Restrictions for Configuring IPv6 Support for LDAP

- Only bind, search, and compare operations are supported.
- The Lightweight Directory Access Protocol (LDAP) referrals are not supported.
- Unsolicited messages or notifications from LDAP server are not handled.

Information About Configuring IPv6 Support for LDAP

IPv6 Support for LDAP

To support Lightweight Directory Access Protocol (LDAP) over IPv6, changes are made to authentication, authorization and accounting (AAA) transactions in terms of authentication and authorization while communicating over an IPv6 network. In order to support LDAP over an IPv6 network, transport calls have been modified to support both IPv4 and IPv6 based on the server configuration.

Transport Layer Security

Transport Layer Security (TLS) is an application-level protocol that enables secure transactions of data through privacy, authentication, and data integrity. It relies upon certificates, public keys, and private keys for clients to prove the identity. Certificates are issued by Certificate Authorities (CAs). Each certificate includes the name of the authority that issued it, the name of the entity to which the certificate was issued, the entity's public key, and time stamps that indicate the certificate's expiration date. TLS support for LDAP is mentioned in RFC 2830 as an extension to the LDAP protocol.

LDAP Operations

Bind

The bind operation is used to authenticate a user to the server. It is used to start a connection with the LDAP server. LDAP is a connection-oriented protocol. The client specifies the protocol version and the client authentication information. LDAP supports the following binds:

- · Authenticated bind
- Anonymous bind

An authenticated bind is performed when a root distinguished name (DN) and password are available. In the absence of a root DN and password, an anonymous bind is performed. In LDAP deployments, the search operation is performed first and the bind operation later. This is because, if a password attribute is returned as part of the search operation, the password verification can be done locally on an LDAP client. Thus, there is no need to perform an extra bind operation. If a password attribute is not returned, the bind operation can be performed later. Another advantage of performing a search operation first and a bind operation later is that the DN received in the search result can be used as the user DN instead of forming a DN by prefixing the username (cn attribute) with the base DN. All entries stored in an LDAP server have a unique DN. The DN consists of two parts: the Relative Distinguished Name (RDN) and the location within the LDAP server where the record resides.

Most of the entries that you store in an LDAP server will have a name, and the name is frequently stored in the Common Name (cn) attribute. Because every object has a name, most objects you store in an LDAP will use their cn value as the basis for their RDN.

Compare

The compare operation is used to replace a bind request with a compare request for an authentication. The compare operation helps to maintain the initial bind parameters for the connection.

Search

A search operation is used to search the LDAP server. The client specifies the starting point (base DN) of the search, the search scope (either the object, its children, or the subtree rooted at the object), and a search filter.

For authorization requests, the search operation is directly performed without a bind operation. The LDAP server can be configured with certain privileges for the search operation to succeed. This privilege level is established with the bind operation.

An LDAP search operation can return multiple user entries for a specific user. In such cases, the LDAP client returns an appropriate error code to AAA. To avoid these errors, appropriate search filters that help to match a single entry must be configured.

How to Configure IPv6 Support for LDAP

Configuring Device-to-LDAP Server Communication

The Lightweight Directory Access Protocol (LDAP) host is a multiuser system running LDAP server software, such as Active Directory (Microsoft) and OpenLDAP. Configuring device-to-LDAP server communication can have several components:

- · Hostname or IP address
- Port number
- · Timeout period
- Base distinguished name (DN)

To configuring Device-to-LDAP server communication, perform this procedure:

Procedure

	Command or Action	Purpose	
Step 1	enable	Enables privileged EXEC mode.	
	Example:	Enter your password if prompted.	
	Device> enable		
Step 2	configure terminal	Enters global configuration mode.	
	Example:		
	Device# configure terminal		
Step 3	aaa new-model	Enables AAA.	
	Example:		
	Device(config)# aaa new-model		
Step 4	ldap server name	Configures a device as an LDAP protocol an	
	Example:	enters LDAP server configuration mode.	
	Device(config)# ldap server server1		
Step 5	ipv6 ipv6-address	Specifies an IPv6 address to the LDAP server.	
	Example:		
	Device(config-ldap-server)# ipv6 2001:DB8:0:0:8:800		

