td>
</tr>
<tr>
<td>forward</td>
<td>Sets the action to forward packets to their destination.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

VLAN access-map mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In a VLAN access map, if at least one ACL is configured for a packet type (IP or MAC), the default action for the packet type is `drop` (deny).

If an ACL is not configured for a packet type, the default action for the packet type is `forward` (permit).

If an ACL for a packet type is configured and the ACL is empty or undefined, the configured action will be applied to the packet type.

**Examples**

This example shows how to define a drop action:

```
Switch(config-access-map)# action drop
Switch(config-access-map)#
```

This example shows how to define a forward action:

```
Switch(config-access-map)# action forward
Switch(config-access-map)#
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match</td>
<td>Specifies a match clause by selecting one or more ACLs for a VLAN access-map sequence.</td>
</tr>
<tr>
<td>show vlan access-map</td>
<td>Displays the contents of a VLAN access map.</td>
</tr>
<tr>
<td>vlan access-map</td>
<td>Enters VLAN access-map command mode to create a VLAN access map.</td>
</tr>
</tbody>
</table>
active

To enable the destination profile, use the `active` command.

```
active
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

`cfg-call-home-profile`

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default the profile is enabled upon creation.

**Examples**

This example shows how to enable the destination profile:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# active
```

**ancp client port identifier**

To create a mapping for an ANCP client to identify an interface on which ANCP should start or stop a multicast stream, use the `ancp client port identifier` command.

```
ancp client port identifier identifying name vlan vlan number interface interface
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>identifying name</code></td>
<td>Identifier used by the ANCP server to specify an interface member of a VLAN.</td>
</tr>
<tr>
<td><code>vlan number</code></td>
<td>VLAN identifier.</td>
</tr>
<tr>
<td><code>interface</code></td>
<td>Interface member of this VLAN.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The ANCP server can use either the DHCP option 82 circuit ID or an identifier created with this command to identify the port. Use only one of the two methods; do not interchange them. If you use the DHCP option 82, the port identifier used by the ANCP server should be (in hex) 0x01060004[vlan][intf]. For example, VLAN 19 and interface Fast Ethernet 2/3 will provide 0x0106000400130203. If you use the port identifier, however, use the exact string provided on the CLI.

**Note**

This command is available only after you set the box in ANCP client mode with the `ancp mode client` configuration command.

**Examples**

This example shows how to identify interface FastEthernet 7/3 on VLAN 10 with the string NArmstrong:

```
Switch# ancp client port identifier NArmstrong vlan 10 interface FastEthernet 7/3
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</thead>
<tbody>
<tr>
<td><code>ancp mode client</code></td>
<td>Sets the router to become an ANCP client.</td>
</tr>
</tbody>
</table>
ancp client server

To set the IP address of the remote ANCP server, use the `ancp client server` command.

```
ancp client server ipaddr of server interface interface
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ipaddr of server</code></td>
<td>IP address of the ANCP server the client must connect with TCP.</td>
</tr>
<tr>
<td><code>interface</code></td>
<td>Interface to use for the connection.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The interface can be the direct interface connected towards the ANCP server (if only one) or a loopback interface if several interfaces are available for connecting to the server and proper routing is set. (An IP address must be configured on this interface and it should not be in shutdown state.) Along with the `ancp mode client` command, the `ancp client server` command is required in order to activate the ANCP client. Once you enter this command, the ANCP client tries to connect to the remote server.

**Examples**

This example shows how to indicate to the ANCP client the IP address of the ANCP server it needs to connect to:

```
Switch# ancp client server 10.1.2.31 interface FastEthernet 2/1
```

**Related Commands**

</table>
ancp mode client

To set the router to become an ANCP client, use the `ancp mode client` command.

```
ancp mode client
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To fully activate ANCP, the administrator must also set the ANCP server IP address to which the ANCP client must connect.

**Examples**
This example shows how to set the router to become an ANCP client:

```
Switch# ancp mode client
```

**Related Commands**

</tbody>
</table>
apply

To implement a new VLAN database, increment the configuration number, save the configuration number in NVRAM, and propagate the configuration number throughout the administrative domain, use the apply command.

```plaintext
apply
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
This command has no default settings.

### Command Modes
VLAN configuration mode

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
The apply command implements the configuration changes that you made after you entered VLAN database mode and uses them for the running configuration. This command keeps you in VLAN database mode.

You cannot use this command when the switch is in the VTP client mode.

You can verify that the VLAN database changes occurred by entering the show vlan command from privileged EXEC mode.

### Examples
This example shows how to implement the proposed new VLAN database and to recognize it as the current database:

```plaintext
Switch(config-vlan)# apply
Switch(config-vlan)#
```

</table>
attach module

To remotely connect to a specific module, use the `attach module` configuration command.

```
attach module mod
```

**Syntax Description**

```
mod       Target module for the command.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies only to the Access Gateway Module on Catalyst 4500 series switches.

The valid values for `mod` depend on the chassis that are used. For example, if you have a Catalyst 4506 chassis, valid values for the module are from 2 to 6. If you have a 4507R chassis, valid values are from 3 to 7.

When you execute the `attach module mod` command, the prompt changes to Gateway#.

This command is identical in the resulting action to the `session module mod` and the `remote login module mod` commands.

**Examples**

This example shows how to remotely log in to an Access Gateway Module:

```
Switch# attach module 5
Attaching console to module 5
Type 'exit' at the remote prompt to end the session

Gateway>
```

**Related Commands**

<table>
<thead>
<tr>

</tbody>
</table>

**Usage Guidelines**

The `authentication control-direction` command replaces the following `dot1x` command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
dot1x control-direction { both | in }
```

The IEEE 802.1X standard defines a client-server-based access control and authentication protocol that restricts unauthorized devices from connecting to a LAN through publicly accessible ports.

IEEE 802.1X controls network access by creating two distinct virtual access points at each port. One access point is an uncontrolled port; the other is a controlled port. All traffic through the single port is available to both access points. IEEE 802.1X authenticates each user device that connects to a switch port and assigns the port to a VLAN before making available any services that are offered by the switch or the LAN. Until the device authenticates, 802.1X access control allows only Extensible Authentication Protocol (EAP) over LAN (EAPOL) traffic through the port to which the device connects. After authentication succeeds, normal traffic can pass through the port.

- Unidirectional state—When you configure a port as unidirectional with the `dot1x control-direction` interface configuration command, the port changes to the spanning-tree forwarding state.

  When the unidirectional controlled port is enabled, the connected host is in sleeping mode or power-down state. The host does not exchange traffic with other devices in the network. If the host connected to the unidirectional port that cannot send traffic to the network, the host can only receive traffic from other devices in the network.

- Bidirectional state—When you configure a port as bidirectional with the `dot1x control-direction` interface configuration command, the port is access-controlled in both directions. In this state, the switch port sends only EAPOL.
Using the **both** keyword or using the **no** form of this command changes the port to its bidirectional default setting.

Setting the port as bidirectional enables 802.1X authentication with Wake-on-LAN (WoL).

You can verify your settings by entering the **show authentication** privileged EXEC command.

### Examples

The following example shows how to enable unidirectional control:

```
Switch(config-if)# authentication control-direction in
Switch(config-if)#
```

The following example shows how to enable bidirectional control:

```
Switch(config-if)# authentication control-direction both
Switch(config-if)#
```

The following example shows how to return to the default settings:

```
Switch(config-if)# no authentication control-direction
Switch(config-if)#
```

<td>no-response action authorize</td>
<td>When the client does not support 802.1x, authorizes the port to a particular VLAN.</td>
</tr>
</tbody>
</table>

**Command Default**

The default settings are as follows:

- The **count** is 2 by default.
- The current authentication method is retried indefinitely (and fails each time) until the AAA server becomes reachable.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The **authentication event fail** command replaces the following 802.1X commands, which are deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x auth-fail max-attempts count`
- `[no] dot1x auth-fail vlan vlan`

The **authentication event fail** command is supported only for 802.1X to signal authentication failures. By default, this failure type causes the authentication method to be retried. You can configure either to authorize the port in the configured VLAN or to failover to the next authentication method. Optionally, you can specify the number of authentication retries before performing this action.

The **authentication event server** command replaces the following 802.1X commands, which are deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x critical`
- `[no] dot1x critical vlan vlan`
- `[no] dot1x critical recover action initialize`

The **authentication event server** command specifies the behavior when the AAA server becomes unreachable, ports are authorized in the specified VLAN.

The **authentication server alive action** command specifies the action to be taken once the AAA server becomes reachable again.

You can verify your settings by entering the **show authentication** privileged EXEC command.

The **authentication event no-response** command replaces the following 802.1X command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x guest-vlan vlan`

The **authentication event no-response** command specifies the action to be taken when the client does not support 802.1X.

Examples

The following example shows how to specify that when an authentication fails due to bad user credentials, the process advances to the next authentication method:

```
Switch(config-if)# authentication event fail action next-method
```

The following example shows how to specify the AAA server alive actions as reinitialize all authorized clients for authentication events:

```
Switch(config-if)# authentication event server alive action reinitialize
```

The following example shows how to specify the AAA server dead actions that authorize the port for authentication events:

```
Switch(config-if)# authentication event server dead action authorize
```

The following example shows how to specify the conditions when a client doesn’t support 802.1X to authorize the port for authentication events:

```
Switch(config-if)# authentication event authentication event no-response action authorize vlan 10
```

Switch(config-if)#

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, if 802.1X times out and if MAB fails, WebAuth is enabled.

The `authentication fallback` command replaces the following dot1x command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x fallback profile
```

The Webauth fallback feature allows you to have those clients that do not have an 802.1X supplicant and are not managed devices to fall back to the WebAuth method.

You can verify your settings with the `show authentication` privileged EXEC command.

**Examples**

This example shows how to enable WebAuth fallback and specify the fallback profile to use when failing over to WebAuth:

```
Switch(config-if)# authentication fallback fallbacktest1
```

This example shows how to disable WebAuth fallback:

```
Switch(config-if)# no authentication fallback fallbacktest1
```

<td></td>
</tr>
<tr>
<td>open</td>
<td>(Optional) Configures the host-mode with open policy on the port.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Single-host mode classifies the session as an interface session (for example, one MAC per interface). Only one client is allowed on the port, and any policies that are downloaded for the client are applied to the whole port. A security violation is triggered if more than one client is detected.

Multi-host mode classifies the session as an interface session, but the difference with this host-mode is that it allows more than one client to attach to the port. Only the first client that is detected on the port will be authenticated and the rest will inherit the same access as the first client. The policies that are downloaded for the first client will be applied to the whole port.

Multi-domain mode classifies the session based on a combination of MAC address and domain, with the restriction that only one MAC is allowed per domain. The domain in the switching environment refers to the VLAN, and the two supported domains are the DATA domain and the voice domain. Only one client is allowed on a particular domain. So, only two clients (MACs) per port are supported. Each one is required to authenticate separately. Any policies that are downloaded for the client will be applied for that client’s MAC/IP only and will not affect the other on the same port. The clients can be authenticated using different methods (such as 802.1X for PC, MAB for IP phone, or vice versa). No restriction exists on the authentication order.
The only caveat with the above statement is that web-based authentication is only available for data devices because a user is probably operating the device and HTTP capability exists. Also, if web-based authentication is configured in MDA mode, the only form of enforcement for all types of devices is downloadable ACLs (dACL). The restriction is in place because VLAN assignment is not supported for web-based authentication. Furthermore, if you use dACLs for data devices and not for voice devices, when the user’s data falls back to webauth, voice traffic is affected by the ACL that is applied based on the fallback policy. Therefore if webauth is configured as a fallback on an MDA enabled port, dACL is the only supported enforcement method.

Multi-auth mode classifies the session as a MAC-based. No limit exists for the number of clients allowed on a port data domain. Only one client is allowed in a voice domain and each one is required to authenticate separately. Any policies that are downloaded for the client are applied for that client’s MAC or IP only and do not affect others on the same port.

The optional pre-authentication open access mode allows you to gain network access before authentication is performed. This is primarily required for the PXE boot scenario, but not limited to just that use case, where a device needs to access the network before PXE times out and downloads a bootable image possibly containing a supplicant.

The configuration related to this feature is attached to the host-mode configuration whereby the host-mode itself is significant for the control plane, while the open access configuration is significant for the data plane. Open-access configuration has absolutely no bearing on the session classification. The host-mode configuration still controls this. If the open-access is defined for single-host mode, the port still allows only one MAC address. The port forwards traffic from the start and is only restricted by what is configured on the port. Such configurations are independent of 802.1X. So, if there is no form of access-restriction configured on the port, the client devices have full access on the configured VLAN.

You can verify your settings with the `show authentication` privileged EXEC command.

### Examples

This example shows how to define the classification of a session that are used to apply the access-policies using the host-mode configuration:

```plaintext
Switch(config-if)# authentication host-mode single-host
Switch(config-if)#
```

authentication open

To enable open access on this port, use the `authentication open` command in interface configuration mode. To disable open access on this port, use the `no` form of this command.

```
authentication open

no authentication open
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Open Access allows clients or devices to gain network access before authentication is performed. You can verify your settings with the `show authentication` privileged EXEC command. This command overrides the `authentication host-mode session-type open` global configuration mode command for the port only. This command operates per-port rather than globally.

**Examples**
The following example shows how to enable open access to a port:
```
Switch(config-if)# authentication open
Switch(config-if)#
```

The following example shows how to enable open access to a port:
```
Switch(config-if)# no authentication open
Switch(config-if)#
```

authentication order

To specify the order in which authentication methods should be attempted for a client on an interface, use the `authentication order` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication order method1 [method2] [method3]
no authentication order
```

### Syntax Description

- **method1**
  - Authentication method to be attempted. The valid values are as follows:
    - `dot1x`—Adds the dot1x authentication method.
    - `mab`—Adds the MAB authentication method.
    - `webauth`—Adds the WebAuth authentication method.

- **method2** (Optional)
  - (Optional) Authentication method to be attempted. The valid values are as follows:
    - `dot1x`—Adds the dot1x authentication method.
    - `mab`—Adds the MAB authentication method.
    - `webauth`—Adds the WebAuth authentication method.

- **method3**

### Command Default

The default order is dot1x, MAB, then WebAuth.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Once you enter the `authentication order` command, only those methods explicitly listed will run. Each method may be entered only once in the run list and no methods may be entered after you enter the `webauth` keyword.

Authentication methods are applied in the configured (or default) order until authentication succeeds. For authentication fails, failover to the next authentication method occurs (subject to the configuration of authentication event handling).

You can verify your settings with the `show authentication` privileged EXEC command.
The following example shows how to specify the order in which authentication methods should be attempted for a client on an interface:

```
Switch(config-if)# authentication order mab dotlx webauth
Switch(config-if)#
```

</tr>
<tr>
<td><code>force-unauthorized</code></td>
<td>(Optional) Denies all access through this interface by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate.</td>
</tr>
</tbody>
</table>

**Command Default**

`force-authorized`

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `authentication port-control` command replaces the following `dot1x` command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x port-control [auto | force-authorized | force-unauthorized]
```

The following guidelines apply to Ethernet switch network modules:

- The 802.1X protocol is supported on Layer 2 static-access ports.
- You can use the `auto` keyword only if the port is not configured as one of the following types:
  - Trunk port—If you try to enable 802.1X on a trunk port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to trunk, the port mode is not changed.
  - EtherChannel port—Before enabling 802.1X on the port, you must first remove it from the EtherChannel. If you try to enable 802.1X on an EtherChannel or on an active port in an EtherChannel, an error message appears, and 802.1X is not enabled. If you enable 802.1X on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.
Switch Port Analyzer (SPAN) destination port—You can enable 802.1X on a port that is a SPAN destination port; however, 802.1X is disabled until the port is removed as a SPAN destination. You can enable 802.1X on a SPAN source port.

To globally disable 802.1X on the device, you must disable it on each port. There is no global configuration command for this task.

You can verify your settings with the `show authentication` privileged EXEC command.

The `auto` keyword allows you to send and receive only Extensible Authentication Protocol over LAN (EAPOL) frames through the port. The authentication process begins when the link state of the port transitions from down to up or when an EAPOL-start frame is received. The system requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the system through the client’s MAC address.

**Examples**

The following example shows that the authentication status of the client PC will be determined by the authentication process:

```
Switch(config-if)# authentication port-control auto
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>

## authentication priority

To specify the priority of authentication methods on an interface, use the `authentication priority` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication priority method1 [method2] [method3]
```

```
no authentication priority
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>method1 Authentication method to be attempted. The valid values are as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>dot1x</code>—Adds the dot1x authentication method.</td>
</tr>
<tr>
<td></td>
<td>• <code>mab</code>—Adds the MAB authentication method.</td>
</tr>
<tr>
<td></td>
<td>• <code>webauth</code>—Adds the Webauth authentication method.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>syntax description</th>
<th>method2 (Optional) Authentication method to be attempted. The valid values are as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <code>dot1x</code>—Adds the dot1x authentication method.</td>
</tr>
<tr>
<td></td>
<td>• <code>mab</code>—Adds the MAB authentication method.</td>
</tr>
<tr>
<td></td>
<td>• <code>webauth</code>—Adds the Webauth authentication method.</td>
</tr>
</tbody>
</table>

| Command Default      | The default order is dot1x, MAB, then webauth.                                          |

| Command Modes        | Interface configuration mode                                                           |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release  Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.2(50)SG                Support for this command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Configuring priorities for authentication methods allows a higher priority method (not currently running) to interrupt an authentication in progress with a lower priority method. Alternatively, if the client is already authenticated, an interrupt from a higher priority method can cause a client, which was previously authenticated using a lower priority method, to reauthenticate.

The default priority of a method is equivalent to its position in the order of execution list. If you do not configure a priority, the relative priorities (highest first) are dot1x, MAB and then webauth. If you enter the `authentication order` command, the default priorities are the same as the configured order.

You can verify your settings with the `show authentication` privileged EXEC command.
Examples

The following example shows how to specify the priority in which authentication methods should be attempted for a client on an interface:

```
Switch(config-if)# authentication priority mab dot1x weauth
Switch(config-if)#
```

<table>
<thead>
<tr>

</tbody>
</table>
authentication timer

To configure the authentication timer, use the `authentication timer` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication timer {{inactivity value} | {reauthenticate server | value}} | {restart value}}
no authentication timer {{inactivity value} | {reauthenticate value} | {restart value}}
```

**Syntax Description**

- `inactivity value` Specifies the amount of time in seconds that a host is allowed to be inactive before being authorized. Range is 1 to 65535. Default is Off.

  - **Note** The inactivity value should be less than the reauthenticate timer value, but configuring the inactivity value higher than the reauthenticate timer value is not considered an error.

- `reauthenticate server` Specifies that the reauthentication period value for the client should be obtained from the authentication, authorization, and accounting (AAA) server as Session-Timeout (RADIUS Attribute 27).

- `reauthenticate value` Specifies the amount of time in seconds after which an automatic reauthentication is initiated. Range is 1 to 65535. Default is 3600.

- `restart value` Specifies the amount of time in seconds after which an attempt is made to authenticate an unauthorized port. Range is 1 to 65535. Default is Off.

**Command Default**

The default settings are as follows:

- `inactivity value`—Off.
- `reauthenticate value`—3600
- `restart value`—Off

**Command Modes**

Interface configuration mode

**Command History**

</tbody>
</table>

**Usage Guidelines**

Reauthentication only occurs if it is enabled on the interface.

The `authentication timer reauthenticate value` command replaces the following dot1x command that is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x timeout {reauth-period seconds | quiet-period seconds | tx-period seconds | supp-timeout seconds | server-timeout seconds}
```
You should change the default values of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients or authentication servers.

During the inactivity period, the Ethernet switch network module does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number less than the default.

The `reauthenticate` keyword affects the behavior of the Ethernet switch network module only if you have enabled periodic reauthentication with the `authentication reauthentication` global configuration command.

### Examples

The following example shows how to specify that the reauthentication period value for the client should be obtained from the authentication, authorization, and accounting (AAA) server as Session-Timeout (RADIUS Attribute 27):

```
Switch(config-if)# authentication timer reauthenticate server
```

```
Switch(config-if)#
```

</table>
authentication violation

Use the `authentication violation` interface configuration command to configure the violation mode: restrict, shutdown, and replace.

In single-host mode, a security violation is triggered when more than one device are detected on the data vlan. In multidomain authentication mode, a security violation is triggered when more than one device are detected on the data or voice VLAN.

Security violation cannot be triggered in multiplehost or multiauthentication mode.

```
authentication violation { restrict | shutdown | replace }
no authentication violation { restrict | shutdown | replace }
```

<table>

<td>Command introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Support for <code>replace</code> keyword.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a new host is seen in single or multiple-domain modes, `replace` mode tears down the old session and authenticates the new host.

**Examples**

This example shows how to configure violation mode shutdown on a switch:

```
Switch# configure terminal
Switch(config)# authentication violation shutdown
```

A port is error-disabled when a security violation triggers on shutdown mode. The following syslog messages displays:

- `%AUTHMGR-5-SECURITY_VIOLATION: Security violation on the interface <interface name>, new MAC address <mac-address> is seen.`
- `%PM-4-ERR_DISABLE: security-violation error detected on <interface name>, putting <interface name> in err-disable state`

class-map match-all AutoQos-4.0-Signaling-Classify
  match access-group name AutoQos-4.0-ACL-Signaling
class-map match-all AutoQos-4.0-Transaction-Classify
  match access-group name AutoQos-4.0-ACL-Transactional-Data
class-map match-all AutoQos-4.0-Bulk-Data-Classify
  match access-group name AutoQos-4.0-ACL-Bulk-Data
class-map match-all AutoQos-4.0-Scavenger-Classify
  match access-group name AutoQos-4.0-ACL-Scavenger
class-map match-all AutoQos-4.0-Default-Classify
  match access-group name AutoQos-4.0-ACL-Default

AutoQos-4.0-VoIP-Data-Cos and AutoQos-4.0-VoIP-Signal-Cos are needed to handle instances when you connect an IP phone to an interface and call the auto qos voip cisco-phone command on that interface. In this situation, the input service policy on the interface must match VoIP and signaling packets solely on their CoS markings. This is because switching ASICs on Cisco IP Phones are limited to only remarking the CoS bits of VoIP and the signaling traffic. Matching DSCP markings results in a security vulnerability because a user whose PC was connected to an IP phone connected to a switch would be able to remark DSCP markings of traffic arising from their PC to dscp ef using the NIC on their PC. This causes incorrect placement of non-real-time traffic in the priority queue in the egress direction.

B. Template for the auto qos classify command input service-policy

policy-map AutoQos-4.0-Classify-Input-Policy
  class AutoQos-4.0-Multimedia-Conf-Classify
    set dscp af41
    set cos 4
    set qos-group 34
  class AutoQos-4.0-Signaling-Classify
    set dscp cs3
    set cos 3
    set qos-group 16
  class AutoQos-4.0-Transaction-Classify
    set dscp af21
    set cos 2
    set qos-group 18
  class AutoQos-4.0-Bulk-Data-Classify
set dscp af11
set cos 1
set qos-group 10
class AutoQos-4.0-Scavenger-Classify
set dscp cs1
set cos 1
set qos-group 8
class AutoQos-4.0-Default-Classify
set dscp default
set cos 0

C. Template for egress queue classes along with the SRND4 output policy that uses the egress classes to allocate 8 queues. This template is required by all SRND4 commands:

```
class-map match-all AutoQos-4.0-Priority-Queue
  match qos-group 32
class-map match-all AutoQos-4.0-Control-Mgmt-Queue
  match qos-group 16
class-map match-all AutoQos-4.0-Multimedia-Conf-Queue
  match qos-group 34
class-map match-all AutoQos-4.0-Multimedia-Stream-Queue
  match qos-group 26
class-map match-all AutoQos-4.0-Trans-Data-Queue
  match qos-group 18
class-map match-all AutoQos-4.0-Bulk-Data-Queue
  match qos-group 10
class-map match-any AutoQos-4.0-Scavenger-Queue
  match qos-group 8
  match dscp cs1
```

Because `police` commands executed in policy map configuration mode do not allow the remarking of qos-groups for traffic flows that exceed defined rate limits, you must configure AutoQos-4.0-Scavenger-Queue to match either qos-group 7 or dscp af11. When you enter the `auto qos classify` policy command, traffic flows that violate the defined rate limit are remarked to cs1 but retain their original qos-group classification because qos-groups cannot be remarked as an exceed action. However, because AutoQos-4.0-Scavenger-Queue is defined before all other queues in the output policy map, remarked packets fall into it, despite retaining their original qos-group labels.

```
policy-map AutoQos-4.0-Output-Policy
  bandwidth remaining percent 1
  class AutoQos-4.0-Priority-Queue
    priority
    police cir percent 30 bc 33 ms
      conform-action transmit exceed-action drop
  class AutoQos-4.0-Control-Mgmt-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Conf-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Stream-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Trans-Data-Queue
    bandwidth remaining percent 10
    dbl
  class AutoQos-4.0-Bulk-Data-Queue
    bandwidth remaining percent 4
    dbl
  class class-default
    bandwidth remaining percent 25
    dbl
```
Interface Level Commands Generated
For Fa/Gig Ports:

Switch(config-if)# service-policy input AutoQos-4.0-Classify-Input-Policy
service-policy output AutoQos-4.0-Output-Policy

Examples
This example shows how to generate a QoS configuration for the untrusted interface gigabitethernet1/1:

Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos classify

</tbody>
</table>

**Usage Guidelines**
This command generates a QoS configuration for untrusted interfaces. It places a service-policy to classify the traffic arriving from these untrusted desktops or devices and marks them accordingly. The generated service-policies police and either mark-down or drop packets.

**Global Level Commands Generated**
Auto QoS srn4 commands, once applied to an interface, generate one or more of the following templates (A, B, and C) at the global configuration level. Typically, a command generates a series of class-maps that either match on ACLs or on DSCP or CoS values to differentiate traffic into application classes. An input policy is generated that matches the generated classes, sets qos-groups on the classes, and in some cases, polices the classes to a set bandwidth. (A qos-group is merely a numerical tag that allows different application classes to be treated as one unit. Outside the switch’s context, it has no significance.) Furthermore, eight egress-queue class-maps are generated, matching the qos-groups set in the input policy. The actual egress output policy assigns a queue to each one of these eight egress-queue class-maps.

The commands generate the following templates as needed. For example, on initial use of the a new command, global configurations that define the eight queue egress service-policy are generated (template C, below). Subsequently, auto qos commands applied to other interfaces do not generate templates for egress queuing because all auto qos commands rely on the same eight queue model after migration, and they will have already been generated from the first use of the command.

The global templates are defined in A, B, C.

A. Template for ACLs and application classes used by the auto qos classify police command

class-map match-all AutoQos-4.0-Default-Classify
  match access-group name AutoQos-4.0-ACL-Default

AutoQos-4.0-VoIP-Data-Cos and AutoQos-4.0-VoIP-Signal-Cos are needed to handle the case in which a user connects an IP phone to an interface and calls the auto qos voip cisco-phone command on that interface. In this situation, the input service policy on the interface must match VoIP and signaling packets solely on their CoS markings because switching ASICs on Cisco IP phones are limited to only remarking the CoS bits of VoIP and signaling traffic. Matching DSCP markings would cause a security
vulnerability because user whose PC was connected to an IP phone connected to a switch would be able to re-mark DSCP markings of traffic arising from their PC to dscp ef using the NIC on their PC. This places non real-time traffic in the priority queue in the egress direction.

B. Template for the input service-policy of the `auto qos classify police` command

```
policy-map AutoQos-4.0-Classify-Police-Input-Policy
  class AutoQos-4.0-Multimedia-Conf-Classify
    set dscp af41
    set cos 4
    set qos-group 34
    police cir 5000000 bc 8000
    exceed-action drop
  class AutoQos-4.0-Signaling-Classify
    set dscp cs3
    set cos 3
    set qos-group 16
    police cir 32000 bc 8000
    exceed-action drop
  class AutoQos-4.0-Transaction-Classify
    set dscp af21
    set cos 2
    set qos-group 18
    police cir 1000000 bc 8000
    exceed-action set-dscp-transmit cs1
    exceed-action set-cos-transmit 1
  class AutoQos-4.0-Bulk-Data-Classify
    set dscp af11
    set cos 1
    set qos-group 10
    police cir 1000000 bc 8000
    exceed-action set-dscp-transmit cs1
    exceed-action set-cos-transmit 1
  class AutoQos-4.0-Scavenger-Classify
    set dscp cs1
    set cos 1
    set qos-group 8
    police cir 1000000 bc 8000
    exceed-action drop
  class AutoQos-4.0-Default-Classify
    set dscp default
    set cos 0
    police cir 1000000 bc 8000
    exceed-action set-dscp-transmit cs1
    exceed-action set-cos-transmit 1
```

C. Template for egress queue classes along with the SRND4 output policy that uses the egress classes to allocate eight queues. This template is required by the four SRND4 commands:

```
class-map match-all AutoQos-4.0-Priority-Queue
  match qos-group 32
class-map match-all AutoQos-4.0-Control-Mgmt-Queue
  match qos-group 16
class-map match-all AutoQos-4.0-Multimedia-Conf-Queue
  match qos-group 34
class-map match-all AutoQos-4.0-Multimedia-Stream-Queue
  match qos-group 26
class-map match-all AutoQos-4.0-Trans-Data-Queue
  match qos-group 18
class-map match-all AutoQos-4.0-Bulk-Data-Queue
  match qos-group 10
class-map match-any AutoQos-4.0-Scavenger-Queue
  match qos-group 8
  match dscp cs1
AutoQos-4.0-Scavenger-Queue must be configured to match either qos-group 7 or dscp af11 to accomodate for the fact that police commands executed in policy map configuration mode do not allow the remarking of qos-groups for traffic flows that exceed defined rate limits. After entering the **auto qos classify police** command, traffic flows that violate the defined rate limit are remarked to cs1 but retain their original qos-group classification because qos-groups cannot be remarked as an exceed action. However, because AutoQos-4.0-Scavenger-Queue is defined before all other queues in the output policy map, remarked packets fall into it, despite retaining their original qos-group labels.

```
  policy-map AutoQos-4.0-Output-Policy
    bandwidth remaining percent 1
    class AutoQos-4.0-Priority-Queue
        priority
        police cir percent 30 bc 33 ms
            conform-action transmit exceed-action drop
    class AutoQos-4.0-Control-Mgmt-Queue
        bandwidth remaining percent 10
    class AutoQos-4.0-Multimedia-Conf-Queue
        bandwidth remaining percent 10
    class AutoQos-4.0-Multimedia-Stream-Queue
        bandwidth remaining percent 10
    class AutoQos-4.0-Trans-Data-Queue
        bandwidth remaining percent 10
dbl
    class AutoQos-4.0-Bulk-Data-Queue
        bandwidth remaining percent 4
dbl
    class class-default
        bandwidth remaining percent 25
dbl
```

**Interface Level Commands Generated**

For Fa/Gig Ports:

```
Switch(config-if)#
  service-policy input AutoQos-4.0-Classify-Police-Input-Policy
  service-policy output AutoQos-4.0-Output-Policy
```

**Examples**

This example shows how to police traffic from an untrusted interface gigabitethernet1/1:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos classify police
Switch(config-if)# do sh run interface gigabitethernet1
Interface gigabitethernet1
  auto qos classify police
      service-policy input AutoQos-4.0-Classify-Police-Input-Policy
      service-policy output AutoQos-4.0-Output-Policy
end
```

</tr>
</tbody>
</table>

**Usage Guidelines**
This command is generated when any new auto-QoS command is configured on an interface.

AutoQos SRND4 commands, when applied to an interface, generate one or more of the following templates (A and B) at the global configuration level.

Typically, a command generates a series of class-maps that either match on ACLs or on DSCP and CoS values to differentiate traffic into application classes. An input policy is also generated, which matches the generated classes, sets qos-groups on the classes, and in some cases, polices the classes to a set bandwidth. (A qos-group is a numerical tag that allows different application classes to be treated as one unit. It has no significance outside the context of the switch in which it was set.) Furthermore, eight egress-queue class-maps are generated, matching the qos-groups set in the input policy. The actual egress output policy assigns a queue to each of the eight egress-queue class-maps.

AutoQos srnd4 commands only generate a templates as needed. For example, the first time you use a new srnd4 command, global configurations that define the eight queue egress service-policy are generated (template B below). Subsequently, **auto qos** commands applied to other interfaces do not generate templates for egress queuing because all auto-QoS commands rely on the same eight queue models after migration, and they will have already been generated from the first use of the command.

**For interfaces with auto qos voip trust enabled**

--- Global Level Commands Generated

The global templates are defined in A and B (below).

A. This template of application classes is used by the auto-QoS video cts, **auto qos video ip-camera**, and **auto qos trust** commands. This template class also includes the input service-policy for the **auto qos video cts**, **auto qos video ip-camera**, and **auto qos trust** commands. Because these three commands are the only ones that use AutoQos-4.0-Input-Policy, it makes sense to include that policy in the same template that defines the application classes used by the previous three commands.

```
class-map match-any AutoQos-4.0-VoIP
  match dscp ef
```

  match dscp af11
  match dscp af12
  match dscp af13
class-map match-all AutoQos-4.0-Scavenger
  match dscp cs1

The AutoQos-4.0-Signaling and AutoQos-4.0-VoIP classes must match on CoS to handle the situation when an IP phone is connected to an interface. (Cisco IP phones are only capable of re-marking CoS bits, not DSCP.)

policy-map AutoQos-4.0-Input-Policy
  class AutoQos-4.0-VoIP
    set qos-group 32
  class AutoQos-4.0-Broadcast-Vid
    set qos-group 32
  class AutoQos-4.0-Realtime-Interact
    set qos-group 32
  class AutoQos-4.0-Network-Ctrl
    set qos-group 16
  class AutoQos-4.0-Internetwork-Ctrl
    set qos-group 16
  class AutoQos-4.0-Signaling
    set qos-group 16
  class AutoQos-4.0-Network-Mgmt
    set qos-group 16
  class AutoQos-4.0-Multimedia-Conf
    set qos-group 34
  class AutoQos-4.0-Multimedia-Stream
    set qos-group 26
  class AutoQos-4.0-Transaction-Data
    set qos-group 18
  class AutoQos-4.0-Bulk-Data
    set qos-group 10
  class AutoQos-4.0-Scavenger
    set qos-group 8
B. This template for egress queue classes (along with the SRND4 output policy) allocates eight queues. This template is required by all SRND4 commands:

```
class-map match-all AutoQos-4.0-Priority-Queue
  match qos-group 32
class-map match-all AutoQos-4.0-Control-Mgmt-Queue
  match qos-group 16
class-map match-all AutoQos-4.0-Multimedia-Conf-Queue
  match qos-group 34
class-map match-all AutoQos-4.0-Multimedia-Stream-Queue
  match qos-group 26
class-map match-all AutoQos-4.0-Trans-Data-Queue
  match qos-group 18
class-map match-all AutoQos-4.0-Bulk-Data-Queue
  match qos-group 10
class-map match-any AutoQos-4.0-Scavenger-Queue
  match qos-group 8
  match dscp cs1
```

Because the `police` commands executed in policy map configuration mode do not allow the re-marking of qos-groups for traffic flows that exceed defined rate limits, you should configure AutoQos-4.0-Scavenger-Queue to match either qos-group 7 or dscp af11. When you enter the `auto qos classify police` command, traffic flows that violate the defined rate limit are remarked to cs1 but retain their original qos-group classification because such groups cannot be re-marked as an exceed action. However, because AutoQos-4.0-Scavenger-Queue is defined before all other queues in the output policy map, re-marked packets fall into it, despite retaining their original qos-group labels.

```
policy-map AutoQos-4.0-Output-Policy
  class AutoQos-4.0-Scavenger-Queue
    bandwidth remaining percent 1
  class AutoQos-4.0-Priority-Queue
    priority
    police cir percent 30 bc 33 ms
      conform-action transmit exceed-action drop
  class AutoQos-4.0-Control-Mgmt-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Conf-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Stream-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Trans-Data-Queue
    bandwidth remaining percent 10
dbl
  class AutoQos-4.0-Bulk-Data-Queue
    bandwidth remaining percent 4
  class class-default
    bandwidth remaining percent 25
dbl
```

15.1(1)SG,           Support for this command was introduced on the Catalyst 4500 series
15.1(1)SG IOS-XE 3.3.0 switch.

Usage Guidelines

Global Level Commands Generated

After you apply auto-QoS srnd4 commands to an interface, they generate one or more of the following templates (A and B) at the global configuration level. Typically, a command generates a series of class-maps that either match on ACLs or on DSCP or CoS values to differentiate traffic into application classes. An input policy is generated, which matches the generated classes, sets qos-groups on the classes, and in some cases, polices the classes to a set bandwidth. (A qos-group is simply a numerical tag that allows different application classes to be treated as one unit. Outside the switch’s context, it has no significance.) Additionally, eight egress-queue class-maps are generated, matching the qos-groups set in the input policy. The actual egress output policy assigns a queue to each of these eight class-maps.

The command only generates templates as needed. For example, on first use of a new command, global configurations that define the eight queue egress service-policy are generated. Subsequently, auto-QoS commands applied to other interfaces do not generate templates for egress queuing. This is because all auto-qos commands rely on the same eight queue models after migration, and they will have already been generated from the first use of the command.

The global templates defined in A and B.

A. Template of application classes used by the auto qos trust command

This template also includes the input service-policy for the auto qos video cts, auto qos video ip-camera, and auto qos trust commands. Because these three commands are the only ones that use the AutoQos-4.0-Input-Policy, you should include that policy in the template that defines the application classes used by the commands.

```plaintext
class-map match-any AutoQos-4.0-VoIP
  match dscp ef
  match cos 5
class-map match-all AutoQos-4.0-Broadcast-Vid
  match dscp cs5
class-map match-all AutoQos-4.0-Realtime-Interact
  match dscp cs4
```
class-map match-all AutoQos-4.0-Network-Ctrl
  match dscp cs7
class-map match-all AutoQos-4.0-Internetwork-Ctrl
  match dscp cs6
class-map match-any AutoQos-4.0-Signaling
  match dscp cs3
  match cos 3
class-map match-all AutoQos-4.0-Network-Mgmt
  match dscp cs2
class-map match-any AutoQos-4.0-Multimedia-Conf
  match dscp af41
  match dscp af42
  match dscp af43
class-map match-any AutoQos-4.0-Multimedia-Stream
  match dscp af31
  match dscp af32
  match dscp af33
class-map match-any AutoQos-4.0-Transaction-Data
  match dscp af21
  match dscp af22
  match dscp af23
class-map match-any AutoQos-4.0-Bulk-Data
  match dscp af11
  match dscp af12
  match dscp af13
class-map match-all AutoQos-4.0-Scavenger
  match dscp cs1

The AutoQos-4.0-Signaling and AutoQos-4.0-VoIP classes must also match on CoS to handle the case when an IP phone is connected to an interface. (Cisco IP phones are only capable of remarking CoS bits, not DSCP.)

policy-map AutoQos-4.0-Input-Policy
class AutoQos-4.0-VoIP
  set qos-group 32
class AutoQos-4.0-Broadcast-Vid
  set qos-group 32
class AutoQos-4.0-Realtime-Interact
  set qos-group 32
class AutoQos-4.0-Network-Ctrl
  set qos-group 16
class AutoQos-4.0-Internetwork-Ctrl
  set qos-group 16
class AutoQos-4.0-Signaling
  set qos-group 16
class AutoQos-4.0-Network-Mgmt
  set qos-group 16
class AutoQos-4.0-Multimedia-Conf
  set qos-group 34
class AutoQos-4.0-Multimedia-Stream
  set qos-group 26
class AutoQos-4.0-Transaction-Data
  set qos-group 18
class AutoQos-4.0-Bulk-Data
  set qos-group 10
class AutoQos-4.0-Scavenger
  set qos-group 8

B. Templates for egress queue classes and the srnd4 output policy that uses the egress classes to allocate eight queues. This template is required by all srnd4 commands.

class-map match-all AutoQos-4.0-Priority-Queue
  match qos-group 32
class-map match-all AutoQos-4.0-Control-Mgmt-Queue
Because `police` commands executed in policy map configuration mode do not allow the remarking of qos-groups for traffic flows that exceed defined rate limits, `AutoQos-4.0-Scavenger-Queue` must be configured to match either qos-group 7 or dscp af11. When the `auto qos classify police` command executes, traffic flows that violate the defined rate limit are remarked to cs1 but retain their original qos-group classification. This is because qos-groups cannot be remarked as an exceed action. However, because `AutoQos-4.0-Scavenger-Queue` is defined before all other queues in the output policy map, remarked packets will fall into it, despite retaining their original qos-group labels.

```
policy-map AutoQos-4.0-Output-Policy
  class AutoQos-4.0-Scavenger-Queue
    bandwidth remaining percent 1
  class AutoQos-4.0-Priority-Queue
    priority
    police cir percent 30 bc 33 ms
      conform-action transmit exceed-action drop
  class AutoQos-4.0-Control-Mgmt-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Conf-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Stream-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Trans-Data-Queue
    bandwidth remaining percent 10
dbl
  class AutoQos-4.0-Bulk-Data-Queue
    bandwidth remaining percent 4
dbl
  class class-default
    bandwidth remaining percent 25
```

### Interface Level Commands Generated

For Fa/Gig Ports:

```
Switch(config-if)# service-policy input AutoQos-4.0-Input-Policy
service-policy output AutoQos-4.0-Output-Policy
```

### Examples

This example shows how to police traffic from an untrusted interface gigabitethernet1/1:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos trust
Switch(config-if)# do sh running interface interface-id
interface FastEthernet2/1
  auto qos trust
  service-policy input AutoQos-4.0-Input-Policy
  service-policy output AutoQos-4.0-Output-Policy
end
```

</table>

**Usage Guidelines**

The `auto qos video` command trusts an interface only if Cisco TelePresence is detected. Else, the port is untrusted.

**Global Level Commands Generated**

When auto-Qos srnd4 commands are applied to an interface, they generate one or more of the following templates at the global configuration level. Typically, a command generates a series of class-maps that either match on ACLs or on DSCP (or CoS) values to differentiate traffic into application classes. An input policy is also generated, which matches the generated classes, sets qos-groups on the classes, and in some cases, polices the classes to a set bandwidth. (A qos-group is simply a numerical tag that allows different application classes to be treated as one unit. Outside the switch’s context, it has no significance.) Furthermore, eight egress-queue class-maps are generated, which match the qos-groups set in the input policy. The actual egress output policy assigns a queue to each of the eight egress-queue class-maps.

The srnd4 commands generate the templates only as needed. For example, on first use of the new command, global configurations that define the eight queue egress service-policy are generated. Subsequently, auto-QoS commands applied to other interfaces do not generate templates for egress queuing. This is because all auto-QoS commands rely on the same eight queue model after migration, already generated on first use of the command.

The global templates defined in A and B.

A. Template of application classes used by the `auto qos video` command

This template also includes the input service-policy for the `auto qos video cts`, `auto qos video ip-camera`, and `auto qos trust` commands. Because these three commands are the only ones that use the AutoQos-4.0-Input-Policy, we advise that you include that policy in the same template that defines the application classes used by the commands.
class-map match-any AutoQos-4.0-VoIP
  match dscp ef
  match cos 5
class-map match-all AutoQos-4.0-Broadcast-Vid
  match dscp cs5
class-map match-all AutoQos-4.0-Realtime-Interact
  match dscp cs4
class-map match-all AutoQos-4.0-Network-Ctrl
  match dscp cs7
class-map match-all AutoQos-4.0-Internetwork-Ctrl
  match dscp cs6
class-map match-any AutoQos-4.0-Signaling
  match dscp cs3
  match cos 3
class-map match-all AutoQos-4.0-Network-Mgmt
  match dscp cs2
class-map match-any AutoQos-4.0-Multimedia-Conf
  match dscp af41
  match dscp af42
  match dscp af43
class-map match-any AutoQos-4.0-Multimedia-Stream
  match dscp af31
  match dscp af32
  match dscp af33
class-map match-any AutoQos-4.0-Transaction-Data
  match dscp af21
  match dscp af22
  match dscp af23
class-map match-any AutoQos-4.0-Bulk-Data
  match dscp af11
  match dscp af12
  match dscp af13
class-map match-all AutoQos-4.0-Scavenger
  match dscp cs1

The AutoQos-4.0-Signaling and AutoQos-4.0-VoIP classes must also match on CoS to the case where an IP phone is connected to an interface. (Cisco IP phones are only capable of remarking CoS bits, not DSCP.)

policy-map AutoQos-4.0-Input-Policy
  class AutoQos-4.0-VoIP
    set qos-group 32
  class AutoQos-4.0-Broadcast-Vid
    set qos-group 32
  class AutoQos-4.0-Realtime-Interact
    set qos-group 32
  class AutoQos-4.0-Network-Ctrl
    set qos-group 16
  class AutoQos-4.0-Internetwork-Ctrl
    set qos-group 16
  class AutoQos-4.0-Signaling
    set qos-group 16
  class AutoQos-4.0-Network-Mgmt
    set qos-group 16
  class AutoQos-4.0-Multimedia-Conf
    set qos-group 34
  class AutoQos-4.0-Multimedia-Stream
    set qos-group 26
  class AutoQos-4.0-Transaction-Data
    set qos-group 18
  class AutoQos-4.0-Bulk-Data
    set qos-group 10
  class AutoQos-4.0-Scavenger
    set qos-group 8
B. Template for egress queue classes and the srnd4 output policy that uses the egress classes to allocate eight queues. This template is required by all srnd commands:

```
class-map match-all AutoQos-4.0-Priority-Queue
    match qos-group 32
class-map match-all AutoQos-4.0-Control-Mgmt-Queue
    match qos-group 16
class-map match-all AutoQos-4.0-Multimedia-Conf-Queue
    match qos-group 34
class-map match-all AutoQos-4.0-Multimedia-Stream-Queue
    match qos-group 26
class-map match-all AutoQos-4.0-Trans-Data-Queue
    match qos-group 18
class-map match-all AutoQos-4.0-Bulk-Data-Queue
    match qos-group 10
class-map match-any AutoQos-4.0-Scavenger-Queue
    match qos-group 8
    match dscp cs1
```

Because `police` commands executed in policy map configuration mode do not allow the remarking of qos-groups for traffic flows that exceed defined rate limits, AutoQos-4.0-Scavenger-Queue must be configured to match either qos-group 7 or dscp af11. When the `auto qos classify police` command has been executed, traffic flows that violate the defined rate limit are remarked to cs1 but retain their original qos-group classification because qos-groups cannot be remarked as an exceed action. However, because AutoQos-4.0-Scavenger-Queue is defined before all other queues in the output policy map, remarked packets will fall into it, despite retaining their original qos-group labels.

```
policy-map AutoQos-4.0-Output-Policy
    class AutoQos-4.0-Scavenger-Queue
        bandwidth remaining percent 1
        priority
        police cir percent 30 bc 33 ms
            conform-action transmit exceed-action drop
    class AutoQos-4.0-Priority-Queue
        bandwidth remaining percent 10
    class AutoQos-4.0-Control-Mgmt-Queue
        bandwidth remaining percent 10
    class AutoQos-4.0-Multimedia-Conf-Queue
        bandwidth remaining percent 10
    class AutoQos-4.0-Multimedia-Stream-Queue
        bandwidth remaining percent 10
    class AutoQos-4.0-Trans-Data-Queue
        bandwidth remaining percent 10
dbl
    class AutoQos-4.0-Bulk-Data-Queue
        bandwidth remaining percent 4
dbl
    class class-default
        bandwidth remaining percent 25
```

**Interface Level Commands Generated**

For Fa/Gig Ports:

```
Switch(config-if)# service-policy input AutoQos-4.0-Input-Policy
Switch(config-if)# service-policy output AutoQos-4.0-Output-Policy
```

**Examples**

This example shows how to generate a QoS configuration on the cisco-telepresence interface gigabitethernet1/1:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos video cts
```
Switch(config-if)# do sh running interface gigabitethernet1/1
interface interface-id
  auto qos video cts
  qos trust device cts
  service-policy input AutoQos-4.0-Input-Policy
  service-policy output AutoQos-4.0-Output-Policy
end

This example shows how to generate QoS configuration for the cisco-camera interface gigabitethernet1/1:

Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos video ip-camera
Switch(config-if)# do sh running interface interface-id
interface interface-id
  auto qos video ip-camera
  qos trust device ip-camera
  service-policy input AutoQos-4.0-Input-Policy
  service-policy output AutoQos-4.0-Output-Policy
end

<table>
<thead>
<tr>
<th>Usage Guidelines</th>
<th>Use this command to configure a QoS that is appropriate for VoIP traffic within the QoS domain, which includes the switch, the interior of the network, and the edge devices that can classify incoming traffic for QoS.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Apply the <code>cisco-phone</code> keyword on those ports (at the edge of the network) that are connected to Cisco IP phones. The switch detects the telephone through Cisco Discovery Protocol (CDP) and trusts those CoS labels in packets that are received from the telephone.</td>
</tr>
<tr>
<td></td>
<td>Apply the <code>trust</code> keyword on those ports that are connected to the interior of the network. Assume that the traffic has already been classified by the other edge devices. So, the CoS/DSCP labels in these packets are trusted.</td>
</tr>
<tr>
<td></td>
<td>When you enable the auto-QoS feature on the specified interface, these actions automatically occur:</td>
</tr>
<tr>
<td></td>
<td>• QoS is globally enabled (<code>qos global configuration command</code>).</td>
</tr>
<tr>
<td></td>
<td>• DBL is enabled globally (<code>qos db1 global configuration command</code>).</td>
</tr>
<tr>
<td></td>
<td>• When you enter the <code>auto qos voip cisco-phone</code> interface configuration command, the trusted boundary feature is enabled. It uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP phone. When a Cisco IP phone is detected, the ingress classification on the specific interface is set to trust the CoS label that is received in the packet because some older phones do not mark DSCP. When a Cisco IP phone is absent, the ingress classification is set to not trust the CoS label in the packet.</td>
</tr>
</tbody>
</table>
When you enter the `auto qos voip trust` interface configuration command, the ingress classification on the specified interface is set to trust the CoS label that is received in the packet provided the specified interface is configured as Layer 2 (and is set to trust DSCP if the interface is configured as Layer 3).

You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging (before you enable auto-QoS) with the `debug auto qos` privileged EXEC command.

To disable auto-QoS on an interface, use the `no auto qos voip` interface configuration command. When you enter this command, the switch enables standard QoS and changes the auto-QoS settings to the standard QoS default settings for that interface. This action will not change any global configuration performed by auto-QoS; the global configuration remains the same.

### Examples

This example shows how to enable auto-QoS and to trust the CoS and DSCP labels that are received in the incoming packets when the switch or router that is connected to Gigabit Ethernet interface 1/1 is a trusted device:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip trust
```

This example shows how to enable auto-QoS and to trust the CoS labels that are received in incoming packets when the device connected to Fast Ethernet interface 2/1 is detected as a Cisco IP phone:

```
Switch(config)# interface fastethernet2/1
Switch(config-if)# auto qos voip cisco-phone
```

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled on an interface on a Supervisor Engine 6-E:

```
Switch(config)# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet3/10
Switch(config-if)# auto qos voip trust
Switch(config-if)#
1d03h: service-policy input AutoQos-VoIP-Input-Cos-Policy
1d03h: service-policy output AutoQos-VoIP-Output-Policy
Switch(config-if)#
Switch(config-if)# interface gigabitethernet3/11
Switch(config-if)# auto qos voip cisco-phone
Switch(config-if)#
1d03h: qos trust device cisco-phone
1d03h: service-policy input AutoQos-VoIP-Input-Cos-Policy
1d03h: service-policy output AutoQos-VoIP-Output-Policy
Switch(config-if)#
Switch(config-if)#
```

You can verify your settings by entering the `show auto qos interface` command.

**auto qos voip cisco-softphone**

To generate QoS configuration for interfaces connected to PCs running the Cisco IP SoftPhone application and mark police traffic coming from such interfaces, use the `auto qos voip` interface configuration command.

```
auto qos voip cisco-softphone
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

Release | Modification
---|---
15.1(1)SG | Support for this command was introduced on the Catalyst 4500 series switch.
15.1(1)SG IOS-XE 3.3.0 |

**Usage Guidelines**

Ports configured with `auto qos voip` command are considered untrusted.

**Global Level Commands Generated**

After auto-QoS smd4 commands are applied to an interface, they generate one or more of the following templates (A, B, and C) at the global configuration level. Typically, a command generates a series of class-maps that either match on ACLs or on DSCP (or CoS) values to differentiate traffic into application classes. An input policy is also generated, which matches the generated classes, sets qos-groups on the classes, and in some cases, polices the classes to a set bandwidth. (A qos-group is a numerical tag that allows different application classes to be treated as one unit. Outside the switch’s context, it has no significance.) Furthermore, eight egress-queue class-maps are generated, matching the qos-groups set in the input policy. The actual egress output policy assigns a queue to each of these eight class-maps.

The commands generate templates only as needed. For example, on first use of a new command, global configurations that define the eight queue egress service-policy are generated. Subsequently, auto-QoS applied to other interfaces do not generate templates for egress queuing. This is because all auto-QoS commands rely on the same eight queue models after migration, already been generated from the first use of the new command.

The global template is defined by A, B, and C.

A. Template for ACLs and application classes used by the `auto qos voip cisco-softphone` command

```
ip access-list extended AutoQos-4.0-ACL-Multimedia-Conf
    permit udp any any range 16384 32767

ip access-list extended AutoQos-4.0-ACL-Default
  permit ip any any

class-map match-any AutoQos-4.0-VoIP-Data
  match dscp ef
  match cos 5
class-map match-all AutoQos-4.0-VoIP-Data-Cos
  match cos 5
class-map match-any AutoQos-4.0-VoIP-Signal
  match dscp cs3
  match cos 3
class-map match-all AutoQos-4.0-VoIP-Signal-Cos
  match cos 3
class-map match-all AutoQos-4.0-Multimedia-Conf-Classify
  match access-group name AutoQos-4.0-ACL-Multimedia-Conf
class-map match-all AutoQos-4.0-Signaling-Classify
  match access-group name AutoQos-4.0-ACL-Signaling
class-map match-all AutoQos-4.0-Transaction-Classify
  match access-group name AutoQos-4.0-ACL-Transactional-Data
class-map match-all AutoQos-4.0-Bulk-Data-Classify
  match access-group name AutoQos-4.0-ACL-Bulk-Data
class-map match-all AutoQos-4.0-Scavenger-Classify
  match access-group name AutoQos-4.0-ACL-Scavenger
class-map match-all AutoQos-4.0-Default-Classify
  match access-group name AutoQos-4.0-ACL-Default

AutoQos-4.0-VoIP-Data-Cos and AutoQos-4.0-VoIP-Signal-Cos handles those instances when a user connects an IP phone to an interface and enters the `auto qos voip cisco-softphone` command on that interface. In this situation, the input service policy on the interface must match VoIP and signaling packets based solely on their CoS markings because switching ASICs on Cisco IP Phones are limited to only remarking the CoS bits of VoIP and signaling traffic. Matching DSCP markings would result in a security vulnerability because a user whose PC was connected to an IP phone connected to a switch
would be able to remark DSCP markings of traffic arriving from their PC to DSCP ef using the NIC on their PC. This results in incorrectly placing non real-time traffic in the priority queue in the egress direction.

B. Template for the `auto qos voip cisco-softphone` command input service-policy

```plaintext
policy-map AutoQos-4.0-Cisco-Softphone-Input-Policy
class AutoQos-4.0-VoIP-Data
set dscp ef
set cos 5
set qos-group 32
police cir 128000 bc 8000
exceed-action set-dscp-transmit cs1
exceed-action set-cos-transmit 1
    class AutoQos-4.0-VoIP-Signal
    set dscp cs3
    set cos 3
    set qos-group 16
    police cir 32000 bc 8000
    exceed-action set-dscp-transmit cs1
    exceed-action set-cos-transmit 1
    class AutoQos-4.0-Multimedia-Conf-Classify
    set dscp af41
    set cos 4
    set qos-group 34
    police cir 5000000 bc 8000
    exceed-action drop
    class AutoQos-4.0-Signaling-Classify
    set dscp cs3
    set cos 3
    set qos-group 16
    police cir 32000 bc 8000
    exceed-action drop
    class AutoQos-4.0-Transaction-Classify
    set dscp af21
    set cos 2
    set qos-group 18
    police cir 10000000 bc 8000
    exceed-action set-dscp-transmit cs1
    exceed-action set-cos-transmit 1
    class AutoQos-4.0-Bulk-Data-Classify
    set dscp af11
    set cos 1
    set qos-group 10
    police cir 10000000 bc 8000
    exceed-action set-dscp-transmit cs1
    exceed-action set-cos-transmit 1
    class AutoQos-4.0-Scavenger-Classify
    set dscp cs1
    set cos 1
    set qos-group 8
    police cir 10000000 bc 8000
    exceed-action drop
    class AutoQos-4.0-Default-Classify
    set dscp default
    set cos 0
```

C. Template for egress queue classes and the srnd4 output policy that uses the egress classes to allocate eight queues. This template is required by all srnd4 commands:

```plaintext
class-map match-all AutoQos-4.0-Priority-Queue
match qos-group 32
class-map match-all AutoQos-4.0-Control-Mgmt-Queue
match qos-group 16
```
class-map match-all AutoQos-4.0-Multimedia-Conf-Queue
  match qos-group 34
class-map match-all AutoQos-4.0-Multimedia-Stream-Queue
  match qos-group 26
class-map match-all AutoQos-4.0-Trans-Data-Queue
  match qos-group 18
class-map match-all AutoQos-4.0-Bulk-Data-Queue
  match qos-group 10
class-map match-any AutoQos-4.0-Scavenger-Queue
  match qos-group 8
  match dscp cs1

Because the `police` commands executed in policy map configuration mode do not allow remarking of qos-groups for traffic flows that exceed defined rate limits, AutoQos-4.0-Scavenger-Queue must be configured to match either qos-group 7 or dscp af11. When the `auto qos classify police` command has been executed, traffic flows that violate the defined rate limit are remarked to cs1 but retain their original qos-group classification because qos-groups cannot be remarked as an exceed action. However, because AutoQos-4.0-Scavenger-Queue is defined before all other queues in the output policy map, remarked packets will fall into it, despite retaining their original qos-group labels.

```plaintext
policy-map AutoQos-4.0-Output-Policy
  class AutoQos-4.0-Scavenger-Queue
    bandwidth remaining percent 1
  class AutoQos-4.0-Priority-Queue
    priority
    police cir percent 30 bc 33 ms
    conform-action transmit exceed-action drop
  class AutoQos-4.0-Control-Mgmt-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Conf-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Multimedia-Stream-Queue
    bandwidth remaining percent 10
  class AutoQos-4.0-Trans-Data-Queue
    bandwidth remaining percent 10
dbl
  class AutoQos-4.0-Bulk-Data-Queue
    bandwidth remaining percent 4
dbl
  class class-default
    bandwidth remaining percent 25
dbl
```

### Interface Level Commands Generated

For Fa/Gig Ports:

```plaintext
Switch(config-if)##
  service-policy input AutoQos-4.0-Cisco-Softphone-Input-Policy
  service-policy input AutoQos-4.0-Output-Policy
```

### Examples

This example shows how to generate QoS configuration for interfaces Gigabit Ethernet 1/1 connected to a PC that is running the Cisco IP SoftPhone application:

```plaintext
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip cisco-softphone
Switch(config-if)# do sh running interface gigabitethernet1/1
interface gigabitethernet1/1
  auto qos voip cisco-phone
  qos trust device cisco-phone
```

auto-sync

To enable automatic synchronization of the configuration files in NVRAM, use the `auto-sync` command. To disable automatic synchronization, use the `no` form of this command.

```
auto-sync {startup-config | config-register | bootvar | standard}
```

```
no auto-sync {startup-config | config-register | bootvar | standard}
```

**Syntax Description**

- **startup-config**: Specifies automatic synchronization of the startup configuration.
- **config-register**: Specifies automatic synchronization of the configuration register configuration.
- **bootvar**: Specifies automatic synchronization of the BOOTVAR configuration.
- **standard**: Specifies automatic synchronization of the startup configuration, BOOTVAR, and configuration registers.

**Defaults**

Standard automatic synchronization of all configuration files

**Command Modes**

Redundancy main-cpu mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the `no auto-sync standard` command, no automatic synchronizations occur.

**Examples**

This example shows how (from the default configuration) to enable automatic synchronization of the configuration register in the main CPU:

```
Switch# config terminal
Switch (config)# redundancy
Switch (config-r)# main-cpu
Switch (config-r-mc)# no auto-sync standard
Switch (config-r-mc)# auto-sync config-register
Switch (config-r-mc)#
```

</tr>
</tbody>
</table>
average-packet-size (netflow-lite monitor submode)

Note

NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify the average packet size at the observation point in netflow-lite monitor submode, use the `average-packet-size` command. To delete a sampler, use the `no` form of this command.

```
average-packet-size average-packet-size
no average-packet-size average-packet-size
```

Syntax Description

`average-packet-size` Specifies the average packet size in bytes expected at the observation point.

Defaults

0 bytes

Command Modes

netflow-lite exporter submode

Command History

```
Release       Modification
15.0(2)SG      Support for this command was introduced on the Catalyst 4500 series switch.
```

Usage Guidelines

You can enter this command in physical port interface mode, port channel interface, or config VLAN mode.

The packet sampling mechanism attempts random 1-in-N sampling. Internally, 2 levels of sampling are performed. The accuracy of the first sampling level depends on the size of the packets arriving at a given interface. Use the `average-packet-size` parameter to tune the accuracy of the algorithm.

The system automatically determines the average packet size at an interface based on observation of input traffic and uses that value in its first level of sampling.

The algorithm requires a range of packet sizes from 64 to 9216 bytes. A value of 0 means that you want an automatic determination of average packet size.

Examples

The following example shows how to configure a monitor on a port interface Gigabit 1/3:

```
Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)# exit
```
average-packet-size (netflow-lite monitor submode)

Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
  Netflow-lite Monitor-1:
    Active:               TRUE
    Sampler:              sampler1
    Exporter:             exporter1
    Average Packet Size:  0

Statistics:
  Packets exported:     0
  Packets observed:     0
  Packets dropped:      0
  Average Packet Size observed: 64
  Average Packet Size used: 64

You can verify your settings with the show netflow-lite exporter privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sampler (netflow-lite monitor submode)</td>
<td>Activates sampling on an interface in netflow-lite monitor submode.</td>
</tr>
<tr>
<td>exporter (netflow-lite monitor submode)</td>
<td>Assigns an exporter in netflow-lite monitor submode.</td>
</tr>
</tbody>
</table>
bandwidth

To specify or modify the minimum bandwidth provided to a class belonging to a policy map attached to a physical port, use the bandwidth policy-map class command. To return to the default setting, use the no form of this command.

```
bandwidth { bandwidth-kbps | percent percent | remaining percent percent }

no bandwidth
```

Syntax Description

- `bandwidth-kbps` Amount of bandwidth in kbps assigned to the class. The range is 32 to 16000000.
- `percent percent` Percentage of available bandwidth assigned to the parent class. The range is 1 to 100.
- `remaining percent percent` Percentage of remaining bandwidth assigned to parent class. The range is 1 to 100. This command is supported only when priority queuing class is configured, and the priority queuing class is not rate-limited.

Defaults

No bandwidth is specified.

Command Modes

Policy-map class configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the bandwidth command only in a policy map attached to a physical port.

The bandwidth command specifies the minimum bandwidth for traffic in that class when there is traffic congestion in the switch. If the switch is not congested, the class receives more bandwidth than you specify with this command.

When queuing class is configured without any explicit bandwidth configuration, since the queue is not guaranteed any minimum bandwidth, this queue will get a share of any unallocated bandwidth on the port.

If there is no unallocated bandwidth for the new queue or if the unallocated bandwidth is not sufficient to meet the minimum configurable rate for all queues which do not have any explicit bandwidth configuration, then the policy association is rejected.

These restrictions apply to the bandwidth command:

- If the percent keyword is used, the sum of the class bandwidth percentages within a single policy map cannot exceed 100 percent. Percentage calculations are based on the bandwidth available on the port.
The amount of bandwidth configured should be large enough to accommodate Layer 2 overhead.

A policy map can have all the class bandwidths specified in either kbps or in percentages, but not a mix of both.

**Examples**

This example shows how to set the minimum bandwidth to 2000 kbps for a class called `silver-class`. The class already exists in the switch configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map polmap6
Switch(config-pmap)# class silver-class
Switch(config-pmap-c)# bandwidth 2000
Switch(config-pmap-c)# end
```

This example shows how to guarantee 30 percent of the bandwidth for `class1` and 25 percent of the bandwidth for `class2` when CBWFQ is configured. A policy map with two classes is created and is then attached to a physical port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# bandwidth percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# bandwidth percent 25
Switch(config-pmap-c)# exit
Switch(config-pmap)# end
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy input policy1
Switch(config-if)# end
```

This example shows how bandwidth is guaranteed if low-latency queueing (LLQ) and bandwidth are configured. In this example, LLQ is enabled in a class called `voice1`.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# bandwidth remaining percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# bandwidth remaining percent 25
Switch(config-pmap-c)# exit
Switch(config-pmap)# class voice1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# end
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

call-home (global configuration)

To enter call home configuration submode, use the call-home command in global configuration mode.

```
call-home
```

Syntax Description
This command has no arguments or keywords.

Command Default
This command has no default settings.

Command Modes
Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on Supervisor Engine 6E and the Catalyst 4900M.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Once you enter the call-home command, the prompt changes to Switch (cfg-call-home)#, and you have access to the call home configuration commands as follows:

- **alert-group**—Enables or disables an alert group. See the alert-group command.
- **contact-email-addr email-address**—Assigns the system contact’s e-mail address. You can enter up to 128 alphanumeric characters in e-mail address format with no spaces.
- **contract-id alphanumeric**—Specifies the customer contract identification for Cisco AutoNotification. You can enter up to 64 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (" ").
- **copy profile source-profile target-profile**—Creates a new destination profile (target-profile) with the same configuration settings as the existing profile (source-profile).
- **customer-id name**—Provides customer identification for Cisco AutoNotify. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (" ").
- **default**—Sets a command to its defaults.
- **exit**—Exits call home configuration mode and returns to global configuration mode.
- **mail-server {ipv4-address | name} priority priority**—Assigns the customer’s e-mail server address and relative priority. You can enter an IP address or a fully qualified domain name (FQDN), and assign a priority from 1 (highest) to 100 (lowest).

You can define backup e-mail servers by repeating the mail-server command and entering different priority numbers.

- **no**—Negates a command or set its defaults.
- **phone-number +phone-number**—Specifies the phone number of the contact person. The phone-number value must begin with a plus (+) prefix, and may contain only dashes (-) and numbers. You can enter up to 16 characters. If you include spaces, you must enclose your entry in quotes (" ").
- **profile name**—Enters call-home profile configuration mode. See the `profile` command.
- **rate-limit threshold**—Configures the call-home message rate-limit threshold; valid values are from 1 to 60 messages per minute.
- **sender [from | reply-to] email-address**—Specifies the call-home message sender’s e-mail addresses. You can enter up to 128 alphanumeric characters in e-mail address format with no spaces.
- **site-id alphanumeric**—Specifies the site identification for Cisco AutoNotify. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (“ ”).
- **street-address street-address**—Specifies the street address for the RMA part shipments. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (“ ”).
- **vrf**—Specifies the VPN routing or forwarding instance name; limited to 32 characters.

**Examples**

This example shows how to configure the contact information:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# call-home
Switch(config-call-home)# contact-email-addr username@example.com
Switch(config-call-home)# phone-number +1-800-555-4567
Switch(config-call-home)# street-address “1234 Picaboo Street, Any city, Any state, 12345”
Switch(config-call-home)# customer-id Customer1234
Switch(config-call-home)# site-id Site1ManhattanNY
Switch(config-call-home)# contract-id Company1234
Switch(config-call-home)# exit
Switch(config)#
```

This example shows how to configure the call-home message rate-limit threshold:

```
Switch(config)# call-home
Switch(config-call-home)# rate-limit 50
```

This example shows how to set the call-home message rate-limit threshold to the default setting:

```
Switch(config)# call-home
Switch(config-call-home)# default rate-limit
```

This example shows how to create a new destination profile with the same configuration settings as an existing profile:

```
Switch(config)# call-home
Switch(config-call-home)# copy profile profile1 profile1a
```

This example shows how to configure the general e-mail parameters, including a primary and secondary e-mail server:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# call-home
Switch(config-call-home)# mail-server smtp.example.com priority 1
Switch(config-call-home)# mail-server 192.168.0.1 priority 2
Switch(config-call-home)# sender from username@example.com
Switch(config-call-home)# sender reply-to username@example.com
Switch(config-call-home)# exit
Switch(config)#
```
This example shows how to specify MgmtVrf as the vrf name where the call-home email message is forwarded:

```
Switch(cfg-call-home)# vrf MgmtVrf
```

### Related Commands

call-home request

To submit information about your system to Cisco for report and analysis information from the Cisco Output Interpreter tool, use the **call-home request** command in privileged EXEC mode. An analysis report is sent by Cisco to a configured contact e-mail address.

```
call-home request { output-analysis "show-command" | config-sanity | bugs-list | command-reference | product-advisory } [ profile name ] [ ccoid user-id ]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>output-analysis</td>
<td>Sends the output of the specified CLI show command for analysis. The show command must be contained in quotes (&quot; &quot;).</td>
</tr>
<tr>
<td>config-sanity</td>
<td>Specifies the type of report requested. Based on this keyword, the output of a predetermined set of commands such as the show running-config all, show version, and show module (standalone) or show module switch all (VS system) commands, is sent to Cisco for analysis.</td>
</tr>
<tr>
<td>bugs-list</td>
<td></td>
</tr>
<tr>
<td>command-reference</td>
<td></td>
</tr>
<tr>
<td>product-advisory</td>
<td></td>
</tr>
<tr>
<td>profile name</td>
<td>(Optional) Specifies an existing profile to which the request is sent. If no profile is specified, the request is sent to the Cisco TAC profile.</td>
</tr>
<tr>
<td>ccoid user-id</td>
<td>(Optional) Specifies the identifier of a registered Smart Call Home user. If a user-id is specified, the resulting analysis report is sent to the e-mail address of the registered user. If no user-id is specified, the report is sent to the contact e-mail address of the device.</td>
</tr>
</tbody>
</table>

### Command Default

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on Supervisor Engine 6E and the Catalyst 4900M.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The recipient profile does not need to be enabled for the call-home request. The profile should specify the e-mail address where the transport gateway is configured so that the request message can be forwarded to the Cisco TAC and the user can receive the reply from the Smart Call Home service.

Based on the keyword specifying the type of report requested, the following information is returned in response to the request:

- **config-sanity**—Information on best practices as related to the current running configuration.
- **bugs-list**—Known bugs in the running version and in the currently applied features.
- **command-reference**—Reference links to all commands in the running configuration.
- **product-advisory**—Product Security Incident Response Team (PSIRT) notices, End of Life (EOL) or End of Sales (EOS) notices, or field notices (FN) that may affect devices in your network.
Examples

This example shows a request for analysis of a user-specified show command:

Switch# call-home request output-analysis "show diagnostic result module all" profile TG

</tbody>
</table>
**call-home send**

To execute a CLI command and e-mail the command output, use the `call-home send` command in privileged EXEC mode.

```
call-home send "cli-command" {email email-addr [service-number SR] | service-number SR}
```

**Syntax Description**

- **“cli-command”** Specifies a CLI command to be executed. The command output is sent by e-mail.
- **email email-addr** Specifies the e-mail address to which the CLI command output is sent. If no e-mail address is specified, the command output is sent to the Cisco TAC at attach@cisco.com.
- **service-number SR** Specifies an active TAC case number to which the command output pertains. This number is required only if no e-mail address (or a TAC e-mail address) is specified, and will appear in the e-mail subject line.

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on Supervisor Engine 6E and the Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command causes the specified CLI command to be executed on the system. The specified CLI command must be enclosed in quotes (""), and can be any run or show command, including commands for all modules.

The command output is then sent by e-mail to the specified e-mail address. If no e-mail address is specified, the command output is sent to the Cisco TAC at attach@cisco.com. The e-mail is sent in long text format with the service number, if specified, in the subject line.

**Examples**

This example shows how to send a CLI command and have the command output e-mailed:

```
switch# call-home send "show diagnostic result module all" email support@example.com
```

**Related Commands**

- **call-home (global configuration)** Enters call home configuration mode.
- **call-home send alert-group** Sends a specific alert group message.
- **service call-home** (refer to Cisco IOS documentation) Enables or disables Call Home.
- **show call-home** Displays call-home configuration information.
call-home send alert-group

To send a specific alert group message, use the `call-home send alert-group` command in privileged EXEC mode.

```
call-home send alert-group {configuration | diagnostic module number | inventory} [profile profile-name]
```

**Syntax Description**

- **configuration**: Sends the configuration alert-group message to the destination profile.
- **diagnostic module number**: Sends the diagnostic alert-group message to the destination profile for a specific module number.
- **inventory**: Sends the inventory call-home message.
- **profile profile-name** (Optional) Specifies the name of the destination profile.

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on Supervisor Engine 6E and the Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the module number, you can enter the number of the module. If you do not specify the `profile profile-name`, the message is sent to all subscribed destination profiles. Only the configuration, diagnostic, and inventory alert groups can be manually sent. The destination profile need not be subscribed to the alert group.

**Examples**

This example shows how to send the configuration alert-group message to the destination profile:

```
Switch# call-home send alert-group configuration
```

This example shows how to send the diagnostic alert-group message to the destination profile for a specific module number:

```
Switch# call-home send alert-group diagnostic module 3
```

This example shows how to send the diagnostic alert-group message to all destination profiles for a specific module number:

```
Switch# call-home send alert-group diagnostic module 3 profile Ciscotacl
```

This example shows how to send the inventory call-home message:

```
Switch# call-home send alert-group inventory
```

call-home test

To manually send a Call Home test message, use the call-home test command in privileged EXEC mode.

```
call-home test ["test-message"] profile profile-name
```

**Syntax Description**
- `"test-message"` (Optional) Test message text.
- `profile profile-name` Specifies the name of the destination profile.

**Command Default**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on Supervisor Engine 6E and the Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command sends a test message to the specified destination profile. If you enter test message text, you must enclose the text in quotes ("""") if it contains spaces. If you do not enter a message, a default message is sent.

**Examples**
This example shows how to manually send a Call Home test message:

```
Switch# call-home test "test of the day" profile Ciscotacl
```

**Related Commands**
- `call-home (global configuration)` Enters call home configuration mode.
- `call-home send alert-group` Sends a specific alert group message.
- `service call-home` (refer to Cisco IOS documentation) Enables or disables Call Home.
- `show call-home` Displays call-home configuration information.
channel-group

To assign and configure an EtherChannel interface to an EtherChannel group, use the `channel-group` command. To remove a channel group configuration from an interface, use the `no` form of this command.

```
channel-group number mode { active | on | auto [non-silent] } | { passive | desirable [non-silent] }
no channel-group
```

**Syntax Description**

- `number` Specifies the channel-group number; valid values are from 1 to 64.
- `mode` Specifies the EtherChannel mode of the interface.
- `active` Enables LACP unconditionally.
- `on` Forces the port to channel without PAgP.
- `auto` Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not initiate PAgP packet negotiation.
- `non-silent` (Optional) Used with the auto or desirable mode when traffic is expected from the other device.
- `passive` Enables LACP only if an LACP device is detected.
- `desirable` Places a port into an active negotiating state, in which the port initiates negotiations with other ports by sending PAgP packets.

**Defaults**

No channel groups are assigned.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Support for LACP was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You do not have to create a port-channel interface before assigning a physical interface to a channel group. If a port-channel interface has not been created, it is automatically created when the first physical interface for the channel group is created.

If a specific channel number is used for the PAgP-enabled interfaces of a channel group, that same channel number cannot be used for configuring a channel that has LACP-enabled interfaces or vice versa.

You can also create port channels by entering the `interface port-channel` command. This will create a Layer 3 port channel. To change the Layer 3 port channel into a Layer 2 port channel, use the `switchport` command before you assign physical interfaces to the channel group. A port channel cannot be changed from Layer 3 to Layer 2 or vice versa when it contains member ports.

You do not have to disable the IP address that is assigned to a physical interface that is part of a channel group, but we recommend that you do so.
Any configuration or attribute changes that you make to the port-channel interface are propagated to all interfaces within the same channel group as the port channel (for example, configuration changes are also propagated to the physical interfaces that are not part of the port channel, but are part of the channel group).

You can create in **on** mode a usable EtherChannel by connecting two port groups together.

---

**Caution**

Do not enable Layer 3 addresses on the physical EtherChannel interfaces. Do not assign bridge groups on the physical EtherChannel interfaces because it creates loops.

---

### Examples

This example shows how to add Gigabit Ethernet interface 1/1 to the EtherChannel group that is specified by port-channel 45:

```
Switch(config-if)# channel-group 45 mode on
Creating a port-channel interface Port-channel45
```

### Related Commands

<table>

</tbody>
</table>
**channel-protocol**

To enable LACP or PAgP on an interface, use the **channel-protocol** command. To disable the protocols, use the no form of this command.

```
channel-protocol {lacp | pagp}
no channel-protocol {lacp | pagp}
```

**Syntax Description**

- **lacp**: Enables LACP to manage channeling.
- **pagp**: Enables PAgP to manage channeling.

**Defaults**

pagp

**Command Modes**

Interface configuration mode

**Command History**

**Release** | **Modification**
------------|------------------
12.1(13)EW | Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

You can also select the protocol using the **channel-group** command.

If the interface belongs to a channel, the no form of this command is rejected.

All ports in an EtherChannel must use the same protocol; you cannot run two protocols on one module. PAgP and LACP are not compatible; both ends of a channel must use the same protocol.

You can manually configure a switch with PAgP on one side and LACP on the other side in the on mode.

You can change the protocol at any time, but this change causes all existing EtherChannels to reset to the default channel mode for the new protocol. You can use the **channel-protocol** command to restrict anyone from selecting a mode that is not applicable to the selected protocol.

Configure all ports in an EtherChannel to operate at the same speed and duplex mode (full duplex only for LACP mode).

For a complete list of guidelines, refer to the “Configuring EtherChannel” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide*.

**Examples**

This example shows how to select LACP to manage channeling on the interface:

```
Switch(config-if)# channel-protocol lacp
Switch(config-if)#
```

## cisp enable

Use the **cisp enable** global configuration command to enable Client Information Signalling Protocol (CISP) on a switch.

```
cisp enable
no cisp enable
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>cisp enable</th>
<th>Enable CISP.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Defaults</th>
<th>None</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command Modes</th>
<th>Global configuration</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must enable the CISP protocol (with the global **cisp enable** command) on both the authenticator and supplicant switch. The CISP protocol is crucial because it conveys the client information from the supplicant switch to the authenticator switch thereby providing access for the clients of the supplicant switch through the authenticator switch.

### Examples

This example shows how to enable CISP:

```
switch(config)# cisp enable
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x credentials (global configuration)</td>
<td>Configures a profile on a supplicant switch.</td>
</tr>
<tr>

</tbody>
</table>
To specify the name of the class whose traffic policy you want to create or change, use the `class` policy-map configuration command. To delete an existing class from a policy map, use the `no` form of this command.

```
class class-name

no class class-name
```

### Syntax Description

- **class-name**
  
  Name of the predefined traffic class for which you want to configure or modify a traffic policy. The class was previously created through the `class-map class-map-name` global configuration command.

### Defaults

No classes are defined; except for the class-default.

### Command Modes

- Policy-map configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before using the `class` command, you must create a class map for matching packets to the class by using the `class-map` global configuration command. You also must use the `policy-map` global configuration command to identify the policy map and to enter policy-map configuration mode. After specifying a policy map, you can configure a traffic policy for new classes or modify a traffic policy for any existing classes in that policy map. The class name that you specify with the `class` command in the policy map ties the characteristics for that class (its policy) to the class map and its match criteria, as configured through the `class-map` global configuration command. You attach the policy map to a port by using the `service-policy (interface configuration)` configuration command.

After you enter the `class` command, the switch enters policy-map class configuration mode, and these configuration commands are available:

- **bandwidth** Specifies or modifies the minimum bandwidth provided to a class belonging to a policy map. For more information, see the `bandwidth` command.
- **dbl** Enables dynamic buffer limiting for traffic hitting this class. For details on `dbl` parameters refer to the `show qos dbl` command.
- **exit** Exits policy-map class configuration mode and returns to policy-map configuration mode.
- **no** Returns a command to its default setting.
- **police** Configures a single-rate policer, an aggregate policer, or a two-rate traffic policer that uses the committed information rate (CIR) and the peak information rate (PIR) for a class of traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For more information, see the `police` command. For more information about the two-rate policer, see the `police (two rates)` and the `police (percent)` command.
• **priority** Enables the strict priority queue for a class of traffic. For more information, see the `priority` command.

• **service-policy (policy-map class)** Creates a service policy as a quality of service (QoS) policy within a policy map (called a hierarchical service policy). For more information, see the `service-policy (policy-map class)` command. This command is effective only in a hierarchical policy map attached to an interface.

• **set** Classifies IP traffic by setting a class of service (CoS), a Differentiated Services Code Point (DSCP) or IP-precedence in the packet. For more information, see the `set` command.

• **shape (class-based queueing)** Sets the token bucket committed information rate (CIR) in a policy map. For more information, see the `shape (class-based queueing)` command.

• **trust** Defines a trust state for a traffic class. For more information, see the `trust` command. This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

The switch supports up to 256 classes, including the default class, in a policy map. Packets that fail to meet any of the matching criteria are classified as members of the default traffic class. You configure the default traffic class by specifying **class-default** as the class name in the `class` policy-map class configuration command. You can manipulate the default traffic class (for example, set policies to police or to shape it) just like any other traffic class, but you cannot delete it.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.

**Examples**

This example shows how to create a policy map called `policy1`. When attached to an ingress port, the policy matches all the inbound traffic defined in `class1`, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mbps and bursts of 20 KB. Traffic exceeding the profile is marked down to a DSCP value obtained from the policed-DSCP map and then sent.

```
Switch# configure terminal
Switch(config)# class-map class1
Switch(config-cmap)# exit
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set ip dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet1/0/4
Switch(config-if)# service-policy input policy1
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

class-map

To create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode, use the class-map global configuration command. To delete an existing class map and to return to global configuration mode, use the no form of this command.

```
class-map [match-all | match-any] class-map-name
```

```
no class-map [match-all | match-any] class-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match-all</td>
<td>(Optional) Perform a logical-AND of all matching under this class map. All criteria in the class map must be matched.</td>
</tr>
<tr>
<td>match-any</td>
<td>(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria in the class map must be matched.</td>
</tr>
<tr>
<td>class-map-name</td>
<td>Name of the class map.</td>
</tr>
</tbody>
</table>

**Defaults**

No class maps are defined.

If neither the match-all nor the match(any keyword is specified, the default is match-all.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to specify the name of the class for which you want to create or modify class-map match criteria and to enter class-map configuration mode. Packets are checked against the match criteria configured for a class map to decide if the packet belongs to that class. If a packet matches the specified criteria, the packet is considered a member of the class and is forwarded according to the quality of service (QoS) specifications set in the traffic policy.

After you enter the class-map command, the switch enters class-map configuration mode, and these configuration commands are available:

- **description** Describes the class map (up to 200 characters). The `show class-map` privileged EXEC command displays the description and the name of the class map.

- **exit** Exits from QoS class-map configuration mode.

- **match** Configures classification criteria. For more information, see the `match (class-map configuration)` command.

- **no** Removes a match statement from a class map.
This example shows how to configure the class map called class1 with one match criterion, which is an access list called 103:

Switch# configure terminal
Switch(config)# access-list 103 permit any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
Switch#

This example shows how to delete the class1 class map:

Switch# configure terminal
Switch(config)# no class-map class1
Switch#

You can verify your settings by entering the `show class-map` privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</tbody>
</table>
clear counters

To clear the interface counters, use the `clear counters` command.

```
clear counters [{{FastEthernet interface_number} | {GigabitEthernet interface_number} | 
    {null interface_number} | {port-channel number} | {vlan vlan_id}}]
```

**Syntax Description**

- **FastEthernet interface_number** *(Optional)* Specifies the Fast Ethernet interface; valid values are from 1 to 9.
- **GigabitEthernet interface_number** *(Optional)* Specifies the Gigabit Ethernet interface; valid values are from 1 to 9.
- **null interface_number** *(Optional)* Specifies the null interface; the valid value is 0.
- **port-channel number** *(Optional)* Specifies the channel interface; valid values are from 1 to 64.
- **vlan vlan_id** *(Optional)* Specifies the VLAN; valid values are from 1 to 4096.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command clears all the current interface counters from all the interfaces unless you specify an interface.

**Note**

This command does not clear the counters that are retrieved using SNMP, but only those seen when you enter the `show interface counters` command.

**Examples**

This example shows how to clear all the interface counters:

```
Switch# clear counters
Clear "show interface" counters on all interfaces [confirm] y
Switch#
```

This example shows how to clear the counters on a specific interface:

```
Switch# clear counters vlan 200
Clear "show interface" counters on this interface [confirm]y
Switch#
```
<table>

<td>Displays interface counter information.</td>
</tr>
</tbody>
</table>
clear energywise neighbors

Use the clear energywise neighbors privileged EXEC command to delete the EnergyWise neighbor tables.

```
clear energywise neighbors
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No default is defined.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to delete the neighbor tables:

```
Switch# clear energywise neighbors
Cleared all non static energywise neighbors
```

You can verify that the tables were deleted by entering the show energywise neighbors privileged EXEC command.

---

**Note**
The clear energywise neighbors command clears all discovered neighbors.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show energywise</td>
<td>Displays the EnergyWise settings and status of the entity and PoE ports.</td>
</tr>
</tbody>
</table>
clear errdisable

To re-enable error-disabled VLANs on an interface, use the `clear errdisable` command.

```
clear errdisable interface {name} vlan [range]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface name</code></td>
<td>Specifies the interface of the VLAN(s) to recover.</td>
</tr>
<tr>
<td><code>vlan</code></td>
<td>Specifies all VLANs on the interface be recovered.</td>
</tr>
<tr>
<td><code>range</code></td>
<td>(Optional) Specifies the VLAN range to be recovered.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a VLAN range is not specified, all VLANs on the specified interface are re-enabled. The `clear errdisable` command recovers the disabled VLANs on an interface.

Clearing the error-disabled state from a virtual port does not change the link state of the physical port, and it does not affect other VLAN ports on the physical port. It does post an event to STP, and spanning tree goes through its normal process of bringing that VLAN port to the appropriate blocking or forwarding state.

**Examples**

This example shows how to re-enable a range of disabled VLANs on an interface:

```
Switch# clear errdisable interface ethernet2 vlan 10-15
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>errdisable detect</code></td>
<td>Enables error-disable detection.</td>
</tr>
<tr>
<td><code>show errdisable detect</code></td>
<td>Displays the error-disable detection status.</td>
</tr>
<tr>
<td><code>show interfaces status</code></td>
<td>Displays the interface status or a list of interfaces in error-disabled state.</td>
</tr>
<tr>
<td><code>switchport port-security</code></td>
<td>Enables port security on an interface.</td>
</tr>
</tbody>
</table>
clear hw-module slot password

To clear the password on an intelligent line module, use the clear hw-module slot password command.

```
  clear hw-module slot slot_num password
```

**Syntax Description**

| slot_num | Slot on a line module. |

**Defaults**
The password is not cleared.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You only need to change the password once unless the password is reset.

**Examples**

This example shows how to clear the password from slot 5 on a line module:

```
Switch# clear hw-module slot 5 password
Switch#
```

**Related Commands**

clear interface vlan

To clear the hardware logic from a VLAN, use the `clear interface vlan` command.

`clear interface vlan number`

### Syntax Description

- **number**: Number of the VLAN interface; valid values are from 1 to 4094.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to clear the hardware logic from a specific VLAN:

```
Switch# clear interface vlan 5
Switch#
```

</table>
clear ip access-template

To clear the statistical information in access lists, use the `clear ip access-template` command.

```
clear ip access-template access-list
```

**Syntax Description**

| Access-list | Number of the access list; valid values are from 100 to 199 for an IP extended access list, and from 2000 to 2699 for an expanded range IP extended access list.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the statistical information for an access list:

```
Switch# clear ip access-template 201
Switch#
```
clear ip arp inspection log

To clear the status of the log buffer, use the **clear ip arp inspection log** command.

```
    clear ip arp inspection log
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

</tr>
</tbody>
</table>
clear ip arp inspection statistics

To clear the dynamic ARP inspection statistics, use the `clear ip arp inspection statistics` command.

```
clear ip arp inspection statistics [vlan vlan-range]
```

**Syntax Description**

- **vlan vlan-range** (Optional) Specifies the VLAN range.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the DAI statistics from VLAN 1 and how to verify the removal:

```
Switch# clear ip arp inspection statistics vlan 1
Switch# show ip arp inspection statistics vlan 1

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Forwarded</th>
<th>Dropped</th>
<th>DHCP Drops</th>
<th>ACL Drops</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vlan</th>
<th>DHCP Permits</th>
<th>ACL Permits</th>

</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Dest MAC Failures</th>
<th>IP Validation Failures</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Switch#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp access-list</td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>
</tr>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the status of the log buffer.</td>

<tr>
<td>show ip arp inspection log</td>
<td>Displays the status of the log buffer.</td>
</tr>
</tbody>
</table>
clear ip dhcp snooping binding

To clear the DHCP snooping binding, use the clear ip dhcp snooping binding command.

```
clear ip dhcp snooping binding [*] [ip-address] [vlan vlan_num] [interface interface_num]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>(Optional) Clears all DHCP snooping binding entries.</td>
</tr>
<tr>
<td>ip-address</td>
<td>(Optional) IP address for the DHCP snooping binding entries.</td>
</tr>
<tr>
<td>vlan vlan_num</td>
<td>(Optional) Specifies a VLAN.</td>
</tr>
<tr>
<td>interface interface_num</td>
<td>(Optional) Specifies an interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

These commands are mainly used to clear DHCP snooping binding entries. DHCP snooping is enabled on a VLAN only if both the global snooping and the VLAN snooping are enabled.

**Examples**

This example shows how to clear all the DHCP snoop binding entries:

```
Switch# clear ip dhcp snooping binding *
Switch#
```

This example shows how to clear a specific DHCP snoop binding entry:

```
Switch# clear ip dhcp snooping binding 1.2.3.4
Switch#
```

This example shows how to clear all the DHCP snoop binding entries on the GigabitEthernet interface 1/1:

```
Switch# clear ip dhcp snooping binding interface gigabitEthernet 1/1
Switch#
```

This example shows how to clear all the DHCP snoop binding entries on VLAN 40:

```
Switch# clear ip dhcp snooping binding vlan 40
Switch#
```
**clear ip dhcp snooping binding**

</tbody>
</table>

clear ip igmp group

To delete the IGMP group cache entries, use the `clear ip igmp group` command.

```
clear ip igmp group [{fastethernt mod/port} | {GigabitEthernet mod/port} | {host_name | group_address} | {Loopback interface_number} | {null interface_number} | {port-channel number} | {vlan vlan_id}]
```

**Syntax Description**

- **fastethernt** (Optional) Specifies the Fast Ethernet interface.
- **mod/port** (Optional) Number of the module and port.
- **GigabitEthernet** (Optional) Specifies the Gigabit Ethernet interface.
- **host_name** (Optional) Hostname, as defined in the DNS hosts table or with the `ip host` command.
- **group_address** (Optional) Address of the multicast group in four-part, dotted notation.
- **Loopback interface_number** (Optional) Specifies the loopback interface; valid values are from 0 to 2,147,483,647.
- **null interface_number** (Optional) Specifies the null interface; the valid value is 0.
- **port-channel number** (Optional) Specifies the channel interface; valid values are from 1 to 64.
- **vlan vlan_id** (Optional) Specifies the VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The IGMP cache contains a list of the multicast groups of which hosts on the directly connected LAN are members.

To delete all the entries from the IGMP cache, enter the `clear ip igmp group` command with no arguments.

**Examples**

This example shows how to clear the entries for a specific group from the IGMP cache:

```
Switch# clear ip igmp group 224.0.255.1
Switch#
```
This example shows how to clear the IGMP group cache entries from a specific interface:

Switch# clear ip igmp group gigabitethernet 2/2
Switch#

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>ip host</strong> (refer to Cisco IOS documentation)</td>
<td>Defines a static host name-to-address mapping in the host cache.</td>
</tr>
<tr>
<td></td>
<td><strong>show ip igmp groups</strong> (refer to Cisco IOS documentation)</td>
<td>Displays the multicast groups with receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP), use the <strong>show ip igmp groups</strong> command in EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>show ip igmp interface</strong></td>
<td>Displays the information about the IGMP-interface status and configuration.</td>
</tr>
</tbody>
</table>
clear ip igmp snooping membership

To clear the explicit host-tracking database, use the **clear ip igmp snooping membership** command.

**clear ip igmp snooping membership [vlan vlan_id]**

**Syntax Description**

- **vlan vlan_id** (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, the explicit host tracking database maintains a maximum of 1-KB entries. After you reach this limit, no additional entries can be created in the database. To create more entries, you will need to delete the database with the **clear ip igmp snooping statistics vlan** command.

**Examples**

This example shows how to display the IGMP snooping statistics for VLAN 25:

```
Switch# clear ip igmp snooping membership vlan 25
Switch#
```
clear ip mfib counters

To clear the global MFIB counters and the counters for all active MFIB routes, use the `clear ip mfib counters` command.

```
clear ip mfib counters
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear all the active MFIB routes and global counters:

```
Switch# clear ip mfib counters
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip mfib</code></td>
<td>Displays all active Multicast Forwarding Information Base (MFIB) routes.</td>
</tr>
</tbody>
</table>
clear ip mfib fastdrop

To clear all the MFIB fast-drop entries, use the **clear ip mfib fastdrop** command.

```
clear ip mfib fastdrop
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**
If new fast-dropped packets arrive, the new fast-drop entries are created.

**Examples**
This example shows how to clear all the fast-drop entries:
```
Switch# clear ip mfib fastdrop
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip mfib fastdrop</td>
<td>Enables MFIB fast drop.</td>
</tr>
<tr>
<td>show ip mfib fastdrop</td>
<td>Displays all currently active fast-drop entries and shows whether fast drop is enabled.</td>
</tr>
</tbody>
</table>
clear ip wccp

To remove Web Cache Communication Protocol (WCCP) statistics (counts) maintained on the switch for a particular service, use the `clear ip wccp` command in privileged EXEC mode.

```
clear ip wccp [vrf vrf-name {web-cache | service-number}] [web-cache | service-number]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>web-cache</th>
<th>(Optional) Directs the router to remove statistics for the web cache service.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>service-number</td>
<td>(Optional) Number of the cache service to be removed. The number can be from 0 to 99.</td>
</tr>
</tbody>
</table>

**Defaults**

No default behavior or values.

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>This command was introduced on Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ip wccp` and `show ip wccp detail` commands to display WCCP statistics.

Use the `clear ip wccp` command to clear the WCCP counters for all WCCP services in all VRFs.

**Examples**

The following example shows how to clear all statistics associated with the web cache service:

```
Switch# clear ip wccp web-cache
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip wccp</code></td>
<td>Enables support of the specified WCCP service for participation in a service group.</td>
</tr>
<tr>
<td><code>show ip wccp</code></td>
<td>Displays global statistics related to the WCCP.</td>
</tr>
</tbody>
</table>
clear lacp counters

To clear the statistics for all the interfaces belonging to a specific channel group, use the clear lacp counters command.

```
clear lacp [channel-group] counters
```

**Syntax Description**
- `channel-group` (Optional) Channel-group number; valid values are from 1 to 64.

**Defaults**
This command has no default settings.

**Command Modes**
- Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you do not specify a channel group, all channel groups are cleared.

If you enter this command for a channel group that contains members in PAgP mode, the command is ignored.

**Examples**
This example shows how to clear the statistics for a specific group:

```
Switch# clear lacp 1 counters
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show lacp</td>
<td>Displays LACP information.</td>
</tr>
</tbody>
</table>
clear mac-address-table

To clear the global counter entries from the Layer 2 MAC address table, use the `clear mac-address-table` command.

```
clear mac-address-table {dynamic [{address mac_addr} | {interface interface}] [vlan vlan_id] | notification}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Specifies dynamic entry types.</td>
</tr>
<tr>
<td>address mac_addr</td>
<td>(Optional) Specifies the MAC address.</td>
</tr>
<tr>
<td>interface interface</td>
<td>(Optional) Specifies the interface and clears the entries associated with it; valid values are FastEthernet and GigabitEthernet.</td>
</tr>
<tr>
<td>vlan vlan_id</td>
<td>(Optional) Specifies the VLANs; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>notification</td>
<td>Specifies MAC change notification global counters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for MAC address notification global counters added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the `clear mac-address-table dynamic` command with no arguments to remove all dynamic entries from the table.

The `clear mac-address-table notification` command only clears the global counters which are displayed with `show mac-address-table notification` command. It does not clear the global counters and the history table of the CISCO-MAC-NATIFICATION-MIB.

**Examples**

This example shows how to clear all the dynamic Layer 2 entries for a specific interface (gi1/1):

```
Switch# clear mac-address-table dynamic interface gi1/1
Switch#
```

This example shows how to clear the MAC address notification counters:

```
Switch# clear mac-address-table notification
Switch#
```

clear mac-address-table dynamic

To clear the dynamic address entries from the Layer 2 MAC address table, use the `clear mac-address-table dynamic` command.

```
clear mac-address-table dynamic [{address mac_addr} | {interface interface}] [vlan vlan_id]
```

**Syntax Description**

- `address mac_addr` (Optional) Specifies the MAC address.
- `interface interface` (Optional) Specifies the interface and clears the entries associated with it; valid values are `FastEthernet` and `GigabitEthernet`.
- `vlan vlan_id` (Optional) Specifies the VLANs; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the `clear mac-address-table dynamic` command with no arguments to remove all dynamic entries from the table.

**Examples**

This example shows how to clear all the dynamic Layer 2 entries for a specific interface (gi1/1):

```
Switch# clear mac-address-table dynamic interface gi1/1
Switch#
```

**Related Commands**

clear netflow-lite exporter statistics

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To clear the collector statistics, use the clear netflow-lite exporter statistics command.

```
clear netflow-lite exporter exporter-name statistics
```

Syntax Description
- `exporter-name`: Specifies an exporter.

Defaults
None

Command Modes
Privileged EXEC mode

Command History
- **Release**: 15.0(2)SG
  - **Modification**: Command introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

Examples
The following examples show how to clear statistics of a packet sampler at a monitor:

```
Switch# clear netflow-lite exporter e1 statistics
```

Related Commands
- **Command**
  - clear netflow-lite monitor statistics interface
  - Description: Clears statistics of a packet sampler at a monitor.
clear netflow-lite monitor statistics interface

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To clear statistics of a packet sampler at a monitor, use the `clear netflow-lite monitor statistics interface` command.

```
clear netflow-lite monitor statistics interface vlan-id
```

**Syntax Description**
- **vlan-id** Specifies an interface.

**Defaults**
None

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Command introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>

clear nmsp statistics

To clear the Network Mobility Services Protocol (NMSP) statistics, use the clear nmsp statistics command. This command is available only when your switch is running the cryptographic (encrypted) software image.

```
clear nmsp statistics
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No default is defined.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear NMSP statistics:

```
Switch# clear nmsp statistics
Switch#
```

You can verify that information was deleted by entering the show nmsp statistics command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show nmsp</td>
<td>Displays the NMSP information.</td>
</tr>
</tbody>
</table>
clear pagp

To clear the port-channel information, use the `clear pagp` command.

```
clear pagp {group-number | counters}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group-number</td>
<td>Channel-group number; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>counters</td>
<td>Clears traffic filters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the port-channel information for a specific group:

```
Switch# clear pagp 32
Switch#
```

This example shows how to clear all the port-channel traffic filters:

```
Switch# clear pagp counters
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>show pagp</td>
<td>Displays information about the port channel.</td>
</tr>
</tbody>
</table>
clear port-security

To delete all configured secure addresses or a specific dynamic or sticky secure address on an interface from the MAC address table, use the clear port-security command.

```
clear port-security dynamic [address mac-addr [vlan vlan-id]] | [interface interface-id] [vlan access | voice]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Deletes all the dynamic secure MAC addresses.</td>
</tr>
<tr>
<td>address mac-addr</td>
<td>(Optional) Deletes the specified secure MAC address.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Deletes the specified secure MAC address from the specified VLAN.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>(Optional) Deletes the secure MAC addresses on the specified physical port or port channel.</td>
</tr>
<tr>
<td>vlan access</td>
<td>(Optional) Deletes the secure MAC addresses from access VLANs.</td>
</tr>
<tr>
<td>vlan voice</td>
<td>(Optional) Deletes the secure MAC addresses from voice VLANs.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Usage Guidelines**

If you enter the clear port-security all command, the switch removes all the dynamic secure MAC addresses from the MAC address table.

**Note**

You can clear sticky and static secure MAC addresses one at a time with the no switchport port-security mac-address command.

If you enter the clear port-security dynamic interface interface-id command, the switch removes all the dynamic secure MAC addresses on an interface from the MAC address table.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Add support for sticky port security.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to remove all the dynamic secure addresses from the MAC address table:

```
Switch# clear port-security dynamic
```

This example shows how to remove a dynamic secure address from the MAC address table:

```
Switch# clear port-security dynamic address 0008.0070.0007
```
This example shows how to remove all the dynamic secure addresses learned on a specific interface:

```
Switch# clear port-security dynamic interface gigabitethernet0/1
```

You can verify that the information was deleted by entering the `show port-security` command.

### Related Commands

<table>
<thead>

clear pppoe intermediate-agent statistics

To clear PPPoE Intermediate Agent statistics (packet counters), use the **clear pppoe intermediate-agent statistics** command.

```
clear pppoe intermediate-agent statistics
```

**Syntax Description**
This command has no arguments.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear PPPoE Intermediate Agent statistics:

```
Switch# clear pppoe intermediate-agent statistics
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>show pppoe</td>
<td>Displays PPPoE Intermediate Agent statistics (packet counters).</td>
</tr>
<tr>
<td>intermediate-agent interface</td>
<td></td>
</tr>
</tbody>
</table>
clear qos

To clear the global and per-interface aggregate QoS counters, use the **clear qos** command.

```
clear qos [aggregate-policer name] | interface {fastethernet | GigabitEthernet} {mod/interface} | vlan {vlan_num} | port-channel {number}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregate-policer name</td>
<td>(Optional) Specifies an aggregate policer.</td>
</tr>
<tr>
<td>interface</td>
<td>(Optional) Specifies an interface.</td>
</tr>
<tr>
<td>fastethernet</td>
<td>(Optional) Specifies the Fast Ethernet 802.3 interface.</td>
</tr>
<tr>
<td>GigabitEthernet</td>
<td>(Optional) Specifies the Gigabit Ethernet 802.3z interface.</td>
</tr>
<tr>
<td>mod/interface</td>
<td>(Optional) Number of the module and interface.</td>
</tr>
<tr>
<td>vlan vlan_num</td>
<td>(Optional) Specifies a VLAN.</td>
</tr>
<tr>
<td>port-channel number</td>
<td>(Optional) Specifies the channel interface; valid values are from 1 to 64.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

#### Note

When you enter the `clear qos` command, the way that the counters work is affected and the traffic that is normally restricted could be forwarded for a short period of time.

The `clear qos` command resets the interface QoS policy counters. If no interface is specified, the `clear qos` command resets the QoS policy counters for all interfaces.

### Examples

This example shows how to clear the global and per-interface aggregate QoS counters for all the protocols:

```
Switch# clear qos
Switch#
```

This example shows how to clear the specific protocol aggregate QoS counters for all the interfaces:

```
Switch# clear qos aggregate-policer
Switch#```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show qos</code></td>
<td>Displays QoS information.</td>
</tr>
</tbody>
</table>
clear vlan counters

To clear the software-cached counter values to start from zero again for a specified VLAN or all existing VLANs, use the `clear vlan counters` command.

```
clear vlan [vlan-id] counters
```

**Syntax Description**
- `vlan-id` (Optional) VLAN number; see the “Usage Guidelines” section for valid values.

**Defaults**
- This command has no default settings.

**Command Modes**
- Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
- If you do not specify a `vlan-id` value; the software-cached counter values for all the existing VLANs are cleared.

