debug ilpower

To enable debugging of the power controller and Power over Ethernet (PoE) system, use the **debug ilpower** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug ilpower {cdp | event | ha | ipc | police | port | powerman | registries | scp | sense} no debug ilpower {cdp | event | ha | ipc | police | port | powerman | registries | scp | sense}

Syntax Description

cdp	Displays PoE Cisco Discovery Protocol (CDP) debug messages.
event	Displays PoE event debug messages.
ha	Displays PoE high-availability messages.
ipc	Displays PoE Inter-Process Communication (IPC) debug messages.
police	Displays PoE police debug messages.
port	Displays PoE port manager debug messages.
powerman	Displays PoE power management debug messages.
registries	Displays PoE registries debug messages.
scp	Displays PoE SCP debug messages.
sense	Displays PoE sense debug messages.

Command Default

Debugging is disabled.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

This command is supported only on PoE-capable switches.

When you enable debugging on a switch stack, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

debug interface

To enable debugging of interface-related activities, use the **debug interface** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug interface {interface-id | counters {exceptions | protocol memory} | null interface-number | port-channel port-channel-number | states | vlan vlan-id}

no debug interface {interface-id | **counters** {**exceptions** | **protocol memory**} | **null** interface-number | **port-channel** port-channel-number | **states** | **vlan** vlan-id}

Syntax Description

interface-id	ID of the physical interface. Displays debug messages for the specified physical port, identified by type switch number/module number/port, for example, gigabitethernet 1/0/2.
null interface-number	Displays debug messages for null interfaces. The interface number is always 0 .
port-channel port-channel-number	Displays debug messages for the specified EtherChannel port-channel interface. The <i>port-channel-number</i> range is 1 to 48.
vlan vlan-id	Displays debug messages for the specified VLAN. The vlan range is 1 to 4094.
counters	Displays counters debugging information.
exceptions	Displays debug messages when a recoverable exceptional condition occurs during the computation of the interface packet and data rate statistics.
protocol memory	Displays debug messages for memory operations of protocol counters.
states	Displays intermediary debug messages when an interface's state transitions.

Command Default

Debugging is disabled.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

If you do not specify a keyword, all debug messages appear.

The **undebug interface** command is the same as the **no debug interface** command.

When you enable debugging on a switch stack, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session** *switch-number* EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

debug IIdp packets

To enable debugging of Link Layer Discovery Protocol (LLDP) packets, use the **debug lldp packets** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug lldp packets no debug lldp packets

Syntax Description

This command has no arguments or keywords.

Command Default

Debugging is disabled.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The undebug lldp packets command is the same as the no debug lldp packets command.

When you enable debugging on a switch stack, it is enabled only on the . To enable debugging on a stack member, you can start a session from the by using the **session** *switch-number* EXEC command.

debug platform poe

To enable debugging of a Power over Ethernet (PoE) port, use the **debug platform poe** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug platform poe [{error | info}] [switch switch-number]
no debug platform poe [{error | info}] [switch switch-number]

Syntax Description

error	(Optional) Displays PoE-related error debug messages.
info	(Optional) Displays PoE-related information debug messages.
switch switch-number	(Optional) Specifies the stack member. This keyword is supported only on stacking-capable switches.

Command Default

Debugging is disabled.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The **undebug platform poe** command is the same as the **no debug platform poe** command.

debug platform software fed switch active punt packet-capture start

To enable debugging of packets during high CPU utilization, for an active switch, use the **debug platform software fed switch active punt packet-capture start** command in privileged EXEC mode. To disable debugging of packets during high CPU utilization, for an active switch, use the **debug platform software fed switch active punt packet-capture stop** command in privileged EXEC mode.

debug platform software fed switch active punt packet-capture start debug platform software fed switch active punt packet-capture stop

Syntax Description

switch active	Displays information about the active switch.
punt	Specifies the punt information.
packet-capture	Specifies information about the captured packet.
start	Enables debugging of the active switch.
stop	Disables debugging of the active switch.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

The **debug platform software fed switch active punt packet-capture start** command starts the debugging of packets during high CPU utilization. The packet capture is stopped when the 4k buffer size is exceeded.

Examples

The following is a sample output from the **debug platform software fed switch active punt packet-capture start** command:

Device# debug platform software fed switch active packet-capture start Punt packet capturing started.

The following is a sample output from the **debug platform software fed switch active punt packet-capture stop** command:

Device# debug platform software fed switch active packet-capture stop Punt packet capturing stopped. Captured 101 packet(s)

duplex

To specify the duplex mode of operation for a port, use the **duplex** command in interface configuration mode. To return to the default value, use the **no** form of this command.

duplex {auto | full | half}
no duplex {auto | full | half}

Syntax Description

auto Enables automatic duplex configuration. The port automatically detects whether it should run in full-or half-duplex mode, depending on the attached device mode.

full Enables full-duplex mode.

half Enables half-duplex mode (only for interfaces operating at 10 or 100 Mbps). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mbps.

Command Default

For Gigabit Ethernet ports, the default is auto.

Command Modes

Interface configuration (config-if)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

For Gigabit Ethernet ports, setting the port to **auto** has the same effect as specifying **full** if the attached device does not autonegotiate the duplex parameter.

Duplex options are not supported on the 1000BASE-x or 10GBASE-x (where -x is -BX, -CWDM, -LX, -SX, or -ZX) small form-factor pluggable (SFP) modules.

Note

Half-duplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is **auto** and the connected device is operating at half duplex. However, you cannot configure these interfaces to operate in half-duplex mode.

Certain ports can be configured to be either full duplex or half duplex. How this command is applied depends on the device to which the switch is attached.

If both ends of the line support autonegotiation, we highly recommend using the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces, and use the **auto** setting on the supported side.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

You can configure the duplex setting when the speed is set to **auto**.

Caution

Changing the interface speed and duplex mode configuration might shut down and reenable the interface during the reconfiguration.

You can verify your setting by entering the **show interfaces** privileged EXEC command.

Examples

This example shows how to configure an interface for full-duplex operation:

Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# duplex full

errdisable detect cause

To enable error-disable detection for a specific cause or for all causes, use the **errdisable detect cause** command in global configuration mode. To disable the error-disable detection feature, use the **no** form of this command.

 $\label{lem:constraint} \begin{tabular}{ll} err disable detect cause $\{all \mid arp-inspection \mid bpduguard shutdown vlan \mid dhcp-rate-limit \mid dtp-flap \mid gbic-invalid \mid inline-power \mid link-flap \mid loopback \mid pagp-flap \mid pppoe-ia-rate-limit \mid psp shutdown vlan \mid security-violation shutdown vlan \mid sfp-config-mismatch $\}$

 $no\ err disable\ detect\ cause\ \{all\ |\ arp-inspection\ |\ bpduguard\ shutdown\ vlan\ |\ dhcp-rate-limit\ |\ dtp-flap\ |\ gbic-invalid\ |\ inline-power\ |\ link-flap\ |\ loopback\ |\ pagp-flap\ |\ pppoe-ia-rate-limit\ |\ psp\ shutdown\ vlan\ |\ security-violation\ shutdown\ vlan\ |\ sfp-config-mismatch\}$

Syntax Description

all	Enables error detection for all error-disabled causes.	
arp-inspection	Enables error detection for dynamic Address Resolution Protocol (ARP) inspection.	
bpduguard shutdown vlan	Enables per-VLAN error-disable for BPDU guard.	
dhcp-rate-limit	Enables error detection for DHCP snooping.	
dtp-flap	Enables error detection for the Dynamic Trunking Protocol (DTP) flapping.	
gbic-invalid	Enables error detection for an invalid Gigabit Interface Converter (GBIC) module.	
	Note This error refers to an invalid small form-factor pluggable (SFP) module.	
inline-power	Enables error detection for the Power over Ethernet (PoE) error-disabled cause.	
	Note This keyword is supported only on switches with PoE ports.	
link-flap	Enables error detection for link-state flapping.	
loopback	Enables error detection for detected loopbacks.	
pagp-flap	Enables error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.	
pppoe-ia-rate-limit Enables error detection for the PPPoE Intermediate Agent rate-error-disabled cause.		
psp shutdown vlan	Enables error detection for protocol storm protection (PSP).	
security-violation shutdown vlan	Enables voice aware 802.1x security.	
sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.	

Command Default

Detection is enabled for all causes. All causes, except per-VLAN error disabling, are configured to shut down the entire port.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

A cause (such as a link-flap or dhcp-rate-limit) is the reason for the error-disabled state. When a cause is detected on an interface, the interface is placed in an error-disabled state, an operational state that is similar to a link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the bridge protocol data unit (BPDU) guard, voice-aware 802.1x security, and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you set a recovery mechanism for the cause by entering the **errdisable recovery** global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

For protocol storm protection, excess packets are dropped for a maximum of two virtual ports. Virtual port error disabling using the **psp** keyword is not supported for EtherChannel and Flexlink interfaces.

To verify your settings, enter the **show errdisable detect** privileged EXEC command.

This example shows how to enable error-disabled detection for the link-flap error-disabled cause:

Device(config) # errdisable detect cause link-flap

This command shows how to globally configure BPDU guard for a per-VLAN error-disabled state:

Device(config) # errdisable detect cause bpduguard shutdown vlan

This command shows how to globally configure voice-aware 802.1x security for a per-VLAN error-disabled state:

Device(config)# errdisable detect cause security-violation shutdown vlan

You can verify your setting by entering the **show errdisable detect** privileged EXEC command.

errdisable recovery cause

To enable the error-disabled mechanism to recover from a specific cause, use the **errdisable recovery cause** command in global configuration mode. To return to the default setting, use the **no** form of this command.

 $err disable \ \ recovery \ \ cause \ \ \{all \ | \ arp-inspection \ | \ bpduguard \ | \ channel-misconfig \ | \ dhcp-rate-limit \ | \ dtp-flap \ | \ gbic-invalid \ | \ inline-power \ | \ link-flap \ | \ loopback \ | \ mac-limit \ | \ pagp-flap \ | \ port-mode-failure \ | \ pppoe-ia-rate-limit \ | \ psecure-violation \ | \ psp \ | \ security-violation \ | \ sfp-config-mismatch \ | \ storm-control \ | \ udld \ \}$

no errdisable recovery cause $\{all \mid arp\text{-inspection} \mid bpduguard \mid channel-misconfig \mid dhcp-rate-limit \mid dtp-flap \mid gbic-invalid \mid inline-power \mid link-flap \mid loopback \mid mac-limit \mid pagp-flap \mid port-mode-failure \mid pppoe-ia-rate-limit \mid psecure-violation \mid psp \mid security-violation \mid sfp-config-mismatch \mid storm-control \mid udld \}$

Syntax Description

all	Enables the timer to recover from all error-disabled causes.	
arp-inspection	Enables the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.	
bpduguard	Enables the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.	
channel-misconfig	Enables the timer to recover from the EtherChannel misconfiguration error-disabled state.	
dhcp-rate-limit	Enables the timer to recover from the DHCP snooping error-disabled state.	
dtp-flap	Enables the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.	
gbic-invalid	Enables the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.	
	Note This error refers to an invalid small form-factor pluggable (SFP) error-disabled state.	
inline-power	Enables the timer to recover from the Power over Ethernet (PoE) error-disabled state.	
	This keyword is supported only on switches with PoE ports.	
link-flap	Enables the timer to recover from the link-flap error-disabled state.	
loopback	Enables the timer to recover from a loopback error-disabled state.	
mac-limit	Enables the timer to recover from the mac limit error-disabled state.	
pagp-flap	Enables the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.	

port-mode-failure	Enables the timer to recover from the port mode change failure error-disabled state.	
	error-disabled state.	
pppoe-ia-rate-limit	Enables the timer to recover from the PPPoE IA rate limit error-disabled state.	
psecure-violation	Enables the timer to recover from a port security violation disable state.	
psp	Enables the timer to recover from the protocol storm protection (PSP) error-disabled state.	
security-violation	Enables the timer to recover from an IEEE 802.1x-violation disabled state.	
sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.	
storm-control	Enables the timer to recover from a storm control error.	
udld	Enables the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.	

Command Default

Recovery is disabled for all causes.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

A cause (such as all or BDPU guard) is defined as the reason that the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in the error-disabled state, an operational state similar to link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you do not enable the recovery for the cause, the interface stays in the error-disabled state until you enter the **shutdown** and the **no shutdown** interface configuration commands. If you enable the recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.

Otherwise, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an interface from the error-disabled state.

You can verify your settings by entering the **show errdisable recovery** privileged EXEC command.

Examples

This example shows how to enable the recovery timer for the BPDU guard error-disabled cause:

Device(config) # errdisable recovery cause bpduguard

errdisable recovery interval

To specify the time to recover from an error-disabled state, use the **errdisable recovery interval** command in global configuration mode. To return to the default setting, use the **no** form of this command.

errdisable recovery interval timer-interval no errdisable recovery interval timer-interval

Syntax Description

timer-interval Time to recover from the error-disabled state. The range is 30 to 86400 seconds. The same interval is applied to all causes. The default interval is 300 seconds.

Command Default

The default recovery interval is 300 seconds.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The error-disabled recovery timer is initialized at a random differential from the configured interval value. The difference between the actual timeout value and the configured value can be up to 15 percent of the configured interval.

You can verify your settings by entering the **show errdisable recovery** privileged EXEC command.

Examples

This example shows how to set the timer to 500 seconds:

Device(config) # errdisable recovery interval 500

interface

To configure an interface, use the **interface** command.

interface {Auto-Template interface-number | FiveGigabitEthernet
switch-number/slot-number/port-number | GigabitEthernet switch-number/slot-number/port-number |
Loopback interface-number Null interface-number Port-channel interface-number TenGigabitEthernet
switch-number/slot-number/port-number TwentyFiveGigE switch-number/slot-number/port-number
TwoGigabitEthernet switch-number/slot-number/port-number Tunnel interface-number Vlan
interface-number }

	TwoGigabitEthernet switch-number/slot-number/port-number Tunnel interface-number Vlan interface-number }			
Syntax Description	Auto-Template interface-number	Enables you to configure a auto-template interface. The range is from 1 to 999.		
	FiveGigabitEthernet switch-number/slot-number/port-number	Enables you to configure a 5-Gigabit Ethernet interface.		
		• <i>switch-number</i> — Switch ID. The range is from 1 to 8.		
		• slot-number — Slot number. Value is 0.		
		• <i>port-number</i> — Port number. The range is from 1 to 48.		
	FortyGigabitEthernet switch-number/slot-number/port-number	Enables you to configure a 40-Gigabit Ethernet interface.		
		• <i>switch-number</i> — Switch ID. The range is from 1 to 8.		
		• slot-number — Slot number. Value is 1.		
		• <i>port-number</i> — Port number. The range is from 1 to 2.		
	GigabitEthernet switch-number/slot-number/port-number	Enables you to configure a Gigabit Ethernet IEEE 802.3z interface.		
		• <i>switch-number</i> — Switch ID. The range is from 1 to 8.		
		• <i>slot-number</i> — Slot number. The range is from 0 to 1.		
		• <i>port-number</i> — Port number. The range is from 1 to 48.		
	Loopback interface-number	Enables you to configure a loopback interface. The range is from 0 to 2147483647.		
	Null interface-number	Enables you to configure a null interface. The default value is 0.		

Port-channel interface-number	Enables you to configure a port-channel interface. The range is from 1 to 128.		
TenGigabitEthernet switch-number/slot-number/port-number	Enables you to configure a 10-Gigabit Ethernet interface.		
	• <i>switch-number</i> — Switch ID. The range is from 1 to 8.		
	• slot-number		
	 Slot number. The range is from 0 to 1. port-number — Port number. The range is from 1 to 24 and 37 to 48 		
TwentyFiveGigE switch-number/slot-number/port-number	Enables you to configure a 25-Gigabit Ethernet interface.		
	• <i>switch-number</i> — Switch ID. The range is from 1 to 8.		
	• <i>slot-number</i> — Slot number. Value is 1.		
	• <i>port-number</i> — Port number. The range is from 1 to 2.		
TwoGigabitEthernet switch-number/slot-number/port-number	Enables you to configure a 2.5-Gigabit Ethernet interface.		
	Note 2.5G ports are available only on C9300-48UXM switch model.		
	• <i>switch-number</i> — Switch ID. The range is from 1 to 8.		
	• slot-number — Slot number. Value is 0.		
	• <i>port-number</i> — Port number. The range is from 1 to 36.		
Tunnel interface-number	Enables you to configure a tunnel interface. The range is from 0 to 2147483647.		
Vlan interface-number	Enables you to configure a switch VLAN. The range is from 1 to 4094.		

