

Configuring Spine Switches in a BGP EVPN VXLAN Fabric

- [Information About Spine Switches in a BGP EVPN VXLAN Fabric, on page 1](#)
- [Configuration Examples for Spine Switches in a BGP EVPN VXLAN Network, on page 2](#)

Information About Spine Switches in a BGP EVPN VXLAN Fabric

Spine switches in a BGP EVPN VXLAN fabric act as the connecting nodes between all the leaf switches or VTEPs. They form the backbone of the EVPN VXLAN network and forward traffic between the leaf switches. Each leaf switch is connected to each spine switch in the network. Spine switches enable redundancy within the network and provide multiple paths for VTEPs to forward traffic to each other.

Spine switches in an EVPN VXLAN network are part of the underlay network and transport the VXLAN-encapsulated packets. When deployed as border nodes, spine switches connect the network with an external network and allow movement of traffic. In a BGP EVPN VXLAN fabric, spine switches can also be deployed as route reflectors.

Deployment Scenarios for Spine Switches and Leaf Switches in a BGP EVPN VXLAN Fabric

Spine switches and leaf switches in a BGP EVPN VXLAN fabric can be deployed in the following ways:

- Spine Switches and Leaf Switches in the Same Autonomous System
- Spine Switches in One Autonomous System and the Leaf Switches in a Different Autonomous System
- Spine Switches in One Autonomous System and Each Leaf Switch in a Different Autonomous System

Spine Switches and Leaf Switches in the Same Autonomous System

In this scenario, all the devices in the EVPN VXLAN network are in the same autonomous system. The spine switches function as BGP route reflectors and anycast rendezvous points (RPs). Internal Border Gateway Protocol (iBGP) is used to establish peering between the spine switches, and between the spine and leaf switches.

See [Configuration Example-Spine and Leaf Switches in the Same Autonomous System, on page 2](#) for a sample topology and configuration.

Spine Switches in One Autonomous System and the Leaf Switches in a Different Autonomous System

In this scenario, all the leaf switches are in a single autonomous system that is different from the autonomous system of the spine switches. The spine switches function as BGP route servers. iBGP is used to establish peering between the spine switches. eBGP is used to establish peering between the spine and leaf switches.

See [Configuration Example-Spine and Leaf Switches are in Different Autonomous Systems, on page 19](#) for a sample topology and configuration.

Spine Switches in One Autonomous System and Each Leaf Switch in a Different Autonomous System

In this scenario, each leaf switch is in its own individual autonomous system that is different from the autonomous system of the spine switches. The spine switches function as BGP route servers. iBGP is used to establish peering between the spine switches. eBGP is used to establish peering between the spine and leaf switches.

See [Configuration Example-Each Leaf Switch in a Different Autonomous System, on page 37](#) for a sample topology and configuration.

Configuration Examples for Spine Switches in a BGP EVPN VXLAN Network

This section provides configuration examples for spine switches for the different deployments of spine and leaf switches in a BGP EVPN VXLAN fabric.

Configuration Example-Spine and Leaf Switches in the Same Autonomous System

This section provides an example to show how spine switches are configured in a BGP EVPN VXLAN fabric using iBGP when the spine switches and leaf switches are in the same autonomous system. The example shows how to configure spine switches and verify the configuration for the topology shown below:

Figure 1: BGP EVPN VXLAN Fabric with the Spine Switches and Leaf Switches in the Same Autonomous System

The topology shows an EVPN VXLAN network with two leaf switches (VTEP 1 and VTEP 2) and two spine switches (Spine Switch 1 and Spine Switch 2). The entire BGP EVPN VXLAN fabric (which includes Spine Switch 1, Spine Switch 2, Leaf Switch 1, and Leaf Switch 2) is in autonomous system AS65001. Anycast RP is configured on both the spine switches. Spine Switch 1 and Spine Switch 2 are not route reflector clients to each other. Multicast Source Discovery Protocol (MSDP) is configured between Spine Switch 1 and Spine Switch 2 for source synchronization. Protocol Independent Multicast (PIM) is enabled on the interfaces that connect leaf switches and spine switches. Static RP is configured in the network and the underlay network uses multicast forwarding mechanism to forward BUM traffic.

The following tables provide sample configurations for the devices in the topology above.

