CONTENTS

CHAPTER 1

Configuring Multiprotocol Label Switching (MPLS) 1

- Multiprotocol Label Switching 1
- Restrictions for Multiprotocol Label Switching 1
- Information about Multiprotocol Label Switching 1
 - Functional Description of Multiprotocol Label Switching 2
 - Functions of Label Switching 2
 - Distribution of Label Bindings 2
 - MPLS Layer 3 VPN 3
 - Classifying and Marking MPLS QoS EXP 3
 - LAN MACsec over MPLS 3
- How to Configure Multiprotocol Label Switching 4
 - Configuring a Switch for MPLS Switching 4
 - Configuring a Switch for MPLS Forwarding 5
- How to Verify Multiprotocol Label Switching Configuration 6
 - Verifying Configuration of MPLS Switching 6
 - Verifying Configuration of MPLS Forwarding 6
- Additional References for Multiprotocol Label Switching 8
- Feature History for Multiprotocol Label Switching 8

CHAPTER 2

Configuring eBGP and iBGP Multipath 11

- BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 11
 - Prerequisites for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 11
 - Restrictions for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 11
- Information About BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 12
 - Multipath Load Sharing Between eBGP and iBGP 12
 - eBGP and iBGP Multipath Load Sharing in a BGP MPLS Network 13

Benefits of Multipath Load Sharing for Both eBGP and iBGP 13

How to Configure BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 14

 Configuring Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 14

 Verifying Multipath Load Sharing for Both eBGP and iBGP 15

Configuration Examples for the BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 15

 Example: Configuring eBGP and iBGP Multipath Load Sharing 16

Feature History for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN 16

CHAPTER 3

Configuring EIGRP MPLS VPN PE-CE Site of Origin 19

EIGRP MPLS VPN PE-CE Site of Origin 19

 Prerequisites for EIGRP MPLS VPN PE-CE Site of Origin 19

 Restrictions for EIGRP MPLS VPN PE-CE Site of Origin 19

Information About EIGRP MPLS VPN PE-CE Site of Origin 20

 EIGRP MPLS VPN PE-CE Site of Origin Support Overview 20

 Site of Origin Support for Backdoor Links 20

 Router Interoperation with the Site of Origin Extended Community 21

 Redistribution of BGP VPN Routes That Carry the Site of Origin into EIGRP 21

 Benefits of the EIGRP MPLS VPN PE-CE Site of Origin Support 21

How to Configure EIGRP MPLS VPN PE-CE Site of Origin Support 21

 Configuring the Site of Origin Extended Community 22

 Verifying the Configuration of the SoO Extended Community 24

Configuration Examples for EIGRP MPLS VPN PE-CE SoO 24

 Example Configuring the Site of Origin Extended Community 24

 Example Verifying the Site of Origin Extended Community 24

Feature History for EIGRP MPLS VPN PE-CE Site of Origin 25

CHAPTER 4

Configuring Ethernet-over-MPLS and Pseudowire Redundancy 27

Configuring Ethernet-over-MPLS 27

 Prerequisites for Ethernet-over-MPLS 27

 Restrictions for Ethernet-over-MPLS 27

 Restrictions for Ethernet-over-MPLS Port Mode 28

 Restrictions for EoMPLS VLAN Mode 28

Information About Ethernet-over-MPLS 29

How to Configure Ethernet-over-MPLS	29
Configuring Ethernet-over-MPLS Port Mode	29
Configuring Ethernet-over-MPLS VLAN Mode	33
Configuration Examples for Ethernet-over-MPLS	37
Configuring Pseudowire Redundancy	42
Prerequisites for Pseudowire Redundancy	42
Restrictions for Pseudowire Redundancy	42
Restrictions for Pseudowire Redundancy Port Mode	42
Restrictions for Pseudowire Redundancy VLAN Mode	43
Information About Pseudowire Redundancy	43
How to Configure Pseudowire Redundancy	43
Configuring Pseudowire Redundancy Port Mode	43
Configuring Pseudowire Redundancy VLAN Mode	48
Configuration Examples for Pseudowire Redundancy	54
Feature History for Ethernet-over-MPLS and Pseudowire Redundancy	57

CHAPTER 5

Configuring IPv6 Provider Edge over MPLS (6PE)	59
Prerequisites for 6PE	59
Restrictions for 6PE	59
Information About 6PE	59
IPv6 Explicit Null label for 6PE	60
Configuring 6PE	60
Configuring IPv6 Explicit Null label for 6PE	63
Configuration Examples for 6PE	65
Configuration Examples for IPv6 Explicit-Null Label for 6PE	67
Feature History for IPv6 Provider Edge over MPLS (6PE)	67

CHAPTER 6

Configuring IPv6 VPN Provider Edge over MPLS (6VPE)	69
Restrictions for 6VPE	69
Information About 6VPE	69
Configuration Examples for 6VPE	70
Feature History for IPv6 VPN Provider Edge over MPLS (6VPE)	74

CHAPTER 7

Configuring MPLS Layer 3 VPN	75
-------------------------------------	-----------

Prerequisites for MPLS Virtual Private Networks 75

Restrictions for MPLS Virtual Private Networks 75

Information About MPLS Virtual Private Networks 78

 MPLS Virtual Private Network Definition 78

 How an MPLS Virtual Private Network Works 79

 Major Components of an MPLS Virtual Private Network 79

 Benefits of an MPLS Virtual Private Network 80

How to Configure MPLS Virtual Private Networks 82

 Configuring the Core Network 82

 Assessing the Needs of MPLS Virtual Private Network Customers 82

 Configuring MPLS in the Core 83

 Connecting the MPLS Virtual Private Network Customers 83

 Defining VRFs on the PE Devices to Enable Customer Connectivity 83

 Configuring VRF Interfaces on PE Devices for Each VPN Customer 84

 Configuring Routing Protocols Between the PE and CE Devices 85

 Verifying the Virtual Private Network Configuration 85

 Verifying Connectivity Between MPLS Virtual Private Network Sites 86

 Verifying IP Connectivity from CE Device to CE Device Across the MPLS Core 86

 Verifying That the Local and Remote CE Devices Are in the PE Routing Table 86

 Configuration Examples for MPLS Virtual Private Networks 87

 Example: Configuring an MPLS Virtual Private Network Using RIP 88

 Example: Configuring an MPLS Virtual Private Network Using Static Routes 89

 Example: Configuring an MPLS Virtual Private Network Using BGP 90

 Additional References 92

 Feature History for MPLS Virtual Private Networks 92

CHAPTER 8

Configuring MPLS VPN InterAS Options 95

 Information About MPLS VPN InterAS Options 95

 Autonomous Systems and ASBRs 95

 MPLS VPN InterAS Options 96

 InterAS Option A 96

 InterAS Option B 97

 InterAS Option AB 100

 How to Configure MPLS VPN InterAS Options 103

Configuring MPLS VPN InterAS Option A	103
Sending AS: Configuring PE	103
Sending AS: Configuring P	110
Sending AS: Configuring ASBR	112
Receiving AS: Configuring ASBR	119
Receiving AS: Configuring P	126
Receiving AS: Configuring PE	128
Configuring MPLS VPN InterAS Option B	135
Configuring InterAS Option B using the Next-Hop-Self Method	135
Configuring InterAS Option B using Redistribute Connected Method	140
Configuring MPLS VPN Inter-AS Option AB	143
Configuring the VRFs on the ASBR Interface for Each VPN Customer	143
Configuring the MP-BGP Session Between ASBR Peers	144
Configuring the Routing Policy for VPNs that Need Inter-AS Connections	146
Changing an Inter-AS Option A Deployment to an Option AB Deployment	148
Verifying MPLS VPN InterAS Options Configuration	149
Configuration Examples for MPLS VPN InterAS Options	150
InterAS Option B	150
Next-Hop-Self Method	150
IGP Redistribute Connected Subnets Method	156
InterAS OptionAB	162
Additional References for MPLS VPN InterAS Options	166
Feature History for MPLS VPN InterAS Options	166

CHAPTER 9
Configuring MPLS over GRE 169

Prerequisites for MPLS over GRE	169
Restrictions for MPLS over GRE	169
Information About MPLS over GRE	170
PE-to-PE Tunneling	170
P-to-PE Tunneling	171
P-to-P Tunneling	171
How to Configure MPLS over GRE	171
Configuring the MPLS over GRE Tunnel Interface	171
Configuration Examples for MPLS over GRE	173

Example: PE-to-PE Tunneling 173

Example: P-to-PE Tunneling 174

Example: P-to-P Tunneling 175

Additional References for MPLS over GRE 176

Feature History for MPLS over GRE 176

CHAPTER 10

Configuring MPLS Layer 2 VPN over GRE 179

Information About MPLS Layer 2 VPN over GRE 179

Types of Tunneling Configurations 179

 PE-to-PE Tunneling 179

 P-to-PE Tunneling 180

 P-to-P Tunneling 180

How to Configure MPLS Layer 3 VPN over GRE 181

Configuration Examples for MPLS Layer 2 VPN over GRE 182

 Example: Configuring a GRE Tunnel That Spans a non-MPLS Network 182

Additional References for Configuring MPLS Layer 2 VPN over GRE 183

Feature History for Configuring MPLS Layer 2 VPN over GRE 183

CHAPTER 11

Configuring MPLS Layer 3 VPN over GRE 185

Prerequisites for MPLS Layer 3 VPN over GRE 185

Restrictions for MPLS Layer 3 VPN over GRE 185

Information About MPLS Layer 3 VPN over GRE 186

Types of Tunneling Configurations 186

 PE-to-PE Tunneling 186

 P-to-PE Tunneling 187

 P-to-P Tunneling 187

How to Configure MPLS Layer 3 VPN over GRE 188

Configuration Examples for MPLS Layer 3 VPN over GRE 189

 Example: Configuring MPLS Layer 3 VPN over GRE (PE-to-PE Tunneling) 189

 Example: Configuring MPLS Layer 3 VPN over GRE (P-to-PE Tunneling) 191

Feature History for Configuring MPLS Layer 3 VPN over GRE 195

CHAPTER 12

Configuring MPLS QoS 197

Prerequisites for MPLS QoS 197

Restrictions for MPLS QoS	197
Information About MPLS QoS	198
MPLS QoS Overview	198
MPLS Experimental Field	198
Benefits of MPLS EXP Classification and Marking	199
How to Configure MPLS QoS	199
Classifying MPLS Encapsulated Packets	200
Marking MPLS EXP on the Outermost Label	200
Marking MPLS EXP on Label Switched Packets	202
Configuring Conditional Marking	202
Configuring WRED for MPLS EXP	204
Configuration Examples for MPLS QoS	205
Example: Classifying MPLS Encapsulated Packets	205
Example: Marking MPLS EXP on Outermost Label	206
Example: Marking MPLS EXP on Label-Switched Packets	207
Example: Configuring Conditional Marking	207
Example: Configuring WRED for MPLS EXP	207
Example: Configuring WRED for MPLS EXP	208
Example: Configuring Priority Queue for MPLS EXP	210
Additional References	212
Feature History for QoS MPLS EXP	212

CHAPTER 13

Configuring MPLS Static Labels	213
Prerequisites for MPLS Static Labels	213
Restrictions for MPLS Static Labels	213
Information About MPLS Static Labels	214
MPLS Static Labels Overview	214
Benefits of MPLS Static Labels	214
How to Configure MPLS Static Labels	214
Configuring MPLS Static Prefix Label Bindings	214
Verifying MPLS Static Prefix Label Bindings	215
Monitoring and Maintaining MPLS Static Labels	216
Configuration Examples for MPLS Static Labels	217
Example: Configuring MPLS Static Prefixes Labels	217

Additional References	218
Feature History for MPLS Static Labels	219
<hr/>	
CHAPTER 14	Configuring MPLS Traffic Engineering and Enhancements 221
Prerequisites for MPLS Traffic Engineering and Enhancements	221
Restrictions for MPLS Traffic Engineering and Enhancements	221
Information About MPLS Traffic Engineering and Enhancements	222
Introduction to MPLS Traffic Engineering and Enhancements	222
Benefits of MPLS Traffic Engineering	223
How MPLS Traffic Engineering Works	223
Mapping Traffic into Tunnels	224
Transition of an IS-IS Network to a New Technology	225
Extensions for the IS-IS Routing Protocol	225
Solution 1 for Transitioning an IS-IS Network to a New Technology	225
Transition Actions During Solution 1	226
Solution 2 for Transitioning an IS-IS Network to a New Technology	226
Transition Actions During Solution 2	227
TLV Configuration Commands	227
Implementation in Cisco IOS XE Software	227
How to Configure MPLS Traffic Engineering and Enhancements	227
Configuring a Device to Support Tunnels	228
Configuring an Interface to Support RSVP-Based Tunnel Signaling and IGP Flooding	228
Configuring IS-IS for MPLS Traffic Engineering	229
Configuring OSPF for MPLS Traffic Engineering	230
Configuring an MPLS Traffic Engineering Tunnel	231
Configuring an MPLS Traffic Engineering Tunnel that an IGP Can Use	233
Configuration Examples for MPLS Traffic Engineering and Enhancements	235
Example: Configuring MPLS Traffic Engineering Using IS-IS	235
Device 1: MPLS Traffic Engineering Configuration	235
Device 1: IS-IS Configuration	235
Example: Configuring MPLS Traffic Engineering Using OSPF	236
Device 1: MPLS Traffic Engineering Configuration	236
Device 1: OSPF Configuration	236
Example: Configuring an MPLS Traffic Engineering Tunnel	236

Device 1: Dynamic Path Tunnel Configuration	236
Device 1: Dynamic Path Tunnel Verification	237
Device 1: Explicit Path Configuration	237
Device 1: Explicit Path Tunnel Configuration	237
Device 1: Explicit Path Tunnel Verification	237
Example: Configuring Enhanced SPF Routing over a Tunnel	237
Device 1: IGP Enhanced SPF Consideration Configuration	237
Device 1: Route and Traffic Verification	238
Additional References	238
Feature History for MPLS Traffic Engineering and Enhancements	239

CHAPTER 15

Configuring Any Transport over MPLS: Tunnel Selection	241
Restrictions for Any Transport over MPLS: Tunnel Selection	241
Information About Any Transport over MPLS: Tunnel Selection	241
How to Configure Any Transport over MPLS: Tunnel Selection	242
Configuring Any Transport over MPLS: Tunnel Selection	242
Configuration Examples for Any Transport over MPLS: Tunnel Selection	243
Example: Configuring Tunnel Selection	243
Example: Verifying the Configuration	245
Example: Troubleshooting Tunnel Selection	245
Feature History for Any Transport over MPLS: Tunnel Selection	245

CHAPTER 16

Configuring MPLS Traffic Engineering—Bundled Interface Support	247
Prerequisites for MPLS TE—Bundled Interface Support	247
Restrictions for MPLS TE—Bundled Interface Support	247
Information About MPLS TE—Bundled Interface Support	248
Cisco EtherChannel Overview	248
Cisco Gigabit EtherChannel Overview	249
Load Balancing in EtherChannel	249
How to Configure MPLS TE—Bundled Interface Support	249
Configuring MPLS Traffic Engineering on an EtherChannel Interface	249
Configuration Examples for MPLS Traffic Engineering—Bundled Interface Support	250
Example: Configuring MPLS TE on an EtherChannel Interface	250

Example: Configuring MPLS Traffic Engineering—Bundled Interface Support over Gigabit Etherchannel	251
Additional References for MPLS Traffic Engineering—Bundled Interface Support	253
Feature History for MPLS Traffic Engineering—Bundled Interface Support	253

CHAPTER 17**Configuring MPLS Traffic Engineering Forwarding Adjacency 255**

Prerequisites for MPLS Traffic Engineering Forwarding Adjacency	255
Restrictions for MPLS Traffic Engineering Forwarding Adjacency	255
Information About MPLS Traffic Engineering Forwarding Adjacency	256
MPLS Traffic Engineering Forwarding Adjacency Functionality	256
MPLS Traffic Engineering Forwarding Adjacency Benefits	256
Usage Tips	257
How to Configure MPLS Traffic Engineering Forwarding Adjacency	257
Configuring a Tunnel Interface for MPLS TE Forwarding Adjacency	257
Configuring MPLS TE Forwarding Adjacency on Tunnels with ISIS	258
Configuring MPLS TE Forwarding Adjacency on Tunnels with OSPF	259
Verifying MPLS TE Forwarding Adjacency	260
Configuration Examples for MPLS Traffic Engineering Forwarding Adjacency	261
Example MPLS TE Forwarding Adjacency	261
Additional References	262
Feature History for MPLS Traffic Engineering Forwarding Adjacency	263

CHAPTER 18**Configuring MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion 265**

Prerequisites for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion	265
Restrictions for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion	265
Information About MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion	266
MPLS Traffic Engineering	266
Cisco Express Forwarding	266
How to Configure MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion	266
Configuring IP Explicit Address Exclusion	267
Configuring an MPLS Traffic Engineering Tunnel	268
Configuration Examples for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion	269
Example: Configuring IP Explicit Address Exclusion	269
Example: Configuring an MPLS Traffic Engineering Tunnel	270

Additional References	270
Feature History for MPLS Traffic Engineering (TE)IP—Explicit Address Exclusion	271

CHAPTER 19

Configuring MPLS Traffic Engineering—LSP Attributes	273
Prerequisites for MPLS Traffic Engineering—LSP Attributes	273
Restrictions for MPLS Traffic Engineering—LSP Attributes	273
Information About MPLS Traffic Engineering—LSP Attributes	273
MPLS Traffic Engineering—LSP Attributes	273
MPLS Traffic Engineering—LSP Attributes Benefits	274
Traffic Engineering Bandwidth	274
Tunnel Attributes and LSP Attributes	274
LSP Attributes and the LSP Attribute List	275
LSP Attribute Lists Management	275
Constraint-Based Routing and Path Option Selection	275
Tunnel Reoptimization and Path Option Selection	276
Path Option Selection with Bandwidth Override	276
Default Path Option Attributes for TE Tunnels Using LSP Attribute Lists	277
How to Configure MPLS Traffic Engineering—LSP Attributes	277
Configuring an LSP Attribute List	277
Adding Attributes to an LSP Attribute List	280
Example: Removing an Attribute from an LSP Attribute List	281
Modifying an Attribute in an LSP Attribute List	282
Deleting an LSP Attribute List	283
Verifying Attributes Within an LSP Attribute List	284
Verifying All LSP Attribute Lists	285
Associating an LSP Attribute List with a Path Option for an MPLS TE Tunnel	286
Modifying a Path Option to Use a Different LSP Attribute List	288
Removing a Path Option for an LSP for an MPLS TE Tunnel	290
Verifying that LSP Is Signaled Using the Correct Attributes	292
Configuring a Path Option for Bandwidth Override	292
Configuring Fallback Bandwidth Path Options for TE Tunnels	293
Modifying the Bandwidth on a Path Option for Bandwidth Override	295
Removing a Path Option for Bandwidth Override	297
Verifying that LSP Is Signaled Using the Correct Bandwidth	298

Configuration Examples for MPLS Traffic Engineering—LSP Attributes	299
Configuring LSP Attribute List Examples	299
Example: Configuring an LSP Attribute List	299
Example: Adding Attributes to an LSP Attribute List	300
Example: Removing an Attribute from an LSP Attribute List	300
Example: Modifying an Attribute in an LSP Attribute List	300
Example: Deleting an LSP Attribute List	300
Example: Associating an LSP Attribute List with a Path Option for a TE Tunnel: Example	301
Example: Modifying a Path Option to Use a Different LSP Attribute List	301
Example: Removing a Path Option for an LSP for an MPLS TE Tunnel	302
Configuring a Path Option for Bandwidth Override Examples	302
Example: Configuring a Path Option to Override the Bandwidth	302
Configuring Fallback Bandwidth Path Options for TE Tunnels: Example	302
Example: Modifying the Bandwidth on a Path Option for Bandwidth Override	303
Example: Removing the Path Option Bandwidth Value for an LSP for an MPLS TE Tunnel	303
Additional References	304
Feature History for MPLS Traffic Engineering—LSP Attributes	304
CHAPTER 20	
Configuring MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	307
Prerequisites for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	307
Restrictions for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	308
Information About MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	308
Overview	308
Benefits	308
How to Configure MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	309
Configuring a Platform to Support Traffic Engineering Tunnels	309
Configuring IS-IS for MPLS Traffic Engineering	309
Configuring Traffic Engineering Link Metrics	310
Configuring an MPLS Traffic Engineering Tunnel	312
Configuring the Metric Type for Tunnel Path Calculation	314
Verifying the Tunnel Path Metric Configuration	315
Configuration Examples for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	316
Example: Configuring Link Type and Metrics for Tunnel Path Selection	316

Example: Verifying the Tunnel Path Metric Configuration	318
Additional References	319
Feature History for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	320

CHAPTER 21**Configuring MPLS Traffic Engineering—RSVP Graceful Restart 321**

Prerequisites for MPLS TE—RSVP Graceful Restart	321
Restrictions for MPLS TE—RSVP Graceful Restart	321
Information About MPLS TE—RSVP Graceful Restart	322
Graceful Restart Operation	322
How to Configure MPLS TE—RSVP Graceful Restart	324
Enabling Graceful Restart	324
Setting a DSCP Value	325
Setting a Hello Refresh Interval	326
Setting a Missed Refresh Limit	326
Verifying Graceful Restart Configuration	327
Configuration Examples for MPLS TE—RSVP Graceful Restart	327
Example: MPLS TE—RSVP Graceful Restart Example	328
Additional References	328
Feature History for MPLS Traffic Engineering—RSVP Graceful Restart	329

CHAPTER 22**Configuring MPLS Traffic Engineering—Verbatim Path Support 331**

Prerequisites for MPLS Traffic Engineering--Verbatim Path Support	331
Restrictions for MPLS Traffic Engineering--Verbatim Path Support	331
Information About MPLS Traffic Engineering--Verbatim Path Support	332
MPLS Traffic Engineering—Verbatim Path Support	332
How to Configure MPLS Traffic Engineering—Verbatim Path Support	332
Configuring MPLS Traffic Engineering--Verbatim Path Support	332
Verifying Verbatim LSPs for MPLS TE Tunnels	335
Configuration Examples for MPLS Traffic Engineering—Verbatim Path Support	336
Example: Configuring MPLS Traffic Engineering: Verbatim Path Support	336
Additional References	336
Feature History for MPLS Traffic Engineering Verbatim Path Support	337

CHAPTER 23**Configuring Virtual Private LAN Service (VPLS) and VPLS BGP-Based Autodiscovery 339**

Restrictions for VPLS	339
Information About VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport	340
VPLS Overview	340
About Full-Mesh Configuration	340
About VPLS BGP-Based Autodiscovery	341
About Flow-Aware Transport Pseudowire	341
Interoperability Between Cisco Catalyst 6000 Series Switches and Cisco Catalyst 9000 Series Switches	342
IGMP or MLD Snooping over VPLS	343
How to Configure VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport	343
Configuring Layer 2 PE Device Interfaces to CE Devices	343
Configuring 802.1Q Trunks on a PE Device for Tagged Traffic from a CE Device	343
Configuring 802.1Q Access Ports on a PE Device for Untagged Traffic from a CE Device	345
Configuring Layer 2 VLAN Instances on a PE Device	346
Configuring VPLS	346
Configuring VPLS in Xconnect Mode	346
Configuring VPLS in Protocol-CLI Mode	349
Configuring VPLS BGP-based Autodiscovery	357
Enabling VPLS BGP-based Autodiscovery	357
Configuring BGP to Enable VPLS Autodiscovery	357
Configuring VPLS BGP-based Autodiscovery in Protocol-CLI Mode	360
Configuration Examples for VPLS and VPLS BGP-Based Autodiscovery	363
Example: Configuring VPLS in Xconnect Mode	363
Examples: Verifying VPLS Configured in Xconnect Mode	364
Example: Configuring VPLS Flow-Aware Transport Using a Template (in Protocol-CLI Mode)	366
Example: Configuring VPLS BGP-Auto Discovery	367
Example: Verifying VPLS BGP-Auto Discovery	367
Feature History for VPLS and VPLS BGP-Based Autodiscovery	368
<hr/>	
CHAPTER 24	Configuring Hierarchical VPLS with MPLS Access 371
	Prerequisites for Configuring Hierarchical VPLS with MPLS Access 371
	Restrictions for Configuring Hierarchical VPLS with MPLS Access 371
	Information About Configuring Hierarchical VPLS with MPLS Access 372
	About Hierarchical VPLS with MPLS Access 372

Features that Support Hierarchical VPLS with MPLS Access Configuration	373
How to Configure Hierarchical VPLS with MPLS Access	373
Configuring VPLS (Protocol-CLI Method) on an N-PE Device	373
Configuring EoMPLS VLAN (Xconnect Method) on an U-PE Device	375
Configuration Examples for Hierarchical VPLS with MPLS Access	376
Additional References for Configuring Hierarchical VPLS with MPLS Access	378
Feature History for Configuring Hierarchical VPLS with MPLS Access	378

CHAPTER 25**Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast 379**

Restrictions for Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast	379
Information About VPLS: Routed Pseudowire IRB for IPv4 Unicast	379
About VPLS: Routed Pseudowire IRB for IPv4 Unicast	379
Centralized Integrated Routing and Bridging	380
Distributed Integrated Routing and Bridging	380
Features Supported with VPLS: Routed Pseudowire IRB for IPv4 Unicast	381
Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast	382
Example: Configuring Distributed IRB	382
Feature History for Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast	383

CHAPTER 26**Configuring VPLS MAC Address Withdrawal 385**

VPLS MAC Address Withdrawal	385
Feature History for VPLS MAC Address Withdrawal	386

CHAPTER 27**Configuring MPLS VPN Route Target Rewrite 387**

Prerequisites for MPLS VPN Route Target Rewrite	387
Restrictions for MPLS VPN Route Target Rewrite	387
Information About MPLS VPN Route Target Rewrite	387
Route Target Replacement Policy	387
Route Maps and Route Target Replacement	388
How to Configure MPLS VPN Route Target Rewrite	388
Configuring a Route Target Replacement Policy	388
Applying the Route Target Replacement Policy	392
Associating Route Maps with Specific BGP Neighbors	392
Verifying the Route Target Replacement Policy	394

Configuration Examples for MPLS VPN Route Target Rewrite 395

Multiprotocol Label Switching

This module describes Multiprotocol Label Switching (MPLS) and how to configure it on Cisco switches.

Restrictions for Multiprotocol Label Switching

- MPLS fragmentation is not supported.
- MPLS maximum transmission unit (MTU) is not supported.
- Cisco Catalyst 9500X Series Switches only supports the per-VRF MPLS label allocation mode for local label allocation. This is also the default mode. However, Cisco Catalyst 9500X Series Switches can interoperate with remote peers operating in the per-prefix mode.

Information about Multiprotocol Label Switching

MPLS combines the performance and capabilities of Layer 2 (data link layer) switching with the proven scalability of Layer 3 (network layer) routing. MPLS enables you to meet the challenges of explosive growth in network utilization while providing the opportunity to differentiate services without sacrificing the existing network infrastructure. The MPLS architecture is flexible and can be employed in any combination of Layer 2 technologies. MPLS support is offered for all Layer 3 protocols, and scaling is possible well beyond that typically offered in today's networks.

Functional Description of Multiprotocol Label Switching

Label switching is a high-performance packet forwarding technology that integrates the performance and traffic management capabilities of data link layer (Layer 2) switching with the scalability, flexibility, and performance of network layer (Layer 3) routing.

Functions of Label Switching

In conventional Layer 3 forwarding mechanisms, as a packet traverses the network, each switch extracts all the information relevant to forwarding the packet from the Layer 3 header. This information is then used as an index for a routing table lookup to determine the next hop for the packet.

In the most common case, the only relevant field in the header is the destination address field, but in some cases, other header fields might also be relevant. As a result, the header analysis must be done independently at each switch through which the packet passes. In addition, a complicated table lookup must also be done at each switch.

In label switching, the analysis of the Layer 3 header is done only once. The Layer 3 header is then mapped into a fixed length, unstructured value called a *label*.

Many different headers can map to the same label, as long as those headers always result in the same choice of next hop. In effect, a label represents a *forwarding equivalence class*--that is, a set of packets which, however different they may be, are indistinguishable by the forwarding function.

The initial choice of a label need not be based exclusively on the contents of the Layer 3 packet header; for example, forwarding decisions at subsequent hops can also be based on routing policy.

After a label is assigned, a short label header is added at the front of the Layer 3 packet. This header is carried across the network as part of the packet. At subsequent hops through each MPLS switch in the network, labels are swapped and forwarding decisions are made by means of MPLS forwarding table lookup for the label carried in the packet header. Hence, the packet header does not need to be reevaluated during packet transit through the network. Because the label is of fixed length and unstructured, the MPLS forwarding table lookup process is both straightforward and fast.

Distribution of Label Bindings

Each label switching router (LSR) in the network makes an independent, local decision as to which label value to use to represent a forwarding equivalence class. This association is known as a label binding. Each LSR informs its neighbors of the label bindings it has made. This awareness of label bindings by neighboring switches is facilitated by the following protocols:

- Label Distribution Protocol (LDP)--enables peer LSRs in an MPLS network to exchange label binding information for supporting hop-by-hop forwarding in an MPLS network
- Border Gateway Protocol (BGP)--Used to support MPLS virtual private networks (VPNs)

When a labeled packet is being sent from LSR A to the neighboring LSR B, the label value carried by the IP packet is the label value that LSR B assigned to represent the forwarding equivalence class of the packet. Thus, the label value changes as the IP packet traverses the network.

For more information about LDP configuration, see the see MPLS: LDP Configuration Guide at http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/mpls/config_library/xe-3s/mp-xe-3s-library.html

Note As the scale of label entries is limited in, especially with ECMP, it is recommended to enable LDP label filtering. LDP labels shall be allocated only for well known prefixes like loopback interfaces of routers and any prefix that needs to be reachable in the global routing table.

MPLS Layer 3 VPN

A MPLS VPN consists of a set of sites that are interconnected by means of an MPLS provider core network. At each customer site, one or more customer edge (CE) routers attach to one or more provider edge (PE) routers.

Before configuring MPLS Layer 3 VPNs, you should have MPLS, LDP, and Cisco Express Forwarding (CEF) installed in your network. All routers in the core, including the PE routers, must be able to support CEF and MPLS forwarding.

Classifying and Marking MPLS QoS EXP

The QoS EXP Matching feature allows you to organize network traffic by setting values for the MPLS EXP field in MPLS packets. By choosing different values for the MPLS EXP field, you can mark packets so that packets have the priority that they require during periods of congestion. Setting the MPLS EXP value allows you to:

- **Classify traffic:** The classification process selects the traffic to be marked. Classification accomplishes this by partitioning traffic into multiple priority levels, or classes of service. Traffic classification is the primary component of class-based QoS provisioning.
- **Police and mark traffic:** Policing causes traffic that exceeds the configured rate to be discarded or marked to a different drop level. Marking traffic is a way to identify packet flows to differentiate them. Packet marking allows you to partition your network into multiple priority levels or classes of service.

Restrictions for classifying and marking MPLS QoS EXP

- Only Uniform mode and Pipe mode are supported; Short-pipe mode is not supported.
- Support range of QoS-group values range between 0 and 30. (Total 31 QoS-groups).
- EXP marking using QoS policy is supported only on the outer label; inner EXP marking is not supported.

LAN MACsec over MPLS

From the Cisco IOS XE Dublin 17.11.1 release, MPLS packets can be encrypted with a MACsec tag. Media Access Control security (MACsec) protocol is a IEEE 802.1AE standard for authenticating and encrypting packets between two MACsec-capable devices. To use MPLS with MACsec both MPLS and MACsec need to be configured on both the devices. When an MPLS packet is forwarded by one device, the MPLS packet is treated as the inner payload and is encrypted with a MACsec tag. This encrypted packet is then securely forwarded to the other device. MACsec encryption safeguards the network against a range of attacks including denial of service, intrusion, man-in-the-middle and eavesdropping. The other device receives the MACsec tagged MPLS packet. It decrypts the MACsec tag and forwards the MPLS packet.

How to Configure Multiprotocol Label Switching

This section explains how to perform the basic configuration required to prepare a switch for MPLS switching and forwarding.

Configuring a Switch for MPLS Switching

Before you configure MPLS switching on Cisco switches, ensure that the Cisco Express Forwarding (CEF) is enabled.

Note The command **ip unnumbered** is not supported in MPLS configuration.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip cef distributed Example: Device(config)# ip cef distributed	Enables Cisco Express Forwarding on the switch.
Step 4	mpls label range <i>minimum-value</i> <i>maximum-value</i> Example: Device(config)# mpls label range 16 4096	Configure the range of local labels available for use with MPLS applications on packet interfaces.
Step 5	mpls label protocol ldp Example: Device(config)# mpls label protocol ldp	Specifies the label distribution protocol for the platform.

Configuring a Switch for MPLS Forwarding

Before you configure MPLS forwarding on Cisco switches, ensure that the forwarding of IPv4 packets is enabled.

Note The command **ip unnumbered** is not supported in MPLS configuration.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface <i>type slot/subslot /port</i> Example: Device(config)# <code>interface gigabitethernet 1/0/0</code>	Specifies the Gigabit Ethernet interface and enters interface configuration mode. For Switch Virtual Interface (SVI), the example is Device(config)# <code>interface vlan 1000</code>
Step 4	mpls ip Example: Device(config-if)# <code>mpls ip</code>	Enables MPLS forwarding of IPv4 packets along routed physical interfaces (Gigabit Ethernet), Switch Virtual Interface (SVI), or port channels.
Step 5	mpls label protocol ldp Example: Device(config-if)# <code>mpls label protocol ldp</code>	Specifies the label distribution protocol for an interface. Note MPLS LDP cannot be enabled on a Virtual Routing and Forwarding (VRF) interface.
Step 6	end Example: Device(config-if)# <code>end</code>	Exits interface configuration mode and returns to privileged EXEC mode.

How to Verify Multiprotocol Label Switching Configuration

This section explains how to verify successful configuration of MPLS switching and forwarding.

Verifying Configuration of MPLS Switching

To verify whether Cisco Express Forwarding has been configured properly, enter the **show ip cef summary** command, which generates output similar to that shown below:

Procedure

show ip cef summary

Example:

```
Device# show ip cef summary

IPv4 CEF is enabled for distributed and running
VRF Default
 150 prefixes (149/1 fwd/non-fwd)
 Table id 0x0
 Database epoch:      4 (150 entries at this epoch)
Device#
```

Verifying Configuration of MPLS Forwarding

To verify whether MPLS forwarding has been configured properly, enter the **show mpls interfaces detail** command, which generates output similar to that shown below:

Note The MPLS MTU value is equivalent to the IP MTU value of the port or switch by default. MTU configuration for MPLS is not supported.

Procedure

Step 1 **show mpls interfaces detail**

Example:

```
For physical (Gigabit Ethernet) interface:
Device# show mpls interfaces detail interface GigabitEthernet 1/0/0

Type Unknown
IP labeling enabled
LSP Tunnel labeling not enabled
IP FRR labeling not enabled
```

```

BGP labeling not enabled
MPLS not operational
MTU = 1500

```

```

For Switch Virtual Interface (SVI):
Device# show mpls interfaces detail interface Vlan1000

```

```

Type Unknown
IP labeling enabled (ldp) :
  Interface config
LSP Tunnel labeling not enabled
IP FRR labeling not enabled
BGP labeling not enabled
MPLS operational
MTU = 1500

```

Step 2 **show running-config interface**

Example:

```

For physical (Gigabit Ethernet) interface:
Device# show running-config interface interface GigabitEthernet 1/0/0

```

```

Building configuration...

```

```

Current configuration : 307 bytes
!
interface TenGigabitEthernet1/0/0
no switchport
ip address xx.xx.x.x xxx.xxx.xxx.x
mpls ip
mpls label protocol ldp
end

```

```

For Switch Virtual Interface (SVI):
Device# show running-config interface interface Vlan1000

```

```

Building configuration...

```

```

Current configuration : 187 bytes
!
interface Vlan1000
ip address xx.xx.x.x xxx.xxx.xxx.x
mpls ip
mpls label protocol ldp
end

```

Step 3 **show mpls forwarding**

Example:

```

For physical (Gigabit Ethernet) interface:

```

```

Device# show mpls forwarding-table

```

Local Label	Outgoing Label	Prefix or Tunnel Id	Bytes Switched	Label	Outgoing interface	Next Hop
500	No Label	l2ckt(3)	0		Gi3/0/22	point2point
501	No Label	l2ckt(1)	12310411816789	none		point2point
502	No Label	l2ckt(2)	0		none	point2point

Feature History for Multiprotocol Label Switching

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	Multiprotocol Label Switching	Multiprotocol Label Switching combines the performance and capabilities of Layer 2 (data link layer) switching with the proven scalability of Layer 3 (network layer) routing.
Cisco IOS XE Cupertino 17.7.1	Multiprotocol Label Switching	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Release	Feature	Feature Information
Cisco IOS XE Dublin 17.11.1	LAN MACsec over MPLS	LAN MACsec over MPLS allows MPLS packets to be encrypted with a MACsec tag. This allows for the flexibility and capability of MPLS to be used with the encryption and security of MACsec.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

CHAPTER 2

Configuring eBGP and iBGP Multipath

- [BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN, on page 11](#)
- [Information About BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN, on page 12](#)
- [How to Configure BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN, on page 14](#)
- [Configuration Examples for the BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN, on page 15](#)
- [Feature History for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN, on page 16](#)

BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

The BGP Multipath Load Sharing for eBGP and iBGP feature allows you to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in Border Gateway Protocol (BGP) networks that are configured to use Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). This feature provides improved load balancing deployment and service offering capabilities and is useful for multi-homed autonomous systems and Provider Edge (PE) routers that import both eBGP and iBGP paths from multihomed and stub networks.

Prerequisites for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

Cisco Express Forwarding (CEF) or distributed CEF (dCEF) must be enabled on all participating devices.

Restrictions for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

Address Family Support

This feature is configured on a per VPN routing and forwarding instance (VRF) basis. This feature can be configured under both IPv4 and IPv6 VRF address families.

Memory Consumption Restriction

Each BGP multipath routing table entry will use additional memory. We recommend that you do not use this feature on a device with a low amount of available memory and especially if the device carries full Internet routing tables.

Number of Paths Limitation

- The number of paths supported are limited to 2 BGP multipaths. This could either be 2 iBGP multipaths or 1 iBGP multipath and 1 eBGP multipath.
- If pairing of equal cost routing is more than 64 unique paths, the routes are not learnt and traffic is dropped.

Unsupported Commands

`ip unnumbered` command is not supported in MPLS configuration.

Information About BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

Multipath Load Sharing Between eBGP and iBGP

A BGP routing process will install a single path as the best path in the routing information base (RIB) by default. The **maximum-paths** command allows you to configure BGP to install multiple paths in the RIB for multipath load sharing. BGP uses the best path algorithm to select a single multipath as the best path and advertise the best path to BGP peers.

Note The valid values for the **maximum-paths** command range from 1 to 32. However, the maximum value that can be configured is 2.

Load balancing over the multipaths is performed by CEF. CEF load balancing is configured on a per-packet round robin or on a per session (source and destination pair) basis. For information about CEF, see [IP Switching Cisco Express Forwarding Configuration Guide](#). The BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature is enabled under the IPv4 VRF address family and IPv6 VRF address family configuration modes. When enabled, this feature can perform load balancing on eBGP and/or iBGP paths that are imported into the VRF. The number of multipaths is configured on a per VRF basis. Separate VRF multipath configurations are isolated by unique route distinguisher.

Note The BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature operates within the parameters of configured outbound routing policy.

eBGP and iBGP Multipath Load Sharing in a BGP MPLS Network

The following figure shows a service provider BGP MPLS network that connects two remote networks to PE router 1 and PE router 2. PE router 1 and PE router 2 are both configured for VPNv4 unicast iBGP peering. Network 2 is a multihomed network that is connected to PE router 1 and PE router 2. Network 2 also has extranet VPN services configured with Network 1. Both Network 1 and Network 2 are configured for eBGP peering with the PE routers.

Figure 1: Service Provider BGP MPLS Network Connected to PE Routers

PE router 1 can be configured with the BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature so that both iBGP and eBGP paths can be selected as multipaths and imported into the VRF. The multipaths will be used by CEF to perform load balancing. IP traffic that is sent from Network 1 to Network 2, PE router 1 will Load Share with eBGP paths as IP traffic & iBGP path will be sent as MPLS traffic.

Note

- eBGP session between local CE & local PE is not supported.
- eBGP session from a local PE to a remote CE is supported.
- eiBGP Multipath is supported in per prefix label allocation mode only. It is not supported in other label allocation modes.

Benefits of Multipath Load Sharing for Both eBGP and iBGP

The BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN feature allows multihomed autonomous systems and PE routers to be configured to distribute traffic across both eBGP and iBGP paths.

How to Configure BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

This section contains the following procedures:

Configuring Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">• Enter your password if prompted.
Step 2	configure { terminal memory network } Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp as-number Example: Device(config)# router bgp 40000	Enters router configuration mode to create or configure a BGP routing process.
Step 4	neighbor {ip-address ipv6-address peer-group-name } Example: Device(config-router)# neighbor group192	Accepts and attempts BGP connections to external peers residing on networks that are not directly connected.
Step 5	address-family ipv4 vrfvrf-name Example: Device(config-router)# address-family ipv4 vrf RED	Places the router in address family configuration mode. <ul style="list-style-type: none">• Separate VRF multipath configurations are isolated by unique route distinguisher.
Step 6	address-family ipv6 vrfvrf-name Example: Device(config-router)# address-family ipv6 vrf RED	Places the router in address family configuration mode. <ul style="list-style-type: none">• Separate VRF multipath configurations are isolated by unique route distinguisher.
Step 7	neighbor {ip-address ipv6-address peer-group-name } update-source interface-type interface-name Example:	Specifies the link-local address over which the peering is to occur.

	Command or Action	Purpose
	Device(config-router)# neighbor FE80::1234:BFF:FE0E:A471 update-source GigabitEthernet 1/0/0	
Step 8	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } activate Example: (config-router)# neighbor group192 activate	Activates the neighbor or listen range peer group for the configured address family.
Step 9	maximum-paths eibgp [<i>import-number</i>] Example: (config-router-af)# maximum-paths eibgp 2	Configures the number of parallel iBGP and eBGP routes that can be installed into a routing table.

Verifying Multipath Load Sharing for Both eBGP and iBGP

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	show ip bgp neighbors Example: Device# show ip bgp neighbors	Displays information about the TCP and BGP connections to neighbors.
Step 3	show ip bgp vpnv4 vrf <i>vrf name</i> Example: Device# show ip bgp vpnv4 vrf RED	Displays VPN address information from the BGP table. This command is used to verify that the VRF has been received by BGP.
Step 4	show ip route vrf <i>vrf-name</i> Example: Device# show ip route vrf RED	Displays the IP routing table associated with a VRF instance. The show ip route vrf command is used to verify that the VRF is in the routing table.

Configuration Examples for the BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

The following examples show how to configure and verify this feature:

Example: Configuring eBGP and iBGP Multipath Load Sharing

This following configuration example configures a router in IPv4 address-family mode to select two BGP routes (eBGP or iBGP) as multipaths:

```
Device(config)# router bgp 40000  
Device(config-router)# address-family ipv4 vrf RED  
Device(config-router-af)# maximum-paths eibgp 2  
Device(config-router-af)# end
```

This following configuration example configures a router in IPv6 address-family mode to select two BGP routes (eBGP or iBGP) as multipaths:

```
Device(config)#router bgp 40000  
Device(config-router)# address-family ipv6 vrf RED  
Device(config-router-af)# maximum-paths eibgp 2  
Device(config-router-af)# end
```

Feature History for BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS VPN

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN	<p>The BGP Multipath Load Sharing for eBGP and iBGP feature allows you to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in Border Gateway Protocol (BGP) networks that are configured to use Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). This feature provides improved load balancing deployment and service offering capabilities and is useful for multi-homed autonomous systems and Provider Edge (PE) routers that import both eBGP and iBGP paths from multihomed and stub networks.</p> <p>Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.</p>
Cisco IOS XE Fuji 16.9.1	BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN	<p>Support for this feature was introduced only on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.</p>

CHAPTER 3

Configuring EIGRP MPLS VPN PE-CE Site of Origin

- [EIGRP MPLS VPN PE-CE Site of Origin, on page 19](#)
- [Information About EIGRP MPLS VPN PE-CE Site of Origin, on page 20](#)
- [How to Configure EIGRP MPLS VPN PE-CE Site of Origin Support, on page 21](#)
- [Configuration Examples for EIGRP MPLS VPN PE-CE SoO, on page 24](#)
- [Feature History for EIGRP MPLS VPN PE-CE Site of Origin, on page 25](#)

EIGRP MPLS VPN PE-CE Site of Origin

The EIGRP MPLS VPN PE-CE Site of Origin feature introduces the capability to filter Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) traffic on a per-site basis for Enhanced Interior Gateway Routing Protocol (EIGRP) networks. Site of Origin (SOO) filtering is configured at the interface level and is used to manage MPLS VPN traffic and to prevent transient routing loops from occurring in complex and mixed network topologies. This feature is designed to support the MPLS VPN Support for EIGRP Between Provider Edge (PE) and Customer Edge (CE) feature. Support for backdoor links is provided by this feature when installed on PE routers that support EIGRP MPLS VPNs.

Prerequisites for EIGRP MPLS VPN PE-CE Site of Origin

This document assumes that Border Gateway Protocol (BGP) is configured in the network core (or the service provider backbone). The following tasks will also need to be completed before you can configure this feature:

- This feature was introduced to support the MPLS VPN Support for EIGRP Between PE-CE (provider edge-customer edge) feature and should be configured after the EIGRP MPLS VPN is created.
- All PE routers that are configured to support the EIGRP MPLS VPN must run Cisco IOS XE Gibraltar 16.11.1 or a later release, which provides support for the SOO extended community.

Restrictions for EIGRP MPLS VPN PE-CE Site of Origin

- If a VPN site is partitioned and the SOO extended community attribute is configured on a backdoor router interface, the backdoor link cannot be used as an alternate path to reach prefixes originated in other partitions of the same site

- A unique SOO value must be configured for each individual VPN site. The same value must be configured on all provider edge and customer edge interfaces (if SOO is configured on the CE routers) that support the same VPN site.
- `ip unnumbered` command is not supported in MPLS configuration.

Information About EIGRP MPLS VPN PE-CE Site of Origin

The following section describes information about EIGRP MPLS VPN PE-CE Site of Origin.

EIGRP MPLS VPN PE-CE Site of Origin Support Overview

The EIGRP MPLS VPN PE-CE Site of Origin feature introduces SOO support for EIGRP-to-BGP and BGP-to-EIGRP redistribution. The SOO extended community is a BGP extended community attribute that is used to identify routes that have originated from a site so that the readvertisement of that prefix back to the source site can be prevented. The SOO extended community uniquely identifies the site from which a PE router has learned a route. SOO support provides the capability to filter MPLS VPN traffic on a per-EIGRP-site basis. SOO filtering is configured at the interface level and is used to manage MPLS VPN traffic and to prevent routing loops from occurring in complex and mixed network topologies, such as EIGRP VPN sites that contain both VPN and backdoor links.

The configuration of the SOO extended community allows MPLS VPN traffic to be filtered on a per-site basis. The SOO extended community is configured in an inbound BGP route map on the PE router and is applied to the interface. The SOO extended community can be applied to all exit points at the customer site for more specific filtering but must be configured on all interfaces of PE routers that provide VPN services to CE routers.

Site of Origin Support for Backdoor Links

The EIGRP MPLS VPN PE-CE Site of Origin (SoO) feature introduces support for backdoor links. A backdoor link or a route is a connection that is configured outside of the VPN between a remote and main site; for example, a WAN leased line that connects a remote site to the corporate network. Backdoor links are typically used as back up routes between EIGRP sites if the VPN link is down or not available. A metric is set on the backdoor link so that the route through the backdoor router is not selected unless there is a VPN link failure.

The SOO extended community is defined on the interface of the backdoor router. It identifies the local site ID, which should match the value that is used on the PE routers that support the same site. When the backdoor router receives an EIGRP update (or reply) from a neighbor across the backdoor link, the router checks the update for an SOO value. If the SOO value in the EIGRP update matches the SOO value on the local backdoor interface, the route is rejected and not added to the EIGRP topology table. This scenario typically occurs when the route with the local SOO value in the received EIGRP update was learned by the other VPN site and then advertised through the backdoor link by the backdoor router in the other VPN site. SOO filtering on the backdoor link prevents transient routing loops from occurring by filtering out EIGRP updates that contain routes that carry the local site ID.

If this feature is enabled on the PE routers and the backdoor routers in the customer sites, and SOO values are defined on both the PE and backdoor routers, both the PE and backdoor routers will support convergence between the VPN sites. The other routers in the customer sites need only propagate the SOO values carried by the routes, as the routes are forwarded to neighbors. These routers do not otherwise affect or support convergence beyond normal Diffusing Update Algorithm (DUAL) computations.

Router Interoperation with the Site of Origin Extended Community

The configuration of an SOO extended community allows routers that support EIGRP MPLS VPN PE-CE Site of Origin feature to identify the site from which each route originated. When this feature is enabled, the EIGRP routing process on the PE or CE router checks each received route for the SOO extended community and filters based on the following conditions:

- A received route from BGP or a CE router contains an SOO value that matches the SOO value on the receiving interface : If a route is received with an associated SOO value that matches the SOO value that is configured on the receiving interface, the route is filtered because it was learned from another PE router or from a backdoor link. This behavior is designed to prevent routing loops.
- A received route from a CE router is configured with an SOO value that does not match: If a route is received with an associated SOO value that does not match the SOO value that is configured on the receiving interface, the route is added to the EIGRP topology table so that it can be redistributed into BGP. If the route is already installed to the EIGRP topology table but is associated with a different SOO value, the SOO value from the topology table will be used when the route is redistributed into BGP.
- A received route from a CE router does not contain an SOO value: If a route is received without a SOO value, the route is accepted into the EIGRP topology table, and the SOO value from the interface that is used to reach the next hop CE router is appended to the route before it is redistributed into BGP.

When BGP and EIGRP peers that support the SOO extended community receive these routes, they will also receive the associated SOO values and pass them to other BGP and EIGRP peers that support the SOO extended community. This filtering is designed to prevent transient routes from being relearned from the originating site, which prevents transient routing loops from occurring.

Redistribution of BGP VPN Routes That Carry the Site of Origin into EIGRP

When an EIGRP routing process on a PE router redistributes BGP VPN routes into an EIGRP topology table, EIGRP extracts the SOO value (if one is present) from the appended BGP extended community attributes and appends the SOO value to the route before adding it to the EIGRP topology table. EIGRP tests the SOO value for each route before sending updates to CE routers. Routes that are associated with SOO values that match the SOO value configured on the interface are filtered out before they are passed to the CE routers. When an EIGRP routing process receives routes that are associated with different SOO values, the SOO value is passed to the CE router and carried through the CE site.

Benefits of the EIGRP MPLS VPN PE-CE Site of Origin Support

The configuration of the EIGRP MPLS VPN PE-CE Site of Origin Support feature introduces per-site VPN filtering, which improves support for complex topologies, such as MPLS VPNs with backdoor links, CE routers that are dual-homed to different PE routers, and PE routers that support CE routers from different sites within the same virtual routing and forwarding (VRF) instance.

How to Configure EIGRP MPLS VPN PE-CE Site of Origin Support

The following sections provide information about how to configure EIGRP MPLS VPN PE-CE Site of Origin Support:

Configuring the Site of Origin Extended Community

The configuration of the SoO extended community allows MPLS VPN traffic to be filtered on a per-site basis. The SoO extended community is configured in an inbound BGP route map on the PE router and is applied to the interface. The SoO extended community can be applied to all exit points at the customer site for more specific filtering but must be configured on all interfaces of PE routers that provide VPN services to CE routers.

Before you begin

- Confirm that the Border Gateway Protocol (BGP) is configured in the network core (or the service provider backbone).
- Configure an EIGRP MPLS VPN before configuring this feature.
- All PE routers that are configured to support the EIGRP MPLS VPN must support the SoO extended community.
- A unique SoO value must be configured for each VPN site. The same value must be used on the interface of the PE router that connects to the CE router for each VPN site.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	route-map <i>map-name</i> { permit deny } [<i>sequence-number</i>] Example: Device(config)# route-map Site-of-Origin permit 10	Enters route-map configuration mode and creates a route map. <ul style="list-style-type: none"> • The route map is created in this step so that SoO extended community can be applied.
Step 4	set extcommunity soo <i>extended-community-value</i> Example: Device(config-route-map)# set extcommunity soo 100:1	Sets BGP extended community attributes. <ul style="list-style-type: none"> • The soo keyword specifies the site of origin extended community attribute. • The extended-community-value argument specifies the value to be set. The value can be one of the following formats: <ul style="list-style-type: none"> • autonomous-system-number: network-number • ip-address: network-number

	Command or Action	Purpose
		The colon is used to separate the autonomous system number and network number or IP address and network number.
Step 5	exit Example: Device(config-route-map)# exit	Exits route-map configuration mode and enters global configuration mode.
Step 6	interface <i>type number</i> Example: Device(config)# interface GigabitEthernet 1/0/1	Enters interface configuration mode to configure the specified interface.
Step 7	no switchport Example: Device(config-if)# no switchport	causes the interface to cease operating as a Layer 2 port and become a Cisco-routed (Layer 3) port:
Step 8	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding VRF1	Associates the VRF with an interface or subinterface. <ul style="list-style-type: none"> The VRF name configured in this step should match the VRF name created for the EIGRP MPLS VPN with the MPLS VPN Support for EIGRP Between Provider Edge and Customer Edge feature.
Step 9	ip vrf sitemap <i>route-map-name</i> Example: Device(config-if)# ip vrf sitemap Site-of-Origin	Associates the VRF with an interface or subinterface. <ul style="list-style-type: none"> The route map name configured in this step should match the route map name created to apply the SoO extended community in Step 3.
Step 10	ip address <i>ip-address subnet-mask</i> Example: Device(config-if)# ip address 10.0.0.1 255.255.255.255	Configures the IP address for the interface. <ul style="list-style-type: none"> The IP address needs to be reconfigured after enabling VRF forwarding.
Step 11	end Example: Device(config-if)# end	Exits interface configuration mode and enters privileged EXEC mode.

What to do next

- For mixed EIGRP MPLS VPN network topologies that contain backdoor routes, the next task is to configure the “prebest path” cost community for backdoor routes.

Verifying the Configuration of the SoO Extended Community

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip bgp vpnv4 <i>{all rd route-distinguisher vrf vrf-name} [ip-prefix/length]</i> Example: Device# ip bgp vpnv4 vrf SOO-1 20.2.1.1/32	Displays VPN address information from the BGP table. <ul style="list-style-type: none"> • Use the show ip bgp vpnv4 command with the all keyword to verify that the specified route has been configured with the SoO extended community attribute.

Configuration Examples for EIGRP MPLS VPN PE-CE SoO

The following section shows configuration examples for EIGRP MPLS VPN PE-CE SoO:

Example Configuring the Site of Origin Extended Community

The following example, beginning in global configuration mode, configures SoO extended community on an interface:

```

route-map Site-of-Origin permit 10
  set extcommunity soo 100:1
exit
GigabitEthernet1/0/1
vrf forwarding RED
ip vrf sitemap Site-of-Origin
ip address 10.0.0.1 255.255.255.255
end

```

Example Verifying the Site of Origin Extended Community

The following example shows VPN address information from the BGP table and verifies the configuration of the SoO extended community:

```

Device# show ip bgp vpnv4 all 10.0.0.1
  BGP routing table entry for 100:1:10.0.0.1/32, version 6
  Paths: (1 available, best #1, no table)
  Advertised to update-groups:
  1
  100 300
  192.168.0.2 from 192.168.0.2 (172.16.13.13)
  Origin incomplete, localpref 100, valid, external, best
  Extended Community: SOO:100:1

```

Show command Customer Edge Device

```
Device# show ip eigrp topo 20.2.1.1/32
EIGRP-IPv4 Topology Entry for AS(30)/ID(30.0.0.1) for 20.2.1.1/32
  State is Passive, Query origin flag is 1, 2 Successor(s), FD is 131072
  Descriptor Blocks:
    31.1.1.2 (GigabitEthernet1/0/13), from 31.1.1.2, Send flag is 0x0
      Composite metric is (131072/130816), route is External
      Vector metric:
        Minimum bandwidth is 1000000 Kbit
        Total delay is 5020 microseconds
        Reliability is 255/255
        Load is 1/255
        Minimum MTU is 1500
        Hop count is 2
        Originating router is 30.0.0.2
      Extended Community: SoO:100:1
  External data:
    AS number of route is 0
    External protocol is Connected, external metric is 0
    Administrator tag is 0 (0x00000000)
```

Show command Provider Edge Device

```
Device# show ip eigrp vrf SOO-1 topology 31.1.1.0/24
EIGRP-IPv4 VR(L3VPN) Topology Entry for AS(30)/ID(2.2.2.22)
  Topology(base) TID(0) VRF(SOO-1)
EIGRP-IPv4(30): Topology base(0) entry for 31.1.1.0/24
  State is Passive, Query origin flag is 1, 1 Successor(s), FD is 1310720
  Descriptor Blocks:
    1.1.1.1, from VPNv4 Sourced, Send flag is 0x0
      Composite metric is (1310720/0), route is Internal (VPNv4 Sourced)
      Vector metric:
        Minimum bandwidth is 1000000 Kbit
        Total delay is 10000000 picoseconds
        Reliability is 255/255
        Load is 1/255
        Minimum MTU is 1500
        Hop count is 0
        Originating router is 1.1.1.11
      Extended Community: SoO:100:1
```

Feature History for EIGRP MPLS VPN PE-CE Site of Origin

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	EIGRP MPLS VPN PE-CE Site of Origin	The EIGRP MPLS VPN PE-CE Site of Origin feature introduces the capability to filter Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) traffic on a per-site basis for Enhanced Interior Gateway Routing Protocol (EIGRP) networks. Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Gibraltar 16.11.1	EIGRP MPLS VPN PE-CE Site of Origin	Support for this feature was introduced only on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Cupertino 17.7.1	EIGRP MPLS VPN PE-CE Site of Origin	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

CHAPTER 4

Configuring Ethernet-over-MPLS and Pseudowire Redundancy

- [Configuring Ethernet-over-MPLS, on page 27](#)
- [Configuring Pseudowire Redundancy, on page 42](#)
- [Feature History for Ethernet-over-MPLS and Pseudowire Redundancy, on page 57](#)

Configuring Ethernet-over-MPLS

This section provides information about how to configure Ethernet over Multiprotocol Label Switching (EoMPLS).

Prerequisites for Ethernet-over-MPLS

Before you configure EoMPLS, ensure that the network is configured as follows:

- Configure IP routing in the core so that the provider edge (PE) devices can reach each other through IP.
- Configure MPLS in the core so that a label switched path (LSP) exists between the PE devices.
- Configure the **no switchport**, **no keepalive**, and **no ip address** commands before configuring Xconnect on the attachment circuit.
- For load-balancing, configuring the **port-channel load-balance** command is mandatory.
- Subinterfaces must be supported to enable EoMPLS VLAN mode.
- The **mpls ldp graceful-restart** command must be configured to enable the device to protect LDP bindings and MPLS forwarding state during a disruption in service. We recommend you to configure this command (even if you do not want to preserve the forwarding state) to avoid device failure during SSO in a high availability setup with scale configurations.

Restrictions for Ethernet-over-MPLS

The following sections list the restrictions for EoMPLS port mode and EoMPLS VLAN mode.

Restrictions for Ethernet-over-MPLS Port Mode

- Ethernet Flow Point is not supported.
- Quality of Service (QoS): Customer differentiated services code point (DSCP) re-marking is not supported with virtual private wire service (VPWS) and EoMPLS.
- Virtual Circuit Connectivity Verification (VCCV) ping with explicit null is not supported.
- Layer 2 Protocol Tunneling is not supported.
- Flow-Aware Transport (FAT) Pseudowire Redundancy is supported only in Protocol-CLI mode. Supported load-balancing parameters are Source IP, Source MAC address, Destination IP, and Destination MAC address.
- MPLS QoS is supported only in pipe and uniform mode. Default mode is pipe mode.
- Both legacy Xconnect and Protocol-CLI (interface pseudowire configuration) modes are supported.
- Xconnect mode cannot be configured on SVI.
- Xconnect and MACSec cannot be configured on the same interface.
- MACSec should be configured on CE devices and Xconnect should be configured on PE devices.
- A MACSec session should be available between CE devices.
- By default, EoMPLS PW tunnels all the protocols such as Cisco Discovery Protocol and Spanning Tree Protocol (STP). EoMPLS PW cannot perform selective protocol tunneling as part of L2 Protocol Tunneling CLI.

Restrictions for EoMPLS VLAN Mode

- Virtual circuit will not work if the same interworking type is not configured on PE devices.
- Untagged traffic is not supported as incoming traffic.
- Xconnect mode cannot be enabled on Layer 2 subinterfaces because multiplexer user-network interface (MUX UNI) is not supported.
- Xconnect mode cannot be configured on subinterfaces if it is enabled on the main interface for port-to-port transport.
- FAT can be configured on Protocol CLI mode only.
- In VLAN mode EoMPLS, only those packets encrypted with the dot1q in clear by the CE device will be processed by the PE device.
- QoS: Customer DSCP Remarking is not supported with VPWS and EoMPLS.
- MPLS QoS is supported in pipe and uniform mode. Default mode is pipe mode.
- In VLAN mode EoMPLS, Cisco Discovery Protocol packets from the CE will be processed by the PE, but will not be carried over the EoMPLS virtual circuit, whereas in port mode, Cisco Discovery Protocol packets from the CE will be carried over the virtual circuit.
- Only Ethernet and VLAN interworking types are supported.
- L2 Protocol Tunneling is not supported.