**Examples**
- This example shows how to clear the software-cached counter values for a specific VLAN:

  ```
  Switch# clear vlan 10 counters
  Clear 'show vlan' counters on this vlan [confirm] y
  Switch#
  ```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vlan counters</code></td>
<td>Displays VLAN counter information.</td>
</tr>
</tbody>
</table>
clear vmps statistics

To clear the VMPS statistics, use the **clear vmps statistics** command.

```
clear vmps statistics
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the VMPS statistics:

```
Switch# clear vmps statistics
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show vmps</strong></td>
<td>Displays VMPS information.</td>
</tr>
<tr>
<td><strong>vmps reconfirm (privileged EXEC)</strong></td>
<td>Changes the reconfirmation interval for the VLAN Query Protocol (VQP) client.</td>
</tr>
</tbody>
</table>
control-plane

To enter control-plane configuration mode, which allows users to associate or modify attributes or parameters (such as a service policy) that are associated with the control plane of the device, use the **control-plane** command.

control-plane

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Default service policy *system-cpp-policy* is attached.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(50)SG</td>
<td>Support on Supervisor 6-E and Catalyst 4900M was introduced.</td>
</tr>
<tr>
<td>12.2(52)XO</td>
<td>Support on Supervisor 6L-E was introduced.</td>
</tr>
<tr>
<td>12.2(54)XO</td>
<td>Support on Catalyst 4948-E was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After you enter the **control-plane** command, you can define control plane services for your route processor. For example, you can associate a service policy with the control plane to police all traffic that is destined to the control plane.

**Examples**

These examples show how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specified rate:

```
Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet
! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet
! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet
! Define class-map "telnet-class."
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map control-plane
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 32000 1000 conform transmit exceed drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
```
! Define aggregate control plane service for the active Route Processor.
Switch(config)# macro global apply system-cpp
Switch(config)# control-plane
Switch(config-cp)# service-policy input system-cpp-policy
Switch(config-cp)# exit

<table>
<thead>

</tbody>
</table>
cos (netflow-lite exporter submode)

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a CoS value for the NetFlow-lite collector, use the cos command. To delete the value, use the no form of this command.

```
cos cos-value

no cos cos-value
```

Syntax Description
- **cos-value**: Specifies a CoS value for the NetFlow-lite collector. Valid values from 0 to 7.

Defaults
0

Command Modes
- netflow-lite exporter submode

Command History
- **Release**: 15.0(2)SG
- **Modification**: Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

Usage Guidelines
This option allows you to set the CoS value of VLAN tags for packet samples exported by the fpga alone.

Examples
This example shows how to specify a CoS value for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter

Switch# `show netflow-lite exporter exporter1`

Netflow-lite Exporter exporter1:

Network Protocol Configuration:
- Destination IP address: 5.5.5.6
- Source IP Address: 5.5.5.5
- VRF label:
- DSCP: 0x20
- TTL: 128
- COS: 7

Transport Protocol Configuration:
- Transport Protocol: UDP
- Destination Port: 8188
- Source Port: 61670

Export Protocol Configuration:
- Export Protocol: netflow-v9
- Template data timeout: 60
- Options sampler-table timeout: 1800
- Options interface-table timeout: 1800

Exporter Statistics:
- Packets Exported: 0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>
**counter**

To assign counters to a Layer 3 interface, use the `counter` interface command. To remove a counter assignment, use the `no` form of this command.

```
counter {ipv4 | ipv6 | ipv4 ipv6 separate}
```

```
no counter
```

**Note**

Supervisor Engine 6-E and Supervisor Engine 6L-E do not support Layer 2 interface counters.

---

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>Enables collection of IPv4 statistics only.</td>
</tr>
<tr>
<td>ipv6</td>
<td>Enables collection of IPv6 statistics only.</td>
</tr>
<tr>
<td>ipv4 ipv6 separate</td>
<td>Enables collection of IPv4 and IPv6 statistics and displays them individually.</td>
</tr>
</tbody>
</table>

**Defaults**

Not enabled

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Support added for IPv4 and IPv6 counters.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Entering the `counter` command without keywords displays the statistics as a sum.

The total number of switch ports that can possess transmit and receive counters is 4092.

When you change a Layer 3 port assigned with a counter to a Layer 2 port, the hardware counters are cleared. This action is similar to entering the `no counter` command.

**Examples**

The following example shows how to enable counters on interface VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# counter ipv4
Switch(config-if)# end
Switch# 00:17:15: %SYS-5-CONFIG_I: Configured from console by console
Switch# show run interface vlan 1
Building configuration...
```
Current configuration : 63 bytes
!
interface Vlan1
  ip address 10.0.0.1 255.0.0.0
  counter ipv4
end

Note

To remove the counter assignment, use the **no counter** command.

If you have already assigned the maximum number of counters, the **counter** command fails, displaying the following error message:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa3/2
Switch(config-if)# no switchport
Switch(config-if)# counter ipv6
Counter resource exhausted for interface fa3/2
Switch(config-if)# end
Switch#
00:24:18: %SYS-5-CONFIG_I: Configured from console by console
```

In this situation, you must release a counter from another interface so the new interface can use it.
To enable active queue management on a transmit queue used by a class of traffic, use the `dbl` command. Use the `no` form of this command to return to the default setting.

```plaintext
dbl
no dbl
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
Active queue management is disabled.

**Command Modes**
Policy-map class configuration

**Command History**
```
Release Modification
12.1(8a)EW This command was introduced on the Catalyst 4500 series switch.
12.2(40)SG Support added on Supervisor Engine 6E.
```

**Usage Guidelines**
The semantics of the DBL configuration is similar to the WRED algorithm. The `dbl` command can operate alone on class-default; otherwise, it requires you to configure the `bandwidth` or `shape` commands on the class.

**Examples**
This example shows how to enable `dbl` action in a class:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# dbl
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

</tr>
</tbody>
</table>
debug condition standby

To limit the debugging output for the standby state changes, use the **debug condition standby** command. To disable the debugging output, use the **no** form of this command.

```
debug condition standby {fastethernet mod/port | GigabitEthernet mod/port |
port-channel interface-num | vlan vlan_id group-number}
```

```
no debug condition standby {fastethernet mod/port | GigabitEthernet mod/port |
port-channel interface-num | vlan vlan_id group-number}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastethernet</td>
<td>Limits the debugging to Fast Ethernet interfaces.</td>
</tr>
<tr>
<td>mod/port</td>
<td>Number of the module and port.</td>
</tr>
<tr>
<td>GigabitEthernet</td>
<td>Limits the debugging to Gigabit Ethernet interfaces.</td>
</tr>
<tr>
<td>port-channel</td>
<td>Limits the debugging output to port-channel interfaces; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>interface-num</td>
<td></td>
</tr>
<tr>
<td>vlan</td>
<td>Limits the debugging of a condition on a VLAN interface; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>vlan_id</td>
<td></td>
</tr>
<tr>
<td>group-number</td>
<td>VLAN group number; valid values are from 0 to 255.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you attempt to remove the only condition set, you will be prompted with a message asking if you want to abort the removal operation. You can enter **n** to abort the removal or **y** to proceed with the removal. If you remove the only condition set, an excessive number of debugging messages might occur.

### Examples

This example shows how to limit the debugging output to group 0 in VLAN 1:

```
Switch# debug condition standby vlan 1 0
Condition 3 set
Switch#
```
This example shows the display if you try to turn off the last standby debug condition:

```
Switch# no debug condition standby vlan 1 0
This condition is the last standby condition set. Removing all conditions may cause a flood of debugging messages to result, unless specific debugging flags are first removed.

Proceed with removal? [yes/no]: n
% Operation aborted
Switch#
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>undebug condition standby</td>
<td>Disables debugging output.</td>
</tr>
<tr>
<td>(same as no debug condition standby)</td>
<td></td>
</tr>
</tbody>
</table>
debug condition vlan

To limit the VLAN debugging output for a specific VLAN, use the `debug condition vlan` command. To disable the debugging output, use the `no` form of this command.

```bash
debug condition vlan {vlan_id}
no debug condition vlan {vlan_id}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan_id</code></td>
<td>Number of the VLAN; valid values are from 1 to 4096.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you attempt to remove the only VLAN condition set, you will be prompted with a message asking if you want to abort the removal operation. You can enter `n` to abort the removal or `y` to proceed with the removal. If you remove the only condition set, it could result in the display of an excessive number of messages.

### Examples

This example shows how to limit the debugging output to VLAN 1:

```bash
Switch# debug condition vlan 1
Condition 4 set
Switch#
```

This example shows the message that is displayed when you attempt to disable the last VLAN debug condition:

```bash
Switch# no debug condition vlan 1
This condition is the last vlan condition set.
Removing all conditions may cause a flood of debugging messages to result, unless specific debugging flags are first removed.

Proceed with removal? [yes/no]: n
% Operation aborted
Switch#
```
### debug condition vlan

debug device-sensor

To enable debugging for Device Sensor, use the **debug device-sensor** command in privileged EXEC mode.

```
debug device-sensor errors events
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>errors</strong></td>
<td>Displays Device Sensor error messages.</td>
</tr>
<tr>
<td><strong>events</strong></td>
<td>Displays messages for events such as protocol packet arrivals, identity updates, and release events sent to the session manager.</td>
</tr>
</tbody>
</table>

### Defaults

There are no defaults for this command.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.0SG and IOS 15.1(2)SG</td>
<td>Command introduced on the Catalyst 4500 Series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **debug device-sensor** command in conjunction with the **debug authentication all** command to troubleshoot scenarios where device sensor cache entries are not being created for the connected devices.

### Examples

The following is sample output from the **debug device-sensor events** command. The debug output shows how Cisco Discovery Protocol packets and TLVs are received from the device connected to the GigabitEthernet 2/1 interface:

```
Switch# debug device-sensor events
Switch# 
*Nov 30 23:58:45.811: DSensor: Received cdp packet from GigabitEthernet2/1:00d0.2bdf.08a5

</table>
debug etherchnl

To debug EtherChannel, use the `debug etherchnl` command. To disable the debugging output, use the `no` form of this command.

```
ddebug etherchnl [all | detail | error | event | idb | linecard]
nno debug etherchnl
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Displays all EtherChannel debug messages.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays the detailed EtherChannel debug messages.</td>

<tr>
<td>idb</td>
<td>(Optional) Debugs the PAgP IDB messages.</td>
</tr>
<tr>
<td>linecard</td>
<td>(Optional) Debugs the SCP messages to the module.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:

- Debug is disabled.
- All messages are displayed.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not specify a keyword, all debug messages are displayed.

### Examples

This example shows how to display all the EtherChannel debug messages:

```
Switch# debug etherchnl
PAgP Shim/FEC debugging is on
22:46:30:FEC:returning agport Po15 for port (Fa2/1)
22:46:31:FEC:returning agport Po15 for port (Fa4/14)
22:46:33:FEC:comparing GC values of Fa2/25 Fa2/15 flag = 1 1
22:46:33:FEC:EC - attrib incompatable for Fa2/25; duplex of Fa2/25 is half, Fa2/15 is full
22:46:33:FEC:pagg_switch_choose_unique:Fa2/25, port Fa2/15 in agport Po3 is incompatable
Switch#
```

This example shows how to display the EtherChannel IDB debug messages:

```
Switch# debug etherchnl idb
Agport idb related debugging is on
Switch#
```
This example shows how to disable the debugging:

```
Switch# no debug etherchnl
Switch#
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>undebug etherchnl</code></td>
<td>(same as no debug etherchnl)</td>
</tr>
<tr>
<td></td>
<td>Disables debugging output.</td>
</tr>
</tbody>
</table>
debug interface

To abbreviate the entry of the `debug condition interface` command, use the `debug interface` command. To disable debugging output, use the `no` form of this command.

```
debug interface {FastEthernet mod/port | GigabitEthernet mod/port | null | port-channel interface-num | vlan vlan_id}

no debug interface {FastEthernet mod/port | GigabitEthernet mod/port | null | port-channel interface-num | vlan vlan_id}
```

### Syntax Description

</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported only by the supervisor engine and can be entered only from the Catalyst 4500 series switch console.

**Examples**

This example shows how to enable the LACP miscellaneous debugging:

```
Switch# debug lacp
Port Aggregation Protocol Miscellaneous debugging is on
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>undebug pagp</code></td>
<td>(same as no debug pagp) Disables debugging output.</td>
</tr>
</tbody>
</table>
**debug monitor**

To display the monitoring activity, use the `debug monitor` command. To disable the debugging output, use the `no` form of this command.

```
debug monitor { all | errors | idb-update | list | notifications | platform | requests }
no debug monitor { all | errors | idb-update | list | notifications | platform | requests }
```

**Syntax Description**

- `all` Displays all the SPAN debugging messages.
- `errors` Displays the SPAN error details.
- `idb-update` Displays the SPAN IDB update traces.
- `list` Displays the SPAN list tracing and the VLAN list tracing.
- `notifications` Displays the SPAN notifications.
- `platform` Displays the SPAN platform tracing.
- `requests` Displays the SPAN requests.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

debug nmsp

To enable debugging of the Network Mobility Services Protocol (NMSP) on the switch, use the **debug nmsp** command. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the `no` form of this command to disable debugging.

```
debug nmsp { all | connection | error | event | packet | rx | tx }

no debug nmsp
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC mode

**Command History**

+ **Release** | **Modification**
  + 12.2(52)SG | Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

The `undebug nmsp` command is the same as the `no debug nmsp` command.

**Related Commands**

<table>

### debug pagp

To debug the PAgP activity, use the `debug pagp` command. To disable the debugging output, use the `no` form of this command.

```
debug pagp [all | dual-active | event | fsm | misc | packet]
```

```
no debug pagp
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Enables all PAgP debugging.</td>
</tr>
<tr>
<td>dual-active</td>
<td>(Optional) Enables the PAgP dual-active debugging.</td>

debug platform packet protocol lacp

To debug the LACP protocol packets, use the debug platform packet protocol lacp command. To disable the debugging output, use the no form of this command.

```
debug platform packet protocol lacp [receive | transmit | vlan]
no debug platform packet protocol lacp [receive | transmit | vlan]
```

**Syntax Description**

- **receive** (Optional) Enables the platform packet reception debugging functions.
- **transmit** (Optional) Enables the platform packet transmission debugging functions.
- **vlan** (Optional) Enables the platform packet VLAN debugging functions.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

</thead>
<tbody>
<tr>
<td><code>switchport port-security</code></td>
<td>Enables port security on an interface.</td>
</tr>
</tbody>
</table>
debug pppoe intermediate-agent

To turn on debugging of the PPPoE Intermediate Agent feature, use the `debug pppoe intermediate-agent` command. To turn off debugging, use the `no` form of this command.

```
debbug pppoe intermediate-agent {event | packet | all}

no debug pppoe intermediate-agent {event | packet | all}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event</td>
<td>Activates event debugging</td>
</tr>
<tr>
<td>packet</td>
<td>Activates packet debugging</td>
</tr>
<tr>
<td>all</td>
<td>Activates both event and packet debugging</td>
</tr>
</tbody>
</table>

### Defaults

All debugging is turned off.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to turn on packet debugging:

```
Switch# debug pppoe intermediate-agent packet
PPPoE IA Packet debugging is on

*Sep 2 06:12:56.133: PPPoE_IA: Process new PPPoE packet, Message type: PADI, input interface: Gi3/7, vlan: 2 MAC da: ffff.ffff.ffff, MAC sa: aabb.cc00.0000 (GigabitEthernet3/4)
*Sep 2 06:12:56.137: PPPoE_IA: received new PPPoE packet from input interface (GigabitEthernet3/4)
*Sep 2 06:12:56.137: PPPoE_IA: received new PPPoE packet from input interface (GigabitEthernet3/8)
*Sep 2 06:12:56.137: PPPoE_IA: Process new PPPoE packet, Message type: PADO, input interface: Gi3/4, vlan: 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
*Sep 2 06:12:56.137: PPPoE_IA: Process new PPPoE packet, Message type: PADO, input interface: Gi3/8, vlan: 2 MAC da: aabb.cc00.0000, MAC sa: aabb.cc80.0000
*Sep 2 06:12:56.137: PPPoE_IA: received new PPPoE packet from input interface (GigabitEthernet3/7)
*Sep 2 06:12:56.137: PPPoE_IA: Process new PPPoE packet, Message type: PADR, input interface: Gi3/7, vlan: 2 MAC da: 001d.e64c.6512, MAC sa: aabb.cc00.0000
*Sep 2 06:12:56.145: PPPoE_IA: Process new PPPoE packet, Message type: PADS, input interface: Gi3/4, vlan: 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
```

This example shows how to turn off packet debugging:

```
Switch# no debug pppoe intermediate-agent packet
PPPoE IA Packet debugging is off
```
### Related Commands

**debug spanning-tree backbonefast**

To enable debugging of the spanning tree BackboneFast events, use the `debug spanning-tree backbonefast` command. To disable the debugging output, use the `no` form of this command.

```
detail exceptions
```

```
no debug spanning-tree backbonefast
```

---

**Syntax Description**

- **detail** (Optional) Displays the detailed BackboneFast debugging messages.
- **exceptions** (Optional) Enables the debugging of spanning tree BackboneFast exceptions.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(8a)EW
- **Modification** Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

This command is supported only on the supervisor engine and enterable only from the switch console.

**Examples**

This example shows how to enable the debugging and to display the detailed spanning tree BackboneFast debugging information:

```
Switch# debug spanning-tree backbonefast detail
Spanning Tree backbonefast detail debugging is on
Switch#
```

**Related Commands**

</tbody>
</table>
debug sw-vlan ifs

To enable the VLAN manager Cisco IOS file system (IFS) error tests, use the debug sw-vlan ifs command. To disable the debugging output, use the no form of this command.

```
dbg sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}

no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>open</td>
<td>Enables the VLAN manager IFS debugging of errors in an IFS file-open operation.</td>
</tr>
<tr>
<td>read</td>
<td>Debugs the errors that occurred when the IFS VLAN configuration file was open for reading.</td>
</tr>
<tr>
<td>write</td>
<td>Debugs the errors that occurred when the IFS VLAN configuration file was open for writing.</td>
</tr>
<tr>
<td>{1</td>
<td>2</td>
</tr>
<tr>
<td>write</td>
<td>Debugs the errors that occurred during an IFS file-write operation.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The following are four types of file read operations:

- **Operation 1**—Reads the file header, which contains the header verification word and the file version number.
- **Operation 2**—Reads the main body of the file, which contains most of the domain and VLAN information.
- **Operation 3**—Reads TLV descriptor structures.
- **Operation 4**—Reads TLV data.

### Examples

This example shows how to debug the TLV data errors during a file-read operation:

```
Switch# debug sw-vlan ifs read 4
vlan manager ifs read # 4 errors debugging is on
Switch#
```

</table>
debug sw-vlan notification

To enable the debugging of the messages that trace the activation and deactivation of the ISL VLAN IDs, use the debug sw-vlan notification command. To disable the debugging output, use the no form of this command.

```
debug sw-vlan notification { accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange }
```

```
no debug sw-vlan notification { accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange }
```

**Syntax Description**

- **accfwdchange**: Enables the VLAN manager notification of aggregated access interface STP forward changes.
- **allowedvlancfgchange**: Enables the VLAN manager notification of changes to allowed VLAN configuration.
- **fwdchange**: Enables the VLAN manager notification of STP forwarding changes.
- **linkchange**: Enables the VLAN manager notification of interface link state changes.
- **modechange**: Enables the VLAN manager notification of interface mode changes.
- **pruningcfgchange**: Enables the VLAN manager notification of changes to pruning configuration.
- **statechange**: Enables the VLAN manager notification of interface state changes.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>

debug sw-vlan vtp

To enable the debugging of messages to be generated by the VTP protocol code, use the debug sw-vlan vtp command. To disable the debugging output, use the no form of this command.

```
debug sw-vlan vtp { events | packets | pruning [ packets | xmit ] | xmit }

no debug sw-vlan vtp { events | packets | pruning [ packets | xmit ] | xmit }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>events</td>
<td>Displays the general-purpose logic flow and detailed VTP debugging messages generated by the VTP_LOG_RUNTIME macro in the VTP code.</td>
</tr>
<tr>
<td>packets</td>
<td>Displays the contents of all incoming VTP packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer, except for pruning packets.</td>
</tr>
<tr>
<td>pruning</td>
<td>Enables the debugging message to be generated by the pruning segment of the VTP protocol code.</td>
</tr>
<tr>
<td>packets</td>
<td>(Optional) Displays the contents of all incoming VTP pruning packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer.</td>
</tr>
<tr>
<td>xmit</td>
<td>(Optional) Displays the contents of all outgoing VTP packets that the VTP code will request that the Cisco IOS VTP platform-dependent layer to send.</td>
</tr>
<tr>
<td>xmit</td>
<td>Displays the contents of all outgoing VTP packets that the VTP code will request that the Cisco IOS VTP platform-dependent layer to send; does not include pruning packets.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not enter any more parameters after entering pruning, the VTP pruning debugging messages are displayed.

**Examples**

This example shows how to debug the software VLAN outgoing VTP packets:

```
Switch# debug sw-vlan vtp xmit
vtp xmit debugging is on
Switch#
```

**Related Commands**

debug udld

To enable the debugging of UDLD activity, use the `debug udld` command. To disable the debugging output, use the `no` form of this command.

```
debug udld {events | packets | registries}
no debug udld {events | packets | registries}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>events</td>
<td>Enables the debugging of UDLD process events as they occur.</td>
</tr>
<tr>
<td>packets</td>
<td>Enables the debugging of the UDLD process as it receives packets from the packet queue and attempts to transmit packets at the request of the UDLD protocol code.</td>
</tr>
<tr>
<td>registries</td>
<td>Enables the debugging of the UDLD process as it processes registry upcalls from the UDLD process-dependent module and other feature modules.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is supported only on the supervisor engine and enterable only from the switch console.

### Examples

This example shows how to debug the UDLD events:

```
Switch# debug udld events
UDLD events debugging is on
Switch#
```

This example shows how to debug the UDLD packets:

```
Switch# debug udld packets
UDLD packets debugging is on
Switch#
```

This example shows how to debug the UDLD registry events:

```
Switch# debug udld registries
UDLD registries debugging is on
Switch#
```

</table>
**define interface-range**

To create a macro of interfaces, use the `define interface-range` command.

```
define interface-range macro-name interface-range
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>macro-name</td>
<td>Name of the interface range macro; up to 32 characters.</td>
</tr>
<tr>
<td>interface-range</td>
<td>List of valid ranges when specifying interfaces; see the “Usage Guidelines” section.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The macro name is a character string of up to 32 characters.

A macro can contain up to five ranges. An interface range cannot span modules.

When entering the `interface-range`, use these formats:

- `interface-type {mod}/({first-interface} - {last-interface})`
- `interface-type {mod}/({first-interface} - {last-interface})`

The valid values for `interface-type` are as follows:

- FastEthernet
- GigabitEthernet
- Vlan `vlan_id`

**Examples**

This example shows how to create a multiple-interface macro:

```
Switch(config)# define interface-range macro1 gigabitethernet 4/1-6, fastethernet 2/1-5
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface range</td>
<td>Runs a command on multiple ports at the same time.</td>
</tr>
</tbody>
</table>
To deny an ARP packet based on matches against the DHCP bindings, use the `deny` command. To remove the specified ACEs from the access list, use the `no` form of this command.

```
```

```
```

### Syntax Description

#### request

(Optional) Requests a match for the ARP request. When `request` is not specified, matching is performed against all ARP packets.

- **ip**
  - Specifies the sender IP address.
- **any**
  - Specifies that any IP or MAC address will be accepted.
- **host sender-ip**
  - Specifies that only a specific sender IP address will be accepted.
- **sender-ip sender-ip-mask**
  - Specifies that a specific range of sender IP addresses will be accepted.
- **mac**
  - Specifies the sender MAC address.
- **host sender-mac**
  - Specifies that only a specific sender MAC address will be accepted.
- **sender-mac sender-mac-mask**
  - Specifies that a specific range of sender MAC addresses will be accepted.

#### response

Specifies a match for the ARP responses.

- **ip**
  - Specifies the IP address values for the ARP responses.
- **host target-ip**
  - (Optional) Specifies that only a specific target IP address will be accepted.
- **target-ip target-ip-mask**
  - (Optional) Specifies that a specific range of target IP addresses will be accepted.
- **mac**
  - Specifies the MAC address values for the ARP responses.
- **host target-mac**
  - (Optional) Specifies that only a specific target MAC address will be accepted.
- **target-mac target-mac-mask**
  - (Optional) Specifies that a specific range of target MAC addresses will be accepted.
- **log**
  - (Optional) Logs a packet when it matches the access control entry (ACE).

### Defaults

At the end of the ARP access list, there is an implicit `deny ip any mac any` command.

### Command Modes

arp-nacl configuration mode
### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Deny clauses can be added to forward or drop ARP packets based on some matching criteria.

### Examples

This example shows a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This example shows how to deny both requests and responses from this host:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# deny ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
Switch# show arp access-list
ARP access list static-hosts
   deny ip host 1.1.1.1 mac host 0000.0000.abcd
Switch#
```

### Related Commands

</tbody>
</table>
destination (netflow-lite exporter submode)

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a destination address in netflow-lite submode, use the `destination` command. To delete an exporter, use the `no` form of this command.

```
destination destination-address
```

```
no destination destination-address
```

**Syntax Description**
- `destination-address` Specifies a destination address of a NetFlow-lite collector.

**Defaults**
None

**Command Modes**
netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
One of the mandatory parameters for a minimally configured exporter along with the source Layer 3 interface and the UDP destination port of the collector.

**Examples**
This example shows how to specify a destination address in netflow-lite submode:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter
Switch# **show netflow-lite exporter exporter1**
Netflow-lite Exporter exporter1:
  Network Protocol Configuration:
    Destination IP address: 5.5.5.6
    Source IP Address: 5.5.5.5
  VRF label:
    DSCP: 0x20
    TTL: 128
    COS: 7
  Transport Protocol Configuration:
    Transport Protocol: UDP
    Destination Port: 8188
    Source Port: 61670
  Export Protocol Configuration:
    Export Protocol: netflow-v9
    Template data timeout: 60
    Options sampler-table timeout: 1800
    Options interface-table timeout: 1800
  Exporter Statistics:
    Packets Exported: 0

You can verify your settings with the **show netflow-lite exporter** privileged EXEC command.

**destination address**

To configure the destination e-mail address or URL to which Call Home messages will be sent, use the `destination address` command.

```
destination address {email email-address | http url}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>email email-address</code></td>
<td>Specifies the destination e-mail address in 1 to 200 characters.</td>
</tr>
<tr>
<td><code>http url</code></td>
<td>Specifies the destination HTTP URL in 2 to 200 characters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

When entering the `https://destination` URL for the secure server, you must also configure a trustpoint CA.

**Examples**

This example shows how to set the destination to the e-mail address `callhome@cisco.com`:

```
Switch(config)# call-home
Switch(config-call-home)# profile cisco
Switch(config-call-home)# destination address email callhome@cisco.com
```

device-sensor filter-list

To create a CDP or Link Layer Discovery Protocol (LLPD) filter list that contains a list of Type-Length-Value (TLV) fields to be included or excluded in the Device Sensor output, use the device-sensor filter-list command in global configuration mode. To remove the filter list, use the no form of this command.

```
device-sensor filter-list cdp | lldp list list-name
no device-sensor filter-list cdp | lldp list list-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Contains a discovery protocol filter list.</td>
</tr>
<tr>
<td>list-name</td>
<td>Name of the filter list.</td>
</tr>
</tbody>
</table>

**Defaults**

Protocol TLV fields filter list is not available.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.0SG and IOS 15.1(2)SG</td>
<td>Command introduced on the Catalyst 4500 Series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the device-sensor filter-list command to configure the name of the protocol filter list and enter into discovery protocol sensor configuration mode. You can configure the list of TLVs in discovery protocol sensor configuration mode using the tlv \{name tlv-name | number tlv-number\} command. Use the name tlv-name keyword-argument pair to specify the name of the TLV. Enter ? to query the available TLV names or refer to the following tables.

**Table 2-1 CDP TLV Names**

<table>
<thead>
<tr>

</tr>
<tr>
<td>location</td>
<td>LLDP MED location TLV</td>
</tr>
<tr>
<td>network-policy</td>
<td>LLDP MED network policy TLV</td>
</tr>
</tbody>
</table>

Use the **number** `tlv-name` keyword-argument pair to specify the TLV number to be added to the TLV filter list.

Use the **no** `tlv { name tlv-name | number tlv-number }` command to remove individual TLVs from the TLV filter list.

Use the **no** `device-sensor filter-list lldp list tlv-list-name` command to remove the entire TLV list containing all of the TLVs.

The following example shows how to create an LLDP filter containing a list of TLVs:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-list lldp list lldp-list
Switch(config-sensor-ldplist)# tlv name mac-phy-config
Switch(config-sensor-ldplist)# tlv name system-name
Switch(config-sensor-ldplist)# end
```

**Examples**

The following example shows how to create an LLDP filter containing a list of TLVs:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-list lldp list lldp-list
Switch(config-sensor-ldplist)# tlv name mac-phy-config
Switch(config-sensor-ldplist)# tlv name system-name
Switch(config-sensor-ldplist)# end
```

</tbody>
</table>
device-sensor filter-list dhcp

To create a DHCP filter containing a list of options that can be included or excluded in the Device Sensor output, use the `device-sensor filter-list dhcp` command in global configuration mode. To remove the DHCP filter containing the list of options, use the `no` form of this command.

```
device-sensor filter-list dhcp list option-list-name

no device-sensor filter-list dhcp list option-list-name
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Contains a DHCP options filter list.</td>
</tr>
<tr>
<td>option-list-name</td>
<td>DHCP options filter list name.</td>
</tr>
</tbody>
</table>

### Defaults

DHCP options filter list is not available.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.0SG</td>
<td>Command introduced on the Catalyst 4500 Series switch.</td>
</tr>
<tr>
<td>IOS 15.1(2)SG</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `device-sensor filter-list dhcp` command to configure the name of the DHCP options filter list and enter into DHCP sensor configuration mode. You can configure the list of options in DHCP sensor configuration mode using the `option {name option-name | number option-number}` command. Use the `name option-name` keyword-argument pair to specify the name of the DHCP option. Use the `number option-number` keyword-argument pair to specify the TLV number to be added to the DHCP options filter list.

Use the `no option {name option-name | number option-number}` command to remove individual options from the DHCP options filter list.

Use the `no device-sensor filter-list dhcp list option-list-name` command to remove the entire options filter list.

### Examples

The following example shows how to create a DHCP filter containing a list of options:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-list dhcp list dhcp-list
Switch(config-sensor-dhcp-list)# option name domain-name
Switch(config-sensor-dhcp-list)# option name host-name
Switch(config-sensor-dhcp-list)# option number 50
Switch(config-sensor-dhcp-list)# end
```
### Related Commands

<table>

</tr>
</tbody>
</table>
**device-sensor filter-spec**

To apply a protocol filter list to the Device Sensor output, use the `device-sensor filter-spec` command in global configuration mode. To remove the protocol filter list from the device sensor output, use the `no` form of this command.

```
device-sensor filter-spec {cdp | lldp | dhcp} {exclude {all | list list-name} | include list list-name}
```

**Syntax Description**

- **cdp**: Applies a CDP TLV filter list to the device sensor output.
- **lldp**: Applies a LLDP TLV filter list to the device sensor output.
- **dhcp**: Applies a DHCP options filter list to the device sensor output.
- **exclude**: Specifies the protocol TLVs or DHCP options to be excluded from the device sensor output.
- **all**: Disables all notifications for the associated protocol.
- **list list-name**: Specifies the name of the filter list.
- **include**: Specifies the TLVs or DHCP options that should be included in the Device Sensor output.

**Defaults**

All TLVs or DHCP options are included in notifications and will trigger notifications.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.0SG and IOS 15.1(2)SG</td>
<td>Command introduced on the Catalyst 4500 Series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `device-sensor filter-spec` command to specify a list of CDP or LLDP TLV fields or DHCP options to be included in Device Sensor outputs.

Certain TLVs and message types such as DISCOVER, OFFER, REQUEST, ACK, and IP address are unconditionally excluded. These excluded TLVs and message types are used as transport for higher layer protocols, which change frequently and convey little useful information about endpoints. OFFER messages are also excluded because they can be received from multiple servers, and therefore, do not convey useful endpoint data.

**Examples**

The following example shows how to apply a CDP TLV filter list to the Device Sensor output:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-spec cdp include cdp-list1
```
## Related Commands

</table>
device-sensor notify

To enable client notifications and events for TLV changes, use the `device-sensor notify` command in global configuration mode. To disable client notifications and accounting events for TLV changes, use the `no` form of this command.

```
device-sensor notify all-changes | new-tlvs

no device-sensor notify all-changes | new-tlvs
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all-changes</td>
<td>Enables client notifications and accounting events for all TLV changes.</td>
</tr>
<tr>
<td>new-tlvs</td>
<td>Enables client notifications and accounting events for only new TLV changes.</td>
</tr>
</tbody>
</table>

### Defaults

Client notifications and accounting events are generated only for new TLVs.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.0SG and IOS 15.1(2)SG</td>
<td>Command introduced on the Catalyst 4500 Series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

By default, for each supported peer protocol, client notifications and accounting events will only be generated when an incoming packet includes a TLV that has not been previously received in the context of a given session.

To enable client notifications and accounting events for all TLV changes, where either a new TLV has been received or a previously received TLV has been received with a different value, use the `device-sensor notify all-changes` command.

To return to the default behavior, use the `device-sensor notify new-tlvs` or the `default device-sensor notify` command.

### Examples

The following example shows how to enable client notifications and accounting events for all TLV change:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor notify all-changes
```

### Related Commands

### diagnostic fpga soft-error recover

To configure the SEU behavior, use the `diagnostic fpga soft-error recover` command. To return to the default setting, use the `no` form of this command.

```
.diagnostic fpga soft-error recover {conservative | aggressive}

no diagnostic fpga soft-error recover
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>conservative</th>
<th>aggressive</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Dictates that the supervisor engine does not reload. Rather it issues a console error message once an hour. You should reload the supervisor engine at the next maintenance window.</td>
<td>Dictates that the supervisor engine reloads immediately and automatically. A crashdump is generated, allowing you to identify the SEU event as the cause of the reload.</td>
</tr>
</tbody>
</table>

#### Defaults

A switch exhibits the default SEU behavior when this command is not configured. On redundant switches that have reached SSO, the default behavior is aggressive. In all other switches, the default behavior is conservative.

#### Command Modes

Global config mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(53)SG3, 12.2(54)SG, 15.0(2)SG XE 3.1.1SG</td>
<td>Support for this command was provided on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(53)SG6 15.0(2)SG2 XE 3.3.0SG</td>
<td>Support for the <code>conservative</code> option was added.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

SEU events on the system FPGAs result in a potentially unstable switch. The only recovery is to reload the affected supervisor engine. However, SEU events may be harmless, so you might want to delay the reload until a maintenance window, to avoid impacting users. Alternatively, you might want to force an immediate reload to avoid an instance where the switch crashes or drops traffic because of the SEU.

#### Examples

This example shows how to configure the SEU behavior as conservative:

```
Switch(config)# diagnostic fpga soft-error recover conservative
```

This example shows how to revert to the default behavior:

```
Switch(config)# no diagnostic fpga soft-error recover
```
diagnostic monitor action

To direct the action of the switch when it detects a packet memory failure, use the diagnostic monitor action command.

```
diagnostic monitor action [conservative | normal | aggressive]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>conservativ e</th>
<th>(Optional) Specifies that the bootup SRAM diagnostics log all failures and remove all affected buffers from the hardware operation. The ongoing SRAM diagnostics will log events, but will take no other action.</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>(Optional) Specifies that the SRAM diagnostics operate as in conservative mode, except that an ongoing failure resets the supervisor engine; allows for the bootup tests to map out the affected memory.</td>
</tr>
<tr>
<td>aggressive</td>
<td>(Optional) Specifies that the SRAM diagnostics operate as in normal mode, except that a bootup failure only logs failures and does not allow the supervisor engine to come online; allows for either a redundant supervisor engine or network-level redundancy to take over.</td>
</tr>
</tbody>
</table>

**Defaults**

normal mode

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **conservative** keyword when you do not want the switch to reboot so that the problem can be fixed.

Use the **aggressive** keyword when you have redundant supervisor engines, or when network-level redundancy has been provided.

**Examples**

This example shows how to configure the switch to initiate an RPR switchover when an ongoing failure occurs:

```
Switch# configure terminal
Switch (config)# diagnostic monitor action normal
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tbody>
<tr>
<td>show diagnostic result module test 2</td>
<td>Displays the module-based diagnostic test results.</td>
</tr>
<tr>
<td>show diagnostic result module test 3</td>
<td>Displays the module-based diagnostic test results.</td>
</tr>
</tbody>
</table>
**diagnostic start**

To run the specified diagnostic test, use the **diagnostic start** command.

```
diagnostic start {module num} {test test-id} [port num]
```

**Syntax Description**

- **module num**: Module number.
- **test**: Specifies a test to run.
- **test-id**: Specifies an identification number for the test to be run; can be the cable diagnostic test-id, or the **cable-tdr** keyword.
- **port num** (Optional): Specifies the interface port number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- Release: 12.2(25)SG  Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to run the specified diagnostic test at the specified module:

```
Switch# diagnostic start module 1 test cable-tdr port 3
```

```
diagnostic start module 1 test cable-tdr port 3
module 1: Running test(s) 5 Run interface level cable diags
module 1: Running test(s) 5 may disrupt normal system operation
Do you want to continue? [no]: yes
yes
Switch#
```

```
2d16h: %DIAG-6-TEST_RUNNING: module 1: Running online-diag-tdr{ID=5} ...
2d16h: %DIAG-6-TEST_OK: module 1: online-diag-tdr{ID=5} has completed successfully
```

```
Switch#
```

**Note**

The **show cable-diagnostic tdr** command displays the results of a TDR test. The test results will not be available until approximately 1 minute after the test starts. If you enter the **show cable-diagnostic tdr** command within 1 minute of the test starting, you may see a “TDR test is in progress on interface...” message.

**dot1x control-direction**

To enable unidirectional port control on a per-port basis on a switch, use the `dot1x control-direction` command. Use the `no` form of this command to disable unidirectional port control.

```
dot1x control-direction [in | both]

no dot1x control-direction
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>in</code></td>
<td>(Optional) Specifies controlling in-bound traffic on a port.</td>
</tr>
<tr>
<td><code>both</code></td>
<td>(Optional) Specifies controlling both in-bound and out-bound traffic on a port.</td>
</tr>
</tbody>
</table>

**Defaults**

Both in-bound and out-bound traffic will be controlled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can manage remote systems using unidirectional control. Unidirectional control enables you to turn on systems remotely using a specific Ethernet packet, known as a magic packet.

Using unidirectional control enables you to remotely manage systems using 802.1X ports. In the past, the port became unauthorized after the systems was turned off. In this state, the port only allowed the receipt and transmission of EAPoL packets. Therefore, there was no way for the unidirectional control magic packet to reach the host and without being turned on there was no way for the system to authenticate and open the port.

**Examples**

This example shows how to enable unidirectional control on incoming packets:

```
Switch(config-if)# dot1x control-direction in
Switch(config-if)#
```

**Related Commands**

dot1x credentials (global configuration)

Use the `dot1x credentials` global configuration command to configure a profile on a supplicant switch.

```
dot1x credentials profile
no dot1x credentials profile
```

**Syntax Description**

| `profile` | Specify a profile for the supplicant switch. |

**Defaults**

No profile is configured for the switch.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must have another switch set up as the authenticator for this switch to be the supplicant.

**Examples**

This example shows how to configure a switch as a supplicant:

```
Switch(config)# dot1x credentials profile
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

</table>
dot1x critical eapol

To enable sending EAPOL success packets when a port is critically authorized partway through an EAP exchange, use the `dot1x critical eapol` command. To return to the default setting, use the `no` form of this command.

```
  dot1x critical eapol

  no dot1x critical eapol
```

**Syntax Description**

This command has no keywords or variables.

**Defaults**

The default is to not send EAPOL success packets.

**Command Modes**

Global configuration mode

**Command History**

**dot1x critical recovery delay**

To set the time interval between port reinitializations, use the `dot1x critical recovery delay` command. To return to the default setting, use the `no` form of this command.

```
dot1x critical recovery delay delay-time
no dot1x critical recovery delay
```

**Syntax Description**

<table>
<thead>
<tr>
<th>delay-time</th>
<th>Specifies the interval between port reinitializations when AAA transition occurs; valid values are from 1 to 10,000 milliseconds.</th>
</tr>
</thead>
</table>

**Defaults**

Delay time is set to 100 milliseconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>

</table>
## dot1x critical vlan

To assign a critically authenticated port to a specific VLAN, use the `dot1x critical vlan` command. To return to the default setting, use the `no` form of this command.

```
dot1x critical vlan vlan-id

no dot1x critical vlan-id
```

### Syntax Description

<table>
<thead>
<tr>
<th><code>vlan-id</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Specifies the VLANs; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

### Defaults

Critical authentication is disabled on a ports VLAN.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The type of VLAN specified must match the type of the port. If the port is an access port, the VLAN must be a regular VLAN. If the port is a private-VLAN host port, the VLAN must be the secondary VLAN of a valid private-VLAN domain. If the port is a routed port, no VLAN may be specified.

This command is not supported on platforms such as Layer 3 switches that do not include the Critical Auth VLAN subsystem.

### Examples

This example shows how to enable 802.1x critical authentication on a ports VLAN:

```
Switch(config-if)# dot1x critical vlan 350
```

### Related Commands

dot1x guest-vlan

To enable a guest VLAN on a per-port basis, use the `dot1x guest-vlan` command. To return to the default setting, use the `no` form of this command.

```
dot1x guest-vlan vlan-id
no dot1x guest-vlan vlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Specifies a VLAN in the range of 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.; the guest VLAN feature is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for secondary VLAN as the configured guest VLAN ID was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Guest VLANs can be configured only on ports that are statically configured as access ports or private VLAN host ports. Statically configured access ports can be configured with regular VLANs as guest VLANs; statically configured private VLAN host ports can be configured with secondary private VLANs as guest VLANs.

**Examples**

This example shows how to enable a guest VLAN on Fast Ethernet interface 4/3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x guest-vlan 26
Switch(config-if)# end
Switch(config)# end
Switch#
```

<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
dot1x guest-vlan supplicant

To place an 802.1X-capable supplicant (host) into a guest VLAN, use the `dot1x guest-vlan supplicant` global configuration command. To return to the default setting, use the `no` form of this command.

```
dot1x guest-vlan supplicant
no dot1x guest-vlan supplicant
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
802.1X-capable hosts are not put into a guest VLAN.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
With Cisco Release 12.2(25) EWA, you can use the `dot1x guest-vlan supplicant` command to place an 802.1X-capable host into a guest VLAN. Prior to Cisco Release 12.2(25)EWA, you could only place non-802.1X capable hosts into a guest VLAN.

When guest VLAN supplicant behavior is enabled, the Catalyst 4500 series switch does not maintain EAPOL packet history. The switch allows clients that fail 802.1X authentication to access a guest VLAN, whether or not EAPOL packets have been detected on the interface.

**Examples**
This example shows how to place an 802.1X-capable supplicant (host) into a guest VLAN:
```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
**dot1x host-mode**

Use the `dot1x host-mode` interface configuration command on the switch stack or on a standalone switch to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port. Use the `multi-domain` keyword to enable multidomain authentication (MDA) on an IEEE 802.1x-authorized port. Use the `no` form of this command to return to the default setting.

```
dot1x host-mode {multi-host | single-host | multi-domain}
```

```
no dot1x host-mode [multi-host | single-host | multi-domain]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>multi-host</code></td>
<td>Enables multiple-hosts mode on the switch.</td>
</tr>
<tr>
<td><code>single-host</code></td>
<td>Enables single-host mode on the switch.</td>
</tr>
<tr>
<td><code>multi-domain</code></td>
<td>Enables MDA on a switch port.</td>
</tr>
</tbody>
</table>

### Defaults

The default is single-host mode.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(37)SG</td>
<td>Added support for multiple domains.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use this command to limit an IEEE 802.1X-enabled port to a single client or to attach multiple clients to an IEEE 802.1X-enabled port. In multiple-hosts mode, only one of the attached hosts needs to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (re-authentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network.

Use the `multi-domain` keyword to enable MDA on a port. MDA divides the port into both a data domain and a voice domain. MDA allows both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), on the same IEEE 802.1x-enabled port.

Before entering this command, make sure that the `dot1x port-control` interface configuration command is set to `auto` for the specified port.

You can assign both voice and data VLAN dynamically from the ACS server. No additional configuration is required to enable dynamic VLAN assignment on the switch. To enable VLAN assignment, you must configure the Cisco ACS server. For details on configuring the ACS server for voice VLAN assignment, refer to the “Cisco ACS Configuration for VLAN Assignment” section in the Catalyst 4500 Series Switch Software Configuration Guide-Release, 12.2(52)SG.
**Examples**

This example shows how to enable IEEE 802.1x authentication and to enable multiple-hosts mode:

```text
Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet6/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
Switch(config-if)# end
Switch#
```

This example shows how to enable MDA and to allow both a host and a voice device on the port:

```text
Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet6/1
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
dot1x initialize

To unauthorized an interface before reinitializing 802.1X, use the **dot1x initialize** command.

```plaintext
dot1x initialize interface
```

### Syntax Description

<table>
<thead>
<tr>
<th>Description</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>interface</strong></td>
<td>Number of the interface.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(2c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use this command to initialize state machines and to set up the environment for fresh authentication.

### Examples

This example shows how to initialize the 802.1X state machines on an interface:

```plaintext
Switch# dot1x initialize
Switch#
```

### Related Commands

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show dot1x</td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x mac-auth-bypass**

To enable the 802.1X MAC address bypassing on a switch, use the `dot1x mac-auth-bypass` command. Use the `no` form of this command to disable MAC address bypassing.

```
dot1x mac-auth-bypass [eap]
no dot1x mac-auth-bypass [eap]
```

**Syntax Description**

`eap`  
(Optional) Specifies using EAP MAC address authentication.

**Defaults**

There is no default setting.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The removal of the `dot1x mac-auth-bypass` configuration from a port does not affect the authorization or authentication state of a port. If the port is in unauthenticated state, it remains unauthenticated, and if MAB is active, the authentication will revert back to the 802.1X Authenticator. If the port is authorized with a MAC address, and the MAB configuration is removed the port remains authorized until re-authentication takes place. When re-authentication occurs the MAC address is removed in favor of an 802.1X supplicant, which is detected on the wire.

**Examples**

This example shows how to enable EAP MAC address authentication:

```
Switch(config-if)# dot1x mac-auth-bypass
Switch(config-if)#
```
dot1x max-reauth-req

To set the maximum number of times that the switch will retransmit an EAP-Request/Identity frame to the client before restarting the authentication process, use the **dot1x max-reauth-req** command. To return to the default setting, use the **no** form of this command.

```
dot1x max-reauth-req count

no dot1x max-reauth-req
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number of times that the switch retransmits EAP-Request/Identity frames before restarting the authentication process; valid values are from 1 to 10.</td>
</tr>
</tbody>
</table>

**Defaults**

The switch sends a maximum of two retransmissions.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers. This setting impacts the wait before a non-dot1x-capable client is admitted to the guest VLAN, if one is configured.

You can verify your settings by entering the **show dot1x** privileged EXEC command.

**Examples**

This example shows how to set 5 as the number of times that the switch retransmits an EAP-Request/Identity frame before restarting the authentication process:

```
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show dot1x</td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x max-req**

To set the maximum number of times that the switch retransmits an Extensible Authentication Protocol (EAP)-Request frame of types other than EAP-Request/Identity to the client before restarting the authentication process, use the `dot1x max-req` command. To return to the default setting, use the `no` form of this command.

```
dot1x max-req count
no dot1x max-req
```

**Syntax Description**

- `count`: Number of times that the switch retransmits EAP-Request frames of types other than EAP-Request/Identity before restarting the authentication process; valid values are from 1 to 10.

**Defaults**

The switch sends a maximum of two retransmissions.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>This command was modified to control EAP-Request/Identity retransmission limits.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

You can verify your settings by entering the `show dot1x` privileged EXEC command.

**Examples**

This example shows how to set 5 as the number of times that the switch retransmits an EAP-Request frame before restarting the authentication process:

```
Switch(config-if)# dot1x max-req 5
Switch(config-if)#
```

This example shows how to return to the default setting:

```
Switch(config-if)# no dot1x max-req
Switch(config-if)#
```
## Related Commands

<table>

</tbody>
</table>
dot1x port-control

To enable manual control of the authorization state on a port, use the `dot1x port-control` command. To return to the default setting, use the `no` form of this command.

```
dot1x port-control {auto | force-authorized | force-unauthorized}
no dot1x port-control {auto | force-authorized | force-unauthorized}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>auto</th>
<th>Enables 802.1X authentication on the interface and causes the port to transition to the authorized or unauthorized state based on the 802.1X authentication exchange between the switch and the client.</th>
</tr>
</thead>
<tbody>
<tr>
<td>force-authorized</td>
<td>Disables 802.1X authentication on the interface and causes the port to transition to the authorized state without any authentication exchange required. The port transmits and receives normal traffic without 802.1X-based authentication of the client.</td>
</tr>
<tr>
<td>force-unauthorized</td>
<td>Denies all access through the specified interface by forcing the port to transition to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the interface.</td>
</tr>
</tbody>
</table>

**Defaults**

The port 802.1X authorization is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The 802.1X protocol is supported on both the Layer 2 static-access ports and the Layer 3-routed ports. You can use the `auto` keyword only if the port is not configured as follows:

- **Trunk port**—If you try to enable 802.1X on a trunk port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to trunk, the port mode is not changed.
- **Dynamic ports**—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1X on a dynamic port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to dynamic, the port mode is not changed.
- **EtherChannel port**—Before enabling 802.1X on the port, you must first remove it from the EtherChannel. If you try to enable 802.1X on an EtherChannel or on an active port in an EtherChannel, an error message appears, and 802.1X is not enabled. If you enable 802.1X on an inactive port of an EtherChannel, the port does not join the EtherChannel.
- Switch Port Analyzer (SPAN) destination port—You can enable 802.1X on a port that is a SPAN destination port; however, 802.1X is disabled until the port is removed as a SPAN destination. You can enable 802.1X on a SPAN source port.

To globally disable 802.1X on the switch, you must disable it on each port. There is no global configuration command for this task.

### Examples

This example shows how to enable 802.1X on Gigabit Ethernet 1/1:

```plaintext
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# dot1x port-control auto
Switch#
```

You can verify your settings by using the `show dot1x all` or `show dot1x interface int` commands to show the port-control status. An enabled status indicates that the port-control value is set either to `auto` or to `force-unauthorized`.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x re-authenticate**

To manually initiate a reauthentication of all 802.1X-enabled ports or the specified 802.1X-enabled port, use the `dot1x re-authenticate` command.

```
dot1x re-authenticate [interface interface-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>interface-id (Optional) Module and port number of the interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command to reauthenticate a client without waiting for the configured number of seconds between reauthentication attempts (re-authperiod) and automatic reauthentication.

**Examples**

This example shows how to manually reauthenticate the device connected to Gigabit Ethernet interface 1/1:

```
Switch# dot1x re-authenticate interface gigabitethernet1/1
Starting reauthentication on gigabitethernet1/1
Switch#
```
dot1x re-authentication

To enable the periodic reauthentication of the client, use the `dot1x re-authentication` command. To return to the default setting, use the `no` form of this command.

```
dot1x re-authentication
no dot1x re-authentication
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The periodic reauthentication is disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You configure the amount of time between the periodic reauthentication attempts by using the `dot1x timeout re-authperiod` global configuration command.

**Examples**

This example shows how to disable the periodic reauthentication of the client:

```
Switch(config-if)# no dot1x re-authentication
Switch(config-if)#
```

This example shows how to enable the periodic reauthentication and set the number of seconds between the reauthentication attempts to 4000 seconds:

```
Switch(config-if)# dot1x re-authentication
Switch(config-if)# dot1x timeout re-authperiod 4000
Switch#
```

You can verify your settings by entering the `show dot1x` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</tbody>
</table>
**dot1x system-auth-control**

To enable 802.1X authentication on the switch, use the `dot1x system-auth-control` command. To disable 802.1X authentication on the system, use the `no` form of this command.

```plaintext
dot1x system-auth-control
no dot1x system-auth-control
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The 802.1X authentication is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enable `dot1x system-auth-control` if you want to use the 802.1X access controls on any port on the switch. You can then use the `dot1x port-control auto` command on each specific port on which you want the 802.1X access controls to be used.

**Examples**
This example shows how to enable 802.1X authentication:

```
Switch(config)# dot1x system-auth-control
Switch(config)#
```

**Related Commands**

</table>
# dot1x timeout

To set the reauthentication timer, use the `dot1x timeout` command. To return to the default setting, use the `no` form of this command.

```
dot1x timeout {reauth-period [seconds | server] | quiet-period seconds | tx-period seconds | supp-timeout seconds | server-timeout seconds}

no dot1x timeout {reauth-period | quiet-period | tx-period | supp-timeout | server-timeout}
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>reauth-period seconds</strong></td>
<td>Number of seconds between reauthentication attempts; valid values are from 1 to 65535. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td><strong>reauth-period server</strong></td>
<td>Number of seconds between reauthentication attempts; valid values are from 1 to 65535 as derived from the Session-Timeout RADIUS attribute. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td><strong>quiet-period seconds</strong></td>
<td>Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client; valid values are from 0 to 65535 seconds.</td>
</tr>
<tr>
<td><strong>tx-period seconds</strong></td>
<td>Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request; valid values are from 1 to 65535 seconds.</td>
</tr>
<tr>
<td><strong>supp-timeout seconds</strong></td>
<td>Number of seconds that the switch waits for the retransmission of EAP-Request packets; valid values are from 30 to 65535 seconds.</td>
</tr>
<tr>
<td><strong>server-timeout seconds</strong></td>
<td>Number of seconds that the switch waits for the retransmission of packets by the back-end authenticator to the authentication server; valid values are from 30 to 65535 seconds.</td>
</tr>
</tbody>
</table>

## Defaults

The default settings are as follows:
- Reauthentication period is 3600 seconds.
- Quiet period is 60 seconds.
- Transmission period is 30 seconds.
- Supplicant timeout is 30 seconds.
- Server timeout is 30 seconds.

## Command Modes

- Interface configuration mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for selecting the reauthentication timer from the “server” was added.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The periodic reauthentication must be enabled before entering the `dot1x timeout re-authperiod` command. Enter the `dot1x re-authentication` command to enable periodic reauthentication.

Examples

This example shows how to set 60 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x timeout tx-period 60
Switch(config-if)# end
Switch#
```

You can verify your settings by entering the `show dot1x` privileged EXEC command.

This example shows how to set up the switch to use a reauthentication timeout derived from a Session-Timeout attribute taken from the RADIUS Access-Accept message received when a host successfully authenticates via 802.1X:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x timeout reauth-period server
Switch(config-if)# end
Switch#
```

Related Commands

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dot1x initialize</code></td>
<td>Unauthorizes an interface before reinitializing 802.1X.</td>
</tr>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dscp (netflow-lite exporter submode)**

To specify a CoS value for the NetFlow-lite collector, use the `dscp` command. To delete the value, use the `no` form of this command.

```
Note

NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.
```

```
dscp dscp-value

no dscp dscp-value
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>dscp-value</code></th>
<th>Specifies a DSCP value for the NetFlow-lite collector. Valid values from 0 to 63</th>
</tr>
</thead>
</table>

**Defaults**

0

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to specify a CoS value for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter

```
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
Network Protocol Configuration:
  Destination IP address: 5.5.5.6
  Source IP Address: 5.5.5.5
  VRF label:
```
DSCP: 0x20
TTL: 128
COS: 7

Transport Protocol Configuration:
  Transport Protocol: UDP
  Destination Port: 8188
  Source Port: 61670

Export Protocol Configuration:
  Export Protocol: netflow-v9
  Template data timeout: 60
  Options sampler-table timeout: 1800
  Options interface-table timeout: 1800

Exporter Statistics:
  Packets Exported: 0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

dual-active detection (virtual switch)

To enable and configure dual-active detection, use the `dual-active detection` command in virtual switch configuration submode. To disable dual-active detection, use the `no` form of this command.

```
dual-active detection {pagp [trust channel-group num]}

no dual-active detection {pagp}
```

**Syntax Description**

- `pagp` Configures Port Aggregation Protocol (PAgP) as the dual-active detection method. Default: enabled.
- `trust channel-group num` (Optional) Specifies the EtherChannel/port bundling to be used for PAgP dual-active detection. Range: 1 to 256. Default: disabled.

**Defaults**

- bfd and `pagp` are enabled.
- `trust` is disabled.

**Command Modes**

Virtual switch configuration submode (config-vs-domain)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If PAgP is running on the MECs between the VSS and its access switches, the VSS can use enhanced PAgP messaging to detect dual-active scenario. The MEC must have links from both chassis of the VSS to the access switch. By default, PAgP dual-active detection is enabled. However, the enhanced messages are only sent on channel groups with trust mode enabled.

If you configure the fast hello dual-active detection mechanism, you must also configure dual-active interface pairs to act as fast hello dual-active messaging links.

When you enter the optional trust channel-group num keywords and argument, the following applies:

- You can configure trust mode on a port channel even if there are no interfaces on the port channel or the port channel is a protocol type other than PAgP. The trust mode status is displayed in the `show pagp dual-active` command output, but no interfaces are displayed.

- Configuring trust mode requires that the port channel exists. If the port channel does not exist, the following error message is displayed:
  
  `Router(config-vs-domain)# dual-active trust pagp channel-group 30
  Port-channel 30 not configured`

- If a trusted port is deleted, the trust-mode configuration is deleted and the following warning message is displayed:
  
  `Port-channel num is a trusted port-channel for PAgP dual-active detection. Restricting this port-channel has deleted the dual-active trust`
channel-group configuration associated with it.

- If a trusted port is changed to a virtual switch port, the trust mode configuration is deleted when the port becomes restricted and the following warning message is displayed:

```
Port-channel num is a trusted port-channel for PAgP dual-active detection. Deletion of this port-channel has deleted the dual-active trust channel-group configuration associated with it.
```

- If you enter the dual-active detection pagp trust port-channel command on a virtual switch port channel, the following error message is displayed:

```
Cannot configure dual-active trust mode on a virtual switch port-channel
```

### Examples

The following example shows how to configure interfaces for PAgP dual-active detection:

```
Router(config)# switch virtual domain domain-id
Router (config-vs-domain)# dual-active detection pagp
```

The following example shows how to specify that EtherChannel/port bundling to be used for PAgP dual-active detection:

```
Router(config)# switch virtual domain domain-id
Router (config-vs-domain)# dual-active detection pagp trust port-channel 20
```

The following example shows how to configure an interface for fast hello dual-active detection:

```
Router(config)# switch virtual domain domain-id
Router (config-vs-domain)# dual-active detection
Router (config-vs-domain)# exit
Router(config)# interface fastethernet 1/2/40
Router(config-if)# dual-active
WARNING: Interface FastEthernet1/2/40 placed in restricted config mode. All extraneous configs removed!
Router(config-if)# no shutdown
```

### Related Commands

<tbody>
<tr>
<td><code>show switch virtual (virtual switch)</code></td>
<td>Displays information about dual-active detection configuration and status.</td>
</tr>
</tbody>
</table>
dual-active recovery ip address

To configure an IP address for the management interface when the switch is in recovery mode, use the `dual-active recovery ip address` command in virtual-switch configuration submode. To remove the IP address, use the `no` form of this command.

```
dual-active recovery [switch num] ip address ip-address ip-mask

no dual-active recovery ip address ip-address ip-mask
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch num</td>
<td>(Optional) The virtual switch number of the chassis for which the IP address must be used. If unspecified, the same IP address is used for either switch.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Specifies an IP address.</td>
</tr>
<tr>
<td>ip-mask</td>
<td>Specifies an IP address mask.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Virtual switch configuration submode (config-vs-domain)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The command accepts up to three IP addresses - one for switch 1, one for switch 2 and one global IP address. When a switch enters recovery mode, it picks up the configured switch-specific recovery IP address for its management interface. If the switch-specific IP address is unconfigured, the global recovery IP address is used. If neither the switch-specific nor global recovery IP addresses are configured, the fastEthernet1 management interface on the switch has no IP address active, when the switch enters recovery mode.

The normal IP address configured for fastEthernet1 in interface configuration mode is retained in the configuration.

### Examples

The following example shows how to configure global recovery IP address:

```
Switch(config)# switch virtual domain domain-id
Switch(config-vs-domain)# dual-active recovery ip address 192.168.1.5 255.255.255.0
Switch(config-vs-domain)# exit
```

</table>
**duplex**

To configure the duplex operation on an interface, use the `duplex` command. To return to the default setting, use the `no` form of this command.

```
duplex (auto | full | half)
```

```
no duplex
```

**Syntax Description**

- **auto**: Specifies the autonegotiation operation.
- **full**: Specifies the full-duplex operation.
- **half**: Specifies the half-duplex operation.

**Defaults**

Half-duplex operation

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Table 2-1 lists the supported command options by interface.

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Supported Syntax</th>
<th>Default Setting</th>
<th>Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100-Mbps module</td>
<td>`duplex [half</td>
<td>full]`</td>
<td><code>half</code></td>
</tr>
<tr>
<td>100-Mbps fiber modules</td>
<td>`duplex [half</td>
<td>full]`</td>
<td><code>half</code></td>
</tr>
<tr>
<td>Gigabit Ethernet Interface</td>
<td>Not supported.</td>
<td>Not supported.</td>
<td>Gigabit Ethernet interfaces are set to <code>full</code> duplex.</td>
</tr>
<tr>
<td>10/100/1000</td>
<td>`duplex [half</td>
<td>full]`</td>
<td></td>
</tr>
</tbody>
</table>
If the transmission speed on a 16-port RJ-45 Gigabit Ethernet port is set to 1000, the duplex mode is set to full. If the transmission speed is changed to 10 or 100, the duplex mode stays at full. You must configure the correct duplex mode on the switch when the transmission speed changes to 10 or 100 from 1000 Mbps.

**Caution**
Changing the interface speed and duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table 2-2 describes the system performance for different combinations of the duplex and speed modes. The specified `duplex` command that is configured with the specified `speed` command produces the resulting action shown in the table.

### Table 2-2 Relationship Between duplex and speed Commands

<table>
<thead>
<tr>
<th>duplex Command</th>
<th>speed Command</th>
<th>Resulting System Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>duplex half or full</td>

energywise (global configuration)

Use the `energywise` global configuration command to enable and configure EnergyWise on an entity. Use the `no` form of this command to disable EnergyWise on the entity and remove the EnergyWise configuration.

```
energywise { importance importance | keywords word,word,... | level level | management
tcp-port-number | name name | neighbor hostname | ip-address udp-port-number | role role }

no energywise { importance | keywords | level | management | name | neighbor | role }
```

**Syntax Description**

- **importance importance**  Sets the importance of the entity.  
  The range is from 1 to 100.

- **keywords word,word,...**  Assigns at least one keyword for the entity.  
  When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.  
  For the `word` value:
    - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
    - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **level level**  Sets the power level of the entity.  
  The only valid value is 10.

- **management tcp-port-number**  Specifies the TCP port that connects to the management station.  
  The range is from 1 to 65000.

- **name name**  Specifies the EnergyWise-specific entity name.  
  For the `name` value:
    - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
    - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **neighbor hostname | ip-address udp-port-number**  Assigns a static neighbor.  
  - Hostname (hostname) or IP address (ip-address).  
  - UDP port (udp-port-number) that sends and receives queries. The range is from 1 to 65000.

- **role role**  Specifies the role of the entity in the EnergyWise domain. For example, lobby.b20.  
  For the `role` value:
    - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
    - Do not use an asterisk (*) or a blank space between the characters and symbols.
energywise (global configuration)

Defaults

The importance is 1.
No keywords are defined.
The power level is 10.
The tcp-port-number is 43440.
The name is the hostname.
No neighbors are assigned.
The role is the model number.

Command Modes

Configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

When you add an entity to a domain, EnergyWise is enabled on the entity and its PoE ports.

Examples

This example shows how to enable EnergyWise, assign the entity to a domain, and set the password:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# energywise importance 50
Switch(config)# energywise keywords lab1,devlab
Switch(config)# energywise management 60500
Switch(config)# energywise name Entity01
Switch(config)# energywise neighbor 4500-21 43440
Switch(config)# energywise role role.lobbyaccess
Switch(config)# end
```

Related Commands

</thead>
<tbody>
<tr>
<td>show energywise</td>
<td>Displays the EnergyWise settings and status.</td>
</tr>
</tbody>
</table>
energywise (interface configuration)

Use the `energywise` interface configuration command to configure EnergyWise on the power over Ethernet (PoE) port. Use the `no` form of this command to disable EnergyWise on the port and remove the EnergyWise configuration.

```snippet
energywise [importance importance | keywords word,word,... | level level [recurrence at minute hour day_of_month month day_of_week] | name name | role role]
```

```snippet
no energywise
```

**Syntax Description**

- **importance importance** (Optional) Sets the importance of the port.
  - The range is from 1 to 100.

- **keywords word,word,...** (Optional) Assigns at least one keyword for the port.
  - When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.
  - For the `word` value:
    - You can enter alphanumeric characters and symbols such as #, %, ! or &.
    - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **level level** (Optional) Sets the power level of the port.
  - The only valid values are 0 and 10.

- **recurrence**
  - **importance importance** (Optional) Sets the importance of the port in the domain.
    - The range is from 1 to 100.
  - **at minute hour day_of_month month day_of_week** (Optional) Schedules the power-on or power-off recurrence.
    - **importance importance**—Sets the importance of the port in the domain.
    - **minute**—The range is from 0 to 59. Use * for the wildcard.
    - **hour**—The range is from 0 to 23. Use * for the wildcard.
    - **day_of_month**—The range is from 1 to 31. Use * for the wildcard.
    - **month**—The range is from 1 to 12. You can also enter `jan`, `feb`, `mar`, `apr`, and so on. Use * for the wildcard.
    - **day_of_week**—The range is from 0 to 7 (0 and 7 both represent Sunday). Use * for the wildcard.

  **Note** The specified times are local times based on the PoE-entity time zone.

  **Note** If the day of the month and day of the week are both specified, (that is, are not wildcards), the recurrence is executed when either field matches the current time.

  **Note** Recurrence takes effect within the minute specified, rather than exactly on the minute; it could occur as much as 60 seconds late.
name name
(Optional) Specifies the EnergyWise-specific port name.
For the name value:

- You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

role role
(Optional) Specifies the role of the port in the domain. For example, lobbyport.
For the role value:

- You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

Defaults
The importance is 1.
No keywords are defined.
The power level is 10.
The name is the short version of the interface name; for example, Gi1.2 for Gigabit Ethernet 1/2.

Command Modes
Interface Configuration

Command History
Release Modification
12.2(52)SG This command was introduced.

Usage Guidelines
To return the importance and level values to the default settings, use the default energywise importance and the default energywise level commands.

Examples
This example shows how to enable and configure EnergyWise on a PoE port:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# interface Gi1.2
Switch(config-if)# energywise level 10 recurrence importance 90 at 0 8 * * *
Switch(config-if)# energywise level 0 recurrence importance 90 at 0 20 * * *
Switch(config-if)# energywise importance 50
Switch(config-if)# energywise name lobbyInterface.3
Switch(config-if)# energywise role role.lobbyaccess
Switch(config-if)# end

Note
Recurrence takes effect within the minute specified, rather than exactly on the minute; it could occur as much as 60-seconds late.
<table>
<thead>
<tr>

energywise domain

Use the `energywise domain` global configuration command to enable EnergyWise on the entity, assign the entity to a domain, and set the password for secure communication among the entities in the domain. Use the `no` form of this command to disable EnergyWise on the entity and to remove the EnergyWise configuration.

```
energywise domain domain-name secret [0 | 7] password [protocol udp port udp-port-number [interface interface-id | ip ip-address]]

no energywise domain
```

**Syntax Description**

- `domain domain-name`: Assigns the entity to a domain with the specified `domain-name`.
  - You can enter alphanumeric characters and symbols such as #, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- `secret [0 | 7] password`: Sets the `password` for secure communication among the entities in the domain.
  - (Optional) 0—Use an unencrypted password.
  - (Optional) 7—Use an hidden password. This requires service password-encryption to be enabled.
  
  If you do not enter 0 or 7, the entity uses the default value of 0.
  
  For the `password` value:
  - You can enter alphanumeric characters and symbols such as #, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- `port udp-port-number`: (Optional) Specifies the UDP port that sends and receives queries.
  
  The range is from 1 to 65000.

- `interface interface-id`: (Optional) In a bridged network, specifies the interface that you would prefer for communicating with other EnergyWise switches rather than letting the switch select an interface by default.

- `ip ip-address`: (Optional) In a routed network, specifies the IP address to be used while communicating with EnergyWise peers instead of letting the system choose a default.

  The `interface` and `ip` options are mutually exclusive.

**Defaults**

- The entity is not assigned to a domain.
- The password is not set.
- The `udp-port-number` is 43440.
energywise domain

Command Modes

Configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If you enter the `energywise domain domain-name secret [0 | 7] password` command, the entity selects the first available interface to communicate with the network and with management applications.

Examples

This example shows how to enable EnergyWise and how to set the `domain-name` and `password` values:
```
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
```

This example shows how to enable EnergyWise and to specify the route to the management applications:
```
Switch(config)# energywise domain cisco secret 0 cisco protocol udp port 43440 ip 192.168.1.2
```

energywise query

Use the *energywise query* privileged EXEC command to run a query to display power information or to power the entities or PoE ports.

```
energywise query importance importance {keywords word,word,... | name name} collect {delta | usage}
energywise query importance importance {keywords word,word,... | name name} set level level
energywise query importance importance {keywords word,word,... | name name} sum {delta | usage}
```

### Syntax Description

**importance importance**  Sets the importance of the entity or ports.

The range is from 1 to 100.

**keywords word,word,...**  Specifies one of more keywords to use in the query.

When specifying multiple keywords, separate the keywords with commas, and do not use spaces between keywords.

For the *word* value:

- You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

For the wildcard, use * or name* with the asterisk at the end of the name.

For the *name* value:

- You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

**name name**  Name to use in the query.

For the wildcard, use * or name* with the asterisk at the end of the name.

For the *name* value:

- You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

**collect {delta | usage}**  Displays the delta or usage values for the entity or PoE ports.

- **delta**—Displays only the differences between the current and available power levels.
- **usage**—Displays only the current power usage.

**set level level**  Sets the power level of the entity or the PoE ports.

For the entity, the only valid value is 10.

For the ports, the valid values are 0 and 10.

**sum {delta | usage}**  Displays the sum of the delta or usage values for the entity or PoE ports.

- **delta**—Displays only the sum of the differences between the current and available power levels.
- **usage**—Displays only the sum of the current power usage.
**energywise query**

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To power on or power off ports, enter the `energywise query {keywords word,word,... | name name} set level level` command.

**Caution**

Use this query with care because it affects the entity on which you enter the command and other devices in the domain that match the query criteria.

**Examples**

These examples show how to filter with the entity name:

```
Switch# energywise query importance 100 name phone* collect usage
EnergyWise query, timeout is 3 seconds:

<table>
<thead>
<tr>
<th>Host</th>
<th>Name</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.2.2.21</td>
<td>phone</td>
<td>0.0 (W)</td>
</tr>
<tr>
<td>2.2.2.21</td>
<td>phone</td>
<td>15.4 (W)</td>
</tr>
<tr>
<td>2.2.2.21</td>
<td>phone</td>
<td>0.0 (W)</td>
</tr>
<tr>
<td>2.2.2.22</td>
<td>phone</td>
<td>0.0 (W)</td>
</tr>
<tr>
<td>2.2.2.21</td>
<td>phone</td>
<td>0.0 (W)</td>
</tr>
<tr>
<td>2.2.2.22</td>
<td>phone</td>
<td>15.4 (W)</td>
</tr>
<tr>
<td>2.2.2.21</td>
<td>phone</td>
<td>0.0 (W)</td>
</tr>
<tr>
<td>2.2.2.23</td>
<td>phone</td>
<td>15.4 (W)</td>
</tr>
<tr>
<td>2.2.2.21</td>
<td>phone</td>
<td>0.0 (W)</td>
</tr>
</tbody>
</table>

Queried:  9    Responded:  9      Time:  0.26 seconds
```

```
Switch# energywise query importance 100 name * sum usage
EnergyWise query, timeout is 3 seconds:

---
Total Usage

epm access control

To configure access control, use the `epm access control [open | default]` command.

```
epm access control [open | default]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>open</code></td>
<td>Specifies open access control.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>Specifies default access control.</td>
</tr>
</tbody>
</table>

**Defaults**

If the `epm access control` command is not configured, the behavior defaults to the `epm access control default` command. Nothing is nvgened.

**Command Modes**

Configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the `epm access control` command, it is nvgen’d.

If no ACLs are downloaded from the ACS server when a host is authenticated, the host is restricted by the port ACLs and do not receive additional permissions. In such a scenario, if you enter the `epm access control open` command, a `permit ip host any` entry is created for the host after authentication. This entry is created only if no ACLs are downloaded from the ACS.

The `epm access control open` command is particularly useful in authentication open mode. Traffic from a host is allowed to pass even before the host is authenticated. This traffic is restricted by the port ACL. In such a scenario, if no ACLs are downloaded from the ACS, the host will not receive any additional permissions. Even after authentication, the host is still restricted by the port ACL. If `epm access control open` is configured, complete access is granted upon authentication.

If `epm access control default` is configured and no ACL is downloaded, port ACL is the only ACL on the port. This is how access control functioned prior to Cisco IOS Release 12.2(54)SG.

**Examples**

The following example shows how to enable open access control:

```
Switch(config)# epm access control open
```

The following example shows how to enable default access control:

```
Switch(config)# epm access control default
```

**Related Commands**

<td><code>show ipv6 snooping counters</code></td>
<td>Displays the number of packets dropped per port due to RA Guard.</td>
</tr>
</tbody>
</table>
To erase a file system, use the `erase` command.

```
erase [/all [non-default | nvram:] | cat4000_flash | nvram: | startup-config]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| /all nvram: | Erases everything in nvram:.
| /all non-default | Erases files and configuration in nonvolatile storage including nvram:, bootflash:, cat4000_flash:, and crashinfo: of the local supervisor engine. Resets the Catalyst 4500 series switch to the factory default settings. 
  
  **Note** This command option is intended to work only on a standalone supervisor engine.
| cat4000_flash: | Erases the VLAN database configuration file.
| nvram: | Erases the startup-config and private-config file in NVRAM.
| startup-config: | Erases the startup-config and private-config file in NVRAM.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

**Caution** When you use the `erase` command to erase a file system, you cannot recover the files in the file system.

In addition to the command options shown above, options with the prefix slave that are used to identify nvram: and flash (such as slavenvram: and slavecat4000_flash:) appear in the command help messages on the dual supervisor engine redundancy switch.

The `erase nvram:` command replaces the `write erase` and the `erase startup-config` commands. This command erases both the startup-config and the private-config file.

The `erase /all nvram:` command erases all files in nvram: in addition to startup-config file and private-config file.

The `erase cat4000_flash:` command erases the VLAN database configuration file.

The `erase /all non-default` command facilitates the work of a manufacturing facility and repair center. It erases the configuration and states stored in the nonvolatile storage and resets the Catalyst 4500 series switch to the factory default settings. The default settings include those mentioned in the Cisco IOS library as well as those set by the `erase /all non-default` command (vtp mode=transparent, and the ROMMON variables: ConfigReg=0x2101, PS1= “rommon ! >” and EnableAutoConfig=1).
For the default settings, refer to these guides:

- *Cisco IOS Configuration Fundamentals Configuration Guide*, Release 12.2, at this URL:
- *Cisco IOS Configuration Fundamentals Configuration Command Reference*, Release 12.2, at this URL:

**Caution**

The `erase /all non-default` command can erase Cisco IOS images in bootflash:. Ensure that a Cisco IOS image can be copied back to the bootflash: (such as, from a accessible TFTP server or a flash card inserted in slot0:) (available on most chassis models), or that the switch can boot from a image stored in an accessible network server.

**Examples**

This example shows how to erase the files and configuration in a nonvolatile storage and reset the switch to factory default settings:

```
Switch# erase /all non-default
Switch# Erase and format operation will destroy all data in non-volatile storage. Continue? [confirm]
Formatting bootflash: ...
Format of bootflash complete
Erasing nvram:
Erasing cat4000_flash:
Clearing crashinfo: data
Clearing the last power failure timestamp
Clearing all ROMMON variables
Setting default ROMMON variables:
  ConfigReg=0x2101
  PS1=rommon ! >
  EnableAutoConfig=1
Setting vtp mode to transparent
%WARNING! Please reboot the system for the changes to take effect
Switch# 00:01:48: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
Switch#
```

This example shows how to erase the contents in nvram.

```
Switch# erase /all nvram:
Erasing the nvram filesystem will remove all files! Continue? [confirm] [OK]
Erase of nvram: complete
Switch# 00:38:10: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
Switch#
```

This example shows how to erase filesystem `cat4000_flash`.

```
Switch# erase cat4000_flash:
Erasing the cat4000_flash filesystem will remove all files! Continue? [confirm] [OK]
Erase of cat4000_flash: complete
Switch# 00:01:48: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
Switch#
```

errdisable detect

To enable error-disable detection, use the `errdisable detect` command. To disable the error-disable detection feature, use the `no` form of this command.

```
erdisable detect cause { all | arp-inspection [action shutdown vlan] | bpduguard shutdown vlan | dhcp-rate-limit [action shutdown vlan] | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap }  
no errdisable detect cause { all | arp-inspection [action shutdown vlan] | bpduguard shutdown vlan | dhcp-rate-limit [action shutdown vlan] | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap }  
```

**Syntax Description**

- `cause` Specifies error-disable detection to detect a specific cause.
- `all` Specifies error-disable detection for all error-disable causes.
- `arp-inspection` Specifies the detection for the ARP inspection error-disable cause.
- `action shutdown vlan` (Optional) Specifies per-VLAN error-disable for ARP inspection and DHCP rate limiting.
- `bpduguard shutdown vlan` Specifies per-VLAN error-disable for BPDU guard.
- `dhcp-rate-limit` Specifies the detection for the DHCP rate-limit error-disable cause.
- `dtp-flap` Specifies the detection for the DTP flap error-disable cause.
- `gbic-invalid` Specifies the detection for the GBIC invalid error-disable cause.
- `l2ptguard` Specifies the detection for the Layer 2 protocol-tunnel error-disable cause.
- `link-flap` Specifies the detection for the link flap error-disable cause.
- `pagp-flap` Specifies the detection for the PAgP flap error-disable cause.

**Defaults**

All error-disable causes are detected.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A cause (dtp-flap, link-flap, pagp-flap) is defined as the reason why the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in error-disabled state (an operational state that is similar to link-down state).

You must enter the `shutdown` command and then the `no shutdown` command to recover an interface manually from the error-disable state.
To prevent the port from shutting down, you can use the `shutdown vlan` option to shut down just the offending VLAN on the port where the violation occurred. This option is available for the following three causes: bpduguard, arp-inspection, and dhcp-rate-limit. You can use the `clear errdisable` command to recover disabled VLANs on a port.

### Examples

This example shows how to enable error-disable detection for the link-flap error-disable cause:

```console
Switch(config)# errdisable detect cause link-flap
Switch(config)#
```

This example shows how to enable per-VLAN error-disable detection for BPDU guard:

```console
Switch(config)# errdisable detect cause bpduguard shutdown vlan
Switch(config)#
```

This example shows how to disable error-disable detection for DAI:

```console
Switch(config)# no errdisable detect cause arp-inspection
Switch(config)# end
Switch# show errdisable detect
```

ErrDisable Reason | Detection  | Mode
-----------------|------------|-----
arp-inspection   | Enabled    | port
bpduguard        | Enabled    | vlan
channel-misconfig| Enabled    | port
dhcp-rate-limit  | Enabled    | port
dtp-flap         | Enabled    | port
gbic-invalid     | Enabled    | port
psecure-violation| Enabled    | port/vlan
Switch#

</tr>
</tbody>
</table>
**errdisable recovery**

**Defaults**

Error disable recovery is disabled.
The recovery interval is set to 300 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for the storm-control feature.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A cause (bpduguard, dtp-flap, link-flap, pagp-flap, udld) is defined as the reason why the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in error-disabled state (an operational state that is similar to the link-down state). If you do not enable error-disable recovery for the cause, the interface stays in the error-disabled state until a shutdown and no shutdown occurs. If you enable recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry operation again once all the causes have timed out.

You must enter the `shutdown` command and then the `no shutdown` command to recover an interface manually from error disable.

**Examples**

This example shows how to enable the recovery timer for the BPDU guard error disable cause:

```
Switch(config)# errdisable recovery cause bpduguard
Switch(config)#
```

This example shows how to set the timer to 300 seconds:

```
Switch(config)# errdisable recovery interval 300
Switch(config)#
```

This example shows how to enable the errdisable recovery for arp-inspection:

```
Switch(config)# errdisable recovery cause arp-inspection
Switch(config)# end
Switch# show errdisable recovery
```

Timer interval: 300 seconds

Interfaces that will be enabled at the next timeout:

Switch#
export-protocol (netflow-lite exporter submode)

Note

NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify the export protocol for the NetFlow-lite collector, use the `export-protocol` command. To delete the value, use the `no` form of this command.

```
export-protocol {netflow-v9 | ipfix}

no export-protocol {netflow-v9 | ipfix}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>netflow-v9</td>
<td>Specifies export format of Netflow V9.</td>
</tr>
<tr>
<td>ipfix</td>
<td>Specifies export format of Netflow V10 or IPFIX.</td>
</tr>
</tbody>
</table>

Defaults

```
netflow-v9
```

Command Modes

```
netflow-lite exporter submode
```

Command History

```
Release  | Modification                                           |
----------|-------------------------------------------------------|
15.0(2)SG | Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches. |
```

Usage Guidelines

By default the export protocol is Netflow V9. IPFIX or Netflow V10 is a newer export format. They support variable length encoding that allows for more efficient packaging of packet samples according to the actual packet section bytes extracted from the original sampled packet.

Examples

This example shows how to specify the export protocol for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter.
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
Network Protocol Configuration:
  Destination IP address:  5.5.5.6
  Source IP Address:  5.5.5.5
  VRF label:
  DSCP:  0x20
  TTL:  128
  COS:  7
Transport Protocol Configuration:
  Transport Protocol:  UDP
  Destination Port:  8188
  Source Port:  61670
Export Protocol Configuration:
  Export Protocol:  netflow-v9
  Template data timeout:  60
  Options sampler-table timeout:  1800
  Options interface-table timeout:  1800
Exporter Statistics:
  Packets Exported:  0
You can verify your settings with the show netflow-lite exporter privileged EXEC command.

**exporter (netflow-lite monitor submode)**

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To assign an exporter in netflow-lite monitor submode, use the `exporter` command. To delete a sampler, use the `no` form of this command.

```
exporter exporter-name

no exporter exporter-name
```

**Syntax Description**
- `exporter-name` Specifies an exporter.

**Defaults**
None

**Command Modes**
netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can enter this command under the physical port interface mode, port channel interface, or config VLAN mode.

**Examples**
The following example shows how to configure a monitor on a port interface Gigabit 1/3:

```
Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)# exit
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
  Netflow-lite Monitor-1:
    Active: TRUE
    Sampler: sampler1
    Exporter: exporter1
    Average Packet Size: 0
  Statistics:
    Packets exported: 0
    Packets observed: 0
```
You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

<table>
<thead>
<tr>

<td><code>average-packet-size (netflow-lite monitor submode)</code></td>
<td>Specifies the average packet size at the observation point.</td>
</tr>
<tr>
<td></td>
<td><code>exporter (netflow-lite monitor submode)</code></td>
<td>Assigns an exporter in netflow-lite monitor submode.</td>
</tr>
</tbody>
</table>
flowcontrol

To configure a Gigabit Ethernet interface to send or receive pause frames, use the `flowcontrol` command. To disable the flow control setting, use the `no` form of this command.

```
flowcontrol { receive | send } { off | on | desired }

no flowcontrol { receive | send } { off | on | desired }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive</td>
<td>Specifies that the interface processes pause frames.</td>
</tr>
<tr>
<td>send</td>
<td>Specifies that the interface sends pause frames.</td>
</tr>
<tr>
<td>off</td>
<td>Prevents a local port from receiving and processing pause frames from remote ports or from sending pause frames to remote ports.</td>
</tr>
<tr>
<td>on</td>
<td>Enables a local port to receive and process pause frames from remote ports or send pause frames to remote ports.</td>
</tr>
<tr>
<td>desired</td>
<td>Obtains predictable results whether a remote port is set to on, off, or desired.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings for Gigabit Ethernet interfaces are as follows:

- Sending pause frames is off—Non-oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Non-oversubscribed Gigabit Ethernet interfaces.
- Sending pause frames is on—Oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Oversubscribed Gigabit Ethernet interfaces.

**Table 2-3** shows the default settings for the modules.

</tbody>
</table>
Usage Guidelines

The pause frames are special packets that signal a source to stop sending frames for a specific period of time because the buffers are full.

Table 2-4 describes the guidelines for using the different configurations of the send and receive keywords with the flowcontrol command.

Table 2-4  Keyword Configurations for send and receive

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>send on</td>
<td>Enables a local port to send pause frames to remote ports. To obtain predictable results, use send on only when remote ports are set to receive on or receive desired.</td>
</tr>
<tr>
<td>send off</td>
<td>Prevents a local port from sending pause frames to remote ports. To obtain predictable results, use send off only when remote ports are set to receive off or receive desired.</td>
</tr>
<tr>
<td>send desired</td>
<td>Obtains predictable results whether a remote port is set to receive on, receive off, or receive desired.</td>
</tr>
<tr>
<td>receive on</td>
<td>Enables a local port to process pause frames that a remote port sends. To obtain predictable results, use receive on only when remote ports are set to send on or send desired.</td>
</tr>
<tr>
<td>receive off</td>
<td>Prevents remote ports from sending pause frames to a local port. To obtain predictable results, use send off only when remote ports are set to receive off or receive desired.</td>
</tr>
<tr>
<td>receive desired</td>
<td>Obtains predictable results whether a remote port is set to send on, send off, or send desired.</td>
</tr>
</tbody>
</table>

Table 2-5 identifies how the flow control will be forced or negotiated on the Gigabit Ethernet interfaces based on their speed settings.

Table 2-5  Send Capability by Switch Type, Module, and Port

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Configured Speed</th>
<th>Advertised Flow Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100/1000BASE-TX</td>
<td>Speed 1000</td>
<td>Configured flow control always</td>
</tr>
<tr>
<td>1000BASE-T</td>
<td>Negotiation always enabled</td>
<td>Configured flow control always negotiated</td>
</tr>
<tr>
<td>1000BASE-X</td>
<td>No speed nonegotiation</td>
<td>Configured flow control negotiated</td>
</tr>
<tr>
<td>1000BASE-X</td>
<td>Speed nonegotiation</td>
<td>Configured flow control forced</td>
</tr>
</tbody>
</table>

Examples

This example shows how to enable send flow control:

```
Switch(config-if)# flowcontrol receive on
Switch(config-if)#
```

This example shows how to disable send flow control:

```
Switch(config-if)# flowcontrol send off
Switch(config-if)#
```
This example shows how to set receive flow control to desired:

```
Switch(config-if)# flowcontrol receive desired
Switch(config-if)#
```

**hardware statistics**

To enable TCAM hardware statistics in your ACLs use the `hardware statistics` command. To disable TCAM hardware statistics, use the `no` form of this command.

```
hardware statistics
no hardware statistics
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Hardware statistics is disabled.

**Command Modes**

Global configuration mode

**Command History**

Release | Modification
---|---
12.2(40)SG | Support introduced on Supervisor Engine 6-E and Catalyst 4900M.

**Usage Guidelines**

The Supervisor Engine 6-E and Catalyst 4900 M chassis TCAM hardware do not have enough hardware statistics entries for every classification/QoS cam entry. Therefore, the statistics for each cam entry needs to be enabled as needed.

**Examples**

This example shows how to enable TCAM hardware statistics in your ACLs ace:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# ip access-list extended myv4
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# hardware statistics
Switch(config-ext-nacl)# end
```

**Related Commands**

</tbody>
</table>
**hw-module beacon**

The `hw-module beacon` command is enabled only on the uplink modules of the WS-C4500X-32.

To control the beacon LED in conjunction with the beacon button, enter the `hw-module beacon` command:

```
hw-module beacon [on | off]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>on</td>
<td>Turns on the LED.</td>
</tr>
<tr>
<td>off</td>
<td>Turns off the LED.</td>
</tr>
</tbody>
</table>

**Defaults**

none

**Command Modes**

global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS-XE 3.3.0SG</td>
<td>Support for this command was introduced on WS-C4500X-32.</td>
</tr>
<tr>
<td>(15.1(1)SG)</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Either press the beacon button on the front side of the switch or enter the `hw-mod beacon` command, so the switch is identifiable when the operator walks around the isle to the back side of the switch. (The LED and the CLI function as switch identifiers when multiple units are present.)

Pressing the blue beacon LED switch toggles the beacon LED state.

**Examples**

If numerous WS-C4500X-32 chassis are in close proximity and you want to remove a transceiver from one chassis’ port 11, you can identify it with the `hw-module beacon on` command:

```
Switch# hw-module beacon on
```

```
*Feb 16 13:12:24.418: %C4K_IOSMODPORTMAN-6-BEACONTURNEDON: Beacon has been turned on
```

The WS-C4500X-32 whose beacon was turned on is the switch you are looking for.

After you complete the necessary service on a switch with the beacon LED turned on, you should either press the beacon button to turn it off, or enter the `hw-module beacon off` command to turn the LED off.

```
Switch# hw-module beacon off
```

```
*Feb 16 13:12:18.083: %C4K_IOSMODPORTMAN-6-BEACONTURNEDOFF: Beacon has been turned off
```
hw-module module start

**Note**

The `hw-module module start` command is enabled only on the uplink modules of the WS-C4500X-32.

To boot a module after it has been stopped, use the `hw-module module start` command:

```
hw-module module number start
```

**Syntax Description**

- `number`  
  Uplink module ID. The only applicable value for WS-C4500 is 2.

**Defaults**

- none

**Command Modes**

- global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS-XE 3.3.0SG</td>
<td>Support for this command was introduced on WS-C4500X-32.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To bring up a module that has been stopped using the `hw-module module number stop` command or by pressing the OIR button, you either enter the `hw-module module number start` command or physically remove and reinsert.

**Examples**

The following example shows what happens if a module has been stopped and you enter this command:

```
Switch# hw-module module 2 start
Switch#
*Feb  5 16:36:27.352: %C4K_IOSMODPORTMAN-6-MODULEINSERTED: Module 2 is inserted
*Feb  5 16:37:15.902: %C4K_IOSMODPORTMAN-6-MODULEONLINE: Module 2 (WS-X4908X-10G-TIM S/N: JAE15340C0J Hw: 0.1) is online
Switch#show module

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for TwinGig converter module introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Support for this command is available on the Cisco Catalyst 4500 modules that support TwinGig converter modules, such as the Supervisor Engine 6-E and WS-X4606-10GE-E.

**Examples**

This example shows how to select Gigabit Ethernet interfaces on a WS-X4606-10GE-E using the TwinGig Converter:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# hw-module module 1 port-group 1 select gigabitethernet
Switch(config)# exit
```

Use the `show interfaces status` command to display your configuration.

**Related Commands**

hw-module system max-queue-limit

To enable a user to change the queue limit for all interfaces globally use the `hw-module system max-queue-limit` command. To cancel the global setting, use the `no` form of the command.

```
hw-module system max-queue-limit max-queue-limit
no hw-module system max-queue-limit max-queue-limit
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>max-queue-limit</code></td>
<td>Specifies the queue limit for all interfaces. Valid values are from 1024 to 8184. This parameter must be a multiple of 8.</td>
</tr>
</tbody>
</table>

**Defaults**

Not enabled by default

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG1, and 3.2.1SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command allows you to change the queue limit for all interfaces globally rather than apply a policy with a queue limit to all the interfaces.

This is a global configuration command. It can be overridden by the per port, per class, `queue-limit` command.

For a standalone supervisor engine, you must reboot the engine after applying this command. For a redundant supervisor engine, you must enter the `redundancy reload shelf` command to enforce a reboot on both the supervisor engines.

**Examples**

This example shows how to set the queue limit globally to 1024:

```
Switch> enable
Switch# configure terminal
Switch(config)# hw-module system max-queue-limit 1024
Need to reboot to take effect max queue limit
Switch(config)# exit
Switch# reload  (for standalone supervisors)
Switch# redundancy reload shelf  (for redundant supervisors in SSO mode)
or
Switch# redundancy force-switchover  (followed by another redundancy force-switchover, for redundant supervisors in RPR mode)
```
**hw-module uplink mode**

To change the uplink mode so that you can use the shared-backplane or the tengigabitethernet mode. To disable shared-backplane uplink mode, use the **no** form of the command.

```
hw-module uplink mode [shared-backplane | tengigabitethernet]

no hw-module uplink mode [shared-backplane | tengigabitethernet]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shared-backplane</td>
<td>(Optional) Specifies the four Ten-Gigabit Ethernet uplinks as blocking</td>
</tr>
<tr>
<td></td>

<td>(15.1(1)SG)</td>
<td>Engine 6-E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When changing the uplink mode using the **hw-module uplink mode shared-backplane** command, you must reload the system. A message appears on the console to reflect this.

On a Supervisor Engine 6-E in a 6 or 7-slot chassis (Catalyst 4506-E, 4507R-E, and 4507R+E), the default uplink mode does not allow a WS-X4640-CSFP-E linecard to boot in the last slot because of a hardware limitation. After you use the **hw-module uplink mode tengigabitethernet** command, you must reload the system to enable TenGig mode. The configuration is NVGEN’d after you save the running configuration to the startup configuration. You can use the **show run incl uplink** command to check the uplink configuration before reloading the system. Furthermore, you can enter the **show hw-module uplink** command to display the uplink mode. It reports the current uplink mode, as well as the mode after the system reloads.

In uplink TenGig mode, the uplink is limited to two 10-Gigabit Ethernet interfaces in non-redundant and in redundant mode; Gigabit Ethernet interfaces are not supported. The WS-X4640-CSFP-E linecard boots in the last slot on 6 and 7-slot chassis. To return to default mode, reload the system from tengigabitethernet mode. SharedBackplane mode can be selected from Default mode, where a system reload is required as well.

The **hw-module module x port-group x select gigabitethernet** command is blocked in uplink TenGig mode, preventing you from selecting gigabitethernet mode.
This example shows how to enable shared-backplane uplink mode:

Switch(config)# hw-module uplink mode shared-backplane
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#

This example shows how to disable shared-backplane uplink mode:

Switch(config)# no hw-module uplink mode shared-backplane
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#

This example shows how to display the current state of uplink-mode:

Switch# show hw-module uplink
Active uplink mode configuration is Default
(will be Shared-backplane after next reload)

A reload of active supervisor is required to apply the new configuration.

**hw-module uplink select**

To select the 10-Gigabit Ethernet, or Gigabit Ethernet uplinks on a Supervisor Engine V-10GE in a WS-C4510R chassis, or Supervisor 7L-E in a WS-C4507R chassis, use the `hw-module uplink select` command.

**Note**
Supervisor Engine 7L-E is not supported on a ten-slot chassis (WS-C4510R).

```plaintext
hw-module uplink select { tengigabitethernet | gigabitethernet | all }
```

**Note**
Option `all` is not supported on Supervisor Engine 7L-E.

**Syntax Description**
- `tengigabitethernet` (Optional) Specifies the 10-Gigabit Ethernet uplinks.
- `gigabitethernet` (Optional) Specifies the Gigabit Ethernet uplinks.
- `all` (Optional) Specifies all uplinks (10-Gigabit Ethernet and Gigabit Ethernet).

**Defaults**
tengigabitethernet

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Support for the <code>all</code> keyword was added.</td>
</tr>
<tr>
<td>15.0(2)XO</td>
<td>The number of uplink ports for Supervisor Engine 7L-E in a WS-C4507R chassis depends on the supervisor engine mode (single or redundant) and the uplink mode configuration (1-Gigabit or 10-Gigabit).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
On a Supervisor Engine V-10GE (WS-X4516-10GE) in a 10-slot chassis (Catalyst 4510R and 4510R-E), if a startup configuration with a new uplink mode is copied into flash memory and the system is power cycled, the system will not come up with the new uplink mode. After copying the startup configuration with the new uplink mode into flash memory, the uplink mode must be changed to the new uplink mode through the command interface before the system is power cycled. This ensures that the system comes up in the new uplink mode.

Supervisor Engine V-10GE and Supervisor Engine II+10GE support 10-Gigabit Ethernet and Gigabit Ethernet uplink ports. On the Supervisor Engine II+10GE, all uplink ports are always available. Similarly, when a Supervisor Engine V-10GE is plugged into a W-C4503, W-4506, or W-4507R chassis, all uplink ports are always available. When a Supervisor Engine V-10GE is plugged into a W-4510R-
chassis, you can choose to use the 10-Gigabit Ethernet uplink ports, the Gigabit Ethernet uplink ports, or all uplink ports. If you choose to use all uplink ports, then the tenth slot will support only the WS-X4302-GB switching linecard. Be aware that this command takes effect only after a reload (after you have executed the `redundancy reload shelf` command).

Because the uplink selection is programmed into hardware during initialization, changing the active uplinks requires saving the configuration and reloading the switch. When you are configuring a change to the uplinks, the system responds with a message informing you that the switch must be reloaded and suggesting the appropriate command (depending on redundancy mode) to reload the switch.

If you select the `all` keyword, ensure that the tenth slot is either empty or has a WS-X4302-GB switching module.

A `no` form of this command does not exist. To undo the configuration, you must configure the uplinks.

For Supervisor Engine 7L-E in a WS-C4507R chassis, the number of uplink options depends on the supervisor engine mode (single or redundant) and the uplink mode configuration (1-Gigabit or 10-Gigabit)

**Single Supervisor Mode**

In single supervisor mode, Supervisor Engine 7L-E supports the uplink configuration of at most either two 10-Gigabit or four 1-Gigabit ports (Table 2-6).

**Table 2-6 Uplink Options for Single Supervisor Mode**

<table>
<thead>
<tr>
<th>Slot 1</th>

</tr>
</tbody>
</table>

Choose 1-Gigabit operation through the command line interface.

<table>
<thead>
<tr>
<th>Slot 1</th>
<th>Slot 2</th>
<th>Slot 3</th>
<th>Slot 4</th>
<th>Speeds Achievable with this Combination of Pluggables</th>
</tr>
</thead>
<tbody>
<tr>
<td>SFP</td>
<td>SFP</td>
<td>SFP</td>
<td>SFP</td>
<td>4 Gbps</td>
</tr>
</tbody>
</table>

**Redundant Supervisor Mode**

In redundant supervisor mode, Supervisor Engine 7L-E support 1+1 (in 10-Gigabit mode) and 2+2 (in 1-Gigabit mode) (Table 2-7).

<table>
<thead>
<tr>
<th>Active Supervisor Uplink Ports</th>
<th>Standby Supervisor Uplink Ports</th>
<th>Speeds Achievable with this Combination of Pluggables</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1 A2 A3 A4</td>
<td>B1 B2 B3 B4</td>
<td>20 Gbps</td>
</tr>
</tbody>
</table>

Choose 10-Gigabit operation through the command line interface.

*Note: No redundancy support exists for slots 3 and 4.*

**Table 2-7 Uplink Options for Redundant Supervisor Mode**
**hw-module uplink select**

**Examples**

This example shows how to select the Gigabit Ethernet uplinks:

```bash
Switch(config)# hw-module uplink select gigabitethernet
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

**Note**

The Gigabit Ethernet uplinks will be active after the next reload.

This example shows how to select the Gigabit Ethernet uplinks in a redundant system in SSO mode:

```bash
Switch(config)# hw-module uplink select gigabitethernet
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration
Switch(config)# exit
Switch#
```

**Note**

The Gigabit Ethernet uplinks will be active after the next reload of the chassis/shelf. Use the `redundancy reload shelf` command to reload the chassis/shelf.

This example shows how to select the Gigabit Ethernet uplinks in a redundant system in RPR mode:

```bash
Switch(config)# hw-module uplink select gigabitethernet
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

**Note**

The Gigabit Ethernet uplinks will be active on a switchover or reload of the active supervisor engine.

This example shows how to select all the uplinks in a redundant system in SSO mode:

```bash
Switch(config)# hw-module uplink select all
Warning: This configuration mode may disable slot10.
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration.
Switch(config)# exit
Switch#
```

**Note**

If you select the `all` keyword, only the Drome board will be supported in the tenth slot of the supervisor engine.

---

### Table 2-7 Uplink Options for Redundant Supervisor Mode

Related Commands | Command | Description  
--- | --- | ---  
show hw-module uplink | Displays hardware-module uplink information.  

To map a VLAN or a set of VLANs to an MST instance, use the `instance` command. To return the VLANs to the common instance default, use the `no` form of this command.

```
instance instance-id {vlans vlan-range}
no instance instance-id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>instance-id</code></td>
<td>MST instance to which the specified VLANs are mapped; valid values are from 0 to 15.</td>
</tr>
<tr>
<td><code>vlans vlan-range</code></td>
<td>Specifies the number of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

### Defaults

Mapping is disabled.

### Command Modes

MST configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The mapping is incremental, not absolute. When you enter a range of VLANs, this range is added or removed to the existing ones.

Any unmapped VLAN is mapped to the CIST instance.

### Examples

This example shows how to map a range of VLANs to instance 2:

```
Switch(config-mst)# instance 2 vlans 1-100
Switch(config-mst)#
```

This example shows how to map a VLAN to instance 5:

```
Switch(config-mst)# instance 5 vlans 1100
Switch(config-mst)#
```

This example shows how to move a range of VLANs from instance 2 to the CIST instance:

```
Switch(config-mst)# no instance 2 vlans 40-60
Switch(config-mst)#
```

This example shows how to move all the VLANs mapped to instance 2 back to the CIST instance:

```
Switch(config-mst)# no instance 2
Switch(config-mst)#
```

interface port-channel

To access or create a port-channel interface, use the interface port-channel command.

```
interface port-channel channel-group
```

**Syntax Description**

- `channel-group`: Port-channel group number; valid values are from 1 to 64.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You do not have to create a port-channel interface before assigning a physical interface to a channel group. A port-channel interface is created automatically when the channel group gets its first physical interface, if it is not already created.

You can also create the port channels by entering the `interface port-channel` command. This will create a Layer 3 port channel. To change the Layer 3 port channel into a Layer 2 port channel, use the `switchport` command before you assign the physical interfaces to the channel group. A port channel cannot be changed from Layer 3 to Layer 2 or vice versa when it contains member ports.

Only one port channel in a channel group is allowed.

**Caution**

The Layer 3 port-channel interface is the routed interface. Do not enable Layer 3 addresses on the physical Fast Ethernet interfaces.

If you want to use CDP, you must configure it only on the physical Fast Ethernet interface and not on the port-channel interface.

**Examples**

This example creates a port-channel interface with a channel-group number of 64:

```
Switch(config)# interface port-channel 64
Switch(config)#
```

**Related Commands**

<table>
<thead>

</table>
interface range

To run a command on multiple ports at the same time, use the **interface range** command.

```
interface range {vlan vlan_id - vlan_id} {port-range | macro name}
```

### Syntax Description

- **vlan vlan_id - vlan_id**
  
  Specifies a VLAN range; valid values are from 1 to 4094.

- **port-range**
  
  Port range; for a list of valid values for `port-range`, see the “Usage Guidelines” section.

- **macro name**
  
  Specifies the name of a macro.

### Defaults

This command has no default settings.

### Command Modes

- Global configuration mode
- Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can use the **interface range** command on the existing VLAN SVIs only. To display the VLAN SVIs, enter the **show running config** command. The VLANs that are not displayed cannot be used in the **interface range** command.

The values that are entered with the **interface range** command are applied to all the existing VLAN SVIs.

Before you can use a macro, you must define a range using the **define interface-range** command.

All configuration changes that are made to a port range are saved to NVRAM, but the port ranges that are created with the **interface range** command do not get saved to NVRAM.

You can enter the port range in two ways:

- Specifying up to five port ranges
- Specifying a previously defined macro

You can either specify the ports or the name of a port-range macro. A port range must consist of the same port type, and the ports within a range cannot span the modules.

You can define up to five port ranges on a single command; separate each range with a comma.

When you define a range, you must enter a space between the first port and the hyphen (-):

```
interface range gigabitethernet 5/1 -20, gigabitethernet4/5 -20.
```
Use these formats when entering the *port-range*:

- `interface-type {mod}/[{first-port} - {last-port}]`
- `interface-type {mod}/[{first-port} - {last-port}]`

Valid values for *interface-type* are as follows:

- **FastEthernet**
- **GigabitEthernet**
- **Vlan vlan_id**

You cannot specify both a macro and an interface range in the same command. After creating a macro, you can enter additional ranges. If you have already entered an interface range, the CLI does not allow you to enter a macro.

You can specify a single interface in the *port-range* value. This makes the command similar to the *interface* *interface-number* command.

### Examples

This example shows how to use the *interface range* command to interface to FE 5/18 - 20:

```
Switch(config)# interface range fastethernet 5/18 - 20
Switch(config-if)#
```

This command shows how to run a port-range macro:

```
Switch(config)# interface range macro macro1
Switch(config-if)#
```

interf ace vlan

To create or access a Layer 3 switch virtual interface (SVI), use the `interface vlan` command. To delete an SVI, use the `no` form of this command.

