CHAPTER 1
Product Overview  1-1
Layer 2 Software Features  1-1
   802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling  1-2
   Cisco IOS Auto Smartport Macros  1-2
   Cisco Discovery Protocol  1-3
   Cisco Group Management Protocol (CGMP) server  1-3
   EtherChannel Bundles  1-3
   Ethernet CFM  1-3
   Ethernet OAM Protocol  1-3
   Flex Links and MAC Address-Table Move Update  1-4
   Flexible NetFlow  1-4
   Internet Group Management Protocol (IGMP) Snooping  1-4
   IPv6 Multicast Listen Discovery (MLD) and Multicast Listen Discovery snooping  1-5
   Jumbo Frames  1-5
   Link Aggregation Control Protocol  1-5
   Cisco IOS XE IP Application Services Features in Cisco IOS XE 3.1.0SG  1-5
Link Layer Discovery Protocol  1-6
Link State Tracking  1-6
Location Service  1-6
Multiple Spanning Tree  1-7

Contents

Network Admission Control 1-35
Network Security with ACLs 1-35
Port Security 1-36
PPPoE Intermediate Agent 1-36
Storm Control 1-36
uRPF Strict Mode 1-37
Utilities 1-37
   Layer 2 Traceroute 1-37
   Time Domain Reflectometry 1-37
   Debugging Features 1-37
   Web-based Authentication 1-38

New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG 1-39

CHAPTER 2

Command-Line Interfaces 2-1
   Accessing the Switch CLI 2-2
      Accessing the CLI Using the EIA/TIA-232 Console Interface 2-2
      Accessing the CLI Through Telnet 2-2
   Performing Command-Line Processing 2-3
   Performing History Substitution 2-4
   About Cisco IOS Command Modes 2-4
   Getting a List of Commands and Syntax 2-5
      Virtual Console for Standby Supervisor Engine 2-6
   ROMMON Command-Line Interface 2-7
   Archiving Crashfiles Information 2-8
   Displaying a Crash Dump for Supervisor Engine 6-E and 6L-E 2-8

CHAPTER 3

Configuring the Switch for the First Time 3-1
   Default Switch Configuration 3-1
   Configuring DHCP-Based Autoconfiguration 3-2
      About DHCP-Based Autoconfiguration 3-2
      DHCP Client Request Process 3-3
      Configuring the DHCP Server 3-4
      Configuring the TFTP Server 3-4
      Configuring the DNS Server 3-5
      Configuring the Relay Device 3-5
      Obtaining Configuration Files 3-6
      Example Configuration 3-7
   Configuring the Switch 3-8
System Clock 4-2
Understanding Network Time Protocol 4-2
Configuring NTP 4-3
   Default NTP Configuration 4-4
   Configuring NTP Authentication 4-4
   Configuring NTP Associations 4-6
   Configuring NTP Broadcast Service 4-7
   Configuring NTP Access Restrictions 4-8
   Configuring the Source IP Address for NTP Packets 4-10
   Displaying the NTP Configuration 4-11
Configuring Time and Date Manually 4-11
   Setting the System Clock 4-11
   Displaying the Time and Date Configuration 4-12
   Configuring the Time Zone 4-12
   Configuring Summer Time (Daylight Saving Time) 4-13
Configuring a System Name and Prompt 4-14
   Configuring a System Name 4-15
Understanding DNS 4-15
   Default DNS Configuration 4-16
   Setting Up DNS 4-16
   Displaying the DNS Configuration 4-17
Creating a Banner 4-17
   Default Banner Configuration 4-18
   Configuring a Message-of-the-Day Login Banner 4-18
   Configuring a Login Banner 4-20
Managing the MAC Address Table 4-21
   Building the Address Table 4-21
   MAC Addresses and VLANs 4-22
   Default MAC Address Table Configuration 4-23
   Changing the Address Aging Time 4-23
   Removing Dynamic Address Entries 4-24
   Configuring MAC Change Notification Traps 4-24
   Configuring MAC Move Notification Traps 4-26
   Configuring MAC Threshold Notification Traps 4-28
   Adding and Removing Static Address Entries 4-29
   Configuring Unicast MAC Address Filtering 4-30
   Disabling MAC Address Learning on a VLAN 4-32
      Configuring Disable MAC Address Learning 4-32
Usage Guidelines 4-33
CHAPTER 5

Configuring the Cisco IOS In-Service Software Upgrade Process 5-1

Prerequisites to Performing ISSU 5-2

About ISSU 5-3
  Stateful Switchover Overview 5-3
  NSF Overview 5-5
  ISSU Process Overview 5-6
  Performing an ISSU Upgrade: 2 Methods 5-11
  Changeversion Process 5-12
    Changeversion: Quick Option 5-12
    Scheduled Changeversion: “in” and “at” Options 5-12
    Changeversion Deployment Scenario 5-13
    Aborting an In-Progress Changeversion Procedure 5-13

Guidelines for Performing ISSU 5-13

Versioning Capability in Cisco IOS Software to Support ISSU 5-13

Compatibility Matrix 5-14

SNMP Support for ISSU 5-15

Compatibility Verification Using Cisco Feature Navigator 5-15

Performing the ISSU Process 5-15
  Verifying the ISSU Software Installation 5-16
  Verifying Redundancy Mode Before Beginning the ISSU Process 5-16
  Verifying the ISSU State Before Beginning the ISSU Process 5-17
  Loading New Cisco IOS Software on the Standby Supervisor Engine 5-18
  Switching to the Standby Supervisor Engine 5-21
  Stopping the ISSU Rollback Timer (Optional) 5-23
  Loading New Cisco IOS Software on the New Standby Supervisor Engine 5-24
  Using changeversion to Automate an ISSU Upgrade 5-26
  Aborting a Software Upgrade During ISSU 5-31
  Configuring the Rollback Timer to Safeguard Against Upgrade Issues 5-32
CHAPTER 6
Configuring the Cisco IOS XE In Service Software Upgrade Process 6-1
Related Documents 6-2
Prerequisites to Performing ISSU 6-2
About Performing ISSU 6-3
Stateful Switchover 6-3
NSF 6-5
ISSU Process 6-6
Performing an ISSU Upgrade: 2 Methods 6-11
Changeversion Process 6-12
Changeversion: Quick Option (LV to INIT) 6-12
Scheduled Changeversion: “in” and “at” Options 6-12
Changeversion Deployment Scenario 6-13
Aborting an In-Progress Changeversion Procedure 6-13
Guidelines for Performing ISSU 6-13
Compatibility Matrix 6-13
SNMP Support for ISSU 6-14
Compatibility Verification Using Cisco Feature Navigator 6-14
How to Perform the ISSU Process 6-15
Verifying the ISSU Software Installation 6-15
Verifying Redundancy Mode Before Beginning the ISSU Process 6-16
Verifying the ISSU State Before Beginning the ISSU Process 6-17
Loading New Cisco IOS XE Software on the Standby Supervisor Engine 6-18
Switching to the Standby Supervisor Engine 6-21
Stopping the ISSU Rollback Timer (Optional) 6-23
Loading New Cisco IOS XE Software on the New Standby Supervisor Engine 6-24
Using changeversion to Automate an ISSU Upgrade 6-25
Aborting a Software Upgrade During ISSU 6-31
Configuring the Rollback Timer to Safeguard Against Upgrade Issues 6-32
Displaying ISSU Compatibility Matrix Information 6-34
Cisco High Availability Features in Cisco IOS XE 3.1.0SG 6-35

CHAPTER 7
Configuring Interfaces 7-1
About Interface Configuration 7-2
Using the interface Command 7-2
Configuring a Range of Interfaces 7-4
Using the Ethernet Management Port 7-6
Understanding the Ethernet Management Port 7-6
Fa1 Interface and mgmtVrf 7-7
SSO Model 7-9
ISSU Model 7-9
Supported Features on the Ethernet Management Port 7-9
Configuring the Ethernet Management Port 7-10
Defining and Using Interface-Range Macros 7-10
Deploying SFP+ in X2 Ports 7-11
Deploying 10-Gigabit Ethernet and Gigabit Ethernet SFP Ports on Supervisor Engine V-10GE 7-12
Deploying 10-Gigabit Ethernet or Gigabit Ethernet Ports 7-13
Port Numbering TwinGig Convertors 7-13
Limitations on Using a TwinGig Convertor 7-14
Selecting X2/TwinGig Convertor Mode 7-14
Invoking Shared-Backplane Uplink Mode on Supervisor Engine 6-E and Supervisor Engine 6L-E 7-15
Limitation and Restrictions on Supervisor Engine 7-E and Supervisor Engine 7L-E 7-16
Selecting Uplink Mode on a Supervisor Engine 6-E 7-16
Selecting the Uplink Port on a Supervisor Engine 7L-E 7-17
Single Supervisor Mode 7-17
Redundant Supervisor Mode 7-18
Digital Optical Monitoring Transceiver Support 7-18
Configuring Optional Interface Features 7-19
Configuring Ethernet Interface Speed and Duplex Mode 7-19
Speed and Duplex Mode Configuration Guidelines 7-19
Setting the Interface Speed 7-20
Setting the Interface Duplex Mode 7-21
Displaying the Interface Speed and Duplex Mode Configuration 7-21
Adding a Description for an Interface 7-22
Configuring Flow Control 7-22
Configuring Jumbo Frame Support 7-24
Ports and Modules That Support Jumbo Frames 7-24
Jumbo Frame Support 7-25
Configuring MTU Sizes 7-27
Interacting with Baby Giants 7-28
Configuring the Port Debounce Timer 7-28
Configuring Auto-M DIX on a Port 7-29
Displaying the Interface Auto-M DIX Configuration 7-30
Understanding Online Insertion and Removal 7-31
Online Insertion and Removal on a WS-4500X-32  7-32
Shutting down a Module  7-32
Booting a Module After it has been Stopped  7-33
Common Scenarios  7-34
Monitoring and Maintaining the Interface  7-34
Monitoring Interface and Controller Status  7-34
Clearing and Resetting the Interface  7-35
Shutting Down and Restarting an Interface  7-35
Configuring Interface Link Status and Trunk Status Events  7-36
   Configuring Link Status Event Notification for an Interface  7-37
   Global Settings  7-37
   Configuring a Switch Global Link Status Logging Event  7-37
   Examples  7-37
Resetting the Interface to the Default Configuration  7-38

CHAPTER 8
Checking Port Status and Connectivity  8-1
   Checking Module Status  8-2
   Checking Interfaces Status  8-3
   Displaying MAC Addresses  8-4
   Checking Cable Status Using Time Domain Reflectometer  8-4
      Overview  8-4
      Running the TDR Test  8-5
      TDR Guidelines  8-6
   Using Telnet  8-6
   Changing the Logout Timer  8-7
   Monitoring User Sessions  8-7
   Using Ping  8-8
      Understanding How Ping Works  8-8
      Running Ping  8-9
   Using IP Traceroute  8-9
      Understanding How IP Traceroute Works  8-9
      Running IP Traceroute  8-10
   Using Layer 2 Traceroute  8-10
      Layer 2 Traceroute Usage Guidelines  8-11
      Running Layer 2 Traceroute  8-12
   Configuring ICMP  8-13
      Enabling ICMP Protocol Unreachable Messages  8-13
      Enabling ICMP Redirect Messages  8-13
### Chapter 9: Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 6-E and Supervisor Engine 6L-E

8-14

#### Enabling ICMP Mask Reply Messages

8-14

#### About Supervisor Engine Redundancy

9-2

- Overview
- RPR Operation
- SSO Operation

9-3

#### About Supervisor Engine Redundancy Synchronization

9-4

- RPR Supervisor Engine Configuration Synchronization
- SSO Supervisor Engine Configuration Synchronization

9-5

#### Supervisor Engine Redundancy Guidelines and Restrictions

9-5

#### Configuring Supervisor Engine Redundancy

9-7

- Configuring Redundancy
- Virtual Console for Standby Supervisor Engine
- Synchronizing the Supervisor Engine Configurations

9-8

9-10

9-11

#### Performing a Manual Switchover

9-12

#### Performing a Software Upgrade

9-13

#### Manipulating Bootflash on the Redundant Supervisor Engine

9-14

---

### Chapter 10: Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 7-E and Supervisor Engine 7L-E

9-1

#### About Supervisor Engine Redundancy

10-2

- Overview
- RPR Operation
- SSO Operation

10-3

#### About Supervisor Engine Redundancy Synchronization

10-5

- RPR Supervisor Engine Configuration Synchronization
- SSO Supervisor Engine Configuration Synchronization

10-5

#### Supervisor Engine Redundancy Guidelines and Restrictions

10-5

#### Configuring Supervisor Engine Redundancy

10-7

- Configuring Redundancy
- Virtual Console for Standby Supervisor Engine
- Synchronizing the Supervisor Engine Configurations

10-7

10-9

10-10

#### Performing a Manual Switchover

10-12

#### Performing a Software Upgrade

10-12

#### Manipulating Bootflash on the Standby Supervisor Engine

10-14
CHAPTER 11

Configuring Cisco NSF with SSO Supervisor Engine Redundancy

About NSF with SSO Supervisor Engine Redundancy 11-1
About Cisco IOS NSF-Aware and NSF-Capable Support 11-2
NSF with SSO Supervisor Engine Redundancy Overview 11-3
SSO Operation 11-4
NSF Operation 11-4
Cisco Express Forwarding 11-5
Routing Protocols 11-5
  BGP Operation 11-5
  OSPF Operation 11-6
  IS-IS Operation 11-7
  EIGRP Operation 11-8
NSF Guidelines and Restrictions 11-9
Configuring NSF with SSO Supervisor Engine Redundancy 11-9
  Configuring SSO 11-10
  Configuring CEF NSF 11-10
  Verifying CEF NSF 11-11
  Configuring BGP NSF 11-11
  Verifying BGP NSF 11-11
  Configuring OSPF NSF 11-12
  Verifying OSPF NSF 11-13
  Configuring IS-IS NSF 11-13
  Verifying IS-IS NSF 11-14
  Configuring EIGRP NSF 11-16
  Verifying EIGRP NSF 11-16
Cisco High Availability Features in Cisco IOS XE 3.1.0SG 11-17

CHAPTER 12

Environmental Monitoring and Power Management

About Environmental Monitoring 12-1
  Using CLI Commands to Monitor your Environment 12-2
  Displaying Environment Conditions 12-2
  Emergency Actions 12-4
  System Alarms 12-5
Power Management 12-6
  Power Management for the Catalyst 4500 Series Switches 12-7
    Supported Power Supplies 12-7
    Power Management Modes for the Catalyst 4500 Switch 12-8
    Selecting a Power Management Mode 12-9
    Power Management Limitations in Catalyst 4500 Series Switches 12-9

| Chapter 14 | Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant | 14-1 |
| About Network Assistant | 14-2 |
| Community Overview | 14-2 |
| Clustering Overview | 14-2 |
| Network Assistant-Related Parameters and Their Defaults | 14-3 |
| Network Assistant CLI Commands | 14-3 |
| Configuring Your Switch for Network Assistant | 14-4 |
| (Minimum) Required Configuration | 14-4 |

Available Power for Catalyst 4500 Series Switches Power Supplies | 12-13 |
Special Considerations for the 4200 W AC and 6000 W AC Power Supplies | 12-14 |
Combined Mode Power Resiliency | 12-16 |
Special Considerations for the 1400 W DC Power Supply | 12-18 |
Special Considerations for the 1400 W DC SP Triple Input Power Supply | 12-19 |
Powering Down a Module | 12-19 |
Power Management for the Catalyst 4948 Switches | 12-20 |
Power Management Modes for the Catalyst 4948 Switches | 12-20 |
IEEE 802.3az Energy Efficient Ethernet | 12-20 |
Determining EEE Capability | 12-21 |
Enabling EEE | 12-21 |
Determining EEE Status | 12-22 |
(Additional) Configuration Required to Use Community  14-5
(Additional) Configuration Required to Use Clustering  14-5
Managing a Network Using Community  14-6
  Candidate and Member Requirements  14-7
  Automatic Discovery of Candidates and Members  14-7
Community Names  14-8
Hostnames  14-8
Passwords  14-8
Communication Protocols  14-8
Access Modes in Network Assistant  14-9
Community Information  14-9
Adding Devices  14-9
Converting a Cluster into a Community  14-10
Managing a Network Using Cluster  14-11
  Understanding Switch Clusters  14-11
    Cluster Command Switch Requirements  14-11
    Network Assistant and VTY  14-12
    Candidate Switch and Cluster Member Switch Requirements  14-12
  Using the CLI to Manage Switch Clusters  14-13
Configuring Network Assistant in Community or Cluster Mode  14-13
  Configuring Network Assistant on a Networked Switch in Community Mode  14-13
  Configuring Network Assistant in a Networked Switch in Cluster Mode  14-17

CHAPTER 15 Configuring VLANs, VTP, and VMPS  15-1
VLANs  15-1
  About VLANs  15-1
  VLAN Configuration Guidelines and Restrictions  15-3
    VLAN Ranges  15-3
    Configurable Normal-Range VLAN Parameters  15-4
  VLAN Default Configuration  15-4
Configuring VLANs  15-5
  Configuring VLANs in Global Configuration Mode  15-6
  Assigning a Layer 2 LAN Interface to a VLAN  15-7
VLAN Trunking Protocol  15-7
  About VTP  15-8
    Understanding the VTP Domain  15-8
    Understanding VTP Modes  15-9
    Understanding VTP Advertisements  15-9
    Understanding VTP Versions  15-9
Understanding VTP Pruning 15-11
VTP Configuration Guidelines and Restrictions 15-12
VTP Default Configuration 15-13
Configuring VTP 15-14
   Configuring VTP Global Parameters 15-14
   Configuring the VTP Mode 15-16
   Starting a Takeover 15-19
   Displaying VTP Statistics 15-19
   Displaying VTP Devices in a Domain 15-20
VLAN Membership Policy Server 15-20
   About VMPS 15-21
      Understanding the VMPS Server 15-21
      Security Modes for VMPS Server 15-22
      Fallback VLAN 15-23
      Illegal VMPS Client Requests 15-23
   Overview of VMPS Clients 15-23
      Understanding Dynamic VLAN Membership 15-23
      Default VMPS Client Configuration 15-24
      Configuring a Switch as a VMPS Client 15-24
      Administering and Monitoring the VMPS 15-28
      Troubleshooting Dynamic Port VLAN Membership 15-29
      Dynamic Port VLAN Membership Configuration Example 15-29
      VMPS Database Configuration File Example 15-32

CHAPTER 16
   Configuring IP Unnumbered Interface 16-1
      About IP Unnumbered Interface Support 16-1
         IP Unnumbered Interface Support with DHCP Server and Relay Agent 16-2
         DHCP Option 82 16-2
         IP Unnumbered Interface with Connected Host Polling 16-3
      IP Unnumbered Configuration Guidelines and Restrictions 16-3
      Configuring IP Unnumbered Interface Support with DHCP Server 16-4
         Configuring IP Unnumbered Interface Support on LAN and VLAN Interfaces 16-4
         Configuring IP Unnumbered Interface Support on a Range of Ethernet VLANs 16-5
      Configuring IP Unnumbered Interface Support with Connected Host Polling 16-6
      Displaying IP Unnumbered Interface Settings 16-7
      Troubleshooting IP Unnumbered Interface 16-8
      Related Documents 16-8
CHAPTER 17  Configuring Layer 2 Ethernet Interfaces  17-1
  About Layer 2 Ethernet Switching  17-1
  Layer 2 Ethernet Switching  17-2
    Switching Frames Between Segments  17-2
    Building the MAC Address Table  17-2
  VLAN Trunks  17-3
  Layer 2 Interface Modes  17-3
Configuring Ethernet Interfaces for Layer 2 Switching  17-5
  Configuring an Ethernet Interface as a Layer 2 Trunk  17-5
  Configuring an Interface as a Layer 2 Access Port  17-7
Clearing Layer 2 Configuration  17-8

CHAPTER 18  Configuring SmartPort Macros  18-1
  About SmartPort Macros and Static SmartPort  18-1
  Configuring SmartPort Macros  18-2
    Passing Parameters Through the Macro  18-3
      Macro Parameter Help  18-3
    Default SmartPort Macro Configuration  18-4
      cisco-global  18-4
      cisco-desktop  18-4
      cisco-phone  18-5
      cisco-router  18-5
      cisco-switch  18-5
  SmartPort Macro Configuration Guidelines  18-6
  Creating SmartPort Macros  18-8
  Applying SmartPort Macros  18-9
    cisco-global  18-10
    cisco-desktop  18-11
    cisco-phone  18-11
    cisco-switch  18-12
    cisco-router  18-13
  Displaying SmartPort Macros  18-14
  Configuring Static SmartPort Macros  18-14
    Default Static SmartPort Configuration  18-14
    Static SmartPort Configuration Guidelines  18-15
    Applying Static SmartPort Macros  18-15
CHAPTER 19  Configuring Cisco IOS Auto Smartport Macros  19-1

   About Auto Smartport Macros  19-1
       Device Classifier  19-2
       Device Visibility Mode  19-3

   Configuring Auto Smartport Macros  19-3
       Enabling Auto Smartport Macros  19-3
       Auto Smartport Default Configuration  19-4
       Auto Smartport Configuration Guidelines  19-5

   Configuring Auto Smartport Built-in Macro Parameters  19-6

   Configuring User-Defined Event Triggers  19-8
       802.1X-Based Event Trigger  19-8
       MAC Address-Based Event Trigger  19-9

   Configuring Mapping Between User-Defined Triggers and Built-in Macros  19-9

   Configuring Auto Smartport User-Defined Macros  19-10

   Displaying Auto Smartport  19-13

CHAPTER 20  Configuring STP and MST  20-1

   About STP  20-1
       Understanding the Bridge ID  20-2
       Bridge Priority Value  20-2
       Extended System ID  20-3
       STP MAC Address Allocation  20-3

   Bridge Protocol Data Units  20-3
   Election of the Root Bridge  20-4
   STP Timers  20-4
   Creating the STP Topology  20-5
   STP Port States  20-5
   MAC Address Allocation  20-6
   STP and IEEE 802.1Q Trunks  20-6
   Per-VLAN Rapid Spanning Tree  20-6

   Default STP Configuration  20-7

   Configuring STP  20-7
       Enabling STP  20-8
       Enabling the Extended System ID  20-9
       Configuring the Root Bridge  20-10
       Configuring a Secondary Root Switch  20-12
       Configuring STP Port Priority  20-13
       Configuring STP Port Cost  20-15
       Configuring the Bridge Priority of a VLAN  20-17
Configuring the Hello Time 20-17
Configuring the Maximum Aging Time for a VLAN 20-18
Configuring the Forward-Delay Time for a VLAN 20-19
Disabling Spanning Tree Protocol 20-20
Enabling Per-VLAN Rapid Spanning Tree 20-20
  Specifying the Link Type 20-21
  Restarting Protocol Migration 20-21

About MST 20-22
  IEEE 802.1s MST 20-22
  IEEE 802.1w RSTP 20-23
    RSTP Port Roles 20-24
    RSTP Port States 20-24
  MST-to-SST Interoperability 20-24
  Common Spanning Tree 20-25
  MST Instances 20-26
  MST Configuration Parameters 20-26
  MST Regions 20-26
    MST Region Overview 20-26
    Boundary Ports 20-27
    IST Master 20-27
    Edge Ports 20-27
    Link Type 20-28
  Message Age and Hop Count 20-28
  MST-to-PVST+ Interoperability 20-28

MST Configuration Restrictions and Guidelines 20-29

Configuring MST 20-29
  Enabling MST 20-29
  Configuring MST Instance Parameters 20-31
  Configuring MST Instance Port Parameters 20-32
  Restarting Protocol Migration 20-33
  Displaying MST Configurations 20-33

CHAPTER 21 Configuring Flex Links and MAC Address-Table Move Update 21-1

About Flex Links 21-1
  Flex Links 21-2
  VLAN Flex Links Load Balancing and Support 21-2
  Flex Links Failover Actions 21-3
  MAC Address-Table Move Update 21-4
  Configuring Flex Links 21-5
Default Configuration 21-5
Configuration Guidelines 21-6
Configuring Flex Links 21-6
Configuring VLAN Load Balancing on Flex Links 21-8
Configuring MAC Address-Table Move Update 21-10
  Default Configuration 21-10
  Configuration Guidelines 21-10
  Configuring the MAC Address-Table Move Update Feature 21-10
    Configuring a Switch to Send MAC Address-Table Move Updates 21-10
    Configuring a Switch to Receive MAC Address-Table Move Updates 21-12
Monitoring Flex Links and the MAC Address-Table Move Update 21-12

CHAPTER 22
Configuring Resilient Ethernet Protocol 22-1
  About REP 22-1
    Link Integrity 22-4
    Fast Convergence 22-4
    VLAN Load Balancing 22-4
    Spanning Tree Interaction 22-6
    REP Ports 22-6
  Configuring REP 22-7
    Default REP Configuration 22-7
    REP Configuration Guidelines 22-7
    Configuring the REP Administrative VLAN 22-8
    Configuring REP Interfaces 22-9
    Configuring SNMP Traps for REP 22-14
  Monitoring REP 22-14

CHAPTER 23
Configuring Optional STP Features 23-1
  About Root Guard 23-2
  Enabling Root Guard 23-2
  About Loop Guard 23-3
  Enabling Loop Guard 23-4
  About EtherChannel Guard 23-6
  Enabling EtherChannel Guard (Optional) 23-6
  About PortFast 23-6
  Enabling PortFast 23-7
About BPDU Guard 23-8
Enabling BPDU Guard 23-8
About PortFast BPDU Filtering 23-9
Enabling PortFast BPDU Filtering 23-9
About UplinkFast 23-11
Enabling UplinkFast 23-12
About BackboneFast 23-13
Enabling BackboneFast 23-15

CHAPTER 24
Configuring EtherChannel and Link State Tracking 24-1
About EtherChannel 24-2
  Port Channel Interfaces 24-2
  Configuring EtherChannels 24-3
    EtherChannel Configuration Overview 24-3
    Manual EtherChannel Configuration 24-3
    PAgP EtherChannel Configuration 24-3
    IEEE 802.3ad LACP EtherChannel Configuration 24-4
  Load Balancing 24-5
Configuring EtherChannel Configuration Guidelines and Restrictions 24-5
Configuring EtherChannel 24-6
  Configuring Layer 3 EtherChannels 24-6
    Creating Port Channel Logical Interfaces 24-7
    Configuring Physical Interfaces as Layer 3 EtherChannels 24-7
  Configuring Layer 2 EtherChannels 24-10
  Configuring LACP Standalone or Independent Mode 24-12
  Configuring the LACP System Priority and System ID 24-13
  Configuring EtherChannel Load Balancing 24-14
  Removing an Interface from an EtherChannel 24-15
  Removing an EtherChannel 24-15
  Displaying EtherChannel to a Virtual Switch System 24-16
    Understanding VSS Client 24-16
    Virtual Switch System 24-16
    Dual-Active Scenarios 24-16
    Dual-Active Detection Using Enhanced PAgP 24-16
    Displaying EtherChannel Links to VSS 24-18
  Understanding Link-State Tracking 24-18
  Configuring Link-State Tracking 24-21
    Default Link-State Tracking Configuration 24-21
Contents

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

Link-State Tracking Configuration Guidelines 24-21
Configuring Link-State Tracking 24-21
Displaying Link-State Tracking Status 24-22

CHAPTER 25
Configuring IGMP Snooping and Filtering 25-1

About IGMP Snooping 25-1
Immediate-Leave Processing 25-3
IGMP Configurable-Leave Timer 25-4
IGMP Snooping Querier 25-4
Explicit Host Tracking 25-4

Configuring IGMP Snooping 25-5
Default IGMP Snooping Configuration 25-5
Enabling IGMP Snooping Globally 25-6
Enabling IGMP Snooping on a VLAN 25-6
Configuring Learning Methods 25-7
Configuring PIM/DVMRP Learning 25-7
Configuring CGMP Learning 25-7
Configuring a Static Connection to a Multicast Router 25-8
Enabling IGMP Immediate-Leave Processing 25-8
Configuring the IGMP Leave Timer 25-9
Configuring IGMP Snooping Querier 25-10
Configuring Explicit Host Tracking 25-11
Configuring a Host Statically 25-11
Suppressing Multicast Flooding 25-12
IGMP Snooping Interface Configuration 25-12
IGMP Snooping Switch Configuration 25-13

Displaying IGMP Snooping Information 25-14
Displaying Querier Information 25-15
Displaying IGMP Host Membership Information 25-15
Displaying Group Information 25-16
Displaying Multicast Router Interfaces 25-17
Displaying MAC Address Multicast Entries 25-18
Displaying IGMP Snooping Information on a VLAN Interface 25-18
Displaying IGMP Snooping Querier Information 25-19

Configuring IGMP Filtering 25-20
Default IGMP Filtering Configuration 25-20
Configuring IGMP Profiles 25-21
Applying IGMP Profiles 25-22
Setting the Maximum Number of IGMP Groups 25-23
CHAPTER 26  Configuring IPv6 MLD Snooping 26-1

About MLD Snooping 26-1
MLD Messages 26-2
MLD Queries 26-3
Multicast Client Aging 26-3
Multicast Router Discovery 26-3
MLD Reports 26-4
MLD Done Messages and Immediate-Leave 26-4
Topology Change Notification Processing 26-4

Configuring IPv6 MLD Snooping 26-5
Default MLD Snooping Configuration 26-5
MLD Snooping Configuration Guidelines 26-6
Enabling or Disabling MLD Snooping 26-6
Configuring a Static Multicast Group 26-7
Configuring a Multicast Router Port 26-7
Enabling MLD Immediate Leave 26-8
Configuring MLD Snooping Queries 26-9
Disabling MLD Listener Message Suppression 26-10
Displaying MLD Snooping Information 26-10

CHAPTER 27  Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling 27-1

About 802.1Q Tunneling 27-2
Configuring 802.1Q Tunneling 27-3
802.1Q Tunneling Configuration Guidelines 27-3
Native VLANs 27-4
System MTU 27-5
802.1Q Tunneling and Other Features 27-5
Configuring an 802.1Q Tunneling Port 27-6

About VLAN Mapping 27-7
Deployment Example 27-7
Mapping Customer VLANs to Service-Provider VLANs 27-9

Configuring VLAN Mapping 27-9
Default VLAN Mapping Configuration 27-9
VLAN Mapping Configuration Guidelines 27-10
Configuring VLAN Mapping 27-11
One-to-One Mapping 27-11
Traditional Q-in-Q on a Trunk Port 27-12
## Chapter 33: Configuring Cisco Express Forwarding

### About CEF
- 33-1

- **CEF Features** 33-2
  - Forwarding Information Base 33-2
  - Adjacency Tables 33-2
    - Adjacency Discovery 33-2
    - Adjacency Resolution 33-3
    - Adjacency Types That Require Special Handling 33-3
    - Unresolved Adjacency 33-3

- **Catalyst 4500 Series Switch Implementation of CEF** 33-3

- **Hardware and Software Switching** 33-4
  - Hardware Switching 33-5
  - Software Switching 33-5

- **Load Balancing** 33-6

- **Software Interfaces** 33-6

- **CEF Configuration Restrictions** 33-6

### Configuring CEF
- 33-6

- **Enabling CEF** 33-6

- **Configuring Load Balancing for CEF** 33-7
  - Configuring Per-Destination Load Balancing 33-7
  - Configuring Load Sharing Hash Function 33-7

- **Viewing CEF Information** 33-8

### Monitoring and Maintaining CEF
- 33-8

### Displaying IP Statistics
- 33-8

## Chapter 34: Configuring Unicast Reverse Path Forwarding

### About Unicast Reverse Path Forwarding
- 34-1

### How Unicast RPF Works
- 34-2

### Implementing Unicast RPF
- 34-4

- **Security Policy and Unicast RPF** 34-5

- **Where to Use Unicast RPF** 34-5

- **Routing Table Requirements** 34-7

- **Where Not to Use Unicast RPF** 34-7

- **Unicast RPF with BOOTP and DHCP** 34-8

### Restrictions
- 34-8
Limitation 34-8
Related Features and Technologies 34-8
Prerequisites to Configuring Unicast RPF 34-9
Unicast RPF Configuration Tasks 34-9
Configuring Unicast RPF 34-9
Verifying Unicast RPF 34-10
Monitoring and Maintaining Unicast RPF 34-11
Unicast RPF Configuration Example: Inbound and Outbound Filters 34-12

CHAPTER 35
Configuring IP Multicast 35-1

About IP Multicast 35-1
IP Multicast Protocols 35-2
Internet Group Management Protocol 35-3
Protocol-Independent Multicast 35-3
Rendezvous Point (RP) 35-4
IGMP Snooping 35-4
IP Multicast Implementation on the Catalyst 4500 Series Switch 35-4
CEF, M FIB, and Layer 2 Forwarding 35-5
IP Multicast Tables 35-7
Hardware and Software Forwarding 35-8
Non-Reverse Path Forwarding Traffic 35-10
Multicast Fast Drop 35-10
Multicast Forwarding Information Base 35-11
S/M, 224/4 35-12
Restrictions on Using Bidirectional PIM 35-12
Configuring IP Multicast Routing 35-12
Default Configuration in IP Multicast Routing 35-13
Enabling IP Multicast Routing 35-13
Enabling PIM on an Interface 35-14
Enabling Dense Mode 35-14
Enabling Sparse Mode 35-14
Enabling Sparse-Dense Mode 35-14
Enabling Bidirectional Mode 35-15
Enabling PIM-SSM Mapping 35-16
Configuring a Rendezvous Point 35-16
Configuring Auto-RP 35-17
Configuring a Single Static RP 35-20
Load Splitting of IP Multicast Traffic 35-21
Monitoring and Maintaining IP Multicast Routing 35-22
Hardware Support for BFD  37-7
How to Configure Bidirectional Forwarding Detection  37-7
   Configuring BFD Session Parameters on the Interface  37-8
   Configuring BFD Support for Dynamic Routing Protocols  37-8
      Configuring BFD Support for BGP  37-8
      Configuring BFD Support for EIGRP  37-9
      Configuring BFD Support for OSPF  37-10
   Configuring BFD Support for Static Routing  37-13
   Configuring BFD Echo Mode  37-14
      Prerequisites  37-15
      Restrictions  37-15
      Configuring the BFD Slow Timer  37-15
      Disabling BFD Echo Mode Without Asymmetry  37-16
Monitoring and Troubleshooting BFD  37-16
Configuration Examples for Bidirectional Forwarding Detection  37-17
   Example: Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default  37-17
   Example: Configuring BFD in an OSPF Network  37-21
   Example: Configuring BFD Hardware-Offload support in a BGP Network Network  37-25
   Example: Configuring BFD Support for Static Routing  37-27
Additional References  37-28
Related Documents  37-28
Standards  37-28
MIBs  37-29
RFCs  37-29
Technical Assistance  37-29

CHAPTER 38
Configuring Policy-Based Routing  38-1
About Policy-Based Routing  38-1
   About PBR  38-2
      Understanding Route-Maps  38-2
      Using Policy-Based Routing  38-5
Policy-Based Routing Configuration Tasks  38-5
   Enabling PBR  38-6
   Enabling Local PBR  38-7
   Unsupported Commands  38-7
Policy-Based Routing Configuration Examples  38-8
   Equal Access  38-8
   Differing Next Hops  38-8
   Deny ACE  38-9
CHAPTER 39  Configuring VRF-lite  39-1
   About VRF-lite  39-2
   Default VRF-lite Configuration  39-3
   VRF-lite Configuration Guidelines  39-4
   Configuring VRFs  39-5
   Configuring VRF-Aware Services  39-5
      Configuring the User Interface for ARP  39-6
      Configuring the User Interface for PING  39-6
      Configuring the User Interface for SNMP  39-7
      Configuring the User Interface for uRPF  39-7
      Configuring the User Interface for Syslog  39-8
      Configuring the User Interface for Traceroute  39-8
      Configuring the User Interface for FTP and TFTP  39-8
      Configuring the User Interface for Telnet and SSH  39-9
      Configuring the User Interface for NTP  39-9
   Configuring Per-VRF for TACACS+ Servers  39-9
   Configuring Multicast VRFs  39-11
   Configuring a VPN Routing Session  39-12
   Configuring BGP PE to CE Routing Sessions  39-12
   VRF-lite Configuration Example  39-13
      Configuring Switch S8  39-14
      Configuring Switch S20  39-16
      Configuring Switch S11  39-16
      Configuring the PE Switch S3  39-16
   Displaying VRF-lite Status  39-17

CHAPTER 40  Configuring Quality of Service  40-1
   Overview of QoS  40-1
      Prioritization  40-2
   QoS Terminology  40-3
   Basic QoS Model  40-5
   Classification  40-6
      Classification Based on QoS ACLs  40-6
      Classification Based on Class Maps and Policy Maps  40-7
   Policing and Marking  40-8
   Queueing and Scheduling  40-8
      Active Queue Management  40-9
      Sharing Link Bandwidth Among Transmit Queues  40-9
Examples 40-41
Configuration Guidelines 40-43
Configuring CoS Mutation 40-44
Configuring System Queue Limit 40-45
Configuring Auto-QoS 40-46

CHAPTER 41
Configuring Voice Interfaces 41-1
About Voice Interfaces 41-1
Cisco IP Phone Voice Traffic 41-2
Cisco IP Phone Data Traffic 41-2
Configuring a Port to Connect to a Cisco 7960 IP Phone 41-3
Configuring Voice Ports for Voice and Data Traffic 41-3
Overriding the CoS Priority of Incoming Frames 41-5
Configuring Power 41-5

CHAPTER 42
Configuring Private VLANs 42-1
About Private VLANs 42-1
Purpose of a PVLAN 42-2
PVLAN Terminology 42-3
PVLANs across Multiple Switches 42-5
Standard Trunk Ports 42-5
Isolated PVLAN Trunk Ports 42-6
Promiscuous PVLAN Trunk Ports 42-7
PVLAN Modes Over Gigabit Etherchannel 42-8
Private-VLAN Interaction with Other Features 42-8
PVLANs and VLAN ACL/QoS 42-8
PVLANs and Unicast, Broadcast, and Multicast Traffic 42-9
PVLANs and SVIs 42-10
Per-Virtual Port Error-Disable on PVLANs 42-10
PVLAN Commands 42-10
Configuring PVLANs 42-11
Basic PVLAN Configuration Procedure 42-12
Default Private-VLAN Configuration 42-12
PVLAN Configuration Guidelines and Restrictions 42-12
Configuring a VLAN as a PVLAN 42-15
Associating a Secondary VLAN with a Primary VLAN 42-16
Configuring a Layer 2 Interface as a PVLAN Promiscuous Port 42-17
Configuring a Layer 2 Interface as a PVLAN Host Port 42-18
Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port 42-19
Configuring a Layer 2 Interface as a Promiscuous PVLAN Trunk Port 42-21
Permitting Routing of Secondary VLAN Ingress Traffic 42-23
Configuring PVLAN over EtherChannel 42-24
  Configuring a Layer 2 EtherChannel 42-24
  Configuring a Layer 2 Etherchannel as a PVLAN Promiscuous Port 42-24
  Configuring a Layer 2 EtherChannel as a PVLAN Host Port 42-26
  Configuring a Layer 2 Etherchannel as an Isolated PVLAN Trunk Port 42-27
  Configuring a Layer 2 Etherchannel as a Promiscuous PVLAN Trunk Port 42-28

CHAPTER 43
Configuring MACsec Encryption 43-1
Understanding Media Access Control Security and MACsec Key Agreement 43-2
  MKA Policies 43-3
  Virtual Ports 43-3
  MACsec 43-3
  MACsec, MKA, and 802.1X Host Modes 43-4
    Single-Host Mode 43-4
    Multiple-Host Mode 43-4
    MKA Statistics 43-5
Configuring MACsec and MKA 43-6
  Default MACsec MKA Configuration 43-6
  Configuring an MKA Policy 43-6
  Configuring MACsec on an Interface 43-7
Understanding Cisco TrustSec MACsec 43-8
Configuring Cisco TrustSec MACsec 43-10
  Configuring Cisco TrustSec Credentials on the Switch 43-10
  Configuring Cisco TrustSec Switch-to-Switch Link Security in 802.1X Mode 43-11
  Configuring Cisco TrustSec Switch-to-Switch Link Security in Manual Mode 43-12
Cisco TrustSec Switch-to-Switch Link Security Configuration Example 43-13

CHAPTER 44
Configuring 802.1X Port-Based Authentication 44-1
About 802.1X Port-Based Authentication 44-1
  Device Roles 44-2
  802.1X and Network Access Control 44-3
  Authentication Initiation and Message Exchange 44-4
  Ports in Authorized and Unauthorized States 44-5
  802.1X Host Mode 44-6
    Single-Host Mode 44-7

  DHCP and IP Source Guard  47-31
  802.1X Authentication  47-32
Configuring Port Security in a Wireless Environment  47-32
Port Security Configuration Guidelines and Restrictions  47-33

CHAPTER 48
Configuring Control Plane Policing and Layer 2 Control Packet QoS  48-1

Configuring Control Plane Policing  48-1
  About Control Plane Policing  48-2
  General Guidelines for Control Plane Policing  48-3
  Default Configuration  48-4
Configuring CoPP for Control Plane Traffic  48-4
Configuring CoPP for Data Plane and Management Plane Traffic  48-5
Control Plane Policing Configuration Guidelines and Restrictions  48-8
  All supervisor engines  48-8
  Do not apply to Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E  48-8
Monitoring CoPP  48-9

Configuring Layer 2 Control Packet QoS  48-11
  Understanding Layer 2 Control Packet QoS  48-11
  Default Configuration  48-11
  Enabling Layer 2 Control Packet QoS  48-12
  Disabling Layer 2 Control Packet QoS  48-13
Layer 2 Control Packet QoS Configuration Examples  48-14
Layer 2 Control Packet QoS Guidelines and Restrictions  48-16
Policing IPv6 Control Traffic  48-16
CHAPTER 49 Configuring Dynamic ARP Inspection

About Dynamic ARP Inspection 49-1
ARP Cache Poisoning 49-2
Purpose of Dynamic ARP Inspection 49-2
Interface Trust State, Security Coverage and Network Configuration 49-3
Relative Priority of Static Bindings and DHCP Snooping Entries 49-4
Logging of Dropped Packets 49-4
Rate Limiting of ARP Packets 49-4
Port Channels Function 49-5

Configuring Dynamic ARP Inspection 49-5
Configuring Dynamic ARP Inspection in DHCP Environments 49-5
DAI Configuration Example 49-7
Switch A 49-7
Switch B 49-9
Configuring ARP ACLs for Non-DHCP Environments 49-11
Configuring the Log Buffer 49-14
Limiting the Rate of Incoming ARP Packets 49-16
Performing Validation Checks 49-19

CHAPTER 50 Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

About DHCP Snooping 50-1
Trusted and Untrusted Sources 50-2
About the DHCP Snooping Database Agent 50-2
Option 82 Data Insertion 50-4

Configuring DHCP Snooping 50-6
Default Configuration for DHCP Snooping 50-7
Enabling DHCP Snooping 50-7
Enabling DHCP Snooping on the Aggregation Switch 50-9
Enabling DHCP Snooping and Option 82 50-10
Enabling DHCP Snooping on Private VLAN 50-12
Configuring DHCP Snooping on Private VLAN 50-12
Configuring DHCP Snooping with an Ethernet Channel Group 50-12
Enabling the DHCP Snooping Database Agent 50-13
Limiting the Rate of Incoming DHCP Packets 50-13
Configuration Examples for the Database Agent 50-15
Example 1: Enabling the Database Agent 50-15
Example 2: Reading Binding Entries from a TFTP File 50-17
Example 3: Adding Information to the DHCP Snooping Database 50-18

Displaying DHCP Snooping Information 50-18
Contents

Displaying a Binding Table 50-19
Displaying the DHCP Snooping Configuration 50-19

About IP Source Guard 50-19
Configuring IP Source Guard 50-20
  Configuring IP Source Guard on Private VLANs 50-22
Displaying IP Source Guard Information 50-22
Displaying IP Source Binding Information 50-23
Configuring IP Source Guard for Static Hosts 50-24
  About IP Source Guard for Static Hosts 50-24
  Configuring IPSG for Static Hosts on a Layer 2 Access Port 50-25
  Configuring IPSG for Static Hosts on a PVLAN Host Port 50-28

CHAPTER 51
Configuring Network Security with ACLs 51-1
  About ACLs 51-2
    Overview 51-2
    Supported Features That Use ACLs 51-3
    Router ACLs 51-3
    Port ACLs 51-4
    Dynamic ACLs 51-5
    VLAN Maps 51-5
  Hardware and Software ACL Support 51-6
  Troubleshooting High CPU Due to ACLs 51-6
  Selecting Mode of Capturing Control Packets 51-7
    Guidelines and Restrictions 51-8
    Selecting Control Packet Capture 51-8
  TCAM Programming and ACLs 51-10
  Layer 4 Operators in ACLs 51-10
    Restrictions for Layer 4 Operations 51-10
    Configuration Guidelines for Layer 4 Operations 51-11
    How ACL Processing Impacts CPU 51-12
  Configuring Unicast MAC Address Filtering 51-13
  Configuring Named MAC Extended ACLs 51-14
  Configuring EtherType Matching 51-15
  Configuring Named IPv6 ACLs 51-16
  Applying IPv6 ACLs to Layer 2 and 3 Interface 51-17
  Configuring VLAN Maps 51-17
    VLAN Map Configuration Guidelines 51-18
    Creating and Deleting VLAN Maps 51-19
Examples of ACLs and VLAN Maps 51-19
Applying a VLAN Map to a VLAN 51-21
Using VLAN Maps in Your Network 51-22
Denying Access to a Server on Another VLAN 51-23
Displaying VLAN Access Map Information 51-24
Using VLAN Maps with Router ACLs 51-25
Guidelines for Using Router ACLs and VLAN Maps on the Same VLAN 51-25
Examples of Router ACLs and VLAN Maps Applied to VLANs 51-25
ACLs and Switched Packets 51-25
ACLs and Routed Packets 51-26
Configuring PACLs 51-27
Creating a PACL 51-27
PACL Configuration Guidelines 51-28
Removing the Requirement for a Port ACL 51-28
Configuration Restrictions 51-29
Debugging Considerations 51-29
Webauth Fallback 51-29
Configuring IPv4, IPv6, and MAC ACLs on a Layer 2 Interface 51-29
Using PACL with Access-Group Mode 51-30
Configuring Access-group Mode on Layer 2 Interface 51-31
Applying ACLs to a Layer 2 Interface 51-31
Displaying an ACL Configuration on a Layer 2 Interface 51-32
Using PACL with VLAN Maps and Router ACLs 51-32
Configuring RA Guard 51-35
Introduction 51-35
Deployment 51-36
Configuring RA Guard 51-36
Examples 51-37
Usage Guidelines 51-38

CHAPTER 52
Support for IPv6 52-1
Finding Feature Information 52-1
About IPv6 52-1
IPv6 Addressing and Basic Connectivity 52-2
DHCP 52-3
Security 52-3
QoS 52-3
Management 52-4
Multicast 52-4
Contents

Static Routes  52-5
First-Hop Redundancy Protocols  52-5
Unicast Routing  52-5

   RIP  52-5
   OSPF  52-6
   EIGRP  52-6
   IS-IS  52-6
   Multiprotocol BGP  52-6
Tunneling  52-7
IPv6 Default States  52-7

CHAPTER 53
Port Unicast and Multicast Flood Blocking  53-1

   About Flood Blocking  53-1
   Configuring Port Blocking  53-1
      Blocking Flooded Traffic on an Interface  53-2
      Resuming Normal Forwarding on a Port  53-3

CHAPTER 54
Configuring Storm Control  54-1

   About Storm Control  54-1
      Hardware-Based Storm Control Implementation  54-2
      Software-Based Storm Control Implementation  54-2
   Enabling Broadcast Storm Control  54-3
   Enabling Multicast Storm Control  54-4
   Disabling Broadcast Storm Control  54-5
   Disabling Multicast Storm Control  54-5
   Displaying Storm Control  54-6

CHAPTER 55
Configuring SPAN and RSPAN  55-1

   About SPAN and RSPAN  55-1
      SPAN and RSPAN Concepts and Terminology  55-3
         SPAN Session  55-3
         Traffic Types  55-3
         Source Port  55-4
         Destination Port  55-5
         VLAN-Based SPAN  55-5
         SPAN Traffic  55-6
      SPAN and RSPAN Session Limits  55-6
   Default SPAN and RSPAN Configuration  55-6
Configuring SPAN  55-7
  SPAN Configuration Guidelines and Restrictions  55-7
  Configuring SPAN Sources  55-8
  Configuring SPAN Destinations  55-9
  Monitoring Source VLANs on a Trunk Interface  55-9
  Configuration Scenario  55-10
  Verifying a SPAN Configuration  55-10
CPU Port Sniffing  55-10
Encapsulation Configuration  55-12
Ingress Packets  55-12
Access List Filtering  55-13
  ACL Configuration Guidelines  55-13
  Configuring Access List Filtering  55-14
Packet Type Filtering  55-14
Configuration Example  55-15
Configuring RSPAN  55-16
  RSPAN Configuration Guidelines  55-16
  Creating an RSPAN Session  55-17
  Creating an RSPAN Destination Session  55-18
  Creating an RSPAN Destination Session and Enabling Ingress Traffic  55-19
  Removing Ports from an RSPAN Session  55-20
  Specifying VLANs to Monitor  55-21
  Specifying VLANs to Filter  55-23
  Displaying SPAN and RSPAN Status  55-24

Chapter 56

Configuring Wireshark  56-1
About Wireshark  56-1
Capture Points  56-2
  Attachment Points: Interfaces and traffic directions  56-2
Filters  56-3
    Core System Filter  56-3
    Capture Filter  56-3
    Display Filter  56-4
Actions  56-4
  Storing Captured Packets to Buffer in Memory  56-4
  Storing Captured Packets to a .pcap File  56-4
  Decoding and Displaying Packets  56-5
  Activating and Deactivating Wireshark Capture Points  56-6
Feature Interactions 56-6
Configuring Wireshark 56-7
  Default Wireshark Configuration 56-7
  Wireshark Configuration Guidelines 56-8
  Defining, Modifying, or Deleting a Capture Point Examples 56-8
  Activating and Deactivating a Capture Point 56-10
Guidelines and Restrictions 56-10
Best Practices 56-11
Notes Specific to the Wireshark CLI 56-12
Monitoring Wireshark 56-13
  Configuration Examples for Wireshark 56-13
    Displaying a Brief Output from a .pcap File 56-13
    Displaying Detailed Output from a .pcap File 56-14
    Displaying a Hexadecimal Dump Output from a .pcap File 56-16
    Displaying Packets from a .pcap File with a Display Filter 56-17
Usage Examples for Wireshark 56-17
  Example 1: Simple Capture and Display 56-17
  Example 2: Simple Capture and Store 56-18
  Example 3: Using Buffer Capture 56-19
  Example 4: Capture Sessions 56-23

CHAPTER 57 Configuring Enhanced Object Tracking 57-1
Understanding Enhanced Object Tracking 57-1
Configuring Enhanced Object Tracking Features 57-2
  Default Configuration 57-2
  Tracking Interface Line-Protocol or IP Routing State 57-2
  Configuring a Tracked List 57-3
    Configuring a Tracked List with a Boolean Expression 57-4
    Configuring a Tracked List with a Weight Threshold 57-5
    Configuring a Tracked List with a Percentage Threshold 57-6
  Configuring HSRP Object Tracking 57-7
  Configuring Other Tracking Characteristics 57-8
  Configuring IP SLAs Object Tracking 57-8
  Configuring Static Routing Support 57-10
    Configuring a Primary Interface 57-10
    Configuring a Cisco IP SLAs Monitoring Agent and Track Object 57-11
    Configuring a Routing Policy and Default Route 57-11
  Monitoring Enhanced Object Tracking 57-12
SNMP Versions 60-2
SNMP Manager Functions 60-3
SNMP Agent Functions 60-4
SNMP Community Strings 60-4
Using SNMP to Access MIB Variables 60-4
SNMP Notifications 60-5
Configuring SNMP 60-5
  Default SNMP Configuration 60-5
  SNMP Configuration Guidelines 60-6
Disabling the SNMP Agent 60-7
Configuring Community Strings 60-7
Configuring SNMP Groups and Users 60-9
Configuring SNMP Notifications 60-11
Setting the Agent Contact and Location Information 60-14
Limiting TFTP Servers Used Through SNMP 60-15
SNMP Examples 60-15
Displaying SNMP Status 60-16

CHAPTER 61
Configuring NetFlow-lite 61-1
  About NetFlow Packet Sampling 61-2
Feature Interaction 61-2
  System-wide Restrictions 61-2
  Interface-level Restrictions 61-2
  Monitor-level Restrictions 61-2
Configuring NetFlow Packet Sampling 61-2
  Configuring Information about the External Collector 61-3
    Example 61-3
    Usage Guidelines 61-4
  Configuring Sampling Parameters 61-4
    Example 61-5
    Usage Guidelines 61-5
  Activating Sampling on an Interface or VLAN 61-5
    Examples 61-6
    Usage Guidelines 61-7
Display Commands 61-8
Clear Commands 61-9
CHAPTER 62
Configuring Flexible NetFlow 62-1

CHAPTER 63
Configuring Ethernet OAM and CFM 63-1

About Ethernet CFM 63-2
   Ethernet CFM and OAM Definitions 63-2
   CFM Domain 63-2
   Maintenance Associations and Maintenance Points 63-4
   CFM Messages 63-5
   Crosscheck Function and Static Remote MEPs 63-5
   SNMP Traps and Fault Alarms 63-5
   Configuration Error List 63-6
   IP SLAs Support for CFM 63-6

Configuring Ethernet CFM 63-6
   Ethernet CFM Default Configuration 63-7
   Ethernet CFM Configuration Guidelines 63-7
   Configuring the CFM Domain 63-8
   Configuring Ethernet CFM Crosscheck 63-11
   Configuring Static Remote MEP 63-13
   Configuring a Port MEP 63-14
   Configuring SNMP Traps 63-16
   Configuring Fault Alarms 63-16
   Configuring IP SLAs CFM Operation 63-18
      Manually Configuring an IP SLAs CFM Probe or Jitter Operation 63-19
      Configuring an IP SLAs Operation with Endpoint Discovery 63-21
   Configuring CFM on C-VLAN (Inner VLAN) 63-24
      Feature Support and Behavior 63-26
      Platform Restrictions and Limitations 63-26

Understanding CFM ITU-T Y.1731 Fault Management 63-27
   Y.1731 Terminology 63-27
   Alarm Indication Signals 63-28
   Ethernet Remote Defect Indication 63-28
   Multicast Ethernet Loopback 63-29
   Configuring Y.1731 Fault Management 63-29
      Default Y.1731 Configuration 63-29
      Configuring ETH-AIS 63-29
      Using Multicast Ethernet Loopback 63-31
   Managing and Displaying Ethernet CFM Information 63-31
   About Ethernet OAM Protocol 63-33
      OAM Features 63-34
Contents

OAM Messages 63-34
Enabling and Configuring Ethernet OAM 63-35
   Ethernet OAM Default Configuration 63-35
   Ethernet OAM Configuration Guidelines 63-35
   Enabling Ethernet OAM on an Interface 63-36
   Enabling Ethernet OAM Remote Loopback 63-37
   Configuring Ethernet OAM Link Monitoring 63-38
   Configuring Ethernet OAM Remote Failure Indications 63-42
   Configuring Ethernet OAM Templates 63-45
Displaying Ethernet OAM Protocol Information 63-49
Ethernet CFM and Ethernet OAM Interaction 63-51
   Configuring Ethernet OAM Interaction with CFM 63-51
   Configuring the OAM Manager 63-52
   Enabling Ethernet OAM 63-52
Example: Configuring Ethernet OAM and CFM 63-53

Chapter 64
Configuring Y.1731 (AIS and RDI) 64-1
   AIS and RDI Terminology 64-1
   About Y.1731 64-2
      Server MEP 64-2
      Alarm Indication Signal 64-2
      Ethernet Remote Defect Indication 64-3
   Configuring Y.1731 64-4
      Y.1731 Configuration Guidelines 64-4
      Configuring AIS Parameters 64-5
      Clearing MEP from the AIS Defect Condition 64-6
      Clearing SMEP from the AIS Defect Condition 64-6
   Displaying Y.1731 Information 64-6

Chapter 65
Configuring Call Home 65-1
   About Call Home 65-2
      Obtaining Smart Call Home 65-2
   Configuring Call Home 65-3
      Configuring Contact Information 65-4
      Configuring Destination Profiles 65-5
      Copying a Destination Profile 65-6
      Subscribing to Alert Groups 65-6
      Configuring Periodic Notification 65-8
Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

CHAPTER 66 Configuring Cisco IOS IP SLA Operations 66-1

Understanding Cisco IOS IP SLAs 66-2
Using Cisco IOS IP SLAs to Measure Network Performance 66-3
IP SLAs Responder and IP SLAs Control Protocol 66-4
Response Time Computation for IP SLAs 66-4
IP SLAs Operation Scheduling 66-5
IP SLAs Operation Threshold Monitoring 66-5
Configuring IP SLAs Operations 66-6
IP SLA Default Configuration 66-6
IP SLA Configuration Guidelines 66-6
Configuring the IP SLAs Responder 66-7
Analyzing IP Service Levels by Using the UDP Jitter Operation 66-8
Analyzing IP Service Levels by Using the ICMP Echo Operation 66-11
Monitoring IP SLAs Operations 66-13

CHAPTER 67 Configuring RMON 67-1

About RMON 67-1
Configuring RMON 67-3
Default RM ON Configuration 67-3
Configuring RM ON Alarms and Events 67-3
Configuring RM ON Collection on an Interface 67-5

Configuring Message Severity Threshold 65-8
Configuring Syslog Pattern Matching 65-9
Configuring General E-Mail Options 65-9
Enabling Call Home 65-10
Testing Call Home Communications 65-10
Sending a Call Home Test Message Manually 65-11
Sending a Call Home Alert Group Message Manually 65-11
Sending a Request for an Analysis and Report 65-12
Sending the Output of a Command 65-13
Configuring and Enabling Smart Call Home 65-13
Displaying Call Home Configuration Information 65-14
Call Home Default Settings 65-18
Alert Group Trigger Events and Commands 65-18
Message Contents 65-21
Syslog Alert Notification in Long-Text Format Example 65-25
Syslog Alert Notification in XML Format Example 65-28
CHAPTER 68
Performing Diagnostics 68-1
Configuring Online Diagnostics 68-1
  Configuring On-Demand Online Diagnostics 68-2
  Scheduling Online Diagnostics 68-2
Performing Diagnostics 68-3
  Starting and Stopping Online Diagnostic Tests 68-3
  Displaying Online Diagnostic Tests and Test Results 68-4
  Displaying Data Path Online Diagnostics Test Results 68-7
  Line Card Online Diagnostics 68-8
  Troubleshooting with Online Diagnostics 68-8
Power-On Self-Test Diagnostics 68-10
  Overview of Power-On Self-Test Diagnostics 68-10
POST Result Example 68-11
Power-On Self-Test Results 68-13
  Sample Display of the POST on an Active Supervisor Engine 68-13
  Sample Display of the POST on a Standby Supervisor Engine 68-16
Troubleshooting the Test Failures 68-20

CHAPTER 69
Configuring WCCP Version 2 Services 69-1
About W CCP 69-1
  Overview 69-2
  Hardware Acceleration 69-2
  Understanding W CCP Configuration 69-3
  W CCP Features 69-4
    HTTP and Non-HTTP Services Support 69-4
    Multiple Routers Support 69-4
    MD5 Security 69-5
    Web Content Packet Return 69-5
Restrictions for W CCP 69-5
Configuring W CCP 69-6
  Configuring a Service Group Using W CCP 69-6
    Specifying a Web Cache Service 69-8
  Using Access Lists for a W CCP Service Group 69-8
  Setting a Password for a Router and Cache Engines 69-9
Verifying and Monitoring W CCP Configuration Settings 69-9
W CCP Configuration Examples 69-10
  Performing a General W CCP Configuration Example 69-10
Preface

This preface describes who should read this document, how it is organized, and its conventions. The preface also tells you how to obtain Cisco documents, as well as how to obtain technical assistance.

Audience

This guide is for experienced network administrators who are responsible for configuring and maintaining Catalyst 4500 series switches.

Organization

This guide is organized into the following chapters:

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>Product Overview</td>
<td>Presents an overview of the Cisco IOS software for the Catalyst 4500 series switches.</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>Command-Line Interfaces</td>
<td>Describes how to use the CLI.</td>
</tr>
<tr>
<td>Chapter 3</td>
<td>Configuring the Switch for the First Time</td>
<td>Describes how to perform a baseline configuration of the switch.</td>
</tr>
<tr>
<td>Chapter 4</td>
<td>Administering the Switch</td>
<td>Describes how to administer the switch.</td>
</tr>
<tr>
<td>Chapter 5</td>
<td>Configuring the Cisco IOS In-Service Software Upgrade Process</td>
<td>Describes how to configure the IOS ISSU process on the switch.</td>
</tr>
<tr>
<td>Chapter 6</td>
<td>Configuring the Cisco IOS XE In Service Software Upgrade Process</td>
<td>Describes how to configure the IOS XE ISSU process on the switch.</td>
</tr>
<tr>
<td>Chapter 7</td>
<td>Configuring Interfaces</td>
<td>Describes how to configure non-layer-specific features on Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces.</td>
</tr>
<tr>
<td>Chapter 8</td>
<td>Checking Port Status and Connectivity</td>
<td>Describes how to check module and interface status.</td>
</tr>
<tr>
<td>Chapter</td>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Chapter 9</td>
<td>Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 6-E and Supervisor Engine 6L-E</td>
<td>Describes how to configure RPR and SSO on Supervisor Engines 6-E and 6L-E.</td>
</tr>
<tr>
<td>Chapter 10</td>
<td>Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 7-E and Supervisor Engine 7L-E</td>
<td>Describes how to configure RPR and SSO on Supervisor Engines 7-E and 7L-E.</td>
</tr>
<tr>
<td>Chapter 11</td>
<td>Configuring Cisco NSF with SSO Supervisor Engine Redundancy</td>
<td>Describes how to configure supervisor engine redundancy using Cisco nonstop forwarding (NSF) with stateful switchover (SSO).</td>
</tr>
<tr>
<td>Chapter 12</td>
<td>Environmental Monitoring and Power Management</td>
<td>Describes how to configure power management and environmental monitoring features.</td>
</tr>
<tr>
<td>Chapter 13</td>
<td>Configuring Power over Ethernet</td>
<td>Describes how to configure Power over Ethernet (PoE).</td>
</tr>
<tr>
<td>Chapter 14</td>
<td>Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant</td>
<td>Describes how to install and configure Network Assistant and Embedded CiscoView.</td>
</tr>
<tr>
<td>Chapter 15</td>
<td>Configuring VLANs, VTP, and VMPS</td>
<td>Describes how to configure VLANs, VTP, and VMPS.</td>
</tr>
<tr>
<td>Chapter 16</td>
<td>Configuring IP Unnumbered Interface</td>
<td>Describes how to configure IP Unnumbered support.</td>
</tr>
<tr>
<td>Chapter 17</td>
<td>Configuring Layer 2 Ethernet Interfaces</td>
<td>Describes how to configure interfaces to support Layer 2 features, including VLAN trunks.</td>
</tr>
<tr>
<td>Chapter 18</td>
<td>Configuring SmartPort Macros</td>
<td>Describes how to configure SmartPort macros.</td>
</tr>
<tr>
<td>Chapter 19</td>
<td>Configuring Cisco IOS Auto Smartport Macros</td>
<td>Describes how to configure Auto SmartPort Macros.</td>
</tr>
<tr>
<td>Chapter 20</td>
<td>Configuring STP and MST</td>
<td>Describes how to configure the Spanning Tree Protocol (STP) and the Multiple Spanning Tree (MST) protocol and explains how they work.</td>
</tr>
<tr>
<td>Chapter 21</td>
<td>Configuring Flex Links and MAC Address-Table Move Update</td>
<td>Describes how to configure Flex Links on a switch.</td>
</tr>
<tr>
<td>Chapter 22</td>
<td>Configuring Resilient Ethernet Protocol</td>
<td>Describes how to configure Resilient Ethernet Protocol (REP).</td>
</tr>
<tr>
<td>Chapter 23</td>
<td>Configuring Optional STP Features</td>
<td>Describes how to configure the spanning-tree PortFast, UplinkFast, BackboneFast, and other STP features.</td>
</tr>
<tr>
<td>Chapter 24</td>
<td>Configuring EtherChannel and Link State Tracking</td>
<td>Describes how to configure Layer 2 and Layer 3 EtherChannel port bundles.</td>
</tr>
<tr>
<td>Chapter 25</td>
<td>Configuring IGMP Snooping and Filtering</td>
<td>Describes how to configure Internet Group Management Protocol (IGMP) snooping.</td>
</tr>
<tr>
<td>Chapter 26</td>
<td>Configuring IPv6 MLD Snooping</td>
<td>Describes how to configure IPv6 MLD Snooping.</td>
</tr>
<tr>
<td>Chapter</td>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>----------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Chapter 27</td>
<td>Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling</td>
<td>Describes how to configure 802.1Q and Layer 2 protocol Tunneling.</td>
</tr>
<tr>
<td>Chapter 28</td>
<td>Configuring CDP</td>
<td>Describes how to configure the Cisco Discovery Protocol (CDP).</td>
</tr>
<tr>
<td>Chapter 29</td>
<td>Configuring LLDP, LLDP-MED, and Location Service</td>
<td>Describes how to configure Link Layer Discovery Protocol (LLDP).</td>
</tr>
<tr>
<td>Chapter 30</td>
<td>Configuring UDLD</td>
<td>Describes how to configure the UniDirectional Link Detection (UDLD) protocol.</td>
</tr>
<tr>
<td>Chapter 31</td>
<td>Configuring Unidirectional Ethernet</td>
<td>Describes how to configure Unidirectional Ethernet</td>
</tr>
<tr>
<td>Chapter 32</td>
<td>Configuring Layer 3 Interfaces</td>
<td>Describes how to configure interfaces to support Layer 3 features.</td>
</tr>
<tr>
<td>Chapter 33</td>
<td>Configuring Cisco Express Forwarding</td>
<td>Describes how to configure Cisco Express Forwarding (CEF) for IP unicast traffic.</td>
</tr>
<tr>
<td>Chapter 34</td>
<td>Configuring Unicast Reverse Path Forwarding</td>
<td>Describes how to configure Unicast Reverse Path Forwarding.</td>
</tr>
<tr>
<td>Chapter 35</td>
<td>Configuring IP Multicast</td>
<td>Describes how to configure IP Multicast Multilayer Switching (MMLS).</td>
</tr>
<tr>
<td>Chapter 36</td>
<td>Configuring ANCP Client</td>
<td>Describes how to configure ANCP.</td>
</tr>
<tr>
<td>Chapter 37</td>
<td>Configuring Bidirectional Forwarding Detection</td>
<td>Describes how to configure Bidirectional Forwarding Detection.</td>
</tr>
<tr>
<td>Chapter 38</td>
<td>Configuring Policy-Based Routing</td>
<td>Describes how to configure policy-based routing.</td>
</tr>
<tr>
<td>Chapter 39</td>
<td>Configuring VRF-lite</td>
<td>Describes how to configure multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices.</td>
</tr>
<tr>
<td>Chapter 40</td>
<td>Configuring Quality of Service</td>
<td>Describes how to configure quality of service (QoS).</td>
</tr>
<tr>
<td>Chapter 41</td>
<td>Configuring Voice Interfaces</td>
<td>Describes how to configure voice interfaces.</td>
</tr>
<tr>
<td>Chapter 42</td>
<td>Configuring Private VLANs</td>
<td>Describes how to set up and modify private VLANs.</td>
</tr>
<tr>
<td>Chapter 43</td>
<td>Configuring MACsec Encryption</td>
<td>Describes how to configure MACsec encryption.</td>
</tr>
<tr>
<td>Chapter 44</td>
<td>Configuring 802.1X Port-Based Authentication</td>
<td>Describes how to configure 802.1X port-based authentication.</td>
</tr>
<tr>
<td>Chapter 45</td>
<td>Configuring the PPPoE Intermediate Agent</td>
<td>Describes how to configure PPPoE Intermediate Agent.</td>
</tr>
<tr>
<td>Chapter 46</td>
<td>Configuring Web-Based Authentication</td>
<td>Describes how to configure web-based authentication.</td>
</tr>
<tr>
<td>Chapter 47</td>
<td>Configuring Port Security</td>
<td>Describes how to configure port security and trunk port security.</td>
</tr>
<tr>
<td>Chapter 48</td>
<td>Configuring Control Plane Policing and Layer 2 Control Packet QoS</td>
<td>Describes how to protect your Catalyst 4500 series switch using control plane policing (CoPP).</td>
</tr>
<tr>
<td>Chapter</td>
<td>Title</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>49</td>
<td>Configuring Dynamic ARP Inspection</td>
<td>Describes how to configure Dynamic ARP Inspection.</td>
</tr>
<tr>
<td>50</td>
<td>Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts</td>
<td>Describes how to configure DHCP snooping and IP Source Guard.</td>
</tr>
<tr>
<td>51</td>
<td>Configuring Network Security with ACLs</td>
<td>Describes how to configure ACLs, VACLs, and MACLs.</td>
</tr>
<tr>
<td>52</td>
<td>Support for IPv6</td>
<td>Describes the support for IPv6 on the switch.</td>
</tr>
<tr>
<td>53</td>
<td>Port Unicast and Multicast Flood Blocking</td>
<td>Describes how to configure unicast flood blocking.</td>
</tr>
<tr>
<td>54</td>
<td>Configuring Storm Control</td>
<td>Describes how to configure storm control suppression.</td>
</tr>
<tr>
<td>55</td>
<td>Configuring SPAN and RSPAN</td>
<td>Describes how to configure the Switched Port Analyzer (SPAN).</td>
</tr>
<tr>
<td>56</td>
<td>Configuring Wireshark</td>
<td>Describes how to configure Wireshark, the Ethernet Analyzer on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>57</td>
<td>Configuring Enhanced Object Tracking</td>
<td>Describes how to configure Enhanced Object Tracking.</td>
</tr>
<tr>
<td>58</td>
<td>Configuring System Message Logging</td>
<td>Describes how to configure system message logging.</td>
</tr>
<tr>
<td>59</td>
<td>Onboard Failure Logging (OBFL)</td>
<td>Describes how to configure OBFL.</td>
</tr>
<tr>
<td>60</td>
<td>Configuring SNMP</td>
<td>Describes how to configure the Simple Network Management Protocol (SNMP).</td>
</tr>
<tr>
<td>61</td>
<td>Configuring NetFlow-lite</td>
<td>Describes how to configure NetFlow-lite.</td>
</tr>
<tr>
<td>62</td>
<td>Configuring Flexible NetFlow</td>
<td>Describes how to configure Flexible NetFlow.</td>
</tr>
<tr>
<td>63</td>
<td>Configuring Ethernet OAM and CFM</td>
<td>Describes how to configure Ethernet OAM and CFM.</td>
</tr>
<tr>
<td>64</td>
<td>Configuring Y.1731 (AIS and RDI)</td>
<td>Describes how to configure Y.1731.</td>
</tr>
<tr>
<td>65</td>
<td>Configuring Call Home</td>
<td>Describes how to configure Call Home.</td>
</tr>
<tr>
<td>66</td>
<td>Configuring Cisco IOS IP SLA Operations</td>
<td>Describes how to configure Cisco IOS IP SLA operations.</td>
</tr>
<tr>
<td>67</td>
<td>Configuring RMON</td>
<td>Describes how to configure Remote Network Monitoring (RMON).</td>
</tr>
<tr>
<td>68</td>
<td>Performing Diagnostics</td>
<td>Describes various types of diagnostics on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>69</td>
<td>Configuring WCCP Version 2 Services</td>
<td>Describes how to configure the Catalyst 4500 series switches to redirect traffic to cache engines (web caches) using the Web Cache Communication Protocol (WCCP), and describes how to manage cache engine clusters (cache farms).</td>
</tr>
<tr>
<td>70</td>
<td>Configuring MIB Support</td>
<td>Describes how to configure SNMP and MIB support.</td>
</tr>

Notes use the following conventions:

**Note**

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the publication.

Cautions use the following conventions:

**Caution**

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.
Related Documentation

- Catalyst 4900 release notes are available at:
Cisco ME4900 4900 Series Ethernet Switch release notes are available at:

Software documents for the Catalyst 4500 Classic, Catalyst 4500 E-Series, Catalyst 4900, and Cisco ME 4900 Series Ethernet Switches are available at the following URLs:

• **Catalyst 4500 Series Software Configuration Guide**

• **Catalyst 4500 Series Software Command Reference**

• **Catalyst 4500 Series Software System Message Guide**

**Cisco IOS Documentation**

Platform-independent Cisco IOS documentation may also apply to the Catalyst 4500 and 4900 switches. These documents are available at the following URLs:

• Cisco IOS configuration guides, Release 12.x

• Cisco IOS command references, Release 12.x

  You can also use the Command Lookup Tool at:

• Cisco IOS system messages, version 12.x

  You can also use the Error Message Decoder tool at:
  http://www.cisco.com/pcgi-bin/Support/Errordecoder/index.cgi

**Commands in Task Tables**

Commands listed in task tables show only the relevant information for completing the task and not all available options for the command. For a complete description of a command, refer to the command in the **Catalyst 4500 Series Switch Cisco IOS Command Reference**.

**Notices**

The following notices pertain to this software license.
OpenSSL/Open SSL Project

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

License Issues

The OpenSSL toolkit stays under a dual license; that is, both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact openssl-core@openssl.org.

**OpenSSL License:**

The license and distribution terms for any publicly available version or derivative of this code cannot be changed, that is, this code cannot be copied and put under another distribution license [including the GNU Public License].
Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What’s New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the *What’s New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.
CHAPTER 1

Product Overview

This chapter provides an overview of Catalyst 4500 series switches and includes the following major sections:

- Layer 2 Software Features, page 1-1
- Layer 3 Software Features, page 1-11
- Management Features, page 1-20
- Security Features, page 1-30
- New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG, page 1-39

**Note**

For more information about the chassis, modules, and software features supported by the Catalyst 4500 series switch, refer to the *Release Notes for the Catalyst 4500 Series Switch* at this location:

Layer 2 Software Features

The following subsections describe the key Layer 2 switching software features on the Catalyst 4500 series switch:

- 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling, page 1-2
- Cisco IOS Auto Smartport Macros, page 1-2
- Cisco Discovery Protocol, page 1-3
- Cisco Group Management Protocol (CGMP) server, page 1-3
- EtherChannel Bundles, page 1-3
- Ethernet CFM, page 1-3
- Ethernet OAM Protocol, page 1-3
- Flex Links and MAC Address-Table Move Update, page 1-4
- Flexible NetFlow, page 1-4
- Internet Group Management Protocol (IGMP) Snooping, page 1-4
- IPv6 Multicast Listen Discovery (MLD) and Multicast Listen Discovery snooping, page 1-5
Layer 2 Software Features

- Jumbo Frames, page 1-5
- Link Aggregation Control Protocol, page 1-5
- Link Layer Discovery Protocol, page 1-6
- Link State Tracking, page 1-6
- Location Service, page 1-6
- Multiple Spanning Tree, page 1-7
- Per-VLAN Rapid Spanning Tree, page 1-7
- Quality of Service, page 1-7
- Resilient Ethernet Protocol, page 1-8
- SmartPort Macros, page 1-8
- Spanning Tree Protocol, page 1-8
- Stateful Switchover, page 1-9
- SVI Autostate, page 1-9
- Unidirectional Link Detection, page 1-9
- VLANs, page 1-10
- Virtual Switch System Client, page 1-10
- Y.1731 (AIS and RDI), page 1-10

802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

802.1Q tunneling is a Q-in-Q technique that expands the VLAN space by retagging the tagged packets that enter the service provider infrastructure. 802.1Q tunneling allows service providers to assign a VLAN to each customer without losing the original customer VLAN IDs inside the tunnel. All data traffic that enters the tunnel is encapsulated with the tunnel VLAN ID. Layer 2 Protocol Tunneling is a similar technique for all Layer 2 control traffic.

To map customer VLANs to service-provider VLANs, you can configure VLAN mapping (or VLAN ID translation) on trunk ports connected to a customer network. Packets entering the port are mapped to a service provider VLAN (S-VLAN) based on the port number and the original customer VLAN-ID (C-VLAN) of the packet.

For information on configuring 802.1Q tunneling and VLAN Mapping, see Chapter 27, “Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling.”

Cisco IOS Auto Smartport Macros

Cisco IOS Auto SmartPort macros dynamically configure ports based on the device type detected on the port. When the switch detects a new device on a port it applies the appropriate Cisco IOS Auto Smartports macro. When a link-down event occurs on the port, the switch removes the macro. For example, when you connect a Cisco IP phone to a port, Cisco IOS Auto SmartPorts automatically applies the IP phone macro. The IP phone macro enables quality of service (QoS), security features, and a dedicated voice VLAN to ensure proper treatment of delay-sensitive voice traffic.

For information on configuring SmartPort macros, see Chapter 19, “Configuring Cisco IOS Auto Smartport Macros.”
Cisco Discovery Protocol

The Cisco Discovery Protocol (CDP) is a device-discovery protocol that is both media- and protocol-independent. CDP is available on all Cisco products, including routers, switches, bridges, and access servers. Using CDP, a device can advertise its existence to other devices and receive information about other devices on the same LAN. CDP enables Cisco switches and routers to exchange information, such as their MAC addresses, IP addresses, and outgoing interfaces. CDP runs over the data-link layer only, allowing two systems that support different network-layer protocols to learn about each other. Each device configured for CDP sends periodic messages to a multicast address. Each device advertises at least one address at which it can receive Simple Network Management Protocol (SNMP) messages.

For information on configuring CDP, see Chapter 28, “Configuring CDP.”

Cisco Group Management Protocol (CGMP) server

CGMP server manages multicast traffic. Multicast traffic is forwarded only to ports with attached hosts that request the multicast traffic.

EtherChannel Bundles

EtherChannel port bundles allow you to create high-bandwidth connections between two switches by grouping multiple ports into a single logical transmission path.

For information on configuring EtherChannel, see Chapter 24, “Configuring EtherChannel and Link State Tracking.”

Ethernet CFM

Ethernet CFM is an end-to-end per-service-instance (per-VLAN) Ethernet layer OAM protocol that includes proactive connectivity monitoring, fault verification, and fault isolation. End-to-end can be provider-edge-to-provider-edge (PE-to-PE) device or customer-edge-to-customer-edge (CE-to-CE) device. Ethernet CFM, as specified by IEEE 802.1ag, is the standard for Layer 2 ping, Layer 2 traceroute, and end-to-end connectivity check of the Ethernet network.

For information about CFM, see Chapter 63, “Configuring Ethernet OAM and CFM.”

Ethernet OAM Protocol

Ethernet Operations, Administration, and Maintenance (OAM) is a protocol for installing, monitoring, and troubleshooting Ethernet networks to increase management capability within the context of the overall Ethernet infrastructure. You can implement Ethernet OAM on any full-duplex, point-to-point, or emulated point-to-point Ethernet link for a network or part of a network (specified interfaces).

For information about OAM, see Chapter 63, “Configuring Ethernet OAM and CFM.”
Flex Links and MAC Address-Table Move Update

Flex Links are a pair of Layer 2 interfaces (switch ports or port channels) where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP). Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on the switch.

MAC Address-Table Move Update allows a switch to provide rapid bidirectional convergence when a primary (forwarding) link goes down and the standby link begins forwarding traffic.

For information about Flex Links and MAC Address-Table Move Update, see Chapter 21, “Configuring Flex Links and MAC Address-Table Move Update.”

Flexible NetFlow

Note

Flexible NetFlow is only supported on Supervisor Engine 7-E, Supervisor Engine 7L-E, and Catalyst 4500X.

Flow is defined as unique set of key fields attributes, which might include fields of packet, packet routing attributes, and input and output interface information. A NetFlow feature defines a flow as a sequence of packets that have the same values for the feature key fields. Flexible NetFlow (FNF) allows a flow record that specifies various flow attributes to be collected and optionally exported. NetFlow collection supports IP, IPv6 and Layer 2 traffic.

For information on configuring Flexible NetFlow, see Chapter 62, “Configuring Flexible NetFlow.”

Internet Group Management Protocol (IGMP) Snooping

IGMP snooping manages multicast traffic. The switch software examines IP multicast packets and forwards packets based on their content. Multicast traffic is forwarded only to ports with attached hosts that request multicast traffic.

Support for IGMPv3 provides constrained flooding of multicast traffic in the presence of IGMPv3 hosts or routers. IGMPv3 snooping listens to IGMPv3 query and membership report messages to maintain host-to-multicast group associations. It enables a switch to propagate multicast data only to ports that need it. IGMPv3 snooping is fully interoperable with IGMPv1 and IGMPv2.

Explicit Host Tracking (EHT) is an extension to IGMPv3 snooping. EHT enables immediate leave operations on a per-port basis. EHT can be used to track per host membership information or to gather statistics about all IGMPv3 group members.

The IGMP Snooping Querier is a Layer 2 feature required to support IGMP snooping in a VLAN where PIM and IGMP are not configured because the multicast traffic does not require routing.

With SSO support, Stateful IGMP Snooping propagates the IGMP data learned by the active supervisor engine to the redundant supervisor engine so that when a switchover occurs, the newly active supervisor engine is aware of the multicast group membership, which alleviates a disruption to multicast traffic during a switchover.

For information on configuring IGMP snooping, see
IPv6 Multicast Listen Discovery (MLD) and Multicast Listen Discovery snooping

MLD is a protocol used by IPv6 multicast devices to discover the presence of multicast listeners (nodes that want to receive IPv6 multicast packets) on its directly attached links and to discover which multicast packets are of interest to neighboring nodes. MLD snooping is supported in two different versions: MLD v1 and MLD v2. Network switches use MLD snooping to limit the flood of multicast traffic, causing IPv6 multicast data to be selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This lessens the load on devices in the network, minimizing unnecessary bandwidth on links, enabling efficient distribution of IPv6 multicast data.

For information on configuring multicast services, see

Jumbo Frames

The jumbo frames feature allows the switch to forward packets as large as 9216 bytes (larger than the IEEE Ethernet MTU), rather than declare those frames “oversize” and discard them. This feature is typically used for large data transfers. The jumbo frames feature can be configured on a per-port basis on Layer 2 and Layer 3 interfaces. The feature is supported only on the following hardware:

- WS-X4306-GB: all ports
- WS-X4232-GB-RJ: ports 1-2
- WS-X4418-GB: ports 1-2
- WS-X4412-2GB-TX: ports 13-14
- WS-4648-RJ45V-E
- WS-X4648+RJ45V+E
- WS-X4706-10GE linecards
- supervisor engine uplink ports

For information on Jumbo Frames, see Chapter 7, “Configuring Interfaces.”

Link Aggregation Control Protocol

LACP supports the automatic creation of EtherChannels by exchanging LACP packets between LAN ports. LACP packets are exchanged only between ports in passive and active modes. The protocol “learns” the capabilities of LAN port groups dynamically and informs the other LAN ports. After LACP identifies correctly matched Ethernet links, it facilitates grouping the links into an EtherChannel. Then the EtherChannel is added to the spanning tree as a single bridge port.

Cisco IOS XE IP Application Services Features in Cisco IOS XE 3.1.0SG

This section lists the IP Application Services software features that are supported in Cisco IOS XE 3.1.0SG. Links to the feature documentation are included.

Feature guides may contain information about more than one feature. To find information about a specific feature within a feature guide, see the Feature Information table at the end of the guide.
Feature guides document features that are supported on many different software releases and platforms. Your Cisco software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in that guide are supported in your software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

IEEE 802.3ad Link Aggregation (LACP)

Link Aggregation Control Protocol (LACP) (802.3ad) for Gigabit Interfaces

Link Layer Discovery Protocol

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB LLDP. Link Layer Discovery Protocol (LLDP) is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. Details such as configuration information, device capabilities, and device identity can be advertised using this protocol.

For information on configuring LLDP, see Chapter 29, “Configuring LLDP, LLDP-MED, and Location Service.”

Link State Tracking

Link-state tracking, also known as trunk failover, is a feature that binds the link state of multiple interfaces. For example, link-state tracking provides redundancy in the network when used with server NIC adapter teaming. When server network adapters are configured in a primary or secondary relationship known as teaming, if the link is lost on the primary interface, connectivity is transparently changed to the secondary interface.

For information on configuring Link State Tracking, see Chapter 24, “Configuring EtherChannel and Link State Tracking.”

Location Service

The location service feature allows the switch to provide location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired switch or controller. The switch informs device link up and link down events through encrypted Network Mobility Services Protocol (NMSP) location and attachment notifications to the MSE.

For information on configuring LLDP, see Chapter 29, “Configuring LLDP, LLDP-MED, and Location Service.”
Multiple Spanning Tree

IEEE 802.1s Multiple Spanning Tree (MST) allows for multiple spanning tree instances within a single 802.1Q or Inter-Switch Link (ISL) VLAN trunk. MST extends the IEEE 802.1w Rapid Spanning Tree (RST) algorithm to multiple spanning trees. This extension provides both rapid convergence and load balancing within a VLAN environment.

MST allows you to build multiple spanning trees over trunks. You can group and associate VLANs to spanning tree instances. Each instance can have a topology independent of other spanning tree instances. This new architecture provides multiple forwarding paths for data traffic and enables load balancing. Network fault tolerance is improved because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

For information on configuring MST, see Chapter 20, “Configuring STP and MST.”

Per-VLAN Rapid Spanning Tree

Per-VLAN Rapid Spanning Tree (PVRST+) is the implementation of 802.1w on a per-VLAN basis. It is the same as PVST+ with respect to STP mode and runs RSTP protocol based on 802.1w.

For information on configuring PVRST+, see Chapter 20, “Configuring STP and MST.”

Quality of Service

QoS functionality on Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E and Supervisor Engine 6L-E are equivalent.

The quality of service (QoS) feature prevents congestion by selecting network traffic and prioritizing it according to its relative importance. Implementing QoS in your network makes network performance more predictable and bandwidth use more effective.

The Catalyst 4500 series switch supports the following QoS features:

- Classification and marking
- Ingress and egress policing, including per-port per-VLAN policing
- Sharing and shaping

Catalyst 4500 series switch supports trusted boundary, which uses the Cisco Discovery Protocol (CDP) to detect the presence of a Cisco IP phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a switch port. If the telephone is not detected, the trusted boundary feature disables the trusted setting on the switch port and prevents misuse of a high-priority queue.

The Catalyst 4500 series switch also supports QoS Automation (Auto QoS), which simplifies the deployment of existing QoS features through automatic configuration.

Cisco Modular QoS Command-Line-Interface

Cisco Modular QoS CLI (MQC) is the framework that implements Cisco IOS software QoS. MQC allows the user to define a traffic class, create a traffic policy (containing the QoS feature to be applied to the traffic class), and attach the traffic policy to an interface. MQC is a cross-Cisco baseline that provides a consistent syntax and behavior of QoS features across multiple product families. Cisco IOS
Software Release 12.2(40)SG complies to MQC for configuration of QoS features on the Supervisor Engine 6-E. MQC enables rapid deployment of new features and technology innovations and facilitates the management of network performance with respect to bandwidth, delay, jitter, and packet loss, enhancing the performance of mission-critical business applications. The rich and advanced QoS features are enabled using Cisco MQC.

**Two-Rate Three-Color Policing**

The Two-Rate Three-Color Policing feature (also termed Hierarchical QoS) limits the input or output transmission rate of a class of traffic based on user-defined criteria and marks or colors packets by setting the applicable differentiated services code point (DSCP) values. This feature is often configured on the interfaces at the edge of a network to limit the rate of traffic entering or leaving the network. Using this feature, traffic that conforms to user-defined criteria can be sent through the interfaces, while traffic that exceeds or violates these criteria is sent out with a decreased priority setting or even dropped.

For information on QoS and Auto QoS, see Chapter 40, “Configuring Quality of Service.”

**Resilient Ethernet Protocol**

Resilient Ethernet Protocol (REP) is a Cisco proprietary protocol that provides an alternative to Spanning Tree Protocol (STP) to control network loops, handle link failures, and improve convergence time. REP controls a group of ports connected in a segment, ensures that the segment does not create any bridging loops, and responds to link failures within the segment. REP provides a basis for constructing more complex networks and supports VLAN load balancing.

For information on REP, see Chapter 22, “Configuring Resilient Ethernet Protocol.”

**SmartPort Macros**

SmartPort macros provide a convenient way to save and share common configurations. You can use SmartPort macros to enable features and settings based on the location of a switch in the network and for mass configuration deployments across the network.

For information on configuring SmartPort macros, see Chapter 18, “Configuring SmartPort Macros.”

**Spanning Tree Protocol**

The Spanning Tree Protocol (STP) allows you to create fault-tolerant internetworks that ensure an active, loop-free data path between all nodes in the network. STP uses an algorithm to calculate the best loop-free path throughout a switched network.

For information on configuring STP, see Chapter 20, “Configuring STP and MST.”

The Catalyst 4500 series switch supports the following STP enhancements:

- **Spanning tree PortFast**—PortFast allows a port with a directly attached host to transition to the forwarding state directly, bypassing the listening and learning states.
- **Spanning tree UplinkFast**—UplinkFast provides fast convergence after a spanning-tree topology change and achieves load balancing between redundant links using uplink groups. Uplink groups provide an alternate path in case the currently forwarding link fails. UplinkFast is designed to decrease spanning-tree convergence time for switches that experience a direct link failure.
Layer 2 Software Features

- Spanning tree BackboneFast—BackboneFast reduces the time needed for the spanning tree to converge after a topology change caused by an indirect link failure. BackboneFast decreases spanning-tree convergence time for any switch that experiences an indirect link failure.
- Spanning tree root guard—Root guard forces a port to become a designated port so that no switch on the other end of the link can become a root switch.

For information on the STP enhancements, see Chapter 23, “Configuring Optional STP Features.”

Stateful Switchover

Stateful switchover (SSO) enables you to propagate configuration and state information from the active to the redundant supervisor engine so that sub-second interruptions in Layer 2 traffic occur when the active supervisor engine switches over to the redundant supervisor engine.

- Stateful IGMP Snooping
  This feature propagates the IGMP data learned by the active supervisor engine to the redundant supervisor engine so that when a switchover occurs, the newly active supervisor engine is aware of the multicast group membership, which alleviates a disruption to multicast traffic during a switchover.

- Stateful DHCP Snooping
  This feature propagates the DHCP-snooped data from the active supervisor engine to the redundant supervisor engine so that when a switchover occurs, the newly active supervisor engine is aware of the DHCP data that was already snooped, and the security benefits continue uninterrupted.

For information about SSO, see Chapter 11, “Configuring Cisco NSF with SSO Supervisor Engine Redundancy.”

SVI Autostate

When an SVI has multiple ports on a VLAN, normally the SVI will go down when all the ports in the VLAN go down. You can design your network so that some ports are not counted in the calculation of SVI “going up or down.” SVI Autostate provides a knob to mark a port so that it is not counted in the SVI “going up and down” calculation and applies to all VLANs that are enabled on that port.

Unidirectional Link Detection

The Unidirectional Link Detection (UDLD) protocol allows devices connected through fiber-optic or copper Ethernet cables to monitor the physical configuration of the cables and detect a unidirectional link.

With standard UDLD, the time to detect a unidirectional link can vary from a few seconds to several minutes depending on how the timers are configured. Link status messages are exchanged every couple of seconds. With Fast UDLD, you can detect unidirectional links in under one second (this also depends on how the timers are configured). Link status messages are exchanged every couple of hundred milliseconds.

For information about UDLD and Fast UDLD, see Chapter 30, “Configuring UDLD.”
VLANs

A VLAN configures switches and routers according to logical, rather than physical, topologies. Using VLANs, you can combine any collection of LAN segments within an internetwork into an autonomous user group, such that the segments appear as a single LAN in the network. VLANs logically segment the network into different broadcast domains so that packets are switched only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily.

For more information about VLANs, VTP, and Dynamic VLAN Membership, see Chapter 15, “Configuring VLANs, VTP, and VMPS.”

The following VLAN-related features also are supported:

- VLAN Trunking Protocol (VTP)—VTP maintains VLAN naming consistency and connectivity between all devices in the VTP management domain. You can have redundancy in a domain by using multiple VTP servers, through which you can maintain and modify the global VLAN information. Only a few VTP servers are required in a large network.
- Private VLANs—Private VLANs are sets of ports that have the features of normal VLANs and also provide some Layer 2 isolation from other ports on the switch.
  For information about private VLANs, see Chapter 42, “Configuring Private VLANs.”
- Private VLAN Trunk Ports—Private VLAN trunk ports allow a secondary port on a private VLAN to carry multiple secondary VLANs.
- Private VLAN Promiscuous Trunk Ports—Private VLAN promiscuous trunk extends the promiscuous port to a 802.1Q trunk port, carrying multiple primary VLANs (hence multiple subnets). Private VLAN promiscuous trunk is typically used to offer different services or content on different primary VLANs to isolated subscribers. Secondary VLANs can not be carried over the private VLAN promiscuous trunk.
- Dynamic VLAN Membership—Dynamic VLAN Membership allows you to assign switch ports to VLANs dynamically, based on the source Media Access Control (MAC) address of the device connected to the port. When you move a host from a port on one switch in the network to a port on another switch in the network, that switch dynamically assigns the new port to the proper VLAN for that host. With the VMPS Client feature, you can convert a dynamic access port to a VMPS client. VMPS clients can use VQP queries to communicate with the VMPS server to obtain a VLAN assignment for the port based on the MAC address of the host attached to that port.

Virtual Switch System Client

Catalyst 4500 series switches support enhanced PAgP. If a Catalyst 4500 series switch is connected to a Catalyst 6500 series Virtual Switch System (VSS) by using a PAgP EtherChannel, the Catalyst 4500 series switch will automatically serve as a VSS client, using enhanced PAgP on this EtherChannel for dual-active detection. This VSS client feature has no impact on the performance of Catalyst 4500 series switches and does not require any user configuration.

For information on VSS, see Chapter 24, “Configuring EtherChannel and Link State Tracking.”

Y.1731 (AIS and RDI)

Y.1731 ETH-AIS (Ethernet Alarm Indication Signal function) and ETH-RDI (Ethernet Remote Defect Indication function) provides fault and performance management for service providers in large networks.
ETH-AIS suppresses alarms following detection of defect conditions at the server (sub) layer. Due to independent restoration capabilities provided within the Spanning Tree Protocol (STP) environments, ETH-AIS is not expected to be applied in the STP environments. In this case, AIS is configurable, and the administrator describes how to enable and disable AIS in STP environment or not.

ETH-RDI can be used by a MEP to communicate to its peer MEPs that a defect condition has been encountered. ETH-RDI is used only when ETH-CC transmission is enabled.

For information about Y.1731, see Chapter 64, “Configuring Y.1731 (AIS and RDI).”

**Layer 3 Software Features**

A Layer 3 switch is a high-performance switch that has been optimized for a campus LAN or an intranet, and it provides both wirespeed Ethernet routing and switching services. Layer 3 switching improves network performance with two software functions: route processing and intelligent network services. Compared to conventional software-based switches, Layer 3 switches process more packets faster by using application-specific integrated circuit (ASIC) hardware instead of microprocessor-based engines.

The following sections describe the key Layer 3 switching software features on the Catalyst 4500 series switch:

- Bidirectional Forwarding Detection, page 1-11
- Cisco Express Forwarding, page 1-12
- EIGRP Stub Routing, page 1-12
- Enhanced Object Tracking, page 1-12
- GLBP, page 1-13
- HSRP, page 1-13
- In Service Software Upgrade, page 1-17
- IP Routing Protocols, page 1-14
- IPv6, page 1-17
- Multicast Services, page 1-17
- NSF with SSO, page 1-18
- OSPF for Routed Access, page 1-19
- Policy-Based Routing, page 1-19
- Unidirectional Link Routing, page 1-19
- VRF-lite, page 1-20
- Virtual Router Redundancy Protocol, page 1-20

**Bidirectional Forwarding Detection**

*Note*

Support on the Catalyst 4500E is limited. Starting with Cisco IOS Release IOS 15.1(1)SG, Bidirectional Forwarding Detection (BFD) is supported only on Catalyst 4900M and Catalyst 4948E Ethernet switches.
Bidirectional Forwarding Detection (BFD) protocol. BFD is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. It includes a description of how to configure multihop BFD sessions. BFD provides a consistent failure detection method for network administrators in addition to fast forwarding path failure detection.

For information on configuring BFD, see Chapter 37, “Configuring Bidirectional Forwarding Detection.”

Cisco Express Forwarding

Cisco Express Forwarding (CEF) is an advanced Layer 3 IP-switching technology. CEF optimizes network performance and scalability in networks with large and dynamic traffic patterns, such as the Internet, and on networks that use intensive web-based applications or interactive sessions. Although you can use CEF in any part of a network, it is designed for high-performance, highly resilient Layer 3 IP-backbone switching.

For information on configuring CEF, see Chapter 33, “Configuring Cisco Express Forwarding.”

EIGRP Stub Routing

The EIGRP stub routing feature, available in all images, reduces resource utilization by moving routed traffic closer to the end user.

The IP base image contains only EIGRP stub routing. The IP services image contains complete EIGRP routing.

In a network using EIGRP stub routing, the only route for IP traffic to follow to the user is through a switch that is configured with EIGRP stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

For information on configuring EIGRP Stub Routing, see Chapter 32, “Configuring Layer 3 Interfaces.”

Enhanced Object Tracking

Before the introduction of the Enhanced Object Tracking feature, the Hot Standby Router Protocol (HSRP) had a simple tracking mechanism that allowed you to track the interface line-protocol state only. If the line-protocol state of the interface went down, the HSRP priority of the router was reduced, allowing another HSRP router with a higher priority to become active.

The Enhanced Object Tracking (EOT) feature separates the tracking mechanism from HSRP and creates a separate standalone tracking process that can be used by other Cisco IOS processes as well as HSRP. This feature allows tracking of other objects in addition to the interface line-protocol state.

A client process, such as HSRP, Virtual Router Redundancy Protocol (VRRP), or Gateway Load Balancing Protocol (GLBP), can now register its interest in tracking objects and then be notified when the tracked object changes state.

For details on EOT, refer to this URL:

For platform specific information on Enhanced Object Tracking, see Chapter 57, “Configuring Enhanced Object Tracking.”

For more detailed information on Enhanced Object Tracking, see the URL:

GLBP

The Gateway Load Balancing Protocol (GLBP) feature provides automatic router backup for IP hosts configured with a single default gateway on a LAN. Multiple first hop routers on the LAN combine to offer a single virtual first hop IP router while sharing the IP packet forwarding load. GLBP devices share packet-forwarding responsibilities, optimizing resource usage, thereby reducing costs. Other routers on the LAN may act as redundant GLBP routers that will become active if any of the existing forwarding routers fail. This improves the resiliency of the network and reduces administrative burden.

For details on GLBP, refer to this URL:

Cisco IOS XE IP Application Services Features in Cisco IOS XE 3.1.0SG

This section lists the IP Application Services software features that are supported in Cisco IOS XE 3.1.0SG. Links to the feature documentation are included.

Feature guides may contain information about more than one feature. To find information about a specific feature within a feature guide, see the Feature Information table at the end of the guide.

Feature guides document features that are supported on many different software releases and platforms. Your Cisco software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in that guide are supported in your software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Gateway Load Balancing Protocol (GLBP), GLBP MD5 Authentication

HSRP

The Hot Standby Router Protocol (HSRP) provides high network availability by routing IP traffic from hosts on Ethernet networks without relying on the availability of any single Layer 3 switch. This feature is particularly useful for hosts that do not support a router discovery protocol and do not have the functionality to switch to a new router when their selected router reloads or loses power.

For information on configuring HSRP, refer to the following URL:

Cisco IOS XE IP Application Services: HSRP Features in Cisco IOS XE 3.1.0SG

This section lists the IP Application Services: HSRP software features that are supported in Cisco IOS XE 3.1.0SG. Links to the feature documentation are included.

Feature guides may contain information about more than one feature. To find information about a specific feature within a feature guide, see the Feature Information table at the end of the guide.

Feature guides document features that are supported on many different software releases and platforms. Your Cisco software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in
that guide are supported in your software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

**HSRP—Hot Standby Router Protocol**

**HSRP MD5 Authentication**

**HSRP Support for ICMP Redirects**

**IP Precedence Accounting**

**ISSU—HSRP**

**SSO—HSRP**

**SSO Aware HSRP**

SSO Aware HSRP offers continuous data packet forwarding during a supervisor engine switchover without a path change to the standby HSRP router. During supervisor engine switchover, NSF with SSO continues forwarding data packets along known routes using the HSRP virtual IP address. When both supervisor engines fail on the active HSRP router, the standby HSRP router takes over as the active HSRP router. It further extends reliability and availability offered by the NSF with SSO to Layer 3. SSO aware HSRP is available for Supervisor Engine IV, V, and V-10GE on Catalyst 4507R and 4510R chassis with supervisor redundancy.

**IP Routing Protocols**

The following routing protocols are supported on the Catalyst 4500 series switch:

- BGP, page 1-15
- EIGRP, page 1-15
- IS-IS, page 1-16
- OSPF, page 1-16
- RIP, page 1-16
BGP

The Border Gateway Protocol (BGP) is an exterior gateway protocol that allows you to set up an interdomain routing system to automatically guarantee the loop-free exchange of routing information between autonomous systems. In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (called the autonomous system path), and a list of other path attributes.

The Catalyst 4500 series switch supports BGP version 4, including classless interdomain routing (CIDR). CIDR lets you reduce the size of your routing tables by creating aggregate routes, resulting in supernets. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes. CIDR routes can be carried by OSPF, EIGRP, and RIP.

BGP Route-Map Continue

The BGP Route-Map Continue feature introduces the continue clause to the BGP route-map configuration. The continue clause provides more programmable policy configuration and route filtering. It introduces the capability to execute additional entries in a route map after an entry is executed with successful match and set clauses. Continue clauses allow configuring and organizing more modular policy definitions to reduce the number of policy configurations that are repeated within the same route map.

For details on BGP, refer to this URL:

EIGRP

The Enhanced Interior Gateway Routing Protocol (EIGRP) is a version of IGRP that combines the advantages of link-state protocols with distance-vector protocols. EIGRP incorporates the Diffusing Update Algorithm (DUAL). EIGRP includes fast convergence, variable-length subnet masks, partially bounded updates, and multiple network-layer support. When a network topology change occurs, EIGRP checks its topology table for a suitable new route to the destination. If such a route exists in the table, EIGRP updates the routing table instantly. You can use the fast convergence and partial updates that EIGRP provides to route Internetwork Packet Exchange (IPX) packets.

EIGRP saves bandwidth by sending routing updates only when routing information changes. The updates contain information only about the link that changed, not the entire routing table. EIGRP also takes into consideration the available bandwidth when determining the rate at which it transmits updates.

Note
Layer 3 switching does not support the Next Hop Resolution Protocol (NHRP).

Note
Customers can configure Enhanced Interior Gateway Routing Protocol (EIGRP) to route IPv6 prefixes. EIGRP configuration and protocol behavior for both IPv4 and IPv6 prefixes are similar, providing operational familiarity and continuity. EIGRP support for IPv6 will enable customers to use their existing EIGRP knowledge and processes, allowing them to deploy an IPv6 network at a low cost.

For details on EIGRP, refer to this URL:
**IS-IS**

The Intermediate System-to-Intermediate System Protocol (IS-IS Protocol) uses a link-state routing algorithm. It closely follows the Open Shortest Path First (OSPF) routing protocol used within the TCP/IP environment. The operation of ISO IS-IS Protocol requires each router to maintain a full topology map of the network (that is, which intermediate systems and end systems are connected to which other intermediate systems and end systems). Periodically, the router runs an algorithm over its map to calculate the shortest path to all possible destinations.

The IS-IS Protocol uses a two-level hierarchy. Intermediate Systems (or routers) are classified as Level 1 and Level 2. Level 1 intermediate systems deal with a single routing area. Traffic is relayed only within that area. Any other internetwork traffic is sent to the nearest Level 2 intermediate systems, which also acts as a Level 1 intermediate systems. Level 2 intermediate systems move traffic between different routing areas within the same domain.

An IS-IS with multi-area support allows multiple Level 1 areas within in a single intermediate system, thus allowing an intermediate system to be in multiple areas. A single Level 2 area is used as backbone for inter-area traffic.

For details on IS-IS, refer to this URL:

**OSPF**

The Open Shortest Path First (OSPF) protocol is a standards-based IP routing protocol designed to overcome the limitations of RIP. Because OSPF is a link-state routing protocol, it sends link-state advertisements (LSAs) to all other routers within the same hierarchical area. Information on the attached interfaces and their metrics is used in OSPF LSAs. As routers accumulate link-state information, they use the shortest path first (SPF) algorithm to calculate the shortest path to each node. Additional OSPF features include equal-cost multipath routing and routing based on the upper-layer type of service (ToS) requests.

OSPF uses the concept of an *area*, which is a group of contiguous OSPF networks and hosts. OSPF areas are logical subdivisions of OSPF autonomous systems in which the internal topology is hidden from routers outside the area. Areas allow an additional level of hierarchy different from that provided by IP network classes, and they can be used to aggregate routing information and mask the details of a network. These features make OSPF particularly scalable for large networks.

For details on OSPF, refer to this URL:

**RIP**

The Routing Information Protocol (RIP) is a distance-vector, intradomain routing protocol. RIP works well in small, homogeneous networks. In large, complex internetworks it has many limitations, such as a maximum hop count of 15, lack of support for variable-length subnet masks (VLSMs), inefficient use of bandwidth, and slow convergence. RIP II does support VLSMs.

For details on RIP, refer to this URL:

In Service Software Upgrade

SSO requires the same version of Cisco IOS on both the active and standby supervisor engines. Because of version mismatch during an upgrade or downgrade of the Cisco IOS software, a Catalyst 4500 series switch is forced into operating in RPR mode. In this mode, after the switchover you can observe link-flaps and a disruption in service. This issue is solved by the In-Service Software Upgrade (ISSU) feature that enables you to operate in SSO/NSF mode while performing software upgrade or downgrade.

ISSU allows an upgrade or downgrade of the Catalyst IOS or IOS XE images at different release levels on the both the active and standby supervisor engines by utilizing the Version Transformation Framework between the stateful components running on each supervisor engine.

For details on Cisco IOS ISSU, refer to Chapter 5, “Configuring the Cisco IOS In-Service Software Upgrade Process.”

For details on Cisco IOS XE ISSU, refer to Chapter 6, “Configuring the Cisco IOS XE In Service Software Upgrade Process.”

IPv6

IPv6 provides services such as end-to-end security, quality of service (QoS), and globally unique addresses. The IPv6 address space reduces the need for private addresses and Network Address Translation (NAT) processing by border routers at network edges.

For more information about IPv6 services supported on the Catalyst 4500 series switch, see Chapter 52, “Support for IPv6.”

Multicast Services

Multicast services save bandwidth by forcing the network to replicate packets only when necessary and by allowing hosts to join and leave groups dynamically. The following multicast services are supported:

- ANCP Client — ANCP Multicast enables you to control multicast traffic on a Catalyst 4500 switch using either ANCP (rather than IGMP) or direct static configuration on the CLI.
- Cisco Group Management Protocol (CGMP) server — CGMP server manages multicast traffic. Multicast traffic is forwarded only to ports with attached hosts that request the multicast traffic.
- Internet Group Management Protocol (IGMP) snooping — IGMP snooping manages multicast traffic. The switch software examines IP multicast packets and forwards packets based on their content. Multicast traffic is forwarded only to ports with attached hosts that request multicast traffic.

Support for IGMPv3 provides constrained flooding of multicast traffic in the presence of IGMPv3 hosts or routers. IGMPv3 snooping listens to IGMPv3 query and membership report messages to maintain host-to-multicast group associations. It enables a switch to propagate multicast data only to ports that need it. IGMPv3 snooping is fully interoperable with IGMPv1 and IGMPv2.

Explicit Host Tracking (EHT) is an extension to IGMPv3 snooping. EHT enables immediate leave operations on a per-port basis. EHT can be used to track per host membership information or to gather statistics about all IGMPv3 group members.

The IGMP Snooping Querier is a Layer 2 feature required to support IGMP snooping in a VLAN where PIM and IGMP are not configured because the multicast traffic does not require routing.

For information on configuring IGMP snooping, see Chapter 25, “Configuring IGMP Snooping and Filtering.”
Layer 3 Software Features

Chapter 1      Product Overview

Layer 3 Software Features

- IPv6 Multicast Listen Discovery (MLD) and Multicast Listen Discovery snooping—MLD is a protocol used by IPv6 multicast devices to discover the presence of multicast listeners (nodes that want to receive IPv6 multicast packets) on its directly attached links and to discover which multicast packets are of interest to neighboring nodes. MLD snooping is supported in two different versions: MLD v1 and MLD v2. Network switches use MLD snooping to limit the flood of multicast traffic, causing IPv6 multicast data to be selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This lessens the load on devices in the network, minimizing unnecessary bandwidth on links, enabling efficient distribution of IPv6 multicast data.

For information on configuring multicast services, see Chapter 26, “Configuring IPv6 MLD Snooping.”

- Protocol Independent Multicast (PIM)—PIM is protocol-independent because it can leverage whichever unicast routing protocol is used to populate the unicast routing table, including EIGRP, OSPF, BGP, or static route. PIM also uses a unicast routing table to perform the Reverse Path Forwarding (RPF) check function instead of building a completely independent multicast routing table.

For information on PIM-SSM mapping, see the URL:

- IP Multicast Load Splitting (Equal Cost Multipath (ECMP) Using S, G and Next Hop)—IP Multicast Load Splitting introduces more flexible support for ECMP multicast load splitting by adding support for load splitting based on source and group address and on source, group, and next-hop address. This feature allows multicast traffic from devices that send many streams to groups or that broadcast many channels, such as IPTV servers or MPEG video servers, to be more effectively load shared across equal-cost paths.

For information on configuring multicast services, see Chapter 35, “Configuring IP Multicast.”

NSF with SSO

Non-Stop Forwarding with Stateful Switchover (NSF/SSO) offers continuous data packet forwarding in a Layer 3 routing environment during supervisor engine switchover. During supervisor engine switchover, NSF/SSO continues forwarding data packets along known routes while the routing protocol information is recovered and validated, avoiding unnecessary route flaps and network instability. With NSF/SSO, IP phone calls do not drop. NSF/SSO is supported for OSPF, BGP, EIGRP, IS-IS, and Cisco Express Forwarding (CEF). NSF/SSO is typically deployed in the most critical parts of an enterprise or service provider network, such as Layer 3 aggregation/core or a resilient Layer 3 wiring closet design. It is an essential component of single chassis deployment for critical applications. NSF/SSO is available for all shipping supervisor engines on Catalyst 4507R and 4510R chassis with supervisor redundancy.

**Note**
With the IP Base image, NSF is supported with EIGRP-stub routing and OSPF.

**Note**
With the Enterprise Services image, NSF is supported on all routing protocols except for RIP.

**Note**
The LAN Base image does not support NSF.
For information on NSF with SSO, see Chapter 11, “Configuring Cisco NSF with SSO Supervisor Engine Redundancy.”

### OSPF for Routed Access

OSPF for Routed Access is designed specifically to enable customers to extend Layer 3 routing capabilities to the access or wiring closet.

**Note** OSPF for Routed Access supports only one OSPFv2 and one OSPFv3 instance with a maximum number of 200 dynamically learned routes.

With the typical topology (hub and spoke) in a campus environment, where the wiring closets (spokes) are connected to the distribution switch (hub) forwarding all nonlocal traffic to the distribution layer, the wiring closet switch does not need to hold a complete routing table. Ideally, the distribution switch sends a default route to the wiring closet switch to reach inter-area and external routes (OSPF stub or totally stub area configuration).

Refer to the following link for more details:

With Cisco IOS Release 12.2(53)SG, the IP Base image supports OSPF for routed access. The Enterprise Services image is required if you need multiple OSPFv2 and OSPFv3 instances without route restrictions. Enterprise Services also is required to enable the VRF-lite feature.

### Policy-Based Routing

Traditional IP forwarding decisions are based purely on the destination IP address of the packet being forwarded. Policy-Based Routing (PBR) enables forwarding based upon other information associated with a packet, such as the source interface, IP source address, Layer 4 ports, and so on. This feature allows network managers more flexibility in how they configure and design their networks.

For more information on policy-based routing, see Chapter 38, “Configuring Policy-Based Routing.”

### Unicast Reverse Path Forwarding

The Unicast Reverse Path Forwarding (Unicast RPF) feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address.

For information on URPF, see Chapter 34, “Configuring Unicast Reverse Path Forwarding.”

### Unidirectional Link Routing

Unidirectional link routing (UDLR) provides a way to forward multicast packets over a physical unidirectional interface (such as a satellite link of high bandwidth) to stub networks that have a back channel.

For information on configuring unidirectional link routing, refer to the chapter “Configuring Unidirectional Link Routing” in the Cisco IP and IP Routing Configuration Guide.
VRF-lite

VPN routing and forwarding (VRF-lite) is an extension of IP routing that provides multiple routing instances. Along with BGP, it enables the creation of a Layer 3 VPN service by keeping separate IP routing and forwarding tables for each VPN customer. VRF-lite uses input interfaces to distinguish routes for different VPNs. It forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF, allowing the creation of multiple Layer 3 VPNs on a single switch. Interfaces in a VRF could be either physical, such as an Ethernet port, or logical, such as a VLAN switch virtual interface (SVI). However, interfaces cannot belong to more than one VRF at any time.

For information on VRF-lite, see Chapter 39, “Configuring VRF-lite.”

Virtual Router Redundancy Protocol

Virtual Router Redundancy Protocol (VRRP) is a standard based first-hop redundancy protocol. With VRRP, a group of routers function as one virtual router by sharing one virtual IP address and one virtual MAC address. The master router performs packet forwarding, while the backup routers stay idle. VRRP is typically used in the multivendor first-hop gateway redundancy deployment.

For details on VRRP, refer to this URL:

Management Features

The Catalyst 4500 series switch offers network management and control using the CLI or through alternative access methods, such as SNMP. The switch software supports these network management features:

- Cisco Call Home, page 1-21
- Cisco Energy Wise, page 1-21
- Cisco IOS IP Service Level Agreements, page 1-22
- Cisco Media Services Proxy, page 1-22
- Cisco Medianet AutoQoS, page 1-23
- Cisco Medianet Flow Metadata, page 1-23
- Cisco IOS Mediatrace and Performance Monitor, page 1-24
- Cisco Network Assistant, page 1-25
- Dynamic Host Control Protocol, page 1-25
- Easy Virtual Network, page 1-25
- Embedded CiscoView, page 1-26
- Embedded Event Manager, page 1-26
- Ethernet Management Port, page 1-26
- File System Management on Supervisor Engine 7-E and Supervisor Engine 7L-E, page 1-26
- FAT File Management System on Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4948E, and Catalyst 4900M, page 1-27
Cisco Call Home

Call Home provides e-mail-based and web-based notification of critical system events. A versatile range of message formats are available for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications. Common uses of this feature may include direct paging of a network support engineer, e-mail notification to a Network Operations Center, XML delivery to a support website, and utilization of Cisco Smart Call Home services for direct case generation with the Cisco Systems Technical Assistance Center (TAC).

The Call Home feature can deliver alert messages containing information on configuration, diagnostics, environmental conditions, inventory, and syslog events.

For more information on Call Home, see Chapter 65, “Configuring Call Home.”

Cisco Energy Wise

Cisco EnergyWise is an energy-management technology added onto Cisco switching solutions to help you measure, report, and reduce energy consumption across your entire infrastructure. With EnergyWise’s management interface, network management applications can communicate with endpoints and each other, using the network as the unifying fabric.

For details refer to the URLs:

Cisco IOS IP Service Level Agreements

Cisco IOS IP Service Level Agreements (SLAs) allows Cisco customers to analyze IP service levels for IP applications and services by using active traffic monitoring—the generation of traffic in a continuous, reliable, and predictable manner—for measuring network performance. With Cisco IOS IP SLA, service provider customers can measure and provide service level agreements, and enterprise customers can verify service levels, verify outsourced service level agreements, and understand network performance. Cisco IOS IP SLAs can perform network assessments, verify quality of service (QoS), ease the deployment of new services, and assist with network troubleshooting.

For platform-specific information on Cisco IOS IP SLA, see Chapter 66, “Configuring Cisco IOS IP SLA Operations.”

Catalyst 4500 series switch also supports a Built-in Traffic Simulator using Cisco IOS IP SLAs video operations to generate synthetic traffic for a variety of video applications, such as Telepresence, IPTV and IP video surveillance camera. You can use the simulator tool:

- for network assessment before deploying applications that have stringent network performance requirements.
- along with the Cisco IOS Mediatrace for post-deployment troubleshooting for any network related performance issues.

The traffic simulator includes a sophisticated scheduler that allows the user to run several tests simultaneously or periodically and over extended time periods. (Supported only on switches running the Enterprise Services feature set.)

For information on configuring this feature, see the Configuring Cisco IOS IP SLAs Video Operations document at:

Cisco Media Services Proxy

The Media Services Proxy (MSP) feature identifies various media end points in the network automatically and renders appropriate media services. It acts as a layer that connects appropriate devices with their respective network services automatically.

MSP follows a network-centric model, where the access switches and routers learn information about devices and flow by using mechanisms such as Cisco Discovery Protocol (formerly known as CDP) and DHCP, or by snooping on key protocol packets such as the Session Initiation Protocol (SIP) and H.323. Modifications to the endpoints are not required to achieve the information learning. After the information is gleaned, MSP provides appropriate services to the network devices.

Following are the benefits of MSP:

- Automatic identification of devices and flow in the network.
- Application of appropriate services to the endpoints.
- Configuration control for the administrator, thereby reducing the manual configuration and management of services. For example, configuring the Resource Reservation Protocol (RSVP) in the network for video applications requiring guaranteed bandwidth.

**Note**

The system cannot scale to greater than 512 SIP flows with MSP and Flow Metadata enabled.
Cisco Medianet AutoQoS

Cisco Medianet AutoQoS provides a default configuration to ease the process of enabling QoS on switches. This process can be difficult given the functional/behavioral differences in QoS across different platforms. This functionality extends AutoQoS functionality for the Catalyst 4500 to support video traffic as well as other kinds of traffic.

The goal of AutoQos is to simplify the work customers have to undertake while configuring their networks to support QoS. This is done by automating QoS configurations to handle various classes of traffic. AutoQos for Medianet provides commands, which act as macros that call existing CLI commands to implement desired configurations. You are required to specify the type of device (PC, another switch, ip camera, etc.) connected to a given interface. AutoQos for Medianet applies a default QoS configuration to that interface, which you can later fine-tune as needed.

For details, refer to Chapter 40, “Configuring Quality of Service.”

Cisco Medianet Flow Metadata

Flow Metadata is the data that qualifies other data. Flow Metadata aids in supporting an intelligent network by making the network aware about the type, nature, and characteristics of the media stream that flows in the network. Flow Metadata also allows for the network to apply policies on the media streams. Across the Medianet system, Flow Metadata is produced, transported, stored, retrieved, and acted on consistently by a wide variety of Medianet services.

The Flow Metadata infrastructure provides a framework that allows data from one component to be available to another component on the same network element as well as across network elements.

Flow Metadata is supported on releases prior to Cisco IOS Release 15.1(1)SG. Flow metadata is the data that describes a flow in the network. This Flow Metadata describes the five tuple flow along with the attributes. Network elements can take action based on the Flow Metadata generated by the endpoints.

The Flow Metadata infrastructure consists of two major components: producers and consumers.

- Flow Metadata producer is any source of Flow Metadata. The producer propagates all the attributes of a given flow. Producers can be anywhere in the network: endpoint, proxy agents, or intermediate nodes. Currently, Flow Metadata generated by the endpoints is supported. Producers use a specific transport protocol, such as RSVP for signalling the Flow Metadata attributes and store the information in a database, referred to as the control plane database, which can then be used by the consumers.

- Flow Metadata consumer is any network element that uses the flow tuple and Flow Metadata provided by the producers. The flow tuple and Flow Metadata can also be propagated along the media path to consumers in different network elements via a transport infrastructure.

For configuration details, refer to the following URLs:

For details on the Flow Metadata commands, refer to the following URL:

Cisco IOS Mediatrace and Performance Monitor

Cisco IOS Mediatrace helps to isolate and troubleshoot network degradation problems by enabling a network administrator to discover an IP flow's path, dynamically enable monitoring capabilities on the nodes along the path, and collect information on a hop-by-hop basis. This information includes, among other things, flow statistics; utilization information for incoming and outgoing interfaces, CPUs, and memory; as well as any changes to IP routes or the Cisco IOS Mediatrace monitoring state.

For details, see the following URLs:

Configuration guidelines for Cisco IOS Mediatrace and Performance Monitor include the following:

- Video monitoring is supported only on physical ports.

Limitations for Cisco IOS Mediatrace and Performance Monitor on a Catalyst 4500 Series Switch include the following:

- Both features can only be configured to monitor ingress traffic.
- On Supervisor Engine 6-E, Supervisor 6L-E, Catalyst 4900M, and Catalyst 4948E, packets cannot be monitored by both CEure and the rxSPAN session with encapsulation. The first-applied configuration takes precedence.
- Not all packets received by an interface can be monitored. After a packet is received by an ingress interface, it might be either unable to make a forwarding decision or dropped at various stages because of configured security features (like IP Source Guard). The switch attempts to monitor packets close to the switch, but only those that are not dropped before the input classification stage can be monitored.
- CPU utilization is impacted when you monitor a high traffic rate. After the internally-determined threshold is crossed, monitored packets are dropped although the original packet is forwarded in hardware intact. Starting with Release IOS XE 3.3.0SG and IOS 15.1(1)SG, monitored packets might be dropped if any of the following apply:
  - The packet rate exceeds 512 PPS per flow.
  - The aggregated bandwidth of the monitor traffic exceeds 10Mbps.
  - Resources are insufficient to enqueue a new monitored packet.

When monitored packets are dropped, the monitor event will be set to TRUE if the flow record contains collect monitor event. If one minute passes with no new drops, the monitor event is set to FALSE but is not reflected in the output of the show performance monitor status until the new monitor interval starts.

monitor event is a global flag. This means that any packet drops that would trigger "monitor event" be set to TRUE for all monitored flows at that monitor interval. If a metric depends on the collection of continuous packets, the accuracy of that metric might be impacted when a monitor event is TRUE.
Cisco Network Assistant

Cisco Network Assistant manages standalone devices, clusters of devices, or federations of devices from anywhere in your intranet. Using its graphical user interface, you can perform multiple configuration tasks without having to remember command-line interface commands. Embedded CiscoView is a device management application that can be embedded on the switch flash and provides dynamic status, monitoring, and configuration information for your switch.

For more information on Cisco Network Assistant, see Chapter 14, “Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant.”

Dynamic Host Control Protocol

The Catalyst 4500 series switch uses DHCP in the following ways:

- Dynamic Host Control Protocol server—The Cisco IOS DHCP server feature is a full DHCP server implementation that assigns and manages IP addresses from specified address pools within the router to DHCP clients. If the Cisco IOS DHCP server cannot satisfy a DHCP request from its own database, it can forward the request to one or more secondary DHCP servers defined by the network administrator.

- Dynamic Host Control Protocol autoconfiguration—With this feature your switch (the DHCP client) is automatically configured at startup with IP address information and a configuration file.

For DHCP server configuration information, refer to the chapter, “Configuring DHCP,” in the Cisco IOS IP and IP Routing Configuration Guide at the following URL:

Easy Virtual Network

Easy Virtual Network (EVN) is an IP-based virtualization technology that provides end-to-end virtualization of the network. You can use a single IP infrastructure to provide separate virtual networks whose traffic paths remain isolated from each other. Configure Easy Virtual Network to configure two or more virtual IP networks.

For details on EVN, refer to the following URLs:

The following restrictions/feature interactions apply:

- Multicast
  When multicast traffic traverses VRFs, where source and receivers are in different VRFs, multicast counters will not increment on receivers’ VRFs.

- NetFlow
  When configured on an EVN trunk interface, NetFlow captures traffic information for all VRFs but does not preserve the VRF information.

- SPAN
  - When an EVN trunk interface is configured as a SPAN source, traffic belonging to all VRFs carried by the EVN trunk is spanned. By default, the VNET tag is not preserved. To preserve it, configure SPAN destination with the encapsulation dot1q option.
- To span traffic belonging to specific VRFs on an EVN trunk, configure `filter vlan` on the SPAN session with the corresponding VNET tags as vlan_ids and configure VLANs specified in `filter vlan`.

- To span traffic in specific VRFs on all interfaces, configure `vlan` as the SPAN source with VNET tags as vlan_ids and configure VLANs specified as sources.

- If cpu is configured as a SPAN source, then transmit packets that will be spanned are tagged by default. If the `encapsulation dot1q` option is set on the SPAN session, then the cpu transmitted packets, which are spanned, are double tagged.

Refer to Chapter 55, “Configuring SPAN and RSPAN,” for information on configuring SPAN sessions.

**Embedded CiscoView**

A web-based tool to configure the Catalyst 4500 series switch. Embedded CiscoView is a device management application that can be embedded on the switch flash and provides dynamic status, monitoring, and configuration information for your switch.

For more information on Embedded CiscoView, see Chapter 4, “Administering the Switch.”

**Embedded Event Manager**

Embedded Event Manager (EEM) is a distributed and customized approach to event detection and recovery offered directly in a Cisco IOS device. EEM offers the ability to monitor events and take informational, corrective, or any desired EEM action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs.

For information on EEM, see the URL:

**Ethernet Management Port**

The Ethernet management port, also referred to as the `Fast or fastethernet1 port`, is a Layer 3 host port to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management. When managing a switch stack, connect the PC to the Ethernet management port on a Catalyst 4500 series switch.

For more information on Ethernet management port, see the “Using the Ethernet Management Port” section in Chapter 7, “Configuring Interfaces.”

**File System Management on Supervisor Engine 7-E and Supervisor Engine 7L-E**

The format command for IOS XE 3.1.0SG changed slightly compared to the classic IOS format because the later does not support ext2 format.

For USB flash under IOS XE 3.1.0SG, there are 3 optional formats, i.e. FAT16, FAT32 and EXT2:

```
Switch# format usb0: ?
FAT16  FAT16 filesystem type
```
Management Features

FAT32  FAT32 filesystem type
ext2  ext2 filesystem type

For SD card under IOS XE 3.1.0SG, the default format is FAT16:

Switch# format slaveusb0: ?
FAT16  FAT16 filesystem type
FAT32  FAT32 filesystem type
ext2  ext2 filesystem type

**FAT File Management System on Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4948E, and Catalyst 4900M**

The FAT file system is widely used to manage files on devices disks and flash. The support of the FAT file system allows you to easily remove, add, and/or transfer images to and from the flash.

**Forced 10/100 Autonegotiation**

This feature allows you to configure a port to limit the speed at which it will autonegotiate to a speed lower than the physically maximum speed. This method of reducing the throughput incurs much less overhead than using an ACL.

**Intelligent Power Management**

Working with powered devices (PDs) from Cisco, this feature uses power negotiation to refine the power consumption of an 802.3af-compliant PD beyond the granularity of power consumption provided by the 802.3af class. Power negotiation also enables the backward compatibility of newer PDs with older modules that do not support either 802.3af or high-power levels as required by IEEE standard.

For more information on Intelligent Power Management, see the “Intelligent Power Management” section in Chapter 13, “Configuring Power over Ethernet.”

**MAC Address Notification**

MAC address notification monitors the MAC addresses that are learned by, aged out, or removed from the Catalyst 4500 series switch. Notifications are sent out or retrieved by using the CISCO-MAC-NOTIFICATION MIB. It is typically used by a central network management application to collect such MAC address notification events for host moves. User-configurable MAC table utilization thresholds can be defined to notify any potential DoS or man-in-the-middle attack.

For information on MAC Address Notification, see Chapter 4, “Administering the Switch.”

**MAC Notify MIB**

The MAC Notify MIB feature monitors network performance, utilization, and security conditions enabling a network administrator to track the MAC addresses that are learned or removed on the switch forwarding the Ethernet frames.
NetFlow-lite

NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

The NetFlow-lite feature is based on ingress packet sampling at a monitoring point that can be an interface on the switch. By exporting NetFlow sampled packets, it provides visibility into traffic that is switched through the device. The rate at which input packets are sampled is configurable and a wide range of sampling rates are supported. Each sampled packet is exported as a separate NetFlow data record in the data path. NetFlow V9 and V10 (IPFIX) export formats are supported.

For more information on NetFlow statistics, see Chapter 61, “Configuring NetFlow-lite.”

Power over Ethernet

Power over Ethernet (PoE) allows the LAN switching infrastructure to provide power to an endpoint ("powered device") over a copper Ethernet cable. This capability, once referred to as "inline power," was originally developed by Cisco in 2000 to support emerging IP telephony deployments.

IP telephones need power for operation, and Power over Ethernet supports scalable, manageable power delivery and simplifies IP telephony deployments. As wireless networking emerged, Power over Ethernet began powering wireless devices in locations where local power access did not exist.

For more information on Power over Ethernet, see Chapter 13, “Configuring Power over Ethernet.”

Secure Shell

Secure Shell (SSH) is a program that enables you to log into another computer over a network, to execute commands remotely, and to move files from one machine to another. The switch may not initiate SSH connections: SSH will be limited to providing a remote login session to the switch and will only function as a server.

Simple Network Management Protocol

Simple Network Management Protocol (SNMP) facilitates the exchange of management information between network devices. The Catalyst 4500 series switch supports these SNMP types and enhancements:

- SNMP—A full Internet standard
- SNMP v2—Community-based administrative framework for version 2 of SNMP
- SNMP v3—Security framework with three levels: noAuthNoPriv, authNoPriv, and authPriv (available only on a crypto image, such as cat4000-i5k91s-mz)
- SNMP trap message enhancements—Additional information with certain SNMP trap messages, including spanning-tree topology change notifications and configuration change notifications

For more information on SNMP, see Chapter 60, “Configuring SNMP.”
SPAN and RSPAN

Switched Port Analyzer (SPAN) allows you to monitor traffic on any port for analysis by a network analyzer or Remote Monitoring (RMON) probe. You also can do the following:

- Configure ACLs on SPAN sessions.
- Allow incoming traffic on SPAN destination ports to be switched normally.
- Explicitly configure the encapsulation type of packets that are spanned out of a destination port.
- Restrict ingress sniffing depending on whether the packet is unicast, multicast, or broadcast, and depending on whether the packet is valid.
- Mirror packets sent to or from the CPU out of a SPAN destination port for troubleshooting purposes.

For information on SPAN, see Chapter 55, “Configuring SPAN and RSPAN.”

Remote SPAN (RSPAN) is an extension of SPAN, where source ports and destination ports are distributed across multiple switches, allowing remote monitoring of multiple switches across the network. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session on all participating switches.

For information on RSPAN, see Chapter 55, “Configuring SPAN and RSPAN.”

Universal Power over Ethernet

The IEEE 802.3 Power over Ethernet (PoE) standard sets the maximum power that can be sourced by data terminal equipment (DTE) at 30W. This power is sourced over two pairs out of the four twisted pairs of conductors in a Class D, or better, cabling as specified in ISO/IEC 11801:1995.

Cisco® Universal Power over Ethernet (UPOE) is a Cisco proprietary technology that extends the IEEE 802.3 PoE standard to provide the capability to source up to 60W of power over standard Ethernet cabling infrastructure (Class D or better).

For more information on UPOE, see the “Configuring Universal PoE” section in Chapter 13, “Configuring Power over Ethernet.”

Web Content Coordination Protocol

WCCP version 1 is not supported.

Web Content Communication Protocol (WCCP) Version 2 Layer 2 redirection enables Catalyst 4500 series switches to transparently redirect content requests to the directly connected content engines by using a Layer 2 and MAC address rewrite. The WCCPv2 Layer 2 redirection is accelerated in the switching hardware, and is more efficient than Layer 3 redirection using Generic Routing Encapsulation (GRE). The content engines in a cache cluster transparently store frequently accessed content, and then fulfills successive requests for the same content, eliminating repetitive transmissions of identical content from the original content servers. It supports the transparent redirection of HTTP and non-HTTP traffic with ports or dynamic services, such as Web caching, HTTPS caching, File Transfer Protocol (FTP) caching, proxy caching, media caching, and streaming services. WCCPv2 Layer 2 redirection is typically deployed for transparent caching at network edge, such as regional or branch sites. WCCPv2 Layer 2 redirection cannot be enabled on the same input interface with PBR or VRF-lite. ACL-based classification for Layer 2 redirection is not supported.
Wireshark

Wireshark is only supported on Supervisor Engine 7-E, Supervisor Engine 7L-E, and Catalyst 4500X-32.

Starting with Cisco IOS Release XE 3.3.0SG and the IP Base and Enterprise Services feature sets, the Catalyst 4500 series switch supports Wireshark. This is a packet analyzer program, formerly known as Ethereal that supports multiple protocols and presents information in a graphical and text-based user interface. Wireshark is applied or enabled on an individual interface; global packet capture is not supported.

For information on Wireshark, see Chapter 56, “Configuring Wireshark.”

XML-PI

eXtensible Markup Language Programmatic Interface (XML-PI) Release 1.0 leverages the Network Configuration Protocol (NETCONF). It provides new data models that collect running configurations and show command output down to the keyword level without requiring the technologies or external XML-to-command line interface (CLI) gateways. XML-PI allows you to develop XML-based network management applications to control any number of network devices simultaneously.

Refer to the following link for more details:

Security Features

The Catalyst 4500 series switch offers network management and control through the CLI or through alternative access methods, such as SNMP. The switch software supports these security features:

- 802.1X Identity-Based Network Security, page 1-31
- Cisco TrustSec Security Architecture, page 1-32
- Cisco TrustSec MACsec Encryption, page 1-33
- Dynamic ARP Inspection, page 1-33
- Dynamic Host Configuration Protocol Snooping, page 1-33
- Flood Blocking, page 1-34
- Hardware-Based Control Plane Policing, page 1-34
- IP Source Guard, page 1-34
- IP Source Guard for Static Hosts, page 1-34
- Local Authentication, RADIUS, and TACACS+ Authentication, page 1-35
- Network Admission Control, page 1-35
- Network Security with ACLs, page 1-35

For information on WCCP, see Chapter 69, “Configuring WCCP Version 2 Services.”
Security Features

- Port Security, page 1-36
- PPPoE Intermediate Agent, page 1-36
- Storm Control, page 1-36
- uRPF Strict Mode, page 1-37
- Utilities, page 1-37
- Web-based Authentication, page 1-38

802.1X Identity-Based Network Security

This security feature consists of the following:

- 802.1X Authentication for Guest VLANs—Allows you to use VLAN assignment to limit network access for certain users.
- 802.1X Authentication Failed Open Assignment—Allows you to configure a switch to handle the case when a device fails to authenticate itself correctly through 802.1X (for example, not providing the correct password).
- 802.1X Authentication with ACL Assignment—Downloads per-host policies such as ACLs and redirect URLs to the switch from the RADIUS server during 802.1X or MAB authentication of the host.
- 802.1X Authentication with Per-User ACL and Filter-ID ACL—Allows ACL policy enforcement using a third-party AAA server.
- 802.1X Convergence—Provides consistency between the switching business units in 802.1X configuration and implementation.
- 802.1X Protocol—Provides a means for a host that is connected to a switch port to be authenticated before it is given access to the switch services.
- 802.1X RADIUS accounting—Allows you to track the use of network devices.
- 802.1X Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)—Extends identity to areas outside the wiring closet (such as conference rooms). NEAT is designed for deployment scenarios where a switch acting as 802.1X authenticator to end-hosts (PC or Cisco IP-phones) is placed in an unsecured location (outside wiring closet); the authenticator switch cannot always be trusted.
- 802.1X with Authentication Failed VLAN Assignment—Allows you to provide access for authentication failed users on a per-port basis. Authentication failed users are end hosts that are 802.1X-capable but do not have valid credentials in an authentication server or end hosts that do not give any username and password combination in the authentication pop-up window on the user side.
- 802.1X with Inaccessible Authentication Bypass—Applies when the AAA servers are unreachable or nonresponsive. In this situation, 802.1X user authentication typically fails with the port closed, and the user is denied access. Inaccessible Authentication Bypass provides a configurable alternative on the Catalyst 4500 series switch to grant a critical port network access in a locally specified VLAN.
- 802.1X with Port Security—Allows port security on an 802.1X port in either single- or multiple-host mode. When you enable port security and 802.1X on a port, 802.1X authenticates the port, and port security manages the number of MAC addresses allowed on that port, including that of the client.
• 802.1X with MAC Authentication Bypass—Provides network access to agentless devices without 802.1X supplicant capabilities, such as printers. Upon detecting a new MAC address on a switch port, the Catalyst 4500 series switch will proxy an 802.1X authentication request based on the device’s MAC address.

• 802.1X with RADIUS-Provided Session Timeouts—Allows you to specify whether a switch uses a locally configured or a RADIUS-provided reauthentication timeout.

• 802.1X with Unidirectional Controlled Port—Allows the Wake-on-LAN (WoL) magic packets to reach a workstation attached to an unauthorized 802.1X switch port. Unidirectional Controlled Port is typically used to send operating systems or software updates from a central server to workstations at night.

• 802.1X with Violation Mode—This feature allows you to configure 802.1X security violation behavior as either shutdown, restrict, or replace mode, based on the response to the violation.

• 802.1X with VLAN assignment—This feature allows you to enable non-802.1X-capable hosts to access networks that use 802.1X authentication.

• 802.1X with VLAN user distribution—An alternative to dynamically assigning a VLAN ID or a VLAN name, this feature assigns a VLAN Group name. It enables you to distribute users belonging to the same group (and characterized by a common VLAN Group name) across multiple VLANs. Ordinarily, you do this to avoid creating an overly large broadcast domain.

• 802.1X with Voice VLAN—This feature allows you to use 802.1X security on a port while enabling it to be used by both Cisco IP phones and devices with 802.1X supplicant support.

• Multi-Domain Authentication—This feature allows both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port, which is divided into a data domain and a voice domain.

• RADIUS Change of Authorization—This feature employs Change of Authorization (CoA) extensions defined in RFC 5176 in a push model to allow for the dynamic reconfiguring of sessions from external authentication, authorization, and accounting (AAA) or policy servers.

For more information on 802.1X identity-based network security, see Chapter 44, “Configuring 802.1X Port-Based Authentication.”

Cisco TrustSec Security Architecture

The Cisco TrustSec security architecture builds secure networks by establishing domains of trusted network devices. Each device in the domain is authenticated by its peers. Communication on the links between devices in the domain is secured with a combination of encryption, message integrity check, and data-path replay protection mechanisms. Cisco TrustSec uses the device and user credentials acquired during authentication for classifying the packets by security groups (SGs) as they enter the network. This packet classification is maintained by tagging packets on ingress to the Cisco TrustSec network so that they can be properly identified for the purpose of applying security and other policy criteria along the data path. The tag, called the security group tag (SGT), allows the network to enforce the access control policy by enabling the endpoint device to act upon the SGT to filter traffic.

For more information, refer to the following URL:

Cisco TrustSec MACsec Encryption

Although the ® Catalyst® 4500-X Series Switch supports Cisco TrustSec® technology, it does not support TrustSec MACsec Encryption.

MACsec (Media Access Control Security) is the IEEE 802.1AE standard for authenticating and encrypting packets between two MACsec-capable devices. The Catalyst 4500 series switch supports 802.1AE encryption with MACsec Key Agreement (MKA) on downlink ports for encryption between the switch and host devices. The switch also supports MACsec link layer switch-to-switch security by using Cisco TrustSec Network Device Admission Control (NDAC) and the Security Association Protocol (SAP) key exchange. Link layer security can include both packet authentication between switches and MACsec encryption between switches (encryption is optional).

For more information on TrustSec MACsec encryption, see Chapter 43, “Configuring MACsec Encryption.”

Dynamic ARP Inspection

Dynamic ARP Inspection (DAI) intercepts all ARP requests, replies on untrusted ports, and verifies each intercepted packet for valid IP to MAC bindings. Dynamic ARP Inspection helps to prevent attacks on a network by not relaying invalid ARP replies out to other ports in the same VLAN. Denied ARP packets are logged by the switch for auditing.

For more information on dynamic ARP inspection, see Chapter 49, “Configuring Dynamic ARP Inspection.”

Dynamic Host Configuration Protocol Snooping

Dynamic Host Configuration Protocol (DHCP) Snooping is a security feature that is a component of a DHCP server. DHCP snooping provides security by intercepting untrusted DHCP messages and by building and maintaining a DHCP snooping binding table. An untrusted message is a message that is received from outside the network or firewall that can cause traffic attacks within your network.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. It also provides a way to differentiate between untrusted interfaces connected to the end-user and trusted interfaces connected to the DHCP server or another switch.

With SSO support, DHCP Snooping propagates the DHCP-snooped data from the active supervisor engine to the redundant supervisor engine so that when a switchover occurs, the newly active supervisor engine is aware of the DHCP data that was already snooped, and the security benefits continue uninterrupted.

For DHCP server configuration information, refer to the chapter, “Configuring DHCP,” in the Cisco IOS IP and IP Routing Configuration Guide at the following URL:

For information on configuring DHCP snooping, see Chapter 50, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”
Flood Blocking

Flood blocking enables users to disable the flooding of unicast and multicast packets on a per-port basis. Occasionally, unknown unicast or multicast traffic from an unprotected port is flooded to a protected port because a MAC address has timed out or has not been learned by the switch.

For information on flood blocking, see Chapter 53, “Port Unicast and Multicast Flood Blocking.”

Hardware-Based Control Plane Policing

Control Plane Policing provides a unified solution to limit the rate of CPU bound control plane traffic in hardware. It enables users to install system wide control plane ACLs to protect the CPU by limiting rates or filtering out malicious DoS attacks. Control plane policing ensures the network stability, availability and packet forwarding, and prevents network outages such as loss of protocol updates despite an attack or heavy load on the switch. Hardware-based control plane policing is available for all Catalyst 4500 supervisor engines. It supports various Layer 2 and Layer 3 control protocols, such as CDP, EAPOL, STP, DTP, VTP, ICMP, CGMP, IGMP, DHCP, RIPv2, OSPF, PIM, TELNET, SNMP, HTTP, and packets destined to 224.0.0.* multicast link local addresses. Predefined system policies or user-configurable policies can be applied to those control protocols.

Through Layer 2 Control Packet QoS, you can police control packets arriving on a physical port or VLAN; it enables you to apply QoS on Layer 2 control packets.

For information on control plane policing and Layer 2 control packet QoS, see Chapter 48, “Configuring Control Plane Policing and Layer 2 Control Packet QoS.”

IP Source Guard

Similar to DHCP snooping, this feature is enabled on an untrusted Layer 2 port that is configured for DHCP snooping. Initially all IP traffic on the port is blocked except for the DHCP packets, which are captured by the DHCP snooping process. When a client receives a valid IP address from the DHCP server, a PVACL is installed on the port, which restricts the client IP traffic only to clients with assigned IP addresses, so any IP traffic with source IP addresses other than those assigned by the DHCP server will be filtered out. This filtering prevents a malicious host from attacking a network by hijacking neighbor host’s IP address.

For information on configuring IP Source Guard, see Chapter 50, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”

IP Source Guard for Static Hosts

This feature allows you to secure the IP address learned from static hosts by using ARP packets and then bind that IP address to a given MAC address using the device tracking database, allowing entries to survive through link down events.

IP Source Guard (IPSG) for static hosts allows multiple bindings per-port per-MAC address for both DHCP and static hosts, in both device tracking database and DHCP snooping binding database. The feature allows you to take action when a limit is exceeded.

For information on configuring IPSG for static hosts, see Chapter 50, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”
Local Authentication, RADIUS, and TACACS+ Authentication

Local Authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+) authentication methods control access to the switch. For additional information, refer to the following URL:

Network Admission Control

Network Admission Control consists of two features:

- **NAC Layer 2 IP validation**
  
  NAC Layer 2 IP is an integral part of Cisco Network Admission Control. It offers the first line of defense for infected hosts (PCs and other devices attached to a LAN port) attempting to connect to the corporate network. NAC Layer 2 IP on the Cisco Catalyst 4500 series switch performs posture validation at the Layer 2 edge of the network for non-802.1x-enabled host devices. Host device posture validation includes antivirus state and OS patch levels. Depending on the corporate access policy and host device posture, a host may be unconditionally admitted, admitted with restricted access, or quarantined to prevent the spread of viruses across the network.

  For more information on Layer 2 IP validation, see the URL:

- **NAC Layer 2 802.1X authentication**
  
  The Cisco Catalyst 4500 series switch extends NAC support to 802.1x-enabled devices. Like NAC Layer 2 IP, the NAC Layer 2 802.1x feature determines the level of network access based on endpoint information.

  For more information on 802.1X identity-based network security, see Chapter 44, “Configuring 802.1X Port-Based Authentication.”

Network Security with ACLs

An access control list (ACL) filters network traffic by controlling whether routed packets are forwarded or blocked at the router interfaces. The Catalyst 4500 series switch examines each packet to determine whether to forward or drop the packet based on the criteria you specified within the access lists.

MAC access control lists (MACLs) and VLAN access control lists (VACLs) are supported. VACLs are also known as VLAN maps in Cisco IOS.

The Catalyst 4500 series switch supports three types of ACLs:

- **IP ACLs**, which filter IP traffic, including TCP, the User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP)
- **IPv6 ACLs**
- **MAC ACLs** which match based on Ethernet addresses and Ether Type
The switch supports the following applications of ACLs to filter traffic:

- MAC address filtering, which enables you to block unicast traffic for a MAC address on a VLAN interface.
- Port ACLs, which enable you to apply ACLs to Layer 2 interfaces on a switch for inbound traffic.
- Router ACLs, which are applied to Layer 3 interfaces to control the access of routed traffic between VLANs.
- VLAN ACLs or VLAN maps to control the access of all packets (bridged and routed).

For information on ACLs, MACLs, VLAN maps, MAC address filtering, and Port ACLs, see Chapter 51, “Configuring Network Security with ACLs.”

### Port Security

Port security restricts traffic on a port based upon the MAC address of the workstation that accesses the port. Trunk port security extends this feature to trunks, including private VLAN isolated trunks, on a per-VLAN basis.

Sticky port security extends port security by saving the dynamically learned MAC addresses in the running configuration to survive port link down and switch reset. It enables a network administrator to restrict the MAC addresses allowed or the maximum number of MAC addresses on each port.

Voice VLAN sticky port security further extends the sticky port security to the voice-over-IP deployment. Voice VLAN sticky port security locks a port and blocks access from a station with a MAC address different from the IP phone and the workstation behind the IP phone.

For information on port security, see Chapter 47, “Configuring Port Security.”

### PPPoE Intermediate Agent

PPPoE Intermediate Agent (PPPoE IA) is placed between a subscriber and BRAS to help the service provider BRAS distinguish between end hosts connected over Ethernet to an access switch. On the access switch, PPPoE IA enables Subscriber Line Identification by appropriately tagging Ethernet frames of different users. (The tag contains specific information such as which subscriber is connected to the switch and VLAN.) PPPoE IA acts as mini-security firewall between host and BRAS by intercepting all PPPoE Active Discovery (PAD) messages on a per-port per-VLAN basis. It provides specific security feature such as verifying the intercepted PAD message from untrusted port, performing per-port PAD message rate limiting, inserting and removing VSA tags into and from PAD messages, respectively.

For information on PPPoE IA, see Chapter 45, “Configuring the PPPoE Intermediate Agent.”

### Storm Control

Broadcast suppression is used to prevent LANs from being disrupted by a broadcast storm on one or more switch ports. A LAN broadcast storm occurs when broadcast packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation or in the network configuration can cause a broadcast storm. Multicast and broadcast suppression measures how much broadcast traffic is passing through a port and compares the broadcast traffic with some configurable threshold value within a specific time interval. If the amount of broadcast traffic reaches the threshold during this interval, broadcast frames are dropped, and optionally the port is shut down...
Starting with Cisco IOS Release 12.2(40)SG, the Catalyst 4500 series switch allows suppression of broadcast and multicast traffic on a per-port basis.

For information on configuring broadcast suppression, see Chapter 54, “Configuring Storm Control.”

**uRPF Strict Mode**

The uRPF feature mitigates problems caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. uRPF deflects denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This helps to protect the network of the customer, the ISP, and the rest of the Internet. When using uRPF in strict mode, the packet must be received on the interface that the router uses to forward the return packet. uRPF strict mode is supported for both IPv4 and IPv6 prefixes.

For information on configuring broadcast suppression, see Chapter 34, “Configuring Unicast Reverse Path Forwarding.”

**Utilities**

Supported utilities include the following:

**Layer 2 Traceroute**

Layer 2 traceroute allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses.

For information about Layer 2 Traceroute, see Chapter 8, “Checking Port Status and Connectivity.”

**Time Domain Reflectometry**

Time Domain Reflectometry (TDR) is a technology used for diagnosing the state and reliability of cables. TDR can detect open, shorted, or terminated cable states. The calculation of the distance to the failure point is also supported.

For information about TDR, see Chapter 8, “Checking Port Status and Connectivity.”

**Debugging Features**

The Catalyst 4500 series switch has several commands to help you debug your initial setup. These commands are included in the following command groups:

- **platform**
- **debug platform**

For more information, refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference.*
Web-based Authentication

The web-based authentication feature, known as Web Authentication Proxy, enables you to authenticate end users on host systems that do not run the IEEE 802.1X supplicant. When you initiate an HTTP session, this feature intercepts ingress HTTP packets from the host and sends an HTML login page to your. You key in the credentials, which the web-based authentication feature sends to the AAA server for authentication. If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

For information on configuring web-based authentication, see Chapter 46, “Configuring Web-Based Authentication.”
New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG

This document provides a list of new and modified software features supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG.

**AAA Double Authentication Secured by Absolute Timeout**

**AAA CLI Stop Record Enhancement**

**AAA Support for MSCHAPv2 Password Aging**

**Local AAA Server**

**Throttling of AAA (RADIUS) Records**

**Area Command in Interface Mode for OSPFv2** (See Enabling OSPFv2 on an Interface Basis)

**Bandwidth-Based Call Admission Control (CAC) for IP Multicast**

**BFD - BFD Hardware Offload Support**

**BFD - EIGRP Support**
**BFD - Static Route Support**

**BFD IPv6 Encap Support**

**BFD - OSPF Support for BFD over IPv4**

**SSO - BFD**

**BGP Support for BFD**

**BGP Support for BFD over IPv6**

**BGP Dynamic Neighbors**

**BGP Per Neighbor Graceful Restart Configuration**

**BGP Support for 4-byte ASN**

**BGP Support for Dual AS Configuration for Network AS Migrations**

**BGP Support for Next-Hop Address Tracking**
Chapter 1      Product Overview

New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG

BGP Event Based VPN Import

BGP Support for the L2VPN Address Family

Bidirectional Forwarding Detection (BFD) MIB version 2

Cisco IOS Shell

EVPN EIGRP

EVPN Multicast

EVPN OSPF

EVPN Route Replication

EVPN Traceroute

EVPN VNET trunk
New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG

Chapter 1      Product Overview

**EVN Cisco EVN MIB**

**Embedded Packet Capture (EPC)**

**Enhanced Test Command**

**Extended NAS-Port-Type and NAS-Port Support**

**HSRP: Global IPv6 Address**

**IGMP MIB Support Enhancements for SNMP**

The Internet Group Management Protocol (IGMP) is used by IP hosts to report their multicast group memberships to neighboring multicast routers. The IGMP MIB describes objects that enable users to remotely monitor and configure IGMP using Simple Network Management Protocol (SNMP). It also allows users to remotely subscribe and unsubscribe from multicast groups. The IGMP MIB Support Enhancements for SNMP feature adds full support of RFC 2933 (Internet Group Management Protocol MIB) in Cisco IOS software.

There are no new or modified Cisco IOS commands associated with this feature.

For detailed information about the IGMP MIB, see the IGMP-STD-MIB.my file available from the Cisco MIB Locator at http://www.cisco.com/go/mibs.

For more information, see one of the following documents:

For Cisco IOS Release 15.1(1)SG, see

For Cisco IOS XE Release 3.3SG, see
Chapter 1  Product Overview

New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG

IGMP Static Group Range Support

IGMPv3 Host Stack

Device Sensor

IP Multicast Load Splitting - Equal Cost Multipath (ECMP) using S, G and Next-hop

IP-RIP Delay Start
Refer to the `ip rip initial-delay` command:

IP SLAs Video Operation

IPv6 ACL Extensions for Hop-by-Hop Filtering

IPv6 BSR - Configure RP mapping

IPv6 Source Specific Multicast (SSM) Mapping

IPv6 Switching: CEFv6 Switched Configured IPv6 over IPv4 Tunnels
IPv6 Tunneling: ISATAP Tunnel Support

IPv6: Multicast Address Group Range Support

ISG: Policy Control: Policy Server: CoA (QoS, L4 redirect, User ACL, TimeOut)

ISG: Session: LifeCycle: POD

IS-IS Support for an IS-IS Instance per VRF for IP

License Call Home

Login Password Retry Lockout

Flow Metadata

Performance Monitor (Phase 1)

MediaTrace 1.0
Chapter 1      Product Overview

New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG

MLD Group Limits

Media Services Proxy

MSDP MD5 password authentication

Multicast Address Group Range Support
The Multicast Address Group Range Support feature enhances multicast access control by introducing the capability to define a global range of multicast groups and channels to be permitted or denied using the `ip multicast group-range` command. For more information, see the Cisco IOS IP Multicast Command Reference at http://www.cisco.com/en/US/docs/ios-xml/ios/ipmulti/command/imc_i2.html.

Named Mode for EIGRP VNETs IPv4

Network Mobility Services Protocol (NMSP) Enhancements
- Custom Location Type
  Users can customize the name and value of a switch location using the `location custom-location identifier` command.
- Geo Location Type Support
  Users can specify the geographical details of a switch location such as latitude, longitude, and altitude of a switch using the `location geo-location identifier` command.
- Switch Location Configuration
  Users can specify the switch location via ‘host’ identifier on the interface and enter specific location data under port-location sub-mode using the following commands:
  - `location civic-location identifier host`
  - `location geo-location identifier host`
  - `location custom-id identifier host`
  Switch location can contain civic address, custom identifier and GPS location where an individual location type can be present or absent.

NTPv4 with support for IPv4 and IPv6

OSPF Enhanced Traffic Statistics for OSPFv2 and OSPFv3
**New and Modified Software Features Supported in Cisco IOS 15.1(1)SG and Cisco IOS XE 3.3SG**

PIM Triggered Joins

Product Security Baseline: Password Encryption and Complexity Restrictions

RADIUS Progress Codes

RADIUS Proxy billing accuracy
In public WLAN deployments, service providers must absolutely ensure the billing accuracy of a user’s session. The billing accuracy must also be met in case of a network component failure. The RADIUS proxy billing accuracy feature ensures that the start and stop session events are accurate and the events are the main references for session management. To configure this feature, use the timer reconnect command in RADIUS proxy server configuration mode and use the show radius-proxy session command to see information about the timer in ISG RADIUS proxy sessions.

RADIUS Server Load Balancing porting

SAF Dynamic Neighbors

SNMP Traps for PPPoE Session Limits
Supressing EXEC Accounting Record
The Supressing EXEC Accounting Record feature enables the suppression of an EXEC-stop accounting record when autoselection during login for the dial-in clients is configured. To configure the Supressing EXEC Accounting Record feature, use the `aaa accounting nested suppress stop` command in global configuration mode.

TFTP - Blocksize Option
The `ip tftp blocksize` command has been added which allows you to specify the size of the TFTP block for negotiation with the TFTP server.

VRF Aware System Message Logging (Syslog)

Web Services Management Agent (WSMA)

WCCP Version 2

WCCP - Configurable Router ID
Command-Line Interfaces

This chapter describes the CLIs you use to configure the Catalyst 4500 series switch. This chapter includes the following major sections:

- Accessing the Switch CLI, page 2-2
- Performing Command-Line Processing, page 2-3
- Performing History Substitution, page 2-4
- About Cisco IOS Command Modes, page 2-4
- Getting a List of Commands and Syntax, page 2-5
- ROMMON Command-Line Interface, page 2-7
- Archiving Crashfiles Information, page 2-8
- Displaying a Crash Dump for Supervisor Engine 6-E and 6L-E, page 2-8

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

The following command changes only apply to Supervisor Engines 6-E and 6L-E:

- The rename command is supported in the FAT file system for bootflash and slot0.
- The fsck command is supported for the slot0 device. It is not supported in the file systems on supervisor engines other than Supervisor Engine 6-E and 6L-E.

The following additional file management commands are supported on Supervisor Engine 7-E and Supervisor Engine 7L-E:

- verify <filename>
- delete <filename>
- copy <source_filename>, target_filename
Chapter 2      Command-Line Interfaces

Accessing the Switch CLI

The following sections describe how to access the switch CLI:
- Accessing the CLI Using the EIA/TIA-232 Console Interface, page 2-2
- Accessing the CLI Through Telnet, page 2-2

Accessing the CLI Using the EIA/TIA-232 Console Interface

Note: EIA/TIA-232 was known as recommended standard 232 (RS-232) before its acceptance as a standard by the Electronic Industries Alliance (EIA) and Telecommunications Industry Association (TIA).

Perform the initial switch configuration over a connection to the EIA/TIA-232 console interface. Refer to the Catalyst 4500 Series Switch Module Installation Guide for console interface cable connection procedures.

To access the switch through the console interface, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch&gt; enable</td>
<td>From the user EXEC prompt (&gt;), enter enable to change to enable mode (also known as privileged mode or privileged EXEC mode).</td>
</tr>
<tr>
<td>2</td>
<td>Password: password</td>
<td>At the password prompt, enter the system password. The prompt (#) appears, indicating that you have accessed the CLI in enabled mode.</td>
</tr>
<tr>
<td></td>
<td>Switch#</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Switch# quit</td>
<td>When you are finished executing the task command, exit the session.</td>
</tr>
</tbody>
</table>

After accessing the switch through the EIA/TIA-232 interface, you see this display:

Press Return for Console prompt

Switch> enable
Password:< >
Switch#

Accessing the CLI Through Telnet

Note: Before you make a Telnet connection to the switch, you must set the IP address for the switch. See the “Configuring Physical Layer 3 Interfaces” section on page 32-12.

The switch supports up to eight simultaneous Telnet sessions. Telnet sessions disconnect automatically after remaining idle for the period specified by the **exec-timeout** command.
To make a Telnet connection to the switch, perform this task:

**Performing Command-Line Processing**

Switch commands are not case sensitive. You can abbreviate commands and parameters if the abbreviations contain enough letters to be different from any other currently available commands or parameters.

You can scroll through the last 20 commands stored in the history buffer and enter or edit a command at the prompt. **Table 2-1** lists the keyboard shortcuts for entering and editing switch commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>telnet {hostname</td>
</tr>
<tr>
<td>Step 2</td>
<td>Password: password At the prompt, enter the password for the CLI. If no password has been configured, press Return.</td>
</tr>
<tr>
<td></td>
<td>Switch# Enter the necessary commands to complete your desired tasks.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# quit When finished, exit the Telnet session.</td>
</tr>
</tbody>
</table>

**Table 2-1** Keyboard Shortcuts

<table>
<thead>
<tr>
<th>Keystrokes</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Press Ctrl-B or press the Left Arrow key</td>
<td>Moves the cursor back one character.</td>
</tr>
<tr>
<td>Press Ctrl-F or press the Right Arrow key</td>
<td>Moves the cursor forward one character.</td>
</tr>
<tr>
<td>Press Ctrl-A</td>
<td>Moves the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Press Ctrl-E</td>
<td>Moves the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Press Esc-B</td>
<td>Moves the cursor back one word.</td>
</tr>
<tr>
<td>Press Esc-F</td>
<td>Moves the cursor forward one word.</td>
</tr>
</tbody>
</table>

1. The Arrow keys function only on ANSI-compatible terminals, such as VT100s.

This example shows how to open a Telnet session to the switch:

```
unix_host% telnet Switch_1
Trying 172.20.52.40...
Connected to 172.20.52.40.
Escape character is '^]'.
User Access Verification
Password:< >
Switch_1> enable
Password:
Switch_1#
```
Performing History Substitution

The history buffer stores the last 20 command lines you entered. History substitution enables you to access these command lines without retyping them. Table 2-2 lists the history substitution commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-P or the Up Arrow key(^1)</td>
<td>Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall older commands successively.</td>
</tr>
<tr>
<td>Ctrl-N or the Down Arrow key(^1)</td>
<td>Returns to more recent commands in the history buffer after commands have been recalled with Ctrl-P or the Up Arrow key. Repeat the key sequence to recall more recent commands.</td>
</tr>
<tr>
<td>Switch# show history</td>
<td>Lists the last several commands you have entered in EXEC mode.</td>
</tr>
</tbody>
</table>

1. The Arrow keys function only on ANSI-compatible terminals such as VT100s.

About Cisco IOS Command Modes

For complete information about Cisco IOS command modes, refer to the *Cisco IOS Configuration Fundamentals Configuration Guide* and the *Cisco IOS Configuration Fundamentals Command Reference* at the following URLs:

The Cisco IOS user interface has many different modes: user EXEC, privileged EXEC (enable), global configuration, interface, subinterface, and protocol-specific. The commands available to you depend on which mode you are in. To get a list of the commands in a given mode, enter a question mark (?) at the system prompt. See the “Getting a List of Commands and Syntax” section on page 2-5 for more information.

When you start a session on the switch, you begin in user mode, also called user EXEC mode. Only a small subset of commands are available in EXEC mode. To have access to all commands, you must enter privileged EXEC mode, also called enable mode. To access the privileged EXEC mode, you must enter a password. When you are in the privileged EXEC mode, you can enter any EXEC command or access global configuration mode. Most EXEC commands are one-time commands, such as `show` commands, which display the current configuration status, and `clear` commands, which reset counters or interfaces. The EXEC commands are not saved when the switch is rebooted.

The configuration modes allow you to make changes to the running configuration. If you save the configuration, these commands are stored when you reboot the switch. You must start in global configuration mode. From global configuration mode, you can enter interface configuration mode, subinterface configuration mode, and a variety of protocol-specific modes.
You use a separate mode called ROMMON when the switch cannot boot up properly. For example, the switch might enter ROMMON mode if it does not find a valid system image when it is booting, or if its configuration file is corrupted. For more information, see the “ROMMON Command-Line Interface” section on page 2-7.

Table 2-3 lists and describes frequently used Cisco IOS modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>What You Use It For</th>
<th>How to Access</th>
<th>Prompt</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>To connect to remote devices, change terminal settings on a temporary basis, perform basic tests, and display system information.</td>
<td>Log in.</td>
<td>Switch&gt;</td>
</tr>
<tr>
<td>Privileged EXEC (enable)</td>
<td>To set operating parameters. The privileged command set includes the commands in user EXEC mode, as well as the configure command. Use the configure command to access the other command modes.</td>

<td>Switch(config-line)#</td>
</tr>
</tbody>
</table>

The Cisco IOS command interpreter, called the EXEC, interprets and runs the commands you enter. You can abbreviate commands and keywords by entering just enough characters to make the command unique from other commands. For example, you can abbreviate the show command to sh and the configure terminal command to config t.

When you type exit, the switch backs out one level. To exit configuration mode completely and return to privileged EXEC mode, press Ctrl-Z.

Getting a List of Commands and Syntax

In any command mode, you can get a list of available commands by entering a question mark (?).

Switch> ?

To obtain a list of commands that begin with a particular character sequence, enter those characters followed by the question mark (?). Do not include a space before the question mark. This form of help is called word help, because it completes a word for you.
To list keywords or arguments, enter a question mark in place of a keyword or argument. Include a space before the question mark. This form of help is called command syntax help, because it reminds you which keywords or arguments are applicable based on the command, keywords, and arguments you have already entered.

Switch# configure ?
  memory             Configure from NV memory
  network            Configure from a TFTP network host
  overwrite-network  Overwrite NV memory from TFTP network host
  terminal           Configure from the terminal
<cr>

To redisplay a command you previously entered, press the **Up Arrow** key or **Ctrl-P**. You can continue to press the **Up Arrow** key to see the last 20 commands you entered.

**Tip**

If you are having trouble entering a command, check the system prompt and enter the question mark (?) for a list of available commands. You might be in the wrong command mode or using incorrect syntax.

Type **exit** to return to the previous mode. Press **Ctrl-Z** or enter the **end** command in any mode to immediately return to privileged EXEC mode.

**Virtual Console for Standby Supervisor Engine**

Catalyst 4500 series switches can be configured with 2 supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. You must connect to the standby console to access, monitor or debug the standby supervisor.

Virtual Console for Standby Supervisor Engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine and thus emulate the standby console on the active supervisor engine. Only one active standby console session is active at any time.

The virtual console for standby supervisor engine enables users who are logged onto the active supervisor engine to remotely execute **show** commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the **attach module**, **session module**, or **remote login** commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

Once you enter the standby virtual console, the terminal prompt automatically changes to **hostname-standby-console#**, where hostname is the configured name of the switch. The prompt is restored back to the original prompt when you exit the virtual console.

You exit the virtual console with the **exit** or **quit** commands. When the inactivity period of the terminal on the active supervisor engine where you logged in exceeds the configured idle time, you are automatically logged out of the terminal on the active supervisor engine. In this case, the virtual console session is also terminated. Virtual console session is also automatically terminated when the standby is rebooted. After the standby boots up, you need to create another virtual console session.
To log in to the standby supervisor engine using a virtual console, enter the following command:

```
Switch# session module 2
Connecting to standby virtual console
Type "exit" or "quit" to end this session
Switch-standby-console# exit
```

If the standby console is not enabled, the following message appears:

```
Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout
```

Virtual session into the standby console is N/A with RPR:

```
Switch# session module 2
IPC server port name IFConsoleServer:2 not registered on standby.
Secondary cannot be accessed by virtual console
```

Note: The standby virtual console provides the standard features that are available from the supervisor console such as command history, command completion, command help and partial command keywords.

The following limitations apply to the standby virtual console:

- All commands on the virtual console run to completion. It does not provide the auto-more feature; it behaves as if the `terminal length 0` command has been executed. It is also noninteractive. A executing command cannot be interrupted or aborted by any key sequence on the active supervisor engine. If a command produces considerable output, the virtual console displays it on the supervisor screen.

- The virtual console is noninteractive. Because the virtual console does not detect the interactive nature of a command, any command that requires user interaction causes the virtual console to wait until the RPC timer aborts the command.

- The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60 seconds. During this time, you cannot abort the command from the keyboard. You must wait for the timer to expire before you continue.

- You cannot use virtual console to view debug and syslog messages that are being displayed on the standby supervisor engine. The virtual console only displays the output of commands that are executed from the virtual console. Other information that is displayed on the real standby console does not appear on the virtual console.

**ROMMON Command-Line Interface**

ROMMON is a ROM-based program that is involved at power-up or reset, or when a fatal exception error occurs. The switch enters ROMMON mode if the switch does not find a valid software image, if the NVRAM configuration is corrupted, or if the configuration register is set to enter ROMMON mode.

From the ROMMON mode, you can load a software image manually from flash memory, from a network server file, or from bootflash.

You can also enter ROMMON mode by restarting the switch and pressing `Ctrl-C` during the first five seconds of startup.

Note: `Ctrl-C` is always enabled for 60 seconds after you reboot the switch, even if `Ctrl-C` is configured to be off in the configuration register settings.
When you enter ROMMON mode, the prompt changes to rommon 1>. Use the ? command to see the available ROMMON commands.

For more information about the ROMMON commands, refer to the Cisco IOS Command Reference.

Archiving Crashfiles Information

This feature allows you to archive crashinfo files (otherwise overwritten if another system reset were to happen first to the bootflash). Having access to archived crashinfo data greatly assists in troubleshooting.

To archive crashinfo files, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# exception crashinfo file bootflash: name</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Displaying a Crash Dump for Supervisor Engine 6-E and 6L-E

A crash dump provides the following information:

- Malloc or free traces
- Chuck alloc/free traces
- Process block dump
- Register memory dump
- Current proc stack partial decode
- Interrupt level stack
- Last 128 memory block dump

To display a crash dump, do the following:

Switch# show platform crashdump

Last Power Failure: 09/06/2010 15:03:28
Last Reload Status: 00000000
Last Software Reset State: 00000000

Switch#
This chapter describes how to initially configure a Catalyst 4500 series switch.

The information presented here supplements the administration information and procedures in this publication: *Cisco IOS Configuration Fundamentals Command Reference*, Release 12.2SR, at this URL:

This chapter includes the following major sections:

- Default Switch Configuration, page 3-1
- Configuring DHCP-Based Autoconfiguration, page 3-2
- Configuring the Switch, page 3-8
- Controlling Access to Privileged EXEC Commands, page 3-13
- Recovering a Lost Enable Password, page 3-25
- Modifying the Supervisor Engine Startup Configuration, page 3-25
- Resetting a Switch to Factory Default Settings, page 3-32

**Note**

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

### Default Switch Configuration

This section describes the default configurations for the Catalyst 4500 series switch. Table 3-1 shows the default configuration settings for each feature.
Chapter 3     Configuring the Switch for the First Time

Configuring DHCP-Based Autoconfiguration

These sections describe how to configure DHCP-based autoconfiguration:

- About DHCP-Based Autoconfiguration, page 3-2
- DHCP Client Request Process, page 3-3
- Configuring the DHCP Server, page 3-4
- Configuring the TFTP Server, page 3-4
- Configuring the DNS Server, page 3-5
- Configuring the Relay Device, page 3-5
- Obtaining Configuration Files, page 3-6
- Example Configuration, page 3-7

If your DHCP server is a Cisco device, or if you are configuring the switch as a DHCP server, refer to the “IP Addressing and Services” section in the Cisco IOS IP and IP Routing Configuration Guide for Cisco IOS Release 12.1 for additional information about configuring DHCP.

About DHCP-Based Autoconfiguration

Note

Starting with Release 12.2(20)EW, you can enable DHCP AutoConfiguration by entering the `write erase` command. This command clears the startup-config in NVRAM. In images prior to Release 12.2(20)EW, this command does not enable autoconfiguration.

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one component for delivering configuration parameters from a DHCP server to a device and another component that is a mechanism for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

</tbody>
</table>
With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch because your switch (the DHCP client) is automatically configured at startup with IP address information and a configuration file. However, you need to configure the DHCP server or the DHCP server feature on your switch for various lease options associated with IP addresses. If you are using DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

**DHCP Client Request Process**

At startup the switch automatically requests configuration information from a DHCP server if a configuration file is not present on the switch.

*Figure 3-1* shows the sequence of messages that are exchanged between the DHCP client and the DHCP server.

*Figure 3-1  DHCP Client and Server Message Exchange*

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses the configuration information that it received from the server. The amount of information the switch receives depends on how you configure the DHCP server. For more information, see the “Configuring the DHCP Server” section on page 3-4.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (if configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message. (The DHCP server might have assigned the parameters to another client.)

A DHCP client might receive offers from multiple DHCP servers and can accept any of them; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address will be allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address.
Configuring the DHCP Server

A switch can act as both the DHCP client and the DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch.

You should configure the DHCP server, or the DHCP server feature running on your switch, with reserved leases that are bound to each switch by the switch hardware address.

If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:

- IP address of the client (required)
- Subnet mask of the client (required)
- DNS server IP address (optional)
- Router IP address (required)

**Note**
The router IP address is the default gateway address for the switch.

If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:

- TFTP server name or IP address (required)
- Boot filename (the name of the configuration file that the client needs) (recommended)
- Host name (optional)

Depending on the settings of the DHCP server or the DHCP server feature running on your switch, the switch can receive IP address information, the configuration file, or both.

If you do not configure the DHCP server, or the DHCP server feature running on your switch, with the lease options described earlier, the switch replies to client requests with only those parameters that are configured. If the IP address and subnet mask are not in the reply, the switch is not configured. If the router IP address or TFTP server name (or IP address) are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not impact autoconfiguration.

The DHCP server, or the DHCP server feature running on your switch, can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay, which forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet. For more information on relay devices, see the “Configuring the Relay Device” section on page 3-5.

Configuring the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename or the TFTP server name, or if the configuration file could not be downloaded, the switch attempts to download a configuration file using various combinations of filenames and TFTP server addresses. The files include the specified configuration...
filename (if any) and the following files: network-config, cisconet.cfg, hostname.config, or hostname.cfg, where hostname is the current hostname of the switch and router-config and ciscortr.cfg. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include the following:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The network-config or the cisconet.cfg file (known as the default configuration files).
- The router-config or the ciscortr.cfg file. (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server you plan to use is on a different LAN from the switch, or if you plan to access it with the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described earlier), you must configure a relay to forward the TFTP packets to the TFTP server. For more information, see the “Configuring the Relay Device” section on page 3-5. The preferred solution is to configure either the DHCP server or the DHCP server feature running on your switch with all the required information.

### Configuring the DNS Server

The DHCP server, or the DHCP server feature running on your switch, uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server where the DHCP replies retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same or on a different LAN as the switch. If it is on a different LAN, the switch must be able to access it through a router.

### Configuring the Relay Device

You must configure a relay device to forward received broadcast packets to the destination host whenever a switch sends broadcast packets to which a host on a different LAN must respond. Examples of such broadcast packets are DHCP, DNS, and in some cases, TFTP packets.

If the relay device is a Cisco router, enable IP routing (`ip routing` global configuration command) and configure helper addresses (`ip helper-address` interface configuration command). For example, in Figure 3-2, configure the router interfaces as follows:

On interface 10.0.0.2:

```
router(config-if)# ip helper-address 20.0.0.2
router(config-if)# ip helper-address 20.0.0.3
router(config-if)# ip helper-address 20.0.0.4
```

On interface 20.0.0.1:

```
router(config-if)# ip helper-address 10.0.0.1
```
Obtaining Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename are reserved for the switch and provided in the DHCP reply (one-file read method).
  
  The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from either the DHCP server or the DHCP server feature running on your switch. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, completes its boot-up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).
  
  The switch receives its IP address, subnet mask, and the configuration filename from either the DHCP server or the DHCP server feature running on your switch. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).
  
  The switch receives its IP address, subnet mask, and the TFTP server address from either the DHCP server or the DHCP server feature running on your switch. The switch sends a unicast message to the TFTP server to retrieve the network-config or cisconet.cfg default configuration file. (If the network-config file cannot be read, the switch reads the cisconet.cfg file.)

  The default configuration file contains the host names-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its host name. If the host name is not found in the file, the switch uses the host name in the DHCP reply. If the host name is not specified in the DHCP reply, the switch uses the default Switch as its host name.

  After obtaining its host name from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its host name (hostname-config or hostname.cfg, depending on whether or not the network-config file or the cisconet.cfg file was read earlier) from the TFTP server. If the cisconet.cfg file is read, the filename of the host is truncated to eight characters.
If the switch cannot read the network-config, cisconet.cfg, or the hostname file, it reads the router-config file. If the switch cannot read the router-config file, it reads the ciscorrt.cfg file.

**Note**
The switch broadcasts TFTP server requests provided that one of these conditions is met: the TFTP server is not obtained from the DHCP replies; all attempts to read the configuration file through unicast transmissions fail; or the TFTP server name cannot be resolved to an IP address.

### Example Configuration

Figure 3-3 shows a network example for retrieving IP information using DHCP-based autoconfiguration.

![DHCP-Based Autoconfiguration Network Example](image)

Table 3-2 shows the configuration of the reserved leases on either the DHCP server or the DHCP server feature running on your switch.

DNS Server Configuration
The DNS server maps the TFTP server name maritsu to IP address 10.0.0.3.

TFTP Server Configuration (on UNIX)
The TFTP server base directory is set to /tftpserver/work/. This directory contains the network-confg file used in the two-file read method. This file contains the host name that you plan to assign to the switch based on its IP address. The base directory also contains a configuration file for each switch (switch1-confg, switch2-confg, and so forth) as shown in the following display:

prompt> cd /tftpserver/work/
prompt> ls
network-confg
switch1-confg
switch2-confg
switch3-confg
switch4-confg
prompt> cat network-confg
ip host switch1 10.0.0.21
ip host switch2 10.0.0.22
ip host switch3 10.0.0.23
ip host switch4 10.0.0.24

DHCP Client Configuration
No configuration file is present on Switch 1 through Switch 4.

Configuration Explanation
In Figure 3-3, Switch 1 reads its configuration file as follows:

- Switch 1 obtains its IP address 10.0.0.21 from the DHCP server.
- If no configuration filename is given in the DHCP server reply, Switch 1 reads the network-confg file from the base directory of the TFTP server.
- Switch 1 adds the contents of the network-confg file to its host table.
- Switch 1 reads its host table by indexing its IP address 10.0.0.21 to its host name (switch1).
- Switch 1 reads the configuration file that corresponds to its host name; for example, it reads switch1-confg from the TFTP server.

Switches 2 through 4 retrieve their configuration files and IP addresses in the same way.

Configuring the Switch

The following sections describe how to configure your switch:

- Using Configuration Mode to Configure Your Switch, page 3-9
- Verifying the Running Configuration Settings, page 3-9
- Saving the Running Configuration Settings to Your Start-Up File, page 3-10
- Reviewing the Configuration in NVRAM, page 3-10
- Configuring a Default Gateway, page 3-11
- Configuring a Static Route, page 3-11
Using Configuration Mode to Configure Your Switch

To configure your switch from configuration mode, follow these steps:

**Step 1** Connect a console terminal to the console interface of your supervisor engine.

**Step 2** After a few seconds, you see the user EXEC prompt (Switch>). Now, you may want to enter privileged EXEC mode, also known as enable mode. Type `enable` to enter enable mode:

```
Switch> enable
```

**Note** You must be in enable mode to make configuration changes.

The prompt changes to the enable prompt (#):

```
Switch#
```

**Step 3** At the enable prompt (#), enter the `configure terminal` command to enter global configuration mode:

```
Switch# configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#
```

**Step 4** At the global configuration mode prompt, enter the `interface type slot/interface` command to enter interface configuration mode:

```
Switch(config)# interface fastethernet 5/1
Switch(config-if)#
```

**Step 5** In either of these configuration modes, enter changes to the switch configuration.

**Step 6** Enter the `end` command to exit configuration mode.

**Step 7** Save your settings. See the “Saving the Running Configuration Settings to Your Start-Up File” section on page 3-10.

Your switch is now minimally configured and can boot with the configuration you entered. To see a list of the configuration commands, enter `?` at the prompt or press the `help` key in configuration mode.

Verifying the Running Configuration Settings

To verify the configuration settings you entered or the changes you made, enter the `show running-config` command at the enable prompt (#), as shown in this example:

```
Switch# show running-config
```

```
Building configuration...

Current configuration:
!
version 12.0
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname Switch
```
Saving the Running Configuration Settings to Your Start-Up File

Caution

This command saves the configuration settings that you created in configuration mode. If you fail to do this step, your configuration is lost the next time you reload the system.

To store the configuration, changes to the configuration, or changes to the startup configuration in NVRAM, enter the `copy running-config startup-config` command at the enable prompt (#), as follows:

Switch# copy running-config startup-config

Reviewing the Configuration in NVRAM

To display information stored in NVRAM, enter the `show startup-config` EXEC command.

The following example shows a typical system configuration:

Switch# show startup-config
Using 1579 out of 491500 bytes, uncompressed size = 7372 bytes
Uncompressed configuration from 1579 bytes to 7372 bytes
!
version 12.1
no service pad
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
service compress-config
!
hostname Switch
!
!
ip subnet-zero
!
!
interface GigabitEthernet1/1
  no snmp trap link-status
!
interface GigabitEthernet1/2
  no snmp trap link-status
|--More--
...
output truncated...>
! line con 0
  exec-timeout 0 0
  transport input none
line vty 0 4
  exec-timeout 0 0
  password lab
  login
  transport input lat pad dsipcon mop telnet rlogin udptn nasi
! end
Switch#

**Configuring a Default Gateway**

*Note*  The switch uses the default gateway only when it is not configured with a routing protocol.

Configure a default gateway to send data to subnets other than its own when the switch is not configured with a routing protocol. The default gateway must be the IP address of an interface on a router that is directly connected to the switch.

To configure a default gateway, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# ip default-gateway IP-address</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# show ip route</td>
</tr>
</tbody>
</table>

This example shows how to configure a default gateway and how to verify the configuration:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip default-gateway 172.20.52.35
Switch(config)# end
3d17h: %SYS-5-CONFIG_I: Configured from console by console
Switch# show ip route
Default gateway is 172.20.52.35

<table>
<thead>
<tr>
<th>Host</th>
<th>Gateway</th>
<th>Last Use</th>
<th>Total Uses</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICMP redirect cache is empty</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Switch#

**Configuring a Static Route**

If your Telnet station or SNMP network management workstation is on a different network from your switch and a routing protocol has not been configured, you might need to add a static routing table entry for the network where your end station is located.
To configure a static route, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td>`Switch(config)# ip route dest_IP_address mask (forwarding_IP</td>
<td>vlan vlan_ID)`</td>
</tr>
<tr>
<td>Configures a static route to the remote network.</td>
<td>Verifies that the static route is displayed correctly.</td>
</tr>
</tbody>
</table>

This example shows how to use the `ip route` command to configure a static route to a workstation at IP address 171.10.5.10 on the switch with a subnet mask and IP address 172.20.3.35 of the forwarding router:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip route 171.10.5.10 255.255.255.255 172.20.3.35
Switch(config)# end
```

This example shows how to use the `show running-config` command to confirm the configuration of the static route:

```
Switch# show running-config
Building configuration...
...
ip default-gateway 172.20.52.35
ip classless
ip route 171.10.5.10 255.255.255.255 172.20.3.35
no ip http server
!
line con 0
  transport input none
line vty 0 4
  exec-timeout 0 0
  password lab
  login
  transport input lat pad dsipcon mop telnet rlogin udptn nasi
!
end
```

This example shows how to use the `ip route` command to configure the static route IP address 171.20.5.3 with subnet mask and connected over VLAN 1 to a workstation on the switch:

```
Switch# configure terminal
Switch(config)# ip route 171.20.5.3 255.255.255.255 vlan 1
Switch(config)# end
```

This example shows how to use the `show running-config` command to confirm the configuration of the static route:

```
Switch# show running-config
Building configuration...
...
```

<...output truncated...>
Controlling Access to Privileged EXEC Commands

The procedures in these sections let you control access to the system configuration file and privileged EXEC commands:

- Setting or Changing a Static enable Password, page 3-13
- Using the enable password and enable secret Commands, page 3-14
- Setting or Changing a Privileged Password, page 3-14
- Controlling Switch Access with TACACS+, page 3-15
- Encrypting Passwords, page 3-22
- Configuring Multiple Privilege Levels, page 3-23

Setting or Changing a Static enable Password

To set or change a static password that controls access to the enable mode, enter this command:

```
Switch(config)# enable password password
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# enable password password</td>
<td>Sets a new password or changes an existing password for the privileged EXEC mode.</td>
</tr>
</tbody>
</table>

This example shows how to configure an enable password as lab:

```
Switch# configure terminal
Switch(config)# enable password lab
Switch(config)#
```

For instructions on how to display the password or access level configuration, see the “Displaying the Password, Access Level, and Privilege Level Configuration” section on page 3-24.
Using the enable password and enable secret Commands

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a TFTP server, use either the `enable password` or `enable secret` command. Both commands configure an encrypted password that you must enter to access the enable mode (the default) or any other privilege level that you specify.

We recommend that you use the `enable secret` command.

If you configure the `enable secret` command, it takes precedence over the `enable password` command; the two commands cannot be in effect simultaneously.

To configure the switch to require an enable password, enter one of these commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`Switch(config)# enable password [level level] {password</td>
<td>encryption-type encrypted-password}`</td>
</tr>
<tr>
<td>`Switch(config)# enable secret [level level] {password</td>
<td>encryption-type encrypted-password}`</td>
</tr>
</tbody>
</table>

When you enter either of these password commands with the `level` option, you define a password for a specific privilege level. After you specify the level and set a password, give the password only to users who need to have access at this level. Use the `privilege level` configuration command to specify commands accessible at various levels.

If you enable the `service password-encryption` command, the password you enter is encrypted. When you display the password with the `more system:running-config` command, the password displays the password in encrypted form.

If you specify an encryption type, you must provide an encrypted password—an encrypted password you copy from another Catalyst 4500 series switch configuration.

**Note**

You cannot recover a lost encrypted password. You must clear NVRAM and set a new password. See the “Recovering a Lost Enable Password” section on page 3-25 for more information.

For information on how to display the password or access level configuration, see the “Displaying the Password, Access Level, and Privilege Level Configuration” section on page 3-24.

Setting or Changing a Privileged Password

To set or change a privileged password, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config-line)# password password</code></td>
<td>Sets a new password or changes an existing password for the privileged level.</td>
</tr>
</tbody>
</table>
For information on how to display the password or access level configuration, see the “Displaying the Password, Access Level, and Privilege Level Configuration” section on page 3-24.

**Controlling Switch Access with TACACS+**

This section describes how to enable and configure TACACS+, which provides detailed accounting information and flexible administrative control over authentication and authorization processes. TACACS+ is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

*Note*

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Security Command Reference, Release 12.2*.

This section contains the following configuration information:

- Understanding TACACS+, page 3-15
- TACACS+ Operation, page 3-17
- Configuring TACACS+, page 3-17
- Displaying the TACACS+ Configuration, page 3-22

**Understanding TACACS+**

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch. TACACS+ services are maintained in a database on a TACACS+ daemon typically running on a UNIX or Windows NT workstation. You should have access to and should configure a TACACS+ server before configuring TACACS+ features on your switch.

TACACS+ provides for separate and modular AAA facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—indeedependently. Each service can be locked into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers. A network access server provides connections to a single user, to a network or subnetwork, and to interconnected networks as shown in Figure 3-4.
Controlling Access to Privileged EXEC Commands

Chapter 3  Configuring the Switch for the First Time

Figure 3-4  Typical TACACS+ Network Configuration

TACACS+ administered through the AAA security services can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.

  The authentication facility can conduct a dialog with the user (such as, after a username and password are provided, to challenge a user with several questions such as home address, mother’s maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- **Authorization**—Provides strict control over user capabilities for the duration of the user’s session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on the commands a user can execute with the TACACS+ authorization feature.

- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

You need a system running the TACACS+ daemon software to use TACACS+ on your switch.
TACACS+ Operation

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt, which is then displayed to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

   TACACS+ allows a conversation between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
   - ACCEPT—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
   - REJECT—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
   - ERROR—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
   - CONTINUE—The user is prompted for additional authentication information.

   After authentication, the user undergoes an additional authorization phase if authentication has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
   - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
   - Connection parameters, including the host or client IP address, access list, and user timeouts

Configuring TACACS+

This section describes how to configure your switch to support TACACS+. At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting. A method list defines the sequence and methods used to authenticate, to authorize, or to keep accounts on a user. Use method lists to designate one or more security protocols, ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

This section contains the following configuration information:
   - Default TACACS+ Configuration, page 3-18
   - Identifying the TACACS+ Server Host and Setting the Authentication Key, page 3-18
   - Configuring TACACS+ Login Authentication, page 3-19
### Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

**Note**

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

### Identifying the TACACS+ Server Host and Setting the Authentication Key

You can configure the switch to use a single server or AAA server groups in order to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

To identify the IP host or host maintaining TACACS+ server and optionally set the encryption key, perform this task, beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2  | `tacacs-server host hostame [port integer] [timeout integer] [key string]` Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.  
  * For `hostname`, specify the name or IP address of the host.  
  * (Optional) For `port integer`, specify a server port number. The default is port 49. The range is 1 to 65535.  
  * (Optional) For `timeout integer`, specify a time in seconds the switch waits for a response from the daemon before it times out and declares an error. The default is 5 seconds. The range is 1 to 1000 seconds.  
  * (Optional) For `key string`, specify the encryption key for encrypting and decrypting all traffic between the switch and the TACACS+ daemon. You must configure the same key on the TACACS+ daemon for encryption to succeed. |
| Step 3  | `aaa new-model` Enables AAA. |
| Step 4  | `aaa group server tacacs+ group-name` (Optional) Defines the AAA server-group with a group name.  
  This command puts the switch in a server group subconfiguration mode. |
| Step 5  | `server ip-address` (Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group.  
  Each server in the group must be previously defined in Step 2. |
| Step 6  | `end` Returns to privileged EXEC mode. |
### Controlling Access to Privileged EXEC Commands

To remove the specified TACACS+ server name or address, use the `no tacacs-server host hostname` global configuration command. To remove a server group from the configuration list, use the `no aaa group server tacacs+ group-name` global configuration command. To remove the IP address of a TACACS+ server, use the `no server ip-address` server group subconfiguration command.

### Configuring TACACS+ Login Authentication

To configure AAA authentication, define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication you intend to perform and the sequence in which you intend to perform them; you must apply the list to a specific port before you can perform any of the defined authentication methods. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.

A method list describes the sequence and authentication methods that must be queried to authenticate a user. You can designate one or more security protocols for authentication, ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

To configure login authentication, perform this task, beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>aaa new-model</code></td>
<td>Enables AAA.</td>
</tr>
</tbody>
</table>

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show tacacs</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Controlling Access to Privileged EXEC Commands

Chapter 3  Configuring the Switch for the First Time

To disable AAA, use the no aaa new-model global configuration command. To disable AAA authentication, use the no aaa authentication login [default | list-name] method1 [method2...] global configuration command. To either disable TACACS+ authentication for logins or to return to the default value, use the no login authentication [default | list-name] line configuration command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 3  | **aaa authentication login [default | list-name] method1 [method2...]**  
Creates a login authentication method list.  
- To create a default list that is used when a named list is *not* specified in the login authentication command, use the default keyword followed by the methods that you plan to use in default situations. The default method list is automatically applied to all ports.  
- For list-name, specify a character string to name the list you are creating.  
- For method1..., specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.  
Select one of these methods:  
- **enable**—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command.  
- **group tacacs+**—Uses TACACS+ authentication. Before you can use this authentication method, you must configure the TACACS+ server. For more information, see the “Identifying the TACACS+ Server Host and Setting the Authentication Key” section on page 3-18.  
- **line**—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the password password line configuration command.  
- **local**—Use the local username database for authentication. You must enter username information in the database. Use the username password global configuration command.  
- **local-case**—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the username name password global configuration command.  
- **none**—Do not use any authentication for login. |
| Step 4  | line [console | tty | vty] line-number  
Enters line configuration mode, and configures the lines to which you want to apply the authentication list. |
| Step 5  | login authentication [default | list-name]  
Applies the authentication list to a line or set of lines.  
- If you specify default, use the default list created with the aaa authentication login command.  
- For list-name, specify the list created with the aaa authentication login command. |
| Step 6  | end  
Returns to privileged EXEC mode. |
| Step 7  | show running-config  
Verifies your entries. |
| Step 8  | copy running-config startup-config  
(Optional) Saves your entries in the configuration file. |
Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

To set parameters that restrict a user’s network access to privileged EXEC mode, use the `aaa authorization` global configuration command with the `tacacs+` keyword.

The `aaa authorization exec tacacs+ local` command sets these authorization parameters:

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
- Use the local database if authentication was not performed by using TACACS+.

**Note**

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

To specify TACACS+ authorization for privileged EXEC access and network services, perform this task, beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> aaa authorization network tacacs+</td>
<td>Configures the switch for user TACACS+ authorization for all network-related service requests.</td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa authorization exec tacacs+</td>
<td>Configures the switch for user TACACS+ authorization if the user has privileged EXEC access. The <code>exec</code> keyword might return user profile information (such as <code>autocommand</code> information).</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable authorization, use the `no aaa authorization {network | exec} method1` global configuration command.

Starting TACACS+ Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.
To enable TACACS+ accounting for each Cisco IOS privilege level and for network services, perform this task, beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>aaa accounting network start-stop tacacs+</td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa accounting exec start-stop tacacs+</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable accounting, use the `no aaa accounting {network | exec} {start-stop} method1...` global configuration command.

**Displaying the TACACS+ Configuration**

To display TACACS+ server statistics, use the `show tacacs` privileged EXEC command.

**Encrypting Passwords**

Because protocol analyzers can examine packets (and read passwords), you can increase access security by configuring the Cisco IOS software to encrypt passwords. Encryption prevents the password from being readable in the configuration file.

To configure the Cisco IOS software to encrypt passwords, enter this command:

```
Switch(config)# service password-encryption
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# service password-encryption</td>
<td>Encrypts a password.</td>
</tr>
</tbody>
</table>

Encryption occurs when the current configuration is written or when a password is configured. Password encryption is applied to all passwords, including authentication key passwords, the privileged command password, console and virtual terminal line access passwords, and Border Gateway Protocol (BGP) neighbor passwords. The `service password-encryption` command keeps unauthorized individuals from viewing your password in your configuration file.

**Caution**

The `service password-encryption` command does not provide a high-level of network security. If you use this command, you should also take additional network security measures.

Although you cannot recover a lost encrypted password (that is, you cannot get the original password back), you can regain control of the switch after having lost or forgotten the encrypted password. See the “Recovering a Lost Enable Password” section on page 3-25 for more information.
Controlling Access to Privileged EXEC Commands

Chapter 3 Configuring the Switch for the First Time

For information on how to display the password or access level configuration, see the “Displaying the Password, Access Level, and Privilege Level Configuration” section on page 3-24.

Configuring Multiple Privilege Levels

By default, Cisco IOS software has two modes of password security: user EXEC mode and privileged EXEC mode. You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

For example, if you want many users to have access to the clear line command, you can assign it level 2 security and distribute the level 2 password to more users. If you want more restricted access to the configure command, you can assign it level 3 security and distribute that password to fewer users.

The procedures in the following sections describe how to configure additional levels of security:

- Setting the Privilege Level for a Command, page 3-23
- Changing the Default Privilege Level for Lines, page 3-23
- Logging In to a Privilege Level, page 3-24
- Exiting a Privilege Level, page 3-24
- Displaying the Password, Access Level, and Privilege Level Configuration, page 3-24

Setting the Privilege Level for a Command

To set the privilege level for a command, perform this task:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command: <code>Switch(config)# privilege mode level level command</code></th>
<th>Purpose: Sets the privilege level for a command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Command: <code>Switch(config)# enable password level level [encryption-type] password</code></td>
<td>Purpose: Specifies the enable password for a privilege level.</td>
</tr>
</tbody>
</table>

For information on how to display the password or access level configuration, see the “Displaying the Password, Access Level, and Privilege Level Configuration” section on page 3-24.

Changing the Default Privilege Level for Lines

To change the default privilege level for a given line or a group of lines, perform this task:

| Command: `Switch(config-line)# privilege level level` | Purpose: Changes the default privilege level for the line. |

For information on how to display the password or access level configuration, see the “Displaying the Password, Access Level, and Privilege Level Configuration” section on page 3-24.
Logging In to a Privilege Level

To log in at a specified privilege level, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# enable level</td>
<td>Logs in to a specified privilege level.</td>
</tr>
</tbody>
</table>

Exiting a Privilege Level

To exit to a specified privilege level, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# disable level</td>
<td>Exits to a specified privilege level.</td>
</tr>
</tbody>
</table>

Displaying the Password, Access Level, and Privilege Level Configuration

To display detailed password information, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# show running-config</td>
<td>Displays the password and access level configuration.</td>
</tr>
<tr>
<td>Step 2 Switch# show privilege</td>
<td>Shows the privilege level configuration.</td>
</tr>
</tbody>
</table>

This example shows how to display the password and access level configuration:

```
Switch# show running-config
Building configuration...

Current configuration:
!
version 12.0
service timestamps debug datetime localtime
service timestamps log datetime localtime
no service password-encryption
!
hostname Switch
!
boot system flash sup-bootflash
enable password lab
!
<...output truncated...>
```

This example shows how to display the privilege level configuration:

```
Switch# show privilege
Current privilege level is 15
Switch#
```
Recovering a Lost Enable Password

**Note**
For more information on the configuration register which is preconfigured in NVRAM, see “Configuring the Software Configuration Register” section on page 3-26.

To recover a lost enable password, follow these steps:

**Step 1** Connect to the console interface.
**Step 2** Stop the boot sequence and enter ROM monitor by pressing Ctrl-C during the first 5 seconds of bootup.
**Step 3** Configure the switch to boot-up without reading the configuration memory (NVRAM).
**Step 4** Reboot the system.
**Step 5** Access enable mode (this can be done without a password if a password has not been configured).
**Step 6** View or change the password, or erase the configuration.
**Step 7** Reconfigure the switch to boot-up and read the NVRAM as it normally does.
**Step 8** Reboot the system.

Modifying the Supervisor Engine Startup Configuration

These sections describe how the startup configuration on the supervisor engine works and how to modify the BOOT variable and the configuration register:
- Understanding the Supervisor Engine Boot Configuration, page 3-25
- Configuring the Software Configuration Register, page 3-26
- Specifying the Startup System Image, page 3-30
- Controlling Environment Variables, page 3-31

Understanding the Supervisor Engine Boot Configuration

The supervisor engine boot process involves two software images: ROM monitor and supervisor engine software. When the switch is booted or reset, the ROMMON code is executed. Depending on the NVRAM configuration, the supervisor engine either stays in ROMMON mode or loads the supervisor engine software.

Two user-configurable parameters determine how the switch boots: the configuration register and the BOOT environment variable. The configuration register is described in the “Modifying the Boot Field and Using the boot Command” section on page 3-27. The BOOT environment variable is described in the “Specifying the Startup System Image” section on page 3-30.
Understanding the ROM Monitor

The ROM monitor (ROMMON) is invoked at switch bootup, reset, or when a fatal exception occurs. The switch enters ROMMON mode if the switch does not find a valid software image, if the NVRAM configuration is corrupted, or if the configuration register is set to enter ROMMON mode. From ROMMON mode, you can manually load a software image from bootflash or a flash disk, or you can boot up from the management interface. ROMMON mode loads a primary image from which you can configure a secondary image to boot up from a specified source either locally or through the network using the BOOTLDR environment variable. This variable is described in the “Switch#” section on page 3-32.

You can also enter ROMMON mode by restarting the switch and then pressing Ctrl-C during the first five seconds of startup. If you are connected through a terminal server, you can escape to the Telnet prompt and enter the send break command to enter ROMMON mode.

Note

Ctrl-C is always enabled for five seconds after you reboot the switch, regardless of whether the configuration-register setting has Ctrl-C disabled.

The ROM monitor has these features:

- Power-on confidence test
- Hardware initialization
- Boot capability (manual bootup and autoboot)
- File system (read-only while in ROMMON)

Configuring the Software Configuration Register

The switch uses a 16-bit software configuration register, which allows you to set specific system parameters. Settings for the software configuration register are preconfigured in NVRAM.

Here are some reasons why you might want to change the software configuration register settings:

- To select a boot source and default boot filename
- To control broadcast addresses
- To set the console terminal baud rate
- To load operating software from flash memory
- To recover a lost password
- To manually boot the system using the boot command at the bootstrap program prompt
- To force an automatic bootup from the system bootstrap software (boot image) or from a default system image in onboard flash memory, and read any boot system commands that are stored in the configuration file in NVRAM

Caution

To avoid possibly halting the Catalyst 4500 series switch switch, remember that valid configuration register settings might be combinations of settings and not just the individual settings listed in Table 3-3. For example, the factory default value of 0x2101 is a combination of settings.

Table 3-3 lists the meaning of each of the software configuration memory bits. Table 3-4 defines the boot field.
Modifying the Supervisor Engine Startup Configuration

Chapter 3  Configuring the Switch for the First Time

Modifying the Supervisor Engine Startup Configuration

Table 3-3  Software Configuration Register Bits

<table>
<thead>
<tr>
<th>Bit Number</th>
<th>Hexadecimal</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00 to 03</td>
<td>0x0000 to 0x000F</td>
<td>Boot field (see Table 3-4)</td>
</tr>
<tr>
<td>04</td>
<td>0x0010</td>
<td>Unused</td>
</tr>
<tr>
<td>05</td>
<td>0x0020</td>
<td>Bit two of console line speed</td>
</tr>
<tr>
<td>06</td>
<td>0x0040</td>
<td>Causes system software to ignore NVRAM contents</td>
</tr>
<tr>
<td>07</td>
<td>0x0080</td>
<td>OEM² bit enabled</td>
</tr>
<tr>
<td>08</td>
<td>0x0100</td>
<td>Unused</td>
</tr>
<tr>
<td>09</td>
<td>0x0200</td>
<td>Unused</td>
</tr>
<tr>
<td>10</td>
<td>0x0400</td>
<td>IP broadcast with all zeros</td>
</tr>
<tr>
<td>11 to 12</td>
<td>0x0800 to 0x1000</td>
<td>Bits one and zero of Console line speed (default is 9600 baud)</td>
</tr>
<tr>
<td>13</td>
<td>0x2000</td>
<td>Loads ROM monitor after netboot fails</td>
</tr>
<tr>
<td>14</td>
<td>0x4000</td>
<td>IP broadcasts do not have network numbers</td>
</tr>
</tbody>
</table>

1. The factory default value for the configuration register is 0x2101. This value is a combination of the following: binary bit 13, bit 8 = 0x0100 and binary bits 00 through 03 = 0x0001. See Table 3-4.
2. OEM = original equipment manufacturer.

Table 3-4  Explanation of Boot Field (Configuration Register Bits 00 to 03)

<table>
<thead>
<tr>
<th>Boot Field</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Stays at the system bootstrap prompt (does not autoboot).</td>
</tr>
<tr>
<td>01</td>
<td>Boots the first file in onboard flash memory.</td>
</tr>
<tr>
<td>02 to 0F</td>
<td>Autoboots using image(s) specified by the BOOT environment variable. If more than one image is specified, the switch attempts to boot the first image specified in the BOOT variable. As long as the switch can successfully boot from this image, the same image is used on a reboot. If the switch fails to boot from the image specified in the BOOT variable, the switch tries to boot from the next image listed in the BOOT variable. If the end of the BOOT variable is reached without the switch booting successfully, the switch attempts the boot from the beginning of the BOOT variable. The autoboot continues until the switch successfully boots from one of the images specified in the BOOT variable.</td>
</tr>
</tbody>
</table>

Modifying the Boot Field and Using the boot Command

The configuration register boot field determines whether the switch loads an operating system image and, if so, where it obtains this system image. The following sections describe how to use and set the configuration register boot field and the procedures you must perform to modify the configuration register boot field. In ROMMON, to modify the configuration register and change boot settings, use the the confreg command.

Bits 0 through 3 of the software configuration register contain the boot field.

Note

The factory default configuration register setting for systems and spares is 0x2101. However, the recommended value is 0x0102.
When the boot field is set to either 00 or 01 (0-0-0-0 or 0-0-0-1), the system ignores any boot instructions in the system configuration file and the following occurs:

- When the boot field is set to 00, you must boot up the operating system manually by entering the `boot` command at the system bootstrap or ROMMON prompt.
- When the boot field is set to 01, the system boots the first image in the bootflash single in-line memory module (SIMM).
- When the entire boot field equals a value between 0-0-1-0 and 1-1-1-1, the switch loads the system image specified by `boot system` commands in the startup configuration file.

⚠️ **Caution**
If you set bootfield to a value between 0-0-1-0 and 1-1-1-1, you must specify a value in the `boot system` command, else the switch cannot boot up and remains in ROMMON.

You can enter the `boot` command only or enter the command and include additional boot instructions, such as the name of a file stored in flash memory, or a file that you specify for booting from a network server. If you use the `boot` command without specifying a file or any other boot instructions, the system boots from the default flash image (the first image in onboard flash memory). Otherwise, you can instruct the system to boot up from a specific flash image (using the `boot system flash filename` command).

You can also use the `boot` command to boot up images stored in the compact flash cards located in slot 0 on the supervisor engine.

---

**Modifying the Boot Field**

Modify the boot field from the software configuration register. To modify the software configuration register boot field, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <code>show version</code></td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# <code>configure terminal</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# <code>config-register value</code></td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# <code>end</code></td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# <code>reload</code></td>
</tr>
</tbody>
</table>

To modify the configuration register while the switch is running Cisco IOS software, follow these steps:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Enter the <code>enable</code> command and your password to enter privileged level, as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Switch&gt; <code>enable</code></td>
</tr>
<tr>
<td></td>
<td>Password:</td>
</tr>
<tr>
<td></td>
<td>Switch#</td>
</tr>
</tbody>
</table>
Step 2  Enter the configure terminal command at the EXEC mode prompt (#), as follows:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#
```

Step 3  Configure the configuration register to 0x102 as follows:

```
Switch(config)# config-register 0x102
```

Set the contents of the configuration register by specifying the value command variable, where value is a hexadecimal number preceded by 0x (see Table 3-3 on page 3-27).

Step 4  Enter the end command to exit configuration mode. The new value settings are saved to memory; however, the new settings do not take effect until the system is rebooted.

Step 5  Enter the show version EXEC command to display the configuration register value currently in effect; it is be used at the next reload. The value is displayed on the last line of the screen display, as shown in this sample output:

```
Configuration register is 0x141 (will be 0x102 at next reload)
```

Step 6  Save your settings.

See the “Saving the Running Configuration Settings to Your Start-Up File” section on page 3-10. Note that configuration register changes take effect only after the system reloads, such as when you enter a reload command from the console.

Step 7  Reboot the system. The new configuration register value takes effect with the next system boot up.

### Verifying the Configuration Register Setting

Enter the show version EXEC command to verify the current configuration register setting. In ROMMON mode, enter the show version command to verify the configuration register setting.

To verify the configuration register setting for the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show version</td>
<td>Displays the configuration register setting.</td>
</tr>
</tbody>
</table>

In this example, the show version command indicates that the current configuration register is set so that the switch does not automatically load an operating system image. Instead, it enters ROMMON mode and waits for you to enter ROM monitor commands.

**Supervisor Engine 6-E and Supervisor Engine 6L-E**

```
Switch# show version

Specifying the Startup System Image

You can enter multiple boot commands in the startup configuration file or in the BOOT environment variable to provide backup methods for loading a system image.

The BOOT environment variable is also described in the “Specify the Startup System Image in the Configuration File” section in the “Loading and Maintaining System Images and Microcode” chapter of the Cisco IOS Configuration Fundamentals Configuration Guide.

Use the following sections to configure your switch to boot from flash memory. Flash memory can be either single in-line memory modules (SIMMs) or flash disks. Check the appropriate hardware installation and maintenance guide for information about types of flash memory.
Flash Memory Features

Flash memory allows you to do the following:

- Remotely load multiple system software images through TFTP or RCP transfers (one transfer for each file loaded)
- Boot a switch manually or automatically from a system software image stored in flash memory (you can also boot directly from ROM)
- Copy the system image to flash memory using TFTP
- Boot the system from flash memory either automatically or manually
- Copy the flash memory image to a network server using TFTP or RCP

For more information on flash memory, see this URL:

Security Precautions

Note the following security precaution when loading from flash memory:

⚠️ Caution

You can only change the system image stored in flash memory from privileged EXEC level on the console terminal.

Configuring Flash Memory

To configure your switch to boot from flash memory, perform the following procedure. Refer to the appropriate hardware installation and maintenance publication for complete instructions on installing the hardware.

**Step 1**
Copy a system image to flash memory using TFTP or other protocols. Refer to the “Cisco IOS File Management” and “Loading and Maintaining System Images” chapters in the Cisco IOS Configuration Fundamentals Configuration Guide, Release 12.2, at the following URL:

**Step 2**
Configure the system to boot automatically from the desired file in flash memory.

You might need to change the configuration register value. See the “Modifying the Boot Field and Using the boot Command” section on page 3-27, for more information on modifying the configuration register.

**Step 3**
Save your configurations.

**Step 4**
Power cycle and reboot your system to verify that all is working as expected.

Controlling Environment Variables

Although the ROM monitor controls environment variables, you can create, modify, or view them with certain commands. To create or modify the BOOT and BOOTLDR variables, use the `boot system` and `boot bootldr` global configuration commands, respectively. Refer to the “Specify the Startup System
Resetting a Switch to Factory Default Settings

Manufacturing and repair centers can use the `erase /all non-default` command to do the following:

- Clear the nonvolatile configurations and states of the local supervisor engine (NVRAM and flashes).
- Set the factory default parameters on the Catalyst 4500 series switch before it is ready to ship to a customer.

For example, entering this command can generate the following output:

```
Switch# erase /all non-default
Erase and format operation will destroy all data in non-volatile storage. Continue? [confirm]
Formatting bootflash: ...

Format of bootflash complete
Erasing nvram:
Erasing cat4000_flash:
Clearing crashinfo: data
Clearing the last power failure timestamp
Clearing all ROMMON variables
Setting default ROMMON variables:
  ConfigReg=0x2101
  PSI=rommon ! >
  EnableAutoConfig=1
Setting vtp mode to transparent
%WARNING! Please reboot the system for the changes to take effect
Switch#
00:01:48: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
Switch#
```

If the Catalyst 4500 series switch is accessible to a TFTP server, you can copy an image to the bootflash memory with the TFTP command:

```
Switch# copy tftp://192.20.3.123/tftpboot/abc/cat4500-entservices-mz.bin bootflash:
```
When the copying is completed, you can reboot the just-copied Catalyst 4500 series switch image to the image stored in the bootflash memory with the **reload** command:

```
Switch# reload
```

System configuration has been modified. Save? [yes/no]: no
Proceed with reload? [confirm]

00:06:17: %SYS-5-RELOAD: Reload requested by console. Reload Reason: Reload Command.

To see details about the default parameters set by the `erase /all non-default` command, see the usage guidelines for the `erase` command in the *Catalyst 4500 Series Switch Cisco IOS Command Reference*. 
Administering the Switch

This chapter describes how to perform one-time operations to administer the Catalyst 4500 Series switch.

This chapter also describes how to install and configure the Embedded CiscoView network management system to provide a graphical representation of a Catalyst 4500 series switch and to provide a GUI-based management and configuration interface.

This chapter includes the following major sections:

- Managing the System Time and Date, page 4-1
- Configuring a System Name and Prompt, page 4-14
- Creating a Banner, page 4-17
- Managing the MAC Address Table, page 4-21
- Managing the ARP Table, page 4-37
- Configuring Embedded CiscoView Support, page 4-37

Note
For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

Managing the System Time and Date

You can configure the system time and date on your switch manually or automatically by using Network Time Protocol (NTP).

These sections contain this configuration information:

- System Clock, page 4-2
- Understanding Network Time Protocol, page 4-2
System Clock

The core of the time service is the system clock, which monitors the date and time. This clock starts when the system starts.

The system clock can provide time to these services:
- User `show` commands
- Logging and debugging messages

The system clock keeps track of whether the time is authoritative or not (whether it was set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed. For configuration information, see the “Configuring Time and Date Manually” section on page 4-11.

Understanding Network Time Protocol

The NTP is designed to synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not have been synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should associate. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can be configured to send or receive broadcast messages; however, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.
Cisco’s implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 4-1 shows a typical network example using NTP. Switch A is the NTP master, with Switches B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F, respectively.

![Typical NTP Network Configuration](image)

If the network is isolated from the Internet, Cisco’s implementation of NTP allows a device to act as if it is synchronized through NTP, when it is not. Other devices then synchronize to that device through NTP.

NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a public version for systems running UNIX and its various derivatives is also available. This software allows host systems to be synchronized as well.

### Configuring NTP

These sections contain this configuration information:

- Default NTP Configuration, page 4-4
- Configuring NTP Authentication, page 4-4
• Configuring NTP Associations, page 4-6
• Configuring NTP Broadcast Service, page 4-7
• Configuring NTP Access Restrictions, page 4-8
• Configuring the Source IP Address for NTP Packets, page 4-10
• Displaying the NTP Configuration, page 4-11

**Default NTP Configuration**

Table 4-1 shows the default NTP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTP authentication</td>
<td>Disabled. No authentication key is specified.</td>
</tr>
<tr>
<td>NTP peer or server associations</td>
<td>None configured.</td>
</tr>
<tr>
<td>NTP broadcast service</td>
<td>Disabled; no interface sends or receives NTP broadcast packets.</td>
</tr>
<tr>
<td>NTP access restrictions</td>
<td>No access control is specified.</td>
</tr>
<tr>
<td>NTP packet source IP address</td>
<td>The source address is set by the outgoing interface.</td>
</tr>
</tbody>
</table>

NTP is enabled on all interfaces by default. All interfaces receive NTP packets.

**Configuring NTP Authentication**

This procedure must be coordinated with the administrator of the NTP server; the information you configure in this procedure must be matched by the servers used by the switch to synchronize its time to the NTP server.

To authenticate the associations (communications between devices running NTP that provide for accurate timekeeping) with other devices for security purposes, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ntp authenticate</td>
<td>Enables the NTP authentication feature, which is disabled by default.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ntp authentication-key number md5 value</td>
<td>Defines the authentication keys. By default, none are defined.</td>
</tr>
<tr>
<td></td>
<td>• For <code>number</code>, specify a key number. The range is 1 to 4294967295.</td>
</tr>
<tr>
<td></td>
<td>• <code>md5</code> specifies that message authentication support is provided by using the message digest algorithm 5 (MD5).</td>
</tr>
<tr>
<td></td>
<td>• For <code>value</code>, enter an arbitrary string of up to eight characters for the key.</td>
</tr>
</tbody>
</table>

The switch does not synchronize to a device unless both have one of these authentication keys, and the key number is specified by the `ntp trusted-key key-number` command.
Managing the System Time and Date

To disable NTP authentication, use the `no ntp authenticate` global configuration command. To remove an authentication key, use the `no ntp authentication-key number` global configuration command. To disable authentication of the identity of a device, use the `no ntp trusted-key key-number` global configuration command.

This example shows how to configure the switch to synchronize only to devices providing authentication key 42 in the device’s NTP packets:

```plaintext
Switch# configure terminal
Switch(config)# ntp authenticate
Switch(config)# ntp authentication-key 42 md5 aNiceKey
Switch(config)# ntp trusted-key 42
Switch(config)# end
Switch#
```

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;<code>ntp trusted-key key-number</code></td>
<td>Specifies one or more key numbers (defined in Step 3) that a peer NTP device must provide in its NTP packets for this switch to synchronize to it. By default, no trusted keys are defined. For <code>key-number</code>, specify the key defined in Step 3. This command provides protection against accidentally synchronizing the switch to a device that is not trusted.</td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;<code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong>&lt;br&gt;<code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 7</strong>&lt;br&gt;<code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Managing the System Time and Date

Chapter 4       Administering the Switch

Configuring NTP Associations

An NTP association can be a peer association (this switch can either synchronize to the other device or allow the other device to synchronize to it), or it can be a server association (meaning that only this switch synchronizes to the other device, and not the other way around).

To form an NTP association with another device, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>ntp peer ip-address [version number]</td>
<td>Configures the switch system clock to synchronize a peer or to be</td>
</tr>
<tr>
<td></td>
<td>synchronized by a peer (peer association).</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>ntp server ip-address [version number]</td>
<td>Configures the switch system clock to be synchronized by a time server</td>
</tr>
<tr>
<td></td>
<td>(server association).</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) For ip-address in a peer association, specify either the IP address of the peer providing, or being provided, the clock synchronization. For a server association, specify the IP address of the time server providing the clock synchronization.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) For number, specify the NTP version number. The range is 1 to 3. By default, Version 3 is selected.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) For keyid, enter the authentication key defined by entering the ntp authentication-key global configuration command.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) For interface, specify the interface from which to pick the IP source address. By default, the source IP address is taken from the outgoing interface.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) Enter the prefer keyword to make this peer or server the preferred one that provides synchronization. This keyword reduces switching back and forth between peers and servers.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

You need to configure only one end of an association; the other device can automatically establish the association. If you are using the default NTP version (Version 3) and NTP synchronization does not occur, try using NTP Version 2. Many NTP servers on the Internet run Version 2.

To remove a peer or server association, use the no ntp peer ip-address or the no ntp server ip-address global configuration command.

This example shows how to configure the switch to synchronize its system clock with the clock of the peer at IP address 172.16.22.44 using NTP Version 2:

```
Switch# configure terminal
Switch(config)# ntp server 172.16.22.44 version 2
Switch(config)# end
Switch#
```
### Configuring NTP Broadcast Service

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP addresses of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can be configured to send or receive broadcast messages. However, the information flow is one-way only.

The switch can send or receive NTP broadcast packets on an interface-by-interface basis if there is an NTP broadcast server, such as a router, broadcasting time information on the network. The switch can send NTP broadcast packets to a peer so that the peer can synchronize to it. The switch can also receive NTP broadcast packets to synchronize its own clock. This section provides procedures for both sending and receiving NTP broadcast packets.

To configure the switch to send NTP broadcast packets to peers so that they can synchronize their clock to the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the interface to send NTP broadcast packets, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> ntp broadcast [version number] [key keyid] [destination-address]</td>
<td>Enables the interface to send NTP broadcast packets to a peer. By default, this feature is disabled on all interfaces.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For number, specify the NTP version number. The range is 1 to 3. If you do not specify a version, Version 3 is used.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For keyid, specify the authentication key to use when sending packets to the peer.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For destination-address, specify the IP address of the peer that is synchronizing its clock to this switch.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the interface from sending NTP broadcast packets, use the **no ntp broadcast** interface configuration command.

This example shows how to configure a port to send NTP Version 2 packets:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast version 2
Switch(config-if)# end
Switch#
```
Managing the System Time and Date

To configure the switch to receive NTP broadcast packets from connected peers, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ntp broadcast client</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>exit</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>ntp broadcastdelay microseconds</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable an interface from receiving NTP broadcast packets, use the **no ntp broadcast client** interface configuration command. To change the estimated round-trip delay to the default, use the **no ntp broadcastdelay** global configuration command.

This example shows how to configure a port to receive NTP broadcast packets:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast client
Switch(config-if)# end
Switch#
```

**Configuring NTP Access Restrictions**

You can control NTP access on two levels as described in these sections:

- Creating an Access Group and Assigning a Basic IP Access List, page 4-9
- Disabling NTP Services on a Specific Interface, page 4-10
Creating an Access Group and Assigning a Basic IP Access List

To control access to NTP services by using access lists, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> `ntp access-group {query-only</td>
<td>serve-only</td>
</tr>
<tr>
<td></td>
<td>• <code>query-only</code>—Allows only NTP control queries.</td>
</tr>
<tr>
<td></td>
<td>• <code>serve-only</code>—Allows only time requests.</td>
</tr>
<tr>
<td></td>
<td>• <code>serve</code>—Allows time requests and NTP control queries, but does not allow the switch to synchronize to the remote device.</td>
</tr>
<tr>
<td></td>
<td>• <code>peer</code>—Allows time requests and NTP control queries and allows the switch to synchronize to the remote device.</td>
</tr>
<tr>
<td></td>
<td>For <code>access-list-number</code>, enter a standard IP access list number from 1 to 99.</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>access-list access-list-number permit source [source-wildcard]</code></td>
<td>Creates the access list.</td>
</tr>
<tr>
<td></td>
<td>• For <code>access-list-number</code>, enter the number specified in Step 2.</td>
</tr>
<tr>
<td></td>
<td>• Enter the <code>permit</code> keyword to permit access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>• For <code>source</code>, enter the IP address of the device that is permitted access to the switch.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>source-wildcard</code>, enter the wildcard bits to be applied to the source.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The access group keywords are scanned in this order, from least restrictive to most restrictive:

1. **peer**—Allows time requests and NTP control queries and allows the switch to synchronize itself to a device whose address passes the access list criteria.
2. **serve**—Allows time requests and NTP control queries, but does not allow the switch to synchronize itself to a device whose address passes the access list criteria.
3. **serve-only**—Allows only time requests from a device whose address passes the access list criteria.
4. **query-only**—Allows only NTP control queries from a device whose address passes the access list criteria.

If the source IP address matches the access lists for more than one access type, the first type is granted. If no access groups are specified, all access types are granted to all devices. If any access groups are specified, only the specified access types are granted.
To remove access control to the switch NTP services, use the 
no ntp access-group \{ query-only \| serve-only \| serve \| peer \} global configuration command.

This example shows how to configure the switch to allow itself to synchronize to a peer from access list 99. However, the switch restricts access to allow only time requests from access list 42:

```
Switch# configure terminal  
Switch(config)# ntp access-group peer 99  
Switch(config)# ntp access-group serve-only 42  
Switch(config)# access-list 99 permit 172.20.130.5  
Switch(config)# access list 42 permit 172.20.130.6  
Switch(config)# end  
Switch#
```

Disabling NTP Services on a Specific Interface

NTP services are enabled on all interfaces by default.

To disable NTP packets from being received on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enters interface configuration mode, and specify the interface to disable.</td>
</tr>
<tr>
<td>Step 3 ntp disable</td>
<td>Disables NTP packets from being received on the interface.</td>
</tr>
<tr>
<td></td>
<td>By default, all interfaces receive NTP packets.</td>
</tr>
<tr>
<td></td>
<td>To reenable receipt of NTP packets on an interface, use the no ntp disable interface configuration command.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Configuring the Source IP Address for NTP Packets

When the switch sends an NTP packet, the source IP address is normally set to the address of the interface through which the NTP packet is sent. To use a particular source IP address for all NTP packets, use the ntp source global configuration command. The address is taken from the specified interface. This command is useful if the address on an interface cannot be used as the destination for reply packets.

To configure a specific interface from which the IP source address is to be taken, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ntp source type number</td>
<td>Specifies the interface type and number from which the IP source address is taken.</td>
</tr>
<tr>
<td></td>
<td>By default, the source address is set by the outgoing interface.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
The specified interface is used for the source address for all packets sent to all destinations. If a source address is to be used for a specific association, use the source keyword in the ntp peer or ntp server global configuration command as described in the “Configuring NTP Associations” section on page 4-6.

Displaying the NTP Configuration

Use the following privileged EXEC commands to display NTP information:

- show ntp associations [detail]
- show ntp status

For detailed information about the fields in these displays, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.3.

Configuring Time and Date Manually

If no other source of time is available, you can manually configure the time and date after the system is restarted. The time remains accurate until the next system restart. We recommend that you use manual configuration only as a last resort. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

These sections contain this configuration information:

- Setting the System Clock, page 4-11
- Displaying the Time and Date Configuration, page 4-12
- Configuring the Time Zone, page 4-12
- Configuring Summer Time (Daylight Saving Time), page 4-13

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

To set the system clock, perform this task:

**Command**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>clock set</td>
<td>Manually sets the system clock using one of these formats.</td>
</tr>
<tr>
<td></td>
<td><strong>hh:mm:ss</strong> day</td>
<td>• For <strong>hh:mm:ss</strong>, specify the time in hours (24-hour format), minutes,</td>
</tr>
<tr>
<td></td>
<td>month year</td>
<td>and seconds. The time specified is relative to the configured time zone.</td>
</tr>
<tr>
<td></td>
<td>or</td>
<td>• For <strong>day</strong>, specify the day by date in the month.</td>
</tr>
<tr>
<td></td>
<td>clock set</td>
<td>• For <strong>month</strong>, specify the month by name.</td>
</tr>
<tr>
<td></td>
<td><strong>hh:mm:ss</strong></td>
<td>• For <strong>year</strong>, specify the year (no abbreviation).</td>
</tr>
<tr>
<td></td>
<td>month year</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to manually set the system clock to 1:32 p.m. on July 23, 2001:

Switch# clock set 13:32:00 23 July 2001
Displaying the Time and Date Configuration

To display the time and date configuration, use the `show clock [detail]` privileged EXEC command.

The system clock keeps an `authoritative` flag that shows whether the time is authoritative (believed to be accurate). If the system clock was set by a timing source such as NTP, the flag is set. If the time is not authoritative, it is used only for display purposes. Until the clock is authoritative and the `authoritative` flag is set, the flag prevents peers from synchronizing to the clock when the peers’ time is invalid.

The symbol that precedes the `show clock` display has this meaning:

- *—Time is not authoritative.
- (blank)—Time is authoritative.
- .—Time is authoritative, but NTP is not synchronized.

Configuring the Time Zone

To manually configure the time zone, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>clock timezone zone hours-offset [minutes-offset]</code></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>end</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>show running-config</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

The `minutes-offset` variable in the `clock timezone` global configuration command is available for those cases where a local time zone is a percentage of an hour different from UTC. For example, the time zone for some sections of Atlantic Canada (AST) is UTC-3.5, where the 3 means 3 hours and .5 means 50 percent. The necessary command is `clock timezone AST -3 30`. 
Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
</tbody>
</table>
**configure terminal** | Enters global configuration mode. |
| **Step 2** |  
**clock summer-time zone recurring**  
`[week day month hh:mm week day month hh:mm [offset]]` | Configures summer time to start and end on the specified days every year. Summer time is disabled by default. If you specify **clock summer-time zone recurring** without parameters, the summer time rules default to the United States rules.  
- For **zone**, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect.  
- (Optional) For **week**, specify the week of the month (1 to 5 or last).  
- (Optional) For **day**, specify the day of the week (Sunday, Monday...).  
- (Optional) For **month**, specify the month (January, February...).  
- (Optional) For **hh:mm**, specify the time (24-hour format) in hours and minutes.  
- (Optional) For **offset**, specify the number of minutes to add during summer time. The default is 60. |
| **Step 3** |  
**end** | Returns to privileged EXEC mode. |
| **Step 4** |  
**show running-config** | Verifies your entries. |
| **Step 5** |  
**copy running-config startup-config** | (Optional) Saves your entries in the configuration file. |

The first part of the **clock summer-time** global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

This example shows how to specify that summer time starts on the first Sunday in April at 02:00 and ends on the last Sunday in October at 02:00:

```
Switch# configure terminal
Switch(config)# clock summer-time PDT recurring 1 Sunday April 2:00 last Sunday October 2:00
Switch(config)# end
Switch#
```
If summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events), perform this task:

The first part of the `clock summer-time` global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

To disable summer time, use the `no clock summer-time` global configuration command.

Summer time is disabled by default.

- For `zone`, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect.
- (Optional) For `week`, specify the week of the month (1 to 5 or `last`).
- (Optional) For `day`, specify the day of the week (Sunday, Monday...).
- (Optional) For `month`, specify the month (January, February...).
- (Optional) For `hh:mm`, specify the time (24-hour format) in hours and minutes.
- (Optional) For `offset`, specify the number of minutes to add during summer time. The default is 60.

The first part of the `clock summer-time` global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

To disable summer time, use the `no clock summer-time` global configuration command.

This example shows how to set summer time to start on October 12, 2000, at 02:00, and end on April 26, 2001, at 02:00:

```
Switch# configure terminal
Switch(config)# clock summer-time pdt date 12 October 2000 2:00 26 April 2001 2:00
Switch#
```

### Configuring a System Name and Prompt

You configure the system name on the switch to identify it. By default, the system name and prompt are `Switch`.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.
For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.3 and the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.3.

These sections contain this configuration information:

- Configuring a System Name, page 4-15
- Understanding DNS, page 4-15

### Configuring a System Name

To manually configure a system name, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>hostname name</td>
<td>Manually configures a system name. The default setting is <code>switch</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The name must follow the rules for ARPANET hostnames. They must start</td>
</tr>
<tr>
<td></td>
<td></td>
<td>with a letter, end with a letter or digit, and have as interior</td>
</tr>
<tr>
<td></td>
<td></td>
<td>characters only letters, digits, and hyphens. Names can be up to 63</td>
</tr>
<tr>
<td></td>
<td></td>
<td>characters. To return to the default hostname, use the <code>no hostname</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>global configuration command.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

When you set the system name, it is also used as the system prompt.

### Understanding DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as `ping`, `telnet`, `connect`, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a `com` domain name, so its domain name is `cisco.com`. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as `ftp.cisco.com`.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.
These sections contain this configuration information:

- Default DNS Configuration, page 4-16
- Setting Up DNS, page 4-16
- Displaying the DNS Configuration, page 4-17

**Default DNS Configuration**

Table 4-2 shows the default DNS configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled.</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

**Setting Up DNS**

To set up your switch to use the DNS, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>ip domain-name name</code></td>
<td>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name). To remove a domain name, use the <code>no ip domain-name name</code> global configuration command. Do not include the initial period that separates an unqualified name from the domain name. At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td><code>ip name-server</code></td>
<td>Specifies the address of one or more name servers to use for name and address resolution. To remove a name server address, use the <code>no ip name-server server-address</code> global configuration command. You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</td>
</tr>
</tbody>
</table>
Chapter 4  Administering the Switch

Creating a Banner

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner displays on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner also displays on all connected terminals. It appears after the MOTD banner and before the login prompts.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.3.

The contain this configuration information:

- Default Banner Configuration, page 4-18
- Configuring a Message-of-the-Day Login Banner, page 4-18
- Configuring a Login Banner, page 4-20

Displaying the DNS Configuration

To display the DNS configuration information, use the show running-config privileged EXEC command.

If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the ip domain-name global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4 ip domain-lookup</td>
<td>(Optional) Enables DNS-based hostname-to-address translation on your switch. This feature is enabled by default. To disable DNS on the switch, use the no ip domain-lookup global configuration command. If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Creating a Banner

Default Banner Configuration

The MOTD and login banners are not configured.

Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

To configure a MOTD login banner, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 banner motd c message c</td>
<td>Specifies the message of the day.</td>
</tr>
</tbody>
</table>

To delete the MOTD banner, use the `no banner motd` global configuration command.

For `c`, enter the delimiting character of your choice, for example, a pound sign (#), and press the `Return` key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.

**Note**

When configuring a banner using the "#" sign as a delimiter on Supervisor Engine 7-E and Supervisor Engine 7L-E, you must first turn off shell processing with the `no shell processing` command. Else, you can not exit from the banner configuration.

### With shell processing enabled ###

```bash
Sup7# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Sup7(config)# ban
Sup7(config)# banner lo
Sup7(config)# banner login #
Enter TEXT message. End with the character '#'
test login banner
#
##
e#
Sup7(config)#
```

### With shell processing disabled ###

```bash
Sup7(config)# banner login #
Enter TEXT message. End with the character '#'
test login banner
#
Sup7(config)#
```

For `message`, enter a banner message up to 255 characters. You cannot use the delimiting character in the message.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Creating a Banner

This example shows how to configure a MOTD banner for the switch by using the pound sign (#) symbol as the beginning and ending delimiter:

```
Switch(config)# banner motd #
it is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Switch(config)#
```

This example shows the banner that appears from the previous configuration:

```
Unix> telnet 172.2.5.4
Trying 172.2.5.4...
Connected to 172.2.5.4.
Escape character is '^]'.

it is a secure site. Only authorized users are allowed.
For access, contact technical support.

User Access Verification

Password:
```
Creating a Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

To configure a login banner, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 banner login <code>c message c</code></td>
<td>Specifies the login message.</td>
</tr>
<tr>
<td></td>
<td>To delete the login banner, use the no banner login global configuration command.</td>
</tr>
<tr>
<td></td>
<td>For <code>c</code>, enter the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.</td>
</tr>
<tr>
<td></td>
<td>Note: When configuring a banner using the &quot;#&quot; sign as a delimiter on Supervisor Engine 7-E and Supervisor Engine 7L-E, you must first turn off shell processing with the no shell processing command. Else, you can not exit from the banner configuration.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the switch learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

**Note**
For complete syntax and usage information for the commands used in this section, see the command reference for this release.

These sections contain this configuration information:

- Building the Address Table, page 4-21
- MAC Addresses and VLANs, page 4-22
- Default MAC Address Table Configuration, page 4-23
- Changing the Address Aging Time, page 4-23
- Removing Dynamic Address Entries, page 4-24
- Configuring MAC Change Notification Traps, page 4-24
- Configuring MAC Move Notification Traps, page 4-26
- Configuring MAC Threshold Notification Traps, page 4-28
- Adding and Removing Static Address Entries, page 4-29
- Configuring Unicast MAC Address Filtering, page 4-30
- Disabling MAC Address Learning on a VLAN, page 4-32
- Displaying Address Table Entries, page 4-37

**Building the Address Table**

With multiple MAC addresses supported on all ports, you can connect any port on the switch to individual workstations, repeaters, switches, routers, or other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the
address and its associated port number to the address table. As stations are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

**MAC Addresses and VLANs**

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.
When PVLANs are configured, address learning depends on the type of MAC address:

- Dynamic MAC addresses learned in one VLAN of a PVLAN are replicated in the associated VLANs. For example, a MAC address learned in a private-VLAN secondary VLAN is replicated in the primary VLAN.

- Static MAC addresses configured in a primary or secondary VLAN are not replicated in the associated VLANs. When you configure a static MAC address in a PVLAN primary or secondary VLAN, you should also configure the same static MAC address in all associated VLANs.

For more information about PVLANs, see Chapter 42, “Configuring Private VLANs.”

### Default MAC Address Table Configuration

Table 4-3 shows the default MAC address table configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>

### Changing the Address Aging Time

Dynamic addresses are source MAC addresses that the switch learns and then ages when they are not in use. You can change the aging time setting for all VLANs or for a specified VLAN.

Setting too short an aging time can cause addresses to be prematurely removed from the table. When the switch receives a packet for an unknown destination, it floods the packet to all ports in the same VLAN as the receiving port. This unnecessary flooding can impact performance. Setting too long an aging time can cause the address table to be filled with unused addresses, which prevents new addresses from being learned. Flooding results, which can impact switch performance.

To configure the dynamic address table aging time, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 mac address-table aging-time [0</td>
<td>10-1000000] [vlan vlan-id]</td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

Chapter 4   Administering the Switch

Managing the MAC Address Table

Removing Dynamic Address Entries

To remove all dynamic entries, use the `clear mac address-table dynamic` command in EXEC mode. You can also remove a specific MAC address (`clear mac address-table dynamic address mac-address`), remove all addresses on the specified physical port or port channel (`clear mac address-table dynamic interface interface-id`), or remove all addresses on a specified VLAN (`clear mac address-table dynamic vlan vlan-id`).

To verify that dynamic entries have been removed, use the `show mac address-table dynamic` privileged EXEC command.

Configuring MAC Change Notification Traps

MAC change notification allows you to track users on a network by storing the MAC change activity on the switch. Whenever the switch learns or removes a MAC address, an SNMP notification can be generated and sent to the network management system. If you have many users entering and exiting the network, you can set a trap interval time to bundle the notification traps and reduce network traffic. The MAC notification history table stores the MAC address activity for each hardware port for which the trap is enabled. MAC address notifications are generated for dynamic and static MAC addresses; events are not generated for self addresses or multicast addresses.

To send MAC change notification traps to an NMS host, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td><code>show mac address-table aging-time</code> Verifies your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code> (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Configuring MAC Change Notification Traps

To send MAC change notification traps to an NMS host, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`snmp-server host host-addr [traps</td>
</tr>
</tbody>
</table>

- For `host-addr`, specify the name or address of the NMS.
- Specify `traps` (the default) to send SNMP traps to the host. Specify `informs` to send SNMP informs to the host.
- Specify the SNMP version to support. Version 1, the default, is not available with informs.
- For `community-string`, specify the string to send with the notification operation. Though you can set this string by using the `snmp-server host` command, we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command.
- For `notification-type`, use the `mac-notification` keyword.
### Managing the MAC Address Table

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp-server enable traps mac-notification change</td>
<td>Enables the switch to send MAC change traps to the NMS. To disable the switch from sending MAC change notification traps, use the <strong>no snmp-server enable traps mac-notification change</strong> global configuration command.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac address-table notification change</td>
<td>Enables the MAC address change notification feature.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac address-table notification change interval [value]</td>
<td>Enters the trap interval time and the history table size.</td>
<td></td>
</tr>
<tr>
<td>history-size [value]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) For <strong>interval value</strong>, specify the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) For <strong>history-size value</strong>, specify the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>Enters interface configuration mode, and specifies the interface on which to enable the SNMP MAC change notification trap.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp trap mac-notification change {added</td>
<td>removed}</td>
<td>Enables the MAC change notification trap.</td>
</tr>
<tr>
<td>• Enable the MAC change notification trap whenever a MAC address is <strong>added</strong> on this interface.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Enable the MAC change notification trap whenever a MAC address is <strong>removed</strong> from this interface.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
</tbody>
</table>

<tr>
<th>Step 10</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

This example shows how to specify 172.69.59.93 as the network management system, enable the switch to send MAC change notification traps to the network management system, enable the MAC change notification feature, set the interval time to 60 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```
Switch# configure terminal
Switch(config)# snmp-server host 172.69.59.93 private mac-notification
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 60
Switch(config)# interface fastethernet0/2
Switch(config-if)# snmp trap mac-notification change added
Switch(config-if)# end
Switch# show mac address-table
MAC Notification Feature is Enabled on the switch
MAC Notification Flags For All Ethernet Interfaces :

Switch#

Configuring MAC Move Notification Traps

When you configure MAC move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.
To configure MAC move notification, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server host host-addr [traps</td>
</tr>
<tr>
<td></td>
<td>Specifies the recipient of the trap message.</td>
</tr>
<tr>
<td></td>
<td>- For host-addr, specify the name or address of the NMS.</td>
</tr>
<tr>
<td></td>
<td>- Specify traps (the default) to send SNMP traps to the host. Specify informs to send SNMP informs to the host.</td>
</tr>
<tr>
<td></td>
<td>- Specify the SNMP version to support. Version 1, the default, is not available with informs.</td>
</tr>
<tr>
<td></td>
<td>- For community-string, specify the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command.</td>
</tr>
<tr>
<td></td>
<td>- For notification-type, use the mac-notification keyword.</td>
</tr>
<tr>
<td>Step 3</td>
<td>snmp-server enable traps mac-notification move</td>
</tr>
<tr>
<td></td>
<td>Enables the switch to send MAC move notification traps to the NMS.</td>
</tr>
<tr>
<td></td>
<td>To disable the switch from sending MAC notification traps, use the no snmp-server enable traps mac-notification move global configuration command.</td>
</tr>
<tr>
<td>Step 4</td>
<td>mac address-table notification mac-move</td>
</tr>
<tr>
<td></td>
<td>Enables the MAC-move notification feature.</td>
</tr>
<tr>
<td></td>
<td>To disable this feature, use the no mac-address-table notification mac-move global configuration command.</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>show mac address-table notification mac-move</td>
</tr>
<tr>
<td></td>
<td>Displays the MAC-move notification status.</td>
</tr>
<tr>
<td>Step 6</td>
<td>show running-config</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to specify 172.69.59.93 as the network management system, enable the switch to send MAC move notification traps to the NMS, enable the MAC move notification feature, and enable traps whenever a MAC address moves from one port to another:

```
Switch# configure terminal
Switch(config)# snmp-server host 171.69.59.93 private mac-notification
Switch(config)# snmp-server enable traps mac-notification move
Switch(config)# mac address-table notification mac-move
Switch(config)# end
Switch# show mac address-table notification mac-move
MAC Move Notification: Enabled
```
# Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table (MAT) threshold limit is reached or exceeded.

To configure MAC address threshold notification, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>snmp-server host host-addr [traps</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>snmp-server enable traps mac-notification threshold</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>mac address-table notification threshold</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>mac address-table notification threshold [limit percentage]</td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

This example shows how to specify 172.69.59.93 as the network management system, enable the MAC threshold notification feature, enable the switch to send MAC threshold notification traps to the NMS, set the interval to 123 seconds, and set the limit to 78 percent:

```
Switch# configure terminal
Switch(config)# snmp-server host 171.69.59.93 private mac-notification
Switch(config)# snmp-server enable traps mac-notification threshold
Switch(config)# mac address-table notification threshold
Switch(config)# mac address-table notification threshold interval 123
Switch(config)# mac address-table notification threshold limit 78
Switch(config)# end
```

Switch# show mac-address-table notification threshold

<table>
<thead>
<tr>
<th>Status</th>
<th>limit</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>78</td>
<td>123</td>
</tr>
</tbody>
</table>

Adding and Removing Static Address Entries

A static address has these characteristics:

- It is manually entered in the address table and must be manually removed.
- It can be a unicast or multicast address.
- It does not age and is retained when the switch restarts.

You can add and remove static addresses and define the forwarding behavior for them. The forwarding behavior defines how a port that receives a packet forwards it to another port for transmission. Because all ports are associated with at least one VLAN, the switch acquires the VLAN ID for the address from the ports that you specify. You can specify a different list of destination ports for each source port.

A packet with a static address that arrives on a VLAN where it has not been statically entered is flooded to all ports and not learned.

You add a static address to the address table by specifying the destination MAC unicast address and the VLAN from which it is received. Packets received with this destination address are forwarded to the interface specified with the interface-id option.

When you configure a static MAC address in a private-VLAN primary or secondary VLAN, you should also configure the same static MAC address in all associated VLANs. Static MAC addresses configured in a private-VLAN primary or secondary VLAN are not replicated in the associated VLAN. For more information about PVLANs, see Chapter 42, “Configuring Private VLANs.”
Managing the MAC Address Table

To add a static address, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>mac address-table static mac-addr vlan vlan-id interface interface-id</td>
</tr>
</tbody>
</table>

- For `mac-addr`, specify the destination MAC unicast address to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.
- For `vlan-id`, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.
- For `interface-id`, specify the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels.

You can specify static multicast addresses for multiple interface IDs. However, you cannot assign static unicast MAC address to multiple interfaces with the same MAC address and VLAN ID.

To remove static entries from the address table, use the `no mac address-table static mac-addr vlan vlan-id [interface interface-id]` global configuration command.

| Step 3     | end | Returns to privileged EXEC mode. |
| Step 4     | show mac address-table static | Verifies your entries. |
| Step 5     | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

```
Switch# configure terminal
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet0/1
Switch(config)# end
Switch#
```

Configuring Unicast MAC Address Filtering

When unicast MAC address filtering is enabled, the switch drops packets with specific source or destination MAC addresses. This feature is disabled by default and only supports unicast static addresses.

When using unicast address filtering, consider these guidelines:

- Multicast MAC addresses, broadcast MAC addresses, and router MAC addresses are not supported. If you specify one of these addresses when entering the `mac address-table static vlan drop` global configuration command, one of these messages appears:

  ```
  % Only unicast addresses can be configured to be dropped
  % CPU destined address cannot be configured as drop address
  ```

- Packets that are forwarded to the CPU are also not supported.
If you add a unicast MAC address as a static address and configure unicast MAC address filtering, the switch either adds the MAC address as a static address or drops packets with that MAC address, depending on which command was entered last. The second command that you entered overrides the first command.

For example, if you enter the `mac address-table static vlan interface` global configuration command followed by the `mac address-table static vlan drop` command, the switch drops packets with the specified MAC address as a source or destination.

If you enter the `mac address-table static vlan drop` global configuration command followed by the `mac address-table static vlan interface` command, the switch adds the MAC address as a static address.

You enable unicast MAC address filtering and configure the switch to drop packets with a specific address by specifying the source or destination unicast MAC address and the VLAN from which it is received.

To configure the switch to drop a source or destination unicast static address, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2  | `mac address-table static mac-adr vlan vlan-id drop` Enables unicast MAC address filtering and configure the switch to drop a packet with the specified source or destination unicast static address.  
  - For `mac-adr`, specify a source or destination unicast MAC address.  
  - For `vlan-id`, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.  
  To disable unicast MAC address filtering, use the `no mac address-table static vlan` global configuration command. |
| Step 3  | `end` Returns to privileged EXEC mode. |
| Step 4  | `show mac address-table static` Verifies your entries. |
| Step 5  | `copy running-config startup-config` (Optional) Saves your entries in the configuration file. |

This example shows how to enable unicast MAC address filtering and to configure the switch to drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch# configure terminal
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
Switch(config)# end
Switch#
```

**Note** To filter MAC addresses on a secondary VLAN, specify the corresponding primary VLAN in the above configuration. If the specified VLAN is a primary VLAN, all matching packets received in this primary VLAN and associated secondary VLANs are dropped.
Disabling MAC Address Learning on a VLAN

By default, MAC address learning is enabled on all VLANs on the switch. By controlling which VLANs can learn MAC addresses, you can manage the available MAC address table space. By disabling learning on a VLAN, you can conserve the MAC address table space because all the MAC addresses seen on this VLAN are not learned.

Before disabling MAC address learning, you should understand the network topology and features deployed. Many Layer 2 features use MAC addresses and may not work properly if learning is disabled. Because disabling learning causes flooding of packets, you need to understand the impact of flooding on the network.

These sections contain this information:
- Deployment Scenarios, page 4-33
- Configuring Disable MAC Address Learning, page 4-32
- Usage Guidelines, page 4-33
- Deployment Scenarios, page 4-33
- Feature Compatibility, page 4-35
- Feature Incompatibility, page 4-36

Configuring Disable MAC Address Learning

To disable MAC address learning on a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# no mac address-table learning vlan vlan-id range</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show mac address-table learning [vlan vlan-id range]</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to disable learning on any VLAN or range of VLANs:

```
Switch# configure terminal
Switch(config)# no mac address-table learning vlan 9-16
Switch(config)# end
Switch#

Switch# show mac address-table learning
Learning disabled on vlans: 9-11,13-16

Switch# show mac address-table learning vlan 10-15
Learning disabled on vlans: 10-11,13-15
```
Usage Guidelines

Note
These guidelines are advisory only. Contact the Cisco solution provider team for specific solution implementations.

When disabling MAC address learning on a VLAN, consider these guidelines:

- If learning is disabled on a VLAN with an SVI interface, it floods every IP packet in the Layer 2 domain. Because this flooding may be undesirable, you should disable MAC address learning on a SVI VLAN carefully.

- If you provide a VLAN range that includes reserved VLAN (such as 1000-1006), the command is accepted and disable learning is enabled for all VLANs except for 1002-005 (that is, 1000-1001,1006). However, if you specify an invalid range (such as 1-5000), the command fails and disable learning is not enabled on any of the VLANs.

- With PVLANs, you need to disable learning on the primary VLAN and all secondary VLANs associated with that primary VLANs. Otherwise, you encounter traffic flooding in one direction and unicast flooding in the other direction.

- To disable MAC address learning on a VLAN, consider the flooding implications.

Deployment Scenarios

This section includes these deployment scenarios:

- Metro (Point to Point Links), page 4-33
- Network Load Balancers, page 4-34
- Layer 2 Firewall or Cache, page 4-35

Metro (Point to Point Links)

In this topology, you have two ports on a VLAN; traffic enters one and must exit the other. On a point-to-point link in metro networks, numerous MAC addresses are on these types of ports by disabling learning on the VLAN to which these two ports belong, many entries in the MAC address table space can be saved. Because there is only one egress port for the traffic, you can flood the packet and avoid having to learn all the MAC addresses seen on this port. This process saves considerable space in the MAC address table.

To obtain source learning, packets are bridged as Layer 2 flood packets. Replicated packets use a distinct dedicated bandwidth. Regardless of the number of ports in a flood set, a flood packet always consumes replication packet bandwidth, which consumes some multicast and broadcast packet-processing bandwidth (Figure 4-2).
**Network Load Balancers**

In this topology, you have two devices, one active and one standby. To perform load balancing, both devices must receive all packets. You could place both devices on the same VLAN. If learning can be disabled on this VLAN, the packet is flooded and both devices receive all traffic destined to any MAC address on the VLAN. You also can assign a multicast MAC address to both load balancers to ensure that all packets reach them. (Figure 4-3).
Layer 2 Firewall or Cache

In this topology, a rewritten Layer 3 packet is routed back to a Layer 2 firewall (or cache) before exiting. When the packet reenters the switch from the firewall, it possesses the switch’s MAC address because the packet was previously routed. If the ingress port is a switch port, the switch learns the router’s MAC address. For a routed port or SVI, however, the switch does not learn the address. Source misses are generated continuously for all arriving data packets and the switch shows a very high CPU utilization.

By disabling learning on the VLAN that the firewall or cache egress is connected to, you will routinely suppress the source miss and do not observe high CPU utilization (Figure 4-4).

Figure 4-4 Disabling MAC Address Learning: Layer 2 Firewall/Cache

Feature Compatibility

The following features are compatible with disabling MAC address learning on a VLAN:

- EtherChannel—The learning disable feature has no impact on EtherChannel provided that the MAC learning state is either disabled or enabled for a VLAN on EtherChannel ports.
- Switch Virtual Interface (SVI, Layer 3 on a VLAN)—The learning disable feature has no impact on SVI. Although disabling MAC address learning on a SVI VLAN causes flooding, it does not impact any Layer 3 feature.
- REP—The learning disable feature has no impact on REP provided that the MAC learning state is either disabled or enabled for an active VLAN on a port where REP is running.
- Unicast, Multicast, and Broadcast—When you enable learning on a VLAN, learning is disabled on all types of traffic.
- DAI, ESMP, and IGMP snooping—These features do not interact with the learning disable feature.
- Control packets—Control packets arrive at the CPU even if learning is disabled.
- RSPAN—Learning on a VLAN and on an RSPAN are compatible.
- VLAN translation—To disable learning on a VLAN that is being translated, you must disable learning on the translated VLAN.
Feature Incompatibility

The following features are incompatible with disabling MAC address learning and do not work properly when the feature is enabled:

- **802.1X**—The 802.1X class of features does not work when learning is disabled because some of these features require source miss, which is ignored.
- **Port security**—Port security VLANs requires learning to be enabled. To secure MAC addresses, packets must first arrive at the CPU. However, if you disable learning on a VLAN, SA suppression ensures that packets do not operate this way.
- **Unicast flood blocking**—When unicast flood blocking is enabled on a port, it is removed from the VLAN flood set. If learning is disabled on the same VLAN, the host connected to that port do not receive traffic.
- **DHCP snooping**—To send the packet out the correct port once a DHCP request has been resolved, DHCP snooping must learn the MAC address. If you disable learning, the switch do not know on which port to exit the packet; the two features are incompatible.
- **Broadcast storm control**—This feature does not interact with the learning disable feature.
- **Flooding of packets in a VLAN domain in which learning is disabled through PVL.**

Partial Feature Incompatibility

Although the following features are partially incompatible with disabling MAC address learning, they still retain a large portion of their functionality:

- **FlexLink**—FlexLink functions and upstream convergence is not impacted. However, downstream fast convergence uses a MAC table to send dummy multicast packets for each learned MAC address upstream to expedite downstream convergence. This situation does not happen if you enabled learning disable. FlexLink downstream convergence occurs naturally, but it is slower if learning is enabled on that VLAN.
- **PVLAN**—To observe correct behavior, you must disable learning on the primary VLAN and all secondary VLANs associated with the primary VLAN.

**Note**

To avoid confusion, configure PVLAN similarly on both the primary and secondary VLANs in the PVLAN space.

- **Spanning Tree (STP)**—Except for the UplinkFast feature, per-VLAN spanning tree functionality is not impacted. To achieve faster downstream convergence, UplinkFast forwards dummy multicast packets using learned MAC addresses. This action is not possible unless MAC learning is enabled.
Displaying Address Table Entries

You can display the MAC address table by using one or more of the privileged EXEC commands described in Table 4-4.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip igmp snooping groups</td>
<td>Displays the Layer 2 multicast entries for all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table address</td>
<td>Displays MAC address table information for the specified MAC address.</td>
</tr>
<tr>
<td>show mac address-table aging-time</td>
<td>Displays the aging time in all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table count</td>
<td>Displays the number of addresses present in all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table dynamic</td>
<td>Displays only dynamic MAC address table entries.</td>
</tr>
<tr>
<td>show mac address-table interface</td>
<td>Displays the MAC address table information for the specified interface.</td>
</tr>
<tr>
<td>show mac address-table notification</td>
<td>Displays the MAC notification parameters and history table.</td>
</tr>
<tr>
<td>show mac address-table static</td>
<td>Displays only static MAC address table entries.</td>
</tr>
<tr>
<td>show mac address-table vlan</td>
<td>Displays the MAC address table information for the specified VLAN.</td>
</tr>
</tbody>
</table>

Managing the ARP Table

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called address resolution.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval and the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the arpa keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.3 documentation on Cisco.com.

Configuring Embedded CiscoView Support

The Catalyst 4500 series switch supports CiscoView web-based administration using the Catalyst Web Interface (CWI) tool. CiscoView is a device management application that can be embedded on the switch flash and provides dynamic status, monitoring, and configuration information for your switch.

CiscoView displays a physical view of your switch chassis with color-coded modules and ports and monitoring capabilities that display the switch status, performance, and other statistics. Configuration capabilities allow comprehensive changes to devices, if the required security privileges have been granted. The configuration and monitoring capabilities for the Catalyst 4500 series of switches mirror those available in CiscoView in all server-based CiscoWorks solutions, including CiscoWorks LAN Management Solution (LMS) and CiscoWorks Routed WAN Management Solution (RWAN).
These sections describe the Embedded CiscoView support available with Cisco IOS Release 12.1(20)EW and later releases:

- Understanding Embedded CiscoView, page 4-38
- Installing and Configuring Embedded CiscoView, page 4-38
- Displaying Embedded CiscoView Information, page 4-41

## Understanding Embedded CiscoView

The Embedded CiscoView network management system is a web-based interface that uses HTTP and SNMP to provide a graphical representation of the switch and to provide a GUI-based management and configuration interface.

## Installing and Configuring Embedded CiscoView

To install and configure Embedded CiscoView, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# dir device_name</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# delete device_name:cv/*</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# squeeze device_name:</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# copy tftp bootflash</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# archive tar /xtract tftp://ip address of tftp server/ciscoview.tar device_name:cv</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# dir device_name:</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config)# ip http server</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config)# snmp-server community string ro</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch(config)# snmp-server community string rw</td>
</tr>
</tbody>
</table>

**Note**

The default password for accessing the switch web page is the enable-level password of the switch.
The following example shows how to install and configure Embedded CiscoView on your switch:

Switch# dir

Configuring the Cisco IOS In-Service Software Upgrade Process

Note

Starting with Cisco IOS 12.2(31)SGA, ISSU is supported on the Catalyst 4500. All line cards are supported.

Operating on redundant systems, the In-Service Software Upgrade (ISSU) process allows Cisco IOS software to be updated or otherwise modified while packet forwarding continues. In most networks, planned software upgrades are a significant cause of downtime. ISSU allows Cisco IOS software to be modified while packet forwarding continues. This increases network availability and reduces downtime caused by planned software upgrades. This document provides information about ISSU concepts and describes the steps taken to perform ISSU in a system.

This section includes these topics:

- Prerequisites to Performing ISSU, page 5-2
- About ISSU, page 5-3
- Performing the ISSU Process, page 5-15
- Related Documents, page 5-39

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

Prerequisites to Performing ISSU

Before performing ISSU, you need to meet these prerequisites:

- Image type of the existing and target image must match. For example, you cannot upgrade from an IP Base image to an Enterprise Services image (and vice versa) without experiencing several minutes of traffic loss.

  **Note**  
  A similar limitation applies between crypto and non-crypto images.

- The active and the standby supervisor engines must have the same supervisor engine hardware (same model, same memory, NFL daughter card and so on).

- The new and old Cisco IOS software images must be loaded into the file systems (bootflash or compact flash) of both the active and the standby supervisor engines before you begin the ISSU process.

  The old image should be available either in bootflash or compact flash and the system should have been booted from one of these locations because the boot variable should not be changed before the ISSU process unfolds.

  **Note**  
  auto-boot must be enabled for ISSU to succeed.

- Stateful Switchover (SSO) must be configured and the standby supervisor engine should be in standby hot state.

  These commands indicate whether SSO is enabled: `show module`, `show running-config`, `show redundancy state`.

  If you do not have SSO enabled, see the *Stateful Switchover* document for further information on how to enable and configure SSO.

- Nonstop Forwarding (NSF) must be configured and working properly. If you do not have NSF enabled, see the *Cisco Nonstop Forwarding* document for further information on how to enable and configure NSF.

- Before you perform ISSU, ensure that the system is configured for redundancy mode SSO and that the file system for both the active and the standby supervisor engines contains the new ISSU-compatible image. The current Cisco IOS version running in the system must also support ISSU.

  You can enter various commands on the Catalyst 4500 series switch or the ISSU application on Cisco Feature Navigator are to determine supervisor engine versioning and Cisco IOS compatibility.

- If you enter the `no ip routing` command, ISSU falls back from SSO to RPR mode, resulting in traffic loss.

- Autoboot is turned on and the current booted image matches the one specified in the BOOT environmental variable. For details on how to configure and verify these, please refer to “Modifying the Boot Field and Using the boot Command, page 3-27.”

- If you enter the `no ip routing` command, ISSU falls back from SSO to RPR mode, resulting in traffic loss.
About ISSU

Note

Do not make any hardware changes while performing ISSU.

Before you perform ISSU, you should understand the following concepts:

- Stateful Switchover Overview, page 5-3
- NSF Overview, page 5-5
- ISSU Process Overview, page 5-6
- Performing an ISSU Upgrade: 2 Methods, page 5-11
- Changeversion Process, page 5-12
- Guidelines for Performing ISSU, page 5-13
- Versioning Capability in Cisco IOS Software to Support ISSU, page 5-13
- SNMP Support for ISSU, page 5-15
- Compatibility Verification Using Cisco Feature Navigator, page 5-15

Stateful Switchover Overview

Development of the SSO feature is an incremental step within an overall program to improve the availability of networks constructed with Cisco IOS switches.

In specific Cisco networking devices that support dual supervisor engines, SSO takes advantage of supervisor engine redundancy to increase network availability. SSO achieves this by establishing one of the supervisor engines as the active processor while the other supervisor engine is designated as the standby processor. Following an initial synchronization between the two supervisor engines, SSO dynamically synchronizes supervisor engine state information between them in real-time.

A switchover from the active to the standby processor occurs when the active supervisor engine fails or is removed from the networking device.

Cisco NSF is used with SSO. Cisco NSF allows the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. With Cisco NSF, peer networking devices do not experience routing flaps, which reduce loss of service outages for customers.

Figure 5-1 illustrates how SSO is typically deployed in service provider networks. In this example, Cisco NSF with SSO is enabled at the access layer (edge) of the service provider network. A fault at this point could result in loss of service for enterprise customers requiring access to the service provider network.

For Cisco NSF protocols that require neighboring devices to participate in Cisco NSF, Cisco NSF-aware software images must be installed on those neighboring distribution layer devices. Depending on your objectives, you may decide to deploy Cisco NSF and SSO features at the core layer of your network. Doing this can help reduce the time to restore network capacity and service for certain failures, which leads to additional availability.
Additional levels of availability may be gained by deploying Cisco NSF with SSO at other points in the network where a single point of failure exists. Figure 5-2 illustrates an optional deployment strategy that applies Cisco NSF with SSO at the enterprise network access layer. In this example, each access point in the enterprise network represents another single point of failure in the network design. In the event of a switchover or a planned software upgrade, enterprise customer sessions continue uninterrupted through the network in this example.
**NSF Overview**

Cisco NSF works with the SSO feature in Cisco IOS software. SSO is a prerequisite of Cisco NSF. NSF works with SSO to minimize the amount of time a network is unavailable to its users following a switchover. The main objective of Cisco NSF is to continue forwarding IP packets following a supervisor engine switchover.

Usually, when a networking device restarts, all routing peers of that device detect that the device went down and then came back up. This transition results in what is called a routing flap, which could spread across multiple routing domains. Routing flaps caused by routing restarts create routing instabilities, which are detrimental to the overall network performance. Cisco NSF helps to suppress routing flaps in SSO-enabled devices, thus reducing network instability.

Cisco NSF allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. With Cisco NSF, peer networking devices do not experience routing flaps. Data traffic is forwarded while the standby supervisor engine assumes control from the failed active supervisor engine during a switchover. The ability of physical links to remain up through a switchover and to be kept current with the Forwarding Information Base (FIB) on the active supervisor engine is key to Cisco NSF operation.
ISSU Process Overview

The ISSU process allows you to perform a Cisco IOS software upgrade or downgrade while the system continues to forward packets. (For an illustration of the commands used during the ISSU process, refer to Figure 5-8 on page 5-11.) Cisco IOS ISSU takes advantage of the Cisco IOS high availability infrastructure—Cisco NSF with SSO and hardware redundancy—and eliminates downtime associated with software upgrades or version changes by allowing changes while the system remains in service (see Figure 5-3).

