Preface

Audience

This guide is for the qualified installer responsible for installing Cisco Catalyst IE3x00 Rugged Series switches. We assume that you are familiar with the concepts and terminology of Ethernet and local area networking.

Purpose

This guide documents the hardware features of the Cisco Catalyst IE3x00 Rugged Switches. It describes the physical and performance characteristics of each switch, explains how to install a switch, and provides troubleshooting information.

For information about the standard Cisco IOS commands, see http://www.cisco.com/cisco/web/psa/configure.html?mode=prod&level0=268438303

Conventions

This document uses the following conventions and symbols for notes, cautions, and warnings.

Note: Means reader take note. Notes contain helpful suggestions or references to materials not contained in this manual.

Caution: Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

Warning: This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

The safety warnings for this product are translated into several languages in the Regulatory Compliance and Safety Information for the Cisco Catalyst IE3x00 Rugged Switch that ships with the product. The EMC regulatory statements are also included in that guide.

Related Publications

Before installing, configuring, or upgrading the switch, see the release notes on Cisco.com for the latest information.

These documents provide complete information about the switch and are available on Cisco.com:

- Regulatory Compliance and Safety Information for the Cisco Catalyst IE3x00 Rugged Switch
- Release Notes for the Cisco Catalyst IE3x00 Rugged Switch
- Cisco Catalyst IE3x00 Rugged Switch Software Configuration Guide
- WebUI online help (available on the switch)
These compatibility matrix documents are available from this Cisco.com site:

https://tmgmatrix.cisco.com/

- *Cisco Gigabit Ethernet Transceiver Modules Compatibility Matrix* (not orderable but available on Cisco.com)
- *Cisco Small Form-Factor Pluggable Modules Compatibility Matrix* (not orderable but available on Cisco.com)

**Obtaining Documentation, Obtaining Support, and Security Guidelines**

For information on obtaining documentation, obtaining support, providing documentation feedback, security guidelines, and also recommended aliases and general Cisco documents, see the monthly *What’s New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

Product Overview

The Cisco® Industrial Ethernet (IE) 3X00 Rugged Series Switch is the latest addition to our ruggedized switching platforms and provides superior high-bandwidth switching and proven Cisco IOS® Software-based routing capabilities for industrial environments. The Catalyst IE3x00 Rugged Series delivers highly secure access and industry-leading convergence using the Cisco Resilient Ethernet Protocol (REP) and is built to withstand extreme environments while adhering to overall IT network design, compliance, and performance requirements.

The Catalyst IE3x00 Rugged Series Switch is ideal for industrial Ethernet applications where hardened products are required, including factory automation, energy and process control, intelligent transportation systems (ITS), oil and gas field sites, city surveillance programs, and mining. With improved overall performance, greater bandwidth, a richer feature set, and enhanced hardware, the Cisco Catalyst IE3x00 Rugged Series Switch complements the current industrial Ethernet portfolio of related Cisco industrial switches.

The Cisco Catalyst IE3x00 Rugged Series Switch can easily be installed in your network. Through a user-friendly web interface, the Cisco Catalyst IE3x00 Rugged Series Switch provides easy out-of-the-box configuration and simplified operational manageability to deliver advanced security, data, video, and voice services over industrial networks.

**Ports**

*Note:* Different configurations are available. Not all ports are present in all configurations.

**10/100/1000 BASE-T Downlink Ports**

You can set the 10/100/1000 Base-T ports to operate in 10, 100 or 1000 Mb/s in Full-duplex or half-duplex mode. You can also set these ports for speed and duplex autonegotiation in compliance with IEEE 802.3. (The default setting is autonegotiate.) When set for autonegotiation, the port senses the speed and duplex settings of the attached device and
advises its own capabilities. If the connected device also supports autonegotiation, the switch port negotiates the best connection (that is, the fastest line speed that both devices support, and full-duplex transmission if the attached device supports it) and configures itself accordingly. In all cases, the attached device must be within 328 feet (100 meters). 100BASE-TX traffic requires Category 5 cable. 10BASE-T traffic can use Category 3 or Category 4 cables.

You can use the **mdix auto** interface configuration command in the command-line interface (CLI) to enable the automatic medium-dependent interface crossover (auto-MDIX) feature. When the auto-MDIX feature is enabled, the switch detects the required cable type for copper Ethernet connections and configures the interfaces accordingly. For configuration information for this feature, see the switch software configuration guide or the switch command reference.

### 1000 Mb/s SFP Module Downlink Ports (on expansion modules only)

Expansion modules that support SFP interfaces support 1000Mb SFP speeds.

The 1000 0Mb/s SFP module downlink slots provide full-duplex 1000 Mb/s connectivity over multi-mode (MM) fiber cables or single-mode (SM) fiber cables. These ports use a SFP fiber-optic transceiver module that accepts a dual LC connector. Check the SFP specifications for the cable type and length.

### 1000 Mb/s SFP Module Uplink Ports

The IEEE 802.3u SFP module uplink slots provide full-duplex 100 and 1000 Mb/s connectivity over multi-mode (MM) fiber cables or single-mode (SM) fiber cables. These ports use a SFP fiber-optic transceiver module that accepts a dual LC connector. Check the SFP specifications for the cable type and length.

### Management Ports

You can connect the switch to a PC running Microsoft Windows or to a terminal server through either the RJ-45 console port or the USB mini-Type B console port, also referred to as the USB-mini console port. These ports use the following connectors:

- RJ-45 console port uses an RJ-45-to-DB-9 female cable.
- USB-mini console port (5-pin connector) uses a USB Type A-to-5-pin mini-Type B cable.

The USB-mini console interface speeds are the same as the RJ-45 console interface speeds.

To use the USB-mini console port, you must install the Windows USB device driver on the device that is connected to the USB-mini console port and that is running Microsoft Windows.

With the Windows USB device driver, connecting and disconnecting the USB cable from the console port does not affect Windows HyperTerminal operations. Mac OS X or Linux require no special drivers.

![USB Mini-Type B Port](image)

The configurable inactivity timeout reactivates the RJ-45 console port if the USB-mini console port is activated, but no input activity occurs for a specified time period. When the USB-mini console port deactivates due to a timeout, you can restore its operation by reopening the terminal program. This will take the CP2102N out of suspend mode and both RJ45 and USB console will output the console data. Only the connected and active port will be able to input data. For information on using the CLI to configure the USB-mini console interface, see the switch software guide.
Power Connectors

DC Power Connector

You connect the DC power to the switch through the front panel connectors. The switch has a dual-feed DC power supply; two connectors provide primary and secondary DC power (DC-A and DC-B). The DC power connectors are near the top right of the front panel. See Figure 1 on page 2. Each power connector has an LED status indicator.

The switch power connectors are attached to the switch chassis. Each power connector has screw terminals for terminating the DC power. All connectors are attached to the switch front panel with the provided captive screws.

The power connector labeling is on the panel. The positive DC power connection is labeled “+”, and the return connection is labeled “−”.

The switch can operate with a single power source or with dual power sources. When both power sources are operational, the switch draws power from the DC source with the higher voltage. If one of the two power sources fail, the other continues to power the switch.

Alarm Connector

You connect the alarm signals to the switch through the alarm connector. The switch supports two alarm inputs and one alarm output relay. The alarm connector is on the bottom right of the front panel. See Figure 3 on page 4.

The alarm connector provides six alarm wire connections. The connector is attached to the switch front panel with the provided captive screws.

![Alarm Connector](image)

Both alarm input circuits can sense if the alarm input is open or closed. The alarm inputs can be activated for environmental, power supply, and port status alarm conditions. From the CLI, you can configure each alarm input as a normally open or normally closed contact.

The alarm output circuit is a relay with a normally open and a normally closed contact. The switch is configured to detect faults that are used to energize the relay coil and change the state on both of the relay contacts: normally open contacts close, and normally closed contacts open. The alarm output relay can be used to control an external alarm device, such as a bell or a light.

See the switch software configuration guide for instructions on configuring the alarm relays.

For more information about the alarm connector, see Cable and Connectors, page 51

SFP Modules Supported

The SFP modules are switch Ethernet SFP modules that provide connections to other devices. Depending on the switch model, these field-replaceable transceiver modules provide uplink or downlink interfaces. The modules have LC connectors for fiber-optic connections.

Refer to the IE3X00 Data Sheet for details about the supported SFP Modules.
LEDs

You can use the LEDs to monitor the switch status, activity, and performance. Figure 4 on page 5 shows the front panel LEDs.

