- Troubleshooting Tenant Routed Multicast, on page 34

Troubleshooting Scenarios for BGP EVPN VXLAN

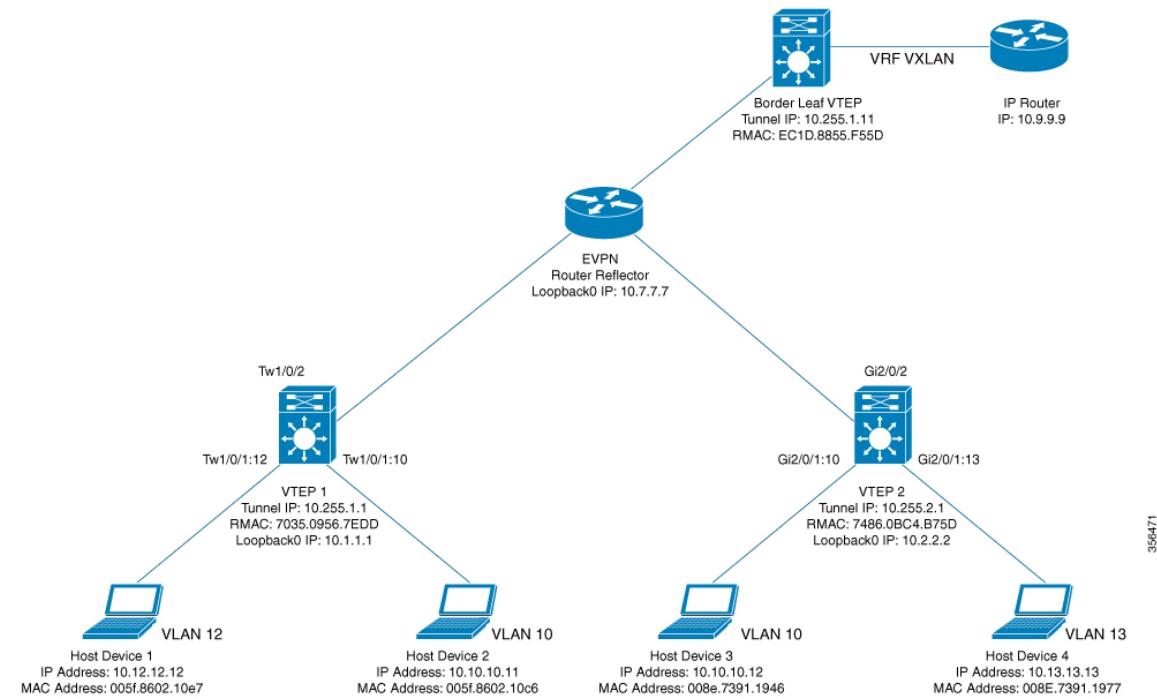

This document provides information about the various troubleshooting scenarios that are applicable to BGP EVPN VXLAN and how to troubleshoot each scenario.

In this troubleshooting document, comments have been added at the end of certain lines of the outputs of **show** commands. This has been done to highlight or explain a specific aspect of that line of output. If a comment begins in a new line, then it refers to the line of output that precedes the comment. The following notation has been used throughout the document to highlight the comments inside the outputs of **show** commands:

**<<-- Text highlighted in this format inside a command's output represents a comment.
This is done for explanation purpose only and is not part of the command's output.**

The following is a sample EVPN VXLAN topology with two access facing VTEPs (VTEP 1 and VTEP 2) and a border leaf VTEP connected in a VXLAN network through an EVPN route reflector. Each of the access facing VTEPs has two host devices connected to it and the border leaf VTEP is connected to an external IP network. All the troubleshooting scenarios in this document are explained using this topology.

Figure 1: EVPN VXLAN Topology

The following are the various troubleshooting scenarios that apply to BGP EVPN VXLAN for the topology illustrated in the [Figure 1: EVPN VXLAN Topology](#) above:

- **Scenario 1:** Troubleshooting Broadcast, Unknown Unicast, Multicast traffic Forwarding
- **Scenario 2:** Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI
- **Scenario 3:** Troubleshooting Unicast Forwarding Between VTEPs in Different VLANs Through a Layer 3 VNI
- **Scenario 4:** Troubleshooting Unicast Forwarding Between a VXLAN Network and an IP Network

