## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Interface Characteristics

The following sections provide information about interface characteristics.

### Interface Types

This section describes the different types of interfaces supported by the device. The rest of the chapter describes configuration procedures for physical interface characteristics.

### Port-Based VLANs

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. Packets received on a port are forwarded only to ports that belong to the

same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is configured to be associated with the VLAN, when the VLAN Trunking Protocol (VTP) learns of its existence from a neighbor on a trunk, or when a user creates a VLAN.

To configure VLANs, use the **vlan** *vlan-id* global configuration command to enter VLAN configuration mode. The VLAN configurations for normal-range VLANs (VLAN IDs 1 to 1005) are saved in the VLAN database. If VTP is version 1 or 2, to configure extended-range VLANs (VLAN IDs 1006 to 4094), you must first set VTP mode to transparent. Extended-range VLANs created in transparent mode are not added to the VLAN database but are saved in the device running configuration. With VTP version 3, you can create extended-range VLANs in client or server mode in addition to transparent mode. These VLANs are saved in the VLAN database.

Add ports to a VLAN by using the **switchport** command in interface configuration mode.

- Identify the interface.
- For a trunk port, set trunk characteristics, and, if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.

## Switch Ports

Switch ports are Layer 2-only interfaces associated with a physical port. Switch ports belong to one or more VLANs. A switch port can be an access port or a trunk port. You can configure a port as an access port or trunk port or let the Dynamic Trunking Protocol (DTP) operate on a per-port basis to set the switchport mode by negotiating with the port on the other end of the link. switch ports are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging.

Configure switch ports by using the **switchport** interface configuration commands.

### Access Ports

An access port belongs to and carries the traffic of only one VLAN (unless it is configured as a voice VLAN port). Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives a tagged packet (Inter-Switch Link [ISL] or IEEE 802.1Q tagged), the packet is dropped, and the source address is not learned.

The types of access ports supported are:

- Static access ports are manually assigned to a VLAN (or through a RADIUS server for use with IEEE 802.1x).

You can also configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.

### Trunk Ports

A trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database. These trunk port types are supported:

- In an ISL trunk port, all received packets are expected to be encapsulated with an ISL header, and all transmitted packets are sent with an ISL header. Native (non-tagged) frames received from an ISL trunk port are dropped.

- An IEEE 802.1Q trunk port supports simultaneous tagged and untagged traffic. An IEEE 802.1Q trunk port is assigned a default port VLAN ID (PVID), and all untagged traffic travels on the port default PVID. All untagged traffic and tagged traffic with a NULL VLAN ID are assumed to belong to the port default PVID. A packet with a VLAN ID equal to the outgoing port default PVID is sent untagged. All other traffic is sent with a VLAN tag.

Although by default, a trunk port is a member of every VLAN known to the VTP, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port. By default, all possible VLANs (VLAN ID 1 to 4094) are in the allowed list. A trunk port can become a member of a VLAN only if VTP knows of the VLAN and if the VLAN is in the enabled state. If VTP learns of a new, enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of that VLAN and traffic is forwarded to and from the trunk port for that VLAN. If VTP learns of a new, enabled VLAN that is not in the allowed list for a trunk port, the port does not become a member of the VLAN, and no traffic for the VLAN is forwarded to or from the port.

## Tunnel Ports

Tunnel ports are used in IEEE 802.1Q tunneling to segregate the traffic of customers in a service-provider network from other customers who are using the same VLAN number. You configure an asymmetric link from a tunnel port on a service-provider edge switch to an IEEE 802.1Q trunk port on the customer switch. Packets entering the tunnel port on the edge switch, already IEEE 802.1Q-tagged with the customer VLANs, are encapsulated with another layer of an IEEE 802.1Q tag (called the metro tag), containing a VLAN ID unique in the service-provider network, for each customer. The double-tagged packets go through the service-provider network keeping the original customer VLANs separate from those of other customers. At the outbound interface, also a tunnel port, the metro tag is removed, and the original VLAN numbers from the customer network are retrieved.

Tunnel ports cannot be trunk ports or access ports and must belong to a VLAN unique to each customer.

## Routed Ports

A routed port is a physical port that acts like a port on a router; it does not have to be connected to a router. A routed port is not associated with a particular VLAN, as is an access port. A routed port behaves like a regular router interface, except that it does not support VLAN subinterfaces. Routed ports can be configured with a Layer 3 routing protocol. A routed port is a Layer 3 interface only and does not support Layer 2 protocols, such as DTP and STP.

Configure routed ports by putting the interface into Layer 3 mode with the **no switchport** interface configuration command. Then assign an IP address to the port, enable routing, and assign routing protocol characteristics by using the **ip routing** and **router protocol** global configuration commands.

**Note** Entering a **no switchport** interface configuration command shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost.

The number of routed ports that you can configure is not limited by software. However, the interrelationship between this number and the number of other features being configured might impact CPU performance because of hardware limitations.

**Note** The Network Essentials license supports static routing and the Routing Information Protocol (RIP). For full Layer 3 routing, you must enable the Network Advantage license on the standalone device, or the active device.

## Switch Virtual Interfaces

A switch virtual interface (SVI) represents a VLAN of switch ports as one interface to the routing function in the system. You can associate only one SVI with a VLAN. You configure an SVI for a VLAN only to route between VLANs or to provide IP host connectivity to the device. By default, an SVI is created for the default VLAN (VLAN 1) to permit remote device administration. Additional SVIs must be explicitly configured.

**Note** You cannot delete interface VLAN 1.

SVIs provide IP host connectivity only to the system. SVIs are created the first time that you enter the **vlan** interface configuration command for a VLAN interface. The VLAN corresponds to the VLAN tag associated with data frames on an ISL or IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port. Configure a VLAN interface for each VLAN for which you want to route traffic, and assign it an IP address.

You can also use the interface range command to configure existing VLAN SVIs within the range. The commands entered under the interface range command are applied to all existing VLAN SVIs within the range. You can enter the command **interface range create vlan x - y** to create all VLANs in the specified range that do not already exist. When the VLAN interface is created, **interface range vlan id** can be used to configure the VLAN interface.

Although the device supports a total of 1005 VLANs and SVIs, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might impact CPU performance because of hardware limitations.

When you create an SVI, it does not become active until it is associated with a physical port.

## EtherChannel Port Groups

EtherChannel port groups treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between devices or between devices and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port, group multiple access ports into one logical access port, group multiple tunnel ports into one logical tunnel port, or group multiple routed ports into one logical routed port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the DTP, the Cisco Discovery Protocol (CDP), and the Port Aggregation Protocol (PAgP), which operate only on physical ports.

When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 3 interfaces, you manually create the logical interface by using the **interface port-channel** global configuration command. Then you manually assign an interface to the EtherChannel by using the **channel-group** interface configuration command. For Layer 2 interfaces, use the **channel-group** interface configuration command to dynamically create the port-channel logical interface. This command binds the physical and logical ports together.

## Using the Switch USB Ports

The device has two USB ports on the front panel — a USB mini-Type B console port and a USB 2.0 host port.

### USB Mini-Type B Console Port

The device has the following console ports:

- USB mini-Type B console connection
- RJ-45 console port

Console output appears on devices connected to both ports, but console input is active on only one port at a time. By default, the USB connector takes precedence over the RJ-45 connector.

**Note**

Windows PCs require a driver for the USB port. See the hardware installation guide for driver installation instructions.

Use the supplied USB Type A-to-USB mini-Type B cable to connect a PC or other device to the device. The connected device must include a terminal emulation application. When the device detects a valid USB connection to a powered-on device that supports host functionality (such as a PC), input from the RJ-45 console is immediately disabled, and input from the USB console is enabled. Removing the USB connection immediately reenables input from the RJ-45 console connection. An LED on the device shows which console connection is in use.

### Console Port Change Logs

At software startup, a log shows whether the USB or the RJ-45 console is active. Every device always first displays the RJ-45 media type.