**Figure 4  LED on the Cisco Catalyst IE3x00 Rugged Switch**

</tr>
<tr>
<td>Blinking red</td>
<td>Major alarm detected.</td>
</tr>
<tr>
<td>Red</td>
<td>Minor alarm detected.</td>
</tr>
</tbody>
</table>

**Power Status LEDs**

The switch can operate with one or two DC power sources. Each DC input has an associated LED that shows the status of the corresponding DC input. If power is present on the circuit, the LED is green. If power is not present, the LED color depends on the alarm configuration. If alarms are configured, the LED is red when power is not present; otherwise, the LED is off.

If the switch has dual power sources, the switch draws power from the power source with the higher voltage. If one of the DC sources fails, the alternate DC source powers the switch, and the corresponding power status LED is green. The power status for the failed DC source is either off or red, depending on the alarm configuration.

<table>
<thead>
<tr>
<th>Color</th>
<th>System Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Power is present on the associated circuit, system is operating normally.</td>
</tr>
<tr>
<td>Off</td>
<td>Power is not present on the circuit, or the system is not powered up.</td>
</tr>
<tr>
<td>Red</td>
<td>Power is not present on the associated circuit, and the power supply alarm is configured.</td>
</tr>
</tbody>
</table>

The Power A and Power B LEDs show that power is not present on the switch if the power input drops below the low valid level. The power status LEDs only show that power is present if the voltage at the switch input exceeds the valid level.

For information about the power LED colors during the boot fast sequence, see Verifying Switch Operation, page 31.

**Port Status LEDs**

Each port and SFP uplink slot has a status LED, as shown in Figure 4 on page 5 and described below.

<table>
<thead>
<tr>
<th>Color</th>
<th>System Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>No link.</td>
</tr>
<tr>
<td>Solid green</td>
<td>Link present.</td>
</tr>
<tr>
<td>Blinking green</td>
<td>Activity. Port is sending or receiving data.</td>
</tr>
<tr>
<td>Alternating green-amber</td>
<td>Link fault. Error frames can affect connectivity, and errors such as excessive collisions, CRC errors, and alignment and jabber errors are monitored for a link-fault indication.</td>
</tr>
<tr>
<td>Solid amber</td>
<td>Port is not forwarding. The port was disabled by management, an address violation, or STP. After a port is reconfigured, the port LED can remain amber for up to 30 seconds while STP checks the switch for possible loops.</td>
</tr>
</tbody>
</table>
PoE Status LED

The PoE STATUS LEDs are located on the front panel, next to the PoE ports (models equipped with PoE ports). The LEDs display the functionality and status of the adjacent PoE ports.

<table>
<thead>
<tr>
<th>Color</th>
<th>PoE Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>PoE is off. If the powered device is receiving power from a non-PoE power source, the port LED is off even if the powered device is connected to the switch port.</td>
</tr>
<tr>
<td>Green</td>
<td>PoE is on. The port LED is green only when the PoE port is providing power.</td>
</tr>
<tr>
<td>Alternating green and amber</td>
<td>PoE is denied because providing power to the powered device will exceed the switch power capacity.</td>
</tr>
<tr>
<td>Flashing amber</td>
<td>PoE is off due to a fault.</td>
</tr>
<tr>
<td>Amber</td>
<td>PoE for the port is disabled. (PoE is enabled by default.)</td>
</tr>
</tbody>
</table>

Caution: Non-compliant cabling or powered devices can cause a PoE port fault. Use only standard-compliant cabling to connect Cisco pre-standard IP Phones and wireless access points or IEEE 802.3af-compliant devices. You must remove any cable or device that causes a PoE fault.

Flash Memory Card

The switch supports a flash memory card that makes it possible to replace a failed switch without reconfiguring the new switch. The slot for the flash memory card is on the front of the switch. A cover protects the flash card and holds the card firmly in place. The cover is hinged and closed with a captive screw. This prevents the card from coming loose and protects against shock and vibration.

Note: For more information on inserting and removing the flash memory card, see Installing or Removing the Flash Memory Card (Optional), page 14.

Note: The replacement SD card part number is SD-IE-4GB.

Rear Panel

The rear panel of the switch has a latch for installation on a DIN rail. See Figure 5 on page 9. The latch is spring-loaded to move down to position the switch over a DIN rail and return to the original position to secure the switch to a DIN rail.

Note: The switch should only be installed in the vertical orientation shown in this document.
Management Options

The switch supports these management options:

- **Web UI**

  You can use Web UI, which is in the switch memory, to manage individual and standalone switches. This web interface offers quick configuration and monitoring. You can access Web UI from anywhere in your network through a web browser. For more information, see the Web UI online help.

- **Cisco IOS CLI**

  The switch CLI is based on Cisco IOS software and is enhanced to support desktop-switching features. You can fully configure and monitor the switch. You can access the CLI either by connecting your management station directly to the switch management port, or a console port, or by using Telnet from a remote management station. See the switch command reference on Cisco.com for more information.

- **SNMP network management**

  You can manage switches from a SNMP-compatible management station that is running platforms such as HP OpenView or SunNet Manager. The switch supports a comprehensive set of Management Information Base (MIB) extensions and four Remote Monitoring (RMON) groups. See the switch software configuration guide on Cisco.com and the documentation that came with your SNMP application for more information.

- **Common Industrial Protocol**
The Common Industrial Protocol (CIP) management objects are supported. The Cisco Catalyst IE3x00 Rugged can be managed by CIP-based management tools, allowing the user to manage an entire industrial automation system with one tool.

- TIA Portal
- TCP/IP and RT

This switch supports TCP/IP and RT and can be managed by Siemens' automation software such as STEP 7 and TIA Portal.

Network Configurations

See the switch software configuration guide on Cisco.com for network configuration concepts and examples of using the switch to create dedicated network segments and interconnecting the segments through Gigabit Ethernet connections.
Switch Installation

This chapter describes how to install your switch, verify the boot fast, and connect the switch to other devices. It also includes information specifically for installations in hazardous environments.

Note: Please refer to the Product Documentation of Compliance for certified installation procedures in Hazardous Locations.

Read these topics, and perform the procedures in this order:

- Preparing for Installation, page 11
- Installing or Removing the Flash Memory Card (Optional), page 14
- Connecting to a Console Port (Optional), page 15
- Connecting to Power, page 16
- Installing the Switch, page 23
- Connecting Alarm Circuits, page 25
- Connecting Destination Ports, page 28
- Verifying Switch Operation, page 31
- Where to Go Next, page 31

Preparing for Installation

This section provides information about these topics:

- Warnings, page 11
- Installation Guidelines, page 12
- Installing or Removing the Flash Memory Card (Optional), page 14

Warnings

These warnings are translated into several languages in the Regulatory Compliance and Safety Information for this switch.

Warning: Before working on equipment that is connected to power lines, remove jewelry (including rings, necklaces, and watches). Metal objects will heat up when connected to power and ground and can cause serious burns or weld the metal object to the terminals. Statement 43

Warning: Exposure to some chemicals could degrade the sealing properties of materials used in the sealed relay device. Statement 381

Warning: Do not work on the system or connect or disconnect cables during periods of lightning activity. Statement 1001
Warning: Before performing any of the following procedures, ensure that power is removed from the DC circuit. Statement 1003

Warning: Read the installation instructions before you connect the system to its power source. Statement 1004

Warning: This unit is intended for installation in restricted access areas. A restricted access area can be accessed only through the use of a special tool, lock and key, or other means of security. Statement 1017

Warning: This equipment is supplied as “open type” equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool.

The enclosure must meet IP 54 or NEMA type 4 minimum enclosure rating standards. Statement 1063

Warning: This equipment must be grounded. Never defeat the ground conductor or operate the equipment in the absence of a suitably installed ground conductor. Contact the appropriate electrical inspection authority or an electrician if you are uncertain that suitable grounding is available. Statement 1024

Warning: This unit might have more than one power supply connection. All connections must be removed to de-energize the unit. Statement 1028

Warning: Only trained and qualified personnel should be allowed to install, replace, or service this equipment. Statement 1030

Warning: Ultimate disposal of this product should be handled according to all national laws and regulations. Statement 1040

Warning: For connections outside the building where the equipment is installed, the following ports must be connected through an approved network termination unit with integral circuit protection. 10/100/1000 Ethernet Statement 1044

Warning: To prevent the system from overheating, do not operate it in an area that exceeds the maximum recommended ambient temperature, 60C/140F. Statement 1047

Warning: Installation of the equipment must comply with local and national electrical codes. Statement 1074

Caution: Airflow around the switch must be unrestricted. To prevent the switch from overheating, there must be the following minimum clearances:
- Top and bottom: 2.0 in. (50.8 mm)
- Sides: 2.0 in. (50.8 mm)
- Front: 2.0 in. (50.8 mm)

Installation Guidelines

When determining where to place the switch, observe these guidelines.

Note: The switch should only be installed in the vertical orientation shown in this document.

Environment and Enclosure Guidelines

Review these environmental and enclosure guidelines before installation:

- This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 9842 ft (3 km) without derating.

