## Information About VRF-lite

VRF-lite is a feature that enables a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. VRF-lite uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but a Layer 3 interface cannot belong to more than one VRF at any time.

---

**Note** VRF-lite interfaces must be Layer 3 interfaces.

---

VRF-lite includes these devices:

- Customer edge (CE) devices provide customer access to the service provider network over a data link to one or more provider edge routers. The CE device advertises the site's local routes to the provider edge router and learns the remote VPN routes from it. A Cisco Catalyst Switch can be a CE.
- Provider routers (or core routers) are any routers in the service provider network that do not attach to CE devices.

The following figure displays a configuration where each Cisco Catalyst switch acts as multiple virtual CEs. Because VRF-lite is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.

Figure 1: Cisco Catalyst Switches Acting as Multiple Virtual CEs

This figure illustrates the packet-forwarding process in a VRF-lite CE-enabled network.

- When the CE receives a packet from a VPN, it looks up the routing table based on the input interface. When a route is found, the CE forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. The egress PE then performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input interface to look up the correct VPN routing table. If a route is found, the CE forwards the packet within the VPN.

To configure VRF, create a VRF table and specify the Layer 3 interface associated with the VRF. You then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the providers' backbone. The VRF-lite network has three major components:

- VPN route target communities—Lists all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- Multiprotocol BGP peering of VPN community PE routers—Propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- VPN forwarding—Transports all traffic between all VPN community members across a VPN service-provider network.

**Note** The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

# Guidelines for Configuring VRF-lite

## IPv4 and IPv6

- A switch with VRF-lite is shared by multiple customers, and all customers have their own routing tables.
- Because customers use different VRF tables, you can reuse the same IP addresses. Overlapped IP addresses are allowed in different VPNs.
- VRF-lite lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. All customers have their own VLANs.
- For the PE router, there is no difference between using VRF-lite or using multiple CEs. In [#unique\\_104](#), multiple virtual Layer 3 interfaces are connected to the VRF-lite device.
- The Cisco Catalyst switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. You can connect SVIs through an access port or a trunk port.
- A customer can use multiple VLANs as long as they do not overlap with those of other customers. A customer's VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
- The Layer 3 TCAM resource is shared between all VRFs. To ensure that any one VRF has sufficient CAM space, use the **maximum routes** command.
- A Cisco Catalyst switch using VRF can support one global network and multiple VRFs. The total number of routes supported is limited by the size of the TCAM.
- A single VRF can be configured for both IPv4 and IPv6.
- If an incoming packet's destination address is not found in the vrf table, the packet is dropped. Also, if insufficient TCAM space exists for a VRF route, hardware switching for that VRF is disabled and the corresponding data packets are sent to software for processing.

## IPv4 Specific

- You can use most routing protocols (BGP, OSPF, EIGRP, RIP and static routing) between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
  - BGP does not require multiple algorithms to communicate with multiple CEs.
  - BGP is designed for passing routing information between systems run by different administrations.
  - BGP makes simplifies passing attributes of the routes to the CE.
- Multicast VRF-lite is not supported.
- The **capability vrf-lite** subcommand under **router ospf** should be used when configuring OSPF as the routing protocol between the PE and the CE.

## IPv6 specific

- VRF-aware OSPFv3, BGPv6, EIGRPv6, and IPv6 static routing are supported.

- VRF-aware IPv6 route applications include: ping, telnet, ssh, tftp, ftp and traceroute. (This list does not include the Mgt interface, which is handled differently even though you can configure both IPv4 or IPv6 VRF under it.)

## How to Configure VRF-lite

### Configuring VRF-lite for IPv4

#### Configuring VRF-Aware Services

IP services can be configured on global interfaces and within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.

VRF-aware services are implemented in platform-independent modules. VRF provides multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

- The user can ping a host in a user-specified VRF.
- ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.

