Configuration Examples for Cisco DNA Service for Bonjour

Configuration Examples for Local Area Bonjour in Unicast Mode for LAN Networks

This section provides configuration examples for Local Area Bonjour Domain in unicast mode.

Example: Single-VLAN Unicast Mode Bonjour

This example provides a sample configuration to implement Local Area Bonjour for single-VLAN unicast mode on an access layer switch. The following figure illustrates a single-VLAN unicast mode Bonjour network environment:

Figure 1: Single VLAN Unicast Mode Bonjour Network
The preceding figure illustrates a multiple-VLAN unicast mode Bonjour network environment with an AirPrint-capable printer and a user computer (MacOS or Microsoft Windows). The devices are connected to an Ethernet network and are part of a common Layer 2 VLAN. Once you configure the devices using the

following sample configuration, the user computer can dynamically discover the printer using Layer 2 unicast and policy.

✎

Note The sample configuration provided in this section can be applied on an access layer switch deployed as a Service-Peer (Layer 2 access) or as an SDG Agent (Layer 3 access).

Table 1: Configuring Single VLAN Unicast Mode Bonjour

Configuration Step	Sample Configuration
| Step 1: Enable mDNS gateway and set the gateway mode. | ```
!
mdns-sd gateway
 active-query timer 1
 mode service-peer
!
``` |
| Step 2: Create a unique mDNS inbound policy to permit ingress AirPrint service announcement from the service provider. | ```
!
mdns-sd service-list LOCAL-AREA-SERVICES-IN in
 match printer-ipps
!
``` |
| Step 3: Create a unique mDNS outbound policy to permit egress AirPrint service response to the service receiver. | ```
!
mdns-sd service-list LOCAL-AREA-SERVICES-OUT out
 match printer-ipps
!
``` |
| Step 4: Associate the inbound and outbound service lists to a unique service-policy. | ```
!
mdns-sd service-policy LOCAL-AREA-POLICY
 service-list LOCAL-AREA-SERVICES-IN
 service-list LOCAL-AREA-SERVICES-OUT
!
``` |
| Step 5: Activate unicast mDNS gateway on VLAN 10 and associate the service-policy with advanced parameters. | ```
!
vlan configuration 10
 mdns-sd gateway
   service-policy LOCAL-AREA-POLICY