In the sample output, Device 1 has a connected USB console cable. Because the bootloader did not change to the USB console, the first log from Device 1 shows the RJ-45 console. A short time later, the console changes and the USB console log appears. Device 2 and Device 3 have connected RJ-45 console cables.

```
switch-1

*Mar  1 00:01:00.171: %USB_CONSOLE-6-MEDIA_RJ45: Console media-type is RJ45.
*Mar  1 00:01:00.431: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

When the USB cable is removed or the PC de-activates the USB connection, the hardware automatically changes to the RJ-45 console interface:

You can configure the console type to always be RJ-45, and you can configure an inactivity timeout for the USB connector.

### USB 2.0 Host Port

The USB 2.0 host port provides access to external USB flash devices, also known as thumb drives or USB keys. The port supports Cisco USB flash drives with capacities from 128 MB to 8 GB (USB devices with port densities of 128 MB, 256 MB, 1 GB, 4 GB, 8 GB are supported). You can use standard Cisco IOS command-line interface (CLI) commands to read, write, erase, and copy to or from the flash device. You can also configure the device to boot from the USB flash drive.

## Interface Connections

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device. With a standard Layer 2 device, ports in different VLANs have to exchange information through a router. By using the device with routing enabled, when you configure both VLAN 20 and VLAN 30 with an SVI to which an IP address is assigned, packets can be sent from Host A to Host B directly through the device with no need for an external router.

**Figure 1: Connecting VLANs with the Switch**

When the Network Advantage license is used on the device or the active device, the device uses the routing method to forward traffic between interfaces. If the Network Essentials license is used on the device or the active device, only basic routing (static routing and RIP) is supported. Whenever possible, to maintain high performance, forwarding is done by the device hardware. However, only IPv4 packets with Ethernet II encapsulation are routed in hardware.

The routing function can be enabled on all SVIs and routed ports. The device routes only IP traffic. When IP routing protocol parameters and address configuration are added to an SVI or routed port, any IP traffic received from these ports is routed.

## Interface Configuration Mode

The device supports these interface types:

- Physical ports—device ports and routed ports
- VLANs—switch virtual interfaces
- Port channels—EtherChannel interfaces

You can also configure a range of interfaces.

To configure a physical interface (port), specify the interface type, module number, and device port number, and enter interface configuration mode.

- Type—FortyGigabitEthernet (fortygigabitethernet or fo) fiber ports.
- Switch number—The number that identifies the given device. The number range is assigned the first time the device initializes.
- Module number—The module or slot number on the device: switch (downlink) ports are 0, and uplink ports are 1.

- Port number—The interface number on the device. The 10/100/1000 port numbers always begin at 1, starting with the far left port when facing the front of the device, for example, fortygigabitethernet1/0/1 or fortygigabitethernet1/0/8.

On a device with SFP uplink ports, the module number is 1 and the port numbers restart. For example, if the device has 24 10/100/1000 ports, the SFP module ports are gigabitethernet1/1/1 through gigabitethernet1/1/4 or tengigabitethernet1/1/1 through tengigabitethernet1/1/4.

You can identify physical interfaces by physically checking the interface location on the device. You can also use the **show** privileged EXEC commands to display information about a specific interface or all the interfaces on the switch. The remainder of this chapter primarily provides physical interface configuration procedures.

These are examples of how to identify interfaces on standalone devices:

- To configure 40-G port 4 on a standalone device, enter this command:

```
Device(config)# interface fortygigabitethernet1/0/4
```

## Default Ethernet Interface Configuration

To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the **switchport** interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

### Note

Starting in Cisco IOS XE Gibraltar 16.11.1, the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches bootup with interfaces in the default Layer 2 state. In all earlier releases, the default is Layer 3. (For all other models of the Cisco Catalyst 9500 Series Switches, the default interface continues to be Layer 2)

This table shows the Ethernet interface default configuration, including some features that apply only to Layer 2 interfaces.

**Table 1: Default Layer 2 Ethernet Interface Configuration**

Feature	Default Setting
Operating mode	Layer 2 or switching mode ( <b>switchport</b> command) for C9500-12Q-E, C9500-12Q-A, C9500-24Q-E, C9500-24Q-A, C9500-40X-E, and C9500-40X-A models of the Cisco Catalyst 9500 Series Switches.  Layer 3 or routed port for C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches
Allowed VLAN range	VLANs 1 to 4094.
Default VLAN (for access ports)	VLAN 1 (Layer 2 interfaces only).

Feature	Default Setting
Native VLAN (for IEEE 802.1Q trunks)	VLAN 1 (Layer 2 interfaces only).
VLAN trunking	Switchport mode dynamic auto (supports DTP) (Layer 2 interfaces only).
Port enable state	All ports are enabled.
Port description	None defined.
Speed	Autonegotiate. (Not supported on the 40-Gigabit interfaces.) The C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches do not support autonegotiate. Their speed is determined by the type of transceiver module plugged in.
Duplex mode	Autonegotiate. (Not supported on the 40-Gigabit interfaces.) The C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches support full duplex mode.
Flow control	Flow control is set to <b>receive: off</b> . It is always off for sent packets.
EtherChannel (PAgP)	Disabled on all Ethernet ports.
Port blocking (unknown multicast and unknown unicast traffic)	Disabled (not blocked) (Layer 2 interfaces only).
Broadcast, multicast, and unicast storm control	Disabled.
Protected port	Disabled (Layer 2 interfaces only).
Port security	Disabled (Layer 2 interfaces only).
Port Fast	Disabled.
Auto-MDIX	Enabled.

## Interface Speed and Duplex Mode

The device supports only 40 Gigabit Ethernet QSPF interfaces where speed and duplex mode are not applicable.

## IEEE 802.3x Flow Control

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon

receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

**Note** The switch ports can receive, but not send, pause frames.

You use the **flowcontrol** interface configuration command to set the interface's ability to **receive** pause frames to **on**, **off**, or **desired**. Prior to Cisco IOS XE Everest 16.6.4 release, the default state is **off**. Starting Cisco IOS XE Everest 16.6.4 release, the default state is **on**.

When set to **desired**, an interface can operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.

These rules apply to flow control settings on the device:

- **receive on** (or **desired**): The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.
- **receive off**: Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

**Note** For details on the command settings and the resulting flow control resolution on local and remote ports, see the **flowcontrol** interface configuration command in the command reference for this release.

## Layer 3 Interfaces

The device supports these types of Layer 3 interfaces:

- **SVIs**: You should configure SVIs for any VLANs for which you want to route traffic. SVIs are created when you enter a VLAN ID following the **interface vlan** global configuration command. To delete an SVI, use the **no interface vlan** global configuration command. You cannot delete interface VLAN 1.

**Note** When you create an SVI, it does not become active until it is associated with a physical port.

When configuring SVIs, you can use the **switchport autostate exclude** command on a port to exclude that port from being included in determining SVI line-state. To disable autostate on the SVI, use the **no autostate** command on the SVI.

- **Routed ports**: Routed ports are physical ports configured to be in Layer 3 mode by using the **no switchport** interface configuration command.
- **Layer 3 EtherChannel ports**: EtherChannel interfaces made up of routed ports.

A Layer 3 device can have an IP address assigned to each routed port and SVI.

There is no defined limit to the number of SVIs and routed ports that can be configured in a device or in a device stack. However, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might have an impact on CPU usage because of hardware limitations. If

the device is using its maximum hardware resources, attempts to create a routed port or SVI have these results:

- If you try to create a new routed port, the device generates a message that there are not enough resources to convert the interface to a routed port, and the interface remains as a switchport.
- If you try to create an extended-range VLAN, an error message is generated, and the extended-range VLAN is rejected.
- If the device is notified by VLAN Trunking Protocol (VTP) of a new VLAN, it sends a message that there are not enough hardware resources available and shuts down the VLAN. The output of the **show vlan** user EXEC command shows the VLAN in a suspended state.
- If the device attempts to boot up with a configuration that has more VLANs and routed ports than hardware can support, the VLANs are created, but the routed ports are shut down, and the device sends a message that this was due to insufficient hardware resources.

#### Note

All Layer 3 interfaces require an IP address to route traffic. This procedure shows how to configure an interface as a Layer 3 interface and how to assign an IP address to an interface:

If the physical port is in Layer 2 mode (the default), you must enter the **no switchport** interface configuration command to put the interface into Layer 3 mode. Entering a **no switchport** command disables and then re-enables the interface, which might generate messages on the device to which the interface is connected. Furthermore, when you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration

# How to Configure Interface Characteristics

## Configuring Interfaces

These general instructions apply to all interface configuration processes.

### Procedure

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
	<b>Example:</b>  Device> <b>enable</b>	
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b>  Device# <b>configure terminal</b>	

	Command or Action	Purpose
<b>Step 3</b>	<b>interface</b> <b>Example:</b> <pre>Device(config)# interface fortygigabitethernet1/0/1 Device(config-if)#</pre>	Identifies the interface type, and the number of the connector.  <b>Note</b> You do not need to add a space between the interface type and the interface number. For example, in the preceding line, you can specify either <b>fortygigabitethernet 1/0/1</b> , or <b>fortygigabitethernet1/0/1</b> .
<b>Step 4</b>	Follow each <b>interface</b> command with the interface configuration commands that the interface requires.	Defines the protocols and applications that will run on the interface. The commands are collected and applied to the interface when you enter another interface command or enter <b>end</b> to return to privileged EXEC mode.
<b>Step 5</b>	<b>interface range</b> or <b>interface range macro</b>	(Optional) Configures a range of interfaces.  <b>Note</b> Interfaces configured in a range must be the same type and must be configured with the same feature options.
<b>Step 6</b>	<b>show interfaces</b>	Displays a list of all interfaces on or configured for the switch. A report is provided for each interface that the device supports or for the specified interface.

## Adding a Description for an Interface

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <b>interface</b> <b>fortygigabitethernet1/0/2</b>	Specifies the interface for which you are adding a description, and enter interface configuration mode.
<b>Step 4</b>	<b>description</b> <i>string</i> <b>Example:</b> Device(config-if)# <b>description</b> Connects to Marketing	Adds a description for an interface.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show interfaces</b> <i>interface-id</i> <b>description</b>	Verifies your entry.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring a Range of Interfaces

To configure multiple interfaces with the same configuration parameters, use the **interface range** global configuration command. When you enter the interface-range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<p><b>interface range</b> {<i>port-range</i>   <b>macro</b> <i>macro_name</i>}</p> <p><b>Example:</b></p> <pre>Device(config)# <b>interface range</b> macro</pre>	<p>Specifies the range of interfaces (VLANs or physical ports) to be configured, and enter interface-range configuration mode.</p> <ul style="list-style-type: none"> <li>You can use the <b>interface range</b> command to configure up to five port ranges or a previously defined macro.</li> <li>The <b>macro</b> variable is explained in the section on <i>Configuring and Using Interface Range Macros</i>.</li> <li>In a comma-separated <i>port-range</i>, you must enter the interface type for each entry and enter spaces before and after the comma.</li> <li>In a hyphen-separated <i>port-range</i>, you do not need to re-enter the interface type, but you must enter a space before the hyphen.</li> </ul> <p><b>Note</b> Use the normal configuration commands to apply the configuration parameters to all interfaces in the range. Each command is executed as it is entered.</p>
<b>Step 4</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# <b>end</b></pre>	Returns to privileged EXEC mode.
<b>Step 5</b>	<p><b>show interfaces</b> [<i>interface-id</i>]</p> <p><b>Example:</b></p> <pre>Device# <b>show interfaces</b></pre>	Verifies the configuration of the interfaces in the range.
<b>Step 6</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# <b>copy running-config</b> <b>startup-config</b></pre>	(Optional) Saves your entries in the configuration file.

## Configuring and Using Interface Range Macros

You can create an interface range macro to automatically select a range of interfaces for configuration. Before you can use the **macro** keyword in the **interface range macro** global configuration command string, you must use the **define interface-range** global configuration command to define the macro.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>define interface-range</b> <i>macro_name</i> <i>interface-range</i> <b>Example:</b> <pre>Device(config)# define interface-range enet_list fortygigabitethernet1/0/1 - 5</pre>	Defines the interface-range macro, and saves it in NVRAM. <ul style="list-style-type: none"> <li>• The <i>macro_name</i> is a 32-character maximum character string.</li> <li>• A macro can contain up to five comma-separated interface ranges.</li> <li>• Each <i>interface-range</i> must consist of the same port type.</li> </ul> <p><b>Note</b> Before you can use the <b>macro</b> keyword in the <b>interface range macro</b> global configuration command string, you must use the <b>define interface-range</b> global configuration command to define the macro.</p>
<b>Step 4</b>	<b>interface range macro</b> <i>macro_name</i> <b>Example:</b> <pre>Device(config)# interface range macro enet_list</pre>	Selects the interface range to be configured using the values saved in the interface-range macro called <i>macro_name</i> . You can now use the normal configuration commands to apply the configuration to all interfaces in the defined macro.
<b>Step 5</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# <b>end</b>	
<b>Step 6</b>	<b>show running-config   include define</b> <b>Example:</b> Device# <b>show running-config   include define</b>	Shows the defined interface range macro configuration.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Ethernet Interfaces

### Configuring IEEE 802.3x Flow Control

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface fortygigabitethernet1/0/1</b>	Specifies the physical interface to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>flowcontrol {receive} {on   off   desired}</b> <b>Example:</b> Device(config-if)# <b>flowcontrol receive on</b>	Configures the flow control mode for the port.
<b>Step 4</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device (config-if) # <b>end</b>	
<b>Step 5</b>	<b>show interfaces</b> <i>interface-id</i> <b>Example:</b> Device# <b>show interfaces</b> <b>fortygigabitethernet1/0/1</b>	Verifies the interface flow control settings.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Layer 3 Interfaces

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface</b> { <b>fortygigabitethernet</b> <i>interface-id</i> }   { <b>vlan</b> <i>vlan-id</i> }   { <b>port-channel</b> <i>port-channel-number</i> } <b>Example:</b> Device (config) # <b>interface</b> <b>fortygigabitethernet1/0/2</b>	Specifies the interface to be configured as a Layer 3 interface, and enter interface configuration mode.
<b>Step 4</b>	<b>no switchport</b> <b>Example:</b>	For physical ports only, enters Layer 3 mode.

	Command or Action	Purpose
	<code>Device(config-if) # no switchport</code>	
<b>Step 5</b>	<b>ip address <i>ip_address subnet_mask</i></b> <b>Example:</b> <code>Device(config-if) # ip address 192.20.135.21 255.255.255.0</code>	Configures the IP address and IP subnet.
<b>Step 6</b>	<b>no shutdown</b> <b>Example:</b> <code>Device(config-if) # no shutdown</code>	Enables the interface.
<b>Step 7</b>	<b>end</b> <b>Example:</b> <code>Device(config-if) # end</code>	Returns to privileged EXEC mode.
<b>Step 8</b>	<b>show interfaces [<i>interface-id</i>]</b>	Verifies the configuration.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> <code>Device# copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring a Logical Layer 3 GRE Tunnel Interface

### Before you begin

Generic Routing Encapsulation (GRE) is a tunneling protocol used to encapsulate network layer protocols inside virtual point-to-point links. A GRE tunnel only provides encapsulation and not encryption.

**Note**

- GRE tunnels are supported on the hardware on Cisco Catalyst 9000 switches. When GRE is configured without tunnel options, packets are hardware-switched. When GRE is configured with tunnel options (such as key, checksum, and so on), packets are switched in the software. A maximum of 1000 GRE tunnels are supported.
- Other features such as Access Control Lists (ACL) and Quality of Service (QoS) are not supported for the GRE tunnels.
- The **tunnel path-mtu-discovery** command is not supported for GRE tunnels. To avoid fragmentation, you can set the maximum transmission unit (MTU) of both ends of the GRE tunnel to the lowest value by using the **ip mtu 256** command.

To configure a GRE tunnel, perform this task:

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>interface tunnel <i>number</i></b> <b>Example:</b> <pre>Device(config)#interface tunnel 2</pre>	Enables tunneling on the interface.
<b>Step 4</b>	<b>ip address <i>ip_address</i><i>subnet_mask</i></b> <b>Example:</b> <pre>Device(config)#ip address 100.1.1.1 255.255.255.0</pre>	Configures the IP address and IP subnet.
<b>Step 5</b>	<b>tunnel source {<i>ip_address</i>   <i>type_number</i>}</b> <b>Example:</b> <pre>Device(config)#tunnel source 10.10.10.1</pre>	Configures the tunnel source.
<b>Step 6</b>	<b>tunnel destination {<i>host_name</i>   <i>ip_address</i>}</b> <b>Example:</b> <pre>Device(config)#tunnel destination 10.10.10.2</pre>	Configures the tunnel destination.

	Command or Action	Purpose
<b>Step 7</b>	<b>tunnel mode gre ip</b>  <b>Example:</b> Device(config)# <b>tunnel mode gre ip</b>	Configures the tunnel mode.
<b>Step 8</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Exits configuration mode.

## Configuring SVI Autostate Exclude

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b>  <b>Example:</b> Device(config)# <b>interface</b> <b>fortygigabitethernet1/0/2</b>	Specifies a Layer 2 interface (physical port or port channel), and enter interface configuration mode.
<b>Step 4</b>	<b>switchport autostate exclude</b>  <b>Example:</b> Device(config-if)# <b>switchport autostate</b> <b>exclude</b>	Excludes the access or trunk port when defining the status of an SVI line state (up or down)
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running config interface <i>interface-id</i></b>	(Optional) Shows the running configuration.

	Command or Action	Purpose
		Verifies the configuration.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Shutting Down and Restarting the Interface

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>interface {vlan <i>vlan-id</i>}   {  fortygigabitethernet <i>interface-id</i>}    {port-channel <i>port-channel-number</i>}</b> <b>Example:</b> <pre>Device(config)# interface fortygigabitethernet1/0/2</pre>	Selects the interface to be configured.
<b>Step 4</b>	<b>shutdown</b> <b>Example:</b> <pre>Device(config-if)# shutdown</pre>	Shuts down an interface.
<b>Step 5</b>	<b>no shutdown</b> <b>Example:</b>	Restarts an interface.

	Command or Action	Purpose
	<code>Device(config-if) # no shutdown</code>	
<b>Step 6</b>	<b>end</b> <b>Example:</b> <code>Device(config-if) # end</code>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b> <code>Device# show running-config</code>	Verifies your entries.

## Configuring the Console Media Type

Follow these steps to set the console media type to RJ-45. If you configure the console as RJ-45, USB console operation is disabled, and input comes only through the RJ-45 connector.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <code>Device&gt; enable</code>	Enables privileged EXEC mode. Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <code>Device# configure terminal</code>	Enters global configuration mode.
<b>Step 3</b>	<b>line console 0</b> <b>Example:</b> <code>Device(config) # line console 0</code>	Configures the console and enters line configuration mode.
<b>Step 4</b>	<b>media-type rj45 switch <i>switch_number</i></b> <b>Example:</b> <code>Device(config-line) # media-type rj45 switch 1</code>	Configures the console media type to be only RJ-45 port. If you do not enter this command and both types are connected, the USB port is used by default.

	Command or Action	Purpose
<b>Step 5</b>	<b>end</b>  <b>Example:</b>  Device (config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring USB Inactivity Timeout

The configurable inactivity timeout reactivates the RJ-45 console port if the USB console port is activated but no input activity occurs on it for a specified time period. When the USB console port is deactivated due to a timeout, you can restore its operation by disconnecting and reconnecting the USB cable.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode.  Enter your password, if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>line console 0</b>  <b>Example:</b>  Device (config)# <b>line console 0</b>	Configures the console and enters line configuration mode.
<b>Step 4</b>	<b>usb-inactivity-timeout switch <i>switch_number</i> <i>timeout-minutes</i></b>  <b>Example:</b>  Device (config-line)# <b>usb-inactivity-timeout switch 1 30</b>	Specifies an inactivity timeout for the console port. The range is 1 to 240 minutes. The default is to have no timeout configured.

	Command or Action	Purpose
<b>Step 5</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Monitoring Interface Characteristics

### Monitoring Interface Status

Commands entered at the privileged EXEC prompt display information about the interface, including the versions of the software and the hardware, the configuration, and statistics about the interfaces.

**Table 2: Show Commands for Interfaces**

Command	Purpose
<b>show interfaces</b> <i>interface-id</i> <b>status</b> [err-disabled]	Displays interface status or a list of interfaces in the error-disabled state.
<b>show interfaces</b> [ <i>interface-id</i> ] <b>switchport</b>	Displays administrative and operational status of switching (nonrouting) ports. You can use this command to find out if a port is in routing or in switching mode.
<b>show interfaces</b> [ <i>interface-id</i> ] <b>description</b>	Displays the description configured on an interface or all interfaces and the interface status.
<b>show ip interface</b> [ <i>interface-id</i> ]	Displays the usability status of all interfaces configured for IP routing or the specified interface.
<b>show interface</b> [ <i>interface-id</i> ] <b>stats</b>	Displays the input and output packets by the switching path for the interface.
<b>show interfaces</b> <i>interface-id</i>	(Optional) Displays speed and duplex on the interface.
<b>show interfaces transceiver dom-supported-list</b>	(Optional) Displays Digital Optical Monitoring (DOM) status on the connect SFP modules.
<b>show interfaces transceiver properties</b>	(Optional) Displays temperature, voltage, or amount of current on the interface.
<b>show interfaces</b> [ <i>interface-id</i> ] [ { <b>transceiver properties</b>   <b>detail</b> } ] <i>module number</i>	Displays physical and operational status about an SFP module.
<b>show running-config interface</b> [ <i>interface-id</i> ]	Displays the running configuration in RAM for the interface.
<b>show version</b>	Displays the hardware configuration, software version, the names and sources of configuration files, and the boot images.

Command	Purpose
<b>show controllers ethernet-controller <i>interface-id</i> phy</b>	Displays the operational state of the auto-MDIX feature on the interface.

## Clearing and Resetting Interfaces and Counters

Table 3: Clear Commands for Interfaces

Command	Purpose
<b>clear counters</b> [ <i>interface-id</i> ]	Clears interface counters.
<b>clear interface</b> <i>interface-id</i>	Resets the hardware logic on an interface.
<b>clear line</b> [ <i>number</i>   <b>console 0</b>   <b>vty number</b> ]	Resets the hardware logic on an asynchronous serial line.

### Note

The **clear counters** privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the **show interface** privileged EXEC command.

## Configuration Examples for Interface Characteristics

### Adding a Description to an Interface: Example

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Device(config)# interface fortygigabitethernet1/0/2
Device(config-if)# description Connects to Marketing
Device(config-if)# end
Device# show interfaces fortygigabitethernet1/0/2 description
Interface Status      Protocol Description
Fa1/0/1    down        down      Connects to Marketing
```