```
interface vlan vlan_id

no interface vlan vlan_id
```

**Syntax Description**

| `vlan_id` | Number of the VLAN; valid values are from 1 to 4094. |

**Defaults**

Fast EtherChannel is not specified.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The SVIs are created the first time that you enter the `interface vlan vlan_id` command for a particular VLAN. The `vlan_id` value corresponds to the VLAN tag that is associated with the data frames on an ISL or 802.1Q-encapsulated trunk or the VLAN ID that is configured for an access port. A message is displayed whenever a VLAN interface is newly created, so you can check that you entered the correct VLAN number.

If you delete an SVI by entering the `no interface vlan vlan_id` command, the associated interface is forced into an administrative down state and marked as deleted. The deleted interface will no longer be visible in a `show interface` command.

You can reinstate a deleted SVI by entering the `interface vlan vlan_id` command for the deleted interface. The interface comes back up, but much of the previous configuration will be gone.

**Examples**

This example shows the output when you enter the `interface vlan vlan_id` command for a new VLAN number:

```
Switch(config)# interface vlan 23
% Creating new VLAN interface.
Switch(config)#
```
ip admission proxy http refresh-all

To ensure that you see a customized WebAuth login page with the same name in the switch system directory as a same-named prior login page, use the `ip admission proxy http refresh-all` command.

```
  ip admission proxy http [success | failure | refresh-all | login [expired | page]]
```

**Syntax Description**

- **success**: Successful authentication proxy.
- **failure**: Failed authentication proxy.
- **refresh-all**: Refresh all custom html pages.
- **login expired**: Specify expired webpage
- **login page**: Specify customized login webpage

**Defaults**

If you do not enter this command, if any of the customized web-based authentication page files with the file of same name have been changed, you see the old login page rather than the new file.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should enter this command whenever the customized web-based authentication page has been changed in the system directory.

**Examples**

This example shows how to enter this command:

```
Switch# config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip admission proxy http [success | failure | refresh-all | login]
Switch(config)# end
Switch#
```

<The new html page is observed.>
ip arp inspection filter vlan

To permit ARPs from hosts that are configured for static IP when DAI is enabled and to define an ARP access list and apply it to a VLAN, use the ip arp inspection filter vlan command. To disable this application, use the no form of this command.

```
ip arp inspection filter arp-acl-name vlan vlan-range [static]
no ip arp inspection filter arp-acl-name vlan vlan-range [static]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp-acl-name</td>
<td>Access control list name.</td>
</tr>
<tr>
<td>vlan-range</td>
<td>VLAN number or range; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>static</td>
<td>(Optional) Specifies that the access control list should be applied statically.</td>
</tr>
</tbody>
</table>

**Defaults**

No defined ARP ACLs are applied to any VLAN.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When an ARP access control list is applied to a VLAN for dynamic ARP inspection, the ARP packets containing only the IP-to-Ethernet MAC bindings are compared against the ACLs. All other packet types are bridged in the incoming VLAN without validation.

This command specifies that the incoming ARP packets are compared against the ARP access control list, and the packets are permitted only if the access control list permits them.

If the access control lists deny the packets because of explicit denies, the packets are dropped. If the packets are denied because of an implicit deny, they are then matched against the list of DHCP bindings if the ACL is not applied statically.

**Examples**

This example shows how to apply the ARP ACL static hosts to VLAN 1 for DAI:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection filter static-hosts vlan 1
Switch(config)# end
Switch#
Switch# show ip arp inspection vlan 1
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
```

ip arp inspection limit (interface)

To limit the rate of incoming ARP requests and responses on an interface and prevent DAI from consuming all of the system’s resources in the event of a DoS attack, use the `ip arp inspection limit` command. To release the limit, use the `no` form of this command.

```
  ip arp inspection limit {rate pps \ none} \ [burst interval seconds]
  no ip arp inspection limit
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>rate pps</em></td>
<td>Specifies an upper limit on the number of incoming packets processed per second. The rate can range from 1 to 10000.</td>
</tr>
<tr>
<td><em>none</em></td>
<td>Specifies no upper limit on the rate of the incoming ARP packets that can be processed.</td>
</tr>
<tr>
<td><em>burst interval seconds</em></td>
<td>(Optional) Specifies the consecutive interval in seconds over which the interface is monitored for the high rate of the ARP packets. The interval is configurable from 1 to 15 seconds.</td>
</tr>
</tbody>
</table>

### Defaults

The rate is set to 15 packets per second on the untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second.

The rate is unlimited on all the trusted interfaces.

The burst interval is set to 1 second by default.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(20)EW</td>
<td>Added support for interface monitoring.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The trunk ports should be configured with higher rates to reflect their aggregation. When the rate of the incoming packets exceeds the user-configured rate, the interface is placed into an error-disabled state. The error-disable timeout feature can be used to remove the port from the error-disabled state. The rate applies to both the trusted and nontrusted interfaces. Configure appropriate rates on trunks to handle the packets across multiple DAI-enabled VLANs or use the `none` keyword to make the rate unlimited.

The rate of the incoming ARP packets on the channel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for the channel ports only after examining the rate of the incoming ARP packets on the channel members.

After a switch receives more than the configured rate of packets every second consecutively over a period of burst seconds, the interface is placed into an error-disabled state.
This example shows how to limit the rate of the incoming ARP requests to 25 packets per second:

```
Switch# config terminal
Switch(config)# interface fa6/3
Switch(config-if)# ip arp inspection limit rate 25
Switch(config-if)# end
Switch# show ip arp inspection interfaces fastEthernet 6/3
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Trust State</th>
<th>Rate (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa6/3</td>
<td>Trusted</td>
<td>25</td>
</tr>
</tbody>
</table>

Switch#

This example shows how to limit the rate of the incoming ARP requests to 20 packets per second and to set the interface monitoring interval to 5 consecutive seconds:

```
Switch# config terminal
Switch(config)# interface fa6/1
Switch(config-if)# ip arp inspection limit rate 20 burst interval 5
Switch(config-if)# end
```

Related Commands

<td>Displays the status of dynamic ARP inspection for a specific range of VLANs.</td>
</tr>
</tbody>
</table>
ip arp inspection log-buffer

To configure the parameters that are associated with the logging buffer, use the ip arp inspection log-buffer command. To disable the parameters, use the no form of this command.

```
ip arp inspection log-buffer {entries number | logs number interval seconds}

no ip arp inspection log-buffer {entries | logs}
```

**Syntax Description**

- **entries number**: Number of entries from the logging buffer; the range is from 0 to 1024.
- **logs number**: Number of entries to be logged in an interval; the range is from 0 to 1024. A 0 value indicates that entries should not be logged out of this buffer.
- **interval seconds**: Logging rate; the range is from 0 to 86400 (1 day). A 0 value indicates an immediate log.

**Defaults**

When dynamic ARP inspection is enabled, denied, or dropped, the ARP packets are logged.

The number of entries is set to 32.

The number of logging entries is limited to 5 per second.

The interval is set to 1.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The first dropped packet of a given flow is logged immediately. The subsequent packets for the same flow are registered but are not logged immediately. Registering these packets is done in a log buffer that is shared by all the VLANs. Entries from this buffer are logged on a rate-controlled basis.

**Examples**

This example shows how to configure the logging buffer to hold up to 45 entries:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection log-buffer entries 45
Switch(config)# end
Switch# show ip arp inspection log
Total Log Buffer Size : 45
Syslog rate : 5 entries per 1 seconds.
No entries in log buffer.
Switch#
```
This example shows how to configure the logging rate to 10 logs per 3 seconds:

```
Switch(config)# ip arp inspection log-buffer logs 10 interval 3
Switch(config)# end
Switch# show ip arp inspection log
Total Log Buffer Size : 45
Syslog rate : 10 entries per 3 seconds.
No entries in log buffer.
Switch#
```

ip arp inspection trust

To set a per-port configurable trust state that determines the set of interfaces where incoming ARP packets are inspected, use the `ip arp inspection trust` command. To make the interfaces untrusted, use the `no` form of this command.

```
ip arp inspection trust
no ip arp inspection trust
```

Syntax Description
This command has no arguments or keywords.

Defaults
This command has no default settings.

Command Modes
Interface configuration mode

Command History
Release          Modification
12.1(19)EW       Support for this command was introduced on the Catalyst 4500 series switch.

Examples
This example shows how to configure an interface to be trusted:

```
Switch# config terminal
Switch(config)# interface fastEthernet 6/3
Switch(config-if)# ip arp inspection trust
Switch(config-if)# end
```

To verify the configuration, use the show form of this command:

```
Switch# show ip arp inspection interfaces fastEthernet 6/3

  Interface     Trust State  Rate (pps)  Burst Interval
              --------    ----------    --------------
  Fa6/3         Trusted      None          1

Switch#
```

</table>
ip arp inspection validate

To perform specific checks for ARP inspection, use the `ip arp inspection validate` command. To disable checks, use the `no` form of this command.

```
ip arp inspection validate [src-mac] [dst-mac] [ip]
no ip arp inspection validate [src-mac] [dst-mac] [ip]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>src-mac</th>
<th>(Optional) Checks the source MAC address in the Ethernet header against the sender’s MAC address in the ARP body. This checking is done against both ARP requests and responses.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note</strong> When <code>src-mac</code> is enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td>dst-mac</td>
<td>(Optional) Checks the destination MAC address in the Ethernet header against the target MAC address in ARP body. This checking is done for ARP responses.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When <code>dst-mac</code> is enabled, the packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td>ip</td>
<td>(Optional) Checks the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses.</td>
</tr>
<tr>
<td></td>
<td>The sender IP addresses are checked in all ARP requests and responses and target IP addresses are checked only in ARP responses.</td>
</tr>
</tbody>
</table>

**Defaults**

Checks are disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabling the checks, specify at least one of the keywords (`src-mac`, `dst-mac`, and `ip`) on the command line. Each command overrides the configuration of the previous command. If a command enables `src` and `dst mac` validations, and a second command enables IP validation only, the `src` and `dst mac` validations are disabled as a result of the second command.

The `no` form of this command disables only the specified checks. If none of the check options are enabled, all the checks are disabled.
ip arp inspection validate

Examples

This example shows how to enable the source MAC validation:

```
Switch(config)# ip arp inspection validate src-mac
Switch(config)# end
Switch# show ip arp inspection vlan 1
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled

<table>
<thead>
<tr>
<th>Vlan</th>

<tbody>
<tr>
<td>arp access-list</td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>
</tr>
<tr>
<td>show ip arp inspection</td>
<td>Displays the status of dynamic ARP inspection for a specific range of VLANs.</td>
</tr>
</tbody>
</table>
ip arp inspection vlan

To enable dynamic ARP inspection (DAI) on a per-VLAN basis, use the `ip arp inspection vlan` command. To disable DAI, use the `no` form of this command.

```
ip arp inspection vlan vlan-range
no ip arp inspection vlan vlan-range
```

**Syntax Description**

`vlan-range` VLAN number or range; valid values are from 1 to 4094.

**Defaults**

ARP inspection is disabled on all VLANs.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must specify on which VLANs to enable DAI. DAI may not function on the configured VLANs if they have not been created or if they are private.

**Examples**

This example shows how to enable DAI on VLAN 1:

```
Switch# configure terminal
Switch(config)# ip arp inspection vlan 1
Switch(config)# end
Switch# show ip arp inspection vlan 1

Source Mac Validation : Disabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
Vlan     Configuration    Operation   ACL Match          Static ACL
---------    -------------    ---------   ---------          ----------
1     Enabled          Active

Switch#
```

This example shows how to disable DAI on VLAN 1:

```
Switch# configure terminal
Switch(config)# no ip arp inspection vlan 1
Switch(config)#
```

</tbody>
</table>
ip arp inspection vlan logging

To control the type of packets that are logged, use the ip arp inspection vlan logging command. To disable this logging control, use the no form of this command.

```
ip arp inspection vlan vlan-range logging { acl-match { matchlog | none } | dhcp-bindings { permit | all | none } }
```

```
no ip arp inspection vlan vlan-range logging { acl-match | dhcp-bindings }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-range</td>
<td>Number of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>acl-match</td>
<td>Specifies the logging criteria for packets that are dropped or permitted based on ACL matches.</td>
</tr>
<tr>
<td>matchlog</td>
<td>Specifies that logging of packets matched against ACLs is controlled by the matchlog keyword in the permit and deny access control entries of the ACL.</td>
</tr>
<tr>
<td>none</td>
<td>Specifies that ACL-matched packets are not logged.</td>
</tr>
<tr>
<td>dhcp-bindings</td>
<td>Specifies the logging criteria for packets dropped or permitted based on matches against the DHCP bindings.</td>
</tr>
<tr>
<td>permit</td>
<td>Specifies logging when permitted by DHCP bindings.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies logging when permitted or denied by DHCP bindings.</td>
</tr>
<tr>
<td>none</td>
<td>Prevents all logging of packets permitted or denied by DHCP bindings.</td>
</tr>
</tbody>
</table>

### Defaults

All denied or dropped packets are logged.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The acl-match and dhcp-bindings keywords merge with each other. When you set an ACL match configuration, the DHCP bindings configuration is not disabled. You can use the no form of this command to reset some of the logging criteria to their defaults. If you do not specify either option, all the logging types are reset to log on when the ARP packets are denied. The two options that are available to you are as follows:

- **acl-match**—Logging on ACL matches is reset to log on deny
- **dhcp-bindings**—Logging on DHCP binding compared is reset to log on deny
Examples

This example shows how to configure an ARP inspection on VLAN 1 to add packets to a log on matching against the ACLs with the `logging` keyword:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog
Switch(config)# end
Switch# show ip arp inspection vlan 1
```

```
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Configuration</th>
<th>Operation</th>
<th>ACL Match</th>
<th>Static ACL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Enabled</td>
<td>Active</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Vlan ACL Logging DHCP Logging
----- ----------- ------------
1 Acl-Match Deny
```

</tbody>
</table>
ip cef load-sharing algorithm

To configure the load-sharing hash function so that the source TCP/UDP port, the destination TCP/UDP port, or both ports can be included in the hash in addition to the source and destination IP addresses, use the `ip cef load-sharing algorithm` command. To revert back to the default, which does not include the ports, use the `no` form of this command.

```
ip cef load-sharing algorithm {include-ports {source source | destination dest} | original | tunnel | universal}
```

```
no ip cef load-sharing algorithm {include-ports {source source | destination dest} | original | tunnel | universal}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>include-ports</code></td>
<td>Specifies the algorithm that includes the Layer 4 ports.</td>
</tr>
<tr>
<td><code>source source</code></td>
<td>Specifies the source port in the load-balancing hash functions.</td>
</tr>
<tr>
<td><code>destination dest</code></td>
<td>Specifies the destination port in the load-balancing hash. Uses the source and destination in hash functions.</td>
</tr>
<tr>
<td><code>original</code></td>
<td>Specifies the original algorithm; not recommended.</td>
</tr>
<tr>
<td><code>tunnel</code></td>
<td>Specifies the algorithm for use in tunnel-only environments.</td>
</tr>
<tr>
<td><code>universal</code></td>
<td>Specifies the default Cisco IOS load-sharing algorithm.</td>
</tr>
</tbody>
</table>

### Defaults

Default load-sharing algorithm is disabled.

### Note

This option does not include the source or destination port in the load-balancing hash.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The original algorithm, tunnel algorithm, and universal algorithm are routed through the hardware. For software-routed packets, the algorithms are handled by the software. The `include-ports` option does not apply to the software-switched traffic.

### Examples

This example shows how to configure the IP CEF load-sharing algorithm that includes Layer 4 ports:

```
Switch(config)# ip cef load-sharing algorithm include-ports
```

```
Switch(config)#
```
This example shows how to configure the IP CEF load-sharing algorithm that includes Layer 4 tunneling ports:

```
Switch(config)# ip cef load-sharing algorithm include-ports tunnel
Switch(config)#
```

<table>
<thead>
<tr>

</tbody>
</table>
ip device tracking maximum

To enable IP port security binding tracking on a Layer 2 port, use the ip device tracking maximum command. To disable IP port security on untrusted Layer 2 interfaces, use the no form of this command.

```
ip device tracking maximum {number}
no ip device tracking maximum {number}
```

**Syntax Description**

- `number`: Specifies the number of bindings created in the IP device tracking table for a port, valid values are from 0 to 2048.

**Defaults**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(37)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable IP port security with IP-MAC filters on a Layer 2 access port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastethernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 1
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# ip verify source tracking port-security
Switch(config-if)# end
```

You can verify your settings by entering the `show ip verify source` privileged EXEC command.

**Related Commands**

<table>

ip dhcp snooping

To enable DHCP snooping globally, use the `ip dhcp snooping` command. To disable DHCP snooping, use the `no` form of this command.

```
ip dhcp snooping
no ip dhcp snooping
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
DHCP snooping is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enable DHCP snooping globally before you can use DHCP snooping on a VLAN.

**Examples**

This example shows how to enable DHCP snooping:
```
Switch(config)# ip dhcp snooping
Switch(config)#
```

This example shows how to disable DHCP snooping:
```
Switch(config)# no ip dhcp snooping
Switch(config)#
```

**Related Commands**

</tbody>
</table>
ip dhcp snooping binding

To set up and generate a DHCP binding configuration to restore bindings across reboots, use the `ip dhcp snooping binding` command. To disable the binding configuration, use the `no` form of this command.

```
ip dhcp snooping binding mac-address vlan vlan-# ip-address interface interface expiry seconds
no ip dhcp snooping binding mac-address vlan vlan-# ip-address interface interface
```

**Syntax Description**
- `mac-address`: Specifies a MAC address.
- `vlan vlan-#`: Specifies a valid VLAN number.
- `ip-address`: Specifies an IP address.
- `interface interface`: Specifies an interface type and number.
- `expiry seconds`: Specifies the interval (in seconds) after which binding is no longer valid.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Whenever a binding is added or removed using this command, the binding database is marked as changed and a write is initiated.

**Examples**
This example shows how to generate a DHCP binding configuration on interface gigabitethernet1/1 in VLAN 1 with an expiration time of 1000 seconds:

```
Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gi1/1 expiry 1000
Switch#
```

</tr>
<tr>
<td><code>write-delay seconds</code></td>
<td>Specifies the duration for which the transfer should be delayed after a change to the binding database.</td>
</tr>
</tbody>
</table>

**Defaults**

The timeout value is set to 300 seconds (5 minutes).
The write-delay value is set to 300 seconds.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You need to create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can write the set of bindings for the first time at the URL.

**Note**

Because both NVRAM and bootflash have limited storage capacity, using TFTP or network-based files is recommended. If you use flash to store the database file, new updates (by the agent) result in the creation of new files (flash fills quickly). In addition, due to the nature of the file system used on the flash, a large number of files causes access to be considerably slowed. When a file is stored in a remote location accessible through TFTP, an RPR/SSO standby supervisor engine can take over the binding list when a switchover occurs.
Examples

This example shows how to store a database file with the IP address 10.1.1.1 within a directory called directory. A file named file must be present on the TFTP server.

Switch# config terminal
Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
Switch(config)# end
Switch# show ip dhcp snooping database
Agent URL : tftp://10.1.1.1/directory/file
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : Yes
Delay Timer Expiry : Not Running
Abort Timer Expiry : Not Running

Last Succeeded Time : None
Last Failed Time : None
Last Failed Reason : No failure recorded.

Total Attempts : 1  Startup Failures : 0
Successful Transfers : 0  Failed Transfers : 0
Successful Reads : 0  Failed Reads : 0
Successful Writes : 0  Failed Writes : 0
Media Failures : 0

Switch#

ip dhcp snooping information option

To enable DHCP option 82 data insertion, use the **ip dhcp snooping information option** command. To disable DHCP option 82 data insertion, use the **no** form of this command.

```
ip dhcp snooping information option format remote-id {hostname | string {word}}
no ip dhcp snooping information option format remote-id {hostname | string {word}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Specifies the option 82 information format.</td>

</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added <strong>remote-id</strong> keyword to support option 82 enhancement.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the hostname is longer than 63 characters it is truncated to 63 characters in the remote ID.

**Examples**

This example shows how to enable DHCP option 82 data insertion:

```
Switch(config)# ip dhcp snooping information option
Switch(config)#
```

This example shows how to disable DHCP option 82 data insertion:

```
Switch(config)# no ip dhcp snooping information option
Switch(config)#
```

This example shows how to configure the hostname as the remote ID:

```
Switch(config)# ip dhcp snooping information option format remote-id hostname
Switch(config)#
```

The following example shows how to enable DHCP Snooping on VLAN 500 through 555 and option 82 remote ID:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
```
ip dhcp snooping information option

Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust

ip dhcp snooping limit rate

To configure the number of the DHCP messages that an interface can receive per second, use the ip dhcp snooping limit rate command. To disable the DHCP snooping rate limiting, use the no form of this command.

    ip dhcp snooping limit rate rate

    no ip dhcp snooping limit rate

Syntax Description

rate Number of DHCP messages a switch can receive per second.

Defaults

DHCP snooping rate limiting is disabled.

Command Modes

Interface configuration mode

Command History

Release Modification
12.1(12c)EW Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

Typically, the rate limit applies to the untrusted interfaces. If you want to set up rate limiting for the trusted interfaces, note that the trusted interfaces aggregate all DHCP traffic in the switch, and you will need to adjust the rate limit of the interfaces to a higher value.

Examples

This example shows how to enable the DHCP message rate limiting:

    Switch(config-if)# ip dhcp snooping limit rate 150
    Switch(config)#

This example shows how to disable the DHCP message rate limiting:

    Switch(config-if)# no ip dhcp snooping limit rate
    Switch(config)#

**ip dhcp snooping vlan**

Use the `ip dhcp snooping vlan` command to enable DHCP snooping on a VLAN. To disable DHCP snooping on a VLAN, use the `no` form of this command.

```
ip dhcp snooping [vlan number]
no ip dhcp snooping [vlan number]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan number</strong></td>
<td>(Optional) Single VLAN number or a range of VLANs; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Defaults</th>
<th>DHCP snooping is disabled.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command Modes</th>
<th>Global configuration mode</th>
</tr>
</thead>
</table>

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

DHCP snooping is enabled on a VLAN only if both global snooping and the VLAN snooping are enabled.

**Examples**

This example shows how to enable DHCP snooping on a VLAN:

```
Switch(config)# ip dhcp snooping vlan 10
Switch(config)#
```

This example shows how to disable DHCP snooping on a VLAN:

```
Switch(config)# no ip dhcp snooping vlan 10
Switch(config)#
```

This example shows how to enable DHCP snooping on a group of VLANs:

```
Switch(config)# ip dhcp snooping vlan 10 55
Switch(config)#
```

This example shows how to disable DHCP snooping on a group of VLANs:

```
Switch(config)# no ip dhcp snooping vlan 10 55
Switch(config)#
```
**ip dhcp snooping vlan**

The `ip dhcp snooping vlan` command is used to enable DHCP snooping on a specific VLAN. This is typically done to enhance network security by tracking DHCP requests and responses to prevent unauthorized devices from accessing the network.

</table>
ip dhcp snooping vlan information option format-type circuit-id string

To enable circuit-id (a suboption of DHCP snooping option 82) on a VLAN, use the `ip dhcp snooping vlan information option format-type circuit-id string` command. To disable circuit-id on a VLAN, use the `no` form of this command.

```
ip dhcp snooping vlan number information option format-type circuit-id [override] string

no ip dhcp snooping vlan number information option format-type circuit-id [override] string
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Specifies single or range of VLANs; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>override</td>
<td>(Optional) Specifies an override string.</td>
</tr>
<tr>
<td>string string</td>
<td>Specifies a user-defined string for the circuit ID; range of 3 to 63 ASCII characters with no spaces.</td>
</tr>
</tbody>
</table>

**Defaults**

VLAN-mod-port, if DHCP snooping option-82 is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Added the <code>override</code> option</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The circuit-id suboption of DHCP option 82 is supported only when DHCP snooping is globally enabled and on VLANs using DHCP option 82.

This command allows you to configure a string of ASCII characters to be the circuit ID. When you want to override the vlan-mod-port format type and instead use the circuit-ID to define subscriber information, use the `override` keyword.

**Examples**

The following example shows how to enable DHCP snooping on VLAN 500 through 555 and option 82 circuit-id:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
```
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config)# end

This example shows how to configure the option-82 circuit-ID override suboption:

Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id override string testcustomer

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

**Note**

The `show ip dhcp snooping` user EXEC command only displays the global command output, including a remote-ID configuration. It does not display any per-interface, per-VLAN string that you have configured for the circuit ID.

ip igmp filter

To control whether all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an IGMP profile to the interface, use the **ip igmp filter** command. To remove a profile from the interface, use the **no** form of this command.

```
ip igmp filter profile number

no ip igmp filter
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>profile number</strong></td>
<td>IGMP profile number to be applied; valid values are from 1 to 429496795.</td>
</tr>
</tbody>
</table>

**Defaults**

Profiles are not applied.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can apply IGMP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.

An IGMP profile can be applied to one or more switch port interfaces, but one port can have only one profile applied to it.

**Examples**

This example shows how to apply IGMP profile 22 to an interface:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip igmp filter 22
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp profile</td>
<td>Creates an IGMP profile.</td>
</tr>
<tr>
<td>show ip igmp profile</td>
<td>Displays all configured IGMP profiles or a specified IGMP profile.</td>
</tr>
</tbody>
</table>
**ip igmp max-groups**

To set the maximum number of IGMP groups that a Layer 2 interface can join, use the `ip igmp max-groups` command. To set the maximum back to the default, use the `no` form of this command.

```
ip igmp max-groups number
no ip igmp max-groups
```

**Syntax Description**

| number | Maximum number of IGMP groups that an interface can join; valid values are from 0 to 4294967294. |

**Defaults**

No maximum limit.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `ip igmp max-groups` command only on Layer 2 physical interfaces; you cannot set the IGMP maximum groups for the routed ports, the switch virtual interfaces (SVIs), or the ports that belong to an EtherChannel group.

**Examples**

This example shows how to limit the number of IGMP groups that an interface can join to 25:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)
```
ip igmp profile

To create an IGMP profile, use the `ip igmp profile` command. To delete the IGMP profile, use the `no` form of this command.

```
ip igmp profile profile number
no ip igmp profile profile number
```

**Syntax Description**

| `profile number` | IGMP profile number being configured; valid values are from 1 to 4294967295. |

**Defaults**

No profile created.

**Command Modes**

- Global configuration mode
- IGMP profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When entering a range, enter the low IP multicast address, a space, and the high IP multicast address.

You can apply an IGMP profile to one or more Layer 2 interfaces, but each interface can have only one profile applied to it.

**Examples**

This example shows how to configure IGMP profile 40 that permits the specified range of IP multicast addresses:

```
Switch # config terminal
Switch(config)# ip igmp profile 40
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 233.1.1.1 233.255.255.255
Switch(config-igmp-profile)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip igmp filter</code></td>
<td>Controls whether all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an IGMP profile to the interface.</td>
</tr>
<tr>
<td><code>show ip igmp profile</code></td>
<td>Displays all configured IGMP profiles or a specified IGMP profile.</td>
</tr>
</tbody>
</table>
ip igmp query-interval

To configure the frequency that the switch sends the IGMP host-query messages, use the `ip igmp query-interval` command. To return to the default frequency, use the `no` form of this command.

```
ip igmp query-interval seconds

no ip igmp query-interval
```

**Syntax Description**

| seconds | Frequency, in seconds, at which the IGMP host-query messages are transmitted; valid values depend on the IGMP snooping mode. See the “Usage Guidelines” section for more information. |

**Defaults**

The query interval is set to 60 seconds.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you use the default IGMP snooping configuration, the valid query interval values are from 1 to 65535 seconds. If you have changed the default configuration to support CGMP as the IGMP snooping learning method, the valid query interval values are from 1 to 300 seconds.

The designated switch for a LAN is the only switch that sends the IGMP host-query messages. For IGMP version 1, the designated switch is elected according to the multicast routing protocol that runs on the LAN. For IGMP version 2, the designated querier is the lowest IP-addressed multicast switch on the subnet.

If no queries are heard for the timeout period (controlled by the `ip igmp query-timeout` command), the switch becomes the querier.

**Note**

Changing the timeout period may severely impact multicast forwarding.

**Examples**

This example shows how to change the frequency at which the designated switch sends the IGMP host-query messages:

```
Switch(config-if)# ip igmp query-interval 120
Switch(config-if)#
```

**Related Commands**
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip igmp querier-timeout</code> (refer to Cisco IOS documentation)</td>
<td>Configures the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.</td>

<td>Configures the frequency of Protocol Independent Multicast (PIM) router query messages.</td>
</tr>
<tr>
<td><code>show ip igmp groups</code> (refer to Cisco IOS documentation)</td>
<td>Displays the multicast groups with receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP), use the <code>show ip igmp groups</code> command in EXEC mode.</td>
</tr>
</tbody>
</table>
ip igmp snooping

To enable IGMP snooping, use the `ip igmp snooping` command. To disable IGMP snooping, use the `no` form of this command.

```
ip igmp snooping [tcn {flood query count count | query solicit}]
no ip igmp snooping [tcn {flood query count count | query solicit}]```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>tcn</strong></td>
<td>(Optional) Specifies the topology change configurations.</td>
</tr>
<tr>
<td><strong>flood</strong></td>
<td>(Optional) Specifies to flood the spanning tree table to the network when a topology change occurs.</td>
</tr>
<tr>
<td><strong>query</strong></td>
<td>(Optional) Specifies the TCN query configurations.</td>
</tr>
<tr>
<td><strong>count count</strong></td>
<td>(Optional) Specifies how often the spanning tree table is flooded; valid values are from 1 to 10.</td>
</tr>
<tr>
<td><strong>solicit</strong></td>
<td>(Optional) Specifies an IGMP general query.</td>
</tr>
</tbody>
</table>

### Defaults

IGMP snooping is enabled.

### Command Modes

- Global configuration mode
- Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for flooding the spanning tree table was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `tcn flood` option applies only to Layer 2 switch ports and EtherChannels; it does not apply to routed ports, VLAN interfaces, or Layer 3 channels.

The `ip igmp snooping` command is disabled by default on multicast routers.

### Note

You can use the `tcn flood` option in interface configuration mode.

### Examples

This example shows how to enable IGMP snooping:

```
Switch(config)# ip igmp snooping
Switch(config)#
```

This example shows how to disable IGMP snooping:

```
Switch(config)# no ip igmp snooping
Switch(config)#
```
This example shows how to enable the flooding of the spanning tree table to the network after nine topology changes have occurred:

```
Switch(config)# ip igmp snooping tcn flood query count 9
Switch(config)#
```

This example shows how to disable the flooding of the spanning tree table to the network:

```
Switch(config)# no ip igmp snooping tcn flood
Switch(config)#
```

This example shows how to enable an IGMP general query:

```
Switch(config)# ip igmp snooping tcn query solicit
Switch(config)#
```

This example shows how to disable an IGMP general query:

```
Switch(config)# no ip igmp snooping tcn query solicit
Switch(config)#
```

ip igmp snooping report-suppression

To enable report suppression, use the `ip igmp snooping report-suppression` command. To disable report suppression and forward the reports to the multicast devices, use the `no` form of this command.

```
  ip igmp snooping report-suppression
  no igmp snooping report-suppression
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
IGMP snooping report-suppression is enabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If the `ip igmp snooping report-suppression` command is disabled, all the IGMP reports are forwarded to the multicast devices.

If the command is enabled, report suppression is done by IGMP snooping.

**Examples**
This example shows how to enable report suppression:

```
Switch(config)# ip igmp snooping report-suppression
Switch(config)#
```

This example shows how to disable report suppression:

```
Switch(config)# no ip igmp snooping report-suppression
Switch(config)#
```

This example shows how to display the system status for report suppression:

```
Switch# show ip igmp snoop
vlan 1
--------
IGMP snooping is globally enabled
IGMP snooping TCN solicit query is globally disabled
IGMP snooping global TCN flood query count is 2
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP_ONLY mode on this Vlan
IGMP snooping report suppression is enabled on this Vlan
Switch#
```

<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is entered in VLAN interface configuration mode only.

The `ip igmp snooping vlan` command is disabled by default on multicast routers.

**Examples**

This example shows how to enable IGMP snooping on a VLAN:

```
Switch(config)# ip igmp snooping vlan 200
Switch(config)#
```

This example shows how to disable IGMP snooping on a VLAN:

```
Switch(config)# no ip igmp snooping vlan 200
Switch(config)#
```

ip igmp snooping vlan immediate-leave

To enable IGMP immediate-leave processing, use the `ip igmp snooping vlan immediate-leave` command. To disable immediate-leave processing, use the `no` form of this command.

```
ip igmp snooping vlan vlan_num immediate-leave
no ip igmp snooping vlan vlan_num immediate-leave
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan_num</code></td>
<td>Number of the VLAN; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>immediate-leave</td>
<td>Enables immediate leave processing.</td>
</tr>
</tbody>
</table>

**Defaults**

Immediate leave processing is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You enter this command in global configuration mode only.

Use the immediate-leave feature only when there is a single receiver for the MAC group for a specific VLAN.

The immediate-leave feature is supported only with IGMP version 2 hosts.

**Examples**

This example shows how to enable IGMP immediate-leave processing on VLAN 4:

```
Switch(config)# ip igmp snooping vlan 4 immediate-leave
Switch(config)#
```

This example shows how to disable IGMP immediate-leave processing on VLAN 4:

```
Switch(config)# no ip igmp snooping vlan 4 immediate-leave
Switch(config)#
```

</tr>
<tr>
<td><strong>pim-dvmrp</strong></td>
<td>Specifies the multicast switch snooping PIM-DVMRP packets.</td>
</tr>
</tbody>
</table>

**Defaults**
Multicast switch snooping PIM-DVMRP packets are specified.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

You enter this command in VLAN interface configuration mode only.

The interface to the switch must be in the VLAN where you are entering the command. It must be both administratively up and line protocol up.

The CGMP learning method can decrease control traffic.

The learning method that you configure is saved in NVRAM.

The static connections to multicast interfaces are supported only on switch interfaces.

**Examples**

This example shows how to specify the next-hop interface to a multicast switch:

```
Switch(config-if)# ip igmp snooping 400 mrouter interface fastethernet 5/6
```

This example shows how to specify the multicast switch learning method:

```
Switch(config-if)# ip igmp snooping 400 mrouter learn cgmp
```

ip local-proxy-arp

To enable the local proxy ARP feature, use the `ip local-proxy-arp` command. To disable the local proxy ARP feature, use the `no` form of this command.

```plaintext
ip local-proxy-arp
no ip local-proxy-arp
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Local proxy ARP is disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use this feature only on subnets where hosts are intentionally prevented from communicating directly to the switch on which they are connected.

ICMP redirect is disabled on interfaces where the local proxy ARP feature is enabled.

**Examples**
This example shows how to enable the local proxy ARP feature:

```
Switch(config-if)# ip local-proxy-arp
Switch(config-if)#
```
ip mfib fastdrop

To enable MFIB fast drop, use the **ip mfib fastdrop** command. To disable MFIB fast drop, use the **no** form of this command.

```
ip mfib fastdrop
no ip mfib fastdrop
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
MFIB fast drop is enabled.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>

<td>show ip mfib fastdrop</td>
<td>Displays all currently active fast-drop entries and shows whether fast drop is enabled.</td>
</tr>
</tbody>
</table>
ip multicast multipath

To enable load splitting of IP multicast traffic over Equal Cost Multipath (ECMP), use the `ip multicast multipath` command in global configuration mode. To disable this functionality, use the `no` form of this command.

```
ip multicast [vrf vrf-name] multipath [s-g-hash {basic | next-hop-based}]
no ip multicast [vrf vrf-name] multipath [s-g-hash {basic | next-hop-based}]
```

**Syntax Description**

- **vrf vrf-name** (Optional) Enables ECMP multicast load splitting for IP multicast traffic associated with the Multicast Virtual Private Network (MVPN) routing and forwarding (MVRF) instance specified for the `vrf-name` argument.
- **s-g-hash basic | next-hop-based** (Optional) Enables ECMP multicast load splitting based on source and group address or on source, group, and next-hop address.

  The `basic` keyword enables a simple hash based on source and group address. This algorithm is referred to as the basic S-G-hash algorithm.

  The `next-hop-based` keyword enables a more complex hash based on source, group, and next-hop address. This algorithm is referred to as the next-hop-based S-G-hash algorithm.

**Command Default**

If multiple equal-cost paths exist, multicast traffic will not be load-split across those paths.

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(53)SG</td>
<td>The <code>s-g-hash</code> keyword was introduced on the Catalyst 4500 switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ip multicast multipath` command does not work with bidirectional Protocol Independent Multicast (PIM).

Use the `ip multicast multipath` command to enable load splitting of IP multicast traffic across multiple equal-cost paths.

If two or more equal-cost paths from a source are available, unicast traffic will be load-split across those paths. However, by default, multicast traffic is not load-split across multiple equal-cost paths. In general, multicast traffic flows down from the reverse path forwarding (RPF) neighbor. According to the PIM specifications, this neighbor must have the highest IP address if more than one neighbor has the same metric.

When you configure load splitting with the `ip multicast multipath` command, the system splits multicast traffic across multiple equal-cost paths based on source address using the S-hash algorithm. When the `ip multicast multipath` command is configured and multiple equal-cost paths exist, the path in which...
multicast traffic will travel is selected based on the source IP address. Multicast traffic from different sources will be load-split across the different equal-cost paths. Load splitting will not occur across equal-cost paths for multicast traffic from the same source sent to different multicast groups.

Note

The `ip multicast multipath` command load splits the traffic but does not load balance the traffic. Traffic from a source will use only one path, even if the traffic greatly exceeds traffic from other sources.

If the `ip multicast multipath` command is configured with the `s-g-hash` keyword and multiple equal-cost paths exist, load splitting will occur across equal-cost paths based on source and group address or on source, group, and next-hop address. If you specify the optional `s-g-hash` keyword for load splitting IP multicast traffic, you must select the algorithm used to calculate the equal-cost paths by specifying one of the following keywords:

- **basic**—The basic S-G-hash algorithm is predictable because no randomization is used in calculating the hash value. The basic S-G-hash algorithm, however, is subject to polarization because for a given source and group the same hash is always chosen irrespective of the router that the hash is being calculated on.

- **next-hop-based**—The next-hop-based S-G-hash algorithm is predictable because no randomization is used to determine the hash value. Unlike the S-hash and basic S-G-hash algorithms, the next-hop-based hash mechanism is not subject to polarization.

Examples

The following example shows how to enable ECMP multicast load splitting on a router based on source address using the S-hash algorithm:

```
Switch(config)# ip multicast multipath
```

The following example shows how to enable ECMP multicast load splitting on a router based on source and group address using the basic S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash basic
```

The following example shows how to enable ECMP multicast load splitting on a router based on source, group, and next-hop address using the next-hop-based S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash next-hop-based
```
### ip route-cache flow

To enable NetFlow statistics for IP routing, use the `ip route-cache flow` command. To disable NetFlow statistics, use the `no` form of this command.

```plaintext
ip route-cache flow [infer-fields]
no ip route-cache flow [infer-fields]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>infer-fields</th>
<th>(Optional) Includes the NetFlow fields as inferred by the software: Input identifier, Output identifier, and Routing information.</th>
</tr>
</thead>

</tbody>
</table>

| Note | NetFlow consumes additional memory and CPU resources compared to other switching modes. You need to know the resources required on your switch before enabling NetFlow. |
**Examples**

This example shows how to enable NetFlow switching on the switch:

```plaintext
Switch# config terminal
Switch(config)# ip route-cache flow
Switch(config)# exit
Switch#
```

**Note**

This command does not work on individual interfaces.
ip source binding

To add or delete a static IP source binding entry, use the `ip source binding` command. To delete the corresponding IP source binding entry, use the `no` form of this command.

```
ip source binding ip-address mac-address vlan vlan-id interface interface-name
no ip source binding ip-address mac-address vlan vlan-id interface interface-name
```

**Syntax Description**

- `ip-address` Binding IP address.
- `mac-address` Binding MAC address.
- `vlan vlan-id` VLAN number.
- `interface interface-name` Binding interface.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 12.1(19)EW | Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

The `ip source binding` command is used to add a static IP source binding entry only.

The `no` form of this command deletes the corresponding IP source binding entry. For the deletion to succeed, all required parameters must match.

Each static IP binding entry is keyed by a MAC address and VLAN number. If the CLI contains an existing MAC and VLAN, the existing binding entry will be updated with the new parameters; a separate binding entry will not be created.

**Examples**

This example shows how to configure the static IP source binding:

```
Switch# config terminal
Switch(config)# ip source binding 11.0.0.1 0000.000A.000B vlan 10 interface fastethernet6/10
Switch(config)#
```

ip sticky-arp

To enable sticky ARP, use the **ip sticky-arp** command. Use the **no** form of this command to disable sticky ARP.

```
ip sticky-arp
no ip sticky-arp
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
Enabled

### Command Modes
Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
This command is supported on PVLANs only.

ARP entries that are learned on Layer 3 PVLAN interfaces are sticky ARP entries. (You should display and verify ARP entries on the PVLAN interface using the **show arp** command).

For security reasons, sticky ARP entries on the PVLAN interface do not age out. Connecting new equipment with the same IP address generates a message and the ARP entry is not created.

Because the ARP entries on the PVLAN interface do not age out, you must manually remove ARP entries on the PVLAN interface if a MAC address changes.

Unlike static entries, sticky-ARP entries are not stored and restored when you enter the **reboot** and **restart** commands.

### Examples

This example shows how to enable sticky ARP:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) ip sticky-arp
Switch(config)# end
Switch#
```

This example shows how to disable sticky ARP:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) no ip sticky-arp
Switch(config)# end
Switch#
```

ip verify header vlan all

To enable IP header validation for Layer 2-switched IPv4 packets, use the `ip verify header vlan all` command. To disable the IP header validation, use the `no` form of this command.

```
ip verify header vlan all
no ip verify header vlan all
```

**Syntax Description**

This command has no default settings.

**Defaults**

The IP header is validated for bridged and routed IPv4 packets.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not apply to Layer 3-switched (routed) packets.

The Catalyst 4500 series switch checks the validity of the following fields in the IPv4 header for all switched IPv4 packets:

- The version must be 4.
- The header length must be greater than or equal to 20 bytes.
- The total length must be greater than or equal to four times the header length and greater than the Layer 2 packet size minus the Layer 2 encapsulation size.

If an IPv4 packet fails the IP header validation, the packet is dropped. If you disable the header validation, the packets with the invalid IP headers are bridged but are not routed even if routing was intended. The IPv4 access lists also are not applied to the IP headers.

**Examples**

This example shows how to disable the IP header validation for the Layer 2-switched IPv4 packets:

```
Switch# config terminal
Switch(config)# no ip verify header vlan all
Switch(config)# end
Switch#
```
ip verify source

To enable IP source guard on untrusted Layer 2 interfaces, use the **ip verify source** command. To disable IP source guard on untrusted Layer 2 interfaces, use the **no** form of this command.

```plaintext
ip verify source {vlan dhcp-snooping | tracking} [port-security]
no ip verify source {vlan dhcp-snooping | tracking} [port-security]
```

**Syntax Description**

- `vlan dhcp-snooping`: Enables IP source guard on untrusted Layer 2 DHCP snooping interfaces.
- `tracking`: Enables IP port security to learn static IP address learning on a port.
- `port-security`: (Optional) Filters both source IP and MAC addresses using the port security feature.

**Defaults**

IP source guard is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>

</tr>
<tr>
<td>12.2(37)SG</td>
<td>Added support for IP port security and tracking.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable IP source guard on VLANs 10 through 20 on a per-port basis:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10 20
Switch(config)# interface fastethernet6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk native vlan 10
Switch(config-if)# switchport trunk allowed vlan 11-20
Switch(config-if)# no ip dhcp snooping trust
Switch(config-if)# ip verify source vlan dhcp-snooping
Switch(config)# end
Switch# show ip verify source interface f6/1
Interface  Filter-type  Filter-mode  IP-address       Mac-address        Vlan
---------  -----------  -----------  ---------------  -----------------  ----------
Fa6/1      ip-mac      active       10.0.0.1                            10
Fa6/1      ip-mac      active       deny-all                            11-20
Switch#
```
This example shows how to enable IP port security with IP-MAC filters on a Layer 2 access port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastEthernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 1
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# ip verify source tracking port-security
Switch(config-if)# end
```

You can verify your settings by entering the `show ip verify source` privileged EXEC command.

**ip verify unicast source reachable-via**

To enable and configure unicast RPF checks on an IPv4 interface, use the `ip verify unicast source reachable-via` command. To disable unicast RPF, use the `no` form of this command.

```plaintext
ip verify unicast source reachable-via rx allow-default

no ip verify unicast source reachable-via
```

**Syntax Description**

- **rx**
  - Verifies that the source address is reachable on the interface where the packet was received.

- **allow-default**
  - Verifies that the default route matches the source address.

**Defaults**

Disabled

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support introduced on Catalyst 4900M chassis and a Catalyst 4500 with a Supervisor Engine 6-E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In basic RX mode, unicast RPF ensures a source address must be reachable on the arrived interface. For example, the source must be reachable without load balancing.

**Note**

Unicast RPF is an input function and is applied only on the input interface of a router at the upstream end of a connection.

Do not use unicast RPF on internal network interfaces. Internal interfaces might have routing asymmetry, which means that there are multiple routes to the source of a packet. Apply unicast RPF only where there is natural or configured symmetry.

**Examples**

This example shows how to enable unicast RPF exist-only checking mode:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip verify unicast source reachable-via rx allow-default
Switch(config-if)# end
Switch#
```

</tbody>
</table>

Usage Guidelines

This command instructs a router to enable or disable the support for the specified service number or the web-cache service name. A service number can be from 0 to 254. Once the service number or name is enabled, the router can participate in the establishment of a service group.

When the no ip wccp command is entered, the router terminates participation in the service group, deallocates space if none of the interfaces still has the service configured, and terminates the WCCP task if no other services are configured.

The keywords following the web-cache keyword and the service-number argument are optional and may be specified in any order, but only may be specified once. The following sections outline the specific usage of each of the optional forms of this command.

```
ip wccp {web-cache | service-number} group-address multicast-address
```

A WCCP group address can be configured to set up a multicast address that cooperating routers and web caches can use to exchange WCCP protocol messages. If such an address is used, IP multicast routing must be enabled so that the messages that use the configured group (multicast) addresses are received correctly.

This option instructs the router to use the specified multicast IP address to coalesce the “I See You” responses for the “Here I Am” messages that it has received on this group address. The response is sent to the group address as well. The default is for no group address to be configured, in which case all “Here I Am” messages are responded to with a unicast reply.

```
ip wccp {web-cache | service-number} redirect-list access-list
```

This option instructs the router to use an access list to control the traffic that is redirected to the web caches of the service group specified by the service name given. The access-list argument specifies either the number or the name of a standard or extended access list. The access list itself specifies which traffic is permitted to be redirected. The default is for no redirect list to be configured (all traffic is redirected).

WCCP requires that the following protocol and ports not be filtered by any access lists:

- User Datagram Protocol (UDP) (protocol type 17) port 2048. This port is used for control signaling. Blocking this type of traffic will prevent WCCP from establishing a connection between the router and cache engines.

```
ip wccp {web-cache | service-number} group-list access-list
```

This option instructs the router to use an access list to control the cache engines that are allowed to participate in the specified service group. The access-list argument specifies either the number of a standard or extended access list or the name of any type of named access list. The access list itself specifies which cache engines are permitted to participate in the service group. The default is for no group list to be configured, in which case all cache engines may participate in the service group.
The `ip wccp {web-cache | service-number} group-list` command syntax resembles the `ip wccp {web-cache | service-number} group-listen` command, but these are entirely different commands. The `ip wccp group-listen` command is an interface configuration command used to configure an interface to listen for multicast notifications from a cache cluster. Refer to the description of the `ip wccp group-listen` command in the *Cisco IOS IP Application Services Command Reference*.

```plaintext
ip wccp {web-cache | service-number} password password
```

This option instructs the router to use MD5 authentication on the messages received from the service group specified by the service name given. Use this form of the command to set the password on the router. You must also configure the same password separately on each web cache. The password can be up to a maximum of eight characters. Messages that do not authenticate when authentication is enabled on the router are discarded. The default is for no authentication password to be configured and for authentication to be disabled.

### Examples

The following example shows how to configure a router to run WCCP reverse-proxy service, using the multicast address of 239.0.0.0:

```plaintext
Router(config)# ip multicast-routing
Router(config)# ip wccp 99 group-address 239.0.0.0
Router(config)# interface gigabitethernet 3/1
Router(config-if)# ip wccp 99 group-listen
```

The following example shows how to configure a router to redirect web-related packets without a destination of 10.168.196.51 to the web cache:

```plaintext
Router(config)# access-list 100 deny ip any host 10.168.196.51
Router(config)# access-list 100 permit ip any any
Router(config)# ip wccp web-cache redirect-list 100
Router(config)# interface gigabitethernet 3/2
Router(config-if)# ip wccp web-cache redirect out
```

</tr>
<tr>
<td>IOS XE 3.3.0 SG (15.1(1)SG)</td>
<td>Supported extended to Supervisor Engine 7-E and Supervisor Engine 7L-E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

With the `ip wccp check services all` command, WCCP can be configured to check all configured services for a match and perform redirection for those services if appropriate. The caches to which packets are redirected can be controlled by a redirect ACL access control list (ACL) as well as by the priority value of the service.

It is possible to configure an interface with more than one WCCP service. When more than one WCCP service is configured on an interface, the precedence of a service depends on the relative priority of the service compared to the priority of the other configured services. Each WCCP service has a priority value as part of its definition.

If no WCCP services are configured with a redirect ACL, the services are considered in priority order until a service is found which matches the IP packet. If no services match the packet, the packet is not redirected. If a service matches the packet and the service has a redirect ACL configured, then the IP packet will be checked against the ACL. If the packet is rejected by the ACL, the packet will not be passed down to lower priority services unless the `ip wccp check services all` command is configured.

When the `ip wccp check services all` command is configured, WCCP will continue to attempt to match the packet against any remaining lower priority services configured on the interface.

### Note

The priority of a WCCP service group is determined by the web cache appliance. The priority of a WCCP service group cannot be configured via Cisco IOS software.
The `ip wccp check services all` command is a global WCCP command that applies to all services and is not associated with a single service.

Examples

The following example shows how to configure all WCCP services:

```
Router(config)# ip wccp check services all
```

Related Commands

ip wccp group-listen

To configure an interface on a router to enable or disable the reception of IP multicast packets for Web Cache Communication Protocol (WCCP), use the `ip wccp group-listen` command in interface configuration mode. To disable the reception of IP multicast packets for WCCP, use the `no` form of this command.

```
ip wccp {web-cache | service-number} group-listen
no ip wccp {web-cache | service-number} group-listen
```

### Syntax Description
- **web-cache**: The web cache service.
- **service-number**: WCCP service number; valid values are from 0 to 254.

### Defaults
This command is disabled by default.

### Command Modes
 Interface configuration (config-if)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>

<td>Supported extended to Supervisor Engine 7-E and Supervisor Engine</td>
</tr>
<tr>
<td>(15.1(1)SG)</td>
<td>7L-E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

On routers that are to be members of a Service Group when IP multicast is used, the following configuration is required:

- Configure the IP multicast address for use by the WCCP Service Group.
- Configure the interfaces on which the router wishes to receive the IP multicast address with the `ip wccp {web-cache | service-number} group-listen` interface configuration command.

### Examples

The following example shows how to enable the multicast packets for a web cache with a multicast address of 224.1.1.100:

```
Switch# configure terminal
Switch(config)# ip wccp web-cache group-address 224.1.1.100
Switch(config)# interface gigabitethernet 3/1
Switch(config-if)# ip wccp web-cache group-listen
```

</tr>
</tbody>
</table>

**Usage Guidelines**

The `ip wccp {web-cache | service-number} redirect in` command allows you to configure WCCP redirection on an interface receiving inbound network traffic. When the command is applied to an interface, all packets arriving at that interface will be compared against the criteria defined by the specified WCCP service. If the packets match the criteria, they will be redirected.

Likewise, the `ip wccp {web-cache | service-number} redirect out` command allows you to configure the WCCP redirection check at an outbound interface.

**Tips**

Be careful not to confuse the `ip wccp {web-cache | service-number} redirect {out | in}` interface configuration command with the `ip wccp redirect exclude in` interface configuration command.
The following example shows how to configure a session in which reverse proxy packets on Ethernet interface 3/1 are being checked for redirection and redirected to a Cisco Cache Engine:

Switch(config)# ip wccp 99
Switch(config)# interface gigabitethernet 3/1
Switch(config-if)# ip wccp 99 redirect out

The following example shows how to configure a session in which HTTP traffic arriving on GigabitEthernet interface 3/1 is redirected to a Cache Engine:

Switch(config)# ip wccp web-cache
Switch(config)# interface gigabitethernet 3/1
Switch(config-if)# ip wccp web-cache redirect in

<td>Displays the WCCP global configuration and statistics.</td>
</tr>
</tbody>
</table>
p wccp redirect exclude in

To configure an interface to exclude packets received on an interface from being checked for redirection, use the `ip wccp redirect exclude in` command in interface configuration mode. To disable the ability of a router to exclude packets from redirection checks, use the `no` form of this command.

```
ip wccp redirect exclude in
no ip wccp redirect exclude in
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Redirection exclusion is disabled.

**Command Modes**

Interface configuration (config-if)

**Command History**

<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This configuration command instructs the interface to exclude inbound packets from any redirection check. Note that the command is global to all the services and should be applied to any inbound interface that will be excluded from redirection.

This command is intended to be used to accelerate the flow of packets from a cache engine to the Internet as well as allow for the use of the Web Cache Communication Protocol (WCCP) v2 packet return feature.

**Examples**

In the following example, packets arriving on GigabitEthernet interface 3/1 are excluded from WCCP output redirection checks:

```
Router (config)# interface gigabitethernet 3/1
Router (config-if)# ip wccp redirect exclude in
```

### Command | Description
--- | ---
`ip wccp check services all` | Configures an interface on a router to enable or disable the reception of IP multicast packets for Web Cache Communication Protocol (WCCP).
`ip wccp group-listen` | Configures an interface on a router to enable or disable the reception of IP multicast packets for Web Cache Communication Protocol (WCCP).
`ip wccp redirect exclude in` | Enables redirection exclusion on an interface.
`show ip interface` | Displays the usability status of interfaces that are configured for IP.
`show ip wccp` | Displays the WCCP global configuration and statistics.
ipv6 mld snooping

To enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN, use the `ipv6 mld snooping` command without keywords. To disable MLD snooping on a switch or the VLAN, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id]
no ipv6 mld snooping [vlan vlan-id]
```

**Syntax Description**

- **vlan vlan-id** (Optional) Enables or disables IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.

**Defaults**

MLD snooping is globally disabled on the switch.

MLD snooping is enabled on all VLANs. However, MLD snooping must be globally enabled before VLAN snooping can take place.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When MLD snooping is globally disabled, it is disabled on all the existing VLAN interfaces. When you globally enable MLD snooping, it is enabled on all VLAN interfaces that are in the default state (enabled). VLAN configuration overrides global configuration on interfaces on which MLD snooping has been disabled.

If MLD snooping is globally disabled, you cannot enable it on a VLAN. If MLD snooping is globally enabled, you can disable it on individual VLANs.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This example shows how to globally enable MLD snooping:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping
Switch(config)# end
Switch#
```
This example shows how to disable MLD snooping on a VLAN:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no ipv6 mld snooping vlan 11
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping` user EXEC command.

ipv6 mld snooping last-listener-query-count

To configure IP version 6 (IPv6) Multicast Listener Discovery Multicast Address Specific Queries (MASQs) that will be sent before aging out a client, use the `ipv6 mld snooping last-listener-query-count` command. To reset the query count to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] last-listener-query-count integer_value
```

```
no ipv6 mld snooping [vlan vlan-id] last-listener-query-count
```

**Syntax Description**

- `vlan vlan-id` (Optional) Configures last-listener query count on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.

- `integer_value` The integer range is 1 to 7.

**Command Default**

The default global count is 2.

The default VLAN count is 0 (the global count is used).

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 12.2(40)SG | This command was introduced on the Catalyst 4500.

**Usage Guidelines**

In MLD snooping, the IPv6 multicast switch periodically sends out queries to hosts belonging to the multicast group. If a host wants to leave a multicast group, it can silently leave or it can respond to the query with a Multicast Listener Done message (equivalent to an IGMP Leave message). When Immediate Leave is not configured (it should not be configured if multiple clients for a group exist on the same port), the configured last-listener query count determines the number of MASQs that are sent before an MLD client is aged out.

When the last-listener query count is set for a VLAN, this count overrides the value configured globally. When the VLAN count is not configured (set to the default of 0), the global count is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
ipv6 mld snooping last-listener-query-count

Examples

This example shows how to globally set the last-listener query count:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping last-listener-query-count 1
Switch(config)# end
Switch#

This example shows how to set the last-listener query count for VLAN 10:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 10 last-listener-query-count 3
Switch(config)# end
Switch#

You can verify your settings by entering the `show ipv6 mld snooping [vlan vlan-id]` user EXEC command.

<td>Sets the time period (in thousandths of a second) that a multicast switch must wait after issuing a MASQ before deleting a port from the multicast group. The range is 100 to 32,768. The default is 1000 (1 second).</td>
</tr>
</tbody>
</table>

**Command Default**

The default global query interval (maximum response time) is 1000 (1 second).
The default VLAN query interval (maximum response time) is 0 (the global count is used).

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The last-listener-query-interval time is the maximum time that a multicast switch waits after issuing a Multicast Address Specific Query (MASQ) before deleting a port from the multicast group.

In MLD snooping, when the IPv6 multicast switch receives an MLD leave message, it sends out queries to hosts belonging to the multicast group. If there are no responses from a port to a MASQ for a length of time, the switch deletes the port from the membership database of the multicast address. The last listener query interval is the maximum time that the switch waits before deleting a nonresponsive port from the multicast group.

When a VLAN query interval is set, the global query interval is overridden. When the VLAN interval is set at 0, the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
ipv6 mld snooping last-listener-query-interval

Examples

This example shows how to globally set the last-listener query interval to 2 seconds:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
Switch(config)# end
Switch#

This example shows how to set the last-listener query interval for VLAN 1 to 5.5 seconds:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 5500
Switch(config)# end
Switch#

You can verify your settings by entering the show ipv6 MLD snooping [vlan vlan-id] user EXEC command.

ipv6 mld snooping listener-message-suppression

To enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping listener message suppression, use the `ipv6 mld snooping listener-message-suppression` command. To disable MLD snooping listener message suppression, use the `no` form of this command.

```
ipv6 mld snooping listener-message-suppression
no ipv6 mld snooping listener-message-suppression
```

**Command Default**

The default is for MLD snooping listener message suppression to be disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

MLD snooping listener message suppression is equivalent to IGMP snooping report suppression. When it is enabled, received MLDv1 reports to a group are forwarded to IPv6 multicast switches only once in every report-forward time. This prevents the forwarding of duplicate reports.

**Examples**

This example shows how to enable MLD snooping listener message suppression:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping listener-message-suppression
Switch(config)# end
Switch#
```

This example shows how to disable MLD snooping listener message suppression:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no ipv6 mld snooping listener-message-suppression
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping [vlan vlan-id]` user EXEC command.

</tbody>
</table>
ipv6 mld snooping robustness-variable

To configure the number of IP version 6 (IPv6) Multicast Listener Discovery (MLD) queries that the switch sends before deleting a listener that does not respond, or to enter a VLAN ID to configure the number of queries per VLAN, use the `ipv6 mld snooping robustness-variable` command. To reset the variable to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] robustness-variable integer_value
no ipv6 mld snooping [vlan vlan-id] robustness-variable
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Configures the robustness variable on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td>integer_value</td>
<td>The robustness value ranges from 1 to 3.</td>
</tr>
</tbody>
</table>

**Command Default**
The default global robustness variable (number of queries before deleting a listener) is 2.
The default VLAN robustness variable (number of queries before aging out a multicast address) is 0, which means that the system uses the global robustness variable for aging out the listener.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Robustness is measured by the number of MLDv1 queries sent with no response before a port is removed from a multicast group. A port is deleted when there are no MLDv1 reports received for the configured number of MLDv1 queries. The global value determines the number of queries that the switch waits before deleting a listener that does not respond, and it applies to all VLANs that do not have a VLAN value set.

The robustness value configured for a VLAN overrides the global value. If the VLAN robustness value is 0 (the default), the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
Examples

This example shows how to configure the global robustness variable so that the switch sends out three queries before it deletes a listener port that does not respond:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping robustness-variable 3
Switch(config)# end
Switch#
```

This example shows how to configure the robustness variable for VLAN 1. This value overrides the global configuration for the VLAN:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 robustness-variable 1
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 MLD snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping vlan

To configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping parameters on the VLAN interface, use the `ipv6 mld snooping vlan` command. To reset the parameters to the default settings, use the `no` form of this command.

```
ipv6 mld snooping vlan vlan-id [immediate-leave | mrouter interface interface-id | static ipv6-multicast-address interface interface-id]
```

```
no ipv6 mld snooping vlan vlan-id [immediate-leave | mrouter interface interface-id | static ipv6-multicast-address interface interface-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
<td>Specifies a VLAN number. The range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>immediate-leave</code></td>
<td>(Optional) Enables MLD Immediate-Leave processing on a VLAN interface. Use the <code>no</code> form of the command to disable the Immediate Leave feature on the interface.</td>
</tr>
<tr>
<td><code>mrouter interface interface-id</code></td>
<td>(Optional) Configures a multicast switch port. The <code>no</code> form of the command removes the configuration.</td>
</tr>
<tr>
<td><code>static ipv6-multicast-address interface interface-id</code></td>
<td>(Optional) Configures a multicast group with the specified IPv6 multicast address.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Adds a Layer 2 port to the group. The mrouter or static interface can be a physical port or a port-channel interface ranging from 1 to 48.</td>
</tr>
</tbody>
</table>

**Command Default**

MLD snooping Immediate-Leave processing is disabled.

By default, there are no static IPv6 multicast groups.

By default, there are no multicast switch ports.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should only configure the Immediate-Leave feature when there is only one receiver on every port in the VLAN. The configuration is saved in NVRAM.

The `static` keyword is used for configuring the MLD member ports statically.

The configuration and the static ports and groups are saved in NVRAM.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
This example shows how to enable MLD Immediate-Leave processing on VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 immediate-leave
Switch(config)# end
Switch#
```

This example shows how to disable MLD Immediate-Leave processing on VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# no ipv6 mld snooping vlan 1 immediate-leave
Switch(config)# end
Switch#
```

This example shows how to configure a port as a multicast switch port:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 mrouter interface GigabitEthernet1/1
Switch(config)# end
Switch#
```

This example shows how to configure a static multicast group:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 2 static FF12::34 interface GigabitEthernet1/1
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping vlan vlan-id` user EXEC command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ipv6 mld snooping</strong></td>
<td>Enables IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN.</td>
</tr>
<tr>
<td><strong>show ipv6 mld snooping</strong></td>
<td>Displays IP version 6 (IPv6) MLD snooping configuration of the switch or the VLAN.</td>
</tr>
</tbody>
</table>
**issu abortversion**

To cancel the ISSU upgrade or the downgrade process in progress and to restore the Catalyst 4500 series switch to its state before the start of the process, use the `issu abortversion` command.

```
issu abortversion active-slot [active-image-new]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>active-slot</code></td>
<td>Specifies the slot number for the current standby supervisor engine.</td>
</tr>
<tr>
<td><code>active-image-new</code></td>
<td>(Optional) Name of the new image present in the current standby supervisor engine.</td>
</tr>
</tbody>
</table>

**Defaults**

There are no default settings

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `issu abortversion` command at any time to stop the ISSU process. To complete the process enter the `issu commitversion` command. Before any action is taken, a check ensures that both supervisor engines are either in the run version (RV) or load version (LV) state.

When the `issu abortversion` command is entered before the `issu runversion` command, the standby supervisor engine is reset and reloaded with the old image. When the `issu abortversion` command is entered after the `issu runversion` command, a change takes place and the new standby supervisor engine is reset and reloaded with the old image.

**Examples**

This example shows how you can reset and reload the standby supervisor engine:

```
Switch# issu abortversion 2
Switch#
```

**Related Commands**

issu acceptversion

To halt the rollback timer and to ensure that the new Cisco IOS software image is not automatically stopped during the ISSU process, use the **issu acceptversion** command.

```
issu acceptversion active-slot [active-image-new]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>active-slot</strong></td>
<td>Specifies the slot number for the currently active supervisor engine.</td>
</tr>
<tr>
<td><strong>active-image-new</strong></td>
<td>(Optional) Name of the new image on the currently active supervisor engine.</td>
</tr>
</tbody>
</table>

**Defaults**

Rollback timer resets automatically 45 minutes after you enter the **issu runversion** command.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After you are satisfied with the new image and have confirmed the new supervisor engine is reachable by both the console and the network, enter the **issu acceptversion** command to halt the rollback timer. If the **issu acceptversion** command is not entered within 45 minutes from the time the **issu runversion** command is entered, the entire ISSU process is automatically rolled back to the previous version of the software. The rollback timer starts immediately after you enter the **issu runversion** command.

If the rollback timer expires before the standby supervisor engine goes to a hot standby state, the timer is automatically extended by up to 15 minutes. If the standby state goes to a hot-standby state within this extension time or the 15 minute extension expires, the switch aborts the ISSU process. A warning message that requires your intervention is displayed every 1 minute of the timer extension.

If the rollback timer is set to a long period of time, such as the default of 45 minutes, and the standby supervisor engine goes into the hot standby state in 7 minutes, you have 38 minutes (45 minus 7) to rollback if necessary.

Use the **issu set rollback-timer** to configure the rollback timer.

**Examples**

This example shows how to halt the rollback timer and allow the ISSU process to continue:

```
Switch# issu acceptversion 2
Switch#
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>issu abortversion</strong></td>
<td>Cancels the ISSU upgrade or the downgrade process in progress and restores the switch to its state before the start of the process.</td>
</tr>
<tr>
<td><strong>issu commitversion</strong></td>
<td>Loads the new Cisco IOS software image into the new standby supervisor engine.</td>
</tr>
<tr>
<td><strong>issu loadversion</strong></td>
<td>Starts the ISSU process.</td>
</tr>
<tr>
<td><strong>issu runversion</strong></td>
<td>Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.</td>
</tr>
<tr>
<td><strong>issu set rollback-timer</strong></td>
<td>Configures the In Service Software Upgrade (ISSU) rollback timer value.</td>
</tr>
<tr>
<td><strong>show issu state</strong></td>
<td>Displays the ISSU state and current booted image name during the ISSU process.</td>
</tr>
</tbody>
</table>
issu commitversion

To load the new Cisco IOS software image into the new standby supervisor engine, use the `issu commitversion` command.

```
issu commitversion standby-slot [standby-image-new]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>standby-slot</td>
<td>Specifies the slot number for the currently active supervisor engine.</td>
</tr>
<tr>
<td>standby-image-new</td>
<td>(Optional) Name of the new image on the currently active supervisor engine.</td>
</tr>
</tbody>
</table>

**Defaults**

Enabled by default.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `issu commitversion` command verifies that the standby supervisor engine has the new Cisco IOS software image in its file system and that both supervisor engines are in the run version (RV) state. If these conditions are met, the following actions take place:

- The standby supervisor engine is reset and booted with the new version of Cisco IOS software.
- The standby supervisor engine moves into the Stateful Switchover (SSO) mode and is fully stateful for all clients and applications with which the standby supervisor engine is compatible.
- The supervisor engines are moved into final state, which is the same as initial state.

Entering the `issu commitversion` command completes the In Service Software Upgrade (ISSU) process. This process cannot be stopped or reverted to its original state without starting a new ISSU process.

Entering the `issu commitversion` command without entering the `issu acceptversion` command is equivalent to entering both the `issu acceptversion` and the `issu commitversion` commands. Use the `issu commitversion` command if you do not intend to run in the current state for an extended period of time and are satisfied with the new software version.

**Examples**

This example shows how you can configure the standby supervisor engine to be reset and reloaded with the new Cisco IOS software version:

```
Switch# issu commitversion 1
Switch#
```
### Related Commands

<td>Loads the new Cisco IOS software image into the new standby supervisor engine.</td>
</tr>
<tr>
<td><code>issu loadversion</code></td>
<td>Starts the ISSU process.</td>
</tr>
<tr>
<td><code>issu runversion</code></td>
<td>Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.</td>
</tr>
<tr>
<td><code>show issu state</code></td>
<td>Displays the ISSU state and current booted image name during the ISSU process.</td>
</tr>
</tbody>
</table>
### issu loadversion

To start the ISSU process, use the ` issu loadversion ` command.

```
issu loadversion active-slot active-image-new standby-slot standby-image-new [force]
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>active-slot</code></td>
<td>Specifies the slot number for the currently active supervisor engine.</td>
</tr>
<tr>
<td><code>active-image-new</code></td>
<td>Specifies the name of the new image on the currently active supervisor engine.</td>
</tr>
<tr>
<td><code>standby-slot</code></td>
<td>Specifies the standby slot on the networking device.</td>
</tr>
<tr>
<td><code>standby-image-new</code></td>
<td>Specifies the name of the new image on the standby supervisor engine.</td>
</tr>
<tr>
<td><code>force</code></td>
<td>(Optional) Overrides the automatic rollback when the new Cisco IOS software version is detected to be incompatible.</td>
</tr>
</tbody>
</table>

#### Defaults

This command has no default settings.

#### Command Modes

Privileged EXEC mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

The ` issu loadversion ` command causes the standby supervisor engine to be reset and booted with the new Cisco IOS software image specified by the command. If both the old image and the new image are ISSU capable, ISSU compatible, and have no configuration mismatches, the standby supervisor engine moves into Stateful Switchover (SSO) mode, and both supervisor engines move into the load version (LV) state.

It will take several seconds after the ` issu loadversion ` command is entered for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode.

#### Examples

This example shows how to initiate the ISSU process:

```
Switch# issu loadversion 1 bootflash:new-image 2 slavebootflash:new-image
Switch#
```

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>issu abortversion</code></td>
<td>Cancels the ISSU upgrade or the downgrade process in progress and restores the switch to its state before the start of the process.</td>
</tr>
<tr>
<td><code>issu acceptversion</code></td>
<td>Halts the rollback timer and ensures that the new Cisco IOS software image is not automatically stopped during the ISSU process.</td>
</tr>
</tbody>
</table>
**Command** | **Description**
--- | ---
**issu commitversion** | Loads the new Cisco IOS software image into the new standby supervisor engine.
**issu runversion** | Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.
**show issu state** | Displays the ISSU state and current booted image name during the ISSU process.

### issu runversion

To force a change from the active supervisor engine to the standby supervisor engine and to cause the newly active supervisor engine to run the new image specified in the `issu loadversion` command, use the `issu runversion` command.

```
issu runversion standby-slot [standby-image-new]
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>standby-slot</code></td>
<td>Specifies the standby slot on the networking device.</td>
</tr>
<tr>
<td><code>standby-image-new</code></td>
<td>(Optional) Specifies the name of the new image on the standby supervisor engine.</td>
</tr>
</tbody>
</table>

#### Defaults

This command has no default settings.

#### Command Modes

Privileged EXEC mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

The `issu runversion` command changes the currently active supervisor engine to standby supervisor engine and the real standby-supervisor engine is booted with the old image version following and resets the switch. As soon as the standby-supervisor engine moves into the standby state, the rollback timer is started.

#### Examples

This example shows how to force a change of the active-supervisor engine to standby-supervisor engine:

```
Switch# issu runversion 2
Switch#
```

#### Related Commands

issu set rollback-timer

To configure the In Service Software Upgrade (ISSU) rollback timer value, use the `issu set rollback-timer` command.

```
issu set rollback-timer seconds
```

**Syntax Description**

```
seconds
```

Specifies the rollback timer value, in seconds. The valid timer value range is from 0 to 7200 seconds (2 hours). A value of 0 seconds disables the rollback timer.

**Defaults**

Rollback timer value is 2700 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `issue set rollback-timer` command to configure the rollback timer value. You can only enable this command when the supervisor engines are in the init state.

**Examples**

This example shows how you can set the rollback timer value to 3600 seconds, or 1 hour:

```
Switch# configure terminal
Switch(config)# issu set rollback-timer 3600
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tr>
<td><code>issu set rollback-timer</code></td>
<td>Configures the In Service Software Upgrade (ISSU) rollback timer value.</td>
</tr>
</tbody>
</table>
**l2protocol-tunnel**

To enable protocol tunneling on an interface, use the `l2protocol-tunnel` command. You can enable tunneling for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable tunneling on the interface, use the `no` form of this command.

```
l2protocol-tunnel [cdp | stp | vtp]
no l2protocol-tunnel [cdp | stp | vtp]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>cdp</th>
<th>(Optional) Enables tunneling of CDP.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>stp</td>
<td>(Optional) Enables tunneling of STP.</td>
</tr>
<tr>
<td></td>
<td>vtp</td>
<td>(Optional) Enables tunneling of VTP.</td>
</tr>
</tbody>
</table>

**Defaults**
The default is that no Layer 2 protocol packets are tunneled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enter this command, with or without protocol types, to tunnel Layer 2 packets.
Layer 2 protocol tunneling across a service-provider network ensures that Layer 2 information is propagated across the network to all customer locations. When protocol tunneling is enabled, protocol packets are encapsulated with a well-known Cisco multicast address for transmission across the network. When the packets reach their destination, the well-known MAC address is replaced by the Layer 2 protocol MAC address.
You can enable Layer 2 protocol tunneling for CDP, STP, and VTP individually or for all three protocols.

**Examples**
This example shows how to enable protocol tunneling for the CDP packets:
```
Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>l2protocol-tunnel cos</td>
<td>Configures the class of service (CoS) value for all tunneled Layer 2 protocol packets.</td>

<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>l2protocol-tunnel drop-threshold</td>
<td>Sets a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.</td>
</tr>
<tr>
<td>l2protocol-tunnel shutdown-threshold</td>
<td>Configures the protocol tunneling encapsulation rate.</td>
</tr>
</tbody>
</table>
l2protocol-tunnel cos

To configure the class of service (CoS) value for all tunneled Layer 2 protocol packets, use the `l2protocol-tunnel cos` command. To return to the default value of zero, use the `no` form of this command.

```
l2protocol-tunnel cos value
no l2protocol-tunnel cos
```

**Syntax Description**

- `value`: Specifies the CoS priority value for tunneled Layer 2 protocol packets. The range is 0 to 7, with 7 being the highest priority.

**Defaults**

The default is to use the CoS value that is configured for data on the interface. If no CoS value is configured, the default is 5 for all tunneled Layer 2 protocol packets.

**Command Modes**

Global configuration mode

**Command History**

- **Release**: 12.2(18)EW
- **Modification**: This command was first introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

When enabled, the tunneled Layer 2 protocol packets use this CoS value.

The value is saved in NVRAM.

**Examples**

This example shows how to configure a Layer 2 protocol tunnel CoS value of 7:

```
Switch(config)# l2protocol-tunnel cos 7
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

<tr>
<td><code>l2protocol-tunnel shutdown-threshold</code></td>
<td>Configures the protocol tunneling encapsulation rate.</td>
</tr>
</tbody>
</table>
l2protocol-tunnel drop-threshold

To set a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets, use the `l2protocol-tunnel drop-threshold` command. You can set the drop threshold for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable the drop threshold on the interface, use the `no` form of this command.

```
l2protocol-tunnel drop-threshold [cdp | stp | vtp] value
no l2protocol-tunnel drop-threshold [cdp | stp | vtp] value
```

**Syntax Description**
- `cdp` (Optional) Specifies a drop threshold for CDP.
- `stp` (Optional) Specifies a drop threshold for STP.
- `vtp` (Optional) Specifies a drop threshold for VTP.
- `value` Specifies a threshold in packets per second to be received for encapsulation before the interface shuts down, or specifies the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.

**Defaults**
The default is no drop threshold for the number of the Layer 2 protocol packets.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `l2protocol-tunnel drop-threshold` command controls the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops the Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

**Examples**
This example shows how to configure the drop threshold rate:

```
Switch(config-if)# l2protocol-tunnel drop-threshold cdp 50
Switch(config-if)#
```

**Related Commands**

**2-394**
l2protocol-tunnel shutdown-threshold

To configure the protocol tunneling encapsulation rate, use the `l2protocol-tunnel shutdown-threshold` command. You can set the encapsulation rate for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable the encapsulation rate on the interface, use the `no` form of this command.

```
l2protocol-tunnel shutdown-threshold [cdp | stp | vtp] value
no l2protocol-tunnel shutdown-threshold [cdp | stp | vtp] value
```

**Syntax Description**

- **cdp** (Optional) Specifies a shutdown threshold for CDP.
- **stp** (Optional) Specifies a shutdown threshold for STP.
- **vtp** (Optional) Specifies a shutdown threshold for VTP.
- **value** Specifies a threshold in packets per second to be received for encapsulation before the interface shuts down. The range is 1 to 4096. The default is no threshold.

**Defaults**

The default is no shutdown threshold for the number of Layer 2 protocol packets.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `l2-protocol-tunnel shutdown-threshold` command controls the number of protocol packets per second that are received on an interface before it shuts down. When no protocol option is specified with the keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a drop threshold on the interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.

When the shutdown threshold is reached, the interface is error disabled. If you enable error recovery by entering the `errdisable recovery cause l2ptguard` command, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out. If the error recovery feature generation is not enabled for `l2ptguard`, the interface stays in the error-disabled state until you enter the `shutdown` and `no shutdown` commands.

**Examples**

This example shows how to configure the maximum rate:

```
Switch(config-if)# l2protocol-tunnel shutdown-threshold cdp 50
Switch(config-if)#
```

**Related Commands**
### l2protocol-tunnel shutdown-threshold

**Command** | **Description**  
--- | ---  
l2protocol-tunnel | Enables protocol tunneling on an interface.  
l2protocol-tunnel cos | Configures the class of service (CoS) value for all tunneled Layer 2 protocol packets.  
l2protocol-tunnel drop-threshold | Sets a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.
**lacp port-priority**

To set the LACP priority for the physical interfaces, use the `lacp port-priority` command.

```
lacp port-priority priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority for the physical interfaces</td>
<td>1 to 65535</td>
</tr>
</tbody>
</table>

**Defaults**

Priority is set to 32768.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>This command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must assign each port in the switch a port priority that can be specified automatically or by entering the `lacp port-priority` command. The port priority is used with the port number to form the port identifier. The port priority is used to decide which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Although this command is a global configuration command, the `priority` value is supported only on port channels with LACP-enabled physical interfaces. This command is supported on LACP-enabled interfaces.

When setting the priority, the higher numbers indicate lower priorities.

**Examples**

This example shows how to set the priority for the interface:

```
Switch(config-if)# lacp port-priority 23748
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>channel-group</code></td>
<td>Assigns and configure an EtherChannel interface to an EtherChannel group.</td>
</tr>
<tr>
<td><code>channel-protocol</code></td>
<td>Enables LACP or PAgP on an interface.</td>
</tr>
<tr>
<td><code>lacp system-priority</code></td>
<td>Sets the priority of the system for LACP.</td>
</tr>
<tr>
<td><code>show lacp</code></td>
<td>Displays LACP information.</td>
</tr>
</tbody>
</table>
**lacp system-priority**

To set the priority of the system for LACP, use the **lacp system-priority** command.

```
lacp system-priority priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Priority of the system; valid values are from 1 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

Priority is set to 32768.

**Command Modes**

Global configuration mode

**Command History**

- **Release 12.1(13)EW**
  - This command was introduced on the Catalyst 4500 series switches.

**Usage Guidelines**

You must assign each switch that is running LACP a system priority that can be specified automatically or by entering the **lacp system-priority** command. The system priority is used with the switch MAC address to form the system ID and is also used during negotiation with other systems.

Although this command is a global configuration command, the `priority` value is supported on port channels with LACP-enabled physical interfaces.

When setting the priority, the higher numbers indicate lower priorities.

You can also enter the **lacp system-priority** command in interface configuration mode. After you enter the command, the system defaults to global configuration mode.

**Examples**

This example shows how to set the system priority:

```
Switch(config)# lacp system-priority 23748
```

**Related Commands**

</table>
license right-to-use activate

Note
This command only applies to Catalyst 4500-X and Supervisor Engine 7-E and 7L-E.

To activate PRTU licenses use the license right-to-use activate command.

    license right-to-use activate feature-name [acceptEula]

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature-name</td>
<td>Specifies the feature name (e.g., entservices, ipbase, lanbase)</td>
</tr>
<tr>
<td>acceptEula</td>
<td>(Optional). Activates the PRTU license. The End User License Agreement is accepted but does not display.</td>
</tr>
</tbody>
</table>

**Defaults**
PRTU licenses are inactive

**Command Modes**
privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.2SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to activate PRTU licenses that are inactive.

Downloading the license file from cisco portal and installing the license are not required. The PRTU licenses are bundled with image. Because the PRTU license is of highest precedence, when the PRTU license is activated, other license of the same feature switch to inactive state.

**Examples**
The following example shows how to activate PRTU licenses:

Switch# license right-to-use activate entservices

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>license right-to-use deactivate</td>
<td>Deactivates the PRTU license</td>
</tr>
</tbody>
</table>
license right-to-use deactivate

**Note**
This command only applies to Catalyst 4500-X and Supervisor Engine 7-E and 7L-E.

To deactivate the PRTU license use the `license right-to-use deactivate` command.

```bash
license right-to-use deactivate feature-name
```

**Syntax Description**
- `feature-name` Specifies the feature name (e.g., entservices, ipbase, lanbase)

**Defaults**
PRTU licenses are inactive

**Command Modes**
- privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.2SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use this command to deactivate the PRTU licenses that are active.

The PRTU licenses can be deactivated provided any other valid license is available for the same feature.

For example, to deactivate an entservices PRTU license, the switch should contain a valid evaluation license. Else, the deactivation will fail.

**Examples**

The following example shows how to deactivate PRTU licenses:

```bash
Switch# license right-to-use deactivate entservices
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>license right-to-use activate</code></td>
<td>Activates the PRTU license</td>
</tr>
</tbody>
</table>
lldp tlv-select power-management

To enable power negotiation through LLDP, use the `lldp tlv-select power-management` interface command.

```plaintext
lldp tlv-select power-management
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled on POEP ports

**Command Modes**
Interface level

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>Support was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You need to disable this feature if you do not want to perform power negotiation through LLDP.

This feature is not supported on non-POEP ports; the CLI is suppressed on such ports and TLV is not exchanged.

**Examples**
This example shows how to enable LLDP power negotiation on interface Gigabit Ethernet 3/1:

```plaintext
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int gi 3/1
Switch(config-if)# lldp tlv-select power-management
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>

logging event link-status global (global configuration)

To change the default switch-wide global link-status event messaging settings, use the `logging event link-status global` command. Use the `no` form of this command to disable the link-status event messaging.

```
logging event link-status global

no logging event link-status global
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The global link-status messaging is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If link-status logging event is not configured at the interface level, this global link-status setting takes effect for each interface.

**Examples**
This example shows how to globally enable link status message on each interface:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# logging event link-status global
Switch(config)# end
Switch#
```

**Related Commands**

</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enable system logging of interface state-change events on a specific interface, enter the `logging event link-status` command in interface configuration mode.

To enable system logging of interface state-change events on all interfaces in the system, enter the `logging event link-status global` command in global configuration mode. All interfaces without the state change event configuration use the global setting.

**Examples**

This example shows how to enable logging event state-change events on interface gi11/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event link-status
Switch(config-if)# end
Switch#
```

This example shows how to turn off logging event link status regardless of the global setting:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# no logging event link-status
Switch(config-if)# end
Switch#
```
This example shows how to enable the global event link-status setting on interface gi11/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event link-status use-global
Switch(config-if)# end
Switch#
```

</table>

**Usage Guidelines**
To enable system logging of interface state-change events on a specific interface, enter the `logging event trunk-status` command in interface configuration mode.

To enable system logging of interface state-change events on all interfaces in the system, enter the `logging event trunk-status use-global` command in global configuration mode. All interfaces without the state change event configuration use the global setting.

**Examples**

This example shows how to enable logging event state-change events on interface gi11/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event trunk-status
Switch(config-if)# end
Switch#
```

This example shows how to turn off logging event trunk status regardless of the global setting:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# no logging event trunk-status
Switch(config-if)# end
Switch#
```
This example shows how to enable the global event trunk-status setting on interface gi1/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi1/1
Switch(config-if)# logging event trunk-status use-global
Switch(config-if)# end
Switch#
```

mab

To enable and configure MAC authorization bypass (MAB) on a port, use the `mab` command in interface configuration mode. To disable MAB, use the `no` form of this command.

```
mab [eap]
no mab [eap]
```

**Note**
The `mab` command is totally independent of the effect of the `dot1x system-auth control` command.

**Syntax Description**
- `eap` (Optional) Specifies that a full EAP conversation should be used, as opposed to standard RADIUS Access-Request, Access-Accept conversation.

**Command Default**
Disabled

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When a port is configured for MAB as a fallback method, it operates in a typical dot1X method until a configurable number of failed attempts to request the identity of the host. The authenticator learns the MAC address of the host and uses that information to query an authentication server to see whether this MAC address will be granted access.

**Examples**
The following example shows how to enable MAB on a port:

```
Switch(config-if)# mab
Switch(config-if)#
```

The following example shows how to enable and configure MAB on a port:

```
Switch(config-if)# mab eap
Switch(config-if)#
```

The following example shows how to disable MAB on a port:

```
Switch(config-if)# no mab
Switch(config-if)#
```

mac access-list extended

To define the extended MAC access lists, use the `mac access-list extended` command. To remove the MAC access lists, use the `no` form of this command.

```
mac access-list extended name
no mac access-list extended name
```

**Syntax Description**

- `name`: ACL to which the entry belongs.

**Defaults**

MAC access lists are not defined.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the ACL name, follow these naming conventions:

- Maximum of 31 characters long and can include a-z, A-Z, 0-9, the dash character (-), the underscore character (_), and the period character (.).
- Must start with an alpha character and must be unique across all ACLs of all types
- Case sensitive
- Cannot be a number
- Must not be a keyword; keywords to avoid are all, default-action, map, help, and editbuffer

When you enter the `mac access-list extended name` command, you use the following subset to create or delete entries in a MAC layer access list:

```
```

Table 2-10 describes the syntax of the `mac access-list extended` subcommands.

Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

When you enter the `src-mac mask` or `dest-mac mask` value, follow these guidelines:

- Enter the MAC addresses as three 4-byte values in dotted hexadecimal format such as 0030.9629.9f84.
- Enter the MAC address masks as three 4-byte values in dotted hexadecimal format. Use 1 bit as a wildcard. For example, to match an address exactly, use 0000.0000.0000 (can be entered as 0.0.0).
- For the optional `protocol` parameter, you can enter either the EtherType or the keyword.
- Entries without a `protocol` parameter match any protocol.
- The access list entries are scanned in the order that you enter them. The first matching entry is used.
- To improve performance, place the most commonly used entries near the beginning of the access list.
- An implicit `deny any any` entry exists at the end of an access list unless you include an explicit `permit any any` entry at the end of the list.
- All new entries to an existing list are placed at the end of the list. You cannot add entries to the middle of a list.

### Examples

This example shows how to create a MAC layer access list named `mac_layer` that denies traffic from 0000.4700.0001, which is going to 0000.4700.0009, and permits all other traffic:

```bash
Switch(config)# mac access-list extended mac_layer
Switch(config-ext-macl)# deny 0000.4700.0001 0.0.0 0000.4700.0009 0.0.0 protocol-family appletalk
Switch(config-ext-macl)# permit any any
Switch(config-ext-macl)# end
Switch#```

**mac-address (virtual switch)**

To specify a Media Access Control (MAC) address to use as the common router MAC address for interfaces on the active and standby chassis, use the `mac-address` virtual switch configuration submode command. To return to the default setting, use the `no` form of this command.

```
mac-address { mac-address | use-virtual | chassis }
no mac-address { mac-address | use-virtual | chassis }
```

**Syntax Description**

- **mac-address** Specifies the MAC address in hexadecimal format.
- **use-virtual** Specifies the MAC address range reserved for the virtual switch system (VSS).
- **chassis** Specifies a MAC address derived from the chassis.

**Defaults**

The router MAC address is derived from the Cisco pool of virtual switch specific MAC addresses intended for the domain 1-255.

**Command Modes**

Virtual switch configuration submode (config-vs-domain)

**Command History**

- **Release** Cisco IOS XE 3.4.0SG and 15.1(2)SG
- **Modification** Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

When a virtual switch boots, the router MAC address is derived from the Cisco pool of virtual switch specific MAC addresses. The router address is used as the common router MAC address for interfaces on both the active and the standby chassis. Between switchovers, this MAC address is maintained on the new active switch. You can enter the `mac-address mac-address` command to specify a MAC address to use or the `mac-address use-virtual` command to use the MAC address range reserved for the VSS.

The MAC address range reserved for the VSS is derived from a reserved pool of addresses with the domain ID encoded in the leading 6 bits of the last octet and trailing 2 bits of the previous octet of the mac-address. The last two bits of the first octet is allocated for the protocol mac-address that is derived by adding the protocol ID (0 to 3) to the router MAC address.

**Note**

You must reload the virtual switch for the new router MAC address to take effect. If the MAC address you configured is different from the current MAC address, the following message is displayed:

```
Console (enable)#
```

**Examples**

The following example shows how to specify the MAC address to use in hexadecimal format:

```
Router(config)# switch virtual domain test-mac-address
Router(config-vs-domain)# mac-address 0000.0000.0000
```
The following example shows how to specify the MAC address range reserved for the VSS:

```
Router(config)# switch virtual domain test-mac-address
Router(config-vs-domain)# mac-address use-virtual
Router(config-vs-domain)#
```

### Related Commands

mac-address-table aging-time

To configure the aging time for the entries in the Layer 2 table, use the `mac-address-table aging-time` command. To reset the `seconds` value to the default setting, use the no form of this command.

```
mac-address-table aging-time seconds [vlan vlan_id]
no mac-address-table aging-time seconds [vlan vlan_id]
```

**Syntax Description**

- `seconds`  
  Aging time in seconds; valid values are 0 and from 10 to 1000000 seconds.
- `vlan vlan_id`  
  (Optional) Single VLAN number or a range of VLANs; valid values are from 1 to 4094.

**Defaults**

Aging time is set to 300 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not enter a VLAN, the change is applied to all routed-port VLANs.

Enter 0 seconds to disable aging.

**Examples**

This example shows how to configure the aging time to 400 seconds:

```
Switch(config)# mac-address-table aging-time 400
```

This example shows how to disable aging:

```
Switch(config)# mac-address-table aging-time 0
```

**Related Commands**

mac-address-table dynamic group protocols

To enable the learning of MAC addresses in both the “ip” and “other” protocol buckets, even though the incoming packet may belong to only one of the protocol buckets, use the mac-address-table dynamic group protocols command. To disable grouped learning, use the no form of this command.

```
mac-address-table dynamic group protocols {ip | other} {ip | other}
no mac-address-table dynamic group protocols {ip | other} {ip | other}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Specifies the “ip” protocol bucket.</td>
</tr>
<tr>
<td>other</td>
<td>Specifies the “other” protocol bucket.</td>
</tr>
</tbody>
</table>

### Defaults

The group learning feature is disabled.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The entries within the “ip” and “other” protocol buckets are created according to the protocol of the incoming traffic.

When you use the `mac-address-table dynamic group protocols` command, an incoming MAC address that might belong to either the “ip” or the “other” protocol bucket, is learned on both protocol buckets. Therefore, any traffic destined to this MAC address and belonging to any of the protocol buckets is unicasted to that MAC address, rather than flooded. This reduces the unicast Layer 2 flooding that might be caused if the incoming traffic from a host belongs to a different protocol bucket than the traffic that is destined to the sending host.

### Examples

This example shows that the MAC addresses are initially assigned to either the “ip” or the “other” protocol bucket:

```
Switch# show mac-address-table dynamic
Unicast Entries
vlan  mac address  type  protocols  port
--------+----------------+--------+---------------------+-------------------+
  1    0000.0000.5000  dynamic  other  GigabitEthernet1/1
  1    0001.0234.6616  dynamic  ip    GigabitEthernet3/1
  1    0003.3178.ec0a  dynamic  assigned GigabitEthernet3/1
  1    0003.4700.24c3  dynamic  ip    GigabitEthernet3/1
  1    0003.4716.f475  dynamic  ip    GigabitEthernet3/1
  1    0003.4748.75c5  dynamic  ip    GigabitEthernet3/1
  1    0003.47f0.d6a3  dynamic  ip    GigabitEthernet3/1
  1    0003.47f6.a91a  dynamic  ip    GigabitEthernet3/1
```
This example shows how to assign MAC addresses that belong to either the “ip” or the “other” bucket to both buckets:

```
Switch(config)# mac-address-table dynamic group protocols ip other
Switch(config)# exit
Switch# show mac address-table dynamic
```

Switch#
mac-address-table learning vlan

To enable MAC address learning on a VLAN, use the `mac-address-table learning` global configuration command. Use the `no` form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

```
mac-address-table learning vlan vlan-id

no mac-address-table learning vlan vlan-id
```

**Syntax Description**

| `vlan-id` | Specifies a single VLAN ID or a range of VLAN IDs separated by a hyphen or comma. Valid VLAN IDs are 1 to 4094. |

**Defaults**

Enabled on all VLANs

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was modified to support the disable learning feature on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you control MAC address learning on a VLAN, you can manage the available table space by controlling which VLANs, and which ports can learn MAC addresses.

You can disable MAC address learning on a single VLAN ID (for example, by entering `no mac-address-table learning vlan 223`) or on a range of VLAN IDs (for example, by entering `no mac-address-table learning vlan 1-20, 15`).

Before you disable MAC address learning, familiarize yourself with the network topology and the switch system configuration. If you disable MAC address learning on a VLAN, flooding may occur in the network. For example, if you disable MAC address learning on a VLAN with a configured switch virtual interface (SVI), the switch floods all IP packets in the Layer 2 domain. If you disable MAC address learning on a VLAN that includes more than two ports, every packet entering the switch is flooded in that VLAN domain. Disable MAC address learning only in VLANs that contain two ports. Use caution before disabling MAC address learning on a VLAN with an SVI.

You cannot disable MAC address learning on a VLAN that the switch uses internally. This action causes the switch to generate an error message and rejects the `no mac-address-table learning vlan` command. To view used internal VLANs, enter the `show vlan internal usage` privileged EXEC command.

If you disable MAC address learning on a VLAN configured as a PVLAN primary or a secondary VLAN, the MAC addresses are still learned on the VLAN (primary or secondary) associated with the PVLAN. You cannot disable MAC address learning on an RSPAN VLAN. The configuration is not allowed.

If you disable MAC address learning on a VLAN that includes a secure port, MAC address learning is not disabled on the secure port. If you later disable port security on the interface, the disabled MAC address learning state is enabled.
To display the MAC address learning status of a specific VLAN or for all VLANs, enter the `show mac-address-table learning vlan` command.

**Examples**

This example shows how to disable MAC address learning on VLAN 2003:

```
Switch(config)# no mac-address-table learning vlan 2003
```

**Related Commands**

</tr>
</thead>
<tbody>
<tr>
<td><code>show mac address-table learning</code></td>
<td>Displays the MAC address learning status on all VLANs or on the specified VLAN.</td>
</tr>
</tbody>
</table>
mac-address-table notification

To enable MAC address notification on a switch, use the `mac-address-table notification` command. To return to the default setting, use the `no` form of this command:

```
mac-address-table notification [ [ change | history-size hs_value | interval intv_value ] | [ mac-move ] | [ threshold | limit percentage | interval time ] ] | [ learn-fail | interval time | limit num_fail ]

no mac-address-table notification [ [ change | history-size hs_value | interval intv_value ] | [ mac-move ] | [ threshold | limit percentage | interval time ] ] | [ learn-fail | interval time | limit num_fail ]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change</td>
<td>(Optional) Specifies enabling MAC change notification.</td>
</tr>
<tr>
<td>history-size hs_value</td>
<td>(Optional) Sets a maximum number of entries in the MAC change notification history table. The range is 0 to 500 entries.</td>
</tr>
<tr>
<td>interval intv_value</td>
<td>(Optional) Sets a notification trap interval: the set interval time between two consecutive traps. The range is 0 to 2,147,483,647 seconds.</td>
</tr>
<tr>
<td>mac-move</td>
<td>(Optional) Specifies enabling MAC move notification.</td>
</tr>
<tr>
<td>threshold</td>
<td>(Optional) Specifies enabling MAC threshold notification.</td>
</tr>
<tr>
<td>limit percentage</td>
<td>(Optional) Specifies the percentage of MAT utilization threshold; valid values are from 1 to 100 percent.</td>
</tr>
<tr>
<td>interval time</td>
<td>(Optional) Specifies the time between MAC threshold notifications; valid values are greater than or equal to 120 seconds.</td>
</tr>
<tr>
<td>learn-fail</td>
<td>(Optional) Specifies syslog (level 6) notifications of failures to install MAC addresses learned in software into hardware. Disabled by default.</td>
</tr>
<tr>
<td>interval time</td>
<td>(Optional) Specifies the syslog interval between hardware MAC learning failure notifications. The default value is 150 seconds. The range is between 1 to 100000 seconds.</td>
</tr>
<tr>
<td>limit num_fail</td>
<td>(Optional) Specifies the number of hardware MAC learning failures to be allowed in a notification interval.</td>
</tr>
</tbody>
</table>

### Defaults

- MAC address notification feature is disabled.
- The default MAC change trap interval value is 1 second.
- The default number of entries in the history table is 1.
- MAC move notification is disabled.
- MAC threshold monitoring feature is disabled.
- The default limit is 50 percent.
- The default time is 120 seconds.
- Hardware MAC learning failure syslog notification is disabled.
- The default limit is 1000.
- The default interval is 150 seconds.
mac-address-table notification

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support introduced for the learn-fail keyword on Supervisor Engine 6-E and Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can enable the MAC change notification feature using the `mac-address-table notification change` command. If you do this, you must also enable MAC notification traps on an interface using the `snmp trap mac-notification change interface` configuration command and configure the switch to send MAC change traps to the NMS using the `snmp-server enable traps mac-notification` global configuration command.

When the `history-size` option is configured, the existing MAC change history table is deleted, and a new table is created.

**Examples**
This example shows how to set the MAC address notification history table size to 300 entries:

```
Switch(config)# mac-address-table notification change history-size 300
Switch(config)#
```

This example shows how to set the MAC address notification interval time to 1250 seconds:

```
Switch(config)# mac-address-table notification change interval 1250
Switch(config)#
```

This example shows how to enable hardware MAC address learning failure syslog notification:

```
Switch(config)# mac address-table notification learn-fail
```

This example shows how to set the interval of hardware MAC address learning failure syslog notification to 30 seconds:

```
Switch(config)# mac address-table notification learn-fail interval 30
```

**Related Commands**

**mac-address-table static**

To configure the static MAC addresses for a VLAN interface or drop unicast traffic for a MAC address for a VLAN interface, use the `mac-address-table static` command. To remove the static MAC address configurations, use the `no` form of this command.

```
mac-address-table static mac-addr {vlan vlan-id} {interface type | drop}
no mac-address-table static mac-addr {vlan vlan-id} {interface type} {drop}
```

**Syntax Description**

- `mac-addr` MAC address; optional when using the `no` form of this command.
- `vlan vlan-id` VLAN and valid VLAN number; valid values are from 1 to 4094.
- `interface type` Interface type and number; valid options are FastEthernet and GigabitEthernet.
- `drop` Drops all traffic received from and going to the configured MAC address in the specified VLAN.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a static MAC address is installed, it is associated with a port.

The output interface specified must be a Layer 2 interface and not an SVI.

If you do not enter a protocol type, an entry is automatically created for each of the four protocol types.

Entering the `no` form of this command does not remove the system MAC addresses.

When removing a MAC address, entering `interface int` is optional. For unicast entries, the entry is removed automatically. For multicast entries, if you do not specify an interface, the entire entry is removed. You can specify the selected ports to be removed by specifying the interface.

**Examples**

This example shows how to add the static entries to the MAC address table:

```
Switch(config)# mac-address-table static 0050.3e8d.6400 vlan 100 interface fastethernet5/7
```

**Related Commands**

**macro apply cisco-desktop**

To enable the Cisco-recommended features and settings that are suitable for connecting a switch port to a standard desktop, use the `macro apply cisco-desktop` command.

```
macro apply cisco-desktop $AVID access_vlanid
```

**Syntax Description**

- `$AVID access_vlanid` Specifies an access VLAN ID.

**Defaults**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command can only be viewed and applied; it cannot be modified.

Ensure that the existing configuration on the interface does not conflict with the intended macro configuration. Before you apply the macro, clear the configuration on the interface with the `default interface` command.

**Examples**

This example shows how to enable the Cisco-recommended features and settings on port fa2/1:

```
Switch(config)# interface FastEthernet2/1
Switch(config-if)# macro apply cisco-desktop $AVID 50
Switch(config-if)#
```

The contents of this macro are as follows:

```
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID [access_vlanid]
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
# Ensure port-security age is greater than one minute
# and use inactivity timer
# "Port-security maximum 1" is the default and will not
# Show up in the config
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
```

**macro auto device**

Use the `macro auto device` command to simplify changing the parameters for a built-in functions for a device type. Use the `no` form of this command to revert to the initial parameter values.

```
macro auto device device_type [params values]

no macro auto device device_type [params values]
```

**Syntax Description**
- `device_type` Specifies the device type.
  - `phone`—Apply interface configs on detecting a phone
  - `switch`—Apply interface configs on detecting a switch
  - `router`—Apply interface configs on detecting a router
  - `ap`—Apply interface configs on detecting an ap
  - `lwap`—Apply interface configs on detecting a light weight ap
  - `dmp`—Apply interface configs on detecting a DMP
  - `ipvsc`—Apply interface configs on detecting a IPVSC

- `params values` (Optional) Replace default values that begin with `$`. Enter new values in the form of name value pair separated by a space: `[<name1>=<value1> <name2>=<value2>...]`. Default values are shown in parenthesis.

**Command Modes**
- Global configuration

**Command History**
- **Release** 12.2(54)SG
- **Modification** This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**
Although you can use the `macro auto execute` command to produce the same effect as the `macro auto device` command, the later is simpler.

**Examples**
This example shows how to change the access VLAN and voice VLAN from their default value to user defined values for phone devices.

```
(config)# macro auto device phone ACCESS_VLAN=10 VOICE_VLAN=20
```

**Related Commands**
- `macro auto execute (built-in function)` Changes built-in function default values or to map user-defined triggers to built-in functions, and to pass the parameter values.
- `macro auto execute (remotely-defined trigger)` Maps a trigger to a remotely defined functions.

</tbody>
</table>

### Defaults

Auto Smartports is disabled.

### Command Modes

Global configuration
The switch automatically maps from builtin event triggers to builtin functions. The builtin functions are system-defined functions in the software image.

Use the `macro auto execute` global configuration command to replace the builtin function default values with values specific to your switch.

You can also create user-defined triggers and use this command to map the triggers to builtin functions.

You can create user-defined event triggers by entering the `shell trigger` global configuration command. Use the `show shell` privileged EXEC command to display the contents of the builtin and user-defined triggers and functions.

