How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:

Procedure

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	

	Command or Action	Purpose	
	Device# configure terminal		
Step 3	aaa new-model	Enables AAA.	
	Example:		
	Device(config)# aaa new-model		
Step 4	aaa authentication login default local	Sets the login authentication to use the local	
	Example:	username database. The default keyword applies the local user database authentication	
	Device(config)# aaa authentication login default local	to all ports.	
Step 5	aaa authorization exec default local	Configures user AAA authorization, check the	
	Example:	local database, and allow the user to run an EXEC shell.	
	<pre>Device(config)# aaa authorization exec default local</pre>		
Step 6	aaa authorization network default local	Configures user AAA authorization for all	
	Example:	network-related service requests.	
	Device(config)# aaa authorization network default local		
Step 7	username name [privilege level] {password encryption-type password}	Enters the local database, and establishes a username-based authentication system.	
	Example:	Repeat this command for each user.	
	<pre>Device(config) # username your_user_name privilege 1 password 7 secret567</pre>	• For <i>name</i> , specify the user ID as one word. Spaces and quotation marks are not allowed.	
		• (Optional) For <i>level</i> , specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access.	
		• For <i>encryption-type</i> , enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows.	
		• For <i>password</i> , specify the password the user must enter to gain access to the switch. The password must be from 1 to	

	Command or Action	Purpose
		25 characters, can contain embedded spaces, and must be the last option specified in the username command.
Step 8	end Example:	Exits global configuration mode and returns to privileged EXEC mode.
	Device(config)# end	

Monitoring Local Authentication and Authorization

To display Local Authentication and Authorization configuration, use the **show running-config** command in privileged EXEC mode.

Feature History for Local Authentication and Authorization

This table provides release and related information for the features explained in this module.

These features are available in all the releases subsequent to the one they were introduced in, unless noted otherwise.

Release	Feature	Feature Information
Cisco IOS XE Gibraltar 16.11.1	Local Authentication and Authorization	This feature helps AAA to operate without a server by setting the device to implement AAA in local mode.
Cisco IOS XE Cupertino 17.7.1	Local Authentication and Authorization	Support for this feature was introduced on the Cisco Catalyst 9600 Series Supervisor 2 Module (C9600X-SUP-2).

Use the Cisco Feature Navigator to find information about platform and software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn.
