Information About MPLS VPN InterAS Options

The MPLS VPN InterAS Options feature provides various ways of interconnecting VPNs between different MPLS VPN service providers. This allows sites of a customer to exist on several carrier networks (autonomous systems) and have seamless VPN connectivity between these sites.

Autonomous Systems and ASBRs

An autonomous system (AS) is a single network or group of networks that is controlled by a common system administration group and using a single, clearly defined protocol. In many cases, VPNs extend to different ASes in different geographical areas. Some VPNs must extend across multiple service providers; these VPNs are called overlapping VPNs. The connection between ASes must be seamless to the customer, regardless of the complexity or location of the VPNs.

An autonomous system boundary router (ASBR) is a device in an AS that is configured by using more than one routing protocol, and exchanges routing information with other ASBRs by using an exterior routing protocol (for example, eBGP), or use static routes, or both.

Separate autonomous systems from different service providers communicate by exchanging information in the form of VPN IP addresses and they use the following protocols to share routing information:

- Within an AS, routing information is shared using iBGP.

iBGP distributes network layer information for IP prefixes within each VPN and each AS.

- Between autonomous systems, routing information is shared using eBGP.

eBGP allows service providers to set up an interdomain routing system that guarantees loop-free exchange of routing information between separate autonomous systems. The primary function of eBGP is to exchange network reachability information between autonomous systems, including information about the list of AS routes. The autonomous systems use eBGP border edge routers to distribute the routes,

which includes label-switching information. Each border edge router rewrites the next-hop and MPLS labels.

MPLS VPN InterAS Options configuration is supported and can include an inter provider VPN, which is MPLS VPNs that include two or more autonomous systems, connected by separate border edge routers. The autonomous systems exchange routes using eBGP, and no iBGP or routing information is exchanged between the autonomous systems.

MPLS VPN InterAS Options

The following options defined in RFC4364 provide MPLS VPN connectivity between different autonomous systems:

- InterAS Option B: This option provides VPNv4 route distribution between ASBRs.
- InterAS Option AB: This option combines the best functionality of an interAS option A and interAS option B network to allow an MPLS VPN service provider to interconnect different autonomous systems to provide VPN services.

InterAS Option B

In an interAS option B network, ASBR ports are connected by one or more interfaces that are enabled to receive MPLS traffic. With this option, the ASBRs peer with each other using eBGP session. The ASBR also functions as a PE router and peers with every PE router in their AS. The ASBR does not hold any VRFs but holds all or a subset of VPNv4 routes from PE router that need to be passed to the other AS. VPNv4 routes are kept unique in ASBR using route-distinguisher and are filtered using route targets. The ASBRs exchange VPNv4 routes and VPN labels using eBGP.

Figure 1: Topology for InterAS Option B

Two methods are supported to distribute the next hop for VPNv4 routes between ASBRs. There is no requirement for LDP or any IGP to be enabled on the link connecting the two ASBRs. The MP-eBGP session

between directly connected interfaces on the ASBRs enables the interfaces to forward labeled packets. To ensure this MPLS forwarding for directly connected BGP peers, you must configure `mpls bgp forwarding` command on the interface connecting to ASBR. This command is implemented in the IOS for directly connected interfaces. Upto 200 BGP neighbors can be configured.

- **Next-hop-self Method:** Changing next-hop to that of the local ASBR for all VPNv4 routes learnt from the other ASBR.
- **Redistribute Connected Subnets Method:** Redistributing the next hop address of the remote ASBR into the local IGP using `redistribute connected subnets` command , i.e., the next hop is not changed when the VPNv4 routes are redistributed into the local AS.

Note In case of multiple equal paths - ECMP towards remote AS, you have to configure MPLS static label bindings towards remote Loopback on ASBR. Otherwise, you may experience packet loss.

The label switch path forwarding sections described below has AS200 configured with the Next-hop-self method and the AS300 is configured with Redistribute-subnet method.

