- Feature Information for Routing Information Protocol, on page 11

## Information About RIP

The Routing Information Protocol (RIP) is an interior gateway protocol (IGP) created for use in small, homogeneous networks. It is a distance-vector routing protocol that uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. The protocol is documented in RFC 1058. You can find detailed information about RIP in *IP Routing Fundamentals*, published by Cisco Press.

Using RIP, the switch sends routing information updates (advertisements) every 30 seconds. If a router does not receive an update from another router for 180 seconds or more, it marks the routes served by that router as unusable. If there is still no update after 240 seconds, the router removes all routing table entries for the non-updating router.

RIP uses hop counts to rate the value of different routes. The hop count is the number of routers that can be traversed in a route. A directly connected network has a hop count of zero; a network with a hop count of 16 is unreachable. This small range (0 to 15) makes RIP unsuitable for large networks.

If the router has a default network path, RIP advertises a route that links the router to the pseudonetwork 0.0.0.0. The 0.0.0.0 network does not exist; it is treated by RIP as a network to implement the default routing feature. The switch advertises the default network if a default was learned by RIP or if the router has a gateway of last resort and RIP is configured with a default metric. RIP sends updates to the interfaces in specified networks. If an interface's network is not specified, it is not advertised in any RIP update.

### **RIP for IPv6**

Routing Information Protocol (RIP) for IPv6 is a distance-vector protocol that uses hop count as a routing metric. It includes support for IPv6 addresses and prefixes and the all-RIP-routers multicast group address FF02::9 as the destination address for RIP update messages.

For configuring RIP for IPv6, see the Configuring RIP for IPv6 section.

For more information about RIP for IPv6, see the "Implementing RIP for IPv6" chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com.

### **Summary Addresses and Split Horizon**

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature usually optimizes communication among multiple routers, especially when links are broken.

# How to Configure RIP

### **Default RIP Configuration**

Feature	Default Setting
Auto summary	Enabled.
Default-information originate	Disabled.
Default metric	Built-in; automatic metric translations.
IP RIP authentication key-chain	No authentication.
	Authentication mode: clear text.
IP RIP triggered	Disabled
IP split horizon	Varies with media.
Neighbor	None defined.
Network	None specified.
Offset list	Disabled.
Output delay	0 milliseconds.
Timers basic	• Update: 30 seconds.
	• Invalid: 180 seconds.
	• Hold-down: 180 seconds.
	• Flush: 240 seconds.
Validate-update-source	Enabled.
Version	Receives RIP Version 1 and 2 packets; sends Version 1 packets.

Table 1: Default RIP Configuration

### **Configuring Basic RIP Parameters**

To configure RIP, you enable RIP routing for a network and optionally configure other parameters. On the switch, RIP configuration commands are ignored until you configure the network number.

routing is
r router
process. You can
P routing updates only on these
ork number for effect.
with which to
allows routing protocol) to reach
[ )
ng metrics to to routes learned
t with an access

	Command or Action	Purpose
Step 8	timers basic update invalid holddown flush Example:	(Optional) Adjusts routing protocol timers. Valid ranges for all timers are 0 to 4294967295 seconds.
	Device(config-router)# timers basic 45 360 400	• <i>update</i> —The time between sending routing updates The default is 30 seconds.
	300	• <i>invalid</i> —The timer after which a route is declared invalid. The default is 180 seconds.
		• <i>holddown</i> —The time before a route is removed from the routing table. The default is 180 seconds.
		• <i>flush</i> —The amount of time for which routing updates are postponed. The default is 240 seconds.
Step 9	version {1   2}	(Optional) Configures the switch to receive and send only
	Example:	RIP Version 1 or RIP Version 2 packets. By default, the switch receives Version 1 and 2 but sends only Version 1
	Device(config-router)# <b>version 2</b>	You can also use the interface commands <b>ip rip</b> { <b>send</b>   <b>receive</b> } <b>version 1</b>   <b>2</b>   <b>1 2</b> } to control what versions are used for sending and receiving on interfaces.
Step 10	no auto summary	(Optional) Disables automatic summarization. By default
	Example:	the switch summarizes subprefixes when crossing classfu network boundaries. Disable summarization (RIP Versior
	Device(config-router)# no auto summary	2 only) to advertise subnet and host routing information to classful network boundaries.
Step 11	output-delay delay	(Optional) Adds interpacket delay for RIP updates sent.
	Example:	By default, packets in a multiple-packet RIP update have no delay added between packets. If you are sending packets
	Device(config-router)# output-delay 8	to a lower-speed device, you can add an interpacket delay in the range of 8 to 50 milliseconds.
Step 12	end	Returns to privileged EXEC mode.
	Example:	
	Device(config-router)# end	
Step 13	show ip protocols	Verifies your entries.
	Example:	
	Device# show ip protocols	
Step 14	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Device# copy running-config startup-config	

