**debug ilpower**

To enable debugging of the power controller and Power over Ethernet (PoE) system, use the **debug ilpower** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug ilpower {cdp | event | ha | cpo | police | port | powerman | registries | scp | sense}
no debug ilpower {cdp | event | ha | cpo | police | port | powerman | registries | scp | sense}
```

<table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported only on PoE-capable switches.

When you enable debugging on a switch stack, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session switch-number** EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE** EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.
debug interface

To enable debugging of interface-related activities, use the **debug interface** command in privileged EXEC mode. To disable debugging, use the no form of this command.

```plaintext
debug interface {interface-id | counters {exceptions | protocol memory} | null interface-number | port-channel port-channel-number | states | vlan vlan-id}
no debug interface {interface-id | counters {exceptions | protocol memory} | null interface-number | port-channel port-channel-number | states | vlan vlan-id}
```

### Syntax Description

</tr>
</tbody>
</table>

### Command Default

Debugging is disabled.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not specify a keyword, all debug messages appear.

The **undebug interface** command is the same as the **no debug interface** command.

When you enable debugging on a switch stack, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session switch-number EXEC** command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** stack-member-number LINE EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.
debug lldp packets

To enable debugging of Link Layer Discovery Protocol (LLDP) packets, use the `debug lldp packets` command in privileged EXEC mode. To disable debugging, use the `no` form of this command.

```
depbug lldp packets
no debug lldp packets
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `undebug lldp packets` command is the same as the `no debug lldp packets` command.

When you enable debugging on a switch stack, it is enabled only on the . To enable debugging on a stack member, you can start a session from the by using the `session switch-number` EXEC command.
debug platform poe

To enable debugging of a Power over Ethernet (PoE) port, use the **debug platform poe** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

```
debug platform poe [{error | info}] [{switch switch-number}]
no debug platform poe [{error | info}] [{switch switch-number}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

</thead>
<tbody>
<tr>
<td><strong>Release</strong></td>
<td><strong>Modification</strong></td>
</tr>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The **undebug platform poe** command is the same as the **no debug platform poe** command.
**duplex**

To specify the duplex mode of operation for a port, use the `duplex` command in interface configuration mode. To return to the default value, use the `no` form of this command.

```
duplex  {auto | full | half}
no duplex  {auto | full | half}
```

**Syntax Description**

- **auto** Enables automatic duplex configuration. The port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.
- **full** Enables full-duplex mode.
- **half** Enables half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mb/s.

**Command Default**

The default is `auto` for Gigabit Ethernet ports.

Duplex options are not supported on the 1000BASE-x or 10GBASE-x (where -x is -BX, -CWDM, -LX, -SX, or -ZX) small form-factor pluggable (SFP) modules.

**Command Modes**

- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Half-duplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is `auto` and the connected device is operating at half duplex. However, you cannot configure these interfaces to operate in half-duplex mode.

Certain ports can be configured to be either full duplex or half duplex. How this command is applied depends on the device to which the switch is attached.

If both ends of the line support autonegotiation, we highly recommend using the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces, and use the `auto` setting on the supported side.

If the speed is set to `auto`, the switch negotiates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

You can configure the duplex setting when the speed is set to `auto`.

---

**Note**

- Interface and Hardware Commands
Changing the interface speed and duplex mode configuration might shut down and reenable the interface during the reconfiguration.

You can verify your setting by entering the `show interfaces` privileged EXEC command.

**Examples**

This example shows how to configure an interface for full-duplex operation:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# duplex full
```
# errdisable detect cause

To enable error-disable detection for a specific cause or for all causes, use the **errdisable detect cause** command in global configuration mode. To disable the error-disable detection feature, use the **no** form of this command.

```
errdisable detect cause {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}
```

```
no errdisable detect cause {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}
```

Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

A cause (such as a link-flap or dhcp-rate-limit) is the reason for the error-disabled state. When a cause is detected on an interface, the interface is placed in an error-disabled state, an operational state that is similar to a link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the bridge protocol data unit (BPDU) guard, voice-aware 802.1x security, and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you set a recovery mechanism for the cause by entering the `errdisable recovery` global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the `shutdown` and then the `no shutdown` commands to manually recover an interface from the error-disabled state.

For protocol storm protection, excess packets are dropped for a maximum of two virtual ports. Virtual port error disabling using the `psp` keyword is not supported for EtherChannel and Flexlink interfaces.

To verify your settings, enter the `show errdisable detect` privileged EXEC command.

This example shows how to enable error-disabled detection for the link-flap error-disabled cause:

```
Device(config)# errdisable detect cause link-flap
```

This command shows how to globally configure BPDU guard for a per-VLAN error-disabled state:

```
Device(config)# errdisable detect cause bpduguard shutdown vlan
```

This command shows how to globally configure voice-aware 802.1x security for a per-VLAN error-disabled state:

```
Device(config)# errdisable detect cause security-violation shutdown vlan
```

You can verify your setting by entering the `show errdisable detect` privileged EXEC command.
To enable the error-disabled mechanism to recover from a specific cause, use the `errdisable recovery cause` command in global configuration mode. To return to the default setting, use the `no` form of this command.

```
errdisable recovery cause { all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control | udld }
```

Enablesthetimertorecoverfromtheportmodechangefailure
errordisabledstate.

**port-mode-failure**

Enables the timer to recover from the PPPoE IA rate limit
errordisabledstate.

**pppoe-ia-rate-limit**

Enables the timer to recover from a port security violation disable
state.

**psecure-violation**

Enables the timer to recover from the protocol storm protection (PSP)
errordisabledstate.

**psp**

Enables the timer to recover from an IEEE 802.1x-violation disabled
state.

**security-violation**

Enables error detection on an SFP configuration mismatch.

**sfp-config-mismatch**

Enables the timer to recover from a storm control error.

**storm-control**

Enables the timer to recover from the UniDirectional Link Detection
(UDLD) errordisabledstate.

**udld**

Enables the timer to recover from all causes.

**Command Default**

Recovery is disabled for all causes.

**Command Modes**

Global configuration

**Command History**

- **Release**
  - Cisco IOS XE Everest 16.5.1a: This command was introduced.

**Usage Guidelines**

A cause (such as all or BDPU guard) is defined as the reason that the errordisabled state occurred. When a
cause is detected on an interface, the interface is placed in the errordisabled state, an operational state similar
to link-down state.

When a port is errordisabled, it is effectively shut down, and no traffic is sent or received on the port. For the
BPDU guard and port-security features, you can configure the switch to shut down only the offending
VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you do not enable the recovery for the cause, the interface stays in the errordisabled state until you enter the
**shutdown** and the **no shutdown** interface configuration commands. If you enable the recovery for a cause,
the interface is brought out of the errordisabled state and allowed to retry the operation again when all the
causes have timed out.

Otherwise, you must enter the **shutdown** and then the **no shutdown** commands to manually recover an
interface from the errordisabled state.

You can verify your settings by entering the **show errdisable recovery** privileged EXEC command.

**Examples**

This example shows how to enable the recovery timer for the BPDU guard errordisabled cause:

```bash
Device(config)# errdisable recovery cause bpduguard
```

**Interface and Hardware Commands**
errdisabe recovery interval

To specify the time to recover from an error-disabled state, use the **errdisable recovery interval** command in global configuration mode. To return to the default setting, use the **no** form of this command.

```
errdisable recovery interval timer-interval
no errdisable recovery interval timer-interval
```

This example shows how you can configure interface range:

```
Device(config)# interface range vlan 1
```
ip mtu

To set the IP maximum transmission unit (MTU) size of routed packets on all routed ports of the switch or switch stack, use the ip mtu command in interface configuration mode. To restore the default IP MTU size, use the no form of this command.

**ip mtu** *bytes*

**no ip mtu** *bytes*

**Syntax Description**

| *bytes* | MTU size, in bytes. The range is from 68 up to the system MTU value (in bytes). |

**Command Default**

The default IP MTU size for frames received and sent on all switch interfaces is 1500 bytes.

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The upper limit of the IP value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the system mtu global configuration command.

To return to the default IP MTU setting, you can apply the default ip mtu command or the no ip mtu command on the interface.

You can verify your setting by entering the show ip interface *interface-id* or show interfaces *interface-id* privileged EXEC command.

The following example sets the maximum IP packet size for VLAN 200 to 1000 bytes:

```
Device(config)# interface vlan 200
Device(config-if)# ip mtu 1000
```

The following example sets the maximum IP packet size for VLAN 200 to the default setting of 1500 bytes:

```
Device(config)# interface vlan 200
Device(config-if)# default ip mtu
```

This is an example of partial output from the show ip interface *interface-id* command. It displays the current IP MTU setting for the interface.

```
Device# show ip interface gigabitethernet4/0/1
GigabitEthernet4/0/1 is up, line protocol is up
  Internet address is 18.0.0.1/24
  Broadcast address is 255.255.255.255
  Address determined by setup command
  MTU is 1500 bytes
  Helper address is not set

<output truncated>
```
ipv6 mtu

To set the IPv6 maximum transmission unit (MTU) size of routed packets on all routed ports of the switch or switch stack, use the ipv6 mtu command in interface configuration mode. To restore the default IPv6 MTU size, use the no form of this command.

```
ipv6 mtu  bytes
no ipv6 mtu  bytes
```

**Syntax Description**

`bytes`  MTU size, in bytes. The range is from 1280 up to the system MTU value (in bytes).

**Command Default**

The default IPv6 MTU size for frames received and sent on all switch interfaces is 1500 bytes.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The upper limit of the IPv6 MTU value is based on the switch or switch stack configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the system mtu global configuration command.

To return to the default IPv6 MTU setting, you can apply the default ipv6 mtu command or the no ipv6 mtu command on the interface.

You can verify your setting by entering the `show ipv6 interface  interface-id` or `show interface  interface-id` privileged EXEC command.