Troubleshooting Broadcast, Unknown Unicast, Multicast Traffic Forwarding

This scenario might occur when host device 2 attempts to learn the ARP for host device 3 in [Figure 1: EVPN VXLAN Topology](#), on page 2. Perform the checks listed in the following table before troubleshooting BUM traffic forwarding:

Table 1: Scenario 1: Broadcast, Unknown Unicast, Multicast traffic Forwarding

Check to be Performed	Steps to Follow
Is the packet of broadcast type?	Check if the packet is a broadcast packet, such as an ARP broadcast packet.
Are the hosts in the same subnet or in different subnets?	Perform any of the following steps: <ul style="list-style-type: none"> Check the host device. Check the SVI configuration on the VTEP.
Has the remote MAC address been learned for unknown unicast traffic?	Run the show platform software fed switch active matm macTable vlan <i>vlan-id</i> command in privileged EXEC mode on the local VTEP and check if the MAC address of the remote host device is displayed in the output. If not, you have not yet learned the remote host device and it needs to be resolved.

BUM traffic is forwarded by a VTEP into the VXLAN Core using multicast routing. In order to follow the path of an ARP broadcast packet, you need to identify the multicast group that needs to be used to send this traffic into the core and to the other VTEPs. BUM traffic first arrives at the local Layer 2 interface. The traffic is encapsulated here and sent out using the multicast group that is sourced from the VXLAN Loopback interface.

Note Underlay multicast needs to be fully configured before troubleshooting BUM traffic forwarding for EVPN VXLAN.

To troubleshoot EVPN VXLAN BUM traffic forwarding, follow these steps:

1. [Determine the MAC Address of the Local Host Device and the Multicast Group Used for ARP Tunneling, on page 3](#)
2. [Set Up Embedded Capture Towards the Core-Facing Interface, on page 4](#)
3. [Ping the Remote Host Device, on page 4](#)
4. [Verify that an ARP Request Has Been Received and a Multicast Route Has Been Built, on page 4](#)
5. [Confirm the Presence of ARP Request Replies in Embedded Capture, on page 5](#)
6. [Verify that the Encapsulated ARP Request is Leaving in a Multicast Group to a VXLAN UDP Destination Port, on page 5](#)
7. [Verify that the ARP Reply from Core Interface is Encapsulated in Unicast to a VXLAN UDP Destination Port, on page 6](#)

Determine the MAC Address of the Local Host Device and the Multicast Group Used for ARP Tunneling

The following examples show how to verify the MAC address of the local host device and the multicast group that is used for tunneling the ARP broadcast request:

Troubleshooting Broadcast, Unknown Unicast, Multicast Traffic Forwarding

```
VTEP-1# show mac address-table address 005f.8602.10c6
Mac Address Table
-----
Vlan Mac Address Type      Ports
----- -----
10 005f.8602.10c6 DYNAMIC Tw1/0/1    <<- MAC address of 10.10.10.11 is learnt here

VTEP-1# show run int nve 1
interface nve1
no ip address
source-interface Loopback999
host-reachability protocol bgp
member vni 10001 mcast-group 239.10.10.10    <<- Group is mapped to the VNI under NVE

VTEP-1# show run | s vlan conf
vlan configuration 10
member evpn-instance 10 vni 10001    <<- VNI mapped under VLAN 10

VTEP-1# show l2vpn evpn evi
EVI   VLAN   Ether Tag   L2 VNI      Multicast      Pseudoport
----- -----
10     10       0        10001      239.10.10.10  Tw1/0/1:10
<<- EVPN instance 10 is mapped to VLAN 10 and VNI 10001
    (Using multicast group 239.10.10.10 for Broadcast ecap tunnel)
<...snip...>
```

Set Up Embedded Capture Towards the Core-Facing Interface

The following example shows how to set up embedded capture towards the core-facing interface:

Note On a production network, use this command with a filter.

```
VTEP-1# show monitor capture 1 parameter
monitor capture 1 interface TwoGigabitEthernet1/0/2 BOTH
monitor capture 1 match any
monitor capture 1 buffer size 100
monitor capture 1 limit pps 1000
```

Ping the Remote Host Device

The following example shows how to ping the remote host device:

```
VTEP-1-HOST# ping 10.10.10.12    <<- sourced from Host machine 10.10.10.11
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.10.10.12, timeout is 2 seconds:
..!!!
```

Verify that an ARP Request Has Been Received and a Multicast Route Has Been Built

This step is to verify that there is multicast reachability between VTEPs using standard multicast validation. Underly multicast state is not permanent. If it is not in use, these S,G states will expire.

