Multiprotocol Label Switching

This module describes Multiprotocol Label Switching and how to configure it on Cisco switches.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Restrictions for Multiprotocol Label Switching

- Multiprotocol Label Switching (MPLS) fragmentation is not supported.
- MPLS maximum transmission unit (MTU) is not supported.

Information about Multiprotocol Label Switching

Multiprotocol label switching (MPLS) combines the performance and capabilities of Layer 2 (data link layer) switching with the proven scalability of Layer 3 (network layer) routing. MPLS enables you to meet the challenges of explosive growth in network utilization while providing the opportunity to differentiate services without sacrificing the existing network infrastructure. The MPLS architecture is flexible and can be employed in any combination of Layer 2 technologies. MPLS support is offered for all Layer 3 protocols, and scaling is possible well beyond that typically offered in today's networks.

Functional Description of Multiprotocol Label Switching

Label switching is a high-performance packet forwarding technology that integrates the performance and traffic management capabilities of data link layer (Layer 2) switching with the scalability, flexibility, and performance of network layer (Layer 3) routing.

Label Switching Functions

In conventional Layer 3 forwarding mechanisms, as a packet traverses the network, each switch extracts all the information relevant to forwarding the packet from the Layer 3 header. This information is then used as an index for a routing table lookup to determine the next hop for the packet.

In the most common case, the only relevant field in the header is the destination address field, but in some cases, other header fields might also be relevant. As a result, the header analysis must be done independently at each switch through which the packet passes. In addition, a complicated table lookup must also be done at each switch.

In label switching, the analysis of the Layer 3 header is done only once. The Layer 3 header is then mapped into a fixed length, unstructured value called a *label*.

Many different headers can map to the same label, as long as those headers always result in the same choice of next hop. In effect, a label represents a *forwarding equivalence class*—that is, a set of packets which, however different they may be, are indistinguishable by the forwarding function.

The initial choice of a label need not be based exclusively on the contents of the Layer 3 packet header; for example, forwarding decisions at subsequent hops can also be based on routing policy.

Once a label is assigned, a short label header is added at the front of the Layer 3 packet. This header is carried across the network as part of the packet. At subsequent hops through each MPLS switch in the network, labels are swapped and forwarding decisions are made by means of MPLS forwarding table lookup for the label carried in the packet header. Hence, the packet header does not need to be reevaluated during packet transit through the network. Because the label is of fixed length and unstructured, the MPLS forwarding table lookup process is both straightforward and fast.

Distribution of Label Bindings

Each label switching router (LSR) in the network makes an independent, local decision as to which label value to use to represent a forwarding equivalence class. This association is known as a label binding. Each LSR informs its neighbors of the label bindings it has made. This awareness of label bindings by neighboring switches is facilitated by the following protocols:

- Label Distribution Protocol (LDP)--enables peer LSRs in an MPLS network to exchange label binding information for supporting hop-by-hop forwarding in an MPLS network
- Border Gateway Protocol (BGP)--Used to support MPLS virtual private networks (VPNs)

When a labeled packet is being sent from LSR A to the neighboring LSR B, the label value carried by the IP packet is the label value that LSR B assigned to represent the forwarding equivalence class of the packet. Thus, the label value changes as the IP packet traverses the network.

For more information about LDP configuration, see the see MPLS: LDP Configuration Guide at http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/mpls/config_library/xe-3s/mp-xe-3s-library.html

**Note**

As the scale of label entries is limited in, especially with ECMP, it is recommended to enable LDP label filtering. LDP labels shall be allocated only for well known prefixes like loopback interfaces of routers and any prefix that needs to be reachable in the global routing table.

MPLS Layer 3 VPN

A Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) consists of a set of sites that are interconnected by means of an MPLS provider core network. At each customer site, one or more customer edge (CE) routers attach to one or more provider edge (PE) routers.

Before configuring MPLS Layer 3 VPNs, you should have MPLS, Label Distribution Protocol (LDP), and Cisco Express Forwarding (CEF) installed in your network. All routers in the core, including the PE routers, must be able to support CEF and MPLS forwarding.

Classifying and Marking MPLS QoS EXP

The QoS EXP Matching feature allows you to classify and mark network traffic by modifying the Multiprotocol Label Switching (MPLS) experimental bits (EXP) field in IP packets.

The QoS EXP Matching feature allows you to organize network traffic by setting values for the MPLS EXP field in MPLS packets. By choosing different values for the MPLS EXP field, you can mark packets so that packets have the priority that they require during periods of congestion. Setting the MPLS EXP value allows you to:

- **Classify traffic:** The classification process selects the traffic to be marked. Classification accomplishes this by partitioning traffic into multiple priority levels, or classes of service. Traffic classification is the primary component of class-based QoS provisioning.
- **Police and mark traffic:** Policing causes traffic that exceeds the configured rate to be discarded or marked to a different drop level. Marking traffic is a way to identify packet flows to differentiate them. Packet marking allows you to partition your network into multiple priority levels or classes of service.

Restrictions

Following is the list of restrictions for classifying and marking MPLS QoS EXP:

- Only Uniform mode and Pipe mode are supported; Short-pipe mode is not supported.
- Support range of QoS-group values range between 0 and 30. (Total 31 QoS-groups).

- EXP marking using QoS policy is supported only on the outer label; inner EXP marking is not supported.

How to Configure Multiprotocol Label Switching

This section explains how to perform the basic configuration required to prepare a switch for MPLS switching and forwarding.

Configuring a Switch for MPLS Switching

MPLS switching on Cisco switches requires that Cisco Express Forwarding be enabled.

Note `ip unnumbered` command is not supported in MPLS configuration.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip cef distributed`
4. `mpls label range` *minimum-value maximum-value*
5. `mpls label protocol ldp`

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ip cef distributed Example: <pre>Device(config)# ip cef distributed</pre>	Enables Cisco Express Forwarding on the switch.
Step 4	mpls label range <i>minimum-value maximum-value</i> Example: <pre>Device(config)# mpls label range 16 4096</pre>	Configure the range of local labels available for use with MPLS applications on packet interfaces.

	Command or Action	Purpose
Step 5	mpls label protocol ldp Example: <pre>Device(config)# mpls label protocol ldp</pre>	Specifies the label distribution protocol for the platform.

Configuring a Switch for MPLS Forwarding

MPLS forwarding on Cisco switches requires that forwarding of IPv4 packets be enabled.

Note **ip unnumbered** command is not supported in MPLS configuration.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/subslot /port*
4. **mpls ip**
5. **mpls label protocol ldp**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interface <i>type slot/subslot /port</i> Example: <pre>Device(config)# interface gigabitethernet 1/0/0</pre>	Specifies the Gigabit Ethernet interface and enters interface configuration mode. For Switch Virtual Interface (SVI), the example is <pre>Device(config)# interface vlan 1000</pre>
Step 4	mpls ip Example: <pre>Device(config-if)# mpls ip</pre>	Enables MPLS forwarding of IPv4 packets along routed physical interfaces (Gigabit Ethernet), Switch Virtual Interface (SVI), or port channels.

	Command or Action	Purpose
Step 5	mpls label protocol ldp Example: <pre>Device(config-if)# mpls label protocol ldp</pre>	Specifies the label distribution protocol for an interface. Note MPLS LDP cannot be enabled on a Virtual Routing and Forwarding (VRF) interface.
Step 6	end Example: <pre>Device(config-if)# end</pre>	Exits interface configuration mode and returns to privileged EXEC mode.

Verifying Multiprotocol Label Switching Configuration

This section explains how to verify successful configuration of MPLS switching and forwarding.

Verifying Configuration of MPLS Switching

To verify that Cisco Express Forwarding has been configured properly, issue the **show ip cef summary** command, which generates output similar to that shown below:

SUMMARY STEPS

1. **show ip cef summary**

DETAILED STEPS

show ip cef summary

Example:

```
Switch# show ip cef summary

IPv4 CEF is enabled for distributed and running
VRF Default
 150 prefixes (149/1 fwd/non-fwd)
  Table id 0x0
  Database epoch:      4 (150 entries at this epoch)
Switch#
```

Verifying Configuration of MPLS Forwarding

To verify that MPLS forwarding has been configured properly, issue the **show mpls interfaces detail** command, which generates output similar to that shown below:

Note The MPLS MTU value is equivalent to the IP MTU value of the port or switch by default. MTU configuration for MPLS is not supported.

SUMMARY STEPS

1. **show mpls interfaces detail**
2. **show running-config interface**
3. **show mpls forwarding**

DETAILED STEPS

Step 1 **show mpls interfaces detail**

Example:

For physical (Gigabit Ethernet) interface:

```
Switch# show mpls interfaces detail interface GigabitEthernet 1/0/0
```

```
Type Unknown
IP labeling enabled
LSP Tunnel labeling not enabled
IP FRR labeling not enabled
BGP labeling not enabled
MPLS not operational
MTU = 1500
```

For Switch Virtual Interface (SVI):

```
Switch# show mpls interfaces detail interface Vlan1000
```

```
Type Unknown
IP labeling enabled (ldp) :
  Interface config
LSP Tunnel labeling not enabled
IP FRR labeling not enabled
BGP labeling not enabled
MPLS operational
MTU = 1500
```

Step 2 **show running-config interface**

Example:

For physical (Gigabit Ethernet) interface:

```
Switch# show running-config interface interface GigabitEthernet 1/0/0
```

Building configuration...

```
Current configuration : 307 bytes
!
interface TenGigabitEthernet1/0/0
no switchport
ip address xx.xx.x.x xxx.xxx.xxx.x
mpls ip
mpls label protocol ldp
```

```
end
```

For Switch Virtual Interface (SVI):

```
Switch# show running-config interface interface Vlan1000
```

Building configuration...

```
Current configuration : 187 bytes
!
interface Vlan1000
ip address xx.xx.x.x xxx.xxx.xxx.x
mpls ip
mpls label protocol ldp
end
```

Step 3 show mpls forwarding

Example:

For physical (Gigabit Ethernet) interface:

```
Switch#show mpls forwarding-table
```

Local Label	Outgoing Label	Prefix or Tunnel Id	Bytes Switched	Outgoing interface	Next Hop
500	No Label	12ckt(3)	0	Gi3/0/22	point2point
501	No Label	12ckt(1)	12310411816789	none	point2point

Feature Information for Multiprotocol Label Switching

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Release	Modification
Cisco IOS XE Everest 16.6.1	This feature was introduced.

CHAPTER 2

Configuring MPLS Layer 3 VPN

An MPLS Virtual Private Network (VPN) consists of a set of sites that are interconnected by means of a Multiprotocol Label Switching (MPLS) provider core network. At each customer site, one or more customer edge (CE) devices attach to one or more provider edge (PE) devices. This module explains how to create an MPLS Layer 3 VPN.

- [MPLS Layer 3 VPNs, on page 11](#)

MPLS Layer 3 VPNs

An MPLS Virtual Private Network (VPN) consists of a set of sites that are interconnected by means of a Multiprotocol Label Switching (MPLS) provider core network. At each customer site, one or more customer edge (CE) devices attach to one or more provider edge (PE) devices. This module explains how to create an MPLS VPN.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for MPLS Virtual Private Networks

- Make sure that you have installed Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP), and Cisco Express Forwarding in your network.
- All devices in the core, including the provider edge (PE) devices, must be able to support Cisco Express Forwarding and MPLS forwarding. See the “Assessing the Needs of the MPLS Virtual Private Network Customers” section.
- Cisco Express Forwarding must be enabled on all devices in the core, including the PE devices. For information about how to determine if Cisco Express Forwarding is enabled, see the “Configuring Basic Cisco Express Forwarding” module in the *Cisco Express Forwarding Configuration Guide*.

Restrictions for MPLS Virtual Private Networks

When static routes are configured in a Multiprotocol Label Switching (MPLS) or MPLS virtual private network (VPN) environment, some variations of the **ip route** and **ip route vrf** commands are not supported. Use the following guidelines when configuring static routes.

Supported Static Routes in an MPLS Environment

The following **ip route** command is supported when you configure static routes in an MPLS environment:

- **ip route** *destination-prefix mask interface next-hop-address*

The following **ip route** commands are supported when you configure static routes in an MPLS environment and configure load sharing with static nonrecursive routes and a specific outbound interface:

- **ip route** *destination-prefix mask interface1 next-hop1*
- **ip route** *destination-prefix mask interface2 next-hop2*

Unsupported Static Routes in an MPLS Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS environment:

- **ip route** *destination-prefix mask next-hop-address*

The following **ip route** command is not supported when you configure static routes in an MPLS environment and enable load sharing where the next hop can be reached through two paths:

- **ip route** *destination-prefix mask next-hop-address*

The following **ip route** commands are not supported when you configure static routes in an MPLS environment and enable load sharing where the destination can be reached through two next hops:

- **ip route** *destination-prefix mask next-hop1*
- **ip route** *destination-prefix mask next-hop2*

Use the *interface* and *next-hop* arguments when specifying static routes.

Supported Static Routes in an MPLS VPN Environment

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are in the same VRF:

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface1 next-hop1*
- **ip route vrf** *vrf-name destination-prefix mask interface2 next-hop2*

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table in the MPLS cloud in the global routing table. For example, these commands are supported when the next hop is pointing to the Internet gateway.

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address global*

- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address* (This command is supported when the next hop and interface are in the core.)

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment and enable load sharing with static nonrecursive routes and a specific outbound interface:

- **ip route** *destination-prefix mask interface1 next-hop1*
- **ip route** *destination-prefix mask interface2 next-hop2*

Unsupported Static Routes in an MPLS VPN Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the next hop can be reached through two paths:

- **ip route vrf** *destination-prefix mask next-hop-address global*

The following **ip route** commands are not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the destination can be reached through two next hops:

- **ip route vrf** *destination-prefix mask next-hop1 global*
- **ip route vrf** *destination-prefix mask next-hop2 global*

The following **ip route vrf** commands are not supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are in the same VRF:

- **ip route vrf** *vrf-name destination-prefix mask next-hop1 vrf-name destination-prefix mask next-hop1*
- **ip route vrf** *vrf-name destination-prefix mask next-hop2*

Supported Static Routes in an MPLS VPN Environment Where the Next Hop Resides in the Global Table on the CE Device

The following **ip route vrf** command is supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table on the customer edge (CE) side. For example, the following command is supported when the destination prefix is the CE device's loopback address, as in external Border Gateway Protocol (EBGP) multihop cases.

- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table on the CE side, and you enable load sharing with static nonrecursive routes and a specific outbound interface:

- **ip route** *destination-prefix mask interface1 nexthop1*
- **ip route** *destination-prefix mask interface2 nexthop2*

Information About MPLS Virtual Private Networks

MPLS Virtual Private Network Definition

Before defining a Multiprotocol Label Switching virtual private network (MPLS VPN), you must define a VPN in general. A VPN is:

- An IP-based network delivering private network services over a public infrastructure
- A set of sites that are allowed to communicate with each other privately over the Internet or other public or private networks

Conventional VPNs are created by configuring a full mesh of tunnels or permanent virtual circuits (PVCs) to all sites in a VPN. This type of VPN is not easy to maintain or expand, because adding a new site requires changing each edge device in the VPN.

MPLS-based VPNs are created in Layer 3 and are based on the peer model. The peer model enables the service provider and the customer to exchange Layer 3 routing information. The service provider relays the data between the customer sites without the customer's involvement.

MPLS VPNs are easier to manage and expand than conventional VPNs. When a new site is added to an MPLS VPN, only the service provider's edge device that provides services to the customer site needs to be updated.

The different parts of the MPLS VPN are described as follows:

- Provider (P) device—Device in the core of the provider network. P devices run MPLS switching, and do not attach VPN labels to routed packets. The MPLS label in each route is assigned by the provider edge (PE) device. VPN labels are used to direct data packets to the correct egress device.
- PE device—Device that attaches the VPN label to incoming packets based on the interface or subinterface on which they are received. A PE device attaches directly to a customer edge (CE) device.
- Customer (C) device—Device in the ISP or enterprise network.
- CE device—Edge device on the network of the ISP that connects to the PE device on the network. A CE device must interface with a PE device.

The figure below shows a basic MPLS VPN.

Figure 1: Basic MPLS VPN Terminology

How an MPLS Virtual Private Network Works

Multiprotocol Label Switching virtual private network (MPLS VPN) functionality is enabled at the edge of an MPLS network. The provider edge (PE) device performs the following:

- Exchanges routing updates with the customer edge (CE) device.
- Translates the CE routing information into VPNv4 routes.
- Exchanges VPNv4 routes with other PE devices through the Multiprotocol Border Gateway Protocol (MP-BGP).

The following sections describe how MPLS VPN works:

Major Components of an MPLS Virtual Private Network

An Multiprotocol Label Switching (MPLS)-based virtual private network (VPN) has three major components:

- VPN route target communities—A VPN route target community is a list of all members of a VPN community. VPN route targets need to be configured for each VPN community member.
- Multiprotocol BGP (MP-BGP) peering of VPN community provider edge (PE) devices—MP-BGP propagates virtual routing and forwarding (VRF) reachability information to all members of a VPN community. MP-BGP peering must be configured on all PE devices within a VPN community.
- MPLS forwarding—MPLS transports all traffic between all VPN community members across a VPN service-provider network.