- This equipment is considered Group 1, Class A industrial equipment, according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.
Preparing for Installation

- This equipment is supplied as open-type equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The enclosure must have suitable flame-retardant properties to prevent or minimize the spread of flame, complying with a flame-spread rating of SVA, V2, V1, V0 (or equivalent) if nonmetallic. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication might contain additional information regarding specific enclosure-type ratings that are required to comply with certain product safety certifications.

General Guidelines

Before installation, observe these general guidelines:

**Caution:** Proper ESD protection is required whenever you handle Cisco equipment. Installation and maintenance personnel should be properly grounded by using ground straps to eliminate the risk of ESD damage to the switch.

Do not touch connectors or pins on component boards. Do not touch circuit components inside the switch. When not in use, store the equipment in appropriate static-safe packaging.

- The switch meets the voltage dips and interruptions requirements of IEC 61850-3 only when powered by a redundant power supply configuration.

- If you are responsible for the application of safety-related programmable electronic systems (PES), you need to be aware of the safety requirements in the application of the system and be trained in using the system.

- For better EMC performance, it is suggested to use S/UTP or SF/UTP cables for copper Ethernet ports. Refer ISO/IEC11801 standard for details on S/UTP and SF/UTP.

**Caution:** The device is designed to mount on a DIN rail that conforms to Standard EN60715.

**Note:** In order to prevent excessive side to side movement of the unit it is advised to install DIN rail stop plates such as mouser part numbers 653-PFP-M, 651-1201662 or 845-CA402. These end stops can be installed on one or both sides or the unit to limit excessive side to side movement that typically occurs in high vibration environments.

When determining where to place the switch, observe these guidelines:

- Before installing the switch, first verify that the switch is operational by powering it on and observing boot fast. Follow the procedures in the Verifying Switch Operation, page 31.

- For 10/100/1000 ports, the cable length from a switch to an attached device cannot exceed 328 feet (100 meters).

- Clearance to front and rear panels must meet these conditions:
  - Front-panel LEDs can be easily read.
  - Access to ports is sufficient for unrestricted cabling.
  - Front-panel direct current (DC) power connectors and the alarm connector are within reach of the connection to the DC power source.

- Airflow around the switch must be unrestricted. To prevent the switch from overheating, you must have the following minimum clearances:
  - Top and bottom: 2.0 in. (50.8 mm)
  - Sides: 2.0 in. (50.8 mm)
  - Front: 2.0 in. (50.8 mm)
Installing or Removing the Flash Memory Card (Optional)

Optionally, you can execute the sync command to copy Flash to SDFlash: and make SDFlash: the primary storage, then remove the SD card. It is strongly recommended that you use the SD card to boot or store the config for future easy replacement, in case of a hardware failure.

To install or replace the flash memory card, follow these steps:

1. On the front of the switch, locate the door that protects the flash memory card slot. Loosen the captive screw at the top of the door using a Phillips screwdriver to open the door. See Figure 6 on page 14.

![Figure 6 Installing the Flash Memory Card in the Switch](image)

2. Install or remove the card:
   - To install a card, slide it into the slot, and press it in until it clicks in place. The card is keyed so that you cannot insert it the wrong way.
   - To remove the card, push it in until it releases for it to pop out. Place it in an antistatic bag to protect it from static discharge.

3. After the card is installed, close the guard door and fasten the captive screw using a Phillips screwdriver to keep the door in place.

| 1 | Flash Memory Card Slot |
Connecting to a Console Port (Optional)

You can also enter CLI commands through the console port. For more information about this process see Accessing the CLI Through the Console Port, page 39.

Attaching an Expansion Module (Optional)

If your installation calls for use of one of the expansion modules listed in Switch Models, use the following procedure to attach the module to the switch:

**Caution:** The device is designed to mount on a DIN rail that conforms to Standard EN50022.

1. Remove the 2 screws securing the side cover plate to the switch.
2. Remove the two screws from the front of the Expansion chassis, and the two screws from the rear of the base.
3. Align tabs on top and bottom left front of expansion module with slots on top and bottom right side of switch along with tabs on top and bottom left rear of module and holes at top and bottom right rear of switch, and press module and switch together so that the electrical connections engage and the screw holes align.

4. Secure the 4 flathead phillips screws with 5–6 in–lbs torque

Connecting to Power

Tools and Equipment

Obtain these necessary tools and equipment:

- Ratcheting torque flathead screwdriver that exerts up to 18 in–lb (2.03 N·m) of pressure.
- For the protective ground connector, obtain a single or pair of stud size 6 ring terminals (such as Hollingsworth part number R3456B or equivalent).
- Crimping tool (such as Thomas & Betts part number WT4000, ERG-2001, or equivalent).
- 10-gauge copper ground wire.
- For DC power connections, use UL- and CSA-rated, style 1007 or 1569 twisted-pair copper appliance wiring material (AWM) wire.
- Wire-stripping tools for stripping 10 and 14 AWG wires.
- A number-2 Phillips screwdriver.
- A flat-blade screwdriver.

Supported Power Supplies

Cisco is constantly updating the IoT Power Supply portfolio. Please refer to the Cisco Catalyst IE3x00 Rugged Switch Data Sheet for a comprehensive list of supported power supplies and their capabilities.
Installing the Power Converter on a DIN Rail, Wall, or Rack Adapter

You install the power converter on a DIN rail, wall, or rack as you would a switch module.

**Warning:** This equipment is supplied as “open type” equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool.

The enclosure must meet IP 54 or NEMA type 4 minimum enclosure rating standards. Statement 1063

**Caution:** To prevent the switch assembly from overheating, there must be sufficient spacings as explained under Installation Guidelines, page 12, between any other switch assembly.

Grounding the Switch

Make sure to follow any grounding requirements at your site.

**Warning:** This equipment must be grounded. Never defeat the ground conductor or operate the equipment in the absence of a suitably installed ground conductor. Contact the appropriate electrical inspection authority or an electrician if you are uncertain that suitable grounding is available. Statement 1024

**Warning:** When installing or replacing the unit, the ground connection must always be made first and disconnected last. Statement 1046

**Warning:** This equipment is intended to be grounded to comply with emission and immunity requirements. Ensure that the switch functional ground lug is connected to earth ground during normal use. Statement 1064

**Caution:** To make sure that the equipment is reliably connected to earth ground, follow the grounding procedure instructions, and use a UL-listed ring terminal lug suitable for number 10-to-12 AWG wire, such as Hollingsworth part number R3456B or equivalent)

**Caution:** Use at least an 10 AWG (5.26 mm2) conductor to connect to the external grounding screw.

The ground lug is not supplied with the switch. You can use one of the these options:

- Single ring terminal
- Two single ring terminals

To ground the switch to earth ground by using the ground screw, follow these steps:

1. Use a standard Phillips screwdriver or a ratcheting torque screwdriver with a Phillips head to remove the ground screw from the front panel of the switch. Store the ground screw for later use.

2. Use the manufacturer’s guidelines to determine the wire length to be stripped.

3. Insert the ground wire into the ring terminal lug, and using a crimping tool, crimp the terminal to the wire. See Figure 7 on page 18. If two ring terminals are being used, repeat this action for a second ring terminal.
4. Slide the ground screw through the terminal.

5. Insert the ground screw into the functional ground screw opening on the front panel.

6. Use a ratcheting torque screwdriver to tighten the ground screws and ring terminal to the switch front panel. The torque should not exceed 4.5 in-lb (0.51 N·m). See Figure 8 on page 18.

7. Attach the other end of the ground wire to an appropriate ground, such as a ground bus, a grounded DIN rail, or a grounded bare rack.
Switch Installation

Connecting to Power

Note: The expansion module must be grounded separately. Note that this is an EMC ground not a safety ground, unlike the one on the main chassis.

Connecting the Power Converter to an AC Power Source

These sections describe the steps required to connect the power converter to an AC power source:

- Preparing the AC Power Connection, page 19
- Connecting the AC Power Source to the Power Converter, page 19

Preparing the AC Power Connection

To connect the power converter to an AC power source, you need an AC power cord. Power cord connector types and standards vary by country. Power-cord wiring color codes also vary by country. You must to have a qualified person select, prepare, and install the appropriate power cord to the power supply.

Note: Use copper conductors only, rated at a minimum temperature of 167°F (75°C).

Note: This section does not apply to PWR-IE50W-AC-IEC, which has pluggable IEC connector.

Connecting the AC Power Source to the Power Converter

Caution: AC power sources must be dedicated AC branch circuits. Each branch circuit must be protected by a dedicated two-pole circuit breaker.

Caution: Do not turn on AC power until the wiring is secured.

