

## **Configuring RADIUS**

- Prerequisites for Configuring RADIUS, on page 1
- Restrictions for Configuring RADIUS, on page 2
- Information about RADIUS, on page 2
- How to Configure RADIUS, on page 25
- Monitoring CoA Functionality, on page 40
- Feature History for RADIUS, on page 40

## **Prerequisites for Configuring RADIUS**

This section lists the prerequisites for controlling device access with RADIUS.

#### General:

- RADIUS and Authentication, Authorization, and Accounting (AAA) must be enabled to use any of the configuration commands in this chapter.
- RADIUS is facilitated through AAA and can be enabled only through AAA commands.
- Use the aaa new-model global configuration command to enable AAA.
- Use the **aaa authentication** global configuration command to define method lists for RADIUS authentication.
- Use line and interface commands to enable the defined method lists to be used.
- At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.
- You should have access to and should configure a RADIUS server before configuring RADIUS features on your device.
- The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.
- To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

**RADIUS** operation:

- Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.
- For RADIUS over IPv6 configurations, users must enable IPv6 unicast routing by enabling the ipv6 unicast-routing command.

## **Restrictions for Configuring RADIUS**

General:

• To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

- Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.
- Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.
- Networks using a variety of services. RADIUS generally binds a user to one service model.

DSCP marking support for RADIUS packets:

- DSCP marking for authentication and accounting is not supported for private servers, fully qualified domain name (FQDN) servers and radsec servers.
- In the case of wired IEEE 802.1x authentication, when source port extension is not enabled, only four default ports are in use. The DSCP marking is set only to the default ports and all the requests will be marked with the same DSCP value where the RADIUS server or server groups may require different DSCP marking values.
- DSCP marking is not supported in the case of wireless IEEE 802.1x authentication, where the source port is enabled by default.

## Information about RADIUS

## **RADIUS and Switch Access**

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.

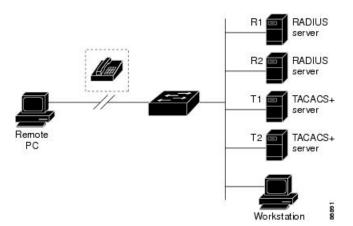

## **RADIUS Overview**

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco devices. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers
  from several vendors use a single RADIUS server-based security database. In an IP-based network with
  multiple vendors' access servers, dial-in users are authenticated through a RADIUS server that has been
  customized to work with the Kerberos security system.
- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a *smart card* access control system.
- Networks already using RADIUS. You can add a Cisco device containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See the illustration: Transitioning from RADIUS to TACACS+ Services below.

#### Figure 1: Transitioning from RADIUS to TACACS+ Services

- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see the chapter *Configuring IEEE 802.1x Port-Based Authentication*.
- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

## **RADIUS Operation**

When a user attempts to log in and authenticate to a device that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.

- **2.** The username and encrypted password are sent over the network to the RADIUS server.
- 3. The user receives one of the following responses from the RADIUS server:
  - ACCEPT—The user is authenticated.
  - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
  - CHALLENGE—A challenge requires additional data from the user.
  - CHALLENGE PASSWORD-A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

## **RADIUS Change of Authorization**

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy. This section provides an overview of the RADIUS interface including available primitives and how they are used during a CoA.

- Change-of-Authorization Requests
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication
- Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Cisco devices support the RADIUS CoA extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external AAA or policy servers.

Cisco devices supports these per-session CoA requests:

- Session reauthentication
- Session termination
- · Session termination with port shutdown
- Session termination with port bounce

This feature is integrated with Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Cisco devices. However, some basic configuration is required for the following attributes:

- Security and Password—refer to the "Preventing Unauthorized Access to Your Switch" section in this guide.
- Accounting—refer to the "Starting RADIUS Accounting" section in the Configuring Switch-Based Authentication chapter in this guide.

Cisco IOS XE software supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a push model to allow the dynamic reconfiguring of sessions from external AAA or policy servers. Per-session CoA requests are supported for session identification, session termination, host reauthentication, port shutdown, and port bounce. This model comprises one request (CoA-Request) and two possible response codes:

- CoA acknowledgement (ACK) [CoA-ACK]
- CoA nonacknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a AAA or policy server) and directed to the device that acts as a listener.

The table below shows the RADIUS CoA commands and vendor-specific attributes (VSAs) supported by Identity-Based Networking Services. All CoA commands must include the session identifier between the device and the CoA client.

| CoA Command            | Cisco VSA   |  |  |  |
|------------------------|---|--|--|--|
| Activate service       | Cisco:Avpair="subscriber:command=activate-service"                              |  |  |  |
|                        | Cisco:Avpair="subscriber:service-name= <service-name>"</service-name>           |  |  |  |
|                        | Cisco:Avpair="subscriber:precedence= <precedence-number>"</precedence-number>   |  |  |  |
|                        | Cisco:Avpair="subscriber:activation-mode=replace-all"                           |  |  |  |
| Deactivate service     | Cisco:Avpair="subscriber:command=deactivate-service"                            |  |  |  |
|                        | Cisco:Avpair="subscriber:service-name= <service-name>"</service-name>           |  |  |  |
| Bounce host port       | Cisco:Avpair="subscriber:command=bounce-host-port"                              |  |  |  |
| Disable host port      | Cisco:Avpair="subscriber:command=disable-host-port"                             |  |  |  |
| Session query          | Cisco:Avpair="subscriber:command=session-query"                                 |  |  |  |
| Session reauthenticate | Cisco:Avpair="subscriber:command=reauthenticate"                                |  |  |  |
|                        | Cisco:Avpair="subscriber:reauthenticate-type=last" or                           |  |  |  |
|                        | Cisco:Avpair="subscriber:reauthenticate-type=rerun"                             |  |  |  |
| Session terminate      | This is a standard disconnect request and does not require a VSA.               |  |  |  |
| Interface template     | Cisco:AVpair="interface-template-name= <interfacetemplate>"</interfacetemplate> |  |  |  |

Table 1: RADIUS CoA Commands Supported by Identity-Based Networking Services

## **Change-of-Authorization Requests**

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

#### **RFC 5176 Compliance**

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.

This table shows the IETF attributes are supported for this feature.

Table 2: Supported IETF Attributes

| Attribute<br>Number | Attribute Name        |
|---------------------|-----------------------|
| 24                  | State                 |
| 31                  | Calling-Station-ID    |
| 44                  | Acct-Session-ID       |
| 80                  | Message-Authenticator |
| 101                 | Error-Cause           |

This table shows the possible values for the Error-Cause attribute.

#### Table 3: Error-Cause Values

| Value | Explanation                      |
|-------|----------------------------------|
| 201   | Residual Session Context Removed |
| 202   | Invalid EAP Packet (Ignored)     |
| 401   | Unsupported Attribute            |
| 402   | Missing Attribute                |
| 403   | NAS Identification Mismatch      |
| 404   | Invalid Request                  |
| 405   | Unsupported Service              |
| 406   | Unsupported Extension            |

| Value | Explanation                            |
|-------|--|
| 407   | Invalid Attribute Value                |
| 501   | Administratively Prohibited            |
| 502   | Request Not Routable (Proxy)           |
| 503   | Session Context Not Found              |
| 504   | Session Context Not Removable          |
| 505   | Other Proxy Processing Error           |
| 506   | Resources Unavailable                  |
| 507   | Request Initiated                      |
| 508   | Multiple Session Selection Unsupported |

## **CoA Request Response Code**

The CoA Request response code can be used to convey a command to the switch.

