BGP EVPN VXLAN

BGP EVPN VXLAN is a campus network solution for Cisco Catalyst 9000 Series Switches running Cisco IOS XE software. This solution is a result of proposed IETF standards and Internet drafts submitted by the BGP Enabled ServiceS (bess¹) workgroup and is designed to provide a unified overlay network solution, and also address the challenges and drawbacks of existing technologies.

This chapter provides a background for the solution's evolution and covers conceptual information and basic terminology that is required to understand BGP EVPN VXLAN. Later chapters cover configuration, implementation, functionalities, and troubleshooting information for BGP EVPN VXLAN.

The Evolution of BGP EVPN VXLAN

Traditionally, VLANs have been the standard method for providing network segmentation in campus networks. VLANs use loop prevention techniques such as Spanning Tree Protocol (STP), which impose restrictions on network design and resiliency. Further, because there is a limitation with the number of VLANs that can be used to address layer 2 segments (4094 VLANs), VLANs are a limiting factor for IT departments and cloud providers who build large and complex campus networks.

VXLAN is designed to overcome the inherent limitations of VLANs and STP. It is a proposed IETF standard [RFC 7348] to provide the same Ethernet Layer 2 network services as VLANs do, but with greater flexibility. Functionally, it is a MAC-in- UDP encapsulation protocol that runs as a virtual overlay on an existing Layer 3 network.

However, VXLAN by itself does not provide for optimal switching and routing in a network, because the “flood and learn” mechanism it uses, limits its scalability (for a host to be reachable, the host's information is flooded across the network). A VXLAN overlay, requires:

- An underlying transport network that performs data plane forwarding, for unicast communication between end points connected to the fabric.

- A control plane that is capable of distributing Layer 2 and Layer 3 host reachability information across the network.

To meet these additional requirements, Internet drafts submitted by the bess workgroup ([draft-ietf-bess-evpn-overlay-12](#)), propose MP-BGP, which features Network Layer Reachability Information (NLRI), to carry both Layer 2 MAC and Layer 3 IP information at the same time. With MAC and IP information available together for forwarding decisions, routing and switching within a network is optimised. This also minimizes the use of the conventional flood and learn mechanism, which limits the VXLAN fabric's ability to scale. The extension that allows BGP to transport Layer 2 MAC and Layer 3 IP information is EVPN.

Benefits of Deploying an Overlay-Underlay Architecture using BGP EVPN VXLAN

Deploying an overlay-underlay architecture using BGP EVPN VXLAN provides the following advantages:

- Scalability — VXLAN provides Layer 2 connectivity that allows the infrastructure that can scale to 16 million tenant networks. It overcomes the 4094-segment limitation of VLANs. This is necessary to address today's multi-tenant cloud requirements.
- Flexibility — VXLAN allows workloads to be placed anywhere, along with the traffic separation required in a multitenant environment. The traffic separation is done by network segmentation using VXLAN segment IDs or VXLAN Network Identifiers (VNIs). Workloads for a tenant can be distributed across different physical devices but they are identified by their respective Layer 2 VNI or Layer 3 VNI.
- Mobility — Virtual machines can be moved from one location to another without updating spine switch tables. This is because entities within the same tenant VXLAN network retain the same VXLAN segment ID, regardless of their location.

Fundamental Concepts of BGP EVPN VXLAN

This section provides information about the various fundamental concepts and terminologies that are involved in the working of BGP EVPN VXLAN.

VXLAN Overlay

An overlay network is a virtual network that is built over an existing Layer 2 or Layer 3 network by forming a static or dynamic tunnel that runs on top of the physical network infrastructure. The existing Layer 2 or Layer 3 network is what forms the underlay and is covered further below in this chapter.

When a data packet is sent through an overlay, the original packet or frame is packaged or encapsulated at a source edge device with an outer header and dispatched toward an appropriate destination edge device. The intermediate network devices forward the packet based on the outer header but are not aware of the data in the original packet. At the destination edge device, the packet is decapsulated by stripping off the overlay header and then forwarded based on the actual data within.

In the context of BGP EVPN VXLAN, VXLAN is used as the overlay technology to encapsulate the data packets and tunnel the traffic over a Layer 3 network. VXLAN creates a Layer 2 overlay network by using a MAC-in-UDP encapsulation. A VXLAN header is added to the original Layer 2 frame and it is then placed

within a UDP-IP packet. A VXLAN overlay network is also called as a VXLAN segment. Only host devices and virtual machines within the same VXLAN segment can communicate with each other.

VXLAN Network Identifier

Each VXLAN segment is identified through a 24-bit segment ID, termed the VXLAN network identifier. This ensures that up to 16 million VXLAN segments can be present within the same administrative domain.

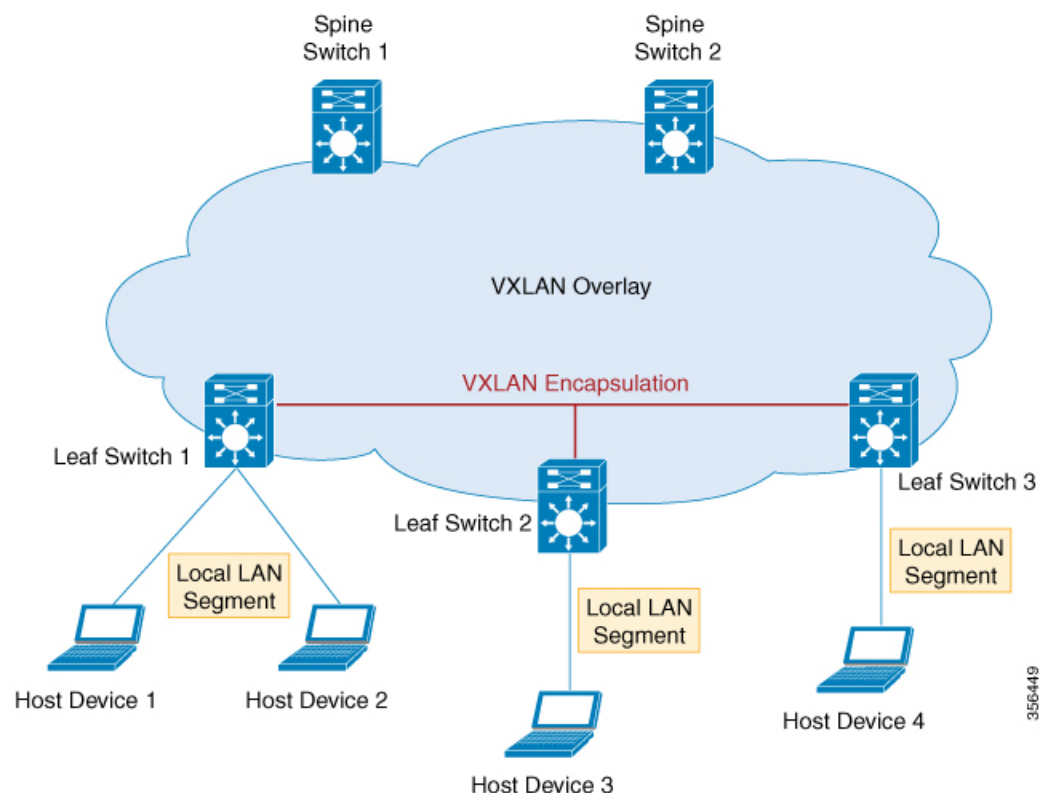

Virtual Tunnel End Points

Every VXLAN segment has tunnel edge devices known as Virtual Tunnel End points (VTEPs). These devices sit at the edge of the VXLAN network and are responsible for creating instances of VXLAN tunnels, and for performing VXLAN encapsulation and decapsulation.

A VTEP has a switch interface on the local LAN segment to support local endpoint communication through bridging, and an IP interface to interact with the transport IP network.

The IP interface has a unique IP address that identifies the VTEP on the transport IP network. The VTEP uses this IP address to encapsulate Ethernet frames and transmits the encapsulated packets to the transport network through the IP interface. A VTEP device also discovers the remote VTEPs for its VXLAN segments and learns remote MAC address-to-VTEP mappings through its IP interface.

The following figure illustrates the working of an overlay VXLAN network connecting various VTEPs:

Overlay Multicast

Overlay multicast is the method by which a overlay network forwards multicast traffic between various VTEPs present in the network. Tenant Routed Multicast (TRM) provides a mechanism to efficiently forward multicast

traffic in a VXLAN overlay network. TRM is a BGP-EVPN based solution that enables multicast routing between sources and receivers connected on VTEPs in VXLAN fabric.

Without TRM, the multicast traffic is sent as part of the underlay network in the form of BUM traffic either using underlay multicast or ingress replication methods. This does not allow sources and receivers that are present across different subnets to communicate with each other. Using TRM, multicast communication is moved out of the BUM underlay traffic. This enables multicast communication in the overlay network irrespective of the subnet in which the source or the receiver resides.

Underlay

An underlay network is the physical network over which the virtual overlay network is established. Once the overlay network is defined along with the data-plane encapsulation, a method of transport is required to move the data across the physical network underneath. This method of transport is typically an underlay transport network, or simply the underlay.

In BGP EVPN VXLAN, the underlay Layer 3 network transports the VXLAN-encapsulated packets between the source and destination VTEPs and provides reachability between them. The VXLAN overlay and the underlying IP network between the VTEPs are independent of each other.

The following figure illustrates an underlay network:

356449

EVPN Control Plane

The overlay requires a mechanism to know which end host device is behind which overlay edge device. VXLAN natively operates on a flood and learn mechanism where broadcast, unknown unicast and multicast

(BUM) traffic in a given VXLAN network is sent over the IP core to every VTEP that has membership in that network. IP multicast is used to send traffic over the network. The receiving VTEPs decapsulate the packet and, based on the inner frame, perform Layer 2 MAC learning. The inner source MAC address is learned against the outer source IP address corresponding to the source VTEP. In this way, reverse traffic is unicasted toward the previously learnt end host.

The drawback of the flood and learn mechanism is that it does not allow scalability in a VXLAN network. In order to address this issue, a control plane is used to manage the MAC address learning and VTEP discovery. In BGP EVPN VXLAN deployments, Ethernet Virtual Private Network (EVPN) is used as the control plane. EVPN control plane provides the capability to exchange both MAC address and IP address information. EVPN uses Multi Protocol Border Gateway Protocol (MP-BGP) as the routing protocol to distribute reachability information pertaining to the VXLAN overlay network, including endpoint MAC addresses, endpoint IP addresses, and subnet reachability information. BGP EVPN distribution protocol facilitates the mapping information to be built by the tunnel edge devices in the location-identity mapping database.

Route Target

A route target is an extended attribute in EVPN route updates that controls route distribution in a multi-tenant network. EVPN VTEPs have an import route target setting and an export route target setting for every VRF and Layer 2 Virtual Network Instance (VNI). When a VTEP advertises EVPN routes, it affixes its export route target in the route update. These routes are received by the other VTEPs in the network. The receiving VTEPs compare the route target value carried with the route against their own local import route target setting. If the two values match, the route is accepted and programmed in the routing table. Otherwise, the route is not imported.

EVPN Route Types

The EVPN control plane advertises the following types of information:

- Route type 1 – This is an Ethernet Auto-Discovery (EAD) route type used to advertise Ethernet segment identifier, Ethernet Tag ID, and EVPN instance information. EAD route advertisements may be sent for each EVPN instance or for each Ethernet segment.
- Route type 2 – This advertises endpoint reachability information, including MAC and IP addresses of the endpoints or VTEPs.
- Route type 3 – This performs multicast router advertisement, announcing the capability and intention to use ingress replication for specific VNIs.
- Route type 4 – This is an Ethernet Segment route used to advertise the Ethernet segment identifier, IP address length, and the originating router's IP address.
- Route type 5 – This is an IP prefix route used to advertise internal IP subnet and externally learned routes to a VXLAN network.

EVPN Instance

An EVPN Instance (EVI) represents a Virtual Private Network (VPN) on a VTEP. It is the equivalent of IP VRF in Layer 3 VPN and is also known as a MAC VRF.

Ethernet Segment

An Ethernet segment is associated with an access-facing interface of a VTEP and represents the connection with a host device. Each Ethernet segment is assigned a unique value known as Ethernet segment identifier

(ESI). When a host device is connected to more than one VTEPs, then the ESI for these connections remains the same.

EVPN Multihoming

EVPN multihoming allows you to connect a Layer 2 device or an end host device to more than one leaf switch in the VXLAN network. This provides redundancy and allows network optimization over single-homed topologies where the customer network is connected to a single leaf switch. Redundancy in the connection with the leaf switches ensures that there is no traffic disruption when there is a network failure. Multihomed topologies are more resilient, secure and efficient than single-homed topologies. EVPN multihoming operates in single-active and all-active redundancy modes.

Stretched VLAN and Subnet

By running over the existing networking infrastructure, EVPN VXLAN provides a means to stretch a Layer 2 network. EVPN VXLAN overlay allows Layer 2 segments and broadcast domains to be extended across sites or campus buildings over a Layer 3 core network. Layer 2 extension with EVPN VXLAN simplifies end user IP address management and provides seamless mobility in large campus networks.

Spine Leaf Architecture

Spine-leaf architecture is a two-layer network topology where one layer is composed of leaf switches and the other layer has one or more spine switches. This design connects all the leaf switches by providing multiple paths through the various spine switches.

Spine Switch

Spine switches are the connecting nodes between all the leaf switches. They forward the traffic between the leaf switches and are unaware of the endpoint addresses. By providing multiple paths to connect the leaf switches, spine switches provide redundancy to the network.

Leaf Switch

Leaf switches are the nodes that are connected to the host or access devices. As a leaf switch sits on the edge of the network, it is also called as an edge or Network Virtualization Edge (NVE). When a host device on one leaf switch tries to communicate with a host device on another leaf switch, the traffic between the leaf switches is sent through a spine switch. Leaf switches function as VTEPs in a VXLAN network and perform the encapsulation and decapsulation.

The following image shows a typical spine-leaf topology where four leaf switches are connected through two spine switches:

356448

Border Spine Switch and Border Leaf Switch

External connectivity of the VXLAN fabric with other Layer 2 and Layer 3 networks is facilitated through nodes known as border nodes. If the border functionality is established through a spine switch, it is known as a border spine switch. If it is established through a leaf switch, it is known as a border leaf switch.

The following image shows a spine-leaf topology with one border leaf switch and one border spine switch connecting the fabric with an external network:

356446

Integrated Routing and Bridging

EVPN VXLAN supports Integrated Routing and Bridging (IRB) functionality which allows the VTEPs in a VXLAN network to forward both Layer 2 (bridged) and Layer 3 (routed) traffic. When a VTEP forwards Layer 2 traffic, it is said to be performing bridging. Similarly, when a VTEP forwards Layer 3 traffic, it is said to be performing routing. The traffic between different subnets is forwarded through the VXLAN gateways. IRB is implemented in two ways:

- Asymmetric IRB
- Symmetric IRB

For more information about IRB, see [Information About EVPN VXLAN Integrated Routing and Bridging, on page 51](#) section.

VXLAN Gateways

A VXLAN Gateway is an entity in the network that forwards traffic between VXLAN segments, or from a VXLAN environment to a non-VXLAN environment. Leaf switches in a VXLAN network can function as both Layer 2 and Layer 3 VXLAN gateways.

Layer 2 VXLAN gateways forward traffic within the same VLAN. Layer 2 VXLAN gateways allow VXLAN to VLAN bridging by mapping a VNI segment to a VLAN.

Layer 3 VXLAN gateways forward traffic to a different VLAN. Layer 3 VXLAN gateways allow both VXLAN to VXLAN routing as well as VXLAN to VLAN routing. VXLAN to VXLAN routing provides Layer 3 connectivity between two VNIs whereas VXLAN to VLAN routing provides connectivity between a VNI and a VLAN.

Layer 2 Virtual Network Instance

The creation of a VXLAN overlay network allows host devices connected to various leaf nodes, that are separated by multiple Layer 3 networks, to interact as if they were connected to a single Layer 2 network, which is the VXLAN segment. This logical Layer 2 segment is called as Layer 2 VNI. The traffic that flows through a Layer 2 VNI between two VLANs within the same subnet is known as bridged traffic.

A VLAN that is locally defined on a VTEP can be mapped to a Layer 2 VNI. In order to allow host devices to connect to a Layer 2 VNI, the connected VLAN must be mapped to the Layer 2 VNI, and then the Layer 2 VNI is associated with the Network Virtualization Edge (NVE) logical interface on the VTEP.

Layer 3 Virtual Network Instance

When endpoints connected to a Layer 2 VNI need to communicate with endpoints belonging to different IP subnets, they send the traffic to their default gateway. Communication between endpoints belonging to different Layer 2 VNIs is possible only through a Layer 3 routing function. In an EVPN VXLAN deployment, the various Layer 2 segments that are defined by combining the local VLANs and the global Layer 2 VNIs can be associated to a VRF in order to communicate.

A Layer 3 VNI facilitates Layer 3 segmentation for every VRF on a VTEP. This is done by mapping each VRF instance to a unique Layer 3 VNI in the network and associating the various Layer 2 VNIs for a VTEP to the same VRF. This allows inter-VXLAN communication throughout the Layer 3 VNI within a particular

VRF instance. The use of VRFs to enable a logical Layer 3 isolation is known as multi-tenancy. The traffic that flows through a Layer 3 VNI between two VLANs in different subnets is known as routed traffic.

The following image shows the movement of traffic between host devices in same and different subnets through Layer 2 and Layer 3 VNIs:

399447

Mobility

The identity of an endpoint in the BGP EVPN control plane is derived from its MAC address and IP address, and BGP EVPN provides a mechanism to support endpoint mobility within a VXLAN overlay.

RFC 7432 defines the scope of endpoint mobility within the VXLAN fabric.

MAC Mobility and Duplicate MAC Detection

A MAC move occurs when an endpoint (or host) moves from one port to another. The new port may be within the same VTEP, or in a different VTEP, in the same VLAN. The BGP EVPN control plane resolves such moves by advertising MAC routes (EVPN route type 2). When an endpoint's MAC address is learned on a new port, the new VTEP it is in advertises (on the BGP EVPN control plane) that it is the local VTEP for the host. All other VTEPs receive the new MAC route.

A host may move several times, causing the corresponding VTEPs to advertise as many MAC routes. There may also be a delay between the time a new MAC route is advertised and when the old route is withdrawn from the route tables of other VTEPs, resulting in two locations briefly having the same MAC route. Here, a MAC mobility sequence number helps decide the most current of the MAC routes.

When the host MAC address is learned for the first time, the MAC mobility sequence number is set to 0. The value 0 indicates that the MAC address has not had a mobility event, and the host is still at the original location. If a MAC mobility event is detected, a new Route type 2 (MAC or IP advertisement) is added to the BGP EVPN control plane by the new VTEP below which the endpoint moved (its new location). Every time the host moves, the VTEP that detects its new location increments the sequence number by 1 and then advertises the MAC route for that host on the BGP EVPN control plane. On receiving the MAC route at the old location (VTEP), the old VTEP withdraws the old route.

A case may arise in which the same MAC address is simultaneously learned on two different ports. The EVPN control plane detects this condition and alerts the user that there is a duplicate MAC. The duplicate MAC condition may be cleared either by manual intervention, or automatically when the MAC address ages out on one of the ports.

IP Mobility and Duplicate IP Detection

BGP EVPN supports IP mobility in a similar manner to the way it supports MAC mobility. The principal difference is that an IP move is detected when the IP address is learned on a different MAC address, regardless of whether it was learned on the same port or a different port. A duplicate IP address is detected when the same IP address is simultaneously learned on two different MAC addresses, and the user is alerted when this occurs.

CHAPTER 2

Configuring EVPN VXLAN Layer 2 Overlay Network

- [Information About EVPN VXLAN Layer 2 Overlay Network, on page 11](#)
- [How to Configure EVPN VXLAN Layer 2 Overlay Network, on page 13](#)
- [Configuration Examples for EVPN VXLAN Layer 2 Overlay Network, on page 22](#)
- [Verifying EVPN VXLAN Layer 2 Overlay Network, on page 28](#)

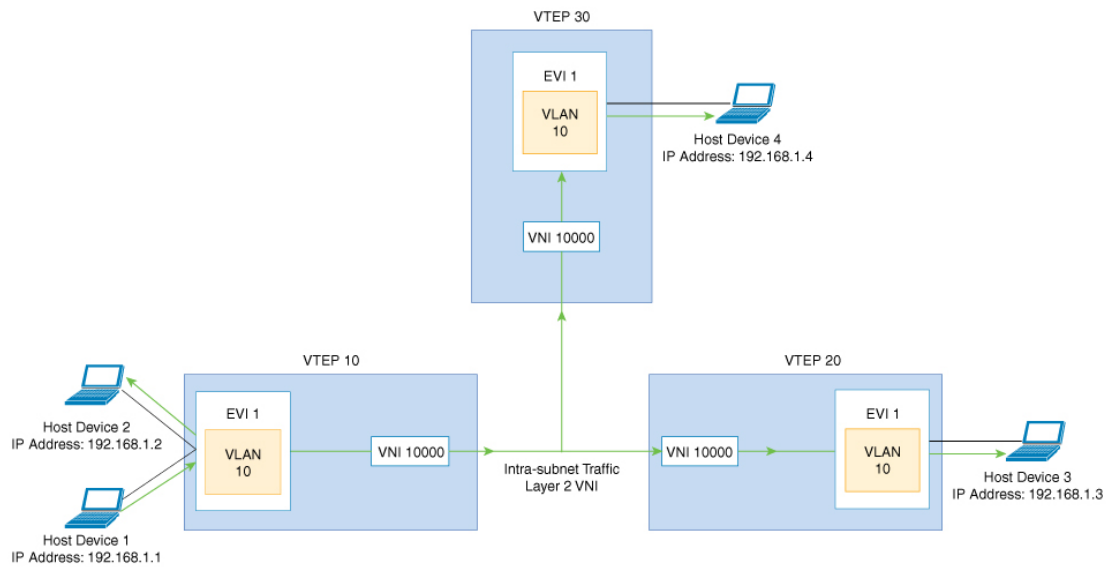

Information About EVPN VXLAN Layer 2 Overlay Network

An EVPN VXLAN Layer 2 overlay network allows host devices in the same subnet to send bridged or Layer 2 traffic to each other. The network forwards the bridged traffic using a Layer 2 virtual network instance (VNI).

Broadcast, Unknown Unicast, and Multicast Traffic

Multidestination Layer 2 traffic in a VXLAN network is typically referred to as broadcast, unknown unicast, and multicast (BUM) traffic. In a BGP EVPN VXLAN fabric, the underlay network forwards the BUM traffic to all the endpoints connected to a common Layer 2 broadcast domain in the VXLAN overlay.

The following image shows the flow of BUM traffic through a Layer 2 VNI. The network forwards BUM traffic from host device 1 to all the VTEPs which in turn send the traffic to all the host devices in the same subnet.

The MP-BGP EVPN control plane uses two different methods to forward BUM traffic in a VXLAN network:

- Underlay Multicast
- Ingress Replication

Underlay Multicast

In underlay multicast, the underlay network replicates the traffic through a multicast group. Forwarding BUM traffic using underlay multicast requires the configuration of IP multicast in the underlay network. A single copy of the BUM traffic moves from the ingress or source VTEP towards the underlay transport network. The network forwards this copy along the multicast tree so that it reaches all egress or destination VTEPs participating in the given multicast group. Various branch points in the network replicate the copy as it travels along the multicast tree. The branch points replicate the copy only if the receivers are part of the multicast group associated with the VNI.

BUM traffic forwarding through underlay multicast is achieved by mapping a Layer 2 VNI to the multicast group. This mapping must be configured on all the VTEPs associated with the Layer 2 VNI. When a VTEP joins the multicast group, it receives all the traffic that is forwarded on that group. If the VTEP receives traffic in a VNI that is not associated with it, it simply drops the traffic. This approach maintains a single link within the network, thus providing an efficient way to forward BUM traffic.

Ingress Replication

Ingress replication, or headend replication, is a unicast approach to handle multdestination Layer 2 overlay BUM traffic. Ingress replication involves an ingress device replicating every incoming BUM packet and sending them as a separate unicast to the remote egress devices. Ingress replication happens through EVPN route type 3, also called as inclusive multicast ethernet tag (IMET) route. BGP EVPN ingress replication uses IMET route for auto-discovery of remote peers in order to set up the BUM tunnels over VXLAN. Using ingress replication to handle BUM traffic can result in scaling issues as an ingress device needs to replicate the BUM traffic as many times as there are VTEPs associated with the Layer 2 VNI.

Ingress Replication Operation

IMET routes carry the remote or egress VNIs advertised from the remote peers, which can be different from the local VNI. The network creates a VXLAN tunnel adjacency when an ingress device receives IMET ingress replication routes from remote NVE peers. The tunnel adjacency is a midchain adjacency which contains IP or UDP encapsulation for the VXLAN Tunnel. If there is more than one VNI along the tunnel, then multiple VNIs share the tunnel. Ingress replication on EVPN can have multiple unicast tunnel adjacencies and different egress VNIs for each remote peer.

The network builds a flooded replication list with the routes advertised by each VTEP. The dynamic replication list stores all the remote destination peers discovered on a BGP IMET route in the same Layer 2 VNI. The replication list gets updated every time you configure the Layer 2 VNI at a remote peer. The network removes the tunnel adjacency and VXLAN encapsulation from the replication list every time a remote NVE peer withdraws the IMET ingress replication route. The network deletes the tunnel adjacency when there is no NVE peer using it.

Any BUM traffic that reaches the ingress device gets replicated after the replication list is built. The ingress device forwards the replicated traffic throughout the network to all the remote peers in the same VNI.

How to Configure EVPN VXLAN Layer 2 Overlay Network

The following figure shows a sample topology of an EVPN VXLAN Network. Host device 1 and host device 3 are part of the same subnet. The network forwards BUM traffic from host device 1 to host device 3 using a Layer 2 VNI through either underlay multicast or ingress replication methods.

Note In a two-VTEP topology, a spine switch is not mandatory. For information about configuration of spine switches in an EVPN VXLAN network, see *Configuring Spine Switches in a BGP EVPN VXLAN Fabric* module.