SSO and NSF mode support configuration and runtime state synchronization from the active to the standby supervisor engine. For this process to happen, the images on both the active and the standby supervisor engines must be the same. When images on active and standby supervisor engines are different ISSU allows the two supervisor engines to be kept in synchronization even when these two versions of Cisco IOS support different sets of features and commands.
An ISSU-capable switch consists of two supervisor engines (active and standby) and one or more line cards. Before initiating the ISSU process, copy the Cisco IOS software into the file systems of both supervisor engines (see Figure 5-4).

**Note**

In the following figure, Cisco IOS 12.x(y)S represents the *current* version of Cisco IOS.

**Figure 5-4 Install/Copy New Version of Cisco IOS Software on Both Supervisor Engines**
After you have copied the Cisco IOS software to both file systems, load the new version of Cisco IOS software onto the standby supervisor engine (see Figure 5-5).

**Note**
Without the ISSU feature, you cannot have SSO or NSF functioning between the active and standby supervisor engines when they are running two different versions of Cisco IOS image.

**Figure 5-5 Load New Version of Cisco IOS Software on the Standby Supervisor Engine**
After a switchover (NSF or SSO, not RPR), the standby supervisor engine takes over as the new active supervisor engine (see Figure 5-6).

**Figure 5-6 Switch Over to Standby Supervisor Engine**
The former active supervisor engine is loaded with an old Cisco IOS image so that if the new active supervisor engine experiences problems, you can abort and conduct a switchover to the former active, which is already running the old image. Next, the former active supervisor engine is loaded with the new version of Cisco IOS software and becomes the new standby supervisor engine (see Figure 5-7).

*Figure 5-7  Load New Standby Supervisor Engine with New Cisco IOS Software*

*Figure 5-8 shows the steps during the ISSU process.*
Performing an ISSU Upgrade: 2 Methods

There are two ways to perform an ISSU upgrade: manually, with four commands; or automatically, with one command.

The normal ISSU upgrade process involves issuing four separate ISSU exec commands (issu loadversion, issu runversion, issu acceptversion, issue commitversion) along with additional show command invocations to evaluate the success of each command before proceeding. Although the ISSU process is complicated, you should not expect disruption of service. The use of multiple ISSU commands dictates an additional level of care to ensure no service disruption. However, in some scenarios, this upgrade procedure might be cumbersome and of minimal value. A typical example is during a network upgrade that involves performing an ISSU upgrade on a large number of Catalyst 4500 switches. In these cases, we recommend that you first perform the normal (four command) ISSU upgrade procedure on one switch (possibly in a lab environment) to verify successful upgrade. Then, use a single issu changeversion command to perform an automatic ISSU on the rest of the Catalyst 4500 switches in the network.

Note

To use the issu changeversion command, both old and new IOS versions must support issu changeversion functionary.
Changeversion Process

The **issu changeversion** command launches a single-step complete ISSU upgrade cycle. It performs the logic for all four of the standard commands (**issu loadversion**, **issu runversion**, **issu acceptversion**, and **issu commitversion**) without user intervention, streamlining the upgrade through a single CLI step.

Additionally, **issu changeversion** allows the upgrade process to be scheduled for a future time. This enables you to stage a number of systems to perform upgrades sequentially when a potential disruption would be least harmful.

After the standby supervisor engine initializes and the system reaches a terminal state (RPR/SSO), the upgrade process is complete and the BOOT variable is permanently written with the new IOS software image. Hence, a reset on any RP will keep the system booting the new software image. Console and syslog messages will be generated to notify anyone monitoring the upgrade that the state transition has occurred.

Similar to the normal ISSU upgrade procedure, the in-progress upgrade procedure initiated by the **issu changeversion** command can be aborted with the **issu abortversion** command. If the system detects any problems or detects an unhealthy system during an upgrade, the upgrade might be automatically aborted.

When the **issu runversion** command is entered during the four step manual upgrade process, if any incompatible ISSU clients exist, the upgrade process reports them and their side effects, and allows the user to abort the upgrade. While performing a single-step upgrade process, when the process reaches the runversion state, it will either automatically continue with the upgrade provided the base clients are compatible, or automatically abort because of client incompatibility. If the user wants to continue the upgrade procedure in RPR mode, the user must use the normal ISSU command set and specify the force option when entering the **issu loadversion** command.

### Changeversion: Quick Option

The **issu changeversion** command provides an optional quick command option that can reduce the time required to perform the automatic ISSU upgrade. When the quick command option is applied, the ISSU upgrade state transition differs from that described previously. With this option, the software logic up the loadversion stage remains the same as previously described, and the logic that performs runversion and commitversion is combined. This logic skips the step in the upgrade procedure that loads the old software version on the new standby (old active) supervisor, reducing the time required for the automatic ISSU upgrade by about a third.

### Scheduled Changeversion: “in” and “at” Options

**issu changeversion** provides in and at command options that enable you to schedule a future automatic ISSU upgrade.

The **at** command option schedules an automatic ISSU upgrade to begin at a specific time. This option specifies an exact time (hh:mm, 24 hour format) in the next 24 hours at which the upgrade will occur.

The **in** command option schedules an automatic ISSU upgrade to begin after a certain amount of time has elapsed. This option specifies the number of hours and minutes (hh:mm format) that must elapse before an upgrade will occur, with a maximum value of 99:59.
**Changeversion Deployment Scenario**

The typical **issu changeversion** command usage scenario is for experienced users with a large installed base. These users typically validate a new image using a topology and configuration similar to their production network. The validation process should be done using both the existing multi-command process and the new **issu changeversion** command process. Once users certify an IOS software image and want to roll it out broadly, they can use the single command process to perform an efficient upgrade of their network.

**Aborting an In-Progress Changeversion Procedure**

The **issu changeversion** command functionality is designed to perform an ISSU software upgrade without user intervention. However, status messages are displayed to the console as the upgrade transitions through the various states. If any anomalies are noticed during the automatic upgrade, perhaps with peers or other parts of the network, you can use the **issu abortversion** command to manually abort the upgrade at any point in the process prior to the commitversion operation.

**Guidelines for Performing ISSU**

Be aware of the following guidelines while performing the ISSU process:

- Even with ISSU, it is recommended that upgrades be performed during a maintenance window.
- The new features should not be enabled (if they require change of configuration) during the ISSU process.

**Note** Enabling them will cause the system to enter RPR mode because commands are only supported on the new version.

- In a downgrade scenario, if any feature is not available in the downgrade revision of the Cisco IOS software handle, that feature should be disabled prior to initiating the ISSU process.

**Versioning Capability in Cisco IOS Software to Support ISSU**

Before the introduction of ISSU, the SSO mode of operation required each supervisor engine to be running the same versions of Cisco IOS software.

**Note** The operating mode of the system in a redundant HA configuration is determined by exchanging version strings when the standby supervisor engine registers with the active supervisor engine.

The system entered SSO mode only if the versions running on the both supervisor engines were the same. If not, the redundancy mode changes to RPR. With ISSU capability, the implementation allows two different but compatible release levels of Cisco IOS images to interoperate in SSO mode and enables software upgrades while packet forwarding continues. Version checking done before ISSU capability was introduced is no longer sufficient to allow the system to determine the operating mode.
ISSU requires additional information to determine compatibility between software versions. A compatibility matrix is defined, containing information about other images relative to the one in question. This compatibility matrix represents the compatibility of two software versions, one running on the active and the other on the standby supervisor engine, and to allow the system to determine the highest operating mode it can achieve. Incompatible versions cannot progress to SSO operational mode.

**Compatibility Matrix**

You can perform the ISSU process when the Cisco IOS software on both the active and the standby supervisor engine is capable of ISSU and the old and new images are compatible. The compatibility matrix information stores the compatibility among releases as follows:

- **Compatible**—The base-level system infrastructure and all optional HA-aware subsystems are compatible. An in-service upgrade or downgrade between these versions succeeds with minimal service impact. The matrix entry designates the images to be compatible (C).
- **Base-level compatible**—One or more of the optional HA-aware subsystems is not compatible. An in-service upgrade or downgrade between these versions succeeds; however, some subsystems cannot always maintain state during the transition from the old to the new version of Cisco IOS. The matrix entry designates the images to be base-level compatible (B).
   
   However, you should be able to perform an ISSU upgrade without any functionality loss even if the matrix entry is B. The downgrade may experience some functionality loss if the newer image had additional functionality.

- **Incompatible**—A core set of system infrastructure exists in Cisco IOS that must be able to interoperate in a stateful manner for SSO to function correctly. If any of these required features or subsystems is not interoperable, then the two versions of the Cisco IOS software images are declared to be incompatible. An in-service upgrade or downgrade between these versions is not possible. The matrix entry designates the images to be incompatible (I). The system operates in RPR mode during the period when the versions of Cisco IOS at the active and standby supervisor engines are incompatible.

If you attempt to perform ISSU with a peer that does not support ISSU, the system automatically uses RPR instead.

The compatibility matrix represents the compatibility relationship a Cisco IOS software image has with all of the other Cisco IOS software versions within the designated support window (for example, all of those software versions the image “knows” about) and is populated and released with every image. The matrix stores compatibility information between its own release and prior releases. It is always the newest release that contains the latest information about compatibility with existing releases in the field. The compatibility matrix is available within the Cisco IOS software image and on Cisco.com so that users can determine in advance whether an upgrade can be done using the ISSU process.

To display the compatibility matrix data between two software versions on a given system, enter the `show issu comp-matrix stored` command.

---

**Note**

This command is useful *only for verification purposes* because it is available *only after* the ISSU process has started. You might want to check the compatibility matrix prior to starting ISSU. Use the Feature Navigator to obtain the needed information:

SNMP Support for ISSU

SNMP for SSO provides a mechanism for synchronizing the SNMP configurations and the MIBs that support SSO from the active supervisor engine to the standby supervisor engine, assuming that both supervisor engines are running the same version of Cisco IOS software. This assumption is not valid for ISSU.

With ISSU, an SNMP client can handle transformations for the MIBs across two different versions of Cisco IOS, if needed. An SNMP client handles transformation for all MIBs and handles the transmit and receive functionality across the active and standby supervisor engines. During SNMP, a MIB is completely synchronized from the active supervisor engine to the standby supervisor engine only if the versions of the MIB on both Cisco IOS releases are the same.

Compatibility Verification Using Cisco Feature Navigator

The ISSU application on Cisco Feature Navigator allows you to:

- Select an ISSU-capable image
- Identify which images are compatible with that image
- Compare two images and understand the compatibility level of the images (that is, compatible, base-level compatible, and incompatible)
- Compare two images and see the client compatibility for each ISSU client
- Provide links to release notes for the image

Performing the ISSU Process

Unlike SSO, which is a mode of operation for the device and a prerequisite for performing ISSU, the ISSU process is a series of steps performed while the switch is in operation. The steps result in an upgrade to a new or modified Cisco IOS software, and have a minimal impact to traffic.

Note
For an illustration of the process flow for ISSU, refer to Figure 5-8 on page 5-11.

This section includes the following topics:
- Verifying the ISSU Software Installation, page 5-16
- Loading New Cisco IOS Software on the Standby Supervisor Engine, page 5-18 (required)
- Switching to the Standby Supervisor Engine, page 5-21 (required)
- Stopping the ISSU Rollback Timer (Optional), page 5-23 (optional)
- Loading New Cisco IOS Software on the New Standby Supervisor Engine, page 5-24
- Aborting a Software Upgrade During ISSU, page 5-31
- Configuring the Rollback Timer to Safeguard Against Upgrade Issues, page 5-32
- Displaying ISSU Compatibility Matrix Information, page 5-34
Verifying the ISSU Software Installation

During the ISSU process, five valid states exist: disabled, init, load version, run version, and system reset. Use the `show issu state` command to obtain the current ISSU state:

- **Disabled state**—The state for the standby supervisor engine while this engine is resetting.
- **Init state**—The initial state is two supervisor engines, one active and one standby, before the ISSU process is started. It is also the final state after the ISSU process completes.
- **Load version (LV) state**—The standby supervisor engine is loaded with the new version of Cisco IOS software.
- **Run version (RV) state**—The `issu runversion` command forces the switchover of the supervisor engines. The newly active supervisor engine now runs the new Cisco IOS software image.
- **System reset (SR) state**—This state occurs either when you enter the `issu abortversion` command before the Init state is reached, or if the rollback timer expires before you execute the `issu acceptversion` command.

You can verify the ISSU software installation by entering `show` commands, as follows:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch&gt; enable</td>
<td>Enables privileged EXEC mode. • Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# show issu state [detail]</td>
<td>Displays the state of the during the ISSU process.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch# show redundancy</td>
<td>Displays current or historical status, mode, and related redundancy information about the device.</td>
</tr>
</tbody>
</table>

This example shows how to display the state and the current status of the supervisor engine during the ISSU process:

```
Switch> enable
Switch# show issu state
Switch# show redundancy
```

Verifying Redundancy Mode Before Beginning the ISSU Process

Before you begin the ISSU process, verify the redundancy mode for the system and be sure to configure NSF and SSO.

The following example displays verification that the system is in SSO mode, that slot 1 is the active supervisor engine, and that slot 2 is the standby supervisor engine. Both supervisor engines are running the same Cisco IOS software image.

```
Switch# show redundancy states
  my state = 13 -ACTIVE
  peer state = 8 -STANDBY HOT
  Mode = Duplex
  Unit = Primary
  Unit ID = 1

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
```
Verifying the ISSU State Before Beginning the ISSU Process

Ensure that the active and standby supervisor engines are up and in ISSU Init state and that the boot variables are set and pointing to valid files.

The following example displays the ISSU state before the process begins:

```bash
Switch# show issu state detail
  Slot = 1
  RP State = Active
```
Performing the ISSU Process

ISSU State = Init
Boot Variable = bootflash:old_image,1;
Operating Mode = Stateful Switchover
Primary Version = N/A
Secondary Version = N/A
Current Version = bootflash:old_image

Slot = 2
RP State = Standby
ISSU State = Init
Boot Variable = bootflash:old_image,1;
Operating Mode = Stateful Switchover
Primary Version = N/A
Secondary Version = N/A
Current Version = bootflash:old_image

The new version of the Cisco IOS software must be present on both of the supervisor engines. The directory information displayed for each of the supervisor engines (or supervisor engines) shows that the new version is present.

Switch# dir bootflash:
Directory of bootflash:/

5  -rwx  13636500   Sep 6 2006 09:32:33 +00:00  old_image
6  -rwx  13636500   Sep 6 2006 09:34:07 +00:00  new_image

61341696 bytes total (1111388 bytes free)

Switch# dir slavebootflash:
Directory of slavebootflash:/

4  -rwx  13636500   Sep 6 2006 09:40:10 +00:00  old_image
5  -rwx  13636500   Sep 6 2006 09:42:13 +00:00  new_image

61341696 bytes total (1116224 bytes free)

Loading New Cisco IOS Software on the Standby Supervisor Engine

This task describes how to use ISSU to load a new version of Cisco IOS software to the standby supervisor engine.

Prerequisites

- Ensure that the new version of Cisco IOS software image is already present in the file system of both the active and standby supervisor engines. Also ensure that appropriate boot parameters (BOOT string and config-register) are set for the standby supervisor engine.

Note: The switch must boot with the BOOT string setting before the ISSU procedure is attempted.

Note: auto-boot must be enabled for ISSU to succeed.

- Optionally, perform additional tests and commands to determine the current state of peers and interfaces for later comparison.
Performing the ISSU Process

- Ensure the system (both active and standby supervisor engines) is in SSO redundancy mode. If the system is in RPR mode rather than SSO mode, you can still upgrade the system using the ISSU CLI commands, but the system experiences extended packet loss during the upgrade.

  Refer to the Stateful Switchover document for more details on how to configure SSO mode on supervisor engines.

- For ISSU to function, the image names on the active and standby supervisor engines must match.

Perform this task at the active supervisor engine:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# issu loadversion active-slot active-image-new standby-slot standby-image-new [forced]</td>
<td>Starts the ISSU process and (optionally) overrides the automatic rollback when the new Cisco IOS software version is detected to be incompatible.</td>
</tr>
<tr>
<td></td>
<td>It may take several seconds after the issu loadversion command is entered for Cisco IOS software to load onto the standby supervisor engine and for the standby supervisor engine to transition to SSO mode. This causes the standby supervisor engine to reload with the new image.</td>
</tr>
<tr>
<td></td>
<td>If you use the forced option, the standby supervisor engine is booted with the new image. After the image is loaded on the standby supervisor engine, if the image is incompatible, the system is forced to the RPR mode. Otherwise the system continues in the SSO mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch# show issu state [detail]</td>
<td>Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that the standby supervisor engine is loaded and is in SSO mode.</td>
</tr>
<tr>
<td></td>
<td>It may take several seconds after entering the issu loadversion command for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode. If you enter the show issu state command too quickly, you may not see the information you need.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch# show redundancy [states]</td>
<td>Displays redundancy facility state information.</td>
</tr>
</tbody>
</table>

This example shows how to start the ISSU process, boot the standby supervisor engine in the Standby Hot state, and load the standby supervisor engine slot (2) with the new image:

Switch> enable
Switch# issu loadversion 1 bootflash:new_image 2 slavebootflash:new_image
Switch# show issu state detail
  Slot = 1
  RP State = Active
  ISSU State = Load Version
  Boot Variable = bootflash:old_image,12
  Operating Mode = Stateful Switchover
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:old_image
Performing the ISSU Process

Slot = 2
RP State = Standby
ISSU State = Load Version
Boot Variable = bootflash:new_image,12;bootflash:old_image,12
Operating Mode = Stateful Switchover
Primary Version = bootflash:old_image
Secondary Version = bootflash:new_image
Current Version = bootflash:new_image

Switch# show redundancy states
  my state = 13  -ACTIVE
  peer state = 8  -STANDBY HOT
  Mode = Duplex
  Unit = Primary
  Unit ID = 1

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up

client count = 39
client_notification_TMR = 240000 milliseconds
keep_alive TMR = 9000 milliseconds
keep_alive count = 1
keep_alive threshold = 18
RF debug mask = 0x0

The following example shows how the forced option places the system in RPR mode:

Switch> enable
Switch# issu loadversion 1 bootflash:new_image 2 slavebootflash:old_image forced
Switch# show issu state detail

Slot = 1
  RP State = Active
  ISSU State = Load Version
  Boot Variable = bootflash:old_image,12
  Operating Mode = RPR
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:old_image

Slot = 2
  RP State = Standby
  ISSU State = Load Version
  Boot Variable = bootflash:new_image,12;bootflash:old_image,12
  Operating Mode = RPR
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:new_image
Performing the ISSU Process

The following example shows the redundancy mode as RPR:

```
Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 4 -STANDBY COLD
Mode = Duplex
Unit = Primary
Unit ID = 1

Redundancy Mode (Operational) = RPR
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = RPR
Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up

client count = 39
client_notification_TMR = 240000 milliseconds
keep_alive TMR = 9000 milliseconds
keep_alive count = 1
keep_alive threshold = 18
RF debug mask = 0x0
```

Switching to the Standby Supervisor Engine

This task describes how to switchover to the standby supervisor engine, which is running the new Cisco IOS software image.

Perform this task at the active supervisor engine:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | Switch> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Step 2** | Switch# issu runversion standby-slot [standby-image-new] | Forces a switchover from the active to the standby supervisor engine and reloads the former active (current standby) supervisor engines with the old image.  
When you enter the issu runversion command, an SSO switchover is performed, and NSF procedures are invoked if configured. |
| **Step 3** | Switch# show issu state [detail] | Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that a switchover occurs to slot 2. |
| **Step 4** | Switch# show redundancy [states] | Displays redundancy facility state information. |

This example shows how to cause a switchover to the former standby supervisor engine (slot 2), reset the former active supervisor engine and reload it with the old image so it becomes the standby supervisor engine:

```
Switch> enable
Switch> issu runversion 2 slavebootflash:new_image
This command will reload the Active unit. Proceed? [confirm]
```
A switchover occurs at this point. At the new active supervisor engine, after old active supervisor engine comes up as the standby engine, do the following:

Switch# `show issu state detail`

```
Slot = 2
RP State = Active
ISSU State = Run Version
Boot Variable = bootflash:new_image,12;bootflash:old_image,12
Operating Mode = Stateful Switchover
Primary Version = bootflash:new_image
Secondary Version = bootflash:old_image
Current Version = bootflash:new_image
```

```
Slot = 1
RP State = Standby
ISSU State = Run Version
Boot Variable = bootflash:old_image,12
Operating Mode = Stateful Switchover
Primary Version = bootflash:new_image
Secondary Version = bootflash:old_image
Current Version = bootflash:old_image
```

**Note**
The new active supervisor engine is now running the new version of software, and the standby supervisor engine is running the old version of software and is in the standby hot state.

Switch# `show redundancy states`

```
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit = Secondary
Unit ID = 2

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up

client count = 39
client_notification_TMR = 240000 milliseconds
keep_alive TMR = 9000 milliseconds
keep_alive count = 1
keep_alive threshold = 18
RF debug mask = 0x0
```

Once `runversion` command completes, the new active supervisor engine is running the new version of software and the previously active supervisor engine now becomes the standby supervisor engine. The standby is reset and reloaded, but remains on the previous version of software and come back online in standby hot status. The following example shows how to verify these conditions:

Switch# `show redundancy`

```
Redundant System Information :
---------------------------------
Available system uptime = 23 minutes
Switchovers system experienced = 1
Standby failures = 0
Last switchover reason = user forced
```
Hardware Mode = Duplex
Configured Redundancy Mode = Stateful Switchover
Operating Redundancy Mode = Stateful Switchover
Maintenance Mode = Disabled
Communications = Up

Current Processor Information:
-----------------------------------
Active Location = slot 2
Current Software state = ACTIVE
Uptime in current state = 11 minutes
Image Version = Cisco IOS Software, Catalyst 4500 L3 Switch Software (cat4500-ENTSERVICES-M), Version 12.2(31)SGA, RELEASE SOFTWARE (fc1)

Compiled Tue 05-Sep-06 16:16 by sanjdas
BOOT = bootflash:old_image,12
Configuration register = 0x822

Stopping the ISSU Rollback Timer (Optional)

This optional task describes how to stop the rollback timer.

If you do not run the following procedure before the rollback timer “timeout,” the system automatically aborts the ISSU process and reverts to the original Cisco IOS software version. By default the rollback timer is 45 minutes.

Use the following information to decide what action you should take:

- If you want to retain your switch in this state for an extended period, you need to stop the rollback timer (then validate and run the `acceptversion` command directly).
- If you want to proceed to the following step (running “commitversion”) within the rollback timer window of 45 minutes, you do not need to stop the rollback timer.

**Note**
The `issu acceptversion` command can be optionally executed after the `issu runversion` command.
Performing the ISSU Process

This example displays the timer before you stop it. In the following example, the Automatic Rollback Time information indicates the amount of time remaining before an automatic rollback occurs.

Switch> enable
Switch# show issu rollback-timer
Rollback Process State = In progress
Configured Rollback Time = 45:00
Automatic Rollback Time = 38:30

Switch# issu acceptversion active-slot [active-image-new]
% Rollback timer stopped. Please issue the commitversion command.
Switch# show issu rollback-timer
Rollback Process State = Not in progress
Configured Rollback Time = 45:00

Loading New Cisco IOS Software on the New Standby Supervisor Engine

This task explains how to load new version of Cisco IOS software to the new standby supervisor engine. Perform this task at the active supervisor engine:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# issu acceptversion active-slot [active-image-new]</td>
<td>Halts the rollback timer and ensures the new Cisco IOS ISSU process is not automatically aborted during the ISSU process. Enter the issu acceptversion command within the time period specified by the rollback timer to acknowledge that the supervisor engine has achieved connectivity to the outside world; otherwise, the ISSU process is terminated, and the system reverts to the previous version of Cisco IOS software by switching to the standby supervisor engine.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch# show issu rollback-timer</td>
<td>Displays the amount of time left before an automatic rollback occurs.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# issu commitversion standby-slot-number [standby-image-new]</td>
<td>Allows the new Cisco IOS software image to be loaded into the standby supervisor engine.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch# show redundancy [states]</td>
<td>Displays redundancy facility state information.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch# show issu state [detail]</td>
<td>Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that a switchover occurs to slot 2.</td>
</tr>
</tbody>
</table>
This example shows how to reset and reload the current standby supervisor engine (slot 1) with the new Cisco IOS software version. After entering the `commitversion` command, the standby supervisor engine boots in the Standby Hot state.

Switch> `enable`
Switch# `issu commitversion 1 slavebootflash:new_image`

Wait till standby supervisor is reloaded with the new image. Then apply the following:

Switch# `show redundancy states`
00:17:12: %RF-5-RF_TERMINAL_STATE: Terminal state reached for (SSO)
  my state = 13 -ACTIVE
  peer state = 8 -STANDBY HOT
  Mode = Duplex
  Unit = Secondary
  Unit ID = 2

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Maintenance Mode = Disabled
  Manual Swact = enabled
Communications = Up

client count = 39
client_notification_TMR = 240000 milliseconds
  keep_alive TMR = 9000 milliseconds
  keep_alive count = 0
  keep_alive threshold = 18
  RF debug mask = 0x0

Switch# `show redundancy`
Redundant System Information :
---------------------------------
Available system uptime = 41 minutes

  Operating Mode = Stateful Switchover
  Primary Version = N/A
  Secondary Version = N/A
  Current Version = bootflash:new_image

The ISSU process has been completed. At this stage, any further Cisco IOS software version upgrade or downgrade requires that a new ISSU process be invoked.

Using changeversion to Automate an ISSU Upgrade

This task describes how to use the issu changeversion command to perform a one step ISSU upgrade.

Prerequisites

- Ensure that the new version of Cisco IOS software image is already present in the file system of both the active and standby supervisor engines. Also ensure that appropriate boot parameters (BOOT string and config-register) are set for the active and standby supervisor engines
- Optionally, perform additional tests and commands to determine the current state of peers and interfaces for later comparison.
- Ensure the system (both active and standby supervisor engines) is in SSO redundancy mode. If the system is in RPR mode, you can still upgrade the system using the ISSU CLI commands, but the system will experience extended packet loss during the upgrade.

Refer to the Stateful Switchover document for more details on how to configure SSO mode on supervisor engines (refer to Chapter 9, “Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 6-E and Supervisor Engine 6L-E”).

- For ISSU to function, the IOS XE software image file names on the active and standby supervisor engines must match.
Perform the following steps at the active supervisor engine:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch&gt; enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# issu changeversion [active-slot active-image-new] [standby-slot [standby-image-new] [at hh:mm</td>
<td>in hh:mm] [quick]</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch# show issu state [detail]</td>
<td>Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that the standby supervisor engine is loaded and is in SSO mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch# show redundancy [states]</td>
<td>Displays redundancy facility state information.</td>
</tr>
</tbody>
</table>

This example shows how to initiate an ISSU upgrade process using the issu changeversion command on slot number 5, the slot for the current active supervisor engine. The show issu state detail and show redundancy command output is included to show the supervisor state before and after the upgrade procedure.

Note: The success messages included in the output below is displayed after some delay because the ISSU upgrade procedure progresses through the ISSU states.

Switch> enable
Switch# show issu state detail
Slot = 5
RP State = Active
ISSU State = Init
Operating Mode = Stateful Switchover
Current Image = bootflash:x.bin

Aborting a Software Upgrade During ISSU

You can abort the ISSU process at any stage manually (prior to entering the issu commitversion command) by entering the issu abortversion command. The ISSU process also aborts on its own if the software detects a failure.

Note: If you enter the issu abortversion command before the standby supervisor engine becomes hot, the traffic might be disrupted.
Perform the following task on the active supervisor engine:

This example shows how to abort the ISSU process on slot number 2, the slot for the current active supervisor engine:

```
Switch> enable
Switch# issu abortversion 2
```

**Configuring the Rollback Timer to Safeguard Against Upgrade Issues**

Cisco IOS software maintains an ISSU rollback timer, to safeguard against an upgrade that may leave the new active supervisor engine in a state in which communication with the standby supervisor engine is severed.

You may want to configure the rollback timer to fewer than 45 minutes (the default) so that the user need not wait in case the new software is not committed or the connection to the switch was lost while it was in runversion mode. A user may want to configure the rollback timer to more than 45 minutes in order to have enough time to verify the operation of the new Cisco IOS software before committing the new image.

**Note**

The valid timer value range is from 0 to 7200 seconds (two hours). A value of 0 seconds disables the rollback timer.

Once you are satisfied that the ISSU process has been successful and you want to remain in the current state, you must indicate acceptance by entering the **issu acceptversion** command, which stops the rollback timer. Entering the **issu acceptversion** command is extremely important in advancing the ISSU process.
Performing the ISSU Process

Entering the **issu commitversion** command at this stage is equal to entering both the **issu acceptversion** and the **issu commitversion** commands. Use the **issu commitversion** command if you do not intend to run in the current state now and are satisfied with the new software version.

**Note**
The rollback timer can be configured only in the ISSU Init state.

Perform this task to configure the rollback timer:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# issu set rollback-timer hh:mm:ss</td>
</tr>
<tr>
<td></td>
<td>Configures the rollback timer value.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td></td>
<td>Returns the user to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# show issu rollback-timer</td>
</tr>
<tr>
<td></td>
<td>Displays the current setting of the ISSU rollback timer.</td>
</tr>
</tbody>
</table>

This example shows how to set the rollback timer to 3600 seconds:

Switch> enable  
Switch# configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
Switch(config)# issu set rollback-timer 3600  
% Rollback timer value set to [ 3600 ] seconds

Switch(config)# exit

Switch# show issu rollback-timer  
Rollback Process State = Not in progress  
Configured Rollback Time = 60:00

The rollback timer cannot be set in LV state, as the following example illustrates:

Switch# show issu state detail  
Slot = 1  
RP State = Active  
ISSU State = Load Version  
Boot Variable = bootflash:old_image,12  
Operating Mode = RPR  
Primary Version = bootflash:old_image  
Secondary Version = bootflash:new_image  
Current Version = bootflash:old_image

    Slot = 2  
    RP State = Standby  
    ISSU State = Load Version  
    Boot Variable = bootflash:new_image,12;bootflash:old_image,12  
    Operating Mode = RPR  
    Primary Version = bootflash:old_image  
    Secondary Version = bootflash:new_image  
    Current Version = bootflash:new_image

Switch# show issu rollback-timer  
Rollback Process State = Not in progress  
Configured Rollback Time = 60:00
Performing the ISSU Process

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# issu set rollback-timer 20
% ISSU state should be [ init ] to set the rollback timer

Displaying ISSU Compatibility Matrix Information

The ISSU compatibility matrix contains information about other software images about the version in question. This compatibility matrix represents the compatibility of the two software versions, one running on the active and the other on the standby supervisor engine, and the matrix allows the system to determine the highest operating mode it can achieve. This information helps the user identify whether to use ISSU.

Perform this task to display information about the ISSU compatibility matrix:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>Enter your password if prompted.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show issu comp-matrix</td>
<td>Displays information regarding the ISSU compatibility matrix.</td>
<td></td>
</tr>
<tr>
<td>(negotiated</td>
<td>stored</td>
<td>xml)</td>
</tr>
<tr>
<td>negotiations—Displays negotiated compatibility matrix information.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>stored—Displays negotiated compatibility matrix information.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>xml—Displays negotiated compatibility matrix information in XML format.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to display negotiated information regarding the compatibility matrix:

Switch> enable
Switch# show issu comp-matrix negotiated

Chapter 5 Configuring the Cisco IOS In-Service Software Upgrade Process

Performing the ISSU Process

This example shows how to display stored information regarding the compatibility matrix:

Switch# show issu comp-matrix stored

Number of Matrices in Table = 1

(1) Matrix for cat4500-ENTSERVICES-M(112) - cat4500-ENTSERVICES-M(112)

Start Flag (0xDEADBABE)

My Image ver:  12.2(53)SG
Peer Version | Compatibility
-------------|-------------
12.2(31)SGA5 | Base(2)     
12.2(44)SG   | Base(2)     
12.2(31)SGA6 | Base(2)     
12.2(31)SGA7 | Base(2)     
12.2(46)SG   | Base(2)     
12.2(31)SGA8 | Base(2)     
12.2(50)SG   | Dynamic(0)  
12.2(31)SGA9 | Base(2)     
12.2(50)SG1  | Dynamic(0)  
12.2(50)SG2  | Dynamic(0)  
12.2(52)SG   | Dynamic(0)  
12.2(31)SGA10| Base(2)     
12.2(50)SG3  | Dynamic(0)  
12.2(53)SG   | Comp(3)     

Dynamic(0) was introduced in Cisco IOS Release 12.2(50)SG with the Dynamic Image Version Compatibility (DIVC) feature. With DIVC, Dynamic(0) is stored instead of Incomp(1), Base(2), or Comp(3). Compatibility is determined during runtime when two different DIVC-capable images are running in the active and standby supervisor engines during ISSU.

For Catalyst 4500 switches, a value of Dynamic(0) in the stored compatibility-matrix normally results in Base(2) or Comp(3) upon rollback negotiation between the two images. You never observe Incomp(1) as long as the other image name is present in the stored compatibility matrix.

Displaying ISSU Compatibility Matrix Information

The ISSU compatibility matrix contains information about other IOS XE software releases and the version in question. This compatibility matrix represents the compatibility of the two software versions, one running on the active and the other on the standby supervisor engine, and the matrix allows the system to determine the highest operating mode it can achieve. This information helps the user identify whether to use ISSU.

This task shows how to display information about the ISSU compatibility matrix:
### Performing the ISSU Process

#### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command/Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

```

Switch#

With Dynamic Image Version Compatibility (DIVC), Dynamic(0) is stored instead of Incomp(1), Base(2), or Comp(3). Compatibility is determined during runtime when two different DIVC-capable images are running in the active and standby supervisor engines during ISSU.

For Catalyst 4500 switches, a value of Dynamic(0) in the stored compatibility-matrix normally results in Base(2) or Comp(3) upon run-time negotiation between the two software images. You never observe Incomp(1) as long as the other image name is present in the stored compatibility matrix.

This example shows how to display negotiated information regarding non-IOSd clients:

```
Switch# show package compatibility

PackageName PeerPackageName ModuleName Compatibility
---------- ------- ----------- -------------
rp_base    rp_base    aaa       COMPATIBLE
rp_base    rp_base    aaacommon COMPATIBLE
rp_base    rp_base    access_policy COMPATIBLE
rp_base    rp_base    app_sess COMPATIBLE
rp_base    rp_base    app_sess_ios COMPATIBLE
rp_base    rp_base    auth_mgr COMPATIBLE
......
```

Configuring the Cisco IOS XE In Service Software Upgrade Process

Note

ISSU is available in Cisco IOS XE Release 3.1.0.SG and later releases.

Operating on redundant systems, the In Service Software Upgrade (ISSU) process allows Cisco IOS XE software to be updated or otherwise modified while packet forwarding continues. In most networks, planned software upgrades are a significant cause of downtime. ISSU allows Cisco IOS XE software to be upgraded while packet forwarding continues. This increases network availability and reduces downtime caused by planned software upgrades. This document provides information about ISSU concepts and describes the steps taken to perform ISSU in a system.

Topics include:

- Prerequisites to Performing ISSU, page 6-2
- About Performing ISSU, page 6-3
- How to Perform the ISSU Process, page 6-15
- Cisco High Availability Features in Cisco IOS XE 3.1.0SG, page 6-35

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

Prerequisites to Performing ISSU

Before performing ISSU, you must meet these prerequisites:

- The type of the existing and target image must match. You cannot upgrade from a Universal Lite image to a Universal image (and vice versa) without experiencing several minutes of traffic loss. The same restriction applies between crypto and non-crypto images.
- The active and the standby supervisor engines must have the same supervisor engine hardware (same model, same memory, and so on).
- The new and old Cisco IOS XE software images must be loaded into the file systems (bootflash, SD card, or USB) of both the active and the standby supervisor engines before you begin the ISSU process.

The old software image should be available either in bootflash, SD card, or USB and the system should have been booted from one of these locations because the boot variable must be changed before the ISSU process starts.

Note: **auto-boot** must be enabled for ISSU to succeed.

- Stateful Switchover (SSO) must be configured and the standby supervisor engine should be in STANDBY HOT state.
  These commands indicate whether SSO is enabled: `show module`, `show running-config`, `show redundancy state`.
  If you do not have SSO enabled, see the *Stateful Switchover* document for further information on how to enable and configure SSO.

- Nonstop Forwarding (NSF) must be configured and working properly. If you do not have NSF enabled, see the *Cisco Nonstop Forwarding* document for further information on how to enable and configure NSF.

- Before you perform ISSU, ensure that the file system for both the active and the standby supervisor engines contains the new ISSU-compatible IOS XE software. The current Cisco IOS XE version running in the system must also support ISSU.

You can enter various commands on the Catalyst 4500 series switch to determine supervisor engine versioning and Cisco IOS XE software compatibility. Alternatively, you can use the ISSU application on Cisco Feature Navigator to determine this.
Chapter 6 Configuring the Cisco IOS XE in Service Software Upgrade Process

About Performing ISSU

Do not make any hardware changes while performing ISSU.

Before you perform ISSU, you should understand the following concepts:

- Stateful Switchover, page 6-3
- NSF, page 6-5
- ISSU Process, page 6-6
- Performing an ISSU Upgrade: 2 Methods, page 6-11
- Changeversion Process, page 6-12
- Guidelines for Performing ISSU, page 6-13
- Compatibility Matrix, page 6-13
- SNMP Support for ISSU, page 6-14
- Compatibility Verification Using Cisco Feature Navigator, page 6-14

Stateful Switchover

Development of the SSO feature is an incremental step within an overall program to improve the availability of networks constructed with Cisco IOS XE switches.

In specific Cisco networking devices that support dual supervisor engines, SSO takes advantage of supervisor engine redundancy to increase network availability. SSO achieves this by establishing one of the supervisor engines as the active processor while the other supervisor engine is designated as the standby processor. Following an initial synchronization between the two supervisor engines, SSO dynamically synchronizes supervisor engine state information between them in real-time.

A switchover from the active to the standby supervisor engine occurs when the active supervisor engine fails or is removed from the networking device.

Cisco NSF is used with SSO. Cisco NSF allows the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. With Cisco NSF, peer networking devices do not experience routing flaps, which reduce loss of service outages for customers.

Figure 6-1 illustrates how SSO is typically deployed in service provider networks. In this example, Cisco NSF with SSO is enabled at the access layer (edge) of the service provider network. A fault at this point could result in loss of service for enterprise customers requiring access to the service provider network.
For Cisco NSF protocols that require neighboring devices to participate in Cisco NSF, Cisco NSF-aware software images must be installed on those neighboring distribution layer devices. Depending on your objectives, you may decide to deploy Cisco NSF and SSO features at the core layer of your network. Doing this can help reduce the time required to restore network capacity and service for certain failures, which leads to additional availability.

Figure 6-1  Cisco NSF with SSO Network Deployment: Service Provider Networks

Additional levels of availability may be gained by deploying Cisco NSF with SSO at other points in the network where a single point of failure exists. Figure 6-2 illustrates an optional deployment strategy that applies Cisco NSF with SSO at the enterprise network access layer. In this example, each access point in the enterprise network represents another single point of failure in the network design. In the event of a switchover or a planned software upgrade, enterprise customer sessions would continue uninterrupted through the network in this example.
Cisco NSF with SSO Network Deployment: Enterprise Networks

For further information on SSO, see the Stateful Switchover document.

NSF

Cisco NSF works with the SSO feature in Cisco IOS XE software. SSO is a prerequisite of Cisco NSF. NSF works with SSO to minimize the amount of time a network is unavailable to its users following a switchover. The main objective of Cisco NSF is to continue forwarding IP packets following a supervisor engine switchover.

Usually, when a networking device restarts, all routing peers of that device detect that the device went down and then came back up. This transition results in what is called a routing flap, which could spread across multiple routing domains. Routing flaps caused by routing restarts create routing instabilities, which are detrimental to the overall network performance. Cisco NSF helps to suppress routing flaps in SSO-enabled devices, thus reducing network instability.

Cisco NSF allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. With Cisco NSF, peer networking devices do not experience routing flaps. Data traffic is forwarded while the standby supervisor engine assumes control from the failed active supervisor engine during a switchover. The ability of physical links to remain up through a switchover and to be kept current with the Forwarding Information Base (FIB) on the active supervisor engine is key to Cisco NSF operation.
**ISSU Process**

The ISSU process allows you to perform a Cisco IOS XE software upgrade or downgrade while the system continues to forward packets. (For an illustration of the commands used during the ISSU process, refer to Figure 6-8.) Cisco IOS XE ISSU takes advantage of the Cisco IOS XE high availability infrastructure—Cisco NSF with SSO and hardware redundancy—and eliminates downtime associated with software upgrades by allowing changes while the system remains in service (see Figure 6-3).

SSO and NSF mode support configuration and runtime state synchronization from the active to the standby supervisor engine. For this process, the IOS XE software image on both the active and the standby supervisor engines must be the same. When images on active and standby supervisor engines are different, ISSU allows the two supervisor engines to be kept in synchronization even when these two versions of Cisco IOS XE support different sets of features and commands.

*Figure 6-3  High Availability Features and Hardware Redundancy in the ISSU Process*
An ISSU-capable switch consists of two supervisor engines (active and standby) and 200 or more linecards. Before initiating the ISSU process, copy the Cisco IOS XE software into the file systems of both supervisor engines (see Figure 6-4).

**Note**

In the following figure, Cisco IOS XE 3.x.y SG represents the *current* version of Cisco IOS XE 3.z.y SG represents the image you are migrating to.

**Figure 6-4 Copy New Version of Cisco IOS XE Software on Both Supervisor Engines**
After you have copied the Cisco IOS XE software to both file systems, load the new version of Cisco IOS XE software onto the standby supervisor engine (see Figure 6-5).

**Note**
Without the ISSU feature, SSO/NSF cannot function between the active and standby supervisor engines when they are running different versions of the Cisco IOS XE image.
After a switchover (NSF/SSO, not RPR), the standby supervisor engine takes over as the new active supervisor engine (see Figure 6-6).

**Figure 6-6 Switch Over to Standby Supervisor Engine**
The former active supervisor engine is loaded with an old Cisco IOS XE image so that if the new active supervisor engine experiences problems, you can abort and conduct a switchover to the former active, which is already running the old software image. Next, the former active supervisor engine is loaded with the new version of Cisco IOS XE software and becomes the new standby supervisor engine (see Figure 6-7).

**Figure 6-7  Load New Standby Supervisor Engine with New Cisco IOS XE Software**
Figure 6-8 shows the steps during the ISSU process.

**Figure 6-8** Steps During the ISSU Process

**Note**

Accept version stops the rollback timer.

**Performing an ISSU Upgrade: 2 Methods**

There are two ways to perform an ISSU upgrade: manually, with four commands; or automatically, with one command.

The normal ISSU upgrade process involves issuing four separate ISSU exec commands (**issu loadversion**, **issu runversion**, **issu acceptversion**, **issue commitversion**) along with additional show command invocations to evaluate the success of each command before proceeding. Although the ISSU process is complicated, you should not expect disruption of service. The use of multiple ISSU commands dictates an additional level of care to ensure no service disruption. However, in some scenarios, this upgrade procedure might be cumbersome and of minimal value. A typical example is during a network upgrade that involves performing an ISSU upgrade on a large number of Catalyst 4500 switches. In these cases, we recommend that you first perform the normal (four command) ISSU upgrade procedure on one switch (possibly in a lab environment) to verify successful upgrade. Then, use a single **issu changeversion** command to perform an automatic ISSU on the rest of the Catalyst 4500 switches in the network.
Chapter 6  Configuring the Cisco IOS XE In Service Software Upgrade Process

Changeversion Process

The `issu changeversion` command launches a single-step complete ISSU upgrade cycle. It performs the logic for all four of the standard commands (`issu loadversion`, `issu runversion`, `issu acceptversion`, and `issu commitversion`) without user intervention, streamlining the upgrade through a single CLI step.

Additionally, `issu changeversion` allows the upgrade process to be scheduled for a future time. This enables you to stage a number of systems to perform upgrades sequentially when a potential disruption would be least harmful.

After the standby supervisor engine initializes and the system reaches a terminal state (RPR/SSO), the upgrade process is complete and the BOOT variable is permanently written with the new IOS XE software image. Hence, a reset on any RP will keep the system booting the new software image. Console and syslog messages will be generated to notify anyone monitoring the upgrade that the state transition has occurred.

Similar to the normal ISSU upgrade procedure, the in-progress upgrade procedure initiated by the `issu changeversion` command can be aborted with the `issu abortversion` command. If the system detects any problems or detects an unhealthy system during an upgrade, the upgrade might be automatically aborted.

When the `issu runversion` command is entered during the four step manual upgrade process, if any incompatible ISSU clients exist, the upgrade process reports them and their side effects, and allows the user to abort the upgrade. While performing a single-step upgrade process, when the process reaches the runversion state, it will either automatically continue with the upgrade provided the base clients are compatible, or automatically abort because of client incompatibility. If the user wants to continue the upgrade procedure in RPR mode, the user must use the normal ISSU command set and specify the `force` option when entering the `issu loadversion` command.

Changeversion: Quick Option (LV to INIT)

The `issu changeversion` command provides an optional quick command option that can reduce the time required to perform the automatic ISSU upgrade. When the `quick` command option is applied, the ISSU upgrade state transition differs from that described previously. With this option, the software logic up the loadversion stage remains the same as previously described, and the logic that performs runversion and commitversion is combined. This logic skips the step in the upgrade procedure that loads the old software version on the new standby (old active) supervisor, reducing the time required for the automatic ISSU upgrade by about a third.

Scheduled Changeversion: “in” and “at” Options

The `issu changeversion` provides `in` and `at` command options that enable you to schedule a future automatic ISSU upgrade.

The `at` command option schedules an automatic ISSU upgrade to begin at a specific time. This option specifies an exact time (`hh:mm`, 24 hour format) in the next 24 hours at which the upgrade will occur.

The `in` command option schedules an automatic ISSU upgrade to begin after a certain amount of time has elapsed. This option specifies the number of hours and minutes (`hh:mm` format) that must elapse before an upgrade will occur, with a maximum value of 99:59.
Changeversion Deployment Scenario

The typical `issu changeversion` command usage scenario is for experienced users with a large installed base. These users typically validate a new image using a topology and configuration similar to their production network. The validation process should be done using both the existing multi-command process and the new `issu changeversion` command process. Once users certify an IOS XE software image and want to roll it out broadly, they can use the single command process to perform an efficient upgrade of their network.

Aborting an In-Progress Changeversion Procedure

The `issu changeversion` command functionality is designed to perform an ISSU software upgrade without user intervention. However, status messages are displayed to the console as the upgrade transitions through the various states. If any anomalies are noticed during the automatic upgrade, perhaps with peers or other parts of the network, you can use the `issu abortversion` command to manually abort the upgrade at any point in the process prior to the commitversion operation.

Guidelines for Performing ISSU

Be aware of the following guidelines while performing the ISSU process:

- Even with ISSU, it is recommended that upgrades be performed during a maintenance window.
- The new features should not be enabled (if they require change of configuration) during the ISSU process.

Note: Enabling them will cause the system to enter RPR mode because commands are only supported on the new version.

- In a downgrade scenario, if any feature is not available in the downgrade revision of the Cisco IOS XE software handle, that feature should be disabled prior to initiating the ISSU process.

Compatibility Matrix

ISSU requires additional information to determine compatibility between software versions. Therefore, a compatibility matrix is defined that contains information about other IOS XE software image with respect to the one in question.

This compatibility matrix represents the compatibility of two software versions, one running on the active and the other on the standby supervisor engine, and to allow the system to determine the highest operating mode it can achieve. Incompatible versions will not be able to progress to SSO operational mode.
The compatibility matrix represents the compatibility relationship a Cisco IOS XE software image has with all of the other Cisco IOS XE software versions within the designated support window (for example, all of those software versions the IOS XE software image “knows” about) and is populated and released with every IOS XE software image. The matrix stores compatibility information between its own release and prior releases. It is always the newest release that contains the latest information about compatibility with existing releases in the field. The compatibility matrix is available within the Cisco IOS XE software image and on Cisco.com so that users can determine in advance whether an upgrade can be done using the ISSU process.

You can perform the ISSU process when the old and new Cisco IOS XE software are compatible. The compatibility matrix information stores the compatibility among releases as follows:

- **Compatible**—The base-level system infrastructure and all optional HA-aware subsystems are compatible. An in-service upgrade or downgrade between these versions will succeed with minimal service impact. The matrix entry designates the images to be compatible (C).
- **Base-level compatible**—One or more of the optional HA-aware subsystems is not compatible. An in-service upgrade or downgrade between these versions will succeed; however, some subsystems will not be able to maintain state always during the transition from the old to the new version of Cisco IOS XE. The matrix entry designates the images to be base-level compatible (B).
- **Incompatible**—A core set of system infrastructure exists in Cisco IOS XE that must be able to interoperate in a stateful manner for SSO to function correctly. If any of these required features or subsystems is not interoperable, then the two versions of the Cisco IOS XE software image are declared to be incompatible. An in-service upgrade or downgrade between these versions is not possible. The matrix entry designates the images to be incompatible (I). The system operates in RPR mode during the upgrade process when the versions of Cisco IOS XE at the active and standby supervisor engines are incompatible.
- **Cisco IOS XE** determines the compatibility between the active and the standby IOS XE software dynamically during STANDBY boot up. The matrix is represented by “x”.

To display the compatibility matrix data between two software versions on a given system, enter the `show issu comp-matrix stored` command.

**Note**

This command is useful only for verification purposes because it is available only after the ISSU process has started. You might want to check the compatibility matrix prior to starting ISSU. Use the Feature Navigator to obtain the needed information:

http://tools.cisco.com/ITDIT/CFN/jsp/index.jsp

**SNMP Support for ISSU**

SNMP for SSO provides a mechanism for synchronizing the SNMP configurations and the MIBs that support SSO from the active supervisor engine to the standby supervisor engine.

**Compatibility Verification Using Cisco Feature Navigator**

The ISSU application on Cisco Feature Navigator allows you to:

- Select a specific software bundle.
- Identify which software images are compatible with the selected software image.
How to Perform the ISSU Process

Unlike SSO, which is a mode of operation for the device and a prerequisite for performing ISSU, the ISSU process is a series of steps performed while the switch is in operation. The steps result in an upgrade to new or modified Cisco IOS XE software, and have a minimal impact to traffic.

Note
For an illustration of the process flow for ISSU, refer to Figure 6-8 on page 6-11.

This section includes the following topics:

- Verifying the ISSU Software Installation, page 6-15
- Loading New Cisco IOS XE Software on the Standby Supervisor Engine, page 6-18 (required)
- Switching to the Standby Supervisor Engine, page 6-21 (required)
- Stopping the ISSU Rollback Timer (Optional), page 6-23 (optional)
- Loading New Cisco IOS XE Software on the New Standby Supervisor Engine, page 6-24 (required)
- Using changeversion to Automate an ISSU Upgrade, page 6-25
- Aborting a Software Upgrade During ISSU, page 6-31
- Configuring the Rollback Timer to Safeguard Against Upgrade Issues, page 6-32
- Displaying ISSU Compatibility Matrix Information, page 6-34

Verifying the ISSU Software Installation

During the ISSU process, there are five valid states: disabled, init, load version, run version, and system reset. Use the show issu state command to obtain the current ISSU state:

- Disabled state—The state for the standby supervisor engine while this engine is resetting.
- Init state—The initial state for two supervisor engines, one active and one standby, before the ISSU process is started. It is also the final state after the ISSU process completes.
- Load version (LV) state—The standby supervisor engine is loaded with the new version of Cisco IOS XE software.
- Run version (RV) state—The issu runversion command forces the switchover of the supervisor engines. The newly active supervisor engine runs the new Cisco IOS XE software image.
- While running ISSU, if both supervisor engines are reset due to power outage, for example, the ISSU context is lost and returns to the init state. Both supervisor engines return to the old software.
Chapter 6 Configuring the Cisco IOS XE In Service Software Upgrade Process

How to Perform the ISSU Process

You can verify the ISSU software upgrade by entering `show` commands to provide information on the state of the during the ISSU process:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 2 Switch# show issu state [detail]</td>
<td>Displays the state of the during the ISSU process.</td>
</tr>
<tr>
<td>Step 3 Switch# show redundancy</td>
<td>Displays current or historical status, mode, and related redundancy information about the device.</td>
</tr>
</tbody>
</table>

This example shows how to display the state and the current status of the supervisor engine during the ISSU process:

```
Switch> enable
Switch# show issu state [detail]
Switch# show redundancy
```

Verifying Redundancy Mode Before Beginning the ISSU Process

Before you begin the ISSU process, verify the redundancy mode for the system and be sure to configure NSF and SSO.

The following example displays verification that the system is in SSO mode, that slot 3 is the active supervisor engine, and that slot 4 is the standby supervisor engine. Both supervisor engines are running the same Cisco IOS XE software release.

```
Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
  Mode = Duplex
  Unit = Primary
  Unit ID = 5

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
  Manual Swact = enabled

Communications = Up
  client count = 64
  client_notification_TMR = 240000 milliseconds
    keep_alive TMR = 9000 milliseconds
    keep_alive count = 1
    keep_alive threshold = 18
    RF debug mask = 0

Switch# show redundancy
Redundant System Information : 
-------------------------------
  Available system uptime = 12 minutes
  Switchovers system experienced = 0
  Standby failures = 0
  Last switchover reason = none
```
Chapter 6  Configuring the Cisco IOS XE In Service Software Upgrade Process

How to Perform the ISSU Process

Hardware Mode = Duplex
Configured Redundancy Mode = Stateful Switchover
Operating Redundancy Mode = Stateful Switchover
Maintenance Mode = Disabled
Communications = Up

Current Processor Information :
-------------------------------
Active Location = slot 5
Current Software state = ACTIVE
Uptime in current state = 9 minutes
Image Version = Cisco IOS Software, IOS-XE Software, Catalyst 4500 L3
Switch Software (cat4500e-UNIVERSALK9-M), Version 03.00.00.1.68 CISCO UNIVERSAL DEVELOPMENT K10 IOSD TEST VERSION

Compiled Sun 29-Aug-10 03:57 by gsbuprod
Configuration register = 0x2920

Verifying the ISSU State Before Beginning the ISSU Process

Ensure that the active and standby supervisor engines are up and in ISSU Init state and that both supervisor engines are running the same current image.

The following example displays the ISSU state before the process begins:

Switch# show issu state detail

Slot = 5
RP State = Active
ISSU State = Init
Operating Mode = Stateful Switchover
Current Image = bootflash:old_image
Pre-ISSU (Original) Image = N/A
Post-ISSU (Targeted) Image = N/A

Slot = 6
RP State = Standby
ISSU State = Init
Operating Mode = Stateful Switchover
Current Image = bootflash:old_image
Pre-ISSU (Original) Image = N/A
Post-ISSU (Targeted) Image = N/A

The new version of the Cisco IOS XE software must be present on both of the supervisor engines. The directory information displayed for each of the supervisor engines shows that the new version is present.

Switch# dir bootflash:
Directory of bootflash:/

5  -rw-  129923402  Aug  6 2010 09:32:33 +00:00  old_image
6  -rw-  127724184  Aug  6 2010 09:34:07 +00:00  new_image
Loading New Cisco IOS XE Software on the Standby Supervisor Engine

This task describes how to use ISSU to load a new version of Cisco IOS XE software to the standby supervisor engine.

**Prerequisites**

- Ensure that the new version of Cisco IOS XE software image is already present in the file system of both the active and standby supervisor engines. Also ensure that appropriate boot parameters (BOOT string and config-register) are set for the active and standby supervisor engines.

  **Note**  
  auto-boot must be enabled for ISSU to succeed.

- Optionally, perform additional tests and commands to determine the current state of peers and interfaces for later comparison.

- Ensure the system (both active and standby supervisor engines) is in SSO redundancy mode. If the system is in RPR mode, you can still upgrade the system using the ISSU CLI commands, but the system will experience extended packet loss during the upgrade.

  Refer to the *Stateful Switchover* document for more details on how to configure SSO mode on supervisor engines.

- For ISSU to function, the IOS XE file names on the active and standby supervisor engines must match.
Perform the following steps at the active supervisor engine:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Starts the ISSU process and (optionally) overrides the automatic rollback when the new Cisco IOS XE software version is detected to be incompatible. It may take several minutes after entering the <strong>issu loadversion</strong> command for Cisco IOS XE software to load onto the standby supervisor engine and for the standby supervisor engine to transition to SSO mode. This causes the standby supervisor engine to reload with the new software image. If you use the <strong>forced</strong> option, the standby supervisor engine is booted with the new software image. After the software image is loaded on the standby supervisor engine, if the software image is incompatible, the system is forced to the RPR mode. Otherwise the system will continue in the SSO mode.</td>
</tr>
<tr>
<td>Switch# issu loadversion [active-slot] active-image-new [standby-slot] standby-image-new [forced]</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Displays the state of ISSU during the ISSU process. At this point in the ISSU process, use this command to check that the standby supervisor engine is loaded and is in SSO mode. It may take several minutes after entering the <strong>issu loadversion</strong> command for Cisco IOS XE software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode. If you enter the <strong>show issu state</strong> command too quickly, you may not see the information you need.</td>
</tr>
<tr>
<td>Switch# show issu state [detail]</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Displays redundancy facility state information.</td>
</tr>
<tr>
<td>Switch# show redundancy [states]</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to start the ISSU process, boot the standby supervisor engine in the Standby Hot state, and load the standby supervisor engine slot (6) with the new IOS XE software image:

Switch> enable
Switch# issu loadversion 5 bootflash:new_image 6 slavebootflash:new_image
%issu loadversion executed successfully, Standby is being reloaded
Switch# show issu state detail
Slot = 5
RP State = Active
ISSU State = Load Version
Operating Mode = Stateful Switchover
Current Image = bootflash:old_image
Pre-ISSU (Original) Image = bootflash:old_image
Post-ISSU (Targeted) Image = bootflash:new_image

Slot = 6
RP State = Standby
ISSU State = Load Version
Operating Mode = Stateful Switchover
How to Perform the ISSU Process

Current Image = bootflash:new_image
Pre-ISSU (Original) Image = bootflash:old_image
Post-ISSU (Targeted) Image = bootflash:new_image

Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
  Mode = Duplex
  Unit = Primary
  Unit ID = 5

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
  Manual Swact = enabled

Communications = Up
client count = 64
client_notification_TMR = 240000 milliseconds
  keep_alive TMR = 9000 milliseconds
  keep_alive count = 1
  keep_alive threshold = 18
  RF debug mask = 0

The following example shows how the forced option places the system in RPR mode:

Switch> enable
Switch# issu loadversion 5 bootflash:new_image 6 slavebootflash:new_image forced
%issu loadversion executed successfully, Standby is being reloaded

Switch# show issu state detail
Slot = 5
  RP State = Active
  ISSU State = Init
  Operating Mode = Stateful Switchover
  Current Image = bootflash:old_image
Pre-ISSU (Original) Image = N/A
Post-ISSU (Targeted) Image = N/A

Slot = 6
  RP State = Standby
  ISSU State = Init
  Operating Mode = Stateful Switchover
  Current Image = bootflash:old_image
Pre-ISSU (Original) Image = N/A
Post-ISSU (Targeted) Image = N/A

The following example shows the redundancy mode as RPR:

Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 4 -STANDBY COLD
  Mode = Duplex
  Unit = Primary
  Unit ID = 3

Redundancy Mode (Operational) = RPR
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = RPR
  Manual Swact = enabled
  Communications = Up
Switching to the Standby Supervisor Engine

This task describes how to switch over to the standby supervisor engine, which is running the new Cisco IOS XE software image. Perform the following steps at the active supervisor engine.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch&gt; enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# issu runversion [standby-slot] [standby-image-new]]</td>
<td>Forces a switchover from the active to the standby supervisor engine and reloads the former active (current standby) supervisor engines with the old IOS XE image. When you enter the issu runversion command, an SSO switchover will be performed, and NSF procedures will be invoked if so configured.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch# show issu state [detail]</td>
<td>Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that a switchover occurs to slot 6.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch# show redundancy [states]</td>
<td>Displays redundancy facility state information.</td>
</tr>
</tbody>
</table>

This example shows how to cause a switchover to the former standby supervisor engine (slot 6), reset the former active supervisor engine and reload it with the old IOS XE software image so it becomes the standby supervisor engine:

Switch> enable
Switch# issu runversion 6 slavebootflash:new_image
%issu runversion initiated successfully

A switchover happens at this point. At the new active supervisor engine, do the following after old active supervisor engine comes up as standby.

Switch# show issu state detail

```
Slot = 6
RP State = Active
ISSU State = Run Version
Operating Mode = Stateful Switchover
Current Image = bootflash:new_image
Pre-ISSU (Original) Image = bootflash:old_image
Post-ISSU (Targeted) Image = bootflash:new_image
```

```
Slot = 5
RP State = Standby
ISSU State = Run Version
Operating Mode = Stateful Switchover
Current Image = bootflash:old_image
Pre-ISSU (Original) Image = bootflash:old_image
Post-ISSU (Targeted) Image = bootflash:new_image
```
The new active supervisor engine is now running the new version of software, and the standby supervisor engine is running the old version of software and is in the standby hot state.

```
Switch# show redundancy states
  my state = 13 -ACTIVE
  peer state =  8 -STANDBY HOT
    Mode = Duplex
    Unit = Primary
    Unit ID = 6

  Redundancy Mode (Operational) = Stateful Switchover
  Redundancy Mode (Configured) = Stateful Switchover
  Redundancy State = Stateful Switchover
    Manual Swact = enabled

  Communications = Up
    client count = 64
    client_notification_TMR = 240000 milliseconds
    keep_alive TMR = 9000 milliseconds
    keep_alive count = 0
    keep_alive threshold = 18
    RF debug mask = 0

Once Runversion has completed, the new active supervisor engine will be running the new version of software and the previously active supervisor engine will now become the standby supervisor engine. The standby will be reset and reloaded, but it will remain on the previous version of software and come back online in standby hot status. The following example shows how to verify these conditions:
```

```
Switch# show redundancy

Redundant System Information :
-------------------------------
  Available system uptime = 12 minutes
  Switchovers system experienced = 0
  Standby failures = 0
  Last switchover reason = none

  Hardware Mode = Duplex
  Configured Redundancy Mode = Stateful Switchover
  Operating Redundancy Mode = Stateful Switchover
  Maintenance Mode = Disabled
  Communications = Up

Current Processor Information :

  Current Software state = STANDBY HOT
  Uptime in current state = 2 minutes
```
How to Perform the ISSU Process

Stopping the ISSU Rollback Timer (Optional)

This optional task describes how to stop the rollback timer.

If you do not run the following procedure before the rollback timer “timeout,” the system automatically aborts the ISSU process and reverts to the original Cisco IOS XE software version. By default the rollback timer is 45 minutes.

Use the following information to decide what action you should take:

- If you want to retain your switch in the runversion state for an extended period, you need to stop the rollback timer by entering the `acceptversion` command. Then validate the new software and enter the `commitversion` command (as described in the following section).
- If you want to proceed with the commitversion operation within the rollback timer window of 45 minutes (or the configured value), you do not need to use the `acceptversion` command to stop the roll-back timer.

This example displays the Timer before you stop it. In the following example, the “Automatic Rollback Time” information indicates the amount of time remaining before an automatic rollback will occur.

```
Switch> enable
Switch# issu acceptversion [active-slot] [active-image-new]
Switch# show issu rollback-timer
Rollback Process State = 00:31:09 remaining
  Configured Rollback Time = 00:45:00

Switch# issu acceptversion 6 bootflash:new_image
```

The `issu acceptversion` command may be optionally executed after the `issu runversion` command.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>Switch&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Halts the rollback timer and ensures the new Cisco IOS XE ISSU process is not automatically aborted during the ISSU process.</td>
</tr>
<tr>
<td><code>Switch# issu acceptversion [active-slot] [active-image-new]</code></td>
<td>Enter the <code>issu acceptversion</code> command within the time period specified by the rollback timer to acknowledge that the supervisor engine has achieved connectivity to the outside world; otherwise, the ISSU process is terminated, when the rollback timer expires, and the system reverts to the previous version of Cisco IOS XE software by switching to the standby supervisor engine.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Displays the amount of time left before an automatic rollback will occur.</td>
</tr>
<tr>
<td><code>Switch# show issu rollback-timer</code></td>
<td></td>
</tr>
</tbody>
</table>

Note: The `issu acceptversion` command may be optionally executed after the `issu runversion` command.
Loading New Cisco IOS XE Software on the New Standby Supervisor Engine

This task explains how to load new version of Cisco IOS XE software to the new standby supervisor engine.

Perform the following steps at the active supervisor engine:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 issu commitversion [standby-slot] [standby-image-new]</td>
<td>Allows the new Cisco IOS XE software image to be loaded into the standby supervisor engine.</td>
</tr>
<tr>
<td>Step 3 show redundancy [states]</td>
<td>Displays redundancy facility state information.</td>
</tr>
<tr>
<td>Step 4 show issu state [detail]</td>
<td>Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that the standby supervisor engine is loaded with the new image.</td>
</tr>
</tbody>
</table>

This example shows how to reset and reload the current standby supervisor engine (slot 1) with the new Cisco IOS XE software version. After you enter the commitversion command, the standby supervisor engine boots in the Standby Hot state.

Switch> enable
Switch# issu commitversion 5 slavebootflash:new_image
%issu commitversion executed successfully

Use the following to verify that the standby supervisor engine is reloaded with the new software.

Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit = Primary
Unit ID = 6

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Manual Swact = enabled
Communications = Up
client count = 64
  client_notification_TMR = 240000 milliseconds
  keep_alive TMR = 9000 milliseconds
  keep_alive count = 1
  keep_alive threshold = 18
  RF debug mask = 0

Switch# show redundancy
Redundant System Information:
The ISSU process has completed. At this stage, any further Cisco IOS XE software version upgrade or downgrade will require that a new ISSU process be invoked.

**Using changeversion to Automate an ISSU Upgrade**

This task describes how to use the `issu changeversion` command to perform a one step ISSU upgrade.
Prerequisites

- Ensure that the new version of Cisco IOS XE software image is already present in the file system of both the active and standby supervisor engines. Also ensure that appropriate boot parameters (BOOT string and config-register) are set for the active and standby supervisor engines.
- Optionally, perform additional tests and commands to determine the current state of peers and interfaces for later comparison.
- Ensure the system (both active and standby supervisor engines) is in SSO redundancy mode. If the system is in RPR mode, you can still upgrade the system using the ISSU CLI commands, but the system will experience extended packet loss during the upgrade.

Refer to the Stateful Switchover document for more details on how to configure SSO mode on supervisor engines (refer to Chapter 9, “Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 6-E and Supervisor Engine 6L-E”).

- For ISSU to function, the IOS XE software image file names on the active and standby supervisor engines must match.

Perform the following steps at the active supervisor engine:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch&gt; enable &lt;br&gt; Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch# issu changeversion [active-slot active-image-new] [standby-slot [standby-image-new]] [at hh:mm</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch# show issu state [detail] &lt;br&gt; Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that the standby supervisor engine is loaded and is in SSO mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show redundancy [states] &lt;br&gt; Displays redundancy facility state information.</td>
</tr>
</tbody>
</table>
This example shows how to initiate an ISSU upgrade process using the issu changeversion command on slot number 5, the slot for the current active supervisor engine. The show issu state detail and show redundancy command output is included to show the supervisor state before and after the upgrade procedure.

```
Switch> enable
Switch# show issu state detail
Slot = 5
  RP State = Active
  ISSU State = Init
  Operating Mode = Stateful Switchover
  Current Image = bootflash:x.bin
  Pre-ISSU (Original) Image = N/A
  Post-ISSU (Targeted) Image = N/A

Slot = 6
  RP State = Standby
  ISSU State = Init
  Operating Mode = Stateful Switchover
  Current Image = bootflash:x.bin
  Pre-ISSU (Original) Image = N/A
  Post-ISSU (Targeted) Image = N/A

  Current Image = bootflash:x.bin
Aborting a Software Upgrade During ISSU

You can abort the ISSU process at any stage manually (prior to entering the `issu commitversion` command) by entering the `issu abortversion` command. The `issu abortversion` command may also be issued after entering the `issu changeversion` command while the automatic ISSU upgrade is still in progress. The ISSU process also aborts on its own if the software detects a failure.

**Note**
If you enter the `issu abortversion` command before the standby supervisor engine becomes hot, the traffic might be disrupted.

If you abort the process after you issue the `issu loadversion` command, the standby supervisor engine is reset and reloaded with the original software.

If the process is aborted after you enter either the `issu runversion` or `issu acceptversion` command, then a second switchover is performed to the new standby supervisor engine that is still running the original software version. The supervisor engine that had been running the new software is reset and reloaded with the original software version.

**Note**
Ensure that the standby supervisor is fully booted *before* issuing the `abortversion` command on an active supervisor engine.

The following task describes how to abort the ISSU process before you complete the ISSU process with the `issu commitversion` command.

Perform the following task on the active supervisor engine.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
Switch> `enable` | Enables privileged EXEC mode. Enter your password if prompted. |
| **Step 2**
Switch# `issu abortversion [active slot [active-image-new]]` | Cancels the ISSU upgrade or downgrade process in progress and restores the switch to its state before the process had started. |

This example shows how to abort the ISSU process on slot number 6, the slot for the current active supervisor engine. In this example, the ISSU upgrade process is in the Runversion state when the `issu abortversion` command is entered:

Switch> `enable`
Switch# `show issu state detail`

```
Slot = 6
RP State = Active
ISSU State = Run Version
Operating Mode = Stateful Switchover
Current Image = bootflash:x.bin
Pre-ISSU (Original) Image = bootflash:y.bin
Post-ISSU (Targeted) Image = bootflash:x.bin
Slot = 5
```
How to Perform the ISSU Process

Switch# issu abortversion 6
% issu abortversion initiated successfully
Switch# show issu state detail

Switch# issu abortversion 6
% issu abortversion initiated successfully
Switch# show issu state detail

Configuring the Rollback Timer to Safeguard Against Upgrade Issues

Cisco IOS XE software maintains an ISSU rollback timer, to safeguard against an upgrade that may leave the new active supervisor engine in a state in which communication with the standby supervisor engine is severed.

You may want to configure the rollback timer to fewer than 45 minutes (the default) so that the user need not wait in case the new software is not committed or the connection to the switch was lost while it was in runversion mode. A user may want to configure the rollback timer to more than 45 minutes in order to have enough time to verify the operation of the new Cisco IOS XE software before committing the new software image.

---

The valid timer value range is from 0 to 7200 seconds (two hours). A value of 0 seconds disables the rollback timer.

Once you are satisfied that the new image at the active supervisor engine has been successful and you want to remain in the current state, you may indicate acceptance by issuing the `issu acceptversion` command, which stops the rollback timer.

Issuing the `issu commitversion` command at this stage is equal to entering both the `issu acceptversion` and the `issu commitversion` commands. Use the `issu commitversion` command if you do not intend to run in the current state for a period of time and are satisfied with the new software version.

---

The rollback timer can be configured only in the ISSU Init state.

This task explains how to configure the rollback timer:
### Command or Action | Purpose
--- | ---
**Step 1**  
Switch> `enable`  
Enables privileged EXEC mode.  
Enter your password if prompted.

**Step 2**  
Switch# `configure terminal`  
Enter configuration commands, one per line.  End with CNTL/Z.

**Step 3**  
Switch(config)# `issu set rollback-timer value`  
Configures the rollback timer value, which can range from 0 to 7200.

**Step 4**  
Switch(config)# `exit`  
Returns the user to privileged EXEC mode.

**Step 5**  
Switch# `show issu rollback-timer`  
Displays the current setting of the ISSU rollback timer.

This example shows how to set the rollback timer to 3600 seconds:

Switch> `enable`  
Switch# `configure terminal`  
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# `issu set rollback-timer 3600`  
% Rollback timer value set to [ 3600 ] seconds

Switch(config)# `exit`  
Switch# `show issu rollback-timer`  
Rollback Process State = Not in progress  
Configured Rollback Time = 60:00

The Rollback Timer cannot be set in loadversion or runversion state, as the following example illustrates:

Switch# `show issu state detail`  
Slot = 5  
RP State = Active  
ISSU State = Load Version  
Operating Mode = Stateful Switchover  
Current Image = bootflash:old_image  
Pre-ISSU (Original) Image = bootflash:old_image  
Post-ISSU (Targeted) Image = bootflash:new_image  

Slot = 6  
RP State = Standby  
ISSU State = Load Version  
Operating Mode = Stateful Switchover  
Current Image = bootflash:new_image  
Pre-ISSU (Original) Image = bootflash:old_image  
Post-ISSU (Targeted) Image = bootflash:new_image

Switch# `show issu rollback-timer`  
Rollback Process State = Not in progress  
Configured Rollback Time = 60:00

Switch# `configure terminal`  
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# `issu set rollback-timer 20`  
% ISSU state should be [ init ] to set the rollback timer
Displaying ISSU Compatibility Matrix Information

The ISSU compatibility matrix contains information about other IOS XE software releases and the version in question. This compatibility matrix represents the compatibility of the two software versions, one running on the active and the other on the standby supervisor engine, and the matrix allows the system to determine the highest operating mode it can achieve. This information helps the user identify whether to use ISSU.

This task shows how to display information about the ISSU compatibility matrix.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch&gt; enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>

List of Clients:
This example shows how to display stored information regarding the compatibility matrix:

Switch# `show issu comp-matrix stored`

Number of Matrices in Table = 1

```
(1) Matrix for cat4500e-ENTSERVICESK9-M(182) - cat4500ex-ENTSERVICESK9-M(182)
```

Start Flag (0xDEADBABE)

```
My Image ver:  03.01.00.SG
Peer Version    Compatibility
------------    -------------
03.01.00.SG              Comp(3)
```

Switch#

Dynamic Image Version Compatibility (DIVC) feature is supported in IOS XE releases. With DIVC, we store Dynamic(0) rather than Incomp(1), Base(2), or Comp(3), and determine compatibility during run-time when two different DIVC-capable IOS XE software images are running in the active and standby supervisor engines during ISSU.

For Catalyst 4500 switches, a value of Dynamic(0) in the stored compatibility-matrix normally results in Base(2) or Comp(3) upon run-time negotiation between the two IOS XE software images; as of today, you never observe Incomp(1) as long as the other IOS XE name is present in the stored compatibility-matrix.

This example shows how to display negotiated information regarding non-IOSd clients:

Switch# `show package compatibility`

```
PackageName      PeerPackageName                       ModuleName    Compatibility
-----------      --------------- --------------------------------    -------------
rp_base              rp_base                              aaa       COMPATIBLE
rp_base              rp_base                        aaacommon       COMPATIBLE
rp_base              rp_base                    access_policy       COMPATIBLE

rp_base              rp_base                     app_sess_ios       COMPATIBLE
rp_base              rp_base                         auth_mgr       COMPATIBLE
......
```

Cisco High Availability Features in Cisco IOS XE 3.1.0SG

This section provides a list of High Availability software features that are supported in Cisco IOS XE 3.1.0SG. Links to the feature documentation are included.

Feature guides may contain information about more than one feature. To find information about a specific feature within a feature guide, see the Feature Information table at the end of the guide.

Feature guides document features that are supported on many different software releases and platforms. Your Cisco software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in
that guide are supported in your software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to 
http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

**ISSU (IOS In-Service Software Upgrade)**

**Enhanced High System Availability**

CHAPTER 7

Configuring Interfaces

This chapter describes how to configure interfaces for the Catalyst 4500 series of standalone and modular switches. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- About Interface Configuration, page 7-2
- Using the interface Command, page 7-2
- Configuring a Range of Interfaces, page 7-4
- Using the Ethernet Management Port, page 7-6
- Defining and Using Interface-Range Macros, page 7-10
- Deploying SFP+ in X2 Ports, page 7-11
- Deploying 10-Gigabit Ethernet and Gigabit Ethernet SFP Ports on Supervisor Engine V-10GE, page 7-12
- Deploying 10-Gigabit Ethernet or Gigabit Ethernet Ports, page 7-13
- Invoking Shared-Backplane Uplink Mode on Supervisor Engine 6-E and Supervisor Engine 6L-E, page 7-15
- Limitation and Restrictions on Supervisor Engine 7-E and Supervisor Engine 7L-E, page 7-16
- Selecting Uplink Mode on a Supervisor Engine 6-E, page 7-16
- Selecting the Uplink Port on a Supervisor Engine 7L-E, page 7-17
- Digital Optical Monitoring Transceiver Support, page 7-18
- Configuring Optional Interface Features, page 7-19
- Understanding Online Insertion and Removal, page 7-31
- Online Insertion and Removal on a WS-4500X-32, page 7-32
- Monitoring and Maintaining the Interface, page 7-34

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this
About Interface Configuration

By default, all interfaces are enabled. The 10/100-Mbps Ethernet interfaces autonegotiate connection speed and duplex. The 10/100/1000-Mbps Ethernet interfaces negotiate speed, duplex, and flow control. The 1000-Mbps Ethernet interfaces negotiate flow control only. Autonegotiation automatically selects the fastest speed possible on that port for the given pair. If a speed is explicitly stated for an interface, that interface defaults to half duplex unless it is explicitly set for full duplex.

Many features are enabled on a per-interface basis. When you enter the interface command, you must specify the following:

- Interface type:
  - Fast Ethernet (use the fastethernet keyword)
  - Gigabit Ethernet (use the gigabitethernet keyword)
  - 10-Gigabit Ethernet (use the tengigabitethernet keyword)
- Slot number—The slot in which the interface module is installed. Slots are numbered starting with 1, from top to bottom.
- Interface number—The interface number on the module. The interface numbers always begin with 1. When you are facing the front of the switch, the interfaces are numbered from left to right.

You can identify interfaces by physically checking the slot/interface location on the switch. You can also use the Cisco IOS show commands to display information about a specific interface or all the interfaces.

Using the interface Command

These general instructions apply to all interface configuration processes:

**Step 1**
At the privileged EXEC prompt, enter the configure terminal command to enter global configuration mode:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#

**Step 2**
In global configuration mode, enter the interface command. Identify the interface type and the number of the connector on the interface card. The following example shows how to select Fast Ethernet, slot 5, interface 1:

Switch(config)# interface fastethernet 5/1
Switch(config-if)#

**Step 3**
Interface numbers are assigned at the factory at the time of installation or when modules are added to a system. Enter the show interfaces EXEC command to see a list of all interfaces installed on your switch. A report is provided for each interface that your switch supports, as shown in this display:

Switch(config-if)# Ctrl-Z
Switch# show interfaces
Vlan1 is up, line protocol is down
Hardware is Ethernet SVI, address is 0004.0d46.7aff (bia 0004.0d46.7aff)

   Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
   0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
   0 input packets with dribble condition detected
   0 packets output, 0 bytes, 0 underruns
   0 output errors, 0 collisions, 0 interface resets
   0 babbles, 0 late collision, 0 deferred
   0 lost carrier, 0 no carrier
   0 output buffer failures, 0 output buffers swapped out
## Configuring Interfaces

### Chapter 7

### Configuring Interfaces

---

**Configuring a Range of Interfaces**

The interface-range configuration mode allows you to configure multiple interfaces with the same configuration parameters. When you enter the interface-range configuration mode, all command parameters you enter are attributed to all interfaces within that range until you exit interface-range configuration mode.

To configure a range of interfaces with the same configuration, enter this command:

```
Switch(config)# interface range
  (vlan vlan_ID - vlan_ID) |
  (fastethernet | gigabitethernet |
  tengigabitethernet | macro macro_name)
  slot/interface - interface) |
  (vlan vlan_ID - vlan_ID) |
  (fastethernet | gigabitethernet |
  tengigabitethernet | macro macro_name)
  slot/interface - interface)
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selects the range of interfaces to be configured. Note the following:</td>
<td></td>
</tr>
<tr>
<td>- You are required to enter a space before the dash.</td>
<td></td>
</tr>
<tr>
<td>- You can enter up to five comma-separated ranges.</td>
<td></td>
</tr>
<tr>
<td>- You are not required to enter spaces before or after the comma.</td>
<td></td>
</tr>
</tbody>
</table>

**Note** When you use the `interface range` command, you must add a space between the `vlan`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, or `macro` keyword and the dash. For example, the command `interface range fastethernet 5/1 - 5` specifies a valid range; the command `interface range fastethernet 5/1-5` does not contain a valid range command.
The **interface range** command works only with VLAN interfaces that have been configured with the **interface vlan** command (the **show running-configuration** command displays the configured VLAN interfaces). VLAN interfaces that are not displayed by the **show running-configuration** command cannot be used with the **interface range** command.

This example shows how to reenable all Fast Ethernet interfaces 5/1 to 5/5:

```
Switch(config)# interface range fastethernet 5/1 - 5
Switch(config-if-range)# no shutdown
Switch(config-if-range)#
```

```
*Oct  6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/1, changed state to up
*Oct  6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/2, changed state to up
*Oct  6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/3, changed state to up
*Oct  6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/4, changed state to up
*Oct  6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/5, changed state to up
*Oct  6 08:24:36: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/5, changed state to up
*Oct  6 08:24:36: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/3, changed state to up
*Oct  6 08:24:36: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/4, changed state to up
Switch(config-if)#
```

This example shows how to use a comma to add different interface type strings to the range to reenable all Fast Ethernet interfaces ranging from 5/1 to 5/5 and both Gigabit Ethernet interfaces 1/1 and 1/2:

```
Switch(config-if)# interface range fastethernet 5/1 - 5, gigabitethernet 1/1 - 2
Switch(config-if)# no shutdown
```

```
*Oct  6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/1, changed state to up
*Oct  6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/2, changed state to up
*Oct  6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/3, changed state to up
*Oct  6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/4, changed state to up
*Oct  6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/5, changed state to up
*Oct  6 08:29:28: %LINK-3-UPDOWN: Interface GigabitEthernet1/1, changed state to up
*Oct  6 08:29:28: %LINK-3-UPDOWN: Interface GigabitEthernet1/2, changed state to up
*Oct  6 08:29:29: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/5, changed state to up
*Oct  6 08:29:29: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/3, changed state to up
*Oct  6 08:29:29: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/4, changed state to up
Switch(config-if)#
```

If you enter multiple configuration commands while in interface-range configuration mode, each command is run as it is entered (they are not batched together and run after you exit interface-range configuration mode). If you exit interface-range configuration mode while the commands are being run, some commands might not be run on all interfaces in the range. Wait until the command prompt is displayed before exiting interface-range configuration mode.
Using the Ethernet Management Port

This section has this information:

- Understanding the Ethernet Management Port, page 7-6
- Supported Features on the Ethernet Management Port, page 7-9
- Configuring the Ethernet Management Port, page 7-10

Understanding the Ethernet Management Port

The Ethernet management port, also referred to as the Fa1 or fastethernet1 port, is a Layer 3 host port to which you can connect a PC. Use the Ethernet management port instead of the switch console port for network management. When managing a switch, connect the PC to the Ethernet management port on a Catalyst 4500 series switch. (Figure 7-1).

Note

When connecting a PC to the Ethernet management port, you must assign an IP address.

Figure 7-1 Connecting a Switch to a PC

By default, the Ethernet management port is enabled. The switch cannot route packets from the Ethernet management port to a network port, and from the network port to the Ethernet port. To obtain these, the Fa1 interface is automatically placed in a separate routing domain (or VRF domain), called mgmtVrf. (You observe the ip Vrf forwarding mgmtVrf line in the running configuration when you boot up.) For details, read the “Fa1 Interface and mgmtVrf” section on page 7-7.

Even though the Ethernet management port does not support routing, you might need to enable routing protocols on the port. As illustrated in Figure 7-2, you must enable routing protocols on the Ethernet management port when the PC is multiple hops away from the switch and the packets must pass through multiple Layer 3 devices to reach the PC.
The specific implementation of Ethernet management port depends on the redundancy model you are applying.

For details on configuring SSO and ISSU, refer to Chapter 9, “Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 6-E and Supervisor Engine 6L-E” and Chapter 5, “Configuring the Cisco IOS In-Service Software Upgrade Process”.

**Fa1 Interface and mgmtVrf**

---

**Caution**

The Ethernet management port is intended for out-of-band access only. Like the console port, the Ethernet management port has direct access to critical resources on the switch. Connecting this port to an in-band network might cause performance degradation and vulnerability to a denial of service attack.

All features that use fa1 now need to be VRF-aware.

---

**Note**

You cannot configure any other interface in the same routing domain and you cannot configure a different routing domain for the Fa1 interface.

On bootup the fa1 port assumes the following default configuration:

```
ip unicast-routing
ip vrf mgmtVrf
!
interface FastEthernet1
 ip vrf forwarding mgmtVrf
 speed auto
duplex auto
```

Switch# `show ip vrf`

<table>
<thead>
<tr>
<th>Name</th>
<th>Default RD</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgmtVrf</td>
<td></td>
<td>Fa1</td>
</tr>
</tbody>
</table>

Because the management port is placed in mgmtVrf, you should be aware of the VRF aware commands required for the following tasks:

- **Ping**, page 7-8
- **TraceRoute**, page 7-8
Using the Ethernet Management Port

Chapter 7      Configuring Interfaces

- Telnet, page 7-8
- TFTP, page 7-8
- FTP, page 7-9
- SSH, page 7-9

Note
Command usage specific to the mgmtVrf are mentioned below. The additional configuration that is necessary to make the feature work needs to be configured.

Ping
If you want to ping an IP address that is reachable through an fa1 port, enter the following command:

Switch# ping vrf mgmtVrf ip address

For example:

Switch# ping vrf mgmtVrf 20.20.20.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 20.20.20.1, timeout is 2 seconds:

Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms

TraceRoute

Switch# traceroute vrf mgmtVrf ip address

For example:

Eg: Switch# traceroute vrf mgmtVrf 20.20.20.1
Type escape sequence to abort.
Tracing the route to 20.20.20.1
1 20.20.20.1 0 msec 0 msec *

Telnet
If you want to Telnet to a remote switch through the Fa1 port, enter the following command:

Switch# telnet word /vrf mgmtVrf
word  IP address or hostname of a remote system

Following is an example illustrating how to use this command:

Switch# telnet 20.20.20.1 /vrf mgmtVrf
Trying 20.20.20.1 ... Open
User Access Verification
Password:
switch> en
Password:
switch#

TFTP
If you want to use Fa1 port for TFTP operation, configure the Fa1 port as the source interface for TFTP as follows:

Switch(config)# ip tftp source-interface fastEthernet1
FTP

If you want to use an Fa1 port for an FTP operation, configure the Fa1 port as the source interface for FTP as follows:

```
Switch(config)# ip ftp source-interface fastEthernet1
```

SSH

If you want initiate SSH from your switch through the Fa1 port, enter the following command:

```
Switch# ssh -l login name -vrf mgmtVrf ip address
```

For example:

```
Switch# ssh -l xyz -vrf mgmtVrf 20.20.20.1
```

SSO Model

On a redundant chassis, management port behavior differs from that of a standard Ethernet port in that each supervisor engine possesses a management port, and only the port on the active supervisor engine is enabled. The management port on the standby supervisor engine is always disabled; it cannot switch any kind of traffic.

When a switchover occurs, the management port of the standby supervisor engine (now, active) is enabled and can be used to switch traffic, while the management port on the “old” active supervisor engine is disabled.

**Note**

The Cisco IOS configuration for the management port is synchronized between the two supervisor engines. Under Cisco IOS, they possess the same IP address. To avoid address overlapping during a switchover on a redundant chassis, you should assign a different IP address on the management port from the one you assigned to the same port in the ROMMON configuration.

ISSU Model

In SSO mode, the running configurations on the active and standby supervisor engines must match. You cannot enable the management port on a redundant chassis if one of the two supervisor engines is running an Cisco IOS image prior to Cisco IOS Release 12.2(50)SG (wherein a management port is not supported).

When you perform an ISSU upgrade or downgrade between Cisco IOS Release 12.2(50)SG and a software image prior to Cisco IOS Release 12.2(50)SG, we automatically disable the management port. The port configuration is restored when both software images running on the supervisor engines are at least Cisco IOS Release 12.2(50)SG. A warning message is also displayed.

Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express setup
- Network Assistant
- Telnet with passwords
- TFTP
Defining and Using Interface-Range Macros

- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SNMP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
  - Speed—10 Mb/s, 100 Mb/s, 1000Mb/s, and autonegotiation
  - Duplex mode—Full, half, and autonegotiation
  - Loopback detection
- Cisco Discovery Protocol (CDP) (only on WS-C4900M and WS-C4948)
- IPv4 access control lists (ACLs)
- Routing protocols (only on WS-C4900M and WS-C4948)
- AAA

Caution

Before enabling a feature on the Ethernet management port, ensure that the feature is supported. If you try to configure an unsupported feature on an Ethernet management port, the feature might not work properly, and the switch might fail.

Configuring the Ethernet Management Port

To specify the Ethernet management port, enter `fastethernet1`.
To disable the port, use the `shutdown` interface configuration command. To enable the port, use the `no shutdown` interface configuration command.
To determine the link status to the PC, you can monitor the LED for the Ethernet management port:
  - The LED is green (on) when the link is active.
  - The LED is off when the link is down.
  - The LED is amber when there is a POST failure.
To display the link status, use the `show interfaces fastethernet 1` privileged EXEC command.

Defining and Using Interface-Range Macros

You can define an interface-range macro to automatically select a range of interfaces for configuration. Before using the `macro` keyword in the `interface-range` macro command string, you must define the macro.
To define an interface-range macro, enter this command:

This example shows how to define an interface-range macro named `enet_list` to select Fast Ethernet interfaces 5/1 through 5/4:

```
Switch(config)# define interface-range enet_list fastethernet 5/1 - 4
```

To show the defined interface-range macro configuration, enter this command:

```
Switch# show running-config | include define
define interface-range enet_list FastEthernet5/1 - 4
Switch#
```

To use an interface-range macro in the `interface range` command, enter this command:

```
Switch(config)# interface range macro enet_list
Switch(config-if)#
```

---

**Deploying SFP+ in X2 Ports**

This feature is supported on Supervisor Engine 6-E and 6L-E as well as on WS-X4606-X2-E, WS-X4908-10GE, WS-X4904-10GE, and WS-C4900M.
To use an SFP+ in an X2 port to obtain 10-Gigabit Ethernet bandwidth, the Catalyst 4500 series switch supports OneX Convertor modules. When you plug a OneX Convertor module into an X2 port, it converts the X2 port into an SFP+ port into which you can plug in an SFP+. An SFP+ in a OneX Convertor module provides the same functionality as an X2 and maintains the same port numbering.

The output for the `show idprom tengigabitethernet slot/interface` command displays the contents of both the SFP+ and the OneX Convertor module EEPROMs when an SFP+ in a OneX Convertor module is plugged into an X2 port.

## Deploying 10-Gigabit Ethernet and Gigabit Ethernet SFP Ports on Supervisor Engine V-10GE

**Note**

On a Catalyst 4510R series switch, if you enable both the 10-Gigabit Ethernet and Gigabit Ethernet SFP uplink ports, you must reboot the switch. On the Catalyst 4503, 4506, and 4507R series switches, this capability is automatically enabled.

Prior to Cisco IOS Release 12.2(25)SG, you could enable either the dual wire-speed 10-Gigabit Ethernet ports or four alternatively wired Gigabit Ethernet SFP uplink ports. Beginning with Cisco IOS Release 12.2(25)SG, you could simultaneously deploy the dual 10-Gigabit Ethernet ports and the four Gigabit Ethernet SFP ports on the Catalyst 4503, Catalyst 4506, and Catalyst 4507R chassis.

When you deploy a Catalyst 4510R chassis, one of the following configurations is supported:

- Dual 10-Gigabit Ethernet ports (X2 optics) only.
- Four Gigabit Ethernet ports (SFP optics) only.
- Both the dual 10-Gigabit Ethernet and the four Gigabit Ethernet ports. The tenth slot (Flex-Slot) only supports a 2-port gigabit interface converter (GBIC) line card (WS-X4302-GB) when in this mode.
- You cannot place a line card with a backplane traffic capacity exceeding 6 Gbps in slots 8, 9, and 10 of a Catalyst 4510R-E chassis when used with a Supervisor Engine 6-E or 6L-E.

To select the 10-Gigabit Ethernet or the Gigabit Ethernet SFP uplink port, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Establishes global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# hw-module uplink select [all</td>
<td>gigabitethernet</td>
</tr>
</tbody>
</table>

The following example shows how to enable both 10-Gigabit Ethernet and Gigabit Ethernet SFP uplink ports on a Catalyst 4510R series switch:

```plaintext
Switch# configure terminal
Switch(config)# hw-module uplink select all
Warning: This configuration mode will place slot 10 in flex slot mode
```

**Note**

When you modify the uplink mode, you must reboot the switch.
Deploying 10-Gigabit Ethernet or Gigabit Ethernet Ports

To increase the flexibility of X2 ports, the Catalyst 4500 series switch as well as Catalyst 4900M and Catalyst 4948E support TwinGig Convertor modules. When you plug a TwinGig Convertor module into an X2 hole, it converts a single X2 hole (capable of holding one pluggable X2 optic) into two SFP holes (capable of holding two pluggable SFP optics). This enables you to have 10-Gigabit ports and 1-Gigabit ports on the same line card. It also allows you to use Gigabit ports, and then switch to a 10-Gigabit port, when needed.

This section includes these topics:
- Port Numbering TwinGig Convertors, page 7-13
- Limitations on Using a TwinGig Convertor, page 7-14
- Selecting X2/TwinGig Convertor Mode, page 7-14

Port Numbering TwinGig Convertors

When a TwinGig Convertor is enabled or disabled, the number and type of ports on the line card change dynamically. The terminology must reflect this behavior. In Cisco IOS, 10-Gigabit ports are named 10-Gigabit and 1-Gigabit ports are named Gigabit. Starting with Cisco IOS Release 12.2(40)SG, to avoid having two ports named 10-Gigabit1/1 and Gigabit1/1, the 10-Gigabit and 1-Gigabit port numbers are independent. For example, for a WS-X4606-10GE-E module with six X2 holes, the X2 ports are named 10-Gigabit slot-num/<1-6>, and the SFP ports are named Gigabit slot-num/<7-18>.

In Cisco IOS, ports 1 through 18 always exist. This means that you can apply configurations on them and they display in the CLI output. However, only the X2 or the SFP ports can be active at any particular time. For example, if an X2 is plugged into the second hole, the X2 port 2 is active and SFP ports 9 and 10 are inactive. If a TwinGig Convertor is plugged into the second hole, the X2 port 2 is inactive, and the SFP ports 9 and 10 are active. The inactive ports are treated analogously to the inactive ports on Supervisor Engines IV and V-10GE, where at no time are all of the uplinks connected to the switching ASICs.

When using both TwinGig and X2 transceivers on the WS-X4606-X2-E module, place ports 1-3 in one group and ports 4-6 in another. (The mode selected with the show hw-module module port-group command determines the behavior. See “Selecting X2/TwinGig Convertor Mode”.) Mixing within a port group does not work. For example, you cannot have an X2 in port 1 and a TwinGig in port 2 and expect both of them to function.
Limitations on Using a TwinGig Convertor

Supervisor Engine 6-E, Supervisor Engine 6L-E, and Catalyst 4900M connect ports to the switching engine through a stub ASIC. This stub ASIC imposes some limitations on the ports: Gigabit and 10-Gigabit ports cannot be mixed on a single stub ASIC; they must either be all 10-Gigabit Ethernet (X2), or all Gigabit (TwinGig Converter and SFP). The faceplates of X2 modules show this stub port grouping, either with actual physical grouping with a box drawn around a grouping.

Selecting X2/TwinGig Convertor Mode

The default configuration mode is X2. If you plan to deploy 10-Gigabit Ethernet interfaces, you do not need to configure anything. However, if you want to deploy Gigabit interfaces (that is, use TwinGig Convertors), you must configure the associated port-group:

To determine how the X2 holes on a module are grouped, enter the `show hw-module module m port-group p` command.

**Note** Place a 10-Gigabit Ethernet port that accepts CVR-X2-SFP into 1-Gigabit mode instead of 10-Gigabit Ethernet mode.

If you configure a 10-Gigabit Ethernet port as 1-Gigabit port, an output similar to the following appears:

```
Switch# show hw-module module 5 port-group
Module Port-group Active                          Inactive
-------------------------------------------------------------
5        1     Gi5/3-6                        Te5/1-2
```

If the port is set to the default, 10-Gigabit Ethernet mode, an output similar to the following appears:

```
Switch# show hw-module module 6 port-group
Module Port-group Active                          Inactive
-------------------------------------------------------------
6        1     Te6/1-2                        Gi6/3-6
```

```
Switch# show int status mod 1
Port      Name               Status       Vlan       Duplex  Speed Type
Te1/1                        notconnect   1            full    10G 10GBase-LR
Te1/2                        connected    1            full    10G 10GBase-LR
Te1/3                        notconnect   1            full    10G No X2
Te1/4                        notconnect   1            full    10G No X2
Te1/5                        notconnect   1            full    10G No X2
Te1/6                        notconnect   1            full    10G No X2
Gi1/7                        inactive     1            full   1000 No Gbic
Gi1/8                        inactive     1            full   1000 No Gbic
Gi1/9                        inactive     1            full   1000 No Gbic
Gi1/10                       inactive     1            full   1000 No Gbic
Gi1/11                       inactive     1            full   1000 No Gbic
Gi1/12                       inactive     1            full   1000 No Gbic
Gi1/13                       inactive     1            full   1000 No Gbic
Gi1/14                       inactive     1            full   1000 No Gbic
Gi1/15                       inactive     1            full   1000 No Gbic
Gi1/16                       inactive     1            full   1000 No Gbic
Gi1/17                       inactive     1            full   1000 No Gbic
Gi1/18                       inactive     1            full   1000 No Gbic
Switch#
```
To configure the modes of operation for each X2 port group in which you want to deploy Gigabit, enter the `hw-module module m port-group p select gigabitethernet` command. This configuration is preserved across power cycles and reloads.

To deploy Gigabit Ethernet interfaces using the TwinGig Convertor, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Establishes global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# hw-module module m port-group p select [gigabitethernet</td>
</tr>
<tr>
<td></td>
<td>Selects the mode of operation for each X2 port-group. Default is 10-Gigabit Ethernet (x2).</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show int status mod n</td>
</tr>
<tr>
<td></td>
<td>Verifies the setting.</td>
</tr>
</tbody>
</table>

This example shows how to select Gigabit Ethernet interfaces on a WS-X4606-10GE-E using the TwinGig Convertor:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# hw-module module 1 port-group 1 select gigabitethernet
Switch(config)# exit
Switch# show int status mod 1
```

Invoking Shared-Backplane Uplink Mode on Supervisor Engine 6-E and Supervisor Engine 6L-E

This feature enables you to use all four 10-Gigabit Ethernet ports on the supervisor engines as blocking ports when in redundant mode.

Prior to Cisco IOS Release 12.2(40)SG, Catalyst 4500 Supervisor Engine V-10GE allowed you to enable either the dual wire-speed 10-Gigabit Ethernet ports or four TwinGig convertor based Gigabit Ethernet SFP uplink ports when operating in redundant mode.
Beginning with Cisco IOS Release 12.2(40)SG, you could deploy all four 10-Gigabit Ethernet ports, two blocking ports on an active supervisor engine and two blocking ports on the standby supervisor engine, or all eight Gigabit Ethernet SFP ports, four on the active supervisor and four on the standby supervisor engine. This capability is supported on all Catalyst 4500 and 4500E series chassis.

To enable shared-backplane mode, enter this command:

```
Switch(config)# hw-module uplink mode shared-backplane
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# hw-module uplink mode shared-backplane</td>
<td>A reload of the active supervisor engine is required to apply the new configuration.</td>
</tr>
</tbody>
</table>

To disable shared-backplane mode, enter this command:

```
Switch(config)# no hw-module uplink mode shared-backplane
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# no hw-module uplink mode shared-backplane</td>
<td>A reload of the active supervisor engine is required to apply the new configuration.</td>
</tr>
</tbody>
</table>

**Limitation and Restrictions on Supervisor Engine 7-E and Supervisor Engine 7L-E**

When you use WS-X45-SUP7-E in RPR or SSO mode, only the first two uplinks on each supervisor engine are available. The second two uplinks are unavailable.

**Selecting Uplink Mode on a Supervisor Engine 6-E**

You can use the `hw-module uplink mode` command to change the uplink mode to either shared-backplane or tengigabitethernet mode.

```
Switch(config)# hw-module uplink mode
```

| Note | Only two 10-Gigabit Ethernet ports or four 1-Gigabit Ethernet ports can be used on the supervisor engine. |

| Note | When changing the uplink mode using the `hw-module uplink mode shared-backplane` command, you must reload the system. A message appears on the console to reflect this. |

To select shared-backplane mode, do the following:

```
Switch(config)# hw-module uplink mode shared-backplane
```

A reload of the active supervisor is required to apply the new configuration.

```
Switch(config)# exit
Switch#
```

On a Supervisor Engine 6-E in a 6 or 7-slot chassis (Catalyst 4506-E, 4507R-E, and 4507R+E), the default uplink mode does not allow a WS-X4640-CSFP-E linecard to boot in the last slot because of a hardware limitation. After you the `hw-module uplink mode tengigabitethernet` command, you must
reload the system to enable Ten Gigabit mode. The configuration is NVGEN’d after you save the running configuration to the startup configuration. You can use the `show run | incl uplink` command to check the uplink configuration before reloading the system. Furthermore, you can enter the `show hw-module uplink` command to display the uplink mode. It reports the current uplink mode, as well as the mode after the system reloa ds.

In uplink Ten Gigabit mode, the uplink is limited to two Ten Gigabit Ethernet interfaces in non-redundant and in redundant mode; Gigabit Ethernet interfaces are not supported. The WS-X4640-CSFP-E linecard boots in the last slot on 6 and 7-slot chassis. To return to default mode, reload the system from tengigabitethernet mode. SharedBackplane mode can be selected from Default mode, where a system reload is required as well.

The `hw-module module x port-group x select gigabitethernet` command is blocked in uplink TenGigabit mode, preventing you from selecting gigabitethernet mode.

---

**Selecting the Uplink Port on a Supervisor Engine 7L-E**

With Cisco IOS Release 15.0(2)SG, the SFP+/SFP uplink modes on Supervisor Engine 7L-E (WS-X45-SUP-7L-E) have changed. The number of uplink ports now depends on the supervisor engine mode (single or redundant) and the uplink mode configuration (1-Gigabit or 10-Gigabit). To configure the uplink mode, use the `hw-module uplink select [gigabitethernet/tengigabitethernet]` command, as follows:

```
Switch(config)# hw-module uplink select?
  gigabitethernet  Select the gigabit uplinks
  tengigabitethernet  Select the 10G uplinks
```

---

**Note**

Supervisor Engine 7L-E is not supported on a ten-slot chassis. USB device and SD card support is applicable to Supervisor 7-E only.

---

**Single Supervisor Mode**

In single supervisor mode, WS-X45-SUP-7L-E supports the uplink configuration of at most either two 10-Gigabit or four 1-Gigabit ports (Table 7-1).

**Table 7-1 Uplink Options for Single Supervisor Mode**

<table>
<thead>
<tr>
<th>Supervisor Engine Uplink Ports</th>
<th>Speeds Achievable with the Following Combination of Pluggables (Band Width)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1</td>
<td>A2</td>
</tr>
<tr>
<td>Choose 10-Gigabit operation through the command line interface.</td>
<td></td>
</tr>
<tr>
<td>SFP+</td>
<td>SFP+</td>
</tr>
<tr>
<td>SFP+</td>
<td>SFP</td>
</tr>
</tbody>
</table>

SFP+ and SFP can be inserted in any order for lines 2 thru 4.
Digital Optical Monitoring Transceiver Support

Command line interface (CLI) commands (show inventory, show idprom interface) are used on transceivers to obtain serial number, model name, inventory information.

The following commands are specific to the transceivers that support the DOM capability:

- Displays current values and thresholds for all sensor on a particular interface transceiver:
  
  ```
  show interfaces int-name transceiver [detail] [threshold]
  ```

- Enables or disables the `entSensorThresholdNotification` for all sensors in all the transceivers:
  
  ```
  snmp-server enable trap transceiver
  ```

- Enables or disables transceiver monitoring:
  
  ```
  transceiver type all monitoring
  ```

**Note**

This feature is only available when a DOM capable transceiver is present and configured for monitoring. The frequency at which the sensor information is refreshed depends on default values configured in the transceiver SEEPROM (Serial Electrically Erasable Programmable Read Only Memory).

**Note**

For details on transceiver module compatibility, refer to this URL:

Chapter 7 Configuring Interfaces

Configuring Optional Interface Features

The following sections describe optional procedures:

- Configuring Ethernet Interface Speed and Duplex Mode, page 7-19
- Configuring Flow Control, page 7-22
- Configuring Jumbo Frame Support, page 7-24
- Interacting with Baby Giants, page 7-28
- Configuring the Port Debounce Timer, page 7-28
- Configuring Auto-MDIX on a Port, page 7-29

Configuring Ethernet Interface Speed and Duplex Mode

Topics include:

- Speed and Duplex Mode Configuration Guidelines, page 7-19
- Setting the Interface Speed, page 7-20
- Setting the Interface Duplex Mode, page 7-21
- Displaying the Interface Speed and Duplex Mode Configuration, page 7-21
- Adding a Description for an Interface, page 7-22

Speed and Duplex Mode Configuration Guidelines

**Note**

You do not configure the client device for autonegotiation. Instead, you configure the switch with the speed, or range of speeds, that you want to autonegotiate.

You can configure the interface speed and duplex mode parameters to **auto** and allow the Catalyst 4500 series switch to negotiate the interface speed and duplex mode between interfaces. If you decide to configure the interface **speed** and **duplex** commands manually, consider the following:

- If you enter the **no speed** command, the switch automatically configures both interface **speed** and **duplex** to **auto**.
- When you set the interface speed to **1000** (Mbps) or **auto 1000**, the duplex mode is full duplex. You cannot change the duplex mode.
- If the interface speed is set to **10** or **100**, the duplex mode is set to half duplex by default unless you explicitly configure it.

**Caution**

Changing the interface speed and duplex mode configuration might shut down and restart the interface during the reconfiguration.
Setting the Interface Speed

If you set the interface speed to auto on a 10/100-Mbps Ethernet interface, speed and duplex are autonegotiated. The forced 10/100 autonegotiation feature allows you to limit interface speed auto negotiation up to 100 Mbps on a 10/100/1000BASE-T port.

To set the port speed for a 10/100-Mbps Ethernet interface, perform this task:

```
Switch(config)# interface fastethernet slot/interface
Switch(config-if)# speed [10 | 100 | auto [10 | 100]]
```

This example shows how to set the interface speed to 100 Mbps on the Fast Ethernet interface 5/4:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed 100
```

This example shows how to allow Fast Ethernet interface 5/4 to autonegotiate the speed and duplex mode:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed auto
```

**Note**
The proceeding cli is analogous to `speed auto 10 100`.

This example shows how to limit the interface speed to 10 and 100 Mbps on the Gigabit Ethernet interface 1/1 in auto-negotiation mode:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 10 100
```

This example shows how to limit speed negotiation to 100 Mbps on the Gigabit Ethernet interface 1/1:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 100
```

**Note**
Turning off autonegotiation on a Gigabit Ethernet interface results in the port being forced into 1000 Mbps and full-duplex mode.

To turn off the port speed autonegotiation for Gigabit Ethernet interface 1/1, perform this task:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# speed nonegotiate
```

To restore autonegotiation, enter the `no speed nonegotiate` command in the interface configuration mode.

**Note**
For the blocking ports on the WS-X4416 module, do not set the speed to autonegotiate.
Chapter 7  Configuring Interfaces

Setting the Interface Duplex Mode

**Note**
When the interface is set to 1000 Mbps, you cannot change the duplex mode from full duplex to half duplex.

To set the duplex mode of a Fast Ethernet interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;Switch(config)# interface fastethernet &lt;br&gt;slot/interface</td>
<td>Specifies the interface to be configured.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;Switch(config-if)# duplex [auto</td>
<td>full</td>
</tr>
</tbody>
</table>

This example shows how to set the interface duplex mode to full on Fast Ethernet interface 5/4:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# duplex full
```

Displaying the Interface Speed and Duplex Mode Configuration

To display the interface speed and duplex mode configuration for an interface, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show interfaces [fastethernet</td>
<td>gigabitethernet</td>
</tr>
</tbody>
</table>

This example shows how to display the interface speed and duplex mode of Fast Ethernet interface 6/1:

```
Switch# show interface fastethernet 6/1
FastEthernet6/1 is up, line protocol is up
    Hardware is Fast Ethernet Port, address is 0050.547a.dee0 (bia 0050.547a.dee0)
    MTU 1500 bytes, BW 100000 Kbit, DLY 100 usec,
    reliability 255/255, txload 1/255, rxload 1/255
    Encapsulation ARPA, loopback not set
    Keepalive set (10 sec)
    Full-duplex, 100Mb/s
    ARP type: ARPA, ARP Timeout 04:00:00
    Last input 00:00:54, output never, output hang never
    Last clearing of "show interface" counters never
    Input queue: 50/2000/0/0 (size/max/drops/flushes); Total output drops: 0
    Queueing strategy: fifo
    Output queue: 0/40 (size/max)
    5 minute input rate 0 bits/sec, 0 packets/sec
    5 minute output rate 0 bits/sec, 0 packets/sec
    50 packets input, 11300 bytes, 0 no buffer
    Received 50 broadcasts, 0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    0 input packets with dribble condition detected
    1456 packets output, 111609 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets
    0 babbles, 0 late collision, 0 deferred
    1 lost carrier, 0 no carrier
    0 output buffer failures, 0 output buffers swapped out
```

OL-25340-01

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG
Adding a Description for an Interface

You can add a description about an interface to help you remember its function. The description appears in the output of the following commands: `show configuration`, `show running-config`, and `show interfaces`.

To add a description for an interface, enter the following command:

```
Switch(config-if)# description string
```

This example shows how to add a description on Fast Ethernet interface 5/5:

```
Switch(config)# interface fastethernet 5/5
Switch(config-if)# description Channel-group to "Marketing"
```

Configuring Flow Control

Gigabit Ethernet ports use flow control to slow down the transmission of incoming packets. If a buffer on a Gigabit Ethernet port runs out of space, the port transmits a special packet that requests remote ports to delay sending packets for a period of time. The port can also receive this special packet from its link partner for the same purpose. This special packet is called a pause frame.

The default settings for Gigabit Ethernet interfaces are as follows:

- Sending pause frames is off—Non-oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Non-oversubscribed Gigabit Ethernet interfaces.
- Sending pause frames is on—Oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Oversubscribed Gigabit Ethernet interfaces.

The default settings for 10-Gigabit Ethernet interfaces are as follows:

- Sending pause frames is off.
- Receiving pause frames is on.

**Note**

`desired` is not a flow control option on the 10-Gigabit Ethernet interfaces.

To configure flow control, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>Switch# configure terminal</code> Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>Switch(config)# interface interface-id</code> Enters interface configuration mode and specifies the interface to be enabled for flowcontrol.</td>
</tr>
<tr>
<td>Step 3</td>
<td>`Switch(config-if)# flowcontrol (receive</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>Switch(config-if)# end</code> Returns to configuration mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>Switch(config)# end</code> Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
This example shows how to configure flow control on an oversubscribed Gigabit Ethernet port 7/5:

```
Switch# configure terminal
Switch(config)# interface g7/5
Switch(config-if)# flowcontrol send on
Switch(config-if)# end
```

```
Switch# show interfaces gigabitEthernet 7/5 capabilities
GigabitEthernet7/5
   Model:              WS-X4548-GB-RJ45-RJ-45
   Type:               10/100/1000-TX
   Speed:              10,100,1000,auto
   Duplex:             half,full,auto
   Trunk encap. type:  802.1Q, ISL
   Trunk mode:         on, off, desirable, nonegotiate
   Channel:            yes
   Broadcast suppression: percentage(0-100), hw
Flowcontrol:          rx-(off, on, desired), tx-(off, on, desired)
VLAN Membership:      static, dynamic
Fast Start:           yes
Queuing:              rx-(N/A), tx-(1p3q1t, Sharing/Shaping)
CoS rewrite:          yes
ToS rewrite:          yes
Inline power:         no
SPAN:                 source/destination
UDLD:                 yes
Link Debounce:        no
Link Debounce Time:   no
Port Security:        yes
Dot1x:                yes
Maximum MTU:          1552 bytes (Baby Giants)
Multiple Media Types: no
Diagnostic Monitoring: N/A
```

```
Switch# show flowcontrol interface GigabitEthernet 7/5
<table>
<thead>
<tr>
<th>Port</th>
<th>Send FlowControl</th>

Configuring Jumbo Frame Support

These sections describe jumbo frame support:

- Ports and Modules That Support Jumbo Frames, page 7-24
- Jumbo Frame Support, page 7-25
- Configuring MTU Sizes, page 7-27

Ports and Modules That Support Jumbo Frames

The following ports and modules support jumbo frames:
• Supervisor uplink ports
• WS-X4306-GB: all ports
• WS-X4232-GB-RJ: ports 1-2
• WS-X4418-GB: ports 1-2
• WS-X4412-2GB-TX: ports 13-14
• WS-X4506-GB-T
• the 4648-GB-RJ45V
• WS-X4648-GB+RJ45V
• WS-X4648-RJ45V-E
• WS-X4648-RJ45V+E
• WS-X4706-10GE

Jumbo Frame Support

These sections describe jumbo frame support:
• Maximum Transmission Units, page 7-25
• Jumbo Frame Support Overview, page 7-25
• Ethernet Ports, page 7-26
• VLAN Interfaces, page 7-26

Maximum Transmission Units

The Catalyst 4500 series switch allows you to configure a maximum of 32 different maximum
transmission unit (MTU) sizes system wide. This means that the maximum number of different MTU
sizes that you can configure with the system mtu, mtu, ip mtu, and ipv6 mtu command on all Layer 2
and Layer 3 interfaces combined is 32.

Also, the system stores the IPv4 and IPv6 MTU sizes configured on an interface separately. For every
system mtu command or per interface mtu command, two separate MTU values are stored, one for IPv4
and one for IPv6. This further reduces the number of slots available (out of 32). However, only a single
MTU value is stored for each ip mtu and ipv6 mtu commands.

If the new MTU value you are configuring is already present in the system (that is, configured on some
other interface), then no new slot(s) are allocated to store it again.

If the maximum limit of 32 is reached and an attempt is made to configure a new MTU size on a new
interface, the system only allows configuration to proceed if the new MTU size has previously been
configured on some interface. Otherwise, an error message is displayed and the default MTU size is
assigned to the interface being configured.

Jumbo Frame Support Overview

A jumbo frame is a frame larger than the default Ethernet size. Enable jumbo frame support by
configuring a larger-than-default MTU size on a port or interface.
Catalyst 4500 series switch Ethernet LAN ports configured with a nondefault MTU size accept frames containing packets with a size between 1500 and 9216 bytes (including Ethernet payload, header and trailer). (The maximum MTU size for a Catalyst 4948 series switch is 9198 bytes (not including header and trailer.)) With a nondefault MTU size configured, the packet size of ingress frames is checked. If the packet is larger than the configured MTU, it is dropped.

For traffic that needs to be routed, the MTU of the egress port is checked. If the MTU is smaller than the packet size, the packet is forwarded to the CPU. If the “do not fragment bit” is not set, it is fragmented. Otherwise, the packet is dropped.

**Note**

Jumbo frame support does not fragment Layer 2 switched packets.

The Catalyst 4500 series switch does not compare the packet size with the MTU at the egress port, but jumbo frames are dropped in ports that do not support them. The frames can be transmitted in ports that do support jumbo frames, even though the MTU is not configured to jumbo size.

**Note**

Jumbo frame support is only configured per interface; jumbo frame support cannot be configured globally.

### Ethernet Ports

These sections describe configuring nondefault MTU sizes on Ethernet ports:

- Ethernet Port Overview, page 7-26
- Layer 3 and Layer 2 EtherChannels, page 7-26

### Ethernet Port Overview

Starting with Cisco IOS Release 12.2(25)EW, configuring a nondefault MTU size on certain Ethernet ports limits the size of ingress packets. The MTU does not impact the egress packets.

Prior to Cisco IOS Release 12.1(13)EW, you could configure the MTU size only on Gigabit Ethernet.

### Layer 3 and Layer 2 EtherChannels

Starting with Release Cisco IOS Release 12.2(25)EW, you could configure all the interfaces in an EtherChannel provided that they have the same MTU. Changing the MTU of an EtherChannel changes the MTU of all member ports. If the MTU of a member port cannot be changed to the new value, that port is suspended (administratively shut down). A port cannot join an EtherChannel if the port has a different MTU. If a member port of an EtherChannel changes MTU, the member port is suspended.

### VLAN Interfaces

If switch ports reside in the same VLAN, either configure all of the switch ports to handle jumbo frames and support the same MTU size, or configure none of them. However, such uniformity of MTU size in the same VLAN is not enforced.

When a VLAN has switch ports with different MTU size, packets received from a port with a larger MTU might be dropped when they are forwarded to a port with a smaller MTU.

If the switch ports in a VLAN have jumbo frames enabled, the corresponding SVI can have jumbo frames enabled. The MTU of an SVI should always be smaller than the smallest MTU among all the switch ports in the VLAN, but this condition is not enforced.
The MTU of a packet is not checked on the ingress side for an SVI; it is checked on the egress side of an SVI. If the MTU of a packet is larger than the MTU of the egress SVI, the packet is sent to the CPU for fragmentation processing. If the “do not fragment” bit is not set, the packet is fragmented. Otherwise, the packet is dropped.

### Configuring MTU Sizes

To configure the MTU size, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# interface {{(vlan vlan_ID)</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-if)# mtu mtu_size</td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# no mtu</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# show running-config interface [{fastethernet</td>
</tr>
</tbody>
</table>

1. type = fastethernet, gigabitethernet, or tengigabitethernet

When you remove a line card, and then reinsert the card, some or all of the MTU values configured on the ports of that line card may be unconfigured. This occurs if the system wide limit of 32 different MTUs is reached while the card is removed. Upon reinserting the line card, the system attempts to reapply the MTU configuration on the ports. If this attempt fails, the MTU values are set to the default.

When configuring the MTU size for VLAN interfaces and Layer 3 and Layer 2 Ethernet ports, note that the supported MTU values are from 1500 to 9198 bytes.

This example shows how to configure the MTU size on Gigabit Ethernet port 1/1:

```
switch# conf terminal
switch(config)# interface gi1/1
switch(config-if)# mtu 9198
switch(config-if)# end
switch(config)# end
switch# show interface gigabitethernet 1/2
GigabitEthernet1/2 is administratively down, line protocol is down
Hardware is C6k 1000Mb 802.3, address is 0030.9629.9f88 (bia 0030.9629.9f88)
MTU 9216 bytes, BW 1000000 Kbit, DLY 10 usec,
<...Output Truncated...>
switch#
```

For details on how to configure IP MTU size, refer to “Configuring IP MTU Sizes” section on page 32-9.
Interacting with Baby Giants

The baby giants feature, introduced in Cisco IOS Release 12.1(12c)EW, uses the global command `system mtu size` to set the global baby giant MTU. This feature also allows certain interfaces to support Ethernet payload size of up to 1552 bytes.

Both the `system mtu` command and the per-interface `mtu` command can operate on interfaces that can support jumbo frames, but the per-interface `mtu` command takes precedence.

For example, before setting the per-interface MTU for interface gi1/1, you enter the `system mtu 1550` command to change the MTU for gi1/1 to 1550 bytes. You enter the per-interface `mtu` command to change the MTU for gi1/1 to 9198 bytes. If you change the baby giant MTU to 1540 bytes with the command `system mtu 1540`, the MTU for gi1/1 remains unchanged at 9198 bytes.

Configuring the Port Debounce Timer

**Note**

You can only configure port debounce on 10-Gigabit Ethernet ports.

The port debounce timer suppresses notification of short link-down events. Link-down events that are shorter than the port debounce timer are not notified to Layer 2 or Layer 3 protocols, decreasing traffic loss due to network reconfiguration. You can configure the port debounce timer separately on each LAN port.

**Caution**

Enabling the port debounce timer causes a delay in link down detections, resulting in loss of traffic during the debouncing period. This situation might affect the convergence and reconvergence of some Layer 2 and Layer 3 protocols.

To configure the debounce timer on a port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# interface tengigabitethernet slot/port</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# link debounce [time debounce_time]</td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# no link debounce</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# show interfaces debounce</td>
</tr>
</tbody>
</table>

**Note**

The default time is 10ms for E-series supervisor engines and line cards.

When configuring the debounce timer on a port, you can increase the port debounce timer value between 10 milliseconds and 5000 milliseconds on the 10-Gigabit Ethernet ports.

This example shows how to enable the port debounce timer on 10-Gigabit Ethernet port 2/1 and to accept the default value (10 ms):

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```Shell
cisco@switch1# set system mtu 1550
```
Switch(config)# interface tenGigabitEthernet 2/1
Switch(config-if)# link debounce
Warning: Enabling debounce feature causes link down detection to be delayed
Switch(config-if)# exit

This example shows how to enable the port debounce timer of 5000 ms on 10-Gigabit Ethernet port 2/2 and to verify the setting:

Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface tenGigabitEthernet 2/2
Switch(config-if)# link debounce time 5000
Warning: Enabling debounce feature causes link down detection to be delayed
Switch(config-if)# end
Switch#
Switch# show interfaces debounce | include enable
Te2/1 enable 10
Te2/2 enable 5000
Switch#

Configuring Auto-MDIX on a Port

When automatic medium-dependent-interface crossover (auto-MDIX) is enabled on an port, the port automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting switches without the auto-MDIX feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other switches or repeaters. With auto-MDIX enabled, use either type of cable to connect to other devices; the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.

Auto-MDIX is enabled by default. When you enable auto-MDIX, you must also set the speed on the port to auto so that for the feature to operate correctly. auto-MDIX is supported on copper media ports. It is not supported on fiber media ports.

---

Note

The following line cards support Auto-MDIX by default, when port auto-negotiation is enabled:

Note

The following line cards do not support Auto-MDIX, neither by default nor by CLI:

Note

The following line cards support Auto-MDIX through the CLI on their copper media ports:
WS-X4124-RJ45, WS-X4148-RJ45 (hardware revision 3.0 or higher), and WS-X4232-GB-RJ45 (hardware revision 3.0, or higher), WS-X4920-GE-RJ45, WS-4648-RJ45V+E, WS-X4748-UPOE+E and WS-X4748-RJ45+E (Auto-MDIX support when inline power is disabled on the port).

Table 7-3 shows the link states that results from auto-MDIX settings and correct and incorrect cabling.
To configure auto-MDIX on a port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface</td>
</tr>
<tr>
<td></td>
<td>interface-id</td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode for the physical interface to be configured.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# speed auto</td>
</tr>
<tr>
<td></td>
<td>Configures the port to autonegotiate speed with the connected device.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# mdix auto</td>
</tr>
<tr>
<td></td>
<td>Enables auto-MDIX on the port.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show interfaces</td>
</tr>
<tr>
<td></td>
<td>interface-id</td>
</tr>
<tr>
<td></td>
<td>Verifies the configuration of the auto-MDIX feature on the interface.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# copy running-config</td>
</tr>
<tr>
<td></td>
<td>startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable auto-MDIX, use the `no mdix auto` interface configuration command.

This example shows how to enable auto-MDIX on a port:

```plaintext
Switch# configure terminal
Switch(config)# interface fastethernet 6/5
Switch(config-if)# speed auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

### Displaying the Interface Auto-MDIX Configuration

To display the interface speed and duplex mode configuration for an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# show interfaces</td>
</tr>
<tr>
<td></td>
<td>type slot/interface</td>
</tr>
<tr>
<td></td>
<td>Displays the interface auto-MDIX configuration setting and operational state.</td>
</tr>
</tbody>
</table>

Depending on how the `speed auto` and the `mdix auto` commands are configured on a supported line card interface, the `show interfaces` command displays the following possible auto-MDIX statuses:

Table 7-4 shows the auto-MDIX setting and operational state and the status of auto-MDIX.
This example shows how to display the auto-MDIX configuration setting and its operational state on Fast Ethernet interface 6/1:

```
Switch# show interfaces fastethernet 6/1
FastEthernet6/1 is up, line protocol is up (connected)
   Hardware is Fast Ethernet Port, address is 0001.64fe.e5d0 (bia 0001.64fe.e5d0)
   MTU 1500 bytes, BW 100000 Kbit, DLY 100 usec,
      reliability 255/255, txload 1/255, rxload 1/255
   Encapsulation ARPA, loopback not set
   Keepalive set (10 sec)
   Full-duplex, 100Mb/s, link type is auto, media type is 10/100BaseTX
   input flow-control is unsupported output flow-control is unsupported
   Auto-MDIX on (operational: on)
   ARP type: ARPA, ARP Timeout 04:00:00
   Last input 00:00:16, output never, output hang never
   Last clearing of "show interface" counters never
   Input queue: 0/2000/0/0 (size/max/drops/flushes); Total output drops: 0
   Queueing strategy: fifo
   Output queue: 0/40 (size/max)
   5 minute input rate 0 bits/sec, 0 packets/sec
   5 minute output rate 0 bits/sec, 0 packets/sec
      511 packets input, 74464 bytes, 0 no buffer
      Received 511 broadcasts (511 multicasts)
      0 runts, 0 giants, 0 throttles
      0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
      0 input packets with dribble condition detected
      3552 packets output, 269088 bytes, 0 underruns
      0 output errors, 0 collisions, 0 interface resets
      0 babbles, 0 late collision, 0 deferred
      1 lost carrier, 0 no carrier
      0 output buffer failures, 0 output buffers swapped out
Switch#
```

### Understanding Online Insertion and Removal

The online insertion and removal (OIR) feature supported on the Catalyst 4500 series switch allows you to remove and replace modules while the system is online. You can shut down the module before removal and restart it after insertion without causing other software or interfaces to shut down.

---

**Table 7-4**  Auto-MDIX and Operational State

<table>
<thead>
<tr>
<th>Auto-MDIX Setting and Operational State on an Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-MDIX on (operational: on)</td>
<td>Auto-MDIX is enabled and is fully functioning.</td>
</tr>
<tr>
<td>Auto-MDIX on (operational: off)</td>
<td>Auto-MDIX is enabled on this interface but it is not functioning. To allow auto-MDIX feature to function properly, you must also set the interface speed to be autonegotiated.</td>
</tr>
<tr>
<td>Auto-MDIX off</td>
<td>Auto-MDIX has been disabled with the no mdix auto command.</td>
</tr>
</tbody>
</table>
Online Insertion and Removal on a WS-4500X-32

You do not need to enter a command to notify the software that you are going to remove or install a module. The system notifies the supervisor engine that a module has been removed or installed and scans the system for a configuration change. The newly installed module is initialized, and each interface type is verified against the system configuration; then the system runs diagnostics on the new interface. There is no disruption to normal operation during module insertion or removal.

If you remove a module and then replace it, or insert a different module of the same type into the same slot, no change to the system configuration is needed. An interface of a type that has been configured previously is brought online immediately. If you remove a module and insert a module of a different type, the interface(s) on that module is administratively up with the default configuration for that module.

Online Insertion and Removal on a WS-4500X-32

You must initiate an uplink module removal procedure on a WS-4500X-32 (the Catalyst 4500-X Series Switch) either through a CLI (below) or through the OIR button on the front panel of the uplink.

Note

Unscheduled uplink module removal is not supported because the C4KX-NM-8 module has hardware communication lines to the baseboard that cannot be unplugged in an online state. Communication must be stopped first.

Before removing the uplink module, you must press the OIR button for 5 seconds, and wait for the OIR LED to turn Green. Removing a module without pressing the OIR button causes the system to reboot to ROMMON with the following console error message:

Kernal panic - not syncing: Removing a module from switch causes instability.
Rebooting in 15 seconds...

Note

No special steps are needed for insertion.

With Cisco Release IOS XE 3.3.0SG and IOS 15.1(1)SG, two CLI’s are introduced: `hw-module module number start` and `hw-module module number stop`. For the `number` keyword, the only applicable value for WS-C4500 is 2. With Cisco Release IOS XE 3.3.0SG and IOS 15.1(1)SG, the `start` and `stop` commands are only enabled on the uplink module of WS-4500X-32.

For details, please refer to the hardware portion of the documentation library:

Shutting down a Module

To shut down a module safely, either enter the `hw-module module stop` command or press the OIR button for 5 seconds.

Note

The `hw-module module stop` command is enabled only on the uplink modules of the WS-C4500X-32.

The following example shows what happens if a module is up and you enter the `hw-module module stop` command:

```
Switch# hw-module module 2 stop
Proceed with module stop? [confirm]
```
Switch#
*Feb 5 16:34:37,325: %C4K_IOSMODPORTMAN-6-MODULEOFFLINE: Module 2 is offline
Switch# show module
Chassis Type : WS-C4500X-32

Power consumed by backplane : 0 Watts

<table>
<thead>
<tr>
<th>Mod Ports Card Type</th>
<th>Model</th>
<th>Serial No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 32 4500X-32 10GE (SFP+)</td>
<td>WS-C4900X-32P-10G</td>
<td>JAE153505E9</td>
</tr>
<tr>
<td>2 8 Module being held in reset</td>
<td>WS-X4908X-10G-TIM</td>
<td>JAE15340C0J</td>
</tr>
</tbody>
</table>

**Boot a Module After if it has been Stopped**

To bring up a module that has been stopped using the `hw-module module number stop` command or by pressing the OIR button, you either enter the `hw-module module number start` command or physically remove and reinsert.

The following example shows what happens if a module has been stopped and you enter this command:

Switch# hw-module module 2 start
% Module 2 not stopped

Switch#
*Feb 5 16:36:27,352: %C4K_IOSMODPORTMAN-6-MODULEINSERTED: Module 2 is inserted

**Boot a Module After if it has been Stopped**

To bring up a module that has been stopped using the `hw-module module number stop` command or by pressing the OIR button, you either enter the `hw-module module number start` command or physically remove and reinsert.

The following example shows what happens if a module has been stopped and you enter this command:

Switch# hw-module module 2 start
% Module 2 not stopped

Switch#
*Feb 5 16:36:27,352: %C4K_IOSMODPORTMAN-6-MODULEINSERTED: Module 2 is inserted

Common Scenarios

Table 7-5 lists the common scenarios associated with an OIR on a WS-4500X-32.

<table>
<thead>
<tr>
<th>If you do this or want to do this...</th>
<th>This happens or you need to do this...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Insert a new module for the first time.</td>
<td>The behavior of new module matches that of current linecard.</td>
</tr>
<tr>
<td>Pull out an uplink module that was not previously stopped or shut down.</td>
<td>The system reboots to ROMMON.</td>
</tr>
<tr>
<td>Press the OIR button accidentally.</td>
<td>Press for less than 5 sec and nothing happens. Press for more than 5 sec and OIR is initiated. The linecard moves to the reset state and the OIR LED turns GREEN.</td>
</tr>
<tr>
<td>Change your mind after entering the module stop command or pressing the OIR button.</td>
<td>Enter the module start command or perform a physical OIR. Both actions trigger uplink module restart. If the module is not faulty, it is restored to online state.</td>
</tr>
<tr>
<td>Know if the OIR button has taken effect.</td>
<td>The OIR LED on the uplink module turns GREEN and the linecard status LED on the uplink module turns off.</td>
</tr>
<tr>
<td>Disable the OIR button and force use of a CLI to initiate an OIR.</td>
<td>Cannot be done.</td>
</tr>
</tbody>
</table>

Monitoring and Maintaining the Interface

The following sections describe how to monitor and maintain the interfaces:

- Monitoring Interface and Controller Status, page 7-34
- Clearing and Resetting the Interface, page 7-35
- Shutting Down and Restarting an Interface, page 7-35
- Configuring Interface Link Status and Trunk Status Events, page 7-36
- Resetting the Interface to the Default Configuration, page 7-38

Monitoring Interface and Controller Status

The Cisco IOS software for the Catalyst 4500 series switch contains commands that you can enter at the EXEC prompt to display information about the interface, including the version of the software and the hardware, the controller status, and statistics about the interfaces. The following table lists some of the interface monitoring commands. (You can display the full list of show commands by entering the show ? command at the EXEC prompt.)
To display information about the interface, enter one of the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show interfaces [type slot/interface]</td>
<td>Displays the status and configuration of all interfaces or of a specific interface.</td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td>Displays the configuration currently running in RAM.</td>
</tr>
<tr>
<td>Switch# show protocols [type slot/interface]</td>
<td>Displays the global (system-wide) and interface-specific status of any configured protocol.</td>
</tr>
<tr>
<td>Switch# show version</td>
<td>Displays the hardware configuration, software version, the names and sources of configuration files, and the boot images.</td>
</tr>
</tbody>
</table>

This example shows how to display the status of Fast Ethernet interface 5/5:

```
Switch# show protocols fastethernet 5/5
FastEthernet5/5 is up, line protocol is up
Switch#
```

### Clearing and Resetting the Interface

To clear the interface counters shown with the `show interfaces` command, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# clear counters [type slot/interface]</td>
<td>Clears interface counters.</td>
</tr>
</tbody>
</table>

This example shows how to clear and reset the counters on Fast Ethernet interface 5/5:

```
Switch# clear counters fastethernet 5/5
Clear "show interface" counters on this interface [confirm] y
Switch# *
Sep 30 08:42:55: %CLEAR-5-COUNTERS: Clear counter on interface FastEthernet5/5 by vty1 (171.69.115.10)
Switch#
```

The `clear counters` command (without any arguments) clears all the current interface counters from all interfaces.

**Note**

The `clear counters` command does not clear counters retrieved with SNMP; it clears only those counters displayed with the EXEC `show interfaces` command.

### Shutting Down and Restarting an Interface

You can disable an interface, which disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.
To shut down an interface and then restart it, perform this task:

```
Step 1
Switch(config)# interface {vlan vlan_ID} | 
{fastethernet | gigabitethernet | 
tengigabitethernet} slot/port | (port-channel
port_channel_number)

Step 2
Switch(config-if)# shutdown

Step 3
Switch(config-if)# no shutdown
```

This example shows how to shut down Fast Ethernet interface 5/5:

```
Switch(config)# interface fastethernet 5/5
Switch(config-if)# shutdown
*Sep 30 08:33:47: %LINK-5-CHANGED: Interface FastEthernet5/5, changed state to a
administratively down
Switch(config-if)#
```

This example shows how to reenable Fast Ethernet interface 5/5:

```
Switch(config-if)# no shutdown
*Sep 30 08:36:00: %LINK-3-UPDOWN: Interface FastEthernet5/5, changed state to up
Switch(config-if)#
```

To verify whether an interface is disabled, enter the EXEC `show interfaces` command. An interface that has been shut down appears as “administratively down.”

### Configuring Interface Link Status and Trunk Status Events

You can configure interface link status and trunk status events. On the Catalyst 4500 series switch, the following interface logging event notifications are supported both globally and per interface:

- Enable or disable notification on the interface whenever its data link status is changed.
- Enable or disable notification on the trunk interface whenever its trunking status is changed.

Use the `[no] logging event link-status use-global` command to enable or disable the interface link status event. Use the `[no] logging event trunk-status use-global` command to enable or disable the interface trunk status event.

Each interface link status logging event can be configured in one of the following states:

- **logging event link-status**—Link status logging event is enabled explicitly on the interface regardless of the switch global setting.
- **no logging event link-status**—Link status logging event is disabled explicitly on the interface regardless of the switch global setting.
- **logging event link-status use-global**—Default link status logging event configuration on the interface; its configuration should follow the switch global link status logging event setting.

The interface trunk status logging event can be configured in the same configuration states.
Configuring Link Status Event Notification for an Interface

To enable or disable a link status logging event, enter one of the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config-if)# logging event link-status</code></td>
<td>Enables interface link status logging.</td>
</tr>
<tr>
<td><code>Switch(config-if)# no logging event link-status</code></td>
<td>Disables interface link status logging.</td>
</tr>
<tr>
<td><code>Switch(config-if)# logging event link-status use-global</code></td>
<td>Specifies the global default setting for interface link status logging.</td>
</tr>
</tbody>
</table>

Global Settings

You can also provide a global configuration for the corresponding logging event. A global configuration provides default logging settings for all interfaces. The `[no] logging event link-status global` command lets you enable or disable the interface link status logging for the entire switch. The `[no] logging event trunk-status global` command lets you enable disable interface trunk status logging for the entire switch.

Each interface link status logging event, if not configured at the interface level, uses the following global logging event setting:

- `logging event link-status global`—Link status logging event is enabled, if not configured on the interface.
- `no logging event link-status global`—Link status logging event is disabled, if not configured on the interface.

The interface trunk status logging event has similar global configurations.

Configuring a Switch Global Link Status Logging Event

To enable or disable the global link status logging event, enter one of the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config-if)# logging event link-status global</code></td>
<td>Enables global link status logging.</td>
</tr>
<tr>
<td><code>Switch(config-if)# no logging event link-status global</code></td>
<td>Disables global link status logging.</td>
</tr>
</tbody>
</table>

Examples

The following example displays a summary of the operating states for the interface logging event using different combinations of global and interface logging settings:

<table>
<thead>
<tr>
<th>Global Setting</th>
<th>Interface Setting</th>
<th>Actual Logging State</th>
</tr>
</thead>
<tbody>
<tr>
<td>on</td>
<td>on</td>
<td>on</td>
</tr>
<tr>
<td>off</td>
<td>on</td>
<td>on</td>
</tr>
<tr>
<td>on</td>
<td>off</td>
<td>off</td>
</tr>
<tr>
<td>off</td>
<td>off</td>
<td>off</td>
</tr>
<tr>
<td>on</td>
<td>default (use-global)</td>
<td>on</td>
</tr>
<tr>
<td>off</td>
<td>default (use-global)</td>
<td>off</td>
</tr>
</tbody>
</table>
The following example displays the configuration and logging message output for link status and trunk status logging events:

```plaintext
//
// The global link status and trunk status logging events are enabled.
//
Switch# show running | include logging
show running | include logging
logging event link-status global
logging event trunk-status global
Switch#

//
// The interface link status and trunk status logging settings
// are set to default values, which follow regardless of the global
// setting.
//
Switch# show running interface g1/4
Building configuration...

Current configuration: 97 bytes
!
interface GigabitEthernet1/4
  switchport trunk encapsulation dot1q
  switchport mode trunk
end
Switch#

//
// The trunk status logging messages for the interface are
// displayed whenever the interface trunking status is changed.
// Here we change the other end node’s trunking encapsulation
// from dot1q to isl.
//

3d00h: %DTP-5-ILGLCFG: Illegal config(on,isl--on,dot1q) on Gi1/4
3d00h: %DTP-5-ILGLCFG: Illegal config(on,isl--on,dot1q) on Gi1/4

//
// The link and trunk status logging message for the interface
// are displayed whenever the interface link status is changed.
// Here we do a 'shut' and "no shut" on the other end link node.
//
3d00h: %DTP-5-NONTRUNKPORTON: Port Gi1/4 has become non-trunk
3d00h: %LINEPROTO-5-UPDOWN: Line protocol on Interface
  GigabitEthernet1/4, changed state to down
3d00h: %LINK-3-UPDOWN: Interface GigabitEthernet1/4, changed state to down
3d00h: %LINK-3-UPDOWN: Interface GigabitEthernet1/4, changed state to up
3d00h: %DTP-5-TRUNKPORTON: Port Gi1/4 has become dot1q trunk
3d00h: %LINEPROTO-5-UPDOWN: Line protocol on Interface
  GigabitEthernet1/4, changed state to up
```

### Resetting the Interface to the Default Configuration

If you have configured a interface with many command lines and you want to clear all the configuration on that interface, use the `default interface` global configuration command, as follows:

```
Switch(config)# default interface fastEtherent 3/5
Interface FastEthernet3/5 set to default configuration
```
This command clears all the configurations and shut down the interface:

Switch# `show run interface fastethernet 3/5`
Building configuration...

Current configuration : 58 bytes
!
interface FastEthernet3/5
    no ip address
    shutdown
end
Checking Port Status and Connectivity

This chapter describes how to check switch port status and connectivity on the Catalyst 4500 series switch.

This chapter includes the following major sections:

- Checking Module Status, page 8-2
- Checking Interfaces Status, page 8-3
- Displaying MAC Addresses, page 8-4
- Checking Cable Status Using Time Domain Reflectometer, page 8-4
- Using Telnet, page 8-6
- Changing the Logout Timer, page 8-7
- Monitoring User Sessions, page 8-7
- Using Ping, page 8-8
- Using IP Traceroute, page 8-9
- Using Layer 2 Traceroute, page 8-10
- Configuring ICMP, page 8-13

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

Checking Module Status

The Catalyst 4500 series switch is a multimodule system. You can see which modules are installed, as well as the MAC address ranges and version numbers for each module, by entering the `show module` command. Use the `mod_num` argument to specify a particular module number and display detailed information on that module.
Chapter 8      Checking Port Status and Connectivity

Checking Interfaces Status

You can view summary or detailed information on the switch ports using the `show interfaces status` command. To see summary information on all ports on the switch, enter the `show interfaces status` command with no arguments. Specify a particular module number to see information on the ports on that module only. Enter both the module number and the port number to see detailed information about the specified port.

To apply configuration commands to a particular port, you must specify the appropriate logical module. For more information, see the “Checking Module Status” section on page 8-2.

This example shows how to display the status of all interfaces on a Catalyst 4500 series switch, including transceivers. Output of this command displays “Unapproved GBIC” for non-Cisco transceivers:

```
Switch# show interfaces status

Port    Name               Status       Vlan   Duplex  Speed Type
Gi1/1                      notconnect   1   auto   auto No Gbic
Gi1/2                      notconnect   1   auto   auto No Gbic
Gi5/1                      notconnect   1   auto   auto 10/100/1000-TX
Gi5/2                      notconnect   1   auto   auto 10/100/1000-TX
Gi5/3                      notconnect   1   auto   auto 10/100/1000-TX
Gi5/4                      notconnect   1   auto   auto 10/100/1000-TX
Fa6/1                      connected    1   a-full a-100 10/100BaseTX
Fa6/2                      connected    2   a-full a-100 10/100BaseTX
Fa6/3                      notconnect   1   auto   auto 10/100BaseTX
Fa6/4                      notconnect   1   auto   auto 10/100BaseTX

Switch#
```

This example shows how to display the status of interfaces in error-disabled state:

```
Switch# show interfaces status err-disabled

Port    Name               Status     Reason
Fa9/4                      err-disabled link-flap
informational error message when the timer expires on a cause

5d04h:%PM-SP-4-ERR_RECOVER:Attempting to recover from link-flap err-disable state on Fa9/4

Switch#
```
Displaying MAC Addresses

In addition to displaying the MAC address range for a module using the `show module` command, you can display the MAC address table information of a specific MAC address or a specific interface in the switch using the `show mac-address-table address` and `show mac-address-table interface` commands.

This example shows how to display Mac address table information for a specific MAC address:

```
Switch# show mac-address-table address 0005.3e8d.6400
vlan mac address type protocol qos             ports
-----+---------------+--------+---------+---+--------------------------------
200  0005.3e8d.6400  static  assigned  --  Switch
100  0005.3e8d.6400  static  assigned  --  Switch
  5  0005.3e8d.6400  static  assigned  --  Switch
  4  0005.3e8d.6400  static    ipx   --  Switch
   1  0005.3e8d.6400  static    ipx   --  Switch
   1  0005.3e8d.6400  static  assigned  --  Switch
   4  0005.3e8d.6400  static  assigned  --  Switch
   5  0005.3e8d.6400  static    ipx   --  Switch
  100 0005.3e8d.6400  static    ipx   --  Switch
  200 0005.3e8d.6400  static    ipx   --  Switch
  100 0005.3e8d.6400  static    other  --  Switch
  200 0005.3e8d.6400  static    other  --  Switch
   5  0005.3e8d.6400  static    other  --  Switch
   4  0005.3e8d.6400  static     ip   --  Switch
   1  0005.3e8d.6400  static     ip   --  Route
   1  0005.3e8d.6400  static     other  --  Switch
   4  0005.3e8d.6400  static     other  --  Switch
   5  0005.3e8d.6400  static     ip   --  Switch
  200 0005.3e8d.6400  static     ip   --  Switch
  100 0005.3e8d.6400  static     ip   --  Switch
Switch#
```

This example shows how to display MAC address table information for a specific interface:

```
Switch# show mac-address-table interface gigabit 1/1
Multicast Entries
  vlan mac address type ports
  -------+---------------+-------+-------------------------------------------
    1    ffff.ffff.ffff system Switch,Gi6/1,Gi6/2,Gi6/9,Gi1/1
Switch#
```

Checking Cable Status Using Time Domain Reflectometer

The Time Domain Reflectometer (TDR) feature allows you to determine if cable is OPEN or SHORT when it is at fault.

Overview

With TDR, you can check the status of copper cables on the 48-port 10/100/1000 BASE-T modules for the Catalyst 4500 series switch. TDR detects a cable fault by sending a signal through the cable and reading the signal that is reflected back. All or part of the signal can be reflected back either by cable defects or by the end of the cable.
Four pairs of standard category 5 cable exist. Each pair can assume one of the following states: open (not connected), broken, shorted, or terminated. The TDR test detects all four states and displays the first three as “Fault” conditions, and displays the fourth as “Terminated.” Although the CLI output is shown, the cable length is displayed only if the state is “Faulty.”

TDR feature is supported on the following modules:

- WS-X4524-GB-RJ45V
- WS-X4548-GB-RJ45
- WS-X4548-GB-RJ45V
- WS-X4548-GB-RJ45V+
- WS-X4548-RJ45V+
- WS-X4748-RJ45+E
- WS-X4748-RJ45V+E
- WS-X4748-UPOE+E
- WS-X4908-10GB-RJ45 (only functions on WS-C4900M chassis)
- WS-C4948E
- WS-C4948E-F

TDR detects a cable fault by sending a signal along its wires and depending on the reflected signal it can determine roughly where a cable fault could be. The variations on how TDR signal is reflected back determine the results on TDR. On Cat4k products, we only support cable fault types: OPEN or SHORT. We do display Terminated status in case cable is proper terminated and this is done for illustrative purpose.

### Running the TDR Test

To start the TDR test, perform this task:

**Command**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <code>test cable-diagnostics tdr {interface interface-number}</code></td>
<td>Starts the TDR test.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# <code>show cable-diagnostics tdr {interface interface-number}</code></td>
<td>Displays the TDR test counter information.</td>
</tr>
</tbody>
</table>

This example shows how to start the TDR test on port 1 on module 2:

```
Switch# test cable-diagnostics tdr int gi2/1
```

This example shows the message that displays when the TDR test is not supported on a module:

```
Switch# test cable-diagnostics tdr int gi2/1
00:03:15:%C4K_IOSDIAGMAN-4-TESTNOTSUPPORTEDONMODULE: Online cable diag tdr test is not supported on this module
```

This example shows how to display TDR test results for a port:
Using Telnet

You can access the switch command-line interface (CLI) using Telnet. In addition, Telnet allows you to access other devices in the network. You can have up to eight simultaneous Telnet sessions.

Before you can open a Telnet session to the switch, you must first set the IP address (and in some cases the default gateway) for the switch. For information about setting the IP address and default gateway, see Chapter 3, “Configuring the Switch for the First Time.”
To establish a Telnet connection to a host by using the hostname, configure and enable DNS.

To establish a Telnet connection to another device on the network from the switch, enter this command:

```
Switch# telnet host [port]
```

This example shows how to establish a Telnet connection from the switch to the remote host named labsparc:

```
Switch# telnet labsparc
Trying 172.16.10.3...
Connected to labsparc.
Escape character is '^]'.

UNIX(r) System V Release 4.0 (labsparc)

login:
```

## Changing the Logout Timer

The logout timer automatically disconnects a user from the switch when the user is idle for longer than the specified time. To set the logout timer, enter this command:

```
Switch# logoutwarning number
```

Use the `no` keyword to return to the default value.

## Monitoring User Sessions

You can display the currently active user sessions on the switch using the `show users` command. The command output lists all active console port and Telnet sessions on the switch.

To display the active user sessions on the switch, enter this command:

```
Switch# show users [all]
```

This example shows the output of the `show users` command when local authentication is enabled for console and Telnet sessions (the asterisk [*] indicates the current session):

```
Switch# show users
Line       User       Host(s)              Idle       Location
*  0 con 0                idle                 00:00:00
```
### Using Ping

These sections describe how to use IP ping:

- [Understanding How Ping Works, page 8-8](#)
- [Running Ping, page 8-9](#)

#### Understanding How Ping Works

The **ping** command allows you to verify connectivity to remote hosts. If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or configure a router to route between those subnets.

The **ping** command is configurable from normal executive and privileged EXEC mode. Ping returns one of the following responses:

- Normal response—The normal response (*hostname* is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a No Answer message is returned.
- Unknown host—If the host does not exist, an Unknown Host message is returned.

---

To disconnect an active user session, enter this command:

```plaintext
Switch# disconnect {console | ip_addr}
```

This example shows how to disconnect an active console port session and an active Telnet session:

```
Switch> disconnect console
console session disconnected.
Switch> disconnect tim-nt.bigcorp.com
Telnet session from tim-nt.bigcorp.com disconnected. (1)
```

---

**Using Ping**

These sections describe how to use IP ping:

- [Understanding How Ping Works, page 8-8](#)
- [Running Ping, page 8-9](#)

#### Understanding How Ping Works

The **ping** command allows you to verify connectivity to remote hosts. If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or configure a router to route between those subnets.

The **ping** command is configurable from normal executive and privileged EXEC mode. Ping returns one of the following responses:

- Normal response—The normal response (*hostname* is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a No Answer message is returned.
- Unknown host—If the host does not exist, an Unknown Host message is returned.
• Destination unreachable—If the default gateway cannot reach the specified network, a Destination Unreachable message is returned.

• Network or host unreachable—If there is no entry in the route table for the host or network, a Network or Host Unreachable message is returned.

To stop a ping in progress, press Ctrl-C.

Running Ping

To ping another device on the network from the switch, enter this command in normal executive and privileged EXEC mode:

```
Command
Switch# ping host
```

This example shows how to ping a remote host from normal executive mode:

```
Switch# ping labsparc
labsparc is alive
Switch> ping 72.16.10.3
12.16.10.3 is alive
Switch#
```

This example shows how to use a ping command in privileged EXEC mode to specify the number of packets, the packet size, and the timeout period:

```
Switch# ping
Target IP Address [ ]: 12.20.5.19
Number of Packets [5]: 10
Datagram Size [56]: 100
Timeout in seconds [2]: 10
Source IP Address [12.20.2.18]: 12.20.2.18
!!!!!!!!!!
----12.20.2.19 PING Statistics----
10 packets transmitted, 10 packets received, 0% packet loss
round-trip (ms) min/avg/max = 1/1/1
Switch
```

Using IP Traceroute

These sections describe how to use IP traceroute feature:

• Understanding How IP Traceroute Works, page 8-9

• Running IP Traceroute, page 8-10

Understanding How IP Traceroute Works

IP traceroute allows you to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.
Layer 2 switches can participate as the source or destination of the trace command but does not appear as a hop in the trace command output.

The trace command uses the time to live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends back an Internet Control Message Protocol (ICMP) Time-Exceeded message to the sender. Traceroute determines the address of the first hop by examining the source address field of the ICMP Time-Exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the Time-Exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host or until the maximum TTL is reached.

To determine when a datagram reaches its destination, traceroute sets the UDP destination port in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram with an unrecognized port number, it sends an ICMP Port Unreachable error message to the source. The Port Unreachable error message indicates to traceroute that the destination has been reached.

### Running IP Traceroute

To trace the path that packets take through the network, enter this command in EXEC or privileged EXEC mode:

```text
Switch# trace [protocol] [destination]
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# trace [protocol] [destination]</td>
<td>Runs IP traceroute to trace the path that packets take through the network.</td>
</tr>
</tbody>
</table>

This example shows how to use the trace command to display the route a packet takes through the network to reach its destination:

```text
Switch# trace ip ABA.NYC.mil
```

Type escape sequence to abort.

Tracing the route to ABA.NYC.mil (26.0.0.73)

```
  1 DEBRIS.CISCO.COM (192.180.1.6) 1000 msec 8 msec 4 msec
  2 BARRNET-GW.CISCO.COM (192.180.16.2) 8 msec 8 msec 8 msec
  3 EXTERNAL-A-GATEWAY.STANFORD.EDU (192.42.110.225) 8 msec 4 msec 4 msec
  4 BB2.SU.BARRNET.NET (192.200.254.6) 8 msec 8 msec 8 msec
  5 SU.ARC.BARRNET.NET (192.200.3.8) 12 msec 12 msec 8 msec
  6 MOFFETT-FLD-MB.in.MIL (192.52.195.1) 216 msec 120 msec 132 msec
  7 ABA.NYC.mil (26.0.0.73) 412 msec 628 msec 664 msec
```

### Using Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. It determines the path by using the MAC address tables of the switches in the path. When the switch detects a device in the path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.
If you want the switch to trace the path from a host on a source device to a host on a destination device, the switch can identify only the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

These sections describe how to use the Layer 2 traceroute feature:

- Layer 2 Traceroute Usage Guidelines, page 8-11
- Running Layer 2 Traceroute, page 8-12

### Layer 2 Traceroute Usage Guidelines

These are the Layer 2 traceroute usage guidelines:

- CDP must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.
  
  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

  **Note**  
  For more information about enabling CDP, see Chapter 28, “Configuring CDP.”

- All switches in the physical path must have IP connectivity. When a switch is reachable from another switch, you can test connectivity by using the `ping` command in privileged EXEC mode.

- The maximum number of hops identified in the path is ten.

- You can enter the `traceroute mac` or the `traceroute mac ip` command in privileged EXEC mode on a switch that is not in the physical path from the source device to the destination device. All switches in the path must be reachable from this switch.

- The `traceroute mac` command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

- The `traceroute mac ip` command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP address with the corresponding MAC address and the VLAN ID.
  
  - If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
  
  - If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.
• This feature is not supported in Token Ring VLANs.

Running Layer 2 Traceroute

To display the physical path that a packet takes from a source device to a destination device, enter either one of these commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch# traceroute mac {source-mac-address} (destination-mac-address)</td>
<td>Runs Layer 2 traceroute to trace the path that packets take through the network.</td>
</tr>
</tbody>
</table>

or

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch# traceroute mac ip {source-mac-address} (destination-mac-address)</td>
<td>Runs IP traceroute to trace the path that packets take through the network.</td>
</tr>
</tbody>
</table>

These examples show how to use the `traceroute mac` and `traceroute mac ip` commands to display the physical path a packet takes through the network to reach its destination:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201

```
Configuring ICMP

Internet Control Message Protocol (ICMP) provides many services that control and manage IP connections. ICMP messages are sent by routers or access servers to hosts or other routers when a problem is discovered with the Internet header. For detailed information on ICMP, refer to RFC 792.

Enabling ICMP Protocol Unreachable Messages

If the Cisco IOS software receives a nonbroadcast packet that uses an unknown protocol, it sends an ICMP Protocol Unreachable message back to the source.

Similarly, if the software receives a packet that it is unable to deliver to the ultimate destination because it knows of no route to the destination address, it sends an ICMP Host Unreachable message to the source. This feature is enabled by default.

To enable the generation of ICMP Protocol Unreachable and Host Unreachable messages, enter the following command in interface configuration mode:

```
Switch (config-if)#  [no] ip unreachables
```

Caution

If you enter the `no ip unreachables` command, you will break the path MTU discovery functionality. Routers in the middle of the network might be forced to fragment packets.

To limit the rate that Internet Control Message Protocol (ICMP) destination unreachable messages are generated, enter the following command:

```
Switch (config)#  [no] ip icmp rate-limit unreachable [df] milliseconds
```

Enabling ICMP Redirect Messages

Data routes are sometimes less than optimal. For example, it is possible for the router to be forced to resend a packet through the same interface on which it was received. If this occurs, the Cisco IOS software sends an ICMP Redirect message to the originator of the packet telling the originator that the router is on a subnet directly connected to the receiving device, and that it must forward the packet to another system on the same subnet. The software sends an ICMP Redirect message to the packet's originator because the originating host presumably could have sent that packet to the next hop without involving this device at all. The Redirect message instructs the sender to remove the receiving device from the route and substitute a specified device representing a more direct path. This feature is enabled by default.
However, when Hot Standby Router Protocol (HSRP) is configured on an interface, ICMP Redirect messages are disabled (by default) for the interface. For more information on HSRP, refer to the following URL:

To enable the sending of ICMP Redirect messages if the Cisco IOS software is forced to resend a packet through the same interface on which it was received, enter the following command in interface configuration mode:

```
Switch (config-if)# [no] ip redirects
```

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch (config-if)# [no] ip redirects | Enables ICMP Redirect messages.  
Use the **no** keyword to disable the ICMP Redirect messages and reduce CPU usage. |

### Enabling ICMP Mask Reply Messages

Occasionally, network devices must know the subnet mask for a particular subnetwork in the internetwork. To obtain this information, devices can send ICMP Mask Request messages. These messages are responded to by ICMP Mask Reply messages from devices that have the requested information. The Cisco IOS software can respond to ICMP Mask Request messages if the ICMP Mask Reply function is enabled.

To have the Cisco IOS software respond to ICMP mask requests by sending ICMP Mask Reply messages, enter the following command:

```
Switch (config-if)# [no] ip mask-reply
```

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch (config-if)# [no] ip mask-reply | Enables response to ICMP destination mask requests.  
Use the **no** keyword to disable this functionality. |
Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 6-E and Supervisor Engine 6L-E

Catalyst 4500 series switches allow a redundant supervisor engine to take over if the active supervisor engine fails. In software, supervisor engine redundancy is enabled by running the redundant supervisor engine in route processor redundancy (RPR) or stateful switchover (SSO) operating mode.

Note

The minimum ROMMON requirement for running SSO is Cisco IOS Release 12.1(20r)EW1 or Cisco IOS Release 12.2(20r)EW1.

This chapter describes how to configure supervisor engine redundancy on the Catalyst 4507R and Catalyst 4510R switches.

Note

For information on Cisco nonstop forwarding (NSF) with SSO, see Chapter 11, “Configuring Cisco NSF with SSO Supervisor Engine Redundancy.”

This chapter contains these major sections:

- About Supervisor Engine Redundancy, page 9-2
- About Supervisor Engine Redundancy Synchronization, page 9-4
- Supervisor Engine Redundancy Guidelines and Restrictions, page 9-5
- Configuring Supervisor Engine Redundancy, page 9-7
- Performing a Manual Switchover, page 9-12
- Performing a Software Upgrade, page 9-13
- Manipulating Bootflash on the Redundant Supervisor Engine, page 9-14

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this...
About Supervisor Engine Redundancy

These sections describe supervisor engine redundancy:

- Overview, page 9-2
- RPR Operation, page 9-2
- SSO Operation, page 9-3

Overview

With supervisor engine redundancy enabled, if the active supervisor engine fails or if a manual switchover is performed, the redundant supervisor engine becomes the active supervisor engine. The redundant supervisor engine has been automatically initialized with the startup configuration of the active supervisor engine, shortening the switchover time (30 seconds or longer in RPR mode, depending on the configuration; subsecond in SSO mode).

In addition to the reduced switchover time, supervisor engine redundancy supports the following:

- Online insertion and removal (OIR) of the redundant supervisor engine.
  Supervisor engine redundancy allows OIR of the redundant supervisor engine for maintenance. When the redundant supervisor engine is inserted, the active supervisor engine detects its presence, and the redundant supervisor engine boots into a partially-initialized state in RPR mode and a fully-initialized state in SSO mode.
- Software upgrade. See the “Performing a Software Upgrade” section on page 9-13.
  To minimize down time during software changes on the supervisor engine, load the new image on the redundant supervisor engine, and conduct a switchover.

When power is first applied to a switch, the supervisor engine that boots first becomes the active supervisor engine and remains active until a switchover occurs.

A switchover occurs when one or more of the following events take place:

- The active supervisor engine fails (due to either hardware or software function) or is removed.
- A user forces a switchover.
- A user reloads the active supervisor engine.

RPR Operation

RPR is supported in Cisco IOS Release 12.2(12c)EW and later releases. When a redundant supervisor engine runs in RPR mode, it starts up in a partially-initialized state and is synchronized with the persistent configuration of the active supervisor engine.

**Note**

Persistent configuration includes the following components: startup-config, boot variables, config-register, and VLAN database.
The redundant supervisor engine pauses the startup sequence after basic system initialization, and in the event that the active supervisor engine fails, the redundant supervisor engine becomes the new active supervisor engine.

In a supervisor engine switchover, traffic is disrupted because in the RPR mode all of the physical ports restart since there is no state maintained between supervisor engines relating to module types and statuses. When the redundant supervisor engine completes its initialization, it reads hardware information directly from the module.

**SSO Operation**

SSO is supported in Cisco IOS Release 12.2(20)EWA and later releases. When a redundant supervisor engine runs in SSO mode, the redundant supervisor engine starts up in a fully-initialized state and synchronizes with the persistent configuration and the running configuration of the active supervisor engine. It subsequently maintains the state on the protocols listed below, and all changes in hardware and software states for features that support stateful switchover are kept in synchronization. Consequently, it offers zero interruption to Layer 2 sessions in a redundant supervisor engine configuration.

Because the redundant supervisor engine recognizes the hardware link status of every link, ports that were active before the switchover remain active, including the uplink ports. However, because uplink ports are physically on the supervisor engine, they will be disconnected if the supervisor engine is removed.

If the active supervisor engine fails, the redundant supervisor engine become active. This newly active supervisor engine uses existing Layer 2 switching information to continue forwarding traffic. Layer 3 forwarding is delayed until the routing tables have been repopulated in the newly active supervisor engine.

SSO supports stateful switchover of the following Layer 2 features. The state of these features is preserved between both the active and redundant supervisor engines:

- 802.3
- 802.3u
- 802.3x (Flow Control)
- 802.3ab (GE)
- 802.3z (Gigabit Ethernet including CWDM)
- 802.3ad (LACP)
- 802.1p (Layer 2 QoS)
- 802.1q
- 802.1X (Authentication)
- 802.1D (Spanning Tree Protocol)
- 802.3af (Inline power)
- PAgP
- VTP
- Dynamic ARP Inspection
- DHCP snooping
- IP source guard
About Supervisor Engine Redundancy Synchronization

During normal operation, the persistent configuration (RPR and SSO) and the running configuration (SSO only) are synchronized by default between the two supervisor engines. In a switchover, the new active supervisor engine uses the current configuration.

**Note** You cannot enter CLI commands on the redundant supervisor engine console.

These sections describe supervisor engine redundancy synchronization:

- **RPR Supervisor Engine Configuration Synchronization**, page 9-5
- **SSO Supervisor Engine Configuration Synchronization**, page 9-5
RPR Supervisor Engine Configuration Synchronization

Because the redundant supervisor engine is only partially initialized in RPR mode, it interacts with the active supervisor engine only to receive configuration changes at startup and upon saving the configuration changes.

When a redundant supervisor engine is running in RPR mode, the following events trigger synchronization of the configuration information:

- When the redundant supervisor engine boots, the `auto-sync` command synchronizes the persistent configuration. This command is enabled by default. For details, refer to “Synchronizing the Supervisor Engine Configurations” section on page 9-11.
- When the active supervisor engine detects the redundant supervisor engine, the configuration information is synchronized from the active supervisor engine to the redundant supervisor engine. This synchronization overwrites any existing startup configuration file on the redundant supervisor engine.
- When you make changes to the configuration, you must use the `write` command to save and synchronize the startup configuration of the redundant supervisor engine.

SSO Supervisor Engine Configuration Synchronization

When a redundant supervisor engine runs in SSO mode, the following events trigger synchronization of the configuration information:

- When the active supervisor detects the redundant supervisor engine, synchronization of the persistent and running configuration takes place, allowing the redundant supervisor engine to arrive at a fully-initiated state.
- When real-time changes occur, the active supervisor engine synchronizes the running-config and (or) the persistent configuration (if necessary) with the redundant supervisor engine.
- When you change the configuration, you must use the `write` command to allow the active supervisor engine to save and synchronize the startup configuration of the redundant supervisor engine.

Supervisor Engine Redundancy Guidelines and Restrictions

The following guidelines and restrictions apply to supervisor engine redundancy:

- If SSO mode cannot be established between the active and standby supervisor engines because of an incompatibility in the configuration file, a mismatched command list (MCL) is generated at the active supervisor engine and a reload into RPR mode is forced for the standby supervisor engine. Subsequent attempts to establish SSO, after removing the offending configuration and rebooting the standby supervisor engine with the exact same image, might cause the `C4K_REDUNDANCY-2-IOS_VERSION_CHECK_FAIL` and `ISSU-3-PEER_IMAGE_INCOMPATIBLE` messages to appear because the peer image is listed as incompatible. If the configuration problem can be corrected, you can clear the peer image from the incompatible list with the `redundancy config-sync ignore mismatched-commands` EXEC command while the peer is in a standby cold (RPR) state. This action allows the standby supervisor engine to boot in standby hot (SSO) state when it reloads.
Here are the steps:

**Step 1** Clear the offending configuration (that caused an MCL) while the standby supervisor engine is in standby cold (RPR) state.

**Step 2** Enter the `redundancy config-sync ignore mismatched-commands` EXEC command at the active standby supervisor engine.

**Step 3** Perform `write memory`.

**Step 4** Reload the standby supervisor engine with the `redundancy reload peer` command.

- If you configure Supervisor Engine V-10GE to use both Gigabit Ethernet and 10-Gigabit Ethernet uplinks without WS-X4302-GB in slot 10, module 10 is disabled and you cannot rollback the configuration to use gigabit ports.

Enter the following commands to recover:

```
config t
hw-module uplink select tengigabitethernet // This sets the switch back to default mode
!
ctrl z
wr me
redundancy reload shelf // The switch will reload with all 10 modules working ok

//The switch reloads

config t
hw-module uplink select gigabitethernet // This sets the switch to the desired link
!
ctrl z
wr me
redundancy reload shelf // The switch reloads with module 10 active with the gigabit ethernet port(s) ON and the ten gigabit ethernet port(s) Off
```

- RPR requires Cisco IOS Release 12.1(12c)EW, Release 12.1(19)E or later releases. SSO requires Cisco IOS Release 12.2(20)EWA or later releases.
- The Catalyst 4507R switch and the 4510R switch are the only Catalyst 4500 series switches that support supervisor engine redundancy.
- In Cisco IOS Release 12.2(25)SG and later releases on a Catalyst 4507R series switch, 10-Gigabit Ethernet and Gigabit Ethernet uplinks are concurrently usable.
- Redundancy requires both supervisor engines in the chassis to have the same components (model, memory, NFL daughter card), and to use the same Cisco IOS software image.
- When the WS-X4516 active and redundant supervisor engines are installed in the same chassis, the four uplink ports (Gig1/1, Gig2/1, Gig 1/2, and Gig2/2) are available.
- The active and redundant supervisor engines in the chassis must be in slots 1 and 2.
- Each supervisor engine in the chassis must have its own flash device and console port connections to operate the switch on its own.
- Each supervisor engine must have a unique console connection. Do not connect a Y cable to the console ports.
- Supervisor engine redundancy does not provide supervisor engine load balancing.
The Cisco Express Forwarding (CEF) table is cleared on a switchover. As a result, routed traffic is interrupted until route tables reconverge. This reconvergence time is minimal because the SSO feature reduces the supervisor engine redundancy switchover time from 30+ seconds to subsecond, so Layer 3 also has a faster failover time if the switch is configured for SSO.

Static IP routes are maintained across a switchover because they are configured from entries in the configuration file.

Information about Layer 3 dynamic states that is maintained on the active supervisor engine is not synchronized to the redundant supervisor engine and is lost on switchover.

Starting with Cisco IOS Release 12.2, if an unsupported condition is detected (such as when the active supervisor engine is running Cisco IOS Release 12.2(20)EW and the redundant supervisor engine is running Cisco IOS Release 12.1(20)EW), the redundant supervisor engine is reset multiple times and then placed in ROMMON mode. It is important to follow the procedures outlined in the “Performing a Software Upgrade” section on page 9-13.

If you are running (or upgrading to) Cisco IOS Release 12.2(20)EWA or Cisco IOS Release 12.2(25)EW and are using a single supervisor engine in a redundant chassis (Catalyst 4507R or Catalyst 4510R series switch), and you intend to use routed ports, do one of the following:

- Use SVIs instead of routed ports.
- Change the redundancy mode from SSO to RPR.

Configuration changes made to the redundant supervisor engine through SNMP synchronization and SNMP set operations in SSO mode are not synchronized to the redundant supervisor engine. Even though you can still perform SNMP set operations in SSO mode, you might experience unexpected behavior.

After you configure the switch through SNMP in SSO mode, copy the running-config file to the startup-config file on the active supervisor engine to trigger synchronization of the startup-config file on the redundant supervisor engine. Reload the redundant supervisor engine so that the new configuration is applied on the redundant supervisor engine.

You cannot perform configuration changes during the startup (bulk) synchronization. If you attempt to make configuration changes during this process, the following message is generated:

Config mode locked out till standby initializes

If configuration changes occur at the same time as a supervisor engine switchover, these configuration changes are lost.

If you remove a line card from a redundant switch and initiate an SSO switchover, and then reinsert the line card, all interfaces are shutdown. The rest of the original line card configuration is preserved.

This situation only occurs if a switch had reached SSO before you removed the line card.

---

**Configuring Supervisor Engine Redundancy**

These sections describe how to configure supervisor engine redundancy:

- Configuring Redundancy, page 9-8
- Virtual Console for Standby Supervisor Engine, page 9-10
- Synchronizing the Supervisor Engine Configurations, page 9-11
Configuring Redundancy

To configure redundancy, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# redundancy</td>
<td>Enters redundancy configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-red)# mode (sso</td>
<td>Configures SSO or RPR. When this command is entered,</td>
</tr>
<tr>
<td></td>
<td>the redundant supervisor engine is reloaded and begins to</td>
</tr>
<tr>
<td></td>
<td>work in SSO or RPR mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td>Verifies that SSO or RPR is enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show redundancy [clients</td>
<td>Displays the redundancy information (counter, state, and</td>
</tr>
<tr>
<td></td>
<td>so on) for the active and redundant supervisor engines.</td>
</tr>
</tbody>
</table>

When configuring redundancy, note the following:

- The `sso` keyword is supported in Cisco IOS Release 12.2(20)EWA and later releases.
- The `rpr` keyword is supported in Cisco IOS Release 12.1(12c)EW and later releases.

This example shows how to configure the system for SSO and display the redundancy facility information:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)# end
Switch# show redundancy
Redundant System Information :
--------------------------------
Available system uptime = 2 days, 2 hours, 39 minutes
Switchovers system experienced = 0
Standby failures = 0
Last switchover reason = none

Hardware Mode = Duplex
Configured Redundancy Mode = Stateful Switchover
Operating Redundancy Mode = Stateful Switchover
Maintenance Mode = Disabled
Communications = Up

Current Processor Information :
--------------------------------
Active Location = slot 1
Current Software state = ACTIVE
Uptime in current state = 2 days, 2 hours, 39 minutes
Image Version = Cisco Internetwork Operating System Software
IOS (tm) Catalyst 4000 L3 Switch Software (cat4000-ISS-M), Version 12.2(20)EWA(3
.92), CISCO INTERNAL USE ONLY ENHANCED PRODUCTION VERSION

Switch#

This example shows how to display redundancy facility state information:

Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 8  -STANDBY HOT
Mode = Duplex
Unit = Primary
Unit ID = 2
Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up
client count = 21
client_notification_TMR = 240000 milliseconds
keep_alive TMR = 9000 milliseconds
keep_alive count = 0
keep_alive threshold = 18
RF debug mask = 0x0

Switch#

This example shows how to change the system configuration from RPR to SSO mode:

Switch(config)# redundancy
Switch(config-red)# mode
Switch(config-red)# mode sso
Changing to sso mode will reset the standby. Do you want to continue?[confirm]
Switch(config-red)# end
Switch#
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-COMMUNICATION: Communication with the peer Supervisor has been lost
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-SIMPLEX_MODE: The peer Supervisor has been lost

This example shows how to change the system configuration from SSO to RPR mode:

Switch(config)# redundancy
Switch(config-red)# mode rpr
Changing to rpr mode will reset the standby. Do you want to continue?[confirm]
Switch(config-red)# end
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-COMMUNICATION: Communication with the peer Supervisor has been lost
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-SIMPLEX_MODE: The peer Supervisor has been lost
Virtual Console for Standby Supervisor Engine

Catalyst 4500 series switches can be configured with two supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. You must connect to the standby console to access, monitor or debug the standby supervisor.

The virtual console for a standby supervisor Engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine, which emulates the standby console on the active supervisor engine. Only one active standby console session is active at any time.

The virtual console for the standby supervisor engine allows users who are logged onto the active supervisor engine to remotely execute `show` commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the `attach module`, `session module`, or `remote login` commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

Once you enter the standby virtual console, the terminal prompt automatically changes to `hostname-standby-console` where `hostname` is the configured name of the switch. The prompt is restored back to the original prompt when you exit the virtual console.

You exit the virtual console with the `exit` or `quit` commands. When the inactivity period of the terminal on the active supervisor engine where you logged in exceeds the configured idle time, you are automatically logged out of the terminal on the active supervisor engine. In this instance, the virtual console session is also terminated. Virtual console session is also automatically terminated when the standby is rebooted. After the standby boots up, you need to create another virtual console session.

To log in to the standby supervisor engine using a virtual console, enter the following command:

```
Switch# session module 2
Connecting to standby virtual console
Type "exit" or "quit" to end this session
```

```
Switch-standby-console# exit
Switch#
```

If the standby console is not enabled, the following message appears:

```
Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout
```

**Note**

The standby virtual console provides the standard features that are available from the supervisor console such as command history, command completion, command help and partial command keywords.

The following limitations apply to the standby virtual console:

- All commands on the virtual console run to completion. It does not provide the auto-more feature; it functions as if the `terminal length 0` command has been executed. It is also noninteractive. You cannot interrupt or abort an executing command by any key sequence on the active supervisor engine. If a command produces considerable output, the virtual console displays it on the supervisor engine screen.
• The virtual console is noninteractive. Because the virtual console does not detect the interactive nature of a command, any command that requires user interaction causes the virtual console to wait until the RPC timer aborts the command.

The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60 seconds. During this time, you cannot abort the command from the keyboard. You must wait for the timer to expire before you continue.

• You cannot use virtual console to view debug and syslog messages that are being displayed on the standby supervisor engine. The virtual console only displays the output of commands that are executed from the virtual console. Other information that is displayed on the real standby console does not appear on the virtual console.

Synchronizing the Supervisor Engine Configurations

To manually synchronize the configurations used by the two supervisor engines, perform this task on the active supervisor engine:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1  | Switch(config)# redundancy
         | Enters redundancy configuration mode. |
| Step 2  | Switch(config-red)# main-cpu
         | Enters main-cpu configuration submode. |
| Step 3  | Switch(config-r-mc)# auto-sync {startup-config | config-register | bootvar | standard}
         | Synchronizes the configuration elements. |
| Step 4  | Switch(config-r-mc)# end
         | Returns to privileged EXEC mode. |
| Step 5  | Switch# copy running-config startup-config
         | Synchronizes the running configuration in dynamic random-access memory (DRAM) to the startup configuration file in NVRAM.

\[Note\] This step is not required to synchronize the running configuration file in (DRAM).

Configuration changes made to the active supervisor engine through SNMP are not synchronized to the redundant supervisor engine. For information on how to handle this situation, see the “Supervisor Engine Redundancy Guidelines and Restrictions” section on page 9-5.

The `auto-sync` command controls the synchronization of the config-reg, bootvar, and startup/private configuration files only. The calendar and VLAN database files are always synchronized when they change. In SSO mode, the running-config is always synchronized.

This example shows how to reenable the default automatic synchronization feature using the `auto-sync standard` command to synchronize the startup-config and config-register configuration of the active supervisor engine with the redundant supervisor engine. Updates for the boot variables are automatic and cannot be disabled.

Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
Switch(config-r-mc)# end
Switch# copy running-config startup-config
Performing a Manual Switchover

This section describes how to perform a manual switchover (from the active supervisor engine to the redundant supervisor engine) for test purposes. We recommend that you perform a manual switchover prior to deploying SSO in your production environment.

**Note** This discussion assumes that SSO has been configured as the redundant mode.

To perform a manual switchover, perform this task on the active supervisor engine:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# show redundancy</td>
<td>Verifies that the peer state is in the standby hot state. See the example of the show redundancy states command on page 6-10.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# redundancy force-switchover</td>
<td>Launches switchover from the active supervisor engine to the redundant supervisor engine. If the state of the redundant supervisor engine is not standby hot, this command does not execute.</td>
</tr>
</tbody>
</table>

Be aware of these usage guidelines:

- To force a switchover, the redundant supervisor engine must be in a standby hot state. You can verify the state with the show redundancy command. If the state is not standby hot, the redundancy force-switchover command does not execute.
- Use the redundancy force-switchover command, rather than the reload command, to initiate a switchover. The redundancy force-switchover command first verifies that the redundant supervisor engine is in the correct state. If you enter the reload command and the status is not standby hot, the reload command resets the current supervisor engine only.
Performing a Software Upgrade

The software upgrade procedure supported by supervisor engine redundancy allows you to reload the Cisco IOS software image on the redundant supervisor engine, and once complete, reload the active supervisor engine once.

The software upgrade procedure supported by supervisor engine redundancy allows you to reload the Cisco IOS software image on the redundant supervisor engine, and once complete, reloads the active supervisor engine once.

The following scenario is not supported: An active supervisor engine running Cisco IOS Release 12.1(x)E, and a standby supervisor engine running Cisco IOS Release 12.2(x)S. The standby supervisor engine resets repeatedly.

If you are trying to upgrade redundant supervisor engines from Cisco IOS Release 12.1(x)E to 12.2(x)S, this requires a full system reboot.

To perform a software upgrade, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Copies the new Cisco IOS software image to bootflash on the supervisor engine.</td>
</tr>
<tr>
<td>Switch# copy source_device:source_filename slot0:target_filename</td>
<td></td>
</tr>
<tr>
<td>Or:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy source_device:source_filename bootflash:target_filename</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Copies the new image to a slave device (such as slavebootflash and slaveslot0).</td>
</tr>
<tr>
<td>Switch# copy source_device:source_filename slaveslot0:target_filename</td>
<td></td>
</tr>
<tr>
<td>Or:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy source_device:source_filename slavebootflash:target_filename</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures the supervisor engines to boot the new image.</td>
</tr>
<tr>
<td>Switch# config terminal</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# config-register 0x2</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# boot system flash device:file_name</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enters redundancy configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# redundancy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Enters main-cpu configuration submode.</td>
</tr>
<tr>
<td>Switch(config-red)# main-cpu</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Synchronizes the configuration elements.</td>
</tr>
<tr>
<td>Switch(config-r-mc)# auto-syn standard</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch(config-r-mc)# end</td>
<td></td>
</tr>
</tbody>
</table>
Manipulating Bootflash on the Redundant Supervisor Engine

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# copy running-config start-config</td>
<td>Saves the configuration.</td>
</tr>
<tr>
<td>Switch# redundancy reload peer</td>
<td>Reloads the redundant supervisor engine and brings it back online (using the new release of the Cisco IOS software).</td>
</tr>
<tr>
<td>Note</td>
<td>Before proceeding to Step 10, ensure that the switch is operating in RPR mode.</td>
</tr>
<tr>
<td>Switch# redundancy force-switchover</td>
<td>Conducts a manual switchover to the redundant supervisor engine. The redundant supervisor engine becomes the new active supervisor engine using the new Cisco IOS software image. The old active supervisor engine reboots with the new image and becomes the redundant supervisor engine.</td>
</tr>
</tbody>
</table>

This example shows how to perform a software upgrade:

```
Switch# config terminal
Switch(config)# config-register 0x2
Switch(config)# boot system flash slot0:cat4000-i5s-mz.122-20.EWA
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-syn standard
Switch(config-r-mc)# end
Switch# copy running-config start-config
Switch# redundancy reload peer
Switch# redundancy force-switchover
Switch#
```

This example illustrates how to verify that the running configuration on the active supervisor engine has successfully synchronized with the redundant supervisor engine:

```
Switch# config terminal
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The bootvar has been successfully synchronized to the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The config-reg has been successfully synchronized to the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The startup-config has been successfully synchronized to the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The private-config has been successfully synchronized to the standby supervisor
```

The example above shows that the boot variable, the config-register, and the startup configuration from the active supervisor engine have successfully synchronized to the redundant supervisor engine.

**Manipulating Bootflash on the Redundant Supervisor Engine**

**Note** The console port on the redundant supervisor engine is not available.
To manipulate the redundant supervisor engine bootflash, perform one or more of the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# dir slaveslot0:target_filename</code> or <code>Switch# dir slavebootflash:target_filename</code></td>
<td>Lists the contents of the slot0: device on the redundant supervisor engine. Lists the contents of the bootflash: device on the redundant supervisor engine.</td>
</tr>
<tr>
<td><code>Switch# delete slaveslot0:target_filename</code> or <code>Switch# delete slavebootflash:target_filename</code></td>
<td>Deletes specific files from the slot0: device on the redundant supervisor engine. Deletes specific files from the bootflash: device on the redundant supervisor engine.</td>
</tr>
<tr>
<td><code>Switch# squeeze slaveslot0:</code> or <code>Switch# squeeze slavebootflash:</code></td>
<td>Squeezes the slot0: device on the redundant supervisor engine. Squeezes the bootflash: device on the redundant supervisor engine.</td>
</tr>
<tr>
<td><code>Switch# format slaveslot0:</code> or <code>Switch# format slavebootflash:</code></td>
<td>Formats the slot0: device on the redundant supervisor engine. Formats the bootflash: device on the redundant supervisor engine.</td>
</tr>
<tr>
<td><code>Switch# copy source_device:source_filename slaveslot0:target_filename</code> or <code>Switch# copy source_device:source_filename slavebootflash:target_filename</code></td>
<td>Copies a file from the active supervisor engine to the slot0: device on the redundant supervisor engine. Copies a file to the bootflash: device on a redundant supervisor engine.</td>
</tr>
</tbody>
</table>

*Note* Source could be the active supervisor engine or a TFTP server.
CHAPTER 10

Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 7-E and Supervisor Engine 7L-E

Catalyst 4500 series switches allow a standby supervisor engine to take over if the active supervisor engine fails. In software, supervisor engine redundancy is enabled by running the redundant supervisor engine in route processor redundancy (RPR) or stateful switchover (SSO) operating mode.

Note

The minimum ROMMON requirement for running SSO and RPR is 15.0(1r)SG1.

This chapter describes how to configure supervisor engine redundancy on the Catalyst 4507R and Catalyst 4510R switches.

Note

For information on Cisco nonstop forwarding (NSF) with SSO, see Chapter 11, “Configuring Cisco NSF with SSO Supervisor Engine Redundancy.”

This chapter contains these major sections:

- About Supervisor Engine Redundancy, page 10-2
- About Supervisor Engine Redundancy Synchronization, page 10-5
- Supervisor Engine Redundancy Guidelines and Restrictions, page 10-5
- Configuring Supervisor Engine Redundancy, page 10-7
- Performing a Manual Switchover, page 10-12
- Performing a Software Upgrade, page 10-12
- Manipulating Bootflash on the Standby Supervisor Engine, page 10-14

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference.
and related publications at this location:

## About Supervisor Engine Redundancy

These sections describe supervisor engine redundancy:

- **Overview**, page 10-2
- **RPR Operation**, page 10-3
- **SSO Operation**, page 10-3

### Overview

With supervisor engine redundancy enabled, if the active supervisor engine fails or if a manual switchover is performed, the standby supervisor engine becomes the “new” active supervisor engine. The standby supervisor engine has been automatically initialized with the startup configuration of the active supervisor engine, shortening the switchover time (30 seconds or longer in RPR mode, depending on the configuration; subsecond in SSO mode).

In addition to the reduced switchover time, supervisor engine redundancy supports the following:

- Online insertion and removal (OIR) of the supervisor engine.
  
  Supervisor engine redundancy allows OIR of the redundant supervisor engine for maintenance. When the redundant supervisor engine is inserted, the active supervisor engine detects its presence, and the redundant supervisor engine boots into a partially-initialized state in RPR mode and a fully-initialized state in SSO mode.

- Software upgrade. (See the “Performing a Software Upgrade” section on page 10-12.)
  
  To minimize down time during software changes on the supervisor engine, load the new image on the standby supervisor engine, and conduct a switchover.

When power is first applied to a switch, the supervisor engine that boots first becomes the active supervisor engine and remains active until a switchover occurs.

A switchover will occur when one or more of the following events take place:

- The active supervisor engine fails (due to either hardware or software function) or is removed.
- A user forces a switchover.
- A user reloads the active supervisor engine.

Table 10-1 provides information about chassis and supervisor engine support for redundancy.

### Table 10-1  Chassis and Supervisor Support

<table>
<thead>
<tr>
<th>Supported Switches</th>
<th>Supported Supervisor Engines</th>
</tr>
</thead>
<tbody>
<tr>
<td>WS-C4507R-E, WS-C4510R-E, WS-C4507R+E, WS-C4510R+E</td>
<td>Supervisor Engine 7-E (WS-X45-SUP7-E) and Supervisor Engine 7L-E (WS-X45-SUP7L-E)</td>
</tr>
</tbody>
</table>
RPR Operation

RPR is supported in Cisco IOS-XE Release 3.1.0SG and later releases. When a standby supervisor engine runs in RPR mode, it starts up in a partially-initialized state and is synchronized with the persistent configuration of the active supervisor engine.

Note

Persistent configuration includes the following components: startup-config, boot variables, config-register, and VLAN database.

The standby supervisor engine pauses the startup sequence after basic system initialization, and in the event that the active supervisor engine fails, the standby supervisor engine becomes the new active supervisor engine.

In a supervisor engine switchover, traffic is disrupted because in the RPR mode all of the physical ports restart since there is no state maintained between supervisor engines relating to module types and statuses. Upon switchover, when the standby supervisor engine completes its initialization, it will read hardware information directly from the module and become the active supervisor engine.

SSO Operation

SSO is supported in Cisco IOS-XE Release 3.1.0SG and later releases. When a standby supervisor engine runs in SSO mode, the standby supervisor engine starts up in a fully-initialized state and synchronizes with the persistent configuration and the running configuration of the active supervisor engine. It subsequently maintains the state on the protocols listed below, and all changes in hardware and software states for features that support stateful switchover are kept in synchronization. Consequently, it offers zero interruption to Layer 2 sessions in a redundant supervisor engine configuration.

Because the standby supervisor engine recognizes the hardware link status of every link, ports that were active before the switchover will remain active, including the uplink ports. However, because uplink ports are physically on the supervisor engine, they will be disconnected if the supervisor engine is removed.

If the active supervisor engine fails, the standby supervisor engine become active. This newly active supervisor engine uses existing Layer 2 switching information to continue forwarding traffic. Layer 3 forwarding will be delayed until the routing tables have been repopulated in the newly active supervisor engine.

SSO supports stateful switchover of the following Layer 2 features.

Note

SSO is not supported if the IOS-XE software is running in the LAN Base mode.

The state of these features is preserved between both the active and standby supervisor engines:

- 802.3
- 802.3u
- 802.3x (Flow Control)
- 802.3ab (GE)
- 802.3z (Gigabit Ethernet including CWDM)
- 802.3ad (LACP)
Chapter 10      Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 7-E and Supervisor

About Supervisor Engine Redundancy

- 802.1p (Layer 2 QoS)
- 802.1q
- 802.1X (Authentication)
- 802.1D (Spanning Tree Protocol)
- 802.3af (Inline power)
- PAgP
- VTP
- Dynamic ARP Inspection
- DHCP snooping
- IP source guard
- IGMP snooping (versions 1 and 2)
- DTP (802.1q and ISL)
- MST
- PVST+
- Rapid-PVST
- PortFast/UplinkFast/BackboneFast
- BPDU guard and filtering
- Voice VLAN
- Port security
- Unicast MAC filtering
- ACL (VACLs, PACLS, RACLs)
- QOS (DBL)
- Multicast storm control/broadcast storm control

SSO is compatible with the following list of features. However, the protocol database for these features is not synchronized between the standby and active supervisor engines:

- 802.1Q tunneling with Layer 2 Protocol Tunneling (L2PT)
- Baby giants
- Jumbo frame support
- CDP
- Flood blocking
- UDLD
- SPAN/RSPAN
- NetFlow

The following features are learned on the standby supervisor engine if the SSO feature is enabled:

- All Layer 3 protocols on Catalyst 4500 series switches (Switch Virtual Interfaces)
About Supervisor Engine Redundancy Synchronization

During normal operation, the persistent configuration (RPR and SSO) and the running configuration (SSO only) are synchronized by default between the two supervisor engines. In a switchover, the new active supervisor engine uses the current configuration.

**Note** You cannot enter CLI commands on the standby supervisor engine console.

These sections describe supervisor engine redundancy synchronization:

- RPR Supervisor Engine Configuration Synchronization, page 10-5
- SSO Supervisor Engine Configuration Synchronization, page 10-5

### RPR Supervisor Engine Configuration Synchronization

Because the standby supervisor engine is only partially initialized in RPR mode, it interacts with the active supervisor engine only to receive configuration changes at startup and upon saving the configuration changes.

When a standby supervisor engine is running in RPR mode, the following events trigger synchronization of the configuration information:

- When the standby supervisor engine boots, the `auto-sync` command synchronizes the persistent configuration. This command is enabled by default. For details, refer to “Synchronizing the Supervisor Engine Configurations” section on page 10-10.
- When the active supervisor engine detects the standby supervisor engine, the configuration information is synchronized from the active supervisor engine to the standby supervisor engine. This synchronization overwrites any existing startup configuration file on the standby supervisor engine.
- When you make changes to the configuration, you must use the `write` command to save and synchronize the startup configuration to the standby supervisor engine.

### SSO Supervisor Engine Configuration Synchronization

When a standby supervisor engine runs in SSO mode, the following events trigger synchronization of the configuration information:

- When the active supervisor detects the standby supervisor engine, synchronization of the persistent and running configuration takes place, allowing the standby supervisor engine to arrive at a fully-initiated state.
- When real-time changes occur, the active supervisor engine synchronizes the running-config and (or) the persistent configuration (if necessary) with the standby supervisor engine.
- When you change the configuration, you must use the `write` command to allow the active supervisor engine to save and synchronize the startup configuration to the standby supervisor engine.

### Supervisor Engine Redundancy Guidelines and Restrictions

The following guidelines and restrictions apply to supervisor engine redundancy:
If SSO mode cannot be established between the active and standby supervisor engines because of an incompatibility in the configuration file, a mismatched command list (MCL) is generated at the active supervisor engine and a reload into RPR mode is forced for the standby supervisor engine. Subsequent attempts to establish SSO, after removing the offending configuration and rebooting the standby supervisor engine with the exact same image, might cause the C4K_REDUNDANCY-2-IOS_VERSION_CHECK_FAIL and ISSU-3-PEER_IMAGE_INCOMPATIBLE messages to appear because the peer image is listed as incompatible. If the configuration problem can be corrected, you can clear the peer image from the incompatible list with the `redundancy config-sync ignore mismatched-commands` EXEC command while the peer is in a standby cold (RPR) state. This action allows the standby supervisor engine to boot in standby hot (SSO) state when it reloads.

Here are the steps:

**Step 1** Clear the offending configuration (that caused an MCL) while the standby supervisor engine is in standby cold (RPR) state.

**Step 2** Enter the `redundancy config-sync ignore mismatched-commands` EXEC command at the active standby supervisor engine.

**Step 3** Perform `write memory`.

**Step 4** Reload the standby supervisor engine with the `redundancy reload peer` command.

- RPR and SSO requires Cisco IOS-XE Release 3.1.0SG and later releases.
- SSO is not supported if the IOS-XE software is running in the LAN Base mode.
- WS-C4507R-E, WS-C4510R-E, WS-C4507R+E, and WS-C4510R+E are the only Catalyst 4500 series switches that support Supervisor Engine 7-E and Supervisor Engine 7L-E redundancy.
- SSO requires both supervisor engines in the chassis to have the same components (model and memory), and to use the same Cisco IOS XE software image.
- When you use WS-X45-SUP7-E and WS-X45-SUP7L-E in RPR or SSO mode, only the first two uplinks on each supervisor engine are available. The second two uplinks are unavailable.
- The active and standby supervisor engines in the chassis must be in slots 3 and 4 for 7-slot chassis and slot 5 and 6 for 10-slot chassis.
- Each supervisor engine in the chassis must have its own flash device and console port connections to operate the switch on its own.
- Each supervisor engine must have a unique console connection. Do not connect a Y cable to the console ports.
- Supervisor engine redundancy does not provide supervisor engine load balancing.
- The Cisco Express Forwarding (CEF) table is cleared on a switchover. As a result, routed traffic is interrupted until route tables reconverge. This reconvergence time is minimal because the SSO feature reduces the supervisor engine redundancy switchover time from 30+ seconds to subsecond, so Layer 3 also has a faster failover time if the switch is configured for SSO.
- Static IP routes are maintained across a switchover because they are configured from entries in the configuration file.
- Information about Layer 3 dynamic states that is maintained on the active supervisor engine is not synchronized to the standby supervisor engine and is lost on switchover.
If configuration changes on a redundant switch are made through SNMP set operations, the changes are not synchronized to the standby supervisor engine even in SSO mode. You might experience unexpected behavior.

After you configure the switch through SNMP in SSO mode, copy the running-config file to the startup-config file on the active supervisor engine to trigger synchronization of the startup-config file to the standby supervisor engine. Then, reload the standby supervisor engine so that the new configuration is applied on the standby supervisor engine.

You cannot perform configuration changes during the startup (bulk) synchronization. If you attempt to make configuration changes during this process, the following message is generated:

```
Config mode locked out till standby initializes
```

If configuration changes occur at the same time as a supervisor engine switchover, these configuration changes are lost.

If you remove a line card from a redundant switch and initiate an SSO switchover, then reinsert the line card, and all interfaces are shutdown. The rest of the original line card configuration is preserved.

This situation only occurs if a switch had reached SSO before you removed the line card.

## Configuring Supervisor Engine Redundancy

These sections describe how to configure supervisor engine redundancy:

- Configuring Redundancy, page 10-7
- Virtual Console for Standby Supervisor Engine, page 10-9
- Synchronizing the Supervisor Engine Configurations, page 10-10

### Configuring Redundancy

**Note**

IOS XE software can be booted at three different levels (Enterprise Services, IP Base, and LAN Base), based on the licenses available on the supervisor engine. If you are booting the image in LAN Base mode, only RPR redundancy mode is available.

To configure redundancy, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# redundancy</td>
</tr>
<tr>
<td>Enters redundancy configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-red)# mode {sso</td>
</tr>
<tr>
<td>Configures SSO or RPR. When this command is entered, the standby supervisor engine is reloaded and begins to work in SSO or RPR mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>Verifies that SSO or RPR is configured.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show redundancy [clients</td>
</tr>
<tr>
<td>Displays the redundancy information (counter, state, and so on) for the active and standby supervisor engines.</td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to configure the system for SSO and display the redundancy facility information:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)# end
```

Switch# show redundancy
Redundant System Information :

```
Available system uptime = 10 minutes Switchovers system experienced = 0
Standby failures = 1
Last switchover reason = none

Hardware Mode = Duplex
Configured Redundancy Mode = Stateful Switchover
Operating Redundancy Mode = Stateful Switchover
Maintenance Mode = Disabled
Communications = Up
```

Current Processor Information :

```
Active Location = slot 3
Current Software state = ACTIVE
Uptime in current state = 9 minutes
Image Version = Cisco IOS Software, Catalyst 4500 L3 Switch Software (cat4500e-UNIVERSALK9-M), Version 15.0(100)XO(1.42), INTERIM SOFTWARE Copyright (c) 1986-2010 by Cisco Systems, Inc.
Compiled Sun 01-Aug-10 04:12 by gsbuprod
Configuration register = 0x920
```

Peer Processor Information :

```
Standby Location = slot 4
Current Software state = STANDBY HOT
Uptime in current state = 0 minute
Image Version = Cisco IOS Software, Catalyst 4500 L3 Switch Software (cat4500e-UNIVERSALK9-M), Version 15.0(100)XO(1.42), INTERIM SOFTWARE Copyright (c) 1986-2010 by Cisco Systems, Inc.
Compiled Sun 01-Aug-10 04:12 by gsbuprod
Configuration register = 0x920
```

This example shows how to display redundancy facility state information:

```
Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit = Primary
Unit ID = 3

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Manual Swact = enabled

Communications = Up

client count = 64
client_notification_TMR = 240000 milliseconds
```
This example shows how to change the system configuration from RPR to SSO mode:

```
Switch(config)# redundancy
Switch(config-red)# mode
Switch(config-red)# mode sso
Changing to sso mode will reset the standby. Do you want to continue?[confirm]
Switch(config-red)# end
Switch#
```

```
*Aug  1 13:11:16: %C4K_REDUNDANCY-3-COMMUNICATION: Communication with the peer Supervisor has been lost
*Aug  1 13:11:16: %C4K_REDUNDANCY-3-SIMPLEX_MODE: The peer Supervisor has been lost
```

This example shows how to change the system configuration from SSO to RPR mode:

```
Switch(config)# redundancy
Switch(config-red)# mode
Changing to rpr mode will reset the standby. Do you want to continue?[confirm]
Switch(config-red)# end
```

```
*Aug  1 13:11:16: %C4K_REDUNDANCY-3-COMMUNICATION: Communication with the peer Supervisor has been lost
*Aug  1 13:11:16: %C4K_REDUNDANCY-3-SIMPLEX_MODE: The peer Supervisor has been lost
```

Virtual Console for Standby Supervisor Engine

Catalyst 4500 series switches can be configured with 2 supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. Therefore, you must connect to the standby console to access, monitor or debug the standby supervisor.

Virtual Console for Standby Supervisor Engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine and thus emulate the standby console on the active supervisor engine. Only one standby console session is active at any time.

The Virtual Console for Standby Supervisor Engine allows users who are logged onto the active supervisor engine to remotely execute `show` commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual Console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the `attach module`, `session module`, or `remote login` commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

Once you enter the standby virtual console, the terminal prompt automatically changes to `hostname-standby-console` where `hostname` is the configured name of the switch. The prompt is restored to the original setting when you exit the virtual console.

You exit the virtual console with the `exit` or `quit` commands. When the inactivity period of the terminal on the active supervisor engine where you logged in exceeds the configured idle time, you are automatically logged out of the terminal on the active supervisor engine. In this instance, the virtual console session is also terminated. Virtual console session is also automatically terminated when the standby is rebooted. After the standby boots up, you need to create another virtual console session.
To log in to the standby supervisor engine using a virtual console, do the following:

Switch# session module 4
Connecting to standby virtual console
Type "exit" or "quit" to end this session

Switch-standby-console# exit
Switch#

If the standby console is not enabled, the following message appears:

Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout

The standby virtual console provides the standard features that are available from the supervisor console such as command history, command completion, command help and partial command keywords.

The following limitations apply to the standby virtual console:

- All commands on the virtual console run to completion. It does not provide the auto-more feature; it behaves as if the terminal length 0 command has been executed. It is also non-interactive. Therefore, a running command cannot be interrupted or aborted by any key sequence on the active supervisor engine. If a command produces considerable output, the virtual console displays it on the supervisor engine screen.

- The virtual console is non-interactive. Because the virtual console does not detect the interactive nature of a command, any command that requires user interaction causes the virtual console to wait until the RPC timer aborts the command.

The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60 seconds. During this time, you cannot abort the command from the keyboard. You must wait for the timer to expire before you continue.

- You cannot use virtual console to view debug and syslog messages that are being displayed on the standby supervisor engine. The virtual console only displays the output of commands that are executed from the virtual console. Other information that is displayed on the real standby console does not appear on the virtual console.

### Synchronizing the Supervisor Engine Configurations

To manually synchronize the configurations used by the two supervisor engines, perform this task on the active supervisor engine:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;Switch(config)# redundancy</td>
<td>Enters redundancy configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;Switch(config-red)# main-cpu</td>
<td>Enters main-cpu configuration submode.</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;Switch(config-r-mc)# auto-sync (startup-config</td>
<td>config-register</td>
</tr>
</tbody>
</table>
Chapter 10  Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 7-E and Supervisor

Configuring Supervisor Engine Redundancy

Note
Configuration changes made to the active supervisor engine through SNMP are not synchronized to the redundant supervisor engine. For information on how to handle this situation, see the “Supervisor Engine Redundancy Guidelines and Restrictions” section on page 10-5.

Note
The auto-sync command controls the synchronization of the config-reg, bootvar, and startup/private configuration files only. The calendar and VLAN database files are always synchronized when they change. In SSO mode, the running-config is always synchronized.

This example shows how to reenable the default automatic synchronization feature using the auto-sync standard command to synchronize the startup-config and config-register configuration of the active supervisor engine with the standby supervisor engine. Updates for the boot variables are automatic and cannot be disabled.

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
Switch(config-r-mc)# end
Switch(config-r-mc)# copy running-config startup-config
```

Note
To manually synchronize individual elements of the standard auto-sync configuration, disable the default automatic synchronization feature.

Note
When you configure the auto-sync standard, the individual sync options such as no auto-sync startup-config are ignored.

This example shows how to disable default automatic synchronization and allow only automatic synchronization of the config-registers of the active supervisor engine to the standby supervisor engine, while disallowing synchronization of the startup configuration:

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# no auto-sync standard
Switch(config-r-mc)# auto-sync config-register
Switch(config-r-mc)# end
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-r-mc)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>Synchronizes the running configuration in dynamic random-access memory (DRAM) to the startup configuration file in NVRAM. Note This step is not required to synchronize the running configuration file in (DRAM).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-r-mc)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Synchronizes the running configuration in dynamic random-access memory (DRAM) to the startup configuration file in NVRAM. Note This step is not required to synchronize the running configuration file in (DRAM).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-r-mc)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Synchronizes the running configuration in dynamic random-access memory (DRAM) to the startup configuration file in NVRAM. Note This step is not required to synchronize the running configuration file in (DRAM).</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-r-mc)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Synchronizes the running configuration in dynamic random-access memory (DRAM) to the startup configuration file in NVRAM. Note This step is not required to synchronize the running configuration file in (DRAM).</td>
</tr>
</tbody>
</table>
Performing a Manual Switchover

This section describes how to perform a manual switchover (from the active supervisor engine to the standby supervisor engine) for test purposes. We recommend that you perform a manual switchover prior to deploying SSO in your production environment.

Note

This discussion assumes that SSO has been configured as the redundant mode.

To perform a manual switchover, perform this task on the active supervisor engine:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# show redundancy</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# redundancy force-switchover</td>
</tr>
</tbody>
</table>

Be aware of these usage guidelines:

- force a switchover, the redundant supervisor engine must be in a standby hot (SSO) or standby cold (RPR) state. You can verify the state with the show redundancy command. If the state is not standby hot or standby cold, the redundancy force-switchover command will not execute.

- Use the redundancy force-switchover command, rather than the reload command, to initiate a switchover. The redundancy force-switchover command will first check that the redundant supervisor engine is in the correct state. If you issue the reload command and the status is not standby hot or standby cold, the reload command will reset the current supervisor engine and the peer supervisor may not be able to take over because it was not in a terminal state (standby hot or cold).

After a normal switchover, you might want to make the supervisor engine in a lower slot number of the chassis the active supervisor engine. Use the show module command to see which slot contains the active supervisor engine, and force another switchover if necessary.

Performing a Software Upgrade

This is useful only if IOS-XE software is running in LAN Base mode. For Enterprise Services or IP Base mode, use ISSU to upgrade software for both RPR and SSO redundant mode.

The software upgrade procedure supported by supervisor engine redundancy allows you to reload the Cisco IOS software image on the redundant supervisor engine, and once complete, reload the active supervisor engine once.
To perform a software upgrade, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><strong>Switch# copy source_device:source_filename</strong></td>
<td>Copies the new Cisco IOS-XE software image to bootflash on the supervisor engine.</td>
</tr>
<tr>
<td></td>
<td><strong>slot0:target_filename</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Or:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Switch# copy source_device:source_filename</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>bootflash:target_filename</strong></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>Switch# copy source_device:source_filename</strong></td>
<td>Copies the new image to a device on the standby supervisor engine (such as slavebootflash and slaveslot0).</td>
</tr>
<tr>
<td></td>
<td><strong>slaveslot0:target_filename</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Or:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Switch# copy source_device:source_filename</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>slavebootflash:target_filename</strong></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>Switch# config terminal</strong></td>
<td>Configures the supervisor engines to boot the new image.</td>
</tr>
<tr>
<td></td>
<td><strong>Switch(config)# config-register 0x2</strong></td>
<td>If your system was configured to autoboot an earlier image, issue the following command string to boot the new image instead:</td>
</tr>
<tr>
<td></td>
<td><strong>Switch(config)# boot system flash</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>device:</strong> file_name</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>Switch(config)# redundancy</strong></td>
<td>Enters redundancy configuration mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><strong>Switch(config-red)# main-cpu</strong></td>
<td>Enters main-cpu configuration submode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><strong>Switch(config-r-mc)# auto-syn standard</strong></td>
<td>Synchronizes the configuration elements.</td>
</tr>
<tr>
<td>Step 7</td>
<td><strong>Switch(config-r-mc)# end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 8</td>
<td><strong>Switch# copy running-config start-config</strong></td>
<td>Saves the configuration.</td>
</tr>
<tr>
<td>Step 9</td>
<td><strong>Switch# redundancy reload peer</strong></td>
<td>Reloads the standby supervisor engine and brings it back online (using the new release of the Cisco IOS-XE software).</td>
</tr>
<tr>
<td>Step 10</td>
<td><strong>Switch# redundancy force-switchover</strong></td>
<td>Conducts a manual switchover to the standby supervisor engine. The standby supervisor engine becomes the new active supervisor engine using the new Cisco IOS-XE software image. The old active supervisor engine reboots with the new image and becomes the standby supervisor engine.</td>
</tr>
</tbody>
</table>

This example shows how to perform a software upgrade:

```
Switch# config terminal
Switch(config)# config-register 0x2
Switch(config)# boot system flash
bootflash0:cat4500e-universalk9.SSA.03.01.00.150.1.XO.bin
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-syn standard
Switch(config-r-mc)# end
Switch# copy running-config start-config
Switch# redundancy reload peer
Switch# redundancy force-switchover
Switch#  
```
This example illustrates how to verify that the running configuration on the active supervisor engine has successfully synchronized with the redundant supervisor engine:

Switch# configure terminal
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The bootvar has been successfully synchronized to the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The config-reg has been successfully synchronized to the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The startup-config has been successfully synchronized to the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The private-config has been successfully synchronized to the standby supervisor

The example above shows that the boot variable, the config-register, and the startup configuration from the active supervisor engine have successfully synchronized to the redundant supervisor engine.

Manipulating Bootflash on the Standby Supervisor Engine

Note

The console port on the standby supervisor engine is not available.

To manipulate the standby supervisor engine bootflash, perform one or more of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# dir slaveslot0:target_filename</td>
<td>Lists the contents of the slot0: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch# dir slavebootflash:target_filename</td>
<td>Lists the contents of the bootflash: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>Switch# delete slaveslot0:target_filename</td>
<td>Deletes specific files from the slot0: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch# delete slavebootflash:target_filename</td>
<td>Deletes specific files from the bootflash: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>Switch# squeeze slaveslot0:target_filename</td>
<td>Squeezes the slot0: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch# squeeze slavebootflash:target_filename</td>
<td>Squeezes the bootflash: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>Switch# format slaveslot0:target_filename</td>
<td>Formats the slot0: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch# format slavebootflash:target_filename</td>
<td>Formats the bootflash: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>Switch# copy source_device:source_filename slaveslot0:target_filename</td>
<td>Copies a file from the active supervisor engine to the slot0: device on the standby supervisor engine.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch# copy source_device:source_filename slavebootflash:target_filename</td>
<td>Copies a file to the bootflash: device on a standby supervisor engine.</td>
</tr>
</tbody>
</table>

Note Source could be the active supervisor engine or a TFTP server.
Configuring Cisco NSF with SSO Supervisor Engine Redundancy

This chapter describes how to configure supervisor engine redundancy using Cisco nonstop forwarding (NSF) with stateful switchover (SSO).

Note

Starting with Cisco IOS Release 12.2(52)SG, the Catalyst 4500 switch supports VRF lite NSF support with routing protocols OSPF/EIGRP/BGP.

This chapter consists of these sections:

- About NSF with SSO Supervisor Engine Redundancy, page 11-1
- Configuring NSF with SSO Supervisor Engine Redundancy, page 11-9
- Cisco High Availability Features in Cisco IOS XE 3.1.0SG, page 11-17

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

About NSF with SSO Supervisor Engine Redundancy

These sections describe supervisor engine redundancy using NSF with SSO:

- About Cisco IOS NSF-Aware and NSF-Capable Support, page 11-2
- NSF with SSO Supervisor Engine Redundancy Overview, page 11-3
- SSO Operation, page 11-4
- NSF Operation, page 11-4
- Cisco Express Forwarding, page 11-5
Chapter 11  Configuring Cisco NSF with SSO Supervisor Engine Redundancy

- Routing Protocols, page 11-5
- NSF Guidelines and Restrictions, page 11-9

About Cisco IOS NSF-Aware and NSF-Capable Support

Cisco IOS Nonstop Forwarding (NSF) has two primary components:

- NSF-awareness—If neighboring router devices detect that an NSF router can still forward packets when a supervisor engine switchover happens, this capability is referred to as NSF-awareness. Cisco IOS enhancements to the Layer 3 routing protocols (OSPF, BGP, EIGRP and IS-IS) are designed to prevent route-flapping so that the CEF routing table does not time out or the NSF router does not drop routes. An NSF-aware router helps to send routing protocol information to the neighboring NSF router.

- NSF-capability—NSF works with SSO to minimize the amount of time that a Layer 3 network is unavailable following a supervisor engine switchover by continuing to forward IP packets. Reconvergence of Layer 3 routing protocols (BGP, EIGRP, OSPF v2, and IS-IS) is transparent to the user and happens automatically in the background. The routing protocols recover routing information from neighbor devices and rebuild the Cisco Express Forwarding (CEF) table.

**Note**

NSF does not support IPv6.

**Note**

NSF-capable devices include Catalyst 4500 series switches, Catalyst 6500 series switches, Cisco 7500 series routers, Cisco 10000 series routers, and Cisco 12000 series routers.

A typical topology for NSF and NSF-aware routers is given below.

**Figure 11-1  Topology for NSF and NSF-Capable Switches**

![Topology Diagram](image-url)
Table 11-1 lists the supervisor engines and Catalyst 4500 series switches that support NSF-awareness:

<table>
<thead>
<tr>
<th>NSF-Aware Supervisor Engine</th>
<th>Switch Support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed Switch (WS-C4948)</td>
<td>Catalyst 4948</td>
</tr>
<tr>
<td>Fixed Switch (WS-C4948-10GE)</td>
<td>Catalyst 4948-10GE switch</td>
</tr>
</tbody>
</table>

Starting with Cisco IOS Release 12.2(20)EWA, the Catalyst 4500 series switch supported NSF-awareness for the EIGRP, IS-IS, OSPF, and BGP protocols. Starting with Cisco IOS Release 12.2(31)SG, the Catalyst 4500 series switch supported NSF-awareness for the EIGRP-stub in IP Base image for all supervisor engines. NSF-awareness is turned on by default for EIGRP-stub, EIGRP, IS-IS, and OSPF protocols. You need to turn BGP on manually.

If the supervisor engine is configured for BGP (with the graceful-restart command), EIGRP, OSPF, or IS-IS routing protocols, routing updates are automatically sent during the supervisor engine switchover of a neighboring NSF-capable switch (typically a Catalyst 6500 series switch).

Starting with Cisco IOS Release 12.2(31)SG, the Catalyst 4500 series switch supports NSF-capability. Table 11-2 lists the supervisor engines and the associated Catalyst 4500 series switches that are NSF-capable.

Table 11-2 NSF-Capable Supervisor Engines

NSF with SSO Supervisor Engine Redundancy Overview

Catalyst 4500 series switches support fault resistance by allowing a redundant supervisor engine to take over if the primary supervisor engine fails. NSF works with SSO to minimize the amount of time a network is unavailable to its users following a switchover.

NSF provides these benefits:

- Improved network availability
  NSF continues forwarding network traffic and application state information so that user session information is maintained after a switchover.
- Overall network stability
  Network stability may be improved with the reduction in the number of route flaps, which were created when routers in the network failed and lost their routing tables.
- Neighboring routers do not detect a link flap
  Because the interfaces remain up during a switchover, neighboring routers do not detect a link flap (the link does not go down and come back up).
- Prevents routing flaps
  Because SSO continues forwarding network traffic during a switchover, routing flaps are avoided.
About NSF with SSO Supervisor Engine Redundancy

- Maintains user sessions established prior to the switchover

Catalyst 4500 series switches also support route processor redundancy (RPR). For information about these redundancy modes, see Chapter 9, “Configuring Supervisor Engine Redundancy Using RPR and SSO on Supervisor Engine 6-E and Supervisor Engine 6L-E.”

SSO Operation

SSO establishes one of the supervisor engines as active while the other supervisor engine is designated as standby, and then SSO synchronizes information between them. A switchover from the active to the redundant supervisor engine occurs when the active supervisor engine fails, or is removed from the switch, or is manually shut down for maintenance.

In networking devices running SSO, both supervisor engines must be running the same Cisco IOS software version and ROMMON version so that the redundant supervisor engine is always ready to assume control following a fault on the active supervisor engine. SSO switchover also preserves FIB and adjacency entries and can forward Layer 3 traffic after a switchover. Configuration information and data structures are synchronized from the active to the redundant supervisor engine at startup and whenever changes to the active supervisor engine configuration occur. Following an initial synchronization between the two supervisor engines, SSO maintains state information between them, including forwarding information.

During switchover, system control and routing protocol execution is transferred from the active supervisor engine to the redundant supervisor engine.

*Note*

Use the `[no] service slave-log` configuration command to forward all error messages from the standby supervisor engine to the active engine. By default, this capability is enabled. For details, refer to the *Catalyst 4500 Series Switch Cisco IOS System Error Message Guide*, Release 12.2(37)SG.

NSF Operation

NSF always runs with SSO and provides redundancy for Layer 3 traffic. NSF is supported by the BGP, OSPF, IS-IS, and EIGRP routing protocols and is supported by Cisco Express Forwarding (CEF) for forwarding. The routing protocols have been enhanced with NSF-capability and awareness, which means that routers running these protocols can detect a switchover and take the necessary actions to continue forwarding network traffic and to recover route information from the peer devices. The IS-IS protocol can be configured to use state information that has been synchronized between the active and the redundant supervisor engine to recover route information following a switchover instead of information received from peer devices.

A networking device is NSF-aware if it is running NSF-compatible software. A device is NSF-capable if it has been configured to support NSF; it rebuilds routing information from NSF-aware or NSF-capable neighbors.

Each protocol depends on CEF to continue forwarding packets during switchover while the routing protocols rebuild the Routing Information Base (RIB) tables. After the routing protocols have converged, CEF updates the FIB table and removes stale route entries. CEF then updates the line cards with the new FIB information.
Cisco Express Forwarding

A key element of NSF is packet forwarding. In a Cisco networking device, packet forwarding is provided by Cisco Express Forwarding (CEF). CEF maintains the FIB and uses the FIB information that was current at the time of the switchover to continue forwarding packets during a switchover. This feature reduces traffic interruption during the switchover.

During normal NSF operation, CEF on the active supervisor engine synchronizes its current FIB and adjacency databases with the FIB and adjacency databases on the redundant supervisor engine. Upon switchover of the active supervisor engine, the redundant supervisor engine initially has FIB and adjacency databases that are mirror images of those that were current on the active supervisor engine. For platforms with forwarding engines, CEF keeps the forwarding engine on the redundant supervisor engine current with changes that are sent to it by CEF on the active supervisor engine. The forwarding engine can continue forwarding after a switchover as soon as the interfaces and a data path are available.

As the routing protocols start to repopulate the RIB on a prefix-by-prefix basis, the updates cause prefix-by-prefix updates to CEF, which it uses to update the FIB and adjacency databases. Existing and new entries receive the new version (“epoch”) number, indicating that they have been refreshed. The forwarding information is updated on the forwarding engine during convergence. The supervisor engine signals when the RIB has converged. The software removes all FIB and adjacency entries that have an epoch older than the current switchover epoch. The FIB now represents the newest routing protocol forwarding information.

Routing Protocols

**Note**

Use of the routing protocols require the Enterprise Services Cisco IOS Software image for the Catalyst 4500 series switch.

The routing protocols run only on the active supervisor engine, and they receive routing updates from their neighbor routers. Routing protocols do not run on the standby supervisor engine. Following a switchover, the routing protocols request that the NSF-aware neighbor devices send state information to help rebuild the routing tables. Alternately, the IS-IS protocol can be configured to synchronize state information from the active to the redundant supervisor engine to help rebuild the routing table on the NSF-capable device in environments where neighbor devices are not NSF-aware. NSF supports the BGP, OSPF, IS-IS, and EIGRP protocols.

**Note**

For NSF operation, the routing protocols depend on CEF to continue forwarding packets while the routing protocols rebuild the routing information.

BGP Operation

When an NSF-capable router begins a BGP session with a BGP peer, it sends an OPEN message to the peer. Included in the message is a statement that the NSF-capable device has “graceful” restart capability. Graceful restart is the mechanism by which BGP routing peers avoid a routing flap following a switchover. If the BGP peer has received this capability, it is aware that the device sending the message is NSF-capable. Both the NSF-capable router and its BGP peers need to exchange the graceful restart capability in their OPEN messages at the time of session establishment. If both peers do not exchange the graceful restart capability, the session will not be capable of a graceful restart.
If the BGP session is lost during the supervisor engine switchover, the NSF-aware BGP peer marks all the routes associated with the NSF-capable router as stale; however, it continues to use these routes to make forwarding decisions for a set period of time. This functionality prevents packets from being lost while the newly active supervisor engine is waiting for convergence of the routing information with the BGP peers.

After a supervisor engine switchover occurs, the NSF-capable router reestablishes the session with the BGP peer. In establishing the new session, it sends a new graceful restart message that identifies the NSF-capable router as having restarted.

At this point, the routing information is exchanged between the two BGP peers. After this exchange is complete, the NSF-capable device uses the routing information to update the RIB and the FIB with the new forwarding information. The NSF-aware device uses the network information to remove stale routes from its BGP table; the BGP protocol then is fully converged.

If a BGP peer does not support the graceful restart capability, it ignores the graceful restart capability in an OPEN message but establishes a BGP session with the NSF-capable device. This function allows interoperability with non-NSF-aware BGP peers (and without NSF functionality), but the BGP session with non-NSF-aware BGP peers is not capable of a graceful restart.

**Note**

BGP support in NSF requires that neighbor networking devices be NSF-aware; that is, the devices must have the graceful restart capability and advertise that capability in their OPEN message during session establishment. If an NSF-capable router discovers that a particular BGP neighbor does not have graceful restart capability, it does not establish an NSF-capable session with that neighbor. All other neighbors that have graceful restart capability continue to have NSF-capable sessions with this NSF-capable networking device.

**OSPF Operation**

When an OSPF NSF-capable router performs a supervisor engine switchover, it must perform the following tasks in order to resynchronize its link state database with its OSPF neighbors:

- Relearn the available OSPF neighbors on the network without causing a reset of the neighbor relationship
- Reacquire the contents of the link state database for the network

As quickly as possible after a supervisor engine switchover, the NSF-capable router sends an OSPF NSF signal to neighboring NSF-aware devices. Neighbor networking devices recognize this signal as an indicator that the neighbor relationship with this router should not be reset. As the NSF-capable router receives signals from other routers on the network, it can begin to rebuild its neighbor list.

After neighbor relationships are reestablished, the NSF-capable router begins to resynchronize its database with all of its NSF-aware neighbors. At this point, the routing information is exchanged between the OSPF neighbors. Once this exchange is complete, the NSF-capable device uses the routing information to remove stale routes, update the RIB, and update the FIB with the new forwarding information. The OSPF protocols are then fully converged.

**Note**

OSPF support in NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers that it has non-NSF-aware neighbors on a particular network segment, it disables NSF capabilities for that segment. Other network segments composed entirely of NSF-capable or NSF-aware routers continue to provide NSF capabilities.
IS-IS Operation

When an IS-IS NSF-capable router performs a supervisor engine switchover, it must perform the following tasks in order to resynchronize its link state database with its IS-IS neighbors:

- Relearn the available IS-IS neighbors on the network without causing a reset of the neighbor relationship
- Reacquire the contents of the link state database for the network

The IS-IS NSF feature offers two options when you configure NSF:

- Internet Engineering Task Force (IETF) IS-IS
- Cisco IS-IS

If neighbor routers on a network segment are running a software version that supports the IETF Internet draft for router restartability, they assist an IETF NSF router that is restarting. With IETF, neighbor routers provide adjacency and link-state information to help rebuild the routing information following a switchover. A benefit of IETF IS-IS configuration is operation between peer devices based on a proposed standard.

Note

If you configure IETF on the networking device, but neighbor routers are not IETF-compatible, NSF aborts following a switchover.

If the neighbor routers on a network segment are not NSF-aware, you must use the Cisco configuration option. The Cisco IS-IS configuration transfers both protocol adjacency and link-state information from the active to the redundant supervisor engine. An advantage of Cisco configuration is that it does not rely on NSF-aware neighbors.

IETF IS-IS Configuration

As quickly as possible after a supervisor engine switchover, the NSF-capable router sends IS-IS NSF restart requests to neighboring NSF-aware devices using the IETF IS-IS configuration. Neighbor networking devices recognize this restart request as an indicator that the neighbor relationship with this router should not be reset, but that they should initiate database resynchronization with the restarting router. As the restarting router receives restart request responses from routers on the network, it can begin to rebuild its neighbor list.

After this exchange is complete, the NSF-capable device uses the link-state information to remove stale routes, update the RIB, and update the FIB with the new forwarding information; IS-IS is then fully converged.

The switchover from one supervisor engine to the other happens within seconds. IS-IS reestablishes its routing table and resynchronizes with the network within a few additional seconds. At this point, IS-IS waits for a specified interval before it attempts a second NSF restart. During this time, the new redundant supervisor engine boots up and synchronizes its configuration with the active supervisor engine. The IS-IS NSF operation waits for a specified interval to ensure that connections are stable before attempting another restart of IS-IS NSF. This functionality prevents IS-IS from attempting back-to-back NSF restarts with stale information.

Cisco IS-IS Configuration

Using the Cisco configuration option, full adjacency and LSP information is saved, or checkpointed, to the redundant supervisor engine. Following a switchover, the newly active supervisor engine maintains its adjacencies using the check-pointed data, and can quickly rebuild its routing tables.
About NSF with SSO Supervisor Engine Redundancy

Following a switchover, Cisco IS-IS NSF has complete neighbor adjacency and LSP information; however, it must wait for all interfaces to come on line that had adjacencies prior to the switchover. If an interface does not come on line within the allocated interface wait time, the routes learned from these neighbor devices are not considered in routing table recalculation. IS-IS NSF provides a command to extend the wait time for interfaces that, for whatever reason, do not come on line in a timely fashion.

The switchover from one supervisor engine to the other happens within seconds. IS-IS reestablishes its routing table and resynchronizes with the network within a few additional seconds. At this point, IS-IS waits for a specified interval before it attempts a second NSF restart. During this time, the new redundant supervisor engine boots up and synchronizes its configuration with the active supervisor engine. After this synchronization is completed, IS-IS adjacency and LSP data is check-pointed to the redundant supervisor engine; however, a new NSF restart is not attempted by IS-IS until the interval time expires. This functionality prevents IS-IS from attempting back-to-back NSF restarts.

EIGRP Operation

When an EIGRP NSF-capable router initially re-boots after an NSF restart, it has no neighbor and its topology table is empty. The router is notified by the redundant (now active) supervisor engine when it needs to bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables. The restarting router and its peers must accomplish these tasks without interrupting the data traffic directed toward the restarting router. EIGRP peer routers maintain the routes learned from the restarting router and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the restarting router uses a new Restart (RS) bit in the EIGRP packet header to indicate a restart. The RS bit is set in the hello packets and in the initial INIT update packets during the NSF restart period. The RS bit in the hello packets allows the neighbors to be quickly notified of the NSF restart. Without seeing the RS bit, the neighbor can only detect an adjacency reset by receiving an INIT update or by the expiration of the hello hold timer. Without the RS bit, a neighbor does not know if the adjacency reset should be handled using NSF or the normal startup method.

When the neighbor receives the restart indication, either by receiving the hello packet or the INIT packet, it recognizes the restarting peer in its peer list and maintains the adjacency with the restarting router. The neighbor then sends it topology table to the restarting router with the RS bit set in the first update packet indicating that it is NSF-aware and is helping out the restarting router. The neighbor does not set the RS bit in their hello packets, unless it is also a NSF restarting neighbor.

A router may be NSF-aware but may not be helping the NSF restarting neighbor because booting from a cold start.

If at least one of the peer routers is NSF-aware, the restarting router then receives updates and rebuilds its database. The restarting router must then find out if it had converged so that it can notify the routing information base (RIB). Each NSF-aware router is required to send an end of table (EOT) marker in the last update packet to indicate the end of the table content. The restarting router knows it has converged when it receives the EOT marker. The restarting router can then begin sending updates.

An NSF-aware peer knows when the restarting router had converged when it receives an EOT indication from the restarting router. The peer then scans its topology table to search for the routes with the restarted neighbor as the source. The peer compares the route timestamp with the restart event timestamp to determine if the route is still available. The peer then goes active to find alternate paths for the routes that are no longer available through the restarted router.
When the restarting router has received all EOT indications from its neighbors or when the NSF converge timer expires, EIGRP notifies the RIB of convergence. EIGRP waits for the RIB convergence signal and then floods its topology table to all awaiting NSF-aware peers.

**NSF Guidelines and Restrictions**

NSF with SSO has these restrictions:

- With aggressive protocol timers (such as, when the default exceeds the timer value), upon switchover, the protocol software running on the new active supervisor engine might not initialize in time to send "hello" packets to its neighboring switches or routers. If the protocol takes longer time to initialize because of other CPU-demanding tasks, then the protocol encounters state transitions and causes a loss in traffic on the order of seconds. We recommend that you do not configure aggressive timers in conjunction with SSO/NSF.
- For NSF operation, you must have SSO configured on the device.
- NSF with SSO supports IP Version 4 traffic and protocols only; NSF with SSO does not support IPv6 traffic.
- The Virtual Redundancy Routing Protocols (VRRP) is not SSO-aware, meaning state information is not maintained between the active and standby supervisor engine during normal operation. VRRP and SSO can coexist but both features work independently. Traffic that relies on VRRP may switch to the VRRP standby in the event of a supervisor engine switchover.
- All neighboring devices participating in BGP NSF must be NSF-capable and configured for BGP graceful restart.
- OSPF NSF for virtual links is not supported.
- All OSPF networking devices on the same network segment must be NSF-aware (running an NSF software image).
- For IETF IS-IS, all neighboring devices must be running an NSF-aware software image.

**Configuring NSF with SSO Supervisor Engine Redundancy**

The following sections describe the configuration tasks for the NSF feature:

- Configuring SSO, page 11-10
- Configuring CEF NSF, page 11-10
- Verifying CEF NSF, page 11-11
- Configuring BGP NSF, page 11-11
- Verifying BGP NSF, page 11-11
- Configuring OSPF NSF, page 11-12
- Verifying OSPF NSF, page 11-13
- Configuring IS-IS NSF, page 11-13
- Verifying IS-IS NSF, page 11-14
- Configuring EIGRP NSF, page 11-16
- Verifying EIGRP NSF, page 11-16
Chapter 11 Configuring Cisco NSF with SSO Supervisor Engine Redundancy

Configuring SSO

You must configure SSO in order to use NSF with any supported protocol.

To configure SSO, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# redundancy</td>
</tr>
<tr>
<td></td>
<td>Enters redundancy configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-red)# mode sso</td>
</tr>
<tr>
<td></td>
<td>Configures SSO. When this command is entered, the redundant supervisor engine is reloaded and begins to work in SSO mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-red)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td></td>
<td>Verifies that SSO is enabled.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# show redundancy states</td>
</tr>
<tr>
<td></td>
<td>Displays the operating redundancy mode.</td>
</tr>
</tbody>
</table>

Note: The sso keyword is supported in Cisco IOS Release 12.2(20)EWA and later releases.

This example shows how to configure the system for SSO and display the redundancy state:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)# end
Switch# show redundancy states
my state = 13 -ACTIVE
    peer state = 8  -STANDBY HOT
    Mode = Duplex
    Unit = Primary
    Unit ID = 5

Redundancy Mode (Operational) = sso
Redundancy Mode (Configured) = sso
Split Mode = Disabled
Manual Swact = Enabled
Communications = Up

    client count = 29
    client_notification_TMR = 30000 milliseconds
    keep_alive TMR = 9000 milliseconds
    keep_alive count = 1
    keep_alive threshold = 18
    RF debug mask = 0x0
```

Configuring CEF NSF

The CEF NSF feature operates by default while the networking device is running in SSO mode. No configuration is necessary.
Verifying CEF NSF

To verify that CEF is NSF-capable, enter the `show cef state` command:

```
Switch# show cef state
```

```
CEF Status [RP]
CEF enabled/running
dCEF enabled/running
CEF switching enabled/running
CEF default capabilities:
  Always FIB switching: yes
  Default CEF switching: yes
  Default dCEF switching: yes
  Update HWIDB counters: no
  Drop multicast packets: no
  .
  .
  CEF NSF capable: yes
  IPC delayed func on SSO: no
  RRP state:
    I am standby RRP: no
    My logical slot: 0
    RF PeerComm: no
```

Configuring BGP NSF

**Note**

You must configure BGP graceful restart on all peer devices participating in BGP NSF.

To configure BGP for NSF, perform this task (repeat this procedure on each of the BGP NSF peer devices):

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# router bgp as-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-router)# bgp graceful-restart</td>
</tr>
</tbody>
</table>

Verifying BGP NSF

To verify BGP NSF, you must check that BGP graceful restart is configured on the SSO-enabled networking device and on the neighbor devices. To verify, follow these steps:
Step 1 Verify that “bgp graceful-restart” appears in the BGP configuration of the SSO-enabled switch by entering the `show running-config` command:

```
Switch# show running-config
```

```
router bgp 120

bgp graceful-restart
neighbor 10.2.2.2 remote-as 300
```

Step 2 Repeat Step 1 on each of the BGP neighbors.

Step 3 On the SSO device and the neighbor device, verify that the graceful restart function is shown as both advertised and received, and confirm the address families that have the graceful restart capability. If no address families are listed, BGP NSF does not occur either:

```
Switch# show ip bgp neighbors x.x.x.x
```

BGP neighbor is 192.168.2.2, remote AS YY, external link
BGP version 4, remote router ID 192.168.2.2
BGP state = Established, up for 00:01:18
Last read 00:00:17, hold time is 180, keepalive interval is 60 seconds
Neighbor capabilities:
  Route refresh: advertised and received (new)
  Address family IPv4 Unicast: advertised and received
  Address family IPv4 Multicast: advertised and received
  Graceful Restart Capability: advertised and received
  Remote Restart timer is 120 seconds
  Address families preserved by peer:
    IPv4 Unicast, IPv4 Multicast
Received 1539 messages, 0 notifications, 0 in queue
Sent 1544 messages, 0 notifications, 0 in queue
Default minimum time between advertisement runs is 30 seconds

---

**Configuring OSPF NSF**

**Note** All peer devices participating in OSPF NSF must be made OSPF NSF-aware, which happens automatically when you install an NSF software image on the device.

To configure OSPF NSF, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 11 Configuring Cisco NSF with SSO Supervisor Engine Redundancy

Configuring NSF with SSO Supervisor Engine Redundancy

Verifying OSPF NSF

To verify OSPF NSF, you must check that the NSF function is configured on the SSO-enabled networking device. To verify OSPF NSF, follow these steps:

### Step 1
Verify that ‘nsf’ appears in the OSPF configuration of the SSO-enabled device by entering the `show running-config` command:

```
Switch# show running-config
```

```
route ospf 120
log-adjacency-changes
nsf
network 192.168.20.0 0.0.0.255 area 0
network 192.168.30.0 0.0.0.255 area 1
network 192.168.40.0 0.0.0.255 area 2
```

### Step 2
Enter the `show ip ospf` command to verify that NSF is enabled on the device:

```
Switch> show ip ospf
```

```
Routing Process "ospf 1" with ID 192.168.2.1 and Domain ID 0.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
Non-Stop Forwarding enabled, last NSF restart 00:02:06 ago (took 44 secs)
Area BACKBONE(0)
Number of interfaces in this area is 1 (0 loopback)
   Area has no authentication
   SPF algorithm executed 3 times
```

Configuring IS-IS NSF

To configure IS-IS NSF, perform this task:

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# router ospf processID</code></td>
<td>Enables an OSPF routing process, which places the switch in router configuration mode.</td>
</tr>
<tr>
<td><code>Switch(config-router)# nsf</code></td>
<td>Enables NSF operations for OSPF.</td>
</tr>
</tbody>
</table>
Verifying IS-IS NSF

To verify IS-IS NSF, you must check that the NSF function is configured on the SSO-enabled networking device. To verify IS-IS NSF, follow these steps:

1. Verify that “nsf” appears in the IS-IS configuration of the SSO-enabled device by entering the `show running-config` command. The display shows either the Cisco IS-IS or the IETF IS-IS configuration. The following display indicates that the device uses the Cisco implementation of IS-IS NSF:

   ```
   Switch# show running-config
   <...Output Truncated...>
   router isis
   nsf cisco
   <...Output Truncated...>
   ```

2. If the NSF configuration is set to `cisco`, enter the `show isis nsf` command to verify that NSF is enabled on the device. Using the Cisco configuration, the display output differs on the active and redundant RPs. The following display shows sample output for the Cisco configuration on the active RP. In this example, note the presence of “NSF restart enabled”:

   ```
   Command | Purpose
   --- | ---
   Step 1 Switch# configure terminal | Enters global configuration mode.
   Step 2 Switch(config)# router isis [tag] | Enables an IS-IS routing process, which places the switch in router configuration mode.
   Step 3 Switch(config-router)# nsf [cisco | ietf] | Enables NSF operation for IS-IS.
   Enter the `ietf` keyword to enable IS-IS in a homogeneous network where adjacencies with networking devices supporting IETF draft-based restartability is guaranteed.
Enter the `cisco` keyword to run IS-IS in heterogeneous networks that might not have adjacencies with NSF-aware networking devices.
   Step 4 Switch(config-router)# nsf interval [minutes] | (Optional) Specifies the minimum time between NSF restart attempts. The default time between consecutive NSF restart attempts is 5 minutes.
   Step 5 Switch(config-router)# nsf t3 (manual [seconds] | adjacency) | (Optional) Specifies the time IS-IS waits for the IS-IS database to synchronize before generating overloaded link-state information for itself and flooding that information out to its neighbors.
The `t3` keyword applies only if you selected IETF operation. When you specify `adjacency`, the switch that is restarting obtains its wait time from neighboring devices.
   Step 6 Switch(config-router)# nsf interface wait seconds | (Optional) Specifies how long an IS-IS NSF restart waits for all interfaces with IS-IS adjacencies to come up before completing the restart. The default is 10 seconds.
Switch# `show isis nsf`

NSF is ENABLED, mode 'cisco'

RP is ACTIVE, standby ready, bulk sync complete
NSF interval timer expired (NSF restart enabled)
Checkpointing enabled, no errors
Local state:ACTIVE, Peer state:STANDBY HOT, Mode:SSO

The following display shows sample output for the Cisco configuration on the standby RP. In this example, note the presence of “NSF restart enabled”:

Switch# `show isis nsf`

NSF enabled, mode 'cisco'
RP is STANDBY, chkpt msg receive count:ADJ 2, LSP 7
NSF interval timer notification received (NSF restart enabled)
Checkpointing enabled, no errors
Local state:STANDBY HOT, Peer state:ACTIVE, Mode:SSO

Step 3 If the NSF configuration is set to `ietf`, enter the `show isis nsf` command to verify that NSF is enabled on the device. The following display shows sample output for the IETF IS-IS configuration on the networking device:

Switch# `show isis nsf`

NSF is ENABLED, mode IETF
NSF pdb state:Inactive
NSF L1 active interfaces:0
NSF L1 active LSPs:0
NSF interfaces awaiting L1 CSNP:0
Awaiting L1 LSPs:
NSF L2 active interfaces:0
NSF L2 active LSPs:0
NSF interfaces awaiting L2 CSNP:0
Awaiting L2 LSPs:
Interface:Serial3/0/2
  NSF L1 Restart state:Running
  NSF p2p Restart retransmissions:0
  Maximum L1 NSF Restart retransmissions:3
  L1 NSF ACK requested:FALSE
  L1 NSF CSNP requested:FALSE
  NSF L2 Restart state:Running
  NSF p2p Restart retransmissions:0
  Maximum L2 NSF Restart retransmissions:3
  L2 NSF ACK requested:FALSE
  L2 NSF CSNP requested:FALSE
  Interface:GigabitEthernet2/0/0
    NSF L1 Restart state:Running
    NSF L1 Restart retransmissions:0
    Maximum L1 NSF Restart retransmissions:3
    L1 NSF ACK requested:FALSE
    L1 NSF CSNP requested:FALSE
    NSF L2 Restart state:Running
    NSF L2 Restart retransmissions:0
    Maximum L2 NSF Restart retransmissions:3
    L2 NSF ACK requested:FALSE
    L2 NSF CSNP requested:FALSE
  Interface:Loopback1
    NSF L1 Restart state:Running
    NSF L1 Restart retransmissions:0
    Maximum L1 NSF Restart retransmissions:3
    L1 NSF ACK requested:FALSE
    L1 NSF CSNP requested:FALSE
    NSF L2 Restart state:Running
**Configuring EIGRP NSF**

To configure EIGRP NSF, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# router eigrp as-number</td>
</tr>
<tr>
<td></td>
<td>Enables an EIGRP routing process, which places the switch in router configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-router)# nsf</td>
</tr>
<tr>
<td></td>
<td>Enables EIGRP NSF. Use this command on the “restarting” switch and all of its peers.</td>
</tr>
</tbody>
</table>

**Verifying EIGRP NSF**

To verify EIGRP NSF, you must check that the NSF function is configured on the SSO-enabled networking device. To verify EIGRP NSF, follow these steps:

**Step 1** Verify that “nsf” appears in the EIGRP configuration of the SSO-enabled device by entering the show running-config command:

Switch# show running-config
.. router eigrp 100
    auto-summary
    nsf
    ..

**Step 2** Enter the show ip protocols command to verify that NSF is enabled on the device:

Switch# show ip protocols
*** IP Routing is NSF aware ***
Routing Protocol is "eigrp 100"
    Outgoing update filter list for all interfaces is not set
    Incoming update filter list for all interfaces is not set
    Default networks flagged in outgoing updates
    Default networks accepted from incoming updates
    EIGRP metric weight K1=1, K2=0, K3=1, K4=0, K5=0
    EIGRP maximum hopcount 100
    EIGRP maximum metric variance 1
    Redistributing: eigrp 100
    EIGRP NSF-aware route hold timer is 240s
    EIGRP NSF enabled
        NSF signal timer is 20s
        NSF converge timer is 120s
    Automatic network summarization is in effect
    Maximum path: 4
Cisco High Availability Features in Cisco IOS XE 3.1.0SG

This section provides a list of High Availability software features that are supported in Cisco IOS XE 3.1.0SG. Links to the feature documentation are included.

Feature guides may contain information about more than one feature. To find information about a specific feature within a feature guide, see the Feature Information table at the end of the guide.

Feature guides document features that are supported on many different software releases and platforms. Your Cisco software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in that guide are supported in your software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Environmental Monitoring and Power Management

**Note**
Before reading this chapter, read the “Preparing for Installation” section of the Catalyst 4500 Series Installation Guide. It is important to ensure that your installation site has enough power and cooling to accommodate the additional electrical load and heat introduced by Power over Ethernet (PoE).

This chapter describes power management and environmental monitoring features in the Catalyst 4500 series switches. It provides guidelines, procedures, and configuration examples.

This chapter consists of the following major sections:

- About Environmental Monitoring, page 12-1
- Power Management, page 12-6
- IEEE 802.3az Energy Efficient Ethernet, page 12-20

**Note**
For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

### About Environmental Monitoring

This section contains the following subsections:

- Using CLI Commands to Monitor your Environment, page 12-2
- Displaying Environment Conditions, page 12-2
- Emergency Actions, page 12-4
Environmental monitoring of chassis components provides early warning indications of possible component failure. This warning helps you to ensure the safe and reliable operation of your system and avoid network interruptions.

This section describes how to monitor critical system components so that you can identify and rapidly correct hardware-related problems.

### Using CLI Commands to Monitor your Environment

Use the `show environment` CLI command to monitor the system. This section gives a basic overview of the command and keywords you need.

Enter the `show environment [alarm | status | temperature]` command to display system status information. Keyword descriptions are listed in Table 12-1.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>alarm</td>
<td>Displays environmental alarms for the system.</td>
</tr>
<tr>
<td>status</td>

### Displaying Environment Conditions

Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E and their associated line cards support multiple temperature sensors per card. The environment condition output includes the temperature reading from each sensor and the temperature thresholds for each sensor. These line cards support three thresholds: warning, critical, and shutdown.

The following example illustrates how to display the environment condition on a Supervisor Engine 6-E and Supervisor 6L-E. The thresholds appear within parentheses.

Emergency Actions

Catalyst 4500 chassis can power down a single card, providing a detailed response to over-temperature conditions on line cards. However, the Catalyst 4500 chassis cannot safely operate when the temperature of the supervisor itself exceeds the critical threshold. The supervisor engine turns off the chassis’ power
supplies to protect itself from overheating. When this happens, you can recover the switch only by
cycling the power on and off switches on the power supplies or by cycling the AC or DC inputs to the
power supplies.

Critical and shutdown temperature emergencies trigger the same action. Table 12-2 lists temperature
emergencies but does not distinguish between critical and shutdown emergencies.

**Table 12-2  Emergency and Action**

<table>
<thead>
<tr>
<th>Case</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case 1. Complete fan failure emergency.</td>
<td>Power down the chassis.</td>

<tr>
<td>supervisor engine or with a standby</td>
<td></td>
</tr>
<tr>
<td>supervisor engine that is not in hot</td>
<td></td>
</tr>
<tr>
<td>standby or cold standby redundancy state.</td>
<td></td>
</tr>
</tbody>
</table>

In Case 4, the standby supervisor engine takes over when the active engine resets itself. If the
temperature emergency remains, the newly active supervisor engine resets the standby supervisor
engine.

Case 5 applies to nonredundant chassis and to chassis with a standby supervisor engine that has been
shutdown or which has not fully booted.

**System Alarms**

Any system has two types of alarms: major and minor. A major alarm indicates a critical problem that
could lead to system shutdown. A minor alarm is informational—it alerts you to a problem that could
become critical if corrective action is not taken.

Table 12-3 lists the possible environment alarms.

**Table 12-3  Possible Environmental Alarms**

<table>
<thead>
<tr>
<th>A temperature sensor over its warning threshold</th>
<th>minor</th>
</tr>
</thead>
<tbody>
<tr>
<td>A temperature sensor over its critical threshold</td>
<td>major</td>
</tr>
<tr>
<td>A temperature sensor over its shutdown threshold</td>
<td>major</td>
</tr>
<tr>
<td>A partial fan failure</td>
<td>minor</td>
</tr>
<tr>
<td>A complete fan failure</td>
<td>major</td>
</tr>
</tbody>
</table>
Fan failure alarms are issued as soon as the fan failure condition is detected and are canceled when the fan failure condition clears. Temperature alarms are issued as soon as the temperature reaches the threshold temperature and are canceled when the temperature drops more than 5 degree C below the threshold. 5 degree C is a hysteresis value designed to prevent toggling alarms.

An LED on the supervisor engine indicates whether an alarm has been issued.

When the system issues a major alarm, it starts a timer whose duration depends on the alarm. If the alarm is not canceled before the timer expires, the system takes emergency action to protect itself from the effects of overheating. The timer values and the emergency actions depend on the type of supervisor engine.

**Note**

Refer to the *Catalyst 4500 Series Switch Module Installation Guide* for information on LEDs, including the startup behavior of the supervisor engine system LED.

Table 12-4 describes the alarms.

**Power Management**

This section describes the power management feature in the Catalyst 4500 series switches. It includes the following topics:

- Power Management for the Catalyst 4500 Series Switches, page 12-7
- Powering Down a Module, page 12-19
- Power Management for the Catalyst 4948 Switches, page 12-20
For power consumption of all Catalyst 4000/4500 family modules, see “Appendix A, Specifications,” in the Catalyst 4500 Series Module Installation Guide. Enter the `show power` command to display the current power redundancy and the current system power usage.

**Power Management for the Catalyst 4500 Series Switches**

This section includes the following subsections:
- Supported Power Supplies, page 12-7
- Power Management Modes for the Catalyst 4500 Switch, page 12-8
- Selecting a Power Management Mode, page 12-9
- Power Management Limitations in Catalyst 4500 Series Switches, page 12-9
- Available Power for Catalyst 4500 Series Switches Power Supplies, page 12-13
- Special Considerations for the 4200 W AC and 6000 W AC Power Supplies, page 12-14
- Combined Mode Power Resiliency, page 12-16
- Special Considerations for the 1400 W DC Power Supply, page 12-18
- Special Considerations for the 1400 W DC SP Triple Input Power Supply, page 12-19
- Power Management Modes for the Catalyst 4948 Switch, page 12-20

**Supported Power Supplies**

You can select from several different power supplies to ensure that you have enough power for the modules installed in your switch.

**Note**

You should select a power supply based on the modules and the amount of PoE desired using the Cisco Power Calculator:

http://tools.cisco.com/cpc/

The choice between 1000 AC and 1400 AC should depend on the type of line cards that the customer plans to use in the chassis.

The Catalyst 4500 series switches support the following power supplies:
- Fixed Wattage—These power supplies always deliver a fixed amount of PoE and system power.
  - 1000 W AC—Supports up to 1050 W of system power. (Not recommended on the Catalyst 4510R switch, PoE not supported)
  - 1400 W AC—Supports up to 1400 W system power. (PoE not supported)
  - 2800 W AC—Supports up to 1400 W of system power and up to 1400 W of PoE.
- Variable Wattage—These power supplies automatically adjust the wattage to accommodate PoE and system power requirements.
  - 1300 W AC—Supports up to 1050 W of system power and 800 W of PoE, limited to a total of 1300 W.
Chapter 12      Environmental Monitoring and Power Management

Power Management

- 1400 W DC—Supports up to 1400 W of system power and variable amounts of PoE, depending on the input feed to the power supply. See “Special Considerations for the 1400 W DC Power Supply” section on page 12-18 for more information.

- 1400 W DC Service Provider—Uses up to three lines (12.5 A, 15 A, 15 A) of DC input and delivers varying amounts of system power ranging from 400 W to 1400 W depending on the lines powered. See “Special Considerations for the 1400 W DC SP Triple Input Power Supply” section on page 12-19 for more information. (PoE not supported)

- 4200 W AC and 6000 W AC—Supports varying amounts of system power and PoE depending on the number of inputs powered and input voltage.

Note

All Catalyst 4500 series switch AC-input power supplies require single-phase source AC. The source AC can be out of phase between multiple power supplies or multiple AC-power plugs on the same power supply because all AC power supply inputs are isolated. Each chassis power supply should ideally have its own dedicated branch circuit sized to local and national codes.

When you insert power supplies in your switch, use power supplies that are of the same wattage. Multi-input power supplies such as 1400 W DC triple-input, 4200 W AC, and 6000 W AC have additional restrictions. Read the sections on special considerations for these power supplies. If you mix power supplies, the switch uses the one with the higher wattage and ignores the other power supply. The power supply status displays as err-disable and the summary displays as all zeros (0) for wattage values in the output for the show power command.

The following example shows the output for the show power command for mixed power supplies:

```
Switch# show power
Power Supply  Model No          Type       Status       Sensor  Status
------  ----------------  ---------  -----------  ------  -----
PS1     PWR-C45-2800AC    AC 2800W   good         good    good
PS2     PWR-C45-1000AC    AC 1000W   err-disable  good    n.a.

*** Power Supplies of different type have been detected***

Power supplies needed by system :1
Power supplies currently available :1

Power Summary                      Maximum
(in Watts)              Used     Available
----------------------   ----     ---------
System Power (12V)        328         1360

```

Power Management Modes for the Catalyst 4500 Switch

The Catalyst 4500 series switches support two power management modes:

- Redundant mode—Redundant mode uses one power supply as a primary power supply and the second power supply as a back-up. If the primary power supply fails, the second power supply immediately supports the switch without any disruption in the network. Both power supplies must be the same wattage. A single power supply must have enough power to support the switch configuration.
Chapter 12      Environmental Monitoring and Power Management

Power Management

- Combined mode—Combined mode uses the power from all installed power supplies to support the switch configuration power requirements. However, combined mode has no power redundancy. If a power supply fails, one or more modules might shut down.

**Note**

On the Catalyst 4510R switch, the 1000 W AC power supply is not enough to support redundant mode for all possible configurations. It is able to support redundant mode for limited configurations that require less than 1050 W.

**Note**

The 1400 W DC power supply supports combined mode for data power. It does not support combined mode for PoE power.

Selecting a Power Management Mode

By default, a switch is set to redundant mode. In the `show power` command, if the `power supplies needed by system` is 1, the switch is in redundant mode; if the `power supplies needed by system` is 2, the switch is in combined mode.

Your switch hardware configuration dictates which power supply or supplies you should use. For example, if your switch configuration requires more power than a single power supply provides, use the combined mode. In combined mode, however, the switch has no power redundancy. Consider the following possibilities:

- The supervisor engine consumes 110 W, the fan boxes for the Catalyst 4503 switch consume 30 W each, the fan boxes for the Catalyst 4506 and Catalyst 4507 switches consume 50 W each, the backplane for the Catalyst 4503 and Catalyst 4506 switches consumes 10 W, and the backplane for the Catalyst 4507 switch consumes 40 W.
- 1000 W can support a fully loaded Catalyst 4503 switch with no powered device support.
- 1300 W can support a fully loaded Catalyst 4503 switch with Cisco powered devices.
- Each PoE port on a WS-X4148-RJ45V module requires 6.3 W. Five fully loaded WS-X4148-RJ45V modules in a switch comprise 240 ports. This configuration requires 1512 W of PoE, plus 300 W for the modules.

Power Management Limitations in Catalyst 4500 Series Switches

Limitation 1

It is possible to configure a switch that requires more power than the power supplies provide. The two ways you could configure a switch to exceed the power capabilities are as follows:

- The power requirements for the installed modules exceed the power provided by the power supplies.

  If you insert a single power supply and then set the switch to combined mode, the switch displays this error message:

  **Insufficient power supplies present for specified configuration.**

  This error message also displays in the output for the `show power` command. This error message displays because, by definition, combined mode requires that two working power supplies be installed in your switch.
If the power requirements for the installed modules exceeds the power provided by the power supplies, the switch displays this error message:

*Insufficient power available for the current chassis configuration.*

This error message also appears in the `show power` command output.

If you attempt to insert additional modules into your switch and exceed the power supply, the switch immediately places the newly inserted module into reset mode, and the switch displays these error messages:

- **Module has been inserted**
- **Insufficient power supplies operating.**

Additionally, if you power down a functioning switch and insert an additional module or change the module configuration so that the power requirements exceed the available power, one or more modules enter reset mode when you power on the switch again.

- **The power requirements for the PoE exceed the PoE provided by the power supplies.**

If you have too many IP phones drawing power from the system, power to IP phones is cut, and some phones may be powered down to reduce the power requirements to match the power supplies.

In the first scenario (power requirements exceed the power supplied), the system attempts to resolve this power usage limitation by evaluating the type and number of modules installed. During the evaluation cycle, beginning from the bottom of the chassis, the system puts the modules that it is unable to support (for lack of power) into reset mode. The supervisor engine and modules for which there is adequate power always remain enabled, with no disruption of network connectivity. Modules placed in reset mode still consume some power and can be removed from the chassis to further reduce power requirements. If you configure the chassis correctly, the system does not enter the evaluation cycle.

A module in reset mode continues to draw power as long as it is installed in the chassis; use the `show power module` command to determine how much power is required to bring the module online.

To compute the power requirements for your system and verify that your system has enough power, add the power consumed by the supervisor engine module(s), the fan box(es), and the installed modules (including PoE). For PoE, total the requirements for all the phones. See the “Powering Down a Module” section on page 12-19 for more information on the power consumption for the various components of your switch.

The 802.3af-compliant PoE modules can consume up to 20 W of PoE to power FPGAs and other hardware components on the module. Be sure to add at least 20 W to your PoE requirements for each 802.3af-compliant PoE module to ensure that the system has adequate power for the PDs connected to the switch.

On the WS-X4148-RJ45V PoE module, PoE consumption cannot be measured. For all PoE calculations, the PoE consumption on this module is presumed to be equal to its administrative PoE.

Use the `show module` command to verify which modules are active and which, if any, have been placed in reset.

The following example shows the `show module` command output for a system with inadequate power for all installed modules. The system does not have enough power for Module 5; the Status displays it as PwrDeny.

If the PoE that is consumed by the module is more than 50 W above the PoE you allocated using the `power inline consumption default` command, the Status displays as PwrOver. If the PoE consumed by the module is more than 50 W above the PoE module limit, the Status displays as PwrFault.
Chapter 12  Environmental Monitoring and Power Management

Limitation 2

Certain configurations on the Catalyst 4507R and Catalyst 4510R chassis exceed the maximum amount of data power available. These configurations include the combination of the follow PIDs:

- 7-slot configuration
- Chassis: WS-C4507R-E, WS-C4510R-E
- Dual supervisor engines: WS-X45-Sup6-E and WS-X45-Sup6L-E
- One or more: WS-X4448-GB-RJ45 or WS-X4148-FX-MT

To maximize the 10/100/1000 port density of 7- and 10- slot chassis, install WS-X4548-GB-RJ45 line cards instead of WS-X4448-GB-RJ45 line cards. If WS-X4448-GB-RJ45 line cards are required, two options are available:

- Option 1
  Only four line card slots can be used on the Catalyst 4507R and six line card slots on the Catalyst 4510R chassis.

- Option 2
  When all slots are required, only one WS-X4448-GB-RJ45 line card can be used.

To maximize the 100-BASE-FX port density of 7- and 10- slot chassis, install WS-4248-FE-SFP line cards with FX optics instead of WS-X4148-FX-MT line cards. If WS-X4148-FX-MT line cards are required, two options are available:

- Option 1
  Only four line card slots can be used on the Cat4507R and six line card slots on the Catalyst 4510R chassis.

- Option 2
  When all slots are required only one WS-X4448-GB-RJ45 line card can be used.

Configuring Redundant Mode on a Catalyst 4500 Series Switch

By default, the power supplies in a Catalyst 4500 series switch are set to operate in redundant mode. To effectively use redundant mode, follow these guidelines:

- Use two power supplies of the same type.
- If you have the power management mode set to redundant mode and only one power supply installed, your switch accepts the configuration but operates without redundancy.

Caution

If you have power supplies with different types or different wattages installed in your switch, the switch does not recognize one of the power supplies and does not have power redundancy.

- For fixed power supplies, choose a power supply that is powerful enough to support the switch configuration.
- For variable power supplies, choose a power supply that provides enough power so that the chassis and PoE requirements are less than the maximum available power. Variable power supplies automatically adjust the power resources at startup to accommodate the chassis and PoE requirements. Modules are brought up first, followed by IP phones.
- The maximum available power for chassis and PoE for each power supply are listed in Table 12-5 on page 12-14.

To configure redundant mode on your Catalyst 4500 series switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>Switch(config)# power redundancy-mode redundant</td>
<td>Sets the power management mode to redundant mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>Switch# show power supplies</td>
<td>Verifies the power redundancy mode for the switch.</td>
</tr>
</tbody>
</table>

The following example shows how to set the power management mode to redundant mode:

```
Switch (config)# power redundancy-mode redundant
Switch (config)# end
Switch#
```

The following example shows how to display the current power redundancy mode. The power supplies needed by system:1 indicates that the switch is in redundant mode.