The packet format for a CoA Request Response code as defined in RFC 5176 consists of the following fields: Code, Identifier, Length, Authenticator, and Attributes in the Type:Length:Value (TLV) format. The Attributes field is used to carry Cisco vendor-specific attributes (VSAs).

#### Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the "Invalid Attribute Value" error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect- negative acknowledgment (NAK) or CoA-NAK with the error code "Invalid Attribute Value."

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.

The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code "Invalid Attribute Value" if any of the above session identification attributes are included in the message.

#### **CoA ACK Response Code**

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

#### **CoA NAK Response Code**

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use **show** commands to verify a successful CoA.

## **CoA Request Commands**

| Command 1           | Cisco VSA  |
|---------------------|--|
| Reauthenticate host | Cisco:Avpair="subscriber:command=reauthenticate"                   |
| Terminate session   | This is a standard disconnect request that does not require a VSA. |
| Bounce host port    | Cisco:Avpair="subscriber:command=bounce-host-port"                 |
| Disable host port   | Cisco:Avpair="subscriber:command=disable-host-port"                |

#### Table 4: Supported CoA Commands

<sup>1</sup> All CoA commands must include the session identifier between the device and the CoA client.

## **Session Reauthentication**

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: *Cisco:Avpair="subscriber:command=reauthenticate"* and one or more session identification attributes.

The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

#### **Session Reauthentication in a Switch Stack**

When a switch stack receives a session reauthentication message:

- It checkpoints the need for a re-authentication before returning an acknowledgment (ACK).
- It initiates reauthentication for the appropriate session.
- If authentication completes with either success or failure, the signal that triggered the reauthentication is removed from the stack member.
- If the active switch fails before authentication completes, reauthentication is initiated after active switch changeover based on the original command (which is subsequently removed).
- If the active switch fails before sending an ACK, the new active switch treats the re-transmitted command as a new command.

#### Session Termination

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host access to the network.

To restrict a host's access to the network, use a CoA Request with the

Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

#### **CoA Disconnect-Request**

This command is a standard Disconnect-Request. If the session cannot be located, the device returns a Disconnect-NAK message with the "Session Context Not Found" error-code attribute. If the session is located, the device terminates the session. After the session has been completely removed, the device returns a Disconnect-ACK.

If the device fails-over to a standby device before returning a Disconnect-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the session is not found following re-sending, a Disconnect-ACK is sent with the "Session Context Not Found" error-code attribute.

#### **CoA Request: Disable Host Port**

The RADIUS server CoA disable port command administratively shuts down the authentication port that is hosting a session, resulting in session termination. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. To restore network access on the port, reenable it using a non-RADIUS mechanism. This command is carried in a standard CoA-Request message that has this new vendor-specific attribute (VSA):

Cisco:Avpair="subscriber:command=disable-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the "Session Identification" section. If the session cannot be located, the device returns a CoA-NAK message with the "Session Context Not Found" error-code attribute. If the session is located, the device disables the hosting port and returns a CoA-ACK message.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active device.

Note

A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby device became active.

#### **CoA Request: Bounce-Port**

A RADIUS server CoA bounce port sent from a RADIUS server can cause a link flap on an authentication port, which triggers DHCP renegotiation from one or more hosts connected to this port. This incident can occur when there is a VLAN change and the endpoint is a device (such as a printer) that does not have a mechanism to detect a change on this authentication port. The CoA bounce port is carried in a standard CoA-Request message that contains the following VSA:

Cisco:Avpair="subscriber:command=bounce-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the device returns a CoA-NAK message with the "Session Context Not Found" error-code attribute. If the session is located, the device disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the device fails before returning a CoA-ACK to the client, the process is repeated on the new active device when the request is re-sent from the client. If the device fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active device.

## Stacking Guidelines for Session Termination

No special handling is required for CoA Disconnect-Request messages in a switch stack.

#### **Stacking Guidelines for CoA-Request Bounce-Port**

Because the **bounce-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the active switch receives a valid **bounce-port** command, it checkpoints the following information before returning a CoA-ACK message:

- the need for a port-bounce
- the port-id (found in the local session context)

The switch initiates a port-bounce (disables the port for 10 seconds, then re-enables it).

If the port-bounce is successful, the signal that triggered the port-bounce is removed from the standby switch.

If the active switch fails before the port-bounce completes, a port-bounce is initiated after active switch changeover based on the original command (which is subsequently removed).

If the active switch fails before sending a CoA-ACK message, the new active switch treats the re-sent command as a new command.

#### **Stacking Guidelines for CoA-Request Disable-Port**

Because the **disable-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the active switch receives a valid **disable-port** command, it verifies this information before returning a CoA-ACK message:

- the need for a port-disable
- the port-id (found in the local session context)

The switch attempts to disable the port.

If the port-disable operation is successful, the signal that triggered the port-disable is removed from the standby switch.

If the active switch fails before the port-disable operation completes, the port is disabled after active switch changeover based on the original command (which is subsequently removed).

If the active switch fails before sending a CoA-ACK message, the new active switch treats the re-sent command as a new command.

## **Default RADIUS Configuration**

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the device through the CLI.

## **RADIUS Server Host**

Device-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- · Accounting destination port
- · Key string
- · Timeout period

• Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS\_DEAD message appears, and then the device tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the device use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the device.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

## **RADIUS Login Authentication**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to a list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

## **AAA Server Groups**

You can configure the device to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order in which they are configured.)

## **AAA** Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the device uses information retrieved from the user's profile, which is in the local user database or on the security server, to configure the user's session. The user is granted access to a requested service only if the information in the user profile allows it.

## **RADIUS Accounting**

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the device reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

## Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the device and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco's vendor-ID is 9, and the supported option has vendor-type 1, which is named *cisco-avpair*. The value is a string with this format:

protocol : attribute sep value \*

*Protocol* is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attributevalue (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is \* for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, the following AV pair causes Cisco's "multiple named IP address pools" feature to be activated during IP authorization (during PPP's Internet Protocol Control Protocol (IPCP) address assignment):

cisco-avpair= "ip:addr-pool=first"

If you insert an "\*", the AV pair "ip:addr-pool=first" becomes optional. Note that any AV pair can be made optional:

cisco-avpair= "ip:addr-pool\*first"

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

cisco-avpair= "shell:priv-lvl=15"

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, "Remote Authentication Dial-In User Service (RADIUS)."

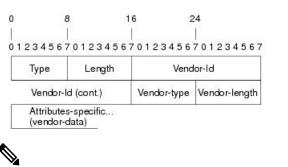

Attribute 26 contains the following three elements:

- Type
- Length
- String (also known as data)

- Vendor-ID
- Vendor-Type
- Vendor-Length
- Vendor-Data

The figure below shows the packet format for a VSA encapsulated "behind" attribute 26.