Perform the following set of procedures to configure an EVPN VXLAN Layer 2 overlay network and forward the BUM traffic:

- Configure Layer 2 VPN EVPN on the VTEPs.
- Configure an EVPN instance in the VLAN on the VTEPs.

- Configure the access-facing interface in the VLAN on the VTEPs.
- Configure the loopback interface on the VTEPs.
- Configure the network virtualization endpoint (NVE) interface on the VTEPs.
- Configure BGP with EVPN address family on the VTEPs.
- Configure underlay multicast, if the specified replication type is static. For more information, see *IP Multicast Routing Configuration Guide*.

Configuring Layer 2 VPN EVPN on a VTEP

To configure the Layer 2 VPN EVPN parameters on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2vpn evpn Example: Device(config)# l2vpn evpn	Enters EVPN configuration mode.
Step 4	replication-type {ingress static} Example: Device(config-evpn)# replication-type static	Configures the Layer 2 VPN EVPN replication type. Note Configure the Layer 2 VPN EVPN replication type as static, if multicast is enabled in the underlay network for EVPN BUM traffic. When the Layer 2 VPN EVPN replication type is configured as static, the IMET route is not advertised and forwarding of BUM traffic relies on underlay multicast being configured on each VTEP.
Step 5	router-id loopback-interface-id Example: Device(config-evpn)# router-id loopback 0	Specifies the interface that will supply the IP addresses to be used in auto-generating route distinguishers.

	Command or Action	Purpose
Step 6	default-gateway advertise Example: Device(config-evpn) # default-gateway advertise	<p>(Optional) Enables default gateway advertisement on the switch. To configure distributed anycast gateway in a VXLAN network using MAC aliasing, enable default gateway advertisement on all the leaf switches in the network.</p> <p>This command is applicable in integrated routing and bridging (IRB) scenarios where Layer 2 and Layer 3 VNIs coexist in a VRF. Refer to <i>Configuring EVPN VXLAN Integrated Routing and Bridging</i> module for more details.</p> <p>This command is mandatory only if the same MAC address is not manually configured on all the access SVIs.</p> <p>Note Use the default-gateway advertise {enable disable} command in EVPN instance configuration mode to override the global default gateway advertisement settings and enable or disable it for a specific EVPN instance.</p>
Step 7	logging peer state Example: Device(config-evpn) # logging peer state	(Optional) Displays syslog message when the first route is received or the last route is withdrawn from a given remote VTEP.
Step 8	mac duplication limit limit-number time time-limit Example: Device(config-evpn) # mac duplication limit 20 time 5	(Optional) Changes parameters for detecting duplicate MAC addresses.
Step 9	ip duplication limit limit-number time time-limit Example: Device(config-evpn) # ip duplication limit 20 time 5	(Optional) Changes parameters for detecting duplicate IP addresses.
Step 10	route-target auto vni Example: Device(config-evpn) # route-target auto vni	(Optional) Specifies to use VNI instead of EVPN instance number to auto-generate route target.
Step 11	exit Example: Device(config-evpn) # exit	Exits EVPN configuration mode and enters global configuration mode.

	Command or Action	Purpose
Step 12	l2vpn evpn instance <i>evpn-instance-number</i> vlan-based Example: <pre>Device(config)# l2vpn evpn instance 1 vlan-based</pre>	<p>Configures a VLAN based EVPN instance in Layer 2 VPN configuration mode.</p> <p>An EVPN instance needs to be explicitly configured only when something needs to be configured per EVPN instance such as a route target.</p>
Step 13	encapsulation vxlan Example: <pre>Device(config-evpn-evi)# encapsulation vxlan</pre>	<p>(Optional) Defines the encapsulation format as VXLAN.</p> <p>The encapsulation format is VXLAN by default.</p>
Step 14	replication-type {ingress static} Example: <pre>Device(config-evpn-evi)# replication-type ingress</pre>	<p>(Optional) Sets the replication type for the EVPN instance.</p> <p>In case a global replication type has already been configured, this overrides the global setting.</p>
Step 15	default-gateway advertise {enable disable} Example: <pre>Device(config-evpn-evi)# default-gateway advertise disable</pre>	<p>(Optional) Enables or disables the default gateway advertisement for the EVPN instance.</p> <p>In case default gateway advertisement has already been globally configured, this overrides the global setting.</p> <p>This command is mandatory only if the same MAC address is not manually configured on all the access SVIs.</p> <p>To configure distributed anycast gateway in a VXLAN network using MAC aliasing, enable default gateway advertisement on all the leaf switches in the network.</p>
Step 16	ip local-learning {enable disable} Example: <pre>Device(config-evpn-evi)# ip local-learning disable</pre>	<p>(Optional) Enables or disables local IP address learning for the specified EVPN instance.</p> <p>In case IP address learning has already been globally configured, this overrides the global setting.</p>
Step 17	no auto-route-target Example: <pre>Device(config-evpn-evi)# no auto-route-target</pre>	<p>(Optional) Disables auto generation of route targets.</p>
Step 18	rd <i>rd-value</i> Example: <pre>Device(config-evpn-evi)# rd 65000:100</pre>	<p>(Optional) Configures a route distinguisher manually.</p>

	Command or Action	Purpose
Step 19	route-target { import export both } <i>rt-value</i> Example: Device(config-evpn-evi) # route-target both 65000:100	(Optional) Configures route targets manually. Note Configure route targets manually if the auto-generated route target values (ASN:EVI or ASN:VNI) are different between the VTEPs.
Step 20	end Example: Device(config-evpn-evi) # end	Returns to privileged EXEC mode.

Configuring an EVPN Instance on the VLAN on a VTEP

To configure an EVPN instance on the VLAN on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan configuration <i>vlan-id</i> Example: Device(config)# vlan configuration 11	Enters VLAN feature configuration mode for the specified VLAN interface.
Step 4	member evpn-instance <i>evpn-instance-id vni l2-vni-number</i> Example: Device(config-vlan)# member evpn-instance 1 vni 10000	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 2 VNI.
Step 5	end Example: Device(config-vlan) # end	Returns to privileged EXEC mode.

Configuring the Access-Facing Interface in the VLAN on a VTEP

To configure the access-facing interface in the VLAN on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-name</i> Example: Device(config)# interface GigabitEthernet1/0/1	Enters interface configuration mode for the specified interface.
Step 4	switchport access vlan <i>vlan-id</i> Example: Device(config-if)# switchport access vlan 11	Configures the interface as a static-access port of the specified VLAN. Interface can also be configured as a trunk interface, if required.
Step 5	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring the Loopback Interface on a VTEP

To configure the loopback interface on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>loopback-interface-id</i> Example: Device(config)# interface Loopback0	Enters interface configuration mode for the specified Loopback interface.

	Command or Action	Purpose
Step 4	ip address <i>ipv4-address</i> Example: Device(config-if) # ip address 10.12.11.11	Configures the IP address for the Loopback interface.
Step 5	ip pim sparse mode Example: Device(config-if) # ip pim sparse mode	Enables Protocol Independent Multicast (PIM) sparse mode on the Loopback interface.
Step 6	end Example: Device(config-vlan) # end	Returns to privileged EXEC mode.

Configuring the NVE Interface on a VTEP

To add a VNI member to the NVE interface of a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>nve-interface-id</i> Example: Device(config) # interface nve1	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address Example: Device(config-if) # no ip address	Disables IP processing on the interface by removing its IP address.
Step 5	source-interface <i>loopback-interface-id</i> Example: Device(config-if) # source-interface loopback0	Sets the IP address of the specified loopback interface as the source IP address.
Step 6	host-reachability protocol bgp Example: Device(config-if) # host-reachability protocol bgp	Configures BGP as the host-reachability protocol on the interface.

	Command or Action	Purpose
Step 7	member vni <i>layer2-vni-id</i> { ingress-replication mcast-group <i>multicast-group-address</i> Example: Device(config-if) # member vni 10000 mcast-group 227.0.0.1	Associates the Layer 2 VNI member with the NVE. The specified replication type must match the replication type that is configured globally or for the specific EVPN instance. Use mcast-group keyword for static replication and ingress-replication keyword for ingress replication.
Step 8	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Configuring BGP on a VTEP with EVPN Address Family

To configure BGP on a VTEP with EVPN address family and with spine switch as the neighbor, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 1	Enables a BGP routing process, assigns it an autonomous system number, and enters router configuration mode.
Step 4	bgp log-neighbor-changes Example: Device(config-router) # bgp log-neighbor-changes	(Optional) Enables the generation of logging messages when the status of a BGP neighbor changes. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 5	bgp update-delay <i>time-period</i> Example: Device(config-router) # bgp update-delay 1	(Optional) Sets the maximum initial delay period before sending the first update. The range is 1 to 3600 seconds. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .

	Command or Action	Purpose
Step 6	bgp graceful-restart Example: <pre>Device(config-router) # bgp graceful-restart</pre>	(Optional) Enables the BGP graceful restart capability for all BGP neighbors. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 7	no bgp default ipv4-unicast Example: <pre>Device(config-router) # no bgp default ipv4-unicast</pre>	(Optional) Disables default IPv4 unicast address family for BGP peering session establishment. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 8	neighbor ip-address remote-as number Example: <pre>Device(config-router) # neighbor 10.11.11.11 remote-as 1</pre>	Defines multiprotocol-BGP neighbors. Under each neighbor, define the Layer 2 Virtual Private Network (L2VPN) EVPN configuration. Use the IP address of the spine switch as the neighbor IP address.
Step 9	neighbor {ip-address group-name} update-source interface Example: <pre>Device(config-router) # neighbor 10.11.11.11 update-source Loopback0</pre>	Configures update source. Update source can be configured per neighbor or per peer-group. Use the IP address of the spine switch as the neighbor IP address.
Step 10	address-family l2vpn evpn Example: <pre>Device(config-router) # address-family l2vpn evpn</pre>	Specifies the L2VPN address family and enters address family configuration mode.
Step 11	neighbor ip-address activate Example: <pre>Device(config-router-af) # neighbor 10.11.11.11 activate</pre>	Enables the exchange information from a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 12	neighbor ip-address send-community [both extended standard] Example: <pre>Device(config-router-af) # neighbor 10.11.11.11 send-community both</pre>	Specifies the communities attribute sent to a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 13	exit-address-family Example: <pre>Device(config-router-af) # exit-address-family</pre>	Exits address family configuration mode and returns to router configuration mode.
Step 14	end Example:	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device (config-router) # end	

Configuration Examples for EVPN VXLAN Layer 2 Overlay Network

This section provides an example for configuring an EVPN VXLAN Layer 2 overlay network. This example shows a sample configuration for a VXLAN network with 2 VTEPs, VTEP 1 and VTEP 2, connected to perform bridging.

356465

Table 1: Configuration Example for a VXLAN Network with Two VTEPs Connected to Perform Bridging

The following examples provide outputs for **show** commands on VTEP 1 and VTEP 2 in the topology configured above.

- [show l2vpn evpn peers vxlan, on page 25](#)
- [show nve peers, on page 25](#)
- [show l2vpn evpn mac, on page 26](#)
- [show bgp l2vpn evpn all, on page 26](#)
- [show platform software fed switch active matm macTable vlan, on page 27](#)

show l2vpn evpn peers vxlan

VTEP 1

This example shows the output for the **show l2vpn evpn peers vxlan** command on VTEP 1:

```

VTEP1# show l2vpn evpn peers vxlan
Interface VNI      Peer-IP              Num routes eVNI      UP time
-----
nve10      6000      10.2.2.20            3          6000      00:12:44

```

VTEP 2

This example shows the output for the **show l2vpn evpn peers vxlan** command on VTEP 2:

```

VTEP2# show l2vpn evpn peers vxlan
Interface VNI      Peer-IP              Num routes eVNI      UP time
-----
nve10      6000      10.1.1.10            3          6000      00:01:41

```

show nve peers

VTEP 1

This example shows the output for the **show nve peers** command on VTEP 1:

```

VTEP1# show nve peers
Interface VNI      Type Peer-IP          RMAC/Num_RTs  eVNI      state flags UP time
nve10      6000      L2CP 10.2.2.20      3          6000      UP      N/A 00:12:48

```

VTEP 2

This example shows the output for the **show nve peers** command on VTEP 2:

```
VTEP2# show nve peers
Interface VNI      Type Peer-IP      RMAC/Num_RTs  eVNI      state flags UP time
nve10     6000    L2CP 10.1.1.10  3          6000      UP    N/A  00:01:46
```

show l2vpn evpn mac

VTEP 1

This example shows the output for the **show l2vpn evpn mac** command on VTEP 1:

```
VTEP1# show l2vpn evpn mac
MAC Address      EVI      VLAN      ESI                      Ether Tag  Next Hop(s)
-----
0018.736c.5681 1         201      0000.0000.0000.0000.0000 0          10.2.2.20
0018.736c.56c3 1         201      0000.0000.0000.0000.0000 0          10.2.2.20
0059.dc50.ae01 1         201      0000.0000.0000.0000.0000 0          Gi1/0/1:201
0059.dc50.ae4c 1         201      0000.0000.0000.0000.0000 0          Gi1/0/1:201
```

VTEP 2

This example shows the output for the **show l2vpn evpn mac** command on VTEP 2:

```
VTEP2# show l2vpn evpn mac
MAC Address      EVI      VLAN      ESI                      Ether Tag  Next Hop(s)
-----
0018.736c.5681 1         201      0000.0000.0000.0000.0000 0          Gi1/0/1:201
0018.736c.56c3 1         201      0000.0000.0000.0000.0000 0          Gi1/0/1:201
0059.dc50.ae01 1         201      0000.0000.0000.0000.0000 0          10.1.1.10
0059.dc50.ae4c 1         201      0000.0000.0000.0000.0000 0          10.1.1.10
```

show bgp l2vpn evpn all

VTEP 1

This example shows the output for the **show bgp l2vpn evpn all** command on VTEP 1:

```
VTEP1# show bgp l2vpn evpn all

Verifying EVPN VXLAN Layer 2 Overlay Network

The following table lists the **show** commands that are used to verify a Layer 2 VXLAN overlay network:

Table 2: Commands to Verify EVPN VXLAN Layer 2 Overlay Network

Command	Purpose
show l2vpn evpn evi [detail]	Displays detailed information for a particular EVPN instance or all EVPN instances.
show l2vpn evpn mac [detail]	Displays the MAC address database for Layer 2 EVPN.
show l2vpn evpn mac ip [detail]	Displays the IP address database for Layer 2 EVPN.

Command	Purpose
show l2vpn evpn summary	Displays a summary of Layer 2 EVPN information.
show l2vpn evpn capabilities	Displays platform capability information for Layer 2 EVPN.
show l2vpn evpn peers	Displays Layer 2 EVPN peer route counts and up time.
show l2vpn evpn route-target	Displays Layer 2 EVPN import route targets.
show l2vpn evpn memory	Displays Layer 2 EVPN memory usage.
show l2route evpn summary	Displays a summary of EVPN routes.
show l2route evpn mac [detail]	Displays MAC address information learnt by the switch in the EVPN control plane.
show l2route evpn mac ip [detail]	Displays MAC and IP address information learnt by the switch in the EVPN control plane.
show l2route evpn imet detail	Displays the IMET route details for Layer 2 EVPN address family. This command shows details only about traffic forwarded using ingress replication.
show bgp l2vpn evpn	Displays BGP information for Layer 2 VPN EVPN address family.
show bgp l2vpn evpn route-type 2	Displays BGP information for route type 2 of L2VPN EVPN address family.
show bgp l2vpn evpn evi context	Displays context information for Layer 2 EVPN instances.
show bgp l2vpn evpn evi <i>evpn-instance-id</i> route-type 3	Displays route type 3 information for the specified Layer 2 EVPN instance. This command shows details only about traffic forwarded using ingress replication.
show l2fib bridge-domain <i>bridge-domain-number</i> detail	Displays detailed information for a Layer 2 forwarding information base bridge domain.
show l2fib bridge-domain <i>bridge-domain-number</i> address unicast	Displays unicast MAC address information for a Layer 2 forwarding information base bridge domain.
show nve vni	Displays information about VXLAN network identifier members associated with an NVE interface.
show nve vni <i>vni-id</i> detail	Displays detailed NVE interface state information for a VXLAN network identifier member.

Command	Purpose
show nve peers	Displays NVE interface state information for peer leaf switches.
show mac address-table vlan <i>vlan-id</i>	Displays MAC addresses for a VLAN.
show platform software fed switch active matm macTable vlan <i>vlan-id</i>	Displays MAC addresses for a VLAN from MAC address table manager database for Forwarding Engine Driver (FED).
show device-tracking database	Displays device tracking database.
show device-tracking database mac	Displays device tracking MAC address database.
show ip mroute	Displays multicast routing table information.

CHAPTER 3

Configuring EVPN VXLAN Layer 3 Overlay Network

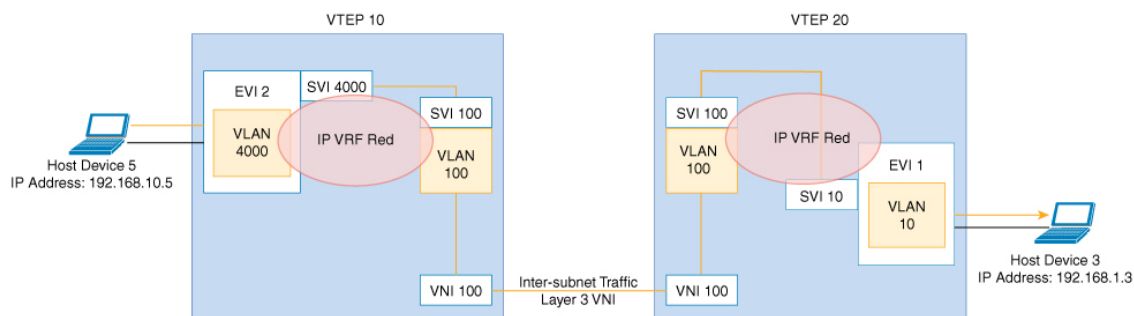

- [Information About EVPN VXLAN Layer 3 Overlay Network, on page 31](#)
- [How to Configure EVPN VXLAN Layer 3 Overlay Network, on page 32](#)
- [Configuration Examples for EVPN VXLAN Layer 3 Overlay Network, on page 42](#)
- [Verifying EVPN VXLAN Layer 3 Overlay Network, on page 49](#)

Information About EVPN VXLAN Layer 3 Overlay Network

An EVPN VXLAN Layer 3 overlay network allows host devices in different Layer 2 networks to send Layer 3 or routed traffic to each other. The network forwards the routed traffic using a Layer 3 virtual network instance (VNI) and an IP VRF.

This module provides information only about how to configure a Layer 3 overlay network. You can also configure both Layer 2 and Layer 3 overlay networks together to enable integrated routing and bridging (IRB). For more information about IRB, see *Configuring EVPN VXLAN Integrated Routing and Bridging* module.

The following figure shows the movement of traffic in an EVPN VXLAN Layer 3 overlay network using a Layer 3 VNI:

How to Configure EVPN VXLAN Layer 3 Overlay Network

The following figure shows a sample topology of an EVPN VXLAN Network. Host device 3 and host device 5 are part of different subnets. The network forwards traffic from host device 1 to host device 3 using a Layer 3 VNI and an IP VRF.

Perform the following set of procedures to configure an EVPN VXLAN Layer 3 overlay network:

- Configure the IP VRF on the VTEPs.
- Configure the core-facing VLAN on the VTEPs.
- Configure the access-facing VLAN on the VTEPs.
- Configure the switch virtual interface (SVI) for the core-facing VLAN.
- Configure the SVI for the access-facing VLAN.
- Configure the loopback interface on the VTEPs.
- Configure the network virtualization endpoint (NVE) interface on the VTEPs.
- Configure BGP with either IPv4 or IPv6 or both address families on the VTEPs.

Configuring an IP VRF on a VTEP

To configure an IP VRF on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	vrf definition <i>vrf-name</i> Example: Device(config)# vrf definition Green	Enters the VRF configuration mode for the specified VRF instance.
Step 4	rd <i>vpn-route-distinguisher</i> Example: Device(config-vrf)# rd 100:1	Specifies the route distinguisher for the VRF instance.
Step 5	address-family ipv4 [multicast unicast] Example: Device(config-vrf)# address-family ipv4	Enters the IPv4 address family configuration mode.
Step 6	route-target { export import both } <i>route-target-ext-community</i> Example: Device(config-vrf-af)# route-target export 100:1 Example: Device(config-vrf-af)# route-target import 100:1	Creates a list of import, export, or both import and export route target communities for the specified VRF. Enter either an autonomous system number and an arbitrary number (xxx:y), or an IP address and an arbitrary number (A.B.C.D:y).
Step 7	route-target { export import both } <i>route-target-ext-community</i> stitching Example: Device(config-vrf-af)# route-target export 100:1 stitching Example: Device(config-vrf-af)# route-target import 100:1 stitching	Configures importing, exporting, or both importing and exporting of EVPN route target communities for the VRF.
Step 8	exit-address-family Example: Device(config-vrf-af)# exit-address-family	Exits VRF address family configuration mode and enters VRF configuration mode.
Step 9	address-family ipv6 [multicast unicast] Example: Device(config-vrf)# address-family ipv6	Enters the IPv6 address family configuration mode.
Step 10	route-target { export import both } <i>route-target-ext-community</i> Example:	Creates a list of import, export, or both import and export route target communities for the specified VRF.

	Command or Action	Purpose
	Device (config-vrf-af) # route-target export 100:1 Example: Device (config-vrf-af) # route-target import 100:1	Enter either an autonomous system number and an arbitrary number (xxx:y), or an IP address and an arbitrary number (A.B.C.D:y).
Step 11	route-target {export import both} route-target-ext-community stitching Example: Device (config-vrf-af) # route-target export 100:1 stitching Example: Device (config-vrf-af) # route-target import 100:1 stitching	Configures importing, exporting, or both importing and exporting of VXLAN route target communities for the VRF.
Step 12	exit-address-family Example: Device (config-vrf-af) # exit-address-family	Exits VRF address family configuration mode and enters VRF configuration mode.
Step 13	end Example: Device (config-vrf) # end	Returns to privileged EXEC mode.

Configuring the Core-facing VLAN on a VTEP

To configure the core-facing VLAN on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan configuration vlan-id Example: Device (config) # vlan configuration 11	Enters VLAN feature configuration mode for the specified VLAN interface.

	Command or Action	Purpose
Step 4	member vni <i>l3-vni-number</i> Example: Device(config-vlan) # member vni 5000	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 3 VNI.
Step 5	end Example: Device(config-vlan) # end	Returns to privileged EXEC mode.

Configuring Access-facing VLAN on a VTEP

To configure the access-facing VLAN on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-name</i> Example: Device(config) # interface GigabitEthernet1/0/1	Enters interface configuration mode for the specified interface.
Step 4	switchport access vlan <i>vlan-id</i> Example: Device(config-if) # switchport access vlan 40	Configures the interface as a static-access port of the specified VLAN. Interface can also be configured as a trunk interface, if required.
Step 5	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Configuring Switch Virtual Interface for the Core-facing VLAN

To configure an SVI for the core-facing VLAN on the VTEP:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface vlan 11	Enters interface configuration mode for the specified VLAN.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding Green	Configures the SVI for the VLAN.
Step 5	ip unnumbered <i>Loopback-interface</i> Example: Device(config-if)# ip unnumbered Loopback0	Enables IP processing on the Loopback interface without assigning an explicit IP address to the interface.
Step 6	no autostate Example: Device(config-if)# no autostate	Disables autostate on the interface. In EVPN deployments, once a VLAN is used for a core-facing SVI, it should not be allowed in any trunk. For a core-facing SVI to function properly, the no autostate command must be configured under the SVI.
Step 7	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring the Switch Virtual Interface for the Access-facing VLANs

To configure the SVI for the access-facing VLAN on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface vlan 40	Enters interface configuration mode for the specified VLAN.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding Green	Configures the SVI for the VLAN.
Step 5	ip address <i>ip-address</i> Example: Device(config-if)# ip address 192.168.10.100 255.255.255.0	Configures the IP address of the SVI.
Step 6	mac-address <i>mac-address-value</i> Example: Device(config-if)# mac-address aabb.cc01.f100	(Optional) Manually sets the MAC address for the VLAN interface.
Step 7	exit Example: Device(config-if)# exit	Returns to global configuration mode.
Step 8	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring the Loopback Interface on a VTEP

To configure the loopback interface on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface <i>loopback-interface-id</i> Example: Device(config)# interface Loopback0	Enters interface configuration mode for the specified Loopback interface.
Step 4	ip address <i>ipv4-address</i> Example: Device(config-if)# ip address 10.12.11.11 255.255.255.255	Configures the IP address for the Loopback interface.
Step 5	ip pim sparse mode Example: Device(config-if)# ip pim sparse mode	(Optional) Enables Protocol Independent Multicast (PIM) sparse mode on the Loopback interface. Note Enable PIM sparse mode only if EVPN VXLAN Layer 2 overlay network is also configured on the VTEP with underlay multicast as the mechanism for forwarding BUM traffic.
Step 6	end Example: Device(config-vlan)# end	Returns to privileged EXEC mode.

Configuring the NVE Interface on a VTEP

To add a Layer 3 VNI member to the NVE interface on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>nve-interface-id</i> Example: Device(config)# interface nve1	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address Example:	Disables IP processing on the interface by removing its IP address.

	Command or Action	Purpose
	<code>Device(config-if)# no ip address</code>	
Step 5	source-interface <i>loopback-interface-id</i> Example: <code>Device(config-if)# source-interface loopback0</code>	Sets the IP address of the specified loopback interface as the source IP address.
Step 6	host-reachability protocol bgp Example: <code>Device(config-if)# host-reachability protocol bgp</code>	Configures BGP as the host-reachability protocol on the interface.
Step 7	member vni vni-id vrf vrf-name Example: <code>Device(config-if)# member vni 5000 vrf Green</code>	Associates the Layer 3 VNI id with the NVE interface. Note The Layer 3 VNI id must match with the VNI id configured in the core VLAN on the VTEP.
Step 8	end Example: <code>Device(config-if)# end</code>	Returns to privileged EXEC mode.

Configuring BGP with IPv4 or IPv6 or Both Address Families on VTEP

To configure BGP on a VTEP with IPv4 or IPv6 or both address families and a spine switch as the neighbor, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Device> enable</code>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <code>Device# configure terminal</code>	Enters global configuration mode.
Step 3	router bgp autonomous-system-number Example: <code>Device(config)# router bgp 1</code>	Enables a BGP routing process, assigns it an autonomous system number, and enters router configuration mode.

	Command or Action	Purpose
Step 4	bgp log-neighbor-changes Example: Device(config-router) # bgp log-neighbor-changes	(Optional) Enables the generation of logging messages when the status of a BGP neighbor changes. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 5	bgp update-delay time-period Example: Device(config-router) # bgp update-delay 1	(Optional) Sets the maximum initial delay period before sending the first update. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 6	bgp graceful-restart Example: Device(config-router) # bgp graceful-restart	(Optional) Enables the BGP graceful restart capability for all BGP neighbors. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 7	no bgp default ipv4-unicast Example: Device(config-router) # no bgp default ipv4-unicast	(Optional) Disables default IPv4 unicast address family for BGP peering session establishment. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 8	neighbor ip-address remote-as number Example: Device(config-router) # neighbor 10.11.11.11 remote-as 1	Defines multiprotocol-BGP neighbors. Under each neighbor, define the configuration. Use the IP address of the spine switch as the neighbor IP address.
Step 9	neighbor {ip-address group-name} update-source interface Example: Device(config-router) # neighbor 10.11.11.11 update-source Loopback0	Configures update source. Update source can be configured per neighbor or per peer-group. Use the IP address of the spine switch as the neighbor IP address.
Step 10	address-family l2vpn evpn Example: Device(config-router) # address-family l2vpn evpn	Specifies the L2VPN address family and enters address family configuration mode.
Step 11	neighbor ip-address activate Example: Device(config-router-af) # neighbor 10.11.11.11 activate	Enables the exchange information from a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 12	neighbor ip-address send-community [both extended standard] Example:	Specifies the communities attribute sent to a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.

	Command or Action	Purpose
	Device(config-router-af) # neighbor 10.11.11.11 send-community both	
Step 13	exit-address-family Example: Device(config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 14	address-family ipv4 vrf vrf-name Example: Device(config-router) # address-family ipv4 vrf Green	Specifies the IPv4 address family and enters address family configuration mode.
Step 15	advertise l2vpn evpn Example: Device(config-router-af) # advertise l2vpn evpn	Advertises Layer 2 VPN EVPN routes within a tenant VRF in an EVPN VXLAN fabric.
Step 16	redistribute connected Example: Device(config-router-af) # redistribute connected	(Optional) Redistributes connected routes to BGP.
Step 17	redistribute static Example: Device(config-router-af) # redistribute static	(Optional) Redistributes static routes to BGP.
Step 18	exit-address-family Example: Device(config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 19	address-family ipv6 vrf vrf-name Example: Device(config-router) # address-family ipv6 vrf green	Specifies the IPv6 address family and enters address family configuration mode.
Step 20	advertise l2vpn evpn Example: Device(config-router-af) # advertise l2vpn evpn	Advertises Layer 2 VPN EVPN routes within a tenant VRF in an EVPN VXLAN fabric.
Step 21	redistribute connected Example: Device(config-router-af) # redistribute connected	(Optional) Redistributes connected routes to BGP.

	Command or Action	Purpose
Step 22	redistribute static Example: Device(config-router-af) # redistribute static	(Optional) Redistributes static routes to BGP.
Step 23	exit-address-family Example: Device(config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 24	end Example: Device(config-router) # end	Returns to privileged EXEC mode.

Configuration Examples for EVPN VXLAN Layer 3 Overlay Network

This section provides an example for configuring an EVPN VXLAN Layer 3 overlay network. This example shows a sample configuration for a VXLAN network with 2 VTEPs, VTEP 1 and VTEP 2, connected to perform routing.

356465

Table 3: Configuration Example for a VXLAN Network with Two VTEPs Connected to Perform Routing

VTEP 1	VTEP 2

The following examples provide outputs for **show** commands on VTEP 1 and VTEP 2 in the topology configured above.

- [show nve peers, on page 46](#)
- [show bgp l2vpn evpn all, on page 46](#)
- [show ip route vrf, on page 47](#)
- [show platform software fed switch active matm mactable vlan, on page 48](#)

show nve peers**VTEP 1**

The following example shows the output for the **show nve peers** command on VTEP 1:

```
VTEP1# show nve peers
Interface VNI      Type Peer-IP      RMAC/Num_RTs  eVNI      state flags UP time
nve10    5000    L3CP 10.2.2.20  380e.4d9b.6a4a 5000      UP   A/M/4 00:38:37
nve10    5000    L3CP 10.2.2.20  380e.4d9b.6a4a 5000      UP   A/-/6 00:03:16
```

VTEP 2

The following example shows the output for the **show nve peers** command on VTEP 2:

```
VTEP2# show nve peers
Interface VNI      Type Peer-IP      RMAC/Num_RTs  eVNI      state flags UP time
nve10    5000    L3CP 10.1.1.10  a0f8.4910.bce2 5000      UP   A/-/4 00:38:53
nve10    5000    L3CP 10.1.1.10  a0f8.4910.bce2 5000      UP   A/M/6 00:38:53
```

show bgp l2vpn evpn all**VTEP 1**

The following example shows the output for the **show bgp l2vpn evpn all** command on VTEP 1:

```

Verifying EVPN VXLAN Layer 3 Overlay Network

The following table lists the **show** commands that are used to verify a Layer 3 VXLAN overlay network:

Table 4: Commands to Verify EVPN VXLAN Layer 3 Overlay Network

Command	Purpose
show nve vni	Displays information about VXLAN network identifier members associated with an NVE interface.
show nve vni <i>vni-id</i> detail	Displays detailed NVE interface state information for a VXLAN network identifier member.
show nve peers	Displays NVE interface state information for peer leaf switches.
show mac address-table vlan <i>vlan-id</i>	Displays MAC addresses for a VLAN.
show platform software fed switch active matm macTable vlan <i>vlan-id</i>	Displays MAC addresses for a VLAN from MAC address table manager database for Forwarding Engine Driver (FED).
show ip route vrf <i>vrf-name</i>	Displays the IP routing table associated with a specific VRF.
show ip cef vrf <i>vrf-name</i>	Displays entries in the Cisco Express Forwarding (CEF) table associated with a VRF.
show arp vrf <i>vrf-name</i>	Displays entries in the Address Resolution Protocol (ARP) table associated with a VRF.
show bgp l2vpn evpn route-type 5	Displays BGP information for route type 5 of Layer 2 VPN EVPN address family.

Command	Purpose
show bgp l2vpn evpn all	Displays all BGP information for L2VPN EVPN address family.

CHAPTER 4

Configuring EVPN VXLAN Integrated Routing and Bridging

- [Information About EVPN VXLAN Integrated Routing and Bridging, on page 51](#)
- [How to Configure EVPN VXLAN Integrated Routing and Bridging, on page 54](#)
- [Configuration Examples for EVPN VXLAN Integrated Routing and Bridging, on page 62](#)
- [Verifying EVPN VXLAN Integrated Routing and Bridging, on page 76](#)

Information About EVPN VXLAN Integrated Routing and Bridging

EVPN VXLAN integrated routing and bridging (IRB) allows the VTEPs or leaf switches in an EVPN VXLAN network to perform both bridging and routing. IRB allows the VTEPs to forward both Layer 2 or bridged and Layer 3 or routed traffic. A VTEP performs bridging when it forwards traffic to the same subnet. Similarly, a VTEP performs routing when it forwards traffic to a different subnet. The VTEPs in the network forward traffic to each other through the VXLAN gateways. BGP EVPN VXLAN implements IRB in two ways:

- Asymmetric IRB
- Symmetric IRB

Asymmetric IRB

In asymmetric IRB, the ingress VTEP performs both bridging and routing whereas the egress VTEP performs only bridging. A packet first moves through a MAC VRF followed by an IP VRF on the network virtualisation endpoint (NVE) of the ingress VTEP. It then moves only through a MAC VRF on the NVE of the egress VTEP. The NVE of the ingress VTEP manages all the packet processing associated with intersubnet forwarding semantics.

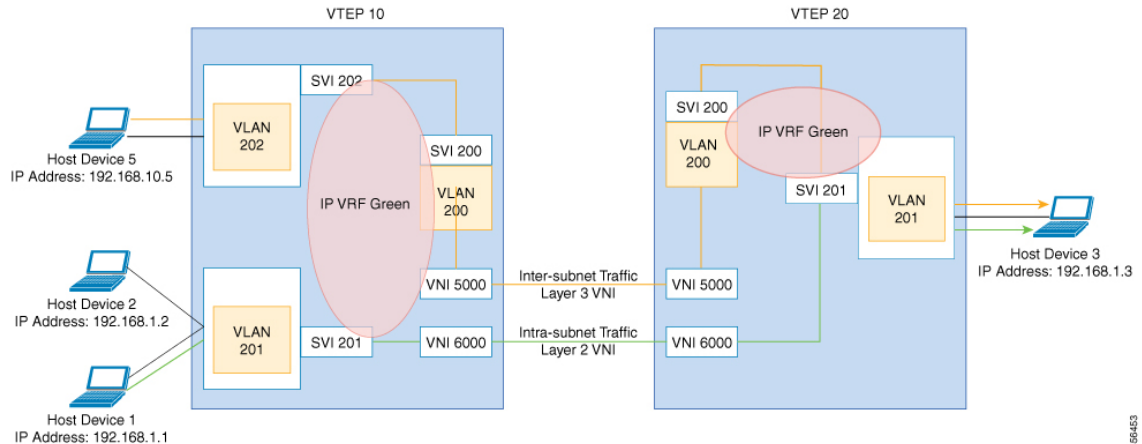

The return traffic during asymmetric IRB goes through a different virtual network instance (VNI) compared to the source traffic. Asymmetric IRB needs the source and destination VNIs to be associated with both the ingress and egress VTEPs.

Symmetric IRB

In symmetric IRB, both the ingress and egress VTEPs perform both bridging and routing. A packet first moves through a MAC VRF followed by an IP VRF on the NVE of the ingress VTEP. It then moves through an IP VRF followed by a MAC VRF on the NVE of the egress VTEP. The NVEs of ingress and egress VTEPs equally share all the packet processing associated with intersubnet forwarding semantics.

In symmetric IRB, you are required to define only the VNIs of locally attached endpoints on the ingress and egress VTEPs. Symmetric IRB offers better scalability in terms of the number of VNIs that a BGP EVPN VXLAN fabric supports.

The following figure shows the implementation of symmetric IRB and the movement of traffic in an EVPN VXLAN network:

EVPN VXLAN Distributed Anycast Gateway

Distributed anycast gateway is a default gateway addressing mechanism in a BGP EVPN VXLAN fabric. The feature enables the use of the same gateway IP and MAC address across all the VTEPs in an EVPN VXLAN network. This ensures that every VTEP functions as the default gateway for the workloads directly connected to it. The feature facilitates flexible workload placement, host mobility, and optimal traffic forwarding across the BGP EVPN VXLAN fabric.

The scenario shown in the following figure depicts a distributed gateway. Subnet 1 contains two leaf switches, leaf switch 1 and leaf switch 2, acting together as a distributed default gateway for VLAN 10. Host device 1 is connected to leaf switch 1 and needs to send traffic to host device 3, which is in a different subnet. When host device 1 tries to send traffic outside of subnet 1, the traffic goes through the configured gateway on leaf switch 1. Host device 1 registers the Address Resolution Protocol (ARP) entries of the gateway VLAN MAC and IP addresses on leaf switch 1.

Figure 1: Distributed Gateway Topology

When multiple VETPs act together as one single distributed default gateway for the same VLAN, the VLAN IP address remains the same across all of them. This IP address becomes the gateway IP address for any host device in the VLAN that tries to reach an IP address outside its subnet. But, each VTEP retains its own MAC address.

In the preceding figure, consider the scenario where host device 1 moves from leaf switch 1 to leaf switch 2. The host device remains within the same network and still maintains the same ARP entries for gateway MAC and IP addresses. But the MAC addresses of the VLAN interfaces on leaf switch 2 and leaf switch 1 are different. This results in a MAC address mismatch between the ARP entry and the VLAN on leaf switch 2. As a result, any traffic that host device 1 tries to send outside of Subnet 1 is either lost or continuously flooded as unknown unicast. EVPN VXLAN distributed anycast gateway feature prevents this traffic loss by ensuring that all the VTEPs have the same gateway MAC and IP addresses.

There are two ways to maintain the same MAC address across all VTEPs and configure distributed anycast gateway:

- Manual MAC address configuration
- MAC aliasing

Manual MAC Address Configuration

Manual MAC address configuration is the conventional method of enabling distributed anycast gateway in an EVPN VXLAN network. In this method, you manually configure the same MAC address on the Layer 2

VNI VLAN SVI on all the VTEPs in the network. You must configure the same MAC address on all the VTEPs in the same Layer 2 VNI.

**Note**

The VLAN SVIs on all the leaf switches must already share the same gateway IP address.

In the [Figure 1: Distributed Gateway Topology, on page 53](#) image, to enable distributed anycast gateway in subnet 1, configure the same MAC address on leaf switch 1 and leaf switch 2. This ensures that the ARP entries of gateway MAC and IP addresses on host device 1 match with the MAC and IP addresses of both leaf switch 1 and leaf switch 2.

MAC Aliasing

MAC aliasing for distributed anycast gateway removes the need to configure the same MAC address explicitly on the VLAN interfaces of every VTEP. MAC aliasing allows the VTEPs to advertise their VLAN MAC addresses as the gateway MAC addresses to all the other VTEPs in the network. The VTEPs in the network store the advertised MAC address as a gateway MAC address provided their VLAN IP address matches with the gateway IP address.

In the [Figure 1: Distributed Gateway Topology, on page 53](#) image, consider the scenario where MAC aliasing is enabled in subnet 1. Leaf switch 1 and leaf switch 2 advertise their MAC addresses to each other as gateway MAC addresses. This allows leaf switch 2 to recognize the MAC address in the ARP entry of host device 1 as a gateway MAC address. It allows host device 1 to send traffic outside of subnet 1 even though its VLAN MAC address does not match with the ARP entry.

MAC aliasing in an EVPN VXLAN network is configured by enabling the default gateway advertisement on all the VTEPs.

How to Configure EVPN VXLAN Integrated Routing and Bridging

To configure EVPN VXLAN IRB, you need to configure EVPN VXLAN Layer 2 and Layer 3 overlay networks, and enable the gateways in the VXLAN network.

To enable IRB in a VXLAN network using distributed anycast gateway, perform the following set of procedures:

- Configure Layer 2 VPN EVPN on the VTEPs.
Enable distributed anycast gateway for the VXLAN network when you configure Layer 2 VPN.
- Configure the core-facing and access-facing VLANs on the VTEPs.
- Configure switch virtual interface (SVI) for the core-facing VLAN on the VTEPs.
- Configure SVI for the access-facing VLAN on the VTEPs.
- Configure the IP VRF on the VTEPs.
- Configure the Loopback interface on the VTEPs.
- Configure the Network Virtualization Endpoint (NVE) interface on the VTEPs.
- Configure BGP with EVPN address family on the VTEPs.

Configuring Layer 2 VPN EVPN on a VTEP

See [Configuring Layer 2 VPN EVPN on a VTEP, on page 14](#) for detailed steps.

Configuring IP VRF on VTEP

See [Configuring an IP VRF on a VTEP, on page 32](#) for detailed steps.

Configuring Core-facing and Access-facing VLANs on a VTEP

To configure the core-facing and access-facing VLANs on a VTEP and enable IRB in the EVPN VXLAN network, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan configuration <i>vlan-id</i> Example: Device(config)# vlan configuration 201	Enters VLAN feature configuration mode for the specified VLAN interface.
Step 4	member evpn-instance <i>evpn-instance-id</i> vni <i>l2-vni-number</i> Example: Device(config-vlan)# member evpn-instance 1 vni 6000	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 2 VNI.
Step 5	exit Example: Device(config-vlan)# exit	Returns to global configuration mode.
Step 6	vlan configuration <i>vlan-id</i> Example: Device(config)# vlan configuration 202	Enters VLAN feature configuration mode for the specified VLAN interface.
Step 7	member evpn-instance <i>evpn-instance-id</i> vni <i>l2-vni-number</i> Example:	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 2 VNI.

	Command or Action	Purpose
	Device (config-vlan) # member evpn-instance 2 vni 7000	
Step 8	exit Example: Device (config-vlan) # exit	Returns to global configuration mode.
Step 9	vlan configuration <i>vlan-id</i> Example: Device (config) # vlan configuration 200	Enters VLAN feature configuration mode for the specified VLAN interface.
Step 10	member vni <i>l3-vni-number</i> Example: Device (config-vlan) # member vni 5000	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 3 VNI.
Step 11	exit Example: Device (config-vlan) # exit	Returns to global configuration mode.
Step 12	end Example: Device (config-vlan) # end	Returns to privileged EXEC mode.

Configuring Switch Virtual Interface for the Core-facing VLAN on a VTEP

To configure an SVI for the core-facing VLAN on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device (config) # interface vlan 200	Enters interface configuration mode for the specified VLAN.
Step 4	vrf forwarding <i>vrf-name</i> Example:	Configures the SVI for the VLAN.

	Command or Action	Purpose
	Device(config-if) # vrf forwarding Green	
Step 5	ip unnumbered <i>Loopback-interface</i> Example: Device(config-if) # ip unnumbered Loopback0	Enables IP processing on the Loopback interface without assigning an explicit IP address to the interface.
Step 6	no autostate Example: Device(config-if) # no autostate	Disables autostate on the interface. In EVPN deployments, once a VLAN is used for a core-facing SVI, it should not be allowed in any trunk. For a core-facing SVI to function properly, the no autostate command must be configured under the SVI.
Step 7	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Configuring Switch Virtual Interface for the Access-facing VLANs on a VTEP

To configure SVIs for the access-facing VLANs on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config) # interface vlan 202	Enters interface configuration mode for the specified VLAN.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if) # vrf forwarding Green	Configures the SVI for the VLAN.
Step 5	ip address <i>gateway-ip-address</i> Example: Device(config-if) # ip address 192.168.10.1 255.255.255.0	Configures the gateway IP address for the access SVI. Configure the same gateway IP address for this SVI on all the other VTEPs.

	Command or Action	Purpose
Step 6	mac-address <i>mac-address-value</i> Example: Device(config-if) # mac-address aabb.cc01.f100	(Optional) Manually sets the MAC address for the VLAN interface. To configure distributed anycast gateway in a VXLAN network using manual MAC configuration, configure the same MAC address on the corresponding Layer 2 VNI SVIs on all the VTEPs in a VXLAN network.
Step 7	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Configuring the Loopback Interface on a VTEP

See [Configuring the Loopback Interface on a VTEP](#), on page 37 for detailed steps.

Configuring the NVE Interface on a VTEP

To add Layer 2 and Layer 3 VNI members to the NVE interface of a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>nve-interface-id</i> Example: Device(config)# interface nve1	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address Example: Device(config-if) # no ip address	Disables IP processing on the interface by removing its IP address.
Step 5	source-interface <i>loopback-interface-id</i> Example: Device(config-if) # source-interface loopback0	Sets the IP address of the specified loopback interface as the source IP address.

	Command or Action	Purpose
Step 6	host-reachability protocol bgp Example: Device(config-if)# host-reachability protocol bgp	Configures BGP as the host-reachability protocol on the interface.
Step 7	member vni layer2-vni-id {ingress-replication mcast-group multicast-group-address} Example: Device(config-if)# member vni 6000 mcast-group 227.0.0.1 Device(config-if)# member vni 7000 mcast-group 227.0.0.1	Associates the Layer 2 VNI member with the NVE. The specified replication type must match the replication type that is configured globally or for the specific EVPN instance. Use mcast-group keyword for static replication and ingress-replication keyword for ingress replication.
Step 8	member vni layer3-vni-id vrf vrf-name Example: Device(config-if)# member vni 5000 vrf Green	Associates the Layer 3 VNI member with the NVE.
Step 9	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring BGP with EVPN and VRF Address Families on a VTEP

To configure BGP on a VTEP with EVPN and VRF address families and a spine switch as the neighbor, perform these steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp autonomous-system-number Example: Device(config)# router bgp 1	Enables a BGP routing process, assigns it an autonomous system number, and enters router configuration mode.

	Command or Action	Purpose
Step 4	bgp log-neighbor-changes Example: <pre>Device(config-router)# bgp log-neighbor-changes</pre>	(Optional) Enables the generation of logging messages when the status of a BGP neighbor changes. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 5	bgp update-delay time-period Example: <pre>Device(config-router)# bgp update-delay 1</pre>	(Optional) Sets the maximum initial delay period before sending the first update. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 6	bgp graceful-restart Example: <pre>Device(config-router)# bgp graceful-restart</pre>	(Optional) Enables the BGP graceful restart capability for all BGP neighbors. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 7	no bgp default ipv4-unicast Example: <pre>Device(config-router)# no bgp default ipv4-unicast</pre>	(Optional) Disables default IPv4 unicast address family for BGP peering session establishment. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 8	neighbor ip-address remote-as number Example: <pre>Device(config-router)# neighbor 10.11.11.11 remote-as 1</pre>	Defines multiprotocol-BGP neighbors. Under each neighbor, define the Layer 2 Virtual Private Network (L2VPN) EVPN configuration. Use the IP address of the spine switch as the neighbor IP address.
Step 9	neighbor {ip-address group-name} update-source interface Example: <pre>Device(config-router)# neighbor 10.11.11.11 update-source Loopback0</pre>	Configures update source. Update source can be configured per neighbor or per peer-group. Use the IP address of the spine switch as the neighbor IP address.
Step 10	address-family l2vpn evpn Example: <pre>Device(config-router)# address-family l2vpn evpn</pre>	Specifies the L2VPN address family and enters address family configuration mode.
Step 11	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 10.11.11.11 activate</pre>	Enables the exchange information from a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 12	neighbor ip-address send-community [both extended standard]	Specifies the communities attribute sent to a BGP neighbor.

	Command or Action	Purpose
	Example: Device(config-router-af) # neighbor 10.11.11.11 send-community both	Use the IP address of the spine switch as the neighbor IP address.
Step 13	exit-address-family Example: Device(config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 14	address-family ipv4 vrf vrf-name Example: Device(config-router) # address-family ipv4 vrf green	Specifies the IPv4 address family and enters address family configuration mode.
Step 15	advertise l2vpn evpn Example: Device(config-router-af) # advertise l2vpn evpn	Advertises Layer 2 VPN EVPN routes within a tenant VRF in an EVPN VXLAN fabric.
Step 16	redistribute connected Example: Device(config-router-af) # redistribute connected	Redistributes connected routes to BGP.
Step 17	redistribute static Example: Device(config-router-af) # redistribute static	Redistributes static routes to BGP.
Step 18	exit-address-family Example: Device(config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 19	address-family ipv6 vrf vrf-name Example: Device(config-router) # address-family ipv6 vrf green	Specifies the IPv6 address family and enters address family configuration mode.
Step 20	advertise l2vpn evpn Example: Device(config-router-af) # advertise l2vpn evpn	Advertises Layer 2 VPN EVPN routes within a tenant VRF in an EVPN VXLAN fabric.
Step 21	redistribute connected Example:	Redistributes connected routes to BGP.

	Command or Action	Purpose
	Device (config-router-af) # redistribute connected	
Step 22	redistribute static Example: Device (config-router-af) # redistribute static	Redistributes static routes to BGP.
Step 23	exit-address-family Example: Device (config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 24	end Example: Device (config-router) # end	Returns to privileged EXEC mode.

Configuration Examples for EVPN VXLAN Integrated Routing and Bridging

This section provides an example to show how to enable EVPN VXLAN IRB using distributed anycast gateway. The following example shows a sample configuration for a VXLAN network with 2 VTEPs. VTEP 1 and VTEP 2 are connected to perform integrated routing and bridging.

