

# CHAPTER 33

## AutoSecure

---

- [Prerequisites for AutoSecure, page 33-1](#)
- [Restrictions for AutoSecure, page 33-2](#)
- [Information About AutoSecure, page 33-2](#)
- [How to Configure AutoSecure, page 33-7](#)
- [Examples for AutoSecure Configuration, page 33-10](#)
- [Feature History and Information for AutoSecure, page 33-13](#)

### Note

- For complete syntax and usage information for the commands used in this chapter, see these publications:  
[http://www.cisco.com/en/US/products/ps11846/prod\\_command\\_reference\\_list.html](http://www.cisco.com/en/US/products/ps11846/prod_command_reference_list.html)
- Cisco IOS Release 15.4SY supports only Ethernet interfaces. Cisco IOS Release 15.4SY does not support any WAN features or commands.

### Tip

For additional information about Cisco Catalyst 6500 Series Switches (including configuration examples and troubleshooting information), see the documents listed on this page:

[http://www.cisco.com/en/US/products/hw/switches/ps708/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/hw/switches/ps708/tsd_products_support_series_home.html)

[Participate in the Technical Documentation Ideas forum](#)

## Prerequisites for AutoSecure

Be ready to answer these questions:

- Is the device going to be connected to the Internet?
- How many interfaces are connected to the Internet?
- What are the names of the interfaces connected to the Internet?
- What will be your local username and password?
- What will be the switch hostname and domain name?

## Restrictions for AutoSecure

- Because there is no command to undo configuration changes made by AutoSecure, always save your running configuration before configuring AutoSecure.
- The AutoSecure configuration can be configured at run time or setup time. If any related configuration is modified after AutoSecure has been enabled, the AutoSecure configuration may not be fully effective.
- After AutoSecure has been enabled, tools that use SNMP to monitor or configure a device will be unable to communicate with the device using SNMP.
- If your device is managed by a network management (NM) application, securing the management plane could turn off some services such as HTTP server and disrupt the NM application support.
- If you are using Security Device Manager (SDM), you must manually enable the HTTP server using the **ip http server** command.
- NM applications that use CDP to discover network topology will not be able to perform discovery
- Starting with Cisco IOS 15.5(1)SY4 Release, type 4 secrets are no longer supported. Entering a type 4 password gives the following error:
 

```
ERROR: Type 4 passwords have been deprecated.
Migrate to a supported password type
```
- In Cisco IOS 15.5(1)SY4 Release, the following warning messages will be displayed upon entering type 0, type 5 or type 7 passwords:
 

```
WARNING: Command has been added to the configuration using a type 0 password.
However, type 0 passwords will soon be deprecated. Migrate to a supported password
type
WARNING: Command has been added to the configuration using a type 5 password.
However, type 5 passwords will soon be deprecated. Migrate to a supported password
type
WARNING: Command has been added to the configuration using a type 7 password.
However, type 7 passwords will soon be deprecated. Migrate to a supported password
type
```
- You cannot perform an ISSU upgrade from Cisco IOS 15.5(1)SY3 release or Cisco IOS15.5(1)SY4 release to Cisco IOS 15.5(1)SY6 release if you use a Type 5 password. See [Upgrading from a Release that Uses Type 5 Passwords, page 33-9](#) for more information.
- If you downgrade to a release that does not support the current password type, you will be locked out of the device once the downgrade is completed. To avoid this lock-out, ensure that you configure the password type that is supported for the required release, before you downgrade to that release. See [Configuring the Password Type Before a Downgrade to an Older Release, page 33-9](#) for more information.

## Information About AutoSecure

- [AutoSecure Overview, page 33-3](#)
- [Management Plane Security Enabled by AutoSecure, page 33-3](#)
- [Forwarding Plane Security Enabled by AutoSecure, page 33-6](#)

### Caution

Although AutoSecure helps to secure a switch, it does not guarantee the complete security of the switch.

## AutoSecure Overview

- [AutoSecure Benefits, page 33-3](#)
- [Simplified Switch Security Configuration, page 33-3](#)
- [Enhanced Password Security Enabled by AutoSecure, page 33-3](#)
- [System Logging Message Support, page 33-3](#)

### AutoSecure Benefits

Use the AutoSecure feature to secure the switch without understanding all the security features. AutoSecure is a simple security configuration process that disables nonessential system services and enables a basic set of recommended security policies to ensure secure networking services.