The following output confirms that an ARP request has been received and a multicast route has been built:

```
VTEP-1# show ip mroute 239.10.10.10 10.255.1.1
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,
T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
U - URD, I - Received Source Specific Host Report,
Z - Multicast Tunnel, z - MDT-data group sender,
Y - Joined MDT-data group, y - Sending to MDT-data group,
G - Received BGP C-Mroute, g - Sent BGP C-Mroute,
N - Received BGP Shared-Tree Prune, n - BGP C-Mroute suppressed,
Q - Received BGP S-A Route, q - Sent BGP S-A Route,
V - RD & Vector, v - Vector, p - PIM Joins on route,
x - VxLAN group, c - PFP-SA cache created entry
Outgoing interface flags: H - Hardware switched, A - Assert winner, p - PIM Join
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

(10.255.1.1, 239.10.10.10), 00:00:25/00:02:34, flags: FTx <<- x flag set for VxLAN group
Incoming interface: Loopback999, RPF nbr 0.0.0.0 <<- Broadcast being encapsulated
                                         into VxLAN tunnel IP
Outgoing interface list:
TwoGigabitEthernet1/0/2, Forward/Sparse, 00:00:23/00:03:06
    <<- Sending towards core to VTEP-2
(10.255.1.4, 239.10.10.10), 3d18h/00:02:25, flags: JTx <<- BUM traffic from VTEP-2 (if the
                                         ARP request was from VTEP-2)
Incoming interface: TwoGigabitEthernet1/0/2, RPF nbr 10.1.1.6
Outgoing interface list:
Tunnel0, Forward/Sparse-Dense, 3d18h/00:00:14 <<- Tunnel 0 is the VxLAN tunnel
                                         used for decapsulation
```

Confirm the Presence of ARP Request Replies in Embedded Capture

The following output confirms that the ARP request replies are present in embedded capture:

```
VTEP-1# show monitor capture 1 buffer display-filter "arp"
Starting the packet display ..... Press Ctrl + Shift + 6 to exit

7 0.000018 00:5f:86:02:10:c6 -> ff:ff:ff:ff:ff:ff ARP 110 Who has 10.10.10.12? Tell
10.10.10.11
9 0.000022 28:52:61:bf:a9:46 -> 00:5f:86:02:10:c6 ARP 110 10.10.10.12 is at 28:52:61:bf:a9:46
```

Verify that the Encapsulated ARP Request is Leaving in a Multicast Group to a VxLAN UDP Destination Port

The following image shows the ARP request leaving encapsulated in the multicast group 239.10.10.10, sourced from a VxLAN Loopback, to the VxLAN UDP destination port 4789 in the VNI 10001 and VLAN 10.

Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000	00:5f:86:02:10:c6	ff:ff:ff:ff:ff:ff	ARP	110	Who has 10.10.10.12? Tell 10.10.10.11

Once all of the above checks are verified, if there is still a problem with broadcast reachability, then repeat the checks on the remote VTEP.

Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI

This scenario might occur when host device 2 in VLAN 10 attempts to ping host device 3 that is also in VLAN 10. Perform the checks listed in the following table before troubleshooting unicast forwarding between VTEPs in the same VLAN through a Layer 2 VNI:

Table 2: Scenario 2: Troubleshooting Unicast Forwarding Between VTEPs in the Same VLAN Through a Layer 2 VNI

Check to be Performed	Steps to Follow
Has ARP been resolved on the local host for the Layer 2 adjacent remote host?	Run the arp -a command in privileged EXEC mode on the host device.
Do the hosts have the same subnet masks?	Perform any of the following steps: <ul style="list-style-type: none"> Check the host device. Check the SVI configuration on the VTEP.
Do you have the EVPN instance configured on your local VTEP?	Run the following commands in privileged EXEC mode on the VTEP: <ul style="list-style-type: none"> show run section l2vpn show run section vlan config show run interface nve interface-number
Has the remote MAC address been learned in platform MATM in the same VLAN as the local host?	Run the show platform software fed switch active matm macTable vlan vlan-id command in privileged EXEC mode on the VTEP to check for the remote MAC addresses in the same VLAN.

To troubleshoot unicast forwarding between two VTEPs in the same VLAN using a Layer 2 VNI, follow these steps:

- Verify the provisioning of the EVPN VXLAN Layer 2 overlay network.
- Verify intra-subnet traffic movement in the EVPN VXLAN Layer 2 overlay network.