Information About Ethernet-over-MPLS

EoMPLS is one of the Any Transport over MPLS (AToM) transport types. EoMPLS works by encapsulating Ethernet protocol data units (PDUs) in MPLS packets and forwarding them across the MPLS network. Each PDU is transported as a single packet.

The following modes are supported:

- **Port mode:** Allows all traffic on a port to share a single virtual circuit across an MPLS network. Port mode uses virtual circuit type 5.
- **VLAN mode:** Transports Ethernet traffic from a source 802.1Q VLAN to a destination 802.1Q VLAN through a single virtual circuit over an MPLS network. VLAN mode uses virtual circuit type 5 as the default (does not transport dot1q tag); however, uses virtual circuit type 4 (transports dot1 tag) if the remote PE does not support virtual circuit type 5 for subinterface-based (VLAN-based) EoMPLS.

Interworking between EoMPLS port mode and EoMPLS VLAN mode: If EoMPLS port mode is configured on a local PE and EoMPLS VLAN mode on a remote PE, then the customer edge (CE) Layer 2 switchport interface must be configured as an *access* on the port mode side and the Spanning Tree Protocol must be disabled on the VLAN mode side of the CE device.

The maximum transmission unit (MTU) of all the intermediate links between PEs must be able to carry the largest Layer 2 packet received on ingress PE.

Starting with the Cisco IOS XE Bengaluru 17.6.1 release, you can forward Link Aggregation Control Protocol (LACP) and Port Aggregation Protocol (PAgP) packets over Ethernet-over-MPLS Pseudowire in the Port mode.

How to Configure Ethernet-over-MPLS

EoMPLS can be configured in the port mode or VLAN mode.

Configuring Ethernet-over-MPLS Port Mode

EoMPLS port mode can be configured using either the Xconnect mode or protocol CLI method.

Xconnect Mode

To configure EoMPLS port mode in Xconnect mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/36	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no switchport Example: Device(config-if)# no switchport	Enters Layer 3 mode for physical ports only.
Step 5	no ip address Example: Device(config-if)# no ip address	Ensures that no IP address is assigned to the physical port.
Step 6	no keepalive Example: Device(config-if)# no keepalive	Ensures that the device does not send keepalive messages.
Step 7	xconnect <i>peer-device-id</i> <i>vc-id</i> encapsulation mpls Example: Device(config-if)# xconnect 10.1.1.1 962 encapsulation mpls	Binds the attachment circuit to a pseudowire virtual circuit (VC). The syntax for this command is the same as for all other Layer 2 transports.
Step 8	end Example: Device(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Protocol CLI Method

To configure EoMPLS port mode in protocol CLI mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	port-channel load-balance dst-ip Example: Device(config)# port-channel load-balance dst-ip	Sets the load distribution method to the destination IP address.
Step 4	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/21	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 5	no switchport Example: Device(config-if)# no switchport	Enters Layer 3 mode for physical ports only.
Step 6	no ip address Example: Device(config-if)# no ip address	Ensures that no IP address is assigned to the physical port.
Step 7	no keepalive Example: Device(config-if)# no keepalive	Ensures that the device does not send keepalive messages.

	Command or Action	Purpose
Step 8	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode and returns to global configuration mode.
Step 9	interface pseudowire <i>number</i> Example: <pre>Device(config)# interface pseudowire 17</pre>	Establishes a pseudowire interface with a value that you specify and enters pseudowire configuration mode.
Step 10	encapsulation mpls Example: <pre>Device(config-if)# encapsulation mpls</pre>	Specifies the tunneling encapsulation.
Step 11	neighbor <i>peer-ip-addr vc-id</i> Example: <pre>Device(config-if)# neighbor 10.10.0.10 17</pre>	Specifies the peer IP address and virtual circuit (VC) ID value of a Layer 2 VPN (L2VPN) pseudowire.
Step 12	l2vpn xconnect context <i>context-name</i> Example: <pre>Device(config-if)# l2vpn xconnect context vpws17</pre>	Creates an L2VPN cross connect context and enters Xconnect context configuration mode.
Step 13	member <i>interface-id</i> Example: <pre>Device(config-if-xconn)# member TenGigabitEthernet1/0/21</pre>	Specifies interface that forms an L2VPN cross connect.
Step 14	member pseudowire <i>number</i> Example: <pre>Device(config-if-xconn)# member pseudowire 17</pre>	Specifies the pseudowire interface that forms an L2VPN cross connect.

	Command or Action	Purpose
Step 15	end Example: Device (config-if-xconn) # end	Exits Xconnect interface configuration mode and returns to privileged EXEC mode.

Configuring Ethernet-over-MPLS VLAN Mode

EoMPLS VLAN mode can be configured using either the Xconnect mode or protocol-CLI method.

Xconnect Mode

To configure EoMPLS VLAN mode in Xconnect mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface interface-id Example: Device (config)# interface TenGigabitEthernet1/0/36	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no switchport Example: Device (config-if) # no switchport	Enters Layer 3 mode, for physical ports only.
Step 5	no ip address Example: Device (config-if) # no ip address	Ensures that there is no IP address assigned to the physical port.

	Command or Action	Purpose
Step 6	no keepalive Example: Device(config-if)# no keepalive	Ensures that the device does not send keepalive messages.
Step 7	exit Example: Device(config-if)# exit	Exits interface configuration mode and returns to global configuration mode.
Step 8	interface interface-id.subinterface Example: Device(config)# interface TenGigabitEthernet1/0/36.1105	Defines the subinterface to be configured, and enters subinterface configuration mode.
Step 9	encapsulation dot1Q vlan-id Example: Device(config-subif)# encapsulation dot1Q 1105	Enables IEEE 802.1Q encapsulation of traffic on the subinterface.
Step 10	xconnect peer-ip-addr vc-id encapsulation mpls Example: Device(config-subif)# xconnect 10.0.0.1 1105 encapsulation mpls	Binds the attachment circuit to a pseudowire VC. The syntax for this command is the same as for all other Layer 2 transports.
Step 11	end Example: Device(config-subif-xconn)# end	Returns to privileged EXEC mode.

Protocol CLI Method

To configure EoMPLS VLAN mode in protocol-CLI mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	port-channel load-balance dst-ip Example: Device(config)# port-channel load-balance dst-ip	Sets the load-distribution method to the destination IP address.
Step 4	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/36	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 5	no switchport Example: Device(config-if)# no switchport	Enters Layer 3 mode, for physical ports only.
Step 6	no ip address Example: Device(config-if)# no ip address	Ensures that there is no IP address assigned to the physical port.
Step 7	no keepalive Example: Device(config-if)# no keepalive	Ensures that the device does not send keepalive messages.

	Command or Action	Purpose
Step 8	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode and returns to global configuration mode.
Step 9	interface <i>interface-id.subinterface</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36.1105</pre>	Defines the subinterface to be configured, and enters subinterface configuration mode.
Step 10	encapsulation dot1Q <i>vlan-id</i> Example: <pre>Device(config-subif)# encapsulation dot1Q 1105</pre>	Enables IEEE 802.1Q encapsulation of traffic on the subinterface.
Step 11	exit Example: <pre>Device(config-subif)# exit</pre>	Exits subinterface configuration mode and returns to interface configuration mode.
Step 12	interface pseudowire <i>number</i> Example: <pre>Device(config)# interface pseudowire 17</pre>	Establishes a pseudowire interface with a value that you specify and enters pseudowire configuration mode.
Step 13	encapsulation mpls Example: <pre>Device(config-if)# encapsulation mpls</pre>	Specifies the tunneling encapsulation.
Step 14	neighbor <i>peer-ip-addr vc-id</i> Example: <pre>Device(config-if)# neighbor 10.10.0.10 17</pre>	Specifies the peer IP address and VC ID value of a L2VPN pseudowire.

	Command or Action	Purpose
Step 15	l2vpn xconnect context <i>context-name</i> Example: Device (config-if) # l2vpn xconnect context vpws17	Creates a L2VPN cross connect context, and enters Xconnect context configuration mode.
Step 16	member interface-id.subinterface Example: Device (config-if-xconn) # member TenGigabitEthernet1/0/36.1105	Specifies the subinterface that forms a L2VPN cross connect.
Step 17	member pseudowire number Example: Device (config-if-xconn) # member pseudowire 17	Specifies pseudowire interface that forms a L2VPN cross connect.
Step 18	end Example: Device (config-if-xconn) # end	Exits Xconnect configuration mode and returns to privileged EXEC mode.

Configuration Examples for Ethernet-over-MPLS

Figure 2: EoMPLS Topology

Table 3: Interworking Between EoMPLS Port Mode and EoMPLS VLAN Mode Configuration

PE Configuration: Port Mode	CE Configuration: Port Mode
<pre> interface tengigabitethernet 1/0/37 no switchport no ip address no keepalive exit ! interface pseudowire1105 encapsulation mpls neighbor 10.11.11.11 1105 exit ! l2vpn xconnect context vme1105 member tengigabitethernet 1/0/37 member pseudowire1105 end ! </pre>	<pre> interface fortygigabitethernet1/10 switchport switchport mode access switchport access vlan 1105 end no spanning-tree vlan 1105 ! </pre>

PE Configuration: VLAN Mode	CE Configuration: VLAN Mode
<pre>interface tengigabitethernet 1/0/36 no switchport no ip address no keepalive exit ! interface tengigabitethernet 1/0/36.1105 encapsulation dot1Q 1105 exit ! interface pseudowire1105 encapsulation mpls neighbor 10.10.0.10 1105 exit ! l2vpn xconnect context vme1105 member tengigabitethernet 1/0/36.1105 member pseudowire1105 end !</pre>	<pre>interface fortygigabitethernet 1/9 switchport switchport mode trunk switchport trunk allowed vlan 1105 mtu 9216 end no spanning-tree vlan 1105 !</pre>

Another scenario for interworking between EoMPLS port mode and EoMPLS VLAN mode is to configure the following commands on both CE devices:

- **switchport mode trunk**
- **switchport trunk allowed vlan *vlan-id***
- **spanning-tree vlan *vlan-id***

Data traffic will flow through by disabling STP on both CE devices, if the traffic sent is not double VLAN tagged.

The following is a sample output of the **show mpls l2 vc vcid *vc-id* detail** command:

```
Device# show mpls l2 vc vcid 1105 detail

Configuring Pseudowire Redundancy

This section provides information about how to configure pseudowire redundancy.

Prerequisites for Pseudowire Redundancy

- Configure the **no switchport**, **no keepalive**, and **no ip address** before configuring Xconnect mode to connect the attachment circuit.
- For load-balancing, configure the **port-channel load-balance** command.
- Subinterfaces must be supported to enable pseudowire redundancy VLAN mode.

Restrictions for Pseudowire Redundancy

The following sections list the restrictions for pseudowire redundancy port mode and pseudowire redundancy VLAN mode.

Restrictions for Pseudowire Redundancy Port Mode

- Ethernet Flow Point (EFP) and Internet Group Management Protocol (IGMP) Snooping is not supported.
- Flow Label for ECMP load balancing in a core network is based on customer's source IP, destination IP, source MAC and destination MAC.
- MPLS QoS is supported in Pipe and Uniform Mode. Default mode is Pipe Mode.
- QoS: Customer DSCP Re-marking is not supported with VPWS and EoMPLS.
- VCCV Ping with explicit null is not supported.

- The **ip unnumbered** command is not supported in MPLS configuration.
- Not more than one backup pseudowire is supported.
- PW redundancy group switchover is not supported

Restrictions for Pseudowire Redundancy VLAN Mode

- Virtual circuit will not work if the same interworking type is not configured on PE devices.
- Untagged traffic is not supported as incoming traffic.
- Xconnect mode cannot be enabled on Layer 2 subinterfaces because multiplexer user-network interface (MUX UNI) is not supported.
- Xconnect mode cannot be configured on subinterfaces if it is enabled on the main interface for port-to-port transport.
- Flow Aware Transport (FAT) can be configured on Protocol CLI mode only.
- MACsec is not supported on pseudowire redundancy VLAN mode.
- QoS: Customer DSCP Remarking is not supported with VPWS and pseudowire redundancy.
- MPLS QoS is supported only in pipe and uniform mode. Default mode is pipe mode.
- In VLAN mode pseudowire redundancy, Cisco Discovery Protocol packets from the CE will be processed by the PE, but is not carried over the pseudowire redundancy virtual circuit, whereas in port mode, Cisco Discovery Protocol packets from the CE will be carried over the virtual circuit.
- Only Ethernet and VLAN interworking types are supported.
- L2 Protocol Tunneling is not supported.

Information About Pseudowire Redundancy

The L2VPN pseudowire redundancy feature enables you to configure your network to detect a failure in the network and reroute the Layer 2 service to another endpoint that can continue to provide service. This feature provides the ability to recover from a failure either of the remote provider edge (PE) device or of the link between the PE and customer edge (CE) devices.

The maximum transmission unit (MTU) of all the intermediate links between PEs must be able to carry the largest Layer 2 packet received on ingress PE.

Pseudowire redundancy can be configured using both the Xconnect and the protocol CLI method.

How to Configure Pseudowire Redundancy

Pseudowire redundancy can be configured in the port mode or VLAN mode.

Configuring Pseudowire Redundancy Port Mode

Pseudowire redundancy port-mode can be configured using either the Xconnect mode or protocol-CLI method.

Xconnect Mode

To configure pseudowire redundancy port mode in Xconnect mode, perform the following task:

Note To enable load balance, use the corresponding **load-balance** commands from Xconnect Mode procedure of the 'How to Configure Ethernet-over-MPLS section.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface GigabitEthernet1/0/44	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no switchport Example: Device(config-if)# no switchport	Enters Layer 3 mode, for physical ports only.
Step 5	no ip address Example: Device(config-if)# no ip address	Ensures that there is no IP address assigned to the physical port.
Step 6	no keepalive Example: Device(config-if)# no keepalive	Ensures that the device does not send keepalive messages.

	Command or Action	Purpose
Step 7	xconnect <i>peer-device-id</i> <i>vc-id</i> encapsulation mpls Example: Device(config-if)# xconnect 10.1.1.1 117 encapsulation mpls	Binds the attachment circuit to a pseudowire VC. The syntax for this command is the same as for all other Layer 2 transports.
Step 8	backup peer <i>peer-router-ip-addr</i> vcid <i>vc-id</i> [priority <i>value</i>] Example: Device(config-if)# backup peer 10.11.11.11 118 priority 9	Specifies a redundant peer for a pseudowire VC.
Step 9	end Example: Device(config)# end	Exits interface configuration mode and returns to privileged EXEC mode.

Protocol CLI Method

To configure pseudowire redundancy port mode in protocol CLI mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	port-channel load-balance dst-ip Example: Device(config)# port-channel	Sets the load-distribution method to the destination IP address.

	Command or Action	Purpose
	<code>load-balance dst-ip</code>	
Step 4	interface <i>interface-id</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36</pre>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 5	no switchport Example: <pre>Device(config-if)# no switchport</pre>	Enters Layer 3 mode, for physical ports only.
Step 6	no ip address Example: <pre>Device(config-if)# no ip address</pre>	Ensures that there is no IP address assigned to the physical port.
Step 7	no keepalive Example: <pre>Device(config-if)# no keepalive</pre>	Ensures that the device does not send keepalive messages.
Step 8	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode.
Step 9	interface pseudowire <i>number-active</i> Example: <pre>Device(config)# interface pseudowire 17</pre>	Establishes an active pseudowire interface with a value that you specify and enters pseudowire configuration mode.
Step 10	encapsulation mpls Example: <pre>Device(config-if)# encapsulation mpls</pre>	Specifies the tunneling encapsulation.

	Command or Action	Purpose
Step 11	neighbor <i>active-peer-ip-addr vc-id</i> Example: <pre>Device(config-if)# neighbor 10.10.0.10 17</pre>	Specifies the active peer IP address and VC ID value of a L2VPN pseudowire.
Step 12	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode and returns to global configuration mode.
Step 13	interface pseudowire <i>number-standby</i> Example: <pre>Device(config)# interface pseudowire 18</pre>	Establishes a standby pseudowire interface with a value that you specify and enters pseudowire configuration mode.
Step 14	encapsulation mpls Example: <pre>Device(config-if)# encapsulation mpls</pre>	Specifies the tunneling encapsulation.
Step 15	neighbor <i>standby-peer-ip-addr vc-id</i> Example: <pre>Device(config-if)# neighbor 10.10.0.11 18</pre>	Specifies the standby peer IP address and VC ID value of a L2VPN pseudowire.
Step 16	l2vpn xconnect context <i>context-name</i> Example: <pre>Device(config-if)# l2vpn xconnect context vpws17</pre>	Creates a L2VPN cross connect context, and attaches the VLAN mode EoMPLS attachment circuit to the active and standby pseudowire interfaces.
Step 17	member <i>interface-id</i> Example: <pre>Device(config-if-xconn)# member TenGigabitEthernet1/0/36</pre>	Specifies interface that forms a L2VPN cross connect.

	Command or Action	Purpose
Step 18	member pseudowire <i>number-active</i> group <i>group-name</i> [priority <i>value</i>] Example: <pre>Device(config-if-xconn)# member pseudowire 17 group pwr10</pre>	Specifies active pseudowire interface that forms a L2VPN cross connect.
Step 19	member pseudowire <i>number-standby</i> group <i>group-name</i> [priority <i>value</i>] Example: <pre>Device(config-if-xconn)# member pseudowire 18 group pwr10 priority 6</pre>	Specifies standby pseudowire interface that forms a L2VPN cross connect.
Step 20	end Example: <pre>Device(config-if-xconn)# end</pre>	Exits Xconnect configuration mode and returns to privileged EXEC mode.

Configuring Pseudowire Redundancy VLAN Mode

Pseudowire redundancy VLAN mode can be configured using either the Xconnect mode or the protocol CLI method.

Xconnect Mode

To configure pseudowire redundancy VLAN mode in Xconnect mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface <i>interface-id</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36</pre>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no switchport Example: <pre>Device(config-if)# no switchport</pre>	Enters Layer 3 mode for physical ports only.
Step 5	no ip address Example: <pre>Device(config-if)# no ip address</pre>	Ensures that no IP address is assigned to the physical port.
Step 6	no keepalive Example: <pre>Device(config-if)# no keepalive</pre>	Ensures that the device does not send keepalive messages.
Step 7	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode and returns to global configuration mode.
Step 8	interface <i>interface-id.subinterface</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36.1105</pre>	Defines the subinterface to be configured, and enters subinterface configuration mode.
Step 9	encapsulation dot1Q <i>vlan-id</i> Example: <pre>Device(config-subif)# encapsulation dot1Q 1105</pre>	Enables IEEE 802.1Q encapsulation of traffic on the subinterface.

	Command or Action	Purpose
Step 10	xconnect <i>peer-ip-addr</i> <i>vc-id</i> encapsulation mpls Example: <pre>Device(config-subif)# xconnect 10.0.0.1 1105 encapsulation mpls</pre>	Binds the attachment circuit to a pseudowire VC. The syntax for this command is the same as for all other Layer 2 transports.
Step 11	backup peer <i>peer-ip-addr</i> <i>vc-id</i> [priority value] Example: <pre>Device(config-subif-xconn)# backup peer 10.10.10.10 1105 priority 8</pre>	Specifies a redundant peer for the pseudowire VC.
Step 12	end Example: <pre>Device(config-subif-xconn)# end</pre>	Exits Xconnect configuration mode and returns to privileged EXEC mode.

Protocol CLI Method

To configure pseudowire redundancy VLAN mode in protocol CLI mode, perform the following task:

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	port-channel load-balance dst-ip Example: <pre>Device(config)# port-channel load-balance dst-ip</pre>	Sets the load-distribution method to the destination IP address.

	Command or Action	Purpose
Step 4	interface <i>interface-id</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36</pre>	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 5	no switchport Example: <pre>Device(config-if)# no switchport</pre>	Enters Layer 3 mode for physical ports only.
Step 6	no ip address Example: <pre>Device(config-if)# no ip address</pre>	Ensures that there is no IP address assigned to the physical port.
Step 7	no keepalive Example: <pre>Device(config-if)# no keepalive</pre>	Ensures that the device does not send keepalive messages.
Step 8	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode.
Step 9	interface <i>interface-id.subinterface</i> Example: <pre>Device(config)# interface TenGigabitEthernet1/0/36.1105</pre>	Defines the subinterface to be configured, and enters subinterface configuration mode.
Step 10	encapsulation dot1Q <i>vlan-id</i> Example: <pre>Device(config-subif)# encapsulation dot1Q 1105</pre>	Enables IEEE 802.1Q encapsulation of traffic on the subinterface.

	Command or Action	Purpose
Step 11	exit Example: <pre>Device(config-subif)# exit</pre>	Exits subinterface configuration mode.
Step 12	interface pseudowire <i>number-active</i> Example: <pre>Device(config)# interface pseudowire 17</pre>	Establishes an active pseudowire interface with a value that you specify, and enters pseudowire configuration mode.
Step 13	encapsulation mpls Example: <pre>Device(config-if)# encapsulation mpls</pre>	Specifies the tunneling encapsulation.
Step 14	neighbor <i>active-peer-ip-addr vc-id</i> Example: <pre>Device(config-if)# neighbor 10.10.0.10 17</pre>	Specifies the active peer IP address and virtual circuit (VC) ID value of a Layer 2 VPN (L2VPN) pseudowire.
Step 15	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode.
Step 16	interface pseudowire <i>number-standby</i> Example: <pre>Device(config)# interface pseudowire 18</pre>	Establishes a standby pseudowire interface with a value that you specify, and enters pseudowire configuration mode.
Step 17	encapsulation mpls Example: <pre>Device(config-if)# encapsulation mpls</pre>	Specifies the tunneling encapsulation.

	Command or Action	Purpose
Step 18	neighbor <i>standby-peer-ip-addr</i> <i>vc-id</i> Example: <pre>Device(config-if)# neighbor 10.10.0.11 18</pre>	Specifies the standby peer IP address and VC ID value of an L2VPN pseudowire.
Step 19	l2vpn xconnect context <i>context-name</i> Example: <pre>Device(config-if)# l2vpn xconnect context vpws17</pre>	Creates an L2VPN cross-connect context, and attaches the VLAN mode EoMPLS attachment circuit to the active and standby pseudowire interfaces.
Step 20	member <i>interface-id.subinterface</i> Example: <pre>Device(config-if-xconn)# member TenGigabitEthernet1/0/36.1105</pre>	Specifies the interface that forms an L2VPN cross connect.
Step 21	member pseudowire <i>number-active</i> group <i>group-name</i> [<i>priority value</i>] Example: <pre>Device(config-if-xconn)# member pseudowire 17 group pwr10</pre>	Specifies the active pseudowire interface that forms an L2VPN cross connect.
Step 22	member pseudowire <i>number-standby</i> group <i>group-name</i> [<i>priority value</i>] Example: <pre>Device(config-if-xconn)# member pseudowire 18 group pwr10 priority 6</pre>	Specifies standby pseudowire interface that forms an L2VPN cross connect.
Step 23	end Example: <pre>Device(config-if-xconn)# end</pre>	Exits Xconnect configuration mode and returns to privileged EXEC mode.

Feature History for Ethernet-over-MPLS and Pseudowire Redundancy

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	Ethernet-over-MPLS and Pseudowire Redundancy	<p>Ethernet-over-MPLS is one of the Any Transport over MPLS (AToM) transport types. EoMPLS works by encapsulating Ethernet protocol data units (PDUs) in MPLS packets and forwarding them across the MPLS network. Each PDU is transported as a single packet.</p> <p>The L2VPN pseudowire redundancy feature enables you to configure your network to detect a failure in the network and reroute the Layer 2 service to another endpoint that can continue to provide service.</p> <p>Port mode support is introduced.</p> <p>Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.</p>

Release	Feature	Feature Information
Cisco IOS XE Fuji 16.9.1	Ethernet-over-MPLS and Pseudowire Redundancy	Support for this feature was introduced only on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Gibraltar 16.12.1	VLAN support for Ethernet-over-MPLS	EoMPLS VLAN mode can be configured using either the Xconnect mode or protocol-CLI method.
Cisco IOS XE Amsterdam 17.1.1	Macsec over EoMPLS	In VLAN mode EoMPLS, only those packets configured with macsec dot1q-in-clear 1 command on the CE device will be processed by the PE device.
Cisco IOS XE Bengaluru 17.6.1	LACP and PAgP packet forwarding over Ethernet-over-MPLS Pseudowire	Support for forwarding Link Aggregation Control Protocol (LACP) and Port Aggregation Protocol (PAgP) packets over Ethernet-over-MPLS Pseudowire in the Port mode was introduced.
Cisco IOS XE Cupertino 17.7.1	Ethernet-over-MPLS	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Dublin 17.11.1	Pseudowire Redundancy	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

CHAPTER 5

Configuring IPv6 Provider Edge over MPLS (6PE)

- [Prerequisites for 6PE, on page 59](#)
- [Restrictions for 6PE, on page 59](#)
- [Information About 6PE, on page 59](#)
- [IPv6 Explicit Null label for 6PE, on page 60](#)
- [Configuring 6PE, on page 60](#)
- [Configuring IPv6 Explicit Null label for 6PE , on page 63](#)
- [Configuration Examples for 6PE, on page 65](#)
- [Configuration Examples for IPv6 Explicit-Null Label for 6PE , on page 67](#)
- [Feature History for IPv6 Provider Edge over MPLS \(6PE\), on page 67](#)

Prerequisites for 6PE

Redistribute PE-CE IGP IPv6 routes into core BGP and vice-versa

Restrictions for 6PE

eBGP as CE-PE is not supported. Static Routes, OSPFv3, ISIS, RIPv2 are supported as CE-PE.

Information About 6PE

6PE is a technique that provides global IPv6 reachability over IPv4 MPLS. It allows one shared routing table for all other devices. 6PE allows IPv6 domains to communicate with one another over the IPv4 without an explicit tunnel setup, requiring only one IPv4 address per IPv6 domain.

While implementing 6PE, the provider edge routers are upgraded to support 6PE, while the rest of the core network is not touched (IPv6 unaware). This implementation requires no reconfiguration of core routers because forwarding is based on labels rather than on the IP header itself. This provides a cost-effective strategy for deploying IPv6. The IPv6 reachability information is exchanged by PE routers using multiprotocol Border Gateway Protocol (mp-iBGP) extensions.

6PE relies on mp-iBGP extensions in the IPv4 network configuration on the PE router to exchange IPv6 reachability information in addition to an MPLS label for each IPv6 address prefix to be advertised. PE routers are configured as dual stacks, running both IPv4 and IPv6, and use the IPv4 mapped IPv6 address for IPv6

prefix reachability exchange. The next hop advertised by the PE router for 6PE and 6VPE prefixes is still the IPv4 address that is used for IPv4 L3 VPN routes. A value of `::FFFF:` is prepended to the IPv4 next hop, which is an IPv4-mapped IPv6 address.

The following figure illustrates the 6PE topology.

Figure 3: 6PE Topology

IPv6 Explicit Null label for 6PE

The null label is a label that is used between the penultimate Label Switch Router (LSR) and the egress LSR.

Starting with Cisco IOS XE Bengaluru 17.6.1 release, you can use the IPv6 Explicit Null Label as the VPN label to exchange IPv6 reachability information over the MPLS core. The IPv6 Explicit Null Label has a value of 2. The null label does not use the Border Gateway Protocol (BGP) to transport labels. When you use null labels the BGP labels are not exhausted and more IPv6 prefixes can be supported.

You can configure the IPv6 Explicit Null Label by using the **label mode** [**explicit-null** | **all-explicit-null**] command in the address family configuration mode.

You can choose the **explicit-null** or the **all-explicit-null** label.

- **explicit-null** label: for directly connected IPv6 prefixes sent to BGP labelled unicast neighbors.
- **all-explicit-null** label: for all IPv6 prefixes sent to BGP labelled unicast neighbors.

Configuring 6PE

Ensure that you configure 6PE on PE routers participating in both the IPv4 cloud and IPv6 clouds.

BGP running on a PE router should establish (IPv4) neighborhood with BGP running on other PEs. Subsequently, it should advertise the IPv6 prefixes learnt from the IPv6 table to the neighbors. The IPv6 prefixes advertised by BGP would automatically have IPv4-encoded-IPv6 addresses as the next-hop-address in the advertisement.

To configure 6PE, complete the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ipv6 unicast-routing Example: Device (config)# ipv6 unicast-routing	Enables the forwarding of IPv6 unicast datagrams.
Step 4	router bgp <i>as-number</i> Example: Device (config)# router bgp 65001	Enters the number that identifies the autonomous system (AS) in which the router resides. <i>as-number</i> —Autonomous system number. Range for 2-byte numbers is 1 to 65535. Range for 4-byte numbers is 1.0 to 65535.65535.
Step 5	bgp router-id interface <i>interface-id</i> Example: Device (config-router)# bgp router-id interface Loopback1	Configures a fixed router ID for the local Border Gateway Protocol (BGP) routing process.
Step 6	bgp log-neighbor-changes Example: Device (config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.
Step 7	bgp graceful-restart Example: Device (config-router)# bgp graceful-restart	Enables the Border Gateway Protocol (BGP) graceful restart capability globally for all BGP neighbors.
Step 8	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i> Example:	Adds an entry to the BGP or multiprotocol BGP neighbor table.

	Command or Action	Purpose
	<pre>Device(config-router)# neighbor 33.33.33.33 remote-as 65001</pre>	<ul style="list-style-type: none"> • <i>ip-address</i>—IP address of a peer router with which routing information will be exchanged. • <i>ipv6-address</i>—IPv6 address of a peer router with which routing information will be exchanged. • <i>peer-group-name</i>—Name of the BGP peer group. • <i>remote-as</i>—Specifies a remote autonomous system. • <i>as-number</i>—Number of an autonomous system to which the neighbor belongs, ranging from 1 to 65535.
Step 9	<p>neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } update-source <i>interface-type interface-number</i></p> <p>Example:</p> <pre>Device(config-router)# neighbor 33.33.33.33 update-source Loopback1</pre>	Configures BGP sessions to use any operational interface for TCP connections.
Step 10	<p>address-family ipv6</p> <p>Example:</p> <pre>Device(config-router)# address-family ipv6</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard IPv6 address prefixes.
Step 11	<p>redistribute <i>protocol as-number match</i> { internal external 1 external 2</p> <p>Example:</p> <pre>Device(config-router-af)# redistribute ospf 11 match internal external 1</pre>	Redistributes routes from one routing domain into another routing domain.
Step 12	<p>neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } activate</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 33.33.33.33 activate</pre>	Enables the exchange of information with a BGP neighbor.

	Command or Action	Purpose
Step 13	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } send-label Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 send-label</pre>	Sends MPLS labels with BGP routes to a neighboring BGP router.
Step 14	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits BGP address-family submode.
Step 15	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

Configuring IPv6 Explicit Null label for 6PE

To configure IPv6 explicit null label for 6PE, complete the following steps.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ipv6 unicast-routing Example: <pre>Device(config)# ipv6 unicast-routing</pre>	Enables the forwarding of IPv6 unicast datagrams.
Step 4	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 65001</pre>	Enters the number that identifies the autonomous system (AS) in which the router resides. <i>as-number</i> —Autonomous system number. Range for 2-byte numbers is 1 to 65535. Range for 4-byte numbers is 1.0 to 65535.65535.

	Command or Action	Purpose
Step 5	address-family ipv6 Example: <pre>Device(config-router)# address-family ipv6</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard IPv6 address prefixes.
Step 6	label mode [explicit-null all-explicit-null] Example: <pre>Device(config-router-af)# label mode explicit-null</pre>	Configures the IPv6 Explicit Null label <ul style="list-style-type: none"> • explicit-null label: for directly connected IPv6 prefixes sent to BGP labelled unicast neighbors. • all-explicit-null label: for all IPv6 prefixes sent to BGP labelled unicast neighbors. <p>Note Ensure that you use the label all-explicit-null for 6PE configured in BGP for Cisco Catalyst 9500X Series Switches.</p>
Step 7	neighbor { ip-address ipv6-address peer-group-name } activate Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 8	neighbor { ip-address ipv6-address peer-group-name } send-label Example: <pre>Device(config-router-af)# neighbor 33.33.33.33 send-label</pre>	Sends MPLS labels with BGP routes to a neighboring BGP router.
Step 9	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits BGP address-family submode.
Step 10	end Example: <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

```

Configuration Examples for IPv6 Explicit-Null Label for 6PE

The following example shows how to configure the IPv6 explicit-null label.

```
Device(config)# router bgp 1
Device(config-router)# address-family ipv6
Device(config-router-af)#label mode explicit-null
Device(config-router-af)# neighbor 33.33.33.33 activate
Device(config-router-af)# neighbor 33.33.33.33 send-label
```

The following example shows how to configure the IPv6 all-explicit-null label.

```
Device(config)# router bgp 1
Device(config-router)# address-family ipv6
Device(config-router-af)#label mode all-explicit-null
Device(config-router-af)# neighbor 33.33.33.33 activate
Device(config-router-af)# neighbor 33.33.33.33 send-label
```

Feature History for IPv6 Provider Edge over MPLS (6PE)

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	IPv6 Provider Edge over MPLS (6PE)	IPv6 Provider Edge over MPLS (6PE) provides global IPv6 reachability over IPv4 MPLS and allows one shared routing table for all other devices. Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Fuji 16.9.1	IPv6 Provider Edge over MPLS (6PE)	Support for this feature was introduced on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.

Release	Feature	Feature Information
Cisco IOS XE Bengaluru 17.6.1	IPv6 Explicit Null label for 6PE	IPv6 Explicit Null Label is supported as a VPN label to exchange IPv6 reachability information over the MPLS core
Cisco IOS XE Cupertino 17.7.1	IPv6 Provider Edge over MPLS (6PE)	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

CHAPTER 6

Configuring IPv6 VPN Provider Edge over MPLS (6VPE)

- [Restrictions for 6VPE, on page 69](#)
- [Information About 6VPE, on page 69](#)
- [Configuration Examples for 6VPE, on page 70](#)
- [Feature History for IPv6 VPN Provider Edge over MPLS \(6VPE\), on page 74](#)

Restrictions for 6VPE

- Inter-AS and carrier supporting carrier (CSC) is not supported.
- VRF Route-Leaking is not supported.
- eBGP as CE-PE is not supported.
- EIGRP, OSPFv3, RIP, ISIS, Static Routes are supported as CE-PE.
- MPLS Label Allocation modes supported are Per-VRF and Per-Prefix. Per-Prefix is the default mode.
- Cisco Catalyst 9500X Series Switches only support the per-VRF MPLS label allocation mode for local label allocation. This is also the default mode. However, Cisco Catalyst 9500X Series Switches can interoperate with remote peers operating in the per-prefix mode.
- IP fragmentation is not supported in the Per-Prefix mode of Layer 3 VPN.
- DHCPv6 is not supported on a 6VPE topology with per-port trust enabled.

Information About 6VPE

6VPE is a mechanism to use the IPv4 backbone to provide VPN IPv6 services. It takes advantage of operational IPv4 MPLS backbones, eliminating the need for dual-stacking within the MPLS core. This translates to savings in operational costs and addresses the security limitations of the 6PE approach. 6VPE is more like a regular IPv4 MPLS-VPN provider edge, with an addition of IPv6 support within VRF. It provides logically separate routing table entries for VPN member devices.

Components of MPLS-based 6VPE Network

- VPN route target communities – A list of all other members of a VPN community.
- Multiprotocol BGP (MP-BGP) peering of VPN community PE routers – Propagates VRF reachability information to all members of a VPN community.
- MPLS forwarding – Transports all traffic between all VPN community members across a VPN service-provider network.

In the MPLS-VPN model a VPN is defined as a collection of sites sharing a common routing table. A customer site is connected to the service provider network by one or more interfaces, where the service provider associates each interface with a VPN routing table—known as the VRF table.

CHAPTER 7

Configuring MPLS Layer 3 VPN

This document describes how to configure Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPN).

- [Prerequisites for MPLS Virtual Private Networks, on page 75](#)
- [Restrictions for MPLS Virtual Private Networks, on page 75](#)
- [Information About MPLS Virtual Private Networks, on page 78](#)
- [How to Configure MPLS Virtual Private Networks, on page 82](#)
- [Configuration Examples for MPLS Virtual Private Networks, on page 87](#)
- [Additional References, on page 92](#)
- [Feature History for MPLS Virtual Private Networks, on page 92](#)

Prerequisites for MPLS Virtual Private Networks

- Make sure that you have installed Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP), and Cisco Express Forwarding in your network.
- All devices in the core, including the provider edge (PE) devices, must be able to support Cisco Express Forwarding and MPLS forwarding. See the “Assessing the Needs of the MPLS Virtual Private Network Customers” section.
- Enable Cisco Express Forwarding on all devices in the core, including the PE devices. For information about how to determine if Cisco Express Forwarding is enabled, see the “Configuring Basic Cisco Express Forwarding” module in the *Cisco Express Forwarding Configuration Guide*.
- The **mpls ldp graceful-restart** command must be configured to enable the device to protect LDP bindings and MPLS forwarding state during a disruption in service. We recommend you to configure this command (even if you do not want to preserve the forwarding state) to avoid device failure during SSO in a high availability setup with scale configurations.

Restrictions for MPLS Virtual Private Networks

When static routes are configured in a Multiprotocol Label Switching (MPLS) or MPLS virtual private network (VPN) environment, some variations of the **ip route** and **ip route vrf** commands are not supported. Use the following guidelines when configuring static routes.

Supported Static Routes in an MPLS Environment

The following **ip route** command is supported when you configure static routes in an MPLS environment:

- **ip route** *destination-prefix mask interface next-hop-address*

The following **ip route** commands are supported when you configure static routes in an MPLS environment and configure load sharing with static nonrecursive routes and a specific outbound interface:

- **ip route** *destination-prefix mask interface1 next-hop1*
- **ip route** *destination-prefix mask interface2 next-hop2*

Unsupported Static Routes in an MPLS Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS environment:

- **ip route** *destination-prefix mask next-hop-address*

The following **ip route** command is not supported when you configure static routes in an MPLS environment and enable load sharing where the next hop can be reached through two paths:

- **ip route** *destination-prefix mask next-hop-address*

The following **ip route** commands are not supported when you configure static routes in an MPLS environment and enable load sharing where the destination can be reached through two next hops:

- **ip route** *destination-prefix mask next-hop1*
- **ip route** *destination-prefix mask next-hop2*

Use the *interface* and *next-hop* arguments when specifying static routes.

Supported Static Routes in an MPLS VPN Environment

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are in the same VRF:

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface1 next-hop1*
- **ip route vrf** *vrf-name destination-prefix mask interface2 next-hop2*

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table in the MPLS cloud in the global routing table. For example, these commands are supported when the next hop is pointing to the Internet gateway.

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address global*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address* (This command is supported when the next hop and interface are in the core.)

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment and enable load sharing with static nonrecursive routes and a specific outbound interface:

- **ip route** *destination-prefix mask interface1 next-hop1*
- **ip route** *destination-prefix mask interface2 next-hop2*

Unsupported Static Routes in an MPLS VPN Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the next hop can be reached through two paths:

- **ip route vrf** *destination-prefix mask next-hop-address global*

The following **ip route** commands are not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the destination can be reached through two next hops:

- **ip route vrf** *destination-prefix mask next-hop1 global*
- **ip route vrf** *destination-prefix mask next-hop2 global*

The following **ip route vrf** commands are not supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are in the same VRF:

- **ip route vrf** *vrf-name destination-prefix mask next-hop1 vrf-name destination-prefix mask next-hop1*
- **ip route vrf** *vrf-name destination-prefix mask next-hop2*

Supported Static Routes in an MPLS VPN Environment Where the Next Hop Resides in the Global Table on the CE Device

The following **ip route vrf** command is supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table on the customer edge (CE) side. For example, the following command is supported when the destination prefix is the CE device's loopback address, as in external Border Gateway Protocol (EBGP) multihop cases.

- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table on the CE side, and you enable load sharing with static nonrecursive routes and a specific outbound interface:

- **ip route** *destination-prefix mask interface1 nexthop1*
- **ip route** *destination-prefix mask interface2 nexthop2*

Note Cisco Catalyst 9500X Series Switches only supports the per-VRF MPLS label allocation mode for local label allocation. This is also the default mode. However, Cisco Catalyst 9500X Series Switches can interoperate with remote peers operating in the per-prefix mode.

Information About MPLS Virtual Private Networks

This section provides information about MPLS Virtual Private Networks:

MPLS Virtual Private Network Definition

Before defining a Multiprotocol Label Switching virtual private network (MPLS VPN), you must define a VPN in general. A VPN is:

- An IP-based network delivering private network services over a public infrastructure
- A set of sites that communicate with each other privately over the Internet or other public or private networks

Conventional VPNs are created by configuring a full mesh of tunnels or permanent virtual circuits (PVCs) to all sites in a VPN. This type of VPN is not easy to maintain or expand, because adding a new site requires changing each edge device in the VPN.

MPLS-based VPNs are created in Layer 3 and are based on the peer model. The peer model enables the service provider and the customer to exchange Layer 3 routing information. The service provider relays the data between the customer sites without the customer's involvement.

MPLS VPNs are easier to manage and expand than conventional VPNs. When a new site is added to an MPLS VPN, only the service provider's edge device that provides services to the customer site needs to be updated.

The different parts of the MPLS VPN are described as follows:

- Provider (P) device—Device in the core of the provider network. P devices run MPLS switching, and do not attach VPN labels to routed packets. The MPLS label in each route is assigned by the provider edge (PE) device. VPN labels are used to direct data packets to the correct egress device.
- PE device—Device that attaches the VPN label to incoming packets based on the interface or subinterface on which they are received. A PE device attaches directly to a customer edge (CE) device.
- Customer (C) device—Device in the ISP or enterprise network.
- CE device—Edge device on the network of the ISP that connects to the PE device on the network. A CE device must interface with a PE device.

The figure below shows a basic MPLS VPN.

Figure 6: Basic MPLS VPN Terminology

How an MPLS Virtual Private Network Works

Multiprotocol Label Switching virtual private network (MPLS VPN) functionality is enabled at the edge of an MPLS network. The provider edge (PE) device performs the following:

- Exchanges routing updates with the customer edge (CE) device.
- Translates the CE routing information into VPNv4 routes.
- Exchanges VPNv4 routes with other PE devices through the Multiprotocol Border Gateway Protocol (MP-BGP).

The following sections describe how MPLS VPN works:

Major Components of an MPLS Virtual Private Network

A Multiprotocol Label Switching (MPLS)-based virtual private network (VPN) has three major components:

- VPN route target communities—A VPN route target community is a list of all members of a VPN community. VPN route targets need to be configured for each VPN community member.
- Multiprotocol BGP (MP-BGP) peering of VPN community provider edge (PE) devices—MP-BGP propagates virtual routing and forwarding (VRF) reachability information to all members of a VPN community. MP-BGP peering must be configured on all PE devices within a VPN community.
- MPLS forwarding—MPLS transports all traffic between all VPN community members across a VPN service-provider network.

A one-to-one relationship does not necessarily exist between customer sites and VPNs. A given site can be a member of multiple VPNs. However, a site can associate with only one VRF. A customer-site VRF contains all the routes available to the site from the VPNs of which it is a member.

Benefits of an MPLS Virtual Private Network

Multiprotocol Label Switching virtual private networks (MPLS VPNs) allow service providers to deploy scalable VPNs. They build the foundation to deliver value-added services, such as the following:

Connectionless Service

A significant technical advantage of MPLS VPNs is that they are connectionless. The Internet owes its success to its basic technology, TCP/IP. TCP/IP is built on a packet-based, connectionless network paradigm. This means that no prior action is necessary to establish communication between hosts, making it easy for two parties to communicate. To establish privacy in a connectionless IP environment, current VPN solutions impose a connection-oriented, point-to-point overlay on the network. Even if it runs over a connectionless network, a VPN cannot take advantage of the ease of connectivity and multiple services available in connectionless networks. When you create a connectionless VPN, you do not need tunnels and encryption for network privacy, thus eliminating significant complexity.

Centralized Service

Building VPNs in Layer 3 allows delivery of targeted services to a group of users represented by a VPN. A VPN must give service providers more than a mechanism for privately connecting users to intranet services. It must also provide a way to flexibly deliver value-added services to targeted customers. Scalability is critical, because you want to use services privately in their intranets and extranets. Because MPLS VPNs are seen as private intranets, you may use new IP services such as:

- Multicast
- Quality of service (QoS)
- Telephony support within a VPN
- Centralized services including content and web hosting to a VPN

You can customize several combinations of specialized services for individual customers. For example, a service that combines IP multicast with a low-latency service class enables video conferencing within an intranet.

Scalability

If you create a VPN using connection-oriented, point-to-point overlays, Frame Relay, or ATM virtual connections (VCs), the VPN's key deficiency is scalability. Specifically, connection-oriented VPNs without fully meshed connections between customer sites are not optimal. MPLS-based VPNs, instead, use the peer model and Layer 3 connectionless architecture to leverage a highly scalable VPN solution. The peer model requires a customer site to peer with only one provider edge (PE) device as opposed to all other customer edge (CE) devices that are members of the VPN. The connectionless architecture allows the creation of VPNs in Layer 3, eliminating the need for tunnels or VCs.

Other scalability issues of MPLS VPNs are due to the partitioning of VPN routes between PE devices. And the further partitioning of VPN and Interior Gateway Protocol (IGP) routes between PE devices and provider (P) devices in a core network.

- PE devices must maintain VPN routes for those VPNs who are members.
- P devices do not maintain any VPN routes.

This increases the scalability of the provider's core and ensures that no one device is a scalability bottleneck.

Security

MPLS VPNs offer the same level of security as connection-oriented VPNs. Packets from one VPN do not inadvertently go to another VPN.

Security is provided in the following areas:

- At the edge of a provider network, ensuring packets that are received from a customer are placed on the correct VPN.
- At the backbone, VPN traffic is kept separate. Malicious spoofing (an attempt to gain access to a PE device) is nearly impossible because the packets that are received from customers are IP packets. These IP packets must be received on a particular interface or subinterface to be uniquely identified with a VPN label.

Ease of Creation

To take full advantage of VPNs, customers must be able to easily create new VPNs and user communities. Because MPLS VPNs are connectionless, no specific point-to-point connection maps or topologies are required. You can add sites to intranets and extranets and form closed user groups. Managing VPNs in this manner enables membership of any given site in multiple VPNs, maximizing flexibility in building intranets and extranets.

Flexible Addressing

To make a VPN service more accessible, customers of a service provider can design their own addressing plan. This addressing plan can be independent of addressing plans for other service provider customers. Many customers use private address spaces, as defined in RFC 1918. They do not want to invest the time and expense of converting to public IP addresses to enable intranet connectivity. MPLS VPNs allow customers to continue to use their present address spaces without Network Address Translation (NAT) by providing a public and private view of the address. A NAT is required only if two VPNs with overlapping address spaces want to communicate. This enables customers to use their own unregistered private addresses, and communicate freely across a public IP network.

Integrated QoS Support

QoS is an important requirement for many IP VPN customers. It provides the ability to address two fundamental VPN requirements:

- Predictable performance and policy implementation
- Support for multiple levels of service in an MPLS VPN

Network traffic is classified and labeled at the edge of the network. The traffic is then aggregated according to policies defined by subscribers and implemented by the provider and transported across the provider core. Traffic at the edge and core of the network can then be differentiated into different classes by drop probability or delay.

Straightforward Migration

For service providers to quickly deploy VPN services, use a straightforward migration path. MPLS VPNs are unique because you can build them over multiple network architectures, including IP, ATM, Frame Relay, and hybrid networks.

Migration for the end customer is simplified because there is no requirement to support MPLS on the CE device. No modifications are required to a customer's intranet.

How to Configure MPLS Virtual Private Networks

The following section provides the steps to configure MPLS Virtual Private Networks:

Configuring the Core Network

The following section provides the steps to configure the core network:

Assessing the Needs of MPLS Virtual Private Network Customers

Before you configure a Multiprotocol Label Switching virtual private network (MPLS VPN), you need to identify the core network topology so that it can best serve MPLS VPN customers. Perform this task to identify the core network topology.

Procedure

	Command or Action	Purpose
Step 1	Identify the size of the network.	Identify the following to determine the number of devices and ports that you need: <ul style="list-style-type: none"> • How many customers do you need to support? • How many VPNs are needed per customer? • How many virtual routing and forwarding instances are there for each VPN?
Step 2	Identify the routing protocols in the core.	Determine which routing protocols you need in the core network.
Step 3	Determine if you need MPLS VPN High Availability support.	MPLS VPN Nonstop Forwarding and Graceful Restart are supported on select devices and Cisco software releases. Contact Cisco Support for the exact requirements and hardware support.
Step 4	Determine if you need Border Gateway Protocol (BGP) load sharing and redundant paths in the MPLS VPN core.	For configuration steps, see the "Load Sharing MPLS VPN Traffic" feature module in the <i>MPLS Layer 3 VPNs Inter-AS and CSC Configuration Guide</i> .

Configuring MPLS in the Core

To enable Multiprotocol Label Switching (MPLS) on all devices in the core, you must configure the MPLS Label Distribution Protocol (LDP). For configuration information, see the “MPLS Label Distribution Protocol (LDP)” module in the *MPLS Label Distribution Protocol Configuration Guide*

On the Cisco Catalyst 9500X Series Switches, LDP label statistics are not displayed by default. To see the LDP label statistics use the **debug mpls lfd local-label local-label statistics-enable** command.

Connecting the MPLS Virtual Private Network Customers

The following section provides information about Connecting the MPLS Virtual Private Network Customers:

Defining VRFs on the PE Devices to Enable Customer Connectivity

Use this procedure to define a virtual routing and forwarding (VRF) configuration for IPv4. To define a VRF for IPv4 and IPv6, see the “Configuring a Virtual Routing and Forwarding Instance for IPv6” section in the “IPv6 VPN over MPLS” module in the *MPLS Layer 3 VPNs Configuration Guide*.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vrf definition vrf-name Example: Device(config)# vrf definition vrf1	Defines the virtual private network (VPN) routing instance by assigning a virtual routing and forwarding (VRF) name and enters VRF configuration mode. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 4	rd route-distinguisher Example: Device(config-vrf)# rd 100:1	Creates routing and forwarding tables. <ul style="list-style-type: none"> • The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter a route distinguisher (RD) in either of these formats: <ul style="list-style-type: none"> • 16-bit AS number:your 32-bit number, for example, 101:3

	Command or Action	Purpose
		<ul style="list-style-type: none"> 32-bit IP address: your 16-bit number, for example, 10.0.0.1:1
Step 5	address-family <i>ipv4 ipv6</i> Example: Device(config-vrf) # address-family ipv6	Enters IPv4 or IPv6 address family mode
Step 6	route-target { import export both } <i>route-target-ext-community</i> Example: Device(config-vrf-af) # route-target both 100:1	Creates a route-target extended community for a VRF. <ul style="list-style-type: none"> The import keyword imports routing information from the target VPN extended community. The export keyword exports routing information to the target VPN extended community. The both keyword imports routing information from and exports routing information to the target VPN extended community. The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both route-target extended communities.
Step 7	exit Example: Device(config-vrf) # exit	(Optional) Exits to global configuration mode.

Configuring VRF Interfaces on PE Devices for Each VPN Customer

To associate a virtual routing and forwarding (VRF) instance with an interface or subinterface on the provider edge (PE) devices, perform this task.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: <pre>Device(config)# interface GigabitEthernet 0/0/1</pre>	Specifies the interface to configure and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument specifies the type of interface to be configured. • The <i>number</i> argument specifies the port, connector, or interface card number.
Step 4	vrf forwarding <i>vrf-name</i> Example: <pre>Device(config-if)# vrf forwarding vrf1</pre>	Associates a VRF with the specified interface or subinterface. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name that is assigned to a VRF.
Step 5	end Example: <pre>Device(config-if)# end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring Routing Protocols Between the PE and CE Devices

Configure the provider edge (PE) device with the same routing protocol that the customer edge (CE) device uses. You can configure the Border Gateway Protocol (BGP), Routing Information Protocol version 2 (RIPv2), EIGRP, Open Shortest Path First (OSPF) or static routes between the PE and CE devices.

Verifying the Virtual Private Network Configuration

A route distinguisher must be configured for the virtual routing and forwarding (VRF) instance. Multiprotocol Label Switching (MPLS) must be configured on the interfaces that carry the VRF. Use the **show ip vrf** command to verify the route distinguisher (RD) and interface configured for the VRF.

Procedure

show ip vrf

Displays the set of defined VRF instances and associated interfaces. The output also maps the VRF instances to the configured route distinguisher.

Verifying Connectivity Between MPLS Virtual Private Network Sites

To verify that the local and remote customer edge (CE) devices can communicate across the Multiprotocol Label Switching (MPLS) core, perform the following tasks:

Verifying IP Connectivity from CE Device to CE Device Across the MPLS Core

Procedure

- Step 1** **enable**
Enables privileged EXEC mode.
- Step 2** **ping** [*protocol*] {*host-name* | *system-address*}
Diagnoses basic network connectivity on AppleTalk, Connectionless-mode Network Service (CLNS), IP, Novell, Apollo, Virtual Integrated Network Service (VINES), DECnet, or Xerox Network Service (XNS) networks. Use the **ping** command to verify the connectivity from one CE device to another.
- Step 3** **trace** [*protocol*] [*destination*]
Discovers the routes that packets take when traveling to their destination. The **trace** command can help isolate a trouble spot if two devices cannot communicate.
- Step 4** **show ip route** [*ip-address* [*mask*] [**longer-prefixes**]] | *protocol* [*process-id*] | [**list** [*access-list-name* | *access-list-number*]]
Displays the current state of the routing table. Use the *ip-address* argument to verify that CE1 has a route to CE2. Verify the routes learned by CE1. Make sure that the route for CE2 is listed.
-

Verifying That the Local and Remote CE Devices Are in the PE Routing Table

Procedure

- Step 1** **enable**
Enables privileged EXEC mode.
- Step 2** **show ip route vrf** *vrf-name* [*prefix*]
Displays the IP routing table that is associated with a virtual routing and forwarding (VRF) instance. Check that the loopback addresses of the local and remote customer edge (CE) devices are in the routing table of the provider edge (PE) devices.
- Step 3** **show ip cef vrf** *vrf-name* [*ip-prefix*]
Displays the Cisco Express Forwarding forwarding table that is associated with a VRF. Check that the prefix of the remote CE device is in the Cisco Express Forwarding table.
-

Configuration Examples for MPLS Virtual Private Networks

The following section provides the configuration examples for MPLS Virtual Private Networks:

Example: Configuring an MPLS Virtual Private Network Using RIP

PE Configuration	CE Configuration
<pre> vrf vpn1 rd 100:1 route-target export 100:1 route-target import 100:1 ! ip cef mpls ldp router-id Loopback0 force mpls label protocol ldp ! interface Loopback0 ip address 10.0.0.1 255.255.255.255 ! interface GigabitEthernet 1/0/1 vrf forwarding vpn1 ip address 192.0.2.3 255.255.255.0 no cdp enable interface GigabitEthernet 1/0/1 ip address 192.0.2.2 255.255.255.0 mpls label protocol ldp mpls ip ! router rip version 2 timers basic 30 60 60 120 ! address-family ipv4 vrf vpn1 version 2 redistribute bgp 100 metric transparent network 192.0.2.0 distribute-list 20 in no auto-summary exit-address-family ! router bgp 100 no synchronization bgp log-neighbor changes neighbor 10.0.0.3 remote-as 100 neighbor 10.0.0.3 update-source Loopback0 no auto-summary ! address-family vpnv4 neighbor 10.0.0.3 activate neighbor 10.0.0.3 send-community extended bgp scan-time import 5 exit-address-family ! address-family ipv4 vrf vpn1 redistribute connected redistribute rip no auto-summary no synchronization exit-address-family </pre>	<pre> ip cef mpls ldp router-id Loopback0 force mpls label protocol ldp ! interface Loopback0 ip address 10.0.0.9 255.255.255.255 ! interface GigabitEthernet 1/0/1 ip address 192.0.2.1 255.255.255.0 no cdp enable router rip version 2 timers basic 30 60 60 120 redistribute connected network 10.0.0.0 network 192.0.2.0 no auto-summary </pre>

Example: Configuring an MPLS Virtual Private Network Using Static Routes

PE Configuration	CE Configuration

Feature History for MPLS Virtual Private Networks

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	MPLS Virtual Private Networks	An MPLS Virtual Private Network (VPN) consists of a set of sites that are interconnected by means of a Multiprotocol Label Switching (MPLS) provider core network. At each customer site, one or more customer edge (CE) devices attach to one or more provider edge (PE) devices.
Cisco IOS XE Gibraltar 16.11.1	BGP PE-CE support for MPLS Layer 3 VPNs	Support for BGP as a routing protocol between the provider edge (PE) device and the customer edge (CE) device was introduced.

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.7.1	MPLS Virtual Private Networks	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

Information About MPLS VPN InterAS Options

The MPLS VPN InterAS Options feature provides various ways of interconnecting VPNs between different MPLS VPN service providers. This allows sites of a customer to exist on several carrier networks (autonomous systems) and have seamless VPN connectivity between these sites.

Autonomous Systems and ASBRs

An autonomous system (AS) is a single network or group of networks that is controlled by a common system administration group and using a single, clearly defined protocol. In many cases, VPNs extend to different ASes in different geographical areas. Some VPNs must extend across multiple service providers; these VPNs are called overlapping VPNs. The connection between ASes must be seamless to the customer, regardless of the complexity or location of the VPNs.

An autonomous system boundary router (ASBR) is a device in an AS that is configured by using more than one routing protocol, and exchanges routing information with other ASBRs by using an exterior routing protocol (for example, eBGP), or use static routes, or both.

Separate autonomous systems from different service providers communicate by exchanging information in the form of VPN IP addresses and they use the following protocols to share routing information:

- Within an AS, routing information is shared using iBGP.

iBGP distributes network layer information for IP prefixes within each VPN and each AS.

- Between autonomous systems, routing information is shared using eBGP.

eBGP allows service providers to set up an interdomain routing system that guarantees loop-free exchange of routing information between separate autonomous systems. The primary function of eBGP is to exchange network reachability information between autonomous systems, including information about the list of AS routes. The autonomous systems use eBGP border edge routers to distribute the routes,

which includes label-switching information. Each border edge router rewrites the next-hop and MPLS labels.

MPLS VPN InterAS Options configuration is supported and can include an inter provider VPN, which is MPLS VPNs that include two or more autonomous systems, connected by separate border edge routers. The autonomous systems exchange routes using eBGP, and no iBGP or routing information is exchanged between the autonomous systems.

MPLS VPN InterAS Options

The following options defined in RFC4364 provide MPLS VPN connectivity between different autonomous systems:

Note The Cisco Catalyst 9500X Series Switches supports only InterAS Option A.

- InterAS Option A: This option provides back-to-back virtual routing and forwarding (VRF) connectivity. Here, MPLS VPN providers exchange routes across VRF interfaces.
- InterAS Option B: This option provides VPNv4 route distribution between ASBRs.
- InterAS Option AB: This option combines the best functionality of an interAS option A and interAS option B network to allow an MPLS VPN service provider to interconnect different autonomous systems to provide VPN services.

InterAS Option A

In terms of configuration, interAS Option A is the simplest of all available options.

A typical AS consists of these devices – Provider Edge(PE), Customer Edge(CE) and an Autonomous System Boundary Router(ASBR). The target is to enable VRF connectivity between CE devices (also referred to as VPN sites) in a network. In order to facilitate interAS option A, you have to perform the following for each VPN site:

- Assign a VRF interface to each VPN site
- Define an interface or sub-interface for each VRF interface. (If multiple VPN sites are involved, they cannot all be associated with a single interface, and therefore, a sub-interface must be configured for each VRF). Optionally, a dedicated QoS policy may be applied to each subinterface.
- Create a BGP (or other routing protocol) session for each VRF.

With the above configuration in place, traffic flow with option A is as follows: Within the AS, data packets travel like regular Layer 3 VPN traffic. Traffic flow between ASBRs when traversing autonomous systems is in the form of unlabeled IP packets on a VRF interface. Any routing protocol may be used to exchange routing information between the ASBRs in the different autonomous systems.

While this option provides certain advantages (flexibility in terms of the routing protocol that can be used within an AS and between ASBRs, and security by means of a QoS policy on a subinterface), the scale for interAS option A is limited by the scale numbers for subinterfaces and VRFs. This option is therefore suited only to scenarios where the number of VPNs and the number of routes to transfer, is limited (and not likely to increase).

The figure below shows the data packet flow from CE 1, CE 2, CE 3 to CE 4, CE 5, CE 6 respectively. The explanation below takes the instance of the route advertisement and data packet flow from CE1 in AS-65001 to CE 4 in AS-65002.

Figure 7: MPLS VPN InterAS Option A Topology

The IP traffic between CE 1 and PE 1 is sent over a VRF sub-interface by using eBGP. Once the packet reaches PE 1 it is sent to ASBR 1 as a two-label MPLS stack. The outermost label is the Interior Gateway protocol (IGP) label and the inner label is the VPN label. Layer 3 VPN traffic is sent from PE 1 to ASBR 1 in AS-65001 and from ASBR 2 to PE 3 in AS-65002 over a MPLS cloud. At ASBR 1, both the labels (IGP and VPN) are popped (removed). From ASBR 1 to ASBR 2 traffic flows as an unlabelled IP packet on a VRF interface. In this example, the routing protocol used between the two ASBRs is eBGP. The two label MPLS stack is pushed once the IP packet reaches ASBR 2. After the packet reaches PE 3, the VPN label is removed. The IGP label is also popped in case of explicit NULL IGP. The VPN packet is sent to CE4 through a VRF interface.