### Simplified Switch Security Configuration

AutoSecure automates a thorough configuration of security features of the switch. AutoSecure disables certain features that are enabled by default that could be exploited for security holes. You can execute AutoSecure in either of two modes, depending on your individual needs:

- Interactive mode—Prompts with options to enable and disable services and other security features, suggesting a default setting for each option.
- Noninteractive mode—Automatically executes the recommended Cisco default settings.

### Enhanced Password Security Enabled by AutoSecure

- You can specify a required minimum password length, which can eliminate weak passwords that are prevalent on most networks, such as “lab” and “cisco.”

To configure a minimum password length, use the **security passwords min-length** command.

- You can cause a syslog message to be generated after the number of unsuccessful login attempts exceeds the configured threshold.

To configure the number of allowable unsuccessful login attempts (the threshold rate), use the **security authentication failure rate** command.

### System Logging Message Support

System logging messages capture any subsequent changes to the AutoSecure configuration that are applied on the running configuration. As a result, a more detailed audit trail is provided when AutoSecure is executed.

## Management Plane Security Enabled by AutoSecure

- [Management Plane Security Overview, page 33-4](#)
- [Global Services Disabled by AutoSecure, page 33-4](#)
- [Per-Interface Services Disabled by AutoSecure, page 33-5](#)
- [Global Services Enabled by AutoSecure, page 33-5](#)

- [Switch Access Secured by AutoSecure, page 33-5](#)
- [Logging Options Enabled by AutoSecure, page 33-6](#)

**Caution**

---

If your device is managed by a network management (NM) application, securing the management plane could turn off some services such as the HTTP server and disrupt the NM application support.

---

## Management Plane Security Overview

AutoSecure provides protection for the switch management interfaces (the management plane) and the data routing and switching functions (the forwarding plane, described in the [“Forwarding Plane Security Enabled by AutoSecure” section on page 33-6.](#)) Securing the management plane is done by turning off certain global and interface services that can be potentially exploited for security attacks and turning on global services that help minimize the threat of attacks. Secure access and secure logging are also configured for the switch.

## Global Services Disabled by AutoSecure

- Finger—Collects information about the system (reconnaissance) before an attack.
- PAD—Enables all packet assembler and disassembler (PAD) commands and connections between PAD devices and access servers.
- Small servers—Causes TCP and User Datagram Protocol (UDP) diagnostic port attacks: a sender transmits a volume of fake requests for UDP diagnostic services on the switch, consuming all CPU resources.
- Bootp server—Bootp is an insecure protocol that can be exploited for an attack.
- HTTP server—Without secure-HTTP or authentication embedded in the HTTP server with an associated ACL, the HTTP server is insecure and can be exploited for an attack. (If you must enable the HTTP server, you will be prompted for the proper authentication or access list.)

---

**Note** If you are using Security Device Manager (SDM), you must manually enable the HTTP server using the **ip http server** command.

---

- Identification service—An unsecure protocol (defined in RFC 1413) that allows an external host to query a TCP port for identification. An attacker can access private information about the user from the ID server.
- CDP—If a large number of Cisco Discovery Protocol (CDP) packets are sent to the switch, the available memory of the switch can be consumed, which causes the switch to crash.

---

**Note** NM applications that use CDP to discover network topology will not be able to perform discovery.

---

- NTP—Without authentication or access control, Network Time Protocol (NTP) is insecure and can be used by an attacker to send NTP packets to crash or overload the switch.

If you require NTP, you must configure NTP authentication using Message Digest 5 (MD5) and the **ntp access-group** command. If NTP is enabled globally, disable it on all interfaces on which it is not needed.

- Source routing—Source routing is provided only for debugging purposes, and should be disabled in all other cases. Otherwise, packets may avoid some of the access control mechanisms of the switch.