This example shows how to use two built-in Auto Smartports macros for connecting Cisco switches and Cisco IP phones to the switch. It modifies the default voice VLAN, access VLAN, and native VLAN for the trunk interface:

```
Switch# configure terminal
Switch(config)##!!! the next command modifies the access and voice vlans
Switch(config)##!!! for the built in Cisco IP phone auto smartport macro
Switch(config)# macro auto execute CISCO_PHONE_EVENT builtin CISCO_PHONE_AUTO_SMARTPORT
ACCESS_VLAN=10 VOICE_VLAN=20
Switch(config)#
Switch(config)##!!! the next command modifies the native vlan
Switch(config)##!!! for the built in switch auto smartport macro
Switch(config)# macro auto execute CISCO_SWITCH_EVENT builtin CISCO_SWITCH_AUTO_SMARTPORT
NATIVE_VLAN=10
Switch(config)##!!! the next example creates a user-defined trigger and maps it to a builtin functions
Switch(config)# shell trigger myTrigger "user-defined trigger"
Switch(config)# macro auto execute myTrigger builtin CISCO_PHONE_AUTO_SMARTPORT_ACCESSVLAN voice_vlan
Switch(config)##!!! the next command enables auto smart ports globally
Switch(config)# macro auto global processing fallback CDP
```

```
Switch# !!! here's the running configuration of the interface connected
Switch# !!! to another Cisco Switch after the Macro is applied
Switch#
Switch# show running-config interface Gi1/0/1
Building configuration...

Current configuration : 284 bytes
!
interface GigabitEthernet1/0/1

**macro auto execute (remotely-defined trigger)**

Use the *macro auto execute* configuration command to map a trigger to a remotely defined function. Use the *no* form of this command to unmap the trigger.

```
macro auto execute trigger_name remote url

no macro auto execute trigger_name remote url
```

**Syntax Description**

- `trigger_name` Specifies the trigger name.
- `url` Specifies the remotely-defined URL.

**Defaults**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command enables you to store shell functions in a central location and utilized by ASP on many switches. This alleviates the problem of updating functions on every switch for each modification.

Triggering of the remotely defined function requires network connectivity to the URL, which is accessed for each execution of the function.

**Examples**

This example shows how to map a trigger to the remotely defined function *myfunction* - the filename that contains the function body:

```
Switch(config)# macro auto execute mytrigger remote tftp://dirt/tftpboot/myfunction
```

**Related Commands**

macro auto execute (user-defined function)

Use the `macro auto execute` configuration command to map a trigger to a user-defined function. Use the `no` form of this command to unmap the trigger.

```
macro auto execute trigger_name [param_name=value] {function_body}
no macro auto execute trigger_name [param_name=value]
```

**Syntax Description**

- `trigger_name` Specifies the trigger name.
- `param_name=value` (Optional) Specifies values for the parameters that are to be used in the function body.
- `function_body` Shell functions with CLIs.

**Defaults**

None.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Because the function defined in this command does not have a name, you cannot use it to map to another trigger. This is the only way that you can map a trigger to a user defined function. Shell functions defined in the non-configure mode can not be used to map triggers.

**Examples**

This example shows how to map the user-defined event trigger `Cisco Digital Media Player` (DMP) to a user-defined macro.

a. Connect the DMP to an 802.1x- or MAB-enabled switch port.

b. On the RADIUS server, set the attribute-value pair to `auto-smart-port=CISCO_DMP_EVENT`.

c. On the switch, create the event trigger `CISCO_DMP_EVENT`, and enter the user-defined macro commands shown below.

d. The switch recognizes the attribute-value pair=CISCO_DMP_EVENT response from the RADIUS server and applies the macro associated with this event trigger.

```
Switch(config)# shell trigger CISCO_DMP_EVENT Cisco DMP player
Switch(config)# macro auto execute CISCO_DMP_EVENT {
  if [[ $LINKUP -eq YES ]]; then
    conf t
    interface $INTERFACE
    macro description $TRIGGER
    switchport access vlan 1
    switchport mode access
    switchport port-security
```
```bash
switchport port-security maximum 1
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
spanning-tree portfast
spanning-tree bpdpuguard enable
exit
fi
if [[ $LINKUP -eq NO ]]; then
  conf t
  interface $INTERFACE
  no macro description $TRIGGER
  no switchport access vlan 1
  if [[ $AUTH_ENABLED -eq NO ]]; then
    no switchport mode access
  fi
  no switchport port-security
  no switchport port-security maximum 1
  no switchport port-security violation restrict
  no switchport port-security aging time 2
  no switchport port-security aging type inactivity
  no spanning-tree portfast
  no spanning-tree bpdpuguard enable
  exit
fi
}
Switch(config)# end
```

macro auto global processing

Use the `macro auto global processing` global configuration command to enable Auto SmartPorts macros on the switch. Use the `no` form of this command to disable Auto SmartPorts (ASP) macros globally.

```
macro auto global processing [cdp | lldp]
no macro auto global processing [ cdp | ldp]
```

**Note** Starting with Release 15.0(2)SG, the `fallback` option has been deprecated.

**Syntax Description**

- `cdp` Selects CDP as fallback mode.
- `lldp` Selects LLDP as fallback mode.

**Defaults**

Auto Smartports is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `macro auto global processing` global configuration command to globally enable Auto Smartports macros on the `switch`. To disable ASP macros on a specific `port`, use the `no macro auto processing` command in the interface mode before ASP is enabled globally.

Auto Smartports macros dynamically configure ports based on the device type detected on the port. When the switch detects a new device on a port it applies the appropriate ASP macro. When a link-down event occurs on a port, the switch removes the macro. For example, when you connect a Cisco IP phone to a port, ASP automatically applies the IP phone macro. The IP phone macro enables quality of service (QoS), security features, and a dedicated voice VLAN to ensure proper treatment of delay-sensitive voice traffic.

ASP uses event triggers to map devices to macros. The most common event triggers are based on Cisco Discovery Protocol (CDP) messages received from connected devices. The detection of a device invokes a CDP event trigger: Cisco IP phone, Cisco wireless access point, Cisco switch, or Cisco router. Other event triggers use MAC authentication bypass (MAB) and 802.1X authentication messages.

Use CDP if port authentication is enabled and the RADIUS server does not send an event trigger. Select LLDP to apply auto configuration if authentication fails.

If authentication is enabled on a port, a switch ignores CDP and LLDP messages unless the `cdp` keyword is enabled.
When using 802.1X or MAB authentication, configure the RADIUS server to support the Cisco attribute-value (AV) pair `auto-smart-port=event trigger`.

When CDP-identified devices advertise multiple capabilities, a switch chooses a capability in this priority order: switch, router, access point, lightweight access point, phone, host.

To verify that an ASP macro is applied to an interface, use the `show running config` command.

The `macro auto global processing cdp` and `macro auto global processing lldp` commands enables ASP globally if it is not already enabled, and set the fallback to CDP or LLDP, respectively. However, the `no macro auto global processing [cdp | lldp]` command only removes the fallback mechanism. It does not disable ASP globally; only the `no macro auto global processing` command disables ASP globally.

The keywords `cdp` and `lldp` are also controlled at the interface level; by default, CDP is the fallback mechanism on an interface. If you prefer LLDP, first enter the `no macro auto processing cdp` command, then enter the `macro auto processing lldp` command.

If you want to activate both CDP and LLDP, you must enable them in sequence. For example, you would first enter the `macro auto processing cdp` command, then the `macro auto processing lldp` command.

### Examples

This example shows how enable ASP on a switch and to disable the feature on Gi1/0/1:

```
Switch(config)# interface interface Gi1/0/1
Switch(config-if)# no macro auto processing
Switch(config)# macro auto global processing
```

macro auto mac-address-group

Use the **macro auto mac-address-group** command to configure a group of MAC-address or OUIs as a trigger. Use the **no** form of this command to unconfigure the group.

```
macro auto mac-address-group *grp_name*
no macro auto mac-address-group *grp_name*
```

**Syntax Description**

*grp_name* Specifies the group name.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command changes the mode to config-mac-addr-grp, in which you can add or remove a MAC address or OUI from the group.

You can specify a list of MACs or OUIs, or a range of OUIs (maximum of 5 in the range).

**Examples**

This example shows how to configure **testGroup** as a trigger:

```
Switch(config)# macro auto mac-address-group testGroup
Switch(config-addr-grp-mac) # mac-address list 1111.1111.1111 2222.2222.2222
Switch(config-addr-grp-mac) # exit
Switch(config)# exit
```

macro auto monitor

To enable the device classifier, use the `macro auto monitor` global configuration command. Use the `no` form of this command to disable the device classifier.

```
macro auto monitor
no macro auto monitor
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Device classifier is enabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release IOS XE 3.3.0</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>SG (15.1(1)SG)</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `no macro auto monitor` global configuration command to disable the device classifier. You cannot disable the device classifier while it is being used by features such as ASP.

**Examples**

This example shows how to enable the ASP device classifier on a switch:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# macro auto monitor
Switch(config)# end
```

**Related Commands**

</tbody>
</table>
macro auto processing

Note
Only use this command when Auto SmartPorts (ASP) is enabled globally; when ASP is disabled globally, interface-level control has no effect.

Use the **macro auto processing** interface configuration command to enable ASP macros on a specific interface. Use the **no** form of this command to disable ASP on a specific interface before ASP is enabled globally.

```
macro auto processing [fallback cdp] [fallback lldp]
no macro auto processing [fallback cdp] [fallback lldp]
```

**Syntax Description**
- **fallback cdp** Specifies as CDP as the fallback mechanism.
- **fallback lldp** Specifies as LLDP as the fallback mechanism.

**Defaults**
Fallback mechanism is CDP.

**Command Modes**
Interface level configuration

**Command History**
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The **no macro auto processing** command should be configured on all interfaces where ASP is not desirable (such as Layer 3 and EtherChannel interfaces) before ASP is enabled globally.

At the interface level, the default fallback mechanism is CDP. To change the mechanism to LLDP, enter the **no macro auto processing fallback cdp** command, followed by the **macro auto processing fallback lldp** command.

**Examples**
This example shows how to enable the feature on an interface:

```
Switch(config)# interface Gi3/1
Switch(config-if)# macro auto processing
```

macro auto sticky

Use the **macro auto sticky** configuration to specify not to remove configurations applied by ASP across link flaps and device removal.

**macro auto sticky**

### Syntax Description

This command has no arguments or keywords.

### Defaults

Not sticky (macros are removed)

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command enables you to avoid unnecessary removal of ASP configurations when a feature intentionally shuts down a link (like EnergyWise, which shuts down inactive links to save energy). When such a feature is enabled, you don't want ASP macros to be applied and removed unnecessarily. So you configure the sticky feature.

### Examples

This example shows how to specify not to remove configurations:

Switch(config)# macro auto sticky

</table>
**macro global description**

To enter a description about the macros that are applied to the switch, use the **macro global description** global configuration command on the switch stack or on a standalone switch. Use the **no** form of this command to remove the description.

```
macro global description text

no macro global description text
```

**Syntax Description**

```
text
```

*Enters a description about the macros that are applied to the switch.*

**Defaults**

This command has no default setting.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command associates comment text, or the macro name, with a switch. When multiple macros are applied on a switch, the description text will be from the last applied macro.

**Examples**

This example shows how to add a description to a switch:

```
Switch(config)# macro global description udld aggressive mode enabled
```

You can verify your settings by entering the **show parser macro description** privileged EXEC command.

**Related Commands**

main-cpu

To enter the main CPU submode and manually synchronize the configurations on the two supervisor engines, use the **main-cpu** command.

```
main-cpu
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Redundancy mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch. (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The main CPU submode is used to manually synchronize the configurations on the two supervisor engines. From the main CPU submode, use the **auto-sync** command to enable automatic synchronization of the configuration files in NVRAM.

**Note**
After you enter the main CPU submode, you can use the **auto-sync** command to automatically synchronize the configuration between the primary and secondary route processors based on the primary configuration. In addition, you can use all of the redundancy commands that are applicable to the main CPU.

**Examples**
This example shows how to reenable the default automatic synchronization feature using the auto-sync standard command to synchronize the startup-config and config-register configuration of the active supervisor engine with the standby supervisor engine. The updates for the boot variables are automatic and cannot be disabled.

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
Switch(config-r-mc)# end
Switch# copy running-config startup-config
Switch#
```

**Related Commands**

<tr>
<td><strong>auto-sync</strong></td>
<td>Enables automatic synchronization of the configuration files in NVRAM.</td>
</tr>
</tbody>
</table>
match

To specify a match clause by selecting one or more ACLs for a VLAN access-map sequence, use the match subcommand. To remove the match clause, use the no form of this command.

```
match {ip address {acl-number | acl-name}} | {mac address acl-name}
```

```
no match {ip address {acl-number | acl-name}} | {mac address acl-name}
```

**Note**

If a match clause is not specified, the action for the VLAN access-map sequence is applied to all packets. All packets are matched against that sequence in the access map.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip address acl-number</code></td>
<td>Selects one or more IP ACLs for a VLAN access-map sequence; valid values are from 1 to 199 and from 1300 to 2699.</td>
</tr>
<tr>
<td><code>ip address acl-name</code></td>
<td>Selects an IP ACL by name.</td>
</tr>
<tr>
<td><code>mac address acl-name</code></td>
<td>Selects one or more MAC ACLs for a VLAN access-map sequence.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

VLAN access-map mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The match clause specifies the IP or MAC ACL for traffic filtering.

The MAC sequence is not effective for IP packets. IP packets should be access controlled by IP match clauses.

Refer to the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional configuration guidelines and restrictions.

Refer to the *Cisco IOS Command Reference* publication for additional match command information.

**Examples**

This example shows how to define a match clause for a VLAN access map:

```
Switch(config)# vlan access-map ganymede 10
Switch(config-access-map)# match ip address 13
```

**Related Commands**

ip address acl-number

ip address acl-name

mac address acl-name
<table>

<tr>
<td><code>show vlan access-map</code></td>
<td>Displays the contents of a VLAN access map.</td>
</tr>
<tr>
<td><code>vlan access-map</code></td>
<td>Enters VLAN access-map command mode to create a VLAN access map.</td>
</tr>
</tbody>
</table>
match (class-map configuration)

To define the match criteria for a class map, use the `match` class-map configuration command. To remove the match criteria, use the `no` form of this command.

```
match {access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list | qos-group value | protocol [ip | ipv6 | arp]

no match {access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list | qos-group value | protocol [ip | ipv6 | arp]
```

**Syntax Description**

- **access-group acl-index-or-name**
  - Number or name of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699.

- **cos cos-list**
  - Lists up to four Layer 2 class of service (CoS) values to match against a packet. Separate each value with a space. The range is 0 to 7.

- **[lp] dscp dscp-list**
  - (Optional) IP keyword. It specifies that the match is for IPv4 packets only. If not used, the match is for both IPv4 and IPv6 packets.
  - Lists up to eight IP Differentiated Services Code Point (DSCP) values to match against a packet. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value.

- **[lp] precedence ip-precedence-list**
  - (Optional) IP keyword. It specifies that the match is for IPv4 packets only. If not used, the match is for both IPv4 and IPv6 packets.
  - Lists up to eight IP-precedence values to match against a packet. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.

- **qos-group value**
  - Specifies the internally generated qos-group value assigned to a packet on the input qos classification.

- **protocol ip**
  - Specifies IP in the Ethernet header. Though visible in the command-line help strings, the only protocol types supported are IP, IPv6, and ARP.

- **protocol ipv6**
  - Specifies IPv6 in the Ethernet header. Though visible in the command-line help strings the only protocol types supported are IP, IPv6, and ARP.

- **protocol arp**
  - Specifies ARP in the Ethernet header. Though visible in the command-line help strings the only protocol types supported are IP, IPv6, and ARP.

**Defaults**

No match criteria are defined.

**Command Modes**

Class-map configuration mode
match (class-map configuration)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support extended to Supervisor Engine 6-E and the Catalyst 4900M chassis.</td>
</tr>
<tr>
<td>12.2(46)SG</td>
<td>Added support for the <strong>match protocol arp</strong> command on the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before entering the `match` command, you must first enter the `class-map` global configuration command to specify the name of the class whose match criteria you want to establish. The `match` command is used to specify which fields in the packets are examined to classify the packets. If a packet matches the specified criteria, the packet is considered a member of the class and is forwarded according to the quality of service (QoS) specifications set in the traffic policy.

For the `match ip dscp dscp-list` or the `match ip precedence ip-precedence-list` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `match ip dscp af11` command, which is the same as entering the `match ip dscp 10` command. You can enter the `match ip precedence critical` command, which is the same as entering the `match ip precedence 5` command. For a list of supported mnemonics, enter the `match ip dscp ?` or the `match ip precedence ?` command to see the command-line help strings.

To match only IPv6 packets, you must use the `match protocol ipv6` command. To match only IPv4 packets you can use either the `ip` prefix or the protocol `ip` keyword.

To match only ARP packets, you must use the `match protocol arp` command.

You can configure the `match cos cos-list`, `match ip dscp dscp-list`, `match ip precedence ip-precedence-list` command in a class map within a policy map.

The `match cos cos-list` command applies only to Ethernet frames that carry a VLAN tag.

The `match qos-group` command is used by the class-map to identify a specific QoS group value assigned to a packet. The QoS group value is local to the switch and is associated with a packet on the input Qos classification.

Packets that do not meet any of the matching criteria are classified as members of the default traffic class. You configure it by specifying `class-default` as the class name in the `class` policy-map configuration command. For more information, see the “class” section on page 2-92.

### Examples

This example shows how to create a class map called class2, which matches all the inbound traffic with DSCP values of 10, 11, and 12:

```
Switch# configure terminal
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
Switch#
```

This example shows how to create a class map called class3, which matches all the inbound traffic with IP-precedence values of 5, 6, and 7 for both IPv4 and IPv6 traffic:

```
Switch# configure terminal
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
Switch#
```
This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1:

Switch# configure terminal
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
Switch#

This example shows how to specify a class-map that applies only to IPv6 traffic on a Supervisor Engine 6-E:

Switch# configure terminal
Switch(config)# class-map match all ipv6 only
Switch(config-cmap)# match dscp af21
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
Switch#

You can verify your settings by entering the show class-map privileged EXEC command.

<table>
<thead>

</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>class-map</td>
</tr>
<tr>
<td>show class-map</td>
</tr>
</tbody>
</table>
match flow ip

To specify match criteria to treat flows with a unique source or destination address as new flows, use the `match flow ip` command. To disable this function, use the `no` form of this command.

```
match flow ip [source-address [ip destination-address ip protocol L4 source-address L4 destination-address] | destination-address]

no match flow ip [source-address [ip destination-address ip protocol L4 source-address L4 destination-address] | destination-address]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-address</td>
<td>Establishes a new flow from a flow with a unique IP source address.</td>
</tr>
<tr>
<td>ip destination-address</td>
<td>(Optional) Comprises the full flow keyword; treats each flow with unique IP source, destination, protocol, and Layer 4 source and destination address as a new flow.</td>
</tr>
<tr>
<td>ip protocol L4</td>
<td></td>
</tr>
<tr>
<td>source-address L4</td>
<td></td>
</tr>
<tr>
<td>destination-address</td>
<td>Establishes a new flow from a flow with a unique IP destination address.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

class-map configuration submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Support for the full flow option was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you specify the source-address keyword, each flow with a unique source address is treated as a new flow.

When you specify the destination-address keyword, each flow with a unique destination address is treated as a new flow.

A policy map is called a *flow-based* policy map when you configure the flow keywords on the class map that it uses. To attach a flow-based policy map as a child to an aggregate policy map, use the `service-policy` command.

**Note**

The `match flow` command is available on the Catalyst 4500 series switch only when Supervisor Engine VI (WS-X4516-10GE) is present.
**Examples**

This example shows how to create a flow-based class map associated with a source address:

```
Switch(config)# class-map match-all cl
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# end
Switch#
Switch# show class-map cl
Class Map match-all cl (id 2)
  Match flow ip source-address
Switch#
```

This example shows how to create a flow-based class map associated with a destination address:

```
Switch(config)# class-map match-all cl
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# end
Switch#
Switch# show class-map cl
Class Map match-all cl (id 2)
  Match flow ip destination-address
Switch#
```

Assume there are two active flows on the Fast Ethernet interface 6/1 with source addresses 192.168.10.20 and 192.168.10.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
```

```
Switch# show policy-map interface
FastEthernet6/1

Service-policy input: p1

Class-map: c1 (match-all)
  15432182 packets
  Match: flow ip source-address
  police: Per-interface
    Conform: 64995654 bytes Exceed: 2376965424 bytes

Class-map: class-default (match-any)
  0 packets
  Match: any
    0 packets
Switch#
```
This example shows two active flows on the Fast Ethernet interface 6/1 with destination addresses of 192.168.20.20 and 192.168.20.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 100000 9000
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet6/1
Switch(config-if)# service-policy input pl
Switch(config-if)# end
Switch# write memory
Switch# show policy-map interface FastEthernet6/1
Service-policy input: p1
Class-map: c1 (match-all)
2965072 packets
Match: flow ip destination-address
police: Per-interface
Conform: 6105636 bytes Exceed: 476652528 bytes
Class-map: class-default (match-any)
0 packets
Match: any
0 packets
```

Assume there are two active flows as shown below on the Fast Ethernet interface 6/1:

```
<table>
<thead>
<tr>
<th>SrcIp</th>
<th>DstIp</th>
<th>IpProt</th>
<th>SrcL4Port</th>
<th>DstL4Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>81</td>
</tr>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>21</td>
</tr>
</tbody>
</table>
```

With the following configuration, each flow is policed to a 1000000 bps with an allowed 9000-byte burst value.

If you use the `match flow ip source-address|destination-address` command, these two flows are consolidated into one flow because they have the same source and destination address.

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol 14 source-port 14 destination-port
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 100000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastEthernet 6/1
```
match flow ip

Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory

**mdix auto**

To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the `mdix auto` command. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the `no` form of this command to disable auto-MDIX.

```
mdix auto
no mdix auto
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Auto-MDIX is enabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(46)SG</td>
<td>Added supported and unsupported linecard information to the usage guidelines.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following linecards support Auto-MDIX through the CLI on their copper media ports:
- WS-X4124-RJ45
- WS-X4148-RJ45 (hardware revision 3.0 or higher)
- WS-X4232-GB-RJ45 (hardware revision 3.0, or higher)
- WS-X4920-GE-RJ45
- WS-4648-RJ45V+E (Auto-MDIX support when inline power is disabled on the port).

Linecards that support auto-MDIX by default when port auto-negotiation enabled and cannot be turned off using an `mdix` CLI command include:
- WS-X4448-GB-RJ45
- WS-X4548-GB-RJ45
- WS-X4424-GB-RJ45
- WS-X4412-2GB-T

Linecards that cannot support auto-MDIX functionality, either by default or CLI commands, include:
- WS-X4548-GB-RJ45V
- WS-X4524-GB-RJ45V
- WS-X4506-GB-T
- WS-X4148-RJ
- WS-X4248-RJ21V
- WS-X4248-RJ45V
- WS-X4224-RJ45V
- WS-X4232-GB-RJ

When you enable auto-MDIX on an interface, you must also set the interface speed to be autonegotiated so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed) is enabled on one or both of connected interfaces, link up occurs even if the cable type (straight-through or crossover) is incorrect.

**Examples**

This example shows how to enable auto MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface FastEthernet6/3
Switch(config-if)# speed auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```
## Related Commands

media-type

To select the connector for a dual-mode capable port, use the `media-type` command.

```
media-type {rj45 | sfp}
```

**Syntax Description**

- **rj45**: Uses the RJ-45 connector.
- **sfp**: Uses the SFP connector.

**Defaults**

- **sfp**

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced for the WS-X4306-GB-T module and the WS-X4948 chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported on all ports on the WS-X4306-GB-T module and ports 1/45-48 on the WS-X4948 chassis.

Entering the `show interface capabilities` command provides the Multiple Media Types field, which displays the value `no` if a port is not dual-mode capable and lists the media types (`sfp` and `rj45`) for dual-mode capable ports.

**Examples**

This example shows how to configure port 5/45 on a WS-X4948 chassis to use the RJ-45 connector:

```
Switch(config)# interface gigabitethernet 5/45
Switch(config-if)# media-type rj45
```
mode

To set the redundancy mode, use the **mode** command.

```
mode {rpr | sso}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>rpr</td>
<td>Specifies RPR mode.</td>
<td></td>
</tr>
<tr>
<td>sso</td>
<td>Specifies SSO mode.</td>
<td></td>
</tr>
</tbody>
</table>

**Defaults**

If you are upgrading the current supervisor engine from Cisco IOS Release 12.2(18)EW or an earlier release to 12.2(20)EWA, and the RPR mode has been saved to the startup configuration, both supervisor engines will continue to operate in RPR mode after the software upgrade. To use SSO mode, you must manually change the redundancy mode to SSO.

**Command Modes**

Redundancy configuration mode

**Command History**

```
Release       Modification
12.2(20)EWA    Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

RPR and SSO mode are not supported on Catalyst 4500 series switches that are configured with Supervisor Engine 2.

The **mode** command can be entered only from within redundancy configuration mode.

Follow these guidelines when configuring your system to RPR or SSO mode:

- You must use identical Cisco IOS images and supervisor engines to support RPR and SSO mode. Redundancy may not work due to differences between the Cisco IOS release and supervisor engine capabilities.
- Any modules that are not online at the time of a switchover are reset and reload on a switchover.
- If you perform an OIR of the module within 60 seconds before a stateful switchover, the module resets during the stateful switchover and the port states are restarted.
- The FIB tables are cleared on a switchover. Routed traffic is interrupted until route tables reconverge.

The redundant supervisor engine reloads on any mode change and begins to work in the current mode.

**Examples**

This example shows how to set the redundancy mode to SSO:

```
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)#
```

monitor capture \{access-list | class-map\}

To specify an access list or class map as the core filter, use the `monitor capture \{access-list | class-map\}` command. To remove the filter, use the `no` form of this command.

```
monitor capture name \{access-list name | class-map name\}
no monitor capture name \{access-list name | class-map name\}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>Specifies a capture point.</td>
</tr>
<tr>
<td><code>access-list name</code></td>
<td>Specifies access list name</td>
</tr>
<tr>
<td><code>class-map name</code></td>
<td>Specifies class map name</td>
</tr>
</tbody>
</table>

### Defaults

None

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The access list or class map is defined with configuration commands. The access list or class map should be defined prior to entering the `monitor capture` command. We can specify the core filter as a class map, access list, or an explicit in-line filter. If the filter has already been specified when you enter the `monitor capture` command, it replaces the older one.

### Examples

The following example shows how to define a core system filter using an existing ACL or class-map:

```
Switch# monitor capture mycap filter access-list myacl
Switch# monitor capture mycap filter class-map mycm
Switch# no monitor capture mycap filter class-map mycm
```
**monitor capture [clear | export]**

To clear capture buffer contents or to store the packets to a file, use the `monitor capture [clear | export filename]` command.

```
monitor capture name [clear] [export filename]
```

**Syntax Description**

- `name`: Specifies a capture point.
- `clear`: Clears all the packets in the capture buffer.
- `export filename`: Stores all the packets in the capture buffer to a .pcap file.

**Defaults**

none

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>15.1(1)SG</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `clear` option empties the capture buffer and the `export` option stores the packets in the capture buffer to the file. You should use these commands only when the storage destination is a capture buffer. These commands are usable either during capture or when it has stopped either because one or more end conditions has been met or you entered the `stop` command. If you enter the `clear` command after the capture has stopped, further `export` (or `decode`) and `display` commands have no impact because the buffer has no packets.

**Examples**

The following example shows how to associate or disassociate a capture file:

```
Switch# monitor capture mycap export bootflash:mycap.pcap
Switch# monitor capture mycap clear
```
monitor capture [interface | vlan | control-plane]

To specify one or more attachment points with direction, use the `monitor capture [interface | vlan | control-plane]` command. To remove the attachment point, use the `no` form of this command.

```plaintext
monitor capture name [(interface name | vlan num | control-plane) {in | out | both}]
no monitor capture name [(interface name | vlan num | control-plane) {in | out | both}]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies a capture point.</td>
</tr>
<tr>
<td>interface name</td>
<td>Specifies an interface. Interface range is allowed.</td>
</tr>
<tr>
<td>vlan num</td>
<td>Specifies a VLAN.</td>
</tr>
<tr>
<td>control-plane</td>
<td>Specifies control plane.</td>
</tr>
<tr>
<td>input</td>
<td>output</td>
</tr>
</tbody>
</table>

### Defaults

None

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Specifies one or more attachment points with direction. We can specify a range of interfaces also. The command can be repeated as many times as needed to add multiple attachment points. We need to mention at least one attachment point. For VLAN, the direction has to be set to both.

### Examples

The following example shows how to add an attachment point:

```plaintext
Switch# monitor capture mycap interface gigabitEthernet 3/1 in
```

The following example shows how to remove an attachment point:

```plaintext
Switch# no monitor capture mycap interface gigabitEthernet 3/1 in
```
**monitor capture file location buffer-size**

To specify the capture destination, use the `monitor capture` command. To remove the details, use the `no` form of this command.

```
monitor capture name [[file location filename [buffer-size <1-100>] [ring <2-10>] [size <1-100>]] | [buffer [circular] size <1-100>]]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file location filename</td>
<td>Specifies filename of location.</td>
</tr>
<tr>
<td>buffer-size &lt;1-100&gt;</td>
<td>Specifies buffer size in MB.</td>
</tr>
<tr>
<td>ring &lt;2-10&gt;</td>
<td>Specifies number of files.</td>
</tr>
<tr>
<td>size &lt;1-100&gt;</td>
<td>Specifies the file size.</td>
</tr>
<tr>
<td>buffer [circular] size &lt;1-100&gt;</td>
<td>Specifies that the capture destination is a buffer. By default, the mode is linear.</td>
</tr>
<tr>
<td></td>
<td>The keyword <strong>circular</strong> sets the buffer mode to circular.</td>
</tr>
<tr>
<td></td>
<td>The keyword <strong>size</strong> specifies the buffer size.</td>
</tr>
</tbody>
</table>

**Defaults**

The default buffer size is one MB.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The capture destination can be a file in storage disk or a memory buffer. This command specifies the parameters related to packet storage.

The `file` option specifies that the packets must be stored to a file. To reduce or avoid any loss in packet capture, you can use the `buffer-size` option. The capture and store operations require more CPU, limiting the capture throughput.

You can increase the throughput by triggering **lock-step** mode, wherein the packets are first captured in the buffer. Within this mode, the “duration” parameter defines the capture duration. Once the buffer is full or the duration closes, the buffer is written to the file, greatly increasing the capture throughput. The lock-step mode is automatically triggered by specifying the buffer size to 32MB or higher.

The size of the capture file can be limited with the `size` option. The file location must one of the following:

- Internal bootflash (bootflash: )
- External flash (slot0: )
- USB (usb0: )
Do not specify any other devices.

The destination file can be a ring of files rather than a single file. The ring option specifies the number of files in the ring whereas size specifies the total size of all the files. In ring file mode, when the file size limit has reached, it accommodates space for new packets by removing the oldest file.

If the capture destination is a buffer, you must use the show command to decode and display the packets from the buffer. If the circular option is specified, capture continues until you explicitly issue the stop command. If no space exists in the buffer, oldest packet(s) are removed to accommodate the new ones. If the circular option is not provided, newer packets are discarded when the capture buffer is full.

Examples

The following example usages show how to specify a file or a ring of files as the capture destination:

```
Switch# monitor capture mycap associate buffer-size 1000000 file location bootflash:mycap.pcap
Switch# monitor capture mycap file location bootflash:mycap.pcap size 40
Switch# monitor capture mycap file location bootflash:mycap.pcap ring 4 size 40
Switch# monitor capture mycap file location bootflash:mycap.pcap buffer-size 8
Switch# monitor capture mycap file location bootflash:mycap.pcap ring 4 size 40 buffer-size 16
Switch# no monitor capture mycap file
```

The following example shows how to setup capture in lock-step mode:

```
Switch# monitor capture mycap file location bootflash:mycap.pcap buffer-size 64
Switch# no monitor capture mycap file
```

The following example shows how to make a circular buffer as the capture destination and operate on the buffer:

```
Switch# monitor capture mycap int gi 3/1 in match ipv4 any any
Switch# monitor capture mycap buffer circular size 1
Switch# monitor capture mycap start
Switch# sh monitor capture mycap buffer

Switch# monitor capture mycap clear
Switch# sh monitor capture mycap buffer detailed

Switch# monitor capture mycap stop
monitor capture limit

To specify capture limits, use the **monitor capture limit** command. To remove the limits, use the **no** form of this command.

```
monitor capture name limit [duration seconds] [packet-length size] [packets num]
```

```
no monitor capture name limit [duration] [packet-length] [packets]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies a capture point.</td>
</tr>
<tr>
<td>duration seconds</td>
<td>Specifies duration in seconds.</td>
</tr>
<tr>
<td>packet-length size</td>
<td>Specifies packet length. If the actual packet is longer, only the first <code>size</code> bytes are stored.</td>
</tr>
<tr>
<td>packets num</td>
<td>Specifies number of packets to be processed.</td>
</tr>
</tbody>
</table>

**Defaults**

Entire packet is processed if packet-length is not specified.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Specifies session duration, packet segment length and number of packets to be stored

**Examples**

The following example shows how to associate/disassociate a capture file:

```
Switch# monitor capture mycap limit duration 10
Switch# monitor capture mycap limit packet-length 128
Switch# monitor capture mycap limit packets 100
Switch# no monitor capture mycap limit duration packet-length packets
Switch# monitor capture mycap limit duration 10 packet-length 128 packets 100
Switch# no monitor capture mycap limit
```
monitor capture mycap match

To define an explicit in-line core filter, use the **monitor capture mycap match** command. To remove it, use the **no** form of this command.

```
Switch# [no] monitor capture mycap match {any | mac mac-match-string | ipv4 ipv4-match-string | ipv6 ipv6-match-string}
```

To use a filter for MAC, use the format below

```
Switch# [no] monitor capture mycap match mac {src-mac-addr src-mac-mask | any | host src-mac-addr} | {dest-mac-addr dest-mac-mask | any | host dest-mac-addr}
```

To use a filter for IPv4/IPv6, use one of the formats below

```
Switch# [no] monitor capture mycap match {ipv4 | ipv6} [src-prefix/length | any | host src-ip-addr] [dest-prefix/length | any | host dest-ip-addr]
```

```
Switch# [no] monitor capture mycap match {ipv4 | ipv6} proto {tcp | udp} [src-prefix/length | any | host src-ip-addr] [dest-prefix/length | any | host dest-ip-addr] [eq | gt | lt | neq <0-65535>]
```

<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can specify the core filter as a class map, access list, or an explicit in-line filter. If the filter has already been specified when you enter this command, it replaces the older one.

The explicit, in-line filter is intended as a simple way to specify a core filter. In certain situations, you must go through the approval process to change a configuration, which could be time-consuming. Although explicit filters simplify this process, be aware that support is more extensive for access list and class maps.

You can capture IPv4, IPv6, MAC, or “any” traffic by specifying the appropriate keywords. Depending on the traffic type, the usage varies. For a MAC, you can specify an address or prefix. For IPv4 or IPv6, you can match on several fields. For source or destination ports, several operators are supported.

Examples

The following example usages show how to set or remove an explicit filter:

Switch# monitor capture mycap match any
Switch# monitor capture mycap match mac any any
Switch# monitor capture mycap match mac host 0000.0a01.0102 host 0000.0a01.0103
Switch# monitor capture mycap match ipv4 any any
Switch# monitor capture mycap match ipv4 host 10.1.1.2 host 20.1.1.2
Switch# monitor capture mycap match ipv4 proto udp 10.1.1.0/24 eq 20001 20.1.1.0/24 eq 20002
Switch# monitor capture mycap match ipv4 proto udp 10.1.1.2/24 eq 20001 any
Switch# no monitor capture mycap match
monitor capture start

To start or stop a capture point, use the **monitor capture** command.

```
monitor capture name start [capture-filter filter-string] [display [display-filter filter-string]]
[brief | detailed | dump | stop]
```

### Syntax Description

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>[brief</td>
<td>detailed</td>
</tr>
<tr>
<td>stop</td>
<td>Stops the Wireshark session.</td>
</tr>
</tbody>
</table>

### Defaults

The default display mode is **brief**.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

These commands start or stop a capture session, assuming all mandatory parameters are specified. We must ensure that resources like CPU and memory are available before starting the session. Because the capture and display filters must observe the Wireshark display filter syntax, ensure that the filters are accurate (for example, specify the filters within double-quotes).

If the packets will be stored and displayed, do not use display filter; in this mode, if a packet is stored, it is displayed as well. If you provide a display filter, it is ignored.

If a capture filter is specified, the capture is limited to 65536 packets. In this release, there is a limitation that the timestamp will be incorrect when we use a capture filter.

### Examples

The following example shows how to start or stop a capture session in various modes:

```
Switch# monitor capture mycap int gi 3/1 in match ipv4 any any
Switch# monitor capture mycap file location bootflash:mycap.pcap
Switch# monitor capture mycap limit packets 100 duration 60

Switch# monitor capture mycap start
Switch#
Switch# monitor capture mycap stop
Switch# monitor capture mycap start capture-filter "udp.port == 20001"
Switch# monitor capture mycap stop
```
Switch# monitor capture mycap start capture-filter "udp.port == 20001" display
A file by the same capture file name already exists, overwrite?[confirm]

Switch# monitor capture mycap start capture-filter "udp.port == 20001" display display-filter "udp.port == 20002"
%Display-filter cannot be specified when capture is associated to a file. Ignoring display filter%
A file by the same capture file name already exists, overwrite?[confirm]

Switch# monitor capture mycap start capture-filter "udp.port == 20001" display
A file by the same capture file name already exists, overwrite?[confirm]

Switch#
monitor session

To enable the SPAN sessions on interfaces or VLANs, use the `monitor session` command. To remove one or more source or destination interfaces from a SPAN session, or a source VLAN from a SPAN session, use the `no` form of this command.

```
```

```
```

### Syntax Description

- **session**: Number of a SPAN session; valid values are from 1 to 6.
- **destination**: Specifies a SPAN destination.
- **interface**: Specifies an interface.
- **FastEthernet interface-number**: Specifies a Fast Ethernet module and port number; valid values are from 1 to 6.
- **GigabitEthernet interface-number**: Specifies a Gigabit Ethernet module and port number; valid values are from 1 to 6.
- **encapsulation**: (Optional) Specifies the encapsulation type of the destination port.
- **isl**: (Optional) Specifies ISL encapsulation.
- **dot1q**: (Optional) Specifies dot1q encapsulation.
- **ingress**: (Optional) Indicates whether the ingress option is enabled.
- **vlan vlan_id**: (Optional) Specifies the VLAN; valid values are from 1 to 4094.
### monitor session

<td>Specifies a bad packet type.</td>
</tr>
<tr>
<td>**address-type unicast</td>
<td>multicast</td>
</tr>
</tbody>
</table>

### Defaults

Received and transmitted traffic, as well as all VLANs, packet types, and address types are monitored on a trunking interface.

Packets are transmitted untagged out the destination port; ingress and learning are disabled.

All packets are permitted and forwarded “as is” on the destination port.

### Command Modes

Global configuration mode
Only one SPAN destination for a SPAN session is supported. If you attempt to add another destination interface to a session that already has a destination interface that is configured, you will get an error. You must first remove a SPAN destination interface before changing the SPAN destination to a different interface.

Beginning in Cisco IOS Release 12.1(12c)EW, you can configure sources from different directions within a single user session.

**Note**
Beginning in Cisco IOS Release 12.1(12c)EW, SPAN is limited to two sessions containing ingress sources and four sessions containing egress sources. Bidirectional sources support both ingress and egress sources.

A particular SPAN session can either monitor VLANs or monitor individual interfaces: you cannot have a SPAN session that monitors both specific interfaces and specific VLANs. If you first configure a SPAN session with a source interface, and then try to add a source VLAN to the same SPAN session, you will receive an error. You will also receive an error message if you configure a SPAN session with a source VLAN, and then try to add a source interface to that session. You must first clear any sources for a SPAN session before switching to another type of source. CPU sources may be combined with source interfaces and source VLANs.

When configuring the `ingress` option on a destination port, you must specify an ingress VLAN if the configured encapsulation type is untagged (the default) or is 802.1Q. If the encapsulation type is ISL, then no ingress VLAN specification is necessary.

By default, when you enable ingress, no host learning is performed on destination ports. When you enter the `learning` keyword, host learning is performed on the destination port, and traffic to learned hosts is forwarded out the destination port.

If you enter the `filter` keyword on a monitored trunking interface, only traffic on the set of specified VLANs is monitored. Port-channel interfaces are displayed in the list of `interface` options if you have them configured. VLAN interfaces are not supported. However, you can span a particular VLAN by entering the `monitor session session source vlan vlan-id` command.

The packet-type filters are supported only in the Rx direction. You can specify both Rx- and Tx-type filters and multiple-type filters at the same time (for example, you can use `good` and `unicast` to only sniff nonerror unicast frames). As with VLAN filters, if you do not specify the type, the session will sniff all packet types.
The queue identifier allows sniffing for only traffic that is sent or received on the specified CPU queues. The queues may be identified either by number or by name. The queue names may contain multiple numbered queues for convenience.

### Examples

This example shows how to configure IP access group 100 on a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 1 filter ip access-group 100
Switch(config)# end
```

This example shows how to add a source interface to a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 1 source interface fa2/3
Switch(config)# end
```

This example shows how to configure the sources with different directions within a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 1 source interface fa2/3 rx
Switch(config)# monitor session 1 source interface fa2/2 tx
Switch(config)# end
```

This example shows how to remove a source interface from a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# no monitor session 1 source interface fa2/3
Switch(config)# end
```

This example shows how to limit SPAN traffic to VLANs 100 through 304:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 1 filter vlan 100 - 304
Switch(config)# end
```

This example shows how to configure RSPAN VLAN 20 as the destination:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 2 destination remote vlan 20
Switch(config)# end
```

This example shows how to use queue names and queue number ranges for the CPU as a SPAN source on Supervisor Engine 6-E:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 2 source cpu queue control-packet rx
Switch(config)# monitor session 3 source cpu queue 10 rx
Switch(config)# end
```

---

**Note**

control-packet is mapped to queue 10.

**mtu**

To enable jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU), use the `mtu` command. To return to the default setting, use the `no` form of this command.

```
mtu bytes

no mtu
```

**Syntax Description**

`bytes` Byte size; valid values are from 1500 to 9198.

**Defaults**

The default settings are as follows:

- Jumbo frames are disabled
- 1500 bytes for all ports

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Jumbo frames are supported on nonblocking Gigabit Ethernet ports, switch virtual interfaces (SVI), and EtherChannels. Jumbo frames are not available for stub-based ports.

The baby giants feature uses the global `system mtu size` command to set the global baby giant MTU. It allows all stub-based port interfaces to support an Ethernet payload size of up to 1552 bytes.

Both the `system mtu` command and the per-interface `mtu` command work on interfaces that can support jumbo frames, but the per-interface `mtu` command takes precedence.

**Examples**

This example shows how to specify an MTU of 1800 bytes:

```
Switch(config)# interface GigabitEthernet 1/1
Switch(config-if)# mtu 1800
```

**Related Commands**

name

To set the MST region name, use the **name** command. To return to the default name, use the **no** form of this command.

```
name name
no name name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>Specifies the name of the MST region. The name can be any string with a maximum length of 32 characters.</td>
</tr>
</tbody>
</table>

**Defaults**

The MST region name is not set.

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Two or more Catalyst 4500 series switches with the same VLAN mapping and configuration version number are considered to be in different MST regions if the region names are different.

**Examples**

This example shows how to name a region:

```
Switch(config-mst)# name Cisco
Switch(config-mst)#
```

netflow-lite exporter

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To define an exporter and to enter NetFlow-lite exporter submode, use the `netflow-lite exporter` command. To delete an exporter, use the `no` form of this command.

```
netflow-lite exporter exporter
no netflow-lite exporter exporter
```

**Syntax Description**
`exporter` Specifies an exporter.

**Defaults**
None

**Command Modes**
global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The exporter's name identifies the exporter. Mandatory parameters for a minimal complete exporter configuration are the destination IP address of the collector, source IP address (on the switch) to use and UDP destination port of the collector. Any unspecified non-mandatory parameters take on default values.

The exporter name can be specified when activating sampling at a data source via the `monitor` command.

The exporter submode also allows you to specify the refresh frequency for the NetFlow templates. Metadata about the NetFlow packet sampling process like sampler configuration parameters and snmp interface table mapping can also be exported periodically to the collector.

Deleting or removing the value of a non-mandatory parameter restores the default.

**Examples**

This example shows how to configure an NetFlow exporter:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
```
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#

Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
  Network Protocol Configuration:
    Destination IP address: 5.5.5.6
    Source IP Address: 5.5.5.5
    VRF label:
      DSCP: 0x20
      TTL: 128
      COS: 7
  Transport Protocol Configuration:
    Transport Protocol: UDP
    Destination Port: 8188
    Source Port: 61670
  Export Protocol Configuration:
    Export Protocol: netflow-v9
    Template data timeout: 60
    Options sampler-table timeout: 1800
    Options interface-table timeout: 1800
  Exporter Statistics:
    Packets Exported: 0

You can verify your settings with the show netflow-lite exporter privileged EXEC command.

netflow-lite monitor

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To define a monitor instance on an interface and to enter netflow-lite monitor submode, use the netflow-lite monitor command. To delete the monitor, use the no form of this command.

```
netflow-lite monitor sampler-name

no netflow-lite sampler sampler-name
```

Syntax Description
```
sampler-name
```
Specifies a sample.

Defaults
None

Command Modes
```
global configuration mode
```

Command History
```
Release       Modification
15.0(2)SG      Support for this command was introduced on the Catalyst 4500 series switch.
```

Usage Guidelines
Only a single packet sampling instance is supported on a data source. These commands are entered under the physical port interface mode, port channel interface, or config VLAN mode. Monitor is not supported on other interfaces. If the physical port is a member of a port channel, applying the monitor to the port has no effect. You must apply the monitor to the port channel instead.

Note
VLAN sampling is not supported in Cisco IOS Release 15.0(2)SG. It will be supported in a later release.

Mandatory parameters are sampler and exporter. If no exporter is associated with a monitor, no samples are exported. If so, no input packet sampling occurs for that target interface. A warning message displays indicating that the sampler or exporter is invalid if any mandatory parameters are missing.

The packet sampling mechanism tries to achieve random 1-in-N sampling. Internally 2 levels of sampling are done. The accuracy of the first level of sampling depends on the size of the packets arriving at a given interface. To tune the relative accuracy of the algorithm the average-packet-size parameter can be used.

The system automatically determines the average packet size at an interface based on observation of input traffic and uses that value in its first level of sampling.

Valid range of packet sizes that can be used by the algorithm is 64 - 9216 bytes. Any number below 64 bytes is taken to mean that automatic determination of average packet size is desired.
The following example shows how to configure a monitor on a port interface Gigabit 1/3:

```
Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)# exit
```

```
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
   Netflow-lite Monitor-1:
      Active:               TRUE
      Sampler:              sampler1
      Exporter:             exporter1
      Average Packet Size:  0
      Statistics:
         Packets exported:  0
         Packets observed:  0
         Packets dropped:   0
         Average Packet Size observed: 64
         Average Packet Size used: 64
```

Similarly, you can configure a monitor on a VLAN in VLAN config mode:

```
Switch# config terminal
Switch(config)# vlan config 2
Switch(config-vlan-config)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# exit
Switch(config-vlan-config)# exit
Switch# show netflow-lite monitor 1 vlan 2
VlanID-2:
   Netflow-lite Monitor-1:
      Active:               TRUE
      Sampler:              sampler1
      Exporter:             exporter1
      Average Packet Size:  0
      Statistics:
         Packets exported:  0
         Packets observed:  0
         Packets dropped:   0
         Average Packet Size observed: 64
         Average Packet Size used: 64
```

You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.

netflow-lite sampler

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To configure packet sampling parameters as a reusable named entity and to enter netflow-lite sampler submode, use the `netflow-lite sampler` command. To delete the sampler, use the `no` form of this command.

```
netflow-lite sampler name

no netflow-lite sampler name
```

**Syntax Description**
- `name` Specifies a sampler.

**Defaults**
None

**Command Modes**
global configuration mode

**Command History**
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The sampler CLI construct allows the user to configure the rate at which input packets are to be sampled. Packet sampling rate can range from 32 to $2^{15}$ in powers of 2. A sampling rate of 1 is allowed for troubleshooting for up to two 1 Gigabit ports only and is essentially equivalent to rx span. It cannot be configured on 10GE ports because the bandwidth demand on the fpga for export is too high.

Mandatory parameters are packet rate.

You can update a sampler in use at a target interface, but you cannot remove or unconfigure mandatory parameters.

All mandatory parameters must be present to validate a sampler. Any unspecified non-mandatory parameters take on default values.

**Examples**
This example shows how to configure packet sampling parameters as a reusable named entity and to display the sampler:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch#```
Switch# `show netflow-lite sampler sampler1`
Netflow-lite Sampler sampler1:
  Id :                   1
  Packet Sampling rate: 1 out of 32
  Packet Section Size:  64    bytes
  Packet offset:        16    bytes

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

</tr>
</tbody>
</table>
To configure Network Mobility Services Protocol (NMSP) on the switch, use the `nmsp` command. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the `no` form of this command to return to the default setting.

```
nmsp [enable | {notification interval {attachment | location} interval-seconds}]}
no nmsp [enable | {notification interval {attachment | location} interval-seconds}]}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the NMSP features on the switch.</td>
</tr>
<tr>
<td>notification interval</td>
<td>Specifies the NMSP notification interval.</td>
</tr>
<tr>
<td>attachment</td>
<td>Specifies the attachment notification interval.</td>
</tr>
<tr>
<td>location</td>
<td>Specifies the location notification interval.</td>
</tr>
<tr>
<td>interval-seconds</td>
<td>Duration in seconds before a switch sends the location or attachment updates to the MSE. The range is 1 to 30; the default is 30.</td>
</tr>
</tbody>
</table>

**Defaults**

NMSP is disabled, NMSP notification interval attachment and NMSP notification interval location defaults are 30 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `nmsp` global configuration command to enable the switch to send encrypted NMSP location and attachment notifications to a Cisco Mobility Services Engine (MSE).

**Examples**

This example shows how to enable NMSP on a switch and set the location notification time to 10 seconds:

```
Switch(config)# nmsp enable
Switch(config)# nmsp notification interval location 10
```

nmsp attachment suppress

To suppress reporting attachment information from a specified interface, use the nmsp attachment suppress interface command. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the no form of this command to report attachment information.

```
nmsp attachment suppress

no nmsp attachment suppress
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Attachment information is reported.

**Command Modes**
Interface configuration mode

**Command History**

</tbody>
</table>

**Usage Guidelines**
Use the nmsp attachment suppress interface configuration command to configure an interface to not send attachment notifications to a Cisco Mobility Services Engine (MSE).

**Examples**
This example shows how to configure an interface to not send attachment information to the MSE:

```
Switch(config)# switch interface gigabitethernet1/2
Switch(config-if)# nmsp attachment suppress
Switch(config-if)#
```

**Usage Guidelines**

Example:

This example shows how to specify an options timeout for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
Network Protocol Configuration:
- Destination IP address: 5.5.5.6
- Source IP Address: 5.5.5.5
VRF label:
- DSCP: 0x20
- TTL: 128
- COS: 7
Transport Protocol Configuration:
- Transport Protocol: UDP
- Destination Port: 8188
- Source Port: 61670
Export Protocol Configuration:
- Export Protocol: netflow-v9
- Template data timeout: 60
- Options sampler-table timeout: 1800
- Options interface-table timeout: 1800
Exporter Statistics:
- Packets Exported: 0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

packet-offset (netflow-lite sampler submode)

Note

NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a starting packet offset in netflow-lite submode, use the packet-offset command. To reset to the default, use the no form of this command.

```
packet-offset offset

no packet-offset offset
```

Syntax Description

offset Specifies the starting packet offset in bytes (maximum of 48).

Defaults

starts at byte 0 of L2 header

Command Modes

netflow-lite exporter submode

Command History

Release Modification

15.0(2)SG Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

Default packet section offset value is 0. The packet section extracted from the sampled packet start at offset 0 of the packet.

Examples

This example shows how to specify a starting packet offset:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
  Id : 1
  Packet Sampling rate: 1 out of 32
  Packet Section Size: 64 bytes
  Packet offset: 16 bytes

You can verify your settings with the show netflow-lite sampler privileged EXEC command.
```
## packet-offset (netflow-lite sampler submode)

**Related Commands.**

</tr>
</tbody>
</table>
packet-rate (netflow-lite sampler submode)

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a packet sampling rate in netflow-lite sampler submode, use the packet rate command. To delete a packet sampling rate, use the no form of this command.

```
packet rate n
no packet rate n
```

Syntax Description

- **n**: Specifies the packet sampling rate.

Defaults
None

Command Modes
netflow-lite exporter submode

Command History

```
Release Modification
15.0(2)SG Support for this command was introduced on the Catalyst 4500 series switch.
```

Usage Guidelines

Packet sampling rate can range from 32 to $2^{15}$ in powers of 2. A rate of 1 is allowed for troubleshooting (equivalent to rx span) only for two 1Gigabit Ethernet ports. You cannot configure a rate of 1 on 10 Gigabit Ethernet ports because the bandwidth demand for export is too high.

This is a mandatory parameter. Up to 2 x 1 Gigabit Ethernet ports can be configured with 1-in-1 sampling. The best packet sampling rate that can be configured on any 1 Gigabit or 10 Gigabit Ethernet port is 1-in-32. Packet sampling rates can be configured in powers of 2 (1-in-64, 1-in-128, etc).

Examples

This example shows how to specify a packet sampling rate in netflow-lite sampler submode:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch#
```

```
Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
  Id :  1
  Packet Sampling rate:  1 out of 32
  Packet Section Size:  64 bytes
  Packet offset:  16 bytes
```
You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.

<table>
<thead>
<tr>

<td><code>packet-section size (netflow-lite sampler submode)</code></td>
<td>Specifies a sampled header size in netflow-lite submode.</td>
</tr>
</tbody>
</table>
packet-section size (netflow-lite sampler submode)

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a sampled header size in netflow-lite submode, use the `packet-section size` command. To store the default, use the `no` form of this command.

```
packet-section size bytes

no packet-section size bytes
```

Syntax Description
| bytes | Specifies the sampled header size. Size ranges from 16 to 252 bytes in increments of 4 bytes. |

Defaults
64 bytes

Command Modes
netflow-lite exporter submode

Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Default packet section size is 64 bytes which normally would cover Layer 2, Layer 3, and Layer 4 headers for an input IPv4 packet.

Examples
This example shows how to specify a sampled header size:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch#

Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
  Id : 1
  Packet Sampling rate: 1 out of 32
  Packet Section Size: 64 bytes
  Packet offset: 16 bytes

You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.
<table>
<thead>
<tr>

</tbody>
</table>
**pagp learn-method**

To learn the input interface of the incoming packets, use the `pagp learn-method` command. To return to the default value, use the `no` form of this command.

```
pagp learn-method {aggregation-port | physical-port}

no pagp learn-method
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregation-port</td>
<td>Specifies learning the address on the port channel.</td>
</tr>
<tr>
<td>physical-port</td>
<td>Specifies learning the address on the physical port within the bundle.</td>
</tr>
</tbody>
</table>

**Defaults**

Aggregation port is enabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable physical port address learning within the bundle:

```
Switch(config-if)# pagp learn-method physical-port
Switch(config-if)#
```

This example shows how to enable aggregation port address learning within the bundle:

```
Switch(config-if)# pagp learn-method aggregation-port
Switch(config-if)#
```

**Related Commands**

</table>
pagp port-priority

To select a port in hot standby mode, use the `pagp port-priority` command. To return to the default value, use the `no` form of this command.

```
pagp port-priority priority
no pagp port-priority
```

**Syntax Description**

| `priority` | Port priority number; valid values are from 1 to 255. |

**Defaults**

Port priority is set to 128.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The higher the priority, the better the chances are that the port will be selected in the hot standby mode.

**Examples**

This example shows how to set the port priority:

```
Switch(config-if)# pagp port-priority 45
Switch(config-if)#
```

<td></td>
</tr>
</tbody>
</table>

### Defaults

Routing updates are sent on the interface.

### Command Modes

Router configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can use the `passive-interface range` command on the following interfaces: FastEthernet, GigabitEthernet, VLAN, Loopback, Port-channel, 10-GigabitEthernet, and Tunnel. When you use the `passive-interface range` command on a VLAN interface, the interface should be the existing VLAN SVIs. To display the VLAN SVIs, enter the `show running config` command. The VLANs that are not displayed cannot be used in the `passive-interface range` command.

The values that are entered with the `passive-interface range` command are applied to all the existing VLAN SVIs.

Before you can use a macro, you must define a range using the `define interface-range` command.

All configuration changes that are made to a port range through the `passive-interface range` command are retained in the running-configuration as individual passive-interface commands.

You can enter the `range` in two ways:

- Specifying up to five interface ranges
- Specifying a previously defined macro

You can either specify the interfaces or the name of an interface-range macro. An interface range must consist of the same interface type, and the interfaces within a range cannot span across the modules.
You can define up to five interface ranges on a single command; separate each range with a comma:

```
interface range gigabitethernet 5/1-20, gigabitethernet4/5-20.
```

Use this format when entering the `port-range`:

```
interface-type {mod}/[{first-port} - {last-port}]
```

You cannot specify both a macro and an interface range in the same command. After creating a macro, you can enter additional ranges. If you have already entered an interface range, the CLI does not allow you to enter a macro.

You can specify a single interface in the `range range` value. This makes the command similar to the `passive-interface interface-number` command.

**Note**
The `range` keyword is only supported in OSPF, EIGRP, RIP, and ISIS router mode.

If you disable the sending of routing updates on an interface, the particular subnet will continue to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.

The `default` keyword sets all interfaces as passive by default. You can then configure individual interfaces where adjacencies are desired using the `no passive-interface` command. The `default` keyword is useful in Internet service provider (ISP) and large enterprise networks where many of the distribution routers have more than 200 interfaces.

For the Open Shortest Path First (OSPF) protocol, OSPF routing information is neither sent nor received through the specified router interface. The specified interface address appears as a stub network in the OSPF domain.

For the Intermediate System-to-Intermediate System (IS-IS) protocol, this command instructs IS-IS to advertise the IP addresses for the specified interface without actually running IS-IS on that interface. The `no` form of this command for IS-IS disables advertising IP addresses for the specified address.

**Note**
For IS-IS you must keep at least one active interface and configure the interface with the `ip router isis` command.

Enhanced Interior Gateway Routing Protocol (EIGRP) is disabled on an interface that is configured as passive although it advertises the route.

**Examples**

The following example sends EIGRP updates to all interfaces on network 10.108.0.0 except GigabitEthernet interface 1/1:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# router eigrp 109
Switch(config-router)# network 10.108.0.0
Switch(config-router)# passive-interface gigabitethernet 1/1
```
The following configuration enables IS-IS on Ethernet interface 1 and serial interface 0 and advertises the IP addresses of Ethernet interface 0 in its link-state protocol data units (PDUs):

```
Switch(config-if)# router isis Finance
Switch(config-router)# passive-interface Ethernet 0
Switch(config-router)# interface Ethernet 1
Switch(config-router)# ip router isis Finance
Switch(config-router)# interface serial 0
Switch(config-router)# ip router isis Finance
Switch(config-router)#
```

The following example sets all interfaces as passive, then activates Ethernet interface 0:

```
Switch(config-if)# router ospf 100
Switch(config-router)# passive-interface default
Switch(config-router)# no passive-interface ethernet0
Switch(config-router)# network 10.108.0.1 0.0.0.255 area 0
Switch(config-router)#
```

The following configuration sets the Ethernet ports 3 through 4 on module 0 and GigabitEthernet ports 4 through 7 on module 1 as passive:

```
Switch(config-if)# router ospf 100
Switch(config-router)# passive-interface range ethernet0/3-4,gigabitethernet1/4-7
Switch(config-router)#
```
permit

To permit an ARP packet based on matches against the DHCP bindings, use the `permit` command. To remove a specified ACE from an access list, use the `no` form of this command.

```
```

```
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>

<td>(Optional) Specifies that a specific range of target MAC addresses will be accepted.</td>
</tr>
<tr>
<td>log</td>
<td>(Optional) Logs a packet when it matches the access control entry (ACE).</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

`arp-nacl configuration mode`
Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Permit clauses can be added to forward or drop ARP packets based on some matching criteria.

Examples

This example shows a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This example shows how to permit both requests and responses from this host:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
Switch# show arp access-list
ARP access list static-hosts
   permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch#
```

</table>
police

To configure the Traffic Policing feature, use the `police` QoS policy-map class configuration command. To remove the Traffic Policing feature from the configuration, use the `no` form of this command.

```
police {bps | kbps | mbps | gbps} [burst-normal] [burst-max] conform-action action exceed-action action [violate-action action]
```

```
no police {bps | kbps | mbps | gbps} [burst-normal] [burst-max] conform-action action exceed-action action [violate-action action]
```

**Syntax Description**

- **bps**
  Average rate, in bits per second. Valid values are 32,000 to 32,000,000,000.

- **kbps**
  Average rate, in kilobytes per second. Valid values are 32 to 32,000,000.

- **mbps**
  Average rate, in megabits per second. Valid values are 1 to 32,000.

- **gbps**
  Average rate, in gigabits per second. Valid values are 1 to 32.

- **burst-normal**
  (Optional) Normal burst size, in bytes. Valid values are 64 to 2,596,929,536. Burst value of up to four times the configured rate can be supported.

- **burst-max**
  (Optional) Excess burst size, in bytes. Valid values are 64 to 2,596,929,536. Burst value of up to four times the configured rate can be supported.

- **conform-action**
  Action to take on packets that conform to the rate limit.

- **exceed-action**
  Action to take on packets that exceed the rate limit.

- **violate-action**
  (Optional) Action to take on packets that violate the normal and maximum burst sizes.

- **action**
  Action to take on packets. Specify one of the following keywords:
  - **drop**—Drops the packet.
  - **set-cos-transmit** new-ios—Sets the class of services (CoS) value to a new value and send the packet. The range is 0 to 7.
  - **set-dscp-transmit** value—Sets the IP differentiated services code point (DSCP) value and transmits the packet with the new IP DSCP value setting.
  - **set-prec-transmit** value—Sets the IP precedence and transmits the packet with the new IP precedence value setting.
  - **transmit**—Transmits the packet. The packet is not altered.

**Defaults**

This command is disabled by default.

**Command Modes**

- Policy-map class configuration mode (when specifying a single action to be applied to a market packet)
- Policy-map class police configuration mode (when specifying multiple actions to be applied to a marked packet)
Use the `police` command to mark a packet with different quality of service (QoS) values based on conformance to the service-level agreement.

Traffic policing will not be executed for traffic that passes through an interface.

### Specifying Multiple Actions

The `police` command allows you to specify multiple policing actions. When specifying multiple policing actions when configuring the `police` command, note the following points:

- You can specify a maximum of four actions at one time.
- You cannot specify contradictory actions such as `conform-action transmit` and `conform-action drop`.

### Using the Police Command with the Traffic Policing Feature

The `police` command can be used with Traffic Policing feature. The Traffic Policing feature works with a token bucket algorithm. Two types of token bucket algorithms are a single-token bucket algorithm and a two-token bucket algorithm. A single-token bucket system is used when the `violate-action` option is not specified, and a two-token bucket system is used when the `violate-action` option is specified.

#### Token Bucket Algorithm with One Token Bucket

The one token bucket algorithm is used when the `violate-action` option is not specified in the `police` command of the command-line interface (CLI).

The conform bucket is initially set to the full size (the full size is the number of bytes specified as the normal burst size).

When a packet of a given size (for example, “B” bytes) arrives at specific time (time “T”) the following actions occur:

- Tokens are updated in the conform bucket. If the previous arrival of the packet was at T1 and the current time is T, the bucket is updated with (T - T1) worth of bits based on the token arrival rate. The token arrival rate is calculated as follows:
  
  \[
  \text{rate} = \frac{\text{time between packets} \times \text{policer rate}}{8 \text{ bytes}}
  \]

- If the number of bytes in the conform bucket B is greater than or equal to 0, the packet conforms and the conform action is taken on the packet. If the packet conforms, B bytes are removed from the conform bucket and the conform action is completed for the packet.

- If the number of bytes in the conform bucket B (minus the packet size to be limited) is fewer than 0, the exceed action is taken.

#### Token Bucket Algorithm with Two Token Buckets (Refer to RFC 2697)

The two-token bucket algorithm is used when the `violate-action` is specified in the `police` command CLI.

The conform bucket is initially full (the full size is the number of bytes specified as the normal burst size).

The exceed bucket is initially full (the full exceed bucket size is the number of bytes specified in the maximum burst size).
The tokens for both the conform and exceed token buckets are updated based on the token arrival rate, or committed information rate (CIR).

When a packet of given size (for example, “B” bytes) arrives at specific time (time “T”) the following actions occur:

- Tokens are updated in the conform bucket. If the previous arrival of the packet was at T1 and the current arrival of the packet is at t, the bucket is updated with T-T1 worth of bits based on the token arrival rate. The refill tokens are placed in the conform bucket. If the tokens overflow the conform bucket, the overflow tokens are placed in the exceed bucket.

  The token arrival rate is calculated as follows:
  
  \[(\text{time between packets} \times \text{policer rate})/8 \text{ bytes}\]

- If the number of bytes in the conform bucket - B is greater than or equal to 0, the packet conforms and the conform action is taken on the packet. If the packet conforms, B bytes are removed from the conform bucket and the conform action is taken. The exceed bucket is unaffected in this scenario.

- If the number of bytes in the conform bucket B is less than 0, the excess token bucket is checked for bytes by the packet. If the number of bytes in the exceed bucket B is greater than or equal to 0, the exceed action is taken and B bytes are removed from the exceed token bucket. No bytes are removed from the conform bucket.

- If the number of bytes in the exceed bucket B is fewer than 0, the packet violates the rate and the violate action is taken. The action is complete for the packet.

**Examples**

**Token Bucket Algorithm with One Token Bucket**

This example shows how to define a traffic class (using the class-map command) and associate the match criteria from the traffic class with the Traffic Policing configuration, which is configured in the service policy (using the policy-map command). The service-policy command is then used to attach this service policy to the interface.

In this particular example, Traffic Policing is configured with the average rate at 8000 bits per second and the normal burst size at 1000 bytes for all packets leaving Gigabit Ethernet interface 6/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map access-match
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map police-setting
Switch(config-pmap)# class access-match
Switch(config-pmap-c)# police 8000 1000 conform-action transmit exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output police-setting
Switch(config-if)# end
```

In this example, the initial token buckets starts full at 1000 bytes. If a 450-byte packet arrives, the packet conforms because enough bytes are available in the conform token bucket. The conform action (send) is taken by the packet and 450 bytes are removed from the conform token bucket (leaving 550 bytes).

If the next packet arrives 0.25 seconds later, 250 bytes are added to the token bucket ((0.25 * 8000)/8), leaving 800 bytes in the token bucket. If the next packet is 900 bytes, the packet exceeds and the exceed action (drop) is taken. No bytes are taken from the token bucket.
**Token Bucket Algorithm with Two Token Buckets Example (Refer to RFC 2697)**

In this particular example, Traffic Policing is configured with the average rate at 8000 bits per second, the normal burst size at 1000 bytes, and the excess burst size at 1000 bytes for all packets leaving Gigabit Ethernet interface 6/1.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch(config)# class-map access-match
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map police-setting
Switch(config-pmap)# class access-match
Switch(config-pmap-c)# police 8000 1000 1000 conform-action transmit exceed-action set-qos-transmit 1 violate-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output police-setting
Switch(config-if)# end
```

In this example, the initial token buckets start full at 1000 bytes. If a 450-byte packet arrives, the packet conforms because enough bytes are available in the conform token bucket. The conform action (send) is taken by the packet and 450 bytes are removed from the conform token bucket (leaving 550 bytes).

If the next packet arrives 0.25 seconds later, 250 bytes are added to the conform token bucket \((0.25 * 8000)/8\), leaving 800 bytes in the conform token bucket. If the next packet is 900 bytes, the packet does not conform because only 800 bytes are available in the conform token bucket.

The exceed token bucket, which starts full at 1000 bytes (as specified by the excess burst size) is then checked for available bytes. Because enough bytes are available in the exceed token bucket, the exceed action (set the QoS transmit value of 1) is taken and 900 bytes are taken from the exceed bucket (leaving 100 bytes in the exceed token bucket).

If the next packet arrives 0.40 seconds later, 400 bytes are added to the token buckets \((0.40 * 8000)/8\). Therefore, the conform token bucket now has 1000 bytes (the maximum number of tokens available in the conform bucket) and 200 bytes overflow the conform token bucket (because it only 200 bytes were needed to fill the conform token bucket to capacity). These overflow bytes are placed in the exceed token bucket, giving the exceed token bucket 300 bytes.

If the arriving packet is 1000 bytes, the packet conforms because enough bytes are available in the conform token bucket. The conform action (transmit) is taken by the packet and 1000 bytes are removed from the conform token bucket (leaving 0 bytes).

If the next packet arrives 0.20 seconds later, 200 bytes are added to the token bucket \((0.20 * 8000)/8\). Therefore, the conform token bucket now has 200 bytes. If the arriving packet is 400 bytes, the packet does not conform because only 200 bytes are available in the conform bucket. Similarly, the packet does not exceed because only 300 bytes are available in the exceed bucket. Therefore, the packet violates and the violate action (drop) is taken.

police (percent)

To configure traffic policing on the basis of a percentage of bandwidth available on an interface, use the `police` command in QoS policy-map class configuration mode. To remove traffic policing from the configuration, use the `no` form of this command.

```
police cir percent [bc conform-burst-in-msec] [pir percent percentage] [be peak-burst-in-msec]
```

```
no police cir percent [bc conform-burst-in-msec] [pir percent percentage] [be peak-burst-in-msec]
```

</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on Catalyst 4900M and Supervisor Engine 6-E..</td>
</tr>
</tbody>
</table>

Usage Guidelines
This command calculates the CIR and PIR on the basis of a percentage of the maximum amount of bandwidth available on the interface. When a policy map is attached to the interface, the equivalent CIR and PIR values in bits per second (bps) are calculated on the basis of the interface bandwidth and the percent value entered with this command. The `show policy-map interface` command can then be used to verify the bps rate calculated.

The calculated CIR and PIR bps rates must be in the range of 32,000 and 32,000,000,000 bps. If the rates are outside this range, the associated policy map cannot be attached to the interface. If the interface bandwidth changes (for example, more is added), the bps values of the CIR and the PIR are recalculated on the basis of the revised amount of bandwidth. If the CIR and PIR percentages are changed after the policy map is attached to the interface, the bps values of the CIR and PIR are recalculated.

This command also allows you to specify the values for the conform burst size and the peak burst size in milliseconds. If you want bandwidth to be calculated as a percentage, the conform burst size and the peak burst size must be specified in milliseconds (ms).

Examples
This example shows how to configure traffic policing using a CIR and a PIR based on a percentage of bandwidth on Gigabit interface 6/2. In this example, a CIR of 20 percent and a PIR of 40 percent have been specified. Additionally, an optional bc value and be value (300 ms and 400 ms, respectively) have been specified.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class-map class1
Switch(config-pmap-c)# police cir percent 20 bc 3 ms pir percent 40 be 4 ms
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# interface gigabitethernet 6/2
Switch(config-if)# service-policy output policy
Switch(config-if)# end
```
police rate

To configure single or dual rate policer, use the `police rate` command in policy-map configuration mode. To remove traffic policing from the configuration, use the `no` form of this command.

**Syntax for Bytes Per Second**

```
police rate units bps [burst burst-in-bytes bytes] [peak-rate peak-rate-in-bps bps] [pack-burst peak-burst-in-bytes bytes]
```

```
no police rate units bps [burst burst-in-bytes bytes] [peak-rate peak-rate-in-bps bps] [pack-burst peak-burst-in-bytes bytes]
```

**Syntax for Percent**

```
police rate percent percentage [burst ms ms] [peak-rate percent percentage] [pack-burst ms ms]
```

```
no police rate percent percentage [burst ms ms] [peak-rate percent percentage] [pack-burst ms ms]
```

<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6-E.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the **police rate** command to limit traffic on the basis of pps, bps, or a percentage of interface bandwidth.

If the **police rate** command is issued, but the a rate is not specified, traffic that is destined will be policed on the basis of bps.

Examples

This example shows how to configure policing on a class to limit traffic to an average rate of 1,500,000 bps:

```
Switch(config)# class-map c1
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police rate 1500000 burst 500000
Switch(config-pmap-c)# exit
```

Usage Guidelines

Refer to RFC 2698-Two Rate Three Color Marker.

Two-rate traffic policing uses two token buckets—Tc and Tp—for policing traffic at two independent rates. Note the following points about the two token buckets:

- The Tc token bucket is updated at the CIR value each time a packet arrives at the two-rate policer. The Tc token bucket can contain up to the confirm burst (Bc) value.
- The Tp token bucket is updated at the PIR value each time a packet arrives at the two-rate policer. The Tp token bucket can contain up to the peak burst (Be) value.

Updating Token Buckets

The following scenario illustrates how the token buckets are updated:

A packet of B bytes arrives at time t. The last packet arrived at time t1. The CIR and the PIR token buckets at time t are represented by Tc(t) and Tp(t), respectively. Using these values and in this scenario, the token buckets are updated as follows:

\[
Tc(t) = \min(CIR \times (t-t1) + Tc(t1), Bc)
\]

\[
Tp(t) = \min(PIR \times (t-t1) + Tp(t1), Be)
\]

Marking Traffic

The two-rate policer marks packets as either conforming, exceeding, or violating a specified rate. The following points (using a packet of B bytes) illustrate how a packet is marked:

- If \( B > Tp(t) \), the packet is marked as violating the specified rate.
- If \( B > Tc(t) \), the packet is marked as exceeding the specified rate, and the Tp(t) token bucket is updated as \( Tp(t) = Tp(t) - B \).

Otherwise, the packet is marked as conforming to the specified rate, and both token buckets—Tc(t) and Tp(t)—are updated as follows:

\[
Tp(t) = Tp(t) - B
\]

\[
Tc(t) = Tc(t) - B
\]

For example, if the CIR is 100 kbps, the PIR is 200 kbps, and a data stream with a rate of 250 kbps arrives at the two-rate policer, the packet would be marked as follows:

- 100 kbps would be marked as conforming to the rate.
- 100 kbps would be marked as exceeding the rate.
- 50 kbps would be marked as violating the rate.

Marking Packets and Assigning Actions Flowchart

The flowchart in Figure 2-1 illustrates how the two-rate policer marks packets and assigns a corresponding action (that is, violate, exceed, or conform) to the packet.
Examples

This example shows how to configure two-rate traffic policing on a class to limit traffic to an average committed rate of 500 kbps and a peak rate of 1 Mbps:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map police
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# policy-map policy1
Switch(config-pmap)# class police
Switch(config-pmap-c)# police cir 500000 bc 10000 pir 1000000 be 10000 conform-action transmit exceed-action set-prec-transmit 2 violate-action drop
Switch(config-pmap-c)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch# show policy-map policy1
```

Traffic marked as conforming to the average committed rate (500 kbps) will be sent as is. Traffic marked as exceeding 500 kbps, but not exceeding 1 Mbps, will be marked with IP Precedence 2 and then sent. All traffic marked as exceeding 1 Mbps will be dropped. The burst parameters are set to 10000 bytes.

Figure 2-1  Marking Packets and Assigning Actions with the Two-Rate Policer
In the following example, 1.25 Mbps of traffic is sent ("offered") to a policer class:

Switch# show policy-map interface gigabitethernet 6/1

GigabitEthernet6/1

Service-policy output: policy1

Class-map: police (match all)
148803 packets, 36605538 bytes
30 second offered rate 1249000 bps, drop rate 249000 bps
Match: access-group 101
police:
cir 500000 bps, conform-burst 10000, pir 1000000, peak-burst 100000
conformed 59538 packets, 14646348 bytes; action: transmit
exceeded 59538 packets, 14646348 bytes; action: set-prec-transmit 2
violated 29731 packets, 7313826 bytes; action: drop
conformed 499000 bps, exceed 500000 bps violate 249000 bps

Class-map: class-default (match-any)
19 packets, 1990 bytes
30 seconds offered rate 0 bps, drop rate 0 bps
Match: any
Switch#

The two-rate policer marks 500 kbps of traffic as conforming, 500 kbps of traffic as exceeding, and 250 kbps of traffic as violating the specified rate. Packets marked as conforming to the rate will be sent as is, and packets marked as exceeding the rate will be marked with IP Precedence 2 and then sent. Packets marked as violating the rate are dropped.
policy-map

To create or modify a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode, use the `policy-map` global configuration command. To delete an existing policy map and to return to global configuration mode, use the `no` form of this command.

```
policy-map policy-map-name

no policy-map policy-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>syntax</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>policy-map-name</code></td>
<td>Name of the policy map.</td>
</tr>
</tbody>
</table>

**Defaults**

No policy maps are defined.

**Command Modes**

</tr>
</tbody>
</table>

**Usage Guidelines**

Before configuring policies for classes whose match criteria are defined in a class map, use the `policy-map` command to specify the name of the policy map to be created or modified. After you enter the `policy-map` command, the switch enters policy-map configuration mode. You can configure or modify the class policies for that policy map and decide how to treat the classified traffic.

These configuration commands are available in policy-map configuration mode:

- **class**—Defines the classification match criteria for the specified class map. For more information, see the “class” section on page 2-92.
- **description**—Describes the policy map (up to 200 characters).
- **exit**—Exits policy-map configuration mode and returns you to global configuration mode.
- **no**—Removes a previously defined policy map.

To return to global configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.

You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the `class-map` global configuration and `match` class-map configuration commands.

**Examples**

This example shows how to configure multiple classes in a policy map called policymap2 on a Supervisor Engine 6-E:

```
Switch# configure terminal
Switch(config)# policy-map policymap2
```
This example shows how to delete the policy map called policymap2:

Switch# configure terminal
Switch(config)# no policy-map policymap2
Switch#

You can verify your settings by entering the `show policy-map` privileged EXEC command.

<td>Attaches a policy map to an interface or applies different QoS policies on VLANs that an interface belongs to.</td>
</tr>
<tr>
<td>show policy-map</td>
<td>Displays information about the policy map.</td>
</tr>
</tbody>
</table>
port-channel load-balance

To set the load-distribution method among the ports in the bundle, use the `port-channel load-balance` command. To reset the load distribution to the default, use the `no` form of this command.

```
port-channel load-balance method

no port-channel load-balance
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>method</code></td>
<td>Specifies the load distribution method. See the “Usage Guidelines” section for more information.</td>
</tr>
</tbody>
</table>

### Defaults

Load distribution on the source XOR destination IP address is enabled.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The following values are valid for the load-distribution method:

- `dst-ip`—Load distribution on the destination IP address
- `dst-mac`—Load distribution on the destination MAC address
- `dst-port`—Load distribution on the destination TCP/UDP port
- `src-dst-ip`—Load distribution on the source XOR destination IP address
- `src-dst-mac`—Load distribution on the source XOR destination MAC address
- `src-dst-port`—Load distribution on the source XOR destination TCP/UDP port
- `src-ip`—Load distribution on the source IP address
- `src-mac`—Load distribution on the source MAC address
- `src-port`—Load distribution on the source port

### Examples

This example shows how to set the load-distribution method to the destination IP address:

```
Switch(config)# port-channel load-balance dst-ip
Switch(config)#
```

This example shows how to set the load-distribution method to the source XOR destination IP address:

```
Switch(config)# port-channel load-balance src-dst-port
Switch(config)#
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG1</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command can only be used when the port channel protocol type is Link Aggregation Control Protocol (LACP). It allows you to change the current behavior when a physical port cannot bundle with an LACP EtherChannel.

**Examples**

The following example shows how to enable the EtherChannel standalone option in a port channel:

```
Switch(config-if)# no port-channel standalone-disable
```

**Related Commands**

port-security mac-address

To configure a secure address on an interface for a specific VLAN or VLAN range, use the `port-security mac-address` command.

```
port-security mac-address mac_address
```

**Syntax Description**
- `mac_address` The MAC-address that needs to be secured.

**Command Modes**
- VLAN-range interface submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan` command, you can use the `port-security mac-address` command to specify different addresses on different VLANs.

**Examples**

This example shows how to configure the secure address 1.1.1 on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# end
Switch#
```

**Related Commands**

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The Sticky feature must be enabled on an interface before you can configure the `port-security mac-address sticky` command.

### Usage Guidelines

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan` command, you can use the `port-security mac-address sticky` command to specify different sticky addresses on different VLANs.

The Sticky feature must be enabled on an interface before you can configure the `port-security mac-address sticky` command.

Sticky MAC addresses are addresses that persist across switch reboots and link flaps.

### Examples

This example shows how to configure the sticky address 1.1.1 on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.1
Switch(config-if-vlan-range)# end
Switch#
```

</tbody>
</table>
port-security maximum

To configure the maximum number of addresses on an interface for a specific VLAN or VLAN range, use the port-security maximum command.

```
port-security maximum max_value
```

**Syntax Description**

| max_value | The maximum number of MAC-addresses. |

**Command Modes**

VLAN-range interface submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan` command, you can use the port-security maximum command to specify the maximum number of secure addresses on different VLANs.

If a specific VLAN on a port is not configured with a maximum value, the maximum configured for the port is used for that VLAN. In this situation, the maximum number of addresses that can be secured on this VLAN is limited to the maximum value configured on the port.

Each VLAN can be configured with a maximum count that is greater than the value configured on the port. Also, the sum total of the maximum configured values for all the VLANs can exceed the maximum configured for the port. In either of these situations, the number of MAC addresses secured on each VLAN is limited to the lesser of the VLAN configuration maximum and the port configuration maximum.

**Examples**

This example shows how to configure a maximum number of addresses (5) on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security maximum 5
Switch(config-if-vlan-range)# exit
Switch#
```

</thead>
<tbody>
<tr>
<td>Release IOS XE 3.4.0SG and IOS 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
EEE is supported on WS-X4748-UPOE+E and WS-X4748-RJ45-E.

EEE defines support for physical layer devices (PHYs) to operate in Low Power Idle (LPI) mode. When enabled, EEE supports QUIET times during low link utilization allowing both sides of a link to disable portions of each PHY’s operating circuitry and save power. This functionality is provided per port and is not enabled by default. To avoid issues with EEE functionality on any port during run-time, Cisco provides the `power efficient-ethernet auto` command to enable or disable EEE.

Because EEE relies on Auto Negotiation pulse to determine whether to activate EEE, the port must initially enable auto negotiation. Furthermore, EEE is the correct action provided the speed is auto 100M, auto 1000M, or auto 100M and 1000M. 10M (either auto or forced mode) does not require EEE for power saving.

**Examples**
This example shows how to enable EEE:

```
Switch# config t
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# power efficient-ethernet auto
Switch(config-if)# exit
```
power inline

To set the inline-power state for the inline-power-capable interfaces, use the `power inline` command. To return to the default values, use the no form of this command.

```
power inline [ auto [ max milliwatt ] | never | static [ max milliwatt ] | consumption milliwatt ]
```

no power inline

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Sets the Power over Ethernet state to auto mode for inline-power-capable interfaces.</td>
</tr>
<tr>
<td>max milliwatt</td>
<td>(Optional) Sets the maximum power that the equipment can consume; valid range is from 2000 to 15400 mW for classic modules. For the WS-X4648-RJ45V-E, the maximum is 20000. For the WS-X4648-RJ45V+E, the maximum is 30000.</td>
</tr>
<tr>
<td>never</td>
<td>Disables both the detection and power for the inline-power capable interfaces.</td>
</tr>
<tr>
<td>static</td>
<td>Allocates power statically.</td>
</tr>
<tr>
<td>consumption milliwatt</td>
<td>Sets power allocation per interface; valid range is from 4000 to 15400 for classic modules. Any non-default value disables automatic adjustment of power allocation.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- Auto mode for Power over Ethernet is set.
- Maximum mW mode is set to 15400. For the WS-X4648-RJ45V-E, the maximum mW is set to 20000. For the WS-X4648-RJ45V+E, the maximum mW is set to 30000.
- Default allocation is set to 15400.

**Command Modes**

</tr>
</tbody>
</table>

**Usage Guidelines**

If your interface is not capable of supporting Power over Ethernet, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```
Examples

This example shows how to set the inline-power detection and power for the inline-power-capable interfaces:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline auto
Switch(config-if)# end
Switch#

This example shows how to disable the inline-power detection and power for the inline-power-capable interfaces:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline never
Switch(config-if)# end
Switch#

This example shows how to set the permanent Power over Ethernet allocation to 8000 mW for Fast Ethernet interface 4/1 regardless what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline consumption 8000
Switch(config-if)# end
Switch#

This example shows how to pre-allocate Power over Ethernet to 16500 mW for Gigabit Ethernet interface 2/1 regardless of what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline static max 16500
Switch(config-if)# end
Switch#

power inline consumption

To set the default power that is allocated to an interface for all the inline-power-capable interfaces on the switch, use the `power inline consumption` command. To return to the default values, use the `no` form of this command.

```
power inline consumption default milliwatts

no power inline consumption default
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td>Specifies the switch to use the default allocation.</td>
</tr>
<tr>
<td><code>milliwatts</code></td>
<td>Sets the default power allocation in milliwatts; the valid range is from 4000 to 15399. Any non-default value disables automatic adjustment of power allocation.</td>
</tr>
</tbody>
</table>

**Defaults**

Milliwatt mode is set to 15400.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(20)EW</td>
<td>Support added for Power over Ethernet.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `inline power consumption` command overrides the power allocated to the port through IEEE/Cisco phone discovery and CDP/LLDP power negotiation. To guarantee safe operation of the system, ensure that the value configured here is no less than the actual power requirement of the attached device. If the power drawn by the inline powered devices exceeds the capability of the power supply, it could trip the power supply.

If your interface is not capable of supporting Power over Ethernet, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```
Examples

This example shows how to set the Power over Ethernet allocation to use 8000 mW, regardless of any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power inline consumption default 8000
Switch(config)# end
Switch#
```

</table>
power inline four-pair forced

**Note**
This command is available only on Supervisor Engine 7-E and Supervisor Engine 7L-E.

To automatically enable power on both signal and spare pairs from a switch port, provided the end-device is PoE capable on both signal and spare pairs but does not support the CDP or LLDP extensions required for UPOE, use the `power inline four-pair forced` command.

```
power inline four-pair forced
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
None

### Command Modes
Interface configuration mode

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 15.0(2)SG | This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 7-E and 7L-E.

### Usage Guidelines
Although IEEE 802.at only provides for power up to 30W per port, the WS-X4748-UPOE+E module can provide up to 60W using the spare pair of an RJ45 cable (wires 4,5,7,8) with the signal pair (wires 1,2,3,6). Power on the spare pair is enabled when the switch port and end-device mutually identify themselves as UPOE capable using CDP or LLDP and the end-device requests for power on the spare pair to be enabled. When the spare pair is powered, the end-device can negotiate up to 60W power from the switch using CDP or LLDP.

If the end-device is PoE capable on both signal and spare pairs but does not support the CDP or LLDP extensions required for UPOE, then the following configuration automatically enables power on both signal and spare pairs from the switch port.

### Examples
The following example shows how to automatically enable power on both signal and spare pairs from switch port gigabit ethernet 2/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline four-pair forced
Switch(config-if)# shutdown
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#
```
Do not enter this command if the end-device is incapable of sourcing inline power on the spare pair or if the end-device supports the CDP or LLDP extensions for UPOE.
power inline logging global

To enable console messages that show when a PoE device has been detected and to show when a PoE device has been removed, use the power inline logging global command.

Syntax Description

This command has no arguments or keywords.

Defaults

Disabled

Command Modes

Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG2/XE 3.2.2SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Be aware of the potential for console flooding if this command is used on a switch connected to several PoE devices.

Examples

This example shows how to globally enable PoE status messaging on each interface:

To enable PoE event logging, you use the logging event poe-status global command:

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power inline logging global
Switch(config)# int gigabitEthernet 5/5
Switch(config-if)# shut
Switch(config-if)#
```

```
Switch(config-if)# no shut
Switch(config-if)#
```

```
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging event link-status global (global configuration)</td>
<td>Changes the default switch-wide global link-status event messaging settings.</td>
</tr>
</tbody>
</table>
power inline police

To configure Power over Ethernet policing on a particular interface, use the `power inline police` command. The `no` form of the command disables PoE policing on an interface.

```
power inline police [action] [errdisable | log]

no power inline police [action] [errdisable | log]
```

Syntax Description

- **action** *(Optional)* Specifies the action to take on the port when a PoE policing fault occurs (the device consumes more power than it’s allocated).
- **errdisable** *(Optional)* Enables PoE policing on the interface and places the port in an errdisable state when a PoE policing fault occurs.
- **log** *(Optional)* Enables PoE policing on the interface and, if a PoE policing fault occurs, shuts, restarts the port, and logs an error message.

Defaults

PoE policing is disabled.

Command Modes

- Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If a port is in the errdisable state because of a PoE policing fault, enter the `shut` command followed by a `no shut` on the interface to make the port operational again.

You can also configure inline-power errdisable autorecovery so that an errdisabled interface is automatically revived when the errdisable autorecovery timer expires.

Examples

This example shows how to enable PoE policing and configure a policing action:

```
Switch(config)# int gigabitEthernet 2/1
Switch(config-if)# power inline police
Switch(config-if)# do show power inline police gigabitEthernet 2/1
Available:421(w) Used:39(w) Remaining:382(w)
Interface Admin  Oper       Admin      Oper       Cutoff Oper
State  State      Police     Police     Power  Power
--------- ------ ---------- ---------- ---------- ------ ----- 
Gi2/1   auto   on         errdisable ok         17.4   7.6
Switch(config-if)# power inline police action log
Available:421(w) Used:39(w) Remaining:382(w)
```
### Related Commands

power redundancy combined max inputs

To configure the power settings for the chassis specifically for 'Combined Mode Resiliency', use the `power redundancy combined max inputs` command. To return to the default setting, use the `default` form of this command.

**Note**
This feature only applies in combined mode when both power supply bays contain the 4200 W AC, 6000 W AC, or 9000W power supply.

```
power redundancy combined max inputs \{x | y\}
default power redundancy combined max inputs
```

**Syntax Description**
- \{x | y\} Sets the max input limits.
  - If 9000W power supplies are installed, the valid input range is 2-5.
  - **Note** The maximum number of power-supply inputs with two 9000W power supplies is 6.
  - If 4200W or 6000W power supplies are installed, the valid input range is 2-3.
  - **Note** The maximum number of power-supply inputs with either two 4200W or two 6000W power supplies is 4.

**Defaults**
Redundant power management mode

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.0SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>and 15.1(2)SG</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Using the combined mode power resiliency feature, you can limit the power usage to a maximum of two or three (configurable) inputs for 4000W and 6000W power supplies. For 9000W power supplies, you can limit the power usage to a maximum of 2 to 5 inputs, since the 9000W is a triple input power supply.

With two 4200 W AC or 6000 W AC power supplies, a maximum of four inputs are available. With two 9000W, a maximum of six inputs are available. This feature allows you to cap the power usage to that of two/three inputs or four/five inputs. If one of the power supplies fails, no loss of power occurs because you have capped its usage to a smaller number of inputs.

If you have max inputs 3 configured with four "good" (220 V) inputs and you limit the user to 5500 W instead of 7600 W and one subunit fails or is powered off, you have three quality inputs providing 5500 W and the chassis is powered at the same rate as it was prior to the failure event.

```
Switch# configuration terminal
```
Here is the output of the `show power` command prior to invoking this feature:

```
Switch# show power
sh power
Power Supply    Model No       Type   Status          Fan Sensor        Inline Status
----------  -----------  ---------  ---------------  ---------------  ---------
PS1        PWR-C45-4200ACV   AC 4200W  good        good               good
PS1-1      110V             good
PS1-2      110V             good
PS2        PWR-C45-4200ACV   AC 4200W  good        good               good
PS2-1      110V             good
PS2-2      110V             good

Power supplies needed by system: 1
Power supplies currently available: 2

Power Summary
(in Watts)    Used   Available
-------------  ------   --------
System Power (12V) 140    1360
Inline Power (-50V) 0      1850
Backplane Power (3.3V) 0      40
-------------  ------   --------
Total          140 (not to exceed Total Maximum Available = 2100)
```

Here is the output after invoking this feature. The combined mode was indicated before

`Power supplies needed = 2` in the output of the `show power` command, combined mode is now indicated by the phrase `Power supplies needed by system: 2 Maximum Inputs = 3`.

```
Switch# show power
sh power
Power Supply    Model No       Type   Status          Fan Sensor        Inline Status
----------  -----------  ---------  ---------------  ---------------  ---------
PS1        PWR-C45-4200ACV   AC 4200W  good        good               good
PS1-1      110V             good
PS1-2      110V             good
PS2        PWR-C45-4200ACV   AC 4200W  good        good               good
PS2-1      110V             good
PS2-2      110V             good

Power supplies needed by system: 2 Maximum Inputs = 3
Power supplies currently available: 2

Power Summary
(in Watts)    Used   Available
-------------  ------   --------
System Power (12V) 140    2400
Inline Power (-50V) 0      2000

</tr>
</tbody>
</table>

### Usage Guidelines

The two power supplies must be the same type and wattage.

**Caution**

If you have power supplies with different types or wattages installed in your switch, the switch will not recognize one of the power supplies. A switch set to redundant mode will not have power redundancy. A switch set to combined mode will use only one power supply.

In redundant mode, the power from a single power supply must provide enough power to support the switch configuration.

*Table 2-12* lists the maximum available power for chassis and Power over Ethernet for each power supply.
Special Considerations for the 4200 W AC, 6000 W AC, and 9000W Power Supplies

The 4200 W AC and 6000 W AC power supply has two inputs: each can be powered at 110 or 220 V. The 9000 W AC power supply has three inputs: each can be powered at 110 or 220V.

As with other power supplies, the two power supplies must be of the same type (6000 W AC or 4200 W AC or 9000 W AC). Otherwise, the right power supply is put in err-disable state and the left one is selected. In addition, all the inputs to the chassis must be at the same voltage. In redundant mode, the inputs to the left and right power supplies must be identical. If the left and right power supplies are powered in redundant mode, the power values is based on the power supply with the higher output wattage.

When the system is powered with a 4200 W, 6000 W, or 9000W power supply either in 110 V or 220 V combined mode operation, the available power is determined by the configuration of the system (the type of line cards, the number of line cards, number of ports consuming inline power, etc.) and does not reflect the absolute maximum power.

Table 2-12  Available Power for Switch Power Supplies

</tbody>
</table>

1. Chassis power includes power for the supervisor engine(s), all line cards, and the fan tray.
2. The efficiency for the 1400 W DC power supply is 0.75, and 0.96 is applied to PoE.
3. DC input can vary for the 1400 W DC power supply and is configurable.
4. Not available for PoE.
5. Not available for PoE.
6. No voice power.
7. Data-only.
8. Inline power.
In a matched redundant power supply configuration, if a power supply submodule fails, the other (good) power supply provides power to its full capability.

Table 2-13 illustrates how the 4200 W AC power supply is evaluated in redundant mode.

<table>
<thead>
<tr>

</tbody>
</table>
pppoe intermediate-agent (global)

To enable the PPPoE Intermediate Agent feature on a switch, use the **pppoe intermediate-agent** global configuration command. To disable the feature, use the **no** form of this command.

```
pppoe intermediate-agent

no pppoe intermediate-agent
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

disabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enable PPPoE Intermediate Agent globally on a switch before you can use PPPoE Intermediate Agent on an interface or interface VLAN.

**Examples**

This example shows how to enable PPPoE Intermediate Agent on a switch:

```
Switch(config)# pppoe intermediate-agent
```

This example shows how to disable PPPoE Intermediate Agent on a switch:

```
Switch(config)# no pppoe intermediate-agent
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pppoe intermediate-agent (global)</td>
<td>Sets the access node identifier, generic error message, and identifier string for a switch.</td>

</tbody>
</table>
**pppoe intermediate-agent (interface)**

**Note**
This command takes effect only if you enable the `pppoe intermediate-agent` global command.

To enable the PPPoE Intermediate Agent feature on an interface, use the `pppoe intermediate-agent` command. To disable the feature, use the `no` form of this command.

```
pppoe intermediate-agent
no pppoe intermediate-agent
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled on all interfaces.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
PPPoE Intermediate Agent is enabled on an interface provided the PPPoE Intermediate Agent is enabled both on the switch and the interface.

**Examples**
This example shows how to enable the PPPoE Intermediate Agent on an interface:

```
Switch(config-if)# pppoe intermediate-agent
```

This example shows how to disable the PPPoE Intermediate Agent on an interface:

```
Switch(config-if)# no pppoe intermediate-agent
```

**Related Commands**

<table>
<thead>
<tr>

</table>
pppoe intermediate-agent (interface vlan-range)

This command takes effect only if you enable the `pppoe intermediate-agent` global command.

To enable PPPoE Intermediate Agent on an interface VLAN range, use the `pppoe intermediate-agent` global command. To disable the feature, use the `no` form of this command.

```
pppoe intermediate-agent

no pppoe intermediate-agent
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled on all VLANs on all interfaces

**Command Modes**

Interface vlan-range configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Although this command takes effect irrespective of the `pppoe intermediate-agent` (interface configuration mode) command, you must enable the `pppoe intermediate-agent` (global configuration mode) command.

**Examples**

This example shows how to enable PPPoE Intermediate Agent on a range of VLANs:

```
Switch(config-if)# vlan-range 167-368
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

This example shows how to disable PPPoE Intermediate Agent on a single VLAN:

```
Switch(config-if)# vlan-range 268
Switch(config-if-vlan-range)# no pppoe intermediate-agent
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pppoe intermediate-agent (interface)</code></td>
<td>Enables the PPPoE Intermediate Agent feature on an interface.</td>
</tr>
</tbody>
</table>
pppoe intermediate-agent format-type (global)

To set the access node identifier, generic error message, and identifier string for the switch, use the `pppoe intermediate-agent format-type (global)` command. To disable the feature, use the `no` form of this command:

```
pppoe intermediate-agent format-type access-node-identifier string string
pppoe intermediate-agent format-type generic-error-message string string
pppoe intermediate-agent format-type identifier-string string string option {sp|sv|pv|spv} delimiter {[,|.|;|/|#}
no pppoe intermediate-agent format-type {access-node-identifier | generic-error-message | identifier-string}
```

**Syntax Description**

- **access-node-identifier string string**  
  ASCII string literal value for the access-node-identifier.

- **generic-error-message string string**  
  ASCII string literal value for the generic-error-message.

- **identifier-string string string**  
  ASCII string literal value for the identifier-string.

- **option {sp|sv|pv|spv}**  
  Options:
  - `sp` = slot + port
  - `sv` = slot + VLAN
  - `pv` = port + VLAN
  - `spv` = slot + port + VLAN

- **delimiter {[,|.|;|/|#}**  
  Delimiter between slot/port/VLAN portions of option.

**Defaults**

- **access-node-identifier** has a default value of 0.0.0.0.
- **generic-error-message**, **identifier-string**, **option**, and **delimiter** have no default values.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **access-node-identifier** and **identifier-string** commands to enable the switch to generate the circuit-id parameters automatically.

The **no** form of **identifier-string** command unsets the option and delimiter.
Use the **generic-error-message** command to set an error message notifying the sender that the PPPoE Discovery packet was too large.

### Examples

This example shows how to set an access-node-identifier:

```
Switch(config)# pppoe intermediate-agent format-type access-node-identifier string switch-abc-123
```

This example shows how to unset a generic-error-message:

```
Switch(config)# no pppoe intermediate-agent format-type generic-error-message
```

pppoe intermediate-agent format-type (interface)

Note
This command takes effect only if you enable the `pppoe intermediate-agent` interface configuration command.

To set circuit-id or remote-id for an interface, use the `pppoe intermediate-agent format-type` command. To unset the parameters, use the `no` form of this command.

```
pppoe intermediate-agent format-type {circuit-id | remote-id} string string
no pppoe intermediate-agent format-type {circuit-id | remote-id} string string
```

Syntax Description
- `circuit-id string string` ASCII string literal value for circuit-id.
- `remote-id string string` ASCII string literal value for remote-id.

Defaults
No default values for circuit-id and remote-id.

Command Modes
Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use the `pppoe intermediate-agent format-type` command to set interface-specific circuit-id and remote-id values. If an interface-specific circuit-id is not set, the system's automatic generated circuit-id value is used.

Examples
This example shows how to set remote-id for an interface:
```
Switch(config-if)# pppoe intermediate-agent format-type remote-id string user5551983
```

This example shows how to unset circuit-id for an interface:
```
Switch(config)# no pppoe intermediate-agent format-type circuit-id
```

**pppoe intermediate-agent format-type (interface vlan-range)**

**Note**
This command takes effect only if you enable the `pppoe intermediate-agent interface vlan-range` configuration mode command.

To set circuit-id or remote-id for an interface vlan-range, use the `pppoe intermediate-agent format-type` interface vlan-range mode command. To unset the parameters, use the `no` form of this command.

```
pppoe intermediate-agent format-type {circuit-id | remote-id} string string
no pppoe intermediate-agent format-type {circuit-id | remote-id} string string
```

**Syntax Description**
- `circuit-id string string`: ASCII string literal value to be set for circuit-id.
- `remote-id string string`: ASCII string literal value to be set for remote-id.

**Defaults**
No default values for circuit-id and remote-id.

**Command Modes**
Interface vlan-range configuration mode

**Command History**

<table>
<thead>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use these commands to set circuit-id or remote-id on an interface vlan-range. If the circuit-id is not set, the system’s automatically generated circuit-id is used.

**Examples**
This example shows how to set remote-id on an interface VLAN:

```
Switch(config-if)# vlan-range 268
Switch(config-if-vlan-range)#
pppoe intermediate-agent format-type remote-id string user5551983-cabletv
```

This example shows how to unset circuit-id on an interface vlan-range:

```
Switch(config-if)# vlan-range 167-368
Switch(config-if-vlan-range)# no pppoe intermediate-agent format-type circuit-id
```

pppoe intermediate-agent limit rate

To limit the rate of the PPPoE Discovery packets arriving on an interface, use the `pppoe intermediate-agent limit rate` command. To disable the feature, use the `no` form of this command.

```
pppoe intermediate-agent limit rate number

no pppoe intermediate-agent limit rate number
```

**Syntax Description**

- `number`: Specifies the threshold rate of PPPoE Discovery packets received on this interface in packets-per-second.

**Defaults**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If this command is used and the PPPoE Discovery packets that are received exceeds the rate set, the interface will be error-disabled (shutdown).

**Examples**

This example shows how to set a rate limit for an interface:

```
Switch(config-if)# pppoe intermediate-agent limit rate 50
```

This example shows how to disable rate limiting for an interface:

```
Switch(config-if)# no pppoe intermediate-agent limit rate
```

**pppoe intermediate-agent trust**

To set the trust configuration of an interface, use the **pppoe intermediate-agent trust** global command. To unset the trust parameter, use the **no** form of this command.

```
pppoe intermediate-agent trust
no pppoe intermediate-agent trust
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

All interfaces are untrusted.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

At least one trusted interface must be present on the switch for PPPoE Intermediate Agent feature to work.

Set the interface connecting the switch to the PPPoE Server (or BRAS) as trusted.

**Examples**

This example shows how to set an interface as trusted:

```
Switch(config-if)# pppoe intermediate-agent trust
```

This example shows how to disable the trust configuration for an interface:

```
Switch(config-if)# no pppoe intermediate-agent trust
```

pppoe intermediate-agent vendor-tag strip

Note

This command takes effect only if you enable the pppoe intermediate-agent interface configuration command and the pppoe intermediate-agent trust command.

To enable vendor-tag stripping on PPPoE Discovery packets from PPPoE Server (or BRAS), use the pppoe intermediate-agent vendor-tag strip command. To disable this setting, use the no form of this command.

```
pppoe intermediate-agent vendor-tag strip
no pppoe intermediate-agent vendor-tag strip
```

Syntax Description

This command has no arguments or keywords.

Defaults

Vendor-tag stripping is turned off.

Command Modes

Interface configuration mode

Command History

Release Modification
12.2(50)SG Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

This command has no effect on untrusted interfaces.

Usage Guidelines

Use this command on a PPPoE Intermediate Agent trusted interface to strip off the vendor-specific tags in PPPoE Discovery packets that arrive downstream from the PPPoE Server (or BRAS), if any.

