#### clear ip nhrp

To clear all dynamic entries from the Next Hop Resolution Protocol (NHRP) cache, use the **clear ip nhrp** command in user EXEC or privileged EXEC mode.

clear ip nhrp[{vrf {vrf-name | global}}] [{dest-ip-address [{dest-mask}] | tunnel number | counters
[{interface tunnel number}] | stats [{tunnel number [{vrf {vrf-name | global}}]}]

| Syntax Description | vrf  | × ± /  | Deletes entries from the N (VRF) instance.  | IHRP cache for the specified virtual routing and |  |  |  |
|--------------------|--|--|---|--|--|--|--|
|                    | vrf-name   | (Optional)   | (Optional) Name of the VRF address family to which the command is applied.  |  |  |  |  |
|                    | global   | (Optional)   | (Optional) Specifies the global VRF instance.   |  |  |  |  |
|                    | dest-ip-address  |  | (Optional) Destination IP address. Specifying this argument clears NHRP mapping entries for the specified destination IP address. |  |  |  |  |
|                    | dest-mask  | (Optional)   | Destination network mask  |  |  |  |  |
|                    | counters   | (Optional)   | Clears the NHRP counters  | 5.   |  |  |  |
|                    | interface  | (Optional)   | Clears the NHRP mapping   | g entries for all interfaces.                    |  |  |  |
|                    | tunnel number  | · (Optional)   | (Optional) Removes the specified interface from the NHRP cache.   |  |  |  |  |
|                    | stats  | (Optional) Clears all IPv4 statistic information for all interfaces. |   |  |  |  |  |
| Command Modes      | User EXEC (>)  |  |   |  |  |  |  |
|                    | Privileged EXE   |  |   |  |  |  |  |
| Command History    | Release  |  | Modification  |  |  |  |  |
|                    | Cisco IOS XE I   | Denali 16.5.1  | This command was introc   | luced.   |  |  |  |
| Usage Guidelines   | The <b>clear ip nh</b><br>NHRP cache.  | <b>rp</b> command  | does not clear any static (   | configured) IP-to-NBMA address mappings from the |  |  |  |
| Examples           | The following example shows how to clear all dynamic entries from the NHRP cache for an interface: |  |   |  |  |  |  |
|                    | Switch# <b>clear</b>   | ip nhrp  |   |  |  |  |  |
| Related Commands   | Command  | Description  |   |  |  |  |  |
|                    | show ip nhrp   | Displays NH  | RP mapping information.   |  |  |  |  |
|                    | ц  |  |   |  |  |  |  |

# clear ipv6 access-list

To reset the IPv6 access list match counters, use the **clear ipv6 access-list**command in privileged EXEC mode.

clear ipv6 access-list [access-list-name]

show ipv6 access-list

| Syntax Description | access-list-name  | 1          | l) Name of the IPv6 access list for which to clear the match counters. Names ontain a space or quotation mark, or begin with a numeric. |  |  |
|--------------------|---|------------|---|--|--|
| Command Default    | No reset is initiated   | <b>1</b> . |   |  |  |
| Command Modes      | Privileged EXEC (#)   |            |   |  |  |
| Command History    | Release   |            | Modification  |  |  |
|                    | Cisco IOS XE Evo<br>16.5.1a   | erest      | This command was introduced.  |  |  |
| Usage Guidelines   | The <b>clear ipv6 access-list</b> command is similar to the <b>clear ip access-list counters</b> command, except that it is IPv6-specific.                                |            |   |  |  |
|                    | The <b>clear ipv6 access-list</b> command used without the <i>access-list-name</i> argument resets the match counters for all IPv6 access lists configured on the router. |            |   |  |  |
|                    | This command resets the IPv6 global ACL hardware counters.  |            |   |  |  |
| Examples           | The following example resets the match counters for the IPv6 access list named marketing:<br>Device# clear ipv6 access-list marketing                                     |            |   |  |  |
|                    |   |            |   |  |  |
| Related Commands   | Command   | Des        | cription  |  |  |
|                    | hardware statisti   | cs Enal    | bles the collection of hardware statistics.   |  |  |
|                    | ipv6 access-list  | Defi       | Defines an IPv6 access list and enters IPv6 access list configuration mode.   |  |  |

Displays the contents of all current IPv6 access lists.

## clear ipv6 dhcp

To clear IPv6 Dynamic Host Configuration Protocol (DHCP) information, use the **clear ipv6 dhcp**command in privileged EXEC mode:

#### clear ipv6 dhcp

| Syntax Description | This command has no arguments or keywords. |  |  |  |
|--------------------|--|--|--|--|
| Command Modes      | Privileged EXEC (#)                        |  |  |  |
| Command History    | Release                                    | Modification                           |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a            | This command was introduced.           |  |  |
| Usage Guidelines   | The clear ipv6 dhcp comm                   | and deletes DHCP for IPv6 information. |  |  |
| Examples           | The following example :                    |  |  |  |

Device# clear ipv6 dhcp

## clear ipv6 dhcp binding

To delete automatic client bindings from the Dynamic Host Configuration Protocol (DHCP) for IPv6 server binding table, use the **clear ipv6 dhcp binding** command in privileged EXEC mode.

clear ipv6 dhcp binding [ipv6-address] [vrf vrf-name]

| Syntax Description | ipv6-address   | (Optional)   | The address of a DHCP for IPv6 client.  |  |
|--------------------|--|--------------|---|--|
|                    |  | -            | ent must be in the form documented in RFC 2373 where the address is specified mal using 16-bit values between colons. |  |
|                    | vrf vrf-name   | (Optional) S | Specifies a virtual routing and forwarding (VRF) configuration.   |  |
| Command Modes      | Privileged EXE   | C (#)        |   |  |
| Command History    | Release  |              | Modification  |  |
|                    | Cisco IOS XE I<br>16.5.1a  | Everest      | This command was introduced.  |  |
| Usage Guidelines   | The clear ipv6 o   | lhcp binding | <b>g</b> command is used as a server function.  |  |
|                    | A binding table entry on the DHCP for IPv6 server is automatically:  |              |   |  |
|                    | • Created whenever a prefix is delegated to a client from the configuration pool.  |              |   |  |
|                    | • Updated when the client renews, rebinds, or confirms the prefix delegation.  |              |   |  |
|                    | • Deleted when the client releases all the prefixes in the binding voluntarily, all prefixes' valid lifetimes have expired, or an administrator runs the <b>clear ipv6 dhcp binding</b> command.   |              |   |  |
|                    | If the <b>clear ipv6 dhcp binding</b> command is used with the optional <i>ipv6-address</i> argument specified, only the binding for the specified client is deleted. If the <b>clear ipv6 dhcp binding</b> command is used without the <i>ipv6-address</i> argument, then all automatic client bindings are deleted from the DHCP for IPv6 binding table. If the optional <b>vrf</b> <i>vrf-name</i> keyword and argument combination is used, only the bindings for the specified VRF are cleared. |              |   |  |
| Examples           |  |              |   |  |
|                    | Device# <b>clear</b>   | ipv6 dhcp 3  | binding   |  |
| Related Commands   | Command  |              | Description   |  |
|                    | show ipv6 dhc  | binding      | Displays automatic client bindings from the DHCP for IPv6 server binding table.                                       |  |

## clear ipv6 dhcp client

To restart the Dynamic Host Configuration Protocol (DHCP) for IPv6 client on an interface, use the **clear ipv6 dhcp client** command in privileged EXEC mode.

Displays DHCP for IPv6 interface information.

clear ipv6 dhcp client interface-type interface-number

| Syntax Description | interface-type interface-nut  | mber | Interface type and number. For a (?) online help function. | more infor | mation, use the question mark |
|--------------------|---|------|--|------------|-------------------------------|
| Command Modes      | Privileged EXEC (#)   |      |  |            |                               |
| Command History    | Release Modification  |      |  |            |                               |
|                    | Cisco IOS XE Everest<br>16.5.1a   | Th   | is command was introduced.                                 |            |                               |
| Usage Guidelines   | The <b>clear ipv6 dhcp client</b> command restarts the DHCP for IPv6 client on specified interface after first releasing and unconfiguring previously acquired prefixes and other configuration options (for example, Dom Name System [DNS] servers). |      |  |            |                               |
| Examples           | The following example restarts the DHCP for IPv6 client for Ethernet interface 1/0:   |      |  | ce 1/0:    |                               |
|                    | Device# clear ipv6 dhcp client Ethernet 1/0   |      |  |            |                               |
| Related Commands   | Command   | Des  | cription   |            |                               |

show ipv6 dhcp interface

## clear ipv6 dhcp conflict

To clear an address conflict from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server database, use the **clear ipv6 dhcp conflict** command in privileged EXEC mode.

clear ipv6 dhcp conflict {\*ipv6-address | vrf vrf-name}

| Syntax Description | *   | Clears all a  | address conflicts.           |  |  |
|--------------------|---|---|------------------------------|--|--|
|                    | <i>ipv6-address</i> Clears the host IPv6 address that contains the conflicting address.   |   |                              |  |  |
|                    | vrf vrf-name  | Specifies a virtual routing and forwarding (VRF) name.  |                              |  |  |
| Command Modes      | Privileged EXE  | C (#)   |                              |  |  |
| Command History    | Release   |   | Modification                 |  |  |
|                    | Cisco IOS XE<br>16.5.1a   | Everest   | This command was introduced. |  |  |
| Usage Guidelines   | <ul> <li>When you configure the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor discovery to detect clients and reports to the server through a DECLINE message. If an address conflict is detected, the address is removed from the pool, and the address is not assigned until the administrator removes the address from the conflict list.</li> <li>If you use the asterisk (*) character as the address parameter, DHCP clears all conflicts.</li> <li>If the vrf vrf-name keyword and argument are specified, only the address conflicts that belong to the specified VRF will be cleared.</li> </ul> |   |                              |  |  |
|                    |   |   |                              |  |  |
|                    |   |   |                              |  |  |
| Examples           | The following example shows how to clear all address conflicts from the DHCPv6 server database:   |   |                              |  |  |
|                    | Device# clear ipv6 dhcp conflict *  |   |                              |  |  |
| Related Commands   | Command   | Command Description   |                              |  |  |
|                    | show ipv6 dhc   | show ipv6 dhcp conflict       Displays address conflicts found by a DHCPv6 server when addresses are offered to the client. |                              |  |  |

#### clear ipv6 dhcp relay binding

To clear an IPv6 address or IPv6 prefix of a Dynamic Host Configuration Protocol (DHCP) for IPv6 relay binding, use the **clear ipv6 dhcp relay binding** command in privileged EXEC mode.

**clear ipv6 dhcp relay binding**{**vrf** *vrf-name*}{*\*ipv6-addressipv6-prefix*}

clear ipv6 dhcp relay binding{vrf vrf-name} {\* ipv6-prefix}

| Syntax Description | vrf vrf-name | Specifies a virtual routing and forwarding (VRF) configuration. |
|--------------------|--------------|---|
|                    | *            | Clears all DHCPv6 relay bindings.                               |
|                    | ipv6-address | DHCPv6 address.   |
|                    | ipv6-prefix  | IPv6 prefix.  |

Command Modes Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** The **clear ipv6 dhcp relay binding** command deletes a specific IPv6 address or IPv6 prefix of a DHCP for IPv6 relay binding. If no relay client is specified, no binding is deleted.

**Examples** The following example shows how to clear the binding for a client with a specified IPv6 address:

Device# clear ipv6 dhcp relay binding 2001:0DB8:3333:4::5

The following example shows how to clear the binding for a client with the VRF name vrf1 and a specified prefix on a Cisco uBR10012 universal broadband device:

Device# clear ipv6 dhcp relay binding vrf vrf1 2001:DB8:0:1::/64

| Related Commands | Command                      | Description   |
|------------------|------------------------------|---|
|                  | show ipv6 dhcp relay binding | Displays DHCPv6 IANA and DHCPv6 IAPD bindings on a relay agent. |

#### clear ipv6 eigrp

To delete entries from Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6 routing tables, use the **clear ipv6 eigrp** command in privileged EXEC mode.

clear ipv6 eigrp [as-number] [neighbor [{ipv6-address | interface-type interface-number}]]

| as-number          | (Optional) Autonomous system number.                    |  |
|--------------------|---|--|
| neighbor           | (Optional) Deletes neighbor router entries.             |  |
| ipv6-address       | (Optional) IPv6 address of a neighboring router.        |  |
| interface-type     | (Optional) The interface type of the neighbor router.   |  |
| interface-number   | (Optional) The interface number of the neighbor router. |  |
| Drivilaged EVEC (4 | <u> </u>  |  |
|                    | neighbor<br>ipv6-address<br>interface-type              |  |

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

# Usage Guidelines Use the clear ipv6 eigrp command without any arguments or keywords to clear all EIGRP for IPv6 routing table entries. Use the *as-number* argument to clear routing table entries on a specified process, and use the neighboripv6-address keyword and argument, or the *interface-typeinterface-number* argument, to remove a specific neighbor from the neighbor table.

**Examples** The following example removes the neighbor whose IPv6 address is 3FEE:12E1:2AC1:EA32:

Device# clear ipv6 eigrp neighbor 3FEE:12E1:2AC1:EA32

## clear ipv6 mfib counters

To reset all active Multicast Forwarding Information Base (MFIB) traffic counters, use the **clear ipv6 mfib counters** command in privileged EXEC mode.

clear ipv6 mfib [vrf vrf-name] counters [{group-name|group-address [{source-addresssource-name}]}]

| Syntax Description | vrf vrf-name  | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |  |  |  |
|--------------------|---|--|--|--|--|
|                    | group-name   group-addre  | ess (Optional) IPv6 address or name of the multicast group.                |  |  |  |
|                    | source-address   source-na  | ame (Optional) IPv6 address or name of the source.                         |  |  |  |
| Command Modes      | Privileged EXEC (#)   |  |  |  |  |
| Command History    | Release   | Modification   |  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced.   |  |  |  |
| Usage Guidelines   | After you enable the <b>clear ipv6 mfib counters</b> command, you can determine if additional traffic is forwarded by using one of the following show commands that display traffic counters: |  |  |  |  |
|                    | • show ipv6 mfib  |  |  |  |  |
|                    | • show ipv6 mfib active   | e  |  |  |  |
|                    | • show ipv6 mfib count  |  |  |  |  |
|                    | • show ipv6 mfib interface  |  |  |  |  |
|                    | • show ipv6 mfib summ   | nary   |  |  |  |
| Examples           | <b>Examples</b> The following example clears and resets all MFIB traffic counters:  |  |  |  |  |
|                    | Device# clear ipv6 mfik   | o counters   |  |  |  |

## clear ipv6 mld counters

To clear the Multicast Listener Discovery (MLD) interface counters, use the **clear ipv6 mld counters** command in privileged EXEC mode.

clear ipv6 mld [vrf vrf-name] counters [interface-type]

| Syntax Description | vrf vrf-name  | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |                                      |                          |  |
|--------------------|---|--|--------------------------------------|--------------------------|--|
|                    | <i>interface-type</i> (Optional) Interface type. For more information, use the question mark (?) online help function.  |  |                                      |                          |  |
| Command Modes      | Privileged EXE  | C (#)  |                                      |                          |  |
| Command History    | Release   |  | Modification                         |                          |  |
|                    | Cisco IOS XE Everest<br>16.5.1aThis command was introduced.   |  |                                      |                          |  |
| Usage Guidelines   | Use the <b>clear ipv6 mld counters</b> command to clear the MLD counters, which keep track of the number of joins and leaves received. If you omit the optional <i>interface-type</i> argument, the <b>clear ipv6 mld counters</b> command clears the counters on all interfaces. |  |                                      |                          |  |
| Examples           | The following e   | xample clear   | rs the counters for Ethernet interfa | ice 1/0:                 |  |
|                    | Device# <b>clear</b>  | ipv6 mld c   | counters Ethernet1/0                 |                          |  |
| Related Commands   | Command   |  | Description                          |                          |  |
|                    | show ipv6 mld   | interface  | Displays multicast-related inform    | ation about an interface |  |

# clear ipv6 mld traffic

To reset the Multicast Listener Discovery (MLD) traffic counters, use the **clear ipv6 mld traffic** command in privileged EXEC mode.

clear ipv6 mld [vrf vrf-name] traffic

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |                                      |                     |  |
|--------------------|---|--------------------------------------|---------------------|--|
| Command Modes      | Privileged EXEC (#)   |                                      |                     |  |
| Command History    | Release   | Modification                         |                     |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced          | -                   |  |
| Usage Guidelines   | Using the <b>clear ipv6 ml</b>  | l traffic command will reset all MLI | D traffic counters. |  |
| Examples           | The following example resets the MLD traffic counters:  |                                      |                     |  |
|                    | Device# clear ipv6 mld traffic  |                                      |                     |  |
|                    | Command   | Description                          |                     |  |
|                    | show ipv6 mld traffic   | Displays the MLD traffic counters.   |                     |  |

#### clear ipv6 mtu

To clear the maximum transmission unit (MTU) cache of messages, use the **clear ipv6 mtu**command in privileged EXEC mode.

#### clear ipv6 mtu

Syntax Description This command has no arguments or keywords.

**Command Default** Messages are not cleared from the MTU cache.

Command Modes Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

Usage Guidelines If a router is flooded with ICMPv6 toobig messages, the router is forced to create an unlimited number of entries in the MTU cache until all available memory is consumed. Use the clear ipv6 mtu command to clear messages from the MTU cache.

**Examples** The following example clears the MTU cache of messages:

Device# clear ipv6 mtu

| Related Commands | Command      | Description  |  |
|------------------|--------------|--|--|
|                  | ipv6 flowset | Configures flow-label marking in 1280-byte or larger packets sent by the router. |  |

#### clear ipv6 multicast aaa authorization

To clear authorization parameters that restrict user access to an IPv6 multicast network, use the **clear ipv6 multicast aaa authorization**command in privileged EXEC mode.

aaa authorization multicast default Sets parameters that restrict user access to an IPv6 multicast network.

clear ipv6 multicast aaa authorization [interface-type interface-number]

| Syntax Description | 0 01 0   |           | erface type and number. For more information, use the question mark online help function.                            |
|--------------------|--|-----------|--|
| Command Modes      | Privileged EXEC (#)  |           |  |
| Command History    | Release  | Modific   | ation  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This cor  | mmand was introduced.  |
| Usage Guidelines   | e i  |           | <b>thorization</b> command without the optional <i>interface-type</i> and all authorization parameters on a network. |
| Examples           | The following example clears all configured authorization parameters on an IPv6 network: |           |  |
|                    | Device# <b>clear ipv6 mult</b>   | icast aaa | authorization FastEthernet 1/0   |
| Related Commands   | Command Description  |           | Description  |

# clear ipv6 nd destination

To clear IPv6 host-mode destination cache entries, use the **clear ipv6 nd destination** command in privileged EXEC mode.

clear ipv6 nd destination[vrf vrf-name]

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration.  |                              |                         |
|--------------------|--|------------------------------|-------------------------|
| Command Modes      | Privileged EXEC (#)  |                              |                         |
| Command History    | Release  | Modification                 |                         |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced. |                         |
| Usage Guidelines   | The <b>clear ipv6 nd destination</b> command clears IPv6 host-mode destination cache entries. If the <b>vrf</b> <i>vrf-name</i> keyword and argument pair is used, then only information about the specified VRF is cleared. |                              |                         |
| Examples           | The following example shows how to clear IPv6 host-mode destination cache entries:<br>Device# clear ipv6 nd destination  |                              | tination cache entries: |
|                    |  |                              |                         |

| Related Commands | Command                  | Description  |
|------------------|--------------------------|--|
|                  | ipv6 nd host mode strict | Enables the conformant, or strict, IPv6 host mode. |

# clear ipv6 nd on-link prefix

To clear on-link prefixes learned through router advertisements (RAs), use the **clear ipv6 nd on-link prefix** command in privileged EXEC mode.

clear ipv6 nd on-link prefix[vrf vrf-name]

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |   |   |
|--------------------|---|---|---|
| Command Modes      | Privileged EXEC (#)   |   |   |
| Command History    | Release   | Modification                                  |   |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced.                  | -   |
| Usage Guidelines   | -   | f the <b>vrf</b> vrf-name keyword and arguing | reachable IPv6 addresses (e.g., on-link prefixes)<br>ment pair is used, then only information about |
| Examples           | The following example   | s shows how to clear on-link prefixes l       | earned through RAs:   |
|                    | Device# <b>clear ipv6</b>   | nd on-link prefix                             |   |
|                    |   |   |   |

| Related Commands | Command                  | Description  |
|------------------|--------------------------|--|
|                  | ipv6 nd host mode strict | Enables the conformant, or strict, IPv6 host mode. |

# clear ipv6 nd router

To clear neighbor discovery (ND) device entries learned through router advertisements (RAs), use the **clear ipv6 nd router** command in privileged EXEC mode.

clear ipv6 nd router[vrf vrf-name]

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |  |   |
|--------------------|---|--|---|
| Command Modes      | Privileged EXEC (#)   |  |   |
| Command History    | Release   | Modification   |   |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced.   |   |
| Usage Guidelines   | -   | ter command to clear ND device entr<br>ir is used, then only information about | - |
| Examples           | The following example shows how to clear neighbor discovery ND device entries learned through RAs:    |  |   |
|                    | Device# clear ipv6 nd   | router   |   |
|                    |   |  |   |

| Related Commands | Command                  | Description  |
|------------------|--------------------------|--|
|                  | ipv6 nd host mode strict | Enables the conformant, or strict, IPv6 host mode. |

#### clear ipv6 neighbors

To delete all entries in the IPv6 neighbor discovery cache, except static entries and ND cache entries on non-virtual routing and forwarding (VRF) interfaces, use the **clear ipv6 neighbors** command in privileged EXEC mode.

**clear ipv6 neighbors** [{**interface** *type number*[**ipv6** *ipv6-address*] | **statistics** | **vrf** *table-name* [{*ipv6-address* | **statistics**}]}]

| Syntax Description | <b>interface</b> <i>type number</i> (Optional) Clears the IPv6 neighbor discovery cache in the specified interface.  |   |  |  |  |
|--------------------|--|---|--|--|--|
|                    | ipv6 ipv6-address  | ipv6 ipv6-address(Optional) Clears the IPv6 neighbor discovery cache that matches the specified<br>IPv6 address on the specified interface. |  |  |  |
|                    | statistics   | (Optional) Clears the IPv6 neighbo  | or discovery entry cache.  |  |  |
|                    | vrf  | (Optional) Clears entries for a virtu forwarding instance.  | ual private network (VPN) routing or   |  |  |
|                    | table-name   | (Optional) Table name or identifier. The value range is from 0x0 to 0xFFFFFFFF<br>(0 to 65535 in decimal).                                  |  |  |  |
| Command Modes      | Privileged EXEC (#)  |   |  |  |  |
| Command History    | Release  | Modification  |  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.  |  |  |  |
| Usage Guidelines   | then the command clears N interfaces that do not have a  | D cache entries on interfaces associa   | te command is issued without the <b>vrf</b> keyword,<br>ated with the default routing table (e.g., those<br>command is issued with the <b>vrf</b> keyword, then<br>cified VRF. |  |  |
| Examples           | The following example deletes all entries, except static entries and ND cache entries on non-VRF interfaces, in the neighbor discovery cache:                        |   |  |  |  |
|                    | Device# clear ipv6 neighbors   |   |  |  |  |
|                    | The following example clears all IPv6 neighbor discovery cache entries, except static entries and ND cache entries on non-VRF interfaces, on Ethernet interface 0/0: |   |  |  |  |
|                    | Device# clear ipv6 neighbors interface Ethernet 0/0  |   |  |  |  |
|                    | The following example clears a neighbor discovery cache entry for 2001:0DB8:1::1 on Ethernet interface 0/0:  |   |  |  |  |
|                    | interface 0/0:   | с , , ,   |  |  |  |

#### clear ipv6 neighbors

#### Device# clear ipv6 neighbors interface Ethernet0/0 ipv6 2001:0DB8:1::1

In the following example, interface Ethernet 0/0 is associated with the VRF named red. Interfaces Ethernet 1/0 and Ethernet 2/0 are associated with the default routing table (because they are not associated with a VRF). Therefore, the **clear ipv6 neighbor** command will clear ND cache entries on interfaces Ethernet 1/0 and Ethernet 2/0 only. In order to clear ND cache entries on interface Ethernet 0/0, the user must issue the **clear ipv6 neighbor vrf** red command.

```
interface ethernet0/0
vrf forward red
ipv6 address 2001:db8:1::1/64
interface ethernet1/0
ipv6 address 2001:db8:2::1/64
interface ethernet2/0
ipv6 address 2001:db8:3::1/64
```

#### **Related Commands**

| Command             | Description   |
|---------------------|---|
| ipv6 neighbor       | Configures a static entry in the IPv6 neighbor discovery cache. |
| show ipv6 neighbors | Displays IPv6 neighbor discovery cache information.             |

#### clear ipv6 nhrp

To clear all dynamic entries from the Next Hop Resolution Protocol (NHRP) cache, use the **clear ipv6 nhrp** command in privileged EXEC mode.

clear ipv6 nhrp [{ipv6-address | counters}]

| Syntax Description | ipv6-address | (Optional) The IPv6 network to delete.        |  |  |
|--------------------|--------------|---|--|--|
|                    | counters     | (Optional) Specifies NHRP counters to delete. |  |  |

Command Modes Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |  |
|-----------------|---------------------------------|------------------------------|--|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |  |

Usage Guidelines This command does not clear any static (configured) IPv6-to-nonbroadcast multiaccess (NBMA) address mappings from the NHRP cache.

**Examples** The following example shows how to clear all dynamic entries from the NHRP cache for the interface:

Device# clear ipv6 nhrp

| Related Commands | Command        | Description              |
|------------------|----------------|--------------------------|
|                  | show ipv6 nhrp | Displays the NHRP cache. |

## clear ipv6 ospf

To clear the Open Shortest Path First (OSPF) state based on the OSPF routing process ID, use the **cl ear ipv6 ospf** command in privileged EXEC mode.

clear ipv6 ospf [process-id] {process | force-spf | redistribution}

| Syntax Description | process-id   | (Optional) Internal identification. It is locally assigned and can be any positive integer.<br>The number used here is the number assigned administratively when enabling the OSPF routing process. |                                    |   |  |  |  |  |
|--------------------|--|---|------------------------------------|---|--|--|--|--|
|                    | process  | Restarts the  | Restarts the OSPF process.         |   |  |  |  |  |
|                    | force-spf  | Starts the sl   | hortest path first (SPF) algorithm | n without first clearing the OSPF database. |  |  |  |  |
|                    | redistribution   | Clears OSPF route redistribution.   |                                    |   |  |  |  |  |
| Command Modes      | Privileged EXEC  | C (#)   |                                    |   |  |  |  |  |
| Command History    | Release  |   | Modification                       | ]   |  |  |  |  |
|                    | Cisco IOS XE Evo<br>16.5.1a  |   | This command was introduced.       | -   |  |  |  |  |
| Usage Guidelines   | When the <b>process</b> keyword is used with the <b>clear ipv6 ospf</b> command, the OSPF database is cleared and repopulated, and then the shortest path first (SPF) algorithm is performed. When the <b>force-spf</b> keyword is used with the <b>clear ipv6 ospf</b> command, the OSPF database is not cleared before the SPF algorithm is performed. |   |                                    |   |  |  |  |  |
|                    | Use the <i>process</i> -processesare clea  | e process-idoptionis not specified, all OSPF  |                                    |   |  |  |  |  |
| Examples           | The following example starts the SPF algorithm without clearing the OSPF database:   |   |                                    |   |  |  |  |  |
|                    | Device# clear ipv6 ospf force-spf  |   |                                    |   |  |  |  |  |

#### clear ipv6 ospf counters

To clear the Open Shortest Path First (OSPF) state based on the OSPF routing process ID, use the **cl ear ipv6 ospf** command in privileged EXEC mode.

clear ipv6 ospf [process-id] counters [neighbor [{neighbor-interfaceneighbor-id}]]

| Syntax Description | process-id   | (Optional) Internal identification. It is locally assigned and can be any positive integer.<br>The number used here is the number assigned administratively when enabling the OSPF routing process. |  |  |  |  |
|--------------------|--|---|--|--|--|--|
|                    | neighbor   | (Optional) Neighbor statistics per interface or neighbor ID.  |  |  |  |  |
|                    | neighbor-interface   | (Optional) Neighbor interface.  |  |  |  |  |
|                    | neighbor-id  | (Optional) IPv6 or IP address of the neighbor.  |  |  |  |  |
| Command Modes      | Privileged EXEC (#)  |   |  |  |  |  |
| Command History    | Release  | Modification  |  |  |  |  |
|                    | Cisco IOS XE Ever<br>16.5.1a   | est This command was introduced.  |  |  |  |  |
| Usage Guidelines   | Use the <b>neighbor</b> <i>neighbor-interface</i> option to clear counters for all neighbors on a specified interface. If the <b>neighbor</b> <i>neighbor-interface</i> option is not used, all OSPF counters are cleared. |   |  |  |  |  |
|                    |  | <i>ighbor-id</i> option to clear counters at a specified neighbor. If the <b>neighbor</b> <i>neighbor-id</i> OSPF counters are cleared.   |  |  |  |  |
| Examples           | The following exam   | ple provides detailed information on a neighbor router:   |  |  |  |  |
|                    | Neighbor 10.0.0.<br>In the area 1<br>Neighbor:inte<br>Neighbor prio:<br>Options is 0x<br>Dead timer du<br>Neighbor is up<br>Index 1/1/1,<br>First 0x0(0)/<br>Last retransm<br>Last retransm                                | via interface Serial19/0<br>rface-id 21, link-local address FE80::A8BB:CCFF:FE00:6F00<br>rity is 1, State is FULL, 6 state changes<br>194AE05   |  |  |  |  |

Device# clear ipv6 ospf counters neighbor s19/0

The following example now shows that there have been 0 state changes since the **clear ipv6 ospf counters neighbor s19/0** command was used:

Device# show ipv6 ospf neighbor detail Neighbor 10.0.0.1 In the area 1 via interface Serial19/0 Neighbor:interface-id 21, link-local address FE80::A8BB:CCFF:FE00:6F00 Neighbor priority is 1, State is FULL, 0 state changes Options is 0x194AE05 Dead timer due in 00:00:39 Neighbor is up for 00:00:43 Index 1/1/1, retransmission queue length 0, number of retransmission 1 First 0x0(0)/0x0(0) /0x0(0) Next 0x0(0)/0x0(0) Last retransmission scan length is 1, maximum is 1 Last retransmission scan time is 0 msec, maximum is 0 msec

| Related Commands | Command                 | Description  |  |  |
|------------------|-------------------------|--|--|--|
|                  | show ipv6 ospf neighbor | Displays OSPF neighbor information on a per-interface basis. |  |  |

## clear ipv6 ospf events

To clear the Open Shortest Path First (OSPF) for IPv6 event log content based on the OSPF routing process ID, use the **cl ear ipv6 ospf events** command in privileged EXEC mode.

clear ipv6 ospf [process-id] events

| Syntax Description | <i>process-id</i> (Optional) Internal identification. It is locally assigned and can be any positive integer number used here is the number assigned administratively when enabling the OSPF reprocess. |               |  |  |  |
|--------------------|---|---------------|--|--|--|
| Command Modes      | Privileged E  | XEC (#)       |  |  |  |

| Usage Guidelines   | -   | *             | argument to clear the IPv6 event s not used, all event log content | log content of a specified OSPF routing process. is cleared. |  |
| Examples           | The following example enables the clearing of OSPF for IPv6 event log content for routing process 1:  |               |  |  |  |
|                    | Device# <b>cl</b>   | ear ipv6 ospf | 1 events   |  |  |

## clear ipv6 pim reset

To delete all entries from the topology table and reset the Multicast Routing Information Base (MRIB) connection, use the **clear ipv6 pim reset** command in privileged EXEC mode.

clear ipv6 pim [vrf vrf-name] reset

| Syntax Description | vrf             | vrf-name          | (Optional)    | Specifies a virtual                                      | routing and fo | orwarding ( | VRF) config   | uration.  |  |
|--------------------|-----------------|-------------------|---------------|--|----------------|-------------|---------------|-----------|--|
| Command Modes      | Privile         | ged EXEC          | (#)           |  |                |             |               |           |  |
| Command History    | Relea           | Release           |               | Modification   |                |             |               |           |  |
|                    | Cisco<br>16.5.1 | IOS XE E<br>a     | verest        | This command w   | vas introduced |             |               |           |  |

## clear ipv6 pim topology

To clear the Protocol Independent Multicast (PIM) topology table, use the **clear ipv6 pim topology** command in privileged EXEC mode.

clear ipv6 pim [vrf vrf-name] topology [{group-namegroup-address}]

| Syntax Description | vrf vrf-name(Optional) Specifies a virtual routing and forwarding (VRF) configuration. |  |   |  |  |  |  |
|--------------------|--|--|---|--|--|--|--|
|                    | group-name   group-address   | <i>ne</i>   <i>group-address</i> (Optional) IPv6 address or name of the multicast group. |   |  |  |  |  |
| Command Default    | When the command is used wi<br>of PIM protocol information.                            | th no arguments, all group entries   | s located in the PIM topology table are cleared   |  |  |  |  |
| Command Modes      | Privileged EXEC (#)  |  |   |  |  |  |  |
| Command History    | Release  | Modification   |   |  |  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.   |   |  |  |  |  |
| Usage Guidelines   | ÷  | • •  | entries located in the PIM topology table.<br>ticast group is specified, only those group |  |  |  |  |
| Examples           | The following example clears all group entries located in the PIM topology table:      |  |   |  |  |  |  |
|                    |  |  |   |  |  |  |  |

# clear ipv6 pim traffic

To clear the Protocol Independent Multicast (PIM) traffic counters, use the **clear ipv6 pim traffic** command in privileged EXEC mode.

clear ipv6 pim [vrf vrf-name] traffic

| Syntax Description | vrf vrf-name                 | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |   |   |  |  |  |  |
|--------------------|------------------------------|---|---|---|--|--|--|--|
| Command Default    | When the com                 | mand is used  | with no arguments, all traffic cou          | inters are cleared.                         |  |  |  |  |
| Command Modes      | Privileged EXI               | EC (#)  |   |   |  |  |  |  |
| Command History    | Release                      |   | Modification                                |   |  |  |  |  |
|                    | Cisco IOS XE<br>16.5.1a      | E Everest   | This command was introduced                 | <u>.</u>                                    |  |  |  |  |
| Usage Guidelines   | This command counters are cl |   | raffic counters. If the <b>vrf</b> vrf-name | e keyword and argument are used, only those |  |  |  |  |
| Examples           | The following                | The following example clears all PIM traffic counter:   |   |   |  |  |  |  |
|                    | Device# <b>clea</b> :        | r ipv6 pim  | traffic                                     |   |  |  |  |  |

# clear ipv6 prefix-list

To reset the hit count of the IPv6 prefix list entries, use the **clear ipv6 prefix-list** command in privileged EXEC mode.

clear ipv6 prefix-list [prefix-list-name] [ipv6-prefix/prefix-length]

|                    | first_list that match the network mask 2001:0DB8::/35.   |   |                           |                                       |  |  |
|--------------------|--|---|---------------------------|---------------------------------------|--|--|
| Examples           | The following example clears the hit count from the prefix list entries for the prefix list named first list that match the natural mask 2001:0DB8://25  |   |                           |                                       |  |  |
|                    | The hit count is a   | value indicati  | ing the number of mate    | ches to a specific prefix list entry. |  |  |
| Usage Guidelines   | The <b>clear ipv6 prefix-list</b> command is similar to the <b>clear ip prefix-list</b> command, except that it is IPv6-specific.  |   |                           |                                       |  |  |
|                    | Cisco IOS XE Ev<br>16.5.1a   | verest  | This command was intr     | roduced.                              |  |  |
| Command History    | Release Mod  |   | Modification              |                                       |  |  |
| Command Modes      | Privileged EXEC  | (#)   |                           |                                       |  |  |
| Command Default    | The hit count is a   | utomatically c  | cleared for all IPv6 pref | fix lists.                            |  |  |
|                    | / prefix-length  | prefix. A decimal value that indicates how many of the<br>ddress comprise the prefix (the network portion of the<br>de the decimal value. |                           |                                       |  |  |
|                    | <i>ipv6-prefix</i> (Optional) The IPv6 network from which the hit count is to be cleared.<br>This argument must be in the form documented in RFC 2373 where the address is spec in hexadecimal using 16-bit values between colons. |   |                           |                                       |  |  |
|                    |  |   |                           |                                       |  |  |
| Syntax Description | prefix-list-name   | (Optional) The name of the prefix list from which the hit count is to be cleared.   |                           |                                       |  |  |

| Related Commands | Command                          | Description  |
|------------------|----------------------------------|--|
|                  | ipv6 prefix-list                 | Creates an entry in an IPv6 prefix list.                                       |
|                  | ipv6 prefix-list sequence-number | Enables the generation of sequence numbers for entries in an IPv6 prefix list. |
|                  | show ipv6 prefix-list            | Displays information about an IPv6 prefix list or prefix list entries.         |

## clear ipv6 rip

To delete routes from the IPv6 Routing Information Protocol (RIP) routing table, use the **clear ipv6 rip** command in privileged EXEC mode.

clear ipv6 rip [name][vrf vrf-name]

clear ipv6 rip [name]

| Syntax Description | name  | (Optional) Name of an IPv6 RIP process.  |                              |  |
|--------------------|---|--|------------------------------|--|
|                    | vrf vrf-name  | e (Optional) Clears information about the specified Virtual Routing and Forwarding (VRF) instance. |                              |  |
| Command Modes      | Privileged EXE  | C (#)  |                              |  |
| Command History    | Release   |  | Modification                 |  |
|                    | Cisco IOS XE Everest 16.5.1a  |  | This command was introduced. |  |
| Usage Guidelines   | <ul> <li>When the <i>name</i> argument is specified, only routes for the specified IPv6 RIP process are deleted from the IPv6 RIP routing table. If no <i>name</i> argument is specified, all IPv6 RIP routes are deleted.</li> <li>Use the <b>show ipv6 rip</b> command to display IPv6 RIP routes.</li> <li>Use the <b>clear ipv6 rip</b> <i>name</i> <b>vrf</b> <i>vrf-name</i> command to delete the specified VRF instances for the specified IPv6 RIP process.</li> </ul> |  |                              |  |
| Examples           | The following example deletes all the IPv6 routes for the RIP process called one:   |  |                              |  |
|                    | Device# clear ipv6 rip one  |  |                              |  |
|                    | The following example deletes the IPv6 VRF instance, called vrf1 for the RIP process, called one:   |  |                              |  |
|                    | Device# clear ipv6 rip one vrf vrf1   |  |                              |  |
|                    | <pre>*Mar 15 12:36:17.022: RIPng: Deleting 2001:DB8::/32 *Mar 15 12:36:17.022: [Exec]IPv6RT[vrf1]: rip <name>, Delete all next-hops for 2001:DB8::1 *Mar 15 12:36:17.022: [Exec]IPv6RT[vrf1]: rip <name>, Delete 2001:DB8::1 from table *Mar 15 12:36:17.022: [IPv6 RIB Event Handler]IPv6RT[<red>]: Event: 2001:DB8::1, Del, owner rip, previous None</red></name></name></pre>  |  |                              |  |

| Related Commands | Command                  | Description  |
|------------------|--------------------------|--|
|                  | debug ipv6 rip           | Displays the current contents of the IPv6 RIP routing table. |
|                  | ipv6 rip vrf-mode enable | Enables VRF-aware support for IPv6 RIP.                      |
|                  | show ipv6 rip            | Displays the current content of the IPv6 RIP routing table.  |

#### clear ipv6 route

To delete routes from the IPv6 routing table, use the **clear ipv6 route** command in privileged EXEC mode.

{clear ipv6 route {ipv6-addressipv6-prefix/prefix-length} | \*}

| Syntax Description | ipv6-address    | The address of the IPv6 network to delete from the table.<br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                        |
|--------------------|-----------------|--|
|                    | ipv6-prefix     | The IPv6 network number to delete from the table.<br>This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.                                |
|                    | l prefix-length | The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
|                    | *               | Clears all IPv6 routes.  |

#### **Command Modes** Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

Usage Guidelines The clear ipv6 route command is similar to the clear ip route command, except that it is IPv6-specific.

When the *ipv6-address* or *ipv6-prefixl prefix-length* argument is specified, only that route is deleted from the IPv6 routing table. When the \* keyword is specified, all routes are deleted from the routing table (the per-destination maximum transmission unit [MTU] cache is also cleared).

**Examples** The following example deletes the IPv6 network 2001:0DB8::/35:

Device# clear ipv6 route 2001:0DB8::/35

|  |                 | Description  |
|--|-----------------|--|
|  | ipv6 route      | Establishes static IPv6 routes.                          |
|  | show ipv6 route | Displays the current contents of the IPv6 routing table. |

#### clear ipv6 spd

To clear the most recent Selective Packet Discard (SPD) state transition, use the **clear ipv6 spd** command in privileged EXEC mode.

#### clear ipv6 spd

**Syntax Description** This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** The **clear ipv6 spd** command removes the most recent SPD state transition and any trend historical data.

**Examples** The following example shows how to clear the most recent SPD state transition:

Device# clear ipv6 spd

#### debug nhrp

To enable Next Hop Resolution Protocol (NHRP) debugging, use the **debug nhrp** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

**debug nhrp** [{attribute | cache | condition {interface tunnel *number* | peer {nbma {*ipv4-nbma-address nbma-name ipv6-nbma-address*} } | **umatched** | **vrf** *vrf-name*} | **detail** | **error** | **extension** | **group** | **packet** | **rate**}]

no debug nhrp [{attribute | cache | condition {interface tunnel *number* | peer {nbma {*ipv4-nbma-address nbma-name ipv6-nbma-address*} } unmatched | vrf *vrf-name*} | detail | error | extension | group | packet | rate }]

| Syntax Description | attribute               | (Optional) Enables NHRP attribute debugging operations.                                       |
|--------------------|-------------------------|---|
|                    | cache                   | (Optional) Enables NHRP cache debugging operations.   |
|                    | condition               | (Optional) Enables NHRP conditional debugging operations.                                     |
|                    | interface tunnel number | (Optional) Enables debugging operations for the tunnel interface.                             |
|                    | nbma                    | (Optional) Enables debugging operations for the non-broadcast multiple access (NBMA) network. |
|                    | ipv4-nbma-address       | (Optional) Enables debugging operations based on the IPv4 address of the NBMA network.        |
|                    | nbma-name               | (Optional) NBMA network name.   |
|                    | IPv6-address            | (Optional) Enables debugging operations based on the IPv6 address of the NBMA network.        |
|                    | vrf vrf-name            | (Optional) Enables debugging operations for the virtual routing and forwarding instance.      |
|                    | detail                  | (Optional) Displays detailed logs of NHRP debugs.   |
|                    | error                   | (Optional) Enables NHRP error debugging operations.   |
|                    | extension               | (Optional) Enables NHRP extension processing debugging operations.                            |
|                    | group                   | (Optional) Enables NHRP group debugging operations.   |
|                    | packet                  | (Optional) Enables NHRP activity debugging.   |
|                    | rate                    | (Optional) Enables NHRP rate limiting.  |
|                    | routing                 | (Optional) Enables NHRP routing debugging operations.   |

**Command Default** NHRP debugging is not enabled.

Command Modes

Privileged EXEC (#)

| Command History  | Release  | Modification  |   |  |  |
|------------------|--|---|---|--|--|
|                  | Cisco IOS XE Denali 16.5.1   | This command was introduced.  |   |  |  |
| Usage Guidelines | Use the <b>debug nhrp detail</b> c   | ommand to view the NHRP attri   | bute logs.  |  |  |
|                  | The <b>Virtual-Access</b> <i>number</i> keyword-argument pair is visible only if the virtual access interface is available on the device.                  |   |   |  |  |
| Examples         | The following sample output from the <b>debug nhrp</b> command displays NHRP debugging output for IPv4:  |   |   |  |  |
|                  | Switch# debug nhrp   |   |   |  |  |
|                  | Aug 9 13:13:41.486: NHR<br>Aug 9 13:13:41.486: NHR<br>Aug 9 13:13:41.486: NHR<br>Aug 9 13:13:41.486:<br>Aug 9 13:13:41.486: NHR<br>Aug 9 13:13:41.486: NHR | P: Send Registration Reques<br>src: 10.1.1.11, dst: 10.<br>P: 105 bytes out Tunnel0 | Tunnel IP addr 10.11.11.99<br>t via Tunnel0 vrf 0, packet size: 105 |  |  |

| Related Commands | Command      | Description                        |
|------------------|--------------|------------------------------------|
|                  | show ip nhrp | Displays NHRP mapping information. |

# fhrp delay

To specify the delay period for the initialization of First Hop Redundancy Protocol (FHRP) clients, use the **fhrp delay** command in interface configuration mode. To remove the delay period specified, use the **no** form of this command.

fhrp delay { [minimum] [reload] seconds }
no fhrp delay { [minimum] [reload] seconds }

| Syntax Description | <b>minimum</b> (Optional) Configures the delay period after an interface becomes available. |  |
|--------------------|---|--|
|                    | reload  | (Optional) Configures the delay period after the device reloads. |
|                    | seconds Delay period in seconds. The range is from 0 to 3600.                               |  |
| Command Default    | None  |  |
| Command Modes      | Interface configuration (config-if)   |  |
| Examples           | This example shows how to specify the delay period for the initialization of FHRP clients:  |  |

Device(config-if) # fhrp delay minimum 90

| Related Commands | Command   | Description  |
|------------------|-----------|--|
|                  | show fhrp | Displays First Hop Redundancy Protocol (FHRP) information. |

### fhrp version vrrp v3

To enable Virtual Router Redundancy Protocol version 3 (VRRPv3) and Virtual Router Redundancy Service (VRRS) configuration on a device, use the **fhrp version vrrp v3** command in global configuration mode. To disable the ability to configure VRRPv3 and VRRS on a device, use the **no** form of this command.

fhrp version vrrp v3 no fhrp version vrrp v3

| Syntax Description | This command has no keywords or arguments.  |  |  |  |  |
|--------------------|---|--|--|--|--|
| Command Default    | VRRPv3 and VRRS configuration on a device is not enabled.   |  |  |  |  |
| Command Modes      | Global configuration (config)   |  |  |  |  |
| Usage Guidelines   | When VRRPv3 is in use, VRRP version 2 (VRRPv2) is unavailable.  |  |  |  |  |
| Examples           | In the following example, a tracking process is configured to track the state of an IPv6 object using a VRRPv3 group. VRRP on GigabitEthernet interface 0/0/0 then registers with the tracking process to be informed of any changes to the IPv6 object on the VRRPv3 group. If the IPv6 object state on serial interface VRRPv3 goes down, then the priority of the VRRP group is reduced by 20: |  |  |  |  |
|                    | Device(config)# fhrp version vrrp v3<br>Device(config)# interface GigabitEthernet 0/0/0<br>Device(config-if)# vrrp 1 address-family ipv6<br>Device(config-if-vrrp)# track 1 decrement 20  |  |  |  |  |
|                    |   |  |  |  |  |

| Related Commands Command |              | Description   |
|--------------------------|--------------|---|
|                          | track (VRRP) | Enables an object to be tracked using a VRRPv3 group. |

### ip address dhcp

To acquire an IP address on an interface from the DHCP, use the **ip address dhcp** command in interface configuration mode. To remove any address that was acquired, use the **no** form of this command.

**ip address dhcp** [**client-id** *interface-type number*] [**hostname** *hostname*] **no ip address dhcp** [**client-id** *interface-type number*] [**hostname** *hostname*]

| Syntax Description | client-id  | (Optional) Specifies the client identifier. By default, the client identifier is an ASCII value.<br>The <b>client-id</b> <i>interface-type number</i> option sets the client identifier to the hexadecimal MAC address of the named interface.  |  |  |
|--------------------|--|---|--|--|
|                    | interface-type   | (Optional) Interface type. For more information, use the question mark (?) online help function.  |  |  |
|                    | number   | (Optional) Interface or subinterface number. For more information about the numberin syntax for your networking device, use the question mark (?) online help function.   |  |  |
|                    | hostname   | (Optional) Specifies the hostname.  |  |  |
|                    | hostname   | (Optional) Name of the host to be placed in the DHCP option 12 field. This name need not be the same as the hostname entered in global configuration mode.  |  |  |
| Command Default    | The hostname is  | s the globally configured hostname of the device. The client identifier is an ASCII value.  |  |  |
| Command Modes      | Interface configuration (config-if)  |   |  |  |
| Usage Guidelines   | The <b>ip address dhcp</b> command allows any interface to dynamically learn its IP address by uprotocol. It is especially useful on Ethernet interfaces that dynamically connect to an Internet (ISP). Once assigned a dynamic address, the interface can be used with the Port Address Translation (NAT) to provide Internet access to a privately address attached to the device.   |   |  |  |
|                    | The <b>ip address dhcp</b> command also works with ATM point-to-point interfaces and will accept any encapsulation type. However, for ATM multipoint interfaces you must specify Inverse ARP via the <b>protoc ip inarp</b> interface configuration command and use only the aa15snap encapsulation type.  |   |  |  |
|                    | <ul> <li>Some ISPs require that the DHCPDISCOVER message have a specific hostname and client identifier that the MAC address of the interface. The most typical usage of the <b>ip address dhcp client-id</b> <i>interface-type number</i> <b>hostname</b> <i>hostname</i> command is when <i>interface-type</i> is the Ethernet interface where the comman is configured and <i>interface-type number</i> is the hostname provided by the ISP.</li> <li>A client identifier (DHCP option 61) can be a hexadecimal or an ASCII value. By default, the client identifier is an ASCII value. The <b>client-id</b> <i>interface-type number</i> option overrides the default and forces the use of the hexadecimal MAC address of the named interface.</li> </ul> |   |  |  |
|                    |  |   |  |  |
|                    |  | e is configured to obtain its IP address from a DHCP server, it sends a DHCPDISCOVER vide information about itself to the DHCP server on the network.   |  |  |
|                    | field (hostname  | <b>address dhcp</b> command with or without any of the optional keywords, the DHCP option 12 option) is included in the DISCOVER message. By default, the hostname specified in option obally configured hostname of the device. However, you can use the <b>ip address dhcp hostname</b> |  |  |

*hostname* command to place a different name in the DHCP option 12 field than the globally configured hostname of the device.

The **no ip address dhcp** command removes any IP address that was acquired, thus sending a DHCPRELEASE message.

You might need to experiment with different configurations to determine the one required by your DHCP server. The table below shows the possible configuration methods and the information placed in the DISCOVER message for each method.

| Configuration Method                                      | Contents of DISCOVER Messages   |  |
|---|---|--|
| ip address dhcp   | The DISCOVER message contains "cisco- <i>mac-address</i> -Eth1" in the client ID field. The <i>mac-address</i> is the MAC address of the Ethernet 1 interface and contains the default hostname of the device in the option 12 field. |  |
| <b>ip address dhcp hostname</b><br><i>hostname</i>        | The DISCOVER message contains "cisco- <i>mac-address</i> -Eth1" in the client ID field. The <i>mac-address</i> is the MAC address of the Ethernet 1 interface, and contains <i>hostname</i> in the option 12 field.                   |  |
| ip address dhcp client-id ethernet<br>1                   | The DISCOVER message contains the MAC address of the Ethernet 1 interface in the client ID field and contains the default hostname of the device in the option 12 field.  |  |
| ip address dhcp client-id ethernet<br>1 hostname hostname | The DISCOVER message contains the MAC address of the Ethernet 1 interface in the client ID field and contains <i>hostname</i> in the option 12 field.   |  |

Table 1: Configuration Method and Resulting Contents of the DISCOVER Message

### **Examples**

In the examples that follow, the command **ip address dhcp** is entered for Ethernet interface 1. The DISCOVER message sent by a device configured as shown in the following example would contain "cisco-*mac-address* -Eth1" in the client-ID field, and the value abc in the option 12 field.

```
hostname abc
!
interface GigabitEthernet 1/0/1
ip address dhcp
```

The DISCOVER message sent by a device configured as shown in the following example would contain "cisco- mac-address -Eth1" in the client-ID field, and the value def in the option 12 field.

```
hostname abc
!
interface GigabitEthernet 1/0/1
ip address dhcp hostname def
```

The DISCOVER message sent by a device configured as shown in the following example would contain the MAC address of Ethernet interface 1 in the client-id field, and the value abc in the option 12 field.

hostname abc !

```
interface Ethernet 1
ip address dhcp client-id GigabitEthernet 1/0/1
```

The DISCOVER message sent by a device configured as shown in the following example would contain the MAC address of Ethernet interface 1 in the client-id field, and the value def in the option 12 field.

```
hostname abc
!
interface Ethernet 1
ip address dhcp client-id GigabitEthernet 1/0/1 hostname def
```

| Related Commands | Command      | Description  |  |
|------------------|--------------|--|--|
|                  | ip dhcp pool | Configures a DHCP address pool on a Cisco IOS DHCP server and enters DHCP pool configuration mode. |  |

# ip address pool (DHCP)

To enable the IP address of an interface to be automatically configured when a Dynamic Host Configuration Protocol (DHCP) pool is populated with a subnet from IP Control Protocol (IPCP) negotiation, use the **ip address pool** command in interface configuration mode. To disable autoconfiguring of the IP address of the interface, use the **no** form of this command.

ip address pool *name* no ip address pool

| Syntax Description | name  | <i>name</i> Name of the DHCP pool. The IP address of the interface will be automatically configured from the DHCP pool specified in <i>name</i> . |  |  |  |
|--------------------|---|---|--|--|--|
| Command Default    | IP addr   | ess pooling is  | s disabled.  |  |  |
| Command Modes      | Interface configuration   |   |  |  |  |
| Usage Guidelines   | Use this command to automatically configure the IP address of a LAN interface when there are DHCP clients<br>on the attached LAN that should be serviced by the DHCP pool on the device. The DHCP pool obtains its<br>subnet dynamically through IPCP subnet negotiation. |   |  |  |  |
| Examples           | The following example specifies that the IP address of GigabitEthernet interface 1/0/1 will be automatically configured from the address pool named abc:  |   |  |  |  |
|                    | impo:<br>orig:<br>!<br>interfa  | p pool abc<br>rt all<br>in ipcp<br>ace Gigabit<br>ddress pool   | Ethernet 1/0/1<br>abc  |  |  |
| Related Commands   | Comma   | and   | Description  |  |  |
|                    | show i  | p interface   | Displays the usability status of interfaces configured for IP. |  |  |

### ip address

To set a primary or secondary IP address for an interface, use the **ip address** command in interface configuration mode. To remove an IP address or disable IP processing, use the noform of this command.

ip address ip-address mask [secondary [vrf vrf-name]]
no ip address ip-address mask [secondary [vrf vrf-name]]

| Syntax Description | ip-address | IP address.   |  |
|--------------------|------------|---|--|
|                    | mask       | Mask for the associated IP subnet.  |  |
|                    | secondary  | (Optional) Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address. |  |
|                    |            | <b>Note</b> If the secondary address is used for a VRF table configuration with the <b>vrf</b> keyword, the <b>vrf</b> keyword must be specified also.    |  |
|                    | vrf        | (Optional) Name of the VRF table. The <i>vrf-name</i> argument specifies the VRF name of the ingress interface.   |  |

### **Command Default** No IP address is defined for the interface.

**Command Modes** Interface configuration (config-if)

| nmand History | Release                         | Modification                 |  |
|---------------|---------------------------------|------------------------------|--|
|               | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

#### Usage Guidelines

Com

An interface can have one primary IP address and multiple secondary IP addresses. Packets generated by the Cisco IOS software always use the primary IP address. Therefore, all devices and access servers on a segment should share the same primary network number.

Hosts can determine subnet masks using the Internet Control Message Protocol (ICMP) mask request message. Devices respond to this request with an ICMP mask reply message.

You can disable IP processing on a particular interface by removing its IP address with the **no ip address** command. If the software detects another host using one of its IP addresses, it will print an error message on the console.

The optional **secondary** keyword allows you to specify an unlimited number of secondary addresses. Secondary addresses are treated like primary addresses, except the system never generates datagrams other than routing updates with secondary source addresses. IP broadcasts and Address Resolution Protocol (ARP) requests are handled properly, as are interface routes in the IP routing table.

