Restrictions for VPLS

- Layer 2 protocol tunneling configuration is not supported
- Virtual Circuit Connectivity Verification (VCCV) ping with explicit null is not supported.
- The switch is supported if configured only as a spoke in hierarchical Virtual Private LAN Services (VPLS) and not as a hub.
- Layer 2 VPN interworking functions are not supported.
- **ip unnumbered** command is not supported in Multiprotocol Label Switching (MPLS) configuration.
- Virtual Circuit (VC) statistics are not displayed for flood traffic in the output of **show mpls l2 vc vcid detail** command.
- Dot1q tunnel configuration is not supported in the attachment circuit.
- On a Cisco StackWise Virtual Multichassis EtherChannel configured on a VPLS network that supports IGMP snooping, if the number of IGMP join requests exceed 12000, and also if a changeover happens, then a traffic drop occurs for around 40 seconds after the standby switch joins back on the Cisco StackWise Virtual.

Information About VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport

The following sections provide information about VPLS, VPLS BGP-based autodiscovery and flow-aware transport.

VPLS Overview

VPLS enables enterprises to link together their Ethernet-based LANs from multiple sites through the infrastructure provided by their service provider. From the enterprise perspective, the service provider's public network looks like one large Ethernet LAN. For the service provider, VPLS provides an opportunity to deploy another revenue-generating service on top of their existing network without major capital expenditures. Operators can extend the operational life of equipment in their network.

VPLS uses the provider core to join multiple attachment circuits together to simulate a virtual bridge between multiple attachment circuits. From a customer point of view, there is no topology for VPLS. All of the customer edge (CE) devices appear to connect to a logical bridge emulated by the provider core.

Figure 1: VPLS Topology

About Full-Mesh Configuration

The full-mesh configuration requires a full mesh of tunnel label switched paths (LSPs) between all the provider edge (PE) devices that participate in the VPLS. With full-mesh configuration, signaling overhead and packet replication requirements for each provisioned VC on a PE device are high.

For a full-mesh configuration, a virtual forwarding instance (VFI) is required on each participating PE device. The VFI includes the VPN ID of a VPLS domain, the addresses of other PE devices in the domain, and the type of tunnel signaling and encapsulation mechanism for each peer PE device.

A VPLS instance constitutes a set of VFIs formed by the interconnection of the emulated VCs. The VPLS instance forms the logic bridge over the packet switched network. The VPLS instance is assigned a unique VPN ID.

The PE devices use the VFI to establish a full-mesh LSP of emulated VCs to all the other PE devices in the VPLS instance. PE devices obtain the membership of a VPLS instance through the static configuration using the Cisco IOS CLI.

The full-mesh configuration allows the PE device to maintain a single broadcast domain. So when the PE device receives a broadcast, multicast, or unknown unicast packet on an attachment circuit, it sends the packet out on all other attachment circuits and emulated circuits, to all the other CE devices participating in that VPLS instance. The CE devices see the VPLS instance as an emulated LAN.

To avoid the problem of a packet looping in the provider core, the PE devices enforce a 'split-horizon' principle for the emulated VCs. The split-horizon principle ensures that a packet received on an emulated VC is not forwarded on any other emulated VC.

After the VFI has been defined, it needs to be bound to an attachment circuit to the CE device.

The packet forwarding decision is made by looking up the Layer 2 VFI of a particular VPLS domain.

A VPLS instance on a particular PE device receives Ethernet frames that enter on specific physical or logical ports and populates a MAC address table similarly to how an Ethernet switch works. The PE device uses the MAC address to switch those frames into the appropriate LSP, for delivery to the other PE device at a remote site.

If a MAC address is not populated in the MAC address table, the PE device replicates the Ethernet frame and floods it to all logical ports associated with that VPLS instance, except on the ingress port where the Ethernet frame had entered. The PE device updates the MAC address table as it receives packets on specific ports and removes addresses not used after specific periods.