Verifying the Provisioning of an EVPN VXLAN Layer 2 Overlay Network

To verify the provisioning of an EVPN VXLAN Layer 2 overlay network, perform these checks:

- Verify the Provisioning of the EVPN Instance in EVPN Manager, on page 7
- Ensure that an NVE Peer is Present for the Layer 2 VNI, on page 9
- Verify the Provisioning of the Layer 2 VNI in NVE Component, on page 9
- Verify That the Layer 2 VNI VXLAN Tunnel Pseudoport is added to the Access VLAN in Layer 2 Forwarding Information Base (FIB), on page 10

Verify the Provisioning of the EVPN Instance in EVPN Manager

The following examples show how to verify that the EVPN instance is provisioned in the EVPN manager:

```
VTEP-1# show run | section l2vpn
l2vpn evpn instance 10 vlan-based
encapsulation vxlan
```

Verifying the Provisioning of an EVPN VXLAN Layer 2 Overlay Network

```

route-target export 10:1      <<- Import or export right route-targets
route-target import 10:2      <<- Import or export right route-targets

VTEP-1# show run | section vlan config
vlan configuration 10
member evpn-instance 10 vni 10001 <<- EVPN instance & VNI mapped to the VLAN

VTEP-1# show run interface nvel
interface nvel
source-interface Loopback999
host-reachability protocol bgp
member vni10001 mcast-group 239.10.10.10 <<- VNI added to NVE interface

VTEP-1# show run interface loopback 999
interface Loopback999
description VxLAN Loopback
ip address 10.255.1.1 255.255.255.255

```

Note Run the **show run** commands on VTEP 2 to verify its configuration, if required.

```

VTEP-1# show l2vpn evpn evi 10 detail <<- VLAN number and EVPN Instance number
                                                are not always the same, confirm which
                                                EVPN Instance maps to your VLAN
                                                with the show l2vpn evpn evi command
EVPN instance:    10 (VLAN Based) <<- EVPN Instance number does map to the VLAN.
RD:              10.1.1.1:10 (auto)
Import-RTs:       10:2 <<- Importing VTEP-2 (if you are not seeing the prefix,
                      check configuration for the right import/export statement
                      under the l2vpn evpn instance)
Export-RTs:       10:1
Per-EVI Label:   none

Verifying Intra-Subnet Traffic Movement in an EVPN VXLAN Layer 2 Overlay Network

The following figure illustrates the movement of traffic from host devices connected to VTEP 1 to host devices connected to VTEP 2:

Figure 2: Movement of traffic in an EVPN VXLAN network Through Layer 2 and Layer 3 VNIs

In the above figure, Layer 2 traffic moves from host device 2 to host device 3 through the Layer 2 VNI 10001. To verify the movement of intra-subnet traffic in the EVPN VXLAN Layer 2 overlay network, perform these checks:

1. Verify that the Local MAC Addresses Have Been Learned in IOS-MATM, on page 12
2. Verify that Both Local and Remote MAC Addresses are Learned in FED-MATM, on page 12

Verifying Intra-Subnet Traffic Movement in an EVPN VXLAN Layer 2 Overlay Network

3. Confirm that the ICMP Echo Request Leaves VTEP 1 Encapsulated and Goes to a UDP Destination Port on VTEP 2, on page 13
4. Verify ARP for Local Host Devices, on page 13
5. Verify that the MAC Address Entries are Learned in SISF Device Tracking Table, on page 13
6. Verify that EVPN Manager Has Been Updated with the MAC Address Entries, on page 14
7. Verify that EVPN Manager Has Updated the MAC Routes into Layer 2 RIB, on page 15
8. Verify that Layer 2 RIB Has Updated BGP with the Local MAC Routes, and that BGP Has Updated Layer 2 RIB with the Remote MAC Routes, on page 15
9. Verify that the MAC Routes Learned from BGP and Updated to Layer 2 RIB are Also Updated to L2FIB, on page 17

Note Only MAC routes are considered while verifying the movement of intra-subnet traffic. MAC-IP routes are not applicable to bridged traffic.

Verify that the Local MAC Addresses Have Been Learned in IOS-MATM

The following examples show how to verify that the local MAC addresses have been learned in IOS-MATM:

```
VTEP-1# show mac address-table interface tw 1/0/1 vlan 10
      Mac Address Table
-----
Vlan     Mac Address          Type      Ports
----  -----
  10    005f.8602.10c6    DYNAMIC    Tw1/0/1    <<- IOS-MATM shows only
                                                local MAC addresses