1. Remove the plastic cover from the input power terminals and set it aside.
2. Insert the exposed ground wire lead (10-to-12 AWG cable) into the power converter ground wire connection. Ensure that only wire with insulation extends from the connector. Note that the position of the power converter may vary on different switch models.
3. Tighten the ground wire terminal block screw.

Note: Torque to 10 in-lb (1.13Nm).

4. Insert the line and neutral wire leads into the terminal block line and neutral connections. Make sure that you cannot see any wire lead. Ensure that only wire with insulation extends from the connectors.
5. Tighten the line and neutral terminal block screws.

Note: Torque to 10 in-lb (1.13Nm).
6. Replace the plastic cover over the terminal block.
7. Connect the other end of the wiring to your AC power source.

Connecting the Power Converter to a DC Power Source

You can also connect the power converter to a DC power source. Several power supplies can be used. Refer to the data sheet for the appropriate DC input ratings.
Switch Installation

Connecting to Power

**Note:** Use copper conductors only, rated at a minimum temperature of 167°F (75°C).

1. Measure a single length of stranded copper wire long enough to connect the power converter to the earth ground. The wire color might differ depending on the country that you are using it in.

For connections from the power converter to earth ground, use 14-AWG stranded copper wire.

2. Measure a length of twisted-pair copper wire long enough to connect the power converter to the DC power source.

For DC connections from the power converter to the DC source, use 10-AWG twisted-pair copper wire.

3. Using a wire-stripping tool, strip the ground wire and both ends of the twisted pair wires to 0.25 inch (6.3 mm) ± 0.02 inch (0.5 mm). Do not strip more than 0.27 inch (6.8 mm) of insulation from the wires. Stripping more than the recommended amount of wire can leave exposed wire from the power and relay connector after installation.

4. Connect one end of the stranded copper wire to a grounded bare metal surface, such as a ground bus, a grounded DIN rail, or a grounded bare rack.

5. Insert the other end of the exposed ground wire lead into the earth-ground wire connection on the power converter terminal block. Note that the position of the power converter may vary on different switch models.

6. Tighten the earth-ground wire connection terminal block screw.

**Note:** Torque to 8 in.-lb, not to exceed 10 in-lb.

**Warning:** An exposed wire lead from a DC-input power source can conduct harmful levels of electricity. Be sure that no exposed portion of the DC-input power source wire extends from the power and relay connector. Statement 122

7. Insert the twisted-pair wire leads into the terminal block line and neutral connections. Insert the wire (labeled number 1 in Figure 8 on page 18) lead into the neutral wire connection and the wire (labeled number 2 in Figure 8 on page 18) lead into the line wire connection. Ensure that only wire with insulation extends from the connectors. See Figure 8 on page 18.

8. Tighten the line and neutral terminal block screws.

**Note:** Torque to 8 in.-lb, not to exceed 10 in-lb.

9. Connect the red wire to the positive pole of the DC power source, and connect the black wire to the return pole. Ensure that each pole has a current-limiting-type fuse rated to 30 Amp.

Wiring the DC Power Source

Read these cautions and warnings before wiring the switch the DC power source.

**Warning:** A readily accessible two-poled disconnect device must be incorporated in the fixed wiring. Statement 1022

**Warning:** This product relies on the building’s installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than: 15A. Statement 1005

**Warning:** Installation of the equipment must comply with local and national electrical codes. Statement 1074

**Warning:** Before performing any of the following procedures, ensure that power is removed from the DC circuit. Statement 1003

**Warning:** Only trained and qualified personnel should be allowed to install, replace, or service this equipment. Statement 1030

**Warning:** Connect the unit only to DC power source that complies with the safety extra-low voltage (SELV) requirements in IEC 60950 based safety standards. Statement 1033
Caution: For wire connections to the power and alarm connectors, you must use UL- and CSA-rated, style 1007 or 1569 twisted-pair copper appliance wiring material (AWM) wire.

To wire the switch to a DC power source, follow these steps:

1. Locate the two power connectors on the switch front panel labeled DC-A and DC-B.

2. Identify the connector positive and return DC power connections. The labels for power connectors DC-A and DC-B are on the switch panel as displayed below.

<table>
<thead>
<tr>
<th>Label</th>
<th>Connection</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Positive DC power connection</td>
</tr>
<tr>
<td>-</td>
<td>Return DC power connection</td>
</tr>
</tbody>
</table>

3. Measure two strands of twisted-pair copper wire (14 AWG) long enough to connect to the DC power source.

4. Using a wire-stripping tool, strip each of the two twisted pair wires coming from each DC-input power source to 0.25 inch (6.3 mm) ± 0.02 inch (0.5 mm). Do not strip more than 0.27 inch (6.8 mm) of insulation from the wire. Stripping more than the recommended amount of wire can leave exposed wire from the power connector after installation.

5. Remove the two captive screws that attach the power connector to the switch, and remove the power connector. Remove both connectors if you are connecting to two power sources. See Figure 10 on page 22.
Switch Installation

Connecting to Power

6. On the power connector, insert the exposed part of the positive wire into the connection labeled “+” and the exposed part of the return wire into the connection labeled “–”. Make sure that you cannot see any wire lead. Only wire with insulation should extend from the connector.

Warning: An exposed wire lead from a DC-input power source can conduct harmful levels of electricity. Be sure that no exposed portion of the DC-input power source wire extends from the connector(s) or terminal block(s).

Statement 122

7. Use a ratcheting torque flathead screwdriver to torque the power connector captive screws (above the installed wire leads) to 5in-lb (0.565 Nm).

Caution: Do not over-torque the power connector’s captive screws. The torque should not exceed 5in-lb (0.565 Nm).

8. Connect the other end of the positive wire to the positive terminal on the DC power source, and connect the other end of the return wire to the return terminal on the DC power source.

When you are testing the switch, one power connection is sufficient. If you are installing the switch and are using a second power source, repeat Step 4 through Step 8 using the second power connector.

Figure 13 shows the completed DC-input wiring on a power connector for a primary power source and an optional secondary power source.

Attaching the Power Connectors to the Switch

To attach the power connectors to the front panel of the switch, follow these steps:

1. Insert one power connector into the DC-A receptacle on the switch front panel, and the other into the DC-B receptacle. See Figure 10 on page 22.
Switch Installation

Installing the Switch

**Warning:** Failure to securely tighten the captive screws can result in an electrical arc if the connector is accidentally removed. Statement 397

**Warning:** Use twisted-pair supply wires suitable for 86°F (30°C) above surrounding ambient temperature outside the enclosure. Statement 1067

**Warning:** Installation of the equipment must comply with local and national electrical codes. Statement 1074

2. Use a ratcheting torque flathead screwdriver to tighten the captive screws on the sides of the power connectors.

When you are testing the switch, one power source is sufficient. If you are installing the switch and are using a second power source, repeat this procedure for the second power connector (DC-B), which installs just below the primary power connector (DC-A).

When you are installing the switch, secure the wires coming from the power connector so that they cannot be disturbed by casual contact. For example, use tie wraps to secure the wires.

Applying Power

Move the circuit breaker for the AC outlet or the DC control circuit to the on position.

The LED on the power converter front panel is green when the unit is operating normally. The LED is off when the unit is not powered or is not operating normally. After the power is connected, the switch automatically begins booting, a series of tests that verifies that the switch functions properly.

Installing the Switch

This section describes how to install the switch:

- Installing the Switch on a DIN Rail, page 23
- Removing the Switch from a DIN Rail, page 24

**Warning:** This equipment is supplied as “open type” equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool.

The enclosure must meet IP 54 or NEMA type 4 minimum enclosure rating standards. Statement 1063

**Caution:** To prevent the switch from overheating, ensure these minimum clearances:
- Top and bottom: 2.0 in. (50.8 mm)
- Exposed side (not connected to the module): 2.0 in. (50.8 mm)
- Front: 2.0 in. (50.8 mm)

Installing the Switch on a DIN Rail

The switch ships with a spring-loaded latch on the rear panel for a mounting on a DIN rail.

You can install the switch as a standalone device on the DIN rail or with the expansion modules already connected. You must connect expansion modules to the switch before installing the switch on the DIN rail.
Switch Installation

Installing the Switch

To attach the switch to a DIN rail, follow these steps:

1. Position the rear panel of the switch directly in front of the DIN rail, making sure that the DIN rail fits in the space between the two hooks near the top of the switch and the spring-loaded latch near the bottom.

2. Holding the bottom of the switch away from the DIN rail, place the two hooks on the back of the switch over the top of the DIN rail.

Caution: **Do not stack any equipment on the switch.**

![Position the Hooks Over the DIN Rail]

3. Push the switch toward the DIN rail to cause the spring-loaded latch at the bottom rear of the switch to move down, and snap into place.

After the switch is mounted on the DIN rail, connect the power and alarm wires, as described in Connecting Alarm Circuits, page 25.

