Configuring IPv6 VPN Provider Edge over MPLS (6VPE)

Configuring 6VPE

This section provides information about Configuring 6VPE on the switch.

Restrictions for 6VPE

- Inter-AS and carrier supporting carrier (CSC) is not supported.

- VRF Route-Leaking is not supported.

- eBGP as CE-PE is not supported.

- EIGRP, OSPFv3, RIP, ISIS, Static Routes are supported as CE-PE.

- MPLS Label Allocation modes supported are Per-VRF and Per-Prefix. Per-Prefix is the default mode.

- Cisco Catalyst 9500X Series Switches only support the per-VRF MPLS label allocation mode for local label allocation. This is also the default mode. However, Cisco Catalyst 9500X Series Switches can interoperate with remote peers operating in the per-prefix mode.

- IP fragmentation is not supported in the Per-Prefix mode of Layer 3 VPN.

- DHCPv6 is not supported on a 6VPE topology with per-port trust enabled.

Information About 6VPE

6VPE is a mechanism to use the IPv4 backbone to provide VPN IPv6 services. It takes advantage of operational IPv4 MPLS backbones, eliminating the need for dual-stacking within the MPLS core. This translates to savings in operational costs and addresses the security limitations of the 6PE approach. 6VPE is more like a regular IPv4 MPLS-VPN provider edge, with an addition of IPv6 support within VRF. It provides logically separate routing table entries for VPN member devices.

Components of MPLS-based 6VPE Network

- VPN route target communities – A list of all other members of a VPN community.

- Multiprotocol BGP (MP-BGP) peering of VPN community PE routers – Propagates VRF reachability information to all members of a VPN community.

- MPLS forwarding – Transports all traffic between all VPN community members across a VPN service-provider network.

In the MPLS-VPN model a VPN is defined as a collection of sites sharing a common routing table. A customer site is connected to the service provider network by one or more interfaces, where the service provider associates each interface with a VPN routing table–known as the VRF table.

Configuration Examples for 6VPE

Figure 1: 6VPE Topology
PE Configuration

PE Configuration

```
vrf definition 6VPE-1

Feature History for IPv6 VPN Provider Edge over MPLS (6VPE)

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.6.1	IPv6 VPN Provider Edge over MPLS (6VPE)	IPv6 VPN Provider Edge over MPLS (6VPE) is a mechanism to use the IPv4 backbone to provide VPN IPv6 services. It takes advantage of operational IPv4 MPLS backbones, eliminating the need for dual-stacking within the MPLS core. Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Cupertino 17.7.1	IPv6 VPN Provider Edge over MPLS (6VPE)	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.

Use Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn.
