

Configuring Ethernet-over-MPLS (EoMPLS)

- [Prerequisites for Ethernet-over-MPLS, on page 1](#)
- [Restrictions for Ethernet-over-MPLS, on page 1](#)
- [Information About Ethernet-over-MPLS, on page 3](#)
- [How to Configure Ethernet-over-MPLS, on page 3](#)
- [Configuration Examples for Ethernet-over-MPLS, on page 11](#)
- [Feature Information for Ethernet-over-MPLS \(EoMPLS\), on page 16](#)

Prerequisites for Ethernet-over-MPLS

Before you configure EoMPLS, ensure that the network is configured as follows:

- Configure IP routing in the core so that the provider edge (PE) devices can reach each other through IP.
- Configure MPLS in the core so that a label switched path (LSP) exists between the PE devices.
- Configure the **no switchport**, **no keepalive**, and **no ip address** commands before configuring Xconnect on the attachment circuit.
- For load-balancing, configuring the **port-channel load-balance** command is mandatory.
- Subinterfaces must be supported to enable EoMPLS VLAN mode.
- The **mpls ldp graceful-restart** command must be configured to enable the device to protect LDP bindings and MPLS forwarding state during a disruption in service. We recommend you to configure this command (even if you do not want to preserve the forwarding state) to avoid device failure during SSO in a high availability setup with scale configurations.

Restrictions for Ethernet-over-MPLS

The following sections list the restrictions for EoMPLS port mode and EoMPLS VLAN mode.

Restrictions for Ethernet-over-MPLS Port Mode

- Ethernet Flow Point is not supported.

- Quality of Service (QoS): Customer differentiated services code point (DSCP) re-marking is not supported with virtual private wire service (VPWS) and EoMPLS.
- Virtual Circuit Connectivity Verification (VCCV) ping with explicit null is not supported.
- Layer 2 Protocol Tunneling CLI is not supported.
- Flow-Aware Transport (FAT) Pseudowire Redundancy is supported only in Protocol-CLI mode. Supported load-balancing parameters are Source IP, Source MAC address, Destination IP, and Destination MAC address.
- MPLS QoS is supported only in pipe and uniform mode. Default mode is pipe mode.
- Both legacy Xconnect and Protocol-CLI (interface pseudowire configuration) modes are supported.
- Xconnect and MACSec cannot be configured on the same interface.
- MACSec should be configured on CE devices and Xconnect should be configured on PE devices.
- A MACSec session should be available between CE devices.
- By default, EoMPLS PW tunnels all the protocols such as Cisco Discovery Protocol and Spanning Tree Protocol (STP). EoMPLS PW cannot perform selective protocol tunneling as part of L2 Protocol Tunneling CLI.

Restrictions for EoMPLS VLAN Mode

- Virtual circuit will not work if the same interworking type is not configured on PE devices.
- Untagged traffic is not supported as incoming traffic.
- Xconnect mode cannot be enabled on Layer 2 subinterfaces because multiplexer user-network interface (MUX UNI) is not supported.
- Xconnect mode cannot be configured on subinterfaces if it is enabled on the main interface for port-to-port transport.
- FAT can be configured on Protocol CLI mode only.
- In VLAN mode EoMPLS, only those packets encrypted with the dot1q in clear by the CE device will be processed by the PE device.
- QoS: Customer DSCP Remarking is not supported with VPWS and EoMPLS.
- MPLS QoS is supported in pipe and uniform mode. Default mode is pipe mode.
- In VLAN mode EoMPLS, Cisco Discovery Protocol packets from the CE will be processed by the PE, but will not be carried over the EoMPLS virtual circuit, whereas in port mode, Cisco Discovery Protocol packets from the CE will be carried over the virtual circuit.
- Only Ethernet and VLAN interworking types are supported.
- L2 Protocol Tunneling CLI is not supported.

Information About Ethernet-over-MPLS

EoMPLS is one of the Any Transport over MPLS (AToM) transport types. EoMPLS works by encapsulating Ethernet protocol data units (PDUs) in MPLS packets and forwarding them across the MPLS network. Each PDU is transported as a single packet.

The following modes are supported:

- **Port mode:** Allows all traffic on a port to share a single virtual circuit across an MPLS network. Port mode uses virtual circuit type 5.
- **VLAN mode:** Transports Ethernet traffic from a source 802.1Q VLAN to a destination 802.1Q VLAN through a single virtual circuit over an MPLS network. VLAN mode uses virtual circuit type 5 as the default (does not transport dot1q tag); however, uses virtual circuit type 4 (transports dot1 tag) if the remote PE does not support virtual circuit type 5 for subinterface-based (VLAN-based) EoMPLS.