For configuration instructions about the CLI setup program, see Configuring the Switch with the CLI-Based Setup Program, page 39.

Note: For instructions on how to remove the switch from a DIN rail, see Removing the Switch from a DIN Rail, page 24.

Removing the Switch from a DIN Rail

To remove the switch from a DIN rail, follow these steps:

1. Ensure that power is removed from the switch, and disconnect all cables and connectors from the front panel of the switch.

2. Insert a tool such as a flathead screwdriver in the slot at the bottom of the spring-loaded latch and use it to release the latch from the DIN rail. See Figure 12 on page 25.
3. Pull the bottom of the switch away from the DIN rail, and lift the hooks off the top of the DIN rail. See Figure 12 on page 25.

Figure 12  Releasing the Spring-Loaded Latch from the DIN Rail

4. Remove the switch from the DIN rail.

Connecting Alarm Circuits

After the switch is installed, you are ready to connect the DC power and alarm connections.

- Wiring the Reference and DC Power for Alarm Circuits, page 25
- Wiring the External Alarms, page 26

Wiring the Reference and DC Power for Alarm Circuits

For instructions on grounding the switch and connecting the DC power, see the Grounding the Switch, page 17.
Wiring the External Alarms

The switch has two alarm input and one alarm output relay circuits for external alarms. The alarm input circuits are designed to sense if the alarm input is open or closed relative to the alarm input reference pin. Each alarm input can be configured as an open or closed contact. The alarm output relay circuit has a normally open and a normally closed contact.

Alarm signals are connected to the switch through the six-pin alarm connector. Three contacts are dedicated to the two alarm input circuits: alarm input 1, alarm input 2, and a reference ground. An alarm input and the reference ground wiring connection are required to complete a single alarm input circuit. The three remaining connections are for the alarm output circuit: a normally open output, a normally closed output, and a common signal. An alarm output and the common wiring connection are required to complete a single alarm output circuit.

The labels for the alarm connector are on the switch panel and are displayed below.

<table>
<thead>
<tr>
<th>Label</th>
<th>Connection</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO</td>
<td>Alarm Output Normally Open (NO) connection</td>
</tr>
<tr>
<td>COM</td>
<td>Alarm Output Common connection</td>
</tr>
<tr>
<td>NC</td>
<td>Alarm Output Normally Closed (NC) connection</td>
</tr>
<tr>
<td>IN2</td>
<td>Alarm Input 2</td>
</tr>
<tr>
<td>REF</td>
<td>Alarm Input Reference connection</td>
</tr>
<tr>
<td>IN1</td>
<td>Alarm Input 1</td>
</tr>
</tbody>
</table>

**Caution:** The input voltage source of the alarm output relay circuit must be an isolated source and limited to less than or equal to 24 VDC, 1.0 A or 48 VDC, 0.5 A.

**Caution:** To reduce risk of electric shock and fire, the alarm ports must be connected to an IEC60950/IEC 62368 compliant limited power source.

**Note:** Wire connections to the power and alarm connectors must be UL- and CSA-rated, style 1007 or 1569 twisted-pair copper appliance wiring material (AWM) wire.

To wire the switch to an external alarm device, follow these steps:

1. Remove the captive screws that hold the alarm connector on the switch, and remove the connector from the switch chassis. See Figure 13 on page 27.
2. Measure two strands of twisted-pair wire (16-to-18 AWG) long enough to connect to the external alarm device. Choose between setting up an external alarm input or output circuit.

3. Use a wire stripper to remove the casing from both ends of each wire to 0.25 inch (6.3 mm) ± 0.02 inch (0.5 mm). Do not strip more than 0.27 inch (6.8 mm) of insulation from the wires. Stripping more than the recommended amount of wire can leave exposed wire from the alarm connector after installation.

4. Insert the exposed wires for the external alarm device into the connections based on an alarm input or output circuit setup. For example, to wire an alarm input circuit, complete the IN1 and REF connections.

5. Use a ratcheting torque flathead screwdriver to tighten the alarm connector captive screw (above the installed wire leads) to 2 in-lb (0.23 N-m).

Caution: Do not over-torque the power and alarm connectors’ captive screws. The torque should not exceed 2 in-lb (0.23 N-m).
6. Repeat Step 2 through Step 5 to insert the input and output wires of one additional external alarm device into the alarm connector.

Figure 13 shows the completed wiring for two external alarm devices. The first alarm device circuit is wired as an alarm input circuit; the IN1 and REF connections complete the circuit. The second alarm device circuit is wired as an alarm output circuit that works on a normally open contact basis; the NO and COM connections complete the circuit.

Attaching the Alarm Connector to the Switch

**Warning:** Failure to securely tighten the captive screws can result in an electrical arc if the connector is accidentally removed. Statement 397

To attach the alarm connector to the front panel of the switch, follow these steps:

1. Insert the alarm connector into the receptacle on the switch front panel.

2. Use a ratcheting torque flathead screwdriver to tighten the captive screws on the sides of the alarm connector.

Connecting Destination Ports

These section provide more information about connecting to the destination ports:

- Connecting to 10/100/1000 Ports, page 29
- Installing and Removing SFP Modules, page 29
- Connecting to SFP Modules, page 31
Connecting Destination Ports

Connecting to 10/100/1000 Ports

The switch 10/100/1000 ports automatically configure themselves to operate at the speed of attached devices. If the attached ports do not support autonegotiation, you can explicitly set the speed and duplex parameters. Connecting devices that do not autonegotiate or that have their speed and duplex parameters manually set can reduce performance or result in no communication.

**Note:** For complying with Rail and Smart Grid compliance, SF/UTP cables were used for Ethernet ports.

To maximize performance, choose one of these methods for configuring the Ethernet ports:

- Let the ports autonegotiate both speed and duplex.
- Set the port speed and duplex parameters on both ends of the connection.

The models that support PoE, provide either PoE (15.4 W per port; IEEE 802.3af) or PoE+ (30 W per port; IEEE 802.3at), depending on the power source used. In addition, PoE capable base and expansion modules each have a maximum power budget of 240W (30W/port) and 480W maximum total power budget for a PoE capable base and expansion module combination.

**Caution:** To prevent electrostatic-discharge (ESD) damage, follow your normal board and component handling procedures.

To connect to 10BASE-T, 100BASE-TX or 1000BASE-T devices, follow these steps:

1. When connecting to workstations, servers, routers, and Cisco IP phones, connect a straight-through cable to an RJ-45 connector on the front panel.

When connecting to 1000BASE-T-compatible devices, use a twisted four-pair, Category 5 or higher cable.

The auto-MDIX feature is enabled by default. For configuration information for this feature, see the Cisco Catalyst IE3x00 Rugged Switch Software Configuration Guide.

2. Connect the other end of the cable to an RJ-45 connector on the other device. The port LED turns on when both the switch and the connected device have established a link.

The port LED is amber while Spanning Tree Protocol (STP) discovers the topology and searches for loops. This can take up to 30 seconds, and then the port LED turns green. If the port LED does not turn on:

- The device at the other end might not be turned on.
- There might be a cable problem or a problem with the adapter installed in the attached device. See Troubleshooting, page 45 for solutions to cabling problems.

3. Reconfigure and reboot the connected device if necessary.

4. Repeat Steps 1 through 3 to connect each device.

Installing and Removing SFP Modules

These sections describe how to install and remove SFP modules. SFP modules are inserted into SFP module slots on the front of the switch. These field-replaceable modules provide the uplink optical interfaces, send (TX) and receive (RX).

You can use any combination of rugged SFP modules. See the release notes on Cisco.com for the list of supported modules. Each SFP module must be of the same type as the SFP module on the other end of the cable, and the cable must not exceed the stipulated cable length for reliable communications.
Switch Installation

Connecting Destination Ports

**Caution:** When you use commercial SFP modules such as CWDM and 1000BX-U/D, reduce the maximum operating temperature by 27°. The minimum operating temperature is 32°F (0°C).

For detailed instructions on installing, removing, and cabling the SFP module, see your SFP module documentation.

Installing SFP Modules into SFP Module Ports

**Figure 15 on page 30** shows an SFP module that has a bale-clasp latch.

**Caution:** Do not install or remove the SFP module with fiber-optic cables attached to it because of the potential damage to the cables, the cable connector, or the optical interfaces in the SFP module. Disconnect all cables before removing or installing an SFP module.

Removing and installing an SFP module can shorten its useful life. Do not remove and insert SFP modules more often than is absolutely necessary.

**Figure 15** SFP Module with a Bale-Clasp Latch

To insert an SFP module into the SFP module slot:

1. Attach an ESD-preventive wrist strap to your wrist and to a grounded bare metal surface.
2. Find the send (TX) and receive (RX) markings that identify the correct side of the SFP module.
3. Align the SFP module sideways in front of the slot opening.
4. Insert the SFP module into the slot until you feel the connector on the module snap into place in the rear of the slot.
5. Remove the dust plugs from the SFP module optical ports and store them for later use.