Command Default

None

Command Modes

Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

You can not use the "no" form of this command.

Examples

The following example shows how to configure a tunnel interface:

```
Device(config) # interface Tunnel 15
Device(config-if) #
```

The following example shows how to configure a 25-Gigabit Ethernet interface

```
Device(config)# interface TwentyFiveGigE 1/1/1
Device(config-if)#
```

The following example shows how to configure a 40-Gigabit Ethernet interface

```
Device(config) # interface FortyGigabitEthernet 1/1/2
Device(config-if) #
```

interface range

To configure an interface range, use the **interface range** command.

interface range {Auto-Template interface-number | FiveGigabitEthernet
switch-number/slot-number/port-number | FortyGigabitEthernet switch-number/slot-number/port-number
| GigabitEthernet switch-number/slot-number/port-number | Loopback interface-number Null
interface-number Port-channel interface-number TenGigabitEthernet
switch-number/slot-number/port-number TwentyFiveGigE switch-number/slot-number/port-number
TwoGigabitEthernet switch-number/slot-number/port-number Tunnel interface-number Vlan
interface-number }

•		_	-

	• <i>port-number</i> — Port number. The range is from 1 to 2.	
TwoGigabitEthernet switch-number/slot-number/port-number	Enables you to configure a 2.5-Gigabit Ethernet interface.	
	Note 2.5G ports are available only on C9300-48UXM switch model.	
	• <i>switch-number</i> — Switch ID. The range is from 1 to 8.	
	• slot-number — Slot number. Value is 0.	
	• <i>port-number</i> — Port number. The range is from 1 to 36.	
Tunnel interface-number	Enables you to configure a tunnel interface. The range is from 0 to 2147483647.	
Vlan interface-number	Enables you to configure a switch VLAN. The range is from 1 to 4094.	

Command Default

None

Command Modes

Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1a	This command was introduced.
Examples	This example shows how you	can configure interface range:
	Device(config)# interface	range vlan 1-100

ip mtu

To set the IP maximum transmission unit (MTU) size of routed packets on all routed ports of the switch or switch stack, use the **ip mtu** command in interface configuration mode. To restore the default IP MTU size, use the **no** form of this command.

ip mtu bytes no ip mtu bytes

Syntax Description

bytes MTU size, in bytes. The range is from 68 up to the system MTU value (in bytes).

Command Default

The default IP MTU size for frames received and sent on all switch interfaces is 1500 bytes.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The upper limit of the IP value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command.

To return to the default IP MTU setting, you can apply the **default ip mtu** command or the **no ip mtu** command on the interface.

You can verify your setting by entering the **show ip interface** *interface-id* or **show interface** *interface-id* privileged EXEC command.

The following example sets the maximum IP packet size for VLAN 200 to 1000 bytes:

```
Device(config) # interface vlan 200
Device(config-if) # ip mtu 1000
```

The following example sets the maximum IP packet size for VLAN 200 to the default setting of 1500 bytes:

```
Device(config) # interface vlan 200
Device(config-if) # default ip mtu
```

This is an example of partial output from the **show ip interface** *interface-id* command. It displays the current IP MTU setting for the interface.

```
Device# show ip interface gigabitethernet4/0/1
```

```
GigabitEthernet4/0/1 is up, line protocol is up
Internet address is 18.0.0.1/24
Broadcast address is 255.255.255
Address determined by setup command
MTU is 1500 bytes
Helper address is not set
```

<output truncated>

ipv6 mtu

To set the IPv6 maximum transmission unit (MTU) size of routed packets on all routed ports of the switch or switch stack, use the **ipv6 mtu** command in interface configuration mode. To restore the default IPv6 MTU size, use the **no** form of this command.

ipv6 mtu bytes no ipv6 mtu bytes

Syntax Description

bytes MTU size, in bytes. The range is from 1280 up to the system MTU value (in bytes).

Command Default

The default IPv6 MTU size for frames received and sent on all switch interfaces is 1500 bytes.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The upper limit of the IPv6 MTU value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command.

To return to the default IPv6 MTU setting, you can apply the **default ipv6 mtu** command or the **no ipv6 mtu** command on the interface.

You can verify your setting by entering the **show ipv6 interface** *interface-id* or **show interface** *interface-id* privileged EXEC command.

The following example sets the maximum IPv6 packet size for an interface to 2000 bytes:

```
Device(config)# interface gigabitethernet4/0/1
Device(config-if)# ipv6 mtu 2000
```

The following example sets the maximum IPv6 packet size for an interface to the default setting of 1500 bytes:

```
Device(config)# interface gigabitethernet4/0/1
Device(config-if)# default ipv6 mtu
```

This is an example of partial output from the **show ipv6 interface** *interface-id* command. It displays the current IPv6 MTU setting for the interface.

Device# show ipv6 interface gigabitethernet4/0/1 GigabitEthernet4/0/1 is up, line protocol is up Internet address is 18.0.0.1/24 Broadcast address is 255.255.255.255 Address determined by setup command MTU is 1500 bytes Helper address is not set

<output truncated>

IIdp (interface configuration)

To enable Link Layer Discovery Protocol (LLDP) on an interface, use the **lldp** command in interface configuration mode. To disable LLDP on an interface, use the **no** form of this command.

lldp {med-tlv-select tlv | receive | tlv-select power-management | transmit} no lldp {med-tlv-select tlv | receive | tlv-select power-management | transmit}

•		-	
51	/ntax	Descri	ntınn
•	,cu.	-	puon

med-tlv-select	Selects an LLDP Media Endpoint Discovery (MED) time-length-value (TLV) element to send.
tlv	String that identifies the TLV element. Valid values are the following:
	• inventory-management— LLDP MED Inventory Management TLV.
	• location— LLDP MED Location TLV.
	• network-policy— LLDP MED Network Policy TLV.
	• power-management— LLDP MED Power Management TLV.
receive	Enables the interface to receive LLDP transmissions.
tlv-select	Selects the LLDP TLVs to send.
power-management	Sends the LLDP Power Management TLV.
transmit	Enables LLDP transmission on the interface.

Command Default

LLDP is disabled.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

This command is supported on 802.1 media types.

If the interface is configured as a tunnel port, LLDP is automatically disabled.

The following example shows how to disable LLDP transmission on an interface:

Device(config) # interface gigabitethernet1/0/1
Device(config-if) # no lldp transmit

The following example shows how to enable LLDP transmission on an interface:

Device(config)# interface gigabitethernet1/0/1

IIdp (interface configuration)

Device(config-if)# lldp transmit

logging event power-inline-status

To enable the logging of Power over Ethernet (PoE) events, use the **logging event power-inline-status** command in interface configuration mode. To disable the logging of PoE status events, use the **no** form of this command.

logging event power-inline-status no logging event power-inline-status

Syntax Description

This command has no arguments or keywords.

Command Default

Logging of PoE events is enabled.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The **no** form of this command does not disable PoE error events.

Examples

This example shows how to enable logging of PoE events on a port:

```
Device(config-if)# interface gigabitethernet1/0/1
Device(config-if)# logging event power-inline-status
Device(config-if)#
```

mdix auto

To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the **mdix auto** command in interface configuration mode. To disable auto-MDIX, use the **no** form of this command.

mdix auto no mdix auto

Syntax Description

This command has no arguments or keywords.

Command Default

Auto-MDIX is enabled.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately.

When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to **auto** so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of the connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect.

Auto-MDIX is supported on all 10/100 and 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-TX small form-factor pluggable (SFP) module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

This example shows how to enable auto-MDIX on a port:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto
Device(config-if)# duplex auto
Device(config-if)# mdix auto
Device(config-if)# end
```

mode (power-stack configuration)

To configure power stack mode for the power stack, use the **mode** command in power-stack configuration mode. To return to the default settings, use the **no** form of the command.

mode {power-shared | redundant} [strict] no mode

•		_	-	
51	yntax	Desc	rın	tınn
•	· · · · · · · · · · · · · · · · · · ·	-	, P	

power-shared	Sets the power stack to operate in power-shared mode. This is the default.
redundant	Sets the power stack to operate in redundant mode. The largest power supply is removed from the power pool to be used as backup power in case one of the other power supplies fails.
strict	(Optional) Configures the power stack mode to run a strict power budget. The stack power needs cannot exceed the available power.

Command Default

The default modes are **power-shared** and nonstrict.

Command Modes

Power-stack configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

This command is available only on switch stacks running the IP Base or IP Services feature set.

To access power-stack configuration mode, enter the **stack-power stack** *power stack name* global configuration command.

Entering the **no mode** command sets the switch to the defaults of **power-shared** and non-strict mode.

Note

For stack power, available power is the total power available for PoE from all power supplies in the power stack, available power is the power allocated to all powered devices connected to PoE ports in the stack, and consumed power is the actual power consumed by the powered devices.

In **power-shared** mode, all of the input power can be used for loads, and the total available power appears as one large power supply. The power budget includes all power from all supplies. No power is set aside for power supply failures. If a power supply fails, load shedding (shutting down of powered devices or switches) might occur.

In **redundant** mode, the largest power supply is removed from the power pool to use as backup power in case one of the other power supplies fails. The available power budget is the total power minus the largest power supply. This reduces the available power in the pool for switches and powered devices, but in case of a failure or an extreme power load, there is less chance of having to shut down switches or powered devices.

In **strict** mode, when a power supply fails and the available power drops below the budgeted power, the system balances the budget through load shedding of powered devices, even if the actual power is less than the available power. In nonstrict mode, the power stack can run in an over-allocated state and is stable as long as

the actual power does not exceed the available power. In this mode, a powered device drawing more than normal power could cause the power stack to start shedding loads. This is normally not a problem because most devices do not run at full power. The chances of multiple powered devices in the stack requiring maximum power at the same time is small.

In both strict and nonstrict modes, power is denied when there is no power available in the power budget.

This is an example of setting the power stack mode for the stack named power1 to power-shared with strict power budgeting. All power in the stack is shared, but when the total available power is allotted, no more devices are allowed power.

```
Device(config) # stack-power stack power1
Device(config-stackpower) # mode power-shared strict
Device(config-stackpower) # exit
```

This is an example of setting the power stack mode for the stack named power2 to redundant. The largest power supply in the stack is removed from the power pool to provide redundancy in case one of the other supplies fails.

```
Device(config) # stack-power stack power2
Device(config-stackpower) # mode redundant
Device(config-stackpower) # exit
```

network-policy

To apply a network-policy profile to an interface, use the **network-policy** command in interface configuration mode. To remove the policy, use the **no** form of this command.

network-policy profile-number
no network-policy

Syntax Description

profile-number The network-policy profile number to apply to the interface.

Command Default

No network-policy profiles are applied.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Use the **network-policy** profile number interface configuration command to apply a profile to an interface.

You cannot apply the **switchport voice vlan** command on an interface if you first configure a network-policy profile on it. However, if **switchport voice vlan** *vlan-id* is already configured on the interface, you can apply a network-policy profile on the interface. The interface then has the voice or voice-signaling VLAN network-policy profile applied.

This example shows how to apply network-policy profile 60 to an interface:

Device(config)# interface gigabitethernet1/0/1
Device(config-if)# network-policy 60

network-policy profile (global configuration)

To create a network-policy profile and to enter network-policy configuration mode, use the **network-policy profile** command in global configuration mode. To delete the policy and to return to global configuration mode, use the **no** form of this command.

network-policy profile *profile-number* **no network-policy profile** *profile-number*

Syntax Description

profile-number Network-policy profile number. The range is 1 to 4294967295.

Command Default

No network-policy profiles are defined.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Use the **network-policy profile** global configuration command to create a profile and to enter network-policy profile configuration mode.

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

When you are in network-policy profile configuration mode, you can create the profile for voice and voice signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

This example shows how to create network-policy profile 60:

Device(config)# network-policy profile 60
Device(config-network-policy)#

power-priority

To configure Cisco StackPower power-priority values for a switch in a power stack and for its high-priority and low-priority PoE ports, use the **power-priority** command in switch stack-power configuration mode. To return to the default setting, use the **no** form of the command.

power-priority {high value | low value | switch value}
no power-priority {high | low | switch}

Syntax Description

high value	Sets the power priority for the ports configured as high-priority ports. The range is 1 to 27, with 1 as the highest priority. The high value must be lower than the value set for the low-priority ports and higher than the value set for the switch.
low value	Sets the power priority for the ports configured as low-priority ports. The range is 1 to 27. The low value must be higher than the value set for the high-priority ports and the value set for the switch.
switch value	Sets the power priority for the switch. The range is 1 to 27. The switch value must be lower than the values set for the low and high-priority ports.

Command Default

If no values are configured, the power stack randomly determines a default priority.

The default ranges are 1 to 9 for switches, 10 to 18 for high-priority ports, 19 to 27 for low-priority ports.

On non-PoE switches, the high and low values (for port priority) have no effect.

Command Modes

Switch stack-power configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

To access switch stack-power configuration mode, enter the **stack-power switch** switch-number global configuration command.

Cisco StackPower power-priority values determine the order for shutting down switches and ports when power is lost and load shedding must occur. Priority values are from 1 to 27; the highest numbers are shut down first.

We recommend that you configure different priority values for each switch and for its high priority ports and low priority ports to limit the number of devices shut down at one time during a loss of power. If you try to configure the same priority value on different switches in a power stack, the configuration is allowed, but you receive a warning message.

Note

This command is available only on switch stacks running the IP Base or IP Services feature set.

Examples

This is an example of setting the power priority for switch 1 in power stack a to 7, for the high-priority ports to 11, and for the low-priority ports to 20.

```
Device(config) # stack-power switch 1
Device(config-switch-stackpower) # stack-id power_stack_a
Device(config-switch-stackpower) # power-priority high 11
Device(config-switch-stackpower) # power-priority low 20
Device(config-switch-stackpower) # power-priority switch 7
Device(config-switch-stackpower) # exit
```

power inline

To configure the power management mode on Power over Ethernet (PoE) ports, use the **power inline** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

no power inline {auto | never | port priority {high | low} | static [max max-wattage]}

•		_	-	
51	/ntax	Des	crin	ition
-			O P	

auto	Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. Allocation is first-come, first-serve.
max max-wattage	(Optional) Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.
never	Disables device detection, and disables power to the port.
port	Configures the power priority of the port. The default priority is low.
priority {high low}	Sets the power priority of the port. In case of a power supply failure, ports configured as low priority are turned off first and ports configured as high priority are turned off last. The default priority is low.
static	Enables powered-device detection. Pre-allocates (reserves) power for a port before the switch discovers the powered device. This action guarantees that the device connected to the interface receives enough power.

Command Default

The default is **auto** (enabled).

The maximum wattage is 30,000 mW.

The default port priority is low.

Command Default

Interface configuration

Co	mm	an	d H	list	orv

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

This command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, this error message appears:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# power inline auto

% Invalid input detected at '^' marker.
```

In a switch stack, this command is supported on all ports in the stack that support PoE.

Use the **max** *max-wattage* option to disallow higher-power powered devices. With this configuration, when the powered device sends Cisco Discovery Protocol (CDP) messages requesting more power than the maximum wattage, the switch removes power from the port. If the powered-device IEEE class maximum is greater than the maximum wattage, the switch does not power the device. The power is reclaimed into the global power budget.

Note

The switch never powers any class 0 or class 3 device if the **power inline max max-wattage** command is configured for less than 30 W.

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** privileged EXEC command output shows *power-deny*.

Use the **power inline static max** *max-wattage* command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

If a port has a Cisco powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur, placing the port in an error-disabled state.

Use the **power inline port priority {high | low}** command to configure the power priority of a PoE port. Powered devices connected to ports with low port priority are shut down first in case of a power shortage.

You can verify your settings by entering the **show power inline** EXEC command.