#### Figure 2: VSA Encapsulated Behind Attribute 26

Note

It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor's definition of that attribute.

51325

The table below describes significant fields listed in the Vendor-Specific RADIUS IETF Attributes table (second table below), which lists supported vendor-specific RADIUS attributes (IETF attribute 26).

Table 5: Vendor-Specific Attributes Table Field Descriptions

| Field                         | Description  |
|-------------------------------|--|
| Number                        | All attributes listed in the following table are extensions of IETF attribute 26.  |
| Vendor-Specific Command Codes | A defined code used to identify a particular vendor. Code 9 defines Cisco VSAs, 311 defines Microsoft VSAs, and 529 defines Ascend VSAs.                       |
| Sub-Type Number               | The attribute ID number. This number is much like the ID numbers of IETF attributes, except it is a "second layer" ID number encapsulated behind attribute 26. |
| Attribute                     | The ASCII string name of the attribute.  |
| Description                   | Description of the attribute.  |

#### Table 6: Vendor-Specific RADIUS IETF Attributes

| Number             | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute | Description |
|--------------------|---------------------------------|-----------------|-----------|-------------|
| MS-CHAP Attributes |                                 |                 |           |             |

| Number       | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute                 | Description  |
|--------------|---------------------------------|-----------------|---------------------------|--|
| 26           | 311                             | 1               | MSCHAP-Response           | Contains the response<br>value provided by a PPP<br>MS-CHAP user in<br>response to the challenge.<br>It is only used in<br>Access-Request packets.<br>This attribute is identical<br>to the PPP CHAP<br>Identifier. (RFC 2548              |
| 26           | 311                             | 11              | MSCHAP-Challenge          | Contains the challenge sent<br>by a network access server<br>to an MS-CHAP user. It<br>can be used in both<br>Access-Request and<br>Access-Challenge packets.<br>(RFC 2548)  |
| VPDN Attribu | ites                            |                 |                           |  |
| 26           | 9                               | 1               | 12tp-cm-local-window-size | Specifies the maximum<br>receive window size for<br>L2TP control messages.<br>This value is advertised to<br>the peer during tunnel<br>establishment.  |
| 26           | 9                               | 1               | l2tp-drop-out-of-order    | Respects sequence<br>numbers on data packets<br>by dropping those that are<br>received out of order. This<br>does not ensure that<br>sequence numbers will be<br>sent on data packets, just<br>how to handle them if they<br>are received. |
| 26           | 9                               | 1               | l2tp-hello-interval       | Specifies the number of<br>seconds for the hello<br>keepalive interval. Hello<br>packets are sent when no<br>data has been sent on a<br>tunnel for the number of<br>seconds configured here.   |
| 26           | 9                               | 1               | l2tp-hidden-avp           | When enabled, sensitive<br>AVPs in L2TP control<br>messages are scrambled or<br>hidden.  |

| Number        | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute              | Description  |
|---------------|---------------------------------|-----------------|------------------------|--|
| 26            | 9                               | 1               | 12tp-nosession-timeout | Specifies the number of<br>seconds that a tunnel will<br>stay active with no sessions<br>before timing out and<br>shutting down.   |
| 26            | 9                               | 1               | tunnel-tos-reflect     | Copies the IP ToS field<br>from the IP header of each<br>payload packet to the IP<br>header of the tunnel packet<br>for packets entering the<br>tunnel at the LNS.               |
| 26            | 9                               | 1               | l2tp-tunnel-authen     | If this attribute is set, it<br>performs L2TP tunnel<br>authentication.  |
| 26            | 9                               | 1               | 12tp-tunnel-password   | Shared secret used for<br>L2TP tunnel authentication<br>and AVP hiding.  |
| 26            | 9                               | 1               | 12tp-udp-checksum      | This is an authorization<br>attribute and defines<br>whether L2TP should<br>perform UDP checksums<br>for data packets. Valid<br>values are "yes" and "no."<br>The default is no. |
| Store and For | rward Fax Attributes            | 1               | 1                      |  |
| 26            | 9                               | 3               | Fax-Account-Id-Origin  | Indicates the account ID<br>origin as defined by system<br>administrator for the<br><b>mmoip aaa receive-id</b> or<br>the <b>mmoip aaa send-id</b><br>commands.                  |
| 26            | 9                               | 4               | Fax-Msg-Id=            | Indicates a unique fax<br>message identification<br>number assigned by Store<br>and Forward Fax.   |
| 26            | 9                               | 5               | Fax-Pages              | Indicates the number of<br>pages transmitted or<br>received during this fax<br>session. This page count<br>includes cover pages.   |

| Number | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute              | Description   |
|--------|---------------------------------|-----------------|------------------------|---|
| 26     | 9                               | 6               | Fax-Coverpage-Flag     | Indicates whether or not a<br>cover page was generated<br>by the off-ramp gateway<br>for this fax session. True<br>indicates that a cover page<br>was generated; false means<br>that a cover page was not<br>generated.   |
| 26     | 9                               | 7               | Fax-Modem-Time         | Indicates the amount of<br>time in seconds the modem<br>sent fax data (x) and the<br>amount of time in seconds<br>of the total fax session (y),<br>which includes both<br>fax-mail and PSTN time,<br>in the form x/y. For<br>example, 10/15 means that<br>the transfer time took 10<br>seconds, and the total fax<br>session took 15 seconds. |
| 26     | 9                               | 8               | Fax-Connect-Speed      | Indicates the modem speed<br>at which this fax-mail was<br>initially transmitted or<br>received. Possible values<br>are 1200, 4800, 9600, and<br>14400.   |
| 26     | 9                               | 9               | Fax-Recipient-Count    | Indicates the number of<br>recipients for this fax<br>transmission. Until e-mail<br>servers support Session<br>mode, the number should<br>be 1.   |
| 26     | 9                               | 10              | Fax-Process-Abort-Flag | Indicates that the fax<br>session was terminated or<br>successful. True means that<br>the session was terminated;<br>false means that the session<br>was successful.  |
| 26     | 9                               | 11              | Fax-Dsn-Address        | Indicates the address to which DSNs will be sent.   |

I

| Number | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute             | Description  |
|--------|---------------------------------|-----------------|-----------------------|--|
| 26     | 9                               | 12              | Fax-Dsn-Flag          | Indicates whether or not<br>DSN has been enabled.<br>True indicates that DSN<br>has been enabled; false<br>means that DSN has not<br>been enabled.                                       |
| 26     | 9                               | 13              | Fax-Mdn-Address       | Indicates the address to which MDNs will be sent.  |
| 26     | 9                               | 14              | Fax-Mdn-Flag          | Indicates whether or not<br>message delivery<br>notification (MDN) has<br>been enabled. True<br>indicates that MDN had<br>been enabled; false means<br>that MDN had not been<br>enabled. |
| 26     | 9                               | 15              | Fax-Auth-Status       | Indicates whether or not<br>authentication for this fax<br>session was successful.<br>Possible values for this<br>field are success, failed,<br>bypassed, or unknown.                    |
| 26     | 9                               | 16              | Email-Server-Address  | Indicates the IP address of<br>the e-mail server handling<br>the on-ramp fax-mail<br>message.  |
| 26     | 9                               | 17              | Email-Server-Ack-Flag | Indicates that the on-ramp<br>gateway has received a<br>positive acknowledgment<br>from the e-mail server<br>accepting the fax-mail<br>message.  |
| 26     | 9                               | 18              | Gateway-Id            | Indicates the name of the<br>gateway that processed the<br>fax session. The name<br>appears in the following<br>format:<br>hostname.domain-name.   |
| 26     | 9                               | 19              | Call-Type             | Describes the type of fax<br>activity: fax receive or fax<br>send.   |

