# **Prerequisites for MPLS over GRE**

Ensure that the following routing protocols are configured and working properly.

- Label Distribution Protocol (LDP)-for MPLS label distribution.
- Routing protocol (ISIS or OSFP) between the core devices P1-P-P2
- MPLS between PE1-P1 and PE2-P2
- Since the ingress traffic enters the IP core from MPLS network and egress traffic leaves the IP core to enter the MPLS network, it is recommended to use QoS group value for defining QoS policies as we traverse the protocol boundary.

# **Restrictions for MPLS over GRE**

#### • GRE Tunneling :

- L2VPN over mGRE and L3VPN over mGRE is not supported.
- The tunnel source can only be a loopback or a Layer 3 interface. These interfaces could either be physical interfaces or etherchannels.
- Tunnel interface supports Static Routes, Enhanced Interior Gateway Routing Protocol (EIGRP) and Open Shortest Path First (OSPF) routing protocols.
- GRE Options Sequencing, Checksum and Source Route are not supported.

- IPv6 generic routing encapsulation (GRE) is not supported.
- Carrier Supporting Carrier (CSC) is not supported.
- Tunnel source cannot be a subinterface.

# **Information About MPLS over GRE**

The MPLS over GRE feature provides a mechanism for tunneling Multiprotocol Label Switching (MPLS) packets over a non-MPLS network. This feature allows you to create a generic routing encapsulation (GRE) tunnel across a non-MPLS network. The MPLS packets are encapsulated within the GRE tunnel packets, and the encapsulated packets traverse the non-MPLS network through the GRE tunnel. When GRE tunnel packets are received at the other side of the non-MPLS network, the GRE tunnel packet header is removed and the inner MPLS packet is forwarded to its final destination. The core network between the end-points of the GRE tunnel uses ISIS or OSPF routing protocol whereas the GRE tunnel uses OSPF or EIGRP.

## **PE-to-PE Tunneling**

The provider-edge-to-provider-edge (PE-to-PE) tunneling configuration provides a scalable way to connect multiple customer networks across a non-MPLS network. With this configuration, traffic that is destined to multiple customer networks is multiplexed through a single generic routing encapsulation (GRE) tunnel.

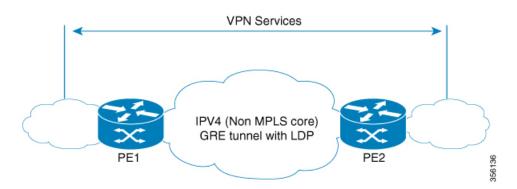

**Note** A similar nonscalable alternative is to connect each customer network through separate GRE tunnels (for example, connecting one customer network to each GRE tunnel).

The PE device on one side of the non-MPLS network uses the routing protocols (that operate within the non-MPLS network) to learn about the PE device on the other side of the non-MPLS network. The learned routes that are established between the PE devices are then stored in the main or default routing table.

The opposing PE device uses OSPF or EIGRP to learn about the routes that are associated with the customer networks that are behind the PE devices. These learned routes are not known to the non-MPLS network.

The following figure shows an end-to-end IP core from one PE device to another through the GRE tunnel that spans the non-MPLS network.

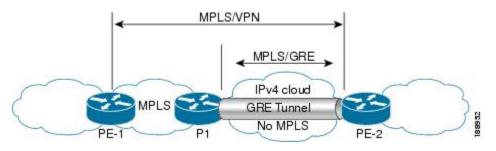

#### Figure 1: PE-to-PE Tunneling

### P-to-PE Tunneling

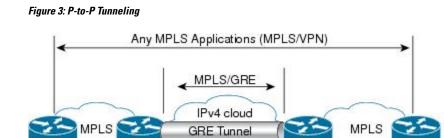

The provider-to-provider-edge (P-to-PE) tunneling configuration provides a way to connect a PE device (P1) to a Multiprotocol Label Switching (MPLS) segment (PE-2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single generic routing encapsulation (GRE) tunnel.