Next-Hop Self Method

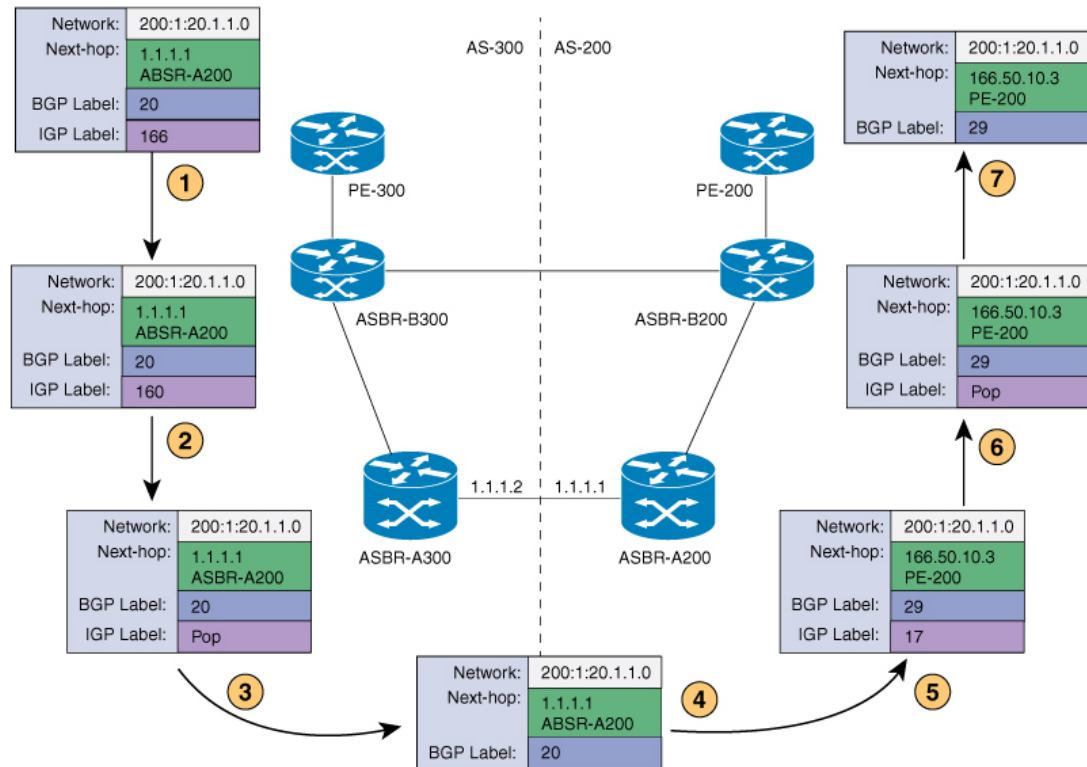

The following figure shows the label forwarding path for next-hop-self method. The labels get pushed, swapped and popped on the stack as packet makes its way from PE-200 in AS 200 to PE-300 in AS 300. In step 5, ASBR-A300 receives labeled frame, replaces label 164 with label 161 pushes IGP label 162 onto the label stack.

356133

Redistribute Connected Subnet Method

The following figure shows the label forwarding path for Redistribute connected subnets method. The labels get pushed, swapped and popped on the stack as packet travels from PE-300 in AS 300 to PE-200 in AS 200. In step 5, ASBR-A200 receives frame with BGP label 20, swaps it with label 29 and pushes label 17.

356134

InterAS Option AB

MPLS VPN service providers need to interconnect different autonomous systems to provide service for multiple VPN customers. The MPLS VPN InterAS Option AB feature allows the different autonomous systems to interconnect by using a single MP-BGP session in the global routing table to carry control plane traffic. This MP-BGP session signals VPN prefixes between two ASBRs for each VRF instance. This traffic can either be IP or MPLS.

MPLS BGP forwarding or LDP does not have to be configured between the two ASBRs because the VPN traffic that is IP traffic over a VRF-specific interface.