```
Switch# show power supplies
Power supplies needed by system:1
Switch#
```

An option in the combined mode provides a form of redundancy available with only the 4200 W AC and 6000 W AC power supplies. Refer to the section “Combined Mode Power Resiliency” on page 16.

**Configuring Combined Mode on a Catalyst 4500 Series Switch**

If your switch configuration requires more power than a single power supply can provide, set the power management mode to combined mode. Combined mode utilizes the available power for both power supplies; however, your switch has no power redundancy.

To effectively use combined mode, follow these guidelines:

- Use power supplies of the same type and wattage (fixed or variable and AC or DC).
- If you use power supplies with different types or wattages, the switch utilizes only one of the power supplies.
For variable power supplies, choose a power supply that provides enough power so that the chassis and PoE requirements are less than the maximum available power. Variable power supplies automatically adjust the power resources at startup to accommodate the chassis and PoE requirements.

If you have the power management mode set to combined mode and only one power supply installed, your switch accepts the configuration, but power is available from only one power supply.

When your switch is configured to combined mode, the total available power is not the mathematical sum of the individual power supplies. The power supplies have a predetermined current sharing ratio. See Table 12-5 on page 12-14 for more information.

The maximum available power for chassis and PoE for each power supply are listed in Table 12-5 on page 12-14.

To configure combined mode on your Catalyst 4500 series switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# power redundancy-mode combined</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show power supplies</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# power redundancy-mode combined</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the power management mode to combined mode:

Switch(config)# power redundancy-mode combined
Switch(config)# end
Switch#

The following example shows how to display the current power redundancy mode. The power supplies needed by system: 2 indicates that the switch is in combined mode.

Switch# show power supplies
Power supplies needed by system:2
Switch#

Available Power for Catalyst 4500 Series Switches Power Supplies

Table 12-5 lists the power available for use in the various Catalyst 4500 series switches power supplies. When your switch is configured to combined mode, the total available power is not the mathematical sum of the individual power supplies. The power supplies have a sharing ratio predetermined by the hardware. In combined mode, the total power available is \( P + (P \times \text{sharing-ratio}) \), where \( P \) is the amount of power in the power supply.
Table 12-5  Available Power for Switch Power Supplies

<table>
<thead>
<tr>
<th>Power Supply</th>
<th>Redundant Mode (W)</th>
<th>Combined Mode (W)</th>
<th>Sharing Ratio</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000 W AC</td>
<td>Chassis(^1) = 1050, PoE = 0</td>
<td>Chassis = 1667, PoE = 0</td>
<td>2/3</td>
</tr>
<tr>
<td>1300 W AC</td>
<td>Chassis (max) = 1050, PoE (max) = 800, Chassis + PoE + Backplane ≤ 1300</td>
<td>Chassis (min) = 767, PoE (max) = 1333, Chassis (max) = 1667, PoE (min) = 533, Chassis + PoE + Backplane ≤ 2200</td>
<td>2/3</td>
</tr>
<tr>
<td>1400 W DC</td>
<td>Chassis (min) = 200, Chassis (max) = 1360, PoE (max) = (DC Input(^2) - [Chassis (min) + Backplane] / 0.75) * 0.96</td>
<td>Chassis = 2267(^4), PoE(^5)</td>
<td>Chassis—2/3, PoE—0</td>
</tr>
<tr>
<td>1400 W AC</td>
<td>Chassis = 1360, PoE = 0(^6)</td>
<td>Chassis = 2473, PoE = 0</td>
<td>9/11</td>
</tr>
<tr>
<td>2800 W AC</td>
<td>Chassis = 1360, PoE = 1400</td>
<td>Chassis = 2473, PoE = 2333</td>
<td>Chassis(^7)—9/11, PoE(^8)—2/3</td>
</tr>
</tbody>
</table>

1. Chassis power includes power for the supervisor engine(s), all line cards, and the fan tray.
2. The efficiency for the 1400 W DC power supply is 0.75, and 0.96 is applied to PoE.
3. DC input can vary for the 1400 W DC power supply and is configurable. For more information, see “Special Considerations for the 1400 W DC Power Supply” on page 18.
4. Not available for PoE.
5. Not available for PoE.
6. No voice power.
7. Data-only.
8. Inline power.

Special Considerations for the 4200 W AC and 6000 W AC Power Supplies

The 4200 W AC and 6000 W AC power supply has two inputs: each can be powered at 110 or 220 V.

The output of the `show power` command for the 4200 W AC and 6000 W AC power supplies are similar to that of 1400 W DC triple-input power supply (that is, the status of the submodules (multiple inputs) is displayed). With these two power supplies, you can distinguish submodule “failed” versus “off,” and the status of the submodules (good, bad, or off):

```
Switch# show power
Power Supply     Model No          Type     Status    Fan Sensor Inline Status
--------------- --------------- -------- ---------- ---------- ----------
PS1             PWR-C45-4200ACV  AC 4200W 220V  good  good  good
PS1-1           PWR-C45-4200ACV  AC 4200W 220V  good  good  good
PS1-2           PWR-C45-4200ACV  AC 4200W 220V  off   bad/off good  bad/off
PS2             PWR-C45-4200ACV  AC 4200W 220V  bad/off good  bad/off
PS2-1           PWR-C45-4200ACV  AC 4200W 220V  bad/off good  bad/off
PS2-2           PWR-C45-4200ACV  AC 4200W 220V  bad/off good  bad/off
```
Power supplies needed by system: 1

</tr>
<tr>
<td>Total</td>
<td>140 (not to exceed Total Maximum Available = 2100)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

As with other power supplies, the two power supplies must be of the same type (6000 W AC or 4200 W AC or 1400 W DC). Otherwise, the right power supply is put in err-disable state and the left one is selected. In addition, all the inputs to the chassis must be at the same voltage. In redundant mode, the inputs to the left and right power supplies must be identical. If the left and right power supplies are powered in redundant mode, the power values is based on the power supply with the higher output wattage.

Note

When the system is powered with a 4200 W or 6000 W power supply either in 110 V or 220 V combined mode operation, the available power is determined by the configuration of the system (the type of line cards, the number of line cards, number of ports consuming inline power, etc.) and does not reflect the absolute maximum power.

Note

In a matched redundant power supply configuration, if a power supply submodule fails, the other (good) power supply provides power to its full capability.

Table 12-6 illustrates how the 4200 W AC power supply is evaluated in redundant mode.

Table 12-9 illustrates how the 6000 W AC power supply is evaluated in combined mode.

Combined Mode Power Resiliency

Note

This feature only applies in combined mode when both power supply bays contain the 4200 W AC or 6000 W AC power supply.

Using the combined mode power resiliency feature, you can limit the power usage to a maximum of two or three (configurable) inputs.

With two 4200 W AC or 6000 W AC power supplies, a maximum of four inputs are available. This feature allows you to cap the power usage to that of two or three inputs. If one of the power supplies fails, no loss of power occurs because you have capped its usage to a smaller number of inputs.

To configure the combined mode resiliency feature, perform this task:

Table 12-7 Combined Mode Output for the 4200 W AC Power Supply

</tbody>
</table>
## Command

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <code>configure terminal</code></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# `power redundancy combined max inputs (2</td>
<td>3)`</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# <code>end</code></td>
<td>Exits configuration mode.</td>
</tr>
</tbody>
</table>

If you have max inputs 3 configured with four “good” (220 V) inputs and you limit the user to 5500 W instead of 7600 W and one subunit fails or is powered off, you have three quality inputs providing 5500 W and the chassis is powered at the same rate as it was prior to the failure event:

```
Switch# configuration terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power redundancy combined max inputs 3
Switch(config)# end
Switch#
14:32:01: %SYS-5-CONFIG_I: Configured from console by console
```

Here is the output of the `show power` command prior to invoking this feature:

```
Switch# show power
sh power
Power
Supply Model No Type Status Sensor Inline
------ ----------------- --------- ----------- ------- ------
PS1 PWR-C45-4200ACV AC 4200W good good good
PS1-1 110V good
good
PS1-2 110V good
good
PS2 PWR-C45-4200ACV AC 4200W good good good
PS2-1 110V good
good
PS2-2 110V good
good
```

```
Power supplies needed by system : 1
Power supplies currently available : 2

Power Summary
(in Watts) Used Maximum Available
-------------------- ------ ------
System Power (12V) 140 1360
Inline Power (-50V) 0 1850
Backplane Power (3.3V) 0 40
-------------------- ------ ------
Total 140 (not to exceed Total Maximum Available = 2100)
```

Here is the output after invoking this feature. The combined mode was indicated before

```
Power supplies needed = 2
```

in the output of the `show power` command, combined mode is now indicated by the phrase `Power supplies needed by system: 2 Maximum Inputs = 3`.

```
Switch# show power
sh power
Power
Supply Model No Type Status Fan Sensor Inline
------ ----------------- --------- ----------- ------- ------ ------
PS1 PWR-C45-4200ACV AC 4200W good good good
good
PS1-1 110V good
good
PS1-2 110V good
good
```

Switch#  

Special Considerations for the 1400 W DC Power Supply

⚠️  Caution

Do not mix the 1400 W DC power supply with any other power supply, even for a hot swap or other short-term emergency. Doing so can seriously damage your switch.

Keep in mind the following guidelines when using a 1400 W DC power supply with your Catalyst 4500 series switch:

- The 1400 W DC power supply works with a variety of DC sources. The DC input can vary from 300 W to 7500 W. Refer to the power supply documentation for additional information.

- The supervisor engine cannot detect the DC source plugged into the 1400 W DC power supply. If you are using the 1400 W DC power supply, use the power dc input command to set the DC input power. For more information on this command, see the “Configuring the DC Input for a Power Supply” section on page 12-18.

- The software automatically adjusts between system power (for modules, backplane, and fans) and PoE. Although PoE is 96 percent efficient, system power has only 75 percent efficiency. For example, each 120 W of system power requires 160 W from the DC input. This requirement is reflected in the “Power Used” column of the output for the show power available command.

- The 1400 W DC power supply has a separate power on or off switch for PoE. The power supply fan status and main power supply status are tied together. If either of them fails, both the power supply and its fan report as bad/off. You should verify that the main power is on before turning on the power for the inline switch. In addition, you should verify that the power for the inline switch is off before turning off the main power.

Configuring the DC Input for a Power Supply

To configure the DC input power for the 1400 W DC power supply or a power shelf, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters configuration mode.</td>
</tr>
</tbody>
</table>
Power Management

The same configuration is applied to both power slots. For example, if you set the dc power input to 1000 W, the switch expects 1000 W as the external DC source for both slot 1 and slot 2 (if present).

The following example shows how to set the external DC power source to 1000 W:

Switch# configure terminal
Switch (config)# power dc input 1000
Switch (config)# end
Switch#

If you use the 1400 W DC SP power supply in combined mode, the inputs do not have to match.

Special Considerations for the 1400 W DC SP Triple Input Power Supply

Unlike the 1400 W DC power supply, the 1400 W DC SP power supply has submodules (multiple inputs) that can be powered on or off. With Cisco IOS Release 12.2(25)EW, the output of the show power command is modified to display the status of these submodules:

```
Switch# show power
Power Supply Model No  Type     Status   Fan Sensor Inline Status
-------- -------------- -------- -------- ---------- ------ ------
PS1     PWR-C45-1400DC DCSP1400W good      good     n.a.
PS1-1                            12.5A good
PS1-2                            15.0A bad
PS1-3                            15.0A off
PS2     none                     --      --      --
```

Observer the following guidelines when using a 1400 W DC SP power supply with your Catalyst 4500 series switch:

- When you use two 48 V power rails to drive two power supplies, you might use cross-wiring to connect the power supplies (to rails) to minimize the inrush current drawn during an initial power up. In this situation, you should configure the switch in combined mode before you take a rail down for maintenance.
- Ordinarily, when configured for redundancy, two power supplies must be matched (have identical inputs). For example, you might provide power to inputs 1 and 3 on both PS1 and PS2. If power supplies are mismatched upon bootup, the right (second) power supply is in err-disable state.

In a matched redundant power supply configuration, if a power supply submodule fails, the other (good) power supply provides power to its full capability.

Powering Down a Module

If your system does not have enough power for all modules installed in the switch, you can power down a module, and place it in low-power mode. To power down a module, perform this task:
### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# no hw-module module num power</code></td>
<td>Turns power down to the specified module by placing it in low power mode.</td>
</tr>
</tbody>
</table>

To power on a module that has been powered down, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# hw-module module num power</code></td>
<td>Turns power on to the specified module.</td>
</tr>
</tbody>
</table>

This example shows how to power down module 6:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no hw-module module 6 power
Switch(config)# end
Switch#
```

**Note**

After you enter `no hw-mod mod x power` command and OIR the linecard, the configuration persists and is valid for any slot in the chassis it is applied to. You observe the same behavior in the active and standby supervisor engines.

---

### Power Management for the Catalyst 4948 Switches

You can select from AC or DC power supplies to ensure that you have enough power for your switch. The Catalyst 4948 switches support the following power supplies:

- 300 W AC
- 300 W DC

These power supplies are incompatible with Catalyst 4500 series switches. Because Power over Ethernet (PoE) is not supported on the Catalyst 4948 switch, you only need a limited wattage is needed. (For information on PoE, see Chapter 13, “Configuring Power over Ethernet.”) When you insert power supplies in your switch, the EEPROM on the power supplies can be read by the system software even if the supply is not powered on. You may mix AC and DC power supplies.

### Power Management Modes for the Catalyst 4948 Switch

The Catalyst 4948 switches support the redundant power management mode. In this mode, if both power supplies are operating normally, each provides from 20/80 to 45/55 percent of the total system power requirements at all times. If one power supply fails, the other unit increases power to 100 percent of the total power requirement.

### IEEE 802.3az Energy Efficient Ethernet

**Note**

EEE is supported on WS-X4748-UPOE+E and WS-X4748-RJ45-E.
Energy Efficient Ethernet is an extension of the IEEE 802.3 standard that provides a mechanism and a standard for reducing energy usage without reducing the vital function of network interfaces. EEE defines the signaling necessary for energy savings during periods where no data is sent on the interface.

EEE defines support for physical layer devices (PHYs) to operate in Low Power Idle (LPI) mode. When enabled, EEE supports QUIET times during low link utilization allowing both sides of a link to disable portions of each PHY’s operating circuitry and save power. This functionality is provided per port and is not enabled by default. To avoid issues with EEE functionality on any port during run-time, Cisco provides the `power efficient-ethernet auto` command to enable or disable EEE.

Because EEE relies on Auto Negotiation pulse to determine whether to activate EEE, the port must initially enable auto negotiation. Furthermore, EEE is the correct action provided the speed is auto 100M, auto 1000M, or auto 100M and 1000M. 10M (either auto or forced mode) does not require EEE for power saving.

For more details, see the URL:

Sections include:
- Determining EEE Capability, page 12-21
- Enabling EEE, page 12-21
- Determining EEE Status, page 12-22

## Determining EEE Capability

To determine whether a line card supports EEE, use the `show interface capabilities module module` command, as follows:

```
Switch# show interface capabilities module 3
```

```
GigabitEthernet3/1
Model:                 WS-X4748-NGPOE+E-RJ-45
Type:                  10/100/1000-TX
Speed:                 10,100,1000,auto
Duplex:                half,full,auto
Auto-MDIX:             yes
EEE:                   yes ( 100-Tx and 1000-T auto mode )
```

## Enabling EEE

To enable EEE on a given port, use the `power efficient-ethernet auto` command.

```
Step 1  Switch# configure terminal
```

```
Step 2  Switch(config)# interface interface
```

```
Step 3  Switch(config-if)# power efficient-ethernet auto
```

```
Step 4  Switch(config-if)# exit
```

The following example shows how to enable EEE:

```
Switch# configure terminal
```

```
Switch(config)# interface interface
```

```
Switch(config-if)# power efficient-ethernet auto
```

```
Switch(config-if)# exit
```

```
```
IEEE 802.3az Energy Efficient Ethernet

Chapter 12 Environmental Monitoring and Power Management

Determining EEE Status

To determine EEE status use the show platform software interface interface status command:

The following example determines EEE status:

```plaintext
Switch(config)# show platform software interface g2/1 status
Switch Phyport G2/1 Software Status
EEE: Disabled
```

EEE status can have the following values:

- **EEE: N/A** — The port is not capable of EEE.
- **EEE: Disabled** — The port EEE is disabled.
- **EEE: Disagreed** — The port EEE is not set because a remote link partner might be incompatible with EEE; either it is not EEE capable, or its EEE setting is incompatible.
- **EEE: Operational** — The port EEE is enabled and operating.
About Power over Ethernet

The Catalyst 4500 series switch provides Power over Ethernet (PoE) support for both Cisco Prestandard PoE and the IEEE 802.3af standard (ratified in 2003). PoE is supported by all Catalyst 4500 series chassis and requires a PoE module and power supply. The amount of PoE power available depends on
the PoE capabilities of individual power supplies. Support for PoE enables the system to power inline devices, such as IP phones, IP video phones, and wireless access points over standard copper cabling (Category 5, 5e, or 6 cabling).

In addition, with PoE, you do not need to provide wall power for each PoE enabled device. This eliminates the cost for additional electrical cabling that is otherwise necessary for connected devices. Moreover, PoE enables you to isolate critical devices on a single power system, enabling the entire system to be supported by UPS backup.

You typically deploy a Catalyst 4500 series switch in one of two deployment scenarios. The first scenario is data-only, which requires power to operate the switch and the associated modules. The second scenario supports data and PoE (also termed “inline power”) for deployments where the attached device derives power from the Ethernet port.

Catalyst 4500 series switches can sense if a powered device is connected to a PoE module. They can supply PoE to the powered device if there is no power on the circuit. (If there is power on the circuit, the switch does not supply it.) The powered device can also be connected to an AC power source and supply its own power to the voice circuit.

Note

You should select the amount of PoE desired using the Cisco Power Calculator:

http://tools.cisco.com/cpc/

## Hardware Requirements

To power a device using PoE, your chassis must use at least one of the power supplies listed in Table 13-1, and connect the device to at least one of the switching modules listed in Table 13-1.

## Power Management Modes

If your switch has a module capable of providing PoE to end stations, you can set each interface on the module to automatically detect and apply PoE if the end station requires power.
The Catalyst 4500 series switch has three PoE modes:

- **auto**—PoE interface. The supervisor engine directs the switching module to power up the interface only if the switching module discovers the phone and the switch has enough power. You can specify the maximum wattage that is allowed on the interface. If you do not specify a wattage, then the switch delivers no more than the hardware-supported maximum value. This mode has no effect if the interface is not capable of providing PoE.

- **static**—High priority PoE interface. The supervisor engine preallocates power to the interface, even when nothing is connected, guaranteeing that power exists for the interface. You can specify the maximum wattage that is allowed on the interface. If you do not specify a wattage, then the switch preallocates the hardware-supported maximum value. If the switch does not have enough power for the allocation, the command fails. The supervisor engine directs the switching module to power up the interface only if the switching module discovers the powered device.

- **never**—Data interface only. The supervisor engine never powers up the interface, even if an unpowered phone is connected. This mode is only needed when you want to make sure power is never applied to a PoE-capable interface.

The switch can measure the actual PoE consumption for an 802.3af-compliant PoE module, and displays this in the `show power module` command.

PoE consumption cannot be measured on the WS-X4148-RJ45V PoE module. For all PoE calculations, the PoE consumption on this module is presumed to be equal to its administrative PoE.

For more information, see the “Displaying the PoE Consumed by a Module” section on page 13-8.

For most users, the default configuration of “auto” works well, providing plug-and-play capability. No further configuration is required. However, to make an interface higher priority or data only, or to specify a maximum wattage, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>**Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td></td>
<td>Selects the interface to configure.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**Switch(config-if)# power inline (auto [max milli-watts]</td>
</tr>
<tr>
<td></td>
<td>The <strong>auto</strong> keyword sets the interface to automatically detect and supply power to the powered device. It is the default configuration. The <strong>static</strong> keyword sets the interface to higher priority than auto. If necessary, use the <strong>max</strong> keyword to specify the maximum wattage allowed on the interface (4000 to 15400 milliwatts for most switching modules. As of Cisco IOS Release 12.2(44)SG, the WS-X4648-RJ45V+E can support up to 30 W available per-port and the WS-X4648-RJ45V-E supports up to 20 W. For more information, see “Enhanced Power PoE Support on the E-Series Chassis” on page 15). Use the <strong>never</strong> keyword to disable detection and power for the PoE capable interface.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Switch(config-if)# end</strong></td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>**Switch# show power inline (fastethernet</td>
</tr>
<tr>
<td></td>
<td>Displays the PoE state for the switch.</td>
</tr>
</tbody>
</table>
Chapter 13  Configuring Power over Ethernet

Power Management Modes

Note

If you set a non-PoE-capable interface to automatically detect and apply power, an error message indicates that the configuration is not valid.

The following example shows how to set the Fast Ethernet interface 4/1 to automatically detect PoE and send power through that interface, and to verify the PoE configuration:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline auto
Switch(config-if)# end
Switch# show power inline fastethernet 4/1
Available:677(w) Used:11(w) Remaining:666(w)

Switch#

The following example shows how to configure an interface so that it never supplies power through the interface:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/2
Switch(config-if)# power inline never
Switch(config-if)# end
Switch#

Intelligent Power Management

All Catalyst 4500 PoE-capable modules use Intelligent Power Management to provide power on each interface. When a powered device (PD) is attached to a PoE-capable port, the port detects the PD and provision power accordingly. If a Cisco PD is used, the switch and PD negotiate power using CDP packets to determine the precise amount of power needed by the PD. If the PD is 802.3af compatible, the difference between what is mandated by the 802.3af class and what is actually needed by the PD is returned to the power budget for use by additional devices. In this way, power negotiation enables customers to stretch their power budget and use it more effectively.

Power negotiation also enables the interoperability of newer Cisco powered devices with older legacy PoE-capable ports from Cisco. Newer Cisco PDs do not consume more than what the switch port can provide.
Configuring Power Consumption for Powered Devices on an Interface

By default, when the switch detects a powered device on an interface, it assumes the powered device consumes the maximum the port can provide (7 W on a legacy PoE module and 15.4W on the IEEE PoE modules introduced in Cisco IOS Release 12.2(18)EW). When the switch receives a CDP packet from the powered device, the wattage automatically adjusts downward to the specific amount required by that device. Normally, this automatic adjustment works well, and no further configuration is required or recommended. However, you can specify the powered device's consumption for a particular interface to provide extra functionality from your switch. This behavior is useful when CDP is disabled or not available.

**Note**
When manually configuring the consumption for powered devices, you need to account for the power loss over the cable between the switch and the powered device.

**Note**
The `inline power consumption` command overrides the power allocated to the port through IEEE/Cisco phone discovery and CDP/LLDP power negotiation. To guarantee safe operation of the system, ensure that the value configured here is no less than the actual power requirement of the attached device. If the power drawn by the inline powered devices exceeds the capability of the power supply, it could trip the power supply.

To change the power consumption of a single powered device, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# interface {fastethernet</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# [no] power inline consumption milli-watts</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show power inline consumption {fastethernet</td>
</tr>
</tbody>
</table>

This example shows how to set the PoE consumption to 5000 milliwatts for interface gi 7/1 regardless what is mandated by the 802.3af class of the discovered device, or by any CDP packet received from the powered device. This example also verifies the PoE consumption on interface gi 7/1.

The following output displays the initial power consumption of the interface:

```
Switch# show power inline gi 7/1
Available:627(w)  Used:267(w)  Remaining:360(w)

Interface Admin Oper  Power (Watts)  Device  Class
                   From PS  To Device
------------------- -------- ------- --------- -------- ------
Gi7/1      auto  on    7.9      7.0    IP Phone 7941  3
```

OL-25340-01

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG
Displaying the Operational Status for an Interface

Each interface has an operational status which reflects the PoE status for an interface. The operational status for an interface is defined as one of the following:

- **on**—Power is supplied by the port.
- **off**—Power is not supplied by the port. If a powered device is connected to an interface with external power, the switch does not recognize the powered device. The “Device” column in the `show power inline` command displays as n/a.
- **Power-deny**—The supervisor engine does not have enough power to allocate to the port, or the power that is configured for the port is less than the power required by the port; power is not being supplied by the port.
- **err-disable**—The port is unable to provide power to the connected device that is configured in static mode.
- **faulty**—The port failed diagnostics tests.

To view the operational status for an interface, use the `show power inline` command.
This example shows how to display the operational status for all interfaces on module 3:

```
Switch# show power inline module 3
Available:677(w) Used:117(w) Remaining:560(w)

Interface Admin Oper Power(Watts) Device Class
From PS To Device

```

Switch#

This example shows how to display the operational status for Fast Ethernet interface 4/1:

```
Switch# show power inline fa4/1
Available:677(w) Used:11(w) Remaining:666(w)

Interface Admin Oper Power(Watts) Device Class
From PS To Device
--------- ------ ---------- ---------- ---------- ------------------- ----- 
Fa4/1     auto on         11.2       10.0       Ieee PD             0
--------- ------ ---------- ---------- ---------- ------------------- ----- 

Switch#
```

Displaying all PoE Detection and Removal Events

Starting with Cisco IOS Release 15.0(2)SG2/XE 3.2.2SG, a Catalyst 4500 series switch can display all PoE detection and removal events.

To enable PoE event logging, you use the `power inline logging global` command:

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power inline logging global
Switch(config)# int gigabitEthernet 5/5
Switch(config-if)# shut
```
Displaying the PoE Consumed by a Module

A Catalyst 4500 series switch can measure the actual PoE consumption for an 802.3af-compliant PoE module. You can observe this consumption by using `show power module` and `show power detail` commands. For all PoE calculations, presume that the PoE consumption on the WS-X4148-RJ45V module equals its administrative PoE.

The 802.3af-compliant PoE modules can consume up to 20 W of PoE to power FPGAs and other hardware components on the module. To ensure that the system has sufficient power for the PDs connected to the switch, add at least 20 W to your PoE requirements for each 802.3af-compliant PoE module.

The following example uses the `show power module` command to display the PoE consumption for an 802.3af-compliant module:

```
Switch# show power module
Power fail interrupts received on slot 1: 0
Power fail interrupts received on slot 2: 0

Debounce value for power fail status: 0 microseconds

Switch#
```

---

**Note:** “Watts budgeted” is not relevant for C4500-X series switches.

The Inline Power Oper column displays the amount of PoE consumed by the powered devices that are attached to the module, in addition to the PoE consumed by the FPGAs and other hardware components on the module.

The Inline Power Admin column displays only the amount of PoE allocated by the powered devices attached to the module.
The operating PoE consumption for an 802.3af-compliant module can be non-zero, even when no powered devices are attached to the module, because of the PoE consumed by FPGAs and other hardware components on the module. In addition, the operating PoE can vary because of fluctuations in the PoE consumed by the hardware components.

The following example uses the `show power detail` and `show power inline` commands to display the PoE consumption for an 802.3af-compliant module:

```
Switch# show power detail

Power Supply  Model No     Type     Status     Fan    Inline

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

OL-25340-01

13-11
PoE Policing and Monitoring

This functionality is supported on the WS-X4548-RJ45V+, WS-X4648-RJ45V-E, and WS-X4648-RJ45V+E line cards.

PoE policing protects a switch from faulty inline powered devices that may draw more current than they were designed for. When a device is connected to a port, a line card detects the type of device connected and allocates the appropriate amount of power. It sets a PoE policing threshold to a value 5 percent greater than the allocated power. If the device consumes more power than specified by the policing threshold for a more than 1 second, the port shuts down. Depending on the policing action configured, the port may then be error-disabled, or a message might be logged to the console and the port restarted.

PoE monitoring lets you display the true power consumption of inline powered devices attached to the switch, allowing you determine your actual power consumption.

This section includes these topics:
- PoE Policing Modes, page 13-12
- Configuring Power Policing on an Interface, page 13-13
- Displaying Power Policing on an Interface, page 13-14
- Configuring Errdisable Recovery, page 13-14

PoE Policing Modes

PoE policing comprises two modes, which determine the action to take on the interface after a port shuts down because of an inline-power policing violation:

- **Logging** — An error message is logged to the console and the interface restarts; the device powers up.

- **Errdisable** (Default) — In addition to logging an error message to the console, the interface is placed in an errdisable state so that the device attached to the port does not receive inline-power until you restart the port or configure an errdisable autorecovery mechanism.

**Note**

After an inline-power policing violation occurs and the port shuts down, PoE policing automatically turns on again when the port restarts. If the connected device exceeds its allocated power again, the port once again shuts down.
Configuring Power Policing on an Interface

The default policing levels are determined by the discovery and power allocation methods (listed in order of priority):

- Configured consumption values, in case any exist
- CDP allocated values (for Cisco devices using CDP)
- Allocated power from IEEE discovery (for devices using this mechanism)

To activate default PoE policing, enter the following:

Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int g2/1
Switch(config-if)# power inline police
Switch(config-if)# end
Switch# show power inline police g2/1
Available:800(w) Used:32(w) Remaining:768(w)

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin State</th>
<th>Oper State</th>
<th>Admin Police</th>
<th>Oper Police</th>
<th>Cutoff Power</th>
<th>Oper Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi2/1</td>
<td>auto</td>
<td>on</td>
<td>errdisable</td>
<td>ok</td>
<td>17.2</td>
<td>16.7</td>
</tr>
</tbody>
</table>

The default action for power policing is to set the port to errdisable; the `power inline police` command is equivalent to the `power inline police action errdisable` command, as the above example illustrates. The following example illustrates how to configure the logging policing action:

Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int g2/1
Switch(config-if)# power inline police action log
Switch(config-if)# end
Switch# show power inline police g2/1
Available:800(w) Used:32(w) Remaining:768(w)

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin State</th>
<th>Oper State</th>
<th>Admin Police</th>
<th>Oper Police</th>
<th>Cutoff Power</th>
<th>Oper Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi2/1</td>
<td>auto</td>
<td>on</td>
<td>log</td>
<td>ok</td>
<td>17.2</td>
<td>16.7</td>
</tr>
</tbody>
</table>

When a PD consumes more than its allocated power, the port shuts down and a warning message similar to the following appears on the console.

For the WS-X4648-GB-RJ45V and WS-X4648-GB-RJ45V+:

For the WS-X4548-RJ45V+:

For actions of Log type, the port restarts itself and the device reboots. In contrast, when the action is to set the port in an errdisable state, a log message similar to the following appears:

*Sep 26 09:30:20.463: %PM-4-ERR_DISABLE: inline-power error detected on Gi2/1, putting Gi2/1 in err-disable state

Switch# show power inline police g2/1
Available:800(w) Used:16(w) Remaining:784(w)
Displaying Power Policing on an Interface

You can display power policing on an interface, on a module, or for all the PoE-capable line cards in a chassis.

The following example shows output for the `show power inline police` command:

```
Switch# show power inline police
Available:623(w)  Used:6(w)  Remaining:617(w)
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin State</th>
<th>Oper State</th>
<th>Admin Police</th>
<th>Oper Police</th>
<th>Cutoff Power</th>
<th>Oper Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi2/1</td>
<td>auto</td>
<td>off</td>
<td>none</td>
<td>n/a</td>
<td>n/a</td>
<td>0.0</td>
</tr>
<tr>
<td>Gi2/2</td>
<td>auto</td>
<td>on</td>
<td>errdisable</td>
<td>n/a</td>
<td>n/a</td>
<td>16.7</td>
</tr>
<tr>
<td>Gi2/3</td>
<td>auto</td>
<td>off</td>
<td>errdisable</td>
<td>n/a</td>
<td>0.0</td>
<td>0.0</td>
</tr>
<tr>
<td>Gi2/4</td>
<td>auto</td>
<td>on</td>
<td>errdisable</td>
<td>ok</td>
<td>16.6</td>
<td>11.4</td>
</tr>
<tr>
<td>Gi2/5</td>
<td>auto</td>
<td>on</td>
<td>log</td>
<td>ok</td>
<td>16.6</td>
<td>11.2</td>
</tr>
<tr>
<td>Gi2/6</td>
<td>auto</td>
<td>on</td>
<td>errdisable</td>
<td>overdrawn</td>
<td>0.0</td>
<td>0.0</td>
</tr>
</tbody>
</table>

The following table lists the interface and the status.

<table>
<thead>
<tr>
<th>Interface Configuration</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi2/1</td>
<td>No PD connected, no policing configured.</td>
</tr>
<tr>
<td>Gi2/2</td>
<td>PD connected, no policing configured.</td>
</tr>
<tr>
<td>Gi2/3</td>
<td>No PD connected, policing configured (is enabled when PD is connected). Policing action is errdisable.</td>
</tr>
<tr>
<td>Gi2/4</td>
<td>PD connected, policing configured. Configured policing action is errdisable. Port is currently operating within policing limits.</td>
</tr>
<tr>
<td>Gi2/5</td>
<td>PD connected, policing configured. Configured policing action is log. Port is currently operating within policing limits.</td>
</tr>
<tr>
<td>Gi2/6</td>
<td>PD connected, policing configured. Configured policing action is errdisable. Port is currently in errdisable state as it has overdrawn its policed power level.</td>
</tr>
</tbody>
</table>

If you enter the `show power inline` command at the global level (`show power inline police`), the last line of the output under the Oper Power field displays the total of true inline power consumption of all devices connected to the switch.

Configuring Errdisable Recovery

By default, errdisable auto recovery for inline-power is disabled; when an interface is placed in an errdisable state because of an inline-power policing violation, it remains in that state. You must enter `shut` and then `no shut` on the affected interface to revive it.
The errdisable autorecovery mechanism allows you to configure a timer for errdisable recovery so that when an interface enters errdisable state (after the timer expires), the interface returns from the errdisable state.

**errdisable detection**

By default, errdisable detection for inline-power is enabled, as the following example illustrates:

```
Switch# show errdisable detect
ErrDisable Reason Detection Mode
----------------- --------- -----
inline-power Enabled port
```

*Note* If detection is disabled (through the `errdisable detect cause inline-power` command), the port is not placed in errdisable state when it exceeds its power policing threshold.

**errdisable recovery**

By default, errdisable recovery for inline-power is disabled. To enable errdisable recovery, enter the `errdisable detect cause line-power` command:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# errdisable detect cause line-power
Switch(config)# end
Switch# show errdisable recovery
ErrDisable Reason Timer Status
----------------- --------------
----------- ---------------
inline-power Enabled
```

### Enhanced Power PoE Support on the E-Series Chassis

The WS-X4648-RJ45V-E, WS-X4648-RJ45V+E, and WS-X4548-RJ45V+ switching modules support IEEE 802.3af PoE as well as the Cisco proprietary Inline Power standard. With Cisco IOS Release 12.2(44)SG, the WS-X4648-RJ45V+E line card can also support the IEEE 802.3at standard with up to 30 W available per-port. The WS-X4648-RJ45V-E line card also supports up to 20 W. The WS-X4548-RJ45V+ switching module is supported with Cisco IOS Release 12.2(50)SG and can provide up to 30 W of inline power per-port.

For these switching modules, the valid milliwatt ranges for the `power inline` command have been increased appropriately for the module, as the following table illustrates:

<table>
<thead>
<tr>
<th>Line card</th>
<th>Standard</th>
<th>Max Power/Port</th>
<th>Cisco IOS Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>WS-X4648-RJ45V-E</td>
<td>IEEE 802.3af</td>
<td>20 W</td>
<td>12.2(44)SG</td>
</tr>
<tr>
<td></td>
<td>IEEE 802.3at</td>
<td></td>
<td></td>
</tr>
<tr>
<td>WS-X4648-RJ45V+E</td>
<td>IEEE 802.3af</td>
<td>30 W</td>
<td>12.2(44)SG</td>
</tr>
<tr>
<td></td>
<td>IEEE 802.3at</td>
<td></td>
<td></td>
</tr>
<tr>
<td>WS-X4548-RJ45V+</td>
<td>IEEE 802.3af</td>
<td>30 W</td>
<td>12.2(50)SG</td>
</tr>
<tr>
<td></td>
<td>IEEE 802.3at</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The default power inline configurations usually are sufficient; no additional configuration is required even for high power-consumption Cisco powered devices (for example, a Cisco AP1250 Wireless Access Point). When a high-power consumption device is attached to a port on a WS-X4648-RJ45V-E or WS-X4648-RJ45V+E line card, the switch and device negotiate power using CDP packets to automatically determine the extended amount of power needed by the device.

Depending on the deployment requirements and design, you specify a specific configuration with the `power inline` command.

The following example shows how to pre-allocate PoE allocation to 16500 mW for Gi 2/1, regardless of what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline static max 16500
Switch(config-if)# end
Switch#
```

### Configuring Universal PoE

**Note**

This feature is only available on Supervisor Engine 7-E and Supervisor Engine 7L-E.

Although IEEE 802.at only provides for power up to 30W per port, the WS-X4748-UPOE+E module can provide up to 60W using the spare pair of an RJ45 cable (wires 4,5,7,8) with the signal pair (wires 1,2,3,6). Power on the spare pair is enabled when the switch port and end-device mutually identify themselves as Universal PoE (UPOE) capable using CDP or LLDP and the end-device requests for power on the spare pair to be enabled. When the spare pair is powered, the end-device can negotiate up to 60W power from the switch using CDP or LLDP.

If the end-device is PoE capable on both signal and spare pairs but does not support the CDP or LLDP extensions required for UPOE, then the following configuration automatically enables power on both signal and spare pairs from the switch port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch # interface terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface {fastethernet</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# power inline four-pair forced</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# shutdown</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# no</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# show platform software interface {fastethernet</td>
</tr>
</tbody>
</table>
The following example shows how to automatically enable power on both signal and spare pairs from switch port gigabit ethernet 2/1:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline four-pair forced
Switch(config-if)# shutdown
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#

Do not enter this command if the end-device is incapable of sourcing inline power on the spare pair or if the end-device supports the CDP or LLDP extensions for UPOE.
Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant

This chapter describes how to install Network Assistant on the workstation and configure the Catalyst 4500 (or 4900) series switch to communicate with Network Assistant. (The term Catalyst 4500 series switch will be used to refer to both switch types in this chapter.) It also describes how to create communities and clusters, which are two technologies used by Network Assistant to manage a group of network devices, including the Catalyst 4500 series switch.

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

This chapter contains these topics:

- About Network Assistant, page 14-2
- Network Assistant-Related Parameters and Their Defaults, page 14-3
- Network Assistant CLI Commands, page 14-3
- Configuring Your Switch for Network Assistant, page 14-4
- Managing a Network Using Community, page 14-6
- Converting a Cluster into a Community, page 14-10
- Managing a Network Using Cluster, page 14-11
- Configuring Network Assistant in Community or Cluster Mode, page 14-13

The Network Assistant is not bundled with an online software image on Cisco.com. You can download the Network Assistant at this location:

About Network Assistant

Network Assistant is a free network management tool that allows you to configure and manage Catalyst 4500 series switches using a graphical user interface (GUI). Network Assistant works in both secure and unsecure environments. Network Assistant manages standalone devices or groups of devices or switches (in communities or clusters) from anywhere in your intranet. Using Network Assistant, you can perform multiple configuration tasks without having to remember commands.

Community Overview

A **community** is a device group that can contain up to 20 connected network devices. Network Assistant uses the Cisco Discovery Protocol (CDP) automatic discovery capability to find eligible network devices and to add them to a community. When a network device is added to a community, it becomes a member device. Network Assistant manages, configures, and monitors each member on an individual basis; therefore, each member must have an IP address assigned to it.

When you use communities, you need to have an HTTP server, and you need to configure an IP address on each switch.

Clustering Overview

A **switch cluster** is a set of up to 16 connected, cluster-capable Catalyst switches that are managed as a single entity. The switches in the cluster use the switch clustering technology so that you can configure and troubleshoot a group of different Catalyst 4500 series switch platforms through a single IP address.

Using switch clusters simplifies the management of multiple switches, regardless of their physical location and platform families.

By default, Network Assistant in clustering mode discovers up to seven hops away.

In a switch cluster, one switch must be the **cluster commander switch**, and up to 15 other switches can be **cluster member switches**. The total number of switches in a cluster cannot exceed 16 switches. The cluster command switch is the single point of access used to configure, manage, and monitor the cluster member switches. Cluster members can belong to only one cluster at a time.

Always choose a Catalyst 4500 or 4948 series switch as the cluster command switch.
Network Assistant-Related Parameters and Their Defaults

Table 14-1 lists the Network Assistant-related configuration parameters on a Catalyst 4500 series switch.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Default Value</th>
<th>Recommended Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>Disabled</td>
<td>Optional</td>
</tr>
<tr>
<td>IP address</td>
<td>Depends on community or discovery option</td>
<td>User selectable</td>
</tr>
<tr>
<td>IP HTTP port number</td>
<td>80</td>
<td>Optional</td>
</tr>
<tr>
<td>IP HTTPS port number</td>
<td>443</td>
<td>Optional</td>
</tr>
<tr>
<td>IP HTTP server</td>
<td>Disabled</td>
<td>Enabled</td>
</tr>
<tr>
<td>Cluster run</td>
<td>Disabled</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

1. You need to set an IP address in each switch for community device discovery and for the cluster commander.
2. Port number on the Network Assistant and the Catalyst 4500 series switch must match.
3. You can only change this value for a cluster of devices. Port number on the Network Assistant and on the Catalyst 4500 series switch must match. Value can be changed to any non-default number above 1024.
4. Required for Network Assistant to access the device.
5. Enabled only if you want to manage a cluster of devices.

Network Assistant CLI Commands

Table 14-2 describes the Network Assistant-related CLI commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>[no] cluster enable</td>
<td>Names the cluster.</td>
</tr>
<tr>
<td>[no] cluster run</td>
<td>Enables clustering.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> This command is used strictly for clustering.</td>
</tr>
<tr>
<td>[no] ip http server</td>
<td>Configures the HTTP on a switch.</td>
</tr>
<tr>
<td>[no] ip http port port_number</td>
<td>Configures the HTTP port.</td>
</tr>
<tr>
<td>[no] ip domain-name domain_name</td>
<td>Configures the domain on the switch.</td>
</tr>
<tr>
<td>[no] ip http secure-server</td>
<td>Configures and enable HTTPS on a switch.</td>
</tr>
<tr>
<td>[no] ip http secure-port</td>
<td>Configures the HTTPS port.</td>
</tr>
<tr>
<td></td>
<td><strong>port_number</strong></td>
</tr>
<tr>
<td>[no] ip http max-connections connection_number</td>
<td>Configures the maximum concurrent connections to the HTTP server.</td>
</tr>
</tbody>
</table>
Configuring Your Switch for Network Assistant

This section includes the following topics:

- (Minimum) Required Configuration, page 14-4
- (Additional) Configuration Required to Use Community, page 14-5
- (Additional) Configuration Required to Use Clustering, page 14-5

( Minimum) Required Configuration

If you use the default configuration, access the Catalyst 4500 series switch and enter the **ip http server** (for HTTP) or **ip http secure-server** (for HTTPS) global configuration command.

To configure the Catalyst 4500 series switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# ip http server</td>
<td>(HTTP only) Enables the HTTP server on the switch. By default, the HTTP server is disabled.</td>
</tr>
<tr>
<td>or Switch(config)# ip domain-name domain_name</td>
<td>Enables the domain name on the switch to configure HTTPS.</td>
</tr>
<tr>
<td>Switch(config)# ip http secure-server</td>
<td>Enables the HTTPS server on the switch. By default, the HTTPS server is disabled.</td>
</tr>
<tr>
<td>Switch(config)# ip http max-connections connection_number</td>
<td>Configures the maximum concurrent connections to the HTTP server. A <code>connection_number</code> of 16 is recommended.</td>
</tr>
</tbody>
</table>
Chapter 14  Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant

Configuring Your Switch for Network Assistant

### Note

If you have enabled clustering, disable clustering before configuring a community (see Table 14-2).

(Additional) Configuration Required to Use Community

If you plan to use community, define an IP address on each switch.

To configure a switch to use community, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;Switch(config)# ip http timeout-policy idle idle_time life life_time requests requests</td>
<td>Configures the HTTPS port. The <code>idle</code> keyword specifies the maximum amount of time a connection can stay idle. A <code>idle</code> value of 180 seconds is recommended. The <code>life</code> keyword specifies the maximum amount of time a connection can stay open since it was established. A <code>life</code> value of 180 seconds is recommended. The <code>requests</code> keyword specifies the maximum amount of requests on a connection. The recommended maximum number of <code>requests</code> allowed is 25.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong>&lt;br&gt;Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong>&lt;br&gt;Switch# show running-config</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

### Note

If you plan to use clustering, enter the `cluster run` global configuration command on each device and enter the `ip address` interface configuration command on the cluster commander.

To configure a switch to use clustering, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;Switch# configuration terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;Switch(config)# interface (vlan vlan_ID</td>
<td>(fastethernet</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;Switch(config-if)# ip address ip_address address_mask</td>
<td>(Optional) Assigns an IP address to the Catalyst 4500 series. This step is mandatory if the switch is part of community or is a cluster command switch. This step is optional if the switch is a cluster member candidate.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;Switch# show running-config</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

(Additional) Configuration Required to Use Clustering

If you plan to use clustering, enter the `cluster run` global configuration command on each device and enter the `ip address` interface configuration command on the cluster commander.
Chapter 14  Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant

Managing a Network Using Community

This section describes how to use communities to manage devices (including Catalyst 4500 series switches, routers, access points, and PIX firewalls) using the Network Assistant application.

Note
Access points have been eliminated from the device limits. There is no current limit for the number of access points that can be managed by CNA.

Note
The Add to Community dialog box displays any number of devices, but can only select 20 devices. If you try to add a twenty-first device, the dialog box displays the twenty-first device and prompts you to select the unwanted device.

Note
For complete procedures for using Network Assistant to configure switch communities, refer to Getting Started with Cisco Network Assistant, available at:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configuration terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# cluster run</td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# cluster enable</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# interface {vlan vlan_ID</td>
</tr>
<tr>
<td></td>
<td>fastethernet</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# ip address ip_address address_mask</td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# show running-config</td>
</tr>
</tbody>
</table>
This section describes the guidelines and requirements you should understand before you create a community. This section contains the following topics:

- Candidate and Member Requirements, page 14-7
- Automatic Discovery of Candidates and Members, page 14-7
- Community Names, page 14-8
- Hostnames, page 14-8
- Passwords, page 14-8
- Access Modes in Network Assistant, page 14-9
- Community Information, page 14-9
- Adding Devices, page 14-9

**Candidate and Member Requirements**

*Candidates* are network devices that have IP addresses but are not part of a community. *Members* are network devices that are currently part of a community.

To join a community, a candidate must meet these requirements:

- An IP address has been obtained.
- Cisco Discovery Protocol (CDP) version 2 is enabled (the default) (if you want the device to be auto-discovered).
- HTTP (or HTTPS) is enabled.

**Note**

A cluster member can be added to a community, but the reverse is not possible.

**Note**

If a cluster commander is added to a community, the other member devices of the cluster are not added automatically. The cluster members must be added to the community on an individual basis in order to be managed.

**Automatic Discovery of Candidates and Members**

Network Assistant forms a community using CDP to locate or discover all the available devices in the network. Beginning with the IP address for a starting device and the port numbers for HTTP (or HTTPS) protocols, Network Assistant uses CDP to compile a list of community candidates that neighbor the starting device. Network Assistant can discover candidate and member devices across multiple networks and VLANs as long as they have valid IP addresses.

**Note**

By default, Network Assistant in community mode discovers up to four hops away.

See the “Candidate and Member Requirements” section on page 14-7 for a list of requirements that network devices must meet in order to be discovered.
Do not disable CDP on candidates, members, or on any network devices that you might want Network Assistant to discover.

Note

PIX firewalls do not support the CDP, so they are not automatically shown as neighbors in the Topology view. They are shown only after you add them to a community with the Create Community or Modify Community window. To see a PIX firewall link to another community member, you must add the link manually by selecting ADD Link in the Topology popup menu.

You can edit the list of discovered devices to fit your needs and add them to the community. As each device is added to the community, its neighbors are discovered and added to the list of candidate devices. If Network Assistant fails to discover a device, you can add it manually through the IP management IP address.

Community Names

When you apply the community configuration information to the list of member devices, Network Assistant requests that you enter a name (or IP address) for the community. You need to assign a name to the community before you can manage it. Network Assistant saves the name to your PC.

The community name can consist of the characters 0 through 9, a through z and A through Z, with spaces allowed between the characters.

Note

You can connect to a cluster only through an IP address. When you select a name the name is always for the community.

Hostnames

You do not need to assign a hostname to a starting device or a community member. However, we recommend that you do assign a hostname because Network Assistant does not assign one by default. If a discovered device does have a hostname, Network Assistant saves it to your PC as identifying information for that device along with its IP address, communication protocol, and designated protocol port.

Passwords

Although you do not need to assign a password to a device if it will become a community member, we recommend that you do so.

Community members can have different passwords.

Communication Protocols

Network Assistant uses the HTTP or HTTPS protocols to communicate with network devices. It attempts communication with HTTP or HTTPS when using CDP to discover candidate devices.
Access Modes in Network Assistant

When Network Assistant is connected to a community or cluster, two access modes are available: read-write and read-only, depending on the password.

Community Information

Network Assistant saves all community configuration information and individual device information such as IP address, hostname, and communication protocol to your local PC. When Network Assistant connects to a community, it uses the locally saved data to rediscover the member devices.

If you attempt to use a different PC to manage an existing community, the member device information is not available. You need to create the community again and add the same member devices.

Adding Devices

You can add members to a community using these methods:

- Use the Devices Found window on Network Assistant to add devices that you discovered to a new community.
  - In the Devices Found window, select the candidate devices that you want to add.
  - To add more than one candidate, press Ctrl and make your choices, or press Shift and choose the first and last device in a range.
  - Click Add.
- Use the Modify Community window to add devices to an existing community.
  - Choose Application > Communities to open the Communities window.
  - In the Communities window, select the name of the community to which you want to add a device, and click Modify.
  - To add a single device manually, enter the IP address for the desired device in the Modify Community window, and click Add.
  - To discover candidate devices, enter the IP address for the starting device, and click Discover.
  - Select a candidate device from the list, click Add, and click OK.
  - To add more than one candidate, press Ctrl and make your choices, or press Shift and choose the first and last device in a range.
- Add a device using the Topology view.
  - If the Topology view is not displayed, choose View window > Topology from the feature bar.
  - Right-click a candidate icon, and select Add to Community.

Candidates are cyan; members are green. To add more than one candidate, press Ctrl and left-click the candidates that you want to add.

When a community has 20 members, the Add to Community option is not available for that community. You must remove a member before adding a new one.
Converting a Cluster into a Community

The Cluster Conversion wizard helps you convert a cluster into a community. When you complete the conversion, you can immediately manage the device group as a community. The benefits of managing a community is that the communication with the devices in a community is more secure (through multiple passwords and HTTPS) than in a cluster. Moreover, device availability is greater, and the range of devices that can be members is broader.

To launch the Cluster Conversion Wizard, follow these steps:

Step 1: Start Network Assistant and connect to an existing cluster through its commander IP address.

Step 2: In the feature bar, choose Configure > Cluster > Cluster Conversion Wizard.

You see the query “or you want to convert this cluster to a community?”

Step 3: Select Yes to proceed or No if you want to manually bring up the Cluster Conversion Wizard.

If you select Yes, the Welcome screen appears, providing information about clusters, communities, and their benefits.

A table appears listing the devices in the cluster starting with those that have no IP address and subnet mask. Be aware that all the devices in the cluster must have an IP address and subnet mask to be members of a community.

Step 4: In the IP Address column, enter an IP address for each device that does not have one.

Step 5: In the Subnet Mask column, click in the cell for each device that does not have a subnet mask and select one.

Step 6: Enter a name for the community.

Step 7: Click Finish to begin the conversion.

When the conversion completes, Network Assistant restarts and automatically connects to the newly created community.

Note: If you are logged into a community and you delete that community from some other CNA instance, then unless you close that community session, you can perform all the configurations through that session. After you close that session (which deletes the community), you cannot connect to that community.

Note: The Cluster Conversion wizard does not alter your cluster definition. This means that you can still manage the devices as a cluster.
Managing a Network Using Cluster

This section describes how to use clustering to create and manage Catalyst 4500 series switches using the standalone Network Assistant application or the command-line interface (CLI).

Use clustering to group the switches in your network. You must enter the `cluster run` command on each switch to be managed. The major advantage is that you can manage 16 devices with one IP address.

Note

Clustering is the auto-discovering mechanism used in CNA 1.0.

Note

For complete procedures for using Network Assistant to configure switch clusters, refer to Getting Started with Cisco Network Assistant, available at:

This section contains the following topics:

- Understanding Switch Clusters, page 14-11
- Using the CLI to Manage Switch Clusters, page 14-13

Understanding Switch Clusters

These sections describes these topics:

- Cluster Command Switch Requirements, page 14-11
- Network Assistant and VTY, page 14-12
- Candidate Switch and Cluster Member Switch Requirements, page 14-12

Cluster Command Switch Requirements

A cluster command switch must meet these requirements:

- Uses Cisco IOS Release 12.2(20)EWA or later.
- Has an IP address.
- Cisco Discovery Protocol (CDP) version 2 is enabled (the default).
- Uses cluster-capable software and has clustering enabled.
- IP HTTP (or HTTPS) server is enabled.

Note

On a Catalyst 4500 series switch, neither HTTP or HTTPS is enabled by default.
Managing a Network Using Cluster

• Has 16 VTY lines.

Note On a Catalyst 4500 series switch, the default is 4 lines. You configure the switch to set the value to 16.

• Is not a command or cluster member switch of another cluster.

Note If your switch cluster contains a Catalyst 4500 series switch, the cluster command switch must also be a Catalyst 4500 series switch.

Network Assistant and VTY

Network Assistant uses virtual terminal (VTY) lines to communicate with the cluster command device. Catalyst 4500 series switches have 5 VTY lines configured by default. Network Assistant can use an additional 8 lines. You should configure the maximum number of lines (or at least, $8 + 5 = 13$) so that Network Assistant can communicate with the switch and not use VTY lines that might be needed for Telnet.

You can configure the Catalyst 4500 series switch to support an appropriate number of VTY lines with the `line vty` configuration command. For example, the `line vty 6 15` command configures the switch to include 9 VTY lines.

Note If your existing VTY lines have nondefault configurations, you might want to apply those configurations to the new VTY lines.

Candidate Switch and Cluster Member Switch Requirements

Candidate switches are cluster-capable switches that are not part of a cluster. Cluster member switches are switches that are currently part of a switch cluster. Although not required, a candidate or cluster member switch can have its own IP address and password.

Note The hostname of a candidate should not be in the form `[a-zA-Z0-9]-n`, where $n$ is 0 to 16. These names are reserved.

To join a cluster, a candidate switch must meet these requirements:
• Running cluster-capable software and has clustering enabled.
• Has CDP version 2 enabled.
• Has HTTP server enabled.

Note Even when HTTP is enabled on the commander switch, communication between the commander switch and member switch is still carried over HTTP.

• Has 16 VTY lines.
• Is not a command or cluster member switch of another cluster.
• Is connected to the cluster command switch through at least one common VLAN.
We recommend that you configure the Catalyst 4500 candidate and cluster member switches with an SVI on the VLAN connection to the cluster command switch.

### Using the CLI to Manage Switch Clusters

You can configure cluster member switches from the CLI by first logging in to the cluster command switch. Enter the `rcommand` user EXEC command and the cluster member switch number to start a Telnet session (through a console or Telnet connection) and to access the cluster member switch CLI. The command mode changes and the Cisco IOS commands operate as usual. Enter the `exit` privileged EXEC command on the cluster member switch to return to the command-switch CLI.

This example shows how to log in to member-switch 3 from the command-switch CLI:

```text
switch# rcommand 3
```

If you do not know the member-switch number, enter the `show cluster members` privileged EXEC command on the cluster command switch. For more information about the `rcommand` command and all other cluster commands, refer to the *Cisco IOS Command Reference*.

The Telnet session accesses the member-switch CLI at the same privilege level as on the cluster command switch. The Cisco IOS commands will operate as usual. For instructions on configuring the switch for a Telnet session, see the “Accessing the CLI Through Telnet” section on page 2-2.

Note

*CISCO-CLUSTER_MIB* is not supported.

### Configuring Network Assistant in Community or Cluster Mode

This section provides a detailed explanation of the CLI used to configure Network Assistant to work in a community or cluster. Network Assistant communicates with a Catalyst 4500 series switch by sending Cisco IOS commands over an HTTP (or HTTPS) connection.

This section includes the following topics:

- Configuring Network Assistant on a Networked Switch in Community Mode, page 14-13
- Configuring Network Assistant in a Networked Switch in Cluster Mode, page 14-17

### Configuring Network Assistant on a Networked Switch in Community Mode

To configure Network Assistant on a networked switch in community mode, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>Switch(config)# enable password name</code></td>
<td>Enables password protection of configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>Switch(config)# vtp domain name</code></td>
<td>Creates a VTP domain to manage VLAN.</td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>Switch(config)# vlan vlan_id</code></td>
<td>Creates a VLAN.</td>
</tr>
<tr>
<td><strong>Step 5</strong> `Switch(config-vlan)# interface (vlan vlan_ID</td>
<td>(fastethernet</td>
</tr>
</tbody>
</table>
## Configuring Network Assistant in Community or Cluster Mode

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td><code>Switch(config-if)# switchport access vlan vlan_id</code></td>
<td>Enables the selected interface to be in the specified VLAN.</td>
</tr>
<tr>
<td>7</td>
<td>`Switch(config-if)# interface (vlan vlan_ID</td>
<td>slot/interface</td>
</tr>
<tr>
<td>8</td>
<td><code>Switch(config-if)# ip address ip_address</code></td>
<td>Assigns an IP address to the SVI.</td>
</tr>
<tr>
<td>9</td>
<td><code>Switch(config-if)# no shutdown</code></td>
<td>Enables the interface.</td>
</tr>
<tr>
<td>10</td>
<td><code>Switch(config-if)# ip http server</code></td>
<td>Starts the HTTP server so that Network Assistant can talk to the switch.</td>
</tr>
<tr>
<td>11</td>
<td><code>Switch(config)# ip domain-name domain_name</code></td>
<td>Enables the domain name on the switch to configure HTTPS.</td>
</tr>
<tr>
<td>12</td>
<td><code>Switch(config)# ip http secure-server</code></td>
<td>Enables the HTTPS server on the switch. By default, the HTTPS server is disabled.</td>
</tr>
<tr>
<td>13</td>
<td><code>Switch(config)# ip http max-connections connection_number</code></td>
<td>Configures the maximum concurrent connections to the HTTP server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>A <code>connection_number</code> of 16 is recommended.</td>
</tr>
<tr>
<td>14</td>
<td><code>Switch(config)# ip http timeout-policy idle idle_time life life_time requests requests</code></td>
<td>Configures the HTTPS port.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The <code>idle</code> keyword specifies the maximum amount of time a connection can stay idle. A <code>idle</code> value of 180 seconds is recommended.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The <code>life</code> keyword specifies the maximum amount of time a connection can stay open since it was established. A <code>life</code> value of 180 seconds is recommended.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The <code>requests</code> keyword specifies the maximum number of requests on a connection. A <code>requests</code> value of 25 recommended.</td>
</tr>
<tr>
<td>15</td>
<td><code>Switch(config-if)# ip http secure-server</code> (Optionally)</td>
<td>Enables the switch to accept HTTPS connections from Network Assistant.</td>
</tr>
<tr>
<td>16</td>
<td><code>Switch(config)# ip route a.b.c</code></td>
<td>Establishes the route to the default router, usually supplied by the local Internet provider.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> This line represents the only difference between the configuration for a standalone and a networked switch.</td>
</tr>
<tr>
<td>17</td>
<td><code>Switch(config)# line con 0</code></td>
<td>Selects the console port to perform the configuration.</td>
</tr>
<tr>
<td>18</td>
<td><code>Switch(config-line)# exec-timeout x y</code></td>
<td>Configures an automatic session logout if no keyboard input or output is displayed on the terminal.</td>
</tr>
<tr>
<td>19</td>
<td><code>Switch(config-line)# password password</code></td>
<td>Specifies a password for the console port.</td>
</tr>
<tr>
<td>20</td>
<td><code>Switch(config-line)# login</code></td>
<td>Allows login to the console port.</td>
</tr>
<tr>
<td>21</td>
<td><code>Switch(config-line)# line vty x y</code></td>
<td>Creates additional VTY lines for CNA to access the switch.</td>
</tr>
<tr>
<td>22</td>
<td><code>Switch(config-line)# password password</code></td>
<td>Specifies a password for the switch.</td>
</tr>
<tr>
<td>23</td>
<td><code>Switch(config-line)# login</code></td>
<td>Allows login to the switch.</td>
</tr>
<tr>
<td>24</td>
<td><code>Switch(config-line)# line vty x y</code></td>
<td>Creates additional VTY lines for CNA to access the switch.</td>
</tr>
<tr>
<td>25</td>
<td><code>Switch(config-line)# password password</code></td>
<td>Specifies a password for the switch.</td>
</tr>
<tr>
<td>26</td>
<td><code>Switch(config-line)# login</code></td>
<td>Allows login to the switch.</td>
</tr>
</tbody>
</table>
Chapter 14 | Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant

Configuring Network Assistant in Community or Cluster Mode

This example shows how to configure Network Assistant on a networked switch in community mode:

```
Switch# configure terminal
Switch(config)# vtp domain cnadoc
Changing VTP domain name from cisco to cnadoc
Switch(config)# vlan 2
Switch(config-vlan)# exit
Switch(config)# interface GigabitEthernet 2/1
Switch(config-if)# switchport access vlan 2
Switch(config-if)# exit
Switch(config)# interface vlan 2
Switch(config-if)# ip address 123.123.123.1 255.255.255.0
Switch(config-if)# no shutdown
Switch(config-if)# exit
Switch(config)# ip http server
Switch(config)# ip domain-name cisco.com
Switch(config)# ip http secure-server
Switch(config)# ip http max-connections 16
Switch(config)# ip http timeout-policy idle 180 life 180 requests 25
Switch(config)# ip route 0.0.0.0 0.0.0.0 123.123.123.2
Switch(config)# line con 0
Switch(config-line)# exec-timeout 0 0
Switch(config-line)# password keepout
Switch(config-line)# login
Switch(config-line)# line vty 5 15
Switch(config-line)# password keepout
Switch(config-line)# login
Switch(config-line)# line vty 5 15
Switch(config-line)# end
Switch# show running-config

Configuring Network Assistant in a Networked Switch in Cluster Mode

To configure Network Assistant on a networked switch in cluster mode, perform this task on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# enable password name</td>
<td>Enables password protection of configuration mode.</td>
</tr>
<tr>
<td>Step 3 Switch(config)# vtp domain name</td>
<td>Creates a VTP domain to manage VLANs and names.</td>
</tr>
<tr>
<td>Step 4 Switch(config)# cluster run</td>
<td>Launches the cluster on the cluster commander.</td>
</tr>
<tr>
<td>Step 5 Switch(config)# cluster enable cluster_name</td>
<td>Makes the switch the cluster commander.</td>
</tr>
<tr>
<td>Step 6 Switch(config)# vlan vlan_id</td>
<td>Creates a VLAN.</td>
</tr>
</tbody>
</table>
Configuring Network Assistant in Community or Cluster Mode

This example shows how to configure Network Assistant on a networked switch in cluster mode:

```
Switch# configure terminal
Switch(config)# vtp domain cnadoc
Switch(config)# cluster run
Switch(config)# cluster enable cnadoc
Switch(config)# vlan 10
Switch(config-vlan)# interface GigabitEthernet 2/1
Switch(config-if)# switchport access vlan 10
Switch(config-if)# interface vlan10
Switch(config-if)# ip address aa.bb.cc.dd
Switch(config-if)# no shut
Switch(config-if)# ip http server
Switch(config-if)# ip http secure-server
Switch(config)# ip route 0.0.0.0 0.0.0.0 123.123.123.2
```

<table>
<thead>
<tr>
<th>Step</th>

CHAPTER 15

Configuring VLANs, VTP, and VMPS

This chapter describes VLANs on Catalyst 4500 series switches. It also describes how to enable the VLAN Trunking Protocol (VTP) and to configure the Catalyst 4500 series switch as a VMPS client.

This chapter includes the following major sections:

- VLANs, page 15-1
- VLAN Trunking Protocol, page 15-7
- VLAN Membership Policy Server, page 15-20

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

VLANs

This section includes the following major subsections:

- About VLANs, page 15-1
- VLAN Configuration Guidelines and Restrictions, page 15-3
- VLAN Default Configuration, page 15-4
- Configuring VLANs, page 15-5

About VLANs

A VLAN is a group of devices on one or more LANs that are configured to communicate as if they were attached to the same wire, when in fact they are located on a number of different LAN segments. Because VLANs are based on logical instead of physical connections, they are extremely flexible.
VLANs define broadcast domains in a Layer 2 network. A broadcast domain is the set of all devices that receives broadcast frames originating from any device within the set. Broadcast domains are typically bounded by switches because switches do not forward broadcast frames. Layer 2 switches create broadcast domains based on the configuration of the switch. Switches are multiport bridges that allow you to create multiple broadcast domains. Each broadcast domain is like a distinct virtual bridge within a switch.

You can define one or many virtual bridges within a switch. Each virtual bridge you create in the switch defines a new broadcast domain (VLAN). Traffic cannot pass directly to another VLAN (between broadcast domains) within the switch or between two switches. To interconnect two different VLANs, you must use switches or Layer 3 switches. See the “About Layer 3 Interfaces” section on page 32-1 for information on inter-VLAN routing on Catalyst 4500 series switches.

Figure 15-1 shows an example of three VLANs that create logically defined networks.

VLANs are often associated with IP subnetworks. For example, all of the end stations in a particular IP subnet belong to the same VLAN. Traffic between VLANs must be routed. You must assign LAN interface VLAN membership on an interface-by-interface basis (termed interface-based or static VLAN membership).

You can set the following parameters when you create a VLAN in the management domain:

- VLAN number
- VLAN name
- VLAN type
VLANs

- VLAN state (active or suspended)
- Maximum transmission unit (MTU) for the VLAN
- Security Association Identifier (SAID)
- VLAN number to use when translating from one VLAN type to another

**Note**

When the software translates from one VLAN type to another, it requires a different VLAN number for each media type.

### VLAN Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when creating and modifying VLANs in your network:

- Before creating a VLAN, put the Catalyst 4500 series switch in VTP server mode or VTP transparent mode. If the Catalyst 4500 series switch is a VTP server, you must define a VTP domain. For information on configuring VTP, see the “VLAN Trunking Protocol” section on page 15-7.
- You cannot use the `end` command in VLAN database mode.
- You cannot use `Ctrl-Z` to exit VLAN database mode.
- If a Catalyst 4948 switch running MSTP and configured with all possible VLANs (4094) is in the path of two HSRP peers with the timeout set below 500 ms, HSRP flaps.

**Workarounds:**

- Use fewer VLANs.
- Set the timers greater than 600 ms.
- Enter the `no igmp snooping` (globally) and `access-list hardware capture mode VLAN` commands

### VLAN Ranges

**Note**

You must enable the extended system ID to use 4094 VLANs. See the “Understanding the Bridge ID” section on page 20-2.

With Cisco IOS Release 12.2(25)EWA and later, Catalyst 4500 series switches support 4096 VLANs in compliance with the IEEE 802.1Q standard. These VLANs are organized into three ranges: reserved, normal, and extended.

Some of these VLANs are propagated to other switches in the network when you use the VLAN Trunking Protocol (VTP). The extended-range VLANs are not propagated, so you must configure extended-range VLANs manually on each network device.
Table 15-1 describes the uses for VLAN ranges.

### Table 15-1  VLAN Ranges

<table>
<thead>
<tr>
<th>VLANs</th>
<th>Range</th>
<th>Usage</th>
<th>Propagated by VTP</th>
</tr>
</thead>
<tbody>
<tr>
<td>0, 4095</td>
<td>Reserved</td>
<td>For system use only. You cannot see or use these VLANs.</td>
<td>—</td>
</tr>
<tr>
<td>1</td>
<td>Normal</td>
<td>Cisco default. You cannot delete this VLAN.</td>
<td>Yes</td>
</tr>
<tr>
<td>2–1001</td>
<td>Normal</td>
<td>Used for Ethernet VLANs; you can create, use, and delete these VLANs.</td>
<td>Yes</td>
</tr>
<tr>
<td>1002–1005</td>
<td>Normal</td>
<td>Cisco defaults for FDDI and Token Ring. You cannot delete VLANs 1002–1005.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
| 1006–4094| Extended| For Ethernet VLANs only. When configuring extended-range VLANs, note the following:  
  • Layer 3 ports and some software features require internal VLANs. Internal VLANs are allocated from 1006 and up. You cannot use a VLAN that has been allocated for such use. To display the VLANs used internally, enter the `show vlan internal usage` command.  
  • Switches running the Catalyst operating system do not support configuration of VLANs 1006-1024. If you configure VLANs 1006-1024, ensure that the VLANs do not extend to any switches running Catalyst operating system software.  
  • You must enable the extended system ID to use extended range VLANs. | No |

#### Configurable Normal-Range VLAN Parameters

*Note*  
Ethernet VLANs 1 and 1006 through 4094 use only default values.

You can configure the following parameters for VLANs 2 through 1001:

- VLAN name
- VLAN type
- VLAN state (active or suspended)
- SAID
- STP type for VLANs

#### VLAN Default Configuration

Table 15-2 shows the default VLAN configuration values.
Table 15-2 Ethernet VLAN Defaults and Ranges

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Valid Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>1</td>
<td>1–4094</td>
</tr>
<tr>
<td>VLAN name</td>
<td>VLANx, where x is a number assigned by the software.</td>
<td>No range</td>
</tr>
<tr>
<td>802.10 SAID</td>
<td>100,001</td>
<td>1–4,294,967,294</td>
</tr>
<tr>
<td>MTU size</td>
<td>1500</td>
<td>1500–18,190</td>
</tr>
<tr>
<td>Translational bridge 1</td>
<td>1002</td>
<td>0–1005</td>
</tr>
<tr>
<td>Translational bridge 2</td>
<td>1003</td>
<td>0–1005</td>
</tr>
<tr>
<td>VLAN state</td>
<td>active</td>
<td>active; suspend; shutdown</td>
</tr>
</tbody>
</table>

Note Catalyst 4500 series switches do not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-NET, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration by using VTP. The software reserves parameters for these media types, but they are not supported.

Configuring VLANs

Note Before you configure VLANs, you must use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration information for your network. For complete information on VTP, see the “VLAN Trunking Protocol” section on page 7.

Note VLANs support a number of parameters that are not discussed in detail in this section. For complete information, refer to the Cisco IOS Command Reference.

Note The VLAN configuration is stored in the vlan.dat file, which is stored in nonvolatile memory. You can cause inconsistency in the VLAN database if you manually delete the vlan.dat file. If you want to modify the VLAN configuration or VTP, use the commands described in the following sections and in the Cisco IOS Command Reference.

The following sections describe how to configure VLANs:

- Configuring VLANs in Global Configuration Mode, page 15-6
- Assigning a Layer 2 LAN Interface to a VLAN, page 15-7
Chapter 15      Configuring VLANs, VTP, and VMPS

VLANs

Configuring VLANs in Global Configuration Mode

If the switch is in VTP server or transparent mode (see the “VLAN Trunking Protocol” section on page 15-7), you can configure VLANs in global and VLAN configuration modes. When you configure VLANs in global and config-vlan configuration modes, the VLAN configuration is saved in the vlan.dat files, not the running-config or startup-config files. To display the VLAN configuration, enter the show vlan command.

If the switch is in VLAN transparent mode, use the copy running-config startup-config command to save the VLAN configuration to the startup-config file. After you save the running configuration as the startup configuration, the show running-config and show startup-config commands display the VLAN configuration.

Note

When the switch boots, if the VTP domain name and VTP mode in the startup-config and vlan.dat files do not match, the switch uses the configuration in the vlan.dat file.

You use the interface configuration command mode to define the port membership mode and add and remove ports from a VLAN. The results of these commands are written to the running-config file, and you can display the contents of the file by entering the show running-config command.

User-configured VLANs have unique IDs from 1 to 4094. To create a VLAN, enter the vlan command with an unused ID. To verify whether a particular ID is in use, enter the show vlan id ID command.

To modify a VLAN, enter the vlan command for an existing VLAN. See the “VLAN Default Configuration” section on page 15-4 for the list of default parameters that are assigned when you create a VLAN. If you do not use the media keyword when specifying the VLAN type, the VLAN is an Ethernet VLAN.

To create a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# vlan vlan_ID</td>
</tr>
<tr>
<td></td>
<td>Switch(config-vlan)#</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-vlan)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show vlan [id</td>
</tr>
</tbody>
</table>

When you create or modify an Ethernet VLAN, note the following:
Because Layer 3 ports and some software features require internal VLANs allocated from 1006 and up, configure extended-range VLANs starting with 4094 and work downward.

You can configure extended-range VLANs only in global configuration mode. You cannot configure extended-range VLANs in VLAN database mode.

Layer 3 ports and some software features use extended-range VLANs. If the VLAN you are trying to create or modify is being used by a Layer 3 port or a software feature, the switch displays a message and does not modify the VLAN configuration.

When you create VLANs with the VLAN configuration command, they are automatically added to the existing VTP domain; no action is required of the user.

This example shows how to create an Ethernet VLAN in global configuration mode and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 3
Switch(config-vlan)# end
Switch# show vlan id 3
```

Assigning a Layer 2 LAN Interface to a VLAN

A VLAN created in a management domain remains unused until you assign one or more LAN interfaces to the VLAN.

**Note**

Make sure you assign LAN interfaces to a VLAN of the proper type. Assign Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces to Ethernet-type VLANs.

To assign one or more LAN interfaces to a VLAN, complete the procedures in the “Configuring Ethernet Interfaces for Layer 2 Switching” section on page 17-5.

**VLAN Trunking Protocol**

This section describes the VLAN Trunking Protocol (VTP) on the Catalyst 4500 series switches, and includes the following major subsections:

- **About VTP**, page 15-8
- **VTP Configuration Guidelines and Restrictions**, page 15-12
- **VTP Default Configuration**, page 15-13
- **Configuring VTP**, page 15-14
About VTP

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs within a VTP domain. A VTP domain (also called a VLAN management domain) is made up of one or more network devices that share the same VTP domain name and that are interconnected with trunks. VTP minimizes misconfigurations and configuration inconsistencies that can result in a number of problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

Before you create VLANs, you must decide whether you want to use VTP in your network. With VTP, you can make configuration changes centrally on one or more network devices and have those changes automatically communicated to all the other network devices in the network. For details on configuring VLANs, see the “VLANs” section on page 15-1.

These sections describe how VTP works:
- Understanding the VTP Domain, page 15-8
- Understanding VTP Modes, page 15-9
- Understanding VTP Advertisements, page 15-9
- Understanding VTP Versions, page 15-9
- Understanding VTP Pruning, page 15-11

Understanding the VTP Domain

A VTP domain is made up of one or more interconnected network devices that share the same VTP domain name. A network device can be configured to be in only one VTP domain. You make global VLAN configuration changes for the domain using either the command-line interface (CLI) or Simple Network Management Protocol (SNMP).

By default, the Catalyst 4500 series switch is in VTP server mode and the domain is set to NULL until the switch receives an advertisement for a domain over a trunk link or you configure a management domain. You cannot create or modify VLANs on a VTP server until the management domain name is specified or learned.

If the switch receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The switch ignores advertisements with a different management domain name or an earlier configuration revision number.

If you configure the switch as VTP transparent, you can create and modify VLANs, but the changes affect only the individual switch.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all network devices in the VTP domain. VTP advertisements are transmitted out all Inter-Switch Link (ISL) and IEEE 802.1Q trunk connections.

VTP maps VLANs dynamically across multiple LAN types with unique names and internal index associations. Mapping eliminates unnecessary device administration for network administrators.
Understanding VTP Modes

You can configure a Catalyst 4500 series switch to operate in any one of these VTP modes:

- **Server**—In VTP server mode, you can create, modify, and delete VLANs and specify other configuration parameters (such as VTP version and VTP pruning) for the entire VTP domain. VTP servers advertise their VLAN configuration to other network devices in the same VTP domain and synchronize their VLAN configuration with other network devices based on advertisements received over trunk links. VTP server is the default mode.

  **Note** In VTP version 3, manipulation of VLANs can be done only to primary servers.

- **Client**—VTP clients behave the same way as VTP servers, but you cannot create, change, or delete VLANs on a VTP client.

- **Transparent**—VTP transparent network devices do not participate in VTP. A VTP transparent network device does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2, transparent network devices do forward VTP advertisements that they receive on their trunking LAN interfaces.

- **Off**—In VTP off mode, a network device functions in the same manner as a VTP transparent device except that it does not forward VTP advertisements.

  **Note** Catalyst 4500 series switches automatically change from VTP server mode to VTP client mode if the switch detects a failure while writing configuration to NVRAM. If this happens, the switch cannot be returned to VTP server mode until the NVRAM is functioning.

Understanding VTP Advertisements

Each network device in the VTP domain sends periodic advertisements out each trunking LAN interface to a reserved multicast address. VTP advertisements are received by neighboring network devices, which update their VTP and VLAN configurations as necessary.

The following global configuration information is distributed in VTP advertisements:

- VLAN IDs (ISL and 802.1Q)
- Emulated LAN names (for ATM LANE)
- 802.10 SAID values (FDDI)
- VTP domain name
- VTP configuration revision number
- VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
- Frame format

Understanding VTP Versions

**VTP Version 2**

If you use VTP in your network, you must decide whether to use VTP version 2 or version 3.
VLAN Trunking Protocol

Note

Catalyst 4500 series switches do not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-Net, Token Ring Concentrator Relay Function (TrCRF), or Token Ring Bridge Relay Function (TrBRF) traffic, but it does propagate the VLAN configuration by using VTP.

VTP version 2 supports the following features, which are not supported in version 1:

- Token Ring support—Supports Token Ring LAN switching and VLANs (TrBRF and TrCRF).
- Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM.
- Version-dependent transparent mode—In VTP version 1 and version 2, a VTP transparent network device forwards VTP messages in transparent mode without checking the version.
- Consistency checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the digest on a received VTP message is correct, its information is accepted without consistency checks.

VTP Version 3

VTP version 3 supports the following features not supported in version 1 or version 2:

- Hidden password support—Supports the option of configuring the password as hidden or secret.
  
  When the hidden keyword is specified, that password must be reentered if a takeover command is issued in the domain. The secret key generated from the password string is saved in the const_nvram:vlan.dat file. When configured with this option, the password does not appear in plain text in the configuration. Instead, the secret key associated with the password is saved in hexadecimal format in the running configuration. If the hidden keyword is not specified, the password is saved in clear text in the const_nvram:vlan.dat file as in VTP version 1 and VTP version 2.
  
  When the secret keyword is specified, the password secret key can be directly configured.
- Extended VLAN database propagation support—In VTP version 2, VLAN configuration information is propagated only for VLANs numbered 1 to 1000. In VTP version 3, information also is propagated for extended-range VLANs (VLANs numbered 1006 to 4094).
- On Catalyst 4500 series switches running VTP version 1, VTP version 2, or VTP version 3, default VLANs 1 and 1002 to 1005 cannot be modified.

Note

VTP pruning continues to apply only to VLANs numbered 1 to 1000.

- Propagation of any database in a domain—In addition to propagating VLAN database information, VTP can propagate Multiple Spanning Tree (MST) protocol database information.
- Disabling VTP—When VTP is disabled on a trunking port, it applies to all VTP instances on that port. When VTP is disabled globally, the setting applies to all the trunking ports in the system.
- In VTP version 1 and VTP version 2, the role of a VTP server is to back up the database to NVRAM and to allow the administrator to change database information. VTP version 3 introduces the roles of VTP primary server and VTP secondary server. A VTP primary server is used to update the
VLAN Trunking Protocol

Chapter 15 Configuring VLANs, VTP, and VMPS

VTP Trunking Protocol

VTP database information. The updates sent out are honored by all the devices in the system. A VTP secondary server can only back up to its NVRAM the VTP configuration received by using updates from the VTP primary server.

The status of primary and secondary servers is a runtime status and is not a configurable option. By default, all devices are initiated as secondary servers. Primary server status is needed only when database updates are needed, and is obtained when the administrator issues a takeover message in the domain. See the “Starting a Takeover” section on page 15-19.

Primary server status is lost upon reload of the device, or when switchover or domain parameters change. Secondary servers back up the configuration and continue to propagate it. Because of that, you may have a working VTP domain without any primary servers.

Understanding VTP Pruning

VTP pruning enhances network bandwidth use by reducing unnecessary flooded traffic, such as broadcast, multicast, and unicast packets. VTP pruning increases available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to access the appropriate network devices. By default, VTP pruning is disabled.

For VTP pruning to be effective, all devices in the management domain must either support VTP pruning or, on devices that do not support VTP pruning, you must manually configure the VLANs allowed on trunks.

Figure 15-2 shows a switched network without VTP pruning enabled. Interface 1 on Switch 1 and Interface 2 on Switch 4 are assigned to the Red VLAN. A broadcast is sent from the host connected to Switch 1. Switch 1 floods the broadcast and every network device in the network receives it, even though Switches 3, 5, and 6 have no interfaces in the Red VLAN.

You can enable pruning globally on the Catalyst 4500 series switch (see the “Enabling VTP Pruning” section on page 15-15).

Figure 15-2 Flooding Traffic without VTP Pruning

Figure 15-3 shows the same switched network with VTP pruning enabled. The broadcast traffic from Switch 1 is not forwarded to Switches 3, 5, and 6 because traffic for the Red VLAN has been pruned on the links indicated (Interface 5 on Switch 2 and Interface 4 on Switch 4).

Figure 15-3 shows the same switched network with VTP pruning enabled. The broadcast traffic from Switch 1 is not forwarded to Switches 3, 5, and 6 because traffic for the Red VLAN has been pruned on the links indicated (Interface 5 on Switch 2 and Interface 4 on Switch 4).
Enabling VTP pruning on a VTP server enables pruning for the entire management domain. VTP pruning takes effect several seconds after you enable it. By default, VLANs 2 through 1000 are eligible for pruning. VTP pruning does not prune traffic from pruning-ineligible VLANs. VLAN 1 is always ineligible for pruning; traffic from VLAN 1 cannot be pruned.

To configure VTP pruning on a trunking LAN interface, use the `switchport trunk pruning vlan` command. VTP pruning operates when a LAN interface is trunking. You can set VLAN pruning eligibility regardless of whether VTP pruning is enabled or disabled for the VTP domain, whether any given VLAN exists, and regardless of whether the LAN interface is currently trunking.

**VTP Configuration Guidelines and Restrictions**

Follow these guidelines and restrictions when implementing VTP in your network:

- Supervisor engine redundancy does not support nondefault VLAN data file names or locations. Do not enter the `vtp file file_name` command on a switch that has a redundant supervisor engine.
- Before installing a redundant supervisor engine, enter the `no vtp file` command to return to the default configuration.
- When a VTP version 3 device on a trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in a VTP version 2 format. A VTP version 3 device does not send out VTP version 2 formatted packets on a trunk port unless it first receives VTP version 2 packets on that trunk.
- Even when a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets in addition to VTP version 2 packets, to allow co-existence of two kinds of neighbors off the trunk.
- A VTP version 3 device does not accept configuration information from a VPT version 2 or version 1 device.
- Unlike in VPT version 2, when VTP is configured to be version 3, this does not configure all the version-3-capable devices in the domain to start behaving as VPT version 3 systems.
- When a VTP version 1 device, capable of version 2 or version 3, receives a VTP version 3 packet, the device is configured as a VTP version 2 device provided a VTP version 2 conflict does not exist.
- Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.
• In a Token Ring environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly.
• Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or VTP version 2 region.
• All network devices in a VTP domain must run the same VTP version.
• You must configure a password on each network device in the management domain when VTP is in secure mode.

Caution
If you configure VTP in secure mode and you do not assign a management domain password to each network device in the domain, the management domain does not function properly.

• A VTP version 2-capable network device can operate in the same VTP domain as a network device running VTP version 1 if VTP version 2 is disabled on the VTP version 2-capable network device (VTP version 2 is disabled by default).
• Do not enable VTP version 2 on a network device unless all of the network devices in the same VTP domain are version 2-capable. When you enable VTP version 2 on a server, all of the version 2-capable network devices in the domain enable VTP version 2.
• Enabling or disabling VTP pruning on a VTP server enables or disables VTP pruning for the entire management domain.
• Configuring VLANs as eligible for pruning on a Catalyst 4500 series switch affects pruning eligibility for those VLANs on that switch only, not on all network devices in the VTP domain.
• The VLAN database is saved in the NVRAM file in a format compliant with the VTP version running on the system. Since older images supporting only VTP version 2 do not recognize the VTP version 3 file format, the NVRAM VLAN database information is lost if the system is downgraded from a new image supporting VTP to one that does not.

VTP Default Configuration

Table 15-3 shows the default VTP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP domain name</td>
<td>Null</td>
</tr>
<tr>
<td>VTP mode</td>
<td>Server</td>
</tr>
<tr>
<td>VTP version 2 enable state</td>
<td>Version 2 is disabled</td>
</tr>
<tr>
<td>VTP password</td>
<td>None</td>
</tr>
<tr>
<td>VTP pruning</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

The default VTP mode for newly manufactured Catalyst 4500 supervisor engines, Catalyst 4900 series switches, and the Cisco ME 4924-10GE switch is transparent. Deleting vlan.dat or entering the erase cat4000_flash: command, and resetting the switch changes the VTP mode to server.
Configuring VTP

These sections describe how to configure VTP:

- Configuring VTP Global Parameters, page 15-14
- Configuring the VTP Mode, page 15-16
- Starting a Takeover, page 15-19
- Displaying VTP Statistics, page 15-19
- Displaying VTP Devices in a Domain, page 15-20

Configuring VTP Global Parameters

These sections describe configuring the VTP global parameters:

- Configuring a VTP Password, page 15-14
- Enabling VTP Pruning, page 15-15
- Enabling the VTP Version Number, page 15-15

Note

You can enter the VTP global parameters in either global configuration mode or in EXEC mode.

Configuring a VTP Password

To configure the VTP global parameters, use these commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# vtp password password_string [hidden</td>
<td>secret]</td>
</tr>
<tr>
<td>Switch(config)# no vtp password</td>
<td>Clears the password.</td>
</tr>
</tbody>
</table>

This example shows one way to configure a VTP password in global configuration mode:

```
Switch# configure terminal
Switch(config)# vtp password WATER
Setting device VLAN database password to WATER.
Switch#
```
This example shows how to configure a VTP password in EXEC mode:

Switch# vtp password WATER
Setting device VLAN database password to WATER.
Switch#

**Note**
The password is not stored in the running-config file.

This example shows how to configure a hidden password:

Switch# configure terminal
Switch(config)# vtp password WATER hidden
Generating the secret associated to the password.
Switch(config)#

This example shows how the password WATER is displayed when it is configured with the hidden keyword.

Switch# show vtp password
VTP Password: 89914640C8D90868B6A0D8103847A733
Switch#

### Enabling VTP Pruning

To enable VTP pruning in the management domain, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# vtp pruning</td>
</tr>
<tr>
<td></td>
<td>Enables VTP pruning in the management domain.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# show vtp status</td>
</tr>
<tr>
<td></td>
<td>(Optional) Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows one way to enable VTP pruning in the management domain:

Switch# configure terminal
Switch(config)# vtp pruning
Pruning switched ON

This example shows how to enable VTP pruning in the management domain with any release:

Switch# vtp pruning
Pruning switched ON

This example shows how to verify the configuration:

Switch# show vtp status | include Pruning
VTP Pruning Mode: Enabled
Switch#

For information about configuring prune eligibility, see the “Understanding VTP Pruning” section on page 15-11.

### Enabling the VTP Version Number

VTP version 2 is disabled by default on VTP version-2-capable network devices. When you enable VTP version 2 on a network device, every VTP version-2-capable network device in the VTP domain enables version 2.
VLAN Trunking Protocol

Caution

VTP version 1 and VTP version 2 are not interoperable on network devices in the same VTP domain. Every network device in the VTP domain must use the same VTP version. Do not enable VTP version 2 unless every network device in the VTP domain supports version 2.

Note

In a Token Ring environment, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly on devices that support Token Ring interfaces.

To enable the VTP version, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1
Switch(config)# vtp version \{1 | 2 | 3\} | Enables the VTP version. |
| Step 2
Switch# show vtp status | include \{v1 | v2 | v3\} | (Optional) Verifies the configuration. |

This example shows one way to enable VTP version 2:

```
Switch# configure terminal
Switch(config)# vtp version 2
V2 mode enabled.
Switch(config)#
```

This example shows how to enable VTP version 2 with any release:

```
Switch# vtp version 2
V2 mode enabled.
Switch#
```

This example shows how to verify the configuration:

```
Switch# show vtp status | include V2
VTP V2 Mode: Enabled
Switch#
```

Configuring the VTP Mode

To configure the VTP mode, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1
Switch(config)# vtp mode \{client | server | transparent | off\} | Configures the VTP mode. |
| Step 2
Switch(config)# vtp domain domain_name | (Optional; for server mode only) Defines the VTP domain name, which can be up to 32 characters long. VTP server mode requires a domain name. If the switch has a trunk connection to a VTP domain, the switch learns the domain name from the VTP server in the domain. |
| Note | You cannot clear the domain name. |
| Step 3
Switch(config)# end | Exits VLAN configuration mode. |
| Step 4
Switch# show vtp status | (Optional) Verifies the configuration. |
When VTP is disabled, you can enter VLAN configuration commands in configuration mode instead of the VLAN database mode and the VLAN configuration is stored in the startup configuration file.

This example shows how to configure the switch as a VTP server:

Switch# configure terminal
Switch(config)# vtp mode server
Setting device to VTP SERVER mode.
Switch(config)# vtp domain Lab_Network
Setting VTP domain name to Lab_Network
Switch(config)# end
Switch#

This example shows how to configure the switch as a VTP client:

Switch# configure terminal
Switch(config)# vtp mode client
Setting device to VTP CLIENT mode.
Switch(config)# end
Switch#

This example shows how to disable VTP on the switch:

Switch# configure terminal
Switch(config)# vtp mode transparent
Setting device to VTP TRANSPARENT mode.
Switch(config)# end
Switch#

This example shows how to disable VTP on the switch and to disable VTP advertisement forwarding:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vtp mode off
Setting device to VTP OFF mode.
Switch(config)# end
Switch#

This example shows an example of the VTP configuration parameters when the device is running VTP version 1:

Switch# show vtp status
VTP Version capable : 1 to 3
VTP version running : 1
VTP Domain Name : Lab_Network
VTP Pruning Mode : Enabled
VTP Traps Generation : Disabled
Device ID : 0016.9c6d.5300
Configuration last modified by 127.0.0.12 at 10-18-07 10:12:42
Local updater ID is 127.00.12 at 10-18-07 10:2:42

Feature VLAN:

```

Switch#

This example shows an example of the VTP configuration parameters when the device is running VTP version 3:

```
Switch# show vtp status
VTP Version capable : 1 to 3
VTP version running  : 3
VTP Domain Name     : Lab_Network
VTP Pruning Mode    : Disabled
VTP Traps Generation: Disabled
Device ID           : 0012.44dc.b800
```

```
Feature VLAN:
-------------
VTP Operating Mode : Server
Number of existing VLANs : 1005
Number of existing extended VLANs: 3074
Configuration Revision  : 18
Primary ID            : 0012.4371.9ec0
Primary Description   :
```

Switch#
Starting a Takeover

This process applies to VTP version 3 only. To start a takeover, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# vtp primary-server [vlan</td>
<td>mst]</td>
</tr>
<tr>
<td>Note</td>
<td>Using the force keyword overwrites the configuration of any conflicting servers. If not using the force keyword, you are prompted for confirmation before proceeding with the takeover.</td>
</tr>
<tr>
<td>Specify where to direct the takeover by selecting the appropriate feature (vlan or mst). If no feature is selected, the takeover is directed to the VLAN database.</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to start a takeover and direct it to the vlan database:

Switch# vtp primary-server vlan
Enter VTP password:password
This system is becoming primary for feature vlan

VTP Feature Conf Revision Primary Server Device ID Description
----------- ------------- -------------- -------- -------------------
MST         Yes 4 0012.4371.9ec0=0012.4371.9ec0 R1
Do you want to continue? (confirm)
Switch#

Displaying VTP Statistics

To display VTP statistics, including VTP advertisements sent and received and VTP errors, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show vtp counters</td>
<td>Displays VTP statistics.</td>
</tr>
</tbody>
</table>

This example shows how to display VTP statistics:

Switch# show vtp counters
VTP statistics:
Summary advertisements received : 7
Subset advertisements received : 5
Request advertisements received : 0
Summary advertisements transmitted : 997
Subset advertisements transmitted : 13
Displaying VTP Devices in a Domain

To display information for all the VTP devices in a domain, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Switch# <code>show vtp devices [conflicts]</code></strong></td>
<td>Gathers and displays information for all the VTP devices in the domain.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>No information is gathered or displayed from switches set to <code>vtp modes off</code> or to <code>transparent</code> for a particular feature.</td>
</tr>
<tr>
<td><strong>The <code>conflicts</code> keyword (optional) displays the information of devices that have conflicting primary servers.</strong></td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to display information for VTP devices in a domain:

**Switch# `show vtp devices`**

Retrieving information from the VTP domain, please wait for 5 seconds.

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Feature Conf Revision Primary Server Device ID</th>
<th>Device Description</th>

VLAN Membership Policy Server

This section describes how to configure dynamic port VLAN membership through the VLAN Membership Policy Server (VMPS), and includes the following subsections:

- About VMPS, page 15-21
- Overview of VMPS Clients, page 15-23
- Dynamic Port VLAN Membership Configuration Example, page 15-29
- VMPS Database Configuration File Example, page 15-32
About VMPS

These subsections describe what a VMPS server does and how it operates:

- Understanding the VMPS Server, page 15-21
- Security Modes for VMPS Server, page 15-22
- Fallback VLAN, page 15-23
- Illegal VMPS Client Requests, page 15-23

Understanding the VMPS Server

A VLAN Membership Policy Server (VMPS) provides a centralized server for selecting the VLAN for a port dynamically based on the MAC address of the device connected to the port. When the host moves from a port on one switch in the network to a port on another switch in the network, that switch dynamically assigns the new port to the proper VLAN for that host.

A Catalyst 4500 series switch running Cisco IOS software does not support the functionality of a VMPS. It can only function as a VLAN Query Protocol (VQP) client, which communicates with a VMPS through the VQP. For VMPS functionality, you need to use a Catalyst 4500 series switch (or Catalyst 6500 series switch) running Catalyst operating system (OS) software.

VMPS uses a UDP port to listen to VQP requests from clients, so, it is not necessary for VMPS clients to know if the VMPS resides on a local or remote device on the network. Upon receiving a valid request from a VMPS client, a VMPS server searches its database for an entry of a MAC-address to VLAN mapping.

In response to a request, the VMPS takes one of the following actions:

- If the assigned VLAN is restricted to a group of ports, the VMPS verifies the requesting port against this group and responds as follows:
  - If the VLAN is allowed on the port, the VMPS sends the VLAN name to the client in response.
  - If the VLAN is not allowed on the port and the VMPS is not in secure mode, the VMPS sends an “access-denied” response.
  - If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a “port-shutdown” response.

- If the VLAN in the database does not match the current VLAN on the port and active hosts exist on the port, the VMPS sends an “access-denied” (open), a “fallback VLAN name” (open with fallback VLAN configured), a “port-shutdown” (secure), or a “new VLAN name” (multiple) response, depending on the secure mode setting of the VMPS.

If the switch receives an “access-denied” response from the VMPS, the switch continues to block traffic from the MAC address to or from the port. The switch continues to monitor the packets directed to the port and sends a query to the VMPS when it identifies a new address. If the switch receives a “port-shutdown” response from the VMPS, the switch disables the port. The port must be manually reenabled by using the CLI, Cisco Visual Switch Manager (CVSM), or SNMP.

You can also use an explicit entry in the configuration table to deny access to specific MAC addresses for security reasons. If you enter the none keyword for the VLAN name, the VMPS sends an “access-denied” or “port-shutdown” response.
Security Modes for VMPS Server

VMPS operates in three different modes. The way a VMPS server responds to illegal requests depends on the mode in which the VMPS is configured:

- **Open Mode**, page 15-22
- **Secure Mode**, page 15-22
- **Multiple Mode**, page 15-22

### Open Mode

If no VLAN is assigned to this port, VMPS verifies the requesting MAC address against this port:

- If the VLAN associated with this MAC address is allowed on the port, the VLAN name is returned to the client.
- If the VLAN associated with this MAC address is not allowed on the port, the host receives an “access denied” response.

If a VLAN is already assigned to this port, VMPS verifies the requesting MAC address against this port:

- If the VLAN associated with this MAC address in the database does not match the current VLAN assigned on the port, and a fallback VLAN name is configured, VMPS sends the fallback VLAN name to the client.
- If a VLAN associated with this MAC address in the database does not match the current VLAN assigned on the port, and a fallback VLAN name is not configured, the host receives an “access denied” response.

### Secure Mode

If no VLAN is assigned to this port, VMPS verifies the requesting MAC address against this port:

- If the VLAN associated with this MAC address is allowed on the port, the VLAN name is returned to the client.
- If the VLAN associated with this MAC address is not allowed on the port, the port is shut down.

If a VLAN is already assigned to this port, VMPS verifies the requesting MAC address against this port:

- If a VLAN associated with this MAC address in the database does not match the current VLAN assigned on the port, the port is shutdown, even if a fallback VLAN name is configured.

### Multiple Mode

Multiple hosts (MAC addresses) can be active on a dynamic port if they are all in the same VLAN. If the link fails on a dynamic port, the port returns to the unassigned state. Any hosts that come online through the port are checked again with VMPS before the port is assigned to a VLAN.

If multiple hosts connected to a dynamic port belong to different VLANs, the VLAN matching the MAC address in the last request is returned to the client provided that multiple mode is configured on the VMPS server.

**Note**

Although Catalyst 4500 series and Catalyst 6500 series switches running Catalyst operating system software support VMPS in all three operation modes, the User Registration Tool (URT) supports open mode only.
Chapter 15   Configuring VLANs, VTP, and VMPS

VLAN Membership Policy Server

Fallback VLAN

You can configure a fallback VLAN name on a VMPS server.

If no VLAN has been assigned to this port, VMPS compares the requesting MAC address to this port:

- If you connect a device with a MAC address that is not in the database, the VMPS sends the fallback VLAN name to the client.
- If you do not configure a fallback VLAN name and the MAC address does not exist in the database, the VMPS sends an “access-denied” response.

If a VLAN is already assigned to this port, VMPS compares the requesting MAC address to this port:

- If the VMPS is in secure mode, it sends a “port-shutdown” response, whether a fallback VLAN has been configured on the server.

Illegal VMPS Client Requests

Two examples of illegal VMPS client requests are as follows:

- When a MAC-address mapping is not present in the VMPS database and “no fallback” VLAN is configured on the VMPS.
- When a port is already assigned a VLAN (and the VMPS mode is not “multiple”) but a second VMPS client request is received on the VMPS for a different MAC-address.

Overview of VMPS Clients

The following subsections describe how to configure a switch as a VMPS client and configure its ports for dynamic VLAN membership.

The following topics are included:

- Understanding Dynamic VLAN Membership, page 15-23
- Default VMPS Client Configuration, page 15-24
- Configuring a Switch as a VMPS Client, page 15-24
- Administering and Monitoring the VMPS, page 15-28
- Troubleshooting Dynamic Port VLAN Membership, page 15-29

Understanding Dynamic VLAN Membership

When a port is configured as “dynamic,” it receives VLAN information based on the MAC-address that is on the port. The VLAN is not statically assigned to the port; it is dynamically acquired from the VMPS based on the MAC-address on the port.

A dynamic port can belong to one VLAN only. When the link becomes active, the switch does not forward traffic to or from this port until the port is assigned to a VLAN. The source MAC address from the first packet of a new host on the dynamic port is sent to the VMPS as part of the VQP request, which attempts to match the MAC address to a VLAN in the VMPS database. If there is a match, the VMPS sends the VLAN number for that port. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS security mode setting). See the “About VMPS” section on page 15-21 for a complete description of possible VMPS responses.
Multiple hosts (MAC addresses) can be active on a dynamic port if all are in the same VLAN. If the link goes down on a dynamic port, the port returns to the unassigned state and does not belong to a VLAN. Any hosts that come online through the port are checked again with the VMPS before the port is assigned to a VLAN.

For this operation to work, the client device must be able to reach the VMPS. A VMPS client sends VQP requests as UDP packets, trying a certain number of times before giving up. For details on how to set the retry interval, refer to section “Configuring the Retry Interval” on page 27.

The VMPS client also periodically reconfirms the VLAN membership. For details on how to set the reconfirm frequency, refer to section “Administering and Monitoring the VMPS” on page 28.

A maximum of 50 hosts are supported on a given port at any given time. Once this maximum is exceeded, the port is shut down, irrespective of the operating mode of the VMPS server.

Note
The VMPS shuts down a dynamic port if more than 50 hosts are active on that port.

Default VMPS Client Configuration

Table 15-4 shows the default VMPS and dynamic port configuration on client switches.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>VMPS domain server</td>
<td>None</td>
</tr>
<tr>
<td>VMPS reconfirm interval</td>
<td>60 minutes</td>
</tr>
<tr>
<td>VMPS server retry count</td>
<td>3</td>
</tr>
<tr>
<td>Dynamic ports</td>
<td>None configured</td>
</tr>
</tbody>
</table>

Configuring a Switch as a VMPS Client

This section contains the following topics:

- Configuring the IP Address of the VMPS Server, page 15-24
- Configuring Dynamic Access Ports on a VMPS Client, page 15-25
- Reconfirming VLAN Memberships, page 15-26
- Configuring Reconfirmation Interval, page 15-26
- Reconfirming VLAN Memberships, page 15-26

Configuring the IP Address of the VMPS Server

To configure a Catalyst 4500 series switch as a VMPS client, you must enter the IP address or hostname of the switch acting as the VMPS.
To define the primary and secondary VMPS on a Catalyst 4500 series switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch# configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**Switch(config)# vmps server (ipaddress</td>
</tr>
<tr>
<td></td>
<td>Specifies the IP address or hostname of the switch acting as the primary VMPS server.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>**Switch(config)# vmps server (ipaddress</td>
</tr>
<tr>
<td></td>
<td>Specifies the IP address or hostname of the switch acting as a secondary VMPS server.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Switch(config)# end</strong></td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Switch# show vmps</strong></td>
</tr>
<tr>
<td></td>
<td>Verifies the VMPS server entry.</td>
</tr>
</tbody>
</table>

This example shows how to define the primary and secondary VMPS devices:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vmps server 172.20.128.179 primary
Switch(config)# vmps server 172.20.128.178
Switch(config)# end
```

**Note**
You can configure up to four VMPS servers using this CLI on the VMPS client.

```
Switch# show vmps
VQP Client Status:
-------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.179 (primary, current)
172.20.128.178

Reconfirmation status
---------------------
VMPS Action: No Dynamic Port
```

**Configuring Dynamic Access Ports on a VMPS Client**

To configure a dynamic access port on a VMPS client switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch# configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Switch(config)# interface interface</strong></td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode and specifies the port to be configured.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Switch(config-if)# switchport mode access</strong></td>
</tr>
<tr>
<td></td>
<td>Sets the port to access mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Switch(config-if)# switchport access vlan dynamic</strong></td>
</tr>
<tr>
<td></td>
<td>Configures the port as eligible for dynamic VLAN access.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Switch(config-if)# end</strong></td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Switch# show interface interface switchport</strong></td>
</tr>
<tr>
<td></td>
<td>Verifies the entry.</td>
</tr>
</tbody>
</table>
This example shows how to configure a dynamic access port and to verify the entry:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa1/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan dynamic
Switch(config-if)# end

Switch# show interface fa1/1 switchport
Name: Fa0/1
Switchport: Enabled
Administrative mode: dynamic auto
Operational Mode: dynamic access
Administrative Trunking Encapsulation: isl
Operational Trunking Encapsulation: isl
Negotiation of Trunking: Disabled
Access Mode VLAN: 0 ((Inactive))
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: NONE
Pruning VLANs Enabled: NONE
```

**Voice Ports**

If a VVID (voice VLAN ID) is configured on a dynamic access port, the port can belong to both an access VLAN and a voice VLAN. Consequently, an access port configured for connecting an IP phone can have separate VLANs for the following:

- Data traffic to and from the PC that is connected to the switch through the access port of the IP phone (access VLAN)
- Voice traffic to and from the IP phone (voice VLAN)

**Reconfirming VLAN Memberships**

To confirm the dynamic port VLAN membership assignments that the switch has received from the VMPS, perform this task:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Switch# vmps reconfirm</td>
<td>Reconfirms dynamic port VLAN membership.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# show vmps</td>
<td>Verifies the dynamic VLAN reconfirmation status.</td>
</tr>
</tbody>
</table>

**Configuring Reconfirmation Interval**

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes the VMPS client waits before reconfirming the VLAN-to-MAC-address assignments.

To configure the reconfirmation interval, perform this task:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# vmps reconfirm minutes</td>
<td>Specifies the number of minutes between reconfirmations of the dynamic VLAN membership.</td>
</tr>
</tbody>
</table>
Chapter 15 Configuring VLANs, VTP, and VMPS

VLAN Membership Policy Server

This example shows how to change the reconfirmation interval to 60 minutes and verify the change:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vmps reconfirm 60
Switch(config)# end
Switch# show vmps
VQP Client Status:
---------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 10
VMPS domain server: 172.20.130.50 (primary, current)

Reconfirmation status
---------------------
VMPS Action: No Host

Configuring the Retry Interval

You can set the number of times that the VMPS client attempts to contact the VMPS before querying the next server.

To configure the retry interval, perform this task:

This example shows how to change the retry count to 5 and to verify the change:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vmps retry 5
Switch(config)# end
Switch# show vmps
VQP Client Status:
---------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 5
VMPS domain server: 172.20.130.50 (primary, current)

Reconfirmation status
---------------------
VMPS Action: No Host

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3 Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 Switch# show vmps</td>
<td>Verifies the dynamic VLAN reconfirmation status.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# vmps retry count</td>
<td>Specifies the retry count for the VPQ queries. Default is 3. Range is from 1 to 10.</td>
</tr>
<tr>
<td>Step 3 Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 Switch# show vmps</td>
<td>Verifies the retry count.</td>
</tr>
</tbody>
</table>
Administering and Monitoring the VMPS

You can display the following information about the VMPS with the `show vmps` command:

- **VQP Version**: The version of VQP used to communicate with the VMPS. The switch queries the VMPS using VQP Version 1.
- **Reconfirm Interval**: The number of minutes the switch waits before reconfirming the VLAN-to-MAC-address assignments.
- **Server Retry Count**: The number of times VQP resends a query to the VMPS. If no response is received after this many tries, the switch starts to query the secondary VMPS.
- **VMPS Domain Server**: The IP address of the configured VLAN membership policy servers. The switch currently sends queries to the one marked “current.” The one marked “primary” is the primary server.
- **VMPS Action**: The result of the most-recent reconfirmation attempt. This action can occur automatically when the reconfirmation interval expired, or you can force it by entering the `vmps reconfirm` command or its CVSM or SNMP equivalent.

The following example shows how to display VMPS information:

```
Switch# show vmps
VQP Client Status:----------------------
VMPS VQP Version:   1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server:---------------------------------
Reconfirmation status
VMPS Action:         other
```

The following example shows how to display VMPS statistics:

```
Switch# show vmps statistics
VMPS Client Statistics
----------------------
VQP Queries:               0
VQP Responses:             0
VMPS Changes:               0
VQP Shutdowns:              0
VQP Denied:                  0
VQP Wrong Domain:           0
VQP Wrong Version:         0
VQP Insufficient Resource: 0
```

Note: Refer to the *Cisco IOS Command Reference* for details on VMPS statistics.
Troubleshooting Dynamic Port VLAN Membership

VMPS errdisables a dynamic port under the following conditions:

- The VMPS is in secure mode, and it does not allow the host to connect to the port. The VMPS errdisables the port to prevent the host from connecting to the network.
- More than 50 active hosts reside on a dynamic port.

For information on how to display the status of interfaces in error-disabled state, refer to Chapter 8, “Checking Port Status and Connectivity.” To recover an errdisabled port, use the `errdisable recovery cause vmps` global configuration command.

Dynamic Port VLAN Membership Configuration Example

Figure 15-4 on page 15-30 shows a network with a VMPS servers and VMPS client switches with dynamic ports. In this example, these assumptions apply:

- The VMPS server and the VMPS client are separate switches.
- The Catalyst 4000 family Switch 1 (running Catalyst Operating System) is the primary VMPS server.
- The Catalyst 6000 family Switch 3 (running Catalyst Operating System) and the URT are secondary VMPS servers.
- End stations are connected to these clients:
  - Catalyst 4500 series XL Switch 2 (running Catalyst Cisco IOS)
  - Catalyst 4500 series XL Switch 9 (running Catalyst Cisco IOS)
- The database configuration file is called Bldg-G.db and is stored on the TFTP server with the IP address 172.20.22.7.
Two topologies are possible. Figure 15-5 illustrates a topology with one end station attached directly to a Catalyst 4500 series switch operating as a VMPS client. Figure 15-6 illustrates a topology with an end station attached to a Cisco IP Phone, which is attached to a Catalyst 4500 series switch.
In the following procedure, the Catalyst 4500 and Catalyst 6500 series switches (running Catalyst Operating System) are the VMPS servers. Use this procedure to configure the Catalyst 4500 series switch clients in the network:

**Step 1** Configure the VMPS server addresses on Switch 2, the client switch.

a. Starting from privileged EXEC mode, enter global configuration mode:

   switch# configuration terminal

b. Enter the primary VMPS server IP address:

   switch(config)# vmps server 172.20.26.150 primary

c. Enter the secondary VMPS server IP addresses:

   switch(config)# vmps server 172.20.26.152

d. To verify your entry of the VMPS IP addresses, return to privileged EXEC mode:

   switch(config)# exit

e. Display VMPS information configured for the switch:

   switch# show vmps
   VQG Client Status:
   -------------------
   VMPS VQP Version: 1
   Reconfirm Interval: 60 min
   Server Retry Count: 3
   VMPS domain server: 172.20.26.152
                       172.20.26.150 (primary, current)

**Step 2** Configure port Fa0/1 on Switch 2 as a dynamic port.

a. Return to global configuration mode:

   switch# configure terminal

b. Enter interface configuration mode:

   switch(config)# interface fa2/1

c. Configure the VLAN membership mode for static-access ports:

   switch(config-if)# switchport mode access
d. Assign the port dynamic VLAN membership:
   switch(config-if)# switchport access vlan dynamic

e. Return to privileged EXEC mode:
   switch(config-if)# exit
   switch#

Step 3 Connect End Station 2 on port Fa2/1. When End Station 2 sends a packet, Switch 2 sends a query to the primary VMPS server, Switch 1. Switch 1 responds with the VLAN ID for port Fa2/1. If spanning-tree PortFast mode is enabled on Fa2/1, port Fa2/1 connects immediately and begins forwarding.

Step 4 Set the VMPS reconfirmation period to 60 minutes. The reconfirmation period is the number of minutes the switch waits before reconfirming the VLAN to MAC address assignments.
   switch# config terminal
   switch(config)# vmps reconfirm 60

Step 5 Confirm the entry from privileged EXEC mode:
   switch# show vmps
   VQP Client Status:
   --------------------
   VMPS VQP Version:   1
   Reconfirm Interval: 60 min
   Server Retry Count: 3
   VMPS domain server:
   Reconfirmation status
   ---------------------
   VMPS Action:         No Dynamic Port

Step 6 Repeat Steps 1 and 2 to configure the VMPS server addresses, and assign dynamic ports on each VMPS client switch.

**VMPS Database Configuration File Example**

This example shows a sample VMPS database configuration file as it appears on a VMPS server. A VMPS database configuration file is an ASCII text file that is stored on a TFTP server accessible to the switch that functions as the VMPS server.

```
!vmps domain <domain-name>
! The VMPS domain must be defined.
!vmps mode {open | secure}
! The default mode is open.
!vmps fallback <vlan-name>
!vmps no-domain-req {allow | deny}
! The default value is allow.
vmps domain WBU
vmps mode open
vmps fallback default
vmps no-domain-req deny
```

Configuring IP Unnumbered Interface

This chapter discusses the IP Unnumbered Interface feature, which allows you to enable IP processing on an interface without assigning an explicit IP address.

This chapter contains these sections:

- About IP Unnumbered Interface Support, page 16-1
- IP Unnumbered Configuration Guidelines and Restrictions, page 16-3
- Configuring IP Unnumbered Interface Support with DHCP Server, page 16-4
- Configuring IP Unnumbered Interface Support with Connected Host Polling, page 16-6
- Displaying IP Unnumbered Interface Settings, page 16-7
- Troubleshooting IP Unnumbered Interface, page 16-8
- Related Documents, page 16-8

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About IP Unnumbered Interface Support

Before you configure VLANs and LAN interfaces with IP unnumbered interfaces, you should understand the following concepts:

- IP Unnumbered Interface Support with DHCP Server and Relay Agent, page 16-2
- DHCP Option 82, page 16-2
- IP Unnumbered Interface with Connected Host Polling, page 16-3
IP Unnumbered Interface Support with DHCP Server and Relay Agent

The IP unnumbered interface configuration allows you to enable IP processing on an interface without assigning it an explicit IP address. The IP unnumbered interface can “borrow” the IP address from another interface that is already configured on the Catalyst 4500 series switch, which conserves network and address space. When used with the DHCP server/relay agent, this feature allows a host address assigned by the DHCP server to be learned dynamically at the DHCP relay agent.

Figure 16-1 shows a sample network topology implementing the IP Unnumbered Interface feature. In this topology, IP routes are dynamically established by the aggregation switch when the DHCP server assigns IP addresses to the hosts.

Figure 16-1 Sample Network Topology Using the VLANs over IP Unnumbered Interfaces Feature

DHCP Option 82

DHCP provides a framework for passing configuration information to hosts on a TCP/IP network. Configuration parameters and other control information are carried in tagged data items that are stored in the options field of the DHCP message. The data items are also called options. Option 82 is organized as a single DHCP option that contains information known by the relay agent.

The IP Unnumbered Interface feature communicates information to the DHCP server using a suboption of the DHCP relay agent information option called agent remote ID. The information sent in the agent remote ID includes an IP address identifying the relay agent and information about the interface and the connection over which the DHCP request entered. The DHCP server can use this information to make IP address assignments and security policy decisions.

Figure 16-2 shows the agent remote ID suboption format that is used with the IP Unnumbered Interfaces feature.
Chapter 16      Configuring IP Unnumbered Interface

IP Unnumbered Configuration Guidelines and Restrictions

Figure 16-2      Format of the Agent Remote ID Suboption

<td>Physical interface. This field has the following format: slot (4 bits)</td>
</tr>
<tr>
<td>Reserved</td>
<td>Reserved. (1 byte)</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN identifier for the Ethernet interface. (2 bytes)</td>
</tr>
</tbody>
</table>

Table 16-1 describes the agent remote ID suboption fields displayed in Figure 16-2.

IP Unnumbered Interface with Connected Host Polling

Note

This feature option is applicable to LAN and VLAN interfaces only.

In some cases, the host IP address is assigned statically. The IP Unnumbered Interfaces feature can learn the static host IP address dynamically.

IP Unnumbered Configuration Guidelines and Restrictions

When using (or configuring) IP Unnumbered Interface, consider these guidelines and restrictions:

- For IP Unnumbered Interfaces, the following features are not supported:
  - Dynamic routing protocols
  - HSRP/VRRP
  - Static ARP
  - Unnumbered Interface and Numbered Interface in different VRFs
• The option to add dhcp host routes as connected routes is available in Cisco IOS. When using connected mode, however, the clear ip route * command deletes the dhcp host connected routes permanently.

Workarounds:
- For a layer 3 interface (SVI), enter shut then no shut.
- To enable IP unnumbered to use static routes, enter the ip dhcp route static command.

• IP Redirect is not sent by an interface configured with IP Unnumbered Interface.
• IP Unnumbered Interface is unable to forward multicast source packets.

Configuring IP Unnumbered Interface Support with DHCP Server

Note
DHCP must be configured and operational before you perform this task.

This section contains the following procedures:
• Configuring IP Unnumbered Interface Support on LAN and VLAN Interfaces, page 16-4
• Configuring IP Unnumbered Interface Support on a Range of Ethernet VLANs, page 16-5

Configuring IP Unnumbered Interface Support on LAN and VLAN Interfaces

To configure IP unnumbered interface support on a single LAN or VLAN interface, perform this task.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# interface [fastethernet</td>
<td>gigabitethernet</td>
</tr>
<tr>
<td>Switch(config-if)# ip unnumbered type number</td>
<td>Enables IP processing on an interface without assigning an explicit IP address to the interface. The type and number arguments specify another interface on which the switch has an assigned IP address. The interface specified cannot be another unnumbered interface.</td>
</tr>
<tr>
<td>Switch(config-if)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td>Verifies that IP unnumbered support has been configured correctly.</td>
</tr>
</tbody>
</table>
In the following example, Ethernet VLAN 10 is configured as an IP unnumbered interfaces:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 10
Switch(config-if)# ip unnumbered Lookback 0
```

## Configuring IP Unnumbered Interface Support on a Range of Ethernet VLANs

To configure IP unnumbered interface support on a range of Ethernet VLAN interfaces, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# enable</td>
<td></td>
</tr>
<tr>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Enters global configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config)# interface range ((fastethernet</td>
<td>gigabitethernet</td>
</tr>
<tr>
<td>Executes commands on multiple interfaces at the same time. A hyphen must be entered with a space on either side to separate the range information.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(config-if)# ip unnumbered type number</td>
<td></td>
</tr>
<tr>
<td>Enables IP processing on an interface without assigning an explicit IP address to the interface. The <code>type</code> and <code>number</code> arguments specify another interface on which the switch has an assigned IP address. The specified interface cannot be another unnumbered interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td>Returns to global configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td>Verifies that IP unnumbered support has been configured correctly.</td>
<td></td>
</tr>
</tbody>
</table>

In the following example, VLANs in the range from 1 to 10 are configured as IP unnumbered interfaces, sharing IP address of Fast Ethernet 3/1:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface range vlan 1 - 10
Switch(config-if)# ip unnumbered fastethernet 3/1
Switch(config-if)# exit
Switch(config-if)# end
```
Chapter 16  Configuring IP Unnumbered Interface

Configuring IP Unnumbered Interface Support with Connected Host Polling

To configure IP unnumbered interface support with connected host polling, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# enable</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# interface vlan vlan-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# ip unnumbered type number poll</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# exit</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# ip arp poll queue &lt;10-10000&gt;</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config)# ip arp poll rate &lt;10-10000&gt;</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch# show running-config</td>
</tr>
</tbody>
</table>

The following example shows how to enable IP processing and connected host polling on Fast Ethernet interface 6/2. It also shows how to set the global backlog queue to 2000 and the maximum number of ARP requests to 500:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastEthernet 6/2
Switch(config-if)# no switchport
Switch(config-if)# ip unnumbered loopback 0 poll
Warning: dynamic routing protocols will not work on non-point-to-point interfaces with IP unnumbered configured.
Switch(config-if)# exit
Switch(config)# ip arp poll queue 2000
Switch(config)# ip arp poll rate 500
Switch(config)# end
```
Displaying IP Unnumbered Interface Settings

Use the `show ip interface unnumbered` command to display status of an unnumbered interface with connected host polling for the switch.

To display **status of an unnumbered interface**, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# show ip interface [type number] unnumbered [detail]</code></td>
<td>Displays the status of unnumbered interface with connected host polling for the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

The following example shows how to display the status of unnumbered interfaces with connected host polling:

```
Switch# show ip interface loopback 0 unnumbered detail
Number of unnumbered interfaces with polling: 1
Number of IP addresses processed for polling: 2
  10.1.1.7
  10.1.1.8
Number of IP addresses in queue for polling: 2(high water mark: 3)
  10.1.1.17
  10.1.1.18
```

To display key statistic for the backlog of unnumbered interfaces with connected host polling for the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# show ip arp poll [detail]</code></td>
<td>Displays key statistic for the backlog of unnumbered interfaces with connected host polling for the switch.</td>
</tr>
</tbody>
</table>

The following example shows how to display key statistic for the backlog of unnumbered interfaces with connected host polling:

```
Switch# show ip arp poll
Number of IP addresses processed for polling: 439
Number of IP addresses in queue for polling: 3 (high water mark: 0, max: 1000)
Number of requests dropped:
  Queue was full: 0
  Request was throttled by incomplete ARP: 0
  Duplicate request was found in queue: 0
```

To clear the key statistic for the backlog of unnumbered interfaces, use the `clear ip arp poll statistic` command, as follows:

```
Switch# clear ip arp poll statistic
Switch# show ip arp poll
Number of IP addresses processed for polling: 0
Number of IP addresses in queue for polling: 0 (high water mark: 0, max: 1000)
Number of requests dropped:
  Queue was full: 0
  Request was throttled by incomplete ARP: 0
  Duplicate request was found in queue: 0
```
Troubleshooting IP Unnumbered Interface

To understand how to debug connect host polling, see the Cisco IOS documentation of the `debug arp` command on cisco.com.

When an IP unnumbered interface shares the IP address of a loopback interface whose prefix is advertised in an OSPF network, you must modify the loopback interface as a point-to-point interface. Otherwise, only the loopback interface host route is advertised to an OSPF neighbor.

```
Switch(config)# int loopback 0
Switch(config-if)# ip address
Switch(config-if)# ip address 10.1.0.1 255.255.0.0
Switch(config-if)# ip ospf network point-to-point
Switch(config-if)# end
```

CHAPTER

17

Configuring Layer 2 Ethernet Interfaces

This chapter describes how to use the command-line interface (CLI) to configure Fast Ethernet and Gigabit Ethernet interfaces for Layer 2 switching on Catalyst 4500 series switches. It also provides guidelines, procedures, and configuration examples. The configuration tasks in this chapter apply to Fast Ethernet and Gigabit Ethernet interfaces on any module, including the uplink ports on the supervisor engine.

This chapter includes the following major sections:
- About Layer 2 Ethernet Switching, page 17-1
- Default Layer 2 Ethernet Interface Configuration, page 17-4
- Layer 2 Interface Configuration Guidelines and Restrictions, page 17-4
- Configuring Ethernet Interfaces for Layer 2 Switching, page 17-5

Note

To configure Layer 3 interfaces, see Chapter 32, “Configuring Layer 3 Interfaces.”

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Layer 2 Ethernet Switching

The following sections describe how Layer 2 Ethernet switching works on Catalyst 4500 series switches:
- Layer 2 Ethernet Switching, page 17-2
- VLAN Trunks, page 17-3
- Layer 2 Interface Modes, page 17-3
Layer 2 Ethernet Switching

Catalyst 4500 series switches support simultaneous, parallel connections between Layer 2 Ethernet segments. Switched connections between Ethernet segments last only for the duration of the packet. New connections can be made between different segments for successive packets.

Note

With Cisco IOS Release 12.1(13)EW, the Catalyst 4500 series switches can handle packets of 1600 bytes, rather than treat them as “oversized” and discard them. This size is larger than the usual IEEE Ethernet Maximum Transmission Unit (MTU) (1518 bytes) and 802.1q MTU (1522 bytes). The ability to handle larger packets is required to support two nested 802.1q headers and Multiprotocol Label Switching (MPLS) on a network.

The Catalyst 4500 series solves congestion problems caused by high-bandwidth devices and a large number of users by assigning each device (for example, a server) to its own 10-, 100-, or 1000-Mbps segment. Because each Ethernet interface on the switch represents a separate Ethernet segment, servers in a properly configured switched environment achieve full access to the bandwidth.

Because collisions are a major bottleneck in Ethernet networks, an effective solution is full-duplex communication. Normally, Ethernet operates in half-duplex mode, which means that stations can either receive or transmit. In full-duplex mode, two devices can transmit and receive at the same time. When packets can flow in both directions simultaneously, effective Ethernet bandwidth doubles to 20 Mbps for 10-Mbps interfaces and to 200 Mbps for Fast Ethernet interfaces. Gigabit Ethernet interfaces on the Catalyst 4500 series switch are full-duplex mode only, providing 2-Gbps effective bandwidth.

Switching Frames Between Segments

Each Ethernet interface on a Catalyst 4500 series switch can connect to a single workstation or server, or to a hub through which workstations or servers connect to the network.

On a typical Ethernet hub, all ports connect to a common backplane within the hub, and the bandwidth of the network is shared by all devices attached to the hub. If two devices establish a session that uses a significant level of bandwidth, the network performance of all other stations attached to the hub is degraded.

To reduce degradation, the switch treats each interface as an individual segment. When stations on different interfaces need to communicate, the switch forwards frames from one interface to the other at wire speed to ensure that each session receives full bandwidth.

To switch frames between interfaces efficiently, the switch maintains an address table. When a frame enters the switch, it associates the MAC address of the sending station with the interface on which it was received.

Building the MAC Address Table

The Catalyst 4500 series builds the MAC address table by using the source address of the frames received. When the switch receives a frame for a destination address not listed in its MAC address table, it floods the frame to all interfaces of the same VLAN except the interface that received the frame. When the destination device replies, the switch adds its relevant source address and interface ID to the address table. The switch then forwards subsequent frames to a single interface without flooding to all interfaces.

The address table can store at least 32,000 address entries without flooding any entries. The switch uses an aging mechanism, defined by a configurable aging timer, so if an address remains inactive for a specified number of seconds, it is removed from the address table.
VLAN Trunks

A trunk is a point-to-point link between one or more Ethernet switch interfaces and another networking device such as a router or a switch. Trunks carry the traffic of multiple VLANs over a single link and allow you to extend VLANs across an entire network.

Only 802.1Q trunking encapsulations is available on all Catalyst 4500 Ethernet interfaces.

**Note**

Ports 3 to 18 are blocking Gigabit ports on the WS-X4418-GB module. Ports 1 to 12 are blocking Gigabit ports on the WS-X4412-2GB-T module.

You can configure a trunk on a single Ethernet interface or on an EtherChannel bundle. For more information about EtherChannel, see Chapter 24, “Configuring EtherChannel and Link State Tracking.”

Layer 2 Interface Modes

Table 17-1 lists the Layer 2 interface modes and describes how they function on Ethernet interfaces.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>switchport mode access</td>
<td>Puts the interface into permanent nontrunking mode and negotiates to convert the link into a nontrunking link. The interface becomes a nontrunk interface even if the neighboring interface does not change.</td>
</tr>
<tr>
<td>switchport mode dynamic desirable</td>
<td>Makes the interface actively attempt to convert the link to a trunking link. The interface becomes a trunk interface if the neighboring interface is set to trunk, desirable, or auto mode.</td>
</tr>
<tr>
<td>switchport mode dynamic auto</td>
<td>Makes the interface convert the link to a trunking link if the neighboring interface is set to trunk or desirable mode. It is the default mode for all Ethernet interfaces.</td>
</tr>
<tr>
<td>switchport mode trunk</td>
<td>Puts the interface into permanent trunking mode and negotiates to convert the link into a trunking link. The interface becomes a trunk interface even if the neighboring interface does not change.</td>
</tr>
<tr>
<td>switchport nonegotiate</td>
<td>Puts the interface into permanent trunking mode but prevents the interface from generating DTP frames. You must configure the neighboring interface manually as a trunk interface to establish a trunking link.</td>
</tr>
</tbody>
</table>

**Note**

DTP is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly. To avoid this problem, ensure that interfaces connected to devices that do not support DTP are configured with the access keyword if you do not intend to trunk across those links. To enable trunking to a device that does not support DTP, use the nonegotiate keyword to cause the interface to become a trunk without generating DTP frames.
Default Layer 2 Ethernet Interface Configuration

Table 17-2 shows the Layer 2 Ethernet interface default configuration.

Table 17-2  Layer 2 Ethernet Interface Default Configuration

<table>
<thead>
<tr>
<th>Feature</th>

</tr>
</tbody>
</table>

1. STP = Spanning Tree Protocol

Layer 2 Interface Configuration Guidelines and Restrictions

When using (or configuring) Layer 2 interfaces, consider these guidelines and restrictions:

- In a network of Cisco switches connected through 802.1Q trunks, the switches maintain one instance of spanning tree for each VLAN allowed on the trunks. Non-Cisco 802.1Q switches maintain only one instance of spanning tree for all VLANs allowed on the trunks.

  When you connect a Cisco switch to a non-Cisco device through an 802.1Q trunk, the Cisco switch combines the spanning tree instance of the native VLAN of the trunk with the spanning tree instance of the non-Cisco 802.1Q switch. However, spanning tree information for each VLAN is maintained by Cisco switches separated by a cloud of non-Cisco 802.1Q switches. The non-Cisco 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

- Make sure the native VLAN for an 802.1Q trunk is the same on both ends of the trunk link. If the VLAN on one end of the trunk is different from the VLAN on the other end, spanning tree loops might result.

- Disabling spanning tree on any VLAN of an 802.1Q trunk can cause spanning tree loops.
## Configuring Ethernet Interfaces for Layer 2 Switching

The following sections describe how to configure Layer 2 switching on a Catalyst 4500 series switch:

- Configuring an Ethernet Interface as a Layer 2 Trunk, page 17-5
- Configuring an Interface as a Layer 2 Access Port, page 17-7
- Clearing Layer 2 Configuration, page 17-8

### Configuring an Ethernet Interface as a Layer 2 Trunk

#### Note

The default for Layer 2 interfaces is `switchport mode dynamic auto`. If the neighboring interface supports trunking and is configured to trunk mode or dynamic desirable mode, the link becomes a Layer 2 trunk.

#### Note

Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, Catalyst 4948E, Supervisor Engine 7-E, and Supervisor Engine 7L-E only support dot1q encapsulation.

To configure an interface as a Layer 2 trunk, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td></td>
<td>Specifies the interface to configure.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-if)# shutdown</td>
</tr>
<tr>
<td></td>
<td>(Optional) Shuts down the interface to prevent traffic flow until configuration is complete.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode (dynamic (auto</td>
</tr>
<tr>
<td></td>
<td>Configures the interface as a Layer 2 trunk. (Required only if the interface is a Layer 2 access port or to specify the trunking mode.)</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# switchport access vlan vlan_num</td>
</tr>
<tr>
<td></td>
<td>(Optional) Specifies the access VLAN, which is used if the interface stops trunking. The access VLAN is not used as the native VLAN.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The <code>vlan_num</code> parameter is either a single VLAN number from 1 to 1005 or a range of VLANs described by two VLAN numbers, the lesser one first, separated by a dash. Do not enter any spaces between comma-separated <code>vlan</code> parameters or in dash-specified ranges.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# switchport trunk native vlan vlan_num</td>
</tr>
<tr>
<td></td>
<td>For 802.1Q trunks, specifies the native VLAN.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> If you do not set the native VLAN, the default is used (VLAN 1).</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-if)# switchport trunk allowed vlan (add</td>
</tr>
<tr>
<td></td>
<td>(Optional) Configures the list of VLANs allowed on the trunk. All VLANs are allowed by default. You cannot remove any of the default VLANs from a trunk.</td>
</tr>
</tbody>
</table>
### Step 7

```plaintext
Switch(config-if)# switchport trunk pruning vlan (add | except | none | remove) vlan_num[,vlan_num[,vlan_num[,...]]]
```

(Optional) Configures the list of VLANs allowed to be pruned from the trunk (see the “VLAN Trunking Protocol” section on page 15-7). The default list of VLANs allowed to be pruned contains all VLANs, except for VLAN 1.

### Step 8

```plaintext
Switch(config-if)# no shutdown
```

Activates the interface. (Required only if you shut down the interface.)

### Step 9

```plaintext
Switch(config-if)# end
```

Exits interface configuration mode.

### Step 10

```plaintext
Switch# show running-config interface (fastethernet | gigabitethernet | tengigabitethernet) slot/port
```

Displays the running configuration of the interface.

### Step 11

```plaintext
Switch# show interfaces [fastethernet | gigabitethernet | tengigabitethernet] slot/port switchport
```

Displays the switch port configuration of the interface.

### Step 12

```plaintext
Switch# show interfaces [(fastethernet | gigabitethernet | tengigabitethernet) slot/port] trunk
```

Displays the trunk configuration of the interface.

This example shows how to configure the Fast Ethernet interface 5/8 as an 802.1Q trunk. This example assumes that the neighbor interface is configured to support 802.1Q trunking and that the native VLAN defaults to VLAN 1:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# interface fastethernet 5/8
Switch(config-if)# shutdown
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# exit
```

This example shows how to verify the running configuration:

```plaintext
Switch# show running-config interface fastethernet 5/8
Building configuration...
Current configuration:
!
interface FastEthernet5/8
  switchport mode dynamic desirable
  switchport trunk encapsulation dot1q
end
```

This example shows how to verify the switch port configuration:

```plaintext
Switch# show interfaces fastethernet 5/8 switchport
Name: Fa5/8
Switchport: Enabled
Administrative Mode: dynamic desirable
Operational Mode: trunk
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: dot1q
Negotiation of Trunking: Enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
```
This example shows how to verify the trunk configuration:

```
Switch# show interfaces fastethernet 5/8 trunk
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Mode</th>
<th>Encapsulation</th>
<th>Status</th>
<th>Native vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa5/8</td>
<td>desirable</td>
<td>n-802.1q</td>
<td>trunking</td>
<td>1</td>
</tr>
</tbody>
</table>

```
Port Vlans allowed on trunk
Fa5/8 1-1005
```

```
Port Vlans allowed and active in management domain
Fa5/8 1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-802,850,917,999,1002-1005
```

```
Port Vlans in spanning tree forwarding state and not pruned
Fa5/8 1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-802,850,917,999,1002-1005
```

Switch#

### Configuring an Interface as a Layer 2 Access Port

**Note**

If you assign an interface to a VLAN that does not exist, the interface is not operational until you create the VLAN in the VLAN database (see the “Configuring VLANs in Global Configuration Mode” section on page 15-6).

To configure an interface as a Layer 2 access port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch(config)# interface {fastethernet</td>
<td>gigabitethernet</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config-if)# shutdown</td>
<td>(Optional) Shuts down the interface to prevent traffic flow until configuration is complete.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config-if)# switchport</td>
<td>Configures the interface for Layer 2 switching:</td>
</tr>
<tr>
<td></td>
<td>• You must enter the switchport command once without any keywords to configure the interface as a Layer 2 port before you can enter additional switchport commands with keywords.</td>
</tr>
<tr>
<td></td>
<td>• Required only if you previously entered the no switchport command for the interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(config-if)# switchport mode access</td>
<td>Configures the interface as a Layer 2 access port.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch(config-if)# switchport access vlan vlan_num</td>
<td>Places the interface in a VLAN.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch(config-if)# no shutdown</td>
<td>Activates the interface. (Required only if you had shut down the interface.)</td>
</tr>
<tr>
<td><strong>Step 7</strong> Switch(config-if)# end</td>
<td>Exits interface configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 17  Configuring Layer 2 Ethernet Interfaces

Configuring Ethernet Interfaces for Layer 2 Switching

This example shows how to configure the Fast Ethernet interface 5/6 as an access port in VLAN 200:

Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# interface fastethernet 5/6
Switch(config-if)# shutdown
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 200
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#

This example shows how to verify the running configuration:

Switch# show running-config interface fastethernet 5/6
Building configuration...
!
Current configuration :33 bytes
interface FastEthernet 5/6
  switchport access vlan 200
  switchport mode access
end

This example shows how to verify the switch port configuration:

Switch# show interface fastethernet 5/6 switchport
Name:Fa5/6
Switchport:Enabled
Administrative Mode:dynamic auto
Operational Mode:static access
Administrative Trunking Encapsulation:negotiate
Operational Trunking Encapsulation:native
Negotiation of Trunking:On
Access Mode VLAN:1 (default)
Trunking Native Mode VLAN:1 (default)
Administrative private-vlan host-association:none
Administrative private-vlan mapping:none
Operational private-vlan:none
Trunking VLANs Enabled:ALL
Pruning VLANs Enabled:2-1001
Switch#

Clearing Layer 2 Configuration

To clear the Layer 2 configuration on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch(config)# default interface (fastethernet</td>
<td>Specifies the interface to clear.</td>
</tr>
<tr>
<td></td>
<td>gigabitethernet</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config-if)# end</td>
<td>Exits interface configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 17  Configuring Layer 2 Ethernet Interfaces

Configuring Ethernet Interfaces for Layer 2 Switching

This example shows how to clear the Layer 2 configuration on the Fast Ethernet interface 5/6:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# default interface fastethernet 5/6
Switch(config)# end
Switch# exit

This example shows how to verify that the Layer 2 configuration was cleared:

Switch# show running-config interface fastethernet 5/6
Building configuration...
Current configuration:
!
interface FastEthernet5/6
end

This example shows how to verify the switch port configuration:

Switch# show interfaces fastethernet 5/6 switchport
Name: Fa5/6
Switchport: Enabled
Switch#
Configuring SmartPort Macros

This chapter describes how to configure and apply SmartPort and Static SmartPort macros on your switch. This chapter consists of these sections:

- About SmartPort Macros and Static SmartPort, page 18-1
- Configuring SmartPort Macros, page 18-2
- Displaying SmartPort Macros, page 18-14
- Configuring Static SmartPort Macros, page 18-14

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About SmartPort Macros and Static SmartPort

SmartPort macros provide a convenient way to save and share common configurations. Use SmartPort macros to enable features and settings based on the location of a switch in the network and for mass configuration deployments across the network.

Each SmartPort macro is a set of CLI commands that you define. SmartPort macro sets do not contain new CLI commands; each SmartPort macro is a group of existing CLI commands.

When you apply a SmartPort macro on an interface, the CLI commands contained within the macro are configured on the interface. When the macro is applied to an interface, the existing interface configurations are not lost. The new commands are added to interface and are saved in the running configuration file.

In addition to SmartPort macros, static SmartPort macros provide port configuration that you manually apply based on the device connected to the port. When you apply a static SmartPort macro the CLI commands within the macro are added to the existing port configuration. When there is a link-down event on the port, the switch does not remove the static macro.
Cisco-default SmartPort macros are embedded in the switch software (see Table 18-1). You can display these macros and the commands they contain by using the `show parser macro` user EXEC command.

<table>
<thead>
<tr>
<th>Macro Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco-global</td>
<td>Use this global configuration macro to enable rapid PVST+, loop guard, and dynamic port error recovery for link state failures.</td>
</tr>
<tr>
<td>cisco-desktop</td>
<td>Use this interface configuration macro for increased network security and reliability when connecting a desktop device, such as a PC, to a switch port.</td>
</tr>
<tr>
<td>cisco-phone</td>
<td>Use this interface configuration macro when connecting a desktop device such as a PC with a Cisco IP Phone to a switch port. This macro is an extension of the <code>cisco-desktop</code> macro and provides the same security and resiliency features, but with the addition of dedicated voice VLANs to ensure proper treatment of delay-sensitive voice traffic.</td>
</tr>
<tr>
<td>cisco-switch</td>
<td>Use this interface configuration macro when connecting an access switch and a distribution switch or between access switches connected using GigaStack modules or GBICs.</td>
</tr>
<tr>
<td>cisco-router</td>
<td>Use this interface configuration macro when connecting the switch and a WAN router.</td>
</tr>
</tbody>
</table>

1. Cisco-default SmartPort macros vary depending on the software version running on your switch.

Cisco also provides a collection of pretested, Cisco-recommended baseline configuration templates for Catalyst switches. The online reference guide templates provide the CLI commands that you use to create SmartPort macros based on the use of the port. Use the configuration templates to create SmartPort macros to build and deploy Cisco-recommended network designs and configurations.

**Configuring SmartPort Macros**

You can create a new SmartPort macro or use an existing macro as a template to create a new macro that is specific to your application. After you create the macro, you can apply it to an interface or a range of interfaces.

This section includes information about these topics:

- **Passing Parameters Through the Macro**, page 18-3
- **Default SmartPort Macro Configuration**, page 18-4
- **SmartPort Macro Configuration Guidelines**, page 18-6
- **Creating SmartPort Macros**, page 18-8
- **Applying SmartPort Macros**, page 18-9
Passing Parameters Through the Macro

Some commands might not be sufficiently generic for all the interfaces; for example, VLAN ID for Layer 2 interfaces and the IP address for Layer 3 interface. Retaining such commands in macro definitions requires that you change the value of such parameters (such as VLAN ID or IP address) before applying the macro to different interfaces. Alternatively, it requires that you create different macros for each possible value of its parameters.

The macro infrastructure can be enhanced to support accepting parameters while applying a macro. The parameters are passed as keyword-value pairs.

The CLI limits the number of keyword-value pairs to a maximum of three, where the first parameter must be the keyword, the second is its corresponding value, and the third parameter is the keyword for the second keyword-value pair. Here is an example of how to pass parameters to a command macro:

```plaintext
Switch(config)# macro name parameter-test
Enter macro commands one per line. End with the character '@'.
switchport mode access
switchport access vlan $VLANID
switchport port-security
switchport port-security maximum $MAXHOST
```

If the above macro is applied to some interface without parameters, the invalid commands fail. Instead, you should apply the macro with appropriate keyword-value pair parameters, as follows:

```plaintext
Switch(config-if)# macro apply parameter-test $VLANID 1 $MAXHOST 5
```

The above command applies the macro after replacing $VLANID with 1 and $MAXHOST with 5. Be aware that you can specify any string in the macro as a keyword.

Macro Parameter Help

It is often difficult to remember the macro keywords while applying a macro to an interface or switch. Macros can contain the definitions for mandatory keywords. If you apply a macro without those keyword values, the commands are considered invalid and they fail.

You can enhance the macro infrastructure to provide help on keywords defined in macros. While creating a macro, you can specify a help string (as a comment) to list the mandatory keywords for that macro.

The following example illustrates how to specify the help string for the keywords:

```plaintext
Switch(config)# macro name test
switchport access vlan $VLANID
switchport port-security maximum $MAX
#macro keywords $VLANID $MAX
```

Help string can be anywhere in the macro. The following example illustrates an alternate way to specify the help string:

```plaintext
Switch(config)# macro name test
switchport access vlan $VLANID
#macro keywords $VLANID
switchport port-security maximum $MAX
#macro keywords $MAX
```
Default SmartPort Macro Configuration

This section illustrates the default configurations for the four supported macros. These macros can only be viewed and applied; they cannot be modified by the user.

- cisco-global, page 18-4
- cisco-desktop, page 18-4
- cisco-phone, page 18-5
- cisco-router, page 18-5
- cisco-switch, page 18-5

**cisco-global**

This is the example for the cisco-global macro:

```
# Enable dynamic port error recovery for link state failures.
errdisable recovery cause link-flap
errdisable recovery interval 60

# VTP requires Transparent mode for future 802.1x Guest VLAN
# and current Best Practice
vtp domain [smartports]
vtp mode transparent

# Enable aggressive mode UDLD on all fiber uplinks
udld aggressive

# Enable Rapid PVST+ and Loopguard
spanning-tree mode rapid-pvst
spanning-tree loopguard default
spanning-tree extend system-id
```

**cisco-desktop**

This is the example for the cisco-desktop macro:

```
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
# Ensure port-security age is greater than one minute
# and use inactivity timer
# "Port-security maximum 1" is the default and will not
# Show up in the config
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
```
### cisco-phone

This is the example for the cisco-phone macro:

```bash
# VoIP enabled interface - Enable data VLAN
# and voice VLAN (VVID)
switchport access vlan $AVID
switchport mode access
# Update the Voice VLAN (VVID) value which should be
# different from data VLAN
switchport voice vlan $VVID
# Enable port security limiting port to a 2 MAC
switchport port-security
switchport port-security maximum 2
# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Enable auto-qos to extend trust to attached Cisco phone
auto qos voip cisco-phone
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
```

### cisco-router

This is the example for the cisco-router macro:

```bash
# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
switchport trunk native vlan $NVID
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
switchport trunk allowed vlan $VRANGE
# Hardcode trunk and disable negotiation to
# speed up convergence
switchport mode trunk
switchport nonegotiate
speed 100
duplex full
# Configure qos to trust this interface
auto qos voip trust
qos trust dscp
# Ensure fast access to the network when enabling the interface.
# Ensure that switch devices cannot become active on the interface.
spanning-tree portfast
spanning-tree bpduguard enable
```

### cisco-switch

This is the example for the cisco-switch macro:

```bash
# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
```
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
switchport trunk allowed vlan $VRANGE
# Hardcode trunk and disable negotiation to
# speed up convergence
switchport mode trunk
switchport nonegotiate
# Configure qos to trust this interface
auto qos voip trust
# 802.1w defines the link as pt-pt for rapid convergence
spanning-tree link-type point-to-point

SmartPort Macro Configuration Guidelines

Follow these guidelines when configuring macros on your switch:

- If a command fails when you apply a macro, either due to a syntax error or to a configuration error, the macro continues to apply the remaining commands to the interface.
- `cisco-global` needs to be applied at the global configuration mode. We recommend that you apply this macro before any other interface level macro.
- Specific keywords are required when you apply the system-defined macros (`cisco-desktop`, `cisco-phone`, `cisco-switch`, and `cisco-router`) on an interface.
- When using the `cisco-phone` macro to apply port security, the port security maximum is 2 (`switchport port-security maximum 2`).
- At most, three keyword-value pairs are allowed per system-defined macro.
- When creating a macro, do not use the `exit` or `end` commands or change the command mode by using `interface interface-id`. This could cause commands that follow `exit`, `end`, or `interface interface-id` to execute in a different command mode.
- When creating a macro, ensure that all CLI commands are in the same configuration mode.
- When creating a macro that requires the assignment of unique values, use the `parameter value` keywords to designate values specific to the interface. Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.
- Macro names are case sensitive. For example, the commands `macro name Sample-Macro` and `macro name sample-macro` result in two separate macros.
- Some macros might contain keywords that require a parameter value. Use the `macro global apply macro-name ? global configuration command or the macro apply macro-name ? interface configuration command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.
- When a macro is applied globally to a switch or to a switch interface, all existing configuration on the interface is retained. it is helpful when applying an incremental configuration.
- If you modify a macro definition by adding or deleting commands, the changes are not reflected on the interface where the original macro was applied. You need to reapply the updated macro on the interface to apply the new or changed commands.
Chapter 18 Configuring SmartPort Macros

- Use the **macro global trace macro-name** global configuration command or the **macro trace macro-name** interface configuration command to apply and debug a macro to find any syntax or configuration errors. If a command fails because of a syntax error or a configuration error, the macro continues to apply the remaining commands.

- Some CLI commands are specific to certain interface types. If a macro is applied to an interface that does not accept the configuration, the macro fails the syntax check or the configuration check, and the switch returns an error message.

- Applying a macro to an interface range is the same as applying a macro to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.

- When you apply a macro to a switch or a switch interface, the macro name is automatically added to the macro description of the switch or interface. You can display the applied commands and macro names by using the **show parser macro description** user EXEC command.

- The user-configurable macro has a buffer that can take commands and comments up to 3000 characters. Each new line takes two characters, and empty lines are counted as is.

Cisco-default SmartPort macros are embedded in the switch software (see Table 18-1). You can display these macros and the commands they contain by using the **show parser macro** user EXEC command.

Follow these guidelines when you apply a Cisco-default SmartPort macro on an interface:

- Display all macros on the switch by using the **show parser macro** user EXEC command. Display the contents of a specific macro by using the **show parser macro macro-name** user EXEC command.

- Keywords that begin with $ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter value** keywords.

The Cisco-default macros use the $ character to help identify required keywords. There is no restriction on using the $ character to define keywords when you create a macro.
Creating SmartPort Macros

To create a SmartPort macro, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch# configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Switch(config)# macro name macro-name</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Switch(config)# end</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Switch# show parser macro name macro-name</strong></td>
</tr>
</tbody>
</table>
## Applying SmartPort Macros

To apply a SmartPort macro, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# macro global {apply</td>
<td>trace} macro-name [parameter {value}]</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Switch(config)# macro global description text</td>
<td>(Optional) Enters a description about the macro that is applied to the switch.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config-if)# interface interface-id</td>
<td>(Optional) Enters interface configuration mode, and specify the interface on which to apply the macro.</td>
</tr>
<tr>
<td>5</td>
<td>Switch(config-if)# default interface interface-id</td>
<td>(Optional) Clears all configuration from the specified interface.</td>
</tr>
<tr>
<td>6</td>
<td>Switch(config-if)# macro {apply</td>
<td>trace} macro-name [parameter {value}]</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td>Switch(config-if)# macro description text</td>
<td>(Optional) Enters a description about the macro that is applied to the interface.</td>
</tr>
<tr>
<td>8</td>
<td>Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Configuring SmartPort Macros

You can delete a global macro-applied configuration on a switch only by entering the `no` version of each command that is in the macro. You can delete a macro-applied configuration on an interface by entering the `default interface interface-id` interface configuration command.

The `no` form of the `macro name` global configuration command deletes only the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied. You can delete a macro-applied configuration on an interface by entering the `default interface interface-id` interface configuration command. Alternatively, you can create an `anti-macro` for an existing macro that contains the `no` form of all the corresponding commands in the original macro and apply the anti-macro to the interface.

The following sections describe how to apply and display the attachments on each of the supported macros:

- `cisco-global`, page 18-10
- `cisco-desktop`, page 18-11
- `cisco-phone`, page 18-11
- `cisco-switch`, page 18-12
- `cisco-router`, page 18-13

### cisco-global

This example shows how to use the system-defined macro `cisco-global`:

```
Switch(config)# macro global apply cisco-global
Changing VTP domain name from gsg-switch to [smartports]
Setting device to VTP TRANSPARENT mode.
Switch(config)# end
Switch# show parser macro description [interface interface-id]
Macro name : cisco-global
Macro type : default global
# Enable dynamic port error recovery for link state failures.
errdisable recovery cause link-flap
errdisable recovery interval 60
# VTP requires Transparent mode for future 802.1x Guest VLAN
# and current Best Practice vtp domain [smartports] vtp mode transparent
# Enable aggressive mode UDLD on all fiber uplinks udld aggressive
# Enable Rapid PVST+ and Loopguard
spanning-tree mode rapid-pvst
spanning-tree loopguard default
spanning-tree extend system-id
```
cisco-desktop

This example shows how to use the system-defined macro `cisco-desktop` to assign a value of 35 to the access VLAN of the Fast Ethernet interface 2/9.

```
Switch(config)# interface fastethernet2/9
Switch(config-if)# macro apply cisco-desktop $AVID 35
Switch(config-if)# end
Switch# show parser macro name cisco-desktop
Macro name : cisco-desktop
Macro type : customizable

# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID [access_vlan_id]
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
# Ensure port-security age is greater than one minute
# and use inactivity timer
# "Port-security maximum 1" is the default and will not
# Show up in the config
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguarded enable
Switch# show parser macro description
Interface    Macro Description
--------------------------------------------------------------
Fa2/9        cisco-desktop
```

cisco-phone

This example shows how to use the system-defined macro `cisco-phone` to assign a value of 35 to the access VLAN and 56 to the voice VLAN on the Fast Ethernet interface 2/9.

```
Switch(config)# interface fastethernet2/9
Switch(config-if)# macro apply cisco-phone
Switch(config-if)# macro description cisco-phone $AVID $VVID
Switch(config-if)# end
Switch# show parser macro name cisco-phone
Macro name : cisco-phone
```
Chapter 18      Configuring SmartPort Macros

Macro type : customizable

# VoIP enabled interface - Enable data VLAN
# and voice VLAN (VVID)
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID [access_vlan_id]
switchport mode access
# Update the Voice VLAN (VVID) value which should be
# different from data VLAN
# Recommended value for voice vlan (VVID) should not be 1
switchport voice vlan $VVID [voice_vlan_id]
# Enable port security limiting port to a 2 MAC
# addressess -- One for desktop and one for phone
switchport port-security
switchport port-security maximum 2
# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Enable auto-qos to extend trust to attached Cisco phone
auto qos voip cisco-phone
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable

Switch# show parser macro description
Interface    Macro Description
--------------------------------------------------------------
Fa2/9        cisco-phone
--------------------------------------------------------------

This example shows how to use the system-defined macro cisco-switch to assign a value of 38 to the

Note

This macro requires the $NVID keyword, which is the native VLANs of the port.

Switch(config)# interface fastethernet2/9
Switch(config-if)#  macro apply cisco-switch
Switch(config-if)#  macro description cisco-switch $NVID 38
Switch(config-if)#  end
Switch# show parser macro name cisco-switch
Macro name : cisco-switch
Macro type : customizable

# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID [native_vlan_id]
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
# switchport trunk allowed vlan $VRANGE [vlan_range]
# Hardcode trunk and disable negotiation to
# speed up convergence
switchport mode trunk
switchport nonegotiate
# Configure qos to trust this interface
auto qos voip trust
# 802.1w defines the link as pt-pt for rapid convergence
spanning-tree link-type point-to-point

Switch# show parser macro description
Interface    Macro Description
--------------------------------------------------------------
Fa2/9        cisco-switch
--------------------------------------------------------------

This example shows how to use the system-defined macro **cisco-router** to assign a value of 451 to the native VLAN on the Fast Ethernet interface 2/9.

**Note**

This macro requires the $NVID keyword, which is the native VLANs of the port.

Switch(config)# interface fastethernet2/9
Switch(config-if)# macro apply cisco-router
Switch(config-if)# macro description cisco-router $NVID 451
Switch(config-if)# end
Switch# show parser macro name cisco-router
Macro name : cisco-router
Macro type : customizable

# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID [native_vlan_id]
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
switchport trunk allowed vlan $VRANGE [vlan_range]
# Hardcode trunk and disable negotiation to
# speed up convergence
# Hardcode speed and duplex to router
switchport mode trunk
switchport nonegotiate
speed 100
duplex full
# Configure qos to trust this interface
auto qos voip trust
qos trust dscp
# Ensure fast access to the network when enabling the interface.
# Ensure that switch devices cannot become active on the interface.
spanning-tree portfast
spanning-tree bpdu-guard enable

Switch# show parser macro description
Interface    Macro Description
--------------------------------------------------------------
Fa2/9        cisco-router
--------------------------------------------------------------
Displaying SmartPort Macros

To display the SmartPort macros, use one or more of the privileged EXEC commands in Table 18-2.

Table 18-2 Commands for Displaying SmartPort Macros

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show parser macro</td>
<td>Displays all configured macros.</td>
</tr>
<tr>
<td>show parser macro name macro-name</td>
<td>Displays a specific macro.</td>
</tr>
<tr>
<td>show parser macro brief</td>
<td>Displays the configured macro names.</td>
</tr>
<tr>
<td>show parser macro description [interface interface-id]</td>
<td>Displays the macro description for all interfaces or for a specified interface.</td>
</tr>
</tbody>
</table>

Configuring Static SmartPort Macros

This section describes how to configure and enable static SmartPort macros:

- Default SmartPort Macro Configuration, page 18-4
- SmartPort Macro Configuration Guidelines, page 18-6
- Applying Static SmartPort Macros, page 18-15

Default Static SmartPort Configuration

No static SmartPort macros are enabled on the switch.

Table 18-3 Default Static SmartPort Macros

<table>
<thead>
<tr>
<th>Macro Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco-global</td>
<td>Use this global configuration macro to enable rapid PVST+, loop guard, and dynamic port error recovery for link state failures.</td>
</tr>
<tr>
<td>cisco-desktop</td>
<td>Use this interface configuration macro for increased network security and reliability when connecting a desktop device, such as a PC, to a switch port.</td>
</tr>
<tr>
<td>cisco-phone</td>
<td>Use this interface configuration macro when connecting a desktop device such as a PC with a Cisco IP Phone to a switch port. This macro is an extension of the cisco-desktop macro and provides the same security and resiliency features, but with the addition of dedicated voice VLANs to ensure proper treatment of delay-sensitive voice traffic.</td>
</tr>
<tr>
<td>cisco-switch</td>
<td>Use this interface configuration macro when connecting an access switch and a distribution switch or between access switches connected by using small form-factor pluggable (SFP) modules.</td>
</tr>
<tr>
<td>cisco-router</td>
<td>Use this interface configuration macro when connecting the switch and a WAN router.</td>
</tr>
</tbody>
</table>

1. Cisco-default SmartPort macros vary, depending on the software version running on your switch.
Static SmartPort Configuration Guidelines

- When a macro is applied globally to a switch or to a switch interface, all existing configuration on the interface is retained. It is helpful when applying an incremental configuration.

- If a command fails because of a syntax or a configuration error, the macro continues to apply the remaining commands. Use the `macro global trace macro-name` global configuration command or the `macro trace macro-name` interface configuration command to apply and debug a macro to find any syntax or configuration errors.

- Some CLI commands are specific to certain interface types. If you apply a macro to an interface that does not accept the configuration, the macro fails the syntax or the configuration check, and the switch returns an error message.

- Applying a macro to an interface range is the same as applying a macro to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.

- When you apply a macro to a switch or a switch interface, the macro name is automatically added to the switch or interface. You can display the applied commands and macro names by using the `show running-config` user EXEC command.

Applying Static SmartPort Macros

To apply a static SmartPort macro, perform these steps, beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>show parser macro</code> Displays the Cisco-default static SmartPort macros embedded in the switch software.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>show parser macro name macro-name</code> Displays the specific macro that you want to apply.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>configure terminal</code> Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`macro global {apply</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>interface interface-id</code> (Optional) Enters interface configuration mode, and specify the interface on which to apply the macro.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>default interface interface-id</code> (Optional) Clears all configuration from the specified interface.</td>
</tr>
</tbody>
</table>
## Chapter 18  Configuring SmartPort Macros

### Configuring Static SmartPort Macros

You can only delete a global macro-applied configuration on a switch by entering the `no` version of each command in the macro. You can delete a macro-applied configuration on a port by entering the `default interface interface-id` interface configuration command.

This example shows how to display the `cisco-desktop` macro, to apply the macro and to set the access VLAN ID to 25 on an interface:

Switch# `show parser macro cisco-desktop`

```
Macro name : cisco-desktop
Macro type : default

# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access

# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
switchport port-security maximum 1

# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity

# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
```

Switch# `configure terminal`
Switch(config)# `interface gigabitethernet1/0/4`
Switch(config-if)# `macro apply cisco-desktop $AVID 25`

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7</td>
<td>Applies each individual command defined in the macro to the port by entering <code>macro global apply macro-name</code>. Specify <code>macro global trace macro-name</code> to apply and to debug a macro to find any syntax or configuration errors. Append the macro with the required values by using the <code>parameter value</code> keywords. Keywords that begin with <code>$</code> require a unique parameter value. Use the <code>macro global apply macro-name ?</code> command to display a list of any required values for the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied. (Optional) Specify unique parameter values that are specific to the switch. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. The corresponding value replaces all matching occurrences of the keyword.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Verifies that the macro is applied to an interface.</td>
</tr>
<tr>
<td>Step 10</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring Cisco IOS Auto Smartport Macros

This chapter describes how to configure and apply Auto Smartport macros on the Catalyst 4500 series switch.

This chapter includes the following major sections:

- About Auto Smartport Macros, page 19-1
- Configuring Auto Smartport Macros, page 19-3
- Displaying Auto Smartport, page 19-13

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Auto Smartport Macros

Auto Smartport macros dynamically configure ports based on the device type detected on the port. When the switch detects a new device on a port, it applies the appropriate Auto Smartport macro. When a link-down event occurs on the port, the switch removes the macro. For example, when you connect a Cisco IP phone to a port, Auto Smartport automatically applies the Cisco IP phone macro. The Cisco IP phone macro enables quality of service (QoS), security features, and a dedicated voice VLAN to ensure proper treatment of delay-sensitive voice traffic.

Auto Smartport uses event triggers to map devices to macros. The most common event triggers are based on Cisco Discovery Protocol (CDP) messages received from connected devices. The detection of a device (Cisco IP phone, Cisco wireless access point, Cisco switch, or Cisco router) invokes an event trigger for that device.

Link Layer Discovery Protocol (LLDP) is used to detect devices that do not support CDP. Other mechanisms used as event triggers include the 802.1X authentication result and MAC-address learned.
System built-in event triggers exist for various devices based mostly on CDP and LLDP messages (Table 19-1) and some MAC address and some MAC addresses. Through Cisco IOS Release 12.2(54)SG, DMP is detected using the MAC address. Starting with Cisco IOS Release 15.0(2)SG, DMP is also detected using CDP.) These triggers are enabled as long as Auto Smartport is enabled.

You can also define your own trigger. User-defined triggers can be CDP/LLDP-based, a group of MAC addresses, or the value of the attribute-value (AV) pair for the auto-smart-port keyword.

The Auto Smartport macros are groups of CLI commands. Detection of devices on a port triggers the application of the macro for the device. (For example, detecting a CISCO_PHONE event on a port triggers the switch to apply the commands in the CISCO_PHONE_AUTO_SMARTPORT macro.)

System built-in macros exist for various devices, and, by default, system built-in triggers are mapped to the corresponding built-in macros. You can change the mapping of built-in triggers or macros as needed.

A macro basically applies or removes a set of CLIs on an interface based on the link status. In a macro, the link status is checked. If the link is up, then a set of CLIs is applied; if the link is down, the set is removed (the no format of the CLIs are applied). The part of the macro that applies the set of CLIs is termed macro. The part that removes the CLIs (the no format of the CLIs) are termed antimacro.

Besides creating user-defined triggers, you can also create user-defined macros and map one to the other among all triggers (both built-in and user-defined) and all macros (both built-in and user-defined). Use the Cisco IOS scripting capability to create the macros. Cisco IOS scripting is a BASH-like language syntax for command automation and variable replacement.

The four detection mechanisms adhere to the following order of priority:

1. If 802.1X authentication is configured on a port, an authentication response-based trigger is applied, and other triggers are ignored.
2. If 802.1X authentication fails and the CDP/LLDP fallback mechanism is configured, CDP/LLDP triggers for phone devices only; if no fallback mechanism is configured, or a device is not a phone device, nothing is triggered.
3. If 802.1X authentication is configured on a port, a MAC address-based trigger is never triggered.
4. If 802.1X authentication is not configured on a port, CDP/LLDP has priority over a MAC address-based trigger with a hold-off timer applied for MAC-address based trigger. Between CDP/LLDP, there is no particular order; whichever one arrives first is triggered.

**Device Classifier**

Starting with Cisco Release IOS XE 3.3.0SG and IOS 15.1(1)SG, the device classifier (DC) feature is enabled by default on the Catalyst 4500 series switch.

The DC collects information from MAC-OUI and protocols such as CDP, LLDP, and DHCP to identify devices. You must enable CDP and LLDP on the switch. To make DHCP options information available to the DC, you must enable the DHCP snooping feature on the switch. The device attributes collected from these protocols are evaluated against a set of profiles available to the DC to find the best match. The best-matched profile is used for device identification.

Devices that do not send CDP, LLDP or DHCP traffic may not be properly identified by the device classifier.

Device-classifier uses profile definitions—built-in and default profiles. The built-in profiles contain the device profiles that are known to the Auto Smartport module, comprising a limited set of Cisco devices. They are built into Cisco IOS and cannot be changed. The default profiles are stored as a text file in nonvolatile storage and allow the DC to identify a much larger set of devices. The default profiles are updated as part of the Cisco IOS archive download.
When a new device is detected, the corresponding shell trigger executes the Auto Smartport configuration macro. Auto Smartport has built-in mappings for a large set of devices. You can use the commands described in the “Configuring Mapping Between User-Defined Triggers and Built-in Macros” section on page 19-9 to create new mappings. You can create the trigger mappings based on the profile name or device name that is provided by the DC.

**Device Visibility Mode**

The DC function is enabled on the switch by default. You can disable it by using the `no macro auto monitor` global configuration command. The DC feature provides `show` commands to display the devices that are connected to the switch. It also provides information about the physical port to which the device is connected, along with device MAC address and other vendor information. Only directly connected devices, such as another Layer 2 switch, are classified on nonaccess ports. On access ports that are connected to hubs, device classification is limited to 32 devices.

When you enable Auto Smartport, the DC is automatically enabled.

**Configuring Auto Smartport Macros**

The following topics are included:

- Enabling Auto Smartport Macros, page 19-3
- Auto Smartport Configuration Guidelines, page 19-5
- Configuring Auto Smartport Built-in Macro Parameters, page 19-6
- Configuring User-Defined Event Triggers, page 19-8
- Configuring Mapping Between User-Defined Triggers and Built-in Macros, page 19-9
- Configuring Auto Smartport User-Defined Macros, page 19-10

**Enabling Auto Smartport Macros**

By default, Auto Smartport is disabled globally. To disable Auto Smartport macros on a specific port, use the `no macro auto global processing` interface command before enabling Auto Smartport globally.

To enable Auto Smartport globally, use the `macro auto global processing` global configuration command.
To enable Auto Smartport macros, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# [no] macro auto global processing [cdp</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the `show shell functions` and the `show shell triggers` privileged EXEC command to display the event triggers, the built-in macros, and the built-in macro default values.

This example shows how enable Auto Smartport on the switch and how to disable the feature on a specific interface:

```
Switch(config)# macro auto global processing
Switch(config)# interface interface_id
Switch(config-if)# no macro auto processing
```

**Auto Smartport Default Configuration**

By default, Cisco IOS shell is enabled and Auto Smartport is disabled globally.

Table 19-1 shows the Auto Smartport built-in event triggers that are embedded in the switch software by default.

**Table 19-1  Auto Smartport Built-in Event Trigger Macros**

<table>
<thead>
<tr>
<th>Event Trigger Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CISCO_PHONE_EVENT</td>
<td>System detects that a phone device is connected to an interface.</td>
</tr>
<tr>

</tbody>
</table>
Chapter 19  Configuring Cisco IOS Auto Smartport Macros

Table 19-2 shows the Auto Smartport built-in macros that are embedded in the switch software.

<table>
<thead>
<tr>
<th>Macro Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CISCO_PHONE_AUTO_SMARTPORT</td>
<td>Use this macro for Cisco IP phone device. It enables QoS, port security, Address Resolution Protocol (ARP) inspection (dynamic ARP inspection), IP source guard, DHCP snooping, storm control and spanning tree protection on the port.</td>
</tr>
<tr>
<td>CISCO_SWITCH_AUTO_SMARTPORT</td>
<td>Use this macro to apply the switch macro for Cisco switches. It enables trunking on the port.</td>
</tr>
<tr>
<td>CISCO_ROUTER_AUTO_SMARTPORT</td>
<td>Use this macro to apply the router macro for Cisco routers. It enables QoS, trunking, and spanning-tree protection on the port.</td>
</tr>
<tr>
<td>CISCO_AP_AUTO_SMARTPORT</td>
<td>Use this macro to apply the wireless access point (AP) macro for Cisco APs. It enables support for an autonomous wireless access point and QoS on the port.</td>
</tr>
<tr>
<td>CISCO_LWAP_AUTO_SMARTPORT</td>
<td>Use this macro to apply the lightweight wireless access point macro for Cisco lightweight wireless APs. It enables QoS, port security, dynamic ARP inspection, IP source guard, DHCP snooping, storm control, and spanning tree protection on the port.</td>
</tr>
<tr>
<td>CISCO_IP_CAMERA_AUTO_SMARTPORT</td>
<td>Use this macro for a Cisco IP surveillance camera device. It enables QoS, port security, and access VLAN on the port.</td>
</tr>
<tr>
<td>CISCO_DMP_AUTOSMARTPORT</td>
<td>Use this macro for a Cisco digital media player device. It enables QoS, port security, and access VLAN on the port.</td>
</tr>
</tbody>
</table>

Note: By default, the built-in event triggers are mapped to the built-in macros.

Auto Smartport Configuration Guidelines

Auto Smartport guidelines include the following:

- To avoid system conflicts when Auto Smartport macros are applied, remove all port configuration except for 802.1X authentication.

- If the macro conflicts with the original configuration, some macro commands might not be applied, or some antimacro commands might not be applied. (The antimacro is the portion of the applied macro that removes it at link down.)

Note: Failure of one command in the macro halts the application of the entire macro.

For example, if 802.1X authentication is enabled, you cannot remove switchport-mode access configuration. You must remove the 802.1X authentication before removing the configuration.

- A port should not be a member of an EtherChannel when applying Auto Smartport macros.

   If Auto Smartport is not yet enabled globally, disable Auto Smartport on all the EtherChannel ports before enabling it globally. If Auto Smartport is already enabled, shut down the port and disable it before adding the port to an EtherChannel.
Note

If an Auto Smartport macro is applied on an interface, EtherChannel configuration usually fails because of conflict with the auto-QoS configuration applied by the macro.

- The built-in macro default data VLAN is VLAN 1. The default voice VLAN is VLAN 2. You should modify the built-in macro default values if your switch uses different VLANs. To view all built-in macro default values, use the `show shell functions` privileged EXEC command.

- To detect non-Cisco devices for 802.1X authentication or MAB, configure the RADIUS server to support the Cisco AV pair `auto-smart-port=event trigger`. You must configure a user-defined trigger with the value returned in the AV pair for `auto-smart-port`.

- For stationary devices that do not support CDP, MAB, or 802.1X authentication, such as network printers, we recommend that you disable Auto Smartport on the port.

- If authentication is enabled on a port, the switch ignores CDP unless the `fallback cdp` keyword is in the `macro auto global processing` global configuration command.

- The order of CLI commands within the macro and the corresponding antimacro can differ.

- Before converting a port into a Layer 3 interface, enter the `no macro auto processing` command. This prevents Auto Smartport from applying macros on the interface. If Layer 3 is already configured, enter the `no macro auto processing` command on the Layer 3 interface enable Auto Smartport globally.

- Auto Smartport macros and Smartport cannot coexist on an interface.

- A switch applies a macro in accordance with the LLDP advertisement from the attached device. If the device does not identify itself properly, the wrong macro is applied. Consult the specific device documentation to ensure the device’s firmware is current.

- The LWAP’s WLC software version must be 6.0.188 ( => Cisco IOS 12.4(21a)JA2) or later to make it detectable as LWAP by AutoSmartport.

- As of Cisco IOS Release 12.2(54)SG, Auto Smartport does not support macros that apply EtherChannel configurations. Interfaces that belong to EtherChannel groups are treated as standard interfaces. You can apply macros on individual interfaces based on the device type but the CLIs in the macro (for example, auto-QoS) might conflict with an EtherChannel configuration. We recommend that you disable Auto Smartport on interfaces belonging to EtherChannels before you enable Auto Smartport globally. If Auto Smartport is already enabled, disable Auto Smartport on the interfaces before configuring EtherChannel.

### Configuring Auto Smartport Built-in Macro Parameters

The switch automatically maps from built-in event triggers to built-in macros. You can replace the built-in macro default values with values that are specific to your switch.

To configure Auto Smartport built-in macros parameters, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 19  Configuring Cisco IOS Auto Smartport Macros

Configuring Auto Smartport Macros

The **no macro auto execute** `event trigger [builtin built-in macro name [parameter=value] [parameter=value]]` command deletes the mapping.

This example shows how to use two built-in Auto Smartport macros for connecting Cisco switches and Cisco IP phones to the switch. This example modifies the default voice VLAN, access VLAN, and native VLAN for the trunk interface:

```
Switch# configure terminal
Switch(config)# macro auto execute CISCO_PHONE_EVENT builtin CISCO_PHONE_AUTO_SMARTPORT
ACCESS_VLAN=10 VOICE_VLAN=20
Switch(config)#
```

### Step 2

**Command**

```
Switch(config)# macro auto execute
event trigger builtin built-in macro name [parameter=value] [parameter=value]
```

**Purpose**

Defines mapping from an event trigger to a built-in macro.

Specify an **event trigger** value:

- CISCO_PHONE_EVENT
- CISCO_SWITCH_EVENT
- CISCO_ROUTER_EVENT
- CISCO_WIRELESS_AP_EVENT
- CISCO_WIRELESS_LIGHTWEIGHT_AP_EVENT
- CISCO_DMP_EVENT
- CISCO_IPVSC_EVENT
- WORD—Apply a user-defined event trigger.

Specify a **built-in macro name** value:

- CISCO_PHONE_AUTO_SMARTPORT
  (Optional) Specify the parameter values: $ACCESS_VLAN=(1) and $VOICE_VLAN=(2).
- CISCO_SWITCH_AUTO_SMARTPORT
  (Optional) Specify the parameter values: $NATIVE_VLAN=(1).
- CISCO_ROUTER_AUTO_SMARTPORT
  (Optional) Specify the parameter values: $NATIVE_VLAN=(1).
- CISCO_AP_AUTO_SMARTPORT
  (Optional) Specify the parameter values: $NATIVE_VLAN=(1).
- CISCO_LWAP_AUTO_SMARTPORT
  (Optional) Specify the parameter values: $ACCESS_VLAN=(1).
- CISCO_DMP_AUTO_SMARTPORT
- CISCO_IP_CAMERA_AUTO_SMARTPORT
  (Optional) `parameter=value`—Replace default values that begin with $.

Enter new values in the form of name value pair separated by a space: `[name1=value1 name2=value2...]`. Default values are shown in parenthesis.

### Step 3

**Command**

```
Switch(config)# end
```

**Purpose**

Returns to privileged EXEC mode.

### Step 4

**Command**

```
Switch# show running-config
```

**Purpose**

Verifies your entries.

### Step 5

**Command**

```
Switch# copy running-config startup-config
```

**Purpose**

(Optional) Saves your entries in the configuration file.
Configuring Auto Smartport Macros

Switch(config)#!!! the next command enables auto smart ports globally
Switch(config)# macro auto global processing fallback cdp
Switch(config)# exit

Switch#
Switch# show running-config interface gigabitethernet2/7
Building configuration...

Current configuration : 284 bytes
!
switchport access vlan 10
switchport mode access
switchport voice vlan 2
switchport port-security maximum 2
switchport port-security
switchport port-security aging time 2
switchport port-security violation restrict
switchport port-security aging type inactivity
auto qos voip cisco-phone
qos trust device cisco-phone
neighbor device type phone
macro description CISCO_PHONE_EVENT
spanning-tree portfast
spanning-tree bpduguard enable
service-policy input AutoQos-VoIP-Input-Cos-Policy
service-policy output AutoQos-VoIP-Output-Policy
end

Note

You can also use the macro auto device command to simplify changing the parameters for a built-in functions for a device type.

Configuring User-Defined Event Triggers

You can configure two types of event triggers: user-defined and MAC address-based.

The following sections describe these triggers:
- 802.1X-Based Event Trigger, page 19-8
- MAC Address-Based Event Trigger, page 19-9

802.1X-Based Event Trigger

When using MAB or 802.1X authentication to trigger Auto Smartport macros, you need to create an event trigger that corresponds to the Cisco AV pair (auto-smart-port=event trigger) sent by the RADIUS server.

To configure an event trigger, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# shell trigger identifier description Specifies the event trigger identifier and description. The identifier should have no spaces or hyphens between words.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Configuring Auto Smartport Macros

Chapter 19      Configuring Cisco IOS Auto Smartport Macros

Use the `no shell trigger identifier` global configuration command to delete the event trigger.

The following example shows how to define a user-defined trigger:

Switch# configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# shell trigger RADIUS_MAB_EVENT MAC_AuthBypass Event
Switch(config)#

MAC Address-Based Event Trigger

To configure a MAC address group as an event trigger, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1  | Switch# configure terminal  
Enters global configuration mode. |
| Step 2  | Switch(config)# macro auto  
mac-address group  
Specifies a group of MAC address as an event trigger.  
Changes mode to config-mac-addr-grp. You can then add or remove the  
MAC address or Organizational Unique Identifier (OUI) from the group.  
The `group` value defines the user-defined trigger. |
| Step 3  | Switch(config)# end  
Returns to privileged EXEC mode. |
| Step 4  | Switch# show shell triggers  
Displays the event triggers on the switch. |
| Step 5  | Switch# copy running-config  
startup-config  
(Optional) Saves your entries in the configuration file. |

Use the `no macro auto mac-address-group grp_name` to delete the event trigger.

Configuring Mapping Between User-Defined Triggers and Built-in Macros

You need to map the user-defined trigger to either a built-in macro or user-defined macro.

To map a user-defined trigger to a built-in macros, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1  | Switch# configure terminal  
Enters global configuration mode. |
| Step 2  | Switch(config)# macro auto execute  
event trigger builtin built-in macro  
name [parameter=value]  
[parameter=value]  
Specifies a user-defined event trigger and a macro name. This action  
replaces built-in macro default values, and configures mapping from an  
event trigger to a built-in Auto Smartport macros.  
**Note** When performing a mapping, you must provide parameter  
values. For example, you must specify $ACCESS_VLAN=(1)  
and $VOICE_VLAN=(2) for the macro  
CISCO_PHONE_AUTO_SMARTPORT. |
Chapter 19 Configuring Cisco IOS Auto Smartport Macros

Configuring Auto Smartport Macros

The Cisco IOS shell provides basic scripting capabilities for configuring the user-defined Auto Smartport macros. These macros can contain multiple lines and can include any CLI command. You can also define variable substitution, conditionals, functions, and triggers within the macro.

Inside a user-defined macro, besides parameters specified through `macro auto execute trigger parameter-name=value ..`, you also can use the following variables published by EEM (Table 19-3):

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>$INTERFACE</td>
<td>Name of the interface where the trigger event is detected.</td>
</tr>
<tr>
<td>$LINKUP</td>
<td>Indicates whether the interface is up or down (true/false).</td>
</tr>
<tr>
<td>$TRIGGER</td>
<td>Name of the trigger event that is raised (for example, CISCO_PHONE_EVENT).</td>
</tr>
<tr>
<td>$AUTH_ENABLED</td>
<td>Indicates whether 802.1X authentication is configured on the interface (true/false).</td>
</tr>
</tbody>
</table>
To map an event trigger to a user-defined macro, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Connect the DMP to an 802.1X- or MAB-enabled switch port.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>On the RADIUS server, set the attribute-value pair to auto-smart-port =MY_MEDIAPLAYER_EVENT.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>On the switch, create the event trigger CISCO_DMP_EVENT, and map it to the user-defined macro commands shown below.</td>
</tr>
</tbody>
</table>

The switch recognizes the attribute-value pair=CISCO_DMP_EVENT response from the RADIUS server and applies the macro associated with this event trigger.

The following example shows the macro portion of the automacro:

```
Switch(config)# shell trigger CISCO_DMP_EVENT Cisco DMP player
Switch(config)# macro auto execute CISCO_DMP_EVENT {
  if [[ $LINKUP -eq YES ]]; then
    conf t
    interface $INTERFACE
    macro description $TRIGGER
    switchport access vlan 1
```
Configuring Auto Smartport Macros

switchport mode access
switchport port-security
switchport port-security maximum 1
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
spanning-tree portfast
spanning-tree bpduguard enable
exit
fi

The following represents the anti-macro portion of the automacro:

if [[ $LINKUP -eq NO ]]; then
  conf
t
  interface $INTERFACE
  no macro description $TRIGGER
  no switchport access vlan 1
  if [[ $AUTH_ENABLED -eq NO ]]; then
    no switchport mode access
    fi
  no switchport port-security
  no switchport port-security maximum 1
  no switchport port-security violation restrict
  no switchport port-security aging time 2
  no switchport port-security aging type inactivity
  no spanning-tree portfast
  no spanning-tree bpduguard enable
  exit
  fi
} Switch(config)# end

Table 19-4 lists the supported shell keywords your can apply in your macros and antimacro statements.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{</td>
<td>Begin the command grouping.</td>
</tr>
<tr>
<td>}</td>
<td>End the command grouping.</td>
</tr>
<tr>
<td>[[</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>]]</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>else</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>-eq</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>fi</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>if</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>then</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>-z</td>
<td>Use as a conditional construct.</td>
</tr>
<tr>
<td>$</td>
<td>Variables that begin with the $ character are replaced with a parameter value.</td>
</tr>
<tr>
<td>#</td>
<td>Use the # character to enter comment text.</td>
</tr>
</tbody>
</table>
Table 19-5 lists the shell keywords that are not supported in macros and antimacros.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Pipeline.</td>
</tr>
<tr>
<td>case</td>
<td>Conditional construct.</td>
</tr>
<tr>
<td>esac</td>
<td>Conditional construct.</td>
</tr>
<tr>
<td>for</td>
<td>Looping construct.</td>
</tr>
<tr>
<td>function</td>
<td>Shell function.</td>
</tr>
<tr>
<td>in</td>
<td>Conditional construct.</td>
</tr>
<tr>
<td>select</td>
<td>Conditional construct.</td>
</tr>
<tr>
<td>time</td>
<td>Pipeline.</td>
</tr>
<tr>
<td>until</td>
<td>Looping construct.</td>
</tr>
<tr>
<td>while</td>
<td>Looping construct.</td>
</tr>
</tbody>
</table>

### Displaying Auto Smartport

To display the Auto Smartport and static Smartport macros, use one or more of the privileged EXEC commands in Table 19-6.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show macro auto monitor clients</td>
<td>Displays the clients using the device classifier facility on the switch.</td>
</tr>
<tr>
<td>show macro auto monitor device</td>
<td>Displays the devices connected to a switch and their associated properties.</td>
</tr>
<tr>
<td>show macro auto monitor type</td>
<td>Displays all the device types recognized by the device classifier.</td>
</tr>
<tr>
<td>show parser macro</td>
<td>Displays all static Smartport macros.</td>
</tr>
<tr>
<td>show parser macro name macro-name</td>
<td>Displays a specific static Smartport macro.</td>
</tr>
<tr>
<td>show parser macro brief</td>
<td>Displays the static Smartport macro names.</td>
</tr>
<tr>
<td>show parser macro description [interface interface-id]</td>
<td>Displays the static Smartport macro description for all interfaces or for a specified interface.</td>
</tr>
<tr>
<td>show shell</td>
<td>Displays information about Auto Smartport event triggers and macros.</td>
</tr>
</tbody>
</table>

This example shows how to use the `show macro auto monitor device` privileged EXEC command with the optional `mac-address` keyword to view summary information about the connected device with the specified MAC address:

```
Switch# show macro auto monitor device mac-address 001f.9e90.1250
MAC_Address  Port_Id  Profile_Name
====================  =====  ================================
001f.9e90.1250  G1/0/4  Cisco-AP-Aironet-1130
```

This example shows how to use the `show macro auto monitor type` privileged EXEC command with no optional keywords to view the devices recognized by the device classifier:

Chapter 19      Configuring Cisco IOS Auto Smartport Macros

Displaying Auto Smartport
Configuring STP and MST

This chapter describes how to configure the Spanning Tree Protocol (STP) on a Catalyst 4500 series switch. This chapter also describes how to configure the IEEE 802.1s Multiple Spanning Tree (MST) protocol on the Catalyst 4500 series switch. MST is a new IEEE standard derived from Cisco’s proprietary Multi-Instance Spanning-Tree Protocol (MISTP) implementation. With MST, you can map a single spanning-tree instance to several VLANs.

This chapter provides guidelines, procedures, and configuration examples. It includes the following major sections:

- About STP, page 20-1
- Default STP Configuration, page 20-7
- Configuring STP, page 20-7
- About MST, page 20-22
- MST Configuration Restrictions and Guidelines, page 20-29
- Configuring MST, page 20-29

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About STP

STP is a Layer 2 link management protocol that provides path redundancy while preventing undesirable loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. A loop-free subset of a network topology is called a spanning tree. The operation of a spanning tree is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.
A Catalyst 4500 series switch use STP (the IEEE 802.1D bridge protocol) on all VLANs. By default, a single spanning tree runs on each configured VLAN (provided you do not manually disable the spanning tree). You can enable and disable a spanning tree on a per-VLAN basis.

When you create fault-tolerant internetworks, you must have a loop-free path between all nodes in a network. The spanning tree algorithm calculates the best loop-free path throughout a switched Layer 2 network. Switches send and receive spanning tree frames at regular intervals. The switches do not forward these frames, but use the frames to construct a loop-free path.

Multiple active paths between end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages and switches might learn end station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network.

A spanning tree defines a tree with a root switch and a loop-free path from the root to all switches in the Layer 2 network. A spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning tree algorithm recalculates the spanning tree topology and activates the standby path.

When two ports on a switch are part of a loop, the spanning tree port priority and port path cost setting determine which port is put in the forwarding state and which port is put in the blocking state. The spanning tree port priority value represents the location of an interface in the network topology and how well located it is to pass traffic. The spanning tree port path cost value represents media speed.

These sections describe STP:

- Understanding the Bridge ID, page 20-2
- Bridge Protocol Data Units, page 20-3
- Election of the Root Bridge, page 20-4
- STP Timers, page 20-4
- Creating the STP Topology, page 20-5
- STP Port States, page 20-5
- MAC Address Allocation, page 20-6
- STP and IEEE 802.1Q Trunks, page 20-6
- Per-VLAN Rapid Spanning Tree, page 20-6

### Understanding the Bridge ID

Each VLAN on each network device has a unique 64-bit bridge ID consisting of a bridge priority value, an extended system ID, and an STP MAC address allocation.

#### Bridge Priority Value

The bridge priority value determines whether a given redundant link is given priority and considered part of a given span in a spanning tree. Preference is given to lower values, and if you want to manually configure a preference, assign a lower bridge priority value to a link than to its redundant possibility. With Cisco IOS releases prior to 12.1(12c)EW, the bridge priority is a 16-bit value (see Table 20-1). With Cisco IOS Release 12.1(12c)EW and later releases, the bridge priority is a 4-bit value when the extended system ID is enabled (see Table 20-2). See the “Configuring the Bridge Priority of a VLAN” section on page 20-17.
Extended System ID

Extended system IDs are VLAN IDs between 1025 and 4096. Cisco IOS Releases 12.1(12c)EW and later releases support a 12-bit extended system ID field as part of the bridge ID (see Table 20-2). Chassis that support only 64 MAC addresses always use the 12-bit extended system ID. On chassis that support 1024 MAC addresses, you can enable use of the extended system ID. STP uses the VLAN ID as the extended system ID. See the “Enabling the Extended System ID” section on page 20-9.

Table 20-1 Bridge Priority Value with the Extended System ID Disabled

| Bridge Priority Value | Bit 16 | Bit 15 | Bit 14 | Bit 13 | Bit 12 | Bit 11 | Bit 10 | Bit 9  | Bit 8  | Bit 7  | Bit 6  | Bit 5  | Bit 4  | Bit 3  | Bit 2  | Bit 1  |
|-----------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
|                       | 32768  | 16384  | 8192   | 4096   | 2048   | 1024   | 512    | 256    | 128    | 64     | 32     | 16     | 8      | 4      | 2      | 1      |

STP MAC Address Allocation

A Catalyst 4500 series switch chassis has either 64 or 1024 MAC addresses available to support software features like STP. Enter the show module command to view the MAC address range on your chassis.

Cisco IOS Release 12.1(12c)EW and later releases support chassis with 64 or 1024 MAC addresses. For chassis with 64 MAC addresses, STP uses the extended system ID plus a MAC address to make the bridge ID unique for each VLAN.

Earlier releases support chassis with 1024 MAC addresses. With earlier releases, STP uses one MAC address per-VLAN to make the bridge ID unique for each VLAN.

Bridge Protocol Data Units

The following elements determine the stable active spanning tree topology of a switched network:

- The unique bridge ID (bridge priority and MAC address) associated with each VLAN on each switch
- The spanning tree path cost (or bridge priority value) to the root bridge
- The port identifier (port priority and MAC address) associated with each Layer 2 interface

Bridge protocol data units (BPDUs) contain information about the transmitting bridge and its ports, including the bridge and MAC addresses, bridge priority, port priority, and path cost. The system computes the spanning tree topology by transmitting BPDUs among connecting switches, and in one direction from the root switch. Each configuration BPDU contains at least the following:

- The unique bridge ID of the switch that the transmitting switch believes to be the root switch
- The spanning tree path cost to the root
- The bridge ID of the transmitting bridge
- The age of the message
About STP

- The identifier of the transmitting port
- Values for the hello, forward delay, and max-age protocol timers

When a switch transmits a BPDU frame, all switches connected to the LAN on which the frame is transmitted receive the BPDU. When a switch receives a BPDU, it does not forward the frame but instead uses the information in the frame to calculate a BPDU and, if the topology changes, initiate a BPDU transmission.

A BPDU exchange results in the following:

- One switch is elected as the root bridge.
- The shortest distance to the root bridge is calculated for each switch based on the path cost.
- A designated bridge for each LAN segment is selected. It is the switch closest to the root bridge through which frames are forwarded to the root.
- A root port is selected. It is the port providing the best path from the bridge to the root bridge.
- Ports included in the spanning tree are selected.

**Election of the Root Bridge**

For each VLAN, the switch with the highest bridge priority (the lowest numerical priority value) is elected as the root bridge. If all switches are configured with the default priority value (32,768), the switch with the lowest MAC address in the VLAN becomes the root bridge.

The spanning tree root bridge is the logical center of the spanning tree topology in a switched network. All paths that are not required to reach the root bridge from anywhere in the switched network are placed in spanning tree blocking mode.

A spanning tree uses the information provided by BPDU s to elect the root bridge and root port for the switched network, as well as the root port and designated port for each switched segment.

**STP Timers**

Table 20-3 describes the STP timers that affect the performance of the entire spanning tree.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hello_time</td>
<td>Determines how often the switch broadcasts hello messages to other switches.</td>
</tr>
<tr>
<td>forward_time</td>
<td>Determines how long each of the listening and learning states last before the port begins forwarding.</td>
</tr>
<tr>
<td>max_age</td>
<td>Determines the amount of time that protocol information received on a port is stored by the switch.</td>
</tr>
</tbody>
</table>
Creating the STP Topology

The goal of the spanning tree algorithm is to make the most direct link the root port. When the spanning tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be optimal according to link speed. For instance, connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change.

In Figure 20-1, Switch A is elected as the root bridge. (This could happen if the bridge priority of all the switches is set to the default value [32,768] and Switch A has the lowest MAC address.) However, due to traffic patterns, the number of forwarding ports, or link types, Switch A might not be the ideal root bridge. By increasing the STP port priority (lowering the numerical value) of the ideal switch so that it becomes the root bridge, you force a spanning tree recalculation to form a new spanning tree topology with the ideal switch as the root.

![Figure 20-1 Spanning Tree Topology](image)

For example, assume that one port on Switch B is a fiber-optic link, and another port on Switch B (an unshielded twisted-pair [UTP] link) is the root port. Network traffic might be more efficient over the high-speed fiber-optic link. By changing the spanning tree port priority on the fiber-optic port to a higher priority (lower numerical value) than the priority set for the root port, the fiber-optic port becomes the new root port.

STP Port States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When a Layer 2 interface transitions directly from nonparticipation in the spanning tree topology to the forwarding state, it can create temporary data loops. Ports must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for frames that have been forwarded under the old topology.

Each Layer 2 interface on a switch that uses spanning tree exists in one of the following five states:

- **Blocking**—In this state, the Layer 2 interface does not participate in frame forwarding.
- **Listening**—This state is the first transitional state after the blocking state when spanning tree determines that the Layer 2 interface should participate in frame forwarding.
- **Learning**—In this state, the Layer 2 interface prepares to participate in frame forwarding.
- **Forwarding**—In this state, the Layer 2 interface forwards frames.
Chapter 20  Configuring STP and MST

About STP

- Disabled—In this state, the Layer 2 interface does not participate in spanning tree and does not forward frames.

MAC Address Allocation

The supervisor engine has a pool of 1024 MAC addresses that are used as the bridge IDs for the VLAN spanning trees. Use the `show module` command to view the MAC address range (allocation range for the supervisor) that the spanning tree uses for the algorithm.

MAC addresses for the Catalyst 4506 switch are allocated sequentially, with the first MAC address in the range assigned to VLAN 1, the second MAC address in the range assigned to VLAN 2, and so forth. For example, if the MAC address range is 00-e0-1e-9b-2e-00 to 00-e0-1e-9b-31-ff, the VLAN 1 bridge ID is 00-e0-1e-9b-2e-00, the VLAN 2 bridge ID is 00-e0-1e-9b-2e-01, the VLAN 3 bridge ID is 00-e0-1e-9b-2e-02, and so on. On other Catalyst 4500 series platforms, all VLANs map to the same MAC address rather than mapping to separate MAC addresses.

STP and IEEE 802.1Q Trunks

802.1Q VLAN trunks impose some limitations on the spanning tree strategy for a network. In a network of Cisco switches connected through 802.1Q trunks, the switches maintain one instance of spanning tree for each VLAN allowed on the trunks. However, non-Cisco 802.1Q switches maintain only one instance of spanning tree for all VLANs allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device (that supports 802.1Q) through an 802.1Q trunk, the Cisco switch combines the spanning tree instance of the 802.1Q native VLAN of the trunk with the spanning tree instance of the non-Cisco 802.1Q switch. However, all per-VLAN spanning tree information is maintained by Cisco switches separated by a network of non-Cisco 802.1Q switches. The non-Cisco 802.1Q network separating the Cisco switches is treated as a single trunk link between the switches.

For more information on 802.1Q trunks, see Chapter 17, “Configuring Layer 2 Ethernet Interfaces.”

Per-VLAN Rapid Spanning Tree

Per-VLAN Rapid Spanning Tree (PVRST+) is the same as PVST+, although PVRST+ utilizes a rapid STP based on IEEE 802.1w rather than 802.1D to provide faster convergence. PVRST+ uses roughly the same configuration as PVST+ and needs only minimal configuration. In PVRST+, dynamic CAM entries are flushed immediately on a per-port basis when any topology change is made. UplinkFast and BackboneFast are enabled but not active in this mode, because the functionality is built into the Rapid STP. PVRST+ provides for rapid recovery of connectivity following the failure of a bridge, bridge port, or LAN.

When you interconnect PVST and Rapid-PVST bridges, if the PVST bridge has a higher priority than the Rapid PVST bridge, then the Rapid PVST bridge transitions directly to the forwarding state, bypassing the intermediate transition states.

Like per-VLAN Spanning Tree (PVST+), per-VLAN Rapid Spanning Tree (PVRST+) instances are equal to the number of vlans configured on the switch and can go up to a maximum of 4094 instances.
Default STP Configuration

Table 20-4 shows the default spanning tree configuration.

<table>
<thead>
<tr>

Configuring STP

The following sections describe how to configure spanning tree on VLANs:

- Enabling STP, page 20-8
- Enabling the Extended System ID, page 20-9
- Configuring the Root Bridge, page 20-10
- Configuring a Secondary Root Switch, page 20-12
- Configuring STP Port Priority, page 20-13
- Configuring STP Port Cost, page 20-15
- Configuring the Bridge Priority of a VLAN, page 20-17
- Configuring the Hello Time, page 20-17
- Configuring the Maximum Aging Time for a VLAN, page 20-18
- Configuring the Forward-Delay Time for a VLAN, page 20-19
Configuring STP

Note

The spanning tree commands described in this chapter can be configured on any interface except those configured with the no switchport command.

Enabling STP

Note

By default, spanning tree is enabled on all the VLANs.

You can enable a spanning tree on a per-VLAN basis. The switch maintains a separate instance of spanning tree for each VLAN (except on VLANs on which you have disabled a spanning tree).

To enable a spanning tree on a per-VLAN basis, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# spanning-tree vlan VLAN_ID</td>
<td>Enables spanning tree for VLAN vlan_id. The vlan_ID value can range from 1 to 4094.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show spanning-tree vlan VLAN_ID</td>
<td>Verifies that spanning tree is enabled.</td>
</tr>
</tbody>
</table>

This example shows how to enable a spanning tree on VLAN 200:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200
Switch(config)# end
Switch#
```

Note

Because spanning tree is enabled by default, entering a show running command to view the resulting configuration does not display the command you entered to enable spanning tree.

This example shows how to verify that spanning tree is enabled on VLAN 200:

```
Switch# show spanning-tree vlan 200
```

VLAN200 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0050.3e8d.6401
Configured hello time 2, max age 20, forward delay 15
Current root has priority 16384, address 0060.704c.7000
Root port is 264 (FastEthernet5/8), cost of root path is 38
Topology change flag not set, detected flag not set
Number of topology changes 0 last change occurred 01:53:48 ago
Times:  hold 1, topology change 24, notification 2
hello 2, max age 14, forward delay 10
Timers:  hello 0, topology change 0, notification 0

Port 264 (FastEthernet5/8) of VLAN200 is forwarding
Port path cost 19, Port priority 128, Port Identifier 129.9.
Designated root has priority 16384, address 0060.704c.7000

Disabling Spanning Tree Protocol, page 20-20

Enabling Per-VLAN Rapid Spanning Tree, page 20-20
Designated bridge has priority 32768, address 00e0.4fac.b000
Designated port id is 128.2, designated path cost 19
Timers: message age 3, forward delay 0, hold 0
Number of transitions to forwarding state: 1
BPDU: sent 3, received 3417

Switch#

Enabling the Extended System ID

Note
The extended system ID is enabled permanently on chassis that support 64 MAC addresses.

Use the `spanning-tree extend system-id` command to enable the extended system ID on chassis that support 1024 MAC addresses. See the “Understanding the Bridge ID” section on page 20-2.

To enable the extended system ID, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# <code>spanning-tree extend system-id</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# <code>end</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch# <code>show spanning-tree vlan vlan_ID</code></td>
</tr>
</tbody>
</table>

Note
When you enable or disable the extended system ID, the bridge IDs of all active STP instances are updated, which might change the spanning tree topology.

This example shows how to enable the extended system ID:

```
Switch# configure terminal
Switch(config)# spanning-tree extend system-id
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree summary | include extended
Extended system ID is enabled.
```
Chapter 20  Configuring STP and MST

Configuring STP

Configuring the Root Bridge

A Catalyst 4000 family switch maintains an instance of spanning tree for each active VLAN configured on the switch. A bridge ID, consisting of the bridge priority and the bridge MAC address, is associated with each instance. For each VLAN, the switch with the lowest bridge ID becomes the root bridge for that VLAN. Whenever the bridge priority changes, the bridge ID also changes, resulting in the recomputation of the root bridge for the VLAN.

To configure a switch to become the root bridge for the specified VLAN, use the `spanning-tree vlan vlan-ID root` command to modify the bridge priority from the default value (32,768) to a significantly lower value. The bridge priority for the specified VLAN is set to 8192 if this value causes the switch to become the root for the VLAN. If any bridge for the VLAN has a priority lower than 8192, the switch sets the priority to 1 less than the lowest bridge priority.

For example, assume that all the switches in the network have the bridge priority for VLAN 100 set to the default value of 32,768. Entering the `spanning-tree vlan 100 root primary` command on a switch sets the bridge priority for VLAN 100 to 8192, causing this switch to become the root bridge for VLAN 100.

Note

The root switch for each instance of spanning tree should be a backbone or distribution switch. Do not configure an access switch as the spanning tree primary root.

Use the `diameter` keyword to specify the Layer 2 network diameter (the maximum number of bridge hops between any two end stations in the network). When you specify the network diameter, a switch automatically picks an optimal hello time, forward delay time, and maximum age time for a network of that diameter. This action can significantly reduce the spanning tree convergence time.

Use the `hello-time` keyword to override the automatically calculated hello time.

Note

We recommend that you avoid manually configuring the hello time, forward delay time, and maximum age time after configuring the switch as the root bridge.

To configure a switch as the root switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configures a switch as the root switch. Use the <code>no</code> keyword to restore the defaults.</td>
</tr>
<tr>
<td>Switch(config)# [no] spanning-tree vlan vlan_ID root primary [diameter hops [hello-time seconds]]</td>
<td>Exits configuration mode.</td>
</tr>
</tbody>
</table>

This example shows how to configure a switch as the root bridge for VLAN 10, with a network diameter of 4:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 10 root primary diameter 4
Switch(config)# end
Switch#
```

This example shows how the configuration changes when a switch becomes a spanning tree root. This configuration is the one before the switch becomes the root for VLAN 1:

```
Switch# show spanning-tree vlan 1
```
VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0030.94fc.0a00
Configured hello time 2, max age 20, forward delay 15
Current root has priority 32768, address 0001.6445.4400
Root port is 323 (FastEthernet6/3), cost of root path is 19
Topology change flag not set, detected flag not set
Number of topology changes 2 last change occurred 00:02:19 ago from FastEthernet6/1
Times: hold 1, topology change 35, notification 2
hello 2, max age 20, forward delay 15
Timers:hello 0, topology change 0, notification 0, aging 300

Port 323 (FastEthernet6/3) of VLAN1 is forwarding
Port path cost 19, Port priority 128, Port Identifier 129.67.
Designated root has priority 32768, address 0001.6445.4400
Designated bridge has priority 32768, address 0001.6445.4400
Designated port id is 129.67, designated path cost 0
Timers:message age 2, forward delay 0, hold 0
Number of transitions to forwarding state:1
BPDU: sent 3, received 91

Port 324 (FastEthernet6/4) of VLAN1 is blocking
Port path cost 19, Port priority 128, Port Identifier 129.68.
Designated root has priority 32768, address 0001.6445.4400
Designated bridge has priority 32768, address 0001.6445.4400
Designated port id is 129.68, designated path cost 0
Timers:message age 2, forward delay 0, hold 0
Number of transitions to forwarding state:0
BPDU: sent 1, received 09

You can set the switch as the root:
Switch# configure terminal
Switch(config)# spanning-tree vlan 1 root primary
Switch(config)# spanning-tree vlan 1 root primary
VLAN 1 bridge priority set to 8192
VLAN 1 bridge max aging time unchanged at 20
VLAN 1 bridge hello time unchanged at 2
VLAN 1 bridge forward delay unchanged at 15
Switch(config)# end

This configuration is the one after the switch becomes the root:
Switch# show spanning-tree vlan 1
VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 8192, address 0030.94fc.0a00
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag set, detected flag set
Number of topology changes 3 last change occurred 00:00:09 ago
Times: hold 1, topology change 35, notification 2
hello 2, max age 20, forward delay 15
Timers:hello 0, topology change 25, notification 0, aging 15

Port 323 (FastEthernet6/3) of VLAN1 is forwarding
Port path cost 19, Port priority 128, Port Identifier 129.67.
Designated root has priority 8192, address 0030.94fc.0a00
Designated bridge has priority 8192, address 0030.94fc.0a00
Designated port id is 129.67, designated path cost 0
Timers:message age 0, forward delay 0, hold 0
Number of transitions to forwarding state:1
BPDU: sent 9, received 105
Chapter 20      Configuring STP and MST

Configuring STP

Port 324 (FastEthernet6/4) of VLAN1 is listening
Port path cost 19, Port priority 128, Port Identifier 129.68.
Designated root has priority 8192, address 0030.94fc.0a00
Designated bridge has priority 8192, address 0030.94fc.0a00
Designated port id is 129.68, designated path cost 0
Timers: message age 0, forward delay 5, hold 0
Number of transitions to forwarding state: 0
BPDU: sent 6, received 102

Switch#

Note Because the bridge priority is now set at 8192, this switch becomes the root of the spanning tree.

Configuring a Secondary Root Switch

When you configure a switch as the secondary root, the spanning tree bridge priority is modified from the default value (32,768) to 16,384. This means that the switch is likely to become the root bridge for the specified VLANs if the primary root bridge fails (assuming the other switches in the network use the default bridge priority of 32,768).

You can run this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello time values that you used when configuring the primary root switch.

Note We recommend that you avoid manually configuring the hello time, forward delay time, and maximum age time after configuring the switch as the root bridge.

To configure a switch as the secondary root switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configures a switch as the secondary root switch. Use the no keyword to restore the defaults.</td>
</tr>
<tr>
<td>Switch(config)# [no] spanning-tree vlan vlan_ID root secondary [diameter hops] [hello-time seconds]</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to configure the switch as the secondary root switch for VLAN 10, with a network diameter of 4:

Switch# configure terminal
Switch(config)# spanning-tree vlan 10 root secondary diameter 4
VLAN 10 bridge priority set to 16384
VLAN 10 bridge max aging time set to 14
VLAN 10 bridge hello time unchanged at 2
VLAN 10 bridge forward delay set to 10
Switch(config)# end
Switch#

This example shows how to verify the configuration of VLAN 1:

Switch# show spanning-tree vlan 1

VLAN0001
  Spanning tree enabled protocol ieee
  Root ID   Priority 32768
  Address 0003.6b10.e800
  This bridge is the root
Configuring STP Port Priority

In the event of a loop, a spanning tree considers port priority when selecting an interface to put into the forwarding state. You can assign higher priority values to interfaces that you want a spanning tree to select first and lower priority values to interfaces that you want a spanning tree to select last. If all interfaces have the same priority value, a spanning tree puts the interface with the lowest interface number in the forwarding state and blocks other interfaces. The possible priority range is 0 through 240, configurable in increments of 16 (the default is 128).

Note

The Cisco IOS software uses the port priority value when the interface is configured as an access port and uses VLAN port priority values when the interface is configured as a trunk port.

To configure the spanning tree port priority of an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# interface {{fastethernet</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-if)# [no] spanning-tree port-priority port_priority</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# [no] spanning-tree vlan vlan_ID port-priority port_priority</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# show spanning-tree interface {{fastethernet</td>
</tr>
</tbody>
</table>

This example shows how to configure the spanning tree port priority of a Fast Ethernet interface:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/8
```
Switch(config-if)# spanning-tree port-priority 100
Switch(config-if)# end
Switch#

This example shows how to verify the configuration of a Fast Ethernet interface when it is configured as an access port:

Switch# show spanning-tree interface fastethernet 3/1

<table>
<thead>
<tr>
<th>Vlan</th>

<td>P2p</td>
</tr>
</tbody>
</table>

Switch#

This example shows how to display the details of the interface configuration when the interface is configured as an access port:

Switch# show spanning-tree interface fastethernet 3/1 detail

Port 129 (FastEthernet3/1) of VLAN0001 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.e800
  Designated bridge has priority 32768, address 0003.6b10.e800
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 187, received 1

Port 129 (FastEthernet3/1) of VLAN1002 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.ebe9
  Designated bridge has priority 32768, address 0003.6b10.ebe9
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 94, received 2

Port 129 (FastEthernet3/1) of VLAN1003 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.ebea
  Designated bridge has priority 32768, address 0003.6b10.ebea
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 94, received 2

Port 129 (FastEthernet3/1) of VLAN1004 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.ebeb
  Designated bridge has priority 32768, address 0003.6b10.ebeb
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 95, received 2

Port 129 (FastEthernet3/1) of VLAN1005 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
Configuring STP Port Cost

The default value for spanning tree port path cost is derived from the interface media speed. In the event of a loop, spanning tree considers port cost when selecting an interface to put into the forwarding state. You can assign lower cost values to interfaces that you want spanning tree to select first, and higher cost values to interfaces that you want spanning tree to select last. If all interfaces have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks other interfaces. The possible cost range is 1 through 200,000,000 (the default is media-specific).

Spanning tree uses the port cost value when the interface is configured as an access port and uses VLAN port cost values when the interface is configured as a trunk port.

To configure the spanning tree port cost of an interface, perform this task:

1. Enter global configuration mode.
2. Use the `configure terminal` command.
3. Use the `interface interfaces ports` command to select the interface.
4. Use the `spanning-tree vlan VLAN-ID port-priority COST` command to set the port priority.
5. Use the `end` command to return to privileged EXEC mode.
6. Verify the configuration using the `show spanning-tree VLAN-ID` command.
### Command and Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch(config)# interface {{fastethernet</td>
<td>gigabitethernet</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Switch(config-if)# [no] spanning-tree cost port_cost</td>
<td>Configures the port cost for an interface. The <code>port_cost</code> value can be from 1 to 200,000,000. Use the no keyword to restore the defaults.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config-if)# [no] spanning-tree vlan vlan_ID cost port_cost</td>
<td>Configures the VLAN port cost for an interface. The <code>port_cost</code> value can be from 1 to 200,000,000. Use the no keyword to restore the defaults.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config-if)# end</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>5</td>
<td>Switch# show spanning-tree interface {{fastethernet</td>
<td>gigabitethernet} slot/port}</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# show spanning-tree vlan vlan_ID</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to change the spanning tree port cost of a Fast Ethernet interface:

```plaintext
Switch# configure terminal
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree cost 18
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration of the interface when it is configured as an access port:

```plaintext
Switch# show spanning-tree interface fastethernet 5/8
Port 264 (FastEthernet5/8) of VLAN200 is forwarding
 Port path cost 18, Port priority 100, Port Identifier 129.8.
 Designated root has priority 32768, address 0010.0d40.34c7
 Designated bridge has priority 32768, address 0010.0d40.34c7
 Designated port id is 128.1, designated path cost 0
 Timers: message age 2, forward delay 0, hold 0
 Number of transitions to forwarding state: 1
 BPDU: sent 0, received 13513
Switch#
```

This example shows how to configure the spanning tree VLAN port cost of a Fast Ethernet interface:

```plaintext
Switch# configure terminal
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree vlan 200 cost 17
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration of VLAN 200 on the interface when it is configured as a trunk port:

```plaintext
Switch# show spanning-tree vlan 200
<...output truncated...>
Port 264 (FastEthernet5/8) of VLAN200 is forwarding
 Port path cost 17, Port priority 64, Port Identifier 129.8.
 Designated root has priority 32768, address 0010.0d40.34c7
 Designated bridge has priority 32768, address 0010.0d40.34c7
 Designated port id is 128.1, designated path cost 0
 Timers: message age 2, forward delay 0, hold 0
Switch#
```
Number of transitions to forwarding state: 1
BPDU: sent 0, received 13513

Switch#

Note The `show spanning-tree` command displays only information for ports with an active link (green light is on). If there is no port with an active link, you can issue a `show running-config` command to confirm the configuration.

Configuring the Bridge Priority of a VLAN

Note Exercise care when configuring the bridge priority of a VLAN. In most cases, we recommend that you enter the `spanning-tree vlan vlan_ID root primary` and the `spanning-tree vlan vlan_ID root secondary` commands to modify the bridge priority.

To configure the spanning tree bridge priority of a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# [no] spanning-tree vlan vlan_ID priority bridge_priority</td>
</tr>
<tr>
<td></td>
<td>Configures the bridge priority of a VLAN. The <code>bridge_priority</code> value can be from 1 to 65,534. Use the <code>no</code> keyword to restore the defaults.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch# show spanning-tree vlan vlan_ID bridge [brief]</td>
</tr>
<tr>
<td></td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows how to configure the bridge priority of VLAN 200 to 33,792:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200 priority 33792
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree vlan 200 bridge brief
Vlan Bridge ID Hello Max Fwd
----------------- -------------- ---- ---- ----
VLAN200 33792 0050.3e8d.64c8  2  20  15  ieee
Switch#
```

Configuring the Hello Time

Note Exercise care when configuring the hello time. In most cases, we recommend that you use the `spanning-tree vlan vlan_ID root primary` and the `spanning-tree vlan vlan_ID root secondary` commands to modify the hello time.
To configure the spanning tree hello time of a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>Switch(config)# [no] spanning-tree vlan vlan_ID hello-time hello_time</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>Switch(config)# end</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>Switch# show spanning-tree vlan vlan_ID bridge [brief]</code></td>
</tr>
</tbody>
</table>

This example shows how to configure the hello time for VLAN 200 to 7 seconds:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200 hello-time 7
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree vlan 200 bridge brief
```

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Bridge ID</th>
<th>Hello Max</th>
<th>Fwd</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN200</td>
<td>49152 0050.3e8d.64c8</td>
<td>7</td>
<td>20</td>
</tr>
<tr>
<td></td>
<td></td>
<td>15</td>
<td>ieee</td>
</tr>
</tbody>
</table>

### Configuring the Maximum Aging Time for a VLAN

**Note** Exercise care when configuring aging time. In most cases, we recommend that you use the `spanning-tree vlan vlan_ID root primary` and the `spanning-tree vlan vlan_ID root secondary` commands to modify the maximum aging time.

To configure the spanning tree maximum aging time for a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>Switch(config)# [no] spanning-tree vlan vlan_ID max-age max_age</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>Switch(config)# end</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>Switch# show spanning-tree vlan vlan_ID bridge [brief]</code></td>
</tr>
</tbody>
</table>

This example shows how to configure the maximum aging time for VLAN 200 to 36 seconds:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200 max-age 36
Switch(config)# end
Switch#
```
Chapter 20  Configuring STP and MST

This example shows how to verify the configuration:

Switch# show spanning-tree vlan 200 bridge brief

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Bridge ID</th>
<th>Hello</th>
<th>Max</th>
<th>Fwd</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN200</td>
<td>49152 0050.3e8d.64c8</td>
<td>2</td>
<td>36</td>
<td>15</td>
</tr>
</tbody>
</table>

Switch#

Configuring the Forward-Delay Time for a VLAN

Note

Exercise care when configuring forward-delay time. In most cases, we recommend that you use the `spanning-tree vlan vlan_ID root primary` and the `spanning-tree vlan vlan_ID root secondary` commands to modify the forward delay time.

To configure the spanning tree forward delay time for a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# [no] spanning-tree vlan vlan_ID forward-time forward_time</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# show spanning-tree vlan vlan_ID bridge [brief]</td>
</tr>
</tbody>
</table>

This example shows how to configure the forward delay time for VLAN 200 to 21 seconds:

Switch# configure terminal
Switch(config)# spanning-tree vlan 200 forward-time 21
Switch(config)# end
Switch#

This example shows how to verify the configuration:

Switch# show spanning-tree vlan 200 bridge brief

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Bridge ID</th>
<th>Hello</th>
<th>Max</th>
<th>Fwd</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN200</td>
<td>49152 0050.3e8d.64c8</td>
<td>2</td>
<td>20</td>
<td>21</td>
</tr>
</tbody>
</table>

Switch#

This example shows how to display spanning tree information for the bridge:

Switch# show spanning-tree bridge

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Bridge ID</th>
<th>Hello</th>
<th>Max</th>
<th>Fwd</th>
<th>Dly</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN200</td>
<td>49152 0050.3e8d.64c8</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>ieee</td>
<td></td>
</tr>
<tr>
<td>VLAN202</td>
<td>49152 0050.3e8d.64c9</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>ieee</td>
<td></td>
</tr>
<tr>
<td>VLAN203</td>
<td>49152 0050.3e8d.64ca</td>
<td>2</td>
<td>20</td>
<td>15</td>
<td>ieee</td>
<td></td>
</tr>
<tr>
<td>VLAN204</td>
<td>49152 0050.3e8d.64cb</td>

</tbody>
</table>

Switch#
Disabling Spanning Tree Protocol

To disable spanning tree on a per-VLAN basis, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# no spanning-tree vlan vlan_ID</td>
<td>Disables spanning tree on a per-VLAN basis.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Switch# show spanning-tree vlan vlan_ID</td>
<td>Verifies that spanning tree is disabled.</td>
</tr>
</tbody>
</table>

This example shows how to disable spanning tree on VLAN 200:

Switch# configure terminal
Switch(config)# no spanning-tree vlan 200
Switch(config)# end
Switch#

This example shows how to verify the configuration:

Switch# show spanning-tree vlan 200
Spanning tree instance for VLAN 200 does not exist.
Switch#

Enabling Per-VLAN Rapid Spanning Tree

Per-VLAN Rapid Spanning Tree (PVRST+) uses the existing PVST+ framework for configuration purposes and for interaction with other features. It also supports some of the PVST+ extensions.

To configure PVRST+, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# [no] spantree mode rapid-pvst</td>
<td>Enables rapid-PVST+.</td>
</tr>
<tr>
<td>Switch(config)# interface interface/port</td>
<td>Switches to interface configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# spanning-tree link-type point-to-point</td>
<td>Sets the link-type to point-to-point mode for the port.</td>
</tr>
<tr>
<td>Switch(config-if)# exit</td>
<td>Exits interface mode.</td>
</tr>
<tr>
<td>Switch(config)# exit</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Switch(config-if)# clear spantree detected-protocols mod/port</td>
<td>Detects any legacy bridges on the port.</td>
</tr>
<tr>
<td>Switch# show spanning-tree summary totals</td>
<td>Verifies the rapid-PVST+ configuration.</td>
</tr>
</tbody>
</table>

The following example shows how to configure Rapid-PVST+:

Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# spanning-tree mode rapid-pvst
Switch(config)# int fa 6/4
Switch(config-if)# spanning-tree link-type point-to-point
Switch(config-if)# end
Switch(config)# end
Switch#
23:55:32:%SYS-5-CONFIG_I:Configured from console by console
Switch# `clear spanning-tree detected-protocols`

The following example shows how to verify the configuration:

Switch# `show spanning-tree summary totals`
Switch is in rapid-pvst mode
Root bridge for:VLAN0001
Extended system ID is disabled
Portfast Default is disabled
PortFast BPDU Guard Default is disabled
Portfast BPDU Filter Default is disabled
Loopguard Default is disabled
EtherChannel misconfig guard is enabled
UplinkFast is disabled
BackboneFast is disabled
Pathcost method used is short
Name Blocking Listening Learning Forwarding STP Active
------------------------ -------- --------- -------- ---------- --------
1 vlan 0         0        0          2          2          2
Switch#

Specifying the Link Type

Rapid connectivity is established only on point-to-point links. Spanning tree views a point-to-point link as a segment connecting only two switches running the spanning tree algorithm. Because the switch assumes that all full-duplex links are point-to-point links and that half-duplex links are shared links, you can avoid explicitly configuring the link type. To configure a specific link type, use the `spanning-tree linktype` command.

Restarting Protocol Migration

A switch running both MSTP and RSTP supports a built-in protocol migration process that enables the switch to interoperate with legacy 802.1D switches. If this switch receives a legacy 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only 802.1D BPDUs on that port. When an MSTP switch receives a legacy BPDU, it can also detect the following:

- A port is at the boundary of a region
- An MST BPDU (version 3) that is associated with a different region
- An RST BPDU (version 2)

The switch, however, does not automatically revert to the MSTP mode if it no longer receives 802.1D BPDUs because it cannot determine whether or not the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

To restart the protocol migration process on the entire switch (that is, to force renegotiation with neighboring switches), use the `clear spanning-tree detected-protocols` commands in privileged EXEC mode. To restart the protocol migration process on a specific interface, enter the `clear spanning-tree detected-protocols interface` command in `interface-id` privileged EXEC mode.
About MST

The following sections describe how MST works on a Catalyst 4000 family switch:

- IEEE 802.1s MST, page 20-22
- IEEE 802.1w RSTP, page 20-23

IEEE 802.1s MST

MST extends the IEEE 802.1w rapid spanning tree (RST) algorithm to multiple spanning trees. This extension provides both rapid convergence and load balancing in a VLAN environment. MST converges faster than per-VLAN Spanning Tree Plus (PVST+) and is backward compatible with 802.1D STP, 802.1w (Rapid Spanning Tree Protocol [RSTP]), and the Cisco PVST+ architecture.

MST allows you to build multiple spanning trees over trunks. You can group and associate VLANs to spanning tree instances. Each instance can have a topology independent of other spanning tree instances. This architecture provides multiple forwarding paths for data traffic and enables load balancing. Network fault tolerance is improved because a failure in one instance (forwarding path) does not affect other instances.

In large networks, you can more easily administer the network and use redundant paths by locating different VLAN and spanning tree instance assignments in different parts of the network. A spanning tree instance can exist only on bridges that have compatible VLAN instance assignments. You must configure a set of bridges with the same MST configuration information, which allows them to participate in a specific set of spanning tree instances. Interconnected bridges that have the same MST configuration are referred to as an MST region.

MST uses the modified RSTP, MSTP. MST has the following characteristics:

- MST runs a variant of spanning tree called Internal Spanning Tree (IST). IST augments Common Spanning Tree (CST) information with internal information about the MST region. The MST region appears as a single bridge to adjacent single spanning tree (SST) and MST regions.
- A bridge running MST provides interoperability with SST bridges as follows:
  - MST bridges run IST, which augments CST information with internal information about the MST region.
  - IST connects all the MST bridges in the region and appears as a subtree in the CST that includes the whole bridged domain. The MST region appears as a virtual bridge to adjacent SST bridges and MST regions.
  - The Common and Internal Spanning Tree (CIST) is the collection of the following: ISTs in each MST region, the CST that interconnects the MST regions, and the SST bridges. CIST is identical to an IST inside an MST region and identical to a CST outside an MST region. The STP, RSTP, and MSTP together elect a single bridge as the root of the CIST.
MST establishes and maintains additional spanning trees within each MST region. These spanning trees are termed MST instances (MSTIs). The IST is numbered 0, and the MSTIs are numbered 1, 2, 3, and so on. Any MSTI is local to the MST region and is independent of MSTIs in another region, even if the MST regions are interconnected.

MST instances combine with the IST at the boundary of MST regions to become the CST as follows:
- Spanning tree information for an MSTI is contained in an MSTP record (M-record).
  M-records are always encapsulated within MST bridge protocol data units (BPDUs). The original spanning trees computed by MSTP are called M-trees, which are active only within the MST region. M-trees merge with the IST at the boundary of the MST region and form the CST.
- MST provides interoperability with PVST+ by generating PVST+ BPDUs for the non-CST VLANs.
- MST supports some of the PVST+ extensions in MSTP as follows:
  - UplinkFast and BackboneFast are not available in MST mode; they are part of RSTP.
  - PortFast is supported.
  - BPDU filter and BPDU guard are supported in MST mode.
  - Loop guard and root guard are supported in MST. MST preserves the VLAN 1 disabled functionality except that BPDUs are still transmitted in VLAN 1.
  - MST switches operate as if MAC reduction is enabled.
  - For private VLANs (PVLANs), you must map a secondary VLAN to the same instance as the primary.

### IEEE 802.1w RSTP

RSTP, specified in 802.1w, supersedes STP specified in 802.1D, but remains compatible with STP. You configure RSTP when you configure the MST feature. For more information, see the “Configuring MST” section on page 20-29.

RSTP provides the structure on which the MST operates, significantly reducing the time to reconfigure the active topology of a network when its physical topology or configuration parameters change. RSTP selects one switch as the root of a spanning-tree-connected active topology and assigns port roles to individual ports of the switch, depending on whether that port is part of the active topology.

RSTP provides rapid connectivity following the failure of a switch, switch port, or a LAN. A new root port and the designated port on the other side of the bridge transition to the forwarding state through an explicit handshake between them. RSTP allows switch port configuration so the ports can transition to forwarding directly when the switch reinitializes.

RSTP provides backward compatibility with 802.1D bridges as follows:
- RSTP selectively sends 802.1D-configured BPDUs and Topology Change Notification (TCN) BPDUs on a per-port basis.
- When a port initializes, the migration delay timer starts and RSTP BPDUs are transmitted. While the migration delay timer is active, the bridge processes all BPDUs received on that port.
- If the bridge receives an 802.1D BPDU after a port’s migration delay timer expires, the bridge assumes it is connected to an 802.1D bridge and starts using only 802.1D BPDUs.
- When RSTP uses 802.1D BPDUs on a port and receives an RSTP BPDU after the migration delay expires, RSTP restarts the migration delay timer and begins using RSTP BPDUs on that port.
RSTP Port Roles

In RSTP, the port roles are defined as follows:

- **Root**—A forwarding port elected for the spanning tree topology.
- **Designated**—A forwarding port elected for every switched LAN segment.
- **Alternate**—An alternate path to the root bridge to that provided by the current root port.
- **Backup**—A backup for the path provided by a designated port toward the leaves of the spanning tree. Backup ports can exist only where two ports are connected together in a loopback mode or bridge with two or more connections to a shared LAN segment.
- **Disabled**—A port that has no role within the operation of spanning tree.

The system assigns port roles as follows:

- A root port or designated port role includes the port in the active topology.
- An alternate port or backup port role excludes the port from the active topology.

RSTP Port States

The port state controls the forwarding and learning processes and provides the values of discarding, learning, and forwarding. Table 20-5 shows the STP port states and RSTP port states.

<table>
<thead>
<tr>
<th>Operational Status</th>
<th>STP Port State</th>
<th>RSTP Port State</th>
<th>Port Included in Active Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>
<td>Blocking(^1)</td>
<td>Discarding(^2)</td>
<td>No</td>
</tr>
<tr>
<td>Enabled</td>
<td>Listening</td>
<td>Discarding</td>
<td>No</td>
</tr>
<tr>
<td>Enabled</td>
<td>Learning</td>
<td>Learning</td>
<td>Yes</td>
</tr>
<tr>
<td>Enabled</td>
<td>Forwarding</td>
<td>Forwarding</td>
<td>Yes</td>
</tr>
<tr>
<td>Disabled</td>
<td>Disabled</td>
<td>Discarding</td>
<td>No</td>
</tr>
</tbody>
</table>

1. IEEE 802.1D port state designation.
2. IEEE 802.1w port state designation. Discarding is the same as blocking in MST.

In a stable topology, RSTP ensures that every root port and designated port transitions to the forwarding state while all alternate ports and backup ports are always in the discarding state.

MST-to-SST Interoperability

A virtual bridged LAN may contain interconnected regions of SST and MST bridges. Figure 20-2 shows this relationship.
To STP running in the SST region, an MST region appears as a single SST or pseudobridge, which operates as follows:

- Although the values for root identifiers and root path costs match for all BPDUs in all pseudobridges, a pseudobridge differs from a single SST bridge as follows:
  - The pseudobridge BPDUs have different bridge identifiers. This difference does not affect STP operation in the neighboring SST regions because the root identifier and root cost are the same.
  - BPDUs sent from the pseudobridge ports may have significantly different message ages. Because the message age increases by one second for each hop, the difference in the message age is measured in seconds.

- Data traffic from one port of a pseudobridge (a port at the edge of a region) to another port follows a path entirely contained within the pseudobridge or MST region. Data traffic belonging to different VLANs might follow different paths within the MST regions established by MST.

- The system prevents looping by doing either of the following:
  - Blocking the appropriate pseudobridge ports by allowing one forwarding port on the boundary and blocking all other ports.
  - Setting the CST partitions to block the ports of the SST regions.

**Common Spanning Tree**

CST (802.1Q) is a single spanning tree for all the VLANs. In a Catalyst 4500 series switch running PVST+, the VLAN 1 spanning tree corresponds to CST. In a Catalyst 4500 series switch running MST, IST (instance 0) corresponds to CST.
MST Instances

We support 65 instances including instance 0. Each spanning tree instance is identified by an instance ID that ranges from 0 to 4094. Instance 0 is mandatory and is always present. Rest of the instances are optional.

MST Configuration Parameters

The MST configuration includes these three parts:

- Name—A 32-character string (null padded) that identifies the MST region.
- Revision number—An unsigned 16-bit number that identifies the revision of the current MST configuration.

Note: You must set the revision number when required as part of the MST configuration. The revision number is not incremented automatically each time you commit the MST configuration.

- MST configuration table—An array of 4096 bytes. Each byte, interpreted as an unsigned integer, corresponds to a VLAN. The value is the instance number to which the VLAN is mapped. The first byte that corresponds to VLAN 0 and the 4096th byte that corresponds to VLAN 4095 are unused and always set to zero.

You must configure each byte manually. Use SNMP or the CLI to perform the configuration.

MST BPDUs contain the MST configuration ID and the checksum. An MST bridge accepts an MST BPDU only if the MST BPDU configuration ID and the checksum match its own MST region configuration ID and checksum. If either value is different, the MST BPDU is considered to be an SST BPDU.

MST Regions

These sections describe MST regions:

- MST Region Overview, page 20-26
- Boundary Ports, page 20-27
- IST Master, page 20-27
- Edge Ports, page 20-27
- Link Type, page 20-28

MST Region Overview

Interconnected bridges that have the same MST configuration are referred to as an MST region. There is no limit on the number of MST regions in the network.
To form an MST region, bridges can be either of the following:

- An MST bridge that is the only member of the MST region.
- An MST bridge interconnected by a LAN. A LAN’s designated bridge has the same MST configuration as an MST bridge. All the bridges on the LAN can process MST BPDUs.

If you connect two MST regions with different MST configurations, the MST regions do the following:

- Load balance across redundant paths in the network. If two MST regions are redundantly connected, all traffic flows on a single connection with the MST regions in a network.
- Provide an RSTP handshake to enable rapid connectivity between regions. However, the handshaking is not as fast as between two bridges. To prevent loops, all the bridges inside the region must agree upon the connections to other regions. This situation introduces a delay. We do not recommend partitioning the network into a large number of regions.

**Boundary Ports**

A boundary port is a port that connects to a LAN, the designated bridge of which is either an SST bridge or a bridge with a different MST configuration. A designated port knows that it is on the boundary if it detects an STP bridge or receives an agreement message from an RST or MST bridge with a different configuration.

At the boundary, the role of MST ports do not matter; their state is forced to be the same as the IST port state. If the boundary flag is set for the port, the MSTP Port Role selection mechanism assigns a port role to the boundary and the same state as that of the IST port. The IST port at the boundary can take up any port role except a backup port role.

**IST Master**

The IST master of an MST region is the bridge with the lowest bridge identifier and the least path cost to the CST root. If an MST bridge is the root bridge for CST, then it is the IST master of that MST region. If the CST root is outside the MST region, then one of the MST bridges at the boundary is selected as the IST master. Other bridges on the boundary that belong to the same region eventually block the boundary ports that lead to the root.

If two or more bridges at the boundary of a region have an identical path to the root, you can set a slightly lower bridge priority to make a specific bridge the IST master.

The root path cost and message age inside a region stay constant, but the IST path cost is incremented and the IST remaining hops are decremented at each hop. Enter the `show spanning-tree mst` command to display the information about the IST master, path cost, and remaining hops for the bridge.

**Edge Ports**

A port that is connected to a nonbridging device (for example, a host or a switch) is an edge port. A port that connects to a hub is also an edge port if the hub or any LAN that is connected to it does not have a bridge. An edge port can start forwarding as soon as the link is up.

MST requires that you configure each port connected to a host. To establish rapid connectivity after a failure, you need to block the non-edge designated ports of an intermediate bridge. If the port connects to another bridge that can send back an agreement, then the port starts forwarding immediately. Otherwise, the port needs twice the forward delay time to start forwarding again. You must explicitly configure the ports that are connected to the hosts and switches as edge ports while using MST.
To prevent a misconfiguration, the PortFast operation is turned off if the port receives a BPDU. You can display the configured and operational status of PortFast by using the `show spanning-tree mst interface` command.

### Link Type

Rapid connectivity is established only on point-to-point links. You must configure ports explicitly to a host or switch. However, cabling in most networks meets this requirement. By entering the `spanning-tree linktype` command to treating all full-duplex links as point-to-point links, you can avoid explicit configuration.

### Message Age and Hop Count

IST and MST instances do not use the message age and maximum age timer settings in the BPDU. IST and MST use a separate hop count mechanism that is very similar to the IP time-to-live (TTL) mechanism. You can configure each MST bridge with a maximum hop count. The root bridge of the instance sends a BPDU (or M-record) with the remaining hop count that is equal to the maximum hop count. When a bridge receives a BPDU (or M-record), it decrements the received remaining hop count by one. The bridge discards the BPDU (M-record) and ages out the information held for the port if the count reaches zero after decrementing. The nonroot bridges propagate the decremented count as the remaining hop count in the BPDU (M-records) they generate.

The message age and maximum age timer settings in the RST portion of the BPDU remain the same throughout the region, and the same values are propagated by the region’s designated ports at the boundary.

### MST-to-PVST+ Interoperability

Note these guidelines when you configure MST switches (in the same region) to interact with PVST+ switches:

- Configure the root for all VLANs inside the MST region as shown in this example:

  ```
  Switch# show spanning-tree mst interface gigabitethernet 1/1
  GigabitEthernet1/1 of MST00 is root forwarding
  Edge port: no (trunk) port guard : none (default)
  Link type: point-to-point (auto) bpdu filter: disable (default)
  Boundary : boundary (PVST) bpdu guard : disable (default)
  Bpdus sent 10, received 310
  ------ ------ ----------- ------------
  Instance Role Sts Cost  Prio.Nbr Vlans mapped
  ------- ---- -------- ------------
  0 Root FWD 20000 128.1 1-2,4-2999,4000-4094
  3 Boun FWD 20000 128.1 3,3000-3999
  ```

The ports that belong to the MST switch at the boundary simulate PVST+ and send PVST+ BPDU for all the VLANs.

If you enable loop guard on the PVST+ switches, the ports might change to a loop-inconsistent state when the MST switches change their configuration. To correct the loop-inconsistent state, you must disable and renewable loop guard on that PVST+ switch.
MST Configuration Restrictions and Guidelines

Follow these restrictions and guidelines to avoid configuration problems:

- Do not disable spanning tree on any VLAN in any of the PVST bridges.
- Do not use PVST bridges as the root of CST.
- Do not connect switches with access links because access links may partition a VLAN.
- Ensure that all PVST root bridges have lower, (numerically higher) priority than the CST root bridge.
- Ensure that trunks carry all of the VLANs mapped to an instance or do not carry any VLANs at all for this instance.
- Complete any MST configuration that incorporates a large number of either existing or new logical VLAN ports during a maintenance window because the complete MST database gets reinitialized for any incremental change (such as adding new VLANs to instances or moving VLANs across instances).

Configuring MST

The following sections describe how to configure MST:

- Enabling MST, page 20-29
- Configuring MST Instance Parameters, page 20-31
- Configuring MST Instance Port Parameters, page 20-32
- Restarting Protocol Migration, page 20-33
- Displaying MST Configurations, page 20-33

Enabling MST

To enable and configure MST on a Catalyst 4500, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch(config)# spanning-tree mode mst</td>
<td>Enters MST mode.</td>
</tr>
</tbody>
</table>
### Configuring MST

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Switch(config)# spanning-tree mst configuration Enters MST configuration submode. Use the no keyword to clear the MST configuration.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-mst)# show current Displays the current MST configuration.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-mst)# name name Sets the MST region name.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-mst)# revision revision_number Sets the MST configuration revision number.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-mst)# instance instance_number vlan vlan_range Maps the VLANs to an MST instance. If you do not specify the vlan keyword, use the no keyword to unmap all the VLANs that were mapped to an MST instance. If you specify the vlan keyword, use the no keyword to unmap a specified VLAN from an MST instance.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-mst)# show pending Displays the new MST configuration to be applied.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config-mst)# end Applies the configuration and exit MST configuration submode.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch# show spanning-tree mst configuration Displays the current MST configuration.</td>
</tr>
</tbody>
</table>

This example shows how to enable MST:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# spanning-tree mode mst

Switch(config)# spanning-tree mst configuration

Configuring MST Instance Parameters

To configure MST instance parameters, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# spanning-tree mst X priority Y</td>
</tr>
<tr>
<td></td>
<td>Configures the priority for an MST instance.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# spanning-tree mst X root [primary</td>
</tr>
<tr>
<td></td>
<td>Configures the bridge as root for an MST instance.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# Ctrl-Z</td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show spanning-tree mst</td>
</tr>
<tr>
<td></td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows how to configure MST instance parameters:

Switch(config)# spanning-tree mst 1 priority ?  
<0-61440> bridge priority in increments of 4096

Switch(config)# spanning-tree mst 1 priority 1  
% Bridge Priority must be in increments of 4096,  
% Allowed values are:

### Configuring MST Instance Port Parameters

To configure MST instance port parameters, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config-if)# <code>spanning-tree mst x cost y</code></td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# <code>spanning-tree mst x port-priority y</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# Ctrl-Z</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# <code>show spanning-tree mst x interface y</code></td>
</tr>
</tbody>
</table>

This example shows how to configure MST instance port parameters:

```
Switch(config)# interface fastethernet 4/4
Switch(config-if)# spanning-tree mst 1 ?
  cost   Change the interface spanning tree path cost for an instance
  port-priority  Change the spanning tree port priority for an instance
Switch(config-if)# spanning-tree mst 1 cost 1234567
Switch(config-if)# spanning-tree mst 1 port-priority 240
Switch(config-if)# ^Z
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config-if)# <code>spanning-tree mst x cost y</code></td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# <code>spanning-tree mst x port-priority y</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# Ctrl-Z</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# <code>show spanning-tree mst x interface y</code></td>
</tr>
</tbody>
</table>
Switch# **show spanning-tree mst 1 interface fastethernet 4/4**

Switch#

**Restarting Protocol Migration**

RSTP and MST have built-in compatibility mechanisms that allow them to interact properly with other regions or other versions of IEEE spanning-tree. For example, an RSTP bridge connected to a legacy bridge can send 802.1D BPDUs on one of its ports. Similarly, when an MST bridge receives a legacy BPDU or an MST BPDU associated with a different region, it is also to detect that a port is at the boundary of a region.

Unfortunately, these mechanisms cannot always revert to the most efficient mode. For example, an RSTP bridge designated for a legacy 802.1D stays in 802.1D mode even after the legacy bridge has been removed from the link. Similarly, an MST port still assumes that it is a boundary port when the bridge(s) to which it is connected have joined the same region. To force a Catalyst 4500 series switch to renegotiate with the neighbors (that is, to restart protocol migration), you must enter the **clear spanning-tree detected-protocols** command, as follows:

Switch# **clear spanning-tree detected-protocols fastethernet 4/4**
Switch#

**Displaying MST Configurations**

To display MST configurations, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <strong>show spanning-tree mst configuration</strong></td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# <strong>show spanning-tree mst [detail]</strong></td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# <strong>show spanning-tree mst instance-id [detail]</strong></td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# <strong>show spanning-tree mst interface interface [detail]</strong></td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# <strong>show spanning-tree mst instance-id interface interface [detail]</strong></td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# <strong>show spanning-tree vlan vlan_ID</strong></td>
</tr>
</tbody>
</table>
The following examples show how to display spanning tree VLAN configurations in MST mode:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 1-10
Switch(config-mst)# name cisco
Switch(config-mst)# revision 1
Switch(config-mst)# Ctrl-D

Configuring Flex Links and MAC Address-Table Move Update

Flex Links provide a fast and simplified Layer 2 Link redundancy mechanism. This chapter describes how to configure Flex Links on the Catalyst 4500 series switch. It also describes how to configure the MAC address-table move update (MMU) feature, also referred to as the Flex Links bidirectional fast convergence feature.

The chapter consists of these sections:

- About Flex Links, page 21-1
- Configuring Flex Links, page 21-5
- Monitoring Flex Links and the MAC Address-Table Move Update, page 21-12

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Flex Links

This section describes this information:

- Flex Links, page 21-2
- VLAN Flex Links Load Balancing and Support, page 21-2
- Flex Links Failover Actions, page 21-3
Flex Links

Flex Links are a pair of Layer 2 interfaces (switch ports or port channels) where one interface is configured to act as a backup to the other. Users can disable STP and still retain basic link redundancy. Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on some interfaces.

**Note**

The Catalyst 4500 series switch supports a maximum of 16 Flex Links.

You configure Flex Links on one Layer 2 interface (the active link) by assigning another Layer 2 interface as the Flex Link or backup link. When one of the links is up and forwarding traffic, the other link is in standby mode, ready to begin forwarding traffic if the other link fails. At any given time, only one of the interfaces is in the forwarding state and forwarding traffic. If the primary link fails, the standby link starts forwarding traffic. When the active link reactivates, it enters standby mode and does not forward traffic. STP is disabled on Flex Links interfaces.

In Figure 21-1, ports 1 and 2 on switch A are connected to uplink switches B and C. Because they are configured as Flex Links, only one of the interfaces is forwarding traffic; the other is in standby mode. If port 1 is the active link, it begins forwarding traffic between port 1 and switch B; the link between port 2 (the backup link) and switch C is not forwarding traffic. If port 1 shuts down, port 2 activates and starts forwarding traffic to switch C. When port 1 reactivates, it enters standby mode and does not forward traffic; port 2 continues forwarding traffic.

You can also choose to configure a preemption mechanism, specifying the preferred port for forwarding traffic. In Figure 21-1, for example, you can configure the Flex Links pair with preemption mode so that after port 1 reactivates in the scenario, and it has greater bandwidth than port 2, port 1 begins forwarding after a duration equal to the preemption delay; and port 2 becomes the standby. You do this by entering the interface configuration `switchport backup interface preemption mode bandwidth` and `switchport backup interface preemption delay` commands.

**VLAN Flex Links Load Balancing and Support**

VLAN Flex Links load balancing allows you to configure a Flex Links pair so that both ports simultaneously forward the traffic for mutually exclusive VLANs. For example, if Flex Links ports are configured for 1 to 100 VLANs, the traffic of the first 50 VLANs can be forwarded on one port and the
rest on the other port. If one of the ports fail, the other active port forwards all the traffic. When the failed port reactivates, it resumes forwarding traffic in the preferred VLANs. In addition to providing the redundancy, this Flex Links pair can be used for load balancing. Also, Flex Links VLAN load balancing also does not impose any restrictions on uplink switches (Figure 21-2).

**Figure 21-2 VLAN Flex Links Load Balancing Configuration Example**

A static MAC address must point to a Flex Links interface that is forwarding for given VLAN. For example, if a backup interface is forwarding VLAN X, then a static MAC address in VLAN X must point to the backup interface. Misconfiguration might cause unexpected results.

**Flex Links Failover Actions**

When a Flex Links primary fails, the following important actions are taken:

- Detects link failure.
- Moves static unicast MAC addresses that are configured on the primary link to the standby link.
- Moves dynamic unicast MAC addresses that are learned on the primary link to the standby link.
- Moves the standby link to a forwarding state.
- Transmits MAC address-table move updates over a new active link, if you enter the **mac move update transmit** command.
- Transmits dummy multicast packets over a new active interface.

**Note**

Local administrative shut down or a link that starts forwarding again due to preemption is not considered a link failure. In those cases, flush the dynamic hosts and not move them.

Static MAC addresses configured on a Flex Links member interface are moved over to the backup, if it fails. Static MAC addresses configured on a Flex Links member interface are restored when it starts forwarding again.

**Note**

The **show mac address-table** command always shows static MAC addresses as associated with the interface on which it was configured even if it may have been moved to the standby link because of a Flex Links failover.
MAC Address-Table Move Update

In Figure 21-3, ports 1 and 2 on switch A are connected to uplink switches B and D through a Flex Links pair. Port 1 is forwarding traffic, and port 2 is in the blocking state. Traffic from the PC to the server is forwarded from port 1 to port 3. The MAC address of the PC was learned on port 3 of switch C. Traffic from the server to the PC is forwarded from port 3 to port 1.

If port 1 shuts down, port 2 starts forwarding traffic. If there is no traffic from PC to the server after failover to port 2, switch C does not learn MAC address of the PC on port 4. As a result, switch C keeps forwarding traffic from the server to the PC out of port 3. There is traffic loss from server to PC because port 1 is down. This problem is alleviated by sending out a dummy multicast packet with source MAC address of the PC over port 2. Switch C learns the PC MAC address on port 4 and start forwarding traffic from server to the PC out of port 4. One dummy multicast packet is sent out for every MAC address, which is the default Flex Links behavior. The MAC address-table move update (MMU) feature may be enabled to further expedite downstream convergence. MMUs are special packets that carry multiple MAC addresses. Switch A is configured to transmit these packets and switches B, C, and D are configured to receive such packets. If MMU transmit is enabled on Switch A, MAC move updates are transmitted before dummy multicast packets over port 2. Switch D processes and floods MMUs over to Switch C. Switch C processes these packets, and moves the MAC addresses contained within the packets from port 3 to port 4. Because one packet carries multiple MAC addresses, downstream convergence is faster.
Configuring Flex Links

These sections contain this configuration information:

- Default Configuration, page 21-5
- Configuration Guidelines, page 21-6
- Configuring Flex Links, page 21-6
- Configuring VLAN Load Balancing on Flex Links, page 21-8

Default Configuration

The following is the default Flex Links configuration:

- Flex Links are not configured on any interface.
- Preemption mode is off.
- If preemption is enabled, preemption delay is 35 seconds.
Chapter 21      Configuring Flex Links and MAC Address-Table Move Update

Configuring Flex Links

Configuration Guidelines

Follow these guidelines to configure Flex Links and associated features:

- You can configure only one Flex Link backup link for any active link, and it must be a different interface from the active interface.
- An interface can belong to only one Flex Links pair. An interface can be a backup link for only one active link, but an active link cannot belong to another Flex Links pair.
- Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links. Moreover, you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.
- The types (Fast Ethernet, Gigabit Ethernet, or port channel) of the backup link and the active link can differ. However, you should configure both Flex Links with similar characteristics so that no loops exist or changes occur in behavior if the standby link begins to forward traffic.
- STP is disabled on Flex Links ports. A Flex Links port does not participate in STP, even if the VLANs present on the port are configured for STP. When STP is not enabled, ensure that no loops exist in the configured topology.
- Configure any static MAC addresses on a Flex Links member interface after enabling Flex Links.

Follow these guidelines to configure VLAN load balancing on the Flex Links feature. For Flex Links VLAN load balancing, you must choose the preferred VLANs on the backup interface.

Set `switchport backup interface interface-id preemption mode` to forced. A default value of 35 seconds is used as the delay timeout. You cannot configure `switchport backup interface interface-id preemption mode` on the interface. So, mode `bandwidth` and `off` cannot be configured.

Adjust the delay time with the `switchport backup interface interface-id preemption delay delay-time` command.

Configuring Flex Links

To configure a pair of Flex Links, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <code>configure terminal</code> Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(conf)# <code>interface interface-id</code> Specifies the interface, and enters interface configuration mode. The interface might be a physical Layer 2 interface or a port channel (logical interface). The port channel range is 1 to 64.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(conf-if)# <code>switchport backup interface interface-id</code> Configures a physical Layer 2 interface (or port channel) as part of a Flex Links pair with the interface. When one link is forwarding traffic, the other interface is in standby mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(conf-if)# <code>end</code> Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# <code>show interface [interface-id] switchport backup</code> Verifies the configuration.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# <code>copy running-config startup config</code> (Optional) Saves your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>
To disable a Flex Links backup interface, enter the `no switchport backup interface interface-id` interface configuration command.

This example shows how to configure an interface with a backup interface and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet1/1
Switch(config-if)# switchport backup interface fastethernet1/2
Switch(config-if)# end
Switch# show interface switchport backup
```

```
Switch Backup Interface Pairs:
+----------------+-----------------+------------------+
| Active Interface | Backup Interface | State            |
+----------------+-----------------+------------------+
| FastEthernet1/1 | FastEthernet1/2 | Active Up/Backup |
| FastEthernet1/3 | FastEthernet1/4 | Active Up/Backup |
| Port-channel1   | GigabitEthernet1/1 | Active Up/Backup |
+----------------+-----------------+------------------+
```

To configure a preemption scheme for a pair of Flex Links, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport backup interface interface-id</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# switchport backup interface interface-id preemption mode [forced</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# switchport backup interface interface-id preemption delay delay-time</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Setting a delay time requires forced or bandwidth mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# show interface [interface-id] switchport backup</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# copy running-config startup config</td>
</tr>
</tbody>
</table>
Chapter 21 Configuring Flex Links and MAC Address-Table Move Update

Configuring Flex Links

To remove a preemption scheme, enter the `no switchport backup interface interface-id preemption mode` interface configuration command. To reset the delay time to the default, enter the `no switchport backup interface interface-id preemption delay` interface configuration command.

This example shows how to configure preemption mode as bandwidth for a backup interface pair and to verify the configuration:

```plaintext
Switch# configure terminal
Switch(conf)# interface gigabitethernet1/0/1
Switch(conf-if)# switchport backup interface gigabitethernet1/2
Switch(conf-if)# switchport backup interface gigabitethernet1/2 preemption mode forced
Switch(conf-if)# switchport backup interface gigabitethernet1/2 preemption delay 50
Switch(conf-if)# end
Switch# show interface switchport backup detail
Active Interface        Backup Interface        State
------------------------------------------------------------------------
GigabitEthernet1/21   GigabitEthernet1/2    Active Down/Backup Down
Interface Pair   : Gi1/21, Gi1/2
Preemption Mode  : forced
Preemption Delay : 50 seconds
Bandwidth : 10000 Kbit (Gi1/1), 10000 Kbit (Gi1/2)
Mac Address Move Update Vlan : auto
<output truncated>
```

Configuring VLAN Load Balancing on Flex Links

To configure VLAN load balancing on Flex Links, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(conf)# interface interface-id</td>
<td>Specifies the interface, and enters interface configuration mode. The interface might be a physical Layer 2 interface or a port channel (logical interface). The port channel range is 1 to 48.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(conf-if)# switchport backup interface interface-id prefer vlan vlan-range</td>
<td>Configures a physical Layer 2 interface (or port channel) as part of a Flex Links pair with the interface, and specifies the VLANs carried on the interface. The VLAN ID range is 1 to 4094.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(conf-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch# show interfaces [interface-id] switchport backup</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch# copy running-config startup config</td>
<td>(Optional) Saves your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

To disable the VLAN load balancing feature, enter the `no switchport backup interface prefer vlan` interface configuration command.

In this example, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

```plaintext
Switch(config)# interface fastethernet 1/6
Switch(config-if)# switchport backup interface fastethernet 1/0/8 prefer vlan 60,100-120
```
When both interfaces are up, Fast Ethernet port 1/0/8 forwards traffic for VLANs 60 and 100 to 120 and Fast Ethernet port 1/0/6 forwards traffic for VLANs 1 to 50.

Switch# `show interfaces switchport backup`  
Switch Backup Interface Pairs:

<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>FastEthernet1/6</td>
<td>FastEthernet1/8</td>
<td>Active Up/Backup Standby</td>
</tr>
</tbody>
</table>

Vlans Preferred on Active Interface: 1-50  
Vlans Preferred on Backup Interface: 60, 100-120

When a Flex Links interface shuts down, VLANs preferred on this interface are moved to the peer interface of the Flex Links pair. In this example, if interface 1/6 shuts down, interface 1/8 carries all VLANs of the Flex Links pair.

Switch# `show interfaces switchport backup`  
Switch Backup Interface Pairs:

<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>FastEthernet1/6</td>
<td>FastEthernet1/8</td>
<td>Active Down/Backup VLB all</td>
</tr>
</tbody>
</table>

Vlans Preferred on Active Interface: 1-50  
Vlans Preferred on Backup Interface: 60, 100-120

When a Flex Links interface becomes active, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Fast Ethernet port 1/6 becomes active, VLANs preferred on this interface are blocked on the peer interface Fast Ethernet port 1/8 and forwarded on Fast Ethernet port 1/6.

Switch# `show interfaces switchport backup`  
Switch Backup Interface Pairs:

<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>FastEthernet1/6</td>
<td>FastEthernet1/8</td>
<td>Active VLB cfg/Backup VLB cfg</td>
</tr>
</tbody>
</table>

Vlans Preferred on Active Interface: 1-50  
Vlans Preferred on Backup Interface: 60, 100-120

Switch# `show interfaces switchport backup detail`  
Switch Backup Interface Pairs:

<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>FastEthernet1/6</td>
<td>FastEthernet1/8</td>
<td>Active VLB cfg/Backup VLB cfg</td>
</tr>
</tbody>
</table>

Vlans Preferred on Active Interface: 1-50  
Vlans Preferred on Backup Interface: 60, 100-120  
Preemption Mode : off

Mac Address Move Update Vlan : auto
Configuring MAC Address-Table Move Update

These sections contain this configuration information:

- Default Configuration, page 21-5
- Configuration Guidelines, page 21-6
- Configuring MAC Address-Table Move Update, page 21-10

Default Configuration

By default, the MAC address-table move update feature is disabled.

Configuration Guidelines

Follow these guidelines to configure the MAC address-table move update feature:

- Enable `mac address-table move transmit` on the switch with Flex Links configured to send MAC address-table move updates.
- Enable `mac address-table move receive` on all upstream switches to process MAC address-table move updates.

Configuring the MAC Address-Table Move Update Feature

This section describes the following tasks:

- Configuring a Switch to Send MAC Address-Table Move Updates, page 21-10
- Configuring a Switch to Receive MAC Address-Table Move Updates, page 21-12

Configuring a Switch to Send MAC Address-Table Move Updates

To configure an access switch to send MAC address-table move updates, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(conf)# interface interface-id</td>
<td>Specifies the interface, and enters interface configuration mode. The interface might be a physical Layer 2 interface or a port channel (logical interface). The port channel range is 1 to 64.</td>
</tr>
</tbody>
</table>
Chapter 21 Configuring Flex Links and MAC Address-Table Move Update

Configuring MAC Address-Table Move Update

To disable the MAC address-table move update feature on the access switch, enter the `no mac address-table move update transmit` interface configuration command. To display the MAC address-table move update information, enter the `show mac address-table move update` command.

This example shows how to configure an access switch to send MAC address-table move update messages and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet1/1
Switch(config)# switchport backup interface fastethernet1/0/2 mmu primary vlan 2
Switch(config)# end
Switch(config)# mac address-table move update transmit
Switch(config)# end
Switch# show mac-address-table move update
Switch-ID : 01d0.2bfc.3180
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 4096/55000
Default/Current settings: Rcv Off/Off, Xmt Off/On
Max packets per min : Rcv 100, Xmt 120
Rcv packet count : 0
Rcv conforming packet count : 0
Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last interface : None
Rcv last src-mac-address : 0000.0000.0000
Rcv last switch-ID : 0000.0000.0000
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : fa1/2
```
Configuring a Switch to Receive MAC Address-Table Move Updates

To configure a switch to receive and process MAC address-table move update messages, perform this task:

- **Step 1**: `Switch# configure terminal`
  - Enters global configuration mode.
- **Step 2**: `Switch(conf)# mac address-table move update receive`
  - Enables the switch to receive and process the MAC address-table move updates.
- **Step 3**: `Switch(conf)# end`
  - Returns to privileged EXEC mode.
- **Step 4**: `Switch# show mac address-table move update`
  - Verifies the configuration.
- **Step 5**: `Switch# copy running-config startup config`
  - (Optional) Saves your entries in the switch startup configuration file.

To disable the MAC address-table move update feature on the access switch, enter the `no mac address-table move update receive` configuration command. To display the MAC address-table move update information, enter the `show mac address-table move update` command.

This example shows how to configure a switch to receive and process MAC address-table move update messages:

```
Switch# configure terminal
Switch(conf)# mac address-table move update receive
Switch(conf)# end
```

Monitoring Flex Links and the MAC Address-Table Move Update

Table 21-1 shows the commands for monitoring the Flex Links configuration and the MAC address-table move update information.

### Table 21-1 Flex Links and MAC Address-Table Move Update Monitoring Commands

Configuring Resilient Ethernet Protocol

This chapter describes how to use Resilient Ethernet Protocol (REP) on the Catalyst 4500 series switch. REP is a Cisco proprietary protocol that provides an alternative to Spanning Tree Protocol (STP) to control network loops, handle link failures, and improve convergence time. REP controls a group of ports connected in a segment, ensures that the segment does not create any bridging loops, and responds to link failures within the segment. REP provides a basis for constructing more complex networks and supports VLAN load balancing.

This chapter includes these sections:

- About REP, page 22-1
- Configuring REP, page 22-7
- Monitoring REP, page 22-14

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

About REP

One REP segment is a chain of ports connected to each other and configured with a segment ID. Each segment consists of standard (non-edge) segment ports and two user-configured edge ports. A switch can have no more than two ports that belong to the same segment, and each segment port can have only one external neighbor. A segment can go through a shared medium, but on any link only two ports can belong to the same segment. REP is supported only on Layer 2 trunk and PVLAN promiscuous trunk interfaces.

*Figure 22-1* shows an example of a segment consisting of six ports spread across four switches. Ports E1 and E2 are configured as edge ports. When all ports are operational (as in the segment on the left), a single port is blocked, shown by the diagonal line. When there is a failure in the network, as shown in the diagram on the right, the blocked port returns to the forwarding state to minimize network disruption.
About REP

The segment shown in Figure 22-1 is an open segment; there is no connectivity between the two edge ports. The REP segment cannot cause a bridging loop and it is safe to connect the segment edges to any network. All hosts connected to switches inside the segment have two possible connections to the rest of the network through the edge ports, but only one connection is accessible at any time. If a failure causes a host to be unable to access its usual gateway, REP unblocks all ports to ensure that connectivity is available through the other gateway.

The segment shown in Figure 22-2, with both edge ports located on the same switch, is a ring segment. In this configuration, there is connectivity between the edge ports through the segment. With this configuration, you can create a redundant connection between any two switches in the segment.

REP segments have these characteristics:

- If all ports in the segment are operational, one port (referred to as the alternate port) is in the blocked state for each VLAN. If VLAN load balancing is configured, two ports in the segment control the blocked state of VLANs.
- If one or more ports in a segment is not operational, causing a link failure, all ports forward traffic on all VLANs to ensure connectivity.
- In case of a link failure, the alternate ports are unblocked as quickly as possible. When the failed link comes back up, a logically blocked port per-VLAN is selected with minimal disruption to the network.
You can construct almost any type of network based on REP segments. REP also supports VLAN load balancing, controlled by the primary edge port but occurring at any port in the segment.

In access ring topologies, the neighboring switch might not support REP, as shown in Figure 22-3. Starting with Cisco IOS Release 15.0(2)SG, you can configure the non-REP facing ports (E1 and E2) as edge no-neighbor ports. These ports inherit all properties of edge ports, and you can configure them the same as any edge port, including configuring them to send STP or REP topology change notices to the aggregation switch. In this case the STP topology change notice (TCN) that is sent is a multiple spanning-tree (MST) STP message.

Figure 22-3  Edge No-Neighbor Ports

REP has these limitations:
- You must configure each segment port; an incorrect configuration can cause forwarding loops in the networks.
- REP can manage only a single failed port within the segment; multiple port failures within the REP segment cause loss of network connectivity.
- You should configure REP only in networks with redundancy. Configuring REP in a network without redundancy causes loss of connectivity.

To use REP effectively, you should understand the following topics:
- Link Integrity, page 22-4
- Fast Convergence, page 22-4
- VLAN Load Balancing, page 22-4
- Spanning Tree Interaction, page 22-6
- REP Ports, page 22-6
Link Integrity

REP does not use an end-to-end polling mechanism between edge ports to verify link integrity. It implements local link failure detection. When enabled on an interface, the REP Link Status Layer (LSL) detects its REP-aware neighbor and establishes connectivity within the segment. All VLANs are blocked on an interface until it detects the neighbor. After the neighbor is identified, REP determines which neighbor port should become the alternate port and which ports should forward traffic.

Each port in a segment has a unique port ID. The port ID format is similar to that used by the spanning tree algorithm: a port number (unique on the bridge), associated to a MAC address (unique in the network). When a segment port is coming up, its LSL starts sending packets that include the segment ID and the port ID. The port is declared as operational after it performs a three-way handshake with a neighbor in the same segment. A segment port does not become operational if these situations occur:

- No neighbor has the same segment ID.
- More than one neighbor has the same segment ID.
- The neighbor does not acknowledge the local port as a peer.

Each port creates an adjacency with its immediate neighbor. Once the neighbor adjacencies are created, the ports negotiate to determine one blocked port for the segment, the alternate port. All other ports become unblocked. By default, REP packets are sent to a BPDU class MAC address. The packets can also be sent to the Cisco multicast address, which at present is used only to send blocked port advertisement (BPA) messages when there is a failure in the segment. The packets are dropped by devices not running REP.

Fast Convergence

Because REP runs on a physical link basis and not a per-VLAN basis, only one hello message is required for all VLANs, reducing the load on the protocol. We recommend that you create VLANs consistently on all switches in a given segment and configure the same allowed VLANs on the REP trunk and PVLAN promiscuous trunk ports. To avoid the delay introduced by relaying messages in software, REP also allows some packets to be flooded to a regular multicast address. These messages operate at the hardware flood layer (HFL) and are flooded to the whole network, not just the REP segment. Switches that do not belong to the segment treat them as data traffic. You can control flooding of these messages by configuring a dedicated administrative VLAN for the whole domain.

The estimated convergence recovery time is less than 200 milliseconds for the local segment.

VLAN Load Balancing

One edge port in the REP segment acts as the primary edge port; the other as the secondary edge port. It is the primary edge port that always participates in VLAN load balancing in the segment. REP VLAN balancing is achieved by blocking some VLANs at a configured alternate port and all other VLANs at the primary edge port. When you configure VLAN load balancing, you can specify the alternate port in one of three ways:

- By entering the port ID of the interface.
  To identify the port ID of a port in the segment, enter the `show interface rep detail` interface configuration command for the port.

- By entering the neighbor offset number of a port in the segment, which identifies the downstream neighbor port of an edge port.
The neighbor offset number range is –256 to +256; a value of 0 is invalid. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers indicate the secondary edge port (offset number -1) and its downstream neighbors.

**Note** You configure offset numbers on the primary edge port by identifying a port’s downstream position from the primary (or secondary) edge port. You never enter an offset value of 1 because that is the offset number of the primary edge port itself.

Figure 22-4 shows neighbor offset numbers for a segment where E1 is the primary edge port and E2 is the secondary edge port. The red numbers inside the ring are numbers offset from the primary edge port; the black numbers outside of the ring show the offset numbers from the secondary edge port. Note that you can identify all ports (except the primary edge port) by either a positive offset number (downstream position from the primary edge port) or a negative offset number (downstream position from the secondary edge port). If E2 became the primary edge port, its offset number is then 1 and E1 is then -1.

- By entering the `preferred` keyword to select the port that you previously configured as the preferred alternate port with the `rep segment preferred` interface configuration command.

**Figure 22-4  Neighbor Offset Numbers in a Segment**

When the REP segment is complete, all VLANs are blocked. When you configure VLAN load balancing, it is triggered in one of two ways:

- You can manually trigger VLAN load balancing at any time by entering the `rep preempt segment segment-id` privileged EXEC command on the switch that has the primary edge port.

- You can configure a preempt delay time by entering the `rep preempt delay seconds` interface configuration command. After a link failure and recovery, VLAN load balancing begins after the configured preemption time period elapses. Note that the delay timer restarts if another port fails before the time has elapsed.

**Note** When VLAN load balancing is configured, it does not start working until triggered by either manual intervention or a link failure and recovery.
When VLAN load balancing is triggered, the primary edge port then sends out a message to alert all interfaces in the segment about the preemption. When the message is received by the secondary edge port, it is reflected into the network to notify the alternate port to block the set of VLANs specified in the message and to notify the primary edge port to block the remaining VLANs.

You can also configure a particular port in the segment to block all VLANs. VLAN load balancing is initiated only by the primary edge port and is not possible if the segment is not terminated by an edge port on each end. The primary edge port determines the local VLAN load balancing configuration.

To reconfigure load balancing, you reconfigure the primary edge port. When you change the load balancing configuration, the primary edge port again waits for the `rep preempt segment` command or for the configured preempt delay period after a port failure and recovery before executing the new configuration. If you change an edge port to a regular segment port, the existing VLAN load balancing status does not change. Configuring a new edge port might cause a new topology configuration.

### Spanning Tree Interaction

REP does not interact with STP, but can coexist with it. A port that belongs to a segment is removed from spanning tree control and STP BPDUs are not accepted or sent from segment ports. STP can not run on a segment.

To migrate from an STP ring configuration to REP segment configuration, begin by configuring a single port in the ring as part of the segment and continue by configuring contiguous ports to minimize the number of segments. Each segment always contains a blocked port, so multiple segments means multiple blocked ports and a potential loss of connectivity. When the segment has been configured in both directions up to the location of the edge ports, you then configure the edge ports.

