Information About Application Visibility and Control in a Wired Network

Application Visibility and Control (AVC) is a critical part of Cisco's efforts to evolve its Branch and Campus solutions from being strictly packet and connection based to being application-aware and application-intelligent. Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition (NBAR2) engine. AVC can be configured on wired access ports for standalone switches. NBAR2 can be activated either explicitly on the interface by enabling protocol-discovery or implicitly by attaching a QoS policy that contains **match protocol** classifier. Wired AVC Flexible NetFlow (FNF) can be configured on an interface to provide client, server and application statistics per interface. The record is similar to **application-client-server-stats** traffic monitor which is available in **application-statistics** and **application-performance** profiles in Easy Performance Monitor (Easy perf-mon or ezPM).

Supported AVC Class Map and Policy Map Formats

This section describbes the supported ave class maps and policy map formats.

Supported AVC Class Map Format

Class Map Format	Class Map Example	Direction
match protocol protocol name	class-map match-any NBAR-VOICE match protocol ms-lync-audio	Both ingress and egress
Combination filters	class-map match-any NBAR-VOICE match protocol ms-lync-audio match dscp ef	Both ingress and egress

Supported AVC Policy Format

Policy Format	QoS Action
Egress policy based on match protocol filter	Mark and police
Ingress policy based on match protocol filter	Mark and police

The following table describes the detailed AVC policy format with an example:

AVC Policy Format	AVC Policy Example	Direction
Basic set	policy-map MARKING-IN class NBAR-MM_CONFERENCING set dscp af41	Ingress and egress
Basic police	policy-map POLICING-IN class NBAR-MM_CONFERENCING police cir 600000 set dscp af41	Ingress and egress
Basic set and police	policy-map webex-policy class webex-class set dscp ef police 5000000	Ingress and egress
Multiple set and police including default	policy-map webex-policy class webex-class set dscp af31 police 4000000 class class-webex-category set dscp ef police 6000000 class class-default set dscp <>	Ingress and egress

AVC Policy Format	AVC Policy Example	Direction
Hierarchical police	policy-map webex-policy class webex-class police 5000000 service-policy client-in-police-only policy-map client-in-police-only class webex-class police 100000 class class-webex-category set dscp ef police 200000	Ingress and egress
Hierarchical set and police	policy-map webex-policy class class-default police 1500000 service policy client-up-child policy-map client-up-child class webex-class police 100000 set dscp ef class class-webex-category police 200000 set dscp af31	

Restrictions for Wired Application Visibility and Control

- AVC and Encrypted Traffic Analytics (ETA) cannot be configured together at the same time on the same interface.
- NBAR and transmit (Tx) Switched Port Analyzer (SPAN) is not supported on the same interface.
- Only one of the NBAR based QoS mechanisms are allowed to be attached to any port at the same time, either protocol based or attributes based. Only the following two attributes are supported:
 - traffic-class
 - business-relevance
- The legacy WDAVC QoS limitations are still applicable:
 - Only marking and policing are supported.
 - Only physical interfaces are supported.
 - There is a delay in the QoS classification since the application classification is done offline (while the initial packet/s of the flow are meanwhile forwarded before the correct QoS classification).
- NBAR2 based match criteria **match protocol** will be allowed only with marking or policing actions. NBAR2 match criteria will not be allowed in a policy that has queuing features configured.
- 'Match Protocol': up to 255 concurrent different protocols in all policies (8 bits HW limitation).
- AVC is not supported on management port (Gig 0/0).

- IPv6 packet classification is not supported.
- Only IPv4 unicast(TCP/UDP) is supported.
- Web UI: You can configure application visibility and perform application monitoring from the Web UI. Application Control can only be done using the CLI. It is not supported on the Web UI.

To manage and check wired AVC traffic on the Web UI, you must first configure **ip http authentication local** and **ip nbar http-service** commands using the CLI.

- NBAR and ACL logging cannot be configured together on the same switch.
- Protocol-discovery, application-based QoS, and wired AVC FNF cannot be configured together at the same time on the same interface with the non-application-based FNF. However, these wired AVC features can be configured with each other. For example, protocol-discovery, application-based QoS and wired AVC FNF can be configured together on the same interface at the same time.
- Starting with Cisco IOS XE Fuji 16.9.1, up to two wired AVC monitors each with a different predefined record can be attached to an interface at the same time.
- Two new directional flow records ingress and egress have been introduced in Cisco IOS XE Fuji 16.9.1, in addition to the two existing legacy flow records.
- Attachment should be done only on physical Layer 2 and Layer 3 ports, and these ports cannot be part of a port channel. Attachment to trunk ports are not supported.
- Performance: Each switch member is able to handle 2000 connections per second (CPS) at less than 50% CPU utilization.
- Scale: Able to handle up to 20,000 bi-directional flows per 48 access ports and 10,000 bi-directional flows per 24 access ports. (~200 flows per access port).
- Wired AVC allows only the fixed set of fields listed in the procedures of this chapter. Other combinations are not allowed. For a regular FNF flow monitor, other combinations are allowed (for the list of supported FNF fields, refer the "Configuring Flexible NetFlow" chapter of the *Network Management Configuration Guide*).
- Starting with Cisco IOS XE 16.12.1 release, a new flow record has been included the DNS flow record. The DNS flow record is similar to the 5-tuple record and includes the DNS domain name field. It accounts only for DNS related fields. This record doesn't have the interface field as a match filed, so the information from all interfaces is aggregated into the same record.

How to Configure Application Visibility and Control

Configuring Application Visibility and Control in a Wired Network

To configure application visibility and control on wired ports, follow these steps:

Configuring Visibility:

 Activate NBAR2 engine by enabling protocol-discovery on the interface using the ip nbar protocol-discovery command in the interface configuration mode. See the section, "Enabling Application Recognition on an Interface." Configuring Control: Configure QoS policies based on application by

- 1. Creating an AVC QoS policy. See the section, "Creating AVC QoS Policy".
- 2. Applying AVC QoS policy to the interface. See the section, "Applying a QoS Policy to the Switch Port".

Configuring application-based Flexible Netflow:

- Create a flow record by specifying key and non-key fields to the flow.
- Create a flow exporter to export the flow record.
- Create a flow monitor based on the flow record and the flow exporter.
- Attach the flow monitor to the interface.

Protocol-Discovery, application-based QoS and application-based FNF are all independent features. They can be configured independently or together on the same interface at the same time.