VTEP-2# show mac address-table interface g 2/0/1 vlan 10
      Mac Address Table
-----

Verify ARP for Local Host Devices

The following examples show how to verify ARP for local host devices:

```

VTEP-1# show ip arp vrf vxlan 10.10.10.11
Protocol Address          Age (min) Hardware Addr      Type      Interface
Internet 10.10.10.11      2      005f.8602.10c6  ARPA      Vlan10

VTEP-2# show ip arp vrf vxlan 10.10.10.12
Protocol Address          Age (min) Hardware Addr      Type      Interface
Internet 10.10.10.12      4      008e.7391.1946  ARPA      Vlan10

```

Verify that the MAC Address Entries are Learned in SISF Device Tracking Table

The following examples show how to verify that the MAC addresses are learned in SISF device tracking table:

Verifying Intra-Subnet Traffic Movement in an EVPN VXLAN Layer 2 Overlay Network

```
VTEP-1# show device-tracking database mac <<- Only Local MAC addresses are seen
                                         in SISF device tracking table
MAC           Interface     vlan prlvl   state      time left policy
005f.8602.10c6 Tw1/0/1       10 NO TRUST  MAC-REACHABLE 347 s    evpn-sisf-policy
<<- MAC, REACH, and EVPN type SISF policy are displayed

VTEP-2# show device-tracking database mac <<- Only Local MAC addresses are seen
                                         in SISF device tracking table
MAC           Interface     vlan prlvl   state      time left policy
008e.7391.1946 Gi2/0/1       10 NO TRUST  MAC-REACHABLE 164 s    evpn-sisf-policy
<<- MAC, REACH, and EVPN type SISF policy are displayed
```

Verify that EVPN Manager Has Been Updated with the MAC Address Entries

EVPN manager learns local MAC addresses and adds them to Layer 2 RIB. EVPN Manager also learns the remote MAC addresses from Layer 2 RIB, but the entries are only used for processing MAC mobility.

The following examples show how to verify that EVPN manager has been updated with the MAC addresses:

```
VTEP-1# show l2vpn evpn mac evi 10

Verify that EVPN Manager Has Updated the MAC Routes into Layer 2 RIB

Layer 2 RIB learns local MAC addresses from EVPN manager and updates BGP and Layer 2 FIB with them. Layer 2 RIB also learns remote MAC addresses from BGP and updates EVPN manager and Layer 2 FIB with them. Layer 2 RIB needs both local and remote MAC addresses in order to update BGP and Layer 2 FIB.

The following examples show how to verify that EVPN manager has updated the MAC routes into Layer 2 RIB:

```
VTEP-1# show l2route evpn mac
  EVI   ETag   Prod   Mac Address           Next Hop(s) Seq Number
-----+-----+-----+-----+-----+-----+-----+-----+
    10      0 L2VPN 005f.8602.10c6           Tw1/0/1:10      0
<<- Local prefix was added by EVPN Manager (Layer 2 VPN) into Layer 2 RIB
    10      0 BGP    008e.7391.1946           V:10001 10.255.2.1      0
<<- Remote prefix was added by BGP into Layer 2 RIB

VTEP-2# show l2route evpn mac
  EVI   ETag   Prod   Mac Address           Next Hop(s) Seq Number
-----+-----+-----+-----+-----+-----+-----+-----+
    10      0 BGP    005f.8602.10c6           V:10001 10.255.1.1      0
<<- Remote prefix was added by BGP into Layer 2 RIB
    10      0 L2VPN 008e.7391.1946           Gi2/0/1:10      0
<<- Local prefix was added by EVPN Manager (Layer 2 VPN) into Layer 2 RIB
```

Verify that Layer 2 RIB Has Updated BGP with the Local MAC Routes, and that BGP Has Updated Layer 2 RIB with the Remote MAC Routes

The following examples show how to verify that Layer 2 RIB has updated BGP with the local MAC routes and that BGP has updated Layer 2 RIB with the remote MAC routes:

```
VTEP-1# show bgp l2vpn evpn route-type 2 0 005f860210c6 *
```

Verifying Intra-Subnet Traffic Movement in an EVPN VXLAN Layer 2 Overlay Network

    VXLAN_REP nv1:10001:239.10.10.10

  Unicast Address table information :
    008e.7391.1946 VXLAN_CP L:10001:10.255.1.1 R:10001:10.255.2.1
    <<- Remote MAC address is learned (local MAC address is not expected to be present)

  IP Multicast Prefix table information :
    Source: *, Group: 224.0.0.0/24, IIF: Null, Adjacency: Olist: 5109, Ports: 2
    Source: *, Group: 224.0.1.39, IIF: Null, Adjacency: Olist: 5109, Ports: 2
    Source: *, Group: 224.0.1.40, IIF: Null, Adjacency: Olist: 5109, Ports: 2
```

Note Only remote MAC routes are displayed in the output.