The following example sets the maximum IPv6 packet size for an interface to 2000 bytes:

```
Device(config)# interface gigabitethernet4/0/1
Device(config-if)# ipv6 mtu 2000
```

The following example sets the maximum IPv6 packet size for an interface to the default setting of 1500 bytes:

```
Device(config)# interface gigabitethernet4/0/1
Device(config-if)# default ipv6 mtu
```

This is an example of partial output from the `show ipv6 interface  interface-id` command. It displays the current IPv6 MTU setting for the interface.

```
Device# show ipv6 interface gigabitethernet4/0/1
GigabitEthernet4/0/1 is up, line protocol is up
    Internet address is 18.0.0.1/24
    Broadcast address is 255.255.255.255
    Address determined by setup command
    MTU is 1500 bytes
    Helper address is not set
```
lldp (interface configuration)

To enable Link Layer Discovery Protocol (LLDP) on an interface, use the `lldp` command in interface configuration mode. To disable LLDP on an interface, use the `no` form of this command.

```
interface gigabitethernet1/0/1
no lldp transmit
```

```
Device(config-if)# lldp transmit
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>med-tlv-select</code></td>
<td>Selects an LLDP Media Endpoint Discovery (MED) time-length-value (TLV) element to send.</td>

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported on 802.1 media types.

If the interface is configured as a tunnel port, LLDP is automatically disabled.

The following example shows how to disable LLDP transmission on an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# no lldp transmit
```

The following example shows how to enable LLDP transmission on an interface:

```
Device(config)# interface gigabitethernet1/0/1
```
Device(config-if)# lldp transmit
logging event power-inline-status

To enable the logging of Power over Ethernet (PoE) events, use the `logging event power-inline-status` command in interface configuration mode. To disable the logging of PoE status events, use the `no` form of this command.

`logging event power-inline-status`
`no logging event power-inline-status`

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Logging of PoE events is enabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `no` form of this command does not disable PoE error events.

**Examples**

This example shows how to enable logging of PoE events on a port:

```
Device(config-if)# interface gigabitethernet1/0/1
Device(config-if)# logging event power-inline-status
Device(config-if)#
```
To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the `mdix auto` command in interface configuration mode. To disable auto-MDIX, use the `no` form of this command.

```
mdix auto
no mdix auto
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Auto-MDIX is enabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately.

When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to `auto` so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of the connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect.

Auto-MDIX is supported on all 10/100 and 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-TX small form-factor pluggable (SFP) module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

This example shows how to enable auto-MDIX on a port:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto
Device(config-if)# duplex auto
Device(config-if)# mdix auto
Device(config-if)# end
```
To configure power stack mode for the power stack, use the `mode` command in power-stack configuration mode. To return to the default settings, use the `no` form of the command.

```
mode {power-shared | redundant} [strict]
no mode
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>power-shared</code></td>
<td>Sets the power stack to operate in power-shared mode. This is the default.</td>
</tr>
<tr>
<td><code>redundant</code></td>
<td>Sets the power stack to operate in redundant mode. The largest power supply is removed from the power pool to be used as backup power in case one of the other power supplies fails.</td>
</tr>
<tr>
<td><code>strict</code></td>
<td>(Optional) Configures the power stack mode to run a strict power budget. The stack power needs cannot exceed the available power.</td>
</tr>
</tbody>
</table>

**Command Default**
The default modes are `power-shared` and nonstrict.

**Command Modes**
Power-stack configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command is available only on switch stacks running the IP Base or IP Services feature set.

To access power-stack configuration mode, enter the `stack-power stack power stack name` global configuration command.

Entering the `no mode` command sets the switch to the defaults of `power-shared` and non-strict mode.

For stack power, available power is the total power available for PoE from all power supplies in the power stack, available power is the power allocated to all powered devices connected to PoE ports in the stack, and consumed power is the actual power consumed by the powered devices.

In **power-shared** mode, all of the input power can be used for loads, and the total available power appears as one large power supply. The power budget includes all power from all supplies. No power is set aside for power supply failures. If a power supply fails, load shedding (shutting down of powered devices or switches) might occur.

In **redundant** mode, the largest power supply is removed from the power pool to use as backup power in case one of the other power supplies fails. The available power budget is the total power minus the largest power supply. This reduces the available power in the pool for switches and powered devices, but in case of a failure or an extreme power load, there is less chance of having to shut down switches or powered devices.

In **strict** mode, when a power supply fails and the available power drops below the budgeted power, the system balances the budget through load shedding of powered devices, even if the actual power is less than the available power. In nonstrict mode, the power stack can run in an over-allocated state and is stable as long as...
the actual power does not exceed the available power. In this mode, a powered device drawing more than normal power could cause the power stack to start shedding loads. This is normally not a problem because most devices do not run at full power. The chances of multiple powered devices in the stack requiring maximum power at the same time is small.

In both strict and nonstrict modes, power is denied when there is no power available in the power budget.

This is an example of setting the power stack mode for the stack named power1 to power-shared with strict power budgeting. All power in the stack is shared, but when the total available power is allotted, no more devices are allowed power.

```
Device(config)# stack-power stack power1
Device(config-stackpower)# mode power-shared strict
Device(config-stackpower)# exit
```

This is an example of setting the power stack mode for the stack named power2 to redundant. The largest power supply in the stack is removed from the power pool to provide redundancy in case one of the other supplies fails.

```
Device(config)# stack-power stack power2
Device(config-stackpower)# mode redundant
Device(config-stackpower)# exit
```
To apply a network-policy profile to an interface, use the `network-policy` command in interface configuration mode. To remove the policy, use the `no` form of this command.

```
network-policy  profile-number
no network-policy
```

**Syntax Description**
- **profile-number**  The network-policy profile number to apply to the interface.

**Command Default**
No network-policy profiles are applied.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `network-policy profile number` interface configuration command to apply a profile to an interface.

You cannot apply the `switchport voice vlan` command on an interface if you first configure a network-policy profile on it. However, if `switchport voice vlan vlan-id` is already configured on the interface, you can apply a network-policy profile on the interface. The interface then has the voice or voice-signaling VLAN network-policy profile applied.

This example shows how to apply network-policy profile 60 to an interface:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# network-policy 60
```
network-policy profile (global configuration)

To create a network-policy profile and to enter network-policy configuration mode, use the network-policy profile command in global configuration mode. To delete the policy and to return to global configuration mode, use the no form of this command.

network-policy profile profile-number
no network-policy profile profile-number

Syntax Description

- `profile-number` Network-policy profile number. The range is 1 to 4294967295.

Command Default

No network-policy profiles are defined.

Command Modes

- Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the network-policy profile global configuration command to create a profile and to enter network-policy profile configuration mode.

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the exit command.

When you are in network-policy profile configuration mode, you can create the profile for voice and voice signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

This example shows how to create network-policy profile 60:

```
Device(config)# network-policy profile 60
Device(config-network-policy)#
```
To configure Cisco StackPower power-priority values for a switch in a power stack and for its high-priority and low-priority PoE ports, use the `power-priority` command in switch stack-power configuration mode. To return to the default setting, use the `no` form of the command.

```
power-priority {high value | low value | switch value}
no power-priority {high | low | switch}
```

**Syntax Description**

- **high value**: Sets the power priority for the ports configured as high-priority ports. The range is 1 to 27, with 1 as the highest priority. The `high` value must be lower than the value set for the low-priority ports and higher than the value set for the switch.

- **low value**: Sets the power priority for the ports configured as low-priority ports. The range is 1 to 27. The `low` value must be higher than the value set for the high-priority ports and the value set for the switch.

- **switch value**: Sets the power priority for the switch. The range is 1 to 27. The `switch` value must be lower than the values set for the low and high-priority ports.

**Command Default**

If no values are configured, the power stack randomly determines a default priority.

The default ranges are 1 to 9 for switches, 10 to 18 for high-priority ports, 19 to 27 for low-priority ports.

On non-PoE switches, the high and low values (for port priority) have no effect.

**Command Modes**

Switch stack-power configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To access switch stack-power configuration mode, enter the `stack-power switch switch-number` global configuration command.

Cisco StackPower power-priority values determine the order for shutting down switches and ports when power is lost and load shedding must occur. Priority values are from 1 to 27; the highest numbers are shut down first.

We recommend that you configure different priority values for each switch and for its high priority ports and low priority ports to limit the number of devices shut down at one time during a loss of power. If you try to configure the same priority value on different switches in a power stack, the configuration is allowed, but you receive a warning message.

**Note**

This command is available only on switch stacks running the IP Base or IP Services feature set.

**Examples**

This is an example of setting the power priority for switch 1 in power stack a to 7, for the high-priority ports to 11, and for the low-priority ports to 20.
Device(config)# stack-power switch 1
Device(config-switch-stackpower)# stack-id power_stack_a
Device(config-switch-stackpower)# power-priority high 11
Device(config-switch-stackpower)# power-priority low 20
Device(config-switch-stackpower)# power-priority switch 7
Device(config-switch-stackpower)# exit
To configure the power management mode on Power over Ethernet (PoE) ports, use the `power inline` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
power inline {auto [max max-wattage] | never | port priority {high | low} | static [max max-wattage]}
```

Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>auto</strong></td>
<td>Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. Allocation is first-come, first-serve.</td>
</tr>
<tr>
<td><strong>max max-wattage</strong></td>
<td>(Optional) Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.</td>
</tr>
<tr>
<td><strong>never</strong></td>
<td>Disables device detection, and disables power to the port.</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>Configures the power priority of the port. The default priority is low.</td>
</tr>
<tr>
<td><strong>priority</strong></td>
<td>Sets the power priority of the port. In case of a power supply failure, ports configured as low priority are turned off first and ports configured as high priority are turned off last. The default priority is low.</td>
</tr>
<tr>
<td><strong>static</strong></td>
<td>Enables powered-device detection. Pre-allocates (reserves) power for a port before the switch discovers the powered device. This action guarantees that the device connected to the interface receives enough power.</td>
</tr>
</tbody>
</table>

**Command Default**

- The default is `auto` (enabled).
- The maximum wattage is 30,000 mW.
- The default port priority is low.

**Interface configuration**
This command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, this error message appears:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# power inline auto
% Invalid input detected at '^' marker.
```

In a switch stack, this command is supported on all ports in the stack that support PoE.