The interAS option AB feature provides the following benefits for service providers:

- IP QoS functions between ASBR peers are maintained for customer SLAs.
- Dataplane traffic is isolated on a per-VRF basis for security purposes.
- A dedicated QoS policy can be applied on each VRF by attaching the policy on an SVI.

Route Distribution and Packet Forwarding

The following attributes describe the topology of the sample interAS Option AB network shown in the figure above:

- CE1 and CE3 belong to VPN 1.
- CE2 and CE 4 belong to VPN 2.
- PE1 uses route distinguisher 1 (RD 1) for VPN 1 (VRF 1) and RD 2 for VPN 2 (VRF 2).
- PE2 uses RD 3 for VPN 1 (VRF 1) and RD 4 for VPN 2 (VRF 2).
- ASBR1 has VRF 1 provisioned with RD 5 and VRF 2 provisioned with RD 6.
- ASBR2 has VRF 1 provisioned with RD 7 and VRF 2 provisioned and RD 8.
- ASBR1 and ASBR2 have three links between them:
 - VRF 1
 - VRF 2
 - MP-BGP session

Route Distribution for VPN 1

A route distinguisher (RD) is an identifier attached to a route that identifies which VPN belongs to each route. Each routing instance must have a unique RD autonomous system associated with it. The RD is used to place a boundary around a VPN so that the same IP address prefixes can be used in different VPNs without having these IP address prefixes overlap. An RD statement is required if the instance type is a VRF.

The following process describes the route distribution process for VPN 1 in the figure above. Prefix “N” is used in this process to indicate the IP address of a VPN.

ASBR 1

- CE1 advertises the prefix N to PE1.
- PE1 advertises a VPN prefix RD 1:N to ASBR1 through MP-iBGP.
- ASBR1 imports the prefix into VPN 1 and creates a prefix RD 5:N.

- ASBR1 advertises the imported prefix RD 5:N to ASBR2. ASBR1 sets itself as the next hop for prefix RD 5:N and allocates a local label that is signaled with this prefix.
- ASBR1 advertises the route with the export RT configured on the VRF rather than the originally received RTs. By default, ASBR1 does not advertise the source prefix RD 1:N to ASBR2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.

ASBR 2

- ASBR2 receives the prefix RD 5:N and imports it into VPN 1 as RD 7:N.
- ASBR2 advertises the route with the export RT configured on the VRF rather than the originally received RTs.
- While importing the prefix, ASBR2 sets the next hop of RD 7:N to the ASBR1 interface IP address in VRF 1. The next hop table ID is also set to VRF 1. When installing the MPLS forwarding entry for RD 7:N, by default ASBR2 does not install the outgoing label in the forwarding process. This enables the traffic between the ASBRs to be IP.
- ASBR2 advertises the imported prefix RD 7:N to PE2. It sets itself as the next hop for this prefix and also allocates a local label that is signaled with the prefix. By default, ASBR2 does not advertise the source prefix RD 5:N to PE2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.
- PE2 imports the RD 7:N into VRF 1 as RD 3:N.

Packet Forwarding for VPN 1

The following packet forwarding process works the same as it does in an Option A scenario. The ASBR acts like the PE by terminating the VPN and then forwards its traffic as standard IP packets with no VPN label to the next PE, which in turn repeats the VPN process. Each PE device, therefore, treats the adjacent PE device as a CE device, and the standard Layer 3 MPLS VPN mechanisms are used for route redistribution with each autonomous system; that is, the PEs use external BGP (eBGP) to distribute unlabeled IPv4 addresses to each other.

- CE3 sends a packet destined for N to PE2.
- PE2 encapsulates the packet with the VPN label allocated by ASBR2 and the Interior Gateway Protocol (IGP) label needed to tunnel the packet to ASBR2.
- The packet arrives on ASBR2 with the VPN label. ASBR2 removes the VPN label and sends the packet as IP to ASBR1 on the VRF 1 interface.
- The IP packet arrives at ASBR1 on the VRF 1 interface. ASBR1 then encapsulates the packet with the VPN label allocated by PE1 and the IGP label needed to tunnel the packet to PE1.
- The packet arrives on PE1 with the VPN label. PE1 disposes the VPN label and forwards the IP packet to CE1.