Examples

This example shows how to enable detection of a powered device and to automatically power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto
```

This example shows how to configure a PoE port on a switch to allow a class 1 or a class 2 powered device:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto max 7000
```

This example shows how to disable powered-device detection and to not power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline never
```

This example shows how to set the priority of a port to high, so that it would be one of the last ports to be shut down in case of power supply failure:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline port priority high
```

power inline police

To enable policing of real-time power consumption on a powered device, use the **power inline police** command in interface configuration mode. To disable this feature, use the **no** form of this command

power inline police [action {errdisable | log}]
no power inline police

Syntax Description

action errdisable	(Optional) Configures the device to turn off power to the port if the real-time power consumption exceeds the maximum power allocation on the port. This is the default action.
action log	(Optional) Configures the device to generate a syslog message while still providing power to a connected device if the real-time power consumption exceeds the maximum power allocation on the port.

Command Default

Policing of the real-time power consumption of the powered device is disabled.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

This command is supported only on the LAN Base image.

This command is supported only on Power over Ethernet (PoE)-capable ports. If you enter this command on a device or port that does not support PoE, an error message appears.

In a switch stack, this command is supported on all switches or ports in the stack that support PoE and real-time power-consumption monitoring.

When policing of the real-time power consumption is enabled, the device takes action when a powered device consumes more power than the allocated maximum amount.

When PoE is enabled, the device senses the real-time power consumption of the powered device. This feature is called *power monitoring* or *power sensing*. The device also polices the power usage with the *power policing* feature.

When power policing is enabled, the device uses one of the these values as the cutoff power on the PoE port in this order:

- 1. The user-defined power level that limits the power allowed on the port when you enter the **power inline** auto max max-wattage or the **power inline static** max max-wattage interface configuration command
- 2. The device automatically sets the power usage of the device by using CDP power negotiation or by the IEEE classification and LLPD power negotiation.

If you do not manually configure the cutoff-power value, the device automatically determines it by using CDP power negotiation or the device IEEE classification and LLDP power negotiation. If CDP or LLDP are not enabled, the default value of 30 W is applied. However without CDP or LLDP, the device does not allow devices to consume more than 15.4 W of power because values from 15400 to 30000 mW are only allocated based on CDP or LLDP requests. If a powered device consumes more than 15.4 W without CDP or LLDP

negotiation, the device might be in violation of the maximum current *Imax* limitation and might experience an *Icut* fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the device locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the device is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the device has locked on it, the device does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.

If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated on the PoE port. If the device uses more than the maximum power allocation (or *cutoff power*) on the port, the device either turns power off to the port, or the device generates a syslog message and updates the LEDs (the port LEDs are blinking amber) while still providing power to the device.

- To configure the device to turn off power to the port and put the port in the error-disabled state, use the **power inline police** interface configuration command.
- To configure the device to generate a syslog message while still providing power to the device, use the **power inline police action log** command.

If you do not enter the **action log** keywords, the default action is to shut down the port, turn off power to it, and put the port in the PoE error-disabled state. To configure the PoE port to automatically recover from the error-disabled state, use the **errdisable detect cause inline-power** global configuration command to enable error-disabled detection for the PoE cause and the **errdisable recovery cause inline-power interval** global configuration command to enable the recovery timer for the PoE error-disabled cause.

Caution

If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the port, which could adversely affect the device.

You can verify your settings by entering the **show power inline police** privileged EXEC command.

Examples

This example shows how to enable policing of the power consumption and configuring the device to generate a syslog message on the PoE port on a device:

```
Device(config) # interface gigabitethernet1/0/2
Device(config-if) # power inline police action log
```

power supply

To configure and manage the internal power supplies on a switch, use the **power supply** command in privileged EXEC mode.

power supply stack-member-number $slot \{A \mid B\} \{off \mid on\}$

Syntax Description

stack-member-number	supplies	Stack member number for which to configure the internal power supplies. The range is 1 to 9, depending on the number of switches in the stack.		
	This par	rameter is available only on stacking-capable switches.		
slot	Selects t	Selects the switch power supply to set.		
A	Selects the power supply in slot A.			
В	Selects t	Selects the power supply in slot B.		
	Note	Power supply slot B is the closest slot to the outer edge of the switch.		
off	Sets the switch power supply to off.			
on	Sets the switch power supply to on.			

Command Default

The switch power supply is on.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The **power supply** command applies to a switch or to a switch stack where all switches are the same platform.

In a switch stack with the same platform switches, you must specify the stack member before entering the slot $\{A \mid B\}$ off or on keywords.

To return to the default setting, use the **power supply** stack-member-number **on** command.

You can verify your settings by entering the show env power privileged EXEC command.

Examples

This example shows how to set the power supply in slot A to off:

```
Device> power supply 2 slot A off
```

Disabling Power supply A may result in a power loss to PoE devices and/or switches ... Continue? (yes/[no]): yes Device

Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off Jun 10 04:52:56.717: %PLATFORM ENV-1-FAN NOT PRESENT: Fan is not present

This example shows how to set the power supply in slot A to on:

```
Device> power supply 1 slot B on
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the show env power command:

Dev	ice> show env power					
SW	PID	Serial#	Status	Sys Pwr	PoE Pwr	Watts

1B	Not Present					

show beacon all

To display the status of beacon LED on the device, use the **show beacon all** command in privileged EXEC mode.

 $show\ beacon\ \{rp\ \{active\ |\ standby\}\ |\ slot\ slot\ -number\ \} \quad |\ all\ \}$

Syntax Description

rp {active standby}	Specifies the active or the standby Switch whose beacon LED status is to be displayed.
slot slot-num	Specifies the slot whose beacon LED status is to be displayed.
all	Displays the status of all beacon LEDs.

Command History

Release	Modification
Cisco IOS XE Fuji 16.9.1	This command was introduced.

Command Default

This command has no default settings.

Command Modes

Privileged EXEC (#)

Usage Guidelines

Use the command **show beacon all** to know the status of all beacon LEDs.

Sample output of show beacon all command.

Device#show beacon all Switch# Beacon Status

Sample output of show beacon rp command.

Device#show beacon rp active Switch# Beacon Status -----*1 OFF

Device#show beacon slot 1
Switch# Beacon Status
-----*

*1 OFF

show environment

To display fan, temperature, and power information, use the **show environment** command in EXEC mode.

show environment { all	fan	power	stack	temperature	xps	}
------------------------	-----	-------	-------	-------------	-----	---

Syntax Description

specified switch. This keyword is available only on stacking-capable switches. temperature Displays the switch temperature status.	all	Displays the fan and temperature environmental status and the status of the internal power supplies.
stack Displays all environmental status for each switch in the stack or for the specified switch. This keyword is available only on stacking-capable switches. temperature Displays the switch temperature status.	fan	Displays the switch fan status.
specified switch. This keyword is available only on stacking-capable switches. temperature Displays the switch temperature status.	power	Displays the internal power status of the active switch.
temperature Displays the switch temperature status.	stack	Displays all environmental status for each switch in the stack or for the specified switch.
		This keyword is available only on stacking-capable switches.
xps Displays the status of the Cisco eXpandable Power System (XPS) 2200	temperature	Displays the switch temperature status.
	xps	Displays the status of the Cisco eXpandable Power System (XPS) 2200.

Command Default

None

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Use the **show environment** EXEC command to display the information for the switch being accessed—a standalone switch or the active switch. Use this command with the **stack** keyword to display all information for the stack or for the specified stack member.

If you enter the **show environment temperature status** command, the command output shows the switch temperature state and the threshold level.

You can also use the **show environment temperature** command to display the switch temperature status. The command output shows the green and yellow states as *OK* and the red state as *FAULTY*.

Examples

This example shows a sample output of the show environment all command:

Device> show environment all

```
Switch 1 FAN 1 is OK
Switch 1 FAN 2 is OK
Switch 1 FAN 3 is OK
FAN PS-1 is NOT PRESENT
FAN PS-2 is OK
Switch 1: SYSTEM TEMPERATURE is OK
Inlet Temperature Value: 25 Degree Celsius
```

Temperature State: GREEN

Yellow Threshold : 46 Degree Celsius Red Threshold : 56 Degree Celsius

Hotspot Temperature Value: 35 Degree Celsius

Temperature State: GREEN

Yellow Threshold : 105 Degree Celsius Red Threshold : 125 Degree Celsius

This example shows a sample output of the **show environment stack** command:

Device# show environment stack

```
System Temperature Value: 41 Degree Celsius
System Temperature State: GREEN
Yellow Threshold: 66 Degree Celsius
```

Yellow Threshold : 66 Degree Celsius Red Threshold : 76 Degree Celsius

This example shows a sample output of the **show environment temperature** command:

Device> show environment temperature

Red Threshold : 125 Degree Celsius

```
Switch 1: SYSTEM TEMPERATURE is OK
Inlet Temperature Value: 25 Degree Celsius
Temperature State: GREEN
Yellow Threshold: 46 Degree Celsius
Red Threshold: 56 Degree Celsius
Hotspot Temperature Value: 35 Degree Celsius
Temperature State: GREEN
Yellow Threshold: 105 Degree Celsius
```

Table 1: States in the show environment temperature status Command Output

State	Description
Green	The switch temperature is in the <i>normal</i> operating range.
Yellow	The temperature is in the <i>warning</i> range. You should check the external temperature around the switch.
Red	The temperature is in the <i>critical</i> range. The switch might not run properly if the temperature is in this range.

show errdisable detect

To display error-disabled detection status, use the **show errdisable detect** command in EXEC mode.

show errdisable detect

Syntax Description

This command has no arguments or keywords.

Command Default

Vone

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

A gbic-invalid error reason refers to an invalid small form-factor pluggable (SFP) module.

The error-disable reasons in the command output are listed in alphabetical order. The mode column shows how error-disable is configured for each feature.

You can configure error-disabled detection in these modes:

- port mode—The entire physical port is error-disabled if a violation occurs.
- vlan mode—The VLAN is error-disabled if a violation occurs.
- port/vlan mode—The entire physical port is error-disabled on some ports and is per-VLAN error-disabled on other ports.

show errdisable recovery

To display the error-disabled recovery timer information, use the **show errdisable recovery** command in EXEC mode.

show errdisable recovery

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

A gbic-invalid error-disable reason refers to an invalid small form-factor pluggable (SFP) module interface.

Note

Though visible in the output, the unicast-flood field is not valid.

This is an example of output from the **show errdisable recovery** command:

show ip interface

To display the usability status of interfaces configured for IP, use the **show ip interface** command in privileged EXEC mode.

show ip interface [type number] [brief]

Syntax Description

type	(Optional) Interface type.
number	(Optional) Interface number.

brief

(Optional) Displays a summary of the usability status information for each interface.

Note

The output of the **show ip interface brief** command displays information of all the available interfaces whether or not the corresponding network module for these interfaces are connected. These interfaces can be configured if the network module is connected. Run the **show interface status** command to see which network modules are connected.

Command Default

The full usability status is displayed for all interfaces configured for IP.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable (which means that it can send and receive packets). If an interface is not usable, the directly connected routing entry is removed from the routing table. Removing the entry lets the software use dynamic routing protocols to determine backup routes to the network, if any.

If the interface can provide two-way communication, the line protocol is marked "up." If the interface hardware is usable, the interface is marked "up."

If you specify an optional interface type, information for that specific interface is displayed. If you specify no optional arguments, information on all the interfaces is displayed.

When an asynchronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP fast switching is enabled. A **show ip interface** command on an asynchronous interface encapsulated with PPP or SLIP displays a message indicating that IP fast switching is enabled.

You can use the **show ip interface brief** command to display a summary of the device interfaces. This command displays the IP address, the interface status, and other information.

The **show ip interface brief** command does not display any information related to Unicast RPF.

Examples

The following example shows interface information on Gigabit Ethernet interface 1/0/1:

Device# show ip interface gigabitethernet 1/0/1

```
GigabitEthernet1/0/1 is up, line protocol is up
  Internet address is 10.1.1.1/16
 Broadcast address is 255.255.255.255
 Address determined by setup command
 MTU is 1500 bytes
 Helper address is not set
  Directed broadcast forwarding is disabled
 Outgoing access list is not set
 Inbound access list is not set
 Proxy ARP is enabled
 Local Proxy ARP is disabled
  Security level is default
  Split horizon is enabled
 ICMP redirects are always sent
 ICMP unreachables are always sent
 ICMP mask replies are never sent
  IP fast switching is enabled
  IP fast switching on the same interface is disabled
 IP Flow switching is disabled
 IP CEF switching is enabled
 IP Feature Fast switching turbo vector
  IP VPN Flow CEF switching turbo vector
  IP multicast fast switching is enabled
  IP multicast distributed fast switching is disabled
  IP route-cache flags are Fast, CEF
  Router Discovery is disabled
  IP output packet accounting is disabled
  IP access violation accounting is disabled
  TCP/IP header compression is disabled
 RTP/IP header compression is disabled
  Policy routing is enabled, using route map PBR
 Network address translation is disabled
 BGP Policy Mapping is disabled
  IP Multi-Processor Forwarding is enabled
     IP Input features, "PBR",
        are not supported by MPF and are IGNORED
     IP Output features, "NetFlow",
        are not supported by MPF and are IGNORED
```

The following example shows how to display the usability status for a specific VLAN:

Device# show ip interface vlan 1

```
Vlan1 is up, line protocol is up
  Internet address is 10.0.0.4/24
  Broadcast address is 255.255.255.255
Address determined by non-volatile memory
 MTU is 1500 bytes
  Helper address is not set
  Directed broadcast forwarding is disabled
  Outgoing access list is not set
  Inbound access list is not set
  Proxy ARP is enabled
  Local Proxy ARP is disabled
  Security level is default
  Split horizon is enabled
  ICMP redirects are always sent
  ICMP unreachables are always sent
  ICMP mask replies are never sent
  IP fast switching is enabled
  IP fast switching on the same interface is disabled
  IP Flow switching is disabled
  IP CEF switching is enabled
```