## Per-Interface Services Disabled by AutoSecure

- ICMP redirects—Disabled on all interfaces. Does not add a useful functionality to a correctly configured network, but could be used by attackers to exploit security holes.
- ICMP unreachable—Disabled on all interfaces. Internet Control Management Protocol (ICMP) unreachable are a known method for some ICMP-based denial of service (DoS) attacks.
- ICMP mask reply messages—Disabled on all interfaces. ICMP mask reply messages can give an attacker the subnet mask for a particular subnetwork in the internetwork.
- Proxy-arp—Disabled on all interfaces. Proxy-arp requests are a known method for DoS attacks because the available bandwidth and resources of the switch can be consumed in an attempt to respond to the repeated requests sent by an attacker.
- Directed broadcast—Disabled on all interfaces. Potential cause of SMURF attacks for DoS.
- Maintenance Operations Protocol (MOP) service—Disabled on all interfaces.

## Global Services Enabled by AutoSecure

- The **service password-encryption** command—Prevents passwords from being visible in the configuration.
- The **service tcp-keepalives-in** and **service tcp-keepalives-out** commands—Ensures that abnormally terminated TCP sessions are removed.

## Switch Access Secured by AutoSecure

### Caution

---

If your device is managed by an NM application, securing access to the switch could turn off vital services and may disrupt the NM application support.

---

- If a text banner does not exist, you will be prompted to add a banner. This feature provides the following sample banner:

**Authorized access only**

```
This system is the property of ABC Enterprise
Disconnect IMMEDIATELY if you are not an authorized user!
Contact abc@example.com +1 408 5551212 for help.
```

- The login and password (preferably a secret password, if supported) are configured on the console, AUX, vty, and tty lines. The **transport input** and **transport output** commands are also configured on all of these lines. (Telnet and secure shell (SSH) are the only valid transport methods.) The **exec-timeout** command is configured on the console and AUX as 10.
- When the image on the device is a crypto image, AutoSecure enables SSH and secure copy (SCP) for access and file transfer to and from the switch. The **timeout seconds** and **authentication-retries integer** options for the **ip ssh** command are configured to a minimum number. (Telnet and FTP are not affected by this operation and remain operational.)

- If the user specifies that the switch does not use Simple Network Management Protocol (SNMP), one of the following functionalities will occur:
  - In interactive mode, the user is asked whether to disable SNMP regardless of the values of the community strings, which act like passwords to regulate access to the agent on the switch.
  - In noninteractive mode, SNMP will be disabled if the community string is public or private.

---

**Note** After AutoSecure has been enabled, tools that use SNMP to monitor or configure a device will be unable to communicate with the device using SNMP.

---

- If authentication, authorization, and accounting (AAA) is not configured, AutoSecure configures local AAA. AutoSecure will prompt the user to configure a local username and password on the switch.

## Logging Options Enabled by AutoSecure

- Sequence numbers and time stamps for all debug and log messages. This option is useful when auditing logging messages.
- Logging messages for login-related events. For example, the message “Blocking Period when Login Attack Detected” will be displayed when a login attack is detected and the switch enters quiet mode. (Quiet mode means that the switch will not allow any login attempts using Telnet, HTTP, or SSH.)
- The **logging console critical** command, which sends system logging (syslog) messages to all available TTY lines and limits messages based on severity.
- The **logging buffered** command, which copies logging messages to an internal buffer and limits messages logged to the buffer based on severity.
- The **logging trap debugging** command, which allows all commands with a severity higher than debugging to be sent to the logging server.

## Forwarding Plane Security Enabled by AutoSecure

- Strict Unicast Reverse Path Forwarding (uRPF) can be configured to help mitigate problems that are caused by the introduction of forged (spoofed) IP source addresses. uRPF discards IP packets that lack a verifiable IP source address.
- Hardware rate limiting—AutoSecure will enable hardware rate-limiting of the following types of traffic without prompting the user:
  - IP errors
  - RPF failures
  - ICMP no-route messages
  - ICMP acl-drop messages
  - IPv4 multicast FIB miss messages
  - IPv4 multicast partially switch flow messages

AutoSecure will provide the option for hardware rate-limiting of the following types of traffic:

- ICMP redirects
- TTL failures

- MTU failures
- IP unicast options
- IP multicast options
- Ingress and egress ACL bridged packets

---

**Note** Rate-limiting of ingress and egress ACL bridged packets can interfere with ACL logging and can increase session setup rates for hardware accelerated features such as TCP intercept, NAT, and Layer 3 WCCP.

