Prerequisites for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

Before you configure tunnel path calculation metrics, your network must support the following Cisco IOS XE features:

- Multiprotocol Label Switching (MPLS) traffic engineering tunnels
- IP Cisco Express Forwarding
- Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS)

Restrictions for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

- Unless explicitly configured, the TE link metric for a given link is the IGP link metric. When the TE link metric is used to represent a link property that is different from cost/distance, you must configure every network link that can be used for TE tunnels with a TE link metric that represents that property. You can do this by using the **mpls traffic-eng administrative-weight** command. Failure to do so might cause tunnels to use unexpected paths.
- MPLS traffic engineering supports only a single IGP process/instance. Multiple IGP processes/instances are not supported. MPLS traffic engineering should not be configured in more than one IGP process/instance.

Information About MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

The following section provides information about Configurable Path Calculation Metric for MPLS Traffic Engineering tunnels.

Overview

The MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels feature enables you to control the metric used in path calculation for traffic engineering (TE) tunnels on a per-tunnel basis.

When MPLS TE is configured in a network, the Interior Gateway Protocol (IGP) floods two metrics for every link. The metrics are the normal IGP (OSPF or IS-IS) link metric and a TE link metric. The IGP uses the IGP link metric in the normal way to compute routes for destination networks.

You can specify that the path calculation for a given tunnel is based on either of the following:

- IGP link metrics
- TE link metrics, which you can configure so that they represent the needs of a particular application. For example, the TE link metrics can be configured to represent link transmission delay.

Benefits

When Traffic Engineering (TE) tunnels carry two types of traffic, the Configurable Path Calculation Metric for Tunnels feature allows you to tailor tunnel path selection to the requirements of each type of traffic.

For example, suppose that certain tunnels are to carry voice traffic (which requires low delay) and other tunnels are to carry data. In this situation, you can use the TE link metric to represent link delay and do the following:

- Configure tunnels that carry voice to use the TE link metric set to represent link delay for path calculation.
- Configure tunnels that carry data to use the IGP metric for path calculation.

How to Configure MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

The following section provides information about the configuration steps for Configurable Path Calculation Metric for Tunnels for MPLS Traffic Engineering.

Configuring a Platform to Support Traffic Engineering Tunnels

To configure a platform to support Traffic Engineering tunnels, perform this procedure.

Procedure

| | Command or Action | Purpose |
|---------------|---|--|
| Step 1 | enable Example: Device> enable | Enables privileged EXEC mode. Enter your password, if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |
| Step 3 | ip cef distributed Example: Device(config)# ip cef distributed | Enables distributed Cisco Express Forwarding operation. |
| Step 4 | mpls traffic-eng tunnels Example: Device(config)# mpls traffic-eng tunnels | Enables the MPLS traffic engineering tunnel feature on a device. |
| Step 5 | exit Example: Device(config)# exit | Exits global configuration mode and returns to privileged EXEC mode. |

Configuring IS-IS for MPLS Traffic Engineering

Note MPLS traffic engineering supports only a single IGP process or instance. Multiple IGP processes or instances are not supported. MPLS traffic engineering should not be configured in more than one IGP process or instance.

To configure IS-IS for MPLS traffic engineering, perform the following steps.

Procedure

| | Command or Action | Purpose |
|---------------|--|--|
| Step 1 | enable Example: Device> enable | Enables privileged EXEC mode. Enter your password, if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |
| Step 3 | router isis Example: Device(config)# router isis | Enables IS-IS routing and specifies an IS-IS process. The device enters configuration mode. |
| Step 4 | mpls traffic-eng level Example: Device(config-router)# mpls traffic-eng level-1 | Turns on MPLS traffic engineering for IS-IS level 1. |
| Step 5 | mpls traffic-eng level Example: Device(config-router)# mpls traffic-eng level-2 | Turns on MPLS traffic engineering for IS-IS level 2. |
| Step 6 | mpls traffic-eng router-id <i>type number</i> Example: Device(config-router)# mpls traffic-eng router-id loopback 0 | Specifies that the traffic engineering router identifier for the node is the IP address associated with interface loopback0. |
| Step 7 | metric-style wide Example: Device(config-router)# metric-style wide | Configures a router to generate and accept only new-style type, length, value objects (TLVs). |

Configuring Traffic Engineering Link Metrics

Unless explicitly configured, the TE link metric is the IGP link metric.