A one-to-one relationship does not necessarily exist between customer sites and VPNs. A given site can be a member of multiple VPNs. However, a site can associate with only one VRF. A customer-site VRF contains all the routes available to the site from the VPNs of which it is a member.

Benefits of an MPLS Virtual Private Network

Multiprotocol Label Switching virtual private networks (MPLS VPNs) allow service providers to deploy scalable VPNs and build the foundation to deliver value-added services, such as the following:

Connectionless Service

A significant technical advantage of MPLS VPNs is that they are connectionless. The Internet owes its success to its basic technology, TCP/IP. TCP/IP is built on a packet-based, connectionless network paradigm. This means that no prior action is necessary to establish communication between hosts, making it easy for two parties to communicate. To establish privacy in a connectionless IP environment, current VPN solutions impose a connection-oriented, point-to-point overlay on the network. Even if it runs over a connectionless network, a VPN cannot take advantage of the ease of connectivity and multiple services available in connectionless networks. When you create a connectionless VPN, you do not need tunnels and encryption for network privacy, thus eliminating significant complexity.

Centralized Service

Building VPNs in Layer 3 allows delivery of targeted services to a group of users represented by a VPN. A VPN must give service providers more than a mechanism for privately connecting users to intranet services. It must also provide a way to flexibly deliver value-added services to targeted customers. Scalability is critical, because customers want to use services privately in their intranets and extranets. Because MPLS VPNs are seen as private intranets, you may use new IP services such as:

- Multicast
- Quality of service (QoS)
- Telephony support within a VPN
- Centralized services including content and web hosting to a VPN

You can customize several combinations of specialized services for individual customers. For example, a service that combines IP multicast with a low-latency service class enables video conferencing within an intranet.

Scalability

If you create a VPN using connection-oriented, point-to-point overlays, Frame Relay, or ATM virtual connections (VCs), the VPN's key deficiency is scalability. Specifically, connection-oriented VPNs without fully meshed connections between customer sites are not optimal. MPLS-based VPNs, instead, use the peer model and Layer 3 connectionless architecture to leverage a highly scalable VPN solution. The peer model requires a customer site to peer with only one provider edge (PE) device as opposed to all other customer edge (CE) devices that are members of the VPN. The connectionless architecture allows the creation of VPNs in Layer 3, eliminating the need for tunnels or VCs.

Other scalability issues of MPLS VPNs are due to the partitioning of VPN routes between PE devices and the further partitioning of VPN and Interior Gateway Protocol (IGP) routes between PE devices and provider (P) devices in a core network.

- PE devices must maintain VPN routes for those VPNs who are members.
- P devices do not maintain any VPN routes.

This increases the scalability of the provider's core and ensures that no one device is a scalability bottleneck.

Security

MPLS VPNs offer the same level of security as connection-oriented VPNs. Packets from one VPN do not inadvertently go to another VPN.

Security is provided in the following areas:

- At the edge of a provider network, ensuring packets received from a customer are placed on the correct VPN.
- At the backbone, VPN traffic is kept separate. Malicious spoofing (an attempt to gain access to a PE device) is nearly impossible because the packets received from customers are IP packets. These IP packets must be received on a particular interface or subinterface to be uniquely identified with a VPN label.

Ease of Creation

To take full advantage of VPNs, customers must be able to easily create new VPNs and user communities. Because MPLS VPNs are connectionless, no specific point-to-point connection maps or topologies are required. You can add sites to intranets and extranets and form closed user groups. Managing VPNs in this manner enables membership of any given site in multiple VPNs, maximizing flexibility in building intranets and extranets.

Flexible Addressing

To make a VPN service more accessible, customers of a service provider can design their own addressing plan, independent of addressing plans for other service provider customers. Many customers use private address spaces, as defined in RFC 1918, and do not want to invest the time and expense of converting to public IP addresses to enable intranet connectivity. MPLS VPNs allow customers to continue to use their present address spaces without network address translation (NAT) by providing a public and private view of the address. A NAT is required only if two VPNs with overlapping address spaces want to communicate. This enables customers to use their own unregistered private addresses, and communicate freely across a public IP network.

Integrated QoS Support

QoS is an important requirement for many IP VPN customers. It provides the ability to address two fundamental VPN requirements:

- Predictable performance and policy implementation
- Support for multiple levels of service in an MPLS VPN

Network traffic is classified and labeled at the edge of the network before traffic is aggregated according to policies defined by subscribers and implemented by the provider and transported across the provider core. Traffic at the edge and core of the network can then be differentiated into different classes by drop probability or delay.

Straightforward Migration

For service providers to quickly deploy VPN services, use a straightforward migration path. MPLS VPNs are unique because you can build them over multiple network architectures, including IP, ATM, Frame Relay, and hybrid networks.

Migration for the end customer is simplified because there is no requirement to support MPLS on the CE device and no modifications are required to a customer's intranet.

How to Configure MPLS Virtual Private Networks

Configuring the Core Network

Assessing the Needs of MPLS Virtual Private Network Customers

Before you configure a Multiprotocol Label Switching virtual private network (MPLS VPN), you need to identify the core network topology so that it can best serve MPLS VPN customers. Perform this task to identify the core network topology.

SUMMARY STEPS

1. Identify the size of the network.
2. Identify the routing protocols in the core.
3. Determine if you need MPLS VPN High Availability support.
4. Determine if you need Border Gateway Protocol (BGP) load sharing and redundant paths in the MPLS VPN core.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Identify the size of the network.	Identify the following to determine the number of devices and ports that you need: <ul style="list-style-type: none"> • How many customers do you need to support? • How many VPNs are needed per customer? • How many virtual routing and forwarding instances are there for each VPN?
Step 2	Identify the routing protocols in the core.	Determine which routing protocols you need in the core network.
Step 3	Determine if you need MPLS VPN High Availability support.	MPLS VPN Nonstop Forwarding and Graceful Restart are supported on select devices and Cisco software releases. Contact Cisco Support for the exact requirements and hardware support.
Step 4	Determine if you need Border Gateway Protocol (BGP) load sharing and redundant paths in the MPLS VPN core.	For configuration steps, see the “Load Sharing MPLS VPN Traffic” feature module in the <i>MPLS Layer 3 VPNs Inter-AS and CSC Configuration Guide</i> .

Configuring MPLS in the Core

To enable Multiprotocol Label Switching (MPLS) on all devices in the core, you must configure either of the following as a label distribution protocol:

- MPLS Label Distribution Protocol (LDP). For configuration information, see the “MPLS Label Distribution Protocol (LDP)” module in the *MPLS Label Distribution Protocol Configuration Guide*.

Connecting the MPLS Virtual Private Network Customers

Defining VRFs on the PE Devices to Enable Customer Connectivity

Use this procedure to define a virtual routing and forwarding (VRF) configuration for IPv4. To define a VRF for IPv4 and IPv6, see the “Configuring a Virtual Routing and Forwarding Instance for IPv6” section in the “IPv6 VPN over MPLS” module in the *MPLS Layer 3 VPNs Configuration Guide*.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf-name*
4. **rd** *route-distinguisher*
5. **address-family** *ipv4* | *ipv6*
6. **route-target** {**import** | **export** | **both**} *route-target-ext-community*
7. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	vrf definition <i>vrf-name</i> Example: <pre>Device(config)# vrf definition vrf1</pre>	Defines the virtual private network (VPN) routing instance by assigning a virtual routing and forwarding (VRF) name and enters VRF configuration mode. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 4	rd <i>route-distinguisher</i> Example: <pre>Device(config-vrf)# rd 100:1</pre>	Creates routing and forwarding tables. <ul style="list-style-type: none"> • The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter a route distinguisher (RD) in either of these formats: <ul style="list-style-type: none"> • 16-bit AS number:your 32-bit number, for example, 101:3 • 32-bit IP address:your 16-bit number, for example, 10.0.0.1:1

	Command or Action	Purpose
Step 5	address-family <i>ipv4 ipv6</i> Example: Device(config-vrf) # address-family ipv6	Enters IPv4 or IPv6 address family mode
Step 6	route-target { import export both } <i>route-target-ext-community</i> Example: Device(config-vrf-af) # route-target both 100:1	Creates a route-target extended community for a VRF. <ul style="list-style-type: none"> The import keyword imports routing information from the target VPN extended community. The export keyword exports routing information to the target VPN extended community. The both keyword imports routing information from and exports routing information to the target VPN extended community. The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both route-target extended communities.
Step 7	exit Example: Device(config-vrf) # exit	(Optional) Exits to global configuration mode.

Configuring VRF Interfaces on PE Devices for Each VPN Customer

To associate a virtual routing and forwarding (VRF) instance with an interface or subinterface on the provider edge (PE) devices, perform this task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **vrf forwarding** *vrf-name*
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: <pre>Device(config)# interface GigabitEthernet 0/0/1</pre>	Specifies the interface to configure and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument specifies the type of interface to be configured. • The <i>number</i> argument specifies the port, connector, or interface card number.
Step 4	vrf forwarding <i>vrf-name</i> Example: <pre>Device(config-if)# vrf forwarding vrf1</pre>	Associates a VRF with the specified interface or subinterface. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 5	end Example: <pre>Device(config-if)# end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring Routing Protocols Between the PE and CE Devices

Configure the provider edge (PE) device with the same routing protocol that the customer edge (CE) device uses. You can configure the Border Gateway Protocol (BGP), Routing Information Protocol version 2 (RIPv2), EIGRP, Open Shortest Path First (OSPF) or static routes between the PE and CE devices.

Verifying the Virtual Private Network Configuration

A route distinguisher must be configured for the virtual routing and forwarding (VRF) instance, and Multiprotocol Label Switching (MPLS) must be configured on the interfaces that carry the VRF. Use the **show ip vrf** command to verify the route distinguisher (RD) and interface that are configured for the VRF.

SUMMARY STEPS

1. **show ip vrf**

DETAILED STEPS

show ip vrf

Displays the set of defined VRF instances and associated interfaces. The output also maps the VRF instances to the configured route distinguisher.

Verifying Connectivity Between MPLS Virtual Private Network Sites

To verify that the local and remote customer edge (CE) devices can communicate across the Multiprotocol Label Switching (MPLS) core, perform the following tasks:

Verifying IP Connectivity from CE Device to CE Device Across the MPLS Core

SUMMARY STEPS

1. **enable**
2. **ping** [*protocol*] {*host-name* | *system-address*}
3. **trace** [*protocol*] [*destination*]
4. **show ip route** [*ip-address* [*mask*] [**longer-prefixes**]] | *protocol* [*process-id*]] | [**list** [*access-list-name* | *access-list-number*]

DETAILED STEPS

-
- | | |
|---------------|---|
| Step 1 | enable
Enables privileged EXEC mode. |
| Step 2 | ping [<i>protocol</i>] { <i>host-name</i> <i>system-address</i> }
Diagnoses basic network connectivity on AppleTalk, Connectionless-mode Network Service (CLNS), IP, Novell, Apollo, Virtual Integrated Network Service (VINES), DECnet, or Xerox Network Service (XNS) networks. Use the ping command to verify the connectivity from one CE device to another. |
| Step 3 | trace [<i>protocol</i>] [<i>destination</i>]
Discovers the routes that packets take when traveling to their destination. The trace command can help isolate a trouble spot if two devices cannot communicate. |
| Step 4 | show ip route [<i>ip-address</i> [<i>mask</i>] [longer-prefixes]] <i>protocol</i> [<i>process-id</i>]] [list [<i>access-list-name</i> <i>access-list-number</i>]
Displays the current state of the routing table. Use the <i>ip-address</i> argument to verify that CE1 has a route to CE2. Verify the routes learned by CE1. Make sure that the route for CE2 is listed. |
-

Verifying That the Local and Remote CE Devices Are in the PE Routing Table

SUMMARY STEPS

1. **enable**
2. **show ip route vrf** *vrf-name* [*prefix*]
3. **show ip cef vrf** *vrf-name* [*ip-prefix*]

DETAILED STEPS

-
- | | |
|---------------|--|
| Step 1 | enable
Enables privileged EXEC mode. |
|---------------|--|

Step 2 **show ip route vrf** *vrf-name* [*prefix*]

Displays the IP routing table associated with a virtual routing and forwarding (VRF) instance. Check that the loopback addresses of the local and remote customer edge (CE) devices are in the routing table of the provider edge (PE) devices.

Step 3 **show ip cef vrf** *vrf-name* [*ip-prefix*]

Displays the Cisco Express Forwarding forwarding table associated with a VRF. Check that the prefix of the remote CE device is in the Cisco Express Forwarding table.

Configuration Examples for MPLS Virtual Private Networks

Example: Configuring an MPLS Virtual Private Network Using RIP

PE Configuration	CE Configuration
<pre> vrf vpn1 rd 100:1 route-target export 100:1 route-target import 100:1 ! ip cef mpls ldp router-id Loopback0 force mpls label protocol ldp ! interface Loopback0 ip address 10.0.0.1 255.255.255.255 ! interface GigabitEthernet 1/0/1 vrf forwarding vpn1 ip address 192.0.2.3 255.255.255.0 no cdp enable interface GigabitEthernet 1/0/1 ip address 192.0.2.2 255.255.255.0 mpls label protocol ldp mpls ip ! router rip version 2 timers basic 30 60 60 120 ! address-family ipv4 vrf vpn1 version 2 redistribute bgp 100 metric transparent network 192.0.2.0 distribute-list 20 in no auto-summary exit-address-family ! router bgp 100 no synchronization bgp log-neighbor changes neighbor 10.0.0.3 remote-as 100 neighbor 10.0.0.3 update-source Loopback0 no auto-summary ! address-family vpnv4 neighbor 10.0.0.3 activate neighbor 10.0.0.3 send-community extended bgp scan-time import 5 exit-address-family ! address-family ipv4 vrf vpn1 redistribute connected redistribute rip no auto-summary no synchronization exit-address-family </pre>	<pre> ip cef mpls ldp router-id Loopback0 force mpls label protocol ldp ! interface Loopback0 ip address 10.0.0.9 255.255.255.255 ! interface GigabitEthernet 1/0/1 ip address 192.0.2.1 255.255.255.0 no cdp enable router rip version 2 timers basic 30 60 60 120 redistribute connected network 10.0.0.0 network 192.0.2.0 no auto-summary </pre>

Release	Modification
Cisco IOS XE Everest 16.6.1	This feature was introduced.

CHAPTER 3

MPLS QoS: Classifying and Marking EXP

- [Classifying and Marking MPLS EXP](#), on page 27

Classifying and Marking MPLS EXP

The QoS EXP Matching feature allows you to classify and mark network traffic by modifying the Multiprotocol Label Switching (MPLS) experimental bits (EXP) field. This module contains conceptual information and the configuration tasks for classifying and marking network traffic using the MPLS EXP field.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Classifying and Marking MPLS EXP

- The switch must be configured as an MPLS provider edge (PE) or provider (P) router, which can include the configuration of a valid label protocol and underlying IP routing protocols.

Restrictions for Classifying and Marking MPLS EXP

- MPLS classification and marking can only occur in an operational MPLS Network.
- MPLS EXP classification and marking is supported only on MPLS enabled interfaces or MPLS traffic on other interfaces.
- If a packet is classified by IP type of service (ToS) or class of service (CoS) at ingress, it cannot be reclassified by MPLS EXP at egress (imposition case). However, if a packet is classified by MPLS at ingress it can be reclassified by IP ToS, CoS, or Quality of Service (QoS) group at egress (disposition case).

- To apply QoS on traffic across protocol boundaries, use QoS-group. You can classify and assign ingress traffic to the QoS-group. Thereafter, you can the QoS-group at egress to classify and apply QoS.
- If a packet is encapsulated in MPLS, the MPLS payload cannot be checked for other protocols such as IP for classification or marking. Only MPLS EXP marking affects packets encapsulated by MPLS.

Information About Classifying and Marking MPLS EXP

Classifying and Marking MPLS EXP Overview

The QoS EXP Matching feature allows you to organize network traffic by setting values for the MPLS EXP field in MPLS packets. By choosing different values for the MPLS EXP field, you can mark packets so that packets have the priority that they require during periods of congestion. Setting the MPLS EXP value allows you to:

- Classify traffic

The classification process selects the traffic to be marked. Classification accomplishes this by partitioning traffic into multiple priority levels, or classes of service. Traffic classification is the primary component of class-based QoS provisioning. For more information, see the “Classifying Network Traffic” module.

- Police and mark traffic

Policing causes traffic that exceeds the configured rate to be discarded or marked to a different drop level. Marking traffic is a way to identify packet flows to differentiate them. Packet marking allows you to partition your network into multiple priority levels or classes of service. For more information, see the “Marking Network Traffic” module.

MPLS Experimental Field

The MPLS experimental bits (EXP) field is a 3-bit field in the MPLS header that you can use to define the QoS treatment (per-hop behavior) that a node should give to a packet. In an IP network, the DiffServ Code Point (DSCP) (a 6-bit field) defines a class and drop precedence. The EXP bits can be used to carry some of the information encoded in the IP DSCP and can also be used to encode the dropping precedence.

By default, Cisco IOS Software copies the three most significant bits of the DSCP or the IP precedence of the IP packet to the EXP field in the MPLS header. This action happens when the MPLS header is initially imposed on the IP packet. However, you can also set the EXP field by defining a mapping between the DSCP or IP precedence and the EXP bits. This mapping is configured using the **set mpls experimental** or **police** commands. For more information, see the “How to Classify and Mark MPLS EXP” section.