Enabling Application Recognition on an interface

To enable application recognition on an interface, follow these steps:

Command or Action	Purpose
configure terminal	Enters global configuration mode.
Example:	
Device# configure terminal	
interface interface-id	Specifies the interface for which you are
Example:	enabling protocol-discovery and enters interface configuration mode.
Device(config) # interface gigabitethernet 1/0/1	
ip nbar protocol-discovery	Enables application recognition on the interface
Example:	by activating NBAR2 engine.
<pre>Device(config-if) # ip nbar protocol-discovery</pre>	
end	Returns to privileged EXEC mode.
Example:	
Device(config-if)# end	
	configure terminal Example: Device# configure terminal interface interface-id Example: Device(config)# interface gigabitethernet 1/0/1 ip nbar protocol-discovery Example: Device(config-if)# ip nbar protocol-discovery end Example:

Creating AVC QoS Policy

To create AVC QoS policy, perform these general steps:

- 1. Create a class map with match protocol filters.
- 2. Create a policy map.
- **3.** Apply the policy map to the interface.

Creating a Class Map

You need to create a class map before configuring any match protocol filter. The QoS actions such as marking and policing can be applied to the traffic. The AVC match protocol filters are applied to the wired access ports. For more information about the protocols that are supported, see http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos nbar/prot lib/config library/nbar-prot-pack-library.html.

Procedure

	Command or Action	Purpose
Step 1	terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 2	class-map class-map-name	Creates a class map.
	Example:	
	Device(config)# class-map webex-class	
Step 3	match protocol application-name	Specifies match to the application name.
	Example:	
	Device(config) # class-map webex-class Device(config-cmap) # match protocol webex-media	
Step 4	end	Returns to privileged EXEC mode.
	Example:	Alternatively, you can also press Ctrl-Z to exit
	Device(config)# end	global configuration mode.

Creating a Policy Map

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	

	Command or Action	Purpose
Step 2	policy-map policy-map-name Example:	Creates a policy map by entering the policy map name, and enters policy-map configuration mode.
	Device(config)# policy-map webex-policy	By default, no policy maps are defined.
		The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed.
		Note To delete an existing policy map, use the no policy-map policy-map-name global configuration command.
Step 3	class [class-map-name class-default] Example:	Defines a traffic classification, and enters policy-map class configuration mode.
	Device(config-pmap)# class webex-class	By default, no policy map and class maps are defined.
		If a traffic class has already been defined by using the class-map global configuration command, specify its name for <i>class-map-name</i> in this command.
		A class-default traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied match any is included in the class-default class, all packets that have not already matched the other traffic classes will match class-default.
		Note To delete an existing class map, use the no class class-map-name policy-map configuration command.
Step 4	police rate-bps burst-byte	Defines a policer for the classified traffic.
	Example:	By default, no policer is defined.
	Device(config-pmap-c)# police 100000 80000	• For <i>rate-bps</i> , specify an average traffic rate in bits per second (b/s). The range is 8000 to 10000000000.
		• For <i>burst-byte</i> , specify the normal burst size in bytes. The range is 1000 to 512000000.

	Command or Action	Purpose
Step 5	<pre>set {dscp new-dscp cos cos-value} Example: Device(config-pmap-c) # set dscp 45</pre>	Classifies IP traffic by setting a new value in the packet. • For dscp <i>new-dscp</i> , enter a new DSCP value to be assigned to the classified traffic. The range is 0 to 63.
Step 6	<pre>end Example: Device(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Applying a QoS Policy to the switch port

Procedure

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 2	interface interface-id	Enters the interface configuration mode.
	Example:	
	Device (config) # interface Gigabitethernet 1/0/1	
Step 3	service-policy input policymapname	Applies local policy to interface.
	Example:	
	<pre>Device(config-if)# service-policy input MARKING_IN</pre>	
Step 4	end	Returns to privileged EXEC mode.
	Example:	Alternatively, you can also press Ctrl-Z to exit
	Device(config)# end	global configuration mode.

Configuring Wired AVC Flexible Netflow

Creating a Flow Record

Wired AVC FNF supports two types of predefined flow records — Legacy Bidirectional flow records and Directional flow records (ingress and egress). A total of four different predefined flow records, two bidirectional flow records and two directional flow records, can be configured and associated with a flow monitor. The legacy bidirectional records are client/server application statistics records, and the new directional records are application-stats for input/output.

Bidirectional Flow Records

Flow Record 1 - Bidirectional Flow Record

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 2	flow record flow_record_name	Enters flow record configuration mode.
	Example:	
	Device(config)# flow record fr-wdavc-1	
Step 3	description description	(Optional) Creates a description for the flow
	Example:	record.
	Device(config-flow-record)# description fr-wdavc-1	
Step 4	match ipv4 version	Specifies a match to the IP version from the
	Example:	IPv4 header.
	<pre>Device(config-flow-record)# match ipv4 version</pre>	
Step 5	match ipv4 protocol	Specifies a match to the IPv4 protocol.
	Example:	
	<pre>DEvice(config-flow-record)# match ipv4 protocol</pre>	
Step 6	match application name	Specifies a match to the application name.
	Example:	Note This action is mandatory for
	<pre>Device(config-flow-record)# match application name</pre>	AVC support, as this allows the flow to be matched against the application.
Step 7	match connection client ipv4 address	Specifies a match to the IPv4 address of the
	Example:	client (flow initiator).
	Device(config-flow-record)# match connection client ipv4 address	
Step 8	match connection server ipv4 address	Specifies a match to the IPv4 address of the
	Example:	server (flow responder).
	Device(config-flow-record)# match connection server ipv4 address	
Step 9	match connection server transport port	Specifies a match to the transport port of the
	Example:	server.

	Command or Action	Purpose
	Device(config-flow-record) # match connection server transport port	
Step 10	<pre>match flow observation point Example: Device(config-flow-record) # match flow observation point</pre>	Specifies a match to the observation point ID for flow observation metrics.
Step 11	<pre>collect flow direction Example: Device(config-flow-record)# collect flow direction</pre>	Specifies to collect the direction — Ingress or Egress — of the relevant side — Initiator or Responder — of the bi-directional flow that is specified by the initiator keyword in the collect connection initiator command in the step below. Depending on the value specified by the initiator keyword, the flow direction keyword takes the following values: • 0x01 = Ingress Flow • 0x02 = Egress Flow When the initiator keyword is set to initiator, the flow direction is specified from the initiator side of the flow. When the initiator keyword is set to responder, the flow direction is specified from the responder side of the flow. For wired AVC, the initiator keyword is always set to initiator.
Step 12	<pre>collect connection initiator Example: Device(config-flow-record) # collect connection initiator</pre>	Specifies to collect the side of the flow — Initiator or Responder — relevant to the direction of the flow specified by the collect flow direction command. The initiator keyword provides the following information about the direction of the flow: • 0x01 = Initiator - the flow source is the initiator of the connection For wired AVC, the initiator keyword is always set to initiator.
Step 13	<pre>collect connection new-connections Example: Device(config-flow-record) # collect connection new-connections</pre>	Specifies to collect the number of connection initiations observed.
Step 14	collect connection client counter packets long Example:	Specifies to collect the number of packets sent by the client.

