- [Configuration Examples for EVPN VXLAN Layer 2 Overlay Network, on page 12](#)
- [Verifying EVPN VXLAN Layer 2 Overlay Network, on page 19](#)

## Information About EVPN VXLAN Layer 2 Overlay Network

An EVPN VXLAN Layer 2 overlay network allows host devices in the same subnet to send bridged or Layer 2 traffic to each other. The network forwards the bridged traffic using a Layer 2 virtual network instance (VNI).

### Broadcast, Unknown Unicast, and Multicast Traffic

Multidestination Layer 2 traffic in a VXLAN network is typically referred to as broadcast, unknown unicast, and multicast (BUM) traffic. In a BGP EVPN VXLAN fabric, the underlay network forwards the BUM traffic to all the endpoints connected to a common Layer 2 broadcast domain in the VXLAN overlay.

The following image shows the flow of BUM traffic through a Layer 2 VNI. The network forwards BUM traffic from host device 1 to all the VTEPs which in turn send the traffic to all the host devices in the same subnet.

The MP-BGP EVPN control plane uses two different methods to forward BUM traffic in a VXLAN network:

- Underlay Multicast
- Ingress Replication

## Underlay Multicast

In underlay multicast, the underlay network replicates the traffic through a multicast group. Forwarding BUM traffic using underlay multicast requires the configuration of IP multicast in the underlay network. A single copy of the BUM traffic moves from the ingress or source VTEP towards the underlay transport network. The network forwards this copy along the multicast tree so that it reaches all egress or destination VTEPs participating in the given multicast group. Various branch points in the network replicate the copy as it travels along the multicast tree. The branch points replicate the copy only if the receivers are part of the multicast group associated with the VNI.

BUM traffic forwarding through underlay multicast is achieved by mapping a Layer 2 VNI to the multicast group. This mapping must be configured on all the VTEPs associated with the Layer 2 VNI. When a VTEP joins the multicast group, it receives all the traffic that is forwarded on that group. If the VTEP receives traffic in a VNI that is not associated with it, it simply drops the traffic. This approach maintains a single link within the network, thus providing an efficient way to forward BUM traffic.

## Ingress Replication

Ingress replication, or headend replication, is a unicast approach to handle multdestination Layer 2 overlay BUM traffic. Ingress replication involves an ingress device replicating every incoming BUM packet and sending them as a separate unicast to the remote egress devices. Ingress replication happens through EVPN route type 3, also called as inclusive multicast ethernet tag (IMET) route. BGP EVPN ingress replication uses IMET route for auto-discovery of remote peers in order to set up the BUM tunnels over VXLAN. Using ingress replication to handle BUM traffic can result in scaling issues as an ingress device needs to replicate the BUM traffic as many times as there are VTEPs associated with the Layer 2 VNI.

### Ingress Replication Operation

IMET routes carry the remote or egress VNIs advertised from the remote peers, which can be different from the local VNI. The network creates a VXLAN tunnel adjacency when an ingress device receives IMET ingress replication routes from remote NVE peers. The tunnel adjacency is a midchain adjacency which contains IP or UDP encapsulation for the VXLAN Tunnel. If there is more than one VNI along the tunnel, then multiple VNIs share the tunnel. Ingress replication on EVPN can have multiple unicast tunnel adjacencies and different egress VNIs for each remote peer.

The network builds a flooded replication list with the routes advertised by each VTEP. The dynamic replication list stores all the remote destination peers discovered on a BGP IMET route in the same Layer 2 VNI. The replication list gets updated every time you configure the Layer 2 VNI at a remote peer. The network removes the tunnel adjacency and VXLAN encapsulation from the replication list every time a remote NVE peer withdraws the IMET ingress replication route. The network deletes the tunnel adjacency when there is no NVE peer using it.

Any BUM traffic that reaches the ingress device gets replicated after the replication list is built. The ingress device forwards the replicated traffic throughout the network to all the remote peers in the same VNI.