Configuration Example-Spine and Leaf Switches in the Same Autonomous System

Table 1: Configuring Spine Switch 1 and Spine Switch 2 using iBGP when the Spine Switches and the Leaf Switches are in the same Autonomous System

Configuration Example-Spine and Leaf Switches are in Different Autonomous Systems

This section provides an example to show how spine switches are configured in a BGP EVPN VXLAN fabric using eBGP when the spine switches are in one autonomous system and the leaf switches are in a different autonomous system. The example shows how to configure spine switches and verify the configuration for the topology shown below:

Configuration Example-Spine and Leaf Switches are in Different Autonomous Systems

Figure 2: BGP EVPN VXLAN Fabric with the Spine Switches in One Autonomous System and the Leaf Switches in a Different Autonomous System

The topology shows an EVPN VXLAN network with two leaf switches (Leaf Switch 1 and Leaf Switch 2) and two spine switches (Spine Switch 1 and Spine Switch 2). Spine Switch 1 and Spine Switch 2 are in autonomous system AS65001. Leaf Switch 1 and Leaf Switch 2 are in autonomous system AS65002. Spine Switch 1 and Spine Switch 2 are BGP route servers and are not route reflector clients to each other. Multicast Source Discovery Protocol (MSDP) is configured between Spine Switch 1 and Spine Switch 2 for source synchronization. Protocol Independent Multicast (PIM) is enabled on the interfaces that connect leaf switches and spine switches. Static RP is configured in the network and the underlay network uses multicast forwarding mechanism to forward BUM traffic.

Note

- You must run the **neighbor ip-address allowas-in** command in the L2VPN EVPN address family configuration mode on the leaf switches to allow processing of BGP updates that have a different autonomous system number.
- You must manually run the **no bgp default route-target filter** command in router configuration mode on the spine switches.
- You must configure eBGP multihop on the leaf and spine switches for the fabric to function.

The following tables provide sample configurations for the devices in the topology above.

Table 3: Configuring Spine Switch 1 and Spine Switch 2 using eBGP when the Spine Switches are in one Autonomous System and the Leaf Switches are in a Different Autonomous System

The following examples provide sample outputs for **show** commands on the devices in the topology configured in the preceding tables:

Spine Switch 1

The following example shows the output for the **show ip ospf neighbor** command on spine switch 1:

```

Spine-01# show ip ospf neighbor
Neighbor ID      Pri   State          Dead Time     Address           Interface
172.16.255.4      0    FULL/ -        00:00:33    172.16.14.4    GigabitEthernet1/0/2
172.16.255.3      0    FULL/ -        00:00:34    172.16.13.3    GigabitEthernet1/0/1

```

The following example shows the output for the **show bgp l2vpn evpn summary** command on spine switch 1:

```

Spine-01# show bgp l2vpn evpn summary
BGP router identifier 172.16.255.1, local AS number 65001
BGP table version is 75, main routing table version 75
 18 network entries using 6192 bytes of memory
 38 path entries using 7904 bytes of memory
 27/13 BGP path/bestpath attribute entries using 7776 bytes of memory
 1 BGP AS-PATH entries using 24 bytes of memory
 12 BGP extended community entries using 640 bytes of memory
 0 BGP route-map cache entries using 0 bytes of memory
 0 BGP filter-list cache entries using 0 bytes of memory
BGP using 22536 total bytes of memory
BGP activity 18/0 prefixes, 76/38 paths, scan interval 60 secs
 18 networks peaked at 20:34:25 May 27 2020 UTC (5d18h ago)

Routing entry for 172.16.255.255/32
  Known via "connected", distance 0, metric 0 (connected, via interface)
  Routing Descriptor Blocks:
    * directly connected, via Loopback2
      Route metric is 0, traffic share count is 1

```

The following example shows the output for the **show ip msdp summary** command on spine switch 2:

```

Spine-02# show ip msdp summary
MSDP Peer Status Summary
Peer Address     AS      State      Uptime/  Reset SA      Peer Name
                  Downtime Count Count
172.16.254.1    65001   Up        5d19h    0      2      ?

```

The following example shows the output for the **show ip msdp sa-cache** command on spine switch 2:

```

Spine-02# show ip msdp sa-cache
MSDP Source-Active Cache - 2 entries
(172.16.254.3, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:04:07/00:05:17, Peer 172.16.254.1
(172.16.254.4, 225.0.0.101), RP 172.16.255.255, BGP/AS 0, 00:03:45/00:05:20, Peer 172.16.254.1

```

The following example shows the output for the **show ip mroute** command on spine switch 2:

```

Spine-02# show ip mroute 225.0.0.101
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,

Configuration Example-Spine and Leaf Switches are in Different Autonomous Systems

The following example shows the output for the **show ip pim neighbor** command on leaf switch 2:

```
Leaf-02# show ip pim neighbor
PIM Neighbor Table
Mode: B - Bidir Capable, DR - Designated Router, N - Default DR Priority,
      P - Proxy Capable, S - State Refresh Capable, G - GenID Capable,
      L - DR Load-balancing Capable
Neighbor           Interface          Uptime/Expires   Ver   DR
Address
172.16.14.1       GigabitEthernet1/0/1    5d19h/00:01:22  v2   1 / S P G
172.16.24.2       GigabitEthernet1/0/2    5d19h/00:01:27  v2   1 / S P G
```

The following example shows the output for the **show ip pim rp mapping** command on leaf switch 2:

```
Leaf-02# show ip pim rp mapping
PIM Group-to-RP Mappings

Group(s): 224.0.0.0/4, Static
RP: 172.16.255.255 (?)
```

The following example shows the output for the **show ip ro** command on leaf switch 2:

```
Leaf-02# show ip ro 172.16.255.255
Routing entry for 172.16.255.255/32
Known via "ospf 1", distance 110, metric 2, type intra area
Last update from 172.16.24.2 on GigabitEthernet1/0/2, 5d19h ago
Routing Descriptor Blocks:
  172.16.24.2, from 172.16.255.2, 5d19h ago, via GigabitEthernet1/0/2
    Route metric is 2, traffic share count is 1
  * 172.16.14.1, from 172.16.255.1, 5d19h ago, via GigabitEthernet1/0/1
    Route metric is 2, traffic share count is 1
```

The following example shows the output for the **show ip rpf** command on leaf switch 2:

```
Leaf-02# show ip rpf 172.16.255.255
RPF information for ? (172.16.255.255)
  RPF interface: GigabitEthernet1/0/2
  RPF neighbor: ? (172.16.24.2)
  RPF route/mask: 172.16.255.255/32
  RPF type: unicast (ospf 1)
  Doing distance-preferred lookups across tables
  RPF topology: ipv4 multicast base, originated from ipv4 unicast base
```

The following example shows the output for the **show ip mroute** command on leaf switch 2:

```
Leaf-02# show ip mroute 225.0.0.101
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
      L - Local, P - Pruned, R - RP-bit set, F - Register flag,
      T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
      X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
      U - URD, I - Received Source Specific Host Report,
      Z - Multicast Tunnel, z - MDT-data group sender,
      Y - Joined MDT-data group, y - Sending to MDT-data group,
      G - Received BGP C-Mroute, g - Sent BGP C-Mroute,
      N - Received BGP Shared-Tree Prune, n - BGP C-Mroute suppressed,
      Q - Received BGP S-A Route, q - Sent BGP S-A Route,
      V - RD & Vector, v - Vector, p - PIM Joins on route,
      x - VxLAN group, c - PFP-SA cache created entry,
      * - determined by Assert, # - iif-starg configured on rpf intf
```

```
Outgoing interface flags: H - Hardware switched, A - Assert winner, p - PIM Join
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

```

Configuration Example-Each Leaf Switch in a Different Autonomous System

This section provides an example to show how spine switches are configured in a BGP EVPN VXLAN fabric using eBGP when the spine switches are in one autonomous system and each leaf switch is in a different autonomous system. The example shows how to configure spine switches and verify the configuration for the topology shown below:

Configuration Example-Each Leaf Switch in a Different Autonomous System

Figure 3: BGP EVPN VXLAN Fabric with the Spine Switches in one Autonomous System and each Leaf Switch in a Different Autonomous System

The topology shows an EVPN VXLAN network with two leaf switches (Leaf Switch 1 and Leaf Switch 2) and two spine switches (Spine Switch 1 and Spine Switch 2). Spine Switch 1 and Spine Switch 2 are in autonomous system AS65001. Leaf Switch 1 is in autonomous system AS65002. Leaf Switch 2 is in autonomous system AS65003. Spine Switch 1 and Spine Switch 2 are BGP route servers and are not route reflector clients to each other. Multicast Source Discovery Protocol (MSDP) is configured between Spine Switch 1 and Spine Switch 2 for source synchronization. Protocol Independent Multicast (PIM) is enabled on the interfaces that connect leaf switches and spine switches. Static RP is configured in the network and the underlay network uses multicast forwarding mechanism to forward BUM traffic.

Note

- You must run the **rewrite-evpn-rt-asn** command in the L2VPN EVPN address family configuration mode on the leaf switches to allow processing of BGP updates that have a different autonomous system number.
- You must manually run the **no bgp default route-target filter** command in router configuration mode on the spine switches.
- You must configure eBGP multihop on the leaf and spine switches for the fabric to function.

The following tables provide sample configurations for the devices in the topology above.

Table 5: Configuring Spine Switch 1 and Spine Switch 2 using eBGP when the Spine Switches are in one Autonomous System and each Leaf Switch is in a Different Autonomous System

Spine Switch 1	Spine Switch 2