	Command or Action	Purpose
	Device(config-flow-record)# collect connection client counter packets long	
Step 15	collect connection client counter bytes network long	Specifies to collect the total number of bytes transmitted by the client.
	Example:	
	<pre>Device(config-flow-record) # collect connection client counter bytes network long</pre>	
Step 16	collect connection server counter packets long	Specifies to collect the number of packets sent by the server.
	Example:	
	Device(config-flow-record)# collect connection server counter packets long	
Step 17	collect connection server counter bytes network long	Specifies to collect the total number of bytes transmitted by the server.
	Example:	
	<pre>Device(config-flow-record) # collect connection server counter bytes network long</pre>	
Step 18	collect timestamp absolute first	Specifies to collect the time, in milliseconds,
	Example:	when the first packet was seen in the flow.
	<pre>Device(config-flow-record) # collect timestamp absolute first</pre>	
Step 19	collect timestamp absolute last	Specifies to collect the time, in milliseconds,
	Example:	when the most recent packet was seen in the
	Device(config-flow-record)# collect	flow.
	timestamp absolute last	
Step 20	end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exglobal configuration mode.
	Example:	
	Device(config)# end	groom comigaturion mode.
Step 21	show flow record	Displays information about all the flow
	Example:	records.
	Device# show flow record	

Flow Record 2 - Bidirectional Flow Record

Command or Action	Purpose
configure terminal	Enters global configuration mode.
Example:	
Device# configure terminal	
flow record flow_record_name	Enters flow record configuration mode.
Example:	
Device(config)# flow record fr-wdavc-1	
description description	(Optional) Creates a description for the flow
Example:	record.
Device(config-flow-record)# description fr-wdavc-1	
match ipv4 version	Specifies a match to the IP version from the
Example:	IPv4 header.
<pre>Device(config-flow-record) # match ipv4 version</pre>	
match ipv4 protocol	Specifies a match to the IPv4 protocol.
Example:	
Device(config-flow-record)# match ipv4 protocol	
match application name	Specifies a match to the application name.
Example:	Note This action is mandatory for
<pre>Device(config-flow-record) # match application name</pre>	AVC support, as this allows the flow to be matched against the application.
match connection client ipv4 address	Specifies a match to the IPv4 address of the
Example:	client (flow initiator).
Device(config-flow-record) # match connection client ipv4 address	
match connection client transport port	(Optional) Specifies a match to the connection
Example:	port of the client as a key field for a flow record.
Device(config-flow-record)# match connection client transport port	record.
match connection server ipv4 address	Specifies a match to the IPv4 address of the
Example:	server (flow responder).
Device(config-flow-record) # match connection server ipv4 address	
	configure terminal Example: Device# configure terminal flow record flow_record_name Example: Device(config)# flow record fr-wdavc-1 description description Example: Device(config-flow-record)# description fr-wdavc-1 match ipv4 version Example: Device(config-flow-record)# match ipv4 version match ipv4 protocol Example: Device(config-flow-record)# match ipv4 protocol match application name Example: Device(config-flow-record)# match application name match connection client ipv4 address Example: Device(config-flow-record)# match connection client ipv4 address match connection client transport port Example: Device(config-flow-record)# match connection client transport port match connection client transport port match connection client transport port match connection server ipv4 address Example: Device(config-flow-record)# match connection client transport port match connection server ipv4 address Example: Device(config-flow-record)# match connection client transport port

	Command or Action	Purpose
Step 10	match connection server transport port Example: Device(config-flow-record) # match connection server transport port	Specifies a match to the transport port of the server.
Step 11	match flow observation point Example: Device(config-flow-record) # match flow observation point	Specifies a match to the observation point ID for flow observation metrics.
Step 12	<pre>collect flow direction Example: Device (config-flow-record) # collect flow direction</pre>	Specifies to collect the direction — Ingress or Egress — of the relevant side — Initiator or Responder — of the bi-directional flow that is specified by the initiator keyword in the collect connection initiator command in the step below. Depending on the value specified by the initiator keyword, the flow direction keyword takes the following values: • 0x01 = Ingress Flow • 0x02 = Egress Flow When the initiator keyword is set to initiator, the flow direction is specified from the initiator side of the flow. When the initiator keyword is set to responder, the flow direction is specified from the responder side of the flow. For wired AVC, the initiator keyword is always set to initiator.
Step 13	<pre>collect connection initiator Example: Device(config-flow-record) # collect connection initiator</pre>	Specifies to collect the side of the flow — Initiator or Responder — relevant to the direction of the flow specified by the collect flow direction command. The initiator keyword provides the following information about the direction of the flow: • 0x01 = Initiator - the flow source is the initiator of the connection For wired AVC, the initiator keyword is always set to initiator.
Step 14	<pre>collect connection new-connections Example: Device(config-flow-record) # collect connection new-connections</pre>	Specifies to collect the number of connection initiations observed.

Directional Flow Records

Flow Record 3 - Directional Flow Record - Ingress

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 2	flow record flow_record_name	Enters flow record configuration mode.
	Example:	
	Device(config)# flow record fr-wdavc-3	
Step 3	description description	(Optional) Creates a description for the flow
	Example:	record.
	<pre>Device(config-flow-record) # description flow-record-1</pre>	
Step 4	match ipv4 version	Specifies a match to the IP version from the
	Example:	IPv4 header.
	<pre>Device(config-flow-record)# match ipv4 version</pre>	
Step 5	match ipv4 protocol	Specifies a match to the IPv4 protocol.
	Example:	
	<pre>Device(config-flow-record)# match ipv4 protocol</pre>	
Step 6	match ipv4 source address	Specifies a match to the IPv4 source address
	Example:	as a key field.
	<pre>Device(config-flow-record) # match ipv4 source address</pre>	
Step 7	match ipv4 destination address	Specifies a match to the IPv4 destination
	Example:	address as a key field.
	<pre>Device(config-flow-record)# match ipv4 destination address</pre>	
Step 8	match transport source-port	Specifies a match to the transport source port
	Example:	as a key field.
	<pre>Device(config-flow-record) # match transport source-port</pre>	
Step 9	match transport destination-port	Specifies a match to the transport destination
	Example:	port as a key field.
	<pre>Device(config-flow-record) # match transport destination-port</pre>	
Step 10	match interface input	Specifies a match to the input interface as a
	Example:	key field.