You can perform MPLS EXP marking operations using table-maps. It is recommended to assign QoS-group to a different class of traffic in ingress policy and translate QoS-group to DSCP and EXP markings in egress policy using table-map.

Benefits of MPLS EXP Classification and Marking

If a service provider does not want to modify the value of the IP precedence field in packets transported through the network, they can use the MPLS EXP field value to classify and mark IP packets.

By choosing different values for the MPLS EXP field, you can mark critical packets so that those packets have priority if network congestion occurs.

How to Classify and Mark MPLS EXP

Classifying MPLS Encapsulated Packets

You can use the **match mpls experimental topmost** command to define traffic classes based on the packet EXP values, inside the MPLS domain. You can use these classes to define services policies to mark the EXP traffic using the **police** command.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map [match-all | match-any] class-map-name**
4. **match mpls experimental topmost mpls-exp-value**
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 3	class-map [match-all match-any] class-map-name Example: Switch(config)# class-map exp3	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode. • Enter the class map name.
Step 4	match mpls experimental topmost mpls-exp-value Example: Switch(config-cmap)# match mpls experimental topmost 3	Specifies the match criteria. Note The match mpls experimental topmost command classifies traffic on the basis of the EXP value in the topmost label header.
Step 5	end Example: Switch(config-cmap)# end	(Optional) Returns to privileged EXEC mode.

Marking MPLS EXP on the Outermost Label

Perform this task to set the value of the MPLS EXP field on imposed label entries.

Before you begin

In typical configurations, marking MPLS packets at imposition is used with ingress classification on IP ToS or CoS fields.

Note For IP imposition marking, the IP precedence value is copied to the MPLS EXP value by default.

Note The **set mpls experimental imposition** command works only on packets that have new or additional MPLS labels added to them.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** *policy-map-name*
4. **class** *class-map-name*
5. **set mpls experimental imposition** *mpls-exp-value*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Switch> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 3	policy-map <i>policy-map-name</i> Example: <pre>Switch(config)# policy-map mark-up-exp-2</pre>	Specifies the name of the policy map to be created and enters policy-map configuration mode. <ul style="list-style-type: none"> • Enter the policy map name.
Step 4	class <i>class-map-name</i> Example: <pre>Switch(config-pmap)# class prec012</pre>	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode. <ul style="list-style-type: none"> • Enter the class map name.
Step 5	set mpls experimental imposition <i>mpls-exp-value</i> Example:	Sets the value of the MPLS EXP field on top label.

	Command or Action	Purpose
	Switch(config-pmap-c)# set mpls experimental imposition 2	
Step 6	end Example: Switch(config-pmap-c)# end	(Optional) Returns to privileged EXEC mode.

Marking MPLS EXP on Label Switched Packets

Perform this task to set the MPLS EXP field on label switched packets.

Before you begin

Note The **set mpls experimental topmost** command marks EXP for the outermost label of MPLS traffic. Due to this marking at ingress policy, the egress policy must include classification based on the MPLS EXP values.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** *policy-map-name*
4. **class** *class-map-name*
5. **set mpls experimental topmost** *mpls-exp-value*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 3	policy-map <i>policy-map-name</i> Example: Switch(config)# policy-map mark-up-exp-2	Specifies the name of the policy map to be created and enters policy-map configuration mode. <ul style="list-style-type: none"> • Enter the policy map name.

	Command or Action	Purpose
Step 4	class <i>class-map-name</i> Example: <pre>Switch(config-pmap) # class-map exp012</pre>	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode. <ul style="list-style-type: none"> Enter the class map name.
Step 5	set mpls experimental topmost <i>mpls-exp-value</i> Example: <pre>Switch(config-pmap-c) # set mpls experimental topmost 2</pre>	Sets the MPLS EXP field value in the topmost label on the output interface.
Step 6	end Example: <pre>Switch(config-pmap-c) # end</pre>	(Optional) Returns to privileged EXEC mode.

Configuring Conditional Marking

To conditionally set the value of the MPLS EXP field on all imposed label, perform the following task:

Before you begin

Note

The **set-mpls-exp-topmost-transmit** action affects MPLS encapsulated packets only. The **set-mpls-exp-imposition-transmit** action affects any new labels that are added to the packet.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** *policy-map-name*
4. **class** *class-map-name*
5. **police cir** *bps* **bc pir** *bps* **be**
6. **conform-action** **transmit**
7. **exceed-action** **set-mpls-exp-topmost-transmit dscp table** *dscp-table-value*
8. **violate-action** **drop**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Switch> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 3	policy-map <i>policy-map-name</i> Example: <pre>Switch(config)# policy-map ip2tag</pre>	Specifies the name of the policy map to be created and enters policy-map configuration mode. <ul style="list-style-type: none"> • Enter the policy map name.
Step 4	class <i>class-map-name</i> Example: <pre>Switch(config-pmap)# class iptcp</pre>	Creates a class map to be used for matching traffic to a specified class, and enters policy-map class configuration mode. <ul style="list-style-type: none"> • Enter the class map name.
Step 5	police <i>cir bps bc pir bps be</i> Example: <pre>Switch(config-pmap-c)# police cir 1000000 pir 2000000</pre>	Defines a policer for classified traffic and enters policy-map class police configuration mode.
Step 6	conform-action transmit Example: <pre>Switch(config-pmap-c-police)# conform-action transmit 3</pre>	Defines the action to take on packets that conform to the values specified by the policer. <ul style="list-style-type: none"> • In this example, if the packet conforms to the committed information rate (cir) or is within the conform burst (bc) size, the MPLS EXP field is set to 3.
Step 7	exceed-action set-mpls-exp-topmost-transmit <i>dscp table dscp-table-value</i> Example: <pre>Switch(config-pmap-c-police)# exceed-action set-mpls-exp-topmost-transmit dscp table dscp2exp</pre>	Defines the action to take on packets that exceed the values specified by the policer.
Step 8	violate-action drop Example: <pre>Switch(config-pmap-c-police)# violate-action drop</pre>	Defines the action to take on packets whose rate exceeds the peak information rate (pir) and is outside the bc and be ranges. <ul style="list-style-type: none"> • You must specify the exceed action before you specify the violate action. • In this example, if the packet rate exceeds the pir rate and is outside the bc and be ranges, the packet is dropped.

	Command or Action	Purpose
Step 9	end Example: Switch(config-pmap-c-police) # end	(Optional) Returns to privileged EXEC mode.

Configuration Examples for Classifying and Marking MPLS EXP

Example: Classifying MPLS Encapsulated Packets

Defining an MPLS EXP Class Map

The following example defines a class map named exp3 that matches packets that contains MPLS experimental value 3:

```
Switch(config)# class-map exp3
Switch(config-cmap)# match mpls experimental topmost 3
Switch(config-cmap)# exit
```

Defining a Policy Map and Applying the Policy Map to an Ingress Interface

The following example uses the class map created in the example above to define a policy map. This example also applies the policy map to a physical interface for ingress traffic.

```
Switch(config)# policy-map change-exp-3-to-2
Switch(config-pmap)# class exp3
Switch(config-pmap-c)# set mpls experimental topmost 2
Switch(config-pmap)# exit
Switch(config)# interface GigabitEthernet 0/0/0
Switch(config-if)# service-policy input change-exp-3-to-2
Switch(config-if)# exit
```

Defining a Policy Map and Applying the Policy Map to an Egress Interface

The following example uses the class map created in the example above to define a policy map. This example also applies the policy map to a physical interface for egress traffic.

```
Switch(config)# policy-map WAN-out
Switch(config-pmap)# class exp3
Switch(config-pmap-c)# shape average 10000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface GigabitEthernet 0/0/0
Switch(config-if)# service-policy output WAN-out
Switch(config-if)# exit
```

Example: Marking MPLS EXP on Outermost Label

Defining an MPLS EXP Imposition Policy Map

The following example defines a policy map that sets the MPLS EXP imposition value to 2 based on the IP precedence value of the forwarded packet:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map prec012
Device(config-cmap)# match ip prec 0 1 2
Device(config-cmap)# exit
Device(config)# policy-map mark-up-exp-2
Device(config-pmap)# class prec012
Device(config-pmap-c)# set mpls experimental imposition 2
Device(config-pmap-c)# exit
Device(config-pmap)# exit
```

Applying the MPLS EXP Imposition Policy Map to a Main Interface

The following example applies a policy map to Gigabit Ethernet interface 0/0/0:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface GigabitEthernet 0/0/0
Device(config-if)# service-policy input mark-up-exp-2
Device(config-if)# exit
```

Example: Marking MPLS EXP on Label Switched Packets

Defining an MPLS EXP Label Switched Packets Policy Map

The following example defines a policy map that sets the MPLS EXP topmost value to 2 according to the MPLS EXP value of the forwarded packet:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map exp012
Switch(config-cmap)# match mpls experimental topmost 0 1 2
Switch(config-cmap)# exit
Switch(config-cmap)# policy-map mark-up-exp-2
Switch(config-pmap)# class exp012
Switch(config-pmap-c)# set mpls experimental topmost 2
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
```

Applying the MPLS EXP Label Switched Packets Policy Map to a Main Interface

The following example shows how to apply the policy map to a main interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface GigabitEthernet 0/0/0
Switch(config-if)# service-policy input mark-up-exp-2
Switch(config-if)# exit
```

Example: Configuring Conditional Marking

The example in this section creates a policer for the **iptcp** class, which is part of the **ip2tag** policy map, and attaches the policy map to the Gigabit Ethernet interface.

```
Switch(config)# policy-map ip2tag
Switch(config-pmap)# class iptcp
Switch(config-pmap-c)# police cir 1000000 pir 2000000
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action set-mpls-exp-imposition-transmit 2
Switch(config-pmap-c-police)# violate-action drop
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface GigabitEthernet 0/0/1
Switch(config-if)# service-policy input ip2tag
```

Cisco IOS XE Everest 16.6.1	This feature was introduced.

CHAPTER 4

Configuring Multicast Virtual Private Network

- [Configuring Multicast VPN, on page 39](#)

Configuring Multicast VPN

The Multicast VPN (MVPN) feature provides the ability to support multicast over a Layer 3 VPN. As enterprises extend the reach of their multicast applications, service providers can accommodate them over their Multiprotocol Label Switching (MPLS) core network. IP multicast is used to stream video, voice, and data over an MPLS VPN network core.

Historically, point-to-point tunnels were the only way to connect through a service provider network. Although such tunneled networks tend to have scalability issues, they represented the only means of passing IP multicast traffic through a VPN.

Because Layer 3 VPNs support only unicast traffic connectivity, deploying MPLS in conjunction with a Layer 3 VPN allows service providers to offer both unicast and multicast connectivity to Layer 3 VPN customers.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Prerequisites for Configuring Multicast VPN

Enable IP multicast and configure the PIM interfaces using the tasks described in the “Configuring Basic IP Multicast” module.

Restrictions for Configuring Multicast VPN

- The update source interface for the Border Gateway Protocol (BGP) peerings must be the same for all BGP peerings configured on the device in order for the default multicast distribution tree (MDT) to be

configured properly. If you use a loopback address for BGP peering, PIM sparse mode must be enabled on the loopback address.

- MVPN does not support multiple BGP peering update sources.
- Multiple BGP update sources are not supported, and configuring them can break MVPN reverse path forwarding (RPF) checking. The source IP address of the MVPN tunnels is determined by the highest IP address used for the BGP peering update source. If this IP address is not the IP address used as the BGP peering address with the remote provider edge (PE) device, MVPN will not function properly.

Information About Configuring Multicast VPN

This section provides information about configuring Multicast VPN:

Multicast VPN Operation

MVPN IP allows a service provider to configure and support multicast traffic in an MPLS VPN environment. This feature supports routing and forwarding of multicast packets for each individual VRF instance, and it also provides a mechanism to transport VPN multicast packets across the service provider backbone.

A VPN is network connectivity across a shared infrastructure, such as an ISP. Its function is to provide the same policies and performance as a private network, at a reduced cost of ownership, thus creating many opportunities for cost savings through operations and infrastructure.

An MVPN allows an enterprise to transparently interconnect its private network across the network backbone of a service provider. The use of an MVPN to interconnect an enterprise network in this way does not change the way that enterprise network is administered, nor does it change general enterprise connectivity.

Benefits of Multicast VPN

- Provides a scalable method to dynamically send information to multiple locations.
- Provides high-speed information delivery.
- Provides connectivity through a shared infrastructure.

Multicast VPN Routing and Forwarding and Multicast Domains

MVPN introduces multicast routing information to the VPN routing and forwarding table. When a provider edge (PE) device receives multicast data or control packets from a customer edge (CE) router, forwarding is performed according to the information in the Multicast VPN routing and forwarding instance (MVRF). MVPN does not use label switching.

A set of MVRFs that can send multicast traffic to each other constitutes a multicast domain. For example, the multicast domain for a customer that wanted to send certain types of multicast traffic to all global employees would consist of all CE routers associated with that enterprise.

Multicast Distribution Trees

MVPN establishes a static default multicast distribution tree (MDT) for each multicast domain. The default MDT defines the path used by PE routers to send multicast data and control messages to every other PE router in the multicast domain.

If Source Specific Multicast (SSM) is used as the core multicast routing protocol, the multicast IP addresses used for the default and data MDT must be configured within the SSM range on all PE routers.

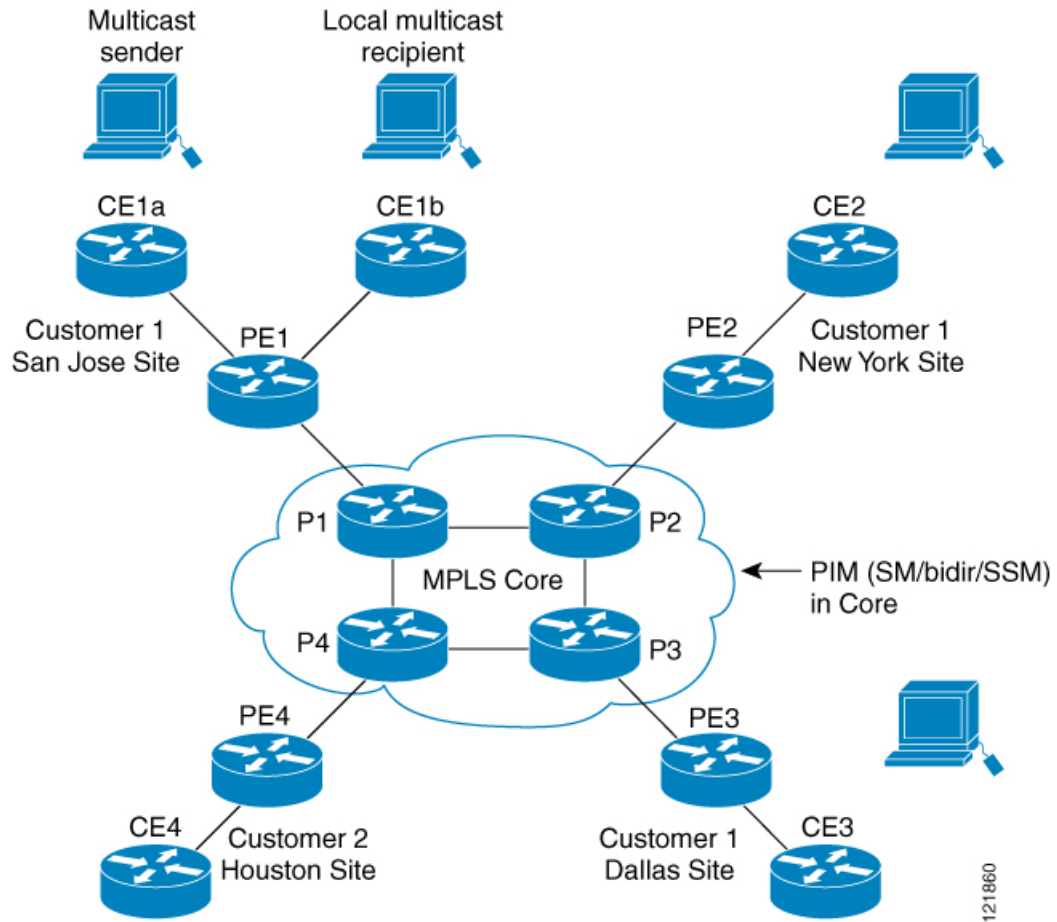

MVPN also supports the dynamic creation of MDTs for high-bandwidth transmission. Data MDTs are a feature unique to Cisco IOS software. Data MDTs are intended for high-bandwidth sources such as full-motion video inside the VPN to ensure optimal traffic forwarding in the MPLS VPN core. The threshold at which the data MDT is created can be configured on a per-router or a per-VRF basis. When the multicast transmission exceeds the defined threshold, the sending PE router creates the data MDT and sends a UDP message, which contains information about the data MDT, to all routers on the default MDT. The statistics to determine whether a multicast stream has exceeded the data MDT threshold are examined once every second. After a PE router sends the UDP message, it waits 3 more seconds before switching over; 13 seconds is the worst case switchover time, and 3 seconds is the best case.