!
``` |

Verifying Single VLAN Unicast Mode Bonjour

Sample outputs for the following **show** commands on a Cisco Catalyst Series switch in Service Peer mode show the operational status after the discovery of AirPrint service from the local network:

Example: Multiple-VLAN Unicast Mode Bonjour

This example provides a sample configuration to implement Local Area Bonjour for multilpe-VLAN unicast mode on an access layer switch.

Figure 2: Multiple-VLAN Unicast Mode Bonjour Network

The preceding figure illustrates a multiple-VLAN unicast mode Bonjour network environment with an AirPrint-capable printer and a user computer (MacOS or Microsoft Windows). The devices are connected to an Ethernet network and are part of different Layer 2 VLANs for the same Ethernet switch. Once you configure the devices using the following sample configuration, the user computer can dynamically discover the printer using Layer 2 unicast and policy between the different VLANs.

Note The sample configuration provided in this section can be applied on an access layer switch deployed as a Service-Peer (Layer 2 access) or as an SDG Agent (Layer 3 access).

Table 2: Configuring Multiple VLAN Unicast Mode Bonjour

Configuration Step	Sample Configuration
Step 1: Enable mDNS gateway and set the gateway mode.	``` ! mdns-sd gateway active-query timer 1 mode service-peer ! ```
Step 2: Create a location filter to enable local service proxy between the grouped VLANs.	``` ! mdns-sd location-filter LOCAL-PROXY match location-group default vlan 10 match location-group default vlan 20 ! ```
Step 3: Create a unique mDNS inbound policy to permit ingress AirPrint service announcement from service provider.	``` ! mdns-sd service-list LOCAL-AREA-SERVICES-IN in match printer-ipps ! ```
Step 4: Create a unique mDNS outbound policy to permit egress AirPrint service response to the service receiver. Associate the location filter to share AirPrint service information from grouped VLAN.	``` ! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer-ipps location-filter LOCAL-PROXY ! ```
Step 5: Associate the inbound and outbound service lists to a unique service-policy.	``` ! mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT ! ```
Step 6: Activate unicast mDNS gateway on VLAN 10 and VLAN 20. Associate the service-policy with advanced parameters.	``` ! vlan configuration 10,20 mdns-sd gateway service-policy LOCAL-AREA-POLICY ! ```

Verifying Multiple VLAN Unicast Mode Bonjour

Sample outputs for the following **show** commands on a Cisco Catalyst Series switch in Service Peer mode show the operational status after the discovery of AirPrint service from the local network:

Example: Configuring Customized Service List and Policy in Unicast Mode for Multilayer Networks

This example provides a sample configuration to implement Local Area Bonjour in unicast mode service-routing for a multilayer network. The network has Layer 2 access switches and Layer 2 or Layer 3 boundary at distribution. The mDNS gateway mode on the Layer 2 access switches must be configured as Service Peers. The distribution layer switch gets configured in SDG Agent mode by default once you activate the mDNS gateway on the specified VLANs. The mDNS service discovery and distribution is extended using an IPv4-based service-routing protocol, instead of the Layer 2 mDNS flood-n-learn over the Layer 2 trunk ports.

Figure 3: Customized Service List and Policy in Unicast Mode for a Multilayer Network

The preceding figure illustrates a VLAN unicast mode Bonjour network environment. The network has an AirPrint-capable printer connected in VLAN-10 of SP-1 switch. User-1 computer is connected in same VLAN 10 of SP-2. User-2 computer is connected to a different VLAN 20 of SP-3. Once you configure the devices using the following sample configuration, the user computers can dynamically discover the printer using Layer 2 unicast and policy on same and different VLAN IDs across the Layer 2 network.

Table 3: Configuring Customized Service List and Policy in Unicast Mode for Multilayer Networks

Configuration Step	Service Peer Sample Configuration	SDG Agent Sample Configuration

Step 1: Enable mDNS gateway and set the gateway mode.	`!`
	`mdns-sd gateway`
	` active-query timer 1`
	` mode service-peer`
	`!`
		`!`
		`mdns-sd gateway`
		` mode service-peer`
		`!`

Configuration Step	Service Peer Sample Configuration	SDG Agent Sample Configuration
Step 2: Create a unique mDNS inbound policy to permit ingress AirPrint service announcement from service provider.	```! mdns-sd service-list LOCAL-AREA-SERVICES-IN in match printer-ipps !```	```! mdns-sd service-list LOCAL-AREA-SERVICES-IN in match printer-ipps !```