**Caution:** Do not remove the dust plugs from the SFP module port or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the SFP module ports and cables from contamination and ambient light.

6. Insert the LC cable connector into the SFP module.

Removing SFP Modules from SFP Module Ports

To remove an SFP module from a module receptacle:

1. Attach an ESD-preventive wrist strap to your wrist and to a grounded bare metal surface.
2. Disconnect the LC from the SFP module.
3. Insert a dust plug into the optical ports of the SFP module to keep the optical interfaces clean.
4. Unlock and remove the SFP module.
   If the module has a bale-clasp latch, pull the bale out and down to eject the module. If the bale-clasp latch is obstructed and you cannot use your index finger to open it, use a small, flat-blade screwdriver or other long, narrow instrument to open the bale-clasp latch.

5. Grasp the SFP module between your thumb and index finger, and carefully remove it from the module slot.

6. Place the removed SFP module in an antistatic bag or other protective environment.

**Connecting to SFP Modules**

This section describes how to connect to a fiber-optic SFP port. For instructions on how to install or remove an SFP module, see *Installing and Removing SFP Modules, page 29.*

**Warning:** Class 1 laser product. Statement 1008

**Caution:** Before connecting to the SFP module, be sure that you understand the port and cabling guidelines in the *Preparing for Installation, page 11.*

To connect a fiber-optic cable to an SFP module, follow these steps:

1. Insert one end of the fiber-optic cable into the SFP module port.

2. Insert the other cable end into a fiber-optic receptacle on a target device.

3. Observe the port status LED:
   - The LED turns green when the switch and the target device have an established link.
   - The LED turns amber while the STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.
   - If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See *Troubleshooting, page 45* for solutions to cabling problems.

4. If necessary, reconfigure and restart the switch or the target device.

**Verifying Switch Operation**

Before installing the switch in its final location, power on the switch, and verify that the switch powers up in boot fast style. The boot fast sequence allows the switch to boot up in less than 90 seconds.

**Where to Go Next**

If the default configuration is satisfactory, the switch does not need further configuration. You can use any of these management options to change the default configuration:

- Start Web UI, which is in the switch memory, to manage individual and standalone switches. This is an easy-to-use web interface that offers quick configuration and monitoring. You can access Web UI from anywhere in your network through a web browser. For more information, see the *Software Configuration Guide* and the Web UI online help.

- Use the CLI to configure the switch as an individual switch from the console. See the *Command Reference* on Cisco.com for information about using the CLI.
Switch Installation

Where to Go Next

- Start an SNMP application such as the Cisco DNA Center application.
- Start the Common Industrial Protocol (CIP) management tool. You can manage an entire industrial automation system with the CIP-based tools.
Running Express Setup

When you first set up the switch, you should use Express Setup to enter the initial IP information. This process enables the switch to connect to local routers and the Internet. You can then access the switch through the IP address for additional configuration.

Required Equipment

You need this equipment to set up the switch:

- A Web browser (IE or Firefox) with JavaScript enabled.
- A straight-through or crossover Category 5 Ethernet cable to connect your computer to the switch port.

**Note:** Do not use the RS232 serial console port for express setup.

- A small paper clip to reach to button.

**Note:** Before running Express Setup, disable any pop-up blockers or proxy settings on your browser and any wireless client running on your computer.

Express Setup Procedure

To run Express Setup:

1. Make sure that nothing is connected to the switch.
2. Ensure the Catalyst IE3X00 is in default factory mode.
   
   **Skip to next step if freshly out of the box.**
   
   a. If not freshly out of the package, use a paper clip to reset the switch for 10 seconds until the SYS LED light turns red, then release the paper clip.
   
   Switch will automatically reboot once the SYS led goes red.
3. Ensure no data port is connected to the switch.
   
   **Note:** During Express Setup, the switch acts as a DHCP server.
   
   - You can add a serial console cable to monitor the booting sequence. *Do not hit [return key] on console screen.*
   
   - Ensure the computer connected to switch is configured with DHCP.
5. Connect power to the switch.

See the wiring instructions in *Grounding the Switch, page 17* and *Wiring the DC Power Source, page 20.*
6. Power on or reset the switch:
   Use LEDs to monitor boot progress:
   - Sys blinking: bootloader
   - Sysl Blank: POST
   - Sys solid: exit post, IOS initializing
   - Sys and alarm LEDs green: IOS init done
   - ~90 – 100 seconds after power on
   - EXP blinking: ready for express setup process

7. Insert paper clip into express setup button for 1-2 seconds.
   When released, port Gig1/1 LED starts flashing green.

8. Connect computer to port Gig1/3.
   LED continues to blink.

10. The username is “admin” and the password is “(system serial number)”.

11. The Account Settings window appears. (This is the first step of 4 that must be completed.)
In the Account Settings:

- **Login Name:** admin (you can change that here, if you like)
- **Login User Password:** by default this is the serial number of the switch. You can change it now if you like.
- **Confirm Login User Password:**
- **Command Line Password (optional):** This defaults to ‘Sync to Login Password’ but if you’d like to change that, you may do so now, using the drop-down menu.
- **Device Name:** Create an identifier for the device in the network.
- **NTP Server (optional):** You may identify an NTP server for the device, here.
- **Date & Time Mode (optional):** Identify the mode here, via the drop-down.

Troubleshooting: If the account settings window does not appear, make sure that any pop-up blockers or proxy settings on your browser are disabled and that any wireless client is disabled on your computer.

- **Click Basic Settings** when finished.

12. The Basic Settings Window Appears (step 2 of 4)

Enter all entries in English letters and Arabic numbers.
- **IP Address**: Choose Static or DHCP here.
- **VLAN ID**: Enter a valid VLAN ID.
- **IP Address**: Enter a valid IP Address.
- **Subnet Mask**: Enter a valid subnet mask.
- **Default Gateway (optional)**: Enter the IP address of the router.
- **(optional)** On this screen you can also enable/Disable Telnet and SSH and configure CIP settings

The CIP VLAN can be the same as the management VLAN, or you can isolate CIP traffic on another VLAN that is already configured on the switch. The default CIP VLAN is VLAN 1. Only one VLAN on a switch can have CIP enabled. If the CIP VLAN is different from the management VLAN, you must specify an IP address for the CIP VLAN. Make sure that the IP address that you assign to the switch is not being used by another device in your network.

For more information about the CIP VLAN settings, click Help on the tool-bar.

- Click **Switch Wide Settings** when finished.

13. The Switch Wide Settings page opens
Running Express Setup

- **Data VLAN**: You can enable/disable data VLAN with the button here.
- **Voice VLAN**: You can enable/disable Voice VLAN here.
- **STP Mode (optional)**: Select a STP Mode from the drop-down
- **Bridge Priority**: You can enable/disable Bridge Priority here.
- **Domain Name (optional)**: Enter a valid Domain Name.
- **Click Day 0 Config Summary** when finished.

14. The Summary page opens

The configuration settings you have entered are displayed here. Confirm everything is accurate and either click the back button to make changes or...
Click Submit to save your changes and to complete the initial setup.

15. After you click Submit, these events occur:
   a. The switch is configured and exits Express Setup mode.
   b. The browser displays a warning message and tries to connect with the earlier switch IP address.
   c. Typically, connectivity between the computer and the switch is lost because the configured switch IP address is in a different subnet from the IP address on the computer.

16. Turn off DC power at the source, disconnect all cables to the switch, and install the switch in your network. See Management Options, page 9 for information about configuring and managing the switch.

17. If you changed the static IP address on your computer in Step 1, change it to the previously configured static IP address.

18. You can now manage the switch by using the Web UI, or both. See Management Options, page 9 for information about configuring and managing the switch.

You can display Web UI by following these steps:
   a. Start a web browser on your computer.
   b. Enter the switch IP address, username, and password in the web browser, and press Enter. The Web UI page appears.

Troubleshooting:
If the Web UI page does not appear:
   - Confirm that the port LED for the switch port connected to your network is green.
   - Confirm that the computer that you are using to access the switch has network connectivity by connecting it to a well known web server in your network. If there is no network connection, troubleshoot the network settings on the computer.
   - Make sure that the switch IP address in the browser is correct.
   - Ping the Switch IP Address and confirm IP reachability.
   - If the switch IP address in the browser is correct, the switch port LED is green, and the computer has network connectivity, continue troubleshooting by reconnecting the computer to the switch. Configure a static IP address on the computer that is in the same subnet as the switch IP address.
   - When the LED on the switch port connected to the computer is green, reenter the switch IP address in a web browser to display the Web UI. When Web UI appears, you can continue with the switch configuration.
Configuring the Switch with the CLI-Based Setup Program

This appendix provides a command-line interface (CLI)-based setup procedure for a switch.
Before connecting the switch to a power source, review the safety warnings in Warnings, page 11
For installation procedures, see Switch Installation, page 11

Accessing the CLI Through the Console Port

You can enter Cisco IOS commands and parameters through the CLI. Use one of these options to access the CLI:

- USB Mini-Type B Console Port
- RJ-45 Console Port

USB Mini-Type B Console Port

1. If you are connecting the switch USB-mini console port to a Windows-based PC for the first time, install a USB driver.