## Flooding Suppression

EVPN allows the distribution of the binding between IPv4 or IPv6 addresses and MAC addresses among the VTEPs of the network. It distributes the MAC-IP binding among all the VTEPs that participate in the EVPN instance associated with the MAC-IP routes. The MAC address associated with the IPv4 or IPv6 addresses is locally known even though it is learned from a remote VTEP. Locally connected endpoints send an Address Resolution Protocol (ARP) or an IPv6 neighbor discovery request when they look for a remote endpoint. The MAC-IP binding distribution allows a VTEP to perform a lookup in the local cache when it receives an ARP or an IPv6 neighbor discovery request. If the MAC-IP address information for the remote end point is available, the VTEP can use this information to avoid flooding the ARP request. If the MAC or IP address information for the remote end point is not available, the request floods throughout the fabric.

Flooding suppression avoids the flooding of ARP and IPv6 neighbor discovery packets over the EVPN VXLAN network. It suppresses the flooding to both the local and remote host or access devices. The network suppresses the flooding by implementing an ARP or neighbor discovery relay. This is achieved by using the known MAC address for the specified IPv4 or IPv6 address to convert broadcast and multicast requests to unicast requests. Flooding suppression is enabled by default on an EVPN-enabled VLAN. An EVPN VXLAN network suppresses the flooding for the following types of traffic:

### ARP Flooding Suppression

VTEPs send ARP requests as broadcast packets. ARP requests represent a large percentage of Layer 2 broadcast traffic. Flooding suppression converts them to unicast packets and reduces the network flood.

### IPv6 Neighbor Discovery Flooding Suppression

The IPv6 neighbor discovery process enables the discovery of a neighbor and helps the peers to determine each other's link-layer addresses. It also verifies the reachability of a neighbor and tracks the neighboring routers. IPv6 neighbor discovery uses Internet Control Message Protocol (ICMP) messages and solicited-node multicast addresses to achieve these functions.

Flooding suppression suppresses all multicast neighbor solicitation packets among Internet Control Message Protocol version 6 (ICMPv6) packets.

# How to Configure EVPN VXLAN Layer 2 Overlay Network

The following figure shows a sample topology of an EVPN VXLAN Network. Host device 1 and host device 3 are part of the same subnet. The network forwards BUM traffic from host device 1 to host device 3 using a Layer 2 VNI through either underlay multicast or ingress replication methods.

**Note** In a two-VTEP topology, a spine switch is not mandatory. For information about configuration of spine switches in an EVPN VXLAN network, see *Configuring Spine Switches in a BGP EVPN VXLAN Fabric* module.

Perform the following set of procedures to configure an EVPN VXLAN Layer 2 overlay network and forward the BUM traffic:

- Configure Layer 2 VPN EVPN on the VTEPs.
- Configure an EVPN instance in the VLAN on the VTEPs.
- Configure the access-facing interface in the VLAN on the VTEPs.
- Configure the loopback interface on the VTEPs.
- Configure the network virtualization endpoint (NVE) interface on the VTEPs.
- Configure BGP with EVPN address family on the VTEPs.
- Configure underlay multicast, if the specified replication type is static. For more information, see *IP Multicast Routing Configuration Guide*.

## Configuring Layer 2 VPN EVPN on a VTEP

To configure the Layer 2 VPN EVPN parameters on a VTEP, perform the following steps:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>l2vpn evpn</b> <b>Example:</b> Device (config)# <b>l2vpn evpn</b>	Enters EVPN configuration mode.
<b>Step 4</b>	<b>replication-type {ingress   static}</b> <b>Example:</b> Device (config-evpn)# <b>replication-type static</b>	Configures the Layer 2 VPN EVPN replication type. <b>Note</b> Configure the Layer 2 VPN EVPN replication type as static, if multicast is enabled in the underlay network for EVPN BUM traffic.  When the Layer 2 VPN EVPN replication type is configured as static, the IMET route is not advertised and forwarding of BUM traffic relies on underlay multicast being configured on each VTEP.
<b>Step 5</b>	<b>router-id loopback-interface-id</b> <b>Example:</b> Device (config-evpn)# <b>router-id loopback 0</b>	Specifies the interface that will supply the IP addresses to be used in auto-generating route distinguishers.
<b>Step 6</b>	<b>default-gateway advertise</b> <b>Example:</b> Device (config-evpn)# <b>default-gateway advertise</b>	(Optional) Enables default gateway advertisement on the switch. To configure distributed anycast gateway in a VXLAN network using MAC aliasing, enable default gateway advertisement on all the leaf switches in the network.  This command is applicable in integrated routing and bridging (IRB) scenarios where Layer 2 and Layer 3 VNIs coexist in a VRF. Refer to <i>Configuring EVPN VXLAN Integrated Routing and Bridging</i> module for more details.  This command is mandatory only if the same MAC address is not manually configured on all the access SVIs.