Step 3: Create a unique mDNS outbound policy to permit egress AirPrint service response to the service receiver. Associate the location filter to share AirPrint service information from the grouped VLAN.	```! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer location-filter LOCAL-PROXY !```	```! mdns-sd service-list LOCAL-AREA-SERVICES-OUT out match printer location-filter LOCAL-PROXY !```
Step 4: Associate the inbound and outbound service lists to a unique service-policy.	```! mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !```	```! mdns-sd service-policy LOCAL-AREA-POLICY service-list LOCAL-AREA-SERVICES-IN service-list LOCAL-AREA-SERVICES-OUT !```

Step 5: Activate unicast mDNS gateway on VLAN 10 and VLAN 20. Associate the service-policy with advanced parameters. Configure the SDG-Agent IP address and the source interface on Service Peer to enable service-routing. No additional configuration required on SDG-Agent.	```!
	vlan configuration 10,20
	 mdns-sd gateway
	   service-policy
	LOCAL-AREA-POLICY
	   source-interface vlan 4094
	   sdg-agent 10.0.0.254
	!```
		``!
		vlan configuration 10,20
		 mdns-sd gateway
		   service-policy
		LOCAL-AREA-POLICY
		!```

Step 6: Configure mDNS Trust on Layer 2 trunk port of the switches.	```interface range TenG 1/0/1 - 2 switchport mode trunk mdns-sd trust !```	```! interface range TenG 1/0/1 - 6 switchport mode trunk mdns-sd trust !```

Step 7: Configure service peer-group on the SDG Agent distribution switch and enable service-routing between the assigned Service Peer switch group.	No configuration is needed.	```!
		mdns-sd service-peer group
		 peer-group 1
		  service-peer 10.0.0.1
		location-group default
		  service-peer 10.0.0.2
		location-group default
		  service-peer 10.0.0.3
		location-group default
		!```

Verifying Customized Service List and Policy in Unicast Mode for Multilayer Networks

Example: Migrating from mDNS Flood to Unicast Mode in Multilayer Networks

Prior to Cisco IOS XE Amsterdam 17.3.1 release, Layer 2 LAN switches functioned as an intermediate pass-through system between an upstream SDG Agent in distribution layer and locally attached wired mDNS end points. This example provides a sample configuration to migrate from mDNS flood to unicast mode in multilayer networks. The network has Layer 2 access switches and Layer 2 or Layer 3 boundary at distribution.

Figure 4: Migration from mDNS Flood to Layer 2 Service-Routing Unicast Mode

The preceding figure illustrates a sample multilayer network that provides key gateway functional difference before and after upgrading to Cisco IOS XE Amsterdam 17.3.1 release.

The following table provides sample configurations for a traditional mDNS flood-based network and a Cisco Catalyst Series switch in SDG Agent mode that operates in a Layer 2 network environment.

Table 4: Layer 2 Access Configuration and Layer 3 SDG Agent Configuration

Layer 2 Access Sample Configuration	Layer 3 SDG Agent Sample Configuration
| ```

The following table provides sample configurations for migration to a Layer 2 unicast-based network for a Cisco Catalyst switch in SDG Agent and Service Peer mode that operates in a Layer 2 network environment. The Layer 2 unicast routing functions between SDG Agent and Service Peer. Thus, no further controller-bound policy or export configuration change is required for the migration to unicast mode.

Table 5: Configuring Layer 2 Access and Layer 3 SDG Agent for Migration to Layer 2 Service-Routing Unicast Mode

Configuration Step	Layer 2 Access Sample Configuration	Layer 3 SDG Agent Sample Configuration
| Step 1: Enable Layer 2 Trunk mode between access and distribution switches. | ```
!
interface TenG 1/1
 switchport mode trunk
 switchport trunk allowed vlan 10, 4094
 mdns trust
!
``` | ```
!
interface TenG 1/1
 switchport mode trunk
 switchport trunk allowed vlan 10, 4094
 mdns trust
!
``` |

Configuration Step	Layer 2 Access Sample Configuration	Layer 3 SDG Agent Sample Configuration
Step 2: Configure the LAN management VLAN and assign a valid IP range.	```!
interface Vlan 4094
 description CAMPUS LAN MGMT
 ip add 10.0.1.1 255.255.255.0

 no shutdown
!``` | ```!
interface Vlan 4094
 description CAMPUS LAN MGMT
 ip add 10.0.1.254
255.255.255.0
 no shutdown
!``` |
| Step 3: Enable mDNS gateway and modes at access and distribution switches. | ```!
mdns-sd gateway
 mode service-peer
!``` | ```!
mdns-sd gateway
 mode sdg-agent
!``` |