---

## How to Configure AutoSecure

- [Configuring AutoSecure Parameters, page 33-7](#)
- [Configuring Additional Security, page 33-8](#)
- [Verifying AutoSecure, page 33-10](#)

## Configuring AutoSecure Parameters

The **auto secure** command guides you through a semi-interactive session (also known as the AutoSecure session) to secure the management and forwarding planes. You can use this command to secure just the management plane or the forwarding plane; if neither option is selected in the command line, you can choose to configure one or both planes during the session.

This command also allows you to go through all noninteractive configuration portions of the session before the interactive portions. The noninteractive portions of the session can be enabled by selecting the optional **no-interact** keyword.

At any prompt you may enter a question mark (?) for help or Ctrl-C to abort the session.

In interactive mode, you will be asked at the end of the session whether to commit the generated configuration to the running configuration of the switch. In noninteractive mode, the changes will be automatically applied to the running configuration.

**Note**

---

There is no undo command for configuration changes made by AutoSecure. You should always save the running configuration before executing the **auto secure** command.

---

To execute the AutoSecure configuration process, beginning in privileged EXEC mode, perform this task:

Command	Purpose
Router# <b>auto secure</b> [ <b>management</b>   <b>forwarding</b> ] [ <b>no-interact</b>   <b>full</b> ]	Executes the AutoSecure session for configuring one or both planes of the switch. <ul style="list-style-type: none"> <li>• <b>management</b>—Only the management plane will be secured.</li> <li>• <b>forwarding</b>—Only the forwarding plane will be secured.</li> <li>• <b>no-interact</b>—The user will not be prompted for any interactive configurations.</li> <li>• <b>full</b>—The user will be prompted for all interactive questions. This is the default.</li> </ul>

For an example of the AutoSecure session, see the [“Examples for AutoSecure Configuration”](#) section on page 33-10.

## Configuring Additional Security

After completing the AutoSecure configuration, you can further enhance the security of management access to your switch by performing this task:

	Command or Action	Purpose
<b>Step 1</b>	Router# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	Router(config)# <b>security passwords min-length</b> <i>length</i>	Ensures that all configured passwords are at least a specified length. <ul style="list-style-type: none"> <li>• <i>length</i>—Minimum length of a configured password. The range is 0 to 16 characters.</li> </ul>
<b>Step 3</b>	Router(config)# <b>enable password</b> { <i>password</i>   [ <i>encryption-type</i> ] <i>password</i> }	Sets a local password to control access to various privilege levels. <ul style="list-style-type: none"> <li>• <i>encryption-type</i>—A value of 0 indicates that an unencrypted password follows. A value of 7 indicates that a hidden password follows.</li> </ul> <p><b>Note</b> You usually will not enter an encryption type unless you enter a password that has already been encrypted by a Cisco router or switch.</p>
<b>Step 4</b>	Router(config)# <b>security authentication failure</b> <b>rate</b> <i>threshold-rate</i> <b>log</b>	Configures the number of allowable unsuccessful login attempts. <ul style="list-style-type: none"> <li>• <i>threshold-rate</i>—Number of allowable unsuccessful login attempts. The range is 1 to 1024.</li> <li>• <b>log</b>—Syslog authentication failures if the number of failures in one minute exceeds the threshold.</li> </ul>

The following example shows how to configure the switch for a minimum password length of 10 characters and a threshold of 3 password failures in one minute. The example also shows how to set a hidden local password.

```
Router# configure terminal
Router(config)# security passwords min-length 10
Router(config)# security authentication failure rate 3
Router(config)# enable password 7 elephant123
```

## Upgrading from a Release that Uses Type 5 Passwords

If the device runs on Cisco IOS 15.5(1)SY3 release or Cisco IOS 15.5(1)SY4 release, that use a Type 5 password, perform one of the following steps to upgrade to Cisco IOS Release 15.5(1)SY6:

- **If you perform an ISSU upgrade:** Ensure that you change the password type and configure a normal Type 9 password before you perform the upgrade. After this, you can perform the ISSU upgrade to Cisco IOS 15.5(1)SY6 release.
- **If you do not perform an ISSU upgrade:** Perform a full reload of the device. This automatically converts Type 5 passwords into convoluted Type 9 passwords and upgrades the device software.