Troubleshooting Unicast Forwarding Between VTEPS in Different VLANs Through a Layer 3 VNI

This scenario might occur when host device 1 in VLAN 12 attempts to ping host device 4 in VLAN 13. Perform the checks listed in the following table before troubleshooting unicast forwarding between VTEPs in different VLANs through a Layer 3 VNI:

Table 3: Scenario 3: Troubleshooting Unicast Forwarding Between VTEPS in Different VLANs Through a Layer 3 VNI

Check to be Performed	Steps to Follow
Are the source and destination host devices in different subnets?	Check the subnet of the local host device and compare it against the subnet of the remote host device.

Check to be Performed	Steps to Follow
Do you have an SVI interface configured for the remote subnet?	Run the show ip interface brief exclude unassigned command in privileged EXEC mode on the VTEP.
Do you have the EVPN instance configured on your local VTEP?	Run the following commands in privileged EXEC mode on the VTEP: <ul style="list-style-type: none"> • show run section l2vpn • show run section vlan config • show run interface nve interface-number

To troubleshoot unicast forwarding between two VTEPs in different VLANs using a Layer 3 VNI, follow these steps:

- Verify the provisioning of the EVPN VXLAN Layer 3 overlay network.
- Verify inter-subnet traffic movement and symmetric IRB in the EVPN VXLAN Layer 3 overlay network.

Verifying the Provisioning of an EVPN VXLAN Layer 3 Overlay Network

To verify the provisioning of an EVPN VXLAN Layer 3 overlay network, perform these checks:

1. [Verify that the Access SVIs, Core SVIs, and NVE Interfaces are Up, on page 19](#)
2. [Verify that the IP VRF is Provisioned with the Correct SVIs, Stitching Route-Targets, and Route Distinguisher, on page 20](#)
3. [Verify that Both Layer 2 and Layer 3 VNIs are provisioned in the VRF and are UP, on page 21](#)
4. [Verify that EVPN Manager is Updated from the NVE with all the Layer 2 and IRB Attributes, on page 22](#)
5. [Verify that the Remote Layer 3 VNI Details are Learned on Each VTEP, on page 23](#)
6. [Verify that the Layer 3 VNI Tunnel Pseudoport is Installed into Layer 2 FIB in the Core VLAN, on page 23](#)

Verify that the Access SVIs, Core SVIs, and NVE Interfaces are Up

The following examples show how to verify that the access SVIs, core SVIs, and NVE interfaces are up:

```
VTEP-1# show ip interface brief
Interface          IP-Address      OK? Method Status      Protocol
Vlan10            10.10.10.1    YES NVRAM  up           up
Vlan12            10.12.12.1    YES NVRAM  up           up      <<- Access Interface
Vlan99            10.255.1.1    YES unset   up           up      <<- Core Interface
                                                <<- If protocol status for the core interface is down, run the no autostate command
Loopback0         10.1.1.1       YES NVRAM  up           up
Loopback999        10.255.1.1    YES NVRAM  up           up
Tunnel0           10.255.1.1    YES unset   up           up
```

Verifying the Provisioning of an EVPN VXLAN Layer 3 Overlay Network

```

Tunne11          10.1.1.5      YES unset up      up
nve1            unassigned    YES unset up      up

VTEP-2# show ip interface brief
Interface        IP-Address     OK? Method Status   Protocol
Vlan10           10.10.10.1    YES NVRAM up      up
Vlan13           10.13.13.1    YES NVRAM up      up      <<- Access Interface
Vlan99           10.255.2.1    YES unset up      up      <<- Core Interface
<<- If protocol status for the core interface is down, run the no autostate command
Loopback0        10.2.2.2      YES NVRAM up      up
Loopback999      10.255.2.1    YES NVRAM up      up
Tunne10          10.255.2.1    YES unset up      up
Tunne11          10.1.1.10    YES unset up      up