Route Distribution for VPN 2

The following information describes the route distribution process for VPN 2 in the figure above:

ASBR 1

- CE2 advertises prefix N to PE1, where N is the VPN IP address.

- PE1 advertises a VPN prefix RD 2:N to ASBR1 through MP-iBGP.
- ASBR1 imports the prefix into VPN 2 and creates a prefix RD 6:N.
- ASBR1 advertises the imported prefix RD 6:N to ASBR2. It sets itself as the next hop for this prefix and also allocates a local label that is signalled with the prefix. By default, ASBR1 does not advertise the source prefix RD 2:N to ASBR2. This advertisement is suppressed as the prefix is being imported into an Option AB VRF.

ASBR 2

- ASBR2 receives the prefix RD 6:N and imports it into VPN 2 as RD 8:N.
- While importing the prefix, ASBR2 sets the next hop of RD 8:N to ASBR1's interface address in VRF 2. The next hop table ID is also set to that of VRF 2. While installing the MPLS forwarding entry for RD 8:N, by default ASBR2 does not install the outgoing label in the forwarding process. This enables traffic between the ASBRs to be IP.
- ASBR2 advertises the imported prefix RD 8:N to PE2. It sets itself as the next hop for this prefix and also allocates a local label that is signalled with the prefix. By default, ASBR2 does not advertise the source prefix RD 6:N to PE2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.
- PE2 imports the RD 8:N into VRF 2 as RD 4:N.

How to Configure MPLS VPN InterAS Options

The following section provides information about how to configure MPLS VPN InterAS Options.

Configuring MPLS VPN InterAS Option B

The following section provides information about how to configure interAS option B using next-hop-self method and redistribute connected method.

Configuring InterAS Option B using the Next-Hop-Self Method

To configure interAS Option B on ASBRs using the next-hop-self method, complete the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	router ospf <i>process-id</i> Example: Device(config)# router ospf 1	Configures an OSPF routing process and assign a process number.
Step 4	router-id <i>ip-address</i> Example: Device(config)# router-id 4.1.1.1	Specifies a fixed router ID.
Step 5	nsr Example: Device(config-router)# nsr	Configures OSPF non-stop routing (NSR).
Step 6	nsf Example: Device(config-router)# nsf	Configures OSPF non-stop forwarding (NSF).
Step 7	redistribute bgp <i>autonomous-system-number</i> Example: Device(config-router)# redistribute bgp 200	Redistributes routes from a BGP autonomous system into an OSPF routing process.
Step 8	passive-interface <i>interface-type interface-number</i> Example: Device(config-router)# passive-interface GigabitEthernet 1/0/10 Device(config-router)# passive-interface Tunnel0	Disables Open Shortest Path First (OSPF) routing updates on an interface.
Step 9	network <i>ip-address wildcard-mask area-id</i> Example: Device(config-router)# network 4.1.1.0 0.0.0.0.255 area 0	Defines an interface on which OSPF runs and defines the area ID for that interface.
Step 10	exit Example: Device(config-router)# exit	Exits router configuration mode.

	Command or Action	Purpose
Step 11	router bgp <i>autonomous-system-number</i> Example: Device (config) # router bgp 200	Configures a BGP routing process.
Step 12	bgp router-id <i>ip-address</i> Example: Device (config-router) # bgp router-id 4.1.1.1	Configures a fixed router ID for the BGP routing process.
Step 13	bgp log-neighbor changes Example: Device (config-router) # bgp log-neighbor changes	Enables logging of BGP neighbor resets.
Step 14	no bgp default ipv4-unicast Example: Device (config-router) # no bgp default ipv4-unicast	Disables advertisement of routing information for address family IPv4.
Step 15	no bgp default route-target filter Example: Device (config-router) # no bgp default route-target filter	Disables automatic BGP route-target community filtering.
Step 16	neighbor ip-address remote-as as-number Example: Device (config-router) # neighbor 4.1.1.3 remote-as 200	Configures an entry to the BGP neighbor table.
Step 17	neighbor ip-address update-source interface-type interface-number Example: Device (config-router) # neighbor 4.1.1.3 update-source Loopback0	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 18	neighbor ip-address remote-as as-number Example: Device (config-router) # neighbor 4.1.1.3 remote-as 300	Configures an entry to the BGP neighbor table.

