- Restrictions for 2-event classification, on page 1
- Information about 2-event Classification, on page 1
- Configuring 2-event Classification, on page 1
- Example: Configuring 2-Event Classification, on page 2
- Feature History for 2-event Classification, on page 2

## **Restrictions for 2-event classification**

The following restrictions apply to 2-event classification:

- Configuration of 2-event classification has to be done before physically connecting any endpoint. Alternatively do a manual shut/no-shut of the ports drawing power.
- Power to the ports will be interrupted in case of MCU firmware upgrade and ports will be back up immediately after the upgrade.

#### Information about 2-event Classification

When a class 4 device gets detected, IOS allocates 30W without any CDP or LLDP negotiation. This means that even before the link comes up the class 4 power device gets 30W.

Also, on the hardware level the PSE does a 2-event classification which allows a class 4 PD to detect PSE capability of providing 30W from hardware, register itself and it can move up to PoE+ level without waiting for any CDP/LLDP packet exchange.

Once 2-event is enabled on a port, you need to manually shut/un-shut the port or connect the PD again to start the IEEE detection again. Power budget allocation for a class-4 device will be 30W if 2-event classification is enabled on the port, else it will be 15.4W.

## **Configuring 2-event Classification**

To configure the switch for a 2-event Classification, perform the steps given below:

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> <b>enable</b>	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface interface-id	Specifies the physical port to be configured, and enters interface configuration mode.
	Example:	
	Device(config)# interface gigabitethernet2/0/1	
Step 4	power inline port 2-event	Configures 2-event classification on the switch
	Example:	
	Device(config-if)# power inline port 2-event	
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Device(config-if)# <b>end</b>	

### **Example: Configuring 2-Event Classification**

This example shows how you can configure 2-event classification.

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# power inline port 2-event
Device(config-if)# end
```

#### **Feature History for 2-event Classification**

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Fuji 16.9.2	2-event classification	When a class 4 device gets detected, IOS allocates 30W without any CDP or LLDP negotiation. This means that even before the link comes up the class 4 power device gets 30W.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn.