#### Configuring the User Interface for ARP

##### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>show ip arp vrf vrf-name</b> <b>Example:</b> Switch# show ip arp vrf vrf-name	Displays the ARP table (static and dynamic entries) in the specified VRF.
<b>Step 2</b>	<b>arp vrf vrf-name ip-address mac-address ARPA</b> <b>Example:</b> Switch(config)# arp vrf vrf-name ip-address mac-address ARPA	Creates a static ARP entry in the specified VRF.

#### Configuring Per-VRF for TACACS+ Servers

The per-VRF for TACACS+ servers feature enables you to configure per-virtual route forwarding (per-VRF) authentication, authorization, and accounting (AAA) on TACACS+ servers.

You can create the VRF routing table (shown in Steps 3 and 4) and configure the interface (Steps 6, 7, and 8). The actual configuration of per-VRF on a TACACS+ server is done in Steps 10 through 13.

**Before you begin**

Before configuring per-VRF on a TACACS+ server, you must have configured AAA and a server group.

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vrf definition</b> <i>vrf-name</i> <b>Example:</b> Switch(config)# ip vrf vrf-name	Names the VRF and enters VRF configuration mode.
<b>Step 4</b>	<b>rd</b> <i>route-distinguisher</i> <b>Example:</b> Switch (config-vrf)# rd route-distinguisher	Creates routing and forwarding tables for a VRF instance.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Switch (config-vrf)# exit	Exits VRF configuration mode.
<b>Step 6</b>	<b>interface</b> <i>interface-name</i> <b>Example:</b> Switch (config)# interface interface-name	Configures an interface and enters interface configuration mode.
<b>Step 7</b>	<b>vrf forwarding</b> <i>vrf-name</i> <b>Example:</b> Switch (config-if)# vrf forwarding vrf-name	Configures a VRF for the interface.
<b>Step 8</b>	<b>ip address</b> <i>ip-address mask [secondary]</i> <b>Example:</b> Switch (config-if)# ip address ip-address mask [secondary]	Sets a primary or secondary IP address for an interface.
<b>Step 9</b>	<b>exit</b> <b>Example:</b> Switch (config-vrf)# exit	Exits interface configuration mode.
<b>Step 10</b>	<b>aaa group server tacacs+</b> <i>group-name</i> <b>Example:</b> Switch (config)# aaa group server tacacs+ tacacs1	Groups different TACACS+ server hosts into distinct lists and distinct methods and enters server-group configuration mode.

	Command or Action	Purpose
<b>Step 11</b>	<b>server-private</b> <i>{ip-address   name}</i> [ <b>nat</b> ] [ <b>single-connection</b> ] [ <b>port</b> <i>port-number</i> ] [ <b>timeout</b> <i>seconds</i> ] [ <b>key</b> [ <b>0   7</b> ] <i>string</i> ]  <b>Example:</b> Switch (config-sg-tacacs)# server-private 10.1.1.1 port 19 key cisco	Configures the IP address of the private TACACS+ server for the group server.
<b>Step 12</b>	<b>vrf forwarding</b> <i>vrf-name</i>  <b>Example:</b> Switch (config-sg-tacacs)# vrf forwarding vrf-name	Configures the VRF reference of a AAA TACACS+ server group.
<b>Step 13</b>	<b>ip tacacs source-interface</b> <i>subinterface-name</i>  <b>Example:</b> Switch (config-sg-tacacs)# ip tacacs source-interface subinterface-name	Uses the IP address of a specified interface for all outgoing TACACS+ packets.
<b>Step 14</b>	<b>exit</b>  <b>Example:</b> Switch (config-sg-tacacs)# exit	Exits server-group configuration mode.