Procedure

| | Command or Action | Purpose |
|---------------|---|---|
| Step 1 | enable Example: <pre>Device> enable</pre> | Enables privileged EXEC mode. Enter your password, if prompted. |
| Step 2 | configure terminal Example: <pre>Device# configure terminal</pre> | Enters global configuration mode. |
| Step 3 | interface <i>type slot / subslot / port</i> [, <i>subinterface-number</i>] Example: <pre>Device(config)# interface port channel 20</pre> | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> • The <i>type</i> argument is the type of interface to be configured. • The <i>slot</i> argument is the chassis slot number. • The <i>/ subslot</i> keyword and argument pair is the secondary slot number. The slash (/) is required. • The <i>/ port</i> keyword and argument pair is the port or interface number. The slash (/) is required. • The <i>. subinterface-number</i> keyword and argument pair is the subinterface number in the range 1–4294967293. The number that precedes the period (.) must match the number to which this subinterface belongs. |
| Step 4 | mpls traffic-eng administrative-weight <i>weight</i> Example: <pre>Device(config-if)# mpls traffic-eng administrative-weight 20</pre> | Overrides the IGP administrative weight (cost) of the link. <ul style="list-style-type: none"> • The <i>weight</i> argument is the cost of the link. |
| Step 5 | exit Example: <pre>Device(config-if)# exit</pre> | Exits interface configuration mode and returns to global configuration mode. |
| Step 6 | exit Example: | Exits global configuration mode and returns to privileged EXEC mode. |

| | Command or Action | Purpose |
|--|-----------------------------|---------|
| | Device(config)# exit | |

Configuring an MPLS Traffic Engineering Tunnel

To configure a preferred explicit path for an MPLS TE tunnel, perform this procedure.

Procedure

| | Command or Action | Purpose |
|---------------|---|---|
| Step 1 | enable Example: Device> enable | Enables privileged EXEC mode. Enter your password, if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |
| Step 3 | interface tunnel number Example: Device(config)# interface Tunnel0 | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> The <i>number</i> argument is the number of the tunnel. |
| Step 4 | ip unnumbered type number Example: Device(config-if)# ip unnumbered loopback0 | Enables IP processing on an interface without assigning an explicit IP address to the interface. <ul style="list-style-type: none"> The <i>type</i> and <i>number</i> arguments name the type and number of another interface on which the router has an assigned IP address. It cannot be another unnumbered interface. An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link. |
| Step 5 | tunnel destination ip-address Example: Device(config-if)# tunnel destination 192.168.4.4 | Specifies the destination for a tunnel interface. <ul style="list-style-type: none"> The <i>ip-address</i> argument must be the MPLS traffic engineering router ID of the destination device. |
| Step 6 | tunnel mode mpls traffic-eng Example: | Sets the tunnel encapsulation mode to MPLS traffic engineering. |

| | Command or Action | Purpose |
|---------------|---|---|
| | <pre>Device(config-if)# tunnel mode mpls traffic-eng</pre> | |
| Step 7 | <p>tunnel mpls traffic-eng bandwidth <i>bandwidth</i></p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng bandwidth 250</pre> | <p>Configures the bandwidth for the MPLS traffic engineering tunnel.</p> <ul style="list-style-type: none"> The <i>bandwidth</i> argument is a number in kilobits per second that is set aside for the MPLS traffic engineering tunnel. Range is from 1 through 4294967295. <p>Note If automatic bandwidth is configured for the tunnel, use the tunnel mpls traffic-eng bandwidth command to configure the initial tunnel bandwidth.</p> |
| Step 8 | <p>tunnel mpls traffic-eng path-option <i>number</i> {dynamic explicit {name <i>path-name</i> identifier <i>path-number</i>}} [lockdown]</p> <p>Example:</p> <pre>Device(config-if)# tunnel mpls traffic-eng path-option 10 explicit identifier 321</pre> | <p>Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database.</p> <ul style="list-style-type: none"> The <i>number</i> argument is the preference for this path option. When you configure multiple path options, lower numbered options are preferred. Valid values are from 1 through 1000. The dynamic keyword indicates that the path of the LSP is dynamically calculated. The explicit keyword indicates that the path of the LSP is an IP explicit path. The name <i>path-name</i> keyword and argument are the path name of the IP explicit path that the tunnel uses with this option. The identifier <i>path-number</i> keyword and argument pair names the path number of the IP explicit path that the tunnel uses with this option. The range is from 1 through 65535. The lockdown keyword specifies that the LSP cannot be reoptimized. <p>Note A dynamic path is used if an explicit path is currently unavailable.</p> |

| | Command or Action | Purpose |
|---------------|---|--|
| Step 9 | exit Example: Device(config-if) # exit | Exits interface configuration mode and returns to global configuration mode. |