```
IP Fast switching turbo vector
IP Normal CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Probe proxy name replies are disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
Sampled Netflow is disabled
IP multicast multilayer switching is disabled
Netflow Data Export (hardware) is enabled
```

The table below describes the significant fields shown in the display.

Table 2: show ip interface Field Descriptions

Field	Description		
Broadcast address is	Broadcast address.		
Peer address is	Peer address.		
MTU is	MTU value set on the interface, in bytes.		
Helper address	Helper address, if one is set.		
Directed broadcast forwarding	Shows whether directed broadcast forwarding is enabled.		
Outgoing access list	Shows whether the interface has an outgoing access list set.		
Inbound access list	Shows whether the interface has an incoming access list set.		
Proxy ARP	Shows whether Proxy Address Resolution Protocol (ARP) is enabled for the interface.		
Security level	IP Security Option (IPSO) security level set for this interface.		
Split horizon	Shows whether split horizon is enabled.		
ICMP redirects	Shows whether redirect messages will be sent on this interface.		
ICMP unreachables	Shows whether unreachable messages will be sent on this interface.		
ICMP mask replies	Shows whether mask replies will be sent on this interface.		
IP fast switching	Shows whether fast switching is enabled for this interface. It is generally enabled on serial interfaces, such as this one.		
IP Flow switching	Shows whether Flow switching is enabled for this interface.		

Field	Description	
IP CEF switching	Shows whether Cisco Express Forwarding switching is enabled for the interface.	
IP multicast fast switching	Shows whether multicast fast switching is enabled for the interface.	
IP route-cache flags are Fast	Shows whether NetFlow is enabled on an interface. Displays "Flow init" to specify that NetFlow is enabled on the interface. Displays "Ingress Flow" to specify that NetFlow is enabled on a subinterface using the ip flow ingress command. Shows "Flow" to specify that NetFlow is enabled on a main interface using the ip route-cache flow command.	
Router Discovery	Shows whether the discovery process is enabled for this interface. It is generally disabled on serial interfaces.	
IP output packet accounting	Shows whether IP accounting is enabled for this interface and what the threshold (maximum number of entries) is.	
TCP/IP header compression	Shows whether compression is enabled.	
WCCP Redirect outbound is disabled	Shows the status of whether packets received on an interface are redirected to a cache engine. Displays "enabled" or "disabled."	
WCCP Redirect exclude is disabled	Shows the status of whether packets targeted for an interface will be excluded from being redirected to a cache engine. Displays "enabled" or "disabled."	
Netflow Data Export (hardware) is enabled	NetFlow Data Expert (NDE) hardware flow status on the interface.	

The following example shows how to display a summary of the usability status information for each interface:

Device# show ip interface brief

Interface	IP-Address	OK?	Method	Status	Protocol	
Vlan1	unassigned	YES	NVRAM	administratively dow	n down	
GigabitEthernet0/0	unassigned	YES	NVRAM	down	down	
GigabitEthernet1/0/1	unassigned	YES	NVRAM	down	down	
GigabitEthernet1/0/2	unassigned	YES	unset	down	down	
GigabitEthernet1/0/3	unassigned	YES	unset	down	down	
GigabitEthernet1/0/4	unassigned	YES	unset	down	down	
GigabitEthernet1/0/5	unassigned	YES	unset	down	down	
GigabitEthernet1/0/6	unassigned	YES	unset	down	down	
GigabitEthernet1/0/7	unassigned	YES	unset	down	down	

<output truncated>

Table 3: show ip interface brief Field Descriptions

Field	Description
Interface	Type of interface.

Field	Description		
IP-Address	IP address assigned to the interface.		
OK?	"Yes" means that the IP Address is valid. "No" means that the IP Address is not valid.		
Method	The Method field has the following possible values:		
	 RARP or SLARP: Reverse Address Resolution Protocol (RARP) or Serial Line Address Resolution Protocol (SLARP) request. 		
	BOOTP: Bootstrap protocol.		
	TFTP: Configuration file obtained from the TFTP server.		
	manual: Manually changed by the command-line interface.		
	NVRAM: Configuration file in NVRAM.		
	• IPCP: ip address negotiated command.		
	• DHCP: ip address dhcp command.		
	• unset: Unset.		
	• other: Unknown.		
Status	Shows the status of the interface. Valid values and their meanings are:		
	• up: Interface is up.		
	down: Interface is down.		
	administratively down: Interface is administratively down.		
Protocol	Shows the operational status of the routing protocol on this interface.		

Related Commands

Command	Description
ip interface	Configures a virtual gateway IP interface on a Secure Socket Layer Virtual Private Network (SSL VPN) gateway
show interface status	Displays the status of the interface.

show interfaces

To display the administrative and operational status of all interfaces or for a specified interface, use the **show interfaces** command in the EXEC mode.

show interfaces $[\{interface-id \mid vlan \quad vlan-id\}]$ $[\{accounting \mid capabilities \quad [module \quad number] \mid debounce \mid description \mid etherchannel \mid flowcontrol \mid private-vlan mapping \mid pruning \mid stats \mid status \quad [\{err-disabled \mid inactive\}] \mid trunk\}]$

•			
~1	/ntay	Descri	ntınn
•	IIIUA	DUJULI	puon

interface-id	(Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels.
	The port channel range is 1 to 128.
vlan vlan-id	(Optional) VLAN identification. The range is 1 to 4094.
accounting	(Optional) Displays accounting information on the interface, including active protocols and input and output packets and octets.
	Note The display shows only packets processed in software; hardware-switched packets do not appear.
capabilities	(Optional) Displays the capabilities of all interfaces or the specified interface, including the features and options that you can configure on the interface. Though visible in the command line help, this option is not available for VLAN IDs.
module number	(Optional) Displays capabilities of all interfaces on the switch or specified stack member.
	The range is 1 to 9.
	This option is not available if you entered a specific interface ID.
description	(Optional) Displays the administrative status and description set for interfaces.
	Note The output of the show interfaces description command displays information of all the available interfaces whether or not the corresponding network module for these interfaces are connected. These interfaces can be configured if the network module is connected. Run the show interface status command to see which network modules are connected.
etherchannel	(Optional) Displays interface EtherChannel information.
flowcontrol	(Optional) Displays interface flow control information.

(Optional) Displays private-VLAN mapping information for the VLAN switch virtual interfaces (SVIs). This keyword is not available if the switch is running the LAN base feature set.	
(Optional) Displays trunk VTP pruning information for the interface.	
(Optional) Displays the input and output packets by switching the path for the interface.	
(Optional) Displays the status of the interface. A status of unsupported in the Type field means that a non-Cisco small form-factor pluggable (SFP) module is inserted in the module slot.	
(Optional) Displays interfaces in an error-disabled state.	
(Optional) Displays interfaces in an inactive state.	
(Optional) Displays interface trunk information. If you do not specify an interface, only information for active trunking ports appears.	

Note

Though visible in the command-line help strings, the **crb**, **fair-queue**, **irb**, **mac-accounting**, **precedence**, **random-detect**, **rate-limit**, and **shape** keywords are not supported.

Command Default

None

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The **show interfaces capabilities** command with different keywords has these results:

- Use the **show interface capabilities module** *number* command to display the capabilities of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.
- Use the **show interfaces** *interface-id* **capabilities** to display the capabilities of the specified interface.
- Use the **show interfaces capabilities** (with no module number or interface ID) to display the capabilities of all interfaces in the stack.

Note

The field **Last Input** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully received by an interface and processed by the CPU on the device. This information can be used to know when a dead interface failed.

Last Input is not updated by fast-switched traffic.

The field **output** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully transmitted by the interface. The information provided by this field can useful for knowing when a dead interface failed.

This is an example of output from the **show interfaces** command for an interface on stack member 3.

```
Device# show interfaces gigabitethernet3/0/2
```

```
GigabitEthernet3/0/2 is down, line protocol is down (notconnect)
  Hardware is Gigabit Ethernet, address is 2037.064d.4381 (bia 2037.064d.4381)

<output truncated>

show interfaces counters

To display various counters for the switch or for a specific interface, use the **show interfaces counters** command in privileged EXEC mode.

show interfaces [interface-id] **counters** [{**errors** | **etherchannel** | **module** stack-member-number | **protocol status** | **trunk**}]

Syntax Description

interface-id	(Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.		
errors	(Optional) Displays error counters.		
etherchannel	(Optional) Displays EtherChannel counters, including octets, broadcast packets, multicast packets, and unicast packets received and sent.		
module stack-member-number	` •	al) Displays counters for the specified stack member. ge is 1 to 9.	
	Note	In this command, the module keyword refers to the stack member number. The module number that is part of the interface ID is always zero.	
protocol status	(Optional) Displays the status of protocols enabled on interfaces.		
trunk	(Optional) Displays trunk counters.		

Note

Though visible in the command-line help string, the **vlan** *vlan-id* keyword is not supported.

Command Default

None

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

If you do not enter any keywords, all counters for all interfaces are included.

This is an example of partial output from the **show interfaces counters** command. It displays all counters for the switch.

Device#	show	interfaces	counters

Port	InOctets	InUcastPkts	InMcastPkts	InBcastPkts
Gi1/0/1	0	0	0	0
Gi1/0/2	0	0	0	0
Gi1/0/3	95285341	43115	1178430	1950
Gi1/0/4	0	0	0	0

<output truncated>

This is an example of partial output from the **show interfaces counters module** command for stack member 2. It displays all counters for the specified switch in the stack.

Device# show	interfaces com	unters module 2		
Port	InOctets	InUcastPkts	InMcastPkts	InBcastPkts
Gi1/0/1	520	2	0	0
Gi1/0/2	520	2	0	0
Gi1/0/3	520	2	0	0
Gi1/0/4	520	2	0	0

<output truncated>

This is an example of partial output from the **show interfaces counters protocol status** command for all interfaces:

```

GigabitEthernet1/0/9: Other, IP
GigabitEthernet1/0/10: Other, IP, CDP
<output truncated>
```

This is an example of output from the **show interfaces counters trunk** command. It displays trunk counters for all interfaces.

Device#	show interfaces co	ounters trunk	
Port	TrunkFramesTx	TrunkFramesRx	WrongEncap
Gi1/0/1	0	0	0
Gi1/0/2	0	0	0
Gi1/0/3	80678	0	0
Gi1/0/4	82320	0	0
Gi1/0/5	0	0	0

<output truncated>

show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings, use the **show interfaces switchport** command in privileged EXEC mode.

show interfaces [interface-id] **switchport** [{**module** number}]

Syntax Description

interface-id	(Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels. The port channel range is 1 to 48.
module number	(Optional) Displays switchport configuration of all interfaces on the switch or specified stack member.
	The range is 1 to 9.
	This ontion is not available if you entered a specific interface ID

Command Default

None

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Use the **show interface switchport module** *number* command to display the switch port characteristics of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.

This is an example of output from the **show interfaces switchport** command for a port. The table that follows describes the fields in the display.

Note

Private VLANs are not supported in this release, so those fields are not applicable.

Device# show interfaces gigabitethernet1/0/1 switchport
Name: Gi1/0/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: down
Administrative Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 10 (VLAN0010)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk native VLAN: none

Administrative private-vlan trunk encapsulation: dot1q

Administrative private-vlan trunk normal VLANs: none Administrative private-vlan trunk associations: none Administrative private-vlan trunk mappings: none

Operational private-vlan: none Trunking VLANs Enabled: 11-20

Pruning VLANs Enabled: 2-1001 Capture Mode Disabled Capture VLANs Allowed: ALL

Protected: false

Unknown unicast blocked: disabled Unknown multicast blocked: disabled

Appliance trust: none

Field	Description
Name	Displays the port name.
Switchport	Displays the administrative and operational status of the port. In this display, the port is in switchport mode.
Administrative Mode	Displays the administrative and operational modes.
Operational Mode	
Administrative Trunking Encapsulation	Displays the administrative and operational
Operational Trunking Encapsulation	encapsulation method and whether trunking negotiation is enabled.
Negotiation of Trunking	
Access Mode VLAN	Displays the VLAN ID to which the port is configured.
Trunking Native Mode VLAN	Lists the VLAN ID of the trunk that is in native mode.
Trunking VLANs Enabled	Lists the allowed VLANs on the trunk. Lists the active VLANs on the trunk.
Trunking VLANs Active	, 221 to 61 to 11
Pruning VLANs Enabled	Lists the VLANs that are pruning-eligible.
Protected	Displays whether or not protected port is enabled (True) or disabled (False) on the interface.
Unknown unicast blocked	Displays whether or not unknown multicast and
Unknown multicast blocked	unknown unicast traffic is blocked on the interface.
Voice VLAN	Displays the VLAN ID on which voice VLAN is enabled.
Appliance trust	Displays the class of service (CoS) setting of the data packets of the IP phone.

show interfaces transceiver

To display the physical properties of a small form-factor pluggable (SFP) module interface, use the **show interfaces transceiver** command in EXEC mode.

show interfaces [interface-id] transceiver $[\{detail \mid module \mid number \mid properties \mid supported-list \mid threshold-table\}]$

Syntax Description

interface-id	(Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.
detail	(Optional) Displays calibration properties, including high and low numbers and any alarm information for any Digital Optical Monitoring (DoM)-capable transceiver if one is installed in the switch.
module number	(Optional) Limits display to interfaces on module on the switch.
	This option is not available if you entered a specific interface ID.
properties	(Optional) Displays speed, duplex, and inline power settings on an interface.
supported-list	(Optional) Lists all supported transceivers.
threshold-table	(Optional) Displays alarm and warning threshold table.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Examples

This is an example of output from the **show interfaces** interface-id **transceiver detail** command:

${\tt Device\#\ show\ interfaces\ gigabitethernet1/1/1\ transceiver\ detail}$

ITU Channel not available (Wavelength not available), Transceiver is internally calibrated.
mA:milliamperes, dBm:decibels (milliwatts), N/A:not applicable.
++:high alarm, +:high warning, -:low warning, -- :low alarm.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are uncalibrated.

		High Alarm	High Warn	Low Warn	Low Alarm
	Temperature	Threshold	Threshold	Threshold	Threshold
Port	(Celsius)	(Celsius)	(Celsius)	(Celsius)	(Celsius)
Gi1/1/1	29.9	74.0	70.0	0.0	-4.0
		High Alarm	High Warn	Low Warn	Low Alarm
	Voltage	Threshold	Threshold	Threshold	Threshold
Port	(Volts)	(Volts)	(Volts)	(Volts)	(Volts)
Gi1/1/1	3.28	3.60	3.50	3.10	3.00

Port	Optical Transmit Power (dBm)	High Alarm Threshold (dBm)	High Warn Threshold (dBm)	Low Warn Threshold (dBm)	Low Alarm Threshold (dBm)
Gi1/1/1	1.8	7.9	3.9	0.0	-4.0
	Optical	High Alarm	High Warn	Low Warn	Low Alarm
	Receive Power	Threshold	Threshold	Threshold	Threshold
Port	(dBm)	(dBm)	(dBm)	(dBm)	(dBm)
Gi1/1/1	-23.5	-5.0	-9.0	-28.2	-32.2

This is an example of output from the **show interfaces transceiver threshold-table** command:

<output truncated>

show inventory

To display the product inventory listing of all Cisco products installed in the networking device, use the **show inventory** command in user EXEC or privileged EXEC mode.

show inventory {fru | oid | raw} [entity]

fru	(Optional) Retrieves information about all Field Replaceable Units (FRUs) installed in the Cisco networking device.
oid	(Optional) Retrieves information about the vendor specific hardware registration identifier referred to as object identifier (OID).
	The OID identifies the MIB object's location in the MIB hierarchy, and provides a means of accessing the MIB object in a network of managed devices
raw	(Optional) Retrieves information about all Cisco products referred to as entities installed in the Cisco networking device, even if the entities do not have a product ID (PID) value, a unique device identifier (UDI), or other physical identification.
entity	(Optional) Name of a Cisco entity (for example, chassis, backplane, module, or slot). A quoted string may be used to display very specific UDI information; for example "sfslot 1" will display the UDI information for slot 1 of an entity named sfslot.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.6.1	This command was introduced.
Cisco IOS XE Everest 16.6.3	This command was enhanced to display the serial number for the chassis.

Usage Guidelines

The **show inventory** command retrieves and displays inventory information about each Cisco product in the form of a UDI. The UDI is a combination of three separate data elements: a product identifier (PID), a version identifier (VID), and the serial number (SN).

The PID is the name by which the product can be ordered; it has been historically called the "Product Name" or "Part Number." This is the identifier that one would use to order an exact replacement part.

The VID is the version of the product. Whenever a product has been revised, the VID will be incremented. The VID is incremented according to a rigorous process derived from Telcordia GR-209-CORE, an industry guideline that governs product change notices.

The SN is the vendor-unique serialization of the product. Each manufactured product will carry a unique serial number assigned at the factory, which cannot be changed in the field. This is the means by which to identify an individual, specific instance of a product.

The UDI refers to each product as an entity. Some entities, such as a chassis, will have subentities like slots. Each entity will display on a separate line in a logically ordered presentation that is arranged hierarchically by Cisco entities.

Use the **show inventory** command without options to display a list of Cisco entities installed in the networking device that are assigned a PID.

The following is sample output from the **show inventory** command:

```
Device#show inventory
NAME: "c93xx Stack", DESCR: "c93xx Stack"
PID: C9300-48UXM
                   , VID: P2B , SN: FCW2117G00C
NAME: "Switch 2", DESCR: "C9300-48UXM"
PID: C9300-48UXM
                    , VID: P2B , SN: FCW2117G00C
NAME: "Switch 2 - Power Supply A", DESCR: "Switch 2 - Power Supply A"
PID: PWR-C1-1100WAC , VID: V02 , SN: LIT211227NZ
NAME: "Switch 2 FRU Uplink Module 1", DESCR: "8x10G Uplink Module"
PID: C3850-NM-8-10G , VID: V01 , SN: FOC20153M58
NAME: "Te2/1/1", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M , VID: V02 , SN: TED2132H0SU
NAME: "Te2/1/3", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M , VID: V02 , SN: TED2132H0A8
NAME: "Te2/1/5", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M , VID: V02 , SN: TED2132H1G8
NAME: "usbflash1", DESCR: "usbflash1"
              , VID: STP21460FNA, SN: V01
PID: SSD-120G
```

Table 4: show inventory Field Descriptions

Field	Description
NAME	Physical name (text string) assigned to the Cisco entity. For example, console or a simple component number (port or module number), such as "1," depending on the physical component naming syntax of the device.
DESCR	Physical description of the Cisco entity that characterizes the object. The physical description includes the hardware serial number and the hardware revision.
PID	Entity product identifier. Equivalent to the entPhysicalModelName MIB variable in RFC 2737.
VID	Entity version identifier. Equivalent to the entPhysicalHardwareRev MIB variable in RFC 2737.
SN	Entity serial number. Equivalent to the entPhysicalSerialNum MIB variable in RFC 2737.