Use the `max max-wattage` option to disallow higher-power powered devices. With this configuration, when the powered device sends Cisco Discovery Protocol (CDP) messages requesting more power than the maximum wattage, the switch removes power from the port. If the powered-device IEEE class maximum is greater than the maximum wattage, the switch does not power the device. The power is reclaimed into the global power budget.

The switch never powers any class 0 or class 3 device if the `power inline max max-wattage` command is configured for less than 30 W.

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the `show power inline` privileged EXEC command output shows `power-deny`.

Use the `power inline static max max-wattage` command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the `power inline auto` or the `power inline static` interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the `power inline never` command, the port reverts to the configured speed and duplex settings.
If a port has a Cisco powered device connected to it, you should not use the `power inline never` command to configure the port. A false link-up can occur, placing the port in an error-disabled state.

Use the `power inline port priority {high | low}` command to configure the power priority of a PoE port. Powered devices connected to ports with low port priority are shut down first in case of a power shortage.

You can verify your settings by entering the `show power inline` EXEC command.

**Examples**

This example shows how to enable detection of a powered device and to automatically power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto
```

This example shows how to configure a PoE port on a switch to allow a class 1 or a class 2 powered device:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto max 7000
```

This example shows how to disable powered-device detection and to not power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline never
```

This example shows how to set the priority of a port to high, so that it would be one of the last ports to be shut down in case of power supply failure:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline port priority high
```
power inline police

To enable policing of real-time power consumption on a powered device, use the `power inline police` command in interface configuration mode. To disable this feature, use the `no` form of this command

```
power inline police [action {errdisable | log}]
no power inline police
```

### Syntax Description

**action errdisable** (Optional) Configures the device to turn off power to the port if the real-time power consumption exceeds the maximum power allocation on the port. This is the default action.

**action log** (Optional) Configures the device to generate a syslog message while still providing power to a connected device if the real-time power consumption exceeds the maximum power allocation on the port.

### Command Default

Policing of the real-time power consumption of the powered device is disabled.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is supported only on the LAN Base image.

This command is supported only on Power over Ethernet (PoE)-capable ports. If you enter this command on a device or port that does not support PoE, an error message appears.

In a switch stack, this command is supported on all switches or ports in the stack that support PoE and real-time power-consumption monitoring.

When policing of the real-time power consumption is enabled, the device takes action when a powered device consumes more power than the allocated maximum amount.

When PoE is enabled, the device senses the real-time power consumption of the powered device. This feature is called *power monitoring* or *power sensing*. The device also polices the power usage with the *power policing* feature.

When power policing is enabled, the device uses one of the these values as the cutoff power on the PoE port in this order:

1. The user-defined power level that limits the power allowed on the port when you enter the `power inline auto max max-wattage` or the `power inline static max max-wattage` interface configuration command
2. The device automatically sets the power usage of the device by using CDP power negotiation or by the IEEE classification and LLDP power negotiation.

If you do not manually configure the cutoff-power value, the device automatically determines it by using CDP power negotiation or the device IEEE classification and LLDP power negotiation. If CDP or LLDP are not enabled, the default value of 30 W is applied. However without CDP or LLDP, the device does not allow devices to consume more than 15.4 W of power because values from 15400 to 30000 mW are only allocated based on CDP or LLDP requests. If a powered device consumes more than 15.4 W without CDP or LLDP
negotiation, the device might be in violation of the maximum current $I_{max}$ limitation and might experience an $I_{cut}$ fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the device locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the device is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the device has locked on it, the device does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.

If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated on the PoE port. If the device uses more than the maximum power allocation (or cutoff power) on the port, the device either turns power off to the port, or the device generates a syslog message and updates the LEDs (the port LEDs are blinking amber) while still providing power to the device.

- To configure the device to turn off power to the port and put the port in the error-disabled state, use the `power inline police` interface configuration command.

- To configure the device to generate a syslog message while still providing power to the device, use the `power inline police action log` command.

If you do not enter the `action log` keywords, the default action is to shut down the port, turn off power to it, and put the port in the PoE error-disabled state. To configure the PoE port to automatically recover from the error-disabled state, use the `errdisable detect cause inline-power` global configuration command to enable error-disabled detection for the PoE cause and the `errdisable recovery cause inline-power interval interval` global configuration command to enable the recovery timer for the PoE error-disabled cause.

If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the port, which could adversely affect the device.

You can verify your settings by entering the `show power inline police` privileged EXEC command.

**Examples**

This example shows how to enable policing of the power consumption and configuring the device to generate a syslog message on the PoE port on a device:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline police action log
```
power supply

To configure and manage the internal power supplies on a switch, use the **power supply** command in privileged EXEC mode.

```
power supply stack-member-number slot {A | B} {off | on}
```

**Syntax Description**

- `stack-member-number`  
  Stack member number for which to configure the internal power supplies. The range is 1 to 9, depending on the number of switches in the stack.
  - This parameter is available only on stacking-capable switches.

- `slot`  
  Selects the switch power supply to set.
- `A`  
  Selects the power supply in slot A.
- `B`  
  Selects the power supply in slot B.
  - **Note**  
    Power supply slot B is the closest slot to the outer edge of the switch.

- `off`  
  Sets the switch power supply to off.
- `on`  
  Sets the switch power supply to on.

**Command Default**

The switch power supply is on.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `power supply` command applies to a switch or to a switch stack where all switches are the same platform.

In a switch stack with the same platform switches, you must specify the stack member before entering the `slot {A | B} off` or `on` keywords.

To return to the default setting, use the `power supply stack-member-number on` command.

You can verify your settings by entering the `show env power` privileged EXEC command.

**Examples**

This example shows how to set the power supply in slot A to off:

```
Device> power supply 2 slot A off
Disabling Power supply A may result in a power loss to PoE devices and/or switches ...
Continue? (yes/[no]): yes
```

```
Device-Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off
Device-Jun 10 04:52:56.717: %PLATFORM_ENV-1-FAN_NOT_PRESENT: Fan is not present
```
This example shows how to set the power supply in slot A to on:

```
Device> power supply 1 slot B on
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the `show env power` command:

```
Device> show env power

<table>

<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

Use the `show env` EXEC command to display the information for the switch being accessed—a standalone switch or the active switch. Use this command with the `stack` and `switch` keywords to display all information for the stack or for the specified stack member.

If you enter the `show env temperature status` command, the command output shows the switch temperature state and the threshold level.
You can also use the `show env temperature` command to display the switch temperature status. The command output shows the green and yellow states as *OK* and the red state as *FAULTY*. If you enter the `show env all` command, the command output is the same as the `show env temperature status` command output.

### Examples

This is an example of output from the `show env all` command:

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>The switch temperature is in the <em>normal</em> operating range.</td>
</tr>
<tr>
<td>Yellow</td>
<td>The temperature is in the <em>warning</em> range. You should check the external temperature around the switch.</td>
</tr>
<tr>
<td>Red</td>
<td>The temperature is in the <em>critical</em> range. The switch might not run properly if the temperature is in this range.</td>
</tr>
</tbody>
</table>

This is an example of output from the `show env fan` command:

This is an example of output from the `show env power all` command on the active switch:

This is an example of output from the `show env stack` command on the active switch:

This example shows how to display the temperature value, state, and the threshold values on a standalone switch. The table describes the temperature states in the command output.

Table 1: States in the `show env temperature status` Command Output
show errdisable detect

To display error-disabled detection status, use the show errdisable detect command in EXEC mode.

show errdisable detect

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

User EXEC

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A gbic-invalid error reason refers to an invalid small form-factor pluggable (SFP) module.

The error-disable reasons in the command output are listed in alphabetical order. The mode column shows how error-disable is configured for each feature.

You can configure error-disabled detection in these modes:

- port mode—The entire physical port is error-disabled if a violation occurs.
- vlan mode—The VLAN is error-disabled if a violation occurs.
- port/vlan mode—The entire physical port is error-disabled on some ports and is per-VLAN error-disabled on other ports.
show errdisable recovery

To display the error-disabled recovery timer information, use the `show errdisable recovery` command in EXEC mode.

```plaintext
show errdisable recovery
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

User EXEC

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A gbic-invalid error-disabled reason refers to an invalid small form-factor pluggable (SFP) module interface.

Though visible in the output, the unicast-flood field is not valid.

This is an example of output from the `show errdisable recovery` command:

```
```
show ip interface

To display the usability status of interfaces configured for IP, use the show ip interface command in privileged EXEC mode.

```
show ip interface [type number] [brief]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>type (Optional) Interface type.</td>
<td></td>
</tr>
<tr>
<td>number (Optional) Interface number.</td>
<td></td>
</tr>
<tr>
<td>brief (Optional) Displays a summary of the usability status information for each interface.</td>
<td></td>
</tr>
</tbody>
</table>

**Note** The output of the show ip interface brief command displays information of all the available interfaces whether or not the corresponding network module for these interfaces are connected. These interfaces can be configured if the network module is connected. Run the show interface status command to see which network modules are connected.

**Command Default**

The full usability status is displayed for all interfaces configured for IP.

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable (which means that it can send and receive packets). If an interface is not usable, the directly connected routing entry is removed from the routing table. Removing the entry lets the software use dynamic routing protocols to determine backup routes to the network, if any.

If the interface can provide two-way communication, the line protocol is marked "up." If the interface hardware is usable, the interface is marked "up."

If you specify an optional interface type, information for that specific interface is displayed. If you specify no optional arguments, information on all the interfaces is displayed.

When an asynchronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP fast switching is enabled. A show ip interface command on an asynchronous interface encapsulated with PPP or SLIP displays a message indicating that IP fast switching is enabled.

You can use the show ip interface brief command to display a summary of the device interfaces. This command displays the IP address, the interface status, and other information.

The show ip interface brief command does not display any information related to Unicast RPF.

**Examples**

The following example shows interface information on Gigabit Ethernet interface 1/0/1:

```
Device# show ip interface gigabitethernet 1/0/1
GigabitEthernet1/0/1 is up, line protocol is up
```
Internet address is 10.1.1.1/16
Broadcast address is 255.255.255.255
Address determined by setup command
MTU is 1500 bytes
Helper address is not set
Directed broadcast forwarding is disabled
Outgoing access list is not set
Inbound access list is not set
Proxy ARP is enabled
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachables are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Feature Fast switching turbo vector
IP VPN Flow CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Policy routing is enabled, using route-map PBR
Network address translation is disabled
BGP Policy Mapping is disabled
IP Multi-Processor Forwarding is enabled
IP Input features, "PBR", are not supported by MPF and are IGNORED
IP Output features, "NetFlow", are not supported by MPF and are IGNORED

The following example shows how to display the usability status for a specific VLAN:

Device# show ip interface vlan 1

Vlan1 is up, line protocol is up
Internet address is 10.0.0.4/24
Broadcast address is 255.255.255.255
Address determined by non-volatile memory
MTU is 1500 bytes
Helper address is not set
Directed broadcast forwarding is disabled
Outgoing access list is not set
Inbound access list is not set
Proxy ARP is enabled
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachables are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Fast switching turbo vector
IP Normal CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Probe proxy name replies are disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
Sampled Netflow is disabled
IP multicast multilayer switching is disabled
Netflow Data Export (hardware) is enabled

The table below describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td>Helper address</td>
<td>Helper address, if one is set.</td>
</tr>
<tr>
<td>Directed broadcast forwarding</td>
<td>Shows whether directed broadcast forwarding is enabled.</td>
</tr>
<tr>
<td>Outgoing access list</td>
<td>Shows whether the interface has an outgoing access list set.</td>
</tr>
<tr>
<td>Inbound access list</td>
<td>Shows whether the interface has an incoming access list set.</td>
</tr>
<tr>
<td>Proxy ARP</td>
<td>Shows whether Proxy Address Resolution Protocol (ARP) is enabled for the interface.</td>
</tr>
<tr>
<td>Security level</td>
<td>IP Security Option (IPSO) security level set for this interface.</td>
</tr>
<tr>
<td>Split horizon</td>
<td>Shows whether split horizon is enabled.</td>
</tr>
<tr>
<td>ICMP redirects</td>
<td>Shows whether redirect messages will be sent on this interface.</td>
</tr>
<tr>
<td>ICMP unreachables</td>
<td>Shows whether unreachable messages will be sent on this interface.</td>
</tr>
<tr>
<td>ICMP mask replies</td>
<td>Shows whether mask replies will be sent on this interface.</td>
</tr>
<tr>
<td>IP fast switching</td>
<td>Shows whether fast switching is enabled for this interface. It is generally enabled on serial interfaces, such as this one.</td>
</tr>
<tr>
<td>IP Flow switching</td>
<td>Shows whether Flow switching is enabled for this interface.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IP CEF switching</td>
<td>Shows whether Cisco Express Forwarding switching is enabled for the interface.</td>
</tr>
<tr>
<td>IP multicast fast switching</td>
<td>Shows whether multicast fast switching is enabled for the interface.</td>
</tr>
<tr>
<td>IP route-cache flags are Fast</td>
<td>Shows whether NetFlow is enabled on an interface. Displays &quot;Flow init&quot; to specify that NetFlow is enabled on the interface. Displays &quot;Ingress Flow&quot; to specify that NetFlow is enabled on a subinterface using the <code>ip flow ingress</code> command. Shows &quot;Flow&quot; to specify that NetFlow is enabled on a main interface using the <code>ip route-cache flow</code> command.</td>
</tr>
<tr>
<td>Router Discovery</td>
<td>Shows whether the discovery process is enabled for this interface. It is generally disabled on serial interfaces.</td>
</tr>
<tr>
<td>IP output packet accounting</td>
<td>Shows whether IP accounting is enabled for this interface and what the threshold (maximum number of entries) is.</td>
</tr>
<tr>
<td>TCP/IP header compression</td>
<td>Shows whether compression is enabled.</td>
</tr>
<tr>
<td>WCCP Redirect outbound is disabled</td>
<td>Shows the status of whether packets received on an interface are redirected to a cache engine. Displays &quot;enabled&quot; or &quot;disabled.&quot;</td>
</tr>
<tr>
<td>WCCP Redirect exclude is disabled</td>
<td>Shows the status of whether packets targeted for an interface will be excluded from being redirected to a cache engine. Displays &quot;enabled&quot; or &quot;disabled.&quot;</td>
</tr>
<tr>
<td>Netflow Data Export (hardware) is enabled</td>
<td>NetFlow Data Expert (NDE) hardware flow status on the interface.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary of the usability status information for each interface:

```
Device# show ip interface brief

<table>
<thead>
<tr>
<th>Interface</th>
<th>IP-Address</th>
<th>OK? Method Status</th>
<th>Protocol</th>
</tr>

</tbody>
</table>
```

Table 3: show ip interface brief Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Type of interface.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
IP-Address | IP address assigned to the interface.
OK? | "Yes" means that the IP Address is valid. "No" means that the IP Address is not valid.

### Method
The Method field has the following possible values:
- **RARP or SLARP**: Reverse Address Resolution Protocol (RARP) or Serial Line Address Resolution Protocol (SLARP) request.
- **BOOTP**: Bootstrap protocol.
- **TFTP**: Configuration file obtained from the TFTP server.
- **manual**: Manually changed by the command-line interface.
- **NVRAM**: Configuration file in NVRAM.
- **IPCP**: `ip address negotiated` command.
- **DHCP**: `ip address dhcp` command.
- **unset**: Unset.
- **other**: Unknown.

### Status
Shows the status of the interface. Valid values and their meanings are:
- **up**: Interface is up.
- **down**: Interface is down.
- **administratively down**: Interface is administratively down.

### Protocol
Shows the operational status of the routing protocol on this interface.

### Related Commands

**Command Default**

None

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **show interfaces capabilities** command with different keywords has these results:

- Use the **show interface capabilities module** number command to display the capabilities of all interfaces on that switch. If there is no switch with that module number in the stack, there is no output.
- Use the **show interfaces interface-id capabilities** to display the capabilities of the specified interface.
- Use the **show interfaces capabilities** (with no module number or interface ID) to display the capabilities of all interfaces in the stack.

**Note**

The field **Last Input** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully received by an interface and processed by the CPU on the device. This information can be used to know when a dead interface failed.

**Last Input** is not updated by fast-switched traffic.

The field **output** displayed in the command output indicates the number of hours, minutes, and seconds since the last packet was successfully transmitted by the interface. The information provided by this field can useful for knowing when a dead interface failed.
This is an example of output from the `show interfaces` command for an interface on stack member 3:

```
Device# show interfaces gigabitethernet3/0/2

GigabitEthernet3/0/2 is down, line protocol is down (notconnect)
Hardware is Gigabit Ethernet, address is 2037.064d.4381 (bia 2037.064d.4381)
MTU 1500 bytes, BW 1000000 Kbit/sec, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Auto-duplex, Auto-speed, media type is 10/100/1000BaseTX
input flow-control is off, output flow-control is unsupported
ARP type: ARPA, ARP Timeout 04:00:00
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 0/2000/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/40 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
  0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts (0 multicasstsp)
      0 runts, 0 giants, 0 throttles
      0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
      0 watchdog, 0 multicast, 0 pause input
      0 input packets with dribble condition detected
      0 packets output, 0 bytes, 0 underruns
      0 output errors, 0 collisions, 1 interface resets
      0 unknown protocol drops
      0 babbles, 0 late collision, 0 deferred
      0 lost carrier, 0 no carrier, 0 pause output
      0 output buffer failures, 0 output buffers swapped out

```

This is an example of output from the `show interfaces interface description` command when the interface has been described as `Connects to Marketing` by using the `description` interface configuration command:

```

```
Device# show interfaces gigabitethernet1/0/2 description

<table>
<thead>
<tr>
<th>Interface</th>
<th>Status</th>
<th>Protocol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/0/2</td>
<td>up</td>
<td>down</td>
<td>Connects to Marketing</td>
</tr>
</tbody>
</table>

Device# show interfaces etherchannel

---
Port-channel34:
Age of the Port-channel = 28d:18h:51m:46s
Logical slot/port = 12/34  Number of ports = 0
GC = 0x00000000  HotStandBy port = null
Passive port list =
Port state = Port-channel L3-Ag Ag-Not-Inuse
Protocol =
Port security = Disabled

This is an example of output from the `show interfaces` `interface-id` `pruning` command when pruning is enabled in the VTP domain:

Device# show interfaces gigabitethernet1/0/2 pruning

Port Vlans pruned for lack of request by neighbor
Gi1/0/2 3,4

Port Vlans traffic requested of neighbor
Gi1/0/2 1-3

This is an example of output from the `show interfaces stats` command for a specified VLAN interface:

Device# show interfaces vlan 1 stats

<table>
<thead>
<tr>
<th>Switching path</th>
<th>Pkts In</th>
<th>Chars In</th>
<th>Pkts Out</th>
<th>Chars Out</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

**Note**

Though visible in the command-line help string, the `vlan vlan-id` keyword is not supported.

**Command Default**

None

**Command Modes**

Privileged EXEC

**Command History**

Release | Modification
---------|------------------
Cisco IOS XE Everest 16.5.1a | This command was introduced.

**Usage Guidelines**

If you do not enter any keywords, all counters for all interfaces are included.

This is an example of partial output from the `show interfaces counters` command. It displays all counters for the switch.

```
Device# show interfaces counters
Port      InOctets  InUcastPkts  InMcastPkts  InBcastPkts
Gi1/0/1   0         0           0          0
Gi1/0/2   0         0           0          0
Gi1/0/3   95285341  43115      1178430   1950
Gi1/0/4   0         0           0          0
```
This is an example of partial output from the `show interfaces counters module` command for stack member 2. It displays all counters for the specified switch in the stack.