About VPLS BGP-Based Autodiscovery

VPLS autodiscovery enables each PE device to discover other PE devices that are part of the same VPLS domain. VPLS autodiscovery also tracks PE devices when they are added to or removed from a VPLS domain. With VPLS autodiscovery enabled, it is no longer needed to manually configure a VPLS domain and maintain the configuration when a PE device is added or deleted. VPLS autodiscovery uses the Border Gateway Protocol (BGP) to discover VPLS members and set up and tear down pseudowires (PWs) in a VPLS domain.

BGP uses the Layer 2 VPN Routing Information Base (RIB) to store endpoint provisioning information, which is updated each time any Layer 2 VFI is configured. The prefix and path information is stored in the Layer 2 VPN database, which allows BGP to make decisions about the best path. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, this endpoint information is used to configure a pseudowire mesh to support Layer 2 VPN-based services.

The BGP autodiscovery mechanism facilitates the configuration of Layer 2 VPN services, which are an integral part of the VPLS feature. VPLS enables flexibility in deploying services by connecting geographically dispersed sites as a large LAN over high-speed Ethernet in a robust and scalable IP MPLS network.

About Flow-Aware Transport Pseudowire

Devices typically load-balance traffic based on the lower most label in the label stack which is the same label for all flows on a given pseudowire. This can lead to asymmetric loadbalancing. The flow, in this context, refers to a sequence of packets that have the same source and destination pair. The packets are transported from a source provider edge (PE) device to a destination PE device.

Flow-aware transport PWs provide the capability to identify individual flows within a PW and provide devices the ability to use these flows to load-balance traffic. Flow-aware transport PWs are used to load-balance traffic in the core when equal cost multipaths (ECMP) are used. A flow label is created based on individual packet flows entering a PW; and is inserted as the lower most label in the packet. Devices can use the flow label for load-balancing which provides a better traffic distribution across ECMP paths or link-bundled paths in the core.

Figure 2: Flow-aware transport PW with two flows distributing over ECMPs and Bundle-Links shows a flow-aware transport PW with two flows distributing over ECMPs and bundle links.

Figure 2: Flow-aware transport PW with two flows distributing over ECMPs and Bundle-Links

An extra label is added to the stack, called the flow label, which contains the flow information of a virtual circuit (VC). A flow label is a unique identifier that distinguishes a flow within the PW, and is derived from source and destination MAC addresses, and source and destination IP addresses. The flow label contains the end of label stack (EOS) bit set and inserted after the VC label and before the control word (if any). The ingress PE calculates and forwards the flow label. The flow-aware transport PW configuration enables the flow label. The egress PE discards the flow label such that no decisions are made.

All core devices perform load balancing based on the flow-label in the flow-aware transport PW. Therefore, it is possible to distribute flows over ECMPs and link bundles.

Flow-aware transport PW works based on port-channel load-balance algorithm only.

Interoperability Between Cisco Catalyst 6000 Series Switches and Cisco Catalyst 9000 Series Switches

The following section describes how to enable sending and receiving flow labels between Cisco Catalyst 6000 Series Switches and Cisco Catalyst 9000 Series Switches.

On a Cisco Catalyst 6000 Series Switch configured with flow-aware transport PW (using Advanced VPLS) flow label negotiations are not supported. If the Cisco Catalyst 6000 Series Switch is in interoperability with a remote PE device such as a Cisco Catalyst 9000 Series Switch, then the Cisco Catalyst 9000 Series Switch cannot receive and send the flow label for data traffic. Configuring the **load-balance flow-label both static** command on the Cisco Catalyst 9000 Series Switch allows the Cisco Catalyst 9000 Series Switch to receive and send the flow labels even though the Cisco Catalyst 6000 Series Switch does not support flow label negotiations.

The following is a configuration example to enable sending and receiving flow labels:

```
Device> enable
Device# configure terminal
```

```

Device(config)# template type pseudowire mpls
Device(config-template)# encapsulation mpls
Device(config-template)# load-balance flow ip dst-ip
Device(config-template)# load-balance flow-label both static
Device(config-template)# end

```

IGMP/MLD Snooping over VPLS

Starting with the Cisco IOS XE Bengaluru 17.6.1 release, support for MLD Snooping over VPLS has been introduced. Support for IGMP Snooping over VPLS was introduced in Cisco IOS XE Amsterdam 17.1.1 release.