Examples

This example shows how to set vendor-tag stripping on an interface:

```
Switch(config-if)# pppoe intermediate-agent vendor-tag strip
```

This example shows how to disable vendor-tag stripping on an interface:

```
Switch(config-if)# no pppoe intermediate-agent vendor-tag strip
```

priority

To enable the strict priority queue (low-latency queueing [LLQ]) and to give priority to a class of traffic belonging to a policy map attached to a physical port, use the `priority` policy-map class configuration command. To return to the default setting, use the `no` form of this command.

```
priority
no priority
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The strict priority queue is disabled.

**Command Modes**
Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.2(40)SG</td>
<td>Support introduced on Supervisor Engine 6E and Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `priority` command only in a policy map attached to a physical port. You can use this command only in class-level classes, you cannot use this command in class class-default.

This command configures LLQ and provides strict-priority queueing. Strict-priority queueing enables delay-sensitive data, such as voice, to be sent before packets in other queues are sent. The priority queue is serviced first until it is empty.

You cannot use the `bandwidth`, `dbl`, and the `shape` policy-map class configuration commands with the `priority` policy-map class configuration command in the same class within the same policy map. However, you can use these commands in the same policy map.

You can use police or set class configuration commands with the priority police-map class configuration command.

If the priority queuing class is not rate limited, you cannot use the `bandwidth` command, you can use the `bandwidth remaining percent` command instead.

**Examples**
This example shows how to enable the LLQ for the policy map called policy1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class voice
Switch(config-pmap-c)# priority
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>15.0(2)SG</td>
<td>Support for twoway-community was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You cannot configure VLAN 1 or VLANs 1001 to 1005 as private VLANs. VTP does not support private VLANs. You must configure private VLANs on each device where you want private VLAN ports.
The `secondary_vlan_list` parameter cannot contain spaces; it can contain multiple comma-separated items. Each item can be a single private VLAN ID or a range of private VLAN IDs separated by hyphens.

The `secondary_vlan_list` parameter can contain multiple community VLAN IDs.

The `secondary_vlan_list` parameter can contain only one isolated VLAN ID. A private VLAN is defined as a set of private ports characterized by a common set of VLAN number pairs: each pair is made up of at least two special unidirectional VLANs and is used by isolated ports or by a community of ports to communicate with the switches.

An isolated VLAN is a VLAN that is used by the isolated ports to communicate with the promiscuous ports. The isolated VLAN traffic is blocked on all other private ports in the same VLAN and can be received only by the standard trunking ports and the promiscuous ports that are assigned to the corresponding primary VLAN.

A community VLAN is the VLAN that carries the traffic among the community ports and from the community ports to the promiscuous ports on the corresponding primary VLAN. A community VLAN is not allowed on a private VLAN trunk.

A promiscuous port is a private port that is assigned to a primary VLAN.

A primary VLAN is a VLAN that is used to convey the traffic from the switches to the customer end stations on the private ports.

You can specify only one isolated `vlan-id` value, while multiple community VLANs are allowed. You can only associate isolated and community VLANs to one VLAN. The associated VLAN list may not contain primary VLANs. Similarly, a VLAN that is already associated to a primary VLAN cannot be configured as a primary VLAN.

The `private-vlan` commands do not take effect until you exit the config-VLAN submode.

If you delete either the primary or secondary VLAN, the ports that are associated with the VLAN become inactive.

Refer to the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide for additional configuration guidelines.

### Examples

This example shows how to configure VLAN 202 as a primary VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202               primary
```

This example shows how to configure VLAN 303 as a community VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 303
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202               primary
303       community
```

This example shows how to configure VLAN 440 as an isolated VLAN and verify the configuration:
This example shows how to create a private VLAN relationship among the primary VLAN 14, the isolated VLAN 19, and community VLANs 20 and 21:

Switch(config)# vlan 14
Switch(config-vlan) # private-vlan primary
Switch(config-vlan) # private-vlan association 19

This example shows how to remove a private VLAN relationship and delete the primary VLAN. The associated secondary VLANs are not deleted.

Switch(config-vlan)# no private-vlan 14
Switch(config-vlan)#

This example shows how to configure VLAN 550 as a two-way-community VLAN and verify the configuration:

Switch# configure terminal
Switch(config)# vlan 550
Switch(config-vlan) # private-vlan twoway-community
Switch(config-vlan)# end
Switch# show vlan private-vlan

Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202 primary
303 community
440 isolated
550 two-way-community

This example shows how to associate community VLANs 303 through 307 and 309 and isolated VLAN 440 with primary VLAN 202 and verify the configuration:

Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan) # private-vlan association 303-307,309,440
Switch(config-vlan)# end
Switch# show vlan private-vlan

Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202 303 community
202 304 community
202 305 community
202 306 community
202 307 community
202 309 community
202 440 isolated
202 308 community
The secondary VLAN 308 has no associated primary VLAN.

This example shows how to remove an isolated VLAN from the private VLAN association:

```
Switch(config)# vlan 14
Switch(config-vlan)# private-vlan association remove 18
Switch(config-vlan)#
```

This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end
Switch# show interfaces fastethernet 5/1 switchport

private-vlan mapping

To create a mapping between the primary and the secondary VLANs so that both share the same primary VLAN SVI, use the `private-vlan mapping` command. To remove all PVLAN mappings from an SVI, use the `no` form of this command.

```
private-vlan mapping primary-vlan-id {[secondary-vlan-list | {add secondary-vlan-list} | {remove secondary-vlan-list}]]
```

```
no private-vlan mapping
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>primary-vlan-id</code></td>
<td>VLAN ID of the primary VLAN of the PVLAN relationship.</td>
</tr>
<tr>

<td>(Optional) VLAN ID of the secondary VLANs to map to the primary VLAN.</td>
</tr>
<tr>
<td><code>add</code></td>
<td>(Optional) Maps the secondary VLAN to the primary VLAN.</td>
</tr>
<tr>
<td><code>remove</code></td>
<td>(Optional) Removes the mapping between the secondary VLAN and the primary VLAN.</td>
</tr>
</tbody>
</table>

### Defaults

All PVLAN mappings are removed.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple, comma-separated items. Each item can be a single PVLAN ID or a range of PVLAN IDs separated by hyphens.

This command is valid in the interface configuration mode of the primary VLAN.

The SVI of the primary VLAN is created at Layer 3.

The traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.

The SVIs of the existing secondary VLANs do not function and are considered down after this command is entered.

A secondary SVI can be mapped to only one primary SVI. If the configured PVLANs association is different from what is specified in this command (if the specified `primary-vlan-id` is configured as a secondary VLAN), all the SVIs that are specified in this command are brought down.

If you configure a mapping between two VLANs that do not have a valid Layer 2 association, the mapping configuration does not take effect.
This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

```
Switch(config)# interface vlan 18
Switch(config-if)# private-vlan mapping 18 20
Switch(config-if)#
```

This example shows how to permit the routing of the secondary VLAN ingress traffic from PVLANs 303 through 307, 309, and 440 and how to verify the configuration:

```
Switch(config)# interface vlan 202
Switch(config-if)# private-vlan mapping add 303-307,309,440
Switch(config-if)# end
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
--------- -------------- -----------------
 vlan202   303            isolated
 vlan202   304            isolated
 vlan202   305            isolated
 vlan202   306            isolated
 vlan202   307            isolated
 vlan202   309            isolated
 vlan202   440            isolated
Switch#
```

This example shows the displayed message that you will see if the VLAN that you are adding is already mapped to the SVI of VLAN 18. You must delete the mapping from the SVI of VLAN 18 first.

```
Switch(config)# interface vlan 19
Switch(config-if)# private-vlan mapping 19 add 21
    Command rejected: The interface for VLAN 21 is already mapped as a secondary.
Switch(config-if)#
```

This example shows how to remove all PVLAN mappings from the SVI of VLAN 19:

```
Switch(config)# interface vlan 19
Switch(config-if)# no private-vlan mapping
Switch(config-if)#
```

```
Switch# configure terminal
Switch(config)# interface vlan 202
Switch(config-if)# private-vlan mapping add 303-307,309,440
Switch(config-if)# end
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
--------- -------------- -----------------
 vlan202   303            community
 vlan202   304            community
 vlan202   305            community
 vlan202   306            community
 vlan202   307            community
 vlan202   309            community
 vlan202   440            isolated
Switch#
```

</tbody>
</table>
private-vlan synchronize

To map the secondary VLANs to the same instance as the primary VLAN, use the `private-vlan synchronize` command.

```
private-vlan synchronize
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you do not map the VLANs to the same instance as the associated primary VLAN when you exit the MST configuration submode, a warning message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The `private-vlan synchronize` command automatically maps all secondary VLANs to the same instance as the associated primary VLANs.

**Examples**
This example shows how to initialize PVLAN synchronization:

```
Switch(config-mst)# private-vlan synchronize
Switch(config-mst)#
```

This example assumes that a primary VLAN 2 and a secondary VLAN 3 are associated to VLAN 2, and that all VLANs are mapped to the CIST instance 1. This example also shows the output if you try to change the mapping for the primary VLAN 2 only:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 2
Switch(config-mst)# exit
These secondary vlans are not mapped to the same instance as their primary: ->3
Switch(config)#
```

**Related Commands**

profile

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode, use the `profile` command.

```
profile profile_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>profile_name</code></td>
<td>Specifies the profile name.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

`cfg-call-home`

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the `profile profile_name` command in call-home mode, the prompt changes to `Switch(cfg-call-home-profile)#`, and you have access to the following profile configuration commands:

- `active`
- `destination address`
- `destination message-size-limit bytes`
- `destination preferred-msg-format`
- `destination transport-method`
- `end`
- `exit`
- `subscribe-to-alert-group all`
- `subscribe-to-alert-group configuration`
- `subscribe-to-alert-group diagnostic`
- `subscribe-to-alert-group environment`
- `subscribe-to-alert-group inventory`
- `subscribe-to-alert-group syslog`
This example shows how to create and configure a user-defined call-home profile:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# destination transport-method http
Switch(cfg-call-home-profile)# destination address http
https://172.17.46.17/its/service/oddce/services/DDCEService
Switch(cfg-call-home-profile)# subscribe-to-alert-group configuration
Switch(cfg-call-home-profile)# subscribe-to-alert-group diagnostic severity normal
Switch(cfg-call-home-profile)# subscribe-to-alert-group environment severity notification
Switch(cfg-call-home-profile)# subscribe-to-alert-group syslog severity notification
pattern "UPDOWN"
Switch(cfg-call-home-profile)# subscribe-to-alert-group inventory periodic daily 21:12
```

## Related Commands

**profile flow**

To enable Media Services Proxy (MSP), use the `profile flow` command. To return to the default setting, use the `no` form of this command:

```
profile flow
no profile flow
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
config

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release IOS XE</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
<tr>
<td>3.4.0SG and IOS</td>
<td></td>
</tr>
<tr>
<td>15.1(2)SG</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must configure the MSP profile flow command to activate the MSP platform Packet parser. This is because the MSP device handler is tightly coupled with MSP flow parser. Not enabling this CLI means that MSP will not send SIP, H323 notifications to IOS sensor.

**Examples**
This example shows how to enable MSP:

```
Switch(config)# profile flow
```
qos account layer-all encapsulation

To account for Layer 1 header length of 20 bytes in QoS policing features, use the `qos account layer-all encapsulation` command. To disable the use of additional bytes, use the `no` form of this command.

```
qos account layer-all encapsulation
no qos account layer-all encapsulation
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
On Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E, policers account only for the Layer 2 header length in policing features. In contrast, shapers account for header length as well as IPG in rate calculations.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E use the `qos account layer-all encapsulation` command to account for Layer 1 header of 20 bytes (preamble + IPG) and Layer 2 header in policing features. When this command is configured, policer statistics (in bytes) observed in the output of the `show policy-map interface` command reflect the Layer 1 header length as well (20 bytes per packet).

**Examples**
This example shows how to include IPG in policing:

```
Switch)# config t
Switch(config)# qos account layer-all encapsulation
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show policy-map interface</code></td>
<td>Displays policer statistics on a specific interface.</td>
</tr>
</tbody>
</table>
qos account layer2 encapsulation

To include additional bytes to be accounted by the QoS features, use the `qos account layer2 encapsulation` command. To disable the use of additional bytes, use the `no` form of this command.

```
qos account layer2 encapsulation { arpa | dot1q | isl | length len }
no qos account layer2 encapsulation { arpa | dot1q | isl | length len }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arpa</td>
<td>Specifies the account length of the Ethernet ARPA-encapsulated packet (18 bytes).</td>
</tr>
<tr>
<td>dot1q</td>
<td>Specifies the account length of the 802.1Q-encapsulated packet (22 bytes).</td>
</tr>
<tr>
<td>isl</td>
<td>Specifies the account length of the ISL-encapsulated packet (48 bytes).</td>
</tr>
<tr>
<td>length len</td>
<td>Specifies the additional packet length to account for; the valid range is from 0 to 64 bytes.</td>
</tr>
</tbody>
</table>

### Defaults

On Supervisor Engine 6E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948-E, the length that is specified in the Ethernet header is considered for both IP and non-IP packets. The Layer 2 length includes the VLAN tag overhead.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

On Supervisor Engine 6E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948-E, shaping and sharing always use Ethernet ARPA length to which 20 bytes of IPv6 overhead is always added for policing. However, only Layer 2 length including VLAN tag overhead is considered.

#### Note

The given length is included when policing all IP packets irrespective of the encapsulation with which it was received. When `qos account layer2 encapsulation isl` is configured, a fixed length of 48 bytes is included when policing all IP packets, not only those IP packets that are received with ISL encapsulation.

Sharing and shaping use the length that is specified in the Layer 2 headers.

### Examples

This example shows how to include an additional 18 bytes when policing IP packets:

```
Switch# config terminal
Switch(config)# qos account layer2 encapsulation length 18
Switch (config)# end
Switch#
```

This example shows how to disable the consistent accounting of the Layer 2 encapsulation by the QoS features:

```
Switch# config terminal
Switch(config)# no qos account layer2 encapsulation
Switch (config)# end
Switch #
```

<table>

</tbody>
</table>
qos trust

To set the trusted state of an interface (for example, whether the packets arriving at an interface are trusted to carry the correct CoS, ToS, and DSCP classifications), use the `qos trust` command. To set an interface to the untrusted state, use the `no` form of this command.

```
qos trust {cos | device cisco-phone | dscp | extend [cos priority]}

no qos trust {cos | device cisco-phone | dscp | extend [cos priority]}
```

### Syntax Description

- **cos**
  Specifies that the CoS bits in incoming frames are trusted and derives the internal DSCP value from the CoS bits.

- **device cisco-phone**
  Specifies the Cisco IP phone as the trust device for a port.

- **dscp**
  Specifies that the ToS bits in the incoming packets contain a DSCP value.

- **extend**
  Specifies to extend the trust to Port VLAN ID (PVID) packets coming from the PC.

- **cos priority**
  (Optional) Specifies that the CoS priority value is set to PVID packets; valid values are from 0 to 7.

### Defaults

The default settings are as follows:

- If global QoS is enabled, trust is disabled on the port.
- If global QoS is disabled, trust DSCP is enabled on the port.
- The CoS priority level is 0.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for extending trust for voice was added.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for trust device Cisco IP phone was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

You can only configure the trusted state on physical LAN interfaces.

By default, the trust state of an interface when QoS is enabled is untrusted; when QoS is disabled on the interface, the trust state is reset to trust DSCP.

When the interface trust state is `qos trust cos`, the transmit CoS is always the incoming packet CoS (or the default CoS for the interface, if the packet is not tagged).

When the interface trust state is not `qos trust dscp`, the security and QoS ACL classification will always use the interface DSCP and not the incoming packet DSCP.
Trusted boundary should not be configured on the ports that are part of an EtherChannel (that is, a port channel).

### Examples

This example shows how to set the trusted state of an interface to CoS:

```
Switch(config-if)# qos trust cos
Switch(config-if)#
```

This example shows how to set the trusted state of an interface to DSCP:

```
Switch(config-if)# qos trust dscp
Switch(config-if)#
```

This example shows how to set the PVID CoS level to 6:

```
Switch(config-if)# qos trust extend cos 6
Switch(config-if)#
```

This example shows how to set the Cisco phone as the trust device:

```
Switch(config-if)# qos trust device cisco-phone
Switch(config-if)#
```

### Related Commands

</tbody>
</table>
queue-limit

To specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map, use the `queue-limit` command. To remove the queue packet limit from a class, use the `no` form of this command.

```
queue-limit number-of-packets

no queue-limit number-of-packets
```

**Syntax Description**

| number-of-packets | Number of packets that the queue for this class can accumulate; valid range is 16 to 8184. This number must be a multiple of 8. |

**Defaults**

By default, each physical interface on a Catalyst 4500 switch has a default queue based on the number of slots in a chassis and the number of ports on the linecards.

**Command Modes**

QoS policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This class-based queuing (CBQ) command applies only to the Supervisor Engine 6-E as part of the MQC support on the Catalyst 4500 Supervisor Engine.

By default, each physical interface on a Catalyst 4500 switch comes up with a default queue. The size of this queue is based on the number of slots in a chassis as well as the number of ports on the line card in each slot. The switch supports 512K queue entries of which 100 K are set aside as a common sharable pool. The remaining 412 K entries are equally distributed among the slots. Each slot further divides its allocated queue entries equally among its ports.

CBQ creates a queue for every class for which a class map is defined. Packets satisfying the match criterion for a class accumulate in the queue reserved for the class until they are sent, which occurs when the queue is serviced by the fair queuing process. When the maximum packet threshold you defined for the class is reached, queuing of any further packets to the class queue causes tail drop or, if DBL is configured for the class policy, packet drop to take effect.

**Note**

The `queue-limit` command is supported only after you first configure a scheduling action, such as bandwidth, or priority, except when you configure `queue-limit` in the class-default class of an output QoS policy-map.s
This example shows how to configure a policy-map called policy11 to contain policy for a class called acl203. Policy for this class is set so that the queue reserved for it has a maximum packet limit of 40:

Switch# configure terminal
Switch (config)# policy-map policy11
Switch (config-pmap)# class acl203
Switch (config-pmap-c)# bandwidth 2000
Switch (config-pmap-c)# queue-limit 40
Switch (config-pmap-c)# end
Switch#

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bandwidth</strong></td>
<td>Specifies or modifies the minimum bandwidth provided to a class belonging to a policy map attached to a physical port.</td>
</tr>
<tr>
<td><strong>class</strong></td>
<td>Specifies the name of the class whose traffic policy you want to create or change.</td>
</tr>
<tr>
<td><strong>policy-map</strong></td>
<td>Creates or modifies a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>shape (class-based queueing)</strong></td>
<td>Enables traffic shaping a class of traffic in a policy map attached to a physical port.</td>
</tr>
</tbody>
</table>
redundancy

To enter the redundancy configuration mode, use the `redundancy` command in the global configuration mode.

```
redundancy
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R and 4510R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The redundancy configuration mode is used to enter the main CPU submode.

To enter the main CPU submode, use the `main-cpu` command in the redundancy configuration mode.

The main CPU submode is used to manually synchronize the configurations on the two supervisor engines.

From the main CPU submode, use the `auto-sync` command to enable automatic synchronization of the configuration files in NVRAM.

Use the `no` command to disable redundancy. If you disable redundancy, then reenable redundancy, the switch returns to default redundancy settings.

Use the `exit` command to exit the redundancy configuration mode.

**Examples**

This example shows how to enter redundancy mode:

```
Switch(config)# redundancy
Switch(config-red)#
```

This example shows how to enter the main CPU submode:

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)#
```

**Related Commands**

</tr>
</tbody>
</table>
redundancy config-sync mismatched-commands

To move the active supervisor engine into the Mismatched Command List (MCL) and resets the standby supervisor engine, use the `redundancy config-sync mismatched-commands` command.

If your active and standby supervisors engines are running different versions of Cisco IOS, some of their CLIs will not be compatible. If such commands are already present in the running configuration of the active supervisor engine and the syntax-check for the command fails at the standby supervisor engine while it is booting, you must move the active supervisor engine into the Mismatched Command List (MCL).

```
redundancy config-sync {ignore | validate} mismatched-commands
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignore</td>
<td>Ignore the mismatched command list.</td>
</tr>
<tr>
<td>validate</td>
<td>Revalidate the mismatched command list with the modified running-configuration.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(44)SG</td>
<td>Updated command name from <code>issu config-sync</code> to <code>redundancy config-sync</code>.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following is a log entry example for mismatched commands:

```
00:06:31: Config Sync: Bulk-sync failure due to Servicing Incompatibility. Please check full list of mismatched commands via:
  show redundancy config-sync failures mcl
00:06:31: Config Sync: Starting lines from MCL file:
  interface GigabitEthernet7/7
  ! <submode> "interface"
  - ip address 11.0.0.1 255.0.0.0
  ! </submode> "interface"
```

To display all mismatched commands, use the `show redundancy config-sync failures mcl` command.

To clean the MCL, remove all mismatched commands from the active supervisor engine’s running configuration, revalidate the MCL with a modified running configuration using the `redundancy config-sync validate mismatched-commands` command, then reload the standby supervisor engine.

You could also ignore the MCL by entering the `redundancy config-sync ignore mismatched-commands` command and reloading the standby supervisor engine; the system changes to SSO mode.
Note

If you ignore the mismatched commands, the out-of-sync configuration at the active supervisor engine and the standby supervisor engine still exists.

You can verify the ignored MCL with the `show redundancy config-sync ignored mcl` command.

If SSO mode cannot be established between the active and standby supervisor engines because of an incompatibility in the configuration file, a mismatched command list (MCL) is generated at the active supervisor engine and a reload into RPR mode is forced for the standby supervisor engine. Subsequent attempts to establish SSO, after removing the offending configuration and rebooting the standby supervisor engine with the exact same image, might cause the C4K_REDUNDANCY-2-IOS_VERSION_CHECK_FAIL and ISSU-3-PEER_IMAGE_INCOMPATIBLE messages to appear because the peer image is listed as incompatible. If the configuration problem can be corrected, you can clear the peer image from the incompatible list with the `redundancy config-sync ignore mismatched-commands` EXEC command while the peer is in a standby cold (RPR) state. This action allows the standby supervisor engine to boot in standby hot (SSO) state when it reloads.

Examples

This example shows how to validate removal of entries from the MCL:

```
Switch# redundancy config-sync validate mismatched-commands
Switch#
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>

</table>
**redundancy force-switchover**

To force a switchover from the active to the standby supervisor engine, use the `redundancy force-switchover` command.

```
redundancy force-switchover
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch</td>
</tr>
<tr>
<td></td>
<td>(Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before using this command, refer to the “Performing a Software Upgrade” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional information.

The `redundancy force-switchover` command conducts a manual switchover to the redundant supervisor engine. The redundant supervisor engine becomes the new active supervisor engine running the Cisco IOS image. The modules are reset.

The old active supervisor engine reboots with the new image and becomes the standby supervisor engine.

**Examples**

This example shows how to switch over manually from the active to the standby supervisor engine:

```
Switch# redundancy force-switchover
Switch#
```

**Related Commands**

<table>

</table>
**redundancy reload**

To force a reload of one or both supervisor engines, use the `redundancy reload` command.

```
redundancy reload {peer | shelf}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer</td>
<td>Reloads the peer unit.</td>
</tr>
<tr>
<td>shelf</td>
<td>Reboots both supervisor engines.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before using this command, refer to the “Performing a Software Upgrade” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional information.

The `redundancy reload shelf` command conducts a reboot of both supervisor engines. The modules are reset.

**Examples**

This example shows how to manually reload one or both supervisor engines:

```
Switch# redundancy reload shelf
Switch#
```

**Related Commands**

<table>
<thead>
<tr>

remote login module

To remotely connect to a specific module, use the `remote login module` configuration command.

```
remote login module mod
```

**Syntax Description**

| mod | Target module for the command. |

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies only to the Access Gateway Module on Catalyst 4500 series switches.

The valid values for `mod` depend on the chassis used. For example, if you have a Catalyst 4506 chassis, valid values for the module are from 2 to 6. If you have a 4507R chassis, valid values are from 3 to 7.

When you execute the `remote login module mod` command, the prompt changes to Gateway#.

The `remote login module` command is identical to the `session module mod` and the `attach module mod` commands.

**Examples**

This example shows how to remotely log in to the Access Gateway Module:

```
Switch# remote login module 5
Attaching console to module 5
Type 'exit' at the remote prompt to end the session

Gateway>
```

**Related Commands**

renew ip dhcp snooping database

To renew the DHCP binding database, use the `renew ip dhcp snooping database` command.

```
renew ip dhcp snooping database [validation none] [url]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validation none</td>
<td>(Optional) Specifies that the checksum associated with the contents of the file specified by the URL is not verified.</td>
</tr>
<tr>
<td>url</td>
<td>(Optional) Specifies the file from which the read is performed.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If the URL is not provided, the switch tries to read the file from the configured URL.

### Examples

This example shows how to renew the DHCP binding database while bypassing the CRC checks:

```
Switch# renew ip dhcp snooping database validation none
Switch#
```

<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the VLAN does not already exist, this command does not create the VLAN.

To avoid the delay introduced by relaying messages in software for link-failure or VLAN-blocking notification during load balancing, REP floods packets at the hardware flood layer (HFL) to a regular multicast address. These messages are flooded to the whole network, not just the REP segment. Switches that do not belong to the segment treat them as data traffic. Configuring an administrative VLAN for the whole domain can control flooding of these messages.

If no REP administrative VLAN is configured, the default is VLAN 1.

There can be only one administrative VLAN on a switch and on a segment.

The administrative VLAN cannot be the RSPAN VLAN.

**Examples**

This example shows how to configure VLAN 100 as the REP administrative VLAN:

```
Switch(config)# rep admin vlan 100
```

You can verify your settings by entering the **show interface rep detail** privileged EXEC command.

**Related Commands**

rep block port

Use the rep block port interface configuration command on the REP primary edge port to configure Resilient Ethernet Protocol (REP) VLAN load balancing. Use the no form of this command to return to the default configuration.

```
rep block port {id port-id | neighbor_offset | preferred} vlan {vlan-list | all}
no rep block port {id port-id | neighbor_offset | preferred}
```

**Syntax Description**

- **id port-id**: Identify the VLAN blocking alternate port by entering the unique port ID that is automatically generated when REP is enabled. The REP port ID is a 16-character hexadecimal value. You can view the port ID for an interface by entering the `show interface interface-id rep detail` command.

- **neighbor_offset**: Identify the VLAN blocking alternate port by entering the offset number of a neighbor. The range is −256 to +256; a value of 0 is invalid. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers identify the secondary edge port (offset number -1) and its downstream neighbors.

- **preferred**: Identify the VLAN blocking alternate port as the segment port on which you entered the `rep segment segment-id preferred` interface configuration command.

  **Note**  Entering the preferred keyword does not ensure that the preferred port is the alternate port; it gives it preference over other similar ports.

- **vlan**: Identify the VLANs to be blocked.

  - **vlan-list**: Enter a VLAN ID from 1 to 4094 or a range or sequence of VLANs (such as 1-3, 22, 41-44) of VLANs to be blocked.

  - **all**: Enter to block all VLANs.

**Defaults**

The default behavior after you enter the rep preempt segment privileged EXEC command (for manual preemption) is to block all VLANs at the primary edge port. This behavior remains until you configure the `rep block port` command.

If the primary edge port cannot determine which port is to be the alternate port, the default action is no preemption and no VLAN load balancing.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter this command on the REP primary edge port.
When you select an alternate port by entering an offset number, this number identifies the downstream neighbor port of an edge port. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers identify the secondary edge port (offset number -1) and its downstream neighbors. See Neighbor Offset Numbers in a REP Segment.

Figure 2-2: Neighbor Offset Numbers in a REP Segment

![Diagram showing neighbor offset numbers in a REP segment]

You would never enter an offset value of 1 because that is the offset number of the primary edge port itself.

If you have configured a preempt delay time by entering the `rep preempt delay seconds` interface configuration command and a link failure and recovery occurs, VLAN load balancing begins after the configured preemption time period elapses without another link failure. The alternate port specified in the load-balancing configuration blocks the configured VLANs and unblocks all other segment ports. If the primary edge port cannot determine the alternate port for VLAN balancing, the default action is no preemption.

Each port in a segment has a unique port ID. The port ID format is similar to the one used by the spanning tree algorithm: a port number (unique on the bridge) associated to a MAC address (unique in the network). To determine the port ID of a port, enter the `show interface interface-id rep detail` privileged EXEC command.

There is no limit to the number of times that you can enter the `rep block port id port-id vlan vlan-list` interface configuration command. You can block an unlimited number, range, or sequence of VLANs.

When you use the `rep block port id port-id vlan vlan-list` interface configuration command on a REP primary edge port to block a VLAN list and then use the same command to block another VLAN list on the same port, the second VLAN list does not replace the first VLAN list but is appended to the first VLAN list.

When you use the `rep block port id port-id vlan vlan-list` interface configuration command on a REP primary edge port to block a VLAN list on one port and then use the same command to block another VLAN list on another port, the original port number and VLAN list are overwritten.
Examples

This example shows how to configure REP VLAN load balancing on the Switch B primary edge port (Gigabit Ethernet port 1/0/1) and to configure Gigabit Ethernet port 1/1 of Switch A as the alternate port to block VLANs 1 to 100. The alternate port is identified by its port ID, shown in bold in the output of the show interface rep detail command for the Switch A port.

Switch A# show interface gigabitethernet1/1 rep detail
GigabitEthernet1/1 REP enabled
Segment-id: 2 (Segment)
PortID: 0080001647FB1780

rep lsl-age-timer

Use the `rep lsl-age-timer` interface configuration command on a Resilient Ethernet Protocol (REP) port to configure the Link Status Layer (LSL) age timer for the time period that the REP interface remains up without receiving a hello from the REP neighbor. Use the `no` form of this command to return to the default time.

```
rep lsl-age timer value

no rep lsl-age timer
```

**Syntax Description**

| value | The age-out time in milliseconds. The range is from 120 to 10000 ms in 40-ms increments. The default is 5000 ms (5 seconds). |

**Defaults**

The REP link shuts down if it does not receive a hello message from a neighbor within 5000 ms.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The LSL hello timer is set to the age-timer value divided by 3 so that there should be at least two LSL hellos sent during the LSL age-timer period. If no hellos are received within that time, the REP link shuts down.

In Cisco IOS Release 12.2(52)SE, the LSL age-timer range changed from 3000 to 10000 ms in 500-ms increments to 120 to 10000 ms in 40-ms increments. If the REP neighbor device is not running Cisco IOS Release 12.2(52)SE or later, you must use the shorter time range because the device does not accept values out of the earlier range.

EtherChannel port channel interfaces do not support LSL age-timer values less than 1000 ms. If you try to configure a value less than 1000 ms on a port channel, you receive an error message and the command is rejected.

**Examples**

This example shows how to configure the REP LSL age timer on a REP link to 7000 ms:

```
Switch(config)# interface GigabitEthernet1/1
Switch(config-if)# rep lsl-age-timer 7000
Switch(config-if)# exit
```

You can verify the configured ageout time by entering the `show interfaces rep detail` privileged EXEC command.

**rep preempt delay**

Use the `rep preempt delay` interface configuration command on the REP primary edge port to configure a waiting period after a segment port failure and recovery before Resilient Ethernet Protocol (REP) VLAN load balancing is triggered. Use the `no` form of this command to remove the configured delay.

```
rep preempt delay seconds

no rep preempt delay
```

**Syntax Description**

- **seconds**
  
  Set the number of seconds to delay REP preemption. The range is 15 to 300.

**Defaults**

No preemption delay is set. If you do not enter the `rep preempt delay` command, the default is manual preemption with no delay.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter this command on the REP primary edge port.

You must enter this command and configure a preempt time delay if you want VLAN load balancing to automatically trigger after a link failure and recovery.

If VLAN load balancing is configured, after a segment port failure and recovery, the REP primary edge port starts a delay timer before VLAN load balancing occurs. Note that the timer restarts after each link failure. When the timer expires, the REP primary edge alerts the alternate port to perform VLAN load balancing (configured by using the `rep block port` interface configuration command) and prepares the segment for the new topology. The configured VLAN list is blocked at the alternate port, and all other VLANs are blocked at the primary edge port.

Do not configure VLAN load balancing on an interface that carries Ethernet over multiprotocol label switching (EoMPLS) traffic. VLAN load balancing across the REP ring might cause some of the EoMPLS traffic to not be forwarded.

**Examples**

This example shows how to configure REP preemption time delay of 100 seconds on the primary edge port:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# rep preempt delay 100
Switch(config-if)# exit
```

You can verify your settings by entering the `show interfaces rep` privileged EXEC command.
### Related Commands

rep preempt segment

Use the rep preempt segment privileged EXEC command to manually start Resilient Ethernet Protocol (REP) VLAN load balancing on a segment.

rep preempt segment segment_id

Syntax Description

<table>
<thead>
<tr>
<th>segment-id</th>
<th>ID of the REP segment. The range is from 1 to 1024.</th>
</tr>
</thead>
</table>

Defaults

Manual preemption is the default behavior.

Command Modes

Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

When you enter the rep preempt segment segment-id command, a confirmation message appears before the command is executed because preemption can cause network disruption.

Enter this command on the switch on the segment that has the primary edge port.

If you do not configure VLAN load balancing, entering this command results in the default behavior—the primary edge port blocks all VLANs.

You configure VLAN load balancing by entering the rep block port {id port-id | neighbor_offset | preferred} vlan {vlan-list | all} interface configuration command on the REP primary edge port before you manually start preemption.

There is not a no version of this command.

Examples

This example shows how to manually trigger REP preemption on segment 100 with the confirmation message:

```
Switch)# rep preempt segment 100
The command will cause a momentary traffic disruption.
Do you still want to continue? [confirm]
```

Related Commands

<tr>
<td>show interfaces rep [detail]</td>
<td>Displays REP configuration and status for all interfaces or the specified interface.</td>
</tr>
</tbody>
</table>
rep segment

Use the `rep segment` interface configuration command to enable Resilient Ethernet Protocol (REP) on the interface and to assign a segment ID to it. Use the `no` form of this command to disable REP on the interface.

```
rep segment segment-id [edge [no-neighbor] [primary]] [preferred]
no rep segment
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>segment-id</code></td>
<td>Assign a segment ID to the interface. The range is from 1 to 1024.</td>
</tr>
<tr>
<td><code>edge</code></td>
<td>(Optional) Identify the interface as one of the two REP edge ports. Entering the <code>edge</code> keyword without the <code>primary</code> keyword configures the port as the secondary edge port.</td>
</tr>
<tr>
<td><code>no-neighbor</code></td>
<td>(Optional) Configure a segment edge with no external REP neighbor.</td>
</tr>
<tr>
<td><code>primary</code></td>
<td>(Optional) On an edge port, specify that the port is the primary edge port. A segment has only one primary edge port. If you configure two ports in a segment as the primary edge port, for example ports on different switches, the REP selects one of them to serve as the segment primary edge port.</td>
</tr>
<tr>
<td><code>preferred</code></td>
<td>(Optional) Specify that the port is the preferred alternate port or the preferred port for VLAN load balancing.</td>
</tr>
</tbody>
</table>

**Note** Configuring a port as preferred does not guarantee that it becomes the alternate port; it merely gives it a slight edge among equal contenders. The alternate port is usually a previously failed port.

### Defaults

REP is disabled on the interface.

When REP is enabled on an interface, the default is for the port to be a regular segment port.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>15(02)SG</td>
<td>The <code>no-neighbor</code> keyword was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

REP ports must be Layer 2 trunk ports. A non-ES REP port can be either an IEEE 802.1Q trunk port or an ISL trunk port.

REP ports should not be configured as one of these port types:
- SPAN destination port
- Private VLAN port
• Tunnel port
• Access port

You must configure two edge ports on each REP segment, a primary edge port and a port to act as a secondary edge port. If you configure two ports in a segment as the primary edge port, for example ports on different switches, the configuration is allowed, but the REP selects one of them to serve as the segment primary edge port.

REP is supported on EtherChannels, but not on an individual port that belongs to an EtherChannel.

• REP ports follow these rules:
  – There is no limit to the number of REP ports on a switch; however, only two ports on a switch can belong to the same REP segment.
  – If only one port on a switch is configured in a segment, the port should be an edge port.
  – If two ports on a switch belong to the same segment, they must be both edge ports, both regular segment ports, or one regular port and one edge no-neighbor port. An edge port and regular segment port on a switch cannot belong to the same segment.
  – If two ports on a switch belong to the same segment and one is configured as an edge port and one as a regular segment port (a misconfiguration), the edge port is treated as a regular segment port.

If you configure two ports in a segment as the primary edge port, for example ports on different switches, the REP selects one of them to serve as the segment primary edge port. Enter the show rep topology privileged EXEC command on a port in the segment to verify which port is the segment primary edge port.

REP interfaces come up in a blocked state and remain in a blocked state until notified that it is safe to unblock. You need to be aware of this to avoid sudden connection losses.

You should configure REP only in networks with redundancy. Configuring REP in a network without redundancy causes loss of connectivity.

In networks where ports on a neighboring switch do not support REP, you can configure the non-REP facing ports as edge no-neighbor ports. These ports inherit all properties of edge ports and you can configure them as any other edge port, including to send STP or REP topology change notices to the aggregation switch. In this case, the STP topology change notice (TCN) that is sent is a multiple spanning-tree (MST) STP message.

### Examples

This example shows how to enable REP on a regular (nonedge) segment port:

Switch (config)# interface gigabitethernet1/0/1
Switch (config-if)# rep segment 100

This example shows how to enable REP on a port and identify the port as the REP primary edge port:

Switch (config)# interface gigabitethernet1/1
Switch (config-if)# rep segment 100 edge primary

This example shows how to configure the same configuration when the interface has no external REP neighbor:

Switch# configure terminal
Switch (config)# interface gigabitethernet1/1
Switch (config-if)# rep segment 100 edge no-neighbor primary
This example shows how to enable REP on a port and identify the port as the REP secondary edge port:

```
Switch (config)# interface GigabitEthernet1/1
Switch (config-if)# rep segment 100 edge
```

You can verify your settings by entering the `show interfaces rep` privileged EXEC command. To verify which port in the segment is the primary edge port, enter the `show rep topology` privileged EXEC command.

rep stcn

Use the `rep stcn` interface configuration command on a Resilient Ethernet Protocol (REP) edge port to configure the port to send REP segment topology change notifications (STCNs) to another interface, to other segments, or to Spanning Tree Protocol (STP) networks. Use the `no` form of this command to disable the sending of STCNs to the interface, segment, or STP network.

```
rep stcn {interface interface-id | segment id-list | stp}
```

```
no rep stcn {interface | segment | stp}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface</code></td>
<td>Identify a physical interface or port channel to receive STCNs.</td>
</tr>
<tr>
<td><code>segment</code></td>
<td>Identify one REP segment or list of segments to receive STCNs. The range is 1</td>
</tr>
<tr>
<td></td>
<td>to 1024. You can also configure a sequence of segments (for example 3-5, 77, 100).</td>
</tr>
<tr>
<td><code>stp</code></td>
<td>Send STCNs to an STP network.</td>
</tr>
</tbody>
</table>

**Defaults**

Transmission of STCNs to other interfaces, segments, or STP networks is disabled.

**Command Modes**

Interface configuration

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter this command on a segment edge port.

You use this command to notify other portions of the Layer 2 network of topology changes that occur in the local REP segment. This removes obsolete entries in the Layer 2 forwarding table in other parts of the network, which allows faster network convergence.

**Examples**

This example shows how to configure a REP edge port to send STCNs to segments 25 to 50:

Switch (config)# interface GigabitEthernet1/1
Switch (config-if)# rep stcn segment 25-50
Switch (config-if)# exit

You can verify your settings by entering the `show interfaces rep detail` privileged EXEC command.
## Related Commands

reset

To leave the proposed new VLAN database but remain in VLAN configuration mode and reset the proposed new database to be identical to the VLAN database currently implemented, use the `reset` command.

```
reset
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to reset the proposed new VLAN database to the current VLAN database:

```
Switch(vlan-config)# reset
RESET completed.
Switch(vlan-config)#
```
## revision

To set the MST configuration revision number, use the **revision** command. To return to the default settings, use the **no** form of this command.

```
revision version

no revision
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>Configuration revision number; valid values are from 0 to 65535.</td>
</tr>
</tbody>
</table>

### Defaults

Revision version is set to 0.

### Command Modes

MST configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If two Catalyst 4500 series switches have the same configuration but have different configuration revision numbers, they are considered to be part of two different regions.

**Caution**

Be careful when using the **revision** command to set the MST configuration revision number because a mistake can put the switch in a different region.

### Examples

This example shows how to set the configuration revision number:

```
Switch(config-mst)# revision 5
Switch(config-mst)#
```

sampler (netflow-lite monitor submode)

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To activate sampling on an interface in netflow-lite monitor submode, use the `sampler` command. To delete a sampler, use the `no` form of this command.

```
sampler sampler-name

no sampler sampler-name
```

Syntax Description
- `sampler-name` Specifies a sampler.

Defaults
None

Command Modes
- netflow-lite exporter submode

Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines
You can enter this command under the physical port interface mode, port channel interface, or config VLAN mode.

Examples
The following example shows how to configure a monitor on a port interface Gigabit 1/3:

```
Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)# exit
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
  Netflow-lite Monitor-1:
    Sampler: sampler1
    Exporter: exporter1
    Average Packet Size: 128
  Statistics:
    Packets exported: 0
    Packets observed: 0
    Packets dropped: 0
```
You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>average-packet-size</code> (netflow-lite monitor submode)</td>
<td>Specifies the average packet size at the observation point.</td>
</tr>
<tr>
<td><code>exporter</code> (netflow-lite monitor submode)</td>
<td>Assigns an exporter in netflow-lite monitor submode.</td>
</tr>
</tbody>
</table>
service-policy (interface configuration)

To attach a policy map to an interface or to apply different QoS policies on VLANs that an interface belongs to, use the `service-policy` command. To remove a policy map from an interface, use the `no` form of this command.

```
  service-policy {input | output} policy-map name
  no service-policy {input | output} policy-map name
```

**Syntax Description**
- `input` Specifies the input policy maps.
- `output` Specifies the output policy maps.
- `policy-map name` Name of a previously configured policy map.

**Defaults**
A policy map is not attached to an interface or a VLAN.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for applying different QoS policies on VLANs was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan-range` command, you can use the `service-policy` command to specify different QoS policies on different VLANs.

**Note**
This capability is restricted to Layer 2 interfaces.

You can apply a service policy under an interface as well as a VLAN range at the same time. However, this is allowed only when the interface policy has only queuing actions whereas a VLAN has only non-queuing actions (QoS marking and/or policing) actions.

To attach a service policy to a VLAN, the VLAN configuration mode has to be used.

**Examples**

This example shows how to attach a policy map to Fast Ethernet interface 5/20:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/20
Switch(config-if)# service-policy input pmap1
Switch(config-if)# end
```
This example shows how to apply policy map p1 for traffic in VLANs 20 and 400, and policy map p2 for traffic in VLANs 300 through 301:

Switch# configure terminal
Switch(config)# interface gigabitEthernet 6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan-range 20,400
Switch(config-if-vlan-range)# service-policy input p1
Switch(config-if-vlan-range)# exit
Switch(config-if)# vlan-range 300-301
Switch(config-if-vlan-range)# service-policy output p2
Switch(config-if-vlan-range)# end
Switch# show policy-map interface gigabitEthernet 6/1 vlan 20
GigabitEthernet6/1 vlan 20
Service-policy input: p1
   Class-map: class-default (match-any)
      0 packets
      Match: any
         0 packets
      police: Per-interface
         Conform: 0 bytes Exceed: 0 bytes

Switch# show policy-map interface gigabitEthernet 6/1 vlan 20
GigabitEthernet6/1 vlan 300
Service-policy output: p2
   Class-map: class-default (match-any)
      0 packets
      Match: any
         0 packets
      police: Per-interface
         Conform: 0 bytes Exceed: 0 bytes

GigabitEthernet6/1 vlan 301
Service-policy output: p2
   Class-map: class-default (match-any)
      0 packets
      Match: any
         0 packets
      police: Per-interface
         Conform: 0 bytes Exceed: 0 bytes

GigabitEthernet6/1 vlan 400
Service-policy input: p1

Class-map: class-default (match-any)
  0 packets
  Match: any
  0 packets
  police: Per-interface
  Conform: 0 bytes Exceed: 0 bytes

This example shows how to attach a policy map to a VLAN using a Supervisor Engine 6-E:

Switch# configure terminal
Switch(config)#vlan configuration 20
Switch(config-vlan-config)#service-policy out policy-vlan
Switch(config-vlan-config)#end
Switch#

service-policy (policy-map class)

To create a service policy that is a quality of service (QoS) policy within a policy map (called a hierarchical service policy), use the `service-policy` policy-map class configuration command. To disable the service policy within a policy map, use the `no` form of this command.

```
service-policy policy-map-name

no service-policy policy-map-name
```

**Syntax Description**

- **policy-map-name**: Name of the policy map.

**Defaults**

No service policies maps are defined.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `service-policy` command only in a hierarchical policy map attached to a physical port. This command is valid in policy maps at level two of the hierarchy.

You can create a hierarchy by having the parent policy map specify marking and/or policing actions and having the child policy map specify the queueing actions.

If you enter this command in policy-map class configuration mode, you return to policy-map configuration mode by using the `exit` command. To return to privileged EXEC mode, use the `end` command.

**Examples**

This example shows how to create a hierarchical service policy in the service policy called “parent”:

```
Switch# configure terminal
Switch(config)# policy-map child
Switch(config-pmap)# class voice
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map parent
Switch(config-pmap)# class class1
Switch(config-pmap-c)# police 32k
Switch(config-pmap-c)# service-policy child
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

service-policy input (control-plane)

To attach a policy map to a control plane for aggregate control plane services, use the **service-policy input** command. Use the **no** form of this command to remove a service policy from a control plane.

**service-policy input policy-map-name**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Applies the specified service policy to the packets that are entering the control plane.</td>
</tr>
<tr>
<td>policy-map-name</td>
<td>Name of a service policy map (created using the <strong>policy-map</strong> command) to be attached.</td>
</tr>
</tbody>
</table>

**Defaults**

No service policy is specified.

**Command Modes**

Control-plane configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In this release, the only policy-map accepted on the control-plane is system-cpp-policy. It is already attached to the control-plane at start up. If not (due to some error conditions), it is recommended to use the **global macro system-cpp** command to attach it to the control-plane. The system-cpp-policy created by the system contains system predefined classes. For these predefined classes, you can change the policing parameters but you should not make any other change to the classes.

You can define your own class-maps and append them to the end of the system-cpp-policy policy-map.

**Examples**

This example shows how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specified rate:

```plaintext
Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet
  ! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet
  ! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet
  ! Define class-map "telnet-class."
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)#
Switch(config)# policy-map control-plane-policy
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 80000 conform transmit exceed drop
Switch(config-pmap-c)#
Switch(config-pmap-c)#
Switch(config-pmap-c)#
  ! Define aggregate control plane service for the active Route Processor.
```
Service-policy input (control-plane)

Switch(config)# control-plane
Switch(config-cp)# service-policy input control-plane-policy
Switch(config-cp)# exit

session module

**Note**
This command is only supported in SSO mode and does not work in RPR mode.

To log in to the standby supervisor engine using a virtual console, use the `session module` configuration command.

`session module mod`

**Syntax Description**

<table>
<thead>
<tr>
<th><code>mod</code></th>
<th>Target module for the command.</th>
</tr>
</thead>
</table>

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Catalyst 4500 series switches can be configured with two supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. Therefore, you must connect to the standby console to access, monitor or debug the standby supervisor.

The virtual console for the standby supervisor engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine and emulates the standby console on the active supervisor engine. Only one active standby console session is active at any time.

The virtual console for the standby supervisor engine allows users who are logged onto the active supervisor engine to remotely execute show commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the `attach module`, `session module`, or `remote login` commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

**Note**
The `session module` command is identical to the `attach module mod` and the `remote login module mod` commands.
Once you enter the standby virtual console, the terminal prompt automatically changes to
hostname-standby-console#, where hostname is the configured name of the switch. The prompt is
restored back to the original prompt when you exit the virtual console.

You exit the virtual console with the exit or quit commands. When the inactivity period of the terminal
on the active supervisor engine where you logged in exceeds the configured idle time, you are
automatically logged out of the terminal on the active supervisor engine. In such a case, the virtual
console session is also terminated. Virtual console session is also automatically terminated when the
standby is rebooted. After the standby boots up, you need to create another virtual console session.

The following limitations apply to the standby virtual console:

- All commands on the virtual console run to completion. It does not provide the auto-more feature;
it behaves as if the terminal length 0 command has been executed. It is also non-interactive.
  Therefore, a running command cannot be interrupted or aborted by any key sequence on the active
  supervisor engine. If a command produces considerable output, the virtual console displays it on the
  supervisor screen.

- The virtual console is non-interactive. Because the virtual console does not detect the interactive
  nature of a command, any command that requires user interaction causes the virtual console to wait
  until the RPC timer aborts the command.

- The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60
  seconds. During this time, you cannot abort the command from the keyboard. You must wait for the
  timer to expire before you continue.

- You cannot use virtual console to view debug and syslog messages that are being displayed on the
  standby supervisor engine. The virtual console only displays the output of commands that are
  executed from the virtual console. Other information that is displayed on the real standby console
do not appear on the virtual console.

Examples

To log in to the standby supervisor engine using a virtual console, do the following:

Switch# session module 2
Connecting to standby virtual console
Type 'exit' or 'quit' to end this session

Switch-standby-console# exit
Switch#

If the standby console is not enabled, the following message appears:

Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout

**set**

To mark IP traffic by setting a class of service (CoS), a Differentiated Services Code Point (DSCP), or IP-precedence in the packet, use the `set` policy-map class configuration command. To remove the traffic classification, use the `no` form of this command.

```
set {cos new-cos | [ip] [dscp new-dscp | precedence new-precedence] | qos group value}
```

```
no set cos new-cos | [ip] [dscp new-dscp | precedence new-precedence] | qos group value}
```

**Syntax Description**

- **cos new-cos**
  - New CoS value assigned to the classified traffic. The range is 0 to 7.

- **ip dscp new-dscp**
  - New DSCP value assigned to the classified traffic. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value. The specified value sets the type of service (ToS) traffic class byte in the IPv4/IPv6 packet header.

- **ip precedence new-precedence**
  - New IP-precedence value assigned to the classified traffic. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value. The specified value sets the precedence bit in the IP header.

- **qos group value**
  - Internal QoS group assigned to a classified packet on ingress to an interface.

**Defaults**

No marking is enabled on packets.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `set` command only in class-level classes.

The `set dscp new-dscp` and the `set precedence new-precedence` commands are the same as the `set ip dscp new-dscp` and the `set ip precedence new-precedence` commands.

For the `set dscp new-dscp` or the `set precedence new-precedence` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `set dscp af11` command, which is the same as entering the `set dscp 10` command. You can enter the `set precedence critical` command, which is the same as entering the `set precedence 5` command. For a list of supported mnemonics, enter the `set dscp ?` or the `set precedence ?` command to see the command-line help strings.

You can configure the `set cos new-cos`, `set dscp new-dscp`, or `set precedence new-precedence` command in an ingress and an egress policy map attached to an interface or VLAN.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.
Examples

This example shows how to create a policy map called p1 with CoS values assigned to different traffic types. Class maps for voice and video-data have already been created.

Switch# configure terminal
Switch(config)# policy-map p1
Switch(config-pmap)# class voice
Switch(config-pmap-c)# set cos 1
Switch(config-pmap)# exit
Switch(config-pmap)# class video-data
Switch(config-pmap-c)# set cos 2
Switch(config-pmap)# exit
Switch#

You can verify your settings by entering the `show policy-map` privileged EXEC command.

</tr>
<tr>
<td>table-map-name</td>
<td>(Optional) Name of the table map used to specify the CoS value. The table map name can be a maximum of 64 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

No CoS value is set for the outgoing packet.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support was introduced on Supervisor Engine 6E and Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The set cos command can be used in an ingress as well as an egress policy map attached to an interface or VLAN.

You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the CoS value. The “from-field” packet-marking categories are as follows:

- Precedence
- Differentiated services code point (DSCP)
- Cost of Service (CoS)
- Quality of Service (QoS) group
If you specify a “from-field” category but do not specify the `table` keyword and the applicable `table-map-name` argument, the default action will be to copy the value associated with the “from-field” category as the CoS value. For instance, if you configure the `set cos precedence` command, the precedence value will be copied and used as the CoS value.

You can do the same for the DSCP marking category. That is, you can configure the `set cos dscp` command, and the DSCP value will be copied and used as the CoS value.

**Note**
If you configure the `set cos dscp` command, only the first three bits (the class selector bits) of the DSCP field are used.

**Note**
If you configure the `set cos qos group` command, only the three least significant bits of the qos group field are used.

**Examples**

This example shows how to configure a policy map called cos-set and assign different CoS values for different types of traffic. This example assumes that the class maps called voice and video-data have already been created.

```
Switch# configure terminal
Switch(config)# policy-map cos-set
Switch(config-pmap)# class voice
Switch(config-pmap-c)# set cos 1
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class video-data
Switch(config-pmap-c)# set cos 2
Switch(config-pmap-c)# end
Switch#
```

This example shows how to configure a policy map called policy-cos and to use the values defined in a table map called table-map1. The table map called table-map1 was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the `table-map` (value mapping) command page.

This example shows how the setting of the CoS value is based on the precedence value defined in table-map1:

```
Switch# configure terminal
Switch(config)# policy-map policy-cos
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set cos precedence table table-map1
Switch(config-pmap-c)# end
Switch#
```

</tbody>
</table>
set dscp

To mark a packet by setting the differentiated services code point (DSCP) value in the type of service (ToS) byte, use the set dscp command in policy-map class configuration mode. To remove a previously set DSCP value, use the no form of this command.

```
set [ip] dscp {dscp-value | from-field [table table-map-name]}
no set [ip] dscp {dscp-value | from-field [table table-map-name]}
```

**Syntax Description**

| **ip** | (Optional) Specifies that the match is for IPv4 packets only. If not used, the match is on both IPv4 and IPv6 packets. |
| **dscp-value** | A number from 0 to 63 that sets the DSCP value. A mnemonic name for commonly used values can also be used. |
| **from-field** | Specific packet-marking category to be used to set the DSCP value of the packet. If you are using a table map for mapping and converting packet-marking values, this establishes the “map from” packet-marking category. Packet-marking category keywords are as follows: |
| | • cos |
| | • qos-group |
| | • dscp |
| | • precedence |

| **table** | (Optional) Used in conjunction with the from-field argument. Indicates that the values set in a specified table map will be used to set the DSCP value. |
| **table-map-name** | (Optional) Used in conjunction with the table keyword. Name of the table map used to specify the DSCP value. The name can be a maximum of 64 alphanumeric characters. |

**Command Default**

Disabled

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for from-field on Supervisor Engine 6-E and Catalyst 4900M.</td>
</tr>
</tbody>
</table>
Once the DSCP bit is set, other quality of service (QoS) features can then operate on the bit settings.

**DSCP and Precedence Values Are Mutually Exclusive**

The `set dscp` command cannot be used with the `set precedence` command to mark the same packet. The two values, DSCP and precedence, are mutually exclusive. A packet can have one value or the other, but not both.

You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the DSCP value. The “from-field” packet-marking categories are as follows:

- Class of service (CoS)
- QoS group
- Precedence
- Differentiated services code point (DSCP)

If you specify a “from-field” category but do not specify the `table` keyword and the applicable `table-map-name` argument, the default action will be to copy the value associated with the “from-field” category as the DSCP value. For instance, if you configure the `set dscp cos` command, the CoS value will be copied and used as the DSCP value.

**Note**

The CoS field is a three-bit field, and the DSCP field is a six-bit field. If you configure the `set dscp cos` command, only the three bits of the CoS field will be used.

If you configure the `set dscp qos-group` command, the QoS group value will be copied and used as the DSCP value.

The valid value range for the DSCP is a number from 0 to 63. The valid value range for the QoS group is a number from 0 to 63.

**Set DSCP Values in IPv6 Environments**

When this command is used in IPv6 environments, the default match occurs on both IP and IPv6 packets. However, the actual packets set by this function are only those which meet the match criteria of the class-map containing this function.

**Set DSCP Values for IPv6 Packets Only**

To set DSCP values for IPv6 values only, the `match protocol ipv6` command must also be used. Without that command, the DSCP match defaults to match both IPv4 and IPv6 packets.

**Set DSCP Values for IPv4 Packets Only**

To set DSCP values for IPv4 packets only, use the `ip` keyword in the `match` command for classification. Without the `ip` keyword, the match occurs on both IPv4 and IPv6 packets.

**Examples**

**Packet-marking Values and Table Map**

In the following example, the policy map called policy1 is created to use the packet-marking values defined in a table map called table-map1. The table map was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the `table-map` (value mapping) command page.
This example shows how the DSCP value is set according to the CoS value defined in the table map called table-map1.

Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set dscp cos table table-map1
Switch(config-pmap-c)# end
Switch#

set precedence

To set the precedence value in the packet header, use the `set precedence` command in policy-map class configuration mode. To remove the precedence value, use the `no` form of this command.

```plaintext
set precedence [precedence-value | from-field [table table-map-name]]

no set precedence [precedence-value | from-field [table table-map-name]]
```

**Syntax Description**

- **precedence-value**
  A number from 0 to 7 that sets the precedence bit in the packet header.

- **from-field**
  Specific packet-marking category to be used to set the precedence value of the packet. If you are using a table map for mapping and converting packet-marking values, this argument value establishes the “map from” packet-marking category. Packet-marking category keywords are as follows:
  - `cos`
  - `qos-group`
  - `dscp`
  - `precedence`

- **table**
  (Optional) Indicates that the values set in a specified table map will be used to set the precedence value.

- **table-map-name**
  (Optional) Name of the table map used to specify a precedence value based on the class of service (CoS) value. The name can be a maximum of 64 alphanumeric characters.

**Command Default**

Disabled

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for <code>from-field</code> on Supervisor Engine 6-E and Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

**Command Compatibility**

The `set precedence` command cannot be used with the `set dscp` command to mark the *same* packet. The two values, DSCP and precedence, are mutually exclusive. A packet can be one value or the other, but not both.
You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the precedence value. The “from-field” packet-marking categories are as follows:

- CoS
- QoS group
- DSCP
- Precedence

If you specify a “from-field” category but do not specify the table keyword and the applicable table-map-name argument, the default action will be to copy the value associated with the “from-field” category as the precedence value. For instance, if you configure the `set precedence cos` command, the CoS value will be copied and used as the precedence value.

You can do the same for the QoS group-marking category. That is, you can configure the `set precedence qos-group` command, and the QoS group value will be copied and used as the precedence value.

The valid value range for the precedence value is a number from 0 to 7. The valid value range for the QoS group is a number from 0 to 63. Therefore, when configuring the `set precedence qos-group` command the three least significant bits of qos-group are copied to precedence.

Precedence Values in IPv6 Environments

When this command is used in IPv6 environments it can set the value in both IPv4 and IPv6 packets. However, the actual packets set by this function are only those that meet the match criteria of the class-map containing this function.

Setting Precedence Values for IPv6 Packets Only

To set the precedence values for IPv6 packets only, the `match protocol ipv6` command must also be used in the class-map that classified packets for this action. Without the `match protocol ipv6` command, the class-map may classify both IPv6 and IPv4 packets, (depending on other match criteria) and the `set precedence` command will act upon both types of packets.

Setting Precedence Values for IPv4 Packets Only

To set the precedence values for IPv4 packets only, use a command involving the `ip` keyword like the `match ip precedence` or `match ip dscp` command or include the `match protocol ip` command along with the others in the class-map. Without the additional `ip` keyword, the class-map may match both IPv6 and IPv4 packets (depending on the other match criteria) and the `set precedence` or `set dscp` command may act upon both types of packets.

Examples

In the following example, the policy map named policy-cos is created to use the values defined in a table map named table-map1. The table map named table-map1 was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the `table-map` (value mapping) command page.

This example shows how the precedence value is set according to the CoS value defined in table-map1.

```
Switch# configure terminal
Switch(config)# policy-map policy-cos
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set precedence cos table table-map1
Switch(config-pmap-c)# end
Switch#
```

set qos-group

To set a quality of service (QoS) group identifier (ID) that can be used later to classify packets, use the set qos-group command in policy-map class configuration mode. To remove the group ID, use the no form of this command.

    set qos-group group-id

    no set qos-group group-id

**Syntax Description**

| group-id | Group ID number in the range from 0 to 63. |

**Command Default**

The group ID is set to 0.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The set qos-group command allows you to associate a group ID with a packet. This association is made through a service-policy attached to an interface or VLAN in the input direction. The group ID can be later used in the output direction to apply QoS service policies to the packet.

**Examples**

This example shows how to set the qos-group to 5:

```
Switch# configure terminal
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# set qos
Switch(config-pmap-c)# set qos-group 5
Switch(config-pmap-c)# end
Switch#
```

</tbody>
</table>
shape (class-based queueing)

To enable traffic shaping a class of traffic in a policy map attached to a physical port, use the `shape average` policy-map class command. Traffic shaping limits the data transmission rate. To return to the default setting, use the `no` form of this command.

```
shape average { rate } [ bps | kbps | mbps | gbps ]

shape average percent { percent_value }

no shape average
```

**Syntax Description**

- `rate` Specifies an average rate for traffic shaping; the range is 16000 to 10000000000. Post-fix notation (k, m, and g) is optional and a decimal point is allowed.
- `bps` (Optional) Specifies a rate in bits per seconds.
- `kbps` (Optional) Specifies a rate in kilobytes per seconds.
- `mbps` (Optional) Specifies a rate in megabits per seconds.
- `gbps` (Optional) Specifies a rate in gigabits per seconds.
- `percent` Specifies a percentage of bandwidth for traffic shaping.
- `percent_value` (Optional) Specifies a percentage of the bandwidth used for traffic shaping; valid values are from 1 to 100 percent.

**Defaults**

Average-rate traffic shaping is disabled.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `shape` command only in a policy map attached to a physical port. This command is valid in policy maps at any level of the hierarchy.

Shaping is the process of delaying out-of-profile packets in queues so that they conform to a specified profile. Shaping is distinct from policing. Policing drops packets that exceed a configured threshold, but shaping buffers packets so that traffic remains within the threshold. Shaping offers greater smoothness in handling traffic than policing.

You cannot use the `bandwidth`, `dbl`, and the `shape` policy-map class configuration commands with the `priority` policy-map class configuration command in the same class within the same policy map. However, you can use these commands in the same policy map.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.
Examples

This example shows how to limit the specified traffic class to a data transmission rate of 256 kbps:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end

You can verify your settings by entering the show policy-map privileged EXEC command.

shape (interface configuration)

To specify traffic shaping on an interface, use the `shape` command. To remove traffic shaping, use the `no` form of this command:

```
shape [rate] [percent]

no shape [rate] [percent]
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rate</td>
<td>(Optional) Specifies an average rate for traffic shaping; the range is 16000 to 1000000000. Post-fix notation (k, m, and g) is optional and a decimal point is allowed.</td>
</tr>
<tr>
<td>percent</td>
<td>(Optional) Specifies a percent of bandwidth for traffic shaping.</td>
</tr>
</tbody>
</table>

Defaults

Default is no traffic shaping.

Command Modes

Interface transmit queue configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

Traffic shaping is available on all the ports, and it sets an upper limit on the bandwidth.

When the high shape rates are configured on the Catalyst 4500 Supervisor Engine II-Plus-10GE (WS-X4013+10GE), the Catalyst 4500 Supervisor Engine V (WS-X4516), and the Catalyst 4500 Supervisor Engine V-10GE (WS-X4516-10GE), the shaped traffic rate may not be achieved in situations that involve contention and unusual packet size distributions. On the ports that are multiplexed through a Stub ASIC and connected to the backplane gigaports, the shape rates above 7 Mbps may not be achieved under worst-case conditions. On ports that are connected directly to the backplane gigaports, or the supervisor engine gigaports, the shape rates above 50 Mbps may not be achieved under worst-case conditions.

Some examples of ports that are connected directly to the backplane are as follows:

- Uplink ports on Supervisor Engine II+, II+10GE, III, IV, V, and V-10GE
- Ports on the WS-X4306-GB module
- The two 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first two ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module
All ports on the 24-port modules and the 48-port modules are multiplexed through a Stub ASIC. Some examples of ports multiplexed through a Stub ASIC are as follows:

- 10/100 ports on the WS-X4148-RJ45 module
- 10/100/1000 ports on the WS-X4124-GB-RJ45 module
- 10/100/1000 ports on the WS-X4448-GB-RJ45 module

### Examples

This example shows how to configure a maximum bandwidth (70 percent) for the interface fa3/1:

```
Switch(config)# interface fastethernet3/1
Switch(config-if)# tx-queue 3
Switch(config-if-queue)# shape 70m
Switch(config-if-queue)#
```
shell trigger

Use the **shell trigger** global configuration command to create a user defined trigger. Use the **no** form of this command to delete the trigger.

```
shell trigger identifier description
no shell trigger identifier description
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>identifier</strong></td>
<td>Specifies the event trigger identifier. The identifier should have no spaces or hyphens between words.</td>
</tr>
<tr>
<td><strong>description</strong></td>
<td>Specifies the event trigger description text.</td>
</tr>
</tbody>
</table>

**Defaults**

There are system-defined event triggers:

- CISCO_PHONE_EVENT
- CISCO_SWITCH_EVENT
- CISCO_ROUTER_EVENT
- CISCO_WIRELESS_AP_EVENT
- CISCO_WIRELESS_LIGHTWEIGHT_AP_EVENT
- DMP
- IPVSC

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to create user-defined event triggers in conjunction with the **macro auto execute** global configuration command.

To support dynamic device discovery when using 802.1X authentication, configure the RADIUS authentication server to support the Cisco attribute-value (AV) pair: `auto-smart-port=event trigger`.

This command is mainly used for 802.1X authentication based triggers provided 802.1X or MAB is supported, enabling you to map new platform strings or device IDs to their respective macros or functions.

**Examples**

This example shows how to create a user-defined event trigger called RADIUS_MAB_EVENT:

```
Switch# configure terminal
Switch(config)# shell trigger RADIUS_MAB_EVENT MAC_AuthBypass Event
Switch(config)# end
```
## Related Commands

show access-group mode interface

To display the ACL configuration on a Layer 2 interface, use the `show access-group mode interface` command.

```
show access-group mode interface [interface interface-number]
```

**Syntax Description**

- `interface` (Optional) Interface type; valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, and `port-channel`.
- `interface-number` (Optional) Interface number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The valid values for the port number depend on the chassis used.

**Examples**

This example shows how to display the ACL configuration on the Fast Ethernet interface 6/1:

```
Switch# show access-group mode interface fa6/1
Interface FastEthernet6/1:
  Access group mode is: merge
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access-group mode</code></td>
<td>Specifies the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode).</td>

</tbody>
</table>
show adjacency

To display information about the Layer 3 switching adjacency table, use the `show adjacency` command.

```
show adjacency [interface interface-number] | [null interface-number] | [port-channel number]
 | {vlan vlan-id} | detail | internal | summary
```

**Syntax Description**

- **interface**  
  (Optional) Interface type; possible valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `pos`, `ge-wan`, and `atm`.

- **interface-number**  
  (Optional) Module and port number; see the “Usage Guidelines” section for valid values.

- **null interface-number**  
  (Optional) Specifies the null interface; the valid value is `0`.

- **port-channel number**  
  (Optional) Specifies the channel interface; valid values are a maximum of 64 values ranging from 1 to 256.

- **vlan vlan-id**  
  (Optional) Specifies the VLAN; valid values are from 1 to 4094.

- **detail**  
  (Optional) Displays the information about the protocol detail and timer.

- **internal**  
  (Optional) Displays the information about the internal data structure.

- **summary**  
  (Optional) Displays a summary of CEF-adjacency information.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Extended to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `interface-number` argument designates the module and port number. Valid values for `interface-number` depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 1 to 13, and valid values for the port number are from 1 to 48.

Hardware Layer 3 switching adjacency statistics are updated every 60 seconds.

The following information is contained in the `show adjacency` command:

- Protocol interface.
- Type of routing protocol that is configured on the interface.
- Interface address.
- Method of adjacency that was learned.
- MAC address of the adjacent router.
- Time left before the adjacency rolls out of the adjacency table. After it rolls out, a packet must use the same next hop to the destination.

### Examples

This example shows how to display adjacency information:

```
Switch# show adjacency
Protocol Interface                Address
IP     FastEthernet2/3           172.20.52.1(3045)
IP     FastEthernet2/3           172.20.52.22(11)
Switch#
```

This example shows how to display a summary of adjacency information:

```
Switch# show adjacency summary
Adjacency Table has 2 adjacencies
  Interface                Adjacency Count
  FastEthernet2/3           2
Switch#
```

This example shows how to display protocol detail and timer information:

```
Switch# show adjacency detail
Protocol Interface                Address                      
IP     FastEthernet2/3           172.20.52.1(3045)          
                        0 packets, 0 bytes 
                        00000000000000000000000000000000

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-group mode</td>
<td>Specifies the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode).</td>
</tr>
<tr>
<td>arp access-list</td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>
</tr>
<tr>
<td>ip arp inspection filter vlan</td>
<td>Permits ARPs from hosts that are configured for static IP when DAI is enabled, defines an ARP access list, and applies the access list to a VLAN.</td>
</tr>
</tbody>
</table>
show authentication

To display the Auth Manager information, use the `show authentication` command in EXEC or Privileged EXEC mode.

```
show authentication {interface interface | registrations | sessions [session-id session-id] [handle handle] [interface interface] [mac mac] [method method]}
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>interface interface</strong></th>
<th>Displays all of the Auth Manager details associated with the specified interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>registrations</strong></td>
<td>Displays details of all methods registered with the Auth Manager.</td>
</tr>
<tr>
<td><strong>sessions</strong></td>
<td>Displays details of the current Auth Manager sessions (for example, client devices). If you do not enter any optional specifiers, all current active sessions are displayed. You can enter the specifiers singly or in combination to display a specific session (or group of sessions).</td>
</tr>
<tr>
<td><strong>session-id session-id</strong></td>
<td>(Optional) Specifies an Auth Manager session.</td>
</tr>
<tr>
<td><strong>handle handle</strong></td>
<td>(Optional) Specifies the particular handle for which Auth Manager information is displayed. Range is 1 to 4294967295.</td>
</tr>
<tr>
<td><strong>mac mac</strong></td>
<td>(Optional) Displays Auth Manager session information for a specified MAC address.</td>
</tr>
<tr>
<td><strong>method method</strong></td>
<td>(Optional) Displays all clients authorized by a specified authentication method. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• dot1x</td>
</tr>
<tr>
<td></td>
<td>• mab</td>
</tr>
<tr>
<td></td>
<td>• webauth</td>
</tr>
</tbody>
</table>

**Command Default**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Table 2-19 describes the significant fields shown in the show authentication display.

**Note**

The possible values for the status of sessions are given below. For a session in terminal state, “Authz Success” or “Authz Failed” are displayed. “No methods” is displayed if no method has provided a result.
Table 2-19  show authentication Command Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle</td>
<td>The session has been initialized and no methods have run yet.</td>
</tr>
<tr>
<td>Running</td>
<td>A method is running for this session.</td>
</tr>
<tr>
<td>No methods</td>
<td>No method has provided a result for this session.</td>
</tr>
<tr>
<td>Authc Success</td>
<td>A method has resulted in authentication success for this session.</td>
</tr>
<tr>
<td>Authc Failed</td>
<td>A method has resulted in authentication fail for this session.</td>
</tr>
<tr>
<td>Authz Success</td>
<td>All features have been successfully applied for this session.</td>
</tr>
<tr>
<td>Authz Failed</td>
<td>A feature has failed to be applied for this session.</td>
</tr>
</tbody>
</table>

Table 2-20 lists the possible values for the state of methods. For a session in terminal state, “Authc Success,” “Authc Failed,” or “Failed over” are displayed (the latter indicates a method ran and failed over to the next method which did not provide a result. “Not run” is displayed in the case of sessions that are synchronized on standby.

Table 2-20  State Method Values

<table>
<thead>
<tr>
<th>Method State</th>
<th>State Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not run</td>
<td>Terminal</td>
<td>The method has not run for this session.</td>
</tr>
<tr>
<td>Running</td>
<td>Intermediate</td>
<td>The method is running for this session.</td>
</tr>
<tr>
<td>Failed over</td>
<td>Terminal</td>
<td>The method has failed and the next method is expected to provide a result.</td>
</tr>
<tr>
<td>Authc Success</td>
<td>Terminal</td>
<td>The method has provided a successful authentication result for the session.</td>
</tr>
<tr>
<td>Authz Failed</td>
<td>Terminal</td>
<td>The method has provided a failed authentication result for the session.</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to display authentication methods registered with Auth Manager:

Switch# show authentication registrations
Auth Methods registered with the Auth Manager:
Handle Priority Name
3 0 dot1x
2 1 mab
1 2 webauth
Switch#

The following example shows how to display Auth Manager details for a specific interface:

Switch# show authentication interface gigabitethernet1/23
Client list:
MAC Address Domain Status Handle Interface
000e.8af.59bd DATA Authz Success 0XE0D000000 GigabitEthernet1/0/23
Available methods list:
Handle Priority Name
The following example shows how to display all Auth Manager sessions on the switch:

```
Switch# show authentication sessions
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address</th>
<th>Method</th>
<th>Domain</th>
<th>Status</th>
<th>Session ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi3/45</td>
<td>(unknown)</td>

<td>Gi3/46</td>
<td>(unknown)</td>
<td>N/A</td>
<td>DATA</td>
<td>Authz Success</td>
<td>09081404000000080057C274</td>
</tr>
</tbody>
</table>

The following example shows how to display all Auth Manager sessions on an interface:

```
Switch# show authentication sessions int gi 3/46
```

```
Interface:  GigabitEthernet3/46
MAC Address:  Unknown
IP Address:  Unknown
Status:  Authz Success
Domain:  DATA
Oper host mode:  multi-host
Oper control dir:  both
Authorized By:  Guest Vlan
Vlan Policy:  4094
Session timeout:  N/A
Idle timeout:  N/A
Common Session ID:  09081404000000080057C274
Acct Session ID:  0x0000000A
Handle:  0xCC000008
```

Runnable methods list:

<table>
<thead>
<tr>
<th>Method</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x</td>
<td>Authc Success</td>
</tr>
</tbody>
</table>

The following example shows how to display Auth Manager session for a specified MAC address:

```
Switch# show authentication sessions mac 000e.84af.59bd
```

```
Interface: GigabitEthernet1/23
MAC Address: 000e.84af.59bd
Status: Authz Success
Domain: DATA
Oper host mode: single-host
Authorized By: Authentication Server
Vlan Policy: 10
Handle: 0xE0000000
Runnable methods list:
Method State
dot1x  Authc Success
```

The following example shows how to display all clients authorized via a specified auth method:

```
Switch# show authentication sessions method mab
No Auth Manager contexts match supplied criteria
```

```
Switch# show authentication sessions method dot1x
MAC Address Domain Status Handle Interface
000e.84af.59bd DATA Authz Success 0xE0000000 GigabitEthernet1/23
```

</tbody>
</table>
show auto install status

To display the status of an automatic installation, use the show auto install status command.

    show auto install status

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to display the IP address of the TFTP server and to display whether or not the switch is currently acquiring the configuration file on the TFTP server:

    Switch# show auto install status
    
    Status : Downloading config file
    DHCP Server : 20.0.0.1
    TFTP Server : 30.0.0.3
    Config File Fetched : Undetermined

    The first IP address in the display indicates the server that is used for the automatic installation. The second IP address indicates the TFTP server that provided the configuration file.
# show auto qos

To display the automatic quality of service (auto-QoS) configuration that is applied, use the `show auto qos` user EXEC command.

```
show auto qos [interface [interface-id]] [{begin | exclude | include} expression]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>Displays auto-QoS information for the specified interface or for all interfaces. Valid interfaces include physical ports.</td>
</tr>
<tr>
<td>begin</td>
<td>Begins with the line that matches the expression.</td>
</tr>
<tr>
<td>exclude</td>
<td>Excludes lines that match the expression.</td>
</tr>
<tr>
<td>include</td>
<td>Includes lines that match the specified expression.</td>
</tr>
<tr>
<td>expression</td>
<td>Expression in the output to use as a reference point.</td>
</tr>
</tbody>
</table>

## Command Modes

Privileged EXEC mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

The `show auto qos interface interface-id` command displays the auto-QoS configuration; it does not display any user changes to the configuration that might be in effect.

To display information about the QoS configuration that might be affected by auto-QoS on a non-Supervisor Engine 6-E, use one of these commands:

- `show qos`
- `show qos map`
- `show qos interface interface-id`
- `show running-config`

Expressions are case sensitive. For example, if you enter `exclude output`, the lines that contain `output` do not appear, but the lines that contain `Output` appear.

## Examples

This example shows output from the `show auto qos` command when auto-QoS is enabled:

```
Switch# show auto qos
GigabitEthernet1/2
auto qos voip cisco-phone
Switch#
```

## Related Commands

<table>

<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to display BOOT environment variable information:

```
Switch# show bootvar
BOOT variable = sup:1;
CONFIG_FILE variable does not exist
BOOTLDR variable does not exist
Configuration register is 0x0
Switch#
```
show cable-diagnostics tdr

To display the test results for the TDR cable diagnostics, use the `show cable-diagnostics tdr` command.

```bash
show cable-diagnostics tdr {interface {interface interface-number}}
```

**Note**

This command will be deprecated in future Cisco IOS releases; use the `diagnostic start` command instead.

**Syntax Description**

- `interface interface`: Interface type; valid values are `fastethernet` and `gigabitethernet`.
- `interface-number`: Module and port number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The TDR test is supported on Catalyst 4500 Series Switches running Cisco IOS Release 12.2(25)SG for the following line cards only:

- WS-X4548-GB-RJ45
- WS-X4548-GB-RJ45V
- WS-X4524-GB-RJ45V
- WS-X4013+TS
- WS-C4948
- WS-C4948-10GE

The distance to the fault is displayed in meters (m).

**Examples**

This example shows how to display information about the TDR test:

```bash
Switch# show cable-diagnostics tdr interface gi4/13
Interface Speed Local pair Cable length Remote channel Status
Gi4/13 0Mbps 1-2 102 +-2m Unknown Fault
3-6 100 +-2m Unknown Fault
4-5 102 +-2m Unknown Fault
7-8 102 +-2m Unknown Fault
Switch#
```
Table 2-21 describes the fields in the `show cable-diagnostics tdr` command output.

**Table 2-21  show cable-diagnoses tdr Command Output Fields**

show cdp neighbors

To display detailed information about the neighboring devices that are discovered through CDP, use the `show cdp neighbors` command.

```
show cdp neighbors [type number] [detail]
```

**Syntax Description**

- **type** (Optional) Interface type that is connected to the neighbors about which you want information; possible valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `port-channel`, and `vlan`.
- **number** (Optional) Interface number that is connected to the neighbors about which you want information.
- **detail** (Optional) Displays detailed information about a neighbor (or neighbors) including network address, enabled protocols, hold time, and software version.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Extended to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `vlan` keyword is supported in Catalyst 4500 Series Switches that are configured with a Supervisor Engine 2.

The `port-channel` values are from 0 to 282; values from 257 to 282 are supported on the CSM and the FWSM only.

**Examples**

This example shows how to display the information about the CDP neighbors:

```
Switch# show cdp neighbors
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, F - Repeater, P - Phone

Device ID        Local Intrfce     Holdtme    Capability  Platform  Port ID
lab-7206         Eth 0              157          R        7206VXR   Fas 0/0/0
lab-as5300-1     Eth 0              163          R        AS5300    Fas 0

Switch#
```
Table 2-22 describes the fields that are shown in the example.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device ID</td>
<td>Configured ID (name), MAC address, or serial number of the neighbor device.</td>
</tr>
<tr>
<td>Local Infrsce</td>
<td>(Local Interface) The protocol that is used by the connectivity media.</td>
</tr>
<tr>
<td>Holdtime</td>
<td>(Holdtime) Remaining amount of time, in seconds, that the current device holds the CDP advertisement from a transmitting router before discarding it.</td>
</tr>
<tr>
<td>Capability</td>
<td>Capability code that is discovered on the device. This device type is listed in the CDP Neighbors table. Possible values are as follows: R—Router, T—Transparent bridge, B—Source-routing bridge, S—Switch, H—Host, I—IGMP device, r—Repeater, P—Phone</td>
</tr>
<tr>
<td>Platform</td>
<td>Product number of the device.</td>
</tr>
<tr>
<td>Port ID</td>
<td>Protocol and port number of the device.</td>
</tr>
</tbody>
</table>

This example shows how to display detailed information about your CDP neighbors:

Switch# show cdp neighbors detail
-----------------------------
Device ID: lab-7206
Entry address(es):
  IP address: 172.19.169.83
Platform: cisco 7206VXR, Capabilities: Router

</tr>
</tbody>
</table>
show class-map

To display class map information, use the `show class-map` command.

```
show class-map class_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>class_name</th>
<th>Name of the class map.</th>
</tr>
</thead>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Displays results from the full-flow option.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display class map information for all class maps:

```
Switch# show class-map
Class Map match-any class-default (id 0)
  Match any
Class Map match-any class-simple (id 2)
  Match any
Class Map match-all ipp5 (id 1)
  Match ip precedence 5
Class Map match-all agg-2 (id 3)
Switch#
```

This example shows how to display class map information for a specific class map:

```
Switch# show class-map ipp5
Class Map match-all ipp5 (id 1)
  Match ip precedence 5
Switch#
```

Assume there are two active flows as shown below on Fast Ethernet interface 6/1:

<table>
<thead>
<tr>
<th>SrcIp</th>
<th>DstIp</th>
<th>IpProt SrcL4Port DstL4Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20 6789 81</td>
</tr>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20 6789 21</td>
</tr>
</tbody>
</table>

With following configuration, each flow will be policed to a 1000000 bps with an allowed 9000-byte burst value.

**Note**

If you use the `match flow ip source-address|destination-address` command, these two flows are consolidated into one flow and they have the same source and destination address.
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol 14 source-port 14 destination-port

show device-sensor cache

To display Device Sensor cache entries, use the **show device-sensor cache** command in privileged EXEC mode.

```
show device-sensor cache {mac mac-address | all}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac</td>
<td>Specifies the MAC address of the device for which the sensor cache entries are to be displayed.</td>
</tr>
<tr>
<td>mac-address</td>
<td></td>
</tr>
<tr>
<td>all</td>
<td>Displays sensor cache entries for all devices.</td>
</tr>
</tbody>
</table>

### Defaults

There are no defaults for this command.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.4.0SG</td>
<td>Command introduced on the Catalyst 4500 Series switch.</td>
</tr>
<tr>
<td>IOS 15.1(2)SG</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **show device-sensor cache** command to display a list of TLV fields or options received from a particular device or from all devices.

### Examples

The following is sample output from the **show device-sensor cache mac mac-address** command:

```
Router# show device-sensor cache mac 0024.14dc.df4d
Device: 0024.14dc.df4d on port GigabitEthernet1/0/24
--------------------------------------------------
Proto   Type:Name                     Len Value
cdp     26:power-available-type        16 00 1A 00 10 00 00 00 01 00 00 00 FF FF FF FF
cdp     22:mgmt-address-type           17 00 16 00 11 00 00 00 01 01 01 CC 00 04 09 1B 65 0E

<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the test suite, monitoring interval, and test attributes for all the modules of the chassis:

```
Switch# show diagnostic content module all

module 1:

Diagnostics test suite attributes:
B/* - Basic ondemand test / NA
P/V/* - Per port test / Per device test / NA
D/N/* - Disruptive test / Non-disruptive test / NA
S/* - Only applicable to standby unit / NA
X/* - Not a health monitoring test / NA
F/* - Fixed monitoring interval test / NA
E/* - Always enabled monitoring test / NA
A/I - Monitoring is active / Monitoring is inactive
m/* - Mandatory bootup test, can't be bypassed / NA
 o/* - Ongoing test, always active / NA

ID Test Name                                    Attributes    Testing Interval   (day hh:mm:ss.ms)
--- ---------------------------------------------- ------------- ----------------------

1) supervisor-bootup ---------------------------> **D*****I** not configured
2) packet-memory-bootup -------------------------> **D*****I** not configured
3) packet-memory-ongoing ------------------------> **N*****I** not configured
```
module 6:

Diagnostics test suite attributes:
B/* - Basic ondemand test / NA
P/V/* - Per port test / Per device test / NA
D/N/* - Disruptive test / Non-disruptive test / NA
S/* - Only applicable to standby unit / NA
X/* - Not a health monitoring test / NA
F/* - Fixed monitoring interval test / NA
E/* - Always enabled monitoring test / NA
A/I - Monitoring is active / Monitoring is inactive
m/* - Mandatory bootup test, can't be bypassed / NA
o/* - Ongoing test, always active / NA

<tr>
<td><code>all</code></td>
<td>(Optional) Displays the diagnostics for all slots.</td>
</tr>
<tr>
<td><code>test</code></td>
<td>(Optional) Displays selected tests on the specified module.</td>
</tr>
<tr>
<td><code>test-id</code></td>
<td>(Optional) Specifies a single test ID.</td>
</tr>
<tr>
<td><code>test-id-range</code></td>
<td>(Optional) Specifies a range of test IDs.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>(Optional) Displays the diagnostics for all tests.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>(Optional) Displays the complete test results.</td>
</tr>
</tbody>
</table>

**Defaults**

A summary of the test results for all modules in the chassis is displayed.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release**: 12.2(18)EW
- **Modification**: Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to display the summary results for all modules in the chassis:

```
Switch# show diagnostic result module

Current bootup diagnostic level: minimal

module 1:

Overall diagnostic result: PASS
Diagnostic level at card bootup: bypass

Test results: (. = Pass, F = Fail, U = Untested)
1) supervisor-bootup -----------------------> U
2) packet-memory-bootup ------------------> U
3) packet-memory-ongoing ------------------> U

module 4:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)
1) linecard-online-diag ------------------> .
```
module 5:

    Overall diagnostic result: PASS
    Diagnostic level at card bootup: minimal

    Test results: (. = Pass, F = Fail, U = Untested)

      1) linecard-online-diag -------------------------->

module 6:

    Overall diagnostic result: PASS
    Diagnostic level at card bootup: minimal

    Test results: (. = Pass, F = Fail, U = Untested)

      1) linecard-online-diag -------------------------->

This example shows how to display the online diagnostics for module 1:

Switch# show diagnostic result module 1 detail

Current bootup diagnostic level: minimal

module 1:

Switch#
show diagnostic result module test

To display the results of the bootup packet memory test, use the `show diagnostic result module test` command. The output indicates whether the test passed, failed, or was not run.

```
show diagnostic result module [N | all] [test test-id] [detail]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>(Optional) Specifies the module number.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Specifies all modules.</td>
</tr>
<tr>
<td>test test-id</td>
<td>(Optional) Specifies the number for the tdr test on the platform.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Specifies the display of detailed information for analysis.</td>
</tr>
<tr>
<td>N</td>
<td>(Optional) Specifies the module number.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Specifies all modules.</td>
</tr>
<tr>
<td>test test-id</td>
<td>(Optional) Specifies the number for the tdr test on the platform.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Specifies the display of detailed information for analysis.</td>
</tr>
</tbody>
</table>

### Defaults

Non-detailed results.

### Command Modes

EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `detail` keyword is intended for use by Cisco support personnel when analyzing failures.

### Examples

This example shows how to display the results of the bootup packet memory tests:

```
Switch# show diagnostic result module 6 detail
module 6:
Overall diagnostic result:PAS
Test results:(. = Pass, F = Fail, U = Untested)

1) linecard-online-diag ----------------------> .
   Error code ---------------------------> 0 (DIAG_SUCCESS)
   Total run count -----------------------> 1
   Last test execution time ---------------> Jan 21 2001 19:48:30
   First test failure time --------------> n/a
   Last test failure time --------------> n/a
   Last test pass time ------------------> Jan 21 2001 19:48:30
   Total failure count -----------------> 0
   Consecutive failure count -------------> 0
```
show diagnostic result module test

show dot1x

To display the 802.1X statistics and operational status for the entire switch or for a specified interface, use the `show dot1x` command.

```
show dot1x [interface interface-id] | [statistics [interface interface-id]] | [all]
```

**Syntax Description**

- `interface interface-id` (Optional) Displays the 802.1X status for the specified port.
- `statistics` (Optional) Displays 802.1X statistics for the switch or the specified interface.
- `all` (Optional) Displays per-interface 802.1X configuration information for all interfaces with a nondefault 802.1X configuration.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Display enhanced to show the guest-VLAN value.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for currently assigned reauthentication timer (if the timer is configured to honor the Session-Timeout value) was added.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for port direction control and critical recovery was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify an interface, the global parameters and a summary are displayed. If you specify an interface, the details for that interface are displayed.

If you enter the `statistics` keyword without the `interface` option, the statistics are displayed for all interfaces. If you enter the `statistics` keyword with the `interface` option, the statistics are displayed for the specified interface.

Expressions are case sensitive. For example, if you enter `exclude output`, the lines that contain `output` are not displayed, but the lines that contain `Output` are displayed.

The `show dot1x` command displays the currently assigned reauthentication timer and time remaining before reauthentication, if reauthentication is enabled.
Examples

This example shows how to display the output from the `show dot1x` command:

```
Switch# show dot1x
Sysauthcontrol = Disabled
Dot1x Protocol Version = 2
Dot1x Oper Controlled Directions = Both
Dot1x Admin Controlled Directions = Both
Critical Recovery Delay = 500
Critical EAP = Enabled
Switch#
```

This example shows how to display the 802.1X statistics for a specific port:

```
Switch# show dot1x interface fastethernet6/1
Dot1x Info for FastEthernet6/1
-----------------------------------
PAE                       = AUTHENTICATOR

show energywise

Use the show energywise privileged EXEC command to display the EnergyWise settings and status of the entity and the power over Ethernet (PoE) ports.

```
show energywise [categories | children | domain | events | level [children | current [children] | delta children] | neighbors | recurrences | statistics | usage [children] | version] [ | ] [begin | exclude | include] expression
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>categories</td>
<td>(Optional) Displays the power levels.</td>
</tr>
<tr>
<td>children</td>
<td>(Optional) Displays the status of the entity and the PoE ports.</td>
</tr>
<tr>
<td>domain</td>
<td>(Optional) Displays the domain to which the entity belongs.</td>
</tr>
<tr>
<td>events</td>
<td>(Optional) Displays the last ten events (messages) sent to other entities in the domain.</td>

show environment

To display the environment alarm, operational status, and current reading for the chassis, use the `show environment` command.

```
show environment [alarm] [status [chassis | fantray | powersupply | supervisor]] [temperature]
```

**Syntax Description**

- **alarm**: (Optional) Specifies the alarm status of the chassis.
- **status**: (Optional) Specifies the operational status information.
- **chassis**: (Optional) Specifies the operational status of the chassis.
- **fantray**: (Optional) Specifies the status of the fan tray, and shows fan tray power consumption.
- **powersupply**: (Optional) Specifies the status of the power supply.
- **supervisor**: (Optional) Specifies the status of the supervisor engine.
- **temperature**: (Optional) Specifies the current chassis temperature readings.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Examples**

This example shows how to display information about the environment alarms, operational status, and current temperature readings for the chassis:

```
Switch# show environment
no alarm

Chassis Temperature = 32 degrees Celsius
Chassis Over Temperature Threshold = 75 degrees Celsius
Chassis Critical Temperature Threshold = 95 degrees Celsius

Power Supply Model No Type Fan Status Sensor
------ --------------- --------- ----------- ------
PS1   PWR-C45-1400AC AC 1400W   good   good
PS2   none           --         --           --

Power Supply (Nos in Watts) Max Min Max Min Absolute
--------------- ------ ------ ------ ------
PS1                0  0   1360   1360   1400
PS2                -- --     --     --     --
```
show environment

Power supplies needed by system : 1
Chassis Type : WS-C4507R
Supervisor Led Color : Green
Fantray : good
Fantray removal timeout: 240
Power consumed by Fantray : 50 Watts

This example shows how to display information about the environment alarms:

Switch# show environment alarm
no alarm
Switch#

This example shows how to display information about the power supplies, chassis type, and fan trays:

Switch# show environment status

### Examples

This example shows how to display recovery timer information for error disable:

```
Switch# show errdisable recovery
ErrDisable Reason     Timer Status
---------------------  --------------
udld                 Disabled
bpduguard            Disabled
security-violatio    Disabled
channel-misconfig    Disabled
vmps                 Disabled
pagp-flap            Disabled
dtp-flap             Disabled
link-flap            Disabled
l2ptguard            Disabled
psecure-violation    Disabled
gbic-invalid         Disabled
dhcp-rate-limit      Disabled
unicast-flood        Disabled
storm-control        Disabled
arp-inspection       Disabled

Timer interval:30 seconds

Interfaces that will be enabled at the next timeout:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Errdisable reason</th>
<th>Time left(sec)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa7/32</td>
<td>arp-inspect</td>
<td>13</td>
</tr>
</tbody>
</table>
```

### Related Commands

Release Modification

- 12.1(8a)EW: Support for this command was introduced on the Catalyst 4500 series switch.
- 12.1(19)EW: Display includes the status of storm control.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errdisable detect</td>
<td>Enables error-disable detection.</td>

</table>
show etherchannel

To display EtherChannel information for a channel, use the show etherchannel command.

```
show etherchannel [channel-group] [port-channel | brief | detail | summary | port | load-balance | protocol]
```

**Syntax Description**

- `channel-group`: (Optional) Number of the channel group; valid values are from 1 to 64.
- `port-channel`: Displays port-channel information.
- `brief`: Displays a summary of EtherChannel information.
- `detail`: Displays detailed EtherChannel information.
- `summary`: Displays a one-line summary per channel group.
- `port`: Displays EtherChannel port information.
- `protocol`: Displays the enabled protocol.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release 12.1(8a)EW**: Support for this command was introduced on the Catalyst 4500 series switch.
- **Release 12.1(13)EW**: Support for LACP was added to this command.

**Usage Guidelines**

If you do not specify a channel group, all channel groups are displayed.

In the output below, the Passive port list field is displayed for Layer 3 port channels only. This field means that the physical interface, which is still not up, is configured to be in the channel group (and indirectly is in the only port channel in the channel group).

**Examples**

This example shows how to display port-channel information for a specific group:

```
Switch# show etherchannel 1 port-channel
Port-channels in the group:
-----------------------------
Port-channel: Po1
----------

<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Table 2-26 describes the fields in the `show flowcontrol` command output.

#### Table 2-26: show flowcontrol Command Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>Module and port number.</td>
</tr>
<tr>
<td>Send-Flowcontrol-Admin</td>
<td>Flow-control administration. Possible settings: on indicates the local port sends flow control to the far end; off indicates the local port does not send flow control to the far end; desired indicates the local end sends flow control to the far end if the far end supports it.</td>
</tr>
<tr>
<td>Send-Flowcontrol-Oper</td>
<td>Flow-control operation. Possible setting: disagree indicates the two ports could not agree on a link protocol.</td>
</tr>
<tr>
<td>Receive-Flowcontrol-Admin</td>
<td>Flow-control administration. Possible settings: on indicates the local port requires the far end to send flow control; off indicates the local port does not allow the far end to send flow control; desired indicates the local end allows the far end to send flow control.</td>
</tr>
<tr>
<td>Receive-Flowcontrol-Oper</td>
<td>Flow-control operation. Possible setting: disagree indicates the two ports could not agree on a link protocol.</td>
</tr>
<tr>
<td>RxPause</td>
<td>Number of pause frames received.</td>
</tr>
<tr>
<td>TxPause</td>
<td>Number of pause frames transmitted.</td>
</tr>
</tbody>
</table>
This example shows how to display the flow control status on all the Gigabit Ethernet interfaces:

```
Switch# show flowcontrol
Port       Send FlowControl  Receive FlowControl  RxPause TxPause
---------  -------- -------- -------- --------    ------- -------
Te1/1      off      off      on       off         0       0
Te1/2      off      off      on       off         0       0
Gi1/3      off      off      desired on          0       0
Gi1/4      off      off      desired on          0       0
Gi1/5      off      off      desired on          0       0
Gi1/6      off      off      desired on          0       0
Gi1/1      off      off      desired off         0       0
Gi1/2      off      off      desired off         0       0
Gi1/3      off      off      desired off         0       0
Gi1/4      off      off      desired off         0       0
Gi1/5      off      off      desired off         0       0
Gi1/6      off      off      desired off         0       0
Switch#
```

This example shows how to display the flow control status on module 1:

```
Switch# show flowcontrol module 1
Port    Send FlowControl  Receive FlowControl  RxPause TxPause
admin   oper     admin    oper
---------  -------- -------- -------- --------    ------- -------
Gi1/1    desired  off      off      off         0       0
Gi1/2    on       disagree on       on          0       0
Switch#
```

This example shows how to display the flow control status on Gigabit Ethernet interface 3/4:

```
Switch# show flowcontrol interface gigabitethernet3/4
Port    Send FlowControl  Receive FlowControl  RxPause TxPause
admin   oper     admin    oper
---------  -------- -------- -------- --------    ------- -------
Gi3/4    off      off      on       on          0       0
Switch#
```

This example shows how to display the flow control status on 10-Gigabit Ethernet interface 1/1:

```
Switch# show flowcontrol interface tengigabitethernet1/1
Port       Send FlowControl  Receive FlowControl  RxPause TxPause
---------  -------- -------- -------- --------    ------- -------
Te1/1      off      off      on       off         0       0
Switch#
```

</tr>
</tbody>
</table>
show hw-module port-group

To display how the X2 holes on a module are grouped, use the `show hw-module port-group` command.

```
show hw-module module number port-group
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module</td>
<td>Specifies a line module.</td>
</tr>
<tr>
<td>number</td>
<td>Specifies a slot or module number.</td>
</tr>
<tr>
<td>port-group</td>
<td>Specifies a port-group on a switch.</td>
</tr>
</tbody>
</table>

**Defaults**

X2 mode.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for WS-X4606-10GE-E Twin Gigabit converter introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a TwinGig converter is enabled or disabled, the number and type of ports on the line card change dynamically. The terminology must reflect this behavior. In Cisco IOS, 10-Gigabit ports are named TenGigabit and 1-Gigabit ports are named Gigabit. Starting with Cisco IOS Release 12.2(40)SG, to avoid having ports named TenGigabit1/1 and Gigabit1/1, the 10-Gigabit and 1-Gigabit port numbers are independent. The WS-X4606-10GE-E module with six X2 ports are named TenGigabit<slot-num>/<1-6>, and the SFP ports are named Gigabit<slot-num>/<7-18>.

In the Supervisor Engine 6-E and Catalyst 4900M chassis, the ports are connected to the switching engine through a stub ASIC. This stub ASIC imposes some limitations on the ports: Gigabit and 10-Gigabit ports cannot be mixed on a single stub ASIC; they must either be all 10-Gigabit (X2), or all Gigabit (TwinGig converter and SFP). The faceplates of X2 modules show this stub-port grouping, either with an actual physical grouping, or a box drawn around a grouping.

**Examples**

This example shows to determine how the X2 holes on a module are grouped on a WS-X4606-10GE-E:

```
Switch# show hw-module module 1 port-group
Module  Port-group     Active     Inactive
--------+-----------------+-----------+----------
1       1              Te1/1-3   Gi1/7-12
1       2              Te1/4-6   Gi1/13-18
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hw-module port-group</td>
<td>Selects either Gigabit Ethernet or Ten Gigabit Ethernet interfaces on your module.</td>
</tr>
</tbody>
</table>
show hw-module uplink

To display the current uplink mode, use the `show hw-module uplink` command.

```
show hw-module uplink
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the active uplink mode is different than configured mode, the output displays the change.

By default, the current (operational) uplink selection is displayed.

**Examples**

This example shows the output displaying the current (active) uplinks:

```
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
```

This example shows the output for redundant systems in SSO mode if the 10-Gigabit Ethernet uplinks are active, and the Gigabit Ethernet uplinks are selected:

```
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
(will be GigabitEthernet after next reload)
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration
```

This example shows the output for redundant systems in RPR mode if the 10-Gigabit Ethernet uplinks are active, and the Gigabit Ethernet uplinks are selected:

```
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
(will be GigabitEthernet after next reload)
A reload of active supervisor is required to apply the new configuration.
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>hw-module uplink select</code></td>
<td>Selects the 10-Gigabit Ethernet or Gigabit Ethernet uplinks on the Supervisor Engine V-10GE within the W-C4510R chassis.</td>
</tr>
</tbody>
</table>
show idprom

To display the IDPROMs for the chassis, supervisor engine, module, power supplies, fan trays, clock module, and multiplexer (mux) buffer, use the `show idprom` command.

```
show idprom { all | chassis | module [mod] | interface int_name | supervisor | power-supply number | fan-tray }
```

**Syntax Description**

- `all` Displays information for all IDPROMs.
- `chassis` Displays information for the chassis IDPROMs.
- `module` Displays information for the module IDPROMs.
- `mod` (Optional) Specifies the module name.
- `interface int_name` Displays information for the GBIC or SFP IDPROMs.
- `supervisor` Displays information for the supervisor engine IDPROMs.
- `power-supply number` Displays information for the power supply IDPROMs.
- `fan-tray` Displays information for the fan tray IDPROMs.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for the <code>power-supply</code>, <code>fan-tray</code>, <code>clock-module</code>, and <code>mux-buffer</code> keywords was added.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Support for <code>interface</code> keyword was added.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Enhanced the <code>show idprom interface</code> output to include the hexadecimal display of the GBIC/SFP SEEPROM contents.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the `show idprom interface` command, the output lines for Calibration type and Rx (receive) power measurement may not be displayed for all GBICs.
This example shows how to display IDPROM information for module 4:

Switch# show idprom module 4
Module 4 Idprom:
  Common Block Signature = 0xABAB

## Usage Guidelines

The statistics are collected per VLAN for Layer 2 switched packets and Layer 3 switched packets. The statistics are available for both unicast and multicast. The Layer 3 switched packet counts are available for both the ingress and egress directions. The per-VLAN statistics are updated every 5 seconds.

In some cases, the duplex mode that is displayed by the `show interfaces` command is different than that displayed by the `show running-config` command. The duplex mode that is displayed in the `show interfaces` command is the actual duplex mode that the interface is running. The `show interfaces` command shows the operating mode for an interface, but the `show running-config` command shows the configured mode for an interface.
If you do not enter any keywords, all counters for all modules are displayed.

Line cards that support auto-MDIX configuration on their copper media ports include: WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or later, and WS-X4232-GB-RJ with hardware revision 3.0 or later.

**Examples**

This example shows how to display traffic for Gigabit Ethernet interface 2/5:

Switch# show interfaces gigabitethernet2/5
GigabitEthernet9/5 is up, line protocol is up (connected) (vlan-err-dis)
Hardware is C4k 1000Mb 802.3, address is 0001.64f8.3fa5 (bia 0001.64f8.3fa5)
Internet address is 172.20.20.20/24
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Full-duplex, 1000Mb/s
ARP type: ARPA, ARP Timeout 04:00:00
Last input 00:00:00, output never, output hang never
Last clearing of "show interface" counters never
Queueing strategy: fifo
Output queue 0/40, 0 drops; input queue 0/75, 0 drops
5 minute input rate 1000 bits/sec, 2 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
L2 Switched: ucast: 8199 pkt, 1362060 bytes - mcast: 6980 pkt, 371952 bytes
L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes mcast
L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes
300114 packets input, 27301436 bytes, 0 no buffer
Received 43458 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
0 input packets with dribble condition detected
15181 packets output, 1955836 bytes, 0 underruns
0 output errors, 0 collisions, 3 interface resets
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier
0 output buffer failures, 0 output buffers swapped out
Switch#

This example shows how to display traffic for 10-Gigabit Ethernet interface 1/1:

Switch# show interfaces tengigabitethernet1/1
Name: Tengigabitethernet1/1
Switchport: Enabled
Administrative Mode: private-vlan promiscuous trunk
Operational Mode: private-vlan promiscuous (suspended member of bundle Po1)
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: none
Trunking Native Mode VLAN: none
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304)
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk
Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: 802.1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Administrative private-vlan trunk mapping trunk: New 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304) 204 (VLAN0204) 305 (VLAN0305) 306 (VLAN0306)
This example shows how to verify the status of auto-MDIX on an RJ-45 port:

You can verify the configuration setting and the operational state of auto-MDIX on the interface by entering the `show interfaces` EXEC command. This field is applicable and appears only on the `show interfaces` command output for 10/100/1000BaseT RJ-45 copper ports on supported linecards including WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or later, and WS-X4232-GB-RJ with hardware revision 3.0 or later.

This example shows how to display status information for Gigabit Ethernet interface 1/2:

```bash
Switch# show interfaces gigabitethernet1/2 status
Port      Name         Status       Vlan       Duplex  Speed Type
Gi1/2                  notconnect   1            auto   1000 10GBase-LR
Switch#
```

This example shows how to display status information for the interfaces on the supervisor engine:

```bash
Switch# show interfaces status
Port      Name       Status   Vlan   Duplex  Speed Type
Te1/1      connected  1       full   10G 10GBase-LR
Te1/2      connected  1       full   10G 10GBase-LR
Switch#
```
show interfaces (virtual switch)

To display traffic that is seen by a specific interface, use the show interfaces command in EXEC mode.

```
show interfaces [interface iswitch-num/mod/port]
```

**Syntax Description**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Usage Guidelines**

Statistics are collected on a per-VLAN basis for Layer 2-switched packets and Layer 3-switched packets. Statistics are available for both unicast and multicast traffic. The Layer 3-switched packet counts are available for both ingress and egress directions. The per-VLAN statistics are updated every 5 seconds.