InterAS Option B

In an interAS option B network, ASBR ports are connected by one or more interfaces that are enabled to receive MPLS traffic. With this option, the ASBRs peer with each other using eBGP session. The ASBR also functions as a PE router and peers with every PE router in their AS. The ASBR does not hold any VRFs but holds all or a subset of VPNv4 routes from PE router that need to be passed to the other AS. VPNv4 routes are kept unique in ASBR using route-distinguisher and are filtered using route targets. The ASBRs exchange VPNv4 routes and VPN labels using eBGP.

Figure 8: Topology for InterAS Option B

356132

Two methods are supported to distribute the next hop for VPNv4 routes between ASBRs. There is no requirement for LDP or any IGP to be enabled on the link connecting the two ASBRs. The MP-eBGP session between directly connected interfaces on the ASBRs enables the interfaces to forward labeled packets. To ensure this MPLS forwarding for directly connected BGP peers, you must configure `mpls bgp forwarding` command on the interface connecting to ASBR. This command is implemented in the IOS for directly connected interfaces. Upto 200 BGP neighbors can be configured.

- **Next-hop-self Method:** Changing next-hop to that of the local ASBR for all VPNv4 routes learnt from the other ASBR.
- **Redistribute Connected Subnets Method:** Redistributing the next hop address of the remote ASBR into the local IGP using `redistribute connected subnets` command, i.e., the next hop is not changed when the VPNv4 routes are redistributed into the local AS.

Note In case of multiple equal paths - ECMP towards remote AS, you have to configure MPLS static label bindings towards remote Loopback on ASBR. Otherwise, you may experience packet loss.

The label switch path forwarding sections described below has AS200 configured with the Next-hop-self method and the AS300 is configured with Redistribute-subnet method.

Next-Hop Self Method

The following figure shows the label forwarding path for next-hop-self method. The labels get pushed, swapped and popped on the stack as packet makes its way from PE-200 in AS 200 to PE-300 in AS 300. In step 5, ASBR-A300 receives labeled frame, replaces label 164 with label 161 pushes IGP label 162 onto the label stack.

356133

Redistribute Connected Subnet Method

The following figure shows the label forwarding path for Redistribute connected subnets method. The labels get pushed, swapped and popped on the stack as packet travels from PE- 300 in AS 300 to PE-200 in AS 200. In step 5, ASBR-A200 receives frame with BGP label 20, swaps it with label 29 and pushes label 17.

356134

InterAS Option AB

MPLS VPN service providers need to interconnect different autonomous systems to provide service for multiple VPN customers. The MPLS VPN InterAS Option AB feature allows the different autonomous systems to interconnect by using a single MP-BGP session in the global routing table to carry control plane traffic. This MP-BGP session signals VPN prefixes between two ASBRs for each VRF instance. This traffic can either be IP or MPLS.

MPLS BGP forwarding or LDP does not have to be configured between the two ASBRs because the VPN traffic that is IP traffic over a VRF-specific interface.

The interAS option AB feature provides the following benefits for service providers:

- IP QoS functions between ASBR peers are maintained for customer SLAs.
- Dataplane traffic is isolated on a per-VRF basis for security purposes.
- A dedicated QoS policy can be applied on each VRF by attaching the policy on an SVI.

Route Distribution and Packet Forwarding

The following attributes describe the topology of the sample interAS Option AB network shown in the figure above:

- CE1 and CE3 belong to VPN 1.
- CE2 and CE 4 belong to VPN 2.
- PE1 uses route distinguisher 1 (RD 1) for VPN 1 (VRF 1) and RD 2 for VPN 2 (VRF 2).
- PE2 uses RD 3 for VPN 1 (VRF 1) and RD 4 for VPN 2 (VRF 2).
- ASBR1 has VRF 1 provisioned with RD 5 and VRF 2 provisioned with RD 6.
- ASBR2 has VRF 1 provisioned with RD 7 and VRF 2 provisioned and RD 8.
- ASBR1 and ASBR2 have three links between them:
 - VRF 1
 - VRF 2
 - MP-BGP session

Route Distribution for VPN 1

A route distinguisher (RD) is an identifier attached to a route that identifies which VPN belongs to each route. Each routing instance must have a unique RD autonomous system associated with it. The RD is used to place a boundary around a VPN so that the same IP address prefixes can be used in different VPNs without having these IP address prefixes overlap. An RD statement is required if the instance type is a VRF.

The following process describes the route distribution process for VPN 1 in the figure above. Prefix “N” is used in this process to indicate the IP address of a VPN.

ASBR 1

- CE1 advertises the prefix N to PE1.
- PE1 advertises a VPN prefix RD 1:N to ASBR1 through MP-iBGP.
- ASBR1 imports the prefix into VPN 1 and creates a prefix RD 5:N.

- ASBR1 advertises the imported prefix RD 5:N to ASBR2. ASBR1 sets itself as the next hop for prefix RD 5:N and allocates a local label that is signaled with this prefix.
- ASBR1 advertises the route with the export RT configured on the VRF rather than the originally received RTs. By default, ASBR1 does not advertise the source prefix RD 1:N to ASBR2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.

ASBR 2

- ASBR2 receives the prefix RD 5:N and imports it into VPN 1 as RD 7:N.
- ASBR2 advertises the route with the export RT configured on the VRF rather than the originally received RTs.
- While importing the prefix, ASBR2 sets the next hop of RD 7:N to the ASBR1 interface IP address in VRF 1. The next hop table ID is also set to VRF 1. When installing the MPLS forwarding entry for RD 7:N, by default ASBR2 does not install the outgoing label in the forwarding process. This enables the traffic between the ASBRs to be IP.
- ASBR2 advertises the imported prefix RD 7:N to PE2. It sets itself as the next hop for this prefix and also allocates a local label that is signaled with the prefix. By default, ASBR2 does not advertise the source prefix RD 5:N to PE2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.
- PE2 imports the RD 7:N into VRF 1 as RD 3:N.

Packet Forwarding for VPN 1

The following packet forwarding process works the same as it does in an Option A scenario. The ASBR acts like the PE by terminating the VPN and then forwards its traffic as standard IP packets with no VPN label to the next PE, which in turn repeats the VPN process. Each PE device, therefore, treats the adjacent PE device as a CE device, and the standard Layer 3 MPLS VPN mechanisms are used for route redistribution with each autonomous system; that is, the PEs use external BGP (eBGP) to distribute unlabeled IPv4 addresses to each other.

- CE3 sends a packet destined for N to PE2.
- PE2 encapsulates the packet with the VPN label allocated by ASBR2 and the Interior Gateway Protocol (IGP) label needed to tunnel the packet to ASBR2.
- The packet arrives on ASBR2 with the VPN label. ASBR2 removes the VPN label and sends the packet as IP to ASBR1 on the VRF 1 interface.
- The IP packet arrives at ASBR1 on the VRF 1 interface. ASBR1 then encapsulates the packet with the VPN label allocated by PE1 and the IGP label needed to tunnel the packet to PE1.
- The packet arrives on PE1 with the VPN label. PE1 disposes the VPN label and forwards the IP packet to CE1.

Route Distribution for VPN 2

The following information describes the route distribution process for VPN 2 in the figure above:

ASBR 1

- CE2 advertises prefix N to PE1, where N is the VPN IP address.

- PE1 advertises a VPN prefix RD 2:N to ASBR1 through MP-iBGP.
- ASBR1 imports the prefix into VPN 2 and creates a prefix RD 6:N.
- ASBR1 advertises the imported prefix RD 6:N to ASBR2. It sets itself as the next hop for this prefix and also allocates a local label that is signalled with the prefix. By default, ASBR1 does not advertise the source prefix RD 2:N to ASBR2. This advertisement is suppressed as the prefix is being imported into an Option AB VRF.

ASBR 2

- ASBR2 receives the prefix RD 6:N and imports it into VPN 2 as RD 8:N.
- While importing the prefix, ASBR2 sets the next hop of RD 8:N to ASBR1s interface address in VRF 2. The next hop table ID is also set to that of VRF 2. While installing the MPLS forwarding entry for RD 8:N, by default ASBR2 does not install the outgoing label in the forwarding process. This enables traffic between the ASBRs to be IP.
- ASBR2 advertises the imported prefix RD 8:N to PE2. It sets itself as the next hop for this prefix and also allocates a local label that is signalled with the prefix. By default, ASBR2 does not advertise the source prefix RD 6:N to PE2. This advertisement is suppressed because the prefix is being imported into an Option AB VRF.
- PE2 imports the RD 8:N into VRF 2 as RD 4:N.

How to Configure MPLS VPN InterAS Options

The following section provides information about how to configure MPLS VPN InterAS Options.

Configuring MPLS VPN InterAS Option A

Sending AS: Configuring PE

Complete the following tasks to configure the PE which is in the AS sending data to another AS.

Sending AS: Configuring a VRF for a PE

Beginning in user EXEC mode complete the following steps to configure a VRF for a PE which is in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	vrf definition <i>vrf-name</i> Example: Device (config)# vrf definition cu1 Device (config-vrf) #	Configures a VRF table and enters VRF configuration mode.
Step 4	rd <i>route-distinguisher</i> Example: Device (config-vrf) # rd 1:1	Creates routing and forwarding tables for a VRF instance.
Step 5	address-family ipv4 Example: Device (config-vrf) # address-family ipv4 Device (config-vrf-af) #	Places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv6 address prefixes.
Step 6	route-target export <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target export 100:1	Creates a list of export route target communities for the specified VRF.
Step 7	route-target import <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target import 100:2	Creates a list of import route target communities for the specified VRF.
Step 8	exit-address-family Example: Device (config-vrf-af) # exit-address-family Device (config-vrf) #	Exits the address family configuration mode and returns to VRF configuration mode.
Step 9	address-family ipv6 Example: Device (config-vrf) # address-family ipv6	Places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv6 address prefixes.

	Command or Action	Purpose
Step 10	route-target export <i>route-target-ext-community</i> Example: Device(config-vrf-af) # route-target export 100:101	Creates a list of export route target communities for the specified VRF.
Step 11	route-target import <i>route-target-ext-community</i> Example: Device(config-vrf-af) # route-target import 100:102	Creates a list of import route target communities for the specified VRF.
Step 12	exit-address-family Example: Device(config-vrf-af) # exit-address-family Device(config-vrf) #	Exits the address family configuration mode and returns to VRF configuration mode.

Sending AS: Configuring a PE-CE Interface

Beginning in privileged EXEC mode complete the following steps to configure a PE-CE interface which is in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>{ interface-id subinterface-id vlan-id }</i> Example: Device(config) # interface Gi1/1/0/13.1 Device(config-if) #	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 3	encapsulation dot1q vlan-id Example: Device(config-if) # encapsulation dot1q 900	Enables IEEE 802.1Q encapsulation of traffic on a specified interface.

	Command or Action	Purpose
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if) # vrf forwarding cu1	Associates the VRF with the Layer 3 interface.
Step 5	ip address <i>ip address mask</i> [secondary] Example: Device(config-if) # ip address 140.1.1.1 255.255.255.0	Sets a primary or secondary IP address for an interface.
Step 6	exit Example: Device(config-if) # exit Device(config) #	Exits interface configuration mode and returns to global configuration mode.

Sending AS: Configuring BGP

Beginning in user EXEC mode complete the following steps to configure a BGP session for a PE which is in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config) # router bgp 65001 Device(config-router) #	Configures a BGP routing process.
Step 4	neighbor <i>ip-address remote-as as-number</i> Example: Device(config-router) # neighbor 2.2.2.2 remote-as 65001	Configures an entry to the BGP neighbor table.

	Command or Action	Purpose
Step 5	address-family <i>ipv4</i> [mdt multicast tunnel unicast [vrf <i>vrf-name</i>] [vrf <i>vrf-name</i>] Example: Device(config-router)# address-family ipv4 Device(config-router-af)#	Enters address family configuration mode for configuring BGP routing sessions that use standard IPv4 address prefixes.
Step 6	neighbor <i>ip-address</i> activate Example: Device(config-router-af)# neighbor 2.2.2.2 activate	Enables the exchange of information with a BGP neighbor.
Step 7	exit address-family Example: Device(config-router-af)# exit address-family Device(config-router)#	Exits BGP address-family submode.
Step 8	address-family <i>vpn4</i> Example: Device(config-router)# address-family vpn4 Device(config-router-af)#	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 9	neighbor <i>ip-address</i> activate Example: Device(config-router-af)# neighbor 2.2.2.2 activate	Enables the exchange of information with a BGP neighbor.
Step 10	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } send-community [both standard extended] Example: Device(config-router-af)# neighbor 2.2.2.2 send-community both	Enables the exchange of information with a BGP neighbor.
Step 11	exit address-family Example: Device(config-router-af)# exit	Exits BGP address-family submode.

	Command or Action	Purpose
	address-family Device(config-router)#	
Step 12	address-family vpv6 Example: Device(config-router)# address-family vpv6 Device(config-router-af)#	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv6 address prefixes.
Step 13	neighbor ip-address activate Example: Device(config-router-af)# neighbor 2.2.2.2 activate	Enables the exchange of information with a BGP neighbor.
Step 14	neighbor ip-address send-community extended Example: Device(config-router-af)# neighbor 2.2.2.2 send-community extended	Specifies that a community attribute should be sent to a BGP neighbor.
Step 15	exit address-family Example: Device(config-router-af)# exit address-family Device(config-router)#	Exits BGP address-family submode.
Step 16	address-family ipv4 vrf vrf-name Example: Device(config-router)# address-family ipv4 vrf cul Device(config-router-af)#	Enters address family configuration mode for configuring BGP routing sessions that use standard IPv4 address prefixes.
Step 17	redistribute protocol Example: Device(config-router-af)# redistribute connected	Redistributes routes from one routing domain into another routing domain.
Step 18	neighbor ip-address remote-as as-number Example: Device(config-router-af)# neighbor 140.1.1.2 remote-as 65002	Configures an entry to the BGP neighbor table.

	Command or Action	Purpose
Step 19	neighbor ip-address activate Example: Device(config-router-af)# neighbor 140.1.1.2 activate	Enables the exchange of information with a BGP neighbor.
Step 20	exit address-family Example: Device(config-router-af)# exit address-family Device(config-router)#	Exits BGP address-family submode.
Step 21	exit Example: Device(config-router)# exit	Exits router BGP mode.

Sending AS: Configuring a PE-P Interface and IGP

Beginning in user EXEC mode complete the following steps to configure a PE-P interface and IGP which is in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface { <i>interface-id</i> <i>subinterface-id</i> <i>vlan-id</i> } Example: Device(config)# interface po91 Device(config-if)#	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 4	no switchport Example: Device(config-if)# no switchport	Sets the interface to the routed-interface status and erases all Layer 2 configurations.

	Command or Action	Purpose
Step 5	ip address <i>ip-address mask</i> Example: Device(config-if)# ip address 91.1.1.1 255.255.255.248	Sets a primary or secondary IP address for an interface.
Step 6	ip ospf <i>process-id area area-id</i> Example: Device(config-if)# ip ospf 2 area 0	Enables OSPF on an interface.
Step 7	mpls ip Example: Device(config-if)# mpls ip	Enables MPLS forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface.
Step 8	exit Example: Device(config-if)# exit	Exits interface configuration mode.
Step 9	router ospf <i>process-id</i> Example: Device(config)# router ospf 2	Configures an OSPF routing process and assigns a process number.
Step 10	router-id <i>ip-address</i> Example: Device(config-router)# router-id 1.1.1.1	Specifies a fixed router ID.
Step 11	end Example: Device(config-router)# end	Exits router configuration mode and returns to privileged EXEC mode.

Sending AS: Configuring P

Complete the following tasks to configure the P which is in the AS sending data to another AS.

Sending AS: Configuring P-PE Interface and IGP

Beginning in user EXEC mode complete the following steps to configure a P-PE interface and IGP which is in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface { <i>interface-id</i> <i>subinterface-id</i> <i>vlan-id</i> } Example: Device (config)# interface Port-channel191 Device (config-if)#	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 4	no switchport Example: Device (config-if)# no switchport	Sets the interface to the routed-interface status and erases all Layer 2 configuration.
Step 5	ip address <i>ip-address mask</i> Example: Device (config-if)# ip address 91.1.1.2 255.255.255.248	Sets a primary or secondary IP address for an interface.
Step 6	ip ospf <i>process-id area area-id</i> Example: Device (config-if)# ip ospf 2 area 0	Enables OSPF on an interface.
Step 7	mpls ip Example: Device (config-if)# mpls ip	Enables MPLS forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface.
Step 8	exit Example: Device (config-if)# exit Device (config)#	Exits interface configuration mode.
Step 9	interface { <i>interface-id</i> <i>subinterface-id</i> <i>vlan-id</i> } Example: Device (config)# interface Port-channel192	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 10	no switchport Example:	Set the interface to the routed-interface status erases all Layer 2 configurations.

	Command or Action	Purpose
	Device (config-if) # no switchport	
Step 11	ip address <i>ip-address mask</i> Example: Device (config-if) # ip address 92.1.1.2 255.255.255.248	Sets a primary or secondary IP address for an interface.
Step 12	ip ospf <i>process-id area area-id</i> Example: Device (config-if) # ip ospf 2 area 0	Enables OSPF on an interface.
Step 13	mpls ip Example: Device (config-if) # mpls ip	Enables MPLS forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface.
Step 14	exit Example: Device (config-if) # exit	Exits interface configuration mode.
Step 15	router ospf <i>process-id</i> Example: Device (config) # router ospf 2 Device (config-router) #	Configures an OSPF routing process and assign a process number.
Step 16	router-id <i>ip-address</i> Example: Device (config-router) # router-id 5.5.5.5	Specifies a fixed router ID.
Step 17	end Example: Device (config-router) # end	Exits router configuration mode, and returns to privileged EXEC mode.

Sending AS: Configuring ASBR

Complete the following tasks to configure the ASBR which is in the AS sending data to another AS.

Sending AS: Configuring VRF for ASBR

Beginning in user EXEC mode complete the following steps to configure a VRF for a ASBR which is in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vrf definition vrf-name Example: Device (config)# vrf definition cul Device (config-vrf)#	Configures a VRF table and enters VRF configuration mode.
Step 4	rd route-distinguisher Example: Device (config-vrf)# rd 1:2	Creates routing and forwarding tables for a VRF instance.
Step 5	address-family ipv4 Example: Device (config-vrf)# address-family ipv4 Device (config-vrf-af)#	The address-family ipv4 command places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv4 address prefixes.
Step 6	route-target export <i>route-target-ext-community</i> Example: Device (config-vrf-af)# route-target export 100:2	Creates a list of export route target communities for the specified VRF.
Step 7	route-target import <i>route-target-ext-community</i> Example: Device (config-vrf-af)# route-target import 100:1	Creates a list of import route target communities for the specified VRF.
Step 8	exit-address-family Example: Device (config-vrf-af)#	Leaves the address family configuration mode and returns to router configuration mode.

	Command or Action	Purpose
	exit-address-family Device (config-vrf) #	
Step 9	address-family ipv6 Example: Device (config-vrf) # address-family ipv6	Places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv6 address prefixes.
Step 10	route-target export <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target export 100:102	Creates a list of export route target communities for the specified VRF.
Step 11	route-target import <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target import 100:101	Creates a list of import route target communities for the specified VRF.
Step 12	exit-address-family Example: Device (config-vrf-af) # exit-address-family Device (config-vrf) #	Exits the address family configuration mode and returns to router configuration mode.
Step 13	exit Example: Device (config-vrf) # exit	Exits the router configuration mode and returns to global configuration mode.

Sending AS: Configuring Interface Towards the Receiving ASBR

Beginning in privileged EXEC mode complete the following steps to configure an interface towards the receiving ASBR:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	interface <i>{ interface-id subinterface-id vlan-id }</i> Example: Device(config) # interface fo1/0/10.1 Device(config-subif) #	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 3	encapsulation dot1q <i>vlan-id</i> Example: Device(config-subif) # encapsulation dot1q 900	Enables IEEE 802.1Q encapsulation of traffic on a specified interface.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-subif) # vrf forwarding cul	Associates the VRF with the Layer 3 interface.
Step 5	ip address <i>ip address mask</i> [secondary] Example: Device(config-subif) # ip address 141.1.1.1 255.255.255.0	Sets a primary or secondary IP address for an interface.

Sending AS: Configuring BGP

Beginning in privileged EXEC mode complete the following steps to configure a BGP session on the ASBR which is in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	router bgp <i>autonomous-system-number</i> Example: Device(config-if) # router bgp 65001	Configures a BGP routing process.
Step 3	bgp log-neighbor changes Example:	Enables logging of BGP neighbor resets.

	Command or Action	Purpose
	Device (config-router) # bgp log-neighbor-changes	
Step 4	neighbor ip-address remote-as as-number Example: Device (config-router) # neighbor 1.1.1.1 remote-as 65001	Configures an entry to the BGP neighbor table.
Step 5	neighbor ip-address update-source interface-type interface-number Example: Device (config-router) # neighbor 1.1.1.1 update-source Loopback0	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 6	address-family ipv4 [mdt multicast tunnel unicast [vrf vrf-name] [vrf vrf-name] Example: Device (config-router) # address-family ipv4 Device (config-router-af) #	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.
Step 7	neighbor ip-address activate Example: Device (config-router-af) # neighbor 1.1.1.1 activate	Enables the exchange of information with a BGP neighbor.
Step 8	exit-address-family Example: Device (config-router-af) # exit-address-family	Exits BGP address-family submode.
Step 9	address-family vpnv4 Example: Device (config-router) # address-family vpnv4	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 10	neighbor ip-address activate Example: Device (config-router-af) # neighbor 1.1.1.1 activate	Enables the exchange of information with a BGP neighbor.

	Command or Action	Purpose
Step 11	neighbor <i>{ ip-address ipv6-address peer-group-name }</i> send-community <i>[both standard extended]</i> Example: <pre>Device(config-router-af)# neighbor 1.1.1.1 send-community both</pre>	Enables the exchange of information with a BGP neighbor.
Step 12	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family Device(config-router)#</pre>	Exits BGP address-family submode.
Step 13	address-family vpv6 Example: <pre>Device(config-router)# address-family vpv6 Device(config-router-af)#</pre>	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv6 address prefixes.
Step 14	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 1.1.1.1 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 15	neighbor <i>{ ip-address ipv6-address peer-group-name }</i> send-community <i>[both standard extended]</i> Example: <pre>Device(config-router-af)# neighbor 1.1.1.1 send-community both</pre>	Enables the exchange of information with a BGP neighbor.
Step 16	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family Device(config-router)#</pre>	Exits BGP address-family submode.

	Command or Action	Purpose
Step 17	address-family ipv4 vrf <i>vrf-name</i> Example: Device (config-router) # address-family ipv4 vrf cul	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.
Step 18	redistribute <i>protocol</i> Example: Device (config-router-af) # redistribute connected	Redistributes routes from one routing domain into another routing domain.
Step 19	neighbor ip-address remote-as <i>as-number</i> Example: Device (config-router-af) # neighbor 141.1.1.2 remote-as 65002	Configures an entry to the BGP neighbor table.
Step 20	neighbor ip-address activate Example: Device (config-router-af) # neighbor 141.1.1.2 activate	Enables the exchange of information with a BGP neighbor.
Step 21	exit-address-family Example: Device (config-router-af) # exit-address-family	Exits BGP address-family submode.

Sending AS: Configuring a ASBR-P Interface and a IGP

Beginning in privileged EXEC mode complete the following steps to configure a ASBR-P interface and a IGP in the sending AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface { <i>interface-id</i> <i>subinterface-id</i> <i>vlan-id</i> } Example:	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.

	Command or Action	Purpose
	Device (config) # interface Port-channel192	
Step 3	no switchport Example: Device (config-if) # no switchport	Set the interface to the routed-interface status erases all Layer 2 configurations.
Step 4	ip address ip-address mask Example: Device (config-if) # ip address 92.1.1.1 255.255.255.248	Sets a primary or secondary IP address for an interface.
Step 5	ip ospf process-id area area-id Example: Device (config-if) # ip ospf 2 area 0	Enables OSPF on an interface.
Step 6	mpls ip Example: Device (config-if) # mpls ip	Enables Multiprotocol Label Switching (MPLS) forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface.
Step 7	end Example: Device (config-if) # end	Exits interface configuration mode and returns to privileged EXEC mode.

Receiving AS: Configuring ASBR

Complete the following tasks to configure the ASBR which is in the AS receiving data from another AS.

Receiving AS: Configuring VRF for ASBR

Beginning in user EXEC mode complete the following steps to configure a VRF for a ASBR which is in the receiving AS:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	vrf definition <i>vrf-name</i> Example: <pre>Device(config)# vrf definition cu1 Device(config-vrf)#</pre>	Configures a VRF table and enters VRF configuration mode.
Step 4	rd <i>route-distinguisher</i> Example: <pre>Device(config-vrf)# rd 1:3</pre>	Creates routing and forwarding tables for a VRF instance.
Step 5	address-family ipv4 Example: <pre>Device(config-vrf)# address-family ipv4 Device(config-vrf-af)#</pre>	The address-family ipv4 command places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv4 address prefixes.
Step 6	route-target import <i>route-target-ext-community</i> Example: <pre>Device(config-vrf-af)# route-target import 200:2</pre>	Creates a list of export route target communities for the specified VRF.
Step 7	route-target export <i>route-target-ext-community</i> Example: <pre>Device(config-vrf-af)# route-target export 200:1</pre>	Creates a list of import route target communities for the specified VRF.
Step 8	exit-address-family Example: <pre>Device(config-vrf-af)# exit-address-family</pre>	Leaves the address family configuration mode and returns to router configuration mode.
Step 9	address-family ipv6 Example: <pre>Device(config-vrf)# address-family ipv6 Device(config-vrf-af)#</pre>	Places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv6 address prefixes.
Step 10	route-target export <i>route-target-ext-community</i> Example:	Creates a list of export route target communities for the specified VRF.

	Command or Action	Purpose
	Device (config-vrf-af) # route-target export 200:101	
Step 11	route-target import <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target import 200:102	Creates a list of import route target communities for the specified VRF.
Step 12	exit-address-family Example: Device (config-vrf-af) # exit-address-family Device (config-vrf) #	Exits the address family configuration mode and returns to router configuration mode.
Step 13	exit Example: Device (config-vrf) # exit	Exits the router configuration mode and returns to global configuration mode.

Receiving AS: Configuring Interface Towards the Sending ASBR

Beginning in privileged EXEC mode complete the following steps to configure an interface towards the sending ASBR:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface { <i>interface-id</i> <i>subinterface-id</i> <i>vlan-id</i> } Example: Device (config) # interface fo1/0/10.1 Device (config-subif) #	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 3	encapsulation dot1q vlan-id Example: Device (config-subif) # encapsulation dot1q 900	Enables IEEE 802.1Q encapsulation of traffic on a specified interface.

	Command or Action	Purpose
Step 4	vrf forwarding <i>vrf-name</i> Example: Device (config-subif) # vrf forwarding <i>cul</i>	Associates the VRF with the Layer 3 interface.
Step 5	ip address <i>ip address mask [secondary]</i> Example: Device (config-subif) # ip address 141.1.1.1 255.255.255.0	Sets a primary or secondary IP address for an interface.
Step 6	exit Example: Device (config-subif) # exit Device (config) #	Exits to global configuration mode.

Receiving AS: Configuring BGP

Beginning in privileged EXEC mode complete the following steps to configure a BGP session on the ASBR which is in the receiving AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	router bgp <i>autonomous-system-number</i> Example: Device (config) # router bgp 65002 Device (config-router) #	Configures a BGP routing process.
Step 3	neighbor <i>ip-address remote-as as-number</i> Example: Device (config-router) # neighbor 30.30.30.30 remote-as 65002	Configures an entry to the BGP neighbor table.
Step 4	address-family <i>ipv4</i> [mdt multicast tunnel unicast [vrf vrf-name] [vrf vrf-name] Example:	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.

	Command or Action	Purpose
	Device(config-router)# address-family ipv4 Device(config-router-af)#	
Step 5	neighbor ip-address activate Example: Device(config-router-af)# neighbor 30.30.30.30 activate	Enables the exchange of information with a BGP neighbor.
Step 6	exit Example: Device(config-router-af)# exit Device(config-router)#	Exits BGP address-family submenu.
Step 7	address-family ipv6 Example: Device(config-router)# address-family ipv6 Device(config-router-af)#	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 8	neighbor ip-address activate Example: Device(config-router-af)# neighbor 30.30.30.30 activate	Enables the exchange of information with a BGP neighbor.
Step 9	exit address-family Example: Device(config-router-af)# exit address-family Device(config-router)#	Exits BGP address-family submenu.
Step 10	address-family vpnv4 Example: Device(config-router)# address-family vpnv4 Device(config-router-af)#	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv6 address prefixes.
Step 11	neighbor ip-address activate Example: Device(config-router-af)# neighbor 30.30.30.30 activate	Enables the exchange of information with a BGP neighbor.

	Command or Action	Purpose
Step 12	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } send-community [both standard extended] Example: Device (config-router-af) # neighbor 30.30.30.30 send-community both	Enables the exchange of information with a BGP neighbor.
Step 13	exit Example: Device (config-router-af) # exit Device (config-router) #	Exits BGP address-family submode.
Step 14	address-family <i>vpn6</i> Example: Device (config-router) # address-family vpn6 Device (config-router-af) #	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.
Step 15	neighbor <i>ip-address</i> activate Example: Device (config-router-af) # neighbor 30.30.30.30 activate	Enables the exchange of information with a BGP neighbor.
Step 16	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } send-community [both standard extended] Example: Device (config-router-af) # neighbor 30.30.30.30 send-community both	Enables the exchange of information with a BGP neighbor.
Step 17	exit Example: Device (config-router-af) # exit Device (config-router) #	Exits BGP address-family submode.
Step 18	address-family <i>ipv4</i> Example: Device (config-router) # address-family ipv4 vrf cu1 Device (config-router-af) #	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.

	Command or Action	Purpose
Step 19	neighbor ip-address remote-as as-number Example: <pre>Device(config-router-af)# neighbor 141.1.1.1 remote-as 65001</pre>	Configures an entry to the BGP neighbor table.
Step 20	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 141.1.1.1 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 21	exit address-family Example: <pre>Device(config-router-af)# exit address-family Device(config-router)#</pre>	Exits BGP address-family submode.
Step 22	end Example: <pre>Device(config-router)# end</pre>	Exits router BGP mode and returns to privileged EXEC mode.

Receiving AS: Configuring a ASBR-P Interface and a IGP

Beginning in privileged EXEC mode complete the following steps to configure a ASBR-P interface and a IGP which is in the receiving AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 2	interface <i>{ interface-id subinterface-id vlan-id }</i> Example: <pre>Device(config)# interface FortyGigabitEthernet1/0/13</pre>	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 3	no switchport Example:	Set the interface to the routed-interface status erases all Layer 2 configurations.

	Command or Action	Purpose
	<code>Device(config-if) # no switchport</code>	
Step 4	ip address <i>ip-address mask</i> Example: <code>Device(config-if) # ip address 10.1.1.1 255.255.255.0</code>	Sets a primary or secondary IP address for an interface.
Step 5	ip ospf <i>process-id area area-id</i> Example: <code>Device(config-if) # ip ospf 10 area 0</code>	Enables OSPF on an interface.
Step 6	mpls ip Example: <code>Device(config-if) # mpls ip</code>	Enables Multiprotocol Label Switching (MPLS) forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface.
Step 7	end Example: <code>Device(config-if) # end</code>	Exits interface configuration mode and returns to privileged EXEC mode.

Receiving AS: Configuring P

Complete the following tasks to configure the P which is in the AS receiving data from another AS.

Receiving AS: Configuring ASBR-P Interface and IGP

Beginning in user EXEC mode complete the following steps to configure a ASBR-P interface and IGP which is in the receiving AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <code>Device# configure terminal</code>	Enters global configuration mode.
Step 2	interface <i>{ interface-id subinterface-id vlan-id }</i> Example: <code>Device(config)# interface HundredGigE1/0/13</code> <code>Device(config-if)#</code>	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.

	Command or Action	Purpose
Step 3	no switchport Example: Device(config-if)# no switchport	Set the interface to the routed-interface status erases all Layer 2 configurations.
Step 4	ip address ip-address mask Example: Device(config-if)# ip address 10.1.1.2 255.255.255.0	Sets a primary or secondary IP address for an interface.
Step 5	ip ospf process-id area area-id Example: Device(config-if)# ip ospf 10 area 0	Enables OSPF on an interface.
Step 6	mpls ip Example: Device(config-if)# mpls ip	Enables Multiprotocol Label Switching (MPLS) forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface.
Step 7	exit Example: Device(config-if)# exit	Exits interface configuration mode.
Step 8	interface { <i>interface-id</i> <i>subinterface-id</i> <i>vlan-id</i> } Example: Device(config)# interface HundredGigE1/0/4 Device(config-if)#	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 9	no switchport Example: Device(config-if)# no switchport	Set the interface to the routed-interface status and erases all Layer 2 configurations.
Step 10	ip address ip-address mask Example: Device(config-if)# ip address 20.1.1.1 255.255.255.0	Sets a primary or secondary IP address for an interface.
Step 11	ip ospf process-id area area-id Example: Device(config-if)# ip ospf 10 area 0	Enables OSPF on an interface.
Step 12	mpls ip Example: Device(config-if)# mpls ip	Enables MPLS forwarding of IPv4 and IPv6 packets along normally routed paths for a particular interface.

	Command or Action	Purpose
Step 13	exit Example: Device (config-if) # exit Device (config) #	Exits interface configuration mode and returns to global configuration mode.
Step 14	exit Example: Device (config) # exit	Exits router configuration mode, and returns to privileged EXEC mode.

Receiving AS: Configuring PE

Complete the following tasks to configure the PE which is in the AS receiving data from another AS.

Configuring VRF for PE2

Beginning in privileged EXEC mode complete the following steps to configure a VRF for a PE:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	vrf definition <i>vrf-name</i> Example: Device (config) # vrf definition cul Device (config-vrf) #	Configures a VRF table and enters VRF configuration mode.
Step 3	rd <i>route-distinguisher</i> Example: Device (config-vrf) # rd 1:4	Creates routing and forwarding tables for a VRF instance.
Step 4	address-family ipv4 Example: Device (config-vrf) # address-family ipv4 Device (config-vrf-af) #	The address-family ipv4 command places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv4 address prefixes.
Step 5	route-target export <i>route-target-ext-community</i> Example:	Creates a list of export route target communities for the specified VRF.

	Command or Action	Purpose
	Device (config-vrf-af) # route-target export 200:2	
Step 6	route-target import <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target import 200:1	Creates a list of import route target communities for the specified VRF.
Step 7	exit-address-family Example: Device (config-vrf-af) # exit-address-family Device (config-vrf) #	Leaves the address family configuration mode and returns to router configuration mode.
Step 8	address-family ipv6 Example: Device (config-vrf) # address-family ipv6 Device (config-vrf-af) #	Places the device in address family configuration mode, from which you can configure routing sessions that use standard IPv6 address prefixes.
Step 9	route-target export <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target export 200:102	Creates a list of export route target communities for the specified VRF.
Step 10	route-target import <i>route-target-ext-community</i> Example: Device (config-vrf-af) # route-target import 200:101	Creates a list of import route target communities for the specified VRF.
Step 11	exit-address-family Example: Device (config-vrf-af) # exit-address-family Device (config-vrf) #	Exits the address family configuration mode and returns to router configuration mode.
Step 12	exit Example: Device (config-vrf) # exit Device (config) #	Exits the router configuration mode and returns to global configuration mode.

Receiving AS: Configuring PE-CE Interface

Beginning in privileged EXEC mode complete the following steps to configure a PE-CE interface which is in the receiving AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	interface <i>{interface-id subinterface-id vlan-id}</i> Example: Device(config)# interface FortyGigabitEthernet1/0/5.1 Device(config-subif)#	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 3	encapsulation dot1q vlan-id Example: Device(config-subif)# encapsulation dot1q 900	Enables IEEE 802.1Q encapsulation of traffic on a specified interface.
Step 4	vrf forwarding vrf-name Example: Device(config-subif)# vrf forwarding cul	Associates the VRF with the Layer 3 interface.
Step 5	ip address ip address mask [secondary] Example: Device(config-subif)# ip address 151.1.1.1 255.255.255.0	Sets a primary or secondary IP address for an interface.
Step 6	exit Example: Device(config-subif)# exit Device(config)#	Exits interface configuration mode and returns to global configuration mode.

Receiving AS: Configuring BGP

Beginning in privileged EXEC mode complete the following steps to configure a BGP session on a PE which is in the receiving AS:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	router bgp <i>autonomous-system-number</i> Example: Device(config-if)# router bgp 65002	Configures a BGP routing process.
Step 3	bgp log-neighbor changes Example: Device(config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.
Step 4	neighbor <i>ip-address</i> remote-as <i>as-number</i> Example: Device(config-router)# neighbor 10.10.10.10 remote-as 65002	Configures an entry to the BGP neighbor table.
Step 5	neighbor <i>ip-address</i> update-source <i>interface-type interface-number</i> Example: Device(config-router)# neighbor 10.10.10.10 update-source Loopback30	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 6	address-family ipv4 Example: Device(config-router)# address-family ipv4 Device(config-router-af)#	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.
Step 7	neighbor <i>ip-address</i> activate Example: Device(config-router-af)# neighbor 10.10.10.10 activate	Enables the exchange of information with a BGP neighbor.
Step 8	exit-address-family Example:	Exits BGP address-family submode.

	Command or Action	Purpose
	Device (config-router-af) # exit address-family Device (config-router) #	
Step 9	address-family <i>vpn4</i> Example: Device (config-router) # address-family vpn4 Device (config-router-af) #	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 10	neighbor <i>ip-address activate</i> Example: Device (config-router-af) # neighbor 10.10.10.10 activate	Enables the exchange of information with a BGP neighbor.
Step 11	neighbor { <i>ip-address</i> <i>ipv6-address</i> <i>peer-group-name</i> } send-community [both standard extended] Example: Device (config-router-af) # neighbor 10.10.10.10 send-community both	Enables the exchange of information with a BGP neighbor.
Step 12	exit-address-family Example: Device (config-router-af) # exit-address-family Device (config-router) #	Exits BGP address-family submode.
Step 13	address-family <i>ipv6</i> Example: Device (config-router) # address-family ipv6	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv6 address prefixes.
Step 14	neighbor <i>ip-address activate</i> Example: Device (config-router-af) # neighbor 10.10.10.10 activate	Enables the exchange of information with a BGP neighbor.
Step 15	exit-address-family Example: Device (config-router-af) #	Exits BGP address-family submode.

	Command or Action	Purpose
	exit-address-family Device(config-router)#	
Step 16	address-family vpv6 Example: Device(config-router)# address-family vpv6	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 17	neighbor ip-address activate Example: Device(config-router-af)# neighbor 10.10.10.10 activate	Enables the exchange of information with a BGP neighbor.
Step 18	neighbor {ip-address ipv6-address peer-group-name} send-community [both standard extended] Example: Device(config-router-af)# neighbor 10.10.10.10 send-community both	Enables the exchange of information with a BGP neighbor.
Step 19	exit address-family Example: Device(config-router-af)# exit address-family	Exits BGP address-family submode.
Step 20	address-family ipv4 vrf vrf-name] Example: Device(config-router)# address-family ipv4 vrf cul Device(config-router-af)#	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.
Step 21	redistribute protocol Example: Device(config-router-af)# redistribute connected	Redistributes routes from one routing domain into another routing domain.
Step 22	neighbor ip-address remote-as as-number Example: Device(config-router-af)# neighbor 151.1.1.2 remote-as 65003	Configures an entry to the BGP neighbor table.

	Command or Action	Purpose
Step 23	neighbor ip-address activate Example: Device(config-router-af) # neighbor 151.1.1.2 activate	Enables the exchange of information with a BGP neighbor.
Step 24	exit address-family Example: Device(config-router-af) # exit address-family Device(config-router) #	Exits BGP address-family submode.
Step 25	exit Example: Device(config-router) # exit	Exits router configuration mode.

Receiving AS: Configuring a PE-P Interface and IGP

Beginning in user EXEC mode complete the following steps to configure a PE-P interface and IGP which is in the receiving AS:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface { <i>interface-id</i> <i>subinterface-id</i> <i>vlan-id</i> } Example: Device(config)# interface FortyGigabitEthernet1/0/4 (config-if) #	Enters interface configuration mode and specifies the Ethernet interface, subinterface, or VLAN to be associated with the VRF.
Step 4	no switchport Example: Device(config-if) # no switchport	Set the interface to the routed-interface status erases all Layer 2 configurations.

	Command or Action	Purpose
Step 5	ip address <i>ip-address mask</i> Example: Device(config-if)# ip address 20.1.1.2 255.255.255.0	Sets a primary or secondary IP address for an interface.
Step 6	ip ospf <i>process-id area area-id</i> Example: Device(config-if)# ip ospf 10 area 0	Enables OSPF on an interface.
Step 7	end Example: Device(config-if)# end Device(config)#	Exits interface configuration mode and returns to privileged EXEC mode.

Configuring MPLS VPN InterAS Option B

The following section provides information about how to configure interAS option B using next-hop-self method and redistribute connected method.

Configuring InterAS Option B using the Next-Hop-Self Method

To configure interAS Option B on ASBRs using the next-hop-self method, complete the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router ospf <i>process-id</i> Example: Device(config)# router ospf 1	Configures an OSPF routing process and assign a process number.
Step 4	router-id <i>ip-address</i> Example: Device(config)# router-id 4.1.1.1	Specifies a fixed router ID.

	Command or Action	Purpose
Step 5	nsr Example: Device (config-router) # nsr	Configures OSPF non-stop routing (NSR).
Step 6	nsf Example: Device (config-router) # nsf	Configures OSPF non-stop forwarding (NSF).
Step 7	redistribute bgp <i>autonomous-system-number</i> Example: Device (config-router) # redistribute bgp 200	Redistributes routes from a BGP autonomous system into and OSPF routing process.
Step 8	passive-interface <i>interface-type</i> <i>interface-number</i> Example: Device (config-router) # passive-interface GigabitEthernet 1/0/10 Device (config-router) # passive-interface Tunnel0	Disables Open Shortest Path First (OSPF) routing updates on an interface.
Step 9	network <i>ip-address wildcard-mask aread</i> <i>area-id</i> Example: Device (config-router) # network 4.1.1.0 0.0.0.0.255 area 0	Defines an interface on which OSPF runs and defines the area ID for that interface.
Step 10	exit Example: Device (config-router) # exit	Exits router configuration mode.
Step 11	router bgp <i>autonomous-system-number</i> Example: Device (config) # router bgp 200	Configures a BGP routing process.
Step 12	bgp router-id <i>ip-address</i> Example: Device (config-router) # bgp router-id 4.1.1.1	Configures a fixed router ID for the BGP routing process.

	Command or Action	Purpose
Step 13	bgp log-neighbor changes Example: <pre>Device(config-router)# bgp log-neighbor changes</pre>	Enables logging of BGP neighbor resets.
Step 14	no bgp default ipv4-unicast Example: <pre>Device(config-router)# no bgp default ipv4-unicast</pre>	Disables advertisement of routing information for address family IPv4.
Step 15	no bgp default route-target filter Example: <pre>Device(config-router)# no bgp default route-target filter</pre>	Disables automatic BGP route-target community filtering.
Step 16	neighbor ip-address remote-as as-number Example: <pre>Device(config-router)# neighbor 4.1.1.3 remote-as 200</pre>	Configures an entry to the BGP neighbor table.
Step 17	neighbor ip-address update-source interface-type interface-number Example: <pre>Device(config-router)# neighbor 4.1.1.3 update-source Loopback0</pre>	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 18	neighbor ip-address remote-as as-number Example: <pre>Device(config-router)# neighbor 4.1.1.3 remote-as 300</pre>	Configures an entry to the BGP neighbor table.
Step 19	address-family ipv4 Example: <pre>Device(config-router)# address-family ipv4</pre>	Enters address family configuration mode for configuring BGP routing sessions that use standard IP Version 4 address prefixes.
Step 20	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 10.32.1.2 activate</pre>	Enables the exchange of information with a BGP neighbor.

	Command or Action	Purpose
Step 21	neighbor <i>ip-address</i> send-label Example: Device(config-router-af) # neighbor 10.32.1.2 send-label	Sends MPLS labels with BGP routes to a neighboring BGP router.
Step 22	exit address-family Example: Device(config-router-af) # exit address-family	Exits BGP address-family submode.
Step 23	address-family <i>vpn4</i> Example: Device(config-router) # address-family vpn4	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 24	neighbor <i>ip-address</i> activate Example: Device(config-router-af) # neighbor 4.1.1.3 activate	Enables the exchange of information with a BGP neighbor.
Step 25	neighbor <i>ip-address</i> send-community extended Example: Device(config-router-af) # neighbor 4.1.1.3 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 26	neighbor <i>ip-address</i> next-hop-self Example: Device(config-router-af) # neighbor 4.1.1.3 next-hop-self	Configure a router as the next hop for a BGP-speaking neighbor. This is the command that implements the next-hop-self method.
Step 27	neighbor <i>ip-address</i> activate Example: Device(config-router-af) # neighbor 10.30.1.2 activate	Enables the exchange of information with a BGP neighbor.
Step 28	neighbor <i>ip-address</i> send-community extended Example: Device(config-router-af) # neighbor 10.30.1.2 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.

	Command or Action	Purpose
Step 29	exit address-family Example: Device(config-router-af) # exit address-family	Exits BGP address-family submode.
Step 30	bgp router-id ip-address Example: Device(config-router) # bgp router-id 4.1.1.3	Configures a fixed router ID for the BGP routing process.
Step 31	bgp log-neighbor changes Example: Device(config-router) # bgp log-neighbor changes	Enables logging of BGP neighbor resets.
Step 32	neighbor ip-address remote-as as-number Example: Device(config-router) # neighbor 4.1.1.1 remote-as 200	Configures an entry to the BGP neighbor table.
Step 33	neighbor ip-address update-source interface-type interface-number Example: Device(config-router) # neighbor 4.1.1.1 update-source Loopback0	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 34	address-family vpnv4 Example: Device(config-router) # address-family vpnv4	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 35	neighbor ip-address activate Example: Device(config-router-af) # neighbor 4.1.1.1 activate	Enables the exchange of information with a BGP neighbor.
Step 36	neighbor ip-address send-community extended Example: Device(config-router-af) # neighbor 4.1.1.1 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.

	Command or Action	Purpose
Step 37	exit address-family Example: Device(config-router-af) # exit address-family	Exits BGP address-family submode.

Configuring InterAS Option B using Redistribute Connected Method

To configure interAS Option B on ASBRs using the redistribute connected method, complete the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router ospf process-id Example: Device(config)# router ospf 1	Configures an OSPF routing process and assign a process number.
Step 4	router-id ip-address Example: Device(config)# router-id 5.1.1.1	Specifies a fixed router ID.
Step 5	nsr Example: Device(config-router)# nsr	Configures OSPF non-stop routing (NSR).
Step 6	nsf Example: Device(config-router)# nsf	Configures OSPF non-stop forwarding (NSF).

	Command or Action	Purpose
Step 7	redistribute connected Example: Device(config-router)# redistribute connected	Redistributes the next hop address of the remote ASBR into the local IGP. This is the command that implements redistribute connected method.
Step 8	passive-interface interface-type interface-number Example: Device(config-router)# passive-interface GigabitEthernet 1/0/10 Device(config-router)# passive-interface Tunnel0	Disables Open Shortest Path First (OSPF) routing updates on an interface.
Step 9	network ip-address wildcard-mask area-id Example: Device(config-router)# network 5.1.1.0 0.0.0.0.255 area 0	Defines an interface on which OSPF runs and defines the area ID for that interface.
Step 10	exit Example: Device(config-router)# exit	Exits router configuration mode.
Step 11	router bgp autonomous-system-number Example: Device(config)# router bgp 300	Configures a BGP routing process.
Step 12	bgp router-id ip-address Example: Device(config-router)# bgp router-id 5.1.1.1	Configures a fixed router ID for the BGP routing process.
Step 13	bgp log-neighbor changes Example: Device(config-router)# bgp log-neighbor changes	Enables logging of BGP neighbor resets.
Step 14	no bgp default ipv4-unicast Example: Device(config-router)# no bgp default ipv4-unicast	Disables advertisement of routing information for address family IPv4.

	Command or Action	Purpose
Step 15	no bgp default route-target filter Example: Device(config-router)# no bgp default route-target filter	Disables automatic BGP route-target community filtering.
Step 16	neighbor ip-address remote-as as-number Example: Device(config-router)# neighbor 5.1.1.3 remote-as 300	Configures an entry to the BGP neighbor table.
Step 17	neighbor ip-address update-source interface-type interface-number Example: Device(config-router)# neighbor 4.1.1.3 update-source Loopback0	Allows Cisco IOS software to use a specific operational interface for TCP connections by the BGP sessions.
Step 18	neighbor ip-address remote-as as-number Example: Device(config-router)# neighbor 10.30.1.2 remote-as 200	Configures an entry to the BGP neighbor table.
Step 19	address-family vpnv4 Example: Device(config-router)# address-family vpnv4	Configures the device in address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.
Step 20	neighbor ip-address activate Example: Device(config-router-af)# neighbor 5.1.1.3 activate	Enables the exchange of information with a BGP neighbor.
Step 21	neighbor ip-address send-community extended Example: Device(config-router-af)# neighbor 5.1.1.3 send-community extended	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 22	neighbor ip-address activate Example: Device(config-router-af)# neighbor 10.30.1.1 activate	Enables the exchange of information with a BGP neighbor.

	Command or Action	Purpose
Step 23	neighbor <i>ip-address</i> send-community extended Example: <pre>Device(config-router-af)# neighbor 10.30.1.2 send-community extended</pre>	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 24	exit address-family Example: <pre>Device(config-router-af)# exit address-family</pre>	Exits BGP address-family submode.
Step 25	mpls ldp router-id <i>interface-id</i> [force] Example: <pre>Device(config-router)# mpls ldp router-id Loopback0 force</pre>	Specifies the preferred interface for determining the LDP router ID.

Configuring MPLS VPN Inter-AS Option AB

The following sections describe how to configure the interAS option AB feature on an ASBR for an MPLS VPN:

Configuring the VRFs on the ASBR Interface for Each VPN Customer

Use the following steps to configure the VRFs on the ASBR interface for each VPN customer so that these VPNs have connectivity over the interAS Option AB network.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interfacetype number Example: <pre>Device(config)# interface gigabitethernet</pre>	Specifies the interface to configure and enters interface configuration mode.

	Command or Action	Purpose
	1/0/1	
Step 4	ip vrf forwarding <i>vrf-name</i> Example: Device(config-if)# ip vrf forwarding vpn1	Associates a VRF with the specified interface. <ul style="list-style-type: none"> The vrf-name argument is the name assigned to a VRF.
Step 5	end Example: Device(config-if)# end	(Optional) Exits to privileged EXEC mode.

Configuring the MP-BGP Session Between ASBR Peers

BGP propagates reachability information for VPN-IPv4 prefixes among PE devices by means of the BGP multiprotocol extensions (see RFC 2283, Multiprotocol Extensions for BGP-4), which define support for address families other than IPv4. Using the extensions ensures that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other.

Follow the steps in this section to configure the MP-BGP session on the ASBR.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 100	Configures a BGP routing process and places the device in router configuration mode. <ul style="list-style-type: none"> The as-number argument indicates the number of an autonomous system that identifies the device to other BGP devices and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.

	Command or Action	Purpose
Step 4	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i></p> <p>Example:</p> <pre>Device(config-router)# neighbor 192.168.0.1 remote-as 200</pre>	<p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	<p>address-family vpnv4 [unicast]</p> <p>Example:</p> <pre>Device(config-router)# address-family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> • The unicast keyword specifies IPv4 unicast address prefixes.
Step 6	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 192.168.0.1 activate</pre>	<p>Enables the exchange of information with a neighboring device.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 7	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } inter-as-hybrid</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 192.168.0.1 inter-as-hybrid</pre>	<p>Configures eBGP peer device (ASBR) as an Inter-AS Option AB peer.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • If any prefixes are imported into Option AB VRFs, then the imported paths are advertised to this peer. • If any prefixes are received from this peer and are imported into Option AB VRFs, then the imported paths are advertised to iBGP peers. <p>Note Advertised routes have RTs that are configured on the VRF. Advertised routes do not have their original RTs.</p>

	Command or Action	Purpose
Step 8	exit-address-family Example: Device(config-router)# exit-address-family	Exits from address family configuration mode.

Configuring the Routing Policy for VPNs that Need Inter-AS Connections

Use the steps in this section to configure VRFs for the VPNs that need Inter-AS connections between ASBR peers, by configuring the appropriate routing policy and Option AB configuration.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vrf definition vrf-name Example: Device(config)# vrf definition vpn1	Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. <ul style="list-style-type: none"> • The <i>vrf-name</i> argument is the name assigned to a VRF.
Step 4	rd route-distinguisher Example: Device(config-vrf)# rd 100:1	Creates routing and forwarding tables. <ul style="list-style-type: none"> • The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats: <ul style="list-style-type: none"> • 16-bit autonomous system number: your 32-bit number, for example, 101:3. • 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1.
Step 5	address-family ipv4 Example: Device(config-vrf)# address-family ipv4	Enters VRF address family configuration mode to specify an address family for a VRF. <ul style="list-style-type: none"> • The ipv4 keyword specifies an IPv4 address family for a VRF.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • 16-bit autonomous system number: your 32-bit number, for example, 101:3. • 32-bit IP address: your 16-bit number, for example, 192.168.122.15:1.
Step 6	route-target { import export both } <i>route-target-ext-community</i> Example: <pre>Device(config-vrf-af)# route-target import 100:1</pre>	<p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> • The import keyword imports routing information from the target VPN extended community. • The export keyword exports routing information to the target VPN extended community. • The both keyword imports routing information from and exports routing information to the target VPN extended community. • The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF list of import, export, or both (import and export) route-target extended communities.
Step 7	inter-as-hybrid Example: <pre>Device(config-vrf-af)# inter-as-hybrid</pre>	<p>Specifies the VRF as an option AB VRF, which has the following effects:</p> <ul style="list-style-type: none"> • Routes imported to this VRF can be advertised to option AB peers and VPNv4 iBGP peers. • When routes received from option AB peers and are imported into the VRF, the next hop table ID of the route is set to the table ID of the VRF.
Step 8	inter-as-hybrid [<i>next-hop ip-address</i>] Example: <pre>Device(config-vrf-af)# inter-as-hybrid next-hop 192.168.1.0</pre>	<p>(Optional) Specifies the next hop IP address to be set on paths that are imported into the VRF and that are received from an Option AB peer.</p> <ul style="list-style-type: none"> • The next hop context is also set to the VRF, which imports these paths.
Step 9	end Example: <pre>Device(config-vrf-af)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Changing an Inter-AS Option A Deployment to an Option AB Deployment

In an option A deployment, the VRF instances are back-to-back between the ASBR devices and there is direct connectivity between PE devices of different autonomous systems. The PE devices are attached by multiple physical or logical interfaces, each of which is associated with a given VPN (through a VRF instance).

In the Option AB deployment, the different autonomous systems interconnect by using a single MP-BGP session in the global routing table to carry control plane traffic.

Use the following steps to change an MPLS VPN Inter-AS Option A deployment to an Option AB deployment.

1. Configure the MP-BGP session on the ASBR. BGP multiprotocol extensions are used to define support for address families other than IPv4 so that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other.
2. Identify the VRFs that need an upgrade from Option A and configure them for Option AB by using the **inter-as-hybrid** command.
3. Use the following steps in this section to remove the configuration for the eBGP (peer ASBR) neighbor.
4. Repeat all the steps in the following procedure to remove the configuration for additional eBGP (peer ASBR) neighbors.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 100	Configures a BGP routing process and places the device in router configuration mode. <ul style="list-style-type: none"> • The <i>as-number</i> argument indicates the number of an autonomous system that identifies the device to other BGP devices and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.
Step 4	address-family ipv4 vrf <i>vrf-name</i> Example:	Configures each VRF that is identified in the MP-BGP session on the ASBR so that the routes for a given VPN are learned only by other

	Command or Action	Purpose
	Device(config-router)# address-family ipv4 vrf vpn4	members of that VPN, enabling members of the VPN to communicate with each other. <ul style="list-style-type: none"> Enters address family configuration mode to specify an address family for a VRF.
Step 5	no neighbor { <i>ip-address</i> <i>peer-group-name</i> } Example: Device(config-router-af) # no neighbor 192.168.0.1	Removes the configuration for the exchange of information with the neighboring eBGP (ASBR) device. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor.
Step 6	exit-address-family Example: Device(config-router-af) # exit-address-family	Exits from address family configuration mode.
Step 7	end Example: Device(config-router-af) # end	Exits to privileged EXEC mode.

Verifying MPLS VPN InterAS Options Configuration

To verify InterAS option B configuration information, perform one of the following tasks:

Command	Purpose
ping <i>ip-address</i> source <i>interface-type</i>	Checks the accessibility of devices. Use this command to check the connection between CE1 and CE2 using the loopback interface.
show bgp vpnv4 unicast labels	Displays incoming and outgoing BGP labels.
show mpls forwarding-table	Display the contents of the MPLS Label Forwarding Information Base.
show ip bgp	Displays entries in the BGP routing table.
show { ip ipv6 } bgp [vrf <i>vrf-name</i>]	Displays information about BGP on a VRF.
show ip route [<i>ip-address</i> [<i>mask</i>]] [<i>protocol</i>] vrf <i>vrf-name</i>	Displays the current state of the routing table. Use the <i>ip-address</i> argument to verify that CE1 has a route to CE2. Verify the routes learned by CE1. Make sure that the route for CE2 is listed.

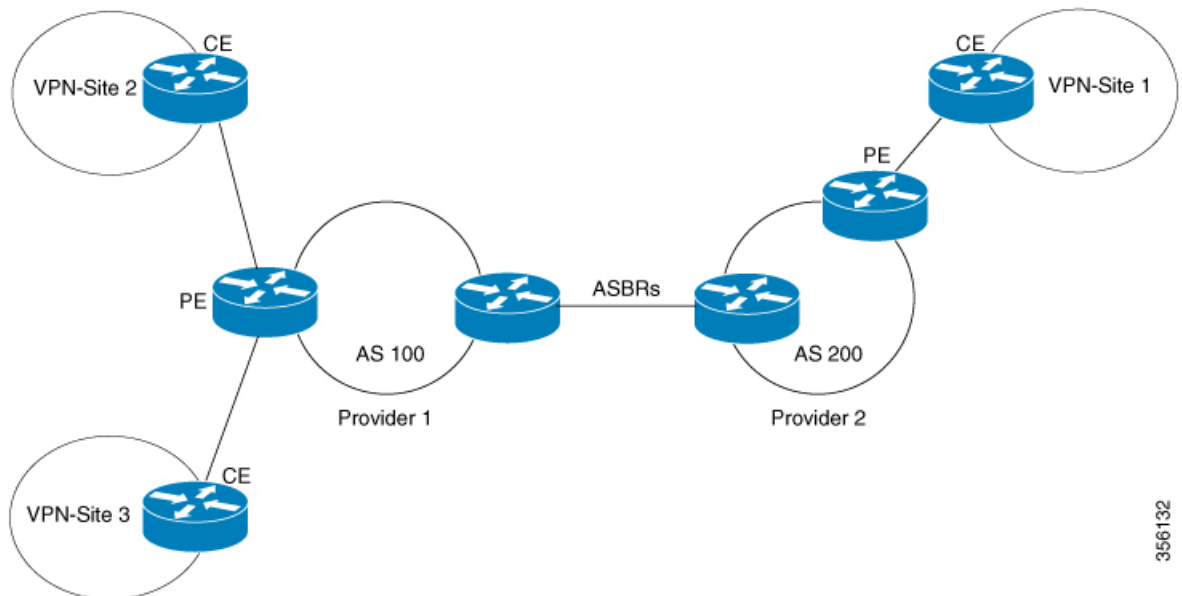

Command	Purpose
<code>show { ip ipv6 } route vrf vrf-name</code>	Displays the IP routing table that is associated with a VRF. Check that the loopback addresses of the local and remote CE routers are in the routing table of the PE routers.
<code>show running-config bgp</code>	Displays the running configuration for BGP.
<code>show running-config vrf vrf-name</code>	Displays the running configuration for VRFs.
<code>show vrf vrf-name interface interface-type interface-id</code>	Verifies the route distinguisher (RD) and interface that are configured for the VRF.
<code>trace destination [vrf vrf-name]</code>	Discovers the routes that packets take when traveling to their destination. The trace command can help isolate a problem if two routers cannot communicate.

Feature History for MPLS VPN InterAS Options

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.11.1	MPLS VPN InterAS Option B	InterAS Options use iBGP and eBGP peering to allow VPNs in different AS to communicate with each other. In an interAS option B network, ASBR ports are connected by one or more interfaces that are enabled to receive MPLS traffic.

Release	Feature	Feature Information
Cisco IOS XE Amsterdam 17.1.1	MPLS VPN InterAS Option A	MPLS VPN InterAS Option A is the simplest to configure of the available InterAS Options. This option provides back to back virtual routing and forwarding (VRF) connectivity. Here, MPLS VPN providers exchange routes across VRF interfaces.
Cisco IOS XE Amsterdam 17.3.1	MPLS VPN InterAS Option AB	MPLS VPN InterAS Option AB enables different autonomous systems to interconnect by using a single Multiprotocol Border Gateway Protocol (MP-BGP) session, which is enabled globally on the router.
Cisco IOS XE Dublin 17.11.1	MPLS VPN InterAS Option A	Support for this feature was introduced on the Cisco Catalyst 9500X series Switches.