Table 5: Configuration Example for a VXLAN Network with Two VTEPs Connected to Perform Integrated Routing and Bridging Using Distributed Anycast Gateway

VTEP 1	VTEP 2

The following examples provide outputs for **show** commands on VTEP 1 and VTEP 2 in the topology configured above:

- [show nve peers, on page 66](#)
- [show l2vpn evpn peers vxlan, on page 67](#)
- [show l2vpn evpn evi evpn-instance detail, on page 67](#)
- [show l2vpn evpn default-gateway, on page 68](#)
- [show bgp l2vpn evpn all, on page 69](#)
- [show ip route vrf green, on page 72](#)
- [show platform software fed switch active matm mactable vlan, on page 73](#)

show nve peers

VTEP 1

The following example shows the output for the **show nve peers** command on VTEP 1:

```

VTEP1# show nve peers
Interface VNI      Type Peer-IP      RMAC/Num_RTs  eVNI      state flags UP time
nve10    5000    L3CP 10.2.2.20   380e.4d9b.6a4a 5000      UP    A/M/4 01:33:41
nve10    5000    L3CP 10.2.2.20   380e.4d9b.6a4a 5000      UP    A/-/6 00:43:38
nve10    6000    L2CP 10.2.2.20      5           6000      UP    N/A   01:33:41
nve10    7000    L2CP 10.2.2.20      6           7000      UP    N/A   01:33:41

```

VTEP 2

The following example shows the output for the **show nve peers** command on VTEP 2:

```

VTEP2# show nve peers
Interface VNI      Type Peer-IP      RMAC/Num_RTs  eVNI      state flags UP time
nve10    5000    L3CP 10.1.1.10    a0f8.4910.bce2 5000      UP    A/M/4 01:33:55

Verifying EVPN VXLAN Integrated Routing and Bridging

The following sections provide information about how to verify EVPN VXLAN integrated routing and bridging:

Verifying EVPN VXLAN Layer 2 Overlay Network

See [Verifying EVPN VXLAN Layer 2 Overlay Network, on page 28](#) for the list of commands.

Verifying EVPN VXLAN Layer 3 Overlay Network

See [Verifying EVPN VXLAN Layer 3 Overlay Network, on page 49](#) for the list of commands.

Verifying Distributed Anycast Gateway

The following table lists the **show** commands that are used to verify distributed anycast gateway:

Table 6: Commands to Verify Distributed Anycast Gateway

Command	Purpose
show l2vpn evpn default-gateway	Displays the default gateway database.
show l2vpn l2route default-gateway	Displays the list of sent or received default gateway routes.
show mac address-table	Displays the list of MAC addresses received in default gateway routes that are installed as static MAC addresses for an SVI interface.

CHAPTER 5

Configuring Spine Switches in a BGP EVPN VXLAN Fabric

- [Restrictions for Spine Switches in a BGP EVPN VXLAN Fabric, on page 77](#)
- [Information About Spine Switches in a BGP EVPN VXLAN Fabric, on page 77](#)
- [Configuration Examples for Spine Switches in a BGP EVPN VXLAN Network, on page 78](#)

Restrictions for Spine Switches in a BGP EVPN VXLAN Fabric

- In an external BGP (eBGP) peering configuration between spine and leaf switches, by default, the spine switch changes the next-hop attribute of the received BGP routes to its own address and advertises these routes to the leaf switches.

The **neighbor ip-address next-hop-unchanged** command does not affect the prefixes that are exchanged in EVPN and Multicast Virtual Private Network (MVPN) address families.

Instead, run the **set ip next-hop unchanged** command in route-map configuration mode on the spine switches and configure next-hop unchanged for a route map. To use this route-map configuration to communicate with BGP neighbors, run the **neighbor ip-address route-map route-map-name out** command in L2VPN EVPN address family configuration mode on the spine switches. This route-map configuration is required on the spine switch to enable eBGP peering between spine and leaf switches.

Information About Spine Switches in a BGP EVPN VXLAN Fabric

Spine switches in a BGP EVPN VXLAN fabric act as the connecting nodes between all the leaf switches or VTEPs. They form the backbone of the EVPN VXLAN network and forward traffic between the leaf switches. Each leaf switch is connected to each spine switch in the network. Spine switches enable redundancy within the network and provide multiple paths for VTEPs to forward traffic to each other.

Spine switches in an EVPN VXLAN network are part of the underlay network and transport the VXLAN-encapsulated packets. When deployed as border nodes, spine switches connect the network with an external network and allow movement of traffic. In a BGP EVPN VXLAN fabric, spine switches can also be deployed as route reflectors.

Deployment Scenarios for Spine Switches and Leaf Switches in a BGP EVPN VXLAN Fabric

Spine switches and leaf switches in a BGP EVPN VXLAN fabric can be deployed in the following ways:

- Spine Switches and Leaf Switches in the Same Autonomous System
- Spine Switches in One Autonomous System and the Leaf Switches in a Different Autonomous System
- Spine Switches in One Autonomous System and Each Leaf Switch in a Different Autonomous System

Spine Switches and Leaf Switches in the Same Autonomous System

In this scenario, all the devices in the EVPN VXLAN network are in the same autonomous system. The spine switches function as BGP route reflectors and anycast rendezvous points (RPs). Internal Border Gateway Protocol (iBGP) is used to establish peering between the spine switches, and between the spine and leaf switches.

See [Configuration Example for Spine Switches Using iBGP when the Spine Switches and Leaf Switches are in the Same Autonomous System](#), on page 79 for a sample topology and configuration.

Spine Switches in One Autonomous System and the Leaf Switches in a Different Autonomous System

In this scenario, all the leaf switches are in a single autonomous system that is different from the autonomous system of the spine switches. The spine switches function as BGP route servers. iBGP is used to establish peering between the spine switches. eBGP is used to establish peering between the spine and leaf switches.

See [Configuration Example for Spine Switches Using eBGP when the Spine Switches are in One Autonomous System and the Leaf Switches are in a Different Autonomous System](#), on page 95 for a sample topology and configuration.

Spine Switches in One Autonomous System and Each Leaf Switch in a Different Autonomous System

In this scenario, each leaf switch is in its own individual autonomous system that is different from the autonomous system of the spine switches. The spine switches function as BGP route servers. iBGP is used to establish peering between the spine switches. eBGP is used to establish peering between the spine and leaf switches.

See [Configuration Example for Spine Switches Using eBGP when the Spine Switches are in one Autonomous System and each Leaf Switch is in a Different Autonomous System](#), on page 114 for a sample topology and configuration.

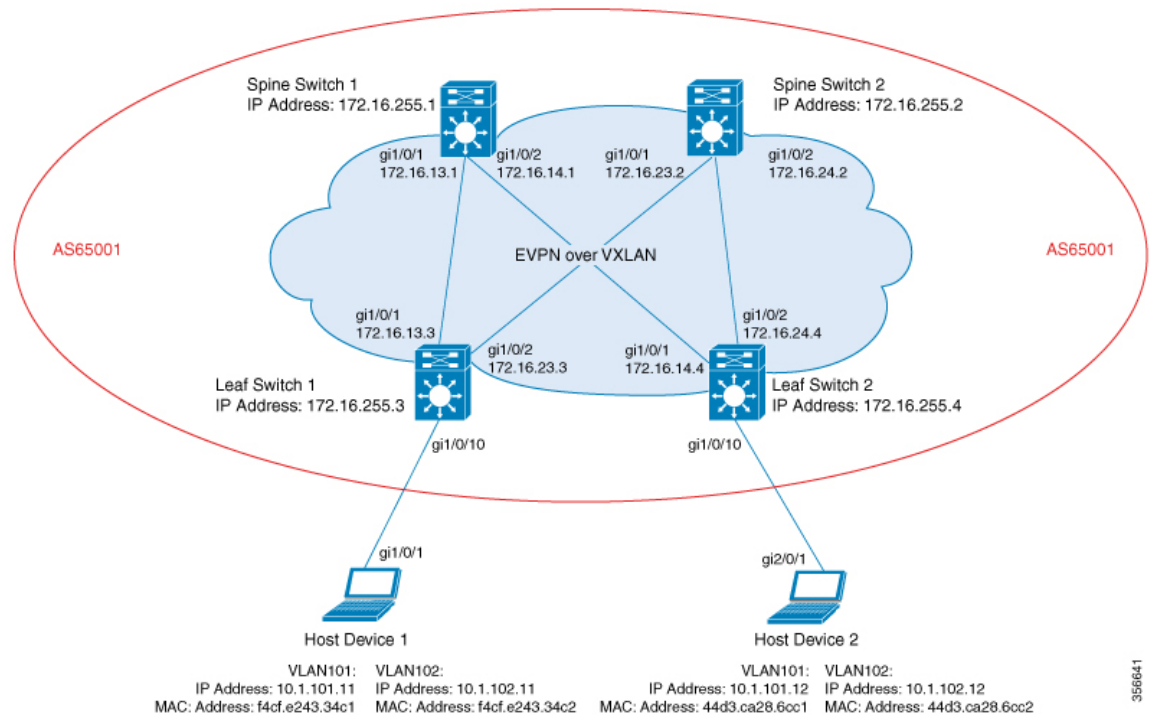

Configuration Examples for Spine Switches in a BGP EVPN VXLAN Network

This section provides configuration examples for spine switches for the different deployments of spine and leaf switches in a BGP EVPN VXLAN fabric.

Configuration Example for Spine Switches Using iBGP when the Spine Switches and Leaf Switches are in the Same Autonomous System

This section provides an example to show how spine switches are configured in a BGP EVPN VXLAN fabric using iBGP when the spine switches and leaf switches are in the same autonomous system. The example shows how to configure spine switches and verify the configuration for the topology shown below:

Figure 2: BGP EVPN VXLAN Fabric with the Spine Switches and Leaf Switches in the Same Autonomous System

The topology shows an EVPN VXLAN network with two leaf switches (VTEP 1 and VTEP 2) and two spine switches (spine switch 1 and spine switch 2). The entire BGP EVPN VXLAN fabric (which includes spine switch 1, spine switch 2, Leaf switch 1, and leaf switch 2) is in autonomous system AS65001. Anycast RP is configured on both the spine switches. Spine switch 1 and spine switch 2 are not route reflector clients to each other. Multicast Source Discovery Protocol (MSDP) is configured between spine switch 1 and spine switch 2 for source synchronisation. Protocol Independent Multicast (PIM) is enabled on the interfaces that connect leaf switches and spine switches. Static RP is configured in the network and the underlay network uses multicast forwarding mechanism to forward BUM traffic.

The following tables provide sample configurations for the devices in the topology above.

Table 7: Configuring Spine Switch 1 and Spine Switch 2 using iBGP when the Spine Switches and the Leaf Switches are in the same Autonomous System

The following example shows the output for the **show ip pim neighbor** command on spine switch 1:

```
Spine-01# show ip pim neighbor
PIM Neighbor Table
Mode: B - Bidir Capable, DR - Designated Router, N - Default DR Priority,
      P - Proxy Capable, S - State Refresh Capable, G - GenID Capable,
      L - DR Load-balancing Capable
Neighbor      Interface      Uptime/Expires    Ver    DR
Address                               Prio/Mode
172.16.13.3    GigabitEthernet1/0/1    1d22h/00:01:41    v2      1 / DR S P G
172.16.14.4    GigabitEthernet1/0/2    4w5d/00:01:24    v2      1 / DR S P G
```

The following example shows the output for the **show ip pim rp map** command on spine switch 1:

```
Spine-01# show ip pim rp map
PIM Group-to-RP Mappings

Group(s): 224.0.0.0/4, Static
          RP: 172.16.255.255 (?)
```

The following example shows the output for the **show ip rpf** command on spine switch 1:

```
Spine-01# show ip rpf 172.16.255.255
RPF information for ? (172.16.255.255)
  RPF interface: Loopback2
  RPF neighbor: ? (172.16.255.255) - directly connected
  RPF route/mask: 172.16.255.255/32
  RPF type: multicast (connected)
  Doing distance-preferred lookups across tables
  RPF topology: ipv4 multicast base
```

The following example shows the output for the **show ip msdp summary** command on spine switch 1:

```
Spine-01# show ip msdp summary
MSDP Peer Status Summary
Peer Address      AS      State      Uptime/  Reset SA      Peer Name
                  Downtime Count Count
172.16.254.2      65001 Up        22:37:35 0        2        ?
```

The following example shows the output for the **show ip msdp sa-cache** command on spine switch 1:

```
Spine-01# show ip msdp sa-cache
MSDP Source-Active Cache - 2 entries
(172.16.254.3, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:00:29/00:05:30, Peer 172.16.254.2
(172.16.254.4, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:00:17/00:05:43, Peer 172.16.254.2
```

The following example shows the output for the **show ip mroute** command on spine switch 1:

```
Spine-01# show ip mroute 225.0.0.10
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
       L - Local, P - Pruned, R - RP-bit set, F - Register flag,
       T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
       X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
       U - URD, I - Received Source Specific Host Report,
       Z - Multicast Tunnel, z - MDT-data group sender,
       Y - Joined MDT-data group, y - Sending to MDT-data group,
```

```

G - Received BGP C-Mroute, g - Sent BGP C-Mroute,
N - Received BGP Shared-Tree Prune, n - BGP C-Mroute suppressed,
Q - Received BGP S-A Route, q - Sent BGP S-A Route,
V - RD & Vector, v - Vector, p - PIM Joins on route,
x - VxLAN group, c - PFP-SA cache created entry,
* - determined by Assert, # - iif-starg configured on rpf intf
Outgoing interface flags: H - Hardware switched, A - Assert winner, p - PIM Join
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

Configuration Example for Spine Switches Using eBGP when the Spine Switches are in One Autonomous System and the Leaf Switches are in a Different Autonomous System

This section provides an example to show how spine switches are configured in a BGP EVPN VXLAN fabric using eBGP when the spine switches are in one autonomous system and the leaf switches are in a different autonomous system. The example shows how to configure spine switches and verify the configuration for the topology shown below:

Figure 3: BGP EVPN VXLAN Fabric with the Spine Switches in One Autonomous System and the Leaf Switches in a Different Autonomous System

The topology shows an EVPN VXLAN network with two leaf switches (leaf switch 1 and leaf switch 2) and two spine switches (spine switch 1 and spine switch 2). Spine switch 1 and spine switch 2 are in autonomous system AS65001. Leaf switch 1 and leaf switch 2 are in autonomous system AS65002. Spine switch 1 and spine switch 2 are BGP route servers and are not route reflector clients to each other. Multicast Source Discovery Protocol (MSDP) is configured between spine switch 1 and spine switch 2 for source synchronisation. Protocol Independent Multicast (PIM) is enabled on the interfaces that connect leaf switches and spine switches. Static RP is configured in the network and the underlay network uses multicast forwarding mechanism to forward BUM traffic.

Note

You must run the **neighbor ip-address allowas-in** command in the L2VPN EVPN address family configuration mode on the leaf switches to allow processing of BGP updates that have a different autonomous system number.

Note You must manually run the **no bgp default route-target filter** command in router configuration mode on the spine switches.

Note You must configure eBGP multihop on the leaf and spine switches for the fabric to function.

The following tables provide sample configurations for the devices in the topology above.

Configuration Example for Spine Switches Using eBGP when the Spine Switches are in One Autonomous System and the Leaf Switches are in a Different Autonomous System

Table 9: Configuring Spine Switch 1 and Spine Switch 2 using eBGP when the Spine Switches are in one Autonomous System and the Leaf Switches are in a Different Autonomous System

172.16.14.4	GigabitEthernet1/0/2	5d19h/00:01:36	v2	1 / DR S P G

The following example shows the output for the **show ip pim rp mapping** command on spine switch 1:

```
Spine-01# show ip pim rp mapping
PIM Group-to-RP Mappings

Group(s): 224.0.0.0/4, Static
RP: 172.16.255.255 (?)
```

The following example shows the output for the **show ip ro** command on spine switch 1:

```
Spine-01# show ip ro 172.16.255.255
Routing entry for 172.16.255.255/32
  Known via "connected", distance 0, metric 0 (connected, via interface)
  Routing Descriptor Blocks:
    * directly connected, via Loopback2
      Route metric is 0, traffic share count is 1
```

The following example shows the output for the **show ip msdp summary** command on spine switch 1:

```
Spine-01# show ip msdp summary
MSDP Peer Status Summary
Peer Address      AS      State    Uptime/  Reset SA   Peer Name
                  AS              Downtime Count Count
172.16.254.2      65001 Up       5d19h    0         2        ?
```

The following example shows the output for the **show ip msdp sa-cache** command on spine switch 1:

```
Spine-01# show ip msdp sa-cache
MSDP Source-Active Cache - 2 entries
(172.16.254.3, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:04:01/00:05:23, Peer 172.16.254.2
(172.16.254.4, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:03:39/00:05:26, Peer 172.16.254.2
```

The following example shows the output for the **show ip mroute** command on spine switch 1:

```
Spine-01# show ip mroute 225.0.0.101
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,
T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
U - URD, I - Received Source Specific Host Report,
Z - Multicast Tunnel, z - MDT-data group sender,
Y - Joined MDT-data group, y - Sending to MDT-data group,
```

```

G - Received BGP C-Mroute, g - Sent BGP C-Mroute,
N - Received BGP Shared-Tree Prune, n - BGP C-Mroute suppressed,
Q - Received BGP S-A Route, q - Sent BGP S-A Route,
V - RD & Vector, v - Vector, p - PIM Joins on route,
x - VxLAN group, c - PFP-SA cache created entry,
* - determined by Assert, # - iif-starg configured on rpf intf
Outgoing interface flags: H - Hardware switched, A - Assert winner, p - PIM Join
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

Configuration Example for Spine Switches Using eBGP when the Spine Switches are in one Autonomous System and each Leaf Switch is in a Different Autonomous System

This section provides an example to show how spine switches are configured in a BGP EVPN VXLAN fabric using eBGP when the spine switches are in one autonomous system and the leaf switches are in a different autonomous system. The example shows how to configure spine switches and verify the configuration for the topology shown below:

Figure 4: BGP EVPN VXLAN Fabric with the Spine Switches in one Autonomous System and each Leaf Switch in a Different Autonomous System

The topology shows an EVPN VXLAN network with two leaf switches (leaf switch 1 and leaf switch 2) and two spine switches (spine switch 1 and spine switch 2). Spine switch 1 and spine switch 2 are in autonomous system AS65001. Leaf switch 1 is in autonomous system AS65002. Leaf switch 2 is in autonomous system AS65003. Spine switch 1 and spine switch 2 are BGP route servers and are not route reflector clients to each other. Multicast Source Discovery Protocol (MSDP) is configured between spine switch 1 and spine switch 2 for source synchronisation. Protocol Independent Multicast (PIM) is enabled on the interfaces that connect leaf switches and spine switches. Static RP is configured in the network and the underlay network uses multicast forwarding mechanism to forward BUM traffic.

Note You must run the **rewrite-evpn-rt-asn** command in the L2VPN EVPN address family configuration mode on the leaf switches to allow processing of BGP updates that have a different autonomous system number.

Note You must manually run the **no bgp default route-target filter** command in router configuration mode on the spine switches.

Note You must configure eBGP multihop on the leaf and spine switches for the fabric to function.

The following tables provide sample configurations for the devices in the topology above.

Table 11: Configuring Spine Switch 1 and Spine Switch 2 using eBGP when the Spine Switches are in one Autonomous System and each Leaf Switch is in a Different Autonomous System

```

The following example shows the output for the **show ip pim rp mapping** command on spine switch 1:

```

Spine-01# show ip pim rp mapping
PIM Group-to-RP Mappings

Group(s): 224.0.0.0/4, Static
RP: 172.16.255.255 (?)

```

The following example shows the output for the **show ip ro** command on spine switch 1:

```

Spine-01# show ip ro 172.16.255.255
Routing entry for 172.16.255.255/32
  Known via "connected", distance 0, metric 0 (connected, via interface)
  Routing Descriptor Blocks:
    * directly connected, via Loopback2
      Route metric is 0, traffic share count is 1

```

The following example shows the output for the **show ip msdp summary** command on spine switch 1:

```

Spine-01# show ip msdp summary
MSDP Peer Status Summary
Peer Address      AS      State      Uptime/  Reset SA      Peer Name
                  AS      State      Downtime Count Count
172.16.254.2      65001  Up         1w4d     0      2      ?

```

The following example shows the output for the **show ip msdp sa-cache** command on spine switch 1:

```

Spine-01# show ip msdp sa-cache
MSDP Source-Active Cache - 2 entries
(172.16.254.3, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:01:07/00:05:06, Peer 172.16.254.2
(172.16.254.4, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:00:45/00:05:14, Peer 172.16.254.2

```

The following example shows the output for the **show ip rpf** command on spine switch 1:

```

Spine-01# show ip rpf 172.16.255.255
RPF information for ? (172.16.255.255)
  RPF interface: Loopback2
  RPF neighbor: ? (172.16.255.255) - directly connected
  RPF route/mask: 172.16.255.255/32
  RPF type: multicast (connected)
  Doing distance-preferred lookups across tables
  RPF topology: ipv4 multicast base

```

The following example shows the output for the **show ip mroute** command on spine switch 1:

Configuration Example for Spine Switches Using eBGP when the Spine Switches are in one Autonomous System and each Leaf Switch is in a Different Autonomous System

```
Spine-01# show ip mroute 225.0.0.101
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,

CHAPTER 6

Configuring DHCP Relay in BGP EVPN VXLAN Fabric

- [Restrictions for DHCP Relay in BGP EVPN VXLAN Fabric, on page 135](#)
- [Information About DHCP Relay in BGP EVPN VXLAN Fabric, on page 135](#)
- [How to Configure DHCP Relay in BGP EVPN VXLAN Fabric, on page 137](#)
- [Configuration Examples for DHCP Relay in BGP EVPN VXLAN Fabric, on page 141](#)

Restrictions for DHCP Relay in BGP EVPN VXLAN Fabric

- DHCP relay in a BGP EVPN VXLAN fabric is supported in the following scenarios only when VRF-Lite is configured on the border VTEP and the border VTEP is connected to the DHCP server through an external router.
 - DHCP client in the tenant VRF and DHCP server in the Layer 3 default VRF
 - DHCP client in the tenant VRF and DHCP server in a different tenant VRF
 - DHCP client in the tenant VRF and DHCP server in a non-default non-VXLAN VRF
- DHCPv6 relay is not supported.

Information About DHCP Relay in BGP EVPN VXLAN Fabric

Networks use DHCP relay to forward DHCP packets between host devices and a DHCP server. In a BGP EVPN VXLAN fabric, you can configure a VTEP as a relay agent to provide DHCP relay services in a multi-tenant VXLAN environment.

When a network uses DHCP relay, DHCP messages move through the same switch in both directions. DHCP relay generally uses the gateway IP address (GiAddr) for scope selection and DHCP response messages. In a BGP EVPN VXLAN fabric that has distributed IP anycast gateway enabled, DHCP messages can return to any switch that hosts the respective GiAddr.

Deploying DHCP relay in an EVPN VXLAN network requires a different method for scope selection and a unique IP address for each switch in the network. The unique Loopback interface for a switch becomes the GiAddr that a switch uses to respond to the correct switch. DHCP option 82, also referred to as DHCP option VPN, is used for scope selection based on the Layer 2 VNI.

In a multi-tenant EVPN environment, DHCP relay uses the following sub-options of option 82:

- **Sub-Option 151(0x97)—Virtual Subnet Selection:**

The virtual subnet selection sub-option is used to convey VRF-related information to the DHCP server in an MPLS VPN and a VXLAN EVPN multi-tenant environment.

[RFC 6607](#) provides the definition for this sub-option.

- **Sub-Option 11(0xb)—Server ID Override**

The server identifier or server ID override sub-option allows the DHCP relay agent to specify a new value for the server ID option. The DHCP server inserts this new value in the reply packet. This sub-option allows the DHCP relay agent to act as the actual DHCP server. The DHCP relay agent begins to receive all the renew requests instead of the DHCP server. The server ID override sub-option contains the incoming interface IP address. The DHCP client accesses the DHCP relay agent using the incoming interface IP address. The DHCP client uses this information to send all the renew and release request packets to the DHCP relay agent. The DHCP relay agent adds all the appropriate sub-options and then forwards the renew and release request packets to the original DHCP server.

For this function, Cisco's proprietary implementation is sub-option 152(0x98). To implement the suboption and manage the function, run the **ip dhcp relay sub-option type cisco** command in global configuration mode on the VTEP that acts as the DHCP relay agent.

[RFC 5107](#) provides the definition for this sub-option.

- **Sub-Option 5(0x5)—Link Selection:**

The link selection sub-option provides a mechanism to separate the subnet or link, on which the DHCP client resides, from the GiAddr. The DHCP server uses this mechanism to communicate with the DHCP relay agent. The DHCP relay agent sets the sub-option to the correct subscriber subnet. The DHCP server then uses this value to assign an IP address different from the GiAddr. The DHCP relay agent sets the GiAddr to its own IP address to ensure that it is possible to forward the DHCP messages over the network.

For this function, Cisco's proprietary implementation is sub-option 150(0x96). To manage the function, run the **ip dhcp relay sub-option type cisco** command in global configuration mode on the VTEP that acts as the DHCP relay agent.

[RFC 3527](#) provides the definition for this sub-option.

DHCP Relay on VTEPs

DHCP relay is generally configured on the default gateway that faces the DHCP client. You can configure a VTEP as a DHCP relay agent in different ways to automate IP addressing. The configuration depends on whether the DHCP server is present in the same network, the same VRF, or a different VRF compared to the DHCP client. When the DHCP server and DHCP client are in different VRFs, traffic is forwarded across the tenant or VRF boundaries.

The following are the common DHCP relay deployment scenarios for a BGP EVPN VXLAN fabric:

1. DHCP client in the tenant VRF and DHCP server in the Layer 3 default VRF
2. DHCP client in the tenant VRF and DHCP server in the same tenant VRF
3. DHCP client in the tenant VRF and DHCP server in a different tenant VRF
4. DHCP client in the tenant VRF and DHCP server in a non-default non-VXLAN VRF

Note The deployment scenarios 1, 3, and 4 are supported only when VRF-Lite is configured on the border VTEP and the border VTEP is connected to the DHCP server through an external router.

How to Configure DHCP Relay in BGP EVPN VXLAN Fabric

You must configure EVPN VXLAN Layer 2 and Layer 3 overlay networks before configuring BGP EVPN VXLAN interworking with DHCP relay. See [How to Configure EVPN VXLAN Integrated Routing and Bridging, on page 54](#) for detailed steps.

Perform the following set of procedures to configure BGP EVPN VLAN interworking with DHCP relay:

Configuring DHCP Relay on a VTEP

To configure DHCP relay on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip dhcp relay information option vpn Example: Device(config)# ip dhcp relay information option vpn	Enables the device to insert VPN suboptions into the DHCP relay agent information option in the messages forwarded to the DHCP server and sets the GiAddr on the outgoing interface towards the DHCP server.
Step 4	ip dhcp relay information option Example: Device(config)# ip dhcp relay information option	Enables the system to insert a DHCP relay agent information option in the messages forwarded to the DHCP server.
Step 5	ip dhcp relay override gateway-ip-address link-selection Example: Device(config)# ip dhcp relay override giaddr link-selection	Sets the gateway IP address as the IP address of the DHCP relay agent and configures the server to assign an IP address that is different from the GiAddr to the DHCP clients.

	Command or Action	Purpose
Step 6	ip dhcp compatibility suboption server-override standard Example: Device(config)# ip dhcp compatibility suboption server-override standard	Configures the DHCP client to use the Internet Assigned Numbers Authority (IANA) standard relay agent server ID override suboption.
Step 7	ip dhcp snooping vlan <i>vlan-id-list</i> Example: Device(config)# ip dhcp snooping vlan 201-202	Enables DHCP snooping on the specified list of VLANs.
Step 8	ip dhcp snooping Example: Device(config)# ip dhcp snooping	Enables DHCP snooping on the VTEP.
Step 9	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuring DHCP Relay on the Access SVI of a VTEP

Perform this procedure on all the VTEPs for each VLAN that is associated with the Layer 2 VNI configured in the EVPN VXLAN network.

To configure DHCP relay on the access SVI of a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface Vlan 201	Enters interface configuration mode for the specified VLAN interface. This VLAN interface acts as the GiAddr.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding green	Associates the VRF with the interface. The interface must be associated with the same VRF for which the Layer 3 VNI has been configured for the EVPN VXLAN network.

	Command or Action	Purpose
Step 5	ip dhcp relay information option vpn-id Example: <pre>Device(config-if)# ip dhcp relay information option vpn-id</pre>	Enables the device to insert VPN suboptions into the DHCP relay agent information option in the messages forwarded to the DHCP server and sets the GiAddr on the outgoing interface towards the DHCP server.
Step 6	ip dhcp relay source-interface Loopback loopback-interface-id Example: <pre>Device(config-if)# ip dhcp relay source-interface Loopback13</pre>	Configures the specified Loopback interface as the source interface for DHCP relay messages. The DHCP relay agent uses the IP address of the source interface as the source IP address to relay messages. Note The IP address configured on the Loopback interface must be unique per VTEP per VRF.
Step 7	ip address ip-address Example: <pre>Device(config-if)# ip address 192.168.1.201 255.255.255.0</pre>	Sets the IP address for the VLAN interface.
Step 8	ip helper-address ip-address Example: <pre>Device(config-if)# ip helper-address 192.168.3.100</pre>	Sets the DHCP IP helper address for the VLAN interface.
Step 9	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode and returns to global configuration mode.
Step 10	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuring the Router Interface on the Border VTEP for DHCP Server Reachability

DHCP server reachability can be achieved through a physical Layer 3 interface or subinterface, or a Layer3 Portchannel interface.

To configure the router interface on the border VTEP for DHCP server reachability, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device (config) # interface vlan 203	Enters interface configuration mode for the specified VLAN interface.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device (config-if) # vrf forwarding green	Configures the SVI for the VLAN and associates the specified VRF with the interface.
Step 5	ip address <i>ip-address</i> Example: Device (config-if) # ip address 192.168.3.203 255.255.255.0	Configures the IP address for the VLAN.
Step 6	ipv6 address <i>ipv6-address</i> Example: Device (config-if) # ipv6 address 2001:203::203/64	Configures the IPv6 address for the VLAN.
Step 7	ipv6 enable Example: Device (config-if) # ipv6 enable	Enables IPv6 processing on the VLAN interface.
Step 8	exit Example: Device (config-if) # exit	Exits interface configuration mode and returns to global configuration mode.
Step 9	interface <i>interface-id</i> Example: Device (config) # interface GigabitEthernet1/0/30	Enters interface configuration mode for the specified interface.
Step 10	switchport access vlan <i>vlan-id</i> Example: Device (config-if) # switchport access vlan 203	Specifies the VLAN to be used as access VLAN when the interface is in access mode.

	Command or Action	Purpose
Step 11	switchport mode access Example: Device(config-if) # switchport mode access	Configures the interface as an access interface.
Step 12	exit Example: Device(config-if) # exit	Exits interface configuration mode and returns to global configuration mode.
Step 13	end Example: Device(config) # end	Returns to privileged EXEC mode.

Configuration Examples for DHCP Relay in BGP EVPN VXLAN Fabric

This section provides an example to show the configuration and verification of DHCP relay deployment in an EVPN VXLAN network. The example uses the following topology where the DHCP client and the DHCP server are in the same tenant VRF:

The illustration shows an EVPN VXLAN network with two VTEPs, VTEP 1 and Border VTEP. Border VTEP is connected to the DHCP server.

DHCP server reachability can be achieved through a physical Layer 3 interface or subinterface, or a Layer3 Portchannel interface. The example shown here deploys DHCP relay using an SVI interface and a switchport.

Table 13: Configuration Example for Deploying DHCP Relay in a BGP EVPN VXLAN Fabric when the DHCP Client and the DHCP Server are in the Same Tenant VRF

CHAPTER 7

Configuring Tenant Routed Multicast

- [Restrictions for Tenant Routed Multicast](#) , on page 147
- [Information about Tenant Routed Multicast](#), on page 147
- [How to Configure Tenant Routed Multicast](#), on page 152
- [Configuration Examples for Tenant Routed Multicast](#), on page 158
- [Verifying Tenant Routed Multicast](#), on page 170

Restrictions for Tenant Routed Multicast

- Only Layer 3 Tenant Routed Multicast (TRM) is supported.
- Layer 2 TRM is not supported.
- Layer 3 TRM is not supported for IPv6 traffic in the overlay and underlay networks.
- TRM works only on the Default Multicast Distribution Tree (MDT).
- In the underlay network, TRM is supported only in the PIM-SM mode. In the overlay network, it is supported in the PIM-SM with Distributed Anycast-RP mode and PIM-SSM mode.
- In the underlay network, the spine switch should be configured as the Rendezvous Point (RP).
- In the overlay network, each of the VTEPs must be configured as the RP for TRM in Distributed Anycast-RP mode.

Information about Tenant Routed Multicast

TRM enables multicast forwarding in a VXLAN fabric that uses a BGP-based EVPN control plane. TRM provides multi-tenancy aware multicast forwarding between senders and receivers within the same or different subnets local or across VTEPs.

This feature brings the efficiency of multicast delivery to VXLAN overlay networks. TRM enables the delivery of a customer's IP multicast traffic in a multi-tenant fabric in an efficient and resilient manner. The delivery of TRM improves Layer-3 overlay multicast functionality in the networks.

With TRM enabled, multicast forwarding in the underlay is leveraged to replicate VXLAN-encapsulated routed multicast traffic. A default-MDT is built per-VRF. This is an addition to the existing multicast groups for broadcast and unknown unicast traffic in a Layer 2 Virtual Network Instance (VNI), and for Layer 2

multicast replication group. The individual multicast group addresses in the overlay are mapped to the respective underlay multicast address for replication and transport. The advantage of using a BGP-based approach is that it allows the BGP EVPN VXLAN fabric with TRM to operate as fully distributed Overlay Rendezvous-Point (RP), with the RP presence on every edge-device or VTEP.

A multicast-enabled data center fabric is typically part of an overall multicast network. Multicast sources, receivers, and multicast rendezvous points, might reside inside the data center but might also be inside the campus or externally reachable via the WAN. TRM allows a seamless integration with existing multicast networks. It can leverage multicast rendezvous points external to the fabric. Furthermore, TRM allows for tenant-aware external connectivity using Layer-3 physical interfaces or subinterfaces.

TRM uses BGP EVPN and MVPN routes to perform multicast routing.

Figure 5: Tenant Routed Multicast Topology

Source detection triggers advertising of EVPN route type 2 in the EVPN fabric. This EVPN route installed in Layer 3 RIB at a receiver VTEP is used as the RPF route towards the source. Thus, if the source is undetected, the RPF for the (S,G) entry is not found. In this case, either RPF remains NULL or a less specific route is installed if present in the RIB.

In EVPN-VXLAN network, TRM supports two modes in the overlay network:

- PIM-SM with Distributed Anycast-RP
- PIM-SSM

PIM-SM with Distributed Anycast-RP Mode

In PIM-SM with Distributed Anycast-RP Mode, each of the VTEPs must be the RP in the overlay network for their respective groups. The rendezvous points in the underlay network must be configured on the spine switches. All the VTEPs do not need to be BGP peers. There can be BGP peering between the VTEPs and the spine switches with the spine switches acting as route reflectors.

When a VTEP discovers a source device, it sends Source A-D Routes (MVPN Route Type 5) to all the other VTEPs. Based on these Source A-D routes, the other VTEPs send (S,G) join requests as MVPN route type 7 to the source VTEP.

Figure 6: PIM-SM with Distributed Anycast-RP Mode

1. IGMP Join for (*,G) from Receiver Device to VTEP 3.
2. Data Traffic from Source Device to VTEP 1.
3. Source A-D Route for (S,G) from VTEP 1 to VTEP 2 and VTEP 3.
4. MVPN route type 7 from VTEP 3 to VTEP 1.
5. Data Traffic from VTEP 1 to VTEP 3.

In PIM-SM with Distributed Anycast-RP Mode, the following sequence of events occurs:

1. Receiver sends (*,G) IGMP Join to VTEP 3. Since VTEP 3 is an RP, (*,G) is created at VTEP 3.

2. The source device starts streaming data and (S,G) is created on VTEP 1.

**Note**

When PIM-SM with Distributed Anycast-RP Mode is enabled, the first packet is dropped.

3. VTEP 1 performs self-source-registration since it is also an RP.
4. The source VTEP (VTEP 1) advertises Source A-D Routes (also called MVPN route type 5) for (S,G) to all the other VTEPs which are BGP peers in the MVPN address family.
5. VTEP 2 and VTEP 3 receive and install the Source A-D Routes for (S,G).
6. (S,G) is created at VTEP 3. VTEP 3 now has an overlay route for (S,G) and also has a unicast route to the source device from the EVPN Control plane. It then sends an MVPN route type 7 (S,G) BGP join to VTEP 1 and starts accepting traffic.
7. VTEP 1 receives and installs MVPN route type 7 from VTEP 3. It uses the Layer 3 VNI's SVI as the forwarding interface for (S,G) and starts forwarding traffic.

PIM-SSM Mode

In PIM-SSM Mode, the Source A-D route (MVPN route type 5) is not needed for the multicast convergence to happen. The receiver VTEP does not wait to receive the Source A-D route to send the MVPN route type 7.

Figure 7: PIM-SSM Mode

1. IGMP Join for (S,G) from Receiver Device to VTEP 3.
2. MVPN route type 7.
3. Data Traffic for (S,G) from Source Device to VTEP 1.
4. Data Traffic from VTEP 1 to VTEP 3.

In PIM-SSM Mode, the following sequence of events occurs:

1. When the source device sends a unicast packet, VTEP 1 sends out EVPN routes to all the other VTEPs, letting them know that the packet is from the source device.
2. The receiver sends an (S,G) IGMP join towards VTEP 3 and an (S,G) entry is created.
3. VTEP 3 performs an RPF lookup for the source device. If the SVI of the Layer 3 VNI is found to be the RPF interface, VTEP 3 sends MVPN route type 7 towards VTEP 1.
4. VTEP 1 receives and installs the MVPN route type 7. VTEP 1 creates an (S,G) entry, using the Layer 3 VNI's SVI as the forwarding interface for (S,G).
5. The source device sends (S,G) data to VTEP 1 which starts forwarding the traffic to VTEP 3.

How to Configure Tenant Routed Multicast

Prerequisites to Configuring TRM

Before configuring TRM, ensure that BGP EVPN VXLAN Layer 2 and Layer 3 Overlay networks have been configured. Perform the following procedures to configure BGP EVPN VXLAN Layer 2 and Layer 3 Overlay networks:

- Configuring Layer 2 VPN EVPN on a VTEP.
- Configuring IP VRF on VTEP.
- Configuring Core-facing and Access-facing VLANs on a VTEP.
- Configuring Switch Virtual Interface for the Core-facing VLAN.
- Configuring Switch Virtual Interface for the Access-facing VLANs.
- Configuring the Loopback Interface on a VTEP.
- Configuring the NVE Interface on a VTEP.
- Configuring BGP with EVPN Address Family on VTEP.

See [How to Configure EVPN VXLAN Integrated Routing and Bridging, on page 54](#) for detailed steps to configure Layer 2 and Layer 3 overlay networks.

Perform the following set of procedures to configure TRM:

- [Configuring the Default Multicast Distribution Tree in the VRF, on page 152](#)
- [Configuring Multicast Routing on the Overlay VRF, on page 153](#)
- [Configuring Multicast on Switch Virtual Interfaces for the Core-facing and Access-facing VLANs, on page 154](#)
- [Configuring BGP with MVPN Address Family on VTEP, on page 155](#)
- [Configuring RP for Underlay Network, on page 156](#)
- [Configuring RP and SSM for Overlay Network, on page 156](#)

Configuring the Default Multicast Distribution Tree in the VRF

To configure the default MDT for TRM, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	vrf definition <i>vrf-name</i> Example: Device(config)# <code>vrf definition green</code>	Names the VRF and enters VRF configuration mode.
Step 4	mdt default vxlan <i>group-address</i> Example: Device(config-vrf)# <code>mdt default vxlan 225.2.2.2</code>	Configures the multicast group address range for data MDT groups for a VRF in a VXLAN. <ul style="list-style-type: none"> • This command creates a tunnel interface. • By default, the destination address of the tunnel header is the <i>group-address</i> argument.
Step 5	mdt auto-discovery vxlan Example: Device(config-vrf)# <code>mdt auto-discovery vxlan</code>	Enables VXLAN with BGP auto-discovery.
Step 6	mdt overlay use-bgp spt-only Example: Device(config-vrf)# <code>mdt overlay use-bgp spt-only</code>	Specifies BGP as the overlay protocol.
Step 7	end Example: Device(config-vrf)# <code>end</code>	Returns to privileged EXEC mode.

Configuring Multicast Routing on the Overlay VRF

To enable multicast routing on the overlay VRF, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	ip multicast-routing vrf <i>vrf-name</i> Example: Device(config)# ip multicast-routing vrf green	Enables IP multicast forwarding on the overlay VRF.
Step 4	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuring Multicast on Switch Virtual Interfaces for the Core-facing and Access-facing VLANs

To configure multicast on SVIs for the core-facing and access-facing VLANs on the VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>core-facing-vlan-id</i> Example: Device(config)# interface vlan 200	Enters interface configuration mode for the specified VLAN.
Step 4	ip pim sparse-mode Example: Device(config-if) # ip pim sparse-mode	Enables multicast on the core-facing SVI.
Step 5	exit Example: Device(config-if) # end	Returns to privileged EXEC mode.
Step 6	interface vlan <i>access-facing-vlan-id</i> Example: Device(config)# interface vlan 202	Enters interface configuration mode for the specified VLAN.

	Command or Action	Purpose
Step 7	ip pim sparse-mode Example: Device(config-if) # ip pim sparse-mode	Enables multicast on the access-facing SVI where sources or receivers are connected. Repeat this step for all the access-facing SVIs that are part of the Layer 2 VNI where sources and receivers are connected.
Step 8	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Configuring BGP with MVPN Address Family on VTEP

To configure BGP on a VTEP with MVPN address family, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 1	Enables a BGP routing process, assigns it an autonomous system number, and enters router configuration mode.
Step 4	address-family ipv4 mvpn Example: Device(config-router)# address-family ipv4 mvpn	Specifies the MVPN address family and enters address family configuration mode.
Step 5	neighbor <i>ip-address</i> activate Example: Device(config-router-af)# neighbor 10.2.2.20 activate	Enables the exchange of information with a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 6	neighbor <i>ip-address</i> send-community extended Example: Device(config-router-af)# neighbor 10.2.2.20 send-community both	Specifies the communities attribute sent to a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.

	Command or Action	Purpose
Step 7	neighbor <i>ip-address</i> advertisement-interval <i>seconds</i> Example: <pre>Device(config-router-af)# neighbor 10.2.2.20 advertisement-interval 10</pre>	(Optional) Sets the minimum route advertisement interval (MRAI) between the sending of BGP routing updates.
Step 8	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits address family configuration mode and returns to router configuration mode.
Step 9	end Example: <pre>Device(config-router)# end</pre>	Returns to privileged EXEC mode.

Configuring RP for Underlay Network

To configure RP for the underlay network, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ip pim rp-address <i>ip-address-of-rp</i> Example: <pre>Device(config)# ip pim rp-address <rp-ip-address></pre>	Configures the RP in the underlay network. For information about RP redundancy, see to <i>IP Multicast Routing Configuration Guide</i> .
Step 4	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuring RP and SSM for Overlay Network

To configure RP and SSM for the overlay network, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>loopback-interface</i> Example: Device(config)# interface Loopback 13	Enters interface configuration mode for the specified Loopback interface.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding green	Configures forwarding table for the Loopback interface.
Step 5	ip-address <i>ip-address subnet-mask</i> Example: Device(config-if)# ip address 10.1.13.13 255.255.255.255	Configures the IP address for the Loopback interface.
Step 6	ip pim sparse-mode Example: Device(config-if)# ip pim sparse-mode	Enables PIM sparse mode on the Loopback interface. Note Enable PIM sparse mode only if EVPN VXLAN Layer 2 overlay network is also configured on the VTEP with underlay multicast as the mechanism for forwarding BUM traffic.
Step 7	exit Example: Device(config-if)# exit	Returns to global configuration mode.
Step 8	ip pim [vrf <i>vrf-name</i>] ssm { default range <i>access-list</i> } Example: Device(config)# ip pim vrf green ssm default	Configures an SSM range for TRM. The default keyword defines the SSM range access list as 232/8. The range keyword specifies the standard IP access list number or name that defines the SSM range.
Step 9	ip pim vrf <i>vrf-name</i> rp-address <i>loopback-address-of-vtep</i>	Configures the address of the loopback interface of the local VTEP as the PIM RP for

	Command or Action	Purpose
	Example: <pre>Device(config)# ip pim vrf green rp-address 10.1.13.13</pre>	the multicast group in PIM-SM with Distributed Anycast RP mode. Note The loopback interface specified must be part of the same VRF.
Step 10	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuration Examples for Tenant Routed Multicast

This section provides an example for TRM configuration. The following example shows a sample configuration for a VXLAN network with a receiver device and a source device connected to VTEP 1 and VTEP 2 respectively, with TRM enabled.

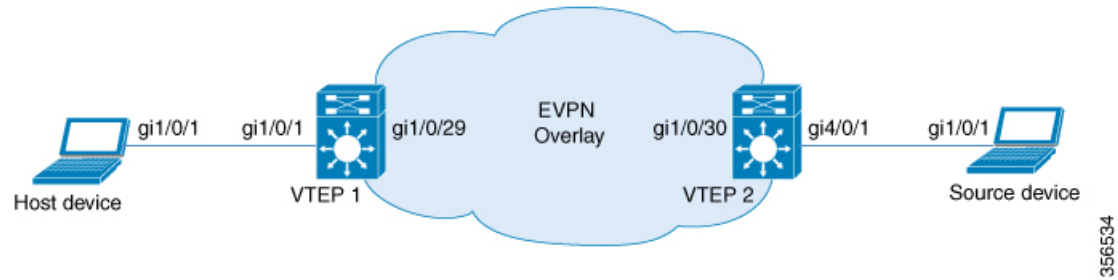

Table 14: Configuration Example for a VXLAN Network with the Source Device and Host Device connected to two VTEPs with TRM Enabled

VTEP 1	VTEP 2

The following examples provide outputs for **show** commands on VTEP 1 and VTEP 2 in the topology configured above.

- [show nve peers, on page 162](#)
- [show l2vpn evpn peers vxlan, on page 163](#)
- [show ip igmp vrf green groups, on page 163](#)
- [show bgp ipv4 mvpn all, on page 163](#)
- [show ip mroute vrf green, on page 164](#)
- [show ip mfib vrf green, on page 165](#)
- [show ip mroute, on page 167](#)
- [show ip mfib, on page 168](#)

show nve peers

VTEP 1

The following example shows the output for the **show nve peers** command on VTEP 1:

```

VTEP1# show nve peers
Interface  VNI      Type Peer-IP      RMAC/Num_RTs  eVNI      state flags UP time
nve10     5000     L3CP 10.2.2.20    380e.4d9b.6a4a 5000      UP    A/-/4 03:22:40
nve10     6000     L2CP 10.2.2.20      14           6000      UP    N/A   03:22:19
nve10     7000     L2CP 10.2.2.20        6           7000      UP    N/A   03:22:19

```

VTEP 2

The following example shows the output for the **show nve peers** command on VTEP 2:

```

VTEP2# show nve peers
Interface  VNI      Type Peer-IP      RMAC/Num_RTs  eVNI      state flags UP time
nve10     5000     L3CP 10.1.1.10      a0f8.4910.bce2 5000      UP    A/M/4 03:22:27
nve10     6000     L2CP 10.1.1.10        6           6000      UP    N/A   03:22:27
nve10     7000     L2CP 10.1.1.10        4           7000      UP    N/A   03:22:27

```

show l2vpn evpn peers vxlan**VTEP 1**

The following example shows the output for the **show l2vpn evpn peers vxlan** command on VTEP 1:

```
VTEP1# show l2vpn evpn peers vxlan
```

Interface	VNI	Peer-IP	Num routes	eVNI	UP time
nve10	6000	10.2.2.20	5	6000	01:34:50
nve10	7000	10.2.2.20	6	7000	01:34:50

VTEP 2

The following example shows the output for the **show l2vpn evpn peers vxlan** command on VTEP 2:

```
VTEP2# show l2vpn evpn peers vxlan
```

Interface	VNI	Peer-IP	Num routes
nve10	6000	10.1.1.10	7
nve10	7000	10.1.1.10	6

show ip igmp vrf green groups**VTEP 1**

The following example shows the output for the **show ip igmp vrf green groups** command on VTEP 1:

```
VTEP1# show ip igmp vrf green groups
```

IGMP Connected Group Address	Interface	Uptime	Expires	Last Reporter	Group Account
229.1.1.1	Vlan201	04:08:35	00:02:16	192.168.1.81	
224.0.1.40	Loopback13	06:35:55	00:02:05	10.1.13.13	

VTEP 2

The following example shows the output for the **show ip igmp vrf green groups** command on VTEP 2:

```
VTEP2# show ip igmp vrf green groups
```

IGMP Connected Group Address	Interface	Uptime	Expires	Last Reporter	Group Account
224.0.1.40	Loopback14	05:11:42	00:02:18	10.1.14.14	

show bgp ipv4 mvpn all**VTEP 1**

The following example shows the output for the **show bgp ipv4 mvpn all** command on VTEP 1:

```

VTEP1# show bgp ipv4 mvpn all

Verifying Tenant Routed Multicast

The following table lists the **show** commands that are used to verify TRM:

Command	Purpose
show nve peers	Displays NVE interface state information for peer leaf switches.
show l2vpn evpn peers vxlan	Displays Layer 2 EVPN peer route counts in the VXLAN and up time.
show ip igmp vrf green groups	Displays the multicast groups with receivers that are directly connected to the router pertaining to the specific Multicast Virtual Routing and Forwarding (MVRF) instance and that were learned through IGMP.
show bgp ipv4 mvpn all	Displays the MVPN options for BGP MVPN C-route signaling.
show ip mroute vrf green	Displays the contents of the mroute table that pertain to a specific MVRF instance.
show ip mfib vrf green	Displays forwarding entries and interfaces in the IPv4 Multicast Forwarding Information Base (MFIB) associated with MVRF instances.
show ip mroute	Displays multicast routing table information.
show ip mfib	Displays the forwarding entries and interfaces in the IPv4 MFIB.

CHAPTER 8

Configuring EVPN VXLAN External Connectivity

- [Restrictions for EVPN VXLAN External Connectivity, on page 173](#)
- [Information About EVPN VXLAN External Connectivity, on page 173](#)
- [How to Configure EVPN VXLAN External Connectivity, on page 177](#)
- [Configuration Examples for EVPN VXLAN External Connectivity, on page 188](#)

Restrictions for EVPN VXLAN External Connectivity

- External connectivity with VPLS networks is supported only when bridging is the mode of interworking between the two domains. Integrated routing and bridging (IRB) is not supported between a BGP EVPN VXLAN fabric and a VPLS network.
- External Connectivity with Layer 3 networks is supported only for IPv4 and IPv6 unicast traffic.
- External connectivity with an MVPN network is not supported for multicast traffic.
- Import of EVPN IP routes, which includes both route type 5 and route type 2 host routes, to global routing table is not supported.

Information About EVPN VXLAN External Connectivity

External connectivity allows the movement of Layer 2 and Layer 3 traffic between an EVPN VXLAN network and an external network. It also enables the EVPN VXLAN network to exchange routes with the externally connected network. Routes within an EVPN VXLAN network are already shared between all the VTEPs or leaf switches. External connectivity uses the VTEPs on the periphery of the network to pass on these routes to an external Layer 2 or Layer 3 network. Similarly, the EVPN VXLAN network imports the reachability routes from the external network. External connectivity extends the Layer 2 or Layer 3 overlay network outside the VXLAN network. The process of extending a Layer 2 or Layer 3 network outside the EVPN VXLAN network is also known as handoff.

Implementation of Border Nodes for EVPN VXLAN External Connectivity

Border nodes or border VTEPs are the devices through which you establish a connection between an EVPN VXLAN network and an external network. The border nodes sit on the periphery of the EVPN VXLAN

network and remain a part of the BGP EVPN VXLAN fabric. To enable external connectivity, you can implement the border nodes of an EVPN VXLAN network as either border leaf or border spine switches.

Connectivity Through a Border Leaf Switch

Leaf switches deployed as border nodes support the required control plane and data plane functionalities. Border leaf deployment ensures that the configuration on the spine switches is much simpler. Border leaf switches only allow communication between the external network and the VXLAN network, also known as north-south communication.

Note

A border leaf switch can also be multiple switches functioning as a single logical system with Cisco StackWise Virtual configured.

The following figure shows border leaf external connectivity of an EVPN VXLAN network with external Layer 2 and Layer 3 networks.:

Figure 8: EVPN VXLAN External Connectivity Through a Border Leaf Switch

Connectivity Through a Border Spine Switch

Deploying spine switches as border nodes provides the advantage of optimizing the north-south communication with external resources. At the same time, border spine deployment allows the spine switches to support VXLAN control and data plane functionality. Border spine switches allow both north-south communication and east-west communication. East-west communication represents the communication within the nodes of the EVPN VXLAN network.

The following figure shows border spine external connectivity of an EVPN VXLAN network with external Layer 2 and Layer 3 networks.:

Figure 9: EVPN VXLAN External Connectivity Through a Border Spine Switch

External Connectivity with Layer 3 Networks

Layer 3 external connectivity or handoff is established by connecting the border nodes of a BGP EVPN VXLAN fabric with an edge router from the external Layer 3 network. The border node acts as a VTEP to perform VXLAN encapsulation and decapsulation, but it also routes the traffic towards the edge routing device. The VXLAN-facing interface on the external Layer 3 network can be a switch virtual interface (SVI), or a Layer 3 interface, or a Layer 3 subinterface.