2. Use a Phillips screwdriver to loosen the screw on the USB mini-type B console port cover. See Figure 16 on page 40. Remove the screw and take off the cover.
3. Connect a USB cable to the PC USB port. Connect the other end of the cable to the switch mini-B (5-pin-connector) USB-mini console port.

4. Identify the COM port assigned to the USB-mini console port:
   - Choose Start > Control Panel > Systems.
   - Click the Hardware tab and expand the Ports section. The assigned COM port appears in parenthesis at the end of the line with this entry: Cisco USB System Management Console.

5. Start the terminal-emulation program on the PC or the terminal. The program, frequently a PC application such as HyperTerminal or ProcommPlus, makes communication possible between the switch and your PC or terminal.

6. Configure the COM port.

7. Configure the baud rate and character format of the PC or terminal to match the console port characteristics:
   - 9600 baud
   - 8 data bits
   - 1 stop bit
   - No parity
   - None (flow control)

8. Connect power to the switch as described in Connecting to Power, page 16.

9. The PC or terminal displays the bootloader sequence. Press Enter to display the setup prompt. Follow the steps in the Completing the Setup Program, page 42.
RJ-45 Console Port

1. Connect the RJ-45-to-DB-9 adapter cable to the 9-pin serial port on the PC. Connect the other end of the cable to the switch console port.

2. Start the terminal-emulation program on the PC or the terminal. The program, frequently a PC application such as HyperTerminal or ProcommPlus, makes communication between the switch and your PC or terminal possible.

3. Configure the baud rate and character format of the PC or terminal to match the console port characteristics:
   - 9600 baud
   - 8 data bits
   - 1 stop bit
   - No parity
   - None (flow control)

4. Connect power to the switch as described in Connecting to Power, page 16.

5. The PC or terminal displays the bootloader sequence. Press Enter to display the setup prompt. Follow the steps in the Completing the Setup Program, page 42.
Uninstalling the Cisco Microsoft Windows XP, 2000, Vista, 7, 8, and 10 USB Driver

**Note:** Disconnect the switch console terminal before uninstalling the driver.

1. Run setup.exe for Windows 32-bit or setup(x64).exe for Windows-64bit.
2. Click **Next**.
3. When the InstallShield Wizard for Cisco Virtual Com appears, click **Next**.
4. When the Program Maintenance window appears, select the **Remove** radio button.
5. Click **Next**.
6. When the Remove the Program window appears, click **Remove**.
   - If a User Account Control warning appears, click **Allow - I trust this program to proceed**.
7. When the InstallShield Wizard Completed window appears, click **Finish**.

Entering the Initial Configuration Information

To set up the switch, you need to complete the setup program, which runs automatically after the switch is powered on. You must assign an IP address and other configuration information necessary for the switch to communicate with the local routers and the Internet. This information is also required if you plan to use Web UI to configure and manage the switch.

**IP Settings**

You need this information from your network administrator before you complete the setup program:

- Switch IP address
- Subnet mask (IP netmask)
- Default gateway (router)
- Enable secret password
- Enable password

**Completing the Setup Program**

To complete the setup program and to create an initial configuration for the switch:

1. Enter **Yes** at these two prompts:
   
   Would you like to enter the initial configuration dialog? [yes/no]: **yes**

   At any point you may enter a question mark ‘?’ for help.
   Use ctrl-c to abort configuration dialog at any prompt.
   Default settings are in square brackets ‘[]’.

   Basic management setup configures only enough connectivity for management of the system, extended setup will ask you
Configuring the Switch with the CLI-Based Setup Program

Entering the Initial Configuration Information

to configure each interface on the system.

Would you like to enter basic management setup? [yes/no]: yes

2. Enter a hostname for the switch, and press Return.

On a command switch, the hostname is limited to 28 characters; on a member switch, it is limited to 31 characters. Do not use \-n, where n is a number, as the last character in a hostname for any switch.

Enter host name [Switch]: host_name

3. Enter an enable secret password, and press Return.

The password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, allows spaces, but ignores leading spaces. The secret password is encrypted, and the enable password is in plain text.

The enable secret is a password used to protect access to privileged EXEC and configuration modes. This password, after entered, becomes encrypted in the configuration.

Enter enable secret: ********

4. Enter an enable password, and press Return.

The enable password is used when you do not specify an enable secret password, with some older software versions, and some boot images.

Enter enable password: ********

5. Enter a virtual terminal password, and press Return.

The virtual terminal password is used to protect access to the router over a network interface.

Enter virtual terminal password: ********

6. (Optional) Configure Simple Network Management Protocol (SNMP) by responding to the prompts. You can also configure SNMP later through the CLI, or Web UI. To configure SNMP later, enter no.

Configure SNMP Network Management? [no]: no

7. Enter the interface name (physical interface or VLAN name) of the interface that connects to the management network, and press Return. For this release, always use vlan1 as that interface.

Current interface summary

Any interface listed with OK? value "NO" does not have a valid configuration

<table>
<thead>
<tr>
<th>Interface</th>
<th>IP-Address</th>
<th>OK?</th>
<th>Method</th>
<th>Status</th>
<th>Protocol</th>

</tbody>
</table>

Enter interface name used to connect to the management network from the above interface summary: vlan1
8. Configure the interface by entering the switch IP address and subnet mask and pressing Return. The IP address and subnet masks shown here are examples.

Configure interface Vlan1:
Configure IP on this interface? [yes]:
   IP address for this interface: 10.1.1.2
   Subnet mask for this interface [255.255.255.0]:
   Class A network is 10.0.0.0, 8 subnet bits; mask is /24

9. This summary appears:

The following configuration command script was created:

```bash
hostname ie3300
enable secret 9 $9$rkqtjJhIkZyANUS1b4nfuxrpHbi.l1xF.0Ir94k9XWYaW3nyF7Glmc6lkc

end
```

After you complete the setup program, the switch can run the default configuration that you created. If you want to change this configuration or want to perform other management tasks, use one of these tools:

- Command-line interface (CLI)

To use the CLI, enter commands at the Switch> prompt through the console port by using a terminal emulation program or through the network by using Telnet. For configuration information, see the switch Cisco Catalyst IE3x00 Rugged Switch Software Configuration Guide.
Troubleshooting

This chapter provides these topics for troubleshooting problems:

- Diagnosing Problems, page 45
- How to Recover Passwords, page 48
- Finding the Switch Serial Number, page 48

Diagnosing Problems

The switch LEDs provide troubleshooting information about the switch. They show boot fast failures, port-connectivity problems, and overall switch performance. You can also get statistics from Web UI, the CLI, or an SNMP workstation. See the Cisco Catalyst IE3x00 Rugged Switch Software Configuration Guide, or the documentation that came with your SNMP application for details.

Switch Boot Fast

See Verifying Switch Operation, page 31 for information on boot fast.

Note: Boot fast failures are usually fatal. Contact your Cisco TAC representative if your switch does not successfully complete boot fast.

Note: You can disable the boot fast and run POST by using the Cisco IOS CLI, see the Cisco Catalyst IE3x00 Rugged Switch Software Configuration Guide for more information.

Switch LEDs

Look at the port LEDs information when troubleshooting the switch. See LEDs, page 6 for a description of the LED colors and their meanings.

Switch Connections

Bad or Damaged Cable

Always examine the cable for marginal damage or failure. A cable might be just good enough to connect at the physical layer, but it could corrupt packets as a result of subtle damage to the wiring or connectors. You can identify this problem because the port has many packet errors or it constantly flaps (loses and regains link).

- Exchange the copper or fiber-optic cable with a known good cable.
- Look for broken or missing pins on cable connectors.
- Rule out any bad patch panel connections or media convertors between the source and the destination. If possible, bypass the patch panel, or eliminate media convertors (fiber-optic-to-copper).
- Try the cable in another port to see if the problem follows the cable.
Troubleshooting

Diagnosing Problems

Ethernet and Fiber-Optic Cables

Make sure that you have the correct cable:

- For Ethernet, use Category 3 copper cable for 10 Mb/s UTP connections. Use either Category 5, Category 5e, or Category 6 UTP for 10/100/1000 Mb/s, and PoE connections.
- Verify that you have the correct fiber-optic cable for the distance and port type. Make sure that the connected device ports match and use the same type encoding, optical frequency, and fiber type.
- Determine if a copper crossover cable was used when a straight-through was required or the reverse. Enable auto-MDIX on the switch, or replace the cable.