## Configuring the Password Type Before a Downgrade to an Older Release

Starting from Cisco IOS 15.5(1)SY6 release, Type 5 passwords are automatically converted into convoluted Type 9 passwords. Type 9 passwords are irreversible passwords. Likewise, Type 0 and Type 7 passwords are automatically converted into Type 6 passwords. Type 6 passwords are reversible passwords.

If you downgrade to a release that does not support the current password type, you will be locked out of the device once the downgrade is completed. To avoid this lock-out, ensure that you configure the password type that is supported for the required release, before you downgrade to that release.

If the startup configuration uses a convoluted Type 9 password and you want to downgrade to an older release that does not support this password type (Cisco IOS 15.5(1) SY4 Release or earlier), perform one of the following steps:

- Configure a Type 9 password in place of the convoluted Type 9 password. After this, you can upgrade or downgrade to any release.
- Downgrade to Cisco IOS 15.5(1) SY5 Release and configure a Type 5 password, during the startup configuration, in place of the convoluted Type 9 password. After this, you can downgrade to Cisco IOS 15.5(1) SY4 Release or earlier.

If the startup configuration uses a Type 6 password and you want to downgrade to an older release that does not support this password type (Cisco IOS 15.5(1) SY4 Release or earlier), perform the following step:

- Downgrade to Cisco IOS 15.5(1) SY5 Release and configure a Type 7 password, during the startup configuration, in place of the Type 6 password. After this, you can downgrade to Cisco IOS 15.5(1) SY4 Release or earlier.

## Verifying AutoSecure

To verify that the AutoSecure feature has executed successfully, perform this task:

Command	Purpose
Router# <b>show auto secure config</b>	Displays all configuration commands that have been added as part of the AutoSecure configuration. The output is the same as the configuration generated output

## Examples for AutoSecure Configuration

The following example is a sample AutoSecure session. After you execute the **auto secure** command, the feature will automatically prompt you with a similar response unless you enable the **no-interact** keyword. (For information on which features are disabled and which features are enabled, see the [“Management Plane Security Enabled by AutoSecure”](#) section on page 33-3 and the [“Forwarding Plane Security Enabled by AutoSecure”](#) section on page 33-6.)

```
Router# auto secure
      --- AutoSecure Configuration ---

*** AutoSecure configuration enhances the security of
the router, but it will not make it absolutely resistant
to all security attacks ***

AutoSecure will modify the configuration of your device.

All the configuration changes will be shown. For a detailed
explanation of how the configuration changes enhance security
and any possible side effects, please refer to Cisco.com for
AutoSecure documentation.
At any prompt you may enter '?' for help.
Use ctrl-c to abort this session at any prompt.

If this device is being managed by a network management station,
AutoSecure configuration may block network management traffic.

## Feature History and Information for Autosecure

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Table 33-1 lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

**Table 33-1** Feature History and Information for Autosecure

Feature Name	Releases	Feature Information
Password Hardening	Cisco IOS Release 15.5(1)SY4	Type 4 passwords were deprecated.  Warnings were introduced for Type 0, Type 5 and Type 7 passwords.

**Table 33-1 Feature History and Information for Autosecure**

Feature Name	Releases	Feature Information
Password Hardening	Cisco IOS Release 15.5(1)SY5	Support was introduced for Type 6 and convoluted Type 9 passwords.
Password Hardening	Cisco IOS Release 15.5(1)SY6	Auto-conversion of Type 5 passwords into convoluted Type 9 passwords was introduced. Type 9 passwords are irreversible passwords.  Auto-conversion of Type 0 and Type 7 passwords into Type 6 passwords was introduced. Type 6 passwords are reversible passwords.

**Tip**

For additional information about Cisco Catalyst 6500 Series Switches (including configuration examples and troubleshooting information), see the documents listed on this page:

[http://www.cisco.com/en/US/products/hw/switches/ps708/tsd\\_products\\_support\\_series\\_home.html](http://www.cisco.com/en/US/products/hw/switches/ps708/tsd_products_support_series_home.html)

[Participate in the Technical Documentation Ideas forum](#)