```

Verify that the IP VRF is Provisioned with the Correct SVIs, Stitching Route-TARGETs, and Route Distinguisher

The following examples show how to verify that the IP VRF is provisioned with the correct SVIs, stitching route-targets, and route distinguisher:

```

VTEP-1# show run vrf vxlan      <<- vxlan is the name of the VRF
vrf definition vxlan
rd 10.255.1.1:1
!
address-family ipv4
  route-target export 10.255.1.1:1 stitching      <<- Exporting local route-target
  route-target import 10.255.2.1:1 stitching       <<- Importing VTEP-2 route-target

```

```

VTEP-1# show ip vrf vxlan      <<- vxlan is the name of the VRF
Name                  Default RD      Interfaces
vxlan                10.255.1.1:1  Vl10
                           Vl12
                           Vl19

```

```

VTEP-1# show ip vrf detail vxlan  <<- vxlan is the name of the VRF

Verifying Inter-Subnet Traffic Movement and Symmetric IRB in an EVPN VXLAN Layer 3 Overlay Network

The following figure illustrates the movement of traffic from host devices connected to VTEP 1 to host devices connected to VTEP 2:

Figure 4: Movement of traffic in an EVPN VXLAN network through Layer2 and Layer 3 VNIs

356470

In the above figure, Layer 3 traffic moves from host device 1 to host device 4 through the Layer 3 VNI 99999. To verify the movement of inter-subnet traffic in the EVPN VXLAN Layer 3 overlay network, perform these checks:

1. Verify that Local MAC Address and IP Address Entries are Learned in SISF Device Tracking Table, on page 25
2. Verify that MAC Address and IP Address Entries are Learned in EVPN Manager, on page 26
3. Verify that MAC Address and IP Address Entries are Learned in Layer 2 RIB, on page 27
4. Verify that Local MAC Address and IP Address Entries are Learned in MAC VRF, on page 27
5. Verify that Remote MAC-IP Address Pair is Learned in the VRF, on page 28
6. Verify that IP Routes are Inserted in RIB, on page 29
7. Verify that the Adjacency Table Contains Entries for the VRF-Enabled Core VLAN Interface, on page 29
8. Confirm that Adjacency Exists to the VTEP Tunnel IP Address for a Host Device in IP VRF, on page 30
9. Confirm that Adjacency Exists to Reach Tunnel Destination, on page 30
10. Confirm that the ICMP Echo Request that Leaves Encapsulated from the Source VTEP Reaches the Loopback Tunnel Endpoint and UDP Destination Port on the Destination VTEP Through the Layer 3 VNI and IP VRF, on page 30

Verify that Local MAC Address and IP Address Entries are Learned in SISF Device Tracking Table

The following examples show how to verify that local MAC address and IP address entries are learned in SISF device tracking table:

```
VTEP-1# show device-tracking database vlanid 12
Binding Table has 4 entries, 2 dynamic (limit 100000)
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
```

Verifying Inter-Subnet Traffic Movement and Symmetric IRB in an EVPN VXLAN Layer 3 Overlay Network

```
Preflevel flags (prlvl):
0001:MAC and LLA match      0002:Orig trunk          0004:Orig access
0008:Orig trusted trunk     0010:Orig trusted access  0020:DHCP assigned
0040:Cga authenticated       0080:Cert authenticated   0100:Statically assigned
```

Network Layer Address state	Link Layer Address Time left	Interface	vlan	prlvl	age
ARP 10.12.12.12 REACHABLE		005f.8602.10e7 Tw1/0/1		12	0005 115s
N/A					

```
VTEP-2# show device-tracking database vlanid 13
vlanDB has 2 entries for vlan 13, 1 dynamic
Codes: L - Local, S - Static, ND - Neighbor Discovery, ARP - Address Resolution Protocol,
DH4 - IPv4 DHCP, DH6 - IPv6 DHCP, PKT - Other Packet, API - API created
Preflevel flags (prlvl):
0001:MAC and LLA match      0002:Orig trunk          0004:Orig access
0008:Orig trusted trunk     0010:Orig trusted access  0020:DHCP assigned
0040:Cga authenticated       0080:Cert authenticated   0100:Statically assigned
```

Network Layer Address state	Link Layer Address Time left	Interface	vlan	prlvl	age
ARP 10.13.13.13 REACHABLE		008e.7391.1977 Gi2/0/1		13	0005 155s
N/A					

Verify that MAC Address and IP Address Entries are Learned in EVPN Manager

The following examples show how to verify that MAC address and IP address entries are learned in EVPN manager:

```
VTEP-1# show 12vpn evpn mac ip evi 12

Troubleshooting Unicast Forwarding Between a VXLAN Network and an IP Network

This scenario might occur when host device 1 attempts to ping an external IP address through a border leaf VTEP. Perform the checks listed in the following table before troubleshooting unicast forwarding between a VXLAN network and an external IP network.