Secondary IP addresses can be used in a variety of situations. The following are the most common applications:

• There may not be enough host addresses for a particular network segment. For example, your subnetting allows up to 254 hosts per logical subnet, but on one physical subnet you need 300 host addresses. Using

secondary IP addresses on the devices or access servers allows you to have two logical subnets using one physical subnet.

- Many older networks were built using Level 2 bridges. The judicious use of secondary addresses can aid in the transition to a subnetted, device-based network. Devices on an older, bridged segment can be easily made aware that many subnets are on that segment.
- Two subnets of a single network might otherwise be separated by another network. This situation is not permitted when subnets are in use. In these instances, the first network is *extended*, or layered on top of the second network using secondary addresses.

Note

- If any device on a network segment uses a secondary address, all other devices on that same segment must also use a secondary address from the same network or subnet. Inconsistent use of secondary addresses on a network segment can very quickly cause routing loops.
- When you are routing using the Open Shortest Path First (OSPF) algorithm, ensure that all secondary
  addresses of an interface fall into the same OSPF area as the primary addresses.
- If you configure a secondary IP address, you must disable sending ICMP redirect messages by entering the **no ip redirects** command, to avoid high CPU utilization.

To transparently bridge IP on an interface, you must perform the following two tasks:

- Disable IP routing (specify the no ip routing command).
- Add the interface to a bridge group, see the bridge-group command.

To concurrently route and transparently bridge IP on an interface, see the **bridge crb** command.

**Examples** 

In the following example, 192.108.1.27 is the primary address and 192.31.7.17 is the secondary address for GigabitEthernet interface 1/0/1:

```
Device> enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/1
Device(config-if)# ip address 192.108.1.27 255.255.255.0
Device(config-if)# ip address 192.31.7.17 255.255.255.0 secondary
```

| Related Commands | Command               | Description   |
|------------------|-----------------------|---|
|                  | match ip route-source | Specifies a source IP address to match to required route maps that have been set<br>up based on VRF connected routes. |
|                  | route-map             | Defines the conditions for redistributing routes from one routing protocol into another, or to enable policy routing. |
|                  | set vrf               | Enables VPN VRF selection within a route map for policy-based routing VRF selection.                                  |
|                  | show ip arp           | Displays the ARP cache, in which SLIP addresses appear as permanent ARP table entries.                                |

I

| Command   | Description |  |
|---|-------------|--|
| show ip interfaceDisplays the usability status of interfaces configured for IP. |             |  |
| show route-mapDisplays static and dynamic route maps.                           |             |  |

### ip nat inside source

To enable Network Address Translation (NAT) of the inside source address, use the **ip nat inside source** command in global configuration mode. To remove the static translation, or the dynamic association to a pool, use the **no** form of this command.

### **Dynamic NAT**

ip nat inside source { list { access-list-number access-list-name } | route-map name } {
interface type number | pool name } [no-payload] [overload] [c] [vrf name]
no ip nat inside source { list { access-list-number access-list-name } | route-map name }
{ interface type number | pool name } [no-payload] [overload] [vrf name]

### Static NAT

ip nat inside source static { interface type number | local-ip global-ip} [extendable] [no-alias] [no-payload] [ route-map name ] [reversible][ vrf name [forced] ] no ip nat inside source static { interface type number | local-ip global-ip} [extendable] [no-alias] [no-payload] [ route-map name ] [ vrf name [forced] ]

#### Port Static NAT

ip nat inside source static {tcp | udp} {local-ip local-port global-ip global-port [extendable]
[forced] [no-alias] [no-payload] [route-map name] [vrf name] | interface global-port}
no ip nat inside source static {tcp | udp} {local-ip local-port global-ip global-port [extendable]
[forced] [no-alias] [no-payload] [route-map name] [vrf name] | interface global-port}

### **Network Static NAT**

**ip nat inside source static network** *local-network global-network mask* [extendable] [forced] [no-alias] [no-payload] [vrf name]

**no ip nat inside source static network** *local-network global-network mask* [**extendable**] [**forced**] [**no-alias**] [**no-payload**] [**vrf** *name*]

| Syntax Description | list access-list-number | Specifies the number of a standard IP access list. Packets with source addresses that pass the access list are dynamically translated using global addresses from the named pool. |
|--------------------|-------------------------|---|
|                    | list access-list-name   | Specifies the name of a standard IP access list. Packets with source addresses that pass the access list are dynamically translated using global addresses from the named pool.   |
|                    | route-map name          | Specifies the named route map.  |
|                    | interface               | Specifies an interface for the global address.  |
|                    | type                    | Interface type. For more information, use the question mark (?) online help function.   |
|                    | number                  | Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function.                     |
|                    | pool name               | Specifies the name of the pool from which global IP addresses are allocated dynamically.  |

| no-payload            | (Optional) Prohibits the translation of an embedded address or port in the payload  |  |  |
|-----------------------|---|--|--|
| overload              | (Optional) Enables the device to use one global address for many local addresses<br>When overloading is configured, the TCP or UDP port number of each inside hos<br>distinguishes between the multiple conversations using the same local IP address |  |  |
| vrf name              | (Optional) Associates the NAT translation rule with a particular VPN routing an forwarding (VRF) instance.  |  |  |
| static                | Sets up a single static translation.  |  |  |
| local-ip              | Local IP address assigned to a host on the inside network. The address could be randomly chosen, allocated from RFC 1918, or obsolete.  |  |  |
| global-ip             | Globally unique IP address of an inside host as it appears to the outside network   |  |  |
| extendable            | (Optional) Extends the translation.   |  |  |
| forced                | (Optional) Forcefully deletes an entry and its children from the configuration.   |  |  |
| no-alias              | (Optional) Prohibits an alias from being created for the global address.  |  |  |
| tcp                   | Establishes the TCP protocol.   |  |  |
| udp                   | Establishes the UDP protocol.   |  |  |
| local-port            | Local TCP or UDP port. The range is from 1 to 65535.  |  |  |
| global-port           | Global TCP or UDP port. The range is from 1 to 65535.   |  |  |
| network local-network | Specifies the local subnet translation.   |  |  |
| global-network        | Global subnet translation.  |  |  |
| mask                  | IP network mask to be used with subnet translations.  |  |  |

|-------------------------------------|---|---|-------------------|--|
|                                     | Cisco IOS XE Everest 16.5.1a                                  | This command was introduced.  |                   |  |
|                                     | Cisco IOS XE Dublin 17.10.1                                   | The route-map keyword was introduced.   |                   |  |
|                                     | Cisco IOS XE Amsterdam 17.1.1 The vrf keyword was introduced. |   |                   |  |
|                                     | The optional keywords of the <b>ip</b>                        | nat inside source command can be ent  | ered in any order |  |
|                                     |   | e dynamic and the static address translation. Packets from addresses that match the |                   |  |

This command has two forms: the dynamic and the static address translation. The form with an access list establishes the dynamic translation. Packets from addresses that match the standard access list are translated using global addresses allocated from the pool named with the **ip nat pool** command.

Packets that enter the device through the inside interface and packets sourced from the device are checked against the access list for possible NAT candidates. The access list is used to specify which traffic is to be translated.

Alternatively, the syntax form with the keyword static establishes a single static translation.

Note

When a session is initiated from outside with the source IP as the outside global address, the device is unable to determine the destination VRF of the packet.

Note

When you configure NAT with a VRF-enabled interface address that acts as the global address, you must configure the **ip nat inside source static no-alias** command. If the **no-alias** keyword is not configured, Telnet to the VRF-enabled interface address fails.

#### **Examples**

The following example shows how to translate between inside hosts addressed from either the 192.0.2.0 or the 198.51.100.0 network to the globally unique 203.0.113.209/28 network:

```
ip nat pool net-209 203.0.113.209 203.0.113.222 prefix-length 28
ip nat inside source list 1 pool net-209
!
interface ethernet 0
ip address 203.0.113.113 255.255.255.240
ip nat outside
!
interface ethernet 1
ip address 192.0.2.1 255.255.255.0
ip nat inside
!
access-list 1 permit 192.0.2.1 255.255.255.0
access-list 1 permit 198.51.100.253 255.255.255.0
```

The following example shows how to translate the traffic that is local to the provider's edge device running NAT (NAT-PE):

```
ip nat inside source list 1 interface ethernet 0 vrf vrf1 overload
ip nat inside source list 1 interface ethernet 0 vrf vrf2 overload
!
ip route vrf vrf1 10.0.0.1 10.0.0.1 192.0.2.1
ip route vrf vrf2 10.0.0.1 10.0.0.1 192.0.2.1
!
access-list 1 permit 10.1.1.1 0.0.0.255
!
ip nat inside source list 1 interface ethernet 1 vrf vrf1 overload
ip nat inside source list 1 interface ethernet 1 vrf vrf2 overload
!
ip route vrf vrf1 10.0.0.1 10.0.0.1 198.51.100.1 global
ip route vrf vrf2 10.0.0.1 10.0.0.1 198.51.100.1 global
access-list 1 permit 10.1.1.0 0.0.0.255
```

The following example shows how to translate sessions from outside to inside networks:

ip nat pool POOL-A 10.1.10.1 10.1.10.126 255.255.255.128 ip nat pool POOL-B 10.1.20.1 10.1.20.126 255.255.255.128 ip nat inside source route-map MAP-A pool POOL-A reversible

```
ip nat inside source route-map MAP-B pool POOL-B reversible
ip access-list extended ACL-A
permit ip any 10.1.10.128 0.0.0.127
ip access-list extended ACL-B
permit ip any 10.1.20.128 0.0.0.127
!
route-map MAP-A permit 10
match ip address ACL-A
!
route-map MAP-B permit 10
match ip address ACL-B
!
```

The following example shows how to configure the route map R1 to allow outside-to-inside translation for static NAT:

```
ip nat inside source static 10.1.1.1 10.2.2.2 route-map R1 reversible
ip access-list extended ACL-A
permit ip any 10.1.10.128 0.0.0.127
route-map R1 permit 10
match ip address ACL-A
```

The following example shows how to configure NAT inside and outside traffic in the same VRF:

```
interface Loopback1
ip vrf forwarding forwarding1
ip address 192.0.2.11 255.255.255.0
ip nat inside
ip virtual-reassembly
1
interface Ethernet0/0
ip vrf forwarding forwarding2
ip address 192.0.2.22 255.255.255.0
ip nat outside
ip virtual-reassembly
ip nat pool MYPOOL 192.0.2.5 192.0.2.5 prefix-length 24
ip nat inside source list acl-nat pool MYPOOL vrf vrf1 overload
1
ip access-list extended acl-nat
permit ip 192.0.2.0 0.0.0.255 any
```

#### **Related Commands**

| Command   | Description   |  |
|---|---|--|
| access-list (IP extended)   | Defines an extended IP access list.   |  |
| access-list (IP standard)   | Defines a standard IP access list.  |  |
| clear ip nat translationClears dynamic NAT translations from the translation table. |   |  |
| interface   | Configures an interface type and enters interface configuration mode.                     |  |
| ip access-list  | Defines an IP access list or object group access control list by name or number.          |  |
| ip nat  | Designates that traffic originating from or destined for the interface is subject to NAT. |  |

| Command   | Description   |  |  |
|---|---|--|--|
| ip nat inside destination   | Enables NAT of the inside destination address.  |  |  |
| ip nat outside source   | Enables NAT of the outside source address.  |  |  |
| ip nat pool   | Defines a pool of IP addresses for NAT.   |  |  |
| ip nat service  | Enables a port other than the default port.   |  |  |
| ip route vrf  | Establishes static routes for a VRF instance.   |  |  |
| <b>p vrf forwarding</b> Associates a VRF instance with a diameter peer.   |   |  |  |
| permit  | Sets conditions in a named IP access list or object group access control list that will permit packets. |  |  |
| <b>route-map</b> Defines the conditions for redistributing routes from one routing pro another routing protocol, or enables policy routing. |   |  |  |
| show ip nat statistics         Displays NAT statistics.   |   |  |  |
| show ip nat translations Displays active NAT translations.  |   |  |  |

### ip nat outside source

To enable Network Address Translation (NAT) of the outside source address, use the **ip nat outside source** command in global configuration mode. To remove the static entry or the dynamic association, use the **no** form of this command.

#### Dynamic NAT

ip nat outside source { list { access-list-number access-list-name } } pool pool-name
[ vrf name ] [add-route]
no ip nat outside source { list { access-list-number access-list-name } } pool pool-name
[ vrf name ] [add-route]

#### Static NAT

ip nat outside source static global-ip local-ip [vrf name] [add-route] [extendable]
[no-alias]
no ip nat outside source static global-ip local-ip [vrf name] [add-route] [extendable]
[no-alias]

#### Port Static NAT

ip nat outside source static { tcp | udp } global-ip global-port local-ip local-port [
vrf name ] [add-route] [extendable] [no-alias]
no ip nat outside source static { tcp | udp } global-ip global-port local-ip local-port
[ vrf name ] [add-route] [extendable] [no-alias]

### **Network Static NAT**

**ip nat outside source static network** *global-network local-network mask* [**vrf** *name*] [**add-route**] [**extendable**] [**no-alias**]

**no ip nat outside source static network** *global-network local-network mask* [**vrf** *name*] [**add-route**] [**extendable**] [**no-alias**]

### Syntax Description

| Specifies the number of a standard IP access list. Packets with source addresses that pass the access list are translated using global addresses from the named pool. |  |
|---|--|
| Specifies the name of a standard IP access list. Packets with source addresses that pass the access list are translated using global addresses from the named pool.   |  |
| Specifies the name of the pool from which global IP addresses are allocated.  |  |
| (Optional) Adds a static route for the outside local address.   |  |
| (Optional) Associates the NAT rule with a particular VPN routing and forwardi (VRF) instance.   |  |
| Sets up a single static translation.  |  |
| Globally unique IP address assigned to a host on the outside network by its owner<br>The address was allocated from the globally routable network space.              |  |
|   |  |

|   | local-ip  | Local IP address of an outside host as it appears to the inside network. The address was allocated from the address space routable on the inside (RFC 1918, Address Allocation for Private Internets).   |  |  |  |  |
|---|---|--|--|--|--|--|
|   | extendable  | (Optional) Extends the transmission.   |  |  |  |  |
|   | no-alias  | (Optional) Prohibits an alias from being created for the local address.  |  |  |  |  |
|   | tcp   | Establishes the TCP.   |  |  |  |  |
|   | udp   | Establishes the UDP.   |  |  |  |  |
|   | global-port   | Port number assigned to a host on the outside network by its owner.  |  |  |  |  |
|   | local-port  | Port number of an outside host as it appears to the inside network.  |  |  |  |  |
|   | static network  | Sets up a single static network translation.   |  |  |  |  |
|   | global-network  | Globally unique network address assigned to a host on the outside network by its owner. The address is allocated from a globally routable network space.   |  |  |  |  |
|   | local-network   | Local network address of an outside host as it appears to the inside network. The address is allocated from an address space that is routable on the inside network.   |  |  |  |  |
|   | mask  | Subnet mask for the networks that are translated.  |  |  |  |  |
| Command Default Command Modes Command History | No translation of source addresses coming from the outside to the inside network occurs.<br>Global configuration (config)   |  |  |  |  |  |
| Command History                               | Release   | Modification   |  |  |  |  |
|   | Cisco IOS XE Ever   | est 16.5.1a This command was introduced.   |  |  |  |  |
|   | Cisco IOS XE Amsterdam 17.1.1 The vrf keyword was introduced.   |  |  |  |  |  |
| Usage Guidelines                              | The optional keywords of the <b>ip nat outside source</b> command except for the <b>vrf</b> <i>name</i> keyword can be entered in any order.  |  |  |  |  |  |
|   | You can use NAT to translate inside addresses that overlap with outside addresses. Use this command if your IP addresses in the stub network happen to be legitimate IP addresses belonging to another network, and you need to communicate with those hosts or devices.  |  |  |  |  |  |
|   | This command has two general forms: dynamic and static address translation. The form with an access list establishes dynamic translation. Packets from addresses that match the standard access list are translated using global addresses allocated from the pool that is named by using the <b>ip nat pool</b> command. |  |  |  |  |  |
|   | Alternatively, the syntax form with the static keyword establishes a single static translation.   |  |  |  |  |  |
|   | addresses, there is a   | the <b>ip nat outside source static</b> command to add static routes for static outside local delay in the translation of packets and packets are dropped. To avoid dropped packets, <b>ip nat outside source static add-route</b> command or the <b>ip route</b> command. |  |  |  |  |

#### **Examples**

The following example shows how to translate between inside hosts addressed from the 10.114.11.0 network to the globally unique 10.69.233.208/28 network. Further, packets from outside hosts addressed from the 10.114.11.0 network (the true 10.114.11.0 network) are translated to appear to be from the 10.0.1.0/24 network.

```
ip nat pool net-208 10.69.233.208 10.69.233.223 prefix-length 28
ip nat pool net-10 10.0.1.0 10.0.1.255 prefix-length 24
ip nat inside source list 1 pool net-208
ip nat outside source list 1 pool net-10
!
interface ethernet 0
ip address 10.69.232.182 255.255.255.240
ip nat outside
!
interface ethernet 1
ip address 10.114.11.39 255.255.255.0
ip nat inside
!
access-list 1 permit 10.114.11.0 0.0.0.255
```

| Related Commands | Command                   | Description  |
|------------------|---------------------------|--|
|                  | access-list (IP extended) | Defines an extended IP access list.  |
|                  | access-list (IP standard) | Defines a standard IP access list.   |
|                  | clear ip nat translation  | Clears dynamic NAT from the translation table.   |
|                  | interface                 | Configures an interface type and enters interface configuration mode.                    |
|                  | ip address                | Sets a primary or secondary IP address for an interface.                                 |
|                  | ip nat                    | Designates the traffic originating from or destined for the interface as subject to NAT. |
|                  | ip nat inside destination | Enables NAT of the inside destination address.   |
|                  | ip nat inside source      | Enables NAT of the inside source address.  |
|                  | ip nat pool               | Defines a pool of IP addresses for NAT.  |
|                  | ip nat service            | Enables a port other than the default port.  |
|                  | ip route                  | Establishes static routes.   |
|                  | show ip nat statistics    | Displays NAT statistics.   |
|                  | show ip nat translations  | Displays active NATs.  |

### ip nat pool

To define a pool of IP addresses for Network Address Translation (NAT) translations, use the **ip nat pool** command in global configuration mode. To remove one or more addresses from the pool, use the **no** form of this command.

ip nat pool name start-ip end-ip { netmask netmask | prefix-length prefix-length }
[add-route] [ type ]
no ip nat pool name start-ip end-ip { netmask netmask | prefix-length prefix-length }
[add-route] [ type ]

| Syntax Description | name   |                         | Name of the pool.  |  |                             |       |  |
|--------------------|--|-------------------------|--|--|-----------------------------|-------|--|
|                    | start-ip   |                         | Starting IP address that defines the range of addresses in the address pool.   |  |                             |       |  |
|                    | end-ip   |                         | Ending IP address that defines the range of addresses in the address pool.   |  |                             |       |  |
|                    | netmask netmask         prefix-length prefix-length         add-route  |                         | Specifies the network mask that indicates the address bits that<br>belong to the network and subnetwork fields and the ones that<br>belong to the host field.• Specify the network mask of the network to which the<br>pool addresses belong.Specifies the number that indicates how many bits of the<br>address is dedicated for the network.(Optional) Specifies that a route is added to the NAT Virtual<br>Interface (NVI) for the global address. |  |                             |       |  |
|                    |  |                         |  |  |                             |       |  |
|                    |  |                         |  |  |                             | type  |  |
| Command Default    |  |                         |  |  | No pool of addresses is def | îned. |  |
| Command Modes      | Global configuration (confi  | ig)                     |  |  |                             |       |  |
| Command History    | -  |                         |  |  |                             |       |  |
| Command History    | Release  | Modification            |  |  |                             |       |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This comman introduced. | d was  |  |                             |       |  |
| Usage Guidelines   | This command defines a pool of addresses by specifying the start address, the end address, ar mask or prefix length. |                         | specifying the start address, the end address, and either network  |  |                             |       |  |
|                    | When you enable the <b>no-al</b> pool.   | lias keyword, IP a      | liases are not created for IP addresses mentioned in the NAT   |  |                             |       |  |

Using the **nopreservation** keyword with the **prefix-length** or the **netmask** keyword disables the default behavior, which is known as IP address reservation. The **no** form of the command with the **nopreservation** keyword enables the default behavior and reserves the first IP address in the NAT pool, making the IP address unavailable for dynamic translation.

#### **Examples**

The following example shows how to translate between inside hosts addressed from either the 192.0.2.1 or 192.0.2.2 network to the globally unique 10.69.233.208/28 network:

```
ip nat pool net-208 10.69.233.208 10.69.233.223 prefix-length 28
ip nat inside source list 1 pool net-208
!
interface ethernet 0
    ip address 10.0.0.1 255.255.255.240
    ip nat outside
!
interface ethernet 1
    ip address 192.0.2.4 255.255.255.0
    ip nat inside
!
access-list 1 permit 192.0.2.1 0.0.0.255
access-list 1 permit 192.0.2.2 0.0.0.255
```

The following example shows how to add a route to the NVI interface for the global address:

ip nat pool NAT 192.0.2.0 192.0.2.3 netmask 255.255.255.0 add-route ip nat source list 1 pool NAT vrf group1 overload

| Related Commands | Command                  | Description  |
|------------------|--------------------------|--|
|                  | access-list              | Defines a standard IP access list.   |
|                  | clear ip nat translation | Clears dynamic NAT translations from the translation table.                              |
|                  | debug ip nat             | Displays information about IP packets translated by NAT.                                 |
|                  | interface                | Configures an interface and enters interface configuration mode.                         |
|                  | ip address               | Sets a primary or secondary IP address for an interface.                                 |

|                  | show ip nat translations | Displays active NAT translations.  |

### ip nat translation (timeout)

To change the Network Address Translation (NAT) timeout, use the **ip nat translation** command in global configuration mode. To disable the timeout, use the **no** form of this command.

ip nat translation { finrst-timeout | icmp-timeout | port-timeout { tcp | udp } port-number |
syn-timeout | tcp-timeout | udp-timeout } {seconds | never}
no ip nat translation { finrst-timeout | icmp-timeout | port-timeout { tcp | udp } port-number
| syn-timeout | tcp-timeout | timeout | udp-timeout }

| Syntax Description | finrst-timeout | Specifies that the timeout value applies to Finish and Reset TCP packets, which terminate a connection. The default is 60 seconds.   |
|--------------------|----------------|--|
|                    | icmp-timeout   | Specifies the timeout value for Internet Control Message Protocol (ICMP) flows. The default is 60 seconds.   |
|                    | port-timeout   | Specifies that the timeout value applies to the TCP/UDP port.  |
|                    | tcp            | Specifies TCP.   |
|                    | udp            | Specifies UDP.   |
|                    | port-number    | Port number for TCP or UDP. The range is from 1 to 65535.  |
|                    | syn-timeout    | Specifies that the timeout value applies to TCP flows immediately<br>after a synchronous transmission (SYN) message that consists of<br>digital signals that are sent with precise clocking. The default is 60<br>seconds. |
|                    | tcp-timeout    | Specifies that the timeout value applies to the TCP port. Default is 86,400 seconds (24 hours).  |
|                    | timeout        | Specifies that the timeout value applies to dynamic translations,<br>except for overload translations. The default is 86,400 seconds (24<br>hours).  |
|                    | udp-timeout    | Specifies that the timeout value applies to the UDP port. The default is 300 seconds (5 minutes).  |
|                    | seconds        | Number of seconds after which the specified port translation times out.  |
|                    | never          | Specifies that port translation will not time out.   |

**Command Default** NAT translation timeouts are enabled by default.

**Command Modes** Global configuration (config)

|                  | ip nat translation max-entries | Limits the size of a NAT table to a specified maximum.   |
|                  | show ip nat statistics         | Displays NAT statistics.   |
|                  | show ip nat translations       | Displays active NAT translations.  |

# ip nhrp authentication

To configure the authentication string for an interface using the Next Hop Resolution Protocol (NHRP), use the **ip nhrp authentication** command in interface configuration mode. To remove the authentication string, use the **no** form of this command.

**ip nhrp authentication** *string* **no ip nhrp authentication** [*string*]

| Syntax Description | stringAuthentication string configured for the source and destination stations that controls whether NHRP<br>stations allow intercommunication. The string can be up to eight characters long. |  |  |  |
|--------------------|--|--|--|--|
| Command Default    | No authentication string is configured; the Cisco IOS software adds no authentication option to NHRP packets it generates.   |  |  |  |
| Command Modes      | Interface configuratio   | n (config-if)  |  |  |
| Command History    | Release  | Modification   |  |  |
|                    | Cisco IOS XE Fuji<br>16.8.1a   | This command was introduced.                               |  |  |
| Usage Guidelines   | All devices configured the same authentication   | •  | roadcast multiaccess (NBMA) network must share |  |
| Examples           | In the following example, the authentication string named specialxx must be configured in all devices using NHRP on the interface before NHRP communication occurs:                            |  |  |  |
|                    | Device(config-if)#   | Device(config-if)# <b>ip nhrp authentication specialxx</b> |  |  |

# ip nhrp holdtime

To change the number of seconds that Next Hop Resolution Protocol (NHRP) nonbroadcast multiaccess (NBMA) addresses are advertised as valid in authoritative NHRP responses, use the **ip nhrp holdtime** command in interface configuration mode. To restore the default value, use the **no** form of this command.

**ip nhrp holdtime** seconds **no ip nhrp holdtime** [seconds]

| Syntax Description | seconds             | Time in seco<br>responses.      | onds that NBMA addresses are adv  | ertised as valid in positive authoritative NHRP   |
|--------------------|---------------------|---------------------------------|---|---|
|                    |                     |                                 | a higher value can be used when rea                                     | e value ranges from 300 to 600 seconds. Although<br>quired, we recommend that you do not use a value<br>, it should be used with extreme caution.       |
| Command Default    | 7200 seco           | onds (2 hours)                  |   |   |
| Command Modes      | Interface           | configuration                   | (config-if)   |   |
| Command History    | Release             |                                 | Modification  |   |

### ip nhrp map

To statically configure the IP-to-nonbroadcast multiaccess (NBMA) address mapping of IP destinations connected to an NBMA network, use the **ip nhrp map** interface configuration command. To remove the static entry from Next Hop Resolution Protocol (NHRP) cache, use the **no** form of this command.

**ip nhrp map** {*ip-address* [*nbma-ip-address*][*dest-mask*][*nbma-ipv6-address*] | **multicast** {*nbma-ip-address nbma-ipv6-address* | **dynamic**}}

**no ip nhrp map** {*ip-address* [*nbma-ip-address*][*dest-mask*][*nbma-ipv6-address*] | **multicast** {*nbma-ip-address nbma-ipv6-address* | **dynamic**}}

| Syntax Description | ip-address  | IP address of the destinations reachable through the Nonbroadcast multiaccess (NBMA) network. This address is mapped to the NBMA address.  |  |  |  |
|--------------------|---|--|--|--|--|
|                    | nbma-ip-address   | NBMA IP address.   |  |  |  |
|                    | dest-mask   | Destin   | ation network address for which  | a mask is required.  |  |
|                    | nbma-ipv6-address   | NBMA   | A IPv6 address.  |  |  |
|                    | dynamic   | Dynan  | nically learns destinations from   | client registrations on hub.   |  |
|                    | multicast   | NBMA address that is directly reachable through the NBMA network. The address forma varies depending on the medium you are using. For example, ATM has a Network Service Access Point (NSAP) address, Ethernet has a MAC address, and Switched Multimegabi Data Service (SMDS) has an E.164 address. This address is mapped to the IP address. |  |  |  |
| Command Default    | No static IP-to-NB  | MA cac   | the entries exist.   |  |  |
| Command Modes      | Interface configura   | tion (co   | onfig-if)  |  |  |
| Command History    | Release   |  | Modification   |  |  |
|                    | Cisco IOS XE Fuji<br>16.8.1a  |  | This command was introduced.   |  |  |
| Usage Guidelines   |   |  | configure at least one static map<br>configure multiple IP-to-NBM/   | ping in order to reach the next-hop server. Repeat A address mappings. |  |
| Examples           | In the following example, this station in a multipoint tunnel network is statically configured to be served by two next-hop servers 10.0.0.1 and 10.0.1.3. The NBMA address for 10.0.0.1 is statically configured to be 192.0.0.1 and the NBMA address for 10.0.1.3 is 192.2.7.8. |  |  |  |  |
|                    | Device(config-if<br>Device(config-if  | )# ip 1<br>)# ip 1<br>)# ip 1  | ace tunnel 0<br>nhrp nhs 10.0.0.1<br>nhrp nhs 10.0.1.3<br>nhrp map 10.0.0.1 192.0.0.1<br>nhrp map 10.0.1.3 192.2.7.8 |  |  |

### **Examples**

In the following example, if a packet is sent to 10.255.255.255, it is replicated to destinations 10.0.0.1 and 10.0.0.2. Addresses 10.0.0.1 and 10.0.0.2 are the IP addresses of two other routers that are part of the tunnel network, but those addresses are their addresses in the underlying network, not the tunnel network. They would have tunnel addresses that are in network 10.0.0.0.

Device (config) # interface tunnel 0 Device (config-if) # ip address 10.0.0.3 255.0.0.0 Device (config-if) # ip nhrp map multicast 10.0.0.1 Device (config-if) # ip nhrp map multicast 10.0.0.2

| Related Commands | Command       | Description                                     |
|------------------|---------------|---|
|                  | clear ip nhrp | Clears all dynamic entries from the NHRP cache. |

### ip nhrp map multicast

To configure nonbroadcast multiaccess (NBMA) addresses used as destinations for broadcast or multicast packets to be sent over a tunnel network, use the **ip nhrp map multicast** command in interface configuration mode. To remove the destinations, use the **no** form of this command.

**ip nhrp map multicast** {*ip-nbma-address ipv6-nbma-address* | **dynamic**} **no ip nhrp map multicast** {*ip-nbma-address ipv6-nbma-address* | **dynamic**}

| Syntax Description  | <i>ip-nbma-address</i> NBMA address that is directly reachable through the NBMA network. The address   |   |  |   |  |  |
|---|--|---|--|---|--|--|
|   |  | format varies depending on the medium that you are using. |  |   |  |  |
|   | ipv6-nbma-address  | <i>ipv6-nbma-address</i> IPv6 NBMA address.               |  |   |  |  |
|   | dynamic  | Dynam   | nically learns destinations fro  | m client registrations on the hub.                  |  |  |
| Command Default   | No NBMA addresses are configured as destinations for broadcast or multicast packets.   |   |  |   |  |  |
| Command Modes   | Interface configuration  | on (conf  | ig-if)   |   |  |  |
| Command History   | Release  |   | Modification   |   |  |  |
|   | Cisco IOS XE Denali 16.5.1   |   | This command was introduc  | ed.   |  |  |
| Usage Guidelines  | This command applies only to tunnel interfaces. This command is useful for supporting broadca tunnel network when the underlying network does not support IP multicast. If the underlying ne support IP multicast, you should use the <b>tunnel destination</b> command to configure a multicast of for transmission of tunnel broadcasts or multicasts. |   |  | port IP multicast. If the underlying network does   |  |  |
| When multiple NBMA addresses are configured, the system replicates the broadcast packet for |  |   |  | m replicates the broadcast packet for each address. |  |  |
| Examples  | <b>mples</b> In the following example, if a packet is sent to 10.255.255.255, it is replicated to destinations 1 and 10.0.0.2:   |   | 255, it is replicated to destinations 10.0.0.1   |   |  |  |

# ip nhrp network-id

To enable the Next Hop Resolution Protocol (NHRP) on an interface, use the **ip nhrp network-id** command in interface configuration mode. To disable NHRP on the interface, use the **no** form of this command.

ip nhrp network-id number
no ip nhrp network-id [number]

| Syntax Description | <i>number</i> Globally unique, 32-bit network identifier from a nonbroadcast multiaccess (NBMA) network.<br>The range is from 1 to 4294967295. |                       |                                |   |
|--------------------|--|-----------------------|--------------------------------|---|
| Command Default    | NHRP is disabled on the interface.   |                       |                                |   |
| Command Modes      | Interface co   | onfiguration (co      | nfig-if)                       |   |
| Command History    | Release  |                       | Modification                   |   |
|                    | Cisco IOS<br>16.8.1a   | XE Fuji               | This command was introduced.   |   |
| Usage Guidelines   | In general, a identifier.  | all NHRP static       | ons within one logical NBMA ne | etwork must be configured with the same network |
| Examples           | The followi  | ng example ena        | ables NHRP on the interface:   |   |
|                    | Device(con   | nfig-if)# <b>ip 1</b> | nhrp network-id 1              |   |

### ip nhrp nhs

16.8.1a

To specify the address of one or more Next Hop Resolution Protocol (NHRP) servers, use the **ip nhrp nhs**command in interface configuration mode. To remove the address, use the **no** form of this command.

**ip nhrp nhs** {*nhs-address* [**nbma** {*nbma-addressFQDN-string*}] [**multicast**] [**priority** *value*] [**cluster** *value*] |**cluster** *value* **max-connections** *value* | **dynamic nbma** {*nbma-addressFQDN-string*} [**multicast**] [**priority** *value*] [**cluster** *value*]}

**no ip nhrp nhs** {*nhs-address* [**nbma** {*nbma-addressFQDN-string*}] [**multicast**] [**priority** *value*] [**cluster** *value*] | **cluster** *value* **max-connections** *value* | **dynamic nbma** {*nbma-addressFQDN-string*} [**multicast**] [**priority** *value*] [**cluster** *value*]}

| Syntax Description | nhs-address   | Address of the next-hop server                                 | being specified.   |  |
|--------------------|---|--|--|--|
|                    | net-address   | (Optional) IP address of a netv                                | vork served by the next-hop server.  |  |
|                    | netmask   | (Optional) IP network mask to<br>is logically ANDed with the m | be associated with the IP address. The IP address ask.   |  |
|                    | nbma  | (Optional) Specifies the nonbroa                               | adcast multiple access (NBMA) address or FQDN.   |  |
|                    | nbma-address  | NBMA address.  |  |  |
|                    | FQDN-string   | Next hop server (NHS) fully q                                  | ualified domain name (FQDN) string.  |  |
|                    | multicast         (Optional) Specifies to use NBMA mapping for broadcasts and multicasts.   |  |  |  |
|                    | priority value  |  | b hubs to control the order in which spokes select<br>range is from 0 to 255; 0 is the highest and 255 |  |
|                    | clustervalue(Optional) Specifies NHS groups. The range is from 0 to 10; 0 is the highest10 is the lowest. The default value is 0. |  |  |  |
|                    | max-connections value   | Specifies the number of NHS active. The range is from 0 to 2   | elements from each NHS group that needs to be 255.   |  |
|                    | dynamic   | Configures the spoke to learn t                                | he NHS protocol address dynamically.   |  |
| Command Default    | No next-hop servers are ex NHRP traffic.  | plicitly configured, so normal ne                              | twork layer routing decisions are used to forward  |  |
| Command Modes      | Interface configuration (co   | nfig-if)   |  |  |
| Command History    | Release   | Modification   |  |  |
|                    | Cisco IOS XE Fuji   | This command was introduced.                                   |  |  |

Use the **ip nhrp nhs** command to specify the address of a next hop server and the networks it serves. Normally, **Usage Guidelines** NHRP consults the network layer forwarding table to determine how to forward NHRP packets. When next hop servers are configured, these next hop addresses override the forwarding path that would otherwise be used for NHRP traffic. When the **ip nhrp nhs dynamic** command is configured on a DMVPN tunnel and the **shut** command is issued to the tunnel interface, the crypto socket does not receive shut message, thereby not bringing up a DMVPN session with the hub. For any next hop server that is configured, you can specify multiple networks by repeating this command with the same nhs-addressargument, but with different IP network addresses. **Examples** The following example shows how to register a hub to a spoke using NBMA and FQDN: Device# configure terminal Device(config) # interface tunnel 1 Device(config-if) # ip nhrp nhs 192.0.2.1 nbma examplehub.example1.com The following example shows how to configure the desired **max-connections** value: Device# configure terminal Device(config) # interface tunnel 1 Device (config-if) # ip nhrp nhs cluster 5 max-connections 100

The following example shows how to configure NHS priority and group values:

```
Device# configure terminal
Device(config)# interface tunnel 1
Device(config-if)# ip nhrp nhs 192.0.2.1 priority 1 cluster 2
```

| Related Commands | Command      | Description   |
|------------------|--------------|---|
|                  | ip nhrp map  | Statically configures the IP-to-NBMA address mapping of IP destinations connected to an NBMA network. |

# Commands Command Description ip nhrp holdtime Changes the number of seconds that NHRP NBMA addresses are advertised as valid in authoritative NHRP responses

### ip unnumbered

To enable IP processing on an interface without assigning an explicit IP address to the interface, use the **ip unnumbered** command in interface configuration mode or subinterface configuration mode. To disable the IP processing on the interface, use the **no** form of this command.

ip unnumbered type number [ poll ] [ point-to-point ]
no ip unnumbered [ type number ]

| Syntax Description | type  | <b>T</b> C'   |                  |                 |  |
|--------------------|---|---|------------------|-----------------|--|
|                    | iype  | Type of interface. For more information, use the question mark (?) online help function.  |                  |                 |  |
|                    | number  | Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function. |                  |                 |  |
|                    | poll  | (Optional) Enables IP connected host polling.   |                  |                 |  |
|                    | point-to-point  | nt (Optional) Enables point to point connection.  |                  |                 |  |
| Command Default    | Unnumbered in   | interfaces are not supported.   |                  |                 |  |
| Command Modes      | nand Modes Interface configuration (config-if)  |   |                  |                 |  |
|                    | Subinterface co   | onfiguratior  | n (config-subif) |                 |  |
| Command History    | Release   |   | Modification     |                 |  |
|                    | Cisco IOS XE<br>16.8.1a   | E Fuji  | This command w   | vas introduced. |  |
| Usage Guidelines   | When an unnumbered interface generates a packet (for example, for a routing update), it uses the address of the specified interface as the source address of the IP packet. It also uses the address of the specified interface in determining which routing processes are sending updates over the unnumbered interface. |   |                  |                 |  |
|                    | The following restrictions are applicable for this command:   |   |                  |                 |  |
|                    | • Serial interfaces using High-Level Data Link Control (HDLC), PPP, Link Access Procedure Balanced (LAPB), Frame Relay encapsulations, and Serial Line Internet Protocol (SLIP), and tunnel interfaces can be unnumbered.   |   |                  |                 |  |
|                    | • You cannot use the <b>ping</b> EXEC command to determine whether the interface is up because the interface has no address. Simple Network Management Protocol (SNMP) can be used to remotely monitor interface status.  |   |                  |                 |  |
|                    | • It is not possible to netboot a Cisco IOS image over a serial interface that is assigned an IP address with the <b>ip unnumbered</b> command.   |   |                  |                 |  |
|                    | • You cannot support IP security options on an unnumbered interface.  |   |                  |                 |  |
|                    | The interface that you specify using the <i>type</i> and <i>number</i> arguments must be enabled (listed as "up" in the <b>show interfaces</b> command display).  |   |                  |                 |  |

If you are configuring Intermediate System-to-Intermediate System (IS-IS) across a serial line, you must configure the serial interfaces as unnumbered. This configuration allows you to comply with RFC 1195, which states that IP addresses are not required on each interface.

Using an unnumbered serial line between different major networks (or *majornets*) requires special care. If at each end of the link there are different majornets assigned to the interfaces that you specified as unnumbered, any routing protocol that is running across the serial line must not advertise subnet information.

### **Examples**

The following example shows how to assign the address of Ethernet 0 to the first serial interface:

```
Device(config) # interface ethernet 0
Device(config-if) # ip address 10.108.6.6 255.255.255.0
!
Device(config-if) # interface serial 0
Device(config-if) # ip unnumbered ethernet 0
```

The following example shows how to configure Ethernet VLAN subinterface 3/0.2 as an IP unnumbered subinterface:

```
Device(config)# interface ethernet 3/0.2
Device(config-subif)# encapsulation dot1q 200
Device(config-subif)# ip unnumbered ethernet 3/1
```

The following example shows how to configure Fast Ethernet subinterfaces in the range from 5/1.1 to 5/1.4 as IP unnumbered subinterfaces:

```
Device(config)# interface range fastethernet5/1.1 - fastethernet5/1.4
Device(config-if-range)# ip unnumbered ethernet 3/1
```

The following example shows how to enable polling on a Gigabit Ethernet interface:

```
Device(config) # interface loopback0
Device(config-if) # ip address 10.108.6.6 255.255.255.0
!
Device(config-if) # ip unnumbered gigabitethernet 3/1
Device(config-if) # ip unnumbered loopback0 poll
```

### ip wccp

To enable support of the specified Web Cache Communication Protocol (WCCP) service for participation in a service group, use the **ip wccp** command in global configuration mode. To disable the service group, use the **no** form of this command.

ip wccp [{ vrf vrf-name }] { web-cache service-number } [service-list service-access-list ]
[ mode { open | closed } ] [group-address multicast-address ] [redirect-list access-list ] [
group-list access-list ] [ password [{ 0 | 7 }] password ]
no ip wccp [{ vrf vrf-name }] { web-cache service-number } [service-list service-access-list ]
[ mode { open | closed } ] [group-address multicast-address ] [redirect-list access-list ]
[ group-list access-list ] [ password [{ 0 | 7 }] password ]

| Syntax Description | vrf vrf-name                              | (Optional) Specifies a virtual routing and forwarding instance (VRF) to associate with a service group.  |  |
|--------------------|---|--|--|
|                    | web-cache                                 | Specifies the web-cache service (WCCP Version 1 and Version 2).  |  |
|                    |   | <b>Note</b> Web-cache counts as one of the services. The maximum number of services, including those assigned with the <i>service-number</i> argument, is 256.   |  |
|                    | service-number                            | Dynamic service identifier, which means the service definition is dictated by the cache. The dynamic service number can be from 0 to 254. The maximum number of services is 256, which includes the web-cache service specified with the <b>web-cache</b> keyword. |  |
|                    |   | <b>Note</b> If Cisco cache engines are used in the cache cluster, the reverse proxy service is indicated by a value of 99.   |  |
|                    | service-list<br>service-access-list       | (Optional) Identifies a named extended IP access list that defines the packets that will match the service.  |  |
|                    | mode open                                 | (Optional) Identifies the service as open. This is the default service mode.   |  |
|                    | mode closed                               | (Optional) Identifies the service as closed.   |  |
|                    | <b>group-address</b><br>multicast-address | (Optional) Specifies the multicast IP address that communicates with the WCCP service group. The multicast address is used by the device to determine which web cache should receive redirected messages.  |  |
|                    | redirect-list access-list                 | (Optional) Specifies the access list that controls traffic redirected to this service group. The <i>access-list</i> argument should consist of a string of no more than 64 characters (name or number) in length that specifies the access list.                   |  |
|                    | group-list access-list                    | (Optional) Specifies the access list that determines which web caches are allowed to participate in the service group. The <i>access-list</i> argument specifies either the number or the name of a standard or extended access list.                              |  |

| password [0   7] password | (Optional) Specifies the message digest algorithm 5 (MD5) authentication for  |
|---------------------------|---|
|                           | messages received from the service group. Messages that are not accepted by   |
|                           | the authentication are discarded. The encryption type can be 0 or 7, with 0   |
|                           | specifying not yet encrypted and 7 for proprietary. The password argument can |
|                           | be up to eight characters in length.  |
|                           |   |

**Command Default** WCCP services are not enabled on the device.

**Command Modes** Global configuration (config)

| Command History | Release                       | Modification   |
|-----------------|-------------------------------|--|
|                 | Cisco IOS XE Everest 16.5.1a  | This command was introduced.   |
|                 | Cisco IOS XE Bengaluru 17.6.1 | The <b>vrf</b> keyword and <i>vrf-name</i> argument pair were added. |

#### **Usage Guidelines**

WCCP transparent caching bypasses Network Address Translation (NAT) when Cisco Express Forwarding switching is enabled. To work around this situation, configure WCCP transparent caching in the outgoing direction, enable Cisco Express Forwarding switching on the content engine interface, and specify the **ip wccp web-cache redirect out** command. Configure WCCP in the incoming direction on the inside interface by specifying the **ip wccp redirect exclude in** command on the device interface facing the cache. This configuration prevents the redirection of any packets arriving on that interface.

You can also include a redirect list when configuring a service group. The specified redirect list will deny packets with a NAT (source) IP address and prevent redirection.

This command instructs a device to enable or disable support for the specified service number or the web-cache service name. A service number can be from 0 to 254. Once the service number or name is enabled, the device can participate in the establishment of a service group.

Note

All WCCP parameters must be included in a single IP WCCP command. For example: **ip wccp 61 redirect-list 10 password password**.

The **vrf** *vrf*-*name* keyword and argument pair is optional. It allows you to specify a VRF to associate with a service group. You can then specify a web-cache service name or service number.

The same service (web-cache or service number) can be configured in different VRF tables. Each service will operate independently.

When the **no ip wccp** command is entered, the device terminates participation in the service group, deallocates space if none of the interfaces still has the service configured, and terminates the WCCP task if no other services are configured.

The keywords following the **web-cache** keyword and the *service-number* argument are optional and may be specified in any order, but only may be specified once. The following sections outline the specific usage of each of the optional forms of this command.

**ip wccp** [**vrf** *vrf*-*name*] {**web-cache** | *service-number*} **group-address** *multicast-address* 

A WCCP group address can be configured to set up a multicast address that cooperating devices and web caches can use to exchange WCCP protocol messages. If such an address is used, IP multicast routing must be enabled so that the messages that use the configured group (multicast) addresses are received correctly.

This option instructs the device to use the specified multicast IP address to coalesce the "I See You" responses for the "Here I Am" messages that it has received on this group address. The response is also sent to the group address. The default is for no group address to be configured, in which case all "Here I Am" messages are responded to with a unicast reply.

#### ip wccp [vrf vrf-name] {web-cache | service-number} redirect-list access-list

This option instructs the device to use an access list to control the traffic that is redirected to the web caches of the service group specified by the service name given. The *access-list* argument specifies either the number or the name of a standard or extended access list. The access list itself specifies which traffic is permitted to be redirected. The default is for no redirect list to be configured (all traffic is redirected).

WCCP requires that the following protocol and ports not be filtered by any access lists:

- UDP (protocol type 17) port 2048. This port is used for control signaling. Blocking this type of traffic prevents WCCP from establishing a connection between the device and web caches.
- Generic routing encapsulation (GRE) (protocol type 47 encapsulated frames). Blocking this type of traffic prevents the web caches from ever seeing the packets that are intercepted.

#### ip wccp [vrf vrf-name] {web-cache | service-number} group-list access-list

This option instructs the device to use an access list to control the web caches that are allowed to participate in the specified service group. The *access-list* argument specifies either the number of a standard or extended access list or the name of any type of named access list. The access list itself specifies which web caches are permitted to participate in the service group. The default is for no group list to be configured, in which case all web caches may participate in the service group.

Note The ip wccp {web-cache | *service-number*} group-list command syntax resembles the ip wccp {web-cache | *service-number*} group-listen command, but these are entirely different commands. The ip wccp group-listen command is an interface configuration command used to configure an interface to listen for multicast notifications from a cache cluster.

#### **ip wccp** [**vrf** *vrf*-*name*] **web-cache** | *service-number*} **password** *password*

This option instructs the device to use MD5 authentication on the messages received from the service group specified by the service name given. Use this form of the command to set the password on the device. You must also configure the same password separately on each web cache. The password can be up to a maximum of eight characters in length. Messages that do not authenticate when authentication is enabled on the device are discarded. The default is for no authentication password to be configured and for authentication to be disabled.

#### ip wccp service-number service-list service-access-list mode closed

In applications where the interception and redirection of WCCP packets to external intermediate devices for the purpose of applying feature processing are not available within Cisco IOS software, packets for the application must be blocked when the intermediary device is not available. This blocking is called a closed service. By default, WCCP operates as an open service, wherein communication between clients and servers proceeds normally in the absence of an intermediary device. The **service-list** keyword can be used only for closed mode services. When a WCCP service is configured as closed, WCCP discards packets that do not have a client application registered to receive the traffic. Use the **service-list** keyword and *service-access-list* argument to register an application protocol type or port number.

When the definition of a service in a service list conflicts with the definition received via the WCCP protocol, a warning message similar to the following is displayed:

Sep 28 14:06:35.923: %WCCP-5-SERVICEMISMATCH: Service 90 mismatched on WCCP client 10.1.1.13

When there is service list definitions conflict, the configured definition takes precedence over the external definition received via WCCP protocol messages.

**Examples** 

The following example shows how to configure a device to run WCCP reverse-proxy service, using the multicast address of 239.0.0.0:

```
Device> enable
Device# configure terminal
Device(config)# ip multicast-routing
Device(config)# ip wccp 99 group-address 239.0.0.0
Device(config)# interface ethernet 0
Device(config-if)# ip wccp 99 group-listen
```

The following example shows how to configure a device to redirect web-related packets without a destination of 10.168.196.51 to the web cache:

```
Device> enable
Device# configure terminal
Device(config)# access-list 100 deny ip any host 10.168.196.51
Device(config)# access-list 100 permit ip any any
Device(config)# ip wccp web-cache redirect-list 100
Device(config)# interface ethernet 0
Device(config-if)# ip wccp web-cache redirect out
```

The following example shows how to configure an access list to prevent traffic from network 10.0.0.0 leaving Fast Ethernet interface 0/0. Because the outbound access control list (ACL) check is enabled, WCCP does not redirect that traffic. WCCP checks packets against the ACL before they are redirected.

```
Device> enable
Device# configure terminal
Device(config)# ip wccp web-cache
Device(config)# ip wccp check acl outbound
Device(config)# interface fastethernet0/0
Device(config-if)# ip access-group 10 out
Device(config-if)# ip wccp web-cache redirect out
Device(config-if)# access-list 10 deny 10.0.0.0 0.255.255.255
Device(config-if)# access-list 10 permit any
```

If the outbound ACL check is disabled, HTTP packets from network 10.0.0.0 would be redirected to a cache, and users with that network address could retrieve web pages when the network administrator wanted to prevent this from happening.

The following example shows how to configure a closed WCCP service:

```
Device> enable
Device# configure terminal
Device(config)# ip wccp 99 service-list access1 mode closed
```

Note

- If multiple parameters are required, all parameters under **ip wccp** [**vrf** *vrf-name*] **web-cache** | *service-number*} must be configured as a single command.
- If the command is reissued with different parameters, the existing parameter will be removed and the new parameter will be configured.

The following example shows how to configure multiple parameters as a single command:

```
Device> enable
Device# configure terminal
Device(config)# ip wccp 61 group-address 10.0.0.1 password 0 password mode closed
redirect-list 121
```

#### **Related Commands**

| Command                     | Description  |
|-----------------------------|--|
| ip wccp check services all  | Enables all WCCP services.   |
| ip wccp group listen        | Configures an interface on a device to enable or disable the reception of IP multicast packets for WCCP. |
| ip wccp redirect exclude in | Enables redirection exclusion on an interface.   |
| ip wccp redirect out        | Configures redirection on an interface in the outgoing direction.  |
| ip wccp version             | Specifies which version of WCCP you want to use on your device.  |
| show ip wccp                | Displays global statistics related to WCCP.  |

### ipv6 access-list

To define an IPv6 access list and to place the device in IPv6 access list configuration mode, use the **ipv6** access-list command in global configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list access-list-name no ipv6 access-list access-list-name

| Syntax Description | access-list-name   | <i>access-list-name</i> Name of the IPv6 access list. Names cannot contain a space or quotation mark, or begin with a numeric. |   |   |
|--------------------|--|--|---|---|
| Command Default    | No IPv6 access lis   | t is defined.  |   |   |
| Command Modes      | Global configurati   | on (config)  |   |   |
| Command History    | Release  |  | Modification  |   |
|                    | Cisco IOS XE Ev<br>16.5.1a   | erest  | This command was introduce  | d.  |
| Usage Guidelines   | The standard IPv6<br>addressesfiltering<br>for finer granularit<br>using the <b>ipv6 acc</b><br>set by using the <b>de</b><br><b>access-list</b> comma | ACL functi<br>g of traffic b<br>y of control<br>ess-list come<br>my and per<br>nd places th<br>6-acl)#. Fro                    | ionality supportsin addition to<br>ased on IPv6 option headers ar<br>l (functionality similar to exter-<br>nmand in global configuration<br><b>rmit</b> commands in IPv6 access<br>ne device in IPv6 access list co | tcommand, except that it is IPv6-specific.<br>o traffic filtering based on source and destination<br>d optional, upper-layer protocol type information<br>nded ACLs in IPv4). IPv6 ACLs are defined by<br>mode and their permit and deny conditions are<br>list configuration mode. Configuring the <b>ipv6</b><br>nfiguration modethe device prompt changes to<br>on mode, permit and deny conditions can be set |
|                    | <b>Note</b> IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.      |  |   |   |
|                    | configuration mod  | e is still sup   | -   | with the <b>deny</b> and <b>permit</b> keywords in global<br>L defined with deny and permit conditions in<br>onfiguration mode.   |

Refer to the deny (IPv6) and permit (IPv6) commands for more information on filtering IPv6 traffic based on IPv6 option headers and optional, upper-layer protocol type information. See the "Examples" section for an example of a translated IPv6 ACL configuration.

Note

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. (The former two match conditions allow for ICMPv6 neighbor discovery.) An IPv6 ACL must contain at least one entry for the implicit **deny ipv6 any any** statement to take effect. The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Note

IPv6 prefix lists, not access lists, should be used for filtering routing protocol prefixes.

Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. Use the **ipv6 access-class** line configuration command with the *access-list-name* argument to apply an IPv6 ACL to incoming and outgoing IPv6 virtual terminal connections to and from the device.

**Note** An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded, not originated, by the device.

Note When using this command to modify an ACL that is already associated with a bootstrap router (BSR) candidate rendezvous point (RP) (see the **ipv6 pim bsr candidate rp** command) or a static RP (see the **ipv6 pim rp-address** command), any added address ranges that overlap the PIM SSM group address range (FF3x::/96) are ignored. A warning message is generated and the overlapping address ranges are added to the ACL, but they have no effect on the operation of the configured BSR candidate RP or static RP commands.

Duplicate remark statements can no longer be configured from the IPv6 access control list. Because each remark statement is a separate entity, each one is required to be unique.

#### Examples

The following example is from a device running Cisco IOS Release 12.0(23)S or later releases. The example configures the IPv6 ACL list named list1 and places the device in IPv6 access list configuration mode.

```
Device(config)# ipv6 access-list list1
Device(config-ipv6-acl)#
```

The following example is from a device running Cisco IOS Release 12.2(2)T or later releases, 12.0(21)ST, or 12.0(22)S. The example configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on Ethernet interface 0. Specifically, the first ACL entry keeps all packets from the network FEC0:0:0:2::/64 (packets that have the site-local prefix FEC0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting out of Ethernet interface 0. The second entry in the ACL permits all other traffic to exit out of Ethernet interface 0. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL.

```
Device(config)# ipv6 access-list list2 deny FEC0:0:0:2::/64 any
Device(config)# ipv6 access-list list2 permit any any
Device(config)# interface ethernet 0
Device(config-if)# ipv6 traffic-filter list2 out
```

If the same configuration was entered on a device running Cisco IOS Release 12.0(23)S or later releases, the configuration would be translated into IPv6 access list configuration mode as follows:

```
ipv6 access-list list2
  deny FEC0:0:0:2::/64 any
  permit ipv6 any any
  interface ethernet 0
  ipv6 traffic-filter list2 out
```

### 

Note

IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

Ŵ

Note IPv6 ACLs defined on a device running Cisco IOS Release 12.2(2)T or later releases, 12.0(21)ST, or 12.0(22)S that rely on the implicit deny condition or specify a **deny any any** statement to filter traffic should contain **permit** statements for link-local and multicast addresses to avoid the filtering of protocol packets (for example, packets associated with the neighbor discovery protocol). Additionally, IPv6 ACLs that use **deny** statements to filter traffic should use a **permit any any** statement as the last statement in the list.