When you enable IGMP/MLD Snooping over VPLS, traffic is forwarded on pseudowires that receive IGMP/MLD reports from remote Provider Edge (PE) devices. IGMP/MLD queries and reports are flooded to all the pseudowires.

MLD Snooping is not enabled by default and needs to be configured at the global level.

IGMP snooping is enabled by default at the global level.

For more information on MLD Snooping, see Information About Configuring IPv6 MLD Snooping.

For more information on IGMP Snooping, see IGMP Snooping.

How to Configure VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport

The following sections provide configuration information about VPLS, VPLS BGP-based autodiscovery and flow-aware transport.

Configuring Layer 2 PE Device Interfaces to CE Devices

You must configure Layer 2 PE device interfaces to CE devices. The following sections provide various configuration tasks that need to be completed before configuring VPLS.

Configuring 802.1Q Trunks on a PE Device for Tagged Traffic from a CE Device

To configure 802.1Q trunks on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	interface <i>interface-id</i> Example: Device(config)# <code>interface</code> <code>TenGigabitEthernet1/0/24</code>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address <i>ip_address mask</i> [secondary] Example: Device(config-if)# <code>no ip address</code>	Disables IP processing and enters interface configuration mode.
Step 5	switchport Example: Device(config-if)# <code>switchport</code>	Modifies the switching characteristics of the Layer 2 switched interface.
Step 6	switchport trunk encapsulation dot1q Example: Device(config-if)# <code>switchport trunk encapsulation dot1q</code>	Sets the switch port encapsulation format to 802.1Q.
Step 7	switchport trunk allow vlan <i>vlan_ID</i> Example: Device(config-if)# <code>switchport trunk allow</code> <code>vlan 2129</code>	Sets the list of allowed VLANs.
Step 8	switchport mode trunk Example: Device(config-if)# <code>switchport mode trunk</code>	Sets the interface to a trunking VLAN Layer 2 interface.
Step 9	end Example: Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

Configuring 802.1Q Access Ports on a PE Device for Untagged Traffic from a CE Device

To configure 802.1Q access ports on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/24	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address <i>ip_address mask</i> [secondary] Example: Device(config-if)# no ip address	Disables IP processing.
Step 5	switchport Example: Device(config-if)# switchport	Modifies the switching characteristics of the Layer 2 switched interface.
Step 6	switchport mode access Example: Device(config-if)# switchport mode access	Sets the interface type to nontrunking and nontagged single VLAN Layer 2 interface.
Step 7	switchport access vlan <i>vlan_ID</i> Example: Device(config-if)# switchport access vlan 2129	Sets the VLAN when the interface is in access mode.
Step 8	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring Layer 2 VLAN Instances on a PE Device

Configuring the Layer 2 VLAN interface on the PE device, enables the Layer 2 VLAN instance on the PE device to the VLAN database, to set up the mapping between the VPLS and VLANs.

To configure Layer 2 VLAN instance on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan <i>vlan-id</i> Example: Device(config)# vlan 2129	Configures a specific VLAN.
Step 4	interface vlan <i>vlan-id</i> Example: Device(config-vlan)# interface vlan 2129	Configures an interface on the VLAN.
Step 5	end Example: Device(config-vlan)# end	Returns to privileged EXEC mode.

Configuring VPLS

VPLS can be configured using either the Xconnect mode or protocol-CLI method. The following sections provide information about how to configure VPLS.

Configuring VPLS in Xconnect Mode

The following sections provide information on configuring VPLS in Xconnect mode.

Configuring MPLS on a PE Device

To configure MPLS on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mpls ip Example: Device(config)# mpls ip	Configures MPLS hop-by-hop forwarding.
Step 4	mpls label protocol ldp Example: Device(config)# mpls label protocol ldp	Specifies the default Label Distribution Protocol (LDP) for a platform.
Step 5	mpls ldp logging neighbor-changes Example: Device(config)# mpls ldp logging neighbor-changes	(Optional) Determines logging neighbor changes.
Step 6	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuring VFI on a PE Device

The VFI specifies the VPN ID of a VPLS domain, the addresses of other PE devices in this domain, and the type of tunnel signaling and encapsulation mechanism for each peer device.