For diagnostic purposes, the **show inventory**command can be used with the **raw** keyword to display every RFC 2737 entity including those without a PID, UDI, or other physical identification.

Note

The **raw** keyword option is primarily intended for troubleshooting problems with the **show inventory** command itself.

Enter the **show inventory** command with an *entity* argument value to display the UDI information for a specific type of Cisco entity installed in the networking device. In this example, a list of Cisco entities that match the sfslot argument string is displayed.

```
Device#show inventory "c93xx Stack"
NAME: "c93xx Stack", DESCR: "c93xx Stack"
PID: C9300-48UXM
                    , VID: P2B , SN: FCW2117G00C
NAME: "Switch 2", DESCR: "C9300-48UXM"
PID: C9300-48UXM
                 , VID: P2B , SN: FCW2117G00C
NAME: "Switch 2 - Power Supply A", DESCR: "Switch 2 - Power Supply A"
PID: PWR-C1-1100WAC , VID: V02 , SN: LIT211227NZ
NAME: "Switch 2 FRU Uplink Module 1", DESCR: "8x10G Uplink Module"
PID: C3850-NM-8-10G , VID: V01 , SN: FOC20153M58
NAME: "Te2/1/1", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M
                       , VID: V02 , SN: TED2132H0SU
NAME: "Te2/1/3", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M
                       , VID: V02 , SN: TED2132H0A8
NAME: "Te2/1/5", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M
                    , VID: V02 , SN: TED2132H1G8
NAME: "usbflash1", DESCR: "usbflash1"
PID: SSD-120G
                     , VID: STP21460FNA, SN: V01
```

You can request even more specific UDI information with the *entity* argument value enclosed in quotation marks.

show memory platform

To display memory statistics of a platform, use the **show memory platform** command in privileged EXEC mode.

show memory platform [{compressed-swap | information | page-merging}]

Syntax Description

compressed-swap	(Optional) Displays platform memory compressed-swap information.
information	(Optional) Displays general information about the platform.
page-merging	(Optional) Displays platform memory page-merging information.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Free memory is accurately computed and displayed in the Free Memory field of the command output.

Examples

The following is sample output from the **show memory platform** command:

Switch# show memory platform

show module

To display module information such as switch number, model number, serial number, hardware revision number, software version, MAC address and so on, use this command in user EXEC or privileged EXEC mode.

show module [{switch-num}]

Syntax Description	switch-num	(Optional) Number of the switch.
Command Default	None	
Command Modes	User EXEC (>)	
	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Entering the **show module** command without the *switch-num* argument is the same as entering the show module all command.

show mgmt-infra trace messages ilpower

To display inline power messages within a trace buffer, use the **show mgmt-infra trace messages ilpower** command in privileged EXEC mode.

show mgmt-infra trace messages ilpower [switch stack-member-number]

Syntax Description

switch stack-member-number (Optional) Specifies the stack member number for which to display inline power messages within a trace buffer.

Command Default

None

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

This is an output example from the **show mgmt-infra trace messages ilpower** command:

Device# show mgmt-infra trace messages ilpower

```

show mgmt-infra trace messages ilpower-ha

To display inline power high availability messages within a trace buffer, use the **show mgmt-infra trace messages ilpower-ha** command in privileged EXEC mode.

show mgmt-infra trace messages ilpower-ha [switch stack-member-number]

Syntax Description

switch *stack-member-number*

(Optional) Specifies the stack member number for which to display inline power messages within a trace buffer.

Command Default

None

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced

This is an output example from the **show mgmt-infra trace messages ilpower-ha** command:

Device# show mgmt-infra trace messages ilpower-ha [10/23/12 14:04:48.087 UTC 1 3] NG3K_ILPOWER_HA: Created NGWC ILP CF client successfully.

show mgmt-infra trace messages platform-mgr-poe

To display platform manager Power over Ethernet (PoE) messages within a trace buffer, use the **show mgmt-infra trace messages platform-mgr-poe** privileged EXEC command.

show mgmt-infra trace messages platform-mgr-poe [switch stack-member-number]

Syntax Description

switch stack-member-number

(Optional) Specifies the stack member number for which to display messages within a trace buffer.

Command Default

None

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

This is an example of partial output from the **show mgmt-infra trace messages platform-mgr-poe** command:

```
Device# show mgmt-infra trace messages platform-mgr-poe
```

```

show platform hardware capacity

Note

The existing **show platform hardware capacity** command is currently supported, but is going to be deprecated. Use the **show tech-support resource** command instead.

To determine system hardware capacity, use the **show platform hardware capacity** command in privileged EXEC mode.

show platform hardware capacity

Syntax Description

This command has no arguments or keywords.

Command Default

This command has no default settings.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification		
Cisco IOS XF Fuji 16 8 1a	This command was introduced		

Example

This example shows how to determine the system hardware capacity

Device# show platform hardware capacity

show platform hardware fed switch forward

To display device-specific hardware information, use the **show platform hardware fed switch** *switch_number* command.

This topic elaborates only the forwarding-specific options, that is, the options available with the **show platform hardware fed switch** { switch_num | active | standby | forward summary command.

The output of the **show platform hardware fed switch** *switch_number* **forward summary** displays all the details about the forwarding decision taken for the packet.

show platform hardware fed switch {switch_num | active | standby} forward summary

Syntax Description

switch { switch_num |
active | standby }

The switch for which you want to display information. You have the following options:

- switch_num—ID of the switch.
- active—Displays information relating to the active switch.
- standby—Displays information relating to the standby switch, if available.

forward summary

Displays packet forwarding information.

Note

Support for the keyword **summary** has been discontinued in the Cisco IOS XE Everest 16.6.1 release and later releases.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.
Cisco IOS XE Everest 16.6.1 and later releases	Supprort for the keyword summary was discontinued.

Usage Guidelines

Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

Fields displayed in the command output are explained below.

- Station Index: The Station Index is the result of the layer 2 lookup and points to a station descriptor which provides the following:
 - Destination Index: Determines the egress port(s) to which the packets should be sent to. Global Port Number(GPN) can be used as the destination index. A destination index with 15 down to 12 bits set indicates the GPN to be used. For example, destination index 0xF04E corresponds to GPN 78 (0x4e).
 - Rewrite Index: Determines what needs to be done with the packets. For layer 2 switching, this is typically a bridging action

- Flexible Lookup Pipeline Stages(FPS): Indicates the forwarding decision that was taken for the packet routing or bridging
- Replication Bit Map: Determines if the packets should be sent to CPU or stack
 - Local Data Copy = 1
 - Remote Data copy = 0
 - Local CPU Copy = 0
 - Remote CPU Copy = 0

Example

This is an example of output from the **show platform hardware fed switch** { switch_num | active | standby } forward summary command.

```

show platform hardware fed switch forward interface

To debug forwarding information and to trace the packet path in the hardware forwarding plane, use the **show** platform hardware fed switch switch number forward interface command. This command simulates a user-defined packet and retrieves the forwarding information from the hardware forwarding plane. A packet is generated on the ingress port based on the packet parameters that you have specified in this command. You can also provide a complete packet from the captured packets stored in a PCAP file.

This topic elaborates only the interface forwarding-specific options, that is, the options available with the **show platform hardware fed switch** { switch_num | active | standby } forward interface command.

show platform hardware fed switch {switch_num | active | standby} forward interface interface-type interface-number source-mac-address destination-mac-address {protocol-number | arp | cos | ipv4 | ipv6 | mpls}

show platform hardware fed switch {switch num | active | standby} forward interface interface-type interface-number pcap pcap-file-name number packet-number

show platform hardware fed switch {switch num | active | standby} forward interface interface-type interface-number vlan vlan-id source-mac-address destination-mac-address{protocol-number | arp | **cos** | **ipv4** | **ipv6** | **mpls**}

Syntax Description

| standby }

switch {switch_num | active | The switch on which packet tracing has to be scheduled. The input port should be available on this switch. You have the following options:

- switch_num—ID of the switch on which the ingress port is present.
- active—indicates the active switch on which the ingress port is
- standby—indicates the standby switch on which the ingress port is present.

This keyword is not supported. Note

interface interface-type interface-number	The input interface on which packet trace is simulated.
source-mac-address	The source MAC address of the packet you want to simulate.
destination-mac-address	The MAC address of the destination interface in hexadecimal format.
protocol-number	The number assigned to any L3 protocol.
arp	The Address Resolution Protocol (ARP) parameters.
ipv4	The IPv4 packet parameters.
ipv6	The IPv6 packet parameters.
mpls	The Multiprotocol Label Switching (MPLS) label parameters.

cos	The class of service (CoS) number from 0 to 7 to set priority.
pcap pcap-file-name	Name of the pcap file in internal flash (flash:). Ensure that the file already exists in flash:.
number packet-number	Specifies the packet number in the pcap file.
vlan vlan-id	VLAN id of the dot1q header in the simulated packet. The range is 1 to 4096.

Command Modes

Privileged EXEC

Command History

Release	Modification		
Cisco IOS XE Everest 16.5.1a	This command was introduced.		
Cisco IOS XE Fuji 16.9.1	The command was enhanced to support MPLS/ARP/VxLAN packet parameters and trace packets captured in a PCAP file.		
Cisco IOS XE Gibraltar 16.10.1	The command was enhanced to support data capture across a stack.		

Usage Guidelines

Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

This command supports the following packet types:

- Non-IP packets with any L3 protocol
- ARP packets
- IPv4 packets with any L4 protocol
- IPv4 packets with TCP/UDP/IGMP/ICMP/SCTP payload
- VxLAN packets
- MPLS packets with up to 3 Labels and meta data
- MPLS packets with IPv4/IPv6 payload
- IPv6 packets with TCP/UDP/IGMP/ICMP/SCTP payload

In a stack environment, you can trace packets across the stack irrespective of the number of stack members and topology. The **show platform hardware fed switch** *switch-number* **forward interface** *interface-type interface-number* command consolidates packet-forwarding information of all the stack members on the ingress switch. To achieve this, ensure that the switch number specified in the *switch_num* and *interface-number* arguments are of the input switch and that the number matches.

To trace any particular packet from the captured packets stored in a PCAP file, use the **show platform** hardware fed switch forward interface interface-type interface-number pcap pcap-file-name number packet-number data command.

Example

This is an example of output from the **show platform hardware fed switch** { switch_num | active | standby | forward interface command.

Device#show platform hardware fed switch active forward interface gigabitEthernet 1/0/35 0000.0022.0055 0000.0055.0066 ipv4 44.44.0.2 55.55.0.2 udp 1222 3333

Show forward is running in the background. After completion, syslog will be generated.

- *Sep 24 05:57:36.614: %SHFWD-6-PACKET_TRACE_DONE: Switch 1 R0/0: fed: Packet Trace Complete: Execute (show platform hardware fed switch <> forward last summary|detail)
- *Sep 24 05:57:36.614: %SHFWD-6-PACKET_TRACE_FLOW_ID: Switch 1 R0/0: fed: Packet Trace Flow id is 150323855361

Related Commands

Command	Description
monitor capture interface	Configures monitor capture points specifying an attachment point and the packet flow direction.
monitor capture start	Starts the capture of packet data at a traffic trace point into a buffer.
monitor capture stop	Stops the capture of packet data at a traffic trace point.
monitor capture export	Saves the captured packets in the buffer. Use this command to export the monitor capture buffer to a pcap file in flash: that you can use as an input in the show forward with pcap .

show platform hardware fed switch forward last summary

To display a summary of packet tracing data from a switch or switches in a stack, use the **show platform** hardware fed switch switch_number forward last summary command.

The output of the **show platform hardware fed switch** *switch_number* **forward last summary** command displays all the details about the forwarding decision taken for the packet from the last time the **show forward** command was run.

show platform hardware fed switch {switch_number | active | standby} forward last summary

Syntax Description

switch {switch_number |
active | standby }

The switch on which you want to schedule a packet capture for a port. You have the following options:

- switch_num—ID of the switch on which the ingress port is present.
- active—indicates the active switch on which the ingress port is present.
- **standby**—indicates the standby switch on which the ingress port is present.

Note This keyword is not supported.

forward last summary

Displays packet forwarding information.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.
Cisco IOS XE Everest 16.6.1 and later releases	Support for the keyword summary was discontinued.
Cisco IOS XE Fuji 16.9.1	Support for keywords last and summary is introduced.
Cisco IOS XE Gibraltar 16.10.1	The output of the command was enhanced to display the details about all the copies of the packets and the corresponding outgoing ports.

Usage Guidelines

Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

With Cisco IOS XE Gibraltar 16.10.1, show platform hardware fed switch forward last summary command is enhanced to:

• Inject the debug packets from the CPU to simulate the incoming port and packets

- Use the debug packets to trace the packet in hardware data-path to provide forwarding details such as lookup, adjacency, rewrite information, drop decision, outgoing port and so on
- Drop the original packets at egress so as not to transmit the packet to the outgoing port
- Send a copy of all the packets to the CPU and display the details in the packet tracing output

Example

This is an example of output from the **show platform hardware fed switch** { switch_number | active | standby } forward last summary command.

```
Device#show platform hardware fed switch active forward last summary

show platform resources

To display platform resource information, use the **show platform reources** command in privileged EXEC mode.

show platform resources

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The output of this command displays the used memory, which is total memory minus the accurate free memory.

Example

The following is sample output from the **show platform resources** command:

Switch# show platform resources

**State Acronym: H - Healthy, W - Warning, C - Critical

Resource State	Usage	Max	Warning	Critical	
Control Processor	7.20%	100%	90%	95%	
DRAM H	2701MB(69%)	3883MB	90%	95%	

show platform software audit

To display the SE Linux Audit logs, use the **show platform software audit** command in privileged EXEC mode.

 $show\ platform\ software\ audit\ \{all\ |\ summary\ |\ [switch\ \{switch-number\ |\ active\ |\ standby\}]\ \{0\ |\ F0\ |\ R0\ |\ \{FP\ |\ RP\}\ \{active\}\}\}$

Syntax Description

all	Shows the audit log from all the slots.	
summary	Shows the audit log summary count from all the slots.	
switch	Shows the audit logs for a slot on a specific switch.	
switch-number	Selects the switch with the specified switch number.	
switch active	Selects the active instance of the switch.	
standby	Selects the standby instance of the switch.	
0	Shows the audit log for the SPA-Inter-Processor slot 0.	
F0	Shows the audit log for the Embedded-Service-Processor slot 0.	
R0	Shows the audit log for the Route-Processor slot 0.	
FP active	Shows the audit log for the active Embedded-Service-Processor slot.	
RP active	Shows the audit log for the active Route-Processor slot.	

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

This command was introduced in the Cisco IOS XE Gibraltar 16.10.1 as a part of the SELinux Permissive Mode feature. The **show platform software audit** command displays the system logs containing the access violation events.

In Cisco IOS XE Gibraltar 16.10.1, operation in a permissive mode is available - with the intent of confining specific components (process or application) of the IOS-XE platform. In the permissive mode, access violation events are detected and system logs are generated, but the event or operation itself is not blocked. The solution operates mainly in an access violation detection mode.