	Command or Action	Purpose
	<pre>Device(config-flow-record)# match interface input</pre>	
Step 11	match application name	Specifies a match to the application name.
	<pre>Example: Device(config-flow-record) # match application name</pre>	Note This action is mandatory for AVC support, as this allows the flow to be matched against the application.
Step 12	collect interface output	Specifies to collect the output interface from
	Example:	the flows.
	<pre>Device(config-flow-record)# collect interface output</pre>	
Step 13	collect counter bytes long	Specifies to collect the number of bytes in a
	Example:	flow.
	Device(config-flow-record)# collect counter bytes long	
Step 14	collect counter packets long	Specifies to collect the number of packets in
	Example:	a flow.
	<pre>Device(config-flow-record)# collect counter packets long</pre>	
Step 15	collect timestamp absolute first	Specifies to collect the time, in millisecond
	Example:	when the first packet was seen in the flow.
	<pre>Device(config-flow-record)# collect timestamp absolute first</pre>	
Step 16	collect timestamp absolute last	Specifies to collect the time, in milliseconds,
	Example:	when the most recent packet was seen in the flow.
	<pre>Device(config-flow-record)# collect timestamp absolute last</pre>	
Step 17	end	Returns to privileged EXEC mode.
	Example:	Alternatively, you can also press Ctrl-Z to exit global configuration mode.
	Device(config)# end	giobai configuration mode.
Step 18	show flow record	Displays information about all the flow
	Example:	records.
	Device# show flow record	

Flow Record 4 - Directional Flow Record - Egress

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 2	flow record flow_record_name	Enters flow record configuration mode.
	Example:	
	Device(config)# flow record fr-wdavc-4	
Step 3	description description	(Optional) Creates a description for the flow
	Example:	record.
	Device(config-flow-record)# description flow-record-1	
Step 4	match ipv4 version	Specifies a match to the IP version from the
	Example:	IPv4 header.
	Device(config-flow-record)# match ipv4 version	
Step 5	match ipv4 protocol	Specifies a match to the IPv4 protocol.
	Example:	
	<pre>Device(config-flow-record) # match ipv4 protocol</pre>	
Step 6	match ipv4 source address	Specifies a match to the IPv4 source address
	Example:	as a key field.
	<pre>Device(config-flow-record)# match ipv4 source address</pre>	
Step 7	match ipv4 destination address	Specifies a match to the IPv4 destination
	Example:	address as a key field.
	<pre>Device(config-flow-record)# match ipv4 destination address</pre>	
Step 8	match transport source-port	Specifies a match to the transport source port
	Example:	as a key field.
	<pre>Device(config-flow-record)# match transport source-port</pre>	
Step 9	match transport destination-port	Specifies a match to the transport destination
	Example:	port as a key field.
	<pre>Device(config-flow-record) # match transport destination-port</pre>	
Step 10	match interface output	Specifies a match to the output interface as a
	Example:	key field.

	Command or Action	Purpose
	<pre>Device(config-flow-record) # match interface output</pre>	
Step 11	match application name	Specifies a match to the application name.
	<pre>Example: Device(config-flow-record) # match application name</pre>	Note This action is mandatory for AVC support, as this allows the flow to be matched against the application.
Step 12	collect interface input	Specifies to collect the input interface from the
	Example:	flows.
	<pre>Device(config-flow-record)# collect interface input</pre>	
Step 13	collect counter bytes long	Specifies to collect the number of bytes in a
	Example:	flow.
	Device(config-flow-record)# collect counter bytes long	
Step 14	collect counter packets long	Specifies to collect the number of packets in
	Example:	a flow.
	<pre>Device(config-flow-record) # collect counter packets long</pre>	
Step 15	collect timestamp absolute first	Specifies to collect the time, in milliseconds,
	Example:	when the first packet was seen in the flow.
	<pre>Device(config-flow-record)# collect timestamp absolute first</pre>	
Step 16	collect timestamp absolute last	Specifies to collect the time, in milliseconds,
	Example:	when the most recent packet was seen in flow.
	<pre>Device(config-flow-record)# collect timestamp absolute last</pre>	
Step 17	end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exglobal configuration mode.
	Example:	
	Device(config)# end	giodal configuration mode.
Step 18	show flow record	Displays information about all the flow
	Example:	records.
	Device# show flow record	

DNS Flow Record

Flow Record 5 - DNS Flow Record

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 2	flow record flow_record_name	Enters flow record configuration mode.
	Example:	
	Device(config)# flow record fr-wdavc-5	
Step 3	description description	(Optional) Creates a description for the flow
	Example:	record.
	Device(config-flow-record)# description flow-record-5	
Step 4	match ipv4 version	Specifies a match to the IP version from the
	Example:	IPv4 header.
	<pre>Device(config-flow-record)# match ipv4 version</pre>	
Step 5	match ipv4 protocol	Specifies a match to the IPv4 protocol.
	Example:	
	<pre>Device(config-flow-record)# match ipv4 protocol</pre>	
Step 6	match application name	Specifies a match to the application name.
	Example:	Note This action is mandatory for
	<pre>Device(config-flow-record)# match application name</pre>	AVC support, as this allows the flow to be matched against the application.
Step 7	match connection client ipv4 address	Specifies a match to the IPv4 address of the
	Example:	client (flow initiator).
	<pre>Device(config-flow-record) # match connection client ipv4 address</pre>	
Step 8	match connection client transport port	Specifies a match to the connection port of the
	Example:	client as a key field for a flow record.
	<pre>Device(config-flow-record) # match connection client transport port</pre>	
Step 9	match connection server ipv4 address	Specifies a match to the IPv4 address of the
	Example:	server (flow responder).
	<pre>Device(config-flow-record) # match connection server ipv4 address</pre>	