To configure VFI and associated VCs on the PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.

Associating the Attachment Circuit with the VFI on the PE Device

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	l2 vfi vfi-name manual Example: Device(config)# <code>l2 vfi 2129 manual</code>	Enables the Layer 2 VFI manual configuration mode.
Step 4	vpn id vpn-id Example: Device(config-vfi)# <code>vpn id 2129</code>	Configures a VPN ID for a VPLS domain. The emulated VCs bound to this Layer 2 virtual routing and forwarding (VRF) use this VPN ID for signaling. Note <code>vpn-id</code> is the same as <code>vlan-id</code> .
Step 5	neighbor router-id {encapsulation mpls} Example: Device(config-vfi)# <code>neighbor remote-router-id encapsulation mpls</code>	Specifies the remote peering router ID and the tunnel encapsulation type or the pseudowire (PW) property to be used to set up the emulated VC.
Step 6	end Example: Device(config-vfi)# <code>end</code>	Returns to privileged EXEC mode.

Associating the Attachment Circuit with the VFI on the PE Device

After defining the VFI, you must associate it to one or more attachment circuits.

To associate the attachment circuit with the VFI, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface vlan 2129	Creates or accesses a dynamic switched virtual interface (SVI). Note <i>vlan-id</i> is the same as <i>vpn-id</i> .
Step 4	no ip address Example: Device(config-if)# no ip address	Disables IP processing. (You can configure a Layer 3 interface for the VLAN if you need to configure an IP address.)
Step 5	xconnect vfi <i>vfi-name</i> Example: Device(config-if)# xconnect vfi 2129	Specifies the Layer 2 VFI that you are binding to the VLAN port.
Step 6	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring VPLS in Protocol-CLI Mode

The following sections provide information on configuring VPLS in protocol-CLI mode.

Configuring VPLS in Protocol-CLI Mode

To configure VPLS in protocol-CLI mode, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2vpn vfi context <i>vfi-name</i> Example: Device(config)# l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.

	Command or Action	Purpose
Step 4	vpn id <i>vpn-id</i> Example: Device(config-vfi)# vpn id 10	Configures a VPN ID for the VPLS domain.
Step 5	member ip-address encapsulation mpls Example: Device(config-vfi)# member 2.2.2.2 encapsulation mpls	Specifies the devices that form a point-to-point Layer 2 VPN VFI connection.
Step 6	exit Example: Device(config-vfi)# exit	Exits to privileged EXEC mode.
Step 7	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device(config)# vlan configuration 100 OR Device(config)# interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 8	member vfi <i>vfi-name</i> Example: Device(config-vlan-config)# member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 9	end Example: Device(config-vlan-config)# end	Returns to privileged EXEC mode.

Configuring VPLS Flow-Aware Transport with Pseudowire Interface (in Protocol-CLI Mode)

To configure VPLS flow-aware transport with pseudowire interface, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface pseudowire <i>number</i> Example: Device(config)# <code>interface pseudowire 1001</code>	Establishes a PW with the specified name, and enters pseudowire interface configuration mode.
Step 4	encapsulation mpls Example: Device(config-if)# <code>encapsulation mpls</code>	Specifies the tunneling encapsulation as MPLS.
Step 5	neighbor <i>peer-address vcid-value</i> Example: Device(config-if)# <code>neighbor 10.1.1.200 200</code>	Specifies the peer IP address and VC ID value of a Layer 2 VPN PW.
Step 6	load-balance flow Example: Device(config-if)# <code>load-balance flow</code>	Enables the load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 7	load-balance flow-label Example: Device(config-if)# <code>load-balance flow-label both</code>	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 8	exit Example: Device(config-if)# <code>exit</code>	Exits to privileged EXEC mode.
Step 9	l2vpn vfi context <i>vfi-name</i> Example: Device(config)# <code>l2vpn vfi context vpls1</code>	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 10	vpn id <i>vpn-id</i> Example: Device(config-vfi)# <code>vpn id 10</code>	Configures a VPN ID for the VPLS domain.