The following is a sample output of the **show software platform software audit summary** command:

Device# show platform software audit summary

AUDIT LOG ON switch 1

AVC Denial count: 58

The following is a sample output of the **show software platform software audit all** command:

Device# show platform software audit all

```

show platform software fed switch punt cpuq rates

To display the rate at which packets are punted, including the drops in the punted path, use the **show platform software fed switch punt cpuq rates** command in privileged EXEC mode.

show platform software fed switch {switch-number | active | standby} punt cpuq rates

Syntax Description

switch{switch-number | active | standby}

Displays information about the switch. You have the following options:

- switch-number.
- active Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

Note This keyword is not supported.

punt	Specifies the punt informtion.
cpuq	Specifies information about CPU receive queue.
rates	Specifies the rate at which the packets are punted.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification		
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.		

Usage Guidelines

The output of this command displays the rate in packets per second at intervals of 10 seconds, 1 minute and 5 minutes.

Example

The following is sample output from the **show platform software fed switch active punt cpuq rates** command.

Device#show platform software fed switch active punt cpuq rates

Punt Rate CPU Q Statistics

Packets per second averaged over 10 seconds, 1 min and 5 mins

Q no	Queue Name		Rx 10s	 	Rx 1min	Rx 5min	Drop 10s	Drop 1min	Drop 5min
0	CPU_Q_DOT1X_AUTH		0		0	0	0	0	0
1	CPU_Q_L2_CONTROL		0		0	0	0	0	0
2	CPU_Q_FORUS_TRAFFIC		336		266	320	0	0	0

29	CPU_Q_FSS	0	0	0	0	0	0
30	CPU_Q_MCAST_DATA	0	0	0	0	0	0
31	CPU Q GOLD PKT	0	0	0	0	0	0

The table below describes the significant fields shown in the display.

Table 5: show platform software fed switch active punt cpuq rates Field Descriptions

Field	Description
Queue Name	Name of the queue.
Rx	The rate at which the packets are received per second in 10s, 1 minute and 5 minutes.
Drop	The rate at which the packets are dropped per second in 10s, 1 minute and 5 minutes.

show platform software fed switch punt packet-capture display

To display packet capture information during high CPU utilization, use the **show platform software fed switch active punt packet-capture display** command in privileged EXEC mode.

show platform software fed switch active punt packet-capture display { detailed | hexdump}

Syntax Description

Displays information about a switch. You have the following options:

- active Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

Note

The **standby** keyword is not supported.

punt	Specifies punt information.
packet-capture display	Specifies information about the captured packet.
detailed	Specifies detailed information about the captured packet.
hex-dump	Specifies information about the captured packet, in hex format.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

The output of this command displays the periodic and persistent logs of CPU-bound packets, inband CPU traffic rates, and running CPU processes when the CPU passes a high CPU utilization threshold.

Examples

The following is a sample output from the **show platform software fed switch active punt packet-capture display detailed** command:

Device# show platform software fed switch active punt packet-capture display detailed Punt packet capturing: disabled. Buffer wrapping: disabled
Total captured so far: 101 packets. Capture capacity: 4096 packets

----- Packet Number: 1, Timestamp: 2018/09/04 23:22:10.179 ----interface: GigabitEthernet2/0/2 [if-id: 0x00000032] (physical)
ether hdr: dest mac: 0100.0ccc.cccd, src mac: 2c36.f8fc.4884
ether hdr: ethertype: 0x0032

Doppler Frame Descriptor:

show platform software fed switch punt rates interfaces

To display the overall statistics of punt rate for all the interfaces, use the **show platform software fed switch punt rates interfaces** command in privileged EXEC mode.

show platform software fed switch $\{switch-number \mid active \mid standby\}$ punt rates interfaces[interface-id]

•	_	-	
81	/ntay	Descri	ntınn
•	IIIUA	DUSUII	Pulli

switch{switch-number | active | standby}

Displays information about the switch. You have the following options:

- switch-number.
- active Displays information relating to the active switch.
- **standby**—Displays information relating to the standby switch, if available.

Note This keyword is not supported.

punt	Specifies the punt informtion.	
rates	Specifies the rate at which the packets are punted.	
interfaces[interface-id]	(Optional) Displays the overall statistics for an interface and also the per-queue configuration for the interface at an interval of 10 seconds.	

Command Modes

Privileged EXEC (#)

Command History

Kelease	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

The output displays the punt rates in packets per second at intervals of 10 seconds, 1 minute and 5 minutes.

Example

The following is sample output from the **show platform software fed switch active punt rates interfaces** command for all the interfaces.

Device#show plataform software fed switch active punt rates interfaces

Punt Rate on Interfaces Statistics

Packets per second averaged over 10 seconds, 1 min and 5 mins

| | Rx | Rx | Rx | Drop | Drop | Drop | Interface Name | IF_ID | 10s | 1min | 5min | 10s | 1min | 5min

		 	======	 	
Vlan3	0x00000034		520	0	0

The table below describes the significant fields shown in the display.

Table 6: show platform software fed switch active punt rates interfaces Field Descriptions

Field	Description
Interface Name	Name of the physical interface.
IF_ID	ID of the physical interface.
Rx	The per second rate at which the packets are received in 10s, 1 minute and 5 minutes.
Drop	The per second rate at which the packets are dropped in 10s, 1 minute and 5 minutes.

The following is sample output from the **show platform software fed switch active punt rates interface**-*id* command for a specific interface.

Device#show platform software fed switch active punt rates interfaces 0x31 Punt Rate on Single Interfaces Statistics

Interface : Port-channel1 [if_id: 0x31]

Received			Drop	ped			
Total	:	29617	To	tal		:	0
10 sec average	:	0	10	sec	average	:	0
1 min average	:	0	1	min	average	:	0
5 min average	:	0	5	min	average	:	0

Per CPUQ punt stats on the interface (rate averaged over 10s interval)

The table below describes the significant fields shown in the display.

Table 7: show platform software fed switch punt rates interfaces interface-id Field Descriptions

Field	Description
Queue Name	Name of the queue.
Recv Total	Total number of packets received.
Recv Rate	Per second rate at which the packets are received.
Drop Total	Total number of packets dropped.
Drop Rate	Per second rate at which the packets are dropped.

show platform software ilpower

To display the inline power details of all the PoE ports on the device, use the **show platform software ilpower** command in privileged EXEC mode.

 $show \ platform \ software \ ilpower \ \{details \mid port \ \{GigabitEthernet \ interface-number \ \} \ \mid \ system \ slot-number \ \}$

Syntax Description

details	Displays inline power details for all the interfaces.
port	Displays inline power port configuration.
GigabitEthernet interface-number	The GigabitEthernet interface number. Values range from 0 to 9.
system slot-number	Displays inline power system configuration.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	The command was introduced.

Examples

The following is sample output from the **show platform software ilpower details** command:

```
Device# show platform software ilpower details

show platform software memory

To display memory information for a specified switch, use the **show platform software memory** command in privileged EXEC mode.

show platform software memory [{chunk | database | messaging}] process slot

Syntax Description Syntax Description

chunk	(Optional) Displays chunk memory information for the specified process.
database	(Optional) Displays database memory information for the specified process.
messaging	(Optional) Displays messaging memory information for the specified process. The information displayed is for internal debugging purposes only.

show n	lattorm	software	memorv

process

Level that is being set. Options include:

- bt-logger—The Binary-Tracing Logger process.
- btrace-manager—The Btrace Manager process.
- chassis-manager—The Chassis Manager process.
- cli-agent—The CLI Agent process.
- cmm—The CMM process.
- dbm—The Database Manager process.
- dmiauthd—The DMI Authentication Daemon process.
- emd—The Environmental Monitoring process.
- **fed**—The Forwarding Engine Driver process.
- forwarding-manager—The Forwarding Manager process.
- **geo**—The Geo Manager process.
- gnmi—The GNMI process.
- host-manager—The Host Manager process.
- interface-manager—The Interface Manager process.
- iomd—The Input/Output Module daemon (IOMd) process.
- ios—The IOS process.
- iox-manager—The IOx Manager process.
- license-manager—The License Manager process.
- logger—The Logging Manager process.
- mdt-pubd—The Model Defined Telemetry Publisher process.
- ndbman—The Netconf DataBase Manager process.
- **nesd**—The Network Element Synchronizer Daemon process.
- **nginx**—The Nginx Webserver process.
- nif_mgr—The NIF Manager process.
- platform-mgr—The Platform Manager process.
- pluggable-services—The Pluggable Services process.
- replication-mgr—The Replication Manager process.
- shell-manager—The Shell Manager process.
- sif—The Stack Interface (SIF) Manager process.
- smd—The Session Manager process.
- stack-mgr—The Stack Manager process.

- **syncfd**—The SyncmDaemon process.
- table-manager—The Table Manager Server.
- thread-test—The Multithread Manager process.
- virt-manager—The Virtualization Manager process.

slot

Hardware slot where the process for which the level is set, is running. Options include:

- *number*—Number of the SIP slot of the hardware module where the level is set. For instance, if you want to specify the SIP in SIP slot 2 of the switch, enter 2.
- *SIP-slot / SPA-bay*—Number of the SIP switch slot and the number of the shared port adapter (SPA) bay of that SIP. For instance, if you want to specify the SPA in bay 2 of the SIP in switch slot 3, enter 3/2.
- **F0**—The Embedded Service Processor slot 0.
- FP active—The active Embedded Service Processor.
- **R0**—The route processor in slot 0.
- **RP** active—The active route processor.
- **RP standby**—The standby route processor.
- **switch** <*number*> —The switch, with its number specified.

Command Default

No default behavior or values.

The following table describes the significant fields shown in the display.

Table 8: show platform software memory brief Field Descriptions

Field	Description
module	Name of submodule.
allocated	Memory, allocated in bytes.
requested	Number of bytes requested by application.
allocs	Number of discrete allocation event attempts.
frees	Number of free events.

show platform software process list

To display the list of running processes on a platform, use the **show platform software process list** command in privileged EXEC mode.

show platform software process list switch $\{switch-number \mid active \mid standby\}$ $\{0 \mid F0 \mid R0\}$ $[\{name\ process-name \mid process-id\ process-ID \mid sort\ memory \mid summary\}]$

Syntax Description

switch switch-number	Displays information about the switch. Valid values for <i>switch-number</i> argument are from 0 to 9.	
active	Displays information about the active instance of the switch.	
standby	Displays information about the standby instance of the switch.	
0	Displays information about the shared port adapters (SPA) Interface Processor slot 0.	
F0	Displays information about the Embedded Service Processor (ESP) slot 0.	
R0	Displays information about the Route Processor (RP) slot 0.	
name process-name	(Optional) Displays information about the specified process. Enter the process name.	
process-id process-ID	(Optional) Displays information about the specified process ID. Enter the process ID.	
sort	(Optional) Displays information sorted according to processes.	
memory	(Optional) Displays information sorted according to memory.	
summary	(Optional) Displays a summary of the process memory of the host device.	

Command Modes

The table below describes the significant fields shown in the displays.

Table 9: show platform software process list Field Descriptions

Field	Description
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.
Pid	Displays the process ID that is used by the operating system to identify and keep track of the processes.
PPid	Displays process ID of the parent process.
Group Id	Displays the group ID

Field	Description
Status	Displays the process status in human readable form.
Priority	Displays the negated scheduling priority.
Size	Prior to Cisco IOS XE Gibraltar 16.10.1:
	Displays Virtual Memory size.
	From Cisco IOS XE Gibraltar 16.10.1 onwards:
	Displays the Resident Set Size (RSS) that shows how much memory is allocated to that process in the RAM.

show platform software process memory

To display the amount of memory used by each system process, use the **show platform software process memory** command in privileged EXEC mode.

show platform process memory

 $switch \{ \textit{switch-number} \mid active \mid standby \} \{ 0 \mid F0 \mid FP \mid R0 \} \{ all [sorted \mid virtual [sorted]] \mid name \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \{ orted \mid virtual [sorted] \} \} \{$ process-name { maps | smaps [summary] } | process-id process-id { maps | smaps [summary] } }

Syntax Description

switch switch-number	Displays information about the switch. Enter the switch number.	
active	Specifies the active instance of the device.	
standby	Specifies the standby instance of the device.	
0	Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.	
F0	Specifies the Embedded Service Processor (ESP) slot 0.	
FP	Specifies the Embedded Service Processor (ESP).	
R0	Specifies the Route Processor (RP) slot 0.	
all	Lists all processes.	
sorted	(Optional) Sorts the output based on Resident Set Siz (RSS).	
virtual	(Optional) Specifies virtual memory.	
name process-name	Specifies a process name.	
maps	Specifies the memory maps of a process.	
smaps summary	Specifies the smaps summary of a process.	
process-id process-id	Specifies a process identifier.

.

The table below describes the significant fields shown in the displays.

Table 10: show platform software process memory Field Descriptions

Field	Description
PID	Displays the process ID that is used by the operating system to identify and keep track of the processes.
RSS	Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.
PSS	Displays the Proportional Set Size of a process. This is the count of pages it has in memory, where each page is divided by the number of processes sharing it.
Неар	Displays where all user-allocated memory is located.
Shared	Shared clean + Shared dirty
Private	Private clean + Private dirty
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.

show platform software process slot switch

To display platform software process switch information, use the **show platform software process slot switch** command in privileged EXEC mode.

show platform software process slot switch $\{switch-number \mid active \mid standby\}$ $\{0 \mid F0 \mid R0\}$ monitor $[\{cycles \ no-of-times \ [\{interval \ delay \ [\{lines \ number\}]\}]\}]$

Syntax Description

switch-number	Switch number.
active	Specifies the active instance.
standby	Specifies the standby instance.
0	Specifies the shared port adapter (SPA) interface processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
R0	Specifies the Route Processor (RP) slot 0.
monitor	Monitors the running processes.
cycles no-of-tmes	(Optional) Sets the number of times to run monitor command. Valid values are from 1 to 4294967295. The default is 5.
interval delay	(Optional) Sets a delay after each . Valid values are from 0 to 300. The default is 3.
lines number	(Optional) Sets the number of lines of output displayed. Valid values are from 0 to 512. The default is 0.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The output of the **show platform software process slot switch** and **show processes cpu platform monitor location** commands display the output of the Linux **top** command. The output of these commands display Free memory and Used memory as displayed by the Linux **top** command. The values displayed for the Free memory and Used memory by these commands do not match the values displayed by the output of other platform-memory related CLIs.

Examples

The following is sample output from the **show platform** software process slot switch active **R0** monitor command:

Switch# show platform software process slot switch active RO monitor

Related Commands

Command	Description
show processes cpu platform monitor location	Displays information about the CPU utilization of the IOS-XE processes.

show platform software status control-processor

To display platform software control-processor status, use the **show platform software status control-processor** command in privileged EXEC mode.

show platform software status control-processor [{brief}]

Syntax Description

brief (Optional) Displays a summary of the platform control-processor status.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Examples

The following is sample output from the **show platform memory software status control-processor** command:

Switch# show platform software status control-processor

show platform software thread list

To display the list of threads on a platform, use the **show platform software thread list** command in privileged EXEC mode.

 $show\ platform\ software\ thread\ list\ switch \{\mathit{switch-number}\ |\ active\ |\ standby\}\ \{0\ |\ F0\ |\ FP\ active\ |\ R0\ \}\ pname\ \{cdman\ |\ vidman\ |\ all\ \}\ tname\ \{main\ |\ pktio\ |\ rt\ |\ all\ \}$

Syntax Description

switch switch-number	Displays information about the switch. Enter the switch number.
active	Specifies the active instance of the device.
standby	Specifies standby instance of the device.
0	Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
FP active	Specifies the active instance of Embedded Service Processor (ESP).
R0	Specifies the Route Processor (RP) slot 0.
pname	Specifies a process name. The possible values are cdman , vidman , and all .
tname	Specifies a thread name. The possible values are main , pktio , rt , and all .
	A. 1992 - 22

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Command Modes

Privileged EXEC(#)

Examples

The following is sample output from the **show platform software thread list switch active R0 pname cdman tname all** command:

Device# show platform software thread list switch active R0 pname cdman tname all

Name TIME+	Tid	PPid	Group Id	Core	Vcswch	Nvcswch	Status	Priority
cdman	8407	7295	8407	1	0	0	S	20

The table below describes the significant fields shown in the displays.