	Command or Action	Purpose
		<p><b>Note</b> Use the <b>default-gateway advertise {enable   disable}</b> command in EVPN instance configuration mode to override the global default gateway advertisement settings and enable or disable it for a specific EVPN instance.</p>
<b>Step 7</b>	<p><b>logging peer state</b></p> <p><b>Example:</b> Device(config-evpn) # <b>logging peer state</b></p>	(Optional) Displays syslog message when the first route is received or the last route is withdrawn from a given remote VTEP.
<b>Step 8</b>	<p><b>mac duplication limit limit-number time time-limit</b></p> <p><b>Example:</b> Device(config-evpn) # <b>mac duplication limit 20 time 5</b></p>	(Optional) Changes parameters for detecting duplicate MAC addresses.
<b>Step 9</b>	<p><b>ip duplication limit limit-number time time-limit</b></p> <p><b>Example:</b> Device(config-evpn) # <b>ip duplication limit 20 time 5</b></p>	(Optional) Changes parameters for detecting duplicate IP addresses.
<b>Step 10</b>	<p><b>route-target auto vni</b></p> <p><b>Example:</b> Device(config-evpn) # <b>route-target auto vni</b></p>	(Optional) Specifies to use VNI instead of EVPN instance number to auto-generate route target.
<b>Step 11</b>	<p><b>exit</b></p> <p><b>Example:</b> Device(config-evpn) # <b>exit</b></p>	Exits EVPN configuration mode and enters global configuration mode.
<b>Step 12</b>	<p><b>l2vpn evpn instance evpn-instance-number vlan-based</b></p> <p><b>Example:</b> Device(config) # <b>l2vpn evpn instance 1 vlan-based</b></p>	<p>Configures a VLAN based EVPN instance in Layer 2 VPN configuration mode.</p> <p>An EVPN instance needs to be explicitly configured only when something needs to be configured per EVPN instance such as a route target.</p>
<b>Step 13</b>	<p><b>encapsulation vxlan</b></p> <p><b>Example:</b> Device(config-evpn-evi) # <b>encapsulation vxlan</b></p>	<p>(Optional) Defines the encapsulation format as VXLAN.</p> <p>The encapsulation format is VXLAN by default.</p>
<b>Step 14</b>	<p><b>replication-type {ingress   static}</b></p> <p><b>Example:</b></p>	(Optional) Sets the replication type for the EVPN instance.

	Command or Action	Purpose
	Device (config-evpn-evi) # <b>replication-type ingress</b>	In case a global replication type has already been configured, this overrides the global setting.
<b>Step 15</b>	<b>default-gateway advertise {enable   disable}</b>  <b>Example:</b> Device (config-evpn-evi) # <b>default-gateway advertise disable</b>	(Optional) Enables or disables the default gateway advertisement for the EVPN instance.  In case default gateway advertisement has already been globally configured, this overrides the global setting.  This command is mandatory only if the same MAC address is not manually configured on all the access SVIs.  To configure distributed anycast gateway in a VXLAN network using MAC aliasing, enable default gateway advertisement on all the leaf switches in the network.
<b>Step 16</b>	<b>ip local-learning {enable   disable}</b>  <b>Example:</b> Device (config-evpn-evi) # <b>ip local-learning disable</b>	(Optional) Enables or disables local IP address learning for the specified EVPN instance.  In case IP address learning has already been globally configured, this overrides the global setting.
<b>Step 17</b>	<b>no auto-route-target</b>  <b>Example:</b> Device (config-evpn-evi) # <b>no auto-route-target</b>	(Optional) Disables auto generation of route targets.
<b>Step 18</b>	<b>rd rd-value</b>  <b>Example:</b> Device (config-evpn-evi) # <b>rd 65000:100</b>	(Optional) Configures a route distinguisher manually.
<b>Step 19</b>	<b>route-target {import   export   both} rt-value</b>  <b>Example:</b> Device (config-evpn-evi) # <b>route-target both 65000:100</b>	(Optional) Configures route targets manually.  <b>Note</b> Configure route targets manually if the auto-generated route target values (ASN:EVI or ASN:VNI) are different between the VTEPs.
<b>Step 20</b>	<b>end</b>  <b>Example:</b> Device (config-evpn-evi) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring an EVPN Instance on the VLAN on a VTEP