Note

An IPv6 device will not forward to another network an IPv6 packet that has a link-local address as either its source or destination address (and the source interface for the packet is different from the destination interface for the packet).

### **Related Commands**

| Command                   | Description  |
|---------------------------|--|
| deny (IPv6)               | Sets deny conditions for an IPv6 access list.  |
| ipv6 access-class         | Filters incoming and outgoing connections to and from the device based on an IPv6 access list. |
| ipv6 pim bsr candidate rp | Configures the candidate RP to send PIM RP advertisements to the BSR.                          |
| ipv6 pim rp-address       | Configure the address of a PIM RP for a particular group range.                                |
| ipv6 traffic-filter       | Filters incoming or outgoing IPv6 traffic on an interface.                                     |
| permit (IPv6)             | Sets permit conditions for an IPv6 access list.  |
| show ipv6 access-list     | Displays the contents of all current IPv6 access lists.  |

### ipv6 address-validate

To enable IPv6 address validation, use the **ipv6 address-validate** in global configuration mode. To disable IPv6 address validation, use the **no** form of this command.

ipv6 address-validate no ipv6 address-validate

**Command Default** This command is enabled by default.

Command Modes Global configuration (config)

| Command History | Release                        | Modification                 |
|-----------------|--------------------------------|------------------------------|
|                 | Cisco IOS XE Gibraltar 16.11.1 | This command was introduced. |

**Usage Guidelines** 

**nes** The **ipv6 address-validate** command is used to validate whether the interface identifiers in an assigned IPv6 address are a part of the reserved IPv6 interface identifiers range, as specified in RFC5453. If the interface identifiers of the assigned IPv6 address are a part of the reserved range, a new IPv6 address is assigned.

Only auto-configured addresses or addresses configured by DHCPv6 are validated.

Ø

**Note** The **no ipv6-address validate** command disables the IPv6 address validation and allows assigning of IPv6 addresses with interface identifiers that are a part of the reserved IPv6 interface identifiers range. We do not recommend the use of this command.

You must enter a minimum of eight characters of the **ipv6-address validate** command if you're using CLI help (?) for completing the syntax of this command. If you enter less than eight characters the command will conflict with the **no ipv6 address** command in interface configuration mode.

Examples

The following example shows how to re-enable IPv6 address validation if it is disabled using the no ipv6-address validate command:

Device> enable Device# configure terminal Device(config)# ipv6 address-validate

### ipv6 cef

To enable Cisco Express Forwarding for IPv6, use the **ipv6 cef** command in global configuration mode. To disable Cisco Express Forwarding for IPv6, use the **no** form of this command.

ipv6 cef no ipv6 cef

**Syntax Description** This command has no arguments or keywords.

**Command Default** Cisco Express Forwarding for IPv6 is disabled by default.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** 

The ipv6 cef command is similar to the ip cef command, except that it is IPv6-specific.

The **ipv6 cef** command is not available on the Cisco 12000 series Internet routers because this distributed platform operates only in distributed Cisco Express Forwarding for IPv6 mode.

Note The ipv6 cefcommand is not supported in interface configuration mode.

Note

\$

Some distributed architecture platforms support both Cisco Express Forwarding for IPv6 and distributed Cisco Express Forwarding for IPv6. When Cisco Express Forwarding for IPv6 is configured on distributed platforms, Cisco Express Forwarding switching is performed by the Route Processor (RP).

**Note** You must enable Cisco Express Forwarding for IPv4 by using the **ip cef** global configuration command before enabling Cisco Express Forwarding for IPv6 by using the **ipv6 cef** global configuration command.

Cisco Express Forwarding for IPv6 is advanced Layer 3 IP switching technology that functions the same and offer the same benefits as Cisco Express Forwarding for IPv4. Cisco Express Forwarding for IPv6 optimizes network performance and scalability for networks with dynamic, topologically dispersed traffic patterns, such as those associated with web-based applications and interactive sessions.

#### **Examples**

The following example enables standard Cisco Express Forwarding for IPv4 operation and then standard Cisco Express Forwarding for IPv6 operation globally on the Device.

Device(config)# ip cef
Device(config)# ipv6 cef

#### **Related Commands**

| Command              | Description   |  |
|----------------------|---|--|
| ip route-cache       | Controls the use of high-speed switching caches for IP routing.   |  |
| ipv6 cef accounting  | ing Enables Cisco Express Forwarding for IPv6 and distributed Cisco Express Forwarding for IPv6 network accounting. |  |
| ipv6 cef distributed | istributed Enables distributed Cisco Express Forwarding for IPv6.   |  |
| show cef             | f Displays which packets the line cards dropped or displays which packets were no express-forwarded.                |  |
| show ipv6 cef        | Displays entries in the IPv6 FIB.   |  |

### ipv6 cef accounting

To enable Cisco Express Forwarding for IPv6 and distributed Cisco Express Forwarding for IPv6 network accounting, use the **ipv6 cef accounting** command in global configuration mode or interface configuration mode. To disable Cisco Express Forwarding for IPv6 network accounting, use the **no** form of this command.

**ipv6 cef accounting** *accounting-types* **no ipv6 cef accounting** *accounting-types* 

Specific Cisco Express Forwarding Accounting Information Through Interface Configuration Mode ipv6 cef accounting non-recursive {external | internal} no ipv6 cef accounting non-recursive {external | internal}

| Syntax Description | iptionaccounting-typesThe accounting-types argument must be replaced with at least one of th<br>keywords. Optionally, you can follow this keyword by any or all of the<br>but you can use each keyword only once.                          |   |  |  |  |
|--------------------|--|---|--|--|--|
|                    |  | • load-balance-hash Enables load balancing hash bucket counters.  |  |  |  |
|                    |  | • <b>non-recursive</b> Enables accounting through nonrecursive prefixes.  |  |  |  |
|                    |  | • <b>per-prefix</b> Enables express forwarding of the collection of the number of packets and bytes to a destination (or prefix).           |  |  |  |
|                    |  | • <b>prefix-length</b> Enables accounting through prefix length.  |  |  |  |
|                    | non-recursive  | Enables accounting through nonrecursive prefixes.   |  |  |  |
|                    |  | This keyword is optional when used in global configuration mode after another keyword is entered. See the <i>accounting-types</i> argument. |  |  |  |
|                    | external   | Counts input traffic in the nonrecursive external bin.  |  |  |  |
|                    | internal   | Counts input traffic in the nonrecursive internal bin.  |  |  |  |
| Command Default    | Cisco Express Forv   | varding for IPv6 network accounting is disabled by default.   |  |  |  |
| Command Modes      | Global configuration   | n (config)  |  |  |  |
|                    | Interface configura  | tion (config-if)  |  |  |  |
| Command History    | Release  | Modification  |  |  |  |
|                    | Cisco IOS XE Eve<br>16.5.1a  | Prest This command was introduced.  |  |  |  |
| Usage Guidelines   | The <b>ipv6 cef accounting</b> command is similar to the <b>ip cef accounting</b> command, except that it is IPv6-specific.<br>Configuring Cisco Express Forwarding for IPv6 network accounting enables you to collect statistics on Cisco |   |  |  |  |
|                    | Express Forwarding for IPv6 traffic patterns in your network.  |   |  |  |  |

|          | When you enable network accounting for Cisco Express Forwarding for IPv6 by using the <b>ipv6 cef accounting</b> command in global configuration mode, accounting information is collected at the Route Processor (RP) when Cisco Express Forwarding for IPv6 mode is enabled and at the line cards when distributed Cisco Express Forwarding for IPv6 mode is enabled. You can then display the collected accounting information using the <b>show ipv6 cef</b> EXEC command.  |
|----------|---|
|          | For prefixes with directly connected next hops, the <b>non-recursive</b> keyword enables express forwarding of the collection of packets and bytes through a prefix. This keyword is optional when this command is used in global configuration mode after you enter another keyword on the <b>ipv6 cef accounting</b> command.   |
|          | This command in interface configuration mode must be used in conjunction with the global configuration command. The interface configuration command allows a user to specify two different bins (internal or external) for the accumulation of statistics. The internal bin is used by default. The statistics are displayed through the <b>show ipv6 cef detail</b> command.   |
|          | Per-destination load balancing uses a series of 16 hash buckets into which the set of available paths are distributed. A hash function operating on certain properties of the packet is applied to select a bucket that contains a path to use. The source and destination IP addresses are the properties used to select the bucket for per-destination load balancing. Use the <b>load-balance-hash</b> keyword with the <b>ipv6 cef accounting</b> command to enable per-hash-bucket counters. Enter the <b>show ipv6 cef</b> <i>prefix</i> <b>internal</b> command to display the per-hash-bucket counters. |
| Examples | The following example enables the collection of Cisco Express Forwarding for IPv6 accounting information for prefixes with directly connected next hops:  |
|          |   |

| Related Commands | Command           | Description   |
|------------------|-------------------|---|
|                  | ip cef accounting | Enable Cisco Express Forwarding network accounting (for IPv4).            |
|                  | show cef          | Displays information about packets forwarded by Cisco Express Forwarding. |
|                  | show ipv6 cef     | Displays entries in the IPv6 FIB.   |

### ipv6 cef distributed

To enable distributed Cisco Express Forwarding for IPv6, use the **ipv6 cef distributed** command in global configuration mode. To disable Cisco Express Forwarding for IPv6, use the **no** form of this command.

ipv6 cef distributed no ipv6 cef distributed

**Syntax Description** This command has no arguments or keywords.

**Command Default** Distributed Cisco Express Forwarding for IPv6 is disabled by default.

**Command Modes** Global configuration (config)

| mand History | Release                         | Modification                 |  |
|--------------|---------------------------------|------------------------------|--|
|              | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** 

Com

The ipv6 cef distributed command is similar to the ip cef distributed command, except that it is IPv6-specific.

Enabling distributed Cisco Express Forwarding for IPv6 globally on the router by using the **ipv6 cef distributed** in global configuration mode distributes the Cisco Express Forwarding processing of IPv6 packets from the Route Processor (RP) to the line cards of distributed architecture platforms.

N,

**Note** To forward distributed Cisco Express Forwarding for IPv6 traffic on the router, configure the forwarding of IPv6 unicast datagrams globally on your router by using the **ipv6 unicast-routing** global configuration command, and configure an IPv6 address and IPv6 processing on an interface by using the **ipv6 address** interface configuration command.

Note You must enable distributed Cisco Express Forwarding for IPv4 by using the **ip cef distributed** global configuration command before enabling distributed Cisco Express Forwarding for IPv6 by using the **ipv6 cef distributed** global configuration command.

Cisco Express Forwarding is advanced Layer 3 IP switching technology. Cisco Express Forwarding optimizes network performance and scalability for networks with dynamic, topologically dispersed traffic patterns, such as those associated with web-based applications and interactive sessions.

**Examples** 

The following example enables distributed Cisco Express Forwarding for IPv6 operation:

Device(config) # ipv6 cef distributed

### **Related Commands**

| 6   | Command        | Description   |
|---|----------------|---|
|   | ip route-cache | Controls the use of high-speed switching caches for IP routing. |
| <b>show ipv6 cef</b> Displays entries in the IPv6 F |                | Displays entries in the IPv6 FIB.                               |

# ipv6 cef load-sharing algorithm

To select a Cisco Express Forwarding load-balancing algorithm for IPv6, use the **ipv6 cef load-sharing algorithm** command in global configuration mode. To return to the default universal load-balancing algorithm, use the **no** form of this command.

ipv6 cef load-sharing algorithm {original | universal [*id*]} no ipv6 cef load-sharing algorithm

| Syntax Description | original  | Sets the load-balancing algorithm to the original algorithm based on a source and destination hash.   |                                |   |  |  |
|--------------------|---|---|--------------------------------|---|--|--|
|                    | universal   | Sets the load-balancing algorithm to the universal algorithm that uses a source and destination and an ID hash.   |                                |   |  |  |
|                    | id  | (Optional) Fixed ic   | lentifier in hexadecimal forma | t.  |  |  |
| Command Default    |   | al load-balancing algorithm is selected by default. If you do not configure the fixed identifier for a logorithm, the device automatically generates a unique ID. |                                |   |  |  |
| Command Modes      | Global conf   | iguration (config)  |                                |   |  |  |

|                    | ip cef load   | p cef load-sharing algorithm       Selects a Cisco Express Forwarding load-balancing algorithm (for IPv4).  |                                |   |  |  |

Configures address resolution optimization from Cisco Express

Forwarding for IPv4 for directly connected neighbors.

# ipv6 cef optimize neighbor resolution

|                    | To configure address resolution optimization from Cisco Express Forwarding for IPv6 for directly connected neighbors, use the <b>ipv6 cef optimize neighbor resolution</b> command in global configuration mode. To disable address resolution optimization from Cisco Express Forwarding for IPv6 for directly connected neighbors, use the <b>no</b> form of this command. |            |                       |  |
|--------------------|--|------------|-----------------------|--|
|                    | ipv6 cef optimize neighbor resolution<br>no ipv6 cef optimize neighbor resolution  |            |                       |  |
| Syntax Description | This command has no argumen  | nts or key | words.                |  |
| Command Default    | If this command is not configured, Cisco Express Forwarding for IPv6 does not optimize the address resolution of directly connected neighbors.   |            |                       |  |
| Command Modes      | Global configuration (config)  |            |                       |  |
| Command History    | Release  | Modifica   | ation                 |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This con   | nmand was introduced. |  |
| Usage Guidelines   | The <b>ipv6 cef optimize neighbor resolution</b> command is very similar to the <b>ip cef optimize neighbor resolution</b> command, except that it is IPv6-specific.   |            |                       |  |
|                    | Use this command to trigger Layer 2 address resolution of neighbors directly from Cisco Express Forwarding for IPv6.   |            |                       |  |
| Examples           | The following example shows how to optimize address resolution from Cisco Express Forwarding for IPv6 for directly connected neighbors:  |            |                       |  |
|                    | Device(config)# <b>ipv6 cef optimize neighbor resolution</b>   |            |                       |  |
| Related Commands   | Command  |            | Description           |  |

ip cef optimize neighbor resolution

## ipv6 destination-guard policy

To define a destination guard policy, use the **ipv6 destination-guard policy** command in global configuration mode. To remove the destination guard policy, use the **no** form of this command.

ipv6 destination-guard policy [policy-name]
no ipv6 destination-guard policy [policy-name]

| Syntax Description | <i>policy-name</i> (Optional) Name of the destination guard policy.               |                       |  |   |  |  |  |
|--------------------|---|-----------------------|--|---|--|--|--|
| Command Default    | No destination guard policy is defined.   |                       |  |   |  |  |  |
| Command Modes      | Global configu  | ration (config)       |  |   |  |  |  |
| Command History    | Release   | Modi                  | fication                                   | ]   |  |  |  |
|                    | Cisco IOS XE<br>16.5.1a   | Everest This          | command was introduced.                    | -   |  |  |  |
| Usage Guidelines   |   | -                     | •  | The destination guard policies can be used to a traffic from an unknown source. |  |  |  |
| Examples           | The following example shows how to define the name of a destination guard policy: |                       |  |   |  |  |  |
|                    | Device(config)#ipv6 destination-guard policy policy1                              |                       |  |   |  |  |  |
| Related Commands   | Command   |                       | Description                                |   |  |  |  |
|                    | show ipv6 des   | stination-guard polic | cy Displays destination guard information. |   |  |  |  |

### ipv6 dhcp-relay bulk-lease

To configure bulk lease query parameters, use the **ipv6 dhcp-relay bulk-lease** command in global configuration mode. To remove the bulk-lease query configuration, use the **no** form of this command.

ipv6 dhcp-relay bulk-lease {data-timeout *seconds* | retry *number*} [disable] no ipv6 dhcp-relay bulk-lease [disable]

| Syntax Description | data-timeout  | (Optional) Bulk lease query data transfer timeout.   |                             |  |  |  |
|--------------------|---|--|-----------------------------|--|--|--|
|                    | seconds   | (Optional) The range is from 60 seconds to 600 seconds. The default is 300 seconds.        |                             |  |  |  |
|                    | retry   | (Optional) Sets the bulk lease query retries.  |                             |  |  |  |
|                    | number  | (Optional) The range is from 0 to 5. The default is 5.                                     |                             |  |  |  |
|                    | disable   | (Optional) Disables the DHCPv6 bulk lease query feature.                                   |                             |  |  |  |
| Command Default    | Bulk lease quer   | y is enabled automatically when the DHCP for IPv6 (DHCPv6) relay agent feature is enabled. |                             |  |  |  |
| Command Modes      | Global configur   | Global configuration (config)  |                             |  |  |  |
| Command History    | Release   |  | Modification                |  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   |  | This command was introduced |  |  |  |
| Usage Guidelines   | Use the <b>ipv6 dhcp-relay bulk-lease</b> command in global configuration mode to configure bulk lease que parameters, such as data transfer timeout and bulk-lease TCP connection retries.<br>The DHCPv6 bulk lease query feature is enabled automatically when the DHCPv6 relay agent is enable The DHCPv6 bulk lease query feature itself cannot be enabled using this command. To disable this feature the <b>ipv6 dhcp-relay bulk-lease</b> command with the <b>disable</b> keyword. |  |                             |  |  |  |
|                    |   |  |                             |  |  |  |
| Examples           | The following example shows how to set the bulk lease query data transfer timeout to 60 seconds:  |  |                             |  |  |  |
|                    | Device(config) # ipv6 dhcp-relay bulk-lease data-timeout 60   |  |                             |  |  |  |

### ipv6 dhcp-relay option vpn

To enable the DHCP for IPv6 relay VRF-aware feature, use the ipv6 dhcp-relay option vpn command in global configuration mode. To disable the feature, use the **no** form of this command.

ipv6 dhcp-relay option vpn no ipv6 dhcp-relay option vpn

**Syntax Description** This command has no arguments or keywords.

**Command Default** The DHCP for IPv6 relay VRF-aware feature is not enabled on the device.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage Guidelines The **ipv6 dhcp-relay option vpn** command allows the DHCPv6 relay VRF-aware feature to be enabled globally on the device. If the **ipv6 dhcp relay option vpn** command is enabled on a specified interface, it overrides the global **ipv6 dhcp-relay option vpn** command.

**Examples** The following example enables the DHCPv6 relay VRF-aware feature globally on the device:

Device(config) # ipv6 dhcp-relay option vpn

| Related Commands | Command                    | Description   |
|------------------|----------------------------|---|
|                  | ipv6 dhcp relay option vpn | Enables the DHCPv6 relay VRF-aware feature on an interface. |

### ipv6 dhcp-relay source-interface

To configure an interface to use as the source when relaying messages, use the **ipv6 dhcp-relay source-interface** command in global configuration mode. To remove the interface from use as the source, use the no form of this command.

**ipv6 dhcp-relay source-interface** *interface-type interface-number* **no ipv6 dhcp-relay source-interface** *interface-type interface-number* 

| Syntax Description | interface-type<br>interface-number   | destination. If the  | (Optional) Interface type and number that specifies output interface for a destination. If this argument is configured, client messages are forwarded to the destination address through the link to which the output interface is connected. |                     |                                 |  |
|--------------------|--|----------------------|---|---------------------|---------------------------------|--|
| Command Default    | The address of the server-facing interface is used as the IPv6 relay source.   |                      |   |                     |                                 |  |
| Command Modes      | Global configuration (config)  |                      |   |                     |                                 |  |
| Command History    | Release  | Modification         |   |                     |                                 |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command         | vas introduced.   |                     |                                 |  |
| Usage Guidelines   | If the configured interface standard behavior.   | s shut down, or if a | l of its IPv6 ad  | dresses are removed | l, the relay will revert to its |  |
|                    | The interface configuration (using the <b>ipv6 dhcp relay source-interface</b> command in interface configuration mode) takes precedence over the global configuration if both have been configured. |                      |   |                     |                                 |  |
| Examples           | The following example configures the Loopback 0 interface to be used as the relay source:  |                      |   |                     |                                 |  |
|                    | Device(config)# <b>ipv6 dhcp-relay source-interface loopback 0</b>   |                      |   |                     |                                 |  |
| Related Commands   | Command  | Descript             | on  |                     |                                 |  |

Enables DHCP for IPv6 service on an interface.

ipv6 dhcp relay source-interface

### ipv6 dhcp binding track ppp

To configure Dynamic Host Configuration Protocol (DHCP) for IPv6 to release any bindings associated with a PPP connection when that connection closes, use the **ipv6 dhcp binding track ppp** command in global configuration mode. To return to the default behavior, use the **no** form of this command.

ipv6 dhcp binding track ppp no ipv6 dhcp binding track ppp

Syntax Description This command has no arguments or keywords.

**Command Default** When a PPP connection closes, the DHCP bindings associated with that connection are not released.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage Guidelines

The **ipv6 dhcp binding track ppp** command configures DHCP for IPv6 to automatically release any bindings associated with a PPP connection when that connection is closed. The bindings are released automatically to accommodate subsequent new registrations by providing sufficient resource.

**Note** In IPv6 broadband deployment using DHCPv6, you must enable release of prefix bindings associated with a PPP virtual interface using this command. This ensures that DHCPv6 bindings are tracked together with PPP sessions, and in the event of DHCP REBIND failure, the client initiates DHCPv6 negotiation again.

A binding table entry on the DHCP for IPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding voluntarily, all prefixes' valid lifetimes have expired, or an administrator clears the binding.

**Examples** The following example shows how to release the prefix bindings associated with the PPP:

Device(config) # ipv6 dhcp binding track ppp

### ipv6 dhcp database

To configure a Dynamic Host Configuration Protocol (DHCP) for IPv6 binding database agent, use the **ipv6 dhcp database** command in global configuration mode. To delete the database agent, use the **no** form of this command.

ipv6 dhcp database agent [write-delay seconds] abort[timeout seconds]
no ipv6 dhcp database agent

|                    | _   | 1  |  |  |  |  |
|--------------------|---|--|--|--|--|--|
| Syntax Description | agent   |  | sh, local bootflash, compact flas<br>pcol (RCP) uniform resource loc | sh, NVRAM, FTP, TFTP, or Remote Copy ator. |  |  |
|                    | write-delay seconds   | <i>econds</i> (Optional) How often (in seconds) DHCP for IPv6 sends database updates. The default is 300 seconds. The minimum write delay is 60 seconds. |  |  |  |  |
|                    | timeout seconds   | (Opti  | onal) How long, in seconds, the                                      | e router waits for a database transfer.    |  |  |
| Command Default    | Write-delay default is 3  | default is 300 seconds. Timeout default is 300 seconds.  |  |  |  |  |
| Command Modes      | Global configuration (config)   |  |  |  |  |  |
| Command History    | Release   |  | Modification   | ]  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   |  | This command was introduced.   |  |  |  |
| Usage Guidelines   | The <b>ipv6 dhcp database</b> command specifies DHCP for IPv6 binding database agent parameters. The user may configure multiple database agents.   |  |  |  |  |  |
|                    | A binding table entry is automatically created whenever a prefix is delegated to a client from the configuration pool, updated when the client renews, rebinds, or confirms the prefix delegation, and deleted when the client releases all the prefixes in the binding voluntarily, all prefixes' valid lifetimes have expired, or administrators enable the clear ipv6 dhcp binding command. These bindings are maintained in RAM and can be saved to permanent storage using the <i>agent</i> argument so that the information about configuration such as prefixes assigned to clients is not lost after a system reload or power down. The bindings are stored as text records for easy maintenance. |  |  |  |  |  |
|                    | Each permanent storage to which the binding database is saved is called the database agent. A database agent can be a remote host such as an FTP server or a local file system such as NVRAM.   |  |  |  |  |  |
|                    | The <b>write-delay</b> keyword specifies how often, in seconds, that DHCP sends database updates. By default, DHCP for IPv6 server waits 300 seconds before sending any database changes.   |  |  |  |  |  |
|                    | The <b>timeout</b> keyword specifies how long, in seconds, the router waits for a database transfer. Infinity is defined as 0 seconds, and transfers that exceed the timeout period are canceled. By default, the DHCP for IPv6 server waits 300 seconds before canceling a database transfer. When the system is going to reload, there is no transfer timeout so that the binding table can be stored completely.   |  |  |  |  |  |
| Examples           | The following example specifies DHCP for IPv6 binding database agent parameters and stores binding entries in TFTP:   |  |  |  |  |  |

Device(config) # ipv6 dhcp database tftp://10.0.0.1/dhcp-binding

The following example specifies DHCP for IPv6 binding database agent parameters and stores binding entries in bootflash:

Device(config) # ipv6 dhcp database bootflash

| Related Commands        | Command | Description   |  |
|-------------------------|---------|---|--|
| clear ipv6 dhcp binding |         | Deletes automatic client bindings from the DHCP for IPv6 server binding table |  |
| show ipv6 dhcp database |         | Displays DHCP for IPv6 binding database agent information.                    |  |

### ipv6 dhcp iana-route-add

To add routes for individually assigned IPv6 addresses on a relay or server, use the **ipv6 dhcp iana-route-add** command in global configuration mode. To disable route addition for individually assigned IPv6 addresses on a relay or server, use the **no** form of the command.

#### ipv6 dhcp iana-route-add no ipv6 dhcp iana-route-add

**Syntax Description** This command has no arguments or keywords.

**Command Default** Route addition for individually assigned IPv6 addresses on a relay or server is disabled by default.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

# Usage Guidelines The **ipv6 dhcp iana-route-add** command is disabled by default and has to be enabled if route addition is required. Route addition for Internet Assigned Numbers Authority (IANA) is possible if the client is connected to the relay or server through unnumbered interfaces, and if route addition is enabled with the help of this command.

### **Examples** The following example shows how to enable route addition for individually assigned IPv6 addresses:

Device(config) # ipv6 dhcp iana-route-add

### ipv6 dhcp iapd-route-add

To enable route addition by Dynamic Host Configuration Protocol for IPv6 (DHCPv6) relay and server for the delegated prefix, use the **ipv6 dhcp iapd-route-add** command in global configuration mode. To disable route addition, use the **no** form of the command.

#### ipv6 dhcp iapd-route-add no ipv6 dhcp iapd-route-add

**Syntax Description** This command has no arguments or keywords.

**Command Default** DHCPv6 relay and DHCPv6 server add routes for delegated prefixes by default.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage Guidelines The DHCPv6 relay and the DHCPv6 server add routes for delegated prefixes by default. The presence of this command on a device does not mean that routes will be added on that device. When you configure the command, routes for delegated prefixes will only be added on the first Layer 3 relay and server.

**Examples** The following example shows how to enable the DHCPv6 relay and server to add routes for a delegated prefix:

Device(config) # ipv6 dhcp iapd-route-add

### ipv6 dhcp-ldra

To enable Lightweight DHCPv6 Relay Agent (LDRA) functionality on an access node, use the **ipv6 dhcp-ldra** command in global configuration mode. To disable the LDRA functionality, use the **no** form of this command.

ipv6 dhcp-ldra {enable | disable} no ipv6 dhcp-ldra {enable | disable}

| Syntax Description | enable Enables LDRA functionality on an access node. |                    |   |  |  |
|--------------------|--|--------------------|---|--|--|
|                    | disable  | Disables LDRA      | functionality on an access node.        |  |  |
| Command Default    | By defau   | lt, LDRA function  | nality is not enabled on an access node |  |  |
| Command Modes      | Global c   | onfiguration (conf | ig)                                     |  |  |
| Command History    | Release  | 1                  | Modification                            |  |  |
|                    | Cisco IO<br>16.5.1a                                  | OS XE Everest      | This command was introduced.            |  |  |

Usage Guidelines You must configure the LDRA functionality globally using the **ipv6 dhcp-ldra** command before configuring it on a VLAN or an access node (such as a Digital Subscriber Link Access Multiplexer [DSLAM] or an Ethernet switch) interface.

#### Example

The following example shows how to enable the LDRA functionality:

```
Device(config)# ipv6 dhcp-ldra enable
Device(config)# exit
```

Note In the above example, Device denotes an access node.

|------------------------------|---|
| ipv6 dhcp ldra attach-policy | Enables LDRA functionality on a VLAN.       |
| ipv6 dhcp-ldra attach-policy | Enables LDRA functionality on an interface. |

### ipv6 dhcp ping packets

To specify the number of packets a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server sends to a pool address as part of a ping operation, use the **ipv6 dhcp ping packets** command in global configuration mode. To prevent the server from pinging pool addresses, use the **no** form of this command.

**ipv6 dhcp ping packets** *number* **ipv6 dhcp ping packets** 

show ipv6 dhcp conflict

| Syntax Description | number The number of prange is from 0  | ping packets sent before the address is assigned to a requesting client. The valid to 10. |  |
|--------------------|--|---|--|
| Command Default    | No ping packets are sent be  | efore the address is assigned to a requesting client.                                     |  |
| Command Modes      | Global configuration (#)   |   |  |
| Command History    | Release  | Modification  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.  |  |
| Usage Guidelines   | <b>ines</b> The DHCPv6 server pings a pool address before assigning the address to a requesting client. If the pin unanswered, the server assumes, with a high probability, that the address is not in use and assigns the a to the requesting client. |   |  |
|                    | Setting the number argume  | ent to 0 turns off the DHCPv6 server ping operation                                       |  |
| Examples           | The following example specifies four ping attempts by the DHCPv6 server before further ping attempts stop:   |   |  |
|                    | Device(config)# <b>ipv6 dł</b>   | ncp ping packets 4  |  |
| Related Commands   | Command  | Description   |  |
|                    | clear ipv6 dhcp conflict   | Clears an address conflict from the DHCPv6 server database.                               |  |
|                    |  |   |  |

DECLINE message from a client.

Displays address conflicts found by a DHCPv6 server, or reported through a

### ipv6 dhcp pool

To configure a Dynamic Host Configuration Protocol (DHCP) for IPv6 server configuration information pool and enter DHCP for IPv6 pool configuration mode, use the **ipv6 dhcp pool** command in global configuration mode. To delete a DHCP for IPv6 pool, use the **no** form of this command.

ipv6 dhcp pool poolname no ipv6 dhcp pool poolname

|   | no ipvo unep poor po   | onane   |  |  |
|---|--|---|--|--|
| Syntax Description  | <i>poolname</i> User-defined name for the local prefix pool. The pool name can be a symbolic string (such as "Engineering") or an integer (such as 0). |   |  |  |
| Command Default   | DHCP for IPv6 pools are not configured.  |   |  |  |
| Command Modes   | Global configuration (con  | nfig)   |  |  |
| Command History   | Release  | Modification  |  |  |
|   | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.  |  |  |
| Usage Guidelines  | the <b>ipv6 dhcp pool</b> comm mode. In this mode, the a   | ommand to create a DHCP for IPv6 server configuration information pool. When<br>and is enabled, the configuration mode changes to DHCP for IPv6 pool configuration<br>dministrator can configure pool parameters, such as prefixes to be delegated and<br>DNS) servers, using the following commands: |  |  |
| • address prefix <i>IPv6-prefix</i> [lifetime { <i>valid-lifetime preferred-lifetime</i>   infinite}]sets for address assignment. This address must be in hexadecimal, using 16-bit values betw |  |   |  |  |
|   | or a link-address in t   | <i>prefix</i> sets a link-address IPv6 prefix. When an address on the incoming interface the packet matches the specified IPv6-prefix, the server uses the configuration his address must be in hexadecimal, using 16-bit values between colons.  |  |  |
|   | identification number  | <i>ndor-id</i> enables DHCPv6 vendor-specific configuration mode. Specify a vendor er. This number is the vendor IANA Private Enterprise Number. The range is 1 to llowing configuration command is available:  |  |  |
|   | -  | <i>ber</i> sets vendor-specific suboption number. The range is 1 to 65535. You can enter s, ASCII text, or a hex string as defined by the suboption parameters.   |  |  |
|   | •  |   |  |  |

Note

The **hex** value used under the **suboption** keyword allows users to enter only hex digits (0-f). Entering an invalid **hex** value does not delete the previous configuration.

Once the DHCP for IPv6 configuration information pool has been created, use the **ipv6 dhcp server** command to associate the pool with a server on an interface. If you do not configure an information pool, you need to use the **ipv6 dhcp server interface** configuration command to enable the DHCPv6 server function on an interface.

**Examples** 

When you associate a DHCPv6 pool with an interface, only that pool services requests on the associated interface. The pool also services other interfaces. If you do not associate a DHCPv6 pool with an interface, it can service requests on any interface.

Not using any IPv6 address prefix means that the pool returns only configured options.

The **link-address** command allows matching a link-address without necessarily allocating an address. You can match the pool from multiple relays by using multiple link-address configuration commands inside a pool.

Since a longest match is performed on either the address pool information or the link information, you can configure one pool to allocate addresses and another pool on a subprefix that returns only configured options.

The following example specifies a DHCP for IPv6 configuration information pool named cisco1 and places the router in DHCP for IPv6 pool configuration mode:

```
Device(config)# ipv6 dhcp pool ciscol
Device(config-dhcpv6)#
```

The following example shows how to configure an IPv6 address prefix for the IPv6 configuration pool cisco1:

```
Device(config-dhcpv6)# address prefix 2001:1000::0/64
Device(config-dhcpv6)# end
```

The following example shows how to configure a pool named engineering with three link-address prefixes and an IPv6 address prefix:

```
Device# configure terminal
Device(config)# ipv6 dhcp pool engineering
Device(config-dhcpv6)# link-address 2001:1001::0/64Device(config-dhcpv6)# link-address
2001:1002::0/64Device(config-dhcpv6)# link-address 2001:2000::0/48Device(config-dhcpv6)#
address prefix 2001:1003::0/64
Device(config-dhcpv6)# end
```

The following example shows how to configure a pool named 350 with vendor-specific options:

```
Device# configure terminal
Device(config)# ipv6 dhcp pool 350
Device(config-dhcpv6)# vendor-specific 9
Device(config-dhcpv6-vs)# suboption 1 address 1000:235D::1Device(config-dhcpv6-vs)# suboption
2 ascii "IP-Phone"
Device(config-dhcpv6-vs)# end
```

| Related Commands | Command             | Description  |
|------------------|---------------------|--|
|                  | ipv6 dhcp server    | Enables DHCP for IPv6 service on an interface.         |
|                  | show ipv6 dhcp pool | Displays DHCP for IPv6 configuration pool information. |

### ipv6 dhcp server vrf enable

To enable the DHCP for IPv6 server VRF-aware feature, use the **ipv6 dhcp server vrf enable** command in global configuration mode. To disable the feature, use the **no** form of this command.

ipv6 dhcp server vrf enable no ipv6 dhcp server vrf enable

Syntax Description This command has no arguments or keywords.

**Command Default** The DHCPv6 server VRF-aware feature is not enabled.

#### **Command Modes**

Global configuration (config)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** The **ipv6 dhcp server option vpn** command allows the DHCPv6 server VRF-aware feature to be enabled globally on a device.

**Examples** The following example enables the DHCPv6 server VRF-aware feature globally on a device:

Device(config) # ipv6 dhcp server option vpn

# ipv6 flow monitor

This command activates a previously created flow monitor by assigning it to the interface to analyze incoming or outgoing traffic.

To activate a previously created flow monitor, use the **ipv6 flow monitor** command. To de-activate a flow monitor, use the **no** form of the command.

**ipv6 flow monitor** *ipv6-monitor-name* [**sampler** *ipv6-sampler-name*] {**input** | **output**} **no ipv6 flow monitor** *ipv6-monitor-name* [**sampler** *ipv6-sampler-name*] {**input** | **output**}

| Syntax Description | ipv6-monitor-name               | Activates a previously created flow monitor by assigning it to the interface to analyze incoming or outgoing traffic.              |
|--------------------|---------------------------------|--|
|                    | sampler ipv6-sampler-name       | Applies the flow monitor sampler.  |
|                    | input                           | Applies the flow monitor on input traffic.   |
|                    | output                          | Applies the flow monitor on output traffic.  |
| Command Default    | IPv6 flow monitor is not active | ated until it is assigned to an interface.   |
| Command Modes      | Interface configuration (config | y-if)  |
| Command History    | Release                         | Modification   |
|                    | Cisco IOS XE Everest 16.5.1a    | This command was introduced.   |

| Usage Guidelines   |                                 | nonitor to a port channel interface. If both service module interfaces are part ld attach the monitor to both physical interfaces. |
| Usage Guidelines   | of an EtherChannel, you shoul   | 1 1  |

### ipv6 general-prefix

To define an IPv6 general prefix, use the **ipv6 general-prefix** command in global configuration mode. To remove the IPv6 general prefix, use the **no** form of this command.

**ipv6 general-prefix** prefix-name {ipv6-prefix/prefix-length | **6to4** interface-type interface-number | **6rd** interface-type interface-number} **no ipv6 general-prefix** prefix-name

| ipv6 | prefix-name                        | The name assigned to the prefix.   |
|------|------------------------------------|--|
|      | ipv6-prefix                        | The IPv6 network assigned to the general prefix.   |
|      |                                    | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.   |
|      |                                    | When defining a general prefix manually, specify both the <i>ipv6-prefix</i> and <i>l prefix-length</i> arguments.   |
|      | / prefix-length                    | The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
|      |                                    | When defining a general prefix manually, specify both the <i>ipv6-prefix</i> and <i>/ prefix-length</i> arguments.   |
|      | 6to4                               | Allows configuration of a general prefix based on an interface used for 6to4 tunneling.  |
|      |                                    | When defining a general prefix based on a 6to4 interface, specify the <b>6to4</b> keyword and the <i>interface-type interface-number</i> argument.   |
|      | interface-type<br>interface-number | Interface type and number. For more information, use the question mark (?) online help function.   |
|      |                                    | When defining a general prefix based on a 6to4 interface, specify the <b>6to4</b> keyword and the <i>interface-type interface-number</i> argument.   |
|      | 6rd                                | Allows configuration of a general prefix computed from an interface used for IPv6 rapid deployment (6RD) tunneling.  |

**Command Default** No general prefix is defined.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** Use the ipv6 general-prefix command to define an IPv6 general prefix.

A general prefix holds a short prefix, based on which a number of longer, more specific, prefixes can be defined. When the general prefix is changed, all of the more specific prefixes based on it will change, too. This function greatly simplifies network renumbering and allows for automated prefix definition.

More specific prefixes, based on a general prefix, can be used when configuring IPv6 on an interface.

When defining a general prefix based on an interface used for 6to4 tunneling, the general prefix will be of the form 2002:a.b.c.d::/48, where "a.b.c.d" is the IPv4 address of the interface referenced.

**Examples** The following example manually defines an IPv6 general prefix named my-prefix:

Device(config)# ipv6 general-prefix my-prefix 2001:DB8:2222::/48

The following example defines an IPv6 general prefix named my-prefix based on a 6to4 interface:

Device(config)# ipv6 general-prefix my-prefix 6to4 ethernet0

| Related Commands | Command                  | Description   |
|------------------|--------------------------|---|
|                  | show ipv6 general-prefix | Displays information on general prefixes for an IPv6 addresses. |

### ipv6 local policy route-map

To enable local policy-based routing (PBR) for IPv6 packets, use the **ipv6 local policy route-map** command in global configuration mode. To disable local policy-based routing for IPv6 packets, use the **no** form of this command.

ipv6 local policy route-map route-map-name no ipv6 local policy route-map route-map-name

| Syntax Description | route-map-name   |       | the route map to be used for loca <i>p-name</i> value specified by the <b>ro</b> | l IPv6 PBR. The name must match a <b>ute-map</b> command. |
|--------------------|--|-------|--|---|
| Command Default    | IPv6 packets are not policy routed.  |       |  |   |
| Command Modes      | Global configuration (config)  |       |  |   |
| Command History    | Release  |       | Modification   | ]   |
|                    | Cisco IOS XE Ev<br>16.5.1a   | erest | This command was introduced.   |   |
| Usage Guidelines   | Packets originating from a router are not normally policy routed. However, you can use the <b>ipv6 local policy</b><br><b>route-map</b> command to policy route such packets. You might enable local PBR if you want packets originated<br>at the router to take a route other than the obvious shortest path.   |       |  |   |
|                    | The <b>ipv6 local policy route-map</b> command identifies a route map to be used for local PBR. The <b>route-map</b> commands each have a list of <b>match</b> and <b>set</b> commands associated with them. The <b>match</b> commands specify the match criteria, which are the conditions under which packets should be policy routed. The <b>set</b> commands specify set actions, which are particular policy routing actions to be performed if the criteria enforced by the <b>match</b> commands are met. The <b>no ipv6 local policy route-map</b> command deletes the reference to the route map and disables local policy routing. |       |  |   |
| Examples           | In the following example, packets with a destination IPv6 address matching that allowed by access list pbr-src-90 are sent to the router at IPv6 address 2001:DB8::1:  |       |  |   |
|                    | <pre>ipv6 access-list src-90 permit ipv6 host 2001::90 2001:1000::/64 route-map pbr-src-90 permit 10 match ipv6 address src-90 set ipv6 next-hop 2001:DB8::1 ipv6 local policy route-map pbr-src-90</pre>  |       |  |   |
| Related Commands   | Command  |       | Description  |   |

| ands | Command               | Description   |
|------|-----------------------|---|
|      | ipv6 policy route-map | Configures IPv6 PBR on an interface.  |
|      | match ipv6 address    | Specifies an IPv6 access list to be used to match packets for PBR for IPv6. |
|      | match length          | Bases policy routing on the Level 3 length of a packet.                     |

| Command                   | Description   |
|---------------------------|---|
| route-map (IP)            | Defines the conditions for redistributing routes from one routing protocol into another, or enables policy routing.   |
| set default interface     | Specifies the default interface to output packets that pass a match clause of a route map for policy routing and have no explicit route to the destination. |
| set interface             | Specifies the default interface to output packets that pass a match clause of a route map for policy routing.   |
| set ipv6 default next-hop | Specifies an IPv6 default next hop to which matching packets will be forwarded.   |
| set ipv6 next-hop (PBR)   | Indicates where to output IPv6 packets that pass a match clause of a route map for policy routing.  |
| set ipv6 precedence       | Sets the precedence value in the IPv6 packet header.  |

### ipv6 local pool

To configure a local IPv6 prefix pool, use the ipv6 local pool configuration command with the prefix pool name. To disband the pool, use the **no** form of this command.

# ipv6 local pool poolname prefix/prefix-length assigned-length [shared] [cache-size *size*] no ipv6 local pool poolname

| Syntax Description | poolname   | User-defined name for the local prefix pool.   |                              |  |  |
|--------------------|--|--|------------------------------|--|--|
|                    | prefix   | IPv6 prefix assigned to the pool.  |                              |  |  |
|                    |  | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.   |                              |  |  |
|                    | / prefix-length  | The length of the IPv6 prefix assigned to the pool. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). |                              |  |  |
|                    | assigned-length  | Length of prefix, in bits, assigned to the user from the pool. The value of the <i>assigned-length</i> argument cannot be less than the value of the <i>l prefix-length</i> argument.                  |                              |  |  |
|                    | shared   | (Optional) Indicates that the pool is a shared pool.   |                              |  |  |
|                    | cache-size size  | (Optional) Specifies the size of the cache.  |                              |  |  |
| Command Default    | No pool is configu   | ired.  |                              |  |  |
| Command Modes      | Global configuration (global)  |  |                              |  |  |
| Command History    | Release  |  | Modification                 |  |  |
|                    | Cisco IOS XE Ev<br>16.5.1a   | verest   | This command was introduced. |  |  |
| Usage Guidelines   | All pool names must be unique.   |  |                              |  |  |
| -                  | IPv6 prefix pools have a function similar to IPv4 address pools. Contrary to IPv4, a block of addresses (an address prefix) are assigned and not single addresses.       |  |                              |  |  |
|                    | Prefix pools are not allowed to overlap.   |  |                              |  |  |
|                    | Once a pool is configured, it cannot be changed. To change the configuration, the pool must be removed and recreated. All prefixes already allocated will also be freed. |  |                              |  |  |
| Examples           | This example shows the creation of an IPv6 prefix pool:  |  | tion of an IPv6 prefix pool: |  |  |
|                    | Device(config)# <b>ipv6 local pool pool1 2001:0DB8::/29 64</b><br>Device(config)# <b>end</b><br>Device# <b>show ipv6 local pool</b>                                      |  |                              |  |  |

Pool Prefix Free In use pool1 2001:0DB8::/29 65516 20

#### **Related Commands**

| Command                        | Description  |  |
|--------------------------------|--|--|
| debug ipv6 pool                | Enables IPv6 pool debugging.   |  |

| prefix-delegation pool         | Specifies a named IPv6 local prefix pool from which prefixes are delegated to DHCP for IPv6 clients. |  |
| show ipv6 local pool           | Displays information about any defined IPv6 address pools.   |  |

# ipv6 mld snooping (global)

To enable Multicast Listener Discovery version 2 (MLDv2) protocol snooping globally, use the **ipv6 mld snooping** command in global configuration mode. To disable the MLDv2 snooping globally, use the **no** form of this command.

ipv6 mld snooping no ipv6 mld snooping

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command is enabled.

Command Modes Global configuration (config)

| Command History | Release                         | Modification  |
|-----------------|---------------------------------|---|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced on the Supervisor Engine 720. |

Usage Guidelines MLDv2 snooping is supported on the Supervisor Engine 720 with all versions of the Policy Feature Card 3 (PFC3).

To use MLDv2 snooping, configure a Layer 3 interface in the subnet for IPv6 multicast routing or enable the MLDv2 snooping querier in the subnet.

**Examples** This example shows how to enable MLDv2 snooping globally:

Device(config) # ipv6 mld snooping

| Related Commands | Command                | Description                          |
|------------------|------------------------|--------------------------------------|
|                  | show ipv6 mld snooping | Displays MLDv2 snooping information. |

### ipv6 mld ssm-map enable

To enable the Source Specific Multicast (SSM) mapping feature for groups in the configured SSM range, use the **ipv6 mld ssm-map enable** command in global configuration mode. To disable this feature, use the **no** form of this command.

ipv6 mld [vrf vrf-name] ssm-map enable
no ipv6 mld [vrf vrf-name] ssm-map enable

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |  |   |
|--------------------|---|--|---|
| Command Default    | The SSM mapping feature is not enabled.   |  |   |
| Command Modes      | Global configuration (config)   |  |   |
| Command History    | Release N   | Iodification                             |   |
|                    | Cisco IOS XE Everest T<br>16.5.1a   | his command was introduced.              |   |
| Usage Guidelines   | The <b>ipv6 mld ssm-map enable</b> command enables the SSM mapping feature for groups in the configured SSM range. When the <b>ipv6 mld ssm-map enable</b> command is used, SSM mapping defaults to use the Domain Name System (DNS). |  |   |
|                    | SSM mapping is applied only to received Multicast Listener Discovery (MLD) version 1 or MLD version 2 membership reports.   |  |   |
| Examples           | The following example shows how to enable the SSM mapping feature:  |  |   |
|                    | <pre>Device(config)# ipv6 mld ssm-map enable</pre>  |  |   |
| Related Commands   | Command   | Description                              |   |
|                    | debug ipv6 mld ssm-map  | Displays debug messages for SSM mapping. | - |
|                    | ipv6 mld ssm-map query dns Enables DNS-based SSM mapping.   |  |   |
|                    | ipv6 mld ssm-map static Configures static SSM mappings.   |  |   |
|                    | show ipv6 mld ssm-map   | Displays SSM mapping information.        |   |

### ipv6 mld state-limit

To limit the number of Multicast Listener Discovery (MLD) states globally, use the **ipv6 mld state-limit** command in global configuration mode. To disable a configured MLD state limit, use the **no** form of this command.

ipv6 mld [vrf vrf-name] state-limit number no ipv6 mld [vrf vrf-name] state-limit number

| Syntax Description  | vrf vrf-name  | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |                                      |               |  |  |
|---|---|---|--------------------------------------|---------------|--|--|
|   | number  | Maximum number of MLD states allowed  | on a router. The valid range is from | n 1 to 64000. |  |  |
| Command Default   |   | No default number of MLD limits is configured. You must configure the number of maximum MLD states allowed globally on a router when you configure this command.  |                                      |               |  |  |
| Command Modes   | Global configurat   | tion (config)   |                                      |               |  |  |
| Command History   | Release Modification  |   |                                      |               |  |  |
|   | Cisco IOS XE Ev   | verest 16.5.1aCisco IOS XE Everest 16.5.1a  | This command was introduced.         |               |  |  |
| Usage Guidelines  | membership repor  | Use the <b>ipv6 mld state-limit</b> command to configure a limit on the number of MLD states resulting from MLD membership reports on a global basis. Membership reports sent after the configured limits have been exceeded are not entered in the MLD cache and traffic for the excess membership reports is not forwarded. |                                      |               |  |  |
| Use the <b>ipv6 mld limit</b> command in interface configuration mode to configure the per-int limit. |   |   |                                      | e MLD state   |  |  |
|   | Per-interface and per-system limits operate independently of each other and can enforce different configured limits. A membership state will be ignored if it exceeds either the per-interface limit or global limit. |   |                                      |               |  |  |
| Examples  | The following exa   | ample shows how to limit the number of M  | LD states on a router to 300:        |               |  |  |
|   | Device(config)#   | ‡ ipv6 mld state-limit 300  |                                      |               |  |  |
| Deleted Commanda  | 0   | Description   |                                      |               |  |  |

| Related Commands | Command               | Description   |
|------------------|-----------------------|---|
|                  | ipv6 mld access-group | Enables the performance of IPv6 multicast receiver access control.                            |
|                  | ipv6 mld limit        | Limits the number of MLD states resulting from MLD membership state on a per-interface basis. |

### ipv6 multicast-routing

no ipv6 pim

no ipv6 mld router

To enable multicast routing using Protocol Independent Multicast (PIM) and Multicast Listener Discovery (MLD) on all IPv6-enabled interfaces of the router and to enable multicast forwarding, use the **ipv6 multicast-routing** command in global configuration mode. To stop multicast routing and forwarding, use the **no** form of this command.

**ipv6 multicast-routing** [vrf vrf-name] **no ipv6 multicast-routing** 

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration.  |  |                              |  |  |
|--------------------|--|--|------------------------------|--|--|
| Command Default    | Multicast routing is not   | Multicast routing is not enabled.      |                              |  |  |
| Command Modes      | Global configuration (config)  |  |                              |  |  |
| Command History    | Release  | Modification                           |                              |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.           |                              |  |  |
| Usage Guidelines   | Use the <b>ipv6 multicast-routing</b> command to enable multicast forwarding. This command also enables Protocol Independent Multicast (PIM) and Multicast Listener Discovery (MLD) on all IPv6-enabled interfaces of the router being configured.   |  |                              |  |  |
|                    | You can configure individual interfaces before you enable multicast so that you can then explicitly disable PIM and MLD protocol processing on those interfaces, as needed. Use the <b>no ipv6 pim</b> or the <b>no ipv6 mld router</b> command to disable IPv6 PIM or MLD router-side processing, respectively. |  |                              |  |  |
| Examples           | The following example enables multicast routing and turns on PIM and MLD on all interfaces:  |  |                              |  |  |
|                    | Device(config)# ipv6 multicast-routing   |  |                              |  |  |
| Related Commands   | Command  | Description                            |                              |  |  |
|                    | ipv6 pim rp-address  | Configures the address of a PIM RP for | or a particular group range. |  |  |
|                    |  |  |                              |  |  |

Turns off IPv6 PIM on a specified interface.

Disables MLD router-side processing on a specified interface.

### ipv6 multicast group-range

To disable multicast protocol actions and traffic forwarding for unauthorized groups or channels on all the interfaces in a router, use the **ipv6 multicast group-range** command in global configuration mode. To return to the command's default settings, use the **no** form of this command.

**ipv6 multicast** [**vrf** *vrf-name*] **group-range** [*access-list-name*] **no ipv6 multicast** [**vrf** *vrf-name*] **group-range** [*access-list-name*]

| Syntax Description | vrf vrf-name   | (Optional)  | l) Specifies a virtual routing and forwarding (VRF) confi  | guration.               |
|--------------------|--|-------------|--|-------------------------|
|                    | access-list-name   |             | I) Name of an access list that contains authenticated subs d channels that can send traffic to the router. | criber groups and       |
| Command Default    | Multicast is enabled for groups and channels permitted by a specified access list and disabled for groups and channels denied by a specified access list.  |             |  |                         |
| Command Modes      | Global configuration   | on (config) | )  |                         |
| Command History    | Release  |             | Modification   |                         |
|                    | Cisco IOS XE Evo<br>16.5.1a  | erest       | This command was introduced.   |                         |
| Usage Guidelines   | <ul> <li>The ipv6 multicast group-range command provides an access control mechanism for IPv6 multicast edge routing. The access list specified by the <i>access-list-name</i> argument specifies the multicast groups or channels that are to be permitted or denied. For denied groups or channels, the router ignores protocol traffic and actions (for example, no Multicast Listener Discovery (MLD) states are created, no mroute states are created, no Protocol Independent Multicast (PIM) joins are forwarded), and drops data traffic on all interfaces in the system, thus disabling multicast for denied groups or channels.</li> <li>Using the ipv6 multicast group-range global configuration command is equivalent to configuring the MLD access control and multicast boundary commands on all interfaces in the system. However, the ipv6 multicast group-range command can be overridden on selected interfaces by using the following interface configuration</li> </ul> |             |  |                         |
|                    | <ul><li>• ipv6 mld access-group access-list-name</li></ul>   |             |  |                         |
|                    | • ipv6 multicas  | st boundar  | ry scope scope-value   |                         |
|                    | Because the <b>no ipv</b> multicast deployme   |             | <b>st group-range</b> command returns the router to its default of the broken.                             | configuration, existing |
| Examples           | The following example ensures that the router disables multicast for groups or channels denied by an access list named list2:  |             | ls denied by   |                         |
|                    | Device(config)#  | ipv6 mult   | ticast group-range list2   |                         |
|                    | The following exan specified by int2:  | nple shows  | that the command in the previous example is overridden o   | on an interface         |

Device(config)# interface int2
Device(config-if)# ipv6 mld access-group int-list2

On int2, MLD states are created for groups or channels permitted by int-list2 but are not created for groups or channels denied by int-list2. On all other interfaces, the access-list named list2 is used for access control.

In this example, list2 can be specified to deny all or most multicast groups or channels, and int-list2 can be specified to permit authorized groups or channels only for interface int2.

| Related Commands | Command                       | Description   |
|------------------|-------------------------------|---|
|                  | ipv6 mld access-group         | Performs IPv6 multicast receiver access control.                        |
|                  | ipv6 multicast boundary scope | Configures a multicast boundary on the interface for a specified scope. |

### ipv6 multicast pim-passive-enable

To enable the Protocol Independent Multicast (PIM) passive feature on an IPv6 router, use the **ipv6 multicast pim-passive-enable** command in global configuration mode. To disable this feature, use the **no** form of this command.

ipv6 multicast pim-passive-enable no ipv6 multicast pim-passive-enable

**Syntax Description** This command has no arguments or keywords.

**Command Default** PIM passive mode is not enabled on the router.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

Usage Guidelines Use the **ipv6 multicast pim-passive-enable** command to configure IPv6 PIM passive mode on a router. Once PIM passive mode is configured globally, use the **ipv6 pim passive** command in interface configuration mode to configure PIM passive mode on a specific interface.

#### **Examples** The following example configures IPv6 PIM passive mode on a router:

Device(config)# ipv6 multicast pim-passive-enable

| Related Commands | Command          | Description  |
|------------------|------------------|--|
|                  | ipv6 pim passive | Configures PIM passive mode on a specific interface. |

### ipv6 multicast rpf

To enable IPv6 multicast reverse path forwarding (RPF) check to use Border Gateway Protocol (BGP) unicast routes in the Routing Information Base (RIB), use the **ipv6 multicast rpf** command in global configuration mode. To disable this function, use the **no** form of this command.