Configuring the Metric Type for Tunnel Path Calculation

Unless explicitly configured, the traffic engineering link metric type is used for tunnel path calculation. You can use two commands to control the metric type to use: an interface configuration command that specifies the metric type to be used for a particular TE tunnel. And a global configuration command that specifies the metric type to use for TE tunnels for which a metric type is unspecified by the interface configuration command.

Note If you do not enter either of the path selection metrics commands, the traffic engineering (TE) metric is used.

Procedure

| | Command or Action | Purpose |
|---------------|--|---|
| Step 1 | enable Example: Device> enable | Enables privileged EXEC mode. Enter your password, if prompted. |
| Step 2 | configure terminal Example: Device# configure terminal | Enters global configuration mode. |
| Step 3 | interface tunnel number Example: Device(config)# interface Tunnel0 | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> The <i>number</i> argument is the number of the tunnel. |
| Step 4 | tunnel mpls traffic-eng path-selection metric {igp te} Example: Device(config-if) # tunnel mpls traffic-eng path-selection metric igp | Specifies the metric type to use for path calculation for a tunnel. <ul style="list-style-type: none"> The igp keyword specifies the use of the Interior Gateway Protocol (IGP) metric. The te keyword specifies the use of the traffic engineering (TE) metric. The traffic engineering metric is the default. |
| Step 5 | exit Example: | Exits interface configuration mode and returns to global configuration mode. |

| | Command or Action | Purpose |
|---------------|--|--|
| | <code>Device(config-if)# exit</code> | |
| Step 6 | <p>mpls traffic-eng path-selection metric {igp te}</p> <p>Example:</p> <pre>Device(config)# mpls traffic-eng path-selection metric igp</pre> | <p>Specifies the metric type to use when a metric type was not explicitly configured for a given tunnel.</p> <ul style="list-style-type: none"> • The igp keyword specifies the use of the Interior Gateway Protocol (IGP) metric. • The te keyword specifies the use of the traffic engineering (TE) metric. This is the default. |
| Step 7 | <p>exit</p> <p>Example:</p> <pre>Device(config)# exit</pre> | <p>Exits global configuration mode and returns to privileged EXEC mode.</p> |

Verifying the Tunnel Path Metric Configuration

To verify the tunnel path metric configuration, perform the following procedure.

Procedure

| | Command or Action | Purpose |
|---------------|--|--|
| Step 1 | <p>enable</p> <p>Example:</p> <pre>Device> enable</pre> | <p>Enables privileged EXEC mode. Enter your password, if prompted.</p> |
| Step 2 | <p>show mpls traffic-eng topolog y</p> <p>Example:</p> <pre>Device# show mpls traffic-eng topology</pre> | <p>Displays TE and IGP metrics for each link. You can verify that link metrics are correctly configured for a network.</p> |
| Step 3 | <p>show mpls traffic-eng tunnels</p> <p>Example:</p> <pre>Device# show mpls traffic-eng tunnels</pre> | <p>Displays the link metric used for tunnel path calculation. You can verify that the desired link metrics are used for each tunnel.</p> |
| Step 4 | <p>exit</p> <p>Example:</p> <pre>Device# exit</pre> | <p>Returns to user EXEC mode.</p> |

Configuration Examples for MPLS Traffic Engineering—Configurable Path Calculation Metric for Tunnels

The following section provides configuration examples for configuring a path calculation metric for tunnels.

Example: Configuring Link Type and Metrics for Tunnel Path Selection

The section illustrates how to configure the link metric type to use for tunnel path selection. And how to configure the link metrics themselves. The configuration commands included focus on specifying the metric type for path calculation and assigning metrics to links. You will need additional commands are required to fully configure the example scenario. For example, the IGP commands for traffic engineering and the link interface commands for enabling traffic engineering and specifying available bandwidth.

The examples in this section support the simple network technology shown in the following figure.