	Command or Action	Purpose
Step 6	transport port port-number Example:	Configures the transport protocol for connecting to the LDAP server.
	Device(config-ldap-server)# transport port 200	
Step 7	<pre>timeout retransmit seconds Example: Device(config-ldap-server) # timeout retransmit 20</pre>	Specifies the number of seconds a device waits for a reply to an LDAP request before retransmitting the request.
Step 8	<pre>exit Example: Device(config-ldap-server)# exit</pre>	Exits the LDAP server configuration mode and enters global configuration mode.

Configuring LDAP Protocol Parameters

To configure LDAP protocol parameters, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	aaa	Enables AAA.
	Example:	
	Device(config)# aaa new-model	
Step 4	ldap server name	Defines a Lightweight Directory Access
	Example:	Protocol (LDAP) server and enters LDAP server configuration mode.
	Device(config)# ldap server server1	
Step 5	bind authenticate root-dn password [0 string 7 string] string	Specifies a shared secret text string used between the device and an LDAP server. Use

	Command or Action	Purpose
	Example: Device(config-ldap-server) # bind authenticate root-dn "Gradministrator,Grusers,Gb-nac-blr2,Gb-example,Gb-cor password"	the 0 line option to configure an unencrypted shared secret. Use the 7 line option to configure an encrypted shared secret.
Step 6	<pre>search-filter user-object-type string Example: Device(config-ldap-server) # search-filter user-object-type string1</pre>	Specifies the search filter to be used in the search requests.
Step 7	<pre>base-dn string Example: Device(config-ldap-server) # base-dn "dc=sns,dc=example,dc=com"</pre>	Specifies the base distinguished name (DN) of the search.
Step 8	mode secure [no-negotiation] Example: Device (config-ldap-server) # mode secure no-negotiation	Configures LDAP to initiate the transport layer security (TLS) connection and specifies the secure mode.
Step 9	secure cipher 3des-ede-cbc-sha Example: Device(config-ldap-server) # secure cipher 3des-ede-cbc-sha	Specifies the ciphersuite in the case of a secure connection.
Step 10	<pre>exit Example: Device(config-ldap-server)# exit</pre>	Exits LDAP server configuration mode and enters global configuration mode.

Configuring Search and Bind Operations for an Authentication Request

To configure search and bind operations for an authentication request, perform this procedure:

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	aaa new-model	Enables AAA.
	Example:	
	Device(config)# aaa new-model	
Step 4	ldap server name	Defines a Lightweight Directory Access
	Example:	Protocol (LDAP) server and enter LDAP server configuration mode.
	Device(config)# ldap server server1	
Step 5	authentication bind-first	Configures the sequence of search and bind
	Example:	operations for an authentication request.
	<pre>Device(config-ldap-server) # authentication bind-first</pre>	
Step 6	authentication compare	Replaces the bind request with the compare
	Example:	request for authentication.
	<pre>Device(config-ldap-server) # authentication compare</pre>	
Step 7	exit	Exits LDAP server configuration mode.
	Example:	
	Device(config-ldap-server)# exit	

Monitoring and Maintaining LDAP Scalability Enhancements

The following **show** and **debug** commands can be entered in any order.

Procedure

Step 1 enable

Example:

> enable

Enables privileged EXEC mode.

Enter your password if prompted.

Step 2 configure terminal

Example:

configure terminal

Enters global configuration mode.

Step 3 clear ldap server

Clears the Lightweight Directory Access Protocol (LDAP) server of the TCP connection.

Example:

clear ldap server

Step 4 debug ldap

Displays information associated with LDAP.

Example:

debug ldap

Step 5 show ldap server

Displays the LDAP server state information and various other counters for the server.

Example:

show ldap server

Step 6 show Idap attributes

Displays information about default LDAP attribute mapping.