### Example

The following example lists all the steps to configure per-VRF TACACS+:

```
Switch> enable
Switch# configure terminal
Switch (config)# vrf definition cisco
Switch (config-vrf)# rd 100:1
Switch (config-vrf)# exit
Switch (config)# interface Loopback0
Switch (config-if)# vrf forwarding cisco
Switch (config-if)# ip address 10.0.0.2 255.0.0.0
Switch (config-if)# exit
Switch (config-sg-tacacs)# vrf forwarding cisco
Switch (config-sg-tacacs)# ip tacacs source-interface Loopback0
Switch (config-sg-tacacs)# exit
```

## Configuring a VPN Routing Session

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<b>router ospf <i>process-id</i> vrf <i>vrf-name</i></b> <b>Example:</b> Switch(config)# router ospf process-id vrf vrf-name	Enables OSPF routing, specifies a VPN forwarding table, and enters router configuration mode.
Step 3	<b>capability vrf-lite</b> <b>Example:</b> Switch(config-router)# capability vrf-lite	
Step 4	<b>log-adjacency-changes</b> <b>Example:</b> Switch(config-router)# log-adjacency-changes	(Optional) Logs changes in the adjacency state (the default state).
Step 5	<b>redistribute bgp <i>autonomous-system-number</i> subnets</b> <b>Example:</b> Switch(config-router)# redistribute bgp autonomous-system-number subnets	Sets the switch to redistribute information from the BGP network to the OSPF network.
Step 6	<b>network <i>network-number</i> area <i>area-id</i></b> <b>Example:</b> Switch(config-router)# network network-number area area-id	Defines a network address and mask on which OSPF runs and the area ID for that network address.
Step 7	<b>end</b> <b>Example:</b> Switch(config-router)# end	Returns to privileged EXEC mode.
Step 8	<b>show ip ospf <i>process-id</i></b> <b>Example:</b> Switch# show ip ospf process-id	Verifies the configuration of the OSPF network.
Step 9	<b>copy running-config startup-config</b> <b>Example:</b> Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file. Use the <b>no router ospf <i>process-id</i> vrf <i>vrf-name</i></b> global configuration command to disassociate the VPN forwarding table from the OSPF routing process.

### Example

```
Switch(config)# vrf definition VRF-RED
Switch(config-vrf)# rd 1:1
Switch(config-vrf)# exit
Switch(config)# router eigrp virtual-name
Switch(config-router)# address-family ipv4 vrf VRF-RED autonomous-system 1
Switch(config-router-af)# network 10.0.0.0 0.0.0.255
Switch(config-router-af)# topology base
Switch(config-router-topology)# default-metric 10000 100 255 1 1500
Switch(config-router-topology)# exit-af-topology
Switch(config-router-af)# exit-address-family
```

## Configuring BGP PE to CE Routing Sessions

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>router bgp <i>autonomous-system-number</i></b> <b>Example:</b> Switch(config)# router bgp autonomous-system-number	Configures the BGP routing process with the AS number passed to other BGP routers and enters router configuration mode.
<b>Step 3</b>	<b>network <i>network-number</i> mask <i>network-mask</i></b> <b>Example:</b> Switch(config-router)# network network-number mask network-mask	Specifies a network and mask to announce using BGP.
<b>Step 4</b>	<b>redistribute ospf <i>process-id</i> match <i>internal</i></b> <b>Example:</b> Switch(config-router)# redistribute ospf process-id match internal	Sets the switch to redistribute OSPF internal routes.
<b>Step 5</b>	<b>network <i>network-number</i> area <i>area-id</i></b> <b>Example:</b> Switch(config-router)# network network-number area area-id	Defines a network address and mask on which OSPF runs and the area ID for that network address.
<b>Step 6</b>	<b>address-family ipv4 vrf <i>vrf-name</i></b> <b>Example:</b> Switch(config-router-af)# address-family ipv4 vrf vrf-name	Defines BGP parameters for PE to CE routing sessions and enters VRF address-family mode.
<b>Step 7</b>	<b>neighbor <i>address</i> remote-as <i>as-number</i></b> <b>Example:</b> Switch(config-router-af)# neighbor address remote-as as-number	Defines a BGP session between PE and CE routers.
<b>Step 8</b>	<b>neighbor <i>address</i> activate</b> <b>Example:</b> Switch(config-router-af)# neighbor address activate	Activates the advertisement of the IPv4 address family.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Switch(config-router-af)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 10</b>	<b>show ip bgp [ipv4] [neighbors]</b>  <b>Example:</b> Switch# show ip bgp [ipv4] [neighbors]	Verifies BGP configuration.  Use the <b>no router bgp autonomous-system-number</b> global configuration command to delete the BGP routing process. Use the command with keywords to delete routing characteristics.