### REP Ports

Ports in REP segments take one of three roles or states: Failed, Open, or Alternate.

- A port configured as a regular segment port starts as a failed port.
- Once the neighbor adjacencies are determined, the port transitions to alternate port state, blocking all VLANs on the interface. Blocked port negotiations occur and when the segment settles, one blocked port remains in the alternate role and all other ports become open ports.
- When a failure occurs in a link, all ports move to the failed state. When the alternate port receives the failure notification, it changes to the open state, forwarding all VLANs.

A regular segment port converted to an edge port, or an edge port converted to a regular segment port, does not always result in a topology change. If you convert an edge port into a regular segment port, VLAN load balancing is not implemented unless it has been configured. For VLAN load balancing, you must configure two edge ports in the segment.

A segment port that is reconfigured as a spanning tree port restarts according the spanning tree configuration (by default, a designated blocking port). If PortFast is configured or if STP is disabled, the port goes into the forwarding state.
Configuring REP

A segment is a collection of ports connected one to the other in a chain and configured with a segment ID. To configure REP segments, you should configure the REP administrative VLAN (or use the default VLAN 1) and then add the ports to the segment using interface configuration mode. You should configure two edge ports in the segment, with one of them the primary edge port and the other by default the secondary edge port. A segment has only one primary edge port. If you configure two ports in a segment as the primary edge port, for example ports on different switches, the REP selects one of them to serve as the segment primary edge port. You can also optionally configure where to send segment topology change notices (STCNs) and VLAN load balancing.

This section includes this information:

- Default REP Configuration, page 22-7
- REP Configuration Guidelines, page 22-7
- Configuring the REP Administrative VLAN, page 22-8
- Configuring REP Interfaces, page 22-9
- Configuring SNMP Traps for REP, page 22-14

Default REP Configuration

REP is disabled on all interfaces. When enabled, the interface is a regular segment port unless it is configured as an edge port.

When REP is enabled, the sending of segment topology change notices (STCNs) is disabled, all VLANs are blocked, and the administrative VLAN is VLAN 1.

When VLAN load balancing is enabled, the default is manual preemption with the delay timer disabled. If VLAN load balancing is not configured, the default after manual preemption is to block all VLANs at the primary edge port.

REP Configuration Guidelines

Follow these guidelines when configuring REP:

- We recommend that you begin by configuring one port and then configure the contiguous ports to minimize the number of segments and the number of blocked ports.
- If more than two ports in a segment fail when no external neighbors are configured, one port goes into a forwarding state for the data path to help maintain connectivity during configuration. In the show rep interface privileged EXEC command output, the Port Role for this port shows as Fail Logical Open; the Port Role for the other failed port shows as Fail No Ext Neighbor. When the external neighbors for the failed ports are configured, the ports go through the alternate port state transitions and eventually go to an open state or remain as the alternate port, based on the alternate port election mechanism.
- REP ports must be Layer 2 dot1Q trunk or PVLAN promiscuous trunk ports.
- Be careful when configuring REP through a Telnet connection. Because REP blocks all VLANs until another REP interface sends a message to unblock it, you might lose connectivity to the switch if you enable REP in a Telnet session that accesses the switch through the same interface.
Configuring REP

- You cannot run REP and STP on the same segment or interface.
- If you connect an STP network to the REP segment, be sure that the connection is at the segment edge. An STP connection that is not at the edge could cause a bridging loop because STP does not run on REP segments. All STP BPDUs are dropped at REP interfaces.
- You must configure all trunk and PVLAN promiscuous trunk ports in the segment with the same set of allowed VLANs, or a misconfiguration occurs.
- REP ports follow these rules:
  - If REP is enabled on two ports on a switch, both ports must be either regular segment ports or edge ports.
  - If only one port on a switch is configured in a segment, the port should be an edge port.
  - If two ports on a switch belong to the same segment, both ports must be edge ports or both ports must be regular segment ports.
  - If two ports on a switch belong to the same segment, they must be both edge ports, both regular segment ports, or one regular port and one edge no-neighbor port. An edge port and regular segment port on a switch cannot belong to the same segment.
  - If two ports on a switch belong to the same segment and one is configured as an edge port and one as a regular segment port (a misconfiguration), the edge port is treated as a regular segment port.
- REP interfaces come up in a blocked state and remains in a blocked state until notified that it is safe to unblock. You need to be aware of this to avoid sudden connection losses.
- REP sends all LSL PDUs in untagged frames on the native VLAN. The BPA message sent to the Cisco multicast address is sent on the administration VLAN, which is VLAN 1 by default.
- REP ports can not be configured as one of these port types:
  - SPAN destination port
  - Private VLAN port
  - Tunnel port
  - Access port
- REP is supported on EtherChannels, but not on an individual port that belongs to an EtherChannel.
- There is a maximum of 384 REP segments per switch.

Configuring the REP Administrative VLAN

To avoid the delay introduced by relaying messages in software for link-failure or VLAN-blocking notification during load balancing, REP floods packets at the hardware flood layer (HFL) to a regular multicast address. These messages are flooded to the whole network, not just the REP segment. You can control flooding of these messages by configuring an administrative VLAN for the whole domain.

Follow these guidelines when configuring the REP administrative VLAN:

- If you do not configure an administrative VLAN, the default is VLAN 1.
- There can be only one administrative VLAN on a switch and on a segment (not enforced by software).
- The administrative VLAN cannot be the RSPAN VLAN.
To configure the REP administrative VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# rep admin vlan vlan-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show interface [interface-id] rep detail</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# copy running-config startup config</td>
</tr>
</tbody>
</table>

This example shows how to configure the administrative VLAN as VLAN 100 and verify the configuration by entering the show interface rep detail command on one of the REP interfaces:

Switch# configure terminal
Switch (config)# rep admin vlan 100
Switch (config)# end

Switch# show interface gigabitethernet1/1 rep detail
GigabitEthernet1/1 REP enabled
Segment-id: 2 (Edge)
PortID: 0010019E714680
Preferred flag: No
Operational Link Status: TWO_WAY
Current Key: 0002001121A2D5800E4D
Port Role: Open
Blocked Vlan: <empty>
Admin-vlan: 100
Preempt Delay Timer: disabled
Load-balancing block port: none
Load-balancing block vlan: none
STCN Propagate to: none
LSL PDU rx: 3322, tx: 1722
HFL PDU rx: 32, tx: 5
BPA TLV rx: 16849, tx: 508
BPA (STCN, LSL) TLV rx: 0, tx: 0
BPA (STCN, HFL) TLV rx: 0, tx: 0
EPA-ELECTION TLV rx: 118, tx: 118
EPA-COMMAND TLV rx: 0, tx: 0
EPA-INFO TLV rx: 4214, tx: 4190

**Configuring REP Interfaces**

For REP operation, you need to enable it on each segment interface and identify the segment ID. This step is required and must be done before other REP configuration. You must also configure a primary and secondary edge port on each segment. All other steps are optional.
To enable and configure REP on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode trunk or, switchport mode private-vlan trunk promiscuous</td>
</tr>
</tbody>
</table>
### Step 4

**Command**

```
Switch(config-if)# rep segment segment-id [edge [no-neighbor] [primary]] [preferred]
```

**Purpose**

Enables REP on the interface, and identifies a segment number. The segment ID range is from 1 to 1024. These optional keywords are available.

- **Note** You must configure two edge ports, including one primary edge port for each segment.
  - Enter `edge` to configure the port as an edge port. Entering `edge` without the `primary` keyword configures the port as the secondary edge port. Each segment has only two edge ports.
  - (Optional) Enter `no-neighbor` to configure a port with no external REP neighbors as an edge port. The port inherits all properties of edge ports. You can configure them as you would any edge port.
  - (Optional) On an edge port, enter `primary` to configure the port as the primary edge port, the port on which you can configure VLAN load balancing.
  - **Note** Although each segment can have only one primary edge port, if you configure edge ports on two different switches and enter the `primary` keyword on both switches, the configuration is allowed. However, REP selects only one of these ports as the segment primary edge port. You can identify the primary edge port for a segment by entering the `show rep topology` privileged EXEC command.
  - (Optional) Enter `preferred` to indicate that the port is the preferred alternate port or the preferred port for VLAN load balancing.
  - **Note** Configuring a port as preferred does not guarantee that it becomes the alternate port; this only provides a slight advantage among equal contenders. The alternate port is usually a previously failed port.

### Step 5

**Command**

```
Switch(config-if)# rep stcn {interface interface-id | segment id-list | stp}
```

(Optional) Configures the edge port to send segment topology change notices (STCNs).

- Enter `interface interface-id` to designate a physical interface or port channel to receive STCNs.
- Enter `segment id-list` to identify one or more segments to receive STCNs. The range is 1 to 1024.
- Enter `stp` to send STCNs to STP networks.
## Configuring REP

### Command

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>`Switch(config-if)# rep block port {id port-id</td>
<td>neighbor_offset</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter the <code>id port-id</code> to identify the alternate port by port ID. The port ID is automatically generated for each port in the segment. You can view interface port IDs by entering the <code>show interface interface-id rep [detail]</code> privileged EXEC command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter a <code>neighbor_offset</code> number to identify the alternate port as a downstream neighbor from an edge port. The range is from –256 to 256, with negative numbers indicating the downstream neighbor from the secondary edge port. A value of 0 is invalid. Enter <code>-1</code> to identify the secondary edge port as the alternate port. For an example of neighbor offset numbering, see Figure 22-4 on page 22-5.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter <code>preferred</code> to select the regular segment port previously identified as the preferred alternate port for VLAN load balancing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter <code>vlan vlan-list</code> to block one VLAN or a range of VLANS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter <code>vlan all</code> to block all VLANS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note Because you enter this command at the primary edge port (offset number 1), you never enter an offset value of 1 to identify an alternate port.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter <code>preferred</code> to select the regular segment port previously identified as the preferred alternate port for VLAN load balancing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter <code>vlan vlan-list</code> to block one VLAN or a range of VLANS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter <code>vlan all</code> to block all VLANS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note Entry this command only on the REP primary edge port.</td>
</tr>
<tr>
<td>7</td>
<td><code>Switch(config-if)# rep preempt delay seconds</code></td>
<td>(Optional) You must enter this command and configure a preempt time delay if you want VLAN load balancing to automatically trigger after a link failure and recovery. The time delay range is 15 to 300 seconds. The default is manual preemption with no time delay.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note Entry this command only on the REP primary edge port.</td>
</tr>
<tr>
<td>8</td>
<td><code>Switch(config-if)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>9</td>
<td><code>Switch# show interface [interface-id] rep [detail]</code></td>
<td>Verifies the REP interface configuration.</td>
</tr>
<tr>
<td>10</td>
<td><code>Switch# copy running-config startup config</code></td>
<td>(Optional) Saves your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

Enter the no form of each command to return to the default configuration. Enter the `show rep topology` privileged EXEC command to see which port in the segment is the primary edge port.

This example shows how to configure an interface as the primary edge port for segment 1, to send STCNs to segments 2 through 5, and to configure the alternate port as the port with port ID 0009001818D68700 to block all VLANS after a preemption delay of 60 seconds after a segment port failure and recovery.

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# rep segment 1 edge primary
Switch(config-if)# rep stcn segment 2-5
Switch(config-if)# rep block port 0009001818D68700 vlan all
Switch(config-if)# rep preempt delay 60
Switch(config-if)# end
```
This example shows how to configure the same configuration when the interface has no external REP neighbor:

Switch# configure terminal
Switch (config)# interface gigabitethernet1/1
Switch (config-if)# rep segment 1 edge no-neighbor primary
Switch (config-if)# rep stcn segment 2-5
Switch (config-if)# rep block port 0009001818D68700 vlan all
Switch (config-if)# rep preempt delay 60
Switch (config-if)# rep lsl-age-timer 6000

This example shows how to configure the VLAN blocking configuration shown in Figure 22-5. The alternate port is the neighbor with neighbor offset number 4. After manual preemption, VLANs 100 to 200 are blocked at this port and all other VLANs are blocked at the primary edge port E1 (Gigabit Ethernet port 1/1).

Switch# configure terminal
Switch (config)# interface gigabitethernet1/1
Switch (config-if)# rep segment 1 edge primary
Switch (config-if)# rep block port 4 vlan 100-200
Switch (config-if)# end

Figure 22-5  Example of VLAN Blocking

Setting Manual Preemption for VLAN Load Balancing

If you do not enter the `rep preempt delay seconds` interface configuration command on the primary edge port to configure a preemption time delay, the default is to manually trigger VLAN load balancing on the segment. Be sure that all other segment configuration has been completed before manually preempting VLAN load balancing. When you enter the `rep preempt segment` command, a confirmation message appears before the command is executed because preemption can cause network disruption.

To manually trigger VLAN load balancing on a segment on the switch that has the segment primary edge port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
</tbody>
</table>
Configuring SNMP Traps for REP

To configure the switch to send REP-specific traps to notify the SNMP server of link operational status changes and port role changes, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Enlists global configuration mode.</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>Enables the switch to send REP traps, and set the number of traps sent per second. The range is from 0 to 1000. The default is 0 (no limit imposed; a trap is sent at every occurrence).</td>
</tr>
<tr>
<td>Switch(config)# snmp mib rep trap-rate value</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>Verifies the REP trap configuration.</td>
</tr>
<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>(Optional) Saves your entries in the switch startup configuration file.</td>
</tr>
<tr>
<td>Switch# copy running-config startup config</td>
<td></td>
</tr>
</tbody>
</table>

To remove the trap, enter the `no snmp mib rep trap-rate` global configuration command.

This example configures the switch to send REP traps at a rate of 10 per second:

Switch(config)# snmp mib rep trap-rate 10

Monitoring REP

To monitor REP, enter the following privileged EXEC commands (Table 22-1).

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show interface [interface-id] rep [detail]</td>
<td>Displays REP configuration and status for a specified interface or for all interfaces.</td>
</tr>
<tr>
<td>Switch# show rep topology [segment segment_id] [archive] [detail]</td>
<td>Displays REP topology information for a segment or for all segments, including the primary and secondary edge ports in the segment.</td>
</tr>
</tbody>
</table>
Configuring Optional STP Features

This chapter describes the Spanning Tree Protocol (STP) features supported on the Catalyst 4500 series switch. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- About Root Guard, page 23-2
- Enabling Root Guard, page 23-2
- About Loop Guard, page 23-3
- Enabling Loop Guard, page 23-4
- About EtherChannel Guard, page 23-6
- Enabling EtherChannel Guard (Optional), page 23-6
- About PortFast, page 23-6
- Enabling PortFast, page 23-7
- About BPDU Guard, page 23-8
- Enabling BackboneFast, page 23-15
- About PortFast BPDU Filtering, page 23-9
- Enabling BackboneFast, page 23-15
- About UplinkFast, page 23-11
- Enabling UplinkFast, page 23-12
- About BackboneFast, page 23-13
- Enabling BackboneFast, page 23-15

Note

For information on configuring STP, see Chapter 20, “Configuring STP and MST.”

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location.
About Root Guard

Spanning Tree root guard forces an interface to become a designated port, to protect the current root status and prevent surrounding switches from becoming the root switch.

When you enable root guard on a per-port basis, it is automatically applied to all of the active VLANs to which that port belongs. When you disable root guard, it is disabled for the specified port and the port automatically goes into the listening state.

When a switch that has ports with root guard enabled detects a new root, the ports enter the root-inconsistent state. The switch no longer detects a new root and its ports automatically go into the listening state.

Enabling Root Guard

To enable root guard on a Layer 2 access port (to force it to become a designated port), perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: Switch(config)# interface {{fastethernet</td>
<td>gigabitethernet</td>
</tr>
<tr>
<td>Step 3: Switch(config-if)# end</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Step 4: Switch# show spanning-tree</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows how to enable root guard on Fast Ethernet interface 5/8:

Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree guard root
Switch(config-if)# end
Switch#

This example shows how to verify the configuration:

Switch# show running-config interface fastethernet 5/8
Building configuration...

Current configuration: 67 bytes
!
interface FastEthernet5/8
  switchport mode access
  spanning-tree guard root
end

Switch#
This example shows how to determine whether any ports are in root inconsistent state:

Switch# `show spanning-tree inconsistentports`

<table>
<thead>
<tr>
<th>Name</th>
<th>Interface</th>
<th>Inconsistency</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN0001</td>
<td>FastEthernet3/1</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN0001</td>
<td>FastEthernet3/2</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1002</td>
<td>FastEthernet3/1</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1002</td>
<td>FastEthernet3/2</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1003</td>
<td>FastEthernet3/1</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1003</td>
<td>FastEthernet3/2</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1004</td>
<td>FastEthernet3/1</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1004</td>
<td>FastEthernet3/2</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1005</td>
<td>FastEthernet3/1</td>
<td>Root Inconsistent</td>
</tr>
<tr>
<td>VLAN1005</td>
<td>FastEthernet3/2</td>
<td>Root Inconsistent</td>
</tr>
</tbody>
</table>

Number of inconsistent ports (segments) in the system: 10

**About Loop Guard**

Loop guard helps prevent bridging loops that could occur because of a unidirectional link failure on a point-to-point link. When enabled globally, loop guard applies to all point-to-point ports on the system. Loop guard detects root ports and blocked ports and ensures that they keep receiving BPDUs from their designated port on the segment. If a loop-guard-enabled root or blocked port stop receiving BPDUs from its designated port, it transitions to the blocking state, assuming there is a physical link error on this port. The port recovers from this state as soon as it receives a BPDU.

You can enable loop guard on a per-port basis. When you enable loop guard, it is automatically applied to all of the active instances or VLANs to which that port belongs. When you disable loop guard, it is disabled for the specified ports. Disabling loop guard moves all loop-inconsistent ports to the listening state.

If you enable loop guard on a channel and the first link becomes unidirectional, loop guard blocks the entire channel until the affected port is removed from the channel. Figure 23-1 shows loop guard in a triangular switch configuration.

**Figure 23-1 Triangular Switch Configuration with Loop Guard**

- Designated port
- Root port
- Alternate port
Figure 23-1 illustrates the following configuration:
• Switches A and B are distribution switches.
• Switch C is an access switch.
• Loop guard is enabled on ports 3/1 and 3/2 on Switches A, B, and C.

Enabling loop guard on a root switch has no effect but provides protection when a root switch becomes a nonroot switch.

Follow these guidelines when using loop guard:
• Do not enable loop guard on PortFast-enabled or dynamic VLAN ports.
• Do not enable loop guard if root guard is enabled.

Loop guard interacts with other features as follows:
• Loop guard does not affect the functionality of UplinkFast or BackboneFast.
• Enabling loop guard on ports that are not connected to a point-to-point link does not work.
• Root guard forces a port to always be the root port. Loop guard is effective only if the port is a root port or an alternate port. You cannot enable loop guard and root guard on a port at the same time.
• Loop guard uses the ports known to spanning tree. Loop guard can take advantage of logical ports provided by the Port Aggregation Protocol (PAgP). However, to form a channel, all the physical ports grouped in the channel must have compatible configurations. PAgP enforces uniform configurations of root guard or loop guard on all the physical ports to form a channel.
  - Spanning tree always chooses the first operational port in the channel to send the BPDUs. If that link becomes unidirectional, loop guard blocks the channel, even if other links in the channel are functioning properly.
  - If a set of ports that are already blocked by loop guard are grouped together to form a channel, spanning tree loses all the state information for those ports and the new channel port may obtain the forwarding state with a designated role.
  - If a channel is blocked by loop guard and the channel breaks, spanning tree loses all the state information. The individual physical ports may obtain the forwarding state with the designated role, even if one or more of the links that formed the channel are unidirectional.

Note You can enable UniDirectional Link Detection (UDLD) to help isolate the link failure. A loop may occur until UDLD detects the failure, but loop guard is not able to detect it.

• Loop guard has no effect on a disabled spanning tree instance or a VLAN.

Enabling Loop Guard

You can enable loop guard globally or per-port.

To enable loop guard globally on the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch(config)# spanning-tree loopguard default</td>
<td>Enables loop guard globally on the switch.</td>
</tr>
</tbody>
</table>
## Enabling Loop Guard

This example shows how to enable loop guard globally:

```
Switch(config)# spanning-tree loopguard default
Switch(config)#
```

This example shows how to verify the previous configuration of port 4/4:

```
Switch# show spanning-tree interface fastethernet 4/4 detail
```

To enable loop guard on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>`Switch(config)# interface (type slot/port)</td>
<td>(port-channel port_channel_number)`</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# spanning-tree guard loop</code></td>
<td>Configures loop guard.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show spanning tree interface 4/4 detail</code></td>
<td>Verifies the configuration impact on that port.</td>
</tr>
</tbody>
</table>

This example shows how to enable loop guard on port 4/4:

```
Switch(config)# interface fastEthernet 4/4
Switch(config-if)# spanning-tree guard loop
Switch(config-if)# ^Z
```

This example shows how to verify the configuration impact on port 4/4:

```
Switch# show spanning-tree interface fastEthernet 4/4 detail
```
About EtherChannel Guard

EtherChannel guard allows you to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the interfaces of a switch are manually configured in an EtherChannel, and one or more interfaces on the other device are not. For EtherChannel configuration guidelines, see the “EtherChannel Configuration Guidelines and Restrictions” section on page 24-5.

Note

EtherChannel guard applies only to EtherChannels in forced mode (that is, manually configured) rather than through PAgP or LACP.

If the switch detects a misconfiguration on the other device, EtherChannel guard error-disables all interfaces in the EtherChannel bundle, and displays an error message.

You can enable this feature with the spanning-tree etherchannel guard misconfig global configuration command.

Enabling EtherChannel Guard (Optional)

You can enable EtherChannel guard to detect an EtherChannel misconfiguration if your switch is running PVST+, rapid PVST+, or MSTP.

To enable EtherChannel guard, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# spanning-tree etherchannel guard misconfig</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# show spanning-tree summary</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable the EtherChannel guard feature, use the no spanning-tree etherchannel guard misconfig global configuration command.

Use the show interfaces status err-disabled privileged EXEC command to show which switch ports are disabled because of an EtherChannel misconfiguration. On the remote device, you can enter the show etherchannel summary privileged EXEC command to verify the EtherChannel configuration.

After the configuration is corrected, enter the shutdown and no shutdown interface configuration commands on the port-channel interfaces that were misconfigured.

About PortFast

Spanning Tree PortFast causes an interface configured as a Layer 2 access port to enter the forwarding state immediately, bypassing the listening and learning states. Use PortFast on Layer 2 access ports connected to a single workstation or server to allow those devices to connect to the network immediately, rather than waiting for spanning tree to converge. Even if the interface receives a bridge protocol data
unit (BPDU), spanning tree does not place the port into the blocking state. Spanning tree sets the port’s operating state to **non-port fast** even if the configured state remains **port fast** and starts participating in the topology change.

---

**Note**

Because the purpose of PortFast is to minimize the time that access ports must wait for spanning tree to converge, it is most effective when used on access ports. If you enable PortFast on a port connecting to another switch, you risk creating a spanning tree loop.

---

### Enabling PortFast

**Caution**

Use PortFast **only** when connecting a single end station to a Layer 2 access port. Otherwise, you might create a network loop.

To enable PortFast on a Layer 2 access port to force it to enter the forwarding state immediately, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# interface {{fastethernet</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-if)# [no] spanning-tree portfast</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show running interface {{fastethernet</td>
</tr>
</tbody>
</table>

This example shows how to enable PortFast on Fast Ethernet interface 5/8:

```plaintext
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree portfast
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```plaintext
Switch# show running-config interface fastethernet 5/8
Building configuration...

Current configuration:
!
interface FastEthernet5/8
  no ip address
  switchport
  switchport access vlan 200
  switchport mode access
  spanning-tree portfast
end

Switch#
```
About BPDU Guard

Spanning Tree BPDU guard shuts down PortFast-configured interfaces that receive BPDUs, rather than putting them into the spanning tree blocking state. In a valid configuration, PortFast-configured interfaces do not receive BPDUs. Reception of a BPDU by a PortFast-configured interface signals an invalid configuration, such as connection of an unauthorized device. BPDU guard provides a secure response to invalid configurations, because the administrator must manually put the interface back in service.

**Note**
When the BPDU guard feature is enabled, spanning tree applies the BPDU guard feature to all PortFast-configured interfaces.

**Note**
To prevent the port from shutting down, use the `errdisable detect cause bpduguard shutdown` `vlan` global configuration command to shut down only the offending VLAN on the port where the violation occurred.

Enabling BPDU Guard

To enable BPDU guard to shut down PortFast-configured interfaces that receive BPDUs, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# [no] spanning-tree portfast bpduguard</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# <code>show spanning-tree summary totals</code></td>
</tr>
</tbody>
</table>

This example shows how to enable BPDU guard:

```
Switch(config)# spanning-tree portfast bpduguard
Switch(config)# end
Switch#
```

This example shows how to verify the BPDU configuration:

```
Switch# `show spanning-tree summary totals`
```

Root bridge for: none.
PortFast BPDU Guard is enabled
Etherchannel misconfiguration guard is enabled
UplinkFast is disabled
BackboneFast is disabled
Default pathcost method used is short

<table>

</tr>
</tbody>
</table>

Switch#
About PortFast BPDU Filtering

Cisco IOS Release 12.2(25)EW and later support PortFast BPDU filtering, which allows the administrator to prevent the system from sending or even receiving BPDUs on specified ports.

When configured globally, PortFast BPDU filtering applies to all operational PortFast ports. Ports in an operational PortFast state are supposed to be connected to hosts that typically drop BPDUs. If an operational PortFast port receives a BPDU, it immediately loses its operational PortFast status. In that case, PortFast BPDU filtering is disabled on this port and STP resumes sending BPDUs on this port.

PortFast BPDU filtering can also be configured on a per-port basis. When PortFast BPDU filtering is explicitly configured on a port, it does not send any BPDUs and drops all BPDUs it receives.

**Caution**

Explicitly configuring PortFast BPDU filtering on a port that is not connected to a host can result in bridging loops, because the port ignores any BPDU it receives and goes to the forwarding state.

When you enable PortFast BPDU filtering globally and set the port configuration as the default for PortFast BPDU filtering (see the “Enabling BackboneFast” section on page 23-15), PortFast enables or disables PortFast BPDU filtering.

If the port configuration is not set to default, then the PortFast configuration does not affect PortFast BPDU filtering. Table 23-1 lists all the possible PortFast BPDU filtering combinations. PortFast BPDU filtering allows access ports to move directly to the forwarding state as soon as the end hosts are connected.

<table>
<thead>
<tr>
<th>Table 23-1 PortFast BPDU Filtering Port Configurations</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Per-Port Configuration</strong></td>
</tr>
</tbody>
</table>
| Default | Enable | Enable | Enable
| Default | Enable | Disable | Disable
| Default | Disable | Not applicable | Disable
| Disable | Not applicable | Not applicable | Disable
| Enable | Not applicable | Not applicable | Enable

1. The port transmits at least 10 BPDUs. If this port receives any BPDUs, then PortFast and PortFast BPDU filtering are disabled.

Enabling PortFast BPDU Filtering

To enable PortFast BPDU filtering globally, perform this task:

**Command**

**Step 1**

```
Switch(config)# spanning-tree portfast bpdudfilter default
```

Purpose

Enables BPDU filtering globally on the switch.

**Step 2**

```
Switch# show spanning-tree summary totals
```

Verifies the BPDU configuration.

This example shows how to enable PortFast BPDU filtering on a port:

```
Switch(config)# spanning-tree portfast bpdudfilter default
```
Enabling PortFast BPDU Filtering

This example shows how to verify the BPDU configuration in PVST+ mode:

```
Switch# show spanning-tree summary totals
Root bridge for:VLAN0010
EtherChannel misconfiguration guard is enabled
Extended system ID is disabled
Portfast is enabled by default
PortFast BPDU Guard is disabled by default
PortFast BPDU Filter is enabled by default
Loopguard is disabled by default
UplinkFast is disabled
BackboneFast is disabled
Pathcost method used is long
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Blocking</th>
<th>Listening</th>
<th>Learning</th>
<th>Forwarding</th>
<th>STP Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 vlans</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>3</td>
<td>3</td>
</tr>
</tbody>
</table>

Switch#

**Note**

For PVST+ information, see Chapter 20, “Configuring STP and MST.”

To enable PortFast BPDU filtering, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# interface fastEthernet 4/4</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# spanning-tree bpdufilter enable</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# show spanning-tree interface fastethernet 4/4</td>
</tr>
</tbody>
</table>

This example shows how to enable PortFast BPDU filtering on port 4/4:

```
Switch(config)# interface fastEthernet 4/4
Switch(config-if)# spanning-tree bpdufilter enable
Switch(config-if)# ^Z
```

This example shows how to verify that PortFast BPDU filtering is enabled:

```
Switch# show spanning-tree interface fastethernet 4/4
```

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Role</th>
<th>Sts</th>
<th>Cost</th>
<th>Prio.Nbr</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>------------------</td>
<td>------</td>
<td>-----</td>
<td>--------</td>

<td>Desg</td>
<td>FWD</td>
<td>1000</td>
<td>160.196</td>
<td>Edge P2p</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This example shows more detail on the port:

```
Switch# show spanning-tree interface fastEthernet 4/4 detail
Port 196 (FastEthernet4/4) of VLAN0010 is forwarding
Port path cost 1000, Port priority 160, Port Identifier 160.196.
Designated root has priority 32768, address 00d0.00b8.140a
Designated bridge has priority 32768, address 00d0.00b8.140a
Designated port id is 160.196, designated path cost 0
Timers: message age 0, forward delay 0, hold 0
Number of transitions to forwarding state:1
The port is in the portfast mode by portfast trunk configuration
Link type is point-to-point by default
Bpdu filter is enabled
BPDUs: sent 0, received 0
```
About UplinkFast

UplinkFast is most useful in wiring-closet switches. This feature might not be useful for other types of applications.

Spanning Tree UplinkFast provides fast convergence after a direct link failure and uses uplink groups to achieve load balancing between redundant Layer 2 links. Convergence is the speed and ability of a group of internetworking devices running a specific routing protocol to agree on the topology of an internetwork after a change in that topology. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.

Figure 23-2 shows an example of a topology with no link failures. Switch A, the root switch, is connected directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that is connected directly to Switch B is in the blocking state.

If Switch C detects a link failure on the currently active link L2 on the root port (a direct link failure), UplinkFast unblocks the blocked port on Switch C and transitions it to the forwarding state without going through the listening and learning states, as shown in Figure 23-3. This switchover takes approximately one to five seconds.
Enabling UplinkFast

UplinkFast increases the bridge priority to 49,152 and adds 3000 to the spanning tree port cost of all interfaces on the switch, making it unlikely that the switch becomes the root switch. The `max_update_rate` value represents the number of multicast packets transmitted per second (the default is 150 packets per second [pps]).

UplinkFast cannot be enabled on VLANs that have been configured for bridge priority. To enable UplinkFast on a VLAN with bridge priority configured, restore the bridge priority on the VLAN to the default value by entering a `no spanning-tree vlan vlan_ID priority` command in global configuration mode.

**Note**
When you enable UplinkFast, it affects all VLANs on the switch. You cannot configure UplinkFast on an individual VLAN.

To enable UplinkFast, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables UplinkFast. Use the <code>no</code> keyword to disable UplinkFast and restore the default rate, use the command.</td>
</tr>
<tr>
<td><code>Switch(config)# [no] spanning-tree uplinkfast [max-update-rate max_update_rate]</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Verifies that UplinkFast is enabled on that VLAN.</td>
</tr>
<tr>
<td><code>Switch# show spanning-tree vlan vlan_ID</code></td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to enable UplinkFast with a maximum update rate of 400 pps:

```
Switch(config)# spanning-tree uplinkfast max-update-rate 400
Switch(config)# exit
Switch#
```

This example shows how to verify which VLANs have UplinkFast enabled:

```
Switch# show spanning-tree uplinkfast
UplinkFast is enabled
```
Station update rate set to 150 packets/sec.

**UplinkFast statistics**

- Number of transitions via uplinkFast (all VLANs) : 14
- Number of proxy multicast addresses transmitted (all VLANs) : 5308

**About BackboneFast**

BackboneFast is a complementary technology to UplinkFast. UplinkFast is designed to quickly respond to failures on links directly connected to leaf-node switches, but it does not help with indirect failures in the backbone core. BackboneFast optimizes the topology based on the Max Age setting. It allows the default convergence time for indirect failures to be reduced from 50 seconds to 30 seconds. However, it never eliminates forward delays and offers no assistance for direct failures.

**Note**

BackboneFast should be enabled on every switch in your network.

Sometimes a switch receives a BPDU from a designated switch that identifies the root bridge and the designated bridge as the same switch. Because this should not happen, the BPDU is considered inferior. BPDUs are considered inferior when a link from the designated switch has lost its link to the root bridge. The designated switch transmits the BPDUs with the information that it is now the root bridge as well as the designated bridge. The receiving switch ignores the inferior BPDU for the time defined by the Max Age setting.

After receiving inferior BPDUs, the receiving switch tries to determine if there is an alternate path to the root bridge.

- If the port that the inferior BPDUs are received on is already in blocking mode, then the root port and other blocked ports on the switch become alternate paths to the root bridge.
- If the inferior BPDUs are received on a root port, then all presently blocking ports become the alternate paths to the root bridge. Also, if the inferior BPDUs are received on a root port and no other blocking ports exist on the switch, the receiving switch assumes that the link to the root bridge is down and the time defined by the Max Age setting expires, which turns the switch into the root switch.
If the switch finds an alternate path to the root bridge, it uses this new alternate path. This new path, and any other alternate paths, are used to send a Root Link Query (RLQ) BPDU. When BackboneFast is enabled, the RLQ BPDUs are sent out as soon as an inferior BPDU is received. This process can enable faster convergence in the event of a backbone link failure.

Figure 23-4 shows an example of a topology with no link failures. Switch A, the root switch, connects directly to Switch B over link L1 and to Switch C over link L2. In this example, because switch B has a lower priority than A but higher than C, switch B becomes the designated bridge for L3. Consequently, the Layer 2 interface on Switch C that connects directly to Switch B must be in the blocking state.

Next, assume that L1 fails. Switch A and Switch B, the switches directly connected to this segment, instantly know that the link is down. The blocking interface on Switch C must enter the forwarding state for the network to recover. However, because L1 is not directly connected to Switch C, Switch C does not start sending any BPDUs on L3 under the normal rules of STP until the time defined by the Max Age setting has expired.

In an STP environment without BackboneFast, if L1 should fail, Switch C cannot detect this failure because it is not connected directly to link L1. However, because Switch B is directly connected to the root switch over L1, Switch B detects the failure and elects itself the root. Switch B begins sending configuration BPDUs to Switch C, listing itself as the root.

The following actions also occur when you use BackboneFast to eliminate the time defined by the Max Age setting (20-second) delay:

1. When Switch C receives the inferior configuration BPDUs from Switch B, Switch C infers that an indirect failure has occurred.
2. Switch C then sends out an RLQ.
3. Switch A receives the RLQ. Because Switch A is the root bridge, it replies with an RLQ response, listing itself as the root bridge.
4. When Switch C receives the RLQ response on its existing root port, it knows that it still has a stable connection to the root bridge. Because Switch C originated the RLQ request, it does not need to forward the RLQ response on to other switches.
5. BackboneFast allows the blocked port on Switch C to move immediately to the listening state without waiting for the time defined by the Max Age setting for the port to expire.
6. BackboneFast transitions the Layer 2 interface on Switch C to the forwarding state, providing a path from Switch B to Switch A.

This switchover takes approximately 30 seconds, twice the Forward Delay time if the default forward delay time of 15 seconds is set.
Figure 23-5 shows how BackboneFast reconfigures the topology to account for the failure of link L1.

If a new switch is introduced into a shared-medium topology as shown in Figure 23-6, BackboneFast is not activated, because the inferior BPDUs did not come from the recognized designated bridge (Switch B). The new switch begins sending inferior BPDUs that say it is the root switch. However, the other switches ignore these inferior BPDUs, and the new switch learns that Switch B is the designated bridge to Switch A, the root switch.

Enabling BackboneFast

Note
For BackboneFast to work, you must enable it on all switches in the network. BackboneFast is supported for use with third-party switches but it is not supported on Token Ring VLANs.

To enable BackboneFast, perform this task:
### Enabling BackboneFast

This example shows how to enable BackboneFast:

```
Switch(config)# spanning-tree backbonefast
Switch(config)# end
Switch#
```

This example shows how to verify that BackboneFast is enabled:

```
Switch# show spanning-tree backbonefast
BackboneFast is enabled
BackboneFast statistics
-----------------------
Number of transition via backboneFast (all VLANs) : 0
Number of inferior BPDU received (all VLANs) : 0
Number of RLQ request PDUs received (all VLANs) : 0
Number of RLQ response PDUs received (all VLANs) : 0
Number of RLQ request PDUs sent (all VLANs) : 0
Number of RLQ response PDUs sent (all VLANs) : 0
Switch#
```

This example shows how to display a summary of port states:

```
Switch# show spanning-tree summary
Root bridge for:VLAN0001, VLAN1002-VLAN1005
Extended system ID is disabled
Portfast is enabled by default
PortFast BPDU Guard is disabled by default

Switch#
Configuring EtherChannel and Link State Tracking

This chapter describes how to use the command-line interface (CLI) to configure EtherChannel on the Catalyst 4500 series switch Layer 2 or Layer 3 interfaces. It also provides guidelines, procedures, and configuration examples.

EtherChannel provides automatic recovery for the loss of a link by redistributing the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention. This chapter also describes how to configure link-state tracking.

This chapter includes the following major sections:

- About EtherChannel, page 24-2
- EtherChannel Configuration Guidelines and Restrictions, page 24-5
- Configuring EtherChannel, page 24-6
- Displaying EtherChannel to a Virtual Switch System, page 24-16
- Understanding Link-State Tracking, page 24-18
- Configuring Link-State Tracking, page 24-21

Note: The commands in the following sections can be used on all Ethernet interfaces on a Catalyst 4500 series switch, including the uplink ports on the supervisor engine.

Note: For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

Chapter 24  Configuring EtherChannel and Link State Tracking

About EtherChannel

EtherChannel bundles up to eight individual Ethernet links into a single logical link that provides an aggregate bandwidth of up to 800 Mbps (Fast EtherChannel), 8 Gbps (Gigabit EtherChannel), or 80 Gbps (10 Gigabit EtherChannel) between a Catalyst 4500 or 4500X series switch and another switch or host.

Note
Because some linecards have a maximum bandwidth capacity toward the backplane, they can limit the aggregate bandwidth of an Etherchannel when all the Etherchannel members belong to the same linecard.

A Catalyst 4500 series switch supports a maximum of 64 EtherChannels. You can form an EtherChannel with up to eight compatibly configured Ethernet interfaces across modules in a Catalyst 4500 series switch. All interfaces in each EtherChannel must be the same speed and must be configured as either Layer 2 or Layer 3 interfaces.

Note
The network device to which a Catalyst 4500 series switch is connected may impose its own limits on the number of interfaces in an Etherchannel.

If a segment within an EtherChannel fails, traffic previously carried over the failed link switches to the remaining segments within the EtherChannel. When the segment fails, an SNMP trap is sent, identifying the switch, the EtherChannel, and the failed link. Inbound broadcast and multicast packets on one segment in an EtherChannel are blocked from returning on any other segment of the EtherChannel.

Note
The port channel link failure switchover for the Catalyst 4500 series switch was measured at 50 milliseconds, which provides SONET-like link failure switchover time.

These subsections describe how EtherChannel works:

- Port Channel Interfaces, page 24-2
- Configuring EtherChannels, page 24-3
- Load Balancing, page 24-5

Port Channel Interfaces

Each EtherChannel has a numbered port channel interface. A configuration applied to the port channel interface affects all physical interfaces assigned to that interface.

Note
QoS does not propagate to members. The defaults, QoS cos = 0 and QoS dscp = 0, apply on the port channel. Input or output policies applied on individual interfaces are ignored.

After you configure an EtherChannel, the configuration that you apply to the port channel interface affects the EtherChannel; the configuration that you apply to the physical interfaces affects only the interface where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port channel interface (such commands can be STP commands or commands to configure a Layer 2 EtherChannel as a trunk).
Configuring EtherChannels

These subsections describe how EtherChannels are configured:

- EtherChannel Configuration Overview, page 24-3
- Manual EtherChannel Configuration, page 24-3
- PAgP EtherChannel Configuration, page 24-3
- IEEE 802.3ad LACP EtherChannel Configuration, page 24-4

EtherChannel Configuration Overview

You can configure EtherChannels manually or use the Port Aggregation Control Protocol (PAgP) or the Link Aggregation Control Protocol (LACP) (Cisco IOS Release 12.2(25)EW A and later), to form EtherChannels. The EtherChannel protocols allow ports with similar characteristics to form an EtherChannel through dynamic negotiation with connected network devices. PAgP is a Cisco-proprietary protocol and LACP is defined in IEEE 802.3ad.

PAgP and LACP do not interoperate. Ports configured to use PAgP cannot form EtherChannels with ports configured to use LACP and vice versa.

Table 24-1 lists the user-configurable EtherChannel modes.

Table 24-1 EtherChannel Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>on</td>
<td>Mode that forces the LAN port to channel unconditionally. In the on mode, a usable EtherChannel exists only when a LAN port group in the on mode is connected to another LAN port group in the on mode. Because ports configured in the on mode do not negotiate, there is no negotiation traffic between the ports.</td>
</tr>
<tr>
<td>auto</td>
<td>PAgP mode that places a LAN port into a passive negotiating state in which the port responds to PAgP packets it receives but does not initiate PAgP negotiation.</td>
</tr>
<tr>
<td>desirable</td>
<td>PAgP mode that places a LAN port into an active negotiating state in which the port initiates negotiations with other LAN ports by sending PAgP packets.</td>
</tr>
<tr>
<td>passive</td>
<td>LACP mode that places a port into a passive negotiating state in which the port responds to LACP packets it receives but does not initiate LACP negotiation.</td>
</tr>
<tr>
<td>active</td>
<td>LACP mode that places a port into an active negotiating state in which the port initiates negotiations with other ports by sending LACP packets.</td>
</tr>
</tbody>
</table>

Manual EtherChannel Configuration

Manually configured EtherChannel ports do not exchange EtherChannel protocol packets. A manually configured EtherChannel forms only when you configure all ports compatibly in the EtherChannel.

PAgP EtherChannel Configuration

PAgP supports the automatic creation of EtherChannels by exchanging PAgP packets between LAN ports. PAgP packets are exchanged only between ports in auto and desirable modes.
About EtherChannel

The protocol learns the capabilities of LAN port groups dynamically and informs the other LAN ports. Once PAgP identifies correctly matched Ethernet links, it facilitates grouping the links into an EtherChannel. The EtherChannel is then added to the spanning tree as a single bridge port.

Both the auto and desirable modes allow PAgP to negotiate between LAN ports to determine if they can form an EtherChannel, based on criteria such as port speed and trunking state. Layer 2 EtherChannels also use VLAN numbers.

LAN ports can form an EtherChannel when they are in different PAgP modes if the modes are compatible. For example:

- A LAN port in desirable mode can form an EtherChannel successfully with another LAN port that is in desirable mode.
- A LAN port in desirable mode can form an EtherChannel with another LAN port in auto mode.
- A LAN port in auto mode cannot form an EtherChannel with another LAN port that is also in auto mode because neither port initiates negotiation.

IEEE 802.3ad LACP EtherChannel Configuration

Cisco IOS Release 12.2(25)EWA and later releases support IEEE 802.3ad LACP EtherChannels. LACP supports the automatic creation of EtherChannels by exchanging LACP packets between LAN ports. LACP packets are exchanged only between ports in passive and active modes.

The protocol learns the capabilities of LAN port groups dynamically and informs the other LAN ports. Once LACP identifies correctly matched Ethernet links, it facilitates grouping the links into an EtherChannel. The EtherChannel is then added to the spanning tree as a single bridge port.

Both the passive and active modes allow LACP to negotiate between LAN ports to determine if they can form an EtherChannel, based on criteria such as port speed and trunking state. Layer 2 EtherChannels also use VLAN numbers.

LAN ports can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- A LAN port in active mode can form an EtherChannel successfully with another LAN port that is in active mode.
- A LAN port in active mode can form an EtherChannel with another LAN port in passive mode.
- A LAN port in passive mode cannot form an EtherChannel with another LAN port that is also in passive mode, because neither port initiates negotiation.

LACP uses the following parameters:

- LACP system priority—You may configure an LACP system priority on each switch running LACP. The system priority can be configured automatically or through the CLI. See the “Configuring the LACP System Priority and System ID” section on page 24-13. LACP uses the system priority with the switch MAC address to form the system ID and also during negotiation with other systems.

  Note
  
  The LACP system ID is the combination of the LACP system priority value and the MAC address of the switch.

- LACP port priority—You must configure an LACP port priority on each port configured to use LACP. The port priority can be configured automatically or through the CLI. See the “Configuring Layer 2 EtherChannels” section on page 24-10. LACP uses the port priority with the port number to form the port identifier.
• LACP administrative key—LACP automatically configures an administrative key value equal to the channel group identification number on each port configured to use LACP. The administrative key defines the ability of a port to aggregate with other ports. A port’s ability to aggregate with other ports is determined by these factors:
  - Port physical characteristics, such as data rate, duplex capability, and point-to-point or shared medium
  - Configuration restrictions that you establish

LACP tries to configure the maximum number of compatible ports in an EtherChannel up to the maximum allowed by the hardware (eight ports). If a port cannot be actively included in a channel, it is not included automatically if a channelled port fails.

**Note**

Standby and “sub-channeling” are not supported in LACP and PAgP.

## Load Balancing

EtherChannel can balance the traffic load across the links in the channel by reducing part of the binary pattern formed from the addresses or ports in the frame to a numerical value that selects one of the links in the channel. To balance the load, EtherChannel uses MAC addresses, IP addresses, or Layer 4 port numbers, and either the message source or message destination, or both.

Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going only to a single MAC address, using the destination MAC address always chooses the same link in the channel; using source addresses or IP addresses might result in better load balancing.

**Note**

Load balancing can only be configured globally. As a result, all channels (manually configured, PAgP, or LACP) use the same load-balancing method.

For additional information on load balancing, see the “Configuring EtherChannel Load Balancing” section on page 24-14.

## EtherChannel Configuration Guidelines and Restrictions

If improperly configured, some EtherChannel interfaces are disabled automatically to avoid network loops and other problems. Follow these guidelines and restrictions to avoid configuration problems:

• All Ethernet interfaces on all modules support EtherChannel (maximum of eight interfaces) with no requirement that interfaces be physically contiguous or on the same module.
• Configure all interfaces in an EtherChannel to operate at the same speed and duplex mode.
• Enable all interfaces in an EtherChannel. Disabling an interface in an EtherChannel is treated as a link failure, and its traffic is transferred to one of the remaining interfaces in the EtherChannel.
• An EtherChannel does not form if one of the interfaces is a Switched Port Analyzer (SPAN) destination port.
• For Layer 3 EtherChannels:
  - Assign Layer 3 addresses to the port channel logical interface, not to the physical interfaces in the channel.
• For Layer 2 EtherChannels:
  - Assign all interfaces in the EtherChannel to the same VLAN, or configure them as trunks.
  - If you configure an EtherChannel from trunk interfaces, verify that the trunking mode and the native VLAN is the same on all the trunks. Interfaces in an EtherChannel with different trunk modes or different native VLANs can have unexpected results.
  - An EtherChannel supports the same allowed range of VLANs on all the interfaces in a trunking Layer 2 EtherChannel. If the allowed ranges differ for selected interface differ, they do not form an EtherChannel.
  - Interfaces with different Spanning Tree Protocol (STP) port path costs can form an EtherChannel as long they are otherwise compatibly configured. Setting different STP port path costs does not make interfaces incompatible for the formation of an EtherChannel.

• After you configure an EtherChannel, any configuration that you apply to the port channel interface affects the EtherChannel; any configuration that you apply to the physical interfaces affects only the interface you configure.

  Storm Control is an exception to this rule. For example, you cannot configure Storm Control on some of the members of an EtherChannel; Storm Control must be configured on all or none of the ports. If you configure Storm Control on only some of the ports, those ports are dropped from the EtherChannel interface (put in suspended state). You should configure Storm Control at the port channel interface level, and not at the physical interface level.

• A physical interface with port security enabled can join a Layer 2 EtherChannel only if port security is also enabled on the EtherChannel; otherwise the command is rejected by the CLI.

• You cannot configure a 802.1X port in an EtherChannel.

### Configuring EtherChannel

These sections describe how to configure EtherChannel:

• Configuring Layer 3 EtherChannels, page 24-6
• Configuring Layer 2 EtherChannels, page 24-10
• Configuring LACP Standalone or Independent Mode, page 24-12
• Configuring the LACP System Priority and System ID, page 24-13
• Configuring EtherChannel Load Balancing, page 24-14
• Removing an Interface from an EtherChannel, page 24-15
• Removing an EtherChannel, page 24-15

**Note**

Ensure that the interfaces are configured correctly. See the “EtherChannel Configuration Guidelines and Restrictions” section on page 24-5.

### Configuring Layer 3 EtherChannels

To configure Layer 3 EtherChannels, create the port channel logical interface and then put the Ethernet interfaces into the port channel.
These sections describe Layer 3 EtherChannel configuration:

- Creating Port Channel Logical Interfaces, page 24-7
- Configuring Physical Interfaces as Layer 3 EtherChannels, page 24-7

## Creating Port Channel Logical Interfaces

To move an IP address from a physical interface to an EtherChannel, you must delete the IP address from the physical interface before configuring it on the port channel interface.

To create a port channel interface for a Layer 3 EtherChannel, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# interface port-channel port_channel_number</td>
</tr>
<tr>
<td></td>
<td>Creates the port channel interface. The value for port_channel_number can range from 1 to 64.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# ip address ip_address mask</td>
</tr>
<tr>
<td></td>
<td>Assigns an IP address and subnet mask to the EtherChannel.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show running-config interface port-channel port_channel_number</td>
</tr>
<tr>
<td></td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows how to create port channel interface 1:

```
Switch# configure terminal
Switch(config)# interface port-channel 1
Switch(config-if)# ip address 172.32.52.10 255.255.255.0
Switch(config-if)# end
```

This example shows how to verify the configuration of port channel interface 1:

```
Switch# show running-config interface port-channel 1
Building configuration...

Current configuration:
!
interface Port-channel1
 ip address 172.32.52.10 255.255.255.0
 no ip directed-broadcast
end

Switch#
```

## Configuring Physical Interfaces as Layer 3 EtherChannels

To configure physical interfaces as Layer 3 EtherChannels, perform this task for each interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# interface {fastethernet</td>
</tr>
<tr>
<td></td>
<td>Selects a physical interface to configure.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# no switchport</td>
</tr>
<tr>
<td></td>
<td>Makes this a Layer 3 routed port.</td>
</tr>
</tbody>
</table>
## Configuring EtherChannel

### This example shows how to configure Fast Ethernet interfaces 5/4 and 5/5 into port channel 1 with PAgP mode desirable:

```
Switch# configure terminal
Switch(config)# interface range fastethernet 5/4 - 5 (Note: Space is mandatory.)
Switch(config-if)# no switchport
Switch(config-if)# no ip address
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# end
```

### The following two examples show how to verify the configuration of Fast Ethernet interface 5/4:

```
Switch# show running-config interface fastethernet 5/4
```

```
Building configuration...
Current configuration:
!
interface FastEthernet5/4
 no ip address
 no switchport
 no ip directed-broadcast
 channel-group 1 mode desirable
end
```

```
Switch# show interfaces fastethernet 5/4 etherchannel
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# no ip address</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# channel-group port_channel_number mode {active</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show running-config interface port-channel port_channel_number</td>
</tr>
</tbody>
</table>

Note: See the “Configuring a Range of Interfaces” section on page 7-4 for information about the range keyword.

Switch#

Configuring Layer 2 EtherChannels

To configure Layer 2 EtherChannels, configure the Ethernet interfaces with the channel-group command. This operation creates the port channel logical interface.

Note
Cisco IOS software creates port channel interfaces for Layer 2 EtherChannels when you configure Layer 2 Ethernet interfaces with the channel-group command.

To configure Layer 2 Ethernet interfaces as Layer 2 EtherChannels, perform this task for each interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Selects a physical interface to configure.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Configures the interface in a port channel and specifies the PAgP or LACP mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows how to configure Fast Ethernet interfaces 5/6 and 5/7 into port channel 2 with PAgP mode desirable:

Switch# configure terminal
Switch(config)# interface range fastethernet 5/6 - 7 (Note: Space is mandatory.)
Switch(config-if-range)# channel-group 2 mode desirable
Switch(config-if-range)# end
Switch# end

Note
See the “Configuring a Range of Interfaces” section on page 7-4 for information about the range keyword.

This example shows how to verify the configuration of port channel interface 2:

Switch# show running-config interface port-channel 2
Building configuration...

Current configuration:

<table>
<thead>
<tr>
<th>Command</th>

Switch#

Configuring LACP Standalone or Independent Mode

This feature is particularly relevant when a port (A) in a Layer 2 LACP EtherChannel is connected to an unresponsive port (B) on the peer. When LACP standalone is disabled on the EtherChannel, all traffic arriving on A is blocked (the default behavior on a switch). In some scenarios, you might want to allow management traffic on such ports. You can do this by enabling LACP standalone (or independent) mode.

Note

This port-channel standalone-disable command only applies to Layer 2 EtherChannels

Note

LACP Standalone Disable is enabled by default.

To configure the LACP Standalone or Independent mode, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# no port-channel standalone-disable</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# port-channel standalone-disable</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# show running configuration (fastethernet</td>
</tr>
<tr>
<td></td>
<td>gigabitethernet) slot/port port-channel</td>
</tr>
<tr>
<td></td>
<td>port_channel_number</td>
</tr>
</tbody>
</table>

This example shows how to configure the LACP Standalone mode:

Switch# configure terminal
Switch(config)# interface port-channel 1
Switch(config-if)# switchport
Switch(config-if)# exit
Switch(config)# int gi3/1
Switch(config-if)# interface-group 1 mode active
Switch(config-if)# exit
Switch(config)# interface port-channel 1
Switch(config-if)# no port-channel standalone-disable
Ports of Po12 already in suspend (S) mode require a shut/no shut.
Switch(config-if)# end

This example shows how to verify the configuration of port channel interface 1:

Switch# show running-config interface port-channel 1
Building configuration...

Current configuration:
!
interface Port-channel1
  switchport
  no port-channel standalone-disable
Chapter 24      Configuring EtherChannel and Link State Tracking

Configuring EtherChannel

This example shows how to verify the state of port channel interface 1:

Switch# show etherchannel 1 port-channel
Port-channels in the group:
---------------------------
Port-channel: Po13    (Primary Aggregator)
------------
Age of the Port-channel   = 0d:00h:07m:57s
Logical slot/port   = 11/13          Number of ports = 0
Port state          = Port-channel Ag-Not-Inuse
Protocol            =   LACP
Port security       = Disabled
Standalone          = Enabled (independent mode)
Switch#

Configuring the LACP System Priority and System ID

The LACP system ID is the LACP system priority value combined with the MAC address of the switch.

To configure the LACP system priority and system ID, perform this task:

This example shows how to configure the LACP system priority:

Switch# configure terminal
Switch(config)# lacp system-priority 23456
Switch(config)# end
Switch# show module
Mod  Ports Card Type                              Model             Serial No.
----+-----+--------------------------------------+-----------------+-----------
1      2  1000BaseX (GBIC) Supervisor(active)    WS-X4014          JAB063808YZ
2     48  10/100BaseTX (RJ45)                    WS-X4148-RJ       JAB0447072W
3     48  10/100BaseTX (RJ45)V                   WS-X4148-RJ45V    JAE061704J6
4     48  10/100BaseTX (RJ45)V                   WS-X4148-RJ45V    JAE061704ML

Command Purpose
Step 1 Switch(config)# lacp system-priority priority_value
(Optional for LACP) Sets the LACP system priority and system ID.
Valid values are 1 through 65535. Higher numbers have lower priority. The default is 32768.

Switch(config)# no system port-priority
Reverts to the default.

Step 2 Switch(config)# end
Exits configuration mode.

Step 3 Switch# show lacp sys-id
Verifies the configuration.

This example shows how to configure the LACP system priority:

Switch# configure terminal
Switch(config)# lacp system-priority 23456
Switch(config)# end
Switch# show module

<table>
<thead>
<tr>
<th>Mod</th>
<th>Ports</th>
<th>Card Type</th>
<th>Model</th>
<th>Serial No.</th>
</tr>
</thead>

<td>1.6</td>
<td></td>
<td></td>
<td>Ok</td>
</tr>
</tbody>
</table>
This example shows how to verify the configuration:

Switch# show lacp sys-id
23456,0050.3e8d.6400
Switch#

The system priority is displayed first, followed by the MAC address of the switch.

**Configuring EtherChannel Load Balancing**

*Note*  
Load balancing can only be configured globally. As a result, all channels (manually configured, PagP, or LACP) use the same load-balancing method.

To configure EtherChannel load balancing, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# port-channel load-balance {src-mac</td>
<td>dst-mac</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show etherchannel load-balance</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

The load-balancing keywords indicate these values:
- **src-mac**—Source MAC addresses
- **dst-mac**—Destination MAC addresses
- **src-dst-mac**—Source and destination MAC addresses
- **src-ip**—Source IP addresses
- **dst-ip**—Destination IP addresses
- **src-dst-ip**—Source and destination IP addresses (Default)
- **src-port**—Source Layer 4 port
- **dst-port**—Destination Layer 4 port
- **src-dst-port**—Source and destination Layer 4 port

This example shows how to configure EtherChannel to use source and destination IP addresses:

Switch# configure terminal
Switch(config)# port-channel load-balance src-dst-ip
Switch(config)# end
Switch#

This example shows how to verify the configuration:

Switch# show etherchannel load-balance
EtherChannel Load-Balancing Configuration:
   src-dst-ip

EtherChannel Load-Balancing Addresses Used Per-Protocol:
Non-IP: Source XOR Destination MAC address
IPv4: Source XOR Destination IP address
Removing an Interface from an EtherChannel

To remove an Ethernet interface from an EtherChannel, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | Switch(config)# interface (fastethernet | Selects a physical interface to configure.  
gigabitethernet | tengigabitethernet) slot/port |
| 2    | Switch(config-if)# no channel-group | Removes the interface from the port channel interface. |
| 3    | Switch(config-if)# end | Exits configuration mode. |
| 4    | Switch# show running-config interface (fastethernet | Verifies the configuration.  
gigabitethernet | tengigabitethernet) slot/port  
Switch# show interface (fastethernet | tengigabitethernet) slot/port  
etherchannel |

This example shows how to remove Fast Ethernet interfaces 5/4 and 5/5 from port channel 1:

Switch# configure terminal  
Switch(config)# interface range fastethernet 5/4 - 5 (Note: Space is mandatory.)  
Switch(config-if)# no channel-group 1  
Switch(config-if)# end

Removing an EtherChannel

If you remove an EtherChannel, the member ports are shut down and removed from the channel group.

**Note**

If you want to change an EtherChannel from Layer 2 to Layer 3, or Layer 3 to Layer 2, you must remove the EtherChannel and recreate it in the desired configuration.

To remove an EtherChannel, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | Switch(config)# no interface port-channel  
port_channel_number | Removes the port channel interface. |
| 2    | Switch(config)# end | Exits configuration mode. |
| 3    | Switch# show etherchannel summary | Verifies the configuration. |

This example shows how to remove port channel 1:

Switch# configure terminal  
Switch(config)# no interface port-channel 1  
Switch(config)# end
Displaying EtherChannel to a Virtual Switch System

Catalyst 4500 series switches support enhanced PAgP. If a Catalyst 4500 series switch is connected to a Catalyst 6500 series Virtual Switch System (VSS) by using a PAgP EtherChannel, the Catalyst 4500 series switch automatically serve as a VSS client, using enhanced PAgP on this EtherChannel for dual-active detection. This VSS client feature has no impact on the performance of Catalyst 4500 series switch and does not require any user configuration.

This section includes these topics:
- Understanding VSS Client, page 24-16
- Displaying EtherChannel Links to VSS, page 24-18

Understanding VSS Client

This section describes these topics:
- Virtual Switch System, page 24-16
- Dual-Active Scenarios, page 24-16
- Dual-Active Detection Using Enhanced PAgP, page 24-16

Virtual Switch System

The Cisco Catalyst 6500 Series VSS 1440 allows for the combination of two Cisco Catalyst 6500 Series switches into a single, logical network entity from the network control-plane and management perspectives. Within the Cisco VSS, one chassis is designated as the active virtual switch, acting as the single management point of the entire system, and the other is designated as the standby virtual switch. There two chassis are bound together by a special link, called Virtual Switch Link (VSL), which carries the internal signaling and control information between them.

Dual-Active Scenarios

One of the failure scenarios in a VSS is called dual-active, which occurs when the VSL fails completely. Neither virtual switch knows of the other's status. From the perspective of the active virtual switch, the standby chassis is lost. The standby virtual switch also views the active chassis as failed and transitions to active state by using an SSO switchover. Two active virtual switches exist in the network with identical configurations, causing duplicate IP addresses and bridge identifiers. This scenario has adverse effects on the network topology and traffic if it persists.

Dual-Active Detection Using Enhanced PAgP

One method for detecting a dual-active scenario is based on enhanced PAgP (PAgP+). Specifically, the VSS sends regularly scheduled PAgP messages with Type-Length-Values (TLVs) containing the ID of the current active virtual switch (Figure 24-1). When the VSL fails completely, the standby virtual switch immediately sends asynchronous PAgP messages with TLVs containing its own ID on all port channels enabled for enhanced PAgP dual-active detection (Figure 24-2). The remote switch (the VSS client) connected to both VSS components by using EtherChannel links, compares every received active ID with its stored active ID. If they match, the remote switch sends TLVs containing its stored active ID back to the VSS in its regularly scheduled PAgP messages. If they do not match, the
remote switch stores the new active ID and immediately transmits asynchronous PAgP messages with TLVs containing the new active ID. Upon receiving the new active ID from the remote switch, the original active virtual switch detects the dual-active scenario and takes appropriate actions.

**Figure 24-1** Enhanced PAgP in VSS Normal Operation

![Diagram showing Enhanced PAgP in VSS Normal Operation](image1)

**Figure 24-2** Enhanced PAgP in VSS Dual-active Scenario

![Diagram showing Enhanced PAgP in VSS Dual-active Scenario](image2)

As a remote switch, the Catalyst 4500 series switch supports stateful VSS client. In particular, the ID of the current active virtual switch is synchronized from the active supervisor engine to the redundant supervisor engine of the Catalyst 4500 series switch. This ensures that dual-active detection is not disrupted even when the active supervisor engine switches over to the redundant supervisor engine.
Displaying EtherChannel Links to VSS

To display the dual-active detection capability of a configured PAgP port channel, enter the `show pagp port_channel_number dual-active` command.

The command provides the following information:

- A switch uses enhanced PAgP for dual-active detection.
  - You should always see Yes after PAgP dual-active detection enabled on a Catalyst 4500 switch.
- The configured PAgP EtherChannel is connected to a Catalyst 6500 switch VSS.
  - You see N/A below Partner Version if this EtherChannel is not connected to a VSS. Otherwise, you see the version of enhanced PAgP dual-active detection implemented in the VSS.
- This switch is capable of detecting dual-active scenarios in the connected VSS.
  - You see Yes below Dual-Active Detect Capable if and only if the configured EtherChannel is connected to a Catalyst 6500 series VSS that uses the same version of enhanced PAgP dual-active detection.

Note

You can also see the name of the neighboring switch (Partner Name) and the ports to which this EtherChannel is connected (Partner Port).

If a Catalyst 4500 switch is connected to a Catalyst 6500 series VSS with the same version of enhanced PAgP dual-active detection, the switch can detect a dual-active scenario:

```
Switch# show pagp 1 dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1

Channel group 1
   Dual-Active Partner Partner Partner
  Port Detec t Capable Name Port Version
Gi6/5 Yes VSS Gi1/8/1 1.1
Gi6/6 Yes VSS Gi2/8/1 1.1
```

If a Catalyst 4500 switch is not connected to a Catalyst 6500 series VSS, the switch cannot detect a dual-active scenario:

```
Switch# show pagp 1 dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1

Channel group 1
   Dual-Active Partner Partner Partner
  Port Detec t Capable Name Port Version
Gi6/5 No Switch Fa6/5 N/A
Gi6/6 No Switch Fa6/6 N/A
```

Understanding Link-State Tracking

Link-state tracking, also known as trunk failover, is a feature that binds the link state of multiple interfaces. For example, link-state tracking provides redundancy in the network when used with server NIC adapter teaming. When server network adapters are configured in a primary or secondary relationship known as teaming, if the link is lost on the primary interface, connectivity is transparently changed to the secondary interface.
Figure 24-3 on page 24-20 shows a network configured with link-state tracking. To enable link-state tracking, create a link-state group, and specify the interfaces that are assigned to the link-state group. An interface can be an aggregation of ports (an EtherChannel), a single physical port in access or trunk mode, or a routed port. In a link-state group, these interfaces are bundled together. The downstream interfaces are bound to the upstream interfaces. Interfaces connected to servers are referred to as downstream interfaces, and interfaces connected to distribution switches and network devices are referred to as upstream interfaces.

The configuration in Figure 24-3 ensures that the network traffic flow is balanced as follows:

- For links to switches and other network devices
  - Server 1 and server 2 use switch A for primary links and switch B for secondary links.
  - Server 3 and server 4 use switch B for primary links and switch A for secondary links.
- Link-state group 1 on switch A
  - Switch A provides primary links to server 1 and server 2 through link-state group 1. Port 1 is connected to server 1, and port 2 is connected to server 2. Port 1 and port 2 are the downstream interfaces in link-state group 1.
  - Port 5 and port 6 are connected to distribution switch 1 through link-state group 1. Port 5 and port 6 are the upstream interfaces in link-state group 1.
- Link-state group 2 on switch A
  - Switch A provides secondary links to server 3 and server 4 through link-state group 2. Port 3 is connected to server 3, and port 4 is connected to server 4. Port 3 and port 4 are the downstream interfaces in link-state group 2.
  - Port 7 and port 8 are connected to distribution switch 2 through link-state group 2. Port 7 and port 8 are the upstream interfaces in link-state group 2.
- Link-state group 2 on switch B
  - Switch B provides primary links to server 3 and server 4 through link-state group 2. Port 3 is connected to server 3, and port 4 is connected to server 4. Port 3 and port 4 are the downstream interfaces in link-state group 2.
  - Port 5 and port 6 are connected to distribution switch 2 through link-state group 2. Port 5 and port 6 are the upstream interfaces in link-state group 2.
- Link-state group 1 on switch B
  - Switch B provides secondary links to server 1 and server 2 through link-state group 1. Port 1 is connected to server 1, and port 2 is connected to server 2. Port 1 and port 2 are the downstream interfaces in link-state group 1.
  - Port 7 and port 8 are connected to distribution switch 1 through link-state group 1. Port 7 and port 8 are the upstream interfaces in link-state group 1.

In a link-state group, the upstream ports can become unavailable or lose connectivity because the distribution switch or router fails, the cables are disconnected, or the link is lost. These are the interactions between the downstream and upstream interfaces when link-state tracking is enabled:

- If any of the upstream interfaces are in the link-up state, the downstream interfaces can change to or remain in the link-up state.
- If all of the upstream interfaces become unavailable, link-state tracking automatically puts the downstream interfaces in the error-disabled state. Connectivity to and from the servers is automatically changed from the primary server interface to the secondary server interface.
As an example of a connectivity change from link-state group 1 to link-state group 2 on switch A, see Figure 24-3 on page 24-20. If the upstream link for port 6 is lost, the link states of downstream ports 1 and 2 do not change. However, if the link for upstream port 5 is also lost, the link state of the downstream ports changes to the link-down state. Connectivity to server 1 and server 2 is then changed from link-state group 1 to link-state group 2. The downstream ports 3 and 4 do not change state because they are in link-group 2.

- If the link-state group is configured, link-state tracking is disabled, and the upstream interfaces lose connectivity, the link states of the downstream interfaces remain unchanged. The server does not recognize that upstream connectivity has been lost and does not failover to the secondary interface.

You can recover a downstream interface link-down condition by removing the failed downstream port from the link-state group. To recover multiple downstream interfaces, disable the link-state group.

**Figure 24-3 Typical Link-State Tracking Configuration**
Configuring Link-State Tracking

These sections describe how to configure link-state tracking ports:

- Default Link-State Tracking Configuration, page 24-21
- Link-State Tracking Configuration Guidelines, page 24-21
- Configuring Link-State Tracking, page 24-21
- Displaying Link-State Tracking Status, page 24-22

Default Link-State Tracking Configuration

No link-state groups are defined, and link-state tracking is not enabled for any group.

Link-State Tracking Configuration Guidelines

Follow these guidelines to avoid configuration problems:

- An interface that is defined as an upstream interface cannot also be defined as a downstream interface in the same or different link-state group. The reverse is also true.

- We recommend that you add the upstream interfaces to the link state group before adding the downstream interfaces. It is because when a downstream interface is added to a link state group without an upstream interface, the downstream interface is put in error-disabled state until an upstream interface is added to the group.

- An interface cannot be a member of more than one link-state group.

- You can configure up to ten link-state groups per switch.

- If a SPAN destination port is configured as a downstream interface, it is error disabled when all upstream interfaces in its group are down. When an upstream interface is configured as a SPAN destination port, it is considered as a link down event on the interface.

Configuring Link-State Tracking

To configure a link-state group and to assign an interface to a group, perform this task beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# link state track number</td>
<td>Creates a link-state group, and enable link-state tracking. The group number can be 1 to 10; the default is 1.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# interface interface-id</td>
<td>Specifies a physical interface or range of interfaces to configure, and enters interface configuration mode. Valid interfaces include switch ports in access or trunk mode (IEEE 802.1q), routed ports, or multiple ports bundled into an EtherChannel interface (static or LACP), also in trunk mode.</td>
</tr>
</tbody>
</table>
Configuring Link-State Tracking

**Configuring Link-State Tracking**

This example shows how to create a link-state group and configure the interfaces:

Switch# **configure terminal**
Switch(config)# **link state track 1**
Switch(config)# **interface gigabitethernet3/1**
Switch(config-if)# **link state group 1 upstream**
Switch(config-if)# **interface gigabitethernet3/3**
Switch(config-if)# **link state group 1 upstream**
Switch(config-if)# **interface gigabitethernet3/5**
Switch(config-if)# **link state group 1 downstream**
Switch(config-if)# **interface gigabitethernet3/7**
Switch(config-if)# **link state group 1 downstream**
Switch(config-if)# **end**

To disable a link-state group, use the **no link state track number** global configuration command.

**Displaying Link-State Tracking Status**

To display the link-state group information, enter the **show link state group** command. Enter this command without keywords to display information about all link-state groups.

Enter the group number to display information specific to the group. Enter the detail keyword to display detailed information about the group.

It is an example of output from the **show link state group 1** command:

Switch> **show link state group 1**
Link State Group: 1 Status: Enabled, Down

It is an example of output from the **show link state group detail** command:

Switch> **show link state group detail**
(Up):Interface up (Dwn):Interface Down (Dis):Interface disabled

Configuring IGMP Snooping and Filtering

This chapter describes how to configure Internet Group Management Protocol (IGMP) snooping on the Catalyst 4500 series switch. It provides guidelines, procedures, and configuration examples.

This chapter consists of the following major sections:

- About IGMP Snooping, page 25-1
- Configuring IGMP Snooping, page 25-5
- Displaying IGMP Snooping Information, page 25-14
- Configuring IGMP Filtering, page 25-20
- Displaying IGMP Filtering Configuration, page 25-24

Note
To support Cisco Group Management Protocol (CGMP) client devices, configure the switch as a CGMP server. For more information, see the chapters “IP Multicast” and “Configuring IP Multicast Routing” in the Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.1 at this location:

Note
For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About IGMP Snooping

This section includes the following subsections:

- Immediate-Leave Processing, page 25-3
- IGMP Configurable-Leave Timer, page 25-4
About IGMP Snooping

- IGMP Snooping Querier, page 25-4
- Explicit Host Tracking, page 25-4

Note

Quality of service does not apply to IGMP packets.

IGMP snooping allows a switch to snoop or capture information from IGMP packets transmitted between hosts and a router. Based on this information, a switch adds or deletes multicast addresses from its address table, which enables (or disables) multicast traffic from flowing to individual host ports.

IGMP snooping supports all versions of IGMP: IGMPv1, IGMPv2, and IGMPv3.

In contrast to IGMPv1 and IGMPv2, IGMPv3 snooping provides immediate-leave processing by default. It provides explicit host tracking (EHT) and allows network administrators to deploy SSM functionality on Layer 2 devices that support IGMPv3. See the “Explicit Host Tracking” section on page 25-4. In subnets where IGMP is configured, IGMP snooping manages multicast traffic at Layer 2. You can configure interfaces to dynamically forward multicast traffic only to those interfaces that are interested in receiving it by using the `switchport` keyword.

IGMP snooping restricts traffic in MAC multicast groups 0100.5e00.0001 to 01-00-5e-ff-ff-ff. IGMP snooping does not restrict Layer 2 multicast packets generated by routing protocols.

Note

For more information on IP multicast and IGMP, refer to RFC 1112, RFC 2236, RFC 3376 (for IGMPv3).

IGMP (configured on a router) periodically sends out IGMP general queries. A host responds to these queries with IGMP membership reports for groups that it is interested in. When IGMP snooping is enabled, the switch creates one entry per-VLAN in the Layer 2 forwarding table for each Layer 2 multicast group from which it receives an IGMP join request. All hosts interested in this multicast traffic send IGMP membership reports and are added to the forwarding table entry.

Layer 2 multicast groups learned through IGMP snooping are dynamic. However, you can statically configure Layer 2 multicast groups using the `ip igmp snooping static` command. If you specify group membership statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can contain both user-defined and IGMP snooping settings.

Groups with IP addresses in the range 224.0.0.0 to 224.0.0.255, which map to the multicast MAC address range 0100.5E00.0001 to 0100.5E00.00FF, are reserved for routing control packets. These groups are flooded to all forwarding ports of the VLAN with the exception of 224.0.0.22, which is used for IGMPv3 membership reports.

Note

If a VLAN experiences a spanning-tree topology change, IP multicast traffic floods on all VLAN ports where PortFast is not enabled, as well as on ports with the `no igmp snooping tcn flood` command configured for a period of TCN query count.

For a Layer 2 IGMPv2 host interface to join an IP multicast group, a host sends an IGMP membership report for the IP multicast group. For a host to leave a multicast group, it can either ignore the periodic IGMP general queries or it can send an IGMP leave message. When the switch receives an IGMP leave message from a host, it sends out an IGMP group-specific query to determine whether any devices connected to that interface are interested in traffic for the specific multicast group. The switch then updates the table entry for that Layer 2 multicast group so that only those hosts interested in receiving multicast traffic for the group are listed.
In contrast, IGMPv3 hosts send IGMPv3 membership reports (with the allow group record mode) to join a specific multicast group. When IGMPv3 hosts send membership reports (with the block group record) to reject traffic from all sources in the previous source list, the last host on the port is removed by immediate-leave if EHT is enabled.

## Immediate-Leave Processing

IGMP snooping immediate-leave processing allows the switch to remove an interface from the forwarding-table entry without first sending out IGMP group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original IGMP leave message. Immediate-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are being used simultaneously.

When a switch with IGMP snooping enabled receives an IGMPv2 or IGMPv3 leave message, it sends an IGMP group-specific query from the interface where the leave message was received to determine when other hosts are attached to that interface that are interested in joining the MAC multicast group. If the switch does not receive an IGMP join message within the query response interval, the interface is removed from the port list of the (MAC-group, VLAN) entry in the Layer 2 forwarding table.

**Note**

By default all IGMP joins are forwarded to all multicast router ports.

With immediate-leave processing enabled on the VLAN, an interface can be removed immediately from the port list of the Layer 2 entry when the IGMP leave message is received, unless a multicast router was learned on the port.

**Note**

When using IGMPv2 snooping, use immediate-leave processing only on VLANs where just one host is connected to each interface. If immediate-leave processing is enabled on VLANs where multiple hosts are connected to an interface, some hosts might be dropped inadvertently. When using IGMPv3, immediate-leave processing is enabled by default, and due to explicit host tracking, the switch can detect when a port has single or multiple hosts maintained by the switch for IGMPv3 hosts. As a result, the switch can perform immediate-leave processing when it detects a single host behind a given port.

**Note**

IGMPv3 is interoperable with older versions of IGMP.

To display the IGMP version on a particular VLAN, use the `show ip igmp snooping querier vlan` command.

To display whether the switch supports IGMPv3 snooping, use the `show ip igmp snooping vlan` command.

To enable immediate-leave for IGMPv2, use the `ip igmp snooping immediate-leave` command.

**Note**

Immediate-leave processing is enabled by default for IGMPv3.
Chapter 25  Configuring IGMP Snooping and Filtering

About IGMP Snooping

IGMP Configurable-Leave Timer

Immediate-leave processing cannot be used on VLANs where multiple hosts may be connected to a single interface. To reduce leave latency in such a scenario, IGMPv3 provides a configurable leave timer.

In Cisco IOS Release 12.2(25)SG and earlier, the IGMP snooping leave time was based on query response time. If membership reports were not received by the switch before the query response time of the query expired, a port was removed from the multicast group membership.

In Cisco IOS Release 12.2(31)SG and later, you can configure the length of time that the switch waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 5000 milliseconds. The timer can be set either globally or per-VLAN. The VLAN configuration of the leave time overrides the global configuration.

For configuration steps, see the “Configuring the IGMP Leave Timer” section on page 25-9.

IGMP Snooping Querier

IGMP Snooping Querier support was introduced in Cisco IOS Release 12.2(50)SG. This is a Layer 2 feature required to support IGMP snooping in a VLAN where PIM and IGMP are not configured because the multicast traffic does not require routing.

In a network where IP multicast routing is configured, the IP multicast router acts as the IGMP querier by sending general queries. If the IP-multicast traffic in a VLAN only needs to be Layer 2-switched, an IP-multicast router is not required. Without an IP-multicast router on the VLAN, you must configure another switch as the IGMP querier so that it can send queries.

When enabled, the IGMP snooping querier sends out periodic IGMPv2 queries that trigger IGMP report messages from the switch that requests IP multicast traffic. IGMP snooping listens to these IGMP reports to establish appropriate forwarding.

On switches that use IGMP to report interest in IP multicast traffic, configure at least one switch as the IGMP snooping querier in each supported VLAN.

You can configure a switch to generate IGMP queries on a VLAN regardless of whether IP multicast routing is enabled.

Explicit Host Tracking

Explicit host tracking (EHT) monitors group membership by tracking hosts that are sending IGMPv3 membership reports. This tracking enables a switch to detect host information associated with the groups of each port. EHT also enables the user to track the membership and various statistics.

EHT enables a switch to track membership on a per-port basis. Consequently, a switch is aware of the hosts residing on each port and can perform immediate-leave processing when there is only one host behind a port.

To determine whether EHT is enabled on a VLAN, use the show ip igmp snoop vlan command.
Configuring IGMP Snooping

When configuring IGMP, configure the VLAN in the VLAN database mode. See Chapter 15, “Configuring VLANs, VTP, and VMPS.”

IGMP snooping allows switches to examine IGMP packets and make forwarding decisions based on their content.

These sections describe how to configure IGMP snooping:

- Default IGMP Snooping Configuration, page 25-5
- Enabling IGMP Snooping Globally, page 25-6
- Enabling IGMP Snooping on a VLAN, page 25-6
- Configuring Learning Methods, page 25-7
- Configuring a Static Connection to a Multicast Router, page 25-8
- Enabling IGMP Immediate-Leave Processing, page 25-8
- Configuring the IGMP Leave Timer, page 25-9
- Configuring IGMP Snooping Querier, page 25-10
- Configuring Explicit Host Tracking, page 25-11
- Configuring a Host Statically, page 25-11
- Suppressing Multicast Flooding, page 25-12

Default IGMP Snooping Configuration

Table 25-1 shows the IGMP snooping default configuration values.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP snooping</td>
<td>Enabled</td>
</tr>
<tr>
<td>Multicast routers</td>
<td>None configured</td>
</tr>
<tr>
<td>Explicit Host Tracking</td>
<td>Enabled for IGMPv3; Not available for IGMPv2</td>
</tr>
<tr>
<td>Immediate-leave processing</td>
<td>Enabled for IGMPv3; Disabled for IGMPv2</td>
</tr>
<tr>
<td>Report Suppression</td>
<td>Enabled</td>
</tr>
<tr>
<td>IGMP snooping learning method</td>
<td>PIM/DVMRP(^1)</td>
</tr>
</tbody>
</table>

1. PIM/DVMRP = Protocol Independent Multicast/Distance Vector Multicast Routing Protocol
Enabling IGMP Snooping Globally

To enable IGMP snooping globally, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# [no] ip igmp snooping Enables IGMP snooping. Use the no keyword to disable IGMP snooping.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end Exits configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show ip igmp snooping</td>
</tr>
</tbody>
</table>

This example shows how to enable IGMP snooping globally and verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping
Switch(config)# end
Switch# show igmp snooping
```

Enabling IGMP Snooping on a VLAN

To enable IGMP snooping on a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# [no] ip igmp snooping vlan vlan_ID Enables IGMP snooping. Use the no keyword to disable IGMP snooping.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# end Exits configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch# show ip igmp snooping vlan vlan_ID Verifies the configuration.</td>
</tr>
</tbody>
</table>
Chapter 25      Configuring IGMP Snooping and Filtering

Configuring IGMP Snooping

This example shows how to enable IGMP snooping on VLAN 2 and verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 2
Switch(config)# end
Switch# show ip igmp snooping vlan 2
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping          : Enabled
IGMPv3 snooping        : Enabled
Report suppression     : Enabled
TCN solicit query      : Disabled
TCN flood query count  : 2

Vlan 2:
--------
IGMP snooping                  : Enabled
IGMPv2 immediate leave         : Disabled
Explicit host tracking         : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode    : IGMP_ONLY
```

Configuring Learning Methods

The following sections describe IGMP snooping learning methods:

- Configuring PIM/DVMRP Learning, page 25-7
- Configuring CGMP Learning, page 25-7

Configuring PIM/DVMRP Learning

To configure IGMP snooping to learn from PIM/DVMRP packets, perform this task:

```
Command Purpose
Switch(config)# ip igmp snooping vlan vlan_ID mrouter learn [cgmp | pim-dvmrp] Specifies the learning method for the VLAN.
```

This example shows how to configure IP IGMP snooping to learn from PIM/DVMRP packets:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 1 mrouter learn pim-dvmrp
Switch(config)# end
Switch#
```

Configuring CGMP Learning

To configure IGMP snooping to learn from CGMP self-join packets, perform this task:

```
Command Purpose
Switch(config)# ip igmp snooping vlan vlan_ID mrouter learn [cgmp | pim-dvmrp] Specifies the learning method for the VLAN.
```
This example shows how to configure IP IGMP snooping to learn from CGMP self-join packets:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp
Switch(config)# end
Switch#
```

### Configuring a Static Connection to a Multicast Router

To configure a static connection to a multicast router, enter the `ip igmp snooping vlan mrouter interface` command on the switch.

To configure a static connection to a multicast router, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
Switch# configure terminal | Enters global configuration mode. |
| **Step 2**
Switch(config)# ip igmp snooping vlan vlan_ID mrouter interface interface_num | Specifies a static connection to a multicast router for the VLAN. |
| **Note** The interface to the router must be in the VLAN where you are entering the command. The router and the line protocol must be up. |
| **Step 3**
Switch(config)# end | Exits configuration mode. |
| **Step 4**
Switch# show ip igmp snooping mrouter vlan vlan_ID | Verifies the configuration. |

This example shows how to configure a static connection to a multicast router:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 mrouter interface fastethernet 2/10
Switch# show ip igmp snooping mrouter vlan 200
--------+----------------------------------------
200    Fa2/10
Switch#
```

### Enabling IGMP Immediate-Leave Processing

When you enable IGMP immediate-leave processing on a VLAN, a switch removes an interface from the multicast group when it detects an IGMPv2 leave message on that interface.

**Note** For IGMPv3, immediate-leave processing is enabled by default with EHT.

To enable immediate-leave processing on an IGMPv2 interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# ip igmp snooping vlan vlan_ID immediate-leave</td>
<td>Enables immediate-leave processing in the VLAN.</td>
</tr>
<tr>
<td><strong>Note</strong> This command applies only to IGMPv2 hosts.</td>
<td></td>
</tr>
</tbody>
</table>
This example shows how to enable IGMP immediate-leave processing on interface VLAN 200 and to verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 immediate-leave
Configuring immediate leave on vlan 200
Switch(config)# end
Switch# show ip igmp interface vlan 200 | include immediate leave
Immediate leave : Disabled
Switch(config)#
```

### Configuring the IGMP Leave Timer

Follows these guidelines when configuring the IGMP leave timer:

- You can configure the leave time globally or per-VLAN.
- Configuring the leave time on a VLAN overrides the global setting.
- The default leave time is 1000 milliseconds.
- The IGMP configurable leave time is only supported on hosts running IGMP Version 2.
- The actual leave latency in the network is usually the configured leave time. However, the leave time might vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.

To enable the IGMP configurable-leave timer, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config)# ip igmp snooping last-member-query-interval time</td>
<td>Configures the IGMP leave timer globally. The range is 100 to 5000 milliseconds. The default is 1000 seconds. To globally reset the IGMP leave timer to the default setting, use the global configuration command no ip igmp snooping last-member-query-interval.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config)# ip igmp snooping vlan vlan_ID last-member-query-interval time</td>
<td>(Optional) Configures the IGMP leave time on the VLAN interface. The range is 100 to 5000 milliseconds. To remove the configured IGMP leave-time setting from the specified VLAN, use the global configuration command no ip igmp snooping vlan vlan-id last-member-query-interval <strong>Note</strong> Configuring the leave time on a VLAN overrides the globally configured timer.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch# show ip igmp snooping</td>
<td>(Optional) Displays the configured IGMP leave time.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to enable the IGMP configurable-leave timer and to verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping last-member-query-interval 200
Switch(config)# ip igmp snooping vlan 10 last-member-query-interval 500
Switch(config)# end
```
Configuring IGMP Snooping Querier

The IGMP Snooping Querier feature can be enabled either globally or per-VLAN.

**Note**

The IGMP snooping querier is disabled by default.

To configure IGMP Snooping Querier, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# [no] ip igmp snooping [vlan vlan_id] querier</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# [no] ip igmp snooping [vlan vlan_id] querier address abcd</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config)# ip igmp snooping [vlan vlan_id] querier query-interval interval</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# ip igmp snooping [vlan vlan_id] querier max-response-time value</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config)# ip igmp snooping [vlan vlan_id] querier timer expiry value</td>
</tr>
</tbody>
</table>
Chapter 25 Configuring IGMP Snooping and Filtering

Configuring IGMP Snooping

For an example of how to display Snooping Querier information, refer to the “Displaying IGMP Snooping Querier Information” section on page 25-19.

Configuring Explicit Host Tracking

For IGMPv3, EHT is enabled by default and can be disabled on a per-VLAN basis.

To disable EHT processing on a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# ip igmp snooping vlan vlan_ID querier tcn query count value</td>
<td>Configures IGMP Snooping Querier tcn query count.</td>
</tr>
<tr>
<td>Switch(config)# ip igmp snooping vlan vlan_ID querier tcn query interval value</td>
<td>Configures IGMP Snooping Querier tcn query interval.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

This example shows how to disable IGMP EHT on VLAN 200 and to verify the configuration:

Switch# configure terminal
Switch(config)# no ip igmp snooping vlan 200 explicit-tracking
Switch(config)# end
Switch# show ip igmp snooping vlan 200 | include Explicit host tracking
Explicit host tracking : Disabled

Configuring a Host Statically

Hosts normally join multicast groups dynamically, but you can also configure a host statically on an interface.

To configure a host statically on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# ip igmp snooping vlan vlan_ID static mac_address interface interface_num</td>
<td>Configures a host statically in the VLAN.</td>
</tr>
<tr>
<td>Note</td>
<td>This command cannot be configured to receive traffic for specific source IP addresses.</td>
</tr>
</tbody>
</table>
This example shows how to configure a host statically in VLAN 200 on interface Fast Ethernet 2/11:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 static 0100.5e02.0203 interface fastethernet 2/11
Configuring port FastEthernet2/11 on group 0100.5e02.0203 vlan 200
Switch(config)# end
```

### Suppressing Multicast Flooding

An IGMP snooping-enabled switch floods multicast traffic to all ports in a VLAN when a spanning-tree topology change notification (TCN) is received. Multicast flooding suppression enables a switch to stop sending such traffic. To support flooding suppression, the following interface and global commands were introduced in Cisco IOS Release 12.1(11b)EW:

- `[no | default] ip igmp snooping tcn flood` (interface command)
- `[no | default] ip igmp snooping tcn flood query count [1 - 10]` (global command)
- `[no | default] ip igmp snooping tcn query solicit` (global command)

Prior to Cisco IOS Release 12.1(11b)EW, when a spanning tree topology change notification (TCN) was received by a switch, the multicast traffic was flooded to all the ports in a VLAN for a period of three IGMP query intervals. This was necessary for redundant configurations. In Cisco IOS Release 12.1(11b)EW, the default time period the switch waits before multicast flooding stops was changed to two IGMP query intervals.

This flooding behavior is undesirable if the switch that does the flooding has many ports that are subscribed to different groups. The traffic could exceed the capacity of the link between the switch and the end host, resulting in packet loss.

With the `no ip igmp snooping tcn flood` command, you can disable multicast flooding on a switch interface following a topology change. Only the multicast groups that have been joined by a port are sent to that port, even during a topology change.

With the `ip igmp snooping tcn flood query count` command, you can enable multicast flooding on a switch interface for a short period of time following a topology change by configuring an IGMP query threshold.

Typically, if a topology change occurs, the spanning tree root switch issues a global IGMP leave message (referred to as a “query solicitation”) with the group multicast address 0.0.0.0. When a switch receives this solicitation, it floods this solicitation on all ports in the VLAN where the spanning tree change occurred. When the upstream router receives this solicitation, it immediately issues an IGMP general query.

With the `ip igmp snooping tcn query solicit` command, you can now direct a non-spanning tree root switch to enter the same query solicitation.

The following sections provide additional details on the new commands and illustrate how you can use them.

### IGMP Snooping Interface Configuration

A topology change in a VLAN may invalidate previously learned IGMP snooping information. A host that was on one port before the topology change may move to another port after the topology change. When the topology changes, the Catalyst 4500 series switch takes special actions to ensure that multicast traffic is delivered to all multicast receivers in that VLAN.
When the spanning tree protocol is running in a VLAN, a spanning tree topology change notification (TCN) is issued by the root switch in the VLAN. A Catalyst 4500 series switch that receives a TCN in a VLAN for which IGMP snooping has been enabled immediately enters into multicast flooding mode for a period of time until the topology restabilizes and the new locations of all multicast receivers are learned.

While in multicast flooding mode, IP multicast traffic is delivered to all ports in the VLAN, and not restricted to those ports on which multicast group members have been detected.

Starting with Cisco IOS Release 12.1(11b)EW, you can manually prevent IP multicast traffic from being flooded to a switch port by using the `no ip igmp snooping tcn flood` command on that port.

For trunk ports, the configuration applies to all VLANs.

By default, multicast flooding is enabled. Use the `no` keyword to disable flooding, and use `default` to restore the default behavior (flooding is enabled).

To disable multicast flooding on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td></td>
<td>gigabitethernet</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# no ip igmp snooping tcn flood</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show running interface (fastethernet</td>
</tr>
<tr>
<td></td>
<td>gigabitethernet</td>
</tr>
</tbody>
</table>

This example shows how to disable multicast flooding on interface Fast Ethernet 2/11:

```
Switch(config)# interface fastethernet 2/11
Switch(config-if)# no ip igmp snooping tcn flood
Switch(config-if)# end
Switch#
```

**IGMP Snooping Switch Configuration**

By default, flooding mode persists until the switch receives two IGMP general queries. You can change this period of time by using the `ip igmp snooping tcn flood query count n` command, where `n` is a number between 1 and 10.

This command operates at the global configuration level.

The default number of queries is 2. The `no` and `default` keywords restore the default.
To establish an IGMP query threshold, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch(config)# ip igmp snooping tcn flood query count &lt;n&gt;</strong>&lt;br&gt;Switch(config)# end</td>
</tr>
</tbody>
</table>

This example shows how to modify the switch to stop flooding multicast traffic after four queries:

Switch(config)# ip igmp snooping tcn flood query count 4
Switch(config)# end
Switch#

When a spanning tree root switch receives a topology change in an IGMP snooping-enabled VLAN, the switch issues a query solicitation that causes an Cisco IOS router to send out one or more general queries. The new command **ip igmp snooping tcn query solicit** causes the switch to send the query solicitation whenever it notices a topology change, even if that switch is not the spanning tree root.

This command operates at the global configuration level.

By default, query solicitation is disabled unless the switch is the spanning tree root. The **default** keyword restores the default behavior.

To direct a switch to send a query solicitation, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch(config)# ip igmp snooping tcn query solicit</strong>&lt;br&gt;Switch(config)# end</td>
</tr>
</tbody>
</table>

This example shows how to configure the switch to send a query solicitation upon detecting a TCN:

Switch(config)# ip igmp snooping tcn query solicit
Switch(config)# end
Switch#

### Displaying IGMP Snooping Information

The following sections show how to display IGMP snooping information:

- Displaying Querier Information, page 25-15
- Displaying IGMP Host Membership Information, page 25-15
- Displaying Group Information, page 25-16
- Displaying Multicast Router Interfaces, page 25-17
Displaying IGMP Snooping Information

To display querier information, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip igmp snooping querier [vlan vlan_ID]</td>
<td>Displays multicast router interfaces.</td>
</tr>
</tbody>
</table>

This example shows how to display the IGMP snooping querier information for all VLANs on the switch:

Switch# show ip igmp snooping querier

<table>
<thead>
<tr>
<th>Vlan</th>
<th>IP Address</th>
<th>IGMP Version</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>10.10.10.1</td>
<td>v2</td>
<td>Router</td>
</tr>
<tr>
<td>3</td>
<td>172.20.50.22</td>
<td>v3</td>
<td>Fa3/15</td>
</tr>
</tbody>
</table>

This example shows how to display the IGMP snooping querier information for VLAN 3:

Switch# show ip igmp snooping querier vlan 3

<table>
<thead>
<tr>
<th>Vlan</th>
<th>IP Address</th>
<th>IGMP Version</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>172.20.50.22</td>
<td>v3</td>
<td>Fa3/15</td>
</tr>
</tbody>
</table>

Displaying IGMP Host Membership Information

By default, EHT maintains a maximum of 1000 entries in the EHT database. Once this limit is reached, no additional entries are created. To create additional entries, clear the database with the clear ip igmp snooping membership vlan command.

To display host membership information, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip igmp snooping membership [interface interface_num][vlan vlan_ID] [reporter a.b.c.d] [source a.b.c.d group a.b.c.d]</td>
<td>Displays EHT information.</td>
</tr>
</tbody>
</table>

Note: This command is valid only if EHT is enabled on the switch.

This example shows how to display host membership information for VLAN 20 and to delete the EHT database:

Switch# show ip igmp snooping membership vlan 20
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave
**Displaying IGMP Snooping Information**

Switch# clear ip igmp snooping membership vlan 20

This example shows how to display host membership for interface gi4/1:

Switch# show ip igmp snooping membership interface gi4/1

 Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10

This example shows how to display host membership for VLAN 20 and group 224.10.10.10:

This example shows how to display host membership for interface gi4/1:

Switch# clear ip igmp snooping membership vlan 20

Switch# show ip igmp snooping membership interface gi4/1

Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10

Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10

**Displaying Group Information**

To display detailed IGMPv3 information associated with a group, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip igmp snooping groups [vlan vlan_ID]</td>
<td>Displays groups, the type of reports that were received for the group (Host Type), and the list of ports on which reports were received.</td>
</tr>
<tr>
<td>The report list includes neither the multicast router ports nor the complete forwarding port set for the group. It lists the ports on which the reports have been received.</td>
<td></td>
</tr>
<tr>
<td>To display the complete forwarding port set for the group, display the CLI output for the MAC address that maps to this group by using the show mac-address-table multicast command.</td>
<td></td>
</tr>
</tbody>
</table>

| Switch# show ip igmp snooping groups [vlan vlan_ID a.b.c.d] [summary|sources|hosts] | Displays information specific to a group address, providing details about the current state of the group with respect to sources and hosts. |
| **Note** This command applies only to full IGMPv3 snooping support and can be used for IGMPv1, IGMPv2, or IGMPv3 groups. |

| Switch# show ip igmp snooping groups [vlan vlan_ID] [count] | Displays the total number of group addresses learned by the system on a global or per-VLAN basis. |
This example shows how to display the host types and ports of a group in VLAN 1:

Switch# show ip igmp snooping groups vlan 10 226.6.6.7
Vlan Group Version Ports
--------------------------------------------
10 226.6.6.7 v3 Fa7/13, Fa7/14
Switch>

This example shows how to display the current state of a group with respect to a source IP address:

Switch# show ip igmp snooping groups vlan 10 226.6.6.7 sources
Source information for group 226.6.6.7:
Timers: Expired sources are deleted on next IGMP General Query

SourceIP Expires Uptime Inc Hosts Exc Hosts
--------------------------------------------
2.0.0.1 00:03:04 00:03:48 2 0
2.0.0.2 00:03:04 00:02:07 2 0
Switch>

This example shows how to display the current state of a group with respect to a host MAC address:

Switch# show ip igmp snooping groups vlan 10 226.6.6.7 hosts
IGMPv3 host information for group 226.6.6.7
Timers: Expired hosts are deleted on next IGMP General Query

Host (MAC/IP) Filter mode Expires Uptime # Sources
--------------------------------------------
175.1.0.29 INCLUDE stopped 00:00:51 2
175.2.0.30 INCLUDE stopped 00:04:14 2

This example shows how to display summary information for an IGMPv3 group:

Switch# show ip igmp snooping groups vlan 10 226.6.6.7 summary
Group Address (Vlan 10) : 226.6.6.7
Host type : v3
Member Ports : Fa7/13, Fa7/14
Expires : stopped
Sources : 2
Reporters (Include/Exclude) : 2/0

This example shows how to display the total number of group addresses learned by the system globally:

Switch# show ip igmp snooping groups count
Total number of groups: 54

This example shows how to display the total number of group addresses learned on VLAN 5:

Switch# show ip igmp snooping groups vlan 5 count
Total number of groups: 30

## Displaying Multicast Router Interfaces

When you enable IGMP snooping, the switch automatically learns to which interface the multicast routers are connected.
To display multicast router interfaces, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip igmp snooping mrouter vlan vlan_ID</td>
<td>Displays multicast router interfaces.</td>
</tr>
</tbody>
</table>

This example shows how to display the multicast router interfaces in VLAN 1:

```
Switch# show ip igmp snooping mrouter vlan 1
vlan    ports
--------+----------------------------------------
1       Gi1/1,Gi2/1,Fa3/48,Router
Switch#
```

### Displaying MAC Address Multicast Entries

To display MAC address multicast entries for a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show mac-address-table multicast vlan vlan_ID [count]</td>
<td>Displays MAC address multicast entries for a VLAN.</td>
</tr>
</tbody>
</table>

This example shows how to display MAC address multicast entries for VLAN 1:

```
Switch# show mac-address-table multicast vlan 1
Multicast Entries
  vlan  mac address     type    ports
  -------+---------------+-------+-------------------------------------------
  1    0100.5e01.0101     igmp Switch,Gi6/1
  1    0100.5e01.0102     igmp Switch,Gi6/1
  1    0100.5e01.0103     igmp Switch,Gi6/1
  1    0100.5e01.0104     igmp Switch,Gi6/1
  1    0100.5e01.0105     igmp Switch,Gi6/1
  1    0100.5e01.0106     igmp Switch,Gi6/1
Switch#
```

This example shows how to display a total count of MAC address entries for VLAN 1:

```
Switch# show mac-address-table multicast vlan 1 count
Multicast MAC Entries for vlan 1:    4
Switch#
```

### Displaying IGMP Snooping Information on a VLAN Interface

To display IGMP snooping information on a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip igmp snooping vlan vlan_ID</td>
<td>Displays IGMP snooping information on a VLAN interface.</td>
</tr>
</tbody>
</table>
This example shows how to display IGMP snooping information on VLAN 5:

```
Switch# show ip igmp snooping vlan 5
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping             :Enabled
IGMPv3 snooping support   :Full
Report suppression        :Enabled
TCN solicit query         :Disabled
TCN flood query count     :2

Vlan 5:
--------
IGMP snooping                  :Enabled
Immediate leave                :Disabled
Explicit Host Tracking         :Disabled
Multicast router learning mode :pim-dvmrp
CGMP interoperability mode     :IGMP_ONLY
```

### Displaying IGMP Snooping Querier Information

To display IGMP Snooping Querier information, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip igmp snooping querier [vlan vlan_ID] [detail]</td>
<td>Displays the IGMP Snooping Querier state.</td>
</tr>
</tbody>
</table>

This example shows how to display Snooping Querier information:

```
switch# show ip igmp snooping querier vlan 2 detail
IP address : 1.2.3.4
IGMP version : v2
Port : Router/Switch
Max response time : 12s

Global IGMP switch querier status
-----------------------------------
admin state : Enabled
admin version : 2
source IP address : 1.2.3.4
query-interval (sec) : 130
max-response-time (sec) : 10
querier-timeout (sec) : 100
tcn query count : 2
tcn query interval (sec) : 10
```
Chapter 25  Configuring IGMP Snooping and Filtering

## Configuring IGMP Filtering

This section includes the following subsections:

- Default IGMP Filtering Configuration, page 25-20
- Configuring IGMP Profiles, page 25-21
- Applying IGMP Profiles, page 25-22
- Setting the Maximum Number of IGMP Groups, page 25-23

**Note**

The IGMP filtering feature works for IGMPv1 and IGMPv2 only.

In some environments, for example metropolitan or multiple-dwelling unit (MDU) installations, an administrator might want to control the multicast groups to which a user on a switch port can belong. This allows the administrator to control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan.

With the IGMP filtering feature, an administrator can use this type of control. With this feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual switch ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a switch port, the IGMP join report requesting the stream of IP multicast traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing.

IGMP filtering controls only IGMP membership join reports and has no relationship to the function that directs the forwarding of IP multicast traffic.

You can also set the maximum number of IGMP groups that a Layer 2 interface can join with the `ip igmp max-groups n` command.

### Default IGMP Filtering Configuration

Table 25-2 shows the default IGMP filtering configuration.

<table>
<thead>
<tr>
<th>Vlan 2: IGMP switch querier status</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>admin state</td>
<td>Enabled</td>
</tr>
<tr>
<td>admin version</td>
<td>2</td>
</tr>
<tr>
<td>source IP address</td>
<td>1.2.3.4</td>
</tr>
<tr>
<td>query-interval (sec)</td>
<td>55</td>
</tr>
<tr>
<td>max-response-time (sec)</td>
<td>12</td>
</tr>
<tr>
<td>querier-timeout (sec)</td>
<td>70</td>
</tr>
<tr>
<td>tcn query count</td>
<td>10</td>
</tr>
<tr>
<td>tcn query interval (sec)</td>
<td>8</td>
</tr>
<tr>
<td>operational state</td>
<td>Querier</td>
</tr>
<tr>
<td>operational version</td>
<td>2</td>
</tr>
<tr>
<td>tcn query pending count</td>
<td>0</td>
</tr>
</tbody>
</table>

Table 25-2 shows the default IGMP filtering configuration.
Configuring IGMP Profiles

To configure an IGMP profile and to enter IGMP profile configuration mode, use the `ip igmp profile` global configuration command. From the IGMP profile configuration mode, you can specify the parameters of the IGMP profile to be used for filtering IGMP join requests from a port. When you are in IGMP profile configuration mode, you can create the profile using these commands:

- `deny`—Specifies that matching addresses are denied (the default condition).
- `exit`—Exits from igmp-profile configuration mode.
- `no`—Negates a command or sets its defaults.
- `permit`—Specifies that matching addresses are permitted.
- `range`—Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with starting and ending addresses.

By default, no IGMP profiles are configured. When a profile is configured with neither the `permit` nor the `deny` keyword, the default is to deny access to the range of IP addresses.

To create an IGMP profile for a port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ip igmp profile profile number</td>
</tr>
<tr>
<td></td>
<td>Enters IGMP profile configuration mode and assigns a number to the profile you are configuring. The range is from 1 to 4,294,967,295.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-igmp-profile)# permit</td>
</tr>
<tr>
<td></td>
<td>(Optional) Sets the action to permit or deny access to the IP multicast address. If no action is configured, the default for the profile is to deny access.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-igmp-profile)# range ip multicast address</td>
</tr>
<tr>
<td></td>
<td>Enters the IP multicast address or range of IP multicast addresses to which access is being controlled. If entering a range, enter the low IP multicast address, a space, and the high IP multicast address. Use the <code>range</code> command multiple times to enter multiple addresses or ranges of addresses.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-igmp-profile)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show ip igmp profile profile-number</td>
</tr>
<tr>
<td></td>
<td>Verifies the profile configuration.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Table 25-2  Default IGMP Filtering Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP filters</td>
<td>No filtering</td>
</tr>
<tr>
<td>IGMP maximum number of IGMP groups</td>
<td>No limit</td>
</tr>
<tr>
<td>IGMP profiles</td>
<td>None defined</td>
</tr>
</tbody>
</table>
To delete a profile, use the **no ip igmp profile** `profile-number` global configuration command.

To delete an IP multicast address or range of IP multicast addresses, use the **no range ip multicast address** IGMP profile configuration command.

This example shows how to create IGMP profile 4 (allowing access to the single IP multicast address) and how to verify the configuration. If the action were to deny (the default), it does not appear in the output of the **show ip igmp profile** command.

Switch# configure terminal
Switch(config)# ip igmp profile 4
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 229.9.9.0
Switch(config-igmp-profile)# end
Switch# show ip igmp profile 4
IGMP Profile 4
  permit
  range 229.9.9.0 229.9.9.0

### Applying IGMP Profiles

To control access as defined in an IGMP profile, use the **ip igmp filter** interface configuration command to apply the profile to the appropriate interfaces. You can apply a profile to multiple interfaces, but each interface can only have one profile applied to it.

**Note**
You can apply IGMP profiles to Layer 2 ports only. You cannot apply IGMP profiles to routed ports (or SVIs) or to ports that belong to an EtherChannel port group.

To apply an IGMP profile to a switch port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# ip igmp filter profile number</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# show running configuration interface interface-id</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.

To remove a profile from an interface, use the **no ip igmp filter** command.

This example shows how to apply IGMP profile 4 to an interface and to verify the configuration:

Switch# configure terminal
Switch(config)# interface fastethernet2/12
Switch(config-if)# ip igmp filter 4
Switch(config-if)# end
Chapter 25  Configuring IGMP Snooping and Filtering

Configuring IGMP Filtering

Switch# show running-config interface fastethernet2/12
Building configuration...

Current configuration : 123 bytes
!
interface FastEthernet2/12
 no ip address
 shutdown
 snmp trap link-status
 ip igmp max-groups 25
 ip igmp filter 4
end

Setting the Maximum Number of IGMP Groups

You can set the maximum number of IGMP groups that a Layer 2 interface can join by using the `ip igmp max-groups` interface configuration command. Use the `no` form of this command to set the maximum back to the default, which is no limit.

Note

This restriction can be applied to Layer 2 ports only. You cannot set a maximum number of IGMP groups on routed ports (or SVIs) or on ports that belong to an EtherChannel port group.

To apply an IGMP profile on a switch port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# ip igmp max-groups number</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# show running-configuration interface interface-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to limit the number of IGMP groups that an interface can join to 25:

Switch# configure terminal
Switch(config)# interface fastethernet2/12
Switch(config)# ip igmp max-groups 25
Switch(config-if)# end
Switch# show running-configuration interface fastethernet2/12
Building configuration...

Current configuration : 123 bytes
!
Displaying IGMP Filtering Configuration

You can display IGMP profile and maximum group configuration for all interfaces on the switch or for a specified interface.

To display IGMP profiles, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip igmp profile [profile number]</td>
<td>Displays the specified IGMP profile or all IGMP profiles defined on the switch.</td>
</tr>
</tbody>
</table>

To display interface configuration, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show running-configuration [interface interface-id]</td>
<td>Displays the configuration of the specified interface or all interfaces on the switch, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface.</td>
</tr>
</tbody>
</table>

This is an example of the `show ip igmp profile` privileged EXEC command when no profile number is entered. All profiles defined on the switch are displayed.

```
Switch# show ip igmp profile
IGMP Profile 3
  range 230.9.9.0 230.9.9.0
IGMP Profile 4
  permit
  range 229.9.9.0 229.255.255.255
```

This is an example of the `show running-config` privileged EXEC command when an interface is specified with IGMP maximum groups configured and IGMP profile 4 has been applied to the interface:

```
Switch# show running-config interface fastethernet2/12
Building configuration...
Current configuration : 123 bytes
!
interface FastEthernet2/12
  no ip address
  shutdown
  snmp trap link-status
  ip igmp max-groups 25
  ip igmp filter 4
end
```
Configuring IPv6 MLD Snooping

Use Multicast Listener Discovery (MLD) snooping to enable efficient distribution of IP version 6 (IPv6) multicast data to clients and routers in a switched network on the Catalyst 4500 series switch.

This chapter includes these sections:

- About MLD Snooping, page 26-1
- Configuring IPv6 MLD Snooping, page 26-5
- Displaying MLD Snooping Information, page 26-10

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About MLD Snooping

In IP version 4 (IPv4), Layer 2 switches can use Internet Group Management Protocol (IGMP) snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.
MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes that want to receive IPv6 multicast packets) on its directly attached links and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD version 1 (MLDv1) is equivalent to IGMPv2 and MLD version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch supports two versions of MLD snooping:

- MLDv1 snooping detects MLDv1 control packets and sets up traffic bridging based on IPv6 destination multicast addresses.
- MLDv2 basic snooping (MBSS) uses MLDv2 control packets to set up traffic forwarding based on IPv6 destination multicast addresses.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 multicast addresses.

**Note**

The switch does not support MLDv2 enhanced snooping (MESS), which sets up IPv6 source and destination multicast address-based forwarding.

MLD snooping can be enabled or disabled globally or per-VLAN. When MLD snooping is enabled, a per-VLAN IPv6 multicast MAC address table is constructed in software and a per-VLAN IPv6 multicast address table is constructed in software and hardware. The switch then performs IPv6 multicast-address based bridging in hardware.

These sections describe some parameters of IPv6 MLD snooping:

- MLD Messages, page 26-2
- MLD Queries, page 26-3
- Multicast Client Aging, page 26-3
- Multicast Router Discovery, page 26-3
- MLD Reports, page 26-4
- MLD Done Messages and Immediate-Leave, page 26-4
- Topology Change Notification Processing, page 26-4

### MLD Messages

MLDv1 supports three types of messages:

- Listener Queries are the equivalent of IGMPv2 queries and are either General Queries or Multicast-Address-Specific Queries (MASQs).
- Multicast Listener Reports are the equivalent of IGMPv2 reports.
- Multicast Listener Done messages are the equivalent of IGMPv2 leave messages.

MLDv2 supports MLDv2 queries and reports, as well as MLDv1 Report and Done messages.

Message timers and state transitions resulting from messages being sent or received are the same as those of IGMPv2 messages. MLD messages that do not have valid link-local IPv6 source addresses are ignored by MLD routers and switches.
Chapter 26      Configuring IPv6 MLD Snooping

About MLD Snooping

MLD Queries

The switch sends out MLD queries, constructs an IPv6 multicast address database, and generates MLD group-specific and MLD group-and-source-specific queries in response to MLD Done messages. The switch also supports report suppression, report proxying, Immediate-Leave functionality, and static IPv6 multicast MAC-address configuration.

When MLD snooping is disabled, all MLD queries are flooded in the ingress VLAN.

When MLD snooping is enabled, received MLD queries are flooded in the ingress VLAN, and a copy of the query is sent to the CPU for processing. From the received query, MLD snooping builds the IPv6 multicast address database. It detects multicast router ports, maintains timers, sets report response time, learns the querier IP source address for the VLAN, learns the querier port in the VLAN, and maintains multicast-address aging.

When a group exists in the MLD snooping database, the switch responds to a group-specific query by sending an MLDv1 report. When the group is unknown, the group-specific query is flooded to the ingress VLAN.

When a host wants to leave a multicast group, it can send out an MLD Done message (equivalent to IGMP Leave message). When the switch receives an MLDv1 Done message, if Immediate-Leave is not enabled, the switch sends an MASQ to the port from which the message was received to determine if other devices connected to the port should remain in the multicast group.

Multicast Client Aging

You can configure port membership removal from addresses based on the number of queries. A port is removed from membership to an address only when there are no reports to the address on the port for the configured number of queries. The default number is 2.

Multicast Router Discovery

MLD snooping performs multicast router discovery with these characteristics:

- Ports configured by a user never age out.
- Dynamic port learning results from MLDv1 snooping queries and IPv6 PIMv2 packets.
- If multiple routers exist on the same Layer 2 interface, MLD snooping tracks a single multicast router on the port (the router that most recently sent a router control packet).
- Dynamic multicast router port aging is based on a default timer of 5 minutes; the multicast router is deleted from the router port list if no control packet is received on the port for 5 minutes.
- IPv6 multicast router discovery only takes place when MLD snooping is enabled on the switch.
- Received IPv6 multicast router control packets are always flooded to the ingress VLAN, whether MLD snooping is enabled on the switch.
- After the discovery of the first IPv6 multicast router port, unknown IPv6 multicast data is forwarded only to the discovered router ports (before that time, all IPv6 multicast data is flooded to the ingress VLAN).
MLD Reports

The processing of MLDv1 join messages is essentially the same as with IGMPv2. When no IPv6 multicast routers are detected in a VLAN, reports are not processed or forwarded from the switch. When IPv6 multicast routers are detected and an MLDv1 report is received, an IPv6 multicast group address and an IPv6 multicast MAC address are entered in the VLAN MLD database. All IPv6 multicast traffic to the group within the VLAN is then forwarded using this address. When MLD snooping is disabled, reports are flooded in the ingress VLAN.

When MLD snooping is enabled, MLD report suppression, called listener message suppression, is automatically enabled. With report suppression, the switch forwards the first MLDv1 report received by a group to IPv6 multicast routers; subsequent reports for the group are not sent to the routers. When MLD snooping is disabled, report suppression is disabled, and all MLDv1 reports are flooded to the ingress VLAN.

The switch also supports MLDv1 proxy reporting. When an MLDv1 MASQ is received, the switch responds with MLDv1 reports for the address on which the query arrived if the group exists in the switch on another port and if the port on which the query arrived is not the last member port for the address.

MLD Done Messages and Immediate-Leave

When the Immediate-Leave feature is enabled and a host sends an MLDv1 Done message (equivalent to an IGMP leave message), the port on which the Done message was received is immediately deleted from the group. You enable Immediate-Leave on VLANs and (as with IGMP snooping), you should only use the feature on VLANs where a single host is connected to the port. If the port was the last member of a group, the group is also deleted, and the leave information is forwarded to the detected IPv6 multicast routers.

When Immediate Leave is not enabled in a VLAN (the case when multiple clients for a group exist on the same port) and a Done message is received on a port, an MASQ is generated on that port. The user can control when a port membership is removed for an existing address in terms of the number of MASQs. A port is removed from membership to an address when there are no MLDv1 reports to the address on the port for the configured number of queries.

The number of MASQs generated is configured by using the `ipv6 mld snooping last-listener-query count` global configuration command. The default number is 2.

The MASQ is sent to the IPv6 multicast address for which the Done message was sent. If no reports are sent to the IPv6 multicast address specified in the MASQ during the switch maximum response time, the port on which the MASQ was sent is deleted from the IPv6 multicast address database. The maximum response time is the time configured by using the `ipv6 mld snooping last-listener-query-interval` global configuration command. If the deleted port is the last member of the multicast address, the multicast address is also deleted, and the switch sends the address leave information to all detected multicast routers.

Topology Change Notification Processing

When topology change notification (TCN) solicitation is enabled by using the `ipv6 mld snooping tcn query solicit` global configuration command, MLDv1 snooping sets the VLAN to flood all IPv6 multicast traffic with a configured number of MLDv1 queries before it begins sending multicast data only to selected ports. You set this value by using the `ipv6 mld snooping tcn flood query count` global
configuration command. The default is to send two queries. The switch also generates MLDv1 global Done messages with valid link-local IPv6 source addresses when the switch becomes the STP root in the VLAN or when it is configured by the user. This process is similar to that in IGMP snooping.

**Configuring IPv6 MLD Snooping**

These sections describe how to configure IPv6 MLD snooping:

- Default MLD Snooping Configuration, page 26-5
- MLD Snooping Configuration Guidelines, page 26-6
- Enabling or Disabling MLD Snooping, page 26-6
- Configuring a Static Multicast Group, page 26-7
- Configuring a Multicast Router Port, page 26-7
- Enabling MLD Immediate Leave, page 26-8
- Configuring MLD Snooping Queries, page 26-9
- Disabling MLD Listener Message Suppression, page 26-10

**Default MLD Snooping Configuration**

Table 26-1 shows the default MLD snooping configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>MLD snooping (Global)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>MLD snooping (per VLAN)</td>
<td>Enabled. MLD snooping must be globally enabled for VLAN MLD snooping to take place.</td>
</tr>
<tr>
<td>IPv6 Multicast addresses</td>
<td>None configured.</td>
</tr>
<tr>
<td>IPv6 Multicast router ports</td>
<td>None configured.</td>
</tr>
<tr>
<td>MLD snooping Immediate Leave</td>
<td>Disabled.</td>
</tr>
<tr>
<td>MLD snooping robustness variable</td>
<td>Global: 2; per-VLAN: 0.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.</td>

### MLD Snooping Configuration Guidelines

When configuring MLD snooping, consider these guidelines:

- You can configure MLD snooping characteristics at any time, but you must globally enable MLD snooping by using the `ipv6 mld snooping` global configuration command for the configuration to take effect.
- MLD snooping and IGMP snooping act independently of each other. You can enable both features at the same time on the switch. The total number of IPv4 and IPv6 multicast groups entries that can coexist on the Catalyst 4500 series switch is limited to 16384.
- The supervisor engine with 512 MB of memory supports about 11000 MLD Snooping multicast groups. A supervisor engine with 1 GB memory supports 16384 MLD Snooping multicast groups.

### Enabling or Disabling MLD Snooping

By default, IPv6 MLD snooping is globally disabled on the switch and enabled on all VLANs. When MLD snooping is globally disabled, it is also disabled on all VLANs. When you globally enable MLD snooping, the VLAN configuration overrides the global configuration. MLD snooping is enabled only on VLAN interfaces in the default state (enabled).

You can enable and disable MLD snooping on a per-VLAN basis, but if you globally disable MLD snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

To globally enable MLD snooping on the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: <code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2: <code>Switch(config)# ipv6 mld snooping</code></td>
<td>Globally enables MLD snooping on the switch.</td>
</tr>
<tr>
<td>Step 3: <code>Switch(config)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4: <code>Switch# copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To globally disable MLD snooping on the switch, use the `no ipv6 mld snooping` global configuration command.

To enable MLD snooping on a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: <code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2: <code>Switch(config)# ipv6 mld snooping</code></td>
<td>Globally enables MLD snooping on the switch.</td>
</tr>
</tbody>
</table>
| Step 3: `Switch(config)# ipv6 mld snooping vlan vlan-id` | Enables MLD snooping on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.  
  **Note** MLD snooping must be globally enabled for VLAN snooping to be enabled. |
| Step 4: `Switch(config)# end` | Returns to privileged EXEC mode. |
| Step 5: `Switch# copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
To disable MLD snooping on a VLAN interface, use the `no ipv6 mld snooping vlan vlan-id` global configuration command for the specified VLAN number.

## Configuring a Static Multicast Group

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure an IPv6 multicast address and member ports for a VLAN.

To add a Layer 2 port as a member of a multicast group, perform this task:

1. **Command:** `Switch# configure terminal`
   **Purpose:** Enters global configuration mode.

2. **Command:** `Switch(config)# ipv6 mld snooping vlan vlan-id static ipv6_multicast_address interface interface-id`
   **Purpose:** Statically configures a multicast group with a Layer 2 port as a member of a multicast group:
   - `vlan-id` is the multicast group VLAN ID. The VLAN ID range is 1 to 1001 and 1006 to 4094.
   - `ipv6_multicast_address` is the 128-bit group IPv6 address. The address must be in the form specified in RFC 2373.
   - `interface-id` is the member port. It can be a physical interface or a port channel (1 to 64).

3. **Command:** `Switch(config)# end`
   **Purpose:** Returns to privileged EXEC mode.

4. **Command:** `Switch# show mac-address-table multicast mld-snooping`
   **Purpose:** Verifies the static member port and the IPv6 address.

5. **Command:** `Switch# copy running-config startup-config`
   **Purpose:** (Optional) Saves your entries in the configuration file.

To remove a Layer 2 port from the multicast group, use the `no ipv6 mld snooping vlan vlan-id static mac-address interface interface-id` global configuration command. If all member ports are removed from a group, the group is deleted.

This example shows how to statically configure an IPv6 MAC address:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 2 static 3333.0000.0003 interface gigabitethernet1/1
Switch(config)# end
```

## Configuring a Multicast Router Port

Although MLD snooping learns about router ports through MLD queries and PIMv6 queries, you can also use the command-line interface (CLI) to add a multicast router port to a VLAN. To add a multicast router port (add a static connection to a multicast router), use the `ipv6 mld snooping vlan mrouter` global configuration command on the switch.

**Note**
Static connections to multicast routers are supported only on switch ports.

To add a multicast router port to a VLAN, follow these steps:
Chapter 26      Configuring IPv6 MLD Snooping

Configuring IPv6 MLD Snooping

To remove a multicast router port from the VLAN, use the no ipv6 mld snooping vlan vlan-id mrouter interface interface-id global configuration command.

This example shows how to add a multicast router port to VLAN 200:

Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 mrouter interface gigabitethernet1/0/2
Switch(config)#

Enabling MLD Immediate Leave

When you enable MLDv1 Immediate Leave, the switch immediately removes a port from a multicast group when it detects an MLD Done message on that port. You should only use the Immediate Leave feature when there is a single receiver present on every port in the VLAN. When multiple clients exist for a multicast group on the same port, do not enable Immediate-Leave in a VLAN.

To enable MLDv1 Immediate Leave, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ipv6 mld snooping vlan vlan-id immediate-leave</td>
</tr>
</tbody>
</table>

To disable MLD Immediate Leave on a VLAN, use the no ipv6 mld snooping vlan vlan-id immediate-leave global configuration command.

This example shows how to enable MLD Immediate Leave on VLAN 130:

Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 130 immediate-leave
Switch(config)# exit
Configuring MLD Snooping Queries

When Immediate Leave is not enabled and a port receives an MLD Done message, the switch generates MASQs on the port and sends them to the IPv6 multicast address for which the Done message was sent. You can optionally configure the number of MASQs that are sent and the length of time the switch waits for a response before deleting the port from the multicast group.

To configure MLD snooping query characteristics for the switch or for a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ipv6 mld snooping robustness-variable value</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# ipv6 mld snooping vlan vlan-id robustness-variable value</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# ipv6 mld snooping last-listener-query-count count</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# ipv6 mld snooping vlan vlan-id last-listener-query-count count</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# ipv6 mld snooping last-listener-query-interval interval</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config)# ipv6 mld snooping vlan vlan-id last-listener-query-interval interval</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config)# ipv6 mld snooping tcn query solicit</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config)# ipv6 mld snooping tcn flood query count count</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 11</td>
<td>Switch# show ipv6 mld snooping querier [vlan vlan-id]</td>
</tr>
<tr>
<td>Step 12</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to set the MLD snooping global robustness variable to 3:
Disabling MLD Listener Message Suppression

MLD snooping listener message suppression is enabled by default. When it is enabled, the switch forwards only one MLD report per multicast router query. When message suppression is disabled, multiple MLD reports could be forwarded to the multicast routers.

To disable MLD listener message suppression, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# no ipv6 mld snooping listener-message-suppression</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show ipv6 mld snooping</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

To reenable MLD message suppression, use the `ipv6 mld snooping listener-message-suppression` global configuration command.

Displaying MLD Snooping Information

You can display MLD snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for MLD snooping.

To display MLD snooping information, use one or more of the privileged EXEC commands in Table 26-2.
### Table 26-2 Commands for Displaying MLD Snooping Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ipv6 mld snooping [vlan vlan-id]</code></td>
<td>Displays the MLD snooping configuration information for all VLANs on the switch or for a specified VLAN. (Optional) Enter <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>show ipv6 mld snooping mrouter [vlan vlan-id]</code></td>
<td>Displays information on dynamically learned and manually configured multicast router interfaces. When you enable MLD snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces. (Optional) Enter <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>show ipv6 mld snooping querier [vlan vlan-id]</code></td>
<td>Displays information about the IPv6 address and incoming port for the most-recently received MLD query messages in the VLAN. (Optional) Enter <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>
Displaying MLD Snooping Information
Virtual private networks (VPNs) provide enterprise-scale connectivity on a shared infrastructure, often Ethernet-based, with the same security, prioritization, reliability, and manageability requirements of private networks. Tunneling is a feature designed for service providers who carry traffic of multiple customers across their networks and who are required to maintain the VLAN and Layer 2 protocol configurations of each customer without impacting the traffic of other customers. This chapter describes how to configure Catalyst 4500 series switch 802.1Q, Layer 2 protocol tunneling, and VLAN mapping (or VLAN ID translation) on the Catalyst 4500 series switch.

This chapter contains these sections:

- About 802.1Q Tunneling, page 27-2
- Configuring 802.1Q Tunneling, page 27-3
- About VLAN Mapping, page 27-7
- Configuring VLAN Mapping, page 27-9
- About Layer 2 Protocol Tunneling, page 27-13
- Configuring Layer 2 Protocol Tunneling, page 27-15
- Monitoring and Maintaining Tunneling Status, page 27-18

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

### About 802.1Q Tunneling

The VLAN ranges required by different customers in the same service provider network might overlap, and customer traffic through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer restricts customer configurations and could easily exceed the VLAN limit (4096) of the 802.1Q specification.

802.1Q tunneling enables service providers to use a single VLAN to support customers who have multiple VLANs, while preserving customer VLAN IDs and keeping traffic in different customer VLANs segregated.

A port configured to support 802.1Q tunneling is called a tunnel port. When you configure tunneling, you assign a tunnel port to a VLAN ID that is dedicated to tunneling. Each customer requires a separate service provider VLAN ID, but that service provider VLAN ID supports VLANs of all the customers.

Customer traffic tagged in the normal way with appropriate VLAN IDs comes from an 802.1Q trunk port on the customer device and into a tunnel port on the service provider edge switch. The link between the customer device and the edge switch is asymmetric because one end is configured as an 802.1Q trunk port, and the other end is configured as a tunnel port. You assign the tunnel port interface to an access VLAN ID that is unique to each customer (Figure 27-1).

![Figure 27-1 802.1Q Tunnel Ports in a Service Provider Network](image)

Packets coming from the customer trunk port into the tunnel port on the service provider edge switch are normally 802.1Q-tagged with the appropriate VLAN ID. When the tagged packets exit the trunk port into the service provider network, they are encapsulated with another layer of an 802.1Q tag (called the *metro tag*) that contains the VLAN ID that is unique to the customer. The original customer 802.1Q tag is preserved in the encapsulated packet. Packets entering the service provider network are double-tagged, with the metro tag containing the customer’s access VLAN ID, and the inner VLAN ID being that of the incoming traffic.

When the double-tagged packet enters another trunk port in a service provider core switch, the metro tag is stripped as the switch processes the packet. When the packet exits another trunk port on the same core switch, the same metro tag is again added to the packet. Figure 27-2 shows the tag structures of the Ethernet packets starting with the original, or normal, frame.
Figure 27-2 Original (Normal), 802.1Q, and Double-Tagged Ethernet Packet Formats

When the packet enters the trunk port of the service provider egress switch, the metro tag is again stripped as the switch processes the packet. However, the metro tag is not added when the packet is sent out the tunnel port on the edge switch into the customer network. The packet is sent as a normal 802.1Q-tagged frame to preserve the original VLAN numbers in the customer network.

All packets entering the service provider network through a tunnel port on an edge switch are treated as untagged packets, whether they are untagged or already tagged with 802.1Q headers. The packets are encapsulated with the metro tag VLAN ID (set to the access VLAN of the tunnel port) when they are sent through the service provider network on an 802.1Q trunk port. The priority field on the metro tag is set to the interface class of service (CoS) priority configured on the tunnel port. (The default is zero if none is configured.)

In Figure 27-1, Customer A was assigned VLAN 30, and Customer B was assigned VLAN 40. Packets entering the edge-switch tunnel ports with 802.1Q tags are double-tagged when they enter the service provider network, with the metro tag containing VLAN ID 30 or 40, appropriately, and the inner tag containing the original customer VLAN number, for example, VLAN 100. Even if Customers A and B both have VLAN 100 in their networks, the traffic remains segregated within the service provider network because the metro tag is different. Each customer controls its own VLAN numbering space, which is independent of the VLAN numbering space used by other customers and the VLAN numbering space used by the service provider network.

Configuring 802.1Q Tunneling

These sections describe 802.1Q tunneling configuration:

- 802.1Q Tunneling Configuration Guidelines, page 27-3
- 802.1Q Tunneling and Other Features, page 27-5
- Configuring an 802.1Q Tunneling Port, page 27-6

Note By default, 802.1Q tunneling is disabled because the default switch port mode is dynamic auto. Tagging of 802.1Q native VLAN packets on all 802.1Q trunk ports is also disabled.

802.1Q Tunneling Configuration Guidelines

When you configure 802.1Q tunneling, you should always use asymmetrical links for traffic going through a tunnel and should dedicate one VLAN for each tunnel. You should also be aware of configuration requirements for native VLANs and maximum transmission units (MTUs). For more information about MTUs, see the “System MTU” section on page 27-5.
Native VLANs

When configuring 802.1Q tunneling on an edge switch, you must use 802.1Q trunk ports for sending packets into the service provider network. However, packets going through the core of the service provider network can be carried through 802.1Q trunks, ISL trunks, or nontrunking links. When 802.1Q trunks are used in these core switches, the native VLANs of the 802.1Q trunks must not match any native VLAN of the nontrunking (tunneling) port on the same switch because traffic on the native VLAN is not tagged on the 802.1Q sending trunk port (Figure 27-3).

VLAN 40 is configured as the native VLAN for the 802.1Q trunk port from Customer A at the ingress edge switch in the service provider network (Switch 2). Switch 1 of Customer A sends a tagged packet on VLAN 30 to the ingress tunnel port of Switch 2 in the service provider network, which belongs to access VLAN 40. Because the access VLAN of the tunnel port (VLAN 40) is the same as the native VLAN of the edge-switch trunk port (VLAN 40), the metro tag is not added to tagged packets received from the tunnel port. The packet carries only the VLAN 30 tag through the service provider network to the trunk port of the egress-edge switch (Switch 3) and is misdirected through the egress switch tunnel port to Customer B.

These are some ways to solve this problem:

- Use ISL trunks between core switches in the service provider network. Although customer interfaces connected to edge switches must be 802.1Q trunks, we recommend using ISL trunks for connecting switches in the core layer.

- Use the `switchport trunk native vlan tag` per-port command and the `vlan dot1q tag native` global configuration command to configure the edge switch so that all packets going out an 802.1Q trunk, including the native VLAN, are tagged. If the switch is configured to tag native VLAN packets on all 802.1Q trunks, the switch ensures that all packets exiting the trunk are tagged and prevents the reception of untagged packets on the trunk port.

- Ensure that the native VLAN ID on the edge-switch trunk port is not within the customer VLAN range. For example, if the trunk port carries traffic of VLANs 100 to 200, assign the native VLAN a number outside that range.
System MTU

The default system MTU for traffic on the Catalyst 4500 series switch is 1500 bytes. You can configure the switch to support larger frames by using the `system mtu` global configuration command. Because the 802.1Q tunneling feature increases the frame size by 4 bytes when the metro tag is added, you must configure all switches in the service provider network to be able to process larger frames by increasing the switch system MTU size to at least 1504 bytes. The maximum allowable system MTU for Catalyst 4500 Gigabit Ethernet switches is 9198 bytes; the maximum system MTU for Fast Ethernet switches is 1552 bytes.

802.1Q Tunneling and Other Features

Although 802.1Q tunneling works well for Layer 2 packet switching, incompatibilities exist between some Layer 2 features and Layer 3 switching:

- A tunnel port cannot be a routed port.
- IP routing is not supported on a VLAN that includes 802.1Q ports. Packets received from a tunnel port are forwarded based only on Layer 2 information. If routing is enabled on a switch virtual interface (SVI) that includes tunnel ports, untagged IP packets received from the tunnel port are recognized and routed by the switch. Customers can access the Internet through the native VLAN. If this access is not needed, you should not configure SVIs on VLANs that include tunnel ports.
- Tunnel ports do not support IP access control lists (ACLs).
- Layer 3 quality of service (QoS) ACLs and other QoS features related to Layer 3 information are not supported on tunnel ports. MAC-based QoS is supported on tunnel ports.
### Configuring an 802.1Q Tunneling Port

To configure a port as an 802.1Q tunnel port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id Enters interface configuration mode and the interface to be configured as a tunnel port. This should be the edge port in the service provider network that connects to the customer switch. Valid interfaces include physical interfaces and port-channel logical interfaces (port channels 1 to 64).</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# switchport access vlan vlan-id Specifies the default VLAN, which is used if the interface stops trunking. This VLAN ID is specific to the particular customer.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# switchport mode dot1q-tunnel Sets the interface as an 802.1Q tunnel port.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# exit Returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-if)# vlan dot1q tag native (Optional) Sets the switch to enable tagging of native VLAN packets on all 802.1Q trunk ports. When not set, and a customer VLAN ID is the same as the native VLAN, the trunk port does not apply a metro tag, and packets could be sent to the wrong destination.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config)# end Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch# show dot1q-tunnel Displays the tunnel ports on the switch.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch# show vlan dot1q tag native Displays 802.1Q native-VLAN tagging status.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch# copy running-config startup-config (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no vlan dot1q tag native` global command and the `no switchport mode dot1q-tunnel` interface configuration command to return the port to the default state of dynamic auto. Use the `no vlan dot1q tag native` global configuration command to disable tagging of native VLAN packets.

This example shows how to configure an interface as a tunnel port, enable tagging of native VLAN packets, and verify the configuration. In this configuration, the VLAN ID for the customer connected to Gigabit Ethernet interface 2/7 is VLAN 22.

```
Switch(config)# interface gigabitethernet2/7
Switch(config-if)# switchport access vlan 22
% Access VLAN does not exist. Creating vlan 22
Switch(config-if)# switchport mode dot1q-tunnel
```
Switch(config-if)# exit
Switch(config)# vlan dot1q tag native
Switch(config)# end
Switch# show dot1q-tunnel interface gigabitethernet2/7
Port
-----
LAN Port(s)
-----
G12/7
Switch# show vlan dot1q tag native
dot1q native vlan tagging is enabled globally

About VLAN Mapping

In a typical deployment of VLAN mapping, you want the service provider to provide a transparent
switching infrastructure that treats customers’ switches at the remote location as a part of the local site.
This allows customers to use the same VLAN ID space and run Layer 2 control protocols seamlessly
across the provider network. In such scenarios, we recommend that service providers do not impose their
VLAN IDs on their customers.

One way to establish translated VLAN IDs (S-VLANs) is to map customer VLANs to service-provider
VLANs (called VLAN ID translation) on trunk ports connected to a customer network. Packets entering
the port are mapped to a service provider VLAN (S-VLAN) based on the port number and the packet’s
original customer VLAN-ID (C-VLAN).

Service providers’ internal assignments might conflict with a customer’s VLAN. To isolate customer
traffic, a service provider could decide to map a specific VLAN into another one while the traffic is in
its cloud.

Deployment Example

In Figure 27-4, the service provider provides Layer 2 VPN service to two different customers, A and B.
The service provider separates the data and control traffic between the two customers and from the
providers’ own control traffic. The service provider network must also be transparent to the customer
edge devices.
Chapter 27 Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

About VLAN Mapping

Figure 27-4 Layer 2 VPN Deployment

All forwarding operations on the Catalyst 4500 series switch are performed using S-VLAN and not C-VLAN information because the VLAN ID is mapped to the S-VLAN on ingress.

Note

When you configure features on a port configured for VLAN mapping, you always use the S-VLAN rather than the customer VLAN-ID (C-VLAN).

On an interface configured for VLAN mapping, the specified C-VLAN packets are mapped to the specified S-VLAN when they enter the port. Symmetrical mapping to the customer C-VLAN occurs when packets exit the port.

The switch supports these types of VLAN mapping on UNI trunk ports:

- One-to-one VLAN mapping occurs at the ingress and egress of the port and maps the customer C-VLAN ID in the 802.1Q tag to the service-provider S-VLAN ID. You can also specify that packets with all other VLAN IDs are dropped. See the “One-to-One Mapping” section on page 27-11.

- Traditional 802.1Q tunneling (QinQ) performs all-to-one bundling of C-VLAN IDs to a single S-VLAN ID for the port. The S-VLAN is added to the incoming unmodified C-VLAN. You can configure the UNI as an 802.1Q tunnel port for traditional QinQ, or you can configure selective QinQ on trunk ports for a more flexible implementation. Mapping takes place at ingress and egress of the port. All packets on the port are bundled into the specified S-VLAN. See the “Traditional QinQ on a Trunk Port” section on page 27-12.

- Selective QinQ maps the specified customer VLANs entering the UNI to the specified S-VLAN ID. The S-VLAN is added to the incoming unmodified C-VLAN. You can also specify that traffic carrying all other customer VLAN IDs is dropped. See the “Selective QinQ on a Trunk Port” section on page 27-12.

Note

Untagged packets enter the switch on the trunk native VLAN and are not mapped.

For quality of service (QoS), the switch supports flexible mapping between C-CoS or C-DSCP and S-CoS, and maps the inner CoS to the outer CoS for traffic with traditional QinQ or selective QinQ VLAN mapping.
Mapping Customer VLANs to Service-Provider VLANs

Figure 27-5 shows a topology where a customer uses the same VLANs in multiple sites on different sides of a service-provider network. You map the customer VLAN IDs to service-provider VLAN IDs for packet travel across the service-provider backbone. The customer VLAN IDs are retrieved at the other side of the service-provider backbone for use in the other customer site. Configure the same set of VLAN mappings at a customer-connected port on each side of the service-provider network.

The examples following the configuration steps illustrate how to use one-to-one mapping, traditional QinQ, or selective QinQ to map customer VLANs 1 to 5 to service-provider VLANs.

Figure 27-5  Mapping Customer VLANs

Configuring VLAN Mapping

- Default VLAN Mapping Configuration, page 27-9
- VLAN Mapping Configuration Guidelines, page 27-10
- Configuring VLAN Mapping, page 27-11

Default VLAN Mapping Configuration

By default, no VLAN mapping is configured.
VLAN Mapping Configuration Guidelines

Guidelines include the following:

- Traditional QinQ uses 802.1Q tunnel ports; you configure one-to-one VLAN mapping and selective QinQ on 802.1Q trunk ports.
- To avoid mixing customer traffic, when you configure traditional Q-in-Q on a trunk port, you should configure the service provider S-VLAN ID as an allowed VLAN on the trunk port.
- When you configure VLAN mapping on an EtherChannel, the mapping applies to all ports in the port channel.
- You cannot configure encapsulation replicate on a SPAN destination port if the source port is configured as a tunnel port or has a 1-to-2 mapping configured. Encapsulation replicate is supported with 1-to-1 VLAN mapping.
- When configuring IEEE 802.1Q tunneling on an edge switch, you must use IEEE 802.1Q trunk ports for sending packets into the service-provider network. However, packets going through the core of the service-provider network can be carried through IEEE 802.1Q trunks, ISL trunks, or nontrunking links. When IEEE 802.1Q trunks are used in these core switches, the native VLANs of the IEEE 802.1Q trunks must not match any native VLAN of the nontrunking (tunneling) port on the same switch. It is because traffic on the native VLAN is not tagged on the IEEE 802.1Q sending trunk port.
- Ensure that the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
- Layer 2 protocol tunneling must be configured for CDP, VTP, LLDP, or your switch detects the SP switches, which is not desirable:

```plaintext
interface GigabitEthernet1/23
switchport mode trunk
switchport vlan mapping 1 dot1q-tunnel 311
switchport vlan mapping 31 dot1q-tunnel 311
l2protocol-tunnel cdp
l2protocol-tunnel lldp
l2protocol-tunnel vtp
```

- To process control traffic consistently, either enable Layer 2 protocol tunneling (recommended) or insert a BPDU filter for spanning tree, as follows:

```plaintext
Current configuration : 153 bytes
!
interface FastEthernet9/1
switchport trunk native vlan 40
switchport mode trunk
switchport vlan mapping 10 20
spanning-tree bpdufilter enable
end
```

- If you need to merge CVLAN and SVLAN spanning tree topology, you do not need to configure spanning-tree bpdufilter enable.
- To ensure consistent operation, do not use a native VLAN for translation.
Configuring VLAN Mapping

The following procedures show how to configure each type of VLAN mapping on trunk ports. To verify your configuration, enter either the `show interfaces interface-id vlan mapping` or the `show vlan mapping` privileged EXEC command. See the “Monitoring and Maintaining Tunneling Status” section on page 27-18 for the syntax of these commands. For more information about all commands in this section, see the Catalyst 4500 Series Switch Software Command Reference for this release.

The following VLAN mapping types are discussed:
- One-to-One Mapping, page 27-11
- Traditional Q-in-Q on a Trunk Port, page 27-12
- Selective Q-in-Q on a Trunk Port, page 27-12

One-to-One Mapping

To configure one-to-one VLAN mapping to map a customer VLAN ID to a service-provider VLAN ID, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Purpose</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Purpose</td>
<td>Enters interface configuration mode for the interface connected to the service-provider network. You can enter a physical interface or an EtherChannel port channel.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode trunk</td>
</tr>
<tr>
<td>Purpose</td>
<td>Configures the interface as a trunk port.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# switchport vlan mapping vlan-id translated-id</td>
</tr>
<tr>
<td>Purpose</td>
<td>Enters the VLAN IDs to be mapped:</td>
</tr>
<tr>
<td></td>
<td>- <code>vlan-id</code>—the customer VLAN ID (C-VLAN) entering the switch from the customer network. The range is from 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>- <code>translated-id</code>—the assigned service-provider VLAN ID (S-VLAN). The range is from 1 to 4094.</td>
</tr>
<tr>
<td>Note</td>
<td>Packets with unconfigured vlan_ids are dropped.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# end</td>
</tr>
<tr>
<td>Purpose</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# show vlan mapping</td>
</tr>
<tr>
<td>Purpose</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
<tr>
<td>Purpose</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no switchport vlan mapping vlan-id translated-id` command to remove the VLAN mapping information. Entering the `no switchport vlan mapping all` command deletes all mapping configurations.

This example shows how to map VLAN IDs 1 to 5 in the customer network to VLANs 101 to 105 in the service-provider network (Figure 27-5). You configure the same VLAN mapping commands for a port in Switch A and Switch B; the traffic on all other VLAN IDs is dropped.

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport vlan mapping 1 101
Switch(config-if)# switchport vlan mapping 2 102
Switch(config-if)# switchport vlan mapping 3 103
```
Chapter 27 Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Configuring VLAN Mapping

Switch(config-if)# switchport vlan mapping 4 104
Switch(config-if)# switchport vlan mapping 4 105
Switch(config-if)# exit

In the previous example, at the ingress of the service-provider network, VLAN IDs 1 to 5 in the customer network are mapped to VLANs 101 to 105, in the service provider network. At the egress of the service provider network, VLANs 101 to 105 in the service provider network are mapped to VLAN IDs 1 to 5, in the customer network.

**Note**

Packets with unconfigured vlan_ids are dropped.

Traditional Q-in-Q on a Trunk Port

To configure VLAN mapping for traditional Q-in-Q on a trunk port or tunneling by default, perform the following task:

**Note**

Configuring tunneling by default bundles all packets on the port into the configured S-VLAN.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# switchport mode trunk</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# switchport trunk allowed vlan vlan-id</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show interfaces interface-id vlan mapping</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Entering the no switchport vlan mapping all command deletes all mapping configurations.

Selective Q-in-Q on a Trunk Port

To configure VLAN mapping for selective Q-in-Q on a trunk port, perform this task:

**Note**

You cannot configure one-to-one mapping and selective Q-in-Q on the same interface.
Chapter 27  Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

About Layer 2 Protocol Tunneling

Customers at different sites connected across a service provider network need to use various Layer 2 protocols to scale their topologies to include all remote and local sites. STP must run properly, and every VLAN should build a proper spanning tree that includes the local site and all remote sites across the service provider network. Cisco Discovery Protocol (CDP) must discover neighboring Cisco devices from local and remote sites. VLAN Trunking Protocol (VTP) must provide consistent VLAN configuration throughout all sites in the customer network.

When protocol tunneling is enabled, edge switches on the inbound side of the service provider network encapsulate Layer 2 protocol packets with a special MAC address and send them across the service provider network. Core switches in the network do not process these packets but forward them as normal packets. Layer 2 protocol data units (PDUs) for CDP, STP, or VTP cross the service provider network and are delivered to customer switches on the outbound side of the service provider network. Identical packets are received by all customer ports on the same VLANs with these results:

- Users on each of a customer’s sites can properly run STP, and every VLAN can build a correct spanning tree, based on parameters from all sites and not just from the local site.
- CDP discovers and shows information about the other Cisco devices connected through the service provider network.

### Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode for the interface connected to the</td>
</tr>
<tr>

<td></td>
<td>EtherChannel port channel.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config-if)# switchport mode trunk</td>
<td>Configure the interface as a trunk port.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config-if)# switchport vlan mapping</td>
<td>Enters the VLAN IDs to be mapped:</td>
</tr>
<tr>
<td></td>
<td>vlan-id dot1q-tunnel outer vlan-id</td>
<td>• vlan-id—the customer VLAN ID (C-VLAN) entering the switch</td>
</tr>
<tr>
<td></td>
<td></td>
<td>from the customer network. The range is from 1 to 4094. You can</td>
</tr>
<tr>
<td></td>
<td></td>
<td>enter a string of VLAN-IDs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• outer-vlan-id—Enter the outer VLAN ID (S-VLAN) of the service</td>
</tr>
<tr>
<td></td>
<td></td>
<td>provider network. The range is from 1 to 4094.</td>
</tr>
<tr>
<td>5</td>
<td>Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td>Switch# show interfaces interface-id vlan mapping</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td>7</td>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no switchport vlan mapping vlan-id dot1q-tunnel outer vlan-id` command to remove the VLAN mapping configuration. Entering the `no switchport vlan mapping all` command deletes all mapping configurations.

This example shows how to configure selective QinQ mapping on the port so that traffic with a C-VLAN ID of 1 to 5 enters the switch with an S-VLAN ID of 100. The traffic of any other VLAN IDs is dropped.

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport vlan mapping 1-5 dot1q-tunnel 100
Switch(config-if)# exit
• VTP provides consistent VLAN configuration throughout the customer network, propagating to all switches through the service provider.

Layer 2 protocol tunneling can enabled on trunk, access and tunnel ports. If protocol tunneling is not enabled, remote switches at the receiving end of the service provider network do not receive the PDUs and cannot properly run STP, CDP, and VTP. When protocol tunneling is enabled, Layer 2 protocols within each customer’s network are totally separate from those running within the service provider network.

As an example, Customer A in Figure 27-6 has four switches in the same VLAN that are connected through the service provider network. If the network does not tunnel PDUs, switches on the far ends of the network cannot properly run STP, CDP, and VTP. For example, STP for a VLAN on a switch in Customer A’s Site 1 builds a spanning tree on the switches at that site without considering convergence parameters based on Customer A’s switch in Site 2. Figure 27-6 shows one possible spanning tree topology.

Figure 27-6  Layer 2 Protocol Tunneling
Configuring Layer 2 Protocol Tunneling

You can enable Layer 2 protocol tunneling (by protocol) on access ports, tunnel ports, or trunk ports that are connected to the customer in the edge switches of the service provider network. The service provider edge switches connected to the customer switch perform the tunneling process. Edge-switch tunnel ports or normal trunk ports can be connected to customer 802.1Q trunk ports. Edge-switch access ports are connected to customer access ports.

When the Layer 2 PDUs that entered the service provider inbound edge switch through the tunnel port or the access port exit through its the trunk port into the service provider network, the switch overwrites the customer PDU-destination MAC address with a well-known Cisco proprietary multicast address (01-00-0c-cd-cd-d0). If 802.1Q tunneling is enabled, packets are also double-tagged; the outer tag is the customer metro tag, and the inner tag is the customer’s VLAN tag. The core switches ignore the inner tags and forward the packet to all trunk ports in the same metro VLAN. The edge switches on the outbound side restore the proper Layer 2 protocol and MAC address information and forward the packets to all tunnel or access ports in the same metro VLAN. This section includes these topics. The Layer 2 PDUs remain intact and are delivered across the service provider network to the other side of the customer network.

Figure 27-6 shows Customer A and Customer B in access VLANs 30 and 40. Asymmetric links connect the Customers in Site 1 to edge switches in the service provider network. The Layer 2 PDUs (for example, BPDUs) coming into Switch 2 from Customer B in Site 1 are forwarded to the infrastructure as double-tagged packets with the well-known MAC address as the destination MAC address. These double-tagged packets have the metro VLAN tag of 40, as well as an inner VLAN tag (for example, VLAN 100). When the double-tagged packets enter Switch 4, the metro VLAN tag 40 is removed. The well-known MAC address is replaced with the respective Layer 2 protocol MAC address, and the packet is sent to Customer B on Site 2 as a single-tagged frame in VLAN 100.

You can also enable Layer 2 protocol tunneling on access ports on the edge switch connected to access ports on the customer switch. The encapsulation and de-encapsulation process is the same as described in the previous paragraph, except that the packets are not double-tagged in the service provider network. The single tag is the customer-specific access VLAN tag.

This section contains the following subsections:

</tr>
</tbody>
</table>

Layer 2 Protocol Tunneling Configuration Guidelines

These are some configuration guidelines and operating characteristics of Layer 2 protocol tunneling:

- The switch supports tunneling of CDP, STP, including multiple STP (MSTP), and VTP. Protocol tunneling is disabled by default but can be enabled for the individual protocols on 802.1Q tunnel ports, access ports or trunk ports.
- Dynamic Trunking Protocol (DTP) is not compatible with Layer 2 protocol tunneling because you must manually configure asymmetric links with tunnel ports and trunk ports.
- EtherChannel port groups are compatible with tunnel ports when the 802.1Q configuration is consistent within an EtherChannel port group.
- If an encapsulated PDU (with the proprietary destination MAC address) is received on a port with Layer 2 tunneling enabled, the port is shut down to prevent loops.
- The port also shuts down when a configured shutdown threshold for the protocol is reached. You can manually reenable the port (by entering a `shutdown` and a `no shutdown` command sequence). If errdisable recovery is enabled, the operation is retried after a specified time interval.
- Only decapsulated PDUs are forwarded to the customer network. The spanning-tree instance running on the service provider network does not forward BPDUs to Layer 2 protocol tunneling ports. CDP packets are not forwarded from Layer 2 protocol tunneling ports.
- When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, shutdown threshold for the PDUs generated by the customer network. If the limit is exceeded, the port shuts down. You can also limit the BPDU rate by using QoS ACLs and policy maps on a Layer 2 protocol tunneling port.
- When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, drop threshold for the PDUs generated by the customer network. If the limit is exceeded, the port drops PDUs until the rate at which it receives them is below the drop threshold.
Because tunneled PDUs (especially STP BPDUs) must be delivered to all remote sites so that the customer virtual network operates properly, you can give PDUs higher priority within the service provider network than data packets received from the same tunnel port. By default, the PDUs use the same CoS value as data packets.

Note

If Layer 2 protocol tunneling is not configured on a system, Layer 2 protocol tunneling packets are handled as data packets and this situation does not apply.

Configuring Layer 2 Tunneling

To configure a port for Layer 2 protocol tunneling, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode access</td>
</tr>
<tr>
<td>or</td>
<td>Switch(config-if)# switchport mode dot1q-tunnel</td>
</tr>
<tr>
<td>or</td>
<td>Switch(config-if)# switchport mode trunk</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# l2protocol-tunnel [cdp</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# l2protocol-tunnel shutdown-threshold [cdp</td>
</tr>
<tr>
<td>Note</td>
<td>If you also set a drop threshold on this interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-if)# l2protocol-tunnel drop-threshold [cdp</td>
</tr>
<tr>
<td>Note</td>
<td>If you also set a shutdown threshold on this interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-if)# exit</td>
</tr>
</tbody>
</table>
Chapter 27  Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Monitoring and Maintaining Tunneling Status

Table 27-2 shows the commands for monitoring and maintaining 802.1Q and Layer 2 protocol tunneling.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# errdisable recovery cause l2ptguard</td>
<td>(Optional) Configures the recovery method from a Layer 2 maximum-rate error so that the interface is reenabled and can try again. Errdisable recovery is disabled by default; when enabled, the default time interval is 300 seconds.</td>
</tr>
<tr>
<td>Step 9 Switch(config)# l2protocol-tunnel cos value</td>
<td>(Optional) Configures the CoS value for all tunneled Layer 2 PDUs. The range is 0 to 7; the default is the default CoS value for the interface. If none is configured, the default is 5.</td>
</tr>
<tr>
<td>Step 10 Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 11 Switch# show l2protocol</td>
<td>Displays the Layer 2 tunnel ports on the switch, including the protocols configured, the thresholds, and the counters.</td>
</tr>
<tr>
<td>Step 12 Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no l2protocol-tunnel [cdp | stp | vtp] interface configuration command to disable protocol tunneling for one of the Layer 2 protocols or for all three. Use the no l2protocol-tunnel shutdown-threshold [cdp | stp | vtp] and the no l2protocol-tunnel drop-threshold [cdp | stp | vtp] commands to return the shutdown and drop thresholds to the default settings.

This example shows how to configure Layer 2 protocol tunneling on an 802.1Q tunnel port for CDP, STP, and VTP and how to verify the configuration:

Switch(config)# interface FastEthernet2/1
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)# l2protocol-tunnel stp
Switch(config-if)# l2protocol-tunnel vtp
Switch(config-if)# l2protocol-tunnel shutdown-threshold 1500
Switch(config-if)# l2protocol-tunnel drop-threshold 1000
Switch(config-if)# exit
Switch(config)# l2protocol-tunnel cos 7
Switch(config)# end
Switch# show l2protocol
COS for Encapsulated Packets: 7

<tr>
<td>Switch# show vlan dot1q native</td>
<td>Displays the status of native VLAN tagging on the switch.</td>
</tr>
</tbody>
</table>

**Note**

With Cisco IOS Release 12.2(20)EW, the BPDU filtering configuration for both dot1q and Layer 2 protocol tunneling is no longer visible in the running configuration as spanning-tree bpdufilter enable. The configuration is visible in the output of the `show spanning tree int detail` command.

```
Switch# show spann int f6/1 detail
Port 321 (FastEthernet6/1) of VLAN0001 is listening
  Port path cost 19, Port priority 128, Port Identifier 128.321.
  Designated root has priority 32768, address 0008.e341.4600
  Designated bridge has priority 32768, address 0008.e341.4600
  Designated port id is 128.321, designated path cost 0
  Timers: message age 0, forward delay 2, hold 0
  Number of transitions to forwarding state: 0
  Link type is point-to-point by default
  ** Bpdu filter is enabled internally **
  BPDU: sent 0, received 0
```
Chapter 27  Configuring 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Monitoring and Maintaining Tunneling Status
Configuring CDP

This chapter describes how to configure Cisco Discovery Protocol (CDP) on the Catalyst 4500 series switch. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- About CDP, page 28-1
- Configuring CDP, page 28-2

Note

For complete syntax and usage information for the Cisco IOS commands used in this chapter, refer to the Cisco IOS Configuration Fundamentals Configuration Guide, Release 12.4:

and the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2:

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About CDP

CDP is a protocol that runs over Layer 2 (the data link layer) on all Cisco routers, bridges, access servers, and switches. CDP allows network management applications to discover Cisco devices that are neighbors of already known devices, in particular, neighbors running lower-layer, transparent protocols. With CDP, network management applications can learn the device type and the SNMP agent address of neighboring devices. CDP enables applications to send SNMP queries to neighboring devices.
CDP runs on all LAN and WAN media that support Subnetwork Access Protocol (SNAP).

Each CDP-configured device sends periodic messages to a multicast address. Each device advertises at least one address at which it can receive SNMP messages. The advertisements also contain the time-to-live, or holdtime information, which indicates the length of time a receiving device should hold CDP information before discarding it.

**Configuring CDP**

The following sections describe how to configure CDP:

- Enabling CDP Globally, page 28-2
- Displaying the CDP Global Configuration, page 28-2
- Enabling CDP on an Interface, page 28-3
- Displaying the CDP Interface Configuration, page 28-3
- Monitoring and Maintaining CDP, page 28-3

**Enabling CDP Globally**

To enable CDP globally, use this command:

```
Switch(config)# cdp run
```

This example shows how to enable CDP globally:

```
Switch(config)# cdp run
```

**Displaying the CDP Global Configuration**

To display the CDP configuration, use this command:

```
Switch# show cdp
```

This example shows how to display the CDP configuration:

```
Switch# show cdp
Global CDP information:
    Sending CDP packets every 120 seconds
    Sending a holdtime value of 180 seconds
    Sending CDPv2 advertisements is enabled
Switch#
```

For additional CDP show commands, see the “Monitoring and Maintaining CDP” section on page 28-3.
Enabling CDP on an Interface

To enable CDP on an interface, use this command:

```
Command
Switch(config-if)# [no] cdp enable

Purpose
Enables CDP on an interface.
Use the no keyword to disable CDP on an interface.
```

This example shows how to enable CDP on Fast Ethernet interface 5/1:

```
Switch(config)# interface fastethernet 5/1
Switch(config-if)# cdp enable
```

This example shows how to disable CDP on Fast Ethernet interface 5/1:

```
Switch(config)# interface fastethernet 5/1
Switch(config-if)# no cdp enable
```

Displaying the CDP Interface Configuration

To display the CDP configuration for an interface, use this command:

```
Command
Switch# show cdp interface [type/number]

Purpose
Displays information about interfaces where CDP is enabled.
```

This example shows how to display the CDP configuration of Fast Ethernet interface 5/1:

```
Switch# show cdp interface fastethernet 5/1
FastEthernet5/1 is up, line protocol is up
Encapsulation ARPA
Sending CDP packets every 120 seconds
Holdtime is 180 seconds
Switch#
```

Monitoring and Maintaining CDP

To monitor and maintain CDP on your device, enter one or more of the following commands:

```
Command
Switch# clear cdp counters
Switch# clear cdp table
Switch# show cdp

Purpose
Resets the traffic counters to zero.
Deletes the CDP table of information about neighbors.
Displays global information such as frequency of transmissions and the holdtime for packets being transmitted.
```
### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show cdp entry entry_name [protocol</td>
<td>version]</td>
</tr>
<tr>
<td>Switch# show cdp interface [type/number]</td>
<td>Displays information about interfaces on which CDP is enabled.</td>
</tr>
<tr>
<td>Switch# show cdp neighbors [type/number] [detail]</td>
<td>Displays information about neighboring equipment. The display can be limited to neighbors on a specific interface and expanded to provide more detailed information.</td>
</tr>
<tr>
<td>Switch# show cdp traffic</td>
<td>Displays CDP counters, including the number of packets sent and received and checksum errors.</td>
</tr>
<tr>
<td>Switch# show debugging</td>
<td>Displays information about the types of debugging that are enabled for your switch.</td>
</tr>
</tbody>
</table>

This example shows how to clear the CDP counter configuration on your switch:

Switch# clear cdp counters

This example shows how to display information about the neighboring equipment:

Switch# show cdp neighbors

Configuring LLDP, LLDP-MED, and Location Service

This chapter describes how to configure the Link Layer Discovery Protocol (LLDP), LLDP Media Endpoint Discovery (LLDP-MED), and Location Service on the Catalyst 4500 series switch.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the “System Management Commands” section in the Cisco IOS Configuration Fundamentals Command Reference, Release 12.4.

This chapter consists of these sections:
- About LLDP, LLDP-MED, and Location Service, page 29-1
- Configuring LLDP and LLDP-MED, and Location Service, page 29-4
- Monitoring and Maintaining LLDP, LLDP-MED, and Location Service, page 29-14
- Cisco IOS Carries Ethernet Features in Cisco IOS XE 3.1.0SG, page 29-15

About LLDP, LLDP-MED, and Location Service

This section describes this information:
- LLDP, page 29-1
- LLDP-MED, page 29-2
- Location Service, page 29-3

LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.
To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB LLDP. LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. Details such as configuration information, device capabilities, and device identity can be advertised using this protocol.

The switch supports the following basic management TLVs (which are optional):

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV
- Power Management TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED:

- Port VLAN ID TLV (IEEE 802.1 specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 specific TLVs)

**LLDP-MED**

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as switches. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, power over Ethernet (PoE), inventory management, and location information. By default, all LLDP-MED TLVs are enabled.

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV
  
  Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and what capabilities the device has enabled.
  
  For configuration details, see the “Configuring Network-Policy Profile” section on page 29-10.

- Network policy profile

  Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect into any switch, obtain its VLAN number, and then start communicating with the call control.

  By defining a network-policy profile TLV, you can create a profile for voice and voice-signalling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are then maintained centrally on the switch and propagated to the phone.

  For configuration details, see the “Configuring Network-Policy Profile” section on page 29-10.
About LLDP, LLDP-MED, and Location Service

- Power management TLV
  Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows switches and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

  For configuration details, see the “Configuring LLDP Power Negotiation” section on page 29-11.

- Inventory management TLV
  Allows an endpoint to send detailed inventory information about itself to the switch, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

- Location TLV
  Provides location information from the switch to the endpoint device. The location TLV can send this information:

  - Civic location information
    Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

  - ELIN location information
    Provides the location information for a caller. The location is determined by the emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

    For configuration details, see the “Configuring Location TLV and Location Service” section on page 29-12.

Note
A switch cannot send LLDP and LLDP-MED simultaneously to an end-point device. By default, a network device sends only LLDP packets until it receives LLDP-MED packets from an end-point device. The network device then sends LLDP-MED packets until it receives only LLDP packets.

Location Service

The location service feature enables the switch to provide location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired switch or controller. The switch informs device link up and link-down events through Network Mobility Services Protocol (NMSP) location and attachment notifications to the MSE.

The MSE initiates the NMSP connection to the switch. When the MSE connects to the switch messages are exchanged to establish version compatibility, service exchange, and location information synchronization. After the connection is established, the switch sends location and attachment notifications periodically to the MSE. Any link-up event, link-down event, or location configuration change detected during the interval are aggregated and sent at the end of the interval using attachment or location notifications.

When the switch discovers the presence or absence of a device on a link-up or link-down event on a port, it obtains the client’s MAC address, IP address, and 802.1x username if applicable. If the device is LLDP-MED or CDP enabled, the switch continues to gather client-specific information such as the model number and software version.

Depending on the device capabilities, the switch obtains this client attachment information at link up:
Chapter 29      Configuring LLDP, LLDP-MED, and Location Service

Configuring LLDP and LLDP-MED, and Location Service

This section contains this configuration information:

- Default LLDP Configuration, page 29-5
- Configuring LLDP Characteristics, page 29-5
- Disabling and Enabling LLDP Globally, page 29-6
- Disabling and Enabling LLDP on an Interface, page 29-7
- Configuring LLDP-MED TLVs, page 29-9
- Configuring Network-Policy Profile, page 29-10
- Configuring LLDP Power Negotiation, page 29-11
- Configuring Location TLV and Location Service, page 29-12
- Monitoring and Maintaining LLDP, LLDP-MED, and Location Service, page 29-14

Depending on the device capabilities, the switch obtains this client information at link down:

- Slot and port that was disconnected
- Client’s MAC address
- Client’s IP address
- 802.1X username if applicable
- Device category is specified as a wired station
- State is specified as Connected
- Serial number, UDI
- Model number
- Software version
- VLAN ID and VLAN name

If an administrator changes a location address at the switch, the information is reported to the MSE. The switch sends a NMSP location notification message that identifies the list of ports affected by the change and the changed address information.

Software Configuration Guide— Release IOS XE 3.3.0SG and IOS 15.1(1)SG
### Default LLDP Configuration

Table 29-1 shows the default LLDP configuration. To change the default settings, use the LLDP global configuration and LLDP interface configuration commands.

#### Table 29-1: Default LLDP Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>LLDP global state</td>
<td>Disabled</td>
</tr>
<tr>
<td>LLDP holdtime (before discarding)</td>
<td>120 seconds</td>
</tr>
<tr>
<td>LLDP timer (packet update frequency)</td>
<td>30 seconds</td>
</tr>
<tr>
<td>LLDP reinitialization delay</td>
<td>2 seconds</td>
</tr>
<tr>
<td>LLDP tlv-select</td>
<td>Enabled to send and receive all TLVs</td>
</tr>
<tr>
<td>LLDP interface state</td>
<td>Enabled</td>
</tr>
<tr>
<td>LLDP receive</td>
<td>Enabled</td>
</tr>
<tr>
<td>LLDP transmit</td>
<td>Enabled</td>
</tr>
<tr>
<td>LLDP med-tlv-select</td>
<td>Enabled to send all LLDP-MED TLVs</td>
</tr>
</tbody>
</table>

### Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, the initialization delay time. You can also select the LLDP and LLDP-MED TLVs for sending and receiving. The location service feature is available only when the switch is running the cryptographic (encrypted) software image.

To configure these characteristics, perform this task:

**Note** Steps 2 through 5 can be performed in any order.

#### Command | Purpose
---|---
**Step 1** Switch# configure terminal | Enters global configuration mode.
**Step 2** Switch(config)# lldp holdtime seconds | (Optional) Specifies the amount of time a receiving device should hold the information sent by your device before discarding it. The range is 0 to 65535 seconds; the default is 120 seconds.
**Step 3** Switch(config)# lldp reinit | (Optional) Specifies the delay time in seconds for LLDP to initialize on any interface. The range is 2 to 5 seconds; the default is 2 seconds.
**Step 4** Switch(config)# lldp timer seconds | (Optional) Sets the transmission frequency of LLDP updates in seconds. The range is 5 to 65534 seconds; the default is 30 seconds.
**Step 5** Switch(config)# lldp tlv-select | (Optional) Specifies the LLDP TLVs to send or receive.
### Configuring LLDP and LLDP-MED, and Location Service

#### Chapter 29  Configuring LLDP, LLDP-MED, and Location Service

**Note**
Use the no form of each of the LLDP commands to return to the default setting.

This example shows how to configure a holdtime of 120 seconds, a delay time of 2 seconds and an update frequency of 30:

```
Switch# configure terminal
Switch(config)# lldp holdtime 120
Switch(config)# lldp reinit 2
Switch(config)# lldp timer 30
Switch(config)# end
```

This example shows how to transmit only LLDP packets:

```
Switch# configure terminal
Switch(config)# no lldp receive
Switch(config)# end
```

This example shows how to receive LLDP packets again:

```
Switch# configure terminal
Switch(config)# lldp receive
Switch(config)# end
```

For additional LLDP show commands, see the “Monitoring and Maintaining LLDP, LLDP-MED, and Location Service” section on page 29-14.

### Disabling and Enabling LLDP Globally

**Note**
LLDP is disabled by default.

To disable LLDP globally, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# no lldp run</td>
<td>Disables LLDP.</td>
</tr>
<tr>
<td>Step 3 Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

To enable LLDP once it has been disabled, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 29  Configuring LLDP, LLDP-MED, and Location Service

29-7 Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

Chapter 29  Configuring LLDP, LLDP-MED, and Location Service

Configuring LLDP and LLDP-MED, and Location Service

This example shows how to globally disable LLDP:

Switch# configure terminal
Switch(config)# no lldp run
Switch(config)# end

This example shows how to globally enable LLDP:

Switch# configure terminal
Switch(config)# lldp run
Switch(config)# end

Disabling and Enabling LLDP on an Interface

LLDP is disabled globally on all supported interfaces. You must enable LLDP globally to allow a device to send LLDP packets. However, no changes are required at the interface level.

You can configure the interface to selectively not to send and receive LLDP packets with the no lldp transmit and no lldp receive commands.

Note

If the interface is configured as a tunnel port, LLDP is automatically disabled.

To disable LLDP on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# no lldp transmit</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# no lldp receive</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# copy running-config startup-config</td>
</tr>
</tbody>
</table>

To enable LLDP on an interface once it has been disabled, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# lldp transmit</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# lldp receive</td>
</tr>
</tbody>
</table>
This example shows how to enable LLDP on an interface:

```
Switch# configure terminal
Switch(config)# interface GigabitEthernet 1/1
Switch(config-if)# lldp transmit
Switch(config-if)# lldp receive
Switch(config-if)# end
```
Configuring LLDP-MED TLVs

By default, the switch only sends LLDP packets until it receives LLDP-MED packets from the end device. The switch continues to send LLDP-MED packets until it only receives LLDP packets.

By using the `lldp` interface configuration command, you can configure the interface not to send the TLVs listed in Table 29-2.

<table>
<thead>
<tr>
<th>LLDP-MED TLV</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inventory-management</td>
<td>LLDP-MED inventory management TLV</td>
</tr>
<tr>
<td>location</td>
<td>LLDP-MED location TLV</td>
</tr>
<tr>
<td>network-policy</td>
<td>LLDP-MED network policy TLV</td>
</tr>
<tr>
<td>power-management</td>
<td>LLDP-MED power management TLV</td>
</tr>
</tbody>
</table>

To disable a TLV on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1   Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2   Switch(config)# interface interface-id</td>
<td>Specifies the interface on which you are configuring a LLDP-MED TLV, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3   Switch(config-if)# no lldp med-tlv-select tlv</td>
<td>Specifies the TLV to disable.</td>
</tr>
<tr>
<td>Step 4   Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5   Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To enable a TLV on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1   Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2   Switch(config)# interface interface-id</td>
<td>Specifies the interface on which you are configuring an LLDP-MED TLV, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3   Switch(config-if)# lldp med-tlv-select tlv</td>
<td>Specifies the TLV to enable.</td>
</tr>
<tr>
<td>Step 4   Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5   Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to enable a TLV on an interface when it has been disabled:

```
Switch# configure terminal
Switch(config)# interface GigabitEthernet0/1
Switch(config-if)# lldp med-tlv-select inventory management
Switch(config-if)# end
```
Configuring Network-Policy Profile

To create a network-policy profile, configure the policy attributes, and apply it to an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# network-policy profile profile number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-network-policy)# {voice</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-if)# network-policy profile number</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config-if)# lldp med-tlv-select network-policy</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch# show network-policy profile</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the **no** form of each command to return to the default setting.
This example shows how to configure VLAN 100 for voice application with CoS and to enable the network-policy profile and network-policy TLV on an interface:

```plaintext
Switch# configure terminal
Switch(config)# network-policy profile 1
Switch(config-network-policy)# voice vlan 100 cos 4
Switch(config)# exit
Switch# configure terminal
Switch(config)# interface interface_id
Switch(config-if)# network-policy profile 1
Switch(config-if)# lldp med-tlv-select network-policy
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```plaintext
Switch(config-network-policy)# voice vlan dot1p cos 4
Switch(config-network-policy)# voice vlan dot1p dscp 34
```

**Note**
As of Cisco IOS Release 12.2(54)SG, the Catalyst 4500 series switch supports only 2 applications: voice and voice signaling. The default cos/dscp values for a voice application is 5/46 and for voice signaling is 3/24. You must configure the network policy profile and attach it to the interface if you need to override the default values. These values are sent as a part of the network-policy TLV in LLDP MED.

## Configuring LLDP Power Negotiation

Starting with Cisco IOS Release 12.2(54)SG, Catalyst 4500 series switches can perform inline power negotiation using LLDP as specified in the IEEE 802.3at standard. (The LLDP TLV used is DTE Power-via-MDI TLV.) With this feature, inline powered devices based on the IEEE standard can be powered in the PoE+ power range (12.95W to 25.5W at the device end) by the switch on PoE+ supported modules.

**Note**
To verify inline power utilization negotiated by using LLDP using the LLDP-MED TLV, use the `show lldp neighbors detail` command. To verify inline power utilization negotiated by using the IEEE 802.3at TLV, use the `show power inline interface detail` command. The `show power inline interface detail` command does not display power negotiated with LLDP.

**Note**
When an inline powered device that performs power negotiation using multiple protocols (CDP/LLDP 802.3at/LLDP-MED) is connected to a switch, the switch locks to the first protocol packet (CDP or LLDP) that contains the power negotiation TLV. The LLDP 802.3at power negotiation TLV overrides the LLDP-MED power negotiation TLV if both are received by the switch. If you need to use any single protocol for power negotiation each time, you must administratively disable the other power negotiation protocols on the switch interface or the end device.

To enable LLDP power negotiation, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specifies the interface on which you are configuring LLDP power negotiation.</td>
</tr>
</tbody>
</table>
**Chapter 29      Configuring LLDP, LLDP-MED, and Location Service**

**Configuring LLDP and LLDP-MED, and Location Service**

This example shows how to enable LLDP power negotiation on interface Gigabit Ethernet 3/1:

```
Switch# config t
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# int gi 3/1
Switch(config-if)# lldp tlv-select power-management
```

**Configuring Location TLV and Location Service**

To configure location information for an end-point and to apply it to an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# location {admin-tag string</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-civic)# exit</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
</tbody>
</table>
Use the **no** form of each command to return to the default setting.

This example shows how to configure civic location information on the switch:

```plaintext
Switch# configure terminal
Switch(config)# location civic-location identifier 1
Switch(config)# number 3550
Switch(config)# primary-road-name "Cisco Way"
Switch(config)# city "San Jose"
Switch(config)# state CA
Switch(config)# building 19
Switch(config)# room C6
Switch(config)# county "Santa Clara"
Switch(config)# country US
Switch(config)# end
```

To enable location service on the switch, perform this task:

**Note**
Your switch must be running the cryptographic (encrypted) software image in order to enable the location service feature. Your Cisco Mobility Service Engine (MSE) must be running Heitz 6.0 or later software image to support wired location service.
Chapter 29  Configuring LLDP, LLDP-MED, and Location Service

Monitoring and Maintaining LLDP, LLDP-MED, and Location Service

This example shows how to enable NMSP on a switch and set the location notification time to 10 seconds:

Switch# configure terminal
Switch(config)# nmsp enable
Switch(config)# ip device tracking
Switch(config)# nmsp notification interval location 10
Switch(config)# end

Note Location service tracks IP devices only on Layer 2 and Layer 3 physical ports. IP devices that are connected through SVIs or port-channels are not tracked and reported to the MSE.

To monitor and maintain LLDP, LLDP-MED, and location service on your device, perform one or more of the following commands in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear lldp counters</td>
<td>Resets the traffic and error counters to zero.</td>
</tr>
<tr>
<td>clear lldp table</td>
<td>Deletes the LLDP table of information about neighbors.</td>
</tr>
<tr>
<td>clear nmsp statistics</td>
<td>Clears the NMSP statistic counters.</td>
</tr>
<tr>
<td>show lldp</td>
<td>Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time for LLDP to initialize on an interface.</td>
</tr>
</tbody>
</table>
Cisco IOS Carries Ethernet Features in Cisco IOS XE 3.1.0SG

This section provides a list of High Availability software features that are supported in Cisco IOS XE 3.1.0SG. Links to the feature documentation are included.

Feature guides may contain information about more than one feature. To find information about a specific feature within a feature guide, see the Feature Information table at the end of the guide.

Feature guides document features that are supported on many different software releases and platforms. Your Cisco software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in that guide are supported in your software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

ANSI TIA-1057 LLDP-MED Support and IEEE 802.1ab LLDP (Link Layer Discovery Protocol)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show lldp entry entry-name</td>
<td>Displays information about a specific neighbor. You can enter an asterisk (*) to display all neighbors, or you can enter the name of the neighbor about which you want information.</td>

Configuring UDLD

This chapter describes how to configure UniDirectional Link Detection (UDLD) Ethernet on a Catalyst switch.

This chapter includes the following major sections:

- About UDLD, page 30-1
- Default UDLD Configuration, page 30-4
- Configuring UDLD on the Switch, page 30-4
- Displaying UDLD Link Status, page 30-9

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About UDLD

UDLD is a Layer 2 protocol that initializes devices connected through fiber-optic or twisted-pair Ethernet cables. This protocol monitors a physical connection (such as wrong cabling) to detect unidirectional links to avoid spanning-tree topology loops or silent drop traffic.

All connected devices must support UDLD for the protocol to successfully identify the unidirectional links. When UDLD detects a unidirectional link, it can administratively shut down the affected port and send you a warning message.

With UDLD, the time to detect a unidirectional link can vary from a few seconds to several minutes depending on how the timers are configured. Link status messages are exchanged every couple of seconds.
Starting with Cisco IOS Release 12.2(54)SG, the enhancement Fast UDLD was added, which supports timers in the few-hundred milliseconds range, which enables subsecond unidirectional link detection. With Fast UDLD, the time to detect a unidirectional link can vary from less than one second to a few seconds (the detection time also depends on how the timers are configured). Link status messages are exchanged every couple of hundred milliseconds.

This section includes these topics:
- UDLD Topology, page 30-2
- Fast UDLD Topology, page 30-2
- Operation Modes, page 30-3
- Default States for UDLD, page 30-3

**UDLD Topology**

Each switch can send packets to a neighbor switch but cannot receive packets from the switch it is sending packets to. UDLD detects and disables these one-way connections. Figure 30-1 illustrates a unidirectional link condition.

**Fast UDLD Topology**

Figure 30-2 illustrates a typical Fast UDLD topology. Switch A and B are connected through a 2-port EtherChannel, and Fast UDLD is enabled on the individual ports. If one of the links becomes unidirectional, Fast UDLD detects this situation faster than regular UDLD and errdisables the link. Traffic is switched over to the second link by EtherChannel. Because this occurs very quickly, traffic loss is minimized.
Chapter 30  Configuring UDLD

About UDLD

For Fast UDLD, Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, Supervisor 6L-E, Supervisor 7-E, and Supervisor Engine 7L-E support up to 32 ports.

Operation Modes

UDLD and Fast UDLD support the following operation modes:

- **Normal**—A UDLD-capable port (A) periodically sends a UDLD probe to a second port (B). If B is not UDLD capable, no unidirectional link detection occurs. If both devices are UDLD capable and bidirectional connectivity exists, probe messages travel in both directions at the rate of the configured message time interval. When the UDLD protocol receives the probe, it attempts to synchronize the devices by sending echo messages to the peer port and waiting for an answer during the detection window. If unidirectional traffic is detected when the port link is still up (B longer sends traffic to A), B enters errdisable mode, and A is marked undetermined but does not enter errdisable mode. It continues to operate under its current STP status because this mode is informational only; it is potentially less disruptive although it does not prevent STP loops.

Note: Bidirectional link failures cannot be detected using normal mode.

- **Aggressive**—If a port (A) loses its neighbor connectivity, it actively attempts to reestablish the relationship by sending a probe to a second port (B). If port B does not respond, the link is considered unidirectional and port A enters an errdisable state to avoid silent drop traffic.

Note: Both unidirectional and bidirectional link failures can be detected in aggressive mode.

UDLD aggressive mode can interoperate with UDLD normal mode. When a unidirectional condition is detected, only the aggressive mode link shuts down.

Default States for UDLD

The following are the defaults for UDLD:

- UDLD is locally disabled on copper LAN ports to avoid sending unnecessary control traffic (BPDU control packets). This protocol is commonly used for access ports.

- UDLD is enabled on a fiber port if global UDLD is activated.

- Fast UDLD is disabled on all ports.
Default UDLD Configuration

Table 30-1 shows the UDLD default configuration.

Table 30-1 UDLD Default Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDLD global enable state</td>
<td>Globally disabled.</td>
</tr>
<tr>
<td>UDLD per-interface enable state for fiber-optic media</td>
<td>Enabled on all Ethernet fiber-optic interfaces.</td>
</tr>
<tr>
<td>UDLD per-interface enable state for twisted-pair (copper) media</td>
<td>Disabled on all Ethernet 10/100 and 1000BASE-TX interfaces.</td>
</tr>
<tr>
<td>Fast UDLD per-interface enable state.</td>
<td>Disabled on all interfaces.</td>
</tr>
</tbody>
</table>

Configuring UDLD on the Switch

The following sections describe how to configure UDLD:

- Fast UDLD Guidelines and Restrictions, page 30-4
- Enabling UDLD Globally, page 30-5
- Enabling UDLD on Individual Interfaces, page 30-6
- Disabling UDLD on Individual Interfaces, page 30-7
- Disabling UDLD on a Fiber-Optic Interface, page 30-7
- Configuring a UDLD Probe Message Interval Globally, page 30-8
- Resetting Disabled LAN Interfaces, page 30-8

Fast UDLD Guidelines and Restrictions

When using (or configuring) Fast UDLD, consider these guidelines and restrictions:

- Fast UDLD is disabled by default.
- Configure fast UDLD only on point-to-point links between network devices that support fast UDLD.
- You can configure fast UDLD in either normal or aggressive mode.
- Do not enter the link debounce command on fast UDLD ports.
- Configure fast UDLD on at least two links between each connected network device. This reduces the number of link disablements due to false positives.
- Fast UDLD does not report a unidirectional link if the same error occurs simultaneously on more than one link to the same neighbor device.
- Fast UDLD is supported on a limited number of ports.
Enabling UDLD Globally

To enable UDLD in aggressive or normal mode and to set the configurable message timer on all fiber-optic interfaces on the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# udld {aggressive</td>
</tr>
<tr>
<td></td>
<td>fast-hello error-reporting</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show udld</td>
</tr>
</tbody>
</table>
## Enabling UDLD on Individual Interfaces

To enable UDLD on individual interfaces, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# udld port</td>
<td>Enables UDLD in normal mode on a specific interface. On a fiber-optic interface, this command overrides the <code>udld enable</code> global configuration command setting.</td>
</tr>
<tr>
<td>Switch(config-if)# udld port aggressive</td>
<td>Enables UDLD in aggressive mode on a specific interface. On a fiber-optic interface, this command overrides the <code>udld enable</code> global configuration command setting.</td>
</tr>
<tr>
<td>Switch(config-if)# udld fast-hello interval</td>
<td>Enables Fast UDLD on the interface with message interval equal to the <code>interval</code> value in milliseconds. The interval value range is from 200 milliseconds to 1000 milliseconds. To enable Fast UDLD, UDLD must be enabled (explicitly configured or globally enabled) and operational (in bidirectional state) on the interface.</td>
</tr>
</tbody>
</table>

**Note** Fast UDLD can only be enabled on individual interfaces (a global enable command does not exist).

**Note** Fast UDLD can only be configured or enabled on a limited number of interfaces that depend on the type of supervisor installed. The number of supported interfaces for Fast UDLD can be displayed with the `show udld fast-hello` command.

<table>
<thead>
<tr>
<th>Step 2</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show udld interface</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>
Disabling UDLD on Individual Interfaces

To disable UDLD on individual interfaces, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# no udld port</code></td>
<td>Disables UDLD on an interface.</td>
</tr>
<tr>
<td></td>
<td>The following applies:</td>
</tr>
<tr>
<td></td>
<td>• On fiber-optic interfaces, the <code>no udld port</code> command reverses the</td>
</tr>
<tr>
<td></td>
<td>interface configuration to the setting established with the `udld</td>
</tr>
<tr>
<td></td>
<td>enable` global configuration command.</td>
</tr>
<tr>
<td></td>
<td>• For both UDLD and Fast UDLD, if aggressive mode is configured, then</td>
</tr>
<tr>
<td></td>
<td>aggressive mode must be explicitly disabled with the `no udld port</td>
</tr>
<tr>
<td></td>
<td>aggressive` command.</td>
</tr>
<tr>
<td></td>
<td>• If normal mode is configured, the <code>no udld port</code> command disables</td>
</tr>
<tr>
<td></td>
<td>both UDLD and Fast UDLD.</td>
</tr>
<tr>
<td><code>Switch(config-if)# no udld fast-hello</code></td>
<td>Disables Fast UDLD on an interface. The interface reverts to the</td>
</tr>
<tr>
<td></td>
<td>UDLD configuration that was present before you enabled Fast UDLD.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show udld interface</code></td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

Disabling UDLD on a Fiber-Optic Interface

To disable UDLD on individual fiber-optic interfaces, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# udld port disable</code></td>
<td>Disables UDLD on a fiber-optic interface and removes all UDLD and Fast</td>
</tr>
<tr>
<td></td>
<td>UDLD related configuration on the interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> You can enable UDLD globally for all fiber-optic interfaces.</td>
</tr>
<tr>
<td><code>Switch(config-if)# no udld fast-hello</code></td>
<td>Disables Fast UDLD on an interface, which reverts to the UDLD</td>
</tr>
<tr>
<td></td>
<td>configuration that was present before you enabled Fast UDLD.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# show udld interface</code></td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>
## Configuring a UDLD Probe Message Interval Globally

To configure the time between UDLD probe messages on ports that are in advertisement mode and are currently determined to be bidirectional, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
Switch(config)# udld message time interval | Configures the time between UDLD probe messages on ports that are in advertisement mode and are currently determined to be bidirectional; valid values are from 1 to 90 seconds. |
| **Note** Prior to Cisco IOS Release 12.2(31)SGA, the time interval is 7 to 90 seconds. With Cisco IOS Release 12.2(31)SGA, the time interval is 1 to 90 second. The `no udld message` command returns the default value (15 seconds). |
| **Step 2**  
Switch# show udld type-slot/interface | Verifies the configuration. |

## Configuring a Fast UDLD Probe Message Interval per Interface

To configure the time between Fast UDLD probe messages on ports that are in advertisement mode and are currently determined to be bidirectional at the interface level, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
Switch(config)# udld fast-hello interval | Configures the time between Fast UDLD probe messages at the interface level. |
| **Step 2**  
Switch# show udld fast-hello fasttype-slot/interface | Verifies the configuration. |

## Resetting Disabled LAN Interfaces

To reset all LAN ports that have been errdisabled by UDLD, use this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# udld reset</td>
<td>Resets all LAN ports that have been errdisabled by UDLD and Fast UDLD.</td>
</tr>
</tbody>
</table>
Displaying UDLD Link Status

To verify link status reported by UDLD, enter the following command:

```
Switch# show udld neighbors
```

<table>
<thead>
<tr>
<th>Port</th>
<th>Device Name</th>
<th>Device ID</th>
<th>Port ID</th>
<th>Neighbor State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/33</td>
<td>FOX10430380</td>
<td>1</td>
<td>Gi1/33</td>
<td>Bidirectional</td>
</tr>
<tr>
<td>Gi1/34</td>
<td>FOX10430380</td>
<td>1</td>
<td>Gi1/34</td>
<td>Bidirectional</td>
</tr>
</tbody>
</table>

To verify status for a particular link as reported by UDLD, enter the following command:

```
Switch# show udld g1/34
```

Interface Gi1/34
---
Port enable administrative configuration setting: Enabled / in aggressive mode
Port enable operational state: Enabled / in aggressive mode

Configuring Unidirectional Ethernet

Note
Unidirectional Ethernet is not supported on the following: Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E uplinks.

This chapter describes how to configure Unidirectional Ethernet on the Catalyst 4000 family switch and contains these sections:

- About Unidirectional Ethernet, page 31-1
- Configuring Unidirectional Ethernet, page 31-2

Note
For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Unidirectional Ethernet

You can set stubless Gigabit Ethernet ports to unidirectionally transmit or receive traffic. Unidirectional Ethernet uses only one strand of fiber for either transmitting or receiving one-way traffic for the Gigabit Ethernet Port, instead of two strands of fiber for a full-duplex Gigabit Ethernet Port. Configuring your Gigabit Ethernet Port either to transmit or receive traffic effectively doubles the amount of traffic capabilities for applications, such as video streaming, where most traffic is sent as unacknowledged unidirectional video broadcast streams.
Configuring Unidirectional Ethernet

Note: You must configure Unidirectional Ethernet on the non-blocking Gigabit Ethernet Port, which automatically disables UDLD on the port.

To enable Unidirectional Ethernet, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# interface (vlan vlan_ID</td>
</tr>
<tr>
<td></td>
<td>(fastethernet</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-if)# [no] unidirectional (send-only</td>
</tr>
<tr>
<td></td>
<td>receive-only)</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch# show interface (vlan vlan_ID</td>
</tr>
<tr>
<td></td>
<td>(fastethernet</td>
</tr>
</tbody>
</table>

This example shows how to set Gigabit Ethernet interface 1/1 to unidirectionally send traffic:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# unidirectional send-only
Switch(config-if)# end

Warning!
Enable l2 port unidirectional mode will automatically disable port udld.
You must manually ensure that the unidirectional link does not create a spanning tree loop in the network.

Enable l3 port unidirectional mode will automatically disable ip routing on the port. You must manually configure static ip route and arp entry in order to route ip traffic.

This example shows how to set Gigabit Ethernet interface 1/1 to receive traffic unidirectionally:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# unidirectional receive-only
Switch(config-if)# end

Warning!
Enable l2 port unidirectional mode will automatically disable port udld.
You must manually ensure that the unidirectional link does not create a spanning tree loop in the network.

Enable l3 port unidirectional mode will automatically disable ip routing on the port. You must manually configure static ip route and arp entry in order to route ip traffic.
This example shows how to verify the configuration:

Switch> show interface gigabitethernet 1/1 unidirectional
show interface gigabitethernet 1/1 unidirectional
Unidirectional configuration mode: send only
CDP neighbor unidirectional configuration mode: receive only

This example shows how to disable Unidirectional Ethernet on Gigabit Ethernet interface 1/1:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# no unidirectional
Switch(config-if)# end

This example shows the result of entering the show interface command for a port that does not support Unidirectional Ethernet:

Switch# show interface f6/1 unidirectional
Unidirectional Ethernet is not supported on FastEthernet6/1
Configuring Layer 3 Interfaces

This chapter describes the Layer 3 interfaces on a Catalyst 4500 series switch. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- About Layer 3 Interfaces, page 32-1
- Configuration Guidelines, page 32-5
- Configuring Logical Layer 3 VLAN Interfaces, page 32-6
- Configuring VLANs as Layer 3 Interfaces, page 32-7
- Configuring Physical Layer 3 Interfaces, page 32-12
- Configuring EIGRP Stub Routing, page 32-13

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Layer 3 Interfaces

The Catalyst 4500 family switch supports Layer 3 interfaces with the Cisco IOS IP and IP routing protocols. Layer 3, the network layer, is primarily responsible for the routing of data in packets across logical internetwork paths.

Layer 2, the data link layer, contains the protocols that control the physical layer (Layer 1) and how data is framed before being transmitted on the medium. The Layer 2 function of filtering and forwarding data in frames between two segments on a LAN is known as bridging.

The Catalyst 4500 series switch supports two types of Layer 3 interfaces. The logical Layer 3 VLAN interfaces integrate the functions of routing and bridging. The physical Layer 3 interfaces allow the Catalyst 4500 series switch to be configured like a traditional router.
About Layer 3 Interfaces

On a Catalyst 4500 Series Switch, a physical Layer 3 interface has MAC address learning enabled.

This section contains the following subsections:

- Logical Layer 3 VLAN Interfaces, page 32-2
- Physical Layer 3 Interfaces, page 32-2
- Understanding SVI Autostate Exclude, page 32-3
- Understanding Layer 3 Interface Counters, page 32-3

Logical Layer 3 VLAN Interfaces

The logical Layer 3 VLAN interfaces provide logical routing interfaces to VLANs on Layer 2 switches. A traditional network requires a physical interface from a router to a switch to perform inter-VLAN routing. The Catalyst 4500 series switch supports inter-VLAN routing by integrating the routing and bridging functions on a single Catalyst 4500 series switch.

Figure 32-1 shows how the routing and bridging functions in the three physical devices of the traditional network are performed logically on one Catalyst 4500 series switch.

Physical Layer 3 Interfaces

The physical Layer 3 interfaces support capabilities equivalent to a traditional router. These Layer 3 interfaces provide hosts with physical routing interfaces to a Catalyst 4500 series switch.

Figure 32-2 shows how the Catalyst 4500 series switch functions as a traditional router.
Figure 32-2 Physical Layer 3 Interfaces for the Catalyst 4500 Series Switch

Understanding SVI Autostate Exclude

To be up/up, a router VLAN interface must fulfill the following general conditions:
- The VLAN exists and is active on the VLAN database of the switch.
- The VLAN interface exists on the router and is not administratively down.
- At least one Layer 2 (access port or trunk) port exists, has a link up on this VLAN, and is in spanning-tree forwarding state on the VLAN.

Note
The protocol line state for the VLAN interfaces comes up when the first switch port belonging to the corresponding VLAN link comes up and is in spanning-tree forwarding state.

Ordinarily, when a VLAN interface has multiple ports in the VLAN, the SVI goes down when all the ports in the VLAN go down. The SVI Autostate Exclude feature provides a knob to mark a port so that it is not counted in the SVI up and down calculation and applies to all VLANs that are enabled on that port.

A VLAN interface is brought up after the Layer 2 port has had time to converge (that is, transition from listening-learning to forwarding). This prevents routing protocols and other features from using the VLAN interface as if it were fully operational. It also prevents other problems from occurring, such as routing black holes.

Understanding Layer 3 Interface Counters

Note
Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E, do not support Layer 2 interface counters. However, they do support Layer 3 (SVI) interface counters.

When you run IPv4 and IPv6 on Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E, packets are routed in hardware by the forwarding engine. They support the following statistics for counting routed packets with a maximum of 4092 interfaces:
- Input unicast
For each counter type, both the number of packets and the total number of bytes received or transmitted are counted. You can collect these statistics uniquely for IPv4 and IPv6 traffic.

Because the total number of supported Layer 3 interfaces exceeds the number of counters supported by hardware, all Layer 3 interfaces might not have counters. You assign counters to Layer 3 interfaces; the default configuration for a Layer 3 interface has no counters.

You can configure collection statistics at an interface level in one of the four ways (see Table 32-1). The maximum number of interfaces applied to the configuration depends on the collection mode.

<table>
<thead>
<tr>
<th>Counter Mode</th>
<th>Configuration CLI</th>
<th>Function</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 only</td>
<td>counter ipv4</td>
<td>Only IPv4 statistics are collected.</td>
<td>4092</td>
</tr>
<tr>
<td>IPv6 only</td>
<td>counter ipv6</td>
<td>Only IPv6 statistics are collected.</td>
<td>4092</td>
</tr>
<tr>
<td>IPv4 and IPv6 combined</td>
<td>counter</td>
<td>Both IPv4 and IPv6 statistics are collected but are displayed only as a sum.</td>
<td>4092</td>
</tr>
<tr>
<td>IPv4 and IPv6 separate</td>
<td>counter ipv4 ipv6 separate</td>
<td>Both IPv4 and IPv6 statistics are collected and can be displayed individually.</td>
<td>2046</td>
</tr>
</tbody>
</table>

When mixing these configured modes, the rule is as follows:

\[(\text{number of \text{v4/v6/v4v6combined interfaces}}) + 2*(\text{number of \text{v4v6separate interfaces}}) \leq 4092\]

To enable Layer 3 interface counters, you need to enter the `counter` command in interface mode. For instructions, see the “Configuring Layer 3 Interface Counters” section on page 32-10.

The hardware counters are displayed in the output of the `show interface` command, as shown in the following example. Counter fields that are updated when the counter configuration is present are highlighted.

```
Switch# show interface gi3/1
GigabitEthernet3/1 is up, line protocol is up (connected)
  Hardware is Gigabit Ethernet Port, address is 001f.9e9e.f43f (bia 001f.9e9e.f43f)
  Internet address is 10.10.10.2/24
  MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
  reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive set (10 sec)
  Full-duplex, 1000Mb/s, link type is auto, media type is 10/100/1000-TX
  input flow-control is on, output flow-control is on
  Auto-MDIX on (operational: on)
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output never, output hang never
```
Chapter 32  Configuring Layer 3 Interfaces

Configuration Guidelines

The Catalyst 4500 series switch supports AppleTalk routing and IPX routing. For AppleTalk routing and IPX routing information, refer to “Configuring AppleTalk” and “Configuring Novell IPX” in the Cisco IOS AppleTalk and Novell IPX configuration guides at the following URLs:

Note

A Catalyst 4500 series switch does not support subinterfaces or the encapsulation keyword on Layer 3 Fast Ethernet, Gigabit Ethernet, 10-Gigabit Ethernet interfaces.

Note

As with any Layer 3 interface running Cisco IOS software, the IP address and network assigned to an SVI cannot overlap those assigned to any other Layer 3 interface on the switch.

Table 32-2  Fields Updated in Previous Configuration/Counter Configuration

<table>
<thead>
<tr>
<th>Counter Configuration</th>
<th>Updated Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 only</td>
<td>(A) and (B) only</td>
</tr>
<tr>
<td>IPv6 only</td>
<td>(C) and (D) only</td>
</tr>
<tr>
<td>IPv4 and IPv6 combined</td>
<td>(A) and (B) only</td>
</tr>
<tr>
<td>IPv4 and IPv6 separate</td>
<td>(A) and (B) for IPv4</td>
</tr>
<tr>
<td></td>
<td>(C) and (D) for IPv6</td>
</tr>
</tbody>
</table>

The output of the previous configuration depends on the counter configuration (Table 32-2).
Note
Before you can configure logical Layer 3 VLAN interfaces, you must create and configure the VLANs on the switch, assign VLAN membership to the Layer 2 interfaces, enable IP routing if IP routing is disabled, and specify an IP routing protocol.

To configure logical Layer 3 VLAN interfaces, perform this task:

**Command** | **Purpose**
--- | ---
**Step 1** | Switch(config)# vlan vlan_ID
Creates the VLAN.
**Step 2** | Switch(config)# interface vlan vlan_ID
Selects an interface to configure.
**Step 3** | Switch(config-if)# ip address ip_address subnet_mask
Configures the IP address and IP subnet.
**Step 4** | Switch(config-if)# no shutdown
Enables the interface.
**Step 5** | Switch(config-if)# end
Exits configuration mode.
**Step 6** | Switch# copy running-config startup-config
Saves your configuration changes to NVRAM.
**Step 7** | Switch# show interfaces [type slot/interface]
Switch# show ip interfaces [type slot/interface]
Switch# show running-config interfaces [type slot/interface]
Switch# show running-config interfaces vlan vlan_ID
Verifies the configuration.

This example shows how to configure the logical Layer 3 VLAN interface VLAN 2 and assign an IP address:

```
Switch> enable
Switch# config term
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vlan 2
Switch(config)# interface vlan 2
Switch(config-if)# ip address 10.1.1.1 255.255.255.248
Switch(config-if)# no shutdown
Switch(config-if)# end
```

This example shows how to use the show interfaces command to display the interface IP address configuration and status of Layer 3 VLAN interface VLAN 2:

```
Switch# show interfaces vlan 2
Vlan2 is up, line protocol is down
    Hardware is Ethernet SVI, address is 00D.588F.B604 (bia 00D.588F.B604)
    Internet address is 172.20.52.106/29
    MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
        reliability 255/255, txload 1/255, rxload 1/255
    Encapsulation ARPA, loopback not set
    ARP type: ARPA, ARP Timeout 04:00:00
    Last input never, output never, output hang never
    Last clearing of "show interface" counters never
    Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
    Queueing strategy: fifo
    Output queue: 0/40 (size/max)
    5 minute input rate 0 bits/sec, 0 packets/sec
```
5 minute output rate 0 bits/sec, 0 packets/sec
0 packets input, 0 bytes, 0 no buffer
Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
0 packets output, 0 bytes, 0 underruns
0 output errors, 0 interface resets
0 output buffer failures, 0 output buffers swapped out
Switch#

This example shows how to use the `show running-config` command to display the interface IP address configuration of Layer 3 VLAN interface VLAN 2:

Switch# show running-config
Building configuration...

Current configuration :
interface Vlan2
  ip address 10.1.1.1 255.255.255.248
  !
  ip classless
  no ip http server
  !
  !line con 0
  line aux 0
  line vty 0 4
  !
end

Configuring VLANs as Layer 3 Interfaces

This section consists of the following subsections:

- Configuring SVI Autostate Exclude, page 32-7
- Configuring IP MTU Sizes, page 32-9
- Configuring Layer 3 Interface Counters, page 32-10

Configuring SVI Autostate Exclude

Note

The SVI Autostate Exclude feature is enabled by default and is synchronized with the STP state.

The SVI Autostate Exclude feature shuts down (or brings up) the Layer 3 interfaces of a switch when the following port configuration changes occur:

- When the last port on a VLAN goes down, the Layer 3 interface on that VLAN is shut down (SVI- autostated).
- When the first port on the VLAN is brought back up, the Layer 3 interface on the VLAN that was previously shut down is brought up.

SVI Autostate Exclude enables you to exclude the access ports and trunks in defining the status of the SVI (up or down) even if it belongs to the same VLAN. If the excluded access port and trunk is in up state and other ports are in down state in the VLAN, the SVI state is changed to down.

To make the SVI state up, at least one port in the VLAN should be up and not excluded. This action helps to exclude the monitoring port status when you are determining the status of the SVI.
To apply SVI Autostate Exclude, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>Switch(config)# interface interface-id</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>Switch(config-if)# switchport autostate exclude</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>Switch(config-if)# end</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>Switch# show run interface</code></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>Switch# show interface switchport</code></td>
</tr>
</tbody>
</table>

This example shows how to apply SVI Autostate Exclude on interface g3/1:

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g3/1
Switch(config-if)# switchport autostate exclude
Switch(config-if)# end
Switch# show run int g3/4
Building configuration...
Current configuration : 162 bytes
!
interface GigabitEthernet3/4
  switchport trunk encapsulation dot1q

Switch#
```
Chapter 32      Configuring Layer 3 Interfaces

Configuring IP MTU Sizes

You can set the protocol-specific maximum transmission unit (MTU) size of IPv4 or IPv6 packets that are sent on an interface.

For information on MTU limitations, refer to “Maximum Transmission Units” on page 25.

Note

To set the nonprotocol-specific MTU value for an interface, use the `mtu` interface configuration command. Changing the MTU value (with the `mtu` interface configuration command) can affect the IP MTU value. If the current IP MTU value matches the MTU value, and you change the MTU value, the IP MTU value is modified automatically to match the new MTU. However, the reverse is not true; changing the IP MTU value has no effect on the value for the `mtu` command.

For information on how to configure MTU size, refer to “Configuring MTU Sizes” on page 27.

To set the protocol-specific maximum transmission unit (MTU) size of IPv4 or IPv6 packets sent on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# <code>interface interface-id</code></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 Switch(config-if)# <code>[no] ip mtu mtu_size</code></td>
<td>Configures the IPv4 MTU size</td>
</tr>
<tr>
<td>or Switch(config-if)# <code>[no] ipv6 mtu mtu_size</code></td>
<td>Configures the IPv6 MTU size.</td>
</tr>
<tr>
<td>Step 4 Switch(config-if)# <code>exit</code></td>
<td>Exits configuration interface mode.</td>
</tr>
<tr>
<td>Step 5 Switch(config)# <code>end</code></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td>Step 6 Switch# <code>show run interface interface-id</code></td>
<td>Displays the running configuration.</td>
</tr>
</tbody>
</table>

This example shows how to configure IPv4 MTU on an interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# ip mtu 68
Switch(config-if)# exit
Switch(config)# end
Switch# show ip interface vlan 1
Vlan1 is up, line protocol is up
    Internet address is 10.10.10.1/24
    Broadcast address is 255.255.255.255
    Address determined by setup command
    MTU is 68 bytes
    Helper address is not set
```

(continued)
The following example shows how to configure IPv6 MTU on an interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# ipv6 mtu 1280
Switch(config)# end
```

This example shows how to verify the configuration:

```
Switch# show ipv6 interface vlan 1
Vlan1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::214:6AFF:FEBC:DEEA
Global unicast address(es):
  1001::1, subnet is 1001::/64
Joined group address(es):
  FF02::1
  FF02::1:FF00:1
  FF02::1:FFBC:DEEA
MTU is 1280 bytes
```

**Note**
When IPv6 is enabled on an interface using any CLI command, you may see the following message:

```
% Hardware MTU table exhausted
```

In this situation, the IPv6 MTU value programmed in hardware differs from the IPv6 interface MTU value. This situation occurs if no room exists in the hardware MTU table to store additional values. You must free up some space in the table by unconfiguring some unused MTU values and subsequently disable and reenable IPv6 on the interface or reapply the MTU configuration.

### Configuring Layer 3 Interface Counters

**Note**

To configure Layer 3 interface counters (assign counters to a Layer 3 interface), perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>interface-id</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring VLANs as Layer 3 Interfaces

#### Chapter 32      Configuring Layer 3 Interfaces

This example shows how to enable counters on interface VLAN 1:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# counter ipv4
Switch(config-if)# end
```

To remove the counters, use the no counter command.

If you have already assigned the maximum number of counters, the counter command fails and displays an error message:

```plaintext
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa3/2
Switch(config-if)# no switchport
Switch(config-if)# counter ipv6
Counter resource exhausted for interface fa3/2
Switch(config-if)# end
```

In this situation, you must release a counter from another interface for use by the new interface.

---

### Command Table

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# counter {ipv4</td>
<td>ipv6</td>
<td>ipv4 ipv6 separate}</td>
</tr>
<tr>
<td></td>
<td>counter — Enables collection of IPv4 and IPv6 statistics and displays them as a sum</td>
<td></td>
</tr>
<tr>
<td></td>
<td>counter ipv4 — Enables collection of IPv4 statistics only</td>
<td></td>
</tr>
<tr>
<td></td>
<td>counter ipv6 — Enables collection of IPv6 statistics only</td>
<td></td>
</tr>
<tr>
<td></td>
<td>counter ipv4 ipv6 separate — Enables collection of IPv4 and IPv6 statistics and displays them individually</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# end</td>
<td>Exits configuration mode.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show run interface interface-id</td>
<td>Displays the running configuration.</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Physical Layer 3 Interfaces

**Note**
Before you can configure physical Layer 3 interfaces, you must enable IP routing if IP routing is disabled, and specify an IP routing protocol.

To configure physical Layer 3 interfaces, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# ip routing</td>
</tr>
<tr>
<td>Enables IP routing (required only if disabled)</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface {fastethernet</td>
</tr>
<tr>
<td>Selects an interface to configure.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# no switchport</td>
</tr>
<tr>
<td>Converts this port from physical Layer 2 port to physical Layer 3 port.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# ip address ip_address subnet_mask</td>
</tr>
<tr>
<td>Configures the IP address and IP subnet.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# no shutdown</td>
</tr>
<tr>
<td>Enables the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Exits configuration mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
<tr>
<td>Saves your configuration changes to NVRAM.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# show interfaces [type slot/interface]</td>
</tr>
<tr>
<td>Switch# show ip interfaces [type slot/interface]</td>
<td></td>
</tr>
<tr>
<td>Switch# show running-config interfaces [type slot/interface]</td>
<td></td>
</tr>
<tr>
<td>Verifies the configuration.</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to configure an IP address on Fast Ethernet interface 2/1:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface fastethernet 2/1
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.1.1.1 255.255.255.248
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#
```

This example shows how to use the `show running-config` command to display the interface IP address configuration of Fast Ethernet interface 2/1:

```
Switch# show running-config
Building configuration...
!
interface FastEthernet2/1
  no switchport
  ip address 10.1.1.1 255.255.255.248
  
  !
  ip classless
  no ip http server
  !
  line con 0
  line aux 0
```
line vty 0 4
!
end

Configuring EIGRP Stub Routing

This section consists of the following subsections:

- About EIGRP Stub Routing, page 32-13
- Configuring EIGRP Stub Routing, page 32-14
- Monitoring and Maintaining EIGRP, page 32-19
- EIGRP Configuration Examples, page 32-19

About EIGRP Stub Routing

The EIGRP stub routing feature, available in all images, reduces resource utilization by moving routed traffic closer to the end user.

The IP base image contains only EIGRP stub routing. The IP services image contains complete EIGRP routing.

In a network using EIGRP stub routing, the only route for IP traffic to follow to the user is through a switch that is configured with EIGRP stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote switches to use EIGRP, and to configure only the switch as a stub. Only specified routes are propagated from the switch. The switch responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub switch for any routes, and a switch that has a stub peer does not query that peer. The stub switch depends on the distribution switch to send the proper updates to all peers.

In Figure 32-3, switch B is configured as an EIGRP stub switch. Switches A and C are connected to the rest of the WAN. Switch B advertise connected, static, redistribution, and summary routes from switch A and C to Hosts A, B, and C. Switch B does not advertise any routes learned from switch A (and the reverse).
Configuring EIGRP Stub Routing

The EIGRP stub routing feature improves network stability, reduces resource utilization, and simplifies stub switch configuration.

Stub routing is commonly used in a hub-and-spoke network topology. In a hub-and-spoke network, one or more end (stub) networks are connected to a remote switch (the spoke) that is connected to one or more distribution switches (the hub). The remote switch is adjacent only to one or more distribution switches. The only route for IP traffic to follow into the remote switch is through a distribution switch. This type of configuration is commonly used in WAN topologies where the distribution switch is directly connected to a WAN. The distribution switch can be connected to many more remote switches. Often, the distribution switch is connected to 100 or more remote routers. In a hub-and-spoke topology, the remote router must forward all nonlocal traffic to a distribution router, so it becomes unnecessary for the remote router to hold a complete routing table. Generally, the distribution router need not send anything more than a default route to the remote router.

When using the EIGRP stub routing feature, you need to configure the distribution and remote routers to use EIGRP, and to configure only the remote router as a stub. Only specified routes are propagated from the remote (stub) router. The stub router responds to all queries for summaries, connected routes, redistributed static routes, external routes, and internal routes with the message “inaccessible.” A router that is configured as a stub sends a special peer information packet to all neighboring routers to report its status as a stub router.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

Figure 32-4 shows a simple hub-and-spoke configuration.

The stub routing feature does not prevent routes from being advertised to the remote router. In the example in Figure 32-4, the remote router can access the corporate network and the Internet using a distribution router only. In this example, having a full route table on the remote router serves no purpose because the path to the corporate network and the Internet always uses a distribution router. The larger route table only reduces the amount of memory required by the remote router. Bandwidth and memory can be conserved by summarizing and filtering routes in the distribution router. The remote router need not receive routes that have been learned from other networks because the remote router must send all nonlocal traffic, regardless of destination, to the distribution router. If a true stub network is desired, the distribution router should be configured to send only a default route to the remote router. The EIGRP stub routing feature does not automatically enable summarization on the distribution router. In most cases, the network administrator needs to configure summarization on the distribution routers.

When configuring the distribution router to send only a default route to the remote router, you must use the `ip classless` command on the remote router. By default, the `ip classless` command is enabled in all Cisco IOS images that support the EIGRP stub routing feature.

Without the stub feature, even after the routes that are sent from the distribution router to the remote router have been filtered or summarized, a problem might occur. If a route is lost somewhere in the corporate network, EIGRP could send a query to the distribution router, which in turn sends a query to the remote router even if routes are being summarized. If there is a problem communicating over the WAN link between the distribution router and the remote router, an EIGRP stuck in active (SIA) condition could occur and cause instability elsewhere in the network. The EIGRP stub routing feature allows a network administrator to prevent queries from being sent to the remote router.

### Dual-Homed Remote Topology

In addition to a simple hub-and-spoke network where a remote router is connected to a single distribution router, the remote router can be dual-homed to two or more distribution routers. This configuration adds redundancy and introduces unique issues, and the stub feature helps to address some of these issues.

A dual-homed remote router has two or more distribution (hub) routers. However, the principles of stub routing are the same as they are with a hub-and-spoke topology. Figure 32-5 shows a common dual-homed remote topology with one remote router, but 100 or more routers could be connected on the same interfaces on distribution router 1 and distribution router 2. The remote router uses the best route to reach its destination. If distribution router 1 experiences a failure, the remote router can still use distribution router 2 to reach the corporate network.
Figure 32-5  
**Simple Dual-Homed Remote Topology**

Figure 32-5 shows a simple dual-homed remote with one remote router and two distribution routers. Both distribution routers maintain routes to the corporate network and stub network 10.1.1.0/24.

Dual-homed routing can introduce instability into an EIGRP network. In Figure 32-6, distribution router 1 is directly connected to network 10.3.1.0/24. If summarization or filtering is applied on distribution router 1, the router advertises network 10.3.1.0/24 to all of its directly connected EIGRP neighbors (distribution router 2 and the remote router).

Figure 32-6  
**Dual-Homed Remote Topology With Distribution Router 1 Connected to Two Networks**

Figure 32-6 shows a simple dual-homed remote router where distribution router 1 is connected to both network 10.3.1.0/24 and network 10.2.1.0/24.

If the 10.2.1.0/24 link between distribution router 1 and distribution router 2 has failed, the lowest cost path to network 10.3.1.0/24 from distribution router 2 is using the remote router (see Figure 32-7). This route is not desirable because the traffic that was previously traveling across the corporate network 10.2.1.0/24 is now sent across a much lower bandwidth connection. The over utilization of the lower bandwidth WAN connection can cause a number of problems that might affect the entire corporate network.
network. The use of the lower bandwidth route that passes using the remote router might cause WAN EIGRP distribution routers to be dropped. Serial lines on distribution and remote routers could also be dropped, and EIGRP SIA errors on the distribution and core routers could occur.

Figure 32-7 Dual-Homed Remote Topology with a Failed Route to a Distribution Router

It is not desirable for traffic from distribution router 2 to travel through any remote router in order to reach network 10.3.1.0/24. If the links are sized to handle the load, it is acceptable to use one of the backup routes. However, most networks of this type have remote routers located at remote offices with relatively slow links. This problem can be prevented if proper summarization is configured on the distribution router and remote router.

It is typically undesirable for traffic from a distribution router to use a remote router as a transit path. A typical connection from a distribution router to a remote router has much less bandwidth than a connection at the network core. Attempting to use a remote router with a limited bandwidth connection as a transit path generally produces excessive congestion to the remote router. The EIGRP stub routing feature can prevent this problem by preventing the remote router from advertising core routes back to distribution routers. Routes learned by the remote router from distribution router 1 are not advertised to distribution router 2. Because the remote router does not advertise core routes to distribution router 2, the distribution router does not use the remote router as a transit for traffic destined for the network core.

The EIGRP stub routing feature can help to provide greater network stability. In the event of network instability, this feature prevents EIGRP queries from being sent over limited bandwidth links to nontransit routers. Instead, distribution routers to which the stub router is connected answer the query on behalf of the stub router. This feature greatly reduces the chance of further network instability due to congested or problematic WAN links. The EIGRP stub routing feature also simplifies the configuration and maintenance of hub-and-spoke networks. When stub routing is enabled in dual-homed remote configurations, it is no longer necessary to configure filtering on remote routers to prevent those remote routers from appearing as transit paths to the hub routers.

Caution

EIGRP stub routing should only be used on stub routers. A stub router is defined as a router connected to the network core or distribution layer through which core transit traffic should not flow. A stub router should not have any EIGRP neighbors other than distribution routers. Ignoring this restriction causes undesirable behavior.
Multi-access interfaces, such as ATM, Ethernet, Frame Relay, ISDN PRI, and X.25, are supported by the EIGRP stub routing feature only when all routers on that interface, except the hub, are configured as stub routers.

EIGRP Stub Routing Configuration Tasks

To configure EIGRP stub routing, perform the tasks described in the following sections. The tasks in the first section are required; the task in the last section is optional.

- Configuring EIGRP Stub Routing (required)
- Verifying EIGRP Stub Routing (optional)

Configuring EIGRP Stub Routing

To configure a remote or spoke router for EIGRP stub routing, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# router eigrp 1</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-router)# network network-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-router)# eigrp stub [receive-only</td>
</tr>
</tbody>
</table>

Note: It is still necessary to redistribute the routes from the other routing processes with the redistribute command.

Verifying EIGRP Stub Routing

To verify that a remote router has been configured as a stub router with EIGRP, use the show ip eigrp neighbor detail command from the distribution router in privileged EXEC mode. The last line of the output shows the stub status of the remote or spoke router. The following example shows output is from the show ip eigrp neighbor detail command:

Switch# show ip eigrp neighbor detail
IP-EIGRP neighbors for process 1
N Address Interface Hold Uptime SRTT RTO Q Seq Type
Chapter 32  Configuring Layer 3 Interfaces

Configuring EIGRP Stub Routing

<table>
<thead>
<tr>
<th>(sec)</th>
<th>(ms)</th>
<th>Cnt</th>
<th>Num</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>10.1.1.2</td>
<td>Se3/1</td>
<td>11 00:00:59</td>
</tr>
</tbody>
</table>

Version 12.1/1.2, Retrans: 2, Retries: 0
Stub Peer Advertising (CONNECTED SUMMARY) Routes

**Monitoring and Maintaining EIGRP**

To delete neighbors from the neighbor table, use the following command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# clear ip eigrp neighbors [ip-address</td>
<td>Deletes neighbors from the neighbor table.</td>
</tr>
<tr>
<td>interface]</td>
<td></td>
</tr>
</tbody>
</table>

To display various routing statistics, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip eigrp interfaces [interface] [as-number]</td>
<td>Displays information about interfaces configured for EIGRP.</td>
</tr>
<tr>
<td>Switch# show ip eigrp neighbors [type</td>
<td>number</td>
</tr>
<tr>
<td>Switch# show ip eigrp topology [autonomous-system-number</td>
<td>Displays the EIGRP topology table for a given process.</td>
</tr>
<tr>
<td>[ip-address] mask]]</td>
<td></td>
</tr>
<tr>
<td>Switch# show ip eigrp traffic [autonomous-system-number]</td>
<td>Displays the number of packets sent and received for all or a specified EIGRP process.</td>
</tr>
</tbody>
</table>

**EIGRP Configuration Examples**

This section contains the following examples:

- Route Summarization Example
- Route Authentication Example
- Stub Routing Example

**Route Summarization Example**

The following example disables autosummarization and causes EIGRP to summarize network 10.0.0.0 out Ethernet interface 0 only:

```
interface Ethernet 0
  ip summary-address eigrp 1 10.0.0.0 255.0.0.0
! router eigrp 1
  network 172.16.0.0
  no auto-summary
```

*Note* You should not use the `ip summary-address eigrp` summarization command to generate the default route (0.0.0.0) from an interface because it creates an EIGRP summary default route to the null 0 interface with an administrative distance of 5. The low administrative distance of this default route can cause this route to displace default routes learned from other neighbors from the routing table. If the
default route learned from the neighbors is displaced by the summary default route, or if the summary route is the only default route present, all traffic destined for the default route does not leave the router. Instead, this traffic is sent to the null 0 interface where it is dropped.

The recommended way to send only the default route out a given interface is to use a `distribute-list` command. You can configure this command to filter all outbound route advertisements sent out the interface with the exception of the default (0.0.0.0).

### Route Authentication Example

The following example enables MD5 authentication on EIGRP packets in autonomous system 1:

**Router A**

```plaintext
interface ethernet 1
ip authentication mode eigrp 1 md5
ip authentication key-chain eigrp 1 holly
key chain holly
key 1
  key-string 0987654321
  accept-lifetime 04:00:00 Dec 4 1996 infinite
  send-lifetime 04:00:00 Dec 4 1996 04:48:00 Dec 4 1996
exit
key 2
  key-string 1234567890
  accept-lifetime 04:00:00 Dec 4 1996 infinite
  send-lifetime 04:45:00 Dec 4 1996 infinite
```

**Router B**

```plaintext
interface ethernet 1
ip authentication mode eigrp 1 md5
ip authentication key-chain eigrp 1 mikel
key chain mikel
key 1
  key-string 0987654321
  accept-lifetime 04:00:00 Dec 4 1996 infinite
  send-lifetime 04:00:00 Dec 4 1996 infinite
exit
key 2

  send-lifetime 04:45:00 Dec 4 1996 infinite
```

Router A accepts and attempts to verify the MD5 digest of any EIGRP packet with a key equal to 1. It also accepts a packet with a key equal to 2. All other MD5 packets are dropped. Router A sends all EIGRP packets with key 2.

Router B accepts key 1 or key 2, and sends key 1. In this scenario, MD5 authenticates.

### Stub Routing Example

A router that is configured as a stub with the `eigrp stub` command shares connected and summary routing information with all neighbor routers by default. Four optional keywords can be used with the `eigrp stub` command to modify this operation:

- `receive-only`
- `connected`
• static
• summary

This section provides configuration examples for all forms of the `eigrp stub` command. The `eigrp stub` command can be modified with several options, and these options can be used in any combination except for the `receive-only` keyword. The `receive-only` keyword restricts the router from sharing any of its routes with any other router in that EIGRP autonomous system, and the `receive-only` keyword does not permit any other option to be specified because it prevents any type of route from being sent. The three other optional keywords (`connected`, `static`, and `summary`) can be used in any combination but cannot be used with the `receive-only` keyword. If any of these three keywords is used individually with the `eigrp stub` command, connected and summary routes are not sent automatically.

The `connected` keyword permits the EIGRP stub routing feature to send connected routes. If the connected routes are not covered by a network statement, it may be necessary to redistribute connected routes with the `redistribute connected` command under the EIGRP process. This option is enabled by default.

The `static` keyword permits the EIGRP stub routing feature to send static routes. Without the static keyword, EIGRP does not send any static routes, including internal static routes that normally are automatically redistributed. It is still necessary to redistribute static routes with the `redistribute static` command.

The `summary` keyword permits the EIGRP stub routing feature to send summary routes. Summary routes can be created manually with the `summary address` command or automatically at a major network border router with the `auto-summary` command enabled. This option is enabled by default.

In the following example, the `eigrp stub` command is used to configure the router as a stub that advertises connected and summary routes:

```plaintext
router eigrp 1
network 10.0.0.0
eigrp stub
```

In the following example, the `eigrp stub connected static` command is used to configure the router as a stub that advertises connected and static routes (sending summary routes is not permitted):

```plaintext
router eigrp 1
network 10.0.0.0
eigrp stub connected static
```

In the following example, the `eigrp stub receive-only` command is used to configure the router as a stub, and connected, summary, or static routes is not sent:

```plaintext
router eigrp 1
network 10.0.0.0 eigrp
stub receive-only
```

In the following example, the `eigrp stub redistributed` command is used to configure the router as a stub that advertises redistributed routes (sending connected, static, or summary routes is not permitted):

```plaintext
router eigrp 1
network 10.0.0.0
eigrp stub redistributed
```

In the following example, the `eigrp stub` command is used to configure the router as a stub that advertises redistributed, static, connected and summary routes:

```plaintext
router eigrp 1
network 10.0.0.0
eigrp stub connected static summary redistributed
```
Configuring Cisco Express Forwarding

This chapter describes Cisco Express Forwarding (CEF) on the Catalyst 4500 series switch. It also provides guidelines, procedures, and examples to configure this feature.

This chapter includes the following major sections:

- About CEF, page 33-1
- Catalyst 4500 Series Switch Implementation of CEF, page 33-3
- CEF Configuration Restrictions, page 33-6
- Configuring CEF, page 33-6
- Monitoring and Maintaining CEF, page 33-8

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About CEF

This section contains information on the two primary components that comprise the CEF operation:

- CEF Features, page 33-2
- Forwarding Information Base, page 33-2
- Adjacency Tables, page 33-2
CEF Features

CEF is advanced Layer 3 IP switching technology that optimizes performance and scalability for large networks with dynamic traffic patterns or networks with intensive web-based applications and interactive sessions.

CEF provides the following features:

- Improves performance over the caching schemes of multilayer switches, which often flush the entire cache when information changes in the routing tables.
- Provides load balancing that distributes packets across multiple links based on Layer 3 routing information. If a network device discovers multiple paths to a destination, the routing table is updated with multiple entries for that destination. Traffic to that destination is then distributed among the various paths.

CEF stores information in several data structures rather than the route cache of multilayer switches. The data structures optimize lookup for efficient packet forwarding.

Forwarding Information Base

The Forwarding Information Base (FIB) is a table that contains a copy of the forwarding information in the IP routing table. When routing or topology changes occur in the network, the route processor updates the IP routing table and CEF updates the FIB. Because there is a one-to-one correlation between FIB entries and routing table entries, the FIB contains all known routes and eliminates the need for route cache maintenance that is associated with switching paths, such as fast switching and optimum switching. CEF uses the FIB to make IP destination-based switching decisions and maintain next-hop address information based on the information in the IP routing table.

On the Catalyst 4500 series switches, CEF loads the FIB into the integrated switching engine hardware to increase the performance of forwarding. The integrated switching engine has a finite number of forwarding slots for storing routing information. If this limit is exceeded, CEF is automatically disabled and all packets are forwarded in software. In this situation, you should reduce the number of routes on the switch and then reenable hardware switching with the `ip cef` command.

Adjacency Tables

In addition to the FIB, CEF uses adjacency tables to prepend Layer 2 addressing information. Nodes in the network are termed adjacent if they are within a single hop from each other. The adjacency table maintains Layer 2 next-hop addresses for all FIB entries.

Adjacency Discovery

The adjacency table is populated as new adjacent nodes are discovered. Each time an adjacency entry is created (such as using the Address Resolution Protocol (ARP), a link-layer header for that adjacent node is stored in the adjacency table. Once a route is determined, the link-layer header points to a next hop and corresponding adjacency entry. The link-layer header is subsequently used for encapsulation during CEF switching of packets.
Adjacency Resolution

A route might have several paths to a destination prefix, such as when a router is configured for simultaneous load balancing and redundancy. For each resolved path, a pointer is added for the adjacency corresponding to the next-hop interface for that path. This method is used for load balancing across several paths.

Adjacency Types That Require Special Handling

In addition to adjacencies for next-hop interfaces (host-route adjacencies), other types of adjacencies are used to expedite switching when certain exception conditions exist. When the prefix is defined, prefixes requiring exception processing are cached with one of the special adjacencies listed in Table 33-1.

Table 33-1 Adjacency Types for Exception Processing

<table>
<thead>
<tr>
<th>Adjacency Type</th>
<th>Processing Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null adjacency</td>
<td>Packets destined for a Null0 interface are dropped. A Null0 interface can be used as an effective form of access filtering.</td>
</tr>
<tr>
<td>Glean adjacency</td>
<td>When a router is connected directly to several hosts, the FIB table on the router maintains a prefix for the subnet rather than for each individual host. The subnet prefix points to a glean adjacency. When packets must be forwarded to a specific host, the adjacency database is gleaned for the specific prefix.</td>
</tr>
<tr>
<td>Punt adjacency</td>
<td>Features that require special handling or features that are not yet supported by CEF switching are sent (punted) to the next higher switching level.</td>
</tr>
<tr>
<td>Discard adjacency</td>
<td>Packets are discarded.</td>
</tr>
<tr>
<td>Drop adjacency</td>
<td>Packets are dropped.</td>
</tr>
</tbody>
</table>

Unresolved Adjacency

When a link-layer header is prepended to packets, FIB requires the prepend to point to an adjacency corresponding to the next hop. If an adjacency was created by FIB and was not discovered through a mechanism such as ARP, the Layer 2 addressing information is not known and the adjacency is considered incomplete. When the Layer 2 information is known, the packet is forwarded to the route processor, and the adjacency is determined through ARP.

Catalyst 4500 Series Switch Implementation of CEF

Catalyst 4500 series switches support an ASIC-based integrated switching engine that provides these features:

- Ethernet bridging at Layer 2
- IP routing at Layer 3

Because the ASIC is specifically designed to forward packets, the integrated switching engine hardware can run this process much faster than CPU subsystem software.

Figure 33-1 shows a high-level view of the ASIC-based Layer 2 and Layer 3 switching process on the integrated switching engine.
The integrated switching engine performs inter-VLAN routing on logical Layer 3 interfaces with the ASIC hardware. The ASIC hardware also supports a physical Layer 3 interface that can be configured to connect with a host, a switch, or a router.

This section contains the following subsections:

- Hardware and Software Switching, page 33-4
- Load Balancing, page 33-6
- Software Interfaces, page 33-6

**Hardware and Software Switching**

For the majority of packets, the integrated switching engine performs the packet forwarding function in hardware. These packets are hardware-switched at very high rates. Exception packets are forwarded by the CPU subsystem software. Statistic reports should show that the integrated switching engine is forwarding the vast majority of packets in hardware. Software forwarding is significantly slower than hardware forwarding, but packets forwarded by the CPU subsystem do not reduce hardware forwarding speed.

Figure 33-2 shows a logical view of the integrated switching engine and the CPU subsystem switching components.
Chapter 33 Configuring Cisco Express Forwarding

Catalyst 4500 Series Switch Implementation of CEF

Figure 33-2 Hardware and Software Switching Components

The integrated switching engine performs inter-VLAN routing in hardware. The CPU subsystem software supports Layer 3 interfaces to VLANs that use Subnetwork Access Protocol (SNAP) encapsulation. The CPU subsystem software also supports generic routing encapsulation (GRE) tunnel.

Hardware Switching

Hardware switching is the normal operation for Supervisor Engine III and Supervisor Engine IV.

Software Switching

Software switching occurs when traffic cannot be processed in hardware. The following types of exception packets are processed in software at a much slower rate:

- Packets that use IP header options
- Packets that have an expiring IP time-to-live (TTL) counter
- Packets that are forwarded to a tunnel interface
- Packets that arrive with non-supported encapsulation types
- Packets that are routed to an interface with non-supported encapsulation types
- Packets that exceed the MTU of an output interface and must be fragmented
- Packets that require an IGMP redirect for routing
- 802.3 Ethernet packets
Chapter 33 Configuring Cisco Express Forwarding

CEF Configuration Restrictions

Load Balancing

The Catalyst 4500 series switch supports load balancing for routing packets in the integrated switching engine hardware. Load balancing is always enabled. It works when multiple routes for the same network with different next-hop addresses are configured. These routes can be configured either statically or through a routing protocol such as OSPF or EIGRP.

The hardware makes a forwarding decision by using a hardware load sharing hash function to compute a value, based on the source and destination IP addresses and the source and destination TCP port numbers (if available). This load sharing hash value is then used to select which route to use to forward the packet. All hardware switching within a particular flow (such as a TCP connection) is routed to the same next hop, which reduces the chance that packet reordering occurs. Up to eight different routes for a particular network are supported.

Software Interfaces

Cisco IOS for the Catalyst 4500 series switch supports GRE and IP tunnel interfaces that are not part of the hardware forwarding engine. All packets that flow to or from these interfaces must be processed in software and have a significantly lower forwarding rate than that of hardware-switched interfaces. Also, Layer 2 features are not supported on these interfaces.

CEF Configuration Restrictions

The CEF integrated switching engine supports only ARPA and ISL/802.1q encapsulation types for Layer 3 switching in hardware. The CPU subsystem supports a number of encapsulations such as SNAP for Layer 2 switching that you can use for Layer 3 switching in software.

Configuring CEF

These sections describe how to configure CEF:

- Enabling CEF, page 33-6
- Configuring Load Balancing for CEF, page 33-7

Enabling CEF

By default, CEF is enabled globally on the Catalyst 4500 series switch. No configuration is required. To reenable CEF, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# ip cef distributed</code></td>
<td>Enables standard CEF operation.</td>
</tr>
</tbody>
</table>
Configuring Load Balancing for CEF

CEF load balancing is based on a combination of source and destination packet information; it allows you to optimize resources by distributing traffic over multiple paths for transferring data to a destination. You can configure load balancing on a per-destination basis. Load-balancing decisions are made on the outbound interface. You can configure per-destination load balancing for CEF on outbound interfaces.

The following topics are discussed:

- Configuring Per-Destination Load Balancing, page 33-7
- Configuring Load Sharing Hash Function, page 33-7
- Viewing CEF Information, page 33-8

Configuring Per-Destination Load Balancing

Per-destination load balancing is enabled by default when you enable CEF. To use per-destination load balancing, you do not perform any additional tasks once you enable CEF.

Per-destination load balancing allows the router to use multiple paths to achieve load sharing. Packets for a given source-destination host pair are guaranteed to take the same path, even if multiple paths are available. Traffic destined for different pairs tend to take different paths. Per-destination load balancing is enabled by default when you enable CEF; it is the load balancing method of choice in most situations.

Because per-destination load balancing depends on the statistical distribution of traffic, load sharing becomes more effective as the number of source-destination pairs increases.

Use per-destination load balancing to ensure that packets for a given host pair arrive in order. All packets for a certain host pair are routed over the same link or links.

Configuring Load Sharing Hash Function

When multiple unicast routes exist to a particular destination IP prefix, the hardware sends packets matching that prefix across all possible routes, which shares the load across all next hop routers. By default, the route used is chosen by computing a hash of the source and destination IP addresses and using the resulting value to select the route. This preserves packet ordering for packets within a flow by ensuring that all packets within a single IP source/destination flow are sent on the same route, but it provides a near-random distribution of flows to routes.

You can change the load-sharing hash function. So, in addition to the source and destination IP addresses, the source TCP/UDP port, the destination TCP/UDP port, or both can also be included in the hash.

To the configure load sharing hash function to use the source and/or destination ports, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch (config)# [no] ip cef load-sharing algorithm include-ports source destination</td>
<td>Enables load sharing hash function to use source and destination ports. Use the no keyword to set the switch to use the default Cisco IOS load-sharing algorithm.</td>
</tr>
</tbody>
</table>
Monitoring and Maintaining CEF

To display information about IP traffic, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show interface type slot/interface begin L3</td>
<td>Displays a summary of IP unicast traffic.</td>
</tr>
</tbody>
</table>

This example shows how to display information about IP unicast traffic on interface Fast Ethernet 3/3:

```
Switch# show interface fastethernet 3/3 | begin L3
  L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 12 pkt, 778 bytes mcast
  L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes
  4046399 packets input, 349370039 bytes, 0 no buffer
  Received 3795255 broadcasts, 2 runts, 0 giants, 0 throttles
  <...output truncated...>
Switch#
```

The IP unicast packet count is updated approximately every five seconds.

Displaying IP Statistics

IP unicast statistics are gathered on a per-interface basis. To display IP statistics, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show interface type number counters detail</td>
<td>Displays IP statistics.</td>
</tr>
</tbody>
</table>
This example shows how to display IP unicast statistics for fastethernet 3/1:

```plaintext
Switch# show interface fastethernet 3/1 counters detail

<table>
<thead>
<tr>
<th>Port</th>
<th>InBytes</th>
<th>InUcastPkts</th>
<th>InMcastPkts</th>
<th>InBcastPkts</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Switch#
```

To display CEF (software switched) and hardware IP unicast adjacency table information, perform this task:

```
Command | Purpose
---------|---------
Switch# show adjacency [interface] [detail | internal | summary]

Displays detailed adjacency information, including Layer 2 information, when the optional detail keyword is used.
```

This example shows how to display adjacency statistics:
```
Switch# show adjacency gigabitethernet 3/5 detail

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Interface</th>
<th>Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP</td>
<td>GigabitEthernet9/5</td>
<td>172.20.53.206(11)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>504 packets, 6110 bytes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>00605C865B82</td>
</tr>
<tr>
<td></td>
<td></td>
<td>000164F83F9A50800</td>
</tr>
<tr>
<td></td>
<td></td>
<td>03:49:31</td>
</tr>
</tbody>
</table>
```

Note: Adjacency statistics are updated approximately every 10 seconds.
Configuring Unicast Reverse Path Forwarding

This chapter describes the Unicast Reverse Path Forwarding (Unicast RPF) feature. The Unicast RPF feature helps to mitigate problems that are caused by malformed or forged IP source addresses that are passing through a switch.

For a complete description of the Unicast RPF commands in this chapter, refer to the chapter “Unicast Reverse Path Forwarding Commands” of the Cisco IOS Security Command Reference. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

This chapter includes the following sections:

- About Unicast Reverse Path Forwarding, page 34-1
- Unicast RPF Configuration Tasks, page 34-9
- Monitoring and Maintaining Unicast RPF, page 34-11
- Unicast RPF Configuration Example: Inbound and Outbound Filters, page 34-12

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Unicast Reverse Path Forwarding

The Unicast RPF feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including
Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

This section covers the following information:

- How Unicast RPF Works, page 34-2
- Implementing Unicast RPF, page 34-4
- Restrictions, page 34-8
- Related Features and Technologies, page 34-8
- Prerequisites to Configuring Unicast RPF, page 34-9

### How Unicast RPF Works

When Unicast RPF is enabled on an interface, the switch examines all packets received as input on that interface to make sure that the source address and source interface appear in the routing table and match the interface on which the packet was received. This ability to look backwards is available only when Cisco Express Forwarding (CEF) is enabled on the switch, because the lookup relies on the presence of the Forwarding Information Base (FIB). CEF generates the FIB as part of its operation.

**Note**

Unicast RPF is an input function and is applied only on the input interface of a switch at the upstream end of a connection.

Unicast RPF checks to see if any packet received at a switch interface arrives on the best return path (return route) to the source of the packet. Unicast RPF does this by doing a reverse lookup in the FIB table. If the packet was received from one of the best reverse path routes, the packet is forwarded as normal. If there is no reverse path route on the same interface from which the packet was received, it might mean that the source address was modified. If Unicast RPF does not find a reverse path for the packet, the packet is dropped.

**Note**

With Unicast RPF, all equal-cost “best” return paths are considered valid. This means that Unicast RPF works in cases where multiple return paths exist, provided that each path is equal to the others in terms of the routing cost (number of hops, weights, and so on) and as long as the route is in the FIB. Unicast RPF also functions where EIGRP variants are being used and unequal candidate paths back to the source IP address exist.

When a packet is received at the interface where Unicast RPF and ACLs have been configured, the following actions occur:

**Step 1**
Input ACLs configured on the inbound interface are checked.

**Step 2**
Unicast RPF checks to see if the packet has arrived on the best return path to the source, which it does by doing a reverse lookup in the FIB table.

**Step 3**
CEF table (FIB) lookup is carried out for packet forwarding.

**Step 4**
Output ACLs are checked on the outbound interface.
Step 5 The packet is forwarded.

This section provides information about Unicast RPF enhancements:
- Access control lists and logging
- Per-interface statistics

Figure 34-1 illustrates how Unicast RPF and CEF work together to validate IP source addresses by verifying packet return paths. In this example, a customer has sent a packet having a source address of 192.168.1.1 from interface Gigabit Ethernet 1/1. Unicast RPF checks the FIB to see if 192.168.1.1 has a path to Gigabit Ethernet 1/1. If there is a matching path, the packet is forwarded. If there is no matching path, the packet is dropped.

Figure 34-1 Unicast RPF Validating IP Source Addresses

Figure 34-2 illustrates how Unicast RPF drops packets that fail validation. In this example, a customer has sent a packet having a source address of 209.165.200.225, which is received at interface Gigabit Ethernet 1/1. Unicast RPF checks the FIB to see if 209.165.200.225 has a return path to Gigabit Ethernet 1/1. If there is a matching path, the packet is forwarded. There is no reverse entry in the routing table that routes the customer packet back to source address 209.165.200.225 on interface Gigabit Ethernet 1/1, and so the packet is dropped.

Figure 34-2
Chapter 34  Configuring Unicast Reverse Path Forwarding

About Unicast Reverse Path Forwarding

Figure 34-2  Unicast RPF Dropping Packets That Fail Verification

Implementing Unicast RPF

Unicast RPF has several key implementation principles:

- The packet must be received at an interface that has the best return path (route) to the packet source (a process called symmetric routing). There must be a route in the FIB matching the route to the receiving interface. Adding a route in the FIB is done with a static route, network statement, or dynamic routing. (ACLs permit the use of Unicast RPF when packets will arrive by specific, less optimal asymmetric input paths.)
- IP source addresses at the receiving interface must match the routing entry for the interface.
- Unicast RPF is an input function and is applied only on the input interface of a switch at the upstream end of a connection.

Given these implementation principles, Unicast RPF becomes a tool that network administrators can use not only for their customers but also for their downstream network or ISP, even if the downstream network or ISP has other connections to the Internet.

Caution  Using optional BGP attributes such as weight and local preference, you can modify the best path back to the source address. Modification affects the operation of Unicast RPF.
This section provides information about the implementation of Unicast RPF:

- Security Policy and Unicast RPF, page 34-5
- Where to Use Unicast RPF, page 34-5
- Routing Table Requirements, page 34-7
- Where Not to Use Unicast RPF, page 34-7
- Unicast RPF with BOOTP and DHCP, page 34-8

**Security Policy and Unicast RPF**

Consider the following points in determining your policy for deploying Unicast RPF:

- Unicast RPF must be applied at the interface downstream from the larger portion of the network, preferably at the edges of your network.
- The farther downstream you apply Unicast RPF, the finer the granularity you have in mitigating address spoofing and in identifying the sources of spoofed addresses. For example, applying Unicast RPF on an aggregation switch helps mitigate attacks from many downstream networks or clients and is simple to administer, but it does not help identify the source of the attack. Applying Unicast RPF at the network access server helps limit the scope of the attack and trace the source of the attack; however, deploying Unicast RPF across many sites does add to the administration cost of operating the network.
- The more entities that deploy Unicast RPF across Internet, intranet, and extranet resources, the better the chances of mitigating large-scale network disruptions throughout the Internet community, and the better the chances of tracing the source of an attack.
- Unicast RPF will not inspect IP packets encapsulated in tunnels, such as GRE, LT2P, or PPTP. Unicast RPF must be configured at a home gateway so that Unicast RPF processes network traffic only after the tunneling and encryption layers have been stripped off the packets.

**Where to Use Unicast RPF**

Unicast RPF can be used in any single-homed environment where there is essentially only one access point out of the network; that is, one upstream connection. Networks having one access point offer the best example of symmetric routing, which means that the interface where a packet enters the network is also the best return path to the source of the IP packet. Unicast RPF is best used at the network perimeter for Internet, intranet, or extranet environments, or in ISP environments for customer network terminations.

**Enterprise Networks with a Single Connection to an ISP**

In enterprise networks, one objective of using Unicast RPF for filtering traffic at the input interface (a process called *ingress filtering*) is for protection from malformed packets arriving from the Internet. Traditionally, local networks with one connection to the Internet use ACLs at the receiving interface to prevent spoofed packets from the Internet from entering their local network.
ACLs work well for many single-homed customers; however, there are trade-offs when ACLs are used as ingress filters, including two commonly referenced limitations:

- Packet per second (PPS) performance at very high packet rates

**Note:** This restriction applies only to software packet forwarding. Hardware packet forwarding is the same on both ACL and uRPF.

- Maintenance of the ACL (whenever new addresses are added to the network)

Unicast RPF is one tool that addresses both of these limitations. With Unicast RPF, ingress filtering is done at CEF PPS rates. This processing speed makes a difference when the link is more than 1 Mbps. Additionally, since Unicast RPF uses the FIB, no ACL maintenance is necessary, and thus the administration overhead of traditional ACLs is reduced. The following figure and example demonstrate how Unicast RPF is configured for ingress filtering.

**Figure 34-3** illustrates an enterprise network that has a single link to an upstream ISP. In this example, Unicast RPF is applied at interface Gigabit Ethernet 1/1 on the Enterprise switch for protection from malformed packets arriving from the Internet. Unicast RPF is also applied at interface Gigabit Ethernet 2/1 on the ISP switch for protection from malformed packets arriving from the enterprise network.

**Figure 34-3** Enterprise Network Using Unicast RPF for Ingress Filtering

Using the topography in **Figure 34-3**, a typical configuration (assuming that CEF is turned on) on the ISP switch appears as follows:

```plaintext
interface Gigabit Ethernet 2/1
  description Link to Enterprise Network
  ip address 192.168.3.1 255.255.255.255
  no switchport
  ip address 10.1.1.2 255.255.255.0
  ip verify unicast source reachable-via rx allow-default
```

The gateway switch configuration of the enterprise network (assuming that CEF is turned on) appears as follows:

```plaintext
interface Gigabit Ethernet 1/2
  description ExampleCorp LAN
  ip address 192.168.10.1 255.255.252.0
  no ip redirects
  no ip directed-broadcast
  no ip proxy-arp

interface Gigabit Ethernet 1/1
  description Link to Internet
  no switchport
  ip address 10.1.1.1 255.255.255.0
  ip verify unicast source reachable-via allow-default
  no ip proxy-arp
  no ip redirects
  no ip directed-broadcast
```
Unicast RPF works with a single default route. No additional routes or routing protocols exist. Network 192.168.10.0/22 is a connected network. Packets arriving from the Internet with a source address in the range 192.168.10.0/22 are dropped by Unicast RPF.

**Routing Table Requirements**

To work correctly, Unicast RPF needs proper information in the CEF tables. This requirement does not mean that the switch must have the entire Internet routing table. The amount of routing information needed in the CEF tables depends on where Unicast RPF is configured and what functions the switch performs in the network. For example, in an ISP environment, a switch that is a leased-line aggregation switch for customers needs only the information based on the static routes redistributed into the IGP or IBGP (depending on which technique is used in the network). Unicast RPF is configured on the customer interfaces, creating the requirement for minimal routing information. In another scenario, a single-homed ISP could place Unicast RPF on the gateway link to the Internet. The full Internet routing table is required. Requiring the full routing table helps protect the ISP from external DoS attacks that use addresses that are not in the Internet routing table.

**Where Not to Use Unicast RPF**

Do not use Unicast RPF on interfaces that are internal to the network. Internal interfaces are likely to have routing asymmetry (see Figure 34-4), meaning multiple routes to the source of a packet. Apply Unicast RPF only where there is natural or configured symmetry. Provided administrators carefully plan which interfaces they activate Unicast RPF on, routing asymmetry is not a serious problem.

For example, switches at the edge of the network of an ISP are more likely to have symmetrical reverse paths than switches that are in the core of the ISP network. Switches that are in the core of the ISP network have no guarantee that the best forwarding path out of the switch is the path selected for packets returning to the switch. We do not recommend that you apply Unicast RPF where there is a chance of asymmetric routing, unless you use ACLs to allow the switch to accept incoming packets. ACLs permit the use of Unicast RPF when packets will arrive by specific, less optimal asymmetric input paths. However, it is simplest to place Unicast RPF only at the edge of a network or, for an ISP, at the customer edge of the network.

Figure 34-4 illustrates how Unicast RPF can block legitimate traffic in an asymmetrical routing environment.
Chapter 34  Configuring Unicast Reverse Path Forwarding

About Unicast Reverse Path Forwarding

Unicast RPF will allow packets with 0.0.0.0 source and 255.255.255.255 destination to pass so that Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) functions work properly.

Restrictions

Restrictions for applying Unicast RPF to multihomed clients include the following:

- Clients should not be multihomed to the same switch because action defeats the purpose of building a redundant service for the client.
- Customers must ensure that the packets flowing up the link (out to the Internet) match the route advertised out the link. Otherwise, Unicast RPF filters those packets as malformed packets.

Limitation

Unicast loose mode is not supported.

Related Features and Technologies

For more information about Unicast RPF-related features and technologies, review the following:

- Unicast RPF requires Cisco express forwarding (CEF) to function properly on the switch. For more information about CEF, refer to the Cisco IOS Switching Services Configuration Guide.
- Unicast RPF can be more effective at mitigating spoofing attacks when combined with a policy of ingress and egress filtering using Cisco IOS access control lists (ACLs).
Chapter 34  Configuring Unicast Reverse Path Forwarding

Unicast RPF Configuration Tasks

- Ingress filtering applies filters to traffic received at a network interface from either internal or external networks. With ingress filtering, packets that arrive from other networks or the Internet and that have a source address that matches a local network, private, or broadcast address are dropped. In ISP environments, for example, ingress filtering can apply to traffic received at the switch from either the client (customer) or the Internet.

- Egress filtering applies filters to traffic exiting a network interface (the sending interface). By filtering packets on switches that connect your network to the Internet or to other networks, you can permit only packets with valid source IP addresses to leave your network.

For more information on network filtering, refer to RFC 2267 and to the Cisco IOS IP Configuration Guide.

Prerequisites to Configuring Unicast RPF

Prior to configuring Unicast RPF, configure ACLs:

- Configure standard or extended ACLs to mitigate transmission of invalid IP addresses (perform egress filtering). Permit only valid source addresses to leave your network and get onto the Internet. Prevent all other source addresses from leaving your network for the Internet.

- Configure standard or extended ACLs entries to drop (deny) packets that have invalid source IP addresses (perform ingress filtering). Invalid source IP addresses include the following types:
  - Reserved addresses
  - Loopback addresses
  - Private addresses (RFC 1918, Address Allocation for Private Internets)
  - Broadcast addresses (including multicast addresses)
  - Source addresses that fall outside the range of valid addresses associated with the protected network

Unicast RPF Configuration Tasks

The following sections describe the configuration tasks for Unicast RPF. Each task in the list is identified as either optional or required.

- Configuring Unicast RPF, page 34-9 (Required)
- Verifying Unicast RPF, page 34-10 (Optional)

See the section “Unicast RPF Configuration Example: Inbound and Outbound Filters” at the end of this chapter.

Configuring Unicast RPF

Unicast RPF is an input-side function that is enabled on an interface operates on IP packets received by the switch.

- Ingress filtering applies filters to traffic received at a network interface from either internal or external networks. With ingress filtering, packets that arrive from other networks or the Internet and that have a source address that matches a local network, private, or broadcast address are dropped. In ISP environments, for example, ingress filtering can apply to traffic received at the switch from either the client (customer) or the Internet.

- Egress filtering applies filters to traffic exiting a network interface (the sending interface). By filtering packets on switches that connect your network to the Internet or to other networks, you can permit only packets with valid source IP addresses to leave your network.

For more information on network filtering, refer to RFC 2267 and to the Cisco IOS IP Configuration Guide.
To configure Unicast RPF, perform the following task:

### Command

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch(config-if)# interface type</td>
<td>Selects the input interface on which you want to apply Unicast RPF. It is the receiving interface, allowing Unicast RPF to verify the best return path before forwarding the packet on to the next destination. The interface type is specific to your switch and the types of interface cards installed on the switch. To display a list of available interface types, enter the <code>interface ?</code> command.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config-if)# ip verify unicast source reachable-via rx allow-default</td>
<td>Enables Unicast RPF on the interface.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config-if)# exit</td>
<td>Exits interface configuration mode. Repeat Steps 2 and 3 for each interface on which you want to apply Unicast RPF.</td>
</tr>
</tbody>
</table>

### Verifying Unicast RPF

To verify that Unicast RPF is operational, use the `show cef interface` command. The following example shows that Unicast RPF is enabled at interface Gigabit Ethernet 3/1:

Switch# show cef interface gigabitEthernet 3/1
GigabitEthernet3/1 is up (if_number 79)
Corresponding hwidb fast_if_number 79
Corresponding hwidb firstsw->if_number 79
Internet address is 10.1.1.1/24
ICMP redirects are always sent
IP unicast RPF check is enabled <======
Input features: uRPF <======
Inbound access list is not set
Outbound access list is not set
IP policy routing is disabled
BGP based policy accounting on input is disabled
BGP based policy accounting on output is disabled
Hardware idb is GigabitEthernet3/1
Fast switching type 1, interface type 155
IP CEF switching enabled
IP CEF switching turbo vector
IP Null turbo vector
IP prefix lookup IPv4 mtrie 8-8-8-8 optimized
Input fast flags 0x4000, Output fast flags 0x0
ifindex 78(78)
Slot 3 Slot unit 1 VC -1
Transmit limit accumulator 0x0 (0x0)
IP MTU 1500
Monitoring and Maintaining Unicast RPF

To monitor and maintain Unicast RPF, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# <code>show ip traffic</code></td>
<td>Displays global switch statistics about Unicast RPF drops and suppressed drops.</td>
</tr>
<tr>
<td>Switch(config-if)# <code>no ip verify unicast</code></td>
<td>Disables Unicast RPF at the interface.</td>
</tr>
</tbody>
</table>

Unicast RPF counts the number of packets dropped or suppressed because of malformed or forged source addresses. Unicast RPF counts dropped or forwarded packets that include the following global and per-interface information:

- Global Unicast RPF drops
- Per-interface Unicast RPF drops
- Per-interface Unicast RPF suppressed drops

The `show ip traffic` command shows the total number (global count) of dropped or suppressed packets as dropped by software; it does not include the count of packets dropped by hardware. The Unicast RPF drop count is included in the IP statistics section.

```
Switch# show ip traffic
IP statistics:
  Rcvd: 1471590 total, 887368 local destination
  0 format errors, 0 checksum errors, 301274 bad hop count
  0 unknown protocol, 0 not a gateway
  0 security failures, 0 bad options, 0 with options
  Opt: 0 end, 0 nop, 0 basic security, 0 loose source route
  0 timestamp, 0 extended security, 0 record route
  0 stream ID, 0 strict source route, 0 alert, 0 other
  Frags: 0 reassembled, 0 timeouts, 0 couldn't reassemble
  0 fragmented, 0 couldn't fragment
  Bcast: 205233 received, 0 sent
  Mcast: 463292 received, 462118 sent
  Sent: 990158 generated, 282938 forwarded
! The second line below ("0 unicast RPF") displays Unicast RPF packet dropping information.
  Drop: 3 encapsulation failed, 0 unresolved, 0 no adjacency
  0 no route, 0 unicast RPF, 0 forced drop
```

A nonzero value for the count of dropped or suppressed packets can mean one of two things:

- Unicast RPF is dropping or suppressing packets that have a bad source address (normal operation).
- Unicast RPF is dropping or suppressing legitimate packets because the route is misconfigured to use Unicast RPF in environments where asymmetric routing exists; that is, where multiple paths can exist as the best return path for a source address.

The `show ip interface` command shows the total of dropped or suppressed packets at a specific interface. If Unicast RPF is configured to use a specific ACL, that ACL information is displayed along with the drop statistics.

```
Switch> show ip interface fast 2/1
  Unicast RPF ACL 197
  1 unicast RPF drop
  1 unicast RPF suppressed drop
```
The `show access-lists` command displays the number of matches found for a specific entry in a specific access list.

Switch> `show access-lists`

Extended IP access list 197
  deny ip 192.168.201.0 0.0.0.63 any log-input (1 match)
  permit ip 192.168.201.64 0.0.0.63 any log-input (1 match)
  deny ip 192.168.201.128 0.0.0.63 any log-input
  permit ip 192.168.201.192 0.0.0.63 any log-input

Unicast RPF Configuration Example: Inbound and Outbound Filters

The following example uses a very simple single-homed ISP to demonstrate the concepts of ingress and egress filters used in conjunction with Unicast RPF. The example illustrates an ISP-allocated classless interdomain routing (CIDR) block 209.165.202.128/28 that has both inbound and outbound filters on the upstream interface. Be aware that ISPs are usually not single-homed. Provisions for asymmetrical flows (when outbound traffic goes out one link and returns by using a different link) must be designed into the filters on the border switches of the ISP.