Interworking between EoMPLS port mode and EoMPLS VLAN mode: If EoMPLS port mode is configured on a local PE and EoMPLS VLAN mode on a remote PE, then the customer edge (CE) Layer 2 switchport interface must be configured as an *access* on the port mode side and the Spanning Tree Protocol must be disabled on the VLAN mode side of the CE device.

The maximum transmission unit (MTU) of all the intermediate links between PEs must be able to carry the largest Layer 2 packet received on ingress PE.

Starting with the Cisco IOS XE Bengaluru 17.6.1 release, you can forward Link Aggregation Control Protocol (LACP) and Port Aggregation Protocol (PAgP) packets over Ethernet-over-MPLS Pseudowire in the Port mode.

How to Configure Ethernet-over-MPLS

EoMPLS can be configured in the port mode or VLAN mode.

Configuring Ethernet-over-MPLS Port Mode

EoMPLS port mode can be configured using either the Xconnect mode or protocol CLI method.

Xconnect Mode

To configure EoMPLS port mode in Xconnect mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/36	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no switchport Example: Device(config-if)# no switchport	Enters Layer 3 mode for physical ports only.
Step 5	no ip address Example: Device(config-if)# no ip address	Ensures that no IP address is assigned to the physical port.
Step 6	no keepalive Example: Device(config-if)# no keepalive	Ensures that the device does not send keepalive messages.
Step 7	xconnect <i>peer-device-id</i> <i>vc-id</i> encapsulation mpls Example: Device(config-if)# xconnect 10.1.1.1 962 encapsulation mpls	Binds the attachment circuit to a pseudowire virtual circuit (VC). The syntax for this command is the same as for all other Layer 2 transports.
Step 8	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Protocol CLI Method

To configure EoMPLS port mode in protocol CLI mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	port-channel load-balance dst-ip Example: Device(config)# port-channel load-balance dst-ip	Sets the load distribution method to the destination IP address.
Step 4	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/21	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 5	no switchport Example: Device(config-if)# no switchport	Enters Layer 3 mode for physical ports only.
Step 6	no ip address Example: Device(config-if)# no ip address	Ensures that no IP address is assigned to the physical port.
Step 7	no keepalive Example:	Ensures that the device does not send keepalive messages.

	Command or Action	Purpose
	Device (config-if) # no keepalive	
Step 8	exit Example: Device (config-if) # exit	Exits interface configuration mode and returns to global configuration mode.
Step 9	interface pseudowire <i>number</i> Example: Device (config) # interface pseudowire 17	Establishes a pseudowire interface with a value that you specify and enters pseudowire configuration mode.
Step 10	encapsulation mpls Example: Device (config-if) # encapsulation mpls	Specifies the tunneling encapsulation.
Step 11	neighbor <i>peer-ip-addr vc-id</i> Example: Device (config-if) # neighbor 10.10.0.10 17	Specifies the peer IP address and virtual circuit (VC) ID value of a Layer 2 VPN (L2VPN) pseudowire.
Step 12	l2vpn xconnect context <i>context-name</i> Example: Device (config-if) # l2vpn xconnect context vpws17	Creates an L2VPN cross connect context and enters Xconnect context configuration mode.
Step 13	member <i>interface-id</i> Example: Device (config-if-xconn) # member TenGigabitEthernet1/0/21	Specifies interface that forms an L2VPN cross connect.

	Command or Action	Purpose
Step 14	member pseudowire <i>number</i> Example: <pre>Device(config-if-xconn)# member pseudowire 17</pre>	Specifies the pseudowire interface that forms an L2VPN cross connect.
Step 15	end Example: <pre>Device(config-if-xconn)# end</pre>	Exits Xconnect interface configuration mode and returns to privileged EXEC mode.

Configuring Ethernet-over-MPLS VLAN Mode

EoMPLS VLAN mode can be configured using either the Xconnect mode or protocol-CLI method.

Xconnect Mode

To configure EoMPLS VLAN mode in Xconnect mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36</pre>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no switchport Example: <pre>Device(config-if)# no switchport</pre>	Enters Layer 3 mode, for physical ports only.

