## Prerequisites for SSM Channel Based Filtering for Multicast Boundaries

IP multicast is enabled on the device using the tasks described in the "Configuring Basic IP Multicast" module of the *IP Multicast: PIM Configuration Guide*.

# Information About the SSM Channel Based Filtering for Multicast Boundaries

This section provides information about the SSM channel based filtering for multicast boundaries feature.

#### **Rules for Multicast Boundaries**

The SSM Channel Based Filtering for Multicast Boundaries feature expands the **ip multicast boundary** command for control plane filtering support. More than one **ip multicast boundary** command can be applied to an interface.

The following rules govern the **ip multicast boundary** command:

- One instance of the **in** and **out** keywords can be configured on an interface.
- The **in** and **out** keywords can be used for standard or extended access lists.
- Only standard access lists are permitted with the use of the **filter-autorp** keyword or no keyword.

- A maximum of three instances of a command will be allowed on an interface: one instance of **in**, one instance of **out**, and one instance of **filter-autorp** or no keyword.
- When multiple instances of the command are used, the filtering will be cumulative. If a boundary statement with no keyword exists with a boundary statement with the **in**keyword, both access lists will be applied on the in direction and a match on either one will be sufficient.
- All instances of the command apply to both control and data plane traffic.
- Protocol information on the extended access list is parsed to allow reuse and filtering for consistency. An (S,G) operation will be filtered by an extended access list under all conditions stated above for keywords if the access list filters (S,G) traffic for all protocols.

### **Benefits of SSM Channel Based Filtering for Multicast Boundaries**

- This feature allows input on the source interface.
- The access control capabilities are the same for SSM and Any Source Multicast (ASM).

## How to Configure SSM Channel Based Filtering for Multicast Boundaries

This section provides steps for configuring SSM channel based filtering for multicast boundaries.

### **Configuring Multicast Boundaries**

#### **Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ip access-list {standard  extended} access-list-name	Configures the standard or extended access list.
	Example:	
	Device(config)# ip access-list 101	

	Command or Action	Purpose
Step 4	permit protocol host address host address	Permits specified ip host traffic.
	Example:	
	Device(config-ext-nacl)# permit ip host 181.1.2.201 host 232.1.1.11	
Step 5	deny protocol host address host address	Denies specified multicast ip group and source traffic.
	Example:	
	Device(config-acl-nacl)# deny ip host 181.1.2.203 host 232.1.1.1	
Step 6	Repeat Step 4 or Step 5 as needed.	Permits and denies specified host and source traffic.
Step 7	interface type interface-number port -number	Enables interface configuration mode.
	Example:	
	Device(config)# interface gigabitethernet 2/3/0	
Step 8	ip multicast boundary access-list-name [in  out   filter-autorp]  Example:	Configures the multicast boundary.
		Note The filter-autorp keyword does not support extended access lists.
	Device(config-if)# ip multicast boundary acc_grp1 out	

# Configuration Examples for SSM Channel Based Filtering for Multicast Boundaries

This section provides configuration examples of SSM Channel Based filtering for multicast boundaries.

### Configuring the Multicast Boundaries Permitting and Denying Traffic Example

The following example permits outgoing traffic for (181.1.2.201, 232.1.1.1) and (181.1.2.202, 232.1.1.1) and denies all other (S,G)s.

```
configure terminal ip access-list extended acc_grp1 permit ip host 0.0.0.0 232.1.1.1 0.0.0.255 permit ip host 181.1.2.201 host 232.1.1.1 permit udp host 181.1.2.202 host 232.1.1.1 permit ip host 181.1.2.202 host 232.1.1.1
```

```
deny igmp host 181.2.3.303 host 232.1.1.1 interface gigabitethernet 1/0/1 ip multicast boundary acc grp1 out
```

#### **Configuring the Multicast Boundaries Permitting Traffic Example**

The following example permits outgoing traffic for (192.168.2.201, 232.1.1.5) and 192.168.2.202, 232.1.1.5).

```
configure terminal ip access-list extended acc_grp6 permit ip host 0.0.0.0 232.1.1.1 5.0.0.255 deny udp host 192.168.2.201 host 232.1.1.5 permit ip host 192.168.2.201 host 232.1.1.5 deny pim host 192.168.2.201 host 232.1.1.5 permit ip host 192.168.2.202 host 232.1.1.5 deny igmp host 192.2.3.303 host 232.1.1.1 interface gigabitethernet 1/0/1 ip multicast boundary acc_grp6 out
```

### **Configuring the Multicast Boundaries Denying Traffic Example**

The following example denies a group-range that is announced by the candidate RP. Because the group range is denied, no pim auto-rp mappings are created.

```
configure terminal
ip access-list standard acc grp10
deny 225.0.0.0 0.255.255.255
permit anv
 access-list extended acc grp12
permit pim host 181.1.2.201 host 232.1.1.8
deny udp host 181.1.2.201 host 232.1.1.8
permit pim host 181.1.2.203 0.0.0.255 host 227.7.7.7
permit ip host 0.0.0.0 host 227.7.7.7
permit ip 181.1.2.203 0.0.0.255 host 227.7.7.7
 permit ip host 181.1.2.201 host 232.1.1.7
ip access-list extended acc_grp13
deny ip host 181.1.2.201 host 232.1.1.8
permit ip any any
interface gigabitethernet 1/0/1
 ip multicast boundary acc grp10 filter-autorp
 ip multicast boundary acc grp12 out
 ip multicast boundary acc grp13 in
```

### Feature History and Information for IP Multicast Optimization: SSM Channel Based Filtering for Multicast

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for IP Multicast Optimization: SSM Channel Based Filtering for Multicast

Feature Name	Releases	Feature Information
IP Multicast Optimization: SSM Channel Based Filtering for Multicast	Cisco IOS XE Everest 16.6.1	The SSM Channel Based Filtering for Multicast Boundaries feature expands the ip multicast boundary command for control plane filtering support. More than one ip multicast boundary command can be applied to an interface.