- [Additional References for MPLS over GRE, on page 176](#)
- [Feature History for MPLS over GRE, on page 176](#)

Prerequisites for MPLS over GRE

Ensure that the following routing protocols are configured and working properly.

- Label Distribution Protocol (LDP)—for MPLS label distribution.
- Routing protocol (ISIS or OSPF) between the core devices P1-P2
- MPLS between PE1-P1 and PE2-P2
- Since the ingress traffic enters the IP core from MPLS network and egress traffic leaves the IP core to enter the MPLS network, it is recommended to use QoS group value for defining QoS policies as we traverse the protocol boundary.

Restrictions for MPLS over GRE

- GRE Tunneling :
 - L2VPN over mGRE and L3VPN over mGRE is not supported.
 - The tunnel source can only be a loopback or a Layer 3 interface. These interfaces could either be physical interfaces or etherchannels.
 - Tunnel interface supports Static Routes, Enhanced Interior Gateway Routing Protocol (EIGRP) and Open Shortest Path First (OSPF) routing protocols.
 - GRE Options - Sequencing, Checksum and Source Route are not supported.

- IPv6 generic routing encapsulation (GRE) is not supported.
- Carrier Supporting Carrier (CSC) is not supported.
- Tunnel source cannot be a subinterface.

Information About MPLS over GRE

The MPLS over GRE feature provides a mechanism for tunneling Multiprotocol Label Switching (MPLS) packets over a non-MPLS network. This feature allows you to create a generic routing encapsulation (GRE) tunnel across a non-MPLS network. The MPLS packets are encapsulated within the GRE tunnel packets, and the encapsulated packets traverse the non-MPLS network through the GRE tunnel. When GRE tunnel packets are received at the other side of the non-MPLS network, the GRE tunnel packet header is removed and the inner MPLS packet is forwarded to its final destination. The core network between the end-points of the GRE tunnel uses ISIS or OSPF routing protocol whereas the GRE tunnel uses OSPF or EIGRP.

PE-to-PE Tunneling

The provider-edge-to-provider-edge (PE-to-PE) tunneling configuration provides a scalable way to connect multiple customer networks across a non-MPLS network. With this configuration, traffic that is destined to multiple customer networks is multiplexed through a single generic routing encapsulation (GRE) tunnel.

Note A similar nonscalable alternative is to connect each customer network through separate GRE tunnels (for example, connecting one customer network to each GRE tunnel).

The PE device on one side of the non-MPLS network uses the routing protocols (that operate within the non-MPLS network) to learn about the PE device on the other side of the non-MPLS network. The learned routes that are established between the PE devices are then stored in the main or default routing table.

The opposing PE device uses OSPF or EIGRP to learn about the routes that are associated with the customer networks that are behind the PE devices. These learned routes are not known to the non-MPLS network.

The following figure shows an end-to-end IP core from one PE device to another through the GRE tunnel that spans the non-MPLS network.

Figure 11: PE-to-PE Tunneling

P-to-PE Tunneling

The provider-to-provider-edge (P-to-PE) tunneling configuration provides a way to connect a PE device (P1) to a Multiprotocol Label Switching (MPLS) segment (PE-2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single generic routing encapsulation (GRE) tunnel.

Figure 12: P-to-PE Tunneling

P-to-P Tunneling

As shown in the figure below, the provider-to-provider (P-to-P) configuration provides a method of connecting two Multiprotocol Label Switching (MPLS) segments (P1 to P2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single generic routing encapsulation (GRE) tunnel.

Figure 13: P-to-P Tunneling

How to Configure MPLS over GRE

The following section provides the various configuration steps for MPLS over GRE:

Configuring the MPLS over GRE Tunnel Interface

To configure the MPLS over GRE feature, you must create a generic routing encapsulation (GRE) tunnel to span the non-MPLS networks. You must perform the following procedure on the devices located at both ends of the GRE tunnel.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel <i>tunnel-number</i> Example: Device(config)# interface tunnel 1	Creates a tunnel interface and enters interface configuration mode.
Step 4	ip address <i>ip-address mask</i> Example: Device(config-if)# ip address 10.0.0.1 255.255.255.0	Assigns an IP address to the tunnel interface.
Step 5	tunnel source <i>source-address</i> Example: Device(config-if)# tunnel source 10.1.1.1	Specifies the tunnel's source IP address.
Step 6	tunnel destination <i>destination-address</i> Example: Device(config-if)# tunnel destination 10.1.1.2	Specifies the tunnel's destination IP address.
Step 7	mpls ip Example: Device(config-if)# mpls ip	Enables Multiprotocol Label Switching (MPLS) on the tunnel's physical interface.
Step 8	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

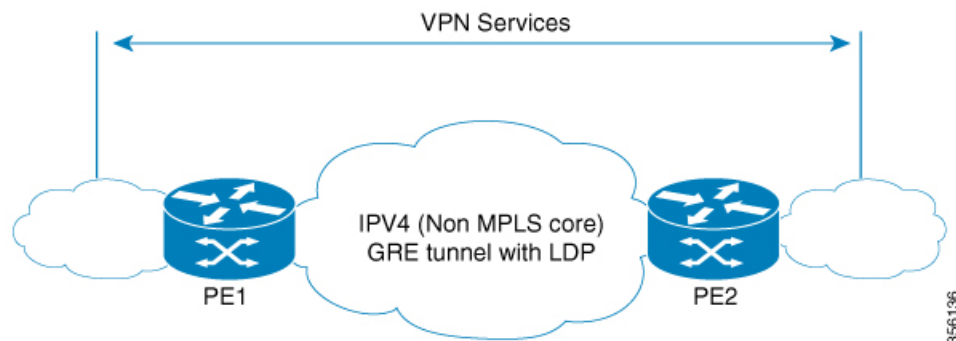

Configuration Examples for MPLS over GRE

The following section provides configuration examples for MPLS over GRE:

Example: PE-to-PE Tunneling

The following shows basic MPLS configuration on two Provider Edge (PE) devices, PE-to-PE tunneling, which use GRE tunnel to send traffic over non-MPLS network.

Figure 14: Topology for PE-to-PE Tunneling

Configuring MPLS Layer 2 VPN over GRE

- [Information About MPLS Layer 2 VPN over GRE, on page 179](#)
- [How to Configure MPLS Layer 3 VPN over GRE, on page 181](#)
- [Configuration Examples for MPLS Layer 2 VPN over GRE, on page 182](#)
- [Additional References for Configuring MPLS Layer 2 VPN over GRE, on page 183](#)
- [Feature History for Configuring MPLS Layer 2 VPN over GRE, on page 183](#)

Information About MPLS Layer 2 VPN over GRE

The MPLS Layer 2 VPN over GRE feature provides a mechanism for tunneling Multiprotocol Label Switching (MPLS) packets over non-MPLS networks. This feature allows you to create a generic routing encapsulation (GRE) tunnel across a non-MPLS network. The MPLS packets are encapsulated within the GRE tunnel packets, and the encapsulated packets traverse the non-MPLS network through the GRE tunnel. When GRE tunnel packets are received at the other side of the non-MPLS network, the GRE tunnel packet header is removed and the inner MPLS packet is forwarded to its final destination.

To configure MPLS Layer 2 VPN over GRE, you must have configured either Virtual Private LAN Service (VPLS) or EoMPLS (Ethernet over MPLS).

Types of Tunneling Configurations

The following sections provide information about the different types of tunneling configurations that are supported.

PE-to-PE Tunneling

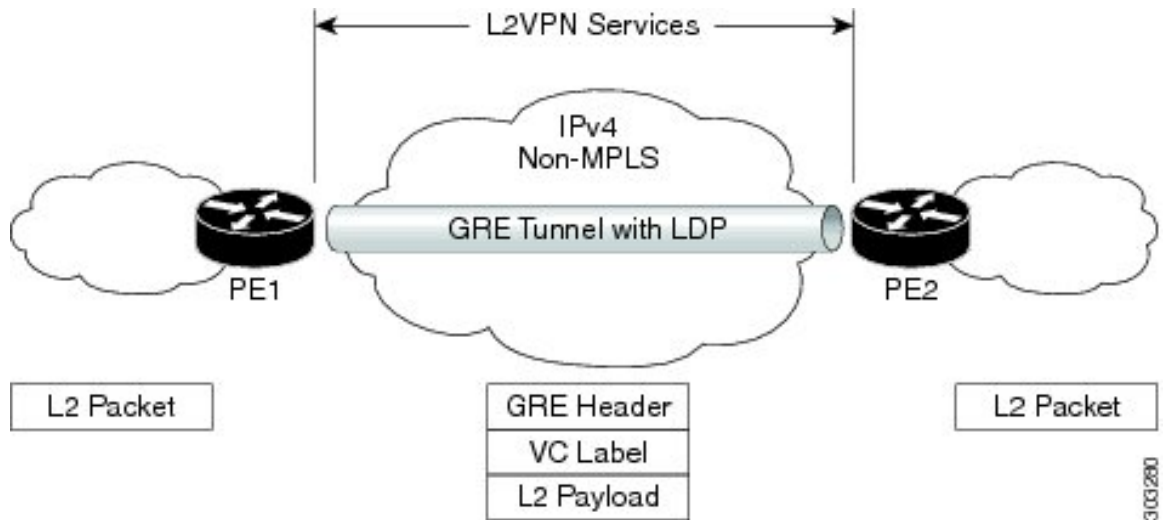

The provider edge-to-provider edge (PE-to-PE) tunneling configuration provides a scalable way to connect multiple customer networks across a non-MPLS network. With this configuration, traffic that is destined to multiple customer networks is multiplexed through a single GRE tunnel.

The PE device on one side of the non-MPLS network uses the routing protocols (that operate within the non-MPLS network) to learn about the PE device on the other side of the non-MPLS network. The learned routes that are established between the PE devices are then stored in the main or default routing table.

The opposing PE device uses Border Gateway Protocol (BGP) to learn about the routes that are associated with the customer networks that are behind the PE devices. These learned routes are not known to the non-MPLS network.

Figure 17: PE-to-PE Tunneling, on page 180 shows an end-to-end IP core from one PE device to another through the GRE tunnel that spans the non-MPLS network.

Figure 17: PE-to-PE Tunneling

P-to-PE Tunneling

Figure 18: P-to-PE Tunneling, on page 180 shows a method of connecting two MPLS segments (P2 to PE2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single GRE tunnel.

Figure 18: P-to-PE Tunneling

P-to-P Tunneling

Figure 19: P-to-P Tunneling, on page 181 shows a method of connecting two MPLS segments (P1 to P2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single GRE tunnel.

Figure 19: P-to-P Tunneling

How to Configure MPLS Layer 3 VPN over GRE

To configure the MPLS over GRE feature, you must create a GRE tunnel to span the non-MPLS networks. Perform the following procedure on the devices that are located at both ends of the GRE tunnel.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel <i>tunnel-number</i> Example: Device(config)# interface tunnel 1	Creates a tunnel interface and enters interface configuration mode.
Step 4	ip address <i>ip-address mask</i> Example: Device(config-if)# ip address 10.0.0.1 255.255.255.0	Assigns an IP address to the tunnel interface.
Step 5	tunnel source <i>source-address</i> Example: Device(config-if)# tunnel source 10.1.1.1	Configures the tunnel's source IP address.

	Command or Action	Purpose
Step 6	tunnel destination <i>destination-address</i> Example: Device(config-if)# tunnel destination 10.1.1.2	Configures the tunnel's destination IP address.
Step 7	mpls ip Example: Device(config-if)# mpls ip	Enables MPLS on the tunnel's physical interface.
Step 8	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuration Examples for MPLS Layer 2 VPN over GRE

The following section provides an example for configuring MPLS Layer 2 VPN over GRE.

Example: Configuring a GRE Tunnel That Spans a non-MPLS Network

The following examples show how to configure a generic GRE tunnel configuration that spans a non-MPLS network.

The following example shows the tunnel configuration on the PE1 device:

```
Device> enable
Device# configure terminal
Device(config)# interface Tunnel 1
Device(config-if)# ip address 10.1.1.1 255.255.255.0
Device(config-if)# tunnel source 10.0.0.1
Device(config-if)# tunnel destination 10.0.0.2
Device(config-if)# ip ospf 1 area 0
Device(config-if)# mpls ip
```

The following example shows the tunnel configuration on the PE2 device:

```
Device> enable
Device# configure terminal
Device(config)# interface Tunnel 1
Device(config-if)# ip address 10.1.1.2 255.255.255.0
Device(config-if)# tunnel source 10.0.0.2
Device(config-if)# tunnel destination 10.0.0.1
Device(config-if)# ip ospf 1 area 0

CHAPTER 11

Configuring MPLS Layer 3 VPN over GRE

- [Prerequisites for MPLS Layer 3 VPN over GRE, on page 185](#)
- [Restrictions for MPLS Layer 3 VPN over GRE, on page 185](#)
- [Information About MPLS Layer 3 VPN over GRE, on page 186](#)
- [How to Configure MPLS Layer 3 VPN over GRE, on page 188](#)
- [Configuration Examples for MPLS Layer 3 VPN over GRE, on page 189](#)
- [Feature History for Configuring MPLS Layer 3 VPN over GRE, on page 195](#)

Prerequisites for MPLS Layer 3 VPN over GRE

- Ensure that your Multiprotocol Label Switching (MPLS) virtual private network (VPN) is configured.
- Ensure that the following routing protocols are configured:
 - Label Distribution Protocol (LDP): For MPLS label distribution.
 - Multiprotocol Border Gateway Protocol (MP-BGP): For VPN route and label distribution.
- We recommend that you use the Quality of Service (QoS) group value for defining QoS policies to traverse the protocol boundary. QoS group values are required because the ingress traffic enters the IP core from the MPLS network and the egress traffic leaves the IP core to enter the MPLS network.
- Before configuring a generic routing encapsulation (GRE) tunnel, configure a loopback interface (that is not attached to a virtual routing and forwarding [VRF]) interface with an IP address. This dummy loopback interface with an IPv4 address enables the internally created tunnel interface for IPv4 forwarding. You do not have to configure a loopback interface if the system has at least one interface that is not attached to the VRF and is configured with an IPv4 address.

Restrictions for MPLS Layer 3 VPN over GRE

The MPLS Layer 3 VPN over GRE feature does not support the following:

- QoS service policies that are configured on the tunnel interface

Note Although QoS service policies configured on the tunnel interface are not supported, QoS service policies configured on a physical interface or a sub-interface are supported.

- GRE options such as sequencing, checksum, and source route
- IPv6 GRE configurations
- Advanced features such as Carrier Supporting Carrier (CSC)

Information About MPLS Layer 3 VPN over GRE

The MPLS Layer 3 VPN over GRE feature provides a mechanism for tunneling MPLS packets over non-MPLS networks. This feature allows you to create a GRE tunnel across a non-MPLS network. The MPLS packets are encapsulated within the GRE tunnel packets, and the encapsulated packets traverse the non-MPLS network through the GRE tunnel. When GRE tunnel packets are received at the other side of the non-MPLS network, the GRE tunnel packet header is removed and the inner MPLS packet is forwarded to its final destination.

Types of Tunneling Configurations

The following sections provide information about the different types of tunneling configurations that are supported.

PE-to-PE Tunneling

The provider edge-to-provider edge (PE-to-PE) tunneling configuration provides a scalable way to connect multiple customer networks across a non-MPLS network. With this configuration, traffic that is destined to multiple customer networks is multiplexed through a single GRE tunnel.

As shown in the [Figure 20: PE-to-PE Tunneling, on page 187](#), the PE devices assign VRF numbers to the customer edge (CE) devices on each side of the non-MPLS network.

The PE devices use routing protocols such as Border Gateway Protocol (BGP), Open Shortest Path First (OSPF), or Routing Information Protocol (RIP) to learn about the IP networks behind the CE devices. The routes to the IP networks behind the CE devices are stored in the associated CE device's VRF routing table.

The PE device on one side of the non-MPLS network uses routing protocols (that operate within the non-MPLS network) to learn about the PE device on the other side of the non-MPLS network. The learned routes that are established between the PE devices are then stored in the main or default routing table.

The opposing PE device uses BGP to learn about the routes that are associated with the customer networks that are behind the PE devices. These learned routes are not known to the non-MPLS network.

[Figure 20: PE-to-PE Tunneling, on page 187](#) shows BGP defining a static route to the BGP neighbor (the opposing PE device) through the GRE tunnel that spans the non-MPLS network. Because the routes that are learned by the BGP neighbor include the GRE tunnel next hop, all the customer network traffic is sent using the GRE tunnel.

Figure 20: PE-to-PE Tunneling

P-to-PE Tunneling

Figure 21: P-to-PE Tunneling, on page 187 shows a method of connecting two MPLS segments (P2 to PE2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single GRE tunnel.

Figure 21: P-to-PE Tunneling

P-to-P Tunneling

Figure 22: P-to-P Tunneling, on page 188 shows a method of connecting two MPLS segments (P1 to P2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single GRE tunnel.

Figure 22: P-to-P Tunneling

How to Configure MPLS Layer 3 VPN over GRE

To configure the MPLS over GRE feature, you must create a GRE tunnel to span the non-MPLS networks. Perform the following procedure on the devices that are located at both ends of the GRE tunnel.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel <i>tunnel-number</i> Example: Device(config)# interface tunnel 1	Creates a tunnel interface and enters interface configuration mode.
Step 4	ip address <i>ip-address mask</i> Example: Device(config-if)# ip address 10.0.0.1 255.255.255.0	Assigns an IP address to the tunnel interface.
Step 5	tunnel source <i>source-address</i> Example: Device(config-if)# tunnel source 10.1.1.1	Configures the tunnel's source IP address.
Step 6	tunnel destination <i>destination-address</i> Example: Device(config-if)# tunnel destination 10.1.1.2	Configures the tunnel's destination IP address.

	Command or Action	Purpose
Step 7	mpls ip Example: Device(config-if)# mpls ip	Enables MPLS on the tunnel's physical interface.
Step 8	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuration Examples for MPLS Layer 3 VPN over GRE

The following sections provide various configuration examples for MPLS Layer 3 VPN over GRE.

Example: Configuring MPLS Layer 3 VPN over GRE (PE-to-PE Tunneling)

The following examples show how to configure Layer 3 VPN and the GRE tunnel from PE1 to PE2 (see [Figure 20: PE-to-PE Tunneling, on page 187](#)).

The following example shows how to configure a loopback interface on PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface Loopback10
Device(config-if)# ip address 209.165.200.225 255.255.255.255
Device(config-if)# end
```

The following example shows how to configure a loopback interface on PE2:

```
Device> enable
Device# configure terminal
Device(config)# interface Loopback3
Device(config-if)# ip address 209.165.202.129 255.255.255.255
Device(config-if)# end
```

The following example shows how to advertise a loopback in IGP on PE1:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 10
Device(config-router)# router-id 198.51.100.10
Device(config-router)# end
```

The following example shows how to configure a GRE tunnel, configure a different IGP instance on the tunnel, and enable MPLS on the tunnel on PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface Tunnel13
Device(config-if)# ip address 203.0.113.200 255.255.255.248
Device(config-if)# ip ospf 11 area 0
Device(config-if)# mpls ip
Device(config-if)# tunnel source 209.165.200.225
Device(config-if)# tunnel destination 209.165.202.129
Device(config-if)# end
```

The following example shows how to configure a GRE tunnel, configure a different IGP instance on the tunnel, and enable MPLS on the tunnel on PE2:

```
Device> enable
Device# configure terminal
Device(config)# interface Tunnel31
Device(config-if)# ip address 203.0.113.201 255.255.255.248
Device(config-if)# ip ospf 11 area 0
Device(config-if)# mpls ip
Device(config-if)# tunnel source 209.165.202.129
Device(config-if)# tunnel destination 209.165.200.225
Device(config-if)# end
```

The following example shows how to advertise PE1 loopback IP for BGP in IGP instance configured on the tunnel:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 11
Device(config-router)# router-id 198.51.100.11
Device(config-router)# network 192.0.1.1 0.0.0.0 area 0
Device(config-router)# end
```

The following example shows how to advertise PE2 loopback IP for BGP in IGP instance configured on the tunnel:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 11
Device(config-router)# router-id 203.0.113.201
Device(config-router)# network 192.0.1.1 0.0.0.0 area 0
Device(config-router)# end
```

The following example shows how to configure VRF on PE1 where CE1 is connected:

```
Device> enable
Device# configure terminal
Device(config)# vrf definition vrf-1
Device (config-vrf)# rd 1:1
Device (config-vrf)# address-family ipv4
Device (config-vrf-af)# route-target import 1:2
Device (config-vrf-af)# route-target export 1:1
Device (config-vrf) # end
```

The following example shows how to configure VRF on PE2 where CE2 is connected:

```
Device> enable
Device# configure terminal
Device (config)# vrf definition vrf-1
Device (config-vrf)# rd 2:2
Device (config-vrf)# address-family ipv4
Device (config-vrf-af)# route-target import 1:1
Device (config-vrf-af)# route-target export 1:2
Device (config-vrf) # end
```

The following example shows how to configure PE1-CE1 interface:

```
Device> enable
Device# configure terminal
Device (config)# int po14.1
Device (config-subif)# encapsulation dot1Q 10
Device (config-subif)# vrf forwarding vrf-1
Device (config-subif)# ip address 14.2.1.1 255.255.255.0
Device (config-subif) # end
```

The following example shows how to configure PE2-CE2 interface:

```
Device> enable
Device# configure terminal
Device (config)# int po24.1
Device (config-subif)# encapsulation dot1Q 10
Device (config-subif)# vrf forwarding vrf-1
Device (config-subif)# ip address 24.2.1.1 255.255.255.0
Device(config-subif)# end
```

The following example shows how to configure PE1-CE1 External Border Gateway Protocol (EBGP):

```
Device> enable
Device# configure terminal
Device (config)# router bgp 65040
Device (config-router)# address-family ipv4 vrf vrf-1
Device (config-router-af)# neighbor 14.2.1.2 remote-as 65041
Device (config-router-af)# neighbor 14.2.1.2 activate
Device (config-router-af)# exit-address-family
Device(config-router)# end
```

The following example shows how to configure PE2-CE2 EBGP:

```
Device> enable
Device# configure terminal
Device (config)# router bgp 65040
Device (config-router)# address-family ipv4 vrf vrf-1
Device (config-router-af)# neighbor 24.2.1.2 remote-as 65041
Device (config-router-af)# neighbor 24.2.1.2 activate
Device (config-router-af)# exit-address-family
Device (config-router)# end
```

The following example shows how to configure PE1-PE2 MP-BGP on PE1:

```
Device> enable
Device# configure terminal
Device (config)# router bgp 65040
Device (config-router)# neighbor 192.0.2.1 remote-as 65040
Device (config-router)# neighbor 192.0.2.1 update-source Loopback0
Device (config-router)# address-family ipv4
Device (config-router-af)# neighbor 192.0.2.1 activate
Device (config-router-af)# exit
Device (config-router)# address-family vpnv4
Device (config-router-af)# neighbor 192.0.2.1 activate
Device (config-router-af)# neighbor 192.0.2.1 send-community both
Device (config-router-af)# exit
Device (config-router)# end
```

Example: Configuring MPLS Layer 3 VPN over GRE (P-to-PE Tunneling)

The following examples show how to configure Layer 3 VPN on the PE devices (PE1 and PE2) and MPLS segment (P1), and the GRE tunnel from PE1 to P1 to PE2 (see [Figure 21: P-to-PE Tunneling, on page 187](#)).

The following example shows how to configure loopback interface for GRE tunnel for PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface Loopback4
```

```
Device(config-if)# ip address 209.165.200.230 255.255.255.255
Device(config-if)# end
```

The following example shows how to configure loopback interface for GRE tunnel for P1:

```
Device> enable
Device# configure terminal
Device(config)# interface Loopback100
Device(config-if)# ip address 209.165.200.235 255.255.255.255
Device(config-if)# end
```

The following example shows how to configure interface from PE1-P1 and configure IGP:

```
Device> enable
Device# configure terminal
Device(config)# interface Port-channel11
Device(config-if)# no switchport
Device(config-if)# ip address 209.165.201.1 255.255.255.248
Device(config-if)# ip ospf 10 area 0
Device(config-if)# end
```

The following example shows how to configure interface from P1-PE1 and configure IGP:

```
Device> enable
Device# configure terminal
Device(config)# interface Port-channel1
Device(config-if)# no switchport
Device(config-if)# ip address 209.165.201.2 255.255.255.248
Device(config-if)# ip broadcast-address 209.165.201.31
Device(config-if)# ip ospf 10 area 0
Device(config-if)# end
```

The following example shows how to advertise loopback in IGP on PE1:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 10
Device(config-router)# router-id 198.51.100.10
Device(config-router)# network 209.165.200.230 0.0.0.0 area 0
Device(config-router)# end
```

The following example shows how to advertise loopback in IGP on P1:

```
Device> enable
Device# configure terminal
Device(config)# router ospf 10
Device(config-router)# router-id 198.51.100.20
Device(config-router)# network 209.165.200.235 0.0.0.0 area 0
Device(config-router)# end
```

The following example shows how to configure GRE tunnel, configure an IGP instance on the tunnel, and enable MPLS on the tunnel on PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface Tunnell111
Device(config-if)# ip address 209.165.202.140 255.255.255.248
Device(config-if)# ip ospf 11 area 0
Device(config-if)# mpls ip
Device(config-if)# tunnel source 209.165.200.230
Device(config-if)# tunnel destination 209.165.200.235
Device(config-if)# end
```

The following example shows how to configure GRE tunnel, configure an IGP instance on the tunnel, and enable MPLS on the tunnel on P1:

```

Device> enable
Device# configure terminal
Device(config)# interface Tunnel111
Device(config-if)# ip address 209.165.202.141 255.255.255.248
Device(config-if)# ip ospf 11 area 0
Device(config-if)# mpls ip
Device(config-if)# tunnel source 209.165.200.235
Device(config-if)# tunnel destination 209.165.200.230
Device(config-if)# end

```

The following example shows how to advertise PE loopback IP for BGP in tunnel's IGP instance on PE1:

```

Device> enable
Device# configure terminal
Device(config)# interface Tunnel111
Device(config)# router ospf 11
Device(config-router)# router-id 198.51.100.11
Device(config-router)# network 192.0.1.1 0.0.0.0 area 0
Device(config-router)# end

```

The following example shows how to configure interface from PE2-P1, and configure IGP and MPLS:

```

Device> enable
Device# configure terminal
Device(config)# interface Port-channel12
Device(config-if)# no switchport
Device(config-if)# ip address 209.165.201.1 255.255.255.248
Device(config-if)# ip ospf 11 area 0
Device(config-if)# mpls ip
Device(config-if)# end

```

The following example shows how to configure interface from P1-PE2, and configure IGP:

```

Device> enable
Device# configure terminal
Device(config)# interface Port-channel12
Device(config-if)# no switchport
Device(config-if)# ip address 209.165.201.2 255.255.255.248
Device(config-if)# ip ospf 11 area 0
Device(config-if)# mpls ip
Device(config-if)# end

```

The following example shows how to create VRF on PE1 where CE1 is connected:

```

Device> enable
Device# configure terminal
Device(config)# vrf definition vrf-1
Device (config-vrf)# rd 1:1
Device (config-vrf)# address-family ipv4
Device (config-vrf-af)# route-target import 1:2
Device (config-vrf-af)# route-target export 1:1
Device (config-vrf-af)# exit
Device (config-vrf)# end

```

The following example shows how to create VRF on PE2 where CE2 is connected:

```

Device> enable
Device# configure terminal
Device (config)# vrf definition vrf-1
Device (config-vrf)# rd 2:2
Device (config-vrf)# address-family ipv4
Device (config-vrf-af)# route-target import 1:1
Device (config-vrf-af)# route-target export 1:2

```

```
Device (config-vrf-af)# exit
Device (config-vrf)# end
```

The following example shows how to configure PE1-CE1 interface:

```
Device> enable
Device# configure terminal
Device (config)# int po14.1
Device (config-subif)# encapsulation dot1Q 10
Device (config-subif)# vrf forwarding vrf-1
Device (config-subif)# ip address 14.2.1.1 255.255.255.0
Device (config-subif)# exit
Device (config)# end
```

The following example shows how to configure PE2-CE2 interface:

```
Device> enable
Device# configure terminal
Device (config)# int po24.1
Device (config-subif)# encapsulation dot1Q 10
Device (config-subif)# vrf forwarding vrf-1
Device (config-subif)# ip address 24.2.1.1 255.255.255.0
Device (config-subif)# exit
Device (config)# end
```

The following example shows how to configure PE1-CE1 EBGP:

```
Device> enable
Device# configure terminal
Device (config)# router bgp 65040
Device (config-router)# address-family ipv4 vrf vrf-1
Device (config-router-af)# neighbor 14.2.1.2 remote-as 65041
Device (config-router-af)# neighbor 14.2.1.2 activate
Device (config-router-af)# exit-address-family
Device (config-router)# end
```

The following example shows how to configure PE2-CE2 EBGP:

```
Device> enable
Device# configure terminal
Device (config)# router bgp 65040
Device (config-router)# address-family ipv4 vrf vrf-1
Device (config-router-af)# neighbor 24.2.1.2 remote-as 65041
Device (config-router-af)# neighbor 24.2.1.2 activate
Device (config-router-af)# exit-address-family
Device (config-router)# end
```

The following example shows how to configure PE1-PE2 MP-BGP on PE1:

```
Device> enable
Device# configure terminal
Device (config)# router bgp 65040
Device (config-router)# neighbor 192.0.2.1 remote-as 65040
Device (config-router)# neighbor 192.0.2.1 update-source Loopback0
Device (config-router)# address-family ipv4
Device (config-router-af)# neighbor 192.0.2.1 activate
Device (config-router-af)# exit
Device (config-router)# address-family vpv4
Device (config-router-af)# neighbor 192.0.2.1 activate
Device (config-router-af)# neighbor 192.0.2.1 send-community both
Device (config-router-af)# exit
Device (config-router)# end
```

The following example shows how to configure PE2-PE1 MP-BGP on PE2:

```

Device> enable
Device# configure terminal
Device (config)# router bgp 65040
Device (config-router)# neighbor 192.0.1.1 remote-as 65040
Device (config-router)# neighbor 192.0.1.1 update-source Loopback0
Device (config-router)# address-family ipv4
Device (config-router-af)# neighbor 192.0.1.1 activate
Device (config-router-af)# exit
Device (config-router)# address-family vpnv4
Device (config-router-af)# neighbor 192.0.1.1 activate
Device (config-router-af)# neighbor 192.0.1.1 send-community both
Device (config-router-af)# exit
Device (config-router)# end

```

Feature History for Configuring MPLS Layer 3 VPN over GRE

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.12.1	MPLS Layer 3 VPN over GRE	The MPLS Layer 3 VPN over GRE feature provides a mechanism for tunneling MPLS packets over a non-MPLS network.

CHAPTER 12

Configuring MPLS QoS

- [Prerequisites for MPLS QoS, on page 197](#)
- [Restrictions for MPLS QoS, on page 197](#)
- [Information About MPLS QoS, on page 198](#)
- [How to Configure MPLS QoS, on page 199](#)
- [Configuration Examples for MPLS QoS, on page 205](#)
- [Additional References, on page 212](#)
- [Feature History for QoS MPLS EXP, on page 212](#)

Prerequisites for MPLS QoS

- The switch must be configured as a Multiprotocol Label Switching (MPLS) provider edge (PE) or provider (P) router, which includes the configuration of a valid label protocol and underlying IP routing protocols.

Restrictions for MPLS QoS

- MPLS classification and marking can only occur in an operational MPLS network.
- If a packet is classified by IP type of service (ToS) or class of service (CoS) at ingress, it cannot be reclassified by MPLS EXP at egress (imposition case). However, if a packet is classified by MPLS at ingress, it can be reclassified by IP ToS, CoS, or Quality of Service (QoS) group at egress (disposition case).
- To apply QoS on traffic across protocol boundaries, use QoS-group. You can classify and assign ingress traffic to the QoS-group. Thereafter, you can use the QoS-group at egress to classify and apply QoS.
- If a packet is encapsulated in MPLS, the MPLS payload cannot be checked for other protocols, such as IP, for classification or marking. Only MPLS EXP marking affects packets that are encapsulated by MPLS.
- The short pipe mode is not supported to transport packets through the MPLS network. You can transport packets using any one of the following modes—uniform mode or pipe mode.

Information About MPLS QoS

This section provides detailed information about MPLS QoS.

MPLS QoS Overview

The MPLS QoS functionality enables network administrators to provide differentiated services across an MPLS network. Network administrators can satisfy a wide range of networking requirements by specifying the CoS applicable to each transmitted IP packet. Different classes of service can be established for IP packets by setting the IP precedence bit in the header of each packet. Classification, remarking, and queuing on an MPLS network is performed over MPLS EXP bits. In the MPLS network, the packets are differentiated by the MPLS EXP field marking, and are treated accordingly, depending on the weighted early random detection (WRED) configuration.

The MPLS EXP field in MPLS packet allows you to:

- Classify traffic

The classification process selects the traffic to be marked. Classification accomplishes this by partitioning traffic into multiple priority levels, or classes of service. Traffic classification is the primary component of class-based QoS provisioning. For more information, see “Classifying Network Traffic”.

- Police and mark traffic

Policing causes traffic that exceeds the configured rate to be discarded or marked to a different drop level. Marking traffic is a way to identify packet flows to differentiate them. Packet marking allows you to partition your network into multiple priority levels or classes of service. For more information, see “Marking Network Traffic”.

- Queueing

Queueing helps prevent traffic congestion. This includes priority level queueing, weighted tail drop (WTD), scheduling, shaping and weighted random early detection (WRED) features.

MPLS Experimental Field

The MPLS experimental bits (EXP) field is a 3-bit field in the MPLS header that you can use to define the QoS treatment (per-hop behavior) that a node should give to a packet. In an IP network, the DiffServ Code Point (DSCP) (a 6-bit field) defines a class and drop precedence. The EXP bits can be used to carry some of the information encoded in the IP DSCP and can also be used to encode the dropping precedence.

By default, Cisco IOS Software copies the three most significant bits of the DSCP or the IP precedence of the IP packet to the EXP field in the MPLS header. This action happens when the MPLS header is initially imposed on the IP packet. However, you can also set the EXP field by defining a mapping between the DSCP or IP precedence and the EXP bits. This mapping is configured using the **set mpls experimental** or **police** commands. For more information, see the “How to Classify and Mark MPLS EXP” section.

Note A policy map configured with **set ip dscp** is not supported on the provider edge device because the policy action for MPLS label imposition node should be based on **set mpls experimental imposition** value. However, a policy map with action **set ip dscp** is supported when both the ingress and egress interfaces are Layer 3 ports.

You can perform MPLS EXP marking operations using table-maps. It is recommended to assign QoS-group to a different class of traffic in ingress policy and translate QoS-group to DSCP and EXP markings in egress policy using table-map.

If a service provider does not want to modify the value of the IP precedence field in packets transported through the network, they can use the MPLS EXP field value to classify and mark IP packets.

By choosing different values for the MPLS EXP field, you can mark critical packets so that those packets have priority if network congestion occurs.

WRED monitors network traffic to anticipate and prevent congestion at common network and internetwork bottlenecks. WRED can selectively discard lower priority traffic when an interface becomes congested. This feature can also provide differentiated performance characteristics for different classes of service.

There are two ways to transport packets through the MPLS network:

Uniform mode: Uniform mode of transferring packets operates on one layer of QoS. The Provider Edge at ingress copies the DSCP information from the incoming IP packet into the MPLS EXP bits of the imposed labels and the IP precedence bits are mapped to the MPLS EXP field. As the EXP bits travel through the core, they may or may not be modified by the intermediate devices on the network. The Provider Edge at egress copies the EXP bits to the DSCP bits of the newly exposed IP packet.

Pipe mode: Pipe mode of transferring packets operates on two layers of QoS. An underlying QoS for the data that remains unchanged when traversing the core. A per-core QoS, which is separate from that of the underlying IP packets. The DSCP information is saved and stored as the packet travels through the MPLS network. The MPLS EXP label is applied by the PE at ingress but the IP precedence bits are not stored. At egress, the original IP precedence value is preserved.

Benefits of MPLS EXP Classification and Marking

The QoS EXP Matching feature allows you to classify, mark and queue network traffic by modifying the Multiprotocol Label Switching (MPLS) experimental bits (EXP) field. If a service provider does not want to modify the value of the IP precedence field in packets transported through the network, they can use the MPLS EXP field value to classify and mark IP packets.

By choosing different values for the MPLS EXP field, you can mark critical packets so that those packets have priority if network congestion occurs.

How to Configure MPLS QoS

This section provides information about how to configure MPLS QoS:

Classifying MPLS Encapsulated Packets

You can use the **match mpls experimental topmost** command to define traffic classes based on the packet EXP values, inside the MPLS domain. You can use these classes to define services policies to mark the EXP traffic using the **police** command.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	class-map [match-all match-any] <i>class-map-name</i> Example: Device(config)# class-map exp3	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode. Enter the class map name.
Step 4	match mpls experimental topmost <i>mpls-exp-value</i> Example: Device(config-cmap)# match mpls experimental topmost 3	Specifies the match criteria. Note The match mpls experimental topmost command classifies traffic on the basis of the EXP value in the topmost label header.
Step 5	end Example: Device(config-cmap)# end	(Optional) Returns to privileged EXEC mode.

Marking MPLS EXP on the Outermost Label

Perform this task to set the value of the MPLS EXP field on imposed label entries.

Before you begin

Marking MPLS packets at imposition is used with ingress classification on IP ToS or CoS fields.

**Note**

- For IP imposition marking, the IP precedence value is copied to the MPLS EXP value by default.
- The egress policy on provider edge works with MPLS EXP class match, only if there is a remarking policy at ingress. The provider edge at ingress is an IP interface and only DSCP value is trusted by default. If you do not configure remarking policy at ingress the label for queueing is generated based on DSCP value and not MPLS EXP value. However, a transit provider router works without configuring remarking policy at ingress as the router works on MPLS interfaces.
- The **set mpls experimental imposition** command works only on packets that have new or additional MPLS labels added to them.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	policy-map <i>policy-map-name</i> Example: Device(config)# policy-map mark-up-exp-2	Specifies the name of the policy map to be created and enters policy-map configuration mode. Enter the policy map name.
Step 4	class <i>class-map-name</i> Example: Device(config-pmap)# class prec012	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode. Enter the class map name.
Step 5	set mpls experimental imposition <i>mpls-exp-value</i> Example: Device(config-pmap-c)# set mpls experimental imposition 2	Sets the value of the MPLS EXP field on top label.
Step 6	end Example: Device(config-pmap-c)# end	(Optional) Returns to privileged EXEC mode.

Marking MPLS EXP on Label Switched Packets

Note The `set mpls experimental topmost` command marks EXP for the outermost label of MPLS traffic. Due to this marking at ingress policy, the egress policy must include classification based on the MPLS EXP values.

Perform this task to set the MPLS EXP field on label switched packets.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	policy-map <i>policy-map-name</i> Example: Device(config)# policy-map mark-up-exp-2	Specifies the name of the policy map to be created and enters policy-map configuration mode. Enter the policy map name.
Step 4	class <i>class-map-name</i> Example: Device(config-pmap)# class-map exp012	Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode. Enter the class map name.
Step 5	set mpls experimental topmost <i>mpls-exp-value</i> Example: Device(config-pmap-c)# set mpls experimental topmost 2	Sets the MPLS EXP field value in the topmost label on the output interface.
Step 6	end Example: Device(config-pmap-c)# end	(Optional) Returns to privileged EXEC mode.

Configuring Conditional Marking

To conditionally set the value of the MPLS EXP field on all imposed label, perform the following task:

Before you begin

Note The **set-mpls-exp-topmost-transmit** action affects MPLS encapsulated packets only. The **set-mpls-exp-imposition-transmit** action affects any new labels that are added to the packet.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	policy-map <i>policy-map-name</i> Example: Device(config)# policy-map ip2tag	Specifies the name of the policy map to be created and enters policy-map configuration mode. <ul style="list-style-type: none"> • Enter the policy map name.
Step 4	class <i>class-map-name</i> Example: Device(config-pmap)# class iptcp	Creates a class map to be used for matching traffic to a specified class, and enters policy-map class configuration mode. <ul style="list-style-type: none"> • Enter the class map name.
Step 5	police cir <i>bps</i> bc pir <i>bps</i> be Example: Device(config-pmap-c)# police cir 1000000 pir 2000000	Defines a policer for classified traffic and enters policy-map class police configuration mode.
Step 6	conform-action transmit Example: Device(config-pmap-c-police)# conform-action transmit 3	Defines the action to take on packets that conform to the values specified by the policer. <ul style="list-style-type: none"> • In this example, if the packet conforms to the committed information rate (cir) or is within the conform burst (bc) size, the MPLS EXP field is set to 3.
Step 7	exceed-action set-mpls-exp-topmost-transmit exp table <i>table-map-name</i> Example:	Defines the action to take on packets that exceed the values specified by the policer.

	Command or Action	Purpose
	<pre>Device(config-pmap-c-police)# exceed-action set-mpls-exp-topmost-transmit exp table dscp2exp</pre>	
Step 8	<p>violate-action drop</p> <p>Example:</p> <pre>Device(config-pmap-c-police)# violate-action drop</pre>	<p>Defines the action to take on packets whose rate exceeds the peak information rate (pir) and is outside the bc and be ranges.</p> <ul style="list-style-type: none"> • You must specify the exceed action before you specify the violate action. • In this example, if the packet rate exceeds the pir rate and is outside the bc and be ranges, the packet is dropped.
Step 9	<p>end</p> <p>Example:</p> <pre>Device(config-pmap-c-police)# end</pre>	(Optional) Returns to privileged EXEC mode.

Configuring WRED for MPLS EXP

Perform this task to enable WRED for MPLS EXP.

Procedure

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	<p>configure terminal</p> <p>Example:</p> <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	<p>policy-map <i>policy-map-name</i></p> <p>Example:</p> <pre>Device(config)# policy-map wred_exp</pre>	<p>Specifies the name of the policy map to be created and enters policy-map configuration mode.</p> <ul style="list-style-type: none"> • Enter the policy map name.
Step 4	<p>class <i>class-map-name</i></p> <p>Example:</p> <pre>Device(config-pmap)# class exp</pre>	<p>Creates a class map to be used for matching traffic to a specified class, and enters class-map configuration mode.</p> <ul style="list-style-type: none"> • Enter the class map name.

	Command or Action	Purpose
Step 5	bandwidth { <i>kbps</i> <i>remaining percentage</i> <i>percent</i> <i>percentage</i> } Example: <pre>Device(config-pmap-c)# bandwidth percent 30</pre>	Specify either the bandwidth allocated for a class belonging to a policy map or the traffic shaping.
Step 6	random-detect Example: <pre>Device(config-pmap-c)# random-detect mpls-exp-based</pre>	Configures WRED to use the MPLS EXP value when it calculates the drop probability for the packet.
Step 7	random-detect <i>exp-value</i> <i>percent</i> <i>min-threshold</i> <i>max-threshold</i> Example: <pre>Device(config-pmap-c)# random-detect exp 1 10 20 Device(config-pmap-c)# random-detect exp 2 30 40 Device(config-pmap-c)# random-detect exp 2 40 80</pre>	Specifies the MPLS EXP value, minimum and maximum thresholds, in percentage.
Step 8	end Example: <pre>Device(config-pmap-c-police)# end</pre>	(Optional) Returns to privileged EXEC mode.

Configuration Examples for MPLS QoS

This section provides configuration examples for MPLS QoS.

Example: Classifying MPLS Encapsulated Packets

Defining an MPLS EXP Class Map

The following example shows how to define a class map named exp3 that matches packets that contains MPLS experimental value 3:

```
Device(config)# class-map exp3
Device(config-cmap)# match mpls experimental topmost 3
Device(config-cmap)# exit
```

Defining a Policy Map and Applying the Policy Map to an Ingress Interface

The following example shows how to use the class map created in the example above to define a policy map. This example also shows how to apply the policy map to a physical interface for ingress traffic.

```
Device(config)# policy-map change-exp-3-to-2
Device(config-pmap)# class exp3
Device(config-pmap-c)# set mpls experimental topmost 2
Device(config-pmap)# exit
Device(config)# interface GigabitEthernet 0/0/0
Device(config-if)# service-policy input change-exp-3-to-2
Device(config-if)# exit
```

Defining a Policy Map and Applying the Policy Map to an Egress Interface

The following example uses the class map created in the example above to define a policy map. This example also applies the policy map to a physical interface for egress traffic.

```
Device(config)# policy-map WAN-out
Device(config-pmap)# class exp3
Device(config-pmap-c)# shape average 10000000
Device(config-pmap-c)# exit
Device(config-pmap)# exit
Device(config)# interface GigabitEthernet 0/0/0
Device(config-if)# service-policy output WAN-out
Device(config-if)# exit
```

Example: Marking MPLS EXP on Outermost Label

Defining an MPLS EXP Imposition Policy Map

The following example defines a policy map that sets the MPLS EXP imposition value to 2 based on the IP precedence value of the forwarded packet:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map prec012
Device(config-cmap)# match ip prec 0 1 2
Device(config-cmap)# exit
Device(config)# policy-map mark-up-exp-2
Device(config-pmap)# class prec012
Device(config-pmap-c)# set mpls experimental imposition 2
Device(config-pmap-c)# exit
Device(config-pmap)# exit
```

Applying the MPLS EXP Imposition Policy Map to a Main Interface

The following example applies a policy map to Gigabit Ethernet interface 0/0/0:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface GigabitEthernet 0/0/0
```

```
Device(config-if)# service-policy input mark-up-exp-2
Device(config-if)# exit
```

Example: Marking MPLS EXP on Label-Switched Packets

Defining an MPLS EXP Label Switched Packets Policy Map

The following example shows how to define a policy map that sets the MPLS EXP top-most value to 2 according to the MPLS EXP value of the forwarded packet:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map exp012
Device(config-cmap)# match mpls experimental topmost 0 1 2
Device(config-cmap)# exit
Device(config-cmap)# policy-map mark-up-exp-2
Device(config-pmap)# class exp012
Device(config-pmap-c)# set mpls experimental topmost 2
Device(config-pmap-c)# exit
Device(config-pmap)# exit
```

Applying the MPLS EXP on Label-Switched Packets Policy Map to a Main Interface

The following example shows how to apply the policy map to a main interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface GigabitEthernet 0/0/0
Device(config-if)# service-policy input mark-up-exp-2
Device(config-if)# exit
```

Example: Configuring Conditional Marking

The following example shows how to create a policer for the **iptcp** class, which is part of the **ip2tag** policy map, and attaches the policy map to the Gigabit Ethernet interface:

```
Device(config)# policy-map ip2tag
Device(config-pmap)# class iptcp
Device(config-pmap-c)# police cir 1000000 pir 2000000
Device(config-pmap-c-police)# conform-action transmit
Device(config-pmap-c-police)# exceed-action set-mpls-exp-imposition-transmit 2
Device(config-pmap-c-police)# violate-action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)# exit
Device(config-pmap)# exit
Device(config)# interface GigabitEthernet 0/0/1
Device(config-if)# service-policy input ip2tag
```

Example: Configuring WRED for MPLS EXP

The following example shows how to enable WRED for MPLS EXP:

```

Device# configure terminal
Device(config)# policy-map wred_exp
Device(config-pmap-c)# bandwidth percent 30
Device(config-pmap-c)# random-detect mpls-exp-based
Device(config-pmap-c)# random-detect exp 1 10 20
Device(config-pmap-c)# random-detect exp 2 30 40
Device(config-pmap-c)# random-detect exp 2 40 80

```

Displaying WRED Threshold Labels

The **show policy-map *policy-map-name*** command verifies the WRED configuration for MPLS EXP.

The following sample output displays WRED threshold labels:

```

Device# show policy-map wred_exp
Policy Map wred_exp
Class exp
bandwidth 30 (%)
percent-based wred, exponential weight 9
exp    min-threshold    max-threshold
-----
0      -                  -
1      10                  20
2      30                  40
3      40                  80
4      -                  -
5      -                  -
6      -                  -
7      -                  -

```

Example: Configuring WRED for MPLS EXP

The following example shows how to enable WRED for MPLS EXP on the Cisco Catalyst 9500X Series Switches.

```

Device(config)#table-map exp2tc
Device(config-tablemap)#map from 0 to 0
Device(config-tablemap)#map from 1 to 1
Device(config-tablemap)#map from 2 to 2
Device(config-tablemap)#map from 3 to 3
Device(config-tablemap)#map from 4 to 4
Device(config-tablemap)#map from 5 to 5
Device(config-tablemap)#map from 6 to 6
Device(config-tablemap)#map from 7 to 7
Device(config-tablemap)#end
Device(config)#table-map exp2discard
Device(config-tablemap)#map from 0 to 0
Device(config-tablemap)#map from 1 to 0
Device(config-tablemap)#map from 2 to 0
Device(config-tablemap)#map from 3 to 0
Device(config-tablemap)#map from 4 to 0
Device(config-tablemap)#map from 5 to 1
Device(config-tablemap)#map from 6 to 1
Device(config-tablemap)#map from 7 to 1
Device(config)#exit

Device(config)#policy-map p1
Device(config-pmap)#cla
Device(config-pmap)#class class-default

```

```

Device(config-pmap-c)# set traffic-class mpls experimental imposition table exp2tc
Device(config-pmap-c)# set discard-class mpls experimental imposition table exp2discard
Device(config-pmap-c)#end

Device(config)#class-map tc7
Device(config-cmap)#match traffic-class 7
Device(config-cmap)#exit
Device(config)#policy-map type queueing p2
Device(config-pmap)#class tc7
Device(config-pmap-c)#shape average 1000000000
Device(config-pmap-c)# queue-limit 300000000 bytes
Device(config-pmap-c)# random-detect discard-class-based
Device(config-pmap-c)# random-detect discard-class 0 percent 40 90 1
Device(config-pmap-c)# random-detect discard-class 1 percent 40 90 1
Device(config-pmap-c)#end

```

The following example displays the running policy configuration of WRED for MPLS EXP on the Cisco Catalyst 9500X Series Switches.

```

Device#show running-config policy-map WRED

Feature History for QoS MPLS EXP

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	QoS MPLS EXP	The QoS EXP Matching feature allows you to classify, mark and queue network traffic by modifying the Multiprotocol Label Switching (MPLS) experimental bits (EXP) field.
Cisco IOS XE Amsterdam 17.3.1	MPLS QoS - WRED	Introduces support for weighted random early detection (WRED) in MPLS Quality of Service (QoS). This feature configures WRED to use the MPLS experimental bits (EXP) to calculate the drop probability of a packet.
Cisco IOS XE Cupertino 17.7.1	QoS MPLS EXP	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

CHAPTER 13

Configuring MPLS Static Labels

- [Prerequisites for MPLS Static Labels, on page 213](#)
- [Restrictions for MPLS Static Labels, on page 213](#)
- [Information About MPLS Static Labels, on page 214](#)
- [How to Configure MPLS Static Labels, on page 214](#)
- [Configuration Examples for MPLS Static Labels, on page 217](#)
- [Additional References, on page 218](#)
- [Feature History for MPLS Static Labels, on page 219](#)

Prerequisites for MPLS Static Labels

The network must support the following Cisco IOS features before you enable MPLS Static Labels:

- Multiprotocol Label Switching (MPLS)
- Cisco Express Forwarding

Restrictions for MPLS Static Labels

- On a provider edge (PE) router for MPLS VPNs, there's no mechanism for statically binding a label to a customer network prefix (VPN IPv4 prefix).
- MPLS Static Crossconnect is not supported.
- MPLS Static Labels is not supported for label-controlled Asynchronous Transfer Mode (lc-atm).
- MPLS static bindings are not supported for local prefixes.
- VRF aware Static Labels is not supported,

Information About MPLS Static Labels

MPLS Static Labels Overview

Generally, label switching routers (LSRs) dynamically learn the labels they should use to label-switch packets. They do this by means of label distribution protocols that include:

- Label Distribution Protocol (LDP), the Internet Engineering Task Force (IETF) standard, used to bind labels to network addresses.
- Resource Reservation Protocol (RSVP) used to distribute labels for traffic engineering (TE)
- Border Gateway Protocol (BGP) used to distribute labels for Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs)

To use a learned label to label-switch packets, an LSR installs the label into its Label Forwarding Information Base (LFIB).

The MPLS Static Labels feature provides the means to configure the binding between a label and an IPv4 prefix statically.

Benefits of MPLS Static Labels

Static Bindings Between Labels and IPv4 Prefixes

You can configure static bindings between labels and IPv4 prefixes to support MPLS hop-by-hop forwarding through neighbor routers that don't implement LDP label distribution.

How to Configure MPLS Static Labels

Configuring MPLS Static Prefix Label Bindings

To configure MPLS static prefix/label bindings, use the following commands beginning in global configuration mode:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	mpls label range <i>min-label max-label</i> [static <i>min-static-label max-static-label</i>] Example: Device(config)# <code>mpls label range 200 100000 static 16 199</code>	Specifies a range of labels for use with MPLS Static Labels feature. (Default is no labels reserved for static assignment.)
Step 4	mpls static binding ipv4 <i>prefix mask</i> [input output <i>nexthop</i>] <i>label</i> Example: Device(config)# <code>mpls static binding ipv4 10.0.0.0 255.0.0.0 55</code>	Specifies static binding of labels to IPv4 prefixes. Bindings specified are installed automatically in the MPLS forwarding table as routing demands.

Verifying MPLS Static Prefix Label Bindings

To verify the configuration for MPLS static prefix/label bindings, use this procedure:

Procedure

- Step 1** Enter **show mpls label range** command. The output shows that the new label ranges do not take effect until a reload occurs:

Example:

```
Device# show mpls label range

Downstream label pool: Min/Max label: 16/983039
  [Configured range for next reload: Min/Max label: 200/100000]
Range for static labels: Min/Max/Number: 16/199
```

The following output from the **show mpls label range** command, executed after a reload, indicates that the new label ranges are in effect:

Example:

```
Device# show mpls label range

Downstream label pool: Min/Max label: 200/100000
Range for static labels: Min/Max/Number: 16/199
```

- Step 2** Enter the **show mpls static binding ipv4** command to show the configured static prefix/label bindings:

Example:

```
Device# show mpls static binding ipv4
10.17.17.17/32: Incoming label: 251 (in LIB)
  Outgoing labels:
    10.0.0.1                18
```

```
10.18.18.18/32: Incoming label: 201 (in LIB)
  Outgoing labels:
10.0.0.1 implicit-null
```

Step 3 Use the **show mpls forwarding-table** command to determine which static prefix/label bindings are currently in use for MPLS forwarding.

Example:

```
Device# show mpls forwarding-table
Local  Outgoing  Prefix          Bytes tag  Outgoing     Next Hop
tag    tag or VC  or Tunnel Id    switched  interface
201    Pop tag    10.18.18.18/32  0         PO1/1/0      point2point
      2/35      10.18.18.18/32  0         AT4/1/0.1    point2point
251    18        10.17.17.17/32  0         PO1/1/0      point2point
```

Monitoring and Maintaining MPLS Static Labels

To monitor and maintain MPLS Static Labels, use one or more of the following commands:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Devie> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	show mpls forwarding-table Example: Device# show mpls forwarding-table	Displays the contents of the MPLS LFIB.
Step 3	show mpls label range Example: Device# show mpls label range	Displays information about the static label range.
Step 4	show mpls static binding ipv4 Example: Device# show mpls static binding ipv4	Displays information about the configured static prefix/label bindings.

Configuration Examples for MPLS Static Labels

Example: Configuring MPLS Static Prefixes Labels

In the following output, the **mpls label range** command reconfigures the range used for dynamically assigned labels 16–983039 to 200–100000. It configures a static label range of 16–199.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# mpls label range 200 100000 static 16 199
% Label range changes take effect at the next reload.
Router(config)# end
```

In the following output, the **show mpls label range** command indicates that the new label ranges don't take effect until a reload occurs:

```
Device# show mpls label range

Downstream label pool: Min/Max label: 16/983039
 [Configured range for next reload: Min/Max label: 200/100000]
Range for static labels: Min/Max/Number: 16/199
```

In the following output, the **show mpls label range** command, executed after a reload, indicates that the new label ranges are in effect:

```
Device# show mpls label range

Downstream label pool: Min/Max label: 200/100000
Range for static labels: Min/Max/Number: 16/199
```

In the following output, the **mpls static binding ipv4** commands configure static prefix/label bindings. They also configure input (local) and output (remote) labels for various prefixes:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.0.0.66 2607
Device(config)# mpls static binding ipv4 10.6.0.0 255.255.0.0 input 17
Device(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.13.0.8 explicit-null
Device(config)# end
```

In the following output, the **show mpls static binding ipv4** command displays the configured static prefix/label bindings:

```
Device# show mpls static binding ipv4

10.0.0.0/8: Incoming label: none;
  Outgoing labels:
10.13.0.8          explicit-null
10.0.0.0/8: Incoming label: 55 (in LIB)
  Outgoing labels:
  10.0.0.66          2607
10.66.0.0/16: Incoming label: 17 (in LIB)
  Outgoing labels: None
```

Feature History for MPLS Static Labels

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	MPLS Static Labels	The MPLS Static Labels feature provides the means to configure the binding between a label and an IPv4 prefix statically. The following commands were introduced or modified: debug mpls static binding , mpls label range , mpls static binding ipv4 , show mpls label range , show mpls static binding ipv4
Cisco IOS XE Gibraltar 16.11.1	MPLS Static Labels	Support for this feature was introduced only on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Cupertino 17.7.1	MPLS Static Labels	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

- [Configuration Examples for MPLS Traffic Engineering and Enhancements, on page 235](#)
- [Additional References, on page 238](#)
- [Feature History for MPLS Traffic Engineering and Enhancements, on page 239](#)

Prerequisites for MPLS Traffic Engineering and Enhancements

Ensure that your network supports the following Cisco IOS features before you enable MPLS TE:

- Multiprotocol Label Switching
- IP Cisco Express Forwarding
- Intermediate System-to-Intermediate System (IS-IS) or Open Shortest Path First (OSPF)

Restrictions for MPLS Traffic Engineering and Enhancements

- MPLS TE fast reroute is not supported.
- MPLS TE supports only a single IGP process or instance. Multiple IGP processes or instances are not supported and MPLS TE should not be configured in more than one IGP process or instance.
- The MPLS TE feature does not support routing and signaling of LSPs over unnumbered IP address links. Therefore, do not configure the feature over those links.
- When specifying an explicit path, if you specify the *forward* address (the address of the interface that forwards the traffic to the next router) as the next-hop address, the explicit path might not be used. Using the forward address allows that entry to be treated as a loose hop for path calculation. We recommend that you use the *receive* address (the address of the interface that receives traffic from the sending router) as the next-hop address.

In the following example, switch S3 sends traffic to switch S1. The paths marked a,b and x,y between switches S1 and S2 are parallel paths.

```
S1 (a) ---- (b) S2 (c) -- (d) S3
    (x) ---- (y)
```

If you configure an explicit path from S3 to S1 using the *forward* addresses (addresses d and b), the tunnel might reroute traffic over the parallel path (x,y) instead of the explicit path. To ensure that the tunnel uses the explicit path, specify the *receive* addresses as part of the **next-address** command, as shown in the following example:

```
ip explicit-path name path1
  next-address (c)
  next-address (a)
```

Information About MPLS Traffic Engineering and Enhancements

The following sections provide information about MPLS TE and enhancements.

Introduction to MPLS Traffic Engineering and Enhancements

MPLS is an integration of Layer 2 and Layer 3 technologies. By making traditional Layer 2 features available to Layer 3, MPLS enables traffic engineering. Thus, you can offer in a one-tier network what can be achieved only by overlaying a Layer 3 network on a Layer 2 network.

Traffic engineering is essential for service provider and ISP backbones. Such backbones must support a high use of transmission capacity, and the networks must be resilient so that they can withstand link or node failures.

MPLS traffic engineering provides an integrated approach to traffic engineering. With MPLS, traffic engineering capabilities are integrated into Layer 3, which optimizes the routing of IP traffic, given the constraints imposed by backbone capacity and topology.

MPLS traffic engineering supports the following functionalities:

- Enhances standard Interior Gateway Protocols (IGPs), such as IS-IS or OSPF, to map packets to the appropriate traffic flows automatically.
- Transports traffic flows across a network using MPLS forwarding.
- Determines the routes for traffic flows across a network. This is based on the resources the traffic flow requires and the resources available in the network.
- Employs Constraint-based routing, in which the path for a traffic flow is the shortest path that meets the resource requirements (constraints) of the traffic flow. In MPLS traffic engineering, the traffic flow has bandwidth requirements, media requirements, a priority that is compared to the priority of other flows, and so forth.
- Recovers from link or node failures by adapting to the new constraints presented by the changed topology.
- Transports packets using MPLS forwarding across a multihop label-switched path (LSP).
- Uses the routing and signaling capability of LSPs across a backbone topology that:
 - Understands the backbone topology and available resources.

- Accounts for link bandwidth and size of traffic flow when determining routes for LSPs across the backbone.
- Has a dynamic adaptation mechanism that enables the backbone to be resilient to failures, even if several primary paths are precalculated offline.
- Includes enhancements to the IGP (IS-IS or OSPF) shortest path first (SPF) calculations to automatically calculate which traffic should be sent over which LSPs.