### Configuring a Range of Interfaces: Examples

```
Device# configure terminal
Device(config)# interface range fortyGigabitEthernet 1/0/1-2

Device(config-if-range)# speed nonegotiate
```

If you enter multiple configuration commands while you are in interface-range mode, each command is executed as it is entered. The commands are not batched and executed after you exit interface-range mode. If you exit interface-range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface-range configuration mode.

## Configuring and Using Interface Range Macros: Examples

This example shows how to define an interface-range named *enet\_list* to include ports 1 and 2 on switch 1 and to verify the macro configuration:

```
Device# configure terminal
Device(config)# define interface-range fortyGigabitEthernet 1/0/1 - 2
Device(config)# end
Device# show running-config | include define
define interface-range enet_list FortyGigabitEthernet1/0/1
```

This example shows how to enter interface-range configuration mode for the interface-range macro *enet\_list*:

```
Device# configure terminal
Device(config)# interface range macro enet_list
Device(config-if-range)#
```

This example shows how to delete the interface-range macro *enet\_list* and to verify that it was deleted.

```
Device# configure terminal
Device(config)# no define interface-range enet_list
Device(config)# end
Device# show run | include define
Device#
```

## Configuring Layer 3 Interfaces: Example

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface fortygigabitethernet1/0/2
Device(config-if)# no switchport
Device(config-if)# ip address 192.20.135.21 255.255.255.0
Device(config-if)# no shutdown
```

## Example: Configuring the Console Media Type

The following example shows how to disable the USB console media type and enable the RJ-45 console media type:

```
Device# configure terminal
Device(config)# line console 0
Device(config-line)# media-type rj45 switch 1
```

The following example shows how to reverse the previous configuration and immediately activate any USB console that is connected:

```
Device# configure terminal
Device(config)# line console 0
```

```
Device(config-line)# no media-type rj45 switch 1
```

## Example: Configuring the USB Inactivity Timeout

The following example shows how to configure the inactivity timeout to 30 minutes:

```
Device# configure terminal
Device(config)# line console 0
Device(config-line)# usb-inactivity-timeout switch 1 30
```

The following example shows how to disable the configuration:

```
Device# configure terminal
Device(config)# line console 0
Device(config-line)# no usb-inactivity-timeout switch 1
```

If there is no (input) activity on a USB console port for the configured number of minutes, the inactivity timeout setting applies to the RJ-45 port, and a log shows this occurrence:

```
*Mar  1 00:47:25.625: %USB_CONSOLE-6-INACTIVITY_DISABLE: Console media-type USB disabled
due to inactivity, media-type reverted to RJ45.
```

At this point, the only way to reactivate the USB console port is to disconnect and reconnect the cable.

When the USB cable on the switch has been disconnected and reconnected, a log similar to this appears:

```
*Mar  1 00:48:28.640: %USB_CONSOLE-6-MEDIA_USB: Console media-type is USB.
```

## Feature History for Configuring Interface Characteristics

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

<b>Release</b>	<b>Feature</b>	<b>Feature Information</b>
Cisco IOS XE Everest 16.5.1a	Interface Characteristics	<p>Interface Characteristics includes interface types, connections, configuration modes, speed, and other aspects of configuring a physical interface on a device.</p> <p>Support for this feature was introduced only on the C9500-12Q, C9500-24Q, C9500-16X and C9500-40X models of the Cisco Catalyst 9500 Series Switches.</p>

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.4	IEEE 802.3x Flow Control	The default value for <b>flowcontrol</b> interface configuration command was modified to <b>on</b> on the C9500-12Q, C9500-24Q, C9500-16X and C9500-40X models of the Cisco Catalyst 9500 Series Switches
Cisco IOS XE Fuji 16.8.1a	Interface Characteristics	Interface Characteristics includes interface types, connections, configuration modes, speed, and other aspects of configuring a physical interface on a device.  Support for this feature was introduced only on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.
	Breakout interfaces	Support for breakout interfaces was introduced on the following: <ul style="list-style-type: none"> <li>• Only the first four ports of C9500-12Q, C9500-24Q, C9500-16X and C9500-40X models.</li> <li>• All the ports of the C9500-NM-2Q network module.</li> </ul>
Cisco IOS XE Fuji 16.9.1	Breakout interfaces	On Cisco Catalyst 9500 Series Switches, support for breakout configuration was introduced only on the first twelve ports of C9500-24Q, C9500-16X, C9500-40X models.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.10.1	Breakout interfaces	On Cisco Catalyst 9500 Series Switches, support for breakout configuration was introduced on the following: <ul style="list-style-type: none"> <li>• The first twenty-four ports of C9500-40X, and all ports of C9500-24Q and C9500-16X models.</li> <li>• C9500-32C model</li> </ul>
	Password Authentication on USB 3.0 SSD	Support for configuring password on a USB 3.0 SSD was enabled on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Gibraltar 16.11.1	Breakout configuration with Cisco StackWise Virtual	Support for breakout configuration with Cisco StackWise Virtual was enabled on all the models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Bengaluru 17.5.1	Disabling USB interfaces	Support to disable all USB ports on a standalone or stacked device was introduced.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

## CHAPTER 2

# Configuring Ethernet Management Port

- [Prerequisites for Ethernet Management Ports, on page 31](#)
- [Information About the Ethernet Management Port, on page 31](#)
- [How to Configure the Ethernet Management Port, on page 33](#)
- [Example for Configuring IP Address on Ethernet Management Interface, on page 34](#)
- [Additional References for Ethernet Management Ports, on page 34](#)
- [Feature History for Ethernet Management Port, on page 35](#)

## Prerequisites for Ethernet Management Ports

When connecting a PC to the Ethernet management port, you must first assign an IP address.

## Information About the Ethernet Management Port

The Ethernet management port, also referred to as the *Gi0/0* or *GigabitEthernet0/0* port, is a VRF (VPN routing/forwarding) interface to which you can connect a PC. You can use the Ethernet management port instead of the device console port for network management.

## Ethernet Management Port Direct Connection to a Device

**Figure 2: Connecting a Switch to a PC**

This figure displays how to connect the Ethernet management port to the PC for a device or a standalone

## Ethernet Management Port and Routing

By default, the Ethernet management port is enabled. The device cannot route packets from the Ethernet management port to a network port, and the reverse. Even though the Ethernet management port does not support routing, you may need to enable routing protocols on the port.

**Figure 3: Network Example with Routing Protocols Enabled**

Enable routing protocols on the Ethernet management port when the PC is multiple hops away from the device and the packets must pass through multiple Layer 3 devices to reach the PC.

In the above figure, if the Ethernet management port and the network ports are associated with the same routing process, the routes are propagated as follows:

- The routes from the Ethernet management port are propagated through the network ports to the network.
- The routes from the network ports are propagated through the Ethernet management port to the network.

Because routing is not supported between the Ethernet management port and the network ports, traffic between these ports cannot be sent or received. If this happens, data packet loops occur between the ports, which disrupt the device and network operation. To prevent the loops, configure route filters to avoid routes between the Ethernet management port and the network ports.

## Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express Setup (only in switch stacks)
- Network Assistant
- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SNMP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
  - Speed—10 Mb/s, 100 Mb/s, 1000 Mb/s, and autonegotiation
  - Duplex mode—Full, half, and autonegotiation

- Loopback detection
- Cisco Discovery Protocol (CDP)
- DHCP relay agent
- IPv4 and IPv6 access control lists (ACLs)
- Routing protocols

**Caution**

Before enabling a feature on the Ethernet management port, make sure that the feature is supported. If you try to configure an unsupported feature on the Ethernet Management port, the feature might not work properly, and the device might fail.

# How to Configure the Ethernet Management Port

## Disabling and Enabling the Ethernet Management Port

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface gigabitethernet0/0</b>  <b>Example:</b> Device(config)# <b>interface gigabitethernet0/0</b>	Specifies the Ethernet management port in the CLI.
<b>Step 3</b>	<b>shutdown</b>  <b>Example:</b> Device(config-if)# <b>shutdown</b>	Disables the Ethernet management port.
<b>Step 4</b>	<b>no shutdown</b>  <b>Example:</b> Device(config-if)# <b>no shutdown</b>	Enables the Ethernet management port.
<b>Step 5</b>	<b>exit</b>  <b>Example:</b> Device(config-if)# <b>exit</b>	Exits interface configuration mode.
<b>Step 6</b>	<b>show interfaces gigabitethernet0/0</b>	Displays the link status.

	Command or Action	Purpose
	<b>Example:</b> Device# <b>show interfaces</b> <b>gigabitethernet0/0</b>	To find out the link status to the PC, you can monitor the LED for the Ethernet management port. The LED is green (on) when the link is active, and the LED is off when the link is down. The LED is amber when there is a POST failure.

### What to do next

Proceed to manage or configure your switch using the Ethernet management port. See the Network Management section.

## Example for Configuring IP Address on Ethernet Management Interface

This example shows how to configure IP address on the management interface.

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# vrf forwarding Mgmt-vrf
Switch(config-if)# ip address 192.168.247.10 255.255.0.0
Switch(config-if)# end
```

```
Switch# show running-config interface Gi0/0
Building configuration...
```

```
Current configuration : 118 bytes
!
interface GigabitEthernet0/0
vrf forwarding Mgmt-vrf
ip address 192.168.247.10 255.255.0.0
negotiation auto
end
```

## Restrictions for LLDP

- If the interface is configured as a tunnel port, LLDP is automatically disabled.
- If you first configure a network-policy profile on an interface, you cannot apply the **switchport voice vlan** command on the interface. If the **switchport voice vlan *vlan-id*** is already configured on an interface, you can apply a network-policy profile on the interface. This way the interface has the voice or voice-signaling VLAN network-policy profile applied on the interface.
- You cannot configure static secure MAC addresses on an interface that has a network-policy profile.
- When Cisco Discovery Protocol and LLDP are both in use within the same switch, it is necessary to disable LLDP on interfaces where Cisco Discovery Protocol is in use for power negotiation. LLDP can be disabled at interface level with the commands **no lldp tlv-select power-management** or **no lldp transmit / no lldp receive**.

## Information About LLDP, LLDP-MED, and Wired Location Service

### LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, switches, and controllers). CDP allows

network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the device supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

## LLDP Supported TLVs

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. This protocol can advertise details such as configuration information, device capabilities, and device identity.

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV (IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 organizationally specific TLVs)

## LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, inventory management and location information. By default, all LLDP-MED TLVs are enabled.

## LLDP-MED Supported TLVs

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV

Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and has enabled.