```plaintext
ip cef distributed
!
interface Serial 5/0/0
  description Connection to Upstream ISP
  ip address 209.165.200.225 255.255.255.252
  no ip redirects
  no ip directed-broadcast
  no ip proxy-arp
  ip verify unicast reverse-path rx allow-default
  ip access-group 111 in
  ip access-group 110 out

  access-list 110 permit ip 209.165.202.128 0.0.0.31 any
  access-list 110 deny ip any any log
  access-list 111 deny ip host 0.0.0.0 any log
  access-list 111 deny ip 127.0.0.0 0.255.255.255 any log
  access-list 111 deny ip 10.0.0.0 0.255.255.255 any log
  access-list 111 deny ip 172.16.0.0 0.15.255.255 any log
  access-list 111 deny ip 192.168.0.0 0.0.255.255 any log
  access-list 111 deny ip 209.165.202.128 0.0.0.31 any log
  access-list 111 permit ip any any
```
Configuring IP Multicast

This chapter describes IP multicast routing on the Catalyst 4500 series switch. It also provides procedures and examples to configure IP multicast routing.

**Note**
For more detailed information on IP Multicast, refer to this URL:

**Note**
For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

This chapter includes the following major sections:

- About IP Multicast, page 35-1
- Configuring IP Multicast Routing, page 35-12
- Monitoring and Maintaining IP Multicast Routing, page 35-22
- Configuration Examples, page 35-28

## About IP Multicast

**Note**
Controlling the transmission rate to a multicast group is not supported.

At one end of the IP communication spectrum is IP unicast, where a source IP host sends packets to a specific destination IP host. In IP unicast, the destination address in the IP packet is the address of a single, unique host in the IP network. These IP packets are forwarded across the network from the source
to the destination host by routers. At each point on the path between source and destination, a router uses a unicast routing table to make unicast forwarding decisions, based on the IP destination address in the packet.

At the other end of the IP communication spectrum is an IP broadcast, where a source host sends packets to all hosts on a network segment. The destination address of an IP broadcast packet has the host portion of the destination IP address set to all ones and the network portion set to the address of the subnet. IP hosts, including routers, understand that packets, which contain an IP broadcast address as the destination address, are addressed to all IP hosts on the subnet. Unless specifically configured otherwise, routers do not forward IP broadcast packets, so IP broadcast communication is normally limited to a local subnet.

IP multicasting falls between IP unicast and IP broadcast communication. IP multicast communication enables a host to send IP packets to a group of hosts anywhere within the IP network. To send information to a specific group, IP multicast communication uses a special form of IP destination address called an IP multicast group address. The IP multicast group address is specified in the IP destination address field of the packet.

To multicast IP information, Layer 3 switches and routers must forward an incoming IP packet to all output interfaces that lead to members of the IP multicast group. In the multicasting process on the Catalyst 4500 series switch, a packet is replicated in the Integrated Switching Engine, forwarded to the appropriate output interfaces, and sent to each member of the multicast group.

We tend to think of IP multicasting and video conferencing as the same thing. Although the first application in a network to use IP multicast is often video conferencing, video is only one of many IP multicast applications that can add value to a company’s business model. Other IP multicast applications that have potential for improving productivity include multimedia conferencing, data replication, real-time data multicasts, and simulation applications.

This section contains the following subsections:
- IP Multicast Protocols, page 35-2
- IP Multicast Implementation on the Catalyst 4500 Series Switch, page 35-4
- Restrictions on Using Bidirectional PIM, page 35-12

### IP Multicast Protocols

The Catalyst 4500 series switch primarily uses these protocols to implement IP multicast routing:
- Internet Group Management Protocol (IGMP)
- Protocol Independent Multicast (PIM)
- IGMP snooping and Cisco Group Management Protocol

Figure 35-1 shows where these protocols operate within the IP multicast environment.
Chapter 35      Configuring IP Multicast

About IP Multicast

Figure 35-1   IP Multicast Routing Protocols

Internet Group Management Protocol

IGMP messages are used by IP multicast hosts to send their local Layer 3 switch or router a request to join a specific multicast group and begin receiving multicast traffic. With some extensions in IGMPv2, IP hosts can also send a request to a Layer 3 switch or router to leave an IP multicast group and not receive the multicast group traffic.

Using the information obtained by using IGMP, a Layer 3 switch or router maintains a list of multicast group memberships on a per-interface basis. A multicast group membership is active on an interface if at least one host on the interface sends an IGMP request to receive multicast group traffic.

Protocol-Independent Multicast

PIM is protocol independent because it can leverage whichever unicast routing protocol is used to populate the unicast routing table, including EIGRP, OSPF, BGP, or static route, to support IP multicast. PIM also uses a unicast routing table to perform the reverse path forwarding (RPF) check function instead of building a completely independent multicast routing table. PIM does not send and receive multicast routing updates between routers like other routing protocols do.

PIM Dense Mode

PIM Dense Mode (PIM-DM) uses a push model to flood multicast traffic to every corner of the network. PIM-DM is intended for networks in which most LANs need to receive the multicast, such as LAN TV and corporate or financial information broadcasts. It can be an efficient delivery mechanism if active receivers exist on every subnet in the network.

For more detailed information on PIM Dense Mode, refer to this URL:

PIM Sparse Mode

PIM Sparse Mode (PIM-SM) uses a pull model to deliver multicast traffic. Only networks with active receivers that have explicitly requested the data are forwarded the traffic. PIM-SM is intended for networks with several different multicasts, such as desktop video conferencing and collaborative computing, that go to a small number of receivers and are typically in progress simultaneously.
Bidirectional PIM Mode

In bidirectional PIM (Bidir-PIM) mode, traffic is routed only along a bidirectional shared tree that is rooted at the rendezvous point (RP) for the group. The IP address of the RP functions as a key enabling all routers to establish a loop-free spanning tree topology rooted in that IP address.

Bidir-PIM is intended for many-to-many applications within individual PIM domains. Multicast groups in bidirectional mode can scale to an arbitrary number of sources without incurring overhead due to the number of sources.

For more detailed information on Bidirectional Mode, refer to this URL:

Rendezvous Point (RP)

If you configure PIM to operate in sparse mode, you must also choose one or more routers to be rendezvous points (RPs). Senders to a multicast group use RPs to announce their presence. Receivers of multicast packets use RPs to learn about new senders. You can configure Cisco IOS software so that packets for a single multicast group can use one or more RPs.

The RP address is used by first hop routers to send PIM register messages on behalf of a host sending a packet to the group. The RP address is also used by last hop routers to send PIM join and prune messages to the RP to inform it about group membership. You must configure the RP address on all routers (including the RP router).

A PIM router can be an RP for more than one group. Only one RP address can be used at a time within a PIM domain for the same group. The conditions specified by the access list determine for which groups the router is an RP (as different groups can have different RPs).

IGMP Snooping

IGMP snooping is used for multicasting in a Layer 2 switching environment. With IGMP snooping, a Layer 3 switch or router examines Layer 3 information in the IGMP packets in transit between hosts and a router. When the switch receives the IGMP Host Report from a host for a particular multicast group, the switch adds the host's port number to the associated multicast table entry. When the switch receives the IGMP Leave Group message from a host, it removes the host's port from the table entry.

Because IGMP control messages are transmitted as multicast packets, they are indistinguishable from multicast data if only the Layer 2 header is examined. A switch running IGMP snooping examines every multicast data packet to determine whether it contains any pertinent IGMP control information. If IGMP snooping is implemented on a low end switch with a slow CPU, performance could be severely impacted when data is transmitted at high rates. On the Catalyst 4500 series switches, IGMP snooping is implemented in the forwarding ASIC, so it does not impact the forwarding rate.

IP Multicast Implementation on the Catalyst 4500 Series Switch

The Catalyst 4500 series switch supports an ASIC-based integrated switching engine that provides Ethernet bridging at Layer 2 and IP routing at Layer 3. Because the ASIC is specifically designed to forward packets, the integrated switching engine hardware provides very high performance with ACLs and QoS enabled. At wire-speed, forwarding in hardware is significantly faster than the CPU subsystem software, which is designed to handle exception packets.
The integrated switching engine hardware supports interfaces for inter-VLAN routing and switch ports for Layer 2 bridging. It also provides a physical Layer 3 interface that can be configured to connect with a host, a switch, or a router.

Figure 35-2 shows a logical view of Layer 2 and Layer 3 forwarding in the integrated switching engine hardware.

Figure 35-2        Logical View of Layer 2 and Layer 3 Forwarding in Hardware

This section contains the following subsections:
- CEF, MFIB, and Layer 2 Forwarding, page 35-5
- IP Multicast Tables, page 35-7
- Hardware and Software Forwarding, page 35-8
- Non-Reverse Path Forwarding Traffic, page 35-10
- Multicast Fast Drop, page 35-10
- Multicast Forwarding Information Base, page 35-11
- S/M, 224/4, page 35-12

CEF, MFIB, and Layer 2 Forwarding

The implementation of IP multicast on the Catalyst 4500 series switch is an extension of centralized Cisco Express Forwarding (CEF). CEF extracts information from the unicast routing table, which is created by unicast routing protocols, such as BGP, OSPF, and EIGR and loads it into the hardware Forwarding Information Base (FIB). With the unicast routes in the FIB, when a route is changed in the upper-layer routing table, only one route needs to be changed in the hardware routing state. To forward unicast packets in hardware, the integrated switching engine looks up source and destination routes in ternary content addressable memory (TCAM), takes the adjacency index from the hardware FIB, and gets the Layer 2 rewrite information and next-hop address from the hardware adjacency table.

The new Multicast Forwarding Information Base (MFIB) subsystem is the multicast analog of the unicast CEF. The MFIB subsystem extracts the multicast routes that PIM and IGMP create and refines them into a protocol-independent format for forwarding in hardware. The MFIB subsystem removes the
About IP Multicast

Protocol-specific information and leaves only the essential forwarding information. Each entry in the MFIB table consists of an (S,G) or (*,G) route, an input RPF VLAN, and a list of Layer 3 output interfaces. The MFIB subsystem, together with platform-dependent management software, loads this multicast routing information into the hardware FIB and Replica Expansion Table (RET).

The Catalyst 4500 series switch performs Layer 3 routing and Layer 2 bridging at the same time. There can be multiple Layer 2 switch ports on any VLAN interface. To determine the set of output switch ports on which to forward a multicast packet, the Supervisor Engine III combines Layer 3 MFIB information with Layer 2 forwarding information and stores it in the hardware MET for packet replication.

Figure 35-3 shows a functional overview of how the Catalyst 4500 series switch combines unicast routing, multicast routing, and Layer 2 bridging information to forward in hardware.

Figure 35-3 Combining CEF, MFIB, and Layer 2 Forwarding Information in Hardware

Like the CEF unicast routes, the MFIB routes are Layer 3 and must be merged with the appropriate Layer 2 information. The following example shows an MFIB route:

(*,224.1.2.3)
RPF interface is Vlan3
Output Interfaces are:
Vlan 1
Vlan 2

The route (*,224.1.2.3) is loaded in the hardware FIB table and the list of output interfaces is loaded into the MET. A pointer to the list of output interfaces, the MET index, and the RPF interface are also loaded in the hardware FIB with the (*,224.1.2.3) route. With this information loaded in hardware, merging of the Layer 2 information can begin. For the output interfaces on VLAN1, the integrated switching engine must send the packet to all switch ports in VLAN1 that are in the spanning tree forwarding state. The same process applies to VLAN 2. To determine the set of switch ports in VLAN 2, the Layer 2 Forwarding Table is used.

When the hardware routes a packet, in addition to sending it to all of the switch ports on all output interfaces, the hardware also sends the packet to all switch ports (other than the one it arrived on) in the input VLAN. For example, assume that VLAN 3 has two switch ports in it, Gig 3/1 and Gig 3/2. If a host
on Gig 3/1 sends a multicast packet, the host on Gig 3/2 might also need to receive the packet. To send a multicast packet to the host on Gig 3/2, all of the switch ports in the ingress VLAN must be added to the port set that is loaded in the MET.

If VLAN 1 contains 1/1 and 1/2, VLAN 2 contains 2/1 and 2/2, and VLAN 3 contains 3/1 and 3/2, the MET chain for this route would contain these switch ports: (1/1,1/2,2/1,2/2,3/1, and 3/2).

If IGMP snooping is on, the packet should not be forwarded to all output switch ports on VLAN 2. The packet should be forwarded only to switch ports where IGMP snooping has determined that there is either a group member or router. For example, if VLAN 1 had IGMP snooping enabled, and IGMP snooping determined that only port 1/2 had a group member on it, then the MET chain would contain these switch ports: (1/1,1/2, 2/1, 2/2, 3/1, and 3/2).

**IP Multicast Tables**

Figure 35-4 shows some key data structures that the Catalyst 4500 series switch uses to forward IP multicast packets in hardware.

The integrated switching engine maintains the hardware FIB table to identify individual IP multicast routes. Each entry consists of a destination group IP address and an optional source IP address. Multicast traffic flows on primarily two types of routes: (S,G) and (*,G). The (S,G) routes flow from a source to a group based on the IP address of the multicast source and the IP address of the multicast group destination. Traffic on a (*,G) route flows from the PIM RP to all receivers of group G. Only sparse-mode groups use (*,G) routes. The integrated switching engine hardware contains space for a total of 128,000 routes, which are shared by unicast routes, multicast routes, and multicast fast-drop entries.
Output interface lists are stored in the multicast expansion table (MET). The MET has room for up to 32,000 output interface lists. (For RET, we can have up to 102 K entries (32 K used for floodsets, 70,000 used for multicast entries)). The MET resources are shared by both Layer 3 multicast routes and by Layer 2 multicast entries. The actual number of output interface lists available in hardware depends on the specific configuration. If the total number of multicast routes exceed 32,000, multicast packets might not be switched by the Integrated Switching Engine. They would be forwarded by the CPU subsystem at much slower speeds.

**Note**
For RET, a maximum of 102 K entries is supported (32 K used for floodsets, 70 K used for multicast entries).

**Note**
Prior to Release IOS XE 3.3.0SG and IOS 15.1(1)SG, partial routing is not supported on Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E; only hardware and software routing are supported. Starting with Release IOS XE 3.3.0SG and IOS 15.1(1)SG, partial routing is supported on all supervisor engines.

### Hardware and Software Forwarding

The integrated switching engine forwards the majority of packets in hardware at very high rates of speed. The CPU subsystem forwards exception packets in software. Statistical reports should show that the integrated switching engine is forwarding the vast majority of packets in hardware.

**Figure 35-5** shows a logical view of the hardware and software forwarding components.

**Figure 35-5  Hardware and Software Forwarding Components**

In the normal mode of operation, the integrated switching engine performs inter-VLAN routing in hardware. The CPU subsystem supports generic routing encapsulation (GRE) tunnels for forwarding in software.
Replication is a particular type of forwarding where, instead of sending out one copy of the packet, the packet is replicated and multiple copies of the packet are sent out. At Layer 3, replication occurs only for multicast packets; unicast packets are never replicated to multiple Layer 3 interfaces. In IP multicasting, for each incoming IP multicast packet that is received, many replicas of the packet are sent out.

IP multicast packets can be transmitted on the following types of routes:

- Hardware routes
- Software routes
- Partial routes

Hardware routes occur when the integrated switching engine hardware forwards all replicas of a packet. Software routes occur when the CPU subsystem software forwards all replicas of a packet. Partial routes occur when the integrated switching engine forwards some of the replicas in hardware and the CPU subsystem forwards some of the replicas in software.

### Partial Routes

**Note**

The conditions listed below cause the replicas to be forwarded by the CPU subsystem software, but the performance of the replicas that are forwarded in hardware is not affected.

The following conditions cause some replicas of a packet for a route to be forwarded by the CPU subsystem:

- The switch is configured with the `ip igmp join-group` command as a member of the IP multicast group on the RPF interface of the multicast source.
- The switch is the first-hop to the source in PIM sparse mode. The switch must send PIM-register messages to the RP.

### Software Routes

**Note**

If any one of the following conditions is configured on the RPF interface or the output interface, all replication of the output is performed in software.

The following conditions cause all replicas of a packet for a route to be forwarded by the CPU subsystem software:

- The interface is configured with multicast helper.
- The interface is a generic routing encapsulation (GRE) or Distance Vector Multicast Routing Protocol (DVMRP) tunnel.
- The interface uses non-Advanced Research Products Agency (ARPA) encapsulation.

The following packets are always forwarded in software:

- Packets sent to multicast groups that fall into the range 224.0.0.* (where * is in the range from 0 to 255). This range is used by routing protocols. Layer 3 switching supports all other multicast group addresses.
- Packets with IP options.
### Non-Reverse Path Forwarding Traffic

Traffic that fails an Reverse Path Forwarding (RPF) check is called non-RPF traffic. Non-RPF traffic is forwarded by the integrated switching engine by filtering (persistently dropping) or rate limiting the non-RPF traffic.

In a redundant configuration where multiple Layer 3 switches or routers connect to the same LAN segment, only one device forwards the multicast traffic from the source to the receivers on the outgoing interfaces. Figure 35-6 shows how non-RPF traffic can occur in a common network configuration.

**Figure 35-6   Redundant Multicast Router Configuration in a Stub Network**

![Diagram of redundant multicast router configuration](image)

In this kind of topology, only Router A, the PIM designated router (PIM DR), forwards data to the common VLAN. Router B receives the forwarded multicast traffic, but must drop this traffic because it has arrived on the wrong interface and fails the RPF check. Traffic that fails the RPF check is called non-RPF traffic.

### Multicast Fast Drop

In IP multicast protocols, such as PIM-SM and PIM-DM, every (S,G) or (*.G) route has an incoming interface associated with it. This interface is referred to as the reverse path forwarding interface. In some cases, when a packet arrives on an interface other than the expected RPF interface, the packet must be forwarded to the CPU subsystem software to allow PIM to perform special protocol processing on the packet. One example of this special protocol processing that PIM performs is the PIM Assert protocol.

By default, the integrated switching engine hardware sends all packets that arrive on a non-RPF interface to the CPU subsystem software. However, processing in software is not necessary in many cases, because these non-RPF packets are often not needed by the multicast routing protocols. The problem is that if no action is taken, the non-RPF packets that are sent to the software can overwhelm the CPU.

Prior to Release IOS XE 3.3.0SG and IOS 15.1(1)SG, to prevent this situation from happening, the CPU subsystem software would load fast-drop entries in the hardware when it receives an RPF failed packet that is not needed by the PIM protocols running on the switch. Any packet matching a fast-drop entry would be bridged in the ingress VLAN, but is not sent to the software so the CPU subsystem is not overloaded by processing these RPF failures unnecessarily. However, this process involved maintaining fast-drop entries in hardware. Because the FLCAM space is limited, the number of fast-drop entries installed in hardware was also limited.
Beginning with Release IOS XE 3.3.0SG and IOS 15.1(1)SG, rather than installing fast-drop entries, your switch uses Dynamic Buffer Limiting (DBL). This flow-based congestion avoidance mechanism provides active queue management by tracking the queue length for each traffic flow. When the queue length of a flow exceeds its set limit, DBL drops packets. Rate DBL limits the non-rpf traffic to the cpu subsystem so that the CPU is not overwhelmed. The packets are rate limited per flow to the CPU. Because installing fast-drop entries in the CAM is unnecessary, the number of fast-drop flows that can be handled by the switch need not be limited.

Protocol events, such as a link going down or a change in the unicast routing table, can impact the set of packets that can safely be fast dropped. A packet that was correctly fast dropped before might, after a topology change, need to be forwarded to the CPU subsystem software so that PIM can process it. The CPU subsystem software handles flushing fast-drop entries in response to protocol events so that the PIM code in IOS can process all the necessary RPF failures.

The use of fast-drop entries in the hardware is critical in some common topologies because you may have persistent RPF failures. Without the fast-drop entries, the CPU is exhausted by RPF failed packets that it did not need to process.

**Multicast Forwarding Information Base**

The Multicast Forwarding Information Base (MFIB) subsystem supports IP multicast routing in the integrated switching engine hardware on the Catalyst 4500 series switch. The MFIB logically resides between the IP multicast routing protocols in the CPU subsystem software (PIM, IGMP, MSDP, MBGP, and DVMRP) and the platform-specific code that manages IP multicast routing in hardware. The MFIB translates the routing table information created by the multicast routing protocols into a simplified format that can be efficiently processed and used for forwarding by the Integrated Switching Engine hardware.

To display the information in the multicast routing table, use the `show ip mroute` command. To display the MFIB table information, use the `show ip mfib` command.

The MFIB table contains a set of IP multicast routes. IP multicast routes include \((S,G)\) and \((*,G)\). Each route in the MFIB table can have one or more optional flags associated with it. The route flags indicate how a packet that matches a route should be forwarded. For example, the Internal Copy (IC) flag on an MFIB route indicates that a process on the switch needs to receive a copy of the packet. The following flags can be associated with MFIB routes:

- **Internal Copy (IC) flag**—Sets on a route when a process on the router needs to receive a copy of all packets matching the specified route.
- **Signalling (S) flag**—Sets on a route when a process needs to be notified when a packet matching the route is received; the expected behavior is that the protocol code updates the MFIB state in response to receiving a packet on a signalling interface.
- **Connected (C) flag**—When set on an MFIB route, has the same meaning as the Signaling (S) flag, except that the C flag indicates that only packets sent by directly connected hosts to the route should be signaled to a protocol process.

A route can also have a set of optional flags associated with one or more interfaces. For example, an \((S,G)\) route with the flags on VLAN 1 indicates how packets arriving on VLAN 1 should be handled, and whether packets matching the route should be forwarded onto VLAN 1. The per-interface flags supported in the MFIB include the following:

- **Accepting (A)**—Sets on the interface that is known in multicast routing as the RPF interface. A packet that arrives on an interface that is marked as Accepting (A) is forwarded to all Forwarding (F) interfaces.
• Forwarding (F)—Used in conjunction with the Accepting (A) flag as described above. The set of Forwarding interfaces that form what is often referred to as the multicast “olist” or output interface list.
• Signaling (S)—Sets on an interface when some multicast routing protocol process in Cisco IOS needs to be notified of packets arriving on that interface.

Note
When PIM-SM routing is in use, the MFIB route might include an interface as in this example:

```
PimTunnel [1.2.3.4].
```

it is a virtual interface that the MFIB subsystem creates to indicate that packets are being tunnelled to the specified destination address. A PimTunnel interface cannot be displayed with the normal `show interface` command.

S/M, 224/4

An (S/M, 224/4) entry is created in the MFIB for every multicast-enabled interface. This entry ensures that all packets sent by directly connected neighbors can be register-encapsulated to the PIM-SM RP. Typically, only a small number of packets are forwarded using the (S/M,224/4) route, until the (S,G) route is established by PIM-SM.

For example, on an interface with IP address 10.0.0.1 and netmask 255.0.0.0, a route is created matching all IP multicast packets in which the source address is anything in the class A network 10. This route can be written in conventional subnet/masklength notation as (10/8,224/4). If an interface has multiple assigned IP addresses, then one route is created for each such IP address.

Restrictions on Using Bidirectional PIM

Restrictions include the following:
• Starting with Release IOS XE 3.3.0SG and IOS 15.1(1)SG, the seven RP restriction was removed.
• IPv4 Bidirectional (Bidir) PIM is supported on Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E. IPv6 Bidir PIM is not supported.

Configuring IP Multicast Routing

The following sections describe IP multicast routing configuration tasks:
• Default Configuration in IP Multicast Routing, page 35-13
• Enabling IP Multicast Routing, page 35-13
• Enabling PIM on an Interface, page 35-14
• Enabling Bidirectional Mode, page 35-15
• Enabling PIM-SSM Mapping, page 35-16
• Configuring a Rendezvous Point, page 35-16
• Configuring a Single Static RP, page 35-20
• **Load Splitting of IP Multicast Traffic**, page 35-21

For more detailed information on IP multicast routing, such as Auto-RP, PIM Version 2, and IP multicast static routes, refer to the *Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.3.*

### Default Configuration in IP Multicast Routing

Table 35-1 shows the IP multicast default configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Value</th>

<td>Enabled on all VLAN interfaces</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td>If you disable IGMP snooping on an interface, all output ports are forwarded by the integrated switching engine. When IGMP snooping is disabled on an input VLAN interface, multicast packets related to that interface are sent to all forwarding switch ports in the VLAN.</td>
</tr>
</tbody>
</table>

**Note**

Source-specific multicast and IGMP v3 are supported.

For more information about source-specific multicast with IGMPv3 and IGMP, see the following URL:

### Enabling IP Multicast Routing

Enabling IP multicast routing allows the Catalyst 4500 series switch to forward multicast packets. To enable IP multicast routing on the router, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# ip multicast-routing</code></td>
<td>Enables IP multicast routing.</td>
</tr>
</tbody>
</table>
Enabling PIM on an Interface

Enabling PIM on an interface also enables IGMP operation on that interface. An interface can be configured to be in dense mode, sparse mode, or sparse-dense mode. The mode determines how the Layer 3 switch or router populates its multicast routing table and how the Layer 3 switch or router forwards multicast packets it receives from its directly connected LANs. You must enable PIM in one of these modes for an interface to perform IP multicast routing.

When the switch populates the multicast routing table, dense-mode interfaces are always added to the table. Sparse-mode interfaces are added to the table only when periodic join messages are received from downstream routers, or when there is a directly connected member on the interface. When forwarding from a LAN, sparse-mode operation occurs if there is an RP known for the group. If so, the packets are encapsulated and sent toward the RP. When no RP is known, the packet is flooded in a dense-mode fashion. If the multicast traffic from a specific source is sufficient, the receiver’s first-hop router can send join messages toward the source to build a source-based distribution tree.

There is no default mode setting. By default, multicast routing is disabled on an interface.

Enabling Dense Mode

To configure PIM on an interface to be in dense mode, enter this command:

```
Command Purpose
Switch(config-if)# ip pim dense-mode Enables dense-mode PIM on the interface.
```

For an example of how to configure a PIM interface in dense mode, see the “PIM Dense Mode Example” section.

Enabling Sparse Mode

To configure PIM on an interface to be in sparse mode, enter this command:

```
Command Purpose
Switch(config-if)# ip pim sparse-mode Enables sparse-mode PIM on the interface.
```

For an example of how to configure a PIM interface in sparse mode, see the “PIM Sparse Mode Example” section.

Enabling Sparse-Dense Mode

When you enter either the `ip pim sparse-mode` or `ip pim dense-mode` command, sparseness or denseness is applied to the interface as a whole. However, some environments might require PIM to run in a single region in sparse mode for some groups and in dense mode for other groups.

An alternative to enabling only dense mode or only sparse mode is to enable sparse-dense mode. The interface is treated as dense mode if the group is in dense mode; the interface is treated in sparse mode if the group is in sparse mode. If you want to treat the group as a sparse group, and the interface is in sparse-dense mode, you must have an RP.
If you configure sparse-dense mode, the idea of sparseness or denseness is applied to the group on the switch, and the network manager should apply the same concept throughout the network.

Another benefit of sparse-dense mode is that Auto-RP information can be distributed in a dense-mode manner; yet, multicast groups for user groups can be used in a sparse-mode manner. You do not need to configure a default RP at the leaf routers.

When an interface is treated in dense mode, it is populated in a multicast routing table’s outgoing interface list when either of the following is true:

- When members or DVMRP neighbors exist on the interface
- When PIM neighbors exist and the group has not been pruned

When an interface is treated in sparse mode, it is populated in a multicast routing table’s outgoing interface list when either of the following is true:

- When members or DVMRP neighbors exist on the interface
- When an explicit join has been received by a PIM neighbor on the interface

To enable PIM to operate in the same mode as the group, enter this command:

```
Enabling Bidirectional Mode

Most of the configuration requirements for Bidir-PIM are the same as those for configuring PIM-SM. You need not enable or disable an interface for carrying traffic for multicast groups in bidirectional mode. Instead, you configure which multicast groups you want to operate in bidirectional mode. Similar to PIM-SM, you can perform this configuration with Auto-RP, static RP configurations, or the PIM Version 2 bootstrap router (PIMv2 BSR) mechanism.

To enable Bidir-PIM, perform this task in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# <strong>ip pim sparse-dense-mode</strong></td>
<td>Enables PIM to operate in sparse or dense mode, depending on the group.</td>
</tr>
</tbody>
</table>

```

To configure Bidir-PIM, enter one of these commands, depending on which method you use to distribute group-to-RP mappings:
Chapter 35      Configuring IP Multicast

Configuring IP Multicast Routing

For an example of how to configure bidir-PIM, see the “Bidirectional PIM Mode Example” section on page 35-28.

Enabling PIM-SSM Mapping

The Catalyst 4500 series switch supports SSM mapping, enabling an SSM transition in cases either where neither URD nor IGMP v3-lite is available, or when supporting SSM on the end system is impossible or unwanted due to administrative or technical reasons. With SSM mapping, you can leverage SSM for video delivery to legacy set-top boxes (STBs) that do not support IGMPv3 or for applications that do not take advantage of the IGMPv3 host stack.

For more details, refer to this URL:

Configuring a Rendezvous Point

A rendezvous point (RP) is required in networks running Protocol Independent Multicast sparse mode (PIM-SM). In PIM-SM, traffic is forwarded only to network segments with active receivers that have explicitly requested multicast data.

The most commonly used methods to configure a rendezvous point (described here) are the use of Static RP and the use of the Auto-RP protocol. Another method (not described here) is the use of the Bootstrap Router (BSR) protocol.

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# ip pim rp-address \  \ \ \ \ \ rp-address [access-list] [override] \  \ \ \ \ \ bidir</td>
<td>Configures the address of a PIM RP for a particular group, and specifies bidirectional mode. Use this command when you are not distributing group-to-RP mappings using either Auto-RP or the PIMv2 BSR mechanism.</td>
</tr>
<tr>
<td>Switch(config)# ip pim rp-candidate \  \ \ \ \ \ type number [group-list access-list] \  \ \ \ \ \ bidir</td>
<td>Configures the router to advertise itself as a PIM Version 2 candidate RP to the BSR, and specifies bidirectional mode. Use this command when you are using the PIMv2 BSR mechanism to distribute group-to-RP mappings.</td>
</tr>
<tr>
<td>Switch(config)# ip pim send-rp-address \  \ \ \ \ \ type number scope ttl-value \  \ \ \ \ \ [group-list access-list] [interval seconds] bidir</td>
<td>Configures the router to use Auto-RP to configure the groups the router is willing to act as RP, and specifies bidirectional mode. Use this command when you are using Auto-RP to distribute group-to-RP mappings.</td>
</tr>
</tbody>
</table>
Configuring Auto-RP

Auto-rendezvous point (Auto-RP) automates the distribution of group-to-rendezvous point (RP) mappings in a PIM network. To make Auto-RP work, a router must be designated as an RP mapping agent, which receives the RP announcement messages from the RPs and arbitrates conflicts. The RP mapping agent then sends the consistent group-to-RP mappings to all other routers by way of dense mode flooding.

All routers automatically discover which RP to use for the groups they support. The Internet Assigned Numbers Authority (IANA) has assigned two group addresses, 224.0.1.39 and 224.0.1.40, for Auto-RP.

The mapping agent receives announcements of intention to become the RP from Candidate-RPs. The mapping agent then announces the winner of the RP election. This announcement is made independently of the decisions by the other mapping agents.

To configure a rendezvous point, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch&gt; enable Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch# configure terminal Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# ip multicast-routing Enables IP multicast routing.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# interface [FastEthernet</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# ip pim [sparse-mode</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-if)# exit Returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Repeat Steps 4 and 5 on all PIM interfaces. —</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config)# ip pim autorp listener Causes IP multicast traffic for the two Auto-RP groups 224.0.1.39 and 224.0.1.40 to be PIM dense mode flooded across interfaces operating in PIM sparse mode.</td>
</tr>
<tr>
<td></td>
<td>• Skip this step if you are configuring sparse-dense mode in Step 8.</td>
</tr>
</tbody>
</table>
Configuring IP Multicast Routing

### Chapter 35 Configuring IP Multicast

#### Step 9
`Switch(config)# ip pim send-rp-announce (interface-type interface-number | ip-address) scope ttl-value [group-list access-list] [interval seconds] [bidir]`

Sends RP announcements out all PIM-enabled interfaces.
- Perform this step on the RP router only.
- Use the `interface-type` and `interface-number` arguments to define which IP address is to be used as the RP address.
- Use the `ip-address` argument to specify a directly connected IP address as the RP address.

**Note**
If the `ip-address` argument is configured for this command, the RP-announce message is sourced by the interface to which this IP address is connected (that is, the source address in the IP header of the RP-announce message is the IP address of that interface).
- This example shows that the interface is enabled with a maximum of 31 hops. The IP address by which the router wants to be identified as RP is the IP address associated with loopback interface 0. Access list 5 describes the groups for which this router serves as RP.

#### Step 10
`Switch(config)# ip pim send-rp-discovery (interface-type interface-number) scope ttl-value [interval seconds]`

Configures the router to be an RP mapping agent.
- Perform this step on the RP router only.
- Use the optional `interface-type` and `interface-number` arguments to define which IP address is to be used as the source address of the RP mapping agent.
- Use the `scope` keyword and `ttl-value` argument to specify the Time-to-Live (TTL) value in the IP header of Auto-RP discovery messages.
- Use the optional `interval` keyword and `seconds` argument to specify the interval at which Auto-RP discovery messages are sent.

**Note**
Lowering the interval at which Auto-RP discovery messages are sent from the default value of 60 seconds results in more frequent floodings of the group-to-RP mappings. In some network environments, the disadvantages of lowering the interval (more control packet overhead) may outweigh the advantages (more frequent Requirements group-to-RP mapping updates).
- The example shows limiting the Auto-RP discovery messages to 31 hops on loopback interface 1.
### Chapter 35  Configuring IP Multicast

#### Configuring IP Multicast Routing

This example illustrates how to configure Auto-RP:

```plaintext
Switch> enable
Switch# configure terminal
Switch(config)# ip multicast-routing
Switch(config)# interface ethernet 1
Switch(config-if)# ip pim sparse-mode
Switch(config-if)# ip multicast-routing
Switch(config)# ip pim autorp listener
Switch(config)# interface ethernet 1
Switch(config-if)# ip pim send-rp-announce loopback0 scope 31 group-list 5
Switch(config)# ip pim send-rp-discovery loopback1 scope 31
Switch(config)# ip pim rp-announce-filter rp-list 1 group-list 2
Switch(config)# interface ethernet 1
Switch(config-if)# ip multicast boundary 10 filter-autorp
Switch(config)#
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>Switch(config)# ip pim rp-announce-filter rp-list access-list group-list access-list</td>
<td>Filters incoming Auto-RP announcement messages coming from the RP.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Perform this step on the RP router only.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Two example access lists that apply to this step could be:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>access-list 1 permit 10.0.0.1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>access-list 1 permit 10.0.0.2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>access-list 2 permit 224.0.0.0 15.255.255.255</td>
</tr>
<tr>
<td>12</td>
<td>Switch(config)# interface type number</td>
<td>Selects an interface that is connected to hosts on which PIM can be enabled.</td>
</tr>
<tr>
<td>13</td>
<td>Switch(config-if)# interface ethernet 1 ip multicast boundary access-list [filter-autorp]</td>
<td>Configures an administratively scoped boundary.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Perform this step on the interfaces that are boundaries to other routers.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The access list is not shown in this task.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- An access list entry that uses the <code>deny</code> keyword creates a multicast boundary for packets that match that entry.</td>
</tr>
<tr>
<td>14</td>
<td>Switch(config-if)# end</td>
<td>Returns to EXEC mode.</td>
</tr>
<tr>
<td>15</td>
<td>Switch# show ip pim autorp</td>
<td>(Optional) Displays the Auto-RP information.</td>
</tr>
<tr>
<td>16</td>
<td>Switch# show ip pim rp [mapping] [rp-address]</td>
<td>(Optional) Displays RPs known in the network and shows how the router learned about each RP.</td>
</tr>
<tr>
<td>17</td>
<td>Switch# show ip igmp groups [group-name</td>
<td>group-address</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- A receiver must be active on the network at the time that this command is issued to ensure the presence of receiver information on the resulting display.</td>
</tr>
<tr>
<td>18</td>
<td>Switch# show ip mroute [group-address</td>
<td>group-name] [source-address</td>
</tr>
</tbody>
</table>

This example illustrates how to configure Auto-RP:
Configuring IP Multicast Routing

Chapter 35 Configuring IP Multicast

Configuring a Single Static RP

If you are configuring PIM sparse mode, you must configure a PIM RP for a multicast group. An RP can either be configured statically in each device, or learned through a dynamic mechanism. This task explains how to statically configure an RP, as opposed to the router learning the RP through a dynamic mechanism such as Auto-RP.

PIM designated routers (DRs) forward data from directly connected multicast sources to the RP for distribution down the shared tree. Data is forwarded to the RP in one of two ways. It is encapsulated in register packets and unicast directly to the RP, or, if the RP has itself joined the source tree, it is multicast forwarded per the RPF forwarding algorithm. Last hop routers directly connected to receivers may, at their discretion, join themselves to the source tree and prune themselves from the shared tree.

A single RP can be configured for multiple groups that are defined by an access list. If no RP is configured for a group, the router treats the group as dense using the PIM dense mode techniques. (You can prevent this occurrence by configuring the `no ip pim dm-fallback` command.)

If a conflict exists between the RP configured with the `ip pim rp-address` command and one learned by Auto-RP, the Auto-RP information is used, unless the override keyword is configured.

To configure a single static RP, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch&gt; enable Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch# configure terminal Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# ip multicast-routing Enables IP multicast routing.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# interface type number Selects an interface that is connected to hosts on which PIM can be enabled.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# ip pim [sparse-mode</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Repeat Steps 4 and 5 on every interface that uses IP multicast. —</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-if)# exit Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config)# ip pim rp-address rp-address [access-list] [override] Configures the address of a PIM RP for a particular group. • Perform this step on any router. • The <code>access-list</code> argument specifies the number or name of an access list that defines for which multicast groups the RP should be used. • The <code>override</code> keyword specifies that if there is a conflict between the RP configured with this command and one learned by Auto-RP, the RP configured with this command prevails.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch(config)# end Ends the current configuration session and returns to EXEC mode.</td>
</tr>
</tbody>
</table>
This example shows how to configure a single-static RP:

```
Switch> enable
Switch# configure terminal
Switch(config)# ip multicast-routing
Switch(config)# interface ethernet 1
Switch(config-if)# ip pim sparse-mode
Switch(config-if)# exit
Switch(config)# ip pim rp-address 192.168.0.0
Switch(config)# end
Switch# show ip pim rp mapping
Switch# show ip igmp groups
Switch# show ip mroute cbone-audio
```

### Load Splitting of IP Multicast Traffic

This feature is only supported on Enterprise Services. It is not supported on IP Base and LAN Base.

If two or more equal-cost paths from a source are available, unicast traffic is load split across those paths. However, by default, multicast traffic is not load split across multiple equal-cost paths. In general, multicast traffic flows down from the reverse path forwarding (RPF) neighbor. According to the Protocol Independent Multicast (PIM) specifications, this neighbor must have the highest IP address if more than one neighbor has the same metric.

Use the `ip multicast multipath` command to enable load splitting of IP multicast traffic across multiple equal-cost paths.

**Note**

The `ip multicast multipath` command does not work with bidirectional Protocol Independent Multicast (PIM).
To enable IP multicast multipath, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# config t</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ip multicast multipath</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

**Note**
The `ip multicast multipath` command load splits the traffic but does not load balance the traffic. Traffic from a source uses only one path, even if the traffic far outweighs traffic from other sources.

Configuring load splitting with the `ip multicast multipath` command causes the system to load split multicast traffic across multiple equal-cost paths based on source address using the S-hash algorithm. When the `ip multicast multipath` command is configured and multiple equal-cost paths exist, the path in which multicast traffic travel is selected based on the source IP address. Multicast traffic from different sources is load split across the different equal-cost paths. Load splitting does not occur across equal-cost paths for multicast traffic from the same source sent to different multicast groups.

The following example shows how to enable ECMP multicast load splitting on a router based on a source address using the S-hash algorithm:

```
Switch(config)# ip multicast multipath
```

The following example shows how to enable ECMP multicast load splitting on a router based on a source and group address using the basic S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash basic
```

The following example shows how to enable ECMP multicast load splitting on a router based on a source, group, and next-hop address using the next-hop-based S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash next-hop-based
```

**Monitoring and Maintaining IP Multicast Routing**

You can remove all contents of a particular cache, table, or database. You also can display specific statistics. The following sections describe how to monitor and maintain IP multicast:

- Displaying System and Network Statistics, page 35-23
- Displaying the Multicast Routing Table, page 35-23
- Displaying IP MFIB, page 35-25
- Displaying Bidirectional PIM Information, page 35-26
- Displaying PIM Statistics, page 35-27
- Clearing Tables and Databases, page 35-27
Displaying System and Network Statistics

You can display specific statistics, such as the contents of IP routing tables and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device’s packets are taking using the network.

To display various routing statistics, enter any of these commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# ping [group-name</td>
<td>group-address]</td>
</tr>
<tr>
<td>Switch# show ip mroute [hostname</td>
<td>group_number]</td>
</tr>
<tr>
<td>Switch# show ip pim interface [type number] [count]</td>
<td>Displays information about interfaces configured for PIM.</td>
</tr>
<tr>
<td>Switch# show ip interface</td>
<td>Displays PIM information for all interfaces.</td>
</tr>
</tbody>
</table>

Displaying the Multicast Routing Table

The following is sample output from the show ip mroute command for a router operating in dense mode. This command displays the contents of the IP multicast FIB table for the multicast group named cbone-audio.

```
Switch# show ip mroute cbone-audio
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
R - RP-bit set, F - Register flag, T - SPT-bit set
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.0.255.1), uptime 0:57:31, expires 0:02:59, RP is 0.0.0.0, flags: DC
Incoming interface: Null, RPF neighbor 0.0.0.0, Dvmrp
Outgoing interface list:
    Ethernet0, Forward/Dense, 0:57:31/0:02:52
    Tunnel0, Forward/Dense, 0:56:55/0:01:28

(198.92.37.100/32, 224.0.255.1), uptime 20:20:00, expires 0:02:55, flags: C
Incoming interface: Tunnel0, RPF neighbor 10.20.37.33, Dvmrp
Outgoing interface list:
    Ethernet0, Forward/Dense, 20:20:00/0:02:52
```

The following is sample output from the show ip mroute command for a router operating in sparse mode:

```
Switch# show ip mroute
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
R - RP-bit set, F - Register flag, T - SPT-bit set
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.0.255.3), uptime 5:29:15, RP is 198.92.37.2, flags: SC
```
Incoming interface: Tunnel0, RPF neighbor 10.3.35.1, Dvmrp
Outgoing interface list:
  Ethernet0, Forward/Sparse, 5:29:15/0:02:57

(198.92.46.0/24, 224.0.255.3), uptime 5:29:15, expires 0:02:59, flags: C
Incoming interface: Tunnel0, RPF neighbor 10.3.35.1
Outgoing interface list:
  Ethernet0, Forward/Sparse, 5:29:15/0:02:57

Interface timers are not updated for hardware-forwarded packets. Entry timers are updated approximately every five seconds.

The following is sample output from the `show ip mroute` command with the **summary** keyword:

Switch# show ip mroute summary

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
    R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.255.255.255), 2d16h/00:02:30, RP 171.69.10.13, flags: SJPC
(*, 224.1.127.253), 00:58:18/00:02:00, RP 171.69.10.13, flags: SJC

The following is sample output from the `show ip mroute` command with the **active** keyword:

Switch# show ip mroute active

Active IP Multicast Sources - sending >= 4 kbps

Group: 224.2.127.254, (edr.cisco.com)
  Source: 146.137.28.69 (mbone.ipd.anl.gov)

Note
Multicast route byte and packet statistics are supported only for the first 1024 multicast routes. Output interface statistics are not maintained.

Displaying IP M FIB

You can display all routes in the MFIB, including routes that might not exist directly in the upper-layer routing protocol database but that are used to accelerate fast switching. These routes appear in the MFIB, even if dense-mode forwarding is in use.

To display various MFIB routing routes, enter one of these commands:
Chapter 35      Configuring IP Multicast

Monitoring and Maintaining IP Multicast Routing

The following is sample output from the show ip mfib command:

```
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal,
            IC - Internal Copy
Interface Flags: A - Accept, F - Forward, S - Signal,
                NP - Not platform switched
Packets: Fast/Partial/Slow Bytes: Fast/Partial/Slow:
  (171.69.10.13, 224.0.1.40), flags (IC)
    Packets: 2292/2292/0, Bytes: 518803/0/518803
    Vlan7 (A)
    Vlan100 (F NS)
    Vlan105 (F NS)
  (*, 224.0.1.60), flags ()
    Packets: 2292/0/0, Bytes: 518803/0/0
    Vlan7 (A NS)
    Vlan105 (F NS)
  (*, 224.0.1.75), flags ()
    Vlan7 (A NS)
  (10.34.2.92, 239.192.128.80), flags ()
    Packets: 24579/100/0, 2113788/15000/0 bytes
    Vlan7 (F NS)
    Vlan100 (A)
  (*, 239.193.100.70), flags ()
    Packets: 1/0/0, 1500/0/0 bytes
    Vlan7 (A)
  ...
```

The fast-switched packet count represents the number of packets that were switched in hardware on the corresponding route.

The partially switched packet counter represents the number of times that a fast-switched packet was also copied to the CPU for software processing or for forwarding to one or more non-platform switched interfaces (such as a PimTunnel interface).

The slow-switched packet count represents the number of packets that were switched completely in software on the corresponding route.

### Displaying Bidirectional PIM Information

To display bidir-PIM information, enter one of these commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip mfib</td>
<td>Displays the (S,G) and (*,G) routes that are used for packet forwarding. Displays counts for fast, slow, and partially switched packets for every multicast route.</td>
</tr>
<tr>
<td>Switch# show ip mfib all</td>
<td>Displays all routes in the MFIB, including routes that may not exist directly in the upper-layer routing protocol database, but that are used to accelerate fast switching. These routes include the (S/M,224/4) routes.</td>
</tr>
<tr>
<td>Switch# show ip mfib log [n]</td>
<td>Displays a log of the most recent n MFIB-related events, the most recent first. n represents the number of events.</td>
</tr>
</tbody>
</table>
Chapter 35 Configuring IP Multicast

Monitoring and Maintaining IP Multicast Routing

Displaying PIM Statistics

The following is sample output from the `show ip pim interface` command:

```
Switch# show ip pim interface
```

```
Address          Interface          Mode    Neighbor  Query     DR
Count     Interval
198.92.37.6      Ethernet0          Dense   2         30        198.92.37.33
198.92.36.129    Ethernet1          Dense   2         30        198.92.36.131
10.1.37.2        Tunnel0            Dense   1         30        0.0.0.0
```

The following is sample output from the `show ip pim interface count` command with a `count`:

```
Switch# show ip pim interface count
```

```
Address          Interface          FS  Mpackets In/Out
171.69.121.35    Ethernet0          *   548305239/13744856
171.69.121.35    Serial0.33         *   8256/67052912
198.92.12.73     Serial0.1719       *   219444/862191
```

The following is sample output from the `show ip pim interface count` command with a `count` when IP multicast is enabled. The example lists the PIM interfaces that are fast-switched and process-switched, and the packet counts for these. The H is added to interfaces where IP multicast is enabled.

```
Switch# show ip pim interface count
```

```
States: FS - Fast Switched, H - Hardware Switched
Address          Interface          FS  Mpackets In/Out
192.1.10.2       Vlan10             * H  40886/0
192.1.11.2       Vlan11             * H  0/40554
192.1.12.2       Vlan12             * H  0/40554
192.1.23.2       Vlan23             *  0/0
192.1.24.2       Vlan24             *  0/0
```

Clearing Tables and Databases

You can remove all contents of a particular cache, table, or database. Clearing a cache, table, or database might be necessary when the contents of the particular structure have become, or are suspected to be, invalid.

To clear IP multicast caches, tables, and databases, enter one of these commands:

```
Command Purpose
Switch(config)# show ip pim interface [type number] [df | count] [rp-address] Displays information about the elected designated forward (DF) for each RP of an interface, along with the unicast routing metric associated with the DF.
Switch(config)# show ip pim rp [mapping | metric] [rp-address] Displays information about configured RPs, learned by using Auto-RP or BSR, along with their unicast routing metric.
```
Chapter 35      Configuring IP Multicast

Configuration Examples

The following sections provide IP multicast routing configuration examples:

- PIM Dense Mode Example, page 35-28
- PIM Sparse Mode Example, page 35-28
- Bidirectional PIM Mode Example, page 35-28
- Sparse Mode with a Single Static RP Example, page 35-29
- Sparse Mode with Auto-RP: Example, page 35-29

PIM Dense Mode Example

This example is a configuration of dense-mode PIM on an Ethernet interface:

```
ip multicast-routing
interface ethernet 0
  ip pim dense-mode
```

PIM Sparse Mode Example

This example is a configuration of sparse-mode PIM. The RP router is the router with the address 10.8.0.20.

```
ip multicast-routing
  ip pim rp-address 10.8.0.20 1
interface ethernet 1
  ip pim sparse-mode
```

Bidirectional PIM Mode Example

By default, a bidirectional RP advertises all groups as bidirectional. Use an access list on the RP to specify a list of groups to be advertised as bidirectional. Groups with the `deny` keyword operate in dense mode. A different, nonbidirectional RP address is required for groups that operate in sparse mode, because a single access list only allows either a `permit` or `deny` keyword.

The following example shows how to configure an RP for both sparse and bidirectional mode groups. 224/8 and 227/8 are bidirectional groups, 226/8 is sparse mode, and 225/8 is dense mode. The RP must be configured to use different IP addresses for sparse and bidirectional mode operations. Two loopback

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# clear ip mroute</td>
<td>Deletes entries from the IP routing table.</td>
</tr>
<tr>
<td>Switch# clear ip mfib counters</td>
<td>Deletes all per-route and global MFIB counters.</td>
</tr>
</tbody>
</table>

Note

IP multicast routes can be regenerated in response to protocol events and as data packets arrive.
interfaces are used to allow this configuration and the addresses of these interfaces must be routed throughout the PIM domain so that the other routers in the PIM domain can receive Auto-RP announcements and communicate with the RP:

```
ip multicast-routing !Enable IP multicast routing
ip pim bidir-enable !Enable bidir-PIM
!
interface loopback 0
description One Loopback address for this routers Bidir Mode RP function
ip address 10.0.1.1 255.255.255.0
ip pim sparse-dense-mode
!
interface loopback 1
description One Loopback address for this routers Sparse Mode RP function
ip address 10.0.2.1 255.255.255.0
ip pim send-rp-announce Loopback0 scope 10 group-list 45 bidir
ip pim send-rp-announce Loopback1 scope 10 group-list 46
ip pim send-rp-discovery scope 10
access-list 45 permit 224.0.0.0 0.255.255.255
access-list 45 permit 227.0.0.0 0.255.255.255
access-list 45 deny 225.0.0.0 0.255.255.255
access-list 46 permit 226.0.0.0 0.255.255.255
```

### Sparse Mode with a Single Static RP Example

The following example sets the PIM RP address to 192.168.1.1 for all multicast groups and defines all groups to operate in sparse mode:

```
ip multicast-routing
interface ethernet 1
  ip pim sparse-mode
  ip pim rp-address 192.168.1.1
no ip pim dm-fallback
```

**Note**
The same RP cannot be used for both bidirectional and sparse mode groups.

The following example sets the PIM RP address to 172.16.1.1 for the multicast group 225.2.2.2 only:

```
access list 1 225.2.2.2 0.0.0.0
ip pim rp-address 172.16.1.1
```

### Sparse Mode with Auto-RP: Example

The following example configures sparse mode with Auto-RP:

```
ip multicast-routing
ip pim autorp listener
ip pim send-rp-announce Loopback0 scope 16 group-list 1
ip pim send-rp-discovery Loopback1 scope 16
no ip pim dm-fallback
access-list 1 permit 239.254.2.0 0.0.0.255
access-list 1 permit 239.254.3.0 0.0.0.255
access-list 10 permit 224.0.1.39
access-list 10 permit 224.0.1.40
access-list 10 permit 239.254.2.0 0.0.0.255
access-list 10 permit 239.254.3.0 0.0.0.255
```
Configuring ANCP Client

This chapter describes Access-Network Control Protocol (ANCP) Client on a Catalyst 4500 series switch. It includes the following sections:

- About ANCP Client, page 36-1
- Enabling and Configuring ANCP Client, page 36-2

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About ANCP Client

ANCP Multicast enables you to control multicast traffic on a Catalyst 4500 series switch using either ANCP (instead of IGMP) or direct static configuration on the CLI. You can configure the switch as an ANCP client that connects to a remote ANCP server with multicast enabled. You can then initiate joins and leaves from that server. Use the switch in a system in which a subscriber requests that a digital right management (DRM) server receive a given channel (multicast) potentially through any private protocol mechanism.

Note

The ANCP client does not allow more than four multicast streams per-port per-VLAN. If a fifth join arrives, it is rejected.

If the digital right management (DRM) server determines that a subscriber is allowed to receive a multicast, it requests that the ANCP server sends an ANCP join command to the ANCP client (Catalyst 4500 series switch) for the port on which the subscriber is connected.
Enabling and Configuring ANCP Client

Identifying a Port with the ANCP Protocol

To make the Catalyst 4500 series switch operate as an ANCP client and to build and initialize its relevant data, enter the `ancp mode client` command. The `no` version of this command disables ANCP. This command disconnects the ANCP client from the ANCP server and terminates any existing multicast streams that have been enabled with ANCP.

To configure a switch to communicate with a single ANCP server, use the `[no] ancp client server interface` command. This command directs the ANCP client to initiate a TCP connection to the remote ANCP server identified with the IP address. If the TCP connection fails, the connection times out and retries for the connection every 120 seconds until it succeeds. The `interface` command specifies the interface from which the local ANCP client obtains its IP address. The `no` command terminates the TCP connection to the ANCP server but retains any existing ANCP activated multicast stream.

Separate commands enable the ANCP client and configure the IP address of the ANCP server. You can reconfigure the IP address of the remote ANCP server without losing existing ANCP activated multicast streams.

To identify a port with the ANCP protocol, follow these steps:

**Step 1**
Enable ANCP as follows:

```
Switch(config)> ancp mode client
```

**Step 2**
Configure the IP address of the remote server as the interface to acquire the source IP address:

```
Switch(config)> ancp client server ip_address_of_server interface interface
```

The interface might be a loopback; this allows the client to reach the server using the interface.
Step 3  
(Optional) Enable the ANCP multicast client to identify this VLAN interface using the port-identifier as opposed to the Option 82 circuit-id:

Switch(config)> ancp client port identifier [port-identifier] vlan [number] interface [interface]

The no version of this command prompts a warning message if any multicast stream is activated by ANCP using the port-identifier on a port:

Switch(config)# no ancp client port identifier bbb vlan 10 interface GigabitEthernet3/5
Warning: Multicast flows seems to exist for this port, remove mapping and delete flows anyway?[confirm]y
Switch(config)#

The ANCP client tries to connect to the server. If it fails, it tries again 10 seconds later. If it fails again, it tries at 20 seconds intervals, until it reaches the timeout setting (120 seconds). It remains timed out until it reconnects.

Note
If the connection fails again and the client attempts to reconnect and it fails, the wait time returns to 10 seconds (and so on).

To determine whether the ANCP client is successfully connected to the server, enter the show ancp status command, which displays the status of the ANCP TCP connection with the remote ANCP server.

Switch# show ancp status
ANCP enabled on following interfaces
Et0/0
ANCP end point(s) on this interface:
====================================
ANCP state ESTAB
Neighbor 10.1.1.1 Neighbor port 6068
Hello interval 100 Sender instance 1 Sender name 372F61C
Sender port 0 Partition ID 0 TCB 36E27E8
Capabilities negotiated: Transactional Multicast
Switch#

In the preceding example, only one capability (transactional multicast) is negotiated (or supported). This capability is the only one that the ANCP client supports. Because the server also supports this capability, the two entities can now communicate.

The server can send ANCP multicast commands (join, leave, leave all requests, and request for active flows report) as defined in the multicast portion of the ANCP protocol. At any time, an administrator can use the show ancp multicast [interface vlan] [group | source] command to see the information the ANCP client has obtained about the current multicast flows.

Example 1

ANCP_Client# show ancp multicast group 239.6.6.6
ANCP Multicast Streams
ClientID     VLAN   Interface       Joined on
Group 239.6.6.6
0x0106000700130103 19  Gi1/3       15:06:23 UTC Tue Aug 26 2008
ANCP_Client#
Example 2

ANCP_Client# show ancp multicast interface Fa2/3 vlan 19
ANCP Multicast Streams
Interface  FastEthernet2/3         VLAN 19: client ID 0x0106000700130203
          Source                Joined on
          239.5.6.7          -      15:03:14 UTC Tue Aug 26 2008
ANCP_Client#

Note Specifying the show ancp multicast command without parameters or keywords lists everything.

Identifying a Port with DHCP Option 82

Note To use DHCP option 82, you need to enable DHCP and DHCP snooping (see Chapter 50, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts”).

If you identify the port with DHCP option 82, you need to configure the Catalyst 4500 series switch as a DHCP relay to insert the DHCP option 82. This action adds a tag in the DHCP packet from the DHCP client so that the DHCP server knows the port connected to this specific DHCP client. The DHCP server can then map the IP address it is providing to the client with the DHCP option 82 it received from the switch. The DHCP server only needs to lookup the DHCP option 82 associated with a given IP address and provide it to the ANCP server. This allows the ANCP client on the switch to identify the proper port using an identifier the switch understands. The configure DHCP snooping on the Catalyst 4500 series switch, use the following commands:

Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan vlan-range

By default, DHCP option 82 is inserted when DHCP snooping is activated. Turning this default off could cause ANCP to function improperly with the DHCP circuit-id; it must remain active. To activate it, enter this command:

Switch(config)# ip dhcp snooping information option

Note The DHCP option 82 circuit-ID is inserted in the Active-Flow report (when queried for all multicast flows) even if a configured circuit-ID exists.

ANCP allows a remote server to request the list of active flows from the ANCP client (Catalyst 4500 series switch is the ANCP client). This list is very similar to the output from the show ancp multicast command except that it follows the ANCP protocol packet format (see IETF.org). Observe that the show ancp multicast command provides the flows that have been activated with the ancp port client identifier command while the ANCP active flow request only reports the client ID in DHCP option 82 circuit-ID format, regardless of the activation mechanism.

Refer to Chapter 50, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts” for details on the CLI.
ANCP Guidelines and Restrictions

When using (or configuring) ANCP, consider these guidelines and restrictions:

- Entering a `shut` command on a port removes ANCP activated multicast streams from the port. They must be reactivated by the ANCP server.
- Entering a `suspend` or `shut` command on a VLAN removes ANCP-activated multicast streams from the VLAN.
- Deleting a VLAN removes ANCP-activated multicast streams from the VLAN.
- If a port enters the errdisable or blocked state, ANCP-activated multicast streams are removed from the port.
- Disabling IGMP snooping globally or per-VLAN might disrupt ANCP client functionality.
- An ANCP client does not account for the Layer 3 interface state changes (if PIM interface at Layer 3 shuts down, ANCP does not remove the streams). When a PIM interface is running again, multicast streams are received by subscribers.
Support on the Catalyst 4500E is limited. Starting with Cisco IOS Release IOS 15.1(1)SG, Bidirectional Forwarding Detection (BFD) is supported only on Catalyst 4900M, and Catalyst 4948E Ethernet switches.

This document describes how to enable the BFD protocol, which is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols.

BFD provides a consistent failure detection method for network administrators in addition to fast forwarding path failure detection. Because the network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol hello mechanisms, network profiling and planning are simplified, and reconvergence time is more consistent and predictable.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “Technical Assistance” section on page 37-29.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

- Information About Bidirectional Forwarding Detection, page 37-2
- How to Configure Bidirectional Forwarding Detection, page 37-7
- Configuration Examples for Bidirectional Forwarding Detection, page 37-17
- Additional References, page 37-28
Prerequisites for Bidirectional Forwarding Detection

Prerequisites include:
- IP routing must be enabled on all participating switches.
- One of the IP routing protocols supported by BFD must be configured on the switches before BFD is deployed. You should implement fast convergence for the routing protocol that you plan to use. See the IP routing documentation for your version of Cisco IOS software for information on configuring fast convergence. See the “Restrictions for Bidirectional Forwarding Detection” section on page 37-2 for more information on BFD routing protocol support in Cisco IOS software.

Restrictions for Bidirectional Forwarding Detection

Restrictions include:
- BFD works only for directly connected neighbors. BFD neighbors must be no more than one IP hop away. Multihop configurations are not supported.

Cisco IOS Release 15.1(1)SG and Cisco Catalyst 4500 Series Switches
- Cisco Catalyst 4500 series switches support up to 128 BFD sessions with a minimum hello interval of 50 ms and a multiplier of 3. The multiplier specifies the minimum number of consecutive packets that can be missed before a session is declared down.

Note
Starting with Cisco IOS Release IOS 15.1(1)SG, Bidirectional Forwarding Detection (BFD) is supported only on Catalyst 4900M, and Catalyst 4948E Ethernet switches

- If SSO is enabled on a dual RP system, the following limitations apply:
  - The minimum hello interval is 50 ms with a multiplier of 5 or higher.
  - Smaller values may be configured but may flap during an SSO switchover.
- To enable echo mode the peer system must be configured with the no ip redirects command.

Note
For the most accurate platform and hardware restrictions, see the Cisco IOS software release notes for your software version.

Information About Bidirectional Forwarding Detection

- BFD Operation, page 37-2
- Benefits of Using BFD for Failure Detection, page 37-6

BFD Operation

BFD provides a low-overhead, short-duration method of detecting failures in the forwarding path between two adjacent switches, including the interfaces, data links, and forwarding planes.
BFD is a detection protocol that you enable at the interface and routing protocol levels. Cisco supports the BFD asynchronous mode, which depends on the sending of BFD control packets between two systems to activate and maintain BFD neighbor sessions between switches. Therefore, to create a BFD session, you must configure BFD on both systems (or BFD peers). Once BFD has been enabled on the interfaces and at the router level for the appropriate routing protocols, a BFD session is created, BFD timers are negotiated, and the BFD peers will begin to send BFD control packets to each other at the negotiated interval.

Cisco supports BFD echo mode. Echo packets are sent by the forwarding engine and are forwarded back along the same path to perform detection. The BFD session at the other end does not participate in the actual forwarding of the echo packets. See Configuring BFD Echo Mode, page 37-14 for more information.

This section includes the following subsections:
- Neighbor Relationships, page 37-3
- BFD Detection of Failures, page 37-4
- BFD Version Interoperability, page 37-4
- BFD Session Limits, page 37-5
- BFD Support for Nonbroadcast Media Interfaces, page 37-5
- BFD Support for Nonstop Forwarding with Stateful Switchover, page 37-5
- BFD Support for Stateful Switchover, page 37-5
- BFD Support for Static Routing, page 37-6

### Neighbor Relationships

BFD provides fast BFD peer failure detection times independently of all media types, encapsulations, topologies, and routing protocols BGP, EIGRP, OSPF, and static routes. By sending rapid failure detection notices to the routing protocols in the local switch to initiate the routing table recalculation process, BFD contributes to greatly reduced overall network convergence time. Figure 37-1 shows a simple network with two switches running OSPF and BFD. When OSPF discovers a neighbor (1) it sends a request to the local BFD process to initiate a BFD neighbor session with the OSPF neighbor routers (2). The BFD neighbor session with the OSPF neighbor router is established (3).

![Figure 37-1 Establishing a BFD Neighbor Relationship](image)

Figure 37-2 shows what happens when a failure occurs in the network (1). The BFD neighbor session with the OSPF neighbor router is torn down (2). BFD notifies the local OSPF process that the BFD neighbor is no longer reachable (3). The local OSPF process tears down the OSPF neighbor relationship (4). If an alternative path is available, the routers will immediately start converging on it.
A routing protocol needs to register with BFD for every neighbor it acquires. Once a neighbor is registered, BFD initiates a session with the neighbor if a session does not already exist.

OSPF registers with BFD when:

- A neighbor finite state machine (FSM) transitions to full state.
- Both OSPF BFD and BFD are enabled.

On broadcast interfaces, OSPF establishes a BFD session only with the designated router (DR) and backup designated router (BDR), but not between any two switches (routers) in DROTHER state.

**BFD Detection of Failures**

Once a BFD session has been established and timer negations are complete, BFD peers send BFD control packets that act in the same manner as an IGP hello protocol to detect liveliness, except at a more accelerated rate. The following information should be noted:

- BFD is a forwarding path failure detection protocol. BFD detects a failure, but the routing protocol must take action to bypass a failed peer.
- Typically, BFD can be used at any protocol layer. However, the Cisco implementation of BFD for Cisco IOS Release 15.1(1)SG supports only Layer 3 clients, in particular, the BGP, EIGRP, and OSPF routing protocols, and static routing.
- Cisco devices will use one BFD session for multiple client protocols in the Cisco implementation of BFD for Cisco IOS Release 15.1(1)SG. For example, if a network is running OSPF and EIGRP across the same link to the same peer, only one BFD session will be established, and BFD will share session information with both routing protocols. However, IPv4 and IPv6 clients cannot share a BFD session.

**BFD Version Interoperability**

Cisco IOS Release 15.1(1)SG supports BFD Version 1 as well as BFD Version 0. All BFD sessions come up as Version 1 by default and will be interoperable with Version 0. The system automatically performs BFD version detection, and BFD sessions between neighbors will run in the highest common BFD version between neighbors. For example, if one BFD neighbor is running BFD Version 0 and the other BFD neighbor is running Version 1, the session will run BFD Version 0. The output from the `show bfd neighbors [details]` command will verify which BFD version a BFD neighbor is running.

See the “Example: Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default” section on page 37-17 for an example of BFD version detection.
BFD Session Limits

Starting with Cisco IOS Release 15.1(1)SG, the minimum number of BFD sessions that can be created varies with the “hello” interval. With “hello” intervals of 50ms, 128 sessions are permitted. More sessions are permitted at larger hello intervals.

BFD Support for Nonbroadcast Media Interfaces

Starting with Cisco IOS Release 15.1(1)SG, the BFD feature is supported on VLAN interfaces. The `bfd interval` command must be configured on the interface to initiate BFD monitoring.

BFD Support for Nonstop Forw arding with Stateful Switchover

Typically, when a networking device restarts, all routing peers of that device detect that the device went down and then came back up. This transition results in a routing flap, which could spread across multiple routing domains. Routing flaps caused by routing restarts create routing instabilities, which are detrimental to the overall network performance. Nonstop forwarding (NSF) helps to suppress routing flaps in devices that are enabled with stateful switchover (SSO), thereby reducing network instability.

NSF allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored after a switchover. With NSF, peer networking devices do not experience routing flaps. Data traffic is forwarded while the standby RP assumes control from the failed active RP during a switchover. The ability of line cards and forwarding processors to remain up through a switchover and to remain current with the Forwarding Information Base (FIB) on the active RP is key to NSF operation.

In devices that support dual RPs, SSO establishes one of the RPs as the active processor; the other RP is designated as the standby processor, and then synchronizes information between them. A switchover from the active to the standby processor occurs when the active RP fails, when it is removed from the networking device, or when it is manually taken down for maintenance.

BFD Support for Stateful Switchover

The BFD protocol provides short-duration detection of failures in the path between adjacent forwarding engines. In network deployments that use dual RP switches (to provide redundancy), the switches have a graceful restart mechanism that protects the forwarding state during a switchover between the active RP and the standby RP.

Stateful BFD on the Standby RP

To ensure a successful switchover to the standby RP, the BFD protocol uses checkpoint messages to send session information from the active RP Cisco IOS instance to the standby RP Cisco IOS instance. The session information includes local and remote discriminators, adjacent router timer information, BFD setup information, and session-specific information such as the type of session and the session version. In addition, the BFD protocol sends session creation and deletion checkpoint messages to create or delete a session on the standby RP.

The BFD sessions on the standby RP do not receive or send packets and do not process expired timers. These sessions wait for a switchover to occur and then send packets for any active sessions so that sessions do not time out on adjacent switches.
When the BFD protocol on the standby RP is notified of a switchover it changes its state to active, registers itself with Cisco Express Forwarding so that it can receive packets, and then sends packets for any elements that have expired.

BFD also uses checkpoint messages to ensure that sessions created by clients on the active RP are maintained during a switchover. When a switchover occurs, BFD starts an SSO reclaim timer. Clients must reclaim their sessions within the duration specified by the reclaim timer or else the session is deleted.

Timer values are different based on the number of BFD sessions and the platform.

Table 37-1 describes the timer value on Cisco 4500 series switches.

<table>
<thead>
<tr>
<th>Maximum Number of BFD Sessions</th>
<th>BFD Session Type</th>
<th>Minimum Timer Value (ms)</th>
<th>Clients</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>128</td>
<td>Async/echo</td>
<td>50</td>
<td>All</td>
<td>A multiple of 5 is recommended for SSO switches.</td>
</tr>
</tbody>
</table>

**BFD Support for Static Routing**

Unlike dynamic routing protocols, such as OSPF and BGP, static routing has no method of peer discovery. Therefore, when BFD is configured, the reachability of the gateway is completely dependent on the state of the BFD session to the specified neighbor. Unless the BFD session is up, the gateway for the static route is considered unreachable, and therefore the affected routes will not be installed in the appropriate Routing Information Base (RIB).

For a BFD session to establish successfully, BFD must be configured on the interface on the peer and there must be a BFD client registered on the peer for the address of the BFD neighbor. When an interface is used by dynamic routing protocols, the latter requirement is usually met by configuring the routing protocol instances on each neighbor for BFD. When an interface is used exclusively for static routing, this requirement must be met by configuring static routes on the peers.

BFD is supported on IPv4 and IPv6 static routes.

---

**Note**

If a BFD configuration is removed from the remote peer while the BFD session is in the up state, the updated state of the BFD session is not signaled to the static route. This will cause the static route to remain in the RIB. The only workaround is to remove the static route BFD neighbor configuration so that the static route no longer tracks BFD session state.

**Benefits of Using BFD for Failure Detection**

When you deploy any feature, it is important to consider all the alternatives and be aware of any trade-offs being made.

The closest alternative to BFD in conventional EIGRP, BGP, and OSPF deployments is the use of modified failure detection mechanisms for EIGRP, BGP, and OSPF routing protocols.

If you set EIGRP hello and hold timers to their absolute minimums, the failure detection rate for EIGRP falls to within a one- to two-second range.
If you use fast hellos for either BGP or OSPF, this Interior Gateway Protocol (IGP) protocol reduces its failure detection mechanism to a minimum of one second.

Advantages to implementing BFD over reduced timer mechanisms for routing protocols include the following:

- Although reducing the EIGRP, BGP, and OSPF timers can result in minimum detection timer of one to two seconds, BFD can provide failure detection in less than one second.
- Because BFD is not tied to any particular routing protocol, it can be used as a generic and consistent failure detection mechanism for EIGRP, BGP, and OSPF.
- Because some parts of BFD can be distributed to the data plane, it can be less CPU-intensive than the reduced EIGRP, BGP, and OSPF timers, which exist wholly at the control plane.

## Hardware Support for BFD

The Catalyst 4500 supports a limited number of BFD sessions in hardware. Placing a session in BFD hardware is termed *hardware offload*. The advantage of hardware offload is that session keep-alive is handled entirely in hardware, placing no load on the CPU.

Not all BFD sessions can be offloaded to hardware. The requirements for offloaded sessions are:

- BFD version 1
- IPv4
- No echo mode

The number of offloaded sessions varies by supervisor. For WS-X45-SUP6-E, WS-X45-SUP6L-E, WS-X4948-E, and C4900M, the number of offloaded sessions is 63.

The `show bfd neighbor detail` command displays print statistics for software and hardware (offloaded) sessions. Hardware sessions provide a limited set of statistics. In particular, statistics for packet transmit and receive intervals are not available for hardware sessions.

The `holddown` and `hello counts` are zero for all offloaded sessions.

### How to Configure Bidirectional Forwarding Detection

Support on the Catalyst 4500E is limited. Starting with Cisco IOS Release IOS 15.1(1)SG, Bidirectional Forwarding Detection (BFD) is supported only on Catalyst 4900M, and Catalyst 4948E Ethernet switches.

You start a BFD process by configuring BFD on the interface. When the BFD process is started, no entries are created in the adjacency database; in other words, no BFD control packets are sent or received. BFD echo mode, which is supported in BFD Version 1 for Cisco IOS Release 15.1(1)SG, is enabled by default. BFD echo packets are sent and received, in addition to BFD control packets. The adjacency creation takes places once you have configured BFD support for the applicable routing protocols. This section contains the following procedures:

- Configuring BFD Session Parameters on the Interface, page 37-8 (required)
Configuring BFD Session Parameters on the Interface

The steps in this procedure show how to configure BFD on the interface by setting the baseline BFD session parameters on an interface. Repeat the steps in this procedure for each interface over which you want to run BFD sessions to BFD neighbors.

To configure BFD session parameters, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface type number</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>switch(config)# interface gigabitethernet 6/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> bfd interval milliseconds min_rx milliseconds multiplier interval-multiplier</td>
<td>Enables BFD on the interface.</td>
</tr>
<tr>
<td>switch(config-if)# bfd interval 50 min_rx 50 multiplier 5</td>
<td>Disables BFD echo mode to enable Hardware Off-load.</td>
</tr>
<tr>
<td>switch(config-if)# no bfd echo</td>
<td>Exits interface configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td></td>
</tr>
<tr>
<td>switch(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

Configuring BFD Support for Dynamic Routing Protocols

You can enable BFD support for dynamic routing protocols at the router level to enable BFD support globally for all interfaces or you can configure BFD on a per-interface basis at the interface level.

This section describes the following procedures:

• Configuring BFD Support for BGP, page 37-8 (optional)
• Configuring BFD Support for EIGRP, page 37-9 (optional)
• Configuring BFD Support for OSPF, page 37-10 (optional)

Configuring BFD Support for BGP

This section describes the procedure for configuring BFD support for BGP so that BGP is a registered protocol with BFD and will receive forwarding path detection failure messages from BFD.
Prerequisites

BGP must be running on all participating switches.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the “Configuring BFD Session Parameters on the Interface” section on page 37-8 for more information.

To configure BFD support for BGP, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | **enable**<br>Switch> enable | Enables privileged EXEC mode.  
|                   | • Enter your password if prompted. |
| **Step 2**        | **configure terminal**<br>Switch# configure terminal | Enters global configuration mode. |
| **Step 3**        | **router bgp as-tag**<br>Switch(config)# router bgp tag1 | Specifies a BGP process and enters router configuration mode. |
| **Step 4**        | **neighbor ip-address fall-over bfd**<br>Switch(config-router)# neighbor 172.16.10.2 fall-over bfd | Enables BFD support for fallover. |
| **Step 5**        | **end**<br>Switch(config-router)# end | Exits router configuration mode and returns the switch to privileged EXEC mode. |
| **Step 6**        | **show bfd neighbors [details]**<br>Switch# show bfd neighbors detail | (Optional) Verifies that the BFD neighbor is active and displays the routing protocols that BFD has registered. |
| **Step 7**        | **show ip bgp neighbor**<br>Switch# show ip bgp neighbor | (Optional) Displays information about BGP and TCP connections to neighbors. |

What to Do Next

See the “Monitoring and Troubleshooting BFD” section on page 37-16 for more information on monitoring and troubleshooting BFD. If you want to configure BFD support for another routing protocol, see the following sections:

• Configuring BFD Support for EIGRP, page 37-9
• Configuring BFD Support for OSPF, page 37-10

Configuring BFD Support for EIGRP

This section describes the procedure for configuring BFD support for EIGRP so that EIGRP is a registered protocol with BFD and will receive forwarding path detection failure messages from BFD. There are two methods for enabling BFD support for EIGRP:

• You can enable BFD for all of the interfaces for which EIGRP is routing by using the `bfd all-interfaces` command in router configuration mode.
• You can enable BFD for a subset of the interfaces for which EIGRP is routing by using the `bfd interface type number` command in router configuration mode.
Prerequisites

EIGRP must be running on all participating switches.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the “Configuring BFD Session Parameters on the Interface” section on page 37-8 for more information.

To configure BFD support for EIGRP, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>• Enter your password if prompted.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch eigrp as-number</td>
<td>Configures the EIGRP routing process and enters router configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# router eigrp 123</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> bfd all-interfaces</td>
<td>Enables BFD globally on all interfaces associated with the EIGRP routing process.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>bfd interface type number</td>
<td>Enables BFD on a per-interface basis for one or more interfaces associated with the EIGRP routing process.</td>
</tr>
<tr>
<td>Switch(config-router)# bfd all-interfaces</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# bfd interface</td>
<td></td>
</tr>
<tr>
<td>gigabitethernet 6/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits router configuration mode and returns the switch to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch(config-router) end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show bfd neighbors {details}</td>
<td>(Optional) Verifies that the BFD neighbor is active and displays the routing protocols that BFD has registered.</td>
</tr>
<tr>
<td>Switch# show bfd neighbors details</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> show ip eigrp interfaces {type number}</td>
<td>(Optional) Displays the interfaces for which BFD support for EIGRP has been enabled.</td>
</tr>
<tr>
<td>[as-number] {detail}</td>
<td></td>
</tr>
<tr>
<td>Switch# show ip eigrp interfaces detail</td>
<td></td>
</tr>
</tbody>
</table>

What to Do Next

See the “Monitoring and Troubleshooting BFD” section on page 37-16 for more information on monitoring and troubleshooting BFD. If you want to configure BFD support for another routing protocol, see the following sections:

• Configuring BFD Support for OSPF, page 37-10

Configuring BFD Support for OSPF

This section describes the procedures for configuring BFD support for OSPF so that OSPF is a registered protocol with BFD and will receive forwarding path detection failure messages from BFD. You can either configure BFD support for OSPF globally on all interfaces or configure it selectively on one or more interfaces.

There are two methods for enabling BFD support for OSPF:
You can enable BFD on all the interfaces for which OSPF is routing by using the \texttt{bfd all-interfaces} command in router configuration mode. You can disable BFD support on individual interfaces using the \texttt{ip ospf bfd [disable]} command in interface configuration mode.

You can enable BFD on a subset of the interfaces for which OSPF is routing by using the \texttt{ip ospf bfd} command in interface configuration mode.

See the following sections for tasks for configuring BFD support for OSPF:

- Configuring BFD Support for OSPF for All Interfaces, page 37-11 (optional)
- Configuring BFD Support for OSPF for One or More Interfaces, page 37-12 (optional)

### Configuring BFD Support for OSPF for All Interfaces

To configure BFD for all OSPF interfaces, perform the steps in this section.

If you do not want to configure BFD on all OSPF interfaces and would rather configure BFD support specifically for one or more interfaces, see the “Configuring BFD Support for OSPF for One or More Interfaces” section on page 37-12.

### Prerequisites

OSPF must be running on all participating switches.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the “Configuring BFD Session Parameters on the Interface” section on page 37-8 for more information.

To configure BFD support for OSPF for all interfaces:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies an OSPF process and enters router configuration mode.</td>
</tr>
<tr>
<td>switch ospf process-id Switch(config)# router ospf 4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables BFD globally on all interfaces associated with the OSPF routing process.</td>
</tr>
<tr>
<td>bfd all-interfaces Switch(config-router)# bfd all-interfaces</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Exits interface configuration mode and returns the switch to privileged EXEC mode.</td>
</tr>
<tr>
<td>end Switch(config-if)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>(Optional) Displays information that can help verify if the BFD neighbor is active and displays the routing protocols that BFD has registered.</td>
</tr>
<tr>
<td>show bfd neighbors [details] Switch# show bfd neighbors detail</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Displays information that can help verify if BFD for OSPF has been enabled.</td>
</tr>
<tr>

Chapter 37 Configuring Bidirectional Forwarding Detection

What to Do Next

See the “Monitoring and Troubleshooting BFD” section on page 37-16 for more information on monitoring and troubleshooting BFD. If you want to configure BFD support for another routing protocol, see the following sections:

- Configuring BFD Support for BGP, page 37-8
- Configuring BFD Support for EIGRP, page 37-9

Configuring BFD Support for OSPF for One or More Interfaces

To configure BFD on one or more OSPF interfaces, perform the steps in this section.

Prerequisites

OSPF must be running on all participating switches.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the “Configuring BFD Session Parameters on the Interface” section on page 37-8 for more information.

To configure BFD support for OSPF for one or more interfaces, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface type number</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet 6/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip ospf bfd [disable]</td>
<td>Enables or disables BFD on a per-interface basis for one or more interfaces associated with the OSPF routing process.</td>
</tr>
<tr>
<td>Switch(config-if)# ip ospf bfd</td>
<td><strong>Note</strong> You should use the disable keyword only if you enabled BFD on all of the interfaces that OSPF is associated with using the bfd all-interfaces command in switch configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits interface configuration mode and returns the switch to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 37  Configuring Bidirectional Forwarding Detection

How to Configure Bidirectional Forwarding Detection

What to Do Next

See the “Monitoring and Troubleshooting BFD” section on page 37-16 for more information on monitoring and troubleshooting BFD. If you want to configure BFD support for another routing protocol, see the following sections:

- Configuring BFD Support for BGP, page 37-8
- Configuring BFD Support for EIGRP, page 37-9

Configuring BFD Support for Static Routing

Perform this task to configure BFD support for static routing. Repeat the steps in this procedure on each BFD neighbor. For more information, see the “Example: Configuring BFD Support for Static Routing” section on page 37-27.

To configure BFD support for static routing, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 interface type number</td>
<td>Configures an interface and enters interface configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet6/1</td>
<td></td>
</tr>
<tr>
<td>Step 4 no switchport</td>
<td>Changes the interface to Layer 3.</td>
</tr>
<tr>
<td>Switch(config-if)# no switchport</td>
<td></td>
</tr>
<tr>
<td>Step 5 ip address ip-address mask</td>
<td>Configures an IP address for the interface.</td>
</tr>
<tr>
<td>Switch(config-if)# ip address 10.201.201.1 255.255.255.0</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 37 Configuring Bidirectional Forwarding Detection

How to Configure Bidirectional Forwarding Detection

Configuring BFD Echo Mode

BFD echo mode is enabled by default, but you can disable it such that it can run independently in each direction.

BFD echo mode works with asynchronous BFD. Echo packets are sent by the forwarding engine and forwarded back along the same path in order to perform detection—the BFD session at the other end does not participate in the actual forwarding of the echo packets. The echo function and the forwarding engine are responsible for the detection process; therefore, the number of BFD control packets that are sent out between two BFD neighbors is reduced. In addition, because the forwarding engine is testing...
the forwarding path on the remote (neighbor) system without involving the remote system, there is an opportunity to improve the interpacket delay variance, thereby achieving quicker failure detection times than when using BFD Version 0 with BFD control packets for the BFD session.

Echo mode is described as without asymmetry when it is running on both sides (both BFD neighbors are running echo mode).

**Prerequisites**

BFD must be running on all participating switches.

Before using BFD echo mode, you must disable the sending of Internet Control Message Protocol (ICMP) redirect messages by entering the `no ip redirects` command, in order to avoid high CPU utilization.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the “Configuring BFD Session Parameters on the Interface” section on page 37-8 for more information.

**Restrictions**

BFD echo mode which is supported in BFD Version 1.

This section contains the following configuration tasks for BFD echo mode:

- Configuring the BFD Slow Timer, page 37-15
- Disabling BFD Echo Mode Without Asymmetry, page 37-16

**Note**

BFD echo mode does not work in conjunction with Unicast Reverse Path Forwarding (uRPF) configuration. If BFD echo mode and uRPF configurations are enabled, then the sessions will flap.

**Configuring the BFD Slow Timer**

The steps in this procedure show how to change the value of the BFD slow timer. Repeat the steps in this procedure for each BFD switch.

To configure the BFD slow timer, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> bfd slow-timer milliseconds</td>
<td>Configures the BFD slow timer.</td>
</tr>
<tr>
<td>Switch(config)# bfd slow-timer 12000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Exits global configuration mode and returns the switch to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Disabling BFD Echo Mode Without Asymmetry

The steps in this procedure show how to disable BFD echo mode without asymmetry — no echo packets will be sent by the switch, and the switch will not forward BFD echo packets that are received from any neighbor switches.

Repeat the steps in this procedure for each BFD switch.

To disable BFD echo mode without asymmetry, perform this task:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch&gt; enable</td>
</tr>
<tr>
<td></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>interface type number</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# interface GigabitEthernet 6/1</td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>no bfd echo</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# no bfd echo</td>
</tr>
<tr>
<td></td>
<td>Disables BFD echo mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td></td>
<td>Exits global configuration mode and returns the switch to global configuration mode.</td>
</tr>
</tbody>
</table>

Monitoring and Troubleshooting BFD

This section describes how to retrieve BFD information for maintenance and troubleshooting. The commands in these tasks can be entered as needed, in any order desired.

For more information about BFD session initiation and failure, refer to the “BFD Operation” section on page 37-2.

To monitor and troubleshoot BFD, perform the following steps:
### Command or Action | Purpose
---|---
**Step 1**
**enable**
Switch> enable | Enables privileged EXEC mode.
• Enter your password if prompted.

**Step 2**
**show bfd neighbors [details]**
Switch# show bfd neighbors details | (Optional) Displays the BFD adjacency database.
• The **details** keyword shows all BFD protocol parameters and timers per neighbor.

**Step 3**
**debug bfd [packet | event]**
Switch# debug bfd packet | (Optional) Displays debugging information about BFD packets.

### Configuration Examples for Bidirectional Forwarding Detection

This section provides the following configuration examples:

- Example: Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default, page 37-17
- Example: Configuring BFD in an OSPF Network, page 37-21
- Example: Configuring BFD Hardware-Offload support in a BGP Network Network, page 37-25
- Example: Configuring BFD Support for Static Routing, page 37-27

### Example: Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default

The following example shows how to configure BFD in an EIGRP network with echo mode enabled by default in Cisco IOS Release 15.1(1)SG. In the following example, the EIGRP network contains SwitchA, SwitchB, and SwitchC. Gigabit Ethernet interface 6/1 on SwitchA is connected to the same network as Gigabit Ethernet interface 6/1 on SwitchB. Gigabit Ethernet interface 6/1 on SwitchB is connected to the same network as Gigabit Ethernet interface 6/1 on SwitchC.

SwitchA and SwitchB are running BFD Version 1, which supports echo mode, and SwitchC is running BFD Version 0, which does not support echo mode. We would say that the BFD sessions between SwitchC and its BFD neighbors are running echo mode with asymmetry. This is because echo mode will...
run on the forwarding path for RouteA and SwitchB, and their echo packets will return along the same path for BFD sessions and failure detections, while their BFD neighbor SwitchC runs BFD Version 0 and uses BFD controls packets for BFD sessions and failure detections.

Figure 37-3 shows a large EIGRP network with several switches, three of which are BFD neighbors that are running EIGRP as their routing protocol.

**Figure 37-3** EIGRP Network with Three BFD Neighbors Running V1 or V0

The example, starting in global configuration mode, shows the configuration of BFD.

**Configuration for SwitchA**

```plaintext
interface GigabitEthernet6/2

ip route 172.16.1.129 255.255.255.255 10.4.9.1
!
!
end
```

The output from the `show bfd neighbors details` command from SwitchA verifies that BFD sessions have been created among all three switches and that EIGRP is registered for BFD support. The first group of output shows that SwitchC with the IP address 172.16.1.3 runs BFD Version 0 and therefore does not use the echo function. The second group of output shows that SwitchB with the IP address 172.16.1.2 does run BFD Version 1, and the 50 millisecond BFD interval parameter had been adopted. The relevant command output is shown in bold in the output.

SwitchA

```
SwitchA# show bfd neighbors details
```

```
<table>

Registered protocols: EIGRP
Figure 37-4 shows that Gigabit Ethernet interface 6/1 on SwitchB has failed. When Gigabit Ethernet interface 6/1 on SwitchB is shut down, the BFD values of the corresponding BFD sessions on SwitchA and SwitchB are reduced.

Figure 37-4 Gigabit Ethernet Interface 6/1 Failure

When Gigabit Ethernet interface 6/1 on SwitchB fails, BFD will no longer detect SwitchB as a BFD neighbor for SwitchA or for SwitchC. In this example, Gigabit Ethernet interface 6/1 has been administratively shut down on SwitchB.

The following output from the `show bfd neighbors` command on SwitchA now shows only one BFD neighbor for SwitchA in the EIGRP network. The relevant command output is shown in bold in the output.

```
SwitchA# show bfd neighbors
OurAddr       NeighAddr   LD/RD  RH/RS  Holdown(mult)  State     Int
172.16.1.1    172.16.1.3 5/3    1(RH)   134 (3 )   Up        Gi6/1
```

The following output from the `show bfd neighbors` command on SwitchC also now shows only one BFD neighbor for SwitchC in the EIGRP network. The relevant command output is shown in bold in the output.

```
SwitchC# show bfd neighbors
OurAddr       NeighAddr   LD/RD RH  Holdown(mult)  State     Int
172.16.1.3    172.16.1.1 3/5   1   114 (3 ) Up        Gi6/1
```

**Example: Configuring BFD in an OSPF Network**

The following example shows how to configure BFD in an OSPF network in Cisco IOS Release 15.1(1)SG. In the following example, the simple OSPF network consists of SwitchA and SwitchB. Gigabit Ethernet interface 6/1 on SwitchA is connected to the same network as Gigabit
Ethernet interface 6/1 in SwitchB. The example, starting in global configuration mode, shows the configuration of BFD. For both SwitchA and SwitchB, BFD is configured globally for all interfaces associated with the OSPF process.

**Configuration for SwitchA**

```plaintext
! interface GigabitEthernet 6/1
 no switchport
 ip address 172.16.10.1 255.255.255.0
 bfd interval 50 min_rx 50 multiplier 3
! interface GigabitEthernet 6/2
 no switchport
 ip address 172.17.0.1 255.255.255.0
! router ospf 123
 log-adjacency-changes detail
 network 172.16.0.0 0.0.0.255 area 0
 network 172.17.0.0 0.0.0.255 area 0
 bfd all-interfaces
```

**Configuration for SwitchB**

```plaintext
! interface GigabitEthernet 6/1
 no switchport
 ip address 172.16.10.2 255.255.255.0
 bfd interval 50 min_rx 50 multiplier 3
! interface GigabitEthernet 6/2
 no switchport
 ip address 172.18.0.1 255.255.255.0
! router ospf 123
 log-adjacency-changes detail
 network 172.16.0.0 0.0.0.255 area 0
 network 172.18.0.0 0.0.0.255 area 0
 bfd all-interfaces
```

The output from the `show bfd neighbors details` command verifies that a BFD session has been created and that OSPF is registered for BFD support. The relevant command output is shown in bold in the output.

- Number of opaque link LSA 0. Checksum Sum 0x000000
- Number of DCbitless LSA 0
- Number of indication LSA 0
- Number of DoNotAge LSA 0
- Flood list length 0

**SwitchB**

SwitchB# show ip ospf

Routing Process "ospf 123" with ID 172.18.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
Supports Link-local Signaling (LLS)
Supports area transit capability
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFIs 10000 msecs
Maximum wait time between two consecutive SPFIs 10000 msecs
Incremental-SPF disabled
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
Number of areas transit capable is 0
External flood list length 0

**BFD is enabled**

Area BACKBONE(0)
- Number of interfaces in this area is 2 (1 loopback)
- Area has no authentication
- SPF algorithm last executed 02:07:30.932 ago
- SPF algorithm executed 7 times
- Area ranges are
- Number of LSA 3. Checksum Sum 0x28417
- Number of opaque link LSA 0. Checksum Sum 0x0
- Number of DCbitless LSA 0
- Number of indication LSA 0
- Number of DoNotAge LSA 0
- Flood list length 0

The output of the `show ip ospf interface` command verifies that BFD has been enabled for OSPF on the interfaces connecting SwitchA and SwitchB. The relevant command output is shown in bold in the output.

**SwitchA**

SwitchA# show ip ospf interface gigabitethernet 6/1

The output of the `show ip ospf interface gigabitethernet 6/1` command verifies that BFD has been enabled for OSPF on the interfaces connecting SwitchA and SwitchB. The relevant command output is shown in bold in the output.
Example: Configuring BFD Hardware-Offload support in a BGP Network

The following example shows how to configure BFD Hardware-Offload support in a BGP network in Cisco IOS Release 15.1(1)SG. In the following example, the simple BGP network consists of SwitchA and SwitchB. Gigabit Ethernet interface 6/1 on SwitchA is connected to the same network as Gigabit Ethernet interface 6/1 in SwitchB.

Configuration for SwitchA

```bash
! interface GigabitEthernet 6/1
   no switchport
   ip address 1.1.1.1 255.255.255.0
   bfd interval 50 min_rx 50 multiplier 3
   no bfd echo
   router bgp 10
      neighbor 1.1.1.2 remote-as 10
      neighbor 1.1.1.2 fall-over bfd
```

SwitchB

```bash
SwitchB# show ip ospf interface gigabitethernet 6/1
```

Gigabitethernet 6/1 is up, line protocol is up
Internet Address 172.18.0.1/24, Area 0
Process ID 123, Router ID 172.18.0.1, Network Type BROADCAST, Cost: 1
Transmit Delay is 1 sec, State DR, Priority 1, BFD enabled
Designated Router (ID) 172.18.0.1, Interface address 172.18.0.1
Backup Designated router on this network
No backup designated router on this network
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
   oob-resync timeout 40
   Hello due in 00:00:01
   Supports Link-local Signaling (LLS)
   Index 1/1, flood queue length 0
   Next 0x0(0)/0x0(0)
   Last flood scan length is 0, maximum is 0
   Last flood scan time is 0 msec, maximum is 0 msec
   Neighbor Count is 0, Adjacent neighbor count is 0
   Suppress hello for 0 neighbor(s)
### Configuration for SwitchB

```
! interface GigabitEthernet 6/1
  no switchport
  ip address 1.1.1.2 255.255.255.0
  bfd interval 50 min_rx 50 multiplier 3
  no bfd echo

router bgp 10
  neighbor 1.1.1.1 remote-as 10
  neighbor 1.1.1.1 fall-over bfd
```

The output from the `show bfd neighbors details` command from SwitchA verifies that a BFD session has been created and that BGP is registered for BFD support. The relevant command output is shown in bold in the output:

**SwitchA**

```
SwitchA# show bfd neighbors details
IPv4 Sessions
NeighAddr     LD/RD  RH/RS  State   Int
1.1.1.1       1/1    Up     Up     Gi3/2

Session state is UP and not using echo function.
Session Host: Hardware
OurAddr: 1.1.1.2
Local Diag: 0, Demand mode: 0, Poll bit: 0
MinTxInt: 50000, MinRxInt: 50000, Multiplier: 3
Received MinRxInt: 50000, Received Multiplier: 3
Holddown (hits): 0(0), Hello (hits): 50(0)
Rx Count: 8678
Tx Count: 8680
Elapsed time watermarks: 0 0 (last: 0)
Registered protocols: BGP
Uptime: 00:06:18
Last packet: Version: 1 - Diagnostic: 0
  State bit: Up - Demand bit: 0
  Poll bit: 0 - Final bit: 0
  Multiplier: 3 - Length: 24
  My Discr.: 1 - Your Discr.: 1
  Min tx interval: 50000 - Min rx interval: 50000
  Min Echo interval: 0
```

The output from the `show bfd neighbors details` command on SwitchB verifies that a BFD session has been created:

**SwitchB**

```
SwitchB# attach 6
SwitchB> show bfd neighbors details
IPv4 Sessions
NeighAddr     LD/RD  RH/RS  State   Int
1.1.1.2       1/1    Up     Up     Gi1/2

Session state is UP and not using echo function.
Session Host: Hardware
OurAddr: 1.1.1.1
Local Diag: 0, Demand mode: 0, Poll bit: 0
MinTxInt: 50000, MinRxInt: 50000, Multiplier: 3
Received MinRxInt: 50000, Received Multiplier: 3
```
Holddown (hits): 0(0), Hello (hits): 50(0)
Rx Count: 10138
Tx Count: 10139
Elapsed time watermarks: 0 0 (last: 0)
Registered protocols: BGP
Uptime: 00:07:22
Last packet: Version: 1                  - Diagnostic: 0
    State bit: Up               - Demand bit: 0
    Poll bit: 0                 - Final bit: 0
    Multiplier: 3               - Length: 24
    My Discr.: 1                - Your Discr.: 1
    Min tx interval: 50000      - Min rx interval: 50000
    Min Echo interval: 0

The output of the `show ip bgp neighbors` command verifies that BFD has been enabled for the BGP neighbors:

**SwitchA**

`SwitchA# show ip bgp neighbors`

BGP neighbor is 1.1.1.2, remote AS 45000, external link
Using BFD to detect fast failover ..

**SwitchB**

`SwitchB# show ip bgp neighbors`

BGP neighbor is 1.1.1.1, remote AS 40000, external link
Using BFD to detect fast failover ..

**Example: Configuring BFD Support for Static Routing**

In the following example, the network consists of SwitchA and SwitchB. Gigabit Ethernet interface 6/1 on SwitchA is connected to the same network as gigabit ethernet interface 6/1 on SwitchB. For the BFD session to come up, SwitchB must be configured.

**SwitchA**

```
configure terminal
no switchport
interface Gigabit Ethernet 6/1
ip address 10.201.201.1 255.255.255.0
bfd interval 500 min_rx 500 multiplier 5
ip route static bfd Gigabit Ethernet 6/1 10.201.201.2
ip route 10.0.0.0 255.0.0.0 Gigabit Ethernet 6/1 10.201.201.2
```

**SwitchB**

```
configure terminal
no switchport
interface Gigabit Ethernet 6/1
ip address 10.201.201.2 255.255.255.0
bfd interval 500 min_rx 500 multiplier 5
ip route static bfd Gigabit Ethernet 6/1 10.201.201.1
ip route 10.1.1.1 255.255.255.255 Gigabit Ethernet 6/1 10.201.201.1
```
The static route on SwitchB exists solely to enable the BFD session between 10.201.201.1 and 10.201.201.2. If there is no useful static route to configure, select a prefix that will not affect packet forwarding, for example, the address of a locally configured loopback interface.

Configuring Policy-Based Routing

This chapter describes the tasks for configuring policy-based routing (PBR) on a Catalyst 4500 series switch and includes these major sections:

- About Policy-Based Routing, page 38-1
- Policy-Based Routing Configuration Tasks, page 38-5
- Policy-Based Routing Configuration Examples, page 38-8

**Note**
For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

**Note**
To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release.

About Policy-Based Routing

This section contains the following subsections:

- About PBR, page 38-2
- Using Policy-Based Routing, page 38-5

PBR gives you a flexible method of routing packets by allowing you to define policies for traffic flows, lessening reliance on routes derived from routing protocols. PBR gives you more control over routing by extending and complementing the existing mechanisms provided by routing protocols. PBR allows you to specify paths for certain traffic, such as priority traffic over a high-cost link.
You can set up PBR as a way to route packets based on configured policies. For example, you can implement routing policies to allow or deny paths based on the identity of a particular end system, or an application protocol.

PBR allows you to perform the following tasks:

- Classify traffic based on extended access list criteria. Access lists, and then establish the match criteria.
- Route packets to specific traffic-engineered paths.

Policies can be based on IP address, port numbers, or protocols. For a simple policy, use any one of these descriptors; for a complicated policy, all of them.

### About PBR

All packets received on an interface with PBR enabled are passed through enhanced packet filters known as route maps. The route maps used by PBR dictate the policy, determining to where the packets are forwarded.

Route maps are composed of statements, which can be marked as permit or deny. They are interpreted in the following ways:

- If a statement is marked as deny, the packets meeting the match criteria are sent back using the normal forwarding channels and destination-based routing is performed.
- If the statement is marked as permit and a packet matches the access-lists, then the first valid set clause is applied to that packet.

This is explained in more detail in the section Understanding Route-Maps, page 38-2.

You specify PBR on the incoming interface (the interface on which packets are received), not outgoing interface.

### Understanding Route-Maps

PBR is implemented by applying a route-map on an incoming interface. A given interface can have only one route-map configured.

A route-map is configured at the global configuration parser mode. You can then apply this route-map on one or more interfaces (in the interface configuration parser sub-mode).

A route-map is comprised of one or more route-map statements. Each statement has a sequence number, as well as a permit or deny clause.

Each route-map statement contains **match** and **set** commands. The **match** command denotes the match criteria to be applied on the packet data. The **set** command denote the PBR action to be taken on the packet.

The following example shows a single route-map called rm-test and six route-map statements:

```plaintext
route-map rm-test permit 21
  match ip address 101
  set ip next-hop 21.1.1.1
!
route-map rm-test permit 22
  match ip address 102
  set ip next-hop 22.2.2.1
!
```
route-map rm-test permit 23
  match ip address 101 2102
  set interface vlan23
!
route-map rm-test deny 24
  match ip address 104
  set ip next-hop 24.4.4.1
!
route-map rm-test deny 25
  match ip address 105
  set ip next-hop 25.5.5.1
!
route-map rm-test permit 26
  match ip address 2104
  set ip next-hop 26.6.6.1

The numbers 21, 22, ..., 26 are the sequence numbers of the route-map statements.

The following topics are discussed:

- PBR Route-Map Processing Logic, page 38-3
- PBR Route-Map Processing Logic Example, page 38-4

**PBR Route-Map Processing Logic**

When a packet is received on an interface configured with a route-map, the forwarding logic processes each route-map statement according to the sequence number.

If the route-map statement encountered is a `route-map...permit` statement:

- The packet is matched against the criteria in the `match` command. This command may refer to an ACL that may itself have one or more permit and/or deny expressions. The packet is matched against the expressions in the ACL, and a permit/deny decision is reached.
- If the decision reached is permit, then the PBR logic executes the action specified by the `set` command on the packet.
- If the decision reached is deny, then the PBR processing logic moves forward to look at the next route-map statement in the sequence (the statement with the next higher sequence number). If no next statement exists, PBR processing terminates, and the packet is routed using the default IP routing table.

If the route-map statement encountered is a `route-map...deny` statement:

- The packet is matched against the criteria given in the `match` command. This command may refer to an ACL that may itself have one or more permit and/or deny expressions. The packet is matched against the expressions in the ACL, and a permit/deny decision is reached.
- If the criteria decision is permit, then the PBR processing terminates, and the packet is routed using the default IP routing table.
- If the criteria decision is deny, then the PBR processing logic moves forward to look at the next route-map statement in the sequence (the statement with the next higher sequence number). If no next statement exists, PBR processing terminates, and the packet is routed using the default IP routing table.

**Note**

The `set` command has no effect inside a `route-map...deny` statement.
PBR Route-Map Processing Logic Example

Consider a route-map called rm-test defined as follows:

```
access-list 101 permit tcp host 61.1.1.1 host 133.3.3.1 eq 101
access-list 102 deny tcp host 61.1.1.1 host 133.3.3.1 eq 102
access-list 2102 permit tcp host 61.1.1.1 host 133.3.3.1 eq 102
access-list 104 deny tcp host 61.1.1.1 host 133.3.3.1 eq 104
access-list 2104 permit tcp host 61.1.1.1 host 133.3.3.1 eq 104
access-list 105 permit tcp host 61.1.1.1 host 133.3.3.1 eq 105
```

```
route-map rm-test permit 21
  match ip address 101
  set ip next-hop 21.1.1.1

route-map rm-test permit 22
  match ip address 102
  set ip next-hop 22.2.2.1

route-map rm-test permit 23
  match ip address 101 2102
  set interface vlan23

route-map rm-test deny 24
  match ip address 104
  set ip next-hop 24.4.4.1

route-map rm-test deny 25
  match ip address 105
  set ip next-hop 25.5.5.1

route-map rm-test permit 26
  match ip address 2104
  set ip next-hop 26.6.6.1
```

- TCP packet from 61.1.1.1 to 133.3.3.1 with destination port 101
  - Matches ACL 101 in sequence #21.
  - PBR is switched through next-hop 21.1.1.1.

- TCP packet from 61.1.1.1 to 133.3.3.1 with destination port 102
  - In sequence #21, the ACL 101 action denies this packet (because all ACLs have an implicit deny). Processing advances to sequence #22.
  - In sequence #22, ACL 102 matches TCP port 102, but the ACL action is deny. Processing advances to sequence #23.
  - In sequence #23, ACL 2102 matches TCP port 102, and the ACL action is permit.
  - Packet is switched to output interface VLAN 23.

Note: ACL 101 is also matched in sequence #23, but the processing doesn't reach that point
• TCP packet from 61.1.1.1 to 133.3.3.1 with destination port 105
  - Processing moves from sequence #21 to #24, because all ACLs in these sequence numbers have a deny action for port 105.
  - In sequence #25, ACL 105 has a permit action for TCP port 105.
  - The route-map deny takes effect, and the packet is routed using the default IP routing table.

The Catalyst 4500 series switch supports matching route-map actions with a packet by installing entries in the TCAM that match the set of packets described by the ACLs in the match criteria of the route map. These TCAM entries point at adjacencies that either perform the necessary output actions or forward the packet to software if either hardware does not support the action or its resources are exhausted.

If the route-map specifies a set interface … action, packets that match the match statement are routed in software. Similarly, if the route-map specifies a set default interface… action and there is no matching IP route for the packet, the packet is routed in software.

### Using Policy-Based Routing

You can enable PBR to change the routing path of certain packets from the default path that would be chosen by IP routing. For example, you can use PBR to provide the following functionality:

• Equal access
• Protocol-sensitive routing
• Source-sensitive routing
• Routing based on interactive versus batch traffic
• Routing based on dedicated links

Some applications or traffic can benefit from source-specific routing; for example, you can transfer stock records to a corporate office on a higher-bandwidth, higher-cost link for a short time while sending routine application data, such as e-mail, over a lower-bandwidth, lower-cost link.

### Policy-Based Routing Configuration Tasks

To configure PBR, perform the tasks described in the following sections. The task in the first section is required; the tasks in the remaining sections are optional. For configuration examples, see the “Policy-Based Routing Configuration Examples” section on page 38-8.

• Enabling PBR, page 38-6 (Required)
• Enabling Local PBR, page 38-7 (Optional)
Enabling PBR

To enable PBR, you must create a route map that specifies the match criteria and the resulting action if all of the match clauses are met. Then you must apply that route-map on a particular interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

To enable PBR on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# route-map map-tag [permit</td>
</tr>
<tr>
<td></td>
<td>Defines a route map to control where packets are sent. This command puts the switch into route-map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-route-map)# match ip address {access-list-number</td>
</tr>
<tr>
<td></td>
<td>Specifies the match criteria. The match criteria take the form of one or more Standard or Extended IP access-lists. The access-lists can specify the source and destination IP addresses, protocol types, and port numbers. See Chapter 51, “Configuring Network Security with ACLs” for more information on Standard and Extended IP access-lists.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-route-map)# set ip next-hop ip-address [... ip-address]</td>
</tr>
<tr>
<td>Or</td>
<td>Specifies the next-hop IP address to which matching packets are sent. The next-hop IP address specified here must belong to a subnet that is directly connected to this switch.</td>
</tr>
<tr>
<td></td>
<td>If more than one next-hop IP address is specified, the first usable next-hop is chosen for routing matching packets. If the next-hop is (or becomes) unavailable for some reason, the next one in the list is chosen.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-route-map)# set interface interface-type interface-number [... type number]</td>
</tr>
<tr>
<td>Or</td>
<td>Specifies the output interface from which the packet will be sent. This action specifies that the packet is forwarded out of the local interface. The interface must be a Layer 3 interface (not a switchport). Packets are forwarded on the specified interface only if one of the following conditions is met:</td>
</tr>
<tr>
<td></td>
<td>• The destination IP address in the packet lies within the IP subnet to which the specified interface belongs.</td>
</tr>
<tr>
<td></td>
<td>• The destination IP address in the packet is reachable through the specified interface (as per the IP routing table).</td>
</tr>
<tr>
<td></td>
<td>If the destination IP address on the packet does not meet either of these conditions, the packet is dropped. This action forces matching packets to be switched in software.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-route-map)# set ip default next-hop ip-address [... ip-address]</td>
</tr>
<tr>
<td>Or</td>
<td>Sets next hop to which to route the packet if there is no explicit route for the destination IP address in the packet. Before forwarding the packet to the next hop, the switch looks up the packet’s destination address in the unicast routing table. If a match is found, the packet is forwarded by way of the routing table. If no match is found, the packet is forwarded to the specified next hop.</td>
</tr>
</tbody>
</table>
### Chapter 38 Configuring Policy-Based Routing

#### Policy-Based Routing Configuration Tasks

**Use the set commands with each other.** These commands are evaluated in the order shown in Step 3 in the previous task table. A usable next hop implies an interface. Once the local switch finds a next hop and a usable interface, it routes the packet.

**Enabling Local PBR**

Packets that are generated by the switch are not normally policy-routed. To enable local PBR for such packets, indicate which route map the switch should use by entering this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# ip local policy route-map map-tag</code></td>
<td>Identifies the route map to use for local PBR.</td>
</tr>
</tbody>
</table>

All packets originating on the switch are then subject to local PBR.

Use the `show ip local policy` command to display the route map used for local PBR, if one exists.

#### Unsupported Commands

The following PBR commands in config-route-map mode are in the CLI but not supported in Cisco IOS for the Catalyst 4500 series switches. If you attempt to use these commands, an error message displays:

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch(config)# set default interface interface-type interface-number` | Specifies the output interface from which the packet will be sent if there is no explicit route for this destination. Before forwarding the packet to the next hop, the switch looks up the packet’s destination address in the unicast routing table. If a match is found, the packet is forwarded by using the routing table. If no match is found, the packet is forwarded to the specified output interface. Packets are forwarded on the specified interface only if one of the following conditions is met:
- The destination IP address in the packet lies within the IP subnet to which the specified interface belongs.
- The destination IP address in the packet is reachable through the specified interface (as per the IP routing table). If the destination IP address on the packet does not meet either of these conditions, the packet is dropped. This action forces matching packets to be switched in software. |

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Specifies the interface. This command puts the switch into interface configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# interface interface-type interface-number</code></td>
<td>Identifies the route map to use for PBR. One interface can only have one route map tag, but you can have multiple route map entries with different sequence numbers. These entries are evaluated in sequence number order until the first match. If no match exists, packets are routed as usual.</td>
</tr>
</tbody>
</table>

| Step 8 | |
Policy-Based Routing Configuration Examples

The following sections provide PBR configuration examples:

- Equal Access, page 38-8
- Differing Next Hops, page 38-8
- Deny ACE, page 38-9

For information on how to configure policy-based routing, see the section “Policy-Based Routing Configuration Tasks” in this chapter.

Equal Access

The following example provides two sources with equal access to two different service providers. Packets arriving on interface fastethernet 3/1 from the source 1.1.1.1 are sent to the switch at 6.6.6.6 if the switch has no explicit route for the destination of the packet. Packets arriving from the source 2.2.2.2 are sent to the switch at 7.7.7.7 if the switch has no explicit route for the destination of the packet. All other packets for which the switch has no explicit route to the destination are discarded.

Switch (config)# access-list 1 permit ip 1.1.1.1
access-list 1 permit ip 1.1.1.1
!
interface fastethernet 3/1
  ip policy route-map equal-access
!
route-map equal-access permit 10
  match ip address 1
  set ip default next-hop 6.6.6.6
route-map equal-access permit 20
  match ip address 2
  set ip default next-hop 7.7.7.7
route-map equal-access permit 30
  set default interface null0

If the packets you want to drop do not match either of the first two route-map clauses, then change | set default interface null0 to set interface null0.

Differing Next Hops

The following example illustrates how to route traffic from different sources to different places (next hops). Packets arriving from source 1.1.1.1 are sent to the next hop at 3.3.3.3; packets arriving from source 2.2.2.2 are sent to the next hop at 3.3.3.5.

access-list 1 permit ip 1.1.1.1
access-list 2 permit ip 2.2.2.2
! interface fastethernet 3/1
  ip policy route-map Texas
!
route-map Texas permit 10
  match ip address 1
  set ip next-hop 3.3.3.3
!
routing-map Texas permit 20
  match ip address 2
  set ip next-hop 3.3.3.5

Deny ACE

The following example illustrates how to stop processing a given route map sequence, and to jump to the next sequence. Packets arriving from source 1.1.1.1 skip sequence 10 and jump to sequence 20. All other packets from subnet 1.1.1.0 follow the set statement in sequence 10.

access-list 1 deny ip 1.1.1.1
access-list 1 permit ip 1.1.1.0 0.0.0.255
access-list 2 permit ip 1.1.1.1
access-list 2 permit ip 2.2.2.2
!
interface fastethernet 3/1
  ip policy route-map Texas
!
routing-map Texas permit 10
  match ip address 1
  set ip next-hop 3.3.3.3
!
routing-map Texas permit 20
  match ip address 2
  set ip next-hop 3.3.3.5
Virtual Private Networks (VPNs) provide a secure way for customers to share bandwidth over an ISP backbone network. A VPN is a collection of sites sharing a common routing table. A customer site is connected to the service provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table. A VPN routing table is called a VPN routing/forwarding (VRF) table.

With the VRF-lite feature, the Catalyst 4500 series switch supports multiple VPN routing/forwarding instances in customer edge devices. (VRF-lite is also termed multi-VRF CE, or multi-VRF Customer Edge Device). VRF-lite allows a service provider to support two or more VPNs with overlapping IP addresses using one interface.

**Note**
Starting with Cisco IOS Release 12.2(52)SG, the Catalyst 4500 switch supports VRF lite NSF support with routing protocols OSPF/EIGRP/BGP.

**Note**
The switch does not use Multiprotocol Label Switching (MPLS) to support VPNs. For information about MPLS VRF, refer to the *Cisco IOS Switching Services Configuration Guide* at:

This chapter includes these topics:

About VRF-lite

VRF-lite is a feature that enables a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. VRF-lite uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but a Layer 3 interface cannot belong to more than one VRF at any time.

**Note**

VRF-lite interfaces must be Layer 3 interfaces.

VRF-lite includes these devices:

- **Customer edge (CE) devices** provide customer access to the service provider network over a data link to one or more provider edge routers. The CE device advertises the site’s local routes to the provider edge router and learns the remote VPN routes from it. A Catalyst 4500 series switch can be a CE.

- **Provider edge (PE) routers** exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv1, or RIPv2. The PE is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE to maintain all of the service provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE router can be associated with a single VRF if all of these sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CEs, a PE router exchanges VPN routing information with other PE routers by using internal BGP (iBPG).

- **Provider routers (or core routers)** are any routers in the service provider network that do not attach to CE devices.

With VRF-lite, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. VRF-lite extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

*Figure 39-1* shows a configuration where each Catalyst 4500 series switch acts as multiple virtual CEs. Because VRF-lite is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.
Figure 39-1 illustrates the packet-forwarding process in a VRF-lite CE-enabled network.

- When the CE receives a packet from a VPN, it looks up the routing table based on the input interface. When a route is found, the CE forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. The egress PE then performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input interface to look up the correct VPN routing table. If a route is found, the CE forwards the packet within the VPN.

To configure VRF, create a VRF table and specify the Layer 3 interface associated with the VRF. You then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the providers’ backbone. The VRF-lite network has three major components:

- VPN route target communities—Lists all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- Multiprotocol BGP peering of VPN community PE routers—Propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- VPN forwarding—Transports all traffic between all VPN community members across a VPN service-provider network.

**Default VRF-lite Configuration**

Table 39-1 shows the default VRF configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRF</td>
<td>Disabled. No VRFs are defined.</td>
</tr>
<tr>
<td>Maps</td>
<td>No import maps, export maps, or route maps are defined.</td>
</tr>
</tbody>
</table>
VRF-lite Configuration Guidelines

Consider these points when configuring VRF in your network:

- A switch with VRF-lite is shared by multiple customers, and all customers have their own routing tables.
- Because customers use different VRF tables, you can reuse the same IP addresses. Overlapped IP addresses are allowed in different VPNs.
- VRF-lite lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. All customers have their own VLANs.
- VRF-lite does not support all MPLS-VRF functionality: label exchange, LDP adjacency, or labeled packets.
- For the PE router, there is no difference between using VRF-lite or using multiple CEs. In Figure 39-1, multiple virtual Layer 3 interfaces are connected to the VRF-lite device.
- The Catalyst 4500 series switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. You can connect SVIs through an access port or a trunk port.
- A customer can use multiple VLANs as long because they do not overlap with those of other customers. A customer’s VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
- The Layer 3 TCAM resource is shared between all VRFs. To ensure that any one VRF has sufficient CAM space, use the `maximum routes` command.
- A Catalyst 4500 series switch using VRF can support one global network and up to 64 VRFs. The total number of routes supported is limited by the size of the TCAM.
- You can use most routing protocols (BGP, OSPF, EIGRP, RIP and static routing) between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
  - BGP does not require multiple algorithms to communicate with multiple CEs.
  - BGP is designed for passing routing information between systems run by different administrations.
  - BGP makes it easy to pass attributes of the routes to the CE.
- VRF-lite does not support IGRP and ISIS.
- VRF-lite does not affect the packet switching rate.
- Starting with Cisco IOS Release 12.2(50)SG, Multicast and VRF can be configured together on a Layer 3 interface.
- The Catalyst 4500 series switch supports all the PIM protocols (PIM-SM, PIM-DM, PIM-SSM, PIM BiDIR).
- The `capability vrf-lite` subcommand under `router ospf` should be used when configuring OSPF as the routing protocol between the PE and the CE.

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

39-4  OL-25340-01
Configuring VRFs

To configure one or more VRFs, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ip routing Enables IP routing.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# ip vrf vrf-name Names the VRF and enters VRF configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-vrf)# rd route-distinguisher Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y).</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-vrf)# route-target { export</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-vrf)# import map route-map (Optional) Associates a route map with the VRF.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-vrf)# interface interface-id Enters interface configuration mode and specify the Layer 3 interface to be associated with the VRF. The interface can be a routed port or SVI.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config-if)# ip vrf forwarding vrf-name Associates the VRF with the Layer 3 interface.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config-if)# end Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch# show ip vrf { brief</td>
</tr>
<tr>
<td>Step 11</td>
<td>Switch# copy running-config startup-config (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

For complete syntax and usage information for the following commands, see the switch command reference for this release and see the Cisco IOS Switching Services Command Reference at: http://www.cisco.com/en/US/docs/ios/ipswitch/command/reference/isw_book.html

Use the no ip vrf vrf-name global configuration command to delete a VRF and to remove all interfaces from it. Use the no ip vrf forwarding interface configuration command to remove an interface from the VRF.

Configuring VRF-Aware Services

IP services can be configured on global interfaces and within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.
VRF-aware services are implemented in platform-independent modules. VRF provides multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

- The user can ping a host in a user-specified VRF.
- ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.

These services are VRF-aware:
- ARP
- Ping
- Simple Network Management Protocol (SNMP)
- Unicast Reverse Path Forwarding (uRPF)
- Syslog
- Traceroute
- FTP and TFTP
- Telnet and SSH
- NTP

### Configuring the User Interface for ARP

To configure VRF-aware services for ARP, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip arp vrf vrf-name</td>
<td>Displays the ARP table (static and dynamic entries) in the specified VRF.</td>
</tr>
<tr>
<td>Switch(config)# arp vrf vrf-name ip-address mac-address ARPA</td>
<td>Creates a static ARP entry in the specified VRF.</td>
</tr>
</tbody>
</table>

### Configuring the User Interface for PING

To perform a VRF-aware ping, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# ping vrf vrf-name ip-host</td>
<td>Pings an IP host or address in the specified VRF.</td>
</tr>
</tbody>
</table>
Configuring the User Interface for SNMP

To configure VRF-aware services for SNMP, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# snmp-server trap authentication vrf</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# snmp-server engineID remote host vrf vpn-instance engine-id string</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# snmp-server host host vrf vpn-instance traps community</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# snmp-server host host vrf vpn-instance informs community</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# snmp-server user user group remote host vrf vpn-instance security model</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

Configuring the User Interface for uRPF

You can configure uRPF on an interface assigned to a VRF. Source lookup is performed in the VRF table.

To configure VRF-aware services for uRPF, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# no switchport</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# ip vrf forwarding vrf-name</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if-vrf)# ip address ip-address subnet-mask</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-if-vrf)# ip verify unicast source reachable-via rx allow-default</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-if-vrf)# end</td>
</tr>
</tbody>
</table>
Configuring the User Interface for Syslog

To configure VRF-aware services for syslog, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# logging on</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# logging host ip-address vrf vrf-name</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# logging buffered logging buffered size debugging</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# logging trap debugging</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# logging facility facility</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

Configuring the User Interface for Traceroute

To configure VRF-aware services for traceroute, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>traceroute vrf vrf-name ipaddress</td>
<td>Specifies the name of a VPN VRF in which to find the destination address.</td>
</tr>
</tbody>
</table>

Configuring the User Interface for FTP and TFTP

You must configure some FTP and TFTP CLIs in order for FTP and TFTP to be VRF-aware. For example, if you want to use a VRF table that is attached to an interface (for example, E1/0), you need to configure the `ip [t]ftp source-interface E1/0` command to inform [t]ftp to use a specific routing table. In this example, the VRF table is used to look up the destination IP address. These changes are backward-compatible and do not affect existing behavior. You can use the source-interface CLI to send packets out a particular interface even if no VRF is configured on that interface.

To specify the source IP address for FTP connections, use the `ip ftp source-interface` show mode command. To use the address of the interface where the connection is made, use the `no` form of this command.

To configure the user interface for FTP and TFTP, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>
To specify the IP address of an interface as the source address for TFTP connections, use the `ip tftp source-interface` show mode command. To return to the default, use the `no` form of this command.

**Configuring Per-VRF for TACACS+ Servers**

The per-VRF for TACACS+ servers feature allows you to configure per-virtual route forwarding (per-VRF) authentication, authorization, and accounting (AAA) on TACACS+ servers.

Before configuring per-VRF on a TACACS+ server, you must have configured AAA and a server group. You can create the VRF routing table (shown in Steps 3 and 4) and configure the interface (Steps 6, 7, and 8). The actual configuration of per-VRF on a TACACS+ server is done in Steps 10 through 13.

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Switch(config)# ip ftp source-interface interface-type interface-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ip tftp source-interface interface-type interface-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

---

**Configuring the User Interface for Telnet and SSH**

To configure VRF-aware for using Telnet and SSH, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# telnet ip-address/vrf vrf-name</td>
<td>Connects through Telnet to an IP host or address in the specified VRF.</td>
</tr>
<tr>
<td>Switch# ssh -l username -vrf vrf-name ip-host</td>
<td>Connects through SSH to an IP host or address in the specified VRF.</td>
</tr>
</tbody>
</table>

**Configuring the User Interface for NTP**

To configure VRF-aware for NTP, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# ntp server vrf vrf-name ip-host</td>
<td>Configure the NTP server in the specified VRF.</td>
</tr>
<tr>
<td>Switch# ntp peer vrf vrf-name ip-host</td>
<td>Configure the NTP peer in the specified VRF.</td>
</tr>
</tbody>
</table>
Chapter 39      Configuring VRF-lite

Configuring Per-VRF for TACACS+ Servers

The following example lists all the steps to configure per-VRF TACACS+:

```
Switch> enable
Switch# configure terminal
Switch (config)# ip vrf cisco
Switch (config-vrf)# rd 100:1
Switch (config-vrf)# exit
Switch (config)# interface Loopback0
Switch (config-if)# ip vrf forwarding cisco
Switch (config-if)# ip address 10.0.0.2 255.0.0.0
Switch (config-if)# exit
Switch (config-sg-tacacs+)# ip vrf forwarding cisco
Switch (config-sg-tacacs+)# ip address 10.0.0.2 255.0.0.0
Switch (config-sg-tacacs+)# exit
```

For more information about configuring per-VRF for TACACS+ server, see the Cisco IOS Per VRF for TACACS + Server, Release 12.3(7)T.
Configuring Multicast VRFs

To configure multicast within a VRF table, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ip routing</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# ip vrf vrf-name</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-vrf)# ip multicast-routing vrf vrf-name</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-vrf)# rd route-distinguisher</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-vrf)# route-target {export</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-vrf)# import map route-map</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config-vrf)# interface interface-id</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config-if)# ip vrf forwarding vrf-name</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch(config-if)# ip address ip-address mask</td>
</tr>
<tr>
<td>Step 11</td>
<td>Switch(config-if)# ip pim {sparse-dense mode</td>
</tr>
<tr>
<td>Step 12</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 13</td>
<td>Switch# show ip vrf [brief</td>
</tr>
<tr>
<td>Step 14</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

For more information about configuring a multicast within a Multi-VRF CE, see the Cisco IOS IP Multicast Configuration Guide, Release 12.4.

Use the no ip vrf vrf-name global configuration command to delete a VRF and to remove all interfaces from it. Use the no ip vrf forwarding interface configuration command to remove an interface from the VRF.
Configuring a VPN Routing Session

Routing within the VPN can be configured with any supported routing protocol (RIP, OSPF, or BGP) or with static routing. The configuration shown here is for OSPF, but the process is the same for other protocols.

To configure OSPF in the VPN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# router ospf process-id vrf vrf-name</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-router)# log-adjacency-changes</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-router)# redistribute bgp autonomous-system-number subnets</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-router)# network network-number area area-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-router)# end</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# show ip ospf process-id</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no router ospf process-id vrf vrf-name global configuration command to disassociate the VPN forwarding table from the OSPF routing process.

The following examples configure a single VRF named VRF-RED:

```
Switch(config)# ip vrf VRF-RED
Switch(config-vrf)# rd 1:1
Switch(config-vrf)# exit
Switch(config)# router eigrp virtual-name
Switch(config-router)# address-family ipv4 vrf VRF-RED autonomous-system 1
Switch(config-router-af)# network 10.0.0.0 0.0.0.255
Switch(config-router-af)# topology base
Switch(config-router-topology)# default-metric 10000 100 255 1 1500
Switch(config-router-topology)# exit-af-topology
Switch(config-router-af)# exit-address-family
```

Configuring BGP PE to CE Routing Sessions

To configure a BGP PE to CE routing session, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# router bgp autonomous-system-number</td>
</tr>
</tbody>
</table>
Use the `no router bgp autonomous-system-number` global configuration command to delete the BGP routing process. Use the command with keywords to delete routing characteristics.

## VRF-lite Configuration Example

Figure 39-2 is a simplified example of the physical connections in a network similar to that in Figure 39-1. OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The example commands show how to configure the CE switch S8 and include the VRF configuration for switches S20 and S11 and the PE router commands related to traffic with switch S8. Commands for configuring the other switches are not included but would be similar.
Chapter 39      Configuring VRF-lite

VRF-lite Configuration Example

Figure 39-2      VRF-lite Configuration Example

Configuring Switch S8

On switch S8, enable routing and configure VRF.

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# ip vrf v11
Switch(config-vrf)# rd 800:1
Switch(config-vrf)# route-target export 800:1
Switch(config-vrf)# route-target import 800:1
Switch(config-vrf)# exit
Switch(config)# ip vrf v12
Switch(config-vrf)# rd 800:2
Switch(config-vrf)# route-target export 800:2
Switch(config-vrf)# route-target import 800:2
Switch(config-vrf)# exit
```

Configure the loopback and physical interfaces on switch S8. Fast Ethernet interface 3/5 is a trunk connection to the PE. Interfaces 3/7 and 3/11 connect to VPNs:

```
Switch(config)# interface loopback1
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 8.8.1.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface loopback2
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 8.8.2.8 255.255.255.0
```

CE = Customer edge device
PE = Provider edge router
Chapter 39  Configuring VRF-lite

VRF-lite Configuration Example

Switch(config-if)# exit
Switch(config)# interface FastEthernet3/5
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit
Switch(config)# interface FastEthernet3/8
Switch(config-if)# switchport access vlan 208
Switch(config-if)# no ip address
Switch(config-if)# exit
Switch(config)# interface FastEthernet3/11
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Configure the VLANs used on switch S8. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for VRF for the VPNs that include switch S11 and switch S20, respectively:
Switch(config)# interface Vlan10
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 38.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface Vlan20
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 83.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface Vlan118
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 118.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface Vlan208
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 208.0.0.8 255.255.255.0
Switch(config-if)# exit

Configure OSPF routing in VPN1 and VPN2:
Switch(config)# router ospf 1 vrf vl1
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit
Switch(config)# router ospf 2 vrf vl2
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit

Configure BGP for CE to PE routing:
Switch(config)# router bgp 800
Switch(config-router)# address-family ipv4 vrf vl2
Switch(config-router-af)# redistribute ospf 2 match internal
Switch(config-router-af)# neighbor 83.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 83.0.0.3 activate
Switch(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Switch(config-router-af)# exit
Chapter 39      Configuring VRF-lite

VRF-lite Configuration Example

VRF-lite Configuration Example

Switch(config-router)# address-family ipv4 vrf vl1
Switch(config-router-af)# redistribute ospf 1 match internal
Switch(config-router-af)# neighbor 38.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 38.0.0.3 activate
Switch(config-router-af)# network 8.8.1.0 mask 255.255.255.0
Switch(config-router-af)# end

Configuring Switch S20

Configure S20 to connect to CE:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface Fast Ethernet 0/7
Switch(config-if)# no switchport
Switch(config-if)# ip address 208.0.0.20 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

Configuring Switch S11

Configure S11 to connect to CE:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface Gigabit Ethernet 0/3
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface Vlan118
Switch(config-if)# ip address 118.0.0.11 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

Configuring the PE Switch S3

On switch S3 (the router), these commands configure only the connections to switch S8:

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip vrf v1
Router(config-vrf)# rd 100:1
Router(config-vrf)# route-target export 100:1
Router(config-vrf)# route-target import 100:1
Router(config-vrf)# exit

Router(config)# ip vrf v2
Router(config-vrf)# rd 100:2
Displaying VRF-lite Status

To display information about VRF-lite configuration and status, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip protocols vrf vrf-name</td>
<td>Displays routing protocol information associated with a VRF.</td>
</tr>
<tr>
<td>Switch# show ip route vrf vrf-name [connected] [protocol [as-number]] [list] [mobile] [odr] [profile] [static] [summary] [supernets-only]</td>
<td>Displays IP routing table information associated with a VRF.</td>
</tr>
<tr>
<td>Switch# show ip vrf [brief</td>
<td>detail</td>

CHAPTER 40

Configuring Quality of Service

This chapter describes how to configure quality of service (QoS) with either automatic QoS (auto-QoS) commands or standard QoS commands on a Catalyst 4500 Series Switch. It describes how to specify QoS configuration on different types of interfaces (access, Layer 2 trunk, Layer 3 routed, Etherchannel) as well as VLANs. It also describes how to specify different QoS configurations on different VLANs on a given interface (per-port per-VLAN QoS).

A switch supports a QoS configuration model known as MQC (Modular QoS CLI). Please refer to the appropriate configuration section for the supervisor engine on which QoS will be configured. For more information about MQC, see the “Modular Quality of Service Command-Line Interface” section of the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.3.

This chapter consists of these sections:

- Overview of QoS, page 40-1
- Configuring QoS, page 40-12
- Configuring Auto-QoS, page 40-46

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

Overview of QoS

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

QoS selects network traffic (both unicast and multicast), prioritizes it according to its relative importance, and uses congestion avoidance to provide priority-indexed treatment; QoS can also limit the bandwidth used by network traffic. QoS can make network performance more predictable and bandwidth utilization more effective.
Overview of QoS

This section contains the following subsections:

- Prioritization, page 40-2
- QoS Terminology, page 40-3
- Basic QoS Model, page 40-5
- Classification, page 40-6
- Policing and Marking, page 40-8
- Queueing and Scheduling, page 40-8
- Packet Modification, page 40-9
- Per Port Per VLAN QoS, page 40-10
- Flow-based QoS, page 40-10
- Using Metadata in QoS Policy, page 40-11

Prioritization

QoS implementation is based on the DiffServ architecture. This architecture specifies that each packet is classified upon entry into the network. The classification is carried in the IP packet header, using 6 bits from the deprecated IP type of service (TOS) field to carry the classification (class) information. Classification can also be carried in the Layer 2 frame. These special bits in the Layer 2 frame or a Layer 3 packet are described here and shown in Figure 40-1:

- Prioritization values in Layer 2 frames:
  - Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p class of service (CoS) value in the three least-significant bits. On interfaces configured as Layer 2 ISL trunks, all traffic is in ISL frames.
  - Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most-significant bits, which are called the User Priority bits. On interfaces configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.
  - Other frame types cannot carry Layer 2 CoS values.
  - Layer 2 CoS values range from 0 for low priority to 7 for high priority.

- Prioritization bits in Layer 3 packets:
  - Layer 3 IP packets can carry either an IP precedence value or a Differentiated Services Code Point (DSCP) value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values.
  - IP precedence values range from 0 to 7.
  - DSCP values range from 0 to 63.
Chapter 40  Configuring Quality of Service

Overview of QoS

All switches and routers across the Internet rely on the class information to provide the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to happen closer to the edge of the network so that the core switches and routers are not overloaded.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the DiffServ architecture is called per-hop behavior. If all devices along a path provide a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control you need over incoming and outgoing traffic.

QoS Terminology

The following terms are used when discussing QoS features:

- **Packets** carry traffic at Layer 3.
- **Frames** carry traffic at Layer 2. Layer 2 frames carry Layer 3 packets.
- **Labels** are prioritization values carried in Layer 3 packets and Layer 2 frames:
  - Layer 2 class of service (CoS) values, which range between zero for low priority and seven for high priority:
    - Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p CoS value in the three least significant bits.
Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most significant bits, which are called the User Priority bits.

Other frame types cannot carry Layer 2 CoS values.

**Note**

On interfaces configured as Layer 2 ISL trunks, all traffic is in ISL frames. On interfaces configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

- Layer 3 IP precedence values—The IP version 4 specification defines the three most significant bits of the 1-byte ToS field as IP precedence. IP precedence values range between zero for low priority and seven for high priority.

- Layer 3 differentiated services code point (DSCP) values—The Internet Engineering Task Force (IETF) has defined the six most significant bits of the 1-byte IP ToS field as the DSCP. The per-hop behavior represented by a particular DSCP value is configurable. DSCP values range between 0 and 63.

**Note**

Layer 3 IP packets can carry either an IP precedence value or a DSCP value. QoS supports the use of either value, since DSCP values are backwards compatible with IP precedence values. See Table 40-1.

Classification is the selection of traffic to be marked.  
Marking, according to RFC 2475, is the process of setting a Layer 3 DSCP value in a packet; in this publication, the definition of marking is extended to include setting Layer 2 CoS values.  
Policing is limiting bandwidth used by a flow of traffic. Policing can mark or drop traffic.

Basic QoS Model

Figure 40-2 illustrates a high-level flow of QoS function.

1. MSb = most significant bit

1. Classification is the selection of traffic to be marked.
2. Marking, according to RFC 2475, is the process of setting a Layer 3 DSCP value in a packet; in this publication, the definition of marking is extended to include setting Layer 2 CoS values.
3. Policing is limiting bandwidth used by a flow of traffic. Policing can mark or drop traffic.
The QoS model proceeds as follows:

**Step 1** The incoming packet is classified (based on different packet fields, receive port and/or VLAN) to belong to a traffic class.

**Step 2** Depending on the traffic class, the packet is rate-limited/policed and its priority is optionally *marked* (typically at the edge of the network) so that lower priority packets are dropped or marked with lower priority in the packet fields (DSCP and CoS).

**Step 3** After the packet has been marked, it is *looked up* for forwarding. This action obtains the transmit port and VLAN to transmit the packet.

**Step 4** The packet is classified in the output direction based on the transmit port and/or VLAN. The classification takes account any marking of the packet by input QoS.

**Step 5** Depending on the output classification, the packet is policed, its priority is optionally *(re-*)marked*, and the transmit queue for the packet is determined depending on the traffic class.

**Step 6** The transmit queue state is dynamically monitored via the AQM (Active Queue Management) algorithm and drop threshold configuration to determine whether the packet should be dropped or enqueued for transmission.

**Step 7** If eligible for transmission, the packet is enqueued to a transmit queue. The transmit queue is selected based on output QoS classification criteria. The selected queue provides the desired behavior in terms of latency and bandwidth.

---

**Classification**

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification is enabled when a QoS policy-map is attached to an interface.

You specify which fields in the frame or packet that you want to use to classify incoming traffic.

For non-IP traffic, you have the following classification options:

- CoS value in the VLAN tag of the incoming frame is used to classify the packet.
- If the frame does not contain a CoS value, the port’s default CoS value (“0”) is used for the classification.
  
  Perform the classification based on a configured MAC ACL, which examines the fields in the Layer 2 header.

For IP traffic, you have the following classification options:

- IP DSCP or IP Precedence in the incoming packet is used for classification. DSCP values range from 0 to 63.
- Perform the classification based on a configured IP standard or extended ACL, which examines various fields in the IP header.

**Classification Based on QoS ACLs**

A packet can be classified for QoS using multiple match criteria, and the classification can specify whether the packet should match all of the specified match criteria or at least one of the match criteria.

To define a QoS classifier, you can provide the match criteria using the `match` statements in a class map.
In the 'match' statements, you can specify the fields in the packet to match on, or you can use IP standard or IP extended ACLs or MAC ACLs. For more information, see the “Classification Based on Class Maps and Policy Maps” section on page 40-7.

If the class map is configured to match all the match criteria, then a packet must satisfy all the match statements in the class map before the QoS action is taken. The QoS action for the packet is not taken if the packet does not match even one match criterion in the class map.

If the class map is configured to match at least one match criterion, then a packet must satisfy at least one of the match statements in the class map before the QoS action is taken. The QoS action for the packet is not taken if the packet does not match any match criteria in the class map.

Note

When you use the IP standard and IP extended ACLs, the permit and deny ACEs in the ACL have a slightly different meaning in the QoS context.

- If a packet encounters (and satisfies) an ACE with a “permit,” then the packet “matches” the match criterion in the QoS classification.
- If a packet encounters (and satisfies) an ACE with a “deny,” then the packet “does not match” the match criterion in the QoS classification.
- If no match with a permit action is encountered and all the ACEs have been examined, then the packet “does not match” the criterion in the QoS classification.

Note

When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

After a traffic class has been defined with the class map, you can create a policy that defines the QoS actions for a traffic class. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the access-list global configuration command.

When a class-map is created with the match-all keyword, you cannot include both IP and MAC ACLs as match criteria.

**Classification Based on Class Maps and Policy Maps**

A class map is a mechanism that you use to isolate and name a specific traffic flow (or class) from all other traffic. The class map defines the criterion used to match against a specific traffic flow to further classify it; the criteria can include matching the access group defined by the ACL or matching a specific list of DSCP, IP precedence, or L2 CoS values. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you can specify the QoS actions via a policy map.

A policy map specifies the QoS actions for the traffic classes. Actions can include setting a specific CoS, DSCP, or IP precedence value; policing the traffic to a specified rate; specifying the traffic bandwidth limitations; shaping the traffic to a specified rate. Before a policy map can be effective, you must attach it to an interface.

You create a class map by using the class-map global configuration command. When you enter the class-map command, the switch enters the class-map configuration mode. In this mode, you define the match criteria for the traffic by using the match class-map configuration command.
You create and name a policy map by using the `policy-map` global configuration command. When you enter this command, the switch enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the set, `police`, `bandwidth`, or `shape` policy-map configuration and policy-map class configuration commands. To make the policy map effective, you attach it to an interface by using the `service-policy` interface configuration command.

The policy map can also contain commands that define the policer, (the bandwidth limitations of the traffic) and the action to take if the limits are exceeded. For more information, see the “Policing and Marking” section on page 40-8.

A policy map also has these characteristics:

- A policy map can contain up to 254 class statements.
- You can have different classes within a policy map.

### Policing and Marking

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are *out of profile* or *nonconforming*. Each policer specifies the action to take for packets that are in or out of profile. These actions, carried out by the marker, include passing through the packet without modification, dropping the packet, or marking down the packet with a new DSCP value that is obtained from the configurable policed-DSCP map. You can configure policer within a policy map with the `police` command in policy-map class configuration mode. For information on the policed-DSCP map, see the “Queueing and Scheduling” section on page 40-8.

When configuring policing and policers, keep these items in mind:

- Policers account only for the Layer 2 header length when calculating policer rates. In contrast, shapers account for header length as well as IPG in rate calculations.
- Beginning with Cisco IOS Release 15.0(2)SG (IOS XE 3.2.0), Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, Catalyst 4948E, Supervisor Engine 7-E, and Supervisor Engine 7L-E support the `qos account layer-all encapsulation` command, which accounts for Layer 1 headers of 20 bytes (12 bytes preamble + 8 bytes IPG) and Layer 2 headers in policing features.
- Only the average rate and committed burst parameters are configurable.
- After you configure the policy map and policing actions, attach the policy to an ingress or egress interface by using the `service-policy` interface configuration command.
- For 2 rate 3 colors (2r3c) policers, if no explicit violation-action is specified, the exceed-action is used as the violate-action.

### Queueing and Scheduling

The Catalyst 4500 Series Switch supports 8 transmit queues per port. Once the decision has been made to forward a packet out a port, the output QoS classification determines the transmit queue into which the packet must be enqueued.

Queues are assigned when an output policy attached to a port with one or more queuing related actions for one or more classes of traffic. Because there are only eight queues per port, there are at most eight traffic classes (including `class-default`, the reserved class) with queuing action(s). Classes of traffic that do not have any queuing action are referred to as non-queuing classes. Non-queuing class traffic use the queue corresponding to `class-default`.
Overview of QoS

Active Queue Management

Active queue management (AQM) is the pro-active approach of informing you about congestion before a buffer overflow occurs. AQM is done using Dynamic buffer limiting (DBL). DBL tracks the queue length for each traffic flow in the switch. When the queue length of a flow exceeds its limit, DBL drops packets.

Sharing Link Bandwidth Among Transmit Queues

The eight transmit queues for a transmit port share the available link bandwidth of that transmit port. You can set the link bandwidth to be shared differently among the transmit queues using the `bandwidth` command in the `policy-map class` configuration command in class mode.

With this command, you assign the minimum guaranteed bandwidth for each transmit queue. By default, all queues are scheduled in a round robin manner.

Strict Priority / Low Latency Queueing

You can only configure one transmit queue on a port as strict priority (termed Low Latency Queue, or LLQ).

LLQ provides strict-priority queuing for a traffic class. It enables delay-sensitive data, such as voice, to be sent before packets in other queues. The priority queue is serviced first until it is empty or until it falls under its shape rate. Only one traffic stream can be destined for the priority queue per class-level policy. You enable the priority queue for a traffic class with the `priority policy-map class` configuration command in class mode.

Traffic Shaping

Traffic Shaping provides the ability to control the rate of outgoing traffic in order to make sure that the traffic conforms to the maximum rate of transmission contracted for it. Traffic that meets certain profile can be shaped to meet the downstream traffic rate requirements to handle any data rate mismatches.

Each transmit queue can be configured to transmit a maximum rate using the `shape` command in the `policy-map class` configuration command in class mode. The configuration allows you to specify the maximum rate of traffic. Any traffic that exceeds the configured shape rate is queued and transmitted at the configured rate. If the burst of traffic exceeds the size of the queue, packets are dropped to maintain transmission at the configured shape rate.

Packet Modification

A packet is classified, policed, and queued to provide QoS. Packet modifications can occur during this process:

- For IP packets, classification involves assigning a DSCP to the packet. However, the packet is not modified at this stage; only an indication of the assigned DSCP is carried along. The reason for this is that QoS classification and ACL lookup occur in parallel, and it is possible that the ACL specifies that the packet should be denied and logged. In this situation, the packet is forwarded with its original DSCP to the CPU, where it is again processed through ACL software.
Overview of QoS

- For non-IP packets, classification involves assigning an internal DSCP to the packet, but because there is no DSCP in the non-IP packet, no overwrite occurs. Instead, the internal DSCP is used both for queueing and scheduling decisions and for writing the CoS priority value in the tag if the packet is being transmitted on either an ISL or 802.1Q trunk port.

- During policing, IP and non-IP packets can have another DSCP assigned to them (if they are out of profile and the policer specifies a markdown DSCP). Once again, the DSCP in the packet is not modified, but an indication of the marked-down value is carried along. For IP packets, the packet modification occurs at a later stage.

Per Port Per VLAN QoS

Per-port per-VLAN QoS (PVQoS) offers differentiated quality-of-services to individual VLANs on a trunk port. It enables service providers to rate limit individual VLAN-based services on each trunk port to a business or a residence. In an enterprise Voice-over-IP environment, it can be used to rate limit voice VLAN even if an attacker impersonates an IP phone. A per-port per-VLAN service policy can be separately applied to either ingress or egress traffic. For configuration details see “Enabling Per-Port Per-VLAN QoS” section on page 40-35.

Flow-based QoS

Note

Before reading this section, you should be familiar with implementing Flexible NetFlow (Chapter 62, “Configuring Flexible NetFlow”) and QoS implementation in this chapter.

Flow based QoS enables microflow policing and marking capability to dynamically learn traffic flows. It also rate limits each unique flow to an individual rate. Flow based QoS is available on a Catalyst 4500 Series Switch with the built-in NetFlow hardware support. It can be applied to ingress traffic on both switched and routed interfaces with flow masks defined using Flexible NetFlow (FNF). It supports up to 100,000 individual flows in hardware and up to 512 unique policer configuration. Flow based QoS is typically used in environments where per-user, granular rate-limiting required. For example, per-flow outbound and inbound traffic rate might differ. Flow based QoS is also referred to as User Based Rate Limiting (UBRL).

A flow is defined as a stream of packets having the same properties as those defined by the key fields in the FNF flow record. A new flow is created when the value of data in packet’s key fields is unique with respect to the flow that already exist.

A flow based QoS policy is possesses one or more classmaps matching on a FNF flow record. Such a classmap must be configured as match-all to match all the match criteria specified in the classmap. When a flow based QoS policy is attached to a QoS target, ingress traffic on the target is first classified based on the classification rules specified in the class-map. If the classifier has FNF flow record, the key fields specified in the FNF flow record are applied on the classified traffic to create flows provided the flow does not already exist. The corresponding policy actions (policing and marking) are then applied to these individual flows. Flow-based policers (termed microflow policers) rate limit each unique flow. Flows are dynamically created and inactive flows are periodically aged out.

Flow based QoS policy can be attached to QoS targets such as port (P), vlan (V), per-port-per-vlan (PV), and EtherChannel but only in the ingress direction.

For details on now to enable FNF, refer to the “Applying Flow-based QoS Policy” section on page 40-40.
Using Metadata in QoS Policy

Beginning with Cisco IOS Release IOS XE 3.3.0SG and IOS 15.1(1)SG, you can configure class-map with metadata filters. A QoS policy that include such classes is termed a metadata based QoS policy or parameterized QoS policy. It allows you to classify flows based on intuitive and user friendly metadata attributes rather than individual flow 5-tuple and applicable QoS actions.

Software uses mechanisms like MSI and MSI-Proxy to do the following:

- Identify flows
- Glean metadata information from the traffic received at the network edge
- Generate and transport metadata information using RSVP messages hop-by-hop to every network element along the flow path using on-path RSVP signalling mechanism.

For configuration details on Cisco Medianet Metadata, refer to the following URL:

For details on the metadata commands, refer to the following URL:

For configuration details on Cisco Media Services Proxy, refer to the following URL:

For command details on Cisco Media Services Proxy, refer to the following URL:

Restrictions

The following restrictions apply to using a metadata-based QoS policy on a Catalyst 4500 series switch:

- They can only be attached to target in input direction.
- They can only be attached to physical ports and EtherChannel. They cannot be attached to VLANs, port VLANs, and SVI interfaces.
- A policy can have multiple metadata-based classifiers.
- A class-map can have one or more metadata filters with match-any or match-all semantics.
- Policy actions corresponding to metadata class are applied on aggregate traffic. However, if the metadata filter is configured along with Flexible NetFlow record filter, the policy action (like policer) applies on individual flows.
- If there are no flows associated with metadata filter, the software configures an implicit ACL with a deny ACE.
- If the same metadata QoS policy is applied on multiple interfaces, the policy is installed in hardware in separate TCAM entries for each interface; the TCAM entries are not shared by the interfaces.
- When a new flow is associated with a metadata filter, the software installs a new set of TCAM entries that includes the new flow along with other existing previously-discovered flows.

Observing Metadata Filter Statistics

- Although interfaces with the same metadata policy do not share TCAM resources in hardware, the metadata filter statistics observed with the show policy-map interface ifname command are reported as though it were shared.
- Only metadata filter statistics are available. The individual flow statistics are not available.
Example

The following example illustrates a metadata-based QoS policy with two classes using metadata filters:

```plaintext
class-map c1
  match application telepresence-media

class-map c2
  match access-group name mysubnet

class-map match-any c3
  match application webex-video
  match application webex-audio

policy-map p1
  class c1
    police cir 10m
  class c2
    set dscp cs1
    police cir 2m
  class c3
    police cir 5m
```

Configuring QoS

HQoS is not supported on the Catalyst 4500 Series Switch.

MQC-based QoS Configuration

Starting with Cisco IOS Release 12.2(40)SG, a Catalyst 4900M, a Catalyst 4948E, or a Catalyst 4500 Series Switch with Supervisor Engine 6-E or Supervisor Engine 6L-E use the MQC model of QoS. Starting with Cisco IOS Release 15.0(1)XO, a Catalyst 4500 Series Switch using Supervisor Engine employs the MQC model.

To apply QoS, you use the Modular QoS Command-Line Interface (MQC), which is a CLI structure that allows you to complete the following tasks:

- Specify the matching criteria used to define a traffic class.
- Create a traffic policy (policy map). The traffic policy defines the QoS policy actions to be taken for each traffic class.
- Apply the policy actions specified in the policy map to an interface, VLAN, or port and VLAN.

For more information about the MQC, see the “Modular Quality of Service Command-Line Interface” section of the Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.3.

Note

The incoming traffic is considered trusted by default. Only when the trusted boundary feature is enabled on an interface can the port enter untrusted mode. In this mode, the switch marks the DSCP value of an IP packet and the CoS value of the VLAN tag on the Ethernet frame as “0”.

Platform-supported Classification Criteria and QoS Features

The following table provides a summary of various classification criteria and actions supported on the Catalyst 4500 Series Switch. For details, refer to the Catalyst 4500 Series Switch Command Reference.

<table>
<thead>
<tr>
<th>Supported classification actions</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>match access-group</td>
<td>Configures the match criteria for a class map on the basis of the specified ACL.</td>
</tr>
<tr>
<td>match any</td>
<td>Configures the match criteria for a class map to be successful match criteria for all packets.</td>
</tr>
<tr>
<td>match cos</td>
<td>Matches a packet based on a Layer 2 class of service (CoS) marking.</td>
</tr>
<tr>
<td>match [ip] dscp</td>
<td>Identifies a specific IP differentiated service code point (DSCP) value as a match criterion. Up to eight DSCP values can be included in one match statement.</td>
</tr>
<tr>
<td>match [ip] precedence</td>
<td>Identifies IP precedence values as match criteria.</td>
</tr>
<tr>
<td>match protocol</td>
<td>Configures the match criteria for a class map on the basis of the specified protocol.</td>
</tr>
<tr>
<td>match qos-group</td>
<td>Identifies a specific QoS group value as a match criterion. Applies only on the egress direction.</td>
</tr>
</tbody>
</table>

Supported Qos Features

<table>
<thead>
<tr>
<th>Supported Qos Features</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>police</td>
<td>Configures traffic policing.</td>
</tr>
<tr>
<td>police (percent)</td>
<td>Configures traffic policing on the basis of a percentage of bandwidth available on an interface.</td>
</tr>
<tr>
<td>police (two rates)</td>
<td>Configures traffic policing using two rates, the committed information rate (CIR) and the peak information rate (PIR).</td>
</tr>
</tbody>
</table>
### Configuring QoS

#### Platform Hardware Capabilities

<table>
<thead>
<tr>
<th>Qos Actions</th>
<th>Numbers of entries supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>64k input and 64k output classification entries are supported. A given policy can use at most 24k ACLs</td>
</tr>
<tr>
<td>Policing</td>
<td>16k policers are supported. Policers are allocated to given direction in blocks of 2k. For example, 2k policers can be used in for input and 14k policers can be used for output. Single rate policers uses one policer entry. Single Rate Three Color Marker (srTCM) (RFC 2697) and Two Rate Three Color Marker (trTCM) (RFC 2698) uses two policer entries</td>
</tr>
<tr>
<td>Marking</td>
<td>Marking of Cos and DSCP/Precedence is supported through two marking tables, each capable of supporting 512 entries. There are separate tables for each direction.</td>
</tr>
<tr>
<td>Queuing</td>
<td>The queue size is Configurable with the maximum number of entries configurable per port depending on the chassis and line card type.</td>
</tr>
<tr>
<td>DBL</td>
<td>You can enable DBL action on all configured class-maps.</td>
</tr>
</tbody>
</table>

### Prerequisites for Applying a QoS Service Policy

Unlike the Switch QoS model, there is no prerequisite for enabling QoS on various targets. Just the attachment of a service policy enables QoS and detachment of that policy disables QoS on that target.

### Restrictions for Applying a QoS Service Policy

Traffic marking can be configured on an interface, a VLAN, or a port and VLAN. An interface can be a Layer 2 access port, a Layer 2 switch trunk, a Layer 3 routed port, or an EtherChannel. A policy is attached to a VLAN using `vlan configuration` mode.

Attaching QoS service policy to VLANs and EtherChannel is described in the “Policy Associations” section on page 40-38.
Classification

The supervisor engine supports classification of Layer 2, IP, IPv6 packets, and ARP packets marking performed on input can be matched in the output direction. The previous table lists the full set of capabilities. By default, the switch also supports classification resources sharing. Similarly, when the same policy is attached to a port or a VLAN or on per-port per-vlan targets, ACL entries are shared though QoS actions are unique on each target.

For example:

```
class-map c1
  match ip dscp 50
Policy Map p1
  class c1
    police rate 1 m burst 200000
```

If policy-map p1 is applied to interfaces Gig 1/1 and Gig 1/2, 1 CAM entry is used (one ACE that matches IP packets), but 2 policers are allocated (one per target). So, all IP packets with dscp 50 are policed to 1 mbps on interface Gig 1/1 and packets on interface Gig 1/2 are policed to 1 mbps.

**Note**

With Cisco IOS Release 12.2(46)SG, you can issue the `match protocol arp` command. For details, see the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

Classification Statistics

The supervisor engine supports only packet based classification statistics and TCAM resource sharing. When a policy-map is applied on multiple targets, the command `show policy-map interface` displays the aggregate classification statistics, not those specific to an interface.

**Note**

To obtain per interface policy-map stats, you should configure a unique policy-map name on each interface.

When a policy-map is attached to a port-channel member ports, classification statistics are not displayed.

Configuring a Policy Map

You can attach only one policy map to an interface. Policy maps can contain one or more policy-map classes, each with different match criteria and actions.

Configure a separate policy-map class in the policy map for each type of traffic that an interface receives. Put all commands for each type of traffic in the same policy-map class. QoS does not attempt to apply commands from more than one policy-map class to matched traffic.

Creating a Policy Map

To create a policy map, enter this command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# [no] policy-map policy_name</code></td>
<td>Creates a policy map with a user-specified name. Use the no keyword to delete the policy map.</td>
</tr>
</tbody>
</table>
Attaching a Policy Map to an Interface

To create a policy map, enter this command:

```
Command                       Purpose
Switch(config)# interface {vlan vlan_ID | (fastethernet | gigabitethernet) slot/interface | Port-channel number} Selects the interface to configure.
Switch(config-if)# [no] service-policy input policy_map_name Attaches a policy map to the input direction of the interface. Use the no keyword to detach a policy map from an interface.
Switch(config-if)# end Exits configuration mode.
Switch# show policy-map interface {vlan vlan_ID | (fastethernet | gigabitethernet) slot/interface} Verifies the configuration.
```

Policing

The supervisor engine supports policers in the following operation modes:

- Single Rate Policer Two Color Marker
  This kind of policer is configured with just the committed rate (CIR) and normal burst and it has only conform and exceed actions.
  This is the only form supported in the Supervisor Engine II-Plus to V-10GE based systems.
- Single Rate Three Color Marker (srTCM) (RFC 2697)
- Two Rate Three Color Marker (trTCM) (RFC 2698)
- Color Blind Mode
  Policing accuracy of 0.75% of configured policer rate.

The engine supports 16384 (16 x 1024, 16K) single rate, single burst policers. 16K policers are organized as 8 banks of 2K policers. The policer banks are dynamically assigned (input or output policer bank) by the software depending on the QoS configuration. So, the 16K policers are dynamically partitioned by software as follows:

- 0 Input Policers and 16K Output Policers
- 2K Input Policers and 14K Output Policers
- 4K Input Policers and 12K Output Policers
- 6K Input Policers and 10K Output Policers
- 8K Input Policers and 8K Output Policers
- 10K Input Policers and 6K Output Policers
- 12K Input Policers and 4K Output Policers
- 14K Input Policers and 2K Output Policers
- 16K Input Policers and 0 Output Policers

These numbers represent individual policer entries in the hardware that support a single rate and burst parameter. Based on this, a switch supports the following number of policers:
• 16K Single Rate Policer with Single Burst (Two Color Marker)
• 8K Single Rate Three Color Marker (srTCM)
• 8K Two Rate Three Color Marker (trTCM)

These policers are partitioned between Input and Output in chunks of 2K policer banks. The different types of policers can all co-exist in the system. However, a given type of policer (srTCM, trTCM etc.) is configurable as a block of 128 policers.

**Note**

Two policers are reserved for internal use.

### How to Implement Policing

For details on how to implement the policing features on a Catalyst 4500 Series Switch, refer to the Cisco IOS documentation at the following link:

### Platform Restrictions

Platform restrictions include the following:

- Multi-policer actions can be specified (setting CoS and IP DSCP is supported).
- When unconditional marking and policer based marking exists on the same field(cos or dscp or precedence), policer-based marking is preferred.
- If policer based service-policy is attached to both a port and a VLAN, port-based policed is preferred by default. To over-ride a specific VLAN policy on a given port, then you must configure a per-port per-vlan policy.
- You should not delete a port-channel with a per-port, per-VLAN QoS policy.

**Workaround:** Before deleting the port-channel, do the following:

1. Remove any per-port per-VLAN QoS policies, if any.
2. Remove the VLAN configuration on the port-channel with the `no vlan-range` command.

### Marking Network Traffic

Marking network traffic allows you to set or modify the attributes of traffic (that is, packets) belonging to a specific class or category. When used in conjunction with network traffic classification, marking network traffic is the foundation for enabling many quality of service (QoS) features on your network.

This module contains conceptual information and the configuration tasks for marking network traffic.

### Contents

- “Information About Marking Network Traffic” section on page 40-18

- “Restrictions for Marking Network Traffic” section on page 40-21
Information About Marking Network Traffic

To mark network traffic, you should understand the following concepts:
- “Purpose of Marking Network Traffic” section on page 40-18
- “Benefits of Marking Network Traffic” section on page 40-18
- “Two Methods for Marking Traffic Attributes” section on page 40-19

Purpose of Marking Network Traffic

Traffic marking is used to identify certain traffic types for unique handling, effectively partitioning network traffic into different categories.

After the network traffic is organized into classes by traffic classification, traffic marking allows you to mark (that is, set or change) a value (attribute) for the traffic belonging to a specific class. For instance, you may want to change the class of service (CoS) value from 2 to 1 in one class, or you may want to change the differentiated services code point (DSCP) value from 3 to 2 in another class. In this module, these values are referred to as attributes or marking fields.

Attributes that can be set and modified include the following:
- CoS value of a tagged Ethernet frame
- DSCP/precedence value in the Type of Service (ToS) byte of IPv4.
- QoS group identifier (ID)
- DSCP/precedence value in the traffic class byte of IPv6

Benefits of Marking Network Traffic

Traffic marking allows you to fine-tune the attributes for traffic on your network. This increased granularity helps isolate traffic that requires special handling, and thus, helps to achieve optimal application performance.

Traffic marking allows you to determine how traffic will be treated, based on how the attributes for the network traffic are set. It allows you to segment network traffic into multiple priority levels or classes of service based on those attributes, as follows:
- Traffic marking is often used to set the IP precedence or IP DSCP values for traffic entering a network. Networking devices within your network can then use the newly marked IP precedence values to determine how traffic should be treated. For example, voice traffic can be marked with a particular IP precedence or DSCP and strict priority can then be configured to put all packets of that marking into that queue. In this case, the marking was used to identify traffic for strict priority queue.
- Traffic marking can be used to identify traffic for any class-based QoS feature (any feature available in policy map class configuration mode, although some restrictions exist).
- Traffic marking can be used to assign traffic to a QoS group within a switch. The switch can use the QoS groups to determine how to prioritize traffic for transmission. The QoS group value is usually used for one of the two following reasons:
- To leverage a large range of traffic classes. The QoS group value has 64 different individual markings, similar to DSCP.
- If changing the Precedence or DSCP value is undesirable.

**Two Methods for Marking Traffic Attributes**

This section describes *Unconditional* marking, which differs from *Policer-based* marking. Unconditional marking is based solely on classification.

**Method One: Unconditional Explicit Marking (using the set command)**

You specify the traffic attribute you want to change with a set command configured in a policy map. The following table lists the available set commands and the corresponding attribute. For details on the set command, refer to the *Catalyst 4500 Series Switch Command Reference*.

<table>
<thead>
<tr>
<th>set Commands</th>
<th>Traffic Attribute</th>
<th>Packet Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>set cos</td>
<td>Layer 2 CoS value of the outgoing traffic</td>
<td>Ethernet IPv4, IPv6</td>
</tr>
<tr>
<td>set dscp</td>
<td>DSCP value in the ToS byte</td>
<td>IPv4, IPv6</td>
</tr>
<tr>
<td>set precedence</td>
<td>precedence value in the packet header</td>
<td>IPv4, IPv6</td>
</tr>
<tr>
<td>set qos-group</td>
<td>QoS group ID</td>
<td>Ethernet, IPv4, IPv6</td>
</tr>
</tbody>
</table>

If you are using individual *set* commands, those set commands are specified in a policy map. The following is a sample of a policy map configured with one of the set commands listed in Table 40-2.

In this sample configuration, the *set cos* command has been configured in the policy map (policy1) to mark the CoS attribute:

```
enable
configure terminal
policy map p1
    class class1
        set cos 3
end
```

For information on configuring a policy map, see the “Creating a Policy Map” section on page 40-15.

The final task is to attach the policy map to the interface. For information on attaching the policy map to the interface, see the “Attaching a Policy Map to an Interface” section on page 40-16.

**Method Two: Unconditional Tablemap-based Marking**

You can create a table map that can be used to mark traffic attributes. A table map is a kind of two-way conversion chart that lists and maps one traffic attribute to another. A table map supports a many-to-one type of conversion and mapping scheme. The table map establishes a to-from relationship for the traffic attributes and defines the change to be made to the attribute. That is, an attribute is set to one value that is taken from another value. The values are based on the specific attribute being changed. For instance, the Precedence attribute can be a number from 0 to 7, while the DSCP attribute can be a number from 0 to 63.

The following is a sample table map configuration:

```
table-map table-map1
    map from 0 to 1
```
map from 2 to 3
exit

The following table lists the traffic attributes for which a to-from relationship can be established using the table map.

<table>
<thead>
<tr>
<th>The “To” Attribute</th>
<th>The “From” Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>Precedence</td>
<td>CoS, QoS group, DSCP, Precedence</td>
</tr>
<tr>
<td>DSCP</td>
<td>COS, QoS group, DSCP, Precedence</td>
</tr>
<tr>
<td>CoS</td>
<td>DSCP, QoS group, CoS, Precedence</td>
</tr>
</tbody>
</table>

The following is an example of a policy map (policy2) configured to use the table map (table-map1) created earlier:

```
Policy map policy
    class class-default
        set cos dscp table table-map
exit
```

In this example, a mapping relationship was created between the CoS attribute and the DSCP attribute as defined in the table map.

For information on configuring a policy map to use a table map, “Configuring a Policy Map” section on page 40-15.

The final task is to attach the policy map to the interface. For information on attaching the policy map to the interface, see the “Attaching a Policy Map to an Interface” section on page 40-16.

**Marking Action Drivers**

A marking action can be triggered based on one of the two QoS processing steps.

- **Classification based**: In this case, all the traffic matching a class is marked using either explicit or tablemap based method. This method is referred to as unconditional marking.
- **Policer result-based**: In this case, a class of traffic is marked differently based on the policer result (conform/exceed/violate) applicable to that packet. This method is referred to as conditional marking.

**Traffic Marking Procedure Flow chart**

Figure 40-3 illustrates the order of the procedures for configuring traffic marking.
Restrictions for Marking Network Traffic

The following restrictions apply to packet marking actions:

- QoS-group can be marked only in the input direction and can only support unconditional explicit marking.
- Only explicit marking is supported for policer-based marking.

Multi-attribute Marking Support

The supervisor engine can mark more than one QoS attribute of a packet matching a class of traffic. For example, DSCP, CoS, and QoS-group can all be set together, using either explicit or tablemap-based marking.
When using unconditional explicit marking of multiple fields or policer-based multi-field, multi-region (conform/exceed/violate) marking the number of tablemaps that can be setup in TOS or COS marking tables will be less than the maximum supported.

**Hardware Capabilities for Marking**

Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E provide a 128 entry marking action (Supervisor Engine 7-E and Supervisor Engine 7L-E provide a 256 entry marking action) where each entry specifies the type of marking actions on CoS and DSCP/Precedence fields as well as policer action to transmit/markdown/drop a packet.

One such table is supported for each direction, input and output. This table is used for both unconditional marking as well as policer-based marking. It can be used to support 256 unique marking actions or 64 unique policer-based actions or a combinations of the two.

For each of the marking fields (COS and DSCP), the supervisor engine provides 512 entry marking tables for each direction. These are similar to mapping tables available on supervisor engines that support the switch QoS model. However, these provide an ability to have multiple unique mapping tables that are setup by the user.

For example, the TOS marking table provides marking of DSCP/Precedence fields and can be used as one of the following:

- 8 different tablemaps with each mapping the 64 DSCP or qos-group values to another DSCP
- 64 (32) different tablemaps with each one mapping 8 CoS (16 CoS and CFi) values to DSCP in input (output) direction
- a combination of above two types of tablemaps

Similar mappings are available on the 512 entry COS marking table.

**Configuring the Policy Map Marking Action**

This section describes how to establish unconditional marking action for network traffic.

As a prerequisites, create a class map (ipp5) and a policy map. (Refer to the “Configuring a Policy Map” section on page 40-15).

**Note** The marking action command options have been extended (refer to Table 40-2 on page 40-19 and Table 40-3 on page 40-20).

**Configuring Tablemap-based Unconditional Marking**

To configure table-map based unconditional marking, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch# configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Switch(config)# table-map name</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Switch(config-tablemap)# map from</strong>&lt;br&gt;<strong>from_value to to_value</strong></td>
</tr>
</tbody>
</table>
### Configuring Quality of Service

#### Configuring QoS

The following example shows how to enable marking action using table-map.

```
Switch(config)# table-map dscp2Cos
Switch(config-tablemap)# map from 8 to 1
Switch(config-tablemap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class ipp5
Switch(config-pmap-c)# set cos dscp table dscp2Cos
Switch(config-pmap-c)# end
Switch# show policy-map p1
Policy Map p1
Class ipp5
    set cos dscp table dscp2Qos
Switch# show table-map dscp2Cos
Table Map dscp2Cos
    from 8 to 1
datacopy
```

#### Configuring Policer Result-based Conditional Marking

To configure policer result-based conditional marking, setup a single rate or dual rate policer. Refer to the “How to Implement Policing” section on page 40-17.

This example shows how to configure a two rate three-color policer with explicit actions for each policer region:

```
Switch# configure terminal
Switch(config-pmap-c)# policer cir percent 20 pir percent 30

Marking Statistics

The marking statistics indicate the number of packets that are marked.

For unconditional marking, the classification entry points to an entry in the marking action table that in turn indicates the fields in the packet that are marked. Therefore, the classification statistics by itself indicates the unconditional marking statistics.

For a conditional marking using policer, provided the policer is a packet rate policer, you cannot determine the number packets marked because the policer only provides byte statistics for different policing results.

Shaping, Sharing (Bandwidth), Priority Queuing, Queue-limiting and DBL

The Catalyst 4500 Series Switch supports the Classification-based (class-based) mode for transmit queue selection. In this mode, the transmit queue selection is based on the Output QoS classification lookup.

Note

Only output (egress) queuing is supported.

The supervisor engine supports 8 transmit queues per port. Once the forwarding decision has been made to forward a packet out a port, the output QoS classification determines the transmit queue into which the packet needs to be enqueued.

By default, without any service policies associated with a port, there are two queues (a control packet queue and a default queue) with no guarantee as to the bandwidth or kind of prioritization. The only exception is that system generated control packets are enqueued into control packet queue so that control traffic receives some minimum link bandwidth.

Queues are assigned when an output policy attached to a port with one or more queuing related actions for one or more classes of traffic. Because there are only eight queues per port, there can be at most eight classes of traffic (including the reserved class, class-default) with queuing action(s). Classes of traffic that do not have any queuing action are referred to as non-queuing classes. Non-queuing class traffic ends up using the queue corresponding to class class-default.

When a queuing policy (a policy with queuing action) is attached, the control packet queue is deleted and the control packets are enqueued into respective queue per their classification. An egress QoS class must be configured to match IP Precedence 6 and 7 traffic, and a bandwidth guarantee must be configured.

Dynamic resizing of queues (queue limit class-map action) is supported through the use of the queue-limit command. Based on the chassis and line card type, all eight queues on a port are configured with equal queue size.

Shaping

Shaping enables you to delay out-of-profile packets in queues so that they conform to a specified profile. Shaping is distinct from policing. Policing drops packets that exceed a configured threshold, whereas shaping buffers packets so that traffic remains within a given threshold. Shaping offers greater smoothness in handling traffic than policing. You enable average-rate traffic shaping on a traffic class with the policy-map class configuration command.

The supervisor engine supports a range of 32kbps to 10 gbps for shaping, with a precision of approximately +/- 0.75 per cent.
When a queuing class is configured without any explicit shape configuration, the queue shape is set to the link rate.

To configure class-level shaping in a service policy, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# policy-map policy-map-name</td>
<td>Creates a policy map by entering the policy-map name, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td></td>
<td>By default, no policy maps are defined.</td>
</tr>
<tr>
<td>Step 3 Switch(config-pmap)# class class-name</td>
<td>Specifies the name of the class whose traffic policy you want to create or change, and enter policy-map class configuration mode. By default, no traffic classes are defined.</td>
</tr>
<tr>
<td>Step 4 Switch(config-pmap-class)# shape average (cir-bps [optional_postfix]</td>
<td>Enables average-rate traffic shaping. You can specify the shaping rate in absolute value or as a percentage:</td>
</tr>
<tr>
<td></td>
<td>• For cir-bps [optional_postfix], specify the shaping rate in bps. Range is 32000 to 10000000000 bps. Supply an optional postfix (K, M, G).</td>
</tr>
<tr>
<td></td>
<td>• For percent, specify the percentage of link rate to shape the class of traffic. The range is 1 to 100. By default, average-rate traffic shaping is disabled.</td>
</tr>
<tr>
<td>Step 5 Switch(config-pmap-class)# exit</td>
<td>Returns to policy-map configuration mode.</td>
</tr>
<tr>
<td>Step 6 Switch(config-pmap)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 7 Switch(config)# interface interface-id</td>
<td>Specifies a physical port and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 8 Switch(config-interface)# service-policy output policy-map-name</td>
<td>Specifies the policy-map name, and apply it to a physical interface.</td>
</tr>
<tr>
<td>Step 9 Switch(config-interface)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10 Switch# show policy-map [policy-map-name [class class-map-name]]</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>Switch# show policy-map interface interface-id</td>
</tr>
<tr>
<td>Step 11 Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete an existing policy map, use the no policy-map policy-map-name global configuration command. To delete an existing class, use the no class class-name policy-map configuration command. To disable the average-rate traffic shaping, use the no shape average policy-map class configuration command.

This example shows how to configure class-level, average-rate shaping. It limits traffic class class1 to a data transmission rate of 256 kbps:

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
```
Chapter 40      Configuring Quality of Service

Configuring QoS

Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch#

Switch# show policy-map policy1
Policy Map policy1
  Class class1
    shape average 256000

This example shows how to configure class-level, average shape percentage to 32% of link bandwidth for queuing-class traffic:

Switch# configure terminal
Switch(config)# policy-map queuing-policy
Switch(config-pmap)# class queuing-class
Switch(config-pmap-c)# shape average percent 32
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output queuing-policy1
Switch(config-if)# end
Switch#

Switch# show policy-map queuing-policy
Policy Map queuing-policy
  Class queuing-class
    Average Rate Traffic Shaping
      cir 32%

Sharing(bandwidth)

The bandwidth assigned to a class of traffic is the minimum bandwidth that is guaranteed to the class during congestion. Transmit Queue Sharing is the process by which output link bandwidth is shared among multiple queues of a given port.

The supervisor engine supports a range of 32 kbps to 10 gbps for sharing, with a precision of approximately +/- 0.75 per cent. The sum of configured bandwidth across all queuing classes should not exceed the link bandwidth.

To configure class-level bandwidth action in a service policy, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# policy-map policy-map-name</td>
</tr>
<tr>
<td></td>
<td>Creates a policy map by entering the policy-map name, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td></td>
<td>By default, no policy maps are defined.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-pmap)# class class-name</td>
</tr>
<tr>
<td></td>
<td>Specifies the name of the class whose traffic policy you want to create or change, and enter policy-map class configuration mode.</td>
</tr>
<tr>
<td></td>
<td>By default, no traffic classes are defined.</td>
</tr>
</tbody>
</table>
Chapter 40  Configuring Quality of Service

To delete an existing policy map, use the no policy-map policy-map-name global configuration command. To delete an existing class, use the no class class-name policy-map configuration command. To return to the default bandwidth, use the no bandwidth policy-map class configuration command.

This example shows how to create a class-level policy map called policy11 for three classes called prec1, prec2, and prec3. In the policy for these classes, 30 percent of the available bandwidth is assigned to the queue for the first class, 20 percent is assigned to the queue for the second class, and 10 percent is assigned to the queue for the third class.

```
Switch # configure terminal
Switch(config)# policy-map policy11
Switch(config-pmap)# class prec1
Switch(config-pmap-c)# bandwidth percent 30
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec2
Switch(config-pmap-c)# bandwidth percent 20
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec3
Switch(config-pmap-c)# bandwidth percent 10
Switch(config-pmap-c)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy11
```
Switch(config-if)# end
Switch #

Switch# show policy-map policy11
Policy Map policy11
  Class prec1
    bandwidth percent 30
  Class prec2
    bandwidth percent 20
  Class prec3
    bandwidth percent 10

This example shows how to create a class-level policy map called policy11 for three classes called prec1, prec2, and prec3. In the policy for these classes, 300 mbps of the available bandwidth is assigned to the queue for the first class, 200 mbps is assigned to the queue for the second class, and 100 mbps is assigned to the queue for the third class.

Switch # configure terminal
Switch(config)# policy-map policy11
Switch(config-pmap)# class prec1
Switch(config-pmap-c)# bandwidth 300000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec2
Switch(config-pmap-c)# bandwidth 200000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec3
Switch(config-pmap-c)# bandwidth 100000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy11
Switch(config-if)# end
Switch #

Switch# show policy-map policy11
Policy Map policy11
  Class prec1
    bandwidth 300000 (kbps)
  Class prec2
    bandwidth 200000 (kbps)
  Class prec3
    bandwidth 100000 (kbps)

When a queuing class is configured without any explicit share/bandwidth configuration, because the queue is not guaranteed any minimum bandwidth, the hardware queue is programmed to get a share of any unallocated bandwidth on the port as shown in the following example.

If there is no bandwidth remaining for the new queue or if the unallocated bandwidth is not sufficient to meet the minimum configurable rate (32kbps) for all queues which do not have any explicit share/bandwidth configuration, then the policy association is rejected.

For example, if there are two queues as given below

```
policy-map queue-policy
  class q1
    bandwidth percent 10

class q2
    bandwidth percent 20
```

then the bandwidth allocation for the queues is as follows

```
q1 = 10%
q2 = 20%
```
class-default = 70%

Similarly, when another queuing class (say q3) is added without any explicit bandwidth (say, just a shape command), then the bandwidth allocation is

\[ q1 = 10\% \]
\[ q2 = 20\% \]
\[ q3 = \min(35\%, q3\text{-shape-rate}) \]
\[ \text{class-default} = \max(35\%, (100 - (q1 + q2 + q3))) \]

### Priority queuing

Only one transmit queue on a port can be configured as strict priority (termed Low Latency Queue, or LLQ).

LLQ provides strict-priority queuing for a traffic class. It enables delay-sensitive data, such as voice, to be sent before packets in other queues. The priority queue is serviced first until it is empty or until it is under its shape rate. Only one traffic stream can be destined for the priority queue per class-level policy. You enable the priority queue for a traffic class with the `priority policy-map class` configuration command at the class mode.

A LLQ can starve other queues unless it is rate limited. The supervisor engine does not support conditional policing where a 2-parameter policer (rate, burst) becomes effective when the queue is congested (based on queue length). However, it supports application of an unconditional policer to rate limit packets enqueued to the strict priority queue.

When a priority queue is configured on one class of a policy map, only bandwidth remaining is accepted on other classes, guaranteeing a minimum bandwidth for other classes from the remaining bandwidth of what is left after using the priority queue. When a priority queue is configured with a policer, then either bandwidth or bandwidth remaining is accepted on other classes.

**Note**

Use bandwidth or bandwidth remaining on all classes. You cannot apply bandwidth on one class and bandwidth remaining on another class within a policy map.

To enable class-level priority queuing in a service policy, follow these steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>Switch(config)# policy-map policy-map-name</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>Switch(config-pmap)# class class-name</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>Switch(config-pmap-class)# priority</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>Switch(config-pmap-class)# exit</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>Switch(config-pmap)# exit</code></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><code>Switch(config)# interface interface-id</code></td>
</tr>
</tbody>
</table>
Configuring QoS

To delete an existing policy map, use the no policy-map policy-map-name global configuration command. To delete an existing class, use the no class class-name policy-map configuration command.
To disable the priority queue, use the no priority policy-map-class configuration command.

This example shows how to configure a class-level policy called policy1. Class 1 is configured as the priority queue, which is serviced first until it is empty.

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch #
```

```
Switch# show policy-map policy1
Policy Map policy1
 Class class1
 priority
```

### Queue-limiting

When a class-based queue is instantiated on a physical port, it is set up with a default size. This size represents the number of queue entries in which packets belonging to that class of traffic can be queued. The scheduler moves packets from the queue that are ready for transmission, based on the queue shape, bandwidth, and priority configuration.

The queue-limit provides the maximum number of packets that can be in the queue at any given time. When the queue is full, an attempt to enqueue any further packets results in tail drop. However, if dynamic buffer limiting (DBL) is enabled on the queue, packets get a probabilistic drop based on the DBL algorithm, even when the queue is not full.

The **queue-limit** command can be configured under a class only when queue scheduling, such as bandwidth, shape, or priority is already configured. The only exception to this requirement is the support of the stand-alone **queue-limit** command on the class-default class.

---

**Command** | **Purpose**
---|---
Step 8 | Switch(config-interface)# service-policy output policy-map-name Specifies the policy-map name, and apply it a physical interface.
Step 9 | Switch(config-interface)# end Returns to privileged EXEC mode.
Step 10 | Switch# show policy-map [policy-map-name [class class-map-name]] or Switch# show policy-map interface interface-id Verifies your entries.
Step 11 | Switch# copy running-config startup-config (Optional) Saves your entries in the configuration file.
Queue Memory

The number of queue entries that can be allocated has to be a multiple of 8 and can range from 16 to 8184. When a class-based queue is instantiated on a physical port, it is given a default number of entries. This default queue size is based on the number of slots in the chassis and the number of front-panel ports in each slot.

Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E have 512 K (524,288) queue entries of which the system sets aside 100 K (102,400) queue entries in a free reserve pool. Of the remaining 412 K (421,88), the drop port is provided 8184 entries and the CPU ports are assigned 11704 entries. Catalyst 6-E has 1M (1,048,576) queue entries of which the system sets aside 100K (102,400) queue entries in a free reserve pool. Of the remaining queue entries, the drop port is provided 8184 entries, 24576 entries for recirculation ports and the CPU ports are assigned 8656 entries. Supervisor Engine 7L-E has a 512 K queue entries.

The remaining entries are divided equally among the slots in the chassis. In a redundant chassis the two supervisor slots are treated as one for the purpose of this entries distribution. Within each slot the number of queue entries are equally divided among the front-panel ports present on the line card in that slot.

When the user configuration for queue entries on an interface exceeds its dedicated quota, the system attempts to satisfy the configuration from the free reserve pool. The entries from the free reserve pool are allocated to interfaces on a first-come first-served basis.

Service Policy Association

When a QoS service-policy with queuing actions is configured, but no explicit queue-limit command is attached in the egress direction on a physical interface, each of the class-based queues gets the same number of queue entries from within the dedicated quota for that physical port. When a queue is explicitly given a size using the queue-limit command, the switch tries to allocate all the entries from within the dedicated quota for the interface. If the required number of entries is greater than the dedicated quota for the interface, the switch tries to allocate the entries from the free reserve.

The queue entries associated with a queue always have to be consecutive. This requirement can result in fragmentation of the 512K of the queue entries that are shared across the switch. For example, an interface may not have enough entries for a queue in its dedicated quota and thus have to use the free reserve to set up that queue. In this case, the queue entries from the dedicated quota remain unused because they cannot be shared with any other port or slot.

When the QoS service-policy associated with an interface is removed, any queue entries taken from the free reserve are returned to the free reserve pool. The interface queuing configuration reverts to two queues — class-default and the control-packet queue with default shape, bandwidth, and size. The control-packet queue is set up with size 16 whereas the default queue is set up with the maximum size possible based on the dedicated quota for that interface.

Queue Allocation Failure

The switch might not be able to satisfy the explicit queue size required on one or more queues on an interface because of fragmentation of queue memory or lack of enough free reserve entries. In this scenario, the switch logs an error message to notify you of the failure. The QoS service-policy is left configured on the interface. You can fix the error by removing the QoS service-policy and examining the current usage of the queue entries from the free reserve by other ports on the switch.

To configure class-level queue-limit in a service policy, perform this task:
### Command Purpose

<table>

</tbody>
</table>

| Step 5       | Switch(config-pmap-class)# | Provides an explicit queue size in packets. The size must be a multiple of 8 and ranging from 16 to 8184. |
| queue-limit  | number-of-packets       |                                               |

| Step 6       | Switch(config-pmap-class)# | Returns to policy-map configuration mode. |
| exit         |                       |                                               |

| Step 7       | Switch(config-pmap)#     | Returns to global configuration mode.         |
| exit         |                       |                                               |

| Step 8       | Switch(config)#          | Specifies a physical port and enter interface configuration mode. |
| interface    | interface-id            |                                               |

| Step 9       | Switch(config-interface)# | Specifies the policy-map name, and apply it a physical interface. |
| service-policy output | policy-map-name     |                                               |

| Step 10      | Switch(config-interface)# | Returns to privileged EXEC mode. |
| end          |                       |                                               |

| Step 11      | Switch#                | Verifies your entries.                        |
| show policy-map | policy-map-name [class class-map-name] |                                               |
| or           |                       |                                               |
| show policy-map interface | interface-id |                                               |

| Step 12      | Switch#                | (Optional) Saves your entries in the configuration file. |
| copy running-config startup-config |                       |                                               |

To remove the explicit queue size use the **no queue-limit** command under the class in a policy-map.

This example shows how to configure a class-based queue with an explicit **queue-limit** command. It limits traffic class class1 to a queue of size 4048:

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# queue-limit 4048
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
```
Switch(config-if)# end
Switch#
Switch# show policy-map policy1
Policy Map policy1
  Class class1
    shape average 256000
    queue-limit 4048
Switch#

Active Queue Management (AQM) via Dynamic Buffer Limiting (DBL)

AQM provides buffering control of traffic flows prior to queuing a packet into a transmit queue of a port. This is of significant interest in a shared memory switch, ensuring that certain flows do not hog the switch packet memory.

Note
The supervisor engine supports active switch buffer management via DBL.

Except for the default class of traffic (class class-default), you can configure DBL action only when at least one of the other queuing action is configured.

To configure class-level dbl action along with shaping in a service policy, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# policy-map policy-map-name</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-pmap)# class class-name</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-pmap-class)# shape average cir-bps</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-pmap-class)# dbl</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-pmap-class)# exit</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-pmap)# exit</td>
</tr>
<tr>

Chapter 40  Configuring Quality of Service

Configuring QoS

To delete an existing policy map, use the `no policy-map policy-map-name` global configuration command. To delete an existing class, use the `no class class-name` policy-map configuration command. To disable DBL on the associated queue, use the `no dbl` policy-map class configuration command.

The following example shows how to configure class-level, DBL action along with average-rate shaping. It enables DBL on the queue associated with traffic-class `class1`.

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# dbl
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch#
```

To delete an existing policy map, use the `no policy-map policy-map-name` global configuration command. To delete an existing class, use the `no class class-name` policy-map configuration command. To disable DBL on the associated queue, use the `no dbl` policy-map class configuration command.

The following example shows how to configure class-level, DBL action along with average-rate shaping. It enables DBL on the queue associated with traffic-class `class1`.

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# dbl
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch#
```

Transmit Queue Statistics

Transmit queue statistics are visible by entering the `show policy-map interface` command:

```
Switch# show policy-map interface gigabitEthernet 1/1
GigabitEthernet1/1

Service-policy output: queuing-policy

Class-map: queuing-class (match-all)
  1833956 packets
  Match: cos 1
  Queueing
  (total drops) 1006239
  (bytes output) 56284756
  shape (average) cir 320000000, bc 1280000, be 1280000
  target shape rate 320000000

Class-map: class-default (match-any)
  1 packets
  Match: any
  (total drops) 0
  (bytes output) 2104
```
Enabling Per-Port Per-VLAN QoS

The per-port per-VLAN QoS feature enables you to specify different QoS configurations on different VLANs on a given interface. Typically, you use this feature on trunk or voice VLANs (Cisco IP Phone) ports, as they belong to multiple VLANs.

To configure per-port per-VLAN QoS, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-if)# vlan-range vlan_range</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if-vlan-range)# service-policy {input</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if-vlan-range)# exit</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show policy-map interface interface_name</td>
</tr>
</tbody>
</table>

Example 1

Figure 40-4 displays a sample topology for configuring PVQoS. The trunk port gi3/1 is comprised of multiple VLANs (101 and 102). Within a port, you can create your own service policy per VLAN. This policy, performed in hardware, might consist of ingress and egress Policing or giving precedence to voice packet over data.
Configuring QoS

Example 2

Let us assume that interface Gigabit Ethernet 6/1 is a trunk port and belongs to VLANs 20, 300-301, and 400. The following example shows how to apply policy-map p1 for traffic in VLANs 20 and 400 and policy map p2 to traffic in VLANs 300 through 301:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# vlan-range 20,400
Switch(config-if-vlan-range)# service-policy input p1
Switch(config-if-vlan-range)# exit
Switch(config-if)# vlan-range 300-301
Switch(config-if-vlan-range)# service-policy output p2
Switch(config-if-vlan-range)# end
Switch#
```

Example 3

The following command shows how to display policy-map statistics on VLAN 20 configured on Gigabit Ethernet interface 6/1:

```
Switch# show policy-map interface gigabitEthernet 6/1 vlan 20
```

```
 GigabitEthernet6/1 vlan 20

Service-policy input: p1

    Class-map: c1 (match-all)
                  0 packets
                            Match: cos 1
                            Match: access-group 100
                            police:
                                    cir 100000000 bps, bc 3125000 bytes
```
Example 4

The following command shows how to display policy-map statistics on all VLANs configured on Gigabit Ethernet interface 6/1:

```
Switch# show policy-map interface gigabitEthernet 6/1
```

```
GigabitEthernet6/1 vlan 20  
Service-policy input: p1  
Class-map: c1 (match-all)  
0 packets  
Match: cos 1  
Match: access-group 100  
police:  
  cir 100000000 bps, bc 3125000 bytes  
  conformed 0 bytes; actions:  
    transmit  
  exceeded 0 bytes; actions:  
    drop  
  conformed 0000 bps, exceed 0000 bps

Class-map: class-default (match-any)  
0 packets  
Match: any
```

```
GigabitEthernet6/1 vlan 300  
Service-policy output: p2  
Class-map: c1 (match-all)  
0 packets  
Match: cos 1  
Match: access-group 100  
QoS Set  
  dscp 50  
police:  
  cir 200000000 bps, bc 6250000 bytes  
  conformed 0 bytes; actions:  
    transmit  
  exceeded 0 bytes; actions:  
    drop  
  conformed 0000 bps, exceed 0000 bps

Class-map: class-default (match-any)  
0 packets  
Match: any
```

```
GigabitEthernet6/1 vlan 301  
Service-policy output: p2
```
Class-map: c1 (match-all)
  0 packets
Match: cos 1
Match: access-group 100
QoS Set
dscp 50
police:
cir 200000000 bps, bc 6250000 bytes
conformed 0 bytes; actions:
  transmit
exceeded 0 bytes; actions:
  drop
conformed 0000 bps, exceed 0000 bps

Policy Associations

The supervisor engine supports per-port, per-VLAN policies. The associated policies are attached to the interface, VLAN, and a specific VLAN on a given port, respectively.

A policy can be associated with a variety of objects. The following table lists the objects and the actions allowed.

Table 40-1 Table QoS Policy Associations

<table>
<thead>
<tr>
<th>Object</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical port</td>
<td>Policing, marking, and queuing</td>
</tr>
<tr>
<td>VLAN</td>
<td>Policing and marking</td>
</tr>
<tr>
<td>Port and VLAN (PV)</td>
<td>Policing and marking</td>
</tr>
<tr>
<td>EtherChannel</td>
<td>Policing and marking</td>
</tr>
<tr>
<td>EtherChannel member port</td>
<td>Queuing</td>
</tr>
</tbody>
</table>

Qos Action Restrictions

• The same actions cannot be performed multiple times in a given direction on different targets. In other words, it is not possible to police the packets both on port and VLAN in the input direction. However, the user can police on the input port and on the output VLAN.

• Queuing actions are only allowed in the egress direction and only on the physical port.

• Percentage-based actions like policer cannot be configured on a VLAN, Port and VLAN (PV) and EtherChannel.

• Port channel or VLAN configuration can only have a policing or a marking action, not a queueing action.

Qos Policy priorities

• If a policy on a port and a VLAN are configured with conflicting actions (such as policing or marking actions on both a port and VLAN), the port policy is picked.

• If policy on a VLAN on a given port must be over-written, the user can configure PV policy.
Qos Policy merging

Applicable policies are applied to a given packet in given direction. For example, if you configure egress VLAN-based police and marking, followed by selective queuing on the port, then actions from both policies will be applied for this packet.

The following policy-map configuration restrictions are imposed on an EtherChannel:

- only policing and marking actions are supported at the EtherChannel level
- only queuing actions are supported at the physical member port level

A packet can be marked (dscp or cos fields) by the EtherChannel policy. If the physical member port policy uses a classification based on dscp or cos fields, it must be based on the marked (modified) value. To ensure proper operation, the following restriction is placed on the EtherChannel.

The classification criteria for the policy-map on the physical member ports has to based only on one type of field:

- dscp
- precedence
- cos
- any non marking field (no dscp or cos based classification)

Classification criteria for the policy-map on the physical member ports cannot be based on a combination of fields. This restriction ensures that if the EtherChannel policy is marking down dscp or cos, the marked (modified) value-based classification can be implemented in hardware.

Note

Auto-qos macros with SRND4 generate class-maps with more than one type of match. These class-maps need to be modified to use only with one matching type when applied on EtherChannel member ports.

Note

Classification criteria for the policy-map on the physical member ports cannot be modified to add a new type of field.

Auto-QoS is not supported on EtherChannel or its member ports. A physical port configured with Auto-QoS is not allowed to become a member of a physical port.

Software QoS

At the highest level, there are two types of locally sourced traffic (such as control protocol packets, pings, and telnets) from the switch: high priority traffic (typically the control protocol packets like OSPF Hellos and STP) and low priority packets (all other packet types).

The QoS treatment for locally-sourced packets differs for the two types.

The supervisor engine provides a way to apply QoS to packets processed in the software path. The packets that get this QoS treatment in software can be classified into two types: software switched packets and software generated packets.

On reception, software switched packets are sent to the CPU that in turn sends them out of another interface. For such packets, input software QoS provides input marking and output software QoS provides output marking and queue selection.
The software generated packets are the ones locally sourced by the switch. The type of output software QoS processing applied to these packets is the same as the one applied to software switched packets. The only difference in the two is that the software switched packets take input marking of the packet into account for output classification purpose.

High Priority Packets

High priority packets are marked as one of the following:

- internally with PAK_PRIORITY
- with IP Precedence of 6 (for IP packets)
- with CoS of 6 (for VLAN Tagged packets)

These packets behave as follows:

- They are not dropped because of any policing, AQM, drop thresholds (or any feature that can drop a packet) configured as per the egress service policy. However, they might be dropped because of hardware resource constraints (packet buffers, queue full, etc.).
- They are classified and marked as per the marking configuration of the egress service policy that could be a port or VLAN (refer to the “Policy Associations” section on page 40-38.
- These high priority packets are enqueued to queue on the egress port based on the following criteria:
  - If there is no egress queuing policy on the port, the packet is queued to a control packet queue that is setup separately from the default queue and has 5 percent of the link bandwidth reserved for it.
  - If there is an egress queuing policy on the port, the queue is selected based on the classification criteria applicable to the packet.

Low Priority Packets

Packets that are not considered high priority (as described previously) are considered unimportant. These include locally sourced pings, telnet, and other protocol packets. They undergo the same treatment as any other packet that is transiting the given transmit port including egress classification, marking and queuing.

Applying Flow-based QoS Policy

Flow based QoS enables microflow policing and marking capability to dynamically learn traffic flows. It also rate limits each unique flow to an individual rate. Flow based QoS is available with the built-in NetFlow hardware support.

For more overview information, refer to the “Flow-based QoS” section on page 40-10.

The following steps show how to apply Flow based QoS policy to QoS targets:

**Step 1** Create a FNF flow record by specifying the key fields that identify unique flows. You can use any FNF flow records that are associated with the FNF monitor.

**Step 2** Create a class-map to specify the set of match criteria. Include the FNF flow record from Step 1 in the class-map match criteria using the **match flow record** command. Then, configure the class-map to match all the match criteria with **class-map match-all class_name**.

**Step 3** Create a policy-map and define actions associated with class-map from Step 2.
Step 4  
Attach the policy to one or more QoS targets.

Examples

The following examples illustrate how to configure Flow based QoS policy and apply microflow policers on individual flows.

Example 1

This example assumes there are multiple users (identified by source IP address) on the subnet 192.168.10.*. The configuration below shows how to configure a flow based QoS policy that uses micro policing to limit the per-user traffic with the source address in the range of 192.168.10.*. The microflow policer is configured with a CIR of 1Mbps, “conform action” as transmit, and “exceed action” as drop.

Step 1: Define an ACL to match traffic with specified source address.

```
Switch(config)# ip access-list extended UserGroup1
Switch(config-ext-nacl)# permit ip 192.168.10.0 0.0.0.255 any
Switch(config-ext-nacl)# exit
Switch(config)#
```

Step 2: Define a flow record to create flows with source address as key.

```
Switch(config)# flow record r1
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# exit
Switch(config)#
```

Step 3: Configure classmap to match on the UserGroup1 and specify flow record definition for flow creation.

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match access-group name UserGroup1
Switch(config-cmap)# match flow record r1
Switch(config-cmap)# exit
Switch(config)#
```

Step 4: Configure flow based QoS policy-map with microflow policing action for the matching traffic.

```
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police cir 1m
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action drop
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
```

Step 5: Attach flow QoS policy to the interface.

```
Switch(config)# interface gigabitEthernet3/1
Switch(config-if)# service-policy input p1
Switch(config-if)#
```

Use the show commands (described in the policy and marking sections of this chapter) to display the policy-map configuration and interface specific policy-map statistics.
Example 2.

This example assumes there are multiple users (identified by source IP address) on subnets 192.168.10.* and 172.20.55.*. The first requirement is to police with a CIR of 500Kbps and a PIR of 650Kbps on any TCP traffic originating from 192 network to any destination at any given time. The **exceed action** keyword marks down the dscp value to 32. The second requirement is to police per-user traffic originating from 172 network to CIR of 2Mbps and unconditionally mark the traffic with dscp 10.

**Step 1: Define an ACL to match traffic with specified source address.**

```
Switch(config)# ip access-list extended UserGroup1
Switch(config-ext-nacl)# permit ip 192.168.10.0 0.0.0.255 any
Switch(config-ext-nacl)# exit
Switch(config)# ip access-list extended UserGroup2
Switch(config-ext-nacl)# permit ip 172.20.55.0 0.0.0.255 any
Switch(config-ext-nacl)# exit
```

**Step 2: Define a flow record to create flows with source address as key.**

```
Switch(config)# flow record r1
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 destination address
Switch(config-flow-record)# match transport tcp source-port
Switch(config-flow-record)# match transport tcp destination-port
Switch(config-flow-record)# exit
Switch(config)# flow record r2
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# exit
```

**Step 3: Configure classmap to match on the UserGroup1 and specify flow record definition for flow creation.**

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match access-group name UserGroup1
Switch(config-cmap)# match flow record r1
Switch(config-cmap)# exit
Switch(config)# class-map match-all c2
Switch(config-cmap)# match access-group name UserGroup2
Switch(config-cmap)# match flow record r2
Switch(config-cmap)# exit
```

**Step 4: Configure flow based QoS policy-map with microflow policing action for the matching traffic.**

```
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police cir 500k pir 650k
Switch(config-pmap-c-policy)# conform-action transmit
Switch(config-pmap-c-policy)# exceed-action set-dscp-transmit 32
Switch(config-pmap-c-policy)# violate-action drop
Switch(config-pmap-c-policy)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# class c2
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police cir 2m
Switch(config-pmap-c-policy)# conform-action transmit
Switch(config-pmap-c-policy)# exceed-action drop
Switch(config-pmap-c-policy)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
```

**Step 5: Attach flow QoS policy to the interface.**
Switch(config)# interface gigabitEthernet3/1
Switch(config-if)# service-policy input p1
Switch(config-if)# exit

Use the show commands described in the QoS section to display the policy-map configuration and interface specific policy-map statistics.

Example 3

Assume that there are two active flows on FastEthernet interface 6/1:

<table>
<thead>
<tr>
<th>SrcIp</th>
<th>DSTlp</th>
<th>IPProt</th>
<th>SrcL4Port</th>
<th>DstL4Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>81</td>
</tr>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>21</td>
</tr>
</tbody>
</table>

With the following configuration, each flow is policed to 1000000 bps with an allowed 9000 burst value.

Switch(config)# flow record r1
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 destination address
Switch(config-flow-record)# match transport tcp source-port
Switch(config-flow-record)# match transport tcp destination-port
Switch(config-flow-record)# match transport udp source-port
Switch(config-flow-record)# match transport udp destination-port
Switch(config-flow-record)# exit
Switch(config)# class-map match-all c1
Switch(config-cmap)# match flow record r1
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config)# interface fastEthernet 6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end

Configuration Guidelines

The general guidelines for creating, configuring, modifying, deleting a flow based QoS policy and attaching (and detaching) a flow based QoS policy to a supported target is the same as described in the QoS section. The following description and restriction applies to Flow based QoS policy:

- A classmap can have multiple match statements but only one FNF flow record can be specified in a class-map.
- A flow record must have at least one key field before it can be used in a classmap. Non-key fields can be present in the flow record. However, all the non-key fields are ignored by microflow QoS. Only key-fields are used for flow creation.
- If a FNF flow record is referenced in any class-map, the flow record cannot be modified. Remove the flow record from all classmaps before modifying it.
- A classmap with a FNF flow record must be configured as match-all; traffic hitting the class-map must satisfy all match criteria in the class-map.
Chapter 40 Configuring Quality of Service

Configuring QoS

A policy can contain multiple classes and each class-map may contain the same or different FNF flow record.

Flow based QoS policy and FNF monitor both cannot be applied on the same target at the same time.

When the interface mode changes from switchport to routed port and vice versa, any Flow QoS policy attached to the port remains applied after the mode change.

There are 3 types of FNF flow records: ipv4, ipv6, and datalink. The datalink flow record is mutually exclusive with the ipv4 and ipv6 flow records; a classmap with the datalink flow record cannot co-exist with classmap having a ipv4 or ipv6 flow record in the same policy and vice-versa.

Classmap class-default is not editable; it cannot be configured with the match flow record. Instead, you can configure the policy with a class-map that uses a match any filter and the flow record.

Traffic is classified in the same order in which class-map is defined in a policy. Hence, if a FNF flow record is the only match statement in a class-map, the classifier matches all packets of the type identified by the flow record. This means that any subsequent class-map in the same policy matching on the same traffic type will be redundant and will never be hit.

Policers associated with classmap having flow record are called microflow policers. The CIR and PIR rates for microflow policers cannot be configured using the percent keyword.

Flow records within the same policy must include appropriate key fields to ensure flows created from different classmaps are unique and distinct. Otherwise, the resulting flows from different classmap cannot be distinguished. In such cases, policy actions corresponding to the classmap which created the first flow in hardware will apply and results will not be always be as expected.

Flows from traffic received on different QoS targets are distinct even if the same policy is applied to those targets.

A flow is aged out if the it is inactive for more than 5 seconds; there is no traffic matching the flow for a period longer than 5 sec.

When a flow is aged out, policer state information associated with the flow is also deleted. When a new flow is created, the policer instance for the flow is re-initialized.

Flows created by flow based QoS policy exist in hardware only and cannot be exported (as with FNF monitor).

Per-flow statistics are not available for flows created by flow based QoS policy.

Class-map statistics indicate the number of packets matching the classifier. It does not represent individual flow stats.

Policer statistics show the aggregate policer statistics of individual flow.

Information about the flows created by hardware are not available and not displayed in the show commands associated with QoS policy-map. Only class-map and policer statistics are displayed in the output of the show policy-map commands.

Configuring CoS Mutation

CoS reflection and CoS mutation are supported on Supervisor Engine 6-E and Catalyst 4900M. Below is an example of how to apply CoS reflection.

Let us say that traffic arrives on interface gigabit 2/5 with VLAN 10 and COS 1, 2, .... We want traffic to egress interface gigabit 2/6 with outer tag VLAN 11 and CoS copied from C-tag, where C-tag is VLAN 10 and COS 1, 2, ...

class-map match-all c2
Configuring System Queue Limit

This feature is available only from Cisco IOS Release 15.0(2)SG1 and later and Cisco IOS Release XE 3.2.1SG.

With the `hw-module system max-queue-limit` command, the Catalyst 4500 series switch allows you to change the queue limit for all interfaces globally, instead of applying a policy with queue limit to all the interfaces.

To set the queue limit globally, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# hw-module system</td>
<td>Sets the queue limit for all interfaces globally.</td>
</tr>
<tr>
<td>max-queue-limit max-queue-limit</td>
<td>Valid values are from 1024 to 8184. The value must be a multiple of 8.</td>
</tr>
</tbody>
</table>
Configuring Auto-QoS

Auto-QoS cannot be applied to VLANs or EtherChannel interfaces.

If you have an auto-QoS policy on a port connected to a device that supports CDP, the port is automatically trusted. However, if the device does not support CDP (like legacy Digital Media Player), QoS trust must be applied manually.

The Catalyst 4500 Series Switch employs the MQC model. This means that instead of using certain global configurations (like qos and qos db), auto-QoS applied to any interface on a switch configures several global class-maps and policy-maps.

Auto-QoS matches traffic and assigns each matched packet to qos-groups. This allows the output policy map to put specific qos-groups into specific queues, including into the priority queue.

We need QoS in both directions, both on inbound and outbound. Inbound, the switch port needs to trust the DSCP in the packet (done by default). Outbound, the switch port needs to give voice packets "front of line" priority. If voice is delayed too long by waiting behind other packets in the outbound queue, the end host drops the packet because it arrives outside of the receive window for that packet.
Note  QoS is a two way street. So, it might work in one direction and not in the other.

- There are 7 policy maps that must be defined (5 Input, 2 output)
- AutoQos-4.0-Input-Policy
- AutoQos-VoIP-Input-Cos-Policy
- AutoQos-VoIP-Input-Dscp-Policy
- AutoQos-4.0-Cisco-Phone-Input-Policy
- AutoQos-4.0-Output-Policy
- AutoQos-4.0-Cisco-Softphone-Input-Policy
- AutoQos-VoIP-Output-Policy

On all ports. The problem with COS is that packets on the native VLAN is marked as zero.

The class maps used for input matching are as follows:

- for control traffic between the phone and the callmanager
  ! and phone to phone [Bearer] DSCP matching
  ! Note: Control traffic can be either AF31 or CS3. So, we match to both values and assign
  them to different qos-groups when matching DSCP and only a single group when matching COS.

  class-map match-all AutoQos-VoIP-Control-Dscp26
    match dscp af31
  class-map match-all AutoQos-VoIP-Control-Dscp24
    match dscp cs3
  class-map match-all AutoQos-VoIP-Bearer-Dscp
    match dscp ef

- for control traffic and phone to phone [Bearer] COS matching
  ! Note: Both CS3 and AF31 control traffic maps to COS 3

  class-map match-all AutoQos-VoIP-Control-Cos
    match cos 3
  class-map match-all AutoQos-VoIP-Bearer-Cos
    match cos 5

- for control traffic between the softphonephone and the callmanager
  ! and softphone to softphonephone [Bearer] DSCP matching
  Class Map match-all AutoQos-4.0-Multimedia-Conf-Classify (id 36)
    Match access-group name AutoQos-4.0-ACL-Multimedia-Conf
  Class Map match-all AutoQos-4.0-Signaling-Classify (id 2)
    Match access-group name AutoQos-4.0-ACL-Signaling
  Class Map match-all AutoQos-4.0-Transaction-Classify (id 18)
    Match access-group name AutoQos-4.0-ACL-Transactional-Data

match dscp cs1

The class maps are intended to identify control and data (bearer) voice traffic for either an Layer 2 or Layer 3 interface.

The 2 Input policy maps, one for matching DSCP and one for matching COS, where DSCP and COS are set to an assigned qos-group used in outbound policy-maps are as follows:

policy-map AutoQos-VoIP-Input-Dscp-Policy
class AutoQos-VoIP-Bearer-Dscp
set qos-group 46
class AutoQos-VoIP-Control-Dscp26
set qos-group 26
class AutoQos-VoIP-Control-Dscp24
set qos-group 24

! Note: For COS, Control traffic only has a single COS value of 3 (versus DSCP which has 2 values to match). So, only 2 class-maps instead of 3 like above.

policy-map AutoQos-VoIP-Input-Cos-Policy

  Match  dscp cs1 (8)
Class Map match-all AutoQos-4.0-Priority-Queue (id 3)
  Match qos-group 32
Class Map match-all AutoQos-4.0-Control-Mgmt-Queue (id 28)
  Match qos-group 16
Class Map match-all AutoQos-4.0-Multimedia-Conf-Queue (id 10)
  Match qos-group 34
Class Map match-all AutoQos-4.0-Multimedia-Stream-Queue (id 5)
  Match qos-group 26
Class Map match-all AutoQos-4.0-Trans-Data-Queue (id 30)
  Match qos-group 18
Class Map match-all AutoQos-4.0-Bulk-Data-Queue (id 17)
  Match qos-group 10

The previous section listing defines the AutoQoS macros for defining QoS guidelines prior to Solution Reference Network Design 4.0 (SRND4). Starting with Cisco Release XE 3.3.0(SG) and 15.1(1)SG, the Catalyst 4500 Series Switch supports the auto qos srnd4 command.

The following classes are required and generated by all SRND4 CLIs.

class-map match-all AutoQos-4.0-Priority-Queue
  match qos-group 32
class-map match-all AutoQos-4.0-Control-Mgmt-Queue
  match qos-group 16
class-map match-all AutoQos-4.0-Multimedia-Conf-Queue
match qos-group 34
class-map match-all AutoQos-4.0-Multimedia-Stream-Queue
  match qos-group 26
class-map match-all AutoQos-4.0-Trans-Data-Queue
  match qos-group 18
class-map match-all AutoQos-4.0-Bulk-Data-Queue
  match qos-group 10
class-map match-any AutoQos-4.0-Scavenger-Queue
  match qos-group 8
match dscp cs1

The output policy maps are as follows:

! Each class maps to a different qos-group with
! class-default taking any traffic not assigned to a qos-group
! Note: in this example, the outbound policy map drops voice packets when the priority queue exceeds 33% utilization of the link. Each deployment must establish their own upper bound for voice packets.

policy-map AutoQos-VoIP-Output-Policy
class AutoQos-VoIP-Bearer-QosGroup
  set dscp ef
  set cos 5
  priority
  police cir percent 33
class AutoQos-VoIP-Control-QosGroup26

  bandwidth remaining percent 10
  Class AutoQos-4.0-Trans-Data-Queue
  bandwidth remaining percent 10
dbl
  Class AutoQos-4.0-Bulk-Data-Queue
  bandwidth remaining percent 4
dbl
  Class class-default
  bandwidth remaining percent 25
The three policy maps are defined as follows:

- **policy-map AutoQos-VoIP-Input-Dscp-Policy**
  This policy map is applied as an input service policy on an Layer 3 interface (such as an uplink connection to a neighboring switch) when auto-QoS is configured on the port.

- **policy-map AutoQos-VoIP-Input-Cos-Policy**
  This policy map is applied as an input service policy on an Layer 2 interface that could be either an uplink connection or a port hooked to a Cisco IP Phone.

- **policy-map AutoQos-VoIP-Output-Policy**
  This policy map is applied as an output policy for any port on which auto-QoS is configured, establishing policy governing egress traffic on the port based on whether it is voice data or control traffic.

The purpose of the input policy maps is to identify voice data or control traffic and mark it as such as it traverses the switch. The output policy map matches the packets on the marking occurring on ingress and then applies egress parameters such as bandwidth, policing and/or priority queuing.

For switch-to-switch connections, the `[no] auto qos voip trust` command is used to apply an input and output service policy on the interface:

```plaintext
service-policy input AutoQos-VoIP-Input-Cos-Policy
OR
service-policy input AutoQos-VoIP-Input-Dscp-Policy
AND
service-policy output AutoQos-VoIP-Output-Policy
```

The selection of the input policy depends on whether the port is Layer 2 or Layer 3. For Layer 2, the policy trusts the Cos setting in the received packets. For Layer 3 ports, it relies on the DSCP value contained in the packets.

For phone connected ports, the `[no] auto qos voice cisco-phone` command is used to apply the following service policy to the port:

```plaintext
qos trust device cisco-phone
service-policy input AutoQos-VoIP-Input-Cos-Policy
AND
service-policy output AutoQos-VoIP-Output-Policy
```

It establishes a trusted boundary that recognizes Cisco IP Phones and trusts the Cos setting of the packets from the phone. If a Cisco IP Phone is not detected, the Cos field is ignored and the packets are not classified as voice traffic. Upon detecting a Cisco phone, the ingress packets are marked based on the Cos value in the packets. This marking is used on egress for proper traffic classification and handling.

**Auto qos srnd4**—Is generated when any new auto qos command is configured on an interface and migrates from legacy CLIs to generate new configurations. This CLI only generates a global configuration if during migration, one or more interfaces has legacy auto-QoS enabled.

**Auto qos video**—Generates QoS configuration for untrusted interfaces. It incorporates a service-policy to classify the traffic coming from untrusted desktops/devices and marks them accordingly.
Auto qos void cisco-softphone—Generate QoS configuration for interfaces connected to PCs running the Cisco IP SoftPhone application and marks as police traffic stemming from such interfaces. Ports configured with this CLI are considered untrusted.

Auto qos classify—Generates QoS configuration for untrusted interfaces. It applies a service-policy to classify the traffic stemming from untrusted desktops or devices and marks them accordingly. The service-policies generated do not police.
Configuring Voice Interfaces

CHAPTER 41

This chapter describes how to configure voice interfaces for the Catalyst 4500 series switches. This chapter includes the following major sections:

- About Voice Interfaces, page 41-1
- Configuring a Port to Connect to a Cisco 7960 IP Phone, page 41-3
- Configuring Voice Ports for Voice and Data Traffic, page 41-3
- Overriding the CoS Priority of Incoming Frames, page 41-5
- Configuring Power, page 41-5

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Voice Interfaces

Catalyst 4500 series switches can connect to a Cisco 7960 IP Phone and carry IP voice traffic. If necessary, the switch can supply electrical power to the circuit connecting it to the Cisco 7960 IP Phone. Because the sound quality of an IP telephone call can deteriorate if the data is unevenly sent, the switch uses quality of service (QoS) based on IEEE 802.1p class of service (CoS). QoS uses classification and scheduling to transmit network traffic from the switch in a predictable manner. See Chapter 38, “Configuring Quality of Service on Supervisor Engine 6-E and 6L-E,” for more information on QoS.

You can configure the Cisco 7960 IP Phone to forward traffic with an 802.1p priority. You can use the CLI to configure a Catalyst 4500 series switch to honor or ignore a traffic priority assigned by a Cisco 7960 IP Phone.
The Cisco 7960 IP Phone contains an integrated three-port 10/100 switch. The ports are dedicated connections as described below:

- Port 1 connects to the Catalyst 4500 series switch or other device that supports voice-over-IP.
- Port 2 is an internal 10/100 interface that carries the phone traffic.
- Port 3 connects to a PC or other device.

Figure 41-1 shows one way to configure a Cisco 7960 IP Phone.

Figure 41-1    Cisco 7960 IP Phone Connected to a Catalyst 4500 Series Switch

---

Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the switch to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the switch in any of these ways:

- In the voice VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN, untagged (no Layer 2 CoS priority value)

**Note**
In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

---

Cisco IP Phone Data Traffic

The switch can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP phone. See Figure 41-1. You can configure Layer 2 access ports on the switch to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received using the access port on the Cisco IP phone passes using the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received using the access port on the Cisco IP phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

**Note**
Untagged traffic from the device attached to the Cisco IP phone passes using the phone unchanged, regardless of the trust state of the access port on the phone.
Configuring a Port to Connect to a Cisco 7960 IP Phone

Because a Cisco 7960 IP Phone also supports connection to a PC or another device, an interface connecting a Catalyst 4500 series switch to a Cisco 7960 IP Phone can carry a mix of voice and data traffic.

The three configurations for a port connected to a Cisco 7960 IP Phone are as follows:

- All traffic is transmitted according to the default CoS priority of the port. It is the default.
- Voice traffic is given a higher priority by the phone (CoS priority is always 5), and all traffic is in the same VLAN.
- Voice and data traffic are carried on separate VLANs.

To configure a port to instruct the phone to give voice traffic a higher priority and to forward all traffic using the 802.1Q native VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td></td>
<td>gigabitethernet) slot/port</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# switchport voice vlan dot1p</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# show interface (fastethernet</td>
</tr>
<tr>
<td></td>
<td>gigabitethernet) slot/port switchport</td>
</tr>
</tbody>
</table>

Configuring Voice Ports for Voice and Data Traffic

Because voice and data traffic can travel using the same voice port, you should specify a different VLAN for each type of traffic. You can configure a switch port to forward voice and data traffic on different VLANs.

Note

For information on configuring sticky port security on voice VLANs, see the “Configuring Port Security on Voice Ports” section on page 47-22.

Note

For information on using 802.1X with voice VLANs, see the “Using 802.1X with Voice VLAN Ports” section on page 44-22.

To configure a port to receive voice and data traffic from a Cisco IP phone on different VLANs, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td></td>
<td>gigabitethernet) slot/port</td>
</tr>
</tbody>
</table>
### Command | Purpose
--- | ---
**Step 3** Switch(config-if)# switchport mode access | Configures the interface as an access port. The voice VLAN is active only on access ports.
**Step 4** Switch(config-if)# switchport voice vlan vlan_num | Instructs the Cisco IP phone to forward all voice traffic through a specified VLAN. The Cisco IP phone forwards the traffic with an 802.1p priority of 5.
**Step 5** Switch(config-if)# switchport access vlan data_vlan_num | Configures the access VLAN (the data VLAN) on the port.
**Step 6** Switch(config-if)# end | Returns to privileged EXEC mode.
**Step 7** Switch# show interface {fastethernet | gigabitethernet} slot/port switchport | Verifies the configuration.

In the following example, VLAN 1 carries data traffic, and VLAN 2 carries voice traffic. In this configuration, you must connect all Cisco IP phones and other voice-related devices to switch ports that belong to VLAN 2.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastEthernet 3/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 2
Switch(config-if)# switchport access vlan 3
Switch(config-if)# end
Switch# show interfaces fastEthernet 3/1 switchport

Switch#
Overriding the CoS Priority of Incoming Frames

A PC or another data device can connect to a Cisco 7960 IP Phone port. The PC can generate packets with an assigned CoS value. You can also use the switch CLI to override the priority of frames arriving on the phone port from connected devices, and you can set the phone port to accept (trust) the priority of frames arriving on the port.

To override the CoS priority setting received from the non-voice port on the Cisco 7960 IP Phone, perform this task:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters configuration mode.</td>
<td></td>
</tr>

<td>gigabitethernet) slot/port switchport</td>
<td></td>
</tr>
</tbody>
</table>

Configuring Power

The Catalyst 4500 series switch recognizes that it is connected to a Cisco 7960 IP Phone. The Catalyst 4500 series switch can supply Power over Ethernet (PoE) to the Cisco 7960 IP Phone if there is no power on the circuit. The Cisco 7960 IP Phone can also be connected to an AC power source and supply its own power to the voice circuit. If there is power on the circuit, the switch does not supply it.

You can configure the switch not to supply power to the Cisco 7960 IP Phone and to disable the detection mechanism. For information on the CLI commands that you can use to supply PoE to a Cisco 7960 IP Phone, see Chapter 13, “Configuring Power over Ethernet.”
This chapter describes how to implement private VLANs (PVLANs) on Catalyst 4500 series switches. It also provides restrictions, procedures, and configuration examples.

This chapter includes the following major sections:

- About Private VLANs, page 42-1
- PVLAN Commands, page 42-10
- Configuring PVLANs, page 42-11

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Private VLANs

The private VLAN (PVLAN) feature addresses two problems that service providers face when using VLANs:

- The switch supports up to 4094 active VLANs. If a service provider assigns one VLAN per customer, this limits the numbers of customers the service provider can support.
- To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can result in wasting the unused IP addresses, and cause IP address management problems.

To configure PVLANs, you need to understand the concepts in these sections:

- Purpose of a PVLAN, page 42-2
- PVLAN Terminology, page 42-3
- PVLANs across Multiple Switches, page 42-5
- PVLAN Modes Over Gigabit Etherchannel, page 42-8
Purpose of a PVLAN

Using PVLANs provides scalability and IP address management benefits for service providers and Layer 2 security for customers. PVLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a primary VLAN and a secondary VLAN. A PVLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a PVLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another. See Figure 42-1.

The three types of secondary VLANs are as follows:

- **Isolated VLANs**—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.
- **Community VLANs**—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level.
- **Twoway-Community VLANs**—Bidirectional VLAN. Ports within a twoway-community VLAN can communicate with each other but not with communities or twoway-communities at the Layer 2 level.

**Note**
Beginning with Cisco IOS Release 15.0(2)SG, you can use a twoway-community VLAN to apply VACLs or QoS in both directions per-community and per-customer.

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community (or twoway-community) VLANs. Layer 3 gateways are typically connected to the switch through a promiscuous port.
In a switched environment, you can assign an individual PVLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the PVLAN.

You can use PVLANs to control access to end stations in these ways:

- Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.
- Configure interfaces connected to default gateways and selected end stations (such as, backup servers) as promiscuous ports to allow all end stations access to a default gateway.
- Reduce VLAN and IP subnet consumption; you can prevent traffic between end stations even though they are in the same VLAN and IP subnet.

With a promiscuous port, you can connect a wide range of devices as access points to a PVLAN. For example, you can connect a promiscuous port to the server port of a LocalDirector to connect an isolated VLAN or a number of community (or two-way-community) VLANs to the server. LocalDirector can load balance the servers present in the isolated, community, or two-way-community VLANs, or you can use a promiscuous port to monitor or back up all the PVLAN servers from an administration workstation.

## PVLAN Terminology

The following table defines the key terms used in this chapter:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVLANs</td>
<td>PVLANs are sets of VLAN pairs that share a common primary identifier and provide a mechanism for achieving layer-2 separation between ports while sharing a single layer-3 router port and IP subnet.</td>
</tr>
<tr>
<td>Secondary VLAN</td>
<td>A type of VLAN used to implement PVLANs. Secondary VLANs are associated with a primary VLAN, and are used to carry traffic from hosts to other allowed hosts or to routers.</td>
</tr>
<tr>
<td>Community Port</td>
<td>A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their PVLAN.</td>
</tr>
<tr>
<td>Community VLAN</td>
<td>Community VLAN—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a PVLAN.</td>
</tr>
</tbody>
</table>
### About Private VLANs

**Isolated Port**  
An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same PVLAN, except for the promiscuous ports. PVLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.

**Isolated VLAN**  
Isolated VLAN — A PVLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.

**Primary VLAN**  
Primary VLAN — A PVLAN has only one primary VLAN. Every port in a PVLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.

**PVLAN Trunk Port**  
A PVLAN trunk port can carry multiple secondary (isolated only) and non-PVLANs. Packets are received and transmitted with secondary or regular VLAN tags on the PVLAN trunk ports.  
**Note**  
Only IEEE 802.1q encapsulation is supported.

**Promiscuous Port**  
A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports and PVLAN trunk ports that belong to the secondary VLANs associated with the primary VLAN.

**Promiscuous Trunk Port**  
A promiscuous trunk port can carry multiple primary and normal VLANs. Packets are received and transmitted with primary or regular VLAN tags. Other than that, the port behaves just like a promiscuous access port.  
**Note**  
Only IEEE 802.1q encapsulation is supported.

**Twoway-Community Ports**  
A twoway-community port is a host port that belongs to a twoway-community secondary VLAN. Ports within a twoway-community VLAN can communicate with each other but not with ports in other communities or twoway-communities at the Layer 2 level. These interfaces are isolated at Layer 2 from all other interfaces in other twoway communities and from isolated ports within their PVLAN.

**Twoway-Community VLANs**  
A bidirectional VLAN. Ports within a 2-way community VLAN can communicate with each other but cannot communicate with ports in other 2-way communities at the Layer 2 level.
PVLANs across Multiple Switches

This section discusses the following topics:
- Standard Trunk Ports, page 42-5
- Isolated PVLAN Trunk Ports, page 42-6
- Promiscuous PVLAN Trunk Ports, page 42-7

Standard Trunk Ports

As with regular VLANS, PVLANs can span multiple switches. A trunk port carries the primary VLAN and secondary VLANS to a neighboring switch. The trunk port treats the PVLAN as any other VLAN. A feature of PVLANs across multiple switches is that traffic from an isolated port in switch A does not reach an isolated port on Switch B. See Figure 42-2.

To maintain the security of your private-VLAN configuration and to avoid other use of the VLANS configured as PVLANs, configure PVLANs on all intermediate devices, including devices that have no private-VLAN ports.

Note

Trunk ports carry traffic from regular VLANS and also from primary, isolated, community or twoway community VLANS.

Note

You should use standard trunk ports if both switches undergoing trunking support PVLANs.

Figure 42-2  PVLANs across Switches

VLAN 100 = Primary VLAN
VLAN 201 = Secondary isolated VLAN
VLAN 202 = Secondary community or Twoway-community VLAN
Because VTP does not support PVLANs, you must manually configure PVLANs on all switches in the Layer 2 network. If you do not configure the primary and secondary VLAN association in some switches in the network, the Layer 2 databases in these switches are not merged. This can result in unnecessary flooding of private-VLAN traffic on those switches.

### Note

PVLANs are supported in VTP v3 under server mode.

### Isolated PVLAN Trunk Ports

You would use an isolated PVLAN trunk port when you would anticipate using PVLAN isolated host ports to carry multiple VLANs, either normal VLANs or for multiple PVLAN domains. This makes it useful for connecting a downstream switch that does not support PVLANs such as Catalyst 2950.

**Figure 42-3 Isolated PVLAN Trunk Ports**

In this illustration, a Catalyst 4500 switch is being used to connect a downstream switch that does not support PVLANs.

Traffic being sent in the downstream direction towards host1 from the router is received by the Catalyst 4500 series switch on the promiscuous port and in the primary VLAN (VLAN 10). The packets are then switched out of the isolated PVLAN trunk. Rather than being tagged with the primary VLAN (VLAN 10), they are transmitted with the isolated VLAN’s tag (VLAN 11). In this way, when the packets arrive on the non-PVLAN switch, they can be bridged to the destination hosts’ access port.
Traffic in the upstream direction is sent by host1 to the non-PVLAN switch, arriving in VLAN 11. The packets are then transmitted to the switch tagged with that VLAN’s tag (VLAN 11) over the trunk port. On the switch, VLAN 11 is configured as the isolated VLAN, and the traffic is forwarded as if it came from an isolated host port.

When an isolated trunk is used in this way, Catalyst 4500 series switch provides isolation between the isolated trunk and directly connected hosts (such as host3) but not between hosts connected to the non-PVLAN switch (such as host1 and host2). The non-PVLAN switch must provide isolation between these hosts, using a feature such as protected ports on a Catalyst 2950.

For details on protected ports, see the URL:

Promiscuous PVLAN Trunk Ports

PVLAN promiscuous trunks are used in situations where one would normally use a PVLAN promiscuous host port but where it is necessary to carry multiple VLANs, either normal VLANs or for multiple PVLAN domains. This makes it useful for connecting an upstream router that does not support PVLANs, such as a Cisco 7200.

In Figure 42-4, a Catalyst 4500 series switch connects a PVLAN domain to an upstream router that does not support PVLANs. Traffic being sent upstream by host1 arrives on the switch in the community VLAN (VLAN 12). When this traffic is bridged onto the promiscuous PVLAN trunk towards the router, it is tagged with the primary VLAN (VLAN 10). This way it can be routed using the correct subinterface configured on the router.

Traffic in the downstream direction is received on the promiscuous PVLAN trunk port by the switch in the primary VLAN (VLAN 10), just as if it had been received on a promiscuous host port. It can then be bridged to the destination host as in any PVLAN domain.

PVLAN promiscuous trunks interact with VLAN QoS. Refer to the section “PVLANs and VLAN ACL/QoS” section on page 42-8.
PVLAN Modes Over Gigabit Etherchannel

Beginning with Cisco IOS Release 15.0(2)SG you can configure PVLAN modes over Etherchannel. These new modes are:

- Host mode - Isolated, Community and 2-way community
- Promiscuous mode
- Secondary Isolated trunks
- Promiscuous trunks

The process of bundling ports has not changed. PVLAN modes are added to already existing modes such as access, trunk, routed, tunneled etc.

Feature interactions include:

- A primary VLAN can be associated with multiple community and two-way-community VLANs, but only one isolated VLAN.
- An isolated or community VLAN or two-way community VLAN can be associated with only one primary VLAN.
- If you delete a VLAN used in a PVLAN configuration, the PVLAN ports associated with the VLAN become inactive.
- The default native VLAN for promiscuous trunk port is VLAN 1 (management VLAN). All untagged packets are forwarded in the native VLAN. Either the primary VLANs or a regular VLAN can be configured as the native VLAN.
- No default native VLAN set exists on an isolated secondary trunks. All untagged packets are dropped, if no native VLAN is configured.
- Community and two-way-community VLANs cannot be propagated or carried over PVLAN trunks.
- For IGMP Snooping, IGMP reports are learned on the primary VLAN and the platform decides if packet must be forwarded in the primary or secondary VLANs.

For details on configuring PVLANs over EtherChannel, Refer to the section “Configuring a Layer 2 EtherChannel” section on page 42-24.

Private-VLAN Interaction with Other Features

PVLANs have specific interaction with some other features, described in these sections:

- PVLANs and VLAN ACL/QoS, page 42-8
- PVLANs and Unicast, Broadcast, and Multicast Traffic, page 42-9
- PVLANs and SVIs, page 42-10
- Per-Virtual Port Error-Disable on PVLANs, page 42-10

For details, see the section “PVLAN Configuration Guidelines and Restrictions” on page 12.

PVLANs and VLAN ACL/QoS

PVLAN ports use primary and secondary VLANs, as follows:

- A packet received on a PVLAN host port belongs to the secondary VLAN.
About Private VLANs

A packet received on a PVLAN trunk port belongs to the secondary VLAN if the packet is tagged with a secondary VLAN or if the packet is untagged and the native VLAN on the port is a secondary VLAN.

A packet received on a PVLAN host or trunk port and assigned to a secondary VLAN is bridged on the secondary VLAN. Because of this bridging, the secondary VLAN ACL as well as the secondary VLAN QoS (on input direction) apply.

When a packet is transmitted out of a PVLAN host or trunk port, the packet logically belongs to the primary VLAN. This relationship applies even though the packet may be transmitted with the secondary VLAN tagging for PVLAN trunk ports. In this situation, the primary VLAN ACL and the primary VLAN QoS on output apply to the packet.

Similarly, a packet received on a PVLAN promiscuous access port belongs to primary VLAN.

A packet received on a PVLAN promiscuous trunk port could belong to the primary VLAN or normal VLAN depending on incoming VLAN.

PVLANs and Unicast, Broadcast, and Multicast Traffic

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In PVLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. PVLAN broadcast forwarding depends on the port sending the broadcast:

- An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
- A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
- A promiscuous port sends a broadcast to all ports in the PVLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).

Multicast traffic is routed or bridged across private-VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.
PVLANs and SVIs

In a Layer 3 switch, a switch virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a PVLAN only using the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

- If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
- If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire PVLAN.

Per-Virtual Port Error-Disable on PVLANs

For PVLANs, per-virtual port error-disable behavior is defined as follows:

- On a PVLAN promiscuous or promiscuous trunk ports, if a violation occurs on the primary VLAN, it is error-disabled.
- On a PVLAN host or trunk port, if a violation occurs on the secondary VLAN, the associated primary VLAN is error-disabled.
- On a standard trunk port that carries both primary and secondary VLANs, if a violation occurs on the primary VLAN, this VLAN and all its associated secondary VLANs are error-disabled. If a violation occurs on a secondary VLAN, the associated primary VLAN and all its associated secondary VLANs are error-disabled.

PVLAN Commands

This table lists the commands most commonly used with PVLANs.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>private-vlan {community</td>
<td>twoway-community</td>
<td>isolated</td>
</tr>
<tr>
<td>private-vlan association {secondary_vlan_list</td>
<td>add secondary_vlan_list</td>
<td>remove secondary_vlan_list}</td>
</tr>
<tr>
<td>show vlan private-vlan [type]</td>
<td>Verifies the configuration.</td>
<td>Configuring a VLAN as a PVLAN, page 42-15 Associating a Secondary VLAN with a Primary VLAN, page 42-16</td>
</tr>
</tbody>
</table>
Chapter 42  Configuring Private VLANs

These sections describe how to configure PVLANs:

- Basic PVLAN Configuration Procedure, page 42-12
- Default Private-VLAN Configuration, page 42-12
- PVLAN Configuration Guidelines and Restrictions, page 42-12
- Configuring a VLAN as a PVLAN, page 42-15
- Associating a Secondary VLAN with a Primary VLAN, page 42-16
- Configuring a Layer 2 Interface as a PVLAN Promiscuous Port, page 42-17
- Configuring a Layer 2 Interface as a PVLAN Host Port, page 42-18
Basic PVLAN Configuration Procedure

To configure a PVLAN, follow these basic steps:

Step 1: Set VTP mode to transparent. See the “VLAN Trunking Protocol” section on page 15-7.
Step 2: Create the secondary VLANs. See the “Configuring a VLAN as a PVLAN” section on page 42-15.
Step 3: Create the primary VLAN. See the “Configuring a VLAN as a PVLAN” section on page 42-15.
Step 4: Associate the secondary VLAN to the primary VLAN. See the “Associating a Secondary VLAN with a Primary VLAN” section on page 42-16.

Note: Only one isolated VLAN can be mapped to a primary VLAN, but more than one community (or twoway-community) VLAN can be mapped to a primary VLAN.

Step 5: Configure an interface as an isolated or community host or trunk port. See the “Configuring a Layer 2 Interface as a PVLAN Host Port” section on page 42-18 and “Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port” section on page 42-19.
Step 6: Associate the isolated port or community port to the primary-secondary VLAN pair. See the “Associating a Secondary VLAN with a Primary VLAN” section on page 42-16.
Step 7: Configure an interface as a promiscuous port. See the “Configuring a Layer 2 Interface as a PVLAN Promiscuous Port” section on page 42-17.
Step 8: Map the promiscuous port to the primary-secondary VLAN pair. See the “Configuring a Layer 2 Interface as a PVLAN Promiscuous Port” section on page 42-17.
Step 9: If you plan to use inter-VLAN routing, configure the primary SVI, and map secondary VLANs to the primary. See the “Permitting Routing of Secondary VLAN Ingress Traffic” section on page 42-23.
Step 10: Verify private-VLAN configuration. See the “Switch#” section on page 42-24.

Default Private-VLAN Configuration

No PVLANs are configured.

PVLAN Configuration Guidelines and Restrictions

When using (or configuring) PVLANs, consider these guidelines and restrictions:

- To configure a PVLAN correctly, enable VTP in transparent mode in VTP version 1 and VTP version 2. (VTP version 3 enables you to create it in server mode).
  
  You cannot change the VTP mode to client or server for PVLANs.
• Do not include VLAN 1 or VLANs 1002 through 1005 in PVLANs.
• Use only PVLAN commands to assign ports to primary, isolated, community VLANs, or twoway-community VLANs.
  Layer 2 interfaces on primary, isolated, community VLANs, or twoway-community VLANs are inactive in PVLANs. Layer 2 trunk interfaces remain in the STP forwarding state.
• You cannot configure Layer 3 VLAN interfaces for secondary VLANs.
  Layer 3 VLAN interfaces for isolated and community (secondary) VLANs are inactive while the VLAN is configured as an isolated or community VLAN.
• Do not apply dynamic access control entries (ACEs) to primary VLANs.
  Cisco IOS dynamic ACL configuration applied to a primary VLAN is inactive while the VLAN is part of the PVLAN configuration.
• To prevent spanning tree loops due to misconfigurations, enable PortFast on the PVLAN trunk ports with the `spanning-tree portfast trunk` command.
• Any VLAN ACL configured on a secondary VLAN is effective in the input direction, and any VLAN ACL configured on the primary VLAN associated with the secondary VLAN is effective in the output direction. Exception case is given below.
• On twoway-community host ports, secondary VLAN ACL and QoS are applied on egress unicast routed traffic stemming from the integrated router port
• You can stop Layer 3 switching on an isolated or community VLAN by deleting the mapping of that VLAN with its primary VLAN.
• PVLAN ports can be on different network devices as long as the devices are trunk-connected and the primary and secondary VLANs remain associated with the trunk
• Isolated ports on two different devices cannot communicate with each other, but community VLAN ports can.
• PVLANs support the following SPAN features:
  - You can configure a PVLAN port as a SPAN source port.
  - To monitor egress or ingress traffic separately, you can use VLAN-based SPAN (VSPAN) on primary, isolated, community VLANs, twoway-community VLANs, or use SPAN on only one VLAN.
For more information about SPAN, see Chapter 55, “Configuring SPAN and RSPAN.”
• A primary VLAN can be associated with multiple community VLANs, or twoway-community VLANs, but only one isolated VLAN.
• An isolated or community VLAN can be associated with only one primary VLAN.
• If you delete a VLAN used in a PVLAN configuration, the PVLAN ports associated with the VLAN become inactive.
• VTP does not support PVLANs. You must configure PVLANs on each device in which you plan to use PVLAN ports.
• To maintain the security of your PVLAN configuration and avoid other use of VLANs configured as PVLANs, configure PVLANs on all intermediate devices, even if the devices have no PVLAN ports.
• Prune the PVLANs from trunks on devices that carry no traffic in the PVLANs.
With port ACLs functionality available, you can apply Cisco IOS ACLs to secondary VLAN ports and Cisco IOS ACLs to PVLANS (VACLs). For more information on VACLs, see Chapter 51, “Configuring Network Security with ACLs.”

You can apply different quality of service (QoS) configurations to primary, isolated, community VLANs, and twoway-community VLANs. See Chapter 38, “Configuring Quality of Service on Supervisor Engine 6-E and 6L-E.” Cisco IOS ACLs applied to the Layer 3 VLAN interface of a primary VLAN automatically apply to the associated isolated, community VLANs, and twoway-community VLANs.

On a PVLAN trunk port a secondary VLAN ACL is applied on ingress traffic and a primary VLAN ACL is applied on egress traffic.

On a promiscuous port the primary VLAN ACL is applied on ingress traffic.

Both PVLAN secondary and promiscuous trunk ports support only IEEE 802.1q encapsulation.

Community VLANs cannot be propagated or carried over PVLAN trunks.

ARP entries learned on Layer 3 PVLAN interfaces are termed “sticky” ARP entries (we recommend that you display and verify PVLAN interface ARP entries).

For security reasons, PVLAN port sticky ARP entries do not age out. Connecting a device with a different MAC address but with the same IP address generates an error message and the ARP entry is not created.

Because PVLAN port sticky ARP entries do not age out, you must manually remove the entries if you change the MAC address. To overwrite a sticky ARP entry, first delete the entry with the no arp command, then overwrite the entry with the arp command.

In a DHCP environment, if you shut down your PC, it is not possible to give your IP address to someone else. To solve this problem, the Catalyst 4500 series switch supports the no ip sticky-arp command. This command promotes IP address overwriting and reuse in a DHCP environment.

Normal VLANs can be carried on a promiscuous or isolated trunk port.

The default native VLAN for promiscuous trunk port is VLAN 1, the management VLAN. All untagged packets are forwarded in the native VLAN. Either the primary VLANs or a regular VLAN can be configured as native VLAN.

Promiscuous trunks cannot be configured to carry secondary VLANs. If a secondary VLAN is specified in the allowed VLAN list, the configuration is accepted but the port is not operational/forwarding in the secondary VLAN. This includes even those VLANs that are of secondary but not associated with any primary VLAN on given port.

On a promiscuous trunk port, the primary VLAN ACL and QoS are applied on ingress traffic coming in primary VLANs.

On a promiscuous trunk port, no VLAN ACL or QoS is applied to the egress traffic. It is because for upstream direction, traffic in PVLAN logically flows in the secondary VLAN. Due to VLAN translation in hardware, information about received secondary VLANs has been lost. No policies are applied. This restriction also applies to traffic bridged from other ports in the same primary VLANs.

Do not configure port security on PVLAN promiscuous trunk port and vice versa.

If port security is enabled on a promiscuous trunk port, that port may behave in an unpredictable manner because this functionality is not supported.

Do not configure IEEE 802.1X on a PVLAN promiscuous trunk port.

---

**Note**

Community or twoway-community PVLAN trunk ports are not supported.
Configuring a VLAN as a PVLAN

To configure a VLAN as a PVLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# vlan vlan_ID</td>
<td>Enters VLAN configuration mode.</td>
</tr>
<tr>
<td>Step 3 Switch(config-vlan)# private-vlan {community</td>
<td>twoway-community</td>
</tr>
<tr>
<td></td>
<td>• This command does not take effect until you exit VLAN configuration submode.</td>
</tr>
<tr>
<td></td>
<td>• You can use the no keyword to clear PVLAN status.</td>
</tr>
<tr>
<td>Step 4 Switch(config-vlan)# end</td>
<td>Exits VLAN configuration mode.</td>
</tr>
<tr>
<td>Step 5 Switch# show vlan private-vlan [type]</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows how to configure VLAN 202 as a primary VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202       primary
```

This example shows how to configure VLAN 303 as a community VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 303
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202       primary
303       community
```

This example shows how to configure VLAN 440 as an isolated VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 440
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202       primary
303       community
440       isolated
```
This example shows how to configure VLAN 550 as a twoway-community VLAN and verify the configuration:

```plaintext
Switch# configure terminal
Switch(config)# vlan 550
Switch(config-vlan)# private-vlan twoway-community
Switch(config-vlan)# end
Switch# show vlan private-vlan
```

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Type</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>202</td>
<td></td>
<td>primary</td>
<td></td>
</tr>
<tr>
<td>303</td>
<td>community</td>
<td>isolated</td>
<td></td>
</tr>
<tr>
<td>440</td>
<td>isolated</td>
<td>twoway-community</td>
<td></td>
</tr>
</tbody>
</table>

### Associating a Secondary VLAN with a Primary VLAN

To associate secondary VLANs with a primary VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# vlan primary_vlan_ID</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-vlan)# private-vlan association {secondary_vlan_list</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-vlan)# end</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# show vlan private-vlan [type]</td>
</tr>
</tbody>
</table>

When you associate secondary VLANs with a primary VLAN, note the following:

- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.
- The `secondary_vlan_list` parameter can contain multiple community or twoway-community VLAN IDs.
- The `secondary_vlan_list` parameter can contain only one isolated VLAN ID.
- Enter a `secondary_vlan_list` or use the `add` keyword with a `secondary_vlan_list` to associate secondary VLANs with a primary VLAN.
- Use the `remove` keyword with a `secondary_vlan_list` to clear the association between secondary VLANs and a primary VLAN.
- The command does not take effect until you exit VLAN configuration submode.

This example shows how to associate community VLANs 303 through 307 and 309, twoway-community VLANs 550 through 552, and isolated VLAN 440 with primary VLAN 202 and verify the configuration:
Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan association 303-307,309,440
Switch(config-vlan)# end
Switch# show vlan private-vlan

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Type</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>202</td>
<td>303</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>304</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>305</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>306</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>307</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>309</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>440</td>
<td>isolated</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>550</td>
<td>twoway-community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>551</td>
<td>twoway-community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>552</td>
<td>twoway-community</td>
<td></td>
</tr>
<tr>
<td>308</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: The secondary VLAN 308 has no associated primary VLAN.

**Configuring a Layer 2 Interface as a PVLAN Promiscuous Port**

To configure a Layer 2 interface as a PVLAN promiscuous port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config)# `interface {fastethernet</td>
<td>gigabitethernet</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config-if)# `switchport mode private-vlan {host</td>
<td>promiscuous</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(config-if)# `[no] switchport private-vlan mapping [trunk] primary_vlan_ID (secondary_vlan_list</td>
<td>add secondary_vlan_list</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch(config-if)# <code>end</code></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch# `show interfaces {fastethernet</td>
<td>gigabitethernet</td>
</tr>
</tbody>
</table>

Note: The maximum number of unique PVLAN pairs supported by the `switchport private-vlan mapping` command is 1000.

When you configure a Layer 2 interface as a PVLAN promiscuous port, note the following:

- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.
- Enter a `secondary_vlan_list` or use the `add` keyword with a `secondary_vlan_list` to map the secondary VLANs to the PVLAN promiscuous port.
• Use the remove keyword with a secondary_vlan_list to clear the mapping between secondary VLANs and the PVLAN promiscuous port.

This example shows how to configure interface FastEthernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
Name: Fa5/2
Switchport: Enabled
Administrative Mode: private-vlan promiscuous
Operational Mode: private-vlan promiscuous
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Voice VLAN: none
Administrative Private VLAN Host Association: none
Administrative Private VLAN Promiscuous Mapping: 200 (VLAN0200) 2 (VLAN0002)
Private VLAN Trunk Native VLAN: none
Administrative Private VLAN Trunk Encapsulation: dot1q
Administrative Private VLAN Trunk Normal VLANs: none
Administrative Private VLAN Trunk Private VLANs: none
Operational Private VLANs:
200 (VLAN0200) 2 (VLAN0002)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
```

### Configuring a Layer 2 Interface as a PVLAN Host Port

To configure a Layer 2 interface as a PVLAN host port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
Switch# configure terminal | Enters configuration mode. |
| **Step 2**
Switch(config)# interface {fastethernet | gigabitethernet | tengigabitethernet} slot/port | Specifies the LAN port to configure. |
| **Step 3**
Switch(config-if)# switchport mode private-vlan {host | promiscuous | trunk promiscuous | trunk [secondary]} | Configures a Layer 2 interface as a PVLAN host port. |
| **Step 4**
Switch(config-if)# [no] switchport private-vlan host-association primary_vlan_ID secondary_vlan_ID | Associates the Layer 2 interface with a PVLAN. You can use the no keyword to delete all associations from the primary VLAN. |
| **Step 5**
Switch(config-if)# end | Exits configuration mode. |
| **Step 6**
Switch# show interfaces {fastethernet | gigabitethernet | tengigabitethernet} {slot/port switchport} | Verifies the configuration. |
This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end
```

```
Switch# show interfaces fastethernet 5/1 switchport
Name: Fa5/1
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Voice VLAN: none
Appliance trust: none
Administrative Private Vlan
   Host Association: 202 (VLAN0202) 440 (VLAN0440)
   Promiscuous Mapping: none
   Trunk encapsulation : dot1q
   Trunk vlans:
      Operational private-vlan(s):
         202 (VLAN0202) 440 (VLAN0440)
   Trunking VLANs Enabled: ALL
   Pruning VLANs Enabled: 2-1001
   Capture Mode Disabled
   Capture VLANs Allowed: ALL
```

### Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port

To configure a Layer 2 interface as an isolated PVLAN trunk port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode private-vlan (host</td>
</tr>
</tbody>
</table>
### Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-if)# [no] switchport private-vlan association trunk primary_vlan_ID secondary_vlan_ID | Configures association between primary VLANs and secondary VLANs the PVLAN trunk port with a PVLAN.  
| **Note** Multiple PVLAN pairs can be specified using this command so that a PVLAN trunk port can carry multiple secondary VLANs. If an association is specified for the existing primary VLAN, the existing association is replaced. If there is no trunk association, any packets received on secondary VLANs are dropped. You can use the **no** keyword to delete all associations from the primary VLAN. |

### Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-if)# [no] switchport private-vlan trunk allowed vlan vlan_list all | Configures a list of allowed normal VLANs on a PVLAN trunk port.  
| You can use the **no** keyword to remove all allowed normal VLANs on a PVLAN trunk port. |
| remove | except | vlan_atom[,vlan_atom...] |

### Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-if)# switchport private-vlan trunk native_vlan vlan_id | Configures a VLAN to which untagged packets (as in IEEE 802.1Q tagging) are assigned on a PVLAN trunk port.  
| If there is no native VLAN configured, all untagged packets are dropped.  
| If the native VLAN is a secondary VLAN and the port does not have the association for the secondary VLAN, the untagged packets are dropped.  
| You can use the **no** keyword to remove all native VLANs on a PVLAN trunk port. |

### Step 7

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# end</td>
<td>Exits configuration mode.</td>
</tr>
</tbody>
</table>

### Step 8

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show interfaces {fastethernet</td>
<td>gigabitethernet</td>
</tr>
</tbody>
</table>

This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10.3-4
Switch(config-if)# switchport private-vlan association trunk 3 301
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
Name: Fa5/2
  Switchport: Enabled
  Administrative Mode: private-vlan trunk secondary
  Operational Mode: private-vlan trunk secondary
  Administrative Trunking Encapsulation: negotiate
  Operational Trunking Encapsulation: dot1q
  Negotiation of Trunking: On
  Access Mode VLAN: 1 (default)
```
Configuring Private VLANs

Chapter 42

Configuring PVLANs

Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: 10
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk associations:
   3 (VLAN0003) 301 (VLAN0301)
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Operational Normal VLANs: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled Capture VLANs Allowed: ALL
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none

Configuring a Layer 2 Interface as a Promiscuous PVLAN Trunk Port

To configure a Layer 2 interface as a promiscuous PVLAN trunk port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface (fastethernet</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode private-vlan {host</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# [no] switchport private-vlan mapping [trunk] primary_vlan_ID [secondary_vlan_list</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# show interfaces (fastethernet</td>
</tr>
</tbody>
</table>

**Note**
The maximum number of unique PVLAN pairs supported by the `switchport private-vlan mapping trunk` command is 500. For example, 500 isolated secondary VLANs could map to 500 primary VLANs, because only one isolated VLAN association per primary VLAN is supported. Or, 500 community secondary VLANs could map to one primary VLAN. Or, 250 community secondary VLANs could map to 1 primary VLAN, and another 250 community secondary VLANs could map to another primary VLAN for a total of 500 pairs.

**Note**
By default, when you configure the mode to PVLAN trunk **promiscuous**, the native VLAN is set to 1.
Chapter 42      Configuring Private VLANs

The [no] switchport private-vlan mapping command provides the following three levels of removal:

- Remove one or more secondary VLANs from the list. For example:
  
  ```
  Switch(config-if)# switchport private-vlan mapping trunk 2 remove 222
  ```

- Remove the entire mapping of PVLAN promiscuous trunk port to the specified primary VLAN (and all of its selected secondary VLANs). For example:
  
  ```
  Switch(config-if)# no switchport private-vlan mapping trunk 2
  ```

- Remove the mapping of a PVLAN promiscuous trunk port to all previously configured primary VLANs (and all of their selected secondary VLANs). For example:
  
  ```
  Switch(config-if)# no switchport private-vlan mapping trunk
  ```

When you configure a Layer 2 interface as a PVLAN promiscuous port, note the following:

- Multiple PVLAN pairs can be specified using the switchport private-vlan mapping trunk command so that a promiscuous trunk port can carry multiple primary VLANs.

- The secondary_vlan_list parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.

- Enter a secondary_vlan_list or use the add keyword with a secondary_vlan_list to map the secondary VLANs to the PVLAN promiscuous port.

- Use the remove keyword with a secondary_vlan_list to clear the mapping between secondary VLANs and the PVLAN promiscuous port.

This example shows how to configure interface FastEthernet 5/2 as a promiscuous trunk port and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk promiscuous
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
Switch(config-if)# switchport private-vlan mapping trunk 3 301, 302
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
Name: Fa5/2
Switchport: Enabled
Administrative Mode: private-vlan trunk promiscuous
Operational Mode: private-vlan trunk promiscuous
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: 10
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: 3-4,10
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings:
  3 (VLAN0003) 301 (VLAN0301) 302 (VLAN0302)
Operational private-vlan:
  3 (VLAN0003) 301 (VLAN0301) 302 (VLAN0302)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
```
Permitting Routing of Secondary VLAN Ingress Traffic

**Note**
Isolated, community VLANs, and twoway-community VLANs are called secondary VLANs.

To permit routing of secondary VLAN ingress traffic, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface vlan primary_vlan_ID</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# [no] private-vlan mapping primary_vlan_ID {secondary_vlan_list</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# show interface private-vlan mapping</td>
</tr>
</tbody>
</table>

When you permit routing on the secondary VLAN ingress traffic, note the following:

- The **private-vlan mapping** interface configuration command only affects PVLAN ingress traffic that is Layer 3 switched.
- The **secondary_vlan_list** parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.
- Enter a **secondary_vlan_list** parameter or use the **add** keyword with a **secondary_vlan_list** parameter to map the secondary VLANs to the primary VLAN.
- Use the **remove** keyword with a **secondary_vlan_list** parameter to clear the mapping between secondary VLANs and the primary VLAN.

This example shows how to permit routing of secondary VLAN ingress traffic from PVLANs 303 through 307, 309, and 440 and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface vlan 202
Switch(config-if)# private-vlan mapping add 303-307,309,440
Switch(config-if)# end
Switch# show interfaces private-vlan mapping
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Secondary VLAN</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan202</td>
<td>303</td>
<td>community</td>
</tr>
<tr>
<td>vlan202</td>
<td>304</td>
<td>community</td>
</tr>
<tr>
<td>vlan202</td>
<td>305</td>
<td>community</td>
</tr>
<tr>
<td>vlan202</td>
<td>306</td>
<td>community</td>
</tr>
<tr>
<td>vlan202</td>
<td>307</td>
<td>community</td>
</tr>
</tbody>
</table>
## Configuring PVLAN over EtherChannel

After creating a Layer 2 Etherchannel, you can configure it with any of the four PVLAN port modes (promiscuous host, secondary host, isolated trunk, promiscuous trunk).

This section includes the following topics:

- Configuring a Layer 2 EtherChannel, page 42-24
- Configuring a Layer 2 Etherchannel as a PVLAN Promiscuous Port, page 42-24
- Configuring a Layer 2 EtherChannel as a PVLAN Host Port, page 42-26
- Configuring a Layer 2 EtherChannel as an Isolated PVLAN Trunk Port, page 42-27
- Configuring a Layer 2 Etherchannel as a Promiscuous PVLAN Trunk Port, page 42-28

### Configuring a Layer 2 EtherChannel

Do the following:

**Step 1** Configure a VLAN as a PVLAN.
Refer to the URL:

**Step 2** Associate a secondary VLAN with a primary VLAN.
Refer to the URL:

**Step 3** Configuring a Layer 2 EtherChannel.
Refer to the URL

### Configuring a Layer 2 Etherchannel as a PVLAN Promiscuous Port

Perform the following task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <code>configure terminal</code> Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# <code>interface port-channel interface-number</code> Specifies the LAN interface to configure.</td>
</tr>
</tbody>
</table>
Chapter 42  Configuring Private VLANs

### Configuring PVLANs

**Note**

The maximum number of unique PVLAN pairs supported by the `switchport private-vlan mapping` command is 1000.

When you configure a Layer 2 Etherchannel as a PVLAN promiscuous port, note the following:

- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.
- Enter a `secondary_vlan_list` or use the `add` keyword with a `secondary_vlan_list` to map the secondary VLANs to the PVLAN promiscuous port.
- Use the `remove` keyword with a `secondary_vlan_list` to clear the mapping between secondary VLANs and the PVLAN promiscuous port.

This example shows how to configure interface port channel 63 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch(config)# configure terminal
Switch(config)# interface port-channel 63
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end
Switch(config)# show interface port-channel 63 switchport
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>`Switch(config-if)# switchport mode private-vlan {host</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`Switch(config-if)# [no] switchport private-vlan mapping [trunk] primary_vlan_ID (secondary_vlan_list</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>Switch(config-if)# end</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>Switch# show interface port-channel interface-number switchport</code></td>
</tr>
</tbody>
</table>

---

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

OL-25340-01

42-25
Configuring a Layer 2 EtherChannel as a PVLAN Host Port

To configure a Layer 2 EtherChannel as a PVLAN host port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface port-channel interface-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# switchport mode private-vlan {host</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# [no] switchport private-vlan host-association primary_vlanb_ID secondary_vlan_ID</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show interface port-channel interface-number switchport</td>
</tr>
</tbody>
</table>

This example shows how to configure interface port channel 63 as a PVLAN host port and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface port-channel 63
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end
Switch# show interfaces port-channel 63 switchport
Name: Po63
Switchport: Enabled

Capture VLANs Allowed: ALL
```
## Configuring a Layer 2 EtherChannel as an Isolated PVLAN Trunk Port

To configure a Layer 2 EtherChannel as an isolated PVLAN trunk port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface port-channel interface-number</td>
</tr>
<tr>
<td></td>
<td>Specifies the LAN interface to configure.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode private-vlan {host</td>
</tr>
<tr>
<td></td>
<td>Configures a Layer 2 Etherchannel as a PVLAN trunk port.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# [no] switchport private-vlan association trunk primary_vlanb_ID secondary_vlan_ID</td>
</tr>
<tr>
<td></td>
<td>(Configures association between primary VLANs and secondary VLANs the PVLAN trunk port with a PVLAN.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Multiple PVLAN pairs can be specified using this command so that a PVLAN trunk port can carry multiple secondary VLANs. If an association is specified for the existing primary VLAN, the existing association is replaced. If there is no trunk association, any packets received on secondary VLANs are dropped.</td>
</tr>
<tr>
<td></td>
<td>You can use the <strong>no</strong> keyword to delete all associations from the primary VLAN.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# [no] switchport private-vlan trunk allowed vlan vlan_list [all</td>
</tr>
<tr>
<td></td>
<td>(Configures a list of allowed normal VLANs on a PVLAN trunk port.</td>
</tr>
<tr>
<td></td>
<td>You can use the <strong>no</strong> keyword to remove all allowed normal VLANs on a PVLAN trunk port.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-if)# switchport private-vlan trunk native vlan vlan_id</td>
</tr>
<tr>
<td></td>
<td>(Configures a VLAN to which untagged packets (as in IEEE 802.1Q tagging) are assigned on a PVLAN trunk port.</td>
</tr>
<tr>
<td></td>
<td>If there no native VLAN is configured, all untagged packets are dropped.</td>
</tr>
<tr>
<td></td>
<td>If the native VLAN is a secondary VLAN and the port does not have the association for the secondary VLAN, the untagged packets are dropped.</td>
</tr>
<tr>
<td></td>
<td>You can use the <strong>no</strong> keyword to remove all native VLANs on a PVLAN trunk port.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# show interfaces Port-channel interface-number switchport</td>
</tr>
<tr>
<td></td>
<td>Verifies the configuration.</td>
</tr>
</tbody>

### Configuring a Layer 2 Etherchannel as a Promiscuous PVLAN Trunk Port

To configure a Layer 2 Etherchannel as a promiscuous PVLAN trunk port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface port-channel interface-number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode private-vlan (host</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# (no) switchport private-vlan mapping [trunk] primary_vlan_ID (secondary_vlan_list</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Specifies the LAN interface to configure.</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Configures a Layer 2 Etherchannel as a PVLAN promiscuous trunk port.</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Maps the promiscuous PVLAN port to a primary VLAN and to the selected secondary VLANs.</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>This command offers 3 levels of removal.</td>
</tr>
</tbody>
</table>
Chapter 42  Configuring Private VLANs

## Configuring PVLANs

### Note

The maximum number of unique PVLAN pairs supported by the switchport private-vlan mapping trunk command is 500. For example, 500 isolated secondary VLANs could map to 500 primary VLANs, because only one isolated VLAN association per primary VLAN is supported. Or, 500 community secondary VLANs could map to one primary VLAN. Or, 250 community secondary VLANs could map to 1 primary VLAN, and another 250 community secondary VLANs could map to another primary VLAN for a total of 500 pairs.

### Note

By default, when you configure the mode to private VLAN trunk promiscuous, the native VLAN is set to 1.

The [no] switchport private-vlan mapping command provides the following three levels of removal:

- Remove one or more secondary VLANs from the list.
  
  For example:
  ```plaintext
  Switch(config-if)# switchport private-vlan mapping trunk 2 remove 222
  ```

- Remove the entire mapping of PVLAN promiscuous trunk port to the specified primary VLAN (and all of its selected secondary VLANs).
  
  For example:
  ```plaintext
  Switch(config-if)# no switchport private-vlan mapping trunk 2
  ```

- Remove the mapping of a PVLAN promiscuous trunk port to all previously configured primary VLANs (and all of their selected secondary VLANs).
  
  For example:
  ```plaintext
  Switch(config-if)# no switchport private-vlan mapping trunk
  ```

When you configure a Layer 2 etherchannel as a PVLAN promiscuous trunk port, observe that multiple private VLAN pairs can be specified with the switchport private-vlan mapping trunk command so that a promiscuous trunk port can carry multiple primary VLANs.

- The secondary_vlan_list parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.

- Enter a secondary_vlan_list or use the add keyword with a secondary_vlan_list to map the secondary VLANs to the PVLAN promiscuous port.

- Use the remove keyword with a secondary_vlan_list to clear the mapping between secondary VLANs and the PVLAN promiscuous port.

This example shows how to configure interface Port-channel 63 as a promiscuous trunk port and to verify the configuration:

```plaintext
Switch# configure terminal
Switch(config)# interface port-channel 63
Switch(config-if)# switchport mode private-vlan trunk promiscuous
Step 5
Switch(config-if)# end
Exits configuration mode.
Step 6
Switch# show interfaces port-channel

Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none
Configuring MACsec Encryption

This chapter describes how to configure Media Access Control Security (MACsec) encryption on the Catalyst 4500 series switch.

Note

Although a Catalyst 4500-X series switch (WS-4500X-32) supports Cisco TrustSec technology, it does not support TrustSec MACsec Encryption.

MACsec is the IEEE 802.1AE standard for authenticating and encrypting packets between two MACsec-capable devices. The Catalyst 4500 series switch supports 802.1AE encryption with MACsec Key Agreement (MKA) on downlink ports for encryption between the switch and host devices. The switch also supports MACsec link layer switch-to-switch security by using Cisco TrustSec Network Device Admission Control (NDAC) and the Security Association Protocol (SAP) key exchange. Link layer security can include both packet authentication between switches and MACsec encryption between switches (encryption is optional).

Note

MACsec is supported on the Catalyst 4500 series switch universal k9 image. It is not supported with the NPE license or with a LAN Base service image.

All downlink ports on a switch can run Cisco TrustSec MACsec link layer switch-to-switch security.

Table 1 MACsec Support on Switch Ports

<table>
<thead>
<tr>
<th>Interface</th>
<th>Connections</th>
<th>MACsec support</th>
</tr>
</thead>
<tbody>
<tr>
<td>User-facing downlink ports</td>
<td>Switch-to-host</td>
<td>MKA MACsec encryption</td>
</tr>
<tr>
<td>Switchports connected to other switches</td>
<td>Switch-to-switch</td>
<td>Cisco TrustSec NDAC MACsec</td>
</tr>
</tbody>
</table>

Cisco TrustSec and Cisco SAP are meant only for switch-to-switch links and are not supported on switch ports connected to end hosts, such as PCs or IP phones. MKA is meant for switch-to-host facing links and is not supported on switch-to-switch links. Host-facing links typically use flexible authentication ordering for handling heterogeneous devices with or without IEEE 802.1X, and can optionally use MKA encryption. Cisco NDAC and SAP are mutually exclusive with Network Edge Access Topology (NEAT), which is used for compact switches to extend security outside the wiring closet.

- Understanding Media Access Control Security and MACsec Key Agreement, page 43-2
- Configuring MACsec and MKA, page 43-6
Understanding Media Access Control Security and MACsec Key Agreement

MACsec, defined in 802.1AE, provides MAC-layer encryption over wired networks by using out-of-band methods for encryption keying. The MACsec Key Agreement (MKA) Protocol provides the required session keys and manages the required encryption keys. MKA and MACsec are implemented after successful authentication using the 802.1X Extensible Authentication Protocol (EAP) framework. Only host facing links (links between network access devices and endpoint devices such as a PC or IP phone) can be secured using MACsec.

A switch using MACsec accepts either MACsec or non-MACsec frames, depending on the policy associated with the client. MACsec frames are encrypted and protected with an integrity check value (ICV). When the switch receives frames from the client, it decrypts them and calculates the correct ICV by using session keys provided by MKA. The switch compares that ICV to the ICV within the frame. If they are not identical, the frame is dropped. The switch also encrypts and adds an ICV to any frames sent over the secured port (the access point used to provide the secure MAC service to a client) using the current session key.

The MKA Protocol manages the encryption keys used by the underlying MACsec protocol. The basic requirements of MKA are defined in 802.1X-2010. The MKA Protocol extends 802.1X to allow peer discovery with confirmation of mutual authentication and sharing of MACsec secret keys to protect data exchanged by the peers.

The EAP framework implements MKA as a newly defined EAP-over-LAN (EAPOL) packet. EAP authentication produces a master session key (MSK) shared by both partners in the data exchange. Entering the EAP session ID generates a secure connectivity association key name (CKN). Because the switch is the authenticator, it is also the key server, generating a random 128-bit secure association key (SAK), which it sends it to the client partner. The client is never a key server and can only interact with a single MKA entity, the key server. After key derivation and generation, the switch sends periodic transports to the partner at a default interval of 2 seconds.

The packet body in an EAPOL Protocol Data Unit (PDU) is referred to as a MACsec Key Agreement PDU (MKPDU). MKA sessions and participants are deleted when the MKA lifetime (6 seconds) passes with no MKPDU received from a participant. For example, if a client disconnects, the participant on the switch continues to operate MKA until 6 seconds have elapsed after the last MKPDU is received from the client.

These sections provide more details:

- MKA Policies, page 43-3
- Virtual Ports, page 43-3
- MACsec, page 43-3
- MACsec, MKA, and 802.1X Host Modes, page 43-4
- MKA Statistics, page 43-5

For more information on TrustSec, refer to the following URL:

Chapter 43      Configuring MACsec Encryption

Understanding Media Access Control Security and MACsec Key Agreement

MKA Policies

You apply a defined MKA policy to an interface to enable MKA on the interface. Removing the MKA policy disables MKA on that interface. You can configure these options:

- Policy name, not to exceed 16 ASCII characters.
- Confidentiality (encryption) offset of 0, 30, or 50 bytes for each physical interface.
- Replay protection. You can configure MACsec window size, as defined by the number of out-of-order frames that are accepted. This value is used while installing the security associations in the MACsec. A value of 0 means that frames are accepted only in the correct order.