| Number         | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute                                  | Description   |
|----------------|---------------------------------|-----------------|--|---|
| 26             | 9                               | 20              | Port-Used                                  | Indicates the slot/port<br>number of the Cisco<br>AS5300 used to either<br>transmit or receive this<br>fax-mail.  |
| 26             | 9                               | 21              | Abort-Cause                                | If the fax session<br>terminates, indicates the<br>system component that<br>signaled the termination.<br>Examples of system<br>components that could<br>trigger an termination are<br>FAP (Fax Application<br>Process), TIFF (the TIFF<br>reader or the TIFF writer),<br>fax-mail client, fax-mail<br>server, ESMTP client, or<br>ESMTP server. |
| H323 Attribute | es                              |                 |  |   |
| 26             | 9                               | 23              | Remote-Gateway-ID<br>(h323-remote-address) | Indicates the IP address of the remote gateway.   |
| 26             | 9                               | 24              | Connection-ID<br>(h323-conf-id)            | Identifies the conference<br>ID.  |
| 26             | 9                               | 25              | Setup-Time<br>(h323-setup-time)            | Indicates the setup time for<br>this connection in<br>Coordinated Universal<br>Time (UTC) formerly<br>known as Greenwich Mean<br>Time (GMT) and Zulu<br>time.   |
| 26             | 9                               | 26              | Call-Origin<br>(h323-call-origin)          | Indicates the origin of the<br>call relative to the gateway.<br>Possible values are<br>originating and terminating<br>(answer).   |
| 26             | 9                               | 27              | Call-Type<br>(h323-call-type)              | Indicates call leg type.<br>Possible values are<br>telephony and VoIP.  |
| 26             | 9                               | 28              | Connect-Time<br>(h323-connect-time)        | Indicates the connection<br>time for this call leg in<br>UTC.   |

I

| Number        | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute                                   | Description   |
|---------------|---------------------------------|-----------------|---|---|
| 26            | 9                               | 29              | Disconnect-Time<br>(h323-disconnect-time)   | Indicates the time this call<br>leg was disconnected in<br>UTC.   |
| 26            | 9                               | 30              | Disconnect-Cause<br>(h323-disconnect-cause) | Specifies the reason a<br>connection was taken<br>offline per Q.931<br>specification.   |
| 26            | 9                               | 31              | Voice-Quality<br>(h323-voice-quality)       | Specifies the impairment factor (ICPIF) affecting voice quality for a call.   |
| 26            | 9                               | 33              | Gateway-ID<br>(h323-gw-id)                  | Indicates the name of the underlying gateway.   |
| Large Scale D | ialout Attributes               |                 |   |   |
| 26            | 9                               | 1               | callback-dialstring                         | Defines a dialing string to be used for callback.   |
| 26            | 9                               | 1               | data-service                                | No description available.   |
| 26            | 9                               | 1               | dial-number                                 | Defines the number to dial.   |
| 26            | 9                               | 1               | force-56                                    | Determines whether the<br>network access server uses<br>only the 56 K portion of a<br>channel, even when all 64<br>K appear to be available.            |
| 26            | 9                               | 1               | map-class                                   | Allows the user profile to<br>reference information<br>configured in a map class<br>of the same name on the<br>network access server that<br>dials out. |
| 26            | 9                               | 1               | send-auth                                   | Defines the protocol to use<br>(PAP or CHAP) for<br>username-password<br>authentication following<br>CLID authentication.                               |

| Number | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute | Description  |
|--------|---------------------------------|-----------------|-----------|--|
| 26     | 9                               |                 | send-name | PPP name authentication.<br>To apply for PAP, do not<br>configure the <b>ppp pap</b><br>sent-name password<br> |

| Number          | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute   | Description   |
|-----------------|---------------------------------|-----------------|-------------|---|
| 26              | 9                               | 1               | send-secret | PPP password<br>authentication. The<br>vendor-specific attributes<br>(VSAs)<br>"preauth:send-name" and<br>"preauth:send-secret" will<br>be used as the PAP<br>username and PAP<br>password for outbound<br>authentication. For a<br>CHAP outbound case, both<br>"preauth:send-name" and<br>"preauth:send-secret" will<br>be used in the response<br>packet. |
| 26              | 9                               | 1               | remote-name | Provides the name of the<br>remote host for use in<br>large-scale dial-out. Dialer<br>checks that the large-scale<br>dial-out remote name<br>matches the authenticated<br>name, to protect against<br>accidental user RADIUS<br>misconfiguration. (For<br>example, dialing a valid<br>phone number but<br>connecting to the wrong<br>device.)               |
| Miscellaneous A | Attributes                      | 1               | <u> </u>    | 1   |

| Number | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute         | Description  |
|--------|---------------------------------|-----------------|-------------------|--|
| 26     | 9                               | 2               | Cisco-NAS-Port    | Specifies additional vendor<br>specific attribute (VSA)<br>information for NAS-Port<br>accounting. To specify<br>  |
| 26     | 9                               | 1               | min-links         | Sets the minimum number of links for MLP.  |
| 26     | 9                               | 1               | proxyacl# <n></n> | Allows users to configure<br>the downloadable user<br>profiles (dynamic ACLs)<br>by using the authentication<br>proxy feature so that users<br>can have the configured<br>authorization to permit<br>traffic going through the<br>configured interfaces. |

| Number | Vendor-Specific<br>Company Code | Sub-Type Number | Attribute | Description  |
|--------|---------------------------------|-----------------|-----------|--|
| 26     | 9                               | 1               | spi       | Carries the authentication<br>information needed by the<br>home agent to authenticate<br>a mobile node during<br>registration. The<br>information is in the same<br>syntax as the <b>ip mobile</b><br><b>secure host <addr></addr></b><br>configuration command.<br>Basically it contains the<br>rest of the configuration<br>command that follows that<br>string, verbatim. It<br>provides the Security<br>Parameter Index (SPI),<br>key, authentication<br>algorithm, authentication<br>mode, and replay<br>protection timestamp<br>range. |

## **Vendor-Proprietary RADIUS Server Communication**

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the device and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS XE software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the device. You specify the RADIUS host and secret text string by using the **radius server** global configuration commands.

## **DSCP** marking for RADIUS packets

Differentiated Services (DiffServ) is a model in which traffic is treated by intermediate systems with relative priorities based on the type of services (ToS) field. The six most significant bits of the DiffServ field is called as the Differentiated Services Code Point (DSCP). Cisco IOS XE software supports DSCP marking for RADIUS packets. DSCP marking enables faster authentication and accounting of RADIUS packets.

