Restrictions for EVPN VXLAN Integrated Routing and Bridging

This section provides restrictions for both EVPN VXLAN distributed anycast gateway and centralized default gateway functionalities that are used to enable integrated routing and bridging (IRB).

EVPN VXLAN Distributed Anycast Gateway

The same subnet mask and IP address must be configured on all the switch virtual interfaces (SVIs) that act as a distributed anycast gateway (DAG).

EVPN VXLAN Centralized Default Gateway

- Only one centralized gateway (CGW) leaf switch or VTEP is supported in an EVPN VXLAN network. To achieve physical redundancy, configure Cisco Stackwise Virtual on the leaf switches. For more information, see *Configuring Cisco StackWise Virtual* module of the *High Availability Configuration Guide*.
- HSRP and VRRP are not supported for the EVPN VXLAN Layer 2 overlay networks when you use centralized gateway.
- Reorigination of route type 2 host routes to route type 5 routes is only supported starting from Cisco IOS XE Amsterdam 17.3.2a release.

Information About EVPN VXLAN Integrated Routing and Bridging

EVPN VXLAN integrated routing and bridging (IRB) allows the VTEPs or leaf switches in an EVPN VXLAN network to perform both bridging and routing. IRB allows the VTEPs to forward both Layer 2 or bridged and

Layer 3 or routed traffic. A VTEP performs bridging when it forwards traffic to the same subnet. Similarly, a VTEP performs routing when it forwards traffic to a different subnet. The VTEPs in the network forward traffic to each other through the VXLAN gateways. BGP EVPN VXLAN implements IRB in two ways:

- Asymmetric IRB
- Symmetric IRB

Asymmetric IRB

In asymmetric IRB, the ingress VTEP performs both bridging and routing whereas the egress VTEP performs only bridging. A packet first moves through a MAC VRF followed by an IP VRF on the network virtualisation endpoint (NVE) of the ingress VTEP. It then moves only through a MAC VRF on the NVE of the egress VTEP. The NVE of the ingress VTEP manages all the packet processing associated with intersubnet forwarding semantics.

The return traffic during asymmetric IRB goes through a different virtual network instance (VNI) compared to the source traffic. Asymmetric IRB needs the source and destination VNIs to be associated with both the ingress and egress VTEPs.

Symmetric IRB

In symmetric IRB, both the ingress and egress VTEPs perform both bridging and routing. A packet first moves through a MAC VRF followed by an IP VRF on the NVE of the ingress VTEP. It then moves through an IP VRF followed by a MAC VRF on the NVE of the egress VTEP. The NVEs of ingress and egress VTEPs equally share all the packet processing associated with intersubnet forwarding semantics.

In symmetric IRB, you are required to define only the VNIs of locally attached endpoints on the ingress and egress VTEPs. Symmetric IRB offers better scalability in terms of the number of VNIs that a BGP EVPN VXLAN fabric supports.

The following figure shows the implementation of symmetric IRB and the movement of traffic in an EVPN VXLAN network:

EVPN VXLAN Distributed Anycast Gateway

Distributed anycast gateway is a default gateway addressing mechanism in a BGP EVPN VXLAN fabric. The feature enables the use of the same gateway IP and MAC address across all the VTEPs in an EVPN

VXLAN network. This ensures that every VTEP functions as the default gateway for the workloads directly connected to it. The feature facilitates flexible workload placement, host mobility, and optimal traffic forwarding across the BGP EVPN VXLAN fabric.

The scenario shown in the following figure depicts a distributed gateway. Subnet 1 contains two leaf switches, leaf switch 1 and leaf switch 2, acting together as a distributed default gateway for VLAN 10. Host device 1 is connected to leaf switch 1 and needs to send traffic to host device 3, which is in a different subnet. When host device 1 tries to send traffic outside of subnet 1, the traffic goes through the configured gateway on leaf switch 1. Host device 1 registers the Address Resolution Protocol (ARP) entries of the gateway VLAN MAC and IP addresses on leaf switch 1.