Virtual Ports

You use virtual ports for multiple secured connectivity associations on a single physical port. Each connectivity association (pair) represents a virtual port, with a maximum of two virtual ports per physical port. Only one of the two virtual ports can be part of a data VLAN; the other must externally tag its packets for the voice VLAN. You cannot simultaneously host secured and unsecured sessions in the same VLAN on the same port. Because of this limitation, 802.1X multiple authentication mode is not supported.

The exception to this limitation is in multiple-host mode when the first MACsec supplicant is successfully authenticated and connected to a hub that is connected to the switch. A non-MACsec host connected to the hub can send traffic without authentication because it is in multiple-host mode. We do not recommend using multi-host mode because after the first successful client, authentication is not required for other clients.

Virtual ports represent an arbitrary identifier for a connectivity association and have no meaning outside the MKA Protocol. A virtual port corresponds to a separate logical port ID. Valid port IDs for a virtual port are 0x0002 to 0xFFFF. Each virtual port receives a unique secure channel identifier (SCI) based on the MAC address of the physical interface concatenated with a 16-bit port ID.

MACsec

A Catalyst 4500 series switch running MACsec maintains the configuration files that show which ports on a member switch support MACsec. The stack master performs these functions:

- Processes secure channel and secure association creation and deletion.
- Sends secure association service requests to the stack members.
- Processes packet number and replay-window information from local or remote ports and notifies the key management protocol.
- Sends MACsec initialization requests with the globally configured options to new switches that are added to the stack.
- Sends any per-port configuration to the member switches.

A member switch performs these functions:

- Processes MACsec initialization requests from the stack master.
- Processes MACsec service requests sent by the stack master.
- Sends information about local ports to the stack master.
MACsec, MKA, and 802.1X Host Modes

You can use MACsec and the MKA Protocol with 802.1X single-host mode, multiple-host mode, or Multi Domain Authentication (MDA) mode. Multiple authentication mode is not supported.

Single-Host Mode

Figure 43-1 shows how a single EAP authenticated session is secured by MACsec using MKA.

Multiple-Host Mode

In standard (not 802.1X-2010) 802, multiple-host mode, a port is open or closed based on a single authentication. If one user, the primary secured client services client host, is authenticated, the same level of network access is provided to any host connected to the same port. If a secondary host is a MACsec supplicant, it cannot be authenticated and traffic would no flow. A secondary host that is a non-MACsec host can send traffic to the network without authentication because it is in multiple-host mode. See Figure 43-2.

We do not recommend using multi-host mode because after the first successful client, authentication is not required for other clients, which is not secure.
MKA Statistics

Some MKA counters are aggregated globally, while others are updated both globally and per session. You can also obtain information about the status of MKA sessions.

This is an example of the `show mka statistics` command output:

```
SWitch# show mka statistics
MKA Global Statistics
=====================
MKA Session Totals
  Secured................. 32

**Configuring MACsec and MKA**

- Default MACsec MKA Configuration, page 43-6
- Configuring an MKA Policy, page 43-6
- Configuring MACsec on an Interface, page 43-7

**Default MACsec MKA Configuration**

MACsec is disabled. No MKA policies are configured.

**Configuring an MKA Policy**

To create an MKA Protocol policy, perform this task. Note that MKA also requires that you enable 802.1X.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>mka policy policy-name</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>replay-protection window-size frames</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show mka policy</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example configures the MKA policy relay-policy:

Switch(config)# mka policy relay-policy
Switch(config-mka-policy)# replay-protection window-size 300
Switch(config-mka-policy)# end
Configuring MACsec on an Interface

To configure MACsec on an interface with one MACsec session for voice and one for data, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport access vlan vlan-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport mode access</td>
</tr>
<tr>
<td>Step 5</td>
<td>macsec</td>
</tr>
<tr>
<td>Step 6</td>
<td>authentication event linksec fail action authorize vlan vlan-id</td>
</tr>
<tr>
<td>Step 7</td>
<td>authentication host-mode multi-domain</td>
</tr>
<tr>
<td>Step 8</td>
<td>authentication linksec policy must-secure</td>
</tr>
<tr>
<td>Step 9</td>
<td>authentication port-control auto</td>
</tr>
<tr>
<td>Step 10</td>
<td>mka policy policy-name</td>
</tr>
<tr>
<td>Step 11</td>
<td>dot1x pae authenticator</td>
</tr>
<tr>
<td>Step 12</td>
<td>spanning-tree portfast</td>
</tr>
<tr>
<td>Step 13</td>
<td>end</td>
</tr>
<tr>
<td>Step 14</td>
<td>show authentication session interface interface-id</td>
</tr>
<tr>
<td>Step 15</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This is an example of configuring and verifying MACsec on an interface:

```
Switch(config)# interface GigabitEthernet1/0/25
Switch(config-if)# switchport access vlan 10
Switch(config-if)# switchport mode access
Switch(config-if)# macsec
Switch(config-if)# authentication event linksec fail action authorize vlan 2
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# authentication linksec policy must-secure
Switch(config-if)# authentication port-control auto
```
### Understanding Cisco TrustSec MACsec

**Note**

MACsec is supported on the Catalyst 4500 series switch universal k9 image. It is not supported with the NPE license or with a LAN Base service image.

Table 43-2 summarizes the Cisco TrustSec features supported on the switch. For more detailed explanations, see the Cisco TrustSec Switch Configuration Guide:

<table>
<thead>
<tr>
<th>Cisco TrustSec Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1AE Encryption (MACsec)</td>
<td>Protocol for 802.1AE-based wire-rate hop-to-hop Layer 2 encryption. Between MACsec-capable devices, packets are encrypted on egress from the sending device, decrypted on ingress to the receiving device, and in the clear within the devices. This feature is only available between 802.1AE-capable devices.</td>
</tr>
</tbody>
</table>
Chapter 43  Configuring MACsec Encryption

Understanding Cisco TrustSec MACsec

When both ends of a link support 802.1AE MACsec, SAP negotiation occurs. An EAPOL-key exchange occurs between the supplicant and the authenticator to negotiate a cipher suite, exchange security parameters, and manage keys. Successful completion of these tasks results in the establishment of a security association (SA).

Depending on your software version and licensing and link hardware support, SAP negotiation can use one of these modes of operation:

- Galois Counter Mode (GCM)—authentication and encryption
- GCM authentication (GMAC)—GCM authentication, no encryption
- No Encapsulation—no encapsulation (clear text)
- Null—encapsulation, no authentication or encryption

Cisco TrustSec uses AES-128 GCM and GMAC and is compliant with the 802.1AE standard. GCM is not supported on switches running the NPE or the LAN Base image.

Cisco TrustSec NDAC SAP is supported on trunk ports because it is intended only for network device to network device links, that is, switch-to-switch links. It is not supported on:

- Host facing access ports (these ports support MKA MACsec)
- Switch virtual interfaces (SVIs)
- SPAN destination ports

The switch also does not support security group ACLs.

You must set the Cisco TrustSec credentials to create the Cisco TrustSec network.

You can configure Cisco TrustSec link layer security in 802.1X mode or manual mode.

---

Table 43-2  Cisco TrustSec Features

<table>
<thead>
<tr>
<th>Cisco TrustSec Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Device Admission Control (NDAC)</td>
<td>NDAC is an authentication process by which each network device in the TrustSec domain can verify the credentials and trustworthiness of its peer device. NDAC uses an authentication framework based on IEEE 802.1X port-based authentication and uses Extensible Authentication Protocol Flexible Authentication via Secure Tunnel (EAP-FAST) as its EAP method. Authentication and authorization by NDAC results in Security Association Protocol negotiation for 802.1AE encryption.</td>
</tr>
<tr>
<td>Security Association Protocol (SAP)</td>
<td>SAP is a Cisco proprietary key exchange protocol between switches. After NDAC switch-to-switch authentication, SAP automatically negotiates keys and the cipher suite for subsequent switch-to-switch MACsec encryption between TrustSec peers. The protocol description is available under a nondisclosure agreement.</td>
</tr>
<tr>
<td>Security Group Tag (SGT)</td>
<td>An SGT is a 16-bit single label showing the security classification of a source in the TrustSec domain. It is appended to an Ethernet frame or an IP packet. SGT is not supported in this release.</td>
</tr>
<tr>
<td>SGT Exchange Protocol (SXP), including SXPv2</td>
<td>With SXP, devices that are not TrustSec-hardware capable can receive SGT attributes for authenticated users or devices from the Cisco Access Control System (ACS). The devices then forward the source IP-to-SGT binding to a TrustSec-hardware capable device for tagging and security group ACL (SGACL) enforcement.</td>
</tr>
</tbody>
</table>

Note:

SGT Exchange Protocol (SXP), including SXPv2

With SXP, devices that are not TrustSec-hardware capable can receive SGT attributes for authenticated users or devices from the Cisco Access Control System (ACS). The devices then forward the source IP-to-SGT binding to a TrustSec-hardware capable device for tagging and security group ACL (SGACL) enforcement.
Configuring Cisco TrustSec MACsec

Note
MACsec is supported on the Catalyst 4500 series switch universal k9 image. It is not supported with the NPE license or with a LAN Base service image.

Following topics are discussed:
- Configuring Cisco TrustSec Credentials on the Switch, page 43-10
- Configuring Cisco TrustSec Switch-to-Switch Link Security in 802.1X Mode, page 43-11
- Configuring Cisco TrustSec Switch-to-Switch Link Security in Manual Mode, page 43-12
- Cisco TrustSec Switch-to-Switch Link Security Configuration Example, page 43-13

Note
The sample configuration in the last section shows the AAA and the RADIUS configuration. Use this example to configure RADIUS and AAA before configuring switch-to-switch security.

Configuring Cisco TrustSec Credentials on the Switch

To enable Cisco TrustSec features, you must create Cisco TrustSec credentials on the switch to use in other TrustSec configurations.

To configure Cisco TrustSec credentials, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>cts credentials id device-id password</code></td>
<td>Specifies the Cisco TrustSec credentials for this switch to use when authenticating with other Cisco TrustSec devices with EAP-FAST.</td>
</tr>
<tr>
<td><code>cts-password</code></td>
<td></td>
</tr>
<tr>
<td>• <code>id device-id</code>—Specifies a Cisco TrustSec device ID for the switch. The device-id argument has a maximum length of 32 characters and is case sensitive.</td>
<td></td>
</tr>
<tr>
<td>• <code>password cts-password</code>—Specifies the Cisco TrustSec password for the device.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>(Optional) Displays Cisco TrustSec credentials configured on the switch.</td>
</tr>
<tr>
<td><code>show cts credentials</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

To delete the Cisco TrustSec credentials, enter the `clear cts credentials` privileged EXEC command.

This example shows how to create Cisco TrustSec credentials:

```
Switch# cts credentials id trustsec password mypassword
CTS device ID and password have been inserted in the local keystore. Please make sure that the same ID and password are configured in the server database.

Switch# show cts credentials
CTS password is defined in keystore, device-id = trustsecchange-password Initiate password change with AAA server
```
## Configuring Cisco TrustSec Switch-to-Switch Link Security in 802.1X Mode

You enable Cisco TrustSec link layer switch-to-switch security on an interface that connects to another Cisco TrustSec device. When configuring Cisco TrustSec in 802.1X mode on an interface, follow these guidelines:

- To use 802.1X mode, you must globally enable 802.1X on each device.
- If you select GCM as the SAP operating mode, you must have a MACsec encryption software license from Cisco.

### Note

MACsec is supported on the Catalyst 4500 series switch universal k9 image. It is not supported with the NPE license or with a LAN Base service image.

If you select GCM without the required license, the interface is forced to a link-down state.

To configure Cisco TrustSec switch-to-switch link layer security with 802.1X, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface Interface-id</code></td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>cts dot1x</code></td>
</tr>
<tr>
<td></td>
<td>Configures the interface to perform NDAC authentication.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>sap mode-list mode1 [mode2 [mode3 [mode4]]]</code></td>
</tr>
<tr>
<td></td>
<td>(Optional) Configures the SAP operation mode on the interface. The interface negotiates with the peer for a mutually acceptable mode. Enter the acceptable modes in your order of preference.</td>
</tr>
<tr>
<td></td>
<td>Choices for <code>mode</code> are:</td>
</tr>
<tr>
<td></td>
<td>- <code>gcm-encrypt</code>—Authentication and encryption</td>
</tr>
<tr>
<td></td>
<td>Note: Select this mode for MACsec authentication and encryption if your software license supports MACsec encryption.</td>
</tr>
<tr>
<td></td>
<td>- <code>gmac</code>—Authentication, no encryption</td>
</tr>
<tr>
<td></td>
<td>- <code>no-encap</code>—No encapsulation</td>
</tr>
<tr>
<td></td>
<td>- <code>null</code>—Encapsulation, no authentication or encryption</td>
</tr>
<tr>
<td></td>
<td>Note: If the interface is not capable of data link encryption, <code>no-encap</code> is the default and the only available SAP operating mode. SGT is not supported.</td>
</tr>
</tbody>
</table>

### Note

Although visible in the CLI help, the `timer reauthentication` and `propagate sgt` keywords are not supported. However, the `no propagate sgt` keyword is supported (refer to Step 5 in the next section).
Chapter 43      Configuring MACsec Encryption

Configuring Cisco TrustSec MACsec

This example shows how to enable Cisco TrustSec authentication in 802.1X mode on an interface using GCM as the preferred SAP mode:

Switch# configure terminal
Switch(config)# interface tengigabitethernet 1/1/2
Switch(config-if)# cts dot1x
Switch(config-if-cts-dot1x)# sap mode-list gcm-encrypt null no-encap
Switch(config-if-cts-dot1x)# exit
Switch(config-if)# end

Configuring Cisco TrustSec Switch-to-Switch Link Security in Manual Mode

If your switch does not have access to an authentication server or if 802.1X authentication is not needed, you can manually configure Cisco TrustSec on an interface. You must manually configure the interface on each end of the connection.

When manually configuring Cisco TrustSec on an interface, consider these usage guidelines and restrictions:

- If no SAP parameters are defined, Cisco TrustSec encapsulation or encryption is not performed.
- If you select GCM as the SAP operating mode, you must have a MACsec Encryption software license from Cisco. If you select GCM without the required license, the interface is forced to a link-down state.
- These protection levels are supported when you configure SAP pairwise master key (sap pmk):
  - SAP is not configured—no protection.
  - sap mode-list gcm-encrypt gmac no-encap—protection desirable but not mandatory.
  - sap mode-list gcm-encrypt gmac—confidentiality preferred and integrity required. The protection is selected by the supplicant according to supplicant preference.
  - sap mode-list gmac—integrity only.
  - sap mode-list gcm-encrypt—confidentiality required.
  - sap mode-list gmac gcm-encrypt—integrity required and preferred, confidentiality optional.

To manually configure Cisco TrustSec on an interface to another Cisco TrustSec device, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
<td>exit</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td>Step 7</td>
<td>show cts interface [interface-id / brief / summary]</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Command Purpose

Step 1 configure terminal
Enters global configuration mode.

Step 2 interface interface-id
Enters interface configuration mode.

Step 3 cts manual
Enters Cisco TrustSec manual configuration mode.
# Chapter 43 Configuring MACsec Encryption

## Configuring Cisco TrustSec MACsec Encryption

### This example shows how to configure Cisco TrustSec authentication in manual mode on an interface:

```
Switch# configure terminal
Switch(config)# interface tengigabitethernet 1/1/2
Switch(config-if)# cts manual
Switch(config-if-cts-manual)# sap pmk 1234abcdef mode-list gcm-encrypt null no-encap
Switch(config-if-cts-manual)# no propagate sgt
Switch(config-if-cts-manual)# exit
Switch(config-if)# end
```

### Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 4    | sap pmk key | (Optional) Configures the SAP pairwise master key (PMK) and operation mode. SAP is disabled by default in Cisco TrustSec manual mode.  

  - **key**—A hexadecimal value with an even number of characters and a maximum length of 32 characters.  
  
The SAP operation **mode** options:  

  - **gcm-encrypt**—Authentication and encryption  
  
  **Note** Select this mode for MACsec authentication and encryption if your software license supports MACsec encryption.  

  - **gmac**—Authentication, no encryption  
  
  - **no-encap**—No encapsulation  
  
  - **null**—Encapsulation, no authentication or encryption  
  
  **Note** If the interface is not capable of data link encryption, **no-encap** is the default and the only available SAP operating mode. SGT is not supported.  

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 5    | no propagate sgt | Prevents the interface from transmitting the SGT to the peer and is required in manual mode.  

  Use the **no** form of this command when the peer is incapable of processing a SGT.  

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 6    | exit    | Exits Cisco TrustSec 802.1X interface configuration mode.  

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 7    | end     | Returns to privileged EXEC mode.  

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 8    | show cts interface [interface-id / brief / summary] | (Optional) Verifies the configuration by displaying TrustSec-related interface characteristics.  

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| 9    | copy running-config startup-config | (Optional) Saves your entries in the configuration file.  

### Cisco TrustSec Switch-to-Switch Link Security Configuration Example

This example shows the configuration necessary for a seed and non-seed device for Cisco TrustSec switch-to-switch security. You must configure the AAA and RADIUS for link security. In this example, **ACS-1** through **ACS-3** can be any server names and **cts-radius** is the Cisco TrustSec server.

#### Seed Device Configuration:

```
Switch(config)# aaa new-model  
Switch(config)# radius server ACS-1 address ipv4 10.5.120.12 auth-port 1812 acct-port 1813 pac key cisco123
```

#### Non-seed Device Configuration:

```
Switch(config)# interface tengigabitethernet 1/1/2

Configuring 802.1X Port-Based Authentication

This chapter describes how to configure IEEE 802.1X port-based authentication on the Catalyst 4500 series switch to prevent unauthorized client devices from gaining access to the network.

This chapter includes the following major sections:

- About 802.1X Port-Based Authentication, page 44-1
- Configuring 802.1X Port-Based Authentication, page 44-26
- Controlling Switch Access with RADIUS, page 44-92
- Displaying 802.1X Statistics and Status, page 44-113
- Displaying Authentication Details, page 44-114
- Cisco IOS Security Features in Cisco IOS XE 3.1.0 SG Release, page 44-118

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About 802.1X Port-Based Authentication

802.1X defines 802.1X port-based authentication as a client-server based access control and authentication protocol that restricts unauthorized clients from connecting to a LAN through publicly accessible ports. An authentication server validates each supplicant (client) connected to an authenticator (network access switch) port before making available any services offered by the switch or the LAN.
802.1X support requires an authentication server that is configured for Remote Authentication Dial-In User Service (RADIUS). 802.1X authentication does not work unless the network access switch can route packets to the configured RADIUS server. To verify that the switch can route packets, you must ping the server from the switch.

Until a client is authenticated, only Extensible Authentication Protocol over LAN (EAPOL) traffic is allowed using the port to which the client is connected. After authentication succeeds, normal traffic can pass using the port.

To configure 802.1X port-based authentication, you need to understand the concepts in these sections:

- Device Roles, page 44-2
- 802.1X and Network Access Control, page 44-3
- Authentication Initiation and Message Exchange, page 44-4
- Ports in Authorized and Unauthorized States, page 44-5
- 802.1X Host Mode, page 44-6
- 802.1X Violation Mode, page 44-8
- Using MAC Move, page 44-9
- Using MAC Replace, page 44-9
- Using 802.1X with VLAN Assignment, page 44-10
- Using 802.1X for Guest VLANs, page 44-11
- Using 802.1X with MAC Authentication Bypass, page 44-12
- Using 802.1X with Web-Based Authentication, page 44-14
- Using 802.1X with Inaccessible Authentication Bypass, page 44-14
- Using 802.1X with Unidirectional Controlled Port, page 44-15
- Using 802.1X with VLAN User Distribution, page 44-16
- Using 802.1X with Authentication Failed VLAN Assignment, page 44-17
- Using 802.1X with Port Security, page 44-19
- Using 802.1X Authentication with ACL Assignments and Redirect URLs, page 44-20
- Using 802.1X with RADIUS-Provided Session Timeouts, page 44-21
- Using 802.1X with Voice VLAN Ports, page 44-22
- Using Multiple Domain Authentication and Multiple Authentication, page 44-22
- 802.1X Supplicant and Authenticator Switches with Network Edge Access Topology, page 44-24
- How 802.1X Fails on a Port, page 44-25
- Supported Topologies, page 44-25

**Device Roles**

With 802.1X port-based authentication, network devices have specific roles. Figure 44-1 shows the role of each device, which is described below.
Chapter 44 Configuring 802.1X Port-Based Authentication

Figure 44-1 802.1X Device Roles

- **Client**—The workstation that requests access to the LAN, and responds to requests from the switch. The workstation must be running 802.1X-compliant client software.

- **Authenticator**—Controls physical access to the network based on the authentication status of the client. The Catalyst 4500 series switch acts as an intermediary between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. The switch encapsulates and decapsulates the Extensible Authentication Protocol (EAP) frames and interacts with the RADIUS authentication server.

  When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped and the remaining EAP frame is reencapsulated in the RADIUS format. The EAP frames are not modified or examined during encapsulation, and the authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the frame header is removed from the server, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

  **Note** The Catalyst 4500 series switches must be running software that supports the RADIUS client and 802.1X.

- **Authentication server**—Performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and switch services. (The only supported authentication server is the RADIUS authentication server with EAP extensions; it is available in Cisco Secure Access Control Server version 3.2 and later releases.)

### 802.1X and Network Access Control

Network Access Control is a feature that allows port access policies to be influenced by the antivirus posture of the authenticating device.

Antivirus posture includes such elements as the operating system running on the device, the operating system version, whether antivirus software is installed and what version of antivirus signatures is available. If the authenticating device has a NAC-aware 802.1X supplicant and the authentication server is configured to support NAC using 802.1X, antivirus posture information is automatically included as part of the 802.1X authentication exchange.

For information on NAC, refer to the URL:

About 802.1X Port-Based Authentication

Authentication Initiation and Message Exchange

The switch or the client can initiate authentication. If you enable authentication on a port by using the `authentication port-control auto` interface configuration command (`dot1x port-control auto` command in Cisco IOS Release 12.2(46)SG and earlier releases), the switch must initiate authentication when it determines that the port link state has changed. It then sends an EAP-request/identity frame to the client to request its identity (typically, the switch sends an initial identity/request frame followed by one or more requests for authentication information). Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client’s identity.

If 802.1X is not enabled or supported on the network access switch, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client transmits frames as if the port is in the authorized state. A port in the authorized state means that the client was successfully authenticated. When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized.

The specific exchange of EAP frames depends on the authentication method being used. Figure 44-2 shows a message exchange that is initiated by the client using the One-Time Password (OTP) authentication method with an authentication server.

![Figure 44-2 Message Exchange](image-url)
Chapter 44 Configuring 802.1X Port-Based Authentication

About 802.1X Port-Based Authentication

Ports in Authorized and Unauthorized States

The switch port state determines whether the client is granted access to the network. The port starts in the unauthorized state. While in this state, the port disallows all ingress and egress traffic except for 802.1X protocol packets. When a client is successfully authenticated, the port transitions to the authorized state, allowing all traffic for the client to flow normally.

If a non-802.1X capable client is connected to an unauthorized 802.1X port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network. If a guest VLAN is configured on a port that connects to a client that does not support 802.1X, the port is placed in the configured guest VLAN and in the authorized state. For more information, see the “Using 802.1X for Guest VLANs” section on page 44-11.

In contrast, when an 802.1X-enabled client connects to a port that is not running the 802.1X protocol, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You can control the port authorization state by using the authentication port-control interface configuration command (dot1x port-control auto command in Cisco IOS Release 12.2(46)SG and earlier releases) and these keywords:

- **force-authorized**—Disables 802.1X authentication and causes the port to transition to the authorized state without requiring authentication exchange. The port transmits and receives normal traffic without 802.1X-based authentication of the client. This setting is the default.

- **force-unauthorized**—Causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client using the interface.

- **auto**—Allows 802.1X authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received using the port. The authentication process begins when the link state of the port transitions from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. The switch can uniquely identify each client attempting to access the network by the client’s MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed using the port. If authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can retransmit the request. If no response is received from the server after the specified number of attempts, authentication fails and network access is not granted.

If the link state of a port transitions from up to down, or if an EAPOL-logoff frame is received by the port, the port returns to the unauthorized state.

If Multidomain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization. For more information on MDA, see the “Using Multiple Domain Authentication and Multiple Authentication” section on page 44-22.

Figure 44-3 shows the authentication process.
### About 802.1X Port-Based Authentication

**Figure 44-3 Authentication Flowchart**

The 802.1X port’s host mode determines whether more than one client can be authenticated on the port and how authentication is enforced. You can configure an 802.1X port to use any of the five host modes described in the following sections. In addition, each mode can be modified to allow preauthentication open access:

- **Single-Host Mode**, page 44-7
- **Multiple-Hosts Mode**, page 44-7
- **Multidomain Authentication Mode**, page 44-7
- **Multiauthentication Mode**, page 44-8

**802.1X Host Mode**

The 802.1X port’s host mode determines whether more than one client can be authenticated on the port and how authentication is enforced. You can configure an 802.1X port to use any of the five host modes described in the following sections. In addition, each mode can be modified to allow preauthentication open access:

- Single-Host Mode, page 44-7
- Multiple-Hosts Mode, page 44-7
- Multidomain Authentication Mode, page 44-7
- Multiauthentication Mode, page 44-8
Chapter 44 Configuring 802.1X Port-Based Authentication

About 802.1X Port-Based Authentication

- Pre-authentication Open Access, page 44-8

Single-Host Mode

You can configure an 802.1X port for single-host or multiple-hosts mode. In single-host mode (see Figure 44-1 on page 44-3), only one client can be connected to the 802.1X-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

Multiple-Hosts Mode

In multiple-hosts mode, you can attach multiple hosts to a single 802.1X-enabled port. Figure 44-4 on page 44-7 shows 802.1X port-based authentication in a wireless LAN. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (reauthentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients. In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

With multiple-hosts mode enabled, you can use 802.1X authentication to authenticate the port and port security to manage network access for all MAC addresses, including that of the client.

Multidomain Authentication Mode

Beginning with Cisco IOS Release 12.2(37)SG, Catalyst 4500 series switches support Multidomain Authentication (MDA), which allows an IP phone (Cisco or third-party) and a single host behind the IP phone to authenticate independently, using 802.1X, MAC authentication bypass (MAB) or (for the host only) web-based authentication. In this application, multidomain refers to two domains — data and voice — and only two MAC addresses are allowed per-port. A switch can place the host in the data VLAN and the IP phone in the voice VLAN, even though they appear on the same switch port. The data VLAN and the voice VLAN can be specified in the CLI configuration. The devices are identified as either data or voice depending on the vendor-specific-attributes (VSAs) received from the authentication, authorization, and accounting (AAA) server. The data and voice VLANs can also be obtained from the VSAs received from the (AAA) server during authentication.
About 802.1X Port-Based Authentication

Figure 44-5 shows a typical MDA application with a single host behind an IP phone connected to the 802.1X-enabled port. Because the client is not directly connected to the switch, the switch cannot detect a loss of port link if the client is disconnected. To prevent another device from using the established authentication of the disconnected client later, Cisco IP phones send a Cisco Discovery Protocol (CDP) host presence type length value (TLV) to notify the switch of changes in the attached client’s port link state.

For details on how to configure MDA, see the “Using Multiple Domain Authentication and Multiple Authentication” section on page 44-22.

Multiauthentication Mode

Available starting in Cisco IOS Release 12.2(50)SG, multiauthentication mode allows one client on the voice VLAN and multiple authenticated clients on the data VLAN. When a hub or access point is connected to an 802.1X port, multiauthentication mode provides enhanced security over multiple-hosts mode by requiring authentication of each connected client. For non-802.1X devices, you can use MAB or web-based authentication as the fallback method for individual host authentications, allowing you to authenticate different hosts through different methods on a single port.

Multiauthentication also supports MDA functionality on the voice VLAN by assigning authenticated devices to either a data or voice VLAN depending on the VSAs received from the authentication server.

Note

When a port is in multiauthentication mode, Guest VLAN and Authentication Failed VLAN will not activate for data devices.

Pre-authentication Open Access

Beginning with Cisco IOS Release 12.2(50)SG, any of the four host modes can be additionally configured to allow a device to gain network access before authentication. This preauthentication open access is useful in an application such as the Pre-boot eXecution Environment (PXE), where a device must access the network to download a bootable image containing an authentication client.

Enable preauthentication open access by entering the authentication open command after host mode configuration. It acts as an extension to the configured host mode. For example, if preauthentication open access is enabled with single-host mode, then the port allows only one MAC address. When preauthentication open access is enabled, initial traffic on the port is restricted only by whatever other access restriction, independent of 802.1X, is configured on the port. If no access restriction other than 802.1X is configured on the port, then a client device has full access on the configured VLAN.

802.1X Violation Mode

You can use the authentication violation interface configuration command to configure the violation mode: restrict, shutdown, and replace.
In single-host mode, a security violation is triggered when more than one device are detected on the data vlan. In multidomain authentication mode, a security violation is triggered when more than one device are detected on the data or voice VLAN.

Security violation cannot be triggered in multiple-host mode or multiauthentication mode.

When security violation occurs, the port is protected depending on the configured violation action:

- **Shutdown**—Errdisables the port; the default behavior on a port.
- **Restrict**—The port state is unaffected. However the platform is notified to restrict the traffic from offending MAC-address.
- **Replace**—Replaces existing host with the new host, instead of error-disabling or restricting the port.

For more information see “Configuring Violation Action” section on page 44-54.

### Using MAC Move

Hosts should be able to move across ports within a switch on the same or different VLAN without restriction, as if they had moved to a port on another switch.

Prior to Cisco IOS Release 12.2(54)SG, when a MAC address is authenticated on one switch port, that address is not allowed on another 802.1X switch port. If the switch detects that same MAC address on another 802.1X port, the address is not allowed.

Beginning with Cisco IOS Release 12.2(54)SG, you can move a MAC address to another port on the same switch. It is not pertinent for directly connected hosts or for hosts behind Cisco phones, where a port-down event or proxy EAPoL-Logoff/CDP TLV is received when the initial host disconnects. It is pertinent for hosts that disconnect from behind a hub, third party phone, or legacy Cisco phone, causing the session to remain up. With MAC move you can disconnect the host from such a device and connect it directly to another port on the same switch.

You can globally enable MAC move so that the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port.

MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, for any host mode enabled on that port.)

For more information see “Configuring MAC Move” section on page 44-53.

### Using MAC Replace

Beginning with Cisco IOS Release 12.2(54)SG, you can allow new hosts to connect to abandoned ports. If the configured violation action is replace, the existing host is replaced by the new host, instead of err-disabling or restricting the port (as happens for single-host and MDA modes).

It is not an issue for directly connected hosts or for hosts behind Cisco phones, where a port-down event or proxy EAPoL-Logoff/CDP TLV is received when the initial host disconnects. It is an issue where a host disconnects from behind a hub, third party phone, or legacy Cisco phone, causing the session to remain up. New hosts connecting to this port violate the host-mode, triggering a violation. When the violation action is replace, the NAD (switch) terminates the initial session and resets the authentication sequence based on the new MAC. This applies to single-host and MDA host modes. In multiple-auth mode, no attempt is made to remove an existing session on the same port.

For more information see the “Configuring MAC Replace” section on page 44-53.
Chapter 44  Configuring 802.1X Port-Based Authentication

Using 802.1X with VLAN Assignment

You can use the VLAN assignment to limit network access for certain users. With the VLAN assignment, 802.1X-authenticated ports are assigned to a VLAN based on the username of the client connected to that port. The RADIUS server database maintains the username-to-VLAN mappings. After successful 802.1X authentication of the port, the RADIUS server sends the VLAN assignment to the switch. The VLAN can be a standard VLAN or a PVLAN.

On platforms that support PVLANs, you can isolate hosts by assigning ports into PVLANs.

When configured on the switch and the RADIUS server, 802.1X with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server, the port is configured in its access VLAN or isolated PVLAN when authentication succeeds.
- If the authentication server provides invalid VLAN information, the port remains unauthorized. This situation prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error.
- Starting with Cisco IOS Release 15.0(2)SG, if multi-authentication mode is enabled on an 802.1X port, VLAN Assignment occurs successfully for the first authenticated host. Subsequent authorized (based on user credentials) data hosts, are considered successfully authenticated, provided either they have no VLAN assignment or have a VLAN assignment matching the first successfully authenticated host on the port. This ensures that all successfully authenticated hosts on a port are members of the same VLAN. Flexibility of VLAN assignment is only provided to the first authenticated host.
- If the authentication server provides valid VLAN information, the port is authorized and placed in the specified VLAN when authentication succeeds.
- If the multiple-hosts mode is enabled, all hosts are in the same VLAN as the first authenticated user.
- If 802.1X is disabled on the port, the port is returned to the configured access VLAN.
- A port must be configured as an access port (which can be assigned only into “regular” VLANs), or as a PVLAN host port (which can be assigned only into PVLANs). Configuring a port as a PVLAN host port implies that all hosts on the port are assigned into PVLANs, whether their posture is compliant or non-compliant. If the type of the VLAN named in the Access-Accept does not match the type of VLAN expected to be assigned to the port (regular VLAN to access port, secondary PVLAN to PVLAN host port), the VLAN assignment fails.
- If a guest VLAN is configured to handle non-responsive hosts, the type of VLAN configured as the guest VLAN must match the port type (that is, guest VLANs configured on access ports must be standard VLANs, and guest VLANs configured on PVLAN host ports must be PVLANs). If the guest VLAN’s type does not match the port type, non-responsive hosts are treated as if no guest VLAN is configured (that is, they are denied network access).
- To assign a port into a PVLAN, the named VLAN must be a secondary PVLAN. The switch determines the implied primary VLAN from the locally configured secondary-primary association.

Note

If you change the access VLAN or PVLAN host VLAN mapping on a port that is already authorized in a RADIUS assigned VLAN, the port remains in the RADIUS assigned VLAN.
To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the `network` keyword to allow interface configuration from the RADIUS server. For an illustration of how to apply the `aaa authorization network group radius` command, refer to the section “Enabling 802.1X Authentication” on page 28.
- Enable 802.1X. (The VLAN assignment feature is automatically enabled when you configure 802.1X on an access port.)
- Assign vendor-specific tunnel attributes in the RADIUS server. To ensure proper VLAN assignment, the RADIUS server must return these attributes to the switch:
  - Tunnel-Type = VLAN
  - Tunnel-Medium-Type = 802
  - Tunnel-Private-Group-ID = VLAN NAME

### Using 802.1X for Guest VLANs

You can use guest VLANs to enable non-802.1X-capable hosts to access networks that use 802.1X authentication. For example, you can use guest VLANs while you are upgrading your system to support 802.1X authentication.

Guest VLANs are supported on a per-port basis, and you can use any VLAN as a guest VLAN as long as its type matches the type of the port. If a port is already forwarding on the guest VLAN and you enable 802.1X support on the network interface of the host, the port is immediately moved out of the guest VLAN and the authenticator waits for authentication to occur.

Enabling 802.1X authentication on a port starts the 802.1X protocol. If the host fails to respond to packets from the authenticator within a certain amount of time, the authenticator brings the port up in the configured guest VLAN.

If the port is configured as a PVLAN host port, the guest VLAN must be a secondary PVLAN. If the port is configured as an access port, the guest VLAN must be a regular VLAN. If the guest VLAN configured on a port is not appropriate for the type of the port, the switch behaves as if no guest VLAN is configured (that is, non-responsive hosts are denied network access).

For details on how to configure guest VLANs, see the “Configuring 802.1X with Guest VLANs” section on page 44-55.

### Usage Guidelines for Using 802.1X Authentication with Guest VLANs

When using 802.1X authentication with guest VLANs, consider these guidelines:

- When you reconfigure a guest VLAN to a different VLAN, any authentication failed ports are also moved and the ports stay in their current authorized state.
- When you shut down or remove a guest VLAN from the VLAN database, any authentication failed ports are immediately moved to an unauthorized state and the authentication process is restarted.

**Note**

No periodic reauthentication is allowed with guest VLANs.
Usage Guidelines for Using 802.1X Authentication with Guest VLANs on Windows-XP Hosts

When using 802.1X authentication with guest VLANs on Windows-XP hosts, consider these guidelines:

- If the host fails to respond to the authenticator, the port attempts to connect three times (with a 30 second timeout between each attempt). After this time, the login/password window does not appear on the host, so you must unplug and reconnect the network interface cable.

- Hosts responding with an incorrect login/password fail authentication. Hosts failing authentication are not put in the guest VLAN. The first time that a host fails authentication, the quiet-period timer starts, and no activity occurs for the duration of the quiet-period timer. When the quiet-period timer expires, the host is presented with the login and password window. If the host fails authentication for the second time, the quiet-period timer starts again, and no activity occurs for the duration of the quiet-period timer. The host is presented with the login and password window a third time. If the host fails authentication the third time, the port is placed in the unauthorized state, and you must disconnect and reconnect the network interface cable.

Using 802.1X with MAC Authentication Bypass

The 802.1X protocol has 3 entities: client (supplicant), authenticator, and authentication server. Typically, the host PC runs the supplicant software and tries to authenticate itself by sending its credentials to the authenticator which in turn relays that info to the authentication server for authentication.

However, not all hosts may have supplicant functionality. Devices that cannot authenticate themselves using 802.1X but still need network access can use MAC Authentication Bypass (MAB), which uses the connecting device's MAC address to grant or deny network access.

Typically, you use this feature on ports where devices such as printers are connected. Such devices do not have 802.1X supplicant functionality.

In a typical deployment, the RADIUS server maintains a database of MAC addresses that require access. When this feature detects a new MAC address on a port, it generates a RADIUS request with both username and password as the device’s MAC address. After authorization succeeds, the port is accessible to the particular device using the same code path that 802.1X authentication would take when processing an 802.1X supplicant. If authentication fails, the port moves to the guest VLAN if configured, or it remains unauthorized.

The Catalyst 4500 series switch also supports reauthentication of MACs on a per-port level. Be aware that the reauthentication functionality is provided by 802.1X and is not MAB specific. In the reauthentication mode, a port stays in the previous RADIUS-sent VLAN and tries to re-authenticate itself. If the reauthentication succeeds, the port stays in the RADIUS-sent VLAN. Otherwise, the port becomes unauthorized and moves to the guest VLAN if one is configured.

For details on how to configure MAB, see the “Configuring 802.1X with MAC Authentication Bypass” section on page 44-58.
Feature Interaction

This section lists feature interactions and restrictions when MAB is enabled. If a feature is not listed, assume that it interacts seamlessly with MAB (such as Unidirectional Controlled Port).

- MAB can only be enabled if 802.1X is configured on a port. MAB functions as a fall back mechanism for authorizing MACs. If you configure both MAB and 802.1X on a port, the port attempts to authenticate using 802.1X. If the host fails to respond to EAPOL requests and MAB is configured, the 802.1X port is opened up to listen to packets and to grab a MAC address, rather than attempt to authenticate endlessly.

Based on the default 802.1X timer values, the transition between mechanisms takes approximately 90 seconds. You can shorten the time by reducing the value of the transmission period time, which affects the frequency of EAPOL transmission. A smaller timer value results in sending EAPOLs during a shorter time interval. With MAB enabled, after 802.1X performs one full set of EAPOLs, the learned MAC address is forwarded to the authentication server for processing.

The MAB module performs authorization for the first MAC address detected on the wire. The port is considered authorized once a valid MAC address is received that RADIUS approves of.

802.1X authentication can re-start if an EAPOL packet is received on a port that was initially authorized as a result of MAB.

Figure 44-6 shows the message exchange during MAB.

- The authentication-failed VLAN is used only with dot1x-authentication-failed users. MAB is not attempted with dot1x-authentication-failed users. If 802.1X authentication fails, a port moves to the authentication-failed VLAN (if configured) whether MAB is configured or not.
When both MAB and guest VLAN are configured and no EAPOL packets are received on a port, the 802.1X state-machine is moved to a MAB state where it opens the port to listen to traffic and grab MAC addresses. The port remains in this state forever waiting to see a MAC on the port. A detected MAC address that fails authorization causes the port to be moved to the guest VLAN if configured. While in a guest VLAN, a port is open to all traffic on the specified guest VLAN. Non-802.1X supplicants that normally would be authorized but are in guest VLAN due to the earlier detection of a device that failed authorization, would remain in the guest VLAN indefinitely. However, loss of link or the detection of an EAPOL on the wire causes a transition out of the guest VLAN and back to the default 802.1X mode.

Once a new MAC is authenticated by MAB, the responsibility to limit access belongs to the 802.1X authenticator (or port security) to secure the port. The 802.1X default host parameter is defined only for a single host. If the port is changed to multiple-user host, port security must be used to enforce the number of MAC addresses allowed through this port.

Catalyst 4500 series switch supports MAB with VVID, with the restriction that the MAC address appears on a port data VLAN only. All IP phone MACs learned using CDP are allowed on voice VLANs.

MAB and VMPS are mutually exclusive because their functionality overlaps.

### Using 802.1X with Web-Based Authentication

The web-based authentication feature, known as Web Authentication Proxy, allows you to authenticate end users on host systems that do not run the IEEE 802.1X supplicant.

When configuring web-based authentication, consider these guidelines:

- Fallback to web-based authentication is configured on switch ports in access mode. Ports in trunk mode are not supported.
- Fallback to web-based authentication is not supported on EtherChannels or EtherChannel members.
- Although fallback to web-based authentication is an interface-specific configuration, the web-based authentication fallback behavior is defined in a global fallback profile. If the global fallback configuration changes, the new profile is not used until the next instance of authentication fallback.

For detailed information on configuring web-based authentication, see Chapter 46, “Configuring Web-Based Authentication.”

### Using 802.1X with Inaccessible Authentication Bypass

When a switch cannot reach the configured RADIUS servers and clients (supplicants) cannot be authenticated, you can configure a switch to allow network access to hosts connected to critical ports that are enabled for Inaccessible Authentication Bypass.

When Inaccessible Authentication Bypass is enabled, a switch monitors the status of the configured RADIUS servers. If no RADIUS servers are available, clients that fail authentication due to server unavailability are authorized. Inaccessible Authentication Bypass can be enabled for data clients and voice clients. For data clients, you can specify an Inaccessible Authentication Bypass VLAN on a per-port basis. For voice clients they are authorized in the configured voice vlan. Inaccessible Authentication Bypass for voice clients can activate in Multiple Domain Authentication and Multiple Authentication modes, in which authentication is enforced for voice devices.
Inaccessible Authentication Bypass allows a voice client to access configured voice VLAN when RADIUS becomes unavailable. For the voice device to operate properly, it must learn the voice VLAN ID through other protocols such as CDP, LLDP, or DHCP, wherever appropriate. When a RADIUS server is unavailable, it may not be possible for a switch to recognize a MAC address as that of a voice device. Therefore, when Inaccessible Authentication Bypass is configured for voice devices, it should also be configured for data. Voice devices may be authorized on both critical data and voice VLANs. If port security is enabled, this may affect the maximum port security entries enforced on the port.

By default, data clients that were already authorized when RADIUS becomes unavailable are unaffected by Inaccessible Authentication Bypass. To reauthenticate all authorized data clients on the port when RADIUS becomes unavailable, use the `authentication server dead action reinitialize vlan` interface configuration command. This command is intended for multiauthentication mode and is mutually exclusive with the `authentication server dead action authorize vlan` command.

By default, data clients that were already authorized when RADIUS becomes unavailable are unaffected by Inaccessible Authentication Bypass. To reauthenticate all authorized data clients on the port when RADIUS becomes unavailable, use the `authentication server dead action reinitialize vlan` interface configuration command. This command is intended for multiauthentication mode and is mutually exclusive with the `authentication server dead action authorize vlan` command.

When RADIUS becomes available, critically authorized ports can be configured to automatically reauthenticate themselves.

To properly detect RADIUS server availability, the `test username name` option should be enabled in the `radius-server host` command. For details on how to configure RADIUS server, see the “Configuring Switch-to-RADIUS-Server Communication” section on page 44-32.

Inaccessible Authentication Bypass cannot activate after a port falls back to Web-based authentication. For details on how to configure Web-based authentication, see Chapter 46, “Configuring Web-Based Authentication.”

For details on how to configure Inaccessible Authentication Bypass, see Chapter 46, “Configuring Web-Based Authentication”.

### Using 802.1X with Unidirectional Controlled Port

Unidirectional Controlled Port is a combined hardware and software feature that allows dormant PCs to be powered on based on the receipt of a specific Ethernet frame, known as the *magic packet*. Generally, Unidirectional Controlled Port is used in environments where administrators plan to manage remote systems during off-hours, when the systems usually have been powered down.

Use of Unidirectional Controlled Port with hosts attached through 802.1X ports presents a unique problem: when the host powers down, a 802.1X port becomes unauthorized. In this state, the port allows the receipt and transmission of EAPoL packets only. The Unidirectional Controlled Port magic packet cannot reach the host; without powering up, the PC cannot authenticate and open the port.

Unidirectional Controlled Port solves this problem by allowing packets to be transmitted on unauthorized 802.1X ports.

**Note** Unidirectional Controlled Port only works when Spanning Tree PortFast is enabled on the port.
For details on how to configure 802.1X with Unidirectional Controlled Port, see the “Configuring 802.1X with Unidirectional Controlled Port” section on page 44-64.

Unidirectional State

A unidirectional controlled port is typically configured when a connected host might enter a sleeping mode or power-down state. When either occurs, the host does not exchange traffic with other devices in the network. A host connected to the unidirectional port cannot send traffic to the network; it can only receive traffic from other devices in the network.

When you configure a port as unidirectional (with the `authentication control-direction in` interface configuration command), the port will receive traffic in VLANs on that port, but it is not put into a spanning-tree forwarding state. If a VLAN contains only unauthenticated ports, any SVI on that VLAN will be in a down state, during which packets will not be routed into the VLAN. For the SVI to be up, and so enable packets to be routed into the VLAN, at least one port in the VLAN must either be authenticated or in the spanning-tree forwarding state.

Bidirectional State

When you configure a port as bidirectional by using the `authentication control-direction both` interface configuration command (or the `dot1x control-direction both` interface configuration command for Cisco IOS Release 12.2(46) or earlier), the port is access-controlled in both directions. In this state, except for EAPOL packets, a switch port does not receive or send packets.

Using 802.1X with VLAN User Distribution

An alternative to dynamically assigning a VLAN ID or a VLAN name is to assign a VLAN group name. The 802.1X VLAN User Distribution feature allows you to distribute users belonging to the same group (and characterized by a common VLAN group name) across multiple VLANs. You usually do this to avoid creating an overly large broadcast domain.

For example, with this feature, you can download a common VLAN group name (similar to ENG-Group, for all the users belonging to the engineering organization) from the authentication server to all the access-layer switches. The VLAN group name is then individually mapped to a different VLAN on each access-layer switch. The same VLAN number need not be spanned across separate switches. Similarly, the VLANs does not need to be renamed at the edge devices.

When the authentication server returns more than one VLAN group name or VLANs, this feature attempts to distribute users evenly across those groups. It internally maintains the count of users assigned to each VLAN on that switch by authentication or port security. Based on this information, this feature assigns a newly authenticated user to the least loaded VLAN on that switch among all the VLANs or VLAN group names obtained from the RADIUS server.

This VLAN distribution considers the load of all the valid VLANs only during initial user authentication, and not during reassignment. When some of the existing authenticated users are removed, the feature does not attempt to redistribute the remaining authenticated users. Group distribution does not guarantee perfect load distribution all the time.
Deployment Example

In a large campus LAN design, you might want to design the VLAN infrastructure without large Layer 2 domain. For the same employee VLAN, customers might have different VLANs at different campus access switches. When you deploy 802.1X with VLAN assignment, it does not assign one employee VLAN to all employees. You have to know the real VLANs configured on the switch. User distribution allows you to send a list of VLAN or VLAN group name(s) to the switch. Your switch can then do a local mapping to the corresponding VLAN. (Figure 44-7).

Figure 44-7  802.1X with VLAN User Distribution

For details on how to configure VLAN User Distribution, see the “Configuring 802.1X with VLAN User Distribution” section on page 44-66.

Using 802.1X with Authentication Failed VLAN Assignment

You can use authentication-failed VLAN assignment on a per-port basis to provide access for authentication failed users. Authentication failed users are end hosts that are 802.1X-capable but do not have valid credentials in an authentication server or end hosts that do not give any username and password combination in the authentication pop-up window on the user side.

If a user fails the authentication process, that port is placed in the authentication-failed VLAN. The port remains in the authentication-failed VLAN until the reauthentication timer expires. When the reauthentication timer expires the switch starts sending the port reauthentication requests. If the port fails reauthentication it remains in the authentication-failed VLAN. If the port is successfully reauthenticated, the port is moved either to the VLAN sent by RADIUS server or to the newly authenticated ports configured VLAN; the location depends on whether RADIUS is configured to send VLAN information.

Note

When enabling periodic reauthentication (see the “Enabling Periodic Reauthentication” section on page 44-78), only local reauthentication timer values are allowed. You cannot use a RADIUS server to assign the reauthentication timer value.
You can set the maximum number of authentication attempts that the authenticator sends before moving a port into the authentication-failed VLAN. The authenticator keeps a count of the failed authentication attempts for each port. A failed authentication attempt is either an empty response or an EAP failure. The authenticator tracks any mix of failed authentication attempts towards the authentication attempt count. After the maximum number of attempts is reached the port is placed in the authentication-failed VLAN until the reauthentication timer expires again.

Note

RADIUS can send a response without an EAP packet in it when it does not support EAP, and sometimes third-party RADIUS servers also send empty responses. When this behavior occurs, the authentication attempt counter is incremented.

For details on how to configure Authentication Failed VLAN Assignment, see the “Configuring 802.1X with Authentication Failed” section on page 44-68.

Usage Guidelines for Using Authentication Failed VLAN Assignment

Usage guidelines include the following:

- You should enable reauthentication. The ports in authentication-failed VLANs do not receive reauthentication attempts if reauthentication is disabled. To start the reauthentication process the authentication-failed VLAN must receive a link-down event or an EAP logoff event from the port. If the host is behind a hub, you may never get a link-down event and may not detect the new host until the next reauthentication occurs.

- EAP failure messages are not sent to the user. If the user fails authentication the port is moved to an authentication-failed VLAN and a EAP success message is sent to the user. Because the user is not notified of the authentication failure there may be confusion as to why there is restricted access to the network. A EAP Success message is sent for the following reasons:
  - If the EAP Success message is not sent, the user tries to authenticate every 60 seconds (by default) by sending an EAP-start message.
  - In some cases, users have configured DHCP to EAP-Success and unless the user sees a success, DHCP does not work on the port.

- Sometimes a user caches an incorrect username and password combination after receiving a EAP success message from the authenticator and reuses that information in every reauthentication. Until the user passes the correct username and password combination the port remains in the authentication-failed VLAN.

- When an authentication failed port is moved to an unauthorized state the authentication process is restarted. If you should fail the authentication process again the authenticator waits in the held state. After you have correctly reauthenticated all 802.1X ports are reinitialized and treated as normal 802.1X ports.

- When you reconfigure an authentication-failed VLAN to a different VLAN, any authentication failed ports are also moved and the ports stay in their current authorized state.

- When you shut down or remove an authentication-failed VLAN from the VLAN database, any authentication failed ports are immediately moved to an unauthorized state and the authentication process is restarted. The authenticator does not wait in a held state because the authentication-failed VLAN configuration still exists. While the authentication-failed VLAN is inactive, all authentication attempts are counted, and as soon as the VLAN becomes active the port is placed in the authentication-failed VLAN.

- If you reconfigure the maximum number of authentication failures allowed by the VLAN, the change takes affect after the reauthentication timer expires.
About 802.1X Port-Based Authentication

- Internal VLANs that are used for Layer 3 ports cannot be configured as authentication-failed VLANs.
- The authentication-failed VLAN is supported only in single-host mode (the default port mode).
- When a port is placed in an authentication-failed VLAN the user’s MAC address is added to the mac-address-table. If a new MAC address appears on the port, it is treated as a security violation.
- When an authentication failed port is moved to an authentication-failed VLAN, the Catalyst 4500 series switch does not transmit a RADIUS-Account Start Message as it does for standard 802.1X authentication.

Using 802.1X with Port Security

You can enable port security on an 802.1X port in either single- or multiple-host mode. (To do so, you must configure port security by using the `switchport port-security` interface configuration command.) When you enable port security and 802.1X on a port, 802.1X authenticates the port, and port security manages the number of MAC addresses allowed on that port, including that of the client. You can use an 802.1X port with port security enabled to limit the number or group of clients that can access the network.

For information on selecting multiple host mode, see the “Resetting the 802.1X Configuration to the Default Values” section on page 44-92.

These examples describe the interaction between 802.1X and port security on a switch:

- When a client is authenticated, and the port security table is not full, the client’s MAC address is added to the port security list of secure hosts. The port then proceeds to come up normally.

  When a client is authenticated and manually configured for port security, it is guaranteed an entry in the secure host table (unless port security static aging was enabled).

  A security violation occurs if an additional host is learned on the port. The action taken depends on which feature (802.1X or port security) detects the security violation:
  - If 802.1X detects the violation, the action is to error-disable the port.
  - If port security detects the violation, the action is to shut down or restrict the port (the action is configurable).

The following describes when port security and 802.1X security violations occur:

- In single-host mode, after the port is authorized, any MAC address received other than the client’s causes a 802.1X security violation.

- In single-host mode, if installation of an 802.1X client’s MAC address fails because port security has already reached its limit (due to a configured secure MAC addresses), a port security violation is triggered.

- In multiple-host mode, once the port is authorized, any additional MAC addresses that cannot be installed because the port security has reached its limit triggers a port security violation.

- When an 802.1X client logs off, the port transitions back to an unauthenticated state, and all dynamic entries in the secure host table are cleared, including the entry for the client. Normal authentication then ensues.

- If you administratively shut down the port, the port becomes unauthenticated, and all dynamic entries are removed from the secure host table.

- Only 802.1X can remove the client’s MAC address from the port security table. Note that in multiple-host mode, with the exception of the client’s MAC address, all MAC addresses that are learned by port security can be deleted using port security CLIs.
About 802.1X Port-Based Authentication

Whenever port security ages out a 802.1X client’s MAC address, 802.1X attempts to reauthenticate the client. Only if the reauthentication succeeds is the client’s MAC address be retained in the port security table.

All of the 802.1X client’s MAC addresses are tagged with (dot1x) when you display the port security table by using CLI.

Using 802.1X Authentication with ACL Assignments and Redirect URLs

Beginning with Cisco IOS Release 12.2(50)SG, you can download per-host policies such as ACLs and redirect URLs to the switch from the RADIUS server during 802.1X or MAB authentication of the host. ACL download is also supported with web authentication after a fallback from 802.1X or MAB.

When the 802.1X host mode of the port is either single-host, MDA, or multiple authentication, the downloaded ACLs (DACLs) are modified to use the authenticated hosts’ IP address as the source address. When the host mode is multiple-hosts, the source address is configured as ANY, and the downloaded ACLs or redirects apply to all devices on the port.

If no ACLs are provided during the authentication of a host, the static default ACL configured on the port is applied to the host. On a voice VLAN port, only the static default ACL of the port is applied to the phone.

This section includes these topics:

- Cisco Secure ACS and AV Pairs for URL-Redirect, page 44-20
- ACLs, page 44-21

For details on how to configure downloadable ACL and URL redirect, refer to the “Configuring 802.1X Authentication with ACL Assignments and Redirect URLs” section on page 44-38.

Cisco Secure ACS and AV Pairs for URL-Redirect

When downloadable ACL is enabled, Cisco Secure ACS provides AAA services through RADIUS.

You can set these Attribute-Value (AV) pairs on the Cisco Secure ACS with RADIUS cisco-av-pair vendor-specific attributes (VSAs):

- CiscoSecure-Defined-ACL specifies the names of the DACLs on the Cisco Secure ACS. The switch receives the ACL name using the CiscoSecure-Defined-ACL AV pair in the format:
  
  #ACL#-IP-name-number

  name is the ACL name and number is the version number (similar to 3f783768).

  The Auth-Manager code verifies whether the access control entries (ACEs) of the specified downloadable ACL were previously downloaded. If not, the Auth-Manager code sends an AAA request with the downloadable ACL name as the username so that the ACEs are downloaded. The downloadable ACL is then created as a named ACL on the switch. This ACL has ACEs with a source address of any and does not have an implicit deny statement at the end. When the downloadable ACL is applied to an interface after authentication completes, the source address changes from any to the host source IP address depending on the host mode of the interface. The ACEs are prepended to the downloadable ACL applied to the switch interface to which the endpoint device is connected. If traffic matches the CiscoSecure-Defined-ACL ACEs, the appropriate actions are taken.

- url-redirect and url-redirect-acl specify the local URL policy on the switch. The switches use these cisco-av-pair VSAs as follows:
Chapter 44 Configuring 802.1X Port-Based Authentication

About 802.1X Port-Based Authentication

- url-redirect = <HTTP or HTTPS URL>
- url-redirect-acl = switch ACL name or number

These AV pairs enable the switch to intercept an HTTP or HTTPS request from the endpoint device and forward the client web browser to the specified redirect address from which the latest antivirus files can be downloaded. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl AV pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to be redirected. Traffic that matches a permit entry in the redirect ACL is redirected.

Note

The redirect or default ACL must be defined on the switch.

ACLs

If downloadable ACL is configured for a particular client on the authentication server, you must configure a default port ACL on a client-facing switch port.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host access policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL already configured on the switch port. However, if the switch receives a host access policy from the Cisco Secure ACS, but the default ACL is not configured, the authorization failure is declared.

For details on how to configure a downloadable policy, refer to the “Configuring a Downloadable Policy” section on page 44-43.

Using 802.1X with RADIUS-Provided Session Timeouts

You can specify whether a switch uses a locally configured or a RADIUS-provided reauthentication timeout. If the switch is configured to use the local timeout, it reauthenticates the host when the timer expires.

If the switch is configured to use the RADIUS-provided timeout, it scans the RADIUS Access-Accept message for the Session-Timeout and optional Termination-Action attributes. The switch uses the value of the Session-Timeout attribute to determine the duration of the session, and it uses the value of the Termination-Action attribute to determine the switch action when the session's timer expires.

If the Termination-Action attribute is present and its value is RADIUS-Request, the switch reauthenticates the host. If the Termination-Action attribute is not present, or its value is Default, the switch terminates the session.

Note

The supplicant on the port detects that its session was terminated and attempts to initiate a new session. Unless the authentication server treats this new session differently, the client may see only a brief interruption in network connectivity as the switch sets up a new session.

If the switch is configured to use the RADIUS-supplied timeout, but the Access-Accept message does not include a Session-Timeout attribute, the switch never reauthenticates the supplicant. This behavior is consistent with Cisco's wireless access points.

For details on how to configure RADIUS-provided session timeouts, see the “Configuring RADIUS-Provided Session Timeouts” section on page 44-51.
Chapter 44 Configuring 802.1X Port-Based Authentication

About 802.1X Port-Based Authentication

Using 802.1X with Voice VLAN Ports

A voice VLAN port is a special access port associated with two VLAN identifiers:

- Voice VLAN ID (VVID) to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- Port VLAN ID (PVID) to carry the data traffic to and from the workstation connected to the switch using the IP phone. The PVID is the native VLAN of the port.

Each port that you configure for a voice VLAN is associated with a VVID and a PVID. This configuration allows voice traffic and data traffic to be separated onto different VLANs.

A voice VLAN port becomes active when a link exists whether the port is AUTHORIZED or UNAUTHORIZED. All traffic exiting the voice VLAN is obtained correctly and appears in the MAC address table. Cisco IP phones do not relay CDP messages from other devices. If several Cisco IP phones are connected in a series, the switch recognizes only the one directly connected to it. When 802.1X is enabled on a voice VLAN port, the switch drops packets from unrecognized Cisco IP phones more than one hop away.

When 802.1X is enabled on a port, you cannot configure a PVID that is equal to a VVID. For more information about voice VLANs, see Chapter 41, “Configuring Voice Interfaces.”

Observe the following feature interactions:

- 802.1X VLAN assignment cannot assign to the port the same VLAN as the voice VLAN; otherwise, the 802.1X authentication fails. The same holds true for dynamic VLAN assignment.
- 802.1X guest VLAN works with the 802.1X voice VLAN port feature. However, the guest VLAN cannot be the same as the voice VLAN.
- 802.1X port security works with the 802.1X voice VLAN port feature and is configured per-port. Two MAC addresses must be configured: one for the Cisco IP phone MAC address on the VVID and one for the PC MAC address on PVID.
  However, you cannot use the 802.1X voice VLAN port feature with 802.1X port security’s sticky MAC address configuration and statically configured MAC address configuration.
- 802.1X accounting is unaffected by the 802.1X voice VLAN port feature.
- When 802.1X is configured on a port, you cannot connect multiple IP phones to a Catalyst 4500 series switch through a hub.
- Because voice VLANs cannot be configured as PVLAN host ports, and because only PVLANs can be assigned to PVLAN host ports, VLAN assignment cannot assign a PVLAN to a port with a voice VLAN configured.

For details on how to configure 802.1X with voice VLANs, see the “Configuring 802.1X with Voice VLAN” section on page 44-70.

Using Multiple Domain Authentication and Multiple Authentication

Multiple Domain Authentication (MDA) allows both a data device and a voice device, such as an IP phone (Cisco or third party non-Cisco), to authenticate on the same switch port, which is divided into a data domain and a voice domain.

Multi Auth allows multiple data devices and a voice device. When a voice VLAN is configured on a multiple-authentication port, the port can perform authentication in the voice domain as on an MDA port.
MDA does not enforce the order of device authentication. For best results, however, you should authenticate a voice device before you authenticate a data device on an MDA-enabled port.

When configuring MDA, consider the following guidelines.

\[\text{Note}\]

The same guidelines also apply for Multiple Authentication when voice VLAN is configured.

- We recommend that you enable CoPP on an MDA-enabled port to protect against a DoS attack. Refer to Chapter 48, “Configuring Control Plane Policing and Layer 2 Control Packet QoS.”
- To configure a switch port for MDA or Multiple Authentication, see the “Configuring Multiple Domain Authentication and Multiple Authorization” section on page 44-34.
- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain. For more information, see Chapter 41, “Configuring Voice Interfaces.”
- To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of device-traffic-class=voice. Without this value, the switch treats the voice device as a data device.
- The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.
- If more than one device attempts authorization on either the voice or the data domain of a port, it is error-disabled.
- Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked. A security violation may occur in MDA if the voice device continues to send traffic on the data VLAN.
- MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support 802.1X authentication. it is especially useful for third party phones without 802.1X supplicant. For more information, see the “Using 802.1X with MAC Authentication Bypass” section on page 44-12.
- When a data or a voice device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.
- If more than one device is detected on the data VLAN or more than one voice device is detected on the voice VLAN while a port is unauthorized, the port is error-disabled.
- When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that was allowed on the port in the voice VLAN is automatically removed and must be reauthenticated on that port.
- Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.
- Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.
- If a data domain is authorized first and placed in the guest VLAN, non-802.1X-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.
- We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.
802.1X Supplicant and Authenticator Switches with Network Edge Access Topology

The Network Edge Access Topology (NEAT) feature extends identity to areas outside the wiring closet (such as conference rooms).

You can enable any authentication host mode on the authenticator switch interface that connects to a supplicant switch. Once the supplicant switch authenticates successfully, the port mode changes from access to trunk. To ensure that NEAT works on all host modes, use the `dot1x supplicant force-multicast` global configuration command on the supplicant switch. If the access VLAN is configured on the authenticator switch, it becomes the native VLAN for the trunk port after successful authentication.

**Note**

MAB is not supported or recommended for use with NEAT. Only use 802.1X to authenticate the supplicant switch.

**Note**

The Catalyst 4500 series switch only supports authenticator ports.

Deployment

NEAT is intended for deployment scenarios where a switch acting as 802.1X authenticator to end-hosts (PC or Cisco IP-phones) is placed in an unsecured location (outside wiring closet).

Because of this topology, the authenticator switch cannot always be trusted. For example, compact switches (8-port Catalyst 3560 and Catalyst 2960) are generally deployed outside the wiring closet. This enables hacker devices to swamp them to gain access to the network, compromising security. An edge switch must be able to authenticate itself against another switch, referred to as Network Edge Authentication Topology (NEAT).

Figure 44-8 illustrates a typical NEAT topology.

**Figure 44-8 Typical NEAT Topology**

NEAT facilitates the following functionality in such scenarios:
Chapter 44 Configuring 802.1X Port-Based Authentication

About 802.1X Port-Based Authentication

Host Authorization—Ensures that only traffic from authorized hosts (connecting to the switch with a supplicant) is allowed on the network. The switches use Client Information Signalling Protocol (CISP) to send the MAC addresses connecting the supplicant switch to the authenticator switch.

Auto enablement—Automatically enables trunk configuration on the authenticator switch, allowing user traffic from multiple VLANs arising from supplicant switches. At the ACS, you must configure the Cisco AV pair as device-traffic-class=switch. For details on how to do this, see the “Configuring an Authenticator and a Supplicant Switch with NEAT” section on page 44-85.

How 802.1X Fails on a Port

802.1X may fail on a port in three ways: timeout, explicit failure, and protocol timeout.

Timeout—A switch attempts 802.1X at link up but the attached endpoint is not 802.1X-capable. After the configured number of retries and timeouts, the switch attempts the next authentication method if one is configured (like MAB). If MAB fails, the switch deploys the Guest VLAN (also called the no-response VLAN), if configured. The Guest VLAN is configured with the authentication event no-response interface command.

Explicit Failure—A switch and the endpoint perform the entire 802.1X authentication sequence and the result is an explicit failure (usually indicated by an Access-Reject from the RADIUS server to the switch and an EAP-Failure sent from the switch to the endpoint). In this case, the switch attempts MAB (if "authentication event failure action next-method" is configured) or deploy the AuthFail VLAN (if "authentication event failure action authorize vlan" is configured).

Protocol Timeout—A switch and the endpoint start the 802.1X authentication process but do not complete it. For example, the endpoint may send an 802.1X EAPoL-Start message and then stop responding to the switch (perhaps, because the endpoint lacks a credential or because it is waiting for end user to enter some information). In this case, the switch knows that the connected device is EAPoL-capable, so it will not deploy the Guest VLAN after timing out. Instead, it restarts authentication after a timeout. The switch continues to label the port as EAPoL-capable until a physical link down event is detected. To force the switch to deploy the Guest VLAN in the case of a protocol timeout, configure dot1x guest-vlan supplicant globally. If the port is configured for hostmode multi-domain authentication, the switch behaves as if dot1x guest-vlan supplicant is configured.

Supported Topologies

The 802.1X port-based authentication supports two topologies:

- Point-to-point
- Wireless LAN

In a point-to-point configuration (see Figure 44-1 on page 44-3), only one client can be connected to the 802.1X-enabled switch port when the multiple-host mode is not enabled (the default). The switch detects the client when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

For 802.1X port-based authentication in a wireless LAN (Figure 44-9), you must configure the 802.1X port as a multiple-host port that is authorized as a wireless access point once the client is authenticated. (See the “Resetting the 802.1X Configuration to the Default Values” section on page 44-92.) When the port is authorized, all other hosts that are indirectly attached to the port are granted access to the network. If the port becomes unauthorized (reauthentication fails or an EAPOL-logoff message is received), the
switch denies access to the network for all wireless access point-attached clients. In this topology, the wireless access point is responsible for authenticating clients attached to it, and the wireless access point acts as a client to the switch.

Figure 44-9 Wireless LAN Example

### Configuring 802.1X Port-Based Authentication

To configure 802.1X, follow this procedure:

1. **Step 1** Enable 802.1X authentication. See the “Enabling 802.1X Authentication” section on page 44-28.
2. **Step 2** Configure switch to RADIUS server communication. See the “Configuring Switch-to-RADIUS-Server Communication” section on page 44-32.
3. **Step 3** Adjust the 802.1X timer values. See the “Changing the Quiet Period” section on page 44-81.
4. **Step 4** Configure optional features. See the “Configuring RADIUS-Provided Session Timeouts” section on page 44-51.

These sections describe how to configure 802.1X:

- Default 802.1X Configuration, page 44-27
- 802.1X Configuration Guidelines, page 44-28
- Enabling 802.1X Authentication, page 44-28 (required)
- Configuring Switch-to-RADIUS-Server Communication, page 44-32 (required)
- Configuring Multiple Domain Authentication and Multiple Authorization, page 44-34
- Configuring 802.1X Authentication with ACL Assignments and Redirect URLs, page 44-38
- Configuring 802.1X Authentication with Per-User ACL and Filter-ID ACL, page 44-44
- Configuring RADIUS-Provided Session Timeouts, page 44-51 (optional)
- Configuring MAC Move, page 44-53 (optional)
- Configuring MAC Replace, page 44-53 (optional)
- Configuring Violation Action, page 44-54 (optional)
- Configuring 802.1X with Guest VLANs, page 44-55 (optional)
- Configuring 802.1X with MAC Authentication Bypass, page 44-58 (optional)
• Configuring 802.1X with Inaccessible Authentication Bypass, page 44-60 (optional)
• Configuring 802.1X with Unidirectional Controlled Port, page 44-64 (optional)
• Configuring 802.1X with VLAN User Distribution, page 44-66
• Configuring 802.1X with Authentication Failed, page 44-68 (optional)
• Configuring 802.1X with Voice VLAN, page 44-70 (optional)
• Configuring 802.1X with VLAN Assignment, page 44-71
• Enabling Fallback Authentication, page 44-73
• Enabling Periodic Reauthentication, page 44-78 (optional)
• Enabling Multiple Hosts, page 44-80 (optional)
• Changing the Quiet Period, page 44-81 (optional)
• Changing the Switch-to-Client Retransmission Time, page 44-82 (optional)
• Setting the Switch-to-Client Frame-Retransmission Number, page 44-83 (optional)
• Configuring an Authenticator and a Supplicant Switch with NEAT, page 44-85
• Manually Reauthenticating a Client Connected to a Port, page 44-91 (optional)
• Initializing the 802.1X Authentication State, page 44-91
• Removing 802.1X Client Information, page 44-92
• Resetting the 802.1X Configuration to the Default Values, page 44-92 (optional)

Default 802.1X Configuration

Table 44-1 shows the default 802.1X configuration.

</table>
Guidelines for configuring 802.1X authentication include the following:

- The 802.1X protocol is supported only on Layer 2 static access, PVLAN host ports, and Layer 3 routed ports. You cannot configure 802.1X for any other port modes.

- If you are planning to use VLAN assignment, be aware that the features use general AAA commands. For information on how to configure AAA, refer to the “Enabling 802.1X Authentication” section on page 44-28. Alternatively, you can refer to the Cisco IOS security documentation at this location:

### Enabling 802.1X Authentication

To enable 802.1X port-based authentication, you first must enable 802.1X globally on your switch, then enable AAA and specify the authentication method list. A method list describes the sequence and authentication methods that must be queried to authenticate a user.

The software uses the first method listed in the method list to authenticate users; if that method fails to respond, the software selects the next authentication method in the list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle, the authentication process stops, and no other authentication methods are attempted.
To allow VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

To configure 802.1X port-based authentication, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>Switch(config)# dot1x system-auth-control</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>Switch(config)# aaa new-model</code></td>
</tr>
</tbody>
</table>
| **Step 4** | `Switch(config)# aaa authentication dot1x {default} method1 [method2...]` | Creates an 802.1X AAA authentication method list. To create a default list that is used when a named list is not specified in the `authentication` command, use the `default` keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all interfaces. Enter at least one of these keywords:  
  - `group radius`—Use the list of all RADIUS servers for authentication.  
  - `none`—Use no authentication. The client is automatically authenticated by the switch without using the information supplied by the client.  
To disable 802.1X AAA authentication, use the `no aaa authentication dot1x {default | list-name} method1 [method2...]` global configuration command. |
| **Step 5** | `Switch(config)# aaa authorization network {default} group radius` | (Optional) Configures the switch for user RADIUS authorization for all network-related service requests, such as VLAN assignment. |
| **Step 6** | `Switch(config)# interface interface-id` | Enters interface configuration mode and specifies the interface to be enabled for 802.1X authentication. |
| **Step 7** | `Switch(config-if)# switchport mode access` | Specifies a nontrunking, nontagged single VLAN Layer 2 interface. |
| **Step 8** | `Switch(config-if)# dot1x pae authenticator` | Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27. |
| **Step 9** | **Cisco IOS Release 12.2(50)SG and later** `Switch(config-if)# authentication port-control auto` | Enables 802.1X authentication on the interface. **Cisco IOS Release 12.2(46)SG or earlier releases** `Switch(config-if)# dot1x port-control auto` |
| **Step 10** | `Switch(config-if)# end` | Returns to privileged EXEC mode. |
### Configuring 802.1X Port-Based Authentication

**Step 4**
```
Switch(config)# aaa authentication dot1x [default] method1 [method2...]
```
Creates an 802.1X AAA authentication method list.

To create a default list that is used when a named list is not specified in the `authentication` command, use the `default` keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all interfaces.

Enter at least one of these keywords:

- **group radius**—Use the list of all RADIUS servers for authentication.
- **none**—Use no authentication. The client is automatically authenticated by the switch without using the information supplied by the client.

To disable 802.1X AAA authentication, use the `no aaa authentication dot1x {default | list-name} method1 [method2...]` global configuration command.

**Step 5**
```
Switch(config)# aaa authorization network (default) group radius
```
(Optional) Configures the switch for user RADIUS authorization for all network-related service requests, such as VLAN assignment.

**Step 6**
```
Switch(config)# interface interface-id
```
Enter interface configuration mode and specifies the interface to be enabled for 802.1X authentication.

**Step 7**
```
Switch(config-if)# switchport mode access
```
Specifies a nontrunking, nontagged single VLAN Layer 2 interface.

**Step 8**
```
Switch(config-if)# dot1x pae authenticator
```
Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.

**Step 9**
```
Cisco IOS Release 12.2(50)SG and later
Switch(config-if)# authentication port-control auto
```
Cisco IOS Release 12.2(46)SG or earlier releases
```
Switch(config-if)# dot1x port-control auto
```
Enables 802.1X authentication on the interface.

**Step 10**
```
Switch(config-if)# end
```
Returns to privileged EXEC mode.

---

**Note**
Enabling Spanning Tree PortFast ensures that a port comes up immediately after authorization.

**Note**
Whenever you configure any 802.1X parameter on a port, a dot1x authenticator is automatically created on the port. As a result, **dot1x pae authenticator** appears in the configuration, ensuring that dot1x authentication still works on legacy configurations without manual intervention.
This example shows how to enable 802.1X and AAA on Fast Ethernet port 2/1, and how to verify the configuration:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# configure terminal
Switch(config)# dot1x system-auth-control
Switch(config)# aaa new-model
Switch(config)# aaa authentication dot1x default group radius
Switch(config)# interface fastethernet2/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
```

```
Switch# show authentication sessions interface f9/2

Configuring Switch-to-RADIUS-Server Communication

A RADIUS security server is identified by its host name or IP address, host name and specific UDP port number, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication), the second host entry configured acts as the failover backup to the first one. The RADIUS host entries are tried in the order they were configured.
To configure the RADIUS server parameters on the switch, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# radius-server host</td>
<td>Configures the RADIUS server parameters on the switch. For hostname</td>
</tr>
<tr>
<td></td>
<td>(hostname</td>
<td>ip-address) auth-port port-number [acct-port port-number]</td>
</tr>
<tr>
<td></td>
<td>[test username name]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[ignore-auth-port]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[ignore-acct-port]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[idle-time min] key string</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon. If you want to use multiple RADIUS servers, use this command multiple times.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config-if)# radius deadtime min</td>
<td>(Optional) Configures the number of minutes before a dead RADIUS server is tested to check whether it has come back up. The default is 1 minute.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config-if)# radius dead-criteria time seconds tries num</td>
<td>(Optional) Configures the criteria used to decide whether a RADIUS server is dead. The time parameter specifies the number of seconds after which a request to the server is unanswered before it is considered dead. The tries parameter specifies the number of times a request to the server is unanswered before it is considered dead. The recommended values for these parameters are tries equal to radius-server retransmit and time equal to radius-server retransmit x radius-server timeout.</td>
</tr>
</tbody>
</table>
Chapter 44      Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

This example shows how to specify the server with IP address 172.120.39.46 as the RADIUS server. The first command specifies port 1612 as the authorization port, sets the encryption key to rad123.

The second command dictates that key matches are performed on the RADIUS server:

Switch# configure terminal
Switch(config)# radius-server host 172.120.39.46 auth-port 1612 key rad123
Switch(config)# end

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the `radius-server host` global configuration command. If you want to configure these options on a per-server basis, use the `radius-server timeout`, `radius-server retransmit`, and the `radius-server key` global configuration commands.

You also need to create a AAA client setting on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch.

### Configuring Multiple Domain Authentication and Multiple Authorization

**Note**

Multiple Authorization requires Cisco IOS Release 12.2(50)SG and later releases.

To configure Multiple Domain Authentication (MDA) and Multiple Authorization, perform this task.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# radius-server vsa send authentication</td>
<td>Configures the network access server to recognize and use vendor-specific attributes (VSAs).</td>
</tr>
<tr>
<td>Step 3 Switch(config)# interface interface-id</td>
<td>Specifies the port to which multiple hosts are indirectly attached, and enters interface configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 44  Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

This example shows how to enable 802.1X authentication and to allow multiple hosts:

### Cisco IOS Release 12.2(50)SG and later

Switch(config)# interface gigabitethernet2/1
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication host-mode multi-host
Switch(config-if)# end

### Cisco IOS Release 12.2(46)SG or earlier

Switch(config)# interface gigabitethernet2/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
Switch(config-if)# end

**Command**

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong></td>
<td>The keywords allow the following:</td>
</tr>
<tr>
<td>Switch(config-if)# [no] authentication host-mode (single-host</td>
<td>multi-host</td>
</tr>
<tr>
<td><strong>Cisco IOS Release 12.2(46)SG or earlier releases</strong></td>
<td>You must configure a voice VLAN for an IP phone when the host mode is set to multi-domain. For more information, see Chapter 41, “Configuring Voice Interfaces.”</td>
</tr>
<tr>
<td>Switch(config-if)# [no] dot1x host-mode (single-host</td>
<td>multi-host</td>
</tr>
</tbody>
</table>

**Note**

- **multi-auth**—Allows multiple hosts and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port. This keyword requires Cisco IOS Release 12.2(50)SG or a later release.

Ensure that the **dot1x port-control** interface configuration command is set to **auto** for the specified interface.

To disable multiple hosts on the port, use the **no authentication host-mode {multi-host | multi-domain | multi-auth}** interface configuration command (for earlier releases, use the **no dot1x host-mode {multi-host | multi-domain}** interface configuration command).

**Step 5**

Switch(config-if)# switchport voice vlan vlan-id 
(Optional) Configures the voice VLAN.

**Step 6**

Switch(config-if)# end
Returns to privileged EXEC mode.

**Step 7**

Switch# show dot1x interface interface-id [detail]
Verifies your entries.

**Step 8**

Switch# copy running-config startup-config
(Optional) Saves your entries in the configuration file.

This example shows how to enable 802.1X authentication and to allow multiple hosts:
This example shows how to enable MDA and to allow both a host and a 802.1X voice device (a Cisco or third-party phone with 802.1X supplicant) on the port:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# end
```

**Cisco IOS Release 12.2(46)SG or earlier**

```
Switch# conf t
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
Switch(config-if)# no shut
Switch(config-if)# end
```

This example shows how to enable MDA and to allow both a host and a non-802.1X voice device on the port:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# mab eap
Switch(config-if)# no shut
Switch(config-if)# end
```

**Cisco IOS Release 12.2(46)SG or earlier**

```
Switch# conf t
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
```
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
Switch(config-if)# dot1x mac-auth-bypass
Switch(config-if)# no shut
Switch(config-if)# end

This example shows how to verify the dot1x MDA settings on interface FastEthernet3/1:

Switch# show dot1x interface FastEthernet3/1 detail

Dot1x Info for FastEthernet3/1
-----------------------------------

Switch#

This example shows how to enable MDA and to authentication of multiple hosts and a voice device on an IEEE 802.1x-authorized port:

Note   This example applies to Cisco IOS Release 12.2(50)SG and later releases.

Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Configuring 802.1X Port-Based Authentication

Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication host-mode multi-auth
Switch(config-if)# map eap
Switch(config-if)# no shut
Switch(config-if)# end

Configuring 802.1X Authentication with ACL Assignments and Redirect URLs

This section includes these topics:
- Downloadable ACL, page 44-38
- URL-Redirect, page 44-40
- Configuring a Downloadable Policy, page 44-43

Downloadable ACL

The downloadable ACL (DACL) feature allows you to download device specific authorization policies from the authentication server. These policies activate after authentication succeeds for the respective client and the client's IP address was populated in the IP device tracking table. (Downloadable ACL is applied on the port, once the port is authenticated and the IP device tracking table has the host IP address entry).

The following sections describe the configuration that is necessary to complement the related authentication (802.1X or MAB) configuration. (No unique configuration is required on the switch. All of the configuration is on the ACS.) After authentication succeeds, enter the show ip access-list command to display the downloadable ACLs.

Configuring the Switch for Downloadable ACL

To configure the switch for downloadable ACL, follow these steps:

1. Configure the IP device tracking table.
   Switch(config)# ip device tracking

2. Configure RADIUS VSA to forward authentication.
   Switch(config)# radius-server vsa send authentication

3. Configure static ACL for the interface.
   Switch(config)# int g2/9
   Switch(config-if)# ip access-group pacl-4 in

Interface Configuration Example

Switch# show running-configuration interface g2/9
Building configuration...

Current configuration : 617 bytes
!
interface GigabitEthernet2/9
  switchport
  switchport access vlan 29
  switchport mode access
switchport voice vlan 1234
access-group mode prefer port
ip access-group pacl-4 in
speed 100
duplex full
authentication event fail action authorize vlan 111
authentication event server dead action authorize vlan 333
authentication event server alive action reinitialize
authentication host-mode multi-auth
authentication order dot1x
authentication port-control auto
authentication timer restart 100
authentication timer reauthenticate 20
authentication timer inactivity 200
mab eap
dot1x pae authenticator
end
Switch#
Switch# show ip access-list pacl-4
  10 permit ip host 1.1.1.1 host 2.2.2.2
  20 permit icmp host 1.1.1.1 host 2.2.2.2
Switch#

Debug Commands for DACL

The IP device tracking table contains the host IP address learned through ARP or DHCP.

The following command displays the constraints on the IP device tracking table:

Switch# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Interface</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>50.0.0.12</td>
<td>0015.60a4.5e84</td>
<td>GigabitEthernet2/9</td>
<td>ACTIVE</td>
</tr>
</tbody>
</table>

The following command shows that the Policy Enforced Module (EPM) session contains the downloadable ACL obtained from ACS:

Switch# show epm session ip 50.0.0.12
Admission feature       : DOT1X
AAA Policies            :
ACS ACL                 : xACSACLx-IP-auth-48b79b6e

The following command displays the contents of the downloadable ACL:

Switch# show ip accesslists xACSACLx-IP-auth-48b79b6e
Extended IP access list xACSACLx-IP-auth-48b79b6e (per-user)
  10 permit udp any any
Switch(config)#
Cisco ACS Configuration for DACL

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
</table>
|Only Cisco ACS supports DACL.

To ensure correct functioning of the ACS configuration required for DACL, follow these steps:

**Step 1** Configure a downloadable IP ACL on the window that appears when you select Radius Shared Profile > Downloadable IP ACL Content (Figure 44-10).

*Figure 44-10  Shared Profile Components*

**Downloadable IP ACL Content**

Name: auth

<table>
<thead>
<tr>
<th>ACL Definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>permit ip any host 10.10.10.10</td>
</tr>
</tbody>
</table>

**Step 2** Attach this downloadable ACL with the USER on the window that appears when you select User > DACLs (Figure 44-11).

*Figure 44-11  Downloadable ACLs*

**URL-Redirect**

To configure URL-direct, you need to configure it on the ACS, and on the switch.
Chapter 44 Configuring 802.1X Port-Based Authentication

Configuring ACS

To configure two Cisco-AV pairs, add the following statements under the user or group Cisco IOS/PIX 6x RADIUS attributes:

```
url-redirect-acl=urlacl
url-redirect=http://www.cisco.com
```

**Note**
A default port ACL must be configured on the interface.

Configuring the Switch

To configure the switch for URL redirect, follow these steps:

1. **Step 1** Configure the IP device tracking table.
   
   `Switch(config)# ip device tracking`

2. **Step 2** Configure RADIUS by using the `send authentication` command.
   
   `Switch(config)# radius-server vsa send authentication`

3. **Step 3** Configure the URL redirect ACL (URLACL).
   
   `Switch# ip access-list urlacl
   10 permit tcp any any
   Switch#`

4. **Step 4** Configure static ACL (PACL) for the interface.
   
   `Switch(config)# int g2/9
   Switch(config-if)# ip access-group pac1-4 in`

Interface Configuration Example

`Switch# show running-configuration int g2/9`

```
Building configuration...

Current configuration : 617 bytes
!
interface GigabitEthernet2/9
switchport
switchport access vlan 29
switchport mode access
switchport voice vlan 1234
access-group mode prefer port
ip access-group pac1-4 in
speed 100
duplex full
authentication event fail action authorize vlan 111
authentication event server dead action authorize vlan 333
authentication event server alive action reinitialize
authentication host-mode multi-auth
authentication order dot1x
authentication port-control auto
authentication timer restart 100
authentication timer reauthenticate 20
authentication timer inactivity 200
mab
```
dot1x pae authenticator
end
Switch#
Switch# show access-list pacl-4
  10 permit ip host 1.1.1.1 host 2.2.2.2
  20 permit icmp host 1.1.1.1 host 2.2.2.2
Switch#

Verify URL-redirect by using the following commands.

The **show ip device tracking** command displays the constraints on the IP device tracking table:

```
Switch(config)# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30
```

```
<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Interface</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>50.0.0.12</td>
<td>0015.60a4.5e84</td>
<td>GigabitEthernet2/9</td>
<td>ACTIVE</td>
</tr>
</tbody>
</table>
```

The **show epm session ip** command displays the EPM session table for a particular host. Observe the URL-redirect-acl and URL-redirect URL information that downloads from the ACS.

```
Switch# show epm session ip 50.0.0.12
Admission feature : DOT1X
AAA Policies      :
URL Redirect ACL  : urlacl
URL Redirect      : http://www.cisco.com
```

For more information about AV pairs that are supported by Cisco IOS software, see the ACS configuration and command reference documentation about the software releases running on the AAA clients.

**Guideline for DACL and URL Redirect**

For downloadable ACL or URL redirect, the ACL source must be ANY (permit TCP ANY host 1.1.1.1 eq 80 or permit TCP ANY host 1.1.1.1 eq 443).
## Configuring a Downloadable Policy

To configure downloadable policies, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td>Defines the default port ACL through a source address and wildcard. The <em>access-list-number</em> is a decimal from 1 to 99 or 1300 to 1999. Enter <em>deny</em> or <em>permit</em> to specify whether to deny or permit access if conditions match. Source is the address of the network or host from which the packet is sent, specified as follows:</td>
</tr>
<tr>
<td></td>
<td>• The 32-bit quantity in dotted-decimal format</td>
</tr>
<tr>
<td></td>
<td>• The keyword <em>any</em> as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255 You do not need a source-wildcard value.</td>
</tr>
<tr>
<td></td>
<td>• The keyword <em>host</em> as an abbreviation for source and source-wildcard of source 0.0.0.0. (Optional) Applies the source-wildcard wildcard bits to the source. (Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# ip access-group {access-list-number</td>
</tr>
<tr>
<td></td>
<td>Controls access to the specified interface. This step is mandatory for a functioning downloaded policy.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# aaa new-model</td>
</tr>
<tr>
<td></td>
<td>Enables AAA.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config)# aaa authorization network default local</td>
</tr>
<tr>
<td></td>
<td>Sets the authorization method to local. To remove the authorization method, use the no aaa authorization network default local command.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config)# ip device tracking</td>
</tr>
<tr>
<td></td>
<td>Enables the IP device tracking table. To disable the IP device tracking table, use the no ip device tracking global configuration commands.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch(config)# ip device tracking {probe {count count</td>
</tr>
<tr>
<td></td>
<td>(Optional) Configures these parameters for the IP device tracking table:</td>
</tr>
<tr>
<td></td>
<td>• <em>count</em>—Number of times that the switch sends the ARP probe. The range is 1 to 5. The default is 3.</td>
</tr>
<tr>
<td></td>
<td>• <em>interval</em>—Number of seconds that the switch waits for a response before resending the ARP probe. The range is 30 to 300 seconds. The default is 30 seconds.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch(config)# ip device tracking {probe {delay interval}}</td>
</tr>
<tr>
<td></td>
<td>(Optional) Configures the optional probe delay parameter for the IP device tracking table:</td>
</tr>
<tr>
<td></td>
<td>• <em>interval</em>—Number of seconds that the switch delays sending an ARP probe, triggered by link-up and ARP probe generation by the tracked device. The range is 1 to 120 seconds. The default is 0 seconds.</td>
</tr>
</tbody>
</table>
Chapter 44  Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

The following example illustrates how to configure a switch for downloadable policy:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# radius-server vsa send authentication</td>
<td>Configures the network access server to recognize and use vendor-specific attributes. <strong>Note</strong> The downloadable ACL must be operational.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch# show ip device tracking (all</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Step 11
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# aaa new-model
Switch(config)# aaa authorization network default local
Switch(config)# ip device tracking
Switch(config)# ip access-list extended default_acl
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# radius-server vsa send authentication
Switch(config)# int fastEthernet 2/13
Switch(config-if)# ip access-group default_acl in
Switch(config-if)# exit

Step 12
Switch(config)# end

Step 13
Switch# show ip device tracking (all | interface interface-id | ip ip-address | mac mac-address)

Step 14
Switch# copy running-config startup-config

The following example illustrates how to configure a switch for downloadable policy:

Switch# config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# aaa new-model
Switch(config)# aaa authorization network default local
Switch(config)# ip device tracking
Switch(config)# ip access-list extended default_acl
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# radius-server vsa send authentication
Switch(config)# int fastEthernet 2/13
Switch(config-if)# ip access-group default_acl in
Switch(config-if)# exit

Configuring 802.1X Authentication with Per-User ACL and Filter-ID ACL

This section includes the following topics:

- Per-User ACL and Filter-ID ACL, page 44-44
- Configuring a Per-User ACL and Filter-ID ACL, page 44-50

Per-User ACL and Filter-ID ACL

Prior to Cisco IOS Release 12.2(52)SG, the Catalyst 4500 platform only supported downloadable ACLs, which work with the Cisco ACS server but not with third-party AAA servers. With Cisco IOS Release 12.2(52)SG, the Catalyst 4500 switch offers the Filter-ID/Per-user-acl enhancement, which allows ACL policy enforcement using a third-party AAA server.

The Filter-ID feature provides the following capabilities:

Filter-ID option allows an administrator to define the ACL name on the AAA server using IETF standard RADIUS attribute. The ACL itself must be preconfigured locally on the switch.

The Per-user-acl feature provides the following capabilities:

Per-user ACL allows an administrator to define the per-user ACL on the AAA server using Cisco RADIUS AV pairs. This action allows a third-party AAA server to interoperate by loading the Cisco RADIUS dictionary, which has Cisco Radius AV pairs configured as a VSA.

**Note** The RADIUS vendor-specific attributes (VSAs) allow vendors to support their own proprietary RADIUS attributes that are not included in standard RADIUS attributes.
Configuring the Switch

To configure the switch for per-user ACL and filter-ID ACL:

**Step 1**  Configure the IP device tracking table.

Switch(config)# ip device tracking

**Step 2**  Configure static ACL for the interface.

Switch(config)# int g2/9
Switch(config-if)# ip access-group pacl-4 in

**Interface Configuration Example**

Switch# show running-configuration interface g2/9
Building configuration...

Current configuration : 617 bytes
!
interface GigabitEthernet2/9
   switchport
   switchport access vlan 29
   switchport mode access
   switchport voice vlan 1234
   access-group mode prefer port
   ip access-group pacl-4 in
   speed 100
duplex full
   authentication event fail action authorize vlan 111
   authentication event server dead action authorize vlan 333
   authentication event server alive action reinitialize
   authentication host-mode multi-auth
   authentication order dot1x
   authentication port-control auto
   authentication timer restart 100
   authentication timer reauthenticate 20
   authentication timer inactivity 200
   mab eap
dot1x pae authenticator
end

Switch#
Switch# show ip access-list pacl-4
   10 permit ip host 1.1.1.1 host 2.2.2.2
   20 permit icmp host 1.1.1.1 host 2.2.2.2
Switch#

**Per-User ACL Configuration in ACS**

In the Group/User Setting page, scroll down to the Cisco IOS/PIX 6.x RADIUS Attributes section. Select the box next to [009\001 cisco-av-pair] and enter the elements of the per-user ACL. Per-user ACLS take this format:

```
protocol_:inacl# sequence number=ACE
```

**protocol** Either  ip (for IP-based ACLs) or mac (for MAC-based ACLs)
Figure 44-12 shows how members of the group you are configuring are denied all access to the 10.100.60.0 subnet, are denied HTTP access to the server at 10.100.10.116, and are permitted everywhere else.

**Figure 44-12** Define the ACEs for the Per-User ACL

*Note* Outbound ACLs (OUTACL) are not supported.

**Filter-Id Configuration in ACS**

In the Group/User Setting page, scroll down to the IETF RADIUS Attributes section. Select the box next to Filter-Id and enter the ACL to apply for members of this group (Figure 44-13).

The Filter-Id is in this format:

```
ACL_.in
```

- **ACL**: Number of the ACL that was previously configured on the switch
Figure 44-13  Configuring the Filter-ID Attribute

**Note**

Outbound ACLs (for example, 100.out) are not supported.

**Debug Commands for Per-User ACL and Filter-ID ACL**

The IP device tracking table contains the host IP address learned through ARP or DHCP. The following command displays the constraints on the IP device tracking table:

```
Switch# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30
--------------------------------------------------------------
IP Address MAC Address Interface STATE
--------------------------------------------------------------
50.0.0.12 0015.60a4.5e84 GigabitEthernet2/9 ACTIVE
```
The following command shows that the Policy Enforced Module (EPM) session contains the per-user-acl from ACS:

```
Switch# show epm session ip 50.0.0.12
Admission feature : DOT1X
AAA Policies :
Per-User ACL            : deny ip any host 20.20.10.10
```

The following command displays the contents of the per-user-acl (note that per-user-acl are shown above as the default port ACL configured on the interface, 151 is the default port ACL in the following example):

```
Switch# show access-list
Extended IP access list 151

    deny ip host 20.20.0.3 host 20.20.10.10

10 permit ip any any (57 estimate matches)
```

The following command displays the number of sessions and the corresponding client IP addresses:

```
Switch# show epm session summary
EPM Session Information

-----------------------
Total sessions seen so far : 1
Total active sessions      : 1
Session IP Address :
-------------------
50.0.0.12
```

The following command displays that the Policy Enforced Module (EPM) session contains the per-user-acl (both IP and MAC ACL from ACS):

```
Switch# show epm session ip 50.0.0.12
Admission feature : DOT1X
AAA Policies :
Per-User ACL            : deny ip any host 20.20.10.10
Per-User ACL            : deny any host 0000.AAAA.AAAA
```

The following command displays the contents of the per-user-acl (note that per-user-acl are shown above as the default port ACL configured on the interface, 151 is the default port ACL in the preceding example below):

```
Switch# show access-list
Extended IP access list 151

    deny ip host 20.20.0.3 host 20.20.10.10

10 permit ip any any (57 estimate matches)
```

```
The following command shows that the Policy Enforced Module (EPM) session contains the Filter-Id 155 from ACS:

```
Note
The 156 IP extended ACL is to be preconfigured on the switch, so that the policy enforcement can happen.
```

```
Switch# show ip access-list 156
Extended IP access list 156
  10 deny ip any host 155.155.155.156
  20 deny ip any 156.100.60.0 0.0.0.255
  30 deny tcp any host 156.100.10.116 eq www

Switch# show epm session ip 50.0.0.12
Admission feature : DOT1X
AAA Policies :
  Filter-Id               : 155

The following command displays the contents of the Filter-Id applied on the interface:

```
Switch# show ip access-list int gi6/3
Switch# show ip access-list interface gi6/3
  deny ip host 20.20.0.2 host 155.155.155.156
  deny ip host 20.20.0.2 156.100.60.0 0.0.0.255
  deny tcp host 20.20.0.2 host 156.100.10.116 eq www
```

**Guidelines for Per-User ACL and Filter-ID ACL**

For per user ACL and Filter-ID ACL, the ACL source must be ANY (permit TCP ANY host 1.1.1.1 eq 80 or permit TCP ANY host 1.1.1.1 eq 443).
# Configuring a Per-User ACL and Filter-ID ACL

To configure per-user ACL and Filter-ID ACL, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# access-list access-list-number {deny</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# ip access-group {access-list-number</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# aaa new-model</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config)# aaa authorization network default local</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config)# ip device tracking</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch(config)# ip device tracking {probe {count count</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch(config)# ip device tracking {probe {delay interval}}</td>
</tr>
</tbody>
</table>

**Command**

- Enters global configuration mode.
- Defines the default port ACL through a source address and wildcard. The *access-list-number* is a decimal from 1 to 99 or 1300 to 1999. Enter *deny* or *permit* to specify whether to deny or permit access if conditions match.
- *source* is the address of the network or host from which the packet is sent, specified as follows:
  - The 32-bit quantity in dotted-decimal format
  - The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255
  - You do not need a source-wildcard value.
  - The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0.

(Optional) Applies the source-wildcard wildcard bits to the source.

(Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.

**Purpose**

- Enters interface configuration mode.
- Controls access to the specified interface. This step is mandatory for a functioning downloaded policy.
- Returns to global configuration mode.
- Enables AAA.
- Sets the authorization method to local. To remove the authorization method, use the *no aaa authorization network default local* command.
- Enables the IP device tracking table.
  - To disable the IP device tracking table, use the *no ip device tracking* global configuration commands.

(Optional) Configures these parameters for the IP device tracking table:

- *count*—Number of times that the switch sends the ARP probe. The range is 1 to 5. The default is 3.
- *interval*—Number of seconds that the switch waits for a response before resending the ARP probe. The range is 30 to 300 seconds. The default is 30 seconds.

(Optional) Configures the optional probe delay parameter for the IP device tracking table:

- *interval*—Number of seconds that the switch delays sending an ARP probe, triggered by link-up and ARP probe generation by the tracked device. The range is 1 to 120 seconds. The default is 0 seconds.
Chapter 44 Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

The following example illustrates how to configure a switch for downloadable policy:

```
Switch(config)# end
```

Returns to privileged EXEC mode.

```
Switch# show ip device tracking {all | interface interface-id | ip ip-address | mac mac-address}
```

Displays information about the entries in the IP device tracking table.

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### Configuring RADIUS-Provided Session Timeouts

You can configure the Catalyst 4500 series switch to use a RADIUS-provided reauthentication timeout. To configure RADIUS-provided timeouts, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode access Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# dot1x pae authenticator Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong></td>
<td>Switch(config-if)# authentication timer reauthenticate {interface</td>
</tr>
<tr>
<td><strong>Cisco IOS Release 12.2(45)SG or earlier releases</strong></td>
<td>Switch(config-if)# dot1x timeout reauth-attempts {interface</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-if)# end Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# show dot1x interface interface-id details Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# copy running-config startup-config (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This example shows how to configure a switch to derive the reauthentication period from the server and to verify the configuration:

**Cisco IOS Release 12.2(50):**

```
Switch# configure terminal
Switch(config)# interface f7/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator

## Configuring MAC Move

MAC move allows an authenticated host to move from one switch port to another.

**Note**  
You should remove port security before configuring MAC move.

To globally enable MAC move on the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config)# authentication mac-move permit</td>
<td>Enable MAC move globally.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch# show run</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch # copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to globally enable MAC move on a switch:

```
Switch# configure terminal
Switch(config)# authentication mac-move permit
```

The following syslog messages displays when MAC-move happens:

```
%AUTHMGR-5-SECUREMACMOVE: <mac-addr> moved from <interface-name> to <interface-name>
```

## Configuring MAC Replace

MAC replace allows new users to connect to abandoned ports.

If a user disconnects but the switch has not received the EAPoL-Logoff, the session will remain up. For single or multiple-domain modes, no new hosts can connect to that port. If a new host tries to connect, a violation is triggered on the port. Where the violation action is configured as replace, the desired behavior is for the NAD (switch) to terminate the initial session and reset the authentication sequence based on the new MAC.

To enable MAC replace on a switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode.</td>
</tr>
</tbody>
</table>
### Configuring 802.1X Port-Based Authentication

#### Configuring 802.1X Port-Based Authentication

This example shows how to globally enable MAC replace on a switch:

```
Switch# configure terminal
Switch(config)# interface f7/1
Switch(config-if)# authentication violation replace
```

The following syslog messages displays when MAC-replace occurs:

```
%AUTHMGR-5-SECUREMACREPLACE: <mac-addr> replaced <mac-addr> on <interface-name>
```

#### Configuring Violation Action

You can configure 802.1X security violation behavior as either shutdown, restrict, or replace mode, based on the response to the violation.

To configure the violation action, performing the following task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 Switch(config-if)# authentication violation [restrict</td>
<td>shutdown</td>
</tr>
<tr>
<td></td>
<td>The default action is to shut down the port. If the restrict keyword is configured, the port does not shut down.</td>
</tr>
<tr>
<td></td>
<td>When a new host is seen in single or multiple-domain modes, replace mode tears down the old session and authenticates the new host.</td>
</tr>
<tr>
<td>Step 4 Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 Switch# show run</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 6 Switch # copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to globally enable MAC replace on a switch:

```
Switch# configure terminal
Switch(config)# interface f7/1
Switch(config-if)# authentication violation replace
```

A port is error-disabled when a security violation triggers on shutdown mode. The following syslog messages displays:

```
%AUTHMGR-5-SECURITY_VIOLATION: Security violation on the interface <interface-name>, new MAC address <mac-address> is seen.
```
%PM-4-ERR_DISABLE: security-violation error detected on <interface name>, putting <interface name> in err-disable state

## Configuring 802.1X with Guest VLANs

You can configure a guest VLAN for each 802.1X port on the Catalyst 4500 series switch to provide limited services to clients, such as downloading the 802.1X client. These clients might be upgrading their system for 802.1X authentication, and some hosts, such as Windows 98 systems, might not be 802.1X-capable.

When you enable a guest VLAN on an 802.1X port, the Catalyst 4500 series switch assigns clients to a guest VLAN, provided one of the following apply:

- The authentication server does not receive a response to its EAPOL request or identity frame.
- The EAPOL packets are not sent by the client.

Beginning with Cisco IOS Release 12.2(25)EWA, the Catalyst 4500 series switch maintains the EAPOL packet history. If another EAPOL packet is detected on the interface during the lifetime of the link, network access is denied. The EAPOL history is reset upon loss of the link.

Any number of 802.1X-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1X-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1X ports in single-host or multiple-hosts mode.

### Note

When a port is put into a guest VLAN, it is automatically placed into multihost mode, and an unlimited number of hosts can connect using the port. Changing the multihost configuration does not effect a port in a guest VLAN.

### Note

Except for an RSPAN VLAN or a voice VLAN, you can configure any active VLAN as an 802.1X guest VLAN.

To configure 802.1X with guest VLAN on a port, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode and specifies the interface to be enabled for 802.1X authentication.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# switchport mode access</td>
<td>Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td></td>
<td>or Switch(config-if)# switchport mode private-vlan host</td>
<td>Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# dot1x pae authenticator</td>
<td>Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
</tbody>
</table>
This example shows how to enable regular VLAN 50 on Fast Ethernet 4/3 as a guest VLAN on a static access port:

**Cisco IOS Release 12.2(50)SG and later**

```plaintext
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication event no-response action authorize vlan 50
Switch(config-if)# end
Switch#
```

**Cisco IOS Release 12.2(46)SG or earlier**

```plaintext
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x guest-vlan 50
Switch(config-if)# end
Switch#
```

This example shows how to enable a secondary PVLAN 100 as a guest VLAN on a PVLAN host port:

**Cisco IOS Release 12.2(50)SG and later**

```plaintext
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication event no-response action authorize vlan 100
Switch(config-if)# end
Switch#
```

**Cisco IOS Release 12.2(46)SG or earlier**

```plaintext
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x guest-vlan 100
Switch(config-if)# end
Switch#
```
Cisco IOS Release 12.2(46)SG or earlier

Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x guest-vlan 100
Switch(config-if)# end
Switch#

To allow supplicants into a guest VLAN on a switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch# dot1x guest-vlan supplicant</td>
<td>(Optional) Enables supplicants to be allowed into the guest VLANs globally on the switch. <strong>Note</strong> Although not visible in the CLI for Cisco IOS Release 12.3(31)SG, legacy configurations that include the <code>dot1x guest-vlan supplicant</code> command still work. We do not recommend that you use this command. However, because the authentication failed VLAN option makes it unnecessary.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode and specifies the interface to be enabled for 802.1X authentication.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(config-if)# switchport mode access or Switch(config-if)# switchport mode private-vlan host</td>
<td>Specifies a nontrunking, nontagged single VLAN Layer 2 interface. Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch(config-if)# dot1x pae authenticator</td>
<td>Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch(config-if)# dot1x guest-vlan vlan-id</td>
<td>Specifies an active VLAN as an 802.1X guest VLAN. The range is 1 to 4094.</td>
</tr>
<tr>
<td><strong>Step 7</strong> <strong>Cisco IOS Release 12.2(50)SG and later</strong> Switch(config-if)# authentication port-control auto <strong>Cisco IOS Release 12.2(46)SG or earlier releases</strong> Switch(config-if)# dot1x port-control auto</td>
<td>Enables 802.1X authentication on the interface.</td>
</tr>
<tr>
<td><strong>Step 8</strong> Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 9</strong> Switch# show dot1x interface interface-id</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 10</strong> Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This example shows how to enable the guest VLAN feature and to specify VLAN 5 as a guest VLAN:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# configure terminal
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication event no-response action authorize vlan 5
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

**Cisco IOS Release 12.2(46)SG or earlier**

```
Switch# configure terminal
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x guest-vlan 5
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

### Configuring 802.1X with MAC Authentication Bypass

To enable MAC Authentication Bypass (MAB), perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# interface interface-id</td>
<td>Specifies the port to be configured, and enters interface configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config-if)# switchport mode access</td>
<td>Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td></td>
<td>or Switch(config-if)# switchport mode private-vlan host</td>
<td>Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config-if)# dot1x pae authenticator</td>
<td>Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
<tr>
<td>5</td>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong> Switch(config-if)# authentication port-control auto</td>
<td>Enables 802.1X authentication on the interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Cisco IOS Release 12.2(46)SG or earlier releases</strong> Switch(config-if)# dot1x port-control auto</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong> Switch(config-if)# mab [eap]</td>
<td>Enables MAB on a switch.</td>
</tr>
<tr>
<td></td>
<td><strong>Cisco IOS Release 12.2(46)SG or earlier releases</strong> Switch(config-if)# dot1x mac-auth-bypass [eap]</td>
<td>The eap option specifies that a complete EAP conversation should be used, as opposed to standard RADIUS Access-Request, Access-Accept conversation. By default, the eap option is not enabled for MAB.</td>
</tr>
</tbody>
</table>
Removing a 802.1X MAB configuration from a port does not impact the authorized or authenticated state of the port. If the port is in an unauthenticated state, it remains in that state. If the port is in an authenticated state because of MAB, the switch reverts to the 802.1X Authenticator. If the port was already authorized with a MAC address and the MAB configuration was removed, the port remains in an authorized state until reauthentication occurs. At that time, if an 802.1X supplicant is detected on the wire, the MAC address is removed.

This example shows how to enable MAB on Gigabit Ethernet interface 3/3 and to verify the configuration:

**Cisco IOS Release 12.2(50)SG and later**

Switch# configure terminal  
Switch(config)# interface gigabitethernet3/3  
Switch(config-if)# switchport mode access  
Switch(config-if)# dot1x pae authenticator  
Switch(config-if)# authentication port-control auto  
Switch(config-if)# mab  
Switch(config-if)# end  
Switch# show mab int g3/3 details  
MAB details for GigabitEthernet3/3  
-------------------------------------  
Mac-Auth-Bypass           = Enabled  
MAB Client List  
-----------------  
Client MAC                = 0001.0001.0001

Vlan Policy = N/A

Switch#

Caution

You must configure the switch to monitor the state of the RADIUS server as described in the section Configuring Switch-to-RADIUS-Server Communication, page 44-32 for Inaccessible Authentication Bypass to work properly. Specifically, you must configure the RADIUS test username, idle-time, deadtime and dead-criteria. Failure to do so results in the switch failing to detect that the RADIUS server has gone down, or prematurely marking a dead RADIUS server as alive again.

To configure a port as a critical port and to enable the Inaccessible Authentication Bypass feature, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# dot1x critical eapol</td>
</tr>
</tbody>
</table>

Note: Some supplicants require this.

The default is not to send EAPOL-Success packets when a port is critically authorized partway through an EAP exchange. If there is no ongoing EAP exchange at the time when a port is critically authorized, EAPOL-Success packet is always sent out regardless of this option.
Chapter 44 Configuring 802.1X Port-Based Authentication

### Step 3

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# <code>authentication critical recovery delay msec</code></td>
<td>(Optional) Specifies a throttle rate for the reinitialization of critically authorized ports when the RADIUS server becomes available. The default throttle rate is 100 milliseconds. This means that 10 ports reinitialize per second.</td>
</tr>
</tbody>
</table>

---

### Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# <code>interface interface-id</code></td>
<td>Specifies the port to be configured and enters interface configuration mode.</td>
</tr>
</tbody>
</table>

---

### Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# <code>switchport mode access</code> or <code>switchport mode private-vlan host</code></td>
<td>Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td>Switch(config-if)# <code>dot1x critical recovery delay msec</code></td>
<td>Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.</td>
</tr>
</tbody>
</table>

### Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# <code>dot1x pae authenticator</code></td>
<td>Enables 802.1X authentication on the port with default parameters.</td>
</tr>
</tbody>
</table>

### Step 7

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# <code>authentication port-control auto</code></td>
<td>Enables 802.1X authentication on the interface.</td>
</tr>
</tbody>
</table>

### Step 8

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# <code>authentication event server dead action authorize [vlan vlan-id]</code></td>
<td>Enables the Inaccessible Authentication Bypass feature for data clients on the port and specifies a VLAN into which data clients are assigned. If no VLAN is specified, data clients are assigned into the configured data VLAN on the port.</td>
</tr>
</tbody>
</table>

To disable the feature, use the `no authentication event server dead action authorize vlan` interface configuration command (for earlier releases, use the `no dot1x critical` interface configuration command).

Alternatively, starting with Cisco IOS Release 15.0(2)SG you can enable Inaccessible Authentication Bypass for data clients using the `authentication event server dead action reinitialize [vlan vlan-id]` interface configuration command which forces all authorized data clients to be reauthenticated when RADIUS becomes unavailable and a client attempts to authenticate. This only applies to data devices. Voice devices are unaffected.

To disable it, use the `no authentication event server dead action reinitialize vlan` interface configuration command.
### Chapter 44  Configuring 802.1X Port-Based Authentication

#### Step 9

**Command**

- Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E
- Cisco IOS Release 12.2(50)SG and later
- Supervisor Engine 7-E and Supervisor Engine 7L-E
- Cisco IOS Release XE 3.2.0SG and later

**Switch (config-if)**

<table>
<thead>
<tr>
<th>authentication</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>event server dead</td>
<td>(Optional) Enables Inaccessible Authentication Bypass for voice clients on the port. This command applies to Multiple Domain Authentication and Multiple Authentication modes. To disable the feature, use the <code>no authentication event server dead action authorize voice</code> interface configuration command.</td>
</tr>
<tr>
<td>action authorize</td>
<td></td>
</tr>
<tr>
<td>voice</td>
<td></td>
</tr>
</tbody>
</table>

**Command**

- Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E
- Cisco IOS Release 12.2(50)SG and later
- Supervisor Engine 7-E and Supervisor Engine 7L-E
- Cisco IOS Release 15.0(1)XO and later

**Switch (config-if)**

<table>
<thead>
<tr>
<th>authentication</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>event server alive</td>
<td>(Optional) Specifies that the port should be reinitialized if it is critically authorized and RADIUS becomes available. The default is not to reinitialize the port.</td>
</tr>
<tr>
<td>action authorize</td>
<td></td>
</tr>
<tr>
<td>voice</td>
<td></td>
</tr>
</tbody>
</table>

**Command**

- Cisco IOS Release 12.2(46)SG or earlier releases

**Switch (config-if)**

| dot1x critical        | (Optional) Enables Inaccessible Authentication Bypass for voice clients on the port. This command applies to Multiple Domain Authentication and Multiple Authentication modes. To disable the feature, use the `no dot1x critical recovery action reinitialize` interface configuration command. |
| recovery action       |         |
| reinitialize          |         |

#### Step 10

**Command**

- Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E
- Cisco IOS Release 12.2(50)SG and later
- Supervisor Engine 7-E and Supervisor Engine 7L-E
- Cisco IOS Release XE 3.2.0SG and later

**Switch (config-if)**

| dot1x critical        | (Optional) Enables Inaccessible Authentication Bypass for voice clients on the port. This command applies to Multiple Domain Authentication and Multiple Authentication modes. To disable the feature, use the `no dot1x critical recovery action reinitialize` interface configuration command. |
| recovery action       |         |
| reinitialize          |         |

**Command**

- Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E
- Cisco IOS Release 12.2(50)SG and later
- Supervisor Engine 7-E and Supervisor Engine 7L-E
- Cisco IOS Release 15.0(1)XO and later

**Switch (config-if)**

- Cisco IOS Release XE 3.2.0SG and later

**Switch (config-if)**

<table>
<thead>
<tr>
<th>authentication</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>event server dead</td>
<td>(Optional) Enables Inaccessible Authentication Bypass for voice clients on the port. This command applies to Multiple Domain Authentication and Multiple Authentication modes. To disable the feature, use the <code>no authentication event server dead action authorize voice</code> interface configuration command.</td>
</tr>
<tr>
<td>action authorize</td>
<td></td>
</tr>
<tr>
<td>voice</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 11

**Command**

- Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E
- Cisco IOS Release 12.2(50)SG and later

- Cisco IOS Release 12.2(50)SG and later
- Supervisor Engine 7-E and Supervisor Engine 7L-E
- Cisco IOS Release XE 3.2.0SG and later

**Switch (config)**

| show dot1x interface | (Optional) Verifies your entries. |
| interface-id details  |         |

#### Step 13

**Command**

- Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E
- Cisco IOS Release 12.2(50)SG and later
- Supervisor Engine 7-E and Supervisor Engine 7L-E
- Cisco IOS Release XE 3.2.0SG and later

**Switch**

| copy running-config   | (Optional) Saves your entries in the configuration file. |
| startup-config        |         |

The following example shows a full configuration of 802.1X with Inaccessible Authentication Bypass, including required AAA and RADIUS configuration as specified in the “Enabling 802.1X Authentication” section on page 44-28 and “Configuring Switch-to-RADIUS-Server Communication” section on page 44-32.

The RADIUS server configured is at IP address 10.1.2.3, using port 1645 for authentication and 1646 for accounting. The RADIUS secret key is mykey. The username used for the test server probes is randomizes. The test probes for both living and dead servers are generated once per minute. The interface FastEthernet 3/1 is configured to critically authenticate into VLAN 17 when AAA becomes unresponsive, and to reinitialize automatically when AAA becomes available again.

**Cisco IOS Release 12.2(50)SG and later**

## Configuring 802.1X with Unidirectional Controlled Port

To configure unidirectional controlled port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode access or Switch(config-if)# switchport mode private-vlan host</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# dot1x pae authenticator</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# authentication port-control auto</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong>&lt;br&gt;Switch(config-if)# authentication control-direction {in</td>
</tr>
<tr>
<td><strong>Cisco IOS Release 12.2(46)SG or earlier releases</strong>&lt;br&gt;Switch(config-if)# dot1x control-direction {in</td>
<td>both}</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# show dot1x interface interface-id details</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>
Unidirectional controlled port only works when Spanning Tree PortFast is enabled on the port. Unidirectional controlled port and Spanning Tree PortFast should be configured on a switch port that connects to a host. If two such ports are connected together with an Ethernet cable, high CPU utilization may result because host learning will be flapping between the two ports.

This example shows how to enable unidirectional port control:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# configure terminal
Switch(config)# interface gigabitethernet3/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication control-direction in
Switch(config-if)# end
Switch# show dot1x int g3/3
```

Dot1x Info for GigabitEthernet3/3
-----------------------------------
PAE = AUTHENTICATOR
PortControl = AUTO
ControlDirection = In
HostMode = SINGLE_HOST
ReAuthentication = Disabled
QuietPeriod = 60
ServerTimeout = 30
SuppTimeout = 30
ReAuthPeriod = 3600 (Locally configured)
ReAuthMax = 2
MaxReq = 2
TxPeriod = 30
RateLimitPeriod = 0

```
Switch#
```

**Cisco IOS Release 12.2(46)SG or earlier**

```
Switch# configure terminal
Switch(config)# interface gigabitethernet3/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# dot1x control-direction in
Switch(config-if)# end
Switch# show dot1x int g3/3
```

Dot1x Info for GigabitEthernet3/3
-----------------------------------
PAE = AUTHENTICATOR
PortControl = AUTO
ControlDirection = In
HostMode = SINGLE_HOST
ReAuthentication = Disabled
QuietPeriod = 60
ServerTimeout = 30
SuppTimeout = 30
ReAuthPeriod = 3600 (Locally configured)
ReAuthMax = 2
MaxReq = 2
TxPeriod = 30
RateLimitPeriod = 0

```
Switch#
```
Configuring 802.1X with VLAN User Distribution

You will need to configure the switch and ACS to configure 802.1X with VLAN user distribution.

Configuring the Switch

To configure the switch, follow these steps:

**Step 1**
Create a VLAN group on the switch.

Enter the following commands to create a VLAN group and assign some VLANs to the VLAN group. The following example creates the VLAN group `eng-group` and maps VLANs 20 to 24 to that group:

```
Switch# configure terminal
Switch(config)# vlan group eng-group vlan-list 20-24
Switch(config)# end
```

```
Switch# show vlan group group-name eng-group
Group Name VLANs Mapped
---------------- -------------------
eng-group        20-24
```

**Note**
Ensure that the VLANs you specify as part of the VLAN group are enabled on the switch. Only specified VLANs are considered for assignment.

**Step 2**
Configure the individual ports for multidomain, single-host or multiple-host.

For details, refer to the “Enabling 802.1X Authentication” section on page 44-28.

show commands

Use the following `show` commands to display the member VLANs in a VLAN group:

```
<table>
<thead>
<tr>
<th>show command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vlan group all</td>
<td>Displays the member VLANs for all the VLAN groups configured on the device.</td>
</tr>
<tr>
<td>show vlan group group-name vlan-group-name</td>
<td>Displays the member VLANs in a VLAN group with the given VLAN group name.</td>
</tr>
<tr>
<td>show vlan group group-name vlan-group-name user-count</td>
<td>Displays the user count for each of the member VLANs of the specified VLAN group This feature counts only authenticated users and MAC addresses added through port security for distribution. It does not consider other learned MAC addresses. As of Cisco IOS Release 12.2(54)SG, the user count for a VLAN is incremented when a host is learned through port security, 802.1X, MAB, or fallback authentication on that VLAN.</td>
</tr>
</tbody>
</table>
```

The following examples show outputs of the `show vlan group` command:
Switch# `show vlan group all`
Group Name VLANs Mapped
---------------- -------------------
eng-dept 3-4

Switch# `show vlan group group-name my_group user-count`

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>4</td>
<td>0</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
</tr>
<tr>
<td>7</td>
<td>0</td>
</tr>
<tr>
<td>9</td>
<td>0</td>
</tr>
</tbody>
</table>

Switch#

In this example, VLANs 3, 4, 5, 7, and 9 are members of the VLAN group `my_group`.

**ACS Configuration**

After configuring the switch, you must provide the VLAN group name in the ACS configuration.

By default, ACS sends only one VLAN name or group per user. However, you can configure ACS to send more than one tag per attribute. To do this, you must modify the configuration in ACS for user or group. (See the example shown in Figure 44-14.)

**Figure 44-14  VLAN User Distribution on ACS: Interface Configuration to Modify Tags per Attribute**

After you add the number of tags required per attribute, the user or group setup presents multiple fields to be filled with values from the RADIUS server (Figure 44-15).
After you complete these two tasks and receive authorization, ACS sends the configured VLAN group to the switch. The switch is alerted to the list of VLANs configured under the VLAN group, and the least loaded valid VLAN in the group is assigned to the port.

### Configuring 802.1X with Authentication Failed

By configuring authentication-failed VLAN alignment on any Layer 2 port on the Catalyst 4500 series switch, you can provide limited network services to clients that fail the authentication process.

**Note**

You can use authentication-failed VLAN assignment with other security features, such as Dynamic ARP Inspection (DAI), Dynamic Host Configuration Protocol (DHCP) snooping, and IP Source Guard. Each of these features can be enabled and disabled independently on the authentication-failed VLAN.

To configure 802.1X with authentication-failed VLAN assignment, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode access</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# authentication port-control auto</td>
</tr>
</tbody>
</table>
Chapter 44  Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

This example shows how to enable a regular VLAN 40 on Fast Ethernet 4/3 as an authentication-failed VLAN on a static access port:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch(config-if)# authentication event fail action authorize vlan vlan-id
```

**Cisco IOS Release 12.2(46)SG or earlier releases**

```
Switch(config-if)# dot1x auth-fail vlan vlan-id
```

**Step 6**

Configures a maximum number of attempts before the port is moved to authentication-failed VLAN.

**Cisco IOS Release 12.2(50)SG and later**

```
Switch(config-if)# authentication event fail retry max-attempts action [authorize vlan vlan-id | next-method]
```

**Cisco IOS Release 12.2(46)SG or earlier releases**

```
Switch(config-if)# dot1x auth-fail max-attempts max-attempts
```

**Step 7**

```
Switch(config-if)# end
```

**Step 8**

```
Switch(config)# end
```

**Step 9**

```
Switch# show dot1x interface interface-id details
```

**Step 10**

```
Switch# copy running-config startup-config
```

This example shows how to enable a regular VLAN 40 on Fast Ethernet 4/3 as an authentication-failed VLAN on a static access port:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# configure terminal
Switch(config)# interface gigabitEthernet3/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication event fail retry 5 action authorize vlan 40
Switch(config-if)# end
Switch# show dot1x all
Sysauthcontrol = Enabled
Dot1x Protocol Version = 2

Dot1x Info for GigabitEthernet3/1
```

---

**Purpose**

Enables authentication-failed VLAN on a particular interface.

To disable the authentication-failed VLAN feature on a particular port, use the **no authentication event fail action authorize vlan interface configuration command**.
Cisco IOS Release 12.2(46)SG or earlier

Switch# configure terminal
Switch(config)# interface gigabitEthernet3/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x auth-fail vlan 40
Switch(config-if)# dot1x auth-fail max-attempts 3
Switch# show dot1x all
Sysauthcontrol      Enabled
Dot1x Protocol Version 2
Critical Recovery Delay 100
Critical EAPOL   Disabled

Dot1x Info for GigabitEthernet3/1
-----------------------------------
PAE                  = AUTHENTICATOR
PortControl          = AUTO
ControlDirection     = Both
HostMode             = SINGLE_HOST
ReAuthentication     = Disabled
QuietPeriod          = 60
ServerTimeout        = 0
SuppTimeout          = 30
ReAuthPeriod         = 3600 (Locally configured)
ReAuthMax            = 2
MaxReq               = 2
TxPeriod             = 5
RateLimitPeriod      = 0
Auth-Fail-Vlan       = 40
Auth-Fail-Max-attempts = 3
Switch#

Configuring 802.1X with Voice VLAN

---

**Note**
You must configure 802.1X and voice VLAN simultaneously.

---

**Note**
You cannot configure an authentication-failed VLAN and a voice VLAN on the same port. When you try to configure these two features on the same port, a syslog message appears.

To enable 802.1X with voice VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# switchport access vlan vlan-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# switchport mode access</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# switchport voice vlan vlan-id</td>
</tr>
</tbody>
</table>
Chapter 44  Configuring 802.1X Port-Based Authentication

### Configuring 802.1X Port-Based Authentication

This example shows how to enable 802.1X with voice VLAN feature on Fast Ethernet interface 5/9:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch(config-if)# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport access vlan 2
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch(config)#
```

**Cisco IOS Release 12.2(46)SG or earlier**

```
Switch(config-if)# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport access vlan 2
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch(config)#
```

### Configuring 802.1X with VLAN Assignment

For enabling dynamic VLAN assignment, no additional configuration is required in the switch. For information on configuring Multiple- authentication (MDA), refer to the “Configuring Multiple Domain Authentication and Multiple Authorization” section on page 44-34. To enable VLAN assignment, you must configure the Cisco ACS server.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Switch(config-if)# dot1x pae authenticator</td>
<td>Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
</tbody>
</table>
| 7     | **Cisco IOS Release 12.2(50)SG and later**
|       | Switch(config-if)# authentication port-control auto | Enables 802.1X authentication on the interface. |
|       | **Cisco IOS Release 12.2(46)SG or earlier**
|       | Switch(config-if)# dot1x port-control auto | |
| 8     | Switch(config-if)# end | Returns to configuration mode. |
| 9     | Switch(config)# end | Returns to privileged EXEC mode. |
| 10    | Switch# show dot1x interface interface-id details | (Optional) Verifies your entries. |
| 11    | Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
To enable 802.1X with VLAN assignment, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id Enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# switchport access vlan vlan-id Sets the VLAN for a switched interface in access mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# switchport mode access Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# switchport voice vlan vlan-id Sets the voice VLAN for the interface.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-if)# authentication host-mode multi-domain Enables MDA on the interface.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-if)# authentication port-control auto Enables 802.1X authentication on the interface.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config-if)# dot1x pae authenticator Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config)# end Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch# show dot1x interface interface-id details (Optional) Verifies your entries.</td>
</tr>
<tr>
<td>Step 11</td>
<td>Switch# copy running-config startup-config (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The following example shows how to configure MDA on an interface and 802.1X as the authentication mechanism:

```
Switch(config)# interface FastEthernet3/3
Switch(config-if)# switchport access vlan 10
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 16
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# authentication port-control auto
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# end
```

**Note** You must configure VLAN assignment in the ACS server. No configuration changes are required on the switch.

**Cisco ACS Configuration for VLAN Assignment**

The procedure for enabling MDA with voice VLAN assignment is the same as that for activating MDA except for one step: Configure a VLAN for dynamic VLAN assignment after selecting

**User > IETF RADIUS Attributes** (*Figure 44-16*). This step ensures correct functioning of the ACS configuration required for dynamic VLAN assignment.
Enabling Fallback Authentication

On a port in multiauthentication mode, either or both of MAB and web-based authentication can be configured as fallback authentication methods for non-802.1X hosts (those that do not respond to EAPOL). You can configure the order and priority of the authentication methods.

For detailed configuration information for MAB, see the “Configuring 802.1X with MAC Authentication Bypass” section on page 44-58.

For detailed configuration information for web-based authentication, see Chapter 46, “Configuring Web-Based Authentication.”

When web-based authentication and other authentication methods are configured on an MDA or multiauthentication port, downloadable ACL policies must be configured for all devices attached to that port.

To enable fallback authentication, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch(config)# ip admission name rule-name proxy http</td>
<td>Configures an authentication rule for web-based authentication.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# fallback profile profile-name</td>
<td>Creates a fallback profile for web-based authentication.</td>
</tr>
</tbody>
</table>
### Configuring 802.1X Port-Based Authentication

#### Step 3
```
Switch(config-fallback-profile)# ip access-group rule-name in
```
- **Purpose**: Specifies the default ACL to apply to network traffic before web-based authentication.

#### Step 4
```
Switch(config-fallback-profile)# ip admission name rule-name
```
- **Purpose**: Associates an IP admission rule with the profile and specifies that a client connecting by web-based authentication uses this rule.

#### Step 5
```
Switch(config-fallback-profile)# exit
```
- **Purpose**: Returns to global configuration mode.

#### Step 6
```
Switch(config)# interface type slot/port
```
- **Purpose**: Specifies the port to be configured and enters interface configuration mode.
  - `type = fastethernet, gigabitethernet, or tengigabitethernet`

#### Step 7
**Cisco IOS Release 12.2(50)SG and later**
```
Switch(config-if)# authentication port-control auto
```
- **Purpose**: Enables authentication on the port.

**Cisco IOS Release 12.2(46)SG or earlier releases**
```
Switch(config-if)# dot1x port-control auto
```
- **Purpose**: (Optional) Specifies the fallback order of authentication methods to be used. The three values of `method`, in the default order, are `dot1x`, `mab`, and `webauth`. The specified order also determines the relative priority of the methods for reauthentication (highest to lowest).

#### Step 8
```
Switch(config-if)# authentication order method1 [method2] [method3]
```
- **Purpose**: (Optional) Overrides the relative priority of authentication methods to be used. The three values of `method`, in the default order of priority, are `dot1x`, `mab`, and `webauth`.

#### Step 9
```
Switch(config-if)# authentication priority method1 [method2] [method3]
```
- **Purpose**: (Optional) Configures the inactivity timeout value for MAB and 802.1X. By default, inactivity aging is disabled for a port.
  - `seconds`—Specifies inactivity timeout period. The range is from 1 to 65535 seconds.
  - `server`—Specifies that the inactivity timeout period value be obtained from the authentication server.
### Command

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Switch(config-fallback-profile)# ip access-group rule-name in</th>
<th>Specifies the default ACL to apply to network traffic before web-based authentication.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td>Switch(config-fallback-profile)# ip admission name rule-name</td>
<td>Associates an IP admission rule with the profile and specifies that a client connecting by web-based authentication uses this rule.</td>

<tr>
<td></td>
<td>Switch(config-if)# dot1x port-control auto</td>
<td></td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config-if)# authentication order method1 [method2] [method3]</td>
<td>(Optional) Overrides the relative priority of authentication methods to be used. The three values of method, in the default order of priority, are dot1x, mab, and webauth.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch(config-if)# authentication event fail action next-method</td>
<td>Specifies that the next configured authentication method be applied if authentication fails.</td>
</tr>
<tr>
<td>Step 11</td>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong></td>
<td>Enables MAC authentication bypass. The optional eap keyword specifies that the EAP extension be used during RADIUS authentication.</td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# mab [eap]</td>
<td></td>
</tr>
<tr>
<td>Step 12</td>
<td>Switch(config-if)# authentication fallback profile-name</td>
<td>Enables web-based authentication using the specified profile.</td>
</tr>
<tr>
<td>Step 13</td>
<td>Switch(config-if)# authentication violation [shutdown</td>
<td>restrict]</td>
</tr>
<tr>
<td>Step 14</td>
<td>Switch(config-if)# authentication timer inactivity (seconds</td>
<td>server)</td>
</tr>
<tr>
<td></td>
<td>seconds)—Specifies inactivity timeout period. The range is from 1 to 65535 seconds.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>server—Specifies that the inactivity timeout period value be obtained from the authentication server.</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 44  Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

This example shows how to enable 802.1X fallback to MAB, and then to enable web-based authentication, on an 802.1X-enabled port:

```
Switch(config)# ip admission name rule1 proxy http
Switch(config)# fallback profile fallback1
Switch(config-fallback-profile)# ip access-group default-policy in
Switch(config-fallback-profile)# ip admission rule1
Switch(config-fallback-profile)# exit
Switch(config)# interface gigabit5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication order dot1x mab webauth
Switch(config-if)# mab eap
Switch(config-if)# authentication fallback fallback1
Switch(config-if)# exit
Switch(config)# ip device tracking
Switch(config)# exit
```

To determine if a host was authenticated using 802.1X when fallback authentication is configured on the port, enter the following commands:

```
Switch# show authentication sessions interface g7/2
```

This example shows how to enable 802.1X fallback to MAB, and then to enable web-based authentication, on an 802.1X-enabled port:

```
Step 15 Switch(config-if)# authentication timer restart seconds
(Optional) Specifies a period after which the authentication process restarts in an attempt to authenticate an unauthorized port.
  * seconds—Specifies the restart period. The range is from 1 to 65535 seconds.

Step 16 Switch(config-if)# exit
Returns to global configuration mode.

Step 17 Switch(config)# ip device tracking
Enables the IP device tracking table, which is required for web-based authentication.

Step 18 Switch(config)# exit
Returns to privileged EXEC mode.

Step 19 Switch# show dot1x interface type slot/port
Verifies your entries.
```
Dot1x Info for GigabitEthernet7/2

  Client IP 10.5.63.13 Port 4643, timeout 1000, state ESTAB
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch(config)# ip admission name rule1 proxy http
Switch(config)# fallback profile fallback
Switch(config-fallback-profile)# ip access-group default-policy in
Switch(config-fallback-profile)# ip admission rule1
Switch(config-fallback-profile)# exit
Switch(config)# interface gigabit5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication order dot1x mab webauth
Switch(config-if)# dot1x mac-auth-bypass eap
Switch(config-if)# dot1x fallback fallback1
Switch(config-if)# exit
Switch(config)# ip device tracking
Switch(config)# exit
```

Enabling Periodic Reauthentication

You can enable periodic 802.1X client reauthentication and specify how often it occurs. If you do not specify a time value before enabling reauthentication, the interval between reauthentication attempts is 3600 seconds.

Automatic 802.1X client reauthentication is a per-interface setting and can be set for clients connected to individual ports. To manually reauthenticate the client connected to a specific port, see the “Changing the Quiet Period” section on page 44-81.
To enable periodic reauthentication of the client and to configure the number of seconds between reauthentication attempts, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>Switch(config)# interface interface-id</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>Switch(config-if)# switchport mode access</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>Switch(config-if)# dot1x pae authenticator</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>Switch(config-if)# authentication periodic</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>Switch(config-if)# dot1x reauthentication</code></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><code>Switch(config-if)# authentication port-control auto</code></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><code>Switch(config-if)# end</code></td>
</tr>
</tbody>
</table>

This example shows how to enable periodic reauthentication and set the number of seconds between reauthentication attempts to 4000:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication periodic
Switch(config-if)# authentication timer reauthenticate 4000
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```
### Enabling Multiple Hosts

You can attach multiple hosts (clients) to a single 802.1X-enabled port as shown in Figure 44-9 on page 44-26. In this mode, when the port is authorized, all other hosts that are indirectly attached to the port are granted access to the network. If the port becomes unauthorized (reauthentication fails or an EAPOL-logoff message is received), the switch denies access to the network for all wireless access point-attached clients.

To allow multiple hosts (clients) on an 802.1X-authorized port that has the `dot1x port-control` interface configuration command set to `auto`, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# <code>configure terminal</code></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# <code>interface fastethernet5/9</code></td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode and specifies the interface to which multiple hosts are indirectly attached.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# <code>switchport mode access</code></td>
</tr>
<tr>
<td></td>
<td>Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# <code>dot1x pae authenticator</code></td>
</tr>
<tr>
<td></td>
<td>Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Cisco IOS Release 12.2(46)SG or earlier releases</strong> if you want to change to or from multi-host</td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# <code>dot1x host-mode multi-host</code></td>
</tr>
<tr>
<td><strong>Current release</strong></td>
<td>Enables 802.1X authentication on the interface.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Ensure that the <code>dot1x port-control</code> interface configuration command set is set to <code>auto</code> for the specified interface.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config-if)# <code>dot1x host-mode multi-host</code></td>
</tr>
<tr>
<td></td>
<td>Allows multiple hosts (clients) on an 802.1X-authorized port.</td>
</tr>
</tbody>
</table>

To disable multiple hosts on the port, use the `no authentication host-mode multi-host` interface configuration command (for earlier releases, use the `no dot1x host-mode multi-host` interface configuration command).

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# <code>authentication port-control auto</code></td>
</tr>
<tr>
<td><strong>Current release</strong></td>
<td>Enables 802.1X authentication on the interface.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-if)# <code>end</code></td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# <code>show dot1x all interface interface-id</code></td>
</tr>
<tr>
<td></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch# <code>copy running-config startup-config</code></td>
</tr>
<tr>
<td></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This example shows how to enable 802.1X on Fast Ethernet interface 5/9 and to allow multiple hosts:

**Cisco IOS Release 12.2(50)SG and later**

Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication host-mode multi-host
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#

**Cisco IOS Release 12.2(46)SG or earlier**

Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x host-mode multi-host
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#

### Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time, and then tries again. The idle time is determined by the quiet-period value. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

To change the quiet period, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode and specifies the interface to be enabled for timeout quiet-period.</td>
</tr>
<tr>
<td>Switch(config-if)# switchport mode access</td>
<td>Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</td>
</tr>
<tr>
<td>Switch(config-if)# dot1x pae authenticator</td>
<td>Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 44-27.</td>
</tr>
<tr>
<td>Switch(config-if)# dot1x timeout quiet-period seconds</td>
<td>Sets the number of seconds that the switch remains in the quiet-period following a failed authentication exchange with the client. To return to the default quiet-period, use the no dot1x timeout quiet-period configuration command. The range is 0 to 65,535 seconds; the default is 60.</td>
</tr>
<tr>
<td>Switch(config-if)# authentication port-control auto</td>
<td>Enables 802.1X authentication on the interface.</td>
</tr>
<tr>
<td>Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch# show dot1x all</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This example shows how to set the quiet period on the switch to 30 seconds:

**Cisco IOS Release 12.2(50)SG and later**

```
Switch# configure terminal
Switch(config)# interface fastethernet4/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout quiet-period 30
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

**Cisco IOS Release 12.2(46)SG or earlier**

```
Switch# configure terminal
Switch(config)# interface fastethernet4/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout quiet-period 30
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

**Changing the Switch-to-Client Retransmission Time**

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then retransmits the frame.

**Note**

You should change the default value of this command only to adjust for unusual circumstances, such as unreliable links or specific behavioral problems with certain clients and authentication servers.

To change the amount of time that the switch waits for client notification, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode access</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# dot1x pae authenticator</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# dot1x timeout tx-period seconds</td>
</tr>
</tbody>
</table>
Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cisco IOS Release 12.2(50)SG and later</strong></td>
<td>Enables 802.1X authentication on the interface.</td>
</tr>
<tr>
<td>Switch(config-if)# authentication port-control auto</td>
<td></td>
</tr>
<tr>
<td><strong>Cisco IOS Release 12.2(46)SG or earlier releases</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# dot1x port-control auto</td>
<td></td>
</tr>
</tbody>
</table>

Step 7

Switch(config-if)# end

Returns to privileged EXEC mode.

Step 8

Switch# show dot1x all

Verifies your entries.

Step 9

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

This example shows how to set the retransmission time to 60 seconds:

**Cisco IOS Release 12.2(50)SG and later**

Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout tx-period 60
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#

**Cisco IOS Release 12.2(46)SG or earlier**

Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout tx-period 60
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#

### Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission times, you can change the number of times that the switch sends EAP-Request/Identity and other EAP-Request frames to the client before restarting the authentication process. The number of EAP-Request/Identity retransmissions is controlled by the `dot1x max-reauth-req` command; the number of retransmissions for other EAP-Request frames is controlled by the `dot1x max-req` command.

**Note**

You should change the default values of these commands only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.
To set the switch-to-client frame-retransmission numbers, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode access</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# dot1x pae authenticator</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# dot1x max-req count</td>
</tr>
<tr>
<td>or</td>
<td>Switch(config-if)# dot1x max-reauth-req count</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-if)# authentication port-control auto</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# show dot1x all</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to set 5 as the number of times that the switch retransmits an EAP-request/identity request before restarting the authentication process:

**Cisco IOS Release 12.2(50)SG and later**

Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
Cisco IOS Release 12.2(46)SG or earlier

Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#

Configuring an Authenticator and a Supplicant Switch with NEAT

Configuring NEAT requires that one switch outside a wiring closet is configured as a supplicant and is connected to an authenticator switch.

This section includes these topics:

- Configuring Switch as an Authenticator, page 44-85
- Configuring Switch as a Supplicant, page 44-89
- Configuring NEAT with ASP, page 44-90
- Configuration Guidelines, page 44-90

Note: For overview information, see the “802.1X Supplicant and Authenticator Switches with Network Edge Access Topology” section on page 44-24.

Configuring Switch as an Authenticator

To configure a switch as an authenticator, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# cisp enable</td>
<td>Enables CISP.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config)# interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config-if)# switchport mode access</td>
<td>Sets the port mode to access.</td>
</tr>
<tr>
<td>5</td>
<td>Switch(config-if)# authentication port-control auto</td>
<td>Sets the port-authentication mode to auto.</td>
</tr>
<tr>
<td>6</td>
<td>Switch(config-if)# dot1x pae authenticator</td>
<td>Configures the interface as a port access entity (PAE) authenticator.</td>
</tr>
<tr>
<td>7</td>
<td>Switch(config-if)# spanning-tree portfast</td>
<td>Enables Port Fast on an access port connected to a single workstation or server.</td>
</tr>
<tr>
<td>8</td>
<td>Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>9</td>
<td>Switch# show running-config interface interface-id</td>
<td>Verifies your configuration.</td>
</tr>
<tr>
<td>10</td>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
When CISP is enabled on a trunk port, the following features are inert. When CISP is neither running nor configured, these features operate as expected:

- VLAN assignment
- Guest, Authentication Failure, voice, and critical VLANs
- Critical authentication
- Wake-on-LAN
- Web authentication
- Port security
- Violation modes (restrict, shut down, and shut down VLAN)

The following example shows how to enable CISP on a port. You must configure the following procedure in the Cisco ACS server. Configuring a user with Cisco AV Pair value, allows SSW to authenticate itself with the ASW. Because the user is attached with the AV pair value, upon successful authentication on ASW, the macro is executed on the interface on which SSW is authenticated:

```
Switch# configure terminal
Switch(config)# cisp enable
Switch(config)# interface GigabitEthernet5/23
Switch(config-if)# switchport mode access
Switch(config-if)# spanning-tree portfast
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
```

**Cisco AV Pair Configuration**

Next, you need to configure a Cisco AV pair value.

Log into ACS, and Select/Create a User. Go to User Setup and scroll down to the [009\001 cisco-av-pair Tab. Enter device-traffic-class=switch (Figure 44-17).
Starting with Cisco IOS XE Release 3.2.0 SG (15.0(2)SG) the spanning-tree bpduguard feature is automatically disabled or enabled as part of a macro provided it was previously enabled in the port configuration. If the configuration did not have BPDU Guard enabled before the supplicant switch was authenticated, the spanning-tree bpduguard feature is not applied to the macro.

Disabling spanning-tree bpduguard happens only if it was previously enabled through the port level command. Enabling it globally without a specific port level CLI prevents NEAT from disabling it on the port after the authenticator switch receives a device-traffic-class=switch AV Pair and applies the macro.

There are 2 scenarios:

1. Scenario 1: With Port Level BPDU Guard Configuration

Before Authorization

```bash
interface GigabitEthernet5/1
switchport access vlan 81
switchport mode access
dot1x pae authenticator
authentication port-control auto
spanning-tree bpduguard enable
end
```

Post Authorization and Application of Internal Macro

```bash
interface GigabitEthernet5/1
switchport trunk encapsulation dot1q
switchport trunk native vlan 81
switchport mode trunk
```
Configuring 802.1X Port-Based Authentication

Scenario 2: Without port level BPDU Guard Configuration (with or without globally enabling BPDU Guard)

Before Authorization

```conf
interface GigabitEthernet5/1
  switchport access vlan 81
  switchport mode access
  dot1x pae authenticator
  authentication port-control auto
end
```

Post Authorization and Application of Internal Macro

```conf
interface GigabitEthernet5/1
  switchport trunk encapsulation dot1q
  switchport trunk native vlan 81
  switchport mode trunk
  dot1x pae authenticator
  authentication port-control auto
  spanning-tree portfast trunk
  no spanning-tree bpduguard
end
```

When the authenticator switch receives a device-traffic-class=switch AV pair, the following macro is applied to the authenticator switch port:

```conf
no switchport access vlan $AVID
no switchport nonegotiate
switchport mode trunk
switchport trunk native vlan $AVID
no spanning-tree bpduguard enable
spanning-tree portfast trunk
```

After the supplicant switch is authenticated as a switch device, the configuration will appear as follows:

```conf
interface GigabitEthernet5/23
  switchport mode trunk
  authentication port-control auto
  dot1x pae authenticator
  spanning-tree portfast trunk
end
```

Radius Config (Cisco AV Pair value)

```
device-traffic-class=switch
```

**show running-config interface** is the only command that informs you that the smart macro has been applied after the supplicant switch is authenticated:

```
Switch# show authentication session

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address</th>
<th>Method</th>
<th>Domain</th>
<th>Status</th>
<th>Session ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi5/23</td>
<td>0024.9844.de23</td>
<td>dot1x</td>
<td>DATA</td>
<td>Authz Success</td>
<td>0909117A000000000010561C</td>
</tr>
</tbody>
</table>

Switch# show running-configuration interface gi 5/23

Building configuration...
Current configuration : 149 bytes
!
interface GigabitEthernet5/23
  switchport mode trunk
  authentication port-control auto
dot1x pae authenticator
  spanning-tree portfast trunk
end

Switch#

NEAT changes the port configuration on the authenticator switch. So, to perform ISSU from one version that supports NEAT to another that does not support NEAT, you must first deactivate NEAT on all switch ports for ISSU. Similarly, NEAT cannot activate when ISSU is in progress. If a supplicant switch tries to authenticate during ISSU, authorization would fail on the port.

**Configuring Switch as a Supplicant**

*Note* The Catalyst 4500 series switch does not support supplicant switch functionality. The following supplicant specific commands are mentioned for a quick reference. For more details, see the Catalyst 3750 Switch Software Configuration Guide.

To configure a switch as a supplicant, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config)# cisp enable</td>
<td>Enables CISP.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config)# dot1x credentials profile</td>
<td>Creates 802.1x credentials profile. This must be attached to the port that is configured as supplicant.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(config)# sername suppswitch</td>
<td>Creates a username.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch(config)# password password</td>
<td>Creates a password for the new username.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch(config)# dot1x supplicant force-multicast</td>
<td>Forces the switch to send only multicast EAPOL packets when it receives either unicast or multicast packets. This also allows NEAT to work on the supplicant switch in all host modes.</td>
</tr>
<tr>
<td><strong>Step 7</strong> Switch(config)# interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> Switch(config-if)# switchport trunk encapsulation dot1q</td>
<td>Sets the port to trunk mode.</td>
</tr>
<tr>
<td><strong>Step 9</strong> Switch(config-if)# switchport mode trunk</td>
<td>Configures the interface as a VLAN trunk port.</td>
</tr>
<tr>
<td><strong>Step 10</strong> Switch(config-if)# dot1x pae supplicant</td>
<td>Configures the interface as a port access entity (PAE) supplicant.</td>
</tr>
<tr>
<td><strong>Step 11</strong> Switch(config-if)# dot1x credentials profile-name</td>
<td>Attaches the 802.1x credentials profile to the interface.</td>
</tr>
<tr>
<td><strong>Step 12</strong> Switch(config-if)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
This example shows how to configure a switch as a supplicant:

```
Switch# configure terminal
Switch(config)# cisp enable
Switch(config)# dot1x credentials test
Switch(config)# username suppswitch
Switch(config)# password myswitch
Switch(config)# dot1x supplicant force-multicast
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# dot1x pae supplicant
Switch(config-if)# dot1x credentials test
Switch(config-if)# end
```

The following macro is applied to the authenticator switch port after the supplicant switch is deauthenticated due to a link-down or a reauthenticate event:

```
no switchport nonegotiate
switchport mode access
no switchport trunk native vlan $AVID
no spanning-tree portfast trunk
switchport access vlan $AVID
spanning-tree bpduguard enable
spanning-tree portfast
```

### Configuring NEAT with ASP

You can also use an AutoSmart Ports user-defined macro rather than a switch VSA to configure the authenticator switch. For more information, see the Chapter 13, “Configuring Auto Smartports Macros.”

### Configuration Guidelines

- If BPDU Guard was enabled prior to supplicant switch authentication, it is re-enabled after the supplicant switch unauthenticates.
- You can configure NEAT ports and non-NEAT ports with the same configuration. When the supplicant switch authenticates, the port mode is changed from access to trunk based on the switch vendor-specific attributes (device-traffic-class=switch).
- To enable NEAT, you must configure the vendor-specific attributes (VSA) attribute as switch. Configuring the trunk with an 802.1X configuration and enabling CISP globally will not enable NEAT.
- VSA device-traffic-class=switch assists the authenticator switch in identifying the supplicant as a switch-device. This identification changes the authenticator switch port mode from access to trunk and enables 802.1X trunk encapsulation. The access VLAN, if any, is converted to a native trunk VLAN. VSA does not change any of the port configurations on the supplicant.
Chapter 44 Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

• Although modified trunk parameters are retained, when the trunk link is down or authentication is cleared, the interface is reconfigured to the following:
  - spanning-tree portfast
  - switchport mode access
  - switchport access vlan access-vlan-id

  **Note**
  access-vlan-id is derived from the switchport trunk native vlan command entered on the interface. If you have modified the trunk native VLAN, the configured native VLAN is used as the access-vlan-id when the port returns to access mode.

• We recommend using 802.1X authentication mode single-host for NEAT configuration on the interface.

• The cisco-av-pairs must be configured as device-traffic-class=switch on the ACS. This sets the interface as a trunk after the supplicant is successfully authenticated.

• You should not modify the trunk mode configurations that are based on device-traffic-class either manually or through features such as AutoSmart Ports. It is because 802.1X configuration is not supported for trunk ports.

• To change the host mode and apply a standard port configuration on the authenticator switch port, you can also use AutoSmart ports user-defined macros rather than the switch VSA. Doing this allows you to remove unsupported configurations on the authenticator switch port and to change the port mode from access to trunk. For details, see Chapter 13, “Configuring Auto Smartports Macros”.

  **Note**
  Configuring only the Auto SmartPorts macro does not identify the end host as a supplicant switch. The switch VSA is required to identify the supplicant switch. However, when Auto Smartports macro is configured, the internal macro that reconfigures the port from access to trunk is not executed and the Auto Smartports macro should ensure that the port reconfigures as a trunk port.

Manually Reauthentication a Client Connected to a Port

You can manually reauthenticate a client connected to a specific port at any time by entering the dot1x re-authenticate interface privileged EXEC command. If you want to enable or disable periodic reauthentication, see the “Enabling Periodic Reauthentication” section on page 44-78.

This example shows how to manually reauthenticate the client connected to Fast Ethernet port 1/1:

```
Switch# dot1x re-authenticate interface fastethernet1/1
Starting reauthentication on FastEthernet1/1
```

Initializing the 802.1X Authentication State

The dot1x initialize command causes the authentication process to be restarted regardless of its current state.

This example shows how to restart the authentication process on Fast Ethernet port 1/1:

```
Switch# dot1x initialize interface fastethernet1/1
```

This example shows how to restart the authentication process on all ports of the switch:
Removing 802.1X Client Information

The clear dot1x command causes all existing supplicants to be completely deleted from an interface or from all the interfaces on a switch.

This example shows how to remove 802.1X client information on Fast Ethernet port 1/1:

Switch# clear dot1x interface fastethernet1/1

This example shows how to remove 802.1X client information on all ports of the switch:

Switch# clear dot1x all

Resetting the 802.1X Configuration to the Default Values

To reset the 802.1X configuration to the default values, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# dot1x default</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show dot1x all</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Controlling Switch Access with RADIUS

This section describes how to enable and configure the RADIUS, which provides detailed accounting information and flexible administrative control over authentication and authorization processes. RADIUS is facilitated through AAA and can be enabled only through AAA commands.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Security Command Reference, Release 12.2.

These sections contain this configuration information:

- Understanding RADIUS, page 44-93
- RADIUS Operation, page 44-94
- RADIUS Change of Authorization, page 44-94
- Configuring RADIUS, page 44-100
- Displaying the RADIUS Configuration, page 44-113
Understanding RADIUS

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information. The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.
- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validates users and to grant access to network resources.
- Networks already using RADIUS. You can add a Cisco switch containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 44-18 on page 44-94.
- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1X.
- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

RADIUS is not suitable in these network security situations:

- Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.
- Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.
- Networks using a variety of services. RADIUS generally binds a user to one service model.
RADIUS Operation

When a user attempts to log in and authenticate to a switch that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of these responses from the RADIUS server:
   a. ACCEPT—The user is authenticated.
   b. REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   c. CHALLENGE—A challenge requires additional data from the user.
   d. CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled. The additional data included with the ACCEPT or REJECT packets includes these items:
- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

RADIUS Change of Authorization

This section provides an overview of the RADIUS interface including available primitives and how they are used during a Change of Authorization (CoA).

- Overview, page 44-95
- Change-of-Authorization Requests, page 44-95
- CoA Request Response Code, page 44-96
Overview

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst switches support the RADIUS Change of Authorization (CoA) extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external authentication, authorization, and accounting (AAA) or policy servers.

The switch supports these per-session CoA requests:
- Session reauthentication
- Session termination
- Session termination with port shut down
- Session termination with port bounce

The RADIUS interface is enabled by default on Catalyst switches.

Change-of-Authorization Requests

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:
- CoA acknowledgement (ACK) [CoA-ACK]
- CoA non-acknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

This section includes these topics:
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication

RFC 5176 Compliance

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.

Table 44-2 shows the IETF attributes are supported for this feature.

<table>
<thead>

</table>

Preconditions

To use the CoA interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch. The supported commands are listed in Table 44-4 on page 44-97.

Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
• Audit-Session-Id (Cisco VSA)
• Acct-Session-Id (IETF attribute #44)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.

```
 0                   1                   2                   3
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|     Code      |  Identifier   |            Length             |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|                                                               |
|                         Authenticator                         |
|                                                               |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|  Attributes ... |                                                               |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

The attributes field is used to carry Cisco VSAs.

**CoA ACK Response Code**

If the authorization state is changed successfully, a positive acknowledgement (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

**CoA NAK Response Code**

A negative acknowledgement (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use `show` commands to verify a successful CoA.

**CoA Request Commands**

This section includes:

• Session Reauthentication
• Session Termination
• CoA Disconnect-Request
• CoA Request: Disable Host Port
• CoA Request: Bounce-Port

The switch supports the commands shown in Table 44-4.

<table>
<thead>
<tr>
<th>Command</th>
<th>Cisco VSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reauthenticate host</td>
<td><code>Cisco:Avpair=&quot;subscriber:command=reauthenticate&quot;</code></td>
</tr>
<tr>
<td>Terminate session</td>
<td>it is a standard disconnect request that does not require a VSA.</td>
</tr>
</tbody>
</table>
Controlling Switch Access with RADIUS

Chapter 44  Configuring 802.1X Port-Based Authentication

Configuring 802.1X Port-Based Authentication

Session Reauthentication

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco vendor-specific attribute (VSA) in this form:

```
Cisco:Avpair="subscriber:command=reauthenticate"
```

and one or more session identification attributes.

The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL-1-RequestId message (see footnote 1 below) to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized by using guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

Session Termination

Three types of CoA requests can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that hosts’ access to the network.

To restrict a hosts’ access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, reenable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

---

**Table 44-4  CoA Commands Supported on the Switch**

<table>
<thead>
<tr>
<th>Command</th>
<th>Cisco VSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bounce host port</td>
<td>Cisco:Avpair=&quot;subscriber:command=bounce-host-port&quot;</td>
</tr>
<tr>
<td>Disable host port</td>
<td>Cisco:Avpair=&quot;subscriber:command=disable-host-port&quot;</td>
</tr>
</tbody>
</table>

1. All CoA commands must include the session identifier between the switch and the CoA client.

---

1. Extensible Authentication Protocol over Lan
CoA Disconnect-Request

This command is a standard Disconnect-Request. Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section on page 44-96. If the session cannot be located, the switch returns a Disconnect-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch terminates the session. After the session has been completely removed, the switch returns a Disconnect-ACK.

If the switch fails-over to a standby switch before returning a Disconnect-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the session is not found following re-sending, a Disconnect-ACK is sent with the “Session Context Not Found” error-code attribute.

CoA Request: Disable Host Port

This command is carried in a standard CoA-Request message that has this new VSA:
Cisco:Avpair="subscriber:command=disable-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section on page 44-96. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

Note
A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.

CoA Request: Bounce-Port

This command is carried in a standard CoA-Request message that contains the following new VSA:
Cisco:Avpair="subscriber:command=disable-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section on page 44-96. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.
Configuring RADIUS

This section describes how to configure your switch to support RADIUS. At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used (such as TACACS+ or local username lookup), thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users. If that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

You should have access to and should configure a RADIUS server before configuring RADIUS features on your switch.

- Default RADIUS Configuration, page 44-100
- Identifying the RADIUS Server Host, page 44-100 (required)
- Configuring RADIUS Login Authentication, page 44-103 (required)
- Defining AAA Server Groups, page 44-105 (optional)
- Configuring RADIUS Authorization for User Privileged Access and Network Services, page 44-107 (optional)
- Starting RADIUS Accounting, page 44-108 (optional)
- Configuring Settings for All RADIUS Servers, page 44-109 (optional)
- Configuring the Switch to Use Vendor-Specific RADIUS Attributes, page 44-109 (optional)
- Configuring the Switch for Vendor-Proprietary RADIUS Server Communication, page 44-111 (optional)
- Configuring CoA on the Switch, page 44-112
- Monitoring and Troubleshooting CoA Functionality, page 44-113
- Configuring RADIUS Server Load Balancing, page 44-113 (optional)

Default RADIUS Configuration

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch using the CLI.

Identifying the RADIUS Server Host

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value
You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a failover backup to the first one. Using this example, if the first host entry fails to provide accounting services, the \%RADIUS-4-RADIUS_DEAD message appears, and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings. To apply these settings globally to all RADIUS servers communicating with the switch, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `radius-server key`. To apply these values on a specific RADIUS server, use the `radius-server host` global configuration command.

Note

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the switch, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see the “Configuring Settings for All RADIUS Servers” section on page 44-109.

You can configure the switch to use AAA server groups to group existing server hosts for authentication. For more information, see the “Defining AAA Server Groups” section on page 44-105.
To configure per-server RADIUS server communication, perform this task. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# radius-server host (hostname</td>
<td>ip-address) [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For auth-port port-number, specify the UDP destination port for authentication requests.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For acct-port port-number, specify the UDP destination port for accounting requests.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For timeout seconds, specify the time interval that the switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the radius-server timeout global configuration command setting. If no timeout is set with the radius-server host command, the setting of the radius-server timeout command is used.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For retransmit retries, specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The range is 1 to 1000. If no retransmit value is set with the radius-server host command, the setting of the radius-server retransmit global configuration command is used.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For key string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.</td>
</tr>
<tr>
<td>Note The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius-server host command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
<td></td>
</tr>
<tr>
<td>To configure the switch to recognize more than one host entry associated with a single IP address, enter this command as many times as necessary, making sure that each UDP port number is different. The switch software searches for hosts in the order in which you specify them. Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host.</td>
<td></td>
</tr>
<tr>
<td>Step 3 Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 Switch# show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 5 Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the specified RADIUS server, use the no radius-server host hostname | ip-address global configuration command.

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Switch(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2
This example shows how to configure host1 as the RADIUS server and to use the default ports for both authentication and accounting:

```
Switch(config)# radius-server host host1
```

Note
---
You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

### Configuring RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

To configure login authentication, perform this task. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa new-model</td>
<td>Enables AAA.</td>
</tr>
</tbody>
</table>
Chapter 44  Configuring 802.1X Port-Based Authentication

Controlling Switch Access with RADIUS

Step 3

Switch(config)# aaa authentication login {default | list-name} method1 [method2...]

Creates a login authentication method list.

- To create a default list that is used when a named list is not specified in the login authentication command, use the default keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.

- For list-name, specify a character string to name the list you are creating.

- For method1..., specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.

Select one of these methods:

- **enable**—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command.

- **group radius**—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server. For more information, see the “Identifying the RADIUS Server Host” section on page 44-100.

- **line**—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the password password line configuration command.

- **local**—Use the local username database for authentication. You must enter username information in the database. Use the username name password global configuration command.

- **local-case**—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the username password global configuration command.

- **none**—Do not use any authentication for login.

Step 4

Switch(config)# line [console | tty] line-number [ending-line-number]

Enters line configuration mode, and configure the lines to which you want to apply the authentication list.

Step 5

Switch(config)# login authentication {default | list-name}

Applies the authentication list to a line or set of lines.

- If you specify default, use the default list created with the aaa authentication login command.

- For list-name, specify the list created with the aaa authentication login command.

Step 6

Switch(config)# end

Returns to privileged EXEC mode.

Step 7

Switch# show running-config

Verifies your entries.

Step 8

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
To disable AAA, use the `no aaa new-model` global configuration command. To disable AAA authentication, use the `no aaa authentication login {default | list-name} method1 [method2...]` global configuration command. To either disable RADIUS authentication for logins or to return to the default value, use the `no login authentication {default | list-name}` line configuration command.

**Note**

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

For more information about the `ip http authentication` command, see the Cisco IOS Security Command Reference, Release 12.2 from the Cisco.com page under Documentation > Cisco IOS Software > 12.2 Mainline > Command References.

### Defining AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a failover backup to the first one.

You use the `server group` group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional `auth-port` and `acct-port` keywords.
To define the AAA server group and associate a particular RADIUS server with it, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# radius-server host (hostname</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius-server host command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# aaa new-model</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# aaa group server radius group-name</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config)# server ip-address</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# show running-config</td>
</tr>
</tbody>
</table>
Chapter 44  Configuring 802.1X Port-Based Authentication

Controlling Switch Access with RADIUS

To remove the specified RADIUS server, use the `no radius-server host hostname | ip-address` global configuration command. To remove a server group from the configuration list, use the `no aaa group server radius group-name` global configuration command. To remove the IP address of a RADIUS server, use the `no server ip-address` server group configuration command.

In this example, the switch is configured to recognize two different RADIUS group servers (`group1` and `group2`). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a failover backup to the first entry.

```
Switch(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Switch(config)# aaa new-model
Switch(config)# aaa group server radius group1
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config-sg-radius)# exit
Switch(config)# aaa group server radius group2
Switch(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Switch(config-sg-radius)# exit
```

Configuring RADIUS Authorization for User Privileged Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

You can use the `aaa authorization` global configuration command with the `radius` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec radius local` command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

**Note** Authorization is bypassed for authenticated users who log in using the CLI even if authorization has been configured.

To specify RADIUS authorization for privileged EXEC access and network services, perform this task:

```
Command | Purpose
--- | ---
Step 1 | Switch# configure terminal
| Enters global configuration mode.
Step 2 | Switch(config)# aaa authorization network radius
| Configures the switch for user RADIUS authorization for all network-related service requests.
```
Controlling Switch Access with RADIUS

Chapter 44      Configuring 802.1X Port-Based Authentication

Controlling Switch Access with RADIUS

To disable authorization, use the `no aaa authorization {network | exec} method1` global configuration command.

Starting RADIUS Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

To enable RADIUS accounting for each Cisco IOS privilege level and for network services, perform these steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# aaa accounting</td>
<td>Enables RADIUS accounting for all network-related service requests.</td>
</tr>
<tr>
<td>network start-stop radius</td>
<td></td>
</tr>
<tr>
<td>Step 3 Switch(config)# aaa accounting exec</td>
<td>Enables RADIUS accounting to send a start-record accounting notice at</td>
</tr>
<tr>
<td>start-stop radius</td>
<td>the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td>Step 4 Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 Switch# show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 6 Switch# copy running-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>startup-config</td>
<td></td>
</tr>
</tbody>
</table>

To disable accounting, use the `no aaa accounting {network | exec} {start-stop} method1`... global configuration command.
Configuring Settings for All RADIUS Servers

To configure global communication settings between the switch and all RADIUS servers, perform these steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# radius-server key string Specifies the shared secret text string used between the switch and all RADIUS servers. Note The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# radius-server retransmit retries Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# radius-server timeout seconds Specifies the number of seconds a switch waits for a reply to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# radius-server deadtime minutes Specifies the number of minutes a RADIUS server, which is not responding to authentication requests, to be skipped, thus avoiding the wait for the request to timeout before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# end Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# show running-config Verifies your settings.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch# copy running-config startup-config (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting for the retransmit, timeout, and deadtime, use the no forms of these commands.

Configuring the Switch to Use Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named cisco-avpair. The value is a string with this format:

```
protocol : attribute sep value *
```

*Protocol* is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.
For example, this AV pair activates Cisco’s multiple named ip address pools feature during IP authorization (during PPP IPCP address assignment):

```cisco-avpair= "ip:addr-pool=first"
```

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```cisco-avpair= "shell:priv-lvl=15"
```

This example shows how to specify an authorized VLAN in the RADIUS server database:

```cisco-avpair= "tunnel-type(#64)=VLAN(13)"
cisco-avpair= "tunnel-medium-type(#65)=802 media(6)"
cisco-avpair= "tunnel-private-group-ID(#81)=vlanid"
```

This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

```cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
cisco-avpair= "mac:inacl#3=deny any any decnet-iv"
```

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:

```cisco-avpair= "ip:outacl#2=deny ip 10.10.10.10 0.0.255.255 any"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

To configure the switch to recognize and use VSAs, perform these steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>
| **Step 2** | Switch(config)# radius-server vsa send [accounting | enables the switch to recognize and use VSAs as defined by RADIUS IETF attribute 26.  
| | authentication] |  
| | • (Optional) Use the accounting keyword to limit the set of recognized vendor-specific attributes to only accounting attributes.  
| | • (Optional) Use the authentication keyword to limit the set of recognized vendor-specific attributes to only authentication attributes.  
| | If you enter this command without keywords, both accounting and authentication vendor-specific attributes are used. |
| **Step 3** | Switch(config)# end | Returns to privileged EXEC mode. |
| **Step 4** | Switch# show running-config | Verifies your settings. |
| **Step 5** | Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

For a complete list of RADIUS attributes or more information about vendor-specific attribute 26, see the “RADIUS Attributes” appendix in theCisco IOS Security Configuration Guide, Release 12.2 from the Cisco.com page under Documentation > Cisco IOS Software > 12.2 Mainline > Command References.
Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius-server` global configuration commands.

To specify a vendor-proprietary RADIUS server host and a shared secret text string, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# <code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# `radius-server host {hostname</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# <code>radius-server key string</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# <code>end</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# <code>show running-config</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# <code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

To delete the vendor-proprietary RADIUS host, use the `no radius-server host {hostname | ip-address} non-standard` global configuration command. To disable the key, use the `no radius-server key` global configuration command.

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of `rad124` between the switch and the server:

Switch(config)# `radius-server host 172.20.30.15 nonstandard`  
Switch(config)# `radius-server key rad124`
# Configuring CoA on the Switch

To configure CoA on a switch, perform these steps. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# aaa new-model</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# aaa server radius dynamic-author</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-locsvr-da-radius)# client [ip-address</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-locsvr-da-radius)# server-key [0</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-locsvr-da-radius)# port port-number</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-locsvr-da-radius)# auth-type (any</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config-locsvr-da-radius)# ignore session-key</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch(config-locsvr-da-radius)# ignore server-key</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch(config-locsvr-da-radius)# exit</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Switch(config)# authentication command bounce-port ignore</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Switch(config)# authentication command disable-port ignore</td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td>Switch# end</td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>
To disable AAA, use the `no aaa new-model` global configuration command. To disable the AAA server functionality on the switch, use the `no aaa server radius dynamic authorization` global configuration command:

```
Switch(config)# aaa server radius dynamic-author
Switch(config-locsvr-da-radius)# client ip addr vrf vrfname
Switch(config-locsvr-da-radius)# server-key cisco123
Switch(config-locsvr-da-radius)# port 3799
```

**Note** Default port for packet of disconnect is 1700. Port 3799 is required to interoperate with ACS 5.1.

```
Switch(config)# authentication command bounce-port ignore
```

### Monitoring and Troubleshooting CoA Functionality

The following Cisco IOS commands can be used to monitor and troubleshoot CoA functionality on the switch:

- `debug radius`
- `debug aaa coa`
- `debug aaa pod`
- `debug aaa subsys`
- `debug cmdhd [detail | error | events]`
- `show aaa attributes protocol radius`

### Configuring RADIUS Server Load Balancing

This feature allows access and authentication requests to be evenly across all RADIUS servers in a server group. For more information, see the *RADIUS Server Load Balancing* chapter of the *Cisco IOS Security Configuration Guide*, Release 12.2:

### Displaying the RADIUS Configuration

To display the RADIUS configuration, use the `show running-config` privileged EXEC command.

### Displaying 802.1X Statistics and Status

To display 802.1X statistics for all interfaces, use the `show dot1x all statistics` privileged EXEC command.

To display the 802.1X administrative and operational status for the switch, use the `show dot1x all details` privileged EXEC command. To display the 802.1X administrative and operational status for a specific interface, use the `show dot1x interface details` privileged EXEC command.
Displaying Authentication Details

This section includes these topics:

- Determining the Authentication Methods Registered with the Auth Manager, page 44-114
- Displaying the Auth Manager Summary for an Interface, page 44-114
- Displaying the Summary of All Auth Manager Sessions on the Switch, page 44-114
- Displaying a Summary of All Auth Manager Sessions on the Switch Authorized for a Specified Authentication Method, page 44-115
- Verifying the Auth Manager Session for an Interface, page 44-115
- Displaying MAB Details, page 44-117
- EPM Logging, page 44-117

Determining the Authentication Methods Registered with the Auth Manager

This example shows how to display the registered authentication methods:

Enter the following:

```
Switch# show authentication registrations
```

```
Handle  Priority  Name
3         0       dot1x
2         1       mab
1         2       webauth
```

Displaying the Auth Manager Summary for an Interface

In the following example, MAB was configured for a higher priority (lower value) than 802.1X:

```
Switch# show authentication int gi1/5
```

```
Client list:
Interface  MAC Address     Method   Domain   Status         Session ID
Gi1/5      000f.23c4.a401  mab      DATA     Authz Success  0A3462B10000000D24F80B58
Gi1/5      0014.bf5d.d26d  dot1x    DATA     Authz Success  0A3462B10000000E29811B94
```

```
Available methods list:
Handle  Priority  Name
3        0      dot1x
2        1      mab
```

```
Runnable methods list:
Handle  Priority  Name
2        0      mab
3        1      dot1x
```

Displaying the Summary of All Auth Manager Sessions on the Switch

This example shows how to display the summary of all sessions:

```
Switch# show authentication sessions
```

```
Interface  MAC Address     Method   Domain   Status         Session ID
Gi1/48     0015.63b0.f676  dot1x    DATA     Authz Success  0A3462B1000000102983C05C
Gi1/5      000f.23c4.a401  mab      DATA     Authz Success  0A3462B10000000D24F80B58
Gi1/5      0014.bf5d.d26d  dot1x    DATA     Authz Success  0A3462B10000000E29811B94
```

Displaying Authentication Details
Displaying a Summary of All Auth Manager Sessions on the Switch Authorized for a Specified Authentication Method

This example shows how to display a summary of all sessions for a specific authentication method:

Switch# show authentication method dot1x

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address</th>
<th>Method</th>
<th>Domain</th>
<th>Status</th>
<th>Session ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/48</td>
<td>0015.61b0.f676</td>
<td>dot1x</td>
<td>DATA</td>
<td>Authz Success</td>
<td>0A3462B1000000102983C05C</td>
</tr>
<tr>
<td>Gi1/5</td>
<td>0014.bf5d.d26d</td>
<td>dot1x</td>
<td>DATA</td>
<td>Authz Success</td>
<td>0A3462B10000000E29811B94</td>
</tr>
</tbody>
</table>

Verifying the Auth Manager Session for an Interface

The Auth manager session can be verified by using the `show authentication sessions` command:

Switch# show authentication sessions int gi1/5

```
Interface: GigabitEthernet1/5
MAC Address: 000f.23c4.a401
IP Address: Unknown
User-Name: 000f23c4a401
Status: Authz Success
Domain: DATA
Oper host mode: multi-auth
Oper control dir: both
Authorized By: Authentication Server
Vlan Policy: N/A
Session timeout: N/A
Idle timeout: N/A
Common Session ID: 0A3462B1000000D24F80B58
Acct Session ID: 0x0000000F
Handle: 0x2400000D
Runnable methods list:
Method State  
<table>
<thead>
<tr>
<th>Method State</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x</td>
<td>Failed over</td>
</tr>
<tr>
<td>mab</td>
<td>Authc Success</td>
</tr>
</tbody>
</table>

----------------------------------------

Interface: GigabitEthernet1/5
MAC Address: 0014.bf5d.d26d
IP Address: 20.0.0.7
User-Name: johndoe
Status: Authz Success
Domain: DATA
Oper host mode: multi-auth
Oper control dir: both

Displaying MAB Details

The following commands display these details:

Switch# show mab all
MAB details for FastEthernet5/9
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None

Switch# show mab all detail
MAB details for FastEthernet5/9
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
---------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED

Switch# show mab int fa5/9
MAB details for FastEthernet5/9
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None

Switch# show mab int fa5/9 detail
MAB details for FastEthernet5/9
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
---------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED

EPM Logging

EPM logging enables you to display EPM logging messages by using the `epm logging` command in global configuration mode. To disable EPM logging, enter `no epm logging`.

Logging messages are displayed during the following events:

- POLICY_APP_SUCCESS—Policy application success events on Named ACLs, Proxy ACLs, and service policies, URL redirect policies.
- POLICY_APP_FAILURE—Policy application failure conditions similar to unconfigured policies, wrong policies, download request failures and download failures from AAA.
- IPEVENT—IP assignment, IP release and IP wait events for clients.
- AAA—AAA events (similar to download requests, or download successes from AAA)

Example 1

Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# epm logging
Switch# clear dot1x all
Switch#
*May 15 08:31:26.561: %EPM-6-POLICY_REQ: IP=100.0.0.222| MAC=0000.0000.0001|
AUDITSESID=0A050B2C00000030004956C| AUTHTYPE=DOT1X|
EVENT=REMOVE
*May 15 08:31:26.581: %AUTHMGR-5-START: Starting 'dot1x' for client (0000.0000.0001) on Interface Fa9/25
*May 15 08:31:26.681: %DOT1X-5-SUCCESS: Authentication successful for client (0000.0000.0001) on Interface Fa9/25
*May 15 08:31:26.681: %AUTHMGR-7-RESULT: Authentication result 'success' from 'dot1x' for client (0000.0000.0001) on Interface Fa9/25

Example 2

Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# epm logging
Switch(config)# int f9/25
Switch(config-if)# shut
Switch(config-if)# no shut
*May 15 08:41:56.329: %EPM-6-IPEVENT: IP=100.0.0.222| MAC=0000.0000.0001|

Cisco IOS Security Features in Cisco IOS XE 3.1.0 SG Release

This document provides a list of security software features that are supported in Cisco IOS XE 3.1.0SG. Links to the feature documentation are included.

Feature guides may contain information about more than one feature. To find information about a specific feature within a feature guide, see the Feature Information table at the end of the guide.

Feature guides document features that are supported on many different software releases and platforms. Your Cisco software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in that guide are supported in your software release. Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Role-Based Access Control CLI Commands

Router Security Audit Manageability

Truste:d Root Certification Authority

Configuring the PPPoE Intermediate Agent

DSL Forum TR-101 [1] offers a means by which the PPPoE Discovery packets are tagged at the service provider's access switch with subscriber line specific information. The mechanism specifies using VSA of the PPPoE Discovery packets to add the line specific information at the switch. Even though you can perform Subscriber Line Identification (SLI) in another way (recreating virtual paths and circuits using stacked VLAN tags), DSL Forum 2004-071 [4] recommends the PPPoE Intermediate Agent mechanism. It cites lower provisioning costs and simpler co-ordination between OSS systems in charge of access switch and BRAS. PPPoE Intermediate Agent helps the service provider, BRAS, distinguish between end hosts connected over Ethernet to an access switch.

This chapter describes PPPoE Intermediate Agent on Catalyst 4500 series switches. It includes the following sections:

- About PPPoE Intermediate Agent, page 45-2
- Enabling PPPoE IA on a Switch, page 45-2
- Configuring the Access Node Identifier for PPPoE IA on a Switch, page 45-2
- Configuring the Identifier String, Option, and Delimiter for PPPoE IA on an Switch, page 45-3
- Configuring the Generic Error Message for PPPoE IA on an Switch, page 45-3
- Enabling PPPoE IA on an Interface, page 45-4
- Configuring the PPPoE IA Trust Setting on an Interface, page 45-4
- Configuring PPPoE IA Rate Limiting Setting on an Interface, page 45-4
- Configuring PPPoE IA Vendor-tag Stripping on an Interface, page 45-5
- Configuring PPPoE IA Circuit-ID and Remote-ID on an Interface, page 45-5
- Enabling PPPoE IA for a Specific VLAN on an Interface, page 45-5
- Configuring PPPoE IA Circuit-ID and Remote-ID for a VLAN on an Interface, page 45-6

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About PPPoE Intermediate Agent

PPPoE Intermediate Agent (PPPoE IA) is placed between a subscriber and BRAS to help the service provider BRAS distinguish between end hosts connected over Ethernet to an access switch. On the access switch, PPPoE IA enables Subscriber Line Identification by appropriately tagging Ethernet frames of different users. (The tag contains specific information such as which subscriber is connected to the switch and VLAN.) PPPoE IA acts as mini security firewall between host and BRAS by intercepting all PPPoE Active Discovery (PAD) messages on a per-port per-VLAN basis. It provides specific security feature such as verifying the intercepted PAD message from untrusted port, performing per-port PAD message rate limiting, inserting and removing VSA Tags into and from PAD messages, respectively.

Enabling PPPoE IA on a Switch

This functionality allows you to enable or disable PPPoE IA globally on the switch:

```
Switch> enable
Switch# configure terminal
Switch(config)# pppoe intermediate-agent
```

By default, PPPoE IA is disabled globally.

Configuring the Access Node Identifier for PPPoE IA on a Switch

This functionality allows you to set the Access Node Identifier of the switch. If unspecified, this parameter is derived automatically with the IP address of the management interface.
The following example shows how to set an access node identifier of **abcd**:

```plaintext
Switch> enable
Switch# configure terminal
Switch(config)# pppoe intermediate-agent format-type access-node-id string abcd
```

By default, `access-node-id` is not set.

### Configuring the Identifier String, Option, and Delimiter for PPPoE IA on a Switch

This functionality overrides the default automatic generation of circuit-id by the system.

The options available are `sp`, `sv`, `pv`, and `spv` denoting slot:port, slot-vlan, port-vlan, and slot-port-vlan combinations, respectively. Valid delimiters are `#`, `;`, `/`, space.

The no form of this command without `WORD`, `options`, and `delimiters`, reverts to the default automatic generation of circuit-id.

The following example shows how to set an identifier string **word** with option `spv` delimited by “:”:

```plaintext
Switch> enable
Switch# configure terminal
Switch(config)# pppoe intermediate-agent format-type identifier-string string word
    option spv delimiter :
```

This command does not affect the circuit ID configured explicitly per-interface or per-interface per-VLAN with the `pppoe intermediate-agent format-type circuit-id` or `pppoe intermediate-agent vlan num format-type circuit-id` commands.

### Configuring the Generic Error Message for PPPoE IA on a Switch

This functionality sets the Generic-Error message of the switch. PPPoE IA sends this message only on a specific error condition. If you do not specify `string {WORD}`, the error message is not added.

The following example shows how to configure a generic message of `packet_length>1484`:

```plaintext
Switch> enable
Switch# configure terminal
Switch(config)# pppoe intermediate-agent format-type
generic-error-message string packet_length>1484
PPPoE Discover packet too large to process. Try reducing the number of tags added.
```

By default the `generic-error-message` is not set. The `string` value is converted to UTF-8 before it is added to the response. The message similar to the following will appear:

PPPoE Discover packet too large to process. Try reducing the number of tags added.

---

This TAG (0x0203 Generic-Error) indicates an error. It can be added to PADO or PADS packets generated by PPPoE IA and then sent back to user in reply of PADI or PADR, when a PPPoE discovery packet received by PPPoE IA with PPPoE payload greater than 1484 bytes. Error data must be a UTF-8 string.
Enabling PPPoE IA on an Interface

This functionality enables the PPPoE IA feature on an interface. The `pppoe intermediate-agent` command has an effect only if the PPPoE IA feature was enabled globally with this command. (You need to enable globally to activate PPPoE IA static ACL and on an interface for PPPoE IA processing of PPPoE discovery packets received on that interface.)

This setting applies to all frames passing through this interface, regardless of the VLAN they belong to. By default the PPPoE IA feature is disabled on all interfaces. You need to run this command on every interface that requires this feature.

The following example shows how to enable PPPoE IA on FastEthernet 3/1:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/1
Switch(config-if) pppoe intermediate-agent
```

**Note**

Enabling PPPoE IA on an interface does not ensure that incoming packets are tagged. For this to happen PPPoE IA must be enabled globally, and at least one interface that connects the switch to PPPoE server has a trusted PPPoE IA setting. Refer to the following section for details.

Configuring the PPPoE IA Trust Setting on an Interface

This functionality sets a physical interface as trusted. The following example shows how to set FastEthernet interface 3/2 as trusted:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/2
Switch(config-if) pppoe intermediate-agent trust
```

This setting is disabled by default.

**Note**

Interfaces that connect the switch to PPPoE server are configured as trusted. Interfaces that connect the switch to users (PPPoE clients) are untrusted.

Configuring PPPoE IA Rate Limiting Setting on an Interface

This functionality limits the rate (per second) at which PPPoE Discovery packets (PADI, PADO, PADR, PADS, or PADT) are received on an interface. When the incoming packet rate achieves or exceeds the configured limit, a port enters an err-disabled state.

The following example shows how to set a rate limit of 30 at FastEthernet 3/1:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/1
Switch(config-if) pppoe intermediate-agent limit rate 30
```

**Note**

The parameter for rate limiting is the number of packets per second. If the incoming packet rate exceeds this value, the port shuts down.
Configuring PPPoE IA Vendor-tag Stripping on an Interface

This functionality enables an administrator to strip the vendor-specific tag (VSA) from PADO, PADS, and PADT packets received on an interface before forwarding them to the user.

The following example shows how to enable stripping on FastEthernet 3/2:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/2
Switch(config-if) pppoe intermediate-agent vendor-tag strip
```

This setting is disabled by default.

**Note**
Generally, you would configure vendor-tag stripping on an interfaces connected to the PPPoE server. If you configure stripping, incoming packets are stripped of their VSAs (which carry subscriber and line identification information). For this to happen, the PPPoE Intermediate agent must be enabled to make the `pppoe intermediate-agent vendor-tag strip` command effective, and the interface must be set to trust. In isolation, the command has no effect.

Configuring PPPoE IA Circuit-ID and Remote-ID on an Interface

The `[no]` `pppoe intermediate-agent format-type circuit-id` command sets the circuit ID on an interface and overrides the automatic generation of circuit ID by the switch. Without this command, one default tag (for example, Ethernet x/y:z on the PPPoE to which the user is connected) inserted by an intermediate-agent.

The `[no]` `pppoe intermediate-agent format-type remote-id` command sets the remote ID on an interface.

This functionality causes tagging of PADI, PADR, and PADT packets (belonging to PPPoE Discovery stage) received on this physical interface with circuit ID or remote ID. This happens regardless of their VLAN if PPPoE IA is not enabled for that VLAN.

You should use remote ID instead of circuit ID for subscriber line identification. You should configure this setting on every interface where you enabled PPPoE IA because it is not set by default. The default value for remote-id is the switch MAC address (for all physical interfaces).

The following example shows how to configure the circuit ID as root and the remote ID as granite:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/1
Switch(config-if) pppoe intermediate-agent format-type circuit-id string root
Switch(config-if) pppoe intermediate-agent format-type remote-id string granite
```

Enabling PPPoE IA for a Specific VLAN on an Interface

This functionality allows you to enable PPPoE IA on either a specific VLAN, a comma-separated list such as “x,y;” or a range such as “x-y.”
Specific VLAN:
```
Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

Comma-separated VLAN list:
```
Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5,6
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

VLAN range:
```
Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5-9
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

**Note** The `pppoe intermediate-agent` command in the vlan-range mode is not dependent on the same command in interface mode. The `pppoe intermediate-agent` command will take effect independently of the command in the interface mode. To make this happen, PPPoE IA must be enabled globally and at least one interface is connected to the PPPoE server.

### Configuring PPPoE IA Circuit-ID and Remote-ID for a VLAN on an Interface

In this section you set the circuit ID and remote ID for a specific VLAN on an interface. The command overrides the circuit ID and remote ID specified for this physical interface and the switch uses the `WORD` value to tag packets received on this VLAN. This parameter is unset by default.

The default value of `remote-id` is the switch MAC address (for all VLANs). You would set this parameter to encode subscriber-specific information.

**Note** The `circuit-id` and `remote-id` configurations in vlan-range mode are affected only if PPPoE IA is enabled globally and in vlan-range mode.

This example shows how to set the circuit-id to `aaa` and the remote-id as `ccc` on interface g3/7:
```
Switch(config)# int g3/7
Switch(config-if)# vlan-range 5
Switch(config-if)# pppoe intermediate-agent
Switch(config-if)# pppoe intermediate-agent format-type circuit-id string aaa
Switch(config-if)# pppoe intermediate-agent format-type remote-id string ccc
```

**Note** The `vlan-range` mode commands configure PPPoE IA for either a specific VLAN, multiple VLANs, or VLAN range, depending on what you specify in the syntax.

### Displaying Configuration Parameters

The `show pppoe intermediate-agent [info|statistics] [interface {interface}]` command displays the various configuration parameters, statistics, and counters stored for PPPoE.
The **info** keyword appears if the PPPoE Intermediate Agent is enabled globally on an interface or on a VLAN (in an interface). It also informs you about the access node ID and generic error message of the switch, as well as the identifier string options and delimiter values configured globally by the following command:

```
Switch(config)# pppoe intermediate-agent format-type ?
  access-node-id         Access Node Identifier
  generic-error-message  Generic Error Message
  identifier-string      Identifier String
```

The **info** keyword also displays the circuit ID, remote ID, trust and rate limit configurations, and vendor tag strip setting for all interfaces and for all VLANs pertaining to those interfaces. If any of these parameters are not set, they are not displayed.

The **statistics** option displays the number of PADI/PADR/PADT packets received, and the time the last packet was received on all interfaces and on all VLANs pertaining to those interfaces. If **interface** is specified, information or statistics applicable only to that physical interface and pertaining VLANs is displayed.

Although PPPoE IA is supported on PVLANs, be aware that no PVLAN association (primary and secondary VLAN mapping) information is displayed.

The PPPoE IA show commands such as `show pppoe intermediate-agent info`, `show pppoe intermediate-agent info interface g3/7`, or `show pppoe intermediate-agent statistics`) do not provide information about private VLAN association (primary and secondary VLAN mapping). However, they do provide information about VLANs regardless of private or normal VLANs, as the following example illustrate:

```
Switch# show pppoe intermediate-agent info
Switch PPPOE Intermediate-Agent is enabled
PPPOE Intermediate-Agent trust/rate is configured on the following Interfaces:

Interface               IA         Trusted    Vsa Strip   Rate limit (pps)
----------------------- --------   -------    ---------   ----------------
GigabitEthernet3/4         no         yes        yes         unlimited

PPPOE Intermediate-Agent is configured on following VLANs:
2-3

Switch# show pppoe intermediate-agent info interface g3/7
Interface               IA         Trusted    Vsa Strip   Rate limit (pps)
----------------------- --------   -------    ---------   ----------------
GigabitEthernet3/7         yes        no         no          unlimited

PPPoE Intermediate-Agent is configured on following VLANs:
2-3

Switch# show pppoe intermediate-agent statistics
PPPOE IA Per-Port Statistics
Interface : GigabitEthernet3/7
Packets received
  All = 0
  PADI = 0 PADO = 0
  PADR = 0 PADS = 0
  PADT = 0
Packets dropped:
  Rate-limit exceeded = 0
```
Clearing Packet Counters

This section illustrates how to clear packet counters on all interfaces (per-port and per-port-per-VLAN).

The following example illustrates how to do this:

```
Switch# clear pppoe intermediate-agent statistics
Issuing of the above command clears the counters for all PPPoE discovery packets (PADI, PADO, PADR, PADS, PADT) received on DUT.

Switch# show pppoe intermediate-agent statistics interface g3/7
Interface : GigabitEthernet3/7
Packets received
  All = 0
  PADI = 0 PADO = 0
  PADR = 0 PADS = 0
  PADT = 0
Packets dropped:
  Rate-limit exceeded = 0
  Server responses from untrusted ports = 0
  Client requests towards untrusted ports = 0
  Malformed PPPoE Discovery packets = 0
Vlan 2: Packets received PADI = 0 PADO = 0 PADR = 0 PADS = 0 PADT = 0
Vlan 3: Packets received PADI = 0 PADO = 0 PADR = 0 PADS = 0 PADT = 0
```

Debugging PPPoE Intermediate Agent

The `debug pppoe intermediate-agent [packet | event | all]` command enables you to display useful PPPoE information that assists in debugging. This command is disabled by default.

The `packet` option of the command displays the contents of a packet received in the software: source and destination MAC address of Ethernet frame, code, version and type of PPPoE Discovery packet and a list of TAGs present.
The event option of the command echoes important messages (interface state change to errdisabed due to PPPoE discovery packets entering at a rate exceeding the configured limit). It is the only event shown by the debug pppoe intermediate-agent event command.

The all option enables both package and event options.

The following example illustrates how to enter the debug command with the packet option:

```
Switch# debug pppoe intermediate-agent packet
PPPOE IA Packet debugging is on
*Sep 2 06:12:56.133: PPPOE_IA: Process new PPPoE packet, Message type: PADI, input interface: Gi3/7, vlan : 2 MAC da: ffff.ffff.ffff, MAC sa: aabb.cc00.0000
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPoE packet from inputinterface (GigabitEthernet3/4)
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPoE packet from inputinterface (GigabitEthernet3/8)
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADO, input interface: Gi3/4, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADO, input interface: Gi3/8, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: aabb.cc80.0000
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPoE packet from inputinterface (GigabitEthernet3/7)
```

The following example illustrates how to enter the debug command with the event option:

```
Switch# debug pppoe intermediate-agent event
PPPOE IA Event debugging is on
*Jul 30 19:00:10.254: %PPPOE_IA-4-PPPOE_IA_ERRDISABLE_WARNING: PPPOE IA received 5 PPPoE packets on interface Gi3/7
*Jul 30 19:00:10.254: %PPPOE_IA-4-PPPOE_IA_RATE_LIMIT_EXCEEDED: The interface Gi3/7 is receiving more than the threshold set
*Jul 30 19:00:10.394: %PM-4-ERR_DISABLE: STANDBY:pppoe-ia-rate-limit error detected on Gi3/7, putting Gi3/7 in err-disable stat
```

**Troubleshooting Tips**

When the `radius-server attribute 31 remote-id` global configuration command is entered in the PPPoE Agent Remote-ID Tag and DSL Line Characteristics feature configuration on the BRAS, the debug radius privileged EXEC command can be used to generate a report that includes information about the incoming access interface, where discovery frames are received, and about the session being established in PPPoE extended NAS-Port format (format d).
Configuring Web-Based Authentication

This chapter describes how to configure web-based authentication. It consists of these sections:

- About Web-Based Authentication, page 46-1
- Configuring Web-Based Authentication, page 46-6
- Displaying Web-Based Authentication Status, page 46-14

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Web-Based Authentication

The web-based authentication feature, known as Web Authentication Proxy, enables you to authenticate end users on host systems that do not run the IEEE 802.1X supplicant.

Note

You can configure web-based authentication on Layer 2 and Layer 3 interfaces.

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the user. The user keys in their credentials, which the web-based authentication feature sends to the AAA server for authentication:

- If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.
- If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host and the user is placed on a watch list for a waiting period.
These sections describe the role of web-based authentication as part of the authentication, authorization, and accounting (AAA) system:

- Device Roles, page 46-2
- Host Detection, page 46-2
- Session Creation, page 46-3
- Authentication Process, page 46-3
- Customization of the Authentication Proxy Web Pages, page 46-4
- Web-Based Authentication Interactions with Other Features, page 46-4

**Device Roles**

With web-based authentication, the devices in the network have specific roles (Figure 46-1).

![Web-Based Authentication Device Roles](image)

The roles are as follows:

- **Client**—The device (workstation) that requests access to the LAN and switch services and responds to requests from the switch. The workstation must be running an HTML browser with JavaScript enabled.
- **Authentication server**—Performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and switch services or that the client is denied.
- **Switch**—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.

**Host Detection**

The switch maintains an IP device tracking table to store information about detected hosts.

**Note**

By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
For Layer 3 interfaces, web-based authentication sets an HTTP intercept ACL when the feature is configured on the interface (or when the interface is put in service).

For Layer 2 interfaces, web-based authentication detects IP hosts using the following mechanisms:

- ARP-based trigger—ARP redirect ACL allows web-based authentication to detect hosts with static IP address or dynamically acquired IP address.
- Dynamic ARP inspection (DAI)
- DHCP snooping—Web-based authentication is notified when the switch creates a DHCP binding entry for the host.

### Session Creation

When web-based authentication detects a new host, it creates a session as follows:

- **Checks for Auth bypass**
  
  If the host IP is not on the exception list, web-based authentication sends a nonresponsive host (NRH) request to the server.
  
  If the server response is Access Accepted, authorization is bypassed for this host. The session is established.

- **Sets up the HTTP Intercept ACL**
  
  If the server response to the NRH request is Access Rejected, the HTTP intercept ACL is activated and the session waits for HTTP traffic from the host.

### Authentication Process

When you enable web-based authentication, the following events occur:

- **The user initiates an HTTP session.**
- **The HTTP traffic is intercepted, and authorization is initiated.** The switch sends the login page to the user. The user enters a username and password on the login page, and the switch sends the entries to the authentication server.
- **If the client identity is valid and the authentication succeeds, the switch downloads and activates the user’s access policy from the authentication server.** The login success page is sent to the user.
- **If the authentication fails, the switch sends the login fail page.** The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.
- **If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host.** The login success page is sent to the user. See the “Customization of the Authentication Proxy Web Pages” section on page 46-4.
- **The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or the host does not send any traffic within the idle timeout on a Layer 3 interface.**
- **The feature applies the downloaded timeout or the locally configured session timeout.**
- **If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server.** The terminate action is included in the response from the server.
- **If the terminate action is default, the session is dismantled and the applied policy is removed.**
Customization of the Authentication Proxy Web Pages

During the web-based authentication process, the internal HTTP server of the switch hosts four HTML pages for delivery to an authenticating client. The four pages allow the server to notify you of the following four states of the authentication process:

- Login—Your credentials are requested.
- Success—The login was successful.
- Fail—The login failed.
- Expire—The login session has expired because of excessive login failures.

**Note**

When your customized web-based authentication page is replaced with a new page (file) of the same name in the switch system directory (i.e. flash), the new page will not be seen; you will see the older page. Beginning with Release 15.0(2)SG, the new page will not display until you enter the `ip admission proxy http refresh-all` command.

In Cisco IOS Release 12.2(50)SG, you can substitute your custom HTML pages for the four default internal HTML pages, or you can specify a URL to which you are redirected upon successful authentication, effectively replacing the internal Success page.

Web-Based Authentication Interactions with Other Features

These sections describe web-based authentication interactions with these features:

- Port Security, page 46-4
- LAN Port IP, page 46-5
- Gateway IP, page 46-5
- ACLs, page 46-5
- Context-Based Access Control, page 46-5
- 802.1X Authentication, page 46-5
- EtherChannel, page 46-5
- Switchover, page 46-5

Port Security

You can configure web-based authentication and port security on the same port. (You configure port security on the port with the `switchport port-security` interface configuration command.) When you enable port security and web-based authentication on a port, web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network using the port.

For more information about enabling port security, see Chapter 47, “Configuring Port Security.”
LAN Port IP

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated and posture is validated again.

Gateway IP

You cannot configure Gateway IP on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

ACLs

If you configure a VLAN ACL or Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, you must configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

Context-Based Access Control

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port’s VLAN.

802.1X Authentication

You cannot configure web-based authentication on the same port as 802.1X authentication except as a fallback authentication method.

EtherChannel

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

Switchover

On Catalyst 4500 series switches with redundant supervisor engines in RPR mode, information about currently authenticated hosts is maintained during a switchover. You do not need to reauthenticate.
Configuring Web-Based Authentication

These sections describe how to configure web-based authentication:

- Default Web-Based Authentication Configuration, page 46-6
- Web-Based Authentication Configuration Guidelines and Restrictions, page 46-6
- Web-Based Authentication Configuration Task List, page 46-7
- Configuring the Authentication Rule and Interfaces, page 46-7
- Configuring AAA Authentication, page 46-9
- Configuring Switch-to-RADIUS-Server Communication, page 46-9
- Configuring the HTTP Server, page 46-11
- Configuring the Web-Based Authentication Parameters, page 46-13
- Removing Web-Based Authentication Cache Entries, page 46-14

Default Web-Based Authentication Configuration

Table 46-1 shows the default web-based authentication configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>AAA</td>
<td>Disabled</td>
</tr>
<tr>
<td>RADIUS server</td>
<td></td>
</tr>
<tr>
<td>IP address</td>
<td>None specified</td>
</tr>
<tr>
<td>UDP authentication port</td>
<td>1812</td>
</tr>
<tr>
<td>Key</td>
<td>None specified</td>
</tr>
<tr>
<td>Default value of inactivity timeout</td>
<td>3600 seconds</td>
</tr>
<tr>
<td>Inactivity timeout</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Web-Based Authentication Configuration Guidelines and Restrictions

When configuring web-based authentication, consider these guidelines and restrictions:

- Web authentication requires two Cisco Attribute-Value (AV) pair attributes:

  The first attribute, priv-lvl=15, must always be set to 15. This sets the privilege level of the user who is logging into the switch.

  The second attribute is an access list to be applied for web-authenticated hosts. The syntax is similar to 802.1x per-user access control lists (ACLs). However, instead of ip:inacl, this attribute must begin with proxyacl, and the source field in each entry must be any. (After authentication, the client IP address replaces the any field when the ACL is applied.)

  For example:

  ```
  proxyacl# 10=permit ip any 10.0.0.0 255.0.0.0
  proxyacl# 20=permit ip any 11.1.0.0 255.255.0.0
  proxyacl# 30=permit udp any any eq syslog
  ```
proxyacl# 40=permit udp any any eq tftp

**Note**
The proxyacl entry determines the type of allowed network access.

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- You must configure the default ACL on the interface before configuring web-based authentication. Configure a port ACL for a Layer 2 interface, or a Cisco IOS ACL for a Layer 3 interface.
- On Layer 2 interfaces, you cannot authenticate hosts with static ARP cache assignment. These hosts are not detected by the web-based authentication feature, because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must configure at least one IP address to run the HTTP server on the switch. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.
- Hosts that are more than one hop away may experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. It is because ARP and DHCP updates may not be sent after a Layer 2 (STP) topology change.
- Web-based authentication does not support VLAN assignment as a downloadable host policy.
- Cisco IOS Release 12.2(50)SG supports downloadable ACLs (DACLs) from the RADIUS server.
- Web-based authentication is not supported for IPv6 traffic.

## Web-Based Authentication Configuration Task List

To configure the web-based authentication feature, perform the following tasks:

- Configuring the Authentication Rule and Interfaces, page 46-7
- Configuring AAA Authentication, page 46-9
- Configuring Switch-to-RADIUS-Server Communication, page 46-9
- Configuring the HTTP Server, page 46-11
- Configuring the Web-Based Authentication Parameters, page 46-13
- Removing Web-Based Authentication Cache Entries, page 46-14

## Configuring the Authentication Rule and Interfaces

To configure web-based authentication, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configures an authentication rule for web-based authorization. Removes the authentication rule.</td>
</tr>
<tr>
<td>Switch(config)# ip admission name name proxy http</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# no ip admission name name</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 46  Configuring Web-Based Authentication

This example shows how to enable web-based authentication on Fast Ethernet port 5/1:

```
Switch(config)# ip admission name webauth1 proxy http
Switch(config)# interface fastethernet 5/1
Switch(config-if)# ip admission webauth1
Switch(config-if)# exit
Switch(config)# ip device tracking
```

This example shows how to verify the configuration:

```
Switch# show ip admission configuration
Authentication Proxy Banner not configured
Authorization global cache time is 60 minutes
Authorization global absolute time is 0 minutes
Authorization global init state time is 2 minutes
Authorization Proxy Watch-list is disabled

Authentication Proxy Rule Configuration
Auth-proxy name webauth1
    http list not specified inactivity-time 60 minutes

Authentication Proxy Auditing is disabled
Max Login attempts per user is 5
```
Configuring AAA Authentication

To enable web-based authentication, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa new-model</td>
<td>Enables AAA functionality.</td>
</tr>
<tr>
<td>Switch(config)# no aaa new-model</td>
<td>Disables AAA functionality.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa authentication login default group {tacacs+</td>
<td>radius}</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa authorization auth-proxy default group {tacacs+</td>
<td>radius}</td>
</tr>
<tr>
<td>Switch(config)# no aaa authorization auth-proxy default group {tacacs+</td>
<td>radius}</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# tacacs-server host {hostname</td>
<td>ip_address}</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# tacacs-server key {key-data}</td>
<td>Configures the authorization and encryption key used between the switch and the TACACS server.</td>
</tr>
</tbody>
</table>

This example shows how to enable AAA:

Switch(config)# aaa new-model
Switch(config)# aaa authentication login default group tacacs+
Switch(config)# aaa authorization auth-proxy default group tacacs+

Configuring Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by one of the following:

- Host name
- Host IP address
- Host name and specific UDP port numbers
- IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

To configure the RADIUS server parameters, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip radius source-interface interface_name</td>
<td>Specifies that the RADIUS packets have the IP address of the indicated interface.</td>
</tr>
<tr>
<td>Switch(config)# no ip radius source-interface</td>
<td>Prevents the RADIUS packets from having the IP address of the previously indicated interface.</td>
</tr>
</tbody>
</table>
When you configure the RADIUS server parameters, follow these steps:

- Specify the **key string** on a separate command line.
- For **key string**, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
- When you specify the **key string**, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
- You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers with the **radius-server host** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, **radius-server retransmit**, and the **radius-server key** global configuration commands. For more information, see the Cisco IOS Security Configuration Guide, Release 12.4, publication at this URL:
  

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2**
Switch(config)# radius-server host (hostname | ip-address) test username username | Specifies the host name or IP address of the remote RADIUS server. The **test username username** option enables automated testing of the RADIUS server connection. The specified **username** does not need to be a valid user name. The **key** option specifies an authentication and encryption key to be used between the switch and the RADIUS server. To use multiple RADIUS servers, reenter this command. |
| **Step 3**
Switch(config)# no radius-server host (hostname | ip-address) | Deletes the specified RADIUS server. |
| **Step 4**
Switch(config)# radius-server key string | Configures the authorization and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. |
| **Step 5**
Switch(config)# radius-server vsa send authentication | Enables downloading of an ACL from the RADIUS server. This feature is supported in Cisco IOS Release 12.2(50)SG. |
| **Step 5**
Switch(config)# radius-server dead-criteria tries num-tries | Specifies the number of unanswered transmits to a RADIUS server before considering the server to be inactive. The range of **num-tries** is 1 to 100. |

You need to configure some settings on the RADIUS server, including: the IP address of the switch, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). (Cisco IOS Release 12.2(50)SG supports DACLs.) For more information, see the RADIUS server documentation.

This example shows how to configure the RADIUS server parameters on a switch:

```
Switch(config)# ip radius source-interface Vlan80
Switch(config)# radius-server host 172.120.39.46 test username user1
Switch(config)# radius-server key rad123
Switch(config)# radius-server dead-criteria tries 2
```
Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the switch. You can enable the server for either HTTP or HTTPS.

To enable the server, perform one of these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# ip http server</td>
<td>Enables the HTTP server. The web-based authentication feature uses the HTTP server to communicate with the hosts for user authentication.</td>
</tr>
<tr>
<td>Switch(config)# ip http secure-server</td>
<td>Enables HTTPS.</td>
</tr>
</tbody>
</table>

Starting with Cisco IOS Release 12.2(50)SG, you can optionally configure custom authentication proxy web pages or specify a redirection URL for successful login, as described in the following sections:

- Customizing the Authentication Proxy Web Pages, page 46-11
- Specifying a Redirection URL for Successful Login, page 46-12

Customizing the Authentication Proxy Web Pages

With Cisco IOS Release 12.2(50)SG, you have the option to display four substitute HTML pages to the user in place of the switch’s internal default HTML pages during web-based authentication.

To specify the use of your custom authentication proxy web pages, first store your custom HTML files on the switch’s internal disk or flash memory, then perform this task in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Switch(config)# ip admission proxy http login page file device:login-filename</td>
<td>Specifies the location in the switch memory file system of the custom HTML file to use in place of the default login page. The device: is either disk or flash memory, such as disk0:.</td>
</tr>
<tr>
<td>Step 2 Switch(config)# ip admission proxy http success page file device:success-filename</td>
<td>Specifies the location of the custom HTML file to use in place of the default login success page.</td>
</tr>
<tr>
<td>Step 3 Switch(config)# ip admission proxy http failure page file device:fail-filename</td>
<td>Specifies the location of the custom HTML file to use in place of the default login failure page.</td>
</tr>
<tr>
<td>Step 4 Switch(config)# ip admission proxy http login expired page file device:expired-filename</td>
<td>Specifies the location of the custom HTML file to use in place of the default login expired page.</td>
</tr>
</tbody>
</table>

When configuring customized authentication proxy web pages, observe the following guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.
- The four custom HTML files must be present on the disk or flash of the switch. The maximum size of each HTML file is 8 KB.
- Any images on the custom pages must be located on an accessible HTTP server. An intercept ACL must be configured within the admission rule to allow access to the HTTP server.
Any external link from a custom page requires configuration of an intercept ACL within the admission rule.

Any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule to access a valid DNS server.

If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.

If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.

To remove the specification of a custom file, use the `no` form of the command.

Because the custom login page is a public web form, consider the following guidelines for this page:

- The login form must accept user input for the username and password and must POST the data as `uname` and `pwd`.
- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.

The following example shows how to configure custom authentication proxy web pages:

```plaintext
Switch(config)# ip admission proxy http login page file disk1:login.htm
Switch(config)# ip admission proxy http success page file disk1:success.htm
Switch(config)# ip admission proxy http fail page file disk1:fail.htm
Switch(config)# ip admission proxy http login expired page file disk1:expired.htm
```

The following example shows how to verify the configuration of custom authentication proxy web pages:

```plaintext
Switch# show ip admission configuration
Authorization global cache time is 60 minutes
Authorization global absolute time is 0 minutes
Authorization global init state time is 2 minutes
Authorization Proxy Session ratelimit is 100
Authorization Proxy Watch-list is disabled
Authorization Proxy Auditing is disabled
Max Login attempts per user is 5
```

### Specifying a Redirection URL for Successful Login

With Cisco IOS Release 12.2(50)SG, you have the option to specify a URL to which the user is redirected upon successful authentication, effectively replacing the internal Success HTML page.

To specify a redirection URL for successful login, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# ip admission proxy http success redirect uri-string</code></td>
<td>Specifies a URL for redirection of the user in place of the default login success page.</td>
</tr>
</tbody>
</table>

When configuring a redirection URL for successful login, consider the following guidelines:
- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom login success page.
- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.
- To remove the specification of a redirection URL, use the no form of the command.

The following example shows how to configure a redirection URL for successful login:

```
Switch(config)# ip admission proxy http success redirect www.cisco.com
```

The following example shows how to verify the redirection URL for successful login:

```
Switch# show ip admission configuration
```

```
Authentication Proxy Banner not configured
Customizable Authentication Proxy webpage not configured
HTTP Authentication success redirect to URL: http://www.cisco.com
Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Watch-list is disabled
Authentication Proxy Max HTTP process is 7
Authentication Proxy Auditing is disabled
Max Login attempts per user is 5
```

### Configuring the Web-Based Authentication Parameters

You can configure the maximum number of failed login attempts allowed before the client is placed in a watch list for a waiting period.

To configure the web-based authentication parameters, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Sets the maximum number of failed login attempts. The default is 5.</td>
</tr>
<tr>
<td>Switch(config)# ip admission max-login-attempts number</td>
<td>Note</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Displays the authentication proxy configuration.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Displays the list of authentication entries.</td>
</tr>
<tr>
<td>Switch# show ip admission configuration</td>
<td>Switch# show ip admission cache</td>
</tr>
</tbody>
</table>

This example shows how to set the maximum number of failed login attempts to 10:

```
Switch(config)# ip admission max-login-attempts 10
```
Removing Web-Based Authentication Cache Entries

To delete existing session entries, perform either of these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`Switch# clear ip auth-proxy cache {*</td>
<td>host ip address}`</td>
</tr>
<tr>
<td>`Switch# clear ip admission cache {*</td>
<td>host ip address}`</td>
</tr>
</tbody>
</table>

This example shows how to remove the web-based authentication session for the client at IP address 209.165.201.1:

```
Switch# clear ip auth-proxy cache 209.165.201.1
```

Displaying Web-Based Authentication Status

To display the web-based authentication settings for all interfaces or for specific ports, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# show authentication sessions [interface type slot/port]</code></td>
<td>Displays the web-based authentication settings. type = fastethernet, gigabitethernet, or tengigabitethernet (Optional) Use the interface keyword to display the web-based authentication settings for a specific interface.</td>
</tr>
</tbody>
</table>

This example shows how to view only the global web-based authentication status:

```
Switch# show authentication sessions
```

This example shows how to view the web-based authentication settings for interface Gi 3/27:

```
Switch# show authentication sessions interface gigabitethernet 3/27
```
Configuring Port Security

This chapter describes how to configure port security on the Catalyst 4500 series switch. It provides an overview of port security on the Catalyst 4500 series switch and details the configuration on various types of ports such as access, voice, trunk, and private VLAN (PVLAN).

This chapter consists of these sections:

- Port Security Commands, page 47-2
- About Port Security, page 47-3
- Configuring Port Security on Access Ports, page 47-7
- Configuring Port Security on PVLAN Ports, page 47-14
- Configuring Port Security on Trunk Ports, page 47-17
- Configuring Port Security on Voice Ports, page 47-22
- Displaying Port Security Settings, page 47-27
- Configuring Port Security with Other Features/Environments, page 47-31
- Port Security Configuration Guidelines and Restrictions, page 47-33

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

# Port Security Commands

This table lists the commands most commonly used with port security.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
<th>Navigation</th>
</tr>
</thead>
<tbody>
<tr>
<td>errdisable recovery cause</td>
<td>Brings a secure port out of error-disabled state.</td>
<td>Violation Actions, page 47-6</td>
</tr>
<tr>
<td>psecure-violation</td>
<td>Customizes the time to recover from a specified error disable cause.</td>
<td>Violation Actions, page 47-6</td>
</tr>
<tr>
<td>port-security mac-address</td>
<td>Configures all secure MAC addresses on each VLAN.</td>
<td>Secure MAC Addresses, page 47-4</td>
</tr>
<tr>
<td>port-security maximum</td>
<td>Configures a maximum number of MAC addresses on an interface.</td>
<td>Configuring Port Security on Access Ports, page 47-7</td>
</tr>
<tr>
<td>private-vlan association add</td>
<td>Creates an association between a secondary VLAN and a primary VLAN.</td>
<td>Example of Port Security on an Isolated Private VLAN Host Port, page 47-16</td>
</tr>
<tr>
<td>private-vlan isolated</td>
<td>Designates the VLAN as a private VLAN.</td>
<td>Configuring Port Security on an Isolated Private VLAN Host Port, page 47-14</td>
</tr>
<tr>
<td>private-vlan primary</td>
<td>Specifies the VLAN as the primary private VLAN.</td>
<td>Configuring Port Security on an Isolated Private VLAN Host Port, page 47-14</td>
</tr>
<tr>
<td>switchport mode private-vlan host</td>
<td>Specifies that ports with valid private VLAN trunk association become active host private VLAN trunk ports.</td>
<td>Configuring Port Security on an Isolated Private VLAN Host Port, page 47-14</td>
</tr>
<tr>
<td>switchport private-vlan host-association</td>
<td>Defines a host association on an isolated host port.</td>
<td>Configuring Port Security on an Isolated Private VLAN Host Port, page 47-14</td>
</tr>
<tr>
<td>switchport private-vlan mapping</td>
<td>Defines a private VLAN for the promiscuous ports.</td>
<td>Configuring Port Security on an Isolated Private VLAN Host Port, page 47-14</td>
</tr>
<tr>
<td>switchport port-security</td>
<td>Enables port security.</td>
<td>Configuring Port Security on Access Ports, page 47-7</td>
</tr>
<tr>
<td>switchport port-security aging static</td>
<td>Configures static aging of MAC address.</td>
<td>Aging Secure MAC Addresses, page 47-5</td>
</tr>
<tr>
<td>switchport port-security aging time</td>
<td>Specifies an aging time for a port.</td>
<td>Example 3: Setting the Aging Timer, page 47-11</td>
</tr>
<tr>
<td>switchport port-security limit rate invalid-source-mac</td>
<td>Sets the rate limit for bad packets.</td>
<td>Example 7: Setting a Rate Limit for Bad Packets, page 47-13</td>
</tr>
<tr>
<td>switchport port-security mac-address</td>

About Port Security

Port security enables you to restrict the number of MAC addresses (termed *secure MAC addresses*) on a port, allowing you to prevent access by unauthorized MAC addresses. It also allows you to configure a maximum number of secure MAC addresses on a given port (and optionally for a VLAN for trunk ports). When a secure port exceeds the maximum, a security violation is triggered, and a violation action is performed based on the violation action mode configured on the port.

If you configure the maximum number of secure MAC addresses as 1 on the port, the device attached to the secure port is assured sole access to the port.

If a secure MAC address is secured on a port, that MAC address is not allowed to enter on any other port off that VLAN. If it does, the packet is dropped unnoticed in the hardware. Other than using the interface or port counters, you do not receive a log message reflecting this fact. Be aware that this condition does not trigger a violation. Dropping these packets in the hardware is more efficient and can be done without putting additional load on the CPU.

Port security has the following characteristics:

- It allows you to age out secure MAC addresses. Two types of aging are supported: inactivity and absolute.
- It supports a sticky feature whereby the secure MAC addresses on a port are retained through switch reboots and link flaps.
- It can be configured on various types of ports such as access, voice, trunk, EtherChannel, and private VLAN ports.

This overview contains the following topics:

- Secure MAC Addresses, page 47-4
- Maximum Number of Secure MAC Addresses, page 47-4
- Aging Secure MAC Addresses, page 47-5
- Sticky Addresses on a Port, page 47-5
- Violation Actions, page 47-6

Secure MAC Addresses

Port security supports the following types of secure MAC addresses:

- **Dynamic or Learned**—Dynamic secure MAC addresses are learned when packets are received from the host on the secure port. You might want to use this type if the user’s MAC address is not fixed (laptop).

- **Static or configured**—Static secure MAC addresses are configured by the user through CLI or SNMP. You might want to use this type if your MAC address remains fixed (PC).

- **Sticky**—Sticky addresses are learned such as dynamic secure MAC addresses, but persist through switch reboots and link flaps such as static secure MAC addresses. You might want to use this type if a large number of fixed MAC addresses exist and you do not want to configure MAC addresses manually (100 PCs secured on their own ports).

If a port has reached its maximum number of secure MAC addresses and you try to configure a static secure MAC address, your configuration is rejected and an error message displays. If a port has reached its maximum number of secure MAC addresses and a new dynamic secure MAC address is added, a violation action is triggered.

You can clear dynamic secure MAC addresses with the `clear port-security` command. You can clear sticky and static secure MAC addresses one at a time with the `no` form of the `switchport port-security mac-address` command.

Maximum Number of Secure MAC Addresses

A secure port has a default of one MAC address. You can change the default to any value between 1 and 3,000. The upper limit of 3,000 guarantees one MAC address per-port and an additional 3,000 across all ports in the system.

After you have set the maximum number of secure MAC addresses on a port, you can include the secure addresses in an address table in one of the following ways:

- You can configure the secure MAC addresses with the `switchport port-security mac-address mac_address` interface configuration command.

- You can configure all secure MAC addresses on a range of VLANs with the `port-security mac-address` VLAN range configuration command for trunk ports.

- You can allow the port to dynamically configure secure MAC addresses with the MAC addresses of connected devices.

- You can configure some of the addresses and allow the rest to be dynamically configured.

Note

If a port’s link goes down, all dynamically secured addresses on that port are no longer secure.

- You can configure MAC addresses to be sticky. These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. After these addresses are saved in the configuration file, the interface does not need to dynamically relearn them when the switch restarts. Although you can manually configure sticky secure addresses, this action is not recommended.
Chapter 47      Configuring Port Security

About Port Security

On a trunk port, a maximum number of secure MAC addresses can be configured on both the port and port VLAN. The port’s maximum value can be greater than or equal to the port VLAN maximum(s) but not less than the port VLAN maximum(s). If the port’s maximum value is less than at least one of the port VLAN’s maximum (for example, if we have max set to 3 on VLAN 10 while no “sw port max” is set (defaults to 1)), the port shuts down when dynamic adds reaches 2 on VLAN 10 (see “Port Security Configuration Guidelines and Restrictions” on page 33). The port VLAN maximum enforces the maximum allowed on a given port on a given VLAN. If the maximum is exceeded on a given VLAN but the port’s maximum is not exceeded, the port still shuts down. The entire port is shut down even if one of the VLANs on the port has actually caused the violation.

Aging Secure MAC Addresses

You might want to age secure MAC addresses when the switch may be receiving more than 3,000 MAC addresses ingress.

Aging of sticky addresses is not supported.

By default, port security does not age out the secure MAC addresses. After learned, the MAC addresses remain on the port until either the switch reboots or the link goes down (unless the sticky feature is enabled). However, port security does allow you to configure aging based on the absolute or inactivity mode and aging interval (in minutes, from 1 to n).

- Absolute mode—Ages between n and n+1
- Inactivity mode—Ages between n+1 and n+2

Use this feature to remove and add PCs on a secure port without manually deleting the existing secure MAC addresses, while still limiting the number of secure addresses on a port.

Unless static aging is explicitly configured with the `switchport port-security aging static` command, static addresses are not aged even if aging is configured on the port.

The aging increment is one minute.

Sticky Addresses on a Port

By enabling sticky port security, you can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration. You might want to do this if you do not expect the user to move to another port, and you want to avoid statically configuring a MAC address on every port.

If you use a different chassis, you might need another MAC address.

To enable sticky port security, enter the `switchport port-security mac-address sticky` command. When you enter this command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses.
The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the running config file to the configuration file, the interface does not need to relearn these addresses when the switch restarts. If you do not save the configuration, they are lost.

If sticky port security is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

After the maximum number of secure MAC addresses is configured, they are stored in an address table. To ensure that an attached device has sole access of the port, configure the MAC address of the attached device and set the maximum number of addresses to one, which is the default.

A security violation occurs if the maximum number of secure MAC addresses to a port has been added to the address table and a workstation whose MAC address is not in the address table attempts to access the interface.

Violation Actions

A security violation is triggered when the number of secure MAC addresses on the port exceeds the maximum number of secure MAC addresses allowed on the port.

Note

A secure violation is not triggered if the host secured on one port shows up on another port. The Catalyst 4500 series switch drops such packets on the new port silently in the hardware and does not overload the CPU.

You can configure the interface for one of following violation modes, which are based on the response to the violation:

- **Restrict**—A port security violation restricts data (that is, packets are dropped in software), causes the SecurityViolation counter to increment, and causes an SNMP Notification to be generated. You might want to configure this mode in order to provide uninterrupted service/access on a secure port.

  The rate at which SNMP traps are generated can be controlled by the `snmp-server enable traps port-security trap-rate` command. The default value (“0”) causes an SNMP trap to be generated for every security violation.

- **Shutdown**—A port security violation causes the interface to shut down immediately. You might want to configure this mode in a highly secure environment, where you do not want unsecured MAC addresses to be denied in software and service interruption is not an issue.

- **Shutdown VLAN**—Use to set the security violation mode for each VLAN. In this mode, the offending VLAN is error disabled instead of the entire port when a violation occurs.

  When a secure port is in the error-disabled state, you can bring it out of this state automatically by configuring the `errdisable recovery cause psecure-violation` global configuration command or you can manually reenable it by entering the `shutdown` and `no shutdown` interface configuration commands. It is the default mode. If a port is in per-VLAN errdisable mode, you can also use the `clear errdisable interface name vlan range` command to reenable the VLAN on the port.

  You can also customize the time to recover from the specified error disable cause (default is 300 seconds) by entering the `errdisable recovery interval interval` command.
Invalid Packet Handling

You might want to rate limit invalid source MAC address packets on a secure port if you anticipate that a device will send invalid packets (such as traffic generator, sniffer, and bad NICs).

The port security feature considers the following as “invalid frames”:

- Packets with a source or destination MAC address that is all zero
- Packets with a multicast or broadcast source MAC address
- Packets from an address either learned or configured on a secure interface that are observed on another secure interface in the same VLAN

You can choose to rate limit these packets. If the rate is exceeded, you can trigger a violation action for the port.

Configuring Port Security on Access Ports

These sections describe how to configure port security:

- Configuring Port Security on Access Ports, page 47-7
- Examples of Port Security on Access Ports, page 47-10

**Note**

Port security can be enabled on a Layer 2 port channel interface configured in access mode. The port security configuration on an EtherChannel is independent of the configuration of any member ports.

### Configuring Port Security on Access Ports

To restrict traffic through a port by limiting and identifying MAC addresses of the stations allowed to the port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** Switch(config)# interface interface_id interface port-channel port_channel_number | Enters interface configuration mode and specifies the interface to configure.  
*Note* The interface can be a Layer 2 port channel logical interface. |
| **Step 2** Switch(config-if)# switchport mode access | Sets the interface mode.  
*Note* An interface in the default mode (dynamic auto) cannot be configured as a secure port. |
| **Step 3** Switch(config-if)# [no] switchport port-security | Enables port security on the interface.  
To return the interface to the default condition as a not secured, use the *no switchport port-security* command. |
### Configuring Port Security on Access Ports

**Step 4**

```
Switch(config-if)# [no] switchport port-security maximum value
```

(Optional) Sets the maximum number of secure MAC addresses for the interface. The range is 1 to 3072; the default is 1.

To return the interface to the default number of secure MAC addresses, use the `no switchport port-security maximum value`.

**Step 5**

```
Switch(config-if)# switchport port-security [aging (static | time aging_time | type (absolute | inactivity)]
```

Sets the aging time and aging type for all secure addresses on a port.

Use this feature to remove and add PCs on a secure port without manually deleting the existing secure MAC addresses while still limiting the number of secure addresses on a port.

The `static` keyword enables aging for statically configured secure addresses on this port.

The `time aging_time` value specifies the aging time for this port. Valid range for `aging_time` is from 0 to 1440 minutes. If the time is equal to 0, aging is disabled for this port.

The `type` keyword sets the aging type as `absolute` or `inactive`.

- **absolute**—All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.
- **inactive**—The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period.

To disable port security aging for all secure addresses on a port, use the `no switchport port-security aging time` interface configuration command.
Step 6

Switch(config-if)# [no] switchport port-security violation {restrict | shutdown | shutdown vlan}

(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:

- **restrict**—A port security violation restricts data and causes the SecurityViolation counter to increment and send an SNMP trap notification.
- **shutdown**—The interface is error-disabled when a security violation occurs.
- **shutdown vlan**—Use to set the security violation mode for each VLAN. In this mode, the VLAN is error-disabled instead of the entire port when a violation occurs.

**Note** When a secure port is in the error-disabled state, you can bring it out of this state by entering the errdisable recovery cause psecure-violation global configuration command or you can manually reenable it by entering the shutdown and no shutdown interface configuration commands.

To return the violation mode to the default condition (shutdown mode), use the no switchport port-security violation shutdown command.

Step 7

Switch(config-if)# switchport port-security limit rate invalid-source-mac packets_per_sec

Sets the rate limit for bad packets.

Default is 10 pps.

Step 8

Switch(config-if)# [no] switchport port-security mac-address mac_address

(Optional) Enters a secure MAC address for the interface. You can use this command to configure a secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.

To delete a MAC address from the address table, use the no switchport port-security mac-address mac_address command.

**Note** This command only applies to access, PVLAN host, and PVLAN promiscuous mode. For more details on PVLAN, trunk, or regular trunk mode, refer to the “Configuring Port Security on Trunk Ports” section on page 47-17.

Step 9

Switch(config-if)# [no] switchport port-security mac-address sticky

(Optional) Enables sticky learning on the interface. To disable sticky learning on an interface, use the no switchport port-security mac-address sticky command. The interface converts the sticky secure MAC addresses to dynamic secure addresses.
Chapter 47  Configuring Port Security

### Configuring Port Security on Access Ports

#### Note
To clear dynamically learned port security MAC addresses in the CAM table, use the `clear port-security dynamic` command. The address keyword enables you to clear a secure MAC addresses. The interface keyword enables you to clear all secure addresses on any interface (including any port channel interface). The VLAN keyword allows you to clear port security MACs on a per-VLAN per-port basis.

#### Examples of Port Security on Access Ports

The following examples are provided:

- **Example 1:** Setting Maximum Number of Secure Addresses, page 47-11
- **Example 2:** Setting a Violation Mode, page 47-11
- **Example 3:** Setting the Aging Timer, page 47-11
- **Example 4:** Setting the Aging Timer Type, page 47-12
- **Example 5:** Configuring a Secure MAC Address, page 47-12
- **Example 6:** Configuring Sticky Port Security, page 47-13
- **Example 7:** Setting a Rate Limit for Bad Packets, page 47-13
- **Example 8:** Clearing Dynamic Secure MAC Addresses, page 47-14

### Command

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>`Switch(config-if)# [no] switchport port-security mac-address mac_address sticky [vlan [voice</td>
<td>access]]`</td>
</tr>
<tr>
<td>11</td>
<td><code>Switch(config-if)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| 12   | `Switch# show port-security address interface interface_id`  
|     | `Switch# show port-security address` | Verifies your entries. |

**Note** To clear dynamically learned port security MAC addresses in the CAM table, use the clear port-security dynamic command. The address keyword enables you to clear a secure MAC addresses. The interface keyword enables you to clear all secure addresses on any interface (including any port channel interface). The VLAN keyword allows you to clear port security MACs on a per-VLAN per-port basis.
Example 1: Setting Maximum Number of Secure Addresses

This example shows how to enable port security on the Fast Ethernet interface 3/12 and how to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```bash
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# end
Switch# show port-security interface fastethernet 3/12
Port Security              : Enabled
Port Status                : Secure-up
Violation Mode             : Shutdown
Aging Time                 : 0 mins
Aging Type                 : Absolute
SecureStatic Address Aging : Enabled
Maximum MAC Addresses      : 5
Total MAC Addresses        : 0
Configured MAC Addresses   : 0
Sticky MAC Addresses       : 0
Last Source Address:Vlan   : 0000.0000.0000:0
Security Violation Count   : 0
```

Example 2: Setting a Violation Mode

This example shows how to set the violation mode on the Fast Ethernet interface 3/12 to restrict.

```bash
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport port-security violation restrict
Switch(config-if)# end
Switch#
```

SNMP traps can be enabled with a rate-limit to detect port-security violations due to restrict mode. The following example shows how to enable traps for port-security with a rate of 5 traps per second:

```bash
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# snmp-server enable traps port-security trap-rate 5
Switch(config)# end
Switch#
```

Example 3: Setting the Aging Timer

This example shows how to set the aging time to 2 hours (120 minutes) for the secure addresses on the Fast Ethernet interface 5/1:

```bash
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport port-security aging time 120
Switch(config-if)# end
Switch#
```
This example shows how to set the aging time to 2 minutes:

\[
\text{Switch(config-if)} \# \text{switchport port-security aging time 2}
\]

You can verify the previous commands with the `show port-security interface` command.

**Example 4: Setting the Aging Timer Type**

This example shows how to set the aging timer type to Inactivity for the secure addresses on the Fast Ethernet interface 3/5:

\[
\text{Switch\# configure terminal} \\
\text{Enter configuration commands, one per line. End with CNTL/Z.} \\
\text{Switch(config)} \# \text{interface fastethernet 3/5} \\
\text{Switch(config-if)} \# \text{switch port-security aging type inactivity} \\
\text{Switch(config-if)} \# \text{end} \\
\text{Switch\# show port-security interface fastethernet 3/5} \\
\text{Port Security} : \text{Enabled} \\
\text{Port Status} : \text{Secure-up} \\
\text{Violation Mode} : \text{Shutdown} \\
\text{Aging Time} : 0 \text{ mins} \\
\text{Aging Type} : \text{Inactivity} \\
\text{SecureStatic Address Aging} : \text{Disabled} \\
\text{Maximum MAC Addresses} : 1 \\
\text{Total MAC Addresses} : 0 \\
\text{Configured MAC Addresses} : 0 \\
\text{Sticky MAC Addresses} : 0 \\
\text{Last Source Address:Vlan} : 0000.0000.0000:0 \\
\text{Security Violation Count} : 0
\]

**Example 5: Configuring a Secure MAC Address**

This example shows how to configure a secure MAC address on Fast Ethernet interface 5/1 and to verify the configuration:

\[
\text{Switch\# configure terminal} \\
\text{Enter configuration commands, one per line. End with CNTL/Z.} \\
\text{Switch(config)} \# \text{interface fastethernet 5/1} \\
\text{Switch(config-if)} \# \text{switchport mode access} \\
\text{Switch(config-if)} \# \text{switchport port-security} \\
\text{Switch(config-if)} \# \text{switchport port-security maximum 10} \\
\text{Switch(config-if)} \# \text{switchport port-security mac-address 0000.0000.0003} \text{ (Static secure MAC)} \\
\text{Switch(config-if)} \# \text{end} \\
\text{Switch\# show port address} \\
\text{Secure Mac Address Table} \\
\text{------------------------} \\
\text{Vlan} | Mac Address | Type | Ports | Remaining Age} \\
\text{|----|-------------|-----|------|---------------|} \\
\text{| 1 | 0000.0000.0003 | SecureConfigured | Fa5/1 | -} \\
\text{------------------------------------------------------------------------} \\
\text{Total Addresses in System (excluding one mac per port) : 2} \\
\text{Max Addresses limit in System (excluding one mac per port) : 3072}
Example 6: Configuring Sticky Port Security

This example shows how to configure a sticky MAC address on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# end
```

Sending traffic to the ports causes the system to configure the port with sticky secure addresses.

```
Switch# show port-security address
Secure Mac Address Table
------------------------------------------------------------------------
Vlan    Mac Address       Type                     Ports   Remaining Age
         ------------       ----------                     -----   -------------
----    -----------       ----                     -----   -----------
1    0000.0000.0001    SecureSticky             Fa5/1        -
1    0000.0000.0002    SecureSticky             Fa5/1        -
1    0000.0000.0003    SecureSticky             Fa5/1        -
------------------------------------------------------------------------
Total Addresses in System (excluding one mac per port) : 2
Max Addresses limit in System (excluding one mac per port) : 3072
Switch# show running-config interface fastEthernet 5/1
Building configuration...

Current configuration : 344 bytes
!
interface FastEthernet5/1
  switchport mode access
  switchport port-security
  switchport port-security maximum 5
  switchport port-security mac-address sticky
  switchport port-security mac-address sticky 0000.0000.0001
  switchport port-security mac-address sticky 0000.0000.0002
  switchport port-security mac-address sticky 0000.0000.0003
end
```

Example 7: Setting a Rate Limit for Bad Packets

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet interface 5/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport port-security limit rate invalid-source-mac 100
Switch(config-if)# end
```

```
Switch# show port-security address
Secure Mac Address Table
------------------------------------------------------------------------
Vlan    Mac Address       Type                     Ports   Remaining Age
         ------------       ----------                     -----   -----------
----    -----------       ----                     -----   -----------
1    0000.0000.0001    SecureSticky             Fa5/1        -
1    0000.0000.0002    SecureSticky             Fa5/1        -
1    0000.0000.0003    SecureSticky             Fa5/1        -
------------------------------------------------------------------------
Total Addresses in System (excluding one mac per port) : 2
Max Addresses limit in System (excluding one mac per port) : 3072
Switch# show running-config interface fastEthernet 5/1
Building configuration...

Current configuration : 344 bytes
!
interface FastEthernet5/1
  switchport mode access
  switchport port-security
  switchport port-security limit rate invalid-source-mac 100
end
```
The following example shows how to configure rate limit for invalid source packets on Fast Ethernet interface 5/1:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport port-security limit rate invalid-source-mac none
Switch(config-if)# end
Switch#

Example 8: Clearing Dynamic Secure MAC Addresses

The following example shows how to clear a dynamic secure MAC address:

Switch# clear port-security dynamic address 0000.0001.0001

The following example shows how to clear all dynamic secure MAC addresses on Fast Ethernet interface 2/1:

Switch# clear port-security dynamic interface fa2/1

The following example shows how to clear all dynamic secure MAC addresses in the system:

Switch# clear port-security dynamic

Configuring Port Security on PVLAN Ports

You can configure port security on a private VLAN port to take advantage of private VLAN functionality as well as to limit the number of MAC addresses.

Note

This section follows the same configuration model that was presented for access ports.

These sections describe how to configure trunk port security on host and promiscuous ports:

- Configuring Port Security on an Isolated Private VLAN Host Port, page 47-14
- Example of Port Security on an Isolated Private VLAN Host Port, page 47-16
- Configuring Port Security on a Private VLAN Promiscuous Port, page 47-16
- Example of Port Security on a Private VLAN Promiscuous Port, page 47-17

Configuring Port Security on an Isolated Private VLAN Host Port

Figure 47-1 illustrates a typical topology for port security implemented on private VLAN host ports. In this topology, the PC connected through port a on the switch can communicate only with the router connected using the promiscuous port on the switch. The PC connected through port a cannot communicate with the PC connected through port b.
### Configuring Port Security on PVLAN Ports

#### Figure 47-1 Port Security on Isolated Private VLAN Host Ports

![Diagram showing Port Security on Isolated Private VLAN Host Ports]

**Note**

Dynamic addresses secured on an isolated private VLAN host port on private VLANs are secured on the secondary VLANs, and not primary VLANs.

To configure port security on an isolated private VLAN host port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# vlan sec_vlan_id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-vlan)# private-vlan isolated</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-vlan)# exit</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config)# vlan pri_vlan_id</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-vlan)# private-vlan primary</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>

Example of Port Security on an Isolated Private VLAN Host Port

The following example shows how to configure port security on an isolated private VLAN host port, Fast Ethernet interface 3/12:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vlan 6
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 3
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# private-vlan association add 6
Switch(config-vlan)# exit
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan association host 3 6
Switch(config-if)# switchport port-security
Switch(config-if)# end
```

Configuring Port Security on a Private VLAN Promiscuous Port

To configure port security on a private VLAN promiscuous port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# vlan sec_vlan_id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-vlan)# private-vlan isolated</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-vlan)# exit</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config)# vlan pri_vlan_id</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-vlan)# private-vlan primary</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-vlan)# private-vlan association add sec_vlan_id</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config-vlan)# exit</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch(config)# interface interface_id</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch(config-if)# switchport mode private-vlan promiscuous</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Switch(config-if)# switchport private-vlan mapping primary_vlan secondary_vlan</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Switch(config-if)# switchport port-security</td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td>Switch# show port-security address interface interface_id</td>

<tr>
<td><strong>Step 15</strong></td>
<td>Switch# show port-security address</td>
</tr>
</tbody>
</table>

Verifies your entries.
Example of Port Security on a Private VLAN Promiscuous Port

The following example shows how to configure port security on a private VLAN promiscuous port, Fast Ethernet interface 3/12:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vlan 6
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 3
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# private-vlan association add 6
Switch(config-vlan)# exit
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport mode private-vlan mapping 3 6
Switch(config-if)# switchport port-security
Switch(config-if)# end

Configuring Port Security on Trunk Ports

You might want to configure port security on trunk ports in metro aggregation to limit the number of MAC addresses per-VLAN. Trunk port security extends port security to trunk ports. It restricts the allowed MAC addresses or the maximum number of MAC addresses to individual VLANs on a trunk port. Trunk port security enables service providers to block the access from a station with a different MAC address than the ones specified for that VLAN on that trunk port. Trunk port security is also supported on private VLAN trunk ports.

Note
Port security can be enabled on a Layer 2 port channel interface configured in mode. The port security configuration on an EtherChannel is kept independent of the configuration of any physical member ports.

These sections describe how to configure trunk port security:

- Configuring Trunk Port Security, page 47-17
- Examples of Trunk Port Security, page 47-19
- Trunk Port Security Configuration Guidelines and Restrictions, page 47-21

Configuring Trunk Port Security

Trunk port security is used when a Catalyst 4500 series switch has a dot1q or isl trunk attached to a neighborhood Layer 2 switch. This may be used, for example, in metro aggregation networks (Figure 47-2).
You can configure various port security related parameters on a per-port per-VLAN basis.

The steps involved in configuring port security parameters is similar to those for access ports. In addition to those steps, the following per-port per-VLAN configuration steps are supported for trunk ports.

To configure port security related parameters on a per-VLAN per-port basis, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters interface configuration mode and specifies the interface to configure.</td>
</tr>
<tr>
<td><strong>Switch(config)# interface interface_id</strong>&lt;br&gt;<strong>interface port-channel port_channel_number</strong></td>
<td><strong>Note</strong> The interface can be a Layer 2 port channel logical interface.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Sets the trunk encapsulation format to 802.1Q.</td>
</tr>
<tr>
<td><strong>Switch(config-if)# switchport trunk encapsulation dot1q</strong></td>
<td><strong>Step 3</strong></td>
</tr>
<tr>
<td><strong>Switch(config-if)# switchport mode trunk</strong></td>
<td><strong>Note</strong> An interface in the default mode (dynamic auto) cannot be configured as a secure port.</td>
</tr>
</tbody>
</table>
Chapter 47 Configuring Port Security

Configuring Port Security on Trunk Ports

Examples of Trunk Port Security

The following examples are provided:

- Example 1: Configuring a Maximum Limit of Secure MAC Addresses for All VLANs, page 47-19
- Example 2: Configuring a Maximum Limit of Secure MAC Addresses for Specific VLANs, page 47-20
- Example 3: Configuring Secure MAC Addresses in a VLAN Range, page 47-20

Example 1: Configuring a Maximum Limit of Secure MAC Addresses for All VLANs

This example shows how to configure a secure MAC-address and a maximum limit of secure MAC addresses on Gigabit Ethernet interface 1/1 for all VLANs:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 3

Switch(config-if)# show port-security in gi1/1 vlan
Default maximum: 3
VLAN  Maximum   Current
  1   3         0
  2   3         0
  3   3         0
  4   3         0
```

Command | Purpose
--- | ---
Step 4 | Configures a maximum number of secure mac-addresses for each VLAN on the interface that are not explicitly configured with a maximum mac-address limit. See the “Maximum Number of Secure MAC Addresses” section on page 47-4.
Step 5 | Enters VLAN range sub-mode.
\* \*Note \* \* You can specify single or multiple VLANs.
Step 6 | Configures a maximum number of secure MAC addresses for each VLAN.
Step 7 | Removes a maximum number of secure MAC addresses configuration for all the VLANs. Subsequently, the maximum value configured on the port will be used for all the VLANs.
Step 8 | Configures a secure MAC-address on a range of VLANs.
Step 9 | Configures a sticky MAC-address on a range of VLANs.
Step 10 | Returns to interface configuration mode.
Step 11 | Returns to privileged EXEC mode.
Chapter 47  Configuring Port Security

Configuring Port Security on Trunk Ports

Example 2: Configuring a Maximum Limit of Secure MAC Addresses for Specific VLANs

This example shows how to configure a secure MAC-address on interface gi1/1 in a specific VLAN or range of VLANs:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security maximum 3
Switch(config-if-vlan-range)# exit

Switch# show port-security interface gi1/1 vlan
Default maximum: not set, using 3072
VLAN  Maximum    Current
  2          3          0
  3          3          0
  4          3          0
  5          3          0
  6          3          0
Switch#

Example 3: Configuring Secure MAC Addresses in a VLAN Range

This example shows how to configure a secure MAC-address in a VLAN on interface gi1/1:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if-vlan-range)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.2
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.3
Switch(config-if-vlan-range)# exit

**Trunk Port Security Configuration Guidelines and Restrictions**

When configuring port security related parameters on a per-port per-VLAN basis, consider these guidelines and restrictions:

- A secure MAC-address cannot be configured on a VLAN that is not allowed on a regular trunk port.
- The configuration on the primary VLAN on the private VLAN trunk is not allowed. The CLI is rejected and an error message is displayed.
- If a specific VLAN on a port is not configured with a maximum value (directly or indirectly), the maximum configured for the port is used for that VLAN. In this situation, the maximum number of addresses that can be secured on this VLAN is limited to the maximum value configured on the port.

Each VLAN can be configured with a maximum count that is greater than the value configured on the port. Also, the sum of the maximum configured values for all the VLANs can exceed the maximum configured for the port. In either of these situations, the number of MAC addresses secured on each VLAN is limited to the lesser of the VLAN configuration maximum and the port configuration maximum. Also, the number of addresses secured on the port across all VLANs cannot exceed a maximum that is configured on the port.

- For private VLAN trunk ports, the VLAN on which the configuration is being performed must be in either the allowed VLAN list of the private VLAN trunk or the secondary VLAN list in the association pairs. (The CLI is rejected if this condition is not met.) The allowed VLAN list on a private VLAN trunk is intended to hold the VLAN-IDs of all the regular VLANs that are allowed on the private VLAN trunk.
- Removal of an association pair from a PVLAN trunk causes all static and sticky addresses associated with the secondary VLAN of the pair to be removed from the running configuration. Dynamic addresses associated with the secondary VLAN are deleted from the system.

Similarly, when a VLAN is removed from the list of allowed PVLAN trunks, the addresses associated with that VLAN are removed.

---

**Note**

For a regular or private VLAN trunk port, if the VLAN is removed from the allowed VLAN list, all the addresses associated with that VLAN are removed.
Port Mode Changes

Generally, when a port mode changes, all dynamic addresses associated with that port are removed. All static or sticky addresses and other port security parameters configured on the native VLAN are moved to the native VLAN of the port in the new mode. All the addresses on the non-native VLANs are removed.

The native VLAN refers to the following VLAN on the specified port type:

<table>
<thead>
<tr>
<th>Port Type</th>
<th>Native VLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>access</td>
<td>access VLAN</td>
</tr>
<tr>
<td>trunk</td>
<td>native VLAN</td>
</tr>
<tr>
<td>isolated</td>
<td>secondary VLAN (from host association)</td>
</tr>
<tr>
<td>promiscuous</td>
<td>primary VLAN (from mapping)</td>
</tr>
<tr>
<td>private VLAN trunk</td>
<td>private VLAN trunk native VLAN</td>
</tr>
<tr>
<td>.1Q tunnel</td>
<td>access VLAN</td>
</tr>
</tbody>
</table>

For example, when the mode changes from access to private VLAN trunk, all the static or sticky addresses configured on the access VLAN of the access port are moved to the private VLAN native VLAN of the private VLAN trunk port. All other addresses are removed.

Similarly, when the mode changes from private VLAN trunk to access mode, all the static or sticky addresses configured on the private VLAN native VLAN are moved to the access VLAN of the access port. All other addresses are removed.

When a port is changed from trunk to private VLAN trunk, addresses associated with a VLAN on the trunk are retained if that VLAN is present in the allowed list of private VLAN trunk or the secondary VLAN of an association on the private VLAN trunk. If the VLAN is not present in either of them, the address is removed from the running configuration.

When a port is changed from private VLAN trunk to trunk, a static or sticky address is retained if the VLAN associated with the address is present in the allowed VLAN list of the trunk. If the VLAN is not present in the allowed list, the address is removed from running configuration.

Configuring Port Security on Voice Ports

You might want to configure port security in an IP phone environment when a port is configured with a data VLAN for a PC and a voice VLAN for a Cisco IP Phone.

These sections describe how to configure port security on voice ports:

- Configuring Port Security on Voice Ports, page 47-23
- Examples of Voice Port Security, page 47-25
- Voice Port Security Configuration Guidelines and Restrictions, page 47-27
# Configuring Port Security on Voice Ports

To configure port security on a voice port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch(config)# <code>interface interface_id</code></td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode and specifies the physical interface to configure.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config-if)# <code>switchport mode access</code></td>
</tr>
<tr>
<td></td>
<td>Sets the interface mode.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>An interface in the default mode (dynamic auto) cannot be configured as a secure port.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# <code>[no] switchport port-security</code></td>
</tr>
<tr>
<td></td>
<td>Enables port security on the interface.</td>
</tr>
<tr>
<td>To return the interface to the default condition as not secured, use the <code>no switchport port-security</code> command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# `[no] switchport port-security violation {restrict</td>
</tr>
<tr>
<td></td>
<td>(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:</td>
</tr>
<tr>
<td></td>
<td>• <code>restrict</code>—A port security violation restricts data and causes the SecurityViolation counter to increment and send an SNMP trap notification.</td>
</tr>
<tr>
<td></td>
<td>• <code>shutdown</code>—The interface is error-disabled when a security violation occurs.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>When a secure port is in the error-disabled state, you can bring it out of this state by entering the <code>errdisable recovery cause psecure-violation</code> global configuration command or you can manually reenable it by entering the <code>shutdown</code> and <code>no shutdown</code> interface configuration commands.</td>
</tr>
<tr>
<td>To return the violation mode to the default condition (shutdown mode), use the <code>no switchport port-security violation shutdown</code> command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# <code>switchport port-security limit rate invalid-source-mac packets_per_sec</code></td>
</tr>
<tr>
<td></td>
<td>Sets the rate limit for bad packets.</td>
</tr>
<tr>
<td>Default is 10 pps.</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Port Security on Voice Ports

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 6     | Switch(config-if)# [no] switchport port-security mac-address mac_address [vlan (voice | (Optional) Specifies a secure MAC address for the interface. When you specify the `vlan` keyword, addresses are configured in the specified VLAN.

- **voice**—MAC address is configured in the voice VLAN.
- **access**—MAC address is configured in the access VLAN.

You can use this command to configure secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.

To delete a MAC address from the address table, use the `no switchport port-security mac-address mac_address` command.

**Note** This command only applies to access, PVLAN host, and PVLAN promiscuous mode. For more details on PVLAN, trunk, or regular trunk mode, refer to the “Configuring Port Security on Trunk Ports” section on page 47-17.

| Step 7     | Switch(config-if)# [no] switchport port-security mac-address sticky      | (Optional) Enables sticky learning on the interface. To disable sticky learning on an interface, use the `no switchport port-security mac-address sticky` command. The interface converts the sticky secure MAC addresses to dynamic secure addresses. |

| Step 8     | Switch(config-if)# [no] switchport port-security mac-address mac_address sticky [vlan (voice | Specifies the sticky mac-address for the interface. When you specify the `vlan` keyword, the mac-address becomes sticky in the specified VLAN.

- **voice**—MAC address becomes sticky in the voice VLAN.
- **access**—MAC address becomes sticky in the access VLAN.

To delete a sticky secure MAC addresses from the address table, use the `no switchport port-security mac-address mac_address sticky` command. To convert sticky to dynamic addresses, use the `no switchport port-security mac-address sticky` command.

**Note** This command only applies to access, PVLAN host, and PVLAN promiscuous mode. For more details on PVLAN or trunk or regular trunk mode, refer to the “Configuring Port Security on Trunk Ports” section on page 47-17.
To clear dynamically learned port security MAC addresses in the CAM table, use the `clear port-security dynamic` command. The `address` keyword enables you to clear a secure MAC address. The `interface` keyword enables you to clear all secure addresses on an interface (including any port channel interface). The `VLAN` keyword allows you to clear port security MACs on a per-VLAN per-port basis.

Each port security-configured interface accepts one MAC-address by default. With port security port level port-security configuration takes precedence over VLAN level port-security configuration. To allow one MAC-address each for voice and data VLAN, configure the port for a maximum of greater than or equal to two addresses.

## Examples of Voice Port Security

The following examples are provided:

- Example 1: Configuring Maximum MAC Addresses for Voice and Data VLANs, page 47-25
- Example 2: Configuring Sticky MAC Addresses for Voice and Data VLANs, page 47-26

### Example 1: Configuring Maximum MAC Addresses for Voice and Data VLANs

This example shows how to designate a maximum of one MAC address for a voice VLAN (for a Cisco IP Phone, let’s say) and one MAC address for the data VLAN (for a PC, let’s say) on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch(config)# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 2
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security maximum 1 vlan voice
Switch(config-if)# switchport port-security maximum 1 vlan access
Switch(config-if)# end
```

**Note**

Sending traffic to the ports causes the system to configure the port with sticky secure addresses.
Configuring Port Security on Voice Ports

Switch# show port-security address

end

Switch#

Voice Port Security Configuration Guidelines and Restrictions

Note

Port security as implemented on voice ports functions the same as port security on access ports.

When using (or configuring) voice port security, consider these guidelines and restrictions:

- You can configure sticky port security on voice ports. If sticky port security is enabled on a voice port, addresses secured on data and voice VLANs are secured as sticky addresses.
- You can configure maximum secure addresses per-VLAN. You can set a maximum for either the data VLAN or the voice VLAN. You can also set a maximum per-port, just as with access ports.
- You can configure port security MAC addresses on a per-VLAN basis on either the data or voice VLANs.
- Prior to Cisco IOS Release 12.2(31)SG, you required three MAC addresses as the maximum parameter to support an IP phone and a PC. With Cisco IOS Release 12.2(31)SG and later releases, the maximum parameter must be configured to two, one for the phone and one for the PC.

Displaying Port Security Settings

Use the `show port-security` command to display port security settings for an interface or for the switch.
Chapter 47      Configuring Port Security

To display traffic control information, perform one or more of these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# <code>show interface status err-disable</code></td>
<td>Displays interfaces that have been error-disabled along with the cause for which they were disabled.</td>
</tr>
<tr>
<td>Switch# <code>show port-security [interface interface_id / interface port_channel port_channel_number]</code></td>
<td>Displays port security settings for the switch or for the specified interface, including the maximum allowed number of secure MAC addresses for each interface, the number of secure MAC addresses on the interface, the number of security violations that have occurred, and the violation mode. The interface can be a port channel logical interface.</td>
</tr>
<tr>
<td>Switch# <code>show port-security [interface interface_id / interface port_channel port_channel_number] address</code></td>
<td>Displays all secure MAC addresses configured on all switch interfaces or on a specified interface with aging information for each address.</td>
</tr>
<tr>
<td>Switch# <code>show port-security [interface interface_id / interface port_channel port_channel_number] vlan vlan_list</code></td>
<td>Displays the maximum allowed number of secure MAC addresses and the current number of secure MAC addresses on a specific VLAN-list and a specific interface.</td>
</tr>
<tr>

Examples of Security Settings

The following examples are provided:

- Example 1: Displaying Security Settings for the Entire Switch, page 47-28
- Example 2: Displaying Security Settings for an Interface, page 47-29
- Example 3: Displaying All Secure Addresses for the Entire Switch, page 47-29
- Example 4: Displaying a Maximum Number of MAC Addresses on an Interface, page 47-30
- Example 5: Displaying Security Settings on an Interface for a VLAN Range, page 47-30
- Example 6: Displaying Secured MAC Addresses and Aging Information on an Interface, page 47-30
- Example 7: Displaying Secured MAC Addresses for a VLAN Range on an Interface, page 47-31

Example 1: Displaying Security Settings for the Entire Switch

This example shows how to display port security settings for the entire switch:

```
Switch# `show port-security`
Secure Port MaxSecureAddr CurrentAddr SecurityViolation Security Action
          (Count)          (Count)          (Count)
Fa3/1      2            2                  0         Restrict
Fa3/2      2            2                  0         Restrict
Fa3/3      2            2                  0         Shutdown
Fa3/4      2            2                  0         Shutdown
Fa3/5      2            2                  0         Shutdown
```

Example 4: Displaying a Maximum Number of MAC Addresses on an Interface

This example shows how to display the maximum allowed number of secure MAC addresses and the current number of secure MAC addresses on Gigabit Ethernet interface 1/1:

```
Switch# show port-security interface g1/1 vlan
Default maximum: 22
VLAN  Maximum    Current
2    22          3
3    22          3
4    22          3
5    22          1
6    22          2
```

Example 5: Displaying Security Settings on an Interface for a VLAN Range

This example shows how to display the port security settings on Gigabit Ethernet interface 1/1 for VLANs 2 and 3:

```
Switch# show port-security interface g1/1 vlan 2-3
Default maximum: 22
VLAN  Maximum    Current
2    22          3
3    22          3
```

Example 6: Displaying Secured MAC Addresses and Aging Information on an Interface

This example shows how to display all secure MAC addresses configured on Gigabit Ethernet interface 1/1 with aging information for each address.

```
Switch# show port-security interface g1/1 address

Configuring Port Security with Other Features/Environments

The following topics are discussed:

- DHCP and IP Source Guard, page 47-31
- 802.1X Authentication, page 47-32
- Configuring Port Security in a Wireless Environment, page 47-32

**DHCP and IP Source Guard**

You might want to configure port security with DHCP and IP Source Guard to prevent IP spoofing by unsecured MAC addresses. IP Source Guard supports two levels of IP traffic filtering:

- Source IP address filtering
- Source IP and MAC address filtering

When used in source IP and MAC address filtering, IP Source Guard uses private ACLs to filter traffic based on the source IP address, and uses port security to filter traffic based on the source MAC address. Port security must be enabled on the access port in this mode.

When both features are enabled, the following limitations apply:

- The DHCP packet is not subject to port security dynamic learning.
- If multiple IP clients are connected to a single access port, port security cannot enforce exact binding of source IP and MAC address for each client.

For example, these clients reside on an access port with the following IP and MAC address:

- client1: MAC1 ----> IP1
- client2: MAC2 ----> IP2

Any combination of the source MAC and IP address traffic will be allowed as shown here:

- MAC1 ----> IP1, valid
- MAC2 ----> IP2, valid
- MAC1 <-> IP2, invalid
- MAC2 <-> IP1, invalid

IP traffic with the correct source IP and MAC address binding will be permitted and port security will dynamically learn its MAC address. IP traffic with source addresses that are not in the binding will be treated as invalid packets and dropped by port security. To prevent a denial of service attack, you must configure port security rate limiting for the invalid source MAC address.

### 802.1X Authentication

You might want to configure port security with 802.1X authentication to prevent MAC spoofing. 802.1X is not supported on regular or private VLAN trunks. On access ports and PVLAN host or promiscuous ports, both port security and 802.1X can be configured simultaneously. When both are configured, hosts must be 802.1X authenticated before port security can secure the MAC address of the host. Both 802.1X and port security must approve of the host or a security violation will be triggered. The type of security violation will depend on which feature rejects the port: if the host is allowed by 802.1X (for example, because the port is in multihost mode) but is disallowed by port security, the port-security violation action will be triggered. If the host is allowed by port security but rejected by 802.1X (for example, because the host is not authorized on a single-host mode port) then the 802.1X security violation action will be triggered.

**Note**

802.1X, port-security and VVID can all be configured on the same port.

For more information on the interaction between 802.1X and port security, see “Using 802.1X with Port Security” on page 19.

### Configuring Port Security in a Wireless Environment

If access points are connected to a secure port, do not configure a static MAC address for your users. A MAC address might move from one access point to another and might cause security violations if both the access points are connected on the same switch.

**Figure 47-3** illustrates a typical topology of port security in a wireless environment.
Port Security Configuration Guidelines and Restrictions

When using (or configuring) port security, consider these guidelines and restrictions:

- After port security is configured on a port along with a "denying" PACL, the CPU will neither see any of the PACL packets denied from the given port nor learn the source MAC addresses from the denied packets. Therefore, the port security feature will not be aware of such packets.

- A secure port cannot be a destination port for the Switch Port Analyzer (SPAN).

- A secure port and a static MAC address configuration for an interface are mutually exclusive.

- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

- While configuring trunk port security on a trunk port, you do not need to account for the protocol packets such as CDP and BPDU) because they are not learned and secured.

- You cannot enable port security aging on sticky secure MAC addresses.

- To restrict MAC spoofing using port security, you must enable 802.1X authentication.

- You cannot configure port security on dynamic ports. You must change the mode to access before you enable port security.

- Port Security over EtherChannels is not supported.
Configuring Control Plane Policing and Layer 2 Control Packet QoS

This chapter contains information on how to protect your Catalyst 4500 series switch using control plane policing (CoPP). The information covered in this chapter is unique to the Catalyst 4500 series switches, and it supplements the network security information and procedures in Chapter 51, “Configuring Network Security with ACLs.” This information also supplements the network security information and procedures in these publications:

- *Cisco IOS Security Configuration Guide, Cisco IOS Release 12.4*, at this URL:
- *Cisco IOS Security Command Reference, Cisco IOS Release 12.4*, at this URL:

This chapter includes the following major sections:

- Configuring Control Plane Policing, page 48-1
- Monitoring CoPP, page 48-9
- Configuring Layer 2 Control Packet QoS, page 48-11
- Policing IPv6 Control Traffic, page 48-16

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

Configuring Control Plane Policing

This section includes these topics:

- About Control Plane Policing, page 48-2
About Control Plane Policing

The control plane policing (CoPP) feature increases security on the Catalyst 4500 series switch by protecting the CPU from unnecessary or DoS traffic and giving priority to important control plane and management traffic. The classification TCAM and QoS policers provide CoPP hardware support.

Note

CoPP is supported on the following: Supervisor 6-E and Catalyst 4900M beginning with Cisco IOS Release 12.2(50)SG; Supervisor 6L-E in Cisco IOS Release 12.2(52)X0; Catalyst 4948-E beginning with Cisco IOS Release 12.2(54)X0; Supervisor Engine 7-E beginning with Cisco IOS XE 3.1.0SG; Supervisor Engine 7L-E beginning with Cisco IOS XE 3.2.0XO.

Traffic managed by the CPU is divided into three functional components or planes:

- Data plane
- Management plane
- Control plane

You can use CoPP to protect most of CPU-bound traffic and to ensure routing stability, reachability, and packet delivery. Most importantly, you can use CoPP to protect the CPU from a DoS attack.

By default, you receive a list of predefined ACLs matching a selected set of Layer 2 and Layer 3 control plane packets. You can further define your preferred policing parameters for each of these packets and modify the matching criteria of these ACLs.

The following table lists the predefined ACLs.

<table>
<thead>
<tr>
<th>Predefined Named ACL</th>
<th>Description</th>

</tbody>
</table>
Chapter 48      Configuring Control Plane Policing and Layer 2 Control Packet QoS

Configuring Control Plane Policing

For the data and management plane traffic, you can define your own ACLs to match the traffic class that you want to police.

CoPP uses MQC to define traffic classification criteria and to specify the configurable policy actions for the classified traffic. MQC uses class maps to define packets for a particular traffic class. After you have classified the traffic, you can create policy maps to enforce policy actions for the identified traffic. The control-plane global configuration command allows you to directly attach a CoPP service policy to the control plane.

The policy map system-cpp-policy must contain the predefined class maps in the predefined order at the beginning of the policy map. The best way to create system-cpp-policy policy map is by using the global macro system-cpp.

The system-cpp-policy policy map contains the predefined class maps for the control plane traffic. The names of all system-defined CoPP class maps and their matching ACLs contain the prefix system-cpp-.

By default, no action is specified for each traffic class. You can define your own class maps matching CPU-bound data plane and management plane traffic. You can also add your defined class maps to system-cpp-policy.

General Guidelines for Control Plane Policing

Guidelines for control plane policing include the following:

- Port security might cancel the effect of CoPP for non-IP control packets.

  Although source MAC learning on a Catalyst 4500 series switch is performed in software, learning control packets' source MAC addresses (for example, IEEE BPDU, CDP, SSTP BDPU, GARP/) is not allowed. Once you configure port security on a port where you expect a high rate of potentially unanticipated control packets, the system generates a copy of the packet to the CPU (until the source address is learned), instead of forward it.

  The current architecture of the Catalyst 4500 supervisor engine does not allow you to apply policing on the copy of packets sent to the CPU. You can only apply policing on packets that are forwarded to the CPU. Copies of packets are sent to the CPU at the same rate as control packets, and port security is not triggered because learning from control packets is not allowed. Policing is not applied because the packet copy, not the original, is sent to the CPU.

- ARP policing is not supported on either the classic series supervisor engines or fixed configuration switches. It is supported on the Catalyst 4900M and 4948E switches, Supervisor Engine 6-E, and Supervisor Engine 6L-E.

- Only ingress CoPP is supported. So only input keyword is supported in control-plane related CLIs.

<table>
<thead>
<tr>
<th>Predefined Named ACL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>system-cpp-pim</td>
<td>IP Protocol = PIM, IP DA matches 224.0.0.0/24</td>

</tr>
</tbody>
</table>

For the data and management plane traffic, you can define your own ACLs to match the traffic class that you want to police.

CoPP uses MQC to define traffic classification criteria and to specify the configurable policy actions for the classified traffic. MQC uses class maps to define packets for a particular traffic class. After you have classified the traffic, you can create policy maps to enforce policy actions for the identified traffic. The control-plane global configuration command allows you to directly attach a CoPP service policy to the control plane.

The policy map system-cpp-policy must contain the predefined class maps in the predefined order at the beginning of the policy map. The best way to create system-cpp-policy policy map is by using the global macro system-cpp.

The system-cpp-policy policy map contains the predefined class maps for the control plane traffic. The names of all system-defined CoPP class maps and their matching ACLs contain the prefix system-cpp-.

By default, no action is specified for each traffic class. You can define your own class maps matching CPU-bound data plane and management plane traffic. You can also add your defined class maps to system-cpp-policy.

General Guidelines for Control Plane Policing

Guidelines for control plane policing include the following:

- Port security might cancel the effect of CoPP for non-IP control packets.

  Although source MAC learning on a Catalyst 4500 series switch is performed in software, learning control packets' source MAC addresses (for example, IEEE BPDU, CDP, SSTP BDPU, GARP/) is not allowed. Once you configure port security on a port where you expect a high rate of potentially unanticipated control packets, the system generates a copy of the packet to the CPU (until the source address is learned), instead of forward it.

  The current architecture of the Catalyst 4500 supervisor engine does not allow you to apply policing on the copy of packets sent to the CPU. You can only apply policing on packets that are forwarded to the CPU. Copies of packets are sent to the CPU at the same rate as control packets, and port security is not triggered because learning from control packets is not allowed. Policing is not applied because the packet copy, not the original, is sent to the CPU.

- ARP policing is not supported on either the classic series supervisor engines or fixed configuration switches. It is supported on the Catalyst 4900M and 4948E switches, Supervisor Engine 6-E, and Supervisor Engine 6L-E.

- Only ingress CoPP is supported. So only input keyword is supported in control-plane related CLIs.
• Use ACLs and class-maps to identify data plane and management plane traffic that are handled by CPU.
• The only action supported in CoPP policy-map is police.
• Do not use the log keyword in the CoPP policy ACLs.

Default Configuration

CoPP is disabled by default.

Configuring CoPP for Control Plane Traffic

To configure CoPP for control plane traffic, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# config terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# qos</td>
<td>(Optional) Enables QoS globally.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# macro global apply system-cpp</td>
<td>(Optional) Creates the system-cpp-policy policy map and attaches it to the control plane.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# policy-map system-cpp-policy</td>
<td>Associates actions to one or multiple system-defined control plane traffic in the service policy map. Repeat this step if necessary.</td>
</tr>
<tr>
<td></td>
<td>Switch(config-pmap)# class</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# show policy-map system-cpp-policy</td>
<td>(Optional) Verifies the configuration.</td>
</tr>
</tbody>
</table>

The following example shows how to police CDP packets:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos
Switch(config)# macro global apply system-cpp
Switch(config)# policy-map system-cpp-policy
Switch(config-pmap)# class system-cpp-cdp
Switch(config-pmap-c)# police 32000 1000 conform-action transmit exceed-action drop
Switch(config-pmap-c)# end
Switch# show policy-map system-cpp-policy
Policy Map system-cpp-policy
  Class system-cpp-cdp
```

Configuring CoPP for Data Plane and Management Plane Traffic

To configure CoPP for data plane and management plane traffic, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# qos</td>
<td>(Optional) Enables QoS globally.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# macro global apply system-cpp</td>
<td>(Optional) Attaches the system-cpp-policy policy map to the control plane.</td>
</tr>
</tbody>
</table>
### Configuring Control Plane Policing

#### Step 3

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# {ip</td>
<td>mac} access-list extended {access-list-name}</td>
</tr>
<tr>
<td>For an ip access list, issue Switch(config-ext-nacl)# {permit</td>
<td>deny} {protocol} source {source-wildcard} destination {destination-wildcard}</td>
</tr>
<tr>
<td>For a mac access list, issue Switch(config-ext-macl)# {permit</td>
<td>deny} source {source-wildcard} destination {destination-wildcard} {protocol-family} OR Switch(config)# access-list {access-list-name} {permit</td>
</tr>
</tbody>
</table>

**Note** You must configure ACLs in most cases to identify the important or unimportant traffic.

- **type-code**—16-bit hexadecimal number written with a leading 0x; for example, 0x6000. Specify either a Link Service Access Point (LSAP) type code for 802-encapsulated packets or a SNAP type code for SNAP-encapsulated packets. (LSAP, sometimes called SAP, refers to the type codes found in the DSAP and SSAP fields of the 802 header.)
- **wild-mask**—16-bit hexadecimal number whose ones bits correspond to bits in the type-code argument. The wild-mask indicates which bits in the type-code argument should be ignored when making a comparison. (A mask for a DSAP/SSAP pair should always be 0x0101 because these two bits are used for purposes other than identifying the SAP code.)
- **address**—48-bit Token Ring address written as a dotted triple of four-digit hexadecimal numbers. This field is used for filtering by vendor code.
- **mask**—48-bit Token Ring address written as a dotted triple of four-digit hexadecimal numbers. The ones bits in the mask are the bits to be ignored in address. This field is used for filtering by vendor code.

#### Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# class-map {traffic-class-name}</td>
<td>Defines the packet classification criteria. To identify the traffic associated with the class, use the <strong>match</strong> statements.</td>
</tr>
<tr>
<td>Switch(config-cmap)# match access-group {access-list-number</td>
<td>name {access-list-name}}</td>
</tr>
</tbody>
</table>

#### Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-cmap)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 48  Configuring Control Plane Policing and Layer 2 Control Packet QoS

Configuring Control Plane Policing

The following example shows how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specific rate. This example assumes that global QoS is enabled and that the system-cpp-policy policy map was created.

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos
Switch(config)# macro global apply system-cpp

! Allow 10.1.1.1 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet

! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet

! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet

! Define class-map 'telnet-class.'
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit

! Add the class-map 'telnet-class' to 'system-cpp-policy' and define the proper action
Switch(config)# policy-map system-cpp-policy
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 80000 1000 conform transmit exceed drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit

! Verify the above configuration steps
Switch# show policy-map system-cpp-policy
Policy Map system-cpp-policy
  Class system-cpp-dot1x
  Class system-cpp-bpdu-range
  Class system-cpp-cdp
    police 32000 bps 1000 byte conform-action transmit exceed-action drop
  Class system-cpp-sstp

Control Plane Policing Configuration Guidelines and Restrictions

When using (or configuring) control plane policing, consider these guidelines and restrictions:

All supervisor engines

When configuring CoPP, consider these guidelines:

- Only ingress CoPP is supported. Only the input keyword is supported in control plane-related CLIs.
- Control plane traffic can be policed only through CoPP. Traffic cannot be policed at the input interface or VLAN even though a policy map containing the control plane traffic is accepted when the policy map is attached to an interface or VLAN.
- Use ACLs and class maps to identify data plane and management plane traffic that are handled by the CPU. User defined class maps should be added to the system-cpp-policy policy map for CoPP.
- The default system-cpp-policy policy map does not define actions for the system-defined class maps (no policing).
- The only action supported in system-cpp-policy is police.
- You can use both MAC and IP ACLs to define data plane and management plane traffic classes. However, if a packet also matches a predefined ACL for the control plane traffic, a police (or no police) action will operate on the control plane class because the control plane classes appear above the user-defined classes in the service policy.
- The exceeding action policed-dscp-transmit is not supported for CoPP.
- Do not use the log keyword in CoPP policy ACLs. Instead, if you want to determine if rogue packets are arriving, view the output of the show policy-map interface command or use the span feature.

Do not apply to Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E

- To police control plane traffic, use the system-defined class maps.
- System-defined class maps cannot be used in policy maps for regular QoS.
- The policy map named system-cpp-policy is dedicated for CoPP.
- CoPP is not enabled unless global QoS is enabled and a police action is specified.
Monitoring CoPP

You can enter the `show policy-map control-plane` command to develop site-specific policies, to monitor statistics for the control plane policy, and to troubleshoot CoPP. This command displays dynamic information about the actual policy applied, including rate information and the number of bytes (and packets) that conformed or exceeded the configured policies both in hardware and in software.

The output of the `show policy-map control-plane` command is similar to the following:

```
Switch# show policy-map control-plane

Control Plane

Service-policy input: system-cpp-policy

  Class-map: system-cpp-dot1x (match-all)
    0 packets
    Match: access-group name system-cpp-dot1x

  Class-map: system-cpp-bpdu-range (match-all)
    0 packets
    Match: access-group name system-cpp-bpdu-range

  Class-map: system-cpp-cdp (match-all)
    160 packets
    Match: access-group name system-cpp-cdp
    police: Per-interface
    Conform: 22960 bytes Exceed: 0 bytes

  Class-map: system-cpp-sstp (match-all)
    0 packets
    Match: access-group name system-cpp-sstp

  Class-map: system-cpp-cgmp (match-all)
    0 packets
    Match: access-group name system-cpp-cgmp

  Class-map: system-cpp-hsrpv2 (match-all)
    0 packets
    Match: access-group name system-cpp-hsrpv2

  Class-map: system-cpp-ospf (match-all)
    0 packets
    Match: access-group name system-cpp-ospf

  Class-map: system-cpp-igmp (match-all)
    0 packets
    Match: access-group name system-cpp-igmp

  Class-map: system-cpp-pim (match-all)
    0 packets
    Match: access-group name system-cpp-pim

  Class-map: system-cpp-all-systems-on-subnet (match-all)
    0 packets
    Match: access-group name system-cpp-all-systems-on-subnet

  Class-map: system-cpp-all-routers-on-subnet (match-all)
    0 packets
    Match: access-group name system-cpp-all-routers-on-subnet

  Class-map: system-cpp-ripv2 (match-all)
    0 packets
```

---

You can enter the `show policy-map control-plane` command to develop site-specific policies, to monitor statistics for the control plane policy, and to troubleshoot CoPP. This command displays dynamic information about the actual policy applied, including rate information and the number of bytes (and packets) that conformed or exceeded the configured policies both in hardware and in software.

The output of the `show policy-map control-plane` command is similar to the following:

```
Switch# show policy-map control-plane

Configuring Layer 2 Control Packet QoS

Layer 2 control packet QoS enables you to police control packets arriving on a physical port or LAN. This section includes these topics:

- Understanding Layer 2 Control Packet QoS, page 48-11
- Default Configuration, page 48-11
- Enabling Layer 2 Control Packet QoS, page 48-12
- Disabling Layer 2 Control Packet QoS, page 48-13
- Layer 2 Control Packet QoS Configuration Examples, page 48-14
- Layer 2 Control Packet QoS Guidelines and Restrictions, page 48-16

Understanding Layer 2 Control Packet QoS

You might want to police incoming Layer 2 control packets such as STP, CDP, VTP, SSTP, BPDU, EAPOL and LLDP on a specific port before the packets reach CPU. This could serve as a first line of defense before aggregate traffic is subjected to policing (through CoPP). By default, policers cannot be applied to Layer 2 control packets in the input direction. This prevents users from inadvertently policing or dropping critical Layer 2 control packets.

While this approach protects a user who is wrongly policing control packets, it introduces a more serious problem. If a flood of Layer 2 control packets is received on any of the switch interfaces at a very high rate due to a DoS attack or to a loop introduced in the customer network because of misconfiguration, CPU utilization can increase quickly. This can have adverse impacts such as loss of protocol keep-alives and routing protocol updates. The Layer 2 control packet QoS feature allows you to police Layer 2 control packets at the port, VLAN, or port-VLAN level in the input direction.

Default Configuration

Layer 2 control packet QoS is disabled by default.

```plaintext
permit any 0180.c200.0000 0000.0000.000f Extended MAC access list system-cpp-cdp
permit any host 0100.0ccc.cccc
Extended MAC access list system-cpp-cgmp
permit any host 0100.0cdd.dddd
Extended MAC access list system-cpp-dot1x
permit any host 0180.c200.0003
system-cpp-sstp
permit any host 0100.0ccc.cccd

To display one CoPP access list, enter the show access-lists system-cpp-cdp command:

Switch# show access-list system-cpp-cdp
Extended MAC access list system-cpp-cdp
permit any host 0100.0ccc.cccc
Switch#
```
Enabling Layer 2 Control Packet QoS

To enable Layer 2 control packet QoS, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# config terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# [no] qos control-packets {bdpu-range</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show run</td>
</tr>
</tbody>
</table>

Table 48-1 lists the types of packets impacted by this feature.

<table>
<thead>
<tr>
<th>Packet Type and Actionable Address Range</th>
<th>Range of Address the Feature Acts On</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPDU-range</td>
<td>0180.C200.0000 BPDU</td>
</tr>
<tr>
<td></td>
<td>0180.C200.0002 OAM, LACP</td>
</tr>
<tr>
<td></td>
<td>0180.C200.0003 EAPOL</td>
</tr>
<tr>
<td>CDP-VTP</td>
<td>0100.0CCC.CCCC</td>
</tr>
<tr>
<td>SSTP</td>
<td>0100.0CCC.CCCD</td>
</tr>
<tr>
<td>LLDP</td>
<td>0180.C200.000E</td>
</tr>
</tbody>
</table>

The following example shows how to enable QoS for CDP packets and to apply a policer to CDP packets arriving on interface gi3/1 and VLAN 1:

Switch# config terminal
Switch(config)# qos control-packets cdp-vtp
Switch(config)# end
Switch# show run | inc qos control-packets
go
Switch# show class-map
Class Map match-any system-control-packet-cdp-vtp (id 1)
  Match access-group name system-control-packet-cdp-vtp

Create a policy map and attach it to interface gi3/1, vlan 1:
Switch# config terminal
Switch(config)# policy-map police_cdp
Switch(config-pmap)# class system-control-packet-cdp-vtp
Switch(config-pmap-c)# police 32k
Switch(config-pmap-c)# end
Switch(config)# interface gi3/1
Switch(config-if)# vlan 1
Switch(config-if-vlan-range)# service-policy in police_cdp
Switch(config-if-vlan-range)# exit
Switch(config-if)# exit
Switch(config)# exit
Switch# show policy-map interface gi3/1

GigabitEthernet3/1 vlan 1

Service-policy input: police_cdp

Class-map: system-control-packet-cdp-vtp (match-any)
  0 packets
  Match: access-group name system-control-packet-cdp-vtp
  0 packets
  police:
    cir 32000 bps, bc 1500 bytes
    conformed 0 packets, 0 bytes; actions:
      transmit
    exceeded 0 packets, 0 bytes; actions:
      drop
    conformed 0000 bps, exceed 0000 bps

Class-map: class-default (match-any)
  0 packets

Disabling Layer 2 Control Packet QoS

The no qos control-packet command disables QoS for all packet types.

The following example shows how to disable QoS for CDP packets after QoS is enabled for all packet types:

Switch# config terminal
Switch(config)# no qos control-packets cdp-vtp
Switch(config)# end
Switch# show running-configuration | include qos control-packets
qos control-packets bpdu-range
qos control-packets cdp-vtp
qos control-packets lldp
qos control-packets eapol
qos control-packets sstp
qos control-packets protocol-tunnel

Note
When all control packets (CDP/VTP, bpdu-range, SSTP, LLDP, and protocol-tunnel), are enabled only qos control-packets is nvegen’d. Individual protocol names mentioned in the previous output are nvegen’d only if the some of the control packets are configured.

Switch# show running-configuration | include qos control-packets
qos control-packets bpdu-range
qos control-packets lldp
qos control-packets sstp
qos control-packets protocol-tunnel

Note
When you unconfigure this feature for a specified protocol type, the user-configured policies handling that protocol type immediately become ineffective. To save TCAM resources, remove the policies as well as MACLs and class maps (auto-generated or user-defined).
Chapter 48  Configuring Control Plane Policing and Layer 2 Control Packet QoS

Configuring Layer 2 Control Packet QoS

Note

TCAM resources are not consumed when the interface is in a down state.

Table 48-2 displays the auto-generated MACLs and class maps that are created when you enable the feature on the corresponding packet type.

### Table 48-2  Packet Types and Auto-Generated MACL/Class Maps

<table>
<thead>
<tr>
<th>Packet Type</th>
<th>Auto-Generated MACL/Class Map</th>
</tr>
</thead>
</table>
| BPDU-range  | mac access-list extended system-control-packet-bpdu-range  
|            | permit any 0180.e200.0000 0000.0000.000c  
|            | class-map match-any system-control-packet-bpdu-range  
|            | match access-group name system-control-packet-bpdu-range |
| SSTP        | mac access-list extended system-control-packet-sstp  
|            | permit any host 0100.0ccc.cccd

|            | match access-group name system-control-packet-sstp |
| CDP-VTP     | mac access-list extended system-control-packet-cdp-vtp  
|            | permit any host 0100.0ccc.ccc  
|            | class-map match-any system-control-packet-cdp-vtp  
|            | match access-group name system-control-packet-cdp-vtp |
| EAPOL       | mac access-list extended system-control-packet-eapol  
|            | permit any 0x888E  
|            | class-map match-any system-control-packet-eapol  
|            | match access-group name system-control-packet-eapol |
| LLDP        | mac access-list extended system-control-packet-lldp  
|            | permit any host 0180.e200.000e  
|            | class-map match-any system-control-packet-lldp  
|            | match access-group name system-control-packet-lldp |
| PROTOCOL TUNNEL | mac access-list extended system-control-packet-protocol-tunnel  
|                | permit any host 0100.0ccd.cdd0  
|                | class-map match-any system-control-packet-protocol-tunnel  
|                | match access-group name system-control-packet-protocol-tunnel |

Layer 2 Control Packet QoS Configuration Examples

You can use CoPP and Layer 2 control packet QoS together to prevent DoS attacks to the CPU. In the following example, BPDU arrivals on interface gi3/1, VLAN 1 and VLAN 2 are limited to 32 Kbps and 34 Kbps, respectively. Aggregate BPDU traffic to CPU then is further rate-limited to 50 Kbps using CoPP.

Switch(config)# qos control-packets
Configuring Layer 2 Control Packet QoS

Switch(config)# policy-map police_bpdu_1
Switch(config-pmap)# class system-control-packet-bpdu-range
Switch(config-pmap-c)# police 32k 1000
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# policy-map police_bpdu_2
Switch(config-pmap)# class system-control-packet-bpdu-range
Switch(config-pmap-c)# police 34k
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit

Configuring Layer 2 Control Packet QoS

Switch(config)# interface gi3/1
Switch(config-if)# vlan-range 1
Switch(config-if-vlan-range)# service-policy in police_bpdu_1
Switch(config-if-vlan-range)# exit
Switch(config-if)# interface gi3/2
Switch(config-if)# vlan-range 2
Switch(config-if-vlan-range)# service-policy in police_bpdu_1
Switch(config-if-vlan-range)# exit

Configuring Control Plane Policy

Switch(config)# macro global apply system-cpp
Switch(config)# policy-map system-cpp-policy
Switch(config-pmap)# class system-cpp-bpdu-range
Switch(config-pmap-c)# police 50k
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit

Note
To reduce the consumption of policer resources, you can also use named-aggregate policers applied to a group of ports or VLANs.

Note
Do not modify class maps and MACLs that are auto-generated by the system. This action can cause unexpected behavior when the switch reloads or when the running configuration is updated from a file.

Note
User defined class map names must begin with the prefix system-control-packet. If not, certain hardware (Catalyst 4924, Catalyst 4948, Catalyst 4948-10GE, Supervisor Engine II-Plus, Supervisor Engine II+10GE, Supervisor Engine V, and Supervisor Engine V-10GE) might not perform the configured QoS action.

For example, the following are valid user-defined class map names to police Layer 2 control packets because they begin with the prefix system-control-packet:

system-control-packet-bpdu
system-control-packet-control-packet

No such restrictions exist on the names you can use for user-defined MACLs (access-groups).

The following example shows how to create user-defined MACLs and class maps to identify EAPOL and BPDU packets. Because the auto-generated class map system-control-packet-bpdu range matches three packet types (BPDU, EAPOL, and OAM), policing this traffic class affects all three packet types. To police BPDU and EAPOL packets at different rates, you can set user-defined MACL and class map as follows:

Switch(config)# mac access-list extended system-control-packet-bpdu
Policing IPv6 Control Traffic

On Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E, IPv6 control packets such as OSPF, PIM and MLD can be policed on a physical port, VLAN, or control plane by configuring IPv6 ACLs to classify such traffic and then applying a QoS policy to police such traffic.

The following examples show how to police OSPFv6, PIMv6 and MLD control traffic received on a port.

This example shows how to configure a traffic class to identify OSPFv6 control packets by its destination IP v6 address:

Switch(config-ext-macl)# permit any host ff02:5
Switch(config-ext-macl)# exit
Switch(config)# class-map ospfv6Class
Switch(config-cmap)# match access-group name ospfv6
Switch(config-cmap)# exit

The following example shows how to configure a traffic class to identify PIMv6 control packets by its destination IPv6 address:
Policing IPv6 Control Traffic

The following example shows how to configure a traffic class to identify MLD protocol control packets:

```plaintext
Switch(config)# ipv6 access-list mldv1
Switch(config-ipv6-acl)# permit icmp any any mld-query
Switch(config-ipv6-acl)# permit icmp any any mld-report
Switch(config-ipv6-acl)# permit icmp any any mld-reduction
Switch(config-ipv6-acl)# exit
Switch(config)# class-map mldClass
Switch(config-cmap)# match access-group name mldv1
Switch(config-cmap)# exit
```

The following example shows how to configure a QoS policy to police OSPFv6, PIMv6 and MLD traffic classes:

```plaintext
Switch(config)# policy-map v6_control_packet_policy
Switch(config-pmap)# class mldClass
Switch(config-pmap-c)# police 32k
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action drop
Switch(config-pmap-c)# police 32k
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action drop
Switch(config-pmap-c)# police 32k
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# show policy-map
```

The following example shows how to policy to interface gi2/2 in the input direction:

```plaintext
Switch(config)# config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# interface gi2/2
Switch(config-if)# service-policy in v6_control_packet_policy
Switch(config-if)# exit
```
Policing IPv6 Control Traffic
Configuring Dynamic ARP Inspection

This chapter describes how to configure Dynamic ARP Inspection (DAI) on the Catalyst 4500 series switch.

This chapter includes the following major sections:

- About Dynamic ARP Inspection, page 49-1
- Configuring Dynamic ARP Inspection, page 49-5

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Dynamic ARP Inspection

Dynamic ARP Inspection (DAI) is a security feature that validates Address Resolution Protocol (ARP) packets in a network. DAI allows a network administrator to intercept, log, and discard ARP packets with invalid MAC-IP pairs. This capability protects the network from certain “man-in-the-middle” attacks.

This section contains the following subsections:

- ARP Cache Poisoning, page 49-2
- Purpose of Dynamic ARP Inspection, page 49-2
- Interface Trust State, Security Coverage and Network Configuration, page 49-3
- Relative Priority of Static Bindings and DHCP Snooping Entries, page 49-4
- Logging of Dropped Packets, page 49-4
- Rate Limiting of ARP Packets, page 49-4
- Port Channels Function, page 49-5
### ARP Cache Poisoning

You can attack hosts, switches, and routers connected to your Layer 2 network by “poisoning” their ARP caches. For example, a malicious user might intercept traffic intended for other hosts on the subnet by poisoning the ARP caches of systems connected to the subnet.

Figure 49-1 shows an example of cache poisoning.

![Figure 49-1 ARP Cache Poisoning](image)

Hosts HA, HB, and HC are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host HA uses IP address IA and MAC address MA. When HA needs to communicate to HB at the IP Layer, HA broadcasts an ARP request for the MAC address associated with IB. As soon as HB receives the ARP request, the ARP cache on HB is populated with an ARP binding for a host with the IP address IA and a MAC address MA. When HB responds to HA, the ARP cache on HA is populated with a binding for a host with the IP address IB and a MAC address MB.

Host HC can “poison” the ARP caches of HA and HB by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that HC intercepts that traffic. Because HC knows the true MAC addresses associated with IA and IB, HC can forward the intercepted traffic to those hosts using the correct MAC address as the destination. HC has inserted itself into the traffic stream from HA to HB, the classic “man in the middle” attack.

### Purpose of Dynamic ARP Inspection

To prevent ARP poisoning attacks, a switch must ensure that only valid ARP requests and responses are relayed. DAI prevents these attacks by intercepting all ARP requests and responses. Each of these intercepted packets is verified for valid MAC address to IP address bindings before the local ARP cache is updated or the packet is forwarded to the appropriate destination. Invalid ARP packets are dropped.

DAI determines the validity of an ARP packet based on valid MAC address to IP address bindings stored in a trusted database. This database is built at runtime by DHCP snooping, provided this feature is enabled on VLANs and on the switch. In addition, in order to handle hosts that use statically configured IP addresses, DAI can also validate ARP packets against user-configured ARP ACLs.

DAI can also be configured to drop ARP packets when the IP addresses in the packet are invalid or when the MAC addresses in the body of the ARP packet do not match the addresses specified in the Ethernet header.
Interface Trust State, Security Coverage and Network Configuration

DAI associates a trust state with each interface on the system. Packets arriving on trusted interfaces bypass all DAI validation checks, while those arriving on untrusted interfaces go using the DAI validation process. In a typical network configuration for DAI, all ports connected to host ports are configured as untrusted, while all ports connected to switches are configured as trusted. With this configuration, all ARP packets entering the network from a given switch pass the security check.

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity. If we assume that both S1 and S2 (in Figure 49-2) run DAI on the VLAN ports that contains H1 and H2, and if H1 and H2 were to acquire their IP addresses from the DHCP server connected to S1, then only S1 binds the IP to MAC address of H1. If the interface between S1 and S2 is untrusted, the ARP packets from H1 get dropped on S2. This condition would result in a loss of connectivity between H1 and H2.

Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If S1 were not running DAI, then H1 can easily poison the ARP of S2 (and H2, if the inter-switch link is configured as trusted). This condition can occur even though S2 is running DAI.

DAI ensures that hosts (on untrusted interfaces) connected to a switch running DAI do not poison the ARP caches of other hosts in the network. It does not, however, ensure that hosts from other portions of the network do not poison the caches of the hosts connected to it.

To handle cases in which some switches in a VLAN run DAI and other switches do not, the interfaces connecting such switches should be configured as untrusted. To validate the bindings of packets from non-DAI switches, however, the switch running DAI should be configured with ARP ACLs. When it is not feasible to determine such bindings, switches running DAI should be isolated from non-DAI switches at Layer 3.

Note

Depending on the set up of the DHCP server and the network, it may not be possible to perform validation of a given ARP packet on all switches in the VLAN.
Relative Priority of Static Bindings and DHCP Snooping Entries

As mentioned previously, DAI populates its database of valid MAC address to IP address bindings through DHCP snooping. It also validates ARP packets against statically configured ARP ACLs. It is important to note that ARP ACLs have precedence over entries in the DHCP snooping database. ARP packets are first compared to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, then the packet is denied even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command. For configuration information, see the “Configuring the Log Buffer” section on page 49-14.

Rate Limiting of ARP Packets

DAI performs validation checks in the CPU, so the number of incoming ARP packets is rate-limited to prevent a denial of service attack. By default, the rate for untrusted interfaces is set to 15 pps second but trusted interfaces have no rate limit. When the rate of incoming ARP packets exceeds the configured limit, the port is placed in the error-disable state. The port remains in that state until an administrator intervenes. With the `errdisable recovery` global configuration command, you can enable error-disable recovery so that ports emerge from this state automatically after a specified timeout period.

You use the `ip arp inspection limit` global configuration command to limit the rate of incoming ARP requests and responses on the interface. Unless a rate limit is explicitly configured on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state; that is, 15 packets per second for untrusted interfaces and unlimited for trusted interfaces. Once a rate limit is configured explicitly, the interface retains the rate limit even when its trust state is changed. At any time, the interface reverts to its default rate limit if the `no` form of the `rate limit` command is applied. For configuration information, see the “Limiting the Rate of Incoming ARP Packets” section on page 49-16.

---

**Note**

When you enable DAI, all ARP packets are forwarded by CPU (software forwarding, the slow path). With this mechanism, whenever a packet exits through multiple ports, the CPU must create as many copies of the packet as there are egress ports. The number of egress ports is a multiplying factor for the CPU. When QoS policing is applied on egress packets that were forwarded by CPU, QoS must be applied in the CPU as well. (You cannot apply QoS in hardware on CPU generated packets because the hardware forwarding path is turned off for CPU generated packets.) Both factors can drive the CPU to a very high utilization level.
Port Channels Function

A given physical port can join a channel only when the trust state of the physical port and of the channel match. Otherwise, the physical port remains suspended in the channel. A channel inherits its trust state from the first physical port that joined the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when the trust state is changed on the channel, the new trust state is configured on all the physical ports that comprise the channel.

The rate limit check on port channels is unique. The rate of incoming packets on a physical port is checked against the port channel configuration rather than the physical ports’ configuration.

The rate limit configuration on a port channel is independent of the configuration on its physical ports. The rate limit is cumulative across all physical ports; that is, the rate of incoming packets on a port channel equals the sum of rates across all physical ports.

When you configure rate limits for ARP packets on trunks, you must account for VLAN aggregation because a high rate limit on one VLAN can cause a denial of service attack to other VLANs when the port is error-disabled by software. Similarly, when a port channel is error-disabled, a high rate limit on one physical port can cause other ports in the channel to go down.

Configuring Dynamic ARP Inspection

These sections describe how to configure DAI on your switch:

- Configuring Dynamic ARP Inspection in DHCP Environments, page 49-5 (required)
- DAI Configuration Example, page 49-7
- Configuring ARP ACLs for Non-DHCP Environments, page 49-11 (optional)
- Configuring the Log Buffer, page 49-14 (optional)
- Limiting the Rate of Incoming ARP Packets, page 49-16 (optional)
- Performing Validation Checks, page 49-19 (optional)

Configuring Dynamic ARP Inspection in DHCP Environments

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B as shown in Figure 49-3. Both switches are running DAI on VLAN 100 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Switch A has the bindings for Host 1, and Switch B has the bindings for Host 2.
Configuring Dynamic ARP Inspection

Figure 49-3 ARP Packet Validation on a VLAN Enabled for DAI

N o t e  DAI depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses. For configuration information, see Chapter 50, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”

For information on how to configure DAI when only one switch supports the feature, see the “Configuring ARP ACLs for Non-DHCP Environments” section on page 49-11.

To configure DAI, perform this task on both switches:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# show cdp neighbors</td>
</tr>
<tr>
<td></td>
<td>Verifies the connection between the switches.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# [no] ip arp inspection vlanvlan-range</td>
</tr>
<tr>
<td></td>
<td>Enables DAI on a per-VLAN basis. By default, DAI is disabled on all VLANs. To disable DAI, use the no ip arp inspection vlan vlan-range global configuration command. For vlan-range, specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. Specify the same VLAN ID for both switches.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specifies the interface connected to the other switch, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>
Configuring Dynamic ARP Inspection

### DAI Configuration Example

This example shows how to configure DAI on Switch A in VLAN 100. You would perform a similar procedure on Switch B.

#### Switch A

```bash
SwitchA# show cdp neighbors
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, r - Repeater, P - Phone
          Local Intrfce        Holdtme  Capability  Platform  Port ID
SwitchB Gig 3/48           179  R S I     WS-C4506  Gig 3/46
SwitchA# configure terminal
SwitchA(config)# ip arp inspection vlan 100
SwitchA(config)# interface g3/48
SwitchA(config)# ip arp inspection trust
SwitchA(config-if)# end
```

#### Step 5

```
Step 5  Switch(config-if)# ip arp inspection trust
```

Configures the connection between the switches as trusted.

To return the interfaces to an untrusted state, use the `no ip arp inspection trust` interface configuration command.

By default, all interfaces are untrusted.

The switch does not check ARP packets that it receives from the other switch on the trusted interface. It forwards the packets.

For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the `ip arp inspection vlan logging` global configuration command.

For more information, see the “Configuring the Log Buffer” section on page 49-14.

#### Step 6

```
Step 6  Switch(config-if)# end
```

Returns to privileged EXEC mode.

#### Step 7

```
Step 7  Switch(config-if)# show ip arp inspection interfaces
Step 7  Switch(config-if)# show ip arp inspection vlan
```

Verifies the DAI configuration.

#### Step 8

```
Step 8  Switch(config-if)# show ip dhcp snooping binding
```

Verifies the DHCP bindings.

#### Step 9

```
Step 9  Switch(config-if)# show ip arp inspection statistics
Step 9  Switch(config-if)# show ip arp inspection vlan
```

Checks the DAI statistics.

#### Step 10

```
Step 10  Switch(config-if)# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

Configuring ARP ACLs for Non-DHCPEnvironments

This procedure shows how to configure DAI when Switch B shown in Figure 49-3 does not support DAI or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 100. If the IP address of Host 2 is not static, such that it is impossible to apply the ACL configuration on Switch A, you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

To configure an ARP ACL (on switch A in a non-DHCP environment), perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# arp access-list acl-name</td>
<td>Defines an ARP ACL, and enter ARP access-list configuration mode. By default, no ARP access lists are defined. Note At the end of the ARP access list, there is an implicit deny ip any mac any command.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-arp-nac)# permit ip host sender-ip mac host sender-mac [log]</td>
<td>Permits ARP packets from the specified host (Host 2). • For sender-ip, enter the IP address of Host 2. • For sender-mac, enter the MAC address of Host 2. • (Optional) Specify log to log a packet in the log buffer when it matches the access control entry (ACE). Matches are logged if you also configure the matchlog keyword in the ip arp inspection vlan logging global configuration command. For more information, see the “Configuring the Log Buffer” section on page 49-14.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-arp-nac)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
</tbody>
</table>
### Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 5    | Switch(config)# ip arp inspection filter \(\text{arp-acl-name}\) vlan \(\text{vlan-range}\) [\(\text{static}\)] | Applies the ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.  
- For \(\text{arp-acl-name}\), specify the name of the ACL created in Step 2.  
- For \(\text{vlan-range}\), specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.  
- (Optional) Specify \(\text{static}\) to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.  
If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL. ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them. |
| 6    | Switch(config)# interface \(\text{interface-id}\) | Specifies the Switch A interface that is connected to Switch B, and enter interface configuration mode. |
| 7    | Switch(config-if)# no ip arp inspection trust | Configures the Switch A interface that is connected to Switch B as untrusted.  
By default, all interfaces are untrusted.  
For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the \(\text{ip arp inspection vlan logging}\) global configuration command. For more information, see the “Configuring the Log Buffer” section on page 49-14. |
| 8    | Switch(config-if)# end | Returns to privileged EXEC mode. |
| 9    | Switch# show arp access-list \(\text{acl-name}\)  
Switch# show ip arp inspection vlan \(\text{vlan-range}\)  
Switch# show ip arp inspection interfaces | Verifies the DAI configuration. |
| 10   | Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
To remove the ARP ACL, use the `no arp access-list` global configuration command. To remove the ARP ACL attached to a VLAN, use the `no ip arp inspection filter arp-acl-name vlan vlan-range` global configuration command.

This example shows how to configure an ARP ACL called host2 on Switch A, to permit ARP packets from HostB (IP address 170.1.1.2 and MAC address 2.2.2), to apply the ACL to VLAN 100, and to configure port 1 on Switch A as untrusted:

```
SwitchA# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchA(config)# arp access-list hostB
SwitchA(config-arp-nacl)# permit ip host 170.1.1.2 mac host 2.2.2 log
SwitchA(config-arp-nacl)# exit
SwitchA(config)# ip arp inspection filter hostB vlan 100 static
SwitchA(config)# interface g3/48
SwitchA(config-if)# no ip arp inspection trust
SwitchA(config-if)# end
SwitchA# show arp access-list hostB
ARP access list hostB
permit ip host 170.1.1.2 mac host 0002.0002.0002 log
```

```
SwitchA# show ip arp inspection interfaces

SwitchA#

Configuring the Log Buffer

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

A log-buffer entry can represent more than one packet. For example, if an interface receives many packets on the same VLAN with the same ARP parameters, the switch combines the packets as one entry in the log buffer and generates a single system message for the entry.

If the log buffer overflows, it means that a log event does not fit into the log buffer, and the display for the `show ip arp inspection log` privileged EXEC command is affected. No other statistics are provided for the entry.
To configure the log buffer, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# ip arp inspection log-buffer {entries number</td>
</tr>
<tr>
<td></td>
<td>Configures the DAI logging buffer.</td>
</tr>
<tr>
<td></td>
<td>By default, when DAI is enabled, denied or dropped ARP packets are logged. The number of log entries is 32. The number of system messages is limited to 5 per second. The logging-rate interval is 1 second.</td>
</tr>
<tr>
<td></td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td>• For entries number, specify the number of entries to be logged in the buffer. The range is 0 to 1024.</td>
</tr>
<tr>
<td></td>
<td>• For logs number interval seconds, specify the number of entries to generate system messages in the specified interval.</td>
</tr>
<tr>
<td></td>
<td>For logs number, the range is 0 to 1024. A 0 value means that the entry is placed in the log buffer, but a system message is not generated.</td>
</tr>
<tr>
<td></td>
<td>For interval seconds, the range is 0 to 86400 seconds (1 day). A 0 value means that a system message is immediately generated (and the log buffer is always empty).</td>
</tr>
<tr>
<td></td>
<td>An interval setting of 0 overrides a log setting of 0.</td>
</tr>
<tr>
<td></td>
<td>The logs and interval settings interact. If the logs number X is greater than interval seconds Y, X divided by Y (X/Y) system messages are sent every second. Otherwise, one system message is sent every Y divided by X (Y/X) seconds.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# [no] ip arp inspection vlan vlan-range logging {acl-match {matchlog</td>
</tr>
<tr>
<td></td>
<td>Controls the type of packets that are logged per-VLAN. By default, all denied or all dropped packets are logged. The term logged means the entry is placed in the log buffer and a system message is generated.</td>
</tr>
<tr>
<td></td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td></td>
<td>• For vlan-range, specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>• For acl-match matchlog, log packets based on the ACE logging configuration. If you specify the matchlog keyword in this command and the log keyword in the permit or deny ARP access-list configuration command, ARP packets permitted or denied by ACEs with log keyword are logged.</td>
</tr>
<tr>
<td></td>
<td>• For acl-match none, do not log packets that match ACLs.</td>
</tr>
<tr>
<td></td>
<td>• For dhcp-bindings all, log all packets that match DHCP bindings.</td>
</tr>
<tr>
<td></td>
<td>• For dhcp-bindings none, do not log packets that match DHCP bindings.</td>
</tr>
<tr>
<td></td>
<td>• For dhcp-bindings permit, log DHCP-binding permitted packets.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring Dynamic ARP Inspection

#### Chapter 49      Configuring Dynamic ARP Inspection

**To return to the default log buffer settings, use the `no ip arp inspection log-buffer` global configuration command. To return to the default VLAN log settings, use the `no ip arp inspection vlan vlan-range logging {acl-match | dhcp-bindings}` global configuration command. To clear the log buffer, use the `clear ip arp inspection log` privileged EXEC command.**

This example shows how to configure the number of entries for the log buffer to 1024. It also shows how to configure your Catalyst 4500 series switch so that the logs must be generated from the buffer at the rate of 100 per 10 seconds.

```
SwitchB# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchB(config)# ip arp inspection log-buffer entries 1024
SwitchB(config)# ip arp inspection log-buffer logs 100 interval 10
SwitchB(config)# end
SwitchB#
```

```
SwitchB# show ip arp inspection log
Total Log Buffer Size : 1024
Syslog rate : 100 entries per 10 seconds.

```

**Limiting the Rate ofIncoming ARP Packets**

The switch CPU performs DAI validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

---

**Note**

Unless you explicitly configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the `no ip arp-inspection limit` interface configuration command, the interface reverts to its default rate limit.

By default, the switch places the port in the error-disabled state when the rate of incoming ARP packets exceeds the configured limit. To prevent the port from shutting down, you can use the `errdisable detect cause arp-inspection action shutdown vlan` global configuration command to shut down just the offending VLAN on the port where the violation occurred.

When a port is in the error-disabled state, you can bring it out of this state automatically by configuring the `errdisable recovery cause arp-inspection` global configuration command or you can manually reenable it by entering the `shutdown` and `no shut down` interface configuration commands. If a port is in per-VLAN error-disabled mode, you can also use `clear errdisable interface name vlan range` command to reenable the VLAN on the port.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip arp inspection log</td>
<td>Verifies your settings.</td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To limit the rate of incoming ARP packets, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# errdisable detect cause arp-inspection [action shutdown vlan]</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# [no] ip arp inspection limit [rate pps [burst interval second]</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# exit</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# errdisable recovery [cause arp-inspection</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch# show ip arp inspection interfaces</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch# show errdisable recovery</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

By default this command is enabled, and when a violation occurs the interface is shutdown.

The default rate is 15 pps on untrusted interfaces and unlimited on trusted interfaces. The burst interval is 1 second.

The keywords have these meanings:

- For **rate pps**, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps.
- (Optional) For **burst interval seconds**, specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15.
- For **rate none**, specify no upper limit for the rate of incoming ARP packets that can be processed.

(Optional) Enables error recovery from the DAI error-disable state. By default, recovery is disabled, and the recovery interval is 300 seconds.

For **interval interval**, specify the time in seconds to recover from the error-disable state. The range is 30 to 86400.

To return to the default rate-limit configuration, use the **no ip arp inspection limit** interface configuration command. To disable error recovery for DAI, use the **no errdisable recovery cause arp-inspection** global configuration command.

This example shows how to set an upper limit for the number of incoming packets (100 pps) and to specify a burst interval (1 second):

SwitchB# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchB(config)# interface g3/31
SwitchB(config-if)# ip arp inspection limit rate 100 burst interval 1
SwitchB(config-if)# exit
SwitchB(config)# errdisable recovery cause arp-inspection
SwitchB(config)# exit
Chapter 49  Configuring Dynamic ARP Inspection

Performing Validation Checks

DAI intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.
To perform specific checks on incoming ARP packets, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;Switch(config)# ip arp inspection validate [[src-mac] [dst-mac] [ip]]</td>
<td>Performs a specific check on incoming ARP packets. By default, no additional checks are performed. The keywords have these meanings:</td>
</tr>
<tr>
<td>• For <strong>src-mac</strong>, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
<td></td>
</tr>
<tr>
<td>• For <strong>dst-mac</strong>, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
<td></td>
</tr>
<tr>
<td>• For <strong>ip</strong>, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses.</td>
<td></td>
</tr>
<tr>
<td>You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables <strong>src</strong> and <strong>dst-mac</strong> validations, and a second command enables IP validation only, the <strong>src</strong> and <strong>dst-mac</strong> validations are disabled as a result of the second command.</td>
<td></td>
</tr>
</tbody>
</table>

| Step 3 | Switch(config)# exit | Returns to privileged EXEC mode. |
| Step 4 | Switch# show ip arp inspection vlan vlan-range | Verifies your settings. |
| Step 5 | Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

To disable checking, use the **no ip arp inspection validate [src-mac] [dst-mac] [ip]** global configuration command. To display statistics for forwarded, dropped, MAC validation failure, and IP validation failure packets, use the **show ip arp inspection statistics** privileged EXEC command.

This example shows how to configure source mac validation. Packets are dropped and an error message may be generated when the source address in the Ethernet header does not match the sender hardware address in the ARP body.

SwitchB# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchB(config)# ip arp inspection validate src-mac
SwitchB(config)# exit
SwitchB# show ip arp inspection vlan 100

Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled

Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

This chapter describes how to configure Dynamic Host Configuration Protocol (DHCP) snooping, IP source guard, and IP source guard (IPSG) for static hosts on Catalyst 4500 series switches. It provides guidelines, procedures, and configuration examples.

This chapter consists of the following major sections:

- About DHCP Snooping, page 50-1
- Configuring DHCP Snooping, page 50-6
- Displaying DHCP Snooping Information, page 50-18
- Displaying IP Source Binding Information, page 50-23
- Configuring IP Source Guard, page 50-20
- Displaying IP Source Binding Information, page 50-23
- Configuring IP Source Guard for Static Hosts, page 50-24

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About DHCP Snooping

DHCP snooping is a DHCP security feature that provides security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding table. An untrusted message is a message that is received from outside the network or firewall and that can cause traffic attacks within your network.
Chapter 50      Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

About DHCP Snooping

The DHCP snooping binding table contains the MAC address, IP address, lease time, binding type, VLAN number, and interface information that corresponds to the local untrusted interfaces of a switch; it does not contain information regarding hosts interconnected with a trusted interface. An untrusted interface is an interface that is configured to receive messages from outside the network or firewall. A trusted interface is an interface that is configured to receive only messages from within the network.

DHCP snooping acts such as a firewall between untrusted hosts and DHCP servers. It also gives you a way to differentiate between untrusted interfaces connected to the end-user and trusted interfaces connected to the DHCP server or another switch.

**Note**

In order to enable DHCP snooping on a VLAN, you must enable DHCP snooping on the switch.

You can configure DHCP snooping for switches and VLANS. When you enable DHCP snooping on a switch, the interface acts as a Layer 2 bridge, intercepting and safeguarding DHCP messages going to a Layer 2 VLAN. When you enable DHCP snooping on a VLAN, the switch acts as a Layer 2 bridge within a VLAN domain.

This section includes these topics:

- Trusted and Untrusted Sources, page 50-2
- About the DHCP Snooping Database Agent, page 50-2
- Option 82 Data Insertion, page 50-4

**Trusted and Untrusted Sources**

The DHCP snooping feature determines whether traffic sources are trusted or untrusted. An untrusted source may initiate traffic attacks or other hostile actions. To prevent such attacks, the DHCP snooping feature filters messages and rate-limits traffic from untrusted sources.

In an enterprise network, devices under your administrative control are trusted sources. These devices include the switches, routers and servers in your network. Any device beyond the firewall or outside your network is an untrusted source. Host ports are generally treated as untrusted sources.

In a service provider environment, any device that is not in the service provider network is an untrusted source (such as a customer switch). Host ports are untrusted sources.

In the Catalyst 4500 series switch, you indicate that a source is trusted by configuring the trust state of its connecting interface.

The default trust state of all interfaces is untrusted. You must configure DHCP server interfaces as trusted. You can also configure other interfaces as trusted if they connect to devices (such as switches or routers) inside your network. You usually do not configure host port interfaces as trusted.

**Note**

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces, as untrusted DHCP messages will be forwarded only to trusted interfaces.

**About the DHCP Snooping Database Agent**

To retain the bindings across switch reloads, you must use the DHCP snooping database agent. Without this agent, the bindings established by DHCP snooping are lost upon switch reload. Connectivity is lost as well.
About DHCP Snooping

The mechanism for the database agent stores the bindings in a file at a configured location. Upon reload, the switch reads the file to build the database for the bindings. The switch keeps the file current by writing to the file as the database changes.

The format of the file that contains the bindings is as follows:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
...
<entry-n> <checksum-1-2-..-n>
END
```

Each entry in the file is tagged with a checksum that is used to validate the entries whenever the file is read. The `<initial-checksum>` entry on the first line helps distinguish entries associated with the latest write from entries that are associated with a previous write.

It is a sample bindings file:

```
3ebe1518
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
1.1.1.1 512 0001.0001.0005 3EBE2881 Gi1/1                                e5e1e733
1.1.1.1 512 0001.0001.0002 3EBE2881 Gi1/1                                4b3486ec
1.1.1.1 1536 0001.0001.0004 3EBE2881 Gi1/1                               f0e02872
1.1.1.1 1024 0001.0001.0003 3EBE2881 Gi1/1                               ac41ad9f
1.1.1.1 1 0001.0001.0001 3EBE2881 Gi1/1                                  34b3273e
END
```

Each entry holds an IP address, VLAN, MAC address, lease time (in hex), and the interface associated with a binding. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry consists of 72 bytes of data, followed by a space, followed by a checksum.

Upon bootup, when the calculated checksum equals the stored checksum, a switch reads entries from the file and adds the bindings to the DHCP snooping database. When the calculated checksum does not equal the stored checksum, the entry read from the file is ignored and so are all the entries following the failed entry. The switch also ignores all those entries from the file whose lease time has expired. (This situation is possible because the lease time might indicate an expired time.) An entry from the file is also ignored if the interface referred to in the entry no longer exists on the system or if it is a router port or a DHCP snooping-trusted interface.

When a switch learns of new bindings or when it loses some bindings, the switch writes the modified set of entries from the snooping database to the file. The writes are performed with a configurable delay to batch as many changes as possible before the actual write happens. Associated with each transfer is a timeout after which a transfer is aborted if it is not completed. These timers are referred to as the write delay and abort timeout.
Option 82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP Option 82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

**Note**

The DHCP Option 82 feature is supported only when DHCP snooping is globally enabled and on the VLANs to which subscriber devices using this feature are assigned.

Figure 50-1 is an example of a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

When you enable the DHCP snooping information Option 82 on the switch, this sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the Option 82 information in the packet. By default, the remote ID suboption is the switch MAC address, and the circuit ID suboption is the port identifier, `vlan-mod-port`, from which the packet is received. Beginning with Cisco IOS Release 12.2(40)SG, you can configure the remote ID and circuit ID. For information on configuring these suboptions, see the “Enabling DHCP Snooping and Option 82” section on page 50-10.
- If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the Option 82 field to the DHCP server.
- The DHCP server receives the packet. If the server is Option 82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. The DHCP server then echoes the Option 82 field in the DHCP reply.
The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the Option 82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the Option 82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields in Figure 50-2 do not change:

- Circuit ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Circuit ID type
  - Length of the circuit ID type

- Remote ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Remote ID type
  - Length of the remote ID type

Figure 50-2 shows the packet formats for the remote ID suboption and the circuit ID suboption when the default suboption configuration is used. For the circuit ID suboption, the module number corresponds to the switch module number. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option` global configuration command.

![Figure 50-2 Suboption Packet Formats](image-url)
Figure 50-3 shows the packet formats for user-configured remote ID and circuit ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote ID and circuit ID suboptions:

- Circuit ID suboption fields
  - The circuit ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

- Remote ID suboption fields
  - The remote ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

### Configuring DHCP Snooping

When you configure DHCP snooping on your switch, you are enabling the switch to differentiate untrusted interfaces from trusted interfaces. You must enable DHCP snooping globally before you can use DHCP snooping on a VLAN. You can enable DHCP snooping independently from other DHCP features.

These sections describe how to configure DHCP snooping:

- Default Configuration for DHCP Snooping, page 50-7
- Enabling DHCP Snooping, page 50-7
Chapter 50  Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

Enabling DHCP Snooping on the Aggregation Switch, page 50-9
Enabling DHCP Snooping and Option 82, page 50-10
Enabling DHCP Snooping on Private VLAN, page 50-12
Configuring DHCP Snooping on Private VLAN, page 50-12
Configuring DHCP Snooping with an Ethernet Channel Group, page 50-12

</tr>
</tbody>
</table>

If you want to change the default configuration values, see the “Enabling DHCP Snooping” section.

Enabling DHCP Snooping

When DHCP snooping is enabled globally, DHCP requests are dropped until the ports are configured. Consequently, you should probably configure this feature during a maintenance window and not during production.
To enable DHCP snooping, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;<code>Switch(config)# ip dhcp snooping</code></td>
<td>Enables DHCP snooping globally. You can use the <code>no</code> keyword to disable DHCP snooping.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;`Switch(config)# ip dhcp snooping vlan number [number]</td>
<td>Enables DHCP snooping on your VLAN or VLAN range.</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;`Switch(config)# errdisable recovery {cause dhcp-rate-limit</td>
<td>interval interval}`</td>
</tr>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;<code>Switch(config)# errdisable detect cause dhcp-rate-limit {action shutdown vlan)</code></td>
<td>(Optional) Enables per-VLAN errdisable detection. Note By default this command is enabled, and when a violation occurs the interface is shutdown.</td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;<code>Switch(config-if)# ip dhcp snooping trust</code></td>
<td>Configures the interface as trusted or untrusted. You can use the <code>no</code> keyword to configure an interface to receive messages from an untrusted client.</td>
</tr>
<tr>
<td><strong>Step 6</strong>&lt;br&gt;<code>Switch(config-if)# ip dhcp snooping limit rate rate</code></td>
<td>Configures the number of DHCP packets per second (pps) that an interface can receive.¹</td>
</tr>
<tr>
<td><strong>Step 7</strong>&lt;br&gt;<code>Switch(config)# end</code></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong>&lt;br&gt;<code>Switch# show ip dhcp snooping</code></td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

¹ We recommend not configuring the untrusted interface rate limit to more than 100 packets per second. The recommended rate limit for each untrusted client is 15 packets per second. Normally, the rate limit applies to untrusted interfaces. If you want to set up rate limiting for trusted interfaces, keep in mind that trusted interfaces aggregate all DHCP traffic in the switch, and you will need to adjust the rate limit to a higher value. You should fine tune this threshold depending on the network configuration. The CPU should not receive DHCP packets at a sustained rate of more than 1,000 packets per second.

You can configure DHCP snooping for a single VLAN or a range of VLANs. To configure a single VLAN, enter a single VLAN number. To configure a range of VLANs, enter a beginning and an ending VLAN number or a dash and range of VLANs.

The number of incoming DHCP packets is rate-limited to prevent a denial-of-service attack. When the rate of incoming DHCP packets exceeds the configured limit, the switch places the port in the errdisabled state. To prevent the port from shutting down, you can use the `errdisable detect cause dhcp-rate-limit action shutdown vlan` global configuration command to shut down just the offending VLAN on the port where the violation occurred.

When a secure port is in the errdisabled state, you can bring it out of this state automatically by configuring the `errdisable recovery cause dhcp-rate-limit` global configuration command or you can manually reenable it by entering the `shutdown` and `no shutdown` interface configuration commands. If a port is in per-VLAN errdisabe mode, you can also use `clear errdisabe interface name vlan range` command to reenable the VLAN on the port.

This example shows how to enable DHCP snooping on VLAN 500 through 555:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
```
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config)# end
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled
DHCP snooping is configured on following VLANs: 500,555
DHCP snooping is operational on following VLANs: 500,555
DHCP snooping is configured on the following L3 Interfaces:

Insertion of option 82 is enabled
   circuit-id default format: vlan-mod-port
   remote-id: switch123 (string)
Option 82 on untrusted port is not allowed Verification of hwaddr field is enabled DHCP
snooping trust/rate is configured on the following Interfaces:

<table>
<thead>
<tr>
<th>Interface</th>

</table>

Switch#

The following configuration describes the DHCP snooping configuration steps if routing is defined on another Catalyst switch (for example, a Catalyst 6500 series switch):

// Trust the uplink gigabit Ethernet trunk port
interface range GigabitEthernet 1/1 – 2
switchport mode trunk
switchport trunk encapsulation dot1q
ip dhcp snooping trust
!

interface VLAN 14
ip address 10.33.234.1 255.255.254.0
ip helper-address 10.5.1.2

If you are enabling trunking on uplink gigabit interfaces, and the above routing configuration is defined on a Catalyst 6500 series switch, you must configure the “trust” relationship with downstream DHCP snooping (on a Catalyst 4500 series switch) which adds Option 82. On a Catalyst 6500 series switch, this task is accomplished with the `ip dhcp relay information trusted` VLAN configuration command.

---

**Enabling DHCP Snooping on the Aggregation Switch**

To enable DHCP snooping on an aggregation switch, configure the interface connecting to a downstream switch as a snooping untrusted port. If the downstream switch (or a device such as a DSLAM in the path between the aggregation switch and the DHCP clients) adds DHCP information Option 82 to the DHCP packets, the DHCP packets would be dropped on arriving on a snooping untrusted port. If you configure
the `ip dhcp snooping information option allow-untrusted` global configuration command on the aggregation switch, the aggregation switch can accept DHCP requests with Option 82 information from any snooping untrusted port.

## Enabling DHCP Snooping and Option 82

To enable DHCP snooping and Option 82 on the switch, perform the following steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# ip dhcp snooping</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# ip dhcp snooping vlan vlan-range</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# ip dhcp snooping information option</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config)# ip dhcp snooping information option format remote-id [string ASCII-string</td>
</tr>
<tr>
<td></td>
<td>hostname]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# ip dhcp snooping information option allow-untrusted</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config-if)# ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string</td>
</tr>
</tbody>
</table>
Chapter 50  Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

Configuring DHCP Snooping

To disable DHCP snooping, use the `no ip dhcp snooping` global configuration command. To disable DHCP snooping on a VLAN or range of VLANs, use the `no ip dhcp snooping vlan vlan-range` global configuration command. To disable the insertion and removal of the Option 82 field, use the `no ip dhcp snooping information option` global configuration command. To configure an aggregation switch to drop incoming DHCP snooping packets with Option 82 information from an edge switch, use the `no ip dhcp snooping information option allow-untrusted` global configuration command.

![Image](image.png)

### Command Table

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td><code>Switch(config-if)# ip dhcp snooping trust</code></td>
<td>(Optional) Configures the interface as trusted or untrusted. You can use the <code>no</code> keyword to configure an interface to receive messages from an untrusted client. The default setting is untrusted.</td>
</tr>
<tr>
<td>10</td>
<td><code>Switch(config-if)# ip dhcp snooping limit rate rate</code></td>
<td>(Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured. <strong>Note</strong> We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN on which DHCP snooping is enabled.</td>
</tr>
<tr>
<td>11</td>
<td><code>Switch(config-if)# exit</code></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>12</td>
<td><code>Switch(config)# ip dhcp snooping verify mac-address</code></td>
<td>(Optional) Configures the switch to verify that the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet. The default is to verify that the source MAC address matches the client hardware address in the packet.</td>
</tr>
<tr>
<td>13</td>
<td><code>Switch(config)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>14</td>
<td><code>Switch# show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>15</td>
<td><code>Switch# copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to enable DHCP snooping globally and on VLAN 10 and to configure a rate limit of 100 packets per second on a port:

```plaintext
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10
Switch(config)# ip dhcp snooping information option
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip dhcp snooping limit rate 100
```

The following example shows how to enable DHCP snooping on VLAN 500 through 555 and option 82 circuit-id:

```plaintext
Switch(config)# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config)# end
```

---

**To disable DHCP snooping, use the `no ip dhcp snooping` global configuration command. To disable DHCP snooping on a VLAN or range of VLANs, use the `no ip dhcp snooping vlan vlan-range` global configuration command. To disable the insertion and removal of the Option 82 field, use the `no ip dhcp snooping information option` global configuration command. To configure an aggregation switch to drop incoming DHCP snooping packets with Option 82 information from an edge switch, use the `no ip dhcp snooping information option allow-untrusted` global configuration command.**

This example shows how to enable DHCP snooping globally and on VLAN 10 and to configure a rate limit of 100 packets per second on a port:

```plaintext
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10
Switch(config)# ip dhcp snooping information option
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip dhcp snooping limit rate 100
```

The following example shows how to enable DHCP snooping on VLAN 500 through 555 and option 82 circuit-id:

```plaintext
Switch(config)# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config)# end
```
This example shows how to configure the Option 82 circuit-ID override suboption:

```
Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id override string testcustomer
```

### Enabling DHCP Snooping on Private VLAN

DHCP snooping can be enabled on private VLANs, which provide isolation between Layer 2 ports within the same VLAN. If DHCP snooping is enabled (or disabled), the configuration is propagated to both the primary VLAN and its associated secondary VLANs. You cannot enable (or disable) DHCP snooping on a primary VLAN without reflecting this configuration change on the secondary VLANs.

Configuring DHCP snooping on a secondary VLAN is still allowed, but it does not take effect if the associated primary VLAN is already configured. If the associated primary VLAN is configured, the effective DHCP snooping mode on the secondary VLAN is derived from the corresponding primary VLAN. Manually configuring DHCP snooping on a secondary VLAN causes the switch to issue this warning message:

```
DHCP Snooping configuration may not take effect on secondary vlan XXX
```

The `show ip dhcp snooping` command displays all VLANs (both primary and secondary) that have DHCP snooping enabled.

### Configuring DHCP Snooping on Private VLAN

DHCP snooping, IPSG, and DAI are Layer 2-based security features that can be enabled and disabled on an individual VLAN, including auxiliary or voice VLAN. You need to enable DHCP snooping on a voice VLAN for a Cisco IP phone to function properly.

### Configuring DHCP Snooping with an Ethernet Channel Group

When you configure DHCP snooping, you need to configure trunk interfaces that transmit DHCP packets as trusted interfaces by adding `ip dhcp snooping trust` to the physical interface configuration. However, if DHCP packets will be transmitted over an Ethernet channel group, you must configure `ip dhcp snooping trust` on the logical port channel interface, for example:

```
Switch# show run int port-channel150
Building configuration...

Current configuration : 150 bytes
!
interface Port-channel150
  switchport
  switchport trunk native vlan 4092
  switchport mode trunk
  switchport nonegotiate
  ip dhcp snooping trust
end

Switch#
```
Enabling the DHCP Snooping Database Agent

To configure the database agent, perform one or more of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# ip dhcp snooping database {url</td>
<td>write-delay seconds</td>
</tr>
<tr>
<td>Switch(config)# no ip dhcp snooping database [write-delay</td>
<td>timeout]</td>
</tr>
<tr>
<td>Switch# show ip dhcp snooping database [detail]</td>
<td>(Optional) Displays the current operating state of the database agent and statistics associated with the transfers.</td>
</tr>
<tr>
<td>Switch# clear ip dhcp snooping database statistics</td>
<td>(Optional) Clears the statistics associated with the database agent.</td>
</tr>
<tr>
<td>Switch# renew ip dhcp snooping database [validation none] [url]</td>
<td>(Optional) Requests the read entries from a file at the given URL.</td>
</tr>
<tr>
<td>Switch# ip dhcp snooping binding mac-addr vlan vlan ipaddr interface ifname expiry lease-in-seconds</td>
<td>(Optional) Adds or deletes bindings to the snooping database.</td>
</tr>
<tr>
<td>Switch# no ip dhcp snooping binding mac-addr vlan vlan ipaddr interface ifname</td>
<td></td>
</tr>
</tbody>
</table>

Note: Because both NVRAM and bootflash have limited storage capacity, you should use TFTP or network-based files. If you use flash to store the database file, new updates (by the agent) result in the creation of new files (flash fills quickly). Moreover, because of the nature of the file system used on flash, a large number of files can cause slow access. When a file is stored in a remote location accessible through TFTP, an RPR or SSO standby supervisor engine can take over the binding list when a switchover occurs.

Note: Network-based URLs (such as TFTP and FTP) require that you create an empty file at the configured URL before the switch can write the set of bindings for the first time.

Limiting the Rate of Incoming DHCP Packets

The switch CPU performs DHCP validation checks; therefore, the number of incoming DHCP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming DHCP packets exceeds the configured limit, the switch places the port in the erred-disabled state. The port remains in that state until you intervene or you enable errdisable recovery so that ports automatically emerge from this state after a specified timeout period.

Note: Unless you explicitly configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the no ip dhcp snooping limit rate interface configuration command, the interface reverts to its default rate limit.
To prevent the port from shutting down, you can use the `errdisable detect cause dhcp-rate-limit action shutdown vlan` global configuration command to shut down just the offending VLAN on the port where the violation occurred.

To limit the rate of incoming DHCP packets, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# errdisable detect cause dhcp-rate-limit [action shutdown vlan]</td>
<td>Enables per-VLAN errdisable detection.</td>
</tr>
<tr>
<td>Switch(config)# interface interface-id</td>
<td>Specifies the interface to be rate-limited, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Switch(config-if)# [no] ip dhcp snooping limit rate</td>
<td>Limits the rate of incoming DHCP requests and responses on the interface. The default rate is disabled.</td>
</tr>
<tr>
<td>Switch(config-if)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# errdisable recovery [cause dhcp-rate-limit</td>
<td>(Optional) Enables error recovery from the DHCP errdisable state. By default, recovery is disabled, and the recovery interval is 300 seconds. For <code>interval interval</code>, specify the time in seconds to recover from the errdisable state. The range is 30 to 86400.</td>
</tr>
<tr>
<td>Switch(config)# exit</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch# show interfaces status</td>
<td>Verifies your settings.</td>
</tr>
<tr>
<td>Switch# show errdisable recovery</td>
<td>Verifies your settings.</td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default rate-limit configuration, use the `no ip dhcp-rate-limit` interface configuration command. To disable error recovery for DHCP inspection, use the `no errdisable recovery cause dhcp-rate-limit` global configuration command.

This example shows how to set an upper limit for the number of incoming packets (100 pps) and to specify a burst interval (1 second):

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g3/31
Switch(config-if)# ip dhcp-rate-limit rate 100 burst interval 1
Switch(config-if)# exit
Switch(config)# errdisable recovery cause dhcp-rate-limit
Switch(config)# exit
Switch# show interfaces status
```

<table>

Configuration Examples for the Database Agent

The following examples show how to configuration commands in the previous procedure:

Example 1: Enabling the Database Agent

The following example shows how to configure the DHCP snooping database agent to store the bindings at a given location and to view the configuration and operating state:

Switch# configure terminal
Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
Switch(config)# end
Chapter 50  Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

Configuring DHCP Snooping

Switch# show ip dhcp snooping database detail
Agent URL : tftp://10.1.1.1/directory/file
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : No
Delay Timer Expiry : 7 (00:00:07)
Abort Timer Expiry : Not Running

Last Succeeded Time : None
Last Failed Time : 17:14:25 UTC Sat Jul 7 2001
Last Failed Reason : Unable to access URL.

Total Attempts : 21  Startup Failures : 0
Successful Transfers : 0  Failed Transfers : 21
Successful Reads : 0  Failed Reads : 0
Successful Writes : 0  Failed Writes : 21
Media Failures : 0

First successful access: Read

Last ignored bindings counters:
Binding Collisions : 0  Expired leases : 0
Invalid interfaces : 0  Unsupported vlans : 0
Parse failures : 0
Last Ignored Time : None

Total ignored bindings counters:
Binding Collisions : 0  Expired leases : 0
Invalid interfaces : 0  Unsupported vlans : 0
Parse failures : 0

Switch#

The first three lines of output show the configured URL and related timer configuration values. The next three lines show the operating state and the amount of time left for expiry of write delay and abort timers. Among the statistics shown in the output, startup failures indicate the number of attempts the read or create of the file has failed upon bootup.

Because the location is based off in the network, you must create a temporary file on the TFTP server. You can create a temporary file on a typical UNIX workstation by creating a 0 byte file “file” in the directory “directory” that can be referenced by the TFTP server daemon. With some server implementations on UNIX workstations, the file should be provided with full (777) permissions for write access to the file.

DHCP snooping bindings are keyed on the MAC address and VLAN combination. If an entry in the remote file has an entry for a given MAC address and VLAN set, for which the switch already has a binding, the entry from the remote file is ignored when the file is read. This condition is referred to as the binding collision.

An entry in a file may no longer be valid because the lease indicated by the entry may have expired by the time it is read. The expired leases counter indicates the number of bindings ignored because of this condition. The Invalid interfaces counter refers to the number of bindings that have been ignored when the interface referred by the entry either does not exist on the system or is a router or DHCP snooping trusted interface if it exists, when the read happened. Unsupported VLANs refers to the number of entries that have been ignored because the indicated VLAN is not supported on the system. The Parse failures counter provides the number of entries that have been ignored when the switch is unable to interpret the meaning of the entries from the file.
Chapter 50  Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

The switch maintains two sets of counters for these ignored bindings. One provides the counters for a read that has at least one binding ignored by at least one of these conditions. These counters are shown as the “Last ignored bindings counters.” The total ignored bindings counters provides a sum of the number of bindings that have been ignored because of all the reads since the switch bootup. These two set of counters are cleared by the `clear` command. The total counter set may indicate the number of bindings that have been ignored since the last clear.

Example 2: Reading Binding Entries from a TFTP File

To manually read the entries from a TFTP file, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>Switch# show ip dhcp snooping database</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>Switch# renew ip dhcp snoop data url</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>Switch# show ip dhcp snoop data</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>Switch# show ip dhcp snoop bind</code></td>
</tr>
</tbody>
</table>

It is an example of how to manually read entries from the tftp://10.1.1.1/directory/file:

```
Switch# show ip dhcp snooping database
Agent URL :
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : No
Delay Timer Expiry : Not Running
Abort Timer Expiry : Not Running

Last Succeeded Time : None
Last Failed Time : None
Last Failed Reason : No failure recorded.

Total Attempts       :        0   Startup Failures :        0
Successful Transfers :        0   Failed Transfers :        0
Successful Reads     :        0   Failed Reads     :        0
Successful Writes    :        0   Failed Writes    :        0
Media Failures       :        0

Switch#
Switch# renew ip dhcp snoop data tftp://10.1.1.1/directory/file
Loading directory/file from 10.1.1.1 (via GigabitEthernet1/1): !
[OK - 457 bytes]
Database downloaded successfully.

Switch#
00:01:29: %DHCP_SNOOPING-6-AGENT_OPERATION_SUCCEEDED: DHCP snooping database Read succeeded.
Switch#
Switch# show ip dhcp snoop data
Agent URL :
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : No
Delay Timer Expiry : Not Running
Abort Timer Expiry : Not Running
```
Displaying DHCP Snooping Information

You can display a DHCP snooping binding table and configuration information for all interfaces on a switch.

Example 3: Adding Information to the DHCP Snooping Database

To manually add a binding to the DHCP snooping database, perform this task:

---

**Command** | **Purpose**
--- | ---

**Step 1**

Switch# `show ip dhcp snooping binding`

Views the DHCP snooping database.

**Step 2**

Switch# `ip dhcp snooping binding binding-id vlan vlan-id interface interface expiry lease-time`

Adds the binding using the `ip dhcp snooping` EXEC command.

**Step 3**

Switch# `show ip dhcp snooping binding`

Checks the DHCP snooping database.

---

This example shows how to manually add a binding to the DHCP snooping database:

**Switch#** `show ip dhcp snooping binding`

```
MacAddress | IpAddress | Lease(sec) | Type            | VLAN | Interface
--- | --- | --- | --- | --- | ---
```

**Switch#** `ip dhcp snooping binding 1.1.1 vlan 1 interface gi1/1 expiry 1000`

**Switch#** `show ip dhcp snooping binding`

```
MacAddress | IpAddress | Lease(sec) | Type            | VLAN | Interface
--- | --- | --- | --- | --- | ---
00:01:00:01:00:01 | 1.1.1.1 | 992 | dhcp-snooping | 1 | GigabitEthernet1/1
```

---

Chapter 50 Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

Displaying DHCP Snooping Information

You can display a DHCP snooping binding table and configuration information for all interfaces on a switch.

---

Switch# `show ip dhcp snoop bind`

```
MacAddress | IpAddress | Lease(sec) | Type            | VLAN | Interface
--- | --- | --- | --- | --- | ---
00:01:00:00:01:00:05 | 1.1.1.1 | 49810 | dhcp-snooping | 512 | GigabitEthernet1/1
00:01:00:01:00:02 | 1.1.1.1 | 49810 | dhcp-snooping | 512 | GigabitEthernet1/1
00:01:00:01:00:04 | 1.1.1.1 | 49810 | dhcp-snooping | 1536 | GigabitEthernet1/1
00:01:00:01:00:03 | 1.1.1.1 | 49810 | dhcp-snooping | 1024 | GigabitEthernet1/1
00:01:00:01:00:01 | 1.1.1.1 | 49810 | dhcp-snooping | 1 | GigabitEthernet1/1
```
Displaying a Binding Table

The DHCP snooping binding table for each switch contains binding entries that correspond to untrusted ports. The table does not contain information about hosts interconnected with a trusted port because each interconnected switch has its own DHCP snooping binding table.

This example shows how to display the DHCP snooping binding information for a switch:

```
Switch# show ip dhcp snooping binding

MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
00:02:B3:3F:3B:99   55.5.5.2         6943        dhcp-snooping  10    FastEthernet6/10
```

This example shows how to display the DHCP snooping binding information for a switch:

```
Switch# show ip dhcp snooping binding

MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
00:02:B3:3F:3B:99   55.5.5.2         6943        dhcp-snooping  10    FastEthernet6/10
```

Table 50-2 describes the fields in the `show ip dhcp snooping binding` command output.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>Client hardware MAC address</td>
</tr>
<tr>
<td>IP Address</td>
<td>Client IP address assigned from the DHCP server</td>
</tr>
<tr>
<td>Lease (seconds)</td>
<td>IP address lease time</td>

Displaying the DHCP Snooping Configuration

This example shows how to display the DHCP snooping configuration for a switch:

```
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled.
DHCP Snooping is configured on the following VLANs:
  10 30-40 100 200-220
Insertion of option 82 is enabled
Option82 on untrusted port is not allowed
Verification of hwaddr field is enabled
Interface            Trusted        Rate limit (pps)
--------------------- ------- -------------------
FastEthernet2/1      yes            10
FastEthernet3/1      yes            none
GigabitEthernet1/1   no             20
Switch#               
```

About IP Source Guard

The IP source guard feature is enabled on a DHCP snooping untrusted Layer 2 port. Initially, all IP traffic on the port is blocked except for DHCP packets that are captured by the DHCP snooping process. When a client receives a valid IP address from the DHCP server, or when you configure a static IP source binding, a per-port and VLAN access control list (VACL) is installed on the port. This process restricts...
the client IP traffic to those source IP addresses configured in the binding; any IP traffic with a source IP address other than that in the IP source binding is filtered out. This filtering limits the ability of a host to attack the network by claiming a neighbor host’s IP address.

**Note** If IP source guard is enabled on a trunk port with a large number of VLANs that have DHCP snooping enabled, you might exhaust ACL hardware resources, and some packets might be switched in software instead.

**Note** When IP source guard is enabled, you might want to designate an alternative scheme for ACL hardware programming. For more information, see the “TCAM Programming and ACLs” section in Chapter 51, “Configuring Network Security with ACLs”.

**Note** When an interface is in down state, TCAMs are consumed for PACLs, but not for RACLs.

IP source guard supports the Layer 2 port only, including both access and trunk. For each untrusted Layer 2 port, there are two levels of IP traffic security filtering:

- **Source IP address filter**
  
  IP traffic is filtered based on its source IP address. Only IP traffic with a source IP address that matches the IP source binding entry is permitted.

  An IP source address filter is changed when a new IP source entry binding is created or deleted on the port. The port VACL is recalculated and reapplied in the hardware to reflect the IP source binding change. By default, if the IP filter is enabled without any IP source binding on the port, a default PVACL that denies all IP traffic is installed on the port. Similarly, when the IP filter is disabled, any IP source filter PVACL is removed from the interface.

- **Source IP and MAC address filter**
  
  IP traffic is filtered based on its source IP address as well as its MAC address; only IP traffic with source IP and MAC addresses matching the IP source binding entry are permitted.

**Note** When IP source guard is enabled in IP and MAC filtering mode, the DHCP snooping Option 82 must be enabled to ensure that the DHCP protocol works properly. Without Option 82 data, the switch cannot locate the client host port to forward the DHCP server reply. Instead, the DHCP server reply is dropped, and the client cannot obtain an IP address.

## Configuring IP Source Guard

To enable IP source guard, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

  \[Switch(config)# ip dhcp snooping\]  

  Enables DHCP snooping globally.  

  You can use the `no` keyword to disable DHCP snooping. |
| **Step 2**

  \[Switch(config)# ip dhcp snooping vlan number [number]\]  

  Enables DHCP snooping on your VLANs. |
### Configuring IP Source Guard

If you want to stop IP source guard with static hosts on an interface, use the following commands in interface configuration submode:

```plaintext
Switch(config-if)# no ip dhcp snooping trust
Switch(config-if)# no ip device tracking max
```

If the `no ip device tracking` command is used in interface configuration submode, it actually runs in global configuration mode and causes IP device tracking to be disabled globally. Disabling IP device tracking globally causes IP source guard with static hosts to deny all IP traffic on interfaces using the `ip verify source tracking [port-security]` command.

### Note

The static IP source binding can only be configured on switch port. If you enter the `ip source binding vlan interface` command on a Layer 3 port, you receive this error message:

```
Static IP source binding can only be configured on switch port.
```

This example shows how to enable per-Layer 2 port IP source guard on VLAN 10 through 20:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10 20
Switch(config)# interface fa6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk native vlan 10
Switch(config-if)# switchport trunk allowed vlan 11-20
Switch(config-if)# no ip dhcp snooping trust
Switch(config-if)# ip verify source vlan dhcp-snooping
Switch(config)# end
```
Displaying IP Source Guard Information

You can display IP source guard PVACL information for all interfaces on a switch using the `show ip verify source` command, as the following examples show:

- This example shows displayed PVACLs if DHCP snooping is enabled on VLAN 10 through 20, if interface fa6/1 is configured for IP filtering, and if there is an existing IP address binding 10.0.0.1 on VLAN 10:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>10.0.0.1</td>
<td></td>
<td>10</td>
</tr>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>deny-all</td>
<td></td>
<td>11-20</td>
</tr>
</tbody>
</table>

- The second entry shows that a default PVACL (deny all IP traffic) is installed on the port for those snooping-enabled VLANs that do not have a valid IP source binding.

- This example shows displayed PVACL for a trusted port:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/2</td>
<td>ip</td>
<td>inactive-trust-port</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This example shows displayed PVACL for a port in a VLAN not configured for DHCP snooping:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/3</td>
<td>ip</td>
<td>inactive-no-snooping-vlan</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This example shows displayed PVACLs for a port with multiple bindings configured for an IP-to-MAC filtering:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.2</td>
<td>aaaa.bbbb.cccc</td>
<td>10</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>11.0.0.1</td>
<td>aaaa.bbbb.cccd</td>
<td>11</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>deny-all</td>
<td>12-20</td>
</tr>
</tbody>
</table>

Configuring IP Source Guard on Private VLANs

For IP source guard to be effective on PVLAN ports, you must enable DHCP snooping on primary VLANs. IP source guard on a primary VLAN is automatically propagated to a secondary VLAN. You can configure static IP source binding on a secondary VLAN, but it does not work. When manually configuring a static IP source binding on a secondary VLAN, you receive the following message:

IP source filter may not take effect on a secondary VLAN where IP source binding is configured. If the private VLAN feature is enabled, IP source filter on the primary VLAN will automatically propagate to all secondary VLAN.

Switch# show ip verify source interface f6/1

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa6/1</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.1</td>
<td></td>
<td>10</td>
</tr>
<tr>
<td>Fa6/1</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td></td>
<td>11-20</td>
</tr>
</tbody>
</table>

The output shows that there is one valid DHCP binding to VLAN 10.
This example shows displayed PVACLs for a port configured for IP-to-MAC filtering but not for port security:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.3</td>
<td>permit-all</td>
<td>10</td>
</tr>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>permit-all</td>
<td>11-20</td>
</tr>
</tbody>
</table>

Note: The MAC filter shows permit-all because port security is not enabled, so the MAC filter cannot apply to the port or VLAN and is effectively disabled. Always enable port security first.

This example shows displayed error message when entering the `show ip verify source` command on a port that does not have an IP source filter mode configured:

IP Source Guard is not configured on the interface fa6/6.

You can also use the `show ip verify source` command to display all interfaces on the switch that have IP source guard enabled, as follows:

```
Switch# show ip verify source
Interface   Filter-type    Filter-mode          IP-address     Mac-address     Vlan
fa6/1       ip             active               10.0.0.1         -              10   
fa6/1       ip             active               deny-all        -              11-20
fa6/2       ip             inactive-trust-port  -              -              -    
fa6/3       ip             inactive-no-snooping-vlan  -              -              -    
fa6/4       ip-mac         active               10.0.0.2         aaaa.bbbb.cccc 10   
fa6/4       ip-mac         active               11.0.0.1         aaaa.bbbb.cccd 11   
fa6/4       ip-mac         active               deny-all         deny-all        12-20
fa6/5       ip-mac         active               10.0.0.3         permit-all      10   
fa6/5       ip-mac         active               deny-all         permit-all      11-20
```

Displaying IP Source Binding Information

You can display all IP source bindings configured on all interfaces on a switch using the `show ip source binding` command.

```
Switch# show ip source binding
MacAddress     IpAddress     Lease(sec)  Type          VLAN  Interface
--------------- --------------- ---------- -------------- ----  --------------- 
00:02:B3:3F:3B:99  55.5.5.2    6522        dhcp-snooping  10   FastEthernet6/10
00:00:00:0A:00:0B  11.0.0.1    infinite    static        10   FastEthernet6/10
```

Table 50-3 describes the fields in the `show ip source binding` command output.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>Client hardware MAC address</td>
</tr>
<tr>
<td>IP Address</td>
<td>Client IP address assigned from the DHCP server</td>
</tr>
<tr>
<td>Lease (seconds)</td>
<td>IP address lease time</td>
</tr>
</tbody>
</table>
Chapter 50  Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

Configuring IP Source Guard for Static Hosts

Note

IPSG for static hosts should not be used on uplink ports.

IP source guard (IPSG) for static hosts extends the IPSG capability to non-DHCP and static environments.

This section includes these topics:

- About IP Source Guard for Static Hosts, page 50-24
- Configuring IPSG for Static Hosts on a Layer 2 Access Port, page 50-25
- Configuring IPSG for Static Hosts on a PVLAN Host Port, page 50-28

About IP Source Guard for Static Hosts

The prior feature, IPSG, uses the entries created by the DHCP snooping feature to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. A DHCP environment is a prerequisite for IPSG to work. The IPSG for static hosts feature removes IPSG’s dependency on DHCP. The switch creates static entries based on ARP requests or other IP packets and uses them to maintain the list of valid hosts for a given port. In addition, you can specify the number of hosts that would be allowed to send traffic to a given port. It is equivalent to port security at Layer 3.

Note

Some IP hosts with multiple network interfaces may inject some invalid packets into a network interface. Those invalid packets contain the IP-to-MAC address for another network interface of that host as the source address. It may cause IPSG for static hosts in the switch, which connects to the host, to learn the invalid IP-to-MAC address bindings and reject the valid bindings. You should consult the vendor of the corresponding operating system and the network device of that host to prevent it from injecting invalid packets.

IPSG for static hosts initially learns IP-to-MAC bindings dynamically through an ACL-based snooping method. IP-to-MAC bindings are learned from static hosts by using ARP and IP packets and are stored using the device tracking database. Once the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum limit, any packet with a new IP address is dropped in hardware. To handle hosts that have moved or gone away for any reason, the IPSG for static hosts feature uses the IP device tracking functionality to age out dynamically learned IP address bindings. This feature can be used in conjunction with DHCP snooping. Multiple bindings will be established on a port that is connected to both DHCP and static hosts (that is, bindings will be stored in both the device tracking database as well as the DHCP snooping binding database).

<table>
<thead>

Table 50-3  show ip source binding Command Output (continued)
## Configuring IPSG for Static Hosts on a Layer 2 Access Port

You can configure IPSG for static hosts on a Layer 2 access port.

To enable IPSG for static hosts with IP filters on a Layer 2 access port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;Switch(config)# ip device tracking</td>
<td>Turns on the IP host table.</td>
</tr>
</tbody>
</table>
| **Step 2**<br>Switch(config)# ip device tracking [probe (count count | interval interval)] | (Optional) Configures these parameters for the IP device tracking table:  
  - `count`—Number of times that the switch sends the ARP probe. The range is 1 to 5. The default is 3.  
  - `interval`—Number of seconds that the switch waits for a response before resending the ARP probe. The range is 30 to 300 seconds. The default is 30 seconds. |
| **Step 3**<br>Switch(config)# ip device tracking [probe (delay interval)] | (Optional) Configures the optional probe delay parameter for the IP device tracking table:  
  - `interval`—Number of seconds that the switch delays sending an ARP probe, triggered by link-up and ARP probe generation by the tracked device. The range is 1 to 120 seconds. The default is 0 seconds. |
| **Step 4**<br>Switch(config)# interface fastEthernet a/b | Enters IP configuration mode. |
| **Step 5**<br>Switch(config-if)# switchport mode access | Configures a port as access. |
| **Step 6**<br>Switch(config-if)# switchport access vlan n | Configures the VLAN for this port. |
| **Step 7**<br>Switch(config-if)# ip device tracking maximum n | Establishes a maximum limit for the bindings on this port.  
Upper bound for the maximum is 10. |
| **Step 8**<br>Switch(config-if)# switchport port-security | (Optional) Activates port security for this port. |
| **Step 9**<br>Switch(config-if)# switchport port-security maximum n | (Optional) Establishes a maximum number of MAC addresses for this port. |
| **Step 10**<br>Switch(config-if)# ip verify source tracking [port-security] | Activates IPSG for static hosts on this port. |
| **Step 11**<br>Switch(config-if)# end | Exits configuration interface mode. |
| **Step 12**<br>Switch# show ip verify source interface-name | Verifies the configuration. |
| **Step 13**<br>Switch# show ip device track all [active | inactive] count | Verifies the configuration by displaying the IP-to-MAC binding for a given host on the switch interface:  
  - `all active`—Displays only the active IP-to-MAC binding entries.  
  - `all inactive`—Displays only the inactive IP-to-MAC binding entries.  
  - `all`—Displays the active and inactive IP-to-MAC binding entries. |
To stop IPSG with static hosts on an interface, use the following commands in interface configuration submode:

```
Switch(config-if)# no ip verify source
Switch(config-if)# no ip device tracking max
```

To enable IPSG with static hosts on a port, enter the following commands:

```
Switch(config)# ip device tracking ****enable IP device tracking globally
Switch(config)# ip device tracking max <n> ****set an IP device tracking maximum on int
Switch(config-if)# ip verify source tracking [port-security] ****activate IPSG on the port
```

If you only configure the `ip verify source tracking [port-security]` interface configuration command on a port without enabling IP device tracking globally or setting an IP device tracking maximum on that interface, IPSG with static hosts will reject all the IP traffic from that interface.

This issue also applies to IPSG with static hosts on a PVLAN host port.

This example shows how to enable IPSG for static hosts with IP filters on a Layer 2 access port and to verify the three valid IP bindings on the interface Fa4/3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastEthernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 10
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# ip verify source tracking
Switch(config-if)# end
```

```
Switch# show ip verify source
Interface  Filter-type  Filter-mode  IP-address       Mac-address        Vlan
---------  -----------  -----------  ---------------  -----------------  ----
Fa4/3      ip trk       active       40.1.1.24                           10
Fa4/3      ip trk       active       40.1.1.20                           10
Fa4/3      ip trk       active       40.1.1.21                           10
```

The following example shows how to enable IPSG for static hosts with IP MAC filters on a Layer 2 access port, to verify the five valid IP-MAC bindings on the interface Fa4/3, and to verify that the number of bindings on this interface has reached the maximum limit:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastEthernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 1
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# ip verify source tracking port-security
Switch(config-if)# end
```

```
Switch# show ip verify source
Interface  Filter-type  Filter-mode  IP-address  Mac-address        Vlan
---------  -----------  -----------  --------  -----------------  ----
Fa4/3      ip-mac trk   active       40.1.1.24  00:00:00:00:03:04  1
Fa4/3      ip-mac trk   active       40.1.1.20  00:00:00:00:03:05  1
Fa4/3      ip-mac trk   active       40.1.1.21  00:00:00:00:03:06  1
Fa4/3      ip-mac trk   active       40.1.1.22  00:00:00:00:03:07  1
Fa4/3      ip-mac trk   active       40.1.1.23  00:00:00:00:03:08  1
```
The following example displays all IP-to-MAC binding entries for all interfaces. The CLI displays all active as well as inactive entries. When a host is learned on a interface, the new entry is marked as active. When the same host is disconnected from the current interface and connected to a different interface, a new IP-to-MAC binding entry is displayed as active as soon as the host is detected. The old entry for this host on the previous interface is now marked as inactive.

```
Switch# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Vlan</th>
<th>Interface</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>200.1.1.8</td>
<td>0001.0600.0000</td>
<td>8</td>
<td>GigabitEthernet3/1</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>200.1.1.9</td>
<td>0001.0600.0000</td>
<td>8</td>
<td>GigabitEthernet3/1</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>200.1.1.10</td>
<td>0001.0600.0000</td>
<td>8</td>
<td>GigabitEthernet3/1</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>200.1.1.11</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>200.1.1.12</td>
<td>0001.0600.0000</td>
<td>8</td>
<td>GigabitEthernet3/1</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>200.1.1.13</td>
<td>0001.0600.0000</td>
<td>8</td>
<td>GigabitEthernet3/1</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>200.1.1.14</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>200.1.1.15</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>200.1.1.16</td>
<td>0001.0600.0000</td>
<td>8</td>
<td>GigabitEthernet3/1</td>
<td>INACTIVE</td>
</tr>
<tr>
<td>200.1.1.17</td>
<td>0001.0600.0000</td>
<td>8</td>
<td>GigabitEthernet3/1</td>
<td>INACTIVE</td>
</tr>
</tbody>
</table>
```

The following example displays all active IP-to-MAC binding entries for all interfaces:

```
Switch# show ip device tracking all active
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Vlan</th>
<th>Interface</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>200.1.1.1</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>200.1.1.2</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>200.1.1.3</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>200.1.1.4</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>200.1.1.5</td>
<td>0001.0600.0000</td>
<td>9</td>
<td>GigabitEthernet4/1</td>
<td>ACTIVE</td>
</tr>
</tbody>
</table>
```

The following example displays all inactive IP-to-MAC binding entries for all interfaces. The host was first learned on GigabitEthernet 3/1 then moved to GigabitEthernet 4/1. The IP-to-MAC binding entries learned on GigabitEthernet 3/1 are marked as inactive.

```
Switch# show ip device tracking all inactive
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30

<table>
<thead>
<tr>
<th>IP Address</th>

Chapter 50 Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

Configuring IP Source Guard for Static Hosts

200.1.1.4 0001.0600.0000 8 GigabitEthernet3/1 INACTIVE
200.1.1.5 0001.0600.0000 8 GigabitEthernet3/1 INACTIVE
200.1.1.6 0001.0600.0000 8 GigabitEthernet3/1 INACTIVE
200.1.1.7 0001.0600.0000 8 GigabitEthernet3/1 INACTIVE

The following example displays the count of all IP device tracking host entries for all interfaces:

Switch# show ip device tracking all count
Total IP Device Tracking Host entries: 5

<table>
<thead>
<tr>
<th>Interface</th>
<th>Maximum Limit</th>
<th>Number of Entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa4/3</td>
<td>5</td>
<td></td>
</tr>
</tbody>
</table>

Configuring IPSG for Static Hosts on a PVLAN Host Port

You can configure IPSG for static hosts on a PVLAN host port.

To enable IPSG for static hosts with IP filters on a PVLAN host port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# vlan n1 Enters configuration VLAN mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config-vlan)# private-vlan primary Establishes a primary VLAN on a PVLAN port.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-vlan)# exit Exits VLAN configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# vlan n2 Enters configuration VLAN mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-vlan)# private-vlan isolated Establishes an isolated VLAN on a PVLAN port.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-vlan)# exit Exits VLAN configuration mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config)# vlan n1 Enters configuration VLAN mode.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config-vlan)# private-vlan association 201 Associates the VLAN on an isolated PVLAN port.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config-vlan)# exit Exits VLAN configuration mode.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch(config)# interface fastEthernet a/b Enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 11</td>
<td>Switch(config-if)# switchport mode private-vlan host (Optional) Establishes a port as a PVLAN host.</td>
</tr>
<tr>
<td>Step 12</td>
<td>Switch(config-if)# switchport private-vlan host-association a b (Optional) Associates this port with the corresponding PVLAN.</td>
</tr>
<tr>
<td>Step 13</td>
<td>Switch(config-if)# ip device tracking maximum n Establishes a maximum limit for the bindings on this port.</td>
</tr>
<tr>
<td>Step 14</td>
<td>Switch(config-if)# ip verify source tracking [port-security] Activates IPSG for static hosts on this port.</td>
</tr>
<tr>
<td>Step 15</td>
<td>Switch(config-if)# end Exits configuration interface mode.</td>
</tr>
<tr>
<td>Step 16</td>
<td>Switch# show ip device tracking all Verifies the configuration.</td>
</tr>
<tr>
<td>Step 17</td>
<td>Switch# show ip verify source interface-name Verifies the configuration.</td>
</tr>
</tbody>
</table>

This example shows how to enable IPSG for static hosts with IP filters on a PVLAN host port:

Switch(config)# vlan 200
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# exit
Switch(config)# vlan 201
Switch(config-vlan)# **private-vlan isolated**
Switch(config-vlan)# exit
Switch(config)# **vlan 200**
Switch(config-vlan)# **private-vlan association 201**
Switch(config-vlan)# exit
Switch(config)# int fastEthernet 4/3
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 200 201
Switch(config-if)# ip device tracking maximum 8
Switch(config-if)# ip verify source tracking

Switch# **show ip device tracking all**
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Vlan</th>
<th>Interface</th>
<th>STATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>40.1.1.24</td>
<td>0000.0000.0304</td>
<td>200</td>
<td>FastEthernet4/3</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>40.1.1.20</td>
<td>0000.0000.0305</td>
<td>200</td>
<td>FastEthernet4/3</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>40.1.1.21</td>
<td>0000.0000.0306</td>
<td>200</td>
<td>FastEthernet4/3</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>40.1.1.22</td>
<td>0000.0000.0307</td>
<td>200</td>
<td>FastEthernet4/3</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>40.1.1.23</td>
<td>0000.0000.0308</td>
<td>200</td>
<td>FastEthernet4/3</td>
<td>ACTIVE</td>
</tr>
</tbody>
</table>

The output shows the five valid IP-to-MAC bindings that have been learned on the interface Fa4/3. For the PVLAN, the bindings are associated with primary VLAN ID. In this example, the primary VLAN ID, 200, is shown in the table.

**Switch# show ip verify source**

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa4/3</td>

<td>40.1.1.23</td>
<td></td>
<td>200</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.24</td>
<td></td>
<td>200</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.20</td>
<td></td>
<td>200</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.21</td>
<td></td>
<td>200</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.22</td>
<td></td>
<td>200</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.23</td>
<td></td>
<td>201</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.24</td>
<td></td>
<td>201</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.20</td>
<td></td>
<td>201</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.21</td>
<td></td>
<td>201</td>
</tr>
<tr>
<td>Fa4/3</td>
<td>ip trk</td>
<td>active</td>
<td>40.1.1.22</td>
<td></td>
<td>201</td>
</tr>
</tbody>
</table>

The output shows that the five valid IP-to-MAC bindings are on both the primary and secondary VLAN.

Configuring IP Source Guard for Static Hosts
Chapter 51

Configuring Network Security with ACLs

This chapter describes how to use access control lists (ACLs) to configure network security on the Catalyst 4500 series switches.

The Catalyst 4500 series switch supports time-based ACLs.

This chapter consists of the following major sections:

- About ACLs, page 51-2
- Hardware and Software ACL Support, page 51-6
- Troubleshooting High CPU Due to ACLs, page 51-6
- TCAM Programming and ACLs, page 51-10
- Layer 4 Operators in ACLs, page 51-10
- Configuring Unicast MAC Address Filtering, page 51-13
- Configuring Named MAC Extended ACLs, page 51-14
- Configuring EtherType Matching, page 51-15
- Configuring Named IPv6 ACLs, page 51-16
- Applying IPv6 ACLs to Layer 2 and 3 Interface, page 51-17
- Configuring VLAN Maps, page 51-17
- Displaying VLAN Access Map Information, page 51-24
- Using VLAN Maps with Router ACLs, page 51-25
- Configuring PACLs, page 51-27
- Using PACL with VLAN Maps and Router ACLs, page 51-32
- Configuring RA Guard, page 51-35

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location: http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location: http://www.cisco.com/en/US/products/ps6350/index.html
About ACLs

This section includes these topics:

- Overview, page 51-2
- Supported Features That Use ACLs, page 51-3
- Router ACLs, page 51-3
- Port ACLs, page 51-4
- Dynamic ACLs, page 51-5
- VLAN Maps, page 51-5

Overview

An ACL is a collection of sequential permit and deny conditions that applies to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the permissions required to be forwarded, based on the conditions specified in the access lists. It tests the packets against the conditions in an access list one-by-one. The first match determines whether the switch accepts or rejects the packets. Because the switch stops testing conditions after the first match, the order of conditions in the list is critical. If no conditions match, the switch drops the packet. If no restrictions exist, the switch forwards the packet; otherwise, the switch drops the packet.

Switches traditionally operate at Layer 2, switching traffic within a VLAN. Routers route traffic between VLANs at Layer 3. The Catalyst 4500 series switch can accelerate packet routing between VLANs by using Layer 3 switching. The Layer 3 switch bridges the packet, and then routes the packet internally without going to an external router. The packet is then bridged again and sent to its destination. During this process, the switch can control all packets, including packets bridged within a VLAN.

You configure access lists on a router or switch to filter traffic and provide basic security for your network. If you do not configure ACLs, all packets passing using the switch could be allowed on all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both. However, on Layer 2 interfaces, you can apply ACLs only in the inbound direction.

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies permit or deny and a set of conditions the packet must satisfy in order to match the ACE. The meaning of permit or deny depends on the context in which the ACL is used.

The Catalyst 4500 series switch supports three types of ACLs:

- IP ACLs, which filter IP traffic, including TCP, the User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP)
- IPv6 ACLs
- MAC ACLs which match based on Ethernet addresses and Ether Type
Chapter 51    Configuring Network Security with ACLs

Supported Features That Use ACLs

The switch supports three applications of ACLs to filter traffic:

- **Router ACLs** are applied to Layer 3 interfaces. They control the access of routed traffic between VLANs. All Catalyst 4500 series switches can create router ACLs, but you must have a Cisco IOS software image on your switch to apply an ACL to a Layer 3 interface and filter packets routed between VLANs.

- **Port ACLs** perform access control on traffic entering a Layer 2 interface. If insufficient hardware CAM entries exist, the output port ACL is not applied to the port and a warning message is given to user. (This restriction applies to all access group modes for output port ACLs.) When sufficient CAM entries exist, the output port ACL may be reapplied.

If there is any output port ACL configured on a Layer 2 port, then no VACL or router ACL can be configured on the VLANs that the Layer 2 port belongs to. Also, the reverse is true: port ACLs and VLAN-based ACLs (VACLs and router ACLs) are mutually exclusive on a Layer 2 port. This restriction applies to all access group modes. On the input direction, port ACLs, VLAN-based ACLs, and router ACLs can co-exist.

You can apply one IPv4 access list, one IPv6 access list and one MAC access list for a Layer 2 interface.

- **You can use VLAN maps** to filter traffic between devices in the same VLAN. You do not need the enhanced image to create or apply VLAN maps. VLAN maps are configured to control access based on Layer 3 addresses for IP, MAC addresses using Ethernet ACEs control the access of unsupported protocols. After you apply a VLAN map to a VLAN, all packets (routed or bridged) entering the VLAN are checked against that map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

You can use both router ACLs and VLAN maps on the same switch.

**Router ACLs**

You can apply one access list of each supported type to an interface.

---

**Note**

Catalyst 4500 series switches running Cisco IOS Release 12.2(40)SG do not support IPv6 port ACLs (PACLs).

Multiple features can use one ACL for a given interface, and one feature can use multiple ACLs. When a single router ACL is used by multiple features, it is examined multiple times. The access list type determines the input to the matching operation:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

The switch examines ACLs associated with features configured on a given interface and a direction. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.
ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL. For example, you can use access lists to allow one host to access a part of a network, but prevent another host from accessing the same part. In Figure 51-1, ACLs applied at the router input allow Host A to access the Human Resources network, but prevent Host B from accessing the same network.

**Figure 51-1 Using ACLs to Control Traffic to a Network**

Port ACLs

You can also apply ACLs to Layer 2 interfaces on a switch. Port ACLs are supported on physical interfaces and EtherChannel interfaces.

The following access lists are supported on Layer 2 interfaces:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- IPv6 access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

As with router ACLs, the switch examines ACLs associated with features configured on a given interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In the example in Figure 51-1, if all workstations were in the same VLAN, ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.
With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

With port ACLs, you can filter IPv4 traffic with IPv4 access lists, IPv6 traffic with IPv6 access lists, and non-IP traffic with MAC access lists. You can filter multiple types of traffic simultaneously by applying ACLs of the appropriate type to the Layer 2 interface simultaneously.

**Note**
You cannot simultaneously apply more than one access list of a given type to a Layer 2 interface. If an IPv4, IPv6, or MAC access list is already configured on a Layer 2 interface, and you apply a new IPv4, IPv6 or MAC access list to the interface, the new ACL replaces the previously configured ACL of the same type.

### Dynamic ACLs

Various security features, such as 802.1X, NAC and Web Authentication, are capable of downloading ACLs from a central server and applying them to interfaces. Prior to Cisco IOS Release 12.2(54)SG, these features required the explicit configuration of a standard port ACL.

Starting with Cisco IOS Release 12.2(54)SG, a port ACL does not require configuration. For more details refer to the “Removing the Requirement for a Port ACL” section on page 51-28.

### VLAN Maps

VLAN maps can control the access of all traffic in a VLAN. You can apply VLAN maps on the switch to all packets that are routed into or out of a VLAN or are bridged within a VLAN. VLAN maps are not defined by direction (input or output).

You can configure VLAN maps to match Layer 3 addresses for IP traffic. Access of all non-IP protocols is controlled with a MAC address and an Ethertype using MAC ACLs in VLAN maps. (IP traffic is not controlled by MAC ACLs in VLAN maps.) You can enforce VLAN maps only on packets heading to the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding packets is permitted or denied, based on the action specified in the map. Figure 51-2 illustrates how a VLAN map is applied to deny a specific type of traffic from Host A in VLAN 10 from being forwarded.

**Figure 51-2** Using VLAN Maps to Control Traffic

- Host A (VLAN 10)
- Catalyst 4500 series switch
- Host B (VLAN 10)

\[\times = \text{VLAN map denying specific type of traffic from Host A}\]
\[\rightarrow = \text{Packet}\]
Hardware and Software ACL Support

This section describes how to determine whether ACLs are processed in hardware or in software:

- Flows that match a deny statement in standard and extended ACLs are dropped in hardware if ICMP unreachable messages are disabled.
- Flows that match a permit statement in standard ACLs are processed in hardware.
- The following ACL types are not supported in software:
  - Standard Xerox Network Systems (XNS) Protocol access list
  - Extended XNS access list
  - DECnet access list
  - Protocol type-code access list
  - Standard Internet Packet Exchange (IPX) access list
  - Extended IPX access list

Note
Packets that require logging are processed in software. A copy of the packets is sent to the CPU for logging while the actual packets are forwarded in hardware so that non-logged packet processing is not impacted.

By default, the Catalyst 4500 series switch sends ICMP unreachable messages when a packet is denied by an access list; these packets are not dropped in hardware but are forwarded to the switch so that it can generate the ICMP unreachable message.

To drop access list denied packets in hardware on the input interface, you must disable ICMP unreachable messages using the no ip unreachables interface configuration command. The ip unreachables command is enabled by default.

Note
Cisco IOS Release 12.2(40)SG does not support disabling IP unreachables on interfaces routing IPv6 traffic.

Note
If you set the no ip unreachable command on all Layer 3 interfaces, output ACL denied packets do not come to the CPU.

Troubleshooting High CPU Due to ACLs

Packets that match entries in fully programmed ACLs are processed in hardware.

Note
Large ACL and IPSG configurations may exhaust TCAM masks on the Catalyst 4948E Ethernet Switch before the ACLs are fully programmed.
Packets that match entries in partially programmed ACLs are processed in software using the CPU. This may cause high CPU utilization and packets to be dropped. To determine whether packets are being dropped due to high CPU utilization, reference the following:

If the ACL and/or IPSG configuration is partially programmed in hardware, upgrading to Cisco IOS Release 12.2(31)SGA or later and resizing the TCAM regions may enable the ACLs to be fully programmed.

**Note**

Removal of obsolete TCAM entries can take several CPU process review cycles to complete. This process may cause some packets to be switched in software if the TCAM entry or mask utilization is at or near 100 percent.

**Selecting Mode of Capturing Control Packets**

In some deployments, you might want to bridge control packets in hardware rather than globally capture and forward them in software (at the expense of the CPU). The per-VLAN capture mode feature allows a Catalyst 4500 series switch to capture control packets only on selected VLANs and bridge traffic in hardware on all other VLANs.

When you use per-VLAN capture mode on your switch, it partially disables the global TCAM capture entries internally and attaches feature-specific capture ACLs on those VLANs that are enabled for snooping features. (All IP capture entries, and other non-IP entries are still captured through global TCAM.)

Because this feature controls specific control packets, they are captured only on the VLANs on which the internal ACLs are installed. On all other VLANs, the control traffic is bridged in hardware rather than forwarded to CPU.

The per-VLAN capture mode allows you to apply user-defined ACLs and QoS policers (in hardware) on control packets. You can also subject the aggregate control traffic ingressing the CPU to control plane policing.

When you use per-VLAN capture mode, the following four protocol groups are selectable per-VLAN. The breakdown of protocols intercepted by each group is as follows:

- IGMP Snooping—Cgmp, Ospf, Igmp, RipV2, Pim, 224.0.0.1, 224.0.0.2, 224.0.0.*
- DHCP Snooping—Client to Server, Server to Client, Server to Server

Because some of the groups have multiple overlapping ACEs (for example, 224.0.0.* is present in all the groups except for DHCP Snooping), turning on a certain group will also trigger the interception of some protocols from other groups.

Following are the programming triggers for the four protocol groups per-VLAN:

- IGMP Snooping should be enabled globally on a given VLAN.
- DHCP Snooping should be enabled globally on a given VLAN.
Guidelines and Restrictions

Before configuring per-VLAN capture mode, you should examine your configuration to ensure that only the necessary features are enabled on the desired VLANs.

The following guidelines and restrictions apply to per-VLAN capture mode:

- Starting with Cisco IOS Release 15.0(2)SG, for Supervisor Engine 6-E and Supervisor Engine 6L-E, (with Cisco IOS XE Release 3.2.0, for Supervisor Engine 7-E; with Cisco IOS XE Release 3.2.0XO, for Supervisor Engine 7L-E), globally reserved static ACL entries in the TCAM region for Layer 3 control packets are removed. The per-VLAN CTI command is not needed and does not apply for Layer 3 control packets because these packets are captured in per-VLAN fashion by default.

The following still function:
- Global static capture and CTI commands for IGMP or PIM packets (both use MAC addresses 224.0.0.1 and 224.0.0.2)
- Global and per-VLAN CTI for DHCP packets

With Cisco IOS Release 15.0(2)SG, per-VLAN capture of Layer 3 control packets is driven by SVI configuration. Except for IGMP, PIM, or DHCP, no special configuration is required.

- Enabling per-VLAN capture mode consumes additional entries in the ACL/feature TCAM. The number of available TCAM entries depends on the type of supervisor engine. The entry and mask count further limits the utilization of the ACL/feature TCAM.

- Certain configurations can exhaust TCAM resource earlier in per-VLAN capture mode than in global capture mode (such as, when IP Source Guard is enabled on several interfaces or on a user-configured PACL).

You can resize TCAM regions to make more entries available to the PortAndVlan or PortOrVlan region based on the configuration. This allows more entries to be programmed in hardware before reaching the limit. When TCAM resources are exhausted, the packets are forwarded in software.

- In per-VLAN capture mode, you can configure ACLs to permit or deny control traffic on a VLAN or port.

Because security ACLs are terminated by an implicit deny, you must ensure that the ACLs are configured to permit the control packets necessary for the feature (protocol) to operate. However, this rule does not differ from the default behavior.

Selecting Control Packet Capture

To select the mode of capturing control packets, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# conf terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# [no] access-list hardware capture mode [vlan</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>
This example shows how to configure a Catalyst 4500 series switch to capture control packets only on
VLANs where features are enabled:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode vlan
Switch(config)# end
Switch#
```

This example shows how to configure a Catalyst 4500 series switch to capture control packets globally
across all VLANs (using static ACL, the default mode):

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode global
Switch(config)# end
Switch#
```

When the capture mode changes from global to VLAN, the static CAM entries are invalidated. This
creates a window during which control packets may pass through a Catalyst 4500 series switch without
being intercepted to the CPU. This temporary situation is restored when the new per-VLAN capture
entries are programmed in the hardware.

When you configure per-VLAN capture mode, you should examine the `show` commands for individual
features to verify the appropriate behavior. In per-VLAN capture mode, the invalidated static CAM
entries will appear as inactive in the output of the `show platform hardware acl input entries static`
command. For example, the hit count for inactive entries will remain frozen because those entries are
invalidated and applied per-VLAN where the feature is enabled. The following table lists the CamIndex
entry types and the Cam regions.

<table>
<thead>

</tbody>
</table>
TCAM Programming and ACLs

You apply three types of hardware resources when you program ACLs and ACL-based features: mapping table entries (MTEs), profiles, and TCAM value/mask entries. If any of these resources are exhausted, packets are sent to the CPU for software-based processing.

Note
Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E automatically manage the available resources. Because masks are not shared on the supervisor engines, only one programming algorithm exists. No regions exist so region resizing is not needed.

If you exhaust resources on the supervisor engine, you should consider reducing the complexity of your configuration.

Note
When an interface is in down state, TCAMs are not consumed for RACLs, but are for PACLs.

Layer 4 Operators in ACLs

The following sections provide guidelines and restrictions for configuring ACLs that include Layer 4 port operations:

- Restrictions for Layer 4 Operations, page 51-10
- Configuration Guidelines for Layer 4 Operations, page 51-11
- How ACL Processing Impacts CPU, page 51-12

Restrictions for Layer 4 Operations

You can specify these operator types, each of which uses one Layer 4 operation in the hardware:

- gt (greater than)
- lt (less than)
- neq (not equal)
- range (inclusive range)

The limits on the number of Layer 4 operations differ for each type of ACL, and can also vary based on other factors: whether an ACL is applied to incoming or outgoing traffic, whether the ACL is a security ACL or is used as a match condition for a QoS policy, and whether IPv6 ACLs are being programmed using the compressed flow label format.

Note
The IPv6 compressed flow label format uses the Layer 2 Address Table to compress a portion of the IPv6 source address of each ACE in the ACL. The extra space freed in the flow label can then be used to support more Layer 4 operations. For this compression to be used, the IPv6 ACL cannot contain any ACEs that mask in only a portion of the bottom 48 bits of the source IPv6 address.

Generally, you will receive at most the following number of Layer 4 operations on the same ACL:

| Direction | Protocol | Type       | Operations |
|-----------|----------|------------|------------|------------|
Layer 4 Operators in ACLs

<table>
<thead>
<tr>
<th>Input</th>
<th>IPv4</th>
<th>Security</th>
<th>16</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>IPv6 Compressed</td>
<td>Security</td>
<td>16</td>
</tr>
<tr>
<td>Input</td>
<td>IPv6 Uncompressed</td>
<td>Security</td>
<td>7</td>
</tr>
<tr>
<td>Input</td>
<td>IPv4</td>
<td>QoS</td>
<td>5</td>
</tr>
<tr>
<td>Input</td>
<td>IPv6 Compressed</td>
<td>QoS</td>
<td>12</td>
</tr>
<tr>
<td>Input</td>
<td>IPv6 Uncompressed</td>
<td>QoS</td>
<td>8</td>
</tr>
<tr>
<td>Output</td>
<td>IPv4</td>
<td>Security</td>
<td>17</td>
</tr>
<tr>
<td>Output</td>
<td>IPv6 Compressed</td>
<td>Security</td>
<td>17</td>
</tr>
<tr>
<td>Output</td>
<td>IPv6 Uncompressed</td>
<td>Security</td>
<td>8</td>
</tr>
<tr>
<td>Output</td>
<td>IPv4</td>
<td>QoS</td>
<td>5</td>
</tr>
<tr>
<td>Output</td>
<td>IPv6 Compressed</td>
<td>QoS</td>
<td>12</td>
</tr>
<tr>
<td>Output</td>
<td>IPv6 Uncompressed</td>
<td>QoS</td>
<td>8</td>
</tr>
</tbody>
</table>

Note: Where up to 16 operations are supported, the seventeenth will trigger an expansion.

If you exceed the number of available Layer 4 operations, each new operation might cause the affected ACE to be translated into multiple ACEs in the hardware. If this translation fails, packets are sent to the CPU for software processing.

Configuration Guidelines for Layer 4 Operations

When using Layer 4 operators, consider these guidelines:

- Layer 4 operations are considered different if the operator or operand differ. For example, the following ACL contains three different Layer 4 operations because gt 10 and gt 11 are considered two different Layer 4 operations:

  ... gt 10 permit
  ... lt 9 deny
  ... gt 11 deny

Note: The eq operator can be used an unlimited number of times because eq does not use a Layer 4 operation in hardware.

- Layer 4 operations are considered different if the same operator/operand couple applies once to a source port and once to a destination port, as in the following example:

  ... Src gt 10....
  ... Dst gt 10

A more detailed example follows:

```
access-list 101
... (dst port) gt 10 permit
... (dst port) lt 9 deny
... (dst port) gt 11 deny
... (dst port) neq 6 permit
... (src port) neq 6 deny
... (dst port) gt 10 deny

access-list 102
... (dst port) gt 20 deny
... (src port) lt 9 deny
... (src port) range 11 13 deny
... (dst port) neq 6 permit
```

Access lists 101 and 102 use the following Layer 4 operations:
• Access list 101 Layer 4 operations: 5
  - gt 10 permit and gt 10 deny both use the same operation because they are identical and both
    operate on the destination port.
• Access list 102 Layer 4 operations: 4
• Total Layer 4 operations: 8 (due to sharing between the two access lists)
  - neq6 permit is shared between the two ACLs because they are identical and both operate on the
    same destination port.

A description of the Layer 4 operations usage is as follows:
• Layer 4 operation 1 stores gt 10 permit and gt 10 deny from ACL 101
• Layer 4 operation 2 stores lt 9 deny from ACL 101
• Layer 4 operation 3 stores gt 11 deny from ACL 101
• Layer 4 operation 4 stores neg 6 permit from ACL 101 and 102
• Layer 4 operation 5 stores neg 6 deny from ACL 101
• Layer 4 operation 6 stores gt 20 deny from ACL 102
• Layer 4 operation 7 stores lt 9 deny from ACL 102
• Layer 4 operation 8 stores range 11 13 deny from ACL 102

How ACL Processing Impacts CPU

ACL processing can impact the CPU in two ways:
• For some packets, when the hardware runs out of resources, the software must perform the ACL
  matches:
    - The TCP flag combinations rst ack, syn fin rst, urg and psh are processed in hardware. rst ack
      is equivalent to the keyword established. Other TCP flag combinations are supported in
      software.
    - If the total number of Layer 4 operations in an ACL is less than six, you can distribute the
      operations in any way you choose.

Examples

The following access lists are processed completely in hardware:

access-list 104 permit tcp any any established
access-list 105 permit tcp any any rst ack
access-list 107 permit tcp any synfin rst

Access lists 104 and 105 are identical; established is shorthand for rst and ack.

Access list 101, is processed completely in software:

access-list 101 permit tcp any any syn

Because four source and two destination operations exist, access list 106 is processed in
hardware:

access-list 106 permit tcp any range 100 120 any range 120 140
access-list 106 permit tcp any range 140 160 any range 180 200
access-list 106 permit tcp any range 200 220
access-list 106 deny tcp any range 220 240
In the following code, the Layer 4 operations for the third ACE trigger an attempt to translate dst lt 1023 into multiple ACEs in hardware, because three source and three destination operations exist. If the translation attempt fails, the third ACE is processed in software.

```
access-list 102 permit tcp any lt 80 any gt 100
access-list 102 permit tcp any range 100 120 any range 120 1024
access-list 102 permit tcp any gt 1024 any lt 1023
```

Similarly, for access list 103, the third ACE triggers an attempt to translate dst gt 1023 into multiple ACEs in hardware. If the attempt fails, the third ACE is processed in software. Although the operations for source and destination ports look similar, they are considered different Layer 4 operations.

```
access-list 103 permit tcp any lt 80 any lt 80
access-list 103 permit tcp any range 100 120 any range 100 120
access-list 103 permit tcp any gt 1024 any gt 1023
```

*Note* Remember that source port lt 80 and destination port lt 80 are considered different operations.

- Some packets must be sent to the CPU for accounting purposes, but the action is still performed by the hardware. For example, if a packet must be logged, a copy is sent to the CPU for logging, but the forwarding (or dropping) is performed in the hardware. Although logging slows the CPU, it does not affect the forwarding rate. This sequence of events would happen under the following conditions:
  - When a log keyword is used
  - When an output ACL denies a packet
  - When an input ACL denies a packet, and on the interface where the ACL is applied, `ip unreachable` is enabled (`ip unreachable` is enabled by default on all the interfaces)

---

**Configuring Unicast MAC Address Filtering**

To block all unicast traffic to or from a MAC address in a specified VLAN, perform this task:

```
Switch(config)# mac-address-table static mac_address drop
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# mac-address-table static mac_address vlan vlan_ID drop</code></td>
<td>Blocks all traffic to or from the configured unicast MAC address in the specified VLAN. To clear MAC address-based blocking, use the <code>no</code> form of this command without the <code>drop</code> keyword.</td>
</tr>
</tbody>
</table>

This example shows how to block all unicast traffic to or from MAC address 0050.3e8d.6400 in VLAN 12:

```
Switch# configure terminal
Switch(config)# mac-address-table static 0050.3e8d.6400 vlan 12 drop
```
Configuring Named MAC Extended ACLs

You can filter non-IPv4, non-IPv6 traffic on a VLAN and on a physical Layer 2 port by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs. You can use a number to name the access list, but MAC access list numbers from 700 to 799 are not supported.

Note

Named MAC extended ACLs cannot be applied to Layer 3 interfaces.

For more information about the supported non-IP protocols in the mac access-list extended command, refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference.

To create a named MAC extended ACL, perform this task:

This example shows how to create and display an access list named mac1, denying only EtherType DECnet Phase IV traffic, but permitting all other types of traffic:

```
Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)# deny any any decnet-iv (old) protocol-family decnet (new)
Switch(config-ext-macl)# permit any any
Switch # show access-lists
Extended MAC access list mac1
    deny any any decnet-iv (old) protocol-family decnet (new)
    permit any any
```

The following example shows how to enable or disable hardware statistics while configuring ACEs in the access list:

```
Switch# config t
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)# hardware statistics
Switch(config-ext-macl)# end
```
Chapter 51 Configuring Network Security with ACLs

Configuring EtherType Matching

You can classify non-IP traffic based on the EtherType value using the existing MAC access list commands. When you classify non-IP traffic by EtherType, you can apply security ACLs and QoS policies to traffic that carry the same EtherType.

EtherType matching allows you to classify tagged and untagged IP packets based on the EtherType value. Tagged packets present a potential operation problem:

- While single-tagged packets are supported on the access and trunk ports, double-tagged packets are not.
- Single and double-tagged packets are not supported if the port mode is dot1q-tunnel.

For more information about the `mac access-list extended` command, refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference.

To create a named MAC extended ACL, perform this task:

This example shows how to create and display an access list named matching, permitting the 0x8863 and 0x8040 EtherType values:

```
Switch(config)# mac access-list extended matching
Switch(config-ext-macl)# permit any 0x8863
Switch(config-ext-macl)# permit any 0x8040
Switch(config-ext-macl)# end
Switch # show access-lists matching
Extended MAC access list matching
   permit any 0x8863
   permit any 0x8040
```
Configuring Named IPv6 ACLs

Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E also support hardware-based IPv6 ACLs to filter unicast, multicast and broadcast IPv6 traffic on Layer 2 and Layer 3 interfaces. You can only configure such access lists on Layer 3 interfaces that are configured with an IPv6 address.

To create a named IPv6 ACLs, perform this task:

The following example shows how to create and display an IPv6 access list named v6test, denying only one IPv6 traffic with one particular source and destination address, but permitting all other types of IPv6 traffic:

```
Switch(config)# ipv6 access-list v6test
Switch(config-ipv6-acl)# deny ipv6 host 2020::10 host 2040::10
Switch(config-ipv6-acl)# permit any any
Switch(config-ipv6-acl)# end
Switch# show ipv6 access-list
IPv6 access list v6test
deny ipv6 host 2020::10 host 2040::10 sequence 10
permit ipv6 any any sequence 20
```

To enable hardware statistics, enter the following commands while configuring ACEs in the access list:

```
Switch(config)# ipv6 access-list v6test
Switch(config-ipv6-acl)# hardware statistics
Switch(config-ipv6-acl)# end
```

Note

Hardware statistics is disabled by default.
Applying IPv6 ACLs to Layer 2 and 3 Interface

To apply an IPv6 ACL to a Layer 3 interface, perform the following task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# interface interface-type slot/interface</td>
<td>Specifies the interface to be configured.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> interface-type must be a Layer 3 interface.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Switch(config-if)# ipv6 traffic-filter ipv6-acl (in</td>
<td>out)</td>
</tr>
</tbody>
</table>

IPv6 ACLs are supported on Layer 3 interfaces and on Layer 2 ports using the `ipv6 traffic-filter` command.

The following example applies the extended-named IPv6 ACL `simple-ipv6-acl` to SVI 300 routed ingress traffic:

```
Switch# configure terminal
Switch(config)# interface vlan 300
Switch(config-if)# ipv6 traffic-filter simple-ipv6-acl in
```

Output IPv6 ACLs with ACE to match on the ICMP option fail on a switch.

The following conditions may cause a RACL to malfunction (no workaround):

- ACLs are applied on the output direction of the interface.
- IPv6 ACL contain Ace to match on the ICMP option fields (ICMP Type or ICMP Code).

The following examples of nonfunctioning RACLs:

```
IPv6 access list a1
    permit icmp any any nd-ns sequence 10
    deny ipv6 any any sequence 20

IPv6 access list a2
    permit icmp 2020::/96 any nd-ns sequence 10
    deny ipv6 any any sequence 20
```

Configuring VLAN Maps

This section includes these topics:

- VLAN Map Configuration Guidelines, page 51-18
- Creating and Deleting VLAN Maps, page 51-19
- Applying a VLAN Map to a VLAN, page 51-21
- Using VLAN Maps in Your Network, page 51-22

This section describes how to configure VLAN maps, which is the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for
Chapter 51 Configuring Network Security with ACLs

Configuring VLAN Maps

that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

To create a VLAN map and apply it to one or more VLANs, follow these steps:

Step 1 Create the standard or extended IP ACLs or named MAC extended ACLs that you want to apply to the VLAN.

Step 2 Enter the `vlan access-map` global configuration command to create a VLAN ACL map entry.

In access map configuration mode, you have the option to enter an action (forward [the default] or drop) and enter the `match` command to specify an IP packet or a non-IP packet and to match the packet against one or more ACLs (standard or extended). If a match clause is not specified, the action is applied to all packets. The match clause can be used to match against multiple ACLs. If a packet matches any of the specified ACLs, the action is applied.

Note If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map for that type of packet, and no action specified, the packet is forwarded.

Step 3 Use the `vlan filter` global configuration command to apply a VLAN map to one or more VLANs.

Note You cannot apply a VLAN map to a VLAN on a switch that has ACLs applied to Layer 2 interfaces (port ACLs).

VLAN Map Configuration Guidelines

When configuring VLAN maps, consider these guidelines:

- VLAN maps do not filter IPv4 ARP packets.
- If there is no router ACL configured to deny traffic on a routed VLAN interface (input or output), and no VLAN map configured, all traffic is permitted.
- Each VLAN map consists of a series of entries. The order of entries in a VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.
- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.
- The system might take longer to boot if you have configured a very large number of ACLs.
Creating and Deleting VLAN Maps

Each VLAN map consists of an ordered series of entries. To create, add to, or delete a VLAN map entry, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# vlan access-map name [number]</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-access-map)# action {drop</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-access-map)# match {ip</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-access-map)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# show running-config</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config)# copy running-config startup-config</td>
</tr>
</tbody>
</table>

You can use the no vlan access-map name global configuration command to delete a map. You can use the no vlan access-map name number global configuration command to delete a single sequence entry from within the map. You can use the no action access-map configuration command to enforce the default action, which is to forward.

VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and then set the action to drop. A permit in the ACL is the same as a match. A deny in the ACL means no match.

Examples of ACLs and VLAN Maps

These examples show how to create ACLs and VLAN maps for specific purposes.

Example 1

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the ip1 ACL (TCP packets) would be dropped. You first create the ip1 ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.
Chapter 51 Configuring Network Security with ACLs

Configuring VLAN Maps

Example 2

In this example, the VLAN map is configured to drop IP packets and to forward MAC packets by default. By applying standard ACL 101 and the extended named access lists `igmp-match` and `tcp-match`, the VLAN map is configured to do the following:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

Example 3

In this example, the VLAN map is configured to drop MAC packets and forward IP packets by default. By applying MAC extended access lists, `good-hosts` and `good-protocols`, the VLAN map is configured to do the following:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets of DECnet or VINES (Virtual Integrated Network Service) protocol-family
Configuring VLAN Maps

Example 4

In this example, the VLAN map is configured to drop all packets (IP and non-IP). By applying access lists `tcp-match` and `good-hosts`, the VLAN map is configured to do the following:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets

Switch(config)# vlan access-map drop-all-default 10
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-all-default 20
Switch(config-access-map)# match mac address good-hosts
Switch(config-access-map)# action forward
Switch(config-access-map)# exit

Applying a VLAN Map to a VLAN

To apply a VLAN map to one or more VLANs, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# vlan filter mapname vlan-list list</td>
<td>Applies the VLAN map to one or more VLAN IDs. The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around comma, and dash, are optional.</td>
</tr>
<tr>
<td>Switch(config)# show running-config</td>
<td>Displays the access list configuration.</td>
</tr>
<tr>
<td>Switch(config)# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring VLAN Maps

You cannot apply a VLAN map to a VLAN on a switch that has ACLs applied to Layer 2 interfaces (port ACLs).

This example shows how to apply VLAN map 1 to VLANs 20 through 22:

```
Switch(config)# vlan filter map 1 vlan-list 20-22
```

Using VLAN Maps in Your Network

Figure 51-3 shows a typical wiring closet configuration. Host X and Host Y are in different VLANs, connected to wiring closet switches A and C. Traffic moving from Host X to Host Y is routed by Switch B. Access to traffic moving from Host X to Host Y can be controlled at the entry point of Switch A. In the following configuration, the switch can support a VLAN map and a QoS classification ACL.

**Figure 51-3** Wiring Closet Configuration

For example, if you do not want HTTP traffic to be switched from Host X to Host Y, you could apply a VLAN map on Switch A to drop all HTTP traffic moving from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge the traffic to Switch B. To configure this scenario, you would do the following.

First, define an IP access list HTTP to permit (match) any TCP traffic on the HTTP port, as follows:

```
Switch(config)# ip access-list extended http
Switch(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Switch(config-ext-nacl)# exit
```
Next, create a VLAN access map named map2 so that traffic that matches the HTTP access list is dropped and all other IP traffic is forwarded, as follows:

```
Switch(config)# vlan access-map map2 10
Switch(config-access-map)# match ip address http
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
```

```
Switch(config)# ip access-list extended match_all
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map2 20
Switch(config-access-map)# match ip address match_all
Switch(config-access-map)# action forward
```

You then apply the VLAN access map named map2 to VLAN 1, as follows:

```
Switch(config)# vlan filter map2 vlan 1
```

### Denying Access to a Server on Another VLAN

**Figure 51-4** shows how to restrict access to a server on another VLAN. In this example, server 10.1.1.100 in VLAN 10 has the following access restrictions:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

![Figure 51-4 Deny Access to a Server on Another VLAN](image)

This procedure configures ACLs with VLAN maps to deny access to a server on another VLAN. The VLAN map SERVER1_ACL denies access to hosts in subnet 10.1.2.0/8, host 10.1.1.4, and host 10.1.1.8. Then it permits all other IP traffic. In Step 3, VLAN map SERVER1 is applied to VLAN 10.

To configure this scenario, follow these steps:

**Step 1** Define the IP ACL to match and permit the correct packets.

```
Switch(config)# ip access-list extended SERVER1_ACL
Switch(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.14 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Switch(config-ext-nacl)# exit
```
Step 2 Define a VLAN map using the ACL to drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

Switch(config)# vlan access-map SERVER1_MAP
Switch(config-access-map)# match ip address SERVER1_ACL
Switch(config-access-map)# action drop
Switch(config)# vlan access-map SERVER1_MAP 20
Switch(config-access-map)# action forward
Switch(config-access-map)# exit

Step 3 Apply the VLAN map to VLAN 10.

Switch(config)# vlan filter SERVER1_MAP vlan-list 10.

Displaying VLAN Access Map Information

To display information about VLAN access maps or VLAN filters, perform one of these commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show vlan access-map [mapname]</td>
<td>Shows information about all VLAN access maps or the specified access map.</td>
</tr>
<tr>
<td>Switch# show vlan filter [access-map name / vlan vlan-id]</td>
<td>Shows information about all VLAN filters or about a specified VLAN or VLAN access map.</td>
</tr>
</tbody>
</table>

it is a sample output of the `show vlan access-map` command:

Switch# show vlan access-map
Vlan access-map 'map_1' 10
  Match clauses:
    ip address: ip1
  Action:
    drop
Vlan access-map 'map_1' 20
  Match clauses:
    mac address: mac1
  Action:
    forward
Vlan access-map 'map_1' 30
  Match clauses:
  Action:
    drop

Sequence 30 does not have a match clause. All packets (IP as well as non-IP) are matched against it and dropped.

it is a sample output of the `show vlan filter` command:

Switch# show vlan filter
VLAN Map map_1 is filtering VLANs:
  20-22
Using VLAN Maps with Router ACLs

If the VLAN map has a match clause for a packet type (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action is specified, the packet is forwarded if it does not match any VLAN map entry.

Note

You cannot combine VLAN maps or input router ACLs with port ACLs on a switch.

Topics include:

- Guidelines for Using Router ACLs and VLAN Maps on the Same VLAN, page 51-25
- Examples of Router ACLs and VLAN Maps Applied to VLANs, page 51-25

Guidelines for Using Router ACLs and VLAN Maps on the Same VLAN

Because the switch hardware performs one lookup for each direction (input and output), you must merge a router ACL and a VLAN map when they are configured on the same VLAN. Merging the router ACL with the VLAN map can significantly increase the number of ACEs.

When possible, try to write the ACL so that all entries have a single action except for the final, default action. You should write the ACL using one of these two forms:

```
permit...
permit...
permit...
deny ip any any
```

or

```
deny...
deny...
deny...
permit ip any any
```

To define multiple permit or deny actions in an ACL, group each action type together to reduce the number of entries.

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. Doing this gives priority to the filtering of traffic based on IP addresses.

Examples of Router ACLs and VLAN Maps Applied to VLANs

These examples show how router ACLs and VLAN maps are applied on a VLAN to control the access of switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time a packet crosses a line indicating a VLAN map or an ACL, the packet could be dropped rather than forwarded.

ACLs and Switched Packets

Figure 51-5 shows how an ACL processes packets that are switched within a VLAN. Packets switched within the VLAN are not processed by router ACLs.
Figure 51-5 Applying ACLs on Switched Packets

Catalyst 4500 series switch

Host A (VLAN 10)

VLAN 10

Routing function

VLAN 10 map

Input router ACL

Output router ACL

VLAN 20 map

Host C (VLAN 10)

VLAN 20

Packet

Figure 51-6 shows how ACLs are applied on routed packets. For routed packets, the ACLs are applied in this order:

1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN
Configuring PACLs

This section describes how to configure PACLs, which are used to control filtering on Layer 2 interfaces. PACLs can filter traffic to or from Layer 2 interfaces based on Layer 3 information, Layer 4 header information or non-IP Layer 2 information.

This section includes these topics:
- Creating a PACL, page 51-27
- PACL Configuration Guidelines, page 51-28
- Removing the Requirement for a Port ACL, page 51-28
- Webauth Fallback, page 51-29
- Configuring IPv4, IPv6, and MAC ACLs on a Layer 2 Interface, page 51-29
- Using PACL with Access-Group Mode, page 51-30
- Configuring Access-group Mode on Layer 2 Interface, page 51-31
- Applying ACLs to a Layer 2 Interface, page 51-31
- Displaying an ACL Configuration on a Layer 2 Interface, page 51-32

Creating a PACL

To create a PACL and apply it to one or more interfaces, follow these steps:

**Step 1** Create the standard or extended IPv4 ACLs, IPv6 ACLs, or named MAC extended ACLs that you want to apply to the interface.
Step 2  Use the IP access-group, IPv6 traffic-filter, or mac access-group interface command to apply IPv4, IPv6, or MAC ACLs to one or more Layer 2 interfaces.

PACL Configuration Guidelines

When configuring PACLs, consider these guidelines:

- There can be at most one IPv4, one IPv6, and one MAC access list applied to the same Layer 2 interface per direction.
- The IPv4 access list filters only IPv4 packets, the IPv6 access list filters only IPv6 packets, and the MAC access list filters only non-IP packets.
- The number of ACLs and ACEs that can be configured as part of a PACL are bounded by the hardware resources on the switch. Those hardware resources are shared by various ACL features (for example, RACL, VACL) that are configured on the system. If insufficient hardware resources to program PACL exist in hardware, the actions for input and output PACLs differ:
  - For input PACLs, some packets are sent to CPU for software forwarding.
  - For output PACLs, the PACL is disabled on the port.
- If insufficient hardware resources exist to program the PACL, the output PACL is not applied to the port, and you receive a warning message.
- The input ACL logging option is supported, although logging is not supported for output ACLs.
- The access group mode can change the way PACLs interact with other ACLs. To maintain consistent behavior across Cisco platforms, use the default access group mode.
- If a PACL is removed when there are active sessions on a port, a hole (permit ip any any) is installed on the port.

Removing the Requirement for a Port ACL

Prior to Cisco IOS Release 12.2(54)SG, a standard port ACL was necessary if you planned to download an ACL from a AAA server. This was because ACL infrastructure was insufficient to provide dynamic creation of access control entries without associating an ACL with the port.

Starting with Cisco IOS Release 12.2(54)SG, configuring a port ACL is not mandatory. If a port ACL is not configured on the port (by entering the ip access-group number in command), a default ACL (AUTH-DEFAULT-ACL) is attached automatically to the port when an ACL is downloaded. It allows only DHCP traffic and consists of the following ACEs:

permit udp any range 65347 any range bootps 65347
permit udp any any range bootpc 65348
deny ip any any.

AUTH-DEFAULT-ACL is automatically created. To modify it, enter the following command:

ip access-list extended AUTH-DEFAULT-ACL

This ACL is not nvgened. AUTH-DEFAULT-ACL is attached provided there are sessions applying dynamic ACLs (Per-user/Filter-Id/DACL). AUTH-DEFAULT-ACL is removed when the last authenticated session with policies is cleared. It remains attached to the port provided at least one session is applying dynamic policies.
Configuration Restrictions

The following restrictions apply:

- Starting with Cisco IOS Release 12.2(54)SG, the port ACL does not require configuration; the default ACL is created automatically.
- Even if AUTH-DEFAULT-ACL is modified, it is not nvgened.

Debugging Considerations

Syslog messages appear when AUTH-DEFAULT-ACL is attached or detached from an interface provided you enter the `epm logging` command in configuration mode.

The following syslog displays when the default ACL is attached:

```
%EPM-6-AUTH_ACL: POLICY Auth-Default-ACL| EVENT CREATE-ATTACH-SUCCESS
```

The following syslog displays when the ACL is detached:

```
%EPM-6-AUTH_ACL: POLICY Auth-Default-ACL| EVENT DETACH-SUCCESS
%EPM-6-AUTH_ACL: POLICY Auth-Default-ACL| EVENT DELETE-SUCCESS
```

Webauth Fallback

Many authentication methods require specific capabilities on the end-point device to respond to the network authenticating device with its identity or credentials. If the end-point lacks the required capability, the authenticator must fallback to alternative methods to gather host or user credentials. If the 802.1X/MAB authentication mechanism fails, a fallback to webauth might occur.

Prior to Cisco IOS Release 12.2(54)SG, webauth fallback implementation required a fallback profile configured on the authenticating device. As part of this profile, an admission rule must be configured along with the access policies (the fallback ACL).

Consider a situation where no port ACL is configured on a port. The first few hosts authenticated through 802.1X/MAB do not download any ACLs. All traffic from these hosts is allowed through. Now, suppose a host connects to the port, and there is a fallback to webauth to authenticate the host. The fallback ACL will be installed on the port, and traffic from previously authenticated hosts will also be restricted by this fallback ACL.

Starting with Cisco IOS Release 12.2(54)SG, Cisco uses a different approach to address this issue. When a host falls back to webauth for authentication, the ACE entries in the fallback ACL are converted into entries with Host IP insertion for a host that has fallen back and will be applied until the host authenticates. Once the host successfully authenticates, the fallback ACL is removed. The resultant host ACLS will be: dynamic ACLs and Port ACL/AUTH-DEFAULT-ACL. Refer to the previous section for an explanation of AUTH-DEFAULT-ACL.

Configuring IPv4, IPv6, and MAC ACLs on a Layer 2 Interface

Note

Only IPv4, IPv6 and MAC ACLs can be applied to Layer 2 physical interfaces.

Standard (numbered, named), Extended (numbered, named) IP ACLs, and Extended Named MAC ACLs are also supported.
To apply IPv4 or MAC ACLs on a Layer 2 interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# [no] (ip</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# show running-config</td>
</tr>
</tbody>
</table>

To apply IPv6 ACLs on a Layer 2 interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# [no] ipv6 traffic-filter name (in</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# show running-config</td>
</tr>
</tbody>
</table>

The following example shows how to configure the Extended Named IP ACL simple-ip-acl to permit all TCP traffic and implicitly deny all other IP traffic:

```
Switch(config)# interface Gi3/1
Switch(config-if)# ip access-list extended simple-ip-acl
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# end
```

The following example shows how to configure the Extended Named MACL simple-mac-acl to permit source host 000.000.011 to any destination host:

```
Switch(config)# interface Gi3/1
Switch(config-if)# mac access-list extended simple-mac-acl
Switch(config-ext-macl)# permit host 000.000.011 any
Switch(config-ext-macl)# end
```

Using PACL with Access-Group Mode

You can use the access group mode to change the way PACLs interact with other ACLs. For example, if a Layer 2 interface belongs to VLAN100, VACL (VLAN filter) V1 is applied on VLAN100, and PACL P1 is applied on the Layer 2 interface. In this situation, you must specify how P1 and V1 impact the traffic with the Layer 2 interface on VLAN100. In a per-interface method, you can use the access-group mode command to specify one of the following desired modes:

- prefer port mode—If PACL is configured on a Layer 2 interface, then PACL takes effect and overwrites the effect of other ACLs (Router ACL and VACL). If no PACL feature is configured on the Layer 2 interface, other features applicable to the interface are merged and applied on the interface. It is the default access group mode.
• prefer VLAN mode—VLAN-based ACL features take effect on the port if they have been applied on the port and no PACLs are in effect. If no VLAN-based ACL features are applicable to the Layer 2 interface, then the PACL feature already on the interface is applied.
• merge mode—Merges applicable ACL features before they are programmed into the hardware.

### Configuring Access-group Mode on Layer 2 Interface

To configure an access mode on a Layer 2 interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface</td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# [no] access-group mode (prefer (port</td>
</tr>
<tr>
<td></td>
<td>Applies numbered or named ACL to the Layer 2 interface. The no form deletes the IP or MAC ACL from the Layer 2 interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# show running-config</td>
</tr>
<tr>
<td></td>
<td>Displays the access list configuration.</td>
</tr>
</tbody>
</table>

This example shows how to merge and apply features other than PACL on the interface:

Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# access-group mode prefer port

This example shows how to merge applicable ACL features before they are programmed into hardware:

Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# access-group mode merge

### Applying ACLs to a Layer 2 Interface

To apply IPv4, IPv6, and MAC ACLs to a Layer 2 interface, perform one of these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# ip access-group ip-acl (in</td>
<td>out)</td>
</tr>
<tr>
<td>Switch(config-if)# ipv6 traffic-filter ipv6-acl (in</td>
<td>out)</td>
</tr>
<tr>
<td>Switch(config-if)# mac access-group mac-acl (in</td>
<td>out)</td>
</tr>
</tbody>
</table>

This example applies the extended named IP ACL simple-ip-acl to interface FastEthernet 6/1 ingress traffic:

Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# ip access-group simple-ip-acl in

This example applies the IPv6 ACL simple-ipv6-acl to interface FastEthernet 6/1 ingress traffic:

Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# ipv6 traffic-filter simple-ipv6-acl in
This example applies the extended named MAC ACL simple-mac-acl to interface FastEthernet 6/1 egress traffic:

```
Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# mac access-group simple-mac-acl out
```

### Displaying an ACL Configuration on a Layer 2 Interface

To display information about an ACL configuration on Layer 2 interfaces, perform one of these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# show ip interface [interface-name]</code></td>
<td>Shows the IP access group configuration on the interface.</td>
</tr>
<tr>
<td><code>Switch# show mac access-group interface [interface-name]</code></td>
<td>Shows the MAC access group configuration on the interface.</td>
</tr>
<tr>
<td><code>Switch# show access-group mode interface [interface-name]</code></td>
<td>Shows the access group mode configuration on the interface.</td>
</tr>
</tbody>
</table>

This example shows that the IP access group simple-ip-acl is configured on the inbound direction of interface fa6/1:

```
Switch# show ip interface fast 6/1
FastEthernet6/1 is up, line protocol is up
  Inbound access list is simple-ip-acl
  Outgoing access list is not set
```

This example shows that MAC access group simple-mac-acl is configured on the inbound direction of interface fa6/1:

```
Switch# show mac access-group interface fast 6/1
Interface FastEthernet6/1:
  Inbound access-list is simple-mac-acl
  Outbound access-list is not set
```

This example shows that access group merge is configured on interface fa6/1:

```
Switch# show access-group mode interface fast 6/1
Interface FastEthernet6/1:
  Access group mode is: merge
```

### Using PACL with VLAN Maps and Router ACLs

For PACLs, the interaction with Router ACLs and VACLs depends on the interface access group mode as shown in Table 51-1.
Using PACL with VLAN Maps and Router ACLs

Each ACL type listed in Table 51-1 corresponds with these scenarios:

**Scenario 1**: Host A is connected to an interface in VLAN 20, which has an SVI configured. The interface has input PACL configured, and the SVI has input Router ACL configured as shown in Figure 51-7:

**Figure 51-7 Scenario 1: PACL Interaction with an Input Router ACL**

If the interface access group mode is prefer port, then only the input PACL is applied on the ingress traffic from Host A. If the mode is prefer VLAN, then only the input Router ACL is applied to ingress traffic from Host A that requires routing. If the mode is merge, then the input PACL is first applied to the ingress traffic from Host A, and the input Router ACL is applied on the traffic that requires routing.

**Scenario 2**: Host A is connected to an interface in VLAN 10, which has a VACL (VLAN Map) configured and an input PACL configured as shown in Figure 51-8:

<table>
<thead>
<tr>
<th>ACL Type(s)</th>
<th>Input PACL</th>
<th>Input Router ACL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefer port mode</td>
<td>PACL applied</td>
<td>Input Router ACL applied</td>
<td>PACL, Input Router ACL (merged) applied in order (ingress)</td>
</tr>
<tr>
<td>Prefer VLAN mode</td>
<td>PACL applied</td>
<td>VACL applied</td>
<td>PACL, VACL (merged) applied in order (ingress)</td>
</tr>
<tr>
<td>Merge mode</td>
<td>PACL applied</td>
<td>VACL + Input Router ACL applied</td>
<td>PACL, VACL, Input Router ACL (merged) applied in order (ingress)</td>
</tr>
</tbody>
</table>
Using PACL with VLAN Maps and Router ACLs

**Figure 51-8  Scenario 2: PACL Interaction with a VACL**

If the interface access group mode is prefer port, then only the input PACL is applied on the ingress traffic from Host A. If the mode is prefer VLAN, then only the VACL is applied to the ingress traffic from Host A. If the mode is merge, the input PACL is first applied to the ingress traffic from Host A, and the VACL is applied on the traffic.

**Scenario 3:** Host A is connected to an interface in VLAN 10, which has a VACL and an SVI configured. The SVI has an input Router ACL configured and the interface has an input PACL configured, as shown in Figure 51-9:

**Figure 51-9  Scenario 3: VACL and Input Router ACL**

If the interface access group mode is prefer port, then only the input PACL is applied on the ingress traffic from Host A. If the mode is prefer VLAN, then the merged results of the VACL and the input Router ACL are applied to the ingress traffic from Host A. If the mode is merge, the input PACL is first...
applied to the ingress traffic from Host A, the VACL is applied on the traffic and finally, and the input Router ACL is applied to the traffic that needs routing. (that is, the merged results of the input PACL, VACL, and input Router ACL are applied to the traffic).

### Configuring RA Guard

This section includes these topics:

- **Introduction, page 51-35**
- **Deployment, page 51-36**
- **Configuring RA Guard, page 51-36**
- **Examples, page 51-37**
- **Usage Guidelines, page 51-38**

### Introduction

When deploying IPv6 networks, routers are configured to use IPv6 Router Advertisements to convey configuration information to hosts on link. Router Advertisement is a critical part of the autoconfiguration process. The conveyed information includes the implied default router address obtained from the observed source address of the Router-Advertisement (RA) message. However, in some networks, invalid RAs are observed. This may happen because of misconfigurations or a malicious attacks on the network.

Devices acting as rogue routers may send illegitimate RAs. When using IPv6 within a single Layer 2 network segment, you can enable Layer 2 devices to drop rogue RAs before they reach end-nodes.

Beginning with Cisco IOS Release 54(SG)SG on Supervisor Engine 6-E (and 6L-E); Cisco IOS XE Release 3.3.0SG on Supervisor Engine 7-E; and Cisco IOS XE Release 3.2.0XO on Supervisor Engine 7L-E, Catalyst 4500 Series Switch supports RA Guard. This feature examines incoming Router-Advertisement and Router-Redirect packets and decides whether to switch or block them based solely on information found in the message and in the Layer 2 device configuration.

You can configure RA Guard in two modes (host and router) based on the device connected to the port.

- **Host mode**—All the Router-Advertisement and Router-Redirect messages are disallowed on the port.
- **Router mode**—All messages (RA/RS/Redirect) are allowed on the port; only host mode is supported.

You can configure Catalyst 4500 host ports to allow or disallow RA messages. Once a port is configured to disallow the Router-Advertisement and Router-Redirect packets, it filters the content of the received frames on that port and blocks Router-Advertisement or Router-Redirect frames.

When RA Guard is configured on a port, the following packets are dropped in hardware:

- **Router-Advertisement packets**—IPv6 ICMP packets with ICMP type = 134
- **Router-Redirect packets**—IPv6 ICMP packets with ICMP type = 137

Per port RA Guard ACL statistics are supported and displayed when you enter a `show ipv6 snooping counters interface` command. The statistics output displays the number of packets that have been dropped per port due to the RA Guard.
Configuring RA Guard

Note

Beginning with Cisco IOS Release 15.0(2)SG, per port RA Guard ACL statistics are supported and displayed when you enter a `show ipv6 snooping counters interface` command. (Previous to this release, you enter the `show ipv6 first-hop counters interface` command.)

Deployment

Figure 51-10 illustrates a deployment scenario for RA Guard. We drop RA packets from ports that are connected to hosts and permit RA packets from ports connected to the Router.

Figure 51-10 Typical RA Guard Deployment

![Diagram of RA Guard deployment](https://www.example.com/image.png)

Configuring RA Guard

To configure RA Guard, perform this step:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td>Step 1</td>
<td><code>Switch(config)# interface interface</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>Switch(config-if)# [no] ipv6 nd raguard</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>Switch(config-if)# end</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>Switch# show ipv6 first-hop policies interface</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>Switch# show ipv6 first-hop counters interface</code></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>Switch# clear ipv6 snooping counters interface</code></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Examples

This examples shows how to enable RA Guard on the switch:

Switch(config)# int gi1/1
Switch(config-if)# ipv6 nd raguard
Switch(config-if)# end
Switch# show running-configuration interface gi1/1

Building configuration...

Current configuration : 53 bytes

!

interface GigabitEthernet1/1

   ipv6 nd raguard

end

The following example shows a sample output of the `show ipv6` commands:

Switch# show ipv6 snooping counters int gi 2/48
Received messages on Gi2/48:
Protocol         Protocol message  RS  RA  NS  NA  REDIR  CPS  CPA
ICMPv6            RS  RA  NS  NA  REDIR  CPS  CPA
0 0 0 0 0 0 0 0

Bridged messages from Gi2/48:
Protocol         Protocol message  RS  RA  NS  NA  REDIR  CPS  CPA
ICMPv6            RS  RA  NS  NA  REDIR  CPS  CPA
0 0 0 0 0 0 0 0

Dropped messages on Gi2/48:
Feature/Message  RS  RA  NS  NA  REDIR  CPS  CPA
Dropped reasons on Gi2/48:
Switch#

Note

Beginning with Cisco IOS Release 15.0(2)SG, per port RA Guard ACL statistics are supported and displayed when you enter a `show ipv6 snooping counters interface` command. (Previous to this release, you enter the `show ipv6 first-hop counters interface` command.)

Note

Be aware that only RA (Router Advertisement) and REDIR (Router Redirected packets) counters are supported in 12.2(54)SG.

Switch# show ipv6 first-hop policies
RA guard policies configured:

Policy    Interface    Vlan
------    ----------    ----
default   Gi2/48       all
Switch#
Usage Guidelines

Observe the following restrictions:

- It is an ingress feature; only IPv6 Router-Advertisement and Router-Redirect packets entering through the port are filtered.
- RA Guard does not offer protection in environments where IPv6 traffic is tunneled.
- This feature is supported only in hardware; packets are not punted to software except under resource exhaustion (for example, TCAM memory exhaustion).
- RA Guard is purely an Layer 2 port based feature and can be configured only on switchports. It works irrespective of whether IPv6 routing is enabled. It is not supported on router interfaces and VLANs.
- RA Guard is supported on trunk ports; filtering is performed on packets arriving from all the allowed VLANs.
- RA Guard is supported on EtherChannel; the RA Guard configuration (whether present or not) on the EtherChannel overrides the RA Guard configuration on the member ports.
- RA Guard is supported on ports that belong to PVLANs (for example, isolated secondary host ports, community secondary host ports, promiscuous primary host ports, (primary/secondary) trunk ports. Primary VLAN features are inherited and merged with port features.
- Because of hardware limitations, it may not be possible for Catalyst 4900M, Catalyst 4948E, Catalyst 4948L-E, Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E and Supervisor Engine 7L-E to collect statistics for RA Guard in hardware. If so, an error message is displayed.

The `show ipv6 snooping counter interface` command displays the estimated counters.

Note

Beginning with Cisco IOS Release 15.0(2)SG, per port RA Guard ACL statistics are supported and displayed when you enter a `show ipv6 snooping counters interface` command. (Previous to this release, you enter the `show ipv6 first-hop counters interface` command.)
Support for IPv6

This chapter lists the IP version 6 (IPv6) features supported on the Catalyst 4500 and Catalyst 4900 series switches.

The IPv6 for Cisco IOS software feature documentation provides implementation and command reference information for IPv6 features supported in the Cisco IOS software. Not all IPv6 features are supported on the Catalyst 4500 and Catalyst 4900 series switches. We strongly recommend that you read this entire chapter before reading the other IPv6 for Cisco IOS software feature documentation.

The Cisco IOS IPv6 Configuration Guide is located at the following website:

The Cisco IOS IPv6 Command Reference is located at the following web site:

This chapter consists of these sections:

- Finding Feature Information, page 52-1
- About IPv6, page 52-1
- IPv6 Default States, page 52-7

Finding Feature Information

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to http://tools.cisco.com/ITDIT/CFN/. An account on Cisco.com is not required.

About IPv6

IPv6 provides services such as end-to-end security, quality of service (QoS), and globally unique addresses. The IPv6 address space reduces the need for private addresses and Network Address Translation (NAT) processing by border routers at network edges.

For information about how Cisco Systems implements IPv6, go to this URL:

This section describes the features that are supported for IPv6:

- IPv6 Addressing and Basic Connectivity, page 52-2
IPv6 Addressing and Basic Connectivity

The switch supports only IPv6 unicast addresses. It does not support site-local unicast addresses or multicast addresses.

The IPv6 128-bit addresses are represented as a series of eight 16-bit hexadecimal fields separated by colons in the format: \( n:n:n:n:n:n:n.n \). It is an example of an IPv6 address:

\[2031:0000:130F:0000:0000:09C0:080F:130B\]

The leading zeros in each field are optional, implementation is easier without them. It is the same address without leading zeros:

\[2031:0:130F:0:0:9C0:80F:130B\]

You can also use two colons (::) to represent successive hexadecimal fields of zeros, but you can use this short version only once in each address:

\[2031:0:130F::09C0:080F:130B\]

The switch supports the following features:

- IPv6 address types: Anycast
- IPv6 default router preferences
- IPv6 MTU path discovery
- Neighbor discovery duplicate address detection
- Cisco Discovery Protocol — IPv6 address family support for neighbor information
- ICMPv6 redirect
- ICMP rate limiting
- DNS lookups over an IPv6 transport
- uRPF
- ICMPv6
- AAAA DNS lookups over an IPv4 transport

You can find information about these features at this location:

DHCP

The following DHCP features are supported for IPv6 on the Catalyst 4500 series switch:

- Relay agent
- Relay agent notification for prefix delegation
- Reload persistent interface ID option
- Ethernet remote ID option
- Stateless auto-configuration

You can find information about these features at this location:

Security

The following security features are supported for IPv6 on the Catalyst 4500 series switch:

- Secure Shell (SSH) support over IPv6
- Traffic filters
- standard access control lists (ACL)
- extended access control lists
- ACL accounting
- ACL addressing
- ACL DSCP
- ACL flags
- ACL flows
- ACL fragments
- ACL ICMP codes
- ACL logging
- ACL protocols

You can find information about these features at this location:

QoS

The following QoS features are supported for IPv6 on the Catalyst 4500 series switch:

- MQC packet classification
- MQC traffic shaping
- MQC traffic policing
- MQC packing marking and remarking
- Queueing
You can find information about these features at this location:

**Management**

The following management features are supported for IPv6 on the Catalyst 4500 series switch:

- Ping
- Syslog
- Netconf support
- SNMP
- SOAP
- HTTP(s)

You can find information about these features at this location:

**Multicast**

Traditional IP communication allows a host to send packets to a single host (unicast transmission) or to all hosts (broadcast transmission). IPv6 multicast, allows a host to send a single data stream to a subset of all hosts (group transmission) simultaneously.

The following multicast features are supported for IPv6 on the Catalyst 4500 series switch:

- Multicast Listener Discovery (MLD) protocol, versions 1 and 2
  
  You can find information about IPv6 MLD Snooping at this location:

- PIM Sparse Mode (PIM-SM)
- PIM Source Specific Multicast (PIM-SSM)
- Scope boundaries
- MLD access group
- PIM embedded Rendezvous Point (RP) support
- Static multicast routing (mroute)
- Explicit tracking of receivers
- Bootstrap routers (BSR)
- MLD snooping

You can find information about these features at this location:
Static Routes

Networking devices forward packets using route information that is either manually configured or dynamically learned using a routing protocol. Static routes are manually configured and define an explicit path between two networking devices. Unlike a dynamic routing protocol, static routes are not automatically updated and must be manually reconfigured if the network topology changes. The benefits of using static routes include security and resource efficiency. Static routes use less bandwidth than dynamic routing protocols and no CPU cycles are used to calculate and communicate routes. The main disadvantage to using static routes is the lack of automatic reconfiguration if the network topology changes.

Static routes can be redistributed into dynamic routing protocols but routes generated by dynamic routing protocols cannot be redistributed into the static routing table. No algorithm exists to prevent the configuration of routing loops that use static routes.

Static routes are useful for smaller networks with only one path to an outside network and to provide security for a larger network for certain types of traffic or links to other networks that need more control. In general, most networks use dynamic routing protocols to communicate between networking devices but may have one or two static routes configured for special cases.

You can find more information regarding static routes at:

First-Hop Redundancy Protocols

IPv6 routing protocols ensure router-to-router resilience and failover. However, in situations in which the path between a host and the first-hop router fails, or the first-hop router itself fails, First-Hop Redundancy Protocols (FHRPs) ensure host-to-router resilience and failover.

The Hot Standby Router Protocol (HSRP) protects data traffic in case of a gateway failure.

You can find more information about First-Hop Redundancy Protocols at:

Unicast Routing

These sections describe the IPv6 unicast routing protocol features supported by the switch:

- RIP, page 52-5
- OSPF, page 52-6
- EIGRP, page 52-6
- IS-IS, page 52-6
- Multiprotocol BGP, page 52-6

RIP

Routing Information Protocol (RIP) for IPv6 is a distance-vector protocol that uses hop count as a routing metric. It includes support for IPv6 addresses and prefixes and the all-RIP routers multicast group address FF02::9 as the destination address for RIP update messages.

You can find more about RIP at this location:
Chapter 52  Support for IPv6

About IPv6

**OSPF**

The switch running the IP services feature set supports Open Shortest Path First (OSPF) for IPv6, a link-state protocol for IP.

You can find more information about OSPF at this location:

**EIGRP**

The switch running the IP-services feature set supports Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6. It is configured on the interfaces on which it runs and does not require a global IPv6 address.

Before running, an instance of EIGRP IPv6 requires an implicit or explicit router ID. An implicit router ID is derived from a local IPv4 address, so any IPv4 node always has an available router ID. However, EIGRP IPv6 might be running in a network with only IPv6 nodes and therefore might not have an available IPv4 router ID.

You can find more information about EIGRP at this location:

**IS-IS**

Intermediate System-to-Intermediate System (IS-IS) is an Interior Gateway Protocol (IGP) that advertises link-state information throughout the network to create a picture of the network topology. IS-IS is an Open Systems Interconnection (OSI) hierarchical routing protocol that designates an intermediate system as a Level 1 or Level 2 device. Level 2 devices route between Level 1 areas to create an intradomain routing backbone. Integrated IS-IS uses a single routing algorithm to support several network address families, such as IPv6, IPv4, and OSI.

You can find more information about Is-IS at this location:

**Multiprotocol BGP**

Multiprotocol Border Gateway Protocol (BGP) is an Exterior Gateway Protocol (EGP) used mainly to connect separate routing domains that contain independent routing policies (autonomous systems). Connecting to a service provider for access to the Internet is a common use for BGP. BGP can also be used within an autonomous system, which is referred to as internal BGP (iBGP). Multiprotocol BGP is an enhanced BGP that carries routing information for multiple network layer protocol address families, for example, IPv6 address family and for IP multicast routes. All BGP commands and routing policy capabilities can be used with multiprotocol BGP.

You can find more information about multiprotocol BGP at this location:

### Tunneling

The following tunneling features are supported for IPv6 on the Catalyst 4500 series switch:

- Automatic 6to4
- ISATAP
- Configured tunnels

**Note**

Tunneling is not supported in hardware but is supported in software.

You can find information about these features at this location:

### IPv6 Default States

Table 52-1 shows the default states of IPv6 configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 routing</td>
<td>Disabled globally and on all interfaces</td>
</tr>
<tr>
<td>CEFv6 or dCEFv6</td>
<td>Disabled (IPv4 CEF and dCEF are enabled by default)</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When IPv6 routing is enabled, CEFv6 and dCEF are automatically enabled.</td>
</tr>
<tr>
<td>IPv6 addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>
Chapter 52      Support for IPv6

IPv6 Default States
Port Unicast and Multicast Flood Blocking

This chapter describes how to configure multicast and unicast flood blocking on the Catalyst 4000 family switch. This chapter contains these topics:

- About Flood Blocking, page 53-1
- Configuring Port Blocking, page 53-1

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Flood Blocking

Occasionally, unknown unicast or multicast traffic is flooded to a switch port because a MAC address has timed out or has not been learned by the switch. (This condition is especially undesirable for a private VLAN isolated port.) To guarantee that no unicast and multicast traffic is flooded to the port, use the switchport block unicast and switchport block multicast commands to enable flood blocking on the switch.

The flood blocking feature is supported on all switched ports (including PVLAN ports) and is applied to all VLANs on which the port is forwarding.

Configuring Port Blocking

By default, a switch floods packets with unknown destination MAC addresses to all ports. If unknown unicast and multicast traffic is forwarded to a switch port, there might be security issues. To prevent forwarding such traffic, you can configure a port to block unknown unicast or multicast packets.
Chapter 53      Port Unicast and Multicast Flood Blocking

Configuring Port Blocking

Note
Blocking of unicast or multicast traffic is not automatically enabled on a switch port; you must explicitly configure it.

Blocking Flooded Traffic on an Interface

Note
The interface can be a physical interface (for example, GigabitEthernet 1/1) or an EtherChannel group (such as port-channel 5). When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port channel group.

Note
Starting with Cisco IOS Release 12.2(52)SG, only IPV4 and IPV6 unknown multicast traffic flooding is blocked; Layer 2 unknown multicast flooding is not. This behavior stems from a fix for the following problem: when you configure blocking of unknown multicast flooding on a port, broadcast traffic to the port is also blocked.

To disable the flooding of multicast and unicast packets to an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode and enter the type and number of the switch port interface (for example, GigabitEthernet 1/1).</td>
</tr>
<tr>
<td><strong>Step 3</strong> Switch(config-if)# switchport block multicast</td>
<td>Blocks unknown multicast forwarding to the port.</td>
</tr>
<tr>
<td><strong>Step 4</strong> Switch(config-if)# switchport block unicast</td>
<td>Blocks unknown unicast forwarding to the port.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Switch# show interface interface-id switchport</td>
<td>Verifies your entry.</td>
</tr>
<tr>
<td><strong>Step 7</strong> Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to block unicast and multicast flooding on a GigabitEthernet interface 1/1 and how to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport block multicast
Switch(config-if)# switchport block unicast
Switch(config-if)# end
Switch# show interface gigabitethernet1/1 switchport
Name: Gi1/3
Switchport: Enabled
```
Port Protected: On
Unknown Unicast Traffic: Not Allowed
Unknown Multicast Traffic: Not Allowed

Broadcast Suppression Level: 100
Multicast Suppression Level: 100
Unicast Suppression Level: 100

Resuming Normal Forwarding on a Port

To resume normal forwarding on a port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode and enter the type</td>
</tr>
<tr>
<td></td>
<td>and number of the switch port interface (GigabitEthernet1/1).</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Step 4</strong></td>
</tr>
<tr>
<td>Switch(config-if)# no switchport block multicast</td>
<td>Enables unknown multicast flooding to the port.</td>
</tr>
<tr>
<td></td>
<td>Enables unknown unicast flooding to the port.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Step 6</strong></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Switch# show interface interface-id switchport</td>
</tr>
<tr>
<td></td>
<td>Verifies your entry.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>Step 7</strong></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
CHAPTER 54

Configuring Storm Control

This chapter describes how to configure port-based traffic control on the Catalyst 4500 series switch. This chapter consists of these sections:

- About Storm Control, page 54-1
- Enabling Broadcast Storm Control, page 54-3
- Enabling Multicast Storm Control, page 54-4
- Disabling Broadcast Storm Control, page 54-5
- Disabling Multicast Storm Control, page 54-5
- Displaying Storm Control, page 54-6

Note
For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Storm Control

This section contains the following subsections:

- Hardware-Based Storm Control Implementation, page 54-2
- Software-Based Storm Control Implementation, page 54-2

Storm control prevents LAN interfaces from being disrupted by a broadcast storm. A broadcast storm occurs when broadcast packets flood the subnet, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation or in the network configuration can cause a broadcast storm.
Hardware-Based Storm Control Implementation

Broadcast suppression uses filtering that measures broadcast activity in a subnet over a one-second interval and compares the measurement with a predefined threshold. If the threshold is reached, further broadcast activity is suppressed for the duration of the interval. Broadcast suppression is disabled by default.

Figure 54-1 shows the broadcast traffic patterns on a LAN interface over a given interval. In this example, broadcast suppression occurs between times T1 and T2 and between T4 and T5. During those intervals, the amount of broadcast traffic exceeded the configured threshold.

Figure 54-1 Storm Control Example—Hardware-based Implementation

The broadcast suppression threshold numbers and the time interval combination make the broadcast suppression algorithm work with different levels of granularity. A higher threshold allows more broadcast packets to pass through.

Broadcast suppression on the Catalyst 4500 series switches is implemented in hardware. The suppression circuitry monitors packets passing from a LAN interface to the switching bus. If the packet destination address is broadcast, then the broadcast suppression circuitry tracks the current count of broadcasts within the one-second interval, and when a threshold is reached, it filters out subsequent broadcast packets.

Because hardware broadcast suppression uses a bandwidth-based method to measure broadcast activity, the most significant implementation factor is setting the percentage of total available bandwidth that can be used by broadcast traffic. Because packets do not arrive at uniform intervals, the one-second interval during which broadcast activity is measured can affect the behavior of broadcast suppression.

Software-Based Storm Control Implementation

When storm control is enabled on an interface, the switch monitors packets received on the interface and determines whether the packets are broadcast. The switch monitors the number of broadcast packets received within a one-second time interval. When the interface threshold is met, all incoming data traffic on the interface is dropped. This threshold is specified as a percentage of total available bandwidth that can be used by broadcast traffic. If the lower threshold is specified, all data traffic is forwarded as soon as the incoming traffic falls below that threshold.
Enabling Broadcast Storm Control

To enable storm control, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode and enter the port to configure.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# storm-control broadcast level [high level]</td>
</tr>
<tr>
<td></td>
<td>Configures broadcast storm control.</td>
</tr>
<tr>
<td></td>
<td>Specifies the upper threshold levels for broadcast traffic. The storm control action occurs when traffic utilization reaches this level.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Specifies the falling threshold level. The normal transmission restarts (if the action is filtering) when traffic drops below this level for interfaces that support software-based suppression.</td>
</tr>
<tr>
<td></td>
<td>Note: For ports that perform hardware-based suppression, the lower threshold is ignored.</td>
</tr>
<tr>
<td></td>
<td>Note: For the Catalyst 4500-X Series Switch, on ports operating at 1Gigabit, thresholds less than 0.02% are not supported.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# storm-control action {shutdown</td>
</tr>
<tr>
<td></td>
<td>Specifies the action to be taken when a storm is detected.</td>
</tr>
<tr>
<td></td>
<td>The default is to filter out the broadcast traffic and not to send out traps.</td>
</tr>
<tr>
<td></td>
<td>The shutdown keyword sets the port to error-disable state during a storm. If the recover interval is not set, the port remains in shutdown state.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# exit</td>
</tr>
<tr>
<td></td>
<td>Returns to configuration mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# show storm-control {interface} broadcast</td>
</tr>
<tr>
<td></td>
<td>Displays the number of packets suppressed.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch# copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The following example shows how to enable storm control on interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa3/1
Switch(config-if)# storm-control broadcast level 50
Switch(config-if)# end

Switch# show storm-control
Interface  Filter State  Broadcast Multicast Level
----------  --------------  ---------------  ---------  ------
Fa3/1      Forwarding    Enabled        Disabled  50.00%

Switch# show int fa2/1 capabilities
FastEthernet2/1
Model:       WS-X4148-RJ45V-RJ-45
Type:        10/100BaseTX
Speed:       10,100, auto
```

```
Enabling Multicast Storm Control

Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, Supervisor Engine 6L-E, Supervisor Engine 7-E, and Supervisor Engine 7L-E support per-interface multicast suppression, which allows you to subject incoming multicast and broadcast traffic to interface-level suppression.

**Note**
Multicast and broadcast suppression share a common threshold per interface. Multicast suppression takes effect only if broadcast suppression is enabled. Disabling broadcast suppression on an interface also disables multicast suppression.

To enable multicast suppression, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface interface-id</td>
<td>Enters interface configuration mode and enter the port to configure.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# storm-control broadcast include multicast</td>
<td>Enables multicast suppression.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# exit</td>
<td>Returns to configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# show storm-control</td>
<td>Verifies the configuration.</td>
</tr>
</tbody>
</table>

The following example shows how to enable multicast suppression on ports that have broadcast suppression already enabled:

Switch# configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch(config)# int fa3/1
Switch(config-if)# storm-control broadcast include multicast
Disabling Broadcast Storm Control

To disable storm control, perform this task:

```
Step 1. Switch(config)# configure terminal
Enters global configuration mode.

Step 2. Switch(config)# interface interface-id
Enters interface configuration mode and enter the port to configure.

Step 3. Switch(config-if)# no storm-control broadcast level
Disables port storm control.

Step 4. Switch(config-if)# no storm-control action {shutdown | trap}
Disables the specified storm control action and returns to default filter action.

Step 5. Switch(config-if)# exit
Returns to configuration mode.

Step 6. Switch(config)# end
Returns to privileged EXEC mode.

Step 7. Switch(config)# show storm-control broadcast
Verifies your entries.

Step 8. Switch(config)# copy running-config startup-config
(Optional) Saves your entries in the configuration file.
```

The following example shows how to disable storm control on interface.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int fa3/1
Switch(config-if)# no storm-control broadcast level
Switch(config-if)# end

Switch# show storm-control
Interface Filter State Broadcast Multicast Level
--------- ------------- --------- --------- -----
Fi3/1 Forwarding Enabled Enabled 50.00%
Switch#
```

Disabling Multicast Storm Control

To disable multicast suppression, perform this task:

```
Command  Purpose
Step 1  Switch(config)# configure terminal
Enters global configuration mode.

Step 2  Switch(config)# [no] storm-control broadcast include multicast
Enables and disables multicast suppression.

Step 3  Switch(config-if)# no storm-control broadcast level
Disables port storm control (broadcast and multicast).
```
Chapter 54      Configuring Storm Control

Displaying Storm Control

Use the `show interface capabilities` command to determine the mode in which storm control is supported on an interface.

The following example shows an interface that supports broadcast suppression in software (sw):

```
Switch# show int fa2/1 capabilities
FastEthernet2/1
  Model:          WS-X4148-RJ45V-RJ-45
  Type:           10/100BaseTX
  Speed:          10,100,auto
  Duplex:         half,full,auto
  Auto-MDIX:      no
  Trunk encap. type: 802.1Q
  Trunk mode:     on,off,desirable,negotiate
  Auto-MDIX:      no
  Broadcast suppression: percentage(0-100), hw
  Multicast suppression: percentage(0-100), hw
  Flowcontrol:    rx-(none),tx-(none)
  VLAN Membership: static, dynamic
  Fast Start:     yes
  CoS rewrite:    yes
  ToS rewrite:    yes
  Inline power:   yes (Cisco Voice Protocol)
  SPAN:           source/destination
  UDLL:           yes
  Link Debounce:  no
  Link Debounce Time: no
  Port Security:  yes
  Dotlx:          yes
  Maximum MTU:    1552 bytes (Baby Giants)
  Multiple Media Types: no
  Diagnostic Monitoring: N/A
```

Note

Use the `show interfaces counters storm-control` command to display a count of discarded packets.

```
Switch# show interfaces counters storm-control
Port       Broadcast   Multicast  Level     TotalSuppressedPackets
----------  ---------    ---------  --------  ------------------------
Fa2/1       Enabled     Disabled  10.00%    46516510
Gi3/1       Enabled     Enabled   50.00%    0
```

```
Switch# show storm-control
Interface Filter State Broadcast Multicast Level
----------  ---------    ---------  --------
Fa2/1       Blocking     Enabled   Disabled  10.00%
Gi3/1       Link Down   Enabled   Enabled   50.00%
```

Step 4

```
Switch(config-if)# end
```

Returns to configuration mode.

Step 5

```
Switch(config)# end
```

Returns to privileged EXEC mode.

Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# end</td>
<td>Returns to configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Configuring SPAN and RSPAN

This chapter describes how to configure the Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) on the Catalyst 4500 series switches. SPAN selects network traffic for analysis by a network analyzer, such as a SwitchProbe device or other Remote Monitoring (RMON) probe.

This chapter consists of the following sections:

- **About SPAN and RSPAN**, page 55-1
- **Configuring SPAN**, page 55-7
- **CPU Port Sniffing**, page 55-10
- **Encapsulation Configuration**, page 55-12
- **Ingress Packets**, page 55-12
- **Access List Filtering**, page 55-13
- **Packet Type Filtering**, page 55-14
- **Configuration Example**, page 55-15
- **Configuring RSPAN**, page 55-16
- **Displaying SPAN and RSPAN Status**, page 55-24

---

**Note**

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

---

**About SPAN and RSPAN**

This sections includes the following subsections:

- **SPAN and RSPAN Concepts and Terminology**, page 55-3
- **SPAN and RSPAN Session Limits**, page 55-6
About SPAN and RSPAN

- Default SPAN and RSPAN Configuration, page 55-6

SPAN mirrors traffic from one or more source interfaces on any VLAN or from one or more VLANs to a destination interface for analysis. In Figure 55-1, all traffic on Ethernet interface 5 (the source interface) is mirrored to Ethernet interface 10. A network analyzer on Ethernet interface 10 receives all network traffic from Ethernet interface 5 without being physically attached to it.

For SPAN configuration, the source interfaces and the destination interface must be on the same switch. SPAN does not affect the switching of network traffic on source interfaces; copies of the packets received or transmitted by the source interfaces are sent to the destination interface.

**Figure 55-1 Example SPAN Configuration**

![Figure 55-1](image1)

RSPAN extends SPAN by enabling remote monitoring of multiple switches across your network. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches. The SPAN traffic from the sources is copied onto the RSPAN VLAN and then forwarded over trunk ports that are carrying the RSPAN VLAN to any RSPAN destination sessions monitoring the RSPAN VLAN, as shown in Figure 55-2.

**Figure 55-2 Example of RSPAN Configuration**

![Figure 55-2](image2)

SPAN and RSPAN do not affect the switching of network traffic on source ports or source VLANs; a copy of the packets received or sent by the sources is sent to the destination. Except for traffic that is required for the SPAN or RSPAN session, by default, destination ports do not receive or forward traffic.

You can use the SPAN or RSPAN destination port to forward transmitted traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) sensor appliance to a destination port, the IDS device can send TCP reset packets to close down the TCP session of a suspected attacker.
SPAN and RSPAN Concepts and Terminology

This section describes concepts and terminology associated with SPAN and RSPAN configuration and includes the following subsections:

- SPAN Session, page 55-3
- Traffic Types, page 55-3
- Source Port, page 55-4
- Destination Port, page 55-5
- VLAN-Based SPAN, page 55-5
- SPAN Traffic, page 55-6

SPAN Session

A local SPAN session associates a destination port with source ports. You can monitor incoming or outgoing traffic on a series or range of ports and source VLANs. An RSPAN session associates source ports and source VLANs across your network with an RSPAN VLAN. The destination source is the RSPAN VLAN.

You configure SPAN sessions by using parameters that specify the source of network traffic to monitor. You can configure multiple SPAN or RSPAN sessions with separate or overlapping sets of SPAN sources. Both switched and routed ports can be configured as SPAN sources or destination ports.

An RSPAN source session associates SPAN source ports or VLANs with a destination RSPAN VLAN. An RSPAN destination session associates an RSPAN VLAN with a destination port.

SPAN sessions do not interfere with the normal operation of the switch; however, an oversubscribed SPAN destination (for example, a 10-Mbps port monitoring a 100-Mbps port) results in dropped or lost packets.

You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.

A SPAN session remains inactive after system startup until the destination port is operational.

Traffic Types

SPAN sessions include these traffic types:

- Receive (Rx) SPAN—The goal of receive (or ingress) SPAN is to monitor as much as possible all packets received by the source interface or VLAN before any modification or processing is performed by the switch. A copy of each packet received by the source is sent to the destination port for that SPAN session. You can monitor a series or range of ingress ports or VLANs in a SPAN session.

  On tagged packets (Inter-Switch Link IEEE 802.1Q), the tagging is removed at the ingress port. At the destination port, if tagging is enabled, the packets appear with 802.1Q headers. If no tagging is specified, packets appear in the native format.

  Packets that are modified because of routing are copied without modification for Rx SPAN; that is, the original packet is copied. Packets that are modified because of quality of service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied without modification for Rx SPAN.
Some features that can cause a packet to be dropped during receive processing have no effect on SPAN; the destination port receives a copy of the packet even if the actual incoming packet is dropped. These features include IP standard and extended input access control lists (ACLs), IP standard and extended output ACLs for unicast and ingress QoS policing, VLAN maps, ingress QoS policing, and policy-based routing. Switch congestion that causes packets to be dropped also has no effect on SPAN.

- **Transmit (Tx) SPAN**—The goal of transmit (or egress) SPAN is to monitor as much as possible all packets sent by the source interface after the switch performs all modification and processing. After the packet is modified, the source sends a copy of each packet to the destination port for that SPAN session. You can monitor a range of egress ports in a SPAN session.

Packets that are modified because of routing—for example, with a time-to-live (TTL) or MAC-address modification—are duplicated at the destination port. On packets that are modified because of QoS, the modified packet might not have the same DSCP (IP packet) or CoS (non-IP packet) as the SPAN source.

Some features that can cause a packet to be dropped during transmit processing might also affect the duplicated copy for SPAN. These features include VLAN maps, IP standard and extended output ACLs on multicast packets, and egress QoS policing. In the case of output ACLs, if the SPAN source drops the packet, the SPAN destination would also drop the packet. In the case of egress QoS policing, if the SPAN source drops the packet, the SPAN destination might not drop it. If the source port is oversubscribed, the destination ports have different dropping behavior.

- **Both**—In a SPAN session, you can monitor a single port series or a range of ports for both received and sent packets.

### Source Port

A source port (also called a monitored port) is a switched or routed port that you monitor for network traffic analysis. In a single local SPAN session or RSPAN source session, you can monitor source port traffic, such as received (Rx), transmitted (Tx), or bidirectional (both). The switch supports any number of source ports (up to the maximum number of available ports on the switch) and any number of source VLANs.

A source port has these characteristics:

- It can be any port type (for example, EtherChannel, Fast Ethernet, Gigabit Ethernet, and so forth).
- It can be monitored in multiple SPAN sessions.
- It cannot be a destination port.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor. For EtherChannel sources, the monitored direction would apply to all physical ports in the group.
- Source ports can be in the same or different VLANs.
- For VLAN SPAN sources, all active ports in the source VLAN are included as source ports.

You can configure a trunk port as a source port. By default, all VLANs active on the trunk are monitored. You can limit SPAN traffic monitoring on trunk source ports to specific VLANs by using VLAN filtering. Only switched traffic in the selected VLANs is sent to the destination port. This feature affects only traffic forwarded to the destination SPAN port and does not affect the switching of normal traffic. This feature is not allowed in sessions with VLAN sources.
Destination Port

Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports and VLANs.

A destination port has these characteristics:

- A destination port must reside on the same switch as the source port (for a local SPAN session).
- A destination port can be any Ethernet physical port.
- A destination port can participate in only one SPAN session at a time. (A destination port in one SPAN session cannot be a destination port for a second SPAN session.)
- A destination port cannot be a source port.
- A destination port cannot be an EtherChannel group.
- A destination port can be a physical port that is assigned to an EtherChannel group, even if the EtherChannel group has been specified as a SPAN source. The port is removed from the group while it is configured as a SPAN destination port.
- The port does not transmit any traffic except that traffic required for the SPAN session unless learning is enabled. If learning is enabled, the port also transmits traffic directed to hosts that have been learned on the destination port.
- If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.
- A destination port does not participate in spanning tree while the SPAN session is active.
- When it is a destination port, it does not participate in any of the Layer 2 protocols (STP, VTP, CDP, DTP, PagP).
- A destination port that belongs to a source VLAN of any SPAN session is excluded from the source list and is not monitored.
- A destination port receives copies of sent and received traffic for all monitored source ports. If a destination port is oversubscribed, it could become congested and result in packet drops at the destination port. This congestion does not affect traffic forwarding on the source ports.

VLAN-Based SPAN

VLAN-based SPAN (VSPAN) is the monitoring of the network traffic in one or more VLANs.

Use these guidelines for VSPAN sessions:

- Traffic on RSPAN VLANs is not monitored by VLAN-based SPAN sessions.
- Only traffic on the monitored VLAN is sent to the destination port.
- If a destination port belongs to a source VLAN, it is excluded from the source list and is not monitored.
- If ports are added to or removed from the source VLANs, the traffic on the source VLAN received by those ports is added to or removed from the sources being monitored.
- VLAN pruning and the VLAN allowed list have no effect on SPAN monitoring.
About SPAN and RSPAN

- VSPAN monitors only traffic that enters the switch, not traffic that is routed between VLANs. For example, if a VLAN is being Rx-monitored, and the multilayer switch routes traffic from another VLAN to the monitored VLAN, that traffic is not monitored and is not received on the SPAN destination port.

- You cannot use filter VLANs in the same session with VLAN sources.

- You can monitor only Ethernet VLANs.

SPAN Traffic

You can use local SPAN to monitor all network traffic, including multicast and bridge protocol data unit (BPDU) packets, Cisco Discovery Protocol (CDP), VLAN Trunk Protocol (VTP), Dynamic Trunking Protocol (DTP), Spanning Tree Protocol (STP), and Port Aggregation Protocol (PAgP) packets. You cannot use RSPAN to monitor Layer 2 protocols. See the “RSPAN Configuration Guidelines” section on page 55-16 for more information.)

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the sources a1 Rx monitor and the a2 Rx and Tx monitor to destination port d1. If a packet enters the switch through a1 and is switched to a2, both incoming and outgoing packets are sent to destination port d1. Both packets are the same (unless a Layer-3 rewrite occurs, in which case the packets are different because of the added Layer 3 information).

SPAN and RSPAN Session Limits

You can configure a maximum of sixteen SPAN/RSPAN sessions (eight concurrent sessions with ingress-only sources and eight concurrent sessions with egress-only sources). Bidirectional sources count as both ingress and egress. RSPAN destination sessions count as a session containing an ingress source.

Default SPAN and RSPAN Configuration

Table 55-1 shows the default SPAN and RSPAN configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPAN state</td>

</table>
## Configuring SPAN

The following sections describe how to configure SPAN:

- SPAN Configuration Guidelines and Restrictions, page 55-7
- Configuring SPAN Sources, page 55-8
- Configuring SPAN Destinations, page 55-9
- Monitoring Source VLANs on a Trunk Interface, page 55-9
- Configuration Scenario, page 55-10
- Verifying a SPAN Configuration, page 55-10

**Note**

Entering SPAN configuration commands does not clear previously configured SPAN parameters. You must enter the **no monitor session** command to clear configured SPAN parameters.

## SPAN Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when configuring SPAN:

- You must use a network analyzer to monitor interfaces.
- You cannot mix source VLANs and filter VLANs within a SPAN session. You can have source VLANs or filter VLANs, but not both at the same time.
- EtherChannel interfaces can be SPAN source interfaces; they cannot be SPAN destination interfaces.
- When you specify source interfaces and do not specify a traffic type (Tx, Rx, or both), “both” is used by default. To change from both to either “tx” or “rx,” unconfigure the corresponding other type “rx” or “tx” with the **no monitor session** {session_number} {source {interface interface_list | {vlan vlan_IDs | cpu [queue queue_ids]}} {rx | tx} command.
- If you specify multiple SPAN source interfaces, the interfaces can belong to different VLANs.
- You must enter the **no monitor session** number command with no other parameters to clear the SPAN session number.
- The **no monitor** command clears all SPAN sessions.
- SPAN destinations never participate in any spanning tree instance. SPAN includes BPDUs in the monitored traffic, so any BPDUs seen on the SPAN destination are from the SPAN source.
- SPAN is limited to one destination port per session.
- When you create a SPAN session, it sets the packet filter to good automatically and hence you will see another configuration line:

  monitor session 1 filter packet-type good rx

Reenter the **monitor session 1 filter packet-type good rx** command.
Configuring SPAN Sources

To configure the source for a SPAN session, perform this task:

Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# [no] monitor session (session_number) {source {interface interface_list</td>
<td>(vlan vlan_IDs</td>
</tr>
</tbody>
</table>

This example shows how to configure SPAN session 1 to monitor bidirectional traffic from source interface Fast Ethernet 5/1:

```
Switch(config)# monitor session 1 source interface fastethernet 5/1
```

This example shows how to configure sources with differing directions within a SPAN session:

```
Switch(config)# monitor session 1 source interface fa2/3 rx
Switch(config)# monitor session 1 source interface fa2/2 tx
```
Configuring SPAN Destinations

To configure the destination for a SPAN session, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# [no] monitor session &lt;session_number&gt; destination interface &lt;interface&gt; [encapsulation {dot1q}] [ingress {vlan vlan_IDs} [learning]]</td>
<td>Specifies the SPAN session number (1 through 6) and the destination interfaces or VLANs. For session_number, specifies the session number identified with this RSPAN session (1 through 6). For interface, specifies the destination interface. For vlan_IDs, specifies the destination VLAN. Use the no keyword to restore the defaults.</td>
</tr>
</tbody>
</table>

Note

SPAN is limited to one destination port per session.

This example shows how to configure interface Fast Ethernet 5/48 as the destination for SPAN session 1:

Switch(config)# monitor session 1 destination interface fastethernet 5/48

Monitoring Source VLANs on a Trunk Interface

To monitor specific VLANs when the SPAN source is a trunk interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# [no] monitor session (session_number) filter {vlan vlan_IDs [ , -</td>
<td>]}</td>
</tr>
</tbody>
</table>

This example shows how to monitor VLANs 1 through 5 and VLAN 9 when the SPAN source is a trunk interface:

Switch(config)# monitor session 2 filter vlan 1 - 5 , 9
Chapter 55      Configuring SPAN and RSPAN

Configuration Scenario

This example shows how to use the commands described in this chapter to completely configure and unconfigure a span session. Assume that you want to monitor bidirectional traffic from source interfaces Fast Ethernet 4/10, 4/11 and 4/12. Interface 4/10 is configured as a trunk interface carrying VLANs 1 through 4094. Interface Fast Ethernet 4/11 is configured as an access port in VLAN 57 and interface Fast Ethernet 4/12 is configured as an access port in VLAN 58. You want to monitor only traffic in VLAN 57 in that session. Using Fast Ethernet 4/15 as your destination interface, you would enter the following commands:

Switch(config)# monitor session 1 source interface fastethernet 4/10 - 12
Switch(config)# monitor session 1 filter vlan 57
Switch(config)# monitor session 1 destination interface fastethernet 4/15

You are now monitoring traffic from interface Fast Ethernet 4/10 that is on VLAN 57 out of interface FastEthernet 4/15. To disable the span session enter the following command:

Switch(config)# no monitor session 1

Verifying a SPAN Configuration

This example shows how to verify the configuration of SPAN session 2:

Switch# show monitor session 2
Session 2
--------
Source Ports:       RX Only:  Fa5/12
                    TX Only:  None
                    Both:  None
Source VLANs:
                    RX Only:  None
                    TX Only:  None
                    Both:  None
Destination Ports:  Fa5/45
Filter VLANs:       1-5,9
Switch#

CPU Port Sniffing

When configuring a SPAN session, you can specify the CPU (or a subset of CPU queues) as a SPAN source. Queues may be specified either by number or by name. When such a source is specified, traffic going to the CPU through one of the specified queues is mirrored and sent out of the SPAN destination port in the session. This traffic includes both control packets and regular data packets that are sent to or from the CPU (due to software forwarding).

You can mix the CPU source with either regular port sources or VLAN sources.
To configure CPU source sniffing, perform this task:

```
Switch(config)# [no] monitor session 
    {session_number} {source {interface 
    interface_list | {vlan vlan_IDs | cpu 
    [queue queue_ids] } [rx | tx | both]
```

**Command**

Switch(config)# [no] monitor session 1 source cpu rx

**Purpose**

Specifies that the CPU causes traffic received by
or sent from the CPU to be copied to the
destination of the session. The *queue* identifier
optionally allows sniffing-only traffic (received)
on the specified CPU queue(s).

For *session_number*, specifies the session number
identified with this SPAN session (1 through 6).

For *interface-list*, specifies the source port to
monitor. Valid interfaces include physical
interfaces and port-channel logical interfaces
*(port-channel port-channel-number)*.

For *vlan_IDs*, specifies the source VLAN.

For *queue_ids*, specifies the queue(s) involved.

(Optional) *,, |-* Specifies a series or range of
interfaces. Enter a space after the comma; enter a
space before and after the hyphen.

(Optional) Specifies the direction of traffic to
monitor. If you do not specify a traffic direction,
the source interface sends both transmitted (Tx)
and received (Rx) traffic. Only received traffic
can be monitored on additional source ports.

- **Rx**—Monitor received traffic.
- **Tx**—Monitor transmitted traffic.
- **both**—Monitor both received and transmitted
  traffic (bidirectional).

Queues may be identified either by number or by
name. Queue names may subsume multiple
numbered queues for convenience.

Use the *no* keyword to restore the defaults.

This example shows how to configure a CPU source to sniff all packets received by the CPU:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# monitor session 1 source cpu rx
```

This example shows how to use queue names and queue number ranges for the CPU as a SPAN source:

```
Switch(config)# monitor session 2 source cpu queue control-packet rx
Switch(config)# monitor session 3 source cpu queue 10 rx
```

**Note**

cache-packet is mapped to queue 10.
Encapsulation Configuration

When configuring a SPAN destination port, you can explicitly specify the encapsulation type used by the port. Packets sent out the port are tagged in accordance with the specified mode. (The encapsulation mode also controls how tagged packets are handled when the ingress packet option is enabled.) The Catalyst 4500 series switch supervisor engines support 802.1q encapsulation and untagged packets.

**Note**

Only 802.1q encapsulation is supported.

The “replicate” encapsulation type (in which packets are transmitted from the destination port using whatever encapsulation applied to the original packet) is not supported. If no encapsulation mode is specified, the port default is untagged.

Ingress Packets

When ingress is enabled, the SPAN destination port accepts incoming packets (potentially tagged depending on the specified encapsulation mode) and switches them normally. When configuring a SPAN destination port, you can specify whether the ingress feature is enabled and what VLAN to use to switch untagged ingress packets. Although the port is STP forwarding, it does not participate in the STP, so use caution when configuring this feature lest a spanning-tree loop be introduced in the network. When both ingress and a trunk encapsulation are specified on a SPAN destination port, the port goes forwarding in all active VLANs. Configuring a non-existent VLAN as an ingress VLAN is not allowed.

By default, host learning is disabled on SPAN destination ports with ingress enabled. The port is also removed from VLAN floodsets, so regular traffic is not switched out of the destination port. If learning is enabled, then traffic for hosts learned on the destination port is switched out the destination port. A host connected to the SPAN destination port will not receive broadcast ARP requests and will not respond. You can also configure static host entries (including a static ARP entry and a static entry in the MAC-address table) on SPAN destination ports.

**Note**

This configuration does not work if the SPAN session does not have a source configured; the session is half configured with only the SPAN destination port.

To configure ingress packets and encapsulation, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# [no] monitor session session_number destination interface interface [encapsulation {dot1q}] [ingress [vlan vlan_IDs] [learning]]</code></td>
<td>Specifies the configuration of the ingress packet and the encapsulation type of the destination port. For <code>session_number</code>, specifies the session number identified with this SPAN session (1 through 6). For <code>interface</code>, specifies the destination interface. For <code>vlan_IDs</code>, specifies the destination VLAN. Use the <code>no</code> keyword to restore the defaults.</td>
</tr>
</tbody>
</table>
This example shows how to configure a destination port with 802.1q encapsulation and ingress packets using native VLAN 7:

```
Switch(config)# monitor session 1 destination interface fastethernet 5/48
         encapsulation dot1q ingress vlan 7
```

With this configuration, traffic from SPAN sources associated with session 1 would be copied out of interface Fast Ethernet 5/48, with 802.1q encapsulation. Incoming traffic would be accepted and switched, with untagged packets being classified into VLAN 7.

## Access List Filtering

When configuring a SPAN session, you can apply access list filtering. Access list filtering applies to all packets passing through a SPAN destination port that might be sniffed in the egress or ingress direction. Access list filters are allowed on local SPAN sessions only. If the SPAN destination is an RSPAN VLAN, the access list filter is rejected.

**Note**

Access list filtering is available in Cisco IOS Release 12.2(20)EW and later releases.

## ACL Configuration Guidelines

You can configure ACLs on a SPAN session. Use these guidelines for ACL/SPAN sessions:

- If an ACL is associated with a SPAN session, the rules associated with that ACL are applied against all packets exiting the SPAN destination interface. Rules pertaining to other VACLs or RACLs previously associated with the SPAN destination interface are not applied.
- Only one ACL can be associated with a SPAN session.
- When no ACLs are applied to packets exiting a SPAN destination interface, all traffic is permitted regardless of the PACLs, VACLs, or RACLs that have been previously applied to the destination interface or VLAN to which the SPAN destination interface belongs.
- If an ACL is removed from a SPAN session, all traffic is permitted once again.
- If SPAN configuration is removed from the SPAN session, all rules associated with the SPAN destination interface are applied once again.
- If a SPAN destination port is configured as a trunk port and the VLANs to which it belongs have ACLs associated with them, the traffic is not subjected to the VACLs.
- ACL configuration applies normally to the RSPAN VLAN and to trunk ports carrying the RSPAN VLAN. This configuration enables you to apply VACLs on RSPAN VLANs. If a user attempts to configure an ACL on a SPAN session with the destination port as an RSPAN VLAN, the configuration is rejected.
- If CAM resources are exhausted and packets are passed to the CPU for lookup, any output port ACLs associated with a SPAN session are not applied.
- If a named IP ACL is configured on a SPAN session before an ACL is created, the configuration is accepted, and the software creates an empty ACL with no ACEs. (An empty ACL permits all packets.) Subsequently, the rules can be added to the ACL.
- The ACLs associated with a SPAN session are applied on the destination interface on output.
- No policing is allowed on traffic exiting SPAN ports.

Only IP ACLs are supported on SPAN sessions.

Configuring Access List Filtering

To configure access list filtering, perform this task:

```
Note
IP access lists must be created in configuration mode as described in the chapter “Configuring Network Security with ACLs.”
```

This example shows how to configure IP access group 10 on a SPAN session and verify that an access list has been configured:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# monitor session 1 source interface fa6/1 both
Switch(config)# monitor session 1 destination interface fa6/2
Switch(config)# monitor session 1 filter vlan 1
Switch(config)# monitor session 1 filter ip access-group 10
Switch(config)# exit
Switch# show monitor
Session 1
---------
Type : Local Session
Source Ports :
    Both : Fa6/1
Destination Ports : Fa6/2
    Encapsulation : Native
    Ingress : Disabled
    Learning : Disabled
Filter VLANs : 1
IP Access-group : 10
```

Packet Type Filtering

When configuring a SPAN session, you can specify packet filter parameters similar to VLAN filters. When specified, the packet filters indicate types of packets that may be sniffed. If no packet filters are specified, packets of all types may be sniffed. Different types of packet filters may be specified for ingress and egress traffic.
The two categories of packet filtering are packet-based (good, error) or address-based (unicast/multicast/broadcast). Packet-based filters can only be applied in the ingress direction. Packets are classified as broadcast, multicast, or unicast by the hardware based on the destination address.

**Note**

When filters of both types are configured, only packets that pass both filters are spanned. For example, if you set both "error" and "multicast," only multicast packets with errors are spanned.

To configure packet type filtering, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config)# [no] monitor session 
(session_number) filter {vlan vlan_IDs 
[, | - ] } | Specifies filter sniffing of the specified packet types in the specified directions. |
| | For session_number, specifies the session number identified with this SPAN session (1 through 6). |
| | For vlan_IDs, specifies the VLAN. |
| | You can specify both Rx and Tx type filters, as well as specify multiple type filters at the same time (such as good and unicast to only sniff non-error unicast frames). As with VLAN filters, if no type or filter is specified, then the session sniffs all packet types. |
| | Use the no keyword to restore the defaults. |

This example shows how to configure a session to accept only unicast packets in the ingress direction:

Switch(config)# monitor session 1 filter address-type unicast rx

**Configuration Example**

The following is an example of SPAN configuration using some of the SPAN enhancements.

In this example, you configure a session to sniff unicast traffic arriving on interface Gi1/1.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# monitor session 1 source interface gi1/1
Switch(config)# monitor session 1 destination interface gi1/2 encapsulation dot1q ingress
Switch(config)# monitor session 1 filter address-type unicast rx
Switch(config)# exit
Switch# show monitor

Session 1
--------
Type : Local Session
Source Ports :
RX Only : Gi1/1
Destination Ports : Gi1/2
Encapsulation : DOT1Q
Ingress : Enabled
Learning : Disabled
Filter Addr Type :
RX Only : Unicast
Configuring RSPAN

This section describes how to configure RSPAN on your switch and it contains this configuration information:

- RSPAN Configuration Guidelines, page 55-16
- Creating an RSPAN Session, page 55-17
- Creating an RSPAN Destination Session, page 55-18
- Creating an RSPAN Destination Session and Enabling Ingress Traffic, page 55-19
- Removing Ports from an RSPAN Session, page 55-20
- Specifying VLANs to Monitor, page 55-21
- Specifying VLANs to Filter, page 55-23

RSPAN Configuration Guidelines

Follow these guidelines when configuring RSPAN:

Note

Since RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.

Note

You can apply an output access control list (ACL) to RSPAN traffic to selectively filter or monitor specific packets. Specify these ACLs on the RSPAN VLAN in the RSPAN source switches.

- RSPAN sessions can coexist with SPAN sessions within the limits described in the “SPAN and RSPAN Session Limits” section on page 55-6.
- For RSPAN configuration, you can distribute the source ports and the destination ports across multiple switches in your network.
- RSPAN does not support BPDU packet monitoring or other Layer 2 switch protocols.
- The RSPAN VLAN is configured only on trunk ports and not on access ports. To avoid unwanted traffic in RSPAN VLANs, make sure that all participating switches support the VLAN remote-span feature. Access ports on the RSPAN VLAN are silently disabled.
- You should create an RSPAN VLAN before configuring an RSPAN source or destination session.
- If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network for VLAN-IDs that are lower than 1005.
- Because RSPAN traffic is carried across a network on an RSPAN VLAN, the original VLAN association of the mirrored packets is lost. RSPAN can only support forwarding of traffic from an IDS device onto a single user-specified VLAN.
Creating an RSPAN Session

First create an RSPAN VLAN that does not exist for the RSPAN session in any of the switches that participate in RSPAN. With VTP enabled in the network, you can create the RSPAN VLAN in one switch, and then VTP propagates it to the other switches in the VTP domain for VLAN-IDs that are lower than 1005.

Use VTP pruning to get efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

To start an RSPAN source session and to specify the source (monitored) ports and the destination RSPAN VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# no monitor session {session_number</td>
<td>all</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# vlan {remote_vlan_ID}</td>
<td>Specifies a remote VLAN ID. Ensure that the VLAN ID is not being used for any user traffic.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-vlan)# remote-span</td>
<td>Converts the VLAN ID to a remote VLAN ID.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-vlan)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# [no] monitor session {session_number} {source {interface interface_list</td>
<td>(vlan vlan_IDs</td>
</tr>
<tr>
<td>• Rx—Monitor received traffic.</td>
<td></td>
</tr>
<tr>
<td>• Tx—Monitor transmitted traffic.</td>
<td></td>
</tr>
<tr>
<td>• both—Monitor both received and transmitted traffic (bidirectional).</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 55      Configuring SPAN and RSPAN

Configuring RSPAN

This example shows how to clear any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination RSPAN VLAN.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface fastEthernet3/10 tx
Switch(config)# monitor session 1 source interface fastEthernet3/2 rx
Switch(config)# monitor session 1 source interface fastEthernet3/3 rx
Switch(config)# monitor session 1 source interface port-channel 102 rx
Switch(config)# monitor session 1 destination remote vlan 901
Switch(config)# end

Creating an RSPAN Destination Session

To create an RSPAN destination session and to specify the source RSPAN VLAN and the destination port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# monitor session session_number destination remote vlan vlan-ID</td>
<td>Specifies the RSPAN session and the destination remote VLAN. For session_number, specifies the session number identified with this RSPAN session (1 through 6). For vlan-ID, specifies the RSPAN VLAN to carry the monitored traffic to the destination port.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

| Step 8 | Switch(config)# show monitor [session session_number] | Verifies your entries. |

| Step 9 | Switch(config)# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

This example shows how to clear any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination RSPAN VLAN.

Switch(config)# monitor session 1 destination remote vlan 901
Switch(config)# end

Creating an RSPAN Destination Session

To create an RSPAN destination session and to specify the source RSPAN VLAN and the destination port, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

| Step 1 | Switch(config)# monitor session session_number source remote vlan vlan-ID | Specifies the RSPAN session and the source RSPAN VLAN. For session_number, specifies the session number identified with this RSPAN session (1 through 6). For vlan-ID, specifies the source RSPAN VLAN to monitor. |

<table>
<thead>
<tr>
<th>Step 2</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

| Step 3 | Switch(config)# show monitor | Verifies your entries. |

| Step 4 | Switch(config)# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
Chapter 55   Configuring SPAN and RSPAN

### Configuring RSPAN

This example shows how to configure VLAN 901 as the source remote VLAN and port 5 as the destination interface:

```plaintext
Switch(config)# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)#
```

#### Step 3

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# [no] monitor session session_number destination interface [encapsulation {dot1q}] [ingress [vlan vlan_IDs] [learning]]</td>
<td>Specifies the RSPAN session and the destination interface. For <code>session_number</code>, specifies the session number identified with this RSPAN session (1 through 6). For <code>interface</code>, specifies the destination interface. For <code>vlan_IDs</code>, specifies the ingress VLAN, if necessary. (Optional) `[,]</td>
</tr>
</tbody>
</table>

```plaintext
Switch(config)# end
Returns to privileged EXEC mode.
```

#### Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show monitor [session session_number]</td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>

#### Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to configure VLAN 901 as the source remote VLAN and port 5 as the destination interface:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)#
```

#### Step 1

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

#### Step 2

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# monitor session {session_number} source vlan vlan_IDs</td>
<td>Specifies the RSPAN session and the source RSPAN VLAN. For <code>session_number</code>, specifies the session number identified with this RSPAN session (1 through 6). For <code>vlan_IDs</code>, specifies the source VLAN or VLANs to monitor. Valid VLANs are in the range from 1 to 4094.</td>
</tr>
</tbody>
</table>
Configuring SPAN and RSPAN

Chapter 55

Configuring RSPAN

This example shows how to configure VLAN 901 as the source remote VLAN and how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports 802.1Q encapsulation:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface gigabitEthernet1/2 ingress vlan 5
Switch(config)#

Removing Ports from an RSPAN Session

To remove a port as an RSPAN source for a session, perform this task:

Command

| Step 3 |
|-----------------|-----------------
| Switch(config)# [monitor session session_number destination interface interface-id [encapsulation (dot1q ingress vlan vlan-id) | ingress vlan vlan-id] [learning]] | Specifies the RSPAN session, the destination port, the packet encapsulation, and the ingress VLAN. For **session_number**, specifies the session number identified with this RSPAN session (1 through 6). For **interface-id**, specifies the destination port. Valid interfaces include physical interfaces. (Optional) Specifies the encapsulation of the packets transmitted on the RSPAN destination port. If no encapsulation is specified, all transmitted packets are sent in native format (untagged).

- Enter **encapsulation dot1q** to send native VLAN packets untagged, and all other VLAN tx packets tagged **dot1q**.

(Optional) Specifies whether forwarding is enabled for ingress traffic on the RSPAN destination port.

- For native (untagged) and **dot1q** encapsulation, specify **ingress vlan vlan-id** to enable ingress forwarding with **vlan-id** as the native VLAN; **vlan-id** is also used as the native VLAN for transmitted packets.

- Specify **learning** to enable learning when ingress is enabled.

| Command |
|-----------------|-----------------
| Step 4 |
| Switch(config)# end | Returns to privileged EXEC mode. |
| Step 5 |
| Switch# show monitor [session session_number] | Verifies your entries. |
| Step 6 |
| Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
### Configuring RSPAN

This example shows how to remove port 1 as an RSPAN source for RSPAN session 1:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no monitor session 1 source interface gigabitEthernet1/1
Switch(config)# end
```

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

```plaintext
Switch(config)# no monitor session 1 source interface gigabitEthernet1/1 rx
```

The monitoring of traffic received on port 1 is disabled, but traffic transmitted from this port continues to be monitored.

### Specifying VLANs to Monitor

VLAN monitoring is similar to port monitoring. To specify VLANs to monitor, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch# configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**Switch(config)# [no] monitor session {session_number} {source [interface interface_list</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Switch(config)# end</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Switch# show monitor [session session_number]</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Switch# copy running-config startup-config</strong></td>
</tr>
</tbody>
</table>

This example shows how to remove port 1 as an RSPAN source for RSPAN session 1:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no monitor session 1 source interface gigabitEthernet1/1
Switch(config)# end
```

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

```plaintext
Switch(config)# no monitor session 1 source interface gigabitEthernet1/1 rx
```

The monitoring of traffic received on port 1 is disabled, but traffic transmitted from this port continues to be monitored.
To remove one or more source VLANs from the RSPAN session, use the `no monitor session
session_number
source vlan vlan-id
{rx | tx | both}` global configuration command.

This example shows how to clear any existing configuration on RSPAN session 2, configure RSPAN
session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to
destination remote VLAN 902. The configuration is then modified to also monitor received traffic on all
ports belonging to VLAN 10.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>Switch# configure terminal</code> Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** | `Switch(config)# no monitor session (session_number | all | local | remote)` Clears any existing SPAN configuration for the session.  
For `session_number`, specifies the session number identified with this RSPAN session (1 through 6).  
Specify `all` to remove all SPAN sessions, `local` to remove all local sessions, or `remote` to remove all remote SPAN sessions. |
| **Step 3** | `Switch(config)# [no] monitor session (session_number) {source (interface interface_list | (vlan vlan_IDs | cpu [queue queue_ids]) | [rx | tx | both] Specifies the RSPAN session and the source VLANs (monitored VLANs). You can monitor only received (`rx`) traffic on VLANs.  
For `session_number`, specifies the session number identified with this RSPAN session (1 through 6).  
For `interface-list`, specifies the source port to no longer monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (`port-channel port-channel-number`).  
For `vlan-IDs`, the range is 1 to 4094; do not enter leading zeros.  
For `queue_ids`, specifies the source queue.  
(Optional) `[,-]` Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen.  
(Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both transmitted (Tx) and received (Rx) traffic. Only received traffic can be monitored on additional source ports.  
• `Rx`—Monitor received traffic.  
• `Tx`—Monitor transmitted traffic.  
• `both`—Monitor both received and transmitted traffic (bidirectional). |
| **Step 4** | `Switch(config)# monitor session session_number destination remote vlan vlan-id` Specifies the RSPAN session, the destination remote VLAN.  
For `session_number`, specifies the session number identified with this RSPAN session (1 through 6).  
For `vlan-id`, specifies the RSPAN VLAN to carry the monitored traffic to the destination port. |
| **Step 5** | `Switch(config)# end` Returns to privileged EXEC mode. |
| **Step 6** | `Switch# show monitor [session session_number]` Verifies your entries. |
| **Step 7** | `Switch# copy running-config startup-config` (Optional) Saves your entries in the configuration file. |
Configuring RSPAN

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source vlan 1 - 3 rx
Switch(config)# monitor session 2 destination remote vlan 902
Switch(config)# monitor session 2 source vlan 10 rx
Switch(config)# end

Specifying VLANs to Filter

To limit RSPAN source traffic to specific VLANs, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# no monitor session</td>
<td>Clears any existing SPAN configuration for the session.</td>
</tr>
<tr>
<td>{session_number</td>
<td>all</td>
</tr>
<tr>
<td>Switch(config)# [no] monitor session</td>
<td>Specifies the characteristics of the source port (monitored port) and RSPAN session.</td>
</tr>
<tr>
<td>{session_number}</td>
<td>For session_number, specifies the session number identified with this RSPAN session (1 through 6).</td>
</tr>
<tr>
<td>{source}</td>
<td>For interface-list, specifies the source port to monitor. The interface specified must already be configured as a trunk port.</td>
</tr>
<tr>
<td>{interface interface_list}</td>
<td>For vlan-IDs, the range is 1 to 4094; do not enter leading zeros.</td>
</tr>
<tr>
<td>{vlan vlan_IDs</td>
<td>cpu}</td>
</tr>
<tr>
<td>{queue queue_ids}</td>
<td>(Optional) [,</td>
</tr>
<tr>
<td>[rx</td>
<td>tx</td>
</tr>
<tr>
<td>• Rx—Monitor received traffic.</td>
<td></td>
</tr>
<tr>
<td>• Tx—Monitor transmitted traffic.</td>
<td></td>
</tr>
<tr>
<td>• both—Monitor both received and transmitted traffic (bidirectional).</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# monitor session</td>
<td>Limits the RSPAN source traffic to specific VLANs.</td>
</tr>
<tr>
<td>session_number</td>
<td>For session_number, specifies the session number identified with this RSPAN session (1 through 6).</td>
</tr>
<tr>
<td>filter vlan vlan-id</td>
<td>For vlan-id, the range is 1 to 4094; do not enter leading zeros.</td>
</tr>
<tr>
<td>[,</td>
<td>-]</td>
</tr>
</tbody>
</table>
Chapter 55      Configuring SPAN and RSPAN

Displaying SPAN and RSPAN Status

To display the status of the current SPAN or RSPAN configuration, use the show monitor privileged EXEC command.

This example displays the output for the show monitor command for SPAN source session 1:

```
Switch# show monitor session 1
Session 1
---------
Type: Local Source Session
Source Ports:
  RX Only:  Fa3/13
  TX Only:  None
  Both:     None

Source VLANs:
  RX Only:  None
  TX Only:  None
  Both:     None
Source RSPAN VLAN: None
Destination Ports: None
  Encapsulation: DOT1Q
  Ingress:Enabled, default VLAN=5
Filter VLANs:  None
Dest RSPAN VLAN: None
Ingress : Enabled, default VLAN=2
Learning : Disabled
```

Step 5

```
Switch(config)# monitor session session_number destination remote vlan vlan-id
```

Specifies the RSPAN session, the destination remote VLAN. For `session_number`, specifies the session number identified with this RSPAN session (1 through 6). For `vlan-id`, specifies the RSPAN VLAN to carry the monitored traffic to the destination port.

Step 6

```
Switch(config)# end
```

Returns to privileged EXEC mode.

Step 7

```
Switch# show monitor [session session_number]
```

Verifies your entries.

Step 8

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

To monitor all VLANs on the trunk port, use the `no monitor session session_number filter vlan` global configuration command.

This example shows how to clear any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor traffic received on trunk port 4, and send traffic for only VLANs 1 through 5 and 9 to destination remote VLAN 902.

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source interface gigabitethernet1/1 rx
Switch(config)# monitor session 2 filter vlan 1 - 5 , 9
Switch(config)# monitor session 2 destination remote vlan 902
Switch(config)# end
```

Displaying SPAN and RSPAN Status
Configuring Wireshark

Wireshark is only supported on Supervisor Engine 7-E, Supervisor Engine 7L-E, and Catalyst 4500X-32.

Beginning with Cisco IOS Release XE 3.3.0SG in the IP Base and Enterprise Services feature sets, the Catalyst 4500 series switch supports Wireshark, a packet analyzer program, formerly known as Ethereal, which supports multiple protocols and presents information in a text-based user interface.

This chapter includes these sections:
- About Wireshark, page 56-1
- Feature Interactions, page 56-6
- Configuring Wireshark, page 56-7
- Guidelines and Restrictions, page 56-10
- Monitoring Wireshark, page 56-13
- Usage Examples for Wireshark, page 56-17

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

About Wireshark

To understand what happens inside a network requires the ability to capture and analyze traffic. Prior to Cisco IOS Release XE 3.3.0SG, the Catalyst 4500 series switch offered only two features to address this need: SPAN and debug platform packet. Both are limited. SPAN is ideal for capturing packets, but can only deliver them by forwarding them to some specified local or remote destination; it provides no local
display or analysis support. The `debug platform packet` command is specific to the Catalyst 4500 series switch and only works on packets that stem from the software process-forwarding path. Although it has limited local display capabilities, it has no analysis support.

So the need exists for a traffic capture and analysis mechanism that is applicable to both hardware and software forwarded traffic and that provides strong packet capture, display and analysis support, preferably using a well known interface.

Wireshark dumps packets to a file using a well known format called `.pcap`, and is applied or enabled on individual interfaces. You specify an interface in EXEC mode along with the filter and other parameters. The Wireshark application is applied only when you enter a `start` command and is removed only when Wireshark stops capturing packets either automatically or manually.

---

**Note**

In Cisco IOS Release XE 3.3.0SG, global packet capture on Wireshark is not supported.

These sections describe some key concepts for Wireshark:

- **Capture Points**, page 56-2
- **Attachment Points: Interfaces and traffic directions**, page 56-2
- **Filters**, page 56-3
- **Actions**, page 56-4
- **Storing Captured Packets to Buffer in Memory**, page 56-4

---

**Capture Points**

A capture point is the central policy definition of the Wireshark feature. The point describes all the characteristics associated with a given instance of Wireshark: what packets to capture, where to capture them from, what to do with the captured packets, and when to stop. Capture points can be modified after creation and do not become active until explicitly activated with a `start` command. This process is termed *activating the capture point* or *starting the capture point*. Capture points are identified by name and may also be manually or automatically deactivated or stopped.

Multiple capture points may be defined and activated simultaneously.

---

**Attachment Points: Interfaces and traffic directions**

An attachment point is a point in the logical packet process path associated with a capture point. Consider an attachment point as an attribute of the capture point. Packets that impact an attachment point are tested against the capture point's filters; packets that match are copied and sent to the capture point's associated Wireshark instance. A specific capture point can be associated with multiple attachment points, with limits on mixing attachment points of different types. Some restrictions apply when you specify attachment points of different types. Attachment points are directional (input or output or both) with the exception of the Layer 2 VLAN attachment point, which is always bidirectional.
Filters

Filters are attributes of a capture point that identify and limit the subset of traffic traveling through the attachment point of a capture point, which is copied and passed to Wireshark. To be displayed by Wireshark, a packet must pass through an attachment point, as well as all of the filters associated with the capture point.

A capture point has three types of filters:

- Core system filter—The core system filter is applied by hardware, and its match criteria is limited by hardware. This filter determines whether hardware-forwarded traffic is copied to software for Wireshark purposes.

- Capture filter—The capture filter is applied by Wireshark. The match criteria are more granular than those supported by the core system filter. Packets that pass the core filter but fail the capture filter are still copied and sent to the CPU/software, but are discarded by the Wireshark process. The capture filter syntax matches that of the display filter.

  Note Wireshark on the Catalyst 4500 series switch does not use the syntax of the capture filter.

- Display filter—The display filter is applied by Wireshark, and its match criteria are similar to those of the capture filter. Packets that fail the display filter are not displayed.

Core System Filter

You can specify core system filter match criteria by using the class map or ACL, or explicitly by using the CLI.

In some installations, you need to obtain authorization to modify the switch configuration, which can lead to extended delays if the approval process is lengthy. This would limit the ability of network administrators to monitor and analyze traffic. To address this situation, Wireshark supports explicit specification of core system filter match criteria from the EXEC mode CLI. The disadvantage is that the match criteria that you can specify is a limited subset of what class map supports, such as MAC, IP source and destination addresses, ether-type, IP protocol, and TCP/UDP source and destination ports.

If you prefer to use configuration mode, you can define ACLs or have class maps refer capture points to them. Explicit and ACL-based match criteria are used internally to construct class maps and policy maps. These implicitly constructed class maps are not reflected in the switch running-config and are not NVGEN’d.

  Note The configuration of ACL and class-map are part of the system and not aspects of the Wireshark feature.

Capture Filter

The capture filter allows you to direct Wireshark to further filter incoming packets based on various conditions. Wireshark applies the capture filter immediately on receipt of the packet; packets that fail the capture filter are neither stored nor displayed.

A switch receives this parameter and passes it unchanged to Wireshark. Because Wireshark parses the application filter definition, the defining syntax is the one provided by the Wireshark display filter. This syntax and that of standard Cisco IOS differ, which allows you to specify ACL match criteria that cannot be expressed with standard syntax.
### Note

The capture filter syntax matches that of the Wireshark display filter. The syntax for capture and display filters are identical in the Wireshark implementation on the Catalyst 4500 series switch.

### Display Filter

With the display filter, you can direct Wireshark to further narrow the set of packets to display when decoding and displaying from a .pcap file. Because the syntax of the display filter is identical to the capture filter, the display filter is superfluous if a capture filter is also defined.

For more details on the syntax of capture and display filters, go to [http://wiki.wireshark.org/DisplayFilters](http://wiki.wireshark.org/DisplayFilters)

### Actions

Wireshark can be invoked on live traffic or on a previously existing .pcap file. When invoked on live traffic, it can perform four types of actions on packets that pass its capture and display filters:

- Captures to buffer in memory to decode and analyze and store
- Stores to a .pcap file
- Decodes and displays
- Stores and displays

When invoked on a .pcap file only, only the decode and display action is applicable.

### Storing Captured Packets to Buffer in Memory

Packets can be stored in the capture buffer in memory for subsequent decode, analysis, or storage to a .pcap file.

The capture buffer can be linear or circular mode. In linear mode, new packets are discarded when the buffer is full. In circular mode, if the buffer is full, the oldest packet are discarded to accommodate the new packet. Although the buffer can also be cleared when needed, this mode is mainly used for debugging network traffic.

### Storing Captured Packets to a .pcap File

Wireshark can store captured packets to a .pcap file. The capture file can be located on the following storage devices:

- Catalyst 4500 series switch on-board flash storage (bootflash:)
- external flash disk (slot:)
- USB drive (usb0:)

| Note | Do not attempt to use Wireshark with any other devices. |
When configuring a Wireshark capture point, you can associate a filename. When the capture point is activated, Wireshark creates a file with the specified name and writes packets to it. If the file already exists when the file is associated or the capture point is activated, Wireshark queries you as to whether the file can be overwritten. Only one capture point may be associated with a given filename.

If the destination of the Wireshark writing process is full, Wireshark fails with partial data in the file. You must ensure that there is sufficient space in the file system before you start the capture session. With Cisco IOS Release IOS XE 3.3.0SG, the file system full status is not detected for some storage devices. You can reduce the required storage space by retaining only a segment, instead of the entire packet. Typically, you do not require details beyond the first 64 or 128 bytes. The default behavior is to store the entire packet.

To avoid possible packet drops when processing and writing to the file system, Wireshark can optionally use a memory buffer to temporarily hold packets as they arrive. Memory buffer size can be specified when the capture point is associated with a .pcap file.

Decoding and Displaying Packets

Wireshark can decode and display packets to the console. This functionality is possible for capture points applied to live traffic and for capture points applied to a previously existing .pcap file.

Note

Decoding and displaying packets may be CPU intensive.

Wireshark can decode and display packet details for a wide variety of packet formats. The details are displayed by entering the `monitor capture name start` command with one of the following keyword options, which place you into a display and decode mode:

- *brief*—Displays one line per packet (the default).
- *detailed*—Decodes and displays all the fields of all the packets whose protocols are supported. Detailed mode require more CPU than the other two modes.
- *(hexadecimal) dump*—Displays one line per packet as a hexadecimal dump of the packet data and the printable characters of each packet.

When we enter the `capture` command with the decode and display option, the Wireshark output is returned to Cisco IOS and displayed on the console unchanged.

Displaying Live Traffic

Wireshark receives copies of packets from the Catalyst 4500 series switch core system. Wireshark applies its capture and display filters to discard uninteresting packets, and then decodes and displays the remaining packets.

Displaying from .pcap File

Wireshark can decode and display packets from a previously stored .pcap file and direct the display filter to selectively displayed packets. A capture filter is not applicable in this situation.

Storing and Displaying Packets

Functionally, this mode is a combination of the previous two modes. Wireshark stores packets in the specified .pcap file and decodes and displays them to the console. Only the core and capture filters are applicable here.
Chapter 56 Configuring Wireshark

Activating and Deactivating Wireshark Capture Points

After a Wireshark capture point has been defined with its attachment points, filters, actions, and other options, it must be activated. Until the capture point is activated, it does not actually capture packets.

Before a capture point is activated, some sanity checks are performed. A capture point cannot be activated if it has neither a core system filter nor attachment points defined. Attempting to activate a capture point that generates an error.

The capture and display filters are specified as needed.

After Wireshark capture points are activated, they can be deactivated in multiple ways. A capture point that is storing only packets to a .pcap file can be halted manually or configured with time or packet limits, after which the capture point halts automatically. Only packets that pass the Wireshark capture filter are counted against the packet limit threshold.

When a Wireshark capture point is activated, a fixed rate filter is applied automatically in the hardware so that the CPU is not flooded with Wireshark-directed packets. The disadvantage of the rate filter is that you cannot capture contiguous packets beyond the established rate even if more resources are available.

Feature Interactions

This section describes how Wireshark features function in the Catalyst 4500 series switch environment:

- Layer 2 security features—Packets that are dropped by Layer 2 security features (such as port security, MAC address filtering, and spanning tree) are not captured by Wireshark. This differs from the behavior of SPAN.

- Classification-based security features—Packets that are dropped by input classification-based security features (such as ACLs and IPSG) are not caught by Wireshark capture points that are connected to attachment points at the same layer. In contrast, packets that are dropped by output classification-based security features are caught by Wireshark capture points that are connected to attachment points at the same layer. The logical model is that the Wireshark attachment point occurs after the security feature lookup on the input side, and symmetrically before the security feature lookup on the output side.

Wireshark capture policies connected to Layer 2 attachment points in the input direction capture packets dropped by Layer 3 classification-based security features. Symmetrically, Wireshark capture policies attached to Layer 3 attachment points in the output direction capture packets dropped by Layer 2 classification-based security features.

- Routed ports and Layer 3 port channels—When a routed port or Layer 3 port channel is used as a Wireshark attachment point, the The policy that is applied to capture the packets is treated as attached at Layer 3. Wireshark only captures packets that are being routed by the interface.

- VLANs—When a VLAN is used as a Wireshark attachment point, packets are captured in both input and output directions. A packet that is bridged in the VLAN generates two copies, one on input and one on output.

- Private VLANs—Secondary PVLANs are disallowed as Wireshark attachment points. Using a primary PVLAN as a Wireshark attachment point enables capture of packets in the primary PVLAN and all associated secondary PVLANs. The entire PV domain becomes the attachment point.
• Redirection features—In the input direction, features traffic redirected by Layer 3 (such as PBR and WCCP), are logically later than Layer 3 Wireshark attachment points. Wireshark captures these packets even though they might later be redirected out another Layer 3 interface. Symmetrically, output features redirected by Layer 3 (such as egress WCCP) are logically prior to Layer 3 Wireshark attachment points, and Wireshark will not capture them.

• Classification copy features—Features that generate copies of packets from the role-based and Security lookup types are compatible with Wireshark. Multiple copies of these packets are generated.

• SPAN—Wireshark and SPAN sources are compatible. You can configure an interface as a SPAN source and as a Wireshark attachment point simultaneously. Configuring a SPAN destination port as a Wireshark attachment point is not supported.

There are four classification results for input and output classification. In the input direction, they are ordered role-based, security, QoS, and forwarding override. In the output direction they are ordered forwarding override, role-based, security, and QoS.

On the input side, the Wireshark capture feature is placed in the forwarding override result type, prioritized above the other FO features (such as multicast local source capture, PBR and ingress WCCP). The packets captured by Wireshark are before any redirection by PBR or WCCP. Because security ACLs are applied ahead of FO-related features, packets that are dropped by security ACLs are not captured by Wireshark.

On the output side, the Wireshark capture feature is placed in the forwarding override result type, prioritized below the other FO features (such as egress WCCP). Wireshark captures packets only if the other egress FO features do not apply.

Configuring Wireshark

The CLI for configuring Wireshark requires that the feature be executed only from EXEC mode. Actions that usually occur in configuration submode (such as defining capture points), are handled at the EXEC mode instead. All key commands are not NVGEN’d and are not synchronized to the standby supervisor in NSF and SSO scenarios.

The following sections describe how to configure Wireshark:

• Default Wireshark Configuration, page 56-7
  • Wireshark Configuration Guidelines, page 56-8
  • Defining, Modifying, or Deleting a Capture Point, page 56-8
  • Activating and Deactivating a Capture Point, page 56-10

Default Wireshark Configuration

Table 56-1 shows the default Wireshark configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>No limit</td>
</tr>
<tr>
<td>Packets</td>
<td>No limit</td>
</tr>
<tr>
<td>Packet-length</td>
<td>No limit (full packet)</td>
</tr>
</tbody>
</table>
Configuring Wireshark

Wireshark Configuration Guidelines

When configuring Wireshark, ensure the following:

- Traffic is active on the interfaces the Wireshark policy is applied on.
- Filter rules match the traffic.
- Mandatory parameters are configured.

Defining, Modifying, or Deleting a Capture Point

Although listed in sequence, the steps to specify values for the options can be executed in any order. You can also specify them in one, two, or several lines. Except for attachment points, which can be multiple, you can replace any value with a more recent value by respecifying the same option, in the following order:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Define the name that identifies the capture point.</td>
</tr>
<tr>
<td>2</td>
<td>Specify the attachment point with which the capture point is associated. Multiple attachment points can be specified. Range support is also available both for adding and removing attachment points.</td>
</tr>
<tr>
<td>3</td>
<td>Define the core system filter, defined either explicitly, through ACL or through a class map.</td>
</tr>
<tr>
<td>4</td>
<td>Specify the session limit (in seconds or packets captured).</td>
</tr>
<tr>
<td>5</td>
<td>Specify the packet segment length to be retained by Wireshark.</td>
</tr>
<tr>
<td>6</td>
<td>Specify the file association, if the capture point intends to capture packets rather than merely display them.</td>
</tr>
<tr>
<td>7</td>
<td>Specify the size of the memory buffer used by Wireshark to handle traffic bursts.</td>
</tr>
</tbody>
</table>

To filter the capture point, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`[no] monitor capture mycap match {any</td>
<td>mac <code>mac-match-string</code></td>
</tr>
</tbody>
</table>
Chapter 56  Configuring Wireshark

Configuring Wireshark

To define a capture point, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>[no] monitor capture mycap match mac {src-mac-addr</td>
<td>any</td>
</tr>
<tr>
<td>[no] monitor capture mycap match {ipv4</td>
<td>ipv6} [src-prefix/length</td>
</tr>
<tr>
<td>[no] monitor capture mycap match {ipv4</td>
<td>ipv6} proto {tcp</td>
</tr>
</tbody>
</table>

Examples

Associating/disassociating a capture file

Switch# monitor capture point mycap file location bootdisk:mycap.pcap

Switch# no monitor capture mycap file
Specifying a memory buffer size for packet burst handling

Switch# monitor capture mycap buffer-size 1000000

Defining an explicit core system filter to match both IPv4 and IPv6 TCP traffic

Switch# monitor capture mycap match any protocol tcp

Defining a core system filter using an existing ACL or class-map

Switch# monitor capture mycap match access-list myacl

Switch# monitor capture mycap match class-map mycm

Activating and Deactivating a Capture Point

A capture point cannot be activated unless an attachment point and a core system filter have been defined and the associated filename (if any) does not already exist. A capture point with no associated filename can only be activated to display. If no capture or display filters are specified, all of the packets captured by the core system filter are displayed. The default display mode is brief.

To activate or deactivate a capture point, perform these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor capture name start [capture-filter filter-string] [display [display-filter filter-string]] [brief</td>
<td>detailed</td>
</tr>
<tr>
<td>monitor capture name stop</td>
<td>Deactivates a capture point.</td>
</tr>
</tbody>
</table>

Example:

Switch# monitor capture mycap start capture-filter "net 10.1.1.0 0.0.0.255 and port 80"

Switch# monitor capture mycap start display display-filter "net 10.1.1.0 0.0.0.255 and port 80"

Guidelines and Restrictions

- When packet capture is enabled in the input direction, the matching packets undergo software-based lookup in the CPU for the first 15 seconds. During this time, CPU usage is high and capture rate is low.
- When packet capture is enabled in the output direction, packets are not captured in the first 15 seconds.
- Packets captured in the output direction of an interface might not reflect the changes made by switch rewrite (includes TTL, VLAN tag, CoS, checksum, and MAC addresses).
- Capturing at a physical port that belongs to another logical port may not be supported. For example, capturing at EtherChannel member ports is not supported.
- Limiting circular file storage by file size is not supported.
• Wireshark cannot capture IPv6 packets if the capture point’s class-map filter is attempting to match one of the following:
  - Extension headers followed by Hop-by-hop header (as per CSCtt16385)
  - DSCP values (as per CSCtx75765)

**Best Practices**

Consider the following best practices:

• During Wireshark packet capture, hardware forwarding happens concurrently.

• Before starting a Wireshark capture process, ensure that CPU usage is moderate and that sufficient memory (at least 200 MB) is available.

• If you plan to store packets to a storage file, ensure that sufficient space is available before beginning a Wireshark capture process.

• The CPU usage during Wireshark capture depends on how many packets match the specified conditions and on the intended actions for the matched packets (store, decode and display, or both).

• Limit packet capture with parameters of the `capture point` command (like packet number and capture duration).

• Because packet forwarding typically occurs in hardware, packets are not copied to the CPU for software processing. For Wireshark packet capture, packets are copied and delivered to the CPU, which causes an increase in CPU usage.

  To avoid high CPU, do the following:
  - Attach only relevant ports.
  - Use a class map, and secondarily, an access list to express match conditions. If neither is viable, use an explicit, in-line filter.
  - Adhere closely to the filter rules. Restrict the traffic type (such as, IPv4 only) with a restrictive, rather than relaxed ACL, which elicits unwanted traffic.

• Always limit packet capture to either a shorter duration or a smaller packet number. The parameters of the `capture` command enable you to specify the following:
  - Capture duration
  - Number of packets captured
  - File size
  - Packet segment size

• Run a capture session without limits if you know that very little traffic matches the core filter.

• Do not leave a capture session enabled and unattended for a long period of time, because unanticipated bursts of traffic could increase the CPU usage.

• During a capture session, watch for high CPU usage and memory consumption due to Wireshark that may impact switch performance or health. If these situations arise, stop the Wireshark session immediately.

• Avoid decoding and displaying packets from a .pcap file for a large file. Instead, transfer the .pcap file to a PC and run Wireshark on the PC.

• Limit the number of Wireshark instances to two or less to avoid CPU or memory resource drain.
You can use up to eight Wireshark instances. An active `show` command that decodes and displays packets from a .pcap file or capture buffer counts as one instance.

- Whenever an ACL is installed or modified on a switch in the ingress direction, for the first 15 seconds, the software ignores packet classification details sent by the hardware. Instead, it uses software-based classification for the packets received by CPU. So, during this period, the system can only capture fewer packets (compared to the time after the first 15 seconds) and CPU usage will be high.

  **Note** In the egress direction, packets are not captured for the first 15 seconds.

- To avoid packet loss, consider the following:
  - Use `store-only` (when you do not specify the `display` option) while capturing live packets rather than `Decode and display`, which is an CPU-intensive operation (especially in detailed mode).
  - If you use the default buffer size, packets may be dropped. Increase buffer size and avoid packet loss.
  - Writing to flash disk is a CPU-intensive operation, so the capture rate may not be sufficient.
  - The Wireshark capture session operates normally in **streaming mode** where packets are both captured and processed. However, when you specify a buffer size of at least 32 MB, the session automatically turns on **lock-step mode** in which a Wireshark capture session is split into two phases: capture and process. In the capture phase, the packets are stored in the temporary buffer. The duration parameter in lock-step mode serves as capture duration rather than session duration. When the buffer is full or the capture duration has ended, a session transitions to the process phase, in which it stops accepting packets and starts processing packets in the buffer. With the second approach (lock-step mode), a higher capture throughput can be achieved.
  - The streaming capture mode supports approximately 1500 pps; lock-step mode supports roughly 45 Mbps (measured with 256-byte packets). When the matching traffic rate exceeds this number, you may experience packet loss.

- If you want to decode and display live packets in the console window, ensure that the Wireshark session is bounded by a short capture duration. A Wireshark session with either a longer duration limit or no capture duration (using a terminal with no auto-more support using the `term len 0` command) may make the console or terminal unusable.

- Do not launch a capture session with ring files or capture buffer and leave it unattended for a long time. This may lead to performance or system health issues because of high CPU or memory usage.

- When using Wireshark to capture live traffic that leads to high CPU usage, consider applying a QoS policy temporarily to limit the actual traffic until the capture process concludes.

### Notes Specific to the Wireshark CLI

- All Wireshark-related commands are in EXEC mode; no configuration commands exist for Wireshark.

  If you need to use access list or class-map in the Wireshark CLI, you must define an access list and class map with configuration commands.

- No specific order applies when defining a capture point; you can define capture point parameters in any order, provided that CLI allows this. The Wireshark CLI allows as many parameters as possible on a single line. This limits the number of commands required to define a capture point.
Chapter 56  Configuring Wireshark

Monitoring Wireshark

The commands in the following table are used to monitor Wireshark.

Table 56-2  Wireshark Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show monitor capture point name</code></td>
<td>Displays the capture point state, so that you can see what capture points are defined, what their attributes are, and whether they are active. When capture point name is specified, it displays specific capture point’s details.</td>
</tr>
<tr>
<td><code>show monitor capture file name</code></td>
<td>Activates Wireshark using an existing .pcap file as the source for packets. If no display filter is specified, then all the packets in the file are displayed. The default display mode is brief.</td>
</tr>
</tbody>
</table>

| show monitor capture file name               | brief | detailed | dump |

Configuration Examples for Wireshark

Displaying a Brief Output from a .pcap File

You can display the output from a .pcap file by entering:

```
Switch# show monitor capture file bootflash:mycap.pcap
```

1   0.000000   10.1.1.140  -> 20.1.1.2   UDP Source port: 20001  Destination port: 20002
2   1.000000   10.1.1.141  -> 20.1.1.2   UDP Source port: 20001  Destination port: 20002
3   2.000000   10.1.1.142  -> 20.1.1.2   UDP Source port: 20001  Destination port: 20002
4   3.000000   10.1.1.143  -> 20.1.1.2   UDP Source port: 20001  Destination port: 20002
Monitoring Wireshark

You can display the detailed .pcap file output by entering:

```
Switch# show monitor capture file bootflash:mycap.pcap detailed
```

Displaying Packets from a .pcap File with a Display Filter

You can display the .pcap file packets output by entering:

Switch# show monitor capture file bootflash:mycap.pcap display-filter "ip.src == 10.1.1.140" dump

Usage Examples for Wireshark

Example 1: Simple Capture and Display

Let us say we want to monitor traffic in the Layer 3 interface Gigabit 3/1:

**Step 1**
Define a capture point to match on the relevant traffic by entering:

Switch# monitor capture mycap interface gi 3/1 in match ipv4 any any
Switch# monitor capture mycap limit duration 60 packets 100

*Note* To avoid high CPU utilization, we have set a low packet count and duration as limits.

**Step 2**
Confirm that the capture point has been correctly defined by entering:

Switch# show monitor capture mycap parameter

monitor capture mycap interface GigabitEthernet3/1 in
monitor capture mycap match ipv4 any any
Chapter 56      Configuring Wireshark

Usage Examples for Wireshark

Step 3     Start the capture process and display the results.

Switch# monitoring capture mycap start display

0.000000  10.1.1.30 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
1.000000  10.1.1.31 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
2.000000  10.1.1.32 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
3.000000  10.1.1.33 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
4.000000  10.1.1.34 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
5.000000  10.1.1.35 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
6.000000  10.1.1.36 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
7.000000  10.1.1.37 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
8.000000  10.1.1.38 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002
9.000000  10.1.1.39 -> 20.1.1.2     UDP Source port: 20001  Destination port: 20002

Step 4     Delete the capture point:

Switch# no monitoring capture mycap

Example 2: Simple Capture and Store

This example shows how to capture packets to a filter.

Step 1     Define a capture point to match on the relevant traffic and associate it to a file.

Switch# monitoring capture mycap interface gi 3/1 in match ipv4 any any
Switch# monitoring capture mycap limit duration 60 packets 100
Switch# monitoring cap mycap file location bootflash:mycap.pcap

Step 2     Confirm that the capture point has been correctly defined.

Switch# show monitoring capture mycap parameter
  monitoring capture mycap interface GigabitEthernet3/1 in
  monitoring capture mycap match ipv4 any any
  monitoring capture mycap file location bootflash:mycap.pcap
  monitoring capture mycap limit packets 100 duration 60

Switch# show monitoring capture mycap
  Target Type:
    Interface: GigabitEthernet3/1, Direction: in
  Status : Inactive
  Filter Details:
    IPv4
Chapter 56 Configuring Wireshark

Usage Examples for Wireshark

### Step 3
Launch packet capture.

```
Switch# monitor capture mycap start
```

### Step 4
After sufficient time has passed, stop the capture.

```
Switch# monitor capture mycap stop
```

**Note** Alternatively, you can allow the capture operation to stop automatically after the time has elapsed or the packet count has been met.

The `mycap.pcap` file now contains the captured packets.

### Step 5
Display the packets.

```
Switch# show monitor capture file bootflash:mycap.pcap
```

### Example 3: Using Buffer Capture

This example shows how to use buffer capture:

### Step 1
Launch a capture session with the buffer capture option:

```
Switch# monitor capture mycap interface gi 3/1 in
Switch# monitor capture mycap match ipv4 any any
Switch# monitor capture mycap buffer circular size 1
Switch# monitor capture mycap start
```

### Step 2
Determine whether the capture is active.

```
Switch# show monitor capture mycap
```

Status Information for Capture mycap
Target Type:
  Interface: GigabitEthernet3/1, Direction: in
Chapter 56  Configuring Wireshark

Usage Examples for Wireshark

Status : Active
Filter Details:
IPv4
Source IP: any
Destination IP: any
Protocol: any
File Details:
File not associated
Buffer Details:
Buffer Type: CIRCULAR
Buffer Size (in MB): 1
Limit Details:
limit not set

Step 3  Display the packets in the buffer.

Switch# show monitor capture mycap buffer brief
0.000000  10.1.1.215 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002
1.000000  10.1.1.216 -> 20.1.1.2  UDP Source port: 20001  Destination port: 20002

Step 5 Clear the buffer once, wait for 10 seconds, then stop the traffic:

Switch# monitor capture mycap clear

Wait for 10 seconds and stop the traffic again.

Confirm that the same set of packets are displayed after this time gap.

Switch# show monitor capture mycap buffer brief
0.000000 10.1.1.12 -> 20.1.1.2  UDP Source port: 20001 Destination port: 20002

[Wait for about 10 secs]

Switch# show monitor capture mycap buffer brief
0.000000 10.1.1.12 -> 20.1.1.2  UDP Source port: 20001 Destination port: 20002

[Wait for about 10 secs]

Switch# show monitor capture mycap buffer brief
0.000000 10.1.1.12 -> 20.1.1.2  UDP Source port: 20001 Destination port: 20002

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

OL-25340-01  56-21
Chapter 56 Configuring Wireshark

Usage Examples for Wireshark

5.000000 10.1.1.7 -> 20.1.1.2  UDP Source port: 20001 Destination port: 20002
6.000000 10.1.1.8 -> 20.1.1.2  UDP Source port: 20001 Destination port: 20002
7.000000 10.1.1.9 -> 20.1.1.2  UDP Source port: 20001 Destination port: 20002
8.000000 10.1.1.10 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
9.000000 10.1.1.11 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002

Step 6 Clear the packets from the buffer.
Switch# monitor capture mycap clear

Step 7 Confirm that the buffer is now empty.
Switch# show monitor capture mycap buffer brief

Wait about 10 seconds.

Step 8 Display the buffer contents.
Switch# show monitor capture mycap buffer brief

Step 9 Restart the traffic, wait about 10 seconds, then display buffer contents.
Switch# show monitor capture mycap buffer brief

Step 10 Store the buffer contents to the mycap1.pcap file in the internal bootflash: storage device.
Switch# monitor capture mycap export bootflash:mycap1.pcap
Exported Successfully

Step 11 Ensure that the file has been created and that it contains the packets.
Switch# dir bootflash:mycap1.pcap
Directory of bootflash:/mycap1.pcap
14758 -rw- 20152 Apr 15 2012 16:00:28 -07:00 mycap1.pcap
831541248 bytes total (831340544 bytes free)
Switch# show monitor capture file bootflash:mycap1.pcap brief

0.000000 10.1.1.2 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
1.000000 10.1.1.3 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
2.000000 10.1.1.4 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
3.000000 10.1.1.5 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
4.000000 10.1.1.6 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002

6.000000 10.1.1.8 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
7.000000 10.1.1.9 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
8.000000 10.1.1.10 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
9.000000 10.1.1.11 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
10.000000 10.1.1.12 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
Chapter 56 Configuring Wireshark

Usage Examples for Wireshark

Example 4: Capture Sessions

The following examples show how to start or stop a capture session in various modes:

Switch# monitor capture mycap int gi 3/1 in match ipv4 any any
Switch# monitor capture mycap file location bootflash:mycap.pcap
Switch# monitor capture mycap limit packets 100 duration 60

Switch# monitor capture mycap start
Switch#
Switch# monitor capture mycap stop
Switch# monitor capture mycap start capture-filter "udp.port == 20001"
Switch# monitor capture mycap stop
Switch# monitor capture mycap start capture-filter "udp.port == 20001" display

A file by the same capture file name already exists, overwrite?[confirm]

0.000000 10.1.1.9 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
0.000000 10.1.1.10 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002

Step 12 Stop the packet capture and display the buffer contents.

Switch# monitor capture mycap stop
Switch# show monitor capture mycap buffer brief

0.000000 10.1.1.10 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
1.000000 10.1.1.11 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
2.000000 10.1.1.12 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
3.000000 10.1.1.13 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
4.000000 10.1.1.14 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
5.000000 10.1.1.15 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
6.000000 10.1.1.16 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
7.000000 10.1.1.17 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
8.000000 10.1.1.18 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
9.000000 10.1.1.19 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
10.000000 10.1.1.20 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
11.000000 10.1.1.21 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002

Step 13 Clear the buffer and then try to display packets from the buffer.

Switch# monitor capture mycap clear
Switch# show monitor capture mycap buffer brief

Step 14 Delete the capture point.

Switch# no monitor capture mycap
Chapter 56  Configuring Wireshark

Usage Examples for Wireshark

Switch#
Configuring Enhanced Object Tracking

This chapter describes how to configure enhanced object tracking on the Catalyst 4500 series switch. This feature provides a more complete alternative to the Hot Standby Routing Protocol (HSRP) tracking mechanism, which allows you to track the line-protocol state of an interface. If the line protocol state of an interface goes down, the HSRP priority of the interface is reduced and another HSRP device with a higher priority becomes active. The enhanced object tracking feature separates the tracking mechanism from HSRP and creates a separate, standalone tracking process that can be used by processes other than HSRP. This allows tracking other objects in addition to the interface line-protocol state. A client process, such as HSRP, can register an interest in tracking objects and request notification when the tracked object changes state. This feature increases the availability and speed of recovery of a routing system and decreases outages and outage duration.

Note

Enhanced object tracking is not supported on switches running the LAN base feature set.

Unless otherwise noted, the term switch refers to a Catalyst 4500 series switch.

The chapter includes these sections:

- Understanding Enhanced Object Tracking, page 57-1
- Configuring Enhanced Object Tracking Features, page 57-2
- Monitoring Enhanced Object Tracking, page 57-12

For more details on enhanced object tracking, refer to this URL:

Understanding Enhanced Object Tracking

Each tracked object has a unique number that is specified in the tracking command-line interface (CLI). Client processes use this number to track a specific object. The tracking process periodically polls the tracked object for value changes and sends any changes (as up or down values) to interested client processes, either immediately or after a specified delay. Several clients can track the same object, and can take different actions when the object changes state.

You can also track a combination of objects in a list by using either a weight threshold or a percentage threshold to measure the state of the list. You can combine objects using Boolean logic. A tracked list with a Boolean “AND” function requires that each object in the list be in an up state for the tracked object to be up. A tracked list with a Boolean “OR” function needs only one object in the list to be in the up state for the tracked object to be up.
# Configuring Enhanced Object Tracking Features

- Tracking Interface Line-Protocol or IP Routing State, page 57-2
- Configuring a Tracked List, page 57-3
- Configuring HSRP Object Tracking, page 57-7
- Configuring Other Tracking Characteristics, page 57-8
- Configuring IP SLAs Object Tracking, page 57-8
- Configuring Static Routing Support, page 57-10

## Default Configuration

No type of object tracking is configured.

## Tracking Interface Line-Protocol or IP Routing State

You can track either the interface line protocol state or the interface IP routing state. When you track the IP routing state, these three conditions are required for the object to be up:

- IP routing must be enabled and active on the interface.
- The interface line-protocol state must be up.
- The interface IP address must be known.

If all three of these conditions are not met, the IP routing state is down.

To track the line-protocol state or IP routing state of an interface, perform the following task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2  track object-number interface</td>
<td>(Optional) Creates a tracking list to track the line-protocol state of</td>
</tr>
<tr>
<td>interface-id line-protocol</td>
<td>an interface and enter tracking configuration mode.</td>
</tr>
<tr>
<td></td>
<td>• The object-number identifies the tracked object and can be from 1</td>
</tr>
<tr>
<td></td>
<td>to 500.</td>
</tr>
<tr>
<td></td>
<td>• The interface interface-id is the interface being tracked.</td>
</tr>
<tr>
<td>Step 3  delay (up seconds [down seconds])</td>
<td>(Optional) Specifies a period of time in seconds to delay communicating</td>
</tr>
<tr>
<td></td>
<td>state changes of a tracked object. The range is from 1 to 180</td>
</tr>
<tr>
<td></td>
<td>seconds.</td>
</tr>
<tr>
<td>Step 4  exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 5  track object-number interface</td>
<td>(Optional) Creates a tracking list to track the IP routing state of an</td>
</tr>
<tr>
<td>interface-id ip routing</td>
<td>an interface, and enter tracking configuration mode. IP-route</td>
</tr>
<tr>
<td></td>
<td>tracking tracks an IP route in the routing table and the ability of</td>
</tr>
<tr>
<td></td>
<td>an interface to route IP packets.</td>
</tr>
<tr>
<td></td>
<td>• The object-number identifies the tracked object and can be from 1</td>
</tr>
<tr>
<td></td>
<td>to 500.</td>
</tr>
<tr>
<td></td>
<td>• The interface interface-id is the interface being tracked.</td>
</tr>
</tbody>
</table>
Chapter 57 Configuring Enhanced Object Tracking

Configuring Enhanced Object Tracking Features

This example configures the tracking of an interface line-protocol state and verifies the configuration:

```
Switch(config)# track 33 interface gigabitethernet 1/0/1 line-protocol
Switch(config-track)# end
Switch# show track 33
Track 33
Interface GigabitEthernet1/0/1 line-protocol
Line protocol is Down (hw down)
1 change, last change 00:18:28
```

Configuring a Tracked List

You can configure a tracked list of objects with a Boolean expression, a weight threshold, or a percentage threshold. A tracked list contains one or more objects. An object must exist before it can be added to the tracked list.

- You configure a Boolean expression to specify calculation by using either “AND” or “OR” operators.
- When you measure the tracked list state by a weight threshold, you assign a weight number to each object in the tracked list. The state of the tracked list is determined by whether or not the threshold was met. The state of each object is determined by comparing the total weight of all objects against a threshold weight for each object.
- When you measure the tracked list by a percentage threshold, you assign a percentage threshold to all objects in the tracked list. The state of each object is determined by comparing the assigned percentages of each object to the list.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>delay ( \text{up seconds} \mid \text{down seconds} )</td>
<td>(Optional) Specifies a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
<tr>
<td>7</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>8</td>
<td>show track object-number</td>
<td>Verifies that the specified objects are being tracked.</td>
</tr>
<tr>
<td>9</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring a Tracked List with a Boolean Expression

Configuring a tracked list with a Boolean expression enables calculation by using either “AND” or “OR” operators. For example, when tracking two interfaces using the “AND” operator, up means that both interfaces are up, and down means that either interface is down.

To configure a tracked list of objects with a Boolean expression, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> track track-number list boolean</td>
<td>Configures a tracked list object, and enter tracking configuration mode.</td>
</tr>
<tr>
<td>(and</td>
<td>or)</td>
</tr>
<tr>
<td></td>
<td>- boolean—Specify the state of the tracked list based on a Boolean</td>
</tr>
<tr>
<td></td>
<td>calculation.</td>
</tr>
<tr>
<td></td>
<td>- and—Specify that the list is up if all objects are up or down if one</td>
</tr>
<tr>
<td></td>
<td>or more objects are down.</td>
</tr>
<tr>
<td></td>
<td>- or—Specify that the list is up if one object is up or down if all</td>
</tr>
<tr>
<td></td>
<td>objects are down.</td>
</tr>
<tr>
<td><strong>Step 3</strong> object object-number [not]</td>
<td>Specifies the object to be tracked. The range is from 1 to 500. The key</td>
</tr>
<tr>
<td></td>
<td>word not negates the state of the object, which means that when the</td>
</tr>
<tr>
<td></td>
<td>object is up, the tracked list detects the object as down.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> An object must exist before you can add it to a tracked list.</td>
</tr>
<tr>
<td><strong>Step 4</strong> delay (up seconds</td>
<td>down seconds)</td>
</tr>
<tr>
<td></td>
<td>state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> show track object-number</td>
<td>Verifies that the specified objects are being tracked.</td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>startup-config</td>
<td></td>
</tr>
</tbody>
</table>

Use the no track track-number global configuration command to delete the tracked list.

This example configures track list 4 with a Boolean AND expression that contains two objects with one object state negated. If the list is up, the list detects that object 2 is down:

```
Switch(config)# track 4 list boolean and
Switch(config-track)# object 1
Switch(config-track)# object 2 not
Switch(config-track)# exit
```
### Configuring a Tracked List with a Weight Threshold

To track by weight threshold, configure a tracked list of objects, specify that weight is used as the threshold, and configure a weight for each of its objects. The state of each object is determined by comparing the total weight of all objects that are up against a threshold weight for each object.

You cannot use the Boolean "NOT" operator in a weight threshold list.

Beginning in privileged EXEC mode, follow these steps to configure a tracked list of objects by using a weight threshold and to configure a weight for each object:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>track track-number list threshold weight</td>
<td>Configures a tracked list object and enter tracking configuration mode. The track-number can be from 1 to 500. &lt;br&gt; • threshold—Specify the state of the tracked list based on a threshold. &lt;br&gt; • weight—Specify that the threshold is based on weight.</td>
</tr>
<tr>
<td>3</td>
<td>object object-number [weight weight-number]</td>
<td>Specifies the object to be tracked. The range is from 1 to 500. The optional weight weight-number specifies a threshold weight for the object. The range is from 1 to 255. &lt;br&gt; <strong>Note</strong> An object must exist before you can add it to a tracked list.</td>
</tr>
<tr>
<td>4</td>
<td>threshold weight {up number</td>
<td>[down number]}</td>
</tr>
<tr>
<td>5</td>
<td>delay {up seconds</td>
<td>[down seconds]}</td>
</tr>
<tr>
<td>6</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>7</td>
<td>show track object-number</td>
<td>Verifies that the specified objects are being tracked.</td>
</tr>
<tr>
<td>8</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the **no track track-number** global configuration command to delete the tracked list.

The example configures track list 4 to track by weight threshold. If object 1 and object 2 are down, then track list 4 is up because object 3 satisfies the up threshold value of up 30. But if object 3 is down, both objects 1 and 2 must be up in order to satisfy the threshold weight.

```
Switch(config)# track 4 list threshold weight
Switch(config-track)# object 1 weight 15
Switch(config-track)# object 2 weight 20
Switch(config-track)# object 3 weight 30
Switch(config-track)# threshold weight up 30 down 10
Switch(config-track)# exit
```

This configuration can be useful if object 1 and object 2 represent two small bandwidth connections and object 3 represents one large bandwidth connection. The configured **down 10** value means that once the tracked object is up, it will not go down until the threshold value is equal to or lower than 10, which in this example means that all connections are down.
Configuring Enhanced Object Tracking Features

Chapter 57  Configuring Enhanced Object Tracking

Configuring a Tracked List with a Percentage Threshold

To track by percentage threshold, configure a tracked list of objects, specify that a percentage will be used as the threshold, and specify a percentage for all objects in the list. The state of the list is determined by comparing the assigned percentage of each object to the list.

You cannot use the Boolean “NOT” operator in a percentage threshold list.

To configure a tracked list of objects by using a percentage threshold, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>track track-number list threshold percentage</td>
</tr>
<tr>
<td></td>
<td>threshold—Specify the state of the tracked list based on a threshold.</td>
</tr>
<tr>
<td></td>
<td>percentage—Specify that the threshold is based on percentage.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>object object-number</td>
</tr>
<tr>
<td></td>
<td>Note  An object must exist before you can add it to a tracked list.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>threshold percentage (up number</td>
</tr>
<tr>
<td></td>
<td>/ down number)</td>
</tr>
<tr>
<td></td>
<td>• down number)—(Optional) The range depends on the number selected for the up number. If you configure the up number as 25, the range shown for the down number is 0 to 24.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>delay (up seconds [down seconds]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show track object-number</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no track track-number global configuration command to delete the tracked list.

This example configures tracked list 4 with three objects and a specified percentages to measure the state of the list:

```
Switch(config)# track 4 list threshold percentage
Switch(config-track)# object 1
Switch(config-track)# object 2
Switch(config-track)# object 3
Switch(config-track)# threshold percentage up 51 down 10
Switch(config-track)# exit
```
Configuring HSRP Object Tracking

To configure a standby HSRP group to track an object and change the HSRP priority based on the object state, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>track object-number {interface interface-id [line-protocol</td>
</tr>
<tr>
<td></td>
<td>(Optional) Creates a tracking list to track the configured state and enter tracking configuration mode.</td>
</tr>
<tr>
<td></td>
<td>- The object-number range is from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td>- Enter interface interface-id to select an interface to track.</td>
</tr>
<tr>
<td></td>
<td>- Enter line-protocol to track the interface line protocol state or enter ip routing to track the interface IP routing state.</td>
</tr>
<tr>
<td></td>
<td>- Enter ip route ip-address/prefix-length to track the state of an IP route.</td>
</tr>
<tr>
<td></td>
<td>- Enter metric threshold to track the threshold metric or enter reachability to track if the route is reachable.</td>
</tr>
<tr>
<td></td>
<td>The default up threshold is 254 and the default down threshold is 255.</td>
</tr>
<tr>
<td></td>
<td>- Enter list to track objects grouped in a list. Configure the list as described on the previous pages.</td>
</tr>
<tr>
<td></td>
<td>- For boolean, see the “Configuring a Tracked List with a Boolean Expression” section on page 57-4.</td>
</tr>
<tr>
<td></td>
<td>- For threshold weight, see the “Configuring a Tracked List with a Weight Threshold” section on page 57-5.</td>
</tr>
<tr>
<td></td>
<td>- For threshold percentage, see the “Configuring a Tracked List with a Percentage Threshold” section on page 57-6.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Repeat this step for each interface to be tracked.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>exit</td>
</tr>
<tr>
<td></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>standby [group-number] ip {ip-address [secondary]}</td>
</tr>
<tr>
<td></td>
<td>Creates (or enable) the HSRP group by using its number and virtual IP address.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) group-number—Enter a group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.</td>
</tr>
<tr>
<td></td>
<td>- (Optional on all but one interface) ip-address—Specify the virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) secondary—Specify that the IP address is a secondary hot standby router interface. If this keyword is omitted, the configured address is the primary IP address.</td>
</tr>
</tbody>
</table>
Configuring Enhanced Object Tracking Features

Chapter 57      Configuring Enhanced Object Tracking

Configuring Other Tracking Characteristics

You can also use the enhanced object tracking for tracking other characteristics.

- You can track the reachability of an IP route by using the `track ip route reachability` global configuration command.
- You can use the `track ip route metric threshold` global configuration command to determine if a route is above or below threshold.
- You can use the `track resolution` global configuration command to change the metric resolution default values for routing protocols.
- You can use the `track timer` tracking configuration command to configure the tracking process to periodically poll tracked objects.

Use the `show track` privileged EXEC command to verify enhanced object tracking configuration.

Configuring IP SLAs Object Tracking

Cisco IOS IP Service Level Agreements (IP SLAs) is a network performance measurement and diagnostics tool that uses active monitoring by generating traffic to measure network performance. Cisco IP SLAs operations collects real-time metrics that you can use for network troubleshooting, design, and analysis.

For more information about Cisco IP SLAs on the switch, see Chapter 66, “Configuring Cisco IOS IP SLA Operations.” For IP SLAs command information see the Cisco IOS IP SLAs Command Reference, Release 12.4T.

Object tracking of IP SLAs operations allows clients to track the output from IP SLAs objects and use this information to trigger an action. Every IP SLAs operation maintains an SNMP operation return-code value, such as OK or OverThreshold, that can be interpreted by the tracking process. You can track two

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td><code>standby [group-number] track object-number [decrement (priority-decrement)]</code></td>
<td>Configures HSRP to track an object and change the hot standby priority based on the state of the object.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- (Optional) <code>group-number</code>—Enter the group number to which the tracking applies.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <code>object-number</code>—Enter a number representing the object to be tracked.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The range is from 1 to 500; the default is 1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- (Optional) <code>decrement priority-decrement</code>—Specify the amount by which the hot standby priority for the router is decremented (or incremented) when the tracked object goes down (or comes back up). The range is from 1 to 255; the default is 10.</td>
</tr>
<tr>
<td>7</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>8</td>
<td><code>show standby</code></td>
<td>Verifies the standby router IP address and tracking states.</td>
</tr>
<tr>
<td>9</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
aspects of IP SLAs operation: state and reachability. For state, if the return code is OK, the track state is up; if the return code is not OK, the track state is down. For reachability, if the return code is OK or OverThreshold, reachability is up; if not OK, reachability is down.

To track the state of an IP SLAs operation or the reachability of an IP SLAs IP host, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> track object-number ip sla operation-number state</td>
<td>Enters tracking configuration mode to track the state of an IP SLAs operation.</td>
</tr>
<tr>
<td></td>
<td>• The object-number range is from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td>• The operation-number range is from 1 to 2147483647.</td>
</tr>
<tr>
<td><strong>Step 3</strong> delay {up seconds [down seconds]</td>
<td>(Optional) Specifies a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
<tr>
<td></td>
<td>[up seconds] down seconds}</td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> track object-number ip sla operation-number reachability</td>
<td>Enters tracking configuration mode to track the reachability of an IP SLAs IP host.</td>
</tr>
<tr>
<td></td>
<td>• The object-number range is from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td>• The operation-number range is from 1 to 2147483647.</td>
</tr>
<tr>
<td><strong>Step 6</strong> delay {up seconds [down seconds]</td>
<td>(Optional) Specifies a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
<tr>
<td></td>
<td>[up seconds] down seconds}</td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> show track object-number</td>
<td>Displays tracking information to verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 9</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to configure and display IP SLAs state tracking:

```
Switch(config)# track 2 200 state
Switch(config)# end
Switch# show track 2
Track 2
  Response Time Reporter 1 state
  State is Down
  1 change, last change 00:00:47
  Latest operation return code: over threshold
  Latest RTT (millisecs) 4
  Tracked by:
    HSRP Ethernet0/1 3
```

This example output shows whether a route is reachable:

```
Switch(config)# track 3 500 reachability
Switch(config)# end
Switch# show track 3
Track 3
  Response Time Reporter 1 reachability
  Reachability is Up
  1 change, last change 00:00:47

Configuring Enhanced Object Tracking Features

Configuring Static Routing Support

Static routing support using enhanced object tracking provides the ability for the switch to use ICMP pings to identify when a preconfigured static route or a DHCP route goes down. When tracking is enabled, the system tracks the state of the route and informs the client when that state changes. Static route object tracking uses Cisco IP SLAs to generate ICMP pings to monitor the state of the connection to the primary gateway.