Benefits of MPLS Traffic Engineering

A WAN connection is an expensive item in an ISP budget. Traffic engineering enables ISPs to route network traffic to offer the best service to their users in terms of throughput and delay. By making the service provider more efficient, traffic engineering reduces the cost of the network.

Currently, some ISPs base their services on an overlay model. In this model, transmission facilities are managed by Layer 2 switching. The routers see only a fully meshed virtual topology, making most destinations appear one hop away. If you use the explicit Layer 2 transit layer, you can precisely control how traffic uses the available bandwidth. However, the overlay model has numerous disadvantages. MPLS traffic engineering achieves the traffic engineering benefits of the overlay model without running a separate network, and without needing a nonscalable, full mesh of router interconnects.

How MPLS Traffic Engineering Works

MPLS TE automatically establishes and maintains LSPs across the backbone by using RSVP. The path that an LSP uses is determined by the LSP resource requirements and network resources, such as bandwidth.

Available resources are flooded by means of extensions to a link state-based IGP.

Traffic engineering tunnels are calculated at the LSP head, based on a fit between the required and available resources (constraint-based routing). The IGP automatically routes the traffic to these LSPs. Typically, a packet traveling across the MPLS TE backbone travels on a single LSP that connects the ingress point to the egress point.

MPLS traffic engineering is built on the following Cisco IOS mechanisms:

- IP tunnel interfaces

From a Layer 2 standpoint, an MPLS tunnel interface represents the head of an LSP. It is configured with a set of resource requirements, such as bandwidth, media requirements, and priority.

From a Layer 3 standpoint, an LSP tunnel interface is the headend of a unidirectional virtual link to the tunnel destination.

- MPLS traffic engineering path calculation module

This calculation module operates at the LSP head. The module determines a path to use for an LSP. The path calculation uses a link-state database containing flooded topology and resource information.

- RSVP with traffic engineering extensions

RSVP operates at each LSP hop and is used to signal and maintain LSPs based on the calculated path.

- MPLS traffic engineering link management module

This module operates at each LSP hop. It enables link call admission on the RSVP signaling messages, and bookkeeping of topology and resource information to be flooded.

- Link-state IGP (IS-IS or OSPF, each with traffic engineering extensions)

These IGPs are used to globally flood topology and resource information from the link management module.

- Enhancements to the SPF calculation used by the link-state IGP (IS-IS or OSPF)

The IGP automatically routes traffic to the appropriate LSP tunnel based on tunnel destination. Static routes can also be used to direct traffic to LSP tunnels.

- Label switching forwarding

This forwarding mechanism provides routers with a Layer 2-like ability to direct traffic across multiple hops of the LSP established by RSVP signaling.

One approach to engineering a backbone is to define a mesh of tunnels from every ingress device to every egress device. The MPLS TE path calculation and signaling modules determine the path taken by the LSPs for these tunnels, subject to resource availability and the dynamic state of the network. The IGP, operating in an ingress device, determines which traffic should go to which egress device, and steers that traffic into the tunnel from ingress to egress.

A flow from an ingress device to an egress device might be so large that it cannot fit over a single link. And it cannot be carried by a single tunnel. In such a scenario, multiple tunnels between a given ingress and egress can be configured, and the flow load can be shared among them.

Mapping Traffic into Tunnels

This section describes how traffic is mapped to tunnels. It describes how conventional hop-by-hop link-state routing protocols interact with MPLS TE capabilities. This section describes how the shortest path first (SPF) algorithm, sometimes called a Dijkstra algorithm, is enhanced. This enhancement allows a link-state IGP to forward traffic automatically over tunnels that MPLS traffic engineering establishes.

Link-state protocols, such as integrated IS-IS or OSPF, use an SPF algorithm to compute a shortest path tree from the headend node to all the nodes in the network. Routing tables are derived from this shortest path tree. The routing tables contain ordered sets of destination and first-hop information. If a router does normal hop-by-hop routing, the first hop is over a physical interface attached to the router.

New traffic engineering algorithms calculate explicit routes to one or more nodes in the network. The originating router views these explicit routes as logical interfaces. In the context of this document, these explicit routes are represented by LSPs and referred to as traffic engineering tunnels (TE tunnels).

The following sections describe how link-state IGPs can use these shortcuts, and how they can install routes in the routing table that point to these TE tunnels. These tunnels use explicit routes. The path taken by a TE tunnel is controlled by the router that is the headend of the tunnel. In the absence of errors, TE tunnels are guaranteed to not loop, but routers must agree on how to use the TE tunnels. Otherwise, traffic might loop through two or more tunnels.

When specifying an explicit path for an MPLS TE tunnel, you can specify link or node addresses of the next-hop routers in an explicit path. You can also specify a mixture of link and node addresses. There are no restrictions when specifying a mixture of link and node addresses.

Transition of an IS-IS Network to a New Technology

IS-IS, as specified in RFC 1142, includes extensions for MPLS TE. Running MPLS traffic engineering over IS-IS or taking advantage of these other extensions requires transitioning an IS-IS network to this new technology. This section describes these extensions. It discusses two ways in which to migrate an existing IS-IS network from the standard ISO 10589 protocol towards the version of IS-IS specified in RFC 1142. Running MPLS TE over an existing IS-IS network requires a transition to the version of IS-IS specified in RFC 1142. However, running MPLS TE over OSPF does *not* require any similar network transition.

Extensions for the IS-IS Routing Protocol

Extensions for the IS-IS routing protocol serve the following purposes:

- Remove the 6-bit limit on link metrics.
- Allow interarea IP routes.
- Enable IS-IS to carry different kinds of information for traffic engineering. In the future, more extensions might be needed.

To serve these purposes, two new type, length, and value (TLV) objects have been defined:

- TLV 22 describes links (or adjacencies). It serves the same purpose as the IS neighbor option in ISO 10589 (TLV 2).
- TLV 135 describes reachable IP prefixes. It is similar to the IP neighbor options from RFC 1195 (TLVs 128 and 130).

Note For ease of use, these two new TLVs, 22 and 135, are referred to as new-style TLVs and TLVs 2, 128, and 130 are referred to as old-style TLVs.

Both the new TLVs have a fixed length part, followed by optional sub-TLVs. The metric space in these new TLVs has been enhanced from 6 bits to 24 or 32 bits. The sub-TLVs allow you to add new properties to links and prefixes. Traffic engineering is the first technology to use this capability to add new properties to a link.

Solution 1 for Transitioning an IS-IS Network to a New Technology

When you migrate from old-style TLVs towards new-style TLVs, you can advertise the same information twice—once in old-style TLVs and once in new-style TLVs. This ensures that all the devices can understand what is advertised.

There are three disadvantages to using that approach:

- Size of the LSPs: During the transition, the LSPs grow to about twice their original size. This might be a problem in networks where the LSP database (LSPDB) is large. An LSP database might be large because:
 - There are many devices, and therefore, many LSPs.
 - There are many neighbors or IP prefixes per router. A device that advertises lots of information causes the LSPs to be fragmented.

- Unpredictable results: In a large network, this approach can produce unpredictable results. A large network that is in transition pushes the limits with regard to LSP flooding and SPF scaling.
- Ambiguity: If a device encounters different information in the old-style TLVs and the new-style TLVs, it may not be clear what the device should do.
 - You can expect some extra network instability. At this time, you must not test how far you can push an implementation.
 - Traffic engineering extensions might cause LSPs to be reflooded frequently.

Most of these problems can be solved easily by using:

- All the information in the old-style and new-style TLVs in an LSP.
- The adjacency with the lowest link metric if an adjacency is advertised more than once.

The main benefit to advertising the same information twice is that network administrators can use new-style TLVs before all the devices in the network can understand them.

Transition Actions During Solution 1

When transitioning from using IS-IS with old-style TLVs to new-style TLVs, perform the following actions:

- If all the devices run old software, advertise and use only old-style TLVs.
- Upgrade some devices to newer software.
- Configure some devices with new software to advertise both old-style and new-style TLVs. They accept both styles of TLVs. Configure other devices (with old software) to continue advertising and using only old-style TLVs.
- Test traffic engineering in parts of your network.
- If the whole network needs to migrate, upgrade and configure all the remaining devices to advertise and accept both styles of TLVs.
- Configure all the devices to advertise and accept only new-style TLVs.
- Configure metrics larger than 63.

Solution 2 for Transitioning an IS-IS Network to a New Technology

Devices advertise only one style of TLVs at the same time, but can understand both types of TLVs during migration. There are two main benefits to this approach:

- LSPs stay approximately the same size during migration.
- There is no ambiguity when the same information is advertised twice inside one LSP.

This method is useful when you are transitioning the whole network (or a whole area) to use wider metrics (that is, you want a router running IS-IS to generate and accept only new-style TLVs).

The disadvantage is that all devices must understand the new-style TLVs before any router can start advertising new-style TLVs. It does not help the second problem, where network administrators want to use the new-style TLVs for traffic engineering, while some devices are capable of understanding only old-style TLVs.

Transition Actions During Solution 2

If you use the second solution, you can perform the following actions:

- If all the devices run old software, advertise and use only old-style TLVs.
- Upgrade all the devices to newer software.
- Configure all the devices one-by-one to advertise old-style TLVs, but to accept both styles of TLVs.
- Configure all the devices one-by-one to advertise new-style TLVs, but to accept both styles of TLVs.
- Configure all the devices one-by-one to advertise and to accept only new-style TLVs.
- Configure metrics larger than 63.

TLV Configuration Commands

You can use the **metric-style** command to configure the type of TLVs that are accepted by a device. When the device is in IS-IS configuration mode, you can configure the following keywords in the **metric-style** command.

- **metric-style narrow** : Enables the device to generate and accept only old-style TLVs
- **metric-style transition** : Enables the device to generate and accept both old-style and new-style TLVs
- **metric-style wide** : Enables the device to generate and accept only new-style TLVs

You can use either of the following transition schemes when you use the **metric-style** command:

- Narrow to transition to wide.
- Narrow to narrow transition to wide transition to wide.

Implementation in Cisco IOS XE Software

Cisco IOS XE can implement both transition solutions. Network administrators can choose the solution that suits them best. For test networks, solution 1 is best (see [Solution 1 for Transitioning an IS-IS Network to a New Technology, on page 225](#)). For a full transition, both solutions can be used. Solution 1 requires fewer steps and less configuration. Solution 2 is for the largest networks, where a risk of doubling the LSP database during transition exists (see [Solution 2 for Transitioning an IS-IS Network to a New Technology, on page 226](#)).

How to Configure MPLS Traffic Engineering and Enhancements

The following sections provide information about the steps to configure the MPLS Traffic Engineering and Enhancements feature.

Configuring a Device to Support Tunnels

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	ip cef Example: Device(config)# <code>ip cef</code>	Enables standard Cisco Express Forwarding operation.
Step 4	mpls traffic-eng tunnels Example: Device(config)# <code>mpls traffic-eng tunnels</code>	Enables MPLS traffic engineering tunnels on a device.
Step 5	exit Example: Device(config)# <code>exit</code>	Exits to privileged EXEC mode.

Configuring an Interface to Support RSVP-Based Tunnel Signaling and IGP Flooding

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface <i>type slot / subslot / port [subinterface-number]</i> Example: Device(config)# interface Port-channel 114	Configures an interface type and enters interface configuration mode.
Step 4	mpls traffic-eng tunnels Example: Device(config-if)# mpls traffic-eng tunnels	Enables MPLS traffic engineering tunnels on an interface.
Step 5	ip rsvp bandwidth <i>bandwidth</i> Example: Device(config-if)# ip rsvp bandwidth 1000	Enables RSVP on an interface and specifies the amount of bandwidth that will be reserved.
Step 6	exit Example: Device(config-if)# exit	Exits interface configuration mode and returns to global configuration mode.
Step 7	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.

Configuring IS-IS for MPLS Traffic Engineering

Note MPLS traffic engineering supports only a single IGP process or instance. Multiple IGP processes or instances are not supported. MPLS traffic engineering should not be configured in more than one IGP process or instance.

To configure IS-IS for MPLS traffic engineering, perform the following steps.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router isis Example: Device(config)# router isis	Enables IS-IS routing and specifies an IS-IS process. The device enters configuration mode.
Step 4	mpls traffic-eng level Example: Device(config-router)# mpls traffic-eng level-1	Turns on MPLS traffic engineering for IS-IS level 1.
Step 5	mpls traffic-eng level Example: Device(config-router)# mpls traffic-eng level-2	Turns on MPLS traffic engineering for IS-IS level 2.
Step 6	mpls traffic-eng router-id type number Example: Device(config-router)# mpls traffic-eng router-id loopback 0	Specifies that the traffic engineering router identifier for the node is the IP address associated with interface loopback0.
Step 7	metric-style wide Example: Device(config-router)# metric-style wide	Configures a router to generate and accept only new-style type, length, value objects (TLVs).

Configuring OSPF for MPLS Traffic Engineering

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	router ospf <i>process-id</i> Example: Device(config)# router ospf 200	Configures an OSPF routing process for IP and enters router configuration mode. <ul style="list-style-type: none"> The value for the <i>process-id</i> argument is an internally used identification parameter for an OSPF routing process. It is locally assigned and can be any positive integer. Assign a unique value for each OSPF routing process.
Step 4	mpls traffic-eng area <i>number</i> Example: Device(config-router)# mpls traffic-eng area 0	Turns on MPLS TE for the indicated OSPF area.
Step 5	mpls traffic-eng router-id loopback0 Example: Device(config-router)# mpls traffic-eng router-id loopback0	Specifies that the TE router identifier for the node is the IP address associated with interface loopback0.
Step 6	exit Example: Device(config-router)# exit	Exits to global configuration mode.
Step 7	exit Example: Device(config)# exit	Exits to privileged EXEC mode.

Configuring an MPLS Traffic Engineering Tunnel

To configure a preferred explicit path for an MPLS TE tunnel, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	interface tunnel <i>number</i> Example: Device(config)# <code>interface Tunnel10</code>	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> The <i>number</i> argument is the number of the tunnel.
Step 4	ip unnumbered <i>type number</i> Example: Device(config-if)# <code>ip unnumbered loopback0</code>	Enables IP processing on an interface without assigning an explicit IP address to the interface. <ul style="list-style-type: none"> The <i>type</i> and <i>number</i> arguments name the type and number of another interface on which the router has an assigned IP address. It cannot be another unnumbered interface. An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link.
Step 5	tunnel destination <i>ip-address</i> Example: Device(config-if)# <code>tunnel destination 192.168.4.4</code>	Specifies the destination for a tunnel interface. <ul style="list-style-type: none"> The <i>ip-address</i> argument must be the MPLS traffic engineering router ID of the destination device.
Step 6	tunnel mode mpls traffic-eng Example: Device(config-if)# <code>tunnel mode mpls traffic-eng</code>	Sets the tunnel encapsulation mode to MPLS traffic engineering.
Step 7	tunnel mpls traffic-eng bandwidth <i>bandwidth</i> Example: Device(config-if)# <code>tunnel mpls traffic-eng bandwidth 250</code>	Configures the bandwidth for the MPLS traffic engineering tunnel. <ul style="list-style-type: none"> The <i>bandwidth</i> argument is a number in kilobits per second that is set aside for the MPLS traffic engineering tunnel. Range is from 1 through 4294967295. <p>Note If automatic bandwidth is configured for the tunnel, use the tunnel mpls traffic-eng bandwidth command to configure the initial tunnel bandwidth.</p>
Step 8	tunnel mpls traffic-eng path-option <i>number</i> {dynamic explicit {name <i>path-name</i> identifier <i>path-number</i>}} [lockdown]	Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng path-option 10 explicit identifier 321</pre>	<ul style="list-style-type: none"> • The <i>number</i> argument is the preference for this path option. When you configure multiple path options, lower numbered options are preferred. Valid values are from 1 through 1000. • The dynamic keyword indicates that the path of the LSP is dynamically calculated. • The explicit keyword indicates that the path of the LSP is an IP explicit path. • The name <i>path-name</i> keyword and argument are the path name of the IP explicit path that the tunnel uses with this option. • The identifier <i>path-number</i> keyword and argument pair names the path number of the IP explicit path that the tunnel uses with this option. The range is from 1 through 65535. • The lockdown keyword specifies that the LSP cannot be reoptimized. <p>Note A dynamic path is used if an explicit path is currently unavailable.</p>
Step 9	<p>exit</p> <p>Example:</p> <pre>Device(config-if)# exit</pre>	Exits interface configuration mode and returns to global configuration mode.

Configuring an MPLS Traffic Engineering Tunnel that an IGP Can Use

To configure an MPLS TE tunnel that an IGP can use, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel number Example: Device(config)# interface tunnel10	Configures an interface type and enters interface configuration mode.
Step 4	ip unnumbered type number Example: Device(config-if)# ip unnumbered loopback 0	Gives the tunnel interface an IP address. An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link.
Step 5	tunnel destination ip-address Example: Device(config-if)# tunnel destination 10.20.1.1	Specifies the destination for a tunnel. The <i>ip-address</i> keyword is the IP address of the host destination expressed in dotted decimal notation.
Step 6	tunnel mode mpls traffic-eng Example: Device(config-if)# tunnel mode mpls traffic-eng	Sets the tunnel encapsulation mode to MPLS traffic engineering.
Step 7	tunnel mpls traffic-eng bandwidth bandwidth Example: Device(config-if)# tunnel mpls traffic-eng bandwidth 1000	Configures the bandwidth for the MPLS traffic engineering tunnel.
Step 8	tunnel mpls traffic-eng path-option number {dynamic explicit {name path-name} identifier path-number} [lockdown] Example: Device(config-if)# tunnel mpls traffic-eng path-option 1 explicit identifier 1	Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database. If an explicit path is currently unavailable a dynamic path is used.
Step 9	exit Example: Device(config-if)# exit	Exits interface configuration mode and returns to global configuration mode.

Configuration Examples for MPLS Traffic Engineering and Enhancements

The following figure illustrates a sample MPLS topology. This example specifies point-to-point outgoing interfaces. The subsequent sections contain sample configuration commands that you should enter to implement MPLS traffic engineering and the basic tunnel configuration shown in Figure 3.

Figure 23: Sample MPLS Traffic Engineering Tunnel Configuration

Example: Configuring MPLS Traffic Engineering Using IS-IS

This example lists the commands you should enter to configure MPLS TE with IS-IS routing enabled (see Figure 1).

Note Enter the following commands in every router in the traffic-engineered portion of your network.

Device 1: MPLS Traffic Engineering Configuration

To configure MPLS traffic engineering, enter the following commands:

```
ip cef
mpls traffic-eng tunnels
interface loopback 0
ip address 10.0.0.0 255.255.255.254
ip router isis
interface Fo 1/0/0
ip address 209.165.200.1 255.255.0.0
ip router isis
mpls traffic-eng tunnels
ip rsvp bandwidth 1000
```

Device 1: IS-IS Configuration

To enable IS-IS routing, enter the following commands:

```

router isis
network 47.0000.0011.0011.00
is-type level-1
metric-style wide
mpls traffic-eng router-id loopback0
mpls traffic-eng level-1

```

Example: Configuring MPLS Traffic Engineering Using OSPF

This example lists the commands that you should enter to configure MPLS traffic engineering with OSPF routing enabled (see Figure 1).

Note Enter the following commands in every router in the traffic-engineered portion of your network.

Device 1: MPLS Traffic Engineering Configuration

To configure MPLS traffic engineering, enter the following commands:

```

ip cef
mpls traffic-eng tunnels
interface loopback 0
ip address 209.165.200.225 255.255.255.255
interface Fo 1/0/0
ip address 209.165.200.1 255.255.0.0
mpls traffic-eng tunnels
ip rsvp bandwidth 1000

```

Device 1: OSPF Configuration

To enable OSPF, enter the following commands:

```

router ospf 0
network 209.165.200.0.0.0.255.255 area 0
mpls traffic-eng router-id Loopback0
mpls traffic-eng area 0

```

Example: Configuring an MPLS Traffic Engineering Tunnel

This example shows you how to configure a dynamic path tunnel and an explicit path in the tunnel. Before you configure MPLS traffic engineering tunnels, enter the appropriate global and interface commands in the specified router (in this case, Router 1).

Device 1: Dynamic Path Tunnel Configuration

To configure a tunnel to use a dynamic path, enter the following commands:

```

interface tunnell
ip unnumbered loopback 0
tunnel destination 209.165.200.228
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 100

```

```
tunnel mpls traffic-eng priority 1 1
tunnel mpls traffic-eng path-option 1 dynamic
```

Device 1: Dynamic Path Tunnel Verification

To verify that the tunnel is up, enter the following commands:

```
show mpls traffic-eng tunnels
show ip interface tunnel1
```

Device 1: Explicit Path Configuration

To configure an explicit path, enter the following commands:

```
ip explicit-path identifier 1
next-address 209.165.200.1
next-address 172.16.0.1
next-address 192.168.0.1
next-address 10.0.0.1
```

Device 1: Explicit Path Tunnel Configuration

To configure a tunnel to use an explicit path, enter the following commands:

```
interface tunnel2
ip unnumbered loopback 0
tunnel destination 209.165.200.228
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 100
tunnel mpls traffic-eng priority 1 1
tunnel mpls traffic-eng path-option 1 explicit identifier 1
```

Device 1: Explicit Path Tunnel Verification

To verify that the tunnel is up, enter the following commands:

```
show mpls traffic-eng tunnels
show ip interface tunnel2
```

Example: Configuring Enhanced SPF Routing over a Tunnel

This section includes the commands that cause a tunnel to be considered by the IGP's enhanced SPF calculation, that installs routes over the tunnel for appropriate network prefixes.

Device 1: IGP Enhanced SPF Consideration Configuration

To specify that the IGP should use the tunnel (if the tunnel is up) in its enhanced shortest path first (SPF) calculation, enter the following commands:

```
interface tunnel1
tunnel mpls traffic-eng autoroute announce
```

Device 1: Route and Traffic Verification

To verify that the tunnel is up and that the traffic is routed through the tunnel, enter the following commands:

```
#show mpls traffic-eng tunnels tu12001 brief
Signalling Summary:
LSP Tunnels Process: running
Passive LSP Listener: running
RSVP Process: running
Forwarding: enabled
auto-tunnel:
p2p Disabled (0), id-range:62336-64335

Periodic reoptimization: every 3600 seconds, next in 694 seconds
Periodic FRR Promotion: Not Running
Periodic auto-bw collection: every 300 seconds, next in 94 seconds
SR tunnel max label push: 2 primary path labels (2 repair path labels)
TUNNEL NAME DESTINATION UP IF DOWN IF STATE/PROT
tu12001 2.2.2.2 - Po114 up/up
```

Feature History for MPLS Traffic Engineering and Enhancements

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Bengaluru 17.6.1	MPLS Traffic Engineering and Enhancements	Multiprotocol Label Switching (MPLS) is an integration of Layer 2 and Layer 3 technologies. By making traditional Layer 2 features available to Layer 3, MPLS enables traffic engineering. Thus, you can offer in a one-tier network what previously could be achieved only by overlaying a Layer 3 network on a Layer 2 network.
Cisco IOS XE Cupertino 17.7.1	MPLS Traffic Engineering and Enhancements	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

CHAPTER 15

Configuring Any Transport over MPLS: Tunnel Selection

- [Restrictions for Any Transport over MPLS: Tunnel Selection, on page 241](#)
- [Information About Any Transport over MPLS: Tunnel Selection, on page 241](#)
- [How to Configure Any Transport over MPLS: Tunnel Selection, on page 242](#)
- [Configuration Examples for Any Transport over MPLS: Tunnel Selection, on page 243](#)
- [Feature History for Any Transport over MPLS: Tunnel Selection, on page 245](#)

Restrictions for Any Transport over MPLS: Tunnel Selection

- The **preferred-path** command is available only if the pseudowire encapsulation type is MPLS.
- This feature is enabled when you exit from pseudowire submode.
- The selected path should be a label switched path (LSP) destined to the peer PE router
- The selected tunnel must be an MPLS TE tunnel.
- If you select a tunnel, the tunnel tailend must be on the remote provider edge (PE) router.
- If you specify an IP address, that address must be the IP address of the loopback interface on the remote PE router. The address must have a /32 mask. There must be an LSP destined to that selected address. The LSP need not be a TE tunnel.

Information About Any Transport over MPLS: Tunnel Selection

This feature allows you to specify the path that Any Transport over MPLS (AToM) traffic uses. You can specify either a Multiprotocol Label Switching (MPLS) Traffic Engineering tunnel or a destination IP address and Domain Name System (DNS) name. If the specified path is unreachable, you can specify that the virtual circuits (VCs) should use the default path, which is the path that MPLS Label Distribution Protocol (LDP) used for signaling. This option is enabled by default; you must explicitly disable it.

How to Configure Any Transport over MPLS: Tunnel Selection

The following section provides information about the procedures you can perform to configure Any Transport over MPLS: Tunnel Selection.

Configuring Any Transport over MPLS: Tunnel Selection

You can configure tunnel selection when you set up a pseudowire class. You can enable tunnel selection with the **preferred-path** command. Then you can apply the pseudowire class to an interface that has been configured to transport AToM packets.

To configure Any Transport over MPLS: Tunnel Selection, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	pseudowire-class name Example: Device(config)# pseudowire-class ts1	Establishes a pseudowire class with a name that you specify and enters pseudowire configuration mode.
Step 4	encapsulation mpls Example: Device(config-pw)# encapsulation mpls	Specifies the tunneling encapsulation. For AToM, the encapsulation type is mpls .
Step 5	preferred-path { interface-tunnel tunnel-number peer { ip-address host-name } } [disable-flood] Example: Device(config-pw)# preferred path peer 10.18.18.18	Specifies the MPLS traffic engineering tunnel or IP address or host name to be used as the preferred path.
Step 6	exit Example: (config-pw)# exit	Exits pseudowire configuration mode.
Step 7	interface slot/port Example:	Specifies an interface and enters interface configuration mode.

	Command or Action	Purpose
	Device(config)# interface atm1/1	
Step 8	encapsulation <i>encapsulation-type</i> Example: Device(config-if)# encapsulation aal5	
Step 9	xconnect <i>peer-router-id vcid pw-class name</i> Example: Device(config-if)# xconnect 10.0.0.1 123 pw-class ts1	Binds the attachment circuit to a pseudowire VC.

Configuration Examples for Any Transport over MPLS: Tunnel Selection

The following section provides examples for configuring Any Transport over MPLS: Tunnel Selection.

Example: Configuring Tunnel Selection

The following example sets up two preferred paths for PE1. One preferred path specifies an MPLS traffic engineering tunnel. The other preferred path specifies an IP address of a loopback address on PE2. There is a static route configured on PE1 that uses a TE tunnel to reach the IP address on PE2.

Device PE1

```
mpls label protocol ldp
mpls traffic-eng tunnels
tag-switching tdp router-id Loopback0
pseudowire-class pw1
  encapsulation mpls
  preferred-path interface Tunnell disable-fallback
!

 no atm ilmi-keepalive
 pvc 0/50 l2transport

```

```

encapsulation aal5
xconnect 10.2.2.2 150 encapsulation mpls
!
router ospf 1
log-adjacency-changes
network 10.0.0.0 0.0.0.255 area 0
network 10.16.16.16 0.0.0.0 area 0
mpls traffic-eng router-id Loopback0
mpls traffic-eng area 0

```

Example: Verifying the Configuration

In the following example, the **show mpls l2transport vc** command shows the following information (in bold) about the VCs:

- VC 101 has been assigned a preferred path called Tunnel1. The default path is disabled because the preferred path specified that the default path should not be used if the preferred path fails.
- VC 150 has been assigned an IP address of a loopback address on PE2. The default path can be used if the preferred path fails.

```

Device# show mpls l2transport vc detail

Local interface: Gi0/0/0.1 up, Eth VLAN 222 up
  Preferred path: Tunnel1, active
  Default path: disabled
  Tunnel label: 3, next hop point2point
  Output interface: Tu1, imposed label stack {17 16}
  Create time: 00:27:31, last status change time: 00:27:31
  Signaling protocol: LDP, peer 10.16.16.16:0 up
  MPLS VC labels: local 25, remote 16
  Group ID: local 0, remote 6
  MTU: local 1500, remote 1500
  Remote interface description:
  Sequencing: receive disabled, send disabled
  VC statistics:
    packet totals: receive 10, send 10
    byte totals:   receive 1260, send 1300
    packet drops:  receive 0, send 0

```

Example: Troubleshooting Tunnel Selection

You can use the **debug mpls l2transport vc event** command to troubleshoot tunnel selection. For example, if the tunnel interface that is used for the preferred path is shut down, the default path is enabled. The **debug mpls l2transport vc event** command provides the following output:

```

AToM SMGR [10.2.2.2, 101]: Processing imposition update, vc_handle 62091860, update_action
3, remote_vc_label 16
AToM SMGR [10.2.2.2, 101]: selected route no parent rewrite: tunnel not up
AToM SMGR [10.2.2.2, 101]: Imposition Programmed, Output Interface: Et3/2

```

Feature History for Any Transport over MPLS: Tunnel Selection

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.7.1	Any Transport over MPLS: Tunnel Selection	The Any Transport over MPLS: Tunnel Selection feature allows you to specify the path that Any Transport over MPLS (AToM) traffic uses. You can specify either a Multiprotocol Label Switching (MPLS) traffic engineering tunnel or a destination IP address and Domain Name System (DNS) name.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

CHAPTER 16

Configuring MPLS Traffic Engineering—Bundled Interface Support

- [Prerequisites for MPLS TE—Bundled Interface Support, on page 247](#)
- [Restrictions for MPLS TE—Bundled Interface Support, on page 247](#)
- [Information About MPLS TE—Bundled Interface Support, on page 248](#)
- [How to Configure MPLS TE—Bundled Interface Support, on page 249](#)
- [Configuration Examples for MPLS Traffic Engineering—Bundled Interface Support, on page 250](#)
- [Additional References for MPLS Traffic Engineering—Bundled Interface Support, on page 253](#)
- [Feature History for MPLS Traffic Engineering—Bundled Interface Support, on page 253](#)

Prerequisites for MPLS TE—Bundled Interface Support

- Configure Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels.
- Enable Cisco Express Forwarding in global configuration mode.
- Enable Resource Reservation Protocol (RSVP) feature.
- Configure EtherChannel.
- Configure Gigabit EtherChannel.

Restrictions for MPLS TE—Bundled Interface Support

- Traffic engineering over switch virtual interfaces (SVIs) is not supported unless the SVI consists of a bundle of links that represent a single point-to-point interface.
- There must be a valid IP address configuration on the bundled interface and there must not be an IP address configuration on the member links.

Information About MPLS TE—Bundled Interface Support

The MPLS Traffic Engineering—Bundled Interface Support feature enables Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels over the bundled interfaces—EtherChannel and Gigabit EtherChannel (GEC).

The Resource Reservation Protocol (RSVP) notifies TE about bandwidth changes that occur when member links are added or deleted, or when links become active or inactive. TE notifies other nodes in the network via Interior Gateway Protocol (IGP) flooding. By default, the bandwidth available to TE Label-Switched Paths (LSPs) is 75 percent of the interface bandwidth. You can change the percentage of the global bandwidth available for TE LSPs by using an RSVP command on the bundled interface. The feature supports bandwidth reservation and preemption.

The following section provides information about Bundled Interface Support for MPLS Traffic Engineering.

Cisco EtherChannel Overview

Cisco EtherChannel technology builds upon standards-based 802.3 full-duplex Fast Ethernet to provide network managers with a reliable, high-speed solution for the campus network backbone. EtherChannel technology provides bandwidth scalability within the campus. It provides up to 800 Mbps, 8 Gbps, or 80 Gbps of aggregate bandwidth for a Fast EtherChannel, Gigabit EtherChannel, or 10 Gigabit EtherChannel connection, respectively. Each of these connection speeds can vary in amounts equal to the speed of the links used (100 Mbps, 1 Gbps, or 10 Gbps). Even in the most bandwidth-demanding situations, EtherChannel technology helps to aggregate traffic, keeps oversubscription to a minimum, and provides effective link-resiliency mechanisms.

Cisco EtherChannel Benefits

Cisco EtherChannel technology allows network managers to provide higher bandwidth among servers, routers, and switches than a single-link Ethernet technology can provide.

Cisco EtherChannel technology provides incremental scalable bandwidth and the following benefits:

- **Standards-based**—Cisco EtherChannel technology builds upon IEEE 802.3-compliant Ethernet by grouping multiple, full-duplex point-to-point links. EtherChannel technology uses IEEE 802.3 mechanisms for full-duplex autonegotiation and autosensing, when applicable.
- **Flexible incremental bandwidth**—Cisco EtherChannel technology provides bandwidth aggregation in multiples of 100 Mbps, 1 Gbps, or 10 Gbps. This depends on the speed of the aggregated links. For example, network managers can deploy EtherChannel technology that consists of pairs of full-duplex Fast Ethernet links to provide more than 400 Mbps between the wiring closet and the data center. In the data center, bandwidths of up to 800 Mbps can be provided between servers and the network backbone to provide large amounts of scalable incremental bandwidth.
- **Load balancing**—Cisco EtherChannel technology comprises several Fast Ethernet links. It is capable of load balancing traffic across those links. Unicast, broadcast, and multicast traffic is evenly distributed across the links, providing improved performance and redundant parallel paths. When a link fails, traffic is redirected to the remaining links within the channel without user intervention and with minimal packet loss.
- **Resiliency and fast convergence**—When a link fails, Cisco EtherChannel technology provides automatic recovery by redistributing the load across the remaining links. When a link fails, Cisco EtherChannel

technology redirects traffic from the failed link to the remaining links in less than one second. This convergence is transparent to the end user—no host protocol timers expire and no sessions are dropped.

Cisco Gigabit EtherChannel Overview

Cisco Gigabit EtherChannel (GEC) is a high-performance Ethernet technology that provides transmission rates in Gigabit per second (Gbps). A Gigabit EtherChannel bundles individual ethernet links (Gigabit Ethernet and 10 Gigabit Ethernet) into a single logical link. This single link provides the aggregate bandwidth of up to four physical links. All LAN ports in each EtherChannel must be of the same speed and must be configured as either Layer 2 or Layer 3 LAN ports. Broadcast and multicast packets which are inbound on one link in an EtherChannel are blocked from returning on any other link in the EtherChannel.

Load Balancing in EtherChannel

Load balancing affects the actual and practical bandwidth that is in use for TE. Multilink load balancing uses a per-packet load balancing method. The entire bundle interface bandwidth is available. EtherChannel load balancing has various load balancing methods, depending on the traffic pattern and the load balancing configuration. The total bandwidth available for TE may be limited to the bandwidth of a single member link.

How to Configure MPLS TE—Bundled Interface Support

The following section provides information about how to configure Bundled Interface Support for MPLS Traffic Engineering.

Configuring MPLS Traffic Engineering on an EtherChannel Interface

To configure MPLS Traffic Engineering on an etherchannel interface, perform the following procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> [<i>name-tag</i>] Example: Device(config)# interface port-channel 1	Creates an EtherChannel bundle, assigns a group number to the bundle, and enters interface configuration mode.

	Command or Action	Purpose
Step 4	ip address <i>ip-address mask</i> [secondary] Example: Device(config-if) # ip address 10.0.0.4 255.255.255.0	Specifies an IP address for the EtherChannel group.
Step 5	mpls traffic-eng tunnels Example: Device(config-if) # mpls traffic-eng tunnels	Enables MPLS TE tunnel signaling on an interface. <ul style="list-style-type: none"> • Enable MPLS TE tunnel on the device before enabling the signaling.
Step 6	ip rsvp bandwidth [<i>interface-kbps</i>] [<i>single-flow-kbps</i>] Example: Device(config-if) # ip rsvp bandwidth 100	Enables RSVP for IP on an interface. Specifies a percentage of the total interface bandwidth as available in the RSVP bandwidth pool.
Step 7	end Example: Device(config-if) # end	Exits interface configuration mode and returns to privileged EXEC mode.

Configuration Examples for MPLS Traffic Engineering—Bundled Interface Support

The following section provides configuration examples for MPLS Traffic Engineering—Bundled Interface Support.

Example: Configuring MPLS TE on an EtherChannel Interface

The following example shows how to configure MPLS TE on an EtherChannel interface.

```
Device> enable
Device# configure terminal
Device(config)# interface port-channel 1
Device(config-if)# ip address 10.0.0.4 255.255.255.0
Device(config-if)# mpls traffic-eng tunnels
Device(config-if)# ip rsvp bandwidth 100
Device(config-if)# end
```

Example: Configuring MPLS Traffic Engineering—Bundled Interface Support over Gigabit Etherchannel

The following example shows how to enable MPLS Traffic Engineering—Bundled Interface Support over GEC on Cisco devices:

```

Device> enable
Device# configure terminal

! Enable global MPLS TE on routers
Device(config)# router ospf 100
Device(config-router)# network 10.0.0.1 0.0.0.255 area 0
Device(config-router)# mpls traffic-eng area 0
Device(config-router)# mpls traffic-eng router-id Loopback 0
Device(config-router)# exit

! Configure GEC interface and enable MPLS TE and RSVP on interface
Device(config)# interface Port-channel 1
Device(config-if)# ip address 10.0.0.1 255.255.255.0
Device(config-if)# mpls traffic-eng tunnels
Device(config-if)# ip rsvp bandwidth
Device(config-if)# exit

! Define explicit path
Device(config)# ip explicit-path name primary enable
Device(cfg-ip-expl-path)# next-address 172.12.1.2
Device(cfg-ip-expl-path)# next-address 172.23.1.2
Device(cfg-ip-expl-path)# next-address 172.34.1.2
Device(cfg-ip-expl-path)# next-address 10.4.4.4
Device(cfg-ip-expl-path)# exit

! Configure primary tunnel on head-end device
Device(config)# interface Tunnel 14
Device(config-if)# ip unnumbered Loopback 0
Device(config-if)# tunnel mode mpls traffic-eng
Device(config-if)# tunnel destination 10.10.10.0
Device(config-if)# tunnel mpls traffic-eng autoroute announce
Device(config-if)# tunnel mpls traffic-eng path-option 10 explicit name primary
Device(config-if)# exit

! Configure GEC interface
Device(config)# interface GigabitEthernet 0/0/1
Device(config-if)# no ip address
Device(config-if)# channel-group 1 mode active
Device(config-if)# exit

! Configure GEC interface
Device(config)# interface GigabitEthernet 0/0/2
Device(config-if)# no ip address
Device(config-if)# channel-group 1 mode active
Device(config-if)# exit

```

The **show mpls traffic-eng tunnels** command output displays information about a tunnel or one-line information about all tunnels configured on the device:

```

Device# show mpls traffic-eng tunnels tunnel 14

Name: Cat9k_t14                               (Tunnel10) Destination: 10.4.4.4

```

```

CHAPTER 17

Configuring MPLS Traffic Engineering Forwarding Adjacency

- [Prerequisites for MPLS Traffic Engineering Forwarding Adjacency, on page 255](#)
- [Restrictions for MPLS Traffic Engineering Forwarding Adjacency, on page 255](#)
- [Information About MPLS Traffic Engineering Forwarding Adjacency, on page 256](#)
- [How to Configure MPLS Traffic Engineering Forwarding Adjacency, on page 257](#)
- [Configuration Examples for MPLS Traffic Engineering Forwarding Adjacency, on page 261](#)
- [Additional References, on page 262](#)
- [Feature History for MPLS Traffic Engineering Forwarding Adjacency, on page 263](#)

Prerequisites for MPLS Traffic Engineering Forwarding Adjacency

Your network must support the following Cisco IOS XE features:

- Multiprotocol Label Switching (MPLS)
- IP Cisco Express Forwarding
- IS-IS

Restrictions for MPLS Traffic Engineering Forwarding Adjacency

- Using the MPLS Traffic Engineering Forwarding Adjacency feature increases the size of the IGP database by advertising a TE tunnel as a link.
- When the MPLS Traffic Engineering Forwarding Adjacency feature is enabled on a TE tunnel, the link is advertised in the IGP network as a type, length, value (TLV) 22 object without any TE sub-TLV.
- You must configure MPLS TE forwarding adjacency tunnels bidirectionally.

Information About MPLS Traffic Engineering Forwarding Adjacency

The following topics provide information about MPLS Traffic Engineering Forwarding Adjacency.

MPLS Traffic Engineering Forwarding Adjacency Functionality

The MPLS Traffic Engineering Forwarding Adjacency feature allows you to handle a TE LSP tunnel as a link in an IGP network based on the SPF algorithm. A forwarding adjacency can be created between devices regardless of their location in the network. The devices can be located multiple hops from each other, as shown in the figure below.

As a result, a TE tunnel is advertised as a link in an IGP network with the link's cost associated with it.

Devices outside of the TE domain see the TE tunnel and use it to compute the shortest path for routing traffic throughout the network.

MPLS Traffic Engineering Forwarding Adjacency Benefits

TE tunnel interfaces advertised for SPF--TE tunnel interfaces are advertised in the IGP network just like any other links. Devices can then use these advertisements in their IGPs to compute the SPF even if they are not the headend of any TE tunnels.

Usage Tips

In the figure below, if you have no forwarding adjacencies configured for the TE tunnels between B and F and C and F, all the traffic that A must forward to F goes through B because B is the shortest path from A to F. (The cost from A to F is 15 through B and 20 through C.)

If you have forwarding adjacencies configured on the TE tunnels between B and F and C and F and also on the TE tunnels between F and B and F and C, then when A computes the SPF algorithm, A sees two equal cost paths of 11 to F. As a result, traffic across the A-B and A-C links is shared.

How to Configure MPLS Traffic Engineering Forwarding Adjacency

The following section provides information about the configuration steps for configuring MPLS Traffic Engineering Forwarding Adjacency.

Configuring a Tunnel Interface for MPLS TE Forwarding Adjacency

To configure a tunnel interface for MPLS TE Forwarding Adjacency, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Devicie# configure terminal	Enters global configuration mode.
Step 3	interface tunnel <i>number</i> Example: Device (config)# interface tunnel 0	Designates a tunnel interface for the forwarding adjacency, and enters interface configuration mode.
Step 4	exit Example: Device (config-if)# exit	Exits interface configuration mode and returns to global configuration mode.
Step 5	exit Example: Device (config)# exit	Exits global configuration mode and returns to privileged EXEC mode.

Configuring MPLS TE Forwarding Adjacency on Tunnels with ISIS

To configure MPLS TE Forwarding Adjacency on tunnels with ISIS, perform this procedure.

Note You must configure a forwarding adjacency on two LSP tunnels bidirectionally, from A to B and B to A. Otherwise, the forwarding adjacency is advertised, but not used in the IGP network.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
Step 3	interface tunnel <i>number</i> Example: Device(config)# <code>interface tunnel 0</code>	Designates a tunnel interface for the forwarding adjacency, and enters interface configuration mode.
Step 4	ip router isis <i>area-tag</i> Example: Device(config-if)# <code>ip router isis 1</code>	Configures an IS-IS routing process for IP on an interface and to attaches an area designator to the routing process.
Step 5	tunnel mpls traffic-eng forwarding-adjacency [<i>holdtime value</i>] Example: Device(config-if)# <code>tunnel mpls traffic-eng forwarding-adjacency</code>	Advertises a TE tunnel as a link in an IGP network.
Step 6	isis metric { <i>metric-value</i> maximum } { level-1 level-2 } Example: Device(config-if)# <code>isis metric 2 level-1</code>	Configures the IS-IS metric for a tunnel interface to be used as a forwarding adjacency. <ul style="list-style-type: none"> You should specify the isis metric command with level-1 or level-2 to be consistent with the IGP level at which you are performing traffic engineering. Otherwise, the metric has the default value of 10.

Configuring MPLS TE Forwarding Adjacency on Tunnels with OSPF

To configure MPLS TE Forwarding Adjacency on tunnels with OSPF, perform this procedure.

Note You must configure a forwarding adjacency on two LSP tunnels bidirectionally, from A to B and B to A. Otherwise, the forwarding adjacency is advertised, but not used in the IGP network.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface tunnel <i>number</i> Example: Device(config)# <code>interface tunnel 0</code>	Designates a tunnel interface for the forwarding adjacency, and enters interface configuration mode.
Step 4	ip ospf <i>process-id</i> area <i>area-id</i> Example: Device(config-if)# <code>ip router ospf 1 area 0</code>	Configures an OSPF routing process for IP on an interface and to attaches an area designator to the routing process.
Step 5	tunnel mpls traffic-eng forwarding-adjacency [<i>holdtime value</i>] Example: Device(config-if)# <code>tunnel mpls traffic-eng forwarding-adjacency</code>	Advertises a TE tunnel as a link in an IGP network.
Step 6	ip ospf cost <i>cost</i> Example: Device(config-if)# <code>ip ospf cost 4</code>	Configures the OSPF metric for a tunnel interface to be used as a forwarding adjacency.

Verifying MPLS TE Forwarding Adjacency

To verify MPLS TE Forwarding Adjacency, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Use this command to enter the privileged EXEC mode. Enter your password, if prompted.
Step 2	show mpls traffic-eng forwarding-adjacency [<i>ip-address</i>] Example: Device# <code>show mpls traffic-eng forwarding-adjacency</code>	Use this command to display the current tunnels.

	Command or Action	Purpose
Step 3	show isis [<i>process-tag</i>] database [<i>level-1</i>] [<i>level-2</i>] [<i>l1</i>] [<i>l2</i>] [<i>detail</i>] [<i>lspid</i>] Example: Device# show isis database Example: Use this command to display information about the IS-IS link-state database. For example:	
Step 4	exit Example: Device# exit	Use this command to exit to user EXEC mode.

Configuration Examples for MPLS Traffic Engineering Forwarding Adjacency

This section provides a configuration example for the MPLS Traffic Engineering Forwarding Adjacency feature using an IS-IS metric.

Example MPLS TE Forwarding Adjacency

The following output shows the configuration of a tunnel interface, a forwarding adjacency, and an IS-IS metric:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# interface tunnel 7
Device(config-if)# ip router isis 1
Device(config-if)# tunnel mpls traffic-eng forwarding-adjacency
Device(config-if)# isis metric 2 level-1
```

Following is sample command output when a forwarding adjacency has been configured:

```
Device# show running-config
Building configuration...
Current configuration :364 bytes
!
interface Tunnel7
ip router isis 1
ip unnumbered Loopback0
no ip directed-broadcast
tunnel destination 192.168.1.7
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng forwarding-adjacency
tunnel mpls traffic-eng priority 7 7
tunnel mpls traffic-eng path-option 10 explicit name short
isis metric 2 level 1
```

Note Do not specify the **tunnel mpls traffic-eng autoroute announce** command in your configuration when you are using forwarding adjacency.

Following is an example where forwarding adjacency is configured with OSPF:

```
Device# configure terminal

Device# show running-config

Building configuration...
Current configuration : 310 bytes
interface Tunnell
ip router ospf 1 area 0
ip unnumbered Loopback0
ip ospf cost 6
tunnel destination 172.16.255.5
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng forwarding-adjacency tunnel mpls
traffic-eng priority 7 7
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 10 dynamic
end
Device# show mpls traffic-eng forwarding-adjacency

destination 172.16.255.5, area ospf 172 area 0, has 1 tunnels
Tunnell (load balancing metric 2000000, nexthop 172.16.255.5)
(flags: Forward-Adjacency, holdtime 0)
```

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.7.1	MPLS Traffic Engineering Forwarding Adjacency	The MPLS Traffic Engineering Forwarding Adjacency feature allows a network administrator to handle a traffic engineering (TE) label switched path (LSP) tunnel as a link in an Interior Gateway Protocol (IGP) network based on the Shortest Path First (SPF) algorithm.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfmg.cisco.com/>

CHAPTER 18

Configuring MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion

- [Prerequisites for MPLS Traffic Engineering \(TE\)—IP Explicit Address Exclusion, on page 265](#)
- [Restrictions for MPLS Traffic Engineering \(TE\)—IP Explicit Address Exclusion, on page 265](#)
- [Information About MPLS Traffic Engineering \(TE\)—IP Explicit Address Exclusion, on page 266](#)
- [How to Configure MPLS Traffic Engineering \(TE\)—IP Explicit Address Exclusion, on page 266](#)
- [Configuration Examples for MPLS Traffic Engineering \(TE\)—IP Explicit Address Exclusion, on page 269](#)
- [Additional References, on page 270](#)
- [Feature History for MPLS Traffic Engineering \(TE\)IP—Explicit Address Exclusion, on page 271](#)

Prerequisites for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion

Your network must support the following Cisco IOS features in order to support IP explicit address exclusion:

- MPLS
- IP Cisco Express Forwarding
- Intermediate System-to-Intermediate System (IS-IS) or Open Shortest Path First (OSPF)

Restrictions for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion

MPLS TE will accept an IP explicit path comprised of either all excluded addresses configured by the **exclude-address** command or all included addresses configured by the **next-address** command. It will not accept a combination of both.

Information About MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion

The MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion feature provides a means to exclude a link or node from the path for a Multiprotocol Label Switching (MPLS) TE label switched path (LSP).

The feature is enabled through the **ip explicit-path** command that allows you to create an IP explicit path and enter a configuration submode for specifying the path. The feature adds to the submode commands the **exclude-address** command for specifying addresses to exclude from the path.

If the excluded address for an MPLS TE LSP identifies a flooded link, the constraint-based shortest path first (CSPF) routing algorithm does not consider that link when computing paths for the LSP. If the excluded address specifies a flooded MPLS TE router ID, the CSPF routing algorithm does not allow paths for the LSP to traverse the node identified by the device ID.

MPLS Traffic Engineering

MPLS is an Internet Engineering Task Force (IETF)-specified framework that provides for the efficient designation, routing, forwarding, and switching of traffic flows through the network.

Traffic engineering (TE) is the process of adjusting bandwidth allocations to ensure that enough is left for high-priority traffic.

In MPLS TE, the upstream device creates a network tunnel for a particular traffic stream, then fixes the bandwidth available for that tunnel.

Cisco Express Forwarding

Cisco Express Forwarding is an advanced, Layer 3 switching technology inside a device. It defines the fastest method by which a Cisco device forwards packets from ingress to egress interfaces. The **ip cef** command enables Cisco Express Forwarding globally, and the **ip route-cache cef** command enables Cisco Express Forwarding on an interface.

How to Configure MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion

The following section provides information about the various configuration steps for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion.

Configuring IP Explicit Address Exclusion

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip explicit-path { <i>name path-name</i> identifier number } [enable disable] Example: Device(config)# ip explicit-path name OmitR12	Specifies the name or number of the explicit path, and enables the path, and enters explicit-path configuration mode.
Step 4	exclude-address <i>ip-address</i> Example: Device(cfg-ip-expl-path)# exclude-address 10.12.12.12	Excludes the specified link or node from consideration by the constraint-based SPF. <ul style="list-style-type: none"> The <i>ip-address</i> is a link address or the router ID for a node.
Step 5	exit Example: Device(cfg-ip-expl-path)# exit	Exits from explicit-path configuration mode, and returns to global configuration mode.
Step 6	exit Example: Device(config)# exit	Exits from global configuration mode, and returns to privileged EXEC mode.
Step 7	show ip explicit-path Example: Device# show ip explicit-path	Displays information about configured IP explicit paths.

Configuring an MPLS Traffic Engineering Tunnel

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel number Example: Device(config)# interface tunnel11	Configures an interface type and enters interface configuration mode.
Step 4	ip unnumbered loopback0 Example: Device(config-if)# ip unnumbered loopback0	Assigns the tunnel interface an IP address. <ul style="list-style-type: none"> An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link.
Step 5	tunnel destination ip-address Example: Device(config-if)# tunnel destination 10.11.11.11	Specifies the destination for a tunnel. <ul style="list-style-type: none"> The destination of the tunnel must be the MPLS traffic engineering router ID of the destination device.
Step 6	tunnel mode mpls traffic-eng Example: Device(config-if)# tunnel mode mpls traffic-eng	Sets the tunnel encapsulation mode to MPLS traffic engineering.
Step 7	tunnel mpls traffic-eng bandwidth bandwidth Example: Device(config-if)# tunnel mpls traffic-eng bandwidth 100	Configures the bandwidth for the MPLS traffic engineering tunnel.
Step 8	tunnel mpls traffic-eng path-option number {dynamic explicit {name path-name ID path-number}} [lockdown]	Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database.

	Command or Action	Purpose
	<p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng path-option 2 dynamic</pre>	<ul style="list-style-type: none"> If an explicit path is unavailable a dynamic path is used. <p>Note To configure a path option that specifies an exclude address, specify the explicit keyword (not the dynamic keyword) and specify an IP explicit path.</p>
Step 9	<p>exit</p> <p>Example:</p> <pre>Device(config-if)# exit</pre>	Exits from interface configuration mode.
Step 10	<p>exit</p> <p>Example:</p> <pre>Device(config)# exit</pre>	Exits to privileged EXEC mode.
Step 11	<p>show mpls traffic eng tunnels</p> <p>Example:</p> <pre>Device# show mpls traffic eng tunnels</pre>	<p>Shows information about tunnels, including the current tunnel path when a tunnel is operational.</p> <ul style="list-style-type: none"> By viewing the command output, you can determine the path that was used to build a tunnel. If you entered the exclude-address command, the specified link or node should not be listed.

Configuration Examples for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion

The following section provides configuration examples for MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion.

Example: Configuring IP Explicit Address Exclusion

The following example shows how to configure an MPLS TE tunnel with two path options: a preferred explicit path with an excluded address and a backup dynamic path.

Configure the IP explicit path named OmitR12, which excludes the router with router ID 10.12.12.12:

```
ip explicit-path name OmitR12
exclude-address 10.12.12.12
Explicit Path name OmitR12:
```

Example: Configuring an MPLS Traffic Engineering Tunnel

```
1: exclude-address 10.12.12.12
exit
```

To verify the configuration of the explicit path, use the **show ip explicit-path** command.

```
show ip explicit-paths name OmitR12
PATH OmitR12 (loose source route, path complete, generation 3)
 1: exclude-address 10.12.12.12
```

Note You must know the router IDs for LSRs (nodes) in the network; in this example, that 10.12.12.12 is a router ID. Otherwise, it will not be apparent whether the specified address is the IP address of a link or a router ID.

Example: Configuring an MPLS Traffic Engineering Tunnel

The following example configures Tunnel11 with its two options, where the preferred path option is the IP explicit path OmitR2:

```
interface tunne 111
ip unnumbered loopback0
tunnel destination 10.11.11.11
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng path-option 1 explicit name OmitR12
tunnel mpls traffic-eng path-option 2 dynamic
```

Note There are additional commands for configuring properties for TE tunnels such as bandwidth and priority. For descriptions of those commands, refer to the *Cisco IOS IP Switching Services Configuration Guide*.

CHAPTER 19

Configuring MPLS Traffic Engineering—LSP Attributes

- [Prerequisites for MPLS Traffic Engineering—LSP Attributes, on page 273](#)
- [Restrictions for MPLS Traffic Engineering—LSP Attributes, on page 273](#)
- [Information About MPLS Traffic Engineering—LSP Attributes, on page 273](#)
- [How to Configure MPLS Traffic Engineering—LSP Attributes, on page 277](#)
- [Configuration Examples for MPLS Traffic Engineering—LSP Attributes, on page 299](#)
- [Additional References, on page 304](#)
- [Feature History for MPLS Traffic Engineering—LSP Attributes, on page 304](#)

Prerequisites for MPLS Traffic Engineering—LSP Attributes

The MPLS Traffic Engineering—LSP Attributes feature requires that you configure an MPLS TE tunnel before you configure either an LSP Attribute List or a Path Option for Bandwidth Override feature.

Restrictions for MPLS Traffic Engineering—LSP Attributes

- Reoptimization between path options with different priorities is not supported.
- With the LSP Attribute List feature, you need to configure priority for path options that is consistent with the priority configured on the tunnel or in other path options used by the tunnel.

Information About MPLS Traffic Engineering—LSP Attributes

The following section provides information about MPLS Traffic Engineering—LSP Attributes.

MPLS Traffic Engineering—LSP Attributes

This document describes how to configure label switched path (LSP) attributes for path options associated with Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels.

The MPLS Traffic Engineering—LSP Attributes feature is an extension to MPLS TE. It provides an LSP Attribute list feature and a Path Option for Bandwidth Override feature. These features provide flexibility in the configuration of LSP attributes for MPLS TE tunnel path options. Several LSP attributes can be applied to path options for TE tunnels using an LSP attribute list. If bandwidth is the only LSP attribute you require, then you can configure a Path Option for Bandwidth Override.

MPLS Traffic Engineering—LSP Attributes Benefits

The MPLS Traffic Engineering—LSP Attributes feature provides an LSP Attribute List feature and a Path Option for Bandwidth Override feature. These features have the following benefits:

- The LSP Attributes List feature enables you to configure values for several LSP-specific path options for TE tunnels.
- One or more TE tunnels can specify specific path options by referencing an LSP Attribute List.
- LSP attribute lists make the MPLS TE user interface more flexible, easier to use, and easier to extend and maintain.
- The Path Option for Bandwidth Override feature provides a single command that allows a TE tunnel to fall back temporarily to path options that can reduce bandwidth constraints.

Traffic Engineering Bandwidth

MPLS traffic engineering allows constraint-based routing (CBR) of IP traffic. One of the constraints satisfied by CBR is the availability of required bandwidth over a selected path. Regular TE tunnel bandwidth is called the global pool. Subpool bandwidth is a portion of the global pool. If the subpool bandwidth is not in use it is not reserved from the global pool. Therefore, subpool tunnels require a higher priority than other tunnels.

You can configure the LSP Attribute bandwidth path option to use either global pool (default) or subpool bandwidth. The bandwidth value for the path option may be any valid value. The pool does not have to be the same as that configured on the tunnel.

Note When you configure bandwidth for path options with the **bandwidth [global] kbps** command, use either all subpool bandwidths or all global-pool bandwidths.

You can configure bandwidth on both dynamic and explicit path options using either the LSP Attribute List feature or the Path Option for Bandwidth Override feature. The commands that enable these features are exclusive of each other. If bandwidth is the only LSP attribute that you need to set on the path option, then use the command to enable the feature. This is the simplest way to configure multiple path options with decreasing bandwidth constraints. Once the **bandwidth** keyword is entered on the **tunnel mpls traffic-eng path-option** command in interface configuration mode, you cannot configure an LSP Attribute List for that path option.

Tunnel Attributes and LSP Attributes

Cisco IOS XE tunneling interfaces have many parameters associated with MPLS TE. Typically, you configure these parameters with **tunnel mpls traffic-eng** commands in interface configuration mode. Many of these commands determine tunnel-specific properties, such as the load-sharing factor for the tunnel. These commands

configure parameters that are unrelated to the particular LSP in use by the tunnel. However, some of the tunneling parameters apply to the LSP that the tunnel uses. You can configure the LSP-specific properties using an LSP Attribute list.

LSP Attributes and the LSP Attribute List

An LSP Attribute list can contain values for each LSP-specific parameter that is configurable for a TE tunnel. You configure an LSP attribute list with the `mpls traffic-eng lsp attributes string` command, where *string* identifies the attribute list. The LSP attributes that you can specify include the following:

- Attribute flags for links that make up the LSP (**affinity** command)
- LSP bandwidth--global pool or subpool (**bandwidth** command)
- Disable reoptimization of the LSP (**lockdown** command)
- LSP priority (**priority** command)
- Record the route used by the LSP (**record-route** command)

LSP Attribute Lists Management

The MPLS Traffic Engineering—LSP Attributes feature also provides commands that help you manage LSP Attribute lists. You can do the following:

- Relist all attribute list entries (**list** command)
- Remove a specific attribute from the list (**noattribute** command)

The **exit** command exits from the LSP attributes configuration submode and returns you to global configuration mode.

Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options. LSP attribute lists also provide an easy way to configure multiple TE tunnels to use the same LSP attributes. That is, you can reference the same LSP attribute list to configure LSP-specific parameters for one or more TE tunnels.

Constraint-Based Routing and Path Option Selection

MPLS traffic engineering automatically establishes and maintains LSPs across the backbone by using the Resource Reservation Protocol (RSVP). The path that an LSP uses is determined by the LSP resource requirements and network resources, such as bandwidth. Traffic engineering tunnels are calculated at the LSP head based on a fit between required and available resources (constraint-based routing).

Without the Path Option for Bandwidth Override feature, a TE tunnel establishes an LSP based on dynamic or explicit path options in order of preference. However, the bandwidth and other attributes configured on the TE tunnel allow the setup of an LSP only if LSP path options satisfy the constraints. If a path cannot be found that satisfies the configured path options, then the tunnel is not set up.

The Path Option for Bandwidth Override feature provides a fallback path option that allows overriding the bandwidth configured on the TE tunnel interface. For example, you can configure a path option that sets the bandwidth to zero (0) effectively removing the bandwidth constraint imposed by the constraint-based routing calculation.

Tunnel Reoptimization and Path Option Selection

Reoptimization occurs when a device with traffic engineering tunnels periodically examines tunnels with established LSPs to learn if better LSPs are available. If a better LSP seems to be available, the device attempts to signal the better LSP. If the signaling is successful, the device replaces the older LSP with the new, better LSP.

Reoptimization can be triggered by a timer, the issuance of an **mpls traffic-eng reoptimize** command, or a configuration change that requires the signalling of a tunnel. The MPLS AutoBandwidth feature, for example, uses a timer to set the frequency of reoptimization based on the bandwidth path option attribute. The Path Option for Bandwidth Override feature allows for the switching between bandwidth configured on the TE tunnel interface and bandwidth configured on a specific path option. This increases the success of signaling an LSP for the TE tunnel.

With bandwidth override configured on a path option, the traffic engineering software attempts to reoptimize the bandwidth every 30 seconds to reestablish the bandwidth configured on the tunnel (see the Configuring a Path Option for Bandwidth Override section).