**ipv6 multicast** [**vrf** *vrf-name*] **rpf** {**backoff** *initial-delay max-delay* | **use-bgp**} **no ipv6 multicast** [**vrf** *vrf-name*] **rpf** {**backoff** *initial-delay max-delay* | **use-bgp**}

| Syntax Description | vrf vrf-name   | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |                                   |                                      |  |
|--------------------|--|---|-----------------------------------|--------------------------------------|--|
|                    | backoff  | backoff         Specifies the backoff delay after a unicast routing change.                           |                                   |                                      |  |
|                    | initial-delay  | Initial RPF   | backoff delay, in milliseconds (r | ns). The range is from 200 to 65535. |  |
|                    | max-delay  | Maximum   | RPF backoff delay, in ms. The ra  | ange is from 200 to 65535.           |  |
|                    | use-bgp  | Specifies to  | o use BGP routes for multicast R  | PF lookups.                          |  |
| Command Default    | The multicast RP   | The multicast RPF check does not use BGP unicast routes.  |                                   |                                      |  |
| Command Modes      | Global configuration (config)  |   |                                   |                                      |  |
| Command History    | Release  |   | Modification                      | ]                                    |  |
|                    | Cisco IOS XE E<br>16.5.1a  | verest  | This command was introduced.      |                                      |  |
| Usage Guidelines   | When the <b>ipv6 multicast rpf</b> command is configured, multicast RPF check uses BGP unicast routes in the RIB. This is not done by default. |   |                                   |                                      |  |
| Examples           | The following example shows how to enable the multicast RPF check function:<br>Device(config) # <b>ipv6 multicast rpf use-bgp</b>              |   |                                   | F check function:                    |  |
|                    |  |   |                                   |                                      |  |
| Related Commands   | Command  |   | Description                       |                                      |  |

| Related Commands | Command                  | Description  |
|------------------|--------------------------|--|
|                  | ipv6 multicast limit     | Configure per-interface multicast route (mroute) state limiters in IPv6.           |
|                  | ipv6 multicast multipath | Enables load splitting of IPv6 multicast traffic across multiple equal-cost paths. |

### ipv6 nd cache expire

To configure the duration of time before an IPv6 neighbor discovery cache entry expires, use the **ipv6 nd cache expire** command in the interface configuration mode. To remove this configuration, use the **no** form of this command.

ipv6 nd cache expire expire-time-in-seconds [refresh] no ipv6 nd cache expire expire-time-in-seconds [refresh]

| Syntax Description | expire-time-in-seconds   | The time range is from 1 through 65536 seconds. The default is 14 or 4 hours.               |  |  |
|--------------------|--|---|--|--|
|                    | refresh  | (Optional) Automatically refreshes the neighbor discovery cache                             |  |  |
| Command Modes      | Interface configuration (config-if)  |   |  |  |
| Command History    | Release  | Modification  |  |  |
|                    | Cisco IOS XE Everest 16.5.1a   | This command was introduced for the Cisco Catalyst 9500 Se                                  |  |  |
| Usage Guidelines   | By default, a neighbor discovery cache entry is expired and deleted if it remains in the STALE state for 14,400 seconds or 4 hours. The <b>ipv6 nd cache expire</b> command allows the expiry time to vary and to trigger auto refresh of an expired entry before the entry is deleted.  |   |  |  |
|                    | When the <b>refresh</b> keyword is used, a neighbor discovery cache entry is auto refreshed. The entry moves into the DELAY state and the neighbor unreachability detection process occurs, in which the entry transitions from the DELAY state to the PROBE state after 5 seconds. When the entry reaches the PROBE state, a neighbor solicitation is sent and then retransmitted as per the configuration. |   |  |  |
| Examples           | The following example shows that the n seconds or 2 hours:   | neighbor discovery cache entry is configured to expire in 7200                              |  |  |
|                    | Device> <b>enable</b><br>Device# <b>configure terminal</b><br>Device(config)# <b>interface gigabi</b><br>Device(config-if)# <b>ipv6 nd cache</b>   |   |  |  |
| Related Commands   | Command  | Description   |  |  |
|                    | ipv6 nd na glean   | Configures neighbor discovery to glean an entry from an unsolicited neighbor advertisement. |  |  |
|                    |  |   |  |  |

| ipv6 nd nud retry   | Configures the number of times neighbor<br>unreachability detection resends neighbor solicitations. |
|---------------------|---|
| show ipv6 interface | Displays the usability status of interfaces that are configured for IPv6.                           |

## ipv6 nd cache interface-limit (global)

To configure a neighbor discovery cache limit on all interfaces on the device, use the **ipv6 nd cache interface-limit** command in global configuration mode. To remove the neighbor discovery from all interfaces on the device, use the **no** form of this command.

**ipv6 nd cache interface-limit** *size* [log *rate*] **no ipv6 nd cache interface-limit** *size* [log *rate*]

|                    |  |  |              |   |                           | _                 |
|--------------------|--|--|--------------|---|---------------------------|-------------------|
| Syntax Description | size   | Cache size.  | Cache size.  |   |                           |                   |
|                    | log rate   | (Optional) Adjustable  | e logging ra | te, in seconds. The                       | valid values are 0 and 1. |                   |
| Command Default    | Default logging rate for the device is one entry every second.   |  |              |   |                           |                   |
| Command Modes      | Global con   | figuration (config)  |              |   |                           |                   |
| Command History    | Release  | Ma   | odification  |   |                           |                   |
|                    | Cisco IOS<br>16.5.1a   | XE Everest Th  | nis comman   | d was introduced.                         |                           |                   |
| Usage Guidelines   | The <b>ipv6 nd cache interface-limit</b> command in global configuration mode imposes a common per-interface cache size limit on all interfaces on the device.   |  |              | mmon per-interface                        |                           |                   |
|                    | Issuing the <b>no</b> or default form of the command will remove the neighbor discovery limit from every interface<br>on the device that was configured using global configuration mode. It will not remove the neighbor discovery<br>limit from any interface configured using the <b>ipv6 nd cache interface-limit</b> command in interface configuration<br>mode. |  |              |   |                           |                   |
|                    | The default  | The default (and maximum) logging rate for the device is one entry every second. |              |   |                           |                   |
| Examples           | The following example shows how to set a common per-interface cache size limit of 4 seconds on all interfaces on the device:   |  |              |   |                           |                   |
|                    | Device(config)# ipv6 nd cache interface-limit 4  |  |              |   |                           |                   |
| Related Commands   | Command  |  |              | Description                               |                           |                   |
|                    | ipv6 nd ca   | ache interface-limit (in   | nterface)    | Configures a neigh<br>interface on the de | hbor discovery cache lim  | it on a specified |

#### ipv6 nd host mode strict

To enable the conformant, or strict, IPv6 host mode, use the **ipv6 nd host mode strict** command in global configuration mode. To reenable conformant, or loose, IPv6 host mode, use the **no** form of this command.

ipv6 nd host mode strict

Syntax Description This command has no arguments or keywords.

**Command Default** Nonconformant, or loose, IPv6 host mode is enabled.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** The default IPv6 host mode type is loose, or nonconformant. To enable IPv6 strict, or conformant, host mode, use the **ipv6 nd host mode strict** command. You can change between the two IPv6 host modes using the **no** form of this command.

The **ipv6 nd host mode strict** command selects the type of IPv6 host mode behavior and enters interface configuration mode. However, the **ipv6 nd host mode strict** command is ignored if you have configured IPv6 routing with the **ipv6 unicast-routing** command. In this situation, the default IPv6 host mode type, loose, is used.

#### **Examples**

The following example shows how to configure the device as a strict IPv6 host and enables IPv6 address autoconfiguration on Ethernet interface 0/0:

Device(config)# ipv6 nd host mode strict Device(config-if)# interface ethernet0/0 Device(config-if)# ipv6 address autoconfig

The following example shows how to configure the device as a strict IPv6 host and configures a static IPv6 address on Ethernet interface 0/0:

```
Device(config)# ipv6 nd host mode strict
Device(config-if)# interface ethernet0/0
Device(config-if)# ipv6 address 2001::1/64
```

| <b>Related Commands</b> | Command              | Description                                       |  |
|-------------------------|----------------------|---|--|
|                         | ipv6 unicast-routing | Enables the forwarding of IPv6 unicast datagrams. |  |

### ipv6 nd na glean

To configure the neighbor discovery to glean an entry from an unsolicited neighbor advertisement, use the **ipv6 nd na glean** command in the interface configuration mode. To disable this feature, use the **no** form of this command.

ipv6 nd na glean no ipv6 nd na glean

 Command Modes
 Interface configuration

 Command History
 Release
 Modification

 Cisco IOS XE Everest 16.5.1a
 This command was introduced for the Cisco Catalyst 9500

Usage GuidelinesIPv6 nodes may emit a multicast unsolicited neighbor advertisement packet following the successful completion<br/>of duplicate address detection (DAD). By default, other IPv6 nodes ignore these unsolicited neighbor<br/>advertisement packets. The **ipv6 nd na glean** command configures the router to create a neighbor advertisement<br/>entry on receipt of an unsolicited neighbor advertisement packet (assuming no such entry already exists and<br/>the neighbor advertisement has the link-layer address option). Use of this command allows a device to populate<br/>its neighbor advertisement cache with an entry for a neighbor before data traffic exchange with the neighbor.

**Examples** The following example shows how to configure neighbor discovery to glean an entry from an unsolicited neighbor advertisement:

Device> enable Device# configure terminal Device(config)# interface gigabitethernet 1/1/4 Device(config-if)# ipv6 nd na glean

| Related Commands | Command              | Description   |
|------------------|----------------------|---|
|                  | ipv6 nd cache expire | Configures the duration of time before an IPv6<br>neighbor discovery cache entry expires.           |
|                  | ipv6 nd nud retry    | Configures the number of times neighbor<br>unreachability detection resends neighbor solicitations. |
|                  | show ipv6 interface  | Displays the usability status of interfaces that are configured for IPv6.                           |

### ipv6 nd ns-interval

To configure the interval between IPv6 neighbor solicitation (NS) retransmissions on an interface, use the **ipv6 nd ns-interval** command in interface configuration mode. To restore the default interval, use the **no** form of this command.

ipv6 nd ns-interval milliseconds no ipv6 nd ns-interval

| Syntax Description  | milliseconds   | The interval between IPv6 neighbor solicit tra<br>range is from 1000 to 3600000 milliseconds |                                    | The acceptable   |
|---|--|--|------------------------------------|------------------|
| Command Default   |  | (unspecified) is advertised in router advertiser wity of the router itself.                  | nents and the value 1000 is used f | for the neighbor |
| Command Modes   | Interface confi  | guration (config-if)   |                                    |                  |
| Command History   | Release  |  | Modification                       |                  |
|   | Cisco IOS XE   | Everest 16.5.1aCisco IOS XE Everest 16.5.1a  | This command was introduced.       |                  |
| <b>Usage Guidelines</b> By default, using the <b>ipv6 nd ns-interval</b> command changes the NS retrieves resolution and duplicate address detection (DAD). To specify a different I use the <b>ipv6 nd dad time</b> command. |  |  |                                    |                  |
|   | This value will be included in all IPv6 router advertisements sent out this interface. Very short intervals are not recommended in normal IPv6 operation. When a nondefault value is configured, the configured time is both advertised and used by the router itself. |  |                                    |                  |
| Examples  | The following example configures an IPv6 neighbor solicit transmission interval of 9000 milliseconds for Ethernet interface 0/0:   |  |                                    |                  |
|   | Device(config)# interface ethernet 0/0<br>Device(config-if)# ipv6 nd ns-interval 9000  |  |                                    |                  |
| Related Commands  | Command  | Description  |                                    |                  |

| lelated Commands | Command             | Description  |
|------------------|---------------------|--|
|                  | ipv6 nd dad time    | Configures the NS retransmit interval for DAD separately from the NS retransmit interval for address resolution. |
|                  | show ipv6 interface | Displays the usability status of interfaces configured for IPv6.   |

### ipv6 nd nud retry

second apart.

To configure the number of times the neighbor unreachability detection process resends neighbor solicitations, use the **ipv6 nd nud retry** command in the interface configuration mode. To disable this feature, use the **no** form of this command.

**ipv6 nd nud retry** *base interval max-attempts* {*final-wait-time*} **no ipv6 nd nud retry** *base interval max-attempts* {*final-wait-time*}

| Syntax Description | base  | The neighbor unreachability detection process base value.   |  |  |
|--------------------|---|---|--|--|
|                    | interval  | The time interval, in milliseconds, between retries.        |  |  |
|                    |   | The range is from 1000 to 32000.                            |  |  |
|                    | max-attempts  | The maximum number of retry attempts, depending on the base |  |  |
|                    |   | The range is from 1 to 128.                                 |  |  |
|                    | final-wait-time   | The waiting time, in milliseconds, on the last probe.       |  |  |
|                    |   | The range is from 1000 to 32000.                            |  |  |
| Command Modes      | Interface configuration (config-if)   |   |  |  |
| Command History    | Release   | Modification  |  |  |
|                    | Cisco IOS XE Everest 16.5.1a  | This command was introduced for the Cisco Catalyst 950      |  |  |
| Usage Guidelines   | When a device runs neighbor unreachability detection to resolve the neighbor detection entry for a neighbor again, it sends three neighbor solicitation packets 1 second apart. In certain situations, for example, spanning-tree events, or high-traffic events, or end-host reloads), three neighbor solicitation packets that are sent at an interval of 1 second may not be sufficient. To help maintain the neighbor cache in such situations, use the <b>ipv6 nd nud retry</b> command to configure exponential timers for neighbor solicitation retransmits. |   |  |  |
|                    | The maximum number of retry attempts is configured using the <i>max-attempts</i> argument. The retransmit interval is calculated with the following formula:  |   |  |  |
|                    | tm^n  |   |  |  |
|                    | here,   |   |  |  |
|                    | • t = Time interval   |   |  |  |
|                    | • m = Base (1, 2, or 3)   |   |  |  |
|                    | • $n = Current$ neighbor solicitation number (where the first neighbor solicitation is 0).  |   |  |  |
|                    | Therefore, <b>ipv6 nd nud retry 3 1000 5</b> command retransmits at intervals of 1,3,9,27,81 seconds. If the final wait time is not configured, the entry remains for 243 seconds before it is deleted.   |   |  |  |
|                    | The <b>ipv6 nd nud retry</b> command affects only the retransmit rate for the neighbor unreachability detection process, and not for the initial resolution, which uses the default of three neighbor solicitation packets sent 1   |   |  |  |

#### **Examples**

The following example shows how to configure a fixed interval of 1 second and three retransmits:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd nud retry 1 1000 3
```

The following example shows how to configure a retransmit interval of 1, 2, 4, and 8:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd nud retry 2 1000 4
```

The following example shows how to configure the retransmit intervals of 1, 3, 9, 27, 81:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/4
Device(config-if)# ipv6 nd nud retry 3 1000 5
```

#### **Related Commands**

| Command              | Description  |
|----------------------|--|
| ipv6 nd cache expire | Configures the duration of time before an IPv6<br>neighbor discovery (ND) cache entry expires. |
| ipv6 nd na glean     | Configures neighbor discovery to glean an entry from an unsolicited neighbor advertisement.    |
| show ipv6 interface  | Displays the usability status of interfaces that are configured for IPv6.                      |

### ipv6 nd reachable-time

To configure the amount of time that a remote IPv6 node is considered reachable after some reachability confirmation event has occurred, use the **ipv6 nd reachable-time** command in interface configuration mode. To restore the default time, use the **no** form of this command.

ipv6 nd reachable-time milliseconds no ipv6 nd reachable-time

| Syntax Description | <i>milliseconds</i> The amount of time that a remote IPv6 node is considered reachable (in milliseconds).   |  |  |
|--------------------|---|--|--|
| Command Default    | 0 milliseconds (unspecified) is advertised in router advertisements and the value 30000 (30 seconds) is used for the neighbor discovery activity of the router itself.  |  |  |
| Command Modes      | Interface configuration   | n (config-if)  |  |
| Command History    | Release   | Modification   |  |
|                    | Cisco IOS XE Everes<br>16.5.1a  | t This command was introduced.                                   |  |
| Usage Guidelines   | <ul> <li>The configured time enables the router to detect unavailable neighbors. Shorter configured times enable the router to detect unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</li> <li>The configured time is included in all router advertisements sent out of an interface so that nodes on the same link use the same time value. A value of 0 means indicates that the configured time is unspecified by this router.</li> </ul> |  |  |
|                    |   |  |  |
| Examples           | The following example configures an IPv6 reachable time of 1,700,000 milliseconds for Ethernet interface 0/0:   |  |  |
|                    | Device(config)# interface ethernet 0/0<br>Device(config-if)# ipv6 nd reachable-time 1700000   |  |  |
| Related Commands   | Command   | Description  |  |
|                    | show ipv6 interface   | Displays the usability status of interfaces configured for IPv6. |  |

#### ipv6 nd resolution data limit

To configure the number of data packets queued pending Neighbor Discovery resolution, use the **ipv6 nd resolution data limit** command in global configuration mode.

**ipv6 nd resolution data limit** *number-of-packets* **no ipv6 nd resolution data limit** *number-of-packets* 

Syntax Description *number-of-packets* The number of queued data packets. The range is from 16 to 2048 packets.

**Command Default** Queue limit is 16 packets.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage GuidelinesThe ipv6 nd resolution data limit command allows the customer to configure the number of data packets<br/>queued pending Neighbor Discovery resolution. IPv6 Neighbor Discovery queues a data packet that initiates<br/>resolution for an unresolved destination. Neighbor Discovery will only queue one packet per destination.<br/>Neighbor Discovery also enforces a global (per-router) limit on the number of packets queued. Once the global<br/>queue limit is reached, further packets to unresolved destinations are discarded. The minimum (and default)<br/>value is 16 packets, and the maximum value is 2048.

In most situations, the default value of 16 queued packets pending Neighbor Discovery resolution is sufficient. However, in some high-scalability scenarios in which the router needs to initiate communication with a very large number of neighbors almost simultaneously, then the value may be insufficient. This may lead to loss of the initial packet sent to some neighbors. In most applications, the initial packet is retransmitted, so initial packet loss generally is not a cause for concern. (Note that dropping the initial packet to an unresolved destination is normal in IPv4.) However, there may be some high-scale configurations where loss of the initial packet is inconvenient. In these cases, the customer can use the **ipv6 nd resolution data limit** command to prevent the initial packet loss by increasing the unresolved packet queue size.

# **Examples** The following example configures the global number of data packets held awaiting resolution to be 32:

Device (config) # ipv6 nd resolution data limit 32

L

#### ipv6 nd route-owner

To insert Neighbor Discovery-learned routes into the routing table with "ND" status and to enable ND autoconfiguration behavior, use the **ipv6 nd route-owner** command. To remove this information from the routing table, use the **no** form of this command.

#### ipv6 ndroute-owner

Syntax Description This command has no arguments or keywords.

**Command Default** The status of Neighbor Discovery-learned routes is "Static."

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage Guidelines The **ipv6 nd route-owner** command inserts routes learned by Neighbor Discovery into the routing table with a status of "ND" rather than "Static" or "Connected."

This global command also enables you to use the **ipv6 nd autoconfig default** or **ipv6 nd autoconfig prefix** commands in interface configuration mode. If the **ipv6 nd route-owner** command is not issued, then the **ipv6 nd autoconfig default** and **ipv6 nd autoconfig prefix** commands are accepted by the router but will not work.

#### Examples

Device(config) # ipv6 nd route-owner

| Related Commands | Command                    | Description   |
|------------------|----------------------------|---|
|                  | ipv6 nd autoconfig default | Allows Neighbor Discovery to install a default route to the Neighbor<br>Discovery-derived default router. |
|                  | ipv6 nd autoconfig prefix  | Uses Neighbor Discovery to install all valid on-link prefixes from RAs received on the interface.         |

#### ipv6 neighbor

To configure a static entry in the IPv6 neighbor discovery cache, use the **ipv6 neighbor** command in global configuration mode. To remove a static IPv6 entry from the IPv6 neighbor discovery cache, use the **no** form of this command.

**ipv6 neighbor** *ipv6-address interface-type interface-number hardware-address* **no ipv6 neighbor** *ipv6-address interface-type interface-number* 

| Syntax Description | ipv6-address     | The IPv6 address that corresponds to the local data-link address.  |  |
|--------------------|------------------|--|--|
|                    |                  | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. |  |
|                    | interface-type   | The specified interface type. For supported interface types, use the question mark (?) online help function.                               |  |
|                    | interface-number | The specified interface number.  |  |
|                    | hardware-address | The local data-link address (a 48-bit address).  |  |

**Command Default** Static entries are not configured in the IPv6 neighbor discovery cache.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** 

The **ipv6 neighbor** command is similar to the **arp** (global) command.

If an entry for the specified IPv6 address already exists in the neighbor discovery cache--learned through the IPv6 neighbor discovery process--the entry is automatically converted to a static entry.

Use the **show ipv6 neighbors** command to view static entries in the IPv6 neighbor discovery cache. A static entry in the IPv6 neighbor discovery cache can have one of the following states:

- INCMP (Incomplete)--The interface for this entry is down.
- REACH (Reachable)--The interface for this entry is up.

**Note** Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache; therefore, the descriptions for the INCMP and REACH states are different for dynamic and static cache entries. See the **show ipv6 neighbors** command for descriptions of the INCMP and REACH states for dynamic cache entries.

The **clear ipv6 neighbors** command deletes all entries in the IPv6 neighbor discovery cache, except static entries. The **no ipv6 neighbor** command deletes a specified static entry from the neighbor discovery cache; the command does not remove dynamic entries--learned from the IPv6 neighbor discovery process--from the

cache. Disabling IPv6 on an interface by using the **no ipv6 enable** command or the **no ipv6 unnumbered** command deletes all IPv6 neighbor discovery cache entries configured for that interface, except static entries (the state of the entry changes to INCMP).

Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.

**Note** Static entries for IPv6 neighbors can be configured only on IPv6-enabled LAN and ATM LAN Emulation interfaces.

#### Examples

I

The following example configures a static entry in the IPv6 neighbor discovery cache for a neighbor with the IPv6 address 2001:0DB8::45A and link-layer address 0002.7D1A.9472 on Ethernet interface 1:

Device(config)# ipv6 neighbor 2001:0DB8::45A ethernet1 0002.7D1A.9472

| Related Commands | Command   | Description  |
|------------------|---|--|
|                  | arp (global)  | Adds a permanent entry in the ARP cache.   |
|                  | clear ipv6 neighbors Deletes all entries in the IPv6 neighbor discovery cache, except |  |
|                  | no ipv6 enable  | Disables IPv6 processing on an interface that has not been configured with an explicit IPv6 address. |
|                  | no ipv6 unnumbered  | Disables IPv6 on an unnumbered interface.  |
|                  | show ipv6 neighbors   | Displays IPv6 neighbor discovery cache information.  |

#### ipv6 ospf name-lookup

To display Open Shortest Path First (OSPF) router IDs as Domain Naming System (DNS) names, use the **ipv6 ospf name-lookup** command in global configuration mode. To stop displaying OSPF router IDs as DNS names, use the **no** form of this command.

ipv6 ospf name-lookup no ipv6 ospf name-lookup

**Syntax Description** This command has no arguments or keywords.

**Command Default** This command is disabled by default

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** This command makes it easier to identify a router because the router is displayed by name rather than by its router ID or neighbor ID.

**Examples** The following example configures OSPF to look up DNS names for use in all OSPF show EXEC command displays:

Device(config) # ipv6 ospf name-lookup

# ipv6 pim

To reenable IPv6 Protocol Independent Multicast (PIM) on a specified interface, use the **ipv6 pim** command in interface configuration mode. To disable PIM on a specified interface, use the **no** form of the command.

ipv6 pim no ipv6 pim

**Syntax Description** This command has no arguments or keywords.

**Command Default** PIM is automatically enabled on every interface.

**Command Modes** Interface configuration (config-if)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

Usage Guidelines After a user has enabled the **ipv6 multicast-routing** command, PIM is enabled to run on every interface. Because PIM is enabled on every interface by default, use the **no** form of the **ipv6 pim** command to disable PIM on a specified interface. When PIM is disabled on an interface, it does not react to any host membership notifications from the Multicast Listener Discovery (MLD) protocol.

**Examples** The following example turns off PIM on Fast Ethernet interface 1/0:

Device(config)# interface FastEthernet 1/0
Device(config-if)# no ipv6 pim

| Related Commands | Command | Description  |
|------------------|---------|--|
|                  |         | Enables multicast routing using PIM and MLD on all IPv6-enabled interfaces of the router and enables multicast forwarding. |

### ipv6 pim accept-register

To accept or reject registers at the rendezvous point (RP), use the **ipv6 pim accept-register** command in global configuration mode. To return to the default value, use the **no** form of this command.

**ipv6 pim** [**vrf** *vrf-name*] **accept-register** {list *access-list* | **route-map** *map-name*} **no ipv6 pim** [**vrf** *vrf-name*] **accept-register** {list *access-list* | **route-map** *map-name*}

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) config  |                               |  |
|--------------------|--|-------------------------------|--|
|                    | list access-list   | Defines the access list name. |  |
|                    | route-map map-name   | Defines the route map.        |  |
| Command Default    | All sources are accepted at the RP.  |                               |  |
| Command Modes      | Global configuration (config)  |                               |  |
| Command History    | Release  | Modification                  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.  |  |
| Usage Guidelines   | Use the <b>ipv6 pim accept-register</b> command to configure a named access list or route map with match attributes.<br>When the permit conditions as defined by the <i>access-list</i> and <i>map-name</i> arguments are met, the register message is accepted. Otherwise, the register message is not accepted, and an immediate register-stop message is returned to the encapsulating designated router. |                               |  |
| Examples           | The following example shows how to filter on all sources that do not have a local multicast Border Gateway Protocol (BGP) prefix:  |                               |  |
|                    | ipv6 pim accept-register route-map reg-filter<br>route-map reg-filter permit 20<br>match as-path 101<br>ip as-path access-list 101 permit  |                               |  |

### ipv6 pim allow-rp

To enable the PIM Allow RP feature for all IP multicast-enabled interfaces in an IPv6 device, use the **ip pim allow-rp** command in global configuration mode. To return to the default value, use the **no** form of this command.

ipv6 pim allow-rp [{group-list access-list | rp-list access-list [group-list access-list]}] no ipv6 pim allow-rp

| Syntax Description | group-list  | (Optional) Identifies an access control list (ACL) of allowed group ranges for PIM Allow RP.             |   |                                       |  |  |
|--------------------|---|--|---|---------------------------------------|--|--|
|                    | rp-list   | (Optional) Specifies an ACL for allowed rendezvous-point (RP) addresses for PIM Allow RP.                |   |                                       |  |  |
|                    | access-list   | (Optional) U   | (Optional) Unique number or name of a standard ACL. |                                       |  |  |
| Command Default    | PIM Allow   | RP is disabled   | P is disabled.                                      |                                       |  |  |
| Command Modes      | Global confi  | configuration (config)   |   |                                       |  |  |
| Command History    | Release   |  | Modification  |                                       |  |  |
|                    | Cisco IOS 2<br>16.5.1a  | XE Everest   | This command was int                                | roduced.                              |  |  |
| Usage Guidelines   | Use this command to enable the receiving device in an IP multicast network to accept a (*, G) Join from an unexpected (different) RP address. |  |   |                                       |  |  |
|                    | Before enab   | Before enabling PIM Allow RP, you must first use the <b>ipv6 pim rp-address</b> command to define an RP. |   |                                       |  |  |
| Related Commands   | Command   | 1  | Description   |                                       |  |  |
|                    | ipv6 pim rj   | <b>im rp-address</b> Statically configures the address of a PIM RP for multicast groups.                 |   | ess of a PIM RP for multicast groups. |  |  |

### ipv6 pim neighbor-filter list

To filter Protocol Independent Multicast (PIM) neighbor messages from specific IPv6 addresses, use the **ipv6 pim neighbor-filter** command in the global configuration mode. To return to the router default, use the **no** form of this command.

ipv6 pim [vrf vrf-name] neighbor-filter list access-list no ipv6 pim [vrf vrf-name] neighbor-filter list access-list

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |                                  |   |                                  |
|--------------------|---|----------------------------------|---|----------------------------------|
|                    | <i>access-list</i> Name of an IPv6 access list that denies PIM hello packets from a source.   |                                  |   | PIM hello packets from a source. |
| Command Default    | PIM neighbor messages are not filtered.   |                                  |   |                                  |
| Command Modes      | Global configurat   | Global configuration (config)    |   |                                  |
| Command History    | Release   |                                  | Modification  |                                  |
|                    | Cisco IOS XE Everest<br>16.5.1a   |                                  | This command was introduc   | eed.                             |
| Usage Guidelines   | The <b>ipv6 pim neighbor-filter list</b> command is used to prevent unauthorized routers on the LAN from becoming PIM neighbors. Hello messages from addresses specified in this command are ignored. |                                  |   |                                  |
| Examples           | The following example causes PIM to ignore all hello messages from IPv6 address FE80::A8BB:CCFF:FE03:7200:  |                                  |   |                                  |
|                    | Device(config)  | # <b>ipv6 acce</b><br>ipv6-acl)# | neighbor-filter list nbr<br>ass-list nbr_filter_acl<br>deny ipv6 host FE80::A8F<br>permit any any |                                  |

### ipv6 pim rp-address

To configure the address of a Protocol Independent Multicast (PIM) rendezvous point (RP) for a particular group range, use the **ipv6 pim rp-address** command in global configuration mode. To remove an RP address, use the **no** form of this command.

**ipv6 pim** [**vrf** *vrf-name*] **rp-address** *ipv6-address* [*group-access-list*] [**bidir**] **no ipv6 pim rp-address** *ipv6-address* [*group-access-list*] [**bidir**]

| Syntax Description | vrf vrf-name  | (Optional) Specifies a virtual routing an  | d forwarding (VRF) configuration.   |  |  |  |  |
|--------------------|---|--|---|--|--|--|--|
|                    | ipv6-address  | The IPv6 address of a router to be a PIM RP.   |   |  |  |  |  |
|                    |   | The <i>ipv6-address</i> argument must be in the form documented in RFC 2373 where address is specified in hexadecimal using 16-bit values between colons.  |   |  |  |  |  |
|                    | group-access-list   | access-list (Optional) Name of an access list that defines for which multicast groups the RP shoul be used.  |   |  |  |  |  |
|                    |   |  | ddress range (FF3x::/96), a warning message is<br>re ignored. If no access list is specified, the |  |  |  |  |
|                    | To support embedded RP, the router configured as the list that permits the embedded RP group ranges derived   |  |   |  |  |  |  |
|                    |   | Note that the embedded RP group ranges need not include all the scopes (for example 3 through 7).  |   |  |  |  |  |
|                    | bidir   | (Optional) Indicates that the group range will be used for bidirectional shared-tree<br>forwarding; otherwise, it will be used for sparse-mode forwarding. A single IPv6 address<br>can be configured to be RP only for either bidirectional or sparse-mode group ranges.<br>A single group-range list can be configured to operate either in bidirectional or sparse<br>mode. |   |  |  |  |  |
| Command Default    |   | configured. Embedded RP support is enab<br>ort is provided). Multicast groups operate  | oled by default when IPv6 PIM is enabled (where<br>in PIM sparse mode.                            |  |  |  |  |
| Command Modes      | Global configuration  | on (config)  |   |  |  |  |  |
| Command History    | Release   |  | Modification  |  |  |  |  |
|                    | Cisco IOS XE Eve  | rest 16.5.1aCisco IOS XE Everest 16.5.1a   | This command was introduced.  |  |  |  |  |
| Usage Guidelines   | When PIM is configured in sparse mode, you must choose one or more routers to operate as the RP. Ar is a single common root of a shared distribution tree and is statically configured on each router.<br>Where embedded RP support is available, only the RP needs to be statically configured as the RP for the embedded RP ranges. No additional configuration is needed on other IPv6 PIM routers. The other router |  |   |  |  |  |  |
|                    |   |  |   |  |  |  |  |

discover the RP address from the IPv6 group address. If these routers want to select a static RP instead of the embedded RP, the specific embedded RP group range must be configured in the access list of the static RP.

The RP address is used by first-hop routers to send register packets on behalf of source multicast hosts. The RP address is also used by routers on behalf of multicast hosts that want to become members of a group. These routers send join and prune messages to the RP.

If the optional *group-access-list* argument is not specified, the RP is applied to the entire routable IPv6 multicast group range, excluding SSM, which ranges from FFX[3-f]::/8 to FF3X::/96. If the *group-access-list* argument is specified, the IPv6 address is the RP address for the group range specified in the *group-access-list* argument.

You can configure Cisco IOS software to use a single RP for more than one group. The conditions specified by the access list determine which groups the RP can be used for. If no access list is configured, the RP is used for all groups.

A PIM router can use multiple RPs, but only one per group.

**Examples** 

The following example shows how to set the PIM RP address to 2001::10:10 for all multicast groups:

Device (config) # ipv6 pim rp-address 2001::10:10

The following example sets the PIM RP address to 2001::10:10 for the multicast group FF04::/64 only:

```
Device(config)# ipv6 access-list acc-grp-1
Device(config-ipv6-acl)# permit ipv6 any ff04::/64
Device(config)# ipv6 pim rp-address 2001::10:10 acc-grp-1
```

The following example shows how to configure a group access list that permits the embedded RP ranges derived from the IPv6 RP address 2001:0DB8:2::2:

```
Device(config)# ipv6 pim rp-address 2001:0DB8:2::2 embd-ranges
Device(config)# ipv6 access-list embd-ranges
Device(config-ipv6-acl)# permit ipv6 any ff73:240:2:2:2::/96
Device(config-ipv6-acl)# permit ipv6 any ff74:240:2:2:2::/96
Device(config-ipv6-acl)# permit ipv6 any ff75:240:2:2:2::/96
Device(config-ipv6-acl)# permit ipv6 any ff76:240:2:2:2::/96
Device(config-ipv6-acl)# permit ipv6 any ff77:240:2:2:2::/96
Device(config-ipv6-acl)# permit ipv6 any ff78:240:2:2:2::/96
```

The following example shows how to enable the address 100::1 as the bidirectional RP for the entries multicast range FF::/8:

```
ipv6 pim rp-address 100::1 bidir
```

In the following example, the IPv6 address 200::1 is enabled as the bidirectional RP for the ranges permitted by the access list named bidir-grps. The ranges permitted by this list are ff05::/16 and ff06::/16.

```
Device(config)# ipv6 access-list bidir-grps
Device(config-ipv6-acl)# permit ipv6 any ff05::/16
Device(config-ipv6-acl)# permit ipv6 any ff06::/16
Device(config-ipv6-acl)# exit
Device(config)# ipv6 pim rp-address 200::1 bidir-grps bidir
```

| Related Commands | Command                    | Description   |
|------------------|----------------------------|---|
|                  | debug ipv6 pim df-election | Displays debug messages for PIM bidirectional DF-election message processing.             |
|                  | ipv6 access-list           | Defines an IPv6 access list and places the router in IPv6 access list configuration mode. |
|                  | show ipv6 pim df           | Displays the DF -election state of each interface for each RP.                            |
|                  | show ipv6 pim df winner    | Displays the DF-election winner on each interface for each RP.                            |

### ipv6 pim rp embedded

To enable embedded rendezvous point (RP) support in IPv6 Protocol Independent Multicast (PIM), use the **ipv6 pim rp-embedded** command in global configuration mode. To disable embedded RP support, use the **no** form of this command.

ipv6 pim [vrf vrf-name] rp embedded
no ipv6 pim [vrf vrf-name] rp embedded

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |                              |  |  |  |
|--------------------|---|------------------------------|--|--|--|
| Command Default    | Embedded RP support is enabled by default.  |                              |  |  |  |
| Command Modes      | Global configuration (config)   |                              |  |  |  |
| Command History    | Release   | Modification                 |  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced. |  |  |  |
| Usage Guidelines   | Because embedded RP support is enabled by default, users will generally use the <b>no</b> form of this command to turn off embedded RP support.   |                              |  |  |  |
|                    | The <b>ipv6 pim rp embedded</b> command applies only to the embedded RP group ranges ff7X::/16 a When the router is enabled, it parses groups in the embedded RP group ranges ff7X::/16 and fff. extracts the RP to be used from the group address. |                              |  |  |  |
| Examples           | The following example disables embedded RP support in IPv6 PIM:   |                              |  |  |  |
|                    | Device# no ipv6 pim rp embedded   |                              |  |  |  |

### ipv6 pim spt-threshold infinity

To configure when a Protocol Independent Multicast (PIM) leaf router joins the shortest path tree (SPT) for the specified groups, use the **ipv6 pim spt-threshold infinity** command in global configuration mode. To restore the default value, use the **no** form of this command.

**ipv6 pim** [**vrf** *vrf-name*] **spt-threshold infinity** [**group-list** *access-list-name*] **no ipv6 pim spt-threshold infinity** 

| Syntax Description | vrf vrf-name  | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |  |  |  |
|--------------------|---|--|--|--|--|
|                    | group-list access-list-name   | (Optional) Indicates to which groups the threshold applies. Must be a standard IPv6 access list name. If the value is omitted, the threshold applies to all groups.  |  |  |  |
| Command Default    | When this command is not used, the PIM leaf router joins the SPT immediately after the first packet arrives from a new source. Once the router has joined the SPT, configuring the <b>ipv6 pim spt-threshold infinity</b> command will not cause it to switch to the shared tree. |  |  |  |  |
| Command Modes      | Global configuration (config)   |  |  |  |  |
| Command History    | Release   | Modification   |  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced.   |  |  |  |
| Usage Guidelines   | Using the <b>ipv6 pim spt-threshold infinity</b> command enables all sources for the specified groups to use the shared tree. The <b>group-list</b> keyword indicates to which groups the SPT threshold applies.  |  |  |  |  |
|                    | with a value of 0, or the group   | t refers to an IPv6 access list. When the <i>access-list-name</i> argument is specified<br><b>p-list</b> keyword is not used, the SPT threshold applies to all groups. The default<br>nand is not enabled) is to join the SPT immediately after the first packet arrives |  |  |  |
| Examples           | <b>Examples</b> The following example configures a PIM last-hop router to stay on the shared tree and the SPT for the group range ff04::/64.:   |  |  |  |  |
|                    | Device(config)# <b>ipv6 access-list acc-grp-1</b><br>Device(config-ipv6-acl)# <b>permit ipv6 any FF04::/64</b><br>Device(config-ipv6-acl)# <b>exit</b><br>Device(config)# <b>ipv6 pim spt-threshold infinity group-list acc-grp-1</b>   |  |  |  |  |

### ipv6 prefix-list

To create an entry in an IPv6 prefix list, use the **ipv6 prefix-list** command in global configuration mode. To delete the entry, use the **no** form of this command.

**ipv6 prefix-list** *list-name* [**seq** *seq-number*] {**deny** *ipv6-prefix/prefix-length* | **permit** *ipv6-prefix/prefix-length* | **description** *text*} [**ge** *ge-value*] [**le** *le-value*] **no ipv6 prefix-list** *list-name* 

| Syntax Description | list-name           | Name of the prefix list.   |
|--------------------|---------------------|--|
|                    |                     | • Cannot be the same name as an existing access list.  |
|                    |                     | • Cannot be the name "detail" or "summary" because they are keywords in the <b>show ipv6 prefix-list</b> command.  |
|                    | seq seq-number      | (Optional) Sequence number of the prefix list entry being configured.  |
|                    | deny                | Denies networks that matches the condition.  |
|                    | permit              | Permits networks that matches the condition.   |
|                    | ipv6-prefix         | The IPv6 network assigned to the specified prefix list.  |
|                    |                     | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.   |
|                    | lprefix-length      | The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
|                    | description<br>text | A description of the prefix list that can be up to 80 characters in length.  |
|                    | ge ge-value         | (Optional) Specifies a prefix length greater than or equal to the <i>ipv6-prefix/prefix-length</i> arguments. It is the lowest value of a range of the <i>length</i> (the "from" portion of the length range).                 |
|                    | le le-value         | (Optional) Specifies a prefix length less than or equal to the <i>ipv6-prefix lprefix-length</i> arguments. It is the highest value of a range of the <i>length</i> (the "to" portion of the length range).                    |

**Command Default** No prefix list is created.

**Command Modes** Global configuration (config)

#### **Command History**

| 'Y | Release                         | Modification                 |
|----|---------------------------------|------------------------------|
|    | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

#### Usage Guidelines

The **ipv6 prefix-list** command is similar to the **ip prefix-list** command, except that it is IPv6-specific.

To suppress networks from being advertised in updates, use the **distribute-list out** command.

The sequence number of a prefix list entry determines the order of the entries in the list. The router compares network addresses to the prefix list entries. The router begins the comparison at the top of the prefix list, with the entry having the lowest sequence number.

If multiple entries of a prefix list match a prefix, the entry with the lowest sequence number is considered the real match. Once a match or deny occurs, the router does not go through the rest of the prefix list. For efficiency, you may want to put the most common permits or denies near the top of the list, using the *seq-number* argument.

The show ipv6 prefix-list command displays the sequence numbers of entries.

IPv6 prefix lists are used to specify certain prefixes or a range of prefixes that must be matched before a permit or deny statement can be applied. Two operand keywords can be used to designate a range of prefix lengths to be matched. A prefix length of less than, or equal to, a value is configured with the **le** keyword. A prefix length greater than, or equal to, a value is specified using the **ge** keyword. The **ge** and **le** keywords can be used to specify the range of the prefix length to be matched in more detail than the usual *ipv6-prefix/prefix-length* argument. For a candidate prefix to match against a prefix list entry three conditions

can exist:

- The candidate prefix must match the specified prefix list and prefix length entry.
- The value of the optional **le** keyword specifies the range of allowed prefix lengths from the *prefix-length* argument up to, and including, the value of the **le** keyword.
- The value of the optional **ge** keyword specifies the range of allowed prefix lengths from the value of the **ge** keyword up to, and including, 128.

Note The first condition must match before the other conditions take effect.

An exact match is assumed when the **ge** or **le** keywords are not specified. If only one keyword operand is specified then the condition for that keyword is applied, and the other condition is not applied. The *prefix-length* value must be less than the **ge** value. The **ge** value must be less than, or equal to, the **le** value. The **le** value must be less than or equal to 128.

Every IPv6 prefix list, including prefix lists that do not have any permit and deny condition statements, has an implicit deny any any statement as its last match condition.

**Examples** The following example denies all routes with a prefix of ::/0.

Device(config) # ipv6 prefix-list abc deny ::/0

The following example permits the prefix 2002::/16:

Device(config) # ipv6 prefix-list abc permit 2002::/16

The following example shows how to specify a group of prefixes to accept any prefixes from prefix 5F00::/48 up to and including prefix 5F00::/64.

Device(config) # ipv6 prefix-list abc permit 5F00::/48 le 64

The following example denies prefix lengths greater than 64 bits in routes that have the prefix 2001:0DB8::/64.

Device (config) # ipv6 prefix-list abc permit 2001:0DB8::/64 le 128 The following example permits mask lengths from 32 to 64 bits in all address space.

Device(config) # ipv6 prefix-list abc permit ::/0 ge 32 le 64

The following example denies mask lengths greater than 32 bits in all address space.

Device(config) # ipv6 prefix-list abc deny ::/0 ge 32

The following example denies all routes with a prefix of 2002::/128.

Device (config) # **ipv6 prefix-list abc deny 2002::/128** The following example permits all routes with a prefix of ::/0.

Device(config)# ipv6 prefix-list abc permit ::/0

| Related Commands |  |
|------------------|--|
|------------------|--|

| Command                          | Description  |  |
|----------------------------------|--|--|
| clear ipv6 prefix-list           | Resets the hit count of the IPv6 prefix list entries.                          |  |
| distribute-list out              | Suppresses networks from being advertised in updates.                          |  |
| ipv6 prefix-list sequence-number | Enables the generation of sequence numbers for entries in an IPv6 prefix list. |  |
| match ipv6 address               | Distributes IPv6 routes that have a prefix permitted by a prefix list.         |  |
| show ipv6 prefix-list            | Displays information about an IPv6 prefix list or IPv6 prefix list entries.    |  |

### ipv6 source-guard attach-policy

To apply IPv6 source guard policy on an interface, use the **ipv6 source-guard attach-policy** in interface configuration mode. To remove this source guard from the interface, use the **no** form of this command.

ipv6 source-guard attach-policy[source-guard-policy ]

| Syntax Description | <i>source-guard-policy</i> (Optional) User-defined name of the source guard policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0).  |   |  |  |  |  |  |
|--------------------|--|---|--|--|--|--|--|
| Command Default    | An IPv6 source-guard policy is not applied on the interface.   |   |  |  |  |  |  |
| Command Modes      | Interface configuration  | Interface configuration (config-if)   |  |  |  |  |  |
| Command History    | Release  | Modification  |  |  |  |  |  |
|                    | Cisco IOS XE Everes<br>16.5.1a   | t This command was introduced.  |  |  |  |  |  |
| Usage Guidelines   | <b>lines</b> If no policy is specified using the <i>source-guard-policy</i> argument, then the default source-guard p applied.   |   |  |  |  |  |  |
|                    | A dependency exists between IPv6 source guard and IPv6 snooping. Whenever IPv6 source guard is configured, when the <b>ipv6 source-guard attach-policy</b> command is entered, it verifies that snooping is enabled and issues a warning if it is not. If IPv6 snooping is disabled, the software checks if IPv6 source guard is enabled and sends a warning if it is. |   |  |  |  |  |  |
| Examples           | The following example shows how to apply IPv6 source guard on an interface:  |   |  |  |  |  |  |
|                    | Device(config)# interface gigabitethernet 0/0/1<br>Device(config-if)# ipv6 source-guard attach-policy mysnoopingpolicy   |   |  |  |  |  |  |
| Related Commands   | Command  | Description   |  |  |  |  |  |
|                    | ipv6 snooping policy   | Configures an IPv6 snooping policy and enters IPv6 snooping configuration mod |  |  |  |  |  |

#### ipv6 source-route

To enable processing of the IPv6 type 0 routing header (the IPv6 source routing header), use the **ipv6** source-route command in global configuration mode. To disable the processing of this IPv6 extension header, use the **no** form of this command.

ipv6 source-route no ipv6 source-route

**Syntax Description** This command has no arguments or keywords.

**Command Default** The **no** version of the **ipv6 source-route** command is the default. When the router receives a packet with a type 0 routing header, the router drops the packet and sends an IPv6 Internet Control Message Protocol (ICMP) error message back to the source and logs an appropriate debug message.

Command Modes Global configuration (config)

| Command History | Release  | Modification                 |  |
|-----------------|--|------------------------------|--|
|                 | Cisco IOS XE Everest 16.5.1aCisco IOS XE Everest 16.5.1a | This command was introduced. |  |

# **Usage Guidelines** The default was changed to be the **no** version of the **ipv6 source-route** command, which means this functionality is not enabled. Before this change, this functionality was enabled automatically. User who had configured the **no ipv6 source-route** command before the default was changed will continue to see this configuration in their **show config** command output, even though the **no** version of the command is the default.

The **no ipv6 source-route** command (which is the default) prevents hosts from performing source routing using your routers. When the **no ipv6 source-route** command is configured and the router receives a packet with a type0 source routing header, the router drops the packet and sends an IPv6 ICMP error message back to the source and logs an appropriate debug message.

In IPv6, source routing is performed only by the destination of the packet. Therefore, in order to stop source routing from occurring inside your network, you need to configure an IPv6 access control list (ACL) that includes the following rule:

deny ipv6 any any routing

The rate at which the router generates all IPv6 ICMP error messages can be limited by using the **ipv6 icmp** error-intervalcommand.

#### **Examples** The following example disables the processing of IPv6 type 0 routing headers:

no ipv6 source-route

| Related Commands | Command                  | Description   |  |
|------------------|--------------------------|---|--|
|                  | deny (IPv6)              | Sets deny conditions for an IPv6 access list.         |  |
|                  | ipv6 icmp error-interval | Configures the interval for IPv6 ICMP error messages. |  |

### ipv6 spd mode

To configure an IPv6 Selective Packet Discard (SPD) mode, use the **ipv6 spd mode** command in global configuration mode. To remove the IPv6 SPD mode, use the **no** form of this command.

ipv6 spd mode {aggressive | tos protocol ospf} no ipv6 spd mode {aggressive | tos protocol ospf}

| Syntax Description | aggressive   | Aggressive drop mode discards incorrectly formatted packets when the IPv6 SPD is in random drop state. |  |  |
|--------------------|--|--|--|--|
|                    | tos protocol o spf   | OSPF mod   | e allows OSPF packets to be handled with SPD priority.           |  |
| Command Default    | No IPv6 SPD mode is  | s configured.  |  |  |
| Command Modes      | Global configuration   | (config)   |  |  |
| Command History    | Release  | Mo   | odification  |  |
|                    | Cisco IOS XE Evere<br>16.5.1a  | st Th  | is command was introduced.                                       |  |
| Usage Guidelines   | The default setting for the IPv6 SPD mode is none, but you may want to use the <b>ipv6 spd mode</b> command to configure a mode to be used when a certain SPD state is reached.  |  |  |  |
|                    | The <b>aggressive</b> keyword enables aggressive drop mode, which drops deformed packets when IPv6 SPD is in random drop state. The <b>ospf</b> keyword enables OSPF mode, in which OSPF packets are handled with SPD priority.  |  |  |  |
|                    | The size of the process input queue governs the SPD state: normal (no drop), random drop, or max. When the process input queue is less than the SPD minimum threshold, SPD takes no action and enters normal state. In the normal state, no packets are dropped. When the input queue reaches the maximum threshold, SPD enters max state, in which normal priority packets are discarded. If the input queue is between the minimum and maximum thresholds, SPD enters the random drop state, in which normal packets may be dropped. |  |  |  |
| Examples           | The following example shows how to enable the router to drop deformed packets when the router is in the random drop state:   |  |  |  |
|                    | Device(config)# <b>ip</b>  | v6 spf mode  | e aggressive   |  |
| Related Commands   | Command  |  | Description  |  |
|                    | ipv6 spd queue max   | -threshold   | Configures the maximum number of packets in the IPv6 SPD process |  |

|               | input queue.  |
|---------------|---|
|               | Configures the minimum number of packets in the IPv6 SPD process input queue. |
| show ipv6 spd | Displays the IPv6 SPD configuration.  |

### ipv6 spd queue max-threshold

To configure the maximum number of packets in the IPv6 Selective Packet Discard (SPD) process input queue, use the **ipv6 spd queue max-threshold** command in global configuration mode. To return to the default value, use the **no** form of this command.

ipv6 spd queue max-threshold value no ipv6 spd queue max-threshold

| Syntax Description | <i>value</i> Number of packets. The range is from 0 through 65535.   |                                     |                                 |            |  |
|--------------------|--|-------------------------------------|---------------------------------|------------|--|
| Command Default    | No SPD queue maximum threshold value is configured.  |                                     |                                 |            |  |
| Command Modes      | Global configuration (config)  |                                     |                                 |            |  |
| Command History    | Release  |                                     | Modification                    |            |  |
|                    | Cisco IOS XE Everest 16.5.1aCise   | co IOS XE Everest 16.5.1a           | This command was introduced.    |            |  |
| Usage Guidelines   | Use the <b>ipv6 spd queue max-threshold</b> command to configure the SPD queue maximum threshold value.<br>The size of the process input queue governs the SPD state: normal (no drop), random drop, or max. When the process input queue is less than the SPD minimum threshold, SPD takes no action and enters normal state.<br>In the normal state, no packets are dropped. When the input queue reaches the maximum threshold, SPD enters max state, in which normal priority packets are discarded. If the input queue is between the minimum and maximum thresholds, SPD enters the random drop state, in which normal packets may be dropped. |                                     |                                 |            |  |
| Examples           | The following example shows how to set the maximum threshold value of the queue to 60,000:   |                                     |                                 |            |  |
|                    |  |                                     |                                 |            |  |
| Related Commands   | Command  | Description                         |                                 |            |  |
|                    | ipv6 spd queue min-threshold   | Configures the minimum input queue. | number of packets in the IPv6 S | PD process |  |

Displays the IPv6 SPD configuration.

show ipv6 spd

### ipv6 traffic interface-statistics

To collect IPv6 forwarding statistics for all interfaces, use the **ipv6 traffic interface-statistics** command in global configuration mode. To ensure that IPv6 forwarding statistics are not collected for any interface, use the **no** form of this command.

ipv6 traffic interface-statistics [unclearable] no ipv6 traffic interface-statistics [unclearable]

| Syntax Description | unclearable   | (Optional) IPv6 forwarding statistics are kept for all interfaces, but it is not possible to clear the statistics on any interface. |                            |              | to clear         |                 |  |
|--------------------|---|---|----------------------------|--------------|------------------|-----------------|--|
| Command Default    | IPv6 forwarding statistics are collected for all interfaces.                    |   |                            |              |                  |                 |  |
| Command Modes      | Global configu  | aration (config   | ;)                         |              |                  |                 |  |
| Command History    | Release   |   | Modification               |              |                  |                 |  |
|                    | Cisco IOS XE<br>16.5.1a   | E Everest   | This command was intro     | uced.        |                  |                 |  |
| Usage Guidelines   | Using the option  | onal unclearab  | le keyword halves the per- | nterface sta | atistics storage | e requirements. |  |
| Examples           | The following example does not allow statistics to be cleared on any interface: |   |                            |              |                  |                 |  |
|                    | Device(confi  | g)# <b>ipv6 tra</b>   | ffic interface-statist     | cs unclea    | rable            |                 |  |

IP Addressing Services Commands

### ipv6 unicast-routing

To enable the forwarding of IPv6 unicast datagrams, use the **ipv6 unicast-routing** command in global configuration mode. To disable the forwarding of IPv6 unicast datagrams, use the **no** form of this command.

ipv6 unicast-routing no ipv6 unicast-routing

**Syntax Description** This command has no arguments or keywords.

**Command Default** IPv6 unicast routing is disabled.

**Command Modes** Global configuration (config)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage Guidelines Configuring the no ipv6 unicast-routing command removes all IPv6 routing protocol entries from the IPv6 routing table.

**Examples** The following example enables the forwarding of IPv6 unicast datagrams:

Device(config) # ipv6 unicast-routing

| Related Commands | Command                 | Description  |
|------------------|-------------------------|--|
|                  | ipv6 address link-local | Configures an IPv6 link-local address for an interface and enables IPv6 processing on the interface.   |
|                  | ipv6 address eui-64     | Configures an IPv6 address and enables IPv6 processing on an interface using an EUI-64 interface ID in the low-order 64 bits of the address. |
|                  | ipv6 enable             | Enables IPv6 processing on an interface that has not been configured with an explicit IPv6 address.  |
|                  | ipv6 unnumbered         | Enables IPv6 processing on an interface without assigning an explicit IPv6 address to the interface.   |
|                  | show ipv6 route         | Displays the current contents of the IPv6 routing table.   |

### key chain

To define an authentication key chain needed to enable authentication for routing protocols and enter key-chain configuration mode, use the **key chain** command in global configuration mode. To remove the key chain, use the **no** form of this command.

key chain name-of-chain no key chain name-of-chain

| Syntax Description | name-of-chain   | Name of a key chain. A key chain must have at least one key and can have up to 2147483647 keys. |  |
|--------------------|---|---|--|
| Command Default    | No key chain ex   | ists.   |  |
| Command Modes      | Global configuration (config)   |   |  |
| Usage Guidelines   | You must configure a key chain with keys to enable authentication.<br>Although you can identify multiple key chains, we recommend using one key chain per interface per routing protocol. Upon specifying the <b>key chain</b> command, you enter key chain configuration mode. |   |  |
| Examples           | 1 1   | cample shows how to specify key chain:  |  |

Device(config-keychain-key) # key-string chestnut

| Related Commands | Command                     | Description   |  |
|------------------|-----------------------------|---|--|
|                  | accept-lifetime             | Sets the time period during which the authentication key on a key chain is received as valid. |  |
|                  | key                         | Identifies an authentication key on a key chain.  |  |
|                  | key-string (authentication) | Specifies the authentication string for a key.  |  |
|                  | send-lifetime               | Sets the time period during which an authentication key on a key chain is valid to be sent.   |  |
|                  | show key chain              | Displays authentication key information.  |  |

## key-string (authentication)

To specify the authentication string for a key, use the **key-string**(authentication) command in key chain key configuration mode. To remove the authentication string, use the **no** form of this command.

key-string key-string *text* no key-string *text* 

| Syntax Description | <i>text</i> Authentication string that must be sent and received in the packets using the routing protocol being authenticated. The string can contain from 1 to 80 uppercase and lowercase alphanumeric characters. |  |  |
|--------------------|--|--|--|
| Command Default    | No authentication string for a key exists.   |  |  |
| Command Modes      | Key chain key configuration (config-keychain-key)  |  |  |
| Examples           | The following example shows how to specify the authentication string for a key:  |  |  |
|                    | Device(config-keychain-key)# <b>key-string key1</b>  |  |  |

| Related Commands | Command         | Description   |  |  |
|------------------|-----------------|---|--|--|
|                  | accept-lifetime | Sets the time period during which the authentication key on a key chain is received as valid. |  |  |
|                  | key             | Identifies an authentication key on a key chain.  |  |  |
|                  | key chain       | Defines an authentication key-chain needed to enable authentication for routing protocols.    |  |  |
|                  | send-lifetime   | Sets the time period during which an authentication key on a key chain is valid to be sent.   |  |  |
|                  | show key chain  | Displays authentication key information.  |  |  |

# key

To identify an authentication key on a key chain, use the **key** command in key-chain configuration mode. To remove the key from the key chain, use the **no** form of this command.

key key-id no key key-id

| Syntax Description | key-idIdentification number of an authentication key on a key chain. The range of keys is from 0 to<br>2147483647. The key identification numbers need not be consecutive.   |
|--------------------|--|
| Command Default    | No key exists on the key chain.  |
| Command Modes      | Key-chain configuration (config-keychain)  |
| Usage Guidelines   | It is useful to have multiple keys on a key chain so that the software can sequence through the keys as they become invalid after time, based on the <b>accept-lifetime</b> and <b>send-lifetime</b> key chain key command settings.   |
|                    | Each key has its own key identifier, which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use. Only one authentication packet is sent, regardless of the number of valid keys. The software starts looking at the lowest key identifier number and uses the first valid key. |
|                    | If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.  |
|                    | To remove all keys, remove the key chain by using the <b>no key chain</b> command.   |
| Examples           | The following example shows how to specify a key to identify authentication on a key-chain:  |
|                    | Device(config-keychain)# <b>key 1</b>  |

| <b>Related Commands</b> | Command                     | Description   |  |  |
|-------------------------|-----------------------------|---|--|--|
|                         | accept-lifetime             | Sets the time period during which the authentication key on a key chain is received as valid. |  |  |
|                         | key chain                   | Defines an authentication key chain needed to enable authentication for routing protocols.    |  |  |
|                         | key-string (authentication) | Specifies the authentication string for a key.  |  |  |
|                         | send-lifetime               | Sets the time period during which an authentication key on a key chain is valid to be sent.   |  |  |
|                         | show key chain              | Displays authentication key information.  |  |  |

## show ip nat translations

To display active Network Address Translation (NAT) translations, use the **show ip nat translations** command in EXEC mode.

show ip nat translations [ inside global-ip ] [ outside local-ip ] [ icmp] [ icmp] [ udp]
[verbose] [ vrf vrf-name ]

| Syntax Description |  |  |  |  |  |  |
|--------------------|--|--|--|--|--|--|
| - <b>·</b>         | icmp (Optional) Displays Internet Control Message Protocol (ICMP) entries.   |  |  |  |  |  |
|                    | inside global-ip   | (Optional) Displays entries for only a specific inside global IP address.  |  |  |  |  |
|                    | outside local-ip   | <b>outside</b> <i>local-ip</i> (Optional) Displays entries for only a specific outside local IP address.   |  |  |  |  |
|                    | tcp (Optional) Displays TCP protocol entries.  |  |  |  |  |  |
|                    | udp         (Optional) Displays User Datagram Protocol (UDP) entries.  |  |  |  |  |  |
|                    | verbose  | verbose         (Optional) Displays additional information for each translation table entry, including how long ago the entry was created and used.  |  |  |  |  |
|                    | vrf vrf-name   | (Optional) Displays VPN routing and forwarding (VRF) traffic-related information.  |  |  |  |  |
| Command Modes      | EXEC   |  |  |  |  |  |
| Command History    | _  |  |  |  |  |  |

| Related Commands | Command                   | Description   |
|------------------|---------------------------|---|
|                  | clear ip nat translation  | Clears dynamic NAT translations from the translation table.                               |
|                  | ip nat                    | Designates that traffic originating from or destined for the interface is subject to NAT. |
|                  | ip nat inside destination | Enables NAT of the inside destination address.  |
|                  | ip nat inside source      | Enables NAT of the inside source address.   |
|                  | ip nat outside source     | Enables NAT of the outside source address.  |
|                  | ip nat pool               | Defines a pool of IP addresses for NAT.   |
|                  | ip nat service            | Enables a port other than the default port.   |
|                  | show ip nat statistics    | Displays NAT statistics.  |

### show ip nhrp nhs

**Auto-Template** 

Capwap

To display Next Hop Resolution Protocol (NHRP) next hop server (NHS) information, use the **show ip nhrp nhs**command in user EXEC or privileged EXEC mode.

show ip nhrp nhs [{interface}] [detail] [{redundancy [{cluster number | preempted | running |
waiting}]}]

| Syntax Description | interface  | \ <b>1</b> /  | isplays NHS information c   | currently configured on the interface. See the table escriptions. |  |
|--------------------|--|---|-----------------------------|---|--|
|                    | detail (Optional) Displays detailed NHS information.       |   |                             |   |  |
|                    | redundancy   | (Optional) D  | isplays information about   | NHS redundancy stacks.  |  |
|                    | cluster number   | (Optional) Displays redundancy cluster information.   |                             |   |  |
|                    | preempted  | d(Optional) Displays information about NHS that failed to become active and is preempted.(Optional) Displays NHSs that are currently in Responding or Expecting replies states. |                             |   |  |
|                    | running  |   |                             |   |  |
|                    | waiting (Optional) Displays NHSs awaiting to be scheduled. |   |                             | be scheduled.   |  |

### show ipv6 access-list

To display the contents of all current IPv6 access lists, use the **show ipv6 access-list** command in user EXEC or privileged EXEC mode.

show ipv6 access-list [access-list-name]

| Syntax Description | access-list-name (Optional) Name of access list.  |  |      |  |  |
|--------------------|---|--|------|--|--|
| Command Default    | All IPv6 access lists are displayed.  |  |      |  |  |
| Command Modes      | User EXEC (>)   |  |      |  |  |
|                    | Privileged EXEC (#)   |  |      |  |  |
| Command History    | Release   | Modification   |      |  |  |
|                    | Cisco IOS XE Everest 16.5.1aCisco IOS XE Everest 16.5.1a  | This command was introduced.   |      |  |  |
| Usage Guidelines   | The <b>show ipv6 access-list</b> command provides output similar it is IPv6-specific.   | to the <b>show ip access-list</b> command, except  | that |  |  |
| Examples           | The following output from the <b>show ipv6 access-list</b> command shows IPv6 access lists named inbound, tcptraffic, and outbound:   |  |      |  |  |
|                    | <pre>Device# show ipv6 access-list<br/>IPv6 access list inbound<br/>permit tcp any any eq bgp reflect tcptraffic (%<br/>permit tcp any any eq telnet reflect tcptraffic<br/>permit udp any any reflect udptraffic sequence<br/>IPv6 access list tcptraffic (reflexive) (per-user)<br/>permit tcp host 2001:0DB8:1::1 eq bgp host 2001<br/>left 243) sequence 1<br/>permit tcp host 2001:0DB8:1::1 eq telnet host 2<br/>(time left 296) sequence 2<br/>IPv6 access list outbound<br/>evaluate udptraffic<br/>evaluate tcptraffic</pre> | c (15 matches) sequence 20<br>30<br>L:ODB8:1::2 eq 11000 timeout 300 (tir<br>2001:ODB8:1::2 eq 11001 timeout 300 | ne   |  |  |

