

Cisco TrustSec SGT Caching

The Cisco TrustSec SGT Caching feature enhances the ability of Cisco TrustSec to make Security Group Tag (SGT) transportability flexible. This feature identifies the IP-SGT binding and caches the corresponding SGT so that network packets are forwarded through all network services for normal deep packet inspection processing, and at the service egress point the packets are re-tagged with the appropriate SGT.

Only IPv4 SGT Caching is supported. High Availability is supported for SGT Caching.

Restrictions for Cisco TrustSec SGT Caching

The global SGT caching configuration and the interface-specific ingress configuration are mutually exclusive. In the following scenarios, a warning message is displayed if you attempt to configure SGT caching both globally and on an interface:

- If an interface has ingress SGT caching enabled using the **cts role-based sgt-cache ingress** command in interface configuration mode, and a global configuration is attempted using the **cts role-based sgt-caching** command, a warning message is displayed, as shown in this example:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitEthernet 1/0/1
Device(config-if)# cts role-based sgt-cache ingress
Device(config-if)# exit
Device(config)# cts role-based sgt-caching
```

```
There is at least one interface that has ingress sgt caching configured. Please remove
all interface ingress sgt caching configuration(s) before attempting global enable.
```

This restriction specifically applies only to Layer 3-routed port interfaces. Also, the port must be a trusted port for SGT caching to work.

- Because SGT caching internally uses the NetFlow ternary content-addressable memory (TCAM) space, at any time on an interface, you can enable only either Flexible NetFlow or SGT caching in a given direction.
- If global configuration is enabled using the **cts role-based sgt-caching** command, and an interface configuration is attempted using the **cts role-based sgt-cache ingress** command in interface configuration mode, a warning message is displayed, as shown in this example:

```
Device> enable
Device# configure terminal
Device(config)# cts role-based sgt-caching
Device(config)# interface gigabitEthernet 1/0/1
Device(config-if)# cts role-based sgt-cache ingress
```

Note that ingress sgt caching is already active on this interface due to global sgt-caching enable.

- IPv6 SGT caching is not supported.
- SGT caching cannot be performed for the link-local IPv6 source address.

A link-local address is a network address that is valid only for communications within the network segment (link) or the broadcast domain that the host is connected to. Link-local addresses are not guaranteed to be unique beyond a single network segment. Therefore, devices do not forward packets with link-local addresses. Because they are not unique, SGT tags are not assigned for packets with source as link-local IPv6 address.

- SGT caching cannot coexist on the same port interface that has Application Visibility and Control (AVC), Wired Device AVC (WDAVC), Encrypted Traffic Analysis (ETTA,) or NetFlow/Flexible NetFlow features configured. An error message is displayed on the console if both SGT caching and one of these features are configured on the same interface.

When SGT caching is enabled along with any of the above mentioned features, the following error message is displayed on the console: *SGT Caching cannot be configured. Remove the configuration.* However; the SGT Caching feature is displayed in the output of the **show running-config** command. You need to manually remove SGT caching and reconfigure it, after removing the feature that cannot co-exist with it.

Information About Cisco TrustSec SGT Caching

Identifying and Reapplying SGT Using SGT Caching

Cisco TrustSec uses Security Group Tag (SGT) caching to ensure that traffic tagged with SGT can also pass through services that are not aware of SGTs. Examples of services that cannot propagate SGTs are WAN acceleration or optimization, Intrusion Prevention Systems (IPSs), and upstream firewalls.

To configure SGACL caching on a VLAN, SGT caching must be enabled on the port and the VLAN.

In one-arm mode, a packet tagged with SGT enters a device (where the tags are cached), and is redirected to a service. After that service is completed, the packet either returns to the device, or is redirected to another device as shown in the figure. In such a scenario:

1. The Cisco TrustSec SGT Caching feature enables the device to identify the IP-SGT binding information from the incoming packet and caches this information.
2. The device redirects the packet to services that cannot propagate SGTs.
3. After the completion of the service, the packet returns to the device.
4. The appropriate SGT is reappplied to the packet at the service egress point.
5. Role-based enforcements are applied to the packet that has returned to the device from the service or services.
6. The packet with SGTs is forwarded to other Cisco TrustSec-capable devices downstream.

Figure 1: SGT Caching in One-Arm Mode

In certain instances, some services are deployed in a bump-in-the-wire topology. In such a scenario:

1. Packets that go through a service or services do not come back to the device.
2. Single-hop SGT Exchange Protocol (SXP) is used to identify and export the identified IP-SGT bindings.
3. The upstream device in the network identifies the IP-SGT bindings through SXP and reapplies the appropriate tags or uses them for SGT-based enforcement. During egress caching, the original pre-Network Address Translation (NAT) source IP address is cached as part of the identified IP-SGT binding information.
4. IP-SGT bindings that do not receive traffic for 300 seconds are removed from the cache.

Figure 2: SGT Caching in Bump-in-the-wire Topology

How to Configure Cisco TrustSec SGT Caching

Configuring SGT Caching Globally

Before you begin

Before SGT caching is enabled, Security Exchange Protocol (SXP) must be established for information exchange. For more information, see the [SGT Exchange Protocol over TCP](#) chapter.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **cts role-based sgt-caching**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	cts role-based sgt-caching Example: Device(config)# cts role-based sgt-caching	Enables SGT caching in ingress direction for all interfaces.
Step 4	end Example: Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

Configuring SGT Caching on an Interface

When an interface is configured to be on a Virtual Routing and Forwarding (VRF) network, the IP-SGT bindings identified on that interface are added under the specific VRF. (To view the bindings identified on a corresponding VRF, use the **show cts role-based sgt-map vrf vrf-name all** command.) SGT caching can also be configured per VRF.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **cts role-based sgt-cache** [ingress | egress]
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type slot/port</i> Example: Device(config)# interface gigabitethernet 1/0/1	Configures an interface and enters interface configuration mode.
Step 4	cts role-based sgt-cache [ingress egress] Example: Device(config-if)# cts role-based sgt-cache ingress	Configures SGT caching on a specific interface. • ingress : Enables SGT caching for traffic entering the specific interface (inbound traffic). • egress : Enables SGT caching for traffic exiting the specific interface (outbound traffic).
Step 5	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Verifying Cisco TrustSec SGT Caching**SUMMARY STEPS**

1. **enable**
2. **show cts**
3. **show cts interface**
4. **show cts interface brief**
5. **show cts role-based sgt-map all ipv4**

6. `show cts role-based sgt-map vrf vrf-name all ipv4`
7. The SGT cache entry get removed after a port shut down or SGT cache timeout.

DETAILED STEPS

Step 1 enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