```
Device# show interfaces counters module 2
Port     InOctets  InUcastPkts InMcastPkts InBcastPkts
Gi1/0/1  520       2           0           0
Gi1/0/2  520       2           0           0
Gi1/0/3  520       2           0           0
Gi1/0/4  520       2           0           0
```

This is an example of partial output from the `show interfaces counters protocol status` command for all interfaces:

```
Device# show interfaces counters protocol status
Protocols allocated:
Vlan1: Other, IP
Vlan20: Other, IP, ARP
Vlan30: Other, IP, ARP
Vlan40: Other, IP, ARP
Vlan50: Other, IP, ARP
Vlan60: Other, IP, ARP
Vlan70: Other, IP, ARP
Vlan80: Other, IP, ARP
Vlan90: Other, IP, ARP
Vlan900: Other, IP, ARP

GigabitEthernet1/0/6: Other, IP
GigabitEthernet1/0/7: Other, IP
GigabitEthernet1/0/8: Other, IP
GigabitEthernet1/0/9: Other, IP
GigabitEthernet1/0/10: Other, IP, CDP
```

This is an example of output from the `show interfaces counters trunk` command. It displays trunk counters for all interfaces.

```
Device# show interfaces counters trunk
Port  TrunkFramesTx  TrunkFramesRx WrongEncap
Gi1/0/1  0           0           0
Gi1/0/2  0           0           0
Gi1/0/3  80678       0           0
Gi1/0/4  82320       0           0
Gi1/0/5  0           0           0
```

This is an example of partial output from the `show interfaces counters` command.
show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings, use the `show interfaces switchport` command in privileged EXEC mode.

```plaintext
show interfaces [interface-id] switchport [{module number}]
```

**Syntax Description**

- `interface-id` (Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels. The port channel range is 1 to 48.
- `module number` (Optional) Displays switchport configuration of all interfaces on the switch or specified stack member.
  The range is 1 to 9.
  This option is not available if you entered a specific interface ID.

**Command Default**

None

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show interface switchport module number` command to display the switch port characteristics of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.

This is an example of output from the `show interfaces switchport` command for a port. The table that follows describes the fields in the display.

```
Device# show interfaces gigabitethernet1/0/1 switchport
Name: Gi1/0/1
Switchport: Enabled
Administrative Mode: trunk
Operational Mode: down
Administrative Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 10 (VLAN0010)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
```

**Note**

Private VLANs are not supported in this release, so those fields are not applicable.
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Trunking VLANs Enabled: 11-20
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL

Protected: false
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none

<table>
<thead>
<tr>

show interfaces transceiver

To display the physical properties of a small form-factor pluggable (SFP) module interface, use the show interfaces transceiver command in EXEC mode.

```
show interfaces [interface-id] transceiver [ [detail | module number | properties | supported-list | threshold-table] ]
```

**Syntax Description**

- `interface-id` (Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.
- `detail` (Optional) Displays calibration properties, including high and low numbers and any alarm information for any Digital Optical Monitoring (DoM)-capable transceiver if one is installed in the switch.
- `module number` (Optional) Limits display to interfaces on module on the switch. This option is not available if you entered a specific interface ID.
- `properties` (Optional) Displays speed, duplex, and inline power settings on an interface.
- `supported-list` (Optional) Lists all supported transceivers.
- `threshold-table` (Optional) Displays alarm and warning threshold table.

**Command Modes**

- User EXEC
- Privileged EXEC

**Command History**

<table>
<thead>
<tr>

Interface and Hardware Commands
show inventory

To display the product inventory listing of all Cisco products installed in the networking device, use the `show inventory` command in user EXEC or privileged EXEC mode.

```
show inventory  {fru | oid | raw}  [entity]
```

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Command History</th>
</tr>
</thead>
<tbody>
<tr>
<td>Privileged EXEC (#)</td>
<td>Release</td>
</tr>
<tr>
<td>Cisco IOS XE Everest 16.6.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Cisco IOS XE Everest 16.6.3</td>
<td>This command was enhanced to display the serial number for the chassis.</td>
</tr>
</tbody>
</table>

**fru** (Optional) Retrieves information about all Field Replaceable Units (FRUs) installed in the Cisco networking device.

**oid** (Optional) Retrieves information about the vendor specific hardware registration identifier referred to as object identifier (OID).

The OID identifies the MIB object’s location in the MIB hierarchy, and provides a means of accessing the MIB object in a network of managed devices.

**raw** (Optional) Retrieves information about all Cisco products referred to as entities installed in the Cisco networking device, even if the entities do not have a product ID (PID) value, a unique device identifier (UDI), or other physical identification.

**entity** (Optional) Name of a Cisco entity (for example, chassis, backplane, module, or slot). A quoted string may be used to display very specific UDI information; for example “sfslot 1” will display the UDI information for slot 1 of an entity named sfslot.

### Usage Guidelines

The `show inventory` command retrieves and displays inventory information about each Cisco product in the form of a UDI. The UDI is a combination of three separate data elements: a product identifier (PID), a version identifier (VID), and the serial number (SN).

The PID is the name by which the product can be ordered; it has been historically called the “Product Name” or “Part Number.” This is the identifier that one would use to order an exact replacement part.

The VID is the version of the product. Whenever a product has been revised, the VID will be incremented. The VID is incremented according to a rigorous process derived from Telcordia GR-209-CORE, an industry guideline that governs product change notices.

The SN is the vendor-unique serialization of the product. Each manufactured product will carry a unique serial number assigned at the factory, which cannot be changed in the field. This is the means by which to identify an individual, specific instance of a product.

The UDI refers to each product as an entity. Some entities, such as a chassis, will have subentities like slots. Each entity will display on a separate line in a logically ordered presentation that is arranged hierarchically by Cisco entities.
Use the `show inventory` command without options to display a list of Cisco entities installed in the networking device that are assigned a PID.

The following is sample output from the `show inventory` command:

```
Device#show inventory
NAME: "c93xx Stack", DESCR: "c93xx Stack"
PID: C9300-48UXM , VID: P2B , SN: FCW2117G00C

NAME: "Switch 2", DESCR: "C9300-48UXM"
PID: C9300-48UXM , VID: P2B , SN: FCW2117G00C

NAME: "Switch 2 - Power Supply A", DESCR: "Switch 2 - Power Supply A"
PID: PWR-C1-1100WAC , VID: V02 , SN: LIT211227NZ

NAME: "Switch 2 FRU Uplink Module 1", DESCR: "8x10G Uplink Module"
PID: C3850-NM-8-10G , VID: V01 , SN: FOC20153M58

NAME: "Te2/1/1", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M , VID: V02 , SN: TED2132H0SU

NAME: "Te2/1/3", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M , VID: V02 , SN: TED2132H0A8

NAME: "Te2/1/5", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M , VID: V02 , SN: TED2132H1G8

NAME: "usbflash1", DESCR: "usbflash1"
PID: SSD-120G , VID: STP21460FNA, SN: V01
```

**Table 4: show inventory Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>Physical name (text string) assigned to the Cisco entity. For example, console or a simple component number (port or module number), such as “1,” depending on the physical component naming syntax of the device.</td>
</tr>
<tr>
<td>DESCR</td>
<td>Physical description of the Cisco entity that characterizes the object. The physical description includes the hardware serial number and the hardware revision.</td>
</tr>
<tr>
<td>PID</td>
<td>Entity product identifier. Equivalent to the entPhysicalModelName MIB variable in RFC 2737.</td>
</tr>
<tr>
<td>VID</td>
<td>Entity version identifier. Equivalent to the entPhysicalHardwareRev MIB variable in RFC 2737.</td>
</tr>
<tr>
<td>SN</td>
<td>Entity serial number. Equivalent to the entPhysicalSerialNum MIB variable in RFC 2737.</td>
</tr>
</tbody>
</table>

For diagnostic purposes, the `show inventory` command can be used with the `raw` keyword to display every RFC 2737 entity including those without a PID, UDI, or other physical identification.

---

**Note**

The `raw` keyword option is primarily intended for troubleshooting problems with the `show inventory` command itself.
Enter the **show inventory** command with an *entity* argument value to display the UDI information for a specific type of Cisco entity installed in the networking device. In this example, a list of Cisco entities that match the sfslot argument string is displayed.

```
Device#show inventory "c93xx Stack"
NAME: "c93xx Stack", DESCR: "c93xx Stack"
PID: C9300-48UXM, VID: P2B, SN: FCW2117G00C

NAME: "Switch 2", DESCR: "C9300-48UXM"
PID: C9300-48UXM, VID: P2B, SN: FCW2117G00C

NAME: "Switch 2 - Power Supply A", DESCR: "Switch 2 - Power Supply A"
PID: PWR-C1-1100WAC, VID: V02, SN: LIT211227NZ

NAME: "Switch 2 FRU Uplink Module 1", DESCR: "8x10G Uplink Module"
PID: C3850-NM-8-10G, VID: V01, SN: FOC20153M58

NAME: "Te2/1/1", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M, VID: V02, SN: TED2132H0SU

NAME: "Te2/1/3", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M, VID: V02, SN: TED2132H0A8

NAME: "Te2/1/5", DESCR: "SFP-10GBase-CX1"
PID: SFP-H10GB-CU2M, VID: V02, SN: TED2132H1G8

NAME: "usbflash1", DESCR: "usbflash1"
PID: SSD-120G, VID: STP21460FNA, SN: V01
```

You can request even more specific UDI information with the *entity* argument value enclosed in quotation marks.
show memory platform

To display memory statistics of a platform, use the `show memory platform` command in privileged EXEC mode.

```
show memory platform [compressed-swap | information | page-merging]
```

**Syntax Description**

- `compressed-swap` (Optional) Displays platform memory compressed-swap information.
- `information` (Optional) Displays general information about the platform.
- `page-merging` (Optional) Displays platform memory page-merging information.

**Command Modes**

Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>

**show module**

To display module information such as switch number, model number, serial number, hardware revision number, software version, MAC address and so on, use this command in user EXEC or privileged EXEC mode.

```
show module [{switch-num}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>switch-num</th>
<th>(Optional) Number of the switch.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Default</td>
<td>None</td>
<td></td>
</tr>
<tr>
<td>Command Modes</td>
<td>User EXEC (&gt;)</td>
<td>Privileged EXEC (#)</td>
</tr>
<tr>
<td>Command History</td>
<td>Release</td>
<td>Modification</td>
</tr>
<tr>
<td></td>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Entering the `show module` command without the `switch-num` argument is the same as entering the `show module all` command.