- Network policy TLV

Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect to any device, obtain its VLAN number, and then start communicating with the call control.

By defining a network-policy profile TLV, you can create a profile for voice and voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are then maintained centrally on the switch and propagated to the phone.

- Power management TLV

Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows devices and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

LLDP-MED also supports an extended power TLV to advertise fine-grained power requirements, end-point power priority, and end-point and network connectivity-device power status. LLDP is enabled and power is applied to a port, the power TLV determines the actual power requirement of the endpoint device so that the system power budget can be adjusted accordingly. The device processes the requests and either grants or denies power based on the current power budget. If the request is granted, the switch updates the power budget. If the request is denied, the device turns off power to the port, generates a syslog message, and updates the power budget. If LLDP-MED is disabled or if the endpoint does not support the LLDP-MED power TLV, the initial allocation value is used throughout the duration of the connection.

You can change power settings by entering the **power inline** {**auto** [**max** *max-wattage*] | **never** | **static** [**max** *max-wattage*] } interface configuration command. By default the PoE interface is in **auto** mode; If no value is specified, the maximum is allowed (30 W).

- Inventory management TLV

Allows an endpoint to send detailed inventory information about itself to the device, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

- Location TLV

Provides location information from the device to the endpoint device. The location TLV can send this information:

- Civic location information

Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

- ELIN location information

Provides the location information of a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

- Geographic location information

Provides the geographical details of a switch location such as latitude, longitude, and altitude of a switch.

- custom location

Provides customized name and value of a switch location.

## Wired Location Service

The device uses the location service feature to send location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired device or controller. The device notifies the MSE of device link up and link down events through the Network Mobility Services Protocol (NMSP) location and attachment notifications.

The MSE starts the NMSP connection to the device, which opens a server port. When the MSE connects to the device there are a set of message exchanges to establish version compatibility and service exchange information followed by location information synchronization. After connection, the device periodically sends location and attachment notifications to the MSE. Any link up or link down events detected during an interval are aggregated and sent at the end of the interval.

When the device determines the presence or absence of a device on a link-up or link-down event, it obtains the client-specific information such as the MAC address, IP address, and username. If the client is LLDP-MED- or CDP-capable, the device obtains the serial number and UDI through the LLDP-MED location TLV or CDP.

Depending on the device capabilities, the device obtains this client information at link up:

- Slot and port specified in port connection
- MAC address specified in the client MAC address
- IP address specified in port connection
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *new*
- Serial number, UDI
- Model number
- Time in seconds since the device detected the association

Depending on the device capabilities, the device obtains this client information at link down:

- Slot and port that was disconnected
- MAC address
- IP address
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *delete*
- Serial number, UDI
- Time in seconds since the device detected the disassociation

When the device shuts down, it sends an attachment notification with the state *delete* and the IP address before closing the NMSP connection to the MSE. The MSE interprets this notification as disassociation for all the wired clients associated with the device.

If you change a location address on the device, the device sends an NMSP location notification message that identifies the affected ports and the changed address information.

## Default LLDP Configuration

*Table 4: Default LLDP Configuration*

Feature	Default Setting
LLDP global state	Disabled
LLDP holdtime (before discarding)	120 seconds
LLDP timer (packet update frequency)	30 seconds
LLDP reinitialization delay	2 seconds
LLDP tlv-select	Disabled to send and receive all TLVs
LLDP interface state	Disabled
LLDP receive	Disabled
LLDP transmit	Disabled
LLDP med-tlv-select	Disabled to send all LLDP-MED TLVs. When LLDP is globally enabled, LLDP-MED-TLV is also enabled.

## How to Configure LLDP, LLDP-MED, and Wired Location Service

### Enabling LLDP

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>lldp run</b> <b>Example:</b> <pre>Device (config)# lldp run</pre>	Enables LLDP globally on the device .
<b>Step 4</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Device (config)# interface fortygigabitethernet2/0/1</pre>	Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.
<b>Step 5</b>	<b>lldp transmit</b> <b>Example:</b> <pre>Device(config-if)# lldp transmit</pre>	Enables the interface to send LLDP packets.
<b>Step 6</b>	<b>lldp receive</b> <b>Example:</b> <pre>Device(config-if)# lldp receive</pre>	Enables the interface to receive LLDP packets.
<b>Step 7</b>	<b>end</b> <b>Example:</b> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 8</b>	<b>show lldp</b> <b>Example:</b> <pre>Device# show lldp</pre>	Verifies the configuration.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP and LLDP-MED TLVs to send and receive.

**Note** Steps 3 through 6 are optional and can be performed in any order.

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>lldp holdtime <i>seconds</i></b> <b>Example:</b> Device(config)# <b>lldp holdtime 120</b>	(Optional) Specifies the amount of time a receiving device should hold the information from your device before discarding it.  The range is 0 to 65535 seconds; the default is 120 seconds.
<b>Step 4</b>	<b>lldp reinit <i>delay</i></b> <b>Example:</b> Device(config)# <b>lldp reinit 2</b>	(Optional) Specifies the delay time in seconds for LLDP to initialize on an interface.  The range is 2 to 5 seconds; the default is 2 seconds.
<b>Step 5</b>	<b>lldp timer <i>rate</i></b> <b>Example:</b> Device(config)# <b>lldp timer 30</b>	(Optional) Sets the sending frequency of LLDP updates in seconds.  The range is 5 to 65534 seconds; the default is 30 seconds.
<b>Step 6</b>	<b>lldp tlv-select</b> <b>Example:</b> Device(config)# <b>tlv-select</b>	(Optional) Specifies the LLDP TLVs to send or receive.
<b>Step 7</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device (config)# <b>interface fortygigabitethernet2/0/1</b>	Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.

	Command or Action	Purpose
<b>Step 8</b>	<b>lldp med-tlv-select</b> <b>Example:</b> <pre>Device (config-if)# lldp med-tlv-select inventory management</pre>	(Optional) Specifies the LLDP-MED TLVs to send or receive.
<b>Step 9</b>	<b>end</b> <b>Example:</b> <pre>Device (config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show lldp</b> <b>Example:</b> <pre>Device# show lldp</pre>	Verifies the configuration.
<b>Step 11</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring LLDP-MED TLVs

By default, the device only sends LLDP packets until it receives LLDP-MED packets from the end device. It then sends LLDP packets with MED TLVs, as well. When the LLDP-MED entry has been aged out, it again only sends LLDP packets.

By using the **lldp** interface configuration command, you can configure the interface not to send the TLVs listed in the following table.

**Table 5: LLDP-MED TLVs**

LLDP-MED TLV	Description
inventory-management	LLDP-MED inventory management TLV
location	LLDP-MED location TLV
network-policy	LLDP-MED network policy TLV
power-management	LLDP-MED power management TLV

Follow these steps to enable a TLV on an interface:

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Device (config)# interface fortygigabitethernet2/0/1</pre>	Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.
<b>Step 4</b>	<b>lldp med-tlv-select</b> <b>Example:</b> <pre>Device(config-if)# lldp med-tlv-select inventory management</pre>	Specifies the TLV to enable.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring Network-Policy TLV

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>	Enables privileged EXEC mode.