```
Device> enable
```

Step 2 show cts

Displays Cisco TrustSec connections and the status of global SGT caching.

Example:

```
Device# show cts

Global Dot1x feature: Disabled
CTS device identity: ""
CTS caching support: disabled
CTS sgt-caching global: Enabled
Number of CTS interfaces in DOT1X mode: 0,    MANUAL mode: 0
Number of CTS interfaces in LAYER3 TrustSec mode: 0
Number of CTS interfaces in corresponding IFC state
  INIT          state: 0
  AUTHENTICATING state: 0
  AUTHORIZING   state: 0
  SAP_NEGOTIATING state: 0
  OPEN          state: 0
  HELD          state: 0
  DISCONNECTING state: 0
  INVALID       state: 0
CTS events statistics:
  authentication success: 0
  authentication reject : 0
  authentication failure: 0
  authentication logoff : 0
  authentication no resp: 0
  authorization success : 0
  authorization failure : 0
  sap success           : 0
  sap failure           : 0
  port auth failure    : 0
```

Step 3 show cts interface

Displays Cisco TrustSec configuration statistics for an interface and SGT caching information with mode details (ingress or egress).

Example:

```
Device# show cts interface GigabitEthernet 1/0/1

Interface GigabitEthernet1/0/1
```

```

CTS sgt-caching Ingress: Enabled
CTS sgt-caching Egress : Disabled
CTS is enabled, mode:      MANUAL
  Propagate SGT:          Enabled
  Static Ingress SGT Policy:
    Peer SGT:              200
    Peer SGT assignment:   Trusted

L2-SGT Statistics
  Pkts In                  : 16298041
  Pkts (policy SGT assigned) : 0
  Pkts Out                  : 5
  Pkts Drop (malformed packet): 0
  Pkts Drop (invalid SGT)   : 0

```

Step 4 show cts interface brief

Displays SGT caching information with mode details (ingress or egress) for all interfaces.

Example:

```

Device# show cts interface brief

Interface GigabitEthernet1/0/1
  CTS sgt-caching Ingress: Enabled
  CTS sgt-caching Egress : Disabled
  CTS is disabled