Table 11: show platform software thread list Field Descriptions

Field	Description
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.
Tid	Displays the process ID.
PPid	Displays the process ID of the parent process.
Group Id	Displays the group ID.
Core	Displays processor information.
Vesweh	Displays the number of voluntary context switches.
Nvcswch	Displays the number of non-voluntary context switches.
Status	Displays the process status in human readable form.
Priority	Displays the negated scheduling priority.
TIME+	Displays the time since the start of the process.
Size	Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.

show processes cpu platform

To display information about the CPU utilization of the IOS-XE processes, use the **show processes cpu platform** command in privileged EXEC mode.

show processes cpu platform [[sorted [$1min \mid 5min \mid 5sec$]] location switch { $switch-number \mid active \mid standby$ } { F0 | FP active | R0 | RP active }]

Syntax Description

sorted	(Optional) Displays output sorted based on percentage of CPU usage on a platform.
1min	(Optional) Sorts based on 1 minute intervals.
5min	(Optional) Sorts based on 5 minute intervals.
5sec	(Optional) Sorts based on 5 second intervals.
location	Specifies the Field Replaceable Unit (FRU) location.
switch switch-number	Displays information about the switch. Enter the switch number.
active	Specifies the active instance of the device.
standby	Specifies the standby instance of the device.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
FP active	Specifies active instances on the Embedded Service Processor (ESP).
R0	Specifies the Route Processor (RP) slot 0.
RP active	Specifies active instances on the Route Processor (RP).

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Command Modes

Privileged EXEC (#)

show processes cpu platform history

To display information about the CPU usage history of a system, use the **show processes cpu platform history** command.

show processes cpu platform history [1min | 5min | 5sec | 60min] location switch {switch-number | active | standby} {0 | F0 | FP | active | R0}

1min	(Optional) Displays CPU utilization history with 1 minute intervals.
5min	(Optional) Displays CPU utilization history with 5 minute intervals.
5sec	(Optional) Displays CPU utilization history with 5 second intervals.
60min	(Optional) Displays CPU utilization history with 60 minute intervals.
location	Specifies the Field Replaceable Unit (FRU) location.
switch switch-number	Displays information about the switch. Enter the switch number.
active	Specifies the active instance of the device.
standby	Specifies the standby instance of the device.
0	Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
FP active	Specifies active instances on the Embedded Service Processor (ESP).
R0	Specifies the Route Processor (RP) slot 0.

show processes cpu platform monitor

To displays information about the CPU utilization of the IOS-XE processes, use the **show processes cpu platform monitor** command in privileged EXEC mode.

show processes cpu platform monitor location switch $\{switch-number \mid active \mid standby\} \ \{0 \mid F0 \mid R0\}$

Syntax Description

location	Displays information about the Field Replaceable Unit (FRU) location.
switch	Specifies the switch.
switch-number	Switch number.
active	Specifies the active instance.
standby	Specifies the standby instance.
0	Specifies the shared port adapter (SPA) interface processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
R0	Specifies the Route Processor (RP) slot 0.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The output of the **show platform software process slot switch** and **show processes cpu platform monitor location** commands display the output of the Linux **top** command. The output of these commands display Free memory and Used memory as displayed by the Linux **top** command. The values displayed for the Free memory and Used memory by these commands do not match the values displayed by the output of other platform-memory related CLIs.

Examples

The following is sample output from the **show processes cpu monitor location switch active R0** command:

Switch# show processes cpu platform monitor location switch active R0

```

Related Commands

Command	Description
show platform software process slot switch	Displays platform software process switch information.

show processes memory

To display the amount of memory used by each system process, use the **show processes memory** command in privileged EXEC mode.

show	processes	memory	[{ process-id	sorted	[{ allocated	getbufs	holding }] }	1
------	-----------	--------	---------------	--------	--------------	---------	--------------	---

Syntax Description

process-id	(Optional) Process ID (PID) of a specific process. When you specify a process ID, only details for the specified process will be shown.
sorted	(Optional) Displays memory data sorted by the Allocated, Get Buffers, or Holding column. If the sorted keyword is used by itself, data is sorted by the Holding column by default.
allocated	(Optional) Displays memory data sorted by the Allocated column.
getbufs	(Optional) Displays memory data sorted by the Getbufs (Get Buffers) column.
holding	(Optional) Displays memory data sorted by the Holding column. This keyword is the default.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

The **show processes memory** command and the **show processes memory sorted** command displays a summary of total, used, and free memory, followed by a list of processes and their memory impact.

If the standard **show processes memory** *process-id* command is used, processes are sorted by their PID. If the **show processes memory sorted** command is used, the default sorting is by the Holding value.

Note

Holding memory of a particular process can be allocated by other processes also, and so it can be greater than the allocated memory.

The following is sample output from the **show processes memory** command:

Device# show processes memory

Proce	ssor	Pool Total:	25954228	Used:	8368640 Free:	175855	588

79	0	160	0	13088	0	0 DHCPD Database
				8329440 Tota	1	

The table below describes the significant fields shown in the display.

Table 12: show processes memory Field Descriptions

Field	Description
Processor Pool Total	Total amount of memory, in kilobytes (KB), held for the Processor memory pool.
Used	Total amount of used memory, in KB, in the Processor memory pool.
Free	Total amount of free memory, in KB, in the Processor memory pool.
PID	Process ID.
TTY	Terminal that controls the process.
Allocated	Bytes of memory allocated by the process.
Freed	Bytes of memory freed by the process, regardless of who originally allocated it.
Holding	Amount of memory, in KB, currently allocated to the process. This includes memory allocated by the process and assigned to the process.
Getbufs	Number of times the process has requested a packet buffer.
Retbufs	Number of times the process has relinquished a packet buffer.
Process	Process name.
Init	System initialization process.
Sched	The scheduler process.
Dead	Processes as a group that are now dead.
<value> Total</value>	Total amount of memory, in KB, held by all processes (sum of the "Holding" column).

The following is sample output from the **show processes memory** command when the **sorted** keyword is used. In this case, the output is sorted by the Holding column, from largest to smallest.

Device# show processes memory sorted

```

Related Commands

Command	Description
show memory	Displays statistics about memory, including memory-free pool statistics.
show processes	Displays information about the active processes.

show processes memory platform

To display memory usage for each Cisco IOS XE process, use the **show processes memory platform** command in privileged EXEC mode.

Syntax Description

accounting	(Optional) Displays the top memory allocators for each Cisco IOS XE process.
detailed	(Optional) Displays detailed memory information for a specified Cisco IOS XE process.
name process-name	(Optional) Displays the Cisco IOS XE process name. Enter the process name.
process-id process-ID	(Optional) Displayss the Cisco IOS XE process ID. Enter the process ID.
location	(Optional) Displays information about the Field Replaceable Unit (FRU) location.
maps	(Optional) Displays memory maps of a process.
smaps	(Optional) Displays static memory maps of a process.
sorted	(Optional) Displays the sorted output based on the Resident Set Size (RSS) memory used by Cisco IOS XE process.
switch switch-number	Displays information about the device.
active	Displays information about the active instance of the device.
standby	Displays information about the standby instance of the device.
0	Displays information about Shared Port Adapter (SPA)-Inter-Processor slot 0.
F0	Displays information about Embedded Service Processor (ESP) slot 0.
R0	Displays information about Route Processor (RP) slot 0.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.
Cisco IOS XE Gibraltar 16.10.1	This command was modified. The keyword accounting was added.
	The Total column was deleted from the output.

show processes platform

To display information about the IOS-XE processes running on a platform, use the **show processes platform** command in privileged EXEC mode.

show processes platform [detailed name process-name] [location switch { switch-number | active | standby} { standby} [location | standby]

detailed	(Optional) Displays detailed information of the specified IOS-XE process.
name process-name	(Optional) Specifies the process name.
location	(Optional) Specifies the Field Replaceable Unit (FRU) location.
switch switch-number	(Optional) Displays information about the switch.
active	(Optional) Specifies the active instance of the device.
standby	(Optional) Specifies standby instance of the device.
0	Specifies the Shared Port Adapter (SPA) Interface Processor slot 0.
F0	Specifies the Embedded Service Processor (ESP) slot 0.
FP active	Specifies the active instance in the Embedded Service Processor (ESP).
R0	Specifies the Route Processor (RP) slot 0.

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Command Modes

The table below describes the significant fields shown in the displays.

Table 13: show processes platform Field Descriptions

Field	Description
Pid	Displays the process ID.

Field	Description
PPid	Displays the process ID of the parent process.
Status	Displays the process status in human readable form.
Size	Displays the Resident Set Size (in kilobytes (KB)) that shows how much memory is allocated to that process in the RAM.
Name	Displays the command name associated with the process. Different threads in the same process may have different command values.

show power inline

To display the Power over Ethernet (PoE) status for the specified PoE port, the specified stack member, or for all PoE ports in the switch stack, use the **show power inline** command in EXEC mode.

show power inline [{police | priority}] [{interface-id | module stack-member-number}] [detail]

Syntax Description

police	(Optional) Displays the power policing information about real-time power consumption.
priority	(Optional) Displays the power inline port priority for each port.
interface-id	(Optional) ID of the physical interface.
module stack-member-number	(Optional) Limits the display to ports on the specified stack member.
	The range is 1 to 9.
	This keyword is supported only on stacking-capable switches.
detail	(Optional) Displays detailed output of the interface or module.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Examples

This is an example of output from the **show power inline** command. The table that follows describes the output fields.

Device> s Module	Availab	le			aining atts)

Gi3/0/10	auto	off	0.0	n/a	n/a	15.4	
<pre><output truncated=""></output></pre>							

Table 14: show power inline Field Descriptions

Field	Description
Available	The total amount of configured power ¹ on the PoE switch in watts (W).
Used	The amount of configured power that is allocated to PoE ports in watts.
Remaining	The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining)
Admin	Administration mode: auto, off, static.

Field	Description
Oper	Operating mode:
	on—The powered device is detected, and power is applied.
	• off—No PoE is applied.
	faulty—Device detection or a powered device is in a faulty state.
	power-deny—A powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.
Power	The maximum amount of power that is allocated to the powered device in watts. This value is the same as the value in the <i>Cutoff Power</i> field in the show power inline police command output.
Device	The device type detected: n/a, unknown, Cisco powered-device, IEEE powered-device, or the name from CDP.
Class	The IEEE classification: n/a or a value from 0 to 4.
Max	The maximum amount of power allocated to the powered device in watts.
AdminPowerMax	The maximum amount power allocated to the powered device in watts when the switch polices the real-time power consumption. This value is the same as the <i>Max</i> field value.
AdminConsumption	The power consumption of the powered device in watts when the switch polices the real-time power consumption. If policing is disabled, this value is the same as the <i>AdminPowerMax</i> field value.

¹ The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the **show power inline police** command on a stacking-capable switch:

	Availab (Watts	le)	Used	Remainin (Watts)	2		
3	370. 865. Admin	0 0 Oper	0.0 864.0	370.(1.(Admin Police	Oper		-

```
Gil/0/13 auto errdisable errdisable n/a 5.4 0.0 <output truncated>
```

In the previous example:

- The Gi1/0/1 port is shut down, and policing is not configured.
- The Gi1/0/2 port is shut down, but policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/3 port is shut down, but policing is enabled with a policing action is to shut down the port.
- Device detection is disabled on the Gi1/0/4 port, power is not applied to the port, and policing
 is disabled.
- Device detection is disabled on the Gi1/0/5 port, and power is not applied to the port, but policing is enabled with a policing action to generate a syslog message.
- Device detection is disabled on the Gi1/0/6 port, and power is not applied to the port, but policing is enabled with a policing action to shut down the port.
- The Gi1/0/7 port is up, and policing is disabled, but the switch does not apply power to the connected device.
- The Gi1/0/8 port is up, and policing is enabled with a policing action to generate a syslog message, but the switch does not apply power to the powered device.
- The Gi1/0/9 port is up and connected to a powered device, and policing is disabled.
- The Gi1/0/10 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/11 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/12 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/13 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port.

This is an example of output from the **show power inline police** *interface-id* command on a standalone switch. The table that follows describes the output fields.

Device> show power inline police gigabitethernet1/0/1

Interface	Admin State	-	Admin Police	Oper Police	Cutoff Power	-
Gi1/0/1	auto	off	none	n/a	n/a	0.0

Table 15: show power inline police Field Descriptions

Field	Description						
Available	The total amount of configured power ² on the switch in watts (W).						
Used	ne amount of configured power allocated to PoE ports in watts.						
Remaining	The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining)						
Admin State	Administration mode: auto, off, static.						
Oper State	 Operating mode: errdisable—Policing is enabled. faulty—Device detection on a powered device is in a faulty state. off—No PoE is applied. on—The powered device is detected, and power is applied. power-deny—A powered device is detected, but no PoE is available, or the real-time power consumption exceeds the maximum power allocation. Note The operating mode is the current PoE state for the specified PoE port, the specified stack member, or for all PoE ports on the switch. 						
Admin Police	Status of the real-time power-consumption policing feature: • errdisable—Policing is enabled, and the switch shuts down the port when the real-time power consumption exceeds the maximum power allocation. • log—Policing is enabled, and the switch generates a syslog message when the real-time power consumption exceeds the maximum power allocation. • none—Policing is disabled.						
Oper Police	 Policing status: errdisable—The real-time power consumption exceeds the maximum power allocation, and the switch shuts down the PoE port. log—The real-time power consumption exceeds the maximum power allocation, and the switch generates a syslog message. n/a—Device detection is disabled, power is not applied to the PoE port, or no policing action is configured. ok—Real-time power consumption is less than the maximum power allocation. 						
Cutoff Power	The maximum power allocated on the port. When the real-time power consumption is greater than this value, the switch takes the configured policing action.						
Oper Power	The real-time power consumption of the powered device.						

² The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the **show power inline priority** command on a standalone switch.

Device> sh	ow powe	r inline pr	iority
Interface	Admin	Oper	Priority
	State	State	
Gi1/0/1	auto	off	low
Gi1/0/2	auto	off	low
Gi1/0/3	auto	off	low
Gi1/0/4	auto	off	low
Gi1/0/5	auto	off	low
Gi1/0/6	auto	off	low
Gi1/0/7	auto	off	low
Gi1/0/8	auto	off	low
Gi1/0/9	auto	off	low

show stack-power

To display information about StackPower stacks or switches in a power stack, use the **show stack-power** command in EXEC mode.

{show stack-power [{budgeting | detail | load-shedding | neighbors}] [order power-stack-name] | [{stack-name | [stack-id] | switch | [switch-id]}]}

Syntax Description

budgeting	(Optional) Displays the stack power budget table.		
detail	Optional) Displays the stack power stack details.		
load-shedding	Optional) Displays the stack power load shedding table.		
neighbors	(Optional) Displays the stack power neighbor table.		
order power-stack-name	(Optional) Displays the load shedding priority for a power stack.		
	Note This keyword is available only after the load-shedding keyword.		
stack-name	(Optional) Displays budget table, details, or neighbors for all power stacks or the specified power stack.		
	Note This keyword is not available after the load-shedding keyword.		
stack-id	(Optional) Power stack ID for the power stack. The stack ID must be 31 characters or less.		
switch	(Optional) Displays budget table, details, load-shedding, or neighbors for all switches or the specified switch.		
switch-id	(Optional) Switch ID for the switch. The switch number is from 1 to 9.		

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Denali 16.3.2	Support for all the options was enabled for this command.
Cisco IOS XE Denali 16.1.1	This command was reintroduced.

Usage Guidelines

This command is available only on switch stacks running the IP Base or IP Services image.

If a switch is shut down because of load shedding, the output of the **show stack-power** command still includes the MAC address of the shutdown neighbor switch. The command output shows the stack power topology even if there is not enough power to power a switch.

Examples

This is an example of output from the **show stack-power** command:

Device# show stack-power								
Power Stack Name	Stack Mode	Stack Topolgy	Total Pwr(W)	Rsvd Pwr(W)	Alloc Pwr(W)	Unused Pwr(W)	Num SW	Num PS
Powerstack-1	SP-PS	Stndaln	350	150	200	0	1	1

This is an example of output from the **show stack-power budgeting** command:

Device# show stack-power budgeting								
Power Stack	Stack	Stack	Total	Rsvd	Alloc	Unused	Num	Num
Name	Mode	Topolgy	y Pwr(W)	Pwr(W)	Pwr(W)	Pwr(W)	SW	PS
Powerstack-1	SP-PS	Stndalr	n 350	150	200	0	1	1
Power Stack SW Name	PS-		Power Budgt	Allo			onsumd ys/PoE	
1 Powerstack-1	350	0	200	200	0	6	0 /0	
Totals:				200	0	6	0 /0	

show system mtu

To display the global maximum transmission unit (MTU) or maximum packet size set for the switch, use the **show system mtu** command in privileged EXEC mode.

show system mtu

^	_	_	
·,	/ntav	Hace	rintion
J١	/IIIax	DCOL	ription

This command has no arguments or keywords.