	Command or Action	Purpose
Step 10	match connection server transport port Example: Device (config-flow-record) # match connection server transport port	Specifies a match to the transport port of the server.
Step 11	<pre>collect flow direction Example: Device(config-flow-record)# collect flow direction</pre>	collect connection initiator command in the step below. Depending on the value specified by the initiator keyword, the flow direction keyword takes the following values: • 0x01 = Ingress Flow
		• 0x02 = Egress Flow When the initiator keyword is set to initiator, the flow direction is specified from the initiator side of the flow. When the initiator keyword is set to responder, the flow direction is specified from the responder side of the flow. For wired AVC, the initiator keyword is always set to initiator.
Step 12	<pre>collect timestamp absolute first Example: Device(config-flow-record) # collect timestamp absolute first</pre>	Specifies to collect the time, in milliseconds, when the first packet was seen in the flow.
Step 13	<pre>collect timestamp absolute last Example: Device(config-flow-record) # collect timestamp absolute last</pre>	Specifies to collect the time, in milliseconds, when the most recent packet was seen in the flow.
Step 14	<pre>collect connection initiator Example: Device(config-flow-record)# collect connection initiator</pre>	Specifies to collect the side of the flow — Initiator or Responder — relevant to the direction of the flow specified by the collect flow direction command. The initiator keyword provides the following information about the direction of the flow: • 0x01 = Initiator - the flow source is the initiator of the connection For wired AVC, the initiator keyword is always set to initiator.

	Command or Action	Purpose
Step 15	collect connection new-connections	Specifies to collect the number of connection
	Example:	initiations observed.
	Device(config-flow-record)# collect connection new-connections	
Step 16	collect connection server counter packets long	Specifies to collect the number of packets sent by the server.
	Example:	
	Device(config-flow-record)# collect connection server counter packets long	
Step 17	collect connection client counter packets long	Specifies to collect the number of packets sent by the client.
	Example:	
	Device(config-flow-record)# collect connection client counter packets long	
Step 18	collect connection server counter bytes network long	Specifies to collect the total number of bytes transmitted by the server.
	Example:	
	<pre>Device(config-flow-record) # collect connection server counter bytes network long</pre>	
Step 19	collect connection client counter bytes network long	Specifies to collect the total number of bytes transmitted by the client.
	Example:	
	<pre>Device(config-flow-record) # collect connection client counter bytes network long</pre>	
Step 20	collect application dns domain-name	Configures the use of the DNS Domain-Name
	Example:	as a Collect field for a DNS flow record.
	Device(config-flow-record)# collect application dns domain-name	
Step 21	end	Returns to privileged EXEC mode.
	<pre>Example: Device(config) # end</pre>	Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Creating a Flow Exporter

You can create a flow exporter to define the export parameters for a flow.

Procedure

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 2	flow exporter flow_exporter_name	Enters flow exporter configuration mode.
	Example:	
	<pre>Device(config)# flow exporter flow-exporter-1</pre>	
Step 3	description description	(Optional) Creates a description for the flow
	Example:	exporter.
	Device(config-flow-exporter)# description flow-exporter-1	
Step 4	destination { hostname ipv4-address ipv6-address }	Specifies the hostname, IPv4 or IPv6 address of the system to which the exporter sends data
	Example:	
	Device(config-flow-exporter)# destination 10.10.1.1	
Step 5	option application-table [timeout seconds]	(Optional) Configures the application table option for the flow exporter. The timeout option configures the resend time in seconds for the flow exporter. The valid range is from 1 to 86400 seconds.
	Example:	
	Device(config-flow-exporter)# option application-table timeout 500	
Step 6	end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to ex global configuration mode.
	Example:	
	Device(config)# end	
Step 7	show flow exporter	Displays information about all the flow exporters.
	Example:	
	Device# show flow exporter	
Step 8	show flow exporter statistics	Displays flow exporter statistics.
	Example:	
	Device# show flow exporter statistics	

Creating a Flow Monitor

You can create a flow monitor and associate it with a flow record.

	Command or Action	Purpose			
Step 1	configure terminal	Enters global configuration mode.			
	Example:				
	Device# configure terminal				
Step 2	flow monitor monitor-name	Creates a flow monitor and enters flow monitor			
	Example:	configuration mode.			
	Device(config)# flow monitor flow-monitor-1				
Step 3	description description	(Optional) Creates a description for the flow			
	Example:	monitor.			
	Device(config-flow-monitor)# description flow-monitor-1				
Step 4	record record-name	Specifies the name of a record that was created previously.			
	Example:				
	<pre>Device(config-flow-monitor)# record flow-record-1</pre>				
Step 5	exporter exporter-name	Specifies the name of an exporter that was			
	Example:	created previously.			
	<pre>Device(config-flow-monitor)# exporter flow-exporter-1</pre>				
Step 6	cache { entries number-of-entries	(Optional) Specifies to configure flow cache			
	timeout {active inactive} type normal }	parameters.			
	Example:	• entries number-of-entries — Specifies the maximum number of flow entries in the flow cache in the range from 16 to			
	Device(config-flow-monitor)# cache				
	timeout active 1800	65536.			
	Example:	Note Only normal cache type is			
	<pre>Device(config-flow-monitor)# cache timeout inactive 200</pre>	supported.			
	Example:				
	<pre>Device(config-flow-monitor)# cache type normal</pre>				
Step 7	end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.			
	Example:				
	Device(config)# end				
Step 8	show flow monitor	Displays information about all the flow			
	Example:	monitors.			
	Device# show flow monitor				

	Command or Action	Purpose
Step 9	<pre>show flow monitor flow-monitor-name Example: Device# show flow monitor flow-monitor-1</pre>	Displays information about the specified wired AVC flow monitor.
Step 10	<pre>show flow monitor flow-monitor-name statistics Example: Device# show flow monitor flow-monitor-1 statistics</pre>	Displays statistics for wired AVC flow monitor.
Step 11	<pre>clear flow monitor flow-monitor-name statistics Example: Device# clear flow monitor flow-monitor-1 statistics</pre>	Clears the statistics of the specified flow monitor. Use the show flow monitor flow-monitor-1 statistics command after using the clear flow monitor flow-monitor-1 statistics to verify that all the statistics have been reset.
Step 12	show flow monitor flow-monitor-name cache format table Example: Device# show flow monitor flow-monitor-1 cache format table	Displays flow cache contents in a tabular format.
Step 13	show flow monitor flow-monitor-name cache format record Example: Device# show flow monitor flow-monitor-1 cache format record	as the flow record.
Step 14	show flow monitor flow-monitor-name cache format csv Example: Device# show flow monitor flow-monitor-1 cache format csv	Displays flow cache contents in CSV format.