Figure 1: Distributed Gateway Topology

When multiple VTEPs act together as one single distributed default gateway for the same VLAN, the VLAN IP address remains the same across all of them. This IP address becomes the gateway IP address for any host device in the VLAN that tries to reach an IP address outside its subnet. But, each VTEP retains its own MAC address.

In the preceding figure, consider the scenario where host device 1 moves from leaf switch 1 to leaf switch 2. The host device remains within the same network and still maintains the same ARP entries for gateway MAC and IP addresses. But the MAC addresses of the VLAN interfaces on leaf switch 2 and leaf switch 1 are different. This results in a MAC address mismatch between the ARP entry and the VLAN on leaf switch 2. As a result, any traffic that host device 1 tries to send outside of Subnet 1 is either lost or continuously flooded as unknown unicast. EVPN VXLAN distributed anycast gateway feature prevents this traffic loss by ensuring that all the VTEPs have the same gateway MAC and IP addresses.

Manual MAC address configuration and MAC aliasing are the two methods used to maintain the same MAC address across all VTEPs and configure distributed anycast gateway.

Manual MAC Address Configuration

Manual MAC address configuration is the conventional method of enabling distributed anycast gateway in an EVPN VXLAN network. In this method, you manually configure the same MAC address on the Layer 2 VNI VLAN SVI on all the VTEPs in the network. You must configure the same MAC address on all the VTEPs in the same Layer 2 VNI.

Note The VLAN SVIs on all the leaf switches must already share the same gateway IP address.

In the [Figure 1: Distributed Gateway Topology, on page 3](#) image, to enable distributed anycast gateway in subnet 1, configure the same MAC address on leaf switch 1 and leaf switch 2. This ensures that the ARP entries of gateway MAC and IP addresses on host device 1 match with the MAC and IP addresses of both leaf switch 1 and leaf switch 2.

MAC Aliasing

MAC aliasing for distributed anycast gateway removes the need to configure the same MAC address explicitly on the VLAN interfaces of every VTEP. MAC aliasing allows the VTEPs to advertise their VLAN MAC addresses as the gateway MAC addresses to all the other VTEPs in the network. The VTEPs in the network store the advertised MAC address as a gateway MAC address provided their VLAN IP address matches with the gateway IP address.

In the [Figure 1: Distributed Gateway Topology, on page 3](#) image, consider the scenario where MAC aliasing is enabled in subnet 1. Leaf switch 1 and leaf switch 2 advertise their MAC addresses to each other as gateway MAC addresses. This allows leaf switch 2 to recognize the MAC address in the ARP entry of host device 1 as a gateway MAC address. It allows host device 1 to send traffic outside of subnet 1 even though its VLAN MAC address does not match with the ARP entry.

MAC aliasing in an EVPN VXLAN network is configured by enabling the default gateway advertisement on all the VTEPs.

EVPN VXLAN Centralized Default Gateway

In this scenario, the network has a CGW VTEP that performs the Layer 3 gateway function for all the Layer 2 VNIs. All the other VTEPs in the network perform only bridging. The CGW VTEP acts as the Layer 3 gateway and performs routing for the inter-subnet VXLAN traffic.

The CGW VTEP advertises the SVI MAC-IP route for a particular VXLAN-enabled VLAN to all other Layer 2 VTEPs that have the same Layer 2 VNI configured. This allows the VTEPs to import and install the remote SVI MAC-IP route as a VXLAN Layer 3 gateway address. A host device uses the address of an SVI in the same VLAN on the CGW VTEP as its gateway address. Configure the SVI for the Layer 2 VNI VLAN only on the CGW VTEP. Do not configure the SVI (for the respective Layer 2 VNI VLAN) on any other VTEP in the network that acts as a Layer 2 VTEP.

When a host device connected to a Layer 2 VTEP sends traffic to a different subnet, the traffic is bridged from the Layer 2 VTEP to the CGW VTEP. The CGW VTEP then routes the traffic to the destination subnet. The destination subnet can be another VXLAN-enabled VLAN or an external route.