**Examples**

This example shows how to display information for all the modules on a Cisco Catalyst 3850 Series switch:
show mgmt-infra trace messages ilpower

To display inline power messages within a trace buffer, use the `show mgmt-infra trace messages ilpower` command in privileged EXEC mode.

**Syntax Description**

```
show mgmt-infra trace messages ilpower [switch stack-member-number]
```

- `switch stack-member-number` (Optional) Specifies the stack member number for which to display inline power messages within a trace buffer.

**Command Default**

None

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This is an output example from the `show mgmt-infra trace messages ilpower` command:

```
Device# show mgmt-infra trace messages ilpower

  voice vlan 4 cos 3
  Interface:
    Interface_id
```
show platform hardware fed switch forward

To display device-specific hardware information, use the `show platform hardware fed switch switch_number` command.

This topic elaborates only the forwarding-specific options, that is, the options available with the `show platform hardware fed switch {switch_num | active | standby} forward summary` command.

The output of the `show platform hardware fed switch switch_number forward summary` displays all the details about the forwarding decision taken for the packet.

```
show platform hardware fed switch {switch_num | active | standby} forward summary
```

**Syntax Description**

| switch {switch_num | active | standby} | The switch for which you want to display information. You have the following options:
| | • switch_num — ID of the switch.
| | • active — Displays information relating to the active switch.
| | • standby — Displays information relating to the standby switch, if available.

| forward summary | Displays packet forwarding information. |

**Note** Support for the keyword `summary` has been discontinued in the Cisco IOS XE Everest 16.6.1 release and later releases.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Cisco IOS XE Everest 16.6.1 and later releases</td>
<td>Support for the keyword <code>summary</code> was discontinued.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.

Fields displayed in the command output are explained below.

- **Station Index**: The Station Index is the result of the layer 2 lookup and points to a station descriptor which provides the following:
  - **Destination Index**: Determines the egress port(s) to which the packets should be sent to. Global Port Number (GPN) can be used as the destination index. A destination index with 15 down to 12 bits set indicates the GPN to be used. For example, destination index - 0xF04E corresponds to GPN - 78 (0x4e).
  - **Rewrite Index**: Determines what needs to be done with the packets. For layer 2 switching, this is typically a bridging action.
• Flexible Lookup Pipeline Stages (FPS): Indicates the forwarding decision that was taken for the packet - routing or bridging

• Replication Bit Map: Determines if the packets should be sent to CPU or stack
  - Local Data Copy = 1
  - Remote Data copy = 0
  - Local CPU Copy = 0
  - Remote CPU Copy = 0

Example

This is an example of output from the `show platform hardware fed switch {switch_num} | active | standby } forward summary` command.

Device# show platform hardware fed switch 1 forward summary

Time: Fri Sep 16 08:25:00 PDT 2016

show platform resources

To display platform resource information, use the `show platform resources` command in privileged EXEC mode.

**show platform resources**

This command has no arguments or keywords.

### Command Modes

<table>
<thead>
<tr>
<th>Command Modes</th>
<th>Privileged EXEC (#)</th>
</tr>
</thead>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The output of this command displays the used memory, which is total memory minus the accurate free memory.

### Example

The following is sample output from the `show platform resources` command:

```
Switch# show platform resources

**State Acronym: H - Healthy, W - Warning, C - Critical

<table>
<thead>
<tr>
<th>Resource</th>
<th>Usage</th>
<th>Max</th>
<th>Warning</th>
<th>Critical</th>

<td>7.20%</td>
<td>100%</td>
<td>90%</td>
<td>95%</td>
</tr>
<tr>
<td>DRAM</td>
<td>2701MB(69%)</td>
<td>3883MB</td>
<td>90%</td>
<td>95%</td>
</tr>
</tbody>
</table>
```

**Interface and Hardware Commands**

71
show platform software ilpower

To display the inline power details of all the PoE ports on the device, use the `show platform software ilpower` command in privileged EXEC mode.

```
show platform software ilpower { details | port { GigabitEthernet interface-number } | system slot-number }
```

**Syntax Description**

- `details` Displays inline power details for all the interfaces.
- `port` Displays inline power port configuration.
- `GigabitEthernet interface-number` The GigabitEthernet interface number. Values range from 0 to 9.
- `system slot-number` Displays inline power system configuration.

**Command Modes**

- Privileged EXEC (#)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>The command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

The following is sample output from the `show platform software ilpower details` command:

```
Device# show platform software ilpower details

show platform software ilpower
show platform software process list

To display the list of running processes on a platform, use the `show platform software process list` command in privileged EXEC mode.

`show platform software process list switch {switch-number | active | standby} {0 | F0 | R0} [name process-name | process-id process-ID | sort memory | summary]`

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switch switch-number</code></td>
<td>Displays information about the switch. Valid values for <code>switch-number</code> argument are from 0 to 9.</td>
</tr>
<tr>
<td><code>active</code></td>
<td>Displays information about the active instance of the switch.</td>
</tr>
<tr>
<td><code>standby</code></td>
<td>Displays information about the standby instance of the switch.</td>
</tr>
<tr>
<td><code>F0</code></td>
<td>Displays information about the Embedded Service Processor (ESP) slot 0.</td>
</tr>
<tr>
<td><code>R0</code></td>

<td>(Optional) Displays information about the specified process.</td>
</tr>
<tr>
<td><code>process-id process-ID</code></td>
<td>(Optional) Displays information about the specified process ID.</td>
</tr>
<tr>
<td><code>sort</code></td>
<td>(Optional) Displays information sorted according to processes.</td>
</tr>
<tr>
<td><code>memory</code></td>
<td>(Optional) Displays information sorted according to memory.</td>
</tr>
<tr>
<td><code>summary</code></td>
<td>(Optional) Displays a summary of the process memory of the host device.</td>
</tr>
</tbody>
</table>

### Command Modes

Privileged EXE (#)

### Command History

- **Release**: Cisco IOS XE Everest 16.5.1a
  - **Modification**: The command was introduced.

### Usage Guidelines

Prior to Cisco IOS XE Denali 16.3.1, the Free Memory displayed in the command output was obtained from the underlying Linux kernel. This value was not accurate because some memory chunks that was available for use was not considered as free memory.

In Cisco IOS XE Denali 16.3.1, the free memory is accurately computed and displayed in the Free Memory field of the command output.

### Examples

The following is sample output from the `show platform software process list switch active R0` command:

```
Switch# show platform software process list switch active R0 summary

show processes cpu platform monitor

To display information about the CPU utilization of the IOS-XE processes, use the `show processes cpu platform monitor` command in privileged EXEC mode.

```
show processes cpu platform monitor location switch {switch-number | active | standby} {0 | F0 | R0}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Displays information about the Field Replaceable Unit (FRU) location.</td>

<tr>
<td>active</td>
<td>Specifies the active instance.</td>
</tr>
<tr>
<td>standby</td>
<td>Specifies the standby instance.</td>
</tr>
<tr>
<td>0</td>
<td>Specifies the shared port adapter (SPA) interface processor slot 0.</td>
</tr>
<tr>
<td>F0</td>
<td>Specifies the Embedded Service Processor (ESP) slot 0.</td>
</tr>
<tr>
<td>R0</td>
<td>Specifies the Route Processor (RP) slot 0.</td>
</tr>
</tbody>
</table>

### Command Modes

Privileged EXEC (#)

### Command History

- **Modification**
  - Cisco IOS XE Denali 16.1.1 This command was introduced.

### Usage Guidelines

The output of the `show platform software process slot switch` and `show processes cpu platform monitor location` commands display the output of the Linux `top` command. The output of these commands display Free memory and Used memory as displayed by the Linux `top` command. The values displayed for the Free memory and Used memory by these commands do not match the values displayed by the output of other platform-memory related CLIs.

### Examples

The following is sample output from the `show processes cpu monitor location switch active R0` command:

```
Switch# show processes cpu platform monitor location switch active R0

top - 00:04:21 up 1 day, 11:22, 0 users, load average: 0.42, 0.60, 0.78

</tbody>
</table>
show processes memory platform

To display memory usage per Cisco IOS XE process, use the `show processes memory platform` command in privileged EXEC mode.

```plaintext
show processes memory platform [ {detailed \{name \{process-name \{process-ID\}\} \{location \{maps \{location\}\} \{smaps \{location\}\}\}\} \{location \{sorted \{location\}\}\} \{switch \{switch-number \{active \| standby\}\}\| \{active \| standby\}\}\{0 | F0 | R0\}]`
```

**Syntax Description**

- `detailed process-name` (Optional) Displays detailed memory information for a specified Cisco IOS XE process.
- `name process-name` (Optional) Matches the Cisco IOS XE process name.
- `process-id process-ID` (Optional) Matches the Cisco IOS XE process ID.
- `location` (Optional) Displays information about the FRU location.
- `maps` (Optional) Displays memory maps of a process.
- `smaps` (Optional) Displays smaps of a process.
- `sorted` (Optional) Displays the sorted output based on the total memory used by Cisco IOS XE processes.
- `switch switch-number` Displays information about the device.
- `active` Displays information about the active instance of the switch.
- `standby` Displays information about the standby instance of the switch.
- `0` Displays information about the SPA-Inter-Processor slot 0.
- `F0` Displays information about the Embedded Service Processor (ESP) slot 0.
- `R0` Displays information about the Route Processor (RP) slot 0.

**Command Modes**

- Privileged EXEC (#)

**Command History**

<table>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Denali 16.1.1</td>
<td>The command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Prior to Cisco IOS XE Denali 16.3.1, the Free Memory displayed in the command output was obtained from the underlying Linux kernel. This value was not accurate because some memory chunks that was available for use was not considered as free memory.

In Cisco IOS XE Denali 16.3.1, the free memory is accurately computed and displayed in the Free Memory field of the command output.

Examples

The following is sample output from the `show processes memory platform` command:

```
Switch# show processes memory platform

System memory: 3976852K total, 2761580K used, 1215272K free,

Interface and Hardware Commands
show power inline

To display the Power over Ethernet (PoE) status for the specified PoE port, the specified stack member, or for all PoE ports in the switch stack, use the **show power inline** command in EXEC mode.

