

Configuring SSH File Transfer Protocol

Secure Shell (SSH) includes support for SSH File Transfer Protocol (SFTP), which is a new standard file transfer protocol introduced in SSHv2. This feature provides a secure and authenticated method for copying device configuration or device image files.

Prerequisites for SSH File Transfer Protocol

- SSH must be enabled.
- The **ip ssh source-interface** *interface-type interface-number* command must be configured.

Restrictions for SSH File Transfer Protocol

- The SFTP server is not supported.
- SFTP boot is not supported.
- The **sftp** option in the **install add** command is not supported.

Information About SSH File Transfer Protocol

The SFTP client functionality is provided as part of the SSH component and is always enabled on the corresponding device. Therefore, any SFTP server user with the appropriate permission can copy files to and from the device.

An SFTP client is VRF-aware; you can configure the secure FTP client to use the virtual routing and forwarding (VRF) associated with a particular source interface during connection attempts.

How to Configure SSH File Transfer Protocol

The following sections provide information about the various tasks that comprise an SFTP configuration.

Configuring SFTP

Perform the following steps:

Before you begin

To configure a Cisco device for SFTP client-side functionality, the **ip ssh source-interface** *interface-type interface-number* command must be configured first.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip ssh source-interface** *interface-type interface-number*
4. **exit**
5. **show running-config**
6. **debug ip sftp**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|--|--|
| Step 1 | enable Example: Device> enable | Enables privileged EXEC mode. Enter your password, if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |
| Step 3 | ip ssh source-interface <i>interface-type interface-number</i> Example: Device(config)# ip ssh source-interface GigabitEthernet 1/0/1 | Defines the source IP for the SSH session. |
| Step 4 | exit Example: Device(config)# exit | Exits global configuration mode and returns to privileged EXEC mode. |

| | Command or Action | Purpose |
|---------------|---|---|
| Step 5 | show running-config Example: <pre>Device# show running-config</pre> | (Optional) Displays the SFTP client-side functionality. |
| Step 6 | debug ip sftp Example: <pre>Device# debug ip sftp</pre> | (Optional) Enables SFTP debugging. |

Perform an SFTP Copy Operation

SFTP copy takes the IP or hostname of the corresponding server if Domain Name System (DNS) is configured. To perform SFTP copy operations, use the following commands in privileged EXEC mode:

| Command | Purpose |
|--|--|
| Device# copy ios-file-system:file sftp://user:pwd@server-ip//filepath Or Device# copy ios-file-system: sftp: | Copies a file from the local Cisco IOS file system to the server. Specify the username, password, IP address, and filepath of the server. |
| Device# copy sftp://user:pwd@server-ip//filepath ios-file-system:file Or Device# copy sftp: ios-file-system: | Copies the file from the server to the local Cisco IOS file system. Specify the username, password, IP address, and filepath of the server. |

Example: Configuring SSH File Transfer Protocol

The following example shows how to configure the client-side functionality of SFTP:

```
Device> enable
Device# configure terminal
Device(config)# ip ssh source-interface gigabitethernet 1/0/1
Device(config)# exit
```