	Command or Action	Purpose
Step 19	address-family <i>ipv4</i> Example: Device (config-router) # address-family ipv4	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.
Step 20	neighbor <i>ip-address</i> activate Example: Device (config-router-af) # neighbor 10.32.1.2 activate	Enables the exchange of information with a BGP neighbor.
Step 21	neighbor <i>ip-address</i> send-label Example: Device (config-router-af) # neighbor 10.32.1.2 send-label	Sends MPLS labels with BGP routes to a neighboring BGP router.
Step 22	exit address-family Example: Device (config-router-af) # exit address-family	Exits BGP address-family submode.
Step 23	address-family <i>vpn4</i> Example: Device (config-router) # address-family vpn4	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 24	neighbor <i>ip-address</i> activate Example: Device (config-router-af) # neighbor 4.1.1.3 activate	Enables the exchange of information with a BGP neighbor.
Step 25	neighbor <i>ip-address</i> send-community extended Example: Device (config-router-af) # neighbor 4.1.1.3 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 26	neighbor <i>ip-address</i> next-hop-self Example: Device (config-router-af) # neighbor 4.1.1.3 next-hop-self	Configure a router as the next hop for a BGP-speaking neighbor. This is the command that implements the next-hop-self method.

	Command or Action	Purpose
Step 27	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 10.30.1.2 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 28	neighbor ip-address send-community extended Example: <pre>Device(config-router-af)# neighbor 10.30.1.2 send-community extended</pre>	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 29	exit address-family Example: <pre>Device(config-router-af)# exit address-family</pre>	Exits BGP address-family submode.
Step 30	bgp router-id ip-address Example: <pre>Device(config-router)# bgp router-id 4.1.1.3</pre>	Configures a fixed router ID for the BGP routing process.
Step 31	bgp log-neighbor changes Example: <pre>Device(config-router)# bgp log-neighbor changes</pre>	Enables logging of BGP neighbor resets.
Step 32	neighbor ip-address remote-as as-number Example: <pre>Device(config-router)# neighbor 4.1.1.1 remote-as 200</pre>	Configures an entry to the BGP neighbor table.
Step 33	neighbor ip-address update-source interface-type interface-number Example: <pre>Device(config-router)# neighbor 4.1.1.1 update-source Loopback0</pre>	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 34	address-family vpnv4 Example: <pre>Device(config-router)# address-family vpnv4</pre>	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.

	Command or Action	Purpose
Step 35	neighbor <i>ip-address</i> activate Example: Device (config-router-af) # neighbor 4.1.1.1 activate	Enables the exchange of information with a BGP neighbor.
Step 36	neighbor <i>ip-address</i> send-community extended Example: Device (config-router-af) # neighbor 4.1.1.1 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 37	exit address-family Example: Device (config-router-af) # exit address-family	Exits BGP address-family submode.

Configuring InterAS Option B using Redistribute Connected Method

To configure interAS Option B on ASBRs using the redistribute connected method, complete the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router ospf <i>process-id</i> Example: Device (config) # router ospf 1	Configures an OSPF routing process and assign a process number.
Step 4	router-id <i>ip-address</i> Example: Device (config) # router-id 5.1.1.1	Specifies a fixed router ID.