You can disable reoptimization of an LSP with the **lockdown** command in an LSP Attribute list. You can apply the LSP Attribute list containing the **lockdown** command to a path option with the **tunnel mpls traffic-eng path-option** command.

Note When you configure bandwidth for path options with the **bandwidth [global] kpbs** command, use either all subpool bandwidths or all global-pool bandwidths. Do not mix subpool and other bandwidths, otherwise the path option does not reoptimize later.

Path Option Selection with Bandwidth Override

The Path Option for Bandwidth Override feature allows you to configure bandwidth parameters on a specific path option. The **tunnel mpls traffic-eng path-option** command's **bandwidth** keyword can be used for this purpose. When an LSP is signaled using a path option with a configured bandwidth, the bandwidth associated with the path option is signaled instead of the tunnel's configured bandwidth.

This feature also provides the ability to configure multiple path options that reduce the bandwidth constraint each time the headend of a tunnel fails to establish an LSP.

The following configuration uses the **tunnel mpls traffic-eng bandwidth** command to configure the bandwidth of the tunnel and three **tunnel mpls traffic-eng path-option** commands that define the signalling path options for the LSP:

```
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 explicit name path1
tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
tunnel mpls traffic-eng path-option 3 dynamic bandwidth 0
```

The device selects a path option for an LSP in order of preference, as follows:

- The device attempts to signal an LSP using path options starting with path option 1.

The device attempts to signal an LSP with the 1000 kbps bandwidth configured on the tunnel interface because path-option 1 has no bandwidth configured.

- If 1000 kbps bandwidth is not available over the network, the device attempts to establish an LSP using path-option 2.

Path option 2 has a bandwidth of 500 kbps configured. This reduces the bandwidth constraint from the original 1000 kbps configured on the tunnel interface.

- If 500 kbps is not available, the device attempts to establish an LSP using path-option 3.

Path-option 3 is configured as dynamic and has bandwidth 0. The device establishes the LSP if an IP path exists to the destination and all other tunnel constraints are met.

Default Path Option Attributes for TE Tunnels Using LSP Attribute Lists

Values for path option attributes for a TE tunnel are determined in this manner:

- LSP attribute list values referenced by the path option take precedence over the values configured on the tunnel interface.
- If you do not specify an attribute in the LSP attribute list, the device uses the attribute in the tunnel configuration. LSP attribute lists do not have defaults.
- If you do not configure the attribute on the tunnel, then the device uses the tunnel default value, as follows:

```
{Affinity= affinity 0 mask 0,
Bandwidth= bandwidth 0,
Lockdown= no lockdown,
Priority= priority 7 7,
Record-route= no record-route
.
.
.
}
```

How to Configure MPLS Traffic Engineering—LSP Attributes

The following section provides information on configuring MPLS Traffic Engineering—LSP Attributes.

Configuring an LSP Attribute List

Perform this task to configure a label switched path (LSP) attribute list with the desired attributes to be applied on a path option. Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options. The LSP attribute list provides a user interface that is flexible, easy to use, and easy to extend and maintain for the configuration of MPLS TE tunnel path options.

LSP attribute lists also provide an easy way to configure multiple TE tunnels to use the same LSP attributes. That is, you can reference the same LSP attribute list to configure LSP-specific parameters for one or more TE tunnels.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	mpls traffic-eng lsp attributes <i>string</i> Example: <pre>Device(config)# mpls traffic-eng lsp attributes 1</pre>	Configures an LSP attribute list and enters LSP Attributes configuration mode. <ul style="list-style-type: none"> The <i>string</i> argument identifies a specific LSP attribute list.
Step 4	affinity <i>value</i> [mask <i>value</i>] Example: <pre>Device(config-lsp-attr)# affinity 0 mask 0</pre>	(Optional) Specifies attribute flags for links comprising an LSP. <ul style="list-style-type: none"> The <i>value</i> argument is a value required for links that make up an LSP. Values of the bits are either 0 or 1. The mask <i>value</i> keyword argument combination indicates which attribute values should be checked. <ul style="list-style-type: none"> If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant. If a bit in the mask is 1, the attribute value of that link and the required affinity of the LSP for that bit must match.
Step 5	bandwidth [global] <i>k</i>bps Example: <pre>Device(config-lsp-attr)# bandwidth 5000</pre>	(Optional) Specifies LSP bandwidth. <ul style="list-style-type: none"> The global keyword indicates a global pool path option. The <i>k</i>bps argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295.
Step 6	list Example:	(Optional) Displays the contents of the LSP attribute list.

	Command or Action	Purpose
	Device (config-lsp-attr) # list	
Step 7	lockdown Example: Device (config-lsp-attr) # lockdown	(Optional) Disables reoptimization of the LSP.
Step 8	priority <i>setup-priority</i> [<i>hold-priority</i>] Example: Device (config-lsp-attr) # priority 1 1	(Optional) Specifies the LSP priority. <ul style="list-style-type: none"> • The <i>setup-priority</i> argument is used when signaling an LSP to determine which existing LSPs can be preempted. Valid values are from 0 through 7, where a lower number indicates a higher priority. Therefore, an LSP with a setup priority of 0 can preempt any LSP with a non-0 priority. • The <i>hold-priority</i> argument is associated with an LSP to determine if it should be preempted by other LSPs that are being signaled. Valid values are from 0 through 7, where a lower number indicates a higher priority.
Step 9	record-route Example: Device (config-lsp-attr) # record-route	(Optional) Records the route used by the LSP.
Step 10	no <i>sub-command</i> Example: Device (config-lsp-attr) # no record-route	(Optional) Removes a specific attribute from the LSP attributes list. <ul style="list-style-type: none"> • The <i>sub-command</i> argument names the LSP attribute to remove from the attributes list.
Step 11	exit Example: Device (config-lsp-attr) # exit	(Optional) Exits from LSP Attributes configuration mode.
Step 12	end Example: Device (config) # end	(Optional) Exits to privileged EXEC mode.

Adding Attributes to an LSP Attribute List

Perform this task to add attributes to an LSP attribute list. The LSP attribute list provides a user interface that is flexible, and easy to use. You can extend or change the LSP attribute list at any time to meet the requirements of your MPLS TE tunnel traffic. LSP Attributes configuration mode is used to display the specific LSP attributes list and to add or change the required path option attribute.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mpls traffic-eng lsp attributes <i>string</i> Example: Device(config)# mpls traffic-eng lsp attributes 1	Configures an LSP Attribute list and enters LSP Attributes configuration mode. <ul style="list-style-type: none"> The <i>string</i> argument identifies a specific LSP Attribute list.
Step 4	affinity <i>value</i> [maskvalue] Example: Device(config-lsp-attr)# affinity 0 mask 0	(Optional) Specifies attribute flags for links comprising an LSP. <ul style="list-style-type: none"> The <i>value</i> argument is a value required for links that make up an LSP. Values of the bits are either 0 or 1. The maskvalue keyword argument combination indicates which attribute values should be checked. <ul style="list-style-type: none"> If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant. If a bit in the mask is 1, the attribute value of that link and the required affinity of the LSP for that bit must match.
Step 5	bandwidth [<i>global</i>] <i>kbps</i> Example: Device(config-lsp-attr)# bandwidth 1000	Specifies an LSP bandwidth. <ul style="list-style-type: none"> The global keyword indicates a global pool path option.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295.
Step 6	priority <i>setup-priority</i> [<i>hold-priority</i>] Example: Device(config-lsp-attr)# priority 2 2	Specifies the LSP priority. <ul style="list-style-type: none"> The <i>setup-priority</i> argument is used when signaling an LSP to determine which existing LSPs can be preempted. Valid values are from 0 through 7, where a lower number indicates a higher priority. Therefore, an LSP with a setup priority of 0 can preempt any LSP with a non-0 priority. The <i>hold-priority</i> argument is associated with an LSP to determine if it should be preempted by other LSPs that are being signaled. Valid values are from 0 through 7, where a lower number indicates a higher priority.
Step 7	list Example: Device(config-lsp-attr)# list	(Optional) Displays the contents of the LSP attribute list. <ul style="list-style-type: none"> Use the list command to display the path option attributes added to the attribute list.
Step 8	exit Example: Device(config-lsp-attr)# exit	(Optional) Exits LSP Attributes configuration mode.
Step 9	end Example: Device(config)# end	(Optional) Exits to privileged EXEC mode.

Example: Removing an Attribute from an LSP Attribute List

The following example shows how to remove the priority attribute from the LSP attribute list identified by the string 'simple'.

```
Device(config)# mpls traffic-eng lsp attributes simple
Device(config-lsp-attr)# priority 1 1
Device(config-lsp-attr)# list
LIST simple
priority 1 1
```

```

!
Device(config-lsp-attr)# no priority
Device(config-lsp-attr)# list
LIST simple
!
Device(config-lsp-attr)# exit

```

Modifying an Attribute in an LSP Attribute List

Perform this task to modify an attribute in an LSP attribute list. The LSP attribute list provides a flexible user interface. You can extend or modify the LSP attribute list any time to meet the requirements of your MPLS TE tunnel traffic. LSP Attributes configuration mode is used to display the specific LSP attributes list and to modify the required path option attribute.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mpls traffic-eng lsp attributes <i>string</i> Example: Device(config)# mpls traffic-eng lsp attributes 1	Configures an LSP Attribute list and enters LSP Attributes configuration mode. <ul style="list-style-type: none"> The <i>string</i> argument identifies a specific LSP attribute list.
Step 4	affinity <i>value</i> [<i>maskvalue</i>] Example: Device(config-lsp-attr)# affinity 1 mask 1	Specifies attribute flags for links comprising an LSP. <ul style="list-style-type: none"> The <i>value</i> argument is a value required for links comprising an LSP. Values of bits are either 0 or 1. The maskvalue keyword argument combination indicates which attribute values should be checked. <ul style="list-style-type: none"> If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant. If a bit in the mask is 1, the attribute value of that link and the required affinity of the tunnel for that bit must match.

	Command or Action	Purpose
Step 5	<p>list</p> <p>Example:</p> <pre>Device(config-lsp-attr)# list</pre>	<p>(Optional) Displays the contents of the LSP Attribute list.</p> <ul style="list-style-type: none"> Use the list command to display the path option attributes configured in the attribute list.
Step 6	<p>affinity <i>value</i> [maskvalue]</p> <p>Example:</p> <pre>Device(config-lsp-attr)# affinity 0 mask 0</pre>	<p>Specifies attribute flags for links comprising an LSP.</p> <ul style="list-style-type: none"> The <i>value</i> argument is a value required for links comprising an LSP. Values of bits are either 0 or 1. The maskvalue keyword argument combination indicates which attribute values should be checked. <ul style="list-style-type: none"> If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant. If a bit in the mask is 1, the attribute value of that link and the required affinity of the tunnel for that bit must match.
Step 7	<p>list</p> <p>Example:</p> <pre>Device(config-lsp-attr)# list</pre>	<p>(Optional) Displays the contents of the LSP attribute list.</p> <ul style="list-style-type: none"> Use the list command to verify that the path option attributes is modified in the attribute list.
Step 8	<p>exit</p> <p>Example:</p> <pre>Device(config-lsp-attr)# exit</pre>	<p>(Optional) Exits LSP Attributes configuration mode.</p>
Step 9	<p>end</p> <p>Example:</p> <pre>Device(config)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Deleting an LSP Attribute List

Perform this task to delete an LSP attribute list. You would perform this task when you no longer require the LSP attribute path options specified in the LSP attribute list for an MPLS TE tunnel.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	no mpls traffic-eng lsp attributes <i>string</i> Example: Device(config)# no mpls traffic-eng lsp attributes 1	Removes a specified LSP Attribute list from the device configuration. <ul style="list-style-type: none"> The <i>string</i> argument identifies the specific LSP attribute list to remove.
Step 4	end Example: Device(config)# end	(Optional) Exits to privileged EXEC mode.
Step 5	show mpls traffic-eng lsp attributes [<i>string</i>] Example: Device# show mpls traffic-eng lsp attributes	(Optional) Displays information about configured LSP attribute lists. <ul style="list-style-type: none"> Use the show mpls traffic-eng lsp attributes command to verify that the LSP attribute list was deleted from the Device.

Verifying Attributes Within an LSP Attribute List

To verify the attributes within an LSP attribute list, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	mpls traffic-eng lsp attributes <i>string</i> list Example: Device(config)# mpls traffic-eng lsp attributes 1 list	Enters LSP Attributes configuration mode. Verifies the contents for a specific LSP attribute list.
Step 4	exit Example: Device(config-lsp-attr)# exit	Exits LSP Attributes configuration mode.
Step 5	end Example: Device(config)# exit	Exits to privileged EXEC mode.

Verifying All LSP Attribute Lists

Perform this task to verify all configured LSP attribute lists. Use this task to display all LSP attribute lists to verify that the attributes lists that you configured are in operation.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	show mpls traffic-eng lsp attributes <i>string</i> [details] Example: Device# show mpls traffic-eng lsp attributes	Displays all configured LSP attribute lists.
Step 3	show running-config begin <i>text-string</i> Example: Device# show running-config begin mpls traffic-eng lsp	Verifies that all configured LSP attribute lists are as expected. The begin command modifier with the mpls traffic-eng lsp <i>text-string</i> locate the LSP attributes information in the configuration file.
Step 4	exit Example: Device# exit	Exits to user EXEC mode.

Associating an LSP Attribute List with a Path Option for an MPLS TE Tunnel

Perform this task to associate an LSP attribute list with a path option for an MPLS TE tunnel. This task is required if you want to apply the LSP attribute list that you configured to path options for your MPLS TE tunnels.

Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options. LSP attribute lists also provide an easy way to configure multiple TE tunnels to use the same LSP attributes. That is, you can reference the same LSP attribute list to configure LSP-specific parameters for one or more TE tunnels.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: Device(config)# interface tunnel 1	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface that you want to configure. • The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.
Step 4	tunnel destination { <i>hostname</i> <i>ip-address</i> } Example: Device(config-if)# tunnel destination 10.10.10.12	Specifies the destination of the tunnel for this path option. <ul style="list-style-type: none"> • The <i>hostname</i> argument is the name of the host destination. • The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.
Step 5	tunnel mode mpls traffic-eng Example: Device(config-if)# tunnel mode mpls traffic-eng	Sets the encapsulation mode for the tunnel for MPLS TE.

	Command or Action	Purpose
Step 6	<p>tunnel mpls traffic-eng autoroute announce</p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng autoroute announce</pre>	Specifies that the IGP should use the tunnel (if the tunnel is up) in its enhanced shortest path first (SPF) calculation.
Step 7	<p>tunnel mpls traffic-eng bandwidth <i>[[global]</i> <i>bandwidth</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng bandwidth 1000</pre>	<p>Configures the bandwidth required for an MPLS TE tunnel and assigns it either to the subpool or the global pool.</p> <ul style="list-style-type: none"> The global keyword indicates a global pool tunnel. The <i>kbps</i> argument is the bandwidth, in kilobits per second, set aside for the MPLS TE tunnel. The range is from 1 through 4294967295.
Step 8	<p>tunnel mpls traffic-eng priority <i>setup-priority</i> <i>[hold-priority]</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng priority 1 1</pre>	<p>Sets the priority to be used when the system determines which existing tunnels are eligible to be preempted.</p> <ul style="list-style-type: none"> The <i>setup-priority</i> argument is the priority used when signaling an LSP for this tunnel to determine which existing tunnels can be preempted. <p>Valid values are from 0 through 7. A lower number indicates a higher priority. An LSP with a setup priority of 0 can preempt any LSP with a non-0 priority.</p> <ul style="list-style-type: none"> The <i>hold-priority</i> argument is the priority associated with an LSP for this tunnel to determine if it should be preempted by other LSPs that are being signaled. <p>Valid values are from 0 through 7, where a lower number indicates a higher priority.</p>
Step 9	<p>tunnel mpls traffic-eng path-option <i>number</i> <i>{dynamic explicit {name path-name path-number} [verbatim]}</i> <i>[attributes string]</i> <i>[bandwidth [global] kbps]</i> <i>[lockdown]</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng path-option 1 dynamic attributes 1</pre>	<p>Adds an LSP attribute list to specify LSP-related parameters for a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> The <i>number</i> argument identifies the path option. The dynamic keyword indicates that the path option is dynamically calculated (the Device figures out the best path).

	Command or Action	Purpose
		<ul style="list-style-type: none"> • The explicit keyword indicates that the path option is specified. You specify the IP addresses of the path. • The name <i>path-name</i> keyword argument combination identifies the name of the explicit path option. • The <i>path-number</i> argument identifies the number of the explicit path option. • The verbatim keyword bypasses the topology database verification. <p>Note You can use the verbatim keyword only with the explicit path option.</p> <ul style="list-style-type: none"> • The attributes <i>string</i> keyword argument combination names an attribute list to specify path options for the LSP. • The bandwidth keyword specifies LSP bandwidth. • The global keyword indicates a global pool path option. • The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295. • The lockdown keyword disables reoptimization of the LSP.
Step 10	end Example: <pre>Device(config-if)# end</pre>	(Optional) Exits to privileged EXEC mode.

Modifying a Path Option to Use a Different LSP Attribute List

Perform this task to modify the path option to use a different LSP Attribute list.

Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options. You can change the set of attributes associated with a path option. The **tunnel mpls traffic-eng path-option** *number* **dynamic attributes** *string* command is used in interface configuration mode to modify the path option to use a different LSP attribute list. The **attributes** and *string* keyword and argument names the new LSP attribute list for the path option specified.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: <pre>Device(config)# interface tunnel 1</pre>	Configures the interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface that you want to configure. • The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.
Step 4	tunnel destination {hostname ip-address} Example: <pre>Device(config-if)# tunnel destination 10.10.10.12</pre>	Specifies the destination of the tunnel for this path option. <ul style="list-style-type: none"> • The <i>hostname</i> argument is the name of the host destination. • The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.
Step 5	tunnel mpls traffic-eng path-option <i>number</i> {dynamic explicit {namepath-name path-number} [verbatim]} [attributesstring] [bandwidth [global] kbps] [lockdown] Example: <pre>Device(config-if)# tunnel mpls traffic-eng path-option 1 dynamic attributes 1</pre>	Adds an LSP Attribute list to specify LSP-related parameters for a path option for an MPLS TE tunnel. <ul style="list-style-type: none"> • The <i>number</i> argument identifies the path option. • The dynamic keyword indicates that the path option is dynamically calculated (the Device figures out the best path). • The explicit keyword indicates that the path option is specified. You specify the IP addresses of the path. • The namepath-name keyword argument combination identifies the name of the explicit path option. • The <i>path-number</i> argument identifies the number of the explicit path option.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The verbatim keyword bypasses the topology database verification. <p>Note You can use the verbatim keyword only with the explicit path option.</p> <ul style="list-style-type: none"> The attributesstring keyword argument combination names an attribute list to specify path options for the LSP. The bandwidth keyword specifies LSP bandwidth. The global keyword indicates a global pool path option. The kbps argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295. The lockdown keyword disables reoptimization of the LSP.
Step 6	end Example: <pre>Device(config-if)# end</pre>	(Optional) Exits to privileged EXEC mode.

Removing a Path Option for an LSP for an MPLS TE Tunnel

Perform this task to remove a path option for an LSP for an MPLS TE tunnel. Use this task to remove a path option for an LSP when your MPLS TE tunnel traffic requirements change.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	<p>interface <i>type number</i></p> <p>Example:</p> <pre>Device(config)# interface tunnel 1</pre>	<p>Configures the interface type and enters interface configuration mode.</p> <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface that you want to configure. • The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.
Step 4	<p>tunnel destination <i>{hostname ip-address}</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel destination 10.10.10.12</pre>	<p>Specifies the destination of the tunnel for this path option.</p> <ul style="list-style-type: none"> • The <i>hostname</i> argument is the name of the host destination. • The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.
Step 5	<p>no tunnel mpls traffic-eng path-option <i>number {dynamic explicit {namepath-name path-number} [verbatim]} [attributesstring] [bandwidth [global] kbps] [lockdown]</i></p> <p>Example:</p> <pre>Device(config-if)# no tunnel mpls traffic-eng path-option 1 dynamic attributes 1</pre>	<p>Removes an LSP Attribute list that specifies LSP-related parameters for a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> • The <i>number</i> argument identifies the path option. • The dynamic keyword indicates that the path option is dynamically calculated (the Device figures out the best path). • The explicit keyword indicates that the path option is specified. You specify the IP addresses of the path. • The namepath-name keyword argument combination identifies the name of the explicit path option. • The <i>path-number</i> argument identifies the number of the explicit path option. • The verbatim keyword bypasses the topology database verification. <p>Note You can use the verbatim keyword only with the explicit path option.</p> <ul style="list-style-type: none"> • The attributesstring keyword argument combination names an attribute list to specify path options for the LSP.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • The bandwidth keyword specifies LSP bandwidth. • The global keyword indicates a global pool path option. • The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295. • The lockdown keyword disables reoptimization of the LSP.
Step 6	end Example: Device(config-if) # end	(Optional) Exits to privileged EXEC mode.

Verifying that LSP Is Signaled Using the Correct Attributes

To verify that the LSP is signaled using the correct attributes for the specified tunnel, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	show mpls traffic-eng tunnels <i>tunnel-interface</i> [brief] Example: Device# show mpls traffic-eng tunnels tunnell	Verifies that the LSP is signaled using the correct attributes for the specified tunnel.
Step 3	exit Example: Device# exit	Use this command to return to user EXEC mode. For example:

Configuring a Path Option for Bandwidth Override

The following section contains the tasks for configuring a path option for bandwidth override.

Note Once you configure bandwidth as a path-option parameter, you can no longer configure an LSP Attribute list as a path-option parameter.

Configuring Fallback Bandwidth Path Options for TE Tunnels

Perform this task to configure fallback bandwidth path options for a TE tunnel. Use this task to configure path options that reduce the bandwidth constraint each time the headend of a tunnel fails to establish an LSP.

Configuration of the Path Option for Bandwidth Override feature can reduce bandwidth constraints on path options temporarily. It improves the chances that an LSP is set up for the TE tunnel. When a TE tunnel uses a path option with bandwidth override, the traffic engineering software attempts every 30 seconds to reoptimize the tunnel to use the preferred path option with the original configured bandwidth. The Path Option for Bandwidth Override feature is designed as a temporary reduction in bandwidth constraint. To force immediate reoptimization of all traffic engineering tunnels, you can use the **mpls traffic-eng reoptimize** command. You can also configure the **lockdown** command with bandwidth override to prevent automatic reoptimization.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>type number</i> Example: Device(config)# interface tunnel 1	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface that you want to configure. • The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.
Step 4	tunnel destination <i>{hostname ip-address}</i> Example: Device(config-if)# tunnel destination 10.10.10.12	Specifies the destination of the tunnel for this path option. <ul style="list-style-type: none"> • The <i>hostname</i> argument is the name of the host destination. • The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.

	Command or Action	Purpose
Step 5	<p>tunnel mpls traffic-eng path-option <i>number</i> {dynamic explicit {name <i>path-name</i> <i>path-number</i>} [verbatim]} [attributes <i>string</i>] [bandwidth [global] <i>kbps</i>] [lockdown]</p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng path-option 1 dynamic bandwidth 500</pre>	<p>Adds a Path Option for Bandwidth Override to specify a bandwidth fallback for a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> • The <i>number</i> argument identifies the path option. • The dynamic keyword indicates that the path option is dynamically calculated (the Device figures out the best path). • The explicit keyword indicates that the path option is specified. You specify the IP addresses of the path. • The name<i>path-name</i>keyword argument combination identifies the name of the explicit path option. • The <i>path-number</i> argument identifies the number of the explicit path option. • The verbatim keyword bypasses the topology database verification. <p>Note You can use the verbatim keyword only with the explicit path option.</p> <ul style="list-style-type: none"> • The attributes<i>string</i> keyword argument combination names an attribute list to specify path options for the LSP. • The bandwidth keyword specifies LSP bandwidth. • The global keyword indicates a global pool path option. • The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295. • The lockdown keyword disables reoptimization of the LSP.
Step 6	<p>end</p> <p>Example:</p> <pre>Device(config-if)# end</pre>	(Optional) Exits to privileged EXEC mode.

Modifying the Bandwidth on a Path Option for Bandwidth Override

Perform this task to modify the bandwidth on a Path Option for Bandwidth Override. You might need to further reduce or modify the bandwidth constraint for a path option to ensure that the headend of a tunnel establishes an LSP.

The Path Option for Bandwidth Override feature is designed as a temporary reduction in bandwidth constraint. To force immediate reoptimization of all traffic engineering tunnels, you can use the **mpls traffic-eng reoptimize** command. You can also configure the **lockdown** command with bandwidth override to prevent automatic reoptimization.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interface type number Example: <pre>Device(config)# interface tunnel 1</pre>	Configures the interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface that you want to configure. • The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.
Step 4	tunnel destination {hostname ip-address} Example: <pre>Device(config-if)# tunnel destination 10.10.10.12</pre>	Specifies the destination of the tunnel for this path option. <ul style="list-style-type: none"> • The <i>hostname</i> argument is the name of the host destination. • The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.
Step 5	tunnel mpls traffic-eng path-option number {dynamic explicit {name path-name path-number} [verbatim]} [attributes string] [bandwidth [global] kbps] [lockdown] Example: <pre>Device(config-if)# tunnel mpls</pre>	Adds a Path Option for Bandwidth Override to specify a bandwidth fallback for a path option for an MPLS TE tunnel. <ul style="list-style-type: none"> • The <i>number</i> argument identifies the path option.

	Command or Action	Purpose
	<pre>traffic-eng path-option 2 dynamic bandwidth 500</pre> <p>Example:</p>	<ul style="list-style-type: none"> The dynamic keyword indicates that the path option is dynamically calculated (the Device figures out the best path). The explicit keyword indicates that the path option is specified. You specify the IP addresses of the path. The namepath-name keyword argument combination identifies the name of the explicit path option. The path-number argument identifies the number of the explicit path option. The verbatim keyword bypasses the topology database verification. <p>Note You can use the verbatim keyword only with the explicit path option.</p> <ul style="list-style-type: none"> The attributesstring keyword argument combination names an attribute list to specify path options for the LSP. The bandwidth keyword specifies LSP bandwidth. The global keyword indicates a global pool path option. The kbps argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295. The lockdown keyword disables reoptimization of the LSP.
Step 6	<pre>end</pre> <p>Example:</p> <pre>Device(config-if)# end</pre>	(Optional) Exits to privileged EXEC mode.
Step 7	<pre>show mpls traffic-eng tunnels tunnel-interface [brief]</pre> <p>Example:</p> <pre>Device# show mpls traffic-eng tunnels tunnell</pre>	(Optional) Displays information about tunnels. <ul style="list-style-type: none"> Use the showmplstraffic-engtunnels command to verify which bandwidth path option is in use by the LSP.

Removing a Path Option for Bandwidth Override

Perform this task to remove the bandwidth on the path option for bandwidth override. The Path Option for Bandwidth Override feature is designed as a temporary reduction in bandwidth constraint. Use this task to remove the bandwidth override when it is not required.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel number Example: Device(config)# interface tunnel 1	Configures a tunnel interface type and enters interface configuration mode. <ul style="list-style-type: none"> The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.
Step 4	tunnel destination {hostname ip-address} Example: Device(config-if)# tunnel destination 10.10.10.12	Specifies the destination of the tunnel for this path option. <ul style="list-style-type: none"> The <i>hostname</i> argument is the name of the host destination. The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.
Step 5	no tunnel mpls traffic-eng path-option number {dynamic explicit {name path-name path-number} [verbatim]} [attributes string] [bandwidth [global] kbps] [lockdown] Example: Device(config-if)# no tunnel mpls traffic-eng path-option 2 dynamic bandwidth 500	Removes a path option for bandwidth override that specifies a bandwidth fallback for a path option for an MPLS TE tunnel. <ul style="list-style-type: none"> The <i>number</i> argument identifies the path option. The dynamic keyword indicates that the path option is dynamically calculated (the Device figures out the best path). The explicit keyword indicates that the path option is specified. You specify the IP addresses of the path.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The name <i>path-name</i> keyword argument combination identifies the name of the explicit path option. The <i>path-number</i> argument identifies the number of the explicit path option. The verbatim keyword bypasses the topology database verification. <p>Note You can use the verbatim keyword only with the explicit path option.</p> <ul style="list-style-type: none"> The attributes <i>string</i> keyword argument combination names an attribute list to specify path options for the LSP. The bandwidth keyword specifies LSP bandwidth. The global keyword indicates a global pool path option. The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 through 4294967295. The lockdown keyword disables reoptimization of the LSP.
Step 6	end Example: Device(config-if)# end	(Optional) Exits to privileged EXEC mode.
Step 7	show mpls traffic-eng tunnels <i>tunnel-interface</i> [brief] Example: Device# show mpls traffic-eng tunnels tunnel1	(Optional) Displays information about tunnels. <ul style="list-style-type: none"> Use the show mpls traffic-eng tunnels command to verify which bandwidth path option is in use by the LSP.

Verifying that LSP Is Signaled Using the Correct Bandwidth

To verify that the LSP is signaled using the correct bandwidth, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	show mpls traffic-eng tunnels <i>tunnel-interface</i> [brief] Example: <pre>Device# show mpls traffic-eng tunnels tunnel21</pre>	<p>Verifies that the LSP is signaled with the correct bandwidth. Overrides the bandwidth configured on the tunnel.</p> <p>If bandwidth override is actively being signaled, the show mpls traffic-eng tunnel command displays the bandwidth override information under the Active Path Option Parameters heading. The example shows that BandwidthOverride is enabled and that the tunnel is signaled using path-option 2. The bandwidth signaled is 500. This is the value configured on the path option 2 and it overrides the 1000 kbps bandwidth configured on the tunnel interface.</p>
Step 3	exit Example: <pre>Device# exit</pre>	Use this command to exit to user EXEC mode. For example:

Configuration Examples for MPLS Traffic Engineering—LSP Attributes

The following section provides configuration examples for configuring MPLS Traffic Engineering—LSP Attributes.

Configuring LSP Attribute List Examples

Example: Configuring an LSP Attribute List

This example shows the configuration of the affinity and bandwidth LSP-related attributes in an LSP attribute list identified with the numeral 1.

```
Device(config)# mpls traffic-eng lsp attributes 1
Device(config-lsp-attr)# affinity 7 mask 7
Device(config-lsp-attr)# bandwidth 1000
Device(config-lsp-attr)# exit
```

Example: Adding Attributes to an LSP Attribute List

This example shows the addition of priority attributes to the LSP attribute list identified with the numeral 1.

```
Device(config)# mpls traffic-eng lsp attributes 1
Device(config-lsp-attr)# affinity 7 mask 7
Device(config-lsp-attr)# bandwidth 1000
Device(config-lsp-attr)# priority 1 1
Device(config-lsp-attr)# exit
```

Example: Removing an Attribute from an LSP Attribute List

The following example shows how to remove the priority attribute from the LSP attribute list identified by the string 'simple'.

```
Device(config)# mpls traffic-eng lsp attributes simple
Device(config-lsp-attr)# priority 1 1
Device(config-lsp-attr)# list
LIST simple
  priority 1 1
!
Device(config-lsp-attr)# no priority
Device(config-lsp-attr)# list
LIST simple
!
Device(config-lsp-attr)# exit
```

Example: Modifying an Attribute in an LSP Attribute List

The following example shows how to modify the bandwidth in an LSP attribute list identified by the numeral 5.

```
Device(config)# mpls traffic-eng lsp attributes 5
Device(config-lsp-attr)# bandwidth 1000
Device(config-lsp-attr)# priority 1 1
Device(config-lsp-attr)# list
LIST 5
  bandwidth 1000
  priority 1 1
Device(config-lsp-attr)# bandwidth 500
Device(config-lsp-attr)# list
LIST 5
  bandwidth 500
  priority 1 1
Device(config-lsp-attr)# exit
```

Example: Deleting an LSP Attribute List

The following example shows how to delete an LSP attribute list identified by the numeral 1.

```
Device(config)# mpls traffic-eng lsp attributes 1
Device(config-lsp-attr)# affinity 7 mask 7
Device(config-lsp-attr)# bandwidth 1000
Device(config-lsp-attr)# priority 1 1

Device(config-lsp-attr)# exit
```

```
!
Device(config)# no mpls traffic-eng lsp attributes 1
```

Example: Associating an LSP Attribute List with a Path Option for a TE Tunnel: Example

The following example associates the LSP attribute list identified by the numeral 3 with path option 1.

```
Device(config)# mpls traffic-eng lsp attributes 3
Device(config-lsp-attr)# bandwidth 1000
Device(config-lsp-attr)# priority 2 2
Device(config-lsp-attr)# exit
!
!
Device(config)# interface Tunnel 1
Device(config-if)# ip unnumbered FastEthernet1/0/1
Device(config-if)# tunnel destination 10.112.0.12
Device(config-if)# tunnel mode mpls traffic-eng
Device(config-if)# tunnel mpls traffic-eng affinity 1
Device(config-if)# tunnel mpls traffic-eng bandwidth 5000
Device(config-if)# tunnel mpls traffic-eng path-option 1 dynamic attributes 3
```

In this configuration, the LSP has the following attributes:

```
{bandwidth = 1000
 priority = 2 2
 affinity 1
 reroute enabled.
}
```

The LSP attribute list referenced by the path option takes precedence over the values configured on the tunnel interface.

Example: Modifying a Path Option to Use a Different LSP Attribute List

The following example modifies path option 1 to use an LSP attribute list identified by the numeral 1.

```
Device(config)# mpls traffic-eng lsp attributes 1
Device(config-lsp-attr)# affinity 7 mask 7
Device(config-lsp-attr)# bandwidth 500
Device(config-lsp-attr)# priority 1 1
Device(config-lsp-attr)# exit
Device(config)# mpls traffic-eng lsp attributes 2
Device(config-lsp-attr)# bandwidth 1000
Device(config-lsp-attr)# priority 1 1
Device(config-lsp-attr)# exit
Device(config)# interface Tunnel 1
Device(config-if)# ip unnumbered FastEthernet1/0/1
Device(config-if)# tunnel destination 10.112.0.12
Device(config-if)# tunnel mode mpls traffic-eng
Device(config-if)# tunnel mpls traffic-eng affinity 1
Device(config-if)# tunnel mpls traffic-eng bandwidth 5000
Device(config-if)# tunnel mpls traffic-eng path-option 1 dynamic attributes 1
```

In this configuration, the LSP has the following attributes:

```
{affinity = 7 mask = 7
 bandwidth = 500
 priority = 1 1
}
```

Example: Removing a Path Option for an LSP for an MPLS TE Tunnel

The following example shows the removal of path option 1 for an LSP for a TE tunnel.

```
Device(config)# interface Tunnel 1
Device(config-if)# ip unnumbered FastEthernet1/0/1
Device(config-if)# tunnel destination 10.112.0.12
Device(config-if)# tunnel mode mpls traffic-eng
Device(config-if)# tunnel mpls traffic-eng affinity 1
Device(config-if)# tunnel mpls traffic-eng bandwidth 5000
Device(config-if)# tunnel mpls traffic-eng path-option 1 explicit path1 attributes 1
Device(config-if)# tunnel mpls traffic-eng path-option 2 explicit path2 attributes 2
!
!
Device(config-if)# no tunnel mpls traffic-eng path-option 1 explicit path1 attributes 1
```

Configuring a Path Option for Bandwidth Override Examples

Example: Configuring a Path Option to Override the Bandwidth

The following examples show how to configure a path option to override the bandwidth:

```
Device(config-if)# tunnel mpls traffic-eng path-option 3 explicit name path1 ?
    attributes Specify an LSP attribute list
    bandwidth override the bandwidth configured on the tunnel
    lockdown not a candidate for reoptimization
    <cr>
Device(config-if)# tunnel mpls traffic-eng path-option 3 explicit name path1 bandwidth ?
    <0-4294967295> bandwidth requirement in kbps
Device(config-if)# tunnel mpls traffic-eng path-option 3 explicit name path1 bandwidth 500
?
    lockdown not a candidate for reoptimization
    <cr>
```

Note Once you configure bandwidth as a path-option parameter, you can no longer configure an LSP attribute list as a path-option parameter.

Configuring Fallback Bandwidth Path Options for TE Tunnels: Example

The following example shows multiple path options configured with the `tunnel mpls traffic-eng path-option` command:

```
interface Tunnel 1
 ip unnumbered Loopback0
 tunnel destination 10.10.10.12
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng path-option 1 explicit name path1
 tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
 tunnel mpls traffic-eng path-option 3 dynamic bandwidth 0
end
```

The device selects a path option for an LSP in order of preference, as follows:

- The device attempts to signal an LSP using path options starting with path-option 1.

The device attempts to signal an LSP with the 1000 kbps bandwidth configured on the tunnel interface because path-option 1 has no bandwidth configured.

- If 1000 kbps bandwidth is not available over the network, the device attempts to establish an LSP using path-option 2.

Path-option 2 has a bandwidth of 500 kbps configured. This reduces the bandwidth constraint from the original 1000 kbps configured on the tunnel interface.

- If 500 kbps is not available, the device attempts to establish an LSP using path-option 3.

Path-option 3 is configured as dynamic and has bandwidth 0. The device establishes the LSP if an IP path exists to the destination and all other tunnel constraints are met.

Example: Modifying the Bandwidth on a Path Option for Bandwidth Override

The following example shows modifying the bandwidth on a path option for bandwidth override. Path-option 3 is changed to an explicit path with a bandwidth of 100 kbps. Path-option 4 is configured with bandwidth 0.

```
interface Tunnel 1
 ip unnumbered Loopback0
 tunnel destination 10.10.10.12
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng path-option 1 explicit name path1
 tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
 tunnel mpls traffic-eng path-option 3 dynamic bandwidth 0
!
Device(config)# tunnel mpls traffic-eng path-option 3 explicit name path3 bandwidth 100
Device(config)# tunnel mpls traffic-eng path-option 4 dynamic bandwidth 0
```

Example: Removing the Path Option Bandwidth Value for an LSP for an MPLS TE Tunnel

The following example shows the removal of the bandwidth for path option 3 for an LSP for an MPLS TE tunnel:

```
interface Tunnel 1
 ip unnumbered Loopback0
 tunnel destination 10.10.10.12
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng path-option 1 explicit name path1
 tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
 tunnel mpls traffic-eng path-option 3 explicit name path3 bandwidth 100
 tunnel mpls traffic-eng path-option 4 dynamic bandwidth 0
!
Router(config)# no tunnel mpls traffic-eng path-option 3 explicit name path3 bandwidth 100
```

Feature History for MPLS Traffic Engineering—LSP Attributes

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Bengaluru 17.6.1	MPLS Traffic Engineering LSP Attributes	The MPLS Traffic Engineering—LSP Attributes feature is an extension to MPLS TE that provides an LSP Attribute List feature and a Path Option for Bandwidth Override feature. These features provide flexibility in the configuration of LSP attributes for MPLS TE tunnel path options. Several LSP attributes can be applied to path options for TE tunnels using an LSP attribute list. If bandwidth is the only LSP attribute you require, then you can configure a Path Option for Bandwidth Override.

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.7.1	MPLS Traffic Engineering LSP Attributes	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

CHAPTER 20

Configuring MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

- [Prerequisites for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels, on page 307](#)
- [Restrictions for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels, on page 308](#)
- [Information About MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels, on page 308](#)
- [How to Configure MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels, on page 309](#)

- [Additional References, on page 319](#)
- [Feature History for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels, on page 320](#)

Prerequisites for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

Before you configure tunnel path calculation metrics, your network must support the following Cisco IOS XE features:

- Multiprotocol Label Switching (MPLS) traffic engineering tunnels
- IP Cisco Express Forwarding
- Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS)

Restrictions for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

- Unless explicitly configured, the TE link metric for a given link is the IGP link metric. When the TE link metric is used to represent a link property that is different from cost/distance, you must configure every network link that can be used for TE tunnels with a TE link metric that represents that property. You can do this by using the **mpls traffic-eng administrative-weight** command. Failure to do so might cause tunnels to use unexpected paths.
- MPLS traffic engineering supports only a single IGP process/instance. Multiple IGP processes/instances are not supported. MPLS traffic engineering should not be configured in more than one IGP process/instance.

Information About MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

The following section provides information about Configurable Path Calculation Metric for MPLS Traffic Engineering tunnels.

Overview

The MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels feature enables you to control the metric used in path calculation for traffic engineering (TE) tunnels on a per-tunnel basis.

When MPLS TE is configured in a network, the Interior Gateway Protocol (IGP) floods two metrics for every link. The metrics are the normal IGP (OSPF or IS-IS) link metric and a TE link metric. The IGP uses the IGP link metric in the normal way to compute routes for destination networks.

You can specify that the path calculation for a given tunnel is based on either of the following:

- IGP link metrics
- TE link metrics, which you can configure so that they represent the needs of a particular application. For example, the TE link metrics can be configured to represent link transmission delay.

Benefits

When Traffic Engineering (TE) tunnels carry two types of traffic, the Configurable Path Calculation Metric for Tunnels feature allows you to tailor tunnel path selection to the requirements of each type of traffic.

For example, suppose that certain tunnels are to carry voice traffic (which requires low delay) and other tunnels are to carry data. In this situation, you can use the TE link metric to represent link delay and do the following:

- Configure tunnels that carry voice to use the TE link metric set to represent link delay for path calculation.
- Configure tunnels that carry data to use the IGP metric for path calculation.

How to Configure MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

The following section provides information about the configuration steps for Configurable Path Calculation Metric for Tunnels for MPLS Traffic Engineering.

Configuring a Platform to Support Traffic Engineering Tunnels

To configure a platform to support Traffic Engineering tunnels, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip cef distributed Example: Device(config)# ip cef distributed	Enables distributed Cisco Express Forwarding operation.
Step 4	mpls traffic-eng tunnels Example: Device(config)# mpls traffic-eng tunnels	Enables the MPLS traffic engineering tunnel feature on a device.
Step 5	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.

Configuring IS-IS for MPLS Traffic Engineering

Note MPLS traffic engineering supports only a single IGP process or instance. Multiple IGP processes or instances are not supported. MPLS traffic engineering should not be configured in more than one IGP process or instance.

To configure IS-IS for MPLS traffic engineering, perform the following steps.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router isis Example: Device(config)# router isis	Enables IS-IS routing and specifies an IS-IS process. The device enters configuration mode.
Step 4	mpls traffic-eng level Example: Device(config-router)# mpls traffic-eng level-1	Turns on MPLS traffic engineering for IS-IS level 1.
Step 5	mpls traffic-eng level Example: Device(config-router)# mpls traffic-eng level-2	Turns on MPLS traffic engineering for IS-IS level 2.
Step 6	mpls traffic-eng router-id <i>type number</i> Example: Device(config-router)# mpls traffic-eng router-id loopback 0	Specifies that the traffic engineering router identifier for the node is the IP address associated with interface loopback0.
Step 7	metric-style wide Example: Device(config-router)# metric-style wide	Configures a router to generate and accept only new-style type, length, value objects (TLVs).

Configuring Traffic Engineering Link Metrics

Unless explicitly configured, the TE link metric is the IGP link metric.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	interface <i>type slot / subslot / port</i> [, <i>subinterface-number</i>] Example: <pre>Device(config)# interface port channel 20</pre>	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface to be configured. • The <i>slot</i> argument is the chassis slot number. • The <i>/ subslot</i> keyword and argument pair is the secondary slot number. The slash (/) is required. • The <i>/ port</i> keyword and argument pair is the port or interface number. The slash (/) is required. • The <i>. subinterface-number</i> keyword and argument pair is the subinterface number in the range 1–4294967293. The number that precedes the period (.) must match the number to which this subinterface belongs.
Step 4	mpls traffic-eng administrative-weight <i>weight</i> Example: <pre>Device(config-if)# mpls traffic-eng administrative-weight 20</pre>	Overrides the IGP administrative weight (cost) of the link. <ul style="list-style-type: none"> • The <i>weight</i> argument is the cost of the link.
Step 5	exit Example: <pre>Device(config-if)# exit</pre>	Exits interface configuration mode and returns to global configuration mode.
Step 6	exit Example:	Exits global configuration mode and returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# exit	

Configuring an MPLS Traffic Engineering Tunnel

To configure a preferred explicit path for an MPLS TE tunnel, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel <i>number</i> Example: Device(config)# interface Tunnel10	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> The <i>number</i> argument is the number of the tunnel.
Step 4	ip unnumbered <i>type number</i> Example: Device(config-if)# ip unnumbered loopback0	Enables IP processing on an interface without assigning an explicit IP address to the interface. <ul style="list-style-type: none"> The <i>type</i> and <i>number</i> arguments name the type and number of another interface on which the router has an assigned IP address. It cannot be another unnumbered interface. An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link.
Step 5	tunnel destination <i>ip-address</i> Example: Device(config-if)# tunnel destination 192.168.4.4	Specifies the destination for a tunnel interface. <ul style="list-style-type: none"> The <i>ip-address</i> argument must be the MPLS traffic engineering router ID of the destination device.
Step 6	tunnel mode mpls traffic-eng Example:	Sets the tunnel encapsulation mode to MPLS traffic engineering.

	Command or Action	Purpose
	<pre>Device(config-if)# tunnel mode mpls traffic-eng</pre>	
Step 7	<p>tunnel mpls traffic-eng bandwidth <i>bandwidth</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng bandwidth 250</pre>	<p>Configures the bandwidth for the MPLS traffic engineering tunnel.</p> <ul style="list-style-type: none"> The <i>bandwidth</i> argument is a number in kilobits per second that is set aside for the MPLS traffic engineering tunnel. Range is from 1 through 4294967295. <p>Note If automatic bandwidth is configured for the tunnel, use the tunnel mpls traffic-eng bandwidth command to configure the initial tunnel bandwidth.</p>
Step 8	<p>tunnel mpls traffic-eng path-option <i>number</i> {dynamic explicit {name <i>path-name</i> identifier <i>path-number</i>}} [lockdown]</p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng path-option 10 explicit identifier 321</pre>	<p>Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database.</p> <ul style="list-style-type: none"> The <i>number</i> argument is the preference for this path option. When you configure multiple path options, lower numbered options are preferred. Valid values are from 1 through 1000. The dynamic keyword indicates that the path of the LSP is dynamically calculated. The explicit keyword indicates that the path of the LSP is an IP explicit path. The name <i>path-name</i> keyword and argument are the path name of the IP explicit path that the tunnel uses with this option. The identifier <i>path-number</i> keyword and argument pair names the path number of the IP explicit path that the tunnel uses with this option. The range is from 1 through 65535. The lockdown keyword specifies that the LSP cannot be reoptimized. <p>Note A dynamic path is used if an explicit path is currently unavailable.</p>

	Command or Action	Purpose
Step 9	exit Example: Device(config-if) # exit	Exits interface configuration mode and returns to global configuration mode.

Configuring the Metric Type for Tunnel Path Calculation

Unless explicitly configured, the traffic engineering link metric type is used for tunnel path calculation. You can use two commands to control the metric type to use: an interface configuration command that specifies the metric type to be used for a particular TE tunnel. And a global configuration command that specifies the metric type to use for TE tunnels for which a metric type is unspecified by the interface configuration command.

Note If you do not enter either of the path selection metrics commands, the traffic engineering (TE) metric is used.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel number Example: Device(config)# interface Tunnel0	Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> The <i>number</i> argument is the number of the tunnel.
Step 4	tunnel mpls traffic-eng path-selection metric {igp te} Example: Device(config-if) # tunnel mpls traffic-eng path-selection metric igp	Specifies the metric type to use for path calculation for a tunnel. <ul style="list-style-type: none"> The igp keyword specifies the use of the Interior Gateway Protocol (IGP) metric. The te keyword specifies the use of the traffic engineering (TE) metric. The traffic engineering metric is the default.
Step 5	exit Example:	Exits interface configuration mode and returns to global configuration mode.

	Command or Action	Purpose
	<code>Device(config-if)# exit</code>	
Step 6	mpls traffic-eng path-selection metric {igp te} Example: <code>Device(config)# mpls traffic-eng path-selection metric igp</code>	Specifies the metric type to use when a metric type was not explicitly configured for a given tunnel. <ul style="list-style-type: none"> • The igp keyword specifies the use of the Interior Gateway Protocol (IGP) metric. • The te keyword specifies the use of the traffic engineering (TE) metric. This is the default.
Step 7	exit Example: <code>Device(config)# exit</code>	Exits global configuration mode and returns to privileged EXEC mode.

Verifying the Tunnel Path Metric Configuration

To verify the tunnel path metric configuration, perform the following procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <code>Device> enable</code>	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	show mpls traffic-eng topology Example: <code>Device# show mpls traffic-eng topology</code>	Displays TE and IGP metrics for each link. You can verify that link metrics are correctly configured for a network.
Step 3	show mpls traffic-eng tunnels Example: <code>Device# show mpls traffic-eng tunnels</code>	Displays the link metric used for tunnel path calculation. You can verify that the desired link metrics are used for each tunnel.
Step 4	exit Example: <code>Device# exit</code>	Returns to user EXEC mode.

Configuration Examples for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

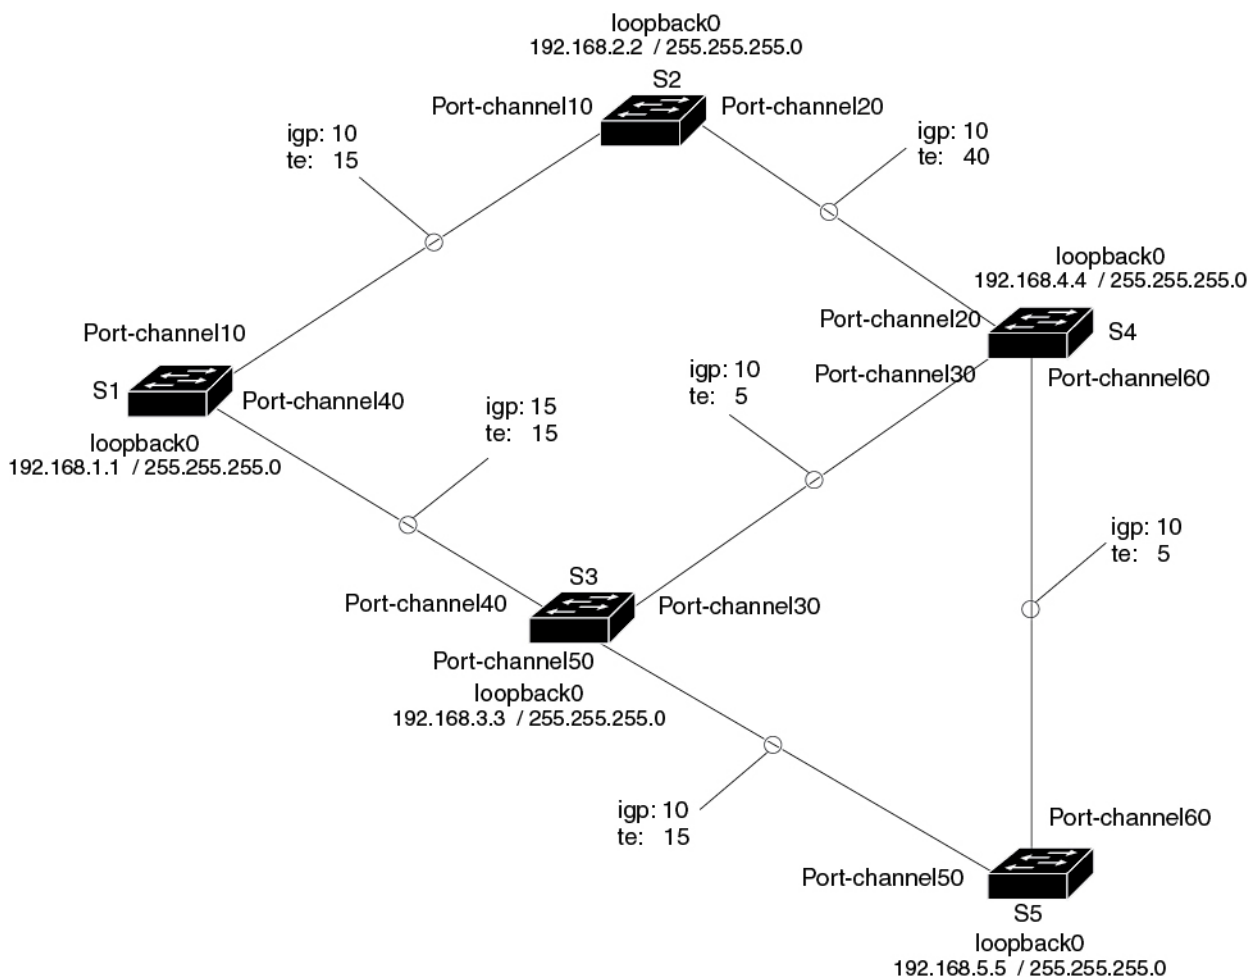

The following section provides configuration examples for configuring a path calculation metric for tunnels.

Example: Configuring Link Type and Metrics for Tunnel Path Selection

The section illustrates how to configure the link metric type to use for tunnel path selection. And how to configure the link metrics themselves. The configuration commands included focus on specifying the metric type for path calculation and assigning metrics to links. You will need additional commands are required to fully configure the example scenario. For example, the IGP commands for traffic engineering and the link interface commands for enabling traffic engineering and specifying available bandwidth.

The examples in this section support the simple network technology shown in the following figure.

Figure 24: Network topology

357511

In the figure above:

- Tunnel1 and Tunnel2 run from S1 (headend) to S4 (tailend).
- Tunnel3 runs from S1 to S5.
- Path calculation for Tunnel1 and Tunnel3 should use a metric that represents link delay because these tunnels carry voice traffic.
- Path calculation for Tunnel2 should use IGP metrics because MPLS TE carries data traffic with no delay requirement.

Configuration fragments follow for each of the devices that illustrate the configuration relating to link metrics and their use in tunnel path calculation. TE metrics that represent link delay must be configured for the network links on each of the devices. And the three tunnels must be configured on S1.

This configuration fragments force Tunnel1 to take path S1-S3-S4, Tunnel2 to take path S1-S2-S4, and Tunnel3 to take path S1-S3-S4-S5 (assuming the links have sufficient bandwidth to accommodate the tunnels).

S1 Configuration

The following example shows how to configure the tunnel headend S1 for Tunnel1, Tunnel2, and Tunnel3 in the preceding figure:

```
interface port channel 40
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 10
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface Tunnel1
                                              !Tunnel1 uses TE metric (default)
                                              !for path selection

ip unnumbered loopback0
tunnel destination 192.168.4.4 255.255.255.0
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 dynamic
interface Tunnel2
                                              !Tunnel2 uses IGP metric
                                              !for path selection

ip unnumbered loopback0
tunnel destination 192.168.4.4 255.255.255.0
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 dynamic
tunnel mpls traffic-eng path-selection-metric igp !Use IGP cost for path selection.
interface Tunnel3
                                              !Tunnel3 uses TE metric (default)
                                              !for path selection

ip unnumbered loopback0
tunnel destination 192.168.5.5 255.255.255.0
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 dynamic
```

S2 Configuration

The following example shows how to configure S2 in the preceding figure:

```
interface port channel 10
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channle 20
mpls traffic-eng administrative-weight 40      !TE metric different from IGP metric
```

S3 Configuration

The following example shows how to configure S3 in the preceding figure:

```

interface port channel 40
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 50
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 30
mpls traffic-eng administrative-weight 5       !TE metric different from IGP metric

```

S4 Configuration

The following example shows how to configure R4 in the preceding figure:

```

interface port channel 20
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 30
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 60
mpls traffic-eng administrative-weight 5       !TE metric different from IGP metric

```

S5 Configuration

The following example shows how to configure S5 in the preceding figure:

```

interface port channel 50
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 60
mpls traffic-eng administrative-weight 5       !TE metric different from IGP metric

```

Example: Verifying the Tunnel Path Metric Configuration

The following examples show how to verify the Tunnel Path Metric configuration.