### **Configuring RIP Authentication**

RIP Version 1 does not support authentication. If you are sending and receiving RIP Version 2 packets, you can enable RIP authentication on an interface. The key chain specifies the set of keys that can be used on the interface. If a key chain is not configured, no authentication is performed, not even the default.

The switch supports two modes of authentication on interfaces for which RIP authentication is enabled: plain text and MD5. The default is plain text.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface interface-id	Enters interface configuration mode, and specifies the
	Example:	interface to configure.
	Device(config)# interface gigabitethernet 1/0/1	
Step 4	ip rip authentication key-chain name-of-chain	Enables RIP authentication.
	Example:	
	Device(config-if)# ip rip authentication key-chain trees	
Step 5	ip rip authentication mode {text   md5}	Configures the interface to use plain text authentication (the
	Example:	default) or MD5 digest authentication.
	Device(config-if)# ip rip authentication mode md5	
Step 6	end	Returns to privileged EXEC mode.
	Example:	
	Device(config)# <b>end</b>	
Step 7	show running-config	Verifies your entries.
	Example:	

	Command or Action	Purpose
	Device# show running-config	
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Device# copy running-config startup-config	

### **Configuring RIP for IPv6**

For more information about configuring RIP routing for IPv6, see the "Implementing RIP for IPv6" chapter in the *Cisco IOS IPv6 Configuration Library* on Cisco.com,

To configure RIP routing for IPv6, perform this procedure:

#### Before you begin

Before configuring the switch to run IPv6 RIP, you must enable routing by using the **ip routing** command in global configuration mode, enable the forwarding of IPv6 packets by using the **ipv6 unicast-routing** command in global configuration mode, and enable IPv6 on any Layer 3 interfaces on which IPv6 RIP is to be enabled.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> <b>enable</b>	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	ipv6 router rip name	Configures an IPv6 RIP routing process, and enters router
	Example:	configuration mode for the process.
	Device(config)# <b>ipv6 router rip cisco</b>	
Step 4	maximum-paths number-paths	(Optional) Define the maximum number of equal-cost
	Example:	routes that IPv6 RIP can support. The range is from 1 t
	Device(config-router)# maximum-paths 6	32, and the default is 16 routes.
Step 5	exit	Returns to global configuration mode.
	Example:	
	Device(config-router)# exit	

	Command or Action	Purpose
Step 6	<pre>interface interface-id Example: Device(config)# interface gigabitethernet 1/0/1</pre>	Enters interface configuration mode, and specifies the Layer 3 interface to configure.
Step 7	<pre>ipv6 rip name enable Example: Device(config-if)# ipv6 rip cisco enable</pre>	Enables the specified IPv6 RIP routing process on the interface.
Step 8	<pre>ipv6 rip name default-information {only   originate} Example: Device(config-if)# ipv6 rip cisco default-information only</pre>	<ul> <li>(Optional) Originates the IPv6 default route (::/0) into the RIP routing process updates sent from the specified interface.</li> <li>Note To avoid routing loops after the IPv6 default route (::/0) is originated from any interface, the routing process ignores all default routes received on any interface.</li> <li>only—Select to originate the default route, but suppress all other routes in the updates sent on this interface.</li> <li>originate—Select to originate the default route in addition to all other routes in the updates sent on this interface.</li> </ul>
Step 9	end Example: Device(config)# end	Returns to privileged EXEC mode.
Step 10	<pre>Use one of the following: • show ipv6 rip [name] [ interface interface-id] [ database ] [ next-hops ] • show ipv6 rip Example: Device# show ipv6 rip cisco interface gigabitethernet 2/0/1 or Device# show ipv6 rip</pre>	<ul> <li>Displays information about current IPv6 RIP processes.</li> <li>Displays the current contents of the IPv6 routing table.</li> </ul>
Step 11	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

### **Configuring Summary Addresses and Split Horizon**

# 

Note

In general, disabling split horizon is not recommended unless you are certain that your application requires it to properly advertise routes.