Command Default

None

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

For information about the MTU values and the stack configurations that affect the MTU values, see the **system mtu** command.

Examples

This is an example of output from the **show system mtu** command:

show tech-support

To automatically run **show** commands that display system information, use the **show tech-support** command in the privilege EXEC mode.

show tech-support

Syntax Description

cef	(Optional) Displays CEF related information.
cft	(Optional) Displays CFT related information.
eigrp	(Optional) Displays EIGRP related information.
evc	(Optional) Displays EVC related information.
fnf	(Optional) Displays flexible netflow related information.
ipc	(Optional) Displays IPC related information.
ipmulticast	(Optional) Displays IP multicast related information.
ipsec	(Optional) Displays IPSEC related information.
mfib	(Optional) Displays MFIB related information.
nat	(Optional) Displays NAT related information.
nbar	(Optional) Displays NBAR related information.
onep	(Optional) Displays ONEP related information.
ospf	(Optional) Displays OSPF related information.
page	(Optional) Displays the command output on a single page at a time. Use the Return key to display the next line of output or use the space bar to display the next page of information. If not used, the output scrolls (that is, it does not stop for page breaks).
	Press the Ctrl-C keys to stop the command output.
password	(Optional) Leaves passwords and other security information in the output. If not used, passwords and other security-sensitive information in the output are replaced with the label " <removed>".</removed>
rsvp	(Optional) Displays IP RSVP related information.
subscriber	(Optional) Displays subscriber related information.
vrrp	(Optional) Displays VRRP related information.
wccp	(Optional) Displays WCCP related information.

Command Modes

Privileged EXEC (#)

Release	Modification		
Cisco IOS XE Gibraltar 16.10.1	This command was enhanced to display the output of the show logging onboard uptime command		
Cisco IOS XE Everest 16.5.1a	This command was implemented on the Cisco Catalyst 9300 Series Switches		

Usage Guidelines

The output of the **show logging onboard uptime** command is displayed in the output of the **show tech-support** command.

The output from the **show tech-support** command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support** > *filename*) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.

You can use one of the following redirection methods:

- > *filename* Redirects the output to a file.
- >> *filename* Redirects the output to a file in append mode.

show tech-support bgp

To automatically run show commands that display BGP related system information, use the **show tech-support bgp** command in the privileged EXEC mode.

 $show\ tech-support\ bgp\ [address-family\ \{all\ |\ ipv4\ [flowspec\ |\ multicast\ |\ unicast\ |\ [mdt\ |\ mvpn]\ \{all\ |\ vrf\ instance-name\}\]\ |\ ipv6\ [flowspec\ |\ multicast\ |\ mvpn\ \{all\ |\ vrf\ vrf-instance-name\}\ |\ unicast]\ |\ [lowspec\ |\ multicast\ |\ unicast]\ |\ [nsap\ |\ vrf-instance-name]\ \}\]\ [flowspec\ |\ multicast\ |\ unicast]\ |\ vrf\ vrf-instance-name\}\]\ [detail]$

Syntax Description

address-family	(Optional) Displays the output for a specified address family.
address-family all	(Optional) Displays the output for all address families.
ipv4	(Optional) Displays the output for IPv4 address family.
ipv6	(Optional) Displays the output for IPv6 address family.
12vpn	(Optional) Displays the output for L2VPN address family.
link-state	(Optional) Displays the output for Link State address family.
nsap	(Optional) Displays the output for NSAP address family.
rtfilter	(Optional) Displays the output for RT Filter address family.
vpnv4	(Optional) Displays the output for VPNv4 address family.
vpnv6	(Optional) Displays the output for VPNv6 address family.
flowspec	(Optional) Displays the flowspec related information for an address family.
multicast	(Optional) Displays the multicast related information for an address family.
unicast	(Optional) Displays the unicast related information for an address family.
mdt	(Optional) Displays the Multicast Distribution Tree (MDT) related information for an address family.

mvpn	(Optional) Displays the Multicast VPN (MVPN) related information for an address family.
vrf	Displays the information for a VPN Routing/Forwarding instance.
evpn	(Optional) Displays the Ethernet VPN (EVPN) related information for an address family.
vpls	(Optional) Displays the Virtual Private LAN Services (VPLS) related information for an address family.
vrf-instance-name	Specifies the name of the VPN Routing/Forwarding instance.
all	Displays the information about all VPN NLRIs.
detail	(Optional) Displays the detailed routes information.

Command Modes

User EXEC (>)

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

The **show tech-support bgp** command is used to display the outputs of various BGP show commands and log them to the show-tech file. The output from the **show tech-support bgp** command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support** > **filename**) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.

You can use one of the following redirection methods:

- > filename Redirects the output to a file.
- >> filename Redirects the output to a file in append mode.

The following **show** commands run automatically when the **show tech-support bgp** command is used:

- · show clock
- show version
- show running-config
- show process cpu sorted
- · show process cpu history
- show process memory sorted

The following **show** commands for a specific address family run automnatically when the **show tech-support bgp address-family***address-family-name address-family-modifier* command is used:

- show bgp address-family-name address-family-modifier summary
- show bgp address-family-name address-family-modifier detail
- show bgp address-family-name address-family-modifier internal
- show bgp address-family-name address-family-modifier neighbors
- show bgp address-family-name address-family-modifier update-group
- show bgp address-family-name address-family-modifier replication
- show bgp address-family-name address-family-modifier community
- show bgp address-family-name address-family-modifier dampening dampened-paths
- show bgp address-family-name address-family-modifier dampening flap-statistics
- show bgp address-family-name address-family-modifier dampening parameters
- show bgp address-family-name address-family-modifier injected-paths
- show bgp address-family-name address-family-modifier cluster-ids
- show bgp address-family-name address-family-modifier cluster-ids internal
- show bgp address-family-name address-family-modifier peer-group
- show bgp address-family-name address-family-modifier pending-prefixes
- show bgp address-family-name address-family-modifier rib-failure

In addition to the above commands, the following segment routing specific **show** commands also run when the **show tech-support bgp** command is used:

- show bgp all binding-sid
- · show segment-routing client
- · show segment-routing mpls state
- show segment-routing mpls gb
- · show segment-routing mpls connected-prefix-sid-map protocol ipv4
- show segment-routing mpls connected-prefix-sid-map protocol backup ipv4
- · show mpls traffic-eng tunnel auto-tunnel client bgp

show tech-support diagnostic

To display diagnostic information for technical support, use the **show tech-support diagnostic** command in privileged EXEC mode.

show tech-support diagnostic

Syntax Description

This command has no arguments or keywords.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

The output of this command is very long. To better manage this output, you can redirect the output to a file (for example, **show tech-support diagnostic** > **flash**: *filename*) in the local writable storage file system or remote file system.

Note

For devices that support stacking, this command is executed on every switch that is up. For devices that do not support stacking, this command is executed only on the active switch.

The output of this command displays the output of the following commands:

- · show clock
- show version
- show running-config
- · show inventory
- · show diagnostic bootup level
- · show diagnostic status
- · show diagnostic content switch all
- · show diagnostic result switch all detail
- show diagnostic schedule switch all
- show diagnostic post
- show diagnostic description switch [switch number] test all
- · show logging onboard switch [switch number] clilog detail
- · show logging onboard switch [switch number] counter detail
- show logging onboard switch [switch number] environment detail
- show logging onboard switch [switch number] message detail

N/A

- show logging onboard switch [switch number] poe detail
- show logging onboard switch [switch number] status

Device# show tech-support diagnostic

- show logging onboard switch [switch number] temperature detail
- show logging onboard switch [switch number] uptime detail
- · show logging onboard switch [switch number] voltage detail

Examples

The following is a sample output from the **show tech-support diagnostic** command:

· ·	show diagn	ostic status

speed

To specify the speed of a 10/100/1000/2500/5000 Mbps port, use the **speed** command in interface configuration mode. To return to the default value, use the **no** form of this command.

 $speed \ \ \{10 \ | \ 1000 \ | \ 2500 \ | \ 5000 \ | \ auto \ \ [\{10 \ | \ 1000 \ | \ 2500 \ | \ 5000\}] \ | \ nonegotiate\} \\ no \ \ speed \ \ \ \ \\$

Syntax Description

10	Specifies that the port runs at 10 Mbps.
100	Specifies that the port runs at 100 Mbps.
1000	Specifies that the port runs at 1000 Mbps. This option is valid and visible only on 10/100/1000 Mb/s ports.
2500	Specifies that the port runs at 2500 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.
5000	Specifies that the port runs at 5000 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.
auto	Detects the speed at which the port should run, automatically, based on the port at the other end of the link. If you use the 10 , 100 , 1000 , 1000 , 2500 , or 5000 keyword with the auto keyword, the port autonegotiates only at the specified speeds.
nonegotiate	Disables autonegotiation, and the port runs at 1000 Mbps.

Command Default

The default is auto.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

You cannot configure speed on 10-Gigabit Ethernet ports.

Except for the 1000BASE-T small form-factor pluggable (SFP) modules, you can configure the speed to not negotiate (**nonegotiate**) when an SFP module port is connected to a device that does not support autonegotiation.

The new keywords, 2500 and 5000 are visible only on multi-Gigabit (m-Gig) Ethernet supporting devices.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting, and then forces the speed setting to the negotiated value. The duplex setting remains configured on each end of the link, which might result in a duplex setting mismatch.

If both ends of the line support autonegotiation, we highly recommend the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, use the auto setting on the supported side, but set the duplex and speed on the other side.

Caution

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.

Verify your settings using the **show interfaces** privileged EXEC command.

Examples

The following example shows how to set speed on a port to 100 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed 100
```

The following example shows how to set a port to autonegotiate at only 10 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10
```

The following example shows how to set a port to autonegotiate at only 10 or 100 Mbps:

```
Device(config) # interface gigabitethernet1/0/1
Device(config-if) # speed auto 10 100
```

stack-power

To configure StackPower parameters for the power stack or for a switch in the power stack, use the **stack power** command in global configuration mode. To return to the default setting, use the **no** form of the command,

stack-power {stack power-stack-name | switch stack-member-number}
no stack-power {stack power-stack-name | switch stack-member-number}

Syntax Description

stack power-stack-name	Specifies the name of the power stack. The name can be up to 31 characters. Entering these keywords followed by a carriage return enters power stack configuration mode.
switch stack-member-number	Specifies the switch number in the stack (1 to 4) to enter switch stack-power configuration mode for the switch.

Command Default

There is no default.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

When you enter the **stack-power stack** *power stack name* command, you enter power stack configuration mode, and these commands are available:

- **default**—Returns a command to its default setting.
- exit—Exits ARP access-list configuration mode.
- mode—Sets the power mode for the power stack. See the mode command.
- no—Negates a command or returns to default settings.

If you enter the **stack-power switch** *switch-number* command with a switch number that is not participating in StackPower, you receive an error message.

When you enter the **stack-power switch** *switch-number* command with the number of a switch participating in StackPower, you enter switch stack power configuration mode, and these commands are available:

- **default**—Returns a command to its default setting.
- exit—Exits switch stack power configuration mode.
- no—Negates a command or returns to default settings.
- **power-priority**—Sets the power priority for the switch and the switch ports. See the **power-priority** command.
- **stack-id** *name*—Enters the name of the power stack to which the switch belongs. If you do not enter the power stack-ID, the switch does not inherit the stack parameters. The name can be up to 31 characters.
- **standalone**—Forces the switch to operate in standalone power mode. This mode shuts down both stack power ports.

Examples

This example removes switch 2, which is connected to the power stack, from the power pool and shutting down both power ports:

Device(config)# stack-power switch 2
Device(config-switch-stackpower)# standalone
Device(config-switch-stackpower)# exit

switchport block

To prevent unknown multicast or unicast packets from being forwarded, use the **switchport block** command in interface configuration mode. To allow forwarding unknown multicast or unicast packets, use the **no** form of this command.

switchport block {multicast | unicast}
no switchport block {multicast | unicast}

Syntax Description

multicast Specifies that unknown multicast traffic should be blocked.

Note

Only pure Layer 2 multicast traffic is blocked. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

unicast Specifies that unknown unicast traffic should be blocked.

Command Default

Unknown multicast and unicast traffic is not blocked.

Command Modes

Interface configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

By default, all traffic with unknown MAC addresses is sent to all ports. You can block unknown multicast or unicast traffic on protected or nonprotected ports. If unknown multicast or unicast traffic is not blocked on a protected port, there could be security issues.

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports; you must explicitly configure it.

For more information about blocking packets, see the software configuration guide for this release.

This example shows how to block unknown unicast traffic on an interface:

Device(config-if)# switchport block unicast

You can verify your setting by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

system mtu

Syntax Description	bytes						
Command Default	The default MTU size for all ports is 1500 bytes.						
Command Modes	Global configuration						
Command History	Release	Modification					
	Cisco IOS XE Everest 16.5.1a	This command was introduced.					
Usage Guidelines	You can verify your setting by entering the show sy	stem mtu privileged EXEC command.					
	The switch does not support the MTU on a per-interface basis.						
	If you enter a value that is outside the allowed range f	For the specific type of interface, the value is not accepted.					

voice-signaling vlan (network-policy configuration)

To create a network-policy profile for the voice-signaling application type, use the **voice-signaling vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

voice-signaling vlan {*vlan-id* [{**cos** *cos-value* | **dscp** *dscp-value*}] | **dot1p** [{**cos** *l2-priority* | **dscp** *dscp*}] | **none** | **untagged**}

Syntax Description

vlan-id	(Optional) The VLAN for voice traffic. The range is 1 to 4094.
cos cos-value	(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.
dscp dscp-value	(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.
dot1p	(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).
none	(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.
untagged	(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.

Command Default

No network-policy profiles for the voice-signaling application type are defined.

The default CoS value is 5.

The default DSCP value is 46.

The default tagging mode is untagged.

Command Modes

Network-policy profile configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Use the **network-policy profile** global configuration command to create a profile and to enter network-policy profile configuration mode.

The voice-signaling application type is for network topologies that require a different policy for voice signaling than for voice media. This application type should not be advertised if all of the same network policies apply as those advertised in the voice policy TLV.

When you are in network-policy profile configuration mode, you can create the profile for voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure voice-signaling for VLAN 200 with a priority 2 CoS:

```
Device(config) # network-policy profile 1
Device(config-network-policy) # voice-signaling vlan 200 cos 2
```

This example shows how to configure voice-signaling for VLAN 400 with a DSCP value of 45:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 400 dscp 45
```

This example shows how to configure voice-signaling for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice-signaling vlan dot1p cos 4
```

voice vlan (network-policy configuration)

To create a network-policy profile for the voice application type, use the **voice vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

voice vlan $\{vlan-id \ [\{\cos \ cos-value \mid dscp \ dscp-value\}] \mid dot1p \ [\{\cos \ l2-priority \mid dscp \ dscp\}] \mid none \mid untagged\}$

Syntax Description

vlan-id	(Optional) The VLAN for voice traffic. The range is 1 to 4094.
cos cos-value	(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.
dscp dscp-value	(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.
dot1p	(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).
none	(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.
untagged	(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.

Command Default

No network-policy profiles for the voice application type are defined.

The default CoS value is 5.

The default DSCP value is 46.

The default tagging mode is untagged.

Command Modes

Network-policy profile configuration

Command History

Release	Modification
Cisco IOS XE Everest 16.5.1a	This command was introduced.

Usage Guidelines

Use the **network-policy profile** global configuration command to create a profile and to enter network-policy profile configuration mode.

The voice application type is for dedicated IP telephones and similar devices that support interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security through isolation from data applications.

When you are in network-policy profile configuration mode, you can create the profile for voice by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
Device(config) # network-policy profile 1
Device(config-network-policy) # voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
Device(config) # network-policy profile 1
Device(config-network-policy) # voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice vlan dot1p cos 4
```

voice vlan (network-policy configuration)
