

Secure Copy

This document provides the procedure to configure a Cisco device for Secure Copy (SCP) server-side functionality.

Prerequisites for Secure Copy

- Configure Secure Shell (SSH), authentication, and authorization on the device.
- Because the Secure Copy Protocol (SCP) relies on SSH for its secure transport, the device must have a Rivest, Shamir, and Adelman (RSA) key pair.

Information About Secure Copy

The Secure Copy feature provides a secure and authenticated method for copying switch configurations or switch image files. The Secure Copy Protocol (SCP) relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

The behavior of SCP is similar to that of Remote Copy Protocol (RCP), which comes from the Berkeley r-tools suite (Berkeley university's own set of networking applications), except that SCP relies on SSH for security. In addition, SCP requires authentication, authorization, and accounting (AAA) to be configured to ensure that the device can determine whether a user has the correct privilege level.

SCP allows only users with a privilege level of 15 to copy a file in the Cisco IOS File System (Cisco IFS) to and from a device by using the **copy** command. An authorized administrator can also perform this action from a workstation.

Note

- Enable the SCP option while using the pscp.exe file.
- An RSA public-private key pair must be configured on the device for SSH to work.

Similar to SCP, SSH File Transfer Protocol (SFTP) can be used to copy switch configuration or image files. For more information, refer the *Configuring SSH File Transfer Protocol* chapter of the *Security Configuration Guide*.

Secure Copy Performance Improvements

SSH bulk data transfer mode can be used to enhance the throughput performance of SCP that is operating in the capacity of a client or a server. This mode is disabled by default, but can be enabled by using the **ip ssh bulk-mode** global configuration command.

Note

We recommend that you enable this command only for transferring large files, and disable it after the file transfer is complete.

How to Configure Secure Copy

The following sections provide information about the Secure Copy configuration tasks.

Configuring Secure Copy

To configure a Cisco device for SCP server-side functionality, perform the following steps.

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password, if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	aaa new-model	Sets AAA authentication at login.
	Example:	
	Device(config)# aaa new-model	

	Command or Action	Purpose	
Step 4	aaa authentication login {default list-name} method1 [method2]	Enables the AAA access control system.	
	Example:		
	Device(config)# aaa authentication login default group tacacs+		
Step 5	username name [privilege level] password encryption-type encrypted-password	Establishes a username-based authentication system.	
	Example: Device(config)# username superuser privilege 2 password 0 superpassword	Note You can omit this step if a network-based authentication mechanism, such as TACACS+ or RADIUS, has been configured.	
Step 6	<pre>ip scp server enable Example: Device(config) # ip scp server enable</pre>	Enables SCP server-side functionality.	
Step 7	exit Example:	Exits global configuration mode and returns to privileged EXEC mode.	
	Device(config)# exit		
Step 8	debug ip scp Example:	(Optional) Troubleshoots SCP authentication problems.	
	Device# debug ip scp		

Enabling Secure Copy on the SSH Server

The following task shows how to configure the server-side functionality for SCP. This task shows a typical configuration that allows a device to securely copy files from a remote workstation.

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password, if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	

	Command or Action	Purpose
	Device# configure terminal	
Step 3	aaa new-model Example:	Enables the Authentication, Authorization, and Accounting (AAA) access control model.
	Device(config)# aaa new-model	
Step 4	aaa authentication login default local Example:	Sets AAA authentication to use the local username database for authentication at login.
	Device(config)# aaa authentication login default local	
Step 5	aaa authorization exec default local Example: Device(config)# aaa authorization exec	Sets the parameters that restrict user access to a network, runs the authorization to determine if the user ID is allowed to run an privileged EXEC shell, and specifies that the system must use the local database for authorization.
Step 6	username name privilege privilege-level password password	Establishes a username-based authentication system, and specifies the username, privilege level, and an unencrypted password.
	Example: Device(config) # username samplename privilege 15 password password1	Note The minimum required value for the <i>privilege-level</i> argument is 15. A privilege level of less than 15 results in the connection closing.
Step 7	ip ssh time-out seconds Example:	Sets the time interval (in seconds) that the device waits for the SSH client to respond.
	Device(config)# ip ssh time-out 120	
Step 8	ip ssh authentication-retries integer Example:	Sets the number of authentication attempts after which the interface is reset.
	<pre>Device(config) # ip ssh authentication-retries 3</pre>	
Step 9	ip scp server enable Example:	Enables the device to securely copy files from a remote workstation.
	Device(config)# ip scp server enable	

	Command or Action	Purpose
Step 10	ip ssh bulk-mode	(Optional) Enables SSH bulk data transfer
	Example:	mode to enhance the throughput performance of SCP.
	Device(config)# ip ssh bulk-mode	
Step 11	exit	Exits global configuration mode and returns
	Example:	to privileged EXEC mode.
	Device(config)# exit	
Step 12	debug ip scp	(Optional) Provides diagnostic information
	Example:	about SCP authentication problems.
	Device# debug ip scp	

Configuration Examples for Secure Copy

The following are examples of the Secure Copy configuration.

Example: Secure Copy Configuration Using Local Authentication

The following example shows how to configure the server-side functionality of Secure Copy. This example uses a locally defined username and password.

```
! AAA authentication and authorization must be configured properly in order for SCP to work.

Device> enable

Device# configure terminal

Device(config)# aaa new-model

Device(config)# aaa authentication login default local

Device(config)# aaa authorization exec default local

Device(config)# username user1 privilege 15 password 0 lab

! SSH must be configured and functioning properly.

Device(config)# ip scp server enable

Device(config)# end
```

Example: Secure Copy Server-Side Configuration Using Network-Based Authentication

The following example shows how to configure the server-side functionality of Secure Copy using a network-based authentication mechanism:

```
! AAA authentication and authorization must be configured properly for SCP to work.

Device> enable

Device# configure terminal

Device(config)# aaa new-model

Device(config)# aaa authentication login default group tacacs+
```

```
Device(config) # aaa authorization exec default group tacacs+
! SSH must be configured and functioning properly.
Device(config) # ip ssh time-out 120
Device(config) # ip ssh authentication-retries 3
Device(config) # ip scp server enable
Device(config) # end
```

Feature History for Secure Copy

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	Secure Copy	The Secure Copy feature provides a secure and authenticated method for copying device configurations or device image files. SCP relies on SSH, an application and protocol that provide a secure replacement for the Berkeley r-tools suite. The following commands were introduced or modified: debug ip scp and ip scp server enable.

Release	Feature	Feature Information
Cisco IOS XE Amsterdam 17.2.1	Secure Copy Performance Improvements	SSH bulk mode enables certain optimizations to enhance the throughput performance of procedures involving large amount of data transfer. This mode can be enabled by using the ip ssh bulk-mode global configuration command.