Data MDTs are created only for (S, G) multicast route entries within the VRF multicast routing table. They are not created for (*, G) entries regardless of the value of the individual source data rate.

In the following example, a service provider has a multicast customer with offices in San Jose, New York, and Dallas. A one-way multicast presentation is occurring in San Jose. The service provider network supports all three sites associated with this customer, in addition to the Houston site of a different enterprise customer.

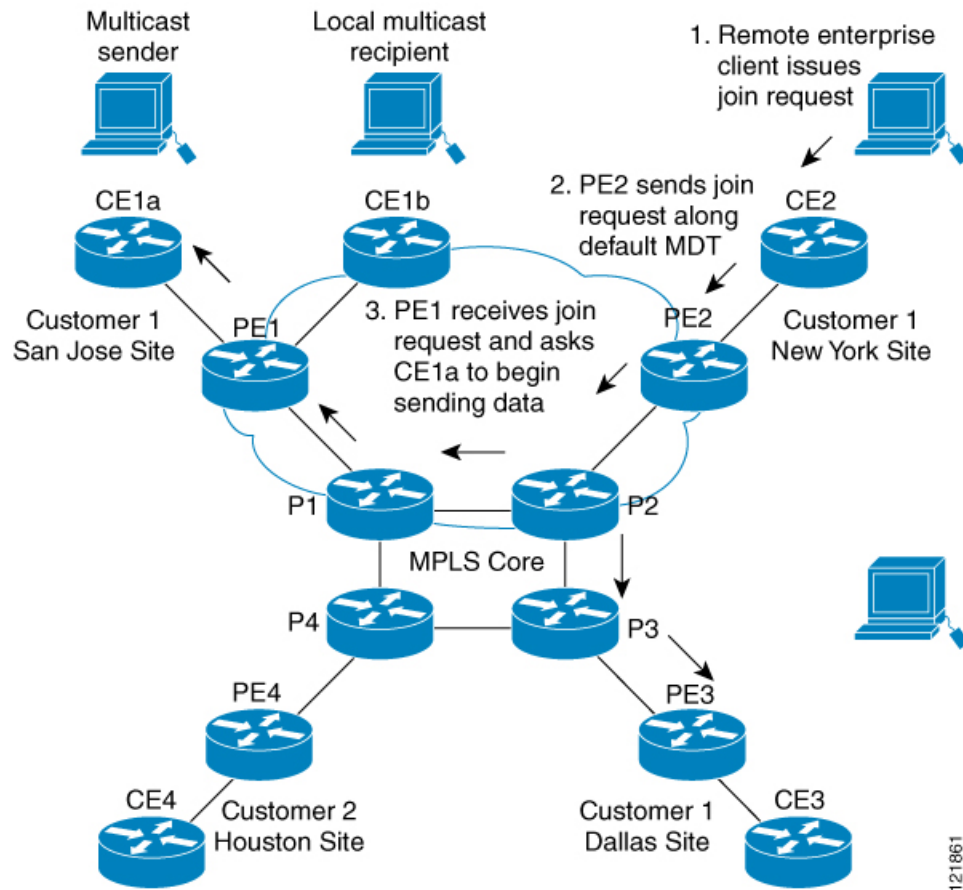

The default MDT for the enterprise customer consists of provider routers P1, P2, and P3 and their associated PE routers. PE4 is not part of the default MDT, because it is associated with a different customer. The figure shows that no data flows along the default MDT, because no one outside of San Jose has joined the multicast.

Figure 2: Default Multicast Distribution Tree Overview

An employee in New York joins the multicast session. The PE router associated with the New York site sends a join request that flows across the default MDT for the multicast domain of the customer. PE1, the PE router associated with the multicast session source, receives the request. The figure depicts that the PE router forwards the request to the CE router associated with the multicast source (CE1a).

Figure 3: Initializing the Data MDT

The CE router (CE1a) begins to send the multicast data to the associated PE router (PE1), which sends the multicast data along the default MDT. Immediately sending the multicast data, PE1 recognizes that the multicast data exceeds the bandwidth threshold for which a data MDT should be created. Therefore, PE1 creates a data MDT, sends a message to all routers using the default MDT, which contains information about the data MDT, and, three seconds later, begins sending the multicast data for that particular stream using the data MDT. Only PE2 has interested receivers for this source, so only PE2 will join the data MDT and receive traffic on it.

PE routers maintain a PIM relationship with other PE routers over the default MDT and a PIM relationship with directly attached PE routers.

Multicast Tunnel Interface

An MVRF, which is created per multicast domain, requires the device to create a tunnel interface from which all MVRF traffic is sourced. A multicast tunnel interface is an interface that the MVRF uses to access the multicast domain. It can be thought of as a conduit that connects an MVRF and the global MVRF. One tunnel interface is created per MVRF.

MDT Address Family in BGP for Multicast VPN

The **mdt** keyword has been added to the **address-family ipv4** command to configure an MDT address-family session. MDT address-family sessions are used to pass the source PE address and MDT group address to PIM using Border Gateway Protocol (BGP) MDT Subaddress Family Identifier (SAFI) updates.

BGP Advertisement Methods for Multicast VPN Support

In a single autonomous system, if the default MDT for an MVPN is using PIM sparse mode (PIM-SM) with a rendezvous point (RP), then PIM is able to establish adjacencies over the Multicast Tunnel Interface (MTI) because the source PE and receiver PE discover each other through the RP. In this scenario, the local PE (the source PE) sends register messages to the RP, which then builds a shortest-path tree (SPT) toward the source PE. The remote PE, which acts as a receiver for the MDT multicast group, then sends (*, G) joins toward the RP and joins the distribution tree for that group.

However, if the default MDT group is configured in a PIM Source Specific Multicast (PIM-SSM) environment rather than a PIM-SM environment, the receiver PE needs information about the source PE and the default MDT group. This information is used to send (S, G) joins toward the source PE to build a distribution tree from the source PE (without the need for an RP). The source PE address and default MDT group address are sent using BGP.

BGP Extended Community

When BGP extended communities are used, the PE loopback (source address) information is sent as a VPNv4 prefix using Route Distinguisher (RD) Type 2 (to distinguish it from unicast VPNv4 prefixes). The MDT group address is carried in a BGP extended community. Using a combination of the embedded source in the VPNv4 address and the group in the extended community, PE routers in the same MVRF instance can establish SSM trees to each other.

Note

Prior to the introduction of MDT SAFI support, the BGP extended community attribute was used as an interim solution to advertise the IP address of the source PE and default MDT group before IETF standardization. A BGP extended community attribute in an MVPN environment, however, has certain limitations: it cannot be used in inter-AS scenarios (because the attribute is nontransitive), and it uses RD Type 2 (which is not a supported standard).

How to Configure Multicast VPN

This section provides the steps to follow while configuring Multicast VPN:

Configuring the Data Multicast Group

A data MDT group can include a maximum of 256 multicast groups per VPN per VRF per PE device. Multicast groups used to create the data MDT group are dynamically chosen from a pool of configured IP addresses. Use the following procedure to configure data multicast group on the device.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target both** *ASN:nn or IP-address:nn*
6. **address family ipv4 unicast** *value*
7. **mdt default** *group-address*
8. **mdt data** *group number*

9. **mdt data threshold** *kbps*
10. **mdt log-reuse**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	vrf definition <i>vrf-name</i> Example: <pre>Device(config)# vrf definition vrf1</pre>	Enters VRF configuration mode and defines the VPN routing instance by assigning a VRF name.
Step 4	rd <i>route-distinguisher</i> Example: <pre>Device(config-vrf)# rd 1:1</pre>	Creates routing and forwarding tables for a VRF. <ul style="list-style-type: none"> The <i>route-distinguisher</i> argument specifies to add an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter a <i>route-distinguisher</i> in either of these formats: 16-bit autonomous system number (ASN): your 32-bit number. For example, 101:3. 32-bit IP address: your 16-bit number. For example, 192.168.122.15:1.
Step 5	route-target both <i>ASN:nn or IP-address:nn</i> Example: <pre>Device(config-vrf)# route-target both 1:1</pre>	Creates a route-target extended community for a VRF. The both keyword specifies to import both import and export routing information to the target VPN extended community.
Step 6	address family ipv4 unicast <i>value</i> Example: <pre>Device(config-vrf)# address family ipv4 unicast</pre>	Enters VRF address family configuration mode to specify an address family for a VRF. <ul style="list-style-type: none"> The ipv4 keyword specifies an IPv4 address family for a VRF
Step 7	mdt default <i>group-address</i> Example: <pre>Device(config-vrf-af)# mdt default 226.10.10.10</pre>	Configures the multicast group address range for data MDT groups for a VRF. <ul style="list-style-type: none"> A tunnel interface is created as a result of this command.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The default MDT group address configuration must be the same on all PEs in the same VRF.
Step 8	mdt data <i>group number</i> Example: Device(config-vrf-af)# mdt data 232.0.1.0 0.0.0.31	Specifies a range of addresses to be used in the data MDT pool.
Step 9	mdt data threshold <i>kbps</i> Example: Device(config-vrf-af)# mdt data threshold 50	Specifies the threshold in <i>kbps</i> . The range is from 1 to 4294967.
Step 10	mdt log-reuse Example: Device(config-vrf-af)# mdt log-reuse	(Optional) Enables the recording of data MDT reuse and generates a syslog message when a data MDT has been reused.
Step 11	end Example: Device(config-vrf-af)# end	Returns to privileged EXEC mode.

Configuring a Default MDT Group for a VRF

Perform this task to configure a default MDT group for a VRF.

The default MDT group must be the same group configured on all devices that belong to the same VPN. The source IP address will be the address used to source the BGP sessions.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip multicast-routing**
4. **ip multicast-routing vrf** *vrf-name*
5. **vrf definition** *vrf-name*
6. **rd** *route-distinguisher*
7. **route-target both** *ASN:nn or IP-address:nn*
8. **address family ipv4 unicast** *value*
9. **mdt default** *group-address*
10. **end**
11. **configure terminal**
12. **ip pim vrf** *vrf-name* **rp-address** *value*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ip multicast-routing Example: <pre>Device(config)# ip multicast-routing</pre>	Enables multicast routing.
Step 4	ip multicast-routing vrf vrf-name Example: <pre>Device(config)# ip multicast-routing vrf vrf1</pre>	Supports the MVPN VRF instance.
Step 5	vrf definition vrf-name Example: <pre>Device(config)# vrf definition vrf1</pre>	Enters VRF configuration mode and defines the VPN routing instance by assigning a VRF name.
Step 6	rd route-distinguisher Example: <pre>Device(config-vrf)# rd 1:1</pre>	Creates routing and forwarding tables for a VRF. <ul style="list-style-type: none"> • The <i>route-distinguisher</i> argument specifies to add an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter a <i>route-distinguisher</i> in either of these formats: • 16-bit autonomous system number (ASN): your 32-bit number. For example, 101:3. • 32-bit IP address: your 16-bit number. For example, 192.168.122.15:1.
Step 7	route-target both ASN:nn or IP-address:nn Example: <pre>Device(config-vrf)# route-target both 1:1</pre>	Creates a route-target extended community for a VRF. The both keyword specifies to import both import and export routing information to the target VPN extended community.
Step 8	address family ipv4 unicast value Example: <pre>Device(config-vrf)# address family ipv4 unicast</pre>	Enters VRF address family configuration mode to specify an address family for a VRF. <ul style="list-style-type: none"> • The ipv4 keyword specifies an IPv4 address family for a VRF

	Command or Action	Purpose
Step 9	mdt default <i>group-address</i> Example: <pre>Device(config-vrf-af)# mdt default 226.10.10.10</pre>	Configures the multicast group address range for data MDT groups for a VRF. <ul style="list-style-type: none"> • A tunnel interface is created as a result of this command. • The default MDT group address configuration must be the same on all PEs in the same VRF.
Step 10	end Example: <pre>Device(config-vrf-af)# end</pre>	Returns to privileged EXEC mode.
Step 11	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 12	ip pim vrf vrf-name rp-address value Example: <pre>Device(config-vrf-af)# ip pim vrf vrf1 rp-address 1.1.1.1</pre>	Enters the RP configuration mode.

Configuring the MDT Address Family in BGP for Multicast VPN

Perform this task to configure an MDT address family session on PE devices to establish MDT peering sessions for MVPN.

Before you begin

Before MVPN peering can be established through an MDT address family, MPLS and Cisco Express Forwarding (CEF) must be configured in the BGP network and multiprotocol BGP on PE devices that provide VPN services to CE devices.

Note

The following policy configuration parameters are not supported:

- Route-originator attribute
- Network Layer Reachability Information (NLRI) prefix filtering (prefix lists, distribute lists)
- Extended community attributes (route target and site of origin)

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **router** *bgp as-number*
4. **address-family** *ipv4 mdt*
5. **neighbor** *neighbor-address activate*
6. **neighbor** *neighbor-address send-community* [*both* | *extended* | *standard*]
7. **exit**
8. **address-family** *vpn4*
9. **neighbor** *neighbor-address activate*
10. **neighbor** *neighbor-address send-community* [*both* | *extended* | *standard*]
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	router <i>bgp as-number</i> Example: <pre>Device(config)# router bgp 65535</pre>	Enters router configuration mode and creates a BGP routing process.
Step 4	address-family <i>ipv4 mdt</i> Example: <pre>Device(config-router)# address-family ipv4 mdt</pre>	Enters address family configuration mode to create an IP MDT address family session.
Step 5	neighbor <i>neighbor-address activate</i> Example: <pre>Device(config-router-af)# neighbor 192.168.1.1 activate</pre>	Enables the MDT address family for this neighbor.
Step 6	neighbor <i>neighbor-address send-community</i> [<i>both</i> <i>extended</i> <i>standard</i>] Example: <pre>Device(config-router-af)# neighbor 192.168.1.1 send-community extended</pre>	Enables community and (or) extended community exchange with the specified neighbor.
Step 7	exit Example:	Exits address family configuration mode and returns to router configuration mode.

	Command or Action	Purpose
	<code>Device(config-router-af)# exit</code>	
Step 8	address-family vpnv4 Example: <code>Device(config-router)# address-family vpnv4</code>	Enters address family configuration mode to create a VPNv4 address family session.
Step 9	neighbor <i>neighbor-address</i> activate Example: <code>Device(config-router-af)# neighbor 192.168.1.1 activate</code>	Enables the VPNv4 address family for this neighbor.
Step 10	neighbor <i>neighbor-address</i> send-community [both extended standard] Example: <code>Device(config-router-af)# neighbor 192.168.1.1 send-community extended</code>	Enables community and (or) extended community exchange with the specified neighbor.
Step 11	end Example: <code>Device(config-router-af)# end</code>	Exits address family configuration mode and enters privileged EXEC mode.

Verifying Information for the MDT Default Group

SUMMARY STEPS

1. **enable**
2. **show ip pim [*vrf vrf-name*] mdt bgp**
3. **show ip pim [*vrf vrf-name*] mdt send**
4. **show ip pim vrf *vrf-name* mdt history interval *minutes***

DETAILED STEPS

-
- Step 1** **enable**
- Example:**
- `Device> enable`
- Enables privileged EXEC mode.
- Enter your password if prompted.
- Step 2** **show ip pim [*vrf vrf-name*] mdt bgp**
- Example:**

```
Device# show ip pim mdt bgp
```

```
MDT-default group 232.2.1.4
rid:1.1.1.1 next_hop:1.1.1.1
```

Displays information about the BGP advertisement of the RD for the MDT default group.

Step 3 **show ip pim [vrf vrf-name] mdt send**

Example:

```
Device# show ip pim mdt send
```

```
MDT-data send list for VRF:vpn8
(source, group)          MDT-data group      ref_count
(10.100.8.10, 225.1.8.1)  232.2.8.0          1
(10.100.8.10, 225.1.8.2)  232.2.8.1          1
(10.100.8.10, 225.1.8.3)  232.2.8.2          1
(10.100.8.10, 225.1.8.4)  232.2.8.3          1
(10.100.8.10, 225.1.8.5)  232.2.8.4          1
(10.100.8.10, 225.1.8.6)  232.2.8.5          1
(10.100.8.10, 225.1.8.7)  232.2.8.6          1
(10.100.8.10, 225.1.8.8)  232.2.8.7          1
(10.100.8.10, 225.1.8.9)  232.2.8.8          1
(10.100.8.10, 225.1.8.10) 232.2.8.9          1
```

Displays detailed information about the MDT data group including MDT advertisements that the specified device has made.

Step 4 **show ip pim vrf vrf-name mdt history interval minutes**

Example:

```
Device# show ip pim vrf vrf1 mdt history interval 20
```

```
MDT-data send history for VRF - vrf1 for the past 20 minutes
MDT-data group      Number of reuse
10.9.9.8             3
10.9.9.9             2
```

Displays the data MDTs that have been reused during the past configured interval.