Table 4: Scenario 4: Troubleshooting Unicast Forwarding Between a VXLAN Network and an IP Network

Check to be performed	Steps to follow
Is one IP address present in the VXLAN network and the other IP address coming from external IP network?	<p>Check the local subnets (or the SVI interfaces) if the remote subnet is present.</p> <p>Note Local subnet has the remote subnet listed even in the case of scenario 3.</p>
Is the EVPN route type 5 being used to send traffic to remote destination?	Run the show bgp l2vpn evpn all command in privileged EXEC mode on the VTEP. Look for remote prefix to be displayed as [5] for route type 5.

To troubleshoot unicast forwarding between a VXLAN network and an external IP network, follow these steps:

- Verify the provisioning of the EVPN VXLAN Layer 3 overlay network.
- Verify traffic movement from the VXLAN network to the IP network through the border leaf switch using route type 5.

Verifying the Provisioning of an EVPN VXLAN Layer 3 Overlay Network

See [Verifying the Provisioning of an EVPN VXLAN Layer 3 Overlay Network, on page 19](#) for detailed steps.

Verifying Traffic from a VXLAN Fabric to an IP Network Through a Border Leaf Switch Using Route Type 5

To verify the movement of traffic from a VXLAN fabric to an external IP network through a border leaf switch, perform these checks:

1. [Check the Table Entries for BGP, EVPN, and VPNv4 Tables, on page 31](#)
2. [Check the Table Entries for BGP, EVPN, and VPNv4 Tables, on page 31](#)
3. [Confirm that Adjacency exists to Reach Tunnel Destination, on page 34](#)

Check the Table Entries for BGP, EVPN, and VPNv4 Tables

The following examples show how to check the table entries for BGP, EVPN and VPNv4 tables:

Verifying Traffic from a VXLAN Fabric to an IP Network Through a Border Leaf Switch Using Route Type 5

```

Note To check if IP routes have been inserted into CEF table, run the **show ip route vrf vrf-name** command in privileged EXEC mode.

Confirm that Adjacency Exists to the VTEP Tunnel IP Address for the Host Device in IP VRF

The following examples show how to confirm that adjacency exists to the VTEP Tunnel IP address for the host device in IP VRF:

```

VTEP-1# show ip cef vrf vxlan 10.9.9.9/32 platform
10.9.9.9/32
Platform adj-id: 0x1A, 0x0, tun_qos_dpidx:0 <<- Adjacency ID to remote IP address

VTEP-1# show platform software fed sw ac matm macTable vlan 99
VLAN   MAC           Type  Seq#  EC_Bi  Flags  machandle          siHandle
      riHandle        diHandle
                           *a_time *e_time ports
-----+-----+-----+-----+-----+-----+-----+-----+
  99    7035.0956.7edd  0x8002    0     0      64  0x7ffa48d61be8  0x7ffa48d630b8
        0x0            0x5154          0          0  Vlan99
  99    7486.0bc4.b75d  0x1000001   0     0      64  0x7ffa48fb1bb8  0x7ffa48fac698
        0x7ffa48fab038  0x7ffa4838cc18          0          0  RLOC 10.255.2.1 adj_id
 103   ec1d.8b55.f55d  0x1000001   0     0      64  0x7ffa48d065e8  0x7ffa48d01d08
        0x7ffa48c9a618  0x7ffa4838cc18          0          0  RLOC 10.255.1.11 adj_id

```

Confirm that Adjacency exists to Reach Tunnel Destination

The following example shows how to confirm that adjacency exists to reach Tunnel destination:

```
VTEP-1# show ip cef 10.255.1.11  
10.255.1.11/32  
nexthop 10.1.1.6 TwoGigabitEthernet1/0/2
```

Troubleshooting Tenant Routed Multicast

See [Troubleshoot EVPN VxLAN TRM on Catalyst 9000 Switches](#) document to learn how to troubleshoot issues with TRM in a BGP EVPN VXLAN fabric.