The following example is a sample output of the **show mpls traffic-eng topology** command. This command displays the TE and IGP metrics for each link.

```

Device# show mpls traffic-eng topology
My_System_id: 1440.0000.0044.00 (isis level-1)
IGP Id: 0090.0000.0009.00, MPLS TE Id:192.168.9.9 Router Node (isis level-1)
  link[0 ]:Nbr IGP Id: 0090.0000.0009.03, gen:7
    frag_id 0, Intf Address:10.0.0.99
    TE metric:100, IGP metric:48, attribute_flags:0x0      !!Note TE and IGP metrics
    physical_bw: 10000 (kbps), max_reservable_bw_global: 0 (kbps)
    max_reservable_bw_sub: 0 (kbps)
  .
  .
  .
  link[1 ]:Nbr IGP Id: 0055.0000.0055.00, gen:7
    frag_id 0, Intf Address:10.205.0.9, Nbr Intf Address:10.205.0.55
    TE metric:120, IGP metric:10, attribute_flags:0x0      !!Note TE and IGP metrics
    physical_bw: 155000 (kbps), max_reservable_bw_global: 500000 (kbps)
    max_reservable_bw_sub: 0 (kbps)

```

The following example is a sample output of the **show mpls traffic-eng tunnels** command. This command displays the link metric used for tunnel path calculation.

```

Device# show mpls traffic-eng tunnels
Name: te3640-17-c_t221 (Tunnel22) Destination: 192.168.100.22
Status:

Feature History for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Bengaluru 17.6.1	MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	The MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels feature enables you to control the metric used in path calculation for traffic engineering (TE) tunnels on a per-tunnel basis.
Cisco IOS XE Cupertino 17.7.1	MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfmng.cisco.com/>

CHAPTER 21

Configuring MPLS Traffic Engineering—RSVP Graceful Restart

- [Prerequisites for MPLS TE—RSVP Graceful Restart, on page 321](#)
- [Restrictions for MPLS TE—RSVP Graceful Restart, on page 321](#)
- [Information About MPLS TE—RSVP Graceful Restart, on page 322](#)

- [Configuration Examples for MPLS TE—RSVP Graceful Restart, on page 327](#)
- [Additional References, on page 328](#)
- [Feature History for MPLS Traffic Engineering—RSVP Graceful Restart, on page 329](#)

Prerequisites for MPLS TE—RSVP Graceful Restart

Perform the following tasks on devices before configuring the MPLS Traffic Engineering—RSVP Graceful Restart feature:

- Configure the Resource Reservation Protocol (RSVP).
- Enable MPLS.
- Configure traffic engineering (TE).
- Enable graceful restart.

Restrictions for MPLS TE—RSVP Graceful Restart

- Graceful restart supports node failure only.
- Cisco recommends that you configure interface hellos only if the neighbor device does not support node hellos.
- Unnumbered interfaces are not supported.
- You cannot configure an interface hello for graceful restart and a hello state timeout (HST) on the same interface.

Information About MPLS TE—RSVP Graceful Restart

The following section provides information about MPLS TE—RSVP Graceful Restart.

Graceful Restart Operation

The MPLS Traffic Engineering—RSVP Graceful Restart feature allows a neighboring Route Processor (RP) to recover from disruption in control plane service (specifically, the Label Distribution Protocol (LDP) component) without losing its Multiprotocol Label Switching (MPLS) forwarding state. This feature has the following benefits:

- Graceful restart allows a node to recover state information from its neighbor when there is an RP failure or the device has undergone a stateful switchover (SSO).
- Graceful restart allows session information recovery with minimal disruption to the network.
- A node can perform a graceful restart to help a neighbor recover its state by keeping the label bindings and state information to provide a quick recovery of the failed node and not affect the traffic that is currently forwarded.

The node failure may be completely transparent to other nodes in the network.

RSVP graceful restart preserves the label values and forwarding information and works with third-party or Cisco Devices seamlessly.

RSVP graceful restart depends on RSVP hello messages to detect that a neighbor went down. Hello messages include Hello Request or Hello Acknowledgment (ACK) objects between two neighbors.

A node hello is transmitted when graceful restart is globally configured and the first LSP to the neighbor is created.

Interface hello is an optional configuration. If you configure the graceful restart Hello command on an interface, the interface hello is considered to be an additional hello instance with the neighbor.

The Device transmits an interface hello for graceful restart when all of the following conditions are met:

- Graceful restart is configured globally.
- Graceful restart is configured on the interface.
- An LSP to the neighboring Device is created and goes over the interface.

Cisco recommends that you use node hellos if the neighbor supports node hellos, and configure interface hellos only if the neighbor Device does not support node hellos.

Interface hellos differ from node hellos. as follows:

- **Interface hello** —The source address in the IP header of the hello message has an IP address that matches the interface that the Hello message sent out. The destination address in the IP header is the interface address of the neighbor on the other side of the link. A TTL of 1 is used for per-interface hellos as it is destined for the directly-connected neighbor.
- **Node hello** —The source address in the IP header of the Hello message includes the TE Device ID of the sending Device. The destination address of the IP header has the Device ID of the neighbor to which this message is sent. A TTL of more than 1 is used.

The figure below shows the graceful restart extension to these messages that an object called `Restart_Cap`, which tells neighbors that a node, may be capable of restarting if a failure occurs. The time-to-live (TTL) in these messages is set to 255 so that adjacencies can be maintained through alternate paths even if the link between two neighbors goes down.

Figure 25: How Graceful Restart Works

The `Restart_Cap` object has two values—the restart time, which is the sender’s time to restart the `RSVP_TE` component and exchange hello messages after a failure; and the recovery time, which is the desired time that the sender wants the receiver to synchronize the RSVP and MPLS databases.

In the figure above, graceful restart is enabled on Device 1, Device 2, Device 3, and Device 4. For simplicity, assume that all Devices are restart capable. A TE label switched path (LSP) is signaled from Device 1 to Device 4.

Device 2 and Device 3 exchange periodic graceful restart hello messages every 10000 ms (10 seconds), and so do Device 2 and Device 1 and Device 3 and Device 4. Assume that Device 2 advertises its restart time as 60000 ms (60 seconds) and its recovery time as 60000 ms (60 seconds) as shown in the following example:

```
23:33:36: Outgoing Hello:
23:33:36:  version:1 flags:0000 cksum:883C ttl:255 reserved:0 length:32
23:33:36:  HELLO                type HELLO REQUEST length 12:
23:33:36:  Src_Instance: 0x6EDA8BD7, Dst_Instance: 0x00000000
23:33:36:  RESTART_CAP          type 1 length 12:
23:33:36:  Restart_Time: 0x0000EA60
, Recovery_Time: 0x0000EA60
```

Note The restart and recovery time are shown in **bold** in the last entry.

Device 3 records this into its database. Also, both neighbors maintain the neighbor status as UP. However, Device 3’s control plane fails at some point (for example, a Primary Route Processor failure). As a result, RSVP and TE lose their signaling information and states although data packets continue to be forwarded by the line cards.

When four ACK messages are missed from Device 2 (40 seconds), Device 3 declares communication with Device 2 lost “indicated by LOST” and starts the restart time to wait for the duration advertised in Device 2’s restart time previously and recorded (60 seconds). Device 1 and Device 2 suppress all RSVP messages to Device 3 except hellos. Device 3 keeps sending the RSVP Path and Resv refresh messages to Device 4 and Device 5 so that they do not expire the state for the LSP; however, Device 3 suppresses these messages for Device 2.

Note A node restarts if it misses four ACKs or its hello src_instance (last source instance sent to its neighbor) changes so that its restart time = 0.

Before the restart time expires, Device 2 restarts and loads its configuration and graceful restart makes the configuration of Device 2 send the hello messages with a new source instance to all the data links attached. However, because Device 2 has lost the neighbor states, it does not know what destination instance it should use in those messages; therefore, all destination instances are set to 0.

When Device 3 sees the hello from Device 2, Device 3 stops the restart time for Device 2 and sends an ACK message back. When Device 3 sees a new source instance value in Device 2's hello message, Device 3 knows that Device 2 had a control plane failure. Device 2 gets Device 3's source instance value and uses it as the destination instance going forward.

Device 3 also checks the recovery time value in the hello message from Device 2. If the recovery time is 0, Device 3 knows that Device 2 was not able to preserve its forwarding information and Device 3 deletes all RSVP state that it had with Device 2.

If the recovery time is greater than 0, Device 1 sends Device 2 Path messages for each LSP that it had previously sent through Device 2. If these messages were previously refreshed in summary messages, they are sent individually during the recovery time. Each of these Path messages includes a Recovery_Label object containing the label value received from Device 2 before the failure.

When Device 3 receives a Path message from Device 2, Device 3 sends a Resv message upstream. However, Device 3 suppresses the Resv message until it receives a Path message.

How to Configure MPLS TE—RSVP Graceful Restart

This section describes how to configure MPLS TE—RSVP Graceful Restart.

Enabling Graceful Restart

To enable graceful restart, perform this procedure.

Note It is optional that you configure graceful restart on an interface.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	ip rsvp signalling hello graceful-restart mode help-neighbor Example: Device(config)# ip rsvp signalling hello graceful-restart mode help-neighbor	Sets the number of DSCP hello messages on a neighboring device with restart capability.
Step 4	interface type number Example: Device(config)# interface POS 1/0/0	(Optional) Configures the interface type and number and enters interface configuration mode.
Step 5	ip rsvp signalling hello graceful-restart Example: Device(config-if)# ip rsvp signalling hello graceful-restart	(Optional) Enables RSVP TE graceful restart capability on a neighboring device.
Step 6	exit Example: Device(config)# exit	Exits to privileged EXEC mode.

Setting a DSCP Value

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip rsvp signalling hello graceful-restart dscp num Example: Device(config)# ip rsvp signalling hello graceful-restart dscp 30	Sets the number of DSCP hello messages on a graceful restart-enabled Device.

	Command or Action	Purpose
Step 4	end Example: Device(config)# end	Exits to privileged EXEC mode.

Setting a Hello Refresh Interval

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip rsvp signalling hello graceful-restart refresh interval <i>interval-value</i> Example: Device(config)# ip rsvp signalling hello graceful-restart refresh interval 5000	Sets a hello refresh interval on a device with graceful restart enabled.
Step 4	end Example: Device(config)# end	Exits to privileged EXEC mode.

Setting a Missed Refresh Limit

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	ip rsvp signalling hello graceful-restart refresh misses <i>msg-count</i> Example: Device(config)# ip rsvp signalling hello graceful-restart refresh misses 5	Sets a refresh limit on a device with graceful restart enabled.
Step 4	end Example: Device(config)# end	Exits to privileged EXEC mode.

Verifying Graceful Restart Configuration

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	show ip rsvp hello graceful-restart Example: Device# show ip rsvp hello graceful-restart	Displays information about the status of graceful restart and related parameters.
Step 3	end Example: Device# end	Exits to user EXEC mode.

Configuration Examples for MPLS TE—RSVP Graceful Restart

The following section provides configuration examples for MPLS TE—RSVP Graceful Restart.

Example: MPLS TE—RSVP Graceful Restart Example

In the following example, graceful restart is enabled, and related parameters, including a DSCP value, a refresh interval, and a missed refresh limit are set:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip rsvp signalling hello graceful-restart mode help-neighbor
Device(config)# ip rsvp signalling hello graceful-restart dscp 30
Device(config)# ip rsvp signalling hello graceful-restart refresh interval 10000
Device(config)# ip rsvp signalling hello graceful-restart refresh misses 4
Device(config)# end
```

The following example verifies the status of graceful restart and the configured parameters:

```
Device# show ip rsvp hello graceful-restart
Graceful Restart:Enabled (help-neighbor only)
Refresh interval:10000 msec
Refresh misses:4
DSCP:0x30
Advertised restart time:0 secs
Advertised recovery time:0 secs
Maximum wait for recovery:3600000 secs
```

Feature History for MPLS Traffic Engineering—RSVP Graceful Restart

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.7.1	MPLS Traffic Engineering—RSVP Graceful Restart	The MPLS Traffic Engineering—RSVP Graceful Restart feature allows a neighboring Route Processor (RP) to recover from disruption in control plane service (specifically, the Label Distribution Protocol (LDP) component) without losing its Multiprotocol Label Switching (MPLS) forwarding state.

CHAPTER 22

Configuring MPLS Traffic Engineering—Verbatim Path Support

- [Prerequisites for MPLS Traffic Engineering--Verbatim Path Support, on page 331](#)
- [Restrictions for MPLS Traffic Engineering--Verbatim Path Support, on page 331](#)
- [Information About MPLS Traffic Engineering--Verbatim Path Support, on page 332](#)
- [How to Configure MPLS Traffic Engineering—Verbatim Path Support, on page 332](#)
- [Configuration Examples for MPLS Traffic Engineering—Verbatim Path Support, on page 336](#)
- [Additional References, on page 336](#)
- [Feature History for MPLS Traffic Engineering Verbatim Path Support, on page 337](#)

Prerequisites for MPLS Traffic Engineering--Verbatim Path Support

- A Multiprotocol Label Switching (MPLS) TE tunnel must be configured globally.
- MPLS TE must be enabled on all links.

Restrictions for MPLS Traffic Engineering--Verbatim Path Support

- The **verbatim** keyword can be used only on a label-switched path (LSP) that is configured with the explicit path option.
- Reoptimization on the verbatim LSP is not supported.
- You cannot configure MPLS Traffic Engineering over the logical GRE tunnel interface.

Information About MPLS Traffic Engineering--Verbatim Path Support

MPLS TE LSPs usually require that all the nodes in the network are TE aware, meaning they have IGP extensions to TE in place. However, some network administrators want the ability to build TE LSPs to traverse nodes that do not support IGP extensions to TE, but that do support RSVP extensions to TE.

Verbatim LSPs are helpful when all or some of the intermediate nodes in a network do not support IGP extensions for TE.

When this feature is enabled, the IP explicit path is not checked against the TE topology database. Because the TE topology database is not verified, a Path message with IP explicit path information is routed using the shortest path first (SPF) algorithm for IP routing.

MPLS Traffic Engineering—Verbatim Path Support

The MPLS Traffic Engineering—Verbatim Path Support feature allows network nodes to support Resource Reservation Protocol (RSVP) extensions without supporting Interior Gateway Protocol (IGP) extensions for traffic engineering (TE), thereby bypassing the topology database verification process.

How to Configure MPLS Traffic Engineering—Verbatim Path Support

This section describes how to configure MPLS Traffic Engineering—Verbatim Path Support.

Configuring MPLS Traffic Engineering--Verbatim Path Support

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface tunnel <i>number</i> Example: Device(config)# interface tunnel 1	Configures a tunnel interface and enters interface configuration mode. <ul style="list-style-type: none"> The <i>number</i> argument identifies the tunnel number to be configured.

	Command or Action	Purpose
Step 4	<p>ip unnumbered loopback <i>number</i></p> <p>Example:</p> <pre>Device(config-if)# ip unnumbered loopback 1</pre>	<p>Configures an unnumbered IP interface, which enables IP processing without an explicit address. A loopback interface is usually configured with the Device ID.</p> <p>Note An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link.</p>
Step 5	<p>tunnel destination <i>{host-name ip-address}</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel destination 10.100.100.100</pre>	<p>Specifies the destination for a tunnel.</p> <ul style="list-style-type: none"> • The <i>host-name</i> argument is the name of the host destination. • The <i>ip-address</i> argument is the IP Version 4 address of the host destination expressed in decimal in four-part, dotted notation.
Step 6	<p>tunnel mode mpls traffic-eng</p> <p>Example:</p> <pre>Device(config-if)# tunnel mode mpls traffic-eng</pre>	<p>Sets the tunnel encapsulation mode to MPLS traffic engineering.</p>
Step 7	<p>tunnel mpls traffic-eng bandwidth <i>{sub-pool kbps kbps}</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng bandwidth 1000</pre>	<p>Configures the bandwidth required for an MPLS TE tunnel and assigns it either to the sub-pool or the global pool.</p> <ul style="list-style-type: none"> • The sub-pool keyword indicates a subpool tunnel. • The <i>kbps</i> argument is the bandwidth, in kilobits per second, set aside for the MPLS TE tunnel. The range is from 1 to 4294967295.
Step 8	<p>tunnel mpls traffic-eng autoroute announce</p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng autoroute announce</pre>	<p>Specifies that IGP should use the tunnel (if the tunnel is up) in its enhanced SPF calculation.</p>
Step 9	<p>tunnel mpls traffic-eng priority <i>setup-priority [hold-priority]</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng priority 1 1</pre>	<p>Configures setup and reservation priority for a tunnel.</p> <ul style="list-style-type: none"> • The <i>setup-priority</i> argument is the priority used when signaling an LSP for this tunnel to determine which existing tunnels can be preempted.

	Command or Action	Purpose
		<p>Valid values are from 0 to 7. A lower number indicates a higher priority. An LSP with a setup priority of 0 can preempt any LSP with a non-0 priority.</p> <ul style="list-style-type: none"> The <i>hold-priority</i> argument is the priority associated with an LSP for this tunnel to determine if it should be preempted by other LSPs that are being signaled. <p>Valid values are from 0 to 7, where a lower number indicates a higher priority.</p>
<p>Step 10</p>	<p>tunnel mpls traffic-eng path-option <i>preference-number</i> {dynamic [attributes <i>string</i> bandwidth {sub-pool <i>kbps</i> <i>kbps</i>} lockdown verbatim] explicit{name <i>path-name</i> identifier <i>path-number</i> }}</p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng path-option 1 explicit name test verbatim</pre> <p>Example:</p>	<p>Specifies LSP-related parameters, including the verbatim keyword used with an explicit path option, for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> The <i>preference-number</i> argument identifies the path option. The protect keyword and <i>preference-number</i> argument identify the path option with protection. The dynamic keyword indicates that the path option is dynamically calculated. (The Device figures out the best path.) The explicit keyword indicates that the path option is specified. The IP addresses are specified for the path. The name <i>path-name</i> keyword argument combination identifies the name of the explicit path option. The <i>path-number</i> argument identifies the number of the explicit path option. The verbatim keyword bypasses the topology database verification. <p>Note You can use the verbatim keyword only with the explicit path option.</p> <ul style="list-style-type: none"> The attributes <i>string</i> keyword argument combination names an attribute list to specify path options for the LSP. The bandwidth keyword specifies the LSP bandwidth.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The sub-pool keyword indicates a subpool path option. The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295. The lockdown keyword disables reoptimization of the LSP.
Step 11	exit Example: Device(config-if)# exit	Exits interface configuration mode and returns to global configuration mode.
Step 12	exit Example: Device(config)# exit	Exits global configuration mode and returns to privileged EXEC mode.

Verifying Verbatim LSPs for MPLS TE Tunnels

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	show mpls traffic-eng tunnels <i>tunnel-interface</i> [brief] Example: Device# show mpls traffic-eng tunnels tunnell	Displays information about tunnels including those configured with an explicit path option using verbatim.
Step 3	disable Example: Device# disable	(Optional) Exits to user EXEC mode.

Configuration Examples for MPLS Traffic Engineering—Verbatim Path Support

The following section provides configuration examples for MPLS Traffic Engineering—Verbatim Path Support.

Example: Configuring MPLS Traffic Engineering: Verbatim Path Support

The following example shows a tunnel that has been configured with an explicit path option using verbatim:

```
interface tunnel 1
 ip unnumbered loopback 1
 tunnel destination 10.10.100.100
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng path-option 1 explicit name path1 verbatim
```

CHAPTER 23

Configuring Virtual Private LAN Service (VPLS) and VPLS BGP-Based Autodiscovery

- [Restrictions for VPLS, on page 339](#)
- [Information About VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport, on page 340](#)
- [How to Configure VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport, on page 343](#)
- [Configuration Examples for VPLS and VPLS BGP-Based Autodiscovery, on page 363](#)
- [Feature History for VPLS and VPLS BGP-Based Autodiscovery, on page 368](#)

Restrictions for VPLS

- Layer 2 protocol tunneling configuration is not supported
- Virtual Circuit Connectivity Verification (VCCV) ping with explicit null is not supported.
- The switch is supported if configured only as a spoke in hierarchical Virtual Private LAN Services (VPLS) and not as a hub.
- Layer 2 VPN interworking functions are not supported.
- **ip unnumbered** command is not supported in Multiprotocol Label Switching (MPLS) configuration.
- Virtual Circuit (VC) statistics are not displayed for flood traffic in the output of **show mpls l2 vc vcid detail** command.
- Dot1q tunnel configuration is not supported in the attachment circuit.
- On a Cisco StackWise Virtual Multichassis EtherChannel configured on a VPLS network that supports IGMP snooping, if the number of IGMP join requests exceed 12000, and also if a changeover happens, then a traffic drop occurs for around 40 seconds after the standby switch joins back on the Cisco StackWise Virtual.
- VPLS BGP signaling is not supported on Cisco Catalyst 9500 Series Switches.

Information About VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport

The following sections provide information about VPLS, VPLS BGP-based autodiscovery and flow-aware transport.

VPLS Overview

VPLS enables enterprises to link together their Ethernet-based LANs from multiple sites through the infrastructure provided by their service provider. From the enterprise perspective, the service provider's public network looks like one large Ethernet LAN. For the service provider, VPLS provides an opportunity to deploy another revenue-generating service on top of their existing network without major capital expenditures. Operators can extend the operational life of equipment in their network.

VPLS uses the provider core to join multiple attachment circuits together to simulate a virtual bridge between multiple attachment circuits. From a customer point of view, there is no topology for VPLS. All of the customer edge (CE) devices appear to connect to a logical bridge emulated by the provider core.

Figure 26: VPLS Topology

About Full-Mesh Configuration

The full-mesh configuration requires a full mesh of tunnel label switched paths (LSPs) between all the provider edge (PE) devices that participate in the VPLS. With full-mesh configuration, signaling overhead and packet replication requirements for each provisioned VC on a PE device are high.

For a full-mesh configuration, a virtual forwarding instance (VFI) is required on each participating PE device. The VFI includes the VPN ID of a VPLS domain, the addresses of other PE devices in the domain, and the type of tunnel signaling and encapsulation mechanism for each peer PE device.

A VPLS instance constitutes a set of VFIs formed by the interconnection of the emulated VCs. The VPLS instance forms the logic bridge over the packet switched network. The VPLS instance is assigned a unique VPN ID.

The PE devices use the VFI to establish a full-mesh LSP of emulated VCs to all the other PE devices in the VPLS instance. PE devices obtain the membership of a VPLS instance through the static configuration using the Cisco IOS CLI.

The full-mesh configuration allows the PE device to maintain a single broadcast domain. So when the PE device receives a broadcast, multicast, or unknown unicast packet on an attachment circuit, it sends the packet out on all other attachment circuits and emulated circuits, to all the other CE devices participating in that VPLS instance. The CE devices see the VPLS instance as an emulated LAN.

To avoid the problem of a packet looping in the provider core, the PE devices enforce a 'split-horizon' principle for the emulated VCs. The split-horizon principle ensures that a packet received on an emulated VC is not forwarded on any other emulated VC.

After the VFI has been defined, it needs to be bound to an attachment circuit to the CE device.

The packet forwarding decision is made by looking up the Layer 2 VFI of a particular VPLS domain.

A VPLS instance on a particular PE device receives Ethernet frames that enter on specific physical or logical ports and populates a MAC address table similarly to how an Ethernet switch works. The PE device uses the MAC address to switch those frames into the appropriate LSP, for delivery to the other PE device at a remote site.

If a MAC address is not populated in the MAC address table, the PE device replicates the Ethernet frame and floods it to all logical ports associated with that VPLS instance, except on the ingress port where the Ethernet frame had entered. The PE device updates the MAC address table as it receives packets on specific ports and removes addresses not used after specific periods.

About VPLS BGP-Based Autodiscovery

VPLS autodiscovery enables each PE device to discover other PE devices that are part of the same VPLS domain. VPLS autodiscovery also tracks PE devices when they are added to or removed from a VPLS domain. With VPLS autodiscovery enabled, it is no longer needed to manually configure a VPLS domain and maintain the configuration when a PE device is added or deleted. VPLS autodiscovery uses the Border Gateway Protocol (BGP) to discover VPLS members and set up and tear down pseudowires (PWs) in a VPLS domain.

BGP uses the Layer 2 VPN Routing Information Base (RIB) to store endpoint provisioning information, which is updated each time any Layer 2 VFI is configured. The prefix and path information is stored in the Layer 2 VPN database, which allows BGP to make decisions about the best path. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, this endpoint information is used to configure a pseudowire mesh to support Layer 2 VPN-based services.

The BGP autodiscovery mechanism facilitates the configuration of Layer 2 VPN services, which are an integral part of the VPLS feature. VPLS enables flexibility in deploying services by connecting geographically dispersed sites as a large LAN over high-speed Ethernet in a robust and scalable IP MPLS network.

About Flow-Aware Transport Pseudowire

Devices typically load-balance traffic based on the lower most label in the label stack which is the same label for all flows on a given pseudowire. This can lead to asymmetric loadbalancing. The flow, in this context, refers to a sequence of packets that have the same source and destination pair. The packets are transported from a source provider edge (PE) device to a destination PE device.

Flow-aware transport PWs provide the capability to identify individual flows within a PW and provide devices the ability to use these flows to load-balance traffic. Flow-aware transport PWs are used to load-balance traffic in the core when equal cost multipaths (ECMP) are used. A flow label is created based on individual packet flows entering a PW; and is inserted as the lower most label in the packet. Devices can use the flow label for load-balancing which provides a better traffic distribution across ECMP paths or link-bundled paths in the core.

Figure 27: Flow-aware transport PW with two flows distributing over ECMPs and Bundle-Links shows a flow-aware transport PW with two flows distributing over ECMPs and bundle links.

Figure 27: Flow-aware transport PW with two flows distributing over ECMPs and Bundle-Links

An extra label is added to the stack, called the flow label, which contains the flow information of a virtual circuit (VC). A flow label is a unique identifier that distinguishes a flow within the PW, and is derived from source and destination MAC addresses, and source and destination IP addresses. The flow label contains the end of label stack (EOS) bit set and inserted after the VC label and before the control word (if any). The ingress PE calculates and forwards the flow label. The flow-aware transport PW configuration enables the flow label. The egress PE discards the flow label such that no decisions are made.

All core devices perform load balancing based on the flow-label in the flow-aware transport PW. Therefore, it is possible to distribute flows over ECMPs and link bundles.

Flow-aware transport PW works based on port-channel load-balance algorithm only.

Interoperability Between Cisco Catalyst 6000 Series Switches and Cisco Catalyst 9000 Series Switches

The following section describes how to enable sending and receiving flow labels between Cisco Catalyst 6000 Series Switches and Cisco Catalyst 9000 Series Switches.

On a Cisco Catalyst 6000 Series Switch configured with flow-aware transport PW (using Advanced VPLS) flow label negotiations are not supported. If the Cisco Catalyst 6000 Series Switch is in interoperability with a remote PE device such as a Cisco Catalyst 9000 Series Switch, then the Cisco Catalyst 9000 Series Switch cannot receive and send the flow label for data traffic. Configuring the **load-balance flow-label both static** command on the Cisco Catalyst 9000 Series Switch allows the Cisco Catalyst 9000 Series Switch to receive and send the flow labels even though the Cisco Catalyst 6000 Series Switch does not support flow label negotiations.

The following is a configuration example to enable sending and receiving flow labels:

```
Device> enable
Device# configure terminal
```

```

Device(config)# template type pseudowire mpls
Device(config-template)# encapsulation mpls
Device(config-template)# load-balance flow ip dst-ip
Device(config-template)# load-balance flow-label both static
Device(config-template)# end

```

IGMP or MLD Snooping over VPLS

Support for:

- IGMP Snooping over VPLS was introduced from Cisco IOS XE Amsterdam 17.1.1 release.
- MLD Snooping over VPLS was introduced from Cisco IOS XE Bengaluru 17.6.1 release.

By default:

- IGMP snooping is enabled at the global level.
- MLD snooping is not enabled and needs to be configured at the global level.

When you enable IGMP or MLD snooping over VPLS, traffic is forwarded on pseudowires that receive IGMP or MLD reports from remote Provider Edge (PE) devices. IGMP or MLD queries and reports are flooded to all the pseudowires.

For more information on:

- IGMP snooping, see *Configuring IGMP* in the *IP Multicast Routing Configuration Guide*.
- MLD snooping, see *Configuring MLD Snooping* in the *IP Multicast Routing Configuration Guide*.

How to Configure VPLS, VPLS BGP-Based Autodiscovery and Flow-Aware Transport

The following sections provide configuration information about VPLS, VPLS BGP-based autodiscovery and flow-aware transport.

Configuring Layer 2 PE Device Interfaces to CE Devices

You must configure Layer 2 PE device interfaces to CE devices. The following sections provide various configuration tasks that need to be completed before configuring VPLS.

Configuring 802.1Q Trunks on a PE Device for Tagged Traffic from a CE Device

To configure 802.1Q trunks on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/24	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address <i>ip_address mask</i> [secondary] Example: Device(config-if)# no ip address	Disables IP processing and enters interface configuration mode.
Step 5	switchport Example: Device(config-if)# switchport	Modifies the switching characteristics of the Layer 2 switched interface.
Step 6	switchport trunk encapsulation dot1q Example: Device(config-if)# switchport trunk encapsulation dot1q	Sets the switch port encapsulation format to 802.1Q.
Step 7	switchport trunk allow vlan <i>vlan_ID</i> Example: Device(config-if)# switchport trunk allow vlan 2129	Sets the list of allowed VLANs.
Step 8	switchport mode trunk Example: Device(config-if)# switchport mode trunk	Sets the interface to a trunking VLAN Layer 2 interface.
Step 9	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring 802.1Q Access Ports on a PE Device for Untagged Traffic from a CE Device

To configure 802.1Q access ports on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id</i> Example: Device(config)# interface TenGigabitEthernet1/0/24	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address <i>ip_address mask</i> [secondary] Example: Device(config-if)# no ip address	Disables IP processing.
Step 5	switchport Example: Device(config-if)# switchport	Modifies the switching characteristics of the Layer 2 switched interface.
Step 6	switchport mode access Example: Device(config-if)# switchport mode access	Sets the interface type to nontrunking and nontagged single VLAN Layer 2 interface.
Step 7	switchport access vlan <i>vlan_ID</i> Example: Device(config-if)# switchport access vlan 2129	Sets the VLAN when the interface is in access mode.
Step 8	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring Layer 2 VLAN Instances on a PE Device

Configuring the Layer 2 VLAN interface on the PE device, enables the Layer 2 VLAN instance on the PE device to the VLAN database, to set up the mapping between the VPLS and VLANs.

To configure Layer 2 VLAN instance on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan <i>vlan-id</i> Example: Device(config)# vlan 2129	Configures a specific VLAN.
Step 4	interface vlan <i>vlan-id</i> Example: Device(config-vlan)# interface vlan 2129	Configures an interface on the VLAN.
Step 5	end Example: Device(config-vlan)# end	Returns to privileged EXEC mode.

Configuring VPLS

VPLS can be configured using either the Xconnect mode or protocol-CLI method. The following sections provide information about how to configure VPLS.

Configuring VPLS in Xconnect Mode

The following sections provide information on configuring VPLS in Xconnect mode.

Configuring MPLS on a PE Device

To configure MPLS on a PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mpls ip Example: Device(config)# mpls ip	Configures MPLS hop-by-hop forwarding.
Step 4	mpls label protocol ldp Example: Device(config)# mpls label protocol ldp	Specifies the default Label Distribution Protocol (LDP) for a platform.
Step 5	mpls ldp logging neighbor-changes Example: Device(config)# mpls ldp logging neighbor-changes	(Optional) Determines logging neighbor changes.
Step 6	end Example: Device(config)# end	Returns to privileged EXEC mode.

Configuring VFI on a PE Device

The VFI specifies the VPN ID of a VPLS domain, the addresses of other PE devices in this domain, and the type of tunnel signaling and encapsulation mechanism for each peer device.

To configure VFI and associated VCs on the PE device, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.

Associating the Attachment Circuit with the VFI on the PE Device

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	l2 vfi vfi-name manual Example: Device(config)# <code>l2 vfi 2129 manual</code>	Enables the Layer 2 VFI manual configuration mode.
Step 4	vpn id vpn-id Example: Device(config-vfi)# <code>vpn id 2129</code>	Configures a VPN ID for a VPLS domain. The emulated VCs bound to this Layer 2 virtual routing and forwarding (VRF) use this VPN ID for signaling. Note <code>vpn-id</code> is the same as <code>vlan-id</code> .
Step 5	neighbor router-id {encapsulation mpls} Example: Device(config-vfi)# <code>neighbor remote-router-id encapsulation mpls</code>	Specifies the remote peering router ID and the tunnel encapsulation type or the pseudowire (PW) property to be used to set up the emulated VC.
Step 6	end Example: Device(config-vfi)# <code>end</code>	Returns to privileged EXEC mode.

Associating the Attachment Circuit with the VFI on the PE Device

After defining the VFI, you must associate it to one or more attachment circuits.

To associate the attachment circuit with the VFI, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface vlan 2129	Creates or accesses a dynamic switched virtual interface (SVI). Note <i>vlan-id</i> is the same as <i>vpn-id</i> .
Step 4	no ip address Example: Device(config-if)# no ip address	Disables IP processing. (You can configure a Layer 3 interface for the VLAN if you need to configure an IP address.)
Step 5	xconnect vfi <i>vfi-name</i> Example: Device(config-if)# xconnect vfi 2129	Specifies the Layer 2 VFI that you are binding to the VLAN port.
Step 6	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring VPLS in Protocol-CLI Mode

The following sections provide information on configuring VPLS in protocol-CLI mode.

Configuring VPLS in Protocol-CLI Mode

To configure VPLS in protocol-CLI mode, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2vpn vfi context <i>vfi-name</i> Example: Device(config)# l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.

	Command or Action	Purpose
Step 4	vpn id <i>vpn-id</i> Example: Device(config-vfi)# vpn id 10	Configures a VPN ID for the VPLS domain.
Step 5	member ip-address encapsulation mpls Example: Device(config-vfi)# member 2.2.2.2 encapsulation mpls	Specifies the devices that form a point-to-point Layer 2 VPN VFI connection.
Step 6	exit Example: Device(config-vfi)# exit	Exits to privileged EXEC mode.
Step 7	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device(config)# vlan configuration 100 OR Device(config)# interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 8	member vfi <i>vfi-name</i> Example: Device(config-vlan-config)# member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 9	end Example: Device(config-vlan-config)# end	Returns to privileged EXEC mode.

Configuring VPLS Flow-Aware Transport with Pseudowire Interface (in Protocol-CLI Mode)

To configure VPLS flow-aware transport with pseudowire interface, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 3	interface pseudowire <i>number</i> Example: Device (config)# <code>interface pseudowire 1001</code>	Establishes a PW with the specified name, and enters pseudowire interface configuration mode.
Step 4	encapsulation mpls Example: Device (config-if)# <code>encapsulation mpls</code>	Specifies the tunneling encapsulation as MPLS.
Step 5	neighbor <i>peer-address vcid-value</i> Example: Device (config-if)# <code>neighbor 10.1.1.200 200</code>	Specifies the peer IP address and VC ID value of a Layer 2 VPN PW.
Step 6	load-balance flow Example: Device (config-if)# <code>load-balance flow</code>	Enables the load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 7	load-balance flow-label Example: Device (config-if)# <code>load-balance flow-label both</code>	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 8	exit Example: Device (config-if)# <code>exit</code>	Exits to privileged EXEC mode.
Step 9	l2vpn vfi context <i>vfi-name</i> Example: Device (config)# <code>l2vpn vfi context vpls1</code>	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 10	vpn id <i>vpn-id</i> Example: Device (config-vfi)# <code>vpn id 10</code>	Configures a VPN ID for the VPLS domain.

	Command or Action	Purpose
Step 11	member pseudowire <i>number</i> Example: Device(config-vfi) # member pseudowire 1001	Adds the pseudowire interface as a member of the VFI.
Step 12	exit Example: Device(config-vfi) # exit	Exits to privileged EXEC mode.
Step 13	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device(config) # vlan configuration 100 OR Device(config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 14	member vfi <i>vfi-name</i> Example: Device(config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 15	end Example: Device(config-vlan-config) # end	Returns to privileged EXEC mode.

Configuring VPLS Flow-Aware Transport Using a Template (in Protocol-CLI Mode)

Configuring VPLS flow-aware transport using a template allows multiple PWs to share the same configuration. To configure VPLS flow-aware transport using a template, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example:	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
Step 3	template type pseudowire [<i>template-name</i>] Example: Device(config)# template type pseudowire mpls	Specifies the name of a Layer 2 PW and enters pseudowire template configuration mode.
Step 4	encapsulation mpls Example: Device(config-template)# encapsulation mpls	Specifies the tunneling encapsulation as MPLS.
Step 5	load-balance flow Example: Device(config-template)# load-balance flow	Enables the load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 6	load-balance flow-label Example: Device(config-template)# load-balance flow-label both	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 7	exit Example: Device(config-template)# exit	Exits to privileged EXEC mode.
Step 8	l2vpn vfi context <i>vfi-name</i> Example: Device(config)# l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 9	vpn id <i>vpn-id</i> Example: Device(config-vfi)# vpn id 10	Configures a VPN ID for the VPLS domain.
Step 10	member <i>ip-address</i> template <i>template-name</i> Example: Device(config-vfi)# member 102.102.102.102 template mpls	Specifies the devices that form a point-to-point Layer 2 VPN VFI connection. • ip-address : IP address of the VFI neighbor.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • template <i>template-name</i>: Specifies the template name <i>mpls</i> as the template method.
Step 11	exit Example: Device (config-vfi) # exit	Exits to privileged EXEC mode.
Step 12	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 13	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vp1s1	Binds a VFI instance to a VLAN or an interface.
Step 14	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuring VPLS Flow-Aware Transport Using Pseudowire and a Template (in Protocol-CLI Mode)

To configure VPLS flow-aware transport using both PW and a template, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	template type pseudowire [<i>template-name</i>] Example: Device (config) # template type pseudowire mpls	Specifies the name of a Layer 2 PW and enters pseudowire template configuration mode.
Step 4	encapsulation mpls Example: Device (config-template) # encapsulation mpls	Specifies the tunneling encapsulation as MPLS.
Step 5	load-balance flow Example: Device (config-template) # load-balance flow	Enables the load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 6	load-balance flow-label Example: Device (config-template) # load-balance flow-label both	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 7	exit Example: Device (config-template) # exit	Exits to privileged EXEC mode.
Step 8	interface pseudowire <i>number</i> Example: Device (config) # interface pseudowire 1001	Establishes a PW with the specified name, and enters pseudowire interface configuration mode.
Step 9	source template type pseudowire [<i>template-name</i>] Example: Device (config-if) # source template type pseudowire mpls	Configures the source template of type pseudowire named mpls.
Step 10	neighbor <i>peer-address</i> <i>vcid-value</i> Example: Device (config-if) # neighbor 10.1.1.200 200	Specifies the peer IP address and VC ID value of a Layer 2 VPN PW.

	Command or Action	Purpose
Step 11	exit Example: Device (config-if) # exit	Exits to privileged EXEC mode.
Step 12	l2vpn vfi context <i>vfi-name</i> Example: Device (config) # l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 13	vpn id <i>vpn-id</i> Example: Device (config-vfi) # vpn id 10	Configures a VPN ID for the VPLS domain.
Step 14	member pseudowire <i>number</i> Example: Device (config-vfi) # member pseudowire 1001	Adds the pseudowire interface as a member of the VFI.
Step 15	exit Example: Device (config-vfi) # exit	Exits to privileged EXEC mode.
Step 16	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 17	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 18	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuring VPLS BGP-based Autodiscovery

The following sections provide information about how to configure VPLS BGP-based Autodiscovery.

Enabling VPLS BGP-based Autodiscovery

To enabling VPLS BGP-based autodiscovery, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2 vfi vfi-name autodiscovery Example: Device(config)# l2 vfi 2128 autodiscovery	Enables VPLS autodiscovery on a PE device and enters L2 VFI configuration mode.
Step 4	vpn id vpn-id Example: Device(config-vfi)# vpn id 2128	Configures a VPN ID for the VPLS domain.
Step 5	end Example: Device(config-vfi)# end	Returns to privileged EXEC mode.

Configuring BGP to Enable VPLS Autodiscovery

To configure BGP to enable VPLS autodiscovery, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device (config)# router bgp 1000	Enters router configuration mode for the specified routing process.
Step 4	no bgp default ipv4-unicast Example: Device (config-router)# no bgp default ipv4-unicast	Disables the IPv4 unicast address family for the BGP routing process. Note Routing information for the IPv4 unicast address family is advertised by default for each BGP routing session configured using the neighbor remote-as router command unless you configure the no bgp default ipv4-unicast command before configuring the neighbor remote-as command. Existing neighbor configurations are not affected.
Step 5	bgp log-neighbor-changes Example: Device (config-router)# bgp log-neighbor-changes	Enables logging of BGP neighbor resets.
Step 6	neighbor remote-as { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>autonomous-system-number</i> Example: Device (config-router)# neighbor 44.254.44.44 remote-as 1000	Adds the IP address or peer group name of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local device. <ul style="list-style-type: none"> • If the <i>autonomous-system-number</i> argument matches the autonomous system number specified in the router bgp

	Command or Action	Purpose
		<p>command, the neighbor is an internal neighbor.</p> <ul style="list-style-type: none"> If the <i>autonomous-system-number</i> argument does not match the autonomous system number specified in the router bgp command, the neighbor is an external neighbor.
Step 7	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } update-source <i>interface-type interface-number</i></p> <p>Example:</p> <pre>Device(config-router)# neighbor 44.254.44.44 update-source Loopback300</pre>	(Optional) Configures a device to select a specific source or interface to receive routing table updates.
Step 8	Repeat Steps 6 and 7 to configure other BGP neighbors.	Exits interface configuration mode.
Step 9	<p>address-family <i>l2vpn</i> [vpls]</p> <p>Example:</p> <pre>Device(config-router)# address-family l2vpn vpls</pre>	<p>Specifies the Layer 2 VPN address family and enters address family configuration mode.</p> <p>The optional vpls keyword specifies that the VPLS endpoint provisioning information is to be distributed to BGP peers.</p>
Step 10	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 44.254.44.44 activate</pre>	Enables the exchange of information with a BGP neighbor.
Step 11	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } send-community { both standard extended }</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 44.254.44.44 send-community both</pre>	Specifies that a communities attribute should be sent to a BGP neighbor.
Step 12	Repeat Steps 10 and 11 to activate other BGP neighbors under an L2VPN address family.	
Step 13	<p>exit-address-family</p> <p>Example:</p>	Exits address family configuration mode and returns to router configuration mode.

	Command or Action	Purpose
	Device (config-router-af) # exit-address-family	
Step 14	end Example: Device (config-router) # end	Exits router configuration mode and returns to privileged EXEC mode.

Configuring VPLS BGP-based Autodiscovery in Protocol-CLI Mode

The following sections provide information on configuring VPLS BGP-based autodiscovery in protocol-CLI mode.

Configuring VPLS BGP based Autodiscovery in Protocol-CLI mode

To configure VPLS BGP based autodiscovery in protocol-CLI mode, perform this procedure

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2vpn vfi context <i>vfi-name</i> Example: Device (config) # l2vpn vfi context vpls1	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 4	vpn id <i>vpn-id</i> Example: Device (config-vfi) # vpn id 10	Configures a VPN ID for the VPLS domain.
Step 5	autodiscovery bgp signaling ldp Example: Device (config-vfi) # autodiscovery bgp signaling ldp	Enables BGP signaling and LDP signaling.

	Command or Action	Purpose
Step 6	exit Example: Device (config-vfi-autodiscovery) # exit	Exits to privileged EXEC mode.
Step 7	exit Example: Device (config-vfi) # exit	Exits to privileged EXEC mode.
Step 8	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 9	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 10	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuring VPLS BGP based Autodiscovery Flow-Aware Transport using Template (in Protocol-CLI Mode)

To configure VPLS BGP based autodiscovery flow-aware transport using template, perform this procedure

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	template type pseudowire <i>[template-name]</i> Example: <pre>Device(config)# template type pseudowire mpls</pre>	Specifies the name of a Layer 2 PW and enters pseudowire template configuration mode.
Step 4	encapsulation mpls Example: <pre>Device(config-template)# encapsulation mpls</pre>	Specifies the tunneling encapsulation as MPLS.
Step 5	load-balance flow Example: <pre>Device(config-template)# load-balance flow</pre>	Enables the Any Transport over MPLS (AToM) load balancing with PW feature so that load balancing is done on a per-flow basis.
Step 6	load-balance flow-label Example: <pre>Device(config-template)# load-balance flow-label both</pre>	Enables the flow-aware transport of MPLS PW feature and specifies how flow labels are to be used.
Step 7	exit Example: <pre>Device(config-template)# exit</pre>	Exits to privileged EXEC mode.
Step 8	l2vpn vfi context <i>vfi-name</i> Example: <pre>Device(config)# l2vpn vfi context vpls1</pre>	Establishes an Layer 2 VPN VFI context and enters Layer 2 VFI configuration mode.
Step 9	vpn id <i>vpn-id</i> Example: <pre>Device(config-vfi)# vpn id 10</pre>	Configures a VPN ID for the VPLS domain.
Step 10	autodiscovery bgp signaling ldp template <i>name</i> Example: <pre>Device(config-vfi)# autodiscovery bgp signaling ldp template mpls</pre>	Enables BGP signaling and LDP signaling.
Step 11	exit Example:	Exits to privileged EXEC mode.

	Command or Action	Purpose
	Device (config-vfi) # exit	
Step 12	Select one of the following: <ul style="list-style-type: none"> • vlan configuration <i>vlan-id</i> • interface vlan <i>vlan-id</i> Example: Device (config) # vlan configuration 100 OR Device (config) # interface vlan 100	Applies configuration to be applied on the VLAN or interface and enters VLAN or interface configuration mode.
Step 13	member vfi <i>vfi-name</i> Example: Device (config-vlan-config) # member vfi vpls1	Binds a VFI instance to a VLAN or an interface.
Step 14	end Example: Device (config-vlan-config) # end	Exits to privileged EXEC mode.

Configuration Examples for VPLS and VPLS BGP-Based Autodiscovery

This section provides the configuration examples for VPLS and VPLS BGP-Based Autodiscovery.

Example: Configuring VPLS in Xconnect Mode

The following example shows how to configure VPLS on a PE1 and PE2 devices:

Figure 28: VPLS Topology

PE1 Configuration

```

Device> enable
Device# configure terminal
Device(config)# pseudowire-class vpls2129
Device(config-if)# encapsulation mpls
Device(config-if)# exit
Device(config)# 12 vfi 2129 manual
Device(config-vfi)# vpn id 2129
Device(config-vfi)# neighbor 44.254.44.44 pw-class vpls2129
Device(config-vfi)# neighbor 188.98.89.98 pw-class vpls2129
Device(config-vfi)# exit
Device(config)# interface TenGigabitEthernet1/0/24
Device(config-if)# switchport trunk allowed vlan 2129
Device(config-if)# switchport mode trunk
Device(config-if)# exit
Device(config)# interface vlan 2129
Device(config-vlan-config)# no ip address
Device(config-vlan-config)# xconnect vfi 2129

```

Examples: Verifying VPLS Configured in Xconnect Mode

The following example is a sample output of the **show mpls 12transport vc detail** command. This command provides information about the virtual circuits.

```

Device# show mpls 12transport vc detail
Local interface: VFI 2129 vfi up
Interworking type is Ethernet
Destination address: 44.254.44.44, VC ID: 2129, VC status: up
Output interface: Gi1/0/9, imposed label stack {18 17}
Preferred path: not configured
Default path: active
Next hop: 177.77.177.2
Create time: 19:09:33, last status change time: 09:24:14
Last label FSM state change time: 09:24:14
Signaling protocol: LDP, peer 44.254.44.44:0 up
Targeted Hello: 1.1.1.72 (LDP Id) -> 44.254.44.44, LDP is UP
Graceful restart: configured and enabled
Non stop routing: not configured and not enabled
Status TLV support (local/remote) : enabled/supported
LDP route watch : enabled
Label/status state machine : established, LruRru
Last local dataplane status rcvd: No fault
Last BFD dataplane status rcvd: Not sent
Last BFD peer monitor status rcvd: No fault
Last local AC circuit status rcvd: No fault
Last local AC circuit status sent: No fault
Last local PW i/f circ status rcvd: No fault
Last local LDP TLV status sent: No fault
Last remote LDP TLV status rcvd: No fault
Last remote LDP ADJ status rcvd: No fault
MPLS VC labels: local 512, remote 17
Group ID: local n/a, remote 0
MTU: local 1500, remote 1500
Remote interface description:
Sequencing: receive disabled, send disabled
Control Word: Off

```

```
SSO Descriptor: 44.254.44.44/2129, local label: 512
Dataplane:

Example: Configuring VPLS Flow-Aware Transport Using a Template (in Protocol-CLI Mode)

The following example shows how to configure VPLS on a PE1 and PE2 devices:

Figure 29: VPLS Topology

PE1 Configuration

```

Device> enable
Device# configure terminal
Device(config)# template type pseudowire mpls
Device(config-template)# encapsulation mpls
Device(config-template)# load-balance flow ip dst-ip
Device(config-template)# load-balance flow-label both
Device(config-template)# exit
Device(config)# interface Loopback0
Device(config-if)# ip address 1.1.1.30 255.255.255.255
Device(config-if)# ip ospf 1 area 0
Device(config-if)# exit
Device(config)# interface TwentyFiveGigE1/0/9
Device(config-if)# no switchport
Device(config-if)# ip address 80.0.0.30 255.255.255.0

```

Example: Configuring VPLS BGP-Auto Discovery

The following example shows how to configure VPLS on a PE device:

```
Device> enable
Device# configure terminal
Device(config)# router bgp 1000
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# bgp graceful-restart
Device(config-router)# neighbor 44.254.44.44 remote-as 1000
Device(config-router)# neighbor 44.254.44.44 update-source Loopback300
Device(config-router)# address-family l2vpn vpls
Device(config-router-af)# neighbor 44.254.44.44 activate
Device(config-router-af)# neighbor 44.254.44.44 send-community both
Device(config-router-af)# exit-address-family
Device(config-router-af)# end
Device(config)# l2 vfi 2128 autodiscovery
Device(config-vfi)# vpn id 2128
Device(config-vfi)# exit
Device(config)# interface vlan 2128
Device(config-vlan-config)# no ip address
Device(config-vlan-config)# xconnect vfi 2128
!
```

Example: Verifying VPLS BGP-Auto Discovery

The following example is a sample output of the **show platform software fed sw 1 matm macTable vlan 2000** command.

```
Device# show platform software fed sw 1 matm macTable vlan 2000

Feature History for VPLS and VPLS BGP-Based Autodiscovery

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	Configuring VPLS and VPLS BGP-based Autodiscovery	VPLS enables enterprises to link together their Ethernet-based LANs from multiple sites via the infrastructure provided by their service provider. VPLS Autodiscovery enables each PE device to discover other PE devices that are part of the same VPLS domain. Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Fuji 16.9.1	Configuring VPLS and VPLS BGP-based Autodiscovery	Support for this feature was introduced only on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.

Release	Feature	Feature Information
Cisco IOS XE Amsterdam 17.1.1	VPLS Layer 2 Snooping : IGMP (IPv4)	IGMP snooping is supported on a VPLS configured network.
Cisco IOS XE Bengaluru 17.6.1	MLD Snooping over VPLS	Support was introduced for MLD Snooping over VPLS. It allows traffic to be forwarded on pseudowires that receive IGMP/MLD reports from remote Provider Edge (PE) devices.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

<http://www.cisco.com/go/cfn>.

CHAPTER 24

Configuring Hierarchical VPLS with MPLS Access

Configuring Virtual Private LAN Service (VPLS) requires a full mesh of tunnel label switched paths (LSPs) between all the provider edge (PE) devices that participate in the VPLS. With full-mesh configuration, signaling overhead and packet replication requirements for each provisioned virtual circuit (VC) on a PE device are high. Configuring Hierarchical VPLS with Multiprotocol Label Switching (MPLS) Access reduces signaling overhead and packet replication between devices.

- [Prerequisites for Configuring Hierarchical VPLS with MPLS Access, on page 371](#)
- [Restrictions for Configuring Hierarchical VPLS with MPLS Access, on page 371](#)

Prerequisites for Configuring Hierarchical VPLS with MPLS Access

Configure the PE to customer edge (CE) interface with a list of allowed VLANs.

Restrictions for Configuring Hierarchical VPLS with MPLS Access

- This feature is not supported if VPLS Autodiscovery is configured on pseudowires (PWs) that are attached to user provider edge (U-PE) devices. (When you create the VPLS, you can manually create the virtual forwarding interface (VFI)).
- This feature is not supported if Q-in-Q access is configured between a U-PE device and a N-PE device.
- Internet Group Management Protocol (IGMP) snooping is not supported.
- Cisco Discovery Protocol (CDP) is not supported.

- Multiprotocol Label Switching (MPLS) over generic routing encapsulation (GRE) and VPLS over GRE are not supported.

Information About Configuring Hierarchical VPLS with MPLS Access

The following section provides information about configuring hierarchical VPLS with MPLS access.

About Hierarchical VPLS with MPLS Access

A standard VPLS configuration comprises CE devices and PE devices. Using the Hierarchical VPLS with MPLS Access feature, each PE device is replaced with a U-PE and an N-PE device. U-PE devices communicate with the CE devices and N-PE devices on the access side, and N-PE devices communicate with other N-PE devices on the provider core.

Figure 30: Hierarchical VPLS with MPLS Access Configuration shows a hierarchical VPLS with MPLS access configuration. Each CE device is connected to a U-PE device through an attachment circuit. A U-PE device is connected to an N-PE device through a single pseudowire (PW) for each VPLS instance.

The following configuration types are supported between a U-PE device and an N-PE device:

- Ethernet Q-in-Q

Note Ethernet Q-in-Q configurations are not supported in Cisco IOS XE Amsterdam 17.2.x.

- EoMPLS

N-PE devices are connected to each other through a mesh of PWs. Packets from a U-PE device to an N-PE device can be forwarded to other U-PE devices that are connected to the same N-PE device and to other N-PE devices, if any, because split horizon is disabled. Packets in the provider core are not forwarded back to the provider core because split horizon is enabled.

Figure 30: Hierarchical VPLS with MPLS Access Configuration

356481

Features that Support Hierarchical VPLS with MPLS Access Configuration

The following is a list of features that support the Hierarchical VPLS with MPLS Access Configuration:

- VPLS integrated routing and bridging (IRB)
- VPLS MAC address withdrawal
- PW redundancy
- VPLS flow-aware transport PW

How to Configure Hierarchical VPLS with MPLS Access

The following sections provide information on how to configure the Hierarchical VPLS with MPLS Access feature.

Configuring VPLS (Protocol-CLI Method) on an N-PE Device

To configure VPLS (Protocol-CLI method) on an N-PE device, perform this procedure,

Note Repeat this procedure on each N-PE device.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	l2vpn vfi context name Example: Device (config)# l2vpn vfi context vpn100	Establishes a Layer 2 VPN VFI between two or more separate networks, and enters L2VFI configuration mode.
Step 4	vpn id vpn id Example: Device (config-vfi)# vpn id 100	Sets a VPN ID on the VPLS instance. <ul style="list-style-type: none"> • Use the same VPN ID for the N-PE devices that belong to the same VPN. • Make sure that the VPN ID is unique for each VPN in the service provider network. The range is from 1 to 4294967295.
Step 5	member ip-address encapsulation mpls Example: Device (config-vfi)# member 4.4.4.4 encapsulation mpls	Specifies the device that forms a point-to-point L2VPN VFI connection. <ul style="list-style-type: none"> • ip-address: IP address of the VFI neighbor (the N-PE device). • encapsulation mpls: Specifies mpls as the data encapsulation method.
Step 6	exit Example: Device (config-vlan-config)# exit	Returns to global configuration mode.
Step 7	vlan configuration vlan-id Example: Device (config)# vlan configuration 100	Applies the configuration on the VLAN, and enters VLAN configuration mode.
Step 8	member vfi vfi-name Example: Device (config-vlan-config)# member vfi vpn100	Binds a VFI instance to a VLAN or an interface.

	Command or Action	Purpose
Step 9	member <i>ip-address</i> encapsulation mpls Example: Device(config-vlan-config)# member 19.19.19.19 encapsulation mpls	Specifies the device that forms a point-to-point L2VPN VFI connection. <ul style="list-style-type: none"> • <i>ip-address</i>: IP address of the VFI neighbor (the U-PE device). • encapsulation mpls: Specifies mpls as the data encapsulation method.
Step 10	end Example: Device(config-vlan-config)# end	Exits privileged EXEC mode.

Configuring EoMPLS VLAN (Xconnect Method) on an U-PE Device

To configure EoMPLS VLAN (Xconnect method) on an U-PE device, perform this procedure,

Note Perform this task on each U-PE device

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>interface-id.subinterface</i> Example: Device(config)# interface TenGigabitEthernet1/6/21.100	Defines the subinterface to be configured, and enters subinterface configuration mode.
Step 4	encapsulation dot1q <i>vlan-id</i> Example: Device(config-subif)# encapsulation dot1q 100	Enables IEEE 802.1Q encapsulation of traffic on the subinterface.

	Command or Action	Purpose
Step 5	xconnect <i>peer-ip-addr</i> <i>vc-id</i> encapsulation mpls Example: Device(config-if)# xconnect 3.3.3.3 150 encapsulation mpls	Binds the attachment circuit to a PW VC. The syntax for this command is the same as for all the other Layer 2 transports.
Step 6	exit Example: Device(config-if)# exit	Returns to global configuration mode.

Configuration Examples for Hierarchical VPLS with MPLS Access

The following example shows how to configure loopback interface for N-PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface loopback 0
Device(config-if)# ip address 3.3.3.3 255.255.255.255
Device(config-if)# ip ospf 1 area 0
Device(config-if)# end
```

The following example shows how to enable MPLS on N-PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface For 1/0/20
Device(config-if)# ip address 17.0.0.2 255.255.255.0
Device(config-if)# mpls ip
Device(config-if)# ip ospf 1 area 0
Device(config-if)# end
```

The following example shows how to enable VFI on N-PE1:

```
Device> enable
Device# configure terminal
Device(config)# l2vpn vfi context vpn100
Device(config-vfi)# vpn id 100
Device(config-vfi)# member 4.4.4.4 encapsulation mpls
```

The following example shows how to specify a point-to-point Layer 2 VPN (L2VPN) VFI connection on N-PE1:

```
Device> enable
Device# configure terminal
Device(config)# vlan configuration 100
Device(config-vlan-config)# member vfi vpn100
Device(config-vlan-config)# member 19.19.19.19 encapsulation mpls
```

The following example shows how to configure loopback interface for N-PE2:

```
Device> enable
Device# configure terminal
Device(config)# interface loopback 0
```

```
Device(config-if)# ip address 4.4.4.4 255.255.255.255
Device(config-if)# ip ospf 1 area 0
Device(config-if)# end
```

The following example shows how to enable MPLS on N-PE2:

```
Device> enable
Device# configure terminal
Device(config)# interface For 1/0/5
Device(config-if)# ip address 13.0.0.2 255.255.255.0
Device(config-if)# mpls ip
Device(config-if)# ip ospf 1 area 0
Device(config-if)# end
```

The following example shows how to enable VFI on the N-PE2:

```
Device> enable
Device# configure terminal
Device(config)# l2vpn vfi context vpn100
Device(config-vfi)# vpn id 100
Device(config-vfi)# member 3.3.3.3 encapsulation mpls
```

The following example shows how to specify a point-to-point L2VPN VFI connection on N-PE2:

```
Device> enable
Device# configure terminal
Device(config)# vlan configuration 100
Device(config-vlan-config)# member vfi vpn100
```

The following example shows how to configure loopback interface for U-PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface loopback 0
Device(config-if)# ip address 19.19.19.19 255.255.255.255
Device(config-if)# ip ospf 1 area 0
Device(config-if)# end
```

The following example shows how to enable MPLS on U-PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface Forty2/1
Device(config-if)# ip address 17.0.0.1 255.255.255.0
Device(config-if)# mpls ip
Device(config-if)# ip ospf 1 area 0
Device(config-if)# end
```

The following example shows how to enable EoMPLS on U-PE1:

```
Device> enable
Device# configure terminal
Device(config)# interface TenGig6/21.100
Device(config-if)# encapsulation dot1q 100
Device(config-if)# xconnect 3.3.3.3 100 encapsulation mpls
```

CHAPTER 25

Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast

The VPLS: Routed Pseudowire IRB for IPv4 Unicast feature allows a switch interface to route traffic instead of using a router.

- [Restrictions for Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast, on page 379](#)
- [Information About VPLS: Routed Pseudowire IRB for IPv4 Unicast, on page 379](#)
- [Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast, on page 382](#)
- [Example: Configuring Distributed IRB, on page 382](#)
- [Feature History for Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast, on page 383](#)

Restrictions for Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast

- This feature is not supported on a domain configured with multicast routing protocols.
- This feature is not supported for the IPv6 address family.
- VPLS over GRE is not supported with integrated routing and bridging (IRB).

Information About VPLS: Routed Pseudowire IRB for IPv4 Unicast

The following sections provide information about VPLS: Routed Pseudowire IRB for IPv4 Unicast.

About VPLS: Routed Pseudowire IRB for IPv4 Unicast

The VPLS: Routed Pseudowire IRB for IPv4 Unicast feature allows a Virtual Private LAN Services (VPLS) multipoint provider edge (PE) device interface to route the Layer 3 traffic along with switch the Layer 2 frames for pseudowire (PW) connections between PE devices. Note that the ability to route frames between interfaces does not affect the termination of a PW into the Layer 3 network (VPN or global) on the same device, or to tunnel Layer 3 frames over a Layer 2 tunnel (VPLS).

Centralized Integrated Routing and Bridging

In centralized Integrated Routing and Bridging (IRB), only one interface on a PE device is configured with IRB in the domain. All the host devices that are connected to PE devices are configured with this IRB interface IP address as the gateway.

The following figure shows a domain configured with centralized IRB. The figure shows that IRB is configured on the PE device (PE1) interface. All the hosts that are connected to the customer edge (CE) devices (CE1, CE2, and CE3), are configured with the IRB interface IP address (10.10.10.1) as the gateway. In this scenario, only those packets that are destined for the Layer 3 router (30.30.30.0/24) undergo Layer 3 packet rewrite because these interfaces or routers are reachable from the PE1 device. All the hosts communicate only in Layer 2 because they are part of the same bridge domain (10.10.10.x).

Figure 31: Centralized IRB

356479

Distributed Integrated Routing and Bridging

In distributed IRB, all the interfaces across all the PE devices are configured with IRB in the domain. The routing protocols enabled on the PE devices allow routes to be learnt between PE devices.

The following figure shows a domain that is configured with distributed IRB. Enhanced Interior Gateway Routing Protocol (EIGRP) is configured on the interfaces of the PE devices (PE1 and PE2), which allows routers (30.30.30.0/24 and 40.40.40.0/24) to exchange routes. Hosts connected to the CE devices are configured with the local IRB interface IP address as the gateway. For example, host 10.10.10.3 is configured with IRB interface IP address 10.10.10.1 as the gateway, and host 10.10.10.4 is configured with IRB interface IP address 10.10.10.2 as the gateway. In this scenario, if the incoming traffic is through a switch virtual interface (SVI),

the outgoing traffic can also be reached by SVI through the MPLS network because the relationship is formed across IRB interfaces under the same bridge domain (10.10.10.x).

Figure 32: Distributed IRB

In the above diagram, where traffic is incoming on PE1 destined for a router interface reachable through PE2, routing takes place on egress of the PE (that is, PE2) based on the gateway configuration. In such a scenario, the packet reaching PE2 always has the source MAC as host MAC, and not the gateway MAC (which ages out after aging time). If the gateway MAC ages out, flooding occurs in the reverse direction traffic. Therefore, we recommend that in case of asymmetric routing, you configure an ARP timeout on the IRB interface that is lower than the MAC aging time so that flooding does not occur across PEs in the VPLS domain.

In this scenario (where traffic is incoming from CE1), both ingress and egress interfaces point to the SVI in the forwarding pipeline of PE1. Although this is expected, it generates ICMP redirect messages. Therefore, we recommend that you configure **no ip redirects** command on the SVI in interface configuration mode so that ICMP redirect messages are not generated in case of distributed IRB.

Features Supported with VPLS: Routed Pseudowire IRB for IPv4 Unicast

The following are the features that are supported on an interface that is configured with the VPLS: Routed Pseudowire IRB for IPv4 Unicast feature:

- IPv4 unicast routing protocols
- Virtual routing and forwarding (VRF)
- DHCP relay
- Address Resolution Protocol (ARP) timeout

- Blocking of Internet Control Message Protocol (ICMP) redirect messages

Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast

To configure VPLS: Routed Pseudowire IRB for IPv4 Unicast, perform this procedure.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface vlan 100	Configures a VLAN interface and enters interface configuration mode
Step 4	xconnect vfi <i>vfi-name</i> Example: Device(config-if)# xconnect vfi VFI100	Specifies the Layer 2 VFI that you are binding to the VLAN port.
Step 5	ip address <i>ip-address mask</i> Example: Device(config-if)# ip address 10.10.10.1 255.255.255.0	Assigns the IP address to the interface.

Example: Configuring Distributed IRB

The following example shows how to configure distributed IRB:

```
Device> enable
Device# configure terminal
Device(config)# template type pseudowire VPLS
Device(config-template)# encapsulation mpls
Device(config-template)# l2vpn vfi context VPLS
Device(config-template)# vpn id 10
Device(config-template)# member pseudowire1
Device(config-if)# end

Device(config)# interface pseudowire1
Device(config-if)# source template type pseudowire VPLS
Device(config-if)# encapsulation mpls
```

```
Device(config-if)# signaling protocol ldp
Device(config-if)# neighbor 10.10.10.10 10
Device(config-if)# end

Device(config)# interface Vlan10
Device(config-if)# ip address 10.10.10.1 255.255.255.0
Device(config-if)# no ip redirects
Device(config-if)# member vfi VPLS
Device(config-if)# end
```

Feature History for Configuring VPLS: Routed Pseudowire IRB for IPv4 Unicast

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Amsterdam 17.2.1	VPLS: Routed Pseudowire IRB for IPv4 Unicast	The VPLS: Routed Pseudowire IRB for IPv4 Unicast feature allows a switch interface to route traffic instead of using a router.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

CHAPTER 26

Configuring VPLS MAC Address Withdrawal

- [VPLS MAC Address Withdrawal, on page 385](#)
- [Feature History for VPLS MAC Address Withdrawal, on page 386](#)

VPLS MAC Address Withdrawal

The VPLS MAC Address Withdrawal feature provides faster convergence by removing (or unlearning) MAC addresses that have been dynamically learned. A Label Distribution Protocol (LDP)-based MAC address withdrawal message is used for this purpose. A MAC list Type Length Value (TLV) is part of the MAC address withdrawal message.

The **debug mpls ldp messages** and **debug mpls ldp session io** commands support monitoring of MAC address withdrawal messages being exchanged between LDP peers. Any Transport over Multiprotocol Label Switching (AToM) might provide other means to display or monitor MAC address withdrawal messages. The Tag Distribution Protocol (TDP) is not supported because AToM uses only LDP for the MAC address withdrawal message.