	Command or Action	Purpose
Step 11	member pseudowire <i>number</i> Example: Device(config-vfi) # member pseudowire 1001	Adds the pseudowire interface as a member of the VFI.
Step 12	exit Example: Device(config-vfi) # exit	Exits to privileged EXEC mode.
Step 13	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device(config) # vlan configuration 100 OR Device(config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 14	member vfi <i>vfi-name</i> Example: Device(config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 15	end Example: Device(config-vlan-config) # end	Returns to privileged EXEC mode.

Configuring VPLS Flow-Aware Transport Using a Template (in Protocol-CLI Mode)

Configuring VPLS flow-aware transport using a template allows multiple PWs to share the same configuration. To configure VPLS flow-aware transport using a template, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	template type pseudowire [<i>template-name</i>] Example: Device(config)# template type pseudowire mpls	Specifies the name of a Layer 2 PW and enters pseudowire template configuration mode.
Step 4	encapsulation mpls Example: Device(config-template)# encapsulation mpls	Specifies the tunneling encapsulation as MPLS.
Step 5	load-balance flow Example: Device(config-template)# load-balance flow	Enables the load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 6	load-balance flow-label Example: Device(config-template)# load-balance flow-label both	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 7	exit Example: Device(config-template)# exit	Exits to privileged EXEC mode.
Step 8	l2vpn vfi context <i>vfi-name</i> Example: Device(config)# l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 9	vpn id <i>vpn-id</i> Example: Device(config-vfi)# vpn id 10	Configures a VPN ID for the VPLS domain.
Step 10	member <i>ip-address</i> template <i>template-name</i> Example: Device(config-vfi)# member 102.102.102.102 template mpls	Specifies the devices that form a point-to-point Layer 2 VPN VFI connection. <ul style="list-style-type: none"> • ip-address: IP address of the VFI neighbor.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • template <i>template-name</i>: Specifies the template name <i>mpls</i> as the template method.
Step 11	exit Example: Device (config-vfi) # exit	Exits to privileged EXEC mode.
Step 12	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 13	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vp1s1	Binds a VFI instance to a VLAN or an interface.
Step 14	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuring VPLS Flow-Aware Transport Using Pseudowire and a Template (in Protocol-CLI Mode)

To configure VPLS flow-aware transport using both PW and a template, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	template type pseudowire [<i>template-name</i>] Example: Device (config) # template type pseudowire mpls	Specifies the name of a Layer 2 PW and enters pseudowire template configuration mode.
Step 4	encapsulation mpls Example: Device (config-template) # encapsulation mpls	Specifies the tunneling encapsulation as MPLS.
Step 5	load-balance flow Example: Device (config-template) # load-balance flow	Enables the load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 6	load-balance flow-label Example: Device (config-template) # load-balance flow-label both	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 7	exit Example: Device (config-template) # exit	Exits to privileged EXEC mode.
Step 8	interface pseudowire <i>number</i> Example: Device (config) # interface pseudowire 1001	Establishes a PW with the specified name, and enters pseudowire interface configuration mode.
Step 9	source template type pseudowire [<i>template-name</i>] Example: Device (config-if) # source template type pseudowire mpls	Configures the source template of type pseudowire named mpls.
Step 10	neighbor <i>peer-address</i> <i>vcid-value</i> Example: Device (config-if) # neighbor 10.1.1.200 200	Specifies the peer IP address and VC ID value of a Layer 2 VPN PW.

	Command or Action	Purpose
Step 11	exit Example: Device (config-if) # exit	Exits to privileged EXEC mode.
Step 12	l2vpn vfi context <i>vfi-name</i> Example: Device (config) # l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 13	vpn id <i>vpn-id</i> Example: Device (config-vfi) # vpn id 10	Configures a VPN ID for the VPLS domain.
Step 14	member pseudowire <i>number</i> Example: Device (config-vfi) # member pseudowire 1001	Adds the pseudowire interface as a member of the VFI.
Step 15	exit Example: Device (config-vfi) # exit	Exits to privileged EXEC mode.
Step 16	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 17	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 18	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuring VPLS BGP-based Autodiscovery

The following sections provide information about how to configure VPLS BGP-based Autodiscovery.