Associating Flow Monitor to an interface

You can attach two different wired AVC monitors with different predefined records to an interface at the same time.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	

	Command or Action	Purpose
Step 2	interface interface-id Example:	Enters the interface configuration mode.
	Device(config)# interface Gigabitethernet 1/0/1	=
Step 3	<pre>ip flow monitor monitor-name { input output }</pre>	Associates a flow monitor to the interface for input and/or output packets.
	Example:	
	<pre>Device(config-if) # ip flow monitor flow-monitor-1 input</pre>	
Step 4	end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit
	Example: Device(config)# end	global configuration mode.

NBAR2 Custom Applications

NBAR2 supports the use of custom protocols to identify custom applications. Custom protocols support protocols and applications that NBAR2 does not currently support.

In every deployment, there are local and specific applications which are not covered by the NBAR2 protocol pack provided by Cisco. Local applications are mainly categorized as:

- Specific applications to an organization
- · Applications specific to a geography

NBAR2 provides a way to manually customize such local applications. You can manually customize applications using the command **ip nbar custom** *myappname* in global configuration mode. Custom applications take precedence over built-in protocols. For each custom protocol, user can define a selector ID that can be used for reporting purposes.

There are various types of application customization:

Generic protocol customization

- HTTP
- SSL
- DNS

Composite: Customization based on multiple underlying protocols – **server-name**

Layer3/Layer4 customization

- IPv4 address
- DSCP values
- TCP/UDP ports

Flow source or destination direction

Byte Offset: Customization based on specific byte values in the payload

HTTP Customization

HTTP customization could be based on a combination of HTTP fields from:

- cookie HTTP Cookie
- host Host name of Origin Server containing resource
- method HTTP method
- referrer Address the resource request was obtained from
- url Uniform Resource Locator path
- user-agent Software used by agent sending the request
- version HTTP version
- via HTTP via field

HTTP Customization

Custom application called MYHTTP using the HTTP host "*mydomain.com" with Selector ID 10.

```
Device# configure terminal
Device(config)# ip nbar custom MYHTTP http host *mydomain.com id 10
```

SSL Customization

Customization can be done for SSL encrypted traffic using information extracted from the SSL Server Name Indication (SNI) or Common Name (CN).

SSL Customization

Custom application called MYSSL using SSL unique-name "mydomain.com" with selector ID 11.

```
Device# configure terminal Device(config)#ip nbar custom MYSSL ssl unique-name *mydomain.com id 11
```

DNS Customization

NBAR2 examines DNS request and response traffic, and can correlate the DNS response to an application. The IP address returned from the DNS response is cached and used for later packet flows associated with that specific application.

The command **ip nbar custom** *application-name* **dns** *domain-name* **id** *application-id* is used for DNS customization. To extend an existing application, use the command **ip nbar custom** *application-name* **dns domain-name** *domain-name* **extends** *existing-application*.

For more information on DNS based customization, see http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/configuration/xe-3s/asr1000/qos-nbar-xe-3s-asr-1000-book/nbar-custapp-dns-xe.html.

DNS Customization

Custom application called MYDNS using the DNS domain name "mydomain.com" with selector ID 12.

```
Device# configure terminal Device(config)# ip nbar custom MYDNS dns domain-name *mydomain.com id 12
```

Composite Customization

NBAR2 provides a way to customize applications based on domain names appearing in HTTP, SSL or DNS.

Composite Customization

Custom application called MYDOMAIN using HTTP, SSL or DNS domain name "mydomain.com" with selector ID 13.

```
Device# configure terminal Device(config)# ip nbar custom MYDOMAIN composite server-name *mydomain.com id 13
```

L3/L4 Customization

Layer3/Layer4 customization is based on the packet tuple and is always matched on the first packet of a flow.

L3/L4 Customization

Custom application called LAYER4CUSTOM matching IP addresses 10.56.1.10 and 10.56.1.11, TCP and DSCP ef with selector ID 14.

```
Device# configure terminal
Device(config)# ip nbar custom LAYER4CUSTOM transport tcp id 14
Device(config-custom)# ip address 10.56.1.10 10.56.1.11
Device(config-custom)# dscp ef
```

Examples: Monitoring Custom Applications

Show Commands for Monitoring Custom Applications

show ip nbar protocol-id | inc Custom

Device# show ip nbar	protocol-id inc Custom	
LAYER4CUSTOM	14	Custom
MYDNS	12	Custom
MYDOMAIN	13	Custom
MYHTTP	10	Custom
MYSSL	11	Custom

show ip nbar protocol-discovery protocol CUSTOM_APP

Device# show ip nbar	protocol-id MYSSL	
Protocol Name	id	type
MYSSL	11	Custom

NBAR2 Dynamic Hitless Protocol Pack Upgrade

Protocol packs are software packages that update the NBAR2 protocol support on a device without replacing the Cisco software on the device. A protocol pack contains information on applications officially supported by NBAR2 which are compiled and packed together. For each application, the protocol-pack includes information on application signatures and application attributes. Each software release has a built-in protocol-pack bundled with it.

Protocol packs provide the following features:

- They are easy and fast to load.
- They are easy to upgrade to a higher version protocol pack or revert to a lower version protocol pack.
- They do not require the switch to be reloaded.

Warning

When using switch stacking, ensure that each switch has the same Protocol Pack file loaded. If you execute the **ip nbar protocol-pack flash** *protocol-pack-file* command on the primary switch in the stack, any switch in the stack that does not have the file loaded will be reloaded due to a configuration mismatch.

NBAR2 protocol packs are available for download on Cisco Software Center from this URL: https://software.cisco.com/download/home .

Prerequisites for the NBAR2 Protocol Pack

Before loading a new protocol pack, you must copy the protocol pack to the flash on all the switch members.

To load a protocol pack, see Loading the NBAR2 Protocol Pack, on page 28.

Loading the NBAR2 Protocol Pack

	Command or Action	Purpose		
Step 1	enable	Enables privileged EXEC mode.		
	Example:	• Enter your password if prompted.		
	Device> enable			
Step 2	configure terminal	Enters global configuration mode.		
	Example:			
	Device# configure terminal			
Step 3	ip nbar protocol-pack protocol-pack	Loads the protocol pack.		
	[force]	Use the force keyword to specify and load		
	Example:	a protocol pack of a lower version, which is different from the base protocol pack		
	Device(config)# ip nbar protocol-pack flash:defProtoPack	version. This also removes the		

	Command or Action	Purpose		
	Example: Device(config)# default ip nbar protocol-pack	configuration that is not supported by the current protocol pack on the switch. For reverting to the built-in protocol pack, use		
		the following command:		
Step 4	exit	Returns to privileged EXEC mode.		
	Example:			
	Device(config)# exit			
Step 5	show ip nbar protocol-pack {protocol-pack	Displays the protocol pack information. • Verify the loaded protocol pack version, publisher, and other details using this command.		
	active} [detail] Example:			
	Device# show ip nbar protocol-pack active	Use the <i>protocol-pack</i> argument to display information about the specified protocol pack.		
		Use the active keyword to display active protocol pack information.		
		Use the detail keyword to display detailed protocol pack information.		