You can configure DSCP marking on the RADIUS server, server group and in global configuration mode. When DSCP marking configuration is applied on RADIUS server, server group and global configuration mode, the DSCP marking values entered on the RADIUS server is taken.

- If there is no DSCP marking configuration on the RADIUS server, the DSCP marking values configured on the server group is applied to the RADIUS packets.
- If there is no DSCP marking configuration on the RADIUS server, RADIUS server group, the DSCP marking values configured at the global configuration mode is applied to the RADIUS packets.

L

## **How to Configure RADIUS**

## **Identifying the RADIUS Server Host**

To apply these settings globally to all RADIUS servers communicating with the device, use the three unique global configuration commands: **radius-server timeout**, **radius-server retransmit**, and **key** *string*.

You can configure the device to use AAA server groups to group existing server hosts for authentication.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the device and the key string to be shared by both the server and the device.

Follow these steps to configure per-server RADIUS server communication.

#### Before you begin

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the device, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands.

#### Procedure

|        | Command or Action  | Purpose   |
|--------|--|---|
| Step 1 | enable   | Enables privileged EXEC mode.   |
|        | Example:   | • Enter your password if prompted.  |
|        | Device> enable   |   |
| Step 2 | configure terminal   | Enters global configuration mode.   |
|        | Example:   |   |
|        | Device# configure terminal   |   |
| Step 3 | radius server server name  | Specifies the name for the RADIUS server  |
|        | Example:   | configuration for Protected Access Credential (PAC) provisioning, and enters RADIUS server                  |
|        | Device(config)# radius server rsim   | configuration mode.   |
| Step 4 | address {ipv4   ipv6}ip address { auth-port         port number   acct-port port number} | (Optional) Specifies the RADIUS server parameters.  |
|        | Example:   | For <b>auth-port</b> <i>port-number</i> , specify the UDP destination port for authentication requests. The |
|        | Device (config-radius-server) # address  | default is 1645. The range is 0 to 65536.   |
|        | ipv4 124.2.2.12 auth-port 1612   | For <b>acct-port</b> <i>port-number</i> , specify the UDP   |
|        |  | destination port for authentication requests. The default is 1646.  |

| <b>xey</b> string<br>Example:<br>Device(config-radius-server)# <b>key rad123</b> | <ul> <li>(Optional) For key string, specify the authentication and encryption key used between the device and the RADIUS daemon running on the RADIUS server.</li> <li>Note The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius server command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks are part of the</li> </ul> |
|--|--|
|  | Note The key is a text string that must<br>match the encryption key used on<br>the RADIUS server. Always<br>configure the key as the last item<br>in the <b>radius server</b> command.<br>Leading spaces are ignored, but<br>spaces within and at the end of the<br>key are used. If you use spaces in<br>your key, do not enclose the key<br>in quotation marks unless the  |
|  | key.   |
| retransmit value<br>Example:<br>Device (config-radius-server)# retransmit<br>10  | (Optional) Specifies the number of times a<br>RADIUS request is resent when the server is<br>not responding or responding slowly. The range<br>is 1 to 100. This setting overrides the<br><b>radius-server retransmit</b> global configuration<br>command setting.   |
| <pre>imeout seconds Example: Device(config-radius-server)# timeout 60</pre>      | (Optional) Specifies the time interval that the device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the <b>radius-server timeout</b> global configuration command setting.  |
| nd<br>:xample:   | Exits RADIUS server configuration mode and enters privileged EXEC mode.  |
| )e   | vice(config-radius-server)# <b>timeout 60</b>  |

## **Configuring RADIUS Login Authentication**

Follow these steps to configure RADIUS login authentication:

#### Before you begin

To secure the device for HTTP access by using AAA methods, you must configur the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the device for HTTP access by using AAA methods.

|        | Command or Action   | Purpose   |
|--------|---|---|
| Step 1 | enable  | Enables privileged EXEC mode.   |
|        | Example:  | • Enter your password if prompted.  |
|        | Device> enable  |   |
| Step 2 | configure terminal  | Enters global configuration mode.   |
|        | Example:  |   |
|        | Device# configure terminal  |   |
| Step 3 | aaa new-model   | Enables AAA.  |
|        | Example:  |   |
|        | Device(config)# aaa new-model   |   |
| Step 4 | aaa authentication login {default   <i>list-name</i> }                | Creates a login authentication method list.   |
|        | method1 [method2]   | • To create a default list that is used when  |
|        | Example:<br>Device(config)# aaa authentication login<br>default local | named list is <i>not</i> specified in the <b>login</b><br><b>authentication</b> command, use the <b>defau</b> |
|        |   |   |
|        |   | to be used in default situations. The defau   |
|        |   | method list is automatically applied to a ports.  |
|        |   | • For <i>list-name</i> , specify a character string t   |
|        |   | name the list you are creating.   |
|        |   | • For <i>method1</i> , specify the actual metho   |
|        |   | the authentication algorithm tries. The   |
|        |   | additional methods of authentication are<br>used only if the previous method returns                          |
|        |   | an error, not if it fails.  |
|        |   | Select one of these methods:  |
|        |   | • <i>enable</i> —Use the enable password for  |
|        |   | authentication. Before you can use  |
|        |   | this authentication method, you mu<br>define an enable password by using                                      |
|        |   | the enable password global  |
|        |   | configuration command.  |
|        |   | • group radius—Use RADIUS authentication. Before you can use  |
|        |   | this authentication method, you mu  |
|        |   | configure the RADIUS server.  |
|        |   | • <i>line</i> —Use the line password for  |
|        |   | authentication. Before you can use<br>this authentication method, you mu                                      |
|        | I   |   |

#### Procedure

|        | Command or Action  | Purpose   |
|--------|--|---|
|        |  | define a line password. Use the <b>password</b> <i>password</i> line configuration command.   |
|        |  | • <i>local</i> —Use the local username database for authentication. You must enter username information in the database. Use the <b>username</b> <i>name</i> <b>password</b> global configuration command.                          |
|        |  | • <i>local-case</i> —Use a case-sensitive<br>local username database for<br>authentication. You must enter<br>username information in the database<br>by using the <b>username</b> <i>password</i><br>global configuration command. |
|        |  | • <i>none</i> —Do not use any authentication for login.   |
| Step 5 | line [console   tty   vty] line-number<br>[ending-line-number]<br>Example: | Enters line configuration mode, and configure<br>the lines to which you want to apply the<br>authentication list.   |
|        | Device(config)# line 1 4   |   |
| Step 6 | login authentication {default   list-name}         Example:                | Applies the authentication list to a line or set of lines.  |
|        | Device(config-line)# login authentication<br>default                       | • If you specify <b>default</b> , use the default list created with the <b>aaa authentication login</b> command.  |
|        |  | • For <i>list-name</i> , specify the list created with the <b>aaa authentication login</b> command.   |
| Step 7 | end<br>Example:<br>Device(config-line)# end                                | Exits line configuration mode and enters privileged EXEC mode.  |

## **Defining AAA Server Groups**

You use the **server** group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional **auth-port** and **acct-port** keywords.