If the CGW VTEP needs to route the traffic between 2 VXLAN-enabled VLANs, then configure the CGW on the same VTEP for both VLANs. In other words, configure the SVI on the same VTEP for both VLANs.

Note We recommend that you configure a centralized default gateway in an EVPN VXLAN network if:

- You require a boundary between Layer 2 and Layer 3 segments at the border of the BGP EVPN VXLAN fabric.
- The inter-subnet traffic is subjected to a firewall inspection or any policy on a centralized plane.

Note Toggling between DAG and CGW on an SVI in a VLAN disrupts the traffic for that VLAN.

The following image shows an EVPN VXLAN network with centralized default gateway configured:

Figure 2: An EVPN VXLAN Network with Centralized Default Gateway

Default Gateway MAC Address Assignment

When leaf switches import gateway addresses, it can result in a conflict if the SVI of a leaf switch has the same IP and MAC address as the imported addresses. To avoid this conflict, the SVI MAC-IP routes are tagged with the Default Gateway Extended Community attribute. The attribute helps the receiving leaf switches to distinguish the MAC-IP routes of the SVIs from the MAC-IP routes of the host devices. When a leaf switch receives a route tagged with the attribute, it results in one of the following scenarios:

- If the leaf switch does not have a local SVI for the same MAC VRF, it installs the route only as a remote MAC route. The leaf switch implements centralized gateway functionality in this scenario.
- If the leaf switch has a local SVI with a matching IP address but different MAC address, it installs the MAC route as a route that points to the local SVI. The leaf switch implements MAC aliasing for distributed anycast gateway in this scenario.
- If the leaf switch has an SVI with no matching IP address, it invalidates the MAC-IP route and issues an error. See [RFC4732](#) for more details about the error.

Route Type 2 to Route Type 5 Host Route Reorigination for Overlay Networks with a Centralized Gateway (Asymmetric IRB)

Route type 2 (RT 2) to Route type 5 (RT 5) reorigination allows a Layer 2 and Layer 3 VXLAN network to import IP addresses from another Layer 2-only VXLAN network. In this deployment model, a VXLAN gateway VTEP functions as both the CGW and the Layer 3 VXLAN gateway. You can use the gateway VTEP to connect a Layer 2-only VXLAN network with a Layer 2 and Layer 3 VXLAN network. The gateway VTEP uses the CGW and asymmetric IRB forwarding functionalities in the EVPN segment of the Layer 2-only network. The VTEP can reoriginate any RT 2 host routes, that it learns from the Layer 2 EVPN segment (or MAC VRF), as RT 5 routes in the Layer 3 EVPN segment (or IP VRF). The VTEP then forwards the reoriginated RT 5 routes to host devices in the Layer 2 and Layer 3 VXLAN network.

Note The Layer 3 EVPN segment can be one of the following:

- An IP VRF-only segment (see *Configuring EVPN VXLAN Layer 3 Overlay Network* module for more information)
- Distributed anycast gateway (DAG) overlay fabric

To enable RT 2 to RT 5 host route reorigination on the CGW VTEP, ensure that you run the **reoriginate route-type5** and **member vni layer2-vni-id ingress-replication local-routing** commands on that VTEP. For detailed steps, see [Configuring Layer 2 VPN EVPN on a VTEP, on page 7](#) and [Configuring the NVE Interface on a VTEP, on page 10](#) sections.

Note The CGW VTEP does not install the reoriginated RT 5 route on its local IP VRF.

How to Configure EVPN VXLAN Integrated Routing and Bridging

To configure EVPN VXLAN IRB, you need to configure EVPN VXLAN Layer 2 and Layer 3 overlay networks, and enable the gateways in the VXLAN network.