```
Device# show ipv6 access-list
IPv6 access list Tunnel0-head-0-ACL (crypto)
        permit ipv6 any any (34 matches) sequence 1
IPv6 access list Ethernet2/0-ipsecv6-ACL (crypto)
        permit 89 FE80::/10 any (85 matches) sequence 1
```

The table below describes the significant fields shown in the display.

| Field                    | Description  |  |  |  |
|--------------------------|--|--|--|--|
| ipv6 access list inbound | Name of the IPv6 access list, for example, inbound.  |  |  |  |
| permit                   | Permits any packet that matches the specified protocol type.   |  |  |  |
| tcp                      | Transmission Control Protocol. The higher-level (Layer 4) protocol type that the packet must match.  |  |  |  |
| any                      | Equal to ::/0.   |  |  |  |
| eq                       | An equal operand that compares the source or destination ports of TCP or UDP packets.  |  |  |  |
| bgp                      | Border Gateway Protocol. The lower-level (Layer 3) protocol type that the packet must be equal to.   |  |  |  |
| reflect                  | Indicates a reflexive IPv6 access list.  |  |  |  |
| tcptraffic (8 matches)   | The name of the reflexive IPv6 access list and the number of matches for the access list. The <b>clear ipv6 access-list</b> privileged EXEC command resets the IPv6 access list match counters.  |  |  |  |
| sequence 10              | Sequence in which an incoming packet is compared to lines in an access list. Lines in an access list are ordered from first priority (lowest number, for example, 10) to last priority (highest number, for example, 80).                              |  |  |  |
| host 2001:0DB8:1::1      | The source IPv6 host address that the source address of the packet must match.   |  |  |  |
| host 2001:0DB8:1::2      | The destination IPv6 host address that the destination address of the packet must match.   |  |  |  |
| 11000                    | The ephemeral source port number for the outgoing connection.  |  |  |  |
| timeout 300              | The total interval of idle time (in seconds) after which the temporary IPv6 reflexive access list named tcptraffic will time out for the indicated session.  |  |  |  |
| (time left 243)          | The amount of idle time (in seconds) remaining before the temporary IPv6 reflexive access list named tcptraffic is deleted for the indicated session. Additional received traffic that matches the indicated session resets this value to 300 seconds. |  |  |  |
| evaluate udptraffic      | Indicates the IPv6 reflexive access list named udptraffic is nested in the IPv6 access list named outbound.  |  |  |  |

#### Table 6: show ipv6 access-list Field Descriptions

| Related Commands |  |
|------------------|--|
|------------------|--|

| nds Command Description |                        | Description   |
|-------------------------|------------------------|---|
|                         | clear ipv6 access-list | Resets the IPv6 access list match counters.           |
|                         | hardware statistics    | Enables the collection of hardware statistics.        |
|                         | show ip access-list    | Displays the contents of all current IP access lists. |

|-----------------------|---|
| show ip prefix-list   | Displays information about a prefix list or prefix list entries.            |
| show ipv6 prefix-list | Displays information about an IPv6 prefix list or IPv6 prefix list entries. |

#### show ipv6 destination-guard policy

To display destination guard information, use the **show ipv6 destination-guard policy** command in privileged EXEC mode.

**show ipv6 destination-guard policy** [policy-name] **Syntax Description** policy-name (Optional) Name of the destination guard policy. Privileged EXEC (#) **Command Modes Command History** Release Modification Cisco IOS XE Everest This command was introduced 16.5.1a If the *policy-name* argument is specified, only the specified policy information is displayed. If the *policy-name* **Usage Guidelines** argument is not specified, information is displayed for all policies. **Examples** The following is sample output from the **show ipv6 destination-guard policy** command when the policy is applied to a VLAN: Device# show ipv6 destination-guard policy pol1 Destination guard policy destination: enforcement always Target: vlan 300

The following is sample output from the **show ipv6 destination-guard policy** command when the policy is applied to an interface:

```
Device# show ipv6 destination-guard policy pol1
Destination guard policy destination:
enforcement always
Target: Gi0/0/1
```

| Related Commands | Command                       | Description                           |  |
|------------------|-------------------------------|---------------------------------------|--|
|                  | ipv6 destination-guard policy | Defines the destination guard policy. |  |

#### show ipv6 dhcp

To display the Dynamic Host Configuration Protocol (DHCP) unique identifier (DUID) on a specified device, use the **show ipv6 dhcp** command in user EXEC or privileged EXEC mode.

show ipv6 dhcp

Syntax Description This command has no arguments or keywords.

**Command Modes** User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage Guidelines The show ipv6 dhcp command uses the DUID based on the link-layer address for both client and server identifiers. The device uses the MAC address from the lowest-numbered interface to form the DUID. The network interface is assumed to be permanently attached to the device. Use the show ipv6 dhcp command to display the DUID of a device.

Examples

The following is sample output from the **show ipv6 dhcp** command. The output is self-explanatory:

Device# show ipv6 dhcp This device's DHCPv6 unique identifier(DUID): 000300010002FCA5DC1C

## show ipv6 dhcp binding

To display automatic client bindings from the Dynamic Host Configuration Protocol (DHCP) for IPv6 server binding table, use the **show ipv6 dhcp binding** command in user EXEC or privileged EXEC mode.

show ipv6 dhcp binding [ipv6-address] [vrf vrf-name]

| Syntax Description | ipv6-address   | (Optional)   | The address of a DHCP for IPv6  | 5 client.                           |                  |  |
|--------------------|--|--|---|-------------------------------------|------------------|--|
| -                  | vrf vrf-name   | · · · ·  | Specifies a virtual routing and fo  |                                     |                  |  |
|                    |  |  |   |                                     |                  |  |
| Command Modes      | User EXEC (>)  |  |   |                                     |                  |  |
|                    | Privileged EXE   | C (#)  |   |                                     |                  |  |

|                    | Prefix: 2<br>p<br>e<br>Client: FE80:<br>DUID: 00030<br>IA PD: IA I | 001AABBCC00<br>client_1<br>Virtual-Acc<br>D 0x000C000<br>001:380:E00<br>referred li<br>xpires at D<br>:A8BB:CCFF:<br>001AABBCC00 | 00300<br>cess2.1<br>01, T1 75, T2 135<br>0::/64<br>Ifetime 150, valid lifetime<br>Dec 06 2007 12:57 PM (262 se<br>FE00:300 (Virtual-Access2.2<br>00300<br>01, T1 75, T2 135 | econds)                             |                  |  |

preferred lifetime 150, valid lifetime 300 expires at Dec 06 2007 12:58 PM (288 seconds)

The table below describes the significant fields shown in the display.

Table 7: show ipv6 dhcp binding Field Descriptions

| Field   | Description  |  |  |
|---|--|--|--|
| Client  | Address of a specified client.   |  |  |
| DUID  | DHCP unique identifier (DUID).   |  |  |
| Virtual-Access2.1   | First virtual client. When an IPv6 DHCP client requests two prefixes with<br>the same DUID but a different identity association for prefix delegation<br>(IAPD) on two different interfaces, these prefixes are considered to be for<br>two different clients, and interface information is maintained for both. |  |  |
| Username : client_1   | The username associated with the binding.  |  |  |
| IA PD   | Collection of prefixes assigned to a client.   |  |  |
| IA ID   | Identifier for this IAPD.  |  |  |
| Prefix  | Prefixes delegated to the indicated IAPD on the specified client.  |  |  |
| preferred lifetime, valid<br>lifetime                                 | The preferred lifetime and valid lifetime settings, in seconds, for the specified client.  |  |  |
| Expires at         Date and time at which the valid lifetime expires. |  |  |  |
| Virtual-Access2.2   | Second virtual client. When an IPv6 DHCP client requests two prefixes with the same DUID but different IAIDs on two different interfaces, these prefixes are considered to be for two different clients, and interface information is maintained for both.   |  |  |

When the DHCPv6 pool on the Cisco IOS DHCPv6 server is configured to obtain prefixes for delegation from an authentication, authorization, and accounting (AAA) server, it sends the PPP username from the incoming PPP session to the AAA server for obtaining the prefixes. The PPP username is associated with the binding is displayed in output from the **show ipv6 dhcp binding** command. If there is no PPP username associated with the binding, this field value is displayed as "unassigned."

The following example shows that the PPP username associated with the binding is "client\_1":

```
Device# show ipv6 dhcp binding
```

```
Client: FE80::2AA:FF:FEBB:CC

DUID: 000300100AA00BB00CC

Username : client_1

Interface : Virtual-Access2

IA PD: IA ID 0x00130001, T1 75, T2 135

Prefix: 2001:0DB8:1:3::/80

preferred lifetime 150, valid lifetime 300

expires at Aug 07 2008 05:19 AM (225 seconds)
```

The following example shows that the PPP username associated with the binding is unassigned:

#### Device# show ipv6 dhcp binding

```
Client: FE80::2AA:FF:FEBB:CC

DUID: 000300100AA00BB00CC

Username : unassigned

Interface : Virtual-Access2

IA PD: IA ID 0x00130001, T1 150, T2 240

Prefix: 2001:0DB8:1:1::/80

preferred lifetime 300, valid lifetime 300

expires at Aug 11 2008 06:23 AM (233 seconds)
```

| Related Commands | Command                     | Description   |
|------------------|-----------------------------|---|
|                  | ipv6 dhcp server vrf enable | Enables the DHCPv6 server VRF-aware feature.                            |
|                  | clear ipv6 dhcp binding     | Deletes automatic client bindings from the DHCP for IPv6 binding table. |

## show ipv6 dhcp conflict

To display address conflicts found by a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server when addresses are offered to the client, use the **show ipv6 dhcp conflict** command in privileged EXEC mode.

show ipv6 dhcp conflict [ipv6-address] [vrf vrf-name]

| Syntax Description  | <i>ipv6-address</i> (Optional) The address of a DHCP for IPv6 client.   |           |                                       |                          |       |  |
|---|---|-----------|---------------------------------------|--------------------------|-------|--|
|   | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration  |           |                                       |                          |       |  |
| Command Modes   | Privileged EXE  | C (#)     |                                       |                          |       |  |
| Command History   | Release   |           |                                       | Modification             |       |  |
|   | Cisco IOS XE I  | Everest 1 | 6.5.1aCisco IOS XE Everest 16.5.1a    | This command was introdu | uced. |  |
| Usage Guidelines  | When you configure the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor discovery to detect clients and reports to the server through a DECLINE message. If an address conflict is detected, the address is removed from the pool, and the address is not assigned until the administrator removes the address from the conflict list. |           |                                       |                          |       |  |
| <b>Examples</b> The following is a sample output from the <b>show ipv6 dhcp conflict</b> command. This command show the pool and prefix values for DHCP conflicts.: |   |           |                                       | mand shows               |       |  |
|   | Device# <b>show ipv6 dhcp conflict</b><br>Pool 350, prefix 2001:0DB8:1005::/48<br>2001:0DB8:1005::10  |           |                                       |                          |       |  |
| Related Commands  | Command   |           | Description                           |                          |       |  |
|   | clear ipv6 dhcp   | conflict  | Clears an address conflict from the I | DHCPv6 server database.  |       |  |

## show ipv6 dhcp database

To display the Dynamic Host Configuration Protocol (DHCP) for IPv6 binding database agent information, use the **show ipv6 dhcp database** command in user EXEC or privileged EXEC mode.

show ipv6 dhcp database [agent-URL]

|                    |  | 1   |   |   |
|--------------------|--|---|---|---|
| Syntax Description | agent-URL  | (Optional) A fl<br>locator.   | ash, NVRAM, FTP, TFTP, or rea   | note copy protocol (RCP) uniform resource   |
| Command Modes      | User EXEC  | (>)   |   |   |
|                    | Privileged E   | XEC (#)   |   |   |
| Command History    | Release  |   | Modification  | 7   |
|                    | Cisco IOS X<br>16.5.1a   | KE Everest  | This command was introduced   |   |
| Usage Guidelines   | configured u   | sing the <b>ipv6 dh</b>   | •   | d is called the database agent. An agent can be<br>ed database agents include FTP and TFTP        |
|                    | agent-URL a  | -   | fied, only the specified agent is c   | Pv6 binding database agent information. If the lisplayed. If the <i>agent-URL</i> argument is not |
| Examples           | The following is sample output from the <b>show ipv6 dhcp database</b> command:  |   |   |   |
|                    | Database ag<br>write del<br>last write<br>last verite<br>last read<br>successfu<br>failed re<br>successfu<br>failed wr<br>Database ag<br>write del<br>last write<br>last read<br>successfu<br>failed re<br>successfu<br>failed re<br>successfu<br>failed re<br>successfu<br>failed wr<br>Database ag<br>write del<br>last write<br>write del<br>last write | ay: 69 seconds<br>then at Jan 09<br>timer expires<br>a at Jan 06 200<br>al read times 0<br>al write times<br>tite times 2<br>gent nvram:/dho<br>ay: 60 seconds<br>then at Jan 09<br>timer expires<br>a t never<br>al read times 0<br>and times 0<br>al write times<br>tite times 0<br>gent flash:/dho<br>ay: 82 seconds | <pre>2.19.216.133/db.tftp:<br/>s, transfer timeout: 300 sec<br/>2003 01:54 PM,<br/>in 56 seconds<br/>03 05:41 PM<br/>1<br/>3172<br/>cpv6-binding:<br/>s, transfer timeout: 300 sec<br/>2003 01:54 PM,<br/>in 37 seconds<br/>0<br/>3325<br/>cpv6-db:<br/>s, transfer timeout: 3 secon<br/>2003 01:54 PM,</pre> | conds   |

successful read times 0 failed read times 0 successful write times 2220 failed write times 614

The table below describes the significant fields shown in the display.

#### Table 8: show ipv6 dhcp database Field Descriptions

| Field                         | Description  |
|-------------------------------|--|
| Database agent                | Specifies the database agent.  |
| Write delay                   | The amount of time (in seconds) to wait before updating the database.  |
| transfer timeout              | Specifies how long (in seconds) the DHCP server should wait before canceling a database transfer. Transfers that exceed the timeout period are canceled. |
| Last written                  | The last date and time bindings were written to the file server.   |
| Write timer expires           | The length of time, in seconds, before the write timer expires.  |
| Last read                     | The last date and time bindings were read from the file server.  |
| Successful/failed read times  | The number of successful or failed read times.   |
| Successful/failed write times | The number of successful or failed write times.  |

| Related Commands | Command            | Description  |
|------------------|--------------------|--|
|                  | ipv6 dhcp database | Specifies DHCP for IPv6 binding database agent parameters. |

### show ipv6 dhcp guard policy

To display Dynamic Host Configuration Protocol for IPv6 (DHCPv6) guard information, use the **show ipv6 dhcp guard policy** command in privileged EXEC mode.

show ipv6 dhcp guard policy [policy-name]

| Syntax Description | policy-name                         | (Optional) D   | HCPv6 guard policy name.                                       |  |
|--------------------|-------------------------------------|--|--|--|
| Command Modes      | Privileged EXI                      | EC (#)   |  |  |
| Command History    | Release                             |  | Modification   |  |
|                    | Cisco IOS XE<br>16.5.1a             | Everest  | This command was introd  | uced.  |
| Usage Guidelines   | · ·                                 | -  | specified, only the specified<br>ormation is displayed for all | d policy information is displayed. If the <i>policy-name</i> policies. |
| Examples           | The following                       | is sample outpu  | ut from the <b>show ipv6 dhcp</b>                              | guard guard command:   |
|                    | Device# show ipv6 dhcp guard policy |  |  |  |
|                    |                                     | olicy: defaul<br>ce Role: dhcp<br>et: Et0/3                                    |  |  |
|                    | Targe<br>Max 1<br>Min 1<br>Sourc    | ce Role: dhcp<br>et: vlan 0<br>Preference: 2<br>Preference: 0<br>ce Address Ma | vlan 1 vlan 2 vl<br>00   | Lan 3 vlan 4   |
|                    |                                     | olicy: test2<br>ce Role: dhcp<br>et: Et0/0 Et0                                 |  |  |

The table below describes the significant fields shown in the display.

#### Table 9: show ipv6 dhcp guard Field Descriptions

| Field          | Description  |
|----------------|--|
| Device<br>Role | The role of the device. The role is either client, server or relay.  |
| Target         | The name of the target. The target is either an interface or a VLAN. |

| Related Commands | Command                | Description                           |
|------------------|------------------------|---------------------------------------|
|                  | ipv6 dhcp guard policy | Defines the DHCPv6 guard policy name. |

## show ipv6 dhcp interface

To display Dynamic Host Configuration Protocol (DHCP) for IPv6 interface information, use the **show ipv6 dhcp interface** command in user EXEC or privileged EXEC mode.

show ipv6 dhcp interface [type number]

| Syntax Description | type number       (Optional) Interface type and number. For more information, use the question mark (?) online help function.   |
|--------------------|---|
| Command Modes      | User EXEC (>)   |
|                    | Privileged EXEC (#)   |
| Command History    | Release Modification  |
|                    | Cisco IOS XE Everest This command was introduced.<br>16.5.1a  |
| Usage Guidelines   | If no interfaces are specified, all interfaces on which DHCP for IPv6 (client or server) is enabled are shown.<br>If an interface is specified, only information about the specified interface is displayed.  |
| Examples           | The following is sample output from the <b>show ipv6 dhcp interface</b> command. In the first example, the command is used on a router that has an interface acting as a DHCP for IPv6 server. In the second example, the command is used on a router that has an interface acting as a DHCP for IPv6 client:   |
|                    | Device# show ipv6 dhcp interface<br>Ethernet2/1 is in server mode<br>Using pool: svr-p1<br>Preference value: 20<br>Rapid-Commit is disabled<br>Router2# show ipv6 dhcp interface<br>Ethernet2/1 is in client mode<br>State is OPEN (1)<br>List of known servers:<br>Address: FE80::202:FCFF:FEA1:7439, DUID 000300010002FCA17400<br>Preference: 20<br>IA PD: IA ID 0x00040001, T1 120, T2 192<br>Prefix: 3FFE:C00:Cl8:1::/72<br>preferred lifetime 240, valid lifetime 54321<br>expires at Nov 08 2002 09:10 AM (54319 seconds)<br>Prefix: 3FFE:C00:Cl8:2::/72<br>preferred lifetime 300, valid lifetime 54333<br>expires at Nov 08 2002 09:11 AM (54331 seconds)<br>Prefix: 3FFE:C00:Cl8:3::/72<br>preferred lifetime 280, valid lifetime 51111<br>expires at Nov 08 2002 08:17 AM (51109 seconds)<br>DNS server: 1001::1<br>DNS server: 1001::2<br>Domain name: domain1.net<br>Domain name: domain2.net |

Prefix name is cli-pl Rapid-Commit is enabled

The table below describes the significant fields shown in the display.

Table 10: show ipv6 dhcp interface Field Descriptions

| Field                                | Description   |
|--------------------------------------|---|
| Ethernet2/1 is in server/client mode | Displays whether the specified interface is in server or client mode.   |
| Preference value:                    | The advertised (or default of 0) preference value for the indicated server.   |
| Prefix name is cli-p1                | Displays the IPv6 general prefix pool name, in which prefixes successfully acquired on this interface are stored.       |
| Using pool: svr-p1                   | The name of the pool that is being used by the interface.   |
| State is OPEN                        | State of the DHCP for IPv6 client on this interface. "Open" indicates that configuration information has been received. |
| List of known servers                | Lists the servers on the interface.   |
| Address, DUID                        | Address and DHCP unique identifier (DUID) of a server heard on the specified interface.                                 |
| Rapid commit is disabled             | Displays whether the <b>rapid-commit</b> keyword has been enabled on the interface.                                     |

The following example shows the DHCP for IPv6 relay agent configuration on FastEthernet interface 0/0, and use of the **show ipv6 dhcp interface** command displays relay agent information on FastEthernet interface 0/0:

```
Device(config-if)# ipv6 dhcp relay destination FE80::250:A2FF:FEBF:A056 FastEthernet0/1
Device# show ipv6 dhcp interface FastEthernet 0/0
FastEthernet0/0 is in relay mode
Relay destinations:
    FE80::250:A2FF:FEBF:A056 via FastEthernet0/1
```

#### **Related Commands**

| Command                     | Description  |
|-----------------------------|--|
| ipv6 dhcp client pd         | Enables the DHCP for IPv6 client process and enables requests for prefix delegation through a specified interface.               |
| ipv6 dhcp relay destination | Specifies a destination address to which client messages are forwarded and enables DHCP for IPv6 relay service on the interface. |
| ipv6 dhcp server            | Enables DHCP for IPv6 service on an interface.   |

#### show ipv6 dhcp relay binding

Prefix

IPv6 prefix for DHCP.

To display DHCPv6 Internet Assigned Numbers Authority (IANA) and DHCPv6 Identity Association for Prefix Delegation (IAPD) bindings on a relay agent, use the **show ipv6 dhcp relay binding** command in user EXEC or privileged EXEC mode.

show ipv6 dhcp relay binding [vrf vrf-name] **Syntax Description** (Optional) Specifies a virtual routing and forwarding (VRF) configuration. **vrf** *vrf-name* User EXEC (>) **Command Modes** Privileged EXEC (#) **Command History Command History** Release Modification Cisco IOS XE Everest This command was introduced. 16.5.1a **Usage Guidelines** If the **vrf**-name keyword-argument pair is specified, all bindings belonging to the specified VRF are displayed. Note Only the DHCPv6 IAPD bindings on a relay agent are displayed on the Cisco uBR10012 and Cisco uBR7200 series universal broadband devices. Examples The following is sample output from the show ipv6 dhcp relay binding command: Device# show ipv6 dhcp relay binding The following example shows output from the show ipv6 dhcp relay binding command with a specified VRF name on a Cisco uBR10012 universal broadband device: Device# show ipv6 dhcp relay binding vrf vrf1 Prefix: 2001:DB8:0:1:/64 (Bundle100.600) DUID: 000300010023BED94D31 IAID: 3201912114 lifetime: 600 The table below describes the significant fields shown in the display. Table 11: show ipv6 dhcp relay binding Field Descriptions Field Description

| Field    | Description   |
|----------|---|
| DUID     | DHCP Unique Identifier (DUID) for the IPv6 relay binding. |
| IAID     | Identity Association Identification (IAID) for DHCP.      |
| lifetime | Lifetime of the prefix, in seconds.                       |

#### **Related Commands**

| Command                          | Description  |
|----------------------------------|--|
| clear ipv6 dhcp relay binding    | Clears a specific IPv6 address or IPv6<br>prefix of a DHCP for IPv6 relay binding. |
| debug ipv6 dhcp relay            | Enables debugging for IPv6 DHCP relay agent.                                       |
| debug ipv6 dhcp relay bulk-lease | Enables bulk lease query debugging for IPv6 DHCP relay agent.                      |

# show ipv6 eigrp events

To display Enhanced Interior Gateway Routing Protocol (EIGRP) events logged for IPv6, use the **show ipv6** eigrp events command in user EXEC or privileged EXEC mode.

show ipv6 eigrp events [{[{errmsg|sia}] [event-num-start event-num-end]|type}]

|                  | errmsg   | (Optional) Displays error messages being logged.  |
|------------------|--|---|
|                  | sia  | (Optional) Displays Stuck In Active (SIA) messages.   |
|                  | event-num-start  | (Optional) Starting number of the event range. The range is from 1 to 4294967295.   |
|                  | event-num-end  | (Optional) Ending number of the event range. The range is from 1 to 4294967295.   |
|                  | type   | (Optional) Displays event types being logged.   |
| Command Default  | If no event range  | is specified, information for all IPv6 EIGRP events is displayed.   |
| Command Modes    | User EXEC (>)  |   |
|                  | Privileged EXEC  | C (#)   |
| Command History  | Release  | Modification  |
|                  | Cisco IOS XE Ev<br>16.5.1a   | verest This command was introduced.   |
| Usage Guidelines | not intended for g   | <b>igrp events</b> command is used to analyze a network failure by the Cisco support team a general use. This command provides internal state information about EIGRP and how sotifications and changes.                        |
|                  |  |   |
| Examples         | The following is s self-explanatory.   | sample output from the show ipv6 eigrp events command. The fields are   |

|                         | debug ipv6 eigrp | Displays information about EIGRP for IPv6 protocol. |  |  |  |
|                         | ipv6 eigrp       | Enables EIGRP for IPv6 on a specified interface.    |  |  |  |

## show ipv6 eigrp interfaces

To display information about interfaces configured for the Enhanced Interior Gateway Routing Protocol (EIGRP) in IPv6 topologies, use the **show ipv6 eigrp interfaces** command in user EXEC or privileged EXEC mode.

|  | show | ipv6 | eigrp | [as-number] | interfaces | [type | number] | [detail] |

The table below describes the significant fields shown in the displays.

| Field                   | Description  |
|-------------------------|--|
| Interface               | Interface over which EIGRP is configured.  |
| Peers                   | Number of directly connected EIGRP neighbors.  |
| Xmit Queue Un/Reliable  | Number of packets remaining in the Unreliable and Reliable transmit queues.  |
| Mean SRTT               | Mean smooth round-trip time (SRTT) interval (in seconds).  |
| Pacing Time Un/Reliable | Pacing time (in seconds) used to determine when EIGRP packets (unreliable and reliable) should be sent out of the interface. |
| Multicast Flow Timer    | Maximum number of seconds in which the device will send multicast EIGRP packets.   |
| Pending Routes          | Number of routes in the transmit queue waiting to be sent.   |
| Hello interval is 5 sec | Length (in seconds) of the hello interval.   |

#### Table 12: show ipv6 eigrp interfaces Field Descriptions

## show ipv6 eigrp topology

To display Enhanced Interior Gateway Routing Protocol (EIGRP) IPv6 topology table entries, use the **show ipv6 eigrp topology** command in user EXEC or privileged EXEC mode.

show ipv6 eigrp topology [{as-number ipv6-address}] [{active | all-links | pending | summary | zero-successors}]

| Syntax Description | as-number (Optional) Autonomous system number.  |  |                               |                            |  |  |
|--------------------|---|--|-------------------------------|----------------------------|--|--|
|                    | ipv6-address  |  |                               |                            |  |  |
|                    | active  | (Optional) Displays only active entries in the EIGRP topology table.   |                               |                            |  |  |
|                    | all-links   | (Optional) Displays all entries in the EIGRP topology table (including nonfeasible-successor sources).   |                               |                            |  |  |
|                    | pending   | (Optional) Displays all entries in the EIGRP topology table that are either waiting for an update from a neighbor or waiting to reply to a neighbor. |                               |                            |  |  |
|                    | summary   | (Optional) Displays a summary of the EIGRP topology table.   |                               |                            |  |  |
|                    | zero-successors   | (Optional)   | Displays the available routes | that have zero successors. |  |  |
| Command Modes      | User EXEC (>) Privileged EXEC (#)   |  |                               |                            |  |  |
| Command History    | Release   |  |                               |                            |  |  |
|                    | Cisco IOS XE Ev<br>16.5.1a  | d.   |                               |                            |  |  |
| Usage Guidelines   | If this command is used without any keywords or arguments, only routes that are feasible successors are displayed. The <b>show ipv6 eigrp topology</b> command can be used to determine Diffusing Update Algorithm (DUAL) states and to debug possible DUAL problems.   |  |                               |                            |  |  |
| Examples           | The following is sample output from the <b>show ipv6 eigrp topology</b> command. The fields in the display are self-explanatory.  |  |                               |                            |  |  |
|                    | Device# show ipv6 eigrp topology  |  |                               |                            |  |  |
|                    | <pre>IPv6-EIGRP Topology Table for AS(1)/ID(2001:0DB8:10::/64)<br/>Codes: P - Passive, A - Active, U - Update, Q - Query, R - Reply,<br/>r - reply Status, s - sia Status<br/>P 2001:0DB8:3::/64, 1 successors, FD is 281600<br/>via Connected, Ethernet1/0<br/>The following sample output from the show ipv6 eigrp topology prefix command displays ECMP<br/>mode information when the no ipv6 next-hop-self command is configured without the no-ecmp-mode<br/>option in the EIGRP topology. The ECMP mode provides information about the path that is being</pre> |  |                               |                            |  |  |
|                    |   |  |                               |                            |  |  |

advertised. If there is more than one successor, the top most path will be advertised as the default path over all interfaces, and the message "ECMP Mode: Advertise by default" will be displayed in the output. If any path other than the default path is advertised, the message "ECMP Mode: Advertise out <Interface name>" will be displayed. The fields in the display are self-explanatory.

## show ipv6 eigrp traffic

To display the number of Enhanced Interior Gateway Routing Protocol (EIGRP) for IPv6 packets sent and received, use the **show ipv6 eigrp traffic** command in user EXEC or privileged EXEC mode.

show ipv6 eigrp traffic [as-number]

| Syntax Description | as-number   | (Optional) Autonomous system number. |
|--------------------|-------------|--------------------------------------|
| Command Modes      | User EXEC ( | >)                                   |

Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** Use the **show ipv6 eigrp traffic** command to provide information on packets received and sent.

**Examples** The following is sample output from the **show ipv6 eigrp traffic** command:

```
Device# show ipv6 eigrp traffic
IPv6-EIGRP Traffic Statistics for process 9
Hellos sent/received: 218/205
Updates sent/received: 7/23
Queries sent/received: 2/0
Replies sent/received: 0/2
Acks sent/received: 21/14
```

The table below describes the significant fields shown in the display.

Table 13: show ipv6 eigrp traffic Field Descriptions

| Field                 | Description   |
|-----------------------|---|
| process 9             | Autonomous system number specified in the <b>ipv6 router eigrp</b> command. |
| Hellos sent/received  | Number of hello packets sent and received.                                  |
| Updates sent/received | Number of update packets sent and received.                                 |
| Queries sent/received | Number of query packets sent and received.                                  |
| Replies sent/received | Number of reply packets sent and received.                                  |
| Acks sent/received    | Number of acknowledgment packets sent and received.                         |

| Related Commands Command |                   | Description                                    |
|--------------------------|-------------------|--|
|                          | ipv6 router eigrp | Configures the EIGRP for IPv6 routing process. |

I

## show ipv6 general-prefix

To display information on IPv6 general prefixes, use the **show ipv6 general-prefix** command in user EXEC or privileged EXEC mode.

## show ipv6 general-prefix

**Syntax Description** This command has no arguments or keywords.

**Command Modes** User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** Use the **show ipv6 general-prefix** command to view information on IPv6 general prefixes.

**Examples** 

The following example shows an IPv6 general prefix called my-prefix, which has been defined based on a 6to4 interface. The general prefix is also being used to define an address on interface loopback42.

```
Device# show ipv6 general-prefix
IPv6 Prefix my-prefix, acquired via 6to4
2002:B0B:B0B::/48
Loopback42 (Address command)
```

The table below describes the significant fields shown in the display.

#### Table 14: show ipv6 general-prefix Field Descriptions

| Field                        | Description   |
|------------------------------|---|
| IPv6 Prefix                  | User-defined name of the IPv6 general prefix.   |
| Acquired via                 | The general prefix has been defined based on a 6to4 interface. A general prefix can also be defined manually or acquired using DHCP for IPv6 prefix delegation. |
| 2002:B0B:B0B::/48            | The prefix value for this general prefix.   |
| Loopback42 (Address command) | List of interfaces where this general prefix is used.   |

| Related Commands | Command             | Description  |
|------------------|---------------------|--|
|                  | ipv6 general-prefix | Defines a general prefix for an IPv6 address manually. |

# show ipv6 interface

To display the usability status of interfaces configured for IPv6, use the **show ipv6 interface** command in user EXEC or privileged EXEC mode.

show ipv6 interface [brief][type number][prefix]

| Syntax Description  | <b>brief</b> (Optional) Displays a brief summary of IPv6 status and configuration for each interface.  |   |   |                             |
|---|--|---|---|-----------------------------|
|   | type   | (Optional) The interface type about which to display information.                             |   |                             |
| <i>number</i> (Optional) The interface number about which to display information. |  |   | splay information.  |                             |
|   | prefix         (Optional) Prefix generated from a local IPv6 prefix pool.  |   |   | x pool.                     |
| Command Default   | All IPv6   | l IPv6 interfaces are displayed.  |   |                             |
| Command Modes   | User EXI   | er EXEC (>)   |   |                             |
|   | Privilege  | d EXEC (#)  |   |                             |

MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ICMP redirects are enabled
ICMP unreachables are sent
ND DAD is enabled, number of DAD attempts: 1
ND reachable time is 30000 milliseconds (using 30000)
ND advertised reachable time is 0 (unspecified)
ND advertised retransmit interval is 0 (unspecified)
ND router advertisements are sent every 200 seconds
ND router advertisements live for 1800 seconds
ND advertised default router preference is Medium
Hosts use stateless autoconfig for addresses.
```

The table below describes the significant fields shown in the display.

| Table 15: show | ipv6 interf | 'ace Field | Descriptions |
|----------------|-------------|------------|--------------|
|----------------|-------------|------------|--------------|

| Field  | Description   |
|--|---|
| Ethernet0/0 is up, line protocol is up   | Indicates whether the interface hardware is active (whether line signal is present) and whether it has been taken down by an administrator. If the interface hardware is usable, the interface is marked "up." For an interface to be usable, both the interface hardware and line protocol must be up.   |
| line protocol is up, down (down<br>is not shown in sample output)                              | Indicates whether the software processes that handle the line protocol consider the line usable (that is, whether keepalives are successful or IPv6 CP has been negotiated). If the interface can provide two-way communication, the line protocol is marked up. For an interface to be usable, both the interface hardware and line protocol must be up.   |
| IPv6 is enabled, stalled, disabled<br>(stalled and disabled are not<br>shown in sample output) | Indicates that IPv6 is enabled, stalled, or disabled on the interface. If IPv6 is enabled, the interface is marked "enabled." If duplicate address detection processing identified the link-local address of the interface as being a duplicate address, the processing of IPv6 packets is disabled on the interface and the interface is marked "stalled." If IPv6 is not enabled, the interface is marked "disabled." |
| link-local address   | Displays the link-local address assigned to the interface.  |
| Global unicast address(es):  | Displays the global unicast addresses assigned to the interface.  |
| Joined group address(es):  | Indicates the multicast groups to which this interface belongs.   |
| MTU  | Maximum transmission unit of the interface.   |
| ICMP error messages  | Specifies the minimum interval (in milliseconds) between error messages sent on this interface.   |
| ICMP redirects   | The state of Internet Control Message Protocol (ICMP) IPv6 redirect messages on the interface (the sending of the messages is enabled or disabled).   |

I

| Field   | Description  |
|---|--|
| ND DAD  | The state of duplicate address detection on the interface (enabled or disabled).   |
| number of DAD attempts:                           | Number of consecutive neighbor solicitation messages that are sent on<br>the interface while duplicate address detection is performed.                                       |
| ND reachable time                                 | Displays the neighbor discovery reachable time (in milliseconds) assigned to this interface.   |
| ND advertised reachable time                      | Displays the neighbor discovery reachable time (in milliseconds) advertised on this interface.   |
| ND advertised retransmit interval                 | Displays the neighbor discovery retransmit interval (in milliseconds) advertised on this interface.  |
| ND router advertisements                          | Specifies the interval (in seconds) for neighbor discovery router<br>advertisements (RAs) sent on this interface and the amount of time before<br>the advertisements expire. |
|   | As of Cisco IOS Release 12.4(2)T, this field displays the default router preference (DRP) value sent by this device on this interface.                                       |
| ND advertised default router preference is Medium | The DRP for the device on a specific interface.  |

The **show ipv6 interface** command displays information about attributes that may be associated with an IPv6 address assigned to the interface.

| Attribute | Description   |
|-----------|---|
| ANY       | Anycast. The address is an anycast address, as specified when configured using the <b>ipv6 address</b> command.   |
| CAL       | Calendar. The address is timed and has valid and preferred lifetimes.   |
| DEP       | Deprecated. The timed address is deprecated.  |
| DUP       | Duplicate. The address is a duplicate, as determined<br>by duplicate address detection (DAD). To re-attampt<br>DAD, the user must use the <b>shutdown</b> or <b>no</b><br><b>shutdown</b> command on the interface. |
| EUI       | EUI-64 based. The address was generated using EUI-64.   |
| OFF       | Offlink. The address is offlink.  |

| Attribute | Description   |
|-----------|---|
| OOD       | Overly optimistic DAD. DAD will not be performed<br>for this address. This attribute applies to virtual<br>addresses. |
| PRE       | Preferred. The timed address is preferred.  |
| TEN       | Tentative. The address is in a tentative state per DAD.   |
| UNA       | Unactivated. The virtual address is not active and is in a standby state.   |
| VIRT      | Virtual. The address is virtual and is managed by<br>HSRP, VRRP, or GLBP.   |

### show ipv6 interface Command Using the brief Keyword

The following is sample output from the **show ipv6 interface** command when entered with the **brief** keyword:

| Device# <b>show ipv6 interface brief</b><br>Ethernet0 is up, line protocol is up |               |                  |                                 |
|--|---------------|------------------|---------------------------------|
| Ethernet0  | [up/          | -                |                                 |
| unassigned   |               |                  |                                 |
| Ethernet1  | [up/          | up]              |                                 |
| 2001:0DB8:1000   |               | ( . ]            |                                 |
| Ethernet2  | [up/          | upj              |                                 |
| 2001:0DB8:2000<br>Ethernet3  | ., .          | /1               |                                 |
| 2001:0DB8:3000   | [up/          | upj              |                                 |
| Ethernet4  |               | /down]           |                                 |
| 2001:0DB8:4000:/29   |               | ,                |                                 |
| Ethernet5 [administratively down/down]   |               | ively down/down] |                                 |
| 2001:123::210:   | 7BFF:FEC2:ACI | 8                |                                 |
| Interface  | Status        |                  | IPv6 Address                    |
| Ethernet0  | up            |                  | 3FFE:C00:0:1:260:3EFF:FE11:6770 |
| Ethernet1  | up            |                  | unassigned                      |
| Fddi0  | up            |                  | 3FFE:C00:0:2:260:3EFF:FE11:6772 |
| Serial0  | administrativ | -                | 2                               |
| Serial1  | administrativ | -                | -                               |
| Serial2  | administrativ | -                | 2                               |
| Serial3  | administrativ | vely down        | -                               |
| Tunnel0  | up            |                  | unnumbered (Ethernet0)          |
| Tunnell  | up            |                  | 3FFE:700:20:1::12               |

### **IPv6 Interface with ND Prefix Configured**

This sample output shows the characteristics of an interface that has generated a prefix from a local IPv6 prefix pool:

Device# show ipv6 interface Ethernet 0/0 prefix

```
interface Ethernet0/0
ipv6 address 2001:0DB8::1/64
ipv6 address 2001:0DB8::2/64
```

```
ipv6 nd prefix 2001:0DB8:2::/64
ipv6 nd prefix 2001:0DB8:3::/64 2592000 604800 off-link
end
.
.
.
IPv6 Prefix Advertisements Ethernet0/0
Codes: A - Address, P - Prefix-Advertisement, O - Pool
U - Per-user prefix, D - Default
N - Not advertised, C - Calendar
default [LA] Valid lifetime 2592000, preferred lifetime 604800
AD 2001:0DB8:1::/64 [LA] Valid lifetime 2592000, preferred lifetime 604800
P 2001:0DB8:2::/64 [LA] Valid lifetime 2592000, preferred lifetime 604800
```

The default prefix shows the parameters that are configured using the ipv6 nd prefix default command.

#### IPv6 Interface with DRP Configured

This sample output shows the state of the DRP preference value as advertised by this device through an interface:

```
Device# show ipv6 interface gigabitethernet 0/1
  GigabitEthernet0/1 is up, line protocol is up
    IPv6 is enabled, link-local address is FE80::130
    Description: Management network (dual stack)
    Global unicast address(es):
      FEC0:240:104:1000::130, subnet is FEC0:240:104:1000::/64
    Joined group address(es):
      FF02::1
      FF02::2
      FF02::1:FF00:130
   MTU is 1500 bytes
    ICMP error messages limited to one every 100 milliseconds
    ICMP redirects are enabled
   ND DAD is enabled, number of DAD attempts: 1
   ND reachable time is 30000 milliseconds
   ND advertised reachable time is 0 milliseconds
   ND advertised retransmit interval is 0 milliseconds
   ND router advertisements are sent every 200 seconds
   ND router advertisements live for 1800 seconds
   ND advertised default router preference is Low
    Hosts use stateless autoconfig for addresses.
```

#### IPv6 Interface with HSRP Configured

When HSRP IPv6 is first configured on an interface, the interface IPv6 link-local address is marked unactive (UNA) because it is no longer advertised, and the HSRP IPv6 virtual link-local address is added to the virtual link-local address list with the UNA and tentative DAD (TEN) attributes set. The interface is also programmed to listen for the HSRP IPv6 multicast address.

This sample output shows the status of UNA and TEN attributes, when HSRP IPv6 is configured on an interface:

```
Device# show ipv6 interface ethernet 0/0
Ethernet0/0 is up, line protocol is up
IPv6 is enabled, link-local address is FE80:2::2 [UNA]
Virtual link-local address(es):
```

L

```
FE80::205:73FF:FEA0:1 [UNA/TEN]
Global unicast address(es):
  2001:2::2, subnet is 2001:2::/64
Joined group address(es):
  FF02::1
  FF02::2
  FF02::66
  FF02::1:FF00:2
MTU is 1500 bytes
ICMP error messages limited to one every 100 milliseconds
ND DAD is enabled, number of DAD attempts: 1
```

After the HSRP group becomes active, the UNA and TEN attributes are cleared, and the overly optimistic DAD (OOD) attribute is set. The solicited node multicast address for the HSRP virtual IPv6 address is also added to the interface.

This sample output shows the status of UNA, TEN and OOD attributes, when HSRP group is activated:

```
# show ipv6 interface ethernet 0/0
Ethernet0/0 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80:2::2 [UNA]
  Virtual link-local address(es):
   FE80::205:73FF:FEA0:1 [OPT]
  Global unicast address(es):
   2001:2::2, subnet is 2001:2::/64
  Joined group address(es):
   FF02::1
   FF02::2
   FF02::66
   FF02::1:FF00:2
   FF02::1:FFA0:1
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ND DAD is enabled, number of DAD attempts: 1
```

The table below describes additional significant fields shown in the displays for the **show ipv6 interface** command with HSRP configured.

| Field   | Description   |
|---|---|
| IPv6 is enabled, link-local address is<br>FE80:2::2 [UNA] | The interface IPv6 link-local address is marked UNA because it is no longer advertised. |
| FE80::205:73FF:FEA0:1 [UNA/TEN]                           | The virtual link-local address list with the UNA and TEN attributes set.                |
| FF02::66  | HSRP IPv6 multicast address.  |
| FE80::205:73FF:FEA0:1 [OPT]                               | HSRP becomes active, and the HSRP virtual address marked OPT.                           |
| FF02::1:FFA0:1  | HSRP solicited node multicast address.  |

### IPv6 Interface with Minimum RA Interval Configured

When you enable Mobile IPv6 on an interface, you can configure a minimum interval between IPv6 router advertisement (RA) transmissions. The **show ipv6 interface** command output reports the minimum RA interval, when configured. If the minimum RA interval is not explicitly configured, then it is not displayed.

In the following example, the maximum RA interval is configured as 100 seconds, and the minimum RA interval is configured as 60 seconds on Ethernet interface 1/0:

Device(config-if) # ipv6 nd ra-interval 100 60

Subsequent use of the **show ipv6 interface** then displays the interval as follows:

```
Device(config) # show ipv6 interface ethernet 1/0
Ethernet1/0 is administratively down, line protocol is down
  IPv6 is enabled, link-local address is FE80::A8BB:CCFF:FE00:5A01 [TEN]
 No Virtual link-local address(es):
 No global unicast address is configured
  Joined group address(es):
   FF02::1
   FF02::2
 MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ICMP unreachables are sent
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
 ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 60 to 100 seconds
  ND router advertisements live for 1800 seconds
  ND advertised default router preference is Medium
  Hosts use stateless autoconfig for addresses.
```

In the following example, the maximum RA interval is configured as 100 milliseconds (ms), and the minimum RA interval is configured as 60 ms on Ethernet interface 1/0:

```
Device(config) # show ipv6 interface ethernet 1/0
Ethernet1/0 is administratively down, line protocol is down
  IPv6 is enabled, link-local address is FE80::A8BB:CCFF:FE00:5A01 [TEN]
  No Virtual link-local address(es):
 No global unicast address is configured
  Joined group address(es):
   FF02::1
   FF02::2
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ICMP unreachables are sent
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
 ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 60 to 100 milliseconds
  ND router advertisements live for 1800 seconds
  ND advertised default router preference is Medium
  Hosts use stateless autoconfig for addresses.
```

The table below describes additional significant fields shown in the displays for the **show ipv6 interface** command with minimum RA interval information configured.

Table 17: show ipv6 interface Command with Minimum RA Interval Information Configuration Field Descriptions

| Field   | Description  |
|---|--|
| ND router advertisements are sent<br>every 60 to 100 seconds      | ND RAs are sent at an interval randomly selected from a value<br>between the minimum and maximum values. In this example, the<br>minimum value is 60 seconds, and the maximum value is 100<br>seconds. |
| ND router advertisements are sent<br>every 60 to 100 milliseconds | ND RAs are sent at an interval randomly selected from a value<br>between the minimum and maximum values. In this example, the<br>minimum value is 60 ms, and the maximum value is 100 ms.              |

| Related Commands Command Description |                     | Description  |
|--------------------------------------|---------------------|--|
|                                      | ipv6 nd prefix      | Configures which IPv6 prefixes are included in IPv6 router advertisements. |
|                                      | ipv6 nd ra interval | Configures the interval between IPv6 RA transmissions on an interface.     |
|                                      | show ip interface   | Displays the usability status of interfaces configured for IP.             |

## show ipv6 mfib

To display the forwarding entries and interfaces in the IPv6 Multicast Forwarding Information Base (MFIB), use the **show ipv6 mfib** command in user EXEC or privileged EXEC mode.

**show ipv6 mfib** [**vrf** *vrf-name*] [{**all** | **linkscope** | **verbose** *group-address-name* | *ipv6-prefix* / *prefix-length source-address-name* | **interface** | **status** | **summary**}]

| Syntax Description | vrf vrf-name        | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.  |
|--------------------|---------------------|---|
|                    | all                 | (Optional) Displays all forwarding entries and interfaces in the IPv6 MFIB.   |
|                    | linkscope           | (Optional) Displays the link-local groups.  |
|                    | verbose             | (Optional) Provides additional information, such as the MAC encapsulation header<br>and platform-specific information.  |
|                    | ipv6-prefix         | (Optional) The IPv6 network assigned to the interface. The default IPv6 prefix is 128.  |
|                    |                     | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.  |
|                    | / prefix-length     | (Optional) The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
|                    | group-address-name  | (Optional) IPv6 address or name of the multicast group.   |
|                    | source-address-name | (Optional) IPv6 address or name of the multicast group.   |
|                    | interface           | (Optional) Interface settings and status.   |
|                    | status              | (Optional) General settings and status.   |

show ipv6 mfib [vrf *vrf-name*] [{all | linkscope | verbose | interface | status | summary}]

**Command Modes** 

User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** 

Use the **show ipv6 mfib** command to display MFIB entries; and forwarding interfaces, and their traffic statistics. This command can be enabled on virtual IP (VIP) if the router is operating in distributed mode.