Example:

Device# show ldap attributes

LDAP Attribute	Format	AAA Attribute
=========	=====	=========
airespaceBwDataBurstContract userPassword	Ulong String	bsn-data-bandwidth-burst-contr password
airespaceBwRealBurstContract	Ulong	bsn-realtime-bandwidth-burst-c
employeeType	String	employee-type
airespaceServiceType	Ulong	service-type
airespaceACLName	String	bsn-acl-name
priv-lvl	Ulong	priv-lvl
memberOf	String DN	supplicant-group
cn	String	username
airespaceDSCP	Ulong	bsn-dscp
policyTag	String	tag-name
airespaceQOSLevel	Ulong	bsn-qos-level
airespace8021PType	Ulong	bsn-8021p-type
airespaceBwRealAveContract	Ulong	bsn-realtime-bandwidth-average
airespaceVlanInterfaceName	String	bsn-vlan-interface-name
airespaceVapId	Ulong	bsn-wlan-id
airespaceBwDataAveContract	Ulong	bsn-data-bandwidth-average-con
sAMAccountName	String	sam-account-name
meetingContactInfo	String	contact-info

Configuration Examples of IPv6 Support for LDAP

Example: Device-to-LDAP Server Communication

The following example shows how to create server group server1 and specify the IP address, transport port 200, and retransmit values:

```
Device> enable

Device# configure terminal

Device(config)# aaa new-model

Device(config)# ldap server server1

Device(config-ldap-server)# ipv6 2001:DB8:0:0:8:800

Device(config-ldap-server)# transport port 200

Device(config-ldap-server)# timeout retransmit 20

Device(config-ldap-server)# exit
```

Example: LDAP Protocol Parameters

The following example shows how to configure Lightweight Directory Access Protocol (LDAP) parameters:

```
Device> enable

Device# configure terminal

Device(config)# aaa new-model

Device(config)# ldap server server1

Device(config-ldap-server)# bind authenticate root-dn

"cn=administrator,cn=users,dc=nac-blr2,dc=example,dc=com password"

Device(config-ldap-server)# base-dn "dc=sns,dc=example,dc=com"

Device(config-ldap-server)# mode secure no-negotiation

Device(config-ldap-server)# secure cipher 3des-ede-cbc-sha

Device(config-ldap-server)# exit
```

Example: Search and Bind Operations for an Authentication Request

The following example shows how to configure the sequence of search and bind operations for an authentication request:

```
Device> enable
Device# configure terminal
Device(config)# aaa new-model
Device(config)# ldap server server1
Device(config-ldap-server)# authentication bind-first
Device(config-ldap-server)# authentication compare
Device(config-ldap-server)# exit
```

Example: Server Information from an LDAP Server

The following is sample output from an LDAP server:

```
Device# show ldap server all
Server Information for server1
Server name
                       :server1
                       :2001:DB8:0:0:8:800
Server TP
Server listening Port :389
Connection status :DOWN
                       :No Bind
Root Bind status
                       :Non-Secure
 Server mode
Cipher Suite :0x00
Authentication Seq :Search first. Then Bind/Compare
                                                           password next
Authentication Procedure :Bind with user password
Request timeout :30
 * LDAP STATISTICS *
Total messages [Sent:0, Received:0]
Response delay(ms) [Average:0, Maximum:0]
Total search [Request:0, ResultEntry:0, ResultDone:0]
Total bind
               [Request:0, Response:0]
Total extended [Request:0, Response:0]
Total compare [Request:0, Response:0]
Search [Success:0, Failures:0]
Bind [Success:0, Failures:0]

Feature History for IPv6 Support for LDAP

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Fuji 16.8.1a	IPv6 Support for LDAP	The IPv6 Support for LDAP feature describes IPv6 transport support for the LDAP protocol by introducing changes in authentication, authorization, and accounting (AAA) transactions. Support for this feature was introduced on the C9500-32C, C9500-32QC, C9500-48Y4C, and C9500-24Y4C models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Cupertino 17.7.1	IPv6 Support for LDAP	Support for this feature was introduced on the C9500X-28C8D model of Cisco Catalyst 9500 Series Switches.

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn.