Enabling VPLS BGP-based Autodiscovery

To enabling VPLS BGP-based autodiscovery, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2 vfi vfi-name autodiscovery Example: Device(config)# l2 vfi 2128 autodiscovery	Enables VPLS autodiscovery on a PE device and enters L2 VFI configuration mode.
Step 4	vpn id vpn-id Example: Device(config-vfi)# vpn id 2128	Configures a VPN ID for the VPLS domain.
Step 5	end Example: Device(config-vfi)# end	Returns to privileged EXEC mode.

Configuring BGP to Enable VPLS Autodiscovery

To configure BGP to enable VPLS autodiscovery, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device (config)# router bgp 1000	Enters router configuration mode for the specified routing process.
Step 4	no bgp default ipv4-unicast Example: Device (config-router)# no bgp default ipv4-unicast	Disables the IPv4 unicast address family for the BGP routing process. Note Routing information for the IPv4 unicast address family is advertised by default for each BGP routing session configured using the neighbor remote-as router command unless you configure the no bgp default ipv4-unicast command before configuring the neighbor remote-as command. Existing neighbor configurations are not affected.
Step 5	bgp log-neighbor-changes Example: Device (config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.
Step 6	neighbor remote-as { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>autonomous-system-number</i> Example: Device (config-router)# neighbor 44.254.44.44 remote-as 1000	Adds the IP address or peer group name of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device. <ul style="list-style-type: none"> • If the <i>autonomous-system-number</i> argument matches the autonomous system number specified in the router bgp

	Command or Action	Purpose
		<p>command, the neighbor is an internal neighbor.</p> <ul style="list-style-type: none"> If the <i>autonomous-system-number</i> argument does not match the autonomous system number specified in the router bgp command, the neighbor is an external neighbor.
Step 7	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } update-source <i>interface-type interface-number</i></p> <p>Example:</p> <pre>Device(config-router)# neighbor 44.254.44.44 update-source Loopback300</pre>	(Optional) Configures a device to select a specific source or interface to receive routing table updates.
Step 8	Repeat Steps 6 and 7 to configure other BGP neighbors.	Exits interface configuration mode.
Step 9	<p>address-family l2vpn [vpls]</p> <p>Example:</p> <pre>Device(config-router)# address-family l2vpn vpls</pre>	<p>Specifies the Layer 2 VPN address family and enters address family configuration mode.</p> <p>The optional vpls keyword specifies that the VPLS endpoint provisioning information is to be distributed to BGP peers.</p>
Step 10	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 44.254.44.44 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 11	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } send-community { both standard extended }</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 44.254.44.44 send-community both</pre>	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 12	Repeat Steps 10 and 11 to activate other BGP neighbors under an L2VPN address family.	
Step 13	<p>exit-address-family</p> <p>Example:</p>	Exits address family configuration mode and returns to router configuration mode.

	Command or Action	Purpose
	Device (config-router-af) # exit-address-family	
Step 14	end Example: Device (config-router) # end	Exits router configuration mode and returns to privileged EXEC mode.

Configuring VPLS BGP-based Autodiscovery in Protocol-CLI Mode

The following sections provide information on configuring VPLS BGP-based autodiscovery in protocol-CLI mode.

Configuring VPLS BGP based Autodiscovery in Protocol-CLI mode

To configure VPLS BGP based autodiscovery in protocol-CLI mode, perform this procedure

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2vpn vfi context <i>vfi-name</i> Example: Device (config) # l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 4	vpn id <i>vpn-id</i> Example: Device (config-vfi) # vpn id 10	Configures a VPN ID for the VPLS domain.
Step 5	autodiscovery bgp signaling ldp Example: Device (config-vfi) # autodiscovery bgp signaling ldp	Enables BGP signaling and LDP signaling.