	Command or Action	Purpose
	<b>Example:</b>  Device> <b>enable</b>	<ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>network-policy profile <i>profile number</i></b>  <b>Example:</b>  Device (config)# <b>network-policy profile 1</b>	Specifies the network-policy profile number, and enter network-policy configuration mode. The range is 1 to 4294967295.
<b>Step 4</b>	<b>{voice   voice-signaling} vlan [vlan-id {cos cvalue   dscp dvalue}]   [[dot1p {cos cvalue   dscp dvalue}]   none   untagged]</b>  <b>Example:</b>  Device (config-network-policy)# <b>voice vlan 100 cos 4</b>	Configures the policy attributes: <ul style="list-style-type: none"> <li>• <b>voice</b>—Specifies the voice application type.</li> <li>• <b>voice-signaling</b>—Specifies the voice-signaling application type.</li> <li>• <b>vlan</b>—Specifies the native VLAN for voice traffic.</li> <li>• <b>vlan-id</b>—(Optional) Specifies the VLAN for voice traffic. The range is 1 to 4094.</li> <li>• <b>cos cvalue</b>—(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.</li> <li>• <b>dscp dvalue</b>—(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.</li> <li>• <b>dot1p</b>—(Optional) Configures the telephone to use IEEE 802.1p priority tagging and use VLAN 0 (the native VLAN).</li> <li>• <b>none</b>—(Optional) Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>untagged</b>—(Optional) Configures the telephone to send untagged voice traffic. This is the default for the telephone.</li> </ul>
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config)# <b>exit</b>	Returns to global configuration mode.
<b>Step 6</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device (config)# <b>interface</b> <b>fortygigabitethernet2/0/1</b>	Specifies the interface on which you are configuring a network-policy profile, and enter interface configuration mode.
<b>Step 7</b>	<b>network-policy</b> <i>profile number</i> <b>Example:</b> Device(config-if)# <b>network-policy 1</b>	Specifies the network-policy profile number.
<b>Step 8</b>	<b>lldp med-tlv-select network-policy</b> <b>Example:</b> Device(config-if)# <b>lldp med-tlv-select</b> <b>network-policy</b>	Specifies the network-policy TLV.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show network-policy profile</b> <b>Example:</b> Device# <b>show network-policy profile</b>	Verifies the configuration.
<b>Step 11</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config</b> <b>startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Location TLV and Wired Location Service

Beginning in privileged EXEC mode, follow these steps to configure location information for an endpoint and to apply it to an interface.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>  <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>location {admin-tag <i>string</i>   civic-location identifier {<i>id</i>   <i>host</i>}   elin-location <i>string</i> identifier <i>id</i>   custom-location identifier {<i>id</i>   <i>host</i>}   geo-location identifier {<i>id</i>   <i>host</i>}}</b>  <b>Example:</b>  <pre>Device(config)# location civic-location identifier 1 Device(config-civic)# number 3550 Device(config-civic)# primary-road-name "Cisco Way" Device(config-civic)# city "San Jose" Device(config-civic)# state CA Device(config-civic)# building 19 Device(config-civic)# room C6 Device(config-civic)# county "Santa Clara" Device(config-civic)# country US</pre>	Specifies the location information for an endpoint. <ul style="list-style-type: none"> <li>• <b>admin-tag</b>—Specifies an administrative tag or site information.</li> <li>• <b>civic-location</b>—Specifies civic location information.</li> <li>• <b>elin-location</b>—Specifies emergency location information (ELIN).</li> <li>• <b>custom-location</b>—Specifies custom location information.</li> <li>• <b>geo-location</b>—Specifies geo-spatial location information.</li> <li>• <b>identifier <i>id</i></b>—Specifies the ID for the civic, ELIN, custom, or geo location.</li> <li>• <b>host</b>—Specifies the host civic, custom, or geo location.</li> <li>• <b>string</b>—Specifies the site or location information in alphanumeric format.</li> </ul>
<b>Step 3</b>	<b>exit</b>  <b>Example:</b>  <pre>Device(config-civic)# exit</pre>	Returns to global configuration mode.
<b>Step 4</b>	<b>interface <i>interface-id</i></b>  <b>Example:</b>  <pre>Device (config)# interface fortygigabitethernet2/0/1</pre>	Specifies the interface on which you are configuring the location information, and enter interface configuration mode.

	Command or Action	Purpose
<b>Step 5</b>	<p><b>location</b> {<b>additional-location-information</b> <i>word</i>   <b>civic-location-id</b> {<i>id</i>   <b>host</b>}   <b>elin-location-id</b> <i>id</i>   <b>custom-location-id</b> {<i>id</i>   <b>host</b>}   <b>geo-location-id</b> {<i>id</i>   <b>host</b>} }</p> <p><b>Example:</b></p> <pre>Device(config-if)# location elin-location-id 1</pre>	<p>Enters location information for an interface:</p> <ul style="list-style-type: none"> <li>• <b>additional-location-information</b>—Specifies additional information for a location or place.</li> <li>• <b>civic-location-id</b>—Specifies global civic location information for an interface.</li> <li>• <b>elin-location-id</b>—Specifies emergency location information for an interface.</li> <li>• <b>custom-location-id</b>—Specifies custom location information for an interface.</li> <li>• <b>geo-location-id</b>—Specifies geo-spatial location information for an interface.</li> <li>• <b>host</b>—Specifies the host location identifier.</li> <li>• <i>word</i>—Specifies a word or phrase with additional location information.</li> <li>• <i>id</i>—Specifies the ID for the civic, ELIN, custom, or geo location. The ID range is 1 to 4095.</li> </ul>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<p>Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>show location admin-tag</b> <i>string</i></li> <li>• <b>show location civic-location identifier</b> <i>id</i></li> <li>• <b>show location elin-location identifier</b> <i>id</i></li> </ul> <p><b>Example:</b></p> <pre>Device# show location admin-tag</pre> <p>or</p> <pre>Device# show location civic-location identifier</pre> <p>or</p> <pre>Device# show location elin-location</pre>	Verifies the configuration.

	Command or Action	Purpose
	<b>identifier</b>	
<b>Step 8</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Enabling Wired Location Service on the Device

### Before you begin

For wired location to function, you must first enter the **ip device tracking** global configuration command.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode.  <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b>  Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 3</b>	<b>nmsp notification interval {attachment   location} interval-seconds</b>  <b>Example:</b>  Device(config)# <b>nmsp notification interval location 10</b>	Specifies the NMSP notification interval.  <b>attachment</b> —Specifies the attachment notification interval.  <b>location</b> —Specifies the location notification interval.  <i>interval-seconds</i> —Duration in seconds before the device sends the MSE the location or attachment updates. The range is 1 to 30; the default is 30.
<b>Step 4</b>	<b>end</b>  <b>Example:</b>  Device(config)# <b>end</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 5</b>	<b>show network-policy profile</b>  <b>Example:</b>  Device# <b>show network-policy profile</b>	Verifies the configuration.
<b>Step 6</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuration Examples for LLDP, LLDP-MED, and Wired Location Service

### Configuring Network-Policy TLV: Examples

This example shows how to configure VLAN 100 for voice application with CoS and to enable the network-policy profile and network-policy TLV on an interface:

```
# configure terminal
(config)# network-policy 1
(config-network-policy)# voice vlan 100 cos 4
(config-network-policy)# exit
(config)# interface gigabitethernet1/0/1
(config-if)# network-policy profile 1
(config-if)# lldp med-tlv-select network-policy
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
config-network-policy)# voice vlan dot1p cos 4
config-network-policy)# voice vlan dot1p dscp 34
```

## Monitoring and Maintaining LLDP, LLDP-MED, and Wired Location Service

Commands for monitoring and maintaining LLDP, LLDP-MED, and wired location service.

Command	Description
<b>clear lldp counters</b>	Resets the traffic counters to zero.

Command	Description
<b>clear lldp table</b>	Deletes the LLDP neighbor information table.
<b>clear nmosp statistics</b>	Clears the NMSP statistic counters.
<b>show lldp</b>	Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time before LLDP initializes on an interface.
<b>show lldp entry</b> <i>entry-name</i>	Displays information about a specific neighbor. You can enter an asterisk (*) to display all neighbors, or you can enter the neighbor name.
<b>show lldp interface</b> [ <i>interface-id</i> ]	Displays information about interfaces with LLDP enabled. You can limit the display to a specific interface.
<b>show lldp neighbors</b> [ <i>interface-id</i> ] [ <b>detail</b> ]	Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID. You can limit the display to neighbors of a specific interface or expand the display for more detailed information.
<b>show lldp traffic</b>	Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.
<b>show location admin-tag</b> <i>string</i>	Displays the location information for the specified administrative tag or site.
<b>show location civic-location identifier</b> <i>id</i>	Displays the location information for a specific global civic location.
<b>show location elin-location identifier</b> <i>id</i>	Displays the location information for an emergency location
<b>show network-policy profile</b>	Displays the configured network-policy profiles.
<b>show nmosp</b>	Displays the NMSP information

# Feature History for LLDP, LLDP-MED, and Wired Location Service

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	Link Layer Discovery Protocol (LLDP), LLDP-MED, Wired Location Service	<p>LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.</p> <p>LLDP-MED operates between endpoints and network devices.</p> <p>Wired Location Service lets you send tracking information of the connected devices to a Cisco Mobility Services Engine (MSE)</p>

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

## CHAPTER 4

# Configuring System MTU

---

- [Restrictions for System MTU](#), on page 55
- [Information About the MTU](#), on page 55
- [How to Configure MTU](#), on page 56
- [Configuration Examples for System MTU](#), on page 58
- [Additional References for System MTU](#), on page 58
- [Feature History for System MTU](#), on page 59

## Restrictions for System MTU

When configuring the system MTU values, follow these guidelines:

- The device does not support the MTU on a per-interface basis.
- If you enter the **system mtu bytes** command in global configuration mode, the command affects all the switched and routed ports on the switch.