For more information about Cisco IP SLAs support on the switch, see Chapter 66, “Configuring Cisco IOS IP SLA Operations.”

For more information about static route object tracking, see:

You use this process to configure static route object tracking:

**Step 1** Configure a primary interface for static routing or for DHCP.
**Step 2** Configure an IP SLAs agent to ping an IP address using a primary interface and a track object to monitor the state of the agent.
**Step 3** Configure a default static default route using a secondary interface. This route is used only if the primary route is removed.

Configuring a Primary Interface

To configure a primary interface for static routing, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Selects a primary or secondary interface and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>description string</code></td>
<td>Adds a description to the interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip address ip-address mask [secondary]</code></td>
<td>Sets the primary or secondary IP address for the interface.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>exit</code></td>
<td>Returns to global configuration mode.</td>
</tr>
</tbody>
</table>

To configure a primary interface for DHCP, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Selects a primary or secondary interface and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>description string</code></td>
<td>Adds a description to the interface.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip dhcp client route track number</code></td>
<td>Configures the DCHP client to associate any added routes with the specified track number. Valid numbers are from 1 to 500.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip address dhcp</code></td>
<td>Acquires an IP address on an Ethernet interface from DHCP.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><code>exit dhcp</code></td>
<td>Returns to global configuration mode.</td>
</tr>
</tbody>
</table>
## Configuring a Cisco IP SLAs Monitoring Agent and Track Object

To configure network monitoring with Cisco IP SLAs, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command/Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>ip sla operation-number</td>
<td>Begins configuring a Cisco IP SLAs operation and enter IP SLA configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>icmp-echo {destination-ip-address</td>
<td>destination hostname [source-ipaddr [ip-address</td>
</tr>
<tr>
<td>4</td>
<td>timeout milliseconds</td>
<td>Sets the amount of time for which the operation waits for a response from its request packet.</td>
</tr>
<tr>
<td>5</td>
<td>frequency seconds</td>
<td>Sets the rate at which the operation is sent into the network.</td>
</tr>
<tr>
<td>6</td>
<td>threshold milliseconds</td>
<td>Sets the rising threshold (hysteresis) that generates a reaction event and stores history information for the operation.</td>
</tr>
<tr>
<td>7</td>
<td>exit</td>
<td>Exits IP SLAs ICMP echo configuration mode.</td>
</tr>
<tr>
<td>8</td>
<td>ip sla schedule operation-number [life [forever</td>
<td>seconds] start-time time</td>
</tr>
<tr>
<td></td>
<td>pending</td>
<td>now</td>
</tr>
<tr>
<td>9</td>
<td>track object-number ip sla operation-number {state</td>
<td>reachability}</td>
</tr>
<tr>
<td>10</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>11</td>
<td>show track object-number</td>
<td>Displays tracking information to verify the configuration.</td>
</tr>
<tr>
<td>12</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

## Configuring a Routing Policy and Default Route

To configure a routing policy for backup static routing by using object tracking, perform the following task. For more details about the commands in the procedure, see: [http://www.cisco.com/en/US/docs/ios/dial/configuration/guide/dia_rel_stc_rtg_bckup.html](http://www.cisco.com/en/US/docs/ios/dial/configuration/guide/dia_rel_stc_rtg_bckup.html)

<table>
<thead>
<tr>
<th>Step</th>
<th>Command/Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>access-list access-list-number</td>
<td>Defines an extended IP access list. Configure any optional characteristics.</td>
</tr>
<tr>
<td>3</td>
<td>route-map map-tag [permit</td>
<td>deny] [sequence-number]</td>
</tr>
<tr>
<td>4</td>
<td>match ip address {access-list number</td>
<td>access-list name}</td>
</tr>
<tr>
<td>5</td>
<td>set ip next-hop dynamic dhcp</td>
<td>For DHCP networks only. Sets the next hop to the gateway that was most recently learned by the DHCP client.</td>
</tr>
<tr>
<td>6</td>
<td>set interface interface-id</td>
<td>For static routing networks only. Indicates where to send output packets that pass a match clause of a route map for policy routing.</td>
</tr>
</tbody>
</table>
Chapter 57 Configuring Enhanced Object Tracking

Monitoring Enhanced Object Tracking

Use the privileged EXEC or user EXEC commands in Table 57-1 to display enhanced object tracking information.

**Table 57-1 Commands for Displaying Tracking Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip route track table</td>
<td>Displays information about the IP route track table.</td>
</tr>
<tr>
<td>show track [object-number]</td>
<td>Displays information about the all tracking lists or the specified list.</td>
</tr>
<tr>
<td>show track brief</td>
<td>Displays a single line of tracking information output.</td>
</tr>
<tr>
<td>show track interface [brief]</td>
<td>Displays information about tracked interface objects.</td>
</tr>
<tr>
<td>show track ip [object-number] [brief] route</td>
<td>Displays information about tracked IP-route objects.</td>
</tr>
<tr>
<td>show track resolution</td>
<td>Displays the resolution of tracked parameters.</td>
</tr>
<tr>
<td>show track timers</td>
<td>Displays tracked polling interval timers.</td>
</tr>
</tbody>
</table>
CHAPTER 58

Configuring System Message Logging

This chapter describes how to configure system message logging on the Catalyst 4500 series switch. This chapter consists of these sections:

- About System Message Logging, page 58-1
- Configuring System Message Logging, page 58-2
- Displaying the Logging Configuration, page 58-12

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference and related publications at this location:

About System Message Logging

By default, a switch sends the output from system messages and debug privileged EXEC commands to a logging process. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

Note

The syslog format is compatible with 4.3 BSD UNIX.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages are displayed on the console after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.
You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on the switch. If the switch fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet or using the console port.

Configuring System Message Logging

These sections describe how to configure system message logging:

- **System Log Message Format**, page 58-2
- **Default System Message Logging Configuration**, page 58-3
- **Disabling Message Logging**, page 58-4
- **Setting the Message Display Destination Device**, page 58-5
- **Synchronizing Log Messages**, page 58-6
- **Enabling and Disabling Timestamps on Log Messages**, page 58-7
- **Enabling and Disabling Sequence Numbers in Log Messages (Optional)**, page 58-7
- **Defining the Message Severity Level (Optional)**, page 58-8
- **Limiting Syslog Messages Sent to the History Table and to SNMP (Optional)**, page 58-9
- **Configuring UNIX Syslog Servers**, page 58-10

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Messages are displayed in this format:

```
seq no:timestamp: %facility-severity-MNEMONIC:description
```

The part of the message preceding the percent sign depends on the setting of the `service sequence-numbers`, `service timestamps log datetime`, `service timestamps log datetime [localtime] [msec] [show-timezone]` command or the `service timestamps log uptime` global configuration command.

Table 58-1 describes the elements of syslog messages.
### Chapter 58 Configuring System Message Logging

#### Configuring System Message Logging

This example shows a partial switch system message:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed state to down

*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar  1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

#### Default System Message Logging Configuration

Table 58-2 shows the default system message logging configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>System message logging to the console</td>
<td>Enabled.</td>
</tr>
<tr>
<td>Console severity</td>
<td>Debugging (and numerically lower levels; see Table 58-3 on page 58-9).</td>
</tr>
<tr>
<td>Logging file configuration</td>
<td>No filename specified.</td>
</tr>
<tr>
<td>Logging buffer size</td>
<td>4096 bytes.</td>
</tr>
<tr>
<td>Logging history size</td>
<td>1 message.</td>
</tr>
<tr>
<td>Timestamps</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

#### Default System Message Logging Configuration

Table 58-2 shows the default system message logging configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>System message logging to the console</td>
<td>Enabled.</td>
</tr>
<tr>
<td>Console severity</td>
<td>Debugging (and numerically lower levels; see Table 58-3 on page 58-9).</td>
</tr>
<tr>
<td>Logging file configuration</td>
<td>No filename specified.</td>
</tr>
<tr>
<td>Logging buffer size</td>
<td>4096 bytes.</td>
</tr>
<tr>
<td>Logging history size</td>
<td>1 message.</td>
</tr>
<tr>
<td>Timestamps</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
Configuring System Message Logging

Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

To disable message logging, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# no logging on</td>
</tr>
<tr>
<td></td>
<td>Disables message logging.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show running-config or show logging</td>
</tr>
<tr>
<td></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages are displayed on the console as soon as they are produced, often appearing in the middle of command output.

The `logging synchronous` global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return. For more information, see the “Synchronizing Log Messages” section on page 58-6.

To reenable message logging after it has been disabled, use the `logging on` global configuration command.
Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

To specify the locations that receive messages, perform this task, beginning in privileged EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# logging buffered [size]&lt;br&gt;Logs messages to an internal buffer on the switch. The default buffer size is 4096. The range is 4096 to 2147483647 bytes.&lt;br&gt;If the switch, the log file is lost unless you previously saved it to flash memory. See Step 4.&lt;br&gt;Note&lt;br&gt;Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should not be set to this amount.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# logging host&lt;br&gt;Logs messages to a UNIX syslog server host.&lt;br&gt;For host, specify the name or IP address of the host to be used as the syslog server.&lt;br&gt;To build a list of syslog servers that receive logging messages, enter this command more than once.&lt;br&gt;For complete syslog server configuration steps, see the “Configuring UNIX Syslog Servers” section on page 58-10.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# end&lt;br&gt;Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# terminal monitor&lt;br&gt;Logs messages to a nonconsole terminal during the current session.&lt;br&gt;Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# show running-config&lt;br&gt;Verifies your entries.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# copy running-config startup-config&lt;br&gt;(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The logging buffered global configuration command copies logging messages to an internal buffer. The buffer is circular, so newer messages overwrite older messages after the buffer is full. To display the messages that are logged in the buffer, use the show logging privileged EXEC command. The first message displayed is the oldest message in the buffer. To clear the contents of the buffer, use the clear logging privileged EXEC command.

To disable logging to the console, use the no logging console global configuration command. To disable logging to a file, use the no logging file [severity-level-number | type] global configuration command.
Synchronizing Log Messages

You can synchronize unsolicited messages and debug privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and debug command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or printed. Unsolicited messages and debug command output appears on the console after the prompt for user input is returned. Unsolicited messages and debug command output are not interspersed with solicited device output and prompts. After the unsolicited messages are displayed, the console again displays the user prompt.

To configure synchronous logging, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# line [console</td>
</tr>
<tr>
<td></td>
<td>line-number [ending-line-number]</td>
</tr>
<tr>
<td></td>
<td>Specifies the line to be configured for synchronous logging of messages.</td>
</tr>
<tr>
<td></td>
<td>• Use the console keyword for configurations that occur using the switch console port.</td>
</tr>
<tr>
<td></td>
<td>• Use the line vty line-number command to specify which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15.</td>
</tr>
<tr>
<td></td>
<td>You can change the setting of all 16 vty lines at once by entering:</td>
</tr>
<tr>
<td></td>
<td>line vty 0 15</td>
</tr>
<tr>
<td></td>
<td>Or you can change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:</td>
</tr>
<tr>
<td></td>
<td>line vty 2</td>
</tr>
<tr>
<td></td>
<td>When you enter this command, the mode changes to line configuration.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config)# logging synchronous</td>
</tr>
<tr>
<td></td>
<td>[level severity-level</td>
</tr>
<tr>
<td></td>
<td>Enables synchronous logging of messages.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For level severity-level, specify the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Specifying level all means that all messages are printed asynchronously regardless of the severity level.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For limit number-of-buffers, specify the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
To disable synchronization of unsolicited messages and debug output, use the 
no logging synchronous [level severity-level | all] [limit number-of-buffers] line configuration 
command.

### Enabling and Disabling Timestamps on Log Messages

**Note**

By default, log messages are not time-stamped.

To enable time-stamping of log messages, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# service timestamps log uptime</td>
<td>Enables log time-stamps.</td>
</tr>
<tr>
<td>or Switch(config)# service timestamps log</td>
<td>The first command enables time-stamps on log messages, showing the time since the system was rebooted.</td>
</tr>
<tr>
<td>datetime [msec] [localtime] [show-timezone]</td>
<td>The second command enables time-stamps on log messages. Depending on the options selected, the timestamp</td>
</tr>
<tr>
<td></td>
<td>can include the date, time in milliseconds relative to the local time zone, and the time zone name.</td>
</tr>
</tbody>
</table>

Switch(config)# end

Returns to privileged EXEC mode.

Switch# show running-config

Verifies your entries.

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

To disable time-stamps for both debug and log messages, use the no service timestamps global 
configuration command.

This example shows part of a logging display with the service timestamps log datetime global 
configuration command enabled:

```
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

This example shows part of a logging display with the service timestamps log uptime global 
configuration command enabled:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
```

### Enabling and Disabling Sequence Numbers in Log Messages (Optional)

Because more than one log message can have the same timestamp, you can display messages with 
sequence numbers so that you can unambiguously refer to a single message. By default, sequence 
numbers in log messages are not displayed.
To enable sequence numbers in log messages, perform this task, which is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# service sequence-numbers</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable sequence numbers, use the `no service sequence-numbers` global configuration command.

This example shows part of a logging display with sequence numbers enabled:

000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

---

### Defining the Message Severity Level (Optional)

You can limit messages displayed to the selected device by specifying the severity level of the message, which are described in Table 58-3.

To define the message severity level, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# logging console level</td>
</tr>
<tr>
<td></td>
<td>By default, the console receives debugging messages and numerically lower levels (see Table 58-3 on page 58-9).</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# logging monitor level</td>
</tr>
<tr>
<td></td>
<td>By default, the terminal receives debugging messages and numerically lower levels (see Table 58-3 on page 58-9).</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# logging trap level</td>
</tr>
<tr>
<td></td>
<td>By default, syslog servers receive informational messages and numerically lower levels (see Table 58-3 on page 58-9).</td>
</tr>
<tr>
<td></td>
<td>For complete syslog server configuration steps, see the “Configuring UNIX Syslog Servers” section on page 58-10.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show running-config or Switch# show logging</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Note** Specifying a `level` causes messages at that level and numerically lower levels to be displayed at the destination.
To disable logging to the console, use the `no logging console` global configuration command. To disable logging to a terminal other than the console, use the `no logging monitor` global configuration command. To disable logging to syslog servers, use the `no logging trap` global configuration command.

Table 58-3 describes the `level` keywords. It also lists the corresponding UNIX syslog definitions from the most severe level to the least severe level.

Table 58-3 Message Logging Level Keywords

<table>
<thead>
<tr>
<th>Level Keyword</th>
<th>Level</th>
<th>Description</th>
<th>Syslog Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>emergencies</td>
<td>0</td>
<td>System unstable</td>
<td>LOG_EMERG</td>
</tr>
<tr>
<td>alerts</td>
<td>1</td>
<td>Immediate action needed</td>
<td>LOG_ALERT</td>
</tr>
<tr>
<td>critical</td>
<td>2</td>
<td>Critical conditions</td>
<td>LOG_CRIT</td>
</tr>
<tr>
<td>errors</td>
<td>3</td>
<td>Error conditions</td>
<td>LOG_ERR</td>
</tr>
<tr>
<td>warnings</td>
<td>4</td>
<td>Warning conditions</td>
<td>LOG_WARNING</td>
</tr>
<tr>
<td>notifications</td>
<td>5</td>
<td>Normal but significant condition</td>
<td>LOG_NOTICE</td>
</tr>
<tr>
<td>informational</td>
<td>6</td>
<td>Informational messages only</td>
<td>LOG_INFO</td>
</tr>
<tr>
<td>debugging</td>
<td>7</td>
<td>Debugging messages</td>
<td>LOG_DEBUG</td>
</tr>
</tbody>
</table>

The software generates four other categories of messages:

- Error messages about software or hardware malfunctions, displayed at levels `warnings` through `emergencies`. These types of messages mean that the functionality of the switch is affected. For information on how to recover from these malfunctions, see the system message guide for this release.
- Output from the `debug` commands, displayed at the `debugging` level. Debug commands are typically used only by the Technical Assistance Center.
- Interface up or down transitions and system restart messages, displayed at the `notifications` level. This message is only for information; switch functionality is not affected.
- Reload requests and low-process stack messages, displayed at the `informational` level. This message is only for information; switch functionality is not affected.

**Limiting Syslog Messages Sent to the History Table and to SNMP (Optional)**

If you enabled syslog message traps to be sent to an SNMP network management station by using the `snmp-server enable trap` global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level `warning` and numerically lower levels (see Table 58-3 on page 58-9) are stored in the history table even if syslog traps are not enabled.
Configuring System Message Logging

To change the level and history table size defaults, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
Switch# configure terminal | Enters global configuration mode. |
| **Step 2**  
Switch(config)# logging history level1 | Changes the default level of syslog messages stored in the history file and sent to the SNMP server.  
See Table 58-3 on page 58-9 for a list of level keywords.  
By default, warnings, errors, critical, alerts, and emergencies messages are sent. |
| **Step 3**  
Switch(config)# logging history size number | Specifies the number of syslog messages that can be stored in the history table.  
The default is to store one message. The range is 0 to 500 messages. |
| **Step 4**  
Switch(config)# end | Returns to privileged EXEC mode. |
| **Step 5**  
Switch# show running-config | Verifies your entries. |
| **Step 6**  
Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

1. Table 58-3 lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, emergencies equal 1, not 0, and critical equals 3, not 2.

When the history table is full (it contains the maximum number of message entries specified with the logging history size global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

To return the logging of syslog messages to the default level, use the no logging history global configuration command. To return the number of messages in the history table to the default value, use the no logging history size global configuration command.

Configuring UNIX Syslog Servers

The next sections describe how to configure the UNIX server syslog daemon and how to define the UNIX system logging facility.

Logging Messages to a UNIX Syslog Daemon

Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server. This procedure is optional.

Note: Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If applies to your system, use the UNIX man syslogd command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.
Log in as root, and perform these steps:

**Step 1**  Add a line such as the following to the file /etc/syslog.conf:

```
local7.debug /usr/adm/logs/cisco.log
```

The `local7` keyword specifies the logging facility to be used; see Table 58-4 on page 58-12 for information on the facilities. The `debug` keyword specifies the syslog level; see Table 58-3 on page 58-9 for information on the severity levels. The syslog daemon sends messages at this level or at a more severe level to the file specified in the next field. The file must already exist, and the syslog daemon must have permission to write to it.

**Step 2**  Create the log file by entering these commands at the UNIX shell prompt:

```
$ touch /var/log/cisco.log
$ chmod 666 /var/log/cisco.log
```

**Step 3**  Ensure that the syslog daemon reads the new changes:

```
$ kill -HUP `cat /etc/syslog.pid`
```

For more information, see the `man syslog.conf` and `man syslogd` commands on your UNIX system.

### Configuring the UNIX System Logging Facility

When sending system log messages to an external device, you can cause the switch to identify its messages as originating from any of the UNIX syslog facilities.

To configure UNIX system facility message logging, perform this task (which is optional):

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <code>configure terminal</code></td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# <code>logging host</code></td>
</tr>
<tr>
<td></td>
<td>To build a list of syslog servers that receive logging messages, enter this command more than once.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# <code>logging trap level</code></td>
</tr>
<tr>
<td></td>
<td>Be default, syslog servers receive informational messages and lower. See Table 58-3 on page 58-9 for <code>level</code> keywords.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# <code>logging facility facility-type</code></td>
</tr>
<tr>
<td></td>
<td>The default is <code>local7</code>.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# <code>end</code></td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# <code>show running-config</code></td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# <code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>
To remove a syslog server, use the `no logging host` global configuration command, and specify the syslog server IP address. To disable logging to syslog servers, enter the `no logging trap` global configuration command.

Table 58-4 lists the UNIX system facilities supported by the software. For more information about these facilities, consult the operator’s manual for your UNIX operating system.

<table>

Displaying the Logging Configuration

To display the logging configuration and the contents of the log buffer, use the `show logging` privileged EXEC command. For information about the fields in this display, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.3.*
Onboard Failure Logging (OBFL)

• Prerequisites for OBFL, page 59-1
• Restrictions for OBFL, page 59-2
• Information About OBFL, page 59-2
• Default Settings for OBFL, page 59-9
• Enabling OBFL, page 59-9

Note
For complete syntax and usage information for the commands used in this chapter, see these publications:

Note
For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference and related publications at this location:

Prerequisites for OBFL

None.
Restrictions for OBFL

They include:

- **Software Restrictions**—If a device (router or switch) intends to use linear flash memory as its OBFL storage media, Cisco IOS software must reserve a minimum of two physical sectors (or physical blocks) for the OBFL feature. Because an erase operation for a linear flash device is done on per-sector (or per-block) basis, one extra physical sector is needed. Otherwise, the minimum amount of space reserved for the OBFL feature on any device must be at least 8 KB.

- **Firmware Restrictions**—If a line card or port adapter runs an operating system or firmware that is different from the Cisco IOS operating system, the line card or port adapter must provide device driver level support or an interprocess communications (IPC) layer that allows the OBFL file system to communicate to the line card or port adapter. This requirement is enforced to allow OBFL data to be recorded on a storage device attached to the line card or port adapter.

- **Hardware Restrictions**—To support the OBFL feature, a device must have at least 8 KB of nonvolatile memory space reserved for OBFL data logging.

Information About OBFL

- Overview of OBFL, page 59-2
- Information about Data Collected by OBFL, page 59-2

Overview of OBFL

The Onboard Failure Logging (OBFL) feature collects data such as operating temperatures, hardware uptime, interrupts, and other important events and messages from system hardware installed in a Cisco router or switch. The data is stored in nonvolatile memory and helps technical personnel diagnose hardware problems.

Information about Data Collected by OBFL

- OBFL Data Overview, page 59-2
- Temperature, page 59-3
- Operational Uptime, page 59-4
- Interrupts, page 59-7
- Message Logging, page 59-8

OBFL Data Overview

The OBFL feature records operating temperatures, hardware uptime, interrupts, and other important events and messages that can assist with diagnosing problems with hardware cards (or modules) installed in a Cisco router or switch. Data is logged to files stored in nonvolatile memory. When the onboard hardware is started up, a first record is made for each area monitored and becomes a base value for subsequent records. The OBFL feature provides a circular updating scheme for collecting continuous records and archiving older (historical) records, ensuring accurate data about the system. Data is
recorded in one of two formats: continuous information that displays a snapshot of measurements and samples in a continuous file, and summary information that provides details about the data being collected. The data is displayed using the `show logging onboard` command. The message “No historical data to display” is seen when historical data is not available.

**Temperature**

Temperatures surrounding hardware modules can exceed recommended safe operating ranges and cause system problems such as packet drops. Higher than recommended operating temperatures can also accelerate component degradation and affect device reliability. Monitoring temperatures is important for maintaining environmental control and system reliability. Once a temperature sample is logged, the sample becomes the base value for the next record. From that point on, temperatures are recorded either when there are changes from the previous record or if the maximum storage time is exceeded. Temperatures are measured and recorded in degrees Celsius.

**Temperature Example**

```shell
Switch# sh logging onboard temperature

Switch#

To interpret this data:

- Number of sensors is the total number of temperature sensors that will be recorded. A column for each sensor is displayed with temperatures listed under the number of each sensor, as available.
- Sampling frequency is the time between measurements.
- Maximum time of storage determines the maximum amount of time, in minutes, that can pass when the temperature remains unchanged and the data is not saved to storage media. After this time, a temperature record will be saved even if the temperature has not changed.
- The Sensor column lists the name of the sensor.
- The ID column lists an assigned identifier for the sensor.
- Maximum Temperature 0C shows the highest recorded temperature per sensor.
- Temp indicates a recorded temperature in degrees Celsius in the historical record. Columns following show the total time each sensor has recorded that temperature.
- Sensor ID is an assigned number, so that temperatures for the same sensor can be stored together.

### Operational Uptime

The operational uptime tracking begins when the module is powered on, and information is retained for the life of the module.
Operational Uptime Example

Switch#

The operational uptime application tracks the following events:

- Date and time the customer first powered on a component.
- Total uptime and downtime for the component in years, weeks, days, hours, and minutes.
- Total number of component resets.
- Total number of slot (module) changes.
- Current reset timestamp to include the date and time.
- Current slot (module) number of the component.
- Current uptime in years, weeks, days, hours, and minutes.
Interrupts

Interrupts are generated by system components that require attention from the CPU such as ASICs and NMIs. Interrupts are generally related to hardware limit conditions or errors that need to be corrected.

The continuous format records each time a component is interrupted, and this record is stored and used as base information for subsequent records. Each time the list is saved, a timestamp is added. Time differences from the previous interrupt are counted, so that technical personnel can gain a complete record of the component’s operational history when an error occurs.

Switch#

To interpret this data:

- **Name** is a description of the component including its position in the device.
- **ID** is an assigned field for data storage.
- **Offset** is the register offset from a component register’s base address.
- **Bit** is the interrupt bit number recorded from the component’s internal register.
- **The timestamp shows the date and time that an interrupt occurred down to the millisecond.
Message Logging

The OBFL feature logs standard system messages. Instead of displaying the message to a terminal, the message is written to and stored in a file, so the message can be accessed and read at a later time. System messages range from level 1 alerts to level 7 debug messages, and these levels can be specified in the **hw module logging onboard** command.

**Error Message Log Example**

```
Switch# sh logging onboard message det

ERROR MESSAGE SUMMARY INFORMATION

Facility-Sev-Name | Count | Persistence Flag
MM/DD/YYYY HH:MM:SS
%CAT4K-3-DIAGNOSTICS_PASSED :   22    LAST
11/24/2010 15:46:20 module passed diagnostics
%CAT4K-2-DIAGNOSTIC_STATUS :   22    LAST

ERROR MESSAGE CONTINUOUS INFORMATION

12/15/2010 14:35:51  %CAT4K-2-DIAGNOSTIC_STATUS : diagnostic Packet memory Skipped
```

To interpret this data:

- A timestamp shows the date and time the message was logged.
- Facility-Sev-Name is a coded naming scheme for a system message, as follows:
  - The Facility code consists of two or more uppercase letters that indicate the hardware device (facility) to which the message refers.
  - Sev is a single-digit code from 1 to 7 that reflects the severity of the message.
  - Name is one or two code names separated by a hyphen that describe the part of the system from where the message is coming.
- The error message follows the Facility-Sev-Name codes. For more information about system messages, see the *Cisco IOS System and Error Messages* guide.
- Count indicates the number of instances of this message that is allowed in the history file. Once that number of instances has been recorded, the oldest instance will be removed from the history file to make room for new ones.
The Persistence Flag gives a message priority over others that do not have the flag set.

### Default Settings for OBFL

The OBFL feature is enabled by default. Because of the valuable information this feature offers technical personnel, it should not be disabled.

### Enabling OBFL

To enable OBFL, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Router&gt; enable</td>
<td>Enables privileged EXEC mode (enter your password if prompted).</td>
</tr>
<tr>
<td>Step 2</td>
<td>Router# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Router(config)# hw-module module module-number logging onboard [message level {1-7}]</td>
<td>Enables OBFL on the specified hardware module. Note: By default, all system messages sent to a device are logged by the OBFL feature. You can define a specific message level (only level 1 messages, as an example) to be logged using the message level keywords.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Router(config)# end</td>
<td>Ends global configuration mode.</td>
</tr>
</tbody>
</table>
Configuration Examples for OBFL

The important OBFL feature is the information that is displayed by the `show logging onboard module` privileged EXEC command. This section provides the following examples of how to enable and display OBFL records.

- **Enabling OBFL Message Logging: Example**
- **OBFL Message Log: Example**
- **OBFL Component Uptime Report: Example**
- **OBFL Report for a Specific Time: Example**

### Enabling OBFL Message Logging: Example

The following example shows how to configure OBFL message logging at level 3:

```plaintext
Router(config)# hw-module module 1 logging onboard message level 3
```

### OBFL Message Log: Example

The following example shows how to display the system messages that are being logged for module 2:

```plaintext
Switch# show logging onboard module 2 message continuous

Switch#
Configuring SNMP

This chapter describes how to configure the Simple Network Management Protocol (SNMP) on the Catalyst 4500 series switch.

This chapter consists of these sections:

- About SNMP, page 60-1
- Configuring SNMP, page 60-5
- Displaying SNMP Status, page 60-16

**Note**

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

**About SNMP**

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a MIB. The SNMP manager can be part of a network management system (NMS) such as CiscoWorks. The agent and MIB reside on the switch. To configure SNMP on the switch, you define the relationship between the manager and the agent.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change. A manager can get a value from an agent or store a value into the agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to a manager’s requests to get or set data.

An agent can send unsolicited traps to the manager. Traps are messages alerting the SNMP manager to a condition on the network. Traps can mean improper user authentication, restarts, link status (up or down), MAC address tracking, closing of a Transmission Control Protocol (TCP) connection, loss of connection to a neighbor, or other significant events.
This section includes information about these topics:

- **SNMP Versions**, page 60-2
- **SNMP Manager Functions**, page 60-3
- **SNMP Agent Functions**, page 60-4
- **SNMP Community Strings**, page 60-4
- **Using SNMP to Access MIB Variables**, page 60-4
- **SNMP Notifications**, page 60-5

## SNMP Versions

The Catalyst 4500 series switch supports these SNMP versions:

- **SNMPv1**—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.
- **SNMPv2**—Version 2 of the Simple Network Management Protocol, a Draft Internet Standard, defined in RFCs 1902 through 1907.
- **SNMPv2C**—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.
- **SNMPv3**—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:
  - Message integrity—Ensures that a packet was not tampered with in transit
  - Authentication—Determines that the message is from a valid source
  - Encryption—Mixes the contents of a package to prevent it from being read by an unauthorized source

**Note**

To select encryption, enter the `priv` keyword. This keyword is available only when the `crypto (encrypted)` software image is installed.

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent’s MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval mechanism and more detailed error message reporting to management stations. The bulk retrieval mechanism retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which you reside. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security mechanism is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.
The following table identifies the characteristics of the different combinations of security models and levels.

<table>
<thead>
<tr>
<th>Model</th>
<th>Level</th>
<th>Authentication</th>
<th>Encryption</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMPv1</td>
<td>noAuthNoPriv</td>
<td>Community string</td>
<td>No</td>
<td>Uses a community string match for authentication.</td>
</tr>
<tr>
<td>SNMPv2C</td>
<td>noAuthNoPriv</td>
<td>Community string</td>
<td>No</td>
<td>Uses a community string match for authentication.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>noAuthNoPriv</td>
<td>Username</td>
<td>No</td>
<td>Uses a username match for authentication.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>authNoPriv</td>
<td>MD5 or SHA</td>
<td>No</td>
<td>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>authPriv</td>
<td>MD5 or SHA</td>
<td>DES</td>
<td>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.</td>
</tr>
<tr>
<td></td>
<td>(requires the</td>
<td></td>
<td></td>
<td>Provides DES 56-bit encryption in addition to authentication based on</td>
</tr>
<tr>
<td></td>
<td>cryptographic software image)</td>
<td></td>
<td></td>
<td>the CBC-DES (DES-56) standard.</td>
</tr>
</tbody>
</table>

You must configure the SNMP agent to use the SNMP version supported by the management station. Because an agent can communicate with multiple managers, you can configure the software to support communications using SNMPv1, and SNMPv2C, and SNMPv3 protocols.

**SNMP Manager Functions**

The SNMP manager uses information in the MIB to perform the operations described in Table 60-1.

<table>
<thead>
<tr>
<th>Table 60-1</th>
<th>SNMP Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation</td>
<td>Description</td>
</tr>
<tr>
<td>get-request</td>
<td>Retrieves a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieves a value from a variable within a table.¹</td>
</tr>
<tr>
<td>get-bulk-request²</td>
<td>Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.</td>
</tr>
<tr>
<td>get-response</td>
<td>Replies to a get-request, get-next-request, and set-request sent by an NMS.</td>
</tr>
<tr>
<td>set-request</td>
<td>Stores a value in a specific variable.</td>
</tr>
<tr>
<td>trap</td>
<td>An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.</td>
</tr>
</tbody>
</table>

¹ With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.

² The get-bulk command only works with SNMPv2 or later.
SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- Get a MIB variable—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.

- Set a MIB variable—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.

The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.

SNMP Community Strings

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the switch, the community string definitions on the NMS must match at least one of the three community string definitions on the switch.

A community string can have one of these attributes:

- Read-only (RO)—Gives read access to authorized management stations to all objects in the MIB except the community strings, but does not allow write access

- Read-write (RW)—Gives read and write access to authorized management stations to all objects in the MIB, but does not allow access to the community strings

- Read-write-all—Gives read and write access to authorized management stations to all objects in the MIB, including the community strings

Using SNMP to Access MIB Variables

An example of an NMS is the CiscoWorks network management software. CiscoWorks 2000 software uses the switch MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in Figure 60-1, the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in get-request, get-next-request, and set-request format.
SNMP Notifications

SNMP allows the switch to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword *traps* refers to either traps or informs, or both. Use the `snmp-server host` command to specify whether to send SNMP notifications as traps or informs.

*Note* SNMPv1 does not support informs.

Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be resent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the switch and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be resent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the switch is a concern and notification is not required, use traps.

Configuring SNMP

This section describes how to configure SNMP on your switch. It contains this configuration information:

- Default SNMP Configuration, page 60-5
- SNMP Configuration Guidelines, page 60-6
- Disabling the SNMP Agent, page 60-7
- Configuring Community Strings, page 60-7
- Configuring SNMP Groups and Users, page 60-9
- Configuring SNMP Notifications, page 60-11
- Setting the Agent Contact and Location Information, page 60-14
- Limiting TFTP Servers Used Through SNMP, page 60-15
- SNMP Examples, page 60-15

Default SNMP Configuration

Table 60-2 shows the default SNMP configuration.
Chapter 60 Configuring SNMP

SNMP Configuration Guidelines

An SNMP group is a table that maps SNMP users to SNMP views. An SNMP user is a member of an SNMP group. An SNMP host is the recipient of an SNMP trap operation. An SNMP engine ID is a name for the local or remote SNMP engine.

When configuring SNMP, follow these guidelines:

- When configuring an SNMP group, do not specify a notify view. The `snmp-server host` global configuration command autogenerates a notify view for you and then adds it to the group associated with that user. Modifying the group's notify view affects all users associated with that group. For information about when you should configure notify views, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

- To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where you reside.

- Before you configure remote users for a particular agent, configure the SNMP engine ID, using the `snmp-server engineID` global configuration with the `remote` option. The remote agent's SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.

- When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.

- If a local user is not associated with a remote host, the switch does not send informs for the `auth` (authNoPriv) and the `priv` (authPriv) authentication levels.

- Changing the value of the SNMP engine ID has important side effects. A user's password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of the engine ID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the `snmp-server user` `username` global configuration command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP agent</td>
<td>Enabled</td>
</tr>
<tr>
<td>SNMP trap receiver</td>
<td>None configured</td>
</tr>
<tr>
<td>SNMP traps</td>
<td>None enabled except the trap for TCP connections (tty)</td>
</tr>
<tr>
<td>SNMP version</td>
<td>If no <code>version</code> keyword is present, the default is Version 1.</td>
</tr>
<tr>
<td>SNMPv3 authentication</td>
<td>If no keyword is entered, the default is the <code>noauth</code> (noAuthNoPriv) security level.</td>
</tr>
<tr>
<td>SNMP notification type</td>
<td>If no type is specified, all notifications are sent.</td>
</tr>
</tbody>
</table>
Disabling the SNMP Agent

To disable the SNMP agent, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2  Switch(config)# no snmp-server</td>
<td>Disables the SNMP agent operation.</td>
</tr>
<tr>
<td>Step 3  Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4  Switch# show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 5  Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The `no snmp-server` global configuration command disables all running versions (Version 1, Version 2C, and Version 3) on the device. No specific Cisco IOS command exists to enable SNMP. The first `snmp-server` global configuration command that you enter enables all versions of SNMP.

Configuring Community Strings

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the switch. Optionally, you can specify one or more of these characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent
- A MIB view, which defines the subset of all MIB objects accessible to the given community
- Read and write or read-only permission for the MIB objects accessible to the community
To configure a community string on the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# [no] snmp-server community string [view view-name] [ro</td>
</tr>
<tr>
<td></td>
<td>• For string, specify a string that acts like a password and permits access to the SNMP protocol. You can configure one or more community strings up to 117 characters.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For view, specify the view record accessible to the community.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Specify either read-only (ro) if you want authorized management stations to retrieve MIB objects, or specify read-write (rw) if you want authorized management stations to retrieve and modify MIB objects. By default, the community string permits read-only access to all objects.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For access-list-number, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.</td>
</tr>
<tr>
<td></td>
<td>To remove a specific community string, use the no snmp-server community string global configuration command.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td>• For access-list-number, enter the access list number specified in Step 2.</td>
</tr>
<tr>
<td></td>
<td>• The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>• For source, enter the IP address of the SNMP managers that are permitted to use the community string to gain access to the agent.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</td>
</tr>
<tr>
<td></td>
<td>Recall that the access list is always terminated by an implicit deny statement for everything.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Note** To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).
You cannot use the **snmp-server enable informs** command. To enable the sending of SNMP inform notifications, use the **snmp-server enable traps** command combined with the **snmp-server host host-addr informs** command.

This example shows how to assign the string **comaccess** to SNMP, to allow read-only access, and to specify that IP access list 4 can use the community string to gain access to the switch SNMP agent:

```
Switch(config)# snmp-server community comaccess ro 4
```

### Configuring SNMP Groups and Users

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the switch. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

To configure SNMP on the switch, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch# <strong>configure terminal</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configures a name for either the local or remote copy of SNMP.</td>
</tr>
<tr>
<td>Switch(config)# <strong>snmp-server engineID</strong> *(local engine-id-string</td>
<td>remote ip-address [udp-port port-number] engine-id-string)*</td>
</tr>
<tr>
<td></td>
<td>• If you select <strong>remote</strong>, specify the <em>ip-address</em> of the device that contains the remote copy of SNMP and the optional UDP port on the remote device. The default is 162.</td>
</tr>
</tbody>
</table>
### Configuring SNMP

**Step 3**

```bash
Switch(config)# snmp-server group
```

- `groupname` [v1 | v2c | v3 [auth | noauth | priv]] [read readview] [write writeview] [notify notifyview] [access access-list]

#### Command Purpose

- Configures a new SNMP group on the remote device.
- For `groupname`, specify the name of the group.
- Specify a security model:
  - `v1` is the least secure of the possible security models.
  - `v2c` is the second least secure model. It allows transmission of informs and integers twice the normal width.
  - `v3`, the most secure, requires you to select an authentication level:
    - `auth`—Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication.
    - `noauth`—The noAuthNoPriv security level. It is the default if no keyword is specified.
    - `priv`—Enables Data Encryption Standard (DES) packet encryption (also called `privacy`).

#### Note

- The `priv` keyword is available only when the crypto software image is installed.

- (Optional) Enter `read readview` with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent.
- (Optional) Enter `write writeview` with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent.
- (Optional) Enter `notify notifyview` with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap.
- (Optional) Enter `access access-list` with a string (not to exceed 64 characters) that is the name of the access list.
Configuring SNMP

Chapter 60  Configuring SNMP

Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the switch generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Switches running Cisco IOS Release 12.2(31)SG and later releases can have an unlimited number of trap managers.

**Note**

Many commands use the word *traps* in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword *traps* refers to either traps, informs, or both. Use the `snmp-server host` command to specify whether to send SNMP notifications as traps or informs.

Table 60-3 describes the supported switch traps (notification types). You can enable any or all of these traps and configure a trap manager to receive them.

### Table 60-3  Switch Notification Types

<table>
<thead>
<tr>
<th>Notification Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>Generates BGP state change traps.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> This option is only available when the enhanced multilayer image is installed.</td>
</tr>
<tr>
<td>bridge</td>
<td>Generates STP bridge MIB traps.</td>
</tr>
</tbody>
</table>
### Table 60-3  Switch Notification Types (continued)

<table>
<thead>
<tr>
<th>Notification Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>Generates a trap for SNMP configuration changes.</td>
</tr>
<tr>
<td>config-copy</td>
<td>Generates a trap for SNMP copy configuration changes.</td>
</tr>
<tr>
<td>cpu</td>
<td>Allows cpu-related traps.</td>
</tr>
<tr>
<td>eigrp</td>
<td>Enable EIGRP traps. <strong>Note</strong> This option is only available when the enhanced multilayer image is installed.</td>
</tr>
<tr>
<td>entity</td>
<td>Generates a trap for SNMP entity changes.</td>
</tr>
<tr>
<td>envmon</td>
<td>Generates environmental monitor traps. You can enable any or all of these environmental traps: fan, shutdown, supply, temperature.</td>
</tr>
<tr>
<td>flash</td>
<td>Generates SNMP FLASH notifications.</td>
</tr>
<tr>
<td>fru-ctrl</td>
<td>Enable SNMP entity FRU control traps.</td>
</tr>
<tr>
<td>hsrp</td>
<td>Generates a trap for Hot Standby Router Protocol (HSRP) changes.</td>
</tr>
<tr>
<td>ipmulticast</td>
<td>Generates a trap for IP multicast routing changes.</td>
</tr>
<tr>
<td>isis</td>
<td>Enable IS-IS traps. <strong>Note</strong> This option is only available when the enhanced multilayer image is installed.</td>
</tr>
<tr>
<td>mac-notification</td>
<td>Generates a trap for MAC address notifications.</td>
</tr>
<tr>
<td>msdp</td>
<td>Generates a trap for Multicast Source Discovery Protocol (MSDP) changes. <strong>Note</strong> This option is only available when the enhanced multilayer image is installed.</td>
</tr>
<tr>
<td>ospf</td>
<td>Generates a trap for Open Shortest Path First (OSPF) changes. You can enable any or all of these traps: Cisco specific, errors, link-state advertisement, rate limit, retransmit, and state changes. <strong>Note</strong> This option is only available when the enhanced multilayer image is installed.</td>
</tr>
<tr>
<td>pim</td>
<td>Generates a trap for Protocol-Independent Multicast (PIM) changes. You can enable any or all of these traps: invalid PIM messages, neighbor changes, and rendezvous point (RP)-mapping changes.</td>
</tr>
<tr>
<td>port-security</td>
<td>Generates SNMP port security traps. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0, which means that there is no rate limit.</td>
</tr>
<tr>
<td>rf</td>
<td>Enable all SNMP traps defined in Cisco-RF-MIB.</td>
</tr>
<tr>
<td>snmp</td>
<td>Generates a trap for SNMP-type notifications for authentication, cold start, warm start, link up or link down.</td>
</tr>
<tr>
<td>storm-control</td>
<td>Generates a trap for SNMP storm-control. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence).</td>
</tr>
<tr>
<td>stpx</td>
<td>Generates SNMP STP Extended MIB traps.</td>
</tr>
<tr>
<td>syslog</td>
<td>Generates SNMP syslog traps.</td>
</tr>
</tbody>
</table>
Table 60-3  Switch Notification Types (continued)

<td>Generates SNMP VLAN created traps.</td>
</tr>
<tr>
<td>vlandelete</td>
<td>Generates SNMP VLAN deleted traps.</td>
</tr>
<tr>
<td>vtp</td>
<td>Generates a trap for VLAN Trunking Protocol (VTP) changes.</td>
</tr>
</tbody>
</table>

You can use the `snmp-server host` global configuration command to a specific host to receive the notification types listed in Table 60-3.

To configure the switch to send traps or informs to a host, perform this task:

Step 1
```
Switch# configure terminal
```
Enters global configuration mode.

Step 2
```
Switch(config)# snmp-server engineID remote ip-address engineid-string
```
Specifies the engine ID for the remote host.

Step 3
```
Switch(config)# snmp-server user username groupname remote host
udp-port port] [v1 | v2c | v3 [auth {md5 | sha} auth-password}] [encrypted] [access access-list]
```
Configures an SNMP user to be associated with the remote host created in Step 2.

Note
You cannot configure a remote user for an address without first configuring the engine ID for the remote host. If you try to configure the user before configuring the remote engine ID, you receive an error message, and the command is not executed.

Step 4
```
Switch(config)# snmp-server host host-addr [traps | informs]
version {1 | 2c | 3 [auth noauth | priv]}] community-string [udp-port port] [notification-type]
```
Specifies the recipient of an SNMP trap operation.

- For `host-addr`, specify the name or Internet address of the host (the targeted recipient).
- (Optional) Enter `traps` (the default) to send SNMP traps to the host.
- (Optional) Enter `informs` to send SNMP informs to the host.
- (Optional) Specify the SNMP `version` (1, 2c, or 3). SNMPv1 does not support informs.
- (Optional) For Version 3, select authentication level `auth`, `noauth`, or `priv`.

Note
The `priv` keyword is available only when the crypto software image is installed.

- For `community-string`, enter the password-like community string sent with the notification operation.
- (Optional) For `udp-port port`, enter the remote device UDP port.
- (Optional) For `notification-type`, use the keywords listed in Table 60-3 on page 60-11. If no type is specified, all notifications are sent.
Configuring SNMP

The `snmp-server host` command specifies which hosts receive the notifications. The `snmp-server enable trap` command globally enables the mechanism for the specified notification (for traps and informs). To enable a host to receive an inform, you must configure an `snmp-server host informs` command for the host and globally enable informs by using the `snmp-server enable traps` command.

To remove the specified host from receiving traps, use the `no snmp-server host host` global configuration command. The `no snmp-server host host` command with no keywords disables traps, but not informs, to the host. To disable informs, use the `no snmp-server host informs` global configuration command. To disable a specific trap type, use the `no snmp-server enable traps notification-types` global configuration command.

### Setting the Agent Contact and Location Information

To set the system contact and location of the SNMP agent so that these descriptions can be accessed using the configuration file, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# snmp-server contact text</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# snmp-server location text</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>
Chapter 60 Configuring SNMP

Configuring SNMP

Limiting TFTP Servers Used Through SNMP

To limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

SNMP Examples

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string public. This configuration does not cause the switch to send any traps.

Switch(config)# snmp-server community public
This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string public. The switch also sends VTP traps to the hosts 192.180.1.111 and 192.180.1.33 using SNMPv1 and to the host 192.180.1.27 using SNMPv2C. The community string public is sent with the traps.

```
Switch(config)# snmp-server community public
Switch(config)# snmp-server enable traps vtp
Switch(config)# snmp-server host 192.180.1.27 version 2c public
Switch(config)# snmp-server host 192.180.1.111 version 1 public
Switch(config)# snmp-server host 192.180.1.33 public
```

This example shows how to allow read-only access for all objects to members of access list 4 that use the comaccess community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2C to the host cisco.com using the community string public.

```
Switch(config)# snmp-server community comaccess ro 4
Switch(config)# snmp-server enable traps snmp authentication
Switch(config)# snmp-server host cisco.com version 2c public
```

This example shows how to send Entity MIB traps to the host cisco.com. The community string is restricted. The first line enables the switch to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous snmp-server host commands for the host cisco.com.

```
Switch(config)# snmp-server enable traps entity
Switch(config)# snmp-server host cisco.com restricted entity
```

This example shows how to enable the switch to send all traps to the host myhost.cisco.com using the community string public:

```
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

This example shows how to associate a user with a remote host and to send auth (authNoPriv) authentication-level informs when you enter global configuration mode:

```
Switch(config)# snmp-server engineID remote 192.180.1.27 00000063000100a1c0b4011b
Switch(config)# snmp-server group authgroup v3 auth
Switch(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5 mypassword
Switch(config)# snmp-server user authuser authgroup v3 auth md5 mypassword
Switch(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server inform retries 0
```

## Displaying SNMP Status

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the show snmp privileged EXEC command. You can also use the other privileged EXEC commands in Table 60-4 to display SNMP information. For information about the fields in the output displays, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.4.*
Table 60-4 Commands for Displaying SNMP Information

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show snmp</code></td>
<td>Displays SNMP statistics.</td>
</tr>
<tr>
<td><code>show snmp engineID</code></td>
<td>Displays information on the local SNMP engine and all remote engines that have been configured on the device.</td>
</tr>
<tr>
<td><code>show snmp group</code></td>
<td>Displays information on each SNMP group on the network.</td>
</tr>
<tr>
<td><code>show snmp pending</code></td>
<td>Displays information on pending SNMP requests.</td>
</tr>
<tr>
<td><code>show snmp sessions</code></td>
<td>Displays information on the current SNMP sessions.</td>
</tr>
<tr>
<td><code>show snmp user</code></td>
<td>Displays information on each SNMP user name in the SNMP users table.</td>
</tr>
</tbody>
</table>

Note
You cannot use the `snmp-server enable informs` command. To enable the sending of SNMP inform notifications, use the `snmp-server enable traps` command combined with the `snmp-server host host-addr informs` command.
Displaying SNMP Status
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches in IP Base or higher.

This chapter describes how to configure NetFlow-lite, which provides traffic monitoring capabilities similar to those provided through NetFlow.

The following topics are included:

- Feature Interaction, page 61-2
- Configuring NetFlow Packet Sampling, page 61-2
- Display Commands, page 61-8
- Clear Commands, page 61-9

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

VLAN monitors are not supported in Cisco IOS Release 15.0(2)SG.

Refer to the NetFlow Solutions Guide for more detailed information on NetFlow usage and management.
About NetFlow Packet Sampling

The NetFlow-lite feature is based on ingress packet sampling at a monitoring point that can be an interface on the switch. By exporting NetFlow sampled packets, it provides visibility into traffic that is switched through the device. The rate at which input packets are sampled is configurable and a wide range of sampling rates are supported. The sampled packets can be exported with NetFlow V9 or IPFIX format.

Feature Interaction

Feature interactions exists on three levels:

System-wide Restrictions

- WCCP output redirect is not supported when NetFlow-lite is configured on any interface.
- Configuring NetFlow-lite monitor on any interface causes Layer 3 Deny ACLs to not generate ICMP unreachable packets.
- Enabling NetFlow-lite monitoring reduces the available TCAM usage and packet forwarding bandwidth.

Interface-level Restrictions

- NetFlow-lite monitoring and the WCCP Exclude feature cannot coexist on the same interface.
- NetFlow-lite and SPAN cannot coexist on the same interface. NetFlow-lite takes precedence over SPAN.

Monitor-level Restrictions

- Port channel with an aggregate bandwidth exceeding 20 Gigabit support the highest sampling rate of 1 in 64; those with an aggregate bandwidth exceeding 40 Gigabit support 1 in 128.
- When running PIM bidirectional mode, NetFlow-lite monitoring for multicast packets does not work when the RP or DF and any of the receivers are on the same VLAN.

Configuring NetFlow Packet Sampling

To configure the NetFlow-lite feature, complete the tasks in these sections:
- Configuring Information about the External Collector, page 61-3
- Configuring Sampling Parameters, page 61-4
- Activating Sampling on an Interface or VLAN, page 61-5
Configuring Information about the External Collector

To configure the external collector, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# <code>config terminal</code> Enters configuration mode</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# <code>netflow-lite exporter exporter1</code> Defines an exporter and to enter NetFlow-lite exporter submode</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-netflow-lite-exporter)# <code>destination source-address</code> Specifies a destination address</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-netflow-lite-exporter)# <code>source source-address</code> Specifies a source Layer 3 interface</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-netflow-lite-exporter)# <code>vrf source-address</code> Specifies a VRF label</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-netflow-lite-exporter)# <code>transport udp destination-port</code> Specifies a UDP transport destination port</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-netflow-lite-exporter)# <code>ttl ttl-value</code> Specifies a ttl value</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config-netflow-lite-exporter)# <code>cos cos-value</code> Specifies a cos value</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch(config-netflow-lite-exporter)# <code>dscp dscp-value</code> Specifies a dscp value</td>
</tr>
<tr>
<td>Step 10</td>
<td>Switch(config-netflow-lite-exporter)# <code>template data timeout timeout</code> Specifies a template data timeout</td>
</tr>
<tr>
<td>Step 11</td>
<td>Switch(config-netflow-lite-exporter)# `options {sampler-table</td>
</tr>
<tr>
<td>Step 12</td>
<td>Switch(config-netflow-lite-exporter)# `export-protocol {netflow-v9</td>
</tr>
<tr>
<td>Step 13</td>
<td>Switch(config-netflow-lite-exporter)# <code>exit</code> Returns to global configuration mode</td>
</tr>
<tr>
<td>Step 14</td>
<td>Switch(config)# <code>exit</code> Returns to EXEC mode</td>
</tr>
<tr>
<td>Step 15</td>
<td>Switch# <code>show netflow-lite exporter exporter1</code> Displays the exporter configuration</td>
</tr>
</tbody>
</table>

Example

This example shows how configure the external collector and to verify the exporter configuration:

```
Switch# `config terminal`
Switch(config)# `netflow-lite exporter exporter1`
Switch(config-netflow-lite-exporter)# `destination 5.5.5.6`
Switch(config-netflow-lite-exporter)# `source 5.5.5.5`
Switch(config-netflow-lite-exporter)# `transport udp 8188`
Switch(config-netflow-lite-exporter)# `ttl 128`
Switch(config-netflow-lite-exporter)# `cos 7`
Switch(config-netflow-lite-exporter)# `dscp 32`
Switch(config-netflow-lite-exporter)# `template data timeout 1`
Switch(config-netflow-lite-exporter)# `options sampler-table timeout 1`
Switch(config-netflow-lite-exporter)# `options interface-table timeout 1`
Switch(config-netflow-lite-exporter)# `export-protocol netflow-v9`
Switch(config-netflow-lite-exporter)# `exit`
Switch(config)# `exit`
Switch# `show netflow-lite exporter exporter1`
Netflow-lite Exporter exporter1:
  Network Protocol Configuration:
    Destination IP address:  5.5.5.6
    Source IP Address:  5.5.5.5
```

Example

This example shows how configure the external collector and to verify the exporter configuration:
Chapter 61 Configuring NetFlow-lite

Configuring NetFlow Packet Sampling

Usage Guidelines

The collector's IP address and UDP port can be specified. Optionally a vrf label can be provided in which the collector is reachable. The exporter agent's address is specified as the source interface. We support either IPFIX or NetFlow V9 export.

The exporter's name can be specified when activating sampling at a monitor. This can be done in interface or VLAN mode. If no exporter is specified for a sampling instance, then no samples are exported.

The exporter submode also allows you to specify the refresh frequency for the NetFlow templates. Metadata about the NetFlow packet sampling process like sampler configuration parameters and SNMP interface table mapping can also be exported periodically to the collector.

Mandatory parameters for a minimal exporter configuration are the destination address of the collector, the source Layer 3 interface, and the UDP destination port of the collector.

The VRF label is ignored if the collector's address is IPv6. The default global routing table is used to route the IPv6 export packets to the collector.

The CoS CLI option is used to set the CoS value of VLAN tags for packet samples exported by fpga alone.

Configuring Sampling Parameters

This task configures packet and counter sampling parameters as reusable named entities.

To configure the NetFlow cache and enable switched IP flow collection, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td>Switch# config terminal</td>
<td>Switch(config)# netflow-lite sampler sampler</td>
</tr>
<tr>
<td>Enters configuration mode.</td>
<td>Configure packet sampling parameters as a reusable named entity and to enter NetFlow-lite sampler submode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Step 4</strong></td>
</tr>
<tr>
<td>Switch(config-netflow-lite-sampler)# packet-rate rate</td>
<td>Switch(config-netflow-lite-sampler)# packet-section size size</td>
</tr>
<tr>
<td>Specifies the specify a packet sampling rate in NetFlow-lite sampler submode.</td>
<td>Specifies a sampled header size in NetFlow-lite submode.</td>
</tr>
</tbody>
</table>
Example

This example shows how to configure sampling parameters and to display the sampler configuration:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config)# exit
Switch(config)# exit
Switch#

Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
  Id :                   1
  Packet Sampling rate:  1 out of 32
  Packet Section Size:   64    bytes
  Packet offset:         16    bytes
```

You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.

Usage Guidelines

The packet sampling rate can range from 32 to $2^{15}$ in powers of 2. To troubleshoot two 1 Gigabit ports, a rate of 1 is allowed. This is equivalent to rx span only. It cannot be configured on 10 Gigabit ports because the bandwidth demand for export will be too high.

Mandatory parameters are packet rate. A maximum of 2 x 1 Gigabit ports can be configured with 1-in-1 sampling. The best packet sampling rate that can be configured on any 1 Gigabit or 10 Gigabit port is 1-in-32. Packet sampling rates can be configured in powers of 2 (like 1-in-64 and 1-in-128).

You can update a sampler at a target interface, but you cannot remove or unconfigure mandatory parameters.

All mandatory parameters must be present to validate a sampler. Any unspecified non-mandatory parameters take on default values.

Activating Sampling on an Interface or VLAN

This task defines a monitor instance on an interface or VLAN, identifying the sampler and exporter to use.
To activate sampling on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# config terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# netflow-lite monitor monitor</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-netflow-lite-monitor)# sampler sampler</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-netflow-lite-monitor)# exporter exporter</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-netflow-lite-monitor)# average-packet-size size</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-netflow-lite-monitor)# exit</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch# show netflow-lite monitor monitor interface interface-name</td>
</tr>
</tbody>
</table>

To activate sampling on a VLAN, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# config terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# vlan config 2</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-vlan-config)# netflow-lite monitor monitor</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-netflow-lite-monitor)# average-packet-size size</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-netflow-lite-monitor)# exporter exporter</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch(config-netflow-lite-monitor)# sampler sampler</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch(config-netflow-lite-monitor)# exit</td>
</tr>
<tr>
<td>Step 8</td>
<td>Switch(config)# exit</td>
</tr>
<tr>
<td>Step 9</td>
<td>Switch# show netflow-lite monitor monitor vlan vlan</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to configure a monitor on a port interface Gigabit 1/3:

```
Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# average-packet-size 128
```
Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG

Chapter 61 Configuring NetFlow-lite

Configuring NetFlow Packet Sampling

```
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)#
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
   Netflow-lite Monitor-1:
      Active:               TRUE
      Sampler:              sampler1
      Exporter:             exporter1
      Average Packet Size:  0
   Statistics:
      Packets exported:     0
      Packets observed:     0
      Packets dropped:      0
      Average Packet Size observed: 64
      Average Packet Size used: 64
```

Similarly, you can configure a monitor on a VLAN in VLAN config mode:

```
Switch# config terminal
Switch(config)# vlan config 2
Switch(config-vlan-config)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# exit
Switch(config-vlan-config)# exit
Switch(config)#
Switch# show netflow-lite monitor 1 vlan 2
VlanID-2:
   Netflow-lite Monitor-1:
      Active:               TRUE
      Sampler:              sampler1
      Exporter:             exporter1
      Average Packet Size:  0
   Statistics:
      Packets exported:     0
      Packets observed:     0
      Packets dropped:      0
      Average Packet Size observed: 64
      Average Packet Size used: 64
```

You can verify your settings with the `show policy-map` privileged EXEC command.

**Usage Guidelines**

Only a single packet sampling instance is supported on a monitor. These commands are entered under the physical port interface mode, port channel interface, or config vlan mode. Monitor is not supported on other interfaces. If the physical port is a member of a port channel, applying the monitor to the port has no effect. Instead, the monitor must be applied to the port channel.

When configuring a monitor, the mandatory parameters are sampler and exporter. If no exporter is associated with a monitor, no samples are exported. If no sampler is specified, no input packet sampling occurs for that target interface.

The packet sampling mechanism tries to achieve random 1-in-N sampling. The accuracy of the algorithm is dependent on the size of the packets arriving at a given interface. To tune the relative accuracy of the algorithm, use the `average-packet-size` parameter. The whole system supports a maximum of 200 monitors.
The system automatically determines the average packet size at an interface based on observation of input traffic and uses that value in rate DBL sampling.

Valid range of packet sizes that can be used by the algorithm is 64 - 9216 bytes. A value of 0 is taken to mean that automatic determination of average packet size is desired.

The sampler and exporter must be valid for packet sampling. If any mandatory parameters are missing, a warning message indicating that sampler or exporter is invalid is displayed.

## Display Commands

To view the configured value of the minimum mask, use the following commands for each aggregation scheme, as needed:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# <code>show netflow-lite sampler sampler_name</code></td>
<td>Displays information about a sampler.</td>
</tr>
<tr>
<td>Switch# <code>show netflow-lite monitor monitor interface interface_name</code></td>
<td>The following commands display information about a particular packet and per monitor stats. The interface can be either a physical port or a VLAN. They display the following packet sampling statistics:</td>
</tr>
</tbody>
</table>
| Switch# `show netflow-lite monitor monitor vlan vlan_id` | · Total # of packet (samples) exported  
|                       | · Total # of packet (samples) dropped due to lack of local resources  
|                       | · Total# of packets seen at the monitor |
| Switch# `show netflow-lite exporter exporter_nsme` | Displays information about the collector and global stats. |

The following example shows how to displays information about a sampler:

```
Switch# show netflow-lite sampler low-rate
Netflow-lite Sampler low-rate:
   Description: Sampler
   Sampling rate: 1 out of 256
   Packet Section Size: 64 bytes
   Packet offset: 0 bytes
```

The following example shows how to display information about a particular packet and per monitor stats on a physical port:

```
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
   Netflow-lite Monitor-1:
      Active: TRUE
      Sampler: sampler1
      Exporter: exporter1
      Average Packet Size: 0
   Statistics:
      Packets exported: 0
      Packets observed: 0
      Packets dropped: 0
```
Average Packet Size observed: 64
Average Packet Size used: 64

The following example shows how to display information about a particular packet and per monitor stats on a VLAN:

Switch# `show netflow-lite monitor 1 vlan 2`
VlanID-2:
Netflow-lite Monitor-1:
   Active:               TRUE
   Sampler:              sampler1
   Exporter:             exporter1
   Average Packet Size:  0
Statistics:
   Packets exported:     0
   Packets observed:     0
   Packets dropped:      0
   Average Packet Size observed: 64
   Average Packet Size used: 64

The following example shows how to display the total number of export packets sent:

Switch# `show netflow-lite e1`
Netflow-lite Exporter e1:
   Description:                Exporter
Network Protocol Configuration:
   Destination IP address:   192.168.1.1
   VRF label:                cisc
   Source IP Address:        10.1.1.5
   DSCP:                     0x1
   TTL:                      30
   COS:                      1
Transport Protocol Configuration:
   Transport Protocol:       UDP
   Destination Port:         1234
   Source Port:              65535
Export Protocol Configuration:
   Export Protocol:          netflow-v9
Export packets sent:      36

---

**Clear Commands**

To clear statistics of a packet sampler at a monitor, use the following commands, as needed:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# clear netflow-lite monitor monitor_id statistics interface interface name</td>
<td>Clear the statistics of a packet sampler at a datasource</td>
</tr>
<tr>
<td>Switch# clear netflow-lite monitor monitor_id statistics vlan vlan_id</td>
<td>Clear the collector statistics</td>
</tr>
<tr>
<td>Switch# clear netflow-lite exporter exporter_name statistics</td>
<td>Clear the collector statistics</td>
</tr>
</tbody>
</table>
Configuring Flexible NetFlow

Note

Flexible NetFlow is only supported on Supervisor Engine 7-E, Supervisor Engine 7L-E, and Catalyst 4500X.

Flow is defined as a unique set of key fields attributes, which might include fields of packet, packet routing attributes, and input and output interface information. A NetFlow feature defines a flow as a sequence of packets that have the same values for the feature key fields. Flexible NetFlow (FNF) allows you to collect and optionally export a flow record that specifies various flow attributes. NetFlow collection supports IP, IPv6 and Layer 2 traffic.

Note

This chapter provides Catalyst 4500 switch specific information. For platform independent configuration and command information refer to the following links

Cisco IOS Flexible NetFlow Configuration Guide:

Cisco IOS Flexible NetFlow Command Reference:

The following items apply to the Catalyst 4500 series switch:

1. The Catalyst 4500 series switch supports ingress flow statistics collection for switched and routed packets; it does not support Flexible Netflow on egress traffic.

2. Supervisor Engine 7-E and Supervisor Engine 7L-E supports a 100,000 entry hardware flow table, which is shared across all the ports and VLANs on the switch. To limit the number of table entries on a given interface or VLAN, enter the cache entries number command.

The following example illustrates how to configure the flow monitor m1 cache to hold 1000 entries. With this configuration, interface gig 3/1 can create a maximum of 1000 flows and interface gig 3/2 can create a maximum of 1000 flows:

```conf
flow exporter e1
    ! exporter specifies where the flow records are send to
destination 20.1.20.4

flow record r1
    ! record specifies packet fields to collect
```
match ipv4 source address
match ipv4 destination address
collect counter bytes long
collect counter packets long
collect timestamp sys-uptime first
collect timestamp sys-uptime last

! flow monitor m1
  ! monitor refers record configuration and optionally exporter
  ! configuration. It specifies the cache size i.e. how many unique flow
  ! records to collect
  record r1
  exporter e1
  cache timeout active 60
  cache timeout inactive 30
  cache entries 1000

! interface GigabitEthernet 3/1
  ! layer2-switched allows collection of flow records even when the packet is
  ! bridged
  ip flow monitor m1 layer2-switched input

! interface GigabitEthernet 3/2
  ip flow monitor m1 input

3. Flow collection is supported on multiple targets (Port, VLAN, per-port per-VLAN (FNF can be
enabled on a specific VLAN on a given port)) and on a port-channel (FNF is configured on the
port-channel interface, rather than individual member ports).

4. 64 unique flow record configurations are supported.

5. Flow QoS/UBRL and FNF cannot be configured on the same target. (For information on Flow-based
QoS, see the section Flow-based QoS, page 40-10.)

6. 14,000 unique IPv6 addresses can be monitored.

7. On a given target, one monitor per traffic type is allowed. However, you can configure multiple
monitors on the same target for different traffic types.

   For example, the following configuration is allowed:

   ! vlan config 10
     ip flow monitor <name> input
     ipv6 flow monitor <name> input

   The following configuration is not allowed:

   !
   interface GigabitEthernet 3/1
     ip flow monitor m1 input
     ip flow monitor m2 input

8. On a given target monitoring Layer 2 and Layer 3, simultaneous traffic is not supported:

   interface channel-group 1
     datalink flow monitor m1 input
     ip flow monitor m2 input

9. Selection of Layer 2 and Layer 3 packet fields in a single flow record definition is not allowed.
   However, ingress 802.1Q VLAN Id of packet and Layer 3 packet field selection is allowed.

10. In order to attach a monitor to port or port-vlan targets, a flow record matching on ingress 802.1Q
    VLAN Id as key field, must match on input interface also as key field.
Chapter 62 Configuring Flexible NetFlow

Note The match datalink dot1q vlan input option is unavailable prior to IOS Release XE 3.3.0; you would only see the input option starting with the IOS Release XE 3.3.0.

11. Only permanent and normal flow cache types are supported.
12. Supervisor Engine 7-E and Supervisor Engine 7L-E do not support predefined records like traditional routers (record netflow ipv4 original-input).
14. Interface option not supported with Cos, Tos, TTL or Packet length options.
15. The configuration of the flow exporter does not support the option output features.
16. Flow aging in flow cache is controlled through active and inactive timer configuration. The minimum for active and inactive aging timers is 5 seconds. The timers must be in units of 5 seconds.

Note Flows in the hardware table are deleted after 5 seconds of in-activity irrespective of the active or in-active timer configuration values. This allows you to create new hardware flows quickly.

17. First and Last-seen flow timestamp accuracy is within 3 seconds.
18. 2048 Flow monitors and records are supported.
   • When TTL is configured as a flow field, the following values are reported for a given packet TTL value. Table 62-1 lists the packet TTL and reported values.

<table>
<thead>
<tr>
<th>Packet TT Value</th>

FNF supports this field only in non-key mode

### IPv6 Fields

destination address
IPv6 destination address

dscp
IPv6 DSCP (part of IPv6 traffic class)

flow-label
IPv6 flow label

is-multicast
Indicator of an IPv6 multicast packet (0 - if it's not, 1 - if it is)
Supported as a non-key field

hop-limit
IPv6 hop limit (replaces IPv4 ttl)
Values are reported based on Table 62-1.

hop-limit minimum
IPv6 minimum hop limit value seen in the flow. It can be used as a non-key field only.

hop-limit maximum
IPv6 maximum hop limit value seen in the flow. It can be used as a non-key field only.

next-header
IPv5 next header type
Only first next header is reported

total length
IPv6 total packet length
Values are based on Table 62-2.

Total length minimum
Minimum packet size seen

Total length maximum
Maximum packet size seen

protocol
IPv6 next header type in the last IPv6 extension header

source address
IPv6 source address

traffic-class
IPv6 traffic class
Yes

### Timestamp
Configuring Flow Monitor Cache Values

Setting active cache timeout to a small value may cause the flows to be exported more frequently to the remote collector. This also causes software to delete flows from the local cache after exporting. So, cache statistics reported by switch may not display the actual flows being monitored.
Configuring Ethernet OAM and CFM

Ethernet Operations, Administration, and Maintenance (OAM) is a protocol for installing, monitoring, and troubleshooting Ethernet networks to increase management capability within the context of the overall Ethernet infrastructure. Starting with Cisco IOS Release 15.0(2)SG, the Catalyst 4500 series switch supports Standardized (Draft 8.1) IEEE 802.1ag Connectivity Fault Management (CFM) and IEEE 802.3ah Ethernet OAM discovery, link monitoring, remote fault detection, and remote loopback. It also supports IP Service Level Agreements (SLAs) for CFM, and ITU-T Y.1731 fault management. Ethernet OAM manager controls the interworking between CFM and 802.3ah OAM protocols.

This chapter provides information about configuring CFM and the Ethernet OAM protocol. It defines the differences between the ratified CFM 802.1ag standard (draft 8.1) and the previous version supported on the switch in Cisco IOS (draft 1.0). It also includes configuration information for CFM ITU-T.Y.1731 fault management support in this release.

For complete command and configuration information for Ethernet OAM, CFM, and Y.1731, see the Cisco IOS Carrier Ethernet Configuration Guide at this URL:

For complete syntax of the commands used in this chapter, see the command reference for this release and the Cisco IOS Carrier Ethernet Command Reference at this URL:

Note

For complete command and configuration information for CFM, see the Cisco IOS feature module at this URL:

This chapter contains these sections:

- Enabling and Configuring Ethernet OAM, page 63-35
- Displaying Ethernet OAM Protocol Information, page 63-49
Ethernet CFM and Ethernet OAM Interaction, page 63-51

About Ethernet CFM

Ethernet CFM is an end-to-end per-service-instance (per-VLAN) Ethernet layer OAM protocol. It includes proactive connectivity monitoring, fault verification, and fault isolation. End-to-end can be provider-edge-to-provider-edge (PE-to-PE) device or customer-edge-to-customer-edge (CE-to-CE) device. Ethernet CFM, as specified by IEEE 802.1ag, is the standard for Layer 2 ping, Layer 2 traceroute, and end-to-end connectivity verification of the Ethernet network.

These sections contain conceptual information about Ethernet CFM:

- Ethernet CFM and OAM Definitions, page 63-2
- CFM Domain, page 63-2
- Maintenance Associations and Maintenance Points, page 63-4
- CFM Messages, page 63-5
- Crosscheck Function and Static Remote MEPs, page 63-5
- SNMP Traps and Fault Alarms, page 63-5
- Configuration Error List, page 63-6
- IP SLAs Support for CFM, page 63-6

Ethernet CFM and OAM Definitions

The following table describes many of the terms in this chapter that are related to OAM and CFM features:

</tbody>
</table>

CFM Domain

A CFM maintenance domain is a management space on a network that is owned and operated by a single entity and defined by a set of internal boundary ports. You assign a unique maintenance level (from 0 to 7) to define the domain hierarchy. The larger the domain, the higher the level. For example, as shown in Figure 63-1, a service-provider domain would be larger than an operator domain and might have a maintenance level of 6, while the operator domain maintenance level would be 3 or 4.
As shown in Figure 63-2, domains cannot intersect or overlap because that would require management by more than one entity, which is not allowed. Domains can touch or nest (if the outer domain has a higher maintenance level than the nested domain). Nesting domains can be useful when a service provider contracts with one or more operators to provide Ethernet service. Each operator has its own maintenance domain and the service provider domain is a superset of the operator domains. Maintenance levels of nesting domains should be communicated among the administrating organizations. CFM exchanges messages and performs operations on a per-domain basis.

**Figure 63-1  CFM Maintenance Domains**

**Figure 63-2  Allowed Domain Relationships**
Chapter 63    Configuring Ethernet OAM and CFM

Maintenance Associations and Maintenance Points

A maintenance association (MA) identifies a service that can be uniquely identified within the maintenance domain. The CFM protocol runs within a maintenance association. A maintenance point is a demarcation point on an interface that participates in CFM within a maintenance domain. Maintenance points drop all lower-level frames and forward all higher-level frames. There are two types of maintenance points:

- Maintenance end points (MEPs) are points at the edge of the domain that define the boundaries and confine CFM messages within these boundaries. Outward facing or Down MEPs communicate through the wire side (connected to the port). Inward facing or Up MEPs communicate through the relay function side, not the wire side.

Note

CFM draft 1 referred to inward and outward-facing MEPs. CFM draft 8.1 refers to up and down MEPs, respectively. This document uses the CFM 8.1 terminology for direction.

CFM draft 1 supported only up MEPs on a per-port or per-VLAN basis. CFM 802.1ag supports up and down per-VLAN MEPs, as well as port MEPs, which are untagged down MEPs that are not associated with a VLAN. Port MEPs are configured to protect a single hop and used to monitor link state through CFM. If a port MEP is not receiving continuity check messages from its peer (static remote MEP), for a specified interval, the port is put into an operational down state in which only CFM and OAM packets pass through, and all other data and control packets are dropped.

- An up MEP sends and receives CFM frames through the relay function. It drops all CFM frames at its level or lower that come from the wire side, except traffic going to the down MEP. For CFM frames from the relay side, it processes the frames at its level and drops frames at a lower level. The MEP transparently forwards all CFM frames at a higher level, regardless of whether they are received from the relay or wire side. If the port on which MEP is configured is blocked by STP, the MEP can still send or receive CFM messages through the relay function. CFM runs at the provider maintenance level (UPE-to-UPE), specifically with up MEPs at the user network interface (UNI).

- A down MEP sends and receives CFM frames through the wire connected to the port on which the MEP is configured. It drops all CFM frames at its level or lower that come from the relay side. For CFM frames from the wire side, it processes all CFM frames at its level and drops CFM frames at lower levels except traffic going to the other lower-level down MEP. The MEP transparently forwards all CFM frames at a higher level, regardless of whether they are received from the relay or through the wire.

- Maintenance intermediate points (MIPs) are internal to a domain, not at the boundary, and respond to CFM only when triggered by traceroute and loopback messages. They forward CFM frames received from MEPs and other MIPs, drop all CFM frames at a lower level (unless MIP filtering is enabled), and forward all CFM frames at a higher level and at a lower level and regardless of whether they are received from the relay or wire side. When MIP filtering is enabled, the MIP drops CFM frames at a lower level. MIPs also catalog and forward continuity check messages (CCMs), but do not respond to them.

In the first draft of CFM, MIP filtering was always enabled. In draft 8.1, MIP filtering is disabled by default, and you can configure it to be enabled or disabled. When MIP filtering is disabled, all CFM frames are forwarded.

You can manually configure a MIP or configure the switch to automatically create a MIP. You can configure a MEP without a MIP. In case of a configuration conflict, manually created MIPs take precedence over automatically created MIPs.
If port on which the MEP is configured is blocked by Spanning-Tree Protocol (STP), the MIP can receive and might respond to CFM messages from both the wire and relay side, but cannot forward any CFM messages. This differs from CFM draft 1, where STP blocked ports could not send or receive CFM messages.

**CFM Messages**

CFM uses standard Ethernet frames distinguished by EtherType or (for multicast messages) by MAC address. All CFM messages are confined to a maintenance domain and to a service-provider VLAN (S-VLAN). These CFM messages are supported:

- **Continuity Check (CC) messages**—multicast heartbeat messages exchanged periodically between MEPs that allow MEPs to discover other MEPs within a domain and allow MIPs to discover MEPs. CC messages are configured to a domain or VLAN. Enter the `continuity-check Ethernet service` command to enable CCM.
  
  The default continuity check message (CCM) interval on the switch is 10 seconds. You can set it to be 100 ms, 1 second, 1 minute, or 10 minutes by entering the `continuity-check interval Ethernet service mode` command. Because faster CCM rates are more CPU intensive, we do not recommend configuring a large number of MEPs running at 100 ms intervals.

- **Loopback messages**—unicast or multicast frames transmitted by a MEP at administrator request to verify connectivity to a particular maintenance point, indicating if a destination is reachable. A loopback message is similar to an Internet Control Message Protocol (ICMP) ping message. Refer to the `ping ethernet` privileged EXEC command.

- **Traceroute messages**—multicast frames transmitted by a MEP at administrator request to track the path (hop-by-hop) to a destination MEP. Traceroute messages are similar in concept to UDP traceroute messages. Refer to the `traceroute ethernet` privileged EXEC command.

**Crosscheck Function and Static Remote MEPs**

The crosscheck function verifies a post-provisioning timer-driven service between dynamically configured MEPs (using crosscheck messages) and expected MEPs (by configuration) for a service. It verifies that all endpoints of a multipoint service are operational. The crosscheck function is performed only one time and is initiated from the command-line interface (CLI).

CFM 802.1ag also supports static remote MEPs or static RMEP check. Unlike the crosscheck function, which is performed only once, configured static RMEP checks run continuously. To configure static RMEP check, enter the `continuity-check static rmep Ethernet CFM service mode` command.

**SNMP Traps and Fault Alarms**

The MEPs generate two types of SNMP traps: CC traps and crosscheck traps. Supported CC traps are MEP up, MEP down, cross-connect (a service ID does not match the VLAN), loop, and configuration error. The crosscheck traps are service up, MEP missing (an expected MEP is down), and unknown MEP.

Fault alarms are unsolicited notifications sent to alert the system administrator when CFM detects a fault. In CFM draft 1, fault alarms were sent instantaneously when detected. In CFM 802.1ag, you can configure the priority level of alarms that trigger an SNMP trap or syslog message. You can also configure a delay period before a fault alarm is sent and the time before the alarm is reset.
**Configuration Error List**

CFM configuration errors in CFM 802.1ag can be misconfigurations or extra configuration commands detected during MEP configuration. They can be caused by overlapping maintenance associations. For example, if you create a maintenance association with a VLAN list and a MEP on an interface, a potential leak error could occur if other maintenance associations associated with the same VLAN exist at a higher level without any MEPs configured. You can display the configuration error list, which is informational only, by entering the `show ethernet cfm errors` configuration privileged EXEC command.

**IP SLAs Support for CFM**

The switch supports CFM with IP Service Level Agreements (SLAs), which gathers Ethernet layer network performance metrics. Available statistical measurements for the IP SLAs CFM operation include round-trip time, jitter (interpacket delay variance), and packet loss. You can schedule multiple IP SLA operations and use Simple Network Management Protocol (SNMP) trap notifications and syslog messages to monitor threshold violations proactively.

IP SLA integration with CFM gathers Ethernet layer statistical measurements by sending and receiving Ethernet data frames between CFM MEPs. Performance is measured between the source MEP and the destination MEP. Unlike other IP SLA operations that provide performance metrics for only the IP layer, IP SLAs with CFM provide performance metrics for Layer 2.

You can manually configure individual Ethernet ping or jitter operations. You can also configure an IP SLA automatic Ethernet operation that queries the CFM database for all MEPs in a given maintenance domain and VLAN. The operation then automatically creates individual Ethernet ping or jitter operations based on the discovered MEPs.

Because IP SLAs is a Cisco proprietary feature, interoperability between CFM draft 1 and CFM 802.1ag is handled automatically by the switch.

For more information about IP SLA operation with CFM, see the IP SLAs for Metro-Ethernet feature module at this URL:

**Configuring Ethernet CFM**

CFM draft 8.1 on Catalyst 4500 series switch mandates that you enter the `ethernet cfm ieee` command before configuring any other CFM CLI. Without this command, no other CFM CLIs are applied.

Configuring Ethernet CFM requires that you configure the CFM domain. You can optionally configure and enable other CFM features (such as crosschecking, static remote MEP, port MEPs, CVLAN MEPs/MIPs, SNMP traps, and fault alarms). Some of the configuration commands and procedures differ from those used in CFM draft 1. CLIs in draft 1 that have been changed are no longer available; they have been deprecated and are not allowed. Only the CLIs mentioned in the following sections are required for draft 8.1.

---

**Note**

Upgrading software from CFM draft 1 to draft 8.1 causes a switch to silently drop the draft 1 configuration on the draft 8.1 image. Also, no CFM stateful sync happens between draft 1 and draft 8.1 images. After the upgrade, all CFM configurations must be reconfigured according to the procedures mentioned for draft 8.1.
To configure Ethernet CFM you must prepare the network and configuring services. You can optionally configure and enable crosschecking. These sections are included:

- Ethernet CFM Default Configuration, page 63-7
- Ethernet CFM Configuration Guidelines, page 63-7
- Configuring the CFM Domain, page 63-8
- Configuring Ethernet CFM Crosscheck, page 63-11
- Configuring Static Remote MEP, page 63-13
- Configuring a Port MEP, page 63-14
- Configuring SNMP Traps, page 63-16
- Configuring Fault Alarms, page 63-16
- Configuring IP SLAs CFM Operation, page 63-18
- Configuring CFM on C-VLAN (Inner VLAN), page 63-24

**Ethernet CFM Default Configuration**

CFM is globally disabled.

CFM is enabled on all interfaces when CFM is globally enabled.

A port can be configured as a flow point (MIP/MEP), a transparent port, or disabled (CFM disabled). By default, ports are transparent ports until configured as MEP, MIP, or disabled.

There are no MEPs or MIPs configured.

When configuring a MA, if you do not configure direction, the default is up (inward facing).

**Ethernet CFM Configuration Guidelines**

When configuring Ethernet CFM, consider these guidelines and restrictions:

- You must enter the `ethernet cfm ieee` global configuration command before configuring any other CFM CLI. If not, all other CFM CLIs are not applied.
- CFM is not supported on and cannot be configured on either routed ports or Layer 3 EtherChannels.
- You can configure a Layer 2 EtherChannel port channel as Up MEP, Down MEP, or MIP. However, such configurations are not supported on individual ports that belong to an EtherChannel. You cannot add a port with this configuration to an EtherChannel group.
- Port MEP is not supported and cannot be configured on Layer 2 EtherChannels.
- CFM is not supported and cannot be configured on VLAN interfaces.
- On isolated host, community host, or a promiscuous access port, only Down MEP is supported on isolated, community and primary VLANs, respectively.
- Up MEP is supported only on regular VLANs on PVLAN trunks. Down MEP is supported on regular VLANs as well as isolated VLANs on PVLAN secondary trunks. Similarly, Down MEP is supported on regular VLANs as well as primary VLANs on promiscuous trunk ports.
- The CFM service on a PVLAN ends at the PVLAN port. The translation of CFM service between PVLANs is not supported between the PVLAN ports.
CFM Unicast packets (Loopback Messages and Traceroute Reply), are not allowed on Down MEP on STP blocked ports. The blocked port cannot respond to ping and traceroute. You must configure a port MEP at a lower level than any service (VLAN) MEPs on an interface.

An 802.1Q (QinQ) tunnel port can be an Up MEP or a port MEP.

A QinQ port cannot be a Down MEP or a MIP; you can configure the port as a MIP, but it is not active or visible in traceroute. Port MEP frames received on a QinQ interface are not tunneled and are processed locally.

CFM on a C-VLAN is supported on Traditional and Selective QinQ and not supported on One-to-One VLAN Mapping on Trunk ports.

Do not configure a port with tunnel mode using the native VLAN as the S-VLAN or the C-VLAN.

For port MEP on a QinQ port, do not enter the `vlan dot1q tag native` global configuration command to enable tagging on native VLAN frames.

If you are running CFM draft 1 and upgrade to a software version that supports CFM draft 8.1, the switch silently drops the draft 1 configuration on draft 8.1 image. Some of the CLIs have been changed from draft1 to draft8.1. You need to reconfigure all the required configurations on draft 8.1 image.

## Configuring the CFM Domain

To configure the Ethernet CFM domain, configure a service to connect the domain to a VLAN, or configure a port to act as a MEP, perform this task. You can also enter the optional commands to configure other parameters, such as continuity checks.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ethernet cfm ieee</td>
<td>A must have configuration for draft 8.1. This is required to be configured before any other configuration.</td>
</tr>
<tr>
<td>Step 3 ethernet cfm global</td>
<td>Globally enable Ethernet CFM on the switch.</td>
</tr>
<tr>
<td>Step 4 ethernet cfm traceroute cache [size entries / hold-time minutes]</td>
<td>(Optional) Configure the CFM traceroute cache. You can set a maximum cache size or hold time.</td>
</tr>
<tr>
<td>Step 5 ethernet cfm mip auto-create level level-id vlan vlan-id</td>
<td>(Optional) Configure the switch to automatically create MIPs for VLAN IDS that are not associated with specific maintenance associations at the specified level. The level range is 0 to 7.</td>
</tr>
<tr>
<td>Step 6 ethernet cfm mip filter</td>
<td>(Optional) Enable MIP filtering, which means that all CFM frames at a lower level are dropped. The default is disabled.</td>
</tr>
</tbody>
</table>

**Note** Configure MIP auto-creation only for VLANs that MIPs should monitor. Configuring for all VLANs can be CPU and memory-intensive.
### Configuring Ethernet CFM

**Step 7**

```
ethernet cfm domain domain-name level level-id
```

Define a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7.

**Step 8**

```
id {mac-address domain_number | dns name | null}
```

(Optional) Assign a maintenance domain identifier.
- `mac-address domain_number`—Enter the MAC address and a domain number. The number can be from 0 to 65535.
- `dns name`—Enter a DNS name string. The name can be a maximum of 43 characters.
- `null`—Assign no domain name.

**Step 9**

```
service {ma-name | ma-number | vpn-id vpn} {vlan vlan-id [direction down] | port}
```

Define a customer service maintenance association (MA) name or number or VPN ID to be associated with the domain, a VLAN ID or port MEP, and enter ethernet-cfm-service configuration mode.
- `ma-name`—a string of no more than 100 characters that identifies the MAID.
- `ma-number`—a value from 0 to 65535.
- `vpn-id vpn`—enter a VPN ID as the `ma-name`.
- `vlan vlan-id`—VLAN range is from 1 to 4094. You cannot use the same VLAN ID for more than one domain at the same level.
- (Optional) `direction down`—specify the service direction as down.
- `port`—Configure port MEP, a down MEP that is untagged and not associated with a VLAN.

**Step 10**

```
continuity-check
```

Enable sending and receiving of continuity check messages.

**Step 11**

```
continuity-check interval value
```

(Optional) Set the interval at which continuity check messages are sent. The available values are 100 ms, 1 second, 10 seconds, 1 minute and 10 minutes. The default is 10 seconds.

**Note** Because faster CCM rates are more CPU-intensive, we do not recommend configuring a large number of MEPs running at 100 ms intervals.

**Step 12**

```
continuity-check loss-threshold threshold-value
```

(Optional) Set the number of continuity check messages to be missed before declaring that an MEP is down. The range is 2 to 255; the default is 3.

**Step 13**

```
maximum meps value
```

(Optional) Configure the maximum number of MEPs allowed across the network. The range is from 1 to 65535. The default is 100.
## Chapter 63 Configuring Ethernet OAM and CFM

### Configuring Ethernet CFM

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>`sender-id [chassis</td>
<td>none]`</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>chassis</strong>—Send the chassis ID (host name).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>none</strong>—Do not include information in the sender ID.</td>
</tr>
<tr>
<td>15</td>
<td>`mip auto-create [lower-mep-only</td>
<td>none]`</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>lower-mep-only</strong>—Create a MIP only if there is a MEP for the service in another domain at the next lower active level.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>none</strong>—No MIP auto-create.</td>
</tr>
<tr>
<td>16</td>
<td><code>exit</code></td>
<td>Return to ethernet-cfm configuration mode.</td>
</tr>
<tr>
<td>17</td>
<td><code>mip auto-create [lower-mep-only]</code></td>
<td>(Optional) Configure auto creation of MIPs for the domain.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>lower-mep-only</strong>—Create a MIP only if there is a MEP for the service in another domain at the next lower active level.</td>
</tr>
<tr>
<td>18</td>
<td><code>mep archive-hold-time minutes</code></td>
<td>(Optional) Set the number of minutes that data from a missing maintenance end point is kept before it is purged. The range is 1 to 65535; the default is 100 minutes.</td>
</tr>
<tr>
<td>19</td>
<td><code>exit</code></td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>20</td>
<td><code>interface interface-id</code></td>
<td>Specify an interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td>21</td>
<td><code>switchport mode trunk</code></td>
<td>(Optional) Configure the port as a trunk port.</td>
</tr>
<tr>
<td>22</td>
<td><code>ethernet cfm mip level level-id</code></td>
<td>(Optional) Configure a customer level or service-provider level maintenance intermediate point (MIP) for the interface. The MIP level range is 0 to 7.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> This step is not required if you have entered the <code>ethernet cfm mip auto-create</code> global configuration command or the <code>mip auto-create</code> ethernet-cfm or ethernet-cfm-srv configuration mode.</td>
</tr>
<tr>
<td>23</td>
<td>`ethernet cfm mep domain domain-name mpid identifier {vlan vlan-id</td>
<td>port}`</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>domain domain-name</strong>—Specify the name of the created domain.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>mpid identifier</strong>—Enter a maintenance end point identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>vlan vlan-id</strong>—Enter the service provider VLAN ID or IDs as a VLAN-ID (1 to 4094), a range of VLAN-IDs separated by a hyphen, or a series of VLAN IDs separated by comma.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>port</strong>—Configure port MEP.</td>
</tr>
<tr>
<td>24</td>
<td><code>cos value</code></td>
<td>(Optional) Specify the class of service (CoS) value to be sent with the messages. The range is 0 to 7.</td>
</tr>
</tbody>
</table>
Chapter 63  Configuring Ethernet OAM and CFM

Configuring Ethernet CFM

Use the **no** versions of the commands to remove the configuration or return to the default configurations.

This is an example of the basic CFM configuration:

```
Switch(config)# ethernet cfm ieee
Switch(config)# ethernet cfm global
Switch(config)# ethernet cfm domain abc level 3
Switch(config-ecfm)# service test vlan 5
Switch(config-ecfm-srv)# continuity-check
Switch(config-ecfm-srv)# exit
Switch(config-ecfm)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ethernet cfm mep domain abc mpid 222 vlan 5
Switch(config-if-ecfm-mep)# exit
```

**Configuring Ethernet CFM Crosscheck**

To configure Ethernet CFM crosscheck, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config)# ethernet cfm mep crosscheck start-delay delay</td>
<td>Configures the number of seconds that the device waits for remote MEPs to come up before the crosscheck is started. The range is 1 to 65535; the default is 30 seconds.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config)# ethernet cfm domain domain-name level level-id</td>
<td>Defines a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config)# service {ma-name</td>
<td>ma-number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>ma-name</strong>—A string of no more than 100 characters that identifies the MAID.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>ma-number</strong>—A value from 0 to 65535.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>vpn-id vpn</strong>—Enter a VPN ID as the ma-name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>vlan vlan-id</strong>—VLAN range is from 1 to 4094. You cannot use the same VLAN ID for more than one domain at the same level.</td>
</tr>
<tr>
<td>5</td>
<td>Switch(config-ether-cfm)# mep mpid identifier</td>
<td>Define the MEP maintenance end point identifier in the domain and service. The range is 1 to 8191.</td>
</tr>
<tr>
<td>6</td>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Step 7

Switch# ethernet cfm mep crosscheck {enable | disable} domain domain-name (vlan {vlan-id | any} | port)

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# ethernet cfm mep crosscheck {enable</td>
<td>disable} domain domain-name (vlan {vlan-id</td>
</tr>
<tr>
<td>domain domain-name—Specify the name of the created domain.</td>
<td></td>
</tr>
<tr>
<td>vlan {vlan-id</td>
<td>any}—Enter the service provider VLAN ID or IDs as a VLAN-ID (1 to 4094), a range of VLAN-IDs separated by a hyphen, or a series of VLAN IDs separated by comma. Enter any for any VLAN.</td>
</tr>
<tr>
<td>port—Identify a port MEP</td>
<td></td>
</tr>
</tbody>
</table>

Step 8

Switch# show ethernet cfm maintenance-points remote crosscheck

Use the no form of each command to remove a configuration or to return to the default settings.

The following example illustrates how to configure Ethernet CFM crosscheck:

Switch(config)# ethernet cfm mep crosscheck start-delay 60
Switch(config)# ethernet cfm domain abc level 3
Switch(config-ecfm)# service test vlan 5
Switch(config-ecfm-srv)# mep mpid 23
Switch(config-ecfm-srv)# mep mpid 34
Switch(config-ecfm-srv)# end
Switch# ethernet cfm mep crosscheck enable domain abc vlan 5

Switch# show ethernet cfm maintenance-points remote crosscheck

<table>
<thead>
<tr>
<th>MPID Domain Name</th>
<th>Lvl Type Id</th>
<th>Mep-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>23 abc test</td>
<td>3 Vlan 5</td>
<td>No</td>
</tr>
<tr>
<td>34 abc test</td>
<td>3 Vlan 5</td>
<td>No</td>
</tr>
</tbody>
</table>

Switch# show ethernet cfm errors

<table>
<thead>
<tr>
<th>MPID Domain Id</th>
<th>Mac Address</th>
<th>Type Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>34 abc test</td>
<td>0000.0000.0000</td>
<td>Vlan 5</td>
</tr>
<tr>
<td>23 abc test</td>
<td>0000.0000.0000</td>
<td>Vlan 5</td>
</tr>
</tbody>
</table>

Step 9

Switch# show ethernet cfm errors [configuration]

Step 10

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
### Configuring Static Remote MEP

To configure Ethernet CFM static remote MEP, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>ethernet cfm domain domain-name level level-id</code></td>
<td>Define a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>`service (ma-name / ma-number / vpn-id vpn) (vlan vlan-id [direction down]</td>
<td>Define a customer service maintenance association name or number or a VPN ID to be associated with the domain, and a VLAN ID or peer MEP, and enter ethernet-cfm-service configuration mode.</td>
</tr>
<tr>
<td>port)`</td>
<td></td>
</tr>
<tr>
<td>• <code>ma-name</code>—a string of no more than 100 characters that identifies the MAID.</td>
<td></td>
</tr>
<tr>
<td>• <code>ma-number</code>—a value from 0 to 65535.</td>
<td></td>
</tr>
<tr>
<td>• <code>vpn-id</code>—enter a VPN ID as the <code>ma-name</code>.</td>
<td></td>
</tr>
<tr>
<td>• <code>vlan vlan-id</code>—VLAN range is from 1 to 4094. You cannot use the same VLAN ID for more than one domain at the same level.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) <code>direction down</code>—specify the service direction as down.</td>
<td></td>
</tr>
<tr>
<td>• <code>port</code>—Configure port MEP, a down MEP that is untagged and not associated with a VLAN.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>continuity-check</code></td>
<td>Enable sending and receiving of continuity check messages.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>mep mpid identifier</code></td>
<td>Define the static remote maintenance end point identifier. The range is 1 to 8191.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><code>continuity-check static rmep</code></td>
<td>Enable checking of the incoming continuity check message from a remote MEP that is configured in the MEP list.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td><code>show ethernet cfm maintenance-points remote static</code></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td></td>
</tr>
<tr>
<td><code>show ethernet cfm errors [configuration]</code></td>
<td>Enter this command after you enable CFM crosscheck to display the results of the crosscheck operation. Enter the <code>configuration</code> keyword to display the configuration error list.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the **no** form of each command to remove a configuration or to return to the default settings.

The following example illustrates how to configure Ethernet CFM static remote MEP:

```
Switch(config)# ethernet cfm domain abc level 3
Switch(config-ecfm)# service test vlan 5
Switch(config-ecfm-srv)# continuity-check
Switch(config-ecfm-srv)# mep mpid 23
```
Switch(config-ecfm-srv)# mep mpid 34
Switch(config-ecfm-srv)# continuity-check static rme

Switch# show ethernet cfm maintenance-points remote static

<table>
<thead>
<tr>
<th>MPID Domain Name</th>
<th>lvl</th>
<th>Type Id</th>
<th>Mep-Up</th>
</tr>
</thead>
<tbody>
<tr>
<td>MA Name</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>23 abc test</td>
<td>3</td>
<td>_vlan 5</td>
<td>No</td>
</tr>
<tr>
<td>34 abc test</td>
<td>3</td>
<td>_vlan 5</td>
<td>No</td>
</tr>
</tbody>
</table>

Switch# show ethernet cfm errors

<table>
<thead>
<tr>
<th>MPID Domain Id</th>
<th>MA Name</th>
<th>lvl</th>
<th>Type Id</th>
<th>Reason</th>
<th>Lvl</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td>34 abc test</td>
<td></td>
<td>3</td>
<td>_vlan 5</td>
<td>RMEP missing</td>
<td>3</td>
<td>421s</td>
</tr>
<tr>
<td>23 abc test</td>
<td></td>
<td>3</td>
<td>_vlan 5</td>
<td>RMEP missing</td>
<td>3</td>
<td>421s</td>
</tr>
</tbody>
</table>

Switch#

### Configuring a Port MEP

A port MEP is a down MEP that is not associated with a VLAN and that uses untagged frames to carry CFM messages. You configure port MEPs on two connected interfaces. Port MEPs are always configured at a lower domain level than native VLAN MEPs.

To configure Ethernet CFM port MEPs, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ethernet cfm domain domain-name level level-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-ecfm)# service (ma-name / ma-number / vpn-id) port</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-ecfm-srv)# mep mpid identifier</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-ecfm-srv)# continuity-check</td>
</tr>
</tbody>
</table>
Chapter 63      Configuring Ethernet OAM and CFM

Configuring Ethernet CFM

Use the **no** form of each command to remove a configuration or to return to the default settings.

This is a sample configuration for a port MEP:

```
Switch(config)# ethernet cfm domain abc level 3
Switch(config-ecfm)# service PORTMEP port
Switch(config-ecfm-srv)# mep mpid 222
Switch(config-ecfm-srv)# continuity-check
Switch(config-ecfm-srv)# continuity-check static rmep
Switch(config-ecfm-srv)# exit
Switch(config-ecfm)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ethernet cfm mep domain abc mpid 111 port
Switch(config-if)# end
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config-ecfm-srv)# continuity-check interval value</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-ecfm-srv)# continuity-check loss-threshold threshold-value</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config-ecfm-srv)# continuity-check static rmep</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Switch(config-ecfm-srv)# exit</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch(config-ecfm)# exit</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Switch(config-if)# ethernet cfm mep domain domain-name mpid identifier port</td>
</tr>
<tr>
<td></td>
<td>• <strong>domain domain-name</strong>—Specify the name of the created domain.</td>
</tr>
<tr>
<td></td>
<td>• <strong>mpid identifier</strong>—Enter a maintenance end point identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191.</td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td>Switch)# show ethernet cfm maintenance-points remote static</td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td>Switch)# show ethernet cfm errors [configuration]</td>
</tr>
<tr>
<td><strong>Step 16</strong></td>
<td>Switch)# copy running-config startup-config</td>
</tr>
</tbody>
</table>
Configuring SNMP Traps

To configure traps for Ethernet CFM, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# snmp-server enable traps ethernet cfm cc [mep-up] [mep-down] [config] [loop] [cross-connect]</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config)# snmp-server enable traps ethernet cfmalarm</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# snmp-server enable traps ethernet cfmalarm crosscheck [mep-unknown] [mep-missing] [service-up]</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no form of each command to remove a configuration or to return to the default settings.

The following example illustrates how to configure SNMP traps:

Switch(config)# snmp-server enable traps ethernet cfm alarm
Switch(config)# snmp-server enable traps ethernet cfm cc mep-down
Switch(config)# snmp-server enable traps ethernet cfm crosscheck mep-missing

Configuring Fault Alarms

To configure Ethernet CFM fault alarms, perform this task.

Note

You can configure fault alarms in either global configuration or Ethernet CFM interface MEP mode. When a conflict exists, the interface MEP mode configuration takes precedence.
<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ethernet cfm alarm notification (all</td>
</tr>
<tr>
<td></td>
<td>error-xcon</td>
</tr>
<tr>
<td></td>
<td>mac-remote-error-xcon</td>
</tr>
<tr>
<td></td>
<td>none</td>
</tr>
<tr>
<td></td>
<td>remote-error-xcon</td>
</tr>
<tr>
<td></td>
<td>xcon</td>
</tr>
<tr>
<td></td>
<td>(Optional) Sets a delay period before a CFM fault alarm is sent. The range is 2500 to 10000 milliseconds (ms). The default is 2500 ms.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ethernet cfm alarm delay value</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ethernet cfm alarm reset value</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>ethernet cfm logging alarm ieee</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>ethernet cfm mep domain domain-name mpid identifier vlan vlan-id</td>
</tr>
<tr>
<td></td>
<td>• domain domain-name—Specify the name of the created domain.</td>
</tr>
<tr>
<td></td>
<td>• mpid identifier—Enter a maintenance end point identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191.</td>
</tr>
<tr>
<td></td>
<td>• vlan vlan-id—Enter the service provider VLAN ID or IDs as a VLAN-ID (1 to 4094), a range of VLAN-IDs separated by a hyphen, or a series of VLAN IDs separated by comma.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>alarm notification (all</td>
</tr>
<tr>
<td></td>
<td>error-xcon</td>
</tr>
<tr>

<td>The Ethernet CFM interface MEP alarm configuration takes precedence over the global configuration.</td>
</tr>
</tbody>
</table>
Use the **no** form of each command to remove a configuration or to return to the default settings.

The following example illustrates how to configure Ethernet CFM fault alarms:

```
Switch(config)# ethernet cfm alarm notification remote-error-xcon
Switch(config)# ethernet cfm logging alarm ieee
Switch(config)# interface gigabitethernet1/2
Switch(config-if)# ethernet cfm mep domain abc mpid 222 vlan 5
Switch(config-if-ecfm-mep)# alarm notification mac-remote-error-xcon
Switch(config-if)# end
```

### Configuring IP SLAs CFM Operation

You can manually configure an IP SLA's Ethernet ping or jitter echo operation, or you can configure IP SLAs Ethernet operation with endpoint discovery. You can also configure multiple operation scheduling. For accurate one-way delay statistics, the clocks on the endpoint switches must be synchronized. You can configure the endpoint switches with Network Time Protocol (NTP) so that the switches are synchronized to the same clock source.

For detailed information about configuring IP SLAs Ethernet operations, see the *Cisco IOS IP SLAs for Metro-Ethernet* feature module at this URL:

and

For detailed information about IP SLAs operations, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4T* at this URL:

For detailed information about IP SLAs commands, see the command reference at this URL:

This section includes these procedures:

- Manually Configuring an IP SLAs CFM Probe or Jitter Operation, page 63-19
- Configuring an IP SLAs Operation with Endpoint Discovery, page 63-21
Manually Configuring an IP SLAs CFM Probe or Jitter Operation

To manually configure an IP SLAs Ethernet echo (ping) or jitter operation, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Switch# configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Switch(config)# ip sla operation-number</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Switch(config-ip-sla)# ethernet echo mpid identifier domain domain-name vlan vlan-id</strong></td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td><strong>ethernet jitter mpid identifier domain domain-name vlan vlan-id [interval interpacket-interval] [num-frames number-of frames transmitted]</strong></td>
</tr>
<tr>
<td></td>
<td>• Enter <strong>echo</strong> for a ping operation or <strong>jitter</strong> for a jitter operation.</td>
</tr>
<tr>
<td></td>
<td>• For <strong>mpid identifier</strong>, enter a maintenance endpoint identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191.</td>
</tr>
<tr>
<td></td>
<td>• For <strong>domain domain-name</strong>, enter the CFM domain name.</td>
</tr>
<tr>
<td></td>
<td>• For <strong>vlan vlan-id</strong>, the VLAN range is from 1 to 4095.</td>
</tr>
<tr>
<td></td>
<td>• (Optional—for jitter only) Enter the <strong>interval</strong> between sending of jitter packets.</td>
</tr>
<tr>
<td></td>
<td>• (Optional—for jitter only) Enter the <strong>num-frames</strong> and the number of frames to be sent.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Switch(config-ip-sla-ethernet-monitor)# cos cos-value</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Switch(config-ip-sla-ethernet-monitor)# frequency seconds</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Switch(config-ip-sla-ethernet-monitor)# history history-parameter</strong></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>Switch(config-ip-sla-ethernet-monitor)# owner owner-id</strong></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>Switch(config-ip-sla-ethernet-monitor)# request-data-size bytes</strong></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>Switch(config-ip-sla-ethernet-monitor)# tag text</strong></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>Switch(config-ip-sla-ethernet-monitor)# threshold milliseconds</strong></td>
</tr>
</tbody>
</table>
### Configuring Ethernet CFM

#### Step 11

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-ip-sla-ethernet-monitor)# timeout milliseconds</td>
<td>(Optional) Specifies the amount of time in ms that the IP SLAs operation waits for a response from its request packet. The range is 0 to 604800000; the default value is 5000.</td>
</tr>
</tbody>
</table>

#### Step 12

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-ip-sla-ethernet-monitor)# exit</td>
<td>Returns to global configuration mode.</td>
</tr>
</tbody>
</table>

#### Step 13

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# ip sla schedule operation-number [ageout seconds] [life (forever</td>
<td>seconds)] [recurring] [start-time (hh:mm [:ss] [month day</td>
</tr>
</tbody>
</table>
  - **operation-number**—Enter the IP SLAs operation number. |
  - (Optional) **ageout seconds**—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds. The default is 0 seconds. |
  - (Optional) **life**—Set the operation to run indefinitely (forever) or for a specific number of seconds. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour) |
  - (Optional) **recurring**—Set the probe to be automatically scheduled every day. |
  - (Optional) **start-time**—Enter the time for the operation to begin collecting information: |
    - To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. |
    - Enter **pending** to select no information collection until a start time is selected. |
    - Enter **now** to start the operation immediately. |
    - Enter **after hh:mm:ss** to show that the operation should start after the entered time has elapsed. |

#### Step 14

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

#### Step 15

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip sla configuration [operation-number]</td>
<td>Shows the configured IP SLAs operation.</td>
</tr>
</tbody>
</table>

#### Step 16

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove an IP SLAs operation, enter the **no ip sla operation-number** global configuration command.

The following example shows how to configure an IP SLA CFM Probe or Jitter Operation:

```
Switch(config)# ip sla 1
Switch(config-ip-sla)# ethernet echo mpid 23 domain abc vlan 5
Switch(config-ip-sla-ethernet-echo)# exit
Switch(config)# ip sla schedule 1 start-time now

Switch# show ip sla configuration 1
IP SLAs, Infrastructure Engine-II.

Switch#

Configuring an IP SLAs Operation with Endpoint Discovery

To use IP SLAs to automatically discover the CFM endpoints for a domain and VLAN ID, perform this task. You can configure ping or jitter operations to the discovered endpoints.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip sla ethernet-monitor</td>
<td>Begins configuration of an IP SLAs automatic Ethernet</td>
</tr>
<tr>
<td>operation-number</td>
<td>operation, and enter IP SLAs Ethernet monitor configuration mode.</td>
</tr>
</tbody>
</table>
Step 3

Switch(config-ip-sla-ethernet-monitor)# type echo domain domain-name vlan vlan-id [exclude-mpids mp-ids]

or

type jitter domain domain-name vlan vlan-id [exclude-mpids mp-ids] [interval interpacket-interval] [num-frames number-of frames transmitted]

Configures the automatic Ethernet operation to create echo (ping) or jitter operation and enters IP SLAs Ethernet echo configuration mode.

- Enter type echo for a ping operation or type jitter for a jitter operation.
- For mpid identifier, enter a maintenance endpoint identifier. The range is 1 to 8191.
- For domain domain-name, enter the CFM domain name.
- For vlan vlan-id, the VLAN range is from 1 to 4095.
- (Optional) Enter exclude-mpids mp-ids to exclude the specified maintenance endpoint identifiers.
- (Optional—for jitter only) Enter the interval between sending of jitter packets.
- (Optional—for jitter only) Enter the num-frames and the number of frames to be sent.

Step 4

Switch(config-ip-sla-ethernet-echo)# cos cos-value

(Optional) Sets a class of service value for the operation.

Step 5

Switch(config-ip-sla-ethernet-echo)# owner owner-id

(Optional) Configures the SNMP owner of the IP SLAs operation.

Step 6

Switch(config-ip-sla-ethernet-echo)# request-data-size bytes

(Optional) Specifies the protocol data size for an IP SLAs request packet. The range is from 0 to the maximum size allowed by the protocol being used; the default is 66 bytes.

Step 7

Switch(config-ip-sla-ethernet-echo)# tag text

(Optional) Creates a user-specified identifier for an IP SLAs operation.

Step 8

Switch(config-ip-sla-ethernet-echo)# threshold milliseconds

(Optional) Specifies the upper threshold value in milliseconds for calculating network monitoring statistics. The range is 0 to 2147483647; the default is 5000.

Step 9

Switch(config-ip-sla-ethernet-echo)# timeout milliseconds

(Optional) Specifies the amount of time in milliseconds that the IP SLAs operation waits for a response from its request packet. The range is 0 to 604800000; the default value is 5000.

Step 10

Switch(config-ip-sla-ethernet-echo)# exit

Returns to global configuration mode.
Chapter 63      Configuring Ethernet OAM and CFM

Configuring Ethernet CFM

To remove an IP SLAs operation, enter the **no ip sla operation-number** global configuration command.

The following example shows how to configure an IP SLAs Operation with Endpoint Discovery:

Switch(config)# ip sla schedule
operation-number [ageout seconds] [life
(for ever | seconds)] [recurring] [start-time
(hh:mm {ss} | month day | day month) | pending
| now | after hh:mm:ss]

Step 11

Schedules the time parameters for the IP SLAs operation.

- **operation-number**—Enter the IP SLAs operation number.
- (Optional) **ageout seconds**—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds. The default is 0 seconds.
- (Optional) **life**—Set the operation to run indefinitely (forever) or for a specific number of seconds. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour)
- (Optional) **recurring**—Set the probe to be automatically scheduled every day.
- (Optional) **start-time**—Enter the time for the operation to begin collecting information:
  - To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month.
  - Enter **pending** to select no information collection until a start time is selected.
  - Enter **now** to start the operation immediately.
  - Enter **after hh:mm:ss** to show that the operation should start after the entered time has elapsed.

Step 12

Switch(config)# end

Returns to privileged EXEC mode.

Step 13

Switch# show ip sla ethernet-monitor configuration [operation-number]

Shows the configured IP SLAs Auto Ethernet Monitor operation.

Step 14

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

To remove an IP SLAs operation, enter the **no ip sla operation-number** global configuration command.
IEEE 802.1ag CFM brings in a support that allows customers to provision maintenance intermediate points (MIPs) and Up maintenance endpoints (MEPs) on the C-VLAN (inner VLAN) component of QinQ ports to provide visibility on the C-VLAN. C-VLANs are now supported on 802.1q tunnel ports. This allows monitoring or troubleshooting when QinQ is enabled on the provider edge (PE) device.

For more information about this feature and the supported commands, see:

The switch supports 802.1q-tunnel-port mode.

To configure Ethernet CFM CVLAN Up MEPs, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# <code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# <code>ethernet cfm domain domain-name level level-id</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-ecfm)# `service (ma-name</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-ecfm-arv)# <code>continuity-check</code></td>
</tr>
</tbody>
</table>
Chapter 63  Configuring Ethernet OAM and CFM

Configuring Ethernet CFM

Use the **no** form of each command to remove a configuration or to return to the default settings.

This is a sample configuration for a CVLAN Up MEP:

```plaintext
Switch(config)# ethernet cfm domain abc level 3
Switch(config-ecfm)# service CVLANMEP vlan 10 inner-vlan 20
Switch(config-ecfm-srv)# continuity-check
Switch(config-ecfm-srv)# exit
Switch(config-ecfm)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ethernet cfm mep domain abc mpid 1020 service CVLANMEP
Switch(config-if)# end
```

Similarly, a manual configuration of MIP for CVLAN is configured using the **ethernet cfm mip level level-id vlan svlan-id inner-vlan cvlan-id** command.
Feature Support and Behavior

CFM S-VLAN component support:
- Up MEPs at any level (0 to 7).
  Up MEPs use the port access VLAN ID (the outer tag or S-VLAN).
  CFM frames sent and received by Up MEPs have a single VLAN tag, and the VLAN identifier is the port access VLAN ID (S-VLAN). Because the 802.1q tunnel interface marks the endpoint of the S-VLAN, the associated S-VLAN component should mark the endpoint of the CFM domain running over the S-VLAN space.

CFM C-VLAN component support:
- Up MEP functions at any level (0 to 7).
  Up MEPs use two tags: an outer tag with a VLAN ID that is the port access VLAN (S-VLAN) and an inner tag with a selected C-VLAN that is allowed through the 802.1q tunnel port. CFM frames sent and received by these Up MEPs are always double-tagged.
- MIP functions at any level (0 to 7).
  MIPs process CFM frames that are single-tagged when coming from the wire-side and double-tagged when coming from the relay-function side.
- Transparent point functions.

Supported maintenance points on 802.1q tunnels:
- Up MEP on the C-VLAN component for selective or all-to-one bundling
- Up MEP on the S-VLAN
- Port MEP
- MIP support on C-VLAN component for selective or all-to-one bundling

Note
The switch supports only manual configuration of MIPs. It does not support MIP autocreation on C-VLANs.

Platform Restrictions and Limitations

- Maximum supported MEPs per switch at each continuity check message (CCM) interval:
  - 1600 MEP local and 1600 MEP remote (on C-VLAN and S-VLAN) with 10-second intervals
  - 250 MEP local and 250 MEP remote (on C-VLAN and S-VLAN) with 1-second intervals
- Maximum supported MIPs at each CCM interval:
  - 300 MIPs at 10 seconds
  - 125 MIPs at 1 second
- There could be issues detecting cross-connect errors on the Catalyst 4500 Series Switch.
- These features are not supported:
  - CFM C-component on the native VLAN
  - Down MEP on S or C-VLAN (provider network port)
  - MIP on S-VLAN (provider network port)
  - CFM C-VLAN alarm indication signal (AIS)
- 802.3ah interworking with CFM C-VLAN
- CFM C-VLAN IP SLAs
- CFM C-VLAN MIP autocreation
- CFM C-VLAN with One-to-One VLAN mapping on Trunk ports.

## Understanding CFM ITU-T Y.1731 Fault Management

The ITU-T Y.1731 feature provides new CFM functionality for fault and performance management for service providers in large network. The switch supports Ethernet Alarm Indication Signal (ETH-AIS), Ethernet Remote Defect Indication (ETH-RDI), Ethernet Locked Signal (ETH-LCK), and Ethernet Multicast Loopback Message (MCAST-LBM) functionality for fault detection, verification, and isolation.

- Y.1731 Terminology, page 63-27
- Alarm Indication Signals, page 63-28
- Ethernet Remote Defect Indication, page 63-28
- Multicast Ethernet Loopback, page 63-29

### Y.1731 Terminology

- Server MEP—the combination of the server layer termination function and server or Ethernet adaptation layer termination function or server or Ethernet adaptation function, where the server layer termination function is expected to run OAM mechanisms specific to the server layer. The supported mechanisms are link up, link down, and 802.3ah.
- Server layer—a virtual MEP layer capable of detecting fault conditions.
- Defect conditions:
  - Loss of continuity (LOC): the MEP stopped receiving CCM frames from a peer MEP
  - Mismerge: the MEP received a CCM frame with a correct maintenance level (matching the MEP level) but an incorrect maintenance ID.
  - Unexpected MEP: the MEP received a CCM frame with the correct maintenance level (matching the MEP’s level) and correct maintenance ID, but an unexpected MEP ID.
  - Unexpected maintenance level: the MEP received a CCM frame with an incorrect maintenance level.
  - Unexpected period: the MEP received a CCM frame with a correct maintenance level, a correct maintenance ID, a correct MEP ID, but a different transmission period field.
- Signal fail—the MEP declares a signal fail condition when it detects a defect condition.
- Alarm Indication Signal (AIS) condition—the MEP received an AIS frame.
- Remote Defect Indication (RDI) condition—The MEP received a CCM frame with the RDI field set.
Alarm Indication Signals

The Ethernet Alarm Signal function (ETH-AIS) is used to suppress alarms after defects are detected at the server (sub) layer, which is a virtual MEP layer capable of detecting fault conditions. A fault condition could be a signal fail condition, an AIS condition, or a LCK condition.

Note

Although the configuration is allowed, you should not configure AIS in networks running STP. An STP configuration might cause AIS interruption or redirection.

When a MEP or a service MEP (SMEP) detects a connectivity fault at a specific maintenance association level, it multicasts AIS frames in the direction away from the detected failure at the client maintenance association level. The frequency of AIS frame transmission is based on the AIS transmission period. The first AIS frame is always sent immediately following the detection of the defect condition. We recommend a transition period of 1 second in a network of only a few VLANs to ensure that the first AIS frame is sent immediately following error detection. We recommend a 60-second interval in a network of multiple (up to 4094) VLANs to prevent stressing the network with 1-second transmissions.

A MEP that receives a frame with ETH-AIS information cannot determine the specific server with the defect condition or the set of peer MEPs for which it should suppress alarms. Therefore, it suppresses alarms for all peer MEPs, whether or not they are connected.

When a MEP receives an AIS frame, it examines it to be sure that the Maintenance Entity Group (MEG) level matches its own MEG and then detects the AIS default condition. (A MEG is Y.1731 terminology for maintenance association in 802.1ag.) After this detection, if no AIS frames are received for an interval of 3.5 times the AIS transmission period, the MEP clears the AIS defect condition. For example, if the AIS timer is set for 60 seconds, the AIS timer period expires after 3.5 times 60, or 210 seconds. The AIS condition is terminated when a valid CCM is received with all error conditions cleared or when the AIS period timer expires (the default time is 60 seconds).

Ethernet Remote Defect Indication

When Ethernet OAM continuity check (ETH-CC) transmission is enabled, the Ethernet Remote Defect Indication (ETH-RDI) function uses a bit in the CFM CC message to communicate defect conditions to the MEP peers. For ETH-RDI functionality, you must configure the MEP MEG level, the ETH-CC transmission period, and the ETH-CC frame priority. ETH-RDI does not require any MIP configuration.

When a MEP receives frames with ETH-RDI information, it determines that its peer MEP has encountered a defect condition and sets the RDI field in the CCM frames for the duration of the defect condition. When the defect condition clears, the MEP clears the RDI field.

When a MEP receives a CCM frame, it examines it to ensure that its MEG level is the same and if the RDI field is set, it detects an RDI condition. For point-to-point Ethernet connections, a MEP can clear the RDI condition when it receives the first frame from its peer MEP with the RDI field cleared. However, for multipoint Ethernet connectivity, the MEP cannot determine the associated subset of peer MEPs with which the sending MEP has seen the defect condition. It can clear the RDI condition after it receives CCM frames with the RDI field cleared from its entire list of peer MEPs.
Chapter 63 Configuring Ethernet OAM and CFM

Multicast Ethernet Loopback

The multicast Ethernet loopback (ETH-LB) function verifies bidirectional connectivity of a MEP with its peer MEPs and is an on-demand OAM function. When the feature is invoked on a MEP by entering the `ping` privileged EXEC command, the MEP sends a multicast frame with ETH-LB request information to peer MEPs in the same MEG. The MEP expects to receive a unicast frame with ETH-LB reply information from its peer MEPs within a specified time period. A MEP receiving a multicast frame with ETH-LB request information validates the frame and transmits a frame with reply information.

To configure multicast ETH-LB, you configure the MEG level of the MEP and the priority of the multicast frames with ETH-LB requests. Multicast frames with ETH-LB request information are always marked as drop ineligible. No MIP configuration is required.

The MEP sends multicast LB message frames on an on-demand basis. After sending a multicast LBM frame, the MEP expects to receive LB reply frames within 5 seconds.

When a MEP receives a valid LBM frame, it generates an LB reply frame and sends it to the requested MEP after a random delay in the range of 0 to 1 second. The validity of the frame is determined on its having the correct MEG level.

When a MEP sends a multicast LBM frame and receives an LB reply frame within 5 seconds, the LB reply frame is valid.

Configuring Y.1731 Fault Management

To configure Y.1731 fault management, you must enable CFM and configure MIPs on the participating interfaces. AIS messages are generated only on interfaces with a configured MIP.

- Default Y.1731 Configuration, page 63-29
- Configuring ETH-AIS, page 63-29
- Using Multicast Ethernet Loopback, page 63-31

Default Y.1731 Configuration

ETH-AIS and ETH-LCK are enabled by default when CFM is enabled.

When you configure ETH-AIS or ETH-LCK, you must configure CFM before ETH-AIS or ETH-LCK is operational.

ETH-RDI is set automatically when continuity check messages are enabled.

Configuring ETH-AIS

Beginning in privileged EXEC mode, follow these steps to configure Ethernet AIS on a switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2: ethernet cfm ais link-status global</td>
<td>Configures AIS-specific SMEP commands by entering config-ais-link-cfm mode.</td>
</tr>
</tbody>
</table>
### Configuring Y.1731 Fault Management

#### Step 3

**Command**

```plaintext
level level-id
```

**Purpose**

Configures the maintenance level for sending AIS frames transmitted by the SMEP. The range is 0 to 7.

**or**

```plaintext
disable
```

Disables generation of ETH-AIS frames.

#### Step 4

**Command**

```plaintext
period value
```

**Purpose**

Configures the SMEP AIS transmission period interval. Allowable values are 1 second or 60 seconds.

#### Step 5

**Command**

```plaintext
exit
```

Returns to global configuration mode.

#### Step 6

**Command**

```plaintext
ethernet cfm domain domain-name level level-id
```

**Purpose**

Defines a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7.

#### Step 7

**Command**

```plaintext
service (ma-name | ma-number | vpn-id vpn) (vlan vlan-id [direction down] | port)
```

**Purpose**

Defines a customer service maintenance association (MA) name or number to be associated with the domain, or a VLAN ID or VPN-ID, and enter ethernet-cfm-service configuration mode.

- **ma-name**—a string of no more than 100 characters that identifies the MAID.
- **ma-number**—a value from 0 to 65535.
- **vpn-id**—enter a VPN ID as the **ma-name**.
- **vlan vlan-id**—VLAN range is from 1 to 4094. You cannot use the same VLAN ID for more than one domain at the same level.
- **(Optional) direction down**—specify the service direction as down.
- **port**—Configure port MEP, a down MEP that is untagged and not associated with a VLAN.

#### Step 8

**Command**

```plaintext
ais level level-id
```

**Purpose**

(Optional) Configures the maintenance level for sending AIS frames transmitted by the MEP. The range is 0 to 7.

#### Step 9

**Command**

```plaintext
ais period value
```

**Purpose**

(Optional) Configures the MEP AIS transmission period interval. Allowable values are 1 second or 60 seconds.

#### Step 10

**Command**

```plaintext
ais expiry-threshold value
```

**Purpose**

(Optional) Sets the expiring threshold for the MA as an integer. The range is 2 to 255. The default is 3.5.

#### Step 11

**Command**

```plaintext
no ais suppress-alarms
```

**Purpose**

(Optional) Overrides the suppression of redundant alarms when the MEP goes into an AIS defect condition after receiving an AIS message.

#### Step 12

**Command**

```plaintext
exit
```

Returns to ethernet-cfm configuration mode.

#### Step 13

**Command**

```plaintext
exit
```

Returns to global configuration mode.

#### Step 14

**Command**

```plaintext
interface interface-id
```

**Purpose**

Specifies an interface ID, and enter interface configuration mode.

#### Step 15

**Command**

```plaintext
[no] ethernet cfm ais link-status
```

**Purpose**

Enables or disable sending AIS frames from the SMEP on the interface.

#### Step 16

**Command**

```plaintext
ethernet cfm ais link-status period value
```

**Purpose**

Configures the ETH-AIS transmission period generated by the SMEP on the interface. Allowable values are 1 second or 60 seconds.
Managing and Displaying Ethernet CFM Information

You can use the privileged EXEC commands in these tables to clear Ethernet CFM information.

### Table 63-1 Clearing CFM Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ethernet cfm ais domain domain-name mpid id vlan vlan-id</td>
<td>Clears MEPs with matching domain and VLAN ID out of AIS defect condition.</td>
</tr>
<tr>
<td>clear ethernet cfm ais link-status interface interface-id</td>
<td>Clears a SMEP out of AIS defect condition.</td>
</tr>
<tr>
<td>clear ethernet cfm error</td>
<td>Clears all CFM error conditions, including AIS.</td>
</tr>
</tbody>
</table>
Managing and Displaying Ethernet CFM Information

You can use the privileged EXEC commands in Table 63-2 to display Ethernet CFM information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ethernet cfm domain [brief]</td>
<td>Displays CFM domain information or brief domain information.</td>
</tr>
<tr>
<td>show ethernet cfm errors [configuration</td>
<td>domain-id]</td>
</tr>
<tr>
<td>show ethernet cfm maintenance-points local [detail</td>
<td>domain</td>
</tr>
<tr>
<td>show ethernet cfm maintenance-points remote [crosscheck</td>
<td>detail</td>
</tr>
<tr>
<td>show ethernet cfm mpdb</td>
<td>Displays information about entries in the MIP continuity-check database.</td>
</tr>
<tr>
<td>show ethernet cfm smep [interface interface-id]</td>
<td>Displays Ethernet CFM SMEP information.</td>
</tr>
<tr>
<td>show ethernet cfm traceroute-cache</td>
<td>Displays the contents of the traceroute cache.</td>
</tr>
</tbody>
</table>

This is an example of output from the show ethernet cfm domain brief command:

```
Switch# show ethernet cfm domain brief
Domain Name       Index  Level  Services Archive(min)
level5            1      5     1     100

LCK Expiry Threshold: 3.5
```
About Ethernet OAM Protocol

The Ethernet OAM protocol for installing, monitoring, and troubleshooting Metro Ethernet networks and Ethernet WANs relies on an optional sublayer in the data link layer of the OSI model. Normal link operation does not require Ethernet OAM. You can implement Ethernet OAM on any full-duplex point-to-point or emulated point-to-point Ethernet link for a network or part of a network (specified interfaces).

OAM frames, called OAM protocol data units (OAM PDUs) use the slow protocol destination MAC address 0180.c200.0002. They are intercepted by the MAC sublayer and cannot propagate beyond a single hop within an Ethernet network. Ethernet OAM is a relatively slow protocol, with a maximum transmission rate of 10 frames per second, resulting in minor impact to normal operations. However, because the CPU must poll error counters frequently, when you enable link monitoring, the number of required CPU cycles is proportional to the number of interfaces that must be polled.

### Table 63-3 Displaying IP SLAs CFM Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip sla configuration [entry-number]</td>
<td>Displays configuration values including all defaults for all IP SLAs operations or a specific operation.</td>
</tr>
<tr>
<td>show ip sla ethernet-monitor configuration [entry-number]</td>
<td>Displays the configuration of the IP SLAs automatic Ethernet operation.</td>
</tr>
<tr>
<td>show ip sla statistics [entry-number / aggregated / details]</td>
<td>Displays current or aggregated operational status and statistics.</td>
</tr>
</tbody>
</table>
Ethernet OAM has two major components:

- The **OAM client** establishes and manages Ethernet OAM on a link and enables and configures the OAM sublayer. During the OAM discovery phase, the OAM client monitors OAM PDUs received from the remote peer and enables OAM functionality. After the discovery phase, it manages the rules of response to OAM PDUs and the OAM remote loopback mode.

- The **OAM sublayer** presents two standard IEEE 802.3 MAC service interfaces facing the superior and inferior MAC sublayers. It provides a dedicated interface for the OAM client to pass OAM control information and PDUs to and from the client. The sublayer includes these components:
  - The **control block** provides the interface between the OAM client and other OAM sublayer internal blocks.
  - The **multiplexer** manages frames from the MAC client, the control block, and the parser and passes OAM PDUs from the control block and loopback frames from the parser to the subordinate layer.
  - The **parser** classifies frames as OAM PDUs, MAC client frames, or loopback frames and sends them to the appropriate entity: OAM PDUs to the control block, MAC client frames to the superior sublayer, and loopback frames to the multiplexer.

### OAM Features

These OAM features are defined by IEEE 802.3ah:

- **Discovery** identifies devices in the network and their OAM capabilities. It uses periodic OAM PDUs to advertise OAM mode, configuration, and capabilities; PDU configuration; and platform identity. An optional phase allows the local station to accept or reject the configuration of the peer OAM entity.

- **Link monitoring** detects and indicates link faults under a variety of conditions and uses the event notification OAM PDU to notify the remote OAM device when it detects problems on the link. Error events include when the number of symbol errors, the number of frame errors, the number of frame errors within a specified number of frames, or the number of error seconds within a specified period exceeding a configured threshold.

- **Remote failure indication** conveys a slowly deteriorating quality of an OAM entity to its peers by communicating these conditions: Link Fault means a loss of signal, Dying Gasp means an unrecoverable condition, and Critical Event means an unspecified vendor-specific critical event. The switch can receive and process but not generate Link Fault or Critical Event OAM PDUs. It can generate Dying Gasp OAM PDUs to show that Ethernet OAM is disabled, the interface is shut down, the interface enters the error-disabled state, or the switch is reloading. It can respond to, but not generate, Dying Gasp PDUs based on loss of power.

- **Remote loopback mode** ensures link quality with a remote peer during installation or troubleshooting. In this mode, when the switch receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same port. The link appears to you to be functioning. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

### OAM Messages

OAM messages or PDUs are standard length, untagged Ethernet frames between 64 and 1518 bytes. They do not go beyond a single hop and have a maximum transmission rate of 10 OAM PDUs per second. Message types are information, event notification, loopback control, or vendor-specific OAM PDUs.
Enabling and Configuring Ethernet OAM

This section includes this information:

- Ethernet OAM Default Configuration, page 63-35
- Ethernet OAM Configuration Guidelines, page 63-35
- Enabling Ethernet OAM on an Interface, page 63-36
- Enabling Ethernet OAM Remote Loopback, page 63-37
- Configuring Ethernet OAM Link Monitoring, page 63-38
- Configuring Ethernet OAM Remote Failure Indications, page 63-42
- Configuring Ethernet OAM Templates, page 63-45

Ethernet OAM Default Configuration

The default configuration is as follows:

- Ethernet OAM is disabled on all interfaces.
- When Ethernet OAM is enabled on an interface, link monitoring is automatically turned on.
- Remote loopback is disabled.
- No Ethernet OAM templates are configured.

Ethernet OAM Configuration Guidelines

Follow these guidelines when configuring Ethernet OAM:

- The switch does not support monitoring of egress frames sent with cyclic redundancy code (CDC) errors. The `ethernet oam link-monitor transmit crc` interface-configuration or template-configuration commands are visible but are not supported on the switch. The commands are accepted but are not applied to an interface.
- For a remote failure indication, the switch does not generate Link Fault or Critical Event OAM PDUs. However, if these PDUs are received from a link partner, they are processed. The switch generates and receives Dying Gasp OAM PDUs when Ethernet OAM is disabled, the interface is shut down, the interface enters the error-disabled state, or the switch is reloading. It can respond to, but not generate, Dying Gasp PDUs based on loss of power.
- The switch does not support Ethernet OAM loopback on ports that belong to an EtherChannel, ISL trunk, and promiscuous trunk.
Enabling Ethernet OAM on a Interface

To enable Ethernet OAM on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# ethernet oam</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# ethernet oam [max-rate oampdus</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show ethernet oam status [interface interface-id]</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Enter the no ethernet oam interface configuration command to disable Ethernet OAM on the interface.

This example shows how to set basic OAM parameters on the switch:

```
Switch(config)# int gi1/3
Switch(config-if)# ethernet oam
Switch(config-if)# ethernet oam max-rate 9
Switch(config-if)# ethernet oam mode passive
Switch(config-if)# end
Switch# show ethernet oam status int gi1/2
GigabitEthernet1/2

General
-------
Admin state: enabled
Mode: passive
PDU max rate: 9 packets per second
PDU min rate: 1 packet per 1 second
Link timeout: 5 seconds
High threshold action: no action
```

Enter the no ethernet oam interface configuration command to disable Ethernet OAM on the interface.
Enabling Ethernet OAM Remote Loopback

You must enable Ethernet OAM remote loopback on an interface for the local OAM client to initiate OAM remote loopback operations. Changing this setting causes the local OAM client to exchange configuration information with its remote peer. Remote loopback is disabled by default.

Remote loopback has these limitations:

- Only data packets are looped back.
- You cannot configure Ethernet OAM remote loopback on ISL ports or ports that belong to an EtherChannel.
- Remote loopback can be supported on a max of 16 ports.

To enable Ethernet OAM remote loopback on an interface, follow these steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
</tbody>
</table>
Enabling and Configuring Ethernet OAM

### Configuring Ethernet OAM Link Monitoring

You can configure high and low thresholds for link-monitoring features. If no high threshold is configured, the default is `none`; no high threshold is set. If you do not set a low threshold, the default is a value lower than the high threshold.

Link event PDUs for rxerr and txerr errors are not generated because they are nonstandard.

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>**Switch(config-if)# ethernet oam remote-loopback {supported</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>**Switch(config-if)# ethernet oam remote-loopback {start</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>Switch(config-if)# end</strong> Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>Switch# show ethernet oam status {interface interface-id}</strong> Verifies the configuration.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>Switch# copy running-config startup-config</strong> (Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the **no ethernet oam remote-loopback {supported | timeout}** interface configuration command to disable remote loopback support or remove the timeout setting.

This example shows how to enable OAM Remote Loopback:

```plaintext
Switch(config)# int gi1/3
Switch(config-if)# ethernet oam
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# end
Switch# show running int gi1/1
Building configuration...

Current configuration : 209 bytes
!
interface GigabitEthernet1/1
  switchport trunk encapsulation dot1q
  switchport trunk allowed vlan 1,19
  switchport mode trunk
  ethernet oam remote-loopback supported
  ethernet oam
end

Switch# ethernet oam remote-loopback start int gi1/1
it is an intrusive loopback. Therefore, while you test Ethernet OAM MAC connectivity, you will be unable to pass traffic across that link. Proceed with Remote Loopback? [confirm]

Switch# ethernet oam remote-loopback stop int gi1/1
Switch# *Apr  9 12:52:39.793: %ETHERNET_OAM-6-LOOPBACK: Interface Gi1/1 has exited the master loopback mode.
```
To configure Ethernet OAM link monitoring on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>

</tr>
<tr>
<td></td>
<td>• Enter <strong>window</strong> <strong>milliseconds</strong> to set the window size (in number of milliseconds) of the period of time during which error frames are counted. The range is 10 to 600 and represents the number of milliseconds in multiples of 100. The default is 100.</td>
</tr>
</tbody>
</table>
### Enabling and Configuring Ethernet OAM

#### Chapter 63  Configuring Ethernet OAM and CFM

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Switch(config-if)# ethernet oam link-monitor frame-period {threshold [high {high-frames</td>
<td>none}]</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Repeat this step to configure both high and low thresholds.</td>
</tr>
</tbody>
</table>

- Enter **threshold high high-frames** to set a high threshold in number of frames. The range is 1 to 65535. The default is **none**.
- Enter **threshold high none** to disable the high threshold if it was set. It is the default.
- Enter **threshold low low-frames** to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.
- Enter **window frames** to set the a polling window size in number of frames. The range is 1 to 65535; each value is a multiple of 10000 frames. The default is 1000.

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Switch(config-if)# ethernet oam link-monitor frame-seconds {threshold [high {high-frames</td>
<td>none}]</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Repeat this step to configure both high and low thresholds.</td>
</tr>
</tbody>
</table>

- Enter **threshold high high-frames** to set a high error frame-seconds threshold in number of seconds. The range is 1 to 900. The default is none.
- Enter **threshold high none** to disable the high threshold if it was set. It is the default.
- Enter **threshold low low-frames** to set a low threshold in number of frames. The range is 1 to 900. The default is 1.
- Enter **window frames** to set the a polling window size in number of milliseconds. The range is 100 to 9000; each value is a multiple of 100 milliseconds. The default is 1000.
Enabling and Configuring Ethernet OAM

Step 8

Switch(config-if)# ethernet oam link-monitor receive-crc [threshold [high [high-frames | none] | low [low-frames]]] | window milliseconds

Repeat this step to configure both high and low thresholds.

Step 9

Switch(config-if)# [no] ethernet link-monitor on

(Optional) Configures thresholds for monitoring ingress frames received with cyclic redundancy code (CRC) errors for a period of time.

- Enter threshold high high-frames to set a high threshold for the number of frames received with CRC errors. The range is 1 to 65535 frames.
- Enter threshold high none to disable the high threshold.
- Enter threshold low low-frames to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.
- Enter window milliseconds to set the a window and period of time during which frames with CRC errors are counted. The range is 10 to 1800 and represents the number of milliseconds in multiples of 100. The default is 100.

Step 10

Switch(config-if)# end

(Optional) Starts or stop (when the no keyword is entered) link-monitoring operations on the interface. Link monitoring operations start automatically when support is enabled.

Step 11

Switch# show ethernet oam status [interface interface-id]

(Optional) Verifies the configuration.

Step 12

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

The ethernet oam link-monitor transmit-crc [threshold [high [high-frames | none] | low [low-frames]]] | window milliseconds] command is visible on the switch and you can enter it, but it is not supported. Enter the no form of the command to disable the configuration. Use the no form of each command to disable the threshold setting.

Symbol error counters are supported on the following line cards and supervisor engine cards:

The rest of the cards do not support symbol error counters.

This example shows how to configure Ethernet OAM link monitoring:

Switch(config)# interface gi1/1
Switch(config-if)# ethernet oam link-monitor receive-crc threshold high 1000
Switch(config-if)# ethernet oam link-monitor receive-crc threshold low 10
Switch(config-if)# ethernet oam link-monitor symbol-period threshold high 5000
Switch(config-if)# ethernet oam link-monitor symbol-period threshold low 5
Switch(config-if)# ethernet oam link-monitor frame threshold high 8000
Switch(config-if)# ethernet oam link-monitor frame threshold low 8
Switch(config-if)# ethernet oam link-monitor frame-period threshold high 9000
Switch(config-if)# ethernet oam link-monitor frame-period threshold low 9

Switch# show ethernet oam status int gi1/1

Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ethernet oam link-monitor</td>
<td>(Optional) Configures thresholds for monitoring ingress frames received with cyclic redundancy code (CRC) errors for a period of time.</td>
</tr>
<tr>
<td>receive-crc [threshold [high [high-frames</td>
<td>none]</td>
</tr>
<tr>
<td>window milliseconds</td>
<td></td>
</tr>
<tr>
<td>Repeat this step to configure both high and low thresholds.</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 9**                                        |         |
| Switch(config-if)# [no] ethernet link-monitor on  | (Optional) Starts or stop (when the no keyword is entered) link-monitoring operations on the interface. Link monitoring operations start automatically when support is enabled. |

| **Step 10**                                       |         |
| Switch(config-if)# end                           | Returns to privileged EXEC mode. |

| **Step 11**                                       |         |
| Switch# show ethernet oam status [interface      | Verifies the configuration. |
| interface-id]                                    |         |

| **Step 12**                                       |         |
| Switch# copy running-config startup-config       | (Optional) Saves your entries in the configuration file. |

Software Configuration Guide—Release IOS XE 3.3.0SG and IOS 15.1(1)SG
GigabitEthernet1/1

General
-------
Admin state: enabled
Mode: active
PDU max rate: 10 packets per second
PDU min rate: 1 packet per 1 second
Link timeout: 5 seconds
High threshold action: error disable interface
Link fault action: no action
Dying gasp action: no action
Critical event action: no action

Link Monitoring
---------------
Status: supported (on)

Symbol Period Error
Window: 100 x 1048576 symbols
Low threshold: 5 error symbol(s)
High threshold: 5000 error symbol(s)

Frame Error
Window: 10 x 100 milliseconds
Low threshold: 8 error frame(s)
High threshold: 8000 error frame(s)

Frame Period Error
Window: 1000 x 10000 frames
Low threshold: 9 error frame(s)
High threshold: 9000 error frame(s)

Frame Seconds Error
Window: 100 x 100 milliseconds
Low threshold: 1 error second(s)
High threshold: none

Receive-Frame CRC Error
Window: 10 x 100 milliseconds
Low threshold: 10 error frame(s)
High threshold: 1000 error frame(s)

Transmit-Frame CRC Error: Not Supported

Configuring Ethernet OAM Remote Failure Indications

You can configure an error-disable action to occur on an interface when the following occur:

- Crossing the high thresholds configured on the interface for link monitoring
- On reception of Dying Gasp, executing `shut` on the interface
- On reception of Dying Gasp, executing `reload` command
- On reception of Dying Gasp, executing `no ethernet oam` command on the interface
To enable Ethernet OAM remote-failure indication actions on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# ethernet oam remote-failure [dying-gasp] action error-disable-interface</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch# show ethernet oam status [interface interface-id]</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to configure Ethernet OAM remote-failure action on the switch interface:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# int gi1/1
Switch(config-if)# ethernet oam remote-failure dying-gasp action error-disable-interface
Switch(config-if)# ethernet oam link-monitor high-threshold action error-disable-interface
Switch(config-if)# end
Switch# show running-config int gi1/1
Building configuration...

To enable Ethernet OAM failover action on an EtherChannel interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface port-channel interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# switchport mode mode</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# ethernet oam link-monitor high-threshold action failover</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch# show ethernet oam status [interface interface-id]</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

The switch does not generate Link Fault or Critical Event OAM PDUs. However, if these PDUs are received from a link partner, they are processed. The switch supports sending and receiving Dying Gasp OAM PDUs when Ethernet OAM is disabled, the interface is shut down, the interface enters the
error-disabled state, or the switch is reloading. It can respond to but not generate Dying Gasp PDUs based on loss of power. Enter the `no ethernet remote-failure {critical-event | dying-gasp | link-fault} action` command to disable the remote failure indication action.

### Configuring Ethernet OAM Templates

You can create a template for configuring a common set of options on multiple Ethernet OAM interfaces. The template can be configured to monitor frame errors, frame-period errors, frame-second errors, received CRS errors, and symbol-period errors and thresholds. You can also set the template to put the interface in error-disabled state if any high thresholds are exceeded. These steps are optional and can be performed in any sequence or repeated to configure different options.

To configure an Ethernet OAM template and to associate it with an interface, follow these steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: <code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2: <code>Switch(config)# template template-name</code></td>
<td>Creates a template and enters template configuration mode.</td>
</tr>
<tr>
<td>Step 3: `Switch(config-template)# ethernet oam link-monitor receive-crc threshold [high {high-frames</td>
<td>none}</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>• Enter <code>threshold high high-frames</code> to set a high threshold for the number of frames received with CRC errors. The range is 1 to 65535 frames.</td>
<td></td>
</tr>
<tr>
<td>• Enter <code>threshold high none</code> to disable the high threshold.</td>
<td></td>
</tr>
<tr>
<td>• Enter <code>threshold low low-frames</code> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.</td>
<td></td>
</tr>
<tr>
<td>• Enter <code>window milliseconds</code> to set the a window and period of time during which frames with CRC errors are counted. The range is 10 to 1800 and represents the number of milliseconds in multiples of 100. The default is 100.</td>
<td></td>
</tr>
</tbody>
</table>
### Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`Switch(config-template)# ethernet oam link-monitor symbol-period {threshold {high {high symbols</td>
<td>none}</td>
</tr>
<tr>
<td>- Enter <code>threshold high high-symbols</code> to set a high threshold in number of symbols. The range is 1 to 65535.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>threshold high none</code> to disable the high threshold.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>threshold low low-symbols</code> to set a low threshold in number of symbols. The range is 0 to 65535. It must be lower than the high threshold.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>window symbols</code> to set the window size (in number of symbols) of the polling period. The range is 1 to 65535 symbols.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`Switch(config-template)# ethernet oam link-monitor frame {threshold {high {high-frames</td>
<td>none}</td>
</tr>
<tr>
<td>- Enter <code>threshold high high-frames</code> to set a high threshold in number of frames. The range is 1 to 65535. You must enter a high threshold.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>threshold high none</code> to disable the high threshold.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>threshold low low-frames</code> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>window milliseconds</code> to set the window size in milliseconds. The range is 10 to 600 and represents the number of milliseconds in a multiple of 100. The default is 100.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`Switch(config-template)# ethernet oam link-monitor frame-period {threshold {high {high-frames</td>
<td>none}</td>
</tr>
<tr>
<td>- Enter <code>threshold high high-frames</code> to set a high threshold in number of frames. The range is 1 to 65535. You must enter a high threshold.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>threshold high none</code> to disable the high threshold.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>threshold low low-frames</code> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>window frames</code> to set the polling window size in number of frames. The range is 1 to 65535; each value is a multiple of 10000 frames. The default is 1000.</td>
<td></td>
</tr>
</tbody>
</table>
### Enabling and Configuring Ethernet OAM

**Step 7**

```bash
Switch(config-template)# ethernet oam link-monitor frame-seconds {threshold [high {high-seconds | none} | low {low-seconds}]} | window milliseconds
```

(Optionalal) Configures frame-seconds high and low thresholds for triggering an error-frame-seconds link event.

- Enter `threshold high high-seconds` to set a high threshold in number of seconds. The range is 1 to 900. You must enter a high threshold.
- Enter `threshold high none` to disable the high threshold.
- Enter `threshold low low-frames` to set a low threshold in number of frames. The range is 1 to 900. The default is 1.
- Enter `window frames` to set the a polling window size in number of frames. The range is 100 to 9000; each value is a multiple of 100 milliseconds. The default is 1000.

**Step 8**

```bash
Switch(config-template)# ethernet oam link-monitor high threshold action error-disable-interface
```

(Optionalal) Configures the switch to put an interface in an error disabled state when a high threshold for an error is exceeded.

**Step 9**

```bash
Switch(config-template)# exit
```

Returns to global configuration mode.

**Step 10**

```bash
Switch(config)# interface interface-id
```

Defines an Ethernet OAM interface and enters interface configuration mode.

**Step 11**

```bash
Switch(config-if)# source-template template-name
```

Associates the template to apply the configured options to the interface.

**Step 12**

```bash
Switch(config-if)# end
```

Returns to privileged EXEC mode.

**Step 13**

```bash
Switch# show ethernet oam status [interface interface-id]
```

Verifies the configuration.

**Step 14**

```bash
Switch# copy running-config startup-config
```

(Optionalal) Saves your entries in the configuration file.

The switch does not support monitoring egress frames with CRC errors. The `ethernet oam link-monitor transmit-crc {threshold [high {high-frames | none} | low {low-frames}]} | window milliseconds` command is visible on the switch and you can enter it, but it is not supported. Use the `no` form of each command to remove the option from the template. Use the `no source-template template-name` command to remove the source template association.

The following example illustrates how to configure an Ethernet OAM template and to associate it with an interface:

```bash
Switch# conf t
Switch(config)# template oam
Switch(config-template)# ethernet oam link-monitor receive-crc threshold high 1000
Switch(config-template)# ethernet oam link-monitor receive-crc threshold low 10
Switch(config-template)# ethernet oam link-monitor symbol-period threshold high 5000
Switch(config-template)# ethernet oam link-monitor symbol-period threshold low 5
Switch(config-template)# ethernet oam link-monitor frame threshold high 8000
Switch(config-template)# ethernet oam link-monitor frame threshold low 8
Switch(config-template)# ethernet oam link-monitor frame-period threshold high 9000
Switch(config-template)# ethernet oam link-monitor frame-period threshold low 9
Switch(config-template)# ethernet oam link-monitor high action error-disable-interface
Switch(config-template)# exit
Switch(config)# int gil/2
Switch(config-if)# source template oam
Switch(config-if)# end
```
Switch# show ethernet oam status int gi1/2
GigabitEthernet1/2
General

Ethernet CFM and Ethernet OAM Interaction

You can also configure the OAM Manager infrastructure to interact between CFM and Ethernet OAM. When the Ethernet OAM protocol is running on an interface that has CFM MEPs configured, Ethernet OAM informs CFM of the state of the interface. Interaction is unidirectional from the Ethernet OAM to the CFM protocol, and the only information exchanged is your (user) network interface port status.

The Ethernet OAM protocol notifies CFM when these conditions occur:

- Error thresholds are crossed at the local interface.
  - CFM responds to the notification by sending a port status of Local_Excessive_Errors in the Port StatusType Length Value (TLV).
- Ethernet OAM receives an OAM PDU from the remote side showing that an error threshold is exceeded on the remote endpoint.
  - CFM responds to the notification by sending a port status of Remote_Excessive_Errors in the Port Status TLV.
- The local port is set into loopback mode.
  - CFM responds by sending a port status of Test in the Port Status TLV.
- The remote port is set into loopback mode.
  - CFM responds by sending a port status of Test in the Port Status TLV.

This section includes this information:

- Configuring Ethernet OAM Interaction with CFM, page 63-51
- Example: Configuring Ethernet OAM and CFM, page 63-53

For more information about CFM and interaction with Ethernet OAM, see the Ethernet Connectivity Fault Management feature module at this URL:

Configuring Ethernet OAM Interaction with CFM

For Ethernet OAM to function with CFM, you must configure an Ethernet Virtual Circuit (EVC) and the OAM manager, and associate the EVC with CFM. You must use an inward facing MEP for interaction with the OAM manager.

Note

If you configure, change, or remove a UNI service type, EVC, Ethernet service instance, or CE-VLAN configuration, all configurations are verified to ensure that the UNI service types match the EVC configuration and that Ethernet service instances are matched with the CE-VLAN configuration. Configurations are rejected if the pairs do not match.
Configuring the OAM Manager

To configure the OAM manager on a PE device, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(config-if)# ethernet cfm domain domain-name level level-id</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(config-if)# service csi-id vlan vlan-id</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(config-if)# exit</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(config)# ethernet evc evc-id</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(config-evc)# oam protocol cfm svlan vlan-id domain domain-name</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(config-evc)# exit</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Repeat Steps 2 through 7 to define other CFM domains that you want OAM manager to monitor.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Switch(config)# ethernet cfm enable</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Enabling Ethernet OAM

To enable Ethernet OAM on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# interface interface-id</td>
</tr>
</tbody>
</table>
**Example: Configuring Ethernet OAM and CFM**

These are configuration examples of the interworking between Ethernet OAM and CFM in a sample service provider network. This example network would contain a provider-edge switch connected to a customer edge switch at each endpoint. You must configure CFM, E-LMI, and Ethernet OAM between the customer edge and the provider edge switch.

Customer-edge switch 1 (CE1) configuration:

Switch# config terminal
Switch(config)# interface GigabitEthernet1/1
Switch(config-if)# switchport trunk allowed vlan 10
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# exit

Provider-edge switch 1 (PE1) configuration:

Switch# config terminal
Switch(config)# interface FastEthernet1/20
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet cfm mip level 7
Switch(config-if)# ethernet cfm mip level 4 mpid 100 vlan 100
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oamt

Provider-edge switch 2 (PE2) configuration:

Switch# config terminal
Switch(config)# interface GigabitEthernet1/20
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet cfm mip level 7
Switch(config-if)# ethernet cfm mip level 4 mpid 101 vlan 10
Switch(config-if)# ethernet oam remote-loopback supported

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-if)# ethernet oam [max-rate campus / min-rate seconds / mode {active / passive} | Enables Ethernet OAM on the interface
| | • (Optional) Enter max-rate oampdu to set the maximum rate (per second) to send OAM PDUs. The range is 1 to 10 PDUs per second; the default is 10. |
| | • (Optional) Enter min-rate seconds to set the minimum rate in seconds. The range is 1 to 10 seconds. |
| | • (Optional) Set the OAM client mode as active or passive. The default is active. |
| | • (Optional) Enter timeout seconds to set the time after which a device declares the OAM peer to be nonoperational and resets its state machine. The range is 2 to 30 seconds; the default is 5 seconds. |
| Switch(config-if)# end | Returns to privileged EXEC mode. |
| Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Switch# show ethernet cfm maintenance points remote | (Optional) Displays the port states as reported by Ethernet OAM. |
Ethernet CFM and Ethernet OAM Interaction

Chapter 63 Configuring Ethernet OAM and CFM

Customer-edge switch 2 (CE2) configuration:

Switch(config-if)# ethernet oam

Customer-edge switch 2 (CE2) configuration:

Switch(config-if)# config terminal
Switch(config)# interface GigabitEthernet1/1
Switch(config-if)# switchport trunk allowed vlan 10
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# exit

These output examples show provider-edge switch port status of the configuration. Port status shows as *UP* at both switches.

Switch PE1:

Switch PE1:

Switch(config-if)# show ethernet cfm maintenance points remote

<table>

Total Remote MEPs: 1

In addition, if you shut down the CE1 interface that connects to PE1, the remote PE2 port shows a PortState of *Down*.
Configuring Y.1731 (AIS and RDI)

The Catalyst 4500 series switch supports Y.1731 Ethernet Alarm Indication Signal function (ETH-AIS) and Ethernet Remote Defect Indication function (ETH-RDI) to provide fault and performance management for service providers in large networks. This chapter describes how to configure Y.1731 ETH-AIS and ETH-RDI.

This chapter contains these sections:
- AIS and RDI Terminology, page 64-1
- About Y.1731, page 64-2
- Configuring Y.1731, page 64-4
- Displaying Y.1731 Information, page 64-6

For complete command and configuration information for Y.1731, see the Cisco IOS feature module at this URL:

About Y.1731

These sections contain conceptual information about Y.1731:

- Server MEP, page 64-2
- Alarm Indication Signal, page 64-2
- Ethernet Remote Defect Indication, page 64-3

The advent of Ethernet as a metropolitan and WAN technology imposes a new set of Operations, Administration, and Maintenance (OAM) requirements on Ethernet's traditionally Enterprise-oriented functions. The expansion of this technology into the larger and more complex user base makes operational management of link uptime crucial. Isolating and responding to failures quickly directly affects the competitiveness of the service provider.

Server MEP

A Server MEP is a combined function of the server layer termination function and the server and ETH adaptation function. It issues frames with ETH-AIS information upon detecting a defect at the Server layer by the server layer termination function or the adaptation function.

A Virtual MEP represents the logical termination point of Connectivity Fault Management (CFM) MAs defined at the link or transport layer. A server MEP runs or is defined at Maintenance Level -1. For example, you could associate an outward-facing Server MEP with each termination point of IEEE 802.3ah OAM, or with each termination point of MPLS PW OAM.

Alarm Indication Signal

ETH-AIS allows you to suppress alarms when defects are detected at the server (sub) layer. Because of STP’s ability to restore, you would not expect to apply ETH-AIS in the STP environments. For the Catalyst 4500 Metro switch, an administrator can enable and disable AIS in the STP environment.

You can enable or disable transmission of frames with ETH-AIS information on an MEP (or on a Server MEP).

You also can issue frames with ETH-AIS information at the client Maintenance Level by a MEP, including a Server MEP upon detecting defect conditions.

The defect conditions may include:

- Signal fail conditions with ETH-CC enabled
- AIS condition with ETH-CC disabled
For multipoint ETH connectivity, a MEP cannot determine the specific server (sub) layer entity that has encountered defect conditions upon receiving a frame with ETH-AIS information. More importantly, it cannot determine the associated subset of its peer MEPs for which it should suppress alarms because the received ETH-AIS information does not contain that information. When a MEP receives a frame with ETH-AIS information, it suppresses alarms for all peer MEPs whether there is still connectivity or not.

For a point-to-point ETH connection, however, a MEP has only one peer MEP. There is no ambiguity regarding the peer MEP for which it should suppress alarms when it receives the ETH-AIS information. Only a MEP, including a Server MEP, is configured to issue frames with ETH-AIS information. Once the MEP detects a defect condition, it immediately starts transmitting periodic frames with ETH-AIS information at a configured client maintenance level. We send the AIS frames at a configured MIP level for an interface. A MEP continues to transmit periodic frames with ETH-AIS information until the defect condition is removed. Upon receiving a frame with ETH-AIS information, a MEP detects AIS condition and suppresses loss of continuity alarms associated with all its peer MEPs. A MEP resumes loss of continuity alarm generation upon detecting loss of continuity defect conditions in the absence of AIS condition.

**Ethernet Remote Defect Indication**

A MEP can use ETH-RDI to notify its peer MEPs that it detects a defect condition. ETH-RDI is used only when ETH-CC transmission is enabled.

ETH-RDI has the following two applications:

- Single-ended fault management—The receiving MEP detects an RDI defect condition, which is correlated with other defect conditions in this MEP and may cause a fault. The absence of received ETH-RDI information in a single MEP indicates the absence of defects in the entire maintenance.
- Contribution to far-end performance monitoring—It reflects a defect condition in the far-end which serves as input to the performance monitoring process.

A MEP that is in a defect condition transmits frames with ETH-RDI information. A MEP, upon receiving frames with ETH-RDI information, determines that its peer MEP has encountered a defect condition. For multipoint ETH connectivity, however, a MEP, upon receiving frames with ETH-RDI information, cannot determine the associated subset of its peer MEPs with which the MEP transmitting RDI information encounters defect conditions. It is because the transmitting MEP itself does not always have that information.
Configuring Y.1731

Note

Y.1731 is enabled by default.

These sections are included:

- Y.1731 Configuration Guidelines, page 64-4
- Configuring AIS Parameters, page 64-5
- Clearing MEP from the AIS Defect Condition, page 64-6
- Clearing SMEP from the AIS Defect Condition, page 64-6

Y.1731 Configuration Guidelines

Configuration guidelines and restrictions for Y.1731 include the following:

- Because of STP’s restoration capability, do not expect ETH-AIS to be applied in the STP environments.
- AIS is enabled by default on a CFM maintenance domain. The following section illustrates the commands you can use to disable AIS on a maintenance domain. Likewise, RDI is a flag bit in the CC message. Provided CC transmission is enabled, the present RDI flag of the CC message is set to true or false.
## Configuring AIS Parameters

To set the parameters for AIS, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| 2    | Switch (config)# ethernet cfm ais domain name vlan range | Enters config-ais-mep-cfm submode to configure parameters for all local Meps belonging to that per Maintenance Association (MA).  
name refers to the domain name.  
range represents VLAN IDs 100, 200-300, 400, 500, or 1-4095  
For the domain name vlan range command only configurations that are VLAN disjoint or congruent are accepted. |
| 3    | Switch(config-ais-mep-cfm)# disable | Disables AIS transmission. |
| 4    | Switch(config-ais-mep-cfm)# period period | Sets the AIS transmission period. |
| 5    | Switch(config-ais-mep-cfm)# level level | Establishes a maintenance level to send AIS frames for MEPs belonging to MA.  
Valid levels are 0 to 7. |
| 6    | Switch(config-ais-mep-cfm)# expiry-threshold threshold | Sets the AIS expiry threshold.  
By default, expiry threshold is 3.5. With this CLI we can change the expiry threshold parameter for MA. |
| 7    | Switch(config-ais-mep-cfm)# express alarm | Configures alarm suppression when an AIS message causes the MEP enters an AIS defect condition. |
| 8    | Switch(config-ais-mep-cfm)# exit | Returns to global configuration. |
| 9    | Switch(config)# [no] ethernet cfm ais link-status global | Enters config-ais-link-cfm submode, enabling you to configure parameters required to follow when link status goes down. |
| 10   | Switch(config-if)# [no] ethernet cfm ais link-status period period | Configures ETH-AIS transmission period generated by the link-status on the interface. |
| 11   | Switch(config-if)# [no] ethernet cfm ais link-status level level | Configures maintenance level to send AIS frames transmitted by the link-status on the interface. |
| 12   | end | Returns to privileged EXEC mode. |
| 13   | Switch# show ethernet cfm smep interface name Switch# show ethernet cfm maintenance-points local detail  
Switch# show ethernet cfm maintenance-points remote detail  
Switch# show ethernet cfm error | Verifies the configuration. |
| 14   | Switch# show running-config | Verifies your entries. |
| 15   | Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

Use the no versions of the commands to remove the configuration or return to the default configurations.
Clearing MEP from the AIS Defect Condition

To clear the MEP, enter one of the following commands:

```plaintext
Switch# clear ethernet cfm ais domain domain name mpid local mpid vlan vlan
Switch# clear ethernet cfm ais domain domain name mpid local mpid evc evc_name
```

Clearing SMEP from the AIS Defect Condition

To clear the CSMP, enter one of the following commands:

```plaintext
Switch# clear ethernet cfm ais link-status interface interface_name
Switch# clear ethernet cfm error
```

Note

This operation also clears all error conditions including AIS.

Displaying Y.1731 Information

To display Y.1731 information, you can use the following commands (Table 64-1).

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ethernet cfm main local detail</td>
<td>Displays AIS status and defect condition on local maintenance points.</td>
</tr>
<tr>
<td>show ethernet cfm smep [interface &lt;name&gt;]</td>
<td>Displays AIS status and defect condition on SMEP.</td>
</tr>
<tr>
<td>show ethernet cfm error</td>
<td>Displays errors due to AIS defect condition.</td>
</tr>
<tr>
<td>show ethernet cfm maintenance-points remote [detail]</td>
<td>Displays AIS status and defect condition on remote maintenance points.</td>
</tr>
</tbody>
</table>

This example shows how to track the RDI defect and to verify the configuration parameters:

```plaintext
Switch# show ethernet cfm main local detail
MEP Settings:

Configuring Call Home

This chapter describes how to configure the Call Home feature in Catalyst 4500 Series Switch. This chapter includes the following sections:

- About Call Home, page 65-2
- Obtaining Smart Call Home, page 65-2
- Configuring Call Home, page 65-3
- Configuring Contact Information, page 65-4
- Configuring Destination Profiles, page 65-5
- Subscribing to Alert Groups, page 65-6
- Configuring General E-Mail Options, page 65-9
- Enabling Call Home, page 65-10
- Testing Call Home Communications, page 65-10
- Configuring and Enabling Smart Call Home, page 65-13
- Displaying Call Home Configuration Information, page 65-14
- Call Home Default Settings, page 65-18
- Alert Group Trigger Events and Commands, page 65-18
- Message Contents, page 65-21

**Note**

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Cisco IOS Command Reference* and related publications at this location:

About Call Home

Call Home provides e-mail-based and web-based notification of critical system events. A versatile range of message formats are available for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications. Common uses of this feature may include direct paging of a network support engineer, e-mail notification to a Network Operations Center, XML delivery to a support website, and utilization of Cisco Smart Call Home services for direct case generation with the Cisco Systems Technical Assistance Center (TAC).

The Call Home feature can deliver alert messages containing information on configuration, diagnostics, environmental conditions, inventory, and syslog events.

The Call Home feature can deliver alerts to multiple recipients, referred to as Call Home destination profiles, each with configurable message formats and content categories. A predefined destination profile is provided for sending alerts to the Cisco TAC (callhome@cisco.com), and you also can define your own destination profiles.

Flexible message delivery and format options make it easy to integrate specific support requirements.

The Call Home feature offers the following advantages:

- Multiple message-format options:
  - Short Text—Suitable for pagers or printed reports.
  - Plain Text—Full formatted message information suitable for human reading.
  - XML—Matching readable format using Extensible Markup Language (XML) and Adaptive Markup Language (AML) document type definitions (DTDs). The XML format enables communication with the Cisco TAC.

- Multiple concurrent message destinations.

- Multiple message categories including configuration, diagnostics, environmental conditions, inventory, and syslog events.

- Filtering of messages by severity and pattern matching.

- Scheduling of periodic message sending.

Obtaining Smart Call Home

If you have a service contract directly with Cisco Systems, you can register your devices for the Smart Call Home service. Smart Call Home provides fast resolution of system problems by analyzing Call Home messages sent from your devices and providing background information and recommendations. For issues that can be identified as known, particularly GOLD diagnostics failures, Automatic Service Requests will be generated with the Cisco TAC.

Smart Call Home offers the following features:

- Boot-up diagnostics alerts for line cards and supervisor engines in the chassis.

- Analysis of Call Home messages from your device, and where appropriate Automatic Service Request generation, routed to the appropriate TAC team, including detailed diagnostic information to speed problem resolution.

- Secure message transport directly from your device or through a downloadable Transport Gateway (TG) aggregation point. You can use a TG aggregation point in cases requiring support for multiple devices or in cases where security requirements mandate that your devices may not be connected directly to the Internet.
• Web-based access to Call Home messages and recommendations, inventory and configuration information for all Call Home devices. Provides access to associated field notices, Security Advisories, and End-of-Life information.

You need to register the following items:
• The SMARTnet contract number for your switch
• Your e-mail address
• Your Cisco.com ID

For detailed information on Smart Call Home, refer to the Smart Call Home page at this URL:

**Configuring Call Home**

How you configure Call Home depends on how you intend to use the feature. Consider the following information before you configure Call Home:

• At least one destination profile (predefined or user-defined) must be configured. The destination profile(s) used depends on whether the receiving entity is a pager, e-mail, or automated service such as Cisco Smart Call Home.
  - If the destination profile uses e-mail message delivery, you must specify a Simple Mail Transfer Protocol (SMTP) server.
  - If the destination profile uses secure HTTP (HTTPS) message transport, you must configure a trustpoint certificate authority (CA).

• The contact e-mail, phone, and street address information should be configured so that the receiver can determine the origin of messages received.

• The switch must have IP connectivity to an e-mail server or the destination HTTP server using the `ip domain name` command.

• If Cisco Smart Call Home is used, an active service contract must cover the device being configured.

To configure Call Home, follow these steps:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Configure your site’s contact information.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Configure destination profiles for each of your intended recipients.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Subscribe each destination profile to one or more alert groups, and set alert options.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Configure e-mail settings or HTTPS settings (including CA certificate), depending on the transport method.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Enable the Call Home feature.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Test Call Home messages.</td>
</tr>
</tbody>
</table>

**Tip**

From the Smart Call Home web application, you can download a basic configuration script to assist you in the configuration of the Call Home feature for use with Smart Call Home and the Cisco TAC. The script will also assist in configuring the trustpoint CA for secure communications with the Smart Call
Configuring Contact Information

Each switch must include a contact e-mail address. You can optionally include a phone number, street address, contract ID, customer ID, and site ID.

To assign the contact information, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# call-home</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(cfg-call-home)# contact-email-addr email-address</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(cfg-call-home)# phone-number +phone-number</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(cfg-call-home)# street-address street-address</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(cfg-call-home)# customer-id text</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(cfg-call-home)# site-id text</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(cfg-call-home)# contract-id text</td>
</tr>
</tbody>
</table>

This example shows the configuration of contact information:

Switch# configure terminal

Home service. The script, provided on an as-is basis, can be downloaded from this URL:

Configuring Call Home

Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# call-home
Switch(cfg-call-home)# contact-email-addr username@example.com
Switch(cfg-call-home)# phone-number +1-800-555-4567
Switch(cfg-call-home)# street-address “1234 Picaboo Street, Any city, Any state, 12345”
Switch(cfg-call-home)# customer-id Customer1234
Switch(cfg-call-home)# site-id Site1ManhattanNY
Switch(cfg-call-home)# contract-id Company1234
Switch(cfg-call-home)# exit
Switch(config)#

Configuring Destination Profiles

A destination profile contains the required delivery information for an alert notification. At least one destination profile is required. You can configure multiple destination profiles of one or more types.

You can use the predefined destination profile or define a desired profile. If you define a new destination profile, you must assign a profile name.

Note

If you use the Cisco Smart Call Home service, the destination profile must use the XML message format.

You can configure the following attributes for a destination profile:

- **Profile name**—A string that uniquely identifies each user-defined destination profile. The profile name is limited to 31 characters and is not case-sensitive. You cannot use `all` as a profile name.

- **Transport method**—The transport mechanism, either e-mail or HTTP (including HTTPS), for delivery of alerts.
  - For user-defined destination profiles, e-mail is the default, and you can enable either or both transport mechanisms. If you disable both methods, e-mail will be enabled.
  - For the predefined Cisco TAC profile, you can enable either transport mechanism, but not both.

- **Destination address**—The actual address related to the transport method to which the alert should be sent.

- **Message formatting**—The message format used for sending the alert.
  - For user-defined destination profiles, the format options are long-text, short-text, or XML. The default is XML.
  - For the predefined Cisco TAC profile, only XML is allowed.

- **Message size**—The maximum destination message size. The valid range is 50 to 3,145,728 bytes and the default is 3,145,728 bytes.

To create and configure a destination profile, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# call-home</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(cfg-call-home)# profile name</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(cfg-call-home-profile)# [no] destination transport-method (email</td>
</tr>
</tbody>
</table>
### Chapter 65    Configuring Call Home

#### Configuring Call Home

**Copying a Destination Profile**

To create a new destination profile by copying an existing profile, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# call-home</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(cfg-call-home)# copy profile source-profile target-profile</td>
</tr>
</tbody>
</table>

#### Subscribing to Alert Groups

An alert group is a predefined subset of Call Home alerts supported on the switch. Different types of Call Home alerts are grouped into different alert groups depending on their type. These alert groups are available:

- Configuration
- Diagnostic
- Environment
- Inventory
- Syslog

The triggering events for each alert group are listed in the “Alert Group Trigger Events and Commands” section on page 65-18, and the contents of the alert group messages are listed in the “Message Contents” section on page 65-21.
You can select one or more alert groups to be received by a destination profile.

**Note**
A Call Home alert is only sent to destination profiles that have subscribed to the alert group containing that Call Home alert. In addition, the alert group must be enabled.

To subscribe a destination profile to an alert group, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Switch(config)# call-home</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Switch(cfg-call-home)# alert-group {all</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Switch(cfg-call-home)# profile name</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Switch(cfg-call-home-profile)# subscribe-to-alert-group configuration periodic {daily hh:mm</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Switch(cfg-call-home-profile)# subscribe-to-alert-group diagnostic {fatal</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Switch(cfg-call-home-profile)# subscribe-to-alert-group environment {severity catastrophic</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Switch(cfg-call-home-profile)# subscribe-to-alert-group inventory periodic {daily hh:mm</td>
</tr>
</tbody>
</table>

Subscribes this destination profile to the Configuration alert group. The Configuration alert group can be configured for periodic notification, as described in the “Configuring Periodic Notification” section on page 65-8.

Subscribes this destination profile to the Diagnostic alert group. The Diagnostic alert group can be configured to filter messages based on severity, as described in the “Configuring Message Severity Threshold” section on page 65-8.

Subscribes this destination profile to the Environment alert group. The Environment alert group can be configured to filter messages based on severity, as described in the “Configuring Message Severity Threshold” section on page 65-8.

Subscribes this destination profile to the Inventory alert group. The Inventory alert group can be configured for periodic notification, as described in the “Configuring Periodic Notification” section on page 65-8.
Chapter 65 Configuring Call Home

Configuring Periodic Notification

When you subscribe a destination profile to either the Configuration or the Inventory alert group, you can choose to receive the alert group messages asynchronously or periodically at a specified time. The sending period can be one of the following:

- Daily—Specify the time of day to send, using an hour:minute format $\text{hh:mm}$, with a 24-hour clock (for example, 14:30).
- Weekly—Specify the day of the week and time of day in the format $\text{day hh:mm}$, where the day of the week is spelled out (for example, monday).
- Monthly—Specify the numeric date, from 1 to 31, and the time of day, in the format $\text{date hh:mm}$.

Configuring Message Severity Threshold

When you subscribe a destination profile to the Diagnostic, Environment, or Syslog alert group, you can set a threshold for sending alert group messages based on the message’s level of severity. Any message with a value lower than the threshold is not sent to the destination.

The severity threshold is configured using the keywords in Table 65-1, and ranges from catastrophic (level 9, highest level of urgency) to debugging (level 0, lowest level of urgency). If no severity threshold is configured, the default is normal (level 1).

Call Home severity levels differ from the system message logging severity levels.

<table>
<thead>
<tr>
<th>Table 65-1</th>
<th>Severity and Syslog Level Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Keyword</td>
</tr>
<tr>
<td>9</td>
<td>catastrophic</td>
</tr>
<tr>
<td>8</td>
<td>disaster</td>
</tr>
<tr>
<td>7</td>
<td>fatal</td>
</tr>
<tr>
<td>6</td>
<td>critical</td>
</tr>
<tr>
<td>5</td>
<td>major</td>
</tr>
<tr>
<td>4</td>
<td>minor</td>
</tr>
<tr>
<td>3</td>
<td>warning</td>
</tr>
</tbody>
</table>

Note

Subscribes this destination profile to the Syslog alert group. The Syslog alert group can be configured to filter messages based on severity, as described in the “Configuring Message Severity Threshold” section on page 65-8. You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (“”).

Exits the Call Home destination profile configuration submode.
Configuring Call Home

Configuring Syslog Pattern Matching

When you subscribe a destination profile to the Syslog alert group, you can optionally specify a text pattern to be matched within each syslog message. If you configure a pattern, a Syslog alert group message will be sent only if it contains the specified pattern and meets the severity threshold. If the pattern contains spaces, you must enclose it in quotes (""") when configuring it. You can specify up to five patterns for each destination profile.

Configuring General E-Mail Options

To use the e-mail message transport, you must configure at least one Simple Mail Transfer Protocol (SMTP) e-mail server address. You can configure the from and reply-to e-mail addresses, and you can specify up to four backup e-mail servers. You can also set a rate limit on e-mail or HTTP messages.

Starting with Cisco IOS Release 15.0(2)SG, you can configure the vrf and source interface or source IP address to send the e-mail messages. If you want to configure similar options to send http messages, you must enter the `ip http client source-interface interface-name` command where the source-interface can be associated with the vrf you want to set.

To configure general e-mail options, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>Switch(config)# call-home</code></td>
</tr>
<tr>
<td></td>
<td>Enters Call Home configuration submode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`Switch(cfg-call-home)# mail-server (ipv4-address</td>
</tr>
<tr>
<td></td>
<td>Assigns an e-mail server address and its relative priority among configured e-mail servers.</td>
</tr>
<tr>
<td></td>
<td>Provide either of these:</td>
</tr>
<tr>
<td></td>
<td>• The e-mail server’s IP address</td>
</tr>
<tr>
<td></td>
<td>• The e-mail server’s fully qualified domain name (FQDN) of 64 characters or less.</td>
</tr>
<tr>
<td></td>
<td>Assign a priority number between 1 (highest priority) and 100 (lowest priority).</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>Switch(cfg-call-home)# sender from email-address</code></td>
</tr>
<tr>
<td></td>
<td>(Optional) Assigns the e-mail address that will appear in the from field in Call Home e-mail messages. If no address is specified, the contact e-mail address is used.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>Switch(cfg-call-home)# sender reply-to email-address</code></td>
</tr>
<tr>
<td></td>
<td>(Optional) Assigns the e-mail address that will appear in the reply-to field in Call Home e-mail messages.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>Switch(cfg-call-home)# rate-limit number</code></td>
</tr>
<tr>
<td></td>
<td>(Optional) Specifies a limit on the number of messages sent per minute, from 1 to 60. The default is 20.</td>
</tr>
</tbody>
</table>
Chapter 65      Configuring Call Home

The following notes apply when configuring general e-mail options:

- Backup e-mail servers can be defined by repeating the `mail-server` command using different priority numbers.

- The `mail-server priority number` parameter can be configured from 1 to 100. The server with the highest priority (lowest priority number) will be tried first.

This example shows the configuration of general e-mail parameters, including a primary and secondary e-mail server:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# call-home
Switch(config)# mail-server smtp.example.com priority 1
Switch(config)# mail-server 192.168.0.1 priority 2
Switch(config)# sender from username@example.com
Switch(config)# sender reply-to username@example.com
Switch(config)# exit
Switch(config)#
```

### Enabling Call Home

To enable or disable the Call Home feature, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>Switch# configure terminal</code> Enters configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>Switch(config)# service call-home</code> Enables the Call Home feature.</td>
</tr>
</tbody>
</table>

### Testing Call Home Communications

You can test Call Home communications by sending messages manually using two command types.

- To send a user-defined Call Home test message, use the `call-home test` command.
- To send a specific alert group message, use the `call-home send` command.
Sending a Call Home Test Message Manually

To manually send a Call Home test message, perform this task:

```
Step 1
Switch# call-home test ["test-message"] profile name
```

This example shows how to manually send a Call Home test message:

```
Switch# call-home test "test of the day" profile Ciscotacl
```

Sending a Call Home Alert Group Message Manually

To manually trigger a Call Home alert group message, perform this task:

```
Step 1
Switch# call-home send alert-group configuration [profile name]
Switch# call-home send alert-group diagnostic (module number | slot/subslot | slot/bay) [profile name]
Switch# call-home send alert-group inventory [profile name]
```

When manually sending Call Home alert group messages, note the following guidelines:

- You can only manually send the configuration, diagnostic, and inventory alert groups.
- When you manually trigger a configuration, diagnostic, or inventory alert group message and you specify a destination profile name, a message is sent to the destination profile regardless of the profile’s active status, subscription status, or severity setting.
- When you manually trigger a configuration or inventory alert group message and do not specify a destination profile name, a message is sent to all active profiles that have either a normal or periodic subscription to the specified alert group.
- When you manually trigger a diagnostic alert group message and do not specify a destination profile name, the command will cause the following actions:
  - For any active profile that subscribes to diagnostic events with a severity level of less than minor, a message is sent regardless of whether the module or interface has observed a diagnostic event.
For any active profile that subscribes to diagnostic events with a severity level of minor or higher, a message is sent only if the specified module or interface has observed a diagnostic event of at least the subscribed severity level; otherwise, no diagnostic message is sent to the destination profile.

This example shows how to send the configuration alert-group message to the destination profile:

```
Switch# call-home send alert-group configuration
```

This example shows how to send the diagnostic alert-group message to the destination profile for a specific module, slot/subslot, or slot/bay number.

```
Switch# call-home send alert-group diagnostic module 3 5/2
```

This example shows how to send the diagnostic alert-group message to all destination profiles for a specific module, slot/subslot, or slot/bay number.

```
Switch# call-home send alert-group diagnostic module 3 5/2 profile Ciscotacl
```

This example shows how to send the inventory call-home message:

```
Switch# call-home send alert-group inventory
```

### Sending a Request for an Analysis and Report

You can use the `call-home request` command to submit information about your system to Cisco in order to receive helpful information specific to your system. You can request a variety of reports, including security alerts, known bugs, best practices, and command references.

To submit a request for report and analysis information from the Cisco Output Interpreter tool, perform one of these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# <code>call-home request output-analysis &quot;show-command&quot; [profile name] [ccoid user-id]</code></td>
<td>Sends the output of the specified <code>show</code> command for analysis. The <code>show</code> command must be contained in quotes (&quot;&quot;).</td>
</tr>
<tr>
<td>Switch# `call-home request {config-sanity</td>
<td>bugs-list</td>
</tr>
</tbody>
</table>

When manually sending a Call Home report and analysis request, note the following guidelines:

- If you specify a `profile name` value, the request is sent to the profile. If you do not specify a profile name, the request is sent to the Cisco TAC profile. The recipient profile does not need to be enabled for the Call Home request. The profile should specify the e-mail address where the transport gateway is configured so that the request message can be forwarded to the Cisco TAC and you can receive the reply from the Smart Call Home service.

- The `ccoid user-id` value is the registered identifier of the Smart Call Home user. If you specify a user-id, the response is sent to the e-mail address of the registered user. If do not specify a user-id, the response is sent to the contact e-mail address of the device.
Based on the keyword specifying the type of report requested, the following information is returned:

- **config-sanity**—Information on best practices as related to the current running configuration
- **bugs-list**—Known bugs in the running version and in the currently applied features
- **command-reference**—Reference links to all commands in the running configuration
- **product-advisory**—Product Security Incident Response Team (PSIRT) notices, End of Life (EOL) or End of Sales (EOS) notices, or field notices (FN) that may affect devices in your network

This example shows a request for analysis of a user-specified `show` command:

```plaintext
Switch# call-home request output-analysis "show diagnostic result module all" profile TG
```

**Sending the Output of a Command**

You can use the `call-home send` command to execute a CLI command and e-mail the command output to Cisco or to an e-mail address that you specify.

To execute a CLI command and e-mail the command output, perform this task:

```plaintext
Command Purpose
Switch# call-home send "command" [email email-addr] [service-number SR] Executes the specified CLI command and e-mails the output.
```

When sending the output of a command, note the following guidelines:

- The specified CLI command can be any run command, including commands for all modules. The command must be contained in quotes (" ").
- If an e-mail address is specified, the command output will be sent to that address. If no e-mail address is specified, the output will be sent to the Cisco TAC (attach@cisco.com). The e-mail will be sent in long text format with the service number, if specified, in the subject line.
- The service number is required only if no e-mail address is specified, or if a Cisco TAC e-mail address is specified.

This example shows how to send the output of a CLI command to a user-specified e-mail address:

```plaintext
Switch# call-home send "show diagnostic result module all" email support@example.com
```

**Configuring and Enabling Smart Call Home**

For application and configuration information of the Cisco Smart Call Home service, see the “FastStart” section of the **Smart Call Home User Guide** at this location:

http://www.cisco.com/go/smartcall/

The user guide includes configuration examples for sending Smart Call Home messages directly from your device or through a transport gateway (TG) aggregation point. You can use a TG aggregation point in cases requiring support for multiple devices or in cases where security requirements mandate that your devices may not be connected directly to the Internet.

Because the Smart Call Home service uses HTTPS as the transport method, you must also configure its CA as a trustpoint, as described in the **Smart Call Home User Guide**.
# Displaying Call Home Configuration Information

To display the configured Call Home information, perform these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# <code>show call-home</code></td>
<td>Displays the Call Home configuration in summary.</td>
</tr>
<tr>
<td>Switch# <code>show call-home detail</code></td>
<td>Displays the Call Home configuration in detail.</td>
</tr>
<tr>
<td>Switch# <code>show call-home alert-group</code></td>
<td>Displays the available alert groups and their status.</td>
</tr>
<tr>
<td>Switch# <code>show call-home mail-server status</code></td>
<td>Checks and displays the availability of the configured e-mail server(s).</td>
</tr>
<tr>
<td>Switch# `show call-home profile (all</td>
<td>name)`</td>
</tr>
<tr>
<td>Switch# <code>show call-home statistics</code></td>
<td>Displays the statistics of Call Home events.</td>
</tr>
</tbody>
</table>

Examples 65-1 to 65-7 show the results when using different options of the `show call-home` command.

### Example 65-1 Configured Call Home Information

Switch# `show call-home`
call home feature : disable
call home message’s from address: switch@example.com
call home message’s reply-to address: support@example.com

vrf for call-home messages: Not yet set up
contact person’s email address: technical@example.com

<tr>
<td>Message rate limit for messages per minute</td>
<td>20</td>
</tr>
</tbody>
</table>

Alert Group Trigger Events and Commands

Call Home trigger events are grouped into alert groups, with each alert group assigned CLI commands to execute when an event occurs. The CLI command output is included in the transmitted message. Table 65-3 lists the trigger events included in each alert group, including the severity level of each event and the executed CLI commands for the alert group.
### Table 65-3 Call Home Alert Groups, Events, and Actions

Table 65-5  Common Fields for All Long Text and XML Messages (continued)

<table>
<thead>
<tr>
<th>Data Item (Plain Text and XML)</th>
<th>Description (Plain Text and XML)</th>
<th>XML Tag (XML Only)</th>
</tr>
</thead>
</table>
| Server ID                     | If message is generated from fabric switch, UDI of switch. If message is proxied or originated by MA, the MA should overwrite this field with the MA UDI. Format is type@Sid@serial Where @: Separator character  
• Type: If WS-C4510R, product model number from backplane SEEPROM.  
• Sid: "C" identifying serial ID as a chassis serial number  
• Serial: The serial number as identified by the Sid field. Example: "WS-C4510R@C@CAT234765XR" | For long text message only |
| Message description           | Short text describing the error. | CallHome/MessageDescription |
| Device name                   | Node that experienced the event. it is the host name of the device. | CallHome/CustomerData/SystemInfo/Name |
| Contact name                  | Name of person to contact for issues associated with the node experiencing the event. | CallHome/CustomerData/SystemInfo/Contact |
| Contact e-mail                | E-mail address of person identified as contact for this unit. | CallHome/CustomerData/SystemInfo/ContactEmail |
| Contact phone number          | Phone number of the person identified as the contact for this unit. | CallHome/CustomerData/SystemInfo/ContactPhoneNumber |
| Street address                | Optional field containing street address for RMA part shipments associated with this unit. | CallHome/CustomerData/SystemInfo/StreetAddress |
| Model name                    | Model name of the unit (such as WS-C4503). it is the specific model as part of a product family name. | CallHome/Device/Cisco_Chassis/Model |
| Serial number                 | Chassis serial number of the unit. | CallHome/Device/Cisco_Chassis/SerialNumber |
| Chassis part number           | Top assembly number of the chassis as read from SEEPROM (such as WS-C4503 = 73-10558). | CallHome/Device/Cisco_Chassis/AdditionalInformation/AD@name="PartNumber" |

Fields specific to a particular alert group message are inserted here.

The following fields may be repeated if multiple CLI commands are executed for this alert group.

| Command output name | The exact command that was run (such as the **show running-config** command). | /aml/attachments/attachment/name |

### Syslog Alert Notification in Long-Text Format Example

TimeStamp : 2009-02-06 12:57 GMT+00:00  
Message Name : syslog  
Message Type : Call Home  
Message Group : reactive  
Severity Level : 2  
Source ID : Cat4500/4900  
Device ID : WS-C4510R@C@1234567  
Customer ID :  
Site ID :  
Server ID : WS-C4510R@C@1234567  
Event Description : *Feb 6 12:57:54.121: %CLEAR-5-COUNTERS: Clear counter on all interfaces by console  
System Name : Router  
Contact Email : abc@example.com  
Contact Phone :  
Street Address :  
Affected Chassis : WS-C4510R  
Affected Chassis Serial Number : 1234567  
Affected Chassis Part No : 12-3456-78  
Affected Chassis Hardware Version : 1.1  
Supervisor Software Version : 12.2(20090204:112419)  
Command Output Name : show logging  
Attachment Type : command output  
MIME Type : text/plain  
Command Output Text :  
Syslog logging: enabled (0 messages dropped, 1 messages rate-limited, 0 flushes, 0 overruns, xml disabled, filtering disabled)  

No Active Message Discriminator.

No Inactive Message Discriminator.
Console logging: level debugging, 95 messages logged, xml disabled, filtering disabled
Monitor logging: level debugging, 0 messages logged, xml disabled, filtering disabled
Buffer logging: level debugging, 95 messages logged, xml disabled, filtering disabled
Exception Logging: size (8192 bytes)
Count and timestamp logging messages: disabled
Persistent logging: disabled

No active filter modules.

Trap logging: level informational, 118 message lines logged

Configuring Cisco IOS IP SLA Operations

This chapter describes how to use Cisco IOS IP Service Level Agreements (SLAs) on Catalyst 4500 series switch. Cisco IP SLAs is a part of Cisco IOS software that allows Cisco customers to analyze IP service levels for IP applications and services by using active traffic monitoring—the generation of traffic in a continuous, reliable, and predictable manner—for measuring network performance. With Cisco IOS IP SLAs, service provider customers can measure and provide service level agreements, and enterprise customers can verify service levels, verify outsourced service level agreements, and understand network performance. Cisco IOS IP SLAs can perform network assessments, verify quality of service (QoS), ease the deployment of new services, and assist with network troubleshooting.

Switches running the IP base or LAN base feature set support only IP SLAs responder functionality and must be configured with another device that supports full IP SLAs functionality, for example, a Catalyst 4500 series switch running the IP services feature set.

The switch also supports the Built-in Traffic Simulator using Cisco IOS IP SLAs video operations to generate synthetic traffic for a variety of video applications, such as Telepresence, IPTV and IP video surveillance camera. You can use the simulator tool:

- for network assessment before deploying applications that have stringent network performance requirements.
- along with the Cisco Mediatrace for post-deployment troubleshooting for any network related performance issues.

The traffic simulator includes a sophisticated scheduler that allows the user to run several tests simultaneously or periodically and over extended time periods (Supported only on switches running the Enterprise Services feature set). For information on configuring this feature, see the Configuring Cisco IOS IP SLAs Video Operations document at:

For more information about IP SLAs, see the Cisco IOS IP SLAs Configuration Guide, Release 12.4T:

For command syntax information, see the command reference:

This chapter consists of these sections:

- Understanding Cisco IOS IP SLAs, page 66-2
- Configuring IP SLAs Operations, page 66-6
- Monitoring IP SLAs Operations, page 66-13
Understanding Cisco IOS IP SLAs

Cisco IOS IP SLAs sends data across the network to measure performance between multiple network locations or across multiple network paths. It simulates network data and IP services and collects network performance information in real time. Cisco IOS IP SLAs generates and analyzes traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLAs operations can be used for troubleshooting, for problem analysis, and for designing network topologies.

Depending on the specific Cisco IOS IP SLAs operation, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLAs packets have configurable IP and application layer options such as source and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs is Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs collects a unique subset of these performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)
- Path (per hop)
- Connectivity (directional)
- Server or website download time

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like CiscoWorks Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products. You can find more details about network management products that use Cisco IOS IP SLAs:

http://www.cisco.com/go/ipsla

Using IP SLAs can provide these benefits:

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
  - Measures the jitter, latency, or packet loss in the network.
  - Provides continuous, reliable, and predictable measurements.
- IP service network health assessment to verify that the existing QoS is sufficient for new IP services.
- Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).
- Troubleshooting of network operation by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.
- Multiprotocol Label Switching (MPLS) performance monitoring and network verification (if the switch supports MPLS)
This section includes this information about IP SLAs functionality:

- Using Cisco IOS IP SLAs to Measure Network Performance, page 66-3
- IP SLAs Responder and IP SLAs Control Protocol, page 66-4
- Response Time Computation for IP SLAs, page 66-4
- IP SLAs Operation Scheduling, page 66-5
- IP SLAs Operation Threshold Monitoring, page 66-5

**Using Cisco IOS IP SLAs to Measure Network Performance**

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices. Figure 66-1 shows how IP SLAs begins when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation, it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

![Figure 66-1 Cisco IOS IP SLAs Operation](image)

To implement IP SLAs network performance measurement, you need to perform these tasks:

1. Enable the IP SLAs responder, if required.
2. Configure the required IP SLAs operation type.
3. Configure any options available for the specified operation type.
4. Configure threshold conditions, if required.
5. Schedule the operation to run, then let the operation run for a period of time to gather statistics.
6. Display and interpret the results of the operation using the Cisco IOS CLI or a network management system (NMS) system with SNMP.
For more information about IP SLAs operations, see the operation-specific chapters in theCisco IOS IP SLAs Configuration Guide:

The switch does not support Voice over IP (VoIP) service levels using the gatekeeper registration delay operations measurements. Before configuring any IP SLAs application, you can use the show ip sla application privileged EXEC command to verify that the operation type is supported on your software image.

IP SLAs Responder and IP SLAs Control Protocol

The IP SLAs responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLAs request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLAs Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond. Only a Cisco IOS device can be a source for a destination IP SLAs Responder.

Note

The IP SLAs responder can be a Cisco IOS Layer 2, responder-configurable switch, such as a Catalyst 3750-X or 3560-X switch running the LAN base feature set or a Catalyst 2960 switch. The responder does not need to support full IP SLAs functionality.

Figure 66-1 shows where the Cisco IOS IP SLAs responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLAs operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLAs packet, or when the specified time expires. MD5 authentication for control messages is available for added security.

You do not need to enable the responder on the destination device for all IP SLAs operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP). You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

Response Time Computation for IP SLAs

Switches and routers can take tens of milliseconds to process incoming packets due to other high priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimizes these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLAs test packets use time stamping to minimize the processing delays.

When the IP SLAs responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

Figure 66-2 demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented
by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt level to allow for greater accuracy.

**Figure 66-2 Cisco IOS IP SLAs Responder Time Stamping**

An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.

### IP SLAs Operation Scheduling

When you configure an IP SLAs operation, you must schedule the operation to begin capturing statistics and collecting error information. You can schedule an operation to start immediately or to start at a certain month, day, and hour. You can use the pending option to set the operation to start at a later time. The pending option is an internal state of the operation that is visible through SNMP. The pending state is also used when an operation is a reaction (threshold) operation waiting to be triggered. You can schedule a single IP SLAs operation or a group of operations at one time.

You can schedule several IP SLAs operations by using a single command through the Cisco IOS CLI or the CISCO RTTMON-MIB. Scheduling the operations to run at evenly distributed times allows you to control the amount of IP SLAs monitoring traffic. This distribution of IP SLAs operations helps minimize the CPU utilization and thus improves network scalability.

For more details about the IP SLAs multioperations scheduling functionality, see the “IP SLAs—Multiple Operation Scheduling” chapter of the *Cisco IOS IP SLAs Configuration Guide*:

### IP SLAs Operation Threshold Monitoring

To support successful service level agreement monitoring, you must have mechanisms that notify you immediately of any possible violation. IP SLAs can send SNMP traps that are triggered by events such as these:

- Connection loss
- Timeout
- Round-trip time threshold
- Average jitter threshold
An IP SLAs threshold violation can also trigger another IP SLAs operation for further analysis. For example, the frequency could be increased or an ICMP path echo or ICMP path jitter operation could be initiated for troubleshooting.

Determining the type of threshold and the level to set can be complex, and depends on the type of IP service being used in the network.

For details on using thresholds with Cisco IOS IP SLAs operations, see the “IP SLAs—Proactive Threshold Monitoring” chapter of the Cisco IOS IP SLAs Configuration Guide at this URL:

### Configuring IP SLAs Operations

This section does not include configuration information for all available operations as the configuration information details are included in the Cisco IOS IP SLAs Configuration Guide. It does include several operations as examples, including configuring the responder, configuring UDP jitter operation, which requires a responder, and configuring ICMP echo operation, which does not require a responder.

For details about configuring other operations, see the Cisco IOS IP SLAs Configuration Guide:

This section includes this information:

- IP SLA Default Configuration, page 66-6
- IP SLA Configuration Guidelines, page 66-6
- Configuring the IP SLAs Responder, page 66-7
- Analyzing IP Service Levels by Using the UDP Jitter Operation, page 66-8
- Analyzing IP Service Levels by Using the ICMP Echo Operation, page 66-11

### IP SLA Default Configuration

By default, no IP SLAs operations are configured.

### IP SLA Configuration Guidelines

For information on the IP SLAs commands, see the Cisco IOS IP SLAs Command Reference, Release 12.4T command reference:

For detailed descriptions and configuration procedures, see the Cisco IOS IP SLAs Configuration Guide, Release 12.4T:

Note that not all of the IP SLAs commands or operations described in this guide are supported on the switch. The switch supports IP service level analysis by using UDP jitter, UDP echo, HTTP, TCP connect, ICMP echo, ICMP path echo, ICMP path jitter, FTP, DNS, and DHCP, as well as multiple operation scheduling and proactive threshold monitoring. It does not support VoIP service levels using the gatekeeper registration delay operations measurements.

Before configuring any IP SLAs application, you can use the show ip sla application privileged EXEC command to verify that the operation type is supported on your software image. This is an example of the output from the command:

Switch# show ip sla application
  IP SLAs
  Version: 2.2.0 Round Trip Time MIB, Infrastructure Engine-II
  Time of last change in whole IP SLAs: 22:17:39.117 UTC Fri Jun
  Estimated system max number of entries: 15801

  Estimated number of configurable operations: 15801
  Number of Entries configured : 0
  Number of active Entries      : 0
  Number of pending Entries    : 0
  Number of inactive Entries   : 0

  Supported Operation Types
  Type of Operation to Perform: 802.1agEcho
  Type of Operation to Perform: 802.1agJitter
  Type of Operation to Perform: dhcp
  Type of Operation to Perform: dns
  Type of Operation to Perform: echo
  Type of Operation to Perform: ftp
  Type of Operation to Perform: http
  Type of Operation to Perform: jitter
  Type of Operation to Perform: pathEcho
  Type of Operation to Perform: pathJitter
  Type of Operation to Perform: tcpConnect
  Type of Operation to Perform: udpEcho

  IP SLAs low memory water mark: 21741224

Configuring the IP SLAs Responder

The IP SLAs responder is available only on Cisco IOS software-based devices, including some Layer 2 switches that do not support full IP SLAs functionality, such as a Catalyst 3750-X or 3560-X switch running the LAN base feature set or a Catalyst 2960 switch.
To configure the IP SLAs responder on the target device (the operational target), perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2  | `ip sla responder {tcp-connect | udp-echo} ipaddress ip-address port port-number` Configures the switch as an IP SLAs responder. The keywords have these meanings:  
  • `tcp-connect`—Enable the responder for TCP connect operations.  
  • `udp-echo`—Enable the responder for User Datagram Protocol (UDP) echo or jitter operations.  
  • `ipaddress ip-address`—Enter the destination IP address.  
  • `port port-number`—Enter the destination port number.  
*Note* The IP address and port number must match those configured on the source device for the IP SLAs operation. |
| Step 3  | `end` Returns to privileged EXEC mode. |
| Step 4  | `show ip sla responder` Verifies the IP SLAs responder configuration on the device. |
| Step 5  | `copy running-config startup-config` (Optional) Saves your entries in the configuration file. |

To disable the IP SLAs responder, enter the `no ip sla responder` global configuration command. This example shows how to configure the device as a responder for the UDP jitter IP SLAs operation in the next procedure:

```
Switch(config)# ip sla responder udp-echo 172.29.139.134 5000
```

### Analyzing IP Service Levels by Using the UDP Jitter Operation

Jitter means interpacket delay variance. When multiple packets are sent consecutively 10 ms apart from source to destination, if the network is behaving correctly, the destination should receive them 10 ms apart. But if there are delays in the network (like queuing, arriving through alternate routes, and so on) the arrival delay between packets might be more than or less than 10 ms with a positive jitter value meaning that the packets arrived more than 10 ms apart. If the packets arrive 12 ms apart, positive jitter is 2 ms; if the packets arrive 8 ms apart, negative jitter is 2 ms. For delay-sensitive networks, positive jitter values are undesirable, and a jitter value of 0 is ideal.

In addition to monitoring jitter, the IP SLAs UDP jitter operation can be used as a multipurpose data gathering operation. The packets IP SLAs generates carry packet sending and receiving sequence information and sending and receiving time stamps from the source and the operational target. Based on these, UDP jitter operations measure this data:

- Per-direction jitter (source to destination and destination to source)
- Per-direction packet-loss
- Per-direction delay (one-way delay)
- Round-trip delay (average round-trip time)

Because the paths for the sending and receiving of data can be different (asymmetric), you can use the per-direction data to more readily identify where congestion or other problems are occurring in the network.
Chapter 66 Configuring Cisco IOS IP SLA Operations

Configuring IP SLAs Operations

The UDP jitter operation generates synthetic (simulated) UDP traffic and sends a number of UDP packets, each of a specified size, sent a specified number of milliseconds apart, from a source router to a target router, at a given frequency. By default, ten packet-frames, each with a payload size of 10 bytes are generated every 10 ms, and the operation is repeated every 60 seconds. You can configure each of these parameters to best simulate the IP service you want to provide.

**Note**
The IP SLA precision microsecond feature does not provide microsecond accuracy; it provides only microsecond granularity of the timestamps.

To obtain one-way delay (latency) measurements, time synchronization, such as that provided by NTP, is required between the source and the target device. Time synchronization is not required for the one-way jitter and packet loss measurements. If the time is not synchronized between the source and target devices, one-way jitter and packet loss data is returned, but values of 0 are returned for the one-way delay measurements provided by the UDP jitter operation.

**Note**
Before you configure a UDP jitter operation on the source device, you must enable the IP SLAs responder on the target device (the operational target).

To configure UDP jitter operation on the source device, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ip sla operation-number</td>
<td>Creates an IP SLAs operation, and enter IP SLAs configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> udp-jitter {destination-ip-address</td>
<td>destination-hostname} destination-port [source-ip {ip-address</td>
</tr>
</tbody>
</table>

- **destination-ip-address | destination-hostname**—Specify the destination IP address or hostname.
- **destination-port**—Specify the destination port number in the range from 1 to 65535.
- (Optional) **source-ip {ip-address | hostname}**—Specify the source IP address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination.
- (Optional) **source-port port-number**—Specify the source port number in the range from 1 to 65535. When a port number is not specified, IP SLAs chooses an available port.
- (Optional) **control**—Enable or disable sending of IP SLAs control messages to the IP SLAs responder. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs responder.
- (Optional) **num-packets number-of-packets**—Enter the number of packets to be generated. The range is 1 to 6000; the default is 10.
- (Optional) **interval inter-packet-interval**—Enter the interval between sending packets in milliseconds. The range is 1 to 6000; the default value is 20 ms.
## Configuring Cisco IOS IP SLA Operations

**Chapter 66      Configuring Cisco IOS IP SLA Operations**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>\texttt{frequency \textit{seconds}}</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>\texttt{exit}</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>\texttt{ip sla monitor schedule operation-number [life \textit{forever}</td>
</tr>
<tr>
<td></td>
<td>- \textit{operation-number}—Enter the RTR entry number.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) \textit{life}—Set the operation to run indefinitely (\textit{forever}) or for a specific number of \textit{seconds}. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour).</td>
</tr>
<tr>
<td></td>
<td>- (Optional) \textit{start-time}—Enter the time for the operation to begin collecting information:</td>
</tr>
<tr>
<td></td>
<td>- To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. If no month is entered, the default is the current month.</td>
</tr>
<tr>
<td></td>
<td>- Enter \textit{pending} to select no information collection until a start time is selected.</td>
</tr>
<tr>
<td></td>
<td>- Enter \textit{now} to start the operation immediately.</td>
</tr>
<tr>
<td></td>
<td>- Enter \textit{after hh:mm:ss} to show that the operation should start after the entered time has elapsed.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) \textit{ageout seconds}—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds, the default is 0 seconds (never ages out).</td>
</tr>
<tr>
<td></td>
<td>- (Optional) \textit{recurring}—Set the operation to automatically run every day.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>\texttt{end}</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>\texttt{show ip sla configuration} [operation-number]</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>\texttt{copy running-config startup-config}</td>
</tr>
</tbody>
</table>

To disable the IP SLAs operation, enter the \texttt{no ip sla operation-number} global configuration command. This example shows how to configure a UDP jitter IP SLAs operation:

\begin{verbatim}
Switch(config)# ip sla 10
Switch(config-ip-sla)# udp-jitter 172.29.139.134 5000
Switch(config-ip-sla-jitter)# frequency 30
Switch(config-ip-sla-jitter)# exit
Switch(config)# ip sla schedule 5 start-time now life forever
Switch(config)# end
Switch# show ip sla configuration 10
IP SLAs, Infrastructure Engine-II.

Analyzing IP Service Levels by Using the ICMP Echo Operation

The ICMP echo operation measures end-to-end response time between a Cisco device and any devices using IP. Response time is computed by measuring the time taken between sending an ICMP echo request message to the destination and receiving an ICMP echo reply. Many customers use IP SLAs ICMP-based operations, in-house ping testing, or ping-based dedicated probes for response time measurements between the source IP SLAs device and the destination IP device. The IP SLAs ICMP echo operation conforms to the same specifications as ICMP ping testing, and the two methods result in the same response times.

Note
This operation does not require the IP SLAs responder to be enabled.

To configure an ICMP echo operation on the source device, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# ip sla operation-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-ip-sla)# icmp-echo {destination-ip-address</td>
</tr>
<tr>
<td></td>
<td>[source-ip {ip-address</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-ip-sla)# frequency seconds</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-ip-sla)# exit</td>
</tr>
</tbody>
</table>
Chapter 66  Configuring Cisco IOS IP SLA Operations

Configuring IP SLAs Operations

To disable the IP SLAs operation, enter the `no ip sla operation-number` global configuration command.

This example shows how to configure an ICMP echo IP SLAs operation:

```
Switch(config)# ip sla 12
Switch(config-ip-sla)# icmp-echo 172.29.139.134
Switch(config-ip-sla-echo)# frequency 30
Switch(config-ip-sla-echo)# exit
Switch(config)# ip sla schedule 5 start-time now life forever
Switch(config)# end
Switch# show ip sla configuration 22
IP SLAs, Infrastructure Engine-II.

Configuring RMON

This chapter describes how to configure Remote Network Monitoring (RMON) on your Catalyst 4500 series switch. RMON is a standard monitoring specification that defines a set of statistics and functions that can be exchanged between RMON-compliant console systems and network probes. RMON provides you with comprehensive network-fault diagnosis, planning, and performance-tuning information.

This chapter consists of these sections:

- About RMON, page 67-1
- Configuring RMON, page 67-3
- Displaying RMON Status, page 67-6

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference and related publications at this location:

About RMON

RMON is an Internet Engineering Task Force (IETF) standard monitoring specification that allows various network agents and console systems to exchange network monitoring data. You can use the RMON feature with the Simple Network Management Protocol (SNMP) agent in the switch to monitor all the traffic flowing among switches on all connected LAN segments.
About RMON

The switch supports these RMON groups (defined in RFC 1757):

- Statistics (RMON group 1)—Collects Ethernet, Fast Ethernet, and Gigabit Ethernet statistics on an interface.
- History (RMON group 2)—Collects a history group of statistics on Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces for a specified polling interval.

Figure 67-1  Remote Monitoring Example

Network management station with generic RMON console application

RMON alarms and events configured. SNMP configured.

RMON history and statistic collection enabled.

Catalyst 4500 switch

Catalyst 4500 switch

Workstations Workstations

Network management station with generic RMON console application

Catalyst 3550 switch

RMON alarms and events configured. SNMP configured.

RMON history and statistic collection enabled.

BladeCenter BladeCenter
• Alarm (RMON group 3)—Monitors a specific MIB object for a specified interval, triggers an alarm at a specified value (rising threshold), and resets the alarm at another value (falling threshold). Alarms can be used with events; the alarm triggers an event, which can generate a log entry or an SNMP trap.
• Event (RMON group 9)—Determines the action to take when an event is triggered by an alarm. The action can be to generate a log entry or an SNMP trap.

Because switches supported by Cisco IOS Release 12.2(31)SG use hardware counters for RMON data processing, the monitoring is more efficient, and little processing power is required.

Configuring RMON

This section describes how to configure RMON on your switch. It contains this configuration information:
• Default RMON Configuration, page 67-3
• Configuring RMON Alarms and Events, page 67-3
• Configuring RMON Collection on an Interface, page 67-5

Default RMON Configuration

RMON is disabled by default; no alarms or events are configured.
Only RMON 1 is supported on the switch.

Configuring RMON Alarms and Events

You can configure your switch for RMON by using the command-line interface (CLI) or an SNMP-compatible network management station. We recommend that you use a generic RMON console application on the network management station (NMS) to take advantage of RMON’s network management capabilities. You must also configure SNMP on the switch to access RMON MIB objects. For more information, see Chapter 60, “Configuring SNMP.”
To enable RMON alarms and events, perform this task:

### Command

#### Step 1

Switch# configure terminal

Enters global configuration mode.

#### Step 2

Switch(config)# rmon alarm number variable interval[
    absolute | delta] rising-threshold value [event-number]
    falling-threshold value [event-number]
    [owner string]

Sets an alarm on a MIB object.

- For `number`, specify the alarm number. The range is 1 to 65535.
- For `variable`, specify the MIB object to monitor.
- For `interval`, specify the time in seconds the alarm monitors the MIB variable. The range is 1 to 4294967295 seconds.
- Specify the `absolute` keyword to test each MIB variable directly; specify the `delta` keyword to test the change between samples of a MIB variable.
- For `value`, specify a number at which the alarm is triggered and one for when the alarm is reset. The range for the rising threshold and falling threshold `values` is -2147483648 to 2147483647.
- (Optional) For `event-number`, specify the event number to trigger when the rising or falling threshold exceeds its limit.
- (Optional) For `owner string`, specify the owner of the alarm.

#### Step 3

Switch(config)# rmon event number [description string]
    [log] [owner string] [trap community]

Adds an event in the RMON event table that is associated with an RMON event number.

- For `number`, assign an event number. The range is 1 to 65535.
- (Optional) For `description string`, specify a description of the event.
- (Optional) Use the `log` keyword to generate an RMON log entry when the event is triggered.
- (Optional) For `owner string`, specify the owner of this event.
- (Optional) For `community`, enter the SNMP community string used for this trap.

#### Step 4

Switch(config)# end

Returns to privileged EXEC mode.

#### Step 5

Switch# show running-config

Verifies your entries.

#### Step 6

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
To disable an alarm, use the `no rmon alarm number` global configuration command on each alarm you configured. You cannot disable at once all the alarms that you configured. To disable an event, use the `no rmon event number` global configuration command. To learn more about alarms and events and how they interact with each other, see RFC 1757.

You can set an alarm on any MIB object. The following example configures RMON alarm number 10 by using the `rmon alarm` command. The alarm monitors the MIB variable `ifEntry.20.1` once every 20 seconds until the alarm is disabled and checks the change in the variable's rise or fall. If the `ifEntry.20.1` value shows a MIB counter increase of 15 or more, such as from 100000 to 100015, the alarm is triggered. The alarm in turn triggers event number 1, which is configured with the `rmon event` command. Possible events can include a log entry or an SNMP trap. If the `ifEntry.20.1` value changes by 0, the alarm is reset and can be triggered again.

```
Switch(config)# rmon alarm 10 ifEntry.20.1 20 delta rising-threshold 15 1 falling-threshold 0 owner jjohnson
```

The following example creates RMON event number 1 by using the `rmon event` command. The event is defined as High `ifOutErrors` and generates a log entry when the event is triggered by the alarm. The user jJones owns the row that is created in the event table by this command. This example also generates an SNMP trap when the event is triggered.

```
Switch(config)# rmon event 1 log trap eventtrap description "High ifOutErrors" owner jjones
```

### Configuring RMON Collection on an Interface

You must first configure RMON alarms and events to display collection information.

To collect group history statistics on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the interface on which to collect history, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables history collection for the specified number of buckets and time period.</td>
</tr>
<tr>
<td></td>
<td>- For <code>index</code>, identify the RMON group of statistics. The range is 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <code>buckets bucket-number</code>, specify the maximum number of buckets desired for the RMON collection history group of statistics. The range is 1 to 65535. The default is 50 buckets.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <code>interval seconds</code>, specify the number of seconds in each polling cycle.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <code>owner ownername</code>, enter the name of the owner of the RMON group of statistics.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>

To disable history collection, use the `no rmon collection history index` interface configuration command.
Displaying RMON Status

To collect group Ethernet statistics on an interface, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# rmon collection stats index [owner ownername]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config-if)# end</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch# show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>Switch# show rmon statistics</td>
</tr>
<tr>
<td>Step 7</td>
<td>Switch# copy running-config startup-config</td>
</tr>
</tbody>
</table>

Displaying RMON Status

To display the RMON status, use one or more of the following privileged EXEC commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show rmon</td>
<td>Displays general RMON statistics.</td>
</tr>
<tr>
<td>show rmon alarms</td>
<td>Displays the RMON alarm table.</td>
</tr>
<tr>
<td>show rmon events</td>
<td>Displays the RMON event table.</td>
</tr>
<tr>
<td>show rmon history</td>
<td>Displays the RMON history table.</td>
</tr>
<tr>
<td>show rmon statistics</td>
<td>Displays the RMON statistics table.</td>
</tr>
</tbody>
</table>
Performing Diagnostics

You can use diagnostics to test and verify the functionality of the hardware components of your system (chassis, supervisor engines, modules, and ASICs) while your Catalyst 4500 series switch is connected to a live network. Diagnostics consists of packet-switching tests that test hardware components and verify the data path and control signals.

Online diagnostics are categorized as bootup, on-demand, schedule, or health-monitoring diagnostics. Bootup diagnostics run during bootup; on-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or specified times when the switch is connected to a live network; and health-monitoring runs in the background.

This chapter consists of these sections:

- Configuring Online Diagnostics, page 68-1
- Performing Diagnostics, page 68-3
- Power-On Self-Test Diagnostics, page 68-10

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Cisco IOS Command Reference and related publications at this location:

Configuring Online Diagnostics

These sections describe how to configure online diagnostics:

- Configuring On-Demand Online Diagnostics, page 68-2
- Scheduling Online Diagnostics, page 68-2
Configuring On-Demand Online Diagnostics

You can run on-demand online diagnostic tests from the CLI. You can set the execution action to either stop or continue the test when a failure is detected, or to stop the test after a specific number of failures occur with the failure count setting. The iteration setting allows you to configure a test to run multiple times.

To schedule online diagnostics, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# diagnostic ondemand iteration iteration_count</td>
<td>Configures on-demand diagnostic tests to run, how many times to run (iterations), and what action to take when errors are found.</td>
</tr>
<tr>
<td>Switch# diagnostic ondemand action-on-error continue 2</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to set the on-demand testing iteration count:

Switch# diagnostic ondemand iterations 3
Switch#

This example shows how to set the execution action when an error is detected:

Switch# diagnostic ondemand action-on-error continue 2
Switch#

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis. You can schedule tests to run only once or to repeat at an interval. Use the no form of this command to remove the scheduling.

To configure online diagnostics, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# diagnostic schedule module number test test_id</td>
<td>Schedules on-demand diagnostic tests on the specified module for a specific date and time, how many times to run (iterations), and what action to take when errors are found.</td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test test_id_range</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test all</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test port num</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test port num_range</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test port all</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test port mm dd yyyy hh:mm</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test port daily hh:mm</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# diagnostic schedule module number test port weekly day_of_week hh:mm</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to schedule diagnostic testing on a specific date and time for a specific port on module 6:

Switch(config)# diagnostic schedule module 6 test 2 port 3 on may 23 2009 23:32
Switch(config)#

This example shows how to schedule diagnostic testing to occur daily:

Switch(config)# diagnostic schedule module 6 test 2 port 3 daily 12:34
Switch(config)#

This example shows how to schedule diagnostic testing to occur weekly:

Switch(config)# diagnostic schedule module 6 test 2 port 3 weekly friday 09:23
Switch(config)#
Performing Diagnostics

After you configure online diagnostics, you can start or stop diagnostic tests or display the test results. You can also see which tests are configured and what diagnostic tests have already run.

These sections describe how to run online diagnostic tests after they have been configured:

- Starting and Stopping Online Diagnostic Tests, page 68-3
- Displaying Online Diagnostic Tests and Test Results, page 68-4
- Displaying Data Path Online Diagnostics Test Results, page 68-7
- Line Card Online Diagnostics, page 68-8
- Troubleshooting with Online Diagnostics, page 68-8

Note

Before you enable any online diagnostics tests, enable the logging console or monitor to observe all warning messages.

Note

When running disruptive tests, only run them when you are connected using the console. When disruptive tests complete, a warning message on the console will recommend that you reload the system to return to normal operation. Strictly follow this warning.

Starting and Stopping Online Diagnostic Tests

After you configure diagnostic tests, you can use the start and stop keywords to begin or end a test.

To start or stop an online diagnostic command, perform one of these tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# diagnostic start module number test {test_id</td>
<td>test_id_range</td>
</tr>
<tr>
<td>Switch# diagnostic stop module number</td>
<td>Stops a diagnostic test on the specified module.</td>
</tr>
</tbody>
</table>

This example shows how to start a diagnostic test on module 6:

```
Switch# diagnostic start module 6 test 2
Diagnostic(module 6): Running test(s) 2 Run interface level cable diags
Diagnostic(module 6): Running test(s) 2 may disrupt normal system operation
Do you want to continue? [no]: yes
Switch#
*May 14 21:11:46.631: %DIAG-6-TEST_RUNNING: module 6: Running online-diag-tdr(ID=2) ...
*May 14 21:11:46.631: %DIAG-6-TEST_OK: module 6: online-diag-tdr(ID=2) has completed successfully
Switch#
```
This example shows how to stop a diagnostic test on module 6:

```
Switch# diagnostic stop module 6
Diagnostic[module 6]: Diagnostic is not active.
```

The message indicates no active diagnostic on module 6

### Displaying Online Diagnostic Tests and Test Results

You can display the configured online diagnostic tests and check the results of the tests with the `show diagnostic` command.

To display the configured diagnostic tests, perform this task:

```
Command
Switch# show diagnostic {bootup | cns | content [module num] | description [module num] | events [module num] [event-type event-type] | ondemand | result [module num] [detail] | schedule | simulation | status}
```

This example shows how to display the online diagnostics configured on module 1:

```
Switch# show diagnostic content module 6
module 6:
Diagnostics test suite attributes:
M/C/* - Minimal bootup level test / Complete bootup level test / NA
B/* - Basic ondemand test / NA
P/V/* - Per port test / Per device test / NA
D/N/* - Disruptive test / Non-disruptive test / NA
S/* - Only applicable to standby unit / NA
X/* - Not a health monitoring test / NA
F/* - Fixed monitoring interval test / NA
E/* - Always enabled monitoring test / NA
A/I - Monitoring is active / Monitoring is inactive
Cable-tdr/* - Interface cable diags / NA
O/* - Ongoing test, always active / NA

ID   Test Name                          Attributes      Test Interval     Thre-
==== ================================== ============    day hh:mm:ss.ms shold
1) linecard-online-diag ------------> M**D****I**     not configured  n/a
2) online-diag-tdr -----------------> **PD****Icable- not configured  n/a
3) stub-rx-errors ------------------> ***N****A**     000 00:01:00.00 n/a
4) supervisor-rx-errors ------------> ***N****A**     000 00:01:00.00 n/a
```

This example shows how to display the test description for a given test on a module:

```
Switch# show diagnostic description module 6 test 1
linecard-online-diag:
Linecard online-diagnostics run after the system boots up but
before it starts passing traffic. Each linecard port is placed in
loopback, and a few packets are injected into the switching fabric
from the cpu to the port. If the packets are successfully
```
received by the cpu, the port passes the test. Sometimes one port or a group of ports sharing common components fail. The linecard is then placed in partial faulty mode. If no ports can loop back traffic, the board is placed in faulty state.

Switch#

This example shows how to display the online diagnostic results for module 6:

Switch# `show diagnostic result module 6`

Current bootup diagnostic level: minimal

module 6: SerialNo : JAB0815059L

Overall Diagnostic Result for module 6 : PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

Displaying Data Path Online Diagnostics Test Results

A data path online diagnostic test verifies that the data paths between the supervisor engine and the linecards (defined as a number of stub ASICs) are functioning correctly. There is a direct connection between each stub ASIC on a line card and the supervisor engine. Error counters on the supervisor engine (supervisor-rx-trends) and each stub ASIC on a line card (stub-rx-trends) are monitored periodically. Error counters that continually increase indicate malfunctioning hardware in the data path and cause the test to fail. Data path online diagnostic tests are non-destructive and the error counters are polled every minute.

Errors on the stub end of the data path are reported as errors in traffic egressing to the line card from the supervisor engine switching ASICs. Some initial errors might be revealed as links are brought up, but they should not increase. An increasing count indicates a poor connection between the supervisor engine and a line card. If only one line card is affected, the cause is likely an incorrectly seated or faulty line card. The error counts include idle frames, so detection can occur when traffic is not flowing.

Errors on the supervisor end of the data path are reported as errors in traffic ingressing to the supervisor engine from linecards. The error counts should not increase and the detection includes idle frames. If the error counts increase for more than one line card, the likely cause is a faulty supervisor engine or chassis. If only one stub or line card is affected, the likely cause is a faulty line card or a defective mux buffer (for a redundant chassis).

In addition to running periodically, data path online diagnostics can be also be invoked on-demand in the following way:

```
Switch# diagnostic start module 1 test stub-rx-errors
*Apr 1 09:25:14.211: %DIAG-6-TEST_RUNNING: module 1: Running stub-rx-errors{ID=3} ...
*Apr 1 09:25:14.211: %DIAG-6-TEST_OK: module 1: stub-rx-errors{ID=3} has completed
```

```
Switch# diagnostic start module 1 test supervisor-rx-errors
*Apr 1 09:25:26.503: %DIAG-6-TEST_RUNNING: module 1: Running supervisor-rx-errors{ID=4} ...
*Apr 1 09:25:26.503: %DIAG-6-TEST_OK: module 1: supervisor-rx-errors{ID=4} has completed successfully
```

Detailed information about the test results can be viewed as follows:

```
Switch# show diagnostic result module 1 test stub-rx-errors detail
```

Current bootup diagnostic level: minimal

   Last test failure time ------ n/a
Line Card Online Diagnostics

A line card online diagnostic test verifies that all ports on a line card are working correctly. The test can detect whether the path to the front panel port on the line card is broken. The test cannot indicate where along the path that the problem occurred.

This test is run only for line cards that have stub chips.

Line card online diagnostics runs only once, when the line cards boot. This situation can happen when you insert a line card or power up a chassis.

Line card online diagnostics are performed by sending a packet from the CPU to every port on the line card. Because this packet is marked loopback, the CPU expects to see this packet return from the port. The packet first traverses the ASICs on the supervisor engine card, then travels by using the chassis backplane and the stub chip on the line cards to the PHYs. The PHY sends it back down the same path.

The packet does not reach or exit the front panel port.

Troubleshooting with Online Diagnostics

A faulty line card occurs if any of the following conditions occurs.

- All ports fail
- All ports on a stub chip fail
- Only one port fails
For all of these situations, the output of the **show module** command would display the status of the line card as faulty:

Switch# `show mod`  
Chassis Type : WS-C4507R  
Power consumed by backplane : 40 Watts

To troubleshoot a faulty line card, follow these steps:

**Step 1** Enter the command **show diagnostic result module 3**.

If a faulty line card was inserted in the chassis, it will fail the diagnostics and the output will be similar to the following:

Current bootup diagnostic level: minimal

module 3: SerialNo : JAB093305RP

Overall Diagnostic Result for module 3 : MAJOR ERROR
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag -----------------> F

Switch#

Issue an RMA for the line card, contact TAC, and skip steps 2 and 3.

The output may display the following:

module 3:

Overall diagnostic result: PASS

Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag -----------------> .
The message indicates that the line card passed online diagnostics either when it was inserted into the chassis the last time or when the switch was powered up (as reported by the “.”). You need to obtain additional information to determine the cause.

**Step 2**  Insert a different supervisor engine card and reinsert the line card.

If the line card passes the test, it suggests that the supervisor engine card is defective. Issue an RMA for the supervisor engine, contact TAC, and skip step 3.

Because online diagnostics are not run on the supervisor engine card, you cannot use the `#show diagnostic module 1` command to test whether the supervisor engine card is faulty.

**Step 3**  Reinsert the line card in a different chassis.

If the line card passes the test, the problem is associated with the chassis.

Issue an RMA for the chassis and contact TAC.

---

**Power-On Self-Test Diagnostics**

The following topics are discussed:

- Overview of Power-On Self-Test Diagnostics, page 68-10
- POST Result Example, page 68-11
- Power-On Self-Test Results, page 68-13
- Troubleshooting the Test Failures, page 68-20

**Overview of Power-On Self-Test Diagnostics**

All Catalyst 4500 series switches have power-on self-test (POST) diagnostics that run whenever a supervisor engine boots. POST tests the basic hardware functionality for the supervisor switching engine, its associated packet memory and other on-board hardware components. The results of the POST impacts how the switch boots, because the health of the supervisor engine is critical to the operation of the switch. The switch might boot in a marginal or faulty state.

POST is currently supported on the following supervisor engines:

- WS-X4014
- WS-X4515
- WS-X4516
- WS-X4516-10GE
- WS-X4013+
- WS-X4013+TS
- WS-X4013+10GE
- WS-C4948G
The POST results are indicated with a period (.) or a Pass for Pass, an F for a Fail and a U for Untested.

POST Result Example

For all the supervisor engines, POST performs CPU, traffic, system, system memory, and feature tests.

For CPU tests, POST verifies appropriate activity of the supervisor engine SEEPROM, temperature sensor, and Ethernet end-of-band channel (E0BC), when used.

The following example illustrates the output of a CPU subsystem test:

```
[..]  
Cpu Subsystem Tests ...  
[..]
```

For traffic tests, the POST sends packets from the CPU to the switch. These packets loop several times within the switch core and validate the switching, the Layer 2 and the Layer 3 functionality. To isolate the hardware failures accurately, the loop back is done both inside and outside the switch ports.

The following example shows the output for a Supervisor Engine 6-E and Supervisor Engine 6L-E:

```

Note

To ensure that the maximum number of ports are tested, ensure that both supervisor engines are present on power-up.
Troubleshooting the Test Failures

A failure of any of the POST tests reflects a problem with the hardware on the supervisor engine. Cisco IOS boots the supervisor engine with limited functionality, allowing you to evaluate and display the diagnostic test results. To determine the failure cause, do one of the following:

- Evaluate whether the hardware failure is persistent by power cycling the supervisor engine to rerun the POST tests.
- Remove and reinsert the supervisor engine into the chassis to ensure that the seating is correct.

   Contact Cisco Systems customer support team for more information.

---

Note

On a redundant chassis, concurrent POST is supported on supervisor engines that are already inserted. However, if a second supervisor engine is inserted while the first one is loading, you might boot the first supervisor engine in a faulty Cisco IOS state (POST will abort, and some of the POST’s tests will be bypassed). This situation only happens during concurrent bootup of the supervisor engines. You should not insert any additional supervisor engines in the empty supervisor engine slot while an already seated supervisor engine is running POST. The POST sequence is completed when the “Exiting to ios...” message is displayed.
Configuring WCCP Version 2 Services

This chapter describes how to configure the Catalyst 4500 series switches to redirect traffic to content engines (web caches) using the Web Cache Communication Protocol (WCCP) version 2.

Throughout this chapter, WCCP refers to WCCP version 2. Version 1 is not supported.

This chapter consists of these sections:
- About WCCP, page 69-1
- Restrictions for WCCP, page 69-5
- Configuring WCCP, page 69-6
- Verifying and Monitoring WCCP Configuration Settings, page 69-9
- WCCP Configuration Examples, page 69-10

The tasks in this chapter assume that you have already configured content engines on your network. For specific information on hardware and network planning associated with Cisco Content Engines and WCCP, see the Product Literature and Documentation links available on the Cisco.com at these locations:

and

About WCCP

- Overview, page 69-2
- Hardware Acceleration, page 69-2
- Understanding WCCP Configuration, page 69-3
- WCCP Features, page 69-4
Overview

WCCP is a Cisco-developed content-routing technology that enables you to integrate content engines into your network infrastructure.

The Cisco IOS WCCP feature allows use of Cisco Content Engines (or other content engines running WCCP) to localize web traffic patterns in the network, enabling content requests to be fulfilled locally. Traffic localization reduces transmission costs and download time.

WCCP enables Cisco IOS routing platforms to transparently redirect content requests. The main benefit of transparent redirection of HTTP/non-http requests is that users need not configure their browsers to use a web proxy. Instead, they can use the target URL to request content, and have their requests automatically redirected to a content engine. The word “transparent” in this case means that the end user does not know that a requested file (such as a web page) came from the content engine instead of from the originally specified server.

When a content engine receives a request, it attempts to service it from its own local content. If the requested information is not present, the content engine issues its own request to the originally targeted server to get the required information. When the content engine retrieves the requested information, it forwards it to the requesting client and caches it to fulfill future requests, thus maximizing download performance and substantially reducing transmission costs.

WCCP enables a series of content engines, called a content engine cluster, to provide content to a router or multiple routers. Network administrators can easily scale their content engines to handle heavy traffic loads using these clustering capabilities. Cisco clustering technology enables each content member to work in parallel, resulting in linear scalability. Clustering content engines greatly improves the scalability, redundancy, and availability of your caching solution. You can cluster up to 32 content engines to scale to your desired capacity.

Hardware Acceleration

Hardware Acceleration is enabled by default on Catalyst 4500 series switches. Layer 2 rewrite forwarding and Layer 2 return method are supported in hardware.

When the switch exhausts hardware (TCAM) or software resources, traffic is redirected in software. GRE return method is supported only in software.

You must configure a directly connected Content Engine to negotiate use of the WCCP Layer 2 Redirection feature (with load balancing) based on the mask assignment table. The `show ip wccp web-cache detail` command displays the redirection method in use for each cache.

**Note**

You can configure the Cisco Content Engine Release 2.2 or later to use the WCCP Layer 2 Redirection feature with the mask assignment table.
Understanding WCCP Configuration

Multiple routers can use WCCP to service a cache cluster. Figure 69-1 illustrates a sample configuration using multiple routers.

The subset of content engines within a cluster and routers connected to the cluster that are running the same service is known as a *service group*. Available services include TCP and User Datagram Protocol (UDP) redirection.

WCCP requires that each content engine be aware of all the routers in the service group. To specify the addresses of all the routers in a service group, you must choose one of the following methods:

- **Unicast**—A list of IP addresses for each of the routers in the group is configured on each content engine. In this case the address of each router in the group must be explicitly specified for each content engine during configuration.

- **Multicast**—A single multicast address is configured on each content engine. In the multicast address method, the content engine sends a single-address notification that provides coverage for all routers in the service group. For example, a content engine could indicate that packets should be sent to a multicast address of 224.0.0.100, which would send a multicast packet to all routers in the service group configured for group listening using WCCP (see the `ip wccp group-listen` interface configuration command for details).

The multicast option is easier to configure because you need only specify a single IP address on each content engine. This option also enables you to add and remove routers from a service group dynamically without needing to reconfigure the content engines with a different list of addresses each time.
The following sequence of events describe how WCCP works:

1. Each WCCP client (content engine) is configured with a list of WCCP servers (routers).
2. Each content engine announces its presence with a "Here I Am" message and a list of routers with which it has established communication. The routers reply with their view (list) of content engines in the service group through "I See You" messages.
3. Once the view is consistent across all content engines in the cluster, one content engine is designated as the lead and sets the policy that the switches need to deploy in redirecting traffic.

**WCCP Features**

These sections describe WCCP features:

- HTTP and Non-HTTP Services Support
- Multiple Routers Support
- MD5 Security
- Web Content Packet Return

**HTTP and Non-HTTP Services Support**

WCCP enables redirection of HTTP traffic (TCP port 80 traffic), as well as non-HTTP traffic (TCP and UDP). WCCP supports the redirection of packets intended for other ports, including those used for proxy-web cache handling, File Transfer Protocol (FTP) caching, FTP proxy handling, web caching for ports other than 80, and real audio, video, and telephony applications.

To accommodate the various types of services available, WCCP introduces the concept of multiple service groups. Service information is specified in the WCCP configuration commands using dynamic services identification numbers (such as “98”) or a predefined service keywords (such as “web-cache”). This information is used to validate that service group members are all using or providing the same service.

---

**Note**

The Catalyst 4500 series switch supports up to eight service groups.

For information on supported WCCP version 2 services with ACNS version 5.2 software, refer to the *Release Notes for Cisco ACNS Software, Release 5.2.3*.

The content engines in service group specify traffic to be redirected by protocol (TCP or UDP) and port (source or destination). Each service group has a priority level assigned to it. Packets are matched against service groups in priority order and redirected by the highest priority service group that matches traffic characteristics.

**Multiple Routers Support**

WCCP enables you to attach multiple routers to a cluster of cache engines. The use of multiple routers in a service group enables redundancy, interface aggregation, and distribution of the redirection load.
**MD5 Security**

WCCP provides optional authentication that enables you to control which routers and content engines become part of the service group using passwords and the HMAC MD5 standard. Shared-secret MD5 one-time authentication (set using the `ip wccp [password [0-7] password]` global configuration command) enables messages to be protected against interception, inspection, and replay.

**Web Content Packet Return**

If a content engine is unable to provide a requested object it has cached due to error or overload, the content engine returns the request to the router for onward transmission to the originally specified destination server. WCCP verifies which requests have been returned from the content engine unserviced. Using this information, the router can then forward the request to the originally targeted server (rather than attempting to resend the request to the content cluster). This provides error handling transparency to clients.

Typical reasons why a content engine would reject packets and initiate the packet return feature include the following:

- Instances when the content engine is overloaded and has no room to service the packets.
- Instances when the content engine is filtering for certain conditions that make caching packets counterproductive (such as, when IP authentication has been turned on).

**Restrictions for WCCP**

The following limitations apply to WCCP:

- WCCP works only with IPv4 networks.
- For routers servicing a multicast cluster, the time to live (TTL) value must be set at 15 or fewer.
- Time To Live (TTL) value of Layer 3 switches servicing a cluster must be 15 second or less.
- Because the WCCP protocol messages may now be IP multicast, members may receive messages that are not relevant or (are) duplicates. Appropriate filtering need to be performed.
- A service group can comprise up to 32 content engines and 32 routers.
- All content engines in a cluster must be configured to communicate with all routers servicing the cluster.
- Up to 8 active service groups are supported on a switch. Up to 8 service groups can be configured simultaneously on the same client interface.
- The Layer 2 rewrite forwarding method is supported in hardware; the GRE encapsulation forwarding method is not supported.
- The GRE return method is supported in software. The Layer 2 return method is supported in hardware and is recommended.
- Direct Layer 3 connectivity to content engines is required; Layer 3 connectivity of one or more hops away is not supported.
- Input / output redirection configuration is not supported on content engine facing interfaces.
- WCCP version 2 standard allows for support of up to 256 distinct masks. However, a Catalyst 4500 series switch only supports mask assignment table with a single mask.
- Valid multicast addresses are from 224.0.0.0 to 239.255.255.255.
Configuring WCCP

The following configuration tasks assume that you have already installed and configured the content engines you want to include in your network. You must configure the content engines in the cluster before configuring WCCP functionality on your routers. Refer to the Cisco Content Engine User Guide for content engine configuration and setup tasks.

IP must be configured on the router interface connected to the cache engines. Examples of router configuration tasks follow this section. For complete descriptions of the command syntax, refer to the Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS Release 12.3.

These sections describe how to configure WCCP:

- Configuring a Service Group Using WCCP, page 69-6 (Required)
- Using Access Lists for a WCCP Service Group, page 69-8 (Optional)
- Setting a Password for a Router and Cache Engines, page 69-9 (Optional)

Configuring a Service Group Using WCCP

WCCP uses service groups based on logical redirection services. The standard service is the content engine, which intercepts TCP port 80 (HTTP) traffic and redirects that traffic to the content engines. This service is referred to as a well-known service, because the characteristics of the web cache service are known by both the router and content engines. A description of a well-known service is not required beyond a service identification (the command line interface (CLI) provides a web-cache keyword in the command syntax).

For information on supported WCCP services with ACNS version 5.2 software, refer to the Release Notes for Cisco ACNS Software, Release 5.2.3.

In addition to the web cache service, there can be up to seven dynamic services running concurrently on the switch.

More than one service can run on a switch at the same time, and routers and content engines can be part of multiple service groups at the same time.

The dynamic services are defined by the content engines; the content engine instructs the router which protocol or ports to intercept, and how to distribute the traffic. The router itself does not have information on the characteristics of the dynamic service group’s traffic, because this information is provided by the first content engine to join the group. In a dynamic service, up to eight ports can be specified within a single protocol TCP or UDP).

Cisco Content Engines, for example, use dynamic service 99 to specify a reverse-proxy service. However, other content engines may use this service number for some other service. The following configuration information deals with enabling general services on Cisco routers. Refer to the content engine documentation for information on configuring services on content engines.
To enable a service on a Catalyst 4500 series switch, perform this task:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Switch(config)# ip wccp {web-cache</td>
<td>service-number} [group-address groupaddress] [redirect-list access-list] [group-list access-list] [password password]</td>
</tr>
<tr>
<td>2</td>
<td>Switch(config-if)# [no] ip wccp check services all</td>
<td>If a service matches the packet and the service has a redirect access-list configured, then the IP packet will be checked against the access-list. If the packet is rejected by the access-list, the packet will not be passed down to lower priority services unless the ip wccp check services all command is configured. When the ip wccp check services all command is configured, WCCP will continue to attempt to match the packet against any remaining lower priority services configured on the interface.</td>
</tr>
<tr>
<td>3</td>
<td>Switch(config)# interface type number</td>
<td>Specifies a client interface to configure and enters interface configuration mode.</td>
</tr>
<tr>
<td>4</td>
<td>Switch(config-if)# ip wccp (web-cache</td>
<td>service-number) redirect {in</td>
</tr>
<tr>
<td>5</td>
<td>Switch(config)# interface type number</td>
<td>Specifies the interface to be configured for egress redirection exclusion.</td>
</tr>
<tr>
<td>6</td>
<td>Switch(config-if)# ip wccp redirect exclude in</td>
<td>Specifies that packets received on this interface be excluded from any egress redirection. This MUST be configured on the content engine interface if Layer 2 return method is used by the content engine and egress redirection is configured on the server interface.</td>
</tr>
<tr>
<td>7</td>
<td>Switch(config)# interface type number</td>
<td>Specifies the content engine interface to be configured for multicast reception. (Only necessary to run the multicast feature).</td>
</tr>
<tr>
<td>8</td>
<td>Switch(config-if)# ip wccp (web-cache</td>
<td>service-number) group-listen</td>
</tr>
</tbody>
</table>
### Specifying a Web Cache Service

To configure a web-cache service and ingress redirection, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# <code>ip wccp web-cache</code> Enables the web cache service on the switch.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# <code>interface type number</code> Targets a client interface number for which the web cache service runs, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# <code>ip wccp web-cache redirect in</code> Enables the check on packets to determine if they qualify to be redirected to a content engine, using the client interface specified in Step 2.</td>
</tr>
</tbody>
</table>

To configure a web-cache service and egress redirection, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# <code>ip wccp web-cache</code> Enables the web cache service on the switch.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# <code>interface type number</code> Targets a server interface number for the web cache service, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Switch(config-if)# <code>ip wccp web-cache redirect out</code> Enables the check on packets to determine if they qualify to be redirected to a content engine, using the client interface specified in Step 2.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Switch(config)# <code>interface type number</code> Specifies the content engine interface number, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Switch(config-if)# <code>ip wccp web-cache redirect in</code> Specifies that packets received on this interface be excluded from any egress redirection. This prevents packets returned by content engine through L2-return method or packets generated by the content engine from being redirected back to the content engine.</td>
</tr>
</tbody>
</table>

### Using Access Lists for a WCCP Service Group

A Catalyst 4500 series switch can use an access list to restrict the content engines that can join a service group.

To restrict a content engine, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Switch(config)# `access-list access-list permit ip host host-address {destination-address</td>
</tr>
<tr>
<td>Step 2</td>
<td>Switch(config)# <code>ip wccp web-cache group-list access-list</code> Indicates to the switch which content engines are allowed or disallowed to form a service group.</td>
</tr>
</tbody>
</table>
### Setting a Password for a Router and Cache Engines

MD5 password security requires that each content engine and Catalyst 4500 series switch that wants to join a service group be configured with the service group password. The password can consist of up to seven characters. Each content engine or Catalyst 4500 series switch in the service group authenticates the security component in a received WCCP packet immediately after validating the WCCP message header. Packets failing authentication are discarded.

To configure an MD5 password for use by the Catalyst 4500 series switch in WCCP communications, perform this task:

```
Switch(config)# ip wccp web-cache password password
```
Sets an MD5 password on the Catalyst 4500 series switch.

### Verifying and Monitoring WCCP Configuration Settings

To verify and monitor the configuration settings for WCCP, use the following commands in EXEC mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# show ip wccp [web-cache</td>
<td>service-number]</td>
</tr>
<tr>
<td>Switch# show ip wccp (web-cache</td>
<td>service-number) detail</td>
</tr>
<tr>
<td>Switch# show ip interface</td>
<td>Displays status about whether any ip wccp redirection commands are configured on a client interface. For example, “Web Cache Redirect is enabled / disabled.”</td>
</tr>
<tr>
<td>Switch# show ip wccp (web-cache</td>
<td>service-number) view</td>
</tr>
</tbody>
</table>
WCCP Configuration Examples

This section provides the following configuration examples:

- Performing a General WCCP Configuration Example, page 69-10
- Running a Web Cache Service Example, page 69-10
- Running a Reverse Proxy Service Example, page 69-10
- Running TCP-Promiscuous Service Example, page 69-11
- Running Redirect Access-List Example, page 69-11
- Using Access Lists Example, page 69-11
- Setting a Password for a Switch and Content Engines Example, page 69-11
- Verifying WCCP Settings Example, page 69-12

Performing a General WCCP Configuration Example

The following example shows a general WCCP configuration session. VLAN 20 is for the client interface. VLAN 50 is for the content engine interface.

```
Switch# configure terminal
Switch(config)# ip wccp web-cache group-address 224.1.1.100 password alaska1
Switch(config)# interface vlan 20
Switch(config-if)# ip wccp web-cache redirect in
Switch(config)# interface vlan 50
Switch(config-if)# ip wccp web cache group-listen
```

Running a Web Cache Service Example

The following example shows a web cache service configuration session with ingress redirection:

```
Switch# configure terminal
Switch(config)# ip wccp web-cache
Switch(config)# interface vlan 20
Switch(config-if)# ip wccp web-cache redirect in
Switch(config-if)# ^Z
Switch# copy running-config startup-config
Switch# show ip interface vlan 20 | include WCCP Redirect
WCCP Redirect inbound is enabled
WCCP Redirect exclude is disabled
```

Running a Reverse Proxy Service Example

The following example assumes you are configuring a service group using Cisco Content Engines, which use dynamic service 99 to run a reverse proxy service. The following example illustrates how to configure egress redirection, where VLAN 40 reflects the server interface and VLAN 50 reflects the content engine interface:

```
Switch# configure terminal
Switch(config)# ip wccp 99
Switch(config)# interface vlan 40
Switch(config-if)# ip wccp 99 redirect in
Switch(config)# interface vlan 50
Switch(config-if)# ip wccp redirect exclude in
```
Running TCP-Promiscuous Service Example

The following example shows how to configure TCP promiscuous service, where VLAN 40 represents the server interface and VLAN 50 represents the content engine interface:

```
Switch# configure terminal
Switch(config)# ip wccp 61
Switch(config)# ip wccp 62
Switch(config)# interface vlan 30
Switch(config-if)# ip wccp 61 redirect in
Switch(config)# interface vlan 40
Switch(config-if)# ip wccp 62 redirect in
Switch(config)# interface vlan 50
Switch(config-if)# ip wccp redirect exclude in
```

Running Redirect Access-List Example

Redirect access-list allows you to control which traffic to be redirected. The following example shows how to redirect traffic only from subnet 10.1.1.0:

```
Switch(config)# ip access-list extended 100
Switch(config-ext-nacl)# permit ip 10.1.1.0 255.255.255.0 any
Switch(config-ext-nacl)# exit
Switch(config)# ip wccp web-cache redirect-list 100
Switch(config)# interface vlan 40
Switch(config-if)# ip wccp web-cache redirect in
Switch(config)# interface vlan 50
Switch(config-if)# ip wccp redirect exclude in
```

Using Access Lists Example

To achieve better security, you can use a standard access list to notify the Catalyst 4500 series switch to which IP addresses are valid addresses for a content engine attempting to register with the current switch. The following example shows a standard access list configuration session where the access list number is 10 for some sample hosts:

```
router(config)# access-list 10 permit host 11.1.1.1
router(config)# access-list 10 permit host 11.1.1.2
router(config)# access-list 10 permit host 11.1.1.3
router(config)# ip wccp web-cache group-list 10
```

Setting a Password for a Switch and Content Engines Example

The following example shows a WCCP password configuration session where the password is alaska1:

```
Switch# configure terminal
router(config)# ip wccp web-cache password alaska1
```
Verifying WCCP Settings Example

To verify your configuration changes, use the `more system:running-config` EXEC command. The following example shows that the both the web cache service and dynamic service 99 are enabled on the Catalyst 4500 series switch:

**WCCP unicast mode**

```
Switch# more system:running-config

Building configuration...
Current configuration:
!

ip address 70.1.1.1 255.255.255.0
ip wccp web-cache group-listen
ip wccp 60 group-listen
ip wccp redirect exclude in
```
Configuring MIB Support

This chapter describes how to configure SNMP and MIB support for the Cisco 4500 series switch. It includes the following sections:

- Determining MIB Support for Cisco IOS Releases, page 70-1
- Using Cisco IOS MIB Tools, page 70-2
- Downloading and Compiling MIBs, page 70-2
- Enabling SNMP Support, page 70-4

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference and related publications at this location:

Determining MIB Support for Cisco IOS Releases

To determine which MIBs are included in the Cisco IOS release running on the Cisco 4500 series switch, follow these steps:

Step 1  Go to the Cisco MIBs Support page:

Step 2  Under Cisco Access Products, select a **Cisco 4500 switch** to display a list of MIBs supported on the Cisco 4500 switches.

Step 3  Scroll through the list to find the release you are interested in.
Using Cisco IOS MIB Tools

This section describes how to access the Cisco MIB tools page. The MIB Locator finds MIBs in Cisco IOS software releases. You can find general MIB information, instructions about how to use the SNMP Object Navigator which translates SNMP object identifiers (OIDs) into SNMP names, and how to load Cisco MIBs.

To access the Cisco IOS MIB tools site, follow these steps:

**Step 1**
Go to the Cisco Products and Services page:
http://tools.cisco.com/ITDIT/MIBS/servlet/index

**Step 2**
Click **MIB Locator** to launch the application.

The MIB Locator application allows you to find a MIB in the following three ways.

- From the MIB Locator page, you can:
  - Click the drop-down menu and select the desired Cisco IOS software release.
  - From the Platform Family menu, select the appropriate feature set: CAT4500-SUP2-PLUS, CAT4500-SUP2-PLUS-TS, CAT4500-SUP3, CAT4500-SUP4, CAT4500-SUP5, CAT4500-SUP5-10gGE2, and CAT4948. If you select the platform first, the system displays only those releases and feature sets that apply to the Cisco 4500 series switch.
  - From the Feature Set menu, select **Service Provider W/VIP**.

- From the MIB Locator page, you can search by image name. For example, enter the following and click the **Submit** button:
  c7200-js56i-mz.12.0-1

- From the MIB Locator page, you can search for the MIB from the list of MIBs in the menu. You can select one, or for multiple selections, hold down the **CTRL** key, then click the **Submit** button.

**Note**
After you make a selection, follow the links and instructions.

---

**Downloading and Compiling MIBs**

The following sections provide information about how to download and compile MIBs for the Cisco 4500 series switch:

- **Guidelines for Working with MIBs, page 70-3**
- **Downloading MIBs, page 70-3**
- **Compiling MIBs, page 70-4**
Guidelines for Working with MIBs

While working with MIBs, consider the following guidelines:

- Mismatches on datatype definitions might cause compiler errors or warning messages. Although Cisco MIB datatype definitions are not mismatched, some standard RFC MIBs do mismatch. For example:

  MIB A defines: SomeDatatype ::= INTEGER(0..100)
  MIB B defines: SomeDatatype ::= INTEGER(1..50)

  This example is considered to be a trivial error and the MIB loads successfully with a warning message.

  The next example is considered as a nontrivial error (even though the two definitions are essentially equivalent), and the MIB is not successfully parsed.

  MIB A defines: SomeDatatype ::= DisplayString
  MIB B defines: SomeDatatype ::= OCTET STRING (SIZE(0..255))

  If your MIB compiler treats these as errors, or you want to delete the warning messages, edit one of the MIBs that define this same datatype so that the definitions match.

- Many MIBs import definitions from other MIBs. If your management application requires MIBs to be loaded, and you experience problems with undefined objects, you might want to load the following MIBs in this order:

  SNMPv2-SMI.my
  SNMPv2-TC.my
  SNMPv2-MIB.my
  RFC1213-MIB.my
  IF-MIB.my
  CISCO-SMI.my
  CISCO-PRODUCTS-MIB.my
  CISCO-TC.my

- For additional information and SNMP technical tips, go to the following URL:

- For a list of SNMP OIDs assigned to MIB objects, go to the following URL and click on SNMP Object Navigator and follow the links:
  http://tools.cisco.com/ITDIT/MIBS/servlet/index

  Note: You must have a Cisco CCO name and password to access the MIB Locator.

- For information about how to download and compile Cisco MIBs, go to the following URL:

Downloading MIBs

To download the MIBs onto your system if they are not already present, follow these steps:

Step 1 Review the guidelines in the previous section ("Guidelines for Working with MIBs").

Step 2 Go to one of the following Cisco URLs. If the MIB you want to download is not there, try the other URL; otherwise, go to one of the URLs in Step 5.
Chapter 70      Configuring MIB Support

Enabling SNMP Support

The following procedure summarizes how to configure the Cisco 4500 series switch for SNMP support. For detailed information about SNMP commands, see the following Cisco documents:

- *Cisco IOS Release 12.4 Configuration Fundamentals and Network Management Configuration Guide*, “Monitoring the Router and Network” section, available at the following URL:
  

- *Cisco IOS Release 12.3 Configuration Fundamentals and Network Management Command Reference*, Part 3: System Management Commands, “Router and Network Configuration Commands” section, available at the following URL:
  

To configure the Cisco 4500 series switch for SNMP support, follow these steps:

**Step 1** Establish your basic SNMP configuration using the command line interface (CLI) on the router. Note that these basic configuration commands are issued for SNMP version 2c. For SNMP version 3, you must also set up SNMP users and groups. Refer to the preceding list of documents for command and set up information.

a. Define SNMP read-only and read-write communities:

   ```
   Router (config)# snmp-server community Read_Only_Community_Name ro
   Router (config)# snmp-server community Read_Write_Community_Name rw
   ```

b. Configure SNMP views (to limit the range of objects accessible to different SNMP user groups):

   ```
   Router (config)# snmp-server view view_name oid-tree (included | excluded)
   ```

**Step 2** Identify (by IP address) the host to receive SNMP notifications from the router:

   ```
   Router (config)# snmp-server host host
   ```

Compiling MIBs

If you plan to integrate the Cisco 4500 series switch with an SNMP-based management application, then you must also compile the MIBs for that platform. For example, if you are running HP OpenView on a UNIX operating system, you must compile Cisco 4500 series switch MIBs with the HP OpenView Network Management System (NMS). For instructions, see the NMS documentation.
Step 3 Configure the router to generate notifications. You can use keywords to limit the number and types of messages generated.

Router (config)# snmp-server enable traps [notification-type] [notification-option]

Step 4 (Optional) Configure the router to generate SNMP notifications released to field replaceable units (FRUs):

Router (config)# snmp-server enable traps fru-ctrl

Step 5 (Optional) Configure the router to generate SNMP notifications related to environmental monitoring:

Router (config)# snmp-server enable traps envmon
This chapter describes the Cisco 806 router ROM monitor (also called the bootstrap program). The ROM monitor firmware runs when the router is powered up or reset. The firmware helps to initialize the processor hardware and boot the operating system software. You can use the ROM monitor to perform certain configuration tasks, such as recovering a lost password or downloading software over the console port. If there is no Cisco IOS software image loaded on the router, the ROM monitor runs the router.

This appendix contains the following sections:

- Entering the ROM Monitor
- ROM Monitor Commands
- ROM Monitor Command Descriptions
- Configuration Register
- Console Download
- Debug Commands
- Exiting the ROM Monitor

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the Cisco Catalyst 4500 Series Switch Command Reference and related publications at this location:

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the Catalyst 4500 Series Switch Cisco IOS Command Reference and related publications at this location:

**Entering the ROM Monitor**

To use the ROM monitor, you must be using a terminal or PC that is connected to the router over the console port. Refer to the installation chapter in the Cisco 806 Router Hardware Installation Guide that came with the router to connect the router to a PC or terminal.
To configure the router to boot up in ROM monitor mode the next time it is rebooted, perform this task:

<table>
<thead>
<tr>
<th>Command</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch(config)# config-reg 0x0</td>
<td>Resets the configuration register.</td>
</tr>
<tr>
<td>Switch(config)# exit</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Switch# reload</td>
<td>Reboots the router with the new configuration register value. The router remains in ROM monitor and does not boot the Cisco IOS software. As long as the configuration value is 0x0, you must manually boot the operating system from the console. See the boot command in the “ROM Monitor Command Descriptions” section in this appendix. After the router reboots, it is in ROM monitor mode. The number in the prompt increments with each new line.</td>
</tr>
</tbody>
</table>

**ROM Monitor Commands**

Enter ? or help at the ROM monitor prompt to display a list of available commands and options, as follows:

```
rommon 1 > ?
alias set and display aliases command
boot boot up an external process
config reg configuration register utility
dev list the device table
dir list files in file system
dir help monitor built-in command help
history monitor command history
meminfo main memory information
repeat repeat a monitor command
reset system reset
set display the monitor variables
sysret print out info from last system return
unalias unset an alias
unset unset a monitor variable
```

Commands are case sensitive. You can halt any command by pressing the Break key on a terminal. If you are using a PC, most terminal emulation programs halt a command when you press the Ctrl and the Break keys at the same time. If you are using another type of terminal emulator or terminal emulation software, refer to the documentation for that product for information on how to send a Break command.
ROM Monitor Command Descriptions

Table 71-1 describes the most commonly used ROM monitor commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reset or i</td>
<td>Resets and initializes the router, similar to a power up.</td>
</tr>
<tr>
<td>dev</td>
<td>Lists boot device identifications on the router; for example:</td>
</tr>
<tr>
<td></td>
<td>rommon 10&gt; dev</td>
</tr>
<tr>
<td></td>
<td>Devices in device table:</td>
</tr>
<tr>
<td></td>
<td>id name</td>
</tr>
<tr>
<td></td>
<td>flash: flash</td>
</tr>
<tr>
<td>dir device:</td>
<td>Lists the files on the named device; flash, for example:</td>
</tr>
<tr>
<td></td>
<td>rommon 4 &gt; dir flash:</td>
</tr>
<tr>
<td></td>
<td>File size Checksum File name</td>
</tr>
<tr>
<td></td>
<td>2835276 bytes (0x2b434c) 0x2073 c806-oy6-mz</td>
</tr>
<tr>
<td>boot commands</td>
<td>For more information about the ROM monitor boot commands, refer to the Cisco IOS Configuration Guide and the Cisco IOS Command Reference.</td>
</tr>
<tr>
<td>b</td>
<td>Boots the first image in flash memory.</td>
</tr>
<tr>
<td>b flash: (filename)</td>
<td>Attempts to boot the image directly from the first partition of flash memory. If you do not enter a filename, this command will boot this first image in flash.</td>
</tr>
</tbody>
</table>

Configuration Register

The virtual configuration register is in nonvolatile RAM (NVRAM) and has the same functionality as other Cisco routers. You can view or modify the virtual configuration register from either the ROM monitor or the operating system software. Within ROM monitor, you can change the configuration register by entering the register value in hexadecimal format, or by allowing the ROM monitor to prompt you for the setting of each bit.

Changing the Configuration Register Manually

To change the virtual configuration register from the ROM monitor manually, enter the `confreg` command followed by the new value of the register in hexadecimal, as shown in the following example:

```
rommon 1 > confreg 0x2101
```

You must reset or power cycle for new config to take effect

```
rommon 2 >
```

The value is always interpreted as hexadecimal. The new virtual configuration register value is written into NVRAM but does not take effect until you reset or reboot the router.
Chapter 71      ROM Monitor

Console Download

Changing the Configuration Register Using Prompts

Entering `confreg` without an argument displays the contents of the virtual configuration register and a
prompt to alter the contents by describing the meaning of each bit.

In either case, the new virtual configuration register value is written into NVRAM but does not take
effect until you reset or reboot the router.

The following display shows an example of entering the `confreg` command:

```
rommon 7> confreg

   Configuration Summary
   enabled are:
   console baud: 9600
   boot: the ROM Monitor

   do you wish to change the configuration? y/n [n]: y
   enable   "diagnostic mode"? y/n [n]: y
   enable   "use net in IP bcast address"? y/n [n]:
   enable   "load rom after netboot fails"? y/n [n]:
   enable   "use all zero broadcast"? y/n [n]:
   enable   "break/abort has effect"? y/n [n]:
   enable   "ignore system config info"? y/n [n]:
   change console baud rate? y/n [n]: y
   enter rate: 0 = 9600, 1 = 4800, 2 = 1200, 3 = 2400 [0]: 0
   change the boot characteristics? y/n [n]: y
   enter to boot:
      0 = ROM Monitor
      1 = the boot helper image
      2-15 = boot system
   [0]: 0

   Configuration Summary
   enabled are:
   diagnostic mode
   console baud: 9600
   boot: the ROM Monitor

   do you wish to change the configuration? y/n [n]:

   You must reset or power cycle for new config to take effect
```

Console Download

You can use console download, a ROM monitor function, to download over the router console port either
a software image or a configuration file. After download, the file is either saved to the mini-Flash
memory module or to main memory for execution (image files only).

Use console download when you do not have access to a Trivial File Transfer Protocol (TFTP) server.

Note

If you want to download a software image or a configuration file to the router over the console port, you
must use the `ROM monitor` command.
If you are using a PC to download a Cisco IOS image over the router console port at 115,200 bps, ensure that the PC serial port is using a 16550 universal asynchronous transmitter/receiver (UART). If the PC serial port is not using a 16550 UART, we recommend using a speed of 38,400 or less when downloading a Cisco IOS image over the console port.

Error Reporting

Because the ROM monitor console download uses the console to perform the data transfer, error messages are only displayed on the console when the data transfer is terminated.

If an error does occur during a data transfer, the transfer is terminated, and an error message is displayed. If you have changed the baud rate from the default rate, the error message is followed by a message telling you to restore the terminal to the baud rate specified in the configuration register.

Debug Commands

Most ROM monitor debugging commands are functional only when Cisco IOS software has crashed or is halted.

The following are ROM monitor debugging commands:

- **frame**—Displays an individual stack frame.
- **sysret**—Displays return information from the last booted system image.

This information includes the reason for terminating the image, a stack dump of up to eight frames, and, if an exception is involved, the address where the exception occurred.

For example:

```
rommon 8> sysret
System Return Info:
count: 19,  reason: user break
pc:0x801111b0,  error address: 0x801111b0
Stack Trace:
FP: 0x80005ea8, PC: 0x801111b0
FP: 0x80005eb4, PC: 0x80113694
FP: 0x80005f74, PC: 0x8010eb44
FP: 0x80005f9c, PC: 0x80008118
FP: 0x80005fac, PC: 0x80008064
FP: 0x80005fd4, PC: 0xfff03d70
FP: 0x80005f0e, PC: 0x00000000
FP: 0x00000000, PC: 0x00000000
```

- **meminfo**—Displays size in bytes, starting address, available range of main memory, the starting point and size of packet memory, and size of NVRAM.

For example:

```
rommon 9> meminfo
Main memory size: 40 MB.
Available main memory starts at 0x10000, size 40896KB
IO (packet) memory size: 5 percent of main memory.
NVRAM size: 32KB
```
Exiting the ROM Monitor

You must set the configuration register to a value from 0x2 to 0xF for the router to boot a Cisco IOS image from flash memory upon startup or reloading.

The following example shows how to reset the configuration register and cause the router to boot a Cisco IOS image stored in flash memory:

```
rommon 1 > confreg 0x2101
```

You must reset or power cycle for new config to take effect

```
rommon 2 > boot
```

The router will boot the Cisco IOS image in flash memory. The configuration register will change to 0x2101 the next time the router is reset or power cycled.