To configure an EVPN instance on the VLAN on a VTEP, perform the following steps:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>vlan configuration <i>vlan-id</i></b> <b>Example:</b> Device(config)# <b>vlan configuration 11</b>	Enters VLAN feature configuration mode for the specified VLAN interface.
<b>Step 4</b>	<b>member evpn-instance <i>evpn-instance-id</i> vni <i>l2-vni-number</i></b> <b>Example:</b> Device(config-vlan)# <b>member evpn-instance 1 vni 10000</b>	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 2 VNI.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-vlan)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring the Loopback Interface on a VTEP

To configure the loopback interface on a VTEP, perform the following steps:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>loopback-interface-id</i></b> <b>Example:</b> Device(config)# <b>interface Loopback0</b>	Enters interface configuration mode for the specified Loopback interface.

	Command or Action	Purpose
<b>Step 4</b>	<b>ip address</b> <i>ipv4-address</i> <b>Example:</b> Device(config-if) # <b>ip address 10.12.11.11</b>	Configures the IP address for the Loopback interface.
<b>Step 5</b>	<b>ip pim sparse mode</b> <b>Example:</b> Device(config-if) # <b>ip pim sparse mode</b>	Enables Protocol Independent Multicast (PIM) sparse mode on the Loopback interface.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config-vlan) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring the Access-Facing Interface in the VLAN on a VTEP

To configure the access-facing interface in the VLAN on a VTEP, perform the following steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface</b> <i>interface-name</i> <b>Example:</b> Device(config) # <b>interface GigabitEthernet1/0/1</b>	Enters interface configuration mode for the specified interface.
<b>Step 4</b>	<b>switchport access vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config-if) # <b>switchport access vlan 11</b>	Configures the interface as a static-access port of the specified VLAN. Interface can also be configured as a trunk interface, if required.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-if) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring the NVE Interface on a VTEP

To add a VNI member to the NVE interface of a VTEP, perform the following steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface nve-interface-id</b> <b>Example:</b> Device(config)# <b>interface nve1</b>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
<b>Step 4</b>	<b>no ip address</b> <b>Example:</b> Device(config-if)# <b>no ip address</b>	Disables IP processing on the interface by removing its IP address.
<b>Step 5</b>	<b>source-interface loopback-interface-id</b> <b>Example:</b> Device(config-if)# <b>source-interface loopback0</b>	Sets the IP address of the specified loopback interface as the source IP address.
<b>Step 6</b>	<b>host-reachability protocol bgp</b> <b>Example:</b> Device(config-if)# <b>host-reachability protocol bgp</b>	Configures BGP as the host-reachability protocol on the interface.
<b>Step 7</b>	<b>member vni layer2-vni-id {ingress-replication   mcast-group multicast-group-address}</b> <b>Example:</b> Device(config-if)# <b>member vni 10000 mcast-group 227.0.0.1</b>	Associates the Layer 2 VNI member with the NVE.  The specified replication type must match the replication type that is configured globally or for the specific EVPN instance. Use <b>mcast-group</b> keyword for static replication and <b>ingress-replication</b> keyword for ingress replication.
<b>Step 8</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring BGP on a VTEP with EVPN Address Family

