

Configuring BFD - VRF Support

- [Prerequisites for BFD - VRF Support, on page 1](#)
- [Information About BFD - VRF Support, on page 1](#)
- [Feature History for Configuring BFD Static Routes, on page 1](#)

Prerequisites for BFD - VRF Support

All Bidirectional Forwarding Detection (BFD) clients must be Virtual Routing and Forwarding (VRF)-aware.

Information About BFD - VRF Support

Overview of BFD - VRF Support

The BFD - VRF Support feature enables Bidirectional Forwarding Detection (BFD) support for Virtual Routing and Forwarding (VRF) on Provider Edge (PE) and Customer Edge (CE) devices to provide fast detection of routing protocol failures between the devices.

A BFD client establishes a Virtual Private Networking (VPN) session with devices that have BFD configured on them before requesting for session monitoring. However, there are no route lookups to determine whether a BFD neighbor is connected to the same VPN session or a different one. BFD relies on its client to get information about the VPN session to monitor the associated neighbor device. All information about VPN sessions is used to forward BFD control packets to the appropriate VPN through Cisco Express Forwarding (CEF).

Feature History for Configuring BFD Static Routes

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.2	BFD - Static Route Support	<p>The BFD - Static Route Support feature enables association of static routes with a static BFD configuration in order to monitor static route reachability using the configured BFD session.</p> <p>Depending on status of the BFD session, static routes are added to or removed from the RIB.</p>

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.