	Command or Action	Purpose
Step 5	no ip address Example: Device(config-if)# no ip address	Ensures that there is no IP address assigned to the physical port.
Step 6	no keepalive Example: Device(config-if)# no keepalive	Ensures that the device does not send keepalive messages.
Step 7	exit Example: Device(config-if)# exit	Exits interface configuration mode and returns to global configuration mode.
Step 8	interface <i>interface-id.subinterface</i> Example: Device(config)# interface TenGigabitEthernet1/0/36.1105	Defines the subinterface to be configured, and enters subinterface configuration mode.
Step 9	encapsulation dot1Q <i>vlan-id</i> Example: Device(config-subif)# encapsulation dot1Q 1105	Enables IEEE 802.1Q encapsulation of traffic on the subinterface.
Step 10	xconnect <i>peer-ip-addr vc-id encapsulation mpls</i> Example: Device(config-subif)# xconnect 10.0.0.1 1105 encapsulation mpls	Binds the attachment circuit to a pseudowire VC. The syntax for this command is the same as for all other Layer 2 transports.
Step 11	end Example: Device(config-subif-xconn)# end	Returns to privileged EXEC mode.

Protocol CLI Method

To configure EoMPLS VLAN mode in protocol-CLI mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	port-channel load-balance dst-ip Example: Device(config)# port-channel load-balance dst-ip	Sets the load-distribution method to the destination IP address.
Step 4	interface interface-id Example: Device(config)# interface TenGigabitEthernet1/0/36	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 5	no switchport Example: Device(config-if)# no switchport	Enters Layer 3 mode, for physical ports only.
Step 6	no ip address Example: Device(config-if)# no ip address	Ensures that there is no IP address assigned to the physical port.
Step 7	no keepalive Example:	Ensures that the device does not send keepalive messages.

	Command or Action	Purpose
	Device (config-if) # no keepalive	
Step 8	exit Example: Device (config-if) # exit	Exits interface configuration mode and returns to global configuration mode.
Step 9	interface <i>interface-id.subinterface</i> Example: Device (config) # interface TenGigabitEthernet1/0/36.1105	Defines the subinterface to be configured, and enters subinterface configuration mode.
Step 10	encapsulation dot1Q <i>vlan-id</i> Example: Device (config-subif) # encapsulation dot1Q 1105	Enables IEEE 802.1Q encapsulation of traffic on the subinterface.
Step 11	exit Example: Device (config-subif) # exit	Exits subinterface configuration mode and returns to interface configuration mode.
Step 12	interface pseudowire <i>number</i> Example: Device (config) # interface pseudowire 17	Establishes a pseudowire interface with a value that you specify and enters pseudowire configuration mode.
Step 13	encapsulation mpls Example: Device (config-if) # encapsulation mpls	Specifies the tunneling encapsulation.
Step 14	neighbor <i>peer-ip-addr vc-id</i> Example: Device (config-if) # neighbor 10.10.0.10 17	Specifies the peer IP address and VC ID value of a L2VPN pseudowire.

	Command or Action	Purpose
Step 15	l2vpn xconnect context <i>context-name</i> Example: <pre>Device(config-if)# l2vpn xconnect context vpws17</pre>	Creates a L2VPN cross connect context, and enters Xconnect context configuration mode.
Step 16	member <i>interface-id.subinterface</i> Example: <pre>Device(config-if-xconn)# member TenGigabitEthernet1/0/36.1105</pre>	Specifies the subinterface that forms a L2VPN cross connect.
Step 17	member pseudowire <i>number</i> Example: <pre>Device(config-if-xconn)# member pseudowire 17</pre>	Specifies pseudowire interface that forms a L2VPN cross connect.
Step 18	end Example: <pre>Device(config-if-xconn)# end</pre>	Exits Xconnect configuration mode and returns to privileged EXEC mode.

Configuration Examples for Ethernet-over-MPLS

Figure 1: EoMPLS Topology

Table 1: EoMPLS Port Mode Configuration

PE Configuration	CE Configuration
<pre> mpls ip mpls label protocol ldp mpls ldp graceful-restart mpls ldp router-id loopback 1 force interface Loopback1 ip address 10.1.1.1 255.255.255.255 ip ospf 100 area 0 router ospf 100 router-id 10.1.1.1 nsf system mtu 9198 port-channel load-balance dst-ip ! interface gigabitethernet 2/0/39 no switchport no ip address no keepalive ! interface pseudowire101 encapsulation mpls neighbor 10.10.10.10 101 load-balance flow ip dst-ip load-balance flow-label both l2vpn xconnect context pw101 member pseudowire101 member gigabitethernet 2/0/39 ! interface tengigabitethernet 3/0/10 switchport trunk allowed vlan 142 switchport mode trunk channel-group 42 mode active ! interface Port-channel42 switchport trunk allowed vlan 142 switchport mode trunk ! interface Vlan142 ip address 10.11.11.11 255.255.255.0 ip ospf 100 area 0 mpls ip mpls label protocol ldp ! </pre>	<pre> interface gigabitethernet 1/0/33 switchport trunk allowed vlan 912 switchport mode trunk spanning-tree portfast trunk ! interface Vlan912 ip address 10.91.2.3 255.255.255.0 ! </pre>