Follow these steps to define AAA server groups:

# **Command or Action**

| Example:<br>Device> enable<br>configure terminal<br>Example:<br>Device# configure terminal<br>radius server name | Enter your password, if prompted.<br>Enters global configuration mode.  |
|--|---|
| <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                | Enters global configuration mode.   |
| Example:<br>Device# configure terminal   | Enters global configuration mode.   |
| Device# configure terminal   |   |
|  |   |
| radius server name   |   |
|  | Specifies the name of the RADIUS server   |
| Example:   | configuration for Protected Access Credential   |
| Device(config)# radius server ISE  | (PAC) provisioning and enters RADIUS server configuration mode.   |
|  | The device also supports RADIUS for IPv6.   |
| address {ipv4   ipv6} {ip-address   hostname}  | Configures the IPv4 address for the RADIUS  |
| auth-port port-number acct-port port-number  | server accounting and authentication  |
| Example:   | parameters.   |
| Device(config-radius-server)# address<br>ipv4 10.1.1.1 auth-port 1645 acct-port<br>1646                          |   |
| key string   | Specifies the authentication and encryption key   |
| Example:   | for all RADIUS communications between the device and the RADIUS server.   |
| Device(config-radius-server)# <b>key</b><br>cisco123   | device and the KADIOS server.   |
| exit   | Exits RADIUS server configuration mode and  |
| Example:   | enters global configuration mode.   |
| Device(config-radius-server)# <b>exit</b>  |   |
| aaa group server radius group_name   | Defines the RADIUS server group configuration   |
| Example:   | and enters RADIUS server group configuration mode.  |
| Device(config)# aaa group server radius abc  | mode.   |
| server name server   | Associates the RADIUS server to the server  |
| Example:   | group.  |
| Device(config-sg-radius)# <b>server name</b><br>ISE  |   |
| end  | Exits RADIUS server group configuration mode  |
| Example:   | and returns to privileged EXEC mode.  |
| -  |   |
|  | auth-port port-number acct-port port-number<br>Example:<br>Device (config-radius-server) # address<br>ipv4 10.1.1.1 auth-port 1645 acct-port<br>1646<br>key string<br>Example:<br>Device (config-radius-server) # key<br>cisco123<br>exit<br>Example:<br>Device (config-radius-server) # exit<br>aaa group server radius group_name<br>Example:<br>Device (config) # aaa group server radius<br>abc<br>server name server<br>Example:<br>Device (config) # aaa group server radius<br>abc |

Purpose

## Procedure

# Configuring RADIUS Authorization for User Privileged Access and Network Services

# 

**Note** Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user priviledged access and network services:

#### Procedure

|        | Command or Action  | Purpose   |
|--------|--|---|
| Step 1 | enable   | Enables privileged EXEC mode.   |
|        | Example:   | • Enter your password if prompted.  |
|        | Device> enable   |   |
| Step 2 | configure terminal   | Enters global configuration mode.   |
|        | Example:   |   |
|        | Device# configure terminal                                 |   |
| Step 3 | aaa authorization network <i>authorization-list</i> radius | Configures the device for user RADIUS authorization for all network-related service                     |
|        | Example:   | requests.   |
|        | Device(config)# aaa authorization network<br>list1 radius  |   |
| Step 4 | aaa authorization exec authorization-list radius           | Configures the device for user RADIUS authorization if the user has privileged EXEC                     |
|        | Example:   | access.   |
|        | Device(config)# aaa authorization exec<br>list1 radius     | The <b>exec</b> keyword might return user profile information (such as <b>autocommand</b> information). |
| Step 5 | end  | Exits global configuration mode and returns to  |
|        | Example:   | privileged EXEC mode.   |
|        | •<br>Device(config)# end                                   |   |

#### What to do next

You can use the **aaa authorization** global configuration command with the **radius** keyword to set parameters that restrict a user's network access to privileged EXEC mode.

The aaa authorization exec radius local command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

## **Starting RADIUS Accounting**

Follow these steps to start RADIUS accounting:

## Procedure

|        | Command or Action   | Purpose   |
|--------|---|---|
| Step 1 | enable  | Enables privileged EXEC mode.                                       |
|        | Example:  | • Enter your password if prompted.                                  |
|        | Device> enable  |   |
| Step 2 | configure terminal  | Enters global configuration mode.                                   |
|        | Example:  |   |
|        | Device# configure terminal  |   |
| Step 3 | aaa accounting network<br>accounting-liststart-stop radius        | Enables RADIUS accounting for all network-related service requests. |
|        | Example:  |   |
|        | Device(config)# aaa accounting network<br>start-stop radius       |   |
| Step 4 | aaa accounting exec accounting-liststart-stop                     | Enables RADIUS accounting to send a                                 |
|        | radius  | start-record accounting notice at the beginning                     |
|        | Example:  | of a privileged EXEC process and a stop-record at the end           |
|        | Device(config)# aaa accounting exec<br>acc-list start-stop radius |   |
| Step 5 | end   | Exits global configuration mode and returns to                      |
|        | Example:  | privileged EXEC mode.   |
|        | Device(config)# end   |   |
|        | 1   | 1   |

## **Configuring Settings for All RADIUS Servers**

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

## Procedure

|        | Command or Action | Purpose                       |
|--------|-------------------|-------------------------------|
| Step 1 | enable            | Enables privileged EXEC mode. |

|        | Command or Action   | Purpose   |
|--------|---|---|
|        | Example:  | Enter your password, if prompted.   |
|        | Device> enable  |   |
| Step 2 | configure terminal  | Enters global configuration mode.   |
|        | Example:  |   |
|        | Device# configure terminal                                  |   |
| Step 3 | radius server server name                                   | Specifies the name for the RADIUS server  |
|        | Example:  | configuration for Protected Access Credentia<br>(PAC) provisioning, and enters RADIUS serve   |
|        | Device(config)# radius server rsim                          | configuration mode.   |
| Step 4 | key string  | Specifies the shared secret text string used  |
|        | Example:  | between the switch and all RADIUS servers.  |
|        | Device(config-radius-server)# <b>key</b><br>your_server_key | Note The key is a text string that must<br>match the encryption key used on<br>the RADIUS server. Leading<br>spaces are ignored, but spaces<br>within and at the end of the key<br>are used. If you use spaces in your<br>key, do not enclose the key in<br>quotation marks unless the<br>quotation marks are part of the<br>key. |
| Step 5 | retransmit retries  | Specifies the number of times the switch sends  |
|        | Example:  | each RADIUS request to the server before  |
|        | Device(config-radius-server)# retransmit<br>5               | giving up. The default is 3; the range 1 to 1000.   |
| Step 6 | timeout seconds   | Specifies the number of seconds a switch waits  |
|        | Example:  | for a reply to a RADIUS request before resending the request. The default is 5 seconds;   |
|        | Device(config-radius-server)# timeout 3                     | the range is 1 to 1000.   |
| Step 7 | end   | Exits RADIUS server configuration mode and  |
|        | Example:  | enters privileged EXEC mode.  |
|        | •<br>Device(config-radius-server)# <b>end</b>               |   |