A forwarding entry in the MFIB has flags that determine the default forwarding and signaling behavior to use for packets matching the entry. The entry also has per-interface flags that further specify the forwarding

behavior for packets received or forwarded on specific interfaces. The table below describes the MFIB forwarding entries and interface flags.

| Table 18: MFIB | Entries and | Interface | Flags |
|----------------|-------------|-----------|-------|
|----------------|-------------|-----------|-------|

| Flag | Description   |
|------|---|
| F    | ForwardData is forwarded out of this interface.   |
| A    | AcceptData received on this interface is accepted for forwarding.   |
| IC   | Internal copyDeliver to the router a copy of the packets received or forwarded on this interface.   |
| NS   | Negate signalReverse the default entry signaling behavior for packets received on this interface.   |
| DP   | Do not preserveWhen signaling the reception of a packet on this interface, do not preserve a copy of it (discard it instead).                     |
| SP   | Signal presentThe reception of a packet on this interface was just signaled.  |
| S    | SignalBy default, signal the reception of packets matching this entry.  |
| С    | Perform directly connected check for packets matching this entry. Signal the reception if packets were originated by a directly connected source. |

### Examples

The following example displays the forwarding entries and interfaces in the MFIB. The router is configured for fast switching, and it has a receiver joined to FF05::1 on Ethernet1/1 and a source (2001::1:1:20) sending on Ethernet1/2:

```
Device# show ipv6 mfib
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IA - Inherit A flag,
             AR - Activity Required, D - Drop
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts: Total/RPF failed/Other drops
Interface Flags: A - Accept, F - Forward, NS - Negate Signalling
             IC - Internal Copy, NP - Not platform switched
             SP - Signal Present
Interface Counts: FS Pkt Count/PS Pkt Count
(*,FF00::/8) Flags: C
   Forwarding: 0/0/0/0, Other: 0/0/0
   Tunnel0 Flags: NS
(*,FF00::/15) Flags: D
   Forwarding: 0/0/0/0, Other: 0/0/0
(*,FF05::1) Flags: C
   Forwarding: 2/0/100/0, Other: 0/0/0
   TunnelO Flags: A NS
   Ethernet1/1 Flags: F NS
     Pkts: 0/2
(2001::1:1:200,FF05::1) Flags:
   Forwarding: 5/0/100/0, Other: 0/0/0
   Ethernet1/2 Flags: A
   Ethernet1/1 Flags: F NS
     Pkts: 3/2
(*,FF10::/15) Flags: D
   Forwarding: 0/0/0/0, Other: 0/0/0
```

The table below describes the significant fields shown in the display.

| Field             | Description  |
|-------------------|--|
| Entry Flags       | Information about the entry.   |
| Forwarding Counts | Statistics on the packets that are received from and forwarded to at least one interface.  |
| Pkt Count/        | Total number of packets received and forwarded since the creation of the multicast forwarding state to which this counter applies.   |
| Pkts per second/  | Number of packets received and forwarded per second.   |
| Avg Pkt Size/     | Total number of bytes divided by the total number of packets for this multicast<br>forwarding state. There is no direct display for the total number of bytes. You can<br>calculate the total number of bytes by multiplying the average packet size by the packet<br>count. |
| Kbits per second  | Bytes per second divided by packets per second divided by 1000.  |
| Other counts:     | Statistics on the received packets. These counters include statistics about the packets received and forwarded and packets received but not forwarded.   |
| Interface Flags:  | Information about the interface.   |
| Interface Counts: | Interface statistics.  |

The following example shows forwarding entries and interfaces in the MFIB, with a group address of FF03:1::1 specified:

```
Device# show ipv6 mfib FF03:1::1
IP Multicast Forwarding Information Base
Entry Flags:C - Directly Connected, S - Signal, IA - Inherit A
flag,
            AR - Activity Required, D - Drop
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kbits per
second
Other counts:Total/RPF failed/Other drops
Interface Flags: A - Accept, F - Forward, NS - Negate Signalling
             IC - Internal Copy, NP - Not platform switched
             SP - Signal Present
Interface Counts:FS Pkt Count/PS Pkt Count
*,FF03:1::1) Flags:C
 Forwarding:0/0/0/0, Other:0/0/0
  Tunnel1 Flags: A NS
  GigabitEthernet5/0.25 Flags:F NS
   Pkts:0/0
  GigabitEthernet5/0.24 Flags:F NS
   Pkts:0/0
(5002:1::2,FF03:1::1) Flags:
  Forwarding:71505/0/50/0, Other:42/0/42
  GigabitEthernet5/0 Flags:A
  GigabitEthernet5/0.19 Flags:F NS
   Pkts:239/24
  GigabitEthernet5/0.20 Flags:F NS
    Pkts:239/24
  GigabitEthernet5/0.21 Flags:F NS
   Pkts:238/24
```

```
.
GigabitEthernet5/0.16 Flags:F NS
Pkts:71628/24
```

Pkts:71628/24

The following example shows forwarding entries and interfaces in the MFIB, with a group address of FF03:1::1 and a source address of 5002:1::2 specified:

```
Device# show ipv6 mfib FF03:1::1 5002:1::2
```

```
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IA - Inherit A flag,
             AR - Activity Required, D - Drop
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts:Total/RPF failed/Other drops
Interface Flags: A - Accept, F - Forward, NS - Negate Signalling
             IC - Internal Copy, NP - Not platform switched
             SP - Signal Present
Interface Counts:FS Pkt Count/PS Pkt Count
(5002:1::2,FF03:1::1) Flags:
   Forwarding:71505/0/50/0, Other:42/0/42
   GigabitEthernet5/0 Flags:A
   GigabitEthernet5/0.19 Flags:F NS
     Pkts:239/24
   GigabitEthernet5/0.20 Flags:F NS
     Pkts:239/24
   GigabitEthernet5/0.16 Flags:F NS
```

The following example shows forwarding entries and interfaces in the MFIB, with a group address of FF03:1::1 and a default prefix of 128:

```
Device# show ipv6 mfib FF03:1::1/128
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IA - Inherit A flag,
             AR - Activity Required, D - Drop
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts: Total/RPF failed/Other drops
Interface Flags: A - Accept, F - Forward, NS - Negate Signalling
             IC - Internal Copy, NP - Not platform switched
             SP - Signal Present
Interface Counts:FS Pkt Count/PS Pkt Count
(*, FF03:1::1) Flags:C
   Forwarding:0/0/0/0, Other:0/0/0
   Tunnell Flags: A NS
   GigabitEthernet5/0.25 Flags:F NS
     Pkts:0/0
   GigabitEthernet5/0.24 Flags:F NS
     Pkts:0/0
.
   GigabitEthernet5/0.16 Flags:F NS
     Pkts:0/0
```

The following example shows forwarding entries and interfaces in the MFIB, with a group address of FFE0 and a prefix of 15:

Device# show ipv6 mfib FFE0::/15

The following example shows output of the **show ipv6 mfib** command used with the **verbose** keyword. It shows forwarding entries and interfaces in the MFIB and additional information such as the MAC encapsulation header and platform-specific information.

```
Device# show ipv6 mfib ff33::1:1 verbose
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IA - Inherit A flag,
             AR - Activity Required, K - Keepalive
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts: Total/RPF failed/Other drops
Platform per slot HW-Forwarding Counts: Pkt Count/Byte Count
Platform flags: HF - Forwarding entry, HB - Bridge entry, HD - NonRPF Drop entry,
                NP - Not platform switchable, RPL - RPF-ltl linkage,
                MCG - Metset change, ERR - S/w Error Flag, RTY - In RetryQ,
                LP - L3 pending, MP - Met pending, AP - ACL pending
Interface Flags: A - Accept, F - Forward, NS - Negate Signalling
             IC - Internal Copy, NP - Not platform switched
             SP - Signal Present
Interface Counts: Distributed FS Pkt Count/FS Pkt Count/PS Pkt Count
(10::2,FF33::1:1) Flags: K
   RP Forwarding: 0/0/0/0, Other: 0/0/0
   LC Forwarding: 0/0/0/0, Other: 0/0/0
   HW Forwd: 0/0/0/0, Other: NA/NA/NA
   Slot 6: HW Forwarding: 0/0, Platform Flags: HF RPL
   Slot 1: HW Forwarding: 0/0, Platform Flags: HF RPL
   Vlan10 Flags: A
   Vlan30 Flags: F NS
     Pkts: 0/0/0 MAC: 33330001000100D0FFFE180086DD
```

The table below describes the fields shown in the display.

| Table 20: shov | v ipv6 mfib | verbose | Field | Descriptions |
|----------------|-------------|---------|-------|--------------|
|                |             |         |       |              |

| Field                                  | Description                                  |
|--|--|
| Platform flags                         | Information about the platform.              |
| Platform per slot HW-Forwarding Counts | Total number of packets per bytes forwarded. |

| Related | Commands |
|---------|----------|
|---------|----------|

| Command                  | Description   |
|--------------------------|---|
| show ipv6 mfib active    | Displays the rate at which active sources are sending to multicast groups.                |
| show ipv6 mfib count     | Displays summary traffic statistics from the MFIB about the group and source.             |
| show ipv6 mfib interface | Displays information about IPv6 multicast-enabled interfaces and their forwarding status. |

| Command                | Description  |

| show ipv6 mfib status  | Displays the general MFIB configuration and operational status.  |
| show ipv6 mfib summary | Displays summary information about the number of IPv6 MFIB entries (including link-local groups) and interfaces. |

## show ipv6 mld groups

To display the multicast groups that are directly connected to the router and that were learned through Multicast Listener Discovery (MLD), use the **show ipv6 mld groups** command in user EXEC or privileged EXEC mode.

**show ipv6 mld** [**vrf** *vrf-name*] **groups** [**link-local**] [{*group-namegroup-address*}] [*interface-type interface-number*] [{**detail** | **explicit**}]

| Syntax Description           | vrf vrf-name         link-local         group-name   group-address         interface-type interface-number         detail         explicit  |  | (Optional) Sp   | ecifies a virtual r  | routing and forwarding (VRF) configura   | tion.         |
|------------------------------|---|--|---|--|--|---------------|
|                              |   |  | (Optional) Displays the link-local groups.  |  |  |               |
|                              |   |  | (Optional) IP   | v6 address or na   | ame of the multicast group.  |               |
|                              |   |  | (Optional) In   | terface type and   | number.  |               |

The table below describes the significant fields shown in the display.

Table 21: show ipv6 mld groups Field Descriptions

| Field          | Description  |  |
|----------------|--|--|
| Group Address  | Address of the multicast group.  |  |
| Interface      | Interface through which the group is reachable.  |  |
| Uptime         | How long (in hours, minutes, and seconds) this multicast group has been known.   |  |
| Expires        | How long (in hours, minutes, and seconds) until the entry is removed from the MLD groups table.  |  |
|                | The expiration timer shows "never" if the router itself has joined the group, and the expiration timer shows "not used" when the router mode of the group is INCLUDE. In this situation, the expiration timers on the source entries are used. |  |
| Last reporter: | Last host to report being a member of the multicast group.   |  |

| Field      | Description   |
|------------|---|
| Flags Ac 4 | Flags counted toward the MLD state limits configured. |

The table below describes the significant fields shown in the display.

Table 22: show ipv6 mld interface Field Descriptions

| Field |   | Description                                    |  |  |
|-------|---|--|--|--|
|       | Global State Limit: 2 active out of 2 max | Two globally configured MLD states are active. |  |  |

| Field  | Description   |
|--|---|
| Ethernet2/1/1 is up, line protocol is up                         | Interface type, number, and status.   |
| Internet address is  | Internet address of the interface and subnet mask being applied to the interface.   |
| MLD is enabled in interface                                      | Indicates whether Multicast Listener Discovery (MLD) has been<br>enabled on the interface with the <b>ipv6 multicast-routing</b><br>command.  |
| Current MLD version is 2   | The current MLD version.  |
| MLD query interval is 125 seconds                                | Interval (in seconds) at which the Cisco IOS software sends MLD query messages, as specified with the <b>ipv6 mld query-interval</b> command.   |
| MLD querier timeout is 255 seconds                               | The length of time (in seconds) before the router takes over as the querier for the interface, as specified with the <b>ipv6 mld query-timeout</b> command.   |
| MLD max query response time is 10 seconds                        | The length of time (in seconds) that hosts have to answer an MLD Query message before the router deletes their group, as specified with the <b>ipv6 mld query-max-response-time</b> command.  |
| Last member query response interval is 1 seconds                 | Used to calculate the maximum response code inserted in group<br>and source-specific query. Also used to tune the "leave latency"<br>of the link. A lower value results in reduced time to detect the<br>last member leaving the group. |
| Interface State Limit : 2 active out of 3 max                    | Two out of three configured interface states are active.  |
| State Limit permit access list: change                           | Activity for the state permit access list.  |
| MLD activity: 83 joins, 63 leaves                                | Number of groups joins and leaves that have been received.  |
| MLD querying router is<br>FE80::260:3EFF:FE86:5649 (this system) | IPv6 address of the querying router.  |

## **Related Commands**

| Command                 | Description   |
|-------------------------|---|
| ipv6 mld join-group     | Configures MLD reporting for a specified group and source.                              |
| ipv6 mld query-interval | Configures the frequency at which the Cisco IOS software sends MLD host-query messages. |

# show ipv6 mld snooping

Use the **show ipv6 mld snooping** command in EXEC mode to display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping configuration of the switch or the VLAN.

show ipv6 mld snooping [vlan vlan-id]

characteristics for all VLANs on the switch.

| Syntax Descriptionvlan-id(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094. |  |  | o 1001 and 1006 to 4094.           |  |  |
|--|--|--|------------------------------------|--|--|

|-------------------|-------------|-------------------------------------|
|                   | SSM Mapping | The SSM mapping feature is enabled. |

| Field                 | Description   |  |
|-----------------------|---|--|
| DNS Lookup            | The DNS lookup feature is automatically enabled when the SSM mapping feature is enabled.              |  |
| Group address         | Group address identified by a specific access list.   |  |
| Group mode ssm : TRUE | a : TRUE The identified group is functioning in SSM mode.   |  |
| Database : STATIC     | The router is configured to determine source addresses by checking static SSM mapping configurations. |  |
| Database : DNS        | The router is configured to determine source addresses using DNS-based SSM mapping.                   |  |
| Source list           | Source address associated with a group identified by the access list.                                 |  |

## **Related Commands**

| Command                    | Description  |  |  |
|----------------------------|--|--|--|
| debug ipv6 mld ssm-map     | Displays debug messages for SSM mapping.                               |  |  |
| ipv6 mld ssm-map enable    | Enables the SSM mapping feature for groups in the configured SSM range |  |  |
| ipv6 mld ssm-map query dns | Enables DNS-based SSM mapping.   |  |  |
| ipv6 mld ssm-map static    | Configures static SSM mappings.  |  |  |

# show ipv6 mld traffic

To display the Multicast Listener Discovery (MLD) traffic counters, use the **show ipv6 mld traffic** command in user EXEC or privileged EXEC mode.

show ipv6 mld [vrf vrf-name] traffic

| Syntax Description | <b>vrf</b> <i>vrf-name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |                |                          |                 |   |  |  |
|--------------------|---|----------------|--------------------------|-----------------|---|--|--|
| Command Modes      | User EXEC (>)<br>Privileged EXEC (#)  |                |                          |                 |   |  |  |
| Command History    | Release   | Modif          | ication                  |                 |   |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This c         | ommand w                 | as introduced.  |   |  |  |
| Usage Guidelines   | Use the <b>show ipv6 mld tr</b><br>been received and sent.  | affic comm     | and to cheo              | ck if the expec | ted number of MLD protocol messages have      |  |  |
| Examples           | The following example dis   | splays the M   | ALD protoc               | col messages r  | eceived and sent.                             |  |  |
|                    | Device# show ipv6 mld traffic   |                |                          |                 |   |  |  |

# show ipv6 mrib client

To display information about the clients of the Multicast Routing Information Base (MRIB), use the **show ipv6 mrib client** command in user EXEC or privileged EXEC mode.

show ipv6 mrib [vrf vrf-name] client [filter] [name {client-name | client-name : client-id}]

| Syntax Description | vrf vrf-name  | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.  |  |  |
|--------------------|---|---|--|--|
|                    | filter (Optional) Displays information about MRIB flags that each client owns an each client is interested in.  |   |  |  |
|                    | name(Optional) The name of a multicast routing protocol that acts as a client of<br>such as Multicast Listener Discovery (MLD) and Protocol Independent M<br>(PIM). |   |  |  |
|                    | <i>client-name</i> : <i>client-id</i> The name and ID of a multicast routing protocol that acts as a client of MRIB such as MLD and PIM. The colon is required.     |   |  |  |
| Command Modes      | User EXEC (>)   |   |  |  |
|                    | Privileged EXEC (#)   |   |  |  |
| Command History    | Release   | Modification  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced.  |  |  |
| Usage Guidelines   | Use the <b>filter</b> keyword to c each client is interested.   | display information about the MRIB flags each client owns and the flags in which  |  |  |
| Examples           | The following is sample or  | utput from the <b>show ipv6 mrib client</b> command:  |  |  |
|                    | pim:146 (connection id<br>mfib ipv6:3 (connection)<br>slot 3 mfib ipv6 rp ac<br>slot 1 mfib ipv6 rp ac  | <pre>ions ction id 0) .1) ction id 2) gent:16 (connection id 3) gent:16 (connection id 4) gent:16 (connection id 5) gent:16 (connection id 6)</pre> |  |  |
|                    |   |   |  |  |

The table below describes the significant fields shown in the display.

#### Table 25: show ipv6 mrib client Field Descriptions

| Field   | Description                        |
|---|------------------------------------|
| igmp:145 (connection id 0) pim:146 (connection id 1) mfib ipv6:3<br>(connection id 2) mfib ipv6 rp agent:16 (connection id 3) | Client ID (client name:process ID) |

# show ipv6 mrib route

To display Multicast Routing Information Base (MRIB) route information, use the **show ipv6 mrib route** command in user EXEC or privileged EXEC mode.

**show ipv6 mrib** [**vrf** *vrf-name*] **route** [{**link-local** | **summary** | [{*source-addresssource-name* | \*}] [*groupname-or-address* [*prefix-length*]]}]

| Syntax Description | vrf   | vrf-name                                       | (0  | ptional) Specifies a virtual routin  | g and for   | warding (VRF) configuration. |
|--------------------|---|--|---|--|-------------|------------------------------|
|                    | link  | -local   | (0  | ptional) Displays the link-local g   | roups.      |                              |
|                    | sum   | summary  |   | (Optional) Displays the number of MRIB entries (including link-local groups) and interfaces present in the MRIB table. |             |                              |
|                    | sour  | ce address-or-name                             | (0  | Optional) IPv6 address or name of the source.  |             |                              |
|                    | *   | (Optional) Displays all MRIB route information |   |  | ion.        |                              |
|                    | grou  | pname or-address                               | <i>or-address</i> (Optional) IPv6 address or name of the multicast group. |  | cast group. |                              |
|                    | prefi   | x-length                                       | -length (Optional) IPv6 prefix length.                                    |  |             |                              |
| Command Modes      |   | EXEC (>)<br>leged EXEC (#)                     |   |  |             |                              |
| Command History    | Rele  | ase  |   | Modification   |             |                              |
|                    | Cisc<br>16.5  | o IOS XE Everest<br>.1a                        |   | This command was introduced.   |             |                              |
| Usage Guidelines   | All entries are created by various clients of the MRIB, such as Multicast Listener Discovery (MLD), Protoc<br>Independent Multicast (PIM), and Multicast Forwarding Information Base (MFIB). The flags on each entri<br>or interface serve as a communication mechanism between various clients of the MRIB. The entries revea<br>how PIM sends register messages for new sources and the action taken. |  |   |  |             |                              |
|                    |   |  |   | s the count of all entries, includin   | g link-loc  | cal entries.                 |
|                    | The interface flags are described in the table below.           Table 26: Description of Interface Flags  |  |   |  |             |                              |
|                    | Flag  | Description                                    |   |  |             |                              |
|                    | F   | ForwardData is fo                              | rwa   | rded out of this interface   |             |                              |
|                    | A   | AcceptData receiv                              | ed c  | on this interface is accepted for for  | rwarding    |                              |
|                    | IC Internal copy  |  |   |  |             |                              |
|                    | NS  | Negate signal                                  |   |  |             |                              |
|                    | L   | l.   |   |  |             | J                            |

| Flag | Description                      |  |
|------|----------------------------------|--|
| DP   | Do not preserve                  |  |
| SP   | Signal present                   |  |
| II   | Internal interest                |  |
| ID   | Internal uninterest              |  |
| LI   | Local interest                   |  |
| LD   | Local uninterest                 |  |
| С    | Perform directly connected check |  |

Special entries in the MRIB indicate exceptions from the normal behavior. For example, no signaling or notification is necessary for arriving data packets that match any of the special group ranges. The special group ranges are as follows:

- Undefined scope (FFX0::/16)
- Node local groups (FFX1::/16)
- Link-local groups (FFX2::/16)
- Source Specific Multicast (SSM) groups (FF3X::/32).

For all the remaining (usually sparse-mode) IPv6 multicast groups, a directly connected check is performed and the PIM notified if a directly connected source arrives. This procedure is how PIM sends register messages for new sources.

### **Examples**

The following is sample output from the **show ipv6 mrib route** command using the **summary** keyword:

```
Device# show ipv6 mrib route summary
MRIB Route-DB Summary
No. of (*,G) routes = 52
No. of (S,G) routes = 0
No. of Route x Interfaces (RxI) = 10
```

The table below describes the significant fields shown in the display.

### Table 27: show ipv6 mrib route Field Descriptions

| Field                           | Description   |
|---------------------------------|---|
| No. of (*, G) routes            | Number of shared tree routes in the MRIB.           |
| No. of (S, G) routes            | Number of source tree routes in the MRIB.           |
| No. of Route x Interfaces (RxI) | Sum of all the interfaces on each MRIB route entry. |

## show ipv6 mroute

To display the information in the PIM topology table in a format similar to the **show ip mroute** command, use the **show ipv6 mroute** command in user EXEC or privileged EXEC mode.

show ipv6 mroute [vrf vrf-name] [{link-local | [{group-name | group-address
[{source-addresssource-name}]}]] [summary] [count]

| Syntax Description | vrf vrf-name   | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |  |
|--------------------|--|--|--|
|                    | link-local   | (Optional) Displays the link-local groups.   |  |
|                    | <i>group-name</i>   <i>group-address</i> (Optional) IPv6 address or name of the multicast group.   |  |  |
|                    |  |  |  |
|                    | source-address   source-name   |  |  |
|                    | summary  | (Optional) Displays a one-line, abbreviated summary of each entry in the IPv6 multicast routing table.   |  |
|                    | count  | (Optional) Displays statistics from the Multicast Forwarding Information<br>Base (MFIB) about the group and source, including number of packets,<br>packets per second, average packet size, and bytes per second. |  |
| Command Default    | The <b>show ipv6 mroute</b> comma  | and displays all groups and sources.   |  |
| Command Modes      | User EXEC (>)  |  |  |
|                    | Privileged EXEC (#)  |  |  |
| Command History    | Release  | Modification   |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.   |  |
| Usage Guidelines   | The IPv6 multicast implementation does not have a separate mroute table. For this reason, the <b>show ipv6 mroute</b> command enables you to display the information in the PIM topology table in a format similar to the <b>show ip mroute</b> command.   |  |  |
|                    | If you omit all optional arguments and keywords, the <b>show ipv6 mroute</b> command displays all the entries in the PIM topology table (except link-local groups where the <b>link-local</b> keyword is available).   |  |  |
|                    | The Cisco IOS software populates the PIM topology table by creating (S,G) and (*,G) entries based on PIM protocol messages, MLD reports, and traffic. The asterisk (*) refers to all source addresses, the "S" refers to a single source address, and the "G" is the destination multicast group address. In creating (S, G) entries, the software uses the best path to that destination group found in the unicast routing table (that is, through Reverse Path Forwarding [RPF]). |  |  |
|                    | Use the <b>show ipv6 mroute</b> con  | nmand to display the forwarding status of each IPv6 multicast route.   |  |
| Examples           | The following is sample output   | from the <b>show ipv6 mroute</b> command:  |  |

```
Device# show ipv6 mroute ff07::1
Multicast Routing Table
Flags:D - Dense, S - Sparse, B - Bidir Group, s - SSM Group,
       C - Connected, L - Local, I - Received Source Specific Host Report,
       P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
       J - Join SPT
Timers:Uptime/Expires
Interface state: Interface, State
(*, FF07::1), 00:04:45/00:02:47, RP 2001:0DB8:6::6, flags:S
 Incoming interface: Tunnel5
  RPF nbr:6:6:6::6
  Outgoing interface list:
    POS4/0, Forward, 00:04:45/00:02:47
(2001:0DB8:999::99, FF07::1), 00:02:06/00:01:23, flags:SFT
  Incoming interface: POS1/0
  RPF nbr:2001:0DB8:999::99
  Outgoing interface list:
    POS4/0, Forward, 00:02:06/00:03:27
```

The following is sample output from the **show ipv6 mroute** command with the **summary** keyword:

```
Device# show ipv6 mroute ff07::1 summary
Multicast Routing Table
Flags:D - Dense, S - Sparse, B - Bidir Group, s - SSM Group,
        C - Connected, L - Local, I - Received Source Specific Host Report,
        P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
        J - Join SPT
Timers:Uptime/Expires
Interface state:Interface, State
(*, FF07::1), 00:04:55/00:02:36, RP 2001:0DB8:6::6, OIF count:1, flags:S
(2001:0DB8:999::99, FF07::1), 00:02:17/00:01:12, OIF count:1, flags:SFT
```

The following is sample output from the **show ipv6 mroute** command with the **count** keyword:

```
Device# show ipv6 mroute ff07::1 count
IP Multicast Statistics
71 routes, 24 groups, 0.04 average sources per group
Forwarding Counts:Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts:Total/RPF failed/Other drops(OIF-null, rate-limit etc)
Group:FF07::1
    RP-tree:
    RP Forwarding:0/0/0/0, Other:0/0/0
    LC Forwarding:0/0/0/0, Other:0/0/0
    Source:2001:0DB8:999::99,
    RP Forwarding:0/0/0/0, Other:0/0/0
    LC Forwarding:0/0/0/0, Other:0/0/0
    HW Forwd: 20000/0/92/0, Other:0/0/0
    Tot. shown:Source count:1, pkt count:20000
```

The table below describes the significant fields shown in the display.

| Field                     | Description   |  |
|---------------------------|---|--|
| Flags:                    | Provides information about the entry.   |  |
|                           | • Ssparse. Entry is operating in sparse mode.   |  |
|                           | • sSSM group. Indicates that a multicast group is within the SSM range of IP addresses. This flag is reset if the SSM range changes.  |  |
|                           | • Cconnected. A member of the multicast group is present on the directly connected interface.   |  |
|                           | • Llocal. The router itself is a member of the multicast group.   |  |
|                           | • Ireceived source specific host report. Indicates that an (S, G) entry was created by an (S, G) report. This flag is set only on the designated router (DR).   |  |
|                           | • Ppruned. Route has been pruned. The Cisco IOS software keeps this information so that a downstream member can join the source.  |  |
|                           | • RRP-bit set. Indicates that the (S, G) entry is pointing toward the RP. This is typically prune state along the shared tree for a particular source.  |  |
|                           | • Fregister flag. Indicates that the software is registering for a multicast source.  |  |
|                           | • TSPT-bit set. Indicates that packets have been received on the shortest path source tree.   |  |
|                           | • Jjoin SPT. For (*, G) entries, indicates that the rate of traffic flowing down the shared tree is exceeding the SPT-Threshold value set for the group. (The default SPT-Threshold setting is 0 kbps.) When the J - Join shortest path tree (SPT) flag is set, the next (S, G) packet received down the shared tree triggers an (S, G) join in the direction of the source, thereby causing the router to join the source tree. The default SPT-Threshold value of 0 kbps is used for the group, and the J - Join SPT flag is always set on (*, G) entries and is never cleared. The router immediately switches to the shortest path source tree when traffic from a new source is received |  |
| Timers:<br>Uptime/Expires | "Uptime" indicates per interface how long (in hours, minutes, and seconds) the entri-<br>has been in the IPv6 multicast routing table. "Expires" indicates per interface how lor<br>(in hours, minutes, and seconds) until the entry will be removed from the IPv6 multica-<br>routing table.   |  |
| Interface state:          | Indicates the state of the incoming or outgoing interface.  |  |
|                           | • Interface. Indicates the type and number of the interface listed in the incoming or outgoing interface list.  |  |
|                           | • Next-Hop. "Next-Hop" specifies the IP address of the downstream neighbor.   |  |
|                           | • State/Mode. "State" indicates that packets will either be forwarded, pruned, or null on the interface depending on whether there are restrictions due to access lists. "Mode" indicates that the interface is operating in sparse mode.   |  |

### Table 28: show ipv6 mroute Field Descriptions

I

| Field                                   | Description  |  |
|---|--|--|
| (*, FF07::1) and<br>(2001:0DB8:999::99) | Entry in the IPv6 multicast routing table. The entry consists of the IPv6 address of the source router followed by the IPv6 address of the multicast group. An asterisk (*) in place of the source router indicates all sources. |  |
|   | Entries in the first format are referred to as (*, G) or "star comma G" entries. Entries in the second format are referred to as (S, G) or "S comma G" entries; (*, G) entries are used to build (S, G) entries.                 |  |
| RP                                      | Address of the RP router.  |  |
| flags:                                  | Information set by the MRIB clients on this MRIB entry.  |  |
| Incoming interface:                     | Expected interface for a multicast packet from the source. If the packet is not received on this interface, it is discarded.   |  |
| RPF nbr                                 | IP address of the upstream router to the RP or source.   |  |
| Outgoing interface list:                | Interfaces through which packets will be forwarded. For (S,G) entries, this list will not include the interfaces inherited from the (*,G) entry.   |  |

**Related Commands** 

| Command        | Description  |
|----------------|--|
|                | Enables multicast routing using PIM and MLD on all IPv6-enabled interfaces of the router and enables multicast forwarding. |
| show ipv6 mfib | Displays the forwarding entries and interfaces in the IPv6 MFIB.   |

# show ipv6 mtu

To display maximum transmission unit (MTU) cache information for IPv6 interfaces, use the **show ipv6 mtu** command in user EXEC or privileged EXEC mode.

show ipv6 mtu [vrf vrfname]

| Syntax Description | vrf  | (Optional) Displays an IPv6 Virtual Private Network (VPN) routing/forwarding instance |   |                              |  |    | ce (VRF). |             |  |  |  |
|--------------------|--|---|---|------------------------------|--|----|-----------|-------------|--|--|--|
|                    | vrfname  | (Optional)  | ) Name of t   | Name of the IPv6 VRF.        |  |    |           |             |  |  |  |
| Command Modes      | User EXEC (>) Privileged EXEC (#)  |   |   |                              |  |    |           |             |  |  |  |
| Command Modes      |  |   |   |                              |  |    |           |             |  |  |  |
|                    | Filvinegeu   | EAEC (#)  |   |                              |  |    |           |             |  |  |  |
| Command History    | Release  |   | Modification  |                              |  |    |           |             |  |  |  |
|                    | Cisco IOS XE Everes<br>16.5.1a   |   | st T  | This command was introduced. |  | d. |           |             |  |  |  |
| Usage Guidelines   | <b>es</b> The <b>vrf</b> keyword and <i>vrfname</i> argument allow you to view MTUs related to a specific VRF.   |   |   |                              |  |    |           |             |  |  |  |
| Examples           | The following is sample output from the <b>show ipv6 mtu</b> command:  |   |   |                              |  |    |           |             |  |  |  |
|                    | Device# <b>show ipv6 mtu</b><br>MTU Since Destination Address<br>1400 00:04:21 5000:1::3<br>1280 00:04:50 FE80::203:A0FF:FED6:141D   |   |   |                              |  |    |           |             |  |  |  |
|                    | The following is sample output from the <b>show ipv6 mtu</b> command using the <b>vrf</b> keyword and <i>vrfname</i> argument. This example provides information about the VRF named vrfname1: |   |   |                              |  |    |           |             |  |  |  |
|                    | MTU Sir  |   |   |                              |  |    |           |             |  |  |  |
|                    | The table below describes the significant fields shown in the display.   |   |   |                              |  |    |           |             |  |  |  |
|                    | Table 29: show ipv6 mtu Field Descriptions   |   |   |                              |  |    |           |             |  |  |  |
|                    | Field  |   | Description   |                              |  |    |           |             |  |  |  |
|                    | MTU  |   | MTU, which was contained in the Internet Control Message Protocol (ICMP) packet-too-big message, used for the path to the destination address.            |                              |  |    |           | IP)         |  |  |  |
|                    | Since  |   | Age of the entry since the ICMP packet-too-big message was received.  |                              |  |    |           |             |  |  |  |
|                    | Destinatio   | on Address  | s Address contained in the received ICMP packet-too-big message. Packets origina from this router to this address should be no bigger than the given MTU. |                              |  |    |           | originating |  |  |  |

I

| Related Commands | Command  | Description   |
|------------------|----------|---|
|                  | ipv6 mtu | Sets the MTU size of IPv6 packets sent on an interface. |

# show ipv6 nd destination

To display information about IPv6 host-mode destination cache entries, use the **show ipv6 nd destination** command in user EXEC or privileged EXEC mode.

show ipv6 nd destination[vrf vrf-name][interface-type interface-number]

| Syntax Description | vrf vrf-name   | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.                                |                                       |            |  |  |
|--------------------|--|---|---------------------------------------|------------|--|--|
|                    | interface- type  | (Option   | nal) Specifies the Interface type.    |            |  |  |
|                    | <i>interface- number</i> (Optional) Specifies the Interface number.  |   |                                       |            |  |  |
| Command Modes      | User EXEC (>) Privileged EXEC (#)  |   |                                       |            |  |  |
| Command History    | Release  |   | Modification                          |            |  |  |
|                    | Cisco IOS XE Eve<br>16.5.1a  | erest   | This command was introduced.          |            |  |  |
| Usage Guidelines   | Use the <b>show ipv6 nd destination</b> command to display information about IPv6 host-mode destination cache entries. If the <b>vrf</b> <i>vrf-name</i> keyword and argument pair is used, then only information about the specified VRF is displayed. If the <i>interface-type</i> and <i>interface-number</i> arguments are used, then only information about the specified interface is displayed. |   |                                       |            |  |  |
| Examples           | Device# <b>show ipv</b>  | 6 nd de   | stination                             |            |  |  |

Table 31: show ipv6 neighbors Field Descriptions

| Field   | Description   |  |  |  |  |  |
|---|---|--|--|--|--|--|
| IPv6 Address  | IPv6 address of neighbor or interface.  |  |  |  |  |  |
| Age   | Time (in minutes) since the address was confirmed to be reachable. A hyphen (-) indicates a static entry.   |  |  |  |  |  |
| Link-layer<br>Addr  | MAC address. If the address is unknown, a hyphen (-) is displayed.  |  |  |  |  |  |
| State   | The state of the neighbor cache entry. Following are the states for dynamic entries in the IPv6 neighbor discovery cache:   |  |  |  |  |  |
|   | • INCMP (Incomplete)Address resolution is being performed on the entry. A neighbor solicitation message has been sent to the solicited-node multicast address of the target, but the corresponding neighbor advertisement message has not yet been received.  |  |  |  |  |  |
|   | • REACH (Reachable)Positive confirmation was received within the last ReachableTime milliseconds that the forward path to the neighbor was functioning properly. While in REACH state, the device takes no special action as packets are sent.  |  |  |  |  |  |
|   | • STALEMore than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. While in STALE state, the device takes no action until a packet is sent.   |  |  |  |  |  |
|   | • DELAYMore than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. A packet was sent within the last DELAY_FIRST_PROBE_TIME seconds. If no reachability confirmation is received within DELAY_FIRST_PROBE_TIME seconds of entering the DELAY state, send a neighbor solicitation message and change the state to PROBE. |  |  |  |  |  |
| <ul> <li>PROBEA reachability confirmation is actively sought by resending neighb<br/>solicitation messages every RetransTimer milliseconds until a reachability con<br/>is received.</li> </ul> |   |  |  |  |  |  |
|   | • ????Unknown state.  |  |  |  |  |  |
|   | Following are the possible states for static entries in the IPv6 neighbor discovery cache:  |  |  |  |  |  |
|   | • INCMP (Incomplete)The interface for this entry is down.   |  |  |  |  |  |
|   | • REACH (Reachable)The interface for this entry is up.  |  |  |  |  |  |
|   | <b>Note</b> Reachability detection is not applied to static entries in the IPv6 neighbor discovery cache; therefore, the descriptions for the INCMP (Incomplete) and REACH (Reachable) states are different for dynamic and static cache entries.   |  |  |  |  |  |
| Interface   | Interface from which the address was reachable.   |  |  |  |  |  |

The following is sample output from the show ipv6 neighbors command with the statistics keyword:

```
Device# show ipv6 neighbor statistics

IPv6 ND Statistics

Entries 2, High-water 2, Gleaned 1, Scavenged 0

Entry States

INCMP 0 REACH 0 STALE 2 GLEAN 0 DELAY 0 PROBE 0

Resolutions (INCMP)

Requested 1, timeouts 0, resolved 1, failed 0

In-progress 0, High-water 1, Throttled 0, Data discards 0

Resolutions (PROBE)

Requested 3, timeouts 0, resolved 3, failed 0
```

Table 32: show ipv6 neighbors statistics Field Descriptions

| Field               | Description   |  |  |  |  |
|---------------------|---|--|--|--|--|
| Entries             | Total number of ND neighbor entries in the ND cache.  |  |  |  |  |
| High-Water          | Maximum amount (so far) of ND neighbor entries in ND cache.   |  |  |  |  |
| Gleaned             | Number of ND neighbor entries gleaned (that is, learned from a neighbor NA or other ND packet).   |  |  |  |  |
| Scavenged           | Number of stale ND neighbor entries that have timed out and been removed from the cache.  |  |  |  |  |
| Entry States        | Number of ND neighbor entries in each state.  |  |  |  |  |
| Resolutions (INCMP) | Statistics for neighbor resolutions attempted in INCMP state (that is, resolution prompted by a data packet). Details about the resolutions attempted in INCMP are follows: |  |  |  |  |
|                     | RequestedTotal number of resolutions requested.   |  |  |  |  |
|                     | • TimeoutsNumber of timeouts during resolutions.  |  |  |  |  |
|                     | ResolvedNumber of successful resolutions.   |  |  |  |  |
|                     | FailedNumber of unsuccessful resolutions.   |  |  |  |  |
|                     | • In-progressNumber of resolutions in progress.   |  |  |  |  |
|                     | • High-waterMaximum number (so far) of resolutions in progress.   |  |  |  |  |
|                     | • ThrottledNumber of times resolution request was ignored due to maximum number of resolutions in progress limit.   |  |  |  |  |
|                     | • Data discardsNumber of data packets discarded that are awaiting neighbor resolution.  |  |  |  |  |

| Field               | Description   |
|---------------------|---|
| Resolutions (PROBE) | Statistics for neighbor resolutions attempted in PROBE state (that is, re-resolutions of existing entries prompted by a data packet): |
|                     | • RequestedTotal number of resolutions requested.   |
|                     | • TimeoutsNumber of timeouts during resolutions.  |
|                     | ResolvedNumber of successful resolutions.   |
|                     | • FailedNumber of unsuccessful resolutions.   |

# show ipv6 nhrp

To display Next Hop Resolution Protocol (NHRP) mapping information, use the show ipv6 nhrp command in user EXEC or privileged EXEC mode.

show ipv6 nhrp [{dynamic [ipv6-address] | incomplete | static}] [{address | interface}] [{brief | detail}] [purge]

| Syntax Description | dynamic                       | (Optional) Displays dynamic (learned) IPv6-to-nonbroadcast multiaccess address (NBMA) mapping entries. Dynamic NHRP mapping entries are obtained from NHRP resolution/registration exchanges. See the table below for types, number ranges, and descriptions.                            |  |  |  |  |  |  |
|--------------------|-------------------------------|--|--|--|--|--|--|--|
|                    | ipv6-address                  | (Optional) The IPv6 address of the cache entry.  |  |  |  |  |  |  |
|                    | incomplete                    | (Optional) Displays information about NHRP mapping entries for which the IPv6-to-NBMA is not resolved. See the table below for types, number ranges, and descriptions.   |  |  |  |  |  |  |
|                    | static                        | (Optional) Displays static IPv6-to-NBMA address mapping entries. Static NHRP mapping<br>entries are configured using the <b>ipv6 nhrp map</b> command. See the table below for types,<br>number ranges, and descriptions.(Optional) NHRP mapping entry for specified protocol addresses. |  |  |  |  |  |  |
|                    | address                       |  |  |  |  |  |  |  |
|                    | interface                     | (Optional) NHRP mapping entry for the specified interface. See the table below for types, number ranges, and descriptions.   |  |  |  |  |  |  |
|                    | brief                         | (Optional) Displays a short output of the NHRP mapping.(Optional) Displays detailed information about NHRP mapping.  |  |  |  |  |  |  |
|                    | detail                        |  |  |  |  |  |  |  |
|                    | purge                         | (Optional) Displays NHRP purge information.  |  |  |  |  |  |  |
| Command Modes      | User EXEC (><br>Privileged EX |  |  |  |  |  |  |  |
| Command History    | Release                       | Modification   |  |  |  |  |  |  |
|                    | Cisco IOS XE<br>16.5.1a       | E Everest This command was introduced.   |  |  |  |  |  |  |
| Usage Guidelines   | The table belo                | w lists the valid types, number ranges, and descriptions for the optional <i>interface</i> argument.   |  |  |  |  |  |  |

Usage Guidelines

Note

The valid types can vary according to the platform and interfaces on the platform.

| Valid Types       | Number Ranges   | Interface Descriptions         |
|-------------------|-----------------|--------------------------------|
| async             | 1               | Async                          |
| atm               | 0 to 6          | ATM                            |
| bvi               | 1 to 255        | Bridge-Group Virtual Interface |
| cdma-ix           | 1               | CDMA Ix                        |
| ctunnel           | 0 to 2147483647 | C-Tunnel                       |
| dialer            | 0 to 20049      | Dialer                         |
| ethernet          | 0 to 4294967295 | Ethernet                       |
| fastethernet      | 0 to 6          | FastEthernet IEEE 802.3        |
| lex               | 0 to 2147483647 | Lex                            |
| loopback          | 0 to 2147483647 | Loopback                       |
| mfr               | 0 to 2147483647 | Multilink Frame Relay bundle   |
| multilink         | 0 to 2147483647 | Multilink-group                |
| null              | 0               | Null                           |
| port-channel      | 1 to 64         | Port channel                   |
| tunnel            | 0 to 2147483647 | Tunnel                         |
| vif               | 1               | PGM multicast host             |
| virtual-ppp       | 0 to 2147483647 | Virtual PPP                    |
| virtual-template  | 1 to 1000       | Virtual template               |
| virtual-tokenring | 0 to 2147483647 | Virtual Token Ring             |
| xtagatm           | 0 to 2147483647 | Extended tag ATM               |

### Table 33: Valid Types, Number Ranges, and Interface Description

### Examples

The following is sample output from the show ipv6 nhrp command:

```
Device# show ipv6 nhrp
2001:0db8:3c4d:0015::1a2f:3d2c/48 via
2001:0db8:3c4d:0015::1a2f:3d2c
Tunnel0 created 6d05h, never expire
```

### Table 34: show ipv6 nhrp Field Descriptions

| Field                              | Description   |
|------------------------------------|---|
| 2001:0db8:3c4d:0015::1a2f: 3d2c/48 | Target network.   |
| 2001:0db8:3c4d:0015::1a2f:3d2c     | Next hop to reach the target network.                   |
| Tunnel0                            | Interface through which the target network is reached.  |
| created 6d05h                      | Length of time since the entry was created (dayshours). |
| never expire                       | Indicates that static entries never expire.             |

The following is sample output from the show ipv6 nhrp command using the brief keyword:

```
Device# show ipv6 nhrp brief
2001:0db8:3c4d:0015:0000:0000:1a2f:3d2c/48
via 2001:0db8:3c4d:0015:0000:0000:1a2f:3d2c
Interface: Tunnel0 Type: static
NBMA address: 10.11.11.99
```

The table below describes the significant fields shown in the display.

### Table 35: show ipv6 nhrp brief Field Descriptions

| Field  | Description  |  |
|--|--|--|
| 2001:0db8:3c4d:0015:0000:0000:<br>1a2f:3d2c/48     | Target network.  |  |
| via<br>2001:0db8:3c4d:0015:0000:0000:<br>1a2f:3d2c | Next Hop to reach the target network.  |  |
| Interface: Tunnel0                                 | Interface through which the target network is reached.   |  |
| Type: static                                       | <ul> <li>Type of tunnel. The types can be one of the following:</li> <li>dynamicNHRP mapping is obtained dynamically. The mapping entry is created using information from the NHRP resolution and registrations.</li> <li>staticNHRP mapping is configured statically. Entries configured by the <b>ipv6 nhrp map</b> command are marked static.</li> <li>incompleteThe NBMA address is not known for the target network.</li> </ul> |  |

| Related | Commands |
|---------|----------|
|---------|----------|

| Command | Description   |
|---------|---|
|         | Statically configures the IPv6-to-NBMA address mapping of IP destinations connected to an NBMA network. |

## show ipv6 ospf

To display general information about Open Shortest Path First (OSPF) routing processes, use the **show ipv6 ospf** command in user EXEC or privileged EXEC mode.

show ipv6 ospf [process-id] [area-id] [rate-limit]

| Syntax Description proces   |            | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
|---|------------|--|
| <i>area-id</i> (Optional) Area ID. This argument displays information |            | (Optional) Area ID. This argument displays information about a specified area only.  |
|   | rate-limit | (Optional) Rate-limited link-state advertisements (LSAs). This keyword displays LSAs that are currently being rate limited, together with the remaining time to the next generation.               |

```
Command Modes
```

User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

### show ipv6 ospf Output Example

The following is sample output from the show ipv6 ospf command:

```
Device# show ipv6 ospf
Routing Process "ospfv3 1" with ID 10.10.10.1
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0{\times}000000
Number of areas in this device is 1. 1 normal 0 stub 0 nssa
   Area BACKBONE(0)
       Number of interfaces in this area is 1
       MD5 Authentication, SPI 1000
        SPF algorithm executed 2 times
        Number of LSA 5. Checksum Sum 0x02A005
        Number of DCbitless LSA 0
        Number of indication LSA 0
        Number of DoNotAge LSA 0
        Flood list length 0
```

### Table 36: show ipv6 ospf Field Descriptions

| Field   | Description   |
|---|---|
| Routing process "ospfv3 1" with ID 10.10.10.1 | Process ID and OSPF device ID.                                |
| LSA group pacing timer                        | Configured LSA group pacing timer (in seconds).               |
| Interface flood pacing timer                  | Configured LSA flood pacing timer (in milliseconds).          |
| Retransmission pacing timer                   | Configured LSA retransmission pacing timer (in milliseconds). |
| Number of areas                               | Number of areas in device, area addresses, and so on.         |

### show ipv6 ospf With Area Encryption Example

The following sample output shows the **show ipv6 ospf** command with area encryption information:

```
Device# show ipv6 ospf
Routing Process "ospfv3 1" with ID 10.0.0.1
It is an area border device
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
LSA group pacing timer 240 secs
Interface flood pacing timer 33 msecs
Retransmission pacing timer 66 msecs
Number of external LSA 0. Checksum Sum 0x000000
Number of areas in this device is 2. 2 normal 0 stub 0 nssa
Reference bandwidth unit is 100 mbps
   Area BACKBONE(0)
       Number of interfaces in this area is 2
        SPF algorithm executed 3 times
        Number of LSA 31. Checksum Sum 0x107493
        Number of DCbitless LSA 0
        Number of indication LSA 0
        Number of DoNotAge LSA 20
        Flood list length 0
    Area 1
        Number of interfaces in this area is 2
        NULL Encryption SHA-1 Auth, SPI 1001
        SPF algorithm executed 7 times
        Number of LSA 20. Checksum Sum 0x095E6A
        Number of DCbitless LSA 0
        Number of indication LSA 0
        Number of DoNotAge LSA 0
        Flood list length 0
```

Table 37: show ipv6 ospf with Area Encryption Information Field Descriptions

| Field  | Description                        |
|--------|------------------------------------|
| Area 1 | Subsequent fields describe area 1. |

| Field                                   | Description  |
|---|--|
| NULL Encryption SHA-1 Auth, SPI<br>1001 | Displays the encryption algorithm (in this case, null, meaning no encryption algorithm is used), the authentication algorithm (SHA-1), and the security policy index (SPI) value (1001). |

The following example displays the configuration values for SPF and LSA throttling timers:

```
Device# show ipv6 ospf
Routing Process "ospfv3 1" with ID 10.9.4.1
Event-log enabled, Maximum number of events: 1000, Mode: cyclic
It is an autonomous system boundary device
Redistributing External Routes from,
        ospf 2
Initial SPF schedule delay 5000 msecs
Minimum hold time between two consecutive SPFs 10000 msecs
Maximum wait time between two consecutive SPFs 10000 msecs
Minimum LSA interval 5 secs
Minimum LSA arrival 1000 msecs
```

The table below describes the significant fields shown in the display.

| Table 38: show ipv6 o | sof with SPF and LSA i | Throttlina Timer I | Field Descriptions |
|-----------------------|------------------------|--------------------|--------------------|
|                       |                        |                    |                    |

| Field   | Description   |
|---|---|
| Initial SPF schedule delay                                    | Delay time of SPF calculations.                                       |
| Minimum hold time between two consecutive SPFs                | Minimum hold time between consecutive SPF calculations.               |
| Maximum wait time between two consecutive<br>SPFs 10000 msecs | Maximum hold time between consecutive SPF calculations.               |
| Minimum LSA interval 5 secs                                   | Minimum time interval (in seconds) between link-state advertisements. |
| Minimum LSA arrival 1000 msecs                                | Maximum arrival time (in milliseconds) of link-state advertisements.  |

The following example shows information about LSAs that are currently being rate limited:

### Device# show ipv6 ospf rate-limit

```
List of LSAs that are in rate limit Queue
LSAID: 0.0.0.0 Type: 0x2001 Adv Rtr: 10.55.55.55 Due in: 00:00:00.500

```

Table 39: show ipv6 ospf rate-limit Field Descriptions

| Field | Description               |
|-------|---------------------------|
| LSAID | Link-state ID of the LSA. |
| Туре  | Description of the LSA.   |

| Field   | Description  |
|---------|--|
| Adv Rtr | ID of the advertising device.                          |
| Due in: | Remaining time until the generation of the next event. |

# show ipv6 ospf border-routers

To display the internal Open Shortest Path First (OSPF) routing table entries to an Area Border Router (ABR) and Autonomous System Boundary Router (ASBR), use the **show ipv6 ospf border-routers** command in user EXEC or privileged EXEC mode.

show ip ospf [process-id] border-routers

| Syntax Description | process-id | (Optional) Internal identification. It is locally assigned and can be any positive integer. The |
|--------------------|------------|---|
|                    |            | number used here is the number assigned administratively when the OSPF routing process is       |
|                    |            | enabled.  |

Command Modes User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

### **Examples**

The following is sample output from the **show ipv6 ospf border-routers** command:

Device# show ipv6 ospf border-routers

```
OSPFv3 Process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 172.16.4.4 [2] via FE80::205:5FFF:FED3:5808, FastEthernet0/0, ABR, Area 1, SPF 13
i 172.16.4.4 [1] via FE80::205:5FFF:FED3:5406, POS4/0, ABR, Area 0, SPF 8
i 172.16.3.3 [1] via FE80::205:5FFF:FED3:5808, FastEthernet0/0, ASBR, Area 1, SPF 3
```

Table 40: show ipv6 ospf border-routers Field Descriptions

| Field  | Description  |
|--|--|
| i - Intra-area route, I - Inter-area route   | The type of this route.                                      |
| 172.16.4.4, 172.16.3.3   | Router ID of the destination router.                         |
| [2], [1]   | Metric used to reach the destination router.                 |
| FE80::205:5FFF:FED3:5808,<br>FE80::205:5FFF:FED3:5406,<br>FE80::205:5FFF:FED3:5808 | Link-local routers.  |
| FastEthernet0/0, POS4/0  | The interface on which the IPv6 OSPF protocol is configured. |
| ABR  | Area border router.  |

| Field                | Description  |
|----------------------|--|
| ASBR                 | Autonomous system boundary router.   |
| Area 0, Area 1       | The area ID of the area from which this route is learned.                                  |
| SPF 13, SPF 8, SPF 3 | The internal number of the shortest path first (SPF) calculation that installs this route. |

### show ipv6 ospf event

To display detailed information about IPv6 Open Shortest Path First (OSPF) events, use the **show ipv6 ospf** event command in privileged EXEC mode.

show ipv6 ospf [process-id] event [{generic | interface | lsa | neighbor | reverse | rib | spf}]

| Syntax Description    | process-id | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
|-----------------------|------------|--|
|                       | generic    | (Optional) Generic information regarding OSPF for IPv6 events.   |
|                       | interface  | (Optional) Interface state change events, including old and new states.  |
| Isa (Optional) LS     |            | (Optional) LSA arrival and LSA generation events.  |
| neighbor (Optional) N |            | (Optional) Neighbor state change events, including old and new states.   |
|                       | reverse    | (Optional) Keyword to allow the display of events in reverse-from the latest to the oldest or from oldest to the latest.   |
|                       | rib        | (Optional) Routing Information Base (RIB) update, delete, and redistribution events.   |
|                       | spf        | (Optional) Scheduling and SPF run events.  |

### Command Modes Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** An OSPF event log is kept for every OSPF instance. If you enter no keywords with the **show ipv6 ospf event** command, all information in the OSPF event log is displayed. Use the keywords to filter specific information.

**Examples** The following example shows scheduling and SPF run events, LSA arrival and LSA generation events, in order from the oldest events to the latest generated events:

```
Device# show ipv6 ospf event spf lsa reverse
```

OSPFv3 Router with ID (10.0.0.1) (Process ID 1) 1 \*Sep 29 11:59:18.367: Rcv Changed Type-0x2009 LSA, LSID 10.0.0.0, Adv-Rtr 192.168.0.1, Seq# 80007699, Age 3600 3 \*Sep 29 11:59:18.367: Schedule SPF, Area 0, Change in LSID 10.0.0.0, LSA type P 4 \*Sep 29 11:59:18.367: Rcv Changed Type-0x2001 LSA, LSID 10.0.0.0, Adv-Rtr 192.168.0.1, Seq# 80007699, Age 2 5 \*Sep 29 11:59:18.367: Schedule SPF, Area 0, Change in LSID 10.0.0.0, LSA type R 6 \*Sep 29 11:59:18.367: Rcv Changed Type-0x2002 LSA, LSID 10.0.0.1, Adv-Rtr 192.168.0.1, Seq# 80007699, Age 3600 8 \*Sep 29 11:59:18.367: Schedule SPF, Area 0, Change in LSID 10.1.0.1, LSA type N

The table below describes the significant fields shown in the display.

#### Table 41: show ip ospf Field Descriptions

| Field   | Description  |
|---|--|
| OSPFv3 Router with ID (10.0.0.1) (Process ID 1) | Process ID and OSPF router ID.   |
| Rev Changed Type-0x2009 LSA                     | Description of newly arrived LSA.  |
| LSID  | Link-state ID of the LSA.  |
| Adv-Rtr   | ID of the advertising router.  |
| Seq#  | Link state sequence number (detects old or duplicate link state advertisements). |
| Age   | Link state age (in seconds).   |
| Schedule SPF                                    | Enables SPF to run.  |
| Area  | OSPF area ID.  |
| Change in LSID                                  | Changed link-state ID of the LSA.  |
| LSA type  | LSA type.  |

# show ipv6 ospf graceful-restart

To display Open Shortest Path First for IPv6 (OSPFv3) graceful restart information, use the **show ipv6 ospf** graceful-restart command in privileged EXEC mode.

show ipv6 ospf graceful-restart

**Syntax Description** This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

 Command History
 Release
 Modification

 Cisco IOS XE Everest
 This command was introduced.

 16.5.1a
 This command was introduced.

Use the show ipv6 ospf graceful-restart command to discover information about the OSPFv3 graceful restart feature.