Configuring EVPN VXLAN Integrated Routing and Bridging using Distributed Anycast Gateway

To enable IRB in an EVPN VXLAN network using distributed anycast gateway, perform the following set of procedures:

- Configure Layer 2 VPN EVPN on the VTEPs.
Enable distributed anycast gateway for the VXLAN network when you configure Layer 2 VPN.
- Configure the core-facing and access-facing VLANs on the VTEPs.
- Configure switch virtual interface (SVI) for the core-facing VLAN on the VTEPs.
- Configure SVI for the access-facing VLAN on the VTEPs.
- Configure the IP VRF on the VTEPs.
- Configure the Loopback interface on the VTEPs.
- Configure the Network Virtualization Endpoint (NVE) interface on the VTEPs.
- Configure BGP with EVPN address family on the VTEPs.

Configuring Layer 2 VPN EVPN on a VTEP

See [Configuring Layer 2 VPN EVPN on a VTEP](#) for detailed steps.

Configuring IP VRF on VTEP

See [Configuring an IP VRF on a VTEP](#) for detailed steps.

Configuring the Loopback Interface on a VTEP

See [Configuring the Loopback Interface on a VTEP](#) for detailed steps.

Configuring Core-facing and Access-facing VLANs on a VTEP

To configure the core-facing and access-facing VLANs on a VTEP and enable IRB in the EVPN VXLAN network, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
	Device> enable	
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	vlan configuration vlan-id Example: Device(config)# vlan configuration 201	Enters VLAN feature configuration mode for the specified VLAN interface.
Step 4	member evpn-instance evpn-instance-id vni l2-vni-number Example: Device(config-vlan)# member evpn-instance 1 vni 6000	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 2 VNI.
Step 5	exit Example: Device(config-vlan)# exit	Returns to global configuration mode.
Step 6	vlan configuration vlan-id Example: Device(config)# vlan configuration 202	Enters VLAN feature configuration mode for the specified VLAN interface.
Step 7	member evpn-instance evpn-instance-id vni l2-vni-number Example: Device(config-vlan)# member evpn-instance 2 vni 7000	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 2 VNI.
Step 8	exit Example: Device(config-vlan)# exit	Returns to global configuration mode.
Step 9	vlan configuration vlan-id Example: Device(config)# vlan configuration 200	Enters VLAN feature configuration mode for the specified VLAN interface.
Step 10	member vni l3-vni-number Example: Device(config-vlan)# member vni 5000	Adds EVPN instance as a member of the VLAN configuration. The VNI here is used as a Layer 3 VNI.
Step 11	exit Example: Device(config-vlan)# exit	Returns to global configuration mode.

	Command or Action	Purpose
Step 12	end Example: Device(config-vlan) # end	Returns to privileged EXEC mode.

Configuring Switch Virtual Interface for the Core-facing VLAN on a VTEP

To configure an SVI for the core-facing VLAN on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config) # interface vlan 200	Enters interface configuration mode for the specified VLAN.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if) # vrf forwarding Green	Configures the SVI for the VLAN.
Step 5	ip unnumbered <i>Loopback-interface</i> Example: Device(config-if) # ip unnumbered Loopback0	Enables IP processing on the Loopback interface without assigning an explicit IP address to the interface.
Step 6	no autostate Example: Device(config-if) # no autostate	Disables autostate on the interface. In EVPN deployments, once a VLAN is used for a core-facing SVI, it should not be allowed in any trunk. For a core-facing SVI to function properly, the no autostate command must be configured under the SVI.
Step 7	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Configuring Switch Virtual Interface for the Access-facing VLANs on a VTEP

To configure SVIs for the access-facing VLANs on a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface vlan <i>vlan-id</i> Example: Device(config)# interface vlan 202	Enters interface configuration mode for the specified VLAN.
Step 4	vrf forwarding <i>vrf-name</i> Example: Device(config-if)# vrf forwarding Green	Configures the SVI for the VLAN.
Step 5	ip address <i>gateway-ip-address</i> Example: Device(config-if)# ip address 192.168.10.1 255.255.255.0	Configures the gateway IP address for the access SVI. Configure the same gateway IP address for this SVI on all the other VTEPs.
Step 6	mac-address <i>mac-address-value</i> Example: Device(config-if)# mac-address aabb.cc01.f100	(Optional) Manually sets the MAC address for the VLAN interface. To configure distributed anycast gateway in a VXLAN network using manual MAC configuration, configure the same MAC address on the corresponding Layer 2 VNI SVIs on all the VTEPs in a VXLAN network.
Step 7	end Example: Device(config-if)# end	Returns to privileged EXEC mode.