## **Configuring the Device to Use Vendor-Specific RADIUS Attributes**

Follow these steps to configure vendor-specific RADIUS attributes:

|        | Command or Action   | Purpose  |
|--------|---|--|
| Step 1 | enable  | Enables privileged EXEC mode.  |
|        | Example:  | Enter your password, if prompted.  |
|        | Device> enable  |  |
| Step 2 | configure terminal  | Enters global configuration mode.  |
|        | Example:  |  |
|        | Device# configure terminal  |  |
| Step 3 | radius-server vsa send [accounting  <br>authentication]                       | Enables the device to recognize and use VSAs as defined by RADIUS IETF attribute 26.   |
|        | <pre>Example:<br/>Device(config)# radius-server vsa send<br/>accounting</pre> | • (Optional) Use the <b>accounting</b> keyword<br>to limit the set of recognized<br>vendor-specific attributes to only<br>accounting attributes.         |
|        |   | • (Optional) Use the <b>authentication</b><br>keyword to limit the set of recognized<br>vendor-specific attributes to only<br>authentication attributes. |
|        |   | If you enter this command without keywords,<br>both accounting and authentication<br>vendor-specific attributes are used.                                |
| Step 4 | end   | Exits global configuration mode and enters   |
|        | Example:  | privileged EXEC mode.  |
|        | Device(config)# <b>end</b>  |  |

#### Procedure

## **Configuring the Device for Vendor-Proprietary RADIUS Server Communication**

Follow these steps to configure vendor-proprietary RADIUS server communication:

## Procedure

|        | Command or Action          | Purpose                            |
|--------|----------------------------|------------------------------------|
| Step 1 | enable                     | Enables privileged EXEC mode.      |
|        | Example:                   | • Enter your password if prompted. |
|        | Device> enable             |                                    |
| Step 2 | configure terminal         | Enters global configuration mode.  |
|        | Example:                   |                                    |
|        | Device# configure terminal |                                    |

|        | Command or Action  | Purpose  |
|--------|--|--|
| Step 3 | <pre>radius server server name Example: Device(config)# radius server rsim</pre>                             | Specifies the name for the RADIUS server<br>configuration for Protected Access Credential<br>(PAC) provisioning, and enters RADIUS server<br>configuration mode.   |
| Step 4 | address { ipv4   ipv6 } ip address<br>Example:<br>Device(config-radius-server)# address<br>ipv4 172.24.25.10 | (Optional) Specifies the IP address of the RADIUS server.  |
| Step 5 | <pre>non-standard Example: Device(config-radius-server)# non-standard</pre>                                  | Identifies that the RADIUS server using a vendor-proprietary implementation of RADIUS.   |
| Step 6 | <pre>key string Example: Device(config-radius-server)# key rad123</pre>                                      | Specifies the shared secret text string used<br>between the device and the vendor-proprietary<br>RADIUS server. The device and the RADIUS<br>server use this text string to encrypt passwords<br>and exchange responses. |
| Step 7 | <pre>end Example: Device(config-radius-server)# end</pre>  | Exits RADIUS server mode and enters privileged EXEC mode.  |

## **Configuring DSCP Marking on a RADIUS Server**

Follow these steps to configure DSCP marking for authentication and accounting on a radius server:

**Note** If there is no DSCP marking configuration on the RADIUS server, the changes on the server group is applied to the RADIUS packets. Similarly, if there is no DSCP marking configuration on the server group then the changes made at the global configuration mode is applied.

|        | Command or Action   | Purpose   |
|--------|---|---|
| Step 1 | enable  | Enables privileged EXEC mode.   |
|        | Example:  |   |
|        | Device> enable  |   |
| Step 2 | configure terminal  | Enters global configuration mode.   |
|        | Example:  |   |
|        | Device# configure terminal  |   |
| Step 3 | radius server server_name   | Specifies the name for the RADIUS server  |
|        | Example:  | configuration for Protected Access Credential<br>(PAC) provisioning, and enters RADIUS server                                   |
|        | Device(config)# <b>radius server rsim</b>   | configuration mode.   |
| Step 4 | address { ipv4   ipv6 } ip address [ auth-port<br>auth_port_number acct-port            | (Optional) Specifies the IP address of the RADIUS server.   |
|        | acct_port_number] Example:  | • <b>auth-port</b> configures the port value for radius authentication server. The default value is 1812.                       |
|        | Device(config-radius-server)# address<br>ipv4 10.1.1.1 auth-port 1645 acct-port<br>1646 | • <b>acct-port</b> configures the port value for radius accounting server. The default value is 1813.                           |
| Step 5 | <pre>dscp {acct dscp_acct_value   auth dscp_auth_value }</pre>                          | Configures DSCP marking for authentication and accounting on the radius server.   |
|        | <b>Example:</b><br>Device(config-radius-server)# <b>dscp auth</b>                       | • <b>acct</b> configures radius DSCP marking value for accounting. The valid range is from 1 to 63. The default value is 0.     |
|        | 10 acct 20  | • <b>auth</b> configures radius DSCP marking value for authentication. The valid range is from 1 to 63. The default value is 0. |
| Step 6 | key string  | Specifies the shared secret text string used  |
|        | Example:  | between the device and the vendor-proprietary<br>RADIUS server. The device and the RADIUS                                       |
|        | Device(config-radius-server)# <b>key rad123</b>   | server use this text string to encrypt passwords<br>and exchange responses.   |
| Step 7 | end   | Exits RADIUS server mode and enters   |
|        | Example:  | privileged EXEC mode.   |
|        | Device(config-radius-server)# <b>end</b>  |   |

#### Procedure

## **Configuring the Source Interface and DSCP Marking on RADIUS Server Group**

Follow these steps to configure the source interface and DSCP marking for authentication and accounting on radius server groups:

#### Procedure

|        | Command or Action  | Purpose   |
|--------|--|---|
| Step 1 | enable   | Enables privileged EXEC mode.   |
|        | Example:   |   |
|        | Device> <b>enable</b>  |   |
| Step 2 | configure terminal   | Enters global configuration mode.   |
|        | Example:   |   |
|        | Device# configure terminal   |   |
| Step 3 | aaa group server radius group_name   | Defines the RADIUS server group configuration   |
|        | Example:   | and enters RADIUS server group configuration mode.  |
|        | Device(config)# aaa group server radius<br>abc                                 | node.   |
| Step 4 | server name name   | Associates the RADIUS server to the server  |
|        | Example:   | group.  |
|        | Device(config-sg-radius)# <b>server name serv1</b>                             |   |
| Step 5 | { <b>ip</b>   <b>ipv6</b> } radius source-interface <i>type</i> number         | Specifies an interface to use for the source address in RADIUS server.  |
|        | Example:   |   |
|        | <pre>Device(config-sg-radius)# ipv6 radius source-interface ethernet 0/0</pre> |   |
| Step 6 | <pre>dscp {acct dscp_acct_value   auth   dscp_auth_value }</pre>               | Configures DSCP marking for authentication and accounting on the radius server group.   |
|        | Example:   | • acct configures radius DSCP marking   |
|        | <pre>Device(config-sg-radius)# dscp auth 10 acct 20</pre>                      | value for accounting. The valid range is from 1 to 63. The default value is 0.  |
|        |  | • <b>auth</b> configures radius DSCP marking<br>value for authentication. The valid range<br>is from 1 to 63. The default value is 0. |
| Step 7 | end  | Exits RADIUS server mode and enters   |
|        | Example:   | privileged EXEC mode.   |
|        | Device(config-radius-server)# <b>end</b>                                       |   |

## **Configuring CoA on the Device**

Follow these steps to configure CoA on a device. This procedure is required.