Figure 2: P-to-PE Tunneling

### **P-to-P Tunneling**

As shown in the figure below, the provider-to-provider (P-to-P) configuration provides a method of connecting two Multiprotocol Label Switching (MPLS) segments (P1 to P2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single generic routing encapsulation (GRE) tunnel.

No MPLS

# How to Configure MPLS over GRE

The following section provides the various configuration steps for MPLS over GRE:

## **Configuring the MPLS over GRE Tunnel Interface**

P1

To configure the MPLS over GRE feature, you must create a generic routing encapsulation (GRE) tunnel to span the non-MPLS networks. You must perform the following procedure on the devices located at both ends of the GRE tunnel.

P2

#### **SUMMARY STEPS**

1. enable

I

- 2. configure terminal
- **3. interface tunnel** *tunnel-number*
- 4. ip address ip-address mask
- **5. tunnel source** *source*-*address*
- 6. tunnel destination destination-address
- 7. mpls ip
- 8. end

#### **DETAILED STEPS**

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	• Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	interface tunnel tunnel-number	Creates a tunnel interface and enters interface configuration mode.	
	Example:		
	Device(config)# interface tunnel 1		
Step 4	ip address ip-address mask	Assigns an IP address to the tunnel interface.	
	Example:		
	Device(config-if)# ip address 10.0.0.1 255.255.255.0		
Step 5	tunnel source source-address	Specifies the tunnel's source IP address.	
	Example:		
	Device(config-if)# tunnel source 10.1.1.1		
Step 6	tunnel destination destination-address	Specifies the tunnel's destination IP address.	
	Example:		
	Device(config-if)# tunnel destination 10.1.1.2		
Step 7	mpls ip	Enables Multiprotocol Label Switching (MPLS) on the tunnel's physical interface.	
	Example:		
	Device(config-if)# mpls ip		

	Command or Action	Purpose
Step 8	end	Returns to privileged EXEC mode.
	Example:	
	Device(config-if)# end	

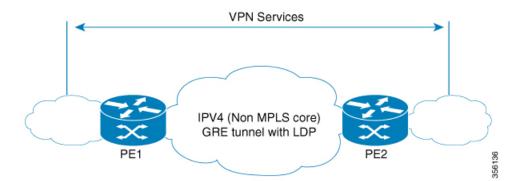

## **Configuration Examples for MPLS over GRE**

The following section provides configuration examples for MPLS over GRE:

## **Example: PE-to-PE Tunneling**

The following shows basic MPLS configuration on two Provider Edge (PE) devices, PE-to-PE tunneling, which use GRE tunnel to send traffic over non-MPLS network.

#### Figure 4: Topology for PE-to-PE Tunneling

#### **PE1 Configuration**

!
mpls ip
!
interface loopback 10
ip address 11.2.2.2 255.255.255.255
ip router isis !
interface GigabitEthernet 1/1/1
ip address 1.1.1.1 255.255.255.0
ip router isis
!
interface Tunnel 1
ip address 10.0.0.1 255.255.255.0
ip ospf 1 are 0
tunnel source 11.2.2.2
tunnel destination 11.1.1.1
mpls ip
!
interface Vlan701
ip address 65.1.1.1 255.255.255.0

ip ospf 1 area 0 !

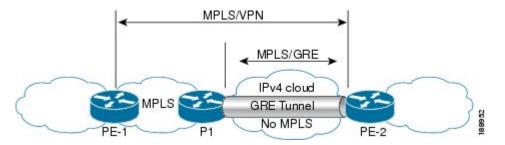

#### **PE2 Configuration**

```

## **Feature History for MPLS over GRE**

This table provides release and related information for the features explained in this module.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.11.1	MPLS over GRE	MPLS over GRE feature provides a mechanism for tunneling Multiprotocol Label Switching (MPLS) packets over non-MPLS networks by creating a generic routing encapsulation (GRE) tunnel. The MPLS packets are encapsulated within the GRE tunnel packets, and the encapsulated packets traverse the non-MPLS network through the GRE tunnel. When GRE tunnel packets are received at the other side of the non-MPLS network, the GRE tunnel packet header is removed and the inner MPLS packet is forwarded to its final destination.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.