Configuring the NVE Interface on a VTEP

To add Layer 2 and Layer 3 VNI members to the NVE interface of a VTEP, perform the following steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	interface <i>nve-interface-id</i> Example: Device(config)# interface nve1	Defines the interface to be configured as a trunk, and enters interface configuration mode.
Step 4	no ip address Example: Device(config-if)# no ip address	Disables IP processing on the interface by removing its IP address.
Step 5	source-interface <i>loopback-interface-id</i> Example: Device(config-if)# source-interface loopback0	Sets the IP address of the specified loopback interface as the source IP address.
Step 6	host-reachability protocol bgp Example: Device(config-if)# host-reachability protocol bgp	Configures BGP as the host-reachability protocol on the interface. Note You must configure the host reachability protocol on the interface. If you do not execute this step, the VXLAN tunnel defaults to static VXLAN tunnel, which is currently not supported on the Cisco Catalyst 9000 Series switches.
Step 7	member vni <i>layer2-vni-id</i> { ingress-replication [local-routing] mcast-group <i>multicast-group-address</i> } Example: Device(config-if)# member vni 6000 mcast-group 227.0.0.1 Device(config-if)# member vni 7000 mcast-group 227.0.0.1	Associates the Layer 2 VNI member with the NVE. The specified replication type must match the replication type that is configured globally or for the specific EVPN instance. Use mcast-group keyword for static replication and ingress-replication keyword for ingress replication. Use the local-routing keyword only when you need to configure route type 2 (RT 2) to route type 5 (RT 5) reorigination on the centralized gateway (CGW) VTEP.

	Command or Action	Purpose
Step 8	member vni <i>layer3-vni-id</i> vrf <i>vrf-name</i> Example: Device(config-if) # member vni 5000 vrf Green	Associates the Layer 3 VNI member with the NVE.
Step 9	end Example: Device(config-if) # end	Returns to privileged EXEC mode.

Configuring BGP with EVPN and VRF Address Families on a VTEP

To configure BGP on a VTEP with EVPN and VRF address families and a spine switch as the neighbor, perform these steps:

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	router bgp <i>autonomous-system-number</i> Example: Device(config) # router bgp 1	Enables a BGP routing process, assigns it an autonomous system number, and enters router configuration mode.
Step 4	bgp log-neighbor-changes Example: Device(config-router) # bgp log-neighbor-changes	(Optional) Enables the generation of logging messages when the status of a BGP neighbor changes. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 5	bgp update-delay <i>time-period</i> Example: Device(config-router) # bgp update-delay 1	(Optional) Sets the maximum initial delay period before sending the first update. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 6	bgp graceful-restart Example: Device(config-router) # bgp graceful-restart	(Optional) Enables the BGP graceful restart capability for all BGP neighbors. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .

	Command or Action	Purpose
Step 7	no bgp default ipv4-unicast Example: <pre>Device(config-router)# no bgp default ipv4-unicast</pre>	(Optional) Disables default IPv4 unicast address family for BGP peering session establishment. For more information, see <i>Configuring BGP</i> module of the <i>IP Routing Configuration Guide</i> .
Step 8	neighbor ip-address remote-as number Example: <pre>Device(config-router)# neighbor 10.11.11.11 remote-as 1</pre>	Defines multiprotocol-BGP neighbors. Under each neighbor, define the Layer 2 Virtual Private Network (L2VPN) EVPN configuration. Use the IP address of the spine switch as the neighbor IP address.
Step 9	neighbor {ip-address group-name} update-source interface Example: <pre>Device(config-router)# neighbor 10.11.11.11 update-source Loopback0</pre>	Configures update source. Update source can be configured per neighbor or per peer-group. Use the IP address of the spine switch as the neighbor IP address.
Step 10	address-family l2vpn evpn Example: <pre>Device(config-router)# address-family l2vpn evpn</pre>	Specifies the L2VPN address family and enters address family configuration mode.
Step 11	neighbor ip-address activate Example: <pre>Device(config-router-af)# neighbor 10.11.11.11 activate</pre>	Enables the exchange information from a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 12	neighbor ip-address send-community [both extended standard] Example: <pre>Device(config-router-af)# neighbor 10.11.11.11 send-community both</pre>	Specifies the communities attribute sent to a BGP neighbor. Use the IP address of the spine switch as the neighbor IP address.
Step 13	exit-address-family Example: <pre>Device(config-router-af)# exit-address-family</pre>	Exits address family configuration mode and returns to router configuration mode.
Step 14	address-family ipv4 vrf vrf-name Example: <pre>Device(config-router)# address-family ipv4 vrf green</pre>	Specifies the IPv4 address family and enters address family configuration mode.
Step 15	advertise l2vpn evpn Example:	Advertises Layer 2 VPN EVPN routes within a tenant VRF in an EVPN VXLAN fabric.

	Command or Action	Purpose
	Device (config-router-af) # advertise l2vpn evpn	
Step 16	redistribute connected Example: Device (config-router-af) # redistribute connected	Redistributes connected routes to BGP.
Step 17	redistribute static Example: Device (config-router-af) # redistribute static	Redistributes static routes to BGP.
Step 18	exit-address-family Example: Device (config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 19	address-family ipv6 vrf vrf-name Example: Device (config-router) # address-family ipv6 vrf green	Specifies the IPv6 address family and enters address family configuration mode.
Step 20	advertise l2vpn evpn Example: Device (config-router-af) # advertise l2vpn evpn	Advertises Layer 2 VPN EVPN routes within a tenant VRF in an EVPN VXLAN fabric.
Step 21	redistribute connected Example: Device (config-router-af) # redistribute connected	Redistributes connected routes to BGP.
Step 22	redistribute static Example: Device (config-router-af) # redistribute static	Redistributes static routes to BGP.
Step 23	exit-address-family Example: Device (config-router-af) # exit-address-family	Exits address family configuration mode and returns to router configuration mode.
Step 24	end Example: Device (config-router) # end	Returns to privileged EXEC mode.

Configuring EVPN VXLAN Integrated Routing and Bridging using Centralized Default Gateway

This section provides information about how to configure EVPN VXLAN IRB using centralized default gateway. Centralized default gateway implements asymmetric IRB in the EVPN VXLAN network. To enable IRB using centralized default gateway in an EVPN VXLAN network, perform these steps:

- On the centralized gateway VTEP, perform these procedures:
 - [Configuring Layer 2 VPN EVPN on a VTEP, on page 7](#)
 - [Configuring the Loopback Interface on a VTEP, on page 7](#)
 - [Configuring Core-facing and Access-facing VLANs on a VTEP, on page 7](#)
 - [Configuring Switch Virtual Interface for the Core-facing VLAN on a VTEP, on page 9](#)
 - [Configuring Switch Virtual Interface for the Access-facing VLANs on a VTEP, on page 10](#)
 - [Configuring the NVE Interface on a VTEP, on page 10](#)
 - [Configuring BGP with EVPN and VRF Address Families on a VTEP, on page 12](#)

Note Do not configure a Layer 3 VNI on the centralized gateway VTEP for the specific VRF in which the Layer 2 VNIs are configured.

Note In order to set the SVI state to up for the respective EVPN instance, run the **no autostate** command in the VLAN configuration mode for the SVI.