	Command or Action	Purpose
Step 6	exit Example: Device (config-vfi-autodiscovery) # exit	Exits to privileged EXEC mode.
Step 7	exit Example: Device (config-vfi) # exit	Exits to privileged EXEC mode.
Step 8	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 9	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 10	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuring VPLS BGP based Autodiscovery Flow-Aware Transport using Template (in Protocol-CLI Mode)

To configure VPLS BGP based autodiscovery flow-aware transport using template, perform this procedure

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	template type pseudowire <i>[template-name]</i> Example: <pre>Device(config)# template type pseudowire mpls</pre>	Specifies the name of a Layer 2 PW and enters pseudowire template configuration mode.
Step 4	encapsulation mpls Example: <pre>Device(config-template)# encapsulation mpls</pre>	Specifies the tunneling encapsulation as MPLS.
Step 5	load-balance flow Example: <pre>Device(config-template)# load-balance flow</pre>	Enables the Any Transport over MPLS (AToM) load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 6	load-balance flow-label Example: <pre>Device(config-template)# load-balance flow-label both</pre>	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 7	exit Example: <pre>Device(config-template)# exit</pre>	Exits to privileged EXEC mode.
Step 8	l2vpn vfi context <i>vfi-name</i> Example: <pre>Device(config)# l2vpn vfi context vpls1</pre>	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 9	vpn id <i>vpn-id</i> Example: <pre>Device(config-vfi)# vpn id 10</pre>	Configures a VPN ID for the VPLS domain.
Step 10	autodiscovery bgp signaling ldp template <i>name</i> Example: <pre>Device(config-vfi)# autodiscovery bgp signaling ldp template mpls</pre>	Enables BGP signaling and LDP signaling.
Step 11	exit Example:	Exits to privileged EXEC mode.

	Command or Action	Purpose
	Device (config-vfi) # exit	
Step 12	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 13	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 14	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuration Examples for VPLS and VPLS BGP-Based Autodiscovery

This section provides the configuration examples for VPLS and VPLS BGP-Based Autodiscovery.

Example: Configuring VPLS in Xconnect Mode

The following example shows how to configure VPLS on a PE1 and PE2 devices:

Figure 3: VPLS Topology

PE1 Configuration

```

Device> enable
Device# configure terminal
Device(config)# pseudowire-class vpls2129
Device(config-if)# encapsulation mpls
Device(config-if)# exit
Device(config)# 12 vfi 2129 manual
Device(config-vfi)# vpn id 2129
Device(config-vfi)# neighbor 44.254.44.44 pw-class vpls2129
Device(config-vfi)# neighbor 188.98.89.98 pw-class vpls2129
Device(config-vfi)# exit
Device(config)# interface TenGigabitEthernet1/0/24
Device(config-if)# switchport trunk allowed vlan 2129
Device(config-if)# switchport mode trunk
Device(config-if)# exit
Device(config)# interface vlan 2129
Device(config-vlan-config)# no ip address
Device(config-vlan-config)# xconnect vfi 2129

```

Examples: Verifying VPLS Configured in Xconnect Mode

The following example is a sample output of the **show mpls 12transport vc detail** command. This command provides information about the virtual circuits.

```

Device# show mpls 12transport vc detail
Local interface: VFI 2129 vfi up
Interworking type is Ethernet
Destination address: 44.254.44.44, VC ID: 2129, VC status: up
Output interface: Gi1/0/9, imposed label stack {18 17}
Preferred path: not configured
Default path: active
Next hop: 177.77.177.2
Create time: 19:09:33, last status change time: 09:24:14
Last label FSM state change time: 09:24:14
Signaling protocol: LDP, peer 44.254.44.44:0 up
Targeted Hello: 1.1.1.72(LDP Id) -> 44.254.44.44, LDP is UP
Graceful restart: configured and enabled
Non stop routing: not configured and not enabled
Status TLV support (local/remote) : enabled/supported
LDP route watch : enabled
Label/status state machine : established, LruRru
Last local dataplane status rcvd: No fault
Last BFD dataplane status rcvd: Not sent
Last BFD peer monitor status rcvd: No fault
Last local AC circuit status rcvd: No fault
Last local AC circuit status sent: No fault
Last local PW i/f circ status rcvd: No fault
Last local LDP TLV status sent: No fault
Last remote LDP TLV status rcvd: No fault
Last remote LDP ADJ status rcvd: No fault
MPLS VC labels: local 512, remote 17
Group ID: local n/a, remote 0
MTU: local 1500, remote 1500
Remote interface description:
Sequencing: receive disabled, send disabled
Control Word: Off