#### **Procedure Command or Action Purpose** Step 1 enable Enables privileged EXEC mode. **Example:** • Enter your password if prompted. Device> enable Step 2 configure terminal Enters global configuration mode. Example: Device# configure terminal Step 3 aaa new-model Enables AAA. Example: Device (config) # aaa new-model Step 4 aaa server radius dynamic-author Configures the device as an authentication, authorization, and accounting (AAA) server Example: to facilitate interaction with an external policy server, and enters dynamic authorization local Device(config) # aaa server radius server configuration mode. dynamic-author Step 5 Specifies a RADIUS client from which a client {ip-address | name} [vrf vrfname] [server-key string] device will accept CoA and disconnect requests. Example: Device (config-locsvr-da-radius) # client client1 vrf vrf1 Step 6 server-key [0 | 7] string Configures the RADIUS key to be shared between a device and RADIUS clients. Example: Device(config-locsvr-da-radius)# server-key your\_server\_key Step 7 Specifies the port on which a device listens for port port-number RADIUS requests from configured RADIUS Example: clients. Device(config-locsvr-da-radius) # port 25

|         | Command or Action   | Purpose  |  |
|---------|---|--|--|
| Step 8  | auth-type {any   all   session-key}<br>Example:               | Specifies the type of authorization the device uses for RADIUS clients.                    |  |
|         | Device(config-locsvr-da-radius)#<br>auth-type any             | The client must match all the configured attributes for authorization.                     |  |
| Step 9  | ignore server-key<br>Example:                                 | (Optional) Configures the device to ignore the server-key.                                 |  |
|         | Device(config-locsvr-da-radius)# ignore<br>server-key         |  |  |
| Step 10 | exit  | Exits dynamic authorization local server   |  |
|         | Example:  | configuration mode and returns to global configuration mode.                               |  |
|         | Device(config-locsvr-da-radius)# exit                         |  |  |
| Step 11 | authentication command bounce-port ignore                     | (Optional) Configures the device to ignore a CoA request to temporarily disable the port   |  |
|         | Example:  | hosting a session. The purpose of temporarily<br>disabling the port is to trigger a DHCP   |  |
|         | Device(config)# authentication command<br>bounce-port ignore  | renegotiation from the host when a VLAN  |  |
| Step 12 | authentication command disable-port ignore                    |  |  |
|         | Example:  | nonstandard command requesting that the port<br>hosting a session be administratively shut |  |
|         | Device(config)# authentication command<br>disable-port ignore | down. Shutting down the port results in termination of the session.                        |  |
|         |   | Use standard CLI or SNMP commands to re-enable the port.                                   |  |
| Step 13 | end   | Exits global configuration mode an returns to  |  |
|         | Example:  | privileged EXEC mode.  |  |
|         | Device(confiq)# end   |  |  |

## **Configuring RADIUS Source-Interface Under a RADIUS Server-Group**

The RADIUS source-interface can be configured under a RADIUS server-group in either of the following methods:

• Configure a RADIUS source-interface under the RADIUS server-group using the **ip radius source-interface** *interface-name* command.

• Configure a VRF using the **vrf** *vrf*-name command under the RADIUS server-group, and then associate the configured VRF globally to a source-interface using the **ip radius source interface** *interface*-name **vrf** *vrf*-name command.

Priority will be given to the source-interface under the server-group configuration in case both methods are configured.

To configure RADIUS source-interface under a RADIUS server-group, perform the following:

#### Before you begin

You must configure a VRF routing table and associate VRF to an interface

|        | Command or Action   | Purpose   |
|--------|---|---|
| Step 1 | enable  | Enables privileged EXEC mode.   |
|        | Example:  | Enter your password if prompted.  |
|        | Device> enable  |   |
| Step 2 | configure terminal  | Enters global configuration mode.   |
|        | Example:  |   |
|        | Device# configure terminal  |   |
| Step 3 | <pre>{ ip   ipv6 } radius source-interface interface-number vrf vrf-name Example:</pre> | Forces RADIUS to use the IP address of a specified interface for all outgoing RADIUS packets, and enables the specification on a per-VRF basis. |
|        | <pre>Device(config)# ip radius source-interface GigabitEthernet1/0/23 vrf vrf17</pre>   | <ul> <li><i>interface-name</i>: Specifies the name of the<br/>interface that RADIUS uses for all of its<br/>outgoing packets.</li> </ul>        |
|        |   | • <b>vrf</b> <i>vrf-name</i> : Specifies the per-VRF configuration.   |
| Step 4 | aaa group server radius group_name  | Groups different RADIUS server hosts into   |
|        | Example:  | distinct lists and distinct methods and enters server-group configuration mode.   |
|        | Device(config-sg-radius)# aa group server<br>radius rad-grp                             |   |
| Step 5 | ip vrf forwarding vrf-name  | (Optional) Configures a VRF for the interface.  |
|        | Example:  |   |
|        | <pre>Device(config-sg-radius)# ip vrf forwarding vrf17</pre>                            |   |
| Step 6 | { ip   ipv6 } radius source-interface   | (Optional) Forces RADIUS to use the IP  |
|        | interface-number  | address of a specified interface for all outgoing<br>RADIUS packets from the RADIUS group   |
|        | Example:  | server.   |

#### Procedure

|        | Command or Action   | Purpose   |
|--------|---|---|
|        | Device(config-sg-radius)# <b>ip radius</b><br><b>source-interface loopback0</b> | <i>interface-name</i> : Specifies the name of the interface that RADIUS uses for all of its outgoing packets. |
| Step 7 | end   | Returns to privileged EXEC mode.  |
|        | Example:  |   |
|        | Device(config-sg-radius)# <b>end</b>  |   |

## **Monitoring CoA Functionality**

Table 7: Privileged EXEC show Commands

| Command                             | Purpose                                     |
|-------------------------------------|---|
| show aaa attributes protocol radius | Displays AAA attributes of RADIUS commands. |

Table 8: Global Troubleshooting Commands

| Command                               | Purpose   |
|---------------------------------------|---|
| debug radius                          | Displays information for troubleshooting RADIUS.          |
| debug aaa coa                         | Displays information for troubleshooting CoA processing.  |
| debug aaa pod                         | Displays information for troubleshooting POD packets.     |
| debug aaa subsys                      | Displays information for troubleshooting POD packets.     |
| debug cmdhd [detail   error   events] | Displays information for troubleshooting command headers. |

## **Feature History for RADIUS**

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

| Release                  | Feature | Feature Information  |
|--------------------------|---------|--|
| Cisco IOS XE Fuji 16.9.2 | RADIUS  | RADIUS is a distributed client/server system that<br>secures networks against unauthorized access.<br>RADIUS clients run on supported Cisco devices.<br>Clients send authentication requests to a central<br>RADIUS server, which contains all user<br>authentication and network service access<br>information. |

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn.