Interface GigabitEthernet1/0/1
  CTS sgt-caching Ingress: Enabled
  CTS sgt-caching Egress : Disabled
  CTS is enabled, mode:      MANUAL
    Propagate SGT:          Enabled
    Static Ingress SGT Policy:
      Peer SGT:              200
      Peer SGT assignment:   Trusted

Interface GigabitEthernet1/0/2
  CTS sgt-caching Ingress: Enabled
  CTS sgt-caching Egress : Disabled
  CTS is enabled, mode:      MANUAL
    Propagate SGT:          Enabled
    Static Ingress SGT Policy:
      Peer SGT:              0
      Peer SGT assignment:   Untrusted

Interface GigabitEthernet1/0/3
  CTS sgt-caching Ingress: Enabled
  CTS sgt-caching Egress : Disabled
  CTS is disabled

Interface Backplane-GigabitEthernet1/0/4
  CTS sgt-caching Ingress: Enabled
  CTS sgt-caching Egress : Disabled
  CTS is disabled

Interface RG-AR-IF-INPUT1
  CTS sgt-caching Ingress: Enabled
  CTS sgt-caching Egress : Disabled
  CTS is disabled

```

Step 5 `show cts role-based sgt-map all ipv4`

Displays all the SGT-IPv4 bindings.

Example:

```
Device# show cts role-based sgt-map all ipv4

Active IPv4-SGT Bindings Information

IP Address          SGT      Source
=====
192.0.2.1           50       CACHED
192.0.2.2           50       CACHED
192.0.2.3           50       CACHED
192.0.2.4           50       CACHED
192.0.2.5           3900    INTERNAL
192.0.2.6           3900    INTERNAL
192.0.2.7           3900    INTERNAL

IP-SGT Active Bindings Summary
=====
Total number of CACHED bindings = 20
Total number of INTERNAL bindings = 3
Total number of active bindings = 23
```

Step 6 `show cts role-based sgt-map vrf vrf-name all ipv4`

Displays all the SGT-IP bindings for the specific Virtual Routing and Forwarding (VRF) interface.

Example:

```
Device# show cts role-based sgt-map vrf vrf1 all ipv4

%IPv6 protocol is not enabled in VRF vrf1
Active IPv4-SGT Bindings Information

IP Address          SGT      Source
=====
192.0.2.1           50       CACHED
192.0.2.2           2007    CACHED
192.0.2.3           50       CACHED
192.0.2.4           50       CACHED
```

Step 7 The SGT cache entry get removed after a port shut down or SGT cache timeout.

Configuration Examples for Cisco TrustSec SGT Caching

Example: Configuring SGT Caching Globally

```
Device> enable
Device# configure terminal
Device(config)# cts role-based sgt-caching
```

```
Device(config)# end
```

Example: Configuring SGT Caching for an Interface

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitEthernet 1/0/1
Device(config-if)# cts role-based sgt-cache ingress
Device(config-if)# end
```

Example: Disabling SGT Caching on an Interface

The following example shows how to disable SGT caching on an interface and displays the status of SGT caching on the interface when caching is enabled globally, but disabled on the interface.

```
Device> enable
Device# configure terminal
Device(config)# cts role-based sgt-caching
Device(config)# interface gigabitEthernet 1/0/1
Device(config-if)# no cts role-based sgt-cache ingress
Device(config-if)# end
Device# show cts interface GigabitEthernet 1/0/1

Interface GigabitEthernet1/0/1
  CTS sgt-caching Ingress: Disabled
  CTS sgt-caching Egress : Disabled
  CTS is enabled, mode:    MANUAL
  Propagate SGT:         Enabled
  Static Ingress SGT Policy:
    Peer SGT:             200
    Peer SGT assignment: Trusted

  L2-SGT Statistics
    Pkts In                : 200890684
    Pkts (policy SGT assigned) : 0
    Pkts Out               : 14
    Pkts Drop (malformed packet): 0
    Pkts Drop (invalid SGT)  : 0
```

Feature Information for Cisco TrustSec SGT Caching

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 1: Feature Information for Cisco TrustSec SGT Caching

Feature Name	Releases	Feature Information
Cisco TrustSec SGT Caching	Cisco IOS XE Everest 16.9.1	<p>The Cisco TrustSec SGT Caching feature enhances the ability of Cisco TrustSec to make SGT transportability flexible.</p> <p>In Cisco IOS XE Fuji 16.9.1, this feature was implemented on Cisco Catalyst 9400 Series Switches.</p>