To configure BGP on a VTEP with EVPN address family and with spine switch as the neighbor, perform the following steps:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>router bgp <i>autonomous-system-number</i></b> <b>Example:</b> Device(config)# <b>router bgp 1</b>	Enables a BGP routing process, assigns it an autonomous system number, and enters router configuration mode.
<b>Step 4</b>	<b>bgp log-neighbor-changes</b> <b>Example:</b> Device(config-router)# <b>bgp log-neighbor-changes</b>	(Optional) Enables the generation of logging messages when the status of a BGP neighbor changes.  For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
<b>Step 5</b>	<b>bgp update-delay <i>time-period</i></b> <b>Example:</b> Device(config-router)# <b>bgp update-delay 1</b>	(Optional) Sets the maximum initial delay period before sending the first update.  The range is 1 to 3600 seconds.  For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
<b>Step 6</b>	<b>bgp graceful-restart</b> <b>Example:</b> Device(config-router)# <b>bgp graceful-restart</b>	(Optional) Enables the BGP graceful restart capability for all BGP neighbors.  For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
<b>Step 7</b>	<b>no bgp default ipv4-unicast</b> <b>Example:</b> Device(config-router)# <b>no bgp default ipv4-unicast</b>	(Optional) Disables default IPv4 unicast address family for BGP peering session establishment.  For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
<b>Step 8</b>	<b>neighbor <i>ip-address</i> remote-as <i>number</i></b> <b>Example:</b> Device(config-router)# <b>neighbor 10.11.11.11 remote-as 1</b>	Defines multiprotocol-BGP neighbors. Under each neighbor, define the Layer 2 Virtual Private Network (L2VPN) EVPN configuration.

	Command or Action	Purpose
		Use the IP address of the spine switch as the neighbor IP address.
<b>Step 9</b>	<b>neighbor</b> { <i>ip-address</i>   <i>group-name</i> } <b>update-source</b> <i>interface</i> <b>Example:</b> Device(config-router)# <b>neighbor</b> 10.11.11.11 <b>update-source</b> Loopback0	Configures update source. Update source can be configured per neighbor or per peer-group. Use the IP address of the spine switch as the neighbor IP address.
<b>Step 10</b>	<b>address-family</b> l2vpn evpn <b>Example:</b> Device(config-router)# <b>address-family</b> l2vpn evpn	Specifies the L2VPN address family and enters address family configuration mode.
<b>Step 11</b>	<b>neighbor</b> <i>ip-address</i> <b>activate</b> <b>Example:</b> Device(config-router-af)# <b>neighbor</b> 10.11.11.11 <b>activate</b>	Enables the exchange information from a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
<b>Step 12</b>	<b>neighbor</b> <i>ip-address</i> <b>send-community</b> [ <b>both</b>   <b>extended</b>   <b>standard</b> ] <b>Example:</b> Device(config-router-af)# <b>neighbor</b> 10.11.11.11 <b>send-community</b> both	Specifies the communities attribute sent to a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
<b>Step 13</b>	<b>exit-address-family</b> <b>Example:</b> Device(config-router-af)# <b>exit-address-family</b>	Exits address family configuration mode and returns to router configuration mode.
<b>Step 14</b>	<b>end</b> <b>Example:</b> Device(config-router)# <b>end</b>	Returns to privileged EXEC mode.

## Configuration Examples for EVPN VXLAN Layer 2 Overlay Network

This section provides an example for configuring an EVPN VXLAN Layer 2 overlay network. This example shows a sample configuration for a VXLAN network with 2 VTEPs, VTEP 1 and VTEP 2, connected to perform bridging.

366465

**Note** In a two-VTEP topology, a spine switch is not mandatory. For information about configuration of spine switches in an EVPN VXLAN network, see *Configuring Spine Switches in a BGP EVPN VXLAN Fabric* module.

*Table 1: Configuration Example for a VXLAN Network with Two VTEPs Connected to Perform Bridging*

VTEP 1	VTEP 2

The following examples provide outputs for **show** commands on VTEP 1 and VTEP 2 in the topology configured above.

- [show l2vpn evpn peers vxlan, on page 16](#)
- [show nve peers, on page 16](#)
- [show l2vpn evpn mac, on page 17](#)
- [show bgp l2vpn evpn all, on page 17](#)
- [show platform software fed switch active matm macTable vlan, on page 18](#)

### show l2vpn evpn peers vxlan

#### VTEP 1

This example shows the output for the **show l2vpn evpn peers vxlan** command on VTEP 1:

```

VTEP1# show l2vpn evpn peers vxlan
Interface VNI      Peer-IP              Num routes  eVNI      UP time
-----
nve10     6000             10.2.2.20            3           6000      00:12:44