```
show power inline  [{police | priority}] [{interface-id | module  stack-member-number}] [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>police</td>
<td>(Optional) Displays the power policing information about real-time power consumption.</td>
</tr>
<tr>
<td>priority</td>
<td>(Optional) Displays the power inline port priority for each port.</td>
</tr>
<tr>
<td>interface-id</td>
<td>(Optional) ID of the physical interface.</td>
</tr>
<tr>
<td>module stack-member-number</td>
<td>(Optional) Limits the display to ports on the specified stack member.</td>
</tr>
<tr>
<td></td>
<td>The range is 1 to 9.</td>
</tr>
<tr>
<td></td>
<td>This keyword is supported only on stacking-capable switches.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays detailed output of the interface or module.</td>
</tr>
</tbody>
</table>

**Command Modes**

- User EXEC
- Privileged EXEC

**Command History**

- **Release**: Cisco IOS XE Everest 16.5.1a
- **Modification**: This command was introduced.

**Examples**

This is an example of output from the **show power inline** command. The table that follows describes the output fields.

Gi3/0/9 auto off 0.0 n/a  n/a 15.4
Gi3/0/10 auto off 0.0 n/a  n/a 15.4
```

### Table 5: show power inline Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>The total amount of configured power (^1) on the PoE switch in watts (W).</td>
</tr>
<tr>
<td>Used</td>
<td>The amount of configured power that is allocated to PoE ports in watts.</td>
</tr>
<tr>
<td>Remaining</td>
<td>The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining)</td>
</tr>
<tr>
<td>Admin</td>
<td>Administration mode: auto, off, static.</td>
</tr>
</tbody>
</table>
Operating mode:
• on—The powered device is detected, and power is applied.
• off—No PoE is applied.
• faulty—Device detection or a powered device is in a faulty state.
• power-deny—A powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.

**Power**
The maximum amount of power that is allocated to the powered device in watts. This value is the same as the value in the *Cutoff Power* field in the `show power inline police` command output.

**Device**
The device type detected: n/a, unknown, Cisco powered-device, IEEE powered-device, or the name from CDP.

**Max**
The maximum amount of power allocated to the powered device in watts.

**AdminPowerMax**
The maximum amount power allocated to the powered device in watts when the switch polices the real-time power consumption. This value is the same as the `Max` field value.

**AdminConsumption**
The power consumption of the powered device in watts when the switch polices the real-time power consumption. If policing is disabled, this value is the same as the `AdminPowerMax` field value.

---

1 The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the `show power inline police` command on a stacking-capable switch:

```
Device> show power inline police
Module Available Used Remaining
(Watts) (Watts) (Watts) ------- -------- -------- ---------
1 370.0 0.0 370.0
3 865.0 864.0 1.0

Admin Oper Admin Oper Cutoff Oper
Interface State State Police Police Power Power
--------- ------ ----------- ---------- ---------- ------ ------
Gi1/0/1 auto off none n/a n/a 0.0
Gi1/0/2 auto off log n/a 5.4 0.0
Gi1/0/3 auto off errdisable n/a 5.4 0.0
Gi1/0/4 off off none n/a n/a 0.0
Gi1/0/5 off off log n/a 5.4 0.0
Gi1/0/6 off off errdisable n/a 5.4 0.0
Gi1/0/7 auto off none n/a n/a 0.0
Gi1/0/8 auto off log n/a 5.4 0.0
Gi1/0/9 auto on none n/a n/a 5.1
Gi1/0/10 auto on log ok 5.4 4.2
Gi1/0/11 auto on log log 5.4 5.9
Gi1/0/12 auto on errdisable ok 5.4 4.2
```

---

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oper</td>
<td>Operating mode:</td>
</tr>
<tr>
<td></td>
<td>• on—The powered device is detected, and power is applied.</td>
</tr>
<tr>
<td></td>
<td>• off—No PoE is applied.</td>
</tr>
<tr>
<td></td>
<td>• faulty—Device detection or a powered device is in a faulty state.</td>
</tr>
<tr>
<td></td>
<td>• power-deny—A powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.</td>
</tr>
<tr>
<td>Device</td>
<td>The device type detected: n/a, unknown, Cisco powered-device, IEEE powered-device, or the name from CDP.</td>
</tr>
<tr>
<td>Class</td>
<td>The IEEE classification: n/a or a value from 0 to 4.</td>
</tr>
<tr>
<td>Max</td>
<td>The maximum amount of power allocated to the powered device in watts.</td>
</tr>
<tr>
<td>AdminPowerMax</td>
<td>The maximum amount power allocated to the powered device in watts when the switch polices the real-time power consumption. This value is the same as the <code>Max</code> field value.</td>
</tr>
<tr>
<td>AdminConsumption</td>
<td>The power consumption of the powered device in watts when the switch polices the real-time power consumption. If policing is disabled, this value is the same as the <code>AdminPowerMax</code> field value.</td>
</tr>
</tbody>
</table>
In the previous example:

- The Gi1/0/1 port is shut down, and policing is not configured.
- The Gi1/0/2 port is shut down, but policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/3 port is shut down, but policing is enabled with a policing action to shut down the port.
- Device detection is disabled on the Gi1/0/4 port, power is not applied to the port, and policing is disabled.
- Device detection is disabled on the Gi1/0/5 port, and power is not applied to the port, but policing is enabled with a policing action to generate a syslog message.
- Device detection is disabled on the Gi1/0/6 port, and power is not applied to the port, but policing is enabled with a policing action to shut down the port.
- The Gi1/0/7 port is up, and policing is disabled, but the switch does not apply power to the connected device.
- The Gi1/0/8 port is up, and policing is enabled with a policing action to generate a syslog message, but the switch does not apply power to the powered device.
- The Gi1/0/9 port is up and connected to a powered device, and policing is disabled.
- The Gi1/0/10 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/11 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port.
- The Gi1/0/12 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/13 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port.

This is an example of output from the `show power inline police interface-id` command on a standalone switch. The table that follows describes the output fields.

<table>
<thead>
<tr>
<th>Interface Admin Oper</th>
<th>Oper</th>
<th>Cutoff</th>
<th>Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/0/1</td>
<td>auto</td>
<td>off</td>
<td>n/a</td>
</tr>
</tbody>

</tr>
</tbody>
</table>
show stack-power

To display information about StackPower stacks or switches in a power stack, use the `show stack-power` command in EXEC mode.

```
{show stack-power [{budgeting | detail | load-shedding | neighbors}] [order power-stack-name] [{stack-name [stack-id] | switch [switch-id]}]}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>budgeting</code></td>
<td>(Optional) Displays the stack power budget table.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>(Optional) Displays the stack power stack details.</td>
</tr>
<tr>
<td><code>load-shedding</code></td>
<td>(Optional) Displays the stack power load shedding table.</td>
</tr>
<tr>
<td><code>neighbors</code></td>
<td>(Optional) Displays the stack power neighbor table.</td>
</tr>
<tr>
<td><code>order power-stack-name</code></td>
<td>(Optional) Displays the load shedding priority for a power stack.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> This keyword is available only after the <code>load-shedding</code> keyword.</td>
</tr>
<tr>
<td><code>stack-name</code></td>
<td>(Optional) Displays budget table, details, or neighbors for all power stacks or the specified power stack.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> This keyword is not available after the <code>load-shedding</code> keyword.</td>
</tr>
<tr>
<td><code>stack-id</code></td>
<td>(Optional) Power stack ID for the power stack. The stack ID must be 31 characters or less.</td>
</tr>
<tr>
<td><code>switch</code></td>
<td>(Optional) Displays budget table, details, load-shedding, or neighbors for all switches or the specified switch.</td>
</tr>
<tr>
<td><code>switch-id</code></td>
<td>(Optional) Switch ID for the switch. The switch number is from 1 to 9.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Denali 16.3.2</td>
<td>Support for all the options was enabled for this command.</td>
</tr>
<tr>
<td>Cisco IOS XE Denali 16.1.1</td>
<td>This command was reintroduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is available only on switch stacks running the IP Base or IP Services image.

If a switch is shut down because of load shedding, the output of the `show stack-power` command still includes the MAC address of the shutdown neighbor switch. The command output shows the stack power topology even if there is not enough power to power a switch.

**Examples**

This is an example of output from the `show stack-power` command:
Device# `show stack-power`

<table>
<thead>
<tr>
<th>Device# <code>show stack-power budgeting</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>--------</td>
</tr>
<tr>
<td>Powerstack-1</td>
</tr>
</tbody>
</table>

This is an example of output from the `show stack-power budgeting` command:

Device# `show stack-power budgeting`

<table>
<thead>
<tr>
<th>Power Stack</th>
<th>SW Name</th>
<th>PS-A (W)</th>
<th>PS-B (W)</th>
<th>Power Budget (W)</th>
<th>Alloc Power (W)</th>
<th>Avail Power (W)</th>
<th>Consumd Power (W)</th>
<th>Sys/PoE (W)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Powerstack-1</td>
<td>350</td>
<td>0</td>
<td>200</td>
<td>200</td>
<td>0</td>
<td>60</td>
<td>/0</td>
<td></td>
</tr>
</tbody>
</table>

Totals:

<table>
<thead>
<tr>
<th>Power Stack</th>
<th>SW Name</th>
<th>PS-A (W)</th>
<th>PS-B (W)</th>
<th>Power Budget (W)</th>
<th>Alloc Power (W)</th>
<th>Avail Power (W)</th>

<th>Sys/PoE (W)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>200</td>
<td>0</td>
<td>200</td>
<td>0</td>
<td>60</td>
<td>/0</td>
<td></td>
</tr>
</tbody>
</table>
show system mtu

To display the global maximum transmission unit (MTU) or maximum packet size set for the switch, use the show system mtu command in privileged EXEC mode.

```
show system mtu
```

### Syntax Description
This command has no arguments or keywords.

### Command Default
None

### Command Modes
Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
For information about the MTU values and the stack configurations that affect the MTU values, see the system mtu command.