Configuration Examples for Multicast VPN

The following section provides the configuration examples for Multicast VPN:

Example: Configuring MVPN and SSM

In the following example, PIM-SSM is configured in the backbone. Therefore, the default and data MDT groups are configured within the SSM range of IP addresses. Inside the VPN, PIM-SM is configured and only Auto-RP announcements are accepted.

```
ip vrf vrf1
 rd 1:1
 route-target export 1:1
 route-target import 1:1
 mdt default 232.0.0.1
 mdt data 232.0.1.0 0.0.0.255 threshold 500 list 101
!
```

Example: Enabling a VPN for Multicast Routing

```
ip pim ssm default
ip pim vrf vrfl accept-rp auto-rp
```

Example: Enabling a VPN for Multicast Routing

In the following example, multicast routing is enabled with a VPN routing instance named vrfl:

```
ip multicast-routing vrfl
```

Example: Configuring the Multicast Group Address Range for Data MDT Groups

In the following example, the VPN routing instance is assigned a VRF named blue. The MDT default group for a VPN VRF is 239.1.1.1, and the multicast group address range for MDT groups is 239.1.2.0 with wildcard bits of 0.0.0.3:

```
ip vrf blue
rd 55:1111
route-target both 55:1111
mdt default 239.1.1.1
mdt data 239.1.2.0 0.0.0.3
end
```

Example: Limiting the Number of Multicast Routes

In the following example, the number of multicast routes that can be added to a multicast routing table is set to 200,000 and the threshold value of the number of mroutes that will cause a warning message to occur is set to 20,000:

```
!
ip multicast-routing
ip multicast-routing vrf cisco
ip multicast cache-headers
ip multicast route-limit 200000 20000
ip multicast vrf cisco route-limit 200000 20000
no mpls traffic-eng auto-bw timers frequency 0
!
```

- [Feature Information for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN, on page 62](#)

BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN

The BGP Multipath Load Sharing for eBGP and iBGP feature allows you to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in Border Gateway Protocol (BGP) networks that are configured to use Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). This feature provides improved load balancing deployment and service offering capabilities and is useful for multi-homed autonomous systems and Provider Edge (PE) routers that import both eBGP and iBGP paths from multihomed and stub networks.

Prerequisites for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN

Cisco Express Forwarding (CEF) or distributed CEF (dCEF) must be enabled on all participating devices.

Restrictions for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN

Address Family Support

This feature is configured on a per VPN routing and forwarding instance (VRF) basis. This feature can be configured under both IPv4 and IPv6 VRF address families.

Memory Consumption Restriction

Each BGP multipath routing table entry will use additional memory. We recommend that you do not use this feature on a device with a low amount of available memory and especially if the device carries full Internet routing tables.

Number of Paths Limitation

The number of paths supported are limited to 2 BGP multipaths. This could either be 2 iBGP multipaths or 1 iBGP multipath and 1 eBGP multipath.

Unsupported Commands

`ip unnumbered` command is not supported in MPLS configuration.

Information About BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN

Multipath Load Sharing Between eBGP and iBGP

A BGP routing process will install a single path as the best path in the routing information base (RIB) by default. The `maximum-paths` command allows you to configure BGP to install multiple paths in the RIB for multipath load sharing. BGP uses the best path algorithm to select a single multipath as the best path and advertise the best path to BGP peers.

**Note**

The number of paths of multipaths that can be configured is documented on the `maximum-paths` command reference page.

Load balancing over the multipaths is performed by CEF. CEF load balancing is configured on a per-packet round robin or on a per session (source and destination pair) basis. For information about CEF, refer to Cisco IOS IP Switching Configuration Guide documentation: [IP Switching Cisco Express Forwarding Configuration Guide](#). The BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature is enabled under the IPv4 VRF address family and IPv6 VRF address family configuration modes. When enabled, this feature can perform load balancing on eBGP and/or iBGP paths that are imported into the VRF. The number of multipaths is configured on a per VRF basis. Separate VRF multipath configurations are isolated by unique route distinguisher.

Note The BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature operates within the parameters of configured outbound routing policy.

eBGP and iBGP Multipath Load Sharing in a BGP MPLS Network

The following figure shows a service provider BGP MPLS network that connects two remote networks to PE router 1 and PE router 2. PE router 1 and PE router 2 are both configured for VPNv4 unicast iBGP peering. Network 2 is a multihomed network that is connected to PE router 1 and PE router 2. Network 2 also has extranet VPN services configured with Network 1. Both Network 1 and Network 2 are configured for eBGP peering with the PE routers.

Figure 4: Service Provider BGP MPLS Network

PE router 1 can be configured with the BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature so that both iBGP and eBGP paths can be selected as multipaths and imported into the VRF. The multipaths will be used by CEF to perform load balancing. IP traffic that is sent from Network 1 to Network 2, PE router 1 will Load Share with eBGP paths as IP traffic & iBGP path will be sent as MPLS traffic.

- Note**
- eBGP session between local CE & local PE is not supported.
 - eBGP session from a local PE to a remote CE is supported.
 - eiBGP Multipath is supported in per prefix label allocation mode only. It is not supported in other label allocation modes.

Benefits of Multipath Load Sharing for Both eBGP and iBGP

The BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature allows multihomed autonomous systems and PE routers to be configured to distribute traffic across both eBGP and iBGP paths.

How to Configure BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN

This section contains the following procedures:

Configuring Multipath Load Sharing for Both eBGP and iBGP

SUMMARY STEPS

1. **enable**
2. **configure** { **terminal** | **memory** | **network** }
3. **router bgp as-number**
4. **neighbor** { *ip-address* | *ipv6-address* | *peer-group-name* }
5. **address-family ipv4 vrfvrf-name**
6. **address-family ipv6 vrfvrf-name**
7. **neighbor** { *ip-address* | *ipv6-address* | *peer-group-name* } **update-source** *interface-type interface-name*
8. **neighbor** { *ip-address* | *ipv6-address* | *peer-group-name* } **activate**
9. **maximum-paths eibgp number** [*import number*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure { terminal memory network } Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp as-number Example: Device(config)# router bgp 40000	Enters router configuration mode to create or configure a BGP routing process.
Step 4	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } Example: Device(config-router)# neighbor group192	Accepts and attempts BGP connections to external peers residing on networks that are not directly connected.
Step 5	address-family ipv4 vrfvrf-name	Places the router in address family configuration mode.

	Command or Action	Purpose
	Example: Device(config-router)# address-family ipv4 vrf RED	<ul style="list-style-type: none"> Separate VRF multipath configurations are isolated by unique route distinguisher.
Step 6	address-family ipv6 vrf vrf-name Example: Device(config-router)# address-family ipv6 vrf RED	Places the router in address family configuration mode. <ul style="list-style-type: none"> Separate VRF multipath configurations are isolated by unique route distinguisher.
Step 7	neighbor {ip-address ipv6-address peer-group-name } update-source interface-type interface-name Example: Device(config-router)# neighbor FE80::1234:BFF:FE0E:A471 update-source GigabitEthernet 1/0/0	Specifies the link-local address over which the peering is to occur.
Step 8	neighbor {ip-address ipv6-address peer-group-name } activate Example: Device(config-router)# neighbor group192 activate	Activates the neighbor or listen range peer group for the configured address family.
Step 9	maximum-paths eibgp number [import number] Example: Device(config-router-af)# maximum-paths eibgp 2	Configures the number of parallel iBGP and eBGP routes that can be installed into a routing table.

Verifying Multipath Load Sharing for Both eBGP and iBGP

SUMMARY STEPS

1. enable
2. show ip bgp neighbors
3. show ip bgp vpnv4 vrf vrf-name
4. show ip route vrf vrf-name

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip bgp neighbors Example: Device# show ip bgp neighbors	Displays information about the TCP and BGP connections to neighbors.

	Command or Action	Purpose
Step 3	show ip bgp vpnv4 vrf <i>vrf name</i> Example: Device# show ip bgp vpnv4 vrf RED	Displays VPN address information from the BGP table. This command is used to verify that the VRF has been received by BGP.
Step 4	show ip route vrf <i>vrf-name</i> Example: Device# show ip route vrf RED	Displays the IP routing table associated with a VRF instance. The show ip route vrf command is used to verify that the VRF is in the routing table.

Configuration Examples for the BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN Feature

The following examples show how to configure and verify this feature:

eBGP and iBGP Multipath Load Sharing Configuration Example

This following configuration example configures a router in IPv4 address-family mode to select two BGP routes (eBGP or iBGP) as multipaths:

```
Device router bgp 40000
  Deviceaddress-family ipv4 vrf RED
  Devicemaximum-paths eibgp 2
Deviceend
```

This following configuration example configures a router in IPv6 address-family mode to select two BGP routes (eBGP or iBGP) as multipaths:

```
Device router bgp 40000
  Deviceaddress-family ipv6 vrf RED
  Devicemaximum-paths eibgp 2
Deviceend
```

Configuring Ethernet-over-MPLS (EoMPLS)

- [Finding Feature Information, on page 63](#)
- [Configuring EoMPLS, on page 63](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Configuring EoMPLS

Information About EoMPLS

EoMPLS is one of the AToM transport types. EoMPLS works by encapsulating Ethernet PDUs in MPLS packets and forwarding them across the MPLS network. Each PDU is transported as a single packet.

Only the following mode is supported:

- Port mode—Allows all traffic on a port to share a single VC across an MPLS network. Port mode uses VC type 5.

For scale information related to this feature, see [Cisco Catalyst 9400 Series Switch Data Sheet](#).

Prerequisites for EoMPLS

Before you configure EoMPLS, ensure that the network is configured as follows:

- Configure IP routing in the core so that the PE routers can reach each other through IP.
- Configure MPLS in the core so that a label switched path (LSP) exists between the PE routers.

- Configure **no switchport**, **no keepalive** and **no ip address** before configuring xconnect on the attachment circuit.
- For load-balancing, **port-channel load-balance** command is mandatory to be configured.

Restrictions for EoMPLS

- VLAN mode is not supported. Ethernet Flow Point is not supported.
- QoS : Customer DSCP Re-marking is not supported with VPWS and EoMPLS.
- VCCV Ping with explicit null is not supported.
- L2 VPN Interworking is not supported.
- L2 Protocol Tunneling CLI is not supported.
- Untagged, tagged and 802.1Q in 802.1Q are supported as incoming traffic.

Note Flow Load balance for 802.1Q in 802.1Q over EoMPLS is not supported.

- Flow Aware Transport Pseudowire Redundancy (FAT PW) is supported only in Protocol-CLI mode. Supported load balancing parameters are Source IP, Source MAC address, Destination IP and Destination MAC address.
- Enabling or disabling Control word is supported.
- MPLS QoS is supported in Pipe and Uniform Mode. Default mode is Pipe Mode.
- Both – the legacy xconnect and Protocol-CLI (interface pseudowire configuration) modes are supported.
- Xconnect and MACSec cannot be configured on the same interface.
- MACSec should be configured on CE devices and Xconnect should be configured on PE devices.
- A MACSec session should be between CE devices.

By default, EoMPLS PW tunnels all protocols like CDP, STP. EoMPLS PW cannot perform selective protocol tunneling as part of L2 Protocol Tunneling CLI.

Configuring Port-Mode EoMPLS

Port-Mode EoMPLS can be configured in two modes :

- Xconnect Mode
- Protocol CLI Method

Xconnect Mode

To configure port-mode EoMPLS in xconnect mode, perform the following task :

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **no switchport**
5. **no ip address**
6. **no keepalive**
7. **xconnect *peer-device-id* *vc-id* encapsulation mpls**
8. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	interface <i>interface-id</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36</pre>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no switchport Example: <pre>Device(config-if)# no switchport</pre>	For physical ports only, enters Layer 3 mode..
Step 5	no ip address Example: <pre>Device(config-if)# no ip address</pre>	Ensures that there is no IP address assigned to the physical port.
Step 6	no keepalive Example:	Ensures that the device does not send keepalive messages.

	Command or Action	Purpose
	Device(config-if) # no keepalive	
Step 7	xconnect <i>peer-device-id</i> <i>vc-id</i> encapsulation mpls Example: Device(config-if) # xconnect 1.1.1.1 962 encapsulation mpls	Binds the attachment circuit to a pseudowire VC. The syntax for this command is the same as for all other Layer 2 transports.
Step 8	end Example: Device(config) # end	Returns to privileged EXEC mode.

Protocol CLI Method

To configure port-mode EoMPLS in protocol-CLI mode, perform the following task :

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **port-channel load-balance dst-ip**
4. **interface** *interface-id*
5. **no switchport**
6. **no ip address**
7. **no keepalive**
8. **exit**
9. **interface pseudowire** *number*
10. **encapsulation mpls**
11. **neighbor** *peer-device-id* *vc-id*
12. **load-balance flow ip** *dst-ip*
13. **load-balance flow-label both**
14. **l2vpn xconnect context** *context-name*
15. **member** *interface-id*
16. **member pseudowire** *number*
17. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	port-channel load-balance dst-ip Example: <pre>Device(config)# port-channel load-balance 192.168.2.25</pre>	Sets the load-distribution method to the destination IP address. <ul style="list-style-type: none"> • <i>dst-ip</i>— Destination IP address
Step 4	interface <i>interface-id</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/21</pre>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 5	no switchport Example: <pre>Device(config-if)# no switchport</pre>	For physical ports only, enters Layer 3 mode..
Step 6	no ip address Example: <pre>Device(config-if)# no ip address</pre>	Ensures that there is no IP address assigned to the physical port.
Step 7	no keepalive Example: <pre>Device(config-if)# no keepalive</pre>	Ensures that the device does not send keepalive messages.

	Command or Action	Purpose
Step 8	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode.
Step 9	interface pseudowire <i>number</i> Example: <pre>Device(config-if)# interface pseudowire 17</pre>	Establishes an interface pseudowire with a value that you specify and enters pseudowire configuration mode. <ul style="list-style-type: none"> <i>number</i> — Specifies the number of the pseudowire to be configured.
Step 10	encapsulation mpls Example: <pre>Device(config-if)# encapsulation mpls</pre>	Specifies the tunneling encapsulation.
Step 11	neighbor <i>peer-device-id</i> <i>vc-id</i> Example: <pre>Device(config-if)# neighbor 4.4.4.4 17</pre>	Specifies the peer IP address and virtual circuit (VC) ID value of a Layer 2 VPN (L2VPN) pseudowire.
Step 12	load-balance flow ip <i>dst-ip</i> Example: <pre>Device(config-if)# load-balance flow ip 192.168.2.25</pre>	Enables edge load balancing of traffic across multiple core facing interfaces using equal cost multipaths (ECMP). <ul style="list-style-type: none"> <i>dst-ip</i>— Destination IP address
Step 13	load-balance flow-label both Example: <pre>Device(config-if)# load-balance flow-label both</pre>	Enables core load balancing based on flow-labels.
Step 14	l2vpn xconnect context <i>context-name</i> Example: <pre>Device(config)# l2vpn xconnect context vpws17</pre>	Creates a Layer 2 VPN (L2VPN) cross connect context and enters xconnect context configuration mode.

	Command or Action	Purpose
Step 15	member <i>interface-id</i> Example: <pre>Device(config-if)# member TenGigabitEthernet1/0/21</pre>	Specifies interface that forms a Layer 2 VPN (L2VPN) cross connect.
Step 16	member pseudowire <i>number</i> Example: <pre>Device(config-if)# member pseudowire 17</pre>	Specifies pseudowire interface that forms a Layer 2 VPN (L2VPN) cross connect.
Step 17	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

CHAPTER 7

Configuring IPv6 Provider Edge over MPLS (6PE)

- [Finding Feature Information, on page 73](#)
- [Configuring 6PE, on page 73](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfmng.cisco.com/>. An account on Cisco.com is not required.

Configuring 6PE

Information About 6PE

6PE is a technique that provides global IPv6 reachability over IPv4 MPLS. It allows one shared routing table for all other devices. 6PE allows IPv6 domains to communicate with one another over the IPv4 without an explicit tunnel setup, requiring only one IPv4 address per IPv6 domain.

While implementing 6PE, the provider edge routers are upgraded to support 6PE, while the rest of the core network is not touched (IPv6 unaware). This implementation requires no reconfiguration of core routers because forwarding is based on labels rather than on the IP header itself. This provides a cost-effective strategy for deploying IPv6. The IPv6 reachability information is exchanged by PE routers using multiprotocol Border Gateway Protocol (mp-iBGP) extensions.

6PE relies on mp-iBGP extensions in the IPv4 network configuration on the PE router to exchange IPv6 reachability information in addition to an MPLS label for each IPv6 address prefix to be advertised. PE routers are configured as dual stacks, running both IPv4 and IPv6, and use the IPv4 mapped IPv6 address for IPv6 prefix reachability exchange. The next hop advertised by the PE router for 6PE and 6VPE prefixes is still the IPv4 address that is used for IPv4 L3 VPN routes. A value of `::FFFF:` is prepended to the IPv4 next hop, which is an IPv4-mapped IPv6 address.

The following figure illustrates the 6PE topology.

Figure 6: 6PE Topology

For scale information related to this feature, see [Cisco Catalyst 9400 Series Switch Data Sheet](#).

Prerequisites for 6PE

Redistribute PE-CE IGP IPv6 routes into core BGP and vice-versa

Restrictions for 6PE

eBGP as CE-PE is not supported. Static Routes, OSPFv3, ISIS, RIPv2 are supported as CE-PE.

Configuring 6PE

Ensure that you configure 6PE on PE routers participating in both the IPv4 cloud and IPv6 clouds.

BGP running on a PE router should establish (IPv4) neighborhood with BGP running on other PEs. Subsequently, it should advertise the IPv6 prefixes learnt from the IPv6 table to the neighbors. The IPv6 prefixes advertised by BGP would automatically have IPv4-encoded-IPv6 addresses as the nexthop-address in the advertisement.