In some cases, you might see a difference in the duplex mode that is displayed between the show interfaces (virtual switch) command and the show running-config switch (virtual switch) command. In this case, the duplex mode that is displayed in the show interfaces (virtual switch) command is the actual duplex mode that the interface is running. The show interfaces (virtual switch) command shows the operating mode for an interface, while the show running-config switch (virtual switch) command shows the configured mode for an interface.

If you do not specify an interface, the information for all interfaces is displayed.

The output of the show interfaces GigabitEthernet command displays an extra 4 bytes for every packet that is sent or received. The extra 4 bytes are the Ethernet frame CRC in the input and output byte statistics.
Examples

The following example shows how to display traffic for a specific interface:

Router# `show interfaces GigabitEthernet switch 1/3/3`
GigabitEthernet1/3/3 is up, line protocol is up (connected)
    Hardware is C6k 1000Mb 802.3, address is 000f.2305.49c0 (bia 000f.2305.49c0)
    MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
    Encapsulation 802.1Q Virtual LAN, Vlan ID 1., loopback not set
    Keepalive set (10 sec)
    Full-duplex, 1000Mb/s, media type is LH
    input flow-control is off, output flow-control is on
    Clock mode is auto
    ARP type: ARPA, ARP Timeout 04:00:00
    Last input 00:00:19, output 00:00:00, output hang never
    Last clearing of "show interface" counters never
    Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
    Queueing strategy: fifo
    Output queue: 0/40 (size/max)
    5 minute input rate 0 bits/sec, 0 packets/sec
    5 minute output rate 0 bits/sec, 0 packets/sec
    L2 Switched: ucast: 360 pkt, 23040 bytes - mcast: 0 pkt, 0 bytes
    L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes mcast
    L3 out Switched: ucast: 0 pkt, 0 bytes mcast: 0 pkt, 0 bytes
    437 packets input, 48503 bytes, 0 no buffer
    Received 76 broadcasts (0 IP multicast)
    0 runs, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    0 watchdog, 0 multicast, 0 pause input
    0 input packets with dribble condition detected
    86 packets output, 25910 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets
    0 babbles, 0 late collision, 0 deferred
    0 lost carrier, 0 no carrier, 0 PAUSE output
    0 output buffer failures, 0 output buffers swapped out

<tr>
<td>12.2(18)EW</td>
<td>Support for the display of total suppression discards.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not enter any keywords, all the counters for all modules are displayed.

The display for the `storm-control` keyword includes the suppressed multicast bytes.

**Examples**

This example shows how to display the error counters for a specific module:

```
Switch# show interfaces counters errors module 1
```

```
Port      | Align-Err | FCS-Err | Xmit-Err | Rcv-Err | UnderSize |
----------|-----------|---------|----------|---------|-----------|
Gi1/1     | 0         | 0       | 0        | 0       | 0         |
Gi1/2     | 0         | 0       | 0        | 0       | 0         |

Port      | Single-Col | Multi-Col | Late-Col | Excess-Col | Carri-Sen | Runts | Giants |
----------|------------|-----------|----------|------------|-----------|-------|--------|
Gi1/1     | 0          | 0         | 0        | 0          | 0         | 0     | 0      |
Gi1/2     | 0          | 0         | 0        | 0          | 0         | 0     | 0      |
Switch#    |
```
This example shows how to display the traffic that is seen by a specific module:

```
Switch# show interfaces counters module 1
```

Port | InOctets | InUcastPkts | InMcastPkts | InBcastPkts |
-----|----------|-------------|-------------|-------------|
G1/1 | 0        | 0           | 0           | 0           |
G1/2 | 0        | 0           | 0           | 0           |

Port | OutOctets | OutUcastPkts | OutMcastPkts | OutBcastPkts |
-----|-----------|-------------|-------------|-------------|

</tr>
</tbody>
</table>

**Usage Guidelines**

The `show interfaces counters` command displays the number of all of the packets arriving and includes the number of packets that may be dropped by the interface due to the storm-control settings. To display the total number of dropped packets, you can enter the `show interfaces counters storm-control` command.

The `show interfaces counters storm-control` command displays the discard count and the level settings for each mode. The discard count is a total of all three modes.

If you do not enter any keywords, all counters for all modules are displayed.

If you do not specify an interface, the information for all interfaces is displayed.

When you enter the `show interfaces interface counters etherchannel` command, follow these guidelines:

- If interface specifies a physical port, the command displays the message "Etherchannel not enabled on this interface."
- If interface is omitted, the command displays the counters for all port channels (in the system) and for their associated physical ports.
The following example shows how to display the error counters for a specific:

```
Router# show interfaces gigabitethernet 2/4/47 counters errors
Port            Align-Err    FCS-Err   Xmit-Err    Rcv-Err UnderSize OutDiscards
Gi2/4/47                0          0          0          0         0           0
Port           Single-Col Multi-Col Late-Col Excess-Col Carri-Sen        Runts    s
Gi2/4/47                0          0          0          0         0           0
Port             SQETest-Err Deferred-Tx IntMacTx-Err IntMacRx-Err Symbol-Err
Gi2/4/47                       0           0            0            0          0
```

The following example shows how to display traffic that is seen by a specific interface:

```
Router# show interfaces gigabitethernet 1/2/5 counters
Port            InOctets   InUcastPkts   InMcastPkts   InBcastPkts
Gi1/2/5                0             0             0             0
Port            OutOctets  OutUcastPkts  OutMcastPkts  OutBcastPkts
Gi1/2/5                0             0             0             0
```

The following example shows how to display the counters for all port channels (in the system) and their associated physical ports:

```
Router# show interfaces counters etherchannel
Port                InOctets   InUcastPkts   InMcastPkts   InBcastPkts

Po20             16338422056      14353951      89573339             0
Gi1/4/1            15628501864      14232410      85017290             0
Gi1/4/2              712663011        121541       4565416             0
```

The following example shows how to display the counters for all port channels (in the system) and their associated physical ports in Cisco IOS Release 12.2(50)SY and later releases:

```
Router# show interfaces counters etherchannel
Port                InOctets   InUcastPkts   InMcastPkts   InBcastPkts
Po1                              0             0             0             0
Po3                              0             0             0             0
Po10             16341138343      77612803      12212915      14110863
Gi1/4/1            15628478622      77612818       7525970      14110865
Gi1/4/2              712662881             0         4686951             5
Po20             33887345029      88483183      11506653      14101212
Gi1/4/1            33326378013      88491521       7177393      14101663
Gi1/4/2              562904837             0         4330030             6
```

- If interface specifies a port channel, the command displays the counters for the port channel and all of the physical ports that are associated with it. In addition, when you enter the command specifying the primary aggregator in a Link Aggregation Control Protocol (LACP) port channel with multiple aggregators, the output includes the statistics for all of the aggregators in the port channels and for the ports that are associated with them.
The following example shows how to display the protocols enabled for a specific interface:

```
Router# show interfaces gigabitethernet 1/2/5 counters protocol status
Protocols allocated:
  GigabitEthernet1/2/5: Other, IP
Router#
```

The following example shows how to display the discard count and the level settings for each mode for a specific interface:

```
Router# show interfaces gigabitethernet 1/2/5 counters storm-control
Port          UcastSupp %     McastSupp %     BcastSupp %   TotalSuppDiscards
Gi1/2/5             100.0           100.0           100.0                   0
Router#
```

### Related Commands

<table>

</thead>
<tbody>
<tr>
<td><code>clear counters</code></td>
<td>Clears the interface counters.</td>
</tr>
</tbody>
</table>
show interfaces description

To display a description and status of an interface, use the `show interfaces description` command.

```
show interfaces [interface] description
```

**Syntax Description**

```
interface  (Optional) Type of interface.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information for all interfaces:

```
Switch# show interfaces description
Interface Status     Protocol Description
P00/0    admin down     down     First interface
P00/1    admin down     down
Gi1/1     up             up       GigE to server farm
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>description</code> (refer to Cisco IOS documentation)</td>
<td>Includes a specific description about the digital signal processor (DSP) interface.</td>
</tr>
</tbody>
</table>
show interfaces link

To display how long a cable has been disconnected from an interface, use the show interfaces link command:

```
show interfaces link [module mod_num]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module mod_num</td>
<td>(Optional) Limits the display to interfaces on a module.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If the interface state is up, the command displays 0:00. If the interface state is down, the time (in hours, minutes, and seconds) is displayed.

### Examples

This example shows how to display active link-level information:

```
Switch# show interfaces link

Port    Name       Down Time
Gi1/1   00:00:00
Gi1/2   00:00:00
Gi3/1   00:00:00
Gi3/2   00:00:00
Fa4/1   00:00:00
Fa4/2   00:00:00
Fa4/3   00:00:00
Fa4/4   00:00:00
```

This example shows how to display inactive link-level information:

```
Switch# show interfaces link

Port    Name       Down Time
Gi3/4   1 minute 28 secs
Gi3/5   1 minute 28 secs
Gi3/6   1 minute 28 secs
Gi4/1   1 minute 28 secs
```

In this example, the cable has been disconnected from the port for 1 minute and 28 seconds.
show interfaces mtu

To display the maximum transmission unit (MTU) size of all the physical interfaces and SVIs on the switch, use the `show interfaces mtu` command.

```
show interfaces mtu [module mod]
```

**Syntax Description**

- **module mod** *(Optional)* Limits the display to interfaces on a specific module.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the MTU size for all interfaces on module 1:

```
Switch> show interfaces mtu module 1

   Port    Name               MTU
    Gi1/1                      1500
    Gi1/2                      1500
Switch>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU).</td>
</tr>
</tbody>
</table>
show interfaces private-vlan mapping

To display PVLAN mapping information for VLAN SVIs, use the `show interfaces private-vlan mapping` command.

```
show interfaces private-vlan mapping [active]
```

**Syntax Description**

| active | (Optional) Displays active interfaces only. |

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release   Modification
12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

This command displays SVI information only.

**Examples**

This example shows how to display PVLAN mapping information:

```
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
---------- --------------- ------------
vlan2     301            isolated
vlan2     302            isolated
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>private-vlan</code></td>
<td>Configures private VLANs and the association between a private VLAN and a secondary VLAN.</td>
</tr>
<tr>
<td><code>private-vlan mapping</code></td>
<td>Creates a mapping between the primary and the secondary VLANs so that both share the same primary VLAN SVI.</td>
</tr>
</tbody>
</table>
show interfaces status

To display the interface status or a list of interfaces in error-disabled state, use the `show interfaces status` command.

```
show interfaces status [err-disabled | inactive | module {module}]
```

**Syntax Description**

- **err-disabled**: (Optional) Displays interfaces in error-disabled state.
- **inactive**: (Optional) Displays interfaces in inactive state.
- **module module**: (Optional) Displays interfaces on a specific module.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support for WS-X4606-10GE-E Twin Gigabit converter introduced.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support for per-VLAN error-disable was introduced by adding Err-Disabled VLAN column to output.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When at least one VLAN on a port is error-disabled the output for the `show interfaces status` command will display `vl-err-dis` in the VLAN column.

**Examples**

This example shows how to display the status of all interfaces:

```
Switch# show interfaces status

Port  Name     Status    Vlan  Duplex  Speed   Type
Te1/1  connected 1  full  10G  10GBase-LR
Te1/2  connected  vl-err-dis full  10G  10GBase-LR
Switch#
```

This example shows how to display the status of interfaces in an error-disabled state:

```
Switch# show interfaces status err-disabled

Port  Name     Status  Reason             Err-Disabled VLANs
Fa9/4  notconnect  link-flap                       
Fa9/5  err-disabled psecure_violation  3-5
Fa9/6  connected  psecure_violation  10,15
Switch#
```
This example shows how to display the Gigabit Ethernet interfaces on a WS-X4606-10GE-E switch using the TwinGig Convertor:

```
Switch# show interfaces status module 1
Port Name Status Vlan Duplex Speed Type
Te1/1 inactive 1 full 10G No X2
Te1/2 inactive 1 full 10G No X2
Te1/3 inactive 1 full 10G No X2
Te1/4 notconnect 1 full 10G No X2
Te1/5 notconnect 1 full 10G No X2
Te1/6 notconnect 1 full 10G No X2
Gi1/7 notconnect 1 full 1000 No Gbic
Gi1/8 notconnect 1 full 1000 No Gbic
Gi1/9 notconnect 1 full 1000 No Gbic
Gi1/10 notconnect 1 full 1000 No Gbic
Gi1/11 notconnect 1 full 1000 No Gbic
Gi1/12 notconnect 1 full 1000 No Gbic
Gi1/13 inactive 1 full 1000 No Gbic
Gi1/14 inactive 1 full 1000 No Gbic
Gi1/15 inactive 1 full 1000 No Gbic
Gi1/16 inactive 1 full 1000 No Gbic
Gi1/17 inactive 1 full 1000 No Gbic
Gi1/18 inactive 1 full 1000 No Gbic
Switch#
```

show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, use the show interfaces switchport command.

```
show interfaces [interface-id] switchport [module mod]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-id</td>
<td>(Optional) Interface ID for the physical port.</td>
</tr>
<tr>
<td>module mod</td>
<td>(Optional) Limits the display to interfaces on the specified module; valid values are from 1 to 6.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>

</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support for displaying the status of native VLAN tagging in the command output.</td>
</tr>
<tr>
<td>15.1.0 SG</td>
<td>Support for PVLAN modes over EtherChannel. Modes include: private-vlan host, private-vlan promiscuous, private-vlan trunk secondary, and private-vlan trunk promiscuous.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display switch-port information using the begin output modifier:

```
Switch# show interfaces switchport | include VLAN
Name: Fa5/6
Access Mode VLAN: 200 (VLAN0200)
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: ALL
Switch#
```

This example shows how to display switch-port information for module 1:

```
Switch# show interfaces switchport module 1
Name: Gi1/1
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: down
Administrative Trunking Encapsulation: negotiate
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
```
Pruning VLANs Enabled: 2-1001

Name: Gi1/2
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: down
Administrative Trunking Encapsulation: negotiate
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Switch#

This example shows how to display the status of native VLAN tagging on the port:

Switch# show interfaces f3/1 switchport
show interface f3/1 switchport
Name: Fa3/1
Switchport: Enabled
Administrative Mode: private-vlan promiscuous
Operational Mode: private-vlan trunk secondary
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: dot1q

</table>
show interfaces transceiver

To display diagnostic-monitoring data for all interfaces that have transceivers installed, use the `show interfaces transceiver` command.

```
show interfaces { [[int_name] transceiver { [detail] | transceiver [module mod] | detail [module mod]]}
```

**Syntax Description**

- `int_name` (Optional) Interface name.
- `detail` (Optional) Displays the calibrated values and the A2D readouts if the readout values differ from the calibrated values. Also displays the high-alarm, high-warning, low-warning, and low-alarm thresholds.
- `module mod` (Optional) Limits the display to interfaces on a specific module.

**Defaults**

The noninterface-specific versions of the `show interfaces transceiver` command are enabled by default. The interface-specific versions of these commands are enabled by default if the specified interface has a transceiver (GBIC or SFP) that is configured for diagnostic monitoring, and the transceiver is in a module that supports diagnostic monitoring.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release       Modification
-------------  ----------------------------------
12.1(20)EW     Support for this command was introduced on the Catalyst 4500 series switch.
12.2(18)EW     Support for the `calibration` keyword was withdrawn.
```

**Usage Guidelines**

The `show interfaces transceiver` command provides useful information under the following conditions:

- At least one transceiver is installed on a chassis that is configured for diagnostic monitoring.
- The transceiver is in a module that supports diagnostic monitoring.

If you notice that the alarm and warning flags have been set on a transceiver, reenter the command to confirm.
show interfaces transceiver

This example shows how to display diagnostic monitoring data for all interfaces with transceivers installed on the switch:

Switch# show interfaces transceiver
If device is externally calibrated, only calibrated values are printed.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).

<table>
<thead>
<tr>
<th>Port</th>
<th>Temperature (Celsius)</th>
<th>Voltage (Volts)</th>
<th>Current (mA)</th>

<td>N/A</td>
</tr>
</tbody>
</table>

Switch#

**Note**
The value for the Optical Tx Power (in dBm) equals ten times log (Tx Power in mW). If the Tx Power value is 3 mW, then the Optical Tx Power value equals 10 * log (3), which equals 10 * .477 or 4.77 dBm. The Optical Rx Power value behaves similarly. If the Tx Power or the Rx Power is zero, then its dBm value is undefined and is shown as N/A (not applicable).

This example shows how to display detailed diagnostic monitoring data, including calibrated values, alarm and warning thresholds, A2D readouts, and alarm and warning flags. The A2D readouts are reported separately in parentheses only if they differ from the calibrated values:

Switch# show interfaces transceiver detail
mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are calibrated.

This example shows how to display the monitoring data for the transceivers on interface Gi1/2:

Switch# `show interfaces g1/2 transceiver`

ITU Channel 23 (1558.98 nm),
Transceiver is externally calibrated.
If device is externally calibrated, only calibrated values are printed.
++: high alarm, +: high warning, -: low warning, --: low alarm.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).

This example shows how to display detailed the monitoring data for the transceivers on interface Gi1/2:

Switch# `show interfaces g1/2 transceiver detail`

ITU Channel 23 (1558.98 nm),
Transceiver is externally calibrated.
mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable.
++: high alarm, +: high warning, -: low warning, --: low alarm.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are calibrated.

</table>
show interfaces trunk

To display port and module interface-trunk information, use the **show interfaces trunk** command.

```
show interfaces trunk [module mod]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module mod</td>
<td>(Optional) Limits the display to interfaces on the specified module; valid values are from 1 to 6.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a keyword, only information for trunking ports is displayed.

**Examples**

This example shows how to display interface-trunk information for module 5:

```
Switch# show interfaces trunk module 5

Port     Mode         Encapsulation  Status        Native vlan
Fa5/1    routed       negotiate      routed        1
Fa5/2    routed       negotiate      routed        1
Fa5/3    routed       negotiate      routed        1
Fa5/4    routed       negotiate      routed        1

This example shows how to display trunking information for active trunking ports:
show ip arp inspection

To show the status of dynamic ARP inspection for a specific range of VLANs, use the `show ip arp inspection` command.

```
show ip arp inspection { [statistics] vlan vlan-range | interfaces [interface-name] }
```

**Syntax Description**

- **statistics** (Optional) Displays statistics for the following types of packets that have been processed by this feature: forwarded, dropped, MAC validation failure, and IP validation failure.

- **vlan vlan-range** (Optional) When used with the `statistics` keyword, displays the statistics for the selected range of VLANs. Without the `statistics` keyword, displays the configuration and operating state of DAI for the selected range of VLANs.

- **interfaces interface-name** (Optional) Displays the trust state and the rate limit of ARP packets for the provided interface. When the interface name is not specified, the command displays the trust state and rate limit for all applicable interfaces in the system.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

**Release** | **Modification**
------------ | ---------------
12.1(8a)EW   | Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to display the prefixes for a specific VLAN:

```
Switch# show ip cef vlan 1003
Prefix      Next Hop     Interface
0.0.0.0/0    172.20.52.1  FastEthernet3/3
0.0.0.0/32   receive     receive
10.7.0.0/16  172.20.52.1  FastEthernet3/3
10.16.18.0/23 172.20.52.1 FastEthernet3/3
Switch#
```

This example shows how to display detailed IP CEF information for a specific VLAN:

```
Switch# show ip cef vlan 1003 detail
IP Distributed CEF with switching (Table Version 2364), flags=0x0
1383 routes, 0 reresolve, 0 unresolved (0 old, 0 new)
1383 leaves, 201 nodes, 380532 bytes, 2372 inserts, 989 invalidations
0 load sharing elements, 0 bytes, 0 references
universal per-destination load sharing algorithm, id 9B6C9823
3 CEF resets, 0 revisions of existing leaves
refcounts: 54276 leaf, 51712 node

Adjacency Table has 5 adjacencies
Switch#
```
show ip dhcp snooping

To display the DHCP snooping configuration, use the `show ip dhcp snooping` command.

```
show ip dhcp snooping
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for option 82 on untrusted ports was added.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the DHCP snooping configuration:

```
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled
DHCP snooping is configured on following VLANs: 500,555
DHCP snooping is operational on following VLANs: 500,555
DHCP snooping is configured on the following L3 Interfaces:
Insertion of option 82 is enabled
circuit-id default format: vlan-mod-port
remote-id: switch123 (string)
Option 82 on untrusted port is not allowed Verification of hwaddr field is enabled DHCP snooping trust/rate is configured on the following Interfaces:
Interface Trusted Rate limit (pps)
------------------------ ------- ----------------
FastEthernet5/1 yes 100
Custom circuit-ids:
VLAN 555: customer-555
FastEthernet2/1 no unlimited
Custom circuit-ids:
VLAN 500: customer-500
Switch#
```
show ip dhcp snooping binding

Command Description
---- ------------------
**ip dhcp snooping** Globally enables DHCP snooping.
**ip dhcp snooping information option** Enables DHCP option 82 data insertion.
**ip dhcp snooping limit rate** Configures the number of the DHCP messages that an interface can receive per second.
**ip dhcp snooping trust** Enables DHCP snooping on a trusted VLAN.
**ip dhcp snooping vlan** Enables DHCP snooping on a VLAN or a group of VLANs.

To display the DHCP snooping binding entries, use the `show ip dhcp snooping binding` command.

```
show ip dhcp snooping binding [ip-address] [mac-address] [vlan vlan_num]
[interface interface_num]
```

**Syntax Description**

- **ip-address**: (Optional) IP address for the binding entries.
- **mac-address**: (Optional) MAC address for the binding entries.
- **vlan vlan_num**: (Optional) Specifies a VLAN.
- **interface interface_num**: (Optional) Specifies an interface.

**Defaults**

If no argument is specified, the switch will display the entire DHCP snooping binding table.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

DHCP snooping is enabled on a VLAN only if both the global snooping and the VLAN snooping are enabled.

To configure a range of VLANs, use the optional `last_vlan` argument to specify the end of the VLAN range.

**Examples**

This example shows how to display the DHCP snooping binding entries for a switch:

```
Switch# show ip dhcp snooping binding
MacAddress IP Address Lease (seconds) Type VLAN Interface
-------- --------- ----------------- ----- ------ ----------------
0000.0100.0201 10.0.0.1 1600 dhcp-snooping 100 FastEthernet3/1
Switch#
```

This example shows how to display an IP address for DHCP snooping binding entries:
## show ip dhcp snooping binding

```
Switch# show ip dhcp snooping binding 172.100.101.102

<table>
<thead>
<tr>
<th>MacAddress</th>
<th>IP Address</th>
<th>Lease (seconds)</th>
<th>Type</th>
<th>VLAN</th>

</tbody>
</table>
show ip igmp interface

To view IP IGMP interface status and configuration information, use the `show ip igmp interface` command.

```
show ip igmp interface [fastethernet slot/port | gigabitethernet slot/port | tengigabitethernet slot/port | null interface-number | vlan vlan_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastethernet slot/port</td>
<td>(Optional) Specifies the Fast Ethernet interface and the number of the slot and port.</td>
</tr>
<tr>
<td>gigabitethernet slot/port</td>
<td>(Optional) Specifies the Gigabit Ethernet interface and the number of the slot and port; valid values are from 1 to 9.</td>
</tr>
<tr>
<td>tengigabitethernet slot/port</td>
<td>(Optional) Specifies the 10-Gigabit Ethernet interface and the number of the slot and port; valid values are from 1 to 2.</td>
</tr>
<tr>
<td>null interface-number</td>
<td>(Optional) Specifies the null interface and the number of the interface; the only valid value is 0.</td>
</tr>
<tr>
<td>vlan vlan_id</td>
<td>(Optional) Specifies the VLAN and the number of the VLAN; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

If you do not specify a VLAN, information for VLAN 1 is shown.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you omit the optional arguments, the `show ip igmp interface` command displays information about all interfaces.

**Examples**

This example shows how to view IGMP information for VLAN 200:

```
Switch# show ip igmp interface vlan 200
IGMP snooping is globally enabled
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP-ONLY mode on this VLAN
Switch#
```
## show ip igmp interface

The `show ip igmp interface` command displays IGMP statistics for interfaces configured for IGMP snooping.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear ip igmp group</code></td>
<td>Deletes the IGMP group cache entries.</td>
</tr>
<tr>
<td><code>show ip igmp snooping mrouter</code></td>
<td>Displays information on the dynamically learned and manually configured multicast switch interfaces.</td>
</tr>
</tbody>
</table>
**show ip igmp profile**

To view all configured IGMP profiles or a specified IGMP profile, use the `show ip igmp profile` privileged EXEC command.

```
show ip igmp profile [profile number]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>profile number</code></td>
<td>(Optional) IGMP profile number to be displayed; valid ranges are from</td>
</tr>
<tr>
<td></td>
<td>1 to 4294967295.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If no profile number is entered, all IGMP profiles are displayed.

**Examples**

This example shows how to display IGMP profile 40:

```
Switch# show ip igmp profile 40
IGMP Profile 40
   permit
   range 233.1.1.1 233.255.255.255
Switch#
```

This example shows how to display all IGMP profiles:

```
Switch# show ip igmp profile
IGMP Profile 3
   range 230.9.9.0 230.9.9.0
IGMP Profile 4
   permit
   range 229.9.9.0 229.255.255.255
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp profile</td>
<td>Creates an IGMP profile.</td>
</tr>
</tbody>
</table>
show ip igmp snooping

To display information on dynamically learned and manually configured VLAN switch interfaces, use the `show ip igmp snooping` command.

```
show ip igmp snooping [querier | groups | mrouter] [vlan vlan_id] a.b.c.d [summary | sources | hosts] [count]
```

**Syntax Description**

- **querier** (Optional) Specifies that the display will contain IP address and version information.
- **groups** (Optional) Specifies that the display will list VLAN members sorted by group IP addresses.
- **mrouter** (Optional) Specifies that the display will contain information on dynamically learned and manually configured multicast switch interfaces.
- **vlan vlan_id** (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.
- **a.b.c.d** Group or multicast IP address.
- **summary** (Optional) Specifies a display of detailed information for a v2 or v3 group.
- **sources** (Optional) Specifies a list of the source IPs for the specified group.
- **hosts** (Optional) Specifies a list of the host IPs for the specified group.
- **count** (Optional) Specifies a display of the total number of group addresses learned by the system on a global or per-VLAN basis.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

- **Release** | **Modification**
  - 12.1(8a)EW | Support for this command was introduced on the Catalyst 4500 series switch.
  - 12.1(19)EW | Support for extended addressing was added.
  - 12.1(20)EW | Added support to display configuration state for IGMPv3 explicit host tracking.

**Usage Guidelines**

You can also use the `show mac-address-table multicast` command to display the entries in the MAC address table for a VLAN that has IGMP snooping enabled.

You can display IGMP snooping information for VLAN interfaces by entering the `show ip igmp snooping` command.
Examples

This example shows how to display the global snooping information on the switch:

Switch# `show ip igmp snooping`
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping             : Enabled
IGMPv3 snooping           : Enabled
Report suppression        : Enabled
TCN solicit query         : Disabled
TCN flood query count     : 2

Vlan 1:  
--------
IGMP snooping                  : Enabled
IGMPv2 immediate leave         : Disabled
Explicit host tracking         : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode     : IGMP_ONLY

Vlan 2:  
--------
IGMP snooping                  : Enabled
IGMPv2 immediate leave         : Disabled
Explicit host tracking         : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode     : IGMP_ONLY
Switch>

This example shows how to display the snooping information on VLAN 2:

Switch# `show ip igmp snooping vlan 2`
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping             : Enabled
IGMPv3 snooping           : Enabled
Report suppression        : Enabled
TCN solicit query         : Disabled
TCN flood query count     : 2

Vlan 2:  
--------
IGMP snooping                  : Enabled
IGMPv2 immediate leave         : Disabled
Explicit host tracking         : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode     : IGMP_ONLY
Switch>

This example shows how to display IGMP querier information for all VLANs on a switch:

Switch# `show ip igmp snooping querier`
Vlan   IP Address     IGMP Version Port
----------------- --------------- -------
2       10.10.10.1     v2       Router
3       172.20.50.22   v3       Fa3/15
Switch>
This example shows how to display IGMP querier information for VLAN 5 when running IGMPv2:

Switch# **show ip igmp snooping querier vlan 5**
| IP address               | :5.5.5.10  |
| IGMP version             | :v2       |
| Port                     | :Fa3/1    |
| Max response time        | :10s      |

Switch>

This example shows how to display IGMP querier information for VLAN 5 when running IGMPv3:

Switch# **show ip igmp snooping querier vlan 5**
| IP address               | :5.5.5.10  |
| IGMP version             | :v3       |
| Port                     | :Fa3/1    |
| Max response time        | :10s      |
| Query interval           | :60s      |
| Robustness variable      | :2        |

Switch>

This example shows how to display snooping information for a specific group:

Switch# **show ip igmp snooping group**

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Group</th>
<th>Version</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>224.0.1.40</td>
<td>v3</td>
<td>Router</td>
</tr>
<tr>
<td>2</td>
<td>224.2.2.2</td>
<td>v3</td>
<td>Fa6/2</td>
</tr>
</tbody>
</table>

Switch>

This example shows how to display the group’s host types and ports in VLAN 1:

Switch# **show ip igmp snooping group vlan 1**

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Group</th>
<th>Host Type</th>
<th>Ports</th>

show ip igmp snooping membership

To display host membership information, use the `show ip igmp snooping membership` command.

```
show ip igmp snooping membership [interface interface_num] [vlan vlan_id] [reporter a.b.c.d] [source a.b.c.d group a.b.c.d]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface</code></td>
<td>Displays IP address and version information of an interface.</td>
</tr>
<tr>
<td><code>interface_num</code></td>
<td>(Optional)</td>
</tr>
<tr>
<td><code>vlan</code></td>
<td>Displays VLAN members sorted by group IP address of a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.</td>
</tr>
<tr>
<td><code>vlan_id</code></td>
<td>(Optional)</td>
</tr>
<tr>
<td><code>reporter</code></td>
<td>Displays membership information for a specified reporter.</td>
</tr>
<tr>
<td><code>a.b.c.d</code></td>
<td>(Optional)</td>
</tr>
<tr>
<td><code>source</code></td>
<td>Specifies a reporter, source, or group IP address.</td>
</tr>
<tr>
<td><code>group</code></td>
<td>Displays all members of a channel (source, group), sorted by interface or VLAN.</td>
</tr>
<tr>
<td><code>a.b.c.d</code></td>
<td>(Optional)</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is valid only if explicit host tracking is enabled on the switch.

### Examples

This example shows how to display host membership for the Gigabit Ethernet interface 4/1:

```
Switch# show ip igmp snooping membership interface gigabitethernet4/1
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave
40.40.40.2/224.10.10.10 G4/1 20.20.20.20 00:23:37 00:06:50 00:20:30
40.40.40.4/224.10.10.10G4/1 20.20.20.20 00:39:42 00:09:17 -
Switch#
```

This example shows how to display host membership for VLAN 20 and group 224.10.10.10:

```
Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave
40.40.40.2/224.10.10.10 G4/1 20.20.20.20 00:23:37 00:06:50 00:20:30
Switch#
```
This example shows how to display host membership information for VLAN 20 and to delete the explicit host tracking:

```
Switch# show ip igmp snooping membership vlan 20
Snooping Membership Summary for Vlan 20
------------------------------------------
Total number of channels:5
Total number of hosts :4
Source/Group                   Interface   Reporter            Uptime   Last-Join/Last-Leave
---------------------------------------------------------------------------------------

**show ip igmp snooping mrouter**

To display information on the dynamically learned and manually configured multicast switch interfaces, use the `show ip igmp snooping mrouter` command.

```
show ip igmp snooping mrouter [vlan vlan-id]
```

**Syntax Description**

- `vlan vlan-id` (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use the `show mac-address-table multicast` command to display entries in the MAC address table for a VLAN that has IGMP snooping enabled.

You can display IGMP snooping information for the VLAN interfaces by entering the `show ip igmp interface vlan vlan-num` command.

**Examples**

This example shows how to display snooping information for a specific VLAN:

```
Switch# show ip igmp snooping mrouter vlan 1
vlan                ports
-------------------+----------------------------------------
1                  Gi1/1,Gi2/1,Fa3/48,Switch
Switch#
```

<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use the show mac-address-table multicast command to display the entries in the MAC address table for a VLAN that has IGMP snooping enabled.

**Examples**

This example shows how to display snooping information for a specific VLAN:

```
Switch# show ip igmp snooping vlan 2
vlan 2
--------
IGMP snooping is globally enabled
IGMP snooping TCN solicit query is globally enabled
IGMP snooping global TCN flood query count is 2
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMPONLY mode on this Vlan
Switch#
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EZ</td>
<td>Extended to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable. A usable interface is one through which the software can send and receive packets. If the software determines that an interface is not usable, it removes the directly connected routing entry from the routing table. Removing the entry allows the software to use dynamic routing protocols to determine backup routes to the network, if any.

If the interface can provide two-way communication, the line protocol is marked “up.” If the interface hardware is usable, the interface is marked “up.”

If you specify an optional interface type, you see information only on that specific interface.

If you specify no optional arguments, you see information on all the interfaces.

When an asynchronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP fast switching is enabled. The `show ip interface` command on an asynchronous interface that is encapsulated with PPP or SLIP displays a message indicating that IP fast switching is enabled.

Examples

This example shows how to display the usability status for a specific VLAN:

```
Switch# show ip interface vlan 1
Vlan1 is up, line protocol is up
  Internet address is 10.6.58.4/24
  Broadcast address is 255.255.255.255
  Address determined by non-volatile memory
  MTU is 1500 bytes
  Helper address is not set
  Directed broadcast forwarding is disabled
  Outgoing access list is not set
  Inbound access list is not set
  Proxy ARP is enabled
```
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachables are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Fast switching turbo vector
IP Normal CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Probe proxy name replies are disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
Sampled Netflow is disabled
IP multicast multilayer switching is disabled
Netflow Data Export (hardware) is enabled

Switch#

show ip mfib

To display all active Multicast Forwarding Information Base (MFIB) routes, use the `show ip mfib` command.

```
show ip mfib [all | counters | log [n]]
```

**Syntax Description**

- **all** (Optional) Specifies all routes in the MFIB, including those routes that are used to accelerate fast switching but that are not necessarily in the upper-layer routing protocol table.
- **counters** (Optional) Specifies the counts of MFIB-related events. Only nonzero counters are shown.
- **log** (Optional) Specifies a log of the most recent number of MFIB-related events. The most recent event is first.
- **n** (Optional) Number of events.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support for command introduced on the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the Supervisor Engine 6-E and Catalyst 4900M chassis, the output of the `show ip mfib` command does not display any hardware counters.

The MFIB table contains a set of IP multicast routes; each route in the MFIB table contains several flags that associate to the route.

The route flags indicate how a packet that matches a route is forwarded. For example, the IC flag on an MFIB route indicates that some process on the switch needs to receive a copy of the packet. These flags are associated with MFIB routes:

- **Internal Copy (IC) flag**—Set on a route when a process on the switch needs to receive a copy of all packets matching the specified route.
- **Signaling (S) flag**—Set on a route when a switch process needs notification that a packet matching the route is received. In the expected behavior, the protocol code updates the MFIB state in response to having received a packet on a signaling interface.
- **Connected (C) flag**—When set on a route, the C flag has the same meaning as the S flag, except that the C flag indicates that only packets sent by directly connected hosts to the route should be signaled to a protocol process.
A route can also have a set of flags associated with one or more interfaces. For an (S,G) route, the flags on interface 1 indicate how the ingress packets should be treated and whether packets matching the route should be forwarded onto interface 1. These per-interface flags are associated with the MFIB routes:

- **Accepting (A)**—Set on the RPF interface when a packet that arrives on the interface and that is marked as Accepting (A) is forwarded to all Forwarding (F) interfaces.

- **Forwarding (F)**—Used with the A flag as described above. The set of forwarding interfaces together form a multicast output interface list.

- **Signaling (S)**—Set on an interface when a multicast routing protocol process in Cisco IOS needs to be notified of ingress packets on that interface.

- **Not Platform (NP) fast-switched**—Used with the F flag. A forwarding interface is also marked as Not Platform fast-switched whenever that output interface cannot be fast-switched by the platform hardware and requires software forwarding.

For example, the Catalyst 4506 switch with Supervisor Engine III cannot switch tunnel interfaces in hardware so these interfaces are marked with the NP flag. When an NP interface is associated with a route, a copy of every ingress packet arriving on an Accepting interface is sent to the switch software forwarding path for software replication and then forwarded to the NP interface.

### Examples

This example shows how to display all active MFIB routes:

```
Switch# show ip mfib
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IC - Internal Copy
Interface Flags: A - Accept, F - Forward, NS - Signal, NP - Not platform switched
Packets: Fast/Partial/Slow Bytes: Fast/Partial/Slow:
(171.69.10.13, 224.0.1.40), flags (IC)

<tr>
<td><code>host_address</code></td>
<td>(Optional) Displays the rate that active sources are sending to multicast groups.</td>
</tr>
<tr>
<td><code>source</code></td>
<td>(Optional) Minimum rate at which active sources are sending to multicast groups; active sources sending at this rate or greater will be displayed. Valid values are from 1 to 4294967295 kbps.</td>
</tr>
<tr>
<td><code>active</code></td>
<td>(Optional) Displays the route and packet count information.</td>
</tr>
<tr>
<td><code>kbps</code></td>
<td>(Optional) Displays the pruned routes.</td>
</tr>
<tr>
<td><code>interface_type</code></td>
<td>(Optional) Displays the static multicast routes.</td>
</tr>
<tr>
<td><code>num</code></td>
<td>(Optional) Displays a one-line, abbreviated summary of each entry in the IP multicast routing table.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release       Modification
12.1(8a)EW     Support for this command was introduced on the Catalyst 4500 series switch.
12.2(25)EW     Added support for the 10-Gigabit Ethernet interface.
```

**Usage Guidelines**

If you omit all the optional arguments and keywords, the `show ip mroute` command displays all the entries in the IP multicast routing table.

The `show ip mroute active kbps` command displays all the sources sending at a rate greater than or equal to `kbps`.

The multicast routing table is populated by creating source, group (S,G) entries from star, group (*,G) entries. The star refers to all source addresses, the “S” refers to a single source address, and the “G” refers to the destination multicast group address. In creating (S,G) entries, the software uses the best path to that destination group found in the unicast routing table (through Reverse Path Forwarding (RPF)).
This example shows how to display all the entries in the IP multicast routing table:

```
Switch# show ip mroute

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, s - SSM Group, C - Connected, L - Local,
P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running
A - Advertised via MSDP, U - URD, I - Received Source Specific Host Report
Outgoing interface flags:H - Hardware switched
Timers:Uptime/Expires
Interface state:Interface, Next-Hop or VCD, State/Mode

(*, 230.13.13.1), 00:16:41/00:00:00, RP 10.15.1.20, flags:SJC
Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20
Outgoing interface list:
  GigabitEthernet4/9, Forward/Sparse-Dense, 00:16:41/00:00:00, H

(10.20.1.15, 230.13.13.1), 00:14:31/00:01:40, flags:CJT
Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD
Outgoing interface list:
  GigabitEthernet4/9, Forward/Sparse-Dense, 00:14:31/00:00:00, H

Switch#
```

This example shows how to display the rate that the active sources are sending to the multicast groups and to display only the active sources that are sending at greater than the default rate:

```
Switch# show ip mroute active

Active IP Multicast Sources - sending > = 4 kbps

Group: 224.2.127.254, (edr.cisco.com)
  Source: 146.137.28.69 (mbone.ipd.anl.gov)
  Rate: 1 pps/4 kbps(lsec), 4 kbps(last 1 secs), 4 kbps(life avg)

Group: 224.2.201.241, ACM 97
  Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
  Rate: 9 pps/93 kbps(lsec), 145 kbps(last 20 secs), 85 kbps(life avg)

Group: 224.2.207.215, ACM 97
  Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
  Rate: 3 pps/31 kbps(lsec), 63 kbps(last 19 secs), 65 kbps(life avg)

Switch#
```
This example shows how to display route and packet count information:

Switch# `show ip mroute count`
IP Multicast Statistics
56 routes using 28552 bytes of memory
13 groups, 3.30 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second

Other counts: Total/RPF failed/Other drops (OIF-null, rate-limit etc)

Group: 224.2.136.89, Source count: 1, Group pkt count: 29051
Source: 132.206.72.28/32, Forwarding: 29051/-278/1186/0, Other: 85724/8/56665
Switch#

This example shows how to display summary information:

Switch# `show ip mroute summary`
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, s - SSM Group, C - Connected, L - Local,
P - Pruned, R - Rp-bit set, F - Register flag, T - SPT-bit set,
J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running
A - Advertised via MSDP, U - URD, I - Received Source Specific Host Report
Outgoing interface flags: H - Hardware switched
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

Switch#

show ip mroute

Table 2-29 show ip mroute Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>J - Join SPT</td>
<td>For (<em>, G) entries, indicates that the rate of traffic flowing down the shared tree is exceeding the SPT-Threshold set for the group. (The default SPT-Threshold setting is 0 kbps.) When the J - Join SPT flag is set, the next (S,G) packet received down the shared tree triggers an (S,G) join in the direction of the source causing the switch to join the source tree. For (S, G) entries, indicates that the entry was created because the SPT-Threshold for the group was exceeded. When the J - Join SPT flag is set for (S,G) entries, the switch monitors the traffic rate on the source tree and attempts to switch back to the shared tree for this source if the traffic rate on the source tree falls below the group’s SPT-Threshold for more than one minute. The switch measures the traffic rate on the shared tree and compares the measured rate to the group’s SPT-Threshold once every second. If the traffic rate exceeds the SPT-Threshold, the J- Join SPT flag is set on the (</em>, G) entry until the next measurement of the traffic rate. The flag is cleared when the next packet arrives on the shared tree and a new measurement interval is started. If the default SPT-Threshold value of 0 Kbps is used for the group, the J- Join SPT flag is always set on (*, G) entries and is never cleared. When the default SPT-Threshold value is used, the switch immediately switches to the shortest-path tree when traffic from a new source is received.</td>

<tr>
<td>Incoming interface</td>
<td>Expected interface for a multicast packet from the source. If the packet is not received on this interface, it is discarded.</td>
</tr>
<tr>
<td>RPF neighbor</td>
<td>IP address of the upstream switch to the source. “Tunneling” indicates that this switch is sending data to the RP encapsulated in Register packets. The hexadecimal number in parentheses indicates to which RP it is registering. Each bit indicates a different RP if multiple RPs per group are used.</td>
</tr>
<tr>
<td>DVMRP or Mroute</td>
<td>Status of whether the RPF information is obtained from the DVMRP routing table or the static mroutes configuration.</td>
</tr>
<tr>
<td>Outgoing interface list</td>
<td>Interfaces through which packets are forwarded. When the <code>ip pim nbma-mode</code> command is enabled on the interface, the IP address of the PIM neighbor is also displayed.</td>
</tr>
<tr>
<td>Ethernet0</td>
<td>Name and number of the outgoing interface.</td>
</tr>
<tr>
<td>Next hop or VCD</td>
<td>Next hop specifies downstream neighbor’s IP address. VCD specifies the virtual circuit descriptor number. VCD0 indicates that the group is using the static-map virtual circuit.</td>
</tr>
<tr>
<td>Forward/Dense</td>
<td>Status of the packets; indicates if they are they forwarded on the interface if there are no restrictions due to access lists or the TTL threshold. Following the slash (/), mode in which the interface is operating (dense or sparse).</td>
</tr>
<tr>
<td>Forward/Sparse</td>
<td>Sparse mode interface is in forward mode.</td>
</tr>
<tr>
<td>time/time (uptime/expiration time)</td>
<td>Per interface, how long (in hours, minutes, and seconds) the entry has been in the IP multicast routing table. Following the slash (/), how long (in hours, minutes, and seconds) until the entry is removed from the IP multicast routing table.</td>
</tr>
</tbody>
</table>

show ip source binding

To display IP source bindings that are configured on the system, use the **show ip source binding** EXEC command.

```
show ip source binding [ip-address] [mac-address] [dhcp-snooping | static] [vlan vlan-id] [interface interface-name]
```

### Syntax Description
- **ip-address**: (Optional) Binding IP address.
- **mac-address**: (Optional) Binding MAC address.
- **dhcp-snooping**: (Optional) DHCP-snooping type binding.
- **static**: (Optional) Statically configured binding.
- **vlan vlan-id**: (Optional) VLAN number.
- **interface interface-name**: (Optional) Binding interface.

### Defaults
Displays both static and DHCP snooping bindings.

### Command Modes
Privileged EXEC mode

### Command History
**Release** | **Modification**
--- | ---
12.1(19)EW | Support for this command was introduced on the Catalyst 4500 series switch.

### Usage Guidelines
The optional parameters filter the display output result.

### Examples
This example shows how to display the IP source bindings:

```
Switch# show ip source binding
MacAddress        IpAddress        Lease(sec)  Type     VLAN  Interface
------------------  ---------------  ----------  ---------  ----  -------------------
00:00:00:0A:00:0B  11.0.0.1         infinite  static   10    FastEthernet6/10
Switch#
```

This example shows how to display the static IP binding entry of IP address 11.0.01:

```
Switch# show ip source binding 11.0.0.1 0000.000A.000B static vlan 10 interface Fa6/10
```

### Related Commands

show ip verify source

To display the IP source guard configuration and filters on a particular interface, use the `show ip verify source` command.

```
show ip verify source [interface interface_num]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface_num</td>
<td>(Optional) Specifies an interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

These examples show how to display the IP source guard configuration and filters on a particular interface with the `show ip verify source interface` command:

- This output appears when DHCP snooping is enabled on VLANs 10–20, interface fa6/1 has IP source filter mode that is configured as IP, and an existing IP address binding 10.0.0.1 is on VLAN 10:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>10.0.0.1</td>
<td></td>
<td>10</td>
</tr>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>deny-all</td>
<td></td>
<td>11-20</td>
</tr>
</tbody>
</table>

  **Note** The second entry shows that a default PVACL (deny all IP traffic) is installed on the port for those snooping-enabled VLANs that do not have a valid IP source binding.

- This output appears when you enter the `show ip verify source interface fa6/2` command and DHCP snooping is enabled on VLANs 10–20, interface fa6/1 has IP source filter mode that is configured as IP, and there is an existing IP address binding 10.0.0.1 on VLAN 10:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/2</td>
<td>ip</td>
<td>inactive-trust-port</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This output appears when you enter the `show ip verify source interface fa6/3` command and the interface fa6/3 does not have a VLAN enabled for DHCP snooping:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/3</td>
<td>ip</td>
<td>inactive-no-snooping-vlan</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
show ip verify source

- This output appears when you enter the `show ip verify source interface fa6/4` command and the interface fa6/4 has an IP source filter mode that is configured as IP MAC and the existing IP MAC that binds 10.0.0.2/aaaa.bbbb.ccce on VLAN 10 and 11.0.0.1/aaaa.bbbb.cccd on VLAN 11:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.2</td>
<td>aaaa.bbbb.ccce</td>
<td>10</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>11.0.0.1</td>
<td>aaaa.bbbb.cccd</td>
<td>11</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>deny-all</td>
<td>12-20</td>
</tr>
</tbody>
</table>

- This output appears when you enter the `show ip verify source interface fa6/5` command and the interface fa6/5 has IP source filter mode that is configured as IP MAC and existing IP MAC binding 10.0.0.3/aaaa.bbbb.ccce on VLAN 10, but port security is not enabled on fa6/5:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.3</td>
<td>permit-all</td>
<td>10</td>
</tr>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>permit-all</td>
<td>11-20</td>
</tr>
</tbody>
</table>

**Note** Enable port security first because the DHCP security MAC filter cannot apply to the port or VLAN.

- This output appears when you enter the `show ip verify source interface fa6/6` command and the interface fa6/6 does not have IP source filter mode that is configured:

DHCP security is not configured on the interface fa6/6.

This example shows how to display all the interfaces on the switch that have DHCP snooping security and IP Port Security tracking enabled with the `show ip verify source` command.

The output is an accumulation of per-interface `show` CLIs:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/1</td>

show ip wccp

To display the Web Cache Communication Protocol (WCCP) global configuration and statistics, use the `show ip wccp` command in user EXEC or privileged EXEC mode.

```
show ip wccp [service-number [view | detail] | interfaces [cef | counts | detail] | web-cache]
```

### Syntax Description

- **service-number** *(Optional)*: Identification number of the web cache service group being controlled by the cache. The number can be from 0 to 254. For web caches using Cisco cache engines, the reverse proxy service is indicated by a value of 99.

- **interfaces** *(Optional)*: WCCP redirect interfaces.

- **cef** *(Optional)*: CEF interface statistics, including the number of input, output, dynamic, static, and multicast services.

- **counts** *(Optional)*: WCCP interface count statistics, including the number of CEF and process-switched output and input packets redirected.

- **detail** *(Optional)*: WCCP interface configuration statistics, including the number of input, output, dynamic, static, and multicast services.

- **web-cache** *(Optional)*: Statistics for the web cache service.

- **view** *(Optional)*: Other members of a particular service group, have or have not been detected.

- **detail** *(Optional)*: Information about the router and all web caches.

### Command Modes

- User EXEC (>
- Privileged EXEC (#)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>This command was introduced on Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Use the `clear ip wccp` command to reset the counter for the “Packets Redirected” information.

- Use the `show ip wccp service-number` command to get the “Total Packets S/W Redirected” count. The “Total Packets S/W Redirected” count is the number of packets redirected in software.

- Use the `show ip wccp service-number detail` command to get the “Packets Redirected” count. The “Packets Redirected” count is the number of packets redirected in software.

- Use the `show ip wccp web-cache detail` command to get an indication of which traffic is redirected to which cache engine.

- Use the `show ip wccp` command to show the configured WCCP services and a summary of their current state.

- For cache-engine clusters using Cisco cache engines, the reverse proxy `service-number` is indicated by a value of 99.

- All the packet statistics correspond to packets switched in software.
Examples

This section contains examples and field descriptions for the following forms of this command:

- `show ip wccp service-number`
- `show ip wccp service-number view`
- `show ip wccp service-number detail`
- `show ip wccp interfaces`
- `show ip wccp web-cache`
- `show ip wccp web-cache detail`
- `show ip wccp`

`show ip wccp service-number`

The following is sample output from the `show ip wccp service-number` command:

```
Switch# show ip wccp 90
Global WCCP information:
  Router information:
    Router Identifier:                   100.1.1.16
    Protocol Version:                    2.0
  Service Identifier: 90
  Number of Service Group Clients:     1
  Number of Service Group Routers:     1
  Total Packets s/w Redirected:        0
    Process:                           0
    CEF:                               0
    Redirect Access-list:                -none-
  Total Packets Denied Redirect:       0
  Total Packets Unassigned:            0
  Group Access-list:                   -none-
  Total Messages Denied to Group:      0
  Total Authentication failures:        0
  Total Bypassed Packets Received:     0
```

Table 30 describes the significant fields shown in the display.

**Table 30  `show ip wccp service-number` Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router information</td>
<td>A list of routers detected by the current router.</td>
</tr>
<tr>
<td>Protocol Version</td>
<td>The version of WCCP being used by the router in the service group.</td>

</tbody>
</table>
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

show ip wccp

The following is sample output from the `show ip wccp` command for service group 1:

```
Switch# show ip wccp 1 view
WCCP Router Informed of:
   10.168.88.10
   10.168.88.20
WCCP Cache Engines Visible
   10.168.88.11
   10.168.88.12
WCCP Cache Engines Not Visible:
   -none-
```

Note
The number of maximum service groups that can be configured is 256.

If any web cache is displayed under the WCCP Cache Engines Not Visible field, the router needs to be reconfigured to map the web cache that is not visible to it.

Table 31 describes the significant fields shown in the display.

### Table 30  show ip wccp service-number Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Packets Unassigned</td>
<td>Number of packets that were not redirected because they were not assigned to any cache engine. Packets may not be assigned during initial discovery of cache engines or when a cache is dropped from a cluster.</td>
</tr>
<tr>
<td>Group Access-list</td>
<td>Indicates which cache engine is allowed to connect to the router.</td>
</tr>
<tr>
<td>Total Messages Denied to Group</td>
<td>Indicates the number of packets denied by the <code>group-list</code> access list.</td>
</tr>
<tr>
<td>Total Authentication failures</td>
<td>The number of instances where a password did not match.</td>
</tr>
<tr>
<td>Total Bypassed Packets Received</td>
<td>The number of packets that have been bypassed. Process, fast, and Cisco Express Forwarding (CEF) are switching paths within Cisco IOS software.</td>
</tr>
</tbody>
</table>

### show ip wccp service-number view

The following is sample output from the `show ip wccp service-number view` command for service group 1:

```
WCCP Router Informed of:
   10.168.88.10
   10.168.88.20
WCCP Cache Engines Visible
   10.168.88.11
   10.168.88.12
WCCP Cache Engines Not Visible:
   -none-
```

The number of maximum service groups that can be configured is 256.

If any web cache is displayed under the WCCP Cache Engines Not Visible field, the router needs to be reconfigured to map the web cache that is not visible to it.

### Table 31  show ip wccp service-number view Field Descriptions

<table>
<thead>
<tr>

show ipc

To display IPC information, use the **show ipc** command.

```
show ipc {nodes | ports | queue | status}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodes</td>
<td>Displays the participating nodes.</td>
</tr>
<tr>
<td>ports</td>
<td>Displays the local IPC ports.</td>
</tr>
<tr>
<td>queue</td>
<td>Displays the contents of the IPC retransmission queue.</td>
</tr>
<tr>
<td>status</td>
<td>Displays the status of the local IPC server.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the participating nodes:

```
Switch# show ipc nodes
There are 3 nodes in this IPC realm.
   ID   Type           Name                  Last Sent Last Heard
10000 Local IPC Master                               0      0
2010000 Local GALIOS IPC:Card 1                        0      0
2020000 Ethernet GALIOS IPC:Card 2                        12     26
Switch#
```

This example shows how to display the local IPC ports:

```
Switch# show ipc ports
There are 11 ports defined.

Port ID   Type   Name                      (current/peak/total)
10000.1 unicast IPC Master:Zone
10000.2 unicast IPC Master:Echo
10000.3 unicast IPC Master:Control
10000.4 unicast Remote TTY Server Port
10000.5 unicast GALIOS RF :Active
   index = 0  seat_id = 0x2020000  last sent = 0  heard = 1635  0/1/1635
10000.6 unicast GALIOS RED:Active
   index = 0  seat_id = 0x2020000  last sent = 0  heard = 2      0/1/2
2020000.3 unicast GALIOS IPC:Card 2:Control
2020000.4 unicast GALIOS RFS :Standby
2020000.5 unicast Slave: Remote TTY Client Port
2020000.6 unicast GALIOS RF :Standby
2020000.7 unicast GALIOS RED:Standby
```
show ipc

RPC packets: current/peak/total 0/1/17

Switch#

This example shows how to display the contents of the IPC retransmission queue:

Switch# show ipc queue
There are 0 IPC messages waiting for acknowledgement in the transmit queue.
There are 0 IPC messages waiting for a response.
There are 0 IPC messages waiting for additional fragments.
There are 0 IPC messages currently on the IPC inboundQ.
There are 0 messages currently in use by the system.
Switch#

This example shows how to display the status of the local IPC server:

Switch# show ipc status
IPC System Status:

This processor is the IPC master server.

6000 IPC message headers in cache
3363 messages in, 1680 out, 1660 delivered to local port,
1686 acknowledgements received, 1675 sent,
0 NACKS received, 0 sent,
0 messages dropped on input, 0 messages dropped on output
0 no local port, 0 destination unknown, 0 no transport
0 missing callback or queue, 0 duplicate ACKs, 0 retries,
0 message timeouts.
0 ipc_output failures, 0 mtu failures,
0 msg alloc failed, 0 emer msg alloc failed, 0 no origs for RPC replies
0 pak alloc failed, 0 memd alloc failed
0 no hwq, 1 failed opens, 0 hardware errors
No regular dropping of IPC output packets for test purposes
Switch#
show ipv6 snooping counters

To display the number of packets dropped per port due to RA Guard, use the show ipv6 snooping counters interface command.

    show ipv6 snooping counters interface

Syntax Description

<table>
<thead>

**show ipv6 mld snooping**

To display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping configuration of the switch or the VLAN, use the `show ipv6 mld snooping` command.

```plaintext
show ipv6 mld snooping [vlan vlan-id]
```

**Syntax Description**

| `vlan vlan-id` | (Optional) Specifies a VLAN; the range is 1 to 1001 and 1006 to 4094. |

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display MLD snooping configuration for the switch or for a specific VLAN. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping vlan` command. It shows snooping characteristics for a specific VLAN.

```plaintext
Switch> show ipv6 mld snooping vlan 100
Global MLD Snooping configuration:
-----------------------------------------------
MLD snooping                  : Enabled
MLDv2 snooping (minimal)      : Enabled
Listener message suppression  : Enabled
TCN solicit query            : Disabled
TCN flood query count        : 2
Robustness variable          : 3
Last listener query count    : 2
Last listener query interval : 1000

Vlan 100:
--------
MLD snooping                  : Disabled
MLDv1 immediate leave         : Disabled
Explicit host tracking        : Enabled
Multicast router learning mode: pim-dvmrp
Robustness variable          : 3
Last listener query count    : 2
Last listener query interval : 1000
```

This is an example of output from the `show ipv6 mld snooping` command. It displays snooping characteristics for all VLANs on the switch.

```plaintext
Switch> show ipv6 mld snooping
Global MLD Snooping configuration:
-----------------------------------------------
MLD snooping                  : Enabled
MLDv2 snooping (minimal)      : Enabled
Listener message suppression  : Enabled
TCN solicit query            : Disabled
TCN flood query count        : 2
Robustness variable          : 3
Last listener query count    : 2
Last listener query interval : 1000
```
### show ipv6 mld snooping

MLD snooping : Enabled  
MLDv2 snooping (minimal) : Enabled  
Listener message suppression : Enabled  
TCN solicit query : Disabled  
TCN flood query count : 2  
Robustness variable : 3  
Last listener query count : 2  
Last listener query interval : 1000

Vlan 1:  
--------  
MLD snooping : Disabled  
MLDv1 immediate leave : Disabled  
Explicit host tracking : Enabled  
Multicast router learning mode : pim-dvmrp  
Robustness variable : 1  
Last listener query count : 2  
Last listener query interval : 1000

Vlan 951:  
--------  
MLD snooping : Disabled  
MLDv1 immediate leave : Disabled  
Explicit host tracking : Enabled  
Multicast router learning mode : pim-dvmrp

<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display MLD snooping switch ports for the switch or for a specific VLAN. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping mrouter` command. It displays snooping characteristics for all VLANs on the switch that are participating in MLD snooping.

```
Switch> show ipv6 mld snooping mrouter
Vlan  ports
----  -----
   2  Gi1/0/11(dynamic)
   72 Gi1/0/11(dynamic)
  200 Gi1/0/11(dynamic)
```

This is an example of output from the `show ipv6 mld snooping mrouter vlan` command. It shows multicast switch ports for a specific VLAN.

```
Switch> show ipv6 mld snooping mrouter vlan 100
Vlan  ports
----  -----
   2  Gi1/0/11(dynamic)
```

**Related Commands**

<td>ipv6 mld snooping vlan</td>
<td>Configures IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping parameters on the VLAN interface.</td>
</tr>
</tbody>
</table>
show ipv6 mld snooping querier

To display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping querier-related information most recently received by the switch or the VLAN, use the `show ipv6 mld snooping querier` command.

```
show ipv6 mld snooping querier [vlan vlan-id]
```

**Syntax Description**

| vlan vlan-id | (Optional) Specifies a VLAN; the range is 1 to 1001 and 1006 to 4094. |

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ipv6 mld snooping querier` command to display the MLD version and IPv6 address of a detected device that sends MLD query messages, which is also called a querier. A subnet can have multiple multicast switches but has only one MLD querier. The querier can be a Layer 3 switch.

The `show ipv6 mld snooping querier` command output also shows the VLAN and interface on which the querier was detected. If the querier is the switch, the output shows the Port field as `Router`. If the querier is a router, the output shows the port number on which the querier is learned in the Port field.

The output of the `show ipv6 mld snooping querier vlan` command displays the information received in response to a query message from an external or internal querier. It does not display user-configured VLAN values, such as the snooping robustness variable on the particular VLAN. This querier information is used only on the MASQ message that is sent by the switch. It does not override the user-configured robustness variable that is used for aging out a member that does not respond to query messages.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping querier` command:

```
Switch> show ipv6 mld snooping querier
Vlan     IP Address             MLD Version Port
-------------------------------------------------------------
2        FE80::201:C9FF:FE40:6000 v1    Gi3/0/1
```

This is an example of output from the `show ipv6 mld snooping querier vlan` command:

```
Switch> show ipv6 mld snooping querier vlan 2
IP address : FE80::201:C9FF:FE40:6000
MLD version : v1
Port : Gi3/0/1
Max response time : 1000s
```

show issu capability

To display the ISSU capability for a client, use the **show issu capability** command.

```
show issu capability {entries | groups | types} [client_id]
```

**Syntax Description**

- **entries**: Displays a list of Capability Types and Dependent Capability Types that are included in a single Capability Entry. Types within an entry can also be independent.
- **groups**: Displays a list of Capability Entries in priority order (the order that they will be negotiated on a session).
- **types**: Displays an ID that identifies a particular capability.
- **client_id** *(Optional)*: Identifies the client registered to the ISSU infrastructure. To obtain a list of client IDs, use the **show issu clients** command.

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Capability is a functionality that an ISSU client can support and is required to interoperate with peers. When an ISSU-aware client establishes its session with the peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

**Examples**

The following example shows how to display the ISSU capability types for the IP host ISSU client (clientid=2082):

```
Switch# show issu capability types 2082
Client_ID = 2082, Entity_ID = 1 :
        Cap_Type = 0
Switch#
```

The following example shows how to display the ISSU capabilities entries for the IP host ISSU client (clientid=2082):

```
Switch# show issu capability entries 2082
Client_ID = 2082, Entity_ID = 1 :
        Cap_Entry = 1 :
                Cap_Type = 0
Switch#
```
The following example shows how to display the ISSU capabilities groups for the IP host ISSU client (clientid=2082):

```
Switch# show issu capability groups 2082
Client_ID = 2082, Entity_ID = 1 :
    Cap_Group = 1 :
    Cap_Entry = 1
    Cap_Type = 0
Switch#
```

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show issu clients</td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
**show issu clients**

To display the ISSU clients, use the `show issu clients` command.

```
show issu clients [peer_uid]
```

**Syntax Description**

- `peer_uid` (Optional) Displays a list of clients registered to ISSU infrastructure at the peer supervisor engine.

**Defaults**

Displays a list of clients registered to the ISSU infrastructure at the supervisor engine where the command is entered.

**Command Modes**

User EXEC mode

**Command History**

- **Release** 12.2(31)SGA
  - This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

To implement ISSU versioning functionality, a client must first register itself, client capability, and client message information with the ISSU infrastructure during the system initialization.

**Examples**

The following example shows how to display the ISSU clients:

```
Switch# show issu clients
Client_ID = 2,  Client_Name = ISSU Proto client,  Entity_Count = 1
Client_ID = 3,  Client_Name = ISSU RF,  Entity_Count = 1
Client_ID = 4,  Client_Name = ISSU CF client,  Entity_Count = 1

</tbody>
</table>

**Usage Guidelines**

Before attempting an ISSU, you should know the compatibility level between the old and the new Cisco IOS software versions on the active and the standby supervisor engines. ISSU will not work if the two versions are incompatible.

The compatibility matrix is available on Cisco.com so that you can also view in advance whether an upgrade can be performed with the ISSU process. The compatibility matrix during the ISSU process and later by entering the show issu comp-matrix command. To display information on the negotiation of the compatibility matrix data between two software versions on a given system, use the show issu comp-matrix command.

Compatibility matrix data is stored with each Cisco IOS software image that supports ISSU capability. To display stored compatibility matrix information, use the show issu comp-matrix stored command.

The compatibility matrix information are built-in any Cisco IOS ISSU image. The ISSU infrastructure performs a matrix lookup as soon as the communication with the standby supervisor engine is established. There are three possible results from the lookup operation:

- **Compatible**—The Base-level system infrastructure and all optional HA-aware subsystems are compatible. In-service upgrade or downgrade between these versions will succeed with minimal service impact.
- **Base-Level Compatible**—One or more of the optional HA-aware subsystems are not compatible. Although an in-service upgrade or downgrade between these versions will succeed, some subsystems will not be able to maintain their state during the switchover. Prior to attempting an in-service upgrade or downgrade, the impact of this on operation and service of the switch must be considered carefully.
Incompatible—A set of core system infrastructure must be able to execute in a stateful manner for SSO to function correctly. If any of these “required” features or subsystems is not compatible in two different Cisco IOS images, the two versions of the Cisco IOS images are declared “Incompatible”. This means that an in-service upgrade or downgrade between these versions is not possible. The systems operate in RPR mode during the period when the versions of Cisco IOS at the active and standby supervisor engines differ.

### Examples

This example displays negotiated compatibility matrix information:

```
Switch# show issu comp-matrix negotiated
```

```

<td>show issu clients</td>
<td>Displays the ISSU clients.</td>
</tr>
<tr>
<td></td>
<td>show issu sessions</td>
<td>Displays ISSU session information for a specified client.</td>
</tr>
</tbody>
</table>
show issu endpoints

To display the ISSU endpoint information, use the `show issu endpoints` command.

```
show issu endpoints
```

**Syntax Description**

This command has no arguments or keywords

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Endpoint is an execution unit within a redundancy domain. There are only 2 endpoints on the Catalyst 4500 series switch redundant chassis: 1 and 2. The endpoints correspond to the slot numbers for the supervisor engine. The ISSU infrastructure communicates between these two endpoints to establish session and to perform session negotiation for ISSU clients.

**Examples**

The following example shows how to display the ISSU endpoints:

```
Switch# show issu endpoints
My_Unique_ID = 1/0x1,  Client_Count = 46

This endpoint communicates with 1 peer endpoints :

<table>
<thead>
<tr>
<th>Peer_Unique_ID</th>
<th>CAP</th>
<th>VER</th>
<th>XFORM</th>
<th>ERP</th>
<th>Compatibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>2/0x2</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>1</td>
<td>Same</td>
</tr>
</tbody>
</table>

Shared Negotiation Session Info :

- Nego_Session_ID = 15
- Nego_Session_Name = shared nego session
- Transport_Mtu = 4096
- Ses_In_Use = 2

Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show issu clients</td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
show issu entities

To display the ISSU entity information, use the `show issu entities` command.

```
show issu entities [client_id]
```

### Syntax Description

| client_id | (Optional) ISSU client ID. |

### Defaults

This command has no default settings.

### Command Modes

User EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Entity is a logical group of sessions with some common attributes (like capability list and message type). Currently, most ISSU clients on the Catalyst 4500 series switch have only one entity.

### Examples

The following example shows how to display the entity information for a specified ISSU client:

```
Switch# show issu entities 2072
Client_ID = 2072 :
    Entity_ID = 1, Entity_Name = ISSU dot1x entity : 
    MsgType MsgGroup CapType CapEntry CapGroup
    Count Count Count count Count
    28 1 1 1 1

Switch#
```

### Related Commands

<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show issu clients</code></td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
**show issu fsm**

*Note*  
This command is not intended for end-users.

To display the ISSU finite state machine (FSM) information corresponding to an ISSU session, use the `show issu fsm` command.

```
show issu fsm [session_id]
```

**Syntax Description**

- `session_id` (Optional) Provides detailed information about the FSM for the specified session.

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

- **Release** 12.2(31)SGA  
  - **Modification** This command was introduced on the Catalyst 4500 series switch.

**Examples**

The following example displays and verifies the ISSU state after LOADVERSION:

```
Switch# show issu fsm 26
Session_ID = 26 :
  FSM_Name          Curr_State  Old_State       Error_Reason
  FSM_L1            TRANS       A_VER           none
  FSM_L2_HELLO      EXIT        RCVD            none
  FSM_L2_A_CAP      A_EXIT      A_RSP           none
  FSM_L2_P_CAP      A_INIT      unknown        none
  FSM_L2_A_VER      A_EXIT      A_RES_RSP       none
  FSM_L2_P_VER      P_INIT      unknown        none
  FSM_L2_TRANS      COMP        COMP            none
Current FSM is FSM_L2_TRANS
Session is compatible
Negotiation started at 00:01:07.688, duration is 0.148 seconds
Switch#
```

**Related Commands**

</tbody>
</table>
show issu message

To display checkpoint messages for a specified ISSU client, use the show issu message command.

```
show issu message {groups | types} [client_id]
```

**Syntax Description**
- **groups**: Displays information on Message Group supported by the specified client.
- **types**: Displays information on all Message Types supported by the specified client.
- **client_id**: (Optional) Specifies a client ID.

**Defaults**
If client ID is not specified, displays message groups or message types information for all clients registered to the ISSU infrastructure.

**Command Modes**
User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Messages are sync-data (also known as checkpoint data) sent between two endpoints.

When an ISSU-aware client establishes its session with a peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

**Examples**
The following example shows how to display the message groups for Client_id 2082:

```
Switch#show issu message groups 2082
Client_ID = 2082,  Entity_ID = 1 :
  Message_Group = 1 :
    Message_Type = 1,  Version_Range = 1 ~ 2
    Message_Type = 2,  Version_Range = 1 ~ 2
Switch#
```

The following example shows how to display the message types for Client_id 2082:

```
Switch#show issu message types 2082
Client_ID = 2082,  Entity_ID = 1 :
  Message_Type = 1,  Version_Range = 1 ~ 2
    Message_Ver = 1,    Message_Mtu = 12
    Message_Ver = 2,    Message_Mtu = 8
  Message_Type = 2,  Version_Range = 1 ~ 2
    Message_Ver = 1,    Message_Mtu = 32
    Message_Ver = 2,    Message_Mtu = 28
Switch#
```
<table>

</tbody>
</table>
show issu negotiated

To display the negotiated capability and message version information of the ISSU clients, use the `show issu negotiated` command.

```
show issu negotiated [capability | version] [session_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capability</td>
<td>Displays all negotiated capabilities.</td>
</tr>
<tr>
<td>version</td>
<td>Displays details of all negotiated messages.</td>
</tr>
<tr>
<td>session_id</td>
<td>(Optional) Specifies the ISSU session ID for which the capability or version information is displayed.</td>
</tr>
</tbody>
</table>

**Defaults**

Displays negotiated capability or version information for all ISSU sessions.

**Command Modes**

User EXEC mode

**Command History**

Release Modification

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to display the message types for a specific group:

```
Switch# show issu negotiated capability 26
Session_ID = 26 :
    Cap_Type = 0,     Cap_Result = 1     No cap value assigned

Switch# show issu negotiated version 26
Session_ID = 26 :
    Message_Type = 1,  Negotiated_Version = 1,  Message_MTU = 44
    Message_Type = 2,  Negotiated_Version = 1,  Message_MTU = 4
```

**Related Commands**

show issu rollback-timer

To display ISSU rollback-timer status, use the `show issu rollback-timer` command.

```
show issu rollback-timer
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

```
Release          Modification
------------------------------------
12.2(31)SGA      This command was introduced on the Catalyst 4500 series switch.
```

**Examples**
The following example shows how to display the rollback-timer status:

```
Switch# show issu rollback-timer
     Rollback Process State = Not in progress
     Configured Rollback Time = 45:00
Switch#
```

**Related Commands**

```
Command                  Description
--------------------------------------------------------
issu acceptversion       Halts the rollback timer and ensures that the new Cisco IOS software image is not automatically stopped during the ISSU process.
issu runversion          Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified in the `issu loadversion` command.
```

show issu sessions

To display ISSU session information for a specified client, use the `show issu sessions` command.

`show issu sessions [client_id]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>client_id</code></td>
<td>(Optional) Specifies the ISSU client ID.</td>
</tr>
</tbody>
</table>

**Defaults**

Displays session information for all clients registered to the ISSU infrastructure.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Session is bidirectional and a reliable connection is established between two endpoints. Sync-data and negotiation messages are sent to the peer endpoint through a session. On a Catalyst 4500 series switch, each ISSU-aware client has a maximum of one session at each endpoint.

When an ISSU-aware client establishes its session with the peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

**Examples**

The following example shows how to display the rollback-timer status:

```
Switch#show issu sessions 2072
Client_ID = 2072, Entity_ID = 1 :

*** Session_ID = 26, Session_Name = dot1x :

<table>
<thead>
<tr>
<th>Peer UniqueID</th>
<th>Peer Sid</th>
<th>Negotiate Role</th>
<th>Negotiated GroupID</th>
<th>Cap</th>
<th>Msg</th>
<th>Session GroupID</th>
<th>Signature</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>26</td>
<td>PRIMARY</td>
<td>COMPATIBLE</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>(no policy)</td>
</tr>
</tbody>
</table>

Negotiation Session Info for This Message Session:
Nego_Session_ID = 26
Nego_Session_Name = dot1x
Transport_Mtu = 17884

Switch#```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td><code>show issu clients</code></td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
show issu state

To display the ISSU state and current booted image name during the ISSU process, use the **show issu state** command.

```
show issu state [slot_number] [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slot_number</td>
<td>(Optional) Specifies the slot number whose ISSU state needs to be displayed (1 or 2).</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Provides detailed information about the state of the active and standby supervisor engines.</td>
</tr>
</tbody>
</table>

**Defaults**
The command displays the ISSU state and current booted image name of both the active and standby supervisor engines.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
It might take several seconds after the **issu loadversion** command is entered for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode. If you enter the **show issu state** command too soon, you might not see the information you need.

**Examples**
The following example displays and verifies the ISSU state after LOADVERSION:

```
Switch# show issu state detail
  Slot = 1
  RP State = Active
  ISSU State = Load Version
  Boot Variable = bootflash:old_image,12
  Operating Mode = Stateful Switchover
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:old_image

  Slot = 2
  RP State = Standby
  ISSU State = Load Version
  Boot Variable = bootflash:new_image,12;bootflash:old_image,12
  Operating Mode = Stateful Switchover
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:new_image

Switch#
```
<table>
<thead>
<tr>

</tbody>
</table>
show l2protocol-tunnel

To display information about the Layer 2 protocol tunnel ports, use the show l2protocol-tunnel command. This command displays information for the interfaces with protocol tunneling enabled.

```
show l2protocol-tunnel [interface interface-id] [[summary] | {begin | exclude | include} expression]
```

**Syntax Description**

- `interface interface-id` (Optional) Specifies the interface for which protocol tunneling information appears. Valid interfaces are physical ports and port channels; the port channel range is 1 to 64.
- `summary` (Optional) Displays only Layer 2 protocol summary information.
- `begin` (Optional) Displays information beginning with the line that matches the `expression`.
- `exclude` (Optional) Displays information that excludes lines that match the `expression`.
- `include` (Optional) Displays the lines that match the specified `expression`.
- `expression` (Optional) Expression in the output to use as a reference point.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After enabling Layer 2 protocol tunneling on an access or 802.1Q tunnel port with the `l2protocol-tunnel` command, you can configure some or all of these parameters:

- Protocol type to be tunneled
- Shutdown threshold
- Drop threshold

If you enter the `show l2protocol-tunnel [interface interface-id]` command, only information about the active ports on which all the parameters are configured appears.

If you enter the `show l2protocol-tunnel summary` command, only information about the active ports on which some or all of the parameters are configured appears.

Expressions are case sensitive. For example, if you enter `exclude output`, the lines that contain `output` do not appear, but the lines that contain `Output` appear.
Examples

This is an example of output from the `show l2protocol-tunnel` command:

```
Switch> show l2protocol-tunnel
COS for Encapsulated Packets: 5

<table>
<thead>
<tr>

</tbody>
</table>
show lacp

To display LACP information, use the `show lacp` command.

```
show lacp [channel-group] {counters | internal | neighbors | sys-id}
```

### Syntax Description

- **channel-group** *(Optional) Number of the channel group; valid values are from 1 to 64.*
- **counters** Displays the LACP statistical information.
- **internal** Displays the internal information.
- **neighbors** Displays the neighbor information.
- **sys-id** Displays the LACP system identification.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 Series Switches.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on systems that are configured with a Supervisor Engine I.

If you do not specify a `channel-group` value, all channel groups are displayed.

You can enter the optional `channel-group` value to specify a channel group for all keywords, except the `sys-id` keyword.

### Examples

This example shows how to display LACP statistical information for a specific channel group:

```
Switch# show lacp 1 counters
Port LACPDUs Marker LACPUs
      Sent Recv Sent Recv Pkts Err
---------------------------------------------------
Channel group: 1
Fa4/1  8   15   0   0   3   0
Fa4/2 14   18   0   0   3   0
Fa4/3 14   18   0   0   0   0
Fa4/4 13   18   0   0   0   0
```

The output displays the following information:

- The LACPUs Sent and Recv columns display the LACPUs sent and received on each specific interface.
- The LACPUs Pkts and Err columns display the marker protocol packets.
This example shows how to display internal information for the interfaces belonging to a specific channel:

```
Switch# show lacp 1 internal
```

Flags:  
- **S** - Device sends PDUs at slow rate.  
- **F** - Device sends PDUs at fast rate.  
- **A** - Device is in Active mode.  
- **P** - Device is in Passive mode.

Switch#

In the case where no PDUs have been received, the default administrative information is displayed in braces.

This example shows how to display the LACP system identification:

Switch> **show lacp sys-id**

8000,AC-12-34-56-78-90

Switch>

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address associated to the system.

show license

To display information about the software license, use the `show license` command.

```
show license [agent | counters | session] [all | detail | feature | file | statistics | status | udi | right-to-use | summary | permanent | in-use | image levels | evaluation | expiring]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Shows information about the software license agent.</td>
</tr>
<tr>
<td>all</td>
<td>Shows information about all licenses in the system.</td>
</tr>
<tr>
<td>detail feature-name</td>
<td>Shows detailed information about a specified licensed feature or about all licenses.</td>
</tr>
<tr>
<td>feature</td>
<td>Shows a list of licensed features available in an image</td>
</tr>
<tr>
<td>file</td>
<td>Shows license entries stored in the license file.</td>

<tr>
<td>IOS XE 3.4.2</td>
<td>Keyword <code>right-to-use</code> introduced on the Catalyst 4500 Series Switches</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display license information and to help with troubleshooting issues related to Cisco IOS software licenses. It displays all the licenses in the system.

This command also displays those features that are available but not licensed to execute (i.e., multiple license can be active but not in use (execute) simultaneously). Only one type license can be used at a given time. Output is grouped according to how the features are stored in license storage (i.e., where license information is stored on the device).
Examples).

These are examples of output from the show license agent command:

Switch# show license agent counters
License Agent Counters
Request Messages Received:0: Messages with Errors:0
Request Operations Received:0: Operations with Errors:0
Notification Messages Sent:1: Transmission Errors:0

Switch# show license agent session
License Agent Sessions: 0 open, maximum is 9

Switch# show license ?
agent show license agent
all Displays All The License(s).
call-home Show license call-home information
detail Displays Details Of A Given License.
evaluation Displays Evaluation License(s)
expiring Displays Expiring License(s).
feature Displays License Enabled Features.
file Displays All The License File(s).
handle show license handle
image show license image level
in-use Displays License That Are In-Use.
permanent Displays Permanent License(s)
right-to-use show permanent right-to-use licenses
statistics Displays License Statistics.
status Displays License Status.
summary Displays Brief Summary Of All License(s).
udi Displays UDI Value

This is an example of output from the show license detail command:

Switch# show license detail

show mab

To display MAC authentication bypass (MAB) information, use the `show mab` command in EXEC mode.

```
show mab [interface interface interface-number | all] [detail]
```

**Syntax Description**
- `interface interface interface-number` Interface type; possible valid value is `gigabitethernet`.
- `interface-number` Module and port number.
- `all` Displays MAB information for all interfaces.
- `detail` (Optional) Displays detailed MAB information.

**Command Default**
None.

**Command Modes**
Privileged EXEC mode

**Command History**
- **Release** 12.2(50)SG
  - Modification: This command was introduced.

**Usage Guidelines**

Table 2-36 lists the fields in the `show mab` command.

**Table 2-36 show mab Command Output**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac-Auth-Bypass</td>
<td>MAB state</td>
</tr>
<tr>
<td>Inactivity Timeout</td>

<thead>
<tr>
<th>Authorizing</th>
<th>Intermediate</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Terminate</td>
<td>Terminal</td>
<td>The state of the session once a result has been obtained. For a session in terminal state, “TERMINATE” displays.</td>
</tr>
</tbody>
</table>

Table 2-38  lists the possible displayed values for the MAB authorization status.

Table 2-38  MAB Authorization Status Values

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTHORIZED</td>
<td>The session has successfully authorized.</td>
</tr>
<tr>
<td>UNAUTHORIZED</td>
<td>The session has failed to be authorized.</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to display MAB information:

Switch# `show mab all`
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
Switch#

The following example shows how to display detailed MAB information:

Switch# `show mab all detail`
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
--------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED

The following example shows how to display MAB information for a specific interface:

Switch# `show mab interface GigaEthernet1/3`
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
show mab

The following example shows how to display detailed MAB information for a specific interface:

```
Switch# show mab interface gigabitethernet1/1 detail
MAB details for GigabitEthernet1/1
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
----------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED
Switch#
```

### Related Commands

<tbody>
<tr>
<td>mab</td>
<td>Enables and configures MAC authorization bypass (MAB) on a port.</td>
</tr>
</tbody>
</table>
show mac access-group interface

To display the ACL configuration on a Layer 2 interface, use the show mac access-group interface command.

```
show mac access-group interface [interface interface-number]
```

**Syntax Description**

- `interface` (Optional) Specifies the interface type; valid values are Ethernet, FastEthernet, GigabitEthernet, TenGigabitEthernet, pos, atm, port-channel, and ge-wan.
- `interface-number` (Optional) Specifies the port number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The valid values for the port number depend on the chassis used.

**Examples**

This example shows how to display the ACL configuration on interface fast 6/1:

```
Switch# show mac access-group interface fast 6/1
Interface FastEthernet6/1:
   Inbound access-list is simple-mac-acl
   Outbound access-list is not set
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-group mode</td>
<td>Specifies the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode).</td>
</tr>
</tbody>
</table>
show mac-address-table address

To display MAC address table information for a specific MAC address, use the show mac-address-table address command.

```
show mac-address-table address mac_addr [interface type slot/port | protocol protocol | vlan vlan_id]
```

**Syntax Description**

- **mac_addr**: 48-bit MAC address; the valid format is H.H.H.
- **interface type slot/port**: (Optional) Displays information for a specific interface; valid values for type are fastethernet, gigabitethernet, and tengigabitethernet.
- **protocol protocol**: (Optional) Specifies a protocol. See the “Usage Guidelines” section for more information.
- **vlan vlan_id**: (Optional) Displays entries for the specific VLAN only; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.
- **Modification** Added support for extended VLAN addresses.
- **Release** 12.2(25)EW Added support for the 10-Gigabit Ethernet interface.

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

The keyword definitions for the protocol variable are as follows:

- **ip** specifies the IP protocol.
- **ipx** specifies the IPX protocols.
- **assigned** specifies the assigned protocol entries.
- **other** specifies the other protocol entries.
Examples

This example shows how to display MAC address table information for a specific MAC address:

```
Switch# show mac-address-table address 0030.94fc.0dff
```

Unicast Entries

```
<table>
<thead>
<tr>
<th>vlan</th>
<th>mac address</th>
<th>type</th>
<th>protocols</th>
<th>port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

show mac-address-table aging-time

To display the MAC address aging time, use the `show mac-address-table aging-time` command.

```
show mac-address-table aging-time [vlan vlan_id]
```

**Syntax Description**

- **vlan vlan_id** (Optional) Specifies a VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release**
  - 12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.
  - 12.1(12c)EW Support for extended addressing was added.

**Examples**

This example shows how to display the currently configured aging time for all VLANs:

```
Switch# show mac-address-table aging-time
Vlan  Aging Time
    ----  ----------
  100    300
  200    1000
Switch#
```

This example shows how to display the currently configured aging time for a specific VLAN:

```
Switch# show mac-address-table aging-time vlan 100
Vlan  Aging Time
    ----  ----------
  100    300
Switch#
```

</table>
show mac-address-table count

To display the number of entries currently in the MAC address table, use the `show mac-address-table count` command.

```
show mac-address-table count [vlan vlan_id]
```

**Syntax Description**

- **vlan vlan_id** (Optional) Specifies a VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Examples**

This example shows how to display the entry count for a specific VLAN:

```
Switch# show mac-address-table count vlan 1
MAC Entries for Vlan 1:
Dynamic Unicast Address Count: 0
Static Unicast Address (User-defined) Count: 0
Static Unicast Address (System-defined) Count: 1
Total Unicast MAC Addresses In Use: 1
Total Unicast MAC Addresses Available: 32768
Multicast MAC Address Count: 1
Total Multicast MAC Addresses Available: 16384
Switch#
```

<td>Displays information about the MAC address table for a specific VLAN.</td>
</tr>
</tbody>
</table>
**show mac-address-table dynamic**

To display the dynamic MAC address table entries only, use the `show mac-address-table dynamic` command.

```
show mac-address-table dynamic [address mac_addr | interface type slot/port | protocol protocol | vlan vlan_id]
```

**Syntax Description**

- `address mac_addr` (Optional) Specifies a 48-bit MAC address; the valid format is H.H.H.
- `interface type slot/port` (Optional) Specifies an interface to match; valid values for `type` are `fastethernet`, `gigabitethernet`, and `tengigabitethernet`.
- `protocol protocol` (Optional) Specifies a protocol. See the “Usage Guidelines” section for more information.
- `vlan vlan_id` (Optional) Displays entries for a specific VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The keyword definitions for the `protocol` argument are as follows:

- `assigned` specifies assigned protocol entries.
- `ip` specifies IP protocol.
- `ipx` specifies IPX protocols.
- `other` specifies other protocol entries.

The `show mac-address-table dynamic` command output for an EtherChannel interface changes the port number designation (such as, 5/7) to a port group number (such as, Po80).

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.
This example shows how to display all the dynamic MAC address entries:

```
Switch# show mac-address-table dynamic
Unicast Entries
  vlan  mac address     type        protocols               port
-------------+---------------------+-------------------+-----------------------
   1    0000.0000.0201   dynamic ip                     FastEthernet6/15
   1    0000.0000.0202   dynamic ip                     FastEthernet6/15
   1    0000.0000.0203   dynamic ip,assigned            FastEthernet6/15
   1    0000.0000.0204   dynamic ip,assigned            FastEthernet6/15
   1    0000.0000.0205   dynamic ip,assigned            FastEthernet6/15
   2    0000.0000.0101   dynamic ip                     FastEthernet6/16
   2    0000.0000.0102   dynamic ip                     FastEthernet6/16
   2    0000.0000.0103   dynamic ip,assigned            FastEthernet6/16
   2    0000.0000.0104   dynamic ip,assigned            FastEthernet6/16
   2    0000.0000.0105   dynamic ip,assigned            FastEthernet6/16
Switch#
```

This example shows how to display the dynamic MAC address entries with a specific protocol type (in this case, assigned):

```
Switch# show mac-address-table dynamic protocol assigned
Unicast Entries
  vlan  mac address     type        protocols               port
-------------+---------------------+-------------------+-----------------------
   1    0000.0000.0203   dynamic ip,assigned            FastEthernet6/15
   1    0000.0000.0204   dynamic ip,assigned            FastEthernet6/15
   1    0000.0000.0205   dynamic ip,assigned            FastEthernet6/15
   2    0000.0000.0103   dynamic ip,assigned            FastEthernet6/16
   2    0000.0000.0104   dynamic ip,assigned            FastEthernet6/16
   2    0000.0000.0105   dynamic ip,assigned            FastEthernet6/16
Switch#
```

<td>Displays the static MAC address table entries only.</td>
</tr>
<tr>
<td><code>show mac-address-table vlan</code></td>
<td>Displays information about the MAC address table for a specific VLAN.</td>
</tr>
</tbody>
</table>
**show mac address-table learning**

To display the status of MAC address learning for all VLANs or a specified VLAN, use the `show mac address-table learning` user EXEC command.

```
show mac address-table learning [vlan vlan-id] [ | begin | exclude | include] expression]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) Displays information for a specific VLAN. The range is 1 to 4094.</td>
</tr>
<tr>
<td>`</td>
<td>begin`</td>
</tr>
<tr>
<td>`</td>
<td>exclude`</td>
</tr>
<tr>
<td>`</td>
<td>include`</td>
</tr>
<tr>
<td><code>expression</code></td>
<td>(Optional) Specifies the expression in the output as a reference point.</td>
</tr>
</tbody>
</table>

**Defaults**

MAC address learning is enabled on all VLANs.

**Command Modes**

User EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was modified to support the learning disable feature on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To display configured VLANs, and whether MAC address learning is enabled or disabled, use the `show mac address-table learning` command without keywords.

To display the learning status on an individual VLAN, use the command with a specific VLAN ID.

Expressions are case sensitive. For example, if you enter `| exclude output`, the lines that contain output do not appear, but the lines that contain Output appear.

**Examples**

This example shows that MAC address learning is disabled on VLAN 200:

```
Switch> show mac address-table learning
VLAN    Learning Status
----    ---------------
1        yes
100      yes
200      no
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac address-table learning vlan</code></td>
<td>Enables or disables MAC address learning on a VLAN.</td>
</tr>
</tbody>
</table>
show mac-address-table multicast

To display information about the multicast MAC address table, use the `show mac-address-table multicast` command.

```
show mac-address-table multicast [count | {igmp-snooping [count]} | {user [count]} | {vlan vlan_num}]
```

**Syntax Description**

- `count` *(Optional)* Displays the number of multicast entries.
- `igmp-snooping` *(Optional)* Displays only the addresses learned by IGMP snooping.
- `user` *(Optional)* Displays only the user-entered static addresses.
- `vlan vlan_num` *(Optional)* Displays information for a specific VLAN only; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the the internal VLAN number.

**Examples**

This example shows how to display multicast MAC address table information for a specific VLAN:

```
Switch# show mac-address-table multicast vlan 1
Multicast Entries
  vid    mac address  type    ports
  +--------------------------------------------+
  1  ffff.ffff.ffff  system  Switch,Fa6/15
Switch#
```

This example shows how to display the number of multicast MAC entries for all VLANs:

```
Switch# show mac-address-table multicast count
MAC Entries for all vlans:
Multicast MAC Address Count: 141
Total Multicast MAC Addresses Available: 16384
Switch#
```
## show mac-address-table multicast

### Related Commands

</tbody>
</table>
show mac-address-table notification

To display the MAC address table notification status and history, use the `show mac-address-table notification` command.

```
show mac-address-table notification [change] [interface [interface-id]] | [mac-move] | [threshold] | [learn-fail]
```

**Syntax Description**

- `change` (Optional) Displays the MAC address change notification status.
- `interface` (Optional) Displays MAC change information for an interfaces.
- `interface-id` (Optional) Displays the information for a specific interface. Valid interfaces include physical ports and port channels.
- `mac-move` (Optional) Displays MAC move notification status.
- `threshold` (Optional) Displays the MAC threshold notification status.
- `learn-fail` (Optional) Displays general information of hardware MAC learning failure notifications.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support for <code>learn-fail</code> keyword, Supervisor Engine 6-E, and Catalyst 4900M chassis added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show mac-address-table notification change` command to display the MAC change notification interval, the maximum number of entries allowed in the history table, the history table contents, and whether the MAC change feature is enabled or disabled.

Use the `interface` keyword to display the flags for all interfaces. If the `interface-id` is included, only the flags for that interface are displayed.

**Examples**

This example shows how to display all the MAC address notification information:

```
Switch# show mac-address-table notification change
MAC Notification Feature is Enabled on the switch
Interval between Notification Traps : 1 secs
Number of MAC Addresses Added : 5
Number of MAC Addresses Removed : 1
Number of Notifications sent to NMS : 3
Maximum Number of entries configured in History Table : 500
Current History Table Length : 3
MAC Notification Traps are Enabled
```
show mac-address-table notification

History Table contents
-------------------------------------
History Index 1, Entry Timestamp 478433, Despatch Timestamp 478433
MAC Changed Message : 
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab0 Dot1dBasePort: 323

History Index 2, Entry Timestamp 481834, Despatch Timestamp 481834
MAC Changed Message : 
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab1 Dot1dBasePort: 323
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab2 Dot1dBasePort: 323
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab3 Dot1dBasePort: 323

History Index 3, Entry Timestamp 484334, Despatch Timestamp 484334
MAC Changed Message : 
Operation: Deleted Vlan: 1 MAC Addr: 1234.5678.9ab0 Dot1dBasePort: 323

This example shows how to display the MAC address change status on the FastEthernet interface 7/1:

Switch# show mac-address-table notification change interface FastEthernet 7/1
MAC Notification Feature is Enabled on the switch

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Added Trap</th>
<th>MAC Removed Trap</th>
</tr>
</thead>
<tbody>
<tr>
<td>FastEthernet7/1</td>
<td>Enabled</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

This example shows how to display the MAC address move status:

Switch# show mac-address-table notification mac-move
MAC Move Notification: Enabled

Switch#

This example shows how to display the MAC address table utilization status:

Switch# show mac-address-table notification threshold
Status   limit  Interval
----------+-----------+-------------
 enabled  50          120

Switch#

This example shows how to display general information of MAC learning failure notifications:

Switch# show mac-address-table notification learn-fail
Status   limit  Interval
----------+-----------+-------------
 disabled 2000         120

</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the the internal VLAN number.

**Examples**

This example shows how to display the MAC address table entries that have a specific protocol type (in this case, assigned):

```
Switch# show mac-address-table protocol assigned
vlan mac address type protocol qos ports
-----+---------------+--------+---------+---+--------------------------------
200  0050.3e8d.6400 static assigned -- Switch
100  0050.3e8d.6400 static assigned -- Switch
   0050.3e8d.6400 static assigned -- Switch
4092 0050.0000.0000 dynamic assigned -- Switch
   0050.0000.0000 dynamic assigned -- Switch
4092  0050.f0ac.3058 static assigned -- Switch
4092  0050.f0ac.3059 dynamic assigned -- Switch
   0010.7b3b.0978 dynamic assigned -- Fa5/9
Switch#
```
This example shows the other output for the previous example:

```
Switch# show mac-address-table protocol other

</tbody>
</table>
show mac-address-table static

To display the static MAC address table entries only, use the `show mac-address-table static` command.

```
show mac-address-table static [address mac_addr | interface type number | protocol protocol | vlan vlan_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>address mac_addr</code></td>
<td>(Optional) Specifies a 48-bit MAC address to match; the valid format is H.H.H.</td>
</tr>
<tr>
<td><code>interface type number</code></td>
<td>(Optional) Specifies an interface to match; valid values for <code>type</code> are <code>fastethernet</code>, <code>gigabitethernet</code>, and <code>tengigabitethernet</code>.</td>
</tr>
<tr>
<td><code>protocol protocol</code></td>
<td>(Optional) Specifies a protocol. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td><code>vlan vlan_id</code></td>
<td>(Optional) Displays the entries for a specific VLAN; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

The keyword definitions for the `protocol` argument are as follows:

- **assigned** specifies the assigned protocol entries.
- **ip** specifies the IP protocol.
- **ipx** specifies the IPX protocols.
- **other** specifies the other protocol entries.
Examples

This example shows how to display all the static MAC address entries:

```
Switch# show mac-address-table static
Unicast Entries
  vlan  mac address     type        protocols               port
  -------+---------------+--------+---------------------+--------------------
  1      0030.94fc.0dff    static ip,ipx,assigned,other  Switch
  Fa6/1  0030.94fc.0dff    static ip,ipx,assigned,other  Switch
  Fa6/2  0030.94fc.0dff    static ip,ipx,assigned,other  Switch
Multicast Entries
  vlan  mac address     type    ports
  -------+---------------+-------+-------------------------------------------
  1      ffff.ffff.ffff   system Switch,Fa6/15
  2      ffff.ffff.ffff   system Fa6/16
  1002    ffff.ffff.ffff   system
  1003    ffff.ffff.ffff   system
  1004    ffff.ffff.ffff   system
  1005    ffff.ffff.ffff   system
  Fa6/1   ffff.ffff.ffff   system Switch,Fa6/1
  Fa6/2   ffff.ffff.ffff   system Switch,Fa6/2
```

Switch#

This example shows how to display the static MAC address entries with a specific protocol type (in this case, assigned):

```
Switch# show mac-address-table static protocol assigned
Unicast Entries
  vlan  mac address     type        protocols               port
  -------+---------------+--------+---------------------+--------------------
  1      0030.94fc.0dff    static ip,ipx,assigned,other  Switch
  Fa6/1  0030.94fc.0dff    static ip,ipx,assigned,other  Switch
  Fa6/2  0030.94fc.0dff    static ip,ipx,assigned,other  Switch
Multicast Entries
  vlan  mac address     type    ports
  -------+---------------+-------+-------------------------------------------
  1      ffff.ffff.ffff   system Switch,Fa6/15
  2      ffff.ffff.ffff   system Fa6/16
  1002    ffff.ffff.ffff   system
  1003    ffff.ffff.ffff   system
  1004    ffff.ffff.ffff   system
  1005    ffff.ffff.ffff   system
  Fa6/1   ffff.ffff.ffff   system Switch,Fa6/1
  Fa6/2   ffff.ffff.ffff   system Switch,Fa6/2
Switch#
```

</table>
show mac-address-table vlan

To display information about the MAC address table for a specific VLAN, use the show mac-address-table vlan command.

```
show mac-address-table vlan vlan_id [protocol protocol]
```

**Syntax Description**

- **vlan vlan_id** (Optional) Displays the entries for a specific VLAN; valid values are from 1 to 4094.
- **protocol protocol** (Optional) Specifies a protocol. See the “Usage Guidelines” section for more information.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>

show macro auto mac-address-group

Use the `show macro auto mac-address-group` command to display the configuration of MAC address group.

`show macro auto mac-address-group`

**Syntax Description**

No keywords

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the configuration of the MAC address group:

```
Switch# show macro auto address-group
MAC Address Group Configuration:

Group Name          OUI                 MAC ADDRESS
--------------------------------------------------------------------
                    2222.2222.2222   1111.1111.1111
```

Note: The example output is a representation and may not match the exact output from the command.
show macro auto device

Use the `show macro auto device` global configuration command to display the default information for a device, including built-in function name and the parameters that can be provided for the commands when executing the built-in function.

```
show macro auto device device_id
```

**Syntax Description**

| `device_id` | Specifies the device ID. |

**Defaults**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the default values as well as the currently used values if configured.

**Examples**

This example shows how to display the default information for the device access-point:

```
Switch# show macro auto device access-point
Device:access-point
Default Macro:CISCO_AP_AUTO_SMARTPORT
Current Macro:CISCO_AP_AUTO_SMARTPORT
Configurable Parameters:NATIVE_VLAN
Defaults Parameters:NATIVE_VLAN=1
Current Parameters:NATIVE_VLAN=1
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tbody>
<tr>
<td><code>show macro auto event manager</code></td>
<td>Refer to the Command Reference in the IOS library</td>
</tr>
<tr>
<td><code>show macro auto interface</code></td>
<td>Display Auto SmartPorts status and the functions applied on an interface.</td>
</tr>
</tbody>
</table>
show macro auto interface

Use the `show macro auto interface` command to display Auto SmartPorts status and the functions applied on an interface.

```
show macro auto interface interface_id
```

**Syntax Description**

- `interface_id`: Specifies an interface ID.

**Defaults**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display Auto SmartPorts status and the applied macros:

```
Switch# show macro auto int gi3/8
Global Auto Smart Port Status
  Auto Smart Ports Enabled
  Fallback : CDP Disabled, LLDP Disabled
Interface     Auto Smart Port  Fallback    Macro Description(s)
--------------  ------------------  ----------  -------------------------------
Gi3/8          TRUE              None        CISCO_PHONE_EVENT
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show macro auto device</code></td>
<td>Displays the default information for a device, including builtin function name and the parameters that can be provided for the commands when executing the builtin function.</td>
</tr>
</tbody>
</table>
show macro auto monitor clients

To display the clients using the device classifier facility on the switch, use the **show macro auto monitor clients** user EXEC command.

```
show macro auto monitor clients
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release IOS XE 3.3.0</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>SG (15.1(1)SG)</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Device classifier (DC) is enabled by default when you enable a client application (for example, Auto Smartports) that uses its functionality. Use the **show macro auto monitor clients** command to display the clients that are using the DC feature on the switch.

As long as any clients are using the DC, you cannot disable it by using the **no macro auto monitor** command. If you attempt to disable the DC while a client is using it, an error message appears.

**Examples**

This example shows how to use the **show macro auto monitor clients** privileged EXEC command to view the clients using the DC on the switch:

```
Switch# show macro auto monitor clients
Client Name
====================
Auto Smart Ports
```

This example shows the error message that appears when you attempt to disable DC while a client is using it:

```
Switch(config)# no macro auto monitor
These subsystems should be disabled before disabling Device classifier
Auto Smart Ports

% Error - device classifier is not disabled
```

show macro auto monitor device

To display the devices connected to a switch and their associated properties, use the show macro auto monitor device user EXEC command.

```
show macro auto monitor device [detail | filter string | interface interface_id | mac-address mac_address]
```

**Syntax Description**

- **detail**: Displays detailed device classifier information.
- **filter string**: Displays information for devices that match the filter.
- **interface interface_id**: Displays information about devices attached to the specified interface.
- **mac mac_address**: Displays device information for the specified endpoint.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

Release   Modification

Release IOS XE 3.3.0 SG (15.1(1)SG)  This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

Use this command to display the devices connected to a switch. Use the show macro auto device privileged EXEC command to display the configurable parameters for a device.

**Examples**

This example shows how to use the show macro auto monitor device privileged EXEC command with no optional keywords to view the devices connected to the switch:

```
Switch# show macro auto monitor device
MAC_Address           Port_Id          Profile Name
==============    =======     ============================
000a.b8c6.1e07    Gi1/0/2    Cisco-Device
001f.9e90.1250    Gi1/0/4    Cisco-AP-Aironet-1130
======================================================
```

This example shows how to use the show macro auto monitor device privileged EXEC command with the optional mac-address keyword to view summary information about the connected device with the specified MAC address:

```
Switch# show macro auto monitor device mac-address 001f.9e90.1250
MAC_Address       Port_Id     Profile Name
==============    =======     ============================
001f.9e90.1250    Gi1/0/4    Cisco-AP-Aironet-1130
==========================================================
```
This example shows how to use the `show macro auto monitor device` privileged EXEC command with the optional `mac-address` and `detail` keywords to view detailed information about the connected device with the specified MAC address:

```
Switch# show macro auto monitor device mac-address 001f.9e90.1250 detail
```

<table>
<thead>
<tr>
<th>MAC_Address</th>
<th>Port_Id</th>

</tbody>
</table>

**Command Modes**

- User EXEC
- Privileged EXEC

**Command History**

- **Release** IOS XE 3.3.0  
  **Modification** This command was introduced on the Catalyst 4500 series switch.  
  **Release** IOS XE 3.4.0SG  
  **Modification** This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

This command displays all the device types recognized by the device classification engine. The number of available device types is the number of profiles stored on the switch. Because the number of profiles can be very large, you can use the **filter** keyword to limit the command output.

**Examples**

This example shows how to use the **show macro auto monitor type** privileged EXEC command with no optional keywords to view the devices recognized by the device classifier:

```
Switch# show macro auto monitor type table
Valid Type   Profile Name             min Conf ID
---------- ----------- ---------------- ----------
Valid Default Apple-Device           10  0

show module

To display information about the module, use the `show module` command.

```
show module [mod | all]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mod</code></td>
<td>(Optional) Number of the module; valid values vary from chassis to chassis.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>(Optional) Displays information for all modules.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Enhanced the output of the <code>show idprom</code> command to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the Mod Sub-Module fields in the command output, the `show module` command displays the supervisor engine number but appends the uplink daughter card’s module type and information.

If the PoE consumed by the module is more than 50 W above the administratively allocated PoE, the “Status” displays as “PwrOver.” If the PoE consumed by the module is more than 50 W above the PoE module limit, the “Status” displays as “PwrFault.”

**Examples**

This example shows how to display information for all the modules.

This example shows the `show module` command output for a system with inadequate power for all installed modules. The system does not have enough power for Module 5; the “Status” displays it as “PwrDeny.”