You can use Layer 3 external connectivity to achieve any of the following:

- Extend the logical isolation between VRFs or VLANs within the EVPN VXLAN network into the externally routed network. The external routed network can be a traditional non-VXLAN campus network, a datacenter, or a WAN.
- Provide shared access within the EVPN VXLAN network to a common external service such as the internet.

BGP EVPN VXLAN fabric supports Layer 3 external connectivity with VRF-Lite and MPLS Layer 3 VPN networks.

Layer 3 External Connectivity with VRF-Lite

Using VRF allows for the use of multiple routing tables that are independent and isolated. VRF-Lite is a mechanism to extend the tenant Layer 3 VRF information beyond the BGP EVPN VXLAN Fabric. External connectivity with VRF-Lite or VRF handoff involves a two-box approach where the border node and the edge router are physically independent devices. With VRF-Lite handoff, the BGP EVPN VXLAN fabric extends the connectivity for different tenants externally on a hop-by-hop basis.

Once the border node learns external routes from the edge router, it advertises the prefixes inside the BGP EVPN VXLAN fabric as EVPN type 5 routes. This information is distributed to all the other VTEPs in the network. The border node also advertises EVPN routes to the external edge router. It sends the EVPN routes learned from the Layer 2 VPN EVPN address family to the IPv4 or IPv6 unicast address family.

Layer 3 Multicast External Connectivity with MPLS Layer 3 VPN

Layer 3 external connectivity with an MPLS Layer 3 VPN network or MPLS handoff uses a single-box approach. The single-box approach combines the functionalities of an EVPN VXLAN border node and an MPLS PE router into a single physical device. The device is also known as a border PE node. The border PE node reoriginates IP prefixes from the EVPN address family of the BGP EVPN VXLAN fabric to the VPNv4 address family of the MPLS network. Likewise, the border PE node performs the corresponding function in the reverse direction. eBGP peering is necessary between the border PE node and the MPLS PE devices to ensure the connectivity.

MPLS handoff allows scalability for EVPN VXLAN networks that have a large number of tenants or VRFs. Scalability is not possible with VRF-Lite handoff.

In every VRF on a border VTEP, there are two sets of manually configured import and export route targets. The first set of import and export route targets is associated with the BGP neighbor in the BGP EVPN VXLAN fabric. This BGP neighbor uses the EVPN address family to exchange Layer 3 information. The second set of import and export route targets is associated with the BGP neighbor in the Layer 3 VPN network. This BGP neighbor uses either VPNv4 or VPNv6 unicast address families to exchange Layer 3 information. The separation of route targets allows you to configure both sets of route targets independently. In this way, a border VTEP in an EVPN VXLAN network effectively stitches the two sets of route targets. The route targets associated with the BGP neighbor in the Layer 3 VPN network are known as normal route targets. The route targets associated with the BGP neighbor in the BGP EVPN VXLAN fabric are known as stitching route targets.

External Connectivity with Layer 2 Networks

Layer 2 external connectivity or handoff for an EVPN VXLAN network extends the Layer 2 domain outside of the network. BGP EVPN VXLAN fabric supports Layer 2 external connectivity with IEE 802.1Q, access, and VPLS over MPLS networks.

Layer 2 External connectivity with IEEE 802.1Q or Access Networks

Layer 2 handoff to IEEE 802.1Q networks is achieved through a regular IEEE 802.1Q Trunk port configuration on the Switchport interfaces on the border nodes. You can also connect EVPN VXLAN networks to external access networks.

The commonly deployed scenario has EVPN enabled at the distribution layer and has the access layer switches connected with IEEE 802.1Q Trunk encapsulation. The IEEE 802.1Q Layer 2 traffic that comes from the access layer switches is mapped to the corresponding VLAN. The border node then bridges the traffic towards the destination with VXLAN encapsulation. The inner packet does not carry the IEEE 802.1Q tag. Instead, the VXLAN network identifier (VNI), which is the Layer 2 VNI in the VXLAN header, represents the broadcast domain. Similarly, the border nodes decapsulate the traffic from the BGP EVPN VXLAN fabric and bridge it with the corresponding IEEE 802.1Q tag to the access switches. The interface on the border VTEP that faces the external interface can be either an access or a Trunk port. The external interface can belong to either a Layer 2 switch or a firewall.

Note If you connect the network to an external Layer 2 switch through two border VTEPs, it represents a dual connection. In such cases, STP does not propagate over the BGP EVPN VXLAN fabric by default.

Layer 2 External connectivity with VPLS over MPLS Network

External connectivity with VPLS networks or VPLS handoff is achieved when a border VTEP or multiple border VTEPs establish a connection with the VPLS network. The border nodes act as the provider edge (PE) devices in the VPLS network and as VTEPs in the EVPN VXLAN network.

BGP EVPN VXLAN supports VPLS handoff in the form of VPLS stitching through either an access VFI or an access pseudowire on the VLAN on the border VTEP.

The access pseudowires and the pseudowires in the access VFI function as the access ports in the EVPN VXLAN network. The BGP EVPN VXLAN fabric treats the MAC addresses learned on the pseudowires as locally learned MAC addresses. It advertises these MAC addresses within the fabric as EVPN type 2 routes. The pseudowires are in a different split horizon group compared to the EVPN VXLAN network. Therefore, BUM traffic floods between both the EVPN VXLAN and VPLS networks.

How to Configure EVPN VXLAN External Connectivity

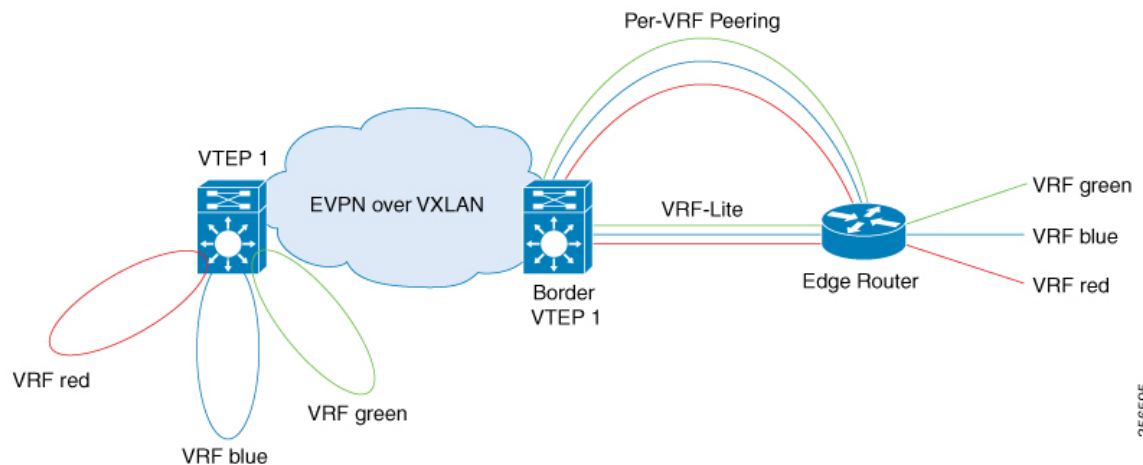

This section provides information about how to configure external connectivity between an EVPN VXLAN network and an external Layer 2 or Layer 3 network.

Note You must configure EVPN VXLAN Layer 2 and Layer 3 overlay networks before you configure external connectivity. See [How to Configure EVPN VXLAN Integrated Routing and Bridging, on page 54](#) for detailed steps.

Enabling Layer 3 External Connectivity with VRF-Lite

The following figure shows a sample topology that illustrates Layer 3 external connectivity with VRF-Lite:

356595

To configure Layer 3 external connectivity with VRF-Lite, perform the following set of procedures:

- Configure the VRF on the border VTEP interface that faces the external router.
- Ensure that Layer 2 VPN EVPN is advertised as part of the BGP VRF configuration. See [Configuring BGP with EVPN and VRF Address Families on a VTEP, on page 59](#) for detailed steps.

**Note**

Redistribution of the respective interior gateway protocol (IGP) is required in the BGP VRF address family to distribute the external prefixes into the BGP EVPN VXLAN fabric.

For more information about VRF-Lite, see *Contents* → *IP Routing Configuration Guide* → *Configuring VRF-lite* in the software configuration guide for the required release.

Configuring the VRF on the Border VTEP Interface that Faces the External Router

To configure the VRF on the border VTEP interface that faces the external router, perform these steps:

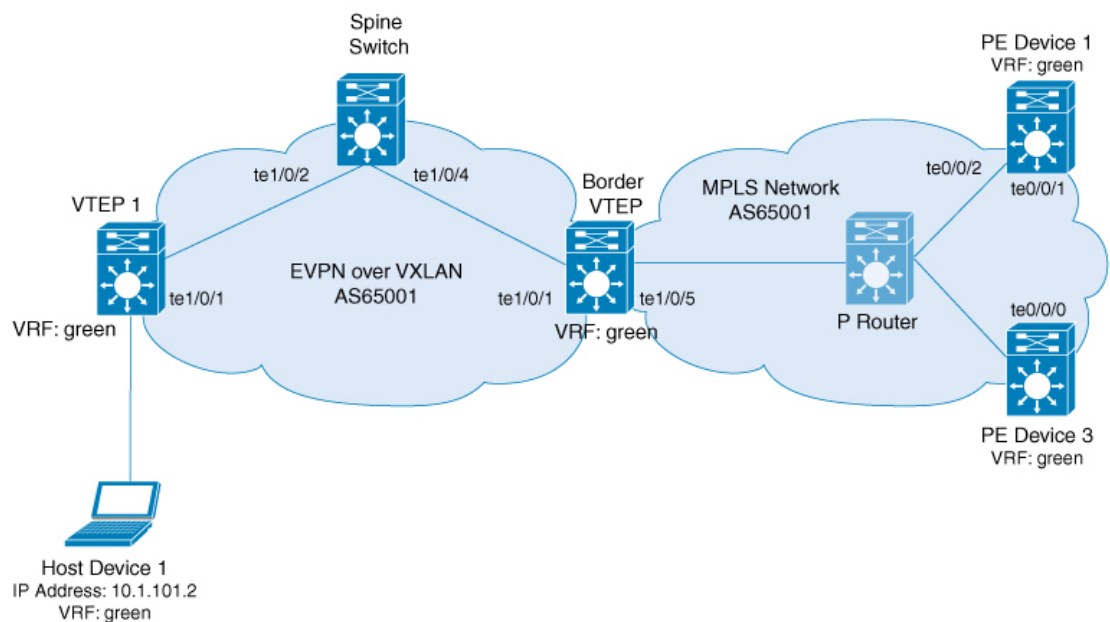

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface <i>interface-id</i> Example: Device(config)# interface GigabitEthernet1/0/30	Enters the interface configuration mode for the specified interface.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding green	Associates the VRF with the interface. Note The interface must be associated with the same VRF for which the Layer 3 VNI has been configured for the EVPN VXLAN network.
Step 5	ip address <i>ip-address</i> Example: Device(config-if)# ip address 192.168.3.203 255.255.255.0	Configures the IP address for the interface.
Step 6	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Enabling Layer 3 External Connectivity with MPLS Layer 3 VPN

The following figure shows a sample topology that illustrates Layer 3 external connectivity with an MPLS Layer 3 VPN network:

356585

To enable EVPN VLAN Layer 3 external connectivity with MPLS Layer 3 VPN networks, perform the following set of procedures:

- Run the **mpls label mode all-vrfs protocol all-afs per-vrf** command in global configuration mode on the border VTEP.
- Configure BGP with reorigination of routes with a new route type for Layer 2 VPN, VPNv4, VPNv6 address families on the border VTEP.

Configuring BGP on a Border VTEP for External Connectivity with MPLS Layer 3 VPN

To configure BGP on a border VTEP to establish external connectivity with an MPLS Layer 3 VPN network, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp autonomous-system-number Example: Device (config)# router bgp 1	Enables a BGP routing process, assigns it an autonomous system number, and enters router configuration mode.
Step 4	bgp log-neighbor-changes Example: Device (config-router)# bgp log-neighbor-changes	(Optional) Enables the generation of logging messages when the status of a BGP neighbor changes. For more information, see Configuring BGP section of the <i>IP Routing Configuration Guide</i> .
Step 5	bgp update-delay time-period Example: Device (config-router)# bgp update-delay 1	(Optional) Sets the maximum initial delay period before sending the first update. For more information, see Configuring BGP section of the <i>IP Routing Configuration Guide</i> .
Step 6	bgp graceful-restart Example: Device (config-router)# bgp graceful-restart	(Optional) Enables the BGP graceful restart capability for all BGP neighbors. For more information, see Configuring BGP section of the <i>IP Routing Configuration Guide</i> .

	Command or Action	Purpose
Step 7	no bgp default ipv4-unicast Example: <pre>Device(config-router)# no bgp default ipv4-unicast</pre>	(Optional) Disables default IPv4 unicast address family for BGP peering session establishment. For more information, see Configuring BGP section of the <i>IP Routing Configuration Guide</i> .
Step 8	neighbor spine-ip-address remote-as number Example: <pre>Device(config-router)# neighbor 172.16.255.1 remote-as 1</pre>	Defines multiprotocol-BGP neighbors in the EVPN network. Use the IP address of the spine switch as the neighbor IP address. This configures the spine switch as a BGP neighbor.
Step 9	neighbor mpls-peer-ip-address remote-as number Example: <pre>Device(config-router)# neighbor 172.16.255.103 remote-as 1</pre>	Defines multiprotocol-BGP neighbors in the external MPLS network. Use the IP address of the external MPLS network peer as the neighbor IP address. This configures the external MPLS network peer as a BGP neighbor.
Step 10	neighbor {ip-address group-name} update-source interface Example: <pre>Device(config-router)# neighbor 172.16.255.1 update-source Loopback0</pre>	Configures update source. Update source can be configured per neighbor or per peer-group. Use the IP address of the spine switch as the neighbor IP address.
Step 11	address-family l2vpn evpn Example: <pre>Device(config-router)# address-family l2vpn evpn</pre>	Specifies the L2VPN address family and enters address family configuration mode.
Step 12	import vpnv4 unicast re-originate Example: <pre>Device(config-router-af)# import vpnv4 unicast re-originate</pre>	Reoriginates the VPNv4 routes imported from the external peer into the EVPN address family as EVPN routes, and distributes within the EVPN fabric.
Step 13	import vpnv6 unicast re-originate Example: <pre>Device(config-router-af)# import vpnv6 unicast re-originate</pre>	Reoriginates the VPNv6 routes imported from the external peer into the EVPN address family as EVPN routes, and distributes within the EVPN fabric.
Step 14	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 10.11.11.11 activate</pre>	Enables the exchange information from a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 15	neighbor ip-address send-community [both extended standard]	Specifies the communities attribute sent to a BGP neighbor.

	Command or Action	Purpose
	Example: <pre>Device(config-router-af) # neighbor 10.11.11.11 send-community both</pre>	<p>Use the IP address of the spine switch as the neighbor IP address.</p> <p>Note Use either of extended or both keywords. External connectivity cannot be established when you use the standard keyword.</p>
Step 16	<pre>neighbor {ip-address peer-group-name} next-hop-self [all]</pre> <p>Example:</p> <pre>Device(config-router-af) # neighbor ip-address next-hop-self all</pre>	<p>Configures the router as the next hop for a BGP-speaking neighbor or peer group.</p> <p>The all keyword is mandatory when implementing external connectivity through iBGP, where the EVPN fabric and the MPLS network are in the same BGP autonomous system number.</p> <p>The all keyword is optional when implementing external connectivity through eBGP, where the EVPN fabric and the MPLS network are in different BGP autonomous system numbers.</p>
Step 17	<pre>exit-address-family</pre> <p>Example:</p> <pre>Device(config-router-af) # exit-address-family</pre>	Exits address family configuration mode and returns to router configuration mode.
Step 18	<pre>address-family vpnv4</pre> <p>Example:</p> <pre>Device(config-router) # address-family vpnv4</pre>	Specifies the VPNv4 address family and enters address family configuration mode.
Step 19	<pre>import l2vpn evpn re-originate</pre> <p>Example:</p> <pre>Device(config-router-af) # import l2vpn evpn re-originate</pre>	Reoriginates the EVPN routes imported from the EVPN fabric into the VPNv4 address family as VPNv4 routes and distributes them to the external network.
Step 20	<pre>neighbor ip-address activate</pre> <p>Example:</p> <pre>Device(config-router-af) # neighbor 172.16.255.103 activate</pre>	<p>Enables the exchange information from a BGP neighbor.</p> <p>Use the IP address of the external MPLS network router as the neighbor IP address.</p>
Step 21	<pre>neighbor ip-address send-community [both extended standard]</pre> <p>Example:</p> <pre>Device(config-router-af) # neighbor 172.16.255.103 send-community both</pre>	<p>Specifies the communities attribute sent to a BGP neighbor.</p> <p>Use the IP address of the external MPLS network router as the neighbor IP address.</p>

	Command or Action	Purpose
		Note Use either of extended or both keywords. External connectivity cannot be established when you use the standard keyword.
Step 22	neighbor {ip-address peer-group-name} next-hop-self [all] Example: <pre>Device(config-router-af)# neighbor ip-address next-hop-self all</pre>	<p>Configures the router as the next hop for a BGP-speaking neighbor or peer group.</p> <p>The all keyword is mandatory when implementing external connectivity through iBGP, where the EVPN fabric and the MPLS network are in the same BGP autonomous system number.</p> <p>The all keyword is optional when implementing external connectivity through eBGP, where the EVPN fabric and the MPLS network are in different BGP autonomous system numbers.</p>
Step 23	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits address family configuration mode and returns to router configuration mode.
Step 24	address-family vpnv6 Example: <pre>Device(config-router)# address-family vpnv6</pre>	Specifies the VPNv6 address family and enters address family configuration mode.
Step 25	import l2vpn evpn re-originate Example: <pre>Device(config-router-af)# import l2vpn evpn re-originate</pre>	Reoriginates the EVPN routes imported from the EVPN fabric into the VPNv6 address family as VPNv6 routes and distributes them to the external network.
Step 26	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 172.16.255.103 activate</pre>	<p>Enables the exchange information from a BGP neighbor.</p> <p>Use the IP address of the spine switch as the neighbor IP address.</p>
Step 27	neighbor ip-address send-community [both extended standard] Example: <pre>Device(config-router-af)# neighbor 172.16.255.103 send-community both</pre>	<p>Specifies the communities attribute sent to a BGP neighbor.</p> <p>Use the IP address of the spine switch as the neighbor IP address.</p> <p>Note Use either of extended or both keywords. External connectivity cannot be established when you use the standard keyword.</p>

	Command or Action	Purpose
Step 28	neighbor {ip-address peer-group-name} next-hop-self [all] Example: <pre>Device(config-router-af) # neighbor ip-address next-hop-self all</pre>	<p>Configures the router as the next hop for a BGP-speaking neighbor or peer group.</p> <p>The all keyword is mandatory when implementing external connectivity through iBGP, where the EVPN fabric and the MPLS network are in the same BGP autonomous system number.</p> <p>The all keyword is optional when implementing external connectivity through eBGP, where the EVPN fabric and the MPLS network are in different BGP autonomous system numbers.</p>
Step 29	exit-address-family Example: <pre>Device(config-router-af) # exit-address-family</pre>	Exits address family configuration mode and returns to router configuration mode.
Step 30	end Example: <pre>Device(config-router) # end</pre>	Returns to privileged EXEC mode.

Enabling Layer 2 External Connectivity with IEEE 802.1Q Networks

The following image shows a sample topology that illustrates Layer 2 external connectivity with an IEEE 802.1Q network:

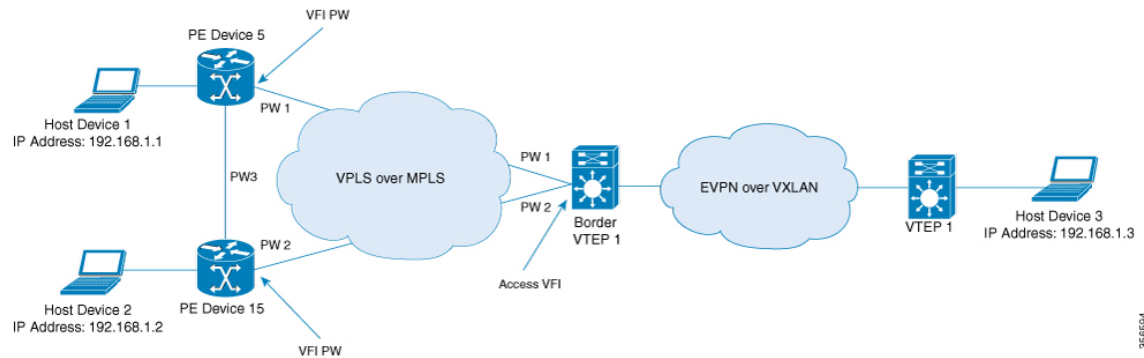

You can also connect the EVPN VXLAN network to a firewall in place of the Layer 2 switch in the above image. To configure Layer 2 external connectivity with an IEEE 802.1Q network, perform the following steps on the external Layer 2 switch:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface interface-id Example: Device(config)# interface GigabitEthernet4/0/1	Enters interface configuration mode for the specified interface. The specified interface must be the interface on the Layer 2 switch through which the EVPN VXLAN network communicates with the IEEE 802.1Q network.
Step 4	switchport mode trunk Example: Device(config-if)# switchport mode trunk	Configures the interface as a trunking VLAN Layer 2 interface.
Step 5	switchport trunk allowed vlan vlan-list Example: Device(config-if)# switchport trunk allowed vlan 201,202	Sets the list of VLANs that are allowed to transmit traffic from this interface in tagged format when the interface is in trunking mode.
Step 6	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Enabling Layer 2 External Connectivity with a VPLS Network Through an Access VFI

The following illustration shows a single-homed VXLAN network connected to a VPLS over MPLS network through the access VFIs on the border VTEP:

**Note**

We recommend you to use Cisco Catalyst 9500 Series - High Performance switches or Cisco Catalyst 9600 Series switches as border VTEPs when you configure Layer 2 external connectivity with a VPLS network.

We recommend you to configure Cisco Stackwise Virtual on the border VTEPs in order to achieve physical redundancy when you configure Layer 2 external connectivity with a VPLS network.

Perform the following set of procedures to enable Layer 2 external connectivity with VPLS networks through an access VFI interface:

1. Define the access VFI for the VTEPs.
2. Configure the access VFI as a member of the VLAN on the VTEPs.
3. Configure the EVPN instance as a member of the VLAN on the VTEPs.
4. Configure VPLS on the border VTEP.

Defining an Access VFI on a Border VTEP

To configure an access facing VFI on the VLAN of a border VTEP, perform the following steps:

For more information on configuring VFIs, in the software configuration guide for the required release, go to *Contents → Multiprotocol Label Switching (MPLS) Configuration Guide → Configuring Virtual Private LAN Service (VPLS) and VPLS BGP-Based Autodiscovery*.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enters privileged EXEC mode. Enter password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	l2vpn vfi context <i>vfi-name</i> Example: Device(config)# l2vpn vfi context myVFI	Establishes an Layer 2 VPN VFI between two or more separate networks, and enters VFI configuration mode.
Step 4	vpn id <i>vpn-id</i> Example: Device(config-vfi)# vpn id 1	Configures the VPN ID for the VFI.
Step 5	member ip-address encapsulation mpls Example: Device(config-vfi)# member 10.12.12.5 encapsulation mpls	Specifies the device that forms a point-to-point Layer 2 VPN VFI connection.
Step 6	Repeat step 5 for all devices that form a point-to-point Layer 2 VPN VFI connection.	
Step 7	end Example: Device(config-vfi)# end	Exits VFI configuration mode and enters privileged EXEC mode.

Adding an Access VFI and an EVPN Instance as Members of the VLAN of a Border VTEP

To add an access VFI and an EVPN instance as members of the VLAN of a border VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enters privileged EXEC mode. Enter password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan configuration <i>vlan-number</i> Example: Device(config)# vlan configuration 11	Enters VLAN feature configuration mode for the specified VLAN interface. Enter the VLAN number that is associated with the Layer 2 VNI configured in the EVPN VXLAN network.
Step 4	member access-vfi <i>vfi-name</i> Example:	Adds the access VFI as a member of the VLAN configuration.

	Command or Action	Purpose
	Device(config-vlan)# member access-vfi myVFI	
Step 5	member evpn-instance <i>evpn-instance-number</i> vni <i>l2-vni-number</i> Example: Device(config-vlan)# member evpn-instance 1 vni 6000	Adds the EVPN instance as a member of the VLAN configuration.
Step 6	end Example: Device(config-vlan)# end	Exits VLAN configuration mode and enters privileged EXEC mode.

Configuring VPLS on a Border VTEP

To configure VPLS on a border VTEP, in the software configuration guide for the required release, see *Contents → Multiprotocol Label Switching (MPLS) Configuration Guide → Configuring Virtual Private LAN Service (VPLS) and VPLS BGP-Based Autodiscovery*.

Configuration Examples for EVPN VXLAN External Connectivity

The following section shows the configuration examples for EVPN VXLAN external connectivity to other technologies:

Configuration Example for Enabling Layer 3 External Connectivity with MPLS Layer 3 VPN through iBGP

This section provides an example to show how Layer 3 external connectivity with MPLS Layer 3 VPN is enabled for a BGP EVPN VXLAN fabric through iBGP. The example shows how to configure and verify Layer 3 external connectivity with MPLS Layer 3 VPN for the topology shown below:

356585

The topology shows an EVPN VXLAN network with two VTEPs, VTEP 1 and border VTEP. Border VTEP is connected to an external PE device that belongs to an MPLS network. The BGP EVPN VXLAN fabric and the MPLS network are in the autonomous system number 65001. All the VTEPs, PE devices and, host devices are part of the VRF green. The following tables provide sample configurations for the devices in the topology above.