	Command or Action	Purpose
Step 5	nsr Example: Device(config-router)# nsr	Configures OSPF non-stop routing (NSR).
Step 6	nsf Example: Device(config-router)# nsf	Configures OSPF non-stop forwarding (NSF).
Step 7	redistribute connected Example: Device(config-router)# redistribute connected	Redistributes the next hop address of the remote ASBR into the local IGP. This is the command that implements redistribute connected method.
Step 8	passive-interface interface-type interface-number Example: Device(config-router)# passive-interface GigabitEthernet 1/0/10 Device(config-router)# passive-interface Tunnel0	Disables Open Shortest Path First (OSPF) routing updates on an interface.
Step 9	network ip-address wildcard-mask aread area-id Example: Device(config-router)# network 5.1.1.0 0.0.0.0.255 area 0	Defines an interface on which OSPF runs and defines the area ID for that interface.
Step 10	exit Example: Device(config-router)# exit	Exits router configuration mode.
Step 11	router bgp autonomous-system-number Example: Device(config)# router bgp 300	Configures a BGP routing process.
Step 12	bgp router-id ip-address Example: Device(config-router)# bgp router-id 5.1.1.1	Configures a fixed router ID for the BGP routing process.

	Command or Action	Purpose
Step 13	bgp log-neighbor changes Example: <pre>Device(config-router)# bgp log-neighbor changes</pre>	Enables logging of BGP neighbor resets.
Step 14	no bgp default ipv4-unicast Example: <pre>Device(config-router)# no bgp default ipv4-unicast</pre>	Disables advertisement of routing information for address family IPv4.
Step 15	no bgp default route-target filter Example: <pre>Device(config-router)# no bgp default route-target filter</pre>	Disables automatic BGP route-target community filtering.
Step 16	neighbor ip-address remote-as as-number Example: <pre>Device(config-router)# neighbor 5.1.1.3 remote-as 300</pre>	Configures an entry to the BGP neighbor table.
Step 17	neighbor ip-address update-source interface-type interface-number Example: <pre>Device(config-router)# neighbor 4.1.1.3 update-source Loopback0</pre>	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 18	neighbor ip-address remote-as as-number Example: <pre>Device(config-router)# neighbor 10.30.1.2 remote-as 200</pre>	Configures an entry to the BGP neighbor table.
Step 19	address-family vpv4 Example: <pre>Device(config-router)# address-family vpv4</pre>	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 20	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 5.1.1.3 activate</pre>	Enables the exchange of information with a BGP neighbor.

	Command or Action	Purpose
Step 21	neighbor ip-address send-community extended Example: Device(config-router-af)# neighbor 5.1.1.3 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 22	neighbor ip-address activate Example: Device(config-router-af)# neighbor 10.30.1.1 activate	Enables the exchange of information with a BGP neighbor.
Step 23	neighbor ip-address send-community extended Example: Device(config-router-af)# neighbor 10.30.1.2 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 24	exit address-family Example: Device(config-router-af)# exit address-family	Exits BGP address-family submode.
Step 25	mpls ldp router-id interface-id [force] Example: Device(config-router)# mpls ldp router-id Loopback0 force	Specifies the preferred interface for determining the LDP router ID.

Configuring MPLS VPN Inter-AS Option AB

The following sections describe how to configure the interAS option AB feature on an ASBR for an MPLS VPN:

Configuring the VRFs on the ASBR Interface for Each VPN Customer

Use the following steps to configure the VRFs on the ASBR interface for each VPN customer so that these VPNs have connectivity over the interAS Option AB network.

Procedure

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: Device (config)# interface gigabitethernet 1/0/1	Specifies the interface to configure and enters interface configuration mode.
Step 4	ip vrf forwarding <i>vrf-name</i> Example: Device (config-if)# ip vrf forwarding vpn1	Associates a VRF with the specified interface. <ul style="list-style-type: none"> • The vrf-name argument is the name assigned to a VRF.
Step 5	end Example: Device (config-if)# end	(Optional) Exits to privileged EXEC mode.

Configuring the MP-BGP Session Between ASBR Peers

BGP propagates reachability information for VPN-IPv4 prefixes among PE devices by means of the BGP multiprotocol extensions (see RFC 2283, Multiprotocol Extensions for BGP-4), which define support for address families other than IPv4. Using the extensions ensures that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other.