To configure 6PE, complete the following steps:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ipv6 unicast-routing**
4. **router bgp *as-number***
5. **bgp router-id interface *interface-id***
6. **bgp log-neighbor-changes**
7. **bgp graceful-restart**
8. **neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } remote-as *as-number***
9. **neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } update-source interface-type *interface-number***
10. **address-family ipv6**
11. **redistribute protocol *as-number* match { internal | external 1 | external 2**
12. **neighbor { *ip-address* | *ipv6-address* | *peer-group-name* } activate**

13. **neighbor** { *ip-address* | *ipv6-address* | *peer-group-name* } **send-label**
14. **exit-address-family**
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	ipv6 unicast-routing Example: <pre>Device(config)# ipv6 unicast-routing</pre>	Enables the forwarding of IPv6 unicast datagrams.
Step 4	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 65001</pre>	Enters the number that identifies the autonomous system (AS) in which the router resides. <i>as-number</i> —Autonomous system number. Range for 2-byte numbers is 1 to 65535. Range for 4-byte numbers is 1.0 to 65535.65535.
Step 5	bgp router-id interface <i>interface-id</i> Example: <pre>Device(config-router)# bgp router-id interface Loopback1</pre>	Configures a fixed router ID for the local Border Gateway Protocol (BGP) routing process.
Step 6	bgp log-neighbor-changes Example: <pre>Device(config-router)# bgp log-neighbor-changes</pre>	Enables logging of BGP neighbor resets.
Step 7	bgp graceful-restart Example: <pre>Device(config-router)# bgp graceful-restart</pre>	Enables the Border Gateway Protocol (BGP) graceful restart capability globally for all BGP neighbors.
Step 8	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i>	Adds an entry to the BGP or multiprotocol BGP neighbor table.

	Command or Action	Purpose
	Example: <pre>Device(config-router)# neighbor 33.33.33.33 remote-as 65001</pre>	<ul style="list-style-type: none"> • <i>ip-address</i>—IP address of a peer router with which routing information will be exchanged. • <i>ipv6-address</i>—IPv6 address of a peer router with which routing information will be exchanged. • <i>peer-group-name</i>—Name of the BGP peer group. • <i>remote-as</i>—Specifies a remote autonomous system. • <i>as-number</i>—Number of an autonomous system to which the neighbor belongs, ranging from 1 to 65535.
Step 9	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } update-source <i>interface-type interface-number</i> Example: <pre>Device(config-router)# neighbor 33.33.33.33 update-source Loopback1</pre>	Configures BGP sessions to use any operational interface for TCP connections.
Step 10	address-family ipv6 Example: <pre>Device(config-router)# address-family ipv6</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard IPv6 address prefixes.
Step 11	redistribute <i>protocol as-number</i> match { internal external 1 external 2 } Example: <pre>Device(config-router-af)# redistribute ospf 11 match internal external 1</pre>	Redistributes routes from one routing domain into another routing domain.
Step 12	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } activate Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 13	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } send-label Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 send-label</pre>	Sends MPLS labels with BGP routes to a neighboring BGP router.
Step 14	exit-address-family Example:	Exits BGP address-family submode.

	Command or Action	Purpose
	Device(config-router-af)# exit-address-family	
Step 15	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuration Examples for 6PE

Figure 7: 6PE Topology

PE Configuration	CE Configuration
<pre> router ospfv3 11 ip routing ipv6 unicast-routing address-family ipv6 unicast redistribute bgp 65001 exit-address-family ! router bgp 65001 bgp router-id interface Loopback1 bgp log-neighbor-changes bgp graceful-restart neighbor 33.33.33.33 remote-as 65001 neighbor 33.33.33.33 update-source Loopback1 ! address-family ipv4 neighbor 33.33.33.33 activate ! address-family ipv6 redistribute ospf 11 match internal external 1 external 2 include-connected neighbor 33.33.33.33 activate neighbor 33.33.33.33 send-label neighbor 33.33.33.33 send-community extended ! </pre>	<pre> ipv6 unicast-routing ! interface vlan4 no ip address ipv6 address 10:1:1:2::2/64 ipv6 enable ospfv3 11 ipv6 area 0 ! router ospfv3 11 address-family ipv6 unicast exit-address-family ! </pre>

```

CHAPTER 8

Configuring IPv6 VPN Provider Edge over MPLS (6VPE)

- [Configuring 6VPE, on page 81](#)

Configuring 6VPE

Information About 6VPE

6VPE is a mechanism to use the IPv4 backbone to provide VPN IPv6 services. It takes advantage of operational IPv4 MPLS backbones, eliminating the need for dual-stacking within the MPLS core. This translates to savings in operational costs and addresses the security limitations of the 6PE approach. 6VPE is more like a regular IPv4 MPLS-VPN provider edge, with an addition of IPv6 support within VRF. It provides logically separate routing table entries for VPN member devices.

Components of MPLS-based 6VPE Network

- VPN route target communities – A list of all other members of a VPN community.
- Multiprotocol BGP (MP-BGP) peering of VPN community PE routers – Propagates VRF reachability information to all members of a VPN community.
- MPLS forwarding – Transports all traffic between all VPN community members across a VPN service-provider network.

In the MPLS-VPN model a VPN is defined as a collection of sites sharing a common routing table. A customer site is connected to the service provider network by one or more interfaces, where the service provider associates each interface with a VPN routing table—known as the VRF table.

For scale information related to this feature, see [Cisco Catalyst 9400 Series Switch Data Sheet](#).

Restrictions for 6VPE

- Inter-AS and carrier supporting carrier (CSC) is not supported.
- VRF Route-Leaking is not supported.
- eBGP as CE-PE is not supported.

- EIGRP, OSPFv3, RIP, ISIS, Static Routes are supported as CE-PE.
- MPLS Label Allocation modes supported are Per-VRF and Per-Prefix. Per-Prefix is the default mode.
- IP fragmentation is not supported in the Per-Prefix mode of Layer 3 VPN.

Configuration Examples for 6VPE

Figure 8: 6VPE Topology

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

CHAPTER 9

Configuring EIGRP MPLS VPN PE-CE

- [Prerequisites for MPLS VPN Support for EIGRP Between PE and CE, on page 87](#)
- [Information About MPLS VPN Support for EIGRP Between PE and CE, on page 87](#)
- [How to Configure MPLS VPN Support for EIGRP Between PE and CE, on page 87](#)
- [Configuration Examples for MPLS VPN Support for EIGRP Between PE and CE, on page 94](#)
- [Feature Information for MPLS VPN Support for EIGRP Between PE and CE, on page 96](#)

Prerequisites for MPLS VPN Support for EIGRP Between PE and CE

- Configure MPLS Layer 3 VPNs.
- Configure the Border Gateway Protocol (BGP) in the network core.

Information About MPLS VPN Support for EIGRP Between PE and CE

How to Configure MPLS VPN Support for EIGRP Between PE and CE

Configuring EIGRP as the Routing Protocol Between the PE and CE Devices

To configure PE-to-CE routing sessions that use EIGRP, perform this task.

Before you begin

Configure the PE device with the same routing protocol that the CE device uses.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp *as-number***
4. **no synchronization**
5. **neighbor *ip-address* remote-as *as-number***
6. **neighbor *ip-address* update-source loopback *interface-number***
7. **address-family vpnv4**
8. **neighbor *ip-address* activate**
9. **neighbor *ip-address* send-community extended**
10. **exit-address-family**
11. **address-family ipv4 vrf *vrf-name***
12. **redistribute eigrp *as-number* [metric *metric-value*] [route-map *map-name*]**
13. **no synchronization**
14. **exit-address-family**
15. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 10	Enters router configuration mode, and creates a BGP routing process.
Step 4	no synchronization Example: Device(config-router)# no synchronization	Configures BGP to send advertisements without waiting to synchronize with the IGP.
Step 5	neighbor <i>ip-address</i> remote-as <i>as-number</i> Example: Device(config-router)# neighbor 10.0.0.1 remote-as 10	Establishes peering with the specified neighbor or peer group. <ul style="list-style-type: none"> • In this step, you are establishing an iBGP session with the PE device that is connected to the CE device at the other CE site.

	Command or Action	Purpose
Step 6	neighbor <i>ip-address</i> update-source loopback <i>interface-number</i> Example: <pre>Device(config-router)# neighbor 10.0.0.1 update-source loopback 0</pre>	<p>Configures BGP to use any operational interface for TCP connections.</p> <ul style="list-style-type: none"> This configuration step is not required. However, the BGP routing process will be less susceptible to the effects of interface or link flapping.
Step 7	address-family vpnv4 Example: <pre>Device(config-router)# address-family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes, such as BGP, RIP, and static routing sessions.</p>
Step 8	neighbor <i>ip-address</i> activate Example: <pre>Device(config-router-af)# neighbor 10.0.0.1 activate</pre>	<p>Establishes peering with the specified neighbor or peer group.</p> <ul style="list-style-type: none"> In this step, you are activating the exchange of VPNv4 routing information between the PE devices.
Step 9	neighbor <i>ip-address</i> send-community extended Example: <pre>Device(config-router-af)# neighbor 10.0.0.1 send-community extended</pre>	<p>Configures the local device to send extended community attribute information to the specified neighbor.</p> <ul style="list-style-type: none"> This step is required for the exchange of EIGRP extended community attributes.
Step 10	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	<p>Exits address family configuration mode and enters router configuration mode.</p>
Step 11	address-family ipv4 vrf <i>vrf-name</i> Example: <pre>Device(config-router)# address-family ipv4 vrf RED</pre>	<p>Configures an IPv4 address family for the EIGRP VRF and enters address family configuration mode.</p> <ul style="list-style-type: none"> An address-family VRF needs to be configured for each EIGRP VRF that runs between the PE and CE devices.
Step 12	redistribute eigrp <i>as-number</i> [metric <i>metric-value</i>] [route-map <i>map-name</i>] Example: <pre>Device(config-router-af)# redistribute eigrp 101</pre>	<p>Redistributes the EIGRP VRF into BGP.</p> <ul style="list-style-type: none"> The autonomous system number from the CE network is configured in this step.
Step 13	no synchronization Example: <pre>Device(config-router-af)# no synchronization</pre>	<p>Configures BGP to send advertisements without waiting to synchronize with the IGP.</p>

	Command or Action	Purpose
Step 14	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits address family configuration mode and enters router configuration mode.
Step 15	end Example: <pre>Device(config-router)# end</pre>	Exits router configuration mode and enters privileged EXEC mode.

Configuring EIGRP Redistribution in the MPLS VPN

Perform this task on every PE device that provides VPN services to enable EIGRP redistribution in the MPLS VPN.

Before you begin

The metric must be configured for routes from external EIGRP autonomous systems and non-EIGRP networks before these routes can be redistributed into an EIGRP CE device. The metric can be configured in the redistribute statement using the **redistribute** (IP) command or can be configured with the **default-metric** (EIGRP) command. If an external route is received from another EIGRP autonomous system or a non-EIGRP network without a configured metric, the route will not be advertised to the CE device.

Note Redistribution between native EIGRP VRFs is not supported. This is designed behavior.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router eigrp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **network** *ip-address wildcard-mask*
6. **redistribute bgp** {*as-number*} [**metric** *bandwidth delay reliability load mtu*] [**route-map** *map-name*]
7. **autonomous-system** *as-number*
8. **exit-address-family**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	router eigrp <i>as-number</i> Example: <pre>Device(config)# router eigrp 1</pre>	Enters router configuration mode and creates an EIGRP routing process. <ul style="list-style-type: none"> The EIGRP routing process for the PE device is created in this step.
Step 4	address-family ipv4 [<i>multicast</i> <i>unicast</i> <i>vrf vrf-name</i>] Example: <pre>Device(config-router)# address-family ipv4 vrf RED</pre>	Enters address-family configuration mode and creates a VRF. <ul style="list-style-type: none"> The VRF name must match the VRF name that was created in the previous section.
Step 5	network <i>ip-address wildcard-mask</i> Example: <pre>Device(config-router-af)# network 172.16.0.0 0.0.255.255</pre>	Specifies the network for the VRF. <ul style="list-style-type: none"> The network statement is used to identify which interfaces to include in EIGRP. The VRF must be configured with addresses that fall within the wildcard-mask range of the network statement.
Step 6	redistribute bgp {<i>as-number</i>} [<i>metric bandwidth delay reliability load mtu</i>] [<i>route-map map-name</i>] Example: <pre>Device(config-router-af)# redistribute bgp 10 metric 10000 100 255 1 1500</pre>	Redistributes BGP into the EIGRP. <ul style="list-style-type: none"> The autonomous system number and metric of the BGP network are configured in this step. BGP must be redistributed into EIGRP for the CE site to accept the BGP routes that carry the EIGRP information. A metric must also be specified for the BGP network and is configured in this step.
Step 7	autonomous-system <i>as-number</i> Example: <pre>Device(config-router-af)# autonomous-system 101</pre>	Specifies the autonomous system number of the EIGRP network for the customer site.
Step 8	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits address family configuration mode and enters router configuration mode.
Step 9	end Example: <pre>Device(config-router)# end</pre>	Exits router configuration mode and enters privileged EXEC mode.

Verifying Connectivity Between MPLS Virtual Private Network Sites

To verify that the local and remote customer edge (CE) devices can communicate across the Multiprotocol Label Switching (MPLS) core, perform the following tasks:

Verifying IP Connectivity from CE Device to CE Device Across the MPLS Core

SUMMARY STEPS

1. **enable**
2. **ping** *[protocol] {host-name | system-address}*
3. **trace** *[protocol] [destination]*
4. **show ip route** *[ip-address [mask] [longer-prefixes]] | protocol [process-id]] | [list [access-list-name | access-list-number]*

DETAILED STEPS

-
- | | |
|---------------|---|
| Step 1 | enable
Enables privileged EXEC mode. |
| Step 2 | ping <i>[protocol] {host-name system-address}</i>
Diagnoses basic network connectivity on AppleTalk, Connectionless-mode Network Service (CLNS), IP, Novell, Apollo, Virtual Integrated Network Service (VINES), DECnet, or Xerox Network Service (XNS) networks. Use the ping command to verify the connectivity from one CE device to another. |
| Step 3 | trace <i>[protocol] [destination]</i>
Discovers the routes that packets take when traveling to their destination. The trace command can help isolate a trouble spot if two devices cannot communicate. |
| Step 4 | show ip route <i>[ip-address [mask] [longer-prefixes]] protocol [process-id]] [list [access-list-name access-list-number]</i>
Displays the current state of the routing table. Use the <i>ip-address</i> argument to verify that CE1 has a route to CE2. Verify the routes learned by CE1. Make sure that the route for CE2 is listed. |
-

Verifying That the Local and Remote CE Devices Are in the PE Routing Table

SUMMARY STEPS

1. **enable**
2. **show ip route vrf** *vrf-name [prefix]*
3. **show ip cef vrf** *vrf-name [ip-prefix]*

DETAILED STEPS

-
- | | |
|---------------|---------------|
| Step 1 | enable |
|---------------|---------------|

Enables privileged EXEC mode.

Step 2 **show ip route vrf** *vrf-name* [*prefix*]

Displays the IP routing table that is associated with a virtual routing and forwarding (VRF) instance. Check that the loopback addresses of the local and remote customer edge (CE) devices are in the routing table of the provider edge (PE) devices.

Step 3 **show ip cef vrf** *vrf-name* [*ip-prefix*]

Displays the Cisco Express Forwarding forwarding table that is associated with a VRF. Check that the prefix of the remote CE device is in the Cisco Express Forwarding table.

Configuration Examples for MPLS VPN Support for EIGRP Between PE and CE

Example: Configuring an MPLS VPN Using EIGRP

PE Configuration	CE Configuration
	<pre>ip cef mpls ldp router-id Loopback0 force mpls label protocol ldp ! interface Loopback0 ip address 10.0.0.9 255.255.255.255 ! interface FastEthernet0/0/0 ip address 34.0.0.1 255.0.0.0 no cdp enable ! router eigrp 1000 network 34.0.0.0 auto-summary</pre>

PE Configuration	CE Configuration

Feature Information for MPLS VPN Support for EIGRP Between PE and CE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Table 10: Feature Information for MPLS VPN Support for EIGRP Between PE and CE

Feature Name	Releases	Feature Information
MPLS VPN Support for EIGRP Between PE and CE	Cisco IOS XE Fuji 16.9.1	The MPLS VPN Support for EIGRP Between PE and CE feature allows service providers to configure the Enhanced Interior Gateway Routing Protocol (EIGRP) between provider edge (PE) and customer edge (CE) devices in a Multiprotocol Label Switching (MPLS) virtual private network (VPN) and offer MPLS VPN services to those customers that require native support for EIGRP.

CHAPTER 10

Configuring MPLS Static Labels

- [MPLS Static Labels, on page 97](#)

MPLS Static Labels

This document describes the Cisco MPLS Static Labels feature. The MPLS Static Labels feature provides the means to configure statically:

- The binding between a label and an IPv4 prefix
- The contents of an LFIB crossconnect entry

Prerequisites for MPLS Static Labels

The network must support the following Cisco IOS features before you enable MPLS static labels:

- Multiprotocol Label Switching (MPLS)
- Cisco Express Forwarding

Restrictions for MPLS Static Labels

- The trouble shooting process for MPLS static labels is complex.
- On a provider edge (PE) router for MPLS VPNs, there's no mechanism for statically binding a label to a customer network prefix (VPN IPv4 prefix).
- MPLS static crossconnect labels remain in the LFIB even if the router to which the entry points goes down.
- MPLS static crossconnect mappings remain in effect even with topology changes.
- MPLS static labels aren't supported for label-controlled Asynchronous Transfer Mode (lc-atm).
- MPLS static bindings aren't supported for local prefixes.

Information About MPLS Static Labels

MPLS Static Labels Overview

Generally, label switching routers (LSRs) dynamically learn the labels they should use to label-switch packets. They do this by means of label distribution protocols that include:

- Label Distribution Protocol (LDP), the Internet Engineering Task Force (IETF) standard, used to bind labels to network addresses.
- Resource Reservation Protocol (RSVP) used to distribute labels for traffic engineering (TE)
- Border Gateway Protocol (BGP) used to distribute labels for Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs)

To use a learned label to label-switch packets, an LSR installs the label into its Label Forwarding Information Base (LFIB).

The MPLS Static Labels feature provides the means to configure statically:

- The binding between a label and an IPv4 prefix
- The contents of an LFIB crossconnect entry

Benefits of MPLS Static Labels

Static Bindings Between Labels and IPv4 Prefixes

You can configure static bindings between labels and IPv4 prefixes to support MPLS hop-by-hop forwarding through neighbor routers that don't implement LDP label distribution.

Static Crossconnects

You can configure static crossconnects to support MPLS Label Switched Path (LSP) midpoints when neighbor routers don't implement either the LDP or RSVP label distribution, but do implement an MPLS forwarding path.

How to Configure MPLS Static Labels

Configuring MPLS Static Prefix Label Bindings

To configure MPLS static prefix/label bindings, use the following commands beginning in global configuration mode:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls label range** *min-label max-label* [**static** *min-static-label max-static-label*]
4. **mpls static binding ipv4** *prefix mask* [**input**|**output** *nexthop*] *label*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mpls label range <i>min-label max-label</i> [static <i>min-static-label max-static-label</i>] Example: Device(config)# mpls label range 200 100000 static 16 199	Specifies a range of labels for use with MPLS Static Labels feature. (Default is no labels reserved for static assignment.)
Step 4	mpls static binding ipv4 <i>prefix mask</i> [input output <i>nexthop</i>] <i>label</i> Example: Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55	Specifies static binding of labels to IPv4 prefixes. Bindings specified are installed automatically in the MPLS forwarding table as routing demands.

Configuring MPLS Static Crossconnects

To configure MPLS static crossconnects, use the following command beginning in global configuration mode:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls label range** *min-label max-label* [**static** *min-static-label max-static-label*]
4. **mpls static binding ipv4** *prefix mask* [**input**|**output** *nexthop*] *label*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	mpls label range <i>min-label max-label</i> [static <i>min-static-label max-static-label</i>] Example: Device(config)# mpls label range 200 100000 static 16 199	Specifies a range of labels for use with MPLS Static Labels feature. (Default is no labels reserved for static assignment.)
Step 4	mpls static binding ipv4 <i>prefix mask</i> [input output <i>next-hop</i>] <i>label</i> Example: Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55	Specifies static binding of labels to IPv4 prefixes. Bindings specified are installed automatically in the MPLS forwarding table as routing demands.

Verifying MPLS Static Prefix Label Bindings

To verify the configuration for MPLS static prefix/label bindings, use this procedure:

SUMMARY STEPS

1. Enter **show mpls label range** command. The output shows that the new label ranges do not take effect until a reload occurs:
2. Enter the **show mpls static binding ipv4** command to show the configured static prefix/label bindings:
3. Use the **show mpls forwarding-table** command to determine which static prefix/label bindings are currently in use for MPLS forwarding.

DETAILED STEPS

Step 1 Enter **show mpls label range** command. The output shows that the new label ranges do not take effect until a reload occurs:

Example:

```
Device# show mpls label range

Downstream label pool: Min/Max label: 16/100000
  [Configured range for next reload: Min/Max label: 200/100000]
Range for static labels: Min/Max/Number: 16/199
```

The following output from the **show mpls label range** command, executed after a reload, indicates that the new label ranges are in effect:

Example:

```
Device# show mpls label range

Downstream label pool: Min/Max label: 200/100000
Range for static labels: Min/Max/Number: 16/199
```

Step 2 Enter the **show mpls static binding ipv4** command to show the configured static prefix/label bindings:

Example:

```
Device# show mpls static binding ipv4
10.17.17.17/32: Incoming label: 251 (in LIB)
  Outgoing labels:
    10.0.0.1          18
10.18.18.18/32: Incoming label: 201 (in LIB)
  Outgoing labels:
10.0.0.1 implicit-null
```

Step 3 Use the **show mpls forwarding-table** command to determine which static prefix/label bindings are currently in use for MPLS forwarding.

Example:

```
Device# show mpls forwarding-table
Local  Outgoing  Prefix      Bytes tag  Outgoing     Next Hop
tag    tag or VC  or Tunnel Id switched   interface
201    Pop tag    10.18.18.18/32  0         PO1/1/0      point2point
        2/35      10.18.18.18/32  0         AT4/1/0.1    point2point
251    18         10.17.17.17/32  0         PO1/1/0      point2point
```

Verifying MPLS Static Crossconnect Configuration

To verify the configuration for MPLS static crossconnects, use this procedure:

SUMMARY STEPS

1. Use the **show mpls static crossconnect** command to display information about crossconnects that have been configured:

DETAILED STEPS

Use the **show mpls static crossconnect** command to display information about crossconnects that have been configured:

Example:

```
Device# show mpls static crossconnect
Local  Outgoing  Outgoing  Next Hop
label  label      interface
34     22         pos3/0/0  point2point (in LFIB)
```

Monitoring and Maintaining MPLS Static Labels

To monitor and maintain MPLS static labels, use one or more of the following commands:

SUMMARY STEPS

1. **enable**

2. **show mpls forwarding-table**
3. **show mpls label range**
4. **show mpls static binding ipv4**
5. **show mpls static crossconnect**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	show mpls forwarding-table Example: <pre>Device# show mpls forwarding-table</pre>	Displays the contents of the MPLS LFIB.
Step 3	show mpls label range Example: <pre>Device# show mpls label range</pre>	Displays information about the static label range.
Step 4	show mpls static binding ipv4 Example: <pre>Device# show mpls static binding ipv4</pre>	Displays information about the configured static prefix/label bindings.
Step 5	show mpls static crossconnect Example: <pre>Device# show mpls static crossconnect</pre>	Displays information about the configured crossconnects.

Configuration Examples for MPLS Static Labels

Example Configuring MPLS Static Prefixes Labels

In the following output, the **mpls label range** command reconfigures the range used for dynamically assigned labels 16–100000 to 200–100000. It configures a static label range of 16–199.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# mpls label range 200 100000 static 16 199
% Label range changes take effect at the next reload.
Router(config)# end
```

In the following output, the **show mpls label range** command indicates that the new label ranges don't take effect until a reload occurs:

```
Device# show mpls label range
```

```
Downstream label pool: Min/Max label: 16/100000
[Configured range for next reload: Min/Max label: 200/100000]
Range for static labels: Min/Max/Number: 16/199
```

In the following output, the **show mpls label range** command, executed after a reload, indicates that the new label ranges are in effect:

```
Device# show mpls label range
```

```
Downstream label pool: Min/Max label: 200/100000
Range for static labels: Min/Max/Number: 16/199
```

In the following output, the **mpls static binding ipv4** commands configure static prefix/label bindings. They also configure input (local) and output (remote) labels for various prefixes:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.0.0.66 2607
Device(config)# mpls static binding ipv4 10.6.0.0 255.255.0.0 input 17
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.13.0.8 explicit-null
Device(config)# end
```

In the following output, the **show mpls static binding ipv4** command displays the configured static prefix/label bindings:

```
Device# show mpls static binding ipv4

10.0.0.0/8: Incoming label: none;
    Outgoing labels:
10.13.0.8          explicit-null
10.0.0.0/8: Incoming label: 55 (in LIB)
    Outgoing labels:
    10.0.0.66          2607
10.66.0.0/16: Incoming label: 17 (in LIB)
    Outgoing labels: None
```

Example Configuring MPLS Static Crossconnects

In the following output, the **mpls static crossconnect** command configures a crossconnect from incoming label 34 to outgoing label 22 out interface pos3/0/0:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# mpls static crossconnect 34 pos3/0/0 22
Device(config)# end
```

In the following output, the **show mpls static crossconnect** command displays the configured crossconnect:

```
Device# show mpls static crossconnect
Local  Outgoing  Outgoing  Next Hop
label  label      interface
34     22         pos3/0/0   point2point (in LFIB)
```

Feature Information for MPLS Static Labels

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Configuring Virtual Private LAN Service (VPLS)

- [Finding Feature Information, on page 107](#)
- [Configuring VPLS, on page 107](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfnng.cisco.com/>. An account on Cisco.com is not required.

Configuring VPLS

Information About VPLS

VPLS Overview

VPLS (Virtual Private LAN Service) enables enterprises to link together their Ethernet-based LANs from multiple sites via the infrastructure provided by their service provider. From the enterprise perspective, the service provider's public network looks like one giant Ethernet LAN. For the service provider, VPLS provides an opportunity to deploy another revenue-generating service on top of their existing network without major capital expenditures. Operators can extend the operational life of equipment in their network.

Virtual Private LAN Services (VPLS) uses the provider core to join multiple attachment circuits together to simulate a virtual bridge that connects the multiple attachment circuits together. From a customer point of view, there is no topology for VPLS. All of the CE devices appear to connect to a logical bridge emulated by the provider core.

Figure 9: VPLS Topology

Full-Mesh Configuration

The full-mesh configuration requires a full mesh of tunnel label switched paths (LSPs) between all the PEs that participate in the VPLS. With full-mesh, signaling overhead and packet replication requirements for each provisioned VC on a PE can be high.

You set up a VPLS by first creating a virtual forwarding instance (VFI) on each participating PE router. The VFI specifies the VPN ID of a VPLS domain, the addresses of other PE devices in the domain, and the type of tunnel signaling and encapsulation mechanism for each peer PE router.

The set of VFIs formed by the interconnection of the emulated VCs is called a VPLS instance; it is the VPLS instance that forms the logic bridge over a packet switched network. The VPLS instance is assigned a unique VPN ID.

The PE devices use the VFI to establish a full-mesh LSP of emulated VCs to all the other PE devices in the VPLS instance. PE devices obtain the membership of a VPLS instance through static configuration using the Cisco IOS CLI.

The full-mesh configuration allows the PE router to maintain a single broadcast domain. Thus, when the PE router receives a broadcast, multicast, or unknown unicast packet on an attachment circuit, it sends the packet out on all other attachment circuits and emulated circuits to all other CE devices participating in that VPLS instance. The CE devices see the VPLS instance as an emulated LAN.

To avoid the problem of a packet looping in the provider core, the PE devices enforce a "split-horizon" principle for the emulated VCs. That means if a packet is received on an emulated VC, it is not forwarded on any other emulated VC.

After the VFI has been defined, it needs to be bound to an attachment circuit to the CE device.

The packet forwarding decision is made by looking up the Layer 2 virtual forwarding instance (VFI) of a particular VPLS domain.

A VPLS instance on a particular PE router receives Ethernet frames that enter on specific physical or logical ports and populates a MAC table similarly to how an Ethernet switch works. The PE router can use the MAC address to switch those frames into the appropriate LSP for delivery to the another PE router at a remote site.

If the MAC address is not in the MAC address table, the PE router replicates the Ethernet frame and floods it to all logical ports associated with that VPLS instance, except the ingress port where it just entered. The PE router updates the MAC table as it receives packets on specific ports and removes addresses not used for specific periods.

VPLS BGP Based Autodiscovery

VPLS Autodiscovery enables each Virtual Private LAN Service (VPLS) provider edge (PE) device to discover other PE devices that are part of the same VPLS domain. VPLS Autodiscovery also tracks PE devices when they are added to or removed from a VPLS domain. As a result, with VPLS Autodiscovery enabled, you no longer need to manually configure a VPLS domain and maintain the configuration when a PE device is added or deleted. VPLS Autodiscovery uses the Border Gateway Protocol (BGP) to discover VPLS members and set up and tear down pseudowires in a VPLS domain.

BGP uses the Layer 2 VPN (L2VPN) Routing Information Base (RIB) to store endpoint provisioning information, which is updated each time any Layer 2 virtual forwarding instance (VFI) is configured. The prefix and path information is stored in the L2VPN database, which allows BGP to make decisions about the best path. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, this endpoint information is used to configure a pseudowire mesh to support L2VPN-based services.

The BGP autodiscovery mechanism facilitates the configuration of L2VPN services, which are an integral part of the VPLS feature. VPLS enables flexibility in deploying services by connecting geographically dispersed sites as a large LAN over high-speed Ethernet in a robust and scalable IP Multiprotocol Label Switching (MPLS) network.

For scale information related to this feature, see [Cisco Catalyst 9400 Series Switch Data Sheet](#).

Restrictions for VPLS

- Protocol-based CLI Method (interface pseudowire configuration) is not supported. Only VFI and Xconnect mode are supported.
- Flow-Aware Transport Pseudowire (FAT PW) is not supported.
- IGMP Snooping is not Supported. Multicast traffic floods with IGMP Snooping disabled.
- L2 Protocol Tunneling is not supported.
- Integrated Routing and Bridging (IRB) not supported.
- Virtual Circuit Connectivity Verification (VCCV) ping with explicit null is not supported.
- The switch is supported only as spoke in H-VPLS but not as hub.
- L2 VPN Interworking is not supported.
- **ip unnumbered** command is not supported in MPLS configuration.
- VC statistics are not displayed for flood traffic in the output of `show mpls l2 vc vcid detail` command.
- `dot1q tunnel` is not supported in the attachment circuit.

Configuring PE Layer 2 Interfaces to CEs

Configuring 802.1Q Trunks for Tagged Traffic from a CE

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **interface** *interface-id*
4. **no ip address** *ip_address mask* [secondary]
5. **switchport**
6. **switchport trunk encapsulation dot1q**
7. **switchport trunk allow vlan** *vlan_ID*
8. **switchport mode trunk**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	interface <i>interface-id</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/24</pre>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address <i>ip_address mask</i> [secondary] Example: <pre>Device(config-if)# no ip address</pre>	Disables IP processing and enters interface configuration mode.
Step 5	switchport Example: <pre>Device(config-if)# switchport</pre>	Modifies the switching characteristics of the Layer 2-switched interface.
Step 6	switchport trunk encapsulation dot1q Example: <pre>Device(config-if)# switchport trunk encapsulation dot1q</pre>	Sets the switch port encapsulation format to 802.1Q.
Step 7	switchport trunk allow vlan <i>vlan_ID</i> Example:	Sets the list of allowed VLANs.

	Command or Action	Purpose
	Device(config-if) # switchport trunk allow vlan 2129	
Step 8	switchport mode trunk Example: Device(config-if) # switchport mode trunk	Sets the interface to a trunking VLAN Layer 2 interface.
Step 9	end Example: Device(config) # end	Returns to privileged EXEC mode.

Configuring 802.1Q Access Ports for Untagged Traffic from a CE

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **no ip address *ip_address mask* [secondary]**
5. **switchport**
6. **switchport mode access**
7. **switchport access vlan *vlan_ID***
8. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters the global configuration mode.
Step 3	interface <i>interface-id</i> Example:	Defines the interface to be configured as a trunk, and enters interface configuration mode.

	Command or Action	Purpose
	Device(config) # interface TenGigabitEthernet1/0/24	
Step 4	no ip address <i>ip_address mask</i> [secondary] Example: Device(config-if) # no ip address	Disables IP processing and enters interface configuration mode.
Step 5	switchport Example: Device(config-if) # switchport	Modifies the switching characteristics of the Layer 2-switched interface.
Step 6	switchport mode access Example: Device(config-if) # switchport mode access	Sets the interface type to nontrunking, nontagged single VLAN Layer 2 interface.
Step 7	switchport access vlan <i>vlan_ID</i> Example: Device(config-if) # switchport access vlan 2129	Sets the VLAN when the interface is in access mode.
Step 8	end Example: Device(config) # end	Returns to privileged EXEC mode.

Configuring Layer 2 VLAN Instances on a PE

Configuring the Layer 2 VLAN interface on the PE enables the Layer 2 VLAN instance on the PE router to the VLAN database to set up the mapping between the VPLS and VLANs.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vlan *vlan-id***
4. **interface vlan *vlan-id***
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	vlan <i>vlan-id</i> Example: <pre>Device(config)# vlan 2129</pre>	Configures a specific virtual LAN (VLAN).
Step 4	interface vlan <i>vlan-id</i> Example: <pre>Device(config-vlan)# interface vlan 2129</pre>	Configures an interface on the VLAN.
Step 5	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuring MPLS in the PE

To configure MPLS in the PE, you must provide the required MPLS parameters.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ip**
4. **mpls label protocol ldp**
5. **end**
6. **mpls ldp logging neighbor-changes**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	mpls ip Example: <pre>Device(config)# mpls ip</pre>	Configures MPLS hop-by-hop forwarding.
Step 4	mpls label protocol ldp Example: <pre>Device(config-vlan)# mpls label protocol ldp</pre>	Specifies the default Label Distribution Protocol for a platform.
Step 5	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 6	mpls ldp logging neighbor-changes Example: <pre>Device(config)# mpls ldp logging neighbor-changes</pre>	(Optional) Determines logging neighbor changes.

