Prerequisites for 6PE

Redistribute PE-CE IGP IPv6 routes into core BGP and vice-versa

Restrictions for 6PE

eBGP as CE-PE is not supported. Static Routes, OSPFv3, ISIS, RIPv2 are supported as CE-PE.

Information About 6PE

6PE is a technique that provides global IPv6 reachability over IPv4 MPLS. It allows one shared routing table for all other devices. 6PE allows IPv6 domains to communicate with one another over the IPv4 without an explicit tunnel setup, requiring only one IPv4 address per IPv6 domain.

While implementing 6PE, the provider edge routers are upgraded to support 6PE, while the rest of the core network is not touched (IPv6 unaware). This implementation requires no reconfiguration of core routers because forwarding is based on labels rather than on the IP header itself. This provides a cost-effective strategy for deploying IPv6. The IPv6 reachability information is exchanged by PE routers using multiprotocol Border Gateway Protocol (mp-iBGP) extensions.

6PE relies on mp-iBGP extensions in the IPv4 network configuration on the PE router to exchange IPv6 reachability information in addition to an MPLS label for each IPv6 address prefix to be advertised. PE routers are configured as dual stacks, running both IPv4 and IPv6, and use the IPv4 mapped IPv6 address for IPv6

prefix reachability exchange. The next hop advertised by the PE router for 6PE and 6VPE prefixes is still the IPv4 address that is used for IPv4 L3 VPN routes. A value of `::FFFF:` is prepended to the IPv4 next hop, which is an IPv4-mapped IPv6 address.

The following figure illustrates the 6PE topology.

Figure 1: 6PE Topology

IPv6 Explicit Null label for 6PE

The null label is a label that is used between the penultimate Label Switch Router (LSR) and the egress LSR.

Starting with Cisco IOS XE Bengaluru 17.6.1 release, you can use the IPv6 Explicit Null Label as the VPN label to exchange IPv6 reachability information over the MPLS core. The IPv6 Explicit Null Label has a value of 2. The null label does not use the Border Gateway Protocol (BGP) to transport labels. When you use null labels the BGP labels are not exhausted and more IPv6 prefixes can be supported.

You can configure the IPv6 Explicit Null Label by using the **label mode** [**explicit-null** | **all-explicit-null**] command in the address family configuration mode.

You can choose the **explicit-null** or the **all-explicit-null** label.

- **explicit-null** label: for directly connected IPv6 prefixes sent to BGP labelled unicast neighbors.
- **all-explicit-null** label: for all IPv6 prefixes sent to BGP labelled unicast neighbors.

Configuring 6PE

Ensure that you configure 6PE on PE routers participating in both the IPv4 cloud and IPv6 clouds.

BGP running on a PE router should establish (IPv4) neighborhood with BGP running on other PEs. Subsequently, it should advertise the IPv6 prefixes learnt from the IPv6 table to the neighbors. The IPv6 prefixes advertised by BGP would automatically have IPv4-encoded-IPv6 addresses as the next-hop-address in the advertisement.

To configure 6PE, complete the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ipv6 unicast-routing Example: Device (config)# ipv6 unicast-routing	Enables the forwarding of IPv6 unicast datagrams.
Step 4	router bgp <i>as-number</i> Example: Device (config)# router bgp 65001	Enters the number that identifies the autonomous system (AS) in which the router resides. <i>as-number</i> —Autonomous system number. Range for 2-byte numbers is 1 to 65535. Range for 4-byte numbers is 1.0 to 65535.65535.
Step 5	bgp router-id interface <i>interface-id</i> Example: Device (config-router)# bgp router-id interface Loopback1	Configures a fixed router ID for the local Border Gateway Protocol (BGP) routing process.
Step 6	bgp log-neighbor-changes Example: Device (config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.
Step 7	bgp graceful-restart Example: Device (config-router)# bgp graceful-restart	Enables the Border Gateway Protocol (BGP) graceful restart capability globally for all BGP neighbors.
Step 8	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i> Example:	Adds an entry to the BGP or multiprotocol BGP neighbor table.