Follow the steps in this section to configure the MP-BGP session on the ASBR.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	router bgp <i>as-number</i> Example: Device(config)# <code>router bgp 100</code>	Configures a BGP routing process and places the device in router configuration mode. <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the device to other BGP devices and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4	neighbor { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i> Example: Device(config-router)# <code>neighbor 192.168.0.1 remote-as 200</code>	Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	address-family vpnv4 [unicast] Example: Device(config-router)# <code>address-family vpnv4</code>	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> The unicast keyword specifies IPv4 unicast address prefixes.
Step 6	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate Example: Device(config-router-af)# <code>neighbor 192.168.0.1 activate</code>	Enables the exchange of information with a neighboring device. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 7	neighbor { <i>ip-address</i> <i>peer-group-name</i> } inter-as-hybrid Example: Device(config-router-af)# <code>neighbor 192.168.0.1 inter-as-hybrid</code>	Configures eBGP peer device (ASBR) as an Inter-AS Option AB peer. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.

	Command or Action	Purpose
		<ul style="list-style-type: none"> If any prefixes are imported into Option AB VRFs, then the imported paths are advertised to this peer. If any prefixes are received from this peer and are imported into Option AB VRFs, then the imported paths are advertised to iBGP peers. <p>Note Advertised routes have RTs that are configured on the VRF. Advertised routes do not have their original RTs.</p>
Step 8	exit-address-family Example: Device(config-router)# exit-address-family	Exits from address family configuration mode.

Configuring the Routing Policy for VPNs that Need Inter-AS Connections

Use the steps in this section to configure VRFs for the VPNs that need Inter-AS connections between ASBR peers, by configuring the appropriate routing policy and Option AB configuration.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vrf definition <i>vrf-name</i> Example: Device(config)# vrf definition vpn1	Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. <ul style="list-style-type: none"> The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 4	rd <i>route-distinguisher</i> Example: Device(config-vrf)# rd 100:1	Creates routing and forwarding tables. <ul style="list-style-type: none"> The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats:

	Command or Action	Purpose
		<ul style="list-style-type: none"> • 16-bit autonomous system number: your 32-bit number, for example, 101:3. • 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1.
Step 5	<p>address-family ipv4</p> <p>Example:</p> <pre>Device(config-vrf) # address-family ipv4</pre>	<p>Enters VRF address family configuration mode to specify an address family for a VRF.</p> <ul style="list-style-type: none"> • The ipv4 keyword specifies an IPv4 address family for a VRF. • 16-bit autonomous system number: your 32-bit number, for example, 101:3. • 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1.
Step 6	<p>route-target (import export both) route-target-ext-community</p> <p>Example:</p> <pre>Device(config-vrf-af) # route-target import 100:1</pre>	<p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> • The import keyword imports routing information from the target VPN extended community. • The export keyword exports routing information to the target VPN extended community. • The both keyword imports routing information from and exports routing information to the target VPN extended community. • The <i>route-target-ext-community</i> argument adds the route-targetextended community attributes to the VRF list of import, export, or both (import and export) route-target extended communities.
Step 7	<p>inter-as-hybrid</p> <p>Example:</p> <pre>Device(config-vrf-af) # inter-as-hybrid</pre>	<p>Specifies the VRF as an option AB VRF, which has the following effects:</p> <ul style="list-style-type: none"> • Routes imported to this VRF can be advertised to option AB peers and VPNv4 iBGP peers. • When routes received from option AB peers and are imported into the VRF, the

	Command or Action	Purpose
		next hop table ID of the route is set to the table ID of the VRF.
Step 8	inter-as-hybrid [<i>next-hopip-address</i>] Example: <pre>Device(config-vrf-af)# inter-as-hybrid next-hop 192.168.1.0</pre>	(Optional) Specifies the next hop IP address to be set on paths that are imported into the VRF and that are received from an Option AB peer. <ul style="list-style-type: none"> • The next hop context is also set to the VRF, which imports these paths.
Step 9	end Example: <pre>Device(config-vrf-af)# end</pre>	(Optional) Exits to privileged EXEC mode.