```
Switch# show module all
  Mod  Ports  Card Type                              Model             Serial No.
  ----+-----+--------------------------------------+-----------------+-----------

Switch#
show monitor

To display information about the SPAN session, use the `show monitor` command.

```
show monitor [session] [range session-range | local | remote | all | session-number] [detail]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session</td>
<td>(Optional) Displays the SPAN information for a session.</td>
</tr>
<tr>
<td>range</td>
<td>(Optional) Displays information for a range of sessions.</td>
</tr>
<tr>
<td>session-range</td>
<td>(Optional) Specifies a range of sessions.</td>
</tr>
<tr>
<td>local</td>
<td>(Optional) Displays all local SPAN sessions.</td>
</tr>
<tr>
<td>remote</td>
<td>(Optional) Displays the RSPAN source and destination sessions.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Displays the SPAN and RSPAN sessions.</td>
</tr>
<tr>
<td>session-number</td>
<td>(Optional) Session number; valid values are from 1 to 6.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays the detailed SPAN information for a session.</td>
</tr>
</tbody>
</table>

### Defaults

The `detail` keyword only displays lines with a nondefault configuration.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Added support for differing directions within a single user session.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Output enhanced to display configuration status of SPAN enhancements.</td>
</tr>
<tr>
<td>12.1(20)EW</td>
<td>Added support to display configuration state for remote SPAN and learning.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Added support to display ACLs that are applied to SPAN sessions.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to display whether ACLs are applied to a given SPAN session on a Catalyst 4500 series switch:

```
Switch# show monitor

Session 1
--------
Type : Local Session
Source Ports :
  Both : Fa6/1
Destination Ports : Fa6/2
Encapsulation : Native
  Ingress : Disabled
  Learning : Disabled
Filter VLANs : 1
IP Access-group : 10
```
This example shows how to display SPAN information for session 2:

```
Switch# show monitor session 2
Session 2
----------
Type : Remote Source Session
Source Ports:
    RX Only:       Fa1/1-3
Dest RSPAN VLAN:  901
Ingress : Enabled, default VLAN=2
Learning : Disabled
Switch#
```

This example shows how to display the detailed SPAN information for session 1:

```
Switch# show monitor session 1 detail
Session 1
--------
Type              : Local Session
Source Ports      :
    RX Only       : None
    TX Only       : None
    Both          : Gi1/1, CPU
Source VLANs      :
    RX Only       : None
    TX Only       : None
    Both          : None
Source RSPAN VLAN : Fa6/1
Destination Ports : Fa6/1
    Encapsulation : DOT1Q
        Ingress : Enabled, default VLAN = 2
Filter VLANs      : None
    Filter Types RX : Good
    Filter Types TX : None
Dest Rspan Vlan : 901
Ingress : Enabled, default VLAN=2
Learning : Disabled
IP Access-group : None
Switch#
```

This example shows how to display SPAN information for session 1 beginning with the line that starts with Destination:

```
Switch# show monitor session 1 | begin Destination
Destination Ports: None
Filter VLANs:      None
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor session</td>
<td>Enables the SPAN sessions on interfaces or VLANs.</td>
</tr>
</tbody>
</table>
show monitor capture

To display the capture point details, so that you can see what capture points are defined, what their attributes are, and whether they are active, use the `show monitor capture` command.

```
show monitor capture [name [parameter] | buffer [brief | detailed | dump]]
```

**Syntax Description**

- **name**: Specifies the capture point name.
- **parameter**: Reconstructs and displays the exec commands for specifying the capture point.
- **buffer [brief | detailed | dump]**: Source the packets from the capture buffer, decode and display them in brief, detailed or dump mode.

**Defaults**

- If the capture point name is not provided, the command displays all the capture point details.
- If the display mode is not specified, the command defaults to brief mode.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the command is issued with no parameters, it displays the details of all the capture points. When specified with a capture point name and no other parameters, it displays the details of the specific capture point name. With the `parameter` keyword, the command reconstructs the commands that describe the capture point and displays them.

The `buffer` option displays the packets from the capture buffer. This option is applicable only if the capture point directs the captured packets to the buffer. The packets can be decoded and displayed in either the brief, detailed, or dump mode. The default mode is `brief`.

**Examples**

Following are example of how to use the `show monitor capture` command:

```
Switch# show monitor capture mycap buffer brief
0.000000 10.1.1.215 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
1.000000 10.1.1.216 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
2.000000 10.1.1.217 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
3.000000 10.1.1.218 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
4.000000 10.1.1.219 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
5.000000 10.1.1.220 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
6.000000 10.1.1.221 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
7.000000 10.1.1.222 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
8.000000 10.1.1.223 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
9.000000 10.1.1.224 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
10.000000 10.1.1.225 -> 20.1.1.2 UDP Source port: 20001  Destination port: 20002
11.000000 10.1.1.226 -> 20.1.1.2 UDP Source port: 20001  Destination port: 20002
```

show monitor capture file

To decode and display packets from a previously captured .pcap file, use the `show monitor capture file` command.

```
show monitor capture file name [display-filter filter-string] [brief | detailed | dump]
```

**Syntax Description**
- **name**: Specifies the filename.
- **display-filter filter-string**: Specifies the display filter string according to Wireshark’s display-filter syntax.
- **brief | detailed | dump**: Determines the display mode.
  - **brief**: Displays a one line summary of the packet with key fields
  - **detailed**: Displays all the fields in the packet for the protocols supported and displays the payload in hexadecimal form.
  - **dump**: Displays a one line summary of the packet with key fields and also displays the packet in hexadecimal form.

**Defaults**
- **brief**

**Command Modes**
- Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS XE 3.3.0SG/15.1(1)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If no display filter is specified, then all the packets in the file are displayed. Because the display filter must observe the Wireshark display filter syntax, ensure that the display filter is accurate. Also, use a double quotes when specifying the filter.

**Examples**

This example shows how to display packets from a .pcap file with a display filter:

```
Switch# show monitor capture file bootflash:test.pcap display-filter
```

This example displays a brief output from a .pcap file:

```
Switch# show monitor capture file bootflash:mycap.pcap display-filter
1   0.000000    10.1.1.140  ->  20.1.1.2     UDP Source port: 20001    Destination port: 20002
2   1.000000    10.1.1.141  ->  20.1.1.2     UDP Source port: 20001    Destination port: 20002
3   2.000000    10.1.1.142  ->  20.1.1.2     UDP Source port: 20001    Destination port: 20002

show netflow-lite exporter

**Syntax Description**

`exporter-name` Specifies an exporter name.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Command introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the total number of export packets sent.

**Examples**

This example shows how to display information about the collector and global stats:

```
Switch# show netflow-lite exporter e1
Netflow-lite Exporter e1:
Description:        Exporter
Network Protocol Configuration:
  Destination IP address:  192.168.1.1

show netflow-lite monitor

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To display information about a particular packet or per data source stats, use the `show netflow-lite monitor` command.

```
show netflow-lite monitor monitor-number interface interface-name
show netflow-lite monitor monitor-number vlan vlan-id
```

**Syntax Description**
- `monitor-number` Specifies a monitor name.
- `interface-name` Specifies an interface.
- `vlan-id` Specifies a VLAN.

**Defaults**
None

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Command introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command displays information about a particular packet or per data source stats. The interface can be either a physical port or a VLAN.

This command displays the following packet sampling statistics:
- Total # of packet (samples) exported
- Total # of packet (samples) dropped due to lack of local resources
- Total# of packets seen at the data source

The `packetsObserved` statistic accounts for packets that are dropped by input ACL or QoS policer.

The exported packets only represent samples from the non-dropped packet population.

**Examples**
These examples show how to display information about a particular packet or per data source stats:

```
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
  Netflow-lite Monitor-1:
    Active: TRUE
    Sampler: sampler1
    Exporter: exporter1
    Average Packet Size: 0
```
Statistics:
  Packets exported: 0
  Packets observed: 0
  Packets dropped: 0
  Average Packet Size observed: 64
  Average Packet Size used: 64

Switch# `show netflow-lite monitor 1 vlan 2`
VlanID-2:
  Netflow-lite Monitor-1:
    Active: TRUE
    Sampler: sampler1
    Exporter: exporter1
    Average Packet Size: 0
  Statistics:
    Packets exported: 0
    Packets observed: 0
    Packets dropped: 0
    Average Packet Size observed: 64
    Average Packet Size used: 64

show netflow-lite sampler

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To display information about a sampler, use the show netflow-lite sampler command.

```
show netflow-lite sampler sampler-name
```

Syntax Description
```
sampler-name
```
Specifies a sampler name.

Defaults
This command has no default settings.

Command Modes
Privileged EXEC mode

Command History
```
Release Modification
15.0(2)SG Command introduced on the Catalyst 4500 series switch.
```

Examples
This example shows how to display information about a sampler:

```
Switch# show netflow-lite sampler low-rate
Netflow-lite Sampler low-rate:
  Description: Sampler
  Sampling rate: 1 out of 256
  Packet Section Size: 64 bytes
  Packet offset: 0 bytes
```

Related Commands
```
Command Description
packet-section size (netflow-lite sampler submode) Specifies a sampled header size in netflow-lite submode.
packet-rate (netflow-lite sampler submode) Specifies a packet sampling rate in netflow-lite sampler submode.
packet-offset (netflow-lite sampler submode) Specifies a starting packet offset in netflow-lite submode.
```
show nmsp

To display the Network Mobility Services Protocol (NMSP) information for the switch, use the `show nmsp` command. This command is available only when your switch is running the cryptographic (encrypted) software image.

```
show nmsp [attachment suppress interface | capability | notification interval | statistics
  {connection | summary} | status | subscription {detail | summary}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment suppress interface</td>
<td>Displays attachment suppress interfaces.</td>
</tr>
<tr>
<td>capability</td>
<td>Displays switch capabilities including the supported services and subservices.</td>

**Examples**

This is an example of output from the `show nmsp attachment suppress interface` command:

```
Switch# show nmsp attachment suppress interface
NMSP Attachment Suppression Interfaces
--------------------------------------
GigabitEthernet1/1
GigabitEthernet1/2
Switch#
```
This is an example of output from the `show nmsp capability` command:

```
Switch# show nmsp capability
NMSP Switch Capability
-----------------------------
Service Subservice
--------- --------------
Attachment Wired Station
Location Subscription
Switch#
```

This is an example of output from the `show nmsp notification interval` command:

```
Switch# show nmsp notification interval
NMSP Notification Intervals
----------------------------------
Attachment notify interval: 30 sec (default)
Location notify interval: 30 sec (default)
Switch#
```

This is an example of output from the `show nmsp statistics connection` and `show nmsp statistics summary` commands:

```
Switch# show nmsp statistics connection
NMSP Connection Counters
----------------------------------
Connection 1:
  Connection status: UP
  Freed connection: 0

  Tx message count
  ----------------------
  Subscr Resp: 1
  Capa Notif: 1
  Atta Resp: 1
  Atta Notif: 0
  Loc Resp: 1
  Loc Notif: 0

  Rx message count
  ----------------------
  Subscr Req: 1
  Capa Notif: 1
  Atta Req: 1
  Atta Notif: 0
  Loc Req: 1
  Unsupported msg: 0

Switch#
```

```
Switch# show nmsp statistics summary
NMSP Global Counters
------------------------
Send too big msg: 0
Failed socket write: 0
Partial socket write: 0
Socket write would block: 0
Partial socket write: 0
Failed socket read: 0
Socket read would block: 0
Transmit Q full: 0
Max Location Notify Msg: 0
Max Attachment Notify Msg: 0
Max TX Q Size: 0
Switch#
```
This is an example of output from the `show nmsp status` command:

```
Switch# show nmsp status
NMSP Status
----------
NMSP: enabled

MSE IP Address   TxEchoResp  RxEchoReq  TxData  RxData
---------------  ----------  ----------  ------  -----
172.19.35.109     5          5          4      4
Switch#
```

This is an example of output from the `show nmsp show subscription detail` and `show nmsp show subscription summary` commands:

```
Switch# show nmsp subscription detail
Mobility Services Subscribed by 172.19.35.109:
Services     Subservices
------------  -------------------
Attachment:   Wired Station
Location:     Subscription

Switch# show nmsp subscription summary
Mobility Services Subscribed:
MSE IP Address Services
---------------  ------
172.19.35.109    Attachment, Location
Switch#
```

**Related Commands**

**show pagp**

To display information about the port channel, use the `show pagp` command.

```
show pagp [group-number] {counters | dual-active | internal | neighbor}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-number</code></td>
<td>(Optional) Channel-group number; valid values are from 1 to 64.</td>
</tr>
<tr>
<td><code>counters</code></td>
<td>Specifies the traffic counter information.</td>
</tr>
<tr>
<td><code>dual-active</code></td>
<td>Specifies the dual-active information.</td>
</tr>
<tr>
<td><code>internal</code></td>
<td>Specifies the PAgP internal information.</td>
</tr>
<tr>
<td><code>neighbor</code></td>
<td>Specifies the PAgP neighbor information.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can enter any `show pagp` command to display the active PAgP port-channel information. To display the nonactive information, enter the `show pagp` command with a group.

**Examples**

This example shows how to display information about the PAgP counter:

```
Switch# show pagp counters
     Information          Flush
     Port    Sent  Recv  Sent  Recv
-----------------------------
Channel group: 1
   Fa5/4  2660   2452   0    0
   Fa5/5  2676   2453   0    0
Channel group: 2
   Fa5/6  289    261   0    0
   Fa5/7  290    261   0    0
Switch#
```

This example shows how to display PAgP dual-active information:

```
Switch# show pagp dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1
```
Channel group 30
Dual-Active Partner Partner Partner
Port Detect Capable Name Port Version

</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

The `show policy-map control-plane` command displays information for aggregate control-plane services that control the number or rate of packets that are going to the process level.

**Examples**

This example shows that the policy map TEST is associated with the control plane. This policy map polices traffic that matches the class-map TEST, while allowing all other traffic (that matches the class-map class-default) to go through as is. Table 2-39 describes the fields shown in the display.

```
Switch# show policy-map control-plane

Control Plane

Service-policy input: system-cpp-policy

Class-map: system-cpp-eapol (match-all)

show policy-map interface

To display the statistics and configurations of the input and output policies that are attached to an interface, use the `show policy-map interface` command.

```
show policy-map interface [ { fastethernet interface-number } | { gigabitethernet interface-number } | { port-channel number } | { vlan vlan_id } ] [ input | output ]
```

**Syntax Description**

- **fastethernet interface-number** (Optional) Specifies the Fast Ethernet 802.3 interface.
- **gigabitethernet interface-number** (Optional) Specifies the Gigabit Ethernet 802.3z interface.
- **port-channel number** (Optional) Specifies the port channel.
- **vlan vlan_id** (Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
- **input** (Optional) Specifies input policies only.
- **output** (Optional) Specifies output policies only.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

</tbody>
</table>

**Examples**

This example shows how to display the statistics and configurations of all input and output policies attached to an interface:

```
Switch# show policy-map interface

FastEthernet6/1

service-policy input:ipp5-policy

  class-map:ipp5 (match-all)
  0 packets
  match:ip precedence 5
  set:
    ip precedence 6

  class-map:class-default (match-any)
  0 packets
  match:any
  0 packets
```
service-policy output:ipp5-policy

class-map:ipp5 (match-all)
  0 packets
  match:ip precedence 5
  set:
    ip precedence 6

class-map:class-default (match-any)
  0 packets
  match:any
  0 packets

Switch#

This example shows how to display the input policy statistics and configurations for a specific interface:

Switch# show policy-map interface fastethernet 5/36 input

service-policy input:ipp5-policy

class-map:ipp5 (match-all)
  0 packets
  match:ip precedence 5
  set:
    ip precedence 6

class-map:class-default (match-any)
  0 packets
  match:any
  0 packets

Switch#

With the following configuration, each flow is policed to a 1000000 bps with an allowed 9000-byte burst value.

Note: If you use the match flow ip source-address|destination-address command, these two flows are consolidated into one flow and they have the same source and destination address.

Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol l4 source-port l4 destination-port
Switch(config-cmap)# exit
Switch(config)# policy-map p1

show policy-map interface vlan

To show the QoS policy-map information applied to a specific VLAN on an interface, use the `show policy-map interface vlan` command.

```
show policy-map interface vlan interface-id vlan vlan-id
```

**Syntax Description**
- `interface interface-id` (Optional) Displays QoS policy-map information for a specific interface.
- `vlan vlan-id` (Optional) Displays QoS policy-map information for a specific VLAN.

**Command Modes**
Privileged EXEC mode

**Examples**

The following example shows a configuration on a non-Supervisor Engine 6-E:

```
interface GigabitEthernet3/1
vlan-range 20,400
service-policy input p1
vlan-range 300-301
service-policy output p2
```

This example shows how to display policy-map statistics on VLAN 20 on the Gigabit Ethernet 6/1 interface:

```
Switch# show policy-map interface gigabitEthernet 3/1 vlan 20
GigabitEthernet3/1 vlan 20
Service-policy input: p1
Class-map: class-default (match-any)
  0 packets
  Match: any
  0 packets
  police: Per-interface
    Conform: 0 bytes Exceed: 0 bytes
Switch#
```

The following example shows a configuration on a non-Supervisor Engine 6-E:

```
interface fastethernet6/1
vlan-range 100
service-policy in p1
```

This example shows how to display policy-map statistics on VLAN 100 on the FastEthernet interface:

```
Switch# show policy-map interface fastEthernet 6/1 vlan 100
FastEthernet6/1 vlan 100
Service-policy input: p1
```
The following example shows a configuration on a Supervisor Engine 6-E:

interface gigabitethernet3/1
vlan-range 100
service-policy in p1

This example shows how to display policy-map statistics on VLAN 100 on the FastEthernet interface:

Switch# show policy-map interface gigabitethernet 3/1 vlan 100
GigabitEthernet3/1 vlan 100
Service-policy input: p1

Class-map: c1 (match-all)
  0 packets
  Match: ip dscp af11 (10)
  police: Per-interface
  Conform: 0 bytes Exceed: 0 bytes

Class-map: class-default (match-any)
  0 packets
  Match: any
  0 packets

Switch#

show port-security

To display the port security settings for an interface or for the switch, use the `show port-security` command.

```
show port-security [address] [interface interface-id] [interface port-channel port-channel-number] [vlan vlan-id]
```

**Syntax Description**

- `address` (Optional) Displays all secure MAC addresses for all ports or for a specific port.
- `interface interface-id` (Optional) Displays port security settings for a specific interface.
- `interface port-channel port-channel-number` (Optional) Displays port security for a specific port-channel interface.
- `vlan vlan-id` (Optional) Displays port security settings for a specific VLAN.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support was enhanced to display sticky MAC addresses.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support was enhanced to display settings on a per-VLAN basis.</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support was enhanced to display settings on EtherChannel interfaces.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If you enter the command without keywords, the output includes the administrative and operational status of all secure ports on the switch.
- If you enter the `interface-id` value or `port-channel-interface` value, the `show port-security` command displays port security settings for the interface.
- If you enter the `address` keyword, the `show port-security address` command displays the secure MAC addresses for all interfaces and the aging information for each secure address.
- If you enter the `interface-id` value and the `address` keyword, the `show port-security address interface` command displays all the MAC addresses for the interface with aging information for each secure address. You can also use this command to display all the MAC addresses for an interface even if you have not enabled port security on it.
- Sticky MAC addresses are addresses that persist across switch reboots and link flaps.
Examples

This example shows how to display port security settings for the entire switch:

```
Switch# show port-security
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
            (Count)       (Count)          (Count)
Fa3/1        2            2                  0         Restrict
Fa3/2        2            2                  0         Restrict
Fa3/3        2            2                  0         Shutdown
Fa3/4        2            2                  0         Shutdown
Fa3/5        2            2                  0         Shutdown
Fa3/6        2            2                  0         Shutdown
Fa3/7        2            2                  0         Shutdown
Fa3/8        2            2                  0         Shutdown

</tr>
</tbody>
</table>

**Usage Guidelines**

If a powered device is connected to an interface with external power, the switch does not recognize the powered device. The Device column in the output of the **show power inline** command displays as unknown.

If your port is not capable of supporting PoE, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```

The **show power inline interface l module** command displays the amount of power that is used to operate a Cisco IP Phone. To view the amount of power requested, use the **show cdp neighbors** command.

Because FPGAs and other hardware components on the WS-X4548-RJ45V+ and WS-X4648-RJ45V+E modules consume PoE, the operating PoE consumption for an 802.3af-compliant module can be nonzero when there are no powered devices attached to the module. The operating PoE can vary by as much as 20 W because of fluctuations in the PoE that is consumed by the hardware components.
show power

Examples

This example shows how to display information about the general power supply:

```
Switch# show power
Power Supply Model No Type Status Fan Sensor Inline Status
------ ----------------- --------- ----------- ------ ------ -----
PS1   PWR-C45-2800AC   AC 2800W good      good    good
PS2   PWR-C45-1000AC   AC 1000W  err-disable good  n.a.

*** Power Supplies of different type have been detected***

Power supplies needed by system : 1
Power supplies currently available : 1

Power Summary (in Watts) Used Maximum
---------------------- ---- --------
System Power (12V)    328   1360
Inline Power (-50V)   0     1400
Backplane Power (3.3V)10      40
---------------------- -----
Total Used            338 (not to exceed Total Maximum Available = 750)
```

This example shows how to display the amount of available system power:

```
Switch# show power available
Power Summary (in Watts) Available Used Remaining
------------- --------- ------ ------
System Power  1360  280   1080
Inline Power  1400   0   1400
Maximum Power 2800  280   2520
```

Note

The “Inline Power Oper” column displays the PoE consumed by the powered devices attached to the module in addition to the PoE consumed by the FPGAs and other hardware components on the module. The “Inline Power Admin” column displays only the PoE allocated by the powered devices attached to the module.

This example shows how to display the power status information:

```
Switch# show power status
Power Supply Model No Type Status Fan Sensor Inline Status
------ ----------------- --------- ----------- ------ ------ -----
PS1   PWR-C45-2800AC   AC 2800W good      good    good
PS2   PWR-C45-1000AC   AC 1000W  err-disable good  n.a.

Power Supply Max Min Max Min Absolute
(Nos in Watts) Inline Inline System System Maximum
---------------------- ------ ------ ------ ------ ------
PS1                   1400  1400   1360  1360    1400  1360  1360  2800
PS2                   1400  1400   1360  1360    1400  1360  1360  2800
```

This example shows how to verify the PoE consumption for the switch:

```
Switch# show power inline consumption default
Default PD consumption : 5000 mW
```

This example shows how to display the status of inline power:

```
Switch# show power inline
Available:677(w) Used:117(w) Remaining:560(w)

**Note**

When the Supervisor Engine II+TS is used with the 1400 W DC power supply (PWR-C45-1400DC), and only one 12.5 A input of the DC power supply is used, the supervisor engine’s power consumption may vary depending on whether there is any linecard inserted at slot 2 and 3, as well as on the type of linecards inserted. This amount varies between 155 W and 330 W. This variability also affects the
The maximum amount of available supervisor engine inline power, which can also vary from 0 W to 175 W. Therefore, it is possible for a supervisor engine to deny inline power to some connected inline power devices when one or more linecards are inserted into the chassis.

The output of the commands `show power detail` and `show power module` display the supervisor engine's variable power consumption and its inline power summary:

```
Switch# show power detail
sh power detail

show power inline police

To display PoE policing and monitoring status, use the show power inline police command.

    show power inline police [interfacename] [module n]

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interfacename</td>
<td>(optional) Displays PoE policing and monitoring status for a particular interface.</td>
</tr>
<tr>
<td>module n</td>
<td>(optional) Display PoE policing and monitoring status for all interfaces on this module.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Oper Power field displays the true power consumption of the connected device.

The show power inline police command with no keywords displays PoE policing status for all interfaces in the chassis.

If this command is executed at the global level, the last line of the output under Oper Power field displays the total true inline power consumption of all devices connected to the switch.

**Examples**

This example shows how to display PoE policing status for a interface GigabitEthernet 2/1:

```
Switch# show power inline police gigabitEthernet 2/1
Available:421(w)  Used:44(w)  Remaining:377(w)

Interface Admin  Oper  Admin  Oper  Cutoff  Oper
              State  State  Police  Police  Power  Power
----------------------------------  ------  -------  ------  ------  -------  ------
Gi2/1      auto  on    errdisab    ok      22.6  9.6
```

show pppoe intermediate-agent interface

To display PPPoE Intermediate Agent configuration and statistics (packet counters), use the `show pppoe intermediate-agent interface` command.

```
show pppoe intermediate-agent information interface interface
show pppoe intermediate-agent statistics interface interface
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Interface interface</th>
<th>Interface for which information or statistics are displayed.</th>
</tr>
</thead>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display PPPoE Intermediate Agent configuration:

```
Switch# show pppoe intermediate-agent information
Switch PPPoE Intermediate-Agent is enabled
PPPoE Intermediate-Agent trust/rate is configured on the following Interfaces:
Interface    IA    Trusted    Vsa Strip    Rate limit (pps)
----------------------- --------   -------    ---------   ----------------
GigabitEthernet3/4     no        yes       yes         unlimited
PPPoE Intermediate-Agent is configured on following VLANs:
2-3
GigabitEthernet3/7     no        no        no          unlimited
PPPoE Intermediate-Agent is configured on following VLANs:
2-3
```

This example shows how to display PPPoE Intermediate Agent statistics on an interface:

```
Switch# show pppoe intermediate-agent statistics interface g3/7
Interface : GigabitEthernet3/7
Packets received
All = 3
PADI = 0 PADO = 0
PADR = 0 PADS = 0
PADT = 3
Packets dropped:
Rate-limit exceeded = 0
Server responses from untrusted ports = 0
Client requests towards untrusted ports = 0
Malformed PPPoE Discovery packets = 0
Vlan 2: Packets received PADI = 6 PADO = 0 PADR = 6 PADS = 0 PADT = 6
Vlan 3: Packets received PADI = 4 PADO = 0 PADR = 4 PADS = 0 PADT = 4
```

show qos

To display QoS information, use the show qos command.

show qos

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

**Examples**

This example shows the output that might be displayed if you do not enter any keywords:

```
Switch# show qos
  QoS is enabled globally
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

show qos aggregate policer

To display QoS aggregate policer information, use the `show qos aggregate policer` command.

```
show qos aggregate policer [aggregate_name]
```

**Syntax Description**

`aggregate_name` (Optional) Named aggregate policer.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

The aggregate policer name is case sensitive.

**Examples**

This example shows the output if you do not enter any keywords:

```
Switch# show qos aggregate policer
Policer aggr-1
Rate(bps):10000000 Normal-Burst(bytes):1000000
conform-action:transmit exceed-action:policed-dscp-transmit
Policymaps using this policer:
  ipp5-policy
Switch#
```

**Related Commands**

show qos dbl

To display global Dynamic Buffer Limiting (DBL) information, use the `show qos dbl` command.

```
show qos dbl
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

### Examples
This example shows how to display global DBL information:

```
Switch# show qos dbl
DBL is enabled globally
DBL flow includes vlan
DBL flow includes l4-ports
DBL does not use ecn to indicate congestion
DBL exceed-action mark probability:15%
DBL max credits:15
DBL aggressive credit limit:10
DBL aggressive buffer limit:2 packets
DBL DSCP with default drop probability: 1-10
Switch#
```

show qos interface

To display queueing information, use the `show qos interface` command.

```
show qos interface {fastethernet interface-number | gigabitethernet interface-number} |
[vlan vlan_id | port-channel number]
```

**Syntax Description**

- `fastethernet interface-number`: Specifies the Fast Ethernet 802.3 interface.
- `gigabitethernet interface-number`: Specifies the Gigabit Ethernet 802.3z interface.
- `vlan vlan_id`: (Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
- `port-channel number`: (Optional) Specifies the port channel; valid ranges are from 1 to 64.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

show redundancy

To display redundancy facility information, use the `show redundancy` command.

```
show redundancy {clients | counters | history | states}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clients</td>
<td>(Optional) Displays information about the redundancy facility client.</td>
</tr>
<tr>
<td>counters</td>
<td>(Optional) Displays information about the redundancy facility counter.</td>
</tr>
<tr>
<td>history</td>
<td>(Optional) Displays a log of past status and related information for the redundancy facility.</td>
</tr>
<tr>
<td>states</td>
<td>(Optional) Displays information about the redundancy facility state, such as disabled, initialization, standby, active.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1.(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support for ISSU was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information about the redundancy facility:

```
Switch# show redundancy
Switch# show redundancy
4507r-demo# show redundancy
Redundant System Information :
--------------------------------
Available system uptime = 2 days, 2 hours, 39 minutes
Switchovers system experienced = 0
  Standby failures = 0
  Last switchover reason = none

Hardware Mode = Duplex
Configured Redundancy Mode = Stateful Switchover
Operating Redundancy Mode = Stateful Switchover
Maintenance Mode = Disabled
Communications = Up

Current Processor Information :
--------------------------------
Active Location = slot 1
Current Software state = ACTIVE
Uptime in current state = 2 days, 2 hours, 39 minutes
Image Version = Cisco Internetwork Operating System Software IOS (tm) Catalyst 4000 L3 Switch Software (cat4000-I5S-M), Version 12.2(20)EWA(3.92), CISCO INTERNAL USE ONLY ENHANCED PRODUCTION VERSION
```
Chapter 2      Cisco IOS Commands for the Catalyst 4500 Series Switches

This example shows how to display redundancy facility client information:

```
Switch# show redundancy clients
clientID = 0       clientSeq = 0        RF_INTERNAL_MSG
clientID = 30      clientSeq = 135      Redundancy Mode RF
clientID = 28      clientSeq = 330      GALIOS_CONFIG_SYNC
clientID = 65000   clientSeq = 65000    RF_LAST_CLIENT Switch
```

The output displays the following information:

- `clientID` displays the client's ID number.
- `clientSeq` displays the client's notification sequence number.
- `Current redundancy facility state`.

This example shows how to display the redundancy facility counter information:

```
Switch# show redundancy counters
Redundancy Facility OMs
  comm link up = 1
  comm link down down = 0
  invalid client tx = 0
  null tx by client = 0
  tx failures = 0
  tx msg length invalid = 0
  client not rxing msgs = 0
  rx peer msg routing errors = 0
  null peer msg rx = 0
  errored peer msg rx = 0
  buffers tx = 1535
  tx buffers unavailable = 0
  buffers rx = 1530
  buffer release errors = 0
  duplicate client registers = 0
  failed to register client = 0
  Invalid client syncs = 0
```

Switch#
This example shows how to display redundancy facility history information:

Switch# show redundancy history

show redundancy config-sync

To display an ISSU config-sync failure or the ignored mismatched command list (MCL), if any, use the show redundancy config-sync command.

```
show redundancy config-sync {failures | ignored} {bem | mcl | prc}
show redundancy config-sync ignored failures mcl
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failures</td>
<td>Displays MCL entries or BEM/PRC failures.</td>
</tr>
<tr>
<td>ignored</td>
<td>Displays the ignored MCL entries.</td>
</tr>
<tr>
<td>bem</td>
<td>(Deprecated)</td>
</tr>
<tr>
<td>mcl</td>
<td>Displays commands that exist in the active supervisor engine’s running configuration, but are not supported by the image on the standby supervisor engine.</td>
</tr>
<tr>
<td>prc</td>
<td>Displays a Parser Return Code (PRC) failure and forces the system to operate in RPR mode provided there is a mismatch in the return code for a command execution at the active and standby supervisor engine.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(44)SGG</td>
<td>Updated command syntax from issu config-sync to redundancy config-sync.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When two versions of Cisco IOS images are involved, the command sets supported by two images might differ. If any of those mismatched commands are executed on the active supervisor engine, the standby supervisor engine might not recognize those commands. This causes a config mismatch condition. If the syntax check for the command fails on standby supervisor engine during a bulk sync, the command is moved into the MCL and the standby supervisor engine is reset. To display all the mismatched commands, use the **show redundancy config-sync failures mcl** command.
To clean the MCL, follow these steps:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Remove all mismatched commands from the active supervisor engines’ running configuration.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Revalidate the MCL with a modified running configuration using the redundancy config-sync validate mismatched-commands command.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Reload the standby supervisor engine.</td>
</tr>
</tbody>
</table>

Alternatively, you could ignore the MCL by following these steps:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Enter the redundancy config-sync ignore mismatched-commands command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Reload the standby supervisor engine; the system transitions to SSO mode.</td>
</tr>
</tbody>
</table>

**Note** If you ignore the mismatched commands, the out-of-sync configuration at the active supervisor engine and the standby supervisor engine still exists.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>You can verify the ignored MCL with the show redundancy config-sync ignored mcl command.</th>
</tr>
</thead>
</table>

Each command sets a return code in the action function that implements the command. This return code indicates whether or not the command successfully executes. The active supervisor engine maintains the PRC after executing a command. The standby supervisor engine executes the command and sends PRC back to the active supervisor engine. PRC failure occurs if these two PRCs do not match. If a PRC error occurs at the standby supervisor engine either during bulk sync or LBL sync, the standby supervisor engine is reset. To display all PRC failures, use the show redundancy config-sync failures prc command.

To display best effort method (BEM) errors, use the show redundancy config-sync failures bem command.

### Examples

The following example shows how to display the ISSU BEM failures:

```
Switch# show redundancy config-sync failures bem
BEM Failed Command List
-----------------------
The list is Empty
Switch#
```

The following example shows how to display the ISSU MCL failures:

```
Switch# show redundancy config-sync failures mcl
Mismatched Command List
-----------------------
The list is Empty
Switch#
```
The following example shows how to display the ISSU PRC failures:

Switch# show redundancy config-sync failures prc
PRC Failed Command List

------------------------
interface FastEthernet3/2
! <submode> "interface"
- channel-protocol pagp
! </submode> "interface"

</tbody>
</table>
show running-config

To display the module status and configuration, use the `show running-config` command.

```
show running-config [module slot]
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>module slot</strong></th>
<th>(Optional) Specifies the module slot number; valid values are from 1 to 6.</th>
</tr>
</thead>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In some cases, you might see a difference in the duplex mode displayed when you enter the `show interfaces` command and the `show running-config` command. If you do see a difference, the duplex mode displayed in the `show interfaces` command is the actual duplex mode that the interface is running. The `show interfaces` command shows the operating mode for an interface, while the `show running-config` command shows the configured mode for an interface.

The `show running-config` command output for an interface may display a duplex mode configuration but no configuration for the speed. When no speed is displayed in the output, it indicates that the interface speed is configured to be auto and that the duplex mode shown becomes the operational setting once the speed is configured to something other than auto. With this configuration, it is possible that the operating duplex mode for that interface does not match the duplex mode shown with the `show running-config` command.

**Examples**

This example shows how to display the module and status configuration for all modules:

```
Switch# show running-config
03:23:36:%SYS-5-CONFIG_I:Configured from console by console
Building configuration...
Current configuration:3268 bytes
!
version 12.1
no service pad
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname Switch
!
!
power supplies required 1
ip subnet-zero
```
This example shows the output for the `show running-config` command when you have enabled the `switchport voice vlan` command:

```
Switch# show running-config int fastethernet 6/1
Building configuration...

Current configuration: 133 bytes
!
interface FastEthernet6/1
switchport voice vlan 2
no snmp trap link-status
spanning-tree portfast
channel-group 1 mode on
end

Switch#
```
show shell functions

Use the **show shell functions** command to display configurations for all built-in shell functions.

```
show shell functions
```

### Syntax Description

**No keywords**

### Defaults

None

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command only displays the contents of built-in shell functions. To display the contents of user created functions, use the **show shell triggers** command.

### Examples

This example illustrates how to display configurations included for all the shell functions:

```
Switch# show shell functions
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shell trigger</td>
<td>Creates a user defined trigger.</td>
</tr>
<tr>
<td>show shell triggers</td>
<td>Configures a user defined trigger.</td>
</tr>
</tbody>
</table>
show shell triggers

Use the `show shell triggers` command to display detail for all supported builtin and user created triggers.

```
show shell triggers
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>No keywords</th>
</tr>
</thead>
<tbody>
<tr>

<td>Command Modes</td>
<td>Privileged EXEC</td>
</tr>
<tr>
<td>Command History</td>
<td>Release</td>
</tr>
<tr>
<td></td>
<td>12.2(54)SG</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command displays builtin triggers and user defined triggers (with their mapped functions).

Examples

This example illustrates how to display detail for all supported triggers:

```
Switch# show shell triggers
Trigger Id: testGroup
Trigger description: testGroup
Trigger environment:
Trigger mapping function:
```

**show spanning-tree**

To display spanning-tree state information, use the `show spanning-tree` command.

```
show spanning-tree [bridge_group | active | backbonefast | bridge [id] | inconsistentports | interface type | root | summary [total] | uplinkfast | vlan vlan_id | pathcost method | detail]
```

### Syntax Description

- **bridge_group** (Optional) Specifies the bridge group number; valid values are from 1 to 255.
- **active** (Optional) Displays the spanning-tree information on active interfaces only.
- **backbonefast** (Optional) Displays the spanning-tree BackboneFast status.
- **bridge** (Optional) Displays the bridge status and configuration information.
- **id** (Optional) Name of the bridge.
- **inconsistentports** (Optional) Displays the root inconsistency state.
- **interface type** (Optional) Specifies the interface type and number; valid values are `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `port-channel` (1 to 64), and `vlan` (1 to 4094).
- **root** (Optional) Displays the root bridge status and configuration.
- **summary** (Optional) Specifies a summary of port states.
- **total** (Optional) Displays the total lines of the spanning-tree state section.
- **uplinkfast** (Optional) Displays the spanning-tree UplinkFast status.
- **vlan vlan_id** (Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
- **pathcost method** (Optional) Displays the default path cost calculation method used.
- **detail** (Optional) Displays a summary of interface information.

### Defaults

Interface information summary is displayed.

### Command Modes

Privileged EXEC mode

### Command History

Switch# This example shows how to display spanning-tree information for Fast Ethernet interface 5/9:
Switch# show spanning-tree interface fastethernet5/9
Interface Fa0/10 (port 23) in Spanning tree 1 is ROOT-INCONSISTENT
Port path cost 100, Port priority 128
Designated root has priority 8192, address 0090.0c71.a400
Designated bridge has priority 32768, address 00e0.1e9f.8940
Designated port is 23, path cost 115
Timers: message age 0, forward delay 0, hold 0
BPDU: sent 0, received 0
The port is in the portfast mode
Switch#

Switch# show spanning-tree vlan 1
VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0030.94fc.0a00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag not set, detected flag not set
Number of topology changes 5 last change occurred 01:50:47 ago from FastEthernet6/16
Times: hold 1, topology change 35, notification 2 hello 2, max age 20, forward delay 15
Timers:hello 0, topology change 0, notification 0, aging 300
Port 335 (FastEthernet6/15) of VLAN1 is forwarding

Switch# show spanning-tree interface fastethernet5/9
Interface Fa0/10 (port 23) in Spanning tree 1 is ROOT-INCONSISTENT
Port path cost 100, Port priority 128
Designated root has priority 8192, address 0090.0c71.a400
Designated bridge has priority 32768, address 00e0.1e9f.8940
Designated port is 23, path cost 115
Timers: message age 0, forward delay 0, hold 0
BPDU: sent 0, received 0
The port is in the portfast mode
Switch#

Switch# show spanning-tree vlan 1
VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0030.94fc.0a00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag not set, detected flag not set
Number of topology changes 5 last change occurred 01:50:47 ago from FastEthernet6/16
Times: hold 1, topology change 35, notification 2 hello 2, max age 20, forward delay 15
Timers:hello 0, topology change 0, notification 0, aging 300
Port 335 (FastEthernet6/15) of VLAN1 is forwarding

Switch# show spanning-tree vlan 1
VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0030.94fc.0a00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag not set, detected flag not set
Number of topology changes 5 last change occurred 01:50:47 ago from FastEthernet6/16
Times: hold 1, topology change 35, notification 2 hello 2, max age 20, forward delay 15
Timers:hello 0, topology change 0, notification 0, aging 300
Port 335 (FastEthernet6/15) of VLAN1 is forwarding
Port path cost 19, Port priority 128, Port Identifier 129.79.
Designated root has priority 32768, address 0030.94fc.0a00
Designated bridge has priority 32768, address 0030.94fc.0a00
Designated port id is 129.79, designated path cost 0
Timers:message age 0, forward delay 0, hold 0
Number of transitions to forwarding state:1
BPDU: sent 6127, received 0
Switch#

This example shows how to display spanning-tree information for a specific bridge group:

Switch# show spanning-tree vlan 1
UplinkFast is disabled
BackboneFast is disabled
Switch#

This example shows how to display a summary of port states:

Switch# show spanning-tree summary
Root bridge for: VLAN1, VLAN2.
PortFast BPDU Guard is disabled
EtherChannel misconfiguration guard is enabled
UplinkFast is disabled
BackboneFast is disabled
Default pathcost method used is short

<table>
<thead>
<tr>
<th>Name</th>
<th>Blocking</th>
<th>Listening</th>

show spanning-tree mst

To display MST protocol information, use the show spanning-tree mst command.

```
show spanning-tree mst [configuration]
show spanning-tree mst [instance-id] [detail]
show spanning-tree mst [instance-id] interface interface [detail]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configuration</code></td>
<td>(Optional) Displays region configuration information.</td>
</tr>
<tr>
<td><code>instance-id</code></td>
<td>(Optional) Instance identification number; valid values are from 0 to 15.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>(Optional) Displays detailed MST protocol information.</td>
</tr>
<tr>
<td><code>interface interface</code></td>
<td>(Optional) Interface type and number; valid values for type are fastethernet, gigabitethernet, tengigabitethernet, port-channel, and vlan. See the “Usage Guidelines” section for more information.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on systems that are configured with a Supervisor Engine I.

In the output display of the `show spanning-tree mst configuration` command, a warning message might display. This message appears if you do not map secondary VLANs to the same instance as the associated primary VLAN. The display includes a list of the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The warning message is as follows:

```
These secondary vlans are not mapped to the same instance as their primary:  
-> 3
```

See the `show spanning-tree` command for output definitions.
Examples

This example shows how to display region configuration information:

Switch# show spanning-tree mst configuration
Name  [leo]
Revision 2702
Instance Vlans mapped
-------- ---------------------------------------------------------------------
0       1-9,11-19,21-29,31-39,41-4094
1       10,20,30,40
-------------------------------------------------------------------------------
Switch#

This example shows how to display additional MST protocol values:

Switch# show spanning-tree mst 3 detail
# # # # # # MST03 vlans mapped: 3,3000-3999
Bridge address 0002.172c.f400 priority 32771 (32768 sysid 3)
Root this switch for MST03

GigabitEthernet1/1 of MST03 is boundary forwarding
Port info port id 128.1 priority 128 cost 20000
Designated root address 0002.172c.f400 priority 32771 cost 0
Designated bridge address 0002.172c.f400 priority 32771 port id 128.1
Timers: message expires in 0 sec, forward delay 0, forward transitions 1
Bpdus (MRecords) sent 4, received 0

FastEthernet4/2 of MST03 is backup blocking
Port info port id 128.194 priority 128 cost 200000
Designated root address 0002.172c.f400 priority 32771 cost 0
Designated bridge address 0002.172c.f400 priority 32771 port id 128.193
Timers: message expires in 2 sec, forward delay 0, forward transitions 1
Bpdus (MRecords) sent 3, received 252
Switch#

This example shows how to display MST information for a specific interface:

Switch# show spanning-tree mst 0 interface fastethernet4/1 detail
Edge port: no (trunk) port guard : none (default)
Link type: point-to-point (point-to-point) bpdu filter: disable (default)
Boundary : internal bpdu guard : disable (default)
FastEthernet4/1 of MST00 is designated forwarding
Vlans mapped to MST00 1-2,4-2999,4000-4094
Port info port id 128.193 priority 128 cost 200000
Designated root address 0050.3e66.d000 priority 8193 cost 20004
Designated ist master address 0002.172c.f400 priority 49152 cost 0
Designated bridge address 0002.172c.f400 priority 49152 port id 128.193
Timers: message expires in 0 sec, forward delay 0, forward transitions 1
Bpdus sent 492, received 3
Switch#

show storm-control

To display the broadcast storm control settings on the switch or on the specified interface, use the `show storm-control` command.

```
show storm-control [interface-id | broadcast]
```

**Supervisor Engine 6-E and Catalyst 4900M chassis**

```
show storm-control [interface-id | broadcast | multicast]
```

**Syntax Description**

- `interface-id` (Optional) Specifies the interface ID for the physical port.
- `broadcast` (Optional) Displays the broadcast storm threshold setting.
- `multicast` (Optional) Displays the multicast storm threshold setting.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter an interface ID, the storm control thresholds are displayed for the specified interface.

If you do not enter an interface ID, the settings are displayed for the broadcast traffic type for all ports on the switch.

**Examples**

This is an example of output from the `show storm-control` command when no keywords are entered. Because no traffic type keyword was entered, the broadcast storm control settings are displayed.

```
Switch# show storm-control
Interface  Filter State  Upper  Lower  Current
----------  -----------  ------  ------  -------
G12/1      Forwarding  30.00%  30.00%  N/A
G14/1      Forwarding  30.00%  30.00%  N/A
G14/3      Forwarding  30.00%  30.00%  N/A
Switch#
```
This is an example of output from the `show storm-control multicast` command on a Supervisor Engine 6-E:

```
Switch# show storm-control multicast //Supervisor Engine 6-E
Interface Filter State  Broadcast Multicast Level
--------- ------------- --------- --------- -----
Fa6/2       Blocking      Enabled   Enabled   61%
Switch#
```

This is an example of output from the `show storm-control` command on a Supervisor Engine 6-E when no keywords are entered:

```
Switch# show storm-control
Interface Filter State  Broadcast Multicast Level
--------- ------------- --------- --------- -----
Fa6/1       Blocking      Enabled   Disabled  81%
Fa6/2       Blocking      Enabled   Enabled   61%
Switch#
```

This is an example of output from the `show storm-control` command for a specified interface:

```
Switch# show storm-control fastethernet2/17
Interface  Filter State   Level    Current
---------  -------------  -------  -------
Fa2/17     Forwarding      50.00%    0.00%
Switch#
```

This is an example of output from the `show storm-control` command for a specified interface on a Supervisor Engine 6-E:

```
Switch# show storm-control interface fastethernet6/1
Interface  Filter State   Broadcast Multicast   Level
---------  -------------  -------   -------     -----
Fa6/1      Blocking       Enabled   Disabled    81%
Switch#
```

Table 2-40 describes the fields in the `show storm-control` display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the ID of the interface.</td>
</tr>
<tr>
<td>Filter State</td>
<td>Displays the status of the filter:</td>
</tr>
<tr>
<td></td>
<td>• Blocking—Storm control is enabled, and a storm has occurred.</td>
</tr>
<tr>
<td></td>
<td>• Forwarding—Storm control is enabled, and no storms have occurred.</td>
</tr>
<tr>
<td></td>
<td>• Inactive—Storm control is disabled.</td>
</tr>
<tr>
<td>Level</td>
<td>Displays the threshold level set on the interface for broadcast traffic.</td>
</tr>
<tr>
<td>Current</td>
<td>Displays the bandwidth utilization of broadcast traffic as a percentage of total available bandwidth. This field is valid only when storm control is enabled.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> N/A is displayed for interfaces that do storm control in the hardware.</td>
</tr>
</tbody>
</table>
### Related Commands

show switch virtual (virtual switch)

To display configuration and status information for a virtual switching system (VSS), use the show switch virtual command in EXEC mode.

```
show switch virtual [dual-active {bfd | pagp | summary}] | link [counters | detail | port-channel | ports] | redundancy | role | slot-map]
```

**Syntax Description**

- `detail` (Optional) Displays detailed virtual switch information.
- `detail-active` (Optional) Displays virtual switch dual-active information.
- `bridge` (Optional) Displays the bridge status and configuration information.
- `pagp` Specifies a summary of dual-active PAgP information.
- `summary` Specifies a summary of dual-active configuration information.
- `link` (Optional) Displays the virtual switch link information.
- `counters` (Optional) Displays VSL counter information.
- `port-channel` (Optional) Displays VSL port channel information.
- `ports` (Optional) Displays VSL port information.
- `redundancy` (Optional) Displays the VSS redundancy status.
- `role` (Optional) Displays the VSS role information.
- `slot-map` (Optional) Displays the VSS slot map table.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display configuration and status information for a VSS.

The `show switch virtual link detail` command displays the output of the `show switch virtual link` commands and the `show vsl lp internal` commands. In the output, the entry "show int" is displayed for all the VSL members.

The `show switch virtual dual-active pagp` command displays dual-active trust mode status.
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

The following example shows how to display configuration and status information for the VSS:

- In virtual switch mode without skipping config-register:

```bash
Router# show switch virtual
Switch mode : Virtual Switch
Virtual switch domain number : 1
Local switch number : 2
Local switch operational role: Virtual Switch Active
Peer switch number : 1
Peer switch operational role : Virtual Switch Standby
Router#
```

- In virtual switch mode with skipping config-register but not yet rebooted:

```bash
Router# show switch virtual
Switch mode : Virtual Switch
Virtual switch domain number : 1
Local switch number : 2
Local switch operational role: Virtual Switch Active
Peer switch number : 1
Peer switch operational role : Virtual Switch Standby
Warning: Config-register set or will be set to skip configuration 0x2142 in the next reload.
Change config-register; otherwise, switch will be boot in Standalone mode with some default config.
Router#
```

- In standalone mode without skipping config-register:

```bash
Router# show switch virtual
Switch Mode : Standalone
Not in Virtual Switch mode due to:
    Domain ID is not configured
Router#
```

- In standalone mode with skipping config-register:

```bash
Router# show switch virtual
Switch Mode : Standalone
Not in Virtual Switch mode due to:
    Domain ID is not configured
Warning: config-register is set to skip parse 0x2142 in RP or SP
Use [show boot] on RP/SP to verify.
Router#
```

The following example shows how to display the virtual switch link information:

```bash
Router# show switch virtual link
VSL Status             : UP
VSL Uptime             : 4 hours, 26 minutes
VSL SCP Ping           : Pass (or Fail) OK (or Not OK)
VSL ICC (Ping)         : Pass (or Fail)
VSL Control Link       : Te1/3/1
Router#
```

The following example shows how to display the virtual switch link counter information:

```bash
Router# show switch virtual link counters
Port               InOctets   InUcastPkts   InMcastPkts   InBcastPkts
Po10               66340451        190415         15637        112069
Te1/3/1             66981250        194528         15770        112072
Po20               42116619         92926         16406        128593
Te2/2/1             42117401         92932         16406        128593
Port               OutOctets  OutUcastPkts  OutMcastPkts  OutBcastPkts
```
The following example shows how to display the virtual switch link port-channel information:

Router# `show switch virtual link port-channel`

VSL Port Channel Information

Flags:  D - down        P - bundled in port-channel
        I - stand-alone s - suspended
        H - Hot-standby (LACP only)
        R - Layer3      S - Layer2
        U - in use      N - not in use, no aggregation
        f - failed to allocate aggregator
        M - not in use, no aggregation due to minimum links not met
        m - not in use, port not aggregated due to minimum links not met
        u - unsuitable for bundling
        w - waiting to be aggregated

Router#

This example shows how to display information for BFD dual-active detection:

Router# `show switch virtual dual-active bfd`

Bfd dual-active detection enabled: Yes
Bfd dual-active interface pairs configured:
interface1 Gi1/9/48 interface2 Gi2/1/48

<table>
<thead>
<tr>
<th>Group</th>

</tr>
</tbody>
</table>
show system mtu

To display the global MTU setting, use the show system mtu command.

```
show system mtu
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the global MTU setting:

```
Switch# show system mtu
Global Ethernet MTU is 1550 bytes.
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>system mtu</td>
<td>Sets the maximum Layer 2 or Layer 3 payload size.</td>
</tr>
</tbody>
</table>
show tech-support

To display troubleshooting information for TAC, use the **show tech-support** command.

```
show tech-support [bridging | cef | ipmulticast | isis | password [page] | page]
```

**Syntax Description**

- **bridging** (Optional) Specifies bridging-related information.
- **cef** (Optional) Specifies CEF-related information.
- **ipmulticast** (Optional) Specifies IP multicast-related information.
- **isis** (Optional) Specifies CLNS and ISIS-related information.
- **password** (Optional) Includes passwords and other security information in the output.
- **page** (Optional) Displays one page of information at a time in the output.

**Defaults**

The defaults are as follows:

- Outputs are displayed without page breaks.
- Passwords and other security information are removed from the output.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Output from the **show tech-support** command may be terminated in midstream with the key combination Ctrl+Alt+6. The command output is buffered so that the command terminates when output of the current subcommand running under this command completes.

Press the Return key to display the next line of output, or press the Space bar to display the next page of information. If you do not enter the **page** keyword, the output scrolls. It does not stop for page breaks.

If you enter the **password** keyword, password encryption is enabled, but only the encrypted form appears in the output.

If you do not enter the **password** keyword, the passwords and other security-sensitive information in the output are replaced in the output with the word “removed.”

The **show tech-support** commands are a compilation of several **show** commands and the output can be quite lengthy. For a sample display of the output of the **show tech-support** command, see the individual **show** command listed.

If you enter the **show tech-support** command without arguments, the output displays the equivalent of these **show** commands:

- **show version**
- **show running-config**
- **show stacks**
show tech-support

- show interfaces
- show controllers
- show process memory
- show process cpu
- show buffers
- show logging
- show module
- show power
- show environment
- show interfaces switchport
- show interfaces trunk
- show vlan

If you enter the `ipmulticast` keyword, the output displays the equivalent of these `show` commands:

- show ip pim interface
- show ip pim interface count
- show ip pim neighbor
- show ip pim rp
- show ip igmp groups
- show ip igmp interface
- show ip mroute count
- show ip mroute
- show ip mcache
- show ip dvmrp route

**Examples**

For a sample display of the `show tech-support` command output, see the commands listed in the “Usage Guidelines” section for more information.

**Related Commands**

See the “Usage Guidelines” section.
show udld

To display the administrative and operational UDLD status, use the show udld privileged EXEC command.

Syntax Description

Defaults

None

Command Modes

Privileged EXEC

Command History

Usage Guidelines

If you do not enter an interface_id value, the administrative and operational UDLD status for all interfaces is displayed.

Examples

To verify status for a particular link as reported by UDLD, enter the following command:

```
Switch# show udld g1/34
Interface Gi1/34
  Port enable administrative configuration setting: Enabled / in aggressive mode
  Port enable operational state: Enabled / in aggressive mode
  Current bidirectional state: Bidirectional
  Current operational state: Advertisement - Single neighbor detected
  Message interval: 15000 ms
  Time out interval: 5000 ms
  Port fast-hello configuration setting: Disabled
  Port fast-hello interval: 0 ms
  Port fast-hello operational state: Disabled
  Neighbor fast-hello configuration setting: Disabled
  Neighbor fast-hello interval: Unknown
  
  Entry 1
```

Entry 1
show udld

Expiration time: 43300 ms
Cache Device index: 1
Current neighbor state: Bidirectional
Device ID: FOX10430380
Port ID: Gi1/34
Neighbor echo 1 device: FOX104303NL
Neighbor echo 1 port: Gi1/34

TLV Message interval: 15 sec
No TLV fast-hello interval
TLV Time out interval: 5
TLV CDP Device name: Switch

To verify link status as reported by UDLD, enter the following command:

Switch# show udld neighbors

<table>
<thead>
<tr>
<th>Port</th>
<th>Device Name</th>
<th>Device ID</th>
<th>Port ID</th>
<th>Neighbor State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/33</td>
<td>FOX10430380</td>
<td>1</td>
<td>Gi1/33</td>
<td>Bidirectional</td>
</tr>
<tr>
<td>Gi1/34</td>
<td>FOX10430380</td>
<td>1</td>
<td>Gi1/34</td>
<td>Bidirectional</td>
</tr>
</tbody>
</table>

To verify Fast UDLD configuration, enter the following command:

Switch# show udld fast-hello

Total ports on which fast hello can be configured: 16
Total ports with fast hello configured: 3
Total ports with fast hello operational: 3
Total ports with fast hello non-operational: 0

<table>
<thead>
<tr>
<th>Port-ID</th>
<th>Hello Neighbor</th>
<th>Neighbor-Device</th>
<th>Neighbor-Port</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/45</td>
<td>200</td>
<td>FOX104303NL</td>
<td>Gi1/45</td>
<td>Operational</td>
</tr>
<tr>
<td>Gi1/46</td>
<td>200</td>
<td>FOX104303NL</td>
<td>Gi1/46</td>
<td>Operational</td>
</tr>
<tr>
<td>Gi1/47</td>
<td>200</td>
<td>FOX104303NL</td>
<td>Gi1/47</td>
<td>Operational</td>
</tr>
</tbody>
</table>

To verify status for a particular link as reported by Fast UDLD, enter the following command:

Switch# show udld fast-hello gi1/33

Interface Gi1/33
---
Port enable administrative configuration setting: Enabled / in aggressive mode
Port enable operational state: Enabled / in aggressive mode
Current bidirectional state: Bidirectional
Current operational state: Advertisement - Single neighbor detected
Message interval: 200 ms
Time out interval: 5000 ms

Port fast-hello configuration setting: Enabled
Port fast-hello interval: 200 ms
Port fast-hello operational state: Enabled
Neighbor fast-hello configuration setting: Enabled
Neighbor fast-hello interval: 200 ms

Entry 1
---
Expiration time: 500 ms
Cache Device index: 1
Current neighbor state: Bidirectional
Device ID: FOX10430380
Port ID: Gi1/33
Neighbor echo 1 device: FOX104303NL
Neighbor echo 1 port: Gi1/33
show udld

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>udld (global configuration mode)</td>
<td>Enables aggressive or normal mode in the UDLD protocol and sets the configurable message timer time.</td>
</tr>
<tr>
<td>udld (interface configuration mode)</td>
<td>Enables UDLD on an individual interface or prevents a fiber interface from being enabled by the udld (global configuration mode) command.</td>
</tr>
</tbody>
</table>

TLV Message interval: 15
TLV fast-hello interval: 200 ms
TLV Time out interval: 5
TLV CDP Device name: Switch
show vlan

To display VLAN information, use the `show vlan` command.

```
show vlan [brief | id vlan_id | name name]
show vlan private-vlan [type]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brief</td>
<td>(Optional) Displays only a single line for each VLAN, naming the VLAN, status, and ports.</td>
</tr>
<tr>
<td>id vlan_id</td>
<td>(Optional) Displays information about a single VLAN identified by VLAN ID number; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>name name</td>
<td>(Optional) Displays information about a single VLAN identified by VLAN name; valid values are an ASCII string from 1 to 32 characters.</td>
</tr>
<tr>
<td>private-vlan</td>
<td>Displays private VLAN information.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Private VLAN type.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the VLAN parameters for all VLANs within the administrative domain:

```
Switch# show vlan
VLAN Name               Status   Ports
---- ------------------- -------- -------------------------------
 1   default            active   Fa5/9
 2   VLAN0002           active   Fa5/9
 3   VLAN0003           active   Fa5/9
 4   VLAN0004           active   Fa5/9
 5   VLAN0005           active   Fa5/9
 6   VLAN0006           active   Fa5/9
 10  VLAN0010           active   Fa5/9
 20  VLAN0020           active   Fa5/9
<...Output truncated...>
```
This example shows how to display the VLAN name, status, and associated ports only:

```
Switch# show vlan brief

VLAN Name                  Status   Ports
--- -------------------- -------------------------------
 1  default                     active   Fa5/9
 2  VLAN00002                  active   Fa5/9
 3  VLAN00003                  active   Fa5/9
 4  VLAN00004                  active   Fa5/9
 5  VLAN00005                  active   Fa5/9
 6  VLAN00010                  active   Fa5/9
 ...  
999  VLAN0999                  active   Fa5/9
1002 fddi-default            active   Fa5/9
1003 trcrf-default           active   Fa5/9
1004 fdnet-default           active   Fa5/9
1005 trbrf-default           active   Fa5/9
Switch#
```

```
850  VLAN0850                  active   Fa5/9
917  VLAN0917                  active   Fa5/9
999  VLAN0999                  active   Fa5/9
1002 fddi-default             active   Fa5/9
1003 trcrf-default            active   Fa5/9
1004 fdnet-default            active   Fa5/9
1005 trbrf-default            active   Fa5/9
```

This example shows how to display the VLAN name, status, and associated ports only:

```
Switch# show vlan brief

VLAN Name                  Status   Ports
--- -------------------- -------------------------------
 1  default                     active   Fa5/9
 2  VLAN00002                  active   Fa5/9
 3  VLAN00003                  active   Fa5/9
 4  VLAN00004                  active   Fa5/9
 5  VLAN00005                  active   Fa5/9
 6  VLAN00010                  active   Fa5/9
 ...  
999  VLAN0999                  active   Fa5/9
1002 fddi-default            active   Fa5/9
1003 trcrf-default           active   Fa5/9
1004 fdnet-default           active   Fa5/9
1005 trbrf-default           active   Fa5/9
Switch#
```
This example shows how to display the VLAN parameters for VLAN 3 only:

```
Switch# show vlan id 3
```

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Name</th>
<th>Status</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>VLAN0003</td>
<td>active</td>
<td>Fa5/9</td>
</tr>
</tbody>
</table>

```
Switch# show vlan private-vlan
```

```
Primary Secondary Type              Ports
-------      ---------       ----------------- ------------------------------------------
10          100           community     Fa3/1, Fa3/2
```

```
The following example shows how to remove the VLAN association:

Switch(config)# vlan 10
Switch(config-vlan)# private-vlan association remove 100
Switch(config-vlan)# end
Switch# show vlan private
```

```
Primary Secondary Type              Ports
------- ---------                      ------------------------------------------
10     100              community
```

Table 2-41 describes the fields in the `show vlan` command output.

**Table 2-41  show vlan Command Output Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN</td>
<td>VLAN number.</td>
</tr>
<tr>
<td>Name</td>
<td>Name, if configured, of the VLAN.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the VLAN (active or suspend).</td>
</tr>
<tr>
<td>Ports</td>
<td>Ports that belong to the VLAN.</td>
</tr>
<tr>
<td>Type</td>
<td>Media type of the VLAN.</td>
</tr>
<tr>
<td>SAID</td>
<td>Security Association Identifier value for the VLAN.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit size for the VLAN.</td>
</tr>
<tr>
<td>Parent</td>
<td>Parent VLAN, if one exists.</td>
</tr>
<tr>
<td>RingNo</td>
<td>Ring number for the VLAN, if applicable.</td>
</tr>
<tr>
<td>BrdgNo</td>
<td>Bridge number for the VLAN, if applicable.</td>
</tr>
<tr>
<td>Stp</td>
<td>Spanning Tree Protocol type used on the VLAN.</td>
</tr>
</tbody>
</table>
This example shows how to verify PVLAN configuration on the interface:

Switch# `show interface f3/2 status`  
Port | Name | Status | Vlan       | Duplex | Speed  | Type       
-----|------|--------|------------|--------|--------|------------
Fa3/2|      | connected | pvlan seco a-full | a-100  | 10/100BaseTX  

Switch# `show interface f3/1 status`  
Port | Name | Status | Vlan       | Duplex | Speed  | Type       
-----|------|--------|------------|--------|--------|------------
Fa3/1|      | connected | pvlan prom a-full | a-100  | 10/100BaseTX  

Related Commands

<table>
<thead>
<tr>

show vlan access-map

To display the contents of a VLAN access map, use the **show vlan access-map** command.

```
show vlan access-map [map-name]
```

### Syntax Description

- **map-name** *(Optional)* Name of the VLAN access map.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This command shows how to display the contents of a VLAN access map:

```
Switch# show vlan access-map mordred
Vlan access-map "mordred" 1
  match: ip address 13
     action: forward capture
Switch#
```

### Related Commands

</table>
show vlan counters

To display the software-cached counter values, use the `show vlan counters` command.

```
show vlan [id vlanid] counters
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>id vlanid</code></td>
<td>(Optional) Displays the software-cached counter values for a specific VLAN.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 Series Switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the `show vlan counters` command without specifying the VLAN ID, the software-cached counter values for all VLANs are displayed.

**Examples**

This example shows how to display the software-cached counter values for a specific VLAN:

```
Switch# show vlan counters
* Multicast counters include broadcast packets

Vlan Id          : 1
L2 Unicast Packets: 0
L2 Unicast Octets : 0
L3 Input Unicast Packets : 0
L3 Input Unicast Octets : 0
L3 Output Unicast Packets : 0
L3 Output Unicast Octets : 0
L3 Output Multicast Packets : 0
L3 Output Multicast Octets : 0
L3 Input Multicast Packets : 0
L3 Input Multicast Octets : 0
L2 Multicast Packets   : 1
L2 Multicast Octets    : 94
Switch>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

<tr>
<td><code>clear vlan counters</code></td>
<td>Clears the software-cached counter values to start from zero again for a specified VLAN or all existing VLANs.</td>
</tr>
</tbody>
</table>
show vlan dot1q tag native

To display all the ports on the switch that are eligible for native VLAN tagging as well as their current native VLAN tagging status, use the `show vlan dot1q tag native` command.

```
show vlan dot1q tag native
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(18)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the `show vlan dot1q tag native` command:

```
Switch# show vlan dot1q tag native
dot1q native vlan tagging is disabled globally

Per Port Native Vlan Tagging State
------------------------------------

Port        Operational Mode    Native VLAN Tagging State
------------------------------------

f3/2        trunk             enabled
f3/16       PVLAN trunk       disabled
f3/16       trunk             enabled
```

<tr>
<td>12.2(54)SG</td>
<td>This command was modified to support user distribution on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The show vlan group command displays the existing VLAN groups and lists the VLANs and VLAN ranges that are members of each VLAN group. If you use the group-name keyword, you display only the members of the VLAN group specified by the group-name argument.

Examples

This example shows how to display the members of a specified VLAN group:

```
Switch# show vlan group group-name ganymede

Group Name Vlans Mapped
----------------- -------------------
   ganymede       7-9
```

Related Commands

show vlan internal usage

To display information about the internal VLAN allocation, use the `show vlan internal usage` command.

```
show vlan [id vlan-id] internal usage
```

**Syntax Description**

- `id vlan-id` (Optional) Displays internal VLAN allocation information for the specified VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information about the current internal VLAN allocation:

```
Switch# show vlan internal usage

VLAN Usage
----- ---------------
1025 -
1026 -
1027 -
1028 -
1029 Port-channel6
1030 GigabitEthernet1/2
1032 FastEthernet3/20
1033 FastEthernet3/21
1129 -
```

This example shows how to display information about the internal VLAN allocation for a specific VLAN:

```
Switch# show vlan id 1030 internal usage

VLAN Usage
----- ---------------
1030 GigabitEthernet1/2
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan internal allocation policy</code></td>
<td>Configures the internal VLAN allocation scheme.</td>
</tr>
</tbody>
</table>
show vlan mapping

Use the **show vlan mapping** privileged EXEC command to display information about VLAN mapping on trunk ports.

```
show vlan mapping [interface interface-id] [ | {begin | exclude | include} expression]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>(Optional) Displays VLAN mapping information for the specified interface.</td>
</tr>
<tr>
<td></td>
<td>begin</td>
</tr>
<tr>
<td></td>
<td>exclude</td>
</tr>
<tr>
<td></td>
<td>include</td>
</tr>
<tr>
<td>expression</td>
<td>Specifies an expression in the output to use as a reference point.</td>
</tr>
</tbody>
</table>

**Defaults**

None

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Expressions are case sensitive. For example, if you enter `| exclude output`, the lines that contain `output` are not displayed, but the lines that contain `Output` are displayed.

**Examples**

This is a sample output from the **show vlan mapping** command:

```
Switch# show vlan mapping
Interface Fa0/5:
VLANs on wire Translated VLAN Operation
------------------ --------------- --------------
default QinQ 1 selective QinQ
```

This is a sample output from the **show vlan mapping** command for an interface:

```
Switch# show vlan mapping interface fa0/6
Interface fa0/6:
VLAN on wire Translated VLAN Operation
------------------ --------------- --------------
1 11 1-to-1 mapping
12,16-18 100 selective QinQ
* 101 default QinQ
```
## show vlan mapping

</thead>
<tbody>
<tr>
<td>switchport vlan mapping</td>
<td>Configures VLAN mapping on an interface.</td>
</tr>
</tbody>
</table>
show vlan mtu

To display the minimum and maximum transmission unit (MTU) sizes of each VLAN, use the `show vlan mtu` command.

show vlan mtu

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The MTU_Mismatch column in the command output indicates whether all the ports in the VLAN have the same MTU. When “yes” is displayed in the MTU_Mismatch column, it means that the VLAN has a port with different MTUs, and packets might be dropped that are switched from a port with a larger MTU to a port with a smaller MTU. If the VLAN does not have an SVI, the hyphen (-) symbol is displayed in the SVI_MTU column.

For a VLAN, if the MTU-Mismatch column displays “yes,” the names of the port with the MinMTU and the port with the MaxMTU are displayed. For a VLAN, if the SVI_MTU is bigger than the MinMTU, “TooBig” is displayed after the SVI_MTU.

Examples

This is an example of output from the `show vlan mtu` command:

```
Switch# show vlan mtu

VLAN  SVI_MTU  MinMTU(port)  MaxMTU(port)  MTU_Mismatch
----  --------  --------------  --------------  ---------------
1     1500     1500           1500           No

Switch>
```

Related Commands

<table>
<thead>
<tr>

</table>
show vlan private-vlan

To display private VLAN information, use the `show vlan private-vlan` command.

```
show vlan private-vlan [type]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>(Optional) Displays the private VLAN type; valid types are isolated, primary, community, twoway-community, nonoperational, and normal.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>15.1.0 SG</td>
<td>Support for PVLAN modes over EtherChannel. Modes include: private-vlan host, private-vlan promiscuous, private-vlan trunk secondary, and private-vlan trunk promiscuous.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the `show vlan private-vlan type` command displays a VLAN type as normal, it indicates that a regular VLAN has been used in the private VLAN configuration. When normal is displayed, this indicates that two VLANs have been associated before the type was set, and the private VLAN is not operational. This information is useful for debugging purposes.

**Examples**

This example shows how to display information about all currently configured private VLANs:

```
Switch# show vlan private-vlan

Primary Secondary Type          Ports
------- --------- ----------------- ------------------------------------------
2       301   community         Fa5/3, Fa5/25
2       302   community
2       303   community         Fa5/3, Po63
10      community
100     101   isolated
150     151   non-operational
202     community
303     twoway-community
401     402   non-operational
Switch#
```

**Note**

A blank Primary value indicates that no association exists.
This example shows how to display information about all currently configured private VLAN types:

```
Switch# show vlan private-vlan
Vlan Type
--- ---------------
 202  primary
 303  community
 304  community
 305  community
 306  community
 307  community
 308  normal
 309  community
 440  isolated
Switch#
```

Table 2-42 describes the fields in the `show vlan private-vlan` command output.

<table>
<thead>
<tr>

show vmps

To display the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers, use the show vmps command.

```
show vmps [statistics]
```

**Syntax Description**
- `statistics` (Optional) Displays the client-side statistics.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the `show vmps` command:

```
Switch# show vmps
VQP Client Status:
---------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.50.120 (primary, current)

Reconfirmation status
---------------------
VMPS Action: No Dynamic Port
Switch#
```

This is an example of output from the `show vmps statistics` command:

```
Switch# show vmps statistics
VMPS Client Statistics
-----------------------
VQP Queries: 0
VQP Responses: 0
VMPS Changes: 0
VQP Shutdowns: 0
VQP Denied: 0
VQP Wrong Domain: 0
VQP Wrong Version: 0
VQP Insufficient Resource: 0
Switch#
```

**Related Commands**
- `statistics` (Optional) Displays the client-side statistics.
### Command Description

</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The valid values for the `type` argument are as follows:

- `counters`—Displays counter information.
- `detail`—Displays detailed information.
- `fsm`—Displays Finite State Machine (FSM) information.
- `neighbors`—Displays neighbor information (supported with the `lmp` keyword only).
- `status`—Displays status information.
- `summary`—Displays a summary of information.
- `timer`—Displays Tx and Rx hello timer values.

The timers already displayed in the show vslp lmp timers output are shown in the output of the show vslp lmp summary command.

The output of the `show vslp rrp detail` command includes the information from the following commands:

- `show vslp rrp summary`
- `show vslp rrp counters`
- `show vslp rrp fsm`
The following example shows how to display a summary of LMP information for a specific VSLP instance.

Router# show vslp 2 lmp summary

LMP summary
  Link info: Configured: 2 Operational: 0
  Peer Peer Peer Peer Timer(s) running
  Port Flag State Flag MAC Swtch Port (Time remaining)

  4/1 v link_down - - - -
  4/2 v link_down - - - -

Router#

The following example shows how to display the VSLP instance mappings.

Router# show vslp instances

VSLP instance mappings:

Instance Num  Name  Switch Num  Flag

----------------------------------------------------------------------
  2  VSL  2  0x00000001

Router#

The following example shows how to display LMP neighbor information:

Router# show vslp 2 lmp neighbors

LMP neighbors
  Peer Group info: # Groups: 0

Router#

The following example shows how to display a summary of LMP information:

Router# show vslp lmp summary

Instance #1:

LMP summary
  Link info: Configured: 3 Operational: 1
  Peer Peer Peer Peer Timer(s) running
  Interface Flag State Flag MAC Switch Interface (Time remaining)

  Gi1/3/1 v link_down - - - -
  Gi1/5/4 vf operational vf 0013.5fcb.1480 2 Gi1/6/4 T4(240ms) T5(2.22s)
  Gi1/5/5 v link_down - - - -

Flags: V - valid f -> B - bidirectional

The following examples shows how to display the LMP Tx and Rx hello timer values:

Router# show vslp lmp timer

Instance #1:

LMP hello timer

Interface State Hello Tx (T4) ms Hello Rx (T5*) ms

  Gi1/9/1 link_down 1000 - - 500000 - -
  Gi1/9/3 link_down 1000 - - 500000 - -
  Gi1/9/5 link_down 1000 - - 500000 - -

Router#

The following example shows how to display VSLP packet information:

Router# show vslp packet

VSLP packet counters
  Transmitted:
    total = 1543
    error = 0
    err_cksum = 0
    eobc = 0
The following example shows how to display VSLP packet counter information:

Router# `show vslp packet counters`
VSLP packet counters
Transmitted:
  total = 28738
  error = 0
  err_cksum = 0
eobc = 28738
eobc[LMP] = 28701
eobc[RRP] = 17
eobc[PING] = 20
ibc = 0
ibc[LMP] = 0
ibc[RRP] = 0
ibc[PING] = 0
Received:
  total = 28590
  error = 0
  err_cksum = 0
eobc = 28590
  eobc[LMP] = 28552
  eobc[RRP] = 18
  eobc[PING] = 20
ibc = 0
ibc[LMP] = 0
ibc[RRP] = 0
ibc[PING] = 0
Router#

The following example shows how to display a summary of RRP information:

Router# `show vslp rrp summary`
RRP information for Instance 1

snmp ifindex clear

To clear any previously configured snmp ifindex commands that were entered for a specific interface, use the snmp ifindex clear command.

```
snmp ifindex clear
```

Syntax Description
This command has no arguments or keywords.

Defaults
This command has no default settings.

Command Modes
Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Interface index persistence occurs when ifIndex values in the interface MIB (IF-MIB) persist across reboots and allow for consistent identification of specific interfaces using SNMP.

Use the snmp ifindex clear command on a specific interface when you want that interface to use the global configuration setting for ifIndex persistence. This command clears any ifIndex configuration commands previously entered for that specific interface.

Examples
This example shows how to enable ifIndex persistence for all interfaces:

```
Router(config)# snmp-server ifindex persist
```

This example shows how to disable IfIndex persistence for FastEthernet 1/1 only:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit
```

This example shows how to clear the ifIndex configuration from the FastEthernet 1/1 configuration:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex clear
Router(config-if)# exit
```

As a result of this sequence of commands, ifIndex persistence is enabled for all interfaces that are specified by the snmp-server ifindex persist global configuration command.

</table>
snmp ifindex persist

To enable ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface, use the **snmp ifindex persist** command. To disable ifIndex persistence only on a specific interface, use the **no** form of this command.

```
snmp ifindex persist
no snmp ifindex persist
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The **snmp ifindex persist** interface configuration command enables and disables ifIndex persistence for individual entries (that correspond to individual interfaces) in the ifIndex table of the IF-MIB.

The **snmp-server ifindex persist** global configuration command enables and disables ifIndex persistence for all interfaces on the routing device. This action applies only to interfaces that have ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

**Examples**

This example shows how to enable ifIndex persistence for interface FastEthernet 1/1 only:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex persist
Router(config-if)# exit
```

This example shows how to enable ifIndex persistence for all interfaces, and then disable ifIndex persistence for interface FastEthernet 1/1 only:

```
Router(config)# snmp-server ifindex persist
Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit
```

**Related Commands**
### Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>snmp ifindex clear</code></td>
<td>Clears any previously configured <code>snmp ifindex</code> commands that were entered for a specific interface.</td>
</tr>
<tr>
<td><code>snmp ifindex persist</code></td>
<td>Enables ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface.</td>
</tr>
</tbody>
</table>
snmp-server enable traps

To enable SNMP notifications (traps or informs), use the `snmp-server enable traps` command. To disable all SNMP notifications, use the `no` form of this command.

```
snmp-server enable traps 
[flash insertion removal] | fru-ctrl | port-security [trap-rate 
trap-rate] | removal | stpx | vlancreate | vlandelete | vtp] [mac-notification [change | move | 
threshold]
```

```
no snmp-server enable traps 
[flash insertion removal] | fru-ctrl | port-security [trap-rate 
trap-rate] | removal | stpx | vlancreate | vlandelete | vtp] [mac-notification]
```

### Syntax Description

<table>
<thead>
<tr>

</tr>
<tr>
<td>move</td>
<td>(Optional) Controls the SNMP MAC move trap notifications.</td>
</tr>
<tr>
<td>threshold</td>
<td>(Optional) Controls the SNMP MAC threshold trap notifications.</td>
</tr>
</tbody>
</table>

### Defaults

SNMP notifications are disabled.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for MAC notification was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you enter this command without an option, all notification types controlled by this command are enabled.
SNMP notifications can be sent as traps or inform requests. This command enables both traps and inform requests for the specified notification types. To specify whether the notifications should be sent as traps or informs, use the `snmp-server host [traps | informs]` command.

The `snmp-server enable traps` command is used in conjunction with the `snmp-server host` command. Use the `snmp-server host` command to specify which host or hosts receive SNMP notifications. To send notifications, you must configure at least one `snmp-server host` command.

This list of the MIBs is used for the traps:

- **flash**—Controls SNMP FLASH traps from the CISCO-FLASH-MIB.
  - **insertion**—Controls the SNMP Flash insertion trap notifications.
  - **removal**—Controls the SNMP Flash removal trap notifications.
- **fru-ctrl**—Controls the FRU control traps from the CISCO-ENTITY-FRU-CONTROL-MIB.
- **port-security**—Controls the port-security traps from the CISCO-PORT-SECURITY-MIB.
- **stpx**—Controls all the traps from the CISCO-STP-EXTENSIONS-MIB.
- **vlancreate**—Controls SNMP VLAN created trap notifications.
- **vlandelete**—Controls SNMP VLAN deleted trap notifications.
- **vtp**—Controls the VTP traps from the CISCO-VTP-MIB.

### Examples

This example shows how to send all traps to the host is specified by the name myhost.cisco.com using the community string defined as public:

```
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

This example shows how to enable the MAC address change MIB notification:

```
Switch(config)# snmp-server enable traps mac-notification change
```

SNMP traps can be enabled with a rate-limit to detect port-security violations due to restrict mode. The following example shows how to enable traps for port-security with a rate of 5 traps per second:

```
Switch(config)# snmp-server enable traps port-security trap-rate 5
```

**snmp-server ifindex persist**

To globally enable ifIndex values that will remain constant across reboots for use by SNMP, use the `snmp-server ifindex persist` command. To globally disable inIndex persistence, use the `no` form of this command.

```
  snmp-server ifindex persist
  no snmp-server ifindex persist
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The `snmp-server ifindex persist` global configuration command does not override the interface-specific configuration. To override the interface-specific configuration of ifIndex persistence, enter the `no snmp ifindex persist` and `snmp ifindex clear` interface configuration commands.

Entering the `no snmp-server ifindex persist` global configuration command enables and disables ifIndex persistence for all interfaces on the routing device using ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

**Examples**

This example shows how to enable ifIndex persistence for all interfaces:

```
Router(config)# snmp-server ifindex persist
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>snmp ifindex clear</code></td>
<td>Clears any previously configured <code>snmp ifindex</code> commands that were entered for a specific interface.</td>

</tbody>
</table>
snmp-server ifindex persist compress

To configure the format of the ifIndex table in a compressed format, use the `snmp-server ifindex persist compress` command. To place the table in a decompressed format, use the `no` form of this command.

```
snmp-server ifindex persist compress

no snmp-server ifindex persist compress
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
Global configuration mode.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command is hidden on Supervisor Engine V and later supervisor engines because the ifIndex table is always in a compressed format on those supervisor engines.

At bootup, if the nvram:ifIndex-table.gz file (the ifIndex table in a compressed format) is present on a Supervisor Engine II+, Supervisor Engine III, or Supervisor Engine IV, the `snmp-server ifindex persist compress` command is automatically run even if the startup-config file does not have this configuration.

**Examples**
This example shows how to enable compression of the ifIndex table:

```
Router(config)# snmp-server ifindex persist compress
```

This example shows how to disable compression of the ifIndex table:

```
Router(config)# no snmp-server ifindex persist compress
```

**Related Commands**

</table>
snmp trap mac-notification change

To enable SNMP MAC address notifications, use the `snmp trap mac-notification` command. To return to the default setting, use the `no` form of this command.

```
snmp trap mac-notification change {added | removed}
no snmp trap mac-notification change {added | removed}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>added</code></td>
<td>Specifies enabling the MAC address notification trap whenever a MAC address is added to an interface.</td>
</tr>
<tr>
<td><code>removed</code></td>
<td>Specifies enabling the MAC address notification trap whenever a MAC address is removed from an interface.</td>
</tr>
</tbody>
</table>

### Defaults

MAC address addition and removal are disabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Even though you enable the change notification trap for a specific interface by using the `snmp trap mac-notification change` command, the trap is generated only when you enable the `snmp-server enable traps mac-notification change` and the `mac address-table notification change` global configuration commands.

### Examples

This example shows how to enable the MAC notification trap when a MAC address is added to a port:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# snmp trap mac-notification change added
```

You can verify your settings by entering the `show mac address-table notification change` interface privileged EXEC command.

source (netflow-lite exporter submode)

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a source Layer 3 interface of the NetFlow-lite collector, use the source command. To delete a source address, use the no form of this command.

source source-address

no source source-address

Syntax Description
source-address Specifies a source Layer 3 interface for a NetFlow-lite exporter.

Defaults
None

Command Modes
netflow-lite exporter submode

Command History
Release Modification
15.0(2)SG Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines
One of the mandatory parameters for a minimally configured exporter along with the destination address and the UDP destination port of the collector.

Examples
This example shows how to specify a source Layer 3 interface of the NetFlow-lite collector:

Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#

Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
    Network Protocol Configuration:
      Destination IP address: 5.5.5.6
Source IP Address:  5.5.5.5  
VRF label:   
DSCP:  0x20  
TTL:  128  
COS:  7  
Transport Protocol Configuration:  
  Transport Protocol:  UDP  
  Destination Port:  8188  
  Source Port:  61670  
Export Protocol Configuration:  
  Export Protocol:  netflow-v9  
  Template data timeout:  60  
  Options sampler-table timeout:  1800  
  Options interface-table timeout:  1800  
  Exporter Statistics:  
    Packets Exported:  0  

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

</tbody>
</table>
source-interface

To send out call home email messages with specific source interface, use the source-interface command.

`source-interface interface name`

**Syntax Description**
- `interface name`: Source interface name for call home email messages

**Defaults**
None

**Command Modes**
cfg-call-home

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You should configure no shut on an interface and provide a valid IP address before specifying it as a source interface for Call Home. Doing this avoids a connection failure when sending Call Home email messages. You should only specify a source interface name under Call Home if source-ip-address is not specified. You can only specify either a source interface or source-ip-address in call-home mode, not simultaneously.

**Examples**
This example shows how to configure source interface for Call Home. Generally, the interface should already be configured with a valid IP address as usually configured for an interface.

```
Switch# config terminal
Switch(config)# call-home
Switch(config-call-home)# source-interface fastEthernet 1/1
Switch(config-call-home)# source-ip
Switch(config-call-home)# source-ip-address 10.2.4.1
Error:a source-interface has already been configured,please remove source-interface config first if you want to configure source-ip-address
Switch(config-call-home)# no source-interface
Switch(config-call-home)# source-ip-address 10.2.4.1
```

**Note**
If Call Home is configured to use http or https as the transport method, you must use `ip http client source-interface` to configure the source interface for all http clients. You cannot specify a source interface for Call Home http messages only.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-ip-address</td>
<td>Sends out Call Home email messages with specific source IP address.</td>
</tr>
</tbody>
</table>
source-ip-address

To send out Call Home email messages with specific source IP address, use the `source-ip-address` command.

```
source-ip-address ip address
```

**Syntax Description**

| ip address | Source IP address for Call Home messages. |

**Defaults**

None

**Command Modes**

cfg-call-home

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

It is best to configure `no shut` an interface with this valid IP address before specifying it as source-ip-address for Call Home. Doing this avoids a connection failure when sending Call Home email messages. You should only specify source-ip-address under Call Home if source-interface is not specified. You can only specify either source interface or source-ip-address in Call Home mode, not both simultaneously.

**Examples**

This example shows how to configure source-ip-address for Call Home:

```
Switch# config terminal
Switch(config)# call-home
Switch(cfg-call-home)# source-interface fastEthernet 1/1
Switch(cfg-call-home)# source-ip
Switch(cfg-call-home)# source-ip-address 10.2.4.1
Error:a source-interface has already been configured,please remove source-interface config first if you want to configure source-ip-address
Switch(cfg-call-home)# no source-interface
Switch(cfg-call-home)# source-ip-address 10.2.4.1
```

**Related Commands**

spanning-tree backbonefast

To enable BackboneFast on a spanning-tree VLAN, use the `spanning-tree backbonefast` command. To disable BackboneFast, use the `no` form of this command.

```
spanning-tree backbonefast
no spanning-tree backbonefast
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
BackboneFast is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
BackboneFast should be enabled on all Catalyst 4506 series switches to allow the detection of indirect link failures. Enabling BackboneFast starts the spanning-tree reconfiguration more quickly.

**Examples**
This example shows how to enable BackboneFast on all VLANs:

```
Switch(config)# spanning-tree backbonefast
Switch(config)#
```

**Defaults**

Disabled

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

Use care when entering the `spanning-tree bpdufilter enable` command. Enabling BPDU filtering on an interface is approximately equivalent to disabling the spanning tree for this interface. It is possible to create bridging loops if this command is not correctly used.

When configuring Layer 2 protocol tunneling on all the service provider edge switches, you must enable spanning-tree BPDU filtering on the 802.1Q tunnel ports by entering the `spanning-tree bpdufilter enable` command.

BPDU filtering allows you to prevent a port from sending and receiving BPDUs. The configuration is applicable to the whole interface, whether it is trunking or not. This command has three states:

- **spanning-tree bpdufilter enable**—This state unconditionally enables the BPDU filter feature on the interface.
- **spanning-tree bpdufilter disable**—This state unconditionally disables the BPDU filter feature on the interface.
- **no spanning-tree bpdufilter**—This state enables the BPDU filter feature on the interface if the interface is in operational PortFast state and if the `spanning-tree portfast bpdufilter default` command is configured.
spanning-tree bpdusfilter

Examples

This example shows how to enable the BPDU filter feature on this interface:

```
Switch(config-if)# spanning-tree bpdusfilter enable
Switch(config-if)#
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</table>
spanning-tree bpduguard

To enable BPDU guard on an interface, use the `spanning-tree bpduguard` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree bpduguard {enable | disable}
no spanning-tree bpduguard
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BPDU guard on this interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BPDU guard on this interface.</td>
</tr>
</tbody>
</table>

**Defaults**

BPDU guard is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

BPDU guard is a feature that prevents a port from receiving BPDUs. This feature is typically used in a service provider environment where the administrator wants to prevent an access port from participating in the spanning tree. If the port still receives a BPDU, it is put in the ErrDisable state as a protective measure. This command has three states:

- `spanning-tree bpduguard enable`—This state unconditionally enables BPDU guard on the interface.
- `spanning-tree bpduguard disable`—This state unconditionally disables BPDU guard on the interface.
- `no spanning-tree bpduguard`—This state enables BPDU guard on the interface if it is in the operational PortFast state and if the `spanning-tree portfast bpduguard default` command is configured.

**Examples**

This example shows how to enable BPDU guard on this interface:

```
Switch(config-if)# spanning-tree bpduguard enable
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show spanning-tree</code></td>
<td>Displays spanning-tree information.</td>
</tr>

<td>Enables the BPDU filtering by default on all PortFast ports.</td>
</tr>
</tbody>
</table>
spanning-tree cost

To calculate the path cost of STP on an interface, use the `spanning-tree cost` command. To revert to the default, use the `no` form of this command.

```
spanning-tree cost cost
no spanning-tree cost cost
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cost</td>
<td>Path cost; valid values are from 1 to 200,000,000.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- FastEthernet—19
- GigabitEthernet—1

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you configure the cost, the higher values indicate higher costs. The range applies regardless of the protocol type that is specified. The path cost is calculated, based on the interface bandwidth.

**Examples**

This example shows how to access an interface and set a path cost value of 250 for the spanning-tree VLAN that is associated with that interface:

```
Switch(config)# interface fastethernet 2/1
Switch(config-if)# spanning-tree cost 250
Switch(config-if)#
```

**Related Commands**

<table>

spanning-tree etherchannel guard misconfig

To display an error message when a loop due to a channel misconfiguration is detected, use the `spanning-tree etherchannel guard misconfig` command. To disable the feature, use the `no` form of this command.

```
spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Spanning-tree EtherChannel guard is enabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When an EtherChannel guard misconfiguration is detected, this message is displayed:

```
%SPANTREE-2-CHNL_MISCFG:Detected loop due to etherchannel misconfig of interface Port-Chanel1
```

To determine which local ports are involved in the misconfiguration, enter the `show interfaces status err-disabled` command. To verify the EtherChannel configuration on the remote device, enter the `show etherchannel summary` command on the remote device.

After you correct the configuration, enter the `shutdown` and the `no shutdown` commands on the associated port-channel interface.

**Examples**

This example shows how to enable the EtherChannel guard misconfiguration feature:

```
Switch(config)# spanning-tree etherchannel guard misconfig
Switch(config)#
```

**Related Commands**

<table>

spanning-tree extend system-id

To enable the extended system ID feature on a chassis that supports 1024 MAC addresses, use the `spanning-tree extend system-id` command. To disable the feature, use the `no` form of this command.

```
spanning-tree extend system-id
no spanning-tree extend system-id
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled on systems that do not provide 1024 MAC addresses.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Releases 12.1(13)E and later support chassis with 64 or 1024 MAC addresses. For chassis with 64 MAC addresses, STP uses the extended system ID plus a MAC address to make the bridge ID unique for each VLAN.

You cannot disable the extended system ID on chassis that support 64 MAC addresses.

Enabling or disabling the extended system ID updates the bridge IDs of all active STP instances, which might change the spanning-tree topology.

**Examples**

This example shows how to enable the extended system ID:

```
Switch(config)# spanning-tree extend system-id
Switch(config)#
```

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RSTP+ fast transition works only on point-to-point links between two bridges.

By default, the switch derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link.

If you designate a port as a shared link, RSTP+ fast transition is forbidden, regardless of the duplex setting.

**Examples**

This example shows how to configure the port as a shared link:

```
Switch(config-if)# spanning-tree link-type shared
Switch(config-if)#
```

**Related Commands**

spanning-tree loopguard default

To enable loop guard as the default on all ports of a specific bridge, use the `spanning-tree loopguard default` command. To disable loop guard, use the `no` form of this command.

```
spanning-tree loopguard default
no spanning-tree loopguard default
```

### Syntax Description

This command has no keywords or arguments.

### Defaults

Loop guard is disabled.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Loop guard provides an additional security in the bridge network. Loop guard prevents alternate or root ports from becoming the designated port because of a failure leading to a unidirectional link.

Loop guard operates only on ports that are considered point-to-point by the spanning tree. Individual loop-guard port configuration overrides this global default.

### Examples

This example shows how to enable loop guard:

```
Switch(config)# spanning-tree loopguard default
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

spanning-tree mode

To switch between PVST+ and MST modes, use the **spanning-tree mode** command. To return to the default settings, use the **no** form of this command.

```
spanning-tree mode {pvst | mst | rapid-pvst}

no spanning-tree mode {pvst | mst | rapid-pvst}
```

### Syntax Description

- **pvst**: Specifies PVST+ mode.
- **mst**: Specifies MST mode.
- **rapid-pvst**: Specifies Rapid PVST mode.

### Defaults

PVST+ mode

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for the <strong>rapid-pvst</strong> keyword.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

**Caution**

Be careful when using the **spanning-tree mode** command to switch between PVST+ and MST modes. When you enter the command, all spanning-tree instances are stopped for the previous mode and restarted in the new mode. Using this command may cause disruption of user traffic.

### Examples

This example shows how to switch to MST mode:

```
Switch(config)# spanning-tree mode mst
Switch(config)#
```

This example shows how to return to the default mode (PVST):

```
Switch(config)# no spanning-tree mode
Switch(config)#
```

### Related Commands

</table>
spanning-tree mst

To set the path cost and port-priority parameters for any MST instance (including the CIST with instance ID 0), use the `spanning-tree mst` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst instance-id [cost cost] | [port-priority prio]
no spanning-tree mst instance-id {cost | port-priority}
```

### Syntax Description

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>instance-id</strong></td>
<td>Instance ID number; valid values are from 0 to 15.</td>
</tr>
<tr>
<td><strong>cost cost</strong></td>
<td>(Optional) Specifies the path cost for an instance; valid values are from 1 to 200000000.</td>
</tr>
<tr>
<td><strong>port-priority prio</strong></td>
<td>(Optional) Specifies the port priority for an instance; valid values are from 0 to 240 in increments of 16.</td>
</tr>
</tbody>
</table>

### Defaults

Port priority is **128**.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The higher **cost** values indicate higher costs. When entering the **cost** value, do not include a comma in the entry; for example, enter **1000**, not **1,000**.

The higher **port-priority** values indicate smaller priorities.

By default, the cost depends on the port speed; faster interface speeds indicate smaller costs. MST always uses long path costs.

### Examples

This example shows how to set the interface path cost:

```
Switch(config-if)# spanning-tree mst 0 cost 17031970
Switch(config-if)#
```

This example shows how to set the interface priority:

```
Switch(config-if)# spanning-tree mst 0 port-priority 64
Switch(config-if)#
```

### Related Commands

spanning-tree mst configuration

To enter the MST configuration submode, use the `spanning-tree mst configuration` command. To return to the default MST configuration, use the `no` form of this command.

```
spanning-tree mst configuration
no spanning-tree mst configuration
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The default settings are as follows:

- No VLANs are mapped to any MST instance.
- All VLANs are mapped to the CIST instance.
- The region name is an empty string.
- The revision number is 0.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The MST configuration consists of three main parameters:

- Instance VLAN mapping (see the `instance` command)
- Region name (see the `name` command)
- Configuration revision number (see the `revision` command)

By default, the value for the MST configuration is the default value for all its parameters.

The `abort` and `exit` commands allow you to exit the MST configuration submode. The difference between the two commands depends on whether you want to save your changes or not.

The `exit` command commits all the changes before leaving MST configuration submode. If you do not map the secondary VLANs to the same instance as the associated primary VLAN, when you exit the MST configuration submode, a message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The message is as follows:

```
These secondary vlans are not mapped to the same instance as their primary: ->3
```

The `abort` command leaves the MST configuration submode without committing any changes.
Whenever you change an MST configuration submode parameter, it can cause a loss of connectivity. To reduce the number of service disruptions, when you enter the MST configuration submode, you are changing a copy of the current MST configuration. When you are done editing the configuration, you can apply all the changes at once by using the `exit` keyword, or you can exit the submode without committing any change to the configuration by using the `abort` keyword.

In the unlikely event that two users enter a new configuration at exactly the same time, this message is displayed:

```plaintext
Switch(config-mst)# exit
% MST CFG:Configuration change lost because of concurrent access
Switch(config-mst)#
```

### Examples

This example shows how to enter the MST configuration submode:

```plaintext
Switch(config)# spanning-tree mst configuration
Switch(config-mst)#
```

This example shows how to reset the MST configuration to the default settings:

```plaintext
Switch(config)# no spanning-tree mst configuration
Switch(config)#
```

<tr>
<td><code>priority prio</code></td>
<td>Sets the bridge priority; see the “Usage Guidelines” section for valid values and additional information.</td>
</tr>
<tr>
<td><code>diameter dia</code></td>
<td>(Optional) Sets the timer values for the bridge based on the network diameter; valid values are from 2 to 7.</td>
</tr>
<tr>
<td><code>hello-time hello</code></td>
<td>(Optional) Specifies the duration between the generation of configuration messages by the root switch.</td>
</tr>
</tbody>
</table>

**Defaults**

Bridge priority is 32768.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The bridge priority can be set in increments of 4096 only. When you set the priority, valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

You can set the priority to 0 to make the switch root.

The `spanning-tree root secondary` bridge priority value is 16384.

The `diameter dia` and `hello-time hello` options are available for instance 0 only.

If you do not specify the `hello_time` value, the value is calculated from the network diameter.
This example shows how to set the priority and timer values for the bridge:

```
Switch(config)# spanning-tree mst 0 root primary diameter 7 hello-time 2
Switch(config)# spanning-tree mst 5 root primary
Switch(config)#
```

### Related Commands

spanning-tree pathcost method

To set the path cost calculation method, use the `spanning-tree pathcost method` command. To revert to the default setting, use the `no` form of this command.

```
spanning-tree pathcost method {long | short}

no spanning-tree pathcost method
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>Specifies 32-bit-based values for port path costs.</td>
</tr>
<tr>
<td>short</td>
<td>Specifies 16-bit-based values for port path costs.</td>
</tr>
</tbody>
</table>

### Defaults

Port path cost has 16-bit-based values.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command applies to all the spanning-tree instances on the switch.

The `long` path cost calculation method uses all the 32 bits for path cost calculation and yields values in the range of 1 through 200,000,000.

The `short` path cost calculation method (16 bits) yields values in the range of 1 through 65,535.

### Examples

This example shows how to set the path cost calculation method to long:

```
Switch(config) spanning-tree pathcost method long
Switch(config)
```

This example shows how to set the path cost calculation method to short:

```
Switch(config) spanning-tree pathcost method short
Switch(config)
```

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables PortFast on the interface.</td>
</tr>
<tr>
<td>trunk</td>
<td>Enables PortFast on the interface even while in the trunk mode.</td>
</tr>
</tbody>
</table>

### Defaults

PortFast mode is disabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>The <code>disable</code> and <code>trunk</code> options were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You should use this feature only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

Be careful when using the `no spanning-tree portfast` command. This command does not disable PortFast if the `spanning-tree portfast default` command is enabled.

This command has four states:

- **spanning-tree portfast**—This command enables PortFast unconditionally on the given port.
- **spanning-tree portfast disable**—This command explicitly disables PortFast for the given port. The configuration line shows up in the running-configuration as it is not the default.
- **spanning-tree portfast trunk**—This command allows you to configure PortFast on trunk ports.

**Note**

If you enter the `spanning-tree portfast trunk` command, the port is configured for PortFast even when in the access mode.
• **no spanning-tree portfast**—This command implicitly enables PortFast if the `spanning-tree portfast default` command is defined in global configuration and if the port is not a trunk port. If you do not configure PortFast globally, the `no spanning-tree portfast` command is equivalent to the `spanning-tree portfast disable` command.

### Examples

This example shows how to enable PortFast mode:

```
Switch(config-if)# spanning-tree portfast
Switch(config-if)
```

</tbody>
</table>
spanning-tree portfast bpdufilter default

To enable the BPDU filtering by default on all PortFast ports, use the `spanning-tree portfast bpdufilter default` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree portfast bpdufilter default

no spanning-tree portfast bpdufilter default
```

**Syntax Description**

This command has no keywords or arguments.

**Defaults**

BPDU filtering is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `spanning-tree portfast bpdufilter default` command enables BPDU filtering globally on the Catalyst 4500 series switch. BPDU filtering prevents a port from sending or receiving any BPDUs.

You can override the effects of the `spanning-tree portfast bpdufilter default` command by configuring BPDU filtering at the interface level.

**Note**

Be careful when enabling BPDU filtering. Functionality is different when enabling on a per-port basis or globally. When enabled globally, BPDU filtering is applied only on ports that are in an operational PortFast state. Ports still send a few BPDUs at linkup before they effectively filter outbound BPDUs. If a BPDU is received on an edge port, it immediately loses its operational PortFast status and BPDU filtering is disabled.

When enabled locally on a port, BPDU filtering prevents the Catalyst 4500 series switch from receiving or sending BPDUs on this port.

**Caution**

Be careful when using this command. This command can cause bridging loops if not used correctly.

**Examples**

This example shows how to enable BPDU filtering by default:

```
Switch(config)# spanning-tree portfast bpdufilter default
Switch(config)#
```
### Related Commands

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

**Caution**

Use this command only with the interfaces that connect to the end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

BPDU guard disables a port if it receives a BPDU. BPDU guard is applied only on ports that are PortFast enabled and are in an operational PortFast state.

**Examples**

This example shows how to enable BPDU guard by default:

```
Switch(config)# spanning-tree portfast bpdu guard default
```

**Related Commands**

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**
Use this command only with the interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

You can enable PortFast mode on individual interfaces using the `spanning-tree portfast (interface configuration mode)` command.

**Examples**
This example shows how to globally enable PortFast by default on all access ports:

```
Switch(config)# spanning-tree portfast default
Switch(config)#
```

**Related Commands**

</table>
spanning-tree port-priority

To prioritize an interface when two bridges compete for position as the root bridge, use the `spanning-tree port-priority` command. The priority you set resolves the conflict. To revert to the default setting, use the `no` form of this command.

```
spanning-tree port-priority port_priority

no spanning-tree port-priority
```

### Syntax Description

```
port_priority  Port priority; valid values are from 0 to 240 in increments of 16.
```

### Defaults

Port priority value is set to 128.

### Command Modes

Interface configuration mode

### Command History

spanning-tree uplinkfast

To enable the UplinkFast feature, use the `spanning-tree uplinkfast` command. To disable UplinkFast, use the `no` form of this command.

```
spanning-tree uplinkfast [max-update-rate packets-per-second]

no spanning-tree uplinkfast [max-update-rate]
```

**Syntax Description**

| Syntax Description | `max-update-rate packets_per_second` (Optional) Specifies the maximum rate (in packets per second) at which update packets are sent; valid values are from 0 to 65535. |

**Defaults**

The default settings are as follows:

- Disabled.
- Maximum update rate is 150.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command should be used only on access switches.

When UplinkFast is configured, the bridge priority is changed to 49,152 so that this switch will not be selected as root. All interface path costs of all spanning-tree interfaces belonging to the specified spanning-tree instances are also increased by 3000.

When spanning tree detects that the root interface has failed, the UplinkFast feature causes an immediate switchover to an alternate root interface, transitioning the new root interface directly to the forwarding state. During this time, a topology change notification is sent. To minimize the disruption caused by the topology change, a multicast packet is sent to 01-00-0C-CD-CD-CD for each station address in the forwarding bridge except for those associated with the old root interface.

Use the `spanning-tree uplinkfast max-update-rate` command to enable UplinkFast (if not already enabled) and change the rate at which the update packets are sent. Use the `no` form of this command to return the default rate of 150 packets per second.

**Examples**

This example shows how to enable UplinkFast and set the maximum rate to 200 packets per second:

```
Switch(config)# spanning-tree uplinkfast
Switch(config)# spanning-tree uplinkfast max-update-rate 200
```

<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>
spanning-tree vlan

**Usage Guidelines**

When you are setting the `max-age seconds` value, if a bridge does not hear BPDUs from the root bridge within the specified interval, it assumes that the network has changed and recomputes the spanning-tree topology.

The `spanning-tree root primary` command alters the switch bridge priority to 8192. If you enter the `spanning-tree root primary` command and the switch does not become root, then the bridge priority is changed to 100 less than the bridge priority of the current bridge. If the switch does not become root, an error will result.

The `spanning-tree root secondary` command alters the switch bridge priority to 16384. If the root switch fails, this switch becomes the next root switch.

Use the `spanning-tree root` commands on backbone switches only.

**Examples**

This example shows how to enable spanning tree on VLAN 200:

```bash
Switch(config)# spanning-tree vlan 200
```

This example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:

```bash
Switch(config)# spanning-tree vlan 10 root primary diameter 4
```

This example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:

```bash
Switch(config)# spanning-tree vlan 10 root secondary diameter 4
```

speed

To configure the interface speed, use the `speed` command. To disable a speed setting, use the `no` form of this command.