Table 2: EoMPLS VLAN Mode Configuration

PE Configuration	CE Configuration
<pre> interface tengigabitethernet 1/0/36 no switchport no ip address no keepalive exit ! interface tengigabitethernet 1/0/36.1105 encapsulation dot1Q 1105 exit ! interface pseudowire1105 encapsulation mpls neighbor 10.10.0.10 1105 exit ! l2vpn xconnect context vme1105 member tengigabitethernet 1/0/36.1105 member pseudowire1105 end ! </pre>	<pre> interface fortygigabitethernet 1/9 switchport switchport mode trunk switchport trunk allowed vlan 1105 mtu 9216 end ! </pre>

Table 3: Interworking Between EoMPLS Port Mode and EoMPLS VLAN Mode Configuration

PE Configuration: Port Mode	CE Configuration: Port Mode
<pre> interface tengigabitethernet 1/0/37 no switchport no ip address no keepalive exit ! interface pseudowire1105 encapsulation mpls neighbor 10.11.11.11 1105 exit ! l2vpn xconnect context vme1105 member tengigabitethernet 1/0/37 member pseudowire1105 end ! </pre>	<pre> interface fortygigabitethernet1/10 switchport switchport mode access switchport access vlan 1105 end no spanning-tree vlan 1105 ! </pre>

PE Configuration: VLAN Mode	CE Configuration: VLAN Mode
<pre>interface tengigabitethernet 1/0/36 no switchport no ip address no keepalive exit ! interface tengigabitethernet 1/0/36.1105 encapsulation dot1Q 1105 exit ! interface pseudowire1105 encapsulation mpls neighbor 10.10.0.10 1105 exit ! l2vpn xconnect context vme1105 member tengigabitethernet 1/0/36.1105 member pseudowire1105 end !</pre>	<pre>interface fortygigabitethernet 1/9 switchport switchport mode trunk switchport trunk allowed vlan 1105 mtu 9216 end no spanning-tree vlan 1105 !</pre>

Another scenario for interworking between EoMPLS port mode and EoMPLS VLAN mode is to configure the following commands on both CE devices:

- **switchport mode trunk**
- **switchport trunk allowed vlan *vlan-id***
- **spanning-tree vlan *vlan-id***

Data traffic will flow through by disabling STP on both CE devices, if the traffic sent is not double VLAN tagged.

The following is a sample output of the **show mpls l2 vc vcid *vc-id* detail** command:

```
Device# show mpls l2 vc vcid 1105 detail
Local interface: TenGigabitEthernet1/0/36.1105 up, line protocol up, Eth VLAN 1105 up

Feature Information for Ethernet-over-MPLS (EoMPLS)

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	Ethernet-over-MPLS and Pseudowire Redundancy	Ethernet-over-MPLS is one of the Any Transport over MPLS (AToM) transport types. The Layer 2 VPN pseudowire redundancy feature enables you to configure your network to detect a failure in the network and reroute the Layer 2 service to another endpoint that can continue to provide service.
Cisco IOS XE Gibraltar 16.12.1	VLAN mode support for Ethernet-over-MPLS	VLAN mode transports Ethernet traffic from a source 802.1Q VLAN to a destination 802.1Q VLAN through a single virtual circuit over an MPLS network.
Cisco IOS XE Amsterdam 17.1.1	Macsec over EoMPLS	In VLAN mode, the switch (PE device) can now process packets in which the 802.1Q tag is not encrypted by the CE device.

Release	Feature	Feature Information
Cisco IOS XE Bengaluru 17.6.1	LACP and PAgP packet forwarding over Ethernet-over-MPLS Pseudowire	Support for forwarding Link Aggregation Control Protocol (LACP) and Port Aggregation Protocol (PAgP) packets over Ethernet-over-MPLS Pseudowire in the Port mode was introduced.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.