If you want to configure an interface running RIP to advertise a summarized local IP address pool on a network access server for dial-up clients, use the **ip summary-address rip** interface configuration command.

Note If split horizon is enabled, neither autosummary nor interface IP summary addresses are advertised.

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> <b>enable</b>	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	interface interface-id	Enters interface configuration mode, and specifies the Layer
	Example:	3 interface to configure.
	Device(config)# interface gigabitethernet 1/0/1	
Step 4	ip address ip-address subnet-mask	Configures the IP address and IP subnet.
	Example:	
	Device(config-if)# <b>ip address 10.1.1.10</b> 255.255.255.0	
Step 5	ip summary-address rip ip address ip-network mask	Configures the IP address to be summarized and the IP
	Example:	network mask.
	Device(config-if)# ip summary-address rip ip address 10.1.1.30 255.255.255.0	
Step 6	no ip split horizon	Disables split horizon on the interface.
	Example:	

	Command or Action	Purpose
	Device(config-if)# no ip split horizon	
Step 7	end	Returns to privileged EXEC mode.
	Example:	
	Device(config)# end	
Step 8	show ip interface interface-id	Verifies your entries.
	Example:	
	Device# show ip interface gigabitethernet 1/0/1	
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Device# copy running-config startup-config	

### **Configuring Split Horizon**

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature can optimize communication among multiple routers, especially when links are broken.

**Note** In general, we do not recommend disabling split horizon unless you are certain that your application requires it to properly advertise routes.

Command or Action	Purpose	
enable	Enables privileged EXEC mode.	
Example:	Enter your password if prompted.	
Device> <b>enable</b>		
configure terminal	Enters global configuration mode.	
Example:		
Device# configure terminal		
	enable         Example:         Device> enable         configure terminal         Example:	enable       Enables privileged EXEC mode.         Example:       Enter your password if prompted.         Device> enable       Enters global configuration mode.         Example:       Enters global configuration mode.

	Command or Action	Purpose
Step 3	interface interface-id	Enters interface configuration mode, and specifies the
	Example:	interface to configure.
	Device(config)# interface gigabitethernet 1/0/1	
Step 4	ip address ip-address subnet-mask	Configures the IP address and IP subnet.
	Example:	
	Device(config-if)# ip address 10.1.1.10 255.255.255.0	
Step 5	no ip split-horizon	Disables split horizon on the interface.
	Example:	
	Device(config-if)# no ip split-horizon	
Step 6	end	Returns to privileged EXEC mode.
	Example:	
	Device(config)# <b>end</b>	
Step 7	show ip interface interface-id	Verifies your entries.
	Example:	
	Device# show ip interface gigabitethernet 1/0/1	
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file
	Example:	
	Device# copy running-config startup-config	

# **Example: Configuring RIP for IPv6**

This example shows how to enable the RIP routing process *cisco* with a maximum of eight equal-cost routes and to enable it on an interface:

```
Device> enable
Devce# configure terminal
Device(config)# ipv6 router rip cisco
Device(config-router)# maximum-paths 8
Device(config)# exit
Device(config)# interface gigabitethernet2/0/11
Device(config-if)# ipv6 rip cisco enable
```

# **Configuration Example for Summary Addresses and Split Horizon**

In this example, the major net is 10.0.0.0. The summary address 10.2.0.0 overrides the autosummary address of 10.0.0.0 so that 10.2.0.0 is advertised out interface Gigabit Ethernet port 2, and 10.0.0.0 is not advertised. In the example, if the interface is still in Layer 2 mode (the default), you must enter a **no switchport** interface configuration command before entering the **ip address** interface configuration command.

**Note** If split horizon is enabled, neither autosummary nor interface summary addresses (those configured with the **ip summary-address rip** router configuration command) are advertised.

```
Device(config) # router rip
Device(config-router) # interface gigabitethernet1/0/2
Device(config-if) # ip address 10.1.5.1 255.255.255.0
Device(config-if) # ip summary-address rip 10.2.0.0 255.255.0.0
Device(config-if) # no ip split-horizon
Device(config-if) # exit
Device(config) # router rip
Device(config-router) # network 10.0.0.0
Device(config-router) # neighbor 2.2.2.2 peer-group mygroup
Device(config-router) # end
```

### **Feature Information for Routing Information Protocol**

**Table 2: Feature Information for Routing Information Protocol** 

Release	Feature Information
Cisco IOS XE Gibraltar 16.11.1	This feature was introduced.