Examples: Loading the NBAR2 Protocol Pack

The following example shows how to load a new protocol pack:

```
Device> enable
Device# configure terminal
Device(config)# ip nbar protocol-pack flash:newDefProtoPack
Device(config)# exit
```

The following example shows how to use the **force** keyword to load a protocol pack of a lower version:

```
Device> enable
Device# configure terminal
Device(config)# ip nbar protocol-pack flash:OldDefProtoPack force
Device(config)# exit
```

The following example shows how to revert to the built-in protocol pack:

```
Device> enable
Device# configure terminal
Device(config)# default ip nbar protocol-pack
Device(config)# exit
```

Monitoring Application Visibility and Control

This section describes the new commands for application visibility.

The following commands can be used to monitor application visibility on the switch and access ports.

Table 1: Monitoring Application Visibility Commands on the Switch

Command	Purpose		
show ip nbar protocol-discovery [interface interface-type interface-number] [stats{byte-count bit-rate packet-count max-bit-rate}] [protocol protocol-name top-n number]	Displays the statistics gathered by the NBAR Protocol Discovery feature. • (Optional) Enter keywords and arguments to fine-tune the statistics displayed. For more information on each of the keywords, refer to the show ip nbar protocol-discovery command in Cisco IOS Quality of Service Solutions Command Reference.		
show policy-map interface interface-type interface-number	Displays information about policy map applied to the interface.		
show platform software fed switch switch id wdavc flows	Displays statistics about all flows on the specified switch.		

Examples: Application Visibility and Control Configuration

This example shows how to create class maps with apply match protocol filters for application name:

```
Device# configure terminal
Device(config)# class-map match-any NBAR-VOICE
Device(config-cmap)# match protocol ms-lync-audio
Device(config-cmap)#end
```

This example shows how to create policy maps and define existing class maps for egress QoS:

```
Device # configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 150000
Device(config-pmap-c)# set dscp 12
Device(config-pmap-c)#end
```

This example shows how to create policy maps and define existing class maps for ingress QoS:

```
Device# configure terminal
Device(config)# policy-map test-avc-down
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 200000
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)#end
```

This example shows how to apply policy maps to a switch port:

```
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/1
Device(config-if)# switchport mode access
Device(config-if)# switchport access vlan 20
Device(config-if)# service-policy input POLICING_IN
Device(config-if)#end
```

This example shows how to create class maps based on NBAR attributes.

```
Device# configure terminal
Device(config) # class-map match-all rel-relevant
Device(config-cmap)# match protocol attribute business-relevance business-relevant
Device(config) # class-map match-all rel-irrelevant
Device(config-cmap) # match protocol attribute business-relevance business-irrelevant
Device(config) # class-map match-all rel-default
Device(config-cmap) # match protocol attribute business-relevance default
Device (config) # class-map match-all class--ops-admin-and-rel
Device(config-cmap)# match protocol attribute traffic-class ops-admin-mgmt
Device(config-cmap)# match protocol attribute business-relevance business-relevant
This example shows how to create policy maps based on class maps based on NBAR attributes.
Device# configure terminal
Device(config) # policy-map attrib--rel-types
Device (config-pmap) # class rel-relevant
Device(config-pmap-c)# set dscp ef
Device(config-pmap-c)# class rel-irrelevant
Device(config-pmap-c)# set dscp af11
Device (config-pmap-c) # class rel-default
Device (config-pmap-c) # set dscp default
Device (config) # policy-map attrib--ops-admin-and-rel
Device(config-pmap)# class class--ops-admin-and-rel
Device(config-pmap-c) # set dscp cs5
This example shows how to attach a policy map based on NBAR attributes to a wired port:
Device# configure terminal
Device (config) # interface GigabitEthernet1/0/2
Device(config-if) # service-policy input attrib--rel-types
Show Commands for Viewing the Configuration
show ip nbar protocol-discovery
Displays a report of the Protocol Discovery statistics per interface.
The following is a sample output for the statistics per interface:
Device# show ip nbar protocol-discovery int GigabitEthernet1/0/1
GigabitEthernet1/0/1
Last clearing of "show ip nbar protocol-discovery" counters 00:03:16
                                           Input

2427000	3613000
3437000	

show policy-map interface

Displays the QoS statistics and the configured policy maps on all interfaces.

The following is a sample output for the policy-maps configured on all the interfaces:

```
Device# show policy-map int
```

```
GigabitEthernet1/0/1
 Service-policy input: MARKING-IN
   Class-map: NBAR-VOICE (match-any)
     718 packets
     Match: protocol ms-lync-audio
       0 packets, 0 bytes
       30 second rate 0 bps
     QoS Set
       dscp ef
   Class-map: NBAR-MM CONFERENCING (match-any)
     6451 packets
     Match: protocol ms-lync
       0 packets, 0 bytes
       30 second rate 0 bps
     Match: protocol ms-lync-video
       0 packets, 0 bytes
       30 second rate 0 bps
     QoS Set
       dscp af41
   Class-map: class-default (match-any)
     34 packets
     Match: any
```

Show Commands for Viewing Attributes-based QoS Configuration

show policy-map interface

Displays the attribute-based QoS statistics and the configured policy maps on all interfaces.

The following is a sample output for the policy-maps configured on all the interfaces:

```
Device# show policy-map interface gigabitEthernet 1/0/2
GigabitEthernet1/0/2
 Service-policy input: attrib--rel-types
    Class-map: rel-relevant (match-all)
      20 packets
      Match: protocol attribute business-relevance business-relevant
      Oos Set
        dscp ef
    Class-map: rel-irrelevant (match-all)
      0 packets
      Match: protocol attribute business-relevance business-irrelevant
      QoS Set
        dscp af11
    Class-map: rel-default (match-all)
      14 packets
      Match: protocol attribute business-relevance default
      QoS Set
        dscp default
    Class-map: class-default (match-any)
      0 packets
     Match: any
```

show ip nbar protocol-attribute

Displays all the protocol attributes used by NBAR.

The following shows sample output for some of the attributes:

```
Device# show ip nbar protocol-attribute cisco-jabber-im

Protocol Name : cisco-jabber-im

encrypted : encrypted-yes

tunnel : tunnel-no

category : voice-and-video

sub-category : enterprise-media-conferencing

application-group : cisco-jabber-group

p2p-technology : p2p-tech-no

traffic-class : transactional-data

business-relevance : business-relevant

application-set : collaboration-apps

Device# show ip nbar protocol-attribute google-services

Protocol Name : google-services

encrypted : encrypted-yes
```

```
tunnel: tunnel-no
                category : other
            sub-category : other
       application-group : google-group
          p2p-technology : p2p-tech-yes
           traffic-class: transactional-data
      business-relevance : default
         application-set : general-browsing
Device# show ip nbar protocol-attribute dns
           Protocol Name : google-services
               encrypted : encrypted-yes
                  tunnel : tunnel-no
                category : other
            sub-category : other
       application-group : google-group
          p2p-technology : p2p-tech-yes
           traffic-class : transactional-data
      business-relevance : default
         application-set : general-browsing
Device# show ip nbar protocol-attribute unknown
           Protocol Name : unknown
               encrypted : encrypted-no
                  tunnel: tunnel-no
                category : other
            sub-category : other
       application-group : other
          p2p-technology : p2p-tech-no
           traffic-class : bulk-data
      business-relevance : default
         application-set : general-misc
```

Show Commands for Viewing Flow Monitor Configuration

show flow monitor wdavc

Displays information about the specified wired AVC flow monitor.

```
Device # show flow monitor wdavc
Flow Monitor wdavc:
                   User defined
 Description:
 Flow Record:
                   wdavc
 Flow Exporter: wdavc-exp (inactive)
 Cache:
   Type:
                         normal (Platform cache)
                        not allocated
   Status:
                        12000 entries
   Inactive Timeout:
                         15 secs
   Active Timeout:
                         1800 secs
```

show flow monitor wdavc statistics

Displays statistics for wired AVC flow monitor.

Device# show flow monitor wday	c sta	tistics				
Cache type:				Normal	(Platform	cache)
Cache size:				12000		
Current entries:				13		
Flows added:				26		
Flows aged:				13		
- Active timeout	(1800	secs)	1		
- Inactive timeout	(15	secs)	12		

clear flow monitor wdavc statistics

Clears the statistics of the specified flow monitor. Use the **show flow monitor wdavc statistics** command after using the **clear flow monitor wdavc statistics** to verify that all the statistics have been reset. The following is a sample output of the **show flow monitor wdavc statistics** command after clearing flow monitor statistics.

Device# show flow monitor wdavc statistics			
Cache type:	Normal	(Platform	cache)
Cache size:	12000		
Current entries:	0		
Flows added:	0		
Flows aged:	0		

Show Commands for Viewing Cache Contents

show flow monitor wdavc cache format table

Displays flow cache contents in a tabular format.

Device# show flow monitor wdavc Cache type: Cache size:	cache format (Normal 12000	(Platform cache)

Basic Troubleshooting - Questions and Answers

Following are the basic questions and answers for troubleshooting wired Application Visibility and Control:

1. Question: My IPv6 traffic is not being classified.

Answer: Currently only IPv4 traffic is supported.

2. Question: My multicast traffic is not being classified

Answer: Currently only unicast traffic is supported

3. Question: I send ping but I don't see them being classified

Answer: Only TCP/UDP protocols are supported

4. Question: Why can't I attach NBAR to an SVI?

Answer: NBAR is only supported on physical interfaces.

5. Question: I see that most of my traffic is CAPWAP traffic, why?

Answer: Make sure that you have enabled NBAR on an access port that is not connected to a wireless access port. All traffic coming from AP's will be classified as capwap. Actual classification in this case happens either on the AP or WLC.

6. Question: In protocol-discovery, I see traffic only on one side. Along with that, there are a lot of unknown traffic.

Answer: This usually indicates that NBAR sees asymmetric traffic: one side of the traffic is classified in one switch member and the other on a different member. The recommendation is to attach NBAR only on access ports where we see both sides of the traffic. If you have multiple uplinks, you can't attach NBAR on them due to this issue. Similar issue happens if you configure NBAR on an interface that is part of a port channel.

7. Question: With protocol-discovery, I see an aggregate view of all application. How can I see traffic distribution over time?

Answer: WebUI will give you view of traffic over time for the last 48 hours.

8. Question: I can't configure queue-based egress policy with **match protocol** *protocol-name* command.

Answer: Only **shape** and **set DSCP** are supported in a policy with NBAR2 based classifiers. Common practice is to set DSCP on ingress and perform shaping on egress based on DSCP.

9. Question: I don't have NBAR2 attached to any interface but I still see that NBAR2 is activated.

Answer: If you have any class-map with **match protocol** *protocol-name*, NBAR will be globally activated on the switch but no traffic will be subjected to NBAR classification. This is an expected behavior and it does not consume any resources.

10. Question: I see some traffic under the default QOS queue. Why?

Answer: For each new flow, it takes a few packets to classify it and install the result in the hardware. During this time, the classification would be 'un-known' and traffic will fall under the default queue.

Feature History for Application Visibility and Control in a Wired Network

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Everest 16.5.1a	Application Visibility and Control in a Wired Network	AVC is a critical part of Cisco's efforts to evolve its Branch and Campus solutions from being strictly packet and connection based to being application-aware and application-intelligent. Support for this feature was introduced only on the C9500-12Q, C9500-16X, C9500-24Q, C9500-40X models of the Cisco Catalyst 9500 Series Switches.
Cisco IOS XE Fuji 16.8.1a	Wired Application Visibility and Control (Wired AVC) Attribute-based QoS (EasyQoS)	Support for defining QoS classes and policies based on Network-Based Application Recognition (NBAR) attributes instead of specific protocols, was made available, with a few limitations. Only business-relevance and traffic-class are the supported NBAR attributes.
Cisco IOS XE Gibraltar 16.12.1	DNS flow record	Support for DNS flow record was introduced. DNS flow record uses the DNS Domain-Name as the collect field for defining the flow record.
Cisco IOS XE Amsterdam 17.3.1	Interoperability of Application Visibility and Control and Encrypted Traffic Analytics	Support for interoperability of Application Visibility and Control and Encrypted Traffic Analytics on the same port was introduced.
Cisco IOS XE Cupertino 17.7.1	Application Visibility and Control in a Wired Network	Support for this feature was introduced on the C9500X-28C8D model of the Cisco Catalyst 9500 Series Switches.