Table 15: Configuring Spine Switch, Border VTEP and PE Device 1 for Enabling Layer 3 External Connectivity with MPLS Layer 3 VPN through iBGP

Spine Switch	Border VTEP	PE Device 1
<pre> Spine_switch# show running-config hostname Spine_switch ! interface Loopback0 ip address 172.16.255.1 255.255.255.255 ip ospf 1 area 0 ip pim sparse-mode ! interface Loopback1 ip address 172.16.254.1 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface Loopback2 ip address 172.16.255.255 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface TenGigabitEthernet1/0/2 no switchport ip address 172.16.14.1 255.255.255.0 ip pim sparse-mode ip ospf network point-to-point ip ospf 1 area 0 ! interface TenGigabitEthernet1/0/4 no switchport ip address 172.16.16.1 255.255.255.0 ip pim sparse-mode ip ospf network point-to-point ip ospf 1 area 0 ! router ospf 1 router-id 172.16.255.1 ! router bgp 65001 template peer-policy RR-PP route-reflector-client send-community both exit-peer-policy ! template peer-session RR-PS remote-as 65001 update-source Loopback0 exit-peer-session ! bgp router-id 172.16.255.1 bgp log-neighbor-changes no bgp default ipv4-unicast neighbor 172.16.255.4 inherit peer-session RR-PS neighbor 172.16.255.6 inherit peer-session RR-PS ! ! ! </pre>	<pre> Border_VTEP# show running-config hostname Border_VTEP !vrf definition green rd 1:1 ! address-family ipv4 route-target export 1:1 route-target import 1:1 route-target export 1:1 stitching route-target import 1:1 stitching exit-address-family ! address-family ipv6 route-target export 1:1 route-target import 1:1 route-target export 1:1 stitching route-target import 1:1 stitching exit-address-family ! mpls label mode all-vrfs protocol all-afs per-vrf ! l2vpn evpn replication-type static router-id Loopback1 default-gateway advertise ! l2vpn evpn instance 101 vlan-based encapsulation vxlan ! l2vpn evpn instance 102 vlan-based encapsulation vxlan replication-type ingress ! vlan configuration 101 member evpn-instance 101 vni 10101 vlan configuration 102 member evpn-instance 102 vni 10102 vlan configuration 901 member vni 50901 ! interface Loopback0 ip address 172.16.255.6 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface Loopback1 ip address 172.16.254.6 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface TenGigabitEthernet1/0/1 no switchport ip address 172.16.16.6 255.255.255.0 ip pim sparse-mode ip ospf network point-to-point ip ospf 1 area 0 </pre>	<pre> PE_device_1# show running-config hostname PE_device_1 ! vrf definition green rd 1:1 ! address-family ipv4 route-target export 1:1 route-target import 1:1 exit-address-family ! address-family ipv6 route-target export 1:1 route-target import 1:1 exit-address-family ! interface Loopback0 ip address 172.16.255.101 255.255.255.255 ! interface Loopback1 vrf forwarding green ip address 10.1.255.101 255.255.255.255 ! interface TenGigabitEthernet0/0/1 ip address 172.16.111.101 255.255.255.0 ip router isis cdp enable mpls ip isis network point-to-point ! interface TenGigabitEthernet0/0/2 ip address 172.16.106.101 255.255.255.0 ip router isis negotiation auto cdp enable mpls ip isis network point-to-point ! router isis net 49.0001.1720.1625.5101.00 is-type level-2-only metric-style wide passive-interface Loopback0 ! router bgp 65001 bgp log-neighbor-changes no bgp default ipv4-unicast neighbor 172.16.255.103 remote-as 65001 neighbor 172.16.255.103 update-source Loopback0 ! address-family ipv4 exit-address-family ! </pre>

Configuration Example for Enabling Layer 3 External Connectivity with MPLS Layer 3 VPN through eBGP

This section provides an example to show how Layer 3 external connectivity with MPLS Layer 3 VPN is enabled for a BGP EVPN VXLAN fabric through eBGP. The example shows how to configure and verify Layer 3 external connectivity with MPLS Layer 3 VPN for the topology shown below:

The topology shows an EVPN VXLAN network with two VTEPs, VTEP 1 and border VTEP. Border VTEP is connected to an external PE device that belongs to an MPLS network. The BGP EVPN VXLAN fabric is in the autonomous system number 65001. The MPLS network is in the autonomous system number 65002. All the VTEPs, PE devices, and host devices are part of the VRF green. The following tables provide sample configurations for the devices in the topology above.

Table 17: Configuring Spine Switch, Border VTEP and PE Device 1 for Enabling Layer 3 External Connectivity with MPLS Layer 3 VPN through eBGP

Spine Switch	Border VTEP	PE Device 1
<pre> Spine_switch# show running-config hostname Spine_switch ! interface Loopback0 ip address 172.16.255.1 255.255.255.255 ip ospf 1 area 0 ip pim sparse-mode ! interface Loopback1 ip address 172.16.254.1 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface Loopback2 ip address 172.16.255.255 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface TenGigabitEthernet1/0/2 no switchport ip address 172.16.14.1 255.255.255.0 ip pim sparse-mode ip ospf network point-to-point ip ospf 1 area 0 ! interface TenGigabitEthernet1/0/4 no switchport ip address 172.16.16.1 255.255.255.0 ip pim sparse-mode ip ospf network point-to-point ip ospf 1 area 0 ! router ospf 1 router-id 172.16.255.1 ! router bgp 65001 template peer-policy RR-PP route-reflector-client send-community both exit-peer-policy ! template peer-session RR-PS remote-as 65001 update-source Loopback0 exit-peer-session ! bgp router-id 172.16.255.1 bgp log-neighbor-changes no bgp default ipv4-unicast neighbor 172.16.255.4 inherit peer-session RR-PS neighbor 172.16.255.6 inherit peer-session RR-PS ! address-family ipv4 exit-address-family ! </pre>	<pre> Border_VTEP# show running-config hostname Border_VTEP ! vrf definition green rd 1:1 ! address-family ipv4 route-target export 1:1 route-target import 1:1 route-target export 1:1 stitching route-target import 1:1 stitching exit-address-family ! address-family ipv6 route-target export 1:1 route-target import 1:1 route-target export 1:1 stitching route-target import 1:1 stitching exit-address-family ! mpls label mode all-vrfs protocol all-afs per-vrf ! l2vpn evpn replication-type static router-id Loopback1 default-gateway advertise ! l2vpn evpn instance 101 vlan-based encapsulation vxlan ! l2vpn evpn instance 102 vlan-based encapsulation vxlan replication-type ingress ! vlan configuration 101 member evpn-instance 101 vni 10101 vlan configuration 102 member evpn-instance 102 vni 10102 vlan configuration 901 member vni 50901 ! interface Loopback0 ip address 172.16.255.6 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface Loopback1 ip address 172.16.254.6 255.255.255.255 ip pim sparse-mode ip ospf 1 area 0 ! interface TenGigabitEthernet1/0/1 no switchport ip address 172.16.16.6 255.255.255.0 ip pim sparse-mode ip ospf network point-to-point ip ospf 1 area 0 </pre>	<pre> PE_device_1# show running-config hostname PE_device_1 ! vrf definition green rd 1:1 ! address-family ipv4 route-target export 1:1 route-target import 1:1 exit-address-family ! address-family ipv6 route-target export 1:1 route-target import 1:1 exit-address-family ! interface Loopback0 ip address 172.16.255.101 255.255.255.255 ! interface Loopback1 vrf forwarding green ip address 10.1.255.101 255.255.255.255 ! interface TenGigabitEthernet0/0/1 ip address 172.16.111.101 255.255.255.0 ip router isis cdp enable mpls ip isis network point-to-point ! interface TenGigabitEthernet0/0/2 ip address 172.16.106.101 255.255.255.0 negotiation auto cdp enable mpls bgp forwarding ! router isis net 49.0001.1720.1625.5101.00 is-type level-2-only metric-style wide passive-interface Loopback0 ! router bgp 65002 bgp log-neighbor-changes no bgp default ipv4-unicas no bgp default route-target filter neighbor 172.16.106.6 remote-as 65001 neighbor 172.16.255.6 remote-as 65001 neighbor 172.16.255.6 ebgp-multihop 255 neighbor 172.16.255.6 update-source Loopback0 neighbor 172.16.255.103 remote-as 65002 neighbor 172.16.255.103 update-source Loopback0 </pre>

CHAPTER 9

Troubleshooting BGP EVPN VXLAN

- [Troubleshooting Scenarios for BGP EVPN VXLAN, on page 211](#)
- [Troubleshooting Broadcast, Unknown Unicast, Multicast Traffic Forwarding, on page 212](#)
- [Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI, on page 216](#)
- [Troubleshooting Unicast Forwarding Between VTEPs in Different VLANs Through a Layer 3 VNI, on page 228](#)
- [Troubleshooting Unicast Forwarding Between a VXLAN Network and an IP Network, on page 241](#)

Troubleshooting Scenarios for BGP EVPN VXLAN

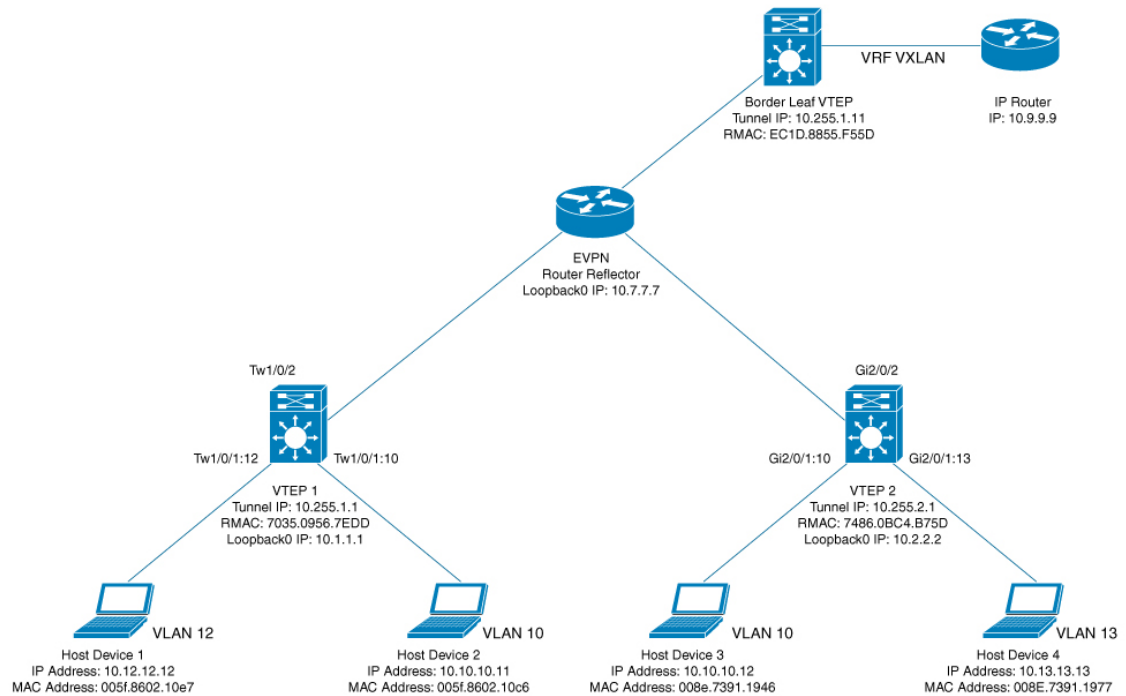

This document provides information about the various troubleshooting scenarios that are applicable to BGP EVPN VXLAN and how to troubleshoot each scenario.

In this troubleshooting document, comments have been added at the end of certain lines of the outputs of **show** commands. This has been done to highlight or explain a specific aspect of that line of output. If a comment begins in a new line, then it refers to the line of output that precedes the comment. The following notation has been used throughout the document to highlight the comments inside the outputs of **show** commands:

```
<<-- Text highlighted in this format inside a command's output represents a comment.  
This is done for explanation purpose only and is not part of the command's output.
```

The following is a sample EVPN VXLAN topology with two access facing VTEPs (VTEP 1 and VTEP 2) and a border leaf VTEP connected in a VXLAN network through an EVPN route reflector. Each of the access facing VTEPs has two host devices connected to it and the border leaf VTEP is connected to an external IP network. All the troubleshooting scenarios in this document are explained using this topology.

Figure 10: EVPN VXLAN Topology

The following are the various troubleshooting scenarios that apply to BGP EVPN VXLAN for the topology illustrated in the [Figure 10: EVPN VXLAN Topology](#) above:

- **Scenario 1:** Troubleshooting Broadcast, Unknown Unicast, Multicast traffic Forwarding
- **Scenario 2:** Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI
- **Scenario 3:** Troubleshooting Unicast Forwarding Between VTEPs in Different VLANs Through a Layer 3 VNI
- **Scenario 4:** Troubleshooting Unicast Forwarding Between a VXLAN Network and an IP Network

Troubleshooting Broadcast, Unknown Unicast, Multicast Traffic Forwarding

This scenario might occur when host device 2 attempts to learn the ARP for host device 3 in [Figure 10: EVPN VXLAN Topology, on page 212](#). Perform the checks listed in the following table before troubleshooting BUM traffic forwarding:

Table 19: Scenario 1: Broadcast, Unknown Unicast, Multicast traffic Forwarding

Check to be Performed	Steps to Follow
Is the packet of broadcast type?	Check if the packet is a broadcast packet, such as an ARP broadcast packet.
Are the hosts in the same subnet or in different subnets?	Perform any of the following steps: <ul style="list-style-type: none"> • Check the host device. • Check the SVI configuration on the VTEP.
Has the remote MAC address been learned for unknown unicast traffic?	Run the show platform software fed switch active macTable vlan <i>vlan-id</i> command in privileged EXEC mode on the local VTEP and check if the MAC address of the remote host device is displayed in the output. If not, you have not yet learned the remote host device and it needs to be resolved.

BUM traffic is forwarded by a VTEP into the VXLAN Core using multicast routing. In order to follow the path of an ARP broadcast packet, you need to identify the multicast group that needs to be used to send this traffic into the core and to the other VTEPs. BUM traffic first arrives at the local Layer 2 interface. The traffic is encapsulated here and sent out using the multicast group that is sourced from the VXLAN Loopback interface.

Note Underlay multicast needs to be fully configured before troubleshooting BUM traffic forwarding for EVPN VXLAN.

To troubleshoot EVPN VXLAN BUM traffic forwarding, follow these steps:

1. [Determine the MAC Address of the Local Host Device and the Multicast Group Used for ARP Tunneling, on page 213](#)
2. [Set Up Embedded Capture Towards the Core-Facing Interface, on page 214](#)
3. [Ping the Remote Host Device, on page 214](#)
4. [Verify that an ARP Request Has Been Received and a Multicast Route Has Been Built, on page 214](#)
5. [Confirm the Presence of ARP Request Replies in Embedded Capture, on page 215](#)
6. [Verify that the Encapsulated ARP Request is Leaving in a Multicast Group to a VXLAN UDP Destination Port, on page 215](#)
7. [Verify that the ARP Reply from Core Interface is Encapsulated in Unicast to a VXLAN UDP Destination Port, on page 216](#)

Determine the MAC Address of the Local Host Device and the Multicast Group Used for ARP Tunneling

The following examples show how to verify the MAC address of the local host device and the multicast group that is used for tunneling the ARP broadcast request:

```

VTEP-1# show mac address-table address 005f.8602.10c6
Mac Address Table
-----
Vlan Mac Address Type      Ports
----
10 005f.8602.10c6 DYNAMIC Tw1/0/1  <<- MAC address of 10.10.10.11 is learnt here

VTEP-1# show run int nve 1
interface nve1
 no ip address
 source-interface Loopback999
 host-reachability protocol bgp
 member vni 10001 mcast-group 239.10.10.10  <<- Group is mapped to the VNI under NVE

VTEP-1# show run | s vlan conf
vlan configuration 10
 member evpn-instance 10 vni 10001  <<- VNI mapped under VLAN 10

VTEP-1# show l2vpn evpn evi
EVI    VLAN  Ether Tag  L2 VNI    Multicast    Pseudopoint
-----
10     10     0           10001     239.10.10.10 Tw1/0/1:10
      <<- EVPN instance 10 is mapped to VLAN 10 and VNI 10001
      (Using multicast group 239.10.10.10 for Broadcast ecap tunnel)
<...snip...>

```

Set Up Embedded Capture Towards the Core-Facing Interface

The following example shows how to set up embedded capture towards the core-facing interface:

Note

On a production network, use this command with a filter.

```

VTEP-1# show monitor capture 1 parameter
monitor capture 1 interface TwoGigabitEthernet1/0/2 BOTH
monitor capture 1 match any
monitor capture 1 buffer size 100
monitor capture 1 limit pps 1000

```

Ping the Remote Host Device

The following example shows how to ping the remote host device:

```

VTEP-1-HOST# ping 10.10.10.12  <<- sourced from Host machine 10.10.10.11
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.10.10.12, timeout is 2 seconds:
..!!!

```

Verify that an ARP Request Has Been Received and a Multicast Route Has Been Built

This step is to verify that there is multicast reachability between VTEPs using standard multicast validation. Underly multicast state is not permanent. If it is not in use, these S,G states will expire.

The following output confirms that an ARP request has been received and a multicast route has been built:

```
VTEP-1# show ip mroute 239.10.10.10 10.255.1.1
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,
T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
U - URD, I - Received Source Specific Host Report,
Z - Multicast Tunnel, z - MDT-data group sender,
Y - Joined MDT-data group, y - Sending to MDT-data group,
G - Received BGP C-Mroute, g - Sent BGP C-Mroute,
N - Received BGP Shared-Tree Prune, n - BGP C-Mroute suppressed,
Q - Received BGP S-A Route, q - Sent BGP S-A Route,
V - RD & Vector, v - Vector, p - PIM Joins on route,
x - VxLAN group, c - PFP-SA cache created entry
Outgoing interface flags: H - Hardware switched, A - Assert winner, p - PIM Join
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

(10.255.1.1, 239.10.10.10), 00:00:25/00:02:34, flags: FTx <<- x flag set for VxLAN group
Incoming interface: Loopback999, RPF nbr 0.0.0.0 <<- Broadcast being encapsulated
into VXLAN tunnel IP

Outgoing interface list:
TwoGigabitEthernet1/0/2, Forward/Sparse, 00:00:23/00:03:06
<<- Sending towards core to VTEP-2
(10.255.1.4, 239.10.10.10), 3d18h/00:02:25, flags: JTx <<- BUM traffic from VTEP-2 (if the
ARP request was from VTEP-2)

Incoming interface: TwoGigabitEthernet1/0/2, RPF nbr 10.1.1.6
Outgoing interface list:
Tunnel0, Forward/Sparse-Dense, 3d18h/00:00:14 <<- Tunnel 0 is the VXLAN tunnel
used for decapsulation
```

Confirm the Presence of ARP Request Replies in Embedded Capture

The following output confirms that the ARP request replies are present in embedded capture:

```
VTEP-1# show monitor capture 1 buffer display-filter "arp"
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

7 0.000018 00:5f:86:02:10:c6 -> ff:ff:ff:ff:ff:ff ARP 110 Who has 10.10.10.12? Tell
10.10.10.11
9 0.000022 28:52:61:bf:a9:46 -> 00:5f:86:02:10:c6 ARP 110 10.10.10.12 is at 28:52:61:bf:a9:46
```

Verify that the Encapsulated ARP Request is Leaving in a Multicast Group to a VXLAN UDP Destination Port

The following image shows the ARP request leaving encapsulated in the multicast group 239.10.10.10, sourced from a VXLAN Loopback, to the VXLAN UDP destination port 4789 in the VNI 10001 and VLAN 10.

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000	00:5f:86:02:10:c6	ff:ff:ff:ff:ff:ff	ARP	110	Who has 10.10.10.12? Tell 10.10.10.11
2	0.000	28:52:61:bf:a9:46	00:5f:86:02:10:c6	ARP	110	10.10.10.12 is at 28:52:61:bf:a9:46

Once all of the above checks are verified, if there is still a problem with broadcast reachability, then repeat the checks on the remote VTEP.

Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI

This scenario might occur when host device 2 in VLAN 10 attempts to ping host device 3 that is also in VLAN 10. Perform the checks listed in the following table before troubleshooting unicast forwarding between VTEPs in the same VLAN through a Layer 2 VNI:

Table 20: Scenario 2: Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI

Check to be Performed	Steps to Follow
Has ARP been resolved on the local host for the Layer 2 adjacent remote host?	Run the arp -a command in privileged EXEC mode on the host device.
Do the hosts have the same subnet masks?	Perform any of the following steps: <ul style="list-style-type: none"> • Check the host device. • Check the SVI configuration on the VTEP.
Do you have the EVPN instance configured on your local VTEP?	Run the following commands in privileged EXEC mode on the VTEP: <ul style="list-style-type: none"> • show run section l2vpn • show run section vlan config • show run interface nve interface-number
Has the remote MAC address been learned in platform MATM in the same VLAN as the local host?	Run the show platform software fed switch active matm macTable vlan vlan-id command in privileged EXEC mode on the VTEP to check for the remote MAC addresses in the same VLAN.

To troubleshoot unicast forwarding between two VTEPs in the same VLAN using a Layer 2 VNI, follow these steps:

- Verify the provisioning of the EVPN VXLAN Layer 2 overlay network.
- Verify intra-subnet traffic movement in the EVPN VXLAN Layer 2 overlay network.

Verifying the Provisioning of an EVPN VXLAN Layer 2 Overlay Network

To verify the provisioning of an EVPN VXLAN Layer 2 overlay network, perform these checks:

1. [Verify the Provisioning of the EVPN Instance in EVPN Manager, on page 217](#)
2. [Ensure that an NVE Peer is Present for the Layer 2 VNI, on page 219](#)
3. [Verify the Provisioning of the Layer 2 VNI in NVE Component, on page 219](#)
4. [Verify That the Layer 2 VNI VXLAN Tunnel Pseudoport is added to the Access VLAN in Layer 2 Forwarding Information Base \(FIB\), on page 220](#)

Verify the Provisioning of the EVPN Instance in EVPN Manager

The following examples show how to verify that the EVPN instance is provisioned in the EVPN manager:

```
VTEP-1# show run | section l2vpn
l2vpn evpn instance 10 vlan-based
encapsulation vxlan
```

```

route-target export 10:1      <<-- Import or export right route-targets

route-target import 10:2     <<-- Import or export right route-targets

VTEP-1# show run | section vlan config
vlan configuration 10
member evpn-instance 10 vni 10001  <<-- EVPN instance & VNI mapped to the VLAN

VTEP-1# show run interface nve1
interface nve1
source-interface Loopback999
host-reachability protocol bgp
member vni10001 mcast-group 239.10.10.10  <<-- VNI added to NVE interface

VTEP-1# show run interface loopback 999
interface Loopback999
description VxLAN Loopback
ip address 10.255.1.1 255.255.255.255

```

Note Run the **show run** commands on VTEP 2 to verify its configuration, if required.

```

VTEP-1# show l2vpn evpn evi 10 detail <<-- VLAN number and EVPN Instance number
                                     are not always the same, confirm which
                                     EVPN Instance maps to your VLAN
                                     with the show l2vpn evpn evi command

EVPN instance: 10 (VLAN Based) <<-- EVPN Instance number does map to the VLAN.
RD: 10.1.1.1:10 (auto)
Import-RTs: 10:2 <<-- Importing VTEP-2 (if you are not seeing the prefix,
                  check configuration for the right import/export statement
                  under the l2vpn evpn instance)

Export-RTs: 10:1
Per-EVI Label: none
State: Established
Encapsulation: vxlan

  IPv6 IRB: Enabled
  Pseudoports:
    GigabitEthernet2/0/1 service instance 10
    <<- Layer 2 Access pseudoport (combination of Layer 2 port and service instance)
```

Ensure that an NVE Peer is Present for the Layer 2 VNI

The following examples show how to check if an NVE peer is present for the Layer 2 VNI:

```
VTEP-1# show nve peers vni 10001 <<- This VNI is learned from "show l2vpn evpn evi"
Interface VNI Type Peer-IP RMAC/Num_RTs eVNI state flags UP time
nve1 10001 L2CP 10.255.2.1 2 10001 UP N/A 00:01:03
<<- Layer 2 Control Plane (L2CP) peer for the VNI is an indicator that this is
Layer 2 forwarding
<<- Interface NVE1, L2CP, egress VNI are shown, state is UP for a time of 00:01:03

VTEP-2# show nve peers vni 10001
Interface VNI Type Peer-IP RMAC/Num_RTs eVNI state flags UP time
nve1 10001 L2CP 10.255.1.1 3 10001 UP N/A 00:47:2
<<- Interface NVE1, L2CP, egress VNI are shown, state is UP for a time of 00:47:02
```

Verify the Provisioning of the Layer 2 VNI in NVE Component

The following example shows how to verify that the Layer 2 VNI is provisioned in the NVE component:

```
VTEP-1# show nve vni 10001 detail <<- VNI 10001 is correlated to VLAN 10
from show l2vpn evpn evi
Interface VNI Multicast-group VNI state Mode VLAN cfg vrf
nve1 10001 239.10.10.10 Up L2CP 10 CLI vxlan
```

```
<<- state is UP, type is Layer 2 VNI (L2CP); VLAN 10 is mapped to VNI 10001
```

```
L2 VNI IPv6 IRB down reason:
BDI or associated L3 BDI's IPv6 addr un-configured
IPv6 topo_id disabled
```

```
L2CP VNI local VTEP info: <<- Layer 2 VNI provisioning
VLAN: 10 <<- Confirms that mapping is with VLAN 10

```

Verifying Intra-Subnet Traffic Movement in an EVPN VXLAN Layer 2 Overlay Network

The following figure illustrates the movement of traffic from host devices connected to VTEP 1 to host devices connected to VTEP 2:

Figure 11: Movement of traffic in an EVPN VXLAN network Through Layer 2 and Layer 3 VNIs

In the above figure, Layer 2 traffic moves from host device 2 to host device 3 through the Layer 2 VNI 10001. To verify the movement of intra-subnet traffic in the EVPN VXLAN Layer 2 overlay network, perform these checks:

1. [Verify that the Local MAC Addresses Have Been Learned in IOS-MATM, on page 222](#)
2. [Verify that Both Local and Remote MAC Addresses are Learned in FED-MATM, on page 222](#)

3. Confirm that the ICMP Echo Request Leaves VTEP 1 Encapsulated and Goes to a UDP Destination Port on VTEP 2, on page 223
4. Verify ARP for Local Host Devices, on page 223
5. Verify that the MAC Address Entries are Learned in SISF Device Tracking Table, on page 223
6. Verify that EVPN Manager Has Been Updated with the MAC Address Entries, on page 224
7. Verify that EVPN Manager Has Updated the MAC Routes into Layer 2 RIB, on page 225
8. Verify that Layer 2 RIB Has Updated BGP with the Local MAC Routes, and that BGP Has Updated Layer 2 RIB with the Remote MAC Routes, on page 225
9. Verify that the MAC Routes Learned from BGP and Updated to Layer 2 RIB are Also Updated to L2FIB, on page 227

**Note**

Only MAC routes are considered while verifying the movement of intra-subnet traffic. MAC-IP routes are not applicable to bridged traffic.