Configuring VFI in the PE

The virtual switch instance (VFI) specifies the VPN ID of a VPLS domain, the addresses of other PE devices in this domain, and the type of tunnel signaling and encapsulation mechanism for each peer (This is where you create the VFI and associated VCs.). Configure a VFI as follows:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **l2 vfi vfi-name manual**
4. **vpn id vpn-id**

5. **neighbor** *router-id* {**encapsulation mpls**}
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	l2 vfi <i>vfi-name</i> manual Example: <pre>Device(config)# l2 vfi 2129 manual</pre>	Enables the Layer 2 VFI manual configuration mode.
Step 4	vpn id <i>vpn-id</i> Example: <pre>Device(config-vfi)# vpn id 2129</pre>	Configures a VPN ID for a VPLS domain. The emulated VCs bound to this Layer 2 VRF use this VPN ID for signaling. Note <i>vpn-id</i> is the same as <i>vlan-id</i> .
Step 5	neighbor <i>router-id</i> { encapsulation mpls } Example: <pre>Device(config-vfi)# neighbor remote-router-id encapsulation mpls</pre>	Specifies the remote peering router ID and the tunnel encapsulation type or the pseudo-wire property to be used to set up the emulated VC.
Step 6	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Associating the Attachment Circuit with the VFI at the PE

After defining the VFI, you must bind it to one or more attachment circuits.

SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **interface vlan** *vlan-id*
4. **no ip address**
5. **xconnect vfi** *vfi-name*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: <pre>Device(config)# interface vlan 2129</pre>	Creates or accesses a dynamic switched virtual interface (SVI). Note <i>vlan-id</i> is the same as <i>vpn-id</i> .
Step 4	no ip address Example: <pre>Device(config-if)# no ip address</pre>	Disables IP processing. (You configure a Layer 3 interface for the VLAN if you configure an IP address.)
Step 5	xconnect vfi <i>vfi-name</i> Example: <pre>Device(config-if)# xconnect vfi 2129</pre>	Specifies the Layer 2 VFI that you are binding to the VLAN port.
Step 6	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuration Examples for VPLS

Figure 10: VPLS Topology

PE1 Configuration	PE2 Configuration
<pre> pseudowire-class vpls2129 encapsulation mpls ! l2 vfi 2129 manual vpn id 2129 neighbor 44.254.44.44 pw-class vpls2129 neighbor 188.98.89.98 pw-class vpls2129 ! interface TenGigabitEthernet1/0/24 switchport trunk allowed vlan 2129 switchport mode trunk ! interface Vlan2129 no ip address xconnect vfi 2129 ! </pre>	<pre> pseudowire-class vpls2129 encapsulation mpls no control-word ! l2 vfi 2129 manual vpn id 2129 neighbor 1.1.1.72 pw-class vpls2129 neighbor 188.98.89.98 pw-class vpls2129 ! interface TenGigabitEthernet1/0/47 switchport trunk allowed vlan 2129 switchport mode trunk end ! interface Vlan2129 no ip address xconnect vfi 2129 ! </pre>

The **show mpls 12transport vc detail** command provides information the virtual circuits.

CHAPTER 12

Configuring MPLS VPN Route Target Rewrite

- [Finding Feature Information, on page 121](#)
- [Prerequisites for MPLS VPN Route Target Rewrite, on page 121](#)
- [Restrictions for MPLS VPN Route Target Rewrite, on page 121](#)
- [Information About MPLS VPN Route Target Rewrite, on page 122](#)
- [How to Configure MPLS VPN Route Target Rewrite, on page 123](#)
- [Configuration Examples for MPLS VPN Route Target Rewrite, on page 129](#)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

Prerequisites for MPLS VPN Route Target Rewrite

- You should know how to configure Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs).
- You need to identify the RT replacement policy and target device for the autonomous system (AS).

Restrictions for MPLS VPN Route Target Rewrite

Route Target Rewrite can only be implemented in a single AS topology.

ip unnumbered command is not supported in MPLS configuration.

Information About MPLS VPN Route Target Rewrite

Route Target Replacement Policy

Routing policies for a peer include all configurations that may impact inbound or outbound routing table updates. The MPLS VPN Route Target Rewrite feature can influence routing table updates by allowing the replacement of route targets on inbound and outbound Border Gateway Protocol (BGP) updates. Route targets are carried as extended community attributes in BGP Virtual Private Network IP Version 4 (VPNv4) updates. Route target extended community attributes are used to identify a set of sites and VPN routing and forwarding (VRF) instances that can receive routes with a configured route target.

You can configure the MPLS VPN Route Target Rewrite feature on provider edge (PE) devices.

The figure below shows an example of route target replacement on PE devices in an Multiprotocol Label Switching (MPLS) VPN single autonomous system topology. This example includes the following configurations:

- PE1 is configured to import and export RT 65000:1 for VRF Customer A and to rewrite all inbound VPNv4 prefixes with RT 65000:1 to RT 65000:2.
- PE2 is configured to import and export RT 65000:2 for VRF Customer B and to rewrite all inbound VPNv4 prefixes with RT 65000:2 to RT 65000:1.

Figure 11: Route Target Replacement on Provide Edge(PE) devices in a single MPLS VPN Autonomous System Topology

Route Maps and Route Target Replacement

The MPLS VPN Route Target Rewrite feature extends the Border Gateway Protocol (BGP) inbound/outbound route map functionality to enable route target replacement. The **set extcomm-list delete** command entered in route-map configuration mode allows the deletion of a route target extended community attribute based on an extended community list.

How to Configure MPLS VPN Route Target Rewrite

Configuring a Route Target Replacement Policy

Perform this task to configure a route target (RT) replacement policy for your internetwork.

If you configure a provider edge (PE) device to rewrite RT x to RT y and the PE has a virtual routing and forwarding (VRF) instance that imports RT x , you need to configure the VRF to import RT y in addition to RT x .

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip extcommunity-list** {*standard-list-number* | *expanded-list-number*} {**permit** | **deny**} [*regular-expression*] [**rt** | **soo** *extended-community-value*]
4. **route-map** *map-name* [**permit** | **deny**] [*sequence-number*]
5. **match extcommunity** {*standard-list-number* | *expanded-list-number*}
6. **set extcomm-list** *extended-community-list-number* **delete**
7. **set extcommunity** {**rt** *extended-community-value* [**additive**] | **soo** *extended-community-value*}
8. **end**
9. **show route-map** *map-name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ip extcommunity-list { <i>standard-list-number</i> <i>expanded-list-number</i> } { permit deny } [<i>regular-expression</i>] [rt soo <i>extended-community-value</i>] Example: <pre>Device(config)# ip extcommunity-list 1 permit rt 65000:2</pre>	Creates an extended community access list and controls access to it. <ul style="list-style-type: none"> • The <i>standard-list-number</i> argument is an integer from 1 to 99 that identifies one or more permit or deny groups of extended communities. • The <i>expanded-list-number</i> argument is an integer from 100 to 500 that identifies one or more permit or deny groups of extended communities. Regular expressions can be configured with expanded lists but not standard lists.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • The permit keyword permits access for a matching condition. • The deny keyword denies access for a matching condition. • The <i>regular-expression</i> argument specifies an input string pattern to match against. When you use an expanded extended community list to match route targets, include the pattern RT: in the regular expression. • The rt keyword specifies the route target extended community attribute. The rt keyword can be configured only with standard extended community lists and not expanded community lists. • The soo keyword specifies the site of origin (SOO) extended community attribute. The soo keyword can be configured only with standard extended community lists and not expanded community lists. • The <i>extended-community-value</i> argument specifies the route target or site of origin. The value can be one of the following combinations: <ul style="list-style-type: none"> • autonomous-system-number:network-number • ip-address:network-number <p>The colon is used to separate the autonomous system number and network number or IP address and network number.</p>
Step 4	route-map <i>map-name</i> [permit deny] [<i>sequence-number</i>] Example: <pre>Device(config)# route-map rtrewrite permit 10</pre>	<p>Defines the conditions for redistributing routes from one routing protocol into another or enables policy routing and enables route-map configuration mode.</p> <ul style="list-style-type: none"> • The <i>map-name</i> argument defines a meaningful name for the route map. The redistribute router configuration command uses this name to reference this route map. Multiple route maps can share the same map name. • If the match criteria are met for this route map, and the permit keyword is specified, the route is redistributed as controlled by the set actions. In the case of policy routing, the packet is policy routed. <p>If the match criteria are not met, and the permit keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set.</p>

	Command or Action	Purpose
		<p>The permit keyword is the default.</p> <ul style="list-style-type: none"> If the match criteria are met for the route map and the deny keyword is specified, the route is not redistributed. In the case of policy routing, the packet is not policy routed, and no further route maps sharing the same map tag name will be examined. If the packet is not policy routed, the normal forwarding algorithm is used. The <i>sequence-number</i> argument is a number that indicates the position a new route map will have in the list of route maps already configured with the same name. If given with the no form of this command, the position of the route map should be deleted.
Step 5	<p>match extcommunity {<i>standard-list-number</i> <i>expanded-list-number</i>}</p> <p>Example:</p> <pre>Device(config-route-map)# match extcommunity 1</pre> <p>Example:</p> <pre>Device(config-route-map)# match extcommunity 101</pre>	<p>Matches the Border Gateway Protocol (BGP) extended community list attributes.</p> <ul style="list-style-type: none"> The <i>standard-list-number</i> argument is a number from 1 to 99 that identifies one or more permit or deny groups of extended community attributes. The <i>expanded-list-number</i> argument is a number from 100 to 500 that identifies one or more permit or deny groups of extended community attributes.
Step 6	<p>set extcomm-list <i>extended-community-list-number</i> delete</p> <p>Example:</p> <pre>Device(config-route-map)# set extcomm-list 1 delete</pre>	<p>Removes a route target from an extended community attribute of an inbound or outbound BGP Virtual Private Network Version 4 (VPNv4) update.</p> <ul style="list-style-type: none"> The <i>extended-community-list-number</i> argument specifies the extended community list number.
Step 7	<p>set extcommunity {rt <i>extended-community-value</i> [additive] soo <i>extended-community-value</i>}</p> <p>Example:</p> <pre>Device(config-route-map)# set extcommunity rt 65000:1 additive</pre>	<p>Sets BGP extended community attributes.</p> <ul style="list-style-type: none"> The rt keyword specifies the route target extended community attribute. The soo keyword specifies the site of origin extended community attribute. The <i>extended-community-value</i> argument specifies the value to be set. The value can be one of the following combinations: <ul style="list-style-type: none"> autonomous-system-number : network-number ip-address : network-number <p>The colon is used to separate the autonomous system number and network number or IP address and network number.</p>

	Command or Action	Purpose
		<ul style="list-style-type: none"> The additive keyword adds a route target to the existing route target list without replacing any existing route targets.
Step 8	end Example: <pre>Device(config-route-map) # end</pre>	(Optional) Returns to privileged EXEC mode.
Step 9	show route-map <i>map-name</i> Example: <pre>Device# show route-map extmap</pre>	(Optional) Verifies that the match and set entries are correct. <ul style="list-style-type: none"> The <i>map-name</i> argument is the name of a specific route map.

Applying the Route Target Replacement Policy

Perform the following tasks to apply the route target replacement policy to your network:

Associating Route Maps with Specific BGP Neighbors

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **address-family** *vpn4* [**unicast**]
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **neighbor** {*ip-address* | *peer-group-name*} **send-community** [**both** | **extended** | **standard**]
8. **neighbor** {*ip-address* | *peer-group-name*} **route-map** *map-name* {**in** | **out**}
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 100</pre>	<p>Configures a Border Gateway Protocol (BGP) routing process and places the device in router configuration mode.</p> <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the device to other BGP devices and tags the routing information passed along. <p>The range is 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</p>
Step 4	neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i> Example: <pre>Device(config-router)# neighbor 172.10.0.2 remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	address-family vpnv4 [unicast] Example: <pre>Device(config-router)# address-family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard Virtual Private Network Version 4 (VPNv4) address prefixes.</p> <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.
Step 6	neighbor {<i>ip-address</i> <i>peer-group-name</i>} activate Example: <pre>Device(config-router-af)# neighbor 172.16.0.2 activate</pre>	<p>Enables the exchange of information with a neighboring BGP device.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 7	neighbor {<i>ip-address</i> <i>peer-group-name</i>} send-community [both extended standard] Example: <pre>Device(config-router-af)# neighbor 172.16.0.2 send-community extended</pre>	<p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group. The both keyword sends standard and extended community attributes.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The extended keyword sends an extended community attribute. The standard keyword sends a standard community attribute.
Step 8	<p>neighbor {<i>ip-address</i> <i>peer-group-name</i>} route-map <i>map-name</i> {in out}</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 172.16.0.2 route-map extmap in</pre>	<p>Apply a route map to incoming or outgoing routes</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP or multiprotocol peer group. The <i>map-name</i> argument specifies the name of a route map. The in keyword applies route map to incoming routes. The out keyword applies route map to outgoing routes.
Step 9	<p>end</p> <p>Example:</p> <pre>Device(config-router-af)# end</pre>	(Optional) Returns to privileged EXEC mode.

Verifying the Route Target Replacement Policy

SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4 vrf** *vrf-name*
3. **exit**

DETAILED STEPS

Step 1	<p>enable</p> <p>Enables privileged EXEC mode. Enter your password if prompted.</p> <p>Example:</p> <pre>Device> enable Device#</pre>
Step 2	<p>show ip bgp vpnv4 vrf <i>vrf-name</i></p> <p>Verifies that Virtual Private Network Version 4 (VPNv4) prefixes with a specified route target (RT) extended community attribute are replaced with the proper RT extended community attribute to verify that the provider edge (PE) devices receive the rewritten RT extended community attributes.</p>

Verify route target replacement on PE1:

Example:

```
Device# show ip bgp vpnv4 vrf Customer_A 192.168.1.1/32 internal
BGP routing table entry for 65000:1:192.168.1.1/32, version 6901
Paths: (1 available, best #1, table Customer_A)
  Advertised to update-groups:
    5
  Refresh Epoch 1
  650002
    3.3.3.3 (metric 3) (via default) from 3.3.3.3 (55.5.4.1)
      Origin IGP, metric 0, localpref 100, valid, internal, best
      Extended Community: RT:65000:1
      mpls labels in/out nolabel/3025
      rx pathid: 0, tx pathid: 0x0
      net: 0xFFB0A72E38, path: 0xFFB0E6A370, pathtext: 0xFFB0E5D970
      flags: net: 0x0, path: 0x7, pathtext: 0x181
```

Step 3 **exit**

Returns to user EXEC mode:

Example:

```
Device# exit
Device>
```

Configuration Examples for MPLS VPN Route Target Rewrite

Examples: Configuring Route Target Replacement Policies

This example shows the route target (RT) replacement configuration of a Provider Edge (PE) device that exchanges Virtual Private Network Version 4 (VPNv4) prefixes with another Provider Edge (PE) device. The route map extmap is configured to replace RTs on inbound updates. Any incoming update with RT 65000:2 is replaced with RT 65000:1.

```
!
ip extcommunity-list 1 permit rt 65000:2
!
route-map rtrewrite permit 10
match extcommunity 1
set extcomm-list 1 delete
set extcommunity rt 65000:1 additive
!
```

This example shows the use of the route-map configuration **continue** command when you need to apply more than one replacement rule on an update. In this example, an incoming update with RT 7777:22222222 is replaced with RT 65000:2. Without the **continue 20** command, route-map evaluation would stop when a match on sequence 10 is made. With the **continue 20** command, route-map evaluation continues into sequence 20 even if a match occurs in sequence 10.

```

!
ip extcommunity-list 2 permit rt 7777:222222222
ip extcommunity-list 3 permit rt 2:2
ip extcommunity-list 4 permit rt 20000:111
!
route-map extmap1 permit 10
match extcommunity 2
continue 20
set extcomm-list 2 delete
set extcommunity rt 65000:2 additive
!
route-map extmap1 permit 20
match extcommunity 3
continue 30
set extcomm-list 3 delete
!
route-map extmap1 permit 30
match extcommunity 4
set extcomm-list 4 delete
!

```

**Note**

The route-map configuration **continue** command is not supported on outbound route maps.

Examples: Applying Route Target Replacement Policies

Examples: Associating Route Maps with Specific BGP Neighbor

This example shows the association of route map extmap with a Border Gateway Protocol (BGP) neighbor. The BGP inbound route map is configured to replace route targets (RTs) on incoming updates.

```

router bgp 1
address-family vpnv4
neighbor 2.2.2.2 route-map rtrewrite in

```

This example shows the association of the same route map with the outbound BGP neighbor. The route map is configured to replace RTs on outgoing updates.

```

router bgp 1
address-family vpnv4
neighbor 2.2.2.2 route-map rtrewrite out

```