```
speed { 10 | 100 | 1000 | auto [10 | 100 | 1000] | nonegotiate }

no speed
```

**Syntax Description**

- `10` Configures the interface to transmit at 10 Mbps.
- `100` Configures the interface to transmit at 100 Mbps.
- `1000` Configures the interface to transmit at 1000 Mbps.
- `auto 10 | 100 | 1000` Enables the interface to autonegotiate the speed and specify the exact values to advertise when autonegotiating.
- `nonegotiate` Enables the interface to not negotiate the speed.

**Defaults**

The default values are shown in the following table:

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Supported Syntax</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100-Mbps module</td>

</tr>
</tbody>
</table>
Table 2-44 lists the supported command options by interface.

### Supported speed Command Options

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Supported Syntax</th>
<th>Default Setting</th>
<th>Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100-Mbps module</td>
<td>`speed [10</td>
<td>100</td>
<td>auto]`</td>
</tr>
<tr>
<td>100-Mbps fiber modules</td>
<td>Not applicable.</td>
<td>Not applicable.</td>
<td>Not applicable.</td>
</tr>
<tr>
<td>Gigabit Ethernet</td>
<td><code>speed nonegotiate</code></td>
<td><code>nonegotiate</code></td>
<td>This is only applicable to Gigabit Ethernet ports.</td>
</tr>
<tr>
<td>Interface</td>
<td></td>
<td>is enabled.</td>
<td></td>
</tr>
<tr>
<td>10/100/1000</td>
<td>`speed [10</td>
<td>100</td>
<td>1000</td>
</tr>
<tr>
<td>1000</td>
<td>Not applicable.</td>
<td>Not applicable.</td>
<td>The speed is always 1000. The duplex is half.</td>
</tr>
</tbody>
</table>

If you configure the interface speed and duplex commands manually and enter a value other than `speed auto` (for example, 10 or 100 Mbps), make sure that you configure the connecting interface speed command to a matching speed but do not use the auto parameter.

When manually configuring the interface speed to either 10 or 100 Mbps, the switch prompts you to also configure duplex mode on the interface.

**Note**

Catalyst 4506 switches cannot automatically negotiate the interface speed and the duplex mode if either connecting interface is configured to a value other than `auto`.

**Caution**

Changing the interface speed and the duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table 2-45 describes the system’s performance for different combinations of the duplex and speed modes. The specified `duplex` command that is configured with the specified `speed` command produces the resulting system action.
Table 2-45  System Action Using duplex and speed Commands

<table>
<thead>
<tr>
<th>duplex Command</th>
<th>speed Command</th>
<th>Resulting System Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>duplex auto</td>
<td>speed auto</td>
<td>Autonegotiates both speed and duplex modes</td>
</tr>
<tr>
<td>duplex half</td>
<td>speed 10</td>
<td>Forces 10 Mbps and half duplex mode</td>
</tr>
<tr>
<td>duplex full</td>
<td>speed 10</td>
<td>Forces 10 Mbps and full duplex mode</td>
</tr>
<tr>
<td>duplex half</td>
<td>speed 100</td>
<td>Forces 100 Mbps and half duplex mode</td>
</tr>
<tr>
<td>duplex full</td>
<td>speed 100</td>
<td>Forces 100 Mbps and full duplex mode</td>
</tr>
<tr>
<td>duplex full</td>
<td>speed 1000</td>
<td>Forces 1000 Mbps and full duplex mode</td>
</tr>
</tbody>
</table>

Examples

This example shows how to set the interface speed to 100 Mbps on the Fast Ethernet interface 5/4:

Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed 100

This example shows how to allow Fast Ethernet interface 5/4 to autonegotiate the speed and duplex mode:

Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed auto

Note

The speed auto 10 100 command is similar to the speed auto command on a Fast Ethernet interface.

This example shows how to limit the interface speed to 10 and 100 Mbps on the Gigabit Ethernet interface 1/1 in auto-negotiation mode:

Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 10 100

This example shows how to limit the speed negotiation to 100 Mbps on the Gigabit Ethernet interface 1/1:

Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 100

</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support introduced for Supervisor Engine 6-E and Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the `storm-control broadcast level` command to enable traffic storm control on the interface, configure the traffic storm control level, and apply the traffic storm control level to the broadcast traffic on the interface.

The Catalyst 4500 series switch supports broadcast traffic storm control on all LAN ports.

The period is required when you enter the fractional suppression level.

The suppression level is entered as a percentage of the total bandwidth. A threshold value of 100 percent indicates that no limit is placed on traffic. A value of 0.0 means that all specified traffic on that port is blocked.
Enter the `show interfaces counters storm-control` command to display the discard count.

Enter the `show running-config` command to display the enabled suppression mode and level setting.

To turn off suppression for the specified traffic type, you can do one of the following:

- Set the `high-level` value to 100 percent for the specified traffic type.
- Use the `no` form of this command.

The `lower level` is ignored for the interfaces that perform storm control in the hardware.

**Note**
The `lower level` keyword does not apply to the Supervisor Engine 6-E and Catalyst 4900M chassis implementations.

### Examples

This example shows how to enable broadcast storm control on a port with a 75.67 percent rising suppression level:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control broadcast level 75.67
Switch(config-if)# end
```

This example shows how to disable the port during a storm:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control action shutdown
Switch(config-if)# end
```

This example shows how to disable storm control on a port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# no storm-control broadcast level
Switch(config-if)# end
```

This example shows how to disable storm control by setting the high level to 100 percent:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control broadcast level 100
Switch(config-if)# end
```

storm-control broadcast include multicast

To enable multicast storm control on a port, use the `storm-control broadcast include multicast` command. To disable multicast storm control, use the `no` form of this command.

```
storm-control broadcast include multicast
no storm-control broadcast include multicast
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Multicast storm control is disabled.

**Command Modes**
Global configuration mode
Interface configuration mode on Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support introduced for Catalyst 4900M and Supervisor Engine 6-E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command prompts the hardware to filter multicast packets if it is already filtering broadcast packets.
The Catalyst 4500 series switch support per-interface multicast suppression. When you enable multicast suppression on an interface you subject incoming multicast and broadcast traffic on that interface to suppression.

**Examples**
This example shows how to enable multicast storm control globally:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# storm-control broadcast include multicast
Switch(config)# end
```

This example shows how to enable per-port Multicast storm control on a Supervisor Engine 6-E:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet2/4
Switch(config-if)# storm-control broadcast include multicast
Switch(config)# end
```

</tr>
<tr>
<td><strong>subscribe-to-alert-group syslog</strong></td>
<td>Subscribes this destination profile to the Syslog alert group.</td>
</tr>
</tbody>
</table>
subscribe-to-alert-group configuration

To subscribe a destination profile to the Configuration alert group, use the `subscribe-to-alert-group configuration` command.

```
subscribe-to-alert-group configuration [periodic {daily hh:mm | monthly date hh:mm | weekly day hh:mm}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>periodic</td>
<td>(Optional) Specifies a periodic call-home message.</td>
</tr>
<tr>
<td>daily hh:mm</td>
<td>Sets a daily alert in hours and minutes.</td>
</tr>
<tr>
<td>monthly date hh:mm</td>
<td>Sets a monthly alert in day, hour, and minute.</td>
</tr>
<tr>
<td>weekly day hh:mm</td>
<td>Sets a weekly alert in day, hour, and minutes.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

The Configuration alert group can be configured for periodic notification.

**Examples**

This example shows how to configure periodic "configuration" alert-group:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group configuration periodic weekly
Tuesday 21:16
```

</tr>
</tbody>
</table>
subscribe-to-alert-group diagnostic

To subscribe a destination profile to the Diagnostic alert group, use the `subscribe-to-alert-group diagnostic` command.

```
subscribe-to-alert-group diagnostic [severity catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal | debugging]
```

**Syntax Description**

- **severity catastrophic**: (Optional) Specifies network wide catastrophic failure (highest severity).
- **disaster**: (Optional) Specifies significant network impact.
- **fatal**: (Optional) Specifies that the system is unusable (System log level 0).
- **critical**: (Optional) Specifies that immediate attention is needed (System log level 1).
- **major**: (Optional) Specifies a major condition (System log level 2).
- **minor**: (Optional) Specifies a minor condition (System log level 3).
- **warning**: (Optional) Specifies a warning condition (System log level 4).
- **notification**: (Optional) Specifies an informational message (System log level 5).
- **normal**: (Optional) Specifies returning to a normal state (System log level 6).
- **debugging**: (Optional) Specifies a debugging message (Lowest severity).

**Defaults**

`normal`

**Command Modes**

`cfg-call-home-profile`

**Command History**

<table>
<thead>

</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

**Examples**

This example shows how to configure the "diagnostic" alert-group with "normal" severity:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group diagnostic severity normal
```

</table>

### Defaults

- `normal`

### Command Modes

- `cfg-call-home-profile`

### Command History

- **Release**: 12.2(52)SG
- **Modification**: Support was introduced on the Catalyst 4500 series switch.

### Usage Guidelines

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

The Environment alert group can be configured to filter messages based on severity.

### Examples

This example shows how to configure the "environmental" alert-group with "severity notification":

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group environment severity notification
```

</tbody>
</table>

### Usage Guidelines

To enter profile call-home configuration submode, use the **profile** command in call-home configuration mode.

You can configure the Syslog alert group can be configured to filter messages based on severity by specifying a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes ("").

### Examples

This example shows how to configure the syslog alert group with severity notification:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group syslog severity notification pattern "UPDOWN"
```

</tbody>
</table>
switch (virtual switch)

To assign a switch number, use the `switch` command in virtual switch domain configuration submode.

```
switch num [preempt delay | priority priority-value]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>num</code></td>
<td>Specifies the switch number; valid values are 1 or 2.</td>
</tr>
<tr>
<td><code>preempt delay</code></td>
<td>(Optional) Enables preemption and specifies a delay in minutes before the standby chassis takes over as the active chassis. Range: 5 (default) to 20</td>
</tr>
<tr>
<td><code>priority priority-value</code></td>
<td>(Optional) Specifies a priority number to determine the standby chassis that will become the new active chassis if the active chassis fails. Range: 1 (lowest priority) to 255 (highest priority)</td>
</tr>
</tbody>
</table>

**Defaults**

`priority-value` settings for Switch 1 and Switch 2 are 100.

**Command Modes**

Virtual switch domain configuration submode (config-vs-domain)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must set the virtual domain name and the switch number prior to converting the chassis into a virtual switch. You cannot configure the switch number after the chassis is in virtual switch mode.

When you boot the virtual switch, the role resolution logic validates that the chassis numbers in the two chassis differ.

When you configure `preempt`, the switch with the highest priority assumes the active role during role negotiation.

**Examples**

The following example shows how to assign a switch number and to configure the virtual switch domain:

```
Router1(config)# switch virtual domain 100
Router1(config-vs-domain)# switch 1 priority 20
Router1(config-vs-domain)# switch 1 preempt 12
Router1(config-vs-domain)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switch virtual domain (virtual switch)</code></td>
<td>Configures the virtual switch domain number and enter the virtual switch domain configuration submode.</td>
</tr>
</tbody>
</table>
switch convert mode (virtual switch)

To select the switch mode, use the `switch convert mode` command in privileged EXEC mode.

```
switch convert mode {stand-alone | virtual}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stand-alone</td>
<td>Specifies standalone mode.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies virtual switch mode.</td>
</tr>
</tbody>
</table>

**Defaults**

stand-alone

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must reboot both switches when you convert a switch to virtual switch mode.

In a VSS, the interface naming convention includes the switch number. For example, you must use `switch/module/port` to specify a port on a switching module. The `switch convert mode virtual` command converts the configuration file to use the VSS naming convention, and saves a backup copy of the file in the RP bootflash.

**Note**

After you confirm the command (by entering `yes` at the prompt), the switch converts the configuration file and restarts both chassis. After the restart, the chassis is in virtual switch mode. Henceforward, you must specify interfaces with three identifiers (`switch/module/port`).

A `no` form of this command does not exist. You must specify either stand-alone or virtual mode.

You can enter the `switch convert mode virtual` command only after the standby switch is fully operational (in hot standby mode). If you enter the command before the standby switch is fully operational, a message is displayed telling you to try again later.

**Note**

If you have configured your config-register with a value that would skip file parsing during the bootup process, your change to either a standalone or virtual switch will not take place until you reconfigure your config-register. The config-register must be allowed to parse files to ensure a conversion from either a standalone or virtual switch.
The following example shows how to configure a device in the distribution layer as a standalone switch that has a switch number of 1:

Router1# switch convert mode virtual
This command will convert all interface names to naming convention "interface-type chassis-number/slot/port", save the running config to startup-config and reload the switch.
Do you want proceed? [yes/no]: yes
Converting interface names
Building Configuration...
[OK]
Saving converted configuration to bootflash: ...
Destination filename [startup-config.converted_vs-20070723-235834]?
## switch virtual domain (virtual switch)

To configure the virtual switch domain number and enter the virtual switch domain configuration submode, use the `switch virtual domain` command in global configuration mode.

```
switch virtual domain number
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Specifies the virtual switch domain number. Range: 1 to 255.</td>
</tr>
</tbody>
</table>

### Defaults

No virtual switch domain number is configured.

### Command Modes

Global configuration (config)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you enter the `switch virtual domain` command, you enter the virtual switch domain configuration submode, and the prompt changes to `Router1(config-vs-domain)#`. Within the virtual switch domain configuration submode, the following commands are available:

- **default**—Sets a command to its defaults.
- **exit**—Exits the virtual-switch-domain-mode and returns to the global configuration mode.
- **no**—Negates a command or set its defaults.
- **switch num**—Assigns the switch number. See the `switch (virtual switch)` command for additional information.

You must configure the same virtual switch domain number on both chassis of the virtual switch. The virtual switch domain is a number between 1 and 255, and must be unique for each virtual switch in your network.

#### Note

The domain identification takes effect only after you enter the `switch convert mode virtual` command.

#### Note

The switch number is not stored in the startup or running configuration, because both chassis use the same configuration file (but must not have the same switch number).

### Examples

The following example shows how to configure the virtual switch number and virtual switch domain on two switches:

```
Router1(config)# switch virtual domain 100
Router1(config-vs-domain)# switch 1
```
### switch virtual domain (virtual switch)

Router1(config-vs-domain)# exit
Router2(config)# switch virtual domain 100
Router2(config-vs-domain)# switch 2
Router2(config-vs-domain)# exit

<table>

switch virtual link (virtual switch)

To associate a switch to an interface, use the `switch virtual link` command in interface configuration mode.

```
switch virtual link switch-number
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switch-number</code></td>
<td>Switch number; valid values are 1 and 2.</td>
</tr>
</tbody>
</table>

**Defaults**

The interfaces are not associated by default.

**Command Modes**

Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The virtual switch link (VSL) is configured with a unique port channel on each chassis. You must add the VSL physical ports to the port channel. The VSL channel group must contain a minimum of two ports.

**Examples**

The following example shows how to associate switch 2 to a port channel:

```
Router-2(config)# interface port-channel 20
Router-2(config-if)# switch virtual link 2
Router-2(config-if)#
```
switchport

To modify the switching characteristics of a Layer 2 switch interface, use the `switchport` command. To return the interface to the routed-interface status and cause all further Layer 2 configuration to be erased, use the `no` form of this command without parameters.

```
switchport [access vlan vlan_num] | [nonegotiate] | [voice vlan {vlan_id | dot1p | none | untagged}]

no switchport [access | nonegotiate | voice vlan]
```

**Syntax Description**

- `access vlan vlan_num` (Optional) Sets the VLAN when the interface is in access mode; valid values are from 1 to 1005.
- `nonegotiate` (Optional) Specifies that the DISL/DTP negotiation packets will not be sent on the interface.
- `voice vlan vlan_id` (Optional) Specifies the number of the VLAN; valid values are from 1 to 1005.
- `dot1p` (Optional) Specifies that the PVID packets are tagged as priority.
- `none` (Optional) Specifies that the telephone and voice VLAN do not communicate.
- `untagged` (Optional) Specifies the untagged PVID packets.

**Defaults**

The default settings are as follows:

- Switchport trunking mode is enabled.
- Dynamic negotiation parameter is set to auto.
- Access VLANs and trunk interface native VLANs are a default VLAN corresponding to the platform or interface hardware.
- All VLAN lists include all VLANs.
- No voice VLAN is enabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for voice VLAN was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `no switchport` command shuts the port down and then reenables it, which may generate messages on the device to which the port is connected.
The no form of the `switchport access` command resets the access mode VLAN to the appropriate default VLAN for the device. The no form of the `switchport nonegotiate` command removes the `nonegotiate` status.

When you are using the `nonegotiate` keyword, DISL/DTP negotiation packets will not be sent on the interface. The device will trunk or not trunk according to the `mode` parameter given: `access` or `trunk`. This command will return an error if you attempt to execute it in `dynamic (auto or desirable)` mode.

The voice VLAN is automatically set to VLAN 1 unless you use one of the optional keywords. If you use the `switch port voice vlan` command for an interface, the interface cannot join a port channel. When you use the `switchport voice vlan` command, the output for the `show running-config` command changes to show the voice VLAN set.

**Examples**

This example shows how to cause the port interface to stop operating as a Cisco-routed port and convert to a Layer 2-switched interface:

```
Switch(config-if)#  switchport
Switch(config-if)#
```

This example shows how to cause a port interface in access mode, which is configured as a switched interface, to operate in VLAN 2:

```
Switch(config-if)#  switchport access vlan 2
Switch(config-if)#
```

This example shows how to cause a port interface, which is configured as a switched interface, to refrain from negotiating in trunking mode and act as a trunk or access port (depending on the `mode` set):

```
Switch(config-if)#  switchport nonegotiate
Switch(config-if)#
```

This example shows how to set the voice VLAN for the interface to VLAN 2:

```
Switch(config-if)#  switchport voice vlan 2
switchport voice vlan 2
Switch(config-if)#
```

**Related Commands**

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-id</td>
<td>(Optional) Number of the VLAN on the interface in access mode; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>dynamic</td>
<td>(Optional) Enables VMPS control of the VLAN.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- The access VLAN and trunk interface native VLAN are default VLANs that correspond to the platform or the interface hardware.
- All VLAN lists include all VLANs.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Support for VPMS was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter the **switchport** command without any keywords to configure the LAN interface as a Layer 2 interface before you can enter the **switchport access vlan** command. This action is required only if you have not already entered the **switchport** command for the interface.

Entering the **no switchport** command shuts the port down and then reenables it, which could generate messages on the device to which the port is connected.

The **no** form of the **switchport access vlan** command resets the access mode VLAN to the appropriate default VLAN for the device.

Valid values for **vlan-id** are from 1 to 4094.

**Examples**

This example shows how to cause the port interface to stop operating as a Cisco-routed port and convert to a Layer 2-switched interface:

```
Switch(config-if)# switchport
Switch(config-if)#
```
**Note**

This command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

This example shows how to cause a port interface that has already been configured as a switched interface to operate in VLAN 2 instead of the platform’s default VLAN when in access mode:

```
Switch(config-if)# switchport access vlan 2
Switch(config-if)#
```

<table>
<thead>
<tr>

</tbody>
</table>
switchport autostate exclude

To exclude a port from the VLAN interface link-up calculation, use the `switchport autostate exclude` command. To return to the default settings, use the `no` form of this command.

```
switchport autostate exclude
no switchport autostate exclude
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
All ports are included in the VLAN interface link-up calculation.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(37)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enter the `switchport` command without any keywords to configure the LAN interface as a Layer 2 interface before you can enter the `switchport autostate exclude` command. This action is required only if you have not entered the `switchport` command for the interface.

**Note**
The `switchport` command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

The `switchport autostate exclude` command marks the port to be excluded from the interface VLAN up calculation when there are multiple ports in the VLAN.

The `show interface interface switchport` command displays the autostate mode if the mode has been set. If the mode has not been set, the autostate mode is not displayed.

**Examples**
This example shows how to exclude a port from the VLAN interface link-up calculation:

```
Switch(config-if)# switchport autostate exclude
Switch(config-if)#
```

This example shows how to include a port in the VLAN interface link-up calculation:

```
Switch(config-if)# no switchport autostate exclude
Switch(config-if)#
```

You can verify your settings by entering the `show interfaces switchport` privileged EXEC command.
### Related Commands

<tbody>
<tr>
<td><code>show interfaces switchport</code></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>
</tr>
</tbody>
</table>
switchport block

To prevent the unknown multicast or unicast packets from being forwarded, use the `switchport block` interface configuration command. To allow the unknown multicast or unicast packets to be forwarded, use the `no` form of this command.

```
switchport block {multicast | unicast}
```

```
no switchport block {multicast | unicast}
```

**Syntax Description**

| multicast | Specifies that the unknown multicast traffic should be blocked. |
| unicast   | Specifies that the unknown unicast traffic should be blocked. |

**Defaults**

Unknown multicast and unicast traffic are not blocked. All traffic with unknown MAC addresses is sent to all ports.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can block the unknown multicast or unicast traffic on the switch ports.

Blocking the unknown multicast or unicast traffic is not automatically enabled on the switch ports; you must explicitly configure it.

**Note**

For more information about blocking the packets, refer to the software configuration guide for this release.

**Examples**

This example shows how to block the unknown multicast traffic on an interface:

```
Switch(config-if)# switchport block multicast
```

You can verify your setting by entering the `show interfaces interface-id switchport` privileged EXEC command.

**Related Commands**

</table>
### switchport mode

To set the interface type, use the `switchport mode` command. To reset the mode to the appropriate default mode for the device, use the `no` form of this command.

```
switchport mode {access | dot1q-tunnel | trunk | dynamic {auto | desirable}}
switchport mode private-vlan {host | promiscuous | trunk promiscuous | trunk [secondary]}
no switchport mode dot1q-tunnel
no switchport mode private-vlan
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>access</strong></td>
<td>Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td><strong>dot1q-tunnel</strong></td>
<td>Specifies an 802.1Q tunnel port.</td>
</tr>
<tr>
<td><strong>trunk</strong></td>
<td>Specifies a trunking VLAN Layer 2 interface.</td>
</tr>
<tr>
<td><strong>dynamic auto</strong></td>
<td>Specifies that the interface convert the link to a trunk link.</td>
</tr>
<tr>
<td><strong>dynamic desirable</strong></td>
<td>Specifies that the interface actively attempt to convert the link to a trunk link.</td>
</tr>
<tr>
<td><strong>private-vlan host</strong></td>
<td>Specifies that the ports with a valid PVLAN trunk association become active host private VLAN trunk ports.</td>
</tr>
<tr>
<td><strong>private-vlan promiscuous</strong></td>
<td>Specifies that the ports with a valid PVLAN mapping become active promiscuous ports.</td>
</tr>
<tr>
<td><strong>private-vlan trunk promiscuous</strong></td>
<td>Specifies that the ports with valid PVLAN trunk mapping become active promiscuous trunk ports.</td>
</tr>
<tr>
<td><strong>private-vlan trunk secondary</strong></td>
<td>Specifies that the ports with a valid PVLAN trunk association become active host private VLAN trunk ports.</td>
</tr>
</tbody>
</table>

**Defaults**

- Link converts to a trunk link.
- dot1q tunnel ports are disabled.

**Command Modes**

- Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support was added for configuring dot1q tunnel ports.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support was added for trunk promiscuous ports.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If you enter `access` mode, the interface goes into permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not approve the change.
- If you enter `trunk` mode, the interface goes into permanent trunking mode and negotiates to convert the link into a trunk link even if the neighboring interface does not approve the change.
If you enter `dynamic auto` mode, the interface converts the link to a trunk link if the neighboring interface is set to `trunk` or `desirable` mode.

If you enter `dynamic desirable` mode, the interface becomes a trunk interface if the neighboring interface is set to `trunk`, `desirable`, or `auto` mode.

If you specify the `dot1q-tunnel` keyword, the port is set unconditionally as an 802.1Q tunnel port.

The port becomes inactive if you configure it as a private VLAN trunk port and one of the following applies:

- The port does not have a valid PVLAN association.
- The port does not have valid allowed normal VLANs.

If a private port PVLAN association or mapping is deleted, or if a private port is configured as a SPAN destination, it becomes inactive.

### Examples

This example shows how to set the interface to dynamic desirable mode:

```bash
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)#
```

This example shows how to set a port to PVLAN host mode:

```bash
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)#
```

This example shows how to set a port to private VLAN trunk:

```bash
Switch(config-if)# switchport mode private-vlan trunk
Switch(config-if)#
```

This example shows how to configure a port for an 802.1Q tunnel port:

```bash
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)#
```

This example shows how to configure a promiscuous trunk port:

```bash
Switch(config-if)# switchport mode private-vlan trunk promiscuous
Switch(config-if)#
```

This example shows how to configure an isolated trunk port:

```bash
Switch(config-if)# switchport mode private-vlan trunk
OR
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)#
```

You can verify your settings by entering the `show interfaces switchport` command and examining information in the Administrative Mode and Operational Mode rows.

This example shows how to configure interface FastEthernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```bash
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
```

**switchport port-security**

To enable port security on an interface, use the `switchport port-security` command. To disable port security and set parameters to their default states, use the `no` form of this command.

```
switchport port-security [aging {static | time time} | type {absolute | inactivity}] | limit rate invalid-source-mac [N | none] | mac-address mac-address | vlan access | voice] | mac-address sticky [mac-address] | vlan access | voice] | maximum value | vlan access | voice] | violation {restrict | shutdown | shutdown vlan]}
```

```
no switchport port-security [aging {static | time time} | type {absolute | inactivity}] | limit rate invalid-source-mac [N | none] | mac-address mac-address | vlan access | voice] | mac-address sticky [mac-address] | vlan access | voice] | maximum value | vlan access | voice] | violation {restrict | shutdown | shutdown vlan]}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aging</td>
<td>(Optional) Specifies aging for port security.</td>
</tr>
<tr>
<td>static</td>
<td>(Optional) Enables aging for statically configured secure addresses on this port.</td>
</tr>
<tr>
<td>time time</td>
<td>(Optional) Specifies the aging time for this port. The valid values are from 0 to 1440 minutes. If the time is 0, aging is disabled for this port.</td>
</tr>
<tr>
<td>type absolute</td>
<td>(Optional) Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.</td>
</tr>
<tr>
<td>type inactivity</td>
<td>(Optional) Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period.</td>
</tr>
<tr>
<td>limit rate invalid-source-mac</td>
<td>(Optional) Sets the rate limit for bad packets. This rate limit also applies to the port where DHCP snooping security mode is enabled as filtering the IP and MAC address.</td>
</tr>
<tr>
<td>N none</td>
<td>(Optional) Supplies a rate limit (N) or indicates none (none).</td>
</tr>
<tr>
<td>mac-address mac-address</td>
<td>(Optional) Specifies a secure MAC address for the interface; a 48-bit MAC address. You can add additional secure MAC addresses up to the maximum value that is configured.</td>
</tr>
<tr>
<td>sticky</td>
<td>(Optional) Configures the dynamic addresses as sticky on the interface.</td>
</tr>
<tr>
<td>vlan access</td>
<td>(Optional) Deletes the secure MAC addresses from access VLANs.</td>
</tr>
<tr>
<td>vlan voice</td>
<td>(Optional) Deletes the secure MAC addresses from voice VLANs.</td>
</tr>
<tr>
<td>maximum value</td>
<td>(Optional) Sets the maximum number of secure MAC addresses for the interface. Valid values are from 1 to 3072. The default setting is 1.</td>
</tr>
<tr>
<td>violation</td>
<td>(Optional) Sets the security violation mode and action to be taken if port security is violated.</td>
</tr>
<tr>
<td>restrict</td>
<td>(Optional) Sets the security violation restrict mode. In this mode, a port security violation restricts data and causes the security violation counter to increment.</td>
</tr>
</tbody>
</table>
The default settings are as follows:

- Port security is disabled.
- When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1.
- Aging is disabled.
- Aging time is 0 minutes.
- All secure addresses on this port age out immediately after they are removed from the secure address list.

After you set the maximum number of secure MAC addresses that are allowed on a port, you can add secure addresses to the address table by manually configuring them, by allowing the port to dynamically configure them, or by configuring some MAC addresses and allowing the rest to be dynamically configured.

The packets are dropped into the hardware when the maximum number of secure MAC addresses are in the address table and a station that does not have a MAC address in the address table attempts to access the interface.

If you enable port security on a voice VLAN port and if there is a PC connected to the IP phone, you set the maximum allowed secure addresses on the port to more than 1.

You cannot configure static secure MAC addresses in the voice VLAN.

A secure port has the following limitations:

- A secure port cannot be a dynamic access port or a trunk port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.

**shutdown**

(Optional) Sets the security violation shutdown mode. In this mode, a port security violation causes the interface to immediately become error disabled.

**shutdown vlan**

(Optional) Set the security violation mode to per-VLAN shutdown. In this mode, only the VLAN on which the violation occurred is error-disabled.
A secure port cannot be a destination port for Switched Port Analyzer (SPAN).

A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel port group.

When a secure port is in the error-disabled state, you can remove it from this state by entering the `errdisable recovery cause psecure-violation` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands. If a port is disabled, you can also use the `clear errdisable` command to re-enable the offending VLAN on the port.

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that port.

To allow limited time access to particular secure addresses, set the aging type as `absolute`. When the aging time lapses, the secure addresses are deleted.

To allow continuous access to a limited number of secure addresses, set the aging type as `inactivity`. This action removes the secure address when it becomes inactive, and other addresses can become secure.

To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the statically configured secure address by using the `no switchport port-security aging static` interface configuration command.

If the sticky command is executed without a MAC address specified, all MAC addresses that are learned on that port will be made sticky. You can also specify a specific MAC address to be a sticky address by entering the `sticky` keyword next to it.

You can configure the sticky feature even when port security is not enabled on the interface. The feature becomes operational when you enable port security on the interface.

You can use the `no` form of the `sticky` command only if the sticky feature is already enabled on the interface.

### Examples

This example shows how to set the aging time to 2 hours (120 minutes) for the secure addresses on the Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security aging time 120
```

This example shows how to set the aging timer type to Inactivity for the secure addresses on the Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security aging type inactivity
```

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security limit rate invalid-source-mac 100
```

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security limit rate invalid-source-mac none
```
You can verify the settings for all secure ports or the specified port by using the `show port-security` privileged EXEC command.

This example shows how to remove all sticky and static addresses that are configured on the interface:

```plaintext
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address
Switch(config-if)
```

This example shows how to configure a secure MAC address on Fast Ethernet port 12:

```plaintext
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 1000.2000.3000
Switch(config-if)
```

This example shows how to make all MAC addresses learned on Fast Ethernet port 12 sticky:

```plaintext
Switch(config)# interface fastethernet 2/12
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)
```

This example shows how to make MAC address 1000.2000.3000 sticky on Fast Ethernet port 12:

```plaintext
Switch(config)# interface fastethernet 2/12
Switch(config-if)# switchport port-security mac-address sticky 1000.2000.3000
```

This example shows how to disable the sticky feature on Fast Ethernet port 12:

```plaintext
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address sticky
Switch(config-if)
```

**Note**

This command makes all sticky addresses on this interface normal learned entries. It does not delete the entries from the secure MAC address table.

**Note**

The following examples show how to configure sticky secure MAC addresses in access and voice VLANs on interfaces with voice VLAN configured. If you do not have voice VLAN configured the `vlan [access | voice]` keywords are not supported.

This example shows how to configure sticky MAC addresses for voice and data VLANs on Fast Ethernet interface 5/1 and to verify the configuration:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0000 vlan voice
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0005 vlan access
Switch(config-if)# end
```

This example shows how to designate a maximum of one MAC address for a voice VLAN (for a Cisco IP Phone, let’s say) and one MAC address for the data VLAN (for a PC, let’s say) on Fast Ethernet interface 5/1 and to verify the configuration:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security maximum 1 vlan voice
Switch(config-if)# switchport port-security maximum 1 vlan access
Switch(config-if)# end

This example shows how to configure a port to shut down only the VLAN if a violation occurs:

Switch(config)# interface gigabitethernet 5/1
Switch(config)# switchport port-security violation shutdown vlan

Note
Sending traffic to the ports causes the system to configure the port with sticky secure addresses.

You can verify your settings by using the `show port-security address` privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces switchport</td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>

</tbody>
</table>
switchport private-vlan association trunk

To configure the association between a secondary VLAN and a VLAN on a private VLAN trunk port, use the `switchport private-vlan association trunk` command. To remove the private VLAN mapping from the port, use the `no` form of this command.

```
switchport private-vlan association trunk {primary-vlan-id} {secondary-vlan-id}
```

```
no switchport private-vlan association trunk {primary-vlan-id}
```

**Syntax Description**

- `primary-vlan-id` Number of the primary VLAN of the private VLAN relationship.
- `secondary-vlan-id` Number of the secondary VLAN of the private VLAN relationship.

**Defaults**

Private VLAN mapping is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Multiple private VLAN pairs can be specified so that a private VLAN trunk port can carry multiple secondary VLANs. If an association is specified for the existing primary VLAN, the existing association is replaced.

Only isolated secondary VLANs can be carried over a private VLAN trunk.

**Note**

Community secondary VLANs on a private VLAN trunk are not supported in this release.

If there is no trunk association, any packets received on the secondary VLANs are dropped.

**Examples**

This example shows how to configure a port with a primary VLAN (VLAN 18) and secondary VLAN (VLAN 20):

```
Switch(config-if)# switchport private-vlan association trunk 18 20
Switch(config-if)#
```

This example shows how to remove the private VLAN association from the port:

```
Switch(config-if)# no switchport private-vlan association trunk 18
Switch(config-if)#
```
This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10. 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport

</table>
**switchport private-vlan host-association**

To define a PVLAN association for an isolated or community port, use the `switchport private-vlan host-association` command. To remove the PVLAN mapping from the port, use the `no` form of this command.

```
switchport private-vlan host-association primary-vlan-id secondary-vlan-id
no switchport private-vlan host-association
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary-vlan-id</td>
<td>Number of the primary VLAN of the PVLAN relationship; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>secondary-vlan-list</td>
<td>Number of the secondary VLAN of the private VLAN relationship; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

Private VLAN mapping is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

There is no runtime effect on the port unless it is in PVLAN host mode. If the port is in PVLAN host mode but all VLANs do not exist, the command is allowed, but the port is made inactive.

The secondary VLAN may be an isolated or community VLAN.

**Examples**

This example shows how to configure a port with a primary VLAN (VLAN 18) and secondary VLAN (VLAN 20):

```
Switch(config-if)# switchport private-vlan host-association 18 20
```

This example shows how to remove the PVLAN association from the port:

```
Switch(config-if)# no switchport private-vlan host-association
```

This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
```
```
Switch(config-if)# end
Switch# show interfaces fastethernet 5/1 switchport
Name: Fa5/1
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host

switchport private-vlan mapping

To define private VLAN mapping for a promiscuous port, use the `switchport private-vlan mapping` command. To clear all mapping from the primary VLAN, use the `no` form of this command.

```
switchport private-vlan mapping {primary-vlan-id} {secondary-vlan-list} | {add secondary-vlan-list} | {remove secondary-vlan-list}
```

```
switchport private-vlan mapping trunk {primary-vlan-id} [add | remove] secondary-vlan-list
```

```
no switchport private-vlan mapping [trunk]
```

### Syntax Description

- **primary-vlan-id**: Number of the primary VLAN of the private VLAN relationship; valid values are from 2 to 4094 (excluding 1002 to 1005).
- **secondary-vlan-list**: Number of the secondary VLANs to map to the primary VLAN; valid values are from 2 to 4094.
- **add**: Maps the secondary VLANs to the primary VLAN.
- **remove**: Clears mapping between the secondary VLANs and the primary VLAN.
- **trunk**: Maps the trunks secondary VLANs to the primary VLAN.

### Defaults

Private VLAN mapping is disabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for trunk VLAN was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

There is no run-time effect on the port unless it is in private VLAN promiscuous mode. If the port is in private VLAN promiscuous mode but the VLANs do not exist, the command is allowed, but the port is made inactive.

The secondary VLAN may be an isolated or community VLAN.

### Note

The maximum number of unique private VLAN pairs supported by the `switchport private-vlan mapping trunk` command above is 500. For example, one thousand secondary VLANs could map to one primary VLAN, or one thousand secondary VLANs could map one to one to one thousand primary VLANs.
**Examples**

This example shows how to configure the mapping of primary VLAN 18 to the secondary isolated VLAN 20 on a port:

```
Switch(config-if)# switchport private-vlan mapping 18 20
```

This example shows how to add a VLAN to the mapping:

```
Switch(config-if)# switchport private-vlan mapping 18 add 21
```

This example shows how to add a range of secondary VLANs to the mapping:

```
Switch(config-if)# switchport private-vlan mapping 18 add 22-24
```

This example shows how to add a range of secondary VLANs to the trunk mapping:

```
Switch(config-if)# switchport private-vlan mapping trunk 18 add 22-24
```

This example shows how to configure interface FastEthernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous

<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

By default, no normal VLANs are allowed unless you explicitly configure the VLANs to be allowed.

Use this command only for normal VLANs on a private VLAN trunk port.

Use the `switchport private-vlan association trunk` command to configure a port that can carry private VLANs on a private VLAN trunk port.
This example shows how to configure the private VLAN trunk port that carries normal VLANs 1 to 10:

```
Switch(config-if)# switchport private-vlan trunk allowed vlan 1-10
```

This example shows how to remove all the allowed normal VLANs from a private VLAN trunk port:

```
Switch(config-if)# no switchport private-vlan trunk allowed vlan
```

This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
  Name: Fa5/2
  Switchport: Enabled
  Administrative Mode: private-vlan trunk secondary
  Operational Mode: private-vlan trunk secondary
  Administrative Trunking Encapsulation: negotiate
  Operational Trunking Encapsulation: dot1q
  Negotiation of Trunking: On
  Access Mode VLAN: 1 (default)
  Trunking Native Mode VLAN: 1 (default)
  Administrative Native VLAN tagging: enabled
  Voice VLAN: none
  Administrative private-vlan host-association: none A
  Administrative private-vlan mapping: none
  Administrative private-vlan trunk native VLAN: 10
  Administrative private-vlan trunk Native VLAN tagging: enabled
  Administrative private-vlan trunk encapsulation: dot1q
  Administrative private-vlan trunk normal VLANs: none
  Administrative private-vlan trunk associations:
    3 (VLAN0003) 301 (VLAN0301)
  Administrative private-vlan trunk mappings: none
  Operational private-vlan: none
  Operational Normal VLANs: none
  Trunking VLANs Enabled: ALL
  Pruning VLANs Enabled: 2-1001
  Capture Mode Disabled Capture VLANs Allowed: ALL

  Unknown unicast blocked: disabled
  Unknown multicast blocked: disabled
  Appliance trust: none
```

Switch(config-if)#

This example shows how to configure interface FastEthernet 5/2 as a promiscuous trunk port and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk promiscuous
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
```

This example shows how to configure the private VLAN trunk port that carries normal VLANs 1 to 10:

```
Switch(config-if)# switchport private-vlan trunk allowed vlan 1-10
```

This example shows how to remove all the allowed normal VLANs from a private VLAN trunk port:

```
Switch(config-if)# no switchport private-vlan trunk allowed vlan
```

This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
  Name: Fa5/2
  Switchport: Enabled
  Administrative Mode: private-vlan trunk secondary
  Operational Mode: private-vlan trunk secondary

switchport private-vlan trunk native vlan tag

To control the tagging of the native VLAN traffic on 802.1Q private VLAN trunks, use the switchport private-vlan trunk native vlan tag command. To remove the control of tagging (and default to the global setting), use the no form of this command.

switchport private-vlan trunk native vlan tag

no switchport private-vlan trunk native vlan tag

Syntax Description
This command has no arguments or keywords.

Defaults
The default setting is global; the settings on the port are determined by the global setting.

Command Modes
Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>T2.2(18)EW</td>
<td>Removed vlan-id keyword.</td>
</tr>
</tbody>
</table>

Usage Guidelines
The configuration created with this command only applies to ports that are configured as private VLAN trunks.

Examples
This example shows how to enable 802.1Q native VLAN tagging on a PVLAN trunk:

Switch(config-if)# switchport private-vlan trunk native vlan tag
Switch(config-if)#

Related Commands

</tbody>
</table>
**switchport trunk**

To set the trunk characteristics when an interface is in trunking mode, use the `switchport trunk` command. To reset all of the trunking characteristics back to the original defaults, use the `no` form of this command.

```
switchport trunk native vlan {tag | vlan_id}
no switchport trunk native vlan {tag | vlan_id}
switchport trunk allowed vlan vlan_list
no switchport trunk allowed vlan vlan_list
switchport trunk pruning vlan vlan_list
no switchport trunk pruning vlan vlan_list
```

### Syntax Description

<td><code>native vlan vlan_id</code></td>
<td>Sets the native VLAN for the trunk in 802.1Q trunking mode.</td>
</tr>
<tr>
<td><code>allowed vlan vlan_list</code></td>
<td>Sets the list of allowed VLANs that transmit this interface in tagged format when in trunking mode. See the “Usage Guidelines” section for formatting guidelines for <code>vlan_list</code>.</td>
</tr>
<tr>
<td><code>pruning vlan vlan_list</code></td>
<td>Sets the list of VLANs that are enabled for VTP pruning when the switch is in trunking mode. See the “Usage Guidelines” section for formatting guidelines for <code>vlan_list</code>.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:

- IOS-XE only supports dot1Q.
- The access VLANs and trunk interface native VLANs are a default VLAN that corresponds to the platform or the interface hardware.
- All VLAN lists include all VLANs.
- Native VLAN tagging is enabled on the port if enabled globally.

Chapter 2      Cisco IOS Commands for the Catalyst 4500 Series Switches

Usage Guidelines

The vlan_list format is all | none | [add | remove | except] vlan_atom,vlan_atom,..., where:

- **all** specifies all VLANs from 1 to 4094. This keyword is not supported on commands that do not permit all VLANs in the list to be set at the same time.
- **none** indicates an empty list. This keyword is not supported on commands that require certain VLANs to be set or at least one VLAN to be set.
- **add** adds the defined list of VLANs to those currently set, instead of replacing the list.
- **remove** removes the defined list of VLANs from those currently set, instead of replacing the list.
- **except** lists the VLANs that should be calculated by inverting the defined list of VLANs.
- **vlan_atom** is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers (the lesser one first, separated by a hyphen).

The no form of the native vlan command resets the native mode VLAN to the appropriate default VLAN for the device.

The no form of the allowed vlan command resets the list to the default list, which allows all VLANs.

The no form of the pruning vlan command resets the list to the default list, which enables all VLANs for VTP pruning.

These configuration guidelines and restrictions apply when using 802.1Q trunks and impose some limitations on the trunking strategy for a network:

- When connecting Cisco switches through an 802.1Q trunk, make sure that the native VLAN for an 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.

- Disabling spanning tree on the native VLAN of an 802.1Q trunk without disabling spanning tree on every VLAN in the network can cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an 802.1Q trunk. If this is not possible, disable spanning tree on every VLAN in the network. Make sure that your network is free of physical loops before disabling spanning tree.

- When you connect two Cisco switches through 802.1Q trunks, the switches exchange spanning-tree BPDUs on each VLAN that is allowed on the trunks. The BPDUs on the native VLAN of the trunk are sent untagged to the reserved 802.1d spanning-tree multicast MAC address (01-80-C2-00-00-00). The BPDUs on all other VLANs on the trunk are sent tagged to the reserved SSTP multicast MAC address (01-00-0c-cc-cc-cd).

- Non-Cisco 802.1Q switches maintain only a single instance of spanning tree (MST) that defines the spanning-tree topology for all VLANs. When you connect a Cisco switch to a non-Cisco switch through an 802.1Q trunk, the MST of the non-Cisco switch and the native VLAN spanning tree of the Cisco switch combine to form a single spanning-tree topology known as the CST.

- Because Cisco switches transmit BPDUs to the SSTP multicast MAC address on the VLANs other than the native VLAN of the trunk, non-Cisco switches do not recognize these frames as BPDUs and flood them on all ports in the corresponding VLAN. Cisco switches connected to the non-Cisco 802.1Q network receive these flooded BPDUs. Because Cisco switches receive the flooded BPDUs, the switches can maintain a per-VLAN spanning-tree topology across a network of non-Cisco 802.1Q switches. The non-Cisco 802.1Q network separating the Cisco switches is treated as a single broadcast segment between all switches that are connected to the non-Cisco 802.1Q network through the 802.1Q trunks.

- Ensure that the native VLAN is the same on all of the 802.1Q trunks connecting the Cisco switches to the non-Cisco 802.1Q network.
If you are connecting multiple Cisco switches to a non-Cisco 802.1Q network, all of the connections must be through the 802.1Q trunks. You cannot connect Cisco switches to a non-Cisco 802.1Q network through the ISL trunks or through the access ports. This action causes the switch to place the ISL trunk port or access port into the spanning-tree “port inconsistent” state and no traffic will pass through the port.

Follow these guidelines for native VLAN tagging:

- The `no switchport trunk native vlan tag` command disables the native VLAN tagging operation on a port. This overrides the global tagging configuration.
- The `switchport trunk native vlan tag` command can be used to reenable tagging on a disabled port.
- The `no` option is saved to NVRAM so that the user does not have to manually select the ports to disable the tagging operation each time that the switch reboots.
- When the `switchport trunk native vlan tag` command is enabled and active, all packets on the native VLAN are tagged, and incoming untagged data packets are dropped. Untagged control packets are accepted.

**Examples**

This example shows how to cause a port interface that is configured as a switched interface to encapsulate in 802.1Q trunking format regardless of its default trunking format in trunking mode:

```
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)#
```

This example shows how to enable 802.1Q tagging on a port:

```
Switch(config-if)# switchport trunk native vlan tag
Switch(config-if)#
```

This example shows how to configure a secure MAC-address and a maximum limit of secure MAC addresses on Gigabit Ethernet port 1 for all VLANs:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 3
```

This example shows how to configure a secure MAC-address on Gigabit Ethernet port 1 in a specific VLAN or range of VLANs:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security maximum 3
```

This example shows how to configure a secure MAC-address in a VLAN on Gigabit Ethernet port 1:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.2
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.3
```
You can verify your settings by using the `show port-security interface vlan` privileged EXEC command.

switchport vlan mapping

Use the switchport vlan mapping interface configuration command to configure VLAN mapping on a trunk port. You can configure one-to-one VLAN mapping, traditional IEEE 802.1Q tunneling (QinQ) mapping, or selective QinQ mapping. Use the no form of the command to disable the configuration.

```
switchport vlan mapping vlan-id {translated-id | dot1q tunnel translated-id} 
no switchport vlan mapping vlan-id {translated-id | dot1q tunnel translated-id} 
no switchport vlan mapping all
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan-id</strong></td>
<td>Specifies the original (customer) VLAN or VLANs (C-VLANs), also known as the VLAN on the wire, for one-to-one or selective QinQ mapping. You can enter multiple VLAN IDs separated by a comma or a series of VLAN IDs separated by a hyphen (for example 1,2,3-5). The range is from 1 to 4094.</td>
</tr>
<tr>
<td><strong>translated-id</strong></td>
<td>Specifies the translated VLAN-ID: the S-VLAN to be used in the service provider network. The range is from 1 to 4094.</td>
</tr>
<tr>
<td><strong>dot1q-tunnel translated-id</strong></td>
<td>Adds a translated VLAN-ID to specify a VLAN tunnel (add an outer S-VLAN tag). The range of the S-VLAN tag is 1 to 4094. Use these keywords for traditional QinQ mapping.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>In the no switchport vlan mapping command, specifies that all VLAN mapping configurations on the interface are deleted.</td>
</tr>
</tbody>
</table>

** Defaults**

No VLAN mapping is configured.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before configuring VLAN mapping on an interface, enter the switchport mode trunk interface configuration command to configure the interface as a trunk port.

You can configure VLAN mapping on a physical interface or on a port channel of multiple interfaces with the same configuration.

To configure one-to-one VLAN mapping, use the switchport vlan mapping vlan-id translated-id command.

**Note**

To avoid mixing customer traffic, when you configure traditional QinQ on a trunk port, you should use the switchport trunk allowed vlan vlan-id interface configuration command to configure the outer VLAN ID (S-VLAN) as an allowed VLAN on the trunk port.
You cannot configure one-to-one mapping and selective QinQ on the same interface.

The `no` form of the `switchport vlan mapping` commands clears the specified mapping configuration. The `no switchport vlan mapping all` command clears all mapping configurations on the interface.

You cannot configure encapsulation replicate on a SPAN destination port if the source port is configured as a tunnel port or has a 1-to-2 mapping configured. Encapsulation replicate is supported with 1-to-1 VLAN mapping.

### Examples

This example shows how to use one-to-one mapping to map VLAN IDs 1 and 2 in the customer network to VLANs 1001 and 1002 in the service-provider network and to drop traffic from any other VLAN IDs.

```bash
Switch(config)# interface gigabiethernet0/1
Switch(config-if)# switchport vlan mapping 1 1001
Switch(config-if)# switchport vlan mapping 2 1002
Switch(config-if)# exit
```

This example shows how to configure selective QinQ mapping on the port so that traffic with a C-VLAN ID of 5, 7, or 8 would enter the switch with an S-VLAN ID of 100. The traffic of any other VLAN IDs is dropped.

```bash
Switch(config)# interface gigabiethernet0/1
Switch(config-if)# switchport vlan mapping 5, 7-8 dot1q-tunnel 100
Switch(config-if)# exit
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vlan mapping</code></td>
<td>Displays VLAN mapping information.</td>
</tr>
</tbody>
</table>
**system mtu**

To set the maximum Layer 2 or Layer 3 payload size, use the `system mtu` command. To revert to the default MTU setting, use the `no` form of this command.

```
    system mtu datagram-size
    no system mtu
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datagram-size</td>
<td>Layer 2 payload size; valid values from 1500 to 1552 bytes.</td>
</tr>
</tbody>
</table>

**Defaults**

The default MTU setting is 1500 bytes.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `datagram-size` parameter specifies the Ethernet payload size, not the total Ethernet frame size, and the Layer 3 MTU is changed as a result of changing the `system mtu` command.

For ports from 3 to 18 on model WS-X4418-GB and ports from 1 to 12 on model WS-X4412-2GB-TX, only the standard IEEE Ethernet payload size of 1500 bytes is supported.

For other modules, an Ethernet payload size of up to 1552 bytes is supported with a total Ethernet frame size of up to 1600 bytes.

**Examples**

This example shows how to set the MTU size to 1550 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# system mtu 1550
Switch(config)# end
Switch#
```

This example shows how to revert to the default MTU setting:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no system mtu
Switch(config)# end
Switch#
```

template data timeout (netflow-lite exporter submode)

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a template data timeout for the NetFlow-lite collector, use the `template data timeout` command. To delete the value, use the `no` form of this command.

`template data timeout seconds`

`no dscp dscp-value`

Syntax Description
- `seconds`: Specifies a template data timeout value for the NetFlow-lite collector.

Defaults
1800 seconds

Command Modes
netflow-lite exporter submode

Command History
- Release: 15.0(2)SG
  - Modification: Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

Usage Guidelines
Default timeout value is 1800 seconds or 30 minutes. The timeout value configured really depends on the collector and how often it needs the templates to be refreshed.

Examples
This example shows how to specify a template data timeout for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter
Switch# **show netflow-lite exporter exporter1**
Netflow-lite Exporter exporter1:

**Network Protocol Configuration:**
- Destination IP address: 5.5.5.6
- Source IP Address: 5.5.5.5
- VRF label:
- DSCP: 0x20
- TTL: 128
- COS: 7

**Transport Protocol Configuration:**
- Transport Protocol: UDP
- Destination Port: 8188
- Source Port: 61670

**Export Protocol Configuration:**
- Export Protocol: netflow-v9
- Template data timeout: 60
- Options sampler-table timeout: 1800
- Options interface-table timeout: 1800

**Exporter Statistics:**
- Packets Exported: 0

You can verify your settings with the **show netflow-lite exporter** privileged EXEC command.

test cable-diagnostics tdr

To test the condition of copper cables on 48-port 10/100/1000 BASE-T modules, use the test cable-diagnostics tdr command.

```
test cable-diagnostics tdr {interface interface interface-number}
```

**Note**
This command will be deprecated in future Cisco IOS releases. Use the diagnostic start command instead.

### Syntax Description
- `interface interface` Interface type; valid values are `fastethernet` and `gigabitethernet`.
- `interface-number` Module and port number.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
The TDR test is supported on Catalyst 4500 series switches running Cisco IOS Release 12.2(25)SG for the following line cards only:
- WS-X4548-GB-RJ45
- WS-X4548-GB-RJ45V
- WS-X4524-GB-RJ45V
- WS-X4013+TS
- WS-C4948
- WS-C4948-10GE

The valid values for `interface interface` are `fastethernet` and `gigabitethernet`.

Do not start the test at the same time on both ends of the cable. Starting the test at both ends of the cable at the same time can lead to false test results.

Do not change the port configuration during any cable diagnostics test. This action may result in incorrect test results.

The interface must be operating before starting the TDR test. If the port is down, the results of the test will be invalid. Issue the `no shutdown` command on the port.
Examples

This example shows how to start the TDR test on port 1 on module 2:

```
Switch# test cable-diagnostics tdr int gi2/1
Switch#
```

This example shows the message that displays when the TDR test is not supported on a module:

```
Switch# test cable-diagnostics tdr int gi2/1
00:03:15:%C4K_IOSDIAGMAN-4-TESTNOTSUPPORTEDONMODULE: Online cable
diag tdr test is not supported on this module
Switch#
```

Note

The **show cable-diagnostic tdr** command is used to display the results of a TDR test. The test results will not be available until approximately 1 minute after the test starts. If you enter the **show cable-diagnostic tdr** command within 1 minute of the test starting, you may see a “TDR test is in progress on interface...” message.

traceroute mac

To display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address, use the `traceroute mac` command.

```
traceroute mac [interface interface-id] {source-mac-address} [interface interface-id]
    {destination-mac-address} [vlan vlan-id] [detail]
```

**Syntax Description**

- **interface interface-id**  (Optional) Specifies the source or destination switch interface.
- **source-mac-address**  MAC address of the source switch in hexadecimal format.
- **destination-mac-address**  MAC address of the destination switch in hexadecimal format.
- **vlan vlan-id**  (Optional) Specifies the VLAN on which to trace the Layer 2 path that the packets take from the source switch to the destination switch; valid VLAN IDs are from 1 to 4094. Do not enter leading zeros.
- **detail**  (Optional) Displays detail information.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(15)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Do not use leading zeros when entering a VLAN ID.

The Layer 2 tracerooute feature is available on these switches:

- Catalyst 2950 switches running Release 12.1(12c)EA1 or later
- Catalyst 3550 switches running Release 12.1(12c)EA1 or later
- Catalyst 4500 series switches running Catalyst operating system Release 6.2 or later for the supervisor engine
- Catalyst 4500 series switches running Release 12.1(15)EW or later
- Catalyst 5000 family switches running Catalyst operating system Release 6.1 or later for the supervisor engine
- Catalyst 6500 series switches running Catalyst operating system Release 6.1 or later for the supervisor engine

For Layer 2 tracerooute to functional properly, Cisco Discovery Protocol (CDP) must be enabled on all of the switches in the network. Do not disable CDP.

When the switch detects a device in the Layer 2 path that does not support Layer 2 tracerooute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.
Layer 2 traceroute supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and a message appears.

The `traceroute mac` command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN. If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and a message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and a message appears.

This feature is not supported in Token Ring VLANs.

**Examples**

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 (2.2.6.6) :Fa0/1 =>Fa0/3
con5 (2.2.5.5 ) : Fa0/3 =>G10/1
con1 (2.2.1.1 ) : G10/1 =>G10/2
con2 (2.2.2.2 ) : G10/2 =>Fa0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the detailed Layer 2 path:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201 detail
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C2950G-24-EI / 2.2.6.6 :
   Fa0/1 [auto, auto] =>Fa0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
   Fa0/3 [auto, auto] =>G10/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
   G10/1 [auto, auto] =>G10/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
   G10/2 [auto, auto] =>Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows the Layer 2 path when the switch is not connected to the source switch:

```
Switch# traceroute mac 0000.0201.0501 0000.0201.0201 detail
Source not directly connected, tracing source ......
Source 0000.0201.0501 found on con5[WS-C2950G-24-EI] (2.2.5.5)
con5 / WS-C2950G-24-EI / 2.2.5.5 :
   Fa0/1 [auto, auto] =>G10/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
   G10/1 [auto, auto] =>G10/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
   G10/2 [auto, auto] =>Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

Switch#
This example shows the Layer 2 path when the switch cannot find the destination port for the source MAC address:

Switch# traceroute mac 0000.0011.1111 0000.0201.0201
Error:Source Mac address not found.
Layer2 trace aborted.
Switch#

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

Switch# traceroute mac 0000.0201.0601 0000.0301.0201
Error:Source and destination macs are on different vlans.
Layer2 trace aborted.
Switch#

This example shows the Layer 2 path when the destination MAC address is a multicast address:

Switch# traceroute mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address
Switch#

This example shows the Layer 2 path when the source and destination switches belong to multiple VLANs:

Switch# traceroute mac 0000.0201.0601 0000.0201.0201
Error:Mac found on multiple vlans.
Layer2 trace aborted.
Switch#

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination switches:

Switch# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
  con6 (2.2.6.6) :Fa0/1 =>Fa0/3
  con5 (2.2.5.5 ) : Fa0/3 =>G10/1
  con1 (2.2.1.1 ) : G10/1 =>G10/2
  con2 (2.2.2.2 ) : G10/2 =>Fa0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed

</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Layer 2 traceroute feature is available on these switches:

- Catalyst 2950 switches running Release 12.1(12c)EA1 or later
- Catalyst 3550 switches running Release 12.1(12c)EA1 or later
- Catalyst 4500 series switches running Catalyst operating system Release 6.2 or later for the supervisor engine
- Catalyst 4500 series switches running Release 12.1(15)EW or later
- Catalyst 5000 family switches running Catalyst operating system Release 6.1 or later for the supervisor engine
- Catalyst 6500 series switches running Catalyst operating system Release 6.1 or later for the supervisor engine

For Layer 2 traceroute to functional properly, Cisco Discovery Protocol (CDP) must be enabled on all the switches in the network. Do not disable CDP.

When the switch detects a device in the Layer 2 path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.
The \texttt{traceroute mac ip} command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

\textbf{Examples}

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the \texttt{detail} keyword:

```
Switch# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac.......
2.2.66.66 =>0000.0201.0601
2.2.22.22 =>0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
 con6 / WS-C2950G-24-EI / 2.2.6.6 :
     Fa0/1 [auto, auto] =>Fa0/3 [auto, auto]
 con5 / WS-C2950G-24-EI / 2.2.5.5 :
     Fa0/3 [auto, auto] =>G10/1 [auto, auto]
 con1 / WS-C3550-12G / 2.2.1.1 :
     G10/1 [auto, auto] =>G10/2 [auto, auto]
 con2 / WS-C3550-24 / 2.2.2.2 :
     G10/2 [auto, auto] =>Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
Switch#
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```
Switch# traceroute mac ip con6 con2
Translating IP to mac ......
2.2.66.66 =>0000.0201.0601
2.2.22.22 =>0000.0201.0201
Source 0000.0201.0601 found on con6
 con6 (2.2.6.6) :Fa0/1 =>Fa0/3
 con5 (2.2.5.5 ) : Fa0/3 =>G10/1
 con1 (2.2.1.1 ) : G10/1 =>G10/2
 con2 (2.2.2.2 ) : G10/2 =>Fa0/1
Destination 0000.0201.0201 found on con2
Layer 2 trace completed
Switch#
```

This example shows the Layer 2 path when Address Resolution Protocol (ARP) cannot associate the source IP address with the corresponding MAC address:

```
Switch# traceroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace aborted.
Switch#
```

transport udp (netflow-lite exporter submode)

NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a UDP transport destination port for a NetFlow-lite collector, use the `transport udp` command. To delete a transport UDP, use the `no` form of this command.

```
transport udp destination-port

no transport udp destination-port
```

**Syntax Description**

- `destination-port` Specifies a UDP transport destination port for a NetFlow-lite collector.

**Defaults**

None

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

One of the mandatory parameters for a minimally configured exporter along with the destination address and UDP destination port of the NetFlow-lite collector.

**Examples**

This example shows how to specify a UDP transport destination port for a NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
  Network Protocol Configuration:

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The CLI for UDP destination port load sharing allows you to leverage multiple receive packet queues in
current server NICs, where the collector is running. This is an optional parameter. When number >= 2
is configured, a switch exports datagrams with a UDP destination port number that “round robins”
between a set of consecutive destination UDP port numbers starting with the base udp port number and
ending with base udp port number + num ports - 1. Typically, netflow templates are sent on the base UDP
port number and the packet sample netflow records are sent on the remaining UDP ports. So, the
collector provides optimized processing for templates or metadata and packet sample records on a
socket.

Examples

This example shows how to specify a UDP transport destination port for a NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# transport udp load-share
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
```
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#

Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:

trust

To define a trust state for traffic classified through the class policy-map configuration command, use the trust policy-map class configuration command. To return to the default setting, use the no form of this command.

trust [cos | dscp]

no trust [cos | dscp]

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cos</td>
<td>(Optional) Classifies an ingress packet by using the packet class of service (CoS) value. For an untagged packet, the port default CoS value is used.</td>
</tr>
<tr>
<td>dscp</td>
<td>(Optional) Classifies an ingress packet by using the packet Differentiated Services Code Point (DSCP) values (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS value is used if the packet is tagged. If the packet is untagged, the default port CoS value is used to map CoS to DSCP.</td>
</tr>
</tbody>
</table>

Defaults

The action is not trusted.

Command Modes

Policy-map class configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

Use this command to distinguish the quality of service (QoS) trust behavior for certain traffic from other traffic. For example, inbound traffic with certain DSCP values can be trusted. You can configure a class map to match and trust the DSCP values in the inbound traffic.

Trust values set with this command supersede trust values set with the qos trust interface configuration command.

If you specify trust cos, QoS uses the received or default port CoS value and the CoS-to-DSCP map to generate a DSCP value for the packet.

If you specify trust dscp, QoS uses the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS uses the received CoS value; for non-IP packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP value for the packet is derived from the CoS-to-DSCP map.

To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.
Examples

This example shows how to define a port trust state to trust inbound DSCP values for traffic classified with “class1”:

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

Related Commands

**ttl (netflow-lite exporter submode)**

**Note**

NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a ttl value for the NetFlow-lite collector, use the `ttl` command. To delete the value, use the `no` form of this command.

```
ttl ttl-value
no ttl ttl-value
```

**Syntax Description**

- `ttl-value` Specifies a ttl value for the NetFlow-lite collector.
  Valid values are from 1 to 254.

**Defaults**

254

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The ttl limit takes effect only when the export packets are based on IPv4. It has no effect on IPv6.

**Examples**

This example shows how to specify a ttl value for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter

```
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
  Network Protocol Configuration:
```

Destination IP address: 5.5.5.6
Source IP Address: 5.5.5.5
VRF label:
DSCP: 0x20
TTL: 128
COS: 7
Transport Protocol Configuration:
Transport Protocol: UDP
Destination Port: 8188
Source Port: 61670
Export Protocol Configuration:
Export Protocol: netflow-v9
Template data timeout: 60
Options sampler-table timeout: 1800
Options interface-table timeout: 1800
Exporter Statistics:
Packets Exported: 0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

tx-queue

To configure the transmit queue parameters for an interface, use the **tx-queue** command. To return to the default value, use the **no** form of this command.

```
  tx-queue [queue-id] {bandwidth bandwidth-rate | priority high | shape shape-rate}

  no tx-queue
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue-id</td>
<td>(Optional) Number of the queue; valid values are from 1 to 4.</td>
</tr>
<tr>
<td>bandwidth</td>
<td>Specifies traffic bandwidth; valid values are from 16000 to 1000000000 bits per second.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies high priority.</td>
</tr>
<tr>
<td>shape</td>
<td>Specifies the maximum rate that packets are passed through a transmit queue; valid values are from 16000 to 1000000000 bits per second.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:
- Encapsulation type is dependent on the platform or interface hardware.
- QoS enabled bandwidth rate is 4:255.
- QoS disabled bandwidth rate is 255:1.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. The bandwidth and shape rates cannot exceed the maximum speed of the interface.

The bandwidth can be configured only on the following:
- Uplink ports on Supervisor Engine III (WS-X4014)
- Ports on the WS-X4306-GB module
- The two 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first two ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module

Only transmit queue 3 can be configured to be a high-priority transmit queue.
Examples

This example shows how to allocate bandwidth on queue 1 to 100 Mbps:

```bash
Switch(config-if)# tx-queue 1
Switch(config-if-tx-queue)# bandwidth 1000000000
Switch(config-if-tx-queue)#
```

This example shows how to configure transmit queue 3 to the high priority:

```bash
Switch(config-if)# tx-queue 3
Switch(config-if-tx-queue)# priority high
Switch(config-if-tx-queue)#
```

This example shows how to configure the traffic shaping rate of 64 kbps to transmit queue 1:

```bash
Switch(config-if)# tx-queue 1
Switch(config-if-tx-queue)# shape 64000
Switch(config-if-tx-queue)#
```

Related Commands

<table>
<thead>

<td>show qos interface</td>
<td>Displays queueing information.</td>
</tr>
</tbody>
</table>
udld (global configuration mode)

To enable aggressive or normal mode in the UDLD protocol and to set the configurable message timer time, use the `udld` global configuration command. You can also use this command to set the error reporting mode for Fast UDLD.

Use the `no` form of this command to do the following:

- Disable normal mode UDLD on all the fiber ports by default
- Disable aggressive mode UDLD on all the fiber ports by default
- Disable the message timer
- Disable Fast UDLD error reporting mode

```
udld enable | aggressive
no udld enable | aggressive
udld message time message-timer-time
no udld message time
udld fast-hello error-reporting
no udld fast-hello error-reporting
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables UDLD in normal mode by default on all the fiber-optic interfaces.</td>
</tr>
<tr>
<td>aggressive</td>
<td>Enables UDLD in aggressive mode by default on all the fiber-optic interfaces.</td>
</tr>
<tr>
<td>message time message-timer-time</td>
<td>Sets the period of time between the UDLD probe messages on the ports that are in advertisement mode and are currently determined to be bidirectional; valid values are from 1 to 90 seconds.</td>
</tr>
<tr>
<td>fast-hello error-reporting</td>
<td>If Fast UDLD is enabled and a link failure is detected, reports the link failure through a log message instead of errdisabling the port.</td>
</tr>
</tbody>
</table>

### Defaults

All fiber-optic interfaces are disabled and the message timer for UDLD is set to 15 seconds.

Fast UDLD is disabled on all interfaces.

### Command Modes

Global configuration
udld (global configuration mode)

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Support for Fast UDLD was added.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If you enable aggressive mode, once all the switch port’s neighbors have aged out either in the advertisement or in the detection phase, UDLD and Fast UDLD restart the linkup sequence. They can resynchronize with any potentially out-of-sync neighbor and shut down the port if the UDLD messages from the neighbor indicate that the link state is still undetermined.

This command affects fiber interfaces only. Use the udld (interface configuration mode) command to enable UDLD on other interface types.

Examples

This example shows how to enable UDLD on all the fiber interfaces:

```
Switch (config)# udld enable
Switch (config)#
```

Related Commands

<table>

</tbody>
</table>
**udld (interface configuration mode)**

To enable UDLD and Fast UDLD on an individual interface or to prevent a fiber-optic interface from being enabled by the `udld (global configuration mode)` command, use the `udld` interface level command. Use the `no` form of this command to disable UDLD, or to return a nonfiber port to the setting specified with the `udld (global configuration mode)` command.

```
uudld port {aggressive | disable}
no udld port {aggressive | disable}
uudld fast-hello interval
no udld fast-hello
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggressive</td>
<td>Enables UDLD in aggressive mode.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables UDLD.</td>
</tr>
<tr>
<td>fast-hello</td>
<td>Enables Fast UDLD with the configured timer.</td>
</tr>
<tr>
<td>interval</td>
<td>Sets the timer interval.</td>
</tr>
</tbody>
</table>

**Defaults**

The fiber-optic interfaces are enabled with the state of the global `udld (enable or aggressive)` command. The nonfiber interfaces are enabled with UDLD disabled. Fast UDLD is disabled.

<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Support was added for Fast UDLD.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enable aggressive mode, once all the switch port’s neighbors have aged out either in the advertisement or in the detection phase, UDLD and Fast UDLD restart the linkup sequence. They can resynchronize with any potentially out-of-sync neighbor and shut down the port if the UDLD messages from the neighbor indicate that the link state is still undetermined.

Use the `udld port aggressive` command on fiber-optic ports to override the setting of the global `udld (enable or aggressive)` command. Use the `no` form of the command on fiber-optic ports to restore the UDLD state as configured by the global `udld` command.

If `udld enable` is configured globally, UDLD is enabled on all fiber-optic interfaces in nonaggressive mode. You can configure `udld port aggressive` on a fiber-optic interface to override the `udld enable` command setting and to enter aggressive mode. If you enter the `no udld port aggressive` command, the settings of the previous global state are reestablished and the aggressive mode is removed.
The `disable` keyword is supported on fiber-optic ports only. Use the `no` form of the `udld` command to reset UDLD to the value specified by the `udld (global configuration mode)` command.

If the port changes from fiber-optic to nonfiber-optic or vice versa, all configurations are maintained.

### Examples

This example shows how to enable UDLD on any port interface for any global `udld (global configuration mode)` setting:

```
Switch (config-if)# udld port
```

This example shows how to enable UDLD in aggressive mode on any port interface for any global `udld (enable or aggressive)` setting:

```
Switch (config-if)# udld port aggressive
```

This example shows how to disable UDLD on a fiber port interface for any global `udld (global configuration mode)` setting:

```
Switch (config-if)# udld disable
```

This example shows how to enable Fast UDLD on a port interface with a timer value of 200 ms. To enable Fast UDLD on a port, you must first enable UDLD in normal or aggressive mode:

```
Switch (config-if)# udld port
Switch (config-if)# udld fast-hello 200
```

### Related Commands

</tr>
</tbody>
</table>
udld reset

To reset all the UDLD ports in the shutdown state (that is, errdisabled by UDLD), use the `udld reset` privileged EXEC command.

```
udld reset
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the interface configuration is still enabled for UDLD, those ports will begin to run UDLD again and may shut down if the reason for the shutdown has not been resolved.

The `udld reset` command permits the traffic to flow on the ports again. Other features, operate normally if enabled, such as STP, PAgP, and DTP.

**Examples**

This example shows how to reset all the ports that are shut down by UDLD:

```
Switch# udld reset
Switch# 
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</tbody>
</table>
To configure the nonblocking Gigabit Ethernet ports to unidirectionally send or receive traffic on an interface, use the `unidirectional` command. To disable unidirectional communication, use the `no` form of this command.

```
unidirectional {receive-only | send-only}

no unidirectional {receive-only | send-only}
```

**Syntax Description**

- `receive-only` Specifies the unidirectional reception.
- `send-only` Specifies the unidirectional transmission.

**Defaults**

Disabled

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enabling port unidirectional mode automatically disables port UDLD. You must manually ensure that the unidirectional link does not create a spanning-tree loop in the network.

**Examples**

This example shows how to set Gigabit Ethernet interface 1/1 to receive traffic unidirectionally:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# unidirectional receive-only
Switch(config-if)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces switchport</code></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>
</tr>
</tbody>
</table>
username

To establish a username-based authentication system, use the `username` command.

```
username name secret {0 | 5} password
```

**Syntax Description**

- `name`: User ID of the user.
- `secret 0 | 5`: Specifies the authentication system for the user; valid values are 0 (text immediately following is not encrypted) and 5 (text immediately following is encrypted using an MD5-type encryption method).
- `password`: Password of the user.

**Defaults**

No username-based authentication system is established.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to enable enhanced password security for the specified username. This command enables MD5 encryption on the password. MD5 encryption is a strong encryption method that is not retrievable. You cannot use MD5 encryption with protocols that require clear-text passwords, such as CHAP.

You can use this command for defining usernames that get special treatment. For example, you can define an “info” username that does not require a password but that connects the user to a general-purpose information service.

The `username` command provides both username and `secret` authentication for login purposes only. The `name` argument can be only one word. White spaces and quotation marks are not allowed.

You can use multiple `username` commands to specify options for a single user.

For information about additional `username` commands, refer to the *Cisco IOS Command Reference*.

**Examples**

This example shows how to specify an MD5 encryption on a password (warrior) for a username (xena):

```
Switch(config)# username xena secret 5 warrior
Switch(config)#
```

**Related Commands**

verify

To verify the checksum of a file on a flash memory file system, use the `verify` command.

```
verify [/md5] [flash-filesystem:] [filename] [expected-md5-signature]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/md5</td>
<td>(Optional) Verifies the MD5 signatures.</td>
</tr>
<tr>
<td>flash-filesystem:</td>
<td>(Optional) Device where the flash resides; valid values are bootflash:, slot0:, flash:, or sup-bootflash:.</td>
</tr>
<tr>
<td>filename</td>
<td>(Optional) Name of the Cisco IOS image.</td>
</tr>
<tr>
<td>expected-md5-signature</td>
<td>(Optional) MD5 signature.</td>
</tr>
</tbody>
</table>

**Defaults**

The current working device is specified.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each software image that is distributed on the disk uses a single checksum for the entire image. This checksum is displayed only when the image is copied into the flash memory.

The Readme file, which is included with the image on the disk, lists the name, file size, and checksum of the image. Review the contents of the Readme file before loading or duplicating the new image so that you can verify the checksum when you copy it into the flash memory or on to a server.

Use the `verify /md5` command to verify the MD5 signature of a file before using it. This command validates the integrity of a copied file by comparing a precomputed MD5 signature with the signature that is computed by this command. If the two MD5 signatures match, the copied file is identical to the original file.

You can find the MD5 signature posted on the Cisco.com page with the image.

You can use the `verify /md5` command in one of the following ways:

- Verify the MD5 signatures manually by entering the `verify /md5 filename` command.
  
  Check the displayed signature against the MD5 signature posted on the Cisco.com page.

- Allow the system to compare the MD5 signatures by entering the `verify /md5 {flash-filesystem:filename} {expected-md5-signature}` command.
After completing the comparison, the system returns with a verified message. If an error is detected, the output is similar to the following:

```
Switch# verify /md5 slot0:c4-jsv-mz 0f
..................................
..................................
..................................
..................................
..................................
...............................Done!
%Error verifying slot0:c4-jsv-mz
Computed signature = 0f369ed9e98756f179d4f29d6e7755d3
Submitted signature = 0f
```

To display the contents of the flash memory, enter the `show flash` command. The flash contents listing does not include the checksum of the individual files. To recompute and verify the image checksum after the image has been copied into the flash memory, enter the `verify` command.

A colon (:) is required after the specified device.

**Examples**

This example shows how to use the `verify` command:

```
Switch# verify cat6k_r47_1.cbi
..........................................................
File cat6k_r47_1.cbi verified OK.
Switch#
```

This example shows how to manually verify the MD5 signature:

```
Switch# verify /md5 c4-jsv-mz
.................................................
.................................................
.................................................
.................................................
.................................................
............................................Done!
verify /md5 (slot0:c4-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3
Switch#
```

This example shows how to allow the system to compare the MD5 signatures:

```
Switch# verify /md5 slot0:c4-jsv-mz 0f369ed9e98756f179d4f29d6e7755d3
..................................
..................................
..................................
..................................
..................................
...............................Done!
verified /md5 (slot0:c6sup12-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3
Switch#
```

# vlan (VLAN Database mode)

To configure a specific VLAN, use the `vlan` command. To delete a VLAN, use the `no` form of this command.

```plaintext
vlan vlan_id [are hops] [backupcrf mode] [bridge type | bridge-num] [media type] [mtu mtu-size] [name vlan-name] [parent parent-vlan-id] [ring ring-number] [said said-value] [state {suspend | active}] [stp type type] [tb-vlan1 tb-vlan1-id] [tb-vlan2 tb-vlan2-id]
no vlan vlan
```

## Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan_id</code></td>
<td>Number of the VLAN; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><code>are hops</code></td>
<td>(Optional) Specifies the maximum number of All Route Explorer hops for this VLAN; valid values are from 0 to 13. Zero is assumed if no value is specified.</td>
</tr>
<tr>
<td><code>backupcrf mode</code></td>
<td>(Optional) Enables or disables the backup CRF mode of the VLAN; valid values are <code>enable</code> and <code>disable</code>.</td>
</tr>
<tr>
<td><code>bridge type</code></td>
<td>(Optional) Specifies the bridging characteristics of the VLAN or identification number of the bridge; valid <code>type</code> values are <code>srb</code> and <code>srt</code>.</td>
</tr>
<tr>
<td><code>bridge_num</code></td>
<td>(Optional) Valid <code>bridge_num</code> values are from 0 to 15.</td>
</tr>
<tr>
<td><code>media type</code></td>
<td>(Optional) Specifies the media type of the VLAN; valid values are <code>fast ethernet</code>, <code>fd-net</code>, <code>fddi</code>, <code>trcrf</code>, and <code>trbrf</code>.</td>
</tr>
<tr>
<td><code>mtu mtu-size</code></td>
<td>(Optional) Specifies the maximum transmission unit (packet size, in bytes) that the VLAN can use; valid values are from 576 to 18190.</td>
</tr>
<tr>
<td><code>name vlan-name</code></td>
<td>(Optional) Defines a text string used as the name of the VLAN (1 to 32 characters).</td>
</tr>
<tr>
<td><code>parent parent-vlan-id</code></td>
<td>(Optional) Specifies the ID number of the parent VLAN of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.</td>
</tr>
<tr>
<td><code>ring ring-number</code></td>
<td>(Optional) Specifies the ring number of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.</td>
</tr>
<tr>
<td><code>said said-value</code></td>
<td>(Optional) Specifies the security association identifier; valid values are from 1 to 4294967294.</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(Optional) Specifies the state of the VLAN.</td>
</tr>
<tr>
<td><code>suspend</code></td>
<td>Specifies that the state of the VLAN is suspended. VLANs in the suspended state do not pass packets.</td>
</tr>
<tr>
<td><code>active</code></td>
<td>Specifies that the state of the VLAN is active.</td>
</tr>
<tr>
<td><code>stp type type</code></td>
<td>(Optional) Specifies the STP type; valid values are <code>ieee</code>, <code>ibm</code>, and <code>auto</code>.</td>
</tr>
<tr>
<td><code>tb-vlan1 tb-vlan1-id</code></td>
<td>(Optional) Specifies the ID number of the first translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.</td>
</tr>
<tr>
<td><code>tb-vlan2 tb-vlan2-id</code></td>
<td>(Optional) Specifies the ID number of the second translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.</td>
</tr>
</tbody>
</table>
The defaults are as follows:

- The vlan-name is “VLANxxxx” where “xxxx” represents four numeric digits (including leading zeroes) equal to the VLAN ID number.
- The media type is Fast Ethernet.
- The state is active.
- The said-value is 100,000 plus the VLAN ID number.
- The mtu-size default is dependent upon the VLAN type:
  - fddi—1500
  - trcrf—1500 if V2 is not enabled; 4472 if it is enabled
  - fd-net—1500
  - trbrf—1500 if V2 is not enabled; 4472 if it is enabled
- No ring number is specified.
- No bridge number is specified.
- No parent VLAN is specified.
- No STP type is specified.
- No translational bridge VLAN is specified.

Command Modes

VLAN configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8aEW)</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

VLAN 1 parameters are factory configured and cannot be changed.

When you define `vlan-name`, the name must be unique within the administrative domain.

The SAID is documented in 802.10. When the `no` form is used, the VLANs SAID is returned to the default.

When you define the `said-value`, the name must be unique within the administrative domain.

The `bridge bridge-number` argument is used only for Token Ring-net and FDDI-net VLANs and is ignored in other types of VLANs. When the `no` form is used, the VLANs source-route bridging number returns to the default.

The parent VLAN resets to the default if the parent VLAN is deleted or the `media` keyword changes the VLAN type or the VLAN type of the parent VLAN.

The `tb-vlan1` and `tb-vlan2` are used to configure translational bridge VLANs of a specified type of VLAN and are not allowed in other types of VLANs. The translational bridge VLANs must be a different VLAN type than the affected VLAN; if two VLANs are specified, the two must be different VLAN types.

A translational bridge VLAN will reset to the default if the translational bridge VLAN is deleted or the `media` keyword changes the VLAN type or the VLAN type of the corresponding translational bridge VLAN.
**Examples**

This example shows how to add a new VLAN with all the default parameters to the new VLAN database:

```
Switch(vlan)# vlan 2
```

**Note**

If the VLAN already exists, no action occurs.

This example shows how to cause the device to add a new VLAN, specify the media type and parent VLAN ID number 3, and set all the other parameters to the defaults:

```
Switch(vlan)# vlan 2 media fastethernet parent 3
VLAN 2 modified:
  Media type FASTETHERNET
  Parent VLAN 3
```

This example shows how to delete VLAN 2:

```
Switch(vlan)# no vlan 2
Switch(vlan)#
```

This example shows how to return the MTU to the default for its type and the translational bridging VLANs to the default:

```
Switch(vlan)# no vlan 2 mtu tb-vlan1 tb-vlan2
Switch(vlan)#
```

vlan access-map

To enter VLAN access-map command mode to create a VLAN access map, use the `vlan access-map` command. To remove a mapping sequence or the entire map, use the `no` form of this command.

```
vlan access-map name [seq# ]
no vlan access-map name [seq# ]
```

**Syntax Description**

- `name`  
  VLAN access-map tag.
- `seq#`  
  (Optional) Map sequence number; valid values are from 0 to 65535.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

- **Release** 12.1(12c)EW  
  Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

If you enter the sequence number of an existing map sequence, you enter VLAN access-map mode. If you do not specify a sequence number, a number is automatically assigned. You can enter one match clause and one action clause per map sequence. If you enter the `no vlan access-map name [seq# ]` command without entering a sequence number, the whole map is removed. Once you enter VLAN access-map mode, the following commands are available:

- `action`—Sets the action to be taken (forward or drop).
- `default`—Returns a command to its default settings.
- `end`—Exits from configuration mode.
- `exit`—Exits from VLAN access-map configuration mode.
- `match`—Sets the values to match (IP address or MAC address).
- `no`—Negates a command or reset its defaults.

**Examples**

This example shows how to enter VLAN access-map mode:

```
Switch(config)# vlan access-map cisco
Switch(config-access-map)#
```
### Related Commands

vlan configuration

To configure a service-policy on a VLAN, use the vlan configuration command to enter the VLAN feature configuration mode.

```
vlan configuration {vlan}
```

**Syntax Description**

- **vlan** Specifies a list of VLANs. "","","-" operators can be used; such as, 1-10,20.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on Catalyst 4900M and Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Even though an SVI is not needed in all cases, such as when you use your Catalyst 4500 series switch as a pure Layer 2 switch, you are required to create an SVI.

VLAN configuration mode has been introduced to remove the requirement of creating an SVI. With this command you can specify lists of VLANs and the input and output policies that are applied. To configure your system in this mode there is no requirement for you to create SVIs, or create VLAN or VTP mode interactions. Once the VLAN becomes active the configuration becomes active on that VLAN. You can use "," or ";" extensions to specifying VLAN list.

**Examples**

This example shows how to configure a service policy while in VLAN configuration mode and display the new service policy:

```
Switch# configure terminal
Switch(config)# vlan configuration 30-40
Switch(config-vlan-config)# service-policy input p1
Switch(config-vlan-config)# end
Switch# show running configuration | begin vlan configuration
!
vlan configuration 30-40
  service-policy input p1
!
vlan internal allocation policy ascending
vlan 2-1000
!
Switch# 
```
This example shows how to display the new service policy:

```
Switch# show policy-map vlan 30
vlan 30

Service-policy input: pl

Class-map: class-default (match-any)
    0 packets
    Match: any
    0 packets

police:
    rate 128000 bps, burst 4000 bytes
    conformed 0 packets, 0 bytes; action: transmit
    exceeded 0 packets, 0 bytes; action: drop
    conformed 0 bps, exceeded 0 bps
```

Switch#

</tbody>
</table>
**vlan database**

To enter VLAN configuration mode, use the `vlan database` command.

```
vlan database
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

From VLAN configuration mode, you can access the VLAN database editing buffer manipulation commands, including:

- **abort**—Exits mode without applying the changes.
- **apply**—Applies the current changes and bumps the revision number.
- **exit**—Applies the changes, bumps the revision number, and exits VLAN configuration mode.
- **no**—Negates a command or sets its defaults; valid values are `vlan` and `vtp`.
- **reset**—Abandons the current changes and rereads the current database.
- **show**—Displays the database information.
- **vlan**—Accesses the subcommands to add, delete, or modify values that are associated with a single VLAN. For information about the `vlan` subcommands, see the `vlan (VLAN Database mode)` command.
- **vtp**—Accesses the subcommands to perform VTP administrative functions. For information about the `vtp` subcommands, see the `vtp client` command.

**Examples**

This example shows how to enter VLAN configuration mode:

```
Switch# vlan database
Switch(vlan)#
```

This example shows how to exit VLAN configuration mode without applying changes after you are in VLAN configuration mode:

```
Switch(vlan)# abort
Abortting....
Switch#
```
This example shows how to delete a VLAN after you are in VLAN configuration mode:

Switch(vlan)# no vlan 100
Deleting VLAN 100...
Switch(vlan)#

This example shows how to turn off pruning after you are in VLAN configuration mode:

Switch(vlan)# no vtp pruning
Pruning switched OFF
Switch(vlan)#

</tbody>
</table>
**vlan dot1q tag native**

To enable tagging of the native VLAN frames on all 802.1Q trunk ports, use the `vlan dot1q tag native` command. To disable tagging of native VLAN frames, use the `no` form of this command.

```
vlan dot1q tag native

no vlan dot1q tag native
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

802.1Q native VLAN tagging is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabled, the native VLAN packets exiting all 802.1Q trunk ports are tagged unless the port is explicitly configured to disable native VLAN tagging.

When disabled, the native VLAN packets exiting all 802.1Q trunk ports are not tagged.

You can use this command with 802.1Q tunneling. This feature operates on an edge switch of a service-provider network and expands VLAN space by using a VLAN-in-VLAN hierarchy and by tagging the tagged packets. You must use the 802.1Q trunk ports for sending out the packets to the service-provider network. However, the packets going through the core of the service-provider network might also be carried on the 802.1Q trunks. If the native VLANs of an 802.1Q trunk match the native VLAN of a tunneling port on the same switch, the traffic on the native VLAN is not tagged on the sending trunk port. This command ensures that the native VLAN packets on all 802.1Q trunk ports are tagged.

**Examples**

This example shows how to enable 802.1Q tagging on the native VLAN frames and verify the configuration:

```
Switch# config terminal
Switch (config)# vlan dot1q tag native
Switch (config)# end
Switch# show vlan dot1q tag native
dot1q native vlan tagging is enabled
```

<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When configuring an action clause in a VLAN access map, note the following:

- You can apply the VLAN access map to one or more VLANs.
- The `vlan-list` parameter can be a single VLAN ID, a list of VLAN IDs, or VLAN ID ranges (`vlan-id-vlan-id`). Multiple entries are separated by `-`, (hyphen), or `,` (comma).
- You can apply only one VLAN access map to each VLAN.

When entering the `no` form of this command, the `vlan-list` parameter is optional (but the keyword `vlan-list` is required). If you do not enter the `vlan-list` parameter, the VACL is removed from all the VLANs where the `map-name` is applied.

**Examples**

This example shows how to apply a VLAN access map on VLANs 7 through 9:

```
Switch(config)# vlan filter ganymede vlan-list 7-9
Switch(config)#
```
To create or modify a VLAN group, use the `vlan group` command in global configuration mode. Use the `no` form of this command to remove a VLAN list from the VLAN group.

```
vlan group group-name vlan-list vlan-list
no vlan group group-name vlan-list vlan-list
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-name</code></td>
<td>Specifies the VLAN group name.</td>
</tr>
<tr>
<td><code>vlan-list</code></td>
<td>Specifies a VLAN list name. See the Usage Guidelines section below for additional information about this argument.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no arguments or keywords.

**Command Modes**

Global configuration

**Command History**

- **Release**
  - 12.2(54)SG: This command was modified to support user distribution on the Catalyst 4500 series switch.

**Usage Guidelines**

- The VLAN group name can contain up to 31 characters and must begin with a letter.
- The `vlan-list` argument can be a single VLAN ID, a list of VLAN IDs, or VLAN ID ranges (`vlan-id-vlan-id`). Multiple entries are separated by a hyphen (-) or a comma (,).
- If the named VLAN group does not exist, the `vlan group` command creates the group and maps the specified VLAN list to the group. If the named VLAN group exists, the specified VLAN list is mapped to the group.
- The `no` form of the `vlan group` command removes the specified VLAN list from the VLAN group. When you remove the last VLAN from the VLAN group, you delete the VLAN group.
- You can configure a maximum of 100 VLAN groups, and map a maximum of 4094 VLANs to a VLAN group.

**Examples**

- This example shows how to map VLANs 7 through 9 and 11 to a VLAN group:
  ```
  Switch(config)# vlan group ganymede vlan-list 7-9,11
  ```

- This example shows how to remove VLAN 7 from the VLAN group:
  ```
  Switch(config)# no vlan group ganymede vlan-list 7

**vlan internal allocation policy**

To configure the internal VLAN allocation scheme, use the `vlan internal allocation policy` command. To return to the default setting, use the `no` form of this command.

```
vlan internal allocation policy {ascending | descending}
```

```
no vlan internal allocation policy
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ascending</td>
<td>Specifies to allocate internal VLANs from 1006 to 4094.</td>
</tr>
<tr>
<td>descending</td>
<td>Specifies to allocate internal VLANs from 4094 to 1006.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is the ascending allocation scheme.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure internal VLAN allocation to be from 1006 and up or from 4094 and down. The internal VLANs and user-configured VLANs share the 1006 to 4094 VLAN spaces. A “first come, first served” policy is used in allocating these spaces.

The `vlan internal allocation policy` command allows you to configure the allocation direction of the internal VLAN.

During system bootup, the internal VLANs that are required for features in the startup-config file are allocated first. The user-configured VLANs in the startup-config file are configured next. If you configure a VLAN that conflicts with an existing internal VLAN, the VLAN that you configured is put into a nonoperational status until the internal VLAN is freed and becomes available.

After you enter the `write mem` command and the system reloads, the reconfigured allocation scheme is used by the port manager.

**Examples**

This example shows how to configure the VLANs in a descending order as the internal VLAN allocation policy:

```
Switch(config)# vlan internal allocation policy descending
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

vmps reconfirm (global configuration)

To change the reconfirmation interval for the VLAN Query Protocol (VQP) client, use the `vmps reconfirm` command. To return to the default setting, use the `no` form of this command.

```
vmps reconfirm interval
no vmps reconfirm
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>Queries to the VLAN Membership Policy Server (VMPS) to reconfirm dynamic VLAN assignments; valid values are from 1 to 120 minutes.</td>
</tr>
</tbody>
</table>

**Defaults**

The reconfirmation interval is 60 minutes.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set the VQP client to reconfirm dynamic VLAN entries every 20 minutes:

```
Switch(config)# vmps reconfirm 20
Switch(config)#
```

You can verify your setting by entering the `show vmps` command and examining information in the Reconfirm Interval row.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vmps</code></td>
<td>Displays the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers.</td>

<tr>
<td><code>vmps reconfirm (privileged EXEC)</code></td>
<td>Sends VLAN Query Protocol (VQP) queries to reconfirm all the dynamic VLAN assignments with the VLAN Membership Policy Server (VMPS).</td>
</tr>
</tbody>
</table>
vmps reconfirm (privileged EXEC)

To immediately send VLAN Query Protocol (VQP) queries to reconfirm all the dynamic VLAN assignments with the VLAN Membership Policy Server (VMPS), use the `vmps reconfirm` command.

```
vmps reconfirm
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release   Modification
12.1(13)EW  Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

You can verify your setting by entering the `show vmps` command and examining the VMPS Action row of the Reconfirmation Status section. The `show vmps` command shows the result of the last time that the assignments were reconfirmed either because the reconfirmation timer expired or because the `vmps reconfirm` command was entered.

**Examples**

This example shows how to immediately send VQP queries to the VMPS:

```
Switch# vmps reconfirm
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>Changes the reconfirmation interval for the VLAN Query Protocol (VQP) client.</td>
</tr>
</tbody>
</table>
vmps retry

To configure the per-server retry count for the VLAN Query Protocol (VQP) client, use the `vmps retry` command. To return to the default setting, use the `no` form of this command.

```
vmps retry count
no vmps retry
```

**Syntax Description**

- `count` Number of attempts to contact the VLAN Membership Policy Server (VMPS) by the client before querying the next server in the list; valid values are from 1 to 10.

**Defaults**
The retry count is 3.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can verify your setting by entering the `show vmps` command and examining information in the Server Retry Count row.

**Examples**
This example shows how to set the retry count to 7:
```
Switch(config)# vmps retry 7
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vmps</code></td>
<td>Displays the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers.</td>
</tr>
</tbody>
</table>
vmps server

To configure the primary VLAN Membership Policy Server (VMPS) and up to three secondary servers, use the `vmps server` command. To remove a VMPS server, use the `no` form of this command.

```
vmps server ipaddress [primary]
no vmps server ipaddress
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ipaddress</code></td>
<td>IP address or host name of the primary or secondary VMPS servers. If you specify a hostname, the Domain Name System (DNS) server must be configured.</td>
</tr>
<tr>
<td><code>primary</code></td>
<td>(Optional) Determines whether primary or secondary VMPS servers are being configured.</td>
</tr>
</tbody>
</table>

**Defaults**

No primary or secondary VMPS servers are defined.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(4)EA1</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The first server that you entered is automatically selected as the primary server whether or not `primary` is entered. You can override the first server address by using `primary` in a subsequent command.

If a member switch in a cluster configuration does not have an IP address, the cluster does not use the VMPS server that is configured for that member switch. Instead, the cluster uses the VMPS server on the command switch, and the command switch proxies the VMPS requests. The VMPS server treats the cluster as a single switch and uses the IP address of the command switch to respond to requests.

When using the `no` form without specifying the `ipaddress`, all configured servers are deleted. If you delete all servers when dynamic-access ports are present, the switch cannot forward the packets from the new sources on these ports because it cannot query the VMPS.

You can verify your setting by entering the `show vmps` command and examining information in the VMPS Domain Server row.

**Examples**

This example shows how to configure the server with IP address 191.10.49.20 as the primary VMPS server. The servers with IP addresses 191.10.49.21 and 191.10.49.22 are configured as secondary servers:

```
Switch(config)# vmps server 191.10.49.20 primary
Switch(config)# vmps server 191.10.49.21
Switch(config)# vmps server 191.10.49.22
Switch(config)#
```
This example shows how to delete the server with IP address 191.10.49.21:

```
Switch(config)# no vmps server 191.10.49.21
Switch(config)#
```

### Related Commands

vrf (netflow-lite exporter submode)

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a VRF label for the NetFlow-lite collector, use the `vrf` command. To delete a VRF label, use the `no` form of this command.

```
vrf source-address
no vrf source-address
```

**Syntax Description**

| vrf-label | Specifies a VRF label for the NetFlow-lite collector. |

**Defaults**

global vrf

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default when no vrf label is specified the global vrf is used for routing. The vrf label is ignored if the collector's address is IPv6. Default global routing table is used to route the IPv6 export packets to the collector.

**Note**
Support for VRF with IPv6 will be provided in a later release.

**Examples**

This example shows how to specify a VRF label for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config)# destination 5.5.5.6
Switch(config)# source 5.5.5.5
Switch(config)# transport udp 8188
Switch(config)# ttl 128
Switch(config)# cos 7
Switch(config)# dscp 32
Switch(config)# template data timeout 1
Switch(config)# options sampler-table timeout 1
Switch(config)# options interface-table timeout 1
Switch(config)# export-protocol netflow-v9
Switch(config)# exit
Switch(config)#
```
Display the exporter
Switch# **show netflow-lite exporter exporter1**
Netflow-lite Exporter exporter1:
Network Protocol Configuration:
  Destination IP address: 5.5.5.6
  Source IP Address: 5.5.5.5
  VRF label:
  DSCP: 0x20
  TTL: 128
  COS: 7
Transport Protocol Configuration:
  Transport Protocol: UDP
  Destination Port: 8188
  Source Port: 61670
Export Protocol Configuration:
  Export Protocol: netflow-v9
  Template data timeout: 60
  Options sampler-table timeout: 1800
  Options interface-table timeout: 1800
Exporter Statistics:
  Packets Exported: 0

You can verify your settings with the **show netflow-lite exporter** privileged EXEC command.

vslp interval (virtual switch)

To configure the virtual switch link protocol (VSLP) hello packet interval, use the `vslp interval` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
vslp interval interval min_rx min-interval multiplier factor
no vslp interval
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interval</code></td>
<td>Specifies the hello packet interval in milliseconds between the transmission of hello packets. Range: 300 to 5000.</td>
</tr>
<tr>
<td><code>min_rx min-interval</code></td>
<td>Specifies the minimum interval in milliseconds for received hello packets. Range: 300 to 10000.</td>
</tr>
<tr>
<td><code>multiplier factor</code></td>
<td>Specifies a factor in which, if no hello packets are received, the link is flagged as non-operational. Range: 3 to 50.</td>
</tr>
</tbody>
</table>

**Defaults**
The interfaces are not associated.

**Command Modes**
Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.4.0SG and 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When you specify a factor, the formula is if no hello packets are received in (min_rx * multiplier) milliseconds, the link is flagged as non-operational.

**Examples**
The following example shows how to configure the virtual switch link protocol (VSLP) hello packet interval:

```
Router-2(config-if)# vslp interval 400 min_rx 500
Router-2(config-if)#
```
vtp (global configuration mode)

To modify the name of a VTP configuration storage file, use the vtp command. To clear a filename, use the no form of this command.

```
vtp { { file filename } | { if-id name } }
no vtp { { file filename } | { if-id name } }
```

**Syntax Description**

- **file filename**: Specifies the IFS file where VTP configuration will be stored.
- **if-id name**: Specifies the name of the interface providing the VTP updater ID for this device, where the **if-id name** is an ASCII string limited to 255 characters.

**Defaults**

Disabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot use the **vtp file** command to load a new database. You can use it only to rename the file in which the existing database is stored.

You can use the **vtp if-id** command to specify the name of the interface providing the VTP updater ID for this device. The VTP updater is the device that adds, deletes, or modifies VLANs to a network, and triggers a VTP updater to inform the rest of the system of the changes.

**Examples**

This example shows how to specify the IFS file system file where VTP configuration is stored:

```
Switch(config)# vtp file vtpconfig
Setting device to store VLAN database at filename vtpconfig.
Switch(config)#
```

This example shows how to specify the name of the interface providing the VTP updater ID:

```
Switch(config)# vtp if-id fastethernet
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>Displays VTP statistics and domain information.</td>
</tr>
</tbody>
</table>
vtp client

To place a device in VTP client mode, use the vtp client command. To return to VTP server mode, use the no form of this command.

vtp client
no vtp client

Syntax Description
This command has no arguments or keywords.

Defaults
Disabled

Command Modes
VLAN configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines
If the receiving switch is in client mode, the client switch changes its configuration to duplicate the configuration of the server. If you have switches in client mode, make sure to make all VTP or VLAN configuration changes on a switch in server mode.

The vtp server command is the functional equivalent of no vtp client except that it does not return an error if the device is not in client mode.

Examples
This example shows how to place the device in VTP client mode:

Switch(vlan-config)# vtp client
Switch(vlan-config)#

Related Commands

</tbody>
</table>
vtp domain

To configure the administrative domain name for a device, use the `vtp domain` command.

```
vtp domain domain-name
```

**Syntax Description**

| domain-name | Name of the domain. |

**Defaults**

This command has no default settings.

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you define the `domain-name`, the domain name is case sensitive and can be from 1 to 32 characters.

You must set a domain name before you can transmit any VTP advertisements.

Even if you do not set a domain name, the device will leave the no-management-domain state upon receiving the first VTP summary packet on any port that is currently trunking.

If the device receives its domain from a summary packet, it resets its configuration revision number to zero. Once the device leaves the no-management-domain state, it can never be configured to reenter the number except by cleaning NVRAM and reloading.

**Examples**

This example shows how to set the devices administrative domain:

```
Switch(vlan-config)# vtp domain DomainChandon
Switch(vlan-config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</tbody>
</table>
vtp password

To create a VTP domain password, use the `vtp password` command. To delete the password, use the `no` form of this command.

```
vtp password password-value
no vtp password
```

**Syntax Description**

| password-value | An ASCII string, from 1 to 32 characters, identifying the administrative domain for the device. |

**Defaults**

Disabled

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to create a VTP domain password:

```
Switch(vlan-config)# vtp password DomainChandon
Switch(vlan-config)#
```

This example shows how to delete the VTP domain password:

```
Switch(vlan-config)# no vtp password
Clearing device VLAN database password.
Switch(vlan-config)#
```

**Related Commands**

</tbody>
</table>
vtp pruning

To enable pruning in the VLAN database, use the **vtp pruning** command. To disable pruning in the VLAN database, use the **no** form of this command.

```
vtp pruning
no vtp pruning
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
VTP pruning causes information about each pruning-eligible VLAN to be removed from VTP updates if there are no stations belonging to that VLAN.

**Examples**
This example shows how to enable pruning in the VLAN database:

```
Switch(vlan-config)# vtp pruning
Pruning switched ON
Switch(vlan-config)#
```

This example shows how to disable pruning in the VLAN database:

```
Switch(vlan-config)# no vtp pruning
Pruning switched OFF
Switch(vlan-config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp</td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td>vtp (global configuration mode)</td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
**vtp server**

To place the device in VTP server mode, use the `vtp server` command.

```
vtp server
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Enabled

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you make a change to the VTP or VLAN configuration on a switch in server mode, that change is propagated to all the switches in the same VTP domain.

You can set VTP to either server or client mode only when you disable dynamic VLAN creation.

If the receiving switch is in server mode, the configuration is not changed.

The `vtp server` command is the functional equivalent of `no vtp client`, except that it does not return an error if the device is not in client mode.

**Examples**

This example shows how to place the device in VTP server mode:

```
Switch(vlan-config)# vtp server
Switch(vlan-config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp</td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
**vtp transparent**

To place a device in VTP transparent mode, use the `vtp transparent` command. To return to VTP server mode, use the `no` form of this command.

```
vtp transparent
no vtp transparent
```

**Syntax Description**  
This command has no arguments or keywords.

**Defaults**  
Disabled

**Command Modes**  
VLAN configuration mode

**Command History**  

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**  
The `vtp transparent` command disables VTP from the domain but does not remove the domain from the switch.

If the receiving switch is in transparent mode, the configuration is not changed. The switches in transparent mode do not participate in VTP. If you make VTP or VLAN configuration changes on a switch in transparent mode, the changes are not propagated to the other switches in the network.

The `vtp server` command is similar to the `no vtp transparent` command, except that it does not return an error if the device is not in transparent mode.

**Examples**  
This example shows how to place the device in VTP transparent mode:

```
Switch(vlan-config)# vtp transparent
Switch(vlan-config)#
```

This example shows how to return the device to VTP server mode:

```
Switch(vlan-config)# no vtp transparent
Switch(vlan-config)#
```

**Related Commands**

<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
vtp v2-mode

To enable version 2 mode, use the `vtp v2-mode` command. To disable version 2 mode, use the `no` form of this command.

```
vtp v2-mode
no vtp v2-mode
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
All switches in a VTP domain must run the same version of VTP. VTP version 1 and VTP version 2 do not operate on switches in the same VTP domain.

If all switches in a domain are VTP version 2-capable, you only need to enable VTP version 2 on one switch; the version number is then propagated to the other version 2-capable switches in the VTP domain.

If you toggle the version 2 mode, the parameters of certain default VLANs will be modified.

**Examples**
This example shows how to enable version 2 mode in the VLAN database:

```
Switch(vlan-config)# vtp v2-mode
Switch(vlan-config)#
```

This example shows how to disable version 2 mode in the VLAN database:

```
Switch(vlan-config)# no vtp v2-mode
Switch(vlan-config)#
```