**Examples** The following example displays OSPFv3 graceful restart information:

```
Device# show ipv6 ospf graceful-restart
Routing Process "ospf 1"
Graceful Restart enabled
    restart-interval limit: 120 sec, last restart 00:00:15 ago (took 36 secs)
Graceful Restart helper support enabled
Router status : Active
Router is running in SSO mode
OSPF restart state : NO_RESTART
Router ID 10.1.1.1, checkpoint Router ID 10.0.0.0
```

 Table 42: show ipv6 ospf graceful-restart Field Descriptions

| Field                                    | Description   |
|--|---|
| Routing Process "ospf 1"                 | The OSPFv3 routing process ID.  |
| Graceful Restart enabled                 | The graceful restart feature is enabled on this router.   |
| restart-interval limit: 120 sec          | The restart-interval limit.   |
| last restart 00:00:15 ago (took 36 secs) | How long ago the last graceful restart occurred, and how long it took to occur.   |
| Graceful Restart helper support enabled  | Graceful restart helper mode is enabled. Because graceful restart<br>mode is also enabled on this router, you can identify this router<br>as being graceful-restart capable. A router that is<br>graceful-restart-aware cannot be configured in graceful-restart<br>mode. |

| Field   | Description   |
|---|---|
| Router status : Active                          | This router is in active, as opposed to standby, mode.              |
| Router is running in SSO mode                   | The router is in stateful switchover mode.                          |
| OSPF restart state : NO_RESTART                 | The current OSPFv3 restart state.                                   |
| Router ID 10.1.1.1, checkpoint Router ID 10.0.0 | The IPv6 addresses of the current router and the checkpoint router. |

### **Related Commands**

| Command                  | Description                                    |  |
|--------------------------|--|--|
| show ipv6 ospf interface | Displays OSPFv3-related interface information. |  |

## show ipv6 ospf interface

To display Open Shortest Path First (OSPF)-related interface information, use the **showipv6ospfinterface** command in user EXEC or privileged mode.

show ipv6 ospf [process-id] [area-id] interface [type number] [brief]

| Syntax Description | process-id  | (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
|--------------------|-------------|--|
|                    | area-id     | (Optional) Displays information about a specified area only.   |
|                    | type number | (Optional) Interface type and number.  |
|                    | brief       | (Optional) Displays brief overview information for OSPF interfaces, states, addresses and masks, and areas on the router.  |

### **Examples**

### show ipv6 ospf interface Standard Output Example

The following is sample output from the **showipv6ospfinterface** command:

```
Device# show ipv6 ospf interface
ATM3/0 is up, line protocol is up
  Link Local Address 2001:0DB1:205:5FFF:FED3:5808, Interface ID 13
  Area 1, Process ID 1, Instance ID 0, Router ID 172.16.3.3
  Network Type POINT TO POINT, Cost: 1
  Transmit Delay is 1 sec, State POINT TO POINT,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in 00:00:06
  Index 1/2/2, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 12, maximum is 12
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
   Adjacent with neighbor 172.16.4.4
  Suppress hello for 0 neighbor(s)
FastEthernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:205:5FFF:FED3:5808, Interface ID 3
  Area 1, Process ID 1, Instance ID 0, Router ID 172.16.3.3
  Network Type BROADCAST, Cost: 1
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router (ID) 172.16.6.6, local address 2001:0DB1:205:5FFF:FED3:6408
  Backup Designated router (ID) 172.16.3.3, local address 2001:0DB1:205:5FFF:FED3:5808
```

```
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:05
Index 1/1/1, flood queue length 0
Next 0x0(0)/0x0(0)/0x0(0)
Last flood scan length is 12, maximum is 12
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
Adjacent with neighbor 172.16.6.6 (Designated Router)
Suppress hello for 0 neighbor(s)
```

The table below describes the significant fields shown in the display.

Table 43: show ipv6 ospf interface Field Descriptions

| Field  | Description   |  |
|--|---|--|
| ATM3/0   | Status of the physical link and operational status of protocol.                                   |  |
| Link Local Address   | Interface IPv6 address.   |  |
| Area 1, Process ID 1, Instance ID 0, Router<br>ID 172.16.3.3 | The area ID, process ID, instance ID, and router ID of the area from which this route is learned. |  |
| Network Type POINT_TO_POINT, Cost: 1                         | Network type and link-state cost.   |  |
| Transmit Delay   | Transmit delay, interface state, and router priority.   |  |
| Designated Router  | Designated router ID and respective interface IP address.   |  |
| Backup Designated router                                     | Backup designated router ID and respective interface IP address.                                  |  |
| Timer intervals configured                                   | Configuration of timer intervals.   |  |
| Hello  | Number of seconds until the next hello packet is sent out this interface.                         |  |
| Neighbor Count   | Count of network neighbors and list of adjacent neighbors.  |  |

### Cisco IOS Release 12.2(33)SRB Example

The following is sample output of the **showipv6ospfinterface** command when the **brief** keyword is entered.

```
Device# show ipv6 ospf interface brief
```

| Interface | PID  | Area | Intf ID | Cost  | State | Nbrs F/C |
|-----------|------|------|---------|-------|-------|----------|
| VL0       | 6    | 0    | 21      | 65535 | DOWN  | 0/0      |
| Se3/0     | 6    | 0    | 14      | 64    | P2P   | 0/0      |
| Lol       | 6    | 0    | 20      | 1     | LOOP  | 0/0      |
| Se2/0     | 6    | 6    | 10      | 62    | P2P   | 0/0      |
| Tu0       | 1000 | 0    | 19      | 11111 | DOWN  | 0/0      |

### **OSPF** with Authentication on the Interface Example

The following is sample output from the **showipv6ospfinterface** command with authentication enabled on the interface:

```
Device# show ipv6 ospf interface
Ethernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:A8BB:CCFF:FE00:6E00, Interface ID 2
  Area 0, Process ID 1, Instance ID 0, Router ID 10.10.10.1
  Network Type BROADCAST, Cost:10
  MD5 Authentication SPI 500, secure socket state UP (errors:0)
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router (ID) 10.11.11.1, local address 2001:0DB1:A8BB:CCFF:FE00:6F00
  Backup Designated router (ID) 10.10.10.1, local address
2001:0DB1:A8BB:CCFF:FE00:6E00
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
   Hello due in 00:00:01
  Index 1/1/1, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
  Neighbor Count is 1, Adjacent neighbor count is 1
   Adjacent with neighbor 10.11.11.1 (Designated Router)
  Suppress hello for 0 neighbor(s)
```

### **OSPF** with Null Authentication Example

The following is sample output from the **showipv6ospfinterface** command with null authentication configured on the interface:

```
Device# show ipv6 ospf interface
Ethernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:A8BB:CCFF:FE00:6E00, Interface ID 2
 Area 0, Process ID 1, Instance ID 0, Router ID 10.10.10.1
 Network Type BROADCAST, Cost:10
 Authentication NULL
 Transmit Delay is 1 sec, State BDR, Priority 1
 Designated Router (ID) 10.11.11.1, local address 2001:0DB1:A8BB:CCFF:FE00:6F00
 Backup Designated router (ID) 10.10.10.1, local address
2001:0DB1:A8BB:CCFF:FE00:6E00
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
   Hello due in 00:00:03
  Index 1/1/1, flood queue length 0
 Next 0x0(0)/0x0(0)/0x0(0)
  Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
 Neighbor Count is 1, Adjacent neighbor count is 1
   Adjacent with neighbor 10.11.11.1 (Designated Router)
  Suppress hello for 0 neighbor(s)
```

### **OSPF** with Authentication for the Area Example

The following is sample output from the **showipv6ospfinterface** command with authentication configured for the area:

Device# show ipv6 ospf interface

```
Ethernet0/0 is up, line protocol is up
  Link Local Address 2001:0DB1:A8BB:CCFF:FE00:6E00, Interface ID 2
  Area 0, Process ID 1, Instance ID 0, Router ID 10.10.10.1
  Network Type BROADCAST, Cost:10
 MD5 Authentication (Area) SPI 1000, secure socket state UP (errors:0)
  Transmit Delay is 1 sec, State BDR, Priority 1
  Designated Router (ID) 10.11.11.1, local address 2001:0DB1:A8BB:CCFF:FE00:6F00
 Backup Designated router (ID) 10.10.10.1, local address
FE80::A8BB:CCFF:FE00:6E00
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
   Hello due in 00:00:03
  Index 1/1/1, flood queue length 0
  Next 0x0(0)/0x0(0)/0x0(0)
 Last flood scan length is 1, maximum is 1
  Last flood scan time is 0 msec, maximum is 0 msec
 Neighbor Count is 1, Adjacent neighbor count is 1
   Adjacent with neighbor 10.11.11.1 (Designated Router)
  Suppress hello for 0 neighbor(s)
```

### **OSPF** with Dynamic Cost Example

The following display shows sample output from the **showipv6ospfinterface** command when the OSPF cost dynamic is configured.

```
Device# show ipv6 ospf interface serial 2/0
Serial2/0 is up, line protocol is up
Link Local Address 2001:0DB1:A8BB:CCFF:FE00:100, Interface ID 10
Area 1, Process ID 1, Instance ID 0, Router ID 172.1.1.1
Network Type POINT_TO_MULTIPOINT, Cost: 64 (dynamic), Cost Hysteresis: 200
Cost Weights: Throughput 100, Resources 20, Latency 80, L2-factor 100
Transmit Delay is 1 sec, State POINT_TO_MULTIPOINT,
Timer intervals configured, Hello 30, Dead 120, Wait 120, Retransmit 5
Hello due in 00:00:19
Index 1/2/3, flood queue length 0
Next 0x0(0)/0x0(0)/0x0(0)
Last flood scan length is 0, maximum is 0
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 0, Adjacent neighbor count is 0
Suppress hello for 0 neighbor(s)
```

### **OSPF Graceful Restart Example**

The following display shows sample output from the **showipv6ospfinterface** command when the OSPF graceful restart feature is configured:

```
Device# show ipv6 ospf interface
Ethernet0/0 is up, line protocol is up
Link Local Address FE80::A8BB:CCFF:FE00:300, Interface ID 2
Area 0, Process ID 1, Instance ID 0, Router ID 10.3.3.3
Network Type POINT_TO_POINT, Cost: 10
Transmit Delay is 1 sec, State POINT_TO_POINT,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Graceful Restart p2p timeout in 00:00:19
Hello due in 00:00:02
Graceful Restart helper support enabled
Index 1/1/1, flood queue length 0
Next 0x0(0)/0x0(0)/0x0(0)
Last flood scan length is 1, maximum is 1
```

L

```
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
Adjacent with neighbor 10.1.1.1
Suppress hello for 0 neighbor(s)
```

### **Example of an Enabled Protocol**

The following display shows that the OSPF interface is enabled for Bidirectional Forwarding Detection (BFD):

```
Device# show ipv6 ospf interface
Serial10/0 is up, line protocol is up
Link Local Address FE80::A8BB:CCFF:FE00:6500, Interface ID 42
Area 1, Process ID 1, Instance ID 0, Router ID 10.0.0.1
Network Type POINT_TO_POINT, Cost: 64
Transmit Delay is 1 sec, State POINT_TO_POINT, BFD enabled
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:07
Index 1/1/1, flood queue length 0
Next 0x0(0)/0x0(0)/0x0(0)
Last flood scan length is 1, maximum is 1
Last flood scan time is 0 msec, maximum is 0 msec
Neighbor Count is 1, Adjacent neighbor count is 1
Adjacent with neighbor 10.1.0.1
Suppress hello for 0 neighbor(s)
```

| Seq NO                           | Sequence number of the LSA.                         |
| Age                              | Age of LSA (in seconds).                            |
| Checksum                         | Checksum of LSA.                                    |

# show ipv6 ospf statistics

To display Open Shortest Path First for IPv6 (OSPFv6) shortest path first (SPF) calculation statistics, use the **show ipv6 ospf statistics** command in user EXEC or privileged EXEC mode.

show ipv6 ospf statistics [detail]

| Syntax Description | detail (Optional) Displays statistics.  | s statistics separately for each OSPF area and includes additional, more detailed  |
|--------------------|---|--|
| Command Modes      | User EXEC (>)   |  |
|                    | Privileged EXEC (#)   |  |
| Command History    | Release   | Modification   |
|                    | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced.   |
| Usage Guidelines   | that trigger them. This inform  | <b>s</b> command provides important information about SPF calculations and the events<br>action can be meaningful for both OSPF network maintenance and troubleshooting.<br><b>Now ipv6 ospf statistics</b> command is recommended as the first troubleshooting<br>nent (LSA) flapping.                                      |
| Examples           | The following example prov  | ides detailed statistics for each OSPFv6 area:   |
|                    | Change record R N SN S<br>LSAs changed 1<br>Changed LSAs. Recorded<br>10.2.2.2/0(R)<br>SPF 2 executed 00:06:47<br>SPF calculation time (<br>SPT Prefix D-Int S<br>0 0 0 0<br>RIB manipulation time<br>RIB Update RIB Dele<br>0 0<br>LSIDs processed R:1 N:<br>Change record R L P<br>LSAs changed 4<br>Changed LSAs. Recorded | <pre>executed 3 times<br/>ago, SPF type Full<br/>(in msec):<br/>Sum D-Sum Ext D-Ext Total<br/>) 0 0 0 0<br/>(in msec):<br/>ste<br/>30 Prefix:0 SN:0 SA:0 X7:0<br/>SA L<br/>d is Advertising Router, LSID and LS type:<br/>ago, SPF type Full<br/>(in msec):<br/>Sum D-Sum Ext D-Ext Total<br/>) 0 0 0 0<br/>(in msec):</pre> |

Table 46: show ipv6 ospf statistics Field Descriptions

| Field           | Description  |
|-----------------|--|
| Area            | OSPF area ID.  |
| SPF             | Number of SPF algorithms executed in the OSPF area. The number increases by one for each SPF algorithm that is executed in the area.   |
| Executed ago    | Time in milliseconds that has passed between the start of the SPF algorithm execution and the current time.  |
| SPF type        | SPF type can be Full or Incremental.   |
| SPT             | Time in milliseconds required to compute the first stage of the SPF algorithm (to build a short path tree). The SPT time plus the time required to process links to stub networks equals the Intra time. |
| Ext             | Time in milliseconds for the SPF algorithm to process external and not so stubby area (NSSA) LSAs and to install external and NSSA routes in the routing table.  |
| Total           | Total duration time in milliseconds for the SPF algorithm process.   |
| LSIDs processed | Number of LSAs processed during the SPF calculation:   |
|                 | • NNetwork LSA.  |
|                 | • RRouter LSA.   |
|                 | • SASummary Autonomous System Boundary Router (ASBR) (SA) LSA.   |
|                 | • SNSummary Network (SN) LSA.  |
|                 | StubStub links.  |
|                 | • X7External Type-7 (X7) LSA.  |

## show ipv6 ospf summary-prefix

To display a list of all summary address redistribution information configured under an OSPF process, use the **show ipv6 ospf summary-prefix** command in user EXEC or privileged EXEC mode.

show ipv6 ospf [process-id] summary-prefix

| <b>Syntax Description</b> process-id (Optional) Internal identification. It is locally assigned and can be any positive integer. The number used here is the number assigned administratively when the OSPF routing process is enabled. |
|---|
|---|

Command Modes User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** The *process-id* argument can be entered as a decimal number or as an IPv6 address format.

**Examples** 

The following is sample output from the **show ipv6 ospf summary-prefix** command:

Device# show ipv6 ospf summary-prefix

```
OSPFv3 Process 1, Summary-prefix
FEC0::/24 Metric 16777215, Type 0, Tag 0
```

Table 47: show ipv6 ospf summary-prefix Field Descriptions

| Field          | Description  |
|----------------|--|
| OSPFv3 Process | Process ID of the router for which information is displayed. |
| Metric         | Metric used to reach the destination router.                 |
| Туре           | Type of link-state advertisement (LSA).                      |
| Tag            | LSA tag.   |

L

# show ipv6 ospf timers rate-limit

To display all of the link-state advertisements (LSAs) in the rate limit queue, use the **show ipv6 ospf timers rate-limit** command in privileged EXEC mode.

show ipv6 ospf timers rate-limit

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

Usage Guidelines Use the show ipv6 ospf timers rate-limit command to discover when LSAs in the queue will be sent.

### **Examples**

### show ipv6 ospf timers rate-limit Output Example

The following is sample output from the show ipv6 ospf timers rate-limitcommand:

```
Device# show ipv6 ospf timers rate-limit
List of LSAs that are in rate limit Queue
LSAID: 0.0.0.0 Type: 0x2001 Adv Rtr: 55.55.55 Due in: 00:00:00.500
LSAID: 0.0.0.0 Type: 0x2009 Adv Rtr: 55.55.55 Due in: 00:00:00.500
```

Table 48: show ipv6 ospf timers rate-limit Field Descriptions

| Field   | Description  |
|---------|--|
| LSAID   | ID of the LSA.   |
| Туре    | Type of LSA.   |
| Adv Rtr | ID of the advertising router.                                    |
| Due in: | When the LSA is scheduled to be sent (in hours:minutes:seconds). |

# show ipv6 ospf traffic

To display IPv6 Open Shortest Path First Version 3 (OSPFv3) traffic statistics, use the **show ipv6 ospf traffic** command in privileged EXEC mode.

show ipv6 ospf [process-id] traffic [interface-type interface-number]

| Syntax Description | process-id   |   | (Optional) OSPF process ID for which you want traffic statistics (for example, queue statistics, statistics for each interface under the OSPF process, and per OSPF process statistics). |  |  |  |
|--------------------|--|---|--|--|--|--|
|                    | interface-type interface-number  |   | (Optional) Type and number associated with a specific OSPF interface.  |  |  |  |
| Command Default    | When the <b>show ipv6 ospf traffic</b> command is entered without any arguments, global OSPF traffic statistics are displayed, including queue statistics for each OSPF process, statistics for each interface, and per OSPF process statistics.   |   |  |  |  |  |
| Command Modes      | Privileged EXEC (#)  |   |  |  |  |  |
| Command History    | Release  | N | lodification   |  |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | Т | his command was introduced.  |  |  |  |
| Usage Guidelines   | You can limit the displayed traffic statistics to those for a specific OSPF process by entering a value for the <i>process-id</i> argument, or you can limit output to traffic statistics for a specific interface associated with an OSPF process by entering values for the <i>interface-type</i> and <i>interface-number</i> arguments. To reset counters and clear statistics, use the <b>clear ipv6 ospf traffic</b> command.   |   |  |  |  |  |
| Examples           | The following example shows the display output for the <b>show ipv6 ospf traffic</b> command for OSPFv3:   |   |  |  |  |  |
|                    | Device# show ipv6 ospf traffic<br>OSPFv3 statistics:<br>Rcvd: 32 total, 0 checksum errors<br>10 hello, 7 database desc, 2 link state req<br>9 link state updates, 4 link state acks<br>0 LSA ignored<br>Sent: 45 total, 0 failed<br>17 hello, 12 database desc, 2 link state req<br>8 link state updates, 6 link state acks<br>0SPFv3 Router with ID (10.1.1.4) (Process ID 6)<br>OSPFv3 queues statistic for process ID 6<br>Hello queue size 0, no limit, max size 2<br>Router queue size 0, limit 200, drops 0, max size 2<br>Interface statistics:<br>Interface Serial2/0<br>OSPFv3 packets received/sent<br>Type Packets Bytes<br>RX Invalid 0 0<br>RX Hello 5 196<br>RX DB des 4 172 |   |  |  |  |  |

The network administrator wants to start collecting new statistics, resetting the counters and clearing the traffic statistics by entering the **clear ipv6 ospf traffic** command as follows:

Device# clear ipv6 ospf traffic

The table below describes the significant fields shown in the display.

#### Table 49: show ipv6 ospf traffic Field Descriptions

| Field                                  | Description  |
|--|--|
| OSPFv3 statistics                      | Traffic statistics accumulated for all OSPF processes running on the router.<br>To ensure compatibility with the <b>showiptraffic</b> command, only checksum<br>errors are displayed. Identifies the route map name. |
| OSPFv3 queues statistic for process ID | Queue statistics specific to Cisco IOS software.   |
| Hello queue                            | Statistics for the internal Cisco IOS queue between the packet switching code (process IP Input) and the OSPF hello process for all received OSPF packets.   |
| Router queue                           | Statistics for the internal Cisco IOS queue between the OSPF hello process<br>and the OSPF router for all received OSPF packets except OSPF hellos.  |
| queue size                             | Actual size of the queue.  |
| queue limit                            | Maximum allowed size of the queue.   |
| queue max size                         | Maximum recorded size of the queue.  |
| Interface statistics                   | Per-interface traffic statistics for all interfaces that belong to the specific OSPFv3 process ID.   |
| OSPFv3 packets received/sent           | Number of OSPFv3 packets received and sent on the interface, sorted by packet types.   |
| OSPFv3 header errors                   | Packet appears in this section if it was discarded because of an error in the header of an OSPFv3 packet. The discarded packet is counted under the appropriate discard reason.                                      |
| OSPFv3 LSA errors                      | Packet appears in this section if it was discarded because of an error in the header of an OSPF link-state advertisement (LSA). The discarded packet is counted under the appropriate discard reason.                |
| Summary traffic statistics for         | Summary traffic statistics accumulated for an OSPFv3 process.  |
| process ID                             | <b>Note</b> The OSPF process ID is a unique value assigned to the OSPFv3 process in the configuration.   |
|  | The value for the received errors is the sum of the OSPFv3 header errors that are detected by the OSPFv3 process, unlike the sum of the checksum errors that are listed in the global OSPF statistics.               |

#### **Related Commands**

| Command                 | Description                         |
|-------------------------|-------------------------------------|
| clear ip ospf traffic   | Clears OSPFv2 traffic statistics.   |
| clear ipv6 ospf traffic | Clears OSPFv3 traffic statistics.   |
| show ip ospf traffic    | Displays OSPFv2 traffic statistics. |

### show ipv6 ospf virtual-links

To display parameters and the current state of Open Shortest Path First (OSPF) virtual links, use the **s how ipv6 ospf virtual-links** command in user EXEC or privileged EXEC mode.

show ipv6 ospf virtual-links

Syntax Description This command has no arguments or keywords.

Command Modes User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Usage Guidelines** The information displayed by the **show ipv6 ospf virtual-links** command is useful in debugging OSPF routing operations.

**Examples** The following is sample output from the **show ipv6 ospf virtual-links** command:

### Device# show ipv6 ospf virtual-links

```
Virtual Link OSPF_VL0 to router 172.16.6.6 is up
Interface ID 27, IPv6 address FEC0:6666:6666::
Run as demand circuit
DoNotAge LSA allowed.
Transit area 2, via interface ATM3/0, Cost of using 1
Transmit Delay is 1 sec, State POINT_TO_POINT,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:06
```

The table below describes the significant fields shown in the display.

| Table 50: show ipv6 ospf virtual-links Field Descr | iptions |
|--|---------|
|--|---------|

| Field   | Description  |
|---|--|
| Virtual Link OSPF_VL0 to router<br>172.16.6.6 is up | Specifies the OSPF neighbor, and if the link to that neighbor is up or down. |
| Interface ID  | Interface ID and IPv6 address of the router.                                 |
| Transit area 2                                      | The transit area through which the virtual link is formed.                   |
| via interface ATM3/0                                | The interface through which the virtual link is formed.                      |
| Cost of using 1                                     | The cost of reaching the OSPF neighbor through the virtual link.             |
| Transmit Delay is 1 sec                             | The transmit delay (in seconds) on the virtual link.                         |
| State POINT_TO_POINT                                | The state of the OSPF neighbor.  |

| Field                | Description  |
|----------------------|--|
| Timer intervals      | The various timer intervals configured for the link. |
| Hello due in 0:00:06 | When the next hello is expected from the neighbor.   |

The following sample output from the **show ipv6 ospf virtual-links** command has two virtual links. One is protected by authentication, and the other is protected by encryption.

```
Device# show ipv6 ospf virtual-links
Virtual Link OSPFv3_VL1 to router 10.2.0.1 is up
   Interface ID 69, IPv6 address 2001:0DB8:11:0:A8BB:CCFF:FE00:6A00
   Run as demand circuit
   DoNotAge LSA allowed.
   Transit area 1, via interface Serial12/0, Cost of using 64
   NULL encryption SHA-1 auth SPI 3944, secure socket UP (errors: 0)
   Transmit Delay is 1 sec, State POINT TO POINT,
   Timer intervals configured, Hello 2, Dead 10, Wait 40, Retransmit 5
     Adjacency State FULL (Hello suppressed)
     Index 1/2/4, retransmission queue length 0, number of retransmission 1
     First 0x0(0)/0x0(0)/0x0(0) Next 0x0(0)/0x0(0)/0x0(0)
     Last retransmission scan length is 1, maximum is 1
     Last retransmission scan time is 0 msec, maximum is 0 msec
Virtual Link OSPFv3 VL0 to router 10.1.0.1 is up
   Interface ID 67, IPv6 address 2001:0DB8:13:0:A8BB:CCFF:FE00:6700
   Run as demand circuit
   DoNotAge LSA allowed.
   Transit area 1, via interface Serial11/0, Cost of using 128
   MD5 authentication SPI 940, secure socket UP (errors: 0)
   Transmit Delay is 1 sec, State POINT TO POINT,
   Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
     Adjacency State FULL (Hello suppressed)
     Index 1/1/3, retransmission queue length 0, number of retransmission 1
First 0x0(0)/0x0(0)/0x0(0) Next 0x0(0)/0x0(0)/0x0(0)
     Last retransmission scan length is 1, maximum is 1
     Last retransmission scan time is 0 msec, maximum is 0 msec
```

### show ipv6 pim anycast-RP

To verify IPv6 PIM anycast RP operation, use the **show ipv6 pim anycast-RP** command in user EXEC or privileged EXEC mode.

show ipv6 pim anycast-RP rp-address

| Syntax Description | rp-address | RP address to be verified. |  |
|--------------------|------------|----------------------------|--|
|--------------------|------------|----------------------------|--|

**Command Modes** User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

#### **Usage Guidelines**

Examples

Device# show ipv6 pim anycast-rp 110::1:1:1

Anycast RP Peers For 110::1:1:1 Last Register/Register-Stop received 20::1:1:1 00:00:00/00:000

| Related Commands | Command             | Description  |
|------------------|---------------------|--|
|                  | ipv6 pim anycast-RP | Configures the address of the PIM RP for an anycast group range. |

## show ipv6 pim bsr

To display information related to Protocol Independent Multicast (PIM) bootstrap router (BSR) protocol processing, use the **show ipv6 pim bsr** command in user EXEC or privileged EXEC mode.

show ipv6 pim [vrf vrf-name] bsr {election | rp-cache | candidate-rp}

|   | vrf vrf-name  | <i>name</i> (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |  |                  |  |
|---|---|--|--|------------------|--|
|   | election  | Displays BSR state, BSR election, and bootstrap message (BSM)-related timers.  |  |                  |  |
|   | rp-cache  | Displays candidate rendezvous point (C-RP) cache learned from unicast C-RP announcements on the elected BSR.   |  |                  |  |
|   | candidate-rp  | Displays C-R   | RP state on devices that are config  | gured as C-RPs.  |  |
| Command Modes   | User EXEC (>)   |  |  |                  |  |
|   | Privileged EXE  | C (#)  |  |                  |  |
| Command History   | Release   |  | Modification   |                  |  |
|   | Cisco IOS XE<br>16.5.1a   | Everest  | This command was introduced.   |                  |  |
| Usage Guidelines  | Use the <b>show ipv6 pim bsr</b> command to display details of the BSR election-state machine, C-RP advertisement state machine, and the C-RP cache. Information on the C-RP cache is displayed only on the elected BSR device, and information on the C-RP state machine is displayed only on a device configured as a C-RP. |  |  |                  |  |
| Examples  | The following e   | example displa   | ys BSM election information:   |                  |  |
| <ul> <li>Device# show ipv6 pim bsr election</li> <li>Device# show ipv6 pim bsr election</li> <li>PIMv2 BSR information</li> <li>BSR Election Information</li> <li>Scope Range List: ff00::/8</li> <li>This system is the Bootstrap Router (BSR)</li> <li>BSR Address: 60::1:1:4</li> <li>Uptime: 00:11:55, BSR Priority: 0, Hash mask length: 126</li> <li>RPF: FE80::A8BB:CCFF:FE03:C400,Ethernet0/0</li> <li>BS Timer: 00:00:07</li> <li>This system is candidate BSR</li> <li>Candidate BSR address: 60::1:1:4, priority: 0, hash mask length: 126</li> <li>The table below describes the significant fields shown in the display.</li> <li>Table 51: show ipv6 pim bsr election Field Descriptions</li> </ul> |   |  |  |                  |  |
|   | PIMv2 BSR inf<br>BSR Election<br>Scope Range L<br>This system i<br>BSR Address:<br>Uptime: 00:11<br>RPF: FE80::A8<br>BS Timer: 00:<br>This system i<br>Candidate BSR<br>The table below   | ormation<br>Information<br>ist: ff00::/<br>s the Bootst<br>60::1:1:4<br>:55, BSR Pri<br>BB:CCFF:FE03<br>00:07<br>s candidate<br>address: 60<br>y describes the | 8<br>rap Router (BSR)<br>ority: 0, Hash mask length:<br>:C400,Ethernet0/0<br>BSR<br>::1:1:4, priority: 0, hash n<br>significant fields shown in the di | mask length: 126 |  |

| Field            | Description                                  |
|------------------|--|
| Scope Range List | Scope to which this BSR information applies. |

| Field  | Description  |
|--|--|
| This system is the Bootstrap Router<br>(BSR) | Indicates this device is the BSR and provides information on the parameters associated with it.              |
| BS Timer                                     | On the elected BSR, the BS timer shows the time in which the next BSM will be originated.                    |
|  | On all other devices in the domain, the BS timer shows the time at which the elected BSR expires.            |
| This system is candidate BSR                 | Indicates this device is the candidate BSR and provides information on<br>the parameters associated with it. |

The following example displays information that has been learned from various C-RPs at the BSR. In this example, two candidate RPs have sent advertisements for the FF00::/8 or the default IPv6 multicast range:

```
Device# show ipv6 pim bsr rp-cache
PIMv2 BSR C-RP Cache
BSR Candidate RP Cache
Group(s) FF00::/8, RP count 2
   RP 10::1:1:3
    Priority 192, Holdtime 150
    Uptime: 00:12:36, expires: 00:01:55
   RP 20::1:1:1
    Priority 192, Holdtime 150
    Uptime: 00:12:36, expires: 00:01:5
```

The following example displays information about the C-RP. This RP has been configured without a specific scope value, so the RP will send C-RP advertisements to all BSRs about which it has learned through BSMs it has received.

```
Device# show ipv6 pim bsr candidate-rp
PIMv2 C-RP information
Candidate RP: 10::1:1:3
All Learnt Scoped Zones, Priority 192, Holdtime 150
Advertisement interval 60 seconds
Next advertisement in 00:00:33
```

The following example confirms that the IPv6 C-BSR is PIM-enabled. If PIM is disabled on an IPv6 C-BSR interface, or if a C-BSR or C-RP is configured with the address of an interface that does not have PIM enabled, the **show ipv6 pim bsr** command used with the **election** keyword would display that information instead.

```
Device# show ipv6 pim bsr election
PIMv2 BSR information
BSR Election Information
Scope Range List: ff00::/8
BSR Address: 2001:DB8:1:1:2
Uptime: 00:02:42, BSR Priority: 34, Hash mask length: 28
RPF: FE80::20:1:2,Ethernet1/0
BS Timer: 00:01:27
```

# show ipv6 pim df

To display the designated forwarder (DF)-election state of each interface for each rendezvous point (RP), use the **show ipv6 pim df** command in user EXEC or privileged EXEC mode.

show ipv6 pim [vrf vrf-name] df [interface-type interface-number] [rp-address]

| Syntax Description           |  |  |   |  |  |  |
|------------------------------|--|--|---|--|--|--|
| •                            | vrf vrf-name   |  | (Optional) Specifies a virtual routing and forwarding (VRF) configuration                                   |  |  |  |
|                              | interface-type interface-number  |  | (Optional) Interface type and number. For more information, use the question mark (?) online help function. |  |  |  |
|                              | rp-address   |  | (Optional) RP I   | v6 address.  |  |  |
| Command Default              | If no interface or RP address is specified, all DFs are displayed.   |  |   |  |  |  |
| Command Modes                | User EXEC (>)  |  |   |  |  |  |
|                              | Privileged EXEC (#)  |  |   |  |  |  |
| Command History              | Release  | Mo   | odification   |  |  |  |
|                              | Cisco IOS XE Everes<br>16.5.1a   | st Th  | is command was  | ntroduced.   |  |  |
|                              |  |  |   |  |  |  |
| Usage Guidelines             |  |  |   | state of the DF election for eac<br>bidirectional multicast traffic i  |  |  |
|                              |  | (PIM)-enab   | oled interface if the   | bidirectional multicast traffic i  |  |  |

The table below describes the significant fields shown in the display.

#### Table 52: show ipv6 pim df Field Descriptions

| Field     | Description   |
|-----------|---|
| Interface | Interface type and number that is configured to run PIM.  |
| DF State  | The state of the DF election on the interface. The state can be:  |
|           | • Offer   |
|           | • Winner  |
|           | • Backoff   |
|           | • Lose  |
|           | • None:RP LAN   |
|           | The None:RP LAN state indicates that no DF election is taking place on this LAN because the RP is directly connected to this LAN. |
| Timer     | DF election timer.  |
| Metrics   | Routing metrics to the RP announced by the DF.  |
| RP        | The IPv6 address of the RP.   |

#### **Related Commands**

| Command  | Description   |  |  |
|--|---|--|--|
| debug ipv6 pim df-election   | Displays debug messages for PIM bidirectional DF-election message processing. |  |  |
| <b>ipv6 pim rp-address</b> Configures the address of a PIM RP for a particular group rar |   |  |  |
| show ipv6 pim df winner  | Displays the DF-election winner on each interface for each RP.                |  |  |

## show ipv6 pim group-map

To display an IPv6 Protocol Independent Multicast (PIM) group mapping table, use the **show ipv6 pim group-map** command in user EXEC or privileged EXEC mode.

{show ipv6 pim [vrf vrf-name] group-map [{group-namegroup-address}]|[{group-rangegroup-mask}]] [info-source {bsr | default | embedded-rp | static}]}

| Syntax Description   | vrf vrf-name  | (Optional) Specifies a virtual routing and forwarding (VRF) configuration.   |  |  |  |
|--|---|--|--|--|--|
|  | group-name   group-address  | (Optional) IPv6 address or name of the multicast group.  |  |  |  |
|  | group-range   group-mask  | <i>group-range</i>   <i>group-mask</i> (Optional) Group range list. Includes group ranges with the same prefix or mask length. |  |  |  |
|  | info-source   | (Optional) Displays all mappings learned from a specific source, such as the bootstrap router (BSR) or static configuration.   |  |  |  |
|  | bsr   | Displays ranges learned through the BSR.   |  |  |  |
|  | default   | Displays ranges enabled by default.  |  |  |  |
|  | embedded-rp   | Displays group ranges learned through the embedded rendezvous point (RP).  |  |  |  |
|  | static  | Displays ranges enabled by static configuration.   |  |  |  |
| Command Modes  | mmand Modes User EXEC (>)<br>Privileged EXEC (#)  |  |  |  |  |
| Command History  | Release   | Modification   |  |  |  |
|  | Cisco IOS XE Everest<br>16.5.1a   | This command was introduced.   |  |  |  |
| Usage Guidelines Use the show ipv6 pim group-map command to find all group mappings installed by a information, such as BSR or static configuration. |   |  |  |  |  |
|  | You can also use this command to find which group mapping a router at a specified IPv6 group ad using by specifying a group address, or to find an exact group mapping entry by specifying a group mask length. |  |  |  |  |
| Examples   | <b>xamples</b> The following is sample output from the <b>show ipv6 pim group-map</b> command:  |  |  |  |  |
|  | Device <b># show ipv6 pim grou</b><br>FF33::/32*<br>SSM<br>Info source:Static   | up-map   |  |  |  |

Info source:Static
Uptime:00:09:42, Groups:0

The table below describes the significant fields shown in the display.

Table 53: show ipv6 pim group-map Field Descriptions

| Field       | Description   |
|-------------|---|
| RP          | Address of the RP router if the protocol is sparse mode or bidir.   |
| Protocol    | Protocol used: sparse mode (SM), Source Specific Multicast (SSM), link-local (LL), or NOROUTE (NO).   |
|             | LL is used for the link-local scoped IPv6 address range (ff[0-f]2::/16). LL is treated as a separate protocol type, because packets received with these destination addresses are not forwarded, but the router might need to receive and process them. |
|             | NOROUTE or NO is used for the reserved and node-local scoped IPv6 address range (ff[0-f][0-1]::/16). These addresses are nonroutable, and the router does not need to process them.   |
| Groups      | How many groups are present in the topology table from this range.  |
| Info source | Mappings learned from a specific source; in this case, static configuration.  |
| Uptime      | The uptime for the group mapping displayed.   |

The following example displays the group mappings learned from BSRs that exist in the PIM group-to-RP or mode-mapping cache. The example shows the address of the BSR from which the group mappings have been learned and the associated timeout.

```
Router# show ipv6 pim group-map info-source bsr
FF00::/8*
    SM, RP: 20::1:1:1
    RPF: Et1/0,FE80::A8BB:CCFF:FE03:C202

|                    | The table bal                    | wy describes the                                    | a cignificant fi       | elds shown in the d                       | ionlay                   |                    |

The table below describes the significant fields shown in the display.

#### Table 54: show ipv6 pim interface Field Descriptions

| Field       | Description   |
|-------------|---|
| Interface   | Interface type and number that is configured to run PIM.                  |
| PIM         | Whether PIM is enabled on an interface.                                   |
| Nbr Count   | Number of PIM neighbors that have been discovered through this interface. |
| Hello Intvl | Frequency, in seconds, of PIM hello messages.                             |
| DR          | IP address of the designated router (DR) on a network.                    |
| Address     | Interface IP address of the next-hop router.                              |

The following is sample output from the **show ipv6 pim interface** command, modified to display passive interface information:

Device(config) # show ipv6 pim interface gigabitethernet0/0/0

```
Interface PIM Nbr Hello DR BFD
Count Intvl Prior
GigabitEthernet0/0/0 on/P 0 30 1 On
Address: FE80::A8BB:CCFF:FE00:9100
DR : this system
```

The table below describes the significant change shown in the display.

#### Table 55: show ipv6 pim interface Field Description

| Field | Description  |
|-------|--|
| PIM   | Whether PIM is enabled on an interface. When PIM passive mode is used, a "P" is displayed in the output. |

### **Related Commands**

| S | Command                | Description  |
|---|------------------------|--|
|   | show ipv6 pim neighbor | Displays the PIM neighbors discovered by the Cisco IOS software. |

## show ipv6 pim join-prune statistic

To display the average join-prune aggregation for the most recently aggregated 1000, 10,000, and 50,000 packets for each interface, use the **show ipv6 pim join-prune statistic** command in user EXEC or privileged EXEC mode.

show ipv6 pim [vrf vrf-name] join-prune statistic [interface-type]

| Syntax Description | vrf vrf-nar  | ne (Optional)  | Specifies a virtual routing and  | forwarding (VRF) configuration.  |  |
|--------------------|--|--|--|--|--|
|                    | interface-typ  | <i>De</i> (Optional) Interface type. For more information, use the question mark (?) online help function. |  |  |  |
| Command Modes      | User EXEC (  | ,  |  |  |  |

|                    | Transmitted  | The number of  | packets transmitted on the inter   | rface.   |  |
|                    | Received   | ved The number of packets received on the interface.   |  |  |  |

### show ipv6 pim limit

To display Protocol Independent Multicast (PIM) interface limit, use the **show ipv6 pim limit** command in privileged EXEC mode.

show ipv6 pim [vrf vrf-name] limit [interface]

| Syntax Description | vrf vrf-name | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |
|--------------------|--------------|--|
|                    | interface    | (Optional) Specific interface for which limit information is provided.     |

Command Modes Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** The **show ipv6 pim limit** command checks interface statistics for limits. If the optional *interface* argument is enabled, only information for the specified interface is shown.

**Examples** The following example displays s PIM interface limit information:

Device# show ipv6 pim limit

| Related Commands | Command                   | Description   |
|------------------|---------------------------|---|
|                  | ipv6 multicast limit      | Configures per-interface mroute state limiters in IPv6.                           |
|                  | ipv6 multicast limit cost | Applies a cost to mroutes that match per interface mroute state limiters in IPv6. |

## show ipv6 pim neighbor

To display the Protocol Independent Multicast (PIM) neighbors discovered by the Cisco software, use the **show ipv6 pim neighbor** command in privileged EXEC mode.

show ipv6 pim [vrf vrf-name ]neighbor [detail ][{interface-type interface-number | count}]

| Syntax Description | vrf vrf-name  |               | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |                 |                     |                         |

## show ipv6 pim topology

To display Protocol Independent Multicast (PIM) topology table information for a specific group or all groups, use the **show ipv6 pim topology** command in user EXEC or privileged EXEC mode.

show ipv6 pim [vrf vrf-name] topology [{group-name|group-address [{source-addresssource-name}]
|link-local}]route-count [detail]

| Syntax Description | vrf vrf-name   | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |  |  |
|--------------------|--|--|--|--|
|                    | group-name   group-address   | (Optional) IPv6 address or name of the multicast group.                    |  |  |
|                    | source-address   source-nam  | <i>e</i> (Optional) IPv6 address or name of the source.                    |  |  |
|                    | link-local   | (Optional) Displays the link-local groups.                                 |  |  |
|                    | route-count  | (Optional) Displays the number of routes in PIM topology table.            |  |  |
| Command Modes      | User EXEC (>)  |  |  |  |
|                    | Privileged EXEC (#)  |  |  |  |
| Command History    | Release  | Modification   |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.   |  |  |
| Usage Guidelines   | This command shows the PIM topology table for a given group(*, G), (S, G), and (S, G) Rendezvous Poin Tree (RPT) as internally stored in a PIM topology table. The PIM topology table may have various entries for a given group, each with its own interface list. The resulting forwarding state is maintained in the Multicas Routing Information Base (MRIB) table, which shows which interface the data packet should be accepted or and which interfaces the data packet should be forwarded to for a given (S, G) entry. Additionally, the Multicas Forwarding Information Base (MFIB) table is used during forwarding to decide on per-packet forwarding actions.  |  |  |  |
|                    | The <b>route-count</b> keyword sho   | ows the count of all entries, including link-local entries.                |  |  |
|                    | <ul> <li>PIM communicates the contents of these entries through the MRIB, which is an intermediary for communicate between multicast routing protocols (such as PIM), local membership protocols (such as Multicast Lister Discovery [MLD]), and the multicast forwarding engine of the system.</li> <li>For example, an interface is added to the (*, G) entry in PIM topology table upon receipt of an MLD report PIM (*, G) join message. Similarly, an interface is added to the (S, G) entry upon receipt of the MLD INCLUDE report for the S and G or PIM (S, G) join message. Then PIM installs an (S, G) entry in the MIW with the immediate olist (from (S, G)) and the inherited olist (from (*, G)). Therefore, the proper forward state for a given entry (S, G) can be seen only in the MRIB or the MFIB, not in the PIM topology table.</li> </ul> |  |  |  |
|                    |  |  |  |  |
| Examples           | The following is sample output   | at from the <b>show ipv6 pim topology</b> command:                         |  |  |
|                    | Device# show ipv6 pim topology   |  |  |  |

The table below describes the significant fields shown in the display.

Table 59: show ipv6 pim topology Field Descriptions

| Field            | Description  |
|------------------|--|
| Entry flags: KAT | The keepalive timer (KAT) associated with a source is used to keep track of two intervals while the source is alive. When a source first becomes active, the first-hop router sets the keepalive timer to 3 minutes and 30 seconds, during which time it does not probe to see if the source is alive. Once this timer expires, the router enters the probe interval and resets the timer to 65 seconds, during which time the router assumes the source is alive and starts probing to determine if it actually is. If the router determines that the source is alive, the router exits the probe interval and resets the keepalive timer to 3 minutes and 30 seconds. If the source is not alive, the entry is deleted at the end of the probe interval. |
| AA, PA           | The assume alive (AA) and probe alive (PA) flags are set when the router is in the probe interval for a particular source.   |
| RR               | The register received (RR) flag is set on the (S, G) entries on the Route Processor (RP) as long as the RP receives registers from the source Designated Router (DR), which keeps the source state alive on the RP.  |
| SR               | The sending registers (SR) flag is set on the (S, G) entries on the DR as long as it sends registers to the RP.  |

| Related Commands | Command               | Description   |  |  |
|------------------|-----------------------|---|--|--|
|                  | show ipv6 mrib client | Displays information about the clients of the MRIB. |  |  |

The table below describes the significant fields shown in the display.

Table 60: show ipv6 pim traffic Field Descriptions

| Field                               | Description   |  |
|-------------------------------------|---|--|
| Elapsed time since counters cleared | Indicates the amount of time (in hours, minutes, and seconds) since the counters cleared. |  |
| Valid PIM Packets                   | Number of valid PIM packets received and sent.  |  |

| Field         | Description   |
|---------------|---|
| Hello         | Number of valid hello messages received and sent.         |
| Join-Prune    | Number of join and prune announcements received and sent. |
| Register      | Number of PIM register messages received and sent.        |
| Register Stop | Number of PIM register stop messages received and sent.   |
| Assert        | Number of asserts received and sent.                      |

## show ipv6 pim tunnel

To display information about the Protocol Independent Multicast (PIM) register encapsulation and de-encapsulation tunnels on an interface, use the **show ipv6 pim tunnel** command in privileged EXEC mode.

show ipv6 pim [vrf vrf-name] tunnel [interface-type interface-number]

| Syntax Description | vrf vrf-name  |                       | (Optional) Specifies a virtual routing and forwarding (VRF) configuration. |                             |   |
|--------------------|---|-----------------------|--|-----------------------------|---|
|                    | interfac  | e-type interface-numl | per  | (Optional) Tunnel interface | type and number.  |
| Command Modes      | Privilege   | d EXEC (#)            |  |                             |   |
| Command History    | Release   |                       | Mo   | odification                 |   |
|                    | Cisco IO<br>16.5.1a   | OS XE Everest         | Th   | is command was introduced.  |   |
| Usage Guidelines   | If you use the <b>show ipv6 pim tunnel</b> command without the optional <i>interface</i> keyword, information about the PIM register encapsulation and de-encapsulation tunnel interfaces is displayed. |                       |  |                             |   |
|                    | rendezvo  | us point (RP) on eacl | 1 roi  | ater. The PIM decapsulation | ulation tunnel is created for every known<br>tunnel is the register decapsulation tunnel. A<br>s configured to be the RP address. |
| Examples           | The following is sample output from the <b>show ipv6 pim tunnel</b> command on the RP:  |                       |  |                             |   |
|                    | Device# show ipv6 pim tunnel<br>Tunnel0*<br>Type :PIM Encap<br>RP :100::1<br>Source:100::1<br>Tunnel0*<br>Type :PIM Decap<br>RP :100::1<br>Source: -  |                       |  |                             |   |
|                    | The following is sample output from the <b>show ipv6 pim tunnel</b> command on a non-RP:  |                       |  |                             |   |
|                    | Device# <b>show ipv6 pim tunnel</b><br>Tunnel0*<br>Type :PIM Encap<br>RP :100::1<br>Source:2001::1:1:1  |                       |  |                             |   |
|                    | The table below describes the significant fields shown in the display.  |                       |  |                             |   |

| Tunnel0* | Name of the tunnel. |

I

| Field  | Description   |  |
|--------|---|--|
| Туре   | Type of tunnel. Can be PIM encapsulation or PIM de-encapsulation.               |  |
| source | Source address of the router that is sending encapsulating registers to the RP. |  |

I

### show ipv6 policy

To display the IPv6 policy-based routing (PBR) configuration, use the **show ipv6 policy** command in user EXEC or privileged EXEC mode.

### show ipv6 policy

 Syntax Description
 This command has no arguments or keywords.

 Command Modes
 User EXEC (>)

 Privileged EXEC (#)
 Modification

 Command History
 Release
 Modification

 Cisco IOS XE Everest
 This command was introduced.

 16.5.1a
 This command was introduced.

**Usage Guidelines** IPv6 policy matches will be counted on route maps, as is done in IPv4. Therefore, IPv6 policy matches can also be displayed on the **show route-map** command.

**Examples** The following example displays the PBR configuration:

Device# show ipv6 policy

Interface Routemap Ethernet0/0 src-1

The table below describes the significant fields shown in the display.

| Field     | Description   |
|-----------|---|
| Interface | Interface type and number that is configured to run Protocol-Independent Multicast (PIM). |
| Routemap  | The name of the route map on which IPv6 policy matches were counted.                      |

#### Related Commands

| Command        | Description   |
|----------------|---|
| show route-map | Displays all route maps configured or only the one specified. |

### show ipv6 prefix-list

To display information about an IPv6 prefix list or IPv6 prefix list entries, use the **show ipv6 prefix-list** command in user EXEC or privileged EXEC mode.

show ipv6 prefix-list [{detail | summary}] [list-name]
show ipv6 prefix-list list-name ipv6-prefix/prefix-length [{longer | first-match}]
show ipv6 prefix-list list-name seq seq-num

| Syntax Description | detail   summary   | ptional) Displays detailed or   | summarized information about all IPv6 prefix lists. |  |  |  |
|--------------------|--|---|---|--|--|--|
|                    | list-name  | (Optional) The name of a specific IPv6 prefix list.   |   |  |  |  |
|                    | ipv6-prefix  | l prefix list entries for the spe   | cified IPv6 network.                                |  |  |  |
|                    |  | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.  |   |  |  |  |
|                    | / prefix-length  | The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address) A slash mark must precede the decimal value. |   |  |  |  |
|                    | longer   | (Optional) Displays all entries of an IPv6 prefix list that are more specific than the given <i>ipv6-prefix   prefix-length</i> values.   |   |  |  |  |
|                    | first-match  | (Optional) Displays the entry of an IPv6 prefix list that matches the given <i>ipv6-prefix l prefix-length</i> values.  |   |  |  |  |
|                    | seq seq-num  | eq seq-num The sequence number of the IPv6 prefix list entry.   |   |  |  |  |
| Command Default    | Displays information about all IPv6 prefix lists.  |   |   |  |  |  |
| Command Modes      | User EXEC (>)  |   |   |  |  |  |
|                    | Privileged EXEC (#   |   |   |  |  |  |
| Command History    | Release  | Modification  |   |  |  |  |
|                    | Cisco IOS XE Eve<br>16.5.1a  | This command was in   | ntroduced.  |  |  |  |
| Usage Guidelines   | The <b>show ipv6 prefix-list</b> command provides output similar to the <b>show ip prefix-list</b> command, except that it is IPv6-specific. |   |   |  |  |  |
| Examples           | The following example shows the output of the <b>show ipv6 prefix-list</b> command with the <b>detail</b> keyword:                           |   |   |  |  |  |
|                    | Device# <b>show ipv6 prefix-list detail</b><br>Prefix-list with the last deletion/insertion: bgp-in<br>ipv6 prefix-list 6to4:                |   |   |  |  |  |

```
count: 1, range entries: 0, sequences: 5 - 5, refcount: 2
seq 5 permit 2002::/16 (hit count: 313, refcount: 1)
ipv6 prefix-list aggregate:
    count: 2, range entries: 2, sequences: 5 - 10, refcount: 30
seq 5 deny 3FFE:C00::/24 ge 25 (hit count: 568, refcount: 1)
seq 10 permit ::/0 le 48 (hit count: 31310, refcount: 1)
ipv6 prefix-list bgp-in:
    count: 6, range entries: 3, sequences: 5 - 30, refcount: 31
seq 5 deny 5F00::/8 le 128 (hit count: 0, refcount: 1)
seq 10 deny ::/0 (hit count: 0, refcount: 1)
seq 20 deny ::/2 (hit count: 0, refcount: 1)
seq 30 permit ::/0 le 128 (hit count: 240664, refcount: 0)
```

The table below describes the significant fields shown in the display.

Table 62: show ipv6 prefix-list Field Descriptions

| Field   | Description   |
|---|---|
| Prefix list with the latest deletion/insertion: | Prefix list that was last modified.                 |
| count   | Number of entries in the list.                      |
| range entries                                   | Number of entries with matching range.              |
| sequences                                       | Sequence number for the prefix entry.               |
| refcount  | Number of objects currently using this prefix list. |
| seq   | Entry number in the list.                           |
| permit, deny                                    | Granting status.                                    |
| hit count                                       | Number of matches for the prefix entry.             |

The following example shows the output of the **show ipv6 prefix-list** command with the **summary** keyword:

```
Device# show ipv6 prefix-list summary
Prefix-list with the last deletion/insertion: bgp-in
ipv6 prefix-list 6to4:
    count: 1, range entries: 0, sequences: 5 - 5, refcount: 2
ipv6 prefix-list aggregate:
    count: 2, range entries: 2, sequences: 5 - 10, refcount: 30
ipv6 prefix-list bgp-in:
    count: 6, range entries: 3, sequences: 5 - 30, refcount: 31
```

| Related Commands | Command                | Description   |
|------------------|------------------------|---|
|                  | clear ipv6 prefix-list | Resets the hit count of the prefix list entries.      |
|                  | distribute-list in     | Filters networks received in updates.                 |
|                  | distribute-list out    | Suppresses networks from being advertised in updates. |
|                  | ipv6 prefix-list       | Creates an entry in an IPv6 prefix list.              |

| Command                      | Description  |
|------------------------------|--|
| ipv6 prefix-list description | Adds a text description of an IPv6 prefix list.                        |
| match ipv6 address           | Distributes IPv6 routes that have a prefix permitted by a prefix list. |
| neighbor prefix-list         | Distributes BGP neighbor information as specified in a prefix list.    |
| remark (prefix-list)         | Adds a comment for an entry in a prefix list.                          |

# show ipv6 protocols

To display the parameters and the current state of the active IPv6 routing protocol processes, use the **show ipv6 protocols** command in user EXEC or privileged EXEC mode.

show ipv6 protocols [summary]

| Syntax Description | <b>summary</b> (Optional) Displays the configured routing protocol process names.  |   |                                       |  |  |
|--------------------|--|---|---------------------------------------|--|--|
| Command Modes      | User EXEC (>) Privileged EXEC (#)  |   |                                       |  |  |
| Command History    | Release  |   | Modification                          |  |  |
|                    | Cisco IOS 2<br>16.5.1a   | XE Everest  | This command was introduc             | ced.   |  |
| Usage Guidelines   | The informa  | ation displayed b   | by the <b>show ipv6 protocols</b> cor | nmand is useful in debugging routing operations. |  |
| Examples           |  | ving sample output from the <b>show ipv6 protocols</b> command displays Intermediate<br>o-Intermediate System (IS-IS) routing protocol information: |                                       |  |  |
|                    | Device# show ipv6 protocols  |   |                                       |  |  |
|                    | <pre>IPv6 Routing Protocol is "connected"<br/>IPv6 Routing Protocol is "static"<br/>IPv6 Routing Protocol is "isis"<br/>Interfaces:<br/>Ethernet0/0/3<br/>Ethernet0/0/1<br/>Serial1/0/1<br/>Loopback1 (Passive)<br/>Loopback2 (Passive)<br/>Loopback3 (Passive)<br/>Loopback4 (Passive)<br/>Loopback5 (Passive)<br/>Redistribution:<br/>Redistributing protocol static at level 1<br/>Inter-area redistribution<br/>Redistributing L1 into L2 using prefix-list word<br/>Address Summarization:<br/>L2: 33::/16 advertised with metric 0<br/>L2: 44::/16 advertised with metric 10<br/>L2: 77::/16 advertised with metric 10</pre> |   |                                       |  |  |

The table below describes the significant fields shown in the display.

| Field                     | Description  |
|---------------------------|--|
| IPv6 Routing Protocol is  | Specifies the IPv6 routing protocol used.  |
| Interfaces                | Specifies the interfaces on which the IPv6 IS-IS protocol is configured.   |
| Redistribution            | Lists the protocol that is being redistributed.  |
| Inter-area redistribution | Lists the IS-IS levels that are being redistributed into other levels.   |
| using prefix-list         | Names the prefix list used in the interarea redistribution.  |
| Address Summarization     | Lists all the summary prefixes. If the summary prefix is being advertised, "advertised with metric $x$ " will be displayed after the prefix. |

#### Table 63: show ipv6 protocols Field Descriptions for IS-IS Processes

The following sample output from the **show ipv6 protocols** command displays the Border Gateway Protocol (BGP) information for autonomous system 30:

#### Device# show ipv6 protocols

```
IPv6 Routing Protocol is "bgp 30"
IGP synchronization is disabled
Redistribution:
   Redistributing protocol connected
Neighbor(s):
   Address FiltIn FiltOut Weight RoutemapIn RoutemapOut
   2001:DB8:0:ABCD::1 5 7 200
   2001:DB8:0:ABCD::2 rmap-in rmap-out
   2001:DB8:0:ABCD::3 rmap-in rmap-out
```

The table below describes the significant fields shown in the display.

| Field                    | Description  |
|--------------------------|--|
| IPv6 Routing Protocol is | Specifies the IPv6 routing protocol used.              |
| Redistribution           | Lists the protocol that is being redistributed.        |
| Address                  | Neighbor IPv6 address.                                 |
| FiltIn                   | AS-path filter list applied to input.                  |
| FiltOut                  | AS-path filter list applied to output.                 |
| Weight                   | Neighbor weight value used in BGP best path selection. |
| RoutemapIn               | Neighbor route map applied to input.                   |
| RoutemapOut              | Neighbor route map applied to output.                  |

#### Table 64: show ipv6 protocols Field Descriptions for BGP Process

The following is sample output from the **show ipv6 protocols summary** command:

Device# show ipv6 protocols summary

Index Process Name 0 connected 1 static 2 rip myrip 3 bgp 30

The following sample output from the **show ipv6 protocols** command displays the EIGRP information including the vector metric and EIGRP IPv6 NSF:

```
Device# show ipv6 protocols
```

```
IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "bgp 1"
  IGP synchronization is disabled
 Redistribution:
   None
IPv6 Routing Protocol is "bgp multicast"
IPv6 Routing Protocol is "ND"
IPv6 Routing Protocol is "eigrp 1"
EIGRP-IPv6 VR(name) Address-Family Protocol for AS(1)
 Metric weight K1=1, K2=0, K3=1, K4=0, K5=0 K6=0
 Metric rib-scale 128
 Metric version 64bit
  NSF-aware route hold timer is 260
  EIGRP NSF enabled
    NSF signal timer is 15s
    NSF converge timer is 65s
  Router-ID: 10.1.2.2
  Topology : 0 (base)
    Active Timer: 3 min
   Distance: internal 90 external 170
   Maximum path: 16
   Maximum hopcount 100
   Maximum metric variance 1
   Total Prefix Count: 0
   Total Redist Count: 0
  Interfaces:
  Redistribution:
    None
```

The following example displays IPv6 protocol information after configuring redistribution in an Open Shortest Path First (OSPF) domain:

```
Device# redistribute ospf 1 match internal
Device (config-rtr) # end
Device# show ipv6 protocols
IPv6 Routing Protocol is "connected"
IPv6 Routing Protocol is "ND"
IPv6 Routing Protocol is "rip 1"
  Interfaces:
   Ethernet0/1
    Loopback9
  Redistribution:
   Redistributing protocol ospf 1 (internal)
IPv6 Routing Protocol is "ospf 1"
  Interfaces (Area 0):
    Ethernet0/0
  Redistribution:
    None
```

### show ipv6 rip

To display information about current IPv6 Routing Information Protocol (RIP) processes, use the **show ipv6 rip** command in user EXEC or privileged EXEC mode.

show ipv6 rip [name] [vrf vrf-name][{database | next-hops}]

show ipv6 rip [name] [{database | next-hops}]

| Syntax Description | name         | (Optional) Name of the RIP process. If the name is not entered, details of all configured RIP processes are displayed.   |
|--------------------|--------------|--|
|                    | vrf vrf-name | (Optional) Displays information about the specified Virtual Routing and Forwarding (VRF) instance.   |
|                    | database     | (Optional) Displays information about entries in the specified RIP IPv6 routing table.   |
|                    | next-hops    | (Optional) Displays information about the next hop addresses for the specified RIP IPv6 process. If no RIP process name is specified, the next-hop addresses for all RIP IPv6 processes are displayed. |

**Command Default** Information about all current IPv6 RIP processes is displayed.

**Command Modes** User EXEC (>)

Privileged EXEC (#)

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

**Examples** 

The following is sample output from the **show ipv6 rip** command:

```
Device# show ipv6 rip
```

RIP process "one", port 521, multicast-group FF02::9, pid 55 Administrative distance is 25. Maximum paths is 4 Updates every 30 seconds, expire after 180 Holddown lasts 0 seconds, garbage collect after 120 Split horizon is on; poison reverse is off Default routes are not generated Periodic updates 8883, trigger updates 2 Interfaces: Ethernet2 Redistribution: RIP process "two", port 521, multicast-group FF02::9, pid 61 Administrative distance is 120. Maximum paths is 4 Updates every 30 seconds, expire after 180 Holddown lasts 0 seconds, garbage collect after 120 Split horizon is on; poison reverse is off Default routes are not generated

L

```
Periodic updates 8883, trigger updates 0
Interfaces:
None
Redistribution:
```

The table below describes the significant fields shown in the display.

#### Table 65: show ipv6 rip Field Descriptions

| Field                   | Description   |
|-------------------------|---|
| RIP process             | The name of the RIP process.  |
| port                    | The port that the RIP process is using.   |
| multicast-group         | The IPv6 multicast group of which the RIP process is a member.  |
| pid                     | The process identification number (pid) assigned to the RIP process.  |
| Administrative distance | Used to rank the preference of sources of routing information. Connected routes have an administrative distance of 1 and are preferred over the same route learned by a protocol with a larger administrative distance value. |
| Updates                 | The value (in seconds) of the update timer.   |
| expire                  | The interval (in seconds) in which updates expire.  |
| Holddown                | The value (in seconds) of the hold-down timer.  |
| garbage collect         | The value (in seconds) of the garbage-collect timer.  |
| Split horizon           | The split horizon state is either on or off.  |
| poison reverse          | The poison reverse state is either on or off.   |
| Default routes          | The origination of a default route into RIP. Default routes are either generated or not generated.  |
| Periodic updates        | The number of RIP update packets sent on an update timer.   |
| trigger updates         | The number of RIP update packets sent as triggered updates.   |

The following is sample output from the show ipv6 rip database command.

#### Device# show ipv6 rip one database

```
RIP process "one", local RIB
2001:72D:1000::/64, metric 2
Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs
2001:72D:2000::/64, metric 2, installed
Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs
2001:72D:3000::/64, metric 2, installed
Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs
2001:72D:4000::/64, metric 16, expired, [advertise 119/hold 0]
Ethernet2/2001:DB8:0:ABCD::1
3004::/64, metric 2 tag 2A, installed
Ethernet2/2001:DB8:0:ABCD::1, expires in 168 secs
```

The table below describes the significant fields shown in the display.

Table 66: show ipv6 rip database Field Descriptions

| Field                        | Description  |
|------------------------------|--|
| RIP process                  | The name of the RIP process.   |
| 2001:72D:1000::/64           | The IPv6 route prefix.   |
| metric                       | Metric for the route.  |
| installed                    | Route is installed in the IPv6 routing table.  |
| Ethernet2/2001:DB8:0:ABCD::1 | Interface and LL next hop through which the IPv6 route was learned.                                |
| expires in                   | The interval (in seconds) before the route expires.  |
| advertise                    | For an expired route, the value (in seconds) during which the route will be advertised as expired. |
| hold                         | The value (in seconds) of the hold-down timer.   |
| tag                          | Route tag.   |

The following is sample output from the **show ipv6 rip next-hops** command.