### Examples
This is an example of output from the show system mtu command:
show tech-support

To automatically run show commands that display system information, use the show tech-support command in the privilege EXEC mode.

```
show tech-support [\{cef | cft | eigrp | evc | fnf | ipc | ipmulticast | ipsec | mfib | nat | nbar | onep | ospf | page | password | poe | rsvp | subscriber | vrrp | wccp\}]
```

### Syntax Description

<table>
<thead>
<tr>

show tech-support

Command Modes

Privileged EXEC (#)

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| Cisco IOS XE Denali 16.3.2 | This command was enhanced to display of the outputs of the following commands in the output modifier:  
  - show power inline  
  - show platform software ilpower details  
  - show power inline police  
  - show stack-power budgeting |
| Cisco IOS XE Denali 16.1.1 | This command was reintroduced. |

Usage Guidelines

The output from the `show tech-support` command is very long. To better manage this output, you can redirect the output to a file (for example, `show tech-support > filename`) in the local writable storage file system or the remote file system. Redirecting the output to a file also makes sending the output to your Cisco Technical Assistance Center (TAC) representative easier.

You can use one of the following redirection methods:
  
  - `>` `filename` - Redirects the output to a file.  
  - `>>` `filename` - Redirects the output to a file in append mode.
speed

To specify the speed of a 10/100/1000/2500/5000 Mbps port, use the `speed` command in interface configuration mode. To return to the default value, use the `no` form of this command.

```
speed  {10 | 100 | 1000 | 2500 | 5000 | auto  [{10 | 100 | 1000 | 2500 | 5000}] | nonegotiate}
no speed
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Speed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Specifies that the port runs at 10 Mbps.</td>
</tr>
<tr>
<td>100</td>
<td>Specifies that the port runs at 100 Mbps.</td>
</tr>
<tr>
<td>1000</td>
<td>Specifies that the port runs at 1000 Mbps. This option is valid and visible only on 10/100/1000 Mb/s ports.</td>
</tr>
<tr>
<td>2500</td>
<td>Specifies that the port runs at 2500 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.</td>
</tr>
<tr>
<td>5000</td>
<td>Specifies that the port runs at 5000 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.</td>
</tr>
<tr>
<td>auto</td>
<td>Detects the speed at which the port should run, automatically, based on the port at the other end of the link. If you use the 10, 100, 1000, 2500, or 5000 keyword with the auto keyword, the port autonegotiates only at the specified speeds.</td>
</tr>
<tr>
<td>nonegotiate</td>
<td>Disables autonegotiation, and the port runs at 1000 Mbps.</td>
</tr>
</tbody>
</table>

**Command Default**

The default is `auto`.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>

</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>Cisco IOS XE Denali 16.3.1</td>
<td>This command was modified. The following keywords were added: 2500 and 5000. These keywords are visible only on multi-Gigabit Ethernet port supporting devices.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot configure speed on 10-Gigabit Ethernet ports.

Except for the 1000BASE-T small form-factor pluggable (SFP) modules, you can configure the speed to not negotiate (nonegotiate) when an SFP module port is connected to a device that does not support autonegotiation.

The new keywords, 2500 and 5000 are visible only on multi-Gigabit (m-Gig) Ethernet supporting devices.

If the speed is set to auto, the switch negotiates with the device at the other end of the link for the speed setting, and then forces the speed setting to the negotiated value. The duplex setting remains configured on each end of the link, which might result in a duplex setting mismatch.
If both ends of the line support autonegotiation, we highly recommend the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, use the auto setting on the supported side, but set the duplex and speed on the other side.

![Caution]

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the “Configuring Interface Characteristics” chapter in the software configuration guide for this release.

Verify your settings using the `show interfaces` privileged EXEC command.

**Examples**

The following example shows how to set speed on a port to 100 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed 100
```

The following example shows how to set a port to autonegotiate at only 10 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10
```

The following example shows how to set a port to autonegotiate at only 10 or 100 Mbps:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10 100
```
stack-power

To configure StackPower parameters for the power stack or for a switch in the power stack, use the `stack power` command in global configuration mode. To return to the default setting, use the `no` form of the command,

```
stack-power {stack power-stack-name | switch stack-member-number}
no stack-power {stack power-stack-name | switch stack-member-number}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stack</td>
<td>Specifies the name of the power stack. The name can be up to 31 characters. Entering these keywords followed by a carriage return enters power stack configuration mode.</td>
</tr>
<tr>
<td>switch</td>
<td>Specifies the switch number in the stack (1 to 4) to enter switch stack-power configuration mode for the switch.</td>
</tr>
</tbody>
</table>

**Command Default**

There is no default.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the `stack-power stack power stack name` command, you enter power stack configuration mode, and these commands are available:

- **default**—Returns a command to its default setting.
- **exit**—Exits ARP access-list configuration mode.
- **mode**—Sets the power mode for the power stack. See the `mode` command.
- **no**—Negates a command or returns to default settings.

If you enter the `stack-power switch switch-number` command with a switch number that is not participating in StackPower, you receive an error message.

When you enter the `stack-power switch switch-number` command with the number of a switch participating in StackPower, you enter switch stack power configuration mode, and these commands are available:

- **default**—Returns a command to its default setting.
- **exit**—Exits switch stack power configuration mode.
- **no**—Negates a command or returns to default settings.
- **power-priority**—Sets the power priority for the switch and the switch ports. See the `power-priority` command.
- **stack-id name**—Enters the name of the power stack to which the switch belongs. If you do not enter the power stack-ID, the switch does not inherit the stack parameters. The name can be up to 31 characters.
- **standalone**—Forces the switch to operate in standalone power mode. This mode shuts down both stack power ports.

**Examples**

This example removes switch 2, which is connected to the power stack, from the power pool and shutting down both power ports:
Device(config)# stack-power switch 2
Device(config-switch-stackpower)# standalone
Device(config-switch-stackpower)# exit
switchport block

To prevent unknown multicast or unicast packets from being forwarded, use the `switchport block` command in interface configuration mode. To allow forwarding unknown multicast or unicast packets, use the `no` form of this command.

```
switchport block {multicast | unicast}
no switchport block {multicast | unicast}
```

**Syntax Description**

- **multicast**: Specifies that unknown multicast traffic should be blocked.
  - Note: Only pure Layer 2 multicast traffic is blocked. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

- **unicast**: Specifies that unknown unicast traffic should be blocked.

**Command Default**

Unknown multicast and unicast traffic is not blocked.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, all traffic with unknown MAC addresses is sent to all ports. You can block unknown multicast or unicast traffic on protected or nonprotected ports. If unknown multicast or unicast traffic is not blocked on a protected port, there could be security issues.

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports; you must explicitly configure it.

For more information about blocking packets, see the software configuration guide for this release.

This example shows how to block unknown unicast traffic on an interface:

```
Device(config-if)# switchport block unicast
```

You can verify your setting by entering the `show interfaces interface-id switchport` privileged EXEC command.
system mtu

Syntax Description

`bytes`

Command Default

The default MTU size for all ports is 1500 bytes.

Command Modes

Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can verify your setting by entering the `show system mtu` privileged EXEC command.

The switch does not support the MTU on a per-interface basis.

If you enter a value that is outside the allowed range for the specific type of interface, the value is not accepted.
To create a network-policy profile for the voice-signaling application type, use the `voice-signaling vlan` command in network-policy configuration mode. To delete the policy, use the `no` form of this command.

```
voice-signaling vlan [vlan-id [{cos cos-value | dscp dscp-value}] | dot1p [{cos l2-priority | dscp dscp}] | none | untagged]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>(Optional) The VLAN for voice traffic. The range is 1 to 4094.</td>
</tr>
<tr>
<td><code>cos cos-value</code></td>
<td>(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.</td>
</tr>
<tr>
<td><code>dscp dscp-value</code></td>
<td>(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.</td>
</tr>
<tr>
<td><code>dot1p</code></td>
<td>(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).</td>
</tr>
<tr>
<td><code>none</code></td>
<td>(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone keypad.</td>
</tr>
<tr>
<td><code>untagged</code></td>
<td>(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.</td>
</tr>
</tbody>
</table>

**Command Default**

No network-policy profiles for the voice-signaling application type are defined.

The default CoS value is 5.

The default DSCP value is 46.

The default tagging mode is untagged.

**Command Modes**

Network-policy profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `network-policy profile` global configuration command to create a profile and to enter network-policy profile configuration mode.

The voice-signaling application type is for network topologies that require a different policy for voice signaling than for voice media. This application type should not be advertised if all of the same network policies apply as those advertised in the voice policy TLV.

When you are in network-policy profile configuration mode, you can create the profile for voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).
To return to privileged EXEC mode from the network-policy profile configuration mode, enter the `exit` command.

This example shows how to configure voice-signaling for VLAN 200 with a priority 2 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 200 cos 2
```

This example shows how to configure voice-signaling for VLAN 400 with a DSCP value of 45:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 400 dscp 45
```

This example shows how to configure voice-signaling for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice-signaling vlan dot1p cos 4
```
voice vlan (network-policy configuration)

To create a network-policy profile for the voice application type, use the voice vlan command in network-policy configuration mode. To delete the policy, use the no form of this command.

```
voice vlan {vlan-id [ {cos cos-value | dscp dscp-value'}] | dot1p [ {cos l2-priority | dscp dscp} ] | none | untagged}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-id</td>
<td>(Optional) The VLAN for voice traffic. The range is 1 to 4094.</td>
</tr>

<td>(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).</td>
</tr>
<tr>
<td>none</td>
<td>(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.</td>
</tr>
<tr>
<td>untagged</td>
<td>(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.</td>
</tr>
</tbody>
</table>

**Command Default**

No network-policy profiles for the voice application type are defined.

- The default CoS value is 5.
- The default DSCP value is 46.
- The default tagging mode is untagged.

**Command Modes**

Network-policy profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE Everest 16.5.1a</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the network-policy profile global configuration command to create a profile and to enter network-policy profile configuration mode.

The voice application type is for dedicated IP telephones and similar devices that support interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security through isolation from data applications.

When you are in network-policy profile configuration mode, you can create the profile for voice by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).
To return to privileged EXEC mode from the network-policy profile configuration mode, enter the `exit` command.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice vlan dot1p cos 4
```