```

```
SSO Descriptor: 44.254.44.44/2129, local label: 512

Example: Configuring VPLS Flow-Aware Transport Using a Template (in Protocol-CLI Mode)

The following example shows how to configure VPLS on a PE1 and PE2 devices:

Figure 4: VPLS Topology

PE1 Configuration

```

Device> enable
Device# configure terminal
Device(config)# template type pseudowire mpls
Device(config-template)# encapsulation mpls
Device(config-template)# load-balance flow ip dst-ip
Device(config-template)# load-balance flow-label both
Device(config-template)# exit
Device(config)# interface Loopback0
Device(config-if)# ip address 1.1.1.30 255.255.255.255
Device(config-if)# ip ospf 1 area 0
Device(config-if)# exit
Device(config)# interface TwentyFiveGigE1/0/9
Device(config-if)# no switchport
Device(config-if)# ip address 80.0.0.30 255.255.255.0
Device(config-if)# ip ospf 1 area 0
Device(config-if)# mpls ip
Device(config-if)# exit
Device(config)# l2vpn vfi context foo
Device(config-vfi)# vpn id 2129
Device(config-vfi)# member 1.1.1.20 template mpls
Device(config-vfi)# exit
Device(config)# interface TwentyFiveGigE1/0/2
Device(config-if)# switchport mode access
Device(config-if)# switchport access vlan 100
Device(config-if)# exit
Device(config)# interface vlan 100
Device(config-vlan-config)# member vfi foo
Device(config-vlan-config)# end

```

Example: Configuring VPLS BGP-Auto Discovery

The following example shows how to configure VPLS on a PE device:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 1000
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# bgp graceful-restart
Device(config-router)# neighbor 44.254.44.44 remote-as 1000
Device(config-router)# neighbor 44.254.44.44 update-source Loopback300
Device(config-router)# address-family l2vpn vpls
Device(config-router-af)# neighbor 44.254.44.44 activate
Device(config-router-af)# neighbor 44.254.44.44 send-community both
Device(config-router-af)# exit-address-family
Device(config-router-af)# end
Device(config)# l2 vfi 2128 autodiscovery
Device(config-vfi)# vpn id 2128
Device(config-vfi)# exit
Device(config)# interface vlan 2128
Device(config-vlan-config)# no ip address
Device(config-vlan-config)# xconnect vfi 2128
!
```

Example: Verifying VPLS BGP-Auto Discovery

The following example is a sample output of the **show platform software fed sw 1 matm macTable vlan 2000** command.

```
Device# show platform software fed sw 1 matm macTable vlan 2000

Feature History for VPLS and VPLS BGP-Based Autodiscovery

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	Configuring VPLS	VPLS enables enterprises to link together their Ethernet-based LANs from multiple sites via the infrastructure provided by their service provider.
Cisco IOS XE Gibraltar 16.12.1	Configuring VPLS BGP-based Autodiscovery	VPLS Autodiscovery enables each PE device to discover other PE devices that are part of the same VPLS domain.
Cisco IOS XE Amsterdam 17.1.1	VPLS Layer 2 Snooping : IGMP (IPv4)	IGMP snooping is supported on a VPLS configured network.
Cisco IOS XE Bengaluru 17.6.1	MLD Snooping over VPLS	Support was introduced for MLD Snooping over VPLS. It allows traffic to be forwarded on pseudowires that receive IGMP/MLD reports from remote Provider Edge (PE) devices.

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.7.1	VPLS BGP-based Autodiscovery	This feature was implemented on supervisor modules C9400X-SUP-2 and C9400X-SUP-2XL, which were introduced in this release.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

<http://www.cisco.com/go/cfn>.