Link Status

Verify that both sides have a link. A broken wire or a shutdown port can cause one side to show a link even though the other side does not have a link.

A port LED that is on does not guarantee that the cable is functional. It might have encountered physical stress, causing it to function at a marginal level. If the port LED does not turn on:

- Connect the cable from the switch to a known good device.
- Make sure that both ends of the cable are connected to the correct ports.
- Verify that both devices have power.
- Verify that you are using the correct cable type. See Cable and Connectors, page 51 for information.
- Look for loose connections. Sometimes a cable appears to be seated but is not. Disconnect the cable, and then reconnect it.

10/100/1000 Port Connections

If a port appears to malfunction:

- Verify the status of all ports by checking the LEDs. For more information, see Switch LEDs, page 45.
- Use the `show interfaces` privileged EXEC command to see if the port is error-disabled, disabled, or shut down. Reenable the port if necessary.
- Verify the cable type. See Cable and Connectors, page 51.

SFP Module

Use only Cisco SFP modules. Each Cisco module has an internal serial EEPROM that is encoded with security information. This encoding verifies that the module meets the requirements for the switch.

- Inspect the SFP module. Exchange the suspect module with a known good module.
- Verify that the module is supported on this platform. (The switch release notes on Cisco.com list the SFP modules that the switch supports.)
- Use the `show interfaces` privileged EXEC command to see if the port or module is error-disabled, disabled, or shutdown. Reenable the port if needed.
- Make sure that all fiber-optic connections are clean and securely connected.
Troubleshooting

Diagnosing Problems

Interface Settings
Verify that the interface is not disabled or powered off. If an interface is manually shut down on either side of the link, it does not come up until you reenable the interface. Use the `show interfaces` privileged EXEC command to see if the interface is error-disabled, disabled, or shut down on either side of the connection. If needed, reenable the interface.

Ping End Device
Ping from the directly connected switch first, and then work your way back port by port, interface by interface, trunk by trunk, until you find the source of the connectivity issue. Make sure that each switch can identify the end device MAC address in its Content-Addressable Memory (CAM) table.

Spanning Tree Loops
STP loops can cause serious performance issues that look like port or interface problems.

A unidirectional link can cause loops. It occurs when the traffic sent by the switch is received by the neighbor, but the traffic from the neighbor is not received by the switch. A broken cable, other cabling problems, or a port issue can cause this one-way communication.

You can enable UniDirectional Link Detection (UDLD) on the switch to help identify unidirectional link problems. For information about enabling UDLD on the switch, see the “Understanding UDLD” section in the switch software configuration guide on Cisco.com.

Switch Performance

Speed, Duplex, and Autonegotiation
Port statistics that show a large amount of alignment errors, frame check sequence (FCS), or late-collisions errors, might mean a speed or duplex mismatch.

A common issue occurs when duplex and speed settings are mismatched between two switches, between a switch and a router, or between the switch and a workstation or server. Mismatches can happen when manually setting the speed and duplex or from autonegotiation issues between the two devices.

To maximize switch performance and to ensure a link, follow one of these guidelines when changing the duplex or the speed settings.

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the interfaces on both ends of the connection.
- If a remote device does not autonegotiate, use the same duplex settings on the two ports. The speed parameter adjusts itself even if the connected port does not autonegotiate.

Autonegotiation and Network Interface Cards
Problems sometimes occur between the switch and third-party network interface cards (NICs). By default, the switch ports and interfaces autonegotiate. Laptops or other devices are commonly set to autonegotiate, yet sometimes issues occur.

To troubleshoot autonegotiation problems, try manually setting both sides of the connection. If this does not solve the problem, there could be a problem with the firmware or software on the NIC. You can resolve this by upgrading the NIC driver to the latest version.
Troubleshooting

Resetting the Switch

Cabling Distance

If the port statistics show excessive FCS, late-collision, or alignment errors, verify that the cable distance from the switch to the connected device meets the recommended guidelines. See Cables and Adapters, page 53.

Resetting the Switch

These are reasons why you might want to reset the switch to the factory default settings:

- You installed the switch in your network and cannot connect to it because you assigned the wrong IP address.
- You want to reset the password on the switch.

**Note:** Resetting the switch deletes the configuration and reboots the switch.

**Caution:** If you press the Express Setup button when you power on, the automatic boot sequence stops, and the switch enters bootloader mode.

To reset the switch:

1. Press and hold the Express Setup button (recessed behind a small hole in the faceplate) for about 15 seconds with a paper clip or similar object. The Express Setup LED will blink red/green when its recessed button has been held down long enough.
2. The switch reboots. The system LED turns green after the switch completes rebooting.
3. Press the Express Setup button again for 3 seconds. A switch Ethernet port blinks green.

The switch now behaves like an unconfigured switch. You can configure the switch by using the CLI setup procedure described in Configuring the Switch with the CLI-Based Setup Program, page 39

How to Recover Passwords

Password recovery is a feature that a system administrator can enable or disable. If password recovery is disabled, the only way to recover from a lost or forgotten password is to clear the switch configuration entirely.

The Cisco Catalyst IE3x00 Rugged Switch Software Configuration Guide provides details about enabling and disabling the password recovery feature and the procedure for recovering passwords.

Finding the Switch Serial Number

If you contact Cisco Technical Assistance, you need to know the serial number of your switch. You can also use the `show version` privileged EXEC command to obtain the switch serial number.

Additionally, the Serial Number for the switch is printed on the device label, on the device itself.
Technical Specifications

The most current technical specifications for the Catalyst IE3x00 Rugged Series Switches can be found in the Catalyst IE3x00 Rugged Series Data Sheet. Additional specs and detail not in the Data Sheet, are found in this section.

Enclosure Specifications

Table 1 on page 49 lists the enclosure specifications for the Catalyst IE3x00 Rugged series switches.

Note: Connector pins 1, 2, 3, and 6 are used for PoE.

SFP Module Connectors

Figure 19 Fiber-Optic SFP Module LC Connector, page 52 shows a LC style connector that is used with the SFP Module slots. It is a fiber-optic cable connector.
Warning: Invisible laser radiation may be emitted from disconnected fibers or connectors. Do not stare into beams or view directly with optical instruments. Statement 1051

Console Port

The switch has two console ports: a USB 5-pin mini-Type B port on the front panel (see Figure 20 on page 52) and an RJ-45 console port on the rear panel.

Note: When running Linux, access the USB Console using Minicom instead of Screen.

Alarm Port

The labels for the alarm connector pin-outs are on the switch panel and are displayed below.
SFP Module Cables

Each port must match the wavelength specifications on each end of the cable, and for reliable communications, the cable must not exceed the allowable length. Refer to the Data Sheets for the complete list of supported SFP Modules and cables.

Notes

- The maximum operating temperature of the switch varies depending on the type of SFP module that you use.
- Modal bandwidth applies only to multimode fiber.
- A mode-field diameter/cladding diameter = 9 micrometers/125 micrometers.
- A mode-conditioning patch cord is required when using 1000BASE-LX/LH SFP modules, MMF, and a short link distance. Using an ordinary patch cord can cause transceiver saturation, resulting in an elevated bit error rate (BER). When using the LX/LH SFP module with 62.5-micron diameter MMF, you must also install a mode-conditioning patch cord between the SFP module and the MMF cable on both the sending and receiving ends of the link. The mode-conditioning patch cord is required for link distances greater than 984 feet (300 m).
- 1000BASE-ZX SFP modules can send data up to 62 miles (100 km) by using dispersion-shifted SMF or low-attenuation SMF. The distance depends on the fiber quality, the number of splices, and the connectors.
- When the fiber-optic cable span is less than 15.43 miles (25 km), insert a 5-decibel (dB) or 10-dB inline optical attenuator between the fiber-optic cable plant and the receiving port on the 1000BASE-ZX SFP module.

---

To identify a crossover cable, hold the cable ends side-by-side, with the tab at the back. The wire connected to pin 1 on the left end should be the same color as the wire connected to pin 3 on the right end. The wire connected to pin 2 on the left end should be the same color as the wire connected to pin 6 on the right end.

**Figure 24**  Identifying a Crossover Cable

Pin 1 — Pin 3
Pin 2 — Pin 6
Console Port Adapter Pinouts

The console port uses an 8-pin RJ-45 connector. If you did not order a console cable, you need to provide an RJ-45-to-DB-9 adapter cable to connect the switch console port to a PC console port. You need to provide an RJ-45-to-DB-25 female DTE adapter if you want to connect the switch console port to a terminal.

**Note:** The RJ-45-to-DB-25 female DTE adapter is not supplied with the switch.