Verify that the Local MAC Addresses Have Been Learned in IOS-MATM

The following examples show how to verify that the local MAC addresses have been learned in IOS-MATM:

```
VTEP-1# show mac address-table interface tw 1/0/1 vlan 10
      Mac Address Table
```

Vlan	Mac Address	Type	Ports
10	005f.8602.10c6	DYNAMIC	Tw1/0/1

<<- IOS-MATM shows only local MAC addresses

```
VTEP-2# show mac address-table interface g 2/0/1 vlan 10
      Mac Address Table
```

Vlan	Mac Address	Type	Ports
10	008e.7391.1946	DYNAMIC	Gi2/0/1

Verify that Both Local and Remote MAC Addresses are Learned in FED-MATM

The following examples show how to verify that both local and remote MAC addresses are learned in FED-MATM:

```
VTEP-1# show platform software fed switch active matm macTable vlan 10
```

VLAN	MAC	Type	Seq#	EC_Bi	Flags	machandle	siHandle	riHandle	diHandle	*a_time	*e_time	ports

```

Verify ARP for Local Host Devices

The following examples show how to verify ARP for local host devices:

```

VTEP-1# show ip arp vrf vxlan 10.10.10.11
Protocol Address          Age (min)  Hardware Addr  Type   Interface
Internet 10.10.10.11             2          005f.8602.10c6 ARPA   Vlan10

VTEP-2# show ip arp vrf vxlan 10.10.10.12
Protocol Address          Age (min)  Hardware Addr  Type   Interface
Internet 10.10.10.12             4          008e.7391.1946 ARPA   Vlan10

```

Verify that the MAC Address Entries are Learned in SISF Device Tracking Table

The following examples show how to verify that the MAC addresses are learned in SISF device tracking table:

```
VTEP-1# show device-tracking database mac <<- Only Local MAC addresses are seen
                                         in SISF device tracking table
MAC                Interface      vlan prlvl      state      time left policy
005f.8602.10c6     Tw1/0/1         10 NO TRUST     MAC-REACHABLE 347 s      evpn-sisf-policy
<<- MAC, REACH, and EVPN type SISF policy are displayed

VTEP-2# show device-tracking database mac <<- Only Local MAC addresses are seen
                                         in SISF device tracking table
MAC                Interface      vlan prlvl      state      time left policy
008e.7391.1946     Gi2/0/1         10 NO TRUST     MAC-REACHABLE 164 s      evpn-sisf-policy
<<- MAC, REACH, and EVPN type SISF policy are displayed
```

Verify that EVPN Manager Has Been Updated with the MAC Address Entries

EVPN manager learns local MAC addresses and adds them to Layer 2 RIB. EVPN Manager also learns the remote MAC addresses from Layer 2 RIB, but the entries are only used for processing MAC mobility.

The following examples show how to verify that EVPN manager has been updated with the MAC addresses:

```
VTEP-1# show 12vpn evpn mac evi 10
MAC Address      EVI    VLAN    ESI                      Ether Tag  Next Hop
-----
005f.8602.10c6  10     10      0000.0000.0000.0000.0000 0           Tw1/0/1:10
<<- MAC Addresss learned by EVPN Manager. States look correct
008e.7391.1946  10     10      0000.0000.0000.0000.0000 0           10.255.2.1

Verify that EVPN Manager Has Updated the MAC Routes into Layer 2 RIB

Layer 2 RIB learns local MAC addresses from EVPN manager and updates BGP and Layer 2 FIB with them. Layer 2 RIB also learns remote MAC addresses from BGP and updates EVPN manager and Layer 2 FIB with them. Layer 2 RIB needs both local and remote MAC addresses in order to update BGP and Layer 2 FIB.

The following examples show how to verify that EVPN manager has updated the MAC routes into Layer 2 RIB:

```

VTEP-1# show l2route evpn mac
  EVI      ETag  Prod  Mac Address                Next Hop(s) Seq Number
-----
  10              0 L2VPN 005f.8602.10c6            Tw1/0/1:10    0
  <<- Local prefix was added by EVPN Manager (Layer 2 VPN) into Layer 2 RIB
  10              0 BGP  008e.7391.1946            V:10001 10.255.2.1    0
  <<- Remote prefix was added by BGP into Layer 2 RIB

VTEP-2# show l2route evpn mac
  EVI      ETag  Prod  Mac Address                Next Hop(s) Seq Number
-----
  10              0 BGP  005f.8602.10c6            V:10001 10.255.1.1    0
  <<- Remote prefix was added by BGP into Layer 2 RIB
  10              0 L2VPN 008e.7391.1946            Gi2/0/1:10    0
  <<- Local prefix was added by EVPN Manager (Layer 2 VPN) into Layer 2 RIB
    
```

Verify that Layer 2 RIB Has Updated BGP with the Local MAC Routes, and that BGP Has Updated Layer 2 RIB with the Remote MAC Routes

The following examples show how to verify that Layer 2 RIB has updated BGP with the local MAC routes and that BGP has updated Layer 2 RIB with the remote MAC routes:

```

VTEP-1# show bgp l2vpn evpn route-type 2 0 005f860210c6 *
    
```

```

Note Only remote MAC routes are displayed in the output.

Troubleshooting Unicast Forwarding Between VTEPS in Different VLANs Through a Layer 3 VNI

This scenario might occur when host device 1 in VLAN 12 attempts to ping host device 4 in VLAN 13. Perform the checks listed in the following table before troubleshooting unicast forwarding between VTEPs in different VLANs through a Layer 3 VNI:

Table 21: Scenario 3: Troubleshooting Unicast Forwarding Between VTEPS in Different VLANs Through a Layer 3 VNI

Check to be Performed	Steps to Follow
Are the source and destination host devices in different subnets?	Check the subnet of the local host device and compare it against the subnet of the remote host device.

Check to be Performed	Steps to Follow
Do you have an SVI interface configured for the remote subnet?	Run the show ip interface brief exclude unassigned command in privileged EXEC mode on the VTEP.
Do you have the EVPN instance configured on your local VTEP?	Run the following commands in privileged EXEC mode on the VTEP: <ul style="list-style-type: none"> • show run section l2vpn • show run section vlan config • show run interface nve interface-number

To troubleshoot unicast forwarding between two VTEPs in different VLANs using a Layer 3 VNI, follow these steps:

- Verify the provisioning of the EVPN VXLAN Layer 3 overlay network.
- Verify inter-subnet traffic movement and symmetric IRB in the EVPN VXLAN Layer 3 overlay network.

Verifying the Provisioning of an EVPN VXLAN Layer 3 Overlay Network

To verify the provisioning of an EVPN VXLAN Layer 3 overlay network, perform these checks:

1. [Verify that the Access SVIs, Core SVIs, and NVE Interfaces are Up, on page 229](#)
2. [Verify that the IP VRF is Provisioned with the Correct SVIs, Stitching Route-Targets, and Route Distinguisher, on page 230](#)
3. [Verify that Both Layer 2 and Layer 3 VNIs are provisioned in the VRF and are UP, on page 231](#)
4. [Verify that EVPN Manager is Updated from the NVE with all the Layer 2 and IRB Attributes, on page 232](#)
5. [Verify that the Remote Layer 3 VNI Details are Learned on Each VTEP, on page 233](#)
6. [Verify that the Layer 3 VNI Tunnel Pseudoport is Installed into Layer 2 FIB in the Core VLAN, on page 233](#)

Verify that the Access SVIs, Core SVIs, and NVE Interfaces are Up

The following examples show how to verify that the access SVIs, core SVIs, and NVE interfaces are up:

```
VTEP-1# show ip interface brief
Interface          IP-Address      OK? Method Status  Protocol
Vlan10             10.10.10.1      YES NVRAM  up      up
Vlan12             10.12.12.1      YES NVRAM  up      up    <<-- Access Interface
Vlan99             10.255.1.1      YES unset  up      up    <<-- Core Interface
<<-- If protocol status for the core interface is down, run the no autostate command
Loopback0          10.1.1.1        YES NVRAM  up      up
Loopback999        10.255.1.1      YES NVRAM  up      up
Tunnel0            10.255.1.1      YES unset  up      up
```

```

Tunnel1          10.1.1.5      YES unset up      up
nve1             unassigned  YES unset up      up

VTEP-2# show ip interface brief
Interface        IP-Address      OK? Method Status      Protocol
Vlan10           10.10.10.1      YES NVRAM  up          up
Vlan13           10.13.13.1      YES NVRAM  up          up    <<- Access Interface
Vlan99           10.255.2.1      YES unset  up          up    <<- Core Interface
    <<- If protocol status for the core interface is down, run the no autostate command
Loopback0        10.2.2.2        YES NVRAM  up          up
Loopback999      10.255.2.1      YES NVRAM  up          up
Tunnel0          10.255.2.1      YES unset  up          up
Tunnel1          10.1.1.10       YES unset  up          up

```

Verify that the IP VRF is Provisioned with the Correct SVIs, Stitching Route-Targets, and Route Distinguisher

The following examples show how to verify that the IP VRF is provisioned with the correct SVIs, stitching route-targets, and route distinguisher:

```

VTEP-1# show run vrf vxlan    <<- vxlan is the name of the VRF
vrf definition vxlan
rd 10.255.1.1:1
!
address-family ipv4
  route-target export 10.255.1.1:1 stitching    <<- Exporting local route-target
  route-target import 10.255.2.1:1 stitching    <<- Importing VTEP-2 route-target

```

```

VTEP-1# show ip vrf vxlan    <<- vxlan is the name of the VRF
Name                          Default RD      Interfaces

Verify that Both Layer 2 and Layer 3 VNIs are provisioned in the VRF and are UP

The following examples show how to verify that both Layer 2 and Layer 3 VNIs are provisioned in the VRF and are up:

```

VTEP-1# show run | section vlan config
vlan configuration 99    <<- VNI is a member of VRF vxlan, not of EVPN instance
member vni99999

VTEP-1# show run interface vlan 99
interface Vlan99
description connected to L3_VNI_99999
vrf forwarding vxlan
ip unnumbered Loopback999

VTEP-1# show run interface nve 1
no ip address
source-interface Loopback999
host-reachability protocol bgp
member vni 99999 vrf vxlan    <<- VNI tied to the VRF under NVE interface
member vni 12012 mcast-group 239.12.12.12    <<- VNI tied to the NVE

VTEP-1# show run | section l2vpn
l2vpn evpn instance 12 vlan-based
encapsulation vxlan
route-target export 12:1    <<- Remote VTEP is NOT importing this route target,
                             as it does not have the VLAN or VNI on its end
route-target import 12:1
no auto-route-target

VTEP-1# show run | section vlan config

```

```
vlan configuration 12
member evpn-instance 12 vni 12012 <<- EVPN instance or VNI associated to the VLAN
```

```
VTEP-1# show nve vni
Interface VNI Multicast-group VNI state Mode VLAN cfg vrf
nve1 10001 239.10.10.10 Up L2CP 10 CLI vxlan

Verifying Inter-Subnet Traffic Movement and Symmetric IRB in an EVPN VXLAN Layer 3 Overlay Network

The following figure illustrates the movement of traffic from host devices connected to VTEP 1 to host devices connected to VTEP 2:

In the above figure, Layer 3 traffic moves from host device 1 to host device 4 through the Layer 3 VNI 99999. To verify the movement of inter-subnet traffic in the EVPN VXLAN Layer 3 overlay network, perform these checks:

1. Verify that Local MAC Address and IP Address Entries are Learned in SISF Device Tracking Table, on page 235
2. Verify that MAC Address and IP Address Entries are Learned in EVPN Manager, on page 236
3. Verify that MAC Address and IP Address Entries are Learned in Layer 2 RIB, on page 237
4. Verify that Local MAC Address and IP Address Entries are Learned in MAC VRF, on page 237
5. Verify that Remote MAC-IP Address Pair is Learned in the VRF, on page 238
6. Verify that IP Routes are Inserted in RIB, on page 239
7. Verify that the Adjacency Table Contains Entries for the VRF-Enabled Core VLAN Interface, on page 239
8. Confirm that Adjacency Exists to the VTEP Tunnel IP Address for a Host Device in IP VRF, on page 240
9. Confirm that Adjacency Exists to Reach Tunnel Destination, on page 240
10. Confirm that the ICMP Echo Request that Leaves Encapsulated from the Source VTEP Reaches the Loopback Tunnel Endpoint and UDP Destination Port on the Destination VTEP Through the Layer 3 VNI and IP VRF, on page 240

Verify that Local MAC Address and IP Address Entries are Learned in SISF Device Tracking Table

The following examples show how to verify that local MAC address and IP address entries are learned in SISF device tracking table:

```
VTEP-1# show device-tracking database vlanid 12
Binding Table has 4 entries, 2 dynamic (limit 100000)
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
Preflevel flags (prlvl):
0001:MAC and LLA match      0002:Orig trunk      0004:Orig access
```

```

0008:Orig trusted trunk    0010:Orig trusted access    0020:DHCP assigned
0040:Cga authenticated     0080:Cert authenticated     0100:Statically assigned

```

Network Layer Address	Link Layer Address	Interface	vlan	prlvl	age
state Time left					
ARP 10.12.12.12	005f.8602.10e7	Tw1/0/1	12	0005	115s
REACHABLE N/A					

VTEP-2# **show device-tracking database vlanid 13**

```

vlanDB has 2 entries for vlan 13, 1 dynamic
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
Preflevel flags (prlvl):
0001:MAC and LLA match    0002:Orig trunk            0004:Orig access
0008:Orig trusted trunk   0010:Orig trusted access    0020:DHCP assigned
0040:Cga authenticated    0080:Cert authenticated    0100:Statically assigned

```

Network Layer Address	Link Layer Address	Interface	vlan	prlvl	age

```

Confirm that Adjacency Exists to the VTEP Tunnel IP Address for a Host Device in IP VRF

The following example shows how to confirm that adjacency exists to the VTEP Tunnel IP address for a host device in IP VRF:

```

VTEP-1# show ip cef vrf vxlan 10.13.13.13/32 <<-- Remote host in VLAN 13 of VTEP-2
10.13.13.13/32
  nexthop 10.255.2.1 Vlan99

```

Confirm that Adjacency Exists to Reach Tunnel Destination

The following example shows how to confirm that adjacency exists to reach tunnel destination:

```

VTEP-1# show ip cef 10.255.1.11
10.255.2.1/32
  nexthop 10.1.1.6 TwoGigabitEthernet1/0/2

```

Confirm that the ICMP Echo Request that Leaves Encapsulated from the Source VTEP Reaches the Loopback Tunnel Endpoint and UDP Destination Port on the Destination VTEP Through the Layer 3 VNI and IP VRF

The following image confirms that the ICMP echo request that leaves encapsulated from source VTEP reaches the Loopback interface and UDP destination port on the destination VTEP through the Layer 3 VNI and IP VRF:

Seq	Len	Source	Destination	Protocol	Length	Operation
3	0.000	10.12.12.12	10.13.13.13	ICMP	164	Echo (ping) request
4	0.000	10.13.13.13	10.12.12.12	ICMP	164	Echo (ping) reply
5	0.000	10.12.12.12	10.13.13.13	ICMP	164	Echo (ping) request
6	0.000	10.13.13.13	10.12.12.12	ICMP	164	Echo (ping) reply

Troubleshooting Unicast Forwarding Between a VXLAN Network and an IP Network

This scenario might occur when host device 1 attempts to ping an external IP address through a border leaf VTEP. Perform the checks listed in the following table before troubleshooting unicast forwarding between a VXLAN network and an external IP network.

Table 22: Scenario 4: Troubleshooting Unicast Forwarding Between a VXLAN Network and an IP Network

Check to be performed	Steps to follow
Is one IP address present in the VXLAN network and the other IP address coming from external IP network?	<p>Check the local subnets (or the SVI interfaces) if the remote subnet is present.</p> <p>Note Local subnet has the remote subnet listed even in the case of scenario 3.</p>
Is the EVPN route type 5 being used to send traffic to remote destination?	Run the show bgp l2vpn evpn all command in privileged EXEC mode on the VTEP. Look for remote prefix to be displayed as [5] for route type 5.

To troubleshoot unicast forwarding between a VXLAN network and an external IP network, follow these steps:

- Verify the provisioning of the EVPN VXLAN Layer 3 overlay network.
- Verify traffic movement from the VXLAN network to the IP network through the border leaf switch using route type 5.

Verifying the Provisioning of an EVPN VXLAN Layer 3 Overlay Network

See [Verifying the Provisioning of an EVPN VXLAN Layer 3 Overlay Network, on page 229](#) for detailed steps.

Verifying Traffic from a VXLAN Fabric to an IP Network Through a Border Leaf Switch Using Route Type 5

To verify the movement of traffic from a VXLAN fabric to an external IP network through a border leaf switch, perform these checks:

1. [Check the Table Entries for BGP, EVPN, and VPNv4 Tables, on page 241](#)
2. [Check the Table Entries for BGP, EVPN, and VPNv4 Tables, on page 241](#)
3. [Confirm that Adjacency exists to Reach Tunnel Destination, on page 244](#)

Check the Table Entries for BGP, EVPN, and VPNv4 Tables

The following examples show how to check the table entries for BGP, EVPN and VPNv4 tables:

```

VTEP-1# show bgp vpnv4 unicast vrf vxlan 10.9.9.9/32
<<- To a remote IP address outside the VXLAN fabric

Confirm that Adjacency exists to Reach Tunnel Destination

The following example shows how to confirm that adjacency exists to reach Tunnel destination:

```
VTEP-1# show ip cef 10.255.1.11  
10.255.1.11/32  
  nexthop 10.1.1.6 TwoGigabitEthernet1/0/2
```

CHAPTER 10

Feature History for BGP EVPN VXLAN

- [Feature History for BGP EVPN VXLAN, on page 245](#)

Feature History for BGP EVPN VXLAN

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Fuji 16.9.1	EVPN VXLAN Overlay Network for IPv4 Bridged Traffic	EVPN VXLAN overlay network for IPv4 bridged traffic is a Layer 2 overlay network that allows host devices within the same subnet to send IPv4 bridged traffic to each other using a Layer 2 virtual network instance (VNI).
	EVPN VXLAN Overlay Network for IPv4 Routed Traffic	EVPN VXLAN overlay network for IPv4 routed traffic is a Layer 3 overlay network that allows host devices in different Layer 2 networks to send IPv4 routed traffic to each other using a Layer 3 VNI and an IP VRF.
	Layer 2 Broadcast, Unknown Unicast, and Multicast (BUM) Traffic Forwarding using Underlay Multicast	Multi-destination Layer 2 broadcast, unknown unicast, and multicast (BUM) traffic in an EVPN VXLAN network is replicated through a multicast group in the underlay network and forwarded to all the endpoints of the network.
	Leaf Functionality	A leaf switch sits on the edge of a BGP EVPN VXLAN fabric and is connected to the host or access devices. It functions as a virtual tunnel end point (VTEP) and performs encapsulation and decapsulation.
	EVPN VXLAN Integrated Routing and Bridging	EVPN VXLAN integrated and bridging (IRB) allows the VTEPs in a VXLAN network to forward both Layer 2 or bridged traffic and Layer 3 or routed traffic. It is implemented as symmetric and asymmetric IRB.
	EVPN VXLAN Distributed Anycast Gateway	EVPN VXLAN distributed anycast gateway is a default gateway addressing mechanism that enables the use of the same gateway IP address across all the leaf switches that are part of a VXLAN network. Support was introduced with manual MAC address configuration on the Layer 2 VNI VLAN's switch virtual interface (SVI) on all VTEPs as the only method to enable the feature.
	DHCP Relay for IPv4 Traffic in BGP EVPN VXLAN Fabric	The VTEP in a BGP EVPN VXLAN fabric is configured as a DHCP relay agent to provide DHCP relay services for IPv4 traffic in a multi-tenant VXLAN environment.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.11.1	EVPN VXLAN Overlay Network for IPv6 Bridged Traffic	EVPN VXLAN overlay network for IPv6 bridged traffic is a Layer 2 overlay network that allows host devices within the same subnet to send IPv6 bridged traffic to each other using a Layer 2 VNI.
	EVPN VXLAN Overlay Network for IPv6 Routed Traffic	EVPN VXLAN overlay network for IPv6 routed traffic is a Layer 3 overlay network that allows host devices in different Layer 2 networks to send IPv6 routed traffic to each other using a Layer 3 VNI and an IP VRF.
	Layer 2 Broadcast, Unknown Unicast, and Multicast (BUM) Traffic Forwarding using Ingress Replication	Ingress replication is a unicast approach to handle multi-destination Layer 2 BUM traffic in an EVPN VXLAN network. It involves an ingress device replicating every incoming BUM packet and sending them as a separate unicast to the remote egress devices.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.12.1	MAC Aliasing for EVPN VXLAN Distributed Anycast Gateway	<p>MAC aliasing allows the leaf switches in an EVPN VXLAN network to advertise the MAC addresses of their Layer 2 VLAN's SVI as the gateway MAC address to all the other leaf switches in the network.</p> <p>MAC aliasing removes the need to explicitly configure the same MAC address on the Layer 2 VNI VLAN's SVI on all VTEPs in order to enable distributed anycast gateway.</p>
	EVPN VXLAN Multihoming in Single-active Redundancy Mode	<p>Multi-homing provides redundancy in the connection between a customer edge (CE) device and a VTEP by connecting the customer network with multiple VTEPs in an EVPN VXLAN network.</p> <p>In single-active redundancy mode, only one VTEP, among a group of VTEPs that are attached to the particular ethernet segment, is allowed to forward traffic to and from that ethernet segment.</p> <p>Multi-homing in single-active redundancy mode was introduced only in the form of dual-homing, allowing a CE device to be connected to two VTEPs.</p>
	Border Leaf Functionality	A border leaf switch is a leaf switch in a BGP EVPN VXLAN fabric that enables external connectivity with other Layer 2 and Layer 3 networks by acting as the connecting node between the two networks.
	Autonomous System Number Rewrite	The rewrite-evpn-rt-asn command was introduced to enable the rewrite of the autonomous system number (ASN) of the EVPN route target that originates from the current autonomous system with the ASN of the target eBGP EVPN peer.
	VRF-Lite Border Leaf Handoff	VRF-Lite border leaf handoff in a BGP EVPN VXLAN fabric allows Layer 3 external connectivity with a VRF-Lite network through a border leaf switch.
	MPLS Layer 3 VPN Border Leaf Handoff	MPLS Layer 3 VPN border leaf handoff in a BGP EVPN VXLAN fabric allows Layer 3 external connectivity with an MPLS Layer 3 VPN network through a border leaf switch.
	IEEE 802.1Q Border Leaf Handoff	IEEE 802.1Q border leaf handoff in a BGP EVPN VXLAN fabric allows Layer 2 external connectivity with an IEEE 802.1Q network through a border leaf switch.
	Access Border Leaf Handoff	Access border leaf handoff in a BGP EVPN VXLAN fabric allows Layer 2 external connectivity with an Access network through a border leaf switch.

Release	Feature	Feature Information
	VPLS over MPLS Border Leaf Handoff	VPLS over MPLS border leaf handoff in a BGP EVPN VXLAN fabric allows Layer 2 external connectivity with a VPLS over MPLS network through a border leaf switch.
Cisco IOS XE Amsterdam 17.1.1	Spine Functionality	A spine switch acts as the connecting node between all the leaf switches in a BGP EVPN VXLAN fabric, forwards the traffic between the leaf switches and provides redundancy to the network.
	Border Spine Functionality	A border spine switch in a BGP EVPN VXLAN fabric enables external connectivity with other Layer 2 and Layer 3 networks by acting as the connecting node between the two networks.
	Layer 3 Tenant Routed Multicast for IPv4 Traffic	Layer 3 tenant routed multicast (TRM) for IPv4 traffic enables multicast forwarding for IPv4 traffic in a BGP EVPN VXLAN fabric. It provides multi-tenancy-aware multicast forwarding between senders and receivers within the same subnet or different subnets, locally or across VTEPs.
	VRF-Lite Border Spine Handoff	VRF-Lite border spine handoff in a BGP EVPN VXLAN fabric allows Layer 3 external connectivity with a VRF-Lite network through a border spine switch.
	MPLS Layer 3 VPN Border Spine Handoff	MPLS Layer 3 VPN border spine handoff in a BGP EVPN VXLAN fabric allows Layer 3 external connectivity with an MPLS Layer 3 VPN network through a border spine switch.
	IEEE 802.1Q Border Spine Handoff	IEEE 802.1Q border spine handoff in a BGP EVPN VXLAN fabric allows Layer 2 external connectivity with an IEEE 802.1Q network through a border spine switch.
	Access Network Border Spine Handoff	Access border spine handoff in a BGP EVPN VXLAN fabric allows Layer 2 external connectivity with an Access network through a border spine switch.
	VPLS over MPLS Border Spine Handoff	VPLS over MPLS border spine handoff in a BGP EVPN VXLAN fabric allows Layer 2 external connectivity with a VPLS over MPLS network through a border spine switch.
	BGP EVPN VXLAN MIB support	Support was introduced for the MIB.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.