Changing an Inter-AS Option A Deployment to an Option AB Deployment

In an option A deployment, the VRF instances are back-to-back between the ASBR devices and there is direct connectivity between PE devices of different autonomous systems. The PE devices are attached by multiple physical or logical interfaces, each of which is associated with a given VPN (through a VRF instance).

In the Option AB deployment, the different autonomous systems interconnect by using a single MP-BGP session in the global routing table to carry control plane traffic.

Use the following steps to change an MPLS VPN Inter-AS Option A deployment to an Option AB deployment.

1. Configure the MP-BGP session on the ASBR. BGP multiprotocol extensions are used to define support for address families other than IPv4 so that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other.
2. Identify the VRFs that need an upgrade from Option A and configure them for Option AB by using the **inter-as-hybrid** command.
3. Use the following steps in this section to remove the configuration for the eBGP (peer ASBR) neighbor.
4. Repeat all the steps in the following procedure to remove the configuration for additional eBGP (peer ASBR) neighbors.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	router bgp <i>as-number</i> Example: Device(config) # router bgp 100	Configures a BGP routing process and places the device in router configuration mode. <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the device to other BGP devices and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4	address-family ipv4 vrf <i>vrf-name</i> Example: Device(config-router) # address-family ipv4 vrf vpn4	Configures each VRF that is identified in the MP-BGP session on the ASBR so that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other. <ul style="list-style-type: none"> Enters address family configuration mode to specify an address family for a VRF.
Step 5	no neighbor {<i>ip-address</i> <i>peer-group-name</i>} Example: Device(config-router-af) # no neighbor 192.168.0.1	Removes the configuration for the exchange of information with the neighboring eBGP (ASBR) device. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor.
Step 6	exit-address-family Example: Device(config-router-af) # exit-address-family	Exits from address family configuration mode.
Step 7	end Example: Device(config-router-af) # end	Exits to privileged EXEC mode.

Verifying MPLS VPN InterAS Options Configuration

To verify InterAS option B configuration information, perform one of the following tasks:

Command	Purpose
ping <i>ip-address</i> source <i>interface-type</i>	Checks the accessibility of devices. Use this command to check the connection between CE1 and CE2 using the loopback interface.
show bgp vpnv4 unicast labels	Displays incoming and outgoing BGP labels.

Command	Purpose
show mpls forwarding-table	Display the contents of the MPLS Label Forwarding Information Base.
show ip bgp	Displays entries in the BGP routing table.
show { ip ipv6 } bgp [vrf vrf-name]	Displays information about BGP on a VRF.
show ip route [ip-address [mask]] [protocol] vrf vrf-name	Displays the current state of the routing table. Use the ip-address argument to verify that CE1 has a route to CE2. Verify the routes learned by CE1. Make sure that the route for CE2 is listed.
show { ip ipv6 } route vrf vrf-name	Displays the IP routing table that is associated with a VRF. Check that the loopback addresses of the local and remote CE routers are in the routing table of the PE routers.
show running-config bgp	Displays the running configuration for BGP.
show running-config vrf vrf-name	Displays the running configuration for VRFs.
show vrf vrf-name interface interface-type interface-id	Verifies the route distinguisher (RD) and interface that are configured for the VRF.
trace destination [vrf vrf-name]	Discovers the routes that packets take when traveling to their destination. The trace command can help isolate a problem if two routers cannot communicate.

Feature History for MPLS VPN InterAS Options

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.11.1	MPLS VPN InterAS Option B	InterAS Options use iBGP and eBGP peering to allow VPNs in different AS to communicate with each other. In an interAS option B network, ASBR ports are connected by one or more interfaces that are enabled to receive MPLS traffic.

Release	Feature	Feature Information
Cisco IOS XE Amsterdam 17.3.1	MPLS VPN InterAS Option AB	MPLS VPN InterAS Option AB enables different autonomous systems to interconnect by using a single Multiprotocol Border Gateway Protocol (MP-BGP) session, which is enabled globally on the router.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.