Note The centralized gateway leaf switch can be configured either as a single switch or a stack of switches. To achieve physical redundancy, configure Cisco Stackwise Virtual on the leaf switches. For more information, see *Configuring Cisco StackWise Virtual* module of the *High Availability Configuration Guide*.

- On all the other VTEPs, configure only EVPN VXLAN Layer 2 overlay network. To configure EVPN VXLAN Layer 2 overlay network on the leaf switches, perform all the procedures listed in [How to Configure EVPN VXLAN Layer 2 Overlay Network](#).

Note As Layer 2 VTEPs perform only bridging, do not configure the SVIs on the non-centralized-gateway VTEPs.

Verifying EVPN VXLAN Integrated Routing and Bridging

The following sections provide information about how to verify EVPN VXLAN integrated routing and bridging:

Verifying EVPN VXLAN Layer 2 Overlay Network

See [Verifying EVPN VXLAN Layer 2 Overlay Network](#) for the list of commands.

Verifying EVPN VXLAN Layer 3 Overlay Network

See [Verifying EVPN VXLAN Layer 3 Overlay Network](#) for the list of commands.

Verifying Distributed Anycast Gateway

The following table lists the **show** commands that are used to verify distributed anycast gateway:

Table 1: Commands to Verify Distributed Anycast Gateway

Command	Purpose
show l2vpn evpn default-gateway	Displays the default gateway database.
show l2vpn l2route default-gateway	Displays the list of sent or received default gateway routes.
show mac address-table	Displays the list of MAC addresses received in default gateway routes that are installed as static MAC addresses for an SVI interface.

Configuration Examples for EVPN VXLAN Integrated Routing and Bridging

This section provides examples to show how EVPN VXLAN IRB is enabled using distributed anycast gateway and centralized default gateway.

Example: Enabling EVPN VXLAN Integrated Routing and Bridging using Distributed Anycast Gateway

This section provides an example to show how to enable EVPN VXLAN IRB using distributed anycast gateway. The following example shows a sample configuration for an EVPN VXLAN network with 2 VTEPs. VTEP 1 and VTEP 2 are connected to perform integrated routing and bridging.

Figure 3: EVPN VXLAN Topology for IRB using Distributed Anycast Gateway

390/97

**Note**

In a two-VTEP topology, a spine switch is not mandatory. For information about configuration of spine switches in an EVPN VXLAN network, see *Configuring Spine Switches in a BGP EVPN VXLAN Fabric* module.

Example: Enabling EVPN VXLAN Integrated Routing and Bridging using Distributed Anycast Gateway

Table 2: Configuration Example for an EVPN VXLAN Network with Two VTEPs Connected to Perform Integrated Routing and Bridging Using Distributed Anycast Gateway

VTEP 1	VTEP 2

Example: Enabling EVPN VXLAN Integrated Routing and Bridging using Centralized Default Gateway

This section provides an example to show how EVPN VXLAN IRB is configured using centralized default gateway. The example shows how to configure and verify EVPN VXLAN IRB for the topology shown in the following image:

Figure 4: EVPN VXLAN Topology with Centralized Default Gateway

The topology shows an EVPN VXLAN network with a spine switch and three leaf switches (Leaf Switch 1, Leaf Switch 2, and Centralized Gateway Leaf Switch). The Centralized Gateway Leaf Switch provides the default gateway for all the VTEPs in the network. EVPN routes of route type 2 are advertised using the Default Gateway Extended Community attribute.

Note Each host device in the image is shown with two different VLANs only to illustrate the example.

Note The Centralized Gateway Leaf Switch can be configured either as a single switch or a stack of switches. To achieve physical redundancy, configure Cisco Stackwise Virtual on the leaf switches. For more information, see *Configuring Cisco StackWise Virtual* module of the *High Availability Configuration Guide*.

The following tables provide sample configurations for the devices in the topology above:

Table 3: Configuring the Leaf Switches and Centralized Gateway Leaf Switch to Enable IRB using Centralized Default Gateway