```

#### VTEP 2

This example shows the output for the **show l2vpn evpn peers vxlan** command on VTEP 2:

```

VTEP2# show l2vpn evpn peers vxlan
Interface VNI      Peer-IP              Num routes  eVNI      UP time
-----
nve10     6000             10.1.1.10            3           6000      00:01:41

```

### show nve peers

#### VTEP 1

This example shows the output for the **show nve peers** command on VTEP 1:

```

VTEP1# show nve peers
Interface VNI      Type Peer-IP              RMAC/Num_RTs  eVNI      state flags UP time
-----
nve10     6000      L2CP 10.2.2.20        3           6000      UP   N/A  00:12:48

```

### VTEP 2

This example shows the output for the **show nve peers** command on VTEP 2:

```
VTEP2# show nve peers
Interface VNI      Type Peer-IP          RMAC/Num_RTs  eVNI  state flags UP time
nve10    6000    L2CP 10.1.1.10      3          6000    UP    N/A  00:01:46

## Verifying EVPN VXLAN Layer 2 Overlay Network

The following table lists the **show** commands that are used to verify a Layer 2 VXLAN overlay network:

**Table 2: Commands to Verify EVPN VXLAN Layer 2 Overlay Network**

Command	Purpose
<b>show l2vpn evpn evi [detail]</b>	Displays detailed information for a particular EVPN instance or all EVPN instances.
<b>show l2vpn evpn mac [detail]</b>	Displays the MAC address database for Layer 2 EVPN.
<b>show l2vpn evpn mac ip [detail]</b>	Displays the IP address database for Layer 2 EVPN.

Command	Purpose
<b>show l2vpn evpn summary</b>	Displays a summary of Layer 2 EVPN information.
<b>show l2vpn evpn capabilities</b>	Displays platform capability information for Layer 2 EVPN.
<b>show l2vpn evpn peers</b>	Displays Layer 2 EVPN peer route counts and up time.
<b>show l2vpn evpn route-target</b>	Displays Layer 2 EVPN import route targets.
<b>show l2vpn evpn memory</b>	Displays Layer 2 EVPN memory usage.
<b>show l2route evpn summary</b>	Displays a summary of EVPN routes.
<b>show l2route evpn mac [detail]</b>	Displays MAC address information learnt by the switch in the EVPN control plane.
<b>show l2route evpn mac ip [detail]</b>	Displays MAC and IP address information learnt by the switch in the EVPN control plane.
<b>show l2route evpn imet detail</b>	Displays the IMET route details for Layer 2 EVPN address family.  This command shows details only about traffic forwarded using ingress replication.
<b>show bgp l2vpn evpn</b>	Displays BGP information for Layer 2 VPN EVPN address family.
<b>show bgp l2vpn evpn route-type 2</b>	Displays BGP information for route type 2 of L2VPN EVPN address family.
<b>show bgp l2vpn evpn evi context</b>	Displays context information for Layer 2 EVPN instances.
<b>show bgp l2vpn evpn evi <i>evpn-instance-id</i> route-type 3</b>	Displays route type 3 information for the specified Layer 2 EVPN instance.  This command shows details only about traffic forwarded using ingress replication.
<b>show l2fib bridge-domain <i>bridge-domain-number</i> detail</b>	Displays detailed information for a Layer 2 forwarding information base bridge domain.
<b>show l2fib bridge-domain <i>bridge-domain-number</i> address unicast</b>	Displays unicast MAC address information for a Layer 2 forwarding information base bridge domain.
<b>show nve vni</b>	Displays information about VXLAN network identifier members associated with an NVE interface.
<b>show nve vni <i>vni-id</i> detail</b>	Displays detailed NVE interface state information for a VXLAN network identifier member.

Command	Purpose
<b>show nve peers</b>	Displays NVE interface state information for peer leaf switches.
<b>show mac address-table vlan <i>vlan-id</i></b>	Displays MAC addresses for a VLAN.
<b>show platform software fed switch active matm macTable vlan <i>vlan-id</i></b>	Displays MAC addresses for a VLAN from MAC address table manager database for Forwarding Engine Driver (FED).
<b>show device-tracking database</b>	Displays device tracking database.
<b>show device-tracking database mac</b>	Displays device tracking MAC address database.
<b>show ip mroute</b>	Displays multicast routing table information.