```
Device# show ipv6 rip one next-hops
```

```
RIP process "one", Next Hops
FE80::210:7BFF:FEC2:ACCF/Ethernet4/2 [1 routes]
FE80::210:7BFF:FEC2:B286/Ethernet4/2 [2 routes]
```

The table below describes the significant fields shown in the display.

Table 67: show ipv6 rip next-hops Field Descriptions

| Field                       | Description  |  |
|-----------------------------|--|--|
| RIP process                 | The name of the RIP process.   |  |
| 2001:DB8:0:1::1/Ethernet4/2 | The next-hop address and interface through which it was learned. Next hops are either the addresses of IPv6 RIP neighbors from which we have learned routes or explicit next hops received in IPv6 RIP advertisements. |  |
|                             | <b>Note</b> An IPv6 RIP neighbor may choose to advertise all its routes with an explicit next hop. In this case the address of the neighbor would not appear in the next hop display.                                  |  |
| [1 routes]                  | The number of routes in the IPv6 RIP routing table using the specified next hop.   |  |

The following is sample output from the **show ipv6 rip vrf** command:

Device# show ipv6 rip vrf red

```
RIP VRF "red", port 521, multicast-group 2001:DB8::/32, pid 295
Administrative distance is 120. Maximum paths is 16
Updates every 30 seconds, expire after 180
Holddown lasts 0 seconds, garbage collect after 120
Split horizon is on; poison reverse is off
Default routes are not generated
Periodic updates 99, trigger updates 3
Full Advertisement 0, Delayed Events 0
Interfaces:
Ethernet0/1
Loopback2
Redistribution:
None
```

The table below describes the significant fields shown in the display.

| Table 68: show ipv6 i | p vrf Field Descriptions |
|-----------------------|--------------------------|
|-----------------------|--------------------------|

| Field                   | Description   |  |
|-------------------------|---|--|
| RIP VRF                 | The name of the RIP VRF.  |  |
| port                    | The port that the RIP process is using.   |  |
| multicast-group         | The IPv6 multicast group of which the RIP process is a member.  |  |
| Administrative distance | Used to rank the preference of sources of routing information. Connected routes have an administrative distance of 1 and are preferred over the same route learned by a protocol with a larger administrative distance value. |  |
| Updates                 | The value (in seconds) of the update timer.   |  |
| expires after           | The interval (in seconds) in which updates expire.  |  |
| Holddown                | The value (in seconds) of the hold-down timer.  |  |
| garbage collect         | The value (in seconds) of the garbage-collect timer.  |  |
| Split horizon           | The split horizon state is either on or off.  |  |
| poison reverse          | The poison reverse state is either on or off.   |  |
| Default routes          | The origination of a default route into RIP. Default routes are either generated or not generated.  |  |
| Periodic updates        | The number of RIP update packets sent on an update timer.   |  |
| trigger updates         | The number of RIP update packets sent as triggered updates.   |  |

The following is sample output from show ipv6 rip vrf next-hops command:

Device# show ipv6 rip vrf blue next-hops

```
RIP VRF "blue", local RIB
AAAA::/64, metric 2, installed
Ethernet0/0/FE80::A8BB:CCFF:FE00:7C00, expires in 177 secs
```

| Field                                 | Description  |  |
|---------------------------------------|--|--|
| RIP VRF                               | The name of the RIP VRF.   |  |
| metric                                | Metric for the route.  |  |
| installed                             | Route is installed in the IPv6 routing table.  |  |
| Ethernet0/0/FE80::A8BB:CCFF:FE00:7C00 | The next hop address and interface through which it was<br>learned. Next hops are either the addresses of IPv6 RIP<br>neighbors from which we have learned routes, or explicit next<br>hops received in IPv6 RIP advertisements. |  |
|                                       | <b>Note</b> An IPv6 RIP neighbor may choose to advertise all its routes with an explicit next hop. In this case the address of the neighbor would not appear in the next hop display.  |  |
| expires in                            | The interval (in seconds) before the route expires.  |  |

#### Table 69: show ipv6 rip vrf next-hops Field Descriptions

The following is sample output from **show ipv6 rip vrf database** command:

```
Device# show ipv6 rip vrf blue database
```

```
RIP VRF "blue", Next Hops
FE80::A8BB:CCFF:FE00:7C00/Ethernet0/0 [1 paths]
```

#### Table 70: show ipv6 rip vrf database Field Descriptions

| Field                                 | Description  |
|---------------------------------------|--|
| RIP VRF                               | The name of the RIP VRF.   |
| FE80::A8BB:CCFF:FE00:7C00/Ethernet0/0 | Interface and LL next hop through which the IPv6 route was learned.                  |
| 1 paths                               | Indicates the number of unique paths to this router that exist in the routing table. |

### **Related Commands**

| ds | Command                  | Description  |
|----|--------------------------|--|
|    | clear ipv6 rip           | Deletes routes from the IPv6 RIP routing table.              |
|    | debug ipv6 rip           | Displays the current contents of the IPv6 RIP routing table. |
|    | ipv6 rip vrf-mode enable | Enables VRF-aware support for IPv6 RIP.                      |

# show ipv6 route

To display contents of the IPv6 routing table, use the **show ipv6 route** command in user EXEC or privileged EXEC mode.

show ipv6 route [{ipv6-address | ipv6-prefix/prefix-length [{longer-prefixes}] | [{protocol}] + [repair]
+ [{updated [{boot-up}] [{day month}] [{time}]}] | interface type number | nd | nsf | table table-id |
watch}]

| Syntax Description | ipv6-address    | (Optional) Displays routing information for a specific IPv6 address.  |
|--------------------|-----------------|---|
|                    | ipv6-prefix     | (Optional) Displays routing information for a specific IPv6 network.  |
|                    | lprefix-length  | (Optional) The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.                                   |
|                    | longer-prefixes | (Optional) Displays output for longer prefix entries.   |
|                    | protocol        | (Optional) The name of a routing protocol or the keyword <b>connected</b> , <b>local</b> , <b>mobile</b> , or <b>static</b> . If you specify a routing protocol, use one of the following keywords: <b>bgp</b> , <b>isis</b> , <b>eigrp</b> , <b>ospf</b> , or <b>rip</b> . |
|                    | repair          | (Optional) Displays routes with repair paths.   |
|                    | updated         | (Optional) Displays routes with time stamps.  |
|                    | boot-up         | (Optional) Displays routing information since bootup.   |
|                    | day month       | (Optional) Displays routes since the specified day and month.   |
|                    | time            | (Optional) Displays routes since the specified time, in <i>hh:mm</i> format.  |
|                    | interface       | (Optional) Displays information about the interface.  |
|                    | type            | (Optional) Interface type.  |
|                    | number          | (Optional) Interface number.  |
|                    | nd              | (Optional) Displays only routes from the IPv6 Routing Information Base (RIB) that are owned by Neighbor Discovery (ND).   |
|                    | nsf             | (Optional) Displays routes in the nonstop forwarding (NSF) state.   |
|                    | repair          | (Optional)  |
|                    | table table-id  | (Optional) Displays IPv6 RIB table information for the specified table ID. The table ID must be in hexadecimal format. The range is from 0 to 0-0xFFFFFFF.  |
|                    | watch           | (Optional) Displays information about route watchers.   |

| Command Default  | If none of the optional syntax elements is chosen, all IPv6 routing information for all active routing tables is displayed.  |  |  |  |  |
|------------------|--|--|--|--|--|
| Command Modes    | User EXEC (>)  |  |  |  |  |
|                  | Privileged EXEC (#)  |  |  |  |  |
| Command History  | Release Modification   |  |  |  |  |
|                  | Cisco IOS XE Everest This command was introduced.<br>16.5.1a   |  |  |  |  |
| Usage Guidelines | The <b>show ipv6 route</b> command provides output similar to the <b>show ip route</b> command, except that the information is IPv6-specific.  |  |  |  |  |
|                  | When the <i>ipv6-address</i> or <i>ipv6-prefix/prefix-length</i> argument is specified, the longest match lookup is performed from the routing table, and only route information for that address or network is displayed. When a routing protocol is specified, only routes for that protocol are displayed. When the <b>connected</b> , <b>local</b> , <b>mobile</b> , or <b>static</b> keyword is specified, only the specified type of route is displayed. When the <b>interface</b> keyword and <i>type</i> and <i>number</i> arguments are specified, only routes for the specified interface are displayed. |  |  |  |  |
| Examples         | The following is sample output from the <b>show ipv6 route</b> command when no keywords or arguments are specified:  |  |  |  |  |
|                  | <pre>IPv6 Routing Table - 9 entries<br/>Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP<br/>I1 - ISIS L1, I2 - ISIS L2, IA - IIS interarea<br/>B 2001:DB8:4::2/48 [20/0]<br/>via FE80::A8BB:CCFF:FE02:8B00, Serial6/0<br/>L 2001:DB8:4::3/48 [0/0]<br/>via ::, Ethernet1/0<br/>C 2001:DB8:4::4/48 [0/0]<br/>via ::, Ethernet1/0<br/>LC 2001:DB8:4::5/48 [0/0]<br/>via ::, Loopback0<br/>L 2001:DB8:4::6/48 [0/0]<br/>via ::, Serial6/0<br/>C 2001:DB8:4::7/48 [0/0]<br/>via ::, Serial6/0<br/>S 2001:DB8:4::8/48 [1/0]<br/>via 2001:DB8:1::1, Null<br/>L FE80::/10 [0/0]</pre>                       |  |  |  |  |

The table below describes the significant fields shown in the display.

| Field                            | Description   |  |  |
|----------------------------------|---|--|--|
| Codes:                           | Indicates the protocol that derived the route. Values are as follows:   |  |  |
|                                  | • B—BGP derived   |  |  |
|                                  | • C—Connected   |  |  |
|                                  | • I1—ISIS L1—Integrated IS-IS Level 1 derived   |  |  |
|                                  | • I2—ISIS L2—Integrated IS-IS Level 2 derived   |  |  |
|                                  | • IA—ISIS interarea—Integrated IS-IS interarea derived  |  |  |
|                                  | • L—Local   |  |  |
|                                  | • R—RIP derived   |  |  |
|                                  | • S—Static  |  |  |
| 2001:DB8:4::2/48                 | Indicates the IPv6 prefix of the remote network.  |  |  |
| [20/0]                           | The first number in brackets is the administrative distance of the information source; the second number is the metric for the route. |  |  |
| via<br>FE80::A8BB:CCFF:FE02:8B00 | Specifies the address of the next device to the remote network.   |  |  |

#### Table 71: show ipv6 route Field Descriptions

When the *ipv6-address* or *ipv6-prefix/prefix-length* argument is specified, only route information for that address or network is displayed. The following is sample output from the **show ipv6 route** command when IPv6 prefix 2001:DB8::/35 is specified. The fields in the display are self-explanatory.

```
Device# show ipv6 route 2001:DB8::/35
```

```
IPv6 Routing Table - 261 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
B 2001:DB8::/35 [20/3]
via FE80::60:5C59:9E00:16, Tunnel1
```

When you specify a protocol, only routes for that particular routing protocol are shown. The following is sample output from the **show ipv6 route bgp** command. The fields in the display are self-explanatory.

```
Device# show ipv6 route bgp
```

```
IPv6 Routing Table - 9 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
B 2001:DB8:4::4/64 [20/0]
via FE80::A8BB:CCFF:FE02:8B00, Serial6/0
```

The following is sample output from the **show ipv6 route local** command. The fields in the display are self-explanatory.

```
Device# show ipv6 route local
IPv6 Routing Table - 9 entries
Codes: C - Connected, L - Local, S - Static, R - RIP, B - BGP
      I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea
   2001:DB8:4::2/128 [0/0]
L
    via ::, Ethernet1/0
LC 2001:DB8:4::1/128 [0/0]
    via ::, Loopback0
   2001:DB8:4::3/128 [0/0]
T.
    via ::, Serial6/0
L
   FE80::/10 [0/0]
    via ::, NullO
T.
   FF00::/8 [0/0]
    via ::, NullO
```

The following is sample output from the **show ipv6 route** command when the 6PE multipath feature is enabled. The fields in the display are self-explanatory.

```
Device# show ipv6 route
IPv6 Routing Table - default - 19 entries
Codes:C - Connected, L - Local, S - Static, R - RIP, B - BGP
U - Per-user Static route
I1 - ISIS L1, I2 - ISIS L2, IA - ISIS interarea, IS - ISIS summary
O - OSPF intra, OI - OSPF inter, OE1 - OSPF ext 1, OE2 - OSPF ext 2
.
.
.
B 2001:DB8::/64 [200/0]
via ::FFFF:172.16.0.1
via ::FFFF:172.30.30.1
```

| elated Commands | Command                 | Description  |
|-----------------|-------------------------|--|
|                 | ipv6 route              | Establishes a static IPv6 route.   |
|                 | show ipv6 interface     | Displays IPv6 interface information.                                       |
|                 | show ipv6 route summary | Displays the current contents of the IPv6 routing table in summary format. |
|                 | show ipv6 tunnel        | Displays IPv6 tunnel information.  |

Re

# show ipv6 routers

To display IPv6 router advertisement (RA) information received from on-link devices, use the **show ipv6** routers command in user EXEC or privileged EXEC mode.

show ipv6 routers [interface-type interface-number][conflicts][vrf vrf-name][detail]

| Syntax Description | interface -type  | (Optional)                                 | ) Specifies the Interface type.                             |  |
|--------------------|--|--|---|--|
|                    | interface -number  | (Optional) Specifies the Interface number. |   |  |
|                    | conflicts  | (Optional)                                 | ) Displays RAs that differ from                             | the RAs configured for a specified interface.      |
|                    | vrf vrf-name   | (Optional)                                 | ) Specifies a virtual routing and                           | forwarding (VRF) configuration.                    |
|                    | detail   | (Optional)<br>device.                      | ) Provides detail about the eligit                          | pility of the neighbor for election as the default |
| Command Default    |  |  | fied, on-link RA information is hable address on the link.) | displayed for all interface types. (The term       |
| Command Modes      | User EXEC (>)  |  |   |  |
|                    | Privileged EXEC (#   | #)   |   |  |
| Command History    | Release  |  | Modification  |  |
|                    | Cisco IOS XE Ev<br>16.5.1a   |  | This command was introduced                                 | 1.   |
| Usage Guidelines   | Devices that advertise parameters that differ from the RA parameters configured for the interface on which the RAs are received are marked as conflicting.   |  |   |  |
| Examples           | The following is sample output from the <b>show ipv6 routers</b> command when entered without an IPv6 interface type and number:   |  |   |  |
|                    | Device# <b>show ipv</b>  | 6 routers                                  |   |  |
|                    | <pre>Device FE80::83B3:60A4 on Tunnel5, last update 3 min<br/>Hops 0, Lifetime 6000 sec, AddrFlag=0, OtherFlag=0<br/>Reachable time 0 msec, Retransmit time 0 msec<br/>Prefix 3FFE:C00:8007::800:207C:4E37/96 autoconfig<br/>Valid lifetime -1, preferred lifetime -1<br/>Device FE80::290:27FF:FE8C:B709 on Tunnel57, last update 0 min<br/>Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0<br/>Reachable time 0 msec, Retransmit time 0 msec<br/>The following sample output shows a single neighboring device that is advertising a high default<br/>device preference and is indicating that it is functioning as a Mobile IPv6 home agent on this link.</pre> |  |   |  |
|                    |  |  |   |  |
|                    | Device# <b>show ipv</b>  | 6 routers                                  |   |  |

```
IPV6 ND Routers (table: default)
Device FE80::100 on Ethernet0/0, last update 0 min
Hops 64, Lifetime 50 sec, AddrFlag=0, OtherFlag=0, MTU=1500
HomeAgentFlag=1, Preference=High
Reachable time 0 msec, Retransmit time 0 msec
Prefix 2001::100/64 onlink autoconfig
Valid lifetime 2592000, preferred lifetime 604800
```

The following table describes the significant fields shown in the displays.

#### Table 72: show ipv6 routers Field Descriptions

| Field              | Description   |  |
|--------------------|---|--|
| Hops               | The configured hop limit value for the RA.  |  |
| Lifetime           | The configured lifetime value for the RA. A value of 0 indicates that the device is not a default device. A value other than 0 indicates that the device is a default device.   |  |
| AddrFlag           | If the value is 0, the RA received from the device indicates that addresses are not configured using the stateful autoconfiguration mechanism. If the value is 1, the addresses are configured using this mechanism.  |  |
| OtherFlag          | If the value is 0, the RA received from the device indicates that information other than addresses is not obtained using the stateful autoconfiguration mechanism. If the value is 1, other information is obtained using this mechanism. (The value of OtherFlag can be 1 only if the value of AddrFlag is 1.) |  |
| MTU                | The maximum transmission unit (MTU).  |  |
| HomeAgentFlag=1    | The value can be either 0 or 1. A value of 1 indicates that the device from which the RA was received is functioning as a mobile IPv6 home agent on this link, and a value of 0 indicates it is not functioning as a mobile IPv6 home agent on this link.   |  |
| Preference=High    | The DRP value, which can be high, medium, or low.   |  |
| Retransmit time    | The configured RetransTimer value. The time value to be used on this link for neighbor solicitation transmissions, which are used in address resolution and neighbor unreachability detection. A value of 0 means the time value is not specified by the advertising device.                                    |  |
| Prefix             | A prefix advertised by the device. Also indicates if on-link or autoconfig bits were set<br>in the RA message.  |  |
| Valid lifetime     | The length of time (in seconds) relative to the time the advertisement is sent that the prefix is valid for the purpose of on-link determination. A value of -1 (all ones, 0xffffffff) represents infinity.   |  |
| preferred lifetime | The length of time (in seconds) relative to the time the advertisements is sent that addresses generated from the prefix via address autoconfiguration remain valid. A value of -1 (all ones, 0xffffffff) represents infinity.  |  |

When the *interface-type* and *interface-number* arguments are specified, RA details about that specific interface are displayed. The following is sample output from the **show ipv6 routers** command when entered with an interface type and number:

```
Device# show ipv6 routers tunnel 5
Device FE80::83B3:60A4 on Tunnel5, last update 5 min
Hops 0, Lifetime 6000 sec, AddrFlag=0, OtherFlag=0
Reachable time 0 msec, Retransmit time 0 msec
Prefix 3FFE:C00:8007::800:207C:4E37/96 autoconfig
Valid lifetime -1, preferred lifetime -1
```

Entering the **conflicts** keyword with the **show ipv6 routers** command displays information for devices that are advertising parameters different from the parameters configured for the interface on which the advertisements are being received, as the following sample output shows:

```
Device# show ipv6 routers conflicts
```

```
Device FE80::203:FDFF:FE34:7039 on Ethernet1, last update 1 min, CONFLICT
Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0
Reachable time 0 msec, Retransmit time 0 msec
Prefix 2003::/64 onlink autoconfig
Valid lifetime -1, preferred lifetime -1
Device FE80::201:42FF:FECA:A5C on Ethernet1, last update 0 min, CONFLICT
Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0
Reachable time 0 msec, Retransmit time 0 msec
Prefix 2001::/64 onlink autoconfig
Valid lifetime -1, preferred lifetime -1
```

Use of the **detail** keyword provides information about the preference rank of the device, its eligibility for election as default device, and whether the device has been elected:

#### Device# show ipv6 routers detail

```
Device FE80::A8BB:CCFF:FE00:5B00 on Ethernet0/0, last update 0 min
Rank 0x811 (elegible), Default Router
Hops 64, Lifetime 1800 sec, AddrFlag=0, OtherFlag=0, MTU=1500
HomeAgentFlag=0, Preference=Medium, trustlevel = 0
Reachable time 0 (unspecified), Retransmit time 0 (unspecified)
Prefix 2001::/64 onlink autoconfig
Valid lifetime 2592000, preferred lifetime 604800
```

# show ipv6 rpf

To check Reverse Path Forwarding (RPF) information for a given unicast host address and prefix, use the **show ipv6 rpf** command in user EXEC or privileged EXEC mode.

show ipv6 rpf {source-vrf [access-list] | vrf receiver-vrf{source-vrf [access-list] | select}}

| Syntax Description | source-vrf   | <i>ource-vrf</i> Name or address of the virtual routing and forwarding (VRF) on which lookups are to be performed. |                                     |   |
|--------------------|--|--|-------------------------------------|---|
|                    | receiver-vrf   | Name or address  | s of the VRF in which the lookup    | s originate.                                |
|                    | access-list  | Name or address policy.  | s of access control list (ACL) to b | be applied to the group-based VRF selection |
|                    | vrf  | Displays informa   | ation about the VRF instance.       |   |
|                    | select   | Displays group-t   | to-VRF mapping information.         |   |
| Command Modes      | User EXEC  |  |                                     |   |
| Command History    | Release  |  | Modification                        | ]   |
|                    | Cisco IOS XE Everest<br>16.5.1a  |  | This command was introduced.        | -   |
| Usage Guidelines   | The <b>show ipv6 rpf</b> command displays information about how IPv6 multicast routing performs Reverse Path Forwarding (RPF). Because the router can find RPF information from multiple routing tables (for example, unicast Routing Information Base [RIB], multiprotocol Border Gateway Protocol [BGP] routing table, or static mroutes), the <b>show ipv6 rpf</b> command to display the source from which the information is retrieved. |  |                                     |   |
| Examples           | The following example displays RPF information for the unicast host with the IPv6 address of 2001::1:1:2:  |  |                                     |   |
|                    | Device# show ipv6 rpf 2001::1:1:2<br>RPF information for 2001::1:1:2<br>RPF interface:Ethernet3/2<br>RPF neighbor:FE80::40:1:3<br>RPF route/mask:20::/64<br>RPF type:Unicast<br>RPF recursion count:0<br>Metric preference:110<br>Metric:30  |  |                                     |   |

The table below describes the significant fields shown in the display.

| Field | Description |
|-------|-------------|
|       |             |

### Table 73: show ipv6 rpf Field Descriptions

| Field                           | Description  |
|---------------------------------|--|
| RPF information for 2001::1:1:2 | Source address that this information concerns.   |
| RPF interface:Ethernet3/2       | For the given source, the interface from which the router expects to get packets.  |
| RPF neighbor:FE80::40:1:3       | For the given source, the neighbor from which the router expects to get packets.   |
| RPF route/mask:20::/64          | Route number and mask that matched against this source.  |
| RPF type:Unicast                | Routing table from which this route was obtained, either unicast, multiprotocol BGP, or static mroutes.                                    |
| RPF recursion count             | Indicates the number of times the route is recursively resolved.   |
| Metric preference:110           | The preference value used for selecting the unicast routing metric to the Route Processor (RP) announced by the designated forwarder (DF). |
| Metric:30                       | Unicast routing metric to the RP announced by the DF.  |

enters source-guard policy configuration mode.

# show ipv6 source-guard policy

To display the IPv6 source-guard policy configuration, use the **show ipv6 source-guard policy** command in user EXEC or privileged EXEC mode.

show ipv6 source-guard policy[source-guard-policy]

| Syntax Description | source-guard-policy  |                         | The snooping policy. The policy name can be a symbolic store or an integer (such as 0).   | tring |
|--------------------|--|-------------------------|---|-------|
| Command Modes      | User EXEC (>) Privileged EXEC (#)                                  |                         |   |       |
| Command History    | Release  | Modification            |   |       |
|                    | Cisco IOS XE Everest<br>16.5.1a                                    | t This command          | was introduced.   |       |
| Usage Guidelines   | -  | which the policy is app | Id displays the IPv6 source-guard policy configuration, as<br>lied. The command also displays IPv6 prefix guard inform<br>the device. |       |
| Examples           | Device# show ipv6 s  | ource-guard policy      | policy1   |       |
|                    | Policy policyl conf<br>data-glean<br>prefix-guard<br>address-guard | iguration:              |   |       |
|                    | Policy policyl is a<br>Target Ty<br>Et0/0 PO<br>vlan 100 VL        | pe Policy<br>RT policy1 | wing targets:<br>Feature Target range<br>source-guard vlan all<br>source-guard vlan all   |       |
| Related Commands   | Command  |                         | Description   |       |
|                    | ipv6 source-guard at   | tach-policy             | Applies IPv6 source guard on an interface.  |       |
|                    | ipv6 source-guard po   | blicy                   | Defines an IPv6 source-guard policy name and  | 1     |

### show ipv6 spd

To display the IPv6 Selective Packet Discard (SPD) configuration, use the **show ipv6 spd** command in privileged EXEC mode.

### show ipv6 spd

**Syntax Description** This command has no arguments or keywords.

**Command Modes** Privileged EXEC (#)

| Command History | Release                         | Modification                 |  |
|-----------------|---------------------------------|------------------------------|--|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |  |

**Usage Guidelines** Use the **show ipv6 spd** command to display the SPD configuration, which may provide useful troubleshooting information.

### **Examples** The following is sample output from the **show ipv6 spd** command:

```
Device# show ipv6 spd
Current mode: normal
Queue max threshold: 74, Headroom: 100, Extended Headroom: 10
IPv6 packet queue: 0
```

The table below describes the significant fields shown in the display.

Table 74: show ipv6 spd Field Description

| Field                  | Description                        |
|------------------------|------------------------------------|
| Current mode: normal   | The current SPD state or mode.     |
| Queue max threshold: 7 | 4 The process input queue maximum. |

| Related Commands | Command                      | Description  |
|------------------|------------------------------|--|
|                  | ipv6 spd queue max-threshold | Configures the maximum number of packets in the SPD process input queue. |

# show ipv6 static

To display the current contents of the IPv6 routing table, use the **show ipv6 static** command in user EXEC or privileged EXEC mode.

show ipv6 static [{ipv6-address | ipv6-prefix/prefix-length}] [{interface type number | recursive}]
[detail]

| Syntax Description | ipv6-address   | (Optional) Provides routing information for a specific IPv6 address.  |
|--------------------|----------------|---|
|                    |                | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.  |
|                    | ipv6-prefix    | (Optional) Provides routing information for a specific IPv6 network.  |
|                    |                | This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.  |
|                    | lprefix-length | (Optional) The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value. |
|                    | interface      | (Optional) Name of an interface.  |
|                    | type           | (Optional, but required if the <b>interface</b> keyword is used) Interface type. For a list of supported interface types, use the question mark (?) online help function.   |
|                    | number         | (Optional, but required if the <b>interface</b> keyword is used) Interface number. For specific numbering syntax for supported interface types, use the question mark (?) online help function.   |
|                    | recursive      | (Optional) Allows the display of recursive static routes only.  |
|                    | detail         | (Optional) Specifies the following additional information:  |
|                    |                | • For valid recursive routes, the output path set and maximum resolution depth.   |
|                    |                | • For invalid recursive routes, the reason why the route is not valid.  |
|                    |                | • For invalid direct or fully specified routes, the reason why the route is not valid.  |
| Command Default    | All IPv6 routi | ing information for all active routing tables is displayed.   |
| Command Modes      | User EXEC (>   | >)  |
|                    | Privileged EX  | EC (#)  |
|                    |                |   |

| Command History | Release                         | Modification                 |
|-----------------|---------------------------------|------------------------------|
|                 | Cisco IOS XE Everest<br>16.5.1a | This command was introduced. |

### Usage Guidelines The s

The **show ipv6 static** command provides output similar to the **show ip route** command, except that it is IPv6-specific.

When the *ipv6-address* or *ipv6-prefix/prefix-length* argument is specified, a longest match lookup is performed from the routing table and only route information for that address or network is displayed. Only the information matching the criteria specified in the command syntax is displayed. For example, when the *type number* arguments are specified, only the specified interface-specific routes are displayed.

#### **Examples**

#### show ipv6 static Command with No Options Specified in the Command Syntax: Example

When no options specified in the command, those routes installed in the IPv6 Routing Information Base (RIB) are marked with an asterisk, as shown in the following example:

#### Device# show ipv6 static

```
IPv6 Static routes
Code: * - installed in RIB
* 3000::/16, interface Ethernet1/0, distance 1
* 4000::/16, via nexthop 2001:1::1, distance 1
5000::/16, interface Ethernet3/0, distance 1
* 5555::/16, via nexthop 4000::1, distance 1
5555::/16, via nexthop 9999::1, distance 1
* 5555::/16, interface Ethernet2/0, distance 1
* 6000::/16, via nexthop 2007::1, interface Ethernet1/0, distance 1
```

The table below describes the significant fields shown in the display.

#### Table 75: show ipv6 static Field Descriptions

| Field      | Description   |
|------------|---|
| vianexthop | Specifies the address of the next Device in the path to the remote network. |
| distance 1 | Indicates the administrative distance to the specified route.               |

#### show ipv6 static Command with the IPv6 Address and Prefix: Example

When the *ipv6-address* or *ipv6-prefix/prefix-length* argument is specified, only information about static routes for that address or network is displayed. The following is sample output from the **show ipv6 route** command when entered with the IPv6 prefix 2001:200::/35:

```
Device# show ipv6 static 2001:200::/35
IPv6 Static routes
Code: * - installed in RIB
```

```
* 2001:200::/35, via nexthop 4000::1, distance 1
    2001:200::/35, via nexthop 9999::1, distance 1
* 2001:200::/35, interface Ethernet2/0, distance 1
```

#### show ipv6 static interface Command: Example

When an interface is supplied, only those static routes with the specified interface as the outgoing interface are displayed. The **interface** keyword may be used with or without the IPv6 address and prefix specified in the command statement.

```
Device# show ipv6 static interface ethernet 3/0
```

IPv6 Static routes Code: \* - installed in RIB 5000::/16, interface Ethernet3/0, distance 1

#### show ipv6 static recursive Command: Example

When the **recursive** keyword is specified, only recursive static routes are displayed:

```
Device# show ipv6 static recursive
```

IPv6 Static routes Code: \* - installed in RIB \* 4000::/16, via nexthop 2001:1::1, distance 1 \* 5555::/16, via nexthop 4000::1, distance 1 5555::/16, via nexthop 9999::1, distance 1

#### show ipv6 static detail Command: Example

When the detail keyword is specified, the following additional information is displayed:

- For valid recursive routes, the output path set and maximum resolution depth.
- For invalid recursive routes, the reason why the route is not valid.
- For invalid direct or fully specified routes, the reason why the route is not valid.

Device# show ipv6 static detail

```
IPv6 Static routes
Code: * - installed in RIB
* 3000::/16, interface Ethernet1/0, distance 1
* 4000::/16, via nexthop 2001:1::1, distance 1
Resolves to 1 paths (max depth 1)
via Ethernet1/0
5000::/16, interface Ethernet3/0, distance 1
Interface is down
* 5555::/16, via nexthop 4000::1, distance 1
Resolves to 1 paths (max depth 2)
via Ethernet1/0
5555::/16, via nexthop 9999::1, distance 1
Route does not fully resolve
* 5555::/16, interface Ethernet2/0, distance 1
* 6000::/16, via nexthop 2007::1, interface Ethernet1/0, distance 1
```

| Related Commands | Command       | Description                                      |
|------------------|---------------|--|
|                  | ipv6 route    | Establishes a static IPv6 route.                 |
|                  | show ip route | Displays the current state of the routing table. |

| Command                 | Description  |
|-------------------------|--|
| show ipv6 interface     | Displays IPv6 interface information.                                       |
| show ipv6 route summary | Displays the current contents of the IPv6 routing table in summary format. |
| show ipv6 tunnel        | Displays IPv6 tunnel information.  |

# show ipv6 traffic

To display statistics about IPv6 traffic, use the **show ipv6 traffic** command in user EXEC or privileged EXEC mode.

show ipv6 traffic [interface[interface type number]]

| interface  | (Optional) All interfaces. IPv6 forwarding statistics for all interfaces on which IPv forwarding statistics are being kept will be displayed.   |  |
|--|---|--|
| <i>interface type number</i> (Optional) Specified interface. Interface statistics that have occurred since the statistics were last cleared on the specific interface are displayed.   |   |  |
| User EXEC (>)<br>Privileged EXEC (#)   |   |  |
| Release  | Modification  |  |
| Cisco IOS XE Everest<br>16.5.1a  | This command was introduced.  |  |
| The <b>show ipv6 traffic</b> command provides output similar to the <b>show ip traffic</b> command, except that it is IPv6-specific.   |   |  |
| The following is sample  | e output from the show ipv6 traffic command:  |  |
| <pre>Device# show ipv6 traffic<br/>IPv6 statistics:<br/>Rcvd: 0 total, 0 local destination<br/>0 source-routed, 0 truncated<br/>0 format errors, 0 hop count exceeded<br/>0 bad header, 0 unknown option, 0 bad source<br/>0 unknown protocol, 0 not a device<br/>0 fragments, 0 total reassembled<br/>0 reassembly timeouts, 0 reassembly failures<br/>0 unicast RFF drop, 0 suppressed RFF drop<br/>Sent: 0 generated, 0 forwarded<br/>0 fragmented into 0 fragments, 0 failed<br/>0 encapsulation failed, 0 no route, 0 too big<br/>Mcast: 0 received, 0 sent<br/>ICMP statistics:<br/>Rcvd: 0 input, 0 checksum errors, 0 too short<br/>0 unknown info type, 0 unknown error type<br/>unreach: 0 routing, 0 admin, 0 neighbor, 0 address, 0 port<br/>parameter: 0 error, 0 header, 0 option<br/>0 hopcount expired, 0 reassembly timeout,0 too big<br/>0 echo request, 0 echo reply<br/>0 group query, 0 group report, 0 group reduce<br/>0 device solicit, 0 device advert, 0 redirects</pre> |   |  |

```
Device# show ipv6 interface ethernet 0/1/1
Ethernet0/1/1 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80::203:FDFF:FE49:9
  Description: sat-2900a f0/12
  Global unicast address(es):
    7::7, subnet is 7::/32
  Joined group address(es):
   FF02::1
   FF02::2
   FF02::1:FF00:7
   FF02::1:FF49:9
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  Input features: RPF
  Unicast RPF access-list MINI
    Process Switching:
      0 verification drops
      0 suppressed verification drops
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
```

The following is sample output for the **show ipv6 interface** command with IPv6 CEF running:

```
Device# show ipv6 interface ethernet 0/1/1
Ethernet0/1/1 is up, line protocol is up
  IPv6 is enabled, link-local address is FE80::203:FDFF:FE49:9
  Description: sat-2900a f0/12
  Global unicast address(es):
    7::7, subnet is 7::/32
  Joined group address(es):
   FF02::1
    FF02::2
   FF02::1:FF00:7
   FF02::1:FF49:9
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  Input features: RPF
  Unicast RPF access-list MINI
    Process Switching:
      0 verification drops
      0 suppressed verification drops
    CEF Switching:
      0 verification drops
      0 suppressed verification drops
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds
  ND advertised reachable time is 0 milliseconds
  ND advertised retransmit interval is 0 milliseconds
  ND router advertisements are sent every 200 seconds
  ND router advertisements live for 1800 seconds
  Hosts use stateless autoconfig for addresses.
```

The table below describes the significant fields shown in the display.

Table 76: show ipv6 traffic Field Descriptions

| Field         | Description                      |
|---------------|----------------------------------|
| source-routed | Number of source-routed packets. |

I

| Field  | Description   |  |
|--|---|--|
| truncated                                    | Number of truncated packets.  |  |
| format errors                                | Errors that can result from checks performed on header fields, the version number, and packet length.   |  |
| not a device                                 | Message sent when IPv6 unicast routing is not enabled.  |  |
| 0 unicast RPF drop, 0<br>suppressed RPF drop | Number of unicast and suppressed reverse path forwarding (RPF) drops.   |  |
| failed                                       | Number of failed fragment transmissions.  |  |
| encapsulation failed                         | Failure that can result from an unresolved address or try-and-queue packet.   |  |
| no route                                     | Counted when the software discards a datagram it did not know how to route.   |  |
| unreach                                      | Unreachable messages received are as follows:   |  |
|  | • routingIndicates no route to the destination.   |  |
|  | • adminIndicates that communication with the destination is administratively prohibited.  |  |
|  | • neighborIndicates that the destination is beyond the scope of the source address. For example, the source may be a local site or the destination may not have a route back to the source. |  |
|  | • addressIndicates that the address is unreachable.   |  |
|  | • portIndicates that the port is unreachable.   |  |
| Unicast RPF access-list MINI                 | Unicast RPF access-list in use.   |  |
| Process Switching                            | Displays process RPF counts, such as verification and suppressed verification drops.  |  |
| CEF Switching                                | Displays CEF switching counts, such as verification drops and suppressed verification drops.  |  |

### show key chain

To display the keychain, use the show key chain command.

**show key chain** [name-of-chain]

Syntax Description name-of-chain (Optional) Name of the key chain to display, as named in the key chain command. If the command is used without any parameters, then it lists out all the key chains. **Command Default** Privileged EXEC (#) **Command Modes** Examples The following is sample output from the **show key chain** command: show key chain Device# show key chain Key-chain AuthenticationGLBP: key 1 -- text "Thisisasecretkey" accept lifetime (always valid) - (always valid) [valid now] send lifetime (always valid) - (always valid) [valid now] Key-chain glbp2: key 100 -- text "abc123" accept lifetime (always valid) - (always valid) [valid now] send lifetime (always valid) - (always valid) [valid now]

| Related Commands | Command       | Description   |
|------------------|---------------|---|
| key-string       |               | Specifies the authentication string for a key.  |
|                  | send-lifetime | Sets the time period during which an authentication key on a key chain is valid to be sent. |

### show track

To display information about objects that are tracked by the tracking process, use the **show track** command in privileged EXEC mode.

show track [{object-number [brief] | application [brief] | interface [brief] | ip[route [brief] | [sla
[brief]] | ipv6 [route [brief]] | list [route [brief]] | resolution [ip | ipv6] | stub-object [brief] |
summary | timers}]

| Syntax Description | object-number  | (Optional) Object number that represents the object to be tracked. The range is from 1 to 1000.      |  |  |  |  |  |
|--------------------|--|--|--|--|--|--|--|
|                    | brief  | (Optional) Displays a single line of information related to the preceding argument or keyword.       |  |  |  |  |  |
|                    | application         (Optional) Displays tracked application objects. |  |  |  |  |  |  |
|                    | interface  | (Optional) Displays tracked interface objects.         (Optional) Displays tracked IP route objects. |  |  |  |  |  |
|                    | ip route   |  |  |  |  |  |  |
|                    | ip sla   | (Optional) Displays tracked IP SLA objects.  |  |  |  |  |  |
|                    | ipv6 route   | (Optional) Displays tracked IPv6 route objects.  |  |  |  |  |  |
|                    | list   | (Optional) Displays the list of boolean objects.   |  |  |  |  |  |
|                    | resolution   | (Optional) Displays resolution of tracked parameters.  |  |  |  |  |  |
|                    | summary  | (Optional) Displays the summary of the specified object.   |  |  |  |  |  |
|                    | timers   | (Optional) Displays polling interval timers.   |  |  |  |  |  |

Command Modes Privileged EXEC (#)

| Command History | Release | Modification                 |
|-----------------|---------|------------------------------|
|                 |         | This command was introduced. |

**Usage Guidelines** Use this command to display information about objects that are tracked by the tracking process. When no arguments or keywords are specified, information for all objects is displayed.

A maximum of 1000 objects can be tracked. Although 1000 tracked objects can be configured, each tracked object uses CPU resources. The amount of available CPU resources on a device is dependent upon variables such as traffic load and how other protocols are configured and run. The ability to use 1000 tracked objects is dependent upon the available CPU. Testing should be conducted on site to ensure that the service works under the specific site traffic conditions.

### **Examples**

The following example shows information about the state of IP routing on the interface that is being tracked:

```
Device# show track 1
```

```
Track 1
Interface GigabitEthernet 1/0/1 ip routing
IP routing is Down (no IP addr)
1 change, last change 00:01:08
```

The table below describes the significant fields shown in the displays.

#### Table 77: show track Field Descriptions

| Field                                      | Description  |  |
|--|--|--|
| Track                                      | Object number that is being tracked.   |  |
| Interface GigabitEthernet 1/0/1 ip routing | Interface type, interface number, and object that is being tracked.  |  |
| IP routing is                              | State value of the object, displayed as Up or Down. If the object is down, the reason is displayed.                      |  |
| 1 change, last change                      | Number of times that the state of a tracked object has changed and the time (in <i>hh:mm:ss</i> ) since the last change. |  |

| Related Commands | Command               | Description   |
|------------------|-----------------------|---|
|                  | show track resolution | Displays the resolution of tracked parameters.                                |
|                  | track interface       | Configures an interface to be tracked and enters tracking configuration mode. |
|                  | track ip route        | Tracks the state of an IP route and enters tracking configuration mode.       |

### track

To configure an interface to be tracked where the Gateway Load Balancing Protocol (GLBP) weighting changes based on the state of the interface, use the **track** command in global configuration mode. To remove the tracking, use the **no** form of this command.

track *object-number* interface *type number* {line-protocol | ip routing | ipv6 routing} no track *object-number* interface *type number* {line-protocol | ip routing | ipv6 routing}

| Syntax Descriptionobject-numberObject number in the range from 1 to 1000 representing the int                    |   |  |                                       | 000 representing the interface to be tracked. |  |  |
|--|---|--|---------------------------------------|---|--|--|
|  | interface type number   | Interface type and number to be tracked. |                                       |   |  |  |
|  | line-protocol   | Tracks whether the interface is up.      |                                       |   |  |  |
| <b>ip routing</b> Tracks whether IP routing is enabled, an IP a and the interface state is up, before reporting  |   |  |                                       |   |  |  |
| ipv6 routingTracks whether IPv6 routing is enabled, an IP a<br>and the interface state is up, before reporting t |   |  | · · · · · · · · · · · · · · · · · · · |   |  |  |
| Command Default  | The state of the interface  | es is n                                  | ot tracked.                           |   |  |  |
| Command Modes  | Global configuration (co  | onfig)                                   |                                       |   |  |  |
| Command History  | Release   |  | Modification                          |   |  |  |
|  | Cisco IOS XE Everest<br>16.5.1a   |  | This command was introduced           |   |  |  |
| Usage Guidelines   | Use the <b>track</b> command in conjunction with the <b>glbp weighting</b> and <b>glbp weighting track</b> commands<br>configure parameters for an interface to be tracked. If a tracked interface on a GLBP device goes down<br>weighting for that device is reduced. If the weighting falls below a specified minimum, the device will<br>its ability to act as an active GLBP virtual forwarder.   |  |                                       | interface on a GLBP device goes down, the     |  |  |
|  | A maximum of 1000 objects can be tracked. Although 1000 tracked objects can be configured, each tracked object uses CPU resources. The amount of available CPU resources on a device is dependent upon variables such as traffic load and how other protocols are configured and run. The ability to use 1000 tracked objects is dependent upon the available CPU. Testing should be conducted on site to ensure that the service works under the specific site traffic conditions.   |  |                                       |   |  |  |
| Examples   | In the following example, TenGigabitEthernet interface 0/0/1 tracks whether GigabitEthernet interfaces 1/0/1 and 1/0/3 are up. If either of the GigabitEthernet interface goes down, the GLBP weighting is reduced by the default value of 10. If both GigabitEthernet interfaces go down, the GLBP weighting will fall below the lower threshold and the device will no longer be an active forwarder. To resume its role as an active forwarder, the device must have both tracked interfaces back up, and the weighting must rise above the upper threshold. |  |                                       |   |  |  |
|  | Device(config)# track 1 interface GigabitEthernet 1/0/1 line-protocol   |  |                                       |   |  |  |

```
Device(config-track) # exit
Device(config) # track 2 interface GigabitEthernet 1/0/3 line-protocol
Device(config-track) # exit
Device(config) # interface TenGigabitEthernet 0/0/1
Device(config-if) # ip address 10.21.8.32 255.255.0
Device(config-if) # glbp 10 weighting 110 lower 95 upper 105
Device(config-if) # glbp 10 weighting track 1
Device(config-if) # glbp 10 weighting track 2
```

|-------------------------|---------|
|-------------------------|---------|

| Command Description |                      | Description   |
|---------------------|----------------------|---|
|                     | glbp weighting       | Specifies the initial weighting value of a GLBP gateway.                        |
|                     | glbp weighting track | Specifies an object to be tracked that affects the weighting of a GLBP gateway. |

### vrrp

To create a Virtual Router Redundancy Protocol version 3 (VRRPv3) group and enter VRRPv3 group configuration mode, use the **vrrp**. To remove the VRRPv3 group, use the **no** form of this command.

vrrp group-id address-family {ipv4 | ipv6}
no vrrp group-id address-family {ipv4 | ipv6}

| Syntax Description | group-id       | Virtual router group number. The range is from 1 to 255. |
|--------------------|----------------|--|
|                    | address-family | Specifies the address-family for this VRRP group.        |
|                    | ipv4           | (Optional) Specifies IPv4 address.                       |
|                    | ipv6           | (Optional) Specifies IPv6 address.                       |

Command Default None

### **Command Modes** Interface configuration (config-if)

| Command History | Release                         | Modification                |  |

|                  | vrrp    | Creates a VRRPv3 group and enters VRRPv3 group configuration mode. |

### vrrp preempt

To configure the device to take over as primary virtual router for a Virtual Router Redundancy Protocol (VRRP) group if it has higher priority than the current primary virtual router, use the **preempt** command in VRRP configuration mode. To disable this function, use the **no** form of this command.

preempt [delay minimum seconds]
no preempt

| Syntax Description | delay min                                 |   | (Optional) Number of seconds tha<br>advertisement claiming primary or  |   |   |  |
|--------------------|---|---|--|---|---|--|
| Command Default    | This comm                                 | and is enabled.                                     |  |   |   |  |
| Command Modes      | VRRP con                                  | VRRP configuration (config-if-vrrp)                 |  |   |   |  |

Sets the priority level of the device within a VRRP group.

priority

# vrrp priority

To set the priority level of the device within a Virtual Router Redundancy Protocol (VRRP) group, use the **priority** command in interface configuration mode. To remove the priority level of the device, use the **no** form of this command.

priority *level* no priority *level* 

| Syntax Description               | <i>level</i> Priority of the device within the VRRP group. The range is from 1 to 254. The default is 100.              |               |  |                              |  |
|----------------------------------|---|---------------|--|------------------------------|--|
| Command Default<br>Command Modes | <ul> <li>The priority level is set to the default value of 100.</li> <li>VRRP configuration (config-if-vrrp)</li> </ul> |               |  |                              |  |
| Command History                  | Release   |               |  | Modification                 |  |
|                                  | Cisco<br>16.5.1   | IOS XE E<br>a | Everest  | This command was introduced. |  |
| Usage Guidelines                 | Use this command to control which device becomes the primary virtual router.  |               |  |                              |  |
| Examples                         | The following example configures the device with a priority of 254:<br>Device (config-if-vrrp) # <b>priority 254</b>    |               |  |                              |  |
| <b>Related Commands</b>          | Comm  | and           | Description  |                              |  |
|                                  | vrrp  |               | Creates a VRRPv3 group and enters VRRPv3 group configuration mode.   |                              |  |
|                                  | vrrp  | preempt       | Configures the device to take over as primary virtual router for a VRRP group if it has higher priority than the current primary virtual router. |                              |  |

# vrrp timers advertise

To configure the interval between successive advertisements by the primary virtual router in a Virtual Router Redundancy Protocol (VRRP) group, use the **timers advertise** command in VRRP configuration mode. To restore the default value, use the **no** form of this command.

timers advertise [msec] *interval* no timers advertise [msec] *interval* 

| Syntax Description | group V   | Virtual router grou   | p number. The group number rai | nge is from 1 to 255.                          |  |
|--------------------|---|---|--------------------------------|--|--|
|                    |   | (Optional) Changes the unit of the advertisement time from seconds to milliseconds. Without this keyword, the advertisement interval is in seconds.   |                                |  |  |
|                    | i<br>r  | Time interval between successive advertisements by the primary virtual router. The unit of the interval is in seconds, unless the <b>msec</b> keyword is specified. The default is 1 second. The valid range is 1 to 255 seconds. When the <b>msec</b> keyword is specified, the valid range is 50 to 999 milliseconds. |                                |  |  |
| Command Default    | The default   | It interval of 1 second is configured.  |                                |  |  |
| Command Modes      | VRRP conf   | iguration (config-i   | if-vrrp)                       |  |  |
| Command History    | Release   |   | Modification                   |  |  |
|                    | Cisco IOS XE Everest<br>16.5.1a   |   | This command was introduced.   | -  |  |
| Usage Guidelines   | The advertisements being sent by the primary virtual router communicate the state and priority of th primary virtual router.  |   |                                | mmunicate the state and priority of the curren |  |
|                    | The <b>vrrp timers advertise</b> command configures the time between successive advertisement packets and the time before other routers declare the primary router to be down. Routers or access servers on which timer values are not configured can learn timer values from the primary router. The timers configured on the primary router always override any other timer settings. All routers in a VRRP group must use the same timer values. If the same timer values are not set, the devices in the VRRP group will not communicate with each other and any misconfigured device will change its state to primary. |   |                                |  |  |
| Examples           | The following example shows how to configure the primary virtual router to send advertisements every 4 seconds:   |   |                                |  |  |
|                    | Device(config-if-vrrp)# timers advertise 4  |   |                                |  |  |
| Related Commands   | Command   | Description   |                                |  |  |
|                    | vrrp         Creates a VRRPv3 group and enters VRRPv3 group configuration mode.   |   |                                | group configuration mode.                      |  |

| Command | Description   |
|---------|---|
|         | Configures the device, when it is acting as backup virtual router for a VRRP group, to learn the advertisement interval used by the primary virtual router. |

# vrrs leader

To specify a leader's name to be registered with Virtual Router Redundancy Service (VRRS), use the **vrrs leader** command. To remove the specified VRRS leader, use the **no** form of this command.

vrrs leader vrrs-leader-name no vrrs leader vrrs-leader-name

| ble by default.        |
|------------------------|
|                        |
|                        |
| cation                 |
| ommand was introduced. |
| 20                     |

**Examples** The following example specifies a leader's name to be registered with VRRS:

Device(config-if-vrrp)# vrrs leader leader-1

| Related Commands | Command | Description  |
|------------------|---------|--|
|                  | vrrp    | Creates a VRRP group and enters VRRP configuration mode. |