PE devices learn the remote MAC addresses and directly attached MAC addresses on customer-facing ports by deriving the topology and forwarding information from packets originating at customer sites. To display the number of MAC address withdrawal messages, enter the **show mpls l2transport vc detail** command, as shown in the following example:

```
Device# show mpls l2transport vc detail

Local interface: VFI TEST VFI up
MPLS VC type is VFI, interworking type is Ethernet
Destination address: 10.1.1.1, VC ID: 1000, VC status: up
  Output interface: Se2/0, imposed label stack {17}
  Preferred path: not configured
  Default path: active
  Next hop: point2point
Create time: 00:04:34, last status change time: 00:04:15
Signaling protocol: LDP, peer 10.1.1.1:0 up
  Targeted Hello: 10.1.1.1(LDP Id) -> 10.1.1.1
  MPLS VC labels: local 16, remote 17
  Group ID: local 0, remote 0
  MTU: local 1500, remote 1500
  Remote interface description:
  MAC Withdraw: sent 5, received 3
  Sequencing: receive disabled, send disabled
VC statistics:
  packet totals: receive 0, send 0
```

```
byte totals:  receive 0, send 0
packet drops: receive 0, send 0
```

Feature History for VPLS MAC Address Withdrawal

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Fuji 16.9.1	VPLS MAC Address Withdrawal	The VPLS MAC Address Withdrawal feature provides faster convergence by removing (or unlearning) MAC addresses that have been dynamically learned.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>

<http://www.cisco.com/go/cfn>.

CHAPTER 27

Configuring MPLS VPN Route Target Rewrite

- [Prerequisites for MPLS VPN Route Target Rewrite, on page 387](#)
- [Restrictions for MPLS VPN Route Target Rewrite, on page 387](#)
- [Information About MPLS VPN Route Target Rewrite, on page 387](#)
- [How to Configure MPLS VPN Route Target Rewrite, on page 388](#)
- [Configuration Examples for MPLS VPN Route Target Rewrite, on page 395](#)
- [Feature History for MPLS VPN Route Target Rewrite, on page 395](#)

Prerequisites for MPLS VPN Route Target Rewrite

- You should know how to configure Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs).
- You need to identify the RT replacement policy and target device for the autonomous system (AS).

Restrictions for MPLS VPN Route Target Rewrite

Route Target Rewrite can only be implemented in a single AS topology.

`ip unnumbered` command is not supported in MPLS configuration.

Information About MPLS VPN Route Target Rewrite

This section provides information about MPLS VPN Route Target Rewrite:

Route Target Replacement Policy

Routing policies for a peer include all configurations that may impact inbound or outbound routing table updates. The MPLS VPN Route Target Rewrite feature can influence routing table updates by allowing the replacement of route targets on inbound and outbound Border Gateway Protocol (BGP) updates. Route targets are carried as extended community attributes in BGP Virtual Private Network IP Version 4 (VPNv4) updates. Route target extended community attributes are used to identify a set of sites and VPN routing and forwarding (VRF) instances that can receive routes with a configured route target.

You can configure the MPLS VPN Route Target Rewrite feature on provider edge (PE) devices.

The figure below shows an example of route target replacement on PE devices in an Multiprotocol Label Switching (MPLS) VPN single autonomous system topology. This example includes the following configurations:

- PE1 is configured to import and export RT 65000:1 for VRF Customer A and to rewrite all inbound VPNv4 prefixes with RT 65000:1 to RT 65000:2.
- PE2 is configured to import and export RT 65000:2 for VRF Customer B and to rewrite all inbound VPNv4 prefixes with RT 65000:2 to RT 65000:1.

Figure 33: Route Target Replacement on Provide Edge(PE) devices in a single MPLS VPN Autonomous System Topology

Route Maps and Route Target Replacement

The MPLS VPN Route Target Rewrite feature extends the Border Gateway Protocol (BGP) inbound/outbound route map functionality to enable route target replacement. The `set extcomm-list delete` command entered in route-map configuration mode allows the deletion of a route target extended community attribute based on an extended community list.

How to Configure MPLS VPN Route Target Rewrite

This section provides the configuration steps for MPLS VPN Route Target Rewrite:

Configuring a Route Target Replacement Policy

Perform this task to configure a route target (RT) replacement policy for your internetwork.

If you configure a provider edge (PE) device to rewrite RT x to RT y and the PE has a virtual routing and forwarding (VRF) instance that imports RT x , you need to configure the VRF to import RT y in addition to RT x .

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	ip extcommunity-list { <i>standard-list-number</i> <i>expanded-list-number</i> } { permit deny } [<i>regular-expression</i>] [rt soo] <i>extended-community-value</i> Example: <pre>Device(config)# ip extcommunity-list 1 permit rt 65000:2</pre>	Creates an extended community access list and controls access to it. <ul style="list-style-type: none"> • The <i>standard-list-number</i> argument is an integer from 1 to 99 that identifies one or more permit or deny groups of extended communities. • The <i>expanded-list-number</i> argument is an integer from 100 to 500 that identifies one or more permit or deny groups of extended communities. Regular expressions can be configured with expanded lists but not standard lists. • The permit keyword permits access for a matching condition. • The deny keyword denies access for a matching condition. • The <i>regular-expression</i> argument specifies an input string pattern to match against. When you use an expanded extended community list to match route targets, include the pattern RT: in the regular expression. • The rt keyword specifies the route target extended community attribute. The rt keyword can be configured only with standard extended community lists and not expanded community lists. • The soo keyword specifies the site of origin (SOO) extended community attribute. The soo keyword can be configured only with standard extended community lists and not expanded community lists.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The <i>extended-community-value</i> argument specifies the route target or site of origin. The value can be one of the following combinations: <ul style="list-style-type: none"> autonomous-system-number:network-number ip-address:network-number <p>The colon is used to separate the autonomous system number and network number or IP address and network number.</p>
Step 4	<p>route-map <i>map-name</i> [permit deny] [<i>sequence-number</i>]</p> <p>Example:</p> <pre>Device(config)# route-map rtrewrite permit 10</pre>	<p>Defines the conditions for redistributing routes from one routing protocol into another or enables policy routing and enables route-map configuration mode.</p> <ul style="list-style-type: none"> The <i>map-name</i> argument defines a meaningful name for the route map. The redistribute router configuration command uses this name to reference this route map. Multiple route maps can share the same map name. If the match criteria are met for this route map, and the permit keyword is specified, the route is redistributed as controlled by the set actions. In the case of policy routing, the packet is policy routed. <p>If the match criteria are not met, and the permit keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set.</p> <p>The permit keyword is the default.</p> <ul style="list-style-type: none"> If the match criteria are met for the route map and the deny keyword is specified, the route is not redistributed. In the case of policy routing, the packet is not policy routed, and no further route maps sharing the same map tag name will be examined. If the packet is not policy routed, the normal forwarding algorithm is used. The <i>sequence-number</i> argument is a number that indicates the position a new route map will have in the list of route maps already configured with the same

	Command or Action	Purpose
		name. If given with the no form of this command, the position of the route map should be deleted.
Step 5	<p>match extcommunity {<i>standard-list-number</i> <i>expanded-list-number</i>}</p> <p>Example:</p> <pre>Device(config-route-map)# match extcommunity 1</pre> <p>Example:</p> <pre>Device(config-route-map)# match extcommunity 101</pre>	<p>Matches the Border Gateway Protocol (BGP) extended community list attributes.</p> <ul style="list-style-type: none"> • The <i>standard-list-number</i> argument is a number from 1 to 99 that identifies one or more permit or deny groups of extended community attributes. • The <i>expanded-list-number</i> argument is a number from 100 to 500 that identifies one or more permit or deny groups of extended community attributes.
Step 6	<p>set extcomm-list <i>extended-community-list-number delete</i></p> <p>Example:</p> <pre>Device(config-route-map)# set extcomm-list 1 delete</pre>	<p>Removes a route target from an extended community attribute of an inbound or outbound BGP Virtual Private Network Version 4 (VPNv4) update.</p> <ul style="list-style-type: none"> • The <i>extended-community-list-number</i> argument specifies the extended community list number.
Step 7	<p>set extcommunity {rt <i>extended-community-value</i> [additive] soo <i>extended-community-value</i>}</p> <p>Example:</p> <pre>Device(config-route-map)# set extcommunity rt 65000:1 additive</pre>	<p>Sets BGP extended community attributes.</p> <ul style="list-style-type: none"> • The rt keyword specifies the route target extended community attribute. • The soo keyword specifies the site of origin extended community attribute. • The <i>extended-community-value</i> argument specifies the value to be set. The value can be one of the following combinations: <ul style="list-style-type: none"> • autonomous-system-number : network-number • ip-address : network-number <p>The colon is used to separate the autonomous system number and network number or IP address and network number.</p> <ul style="list-style-type: none"> • The additive keyword adds a route target to the existing route target list without replacing any existing route targets.

	Command or Action	Purpose
Step 8	end Example: <pre>Device(config-route-map)# end</pre>	(Optional) Returns to privileged EXEC mode.
Step 9	show route-map <i>map-name</i> Example: <pre>Device# show route-map extmap</pre>	(Optional) Verifies that the match and set entries are correct. <ul style="list-style-type: none"> The <i>map-name</i> argument is the name of a specific route map.

Applying the Route Target Replacement Policy

Perform the following tasks to apply the route target replacement policy to your network:

Associating Route Maps with Specific BGP Neighbors

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 100</pre>	Configures a Border Gateway Protocol (BGP) routing process and places the device in router configuration mode. <ul style="list-style-type: none"> The <i>as-number</i> argument indicates the number of an autonomous system that identifies the device to other BGP devices and tags the routing information passed along. <p>The range is 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</p>
Step 4	neighbor {<i>ip-address</i> <i>peer-group-name</i>} remote-as <i>as-number</i> Example:	Adds an entry to the BGP or multiprotocol BGP neighbor table.

	Command or Action	Purpose
	<pre>Device(config-router)# neighbor 172.10.0.2 remote-as 200</pre>	<ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	<p>address-family vpnv4 [unicast]</p> <p>Example:</p> <pre>Device(config-router)# address-family vpnv4</pre>	<p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard Virtual Private Network Version 4 (VPNv4) address prefixes.</p> <ul style="list-style-type: none"> • The optional unicast keyword specifies VPNv4 unicast address prefixes.
Step 6	<p>neighbor {ip-address peer-group-name} activate</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 172.16.0.2 activate</pre>	<p>Enables the exchange of information with a neighboring BGP device.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 7	<p>neighbor {ip-address peer-group-name} send-community [both extended standard]</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 172.16.0.2 send-community extended</pre>	<p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • The both keyword sends standard and extended community attributes. • The extended keyword sends an extended community attribute. • The standard keyword sends a standard community attribute.
Step 8	<p>neighbor {ip-address peer-group-name} route-map map-name {in out}</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 172.16.0.2 route-map extmap in</pre>	<p>Apply a route map to incoming or outgoing routes</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The <i>peer-group-name</i> argument specifies the name of a BGP or multiprotocol peer group. The <i>map-name</i> argument specifies the name of a route map. The in keyword applies route map to incoming routes. The out keyword applies route map to outgoing routes.
Step 9	end Example: Device(config-router-af)# end	(Optional) Returns to privileged EXEC mode.

Verifying the Route Target Replacement Policy

Procedure

Step 1 enable

Enables privileged EXEC mode. Enter your password if prompted.

Example:

```
Device> enable
Device#
```

Step 2 show ip bgp vpnv4 vrf vrf-name

Verifies that Virtual Private Network Version 4 (VPNv4) prefixes with a specified route target (RT) extended community attribute are replaced with the proper RT extended community attribute to verify that the provider edge (PE) devices receive the rewritten RT extended community attributes.

Verify route target replacement on PE1:

Example:

```
Device# show ip bgp vpnv4 vrf Customer_A 192.168.1.1/32 internal
BGP routing table entry for 65000:1:192.168.1.1/32, version 6901
Paths: (1 available, best #1, table Customer_A)
  Advertised to update-groups:
    5
  Refresh Epoch 1
  650002
    3.3.3.3 (metric 3) (via default) from 3.3.3.3 (55.5.4.1)
      Origin IGP, metric 0, localpref 100, valid, internal, best
      Extended Community: RT:65000:1
      mpls labels in/out nolabel/3025
```

```
rx pathid: 0, tx pathid: 0x0
net: 0xFFB0A72E38, path: 0xFFB0E6A370, pathext: 0xFFB0E5D970
flags: net: 0x0, path: 0x7, pathext: 0x181
```

Step 3 **exit**

Returns to user EXEC mode:

Example:

```
Device# exit
Device>
```

Configuration Examples for MPLS VPN Route Target Rewrite

The following section provides configuration examples for MPLS VPN Route Target Rewrite:

Examples: Applying Route Target Replacement Policies

Examples: Associating Route Maps with Specific BGP Neighbor

This example shows the association of route map extmap with a Border Gateway Protocol (BGP) neighbor. The BGP inbound route map is configured to replace route targets (RTs) on incoming updates.

```
router bgp 1
address-family vpnv4
neighbor 2.2.2.2 route-map rtrewrite in
```

This example shows the association of the same route map with the outbound BGP neighbor. The route map is configured to replace RTs on outgoing updates.

```
router bgp 1
address-family vpnv4
neighbor 2.2.2.2 route-map rtrewrite out
```

Feature History for MPLS VPN Route Target Rewrite

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	MPLS VPN Route Target Rewrite	The MPLS VPN Route Target Rewrite feature can influence routing table updates by allowing the replacement of route targets on inbound and outbound Border Gateway Protocol (BGP) updates.
Cisco IOS XE Cupertino 17.7.1	MPLS VPN Route Target Rewrite	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

MPLS VPN Inter-AS IPv4 BGP Label Distribution

This feature enables you to set up a Virtual Private Network (VPN) service provider network. In this network, the Autonomous System Boundary Routers (ASBRs) exchange IPv4 routes with Multiprotocol Label Switching (MPLS) labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPNv4 routes by using multihop, multiprotocol, External Border Gateway Protocol (EBGP). This configuration saves the ASBRs from having to store all the VPNv4 routes. Using the route reflectors to store the VPNv4 routes and forward them to the PE routers results in improved scalability.

The MPLS VPN—Inter-AS—IPv4 BGP Label Distribution feature has the following benefits:

- Having the route reflectors store VPNv4 routes results in improved scalability—This configuration scales better than configurations where the ASBR holds all the VPNv4 routes and forwards the routes based on VPNv4 labels. With this configuration, route reflectors hold the VPNv4 route, which simplifies the configuration at the border of the network.
- Enables a non-VPN core network to act as a transit network for VPN traffic—You can transport IPv4 routes with MPLS labels over a non MPLS VPN service provider.
- Eliminates the need for any other label distribution protocol between adjacent LSRs—If two adjacent label switch routers (LSRs) are also BGP peers, BGP can handle the distribution of the MPLS labels. No other label distribution protocol is needed between the two LSRs.
- Includes EBGP multipath support to enable load balancing for IPv4 routes across autonomous system (AS) boundaries.

Restrictions for MPLS VPN Inter-AS IPv4 BGP Label Distribution

This feature includes the following restrictions:

- For networks configured with EBGP multihop, a labeled switched path (LSP) must be established between nonadjacent devices. (RFC 3107)
- The PE devices must run images that support BGP label distribution. Otherwise, you cannot run EBGP between them.
- Point-to-Point Protocol (PPP) encapsulation on the ASBRs is not supported with this feature.
- The physical interfaces that connect the BGP speakers must support Cisco Express Forwarding (CEF) or distributed CEF and MPLS

Information About MPLS VPN Inter-AS IPv4 BGP Label Distribution

To configure MPLS VPN Inter-AS IPv4 BGP Label Distribution, you need the following information:

MPLS VPN Inter-AS IPv4 BGP Label Distribution Overview

This feature enables you to set up a VPN service provider network to exchange IPv4 routes with MPLS labels. You can configure the VPN service provider network as follows:

- Route reflectors exchange VPNv4 routes by using multihop, multiprotocol EBGP. This configuration also preserves the next hop information and the VPN labels across the autonomous systems.
- A local PE router (for example, PE1 in Figure 1) needs to know the routes and label information for the remote PE router (PE2). This information can be exchanged between the PE routers and ASBRs in one of two ways:
 - Internal Gateway Protocol (IGP) and Label Distribution Protocol (LDP): The ASBR can redistribute the IPv4 routes and MPLS labels it learned from EBGP into IGP and LDP and vice versa.
 - Internal Border Gateway Protocol (IBGP) IPv4 label distribution: The ASBR and PE router can use direct IBGP sessions to exchange VPNv4 and IPv4 routes and MPLS labels.

Alternatively, the route reflector can reflect the IPv4 routes and MPLS labels learned from the ASBR to the PE routers in the VPN. This is accomplished by enabling the ASBR to exchange IPv4 routes and MPLS labels with the route reflector. The route reflector also reflects the VPNv4 routes to the PE routers in the VPN (as mentioned in the first bullet). For example, in VPN1, RR1 reflects to PE1 the VPNv4 routes it learned and IPv4 routes and MPLS labels learned from ASBR1. Using the route reflectors to store the VPNv4 routes and forward them through the PE routers and ASBRs allows for a scalable configuration.

- ASBRs exchange IPv4 routes and MPLS labels for the PE routers by using EBGP. This enables load balancing across CSC boundaries.

Figure 34: VPNs Using EBGP and IBGP to Distribute Routes and MPLS Labels

BGP Routing Information

BGP routing information includes the following items:

- A network number (prefix), which is the IP address of the destination.
- Autonomous system (AS) path, which is a list of the other ASs through which a route passes on its way to the local router. The first autonomous system in the list is closest to the local router. The last autonomous system in the list is farthest from the local router and usually the autonomous system where the route began.
- Path attributes, which provide other information about the autonomous system path, for example, the next hop.

How BGP Sends MPLS Labels with Routes

When BGP (EBGP and IBGP) distributes a route, it can also distribute an MPLS label that is mapped to that route. The MPLS label-mapping information for the route is carried in the BGP update message that contains the information about the route. If the next hop is not changed, the label is preserved.

When you issue the **neighbor send-label** command on both BGP routers, the routers advertise to each other that they can then send MPLS labels with the routes. If the routers successfully negotiate their ability to send MPLS labels, the routers add MPLS labels to all outgoing BGP updates.

Using Route Maps to Filter Routes

When both routers are configured to distribute routes with MPLS labels, all the routes are encoded with the multiprotocol extensions and contain an MPLS label. You can use a route map to control the distribution of MPLS labels between routers. Route maps enable you to specify the following:

- For a router distributing MPLS labels, you can specify which routes are distributed with an MPLS label.
- For a router receiving MPLS labels, you can specify which routes are accepted and installed in the BGP table.

How to Configure MPLS VPN Inter-AS IPv4 BGP Label Distribution

The figure below shows the following configuration:

- The configuration consists of two VPNs.
- The ASBRs exchange the IPv4 routes with MPLS labels.
- The route reflectors exchange the VPNv4 routes using multi-hop MPLS EBGP.
- The route reflectors reflect the IPv4 and VPNv4 routes to the other routers in its autonomous system.

Figure 35: Configuring Two VPN Service Providers to Exchange IPv4 Routes and MPLS Labels

Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels

Perform this task to configure the ASBRs so that they can distribute BGP routes with MPLS labels.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 3	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 100</pre>	Enters router configuration mode. <ul style="list-style-type: none"> • <i>as-number</i>—Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. The valid values range from 1 through 65535. Private autonomous system numbers that can be used in internal networks range from 64512 through 65535.
Step 4	neighbor { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i> Example: <pre>Device(config)# neighbor 209.165.201.2 remote-as 200</pre>	Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	address-family ipv4 [multicast unicast vrf <i>vrf-name</i>] Example: <pre>Device(config-router)# address-family ipv4</pre>	Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes. <ul style="list-style-type: none"> • The multicast keyword specifies IPv4 multicast address prefixes. • The unicast keyword specifies IPv4 unicast address prefixes. • The vrf <i>vrf-name</i> keyword and argument specifies the name of the VPN routing/forwarding instance (VRF) to associate with subsequent IPv4 address family configuration mode commands.
Step 6	maximum-paths <i>number-paths</i> Example: <pre>Device(config-router)# maximum-paths 2</pre>	(Optional) Controls the maximum number of parallel routes an IP routing protocol can support. The <i>number-paths</i> argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table, in the range from 1 through 6.

	Command or Action	Purpose
		<p>Note The valid values of the maximum-paths command range from 1 to 32. However, the maximum value that can be configured is 2.</p>
Step 7	<p>neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 209.165.201.2 activate</pre>	<p>Enables the exchange of information with a neighboring router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 8	<p>neighbor <i>ip-address</i>send-label</p> <p>Example:</p> <pre>Device(config-router-af)# neighbor 10.0.0.1 send-label</pre>	<p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.
Step 9	<p>exit-address-family</p> <p>Example:</p> <pre>Device(config-router-af)# exit-address-family</pre>	<p>Exits from the address family submode.</p>
Step 10	<p>end</p> <p>Example:</p> <pre>Device(config-router-af)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Configuring the Route Reflectors to Exchange VPNv4 Routes

Before you begin

Perform this task to enable the route reflectors to exchange VPNv4 routes by using multihop, multiprotocol EBGP.

This procedure also specifies that the next hop information and the VPN label are preserved across the autonomous systems. This procedure uses RR1 as an example.

Procedure

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 100</pre>	Enters router configuration mode. <ul style="list-style-type: none"> • <i>as-number</i>—Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. The valid values range from 1 through 65535. Private autonomous system numbers that can be used in internal networks range from 64512 through 65535. The autonomous system number identifies RR1 to routers in other autonomous systems.
Step 4	neighbor { <i>ip-address</i> <i>peer-group-name</i> } remote-as <i>as-number</i> Example: <pre>Device(config)# neighbor 192.0.2.1 remote-as 200</pre>	Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group. • The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.
Step 5	address-family vpnv4 [unicast] Example: <pre>Device(config-router)# address-family vpn4</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP, that uses standard Virtual Private Network Version 4 (VPNv4) address prefixes. <ul style="list-style-type: none"> • The optional unicast keyword specifies VPNv4 unicast address prefixes.
Step 6	neighbor { <i>ip-address</i> <i>peer-group-name</i> } ebgp-multihop [<i>tth</i>] Example: <pre>Device(config-router-af)# neighbor 192.0.2.1 ebgp-multihop 255</pre>	Accepts and attempts BGP connections to external peers residing on networks that are not directly connected. <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The <i>ttl</i> argument specifies the time-to-live in the range from 1 through 255 hops.
Step 7	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate Example: <pre>Device(config-router-af)# neighbor 192.0.2.1 activate</pre>	Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 8	neighbor { <i>ip-address</i> <i>peer-group-name</i> } next-hop unchanged Example: <pre>Device(config-router-af)# neighbor 10.0.0.2 next-hop unchanged</pre>	Enables an External BGP (EBGP) multihop peer to propagate the next hop unchanged. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the next hop. The <i>peer-group-name</i> argument specifies the name of a BGP peer group that is the next hop.
Step 9	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits from the address family submode.
Step 10	end Example: <pre>Device(config-router-af)# end</pre>	(Optional) Exits to privileged EXEC mode.

Configuring the Route Reflectors to Reflect Remote Routes in Its autonomous system

Perform this task to enable the RR to reflect the IPv4 routes and labels that are learned by the ASBR to the PE routers in the autonomous system.

This is accomplished by making the ASBR and PE router the route reflector clients of the RR. This procedure also explains how to enable the RR to reflect the VPNv4 routes.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: <pre>Device# configure terminal</pre>	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: <pre>Device(config)# router bgp 100</pre>	Enters router configuration mode. <ul style="list-style-type: none"> • as-number—Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. The valid values range from 1 through 65535. Private autonomous system numbers that can be used in internal networks range from 64512 through 65535. The autonomous system number identifies RR1 to routers in other autonomous systems.
Step 4	address-family ipv4 [<i>multicast</i> <i>unicast</i> <i>vrf vrf-name</i>] Example: <pre>Device(config-router)# address-family ipv4</pre>	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard IPv4 address prefixes. <ul style="list-style-type: none"> • The multicast keyword specifies IPv4 multicast address prefixes. • The unicast keyword specifies IPv4 unicast address prefixes. • The vrf vrf-name keyword and argument specifies the name of the VPN routing/forwarding instance (VRF) to associate with subsequent IPv4 address family configuration mode commands.
Step 5	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate Example: <pre>Device(config-router-af)# neighbor 203.0.113.1 activate</pre>	Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the neighbor. • The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 6	neighbor <i>ip-address</i> route-reflector-client Example: <pre>Device(config-router-af)# neighbor 203.0.113.1 route-reflector-client</pre>	Configures the router as a BGP route reflector and configures the specified neighbor as its client. <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the IP address of the BGP neighbor being identified as a client.

	Command or Action	Purpose
Step 7	neighbor <i>ip-address</i> send-label Example: Device(config-router-af)# neighbor 203.0.113.1 send-label	Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighboring router.
Step 8	exit-address-family Example: Device(config-router-af)# exit-address-family	Exits from the address family submode.
Step 9	address-family vpvv4 [unicast] Example: Device(config-router)# address-family vpvv4	Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> The optional unicast keyword specifies VPNv4 unicast address prefixes.
Step 10	neighbor { <i>ip-address</i> <i>peer-group-name</i> } activate Example: Device(config-router-af)# neighbor 203.0.113.1 activate	Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> The <i>ip-address</i> argument specifies the IP address of the neighbor. The <i>peer-group-name</i> argument specifies the name of a BGP peer group.
Step 11	neighbor <i>ip-address</i> route-reflector-client Example: Device(config-router-af)# neighbor 203.0.113.1 route-reflector-client	Enables the RR to pass IBGP routes to the neighboring router.
Step 12	exit-address-family Example: Device(config-router-af)# exit-address-family	Exits from the address family submode.
Step 13	end Example: Device(config-router-af)# end	(Optional) Exits to privileged EXEC mode.

Creating Route Maps

Route maps enable you to specify which routes are distributed with MPLS labels. Route maps also enable you to specify which routes with MPLS labels a router receives and adds to its BGP table.

Route maps work with access lists. You enter the routes into an access list and then specify the access list when you configure the route map.

The following procedures enable the ASBRs to send MPLS labels with the routes specified in the route maps. Further, the ASBRs accept only the routes that are specified in the route map.

Configuring a Route Map for Arriving Routes

Perform this task to create a route map to filter arriving routes. You create an access list and specify the routes that the router accepts and adds to the BGP table.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 100	Enters router configuration mode. <ul style="list-style-type: none"> • as-number—Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. The valid values range from 1 through 65535. Private autonomous system numbers that can be used in internal networks range from 64512 through 65535. The autonomous system number identifies RR1 to routers in other autonomous systems.
Step 4	route-map <i>route-map name</i> [permit deny] [sequence-number] Example: Device(config-router)# route-map IN permit 11	Creates a route map with the name you specify. <ul style="list-style-type: none"> • The permit keyword allows the actions to happen if all conditions are met. • The deny keyword prevents any actions from happening if all conditions are met. • The sequence-number argument allows you to prioritize route maps. If you have multiple route maps and want to prioritize them, assign each one a number. The route map with the lowest number is implemented first, followed by the route map with the second lowest number, and so on.

	Command or Action	Purpose
Step 5	match ip address { <i>access-list-number</i> <i>access-list-name</i> } [... <i>access-list-number</i> ... <i>access-list-name</i>] Example: Device(config-route-map)# match ip address 2	Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, or performs policy routing on packets. <ul style="list-style-type: none"> • The <i>access-list-number</i> argument is a number of a standard or extended access list. It can be an integer from 1 through 199. • The <i>access-list-name</i> argument is a name of a standard or extended access list. It can be an integer from 1 through 199.
Step 6	match mpls-label Example: Device(config-route-map)# match mpls-label	Redistributes routes that include MPLS labels if the routes meet the conditions that are specified in the route map.
Step 7	end Example: Device(config-router-af)# end	(Optional) Exits to privileged EXEC mode.

Configuring a Route Map for Departing Routes

Perform this task to create a route map to filter departing routes. You create an access list and specify the routes that the router distributes with MPLS labels.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp as-number Example: Device(config)# router bgp 100	Enters router configuration mode. <ul style="list-style-type: none"> • <i>as-number</i>—Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. The valid

	Command or Action	Purpose
		<p>values range from 1 through 65535. Private autonomous system numbers that can be used in internal networks range from 64512 through 65535.</p> <p>The AS number identifies RR1 to routers in other autonomous systems.</p>
Step 4	<p>route-map <i>route-map name</i> [permit deny] [<i>sequence-number</i>]</p> <p>Example:</p> <pre>Device(config-router)# route-map OUT permit 10</pre>	<p>Creates a route map with the name you specify.</p> <ul style="list-style-type: none"> • The permit keyword allows the actions to happen if all conditions are met. • The deny keyword prevents any actions from happening if all conditions are met. • The <i>sequence-number</i> argument allows you to prioritize route maps. If you have multiple route maps and want to prioritize them, assign each one a number. The route map with the lowest number is implemented first, followed by the route map with the second lowest number, and so on.
Step 5	<p>match ip address {<i>access-list-number</i> <i>access-list-name</i>} [...<i>access-list-number</i> ...<i>access-list-name</i>]</p> <p>Example:</p> <pre>Device(config-route-map)# match 10.0.0.2 1</pre>	<p>Distributes any routes that have a destination network number address that is permitted by a standard or extended access list, or performs policy routing on packets.</p> <ul style="list-style-type: none"> • The <i>access-list-number</i> argument is a number of a standard or extended access list. It can be an integer from 1 through 199. • The <i>access-list-name</i> argument is a name of a standard or extended access list. It can be an integer from 1 through 199.
Step 6	<p>set mpls-label</p> <p>Example:</p> <pre>Device(config-route-map)# set mpls-label</pre>	<p>Enables a route to be distributed with an MPLS label if the route matches the conditions that are specified in the route map.</p>
Step 7	<p>end</p> <p>Example:</p> <pre>Device(config-router-af)# end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Applying the Route Maps to the ASBRs

Perform this task to enable the ASBRs to use the route maps.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>as-number</i> Example: Device(config)# router bgp 100	Enters router configuration mode. <ul style="list-style-type: none"> • as-number—Number of an autonomous system that identifies the router to other BGP routers and tags the routing information that is passed along. The valid values range from 1 through 65535. Private autonomous system numbers that can be used in internal networks range from 64512 through 65535. The autonomous system number identifies RR1 to routers in other autonomous systems.
Step 4	address-family ipv4 [<i>multicast</i> <i>unicast</i> <i>vrf vrf-name</i>] Example: Device(config-router)# address-family ipv4	Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes. <ul style="list-style-type: none"> • The multicast keyword specifies IPv4 multicast address prefixes. • The unicast keyword specifies IPv4 unicast address prefixes. • The vrf vrf-name keyword and argument specifies the name of the VPN routing/forwarding instance (VRF) to associate with subsequent IPv4 address family configuration mode commands.
Step 5	neighbor <i>ip-address</i> route-map <i>route-map-name</i> out Example:	Applies a route map to incoming routes.

	Command or Action	Purpose
	<pre>Device(config-router-af) # neighbor 209.165.200.225 route-map OUT out</pre>	<ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the device to which the route map is to be applied. • The <i>route-map-name</i> argument specifies the name of the route map. • The out keyword applies the route map to outgoing routes.
Step 6	<p>neighbor ip-address send-label</p> <p>Example:</p> <pre>Device(config-router-af) # neighbor 209.165.200.225 send-label</pre>	<p>Advertises the ability of the router to send MPLS labels with routes.</p> <ul style="list-style-type: none"> • The <i>ip-address</i> argument specifies the router that is enabled to send MPLS labels with routes.
Step 7	<p>exit-address-family</p> <p>Example:</p> <pre>Device(config-router-af) # exit-address-family</pre>	<p>Exits from the address family submode.</p>
Step 8	<p>end</p> <p>Example:</p> <pre>Device(config-router-af) # end</pre>	<p>(Optional) Exits to privileged EXEC mode.</p>

Verifying the MPLS VPN Inter-AS IPv4 BGP Label Distribution Configuration

The following figure is a reference for the configuration.

Figure 36: Configuring Two VPN Service Providers to Exchange IPv4 Routes and MPLS Labels

If you use route reflectors to distribute the VPNv4 routes and use the ASBRs to distribute the IPv4 labels, use the following procedures to help verify the configuration:

Verifying the Route Reflector Configuration

Perform this task to verify the route reflector configuration.

Procedure

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Device> enable</pre>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<p>show ip bgp vpnv4 { all rd route-distinguisher vrf vrf-name } [summary] [labels]</p> <p>Example:</p> <pre>Device# show ip bgp vpnv4 all summary</pre> <p>Example:</p> <pre>Device# show ip bgp vpnv4 all labels</pre>	<p>(Optional) Displays VPN address information from the BGP table.</p> <ul style="list-style-type: none"> Use the show ip bgp vpnv4 command with the all and summary keywords to verify that a multihop, multiprotocol, EBGP session exists between the route reflectors and that the VPNv4 routes are being exchanged between the route reflectors. The last two lines of the command output show the following information: <ul style="list-style-type: none"> Prefixes are being learned from PE1 and then passed to RR2.

	Command or Action	Purpose
		<ul style="list-style-type: none"> Prefixes are being learned from RR2 and then passed to PE1. Use the show ip bgp vpnv4 command with the all and labels keywords to verify that the route reflectors are exchanging VPNv4 label information.
Step 3	disable Example: Device# disable	(Optional) Exits to user EXEC mode.

Verifying that CE1 Has Network Reachability Information for CE2

Perform this task to verify that router CE1 has NLRI for router CE2.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip route [<i>ip-address</i> [<i>mask</i>] [longer prefixes]] [<i>protocol</i> [<i>process-id</i>]] [list access-list-number <i>access-list-name</i>] Example: Device# show ip route 209.165.201.1	Displays the current state of the routing table. <ul style="list-style-type: none"> Use the show ip route command with the ip-address argument to verify that CE1 has a route to CE2. Use the show ip route command to verify the routes learned by CE1. Make sure to list the route for CE2.
Step 3	disable Example: Device# disable	(Optional) Exits to user EXEC mode.

Verifying that PE1 Has Network Layer Reachability Information for CE2

Perform this task to verify that router PE1 has NLRI for router CE2.

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device> enable</pre>	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	show ip route vrf <i>vrf-name</i> [connected] [<i>protocols</i> [<i>as-number</i>] [<i>tag</i>] [<i>output-modifiers</i>]] [list <i>number</i> [<i>output-modifiers</i>]] [profile] [static [<i>output-modifiers</i>]] [summary [<i>output-modifiers</i>]] [supernets-only [<i>output-modifiers</i>]] [traffic engineering [<i>output-modifiers</i>]] Example: <pre>Device# show ip route vrf vpn1 209.165.201.1</pre>	(Optional) Displays the IP routing table that is associated with a VRF. <ul style="list-style-type: none"> • Use the show ip route vrf command to verify that router PE1 learns routes from router CE2 (nn.nn.nn.nn).
Step 3	show ip bgp vpnv4 { all rd <i>route-distinguisher</i> vrf <i>vrf-name</i> } { <i>ip-prefix/length</i> [longer-prefixes] [<i>output-modifiers</i>]] [<i>network-address</i> [<i>mask</i>] [longer-prefixes] [<i>output-modifiers</i>]] [cidr-only] [<i>community</i>] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [path [<i>line</i>]] [peer-group] [quote-regexp] [regexp] [summary] [tags] Example: <pre>Device# show ip bgp vpnv4 vrf vpn1 209.165.201.1</pre>	(Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> • Use the show ip bgp vpnv4 command with the vrf or all keyword to verify that router PE2 is the BGP next-hop to router CE2.
Step 4	show ip cef [vrf <i>vrf-name</i>] [<i>network</i> [<i>mask</i>]] [longer-prefixes] [detail] Example: <pre>Device# show ip cef vrf vpn1 209.165.201.1</pre>	(Optional) Displays entries in the forwarding information base (FIB) or displays a summary of the FIB. <ul style="list-style-type: none"> • Use the show ip cef command to verify that the Cisco Express Forwarding (CEF) entries are correct.
Step 5	show mpls forwarding-table [{ <i>network</i> { <i>mask</i> <i>length</i> } labels <i>label</i> [- <i>label</i>] interface <i>interface</i> next-hop <i>address</i> lsp-tunnel [<i>tunnel-id</i>] }] [detail] Example:	(Optional) Displays the contents of the MPLS forwarding information base (LFIB). <ul style="list-style-type: none"> • Use the show mpls forwarding-table command to verify the IGP label for the BGP next hop router (autonomous system boundary).

	Command or Action	Purpose
	Device# show mpls forwarding-table	
Step 6	show ip bgp [network] [network-mask] [longer-prefixes] Example: Device# show ip bgp 209.165.202.129	(Optional) Displays entries in the BGP routing table. <ul style="list-style-type: none"> Use the show ip bgp command to verify the label for the remote egress PE router (PE2).
Step 7	show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name } [summary] [labels] Example: Device# show ip bgp vpnv4 all labels	(Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> Use the show ip bgp vpnv4 all summary command to verify the VPN label of CE2, as advertised by PE2.
Step 8	disable Example: Device# disable	(Optional) Exits to user EXEC mode.

Verifying that PE2 Has Network Reachability Information for CE2

Perform this task to ensure that PE2 can access CE2.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip route vrf vrf-name [connected] [protocol [as-number] [tag] [output-modifiers]] [list number [output-modifiers]] [profile] [static [output-modifiers]] [summary [output-modifiers]] [supernets-only [output-modifiers]] [traffic-engineering [output-modifiers]] Example: Device# show ip route vrf vpn1 209.165.201.1	(Optional) Displays the IP routing table that is associated with a VRF. <ul style="list-style-type: none"> Use the show ip route vrf command to check the VPN routing and forwarding table for CE2. The output provides next hop information.
Step 3	show mpls forwarding-table [vrf vpn-name] [{network {mask length } labels	(Optional) Displays the contents of the LFIB. <ul style="list-style-type: none"> Use the show mpls forwarding-table command with the vrf keyword to check

	Command or Action	Purpose
	label [-label] interface interface next-hop address lsp-tunnel [tunnel-id]}] [detail] Example: Device# show mpls forwarding-table vrf vpn1 209.165.201.1	the VPN routing and forwarding table for CE2. The output provides the label for CE2 and the outgoing interface.
Step 4	show ip bgp vpnv4 {all rd route-distinguisher vrf vrf-name} [summary] [labels] Example: Device# show ip bgp vpnv4 all labels	(Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> Use the show ip bgp vpnv4 command with the all and labels keywords to check the VPN label for CE2 in the multiprotocol BGP table.
Step 5	show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail] Example: Device# show ip cef <vrf-name> 209.165.201.1	(Optional) Displays entries in the forwarding information base (FIB) or displays a summary of the FIB. <ul style="list-style-type: none"> Use the show ip cef command to check the CEF entry for CE2. The command output shows the local label for CE2 and the outgoing interface.
Step 6	disable Example: Device# disable	(Optional) Exits to user EXEC mode.

Verifying the ASBR Configuration

Perform this task to verify that the ASBRs exchange IPv4 routes with MPLS labels or IPv4 routes without labels as prescribed by a route map.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	show ip bgp [network] [network-mask] [longer-prefixes] Example: Device# show ip bgp 209.165.202.129 Example: Device# show ip bgp 192.0.2.1	(Optional) Displays entries in the BGP routing table. <ul style="list-style-type: none"> Use the show ip bgp command to verify that <ul style="list-style-type: none"> ASBR1 receives an MPLS label for PE2 from ASBR2.

	Command or Action	Purpose
		<ul style="list-style-type: none"> ASBR1 received from ASBR2 IPv4 routes for RR2 without labels. If the command output does not display the MPLS label information, the route was received without an MPLS label. ASBR2 distributes an MPLS label for PE2 to ASBR1. ASBR2 does not distribute a label for RR2 to ASBR1.
Step 3	show ip cef [<i>vrf vrf-name</i>] [<i>network [mask]</i>] [longer-prefixes] [detail] Example: Device# show ip cef 209.165.202.129 Example: Device# show ip cef 192.0.2.1	(Optional) Displays entries in the forwarding information base (FIB) or displays a summary of the FIB. <ul style="list-style-type: none"> Use the show ip cef command from ASBR1 and ASBR2 to check that <ul style="list-style-type: none"> The CEF entry for PE2 is correct. The CEF entry for RR2 is correct.
Step 4	disable Example: Device# disable	(Optional) Exits to the user EXEC mode.

Configuration Examples for MPLS VPN Inter-AS IPv4 BGP Label Distribution

Configuration examples for MPLS VPN Inter-AS IPv4 BGP Label Distribution feature include the following:

Configuration Examples for Inter-AS Using BGP to Distribute Routes and MPLS Labels Over an MPLS VPN Service Provider

The figure shows two MPLS VPN service providers. The service provider distributes the VPNv4 routes between the route reflectors. They distribute the IPv4 routes with MPLS labels between the ASBRs.

Figure 37: Distributing IPv4 Routes and MPLS Labels Between MPLS VPN Service Providers

The configuration examples show the two techniques that you can use to distribute the VPNv4 routes and the IPv4 routes with MPLS labels, from the remote RRs and PEs to the local RRs and PEs:

- Autonomous system 100 uses the RRs to distribute the VPNv4 routes learned from the remote RRs. The RRs also distribute the remote PE address and label that is learned from ASBR1 using IPv4 + labels.
- In autonomous system 200, the IPv4 routes that ASBR2 learned are redistributed into IGP.

The configuration examples in this section are as follow:

Example: Route Reflector 1 (MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPNv4 routes with RR2 using multiprotocol, multihop EBGP.
- The VPNv4 next hop information and the VPN label preserved across the autonomous systems.
- RR1 reflects to PE1:
 - The VPNv4 routes learned from RR2.
 - The IPv4 routes and MPLS labels learned from ASBR1

Configuration Examples: Inter-AS Using BGP to Distribute Routes and MPLS Labels Over a Non MPLS VPN Service Provider

The figure shows two MPLS VPN service providers that are connected through a non MPLS VPN service provider. The autonomous system in the middle of the network is configured as a backbone autonomous system that uses Label Distribution Protocol (LDP) or Tag Distribution Protocol (TDP) to distribute MPLS labels. You can also use traffic engineering tunnels instead of TDP or LDP to build the LSP across the non MPLS VPN service provider.

Figure 38: Distributing Routes and MPLS Labels Over a Non MPLS VPN Service Provider

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over a non MPLS VPN service provider included in this section are as follows:

Configuration Example: Route Reflector 1 (Non MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPNv4 routes with RR2 using multiprotocol, multihop EBGP.
- The VPNv4 next hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
 - The VPNv4 routes learned from RR2
 - The IPv4 routes and MPLS labels learned from ASBR 1

Configuration Example: ASBR4 (Non MPLS VPN Service Provider)

ASBR4 belongs to a non MPLS VPN service provider. ASBR4 and ASBR3 exchange IPv4 routes and MPLS labels by means of RR3.

Note Do not redistribute EBGP routes learned into IBG if you are using IBGP to distribute the routes and labels. This is not a supported configuration.

Feature History for Configuring MPLS VPN Inter-AS IPv4 BGP Label Distribution

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.11.1	MPLS VPN Inter-AS IPv4 BGP Label Distribution	This feature enables you to set up a Virtual Private Network (VPN) service provider network. In this network, the Autonomous System Boundary Routers (ASBRs) exchange IPv4 routes with Multiprotocol Label Switching (MPLS) labels of the provider edge (PE) routers.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>.

CHAPTER 29

Configuring Seamless MPLS

- [Information about Seamless MPLS, on page 435](#)
- [How to configure Seamless MPLS, on page 436](#)
- [Configuration Examples for Seamless MPLS, on page 442](#)
- [Feature History for Seamless MPLS, on page 444](#)

Information about Seamless MPLS

The following sections provide information about Seamless MPLS.

Overview of Seamless MPLS

Seamless MPLS provides a highly flexible and scalable architecture to integrate multiple networks into a single MPLS domain. It is based on existing and well known protocols.

A large MPLS network can have several types of platforms and services in different parts of the network. Such a network would usually be divided into areas such as a core area and aggregation areas, and each of these areas have different Interior Gateway Protocols (IGPs). The IGP prefixes from one area cannot be distributed to another area. If the IGP prefixes cannot be distributed, then end-to-end Label-Switched-Paths (LSP) cannot be established. This affects the scalability of the network.

Seamless MPLS introduces greater scalability by establishing end-to-end LSPs. Seamless MPLS uses the Border Gateway Protocol (BGP) instead of IGP to forward the loopback prefixes of the Provider Edge (PE) routers. BGP distributes the prefixes end-to-end. This eliminates the need to install IGP prefixes of one domain in another domain.

Seamless MPLS introduces separation of the service and transport planes and provides end to end service independent transport. It removes the need for service specific configurations in network transport nodes.

Architecture for Seamless MPLS

The figure shows a network with three different areas: one core and two aggregation areas on the side. Each area runs its own IGP, with no redistribution between them on the Area Border Router (ABR). Use of BGP is needed in order to provide an end-to-end MPLS LSP. BGP advertises the loopbacks of the PE routers with a label across the whole domain, and provides an end-to-end LSP. BGP is deployed between the PEs and ABRs.

Seamless MPLS uses BGP to provide an end-to-end MPLS LSP. BGP is deployed between the PEs and the ABRs. BGP sends the IPv4 prefix and label. BGP advertises the loopbacks of the PE routers with a label across the whole domain and provides an end-to-end LSP.

When using IGP in the network, the next-hop address of the prefixes is the loopback prefix of the PE routers. This prefix is not known to the IGP being used in other parts of the network. The next hop address cannot be used to recurse to an IGP prefix. To avoid this the prefixes are carried in BGP. The ABRs are configured as Route Reflectors (RR). And the RRs are configured to set the next hop to self even for the reflected iBGP prefixes.

There are two possible scenarios.

- The ABR does not set the next hop to self for the prefixes advertised (reflected by BGP) by the ABR into the aggregation part of the network. The ABR needs to redistribute the loopback prefixes of the ABRs from the core IGP into the aggregation IGP. Only the ABR loopback prefixes (from the core) need to be advertised into the aggregation part, not the loopback prefixes from the PE routers from the remote aggregation parts.
- The ABR sets the next hop to self for the prefixes advertised (reflected by BGP) by the ABR into the aggregation part. Because of this, the ABR does not need to redistribute the loopback prefixes of the ABRs from the core IGP into the aggregation IGP.

In both scenarios, the ABR sets the next hop to self for the prefixes advertised (reflected by BGP) by the ABR from the aggregation part of the network into the core part.

How to configure Seamless MPLS

The following sections provide information on how to configure Seamless MPLS.

Configuring Seamless MPLS on the PE Router

The following steps can be used to configure Seamless MPLS on the PE Router

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface loopback slot/port Example: Device(config-if)# interface Loopback0	Configures a Loopback interface and enters interface configuration mode.
Step 4	ip address ip-address subnet-mask Example: Device(config-if) ip address 10.100.1.4 255.255.255.255	Enters the IP address for the interface.
Step 5	interface ethernet slot/port Example: Device(config-if)# interface Ethernet1/0	Configures an Ethernet interface and enters interface configuration mode.
Step 6	no ip address Example: Device(config-if)# no ip address	Removes an IP address definition.
Step 7	xconnect peer-ip-address vcid encapsulation mpls Example: Device(config-if)# xconnect 10.100.1.5 100 encapsulation mpls	Specifies MPLS as the tunneling method to encapsulate.
Step 8	router ospf process-id Example: Device(config)# router ospf 2	Configures the OSPF routing process.
Step 9	network ip-address wild-mask area area-id Example:	Defines the interfaces on which OSPF runs and defines the area ID for those interfaces.

	Command or Action	Purpose
	Device(config-router)# network 10.2.0.0 0.0.255.255 area 0	
Step 10	network <i>ip-address wild-mask area area-id</i> Example: Device(config-router)# network 10.100.1.4 0.0.0.0 area 0	Defines the interfaces on which OSPF runs and defines the area ID for those interfaces.
Step 11	router bgp <i>autonomous-system-number</i> Example: Device(config)# router bgp 1	Configures the BGP routing process.
Step 12	bgp log neighbor changes Example: Device(config-router)# bgp log neighbor changes	Enables logging of BGP neighbor resets.
Step 13	address-family ipv4 Example: Device(config-router)# address-family ipv4	Enters address family configuration mode.
Step 14	network <i>network-number mask network-mask</i> Example: Device(config-router-af)# network 10.100.1.4 mask 255.255.255.255	Specifies the networks to be advertised by BGP and multiprotocol BGP routing processes.
Step 15	no bgp default ipv4 unicast Example: Device(config-router-af)# no bgp default ipv4 unicast	Disables default IPv4 unicast address family for peering session establishment
Step 16	no bgp default route-target filter Example: Device(config-router-af)# no bgp default route-target filter	Disables automatic BGP route-target community filtering.
Step 17	neighbor <i>ip-address remote-as autonomous-system-number</i> Example: Device(config-router-af)# neighbor 10.100.1.1 remote-as 1	Adds an entry to the BGP or multiprotocol BGP neighbor table.
Step 18	neighbor <i>ip-address update-source interface-type interface-number</i> Example: Device(config-router-af)# neighbor 10.100.1.1 update-source Loopback0	Allows BGP sessions to use any operational interface for TCP connections.

	Command or Action	Purpose
Step 19	neighbor <i>ip-address</i> send-label Example: Device(config-router-af)# neighbor 10.100.1.1 send-label	Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.

Configuring Seamless MPLS on the Route Reflector

The following steps can be used to configure Seamless MPLS on the Route Reflector.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface loopback <i>slot/port</i> Example: Device(config-if)# interface Loopback0	Configures a Loopback interface and enters interface configuration mode.
Step 4	ip address <i>ip-address subnet-mask</i> Example: Device(config-if)# ip address 10.100.1.1 255.255.255.255	Enters the IP address for the interface.
Step 5	router ospf <i>process-id</i> Example: Device(config)# router ospf 1	Configures the OSPF routing process.
Step 6	network <i>ip-address wild-mask area area-id</i> Example: Device(config-router)# network 10.1.0.0 0.0.255.255 area 0	Defines the interfaces on which OSPF runs and defines the area ID for those interfaces.
Step 7	network <i>ip-address wild-mask area area-id</i> Example: Device(config-router)# 10.100.1.1 0.0.0.0 area 0	Defines the interfaces on which OSPF runs and defines the area ID for those interfaces.

	Command or Action	Purpose
Step 8	exit Example: Device(config-router)#exit	Exits the configuration mode.
Step 9	router ospf process-id Example: Device(config)# router ospf 2	Configures the OSPF routing process.
Step 10	redistribute ospf instance-tag route-map map-name Example: Device(config-router)# redistribute ospf 1 subnets match internal route-map ospf1-into-ospf2	Injects routes from one routing domain into OSPF.
Step 11	network ip-address wild-mask area area-id Example: Device(config-router)# network 10.2.0.0 0.0.255.255 area 0	Defines the interfaces on which OSPF runs and defines the area ID for those interfaces.
Step 12	exit Example: Device(config-router)#exit	Exits the configuration mode.
Step 13	router bgp autonomous-system-number Example: Device(config)# router bgp 1	Configures the BGP routing process.
Step 14	bgp log neighbor changes Example: Device(config-router)# bgp log neighbor changes	Enables logging of BGP neighbor resets.
Step 15	address-family ipv4 Example: Device(config-router)# address family ipv4	Enters address family configuration mode.
Step 16	neighbor ip-address remote-as autonomous-system-number Example: Device(config-route-af)# neighbor 10.100.1.2 remote-as 1	Adds an entry to the BGP or multiprotocol BGP neighbor table.

	Command or Action	Purpose
Step 17	neighbor ip-address update-source interface-type interface-number Example: <pre>Device(config-router-af)# neighbor 10.100.1.2 update-source Loopback0</pre>	Allows BGP sessions to use any operational interface for TCP connections.
Step 18	neighbor ip-address next-hop-self all Example: <pre>Device(config-router-af)# neighbor 10.100.1.2 next-hop-self all</pre>	Configures a router as the next hop for a BGP-speaking neighbor or peer group.
Step 19	neighbor ip-address send-label Example: <pre>Device(config-router-af)# neighbor 10.100.1.2 send-label</pre>	Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.
Step 20	neighbor ip-address remote-as autonomous-system-number Example: <pre>Device(config-router-af)# neighbor 10.100.1.4 remote-as 1</pre>	Adds an entry to the BGP or multiprotocol BGP neighbor table.
Step 21	neighbor ip-address update-source interface-type interface-number Example: <pre>Device(config-router-af)# neighbor 10.100.1.4 update-source Loopback0</pre>	Allows BGP sessions to use any operational interface for TCP connections.
Step 22	neighbor ip-address route-reflector-client Example: <pre>Device(config_router-af)# neighbor 10.100.1.4 route-reflector-client</pre>	Configures the router as a BGP route reflector and configure the specified neighbor as its client.
Step 23	neighbor ip-address next-hop-self all Example: <pre>Device(config-router-af)# neighbor 10.100.1.4 next-hop-self all</pre>	Configures a router as the next hop for a BGP-speaking neighbor or peer group.
Step 24	neighbor ip-address send-label Example: <pre>Device(config-router-af)# neighbor 10.100.1.4 send-label</pre>	Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.
Step 25	exit Example: <pre>Device(config-router)#exit</pre>	Exits the configuration mode.

	Command or Action	Purpose
Step 26	ip prefix-list name seq number permit prefix Example: Device(config)# ip prefix-list prefix-list-ospf1-into-ospf2 seq 5 permit 10.100.1.1/32	Creates a prefix list to match IP packets or routes against.
Step 27	route-map name permit sequence-number Example: Device(config)# route-map ospf1-into-ospf2 permit 10	Creates the route map entry. Enters route-map configuration mode.
Step 28	match ip address prefix-list prefix-list-name Example: Device(config-route-map)# match ip address prefix-list prefix-list-ospf1-into-ospf2	Distributes routes that have a destination IP network number address that is permitted by a prefix list.

Configuration Examples for Seamless MPLS

The following sections provide examples for configuring Seamless MPLS.

Example: Configuring Seamless MPLS on PE Router 1

The following example shows how to configure Seamless MPLS on PE router 1.

```

Device(config-if)#interface Loopback0
 Device(config-if)#ip address 10.100.1.4 255.255.255.255
!
Device(config-if)# interface Ethernet1/0
Device(config-if)# no ip address
Device(config-if)# xconnect 10.100.1.5 100 encapsulation mpls
!
Device(config)# router ospf 2
Device(config-router)# network 10.2.0.0 0.0.255.255 area 0
Device(config-router)# network 10.100.1.4 0.0.0.0 area 0
!
Device(config)#router bgp 1
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# address family ipv4
Device(config-router-af)# network 10.100.1.4 mask 255.255.255.255
Device(config-router-af)# no bgp default ipv4 unicast
Device(config-router-af)# no bgp default route-target filter
Device(config-router-af)# neighbor 10.100.1.1 remote-as 1
Device(config-router-af)# neighbor 10.100.1.1 update-source Loopback0
Device(config-router-af)# neighbor 10.100.1.1 send-label

```

Example: Configuring Seamless MPLS on Route Reflector 1

The following examples shows how to configure Seamless MPLS on route reflector 1.

```

Device(config-if)# interface Loopback0
Device(config-if)# ip address 10.100.1.1 255.255.255.255
Device(config)# router ospf 1
Device(config-router)# network 10.1.0.0 0.0.255.255 area 0
Device(config-router)# network 10.100.1.1 0.0.0.0 area 0
!
Device(config)# router ospf 2
Device(config-router)# redistribute ospf 1 subnets match internal route-map ospf1-into-ospf2
Device(config-router)# network 10.2.0.0 0.0.255.255 area 0
!
Device(config)# router bgp 1
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# address family ipv4
Device(config-router-af)# neighbor 10.100.1.2 remote-as 1
Device(config-router-af)# neighbor 10.100.1.2 update-source Loopback0
Device(config-router-af)# neighbor 10.100.1.2 next-hop-self all
Device(config-router-af)# neighbor 10.100.1.2 send-label
Device(config-router-af)# neighbor 10.100.1.4 remote-as 1
Device(config-router-af)# neighbor 10.100.1.4 update-source Loopback0
Device(config-router-af)# neighbor 10.100.1.4 route-reflector-client
Device(config-router-af)# neighbor 10.100.1.4 next-hop-self all
Device(config-router-af)# neighbor 10.100.1.4 send-label

Device(config)# ip prefix-list prefix-list-ospf1-into-ospf2 seq 5 permit 10.100.1.1/32

Device(config)# route-map ospf1-into-ospf2 permit 10
Device(config-route-map)# match ip address prefix-list prefix-list-ospf1-into-ospf2

```

Example: Configuring Seamless MPLS on PE Router 2

The following example shows how to configure Seamless MPLS on PE router 2.

```

Device(config-if)#interface Loopback0
Device(config-if)#ip address 10.100.1.5 255.255.255.255
!
Device(config-if)# interface Ethernet1/0
Device(config-if)# no ip address
Device(config-if)# xconnect 10.100.1.4 100 encapsulation mpls
!
Device(config)# router ospf 3
Device(config-router)# network 10.3.0.0 0.0.255.255 area 0
Device(config-router)# network 10.100.1.5 0.0.0.0 area 0
!
Device(config)#router bgp 1
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# address family ipv4
Device(config-router-af)# network 10.100.1.5 mask 255.255.255.255
Device(config-router-af)# no bgp default ipv4 unicast
Device(config-router-af)# no bgp default route-target filter
Device(config-router-af)# neighbor 10.100.1.2 remote-as 1
Device(config-router-af)# neighbor 10.100.1.2 update-source Loopback0
Device(config-router-af)# neighbor 10.100.1.2 send-label

```

Example: Configuring Seamless MPLS on Route Reflector 2

The following examples shows how to configure Seamless MPLS on route reflector 2.

```

Device(config-if)# interface Loopback0
Device(config-if)# ip address 10.100.1.2 255.255.255.255
Device(config)# router ospf 1
Device(config-router)# network 10.1.0.0 0.0.255.255 area 0

```

```

Device(config-router)# network 10.100.1.2 0.0.0.0 area 0
!
Device(config)# router ospf 3
Device(config-router)# redistribute ospf 1 subnets match internal route-map ospf1-into-ospf3
Device(config-router)# network 10.3.0.0 0.0.255.255 area 0
!
Device(config)# router bgp 1
Device(config-router)# bgp log-neighbor-changes
Device(config-router)# address family ipv4
Device(config-router-af)# neighbor 10.100.1.1 remote-as 1
Device(config-router-af)# neighbor 10.100.1.1 update-source Loopback0
Device(config-router-af)# neighbor 10.100.1.1 next-hop-self all
Device(config-router-af)# neighbor 10.100.1.1 send-label
Device(config-router-af)# neighbor 10.100.1.5 remote-as 1
Device(config-router-af)# neighbor 10.100.1.5 update-source Loopback0
Device(config-router-af)# neighbor 10.100.1.5 route-reflector-client
Device(config-router-af)# neighbor 10.100.1.5 next-hop-self all
Device(config-router-af)# neighbor 10.100.1.5 send-label

Device(config)# ip prefix-list prefix-list-ospf1-into-ospf3 seq 5 permit 10.100.1.1/32

Device(config)# route-map ospf1-into-ospf3 permit 10
Device(config-route-map)# match ip address prefix-list prefix-list-ospf1-into-ospf3

```

Feature History for Seamless MPLS

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.12.1	Seamless MPLS	Seamless MPLS provides a highly flexible and scalable architecture to integrate multiple networks into a single MPLS domain. It is based on existing and well known protocols.

Use [Cisco Feature Navigator](#) to find information about platform and software image support.

CHAPTER 30

Troubleshooting Multiprotocol Label Switching

- [Overview](#), on page 445
- [Support Articles](#), on page 445
- [Feedback Request](#), on page 446
- [Disclaimer and Caution](#), on page 446

Overview

This chapter provides links to documents authored by Cisco subject matter experts (SMEs). They aim to help you resolve technical issues without requiring a support ticket. If these documents are unable to resolve your issue, we recommend visiting the applicable [Cisco Community](#). There is a wealth of information and advice available from fellow Cisco customers who may have experienced this issue already and provided a solution. If you are not able to find a resolution on the Community, it may be best that you raise a support ticket at [Cisco Support](#). In cases where a support ticket has to be raised, these documents provide guidance about the data that should be collected and added to the support ticket. Specify the support document you referred, and TAC can create an improvement request with the document owner.

Support Articles

The documents in this section were created using specific software and hardware listed in the Components Used section of each article. However, this does not mean that they are limited to what is listed in Components Used, and generally remain relevant for later versions of software and hardware. Note that there could be some changes in the software or hardware that can cause commands to stop working, the syntax to change, or GUIs and CLIs to look different from one release to another.

The following are the support articles associated with this technology:

Document	Description
Verify MPLS on Catalyst 9000 Switches	This document describes the how to configure and validate Multiprotocol Label Switching (MPLS) Layer 3 Virtual Private Network (VPN) on Catalyst 9000 series switches.

Feedback Request

Your input helps. A key aspect to improving these support documents is customer feedback. Note that these documents are owned and maintained by multiple teams within Cisco. If you find an issue specific to the document (unclear, confusing, information missing, etc):

- Provide feedback using the **Feedback** button located at the right panel of the corresponding article. The document owner will be notified, and will either update the article, or flag it for removal.
- Include information regarding the section, area, or issue you had with the document and what could be improved. Provide as much detail as possible.

Disclaimer and Caution

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.