Figure 1: Network topology

357511

In the figure above:

- Tunnel1 and Tunnel2 run from S1 (headend) to S4 (tailend).
- Tunnel3 runs from S1 to S5.
- Path calculation for Tunnel1 and Tunnel3 should use a metric that represents link delay because these tunnels carry voice traffic.
- Path calculation for Tunnel2 should use IGP metrics because MPLS TE carries data traffic with no delay requirement.

Configuration fragments follow for each of the devices that illustrate the configuration relating to link metrics and their use in tunnel path calculation. TE metrics that represent link delay must be configured for the network links on each of the devices. And the three tunnels must be configured on S1.

This configuration fragments force Tunnel1 to take path S1-S3-S4, Tunnel2 to take path S1-S2-S4, and Tunnel3 to take path S1-S3-S4-S5 (assuming the links have sufficient bandwidth to accommodate the tunnels).

S1 Configuration

The following example shows how to configure the tunnel headend S1 for Tunnel1, Tunnel2, and Tunnel3 in the preceding figure:

```
interface port channel 40
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 10
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface Tunnel1
                                              !Tunnel1 uses TE metric (default)
                                              !for path selection

ip unnumbered loopback0
tunnel destination 192.168.4.4 255.255.255.0
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 dynamic
interface Tunnel2
                                              !Tunnel2 uses IGP metric
                                              !for path selection

ip unnumbered loopback0
tunnel destination 192.168.4.4 255.255.255.0
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 dynamic
tunnel mpls traffic-eng path-selection-metric igp !Use IGP cost for path selection.
interface Tunnel3
                                              !Tunnel3 uses TE metric (default)
                                              !for path selection

ip unnumbered loopback0
tunnel destination 192.168.5.5 255.255.255.0
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 dynamic
```

S2 Configuration

The following example shows how to configure S2 in the preceding figure:

```
interface port channel 10
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channle 20
mpls traffic-eng administrative-weight 40      !TE metric different from IGP metric
```

S3 Configuration

The following example shows how to configure S3 in the preceding figure:

```
interface port channel 40
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 50
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 30
mpls traffic-eng administrative-weight 5       !TE metric different from IGP metric
```

S4 Configuration

The following example shows how to configure R4 in the preceding figure:

```
interface port channel 20
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 30
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 60
mpls traffic-eng administrative-weight 5       !TE metric different from IGP metric
```

S5 Configuration

The following example shows how to configure S5 in the preceding figure:

```
interface port channel 50
mpls traffic-eng administrative-weight 15      !TE metric different from IGP metric
interface port channel 60
mpls traffic-eng administrative-weight 5       !TE metric different from IGP metric
```

Example: Verifying the Tunnel Path Metric Configuration

The following examples show how to verify the Tunnel Path Metric configuration.

The following example is a sample output of the **show mpls traffic-eng topology** command. This command displays the TE and IGP metrics for each link.

```
Device# show mpls traffic-eng topology
My_System_id: 1440.0000.0044.00 (isis level-1)
IGP Id: 0090.0000.0009.00, MPLS TE Id:192.168.9.9 Router Node (isis level-1)
  link[0 ]:Nbr IGP Id: 0090.0000.0009.03, gen:7
    frag_id 0, Intf Address:10.0.0.99
    TE metric:100, IGP metric:48, attribute_flags:0x0      !!Note TE and IGP metrics
    physical_bw: 10000 (kbps), max_reservable_bw_global: 0 (kbps)
    max_reservable_bw_sub: 0 (kbps)
  .
  .
  .
  link[1 ]:Nbr IGP Id: 0055.0000.0055.00, gen:7
    frag_id 0, Intf Address:10.205.0.9, Nbr Intf Address:10.205.0.55
    TE metric:120, IGP metric:10, attribute_flags:0x0      !!Note TE and IGP metrics
    physical_bw: 155000 (kbps), max_reservable_bw_global: 500000 (kbps)
    max_reservable_bw_sub: 0 (kbps)
```

The following example is a sample output of the **show mpls traffic-eng tunnels** command. This command displays the link metric used for tunnel path calculation.

```

Device# show mpls traffic-eng tunnels
Name: te3640-17-c_t221                (Tunnel22) Destination: 192.168.100.22
Status:
  Admin: up          Oper: up      Path: valid      Signalling: connected
  path option 1, type dynamic (Basis for Setup, path weight 10)
Config Parameters:
  Bandwidth: 400 kps (Global)  Priority: 1 1  Affinity: 0x0/0xFFFF
  Metric Type: IGP                                !!Note metric type