	Command or Action	Purpose
	<pre>Device(config-router)# neighbor 33.33.33.33 remote-as 65001</pre>	<ul style="list-style-type: none"> • <i>ip-address</i>—IP address of a peer router with which routing information will be exchanged. • <i>ipv6-address</i>—IPv6 address of a peer router with which routing information will be exchanged. • <i>peer-group-name</i>—Name of the BGP peer group. • <i>remote-as</i>—Specifies a remote autonomous system. • <i>as-number</i>—Number of an autonomous system to which the neighbor belongs, ranging from 1 to 65535.
Step 9	<p>neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } update-source <i>interface-type interface-number</i></p> <p>Example:</p> <pre>Device(config-router)# neighbor 33.33.33.33 update-source Loopback1</pre>	Configures BGP sessions to use any operational interface for TCP connections.
Step 10	<p>address-family ipv6</p> <p>Example:</p> <pre>Device(config-router)# address-family ipv6</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard IPv6 address prefixes.
Step 11	<p>redistribute <i>protocol as-number match</i> { internal external 1 external 2</p> <p>Example:</p> <pre>Device(config-router-af)# redistribute ospf 11 match internal external 1</pre>	Redistributes routes from one routing domain into another routing domain.
Step 12	<p>neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } activate</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 33.33.33.33 activate</pre>	Enables the exchange of information with a BGP neighbor.

	Command or Action	Purpose
Step 13	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } send-label Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 send-label</pre>	Sends MPLS labels with BGP routes to a neighboring BGP router.
Step 14	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits BGP address-family submode.
Step 15	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuring IPv6 Explicit Null label for 6PE

To configure IPv6 explicit null label for 6PE, complete the following steps.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ipv6 unicast-routing Example: <pre>Device(config)# ipv6 unicast-routing</pre>	Enables the forwarding of IPv6 unicast datagrams.
Step 4	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 65001</pre>	Enters the number that identifies the autonomous system (AS) in which the router resides. <i>as-number</i> —Autonomous system number. Range for 2-byte numbers is 1 to 65535. Range for 4-byte numbers is 1.0 to 65535.65535.

	Command or Action	Purpose
Step 5	address-family ipv6 Example: <pre>Device(config-router)# address-family ipv6</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard IPv6 address prefixes.
Step 6	label mode [explicit-null all-explicit-null] Example: <pre>Device(config-router-af)# label mode explicit-null</pre>	Configures the IPv6 Explicit Null label <ul style="list-style-type: none"> • explicit-null label: for directly connected IPv6 prefixes sent to BGP labelled unicast neighbors. • all-explicit-null label: for all IPv6 prefixes sent to BGP labelled unicast neighbors.
Step 7	neighbor { ip-address ipv6-address peer-group-name } activate Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 8	neighbor { ip-address ipv6-address peer-group-name } send-label Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 send-label</pre>	Sends MPLS labels with BGP routes to a neighboring BGP router.
Step 9	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits BGP address-family submode.
Step 10	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuration Examples for 6PE

Figure 2: 6PE Topology

PE Configuration

```

router ospfv3 11
ip routing
ipv6 unicast-routing
address-family ipv6 unicast
redistribute bgp 65001
exit-address-family
!
router bgp 65001
bgp router-id interface Loopback1
bgp log-neighbor-changes
bgp graceful-restart
neighbor 33.33.33.33 remote-as 65001
neighbor 33.33.33.33 update-source Loopback1
!
address-family ipv4
neighbor 33.33.33.33 activate
!
address-family ipv6
redistribute ospf 11 match internal external 1 external 2 include-connected
neighbor 33.33.33.33 activate
neighbor 33.33.33.33 send-label
neighbor 33.33.33.33 send-community extended
!

```

The following is a sample output of **show bgp ipv6 unicast summary** :

```

BGP router identifier 1.1.1.1, local AS number 100
BGP table version is 34, main routing table version 34
4 network entries using 1088 bytes of memory
4 path entries using 608 bytes of memory
4/4 BGP path/bestpath attribute entries using 1120 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
BGP using 2816 total bytes of memory
BGP activity 6/2 prefixes, 16/12 paths, scan interval 60 secs

```

Configuration Examples for IPv6 Explicit Null label for 6PE

The following example shows how to configure the IPv6 explicit-null label.

```
Device(config)# router bgp 1
Device(config-router)# address-family ipv6
Device(config-router-af)#label mode explicit-null
Device(config-router-af)# neighbor 33.33.33.33 activate
Device(config-router-af)# neighbor 33.33.33.33 send-label
```

The following example shows how to configure the IPv6 all-explicit-null label.

```
Device(config)# router bgp 1
Device(config-router)# address-family ipv6
Device(config-router-af)#label mode all-explicit-null
Device(config-router-af)# neighbor 33.33.33.33 activate
Device(config-router-af)# neighbor 33.33.33.33 send-label
```

Feature History for IPv6 Provider Edge over MPLS (6PE)

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	IPv6 Provider Edge over MPLS (6PE)	IPv6 Provider Edge over MPLS (6PE) provides global IPv6 reachability over IPv4 MPLS and allows one shared routing table for all other devices.
Cisco IOS XE Bengaluru 17.6.1	IPV6 Explicit Null label for 6PE	IPv6 Explicit Null Label is supported as a VPN label to exchange IPv6 reachability information over the MPLS core. The label has a value of 2.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.