| Step 4: Create a unique mDNS inbound policy to permit ingress AirPrint service announcement from the service provider. | ```!
mdns-sd service-list
LOCAL-AREA-SERVICES-IN in
 match printer-ipps
!``` | ```!
mdns-sd service-list
LOCAL-AREA-SERVICES-IN in
 match printer-ipps
!``` |
| Step 5: Create a unique mDNS outbound policy to permit egress AirPrint service response to the service receiver. Associate the location filter to share AirPrint service information from the grouped VLAN. | ```!
mdns-sd service-list
LOCAL-AREA-SERVICES-OUT out
 match printer-ipps
!``` | ```!
mdns-sd service-list
LOCAL-AREA-SERVICES-OUT out
 match printer-ipps
!``` |
| Step 6: Associate inbound and outbound service lists to a unique service policy. | ```!
mdns-sd service-policy
LOCAL-AREA-POLICY
 service-list
LOCAL-AREA-SERVICES-IN
 service-list
LOCAL-AREA-SERVICES-OUT
!``` | ```!
mdns-sd service-policy
LOCAL-AREA-POLICY
 service-list
LOCAL-AREA-SERVICES-IN
 service-list
LOCAL-AREA-SERVICES-OUT
!``` |
| Step 7: Disable mDNS gateway from the SVI interface. | No configuration is needed. | ```!
interface vlan 10
 no mdns-sd gateway
!``` |
| Step 8: Enable a unicast-based mDNS gateway on VLAN 10. Associate the service policy with advanced parameters. Configure the SDG Agent IP address and the source interface settings on the Service Peer. | ```!
! mDNS Unicast based gateway
!
vlan configuration 10
 mdns-sd gateway
   service-policy
LOCAL-AREA-POLICY
   active-query timer 1
   sdg-agent 10.0.0.254
   source-interface Vlan 4094
!``` | ```!
! mDNS Unicast based gateway
!
vlan configuration 10
 mdns-sd gateway

!``` |
| Step 9: Clear cache on the SDG Agent to remove stale entries which are learnt from the mDNS flood. | No configuration is needed. | ```!
clear mdns-sd cache
!``` |

Example: Migrating from mDNS Flood to Unicast Mode in Routed Access Networks

Prior to Cisco IOS XE Amsterdam 17.3.1 release, a Layer 3 Access LAN switch limits the extension of mDNS flood to the upstream Layer 3 network. However, it continues to flood the incoming mDNS frames to all ports participating in a common Layer 2 broadcast domain. This example provides a sample configuration to migrate from mDNS flood to unicast mode in Layer 3 or routed access networks. The network has Layer 2 access switches and Layer 2 or Layer 3 boundary at distribution.

Figure 5: Migration from mDNS Flood to Layer 3 Unicast Mode

The preceding figure illustrates a sample routed access network that provides key gateway functional difference before and after upgrading to Cisco IOS XE Amsterdam 17.3.1 release.

The following table provides sample configurations for a traditional mDNS flood-based network and a Cisco Catalyst Series switch in SDG Agent mode that operates in a Layer 2 network environment.

Table 6: Layer 2 Access Configuration and Layer 3 SDG Agent Configuration

The following table provides sample configurations for migration to a Layer 2 unicast-based network for a Cisco Catalyst switch in SDG Agent that operates in a Layer 3 network environment. The unicast mode function is a local function on the SDG Agent. Thus, no further controller bound policy or export configuration change required for the migration to unicast mode.

Table 7: Configuring Layer 2 Access and Layer 3 SDG Agent for Migration to Layer 3 Unicast Mode

Configuration Step	Layer 2 Access Sample Configuration	Layer 3 SDG Agent Sample Configuration
Step 1: Enable mDNS gateway and modes at access and distribution switches.	No configuration is needed.	```!
mdns-sd gateway
active-query timer 1
mode sdg-agent
!```
Step 2: Create a unique mDNS inbound policy to permit ingress AirPrint service announcement from the service provider.		```!
mdns-sd service-list
LOCAL-AREA-SERVICES-IN in
match printer-ipps
!```
Step 3: Create a unique mDNS outbound policy to permit egress AirPrint service response to the service receiver. Associate the location filter to share AirPrint service information from the grouped VLAN.		```!
mdns-sd service-list
LOCAL-AREA-SERVICES-OUT out
match printer-ipps
!```
Step 4: Associate inbound and outbound service lists to a unique service policy.		```!
mdns-sd service-policy
LOCAL-AREA-POLICY
service-list
LOCAL-AREA-SERVICES-IN
service-list
LOCAL-AREA-SERVICES-OUT
!```
Step 5: Disable mDNS gateway from the SVI interface.		```!!
interface vlan 10
no mdns-sd gateway
!```
Step 6: Enable a unicast-based mDNS gateway on VLAN 10. Associate the service policy with advanced parameters.		```!
! mDNS Unicast based gateway
!
vlan configuration 10
 mdns-sd gateway
   service-policy
LOCAL-AREA-POLICY

!
source-interface vlan 4094
!``` |