## Information About the MTU

The default maximum transmission unit (MTU) size for payload received in Ethernet frame and sent on all device interfaces is 1500 bytes.

## System MTU Value Application

This table shows how the MTU values are applied.

**Table 6: MTU Values**

Configuration	system mtu command	ip mtu command	ipv6 mtu command
Standalone switch	<p>You can enter the <b>system mtu</b> command on a switch, but system MTU value does not take effect on the switch. It affects the Fast Ethernet ports.</p> <p>The range is from 1500 to 9198 bytes.</p>	<p>Use the <b>ip mtu bytes</b> command.</p> <p>The range is from 832 up to 1500 bytes.</p> <p><b>Note</b> The IP MTU value is the applied value, not the configured value.</p>	<p>Use the <b>ipv6 mtu bytes</b> command.</p> <p>The range is from 1280 to the system jumbo MTU value (in bytes).</p> <p><b>Note</b> The IPv6 MTU value is the applied value, not the configured value.</p>

The upper limit of the IP or IPv6 MTU value is based on the switch configuration and refers to the currently applied system MTU value. For more information about setting the MTU sizes, see the **system mtu** global configuration command in the command reference for this release.

## How to Configure MTU

### Configuring the System MTU

Follow these steps to change the MTU size for switched packets:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>enable</b></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
<b>Step 3</b>	<p><b>system mtu bytes</b></p> <p><b>Example:</b></p> <pre>Device(config)# system mtu 1900</pre>	(Optional) Changes the MTU size for all interfaces.

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b>  <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>copy running-config startup-config</b>  <b>Example:</b> Device# <b>copy running-config startup-config</b>	Saves your entries in the configuration file.
<b>Step 6</b>	<b>show system mtu</b>  <b>Example:</b> Device# <b>show system mtu</b>	Verifies your settings.

## Configuring Protocol-Specific MTU

To override system MTU values on routed interfaces, configure protocol-specific MTU under each routed interface. To change the MTU size for routed ports, perform this procedure

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface</i></b>  <b>Example:</b> Device(config)# <b>interface gigabitethernet0/0</b>	Enters interface configuration mode.
<b>Step 3</b>	<b>ip mtu <i>bytes</i></b>  <b>Example:</b> Device(config-if)# <b>ip mtu 68</b>	Changes the IPv4 MTU size
<b>Step 4</b>	<b>ipv6 mtu <i>bytes</i></b>  <b>Example:</b> Device(config-if)# <b>ipv6 mtu 1280</b>	(Optional) Changes the IPv6 MTU size.
<b>Step 5</b>	<b>end</b>  <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>copy running-config startup-config</b>  <b>Example:</b>	Saves your entries in the configuration file.

	Command or Action	Purpose
	Device# <code>copy running-config startup-config</code>	
<b>Step 7</b>	<b>show system mtu</b>  <b>Example:</b> Device# <code>show system mtu</code>	Verifies your settings.

## Configuration Examples for System MTU

### Example: Configuring Protocol-Specific MTU

```
Device# configure terminal
Device(config)# interface fortygigabitethernet 0/0
Device(config-if)# ip mtu 900
Device(config-if)# ipv6 mtu 1286
Device(config-if)# end
```

### Example: Configuring the System MTU

```
Device# configure terminal
Device(config)# system mtu 1600
Device(config)# exit
```

## CHAPTER 5

# Configuring Internal Power Supplies

- [Information About Internal Power Supplies](#) , on page 61
- [How to Configure Internal Power Supplies](#), on page 61
- [Monitoring Internal Power Supplies](#), on page 62
- [Configuration Examples for Internal Power Supplies](#), on page 62
- [Additional References for Internal Power Supplies](#), on page 64
- [Feature History for Internal Power Supplies](#), on page 64

## Information About Internal Power Supplies

See the device installation guide for information about the power supplies.

## How to Configure Internal Power Supplies

### Configuring Internal Power Supply

You can use the **power supply** EXEC command to configure and manage the internal power supply on the device. The device does not support the **no power supply** EXEC command.

Follow these steps beginning in user EXEC mode:

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>power supply</b> <i>switch_number</i> <b>slot</b> { <b>A</b>   <b>B</b> } { <b>off</b>   <b>on</b> }  <b>Example:</b>  Device# <b>power supply 1 slot A on</b>	Sets the specified power supply to <b>off</b> or <b>on</b> by using one of these keywords: <ul style="list-style-type: none"><li>• <b>A</b> —Selects the power supply in slot A.</li><li>• <b>B</b> —Selects power supply in slot B.</li></ul> <b>Note</b> Power supply slot B is the closest to the outer edge of the device.

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>off</b> —Set the power supply off.</li> <li>• <b>on</b> —Set the power supply on.</li> </ul> <p>By default, the device power supply is <b>on</b>.</p>
<b>Step 2</b>	<b>show environment power</b>  <b>Example:</b>  Device# <b>show environment power</b>	Verifies your settings.

## Monitoring Internal Power Supplies

Table 7: Show Commands for Power Supplies

Command	Purpose
<b>show environment power</b> [ <b>all</b>   <b>switch</b> <i>switch_number</i> ]	(Optional) Displays the status of the internal power supplies for the specified device . .  The <b>device</b> keywords are available only on stacking-capable devices .

## Configuration Examples for Internal Power Supplies

This example shows the sample output of **show environment status** command when a power supply with serial number starting with QCS is installed into C9500-32C switch. In this example, the second fan displays the state as N/A because the power supply with serial number starting with QCS has a single fan.

Device# **show inventory**

NAME: "Chassis", DESCR: "Cisco Catalyst 9500 Series Chassis"  
 PID: C9500-32C , VID: V00 , SN: CAT2202L2M5

NAME: "Power Supply Module 1", DESCR: "Cisco Catalyst 9500 Series 1600W AC Power Supply"  
 PID: C9K-PWR-1600WAC-R , VID: V01 , SN: QCS2230500J

Device# **show environment status**

Power Supply	Model No	Type	Capacity	Fan States Status	0	1
PS1	C9K-PWR-1600WAC-R	AC	1600 W	ok	good	N/A

This example shows the sample output of **show environment status** command when a power supply with serial number starting with POG is installed into C9500-32C switch. In this example, the second fan displays the state as good because the power supply with serial number starting with POG has a two fans.

```
Device# show inventory
```

```
NAME: "Chassis", DESCR: "Cisco Catalyst 9500 Series Chassis"
PID: C9500-32C , VID: V01 , SN: CAT2344L1N8
```

```
NAME: "Power Supply Module 0", DESCR: "Cisco Catalyst 9500 Series 1600W
AC Power Supply"
PID: C9K-PWR-1600WAC-R , VID: V01 , SN: POG2319D04K
```

```
Device# show environment status
```

Power Supply	Model No	Type	Capacity	Fan States Status	0	1
PS0	C9K-PWR-1600WAC-R	AC	1600 W	ok	good	good

This example shows how to set the power supply in slot A to off:

```
Device# power supply 1 slot A off
```

```
Disabling Power supply A may result in a power loss to PoE devices and/or switches ...
```

```
Continue? (yes/[no]): yes
```

```
Device#
```

```
Jun 10 04:52:54.389: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered off
```

```
Jun 10 04:52:56.717: %PLATFORM_ENV-1-FAN_NOT_PRESENT: Fan is not present
```

```
Device#
```

This example shows how to set the power supply in slot A to on:

```
Device# power supply 1 slot A on
```

```
Jun 10 04:54:39.600: %PLATFORM_ENV-6-FRU_PS_OIR: FRU Power Supply 1 powered on
```

This example shows the output of the **show env power** command:

**Table 8: show env power Status Descriptions**

Field	Description
OK	The power supply is present and power is good.
Not Present	No power supply is installed.
No Input Power	The power supply is present but there is no input power.
Disabled	The power supply and input power are present, but power supply is switched off by CLI.
Not Responding	The power supply is not recognizable or is faulty.
Failure-Fan	The power supply fan is faulty.