## Configuring IPv4 VRFs

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ip routing</b>  <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>vrf definition vrf-name</b>  <b>Example:</b> Switch(config)# vrf definition vrf-name	Names the VRF and enters VRF configuration mode.
<b>Step 4</b>	<b>rd route-distinguisher</b>  <b>Example:</b> Switch(config-vrf)# rd route-distinguisher	Creates a VRF table by specifying a route distinguisher. Enter either an Autonomous System number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y).
<b>Step 5</b>	<b>route-target {export   import   both} route-target-ext-community</b>  <b>Example:</b> Switch(config-vrf)# route-target {export   import   both} route-target-ext-community	Creates a list of import, export, or import and export route target communities for the specified VRF. Enter either an AS system number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y).  <b>Note</b> This command is effective only if BGP is running.
<b>Step 6</b>	<b>import map route-map</b>  <b>Example:</b> Switch(config-vrf)# import map route-map	(Optional) Associates a route map with the VRF.
<b>Step 7</b>	<b>interface interface-id</b>  <b>Example:</b> Switch(config-vrf)# interface interface-id	Enters interface configuration mode and specify the Layer 3 interface to be associated with the VRF. The interface can be a routed port or SVI.

	Command or Action	Purpose
<b>Step 8</b>	<b>vrf forwarding</b> <i>vrf-name</i> <b>Example:</b> Switch(config-if)# vrf forwarding vrf-name	Associates the VRF with the Layer 3 interface.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Switch(config-if)# end	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show ip vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interfaces</b> ] [ <i>vrf-name</i> ] <b>Example:</b> Switch# show ip vrf [brief   detail   interfaces] [ <i>vrf-name</i> ]	Verifies the configuration. Displays information about the configured VRFs.
<b>Step 11</b>	<b>copy running-config startup-config</b> <b>Example:</b> Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.  <b>Note</b> For complete syntax and usage information for the following commands, see the switch command reference for this release and see the <a href="#">Cisco IOS Switching Services Command Reference</a> .  Use the <b>no vrf definition</b> <i>vrf-name</i> global configuration command to delete a VRF and to remove all interfaces from it. Use the <b>no vrf forwarding</b> interface configuration command to remove an interface from the VRF.

## Configuring VRF-lite for IPv6

### Configuring VRF-Aware Services

IPv6 services can be configured on global interfaces and within the global routing instance. IPv6 services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.

VRF-aware services are implemented in platform-independent modules. VRF provides multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

- The user can ping a host in a user-specified VRF.
- Neighbor Discovery entries are learned in separate VRFs. The user can display Neighbor Discovery (ND) entries for specific VRFs.

The following services are VRF-aware:

- Ping
- Unicast Reverse Path Forwarding (uRPF)

- Traceroute
- FTP and TFTP
- Telnet and SSH
- NTP

## Configuring the User Interface for PING

Perform the following task to configure a VRF-aware ping:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<p><b>ping vrf</b> <i>vrf-name</i> <b>ipv6-host</b></p> <p><b>Example:</b></p> <pre>Switch# ping vrf vrf-name ipv6-host</pre>	Pings an IPv6 host or address in the specified VRF.

## Configuring the User Interface for uRPF

You can configure uRPF on an interface assigned to a VRF. Source lookup is performed in the VRF table

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **no switchport**
4. **vrf forwarding** *vrf-name*
5. **ipv6 address** *ip-address* *subnet-mask*
6. **ipv6 verify unicast source reachable-via rx allow-default**
7. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Switch# configure terminal</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Switch (config)# interface interface-id</pre>	Enters interface configuration mode and specifies the Layer 3 interface to configure.
<b>Step 3</b>	<p><b>no switchport</b></p> <p><b>Example:</b></p> <pre>Switch (config-if)# no switchport</pre>	Removes the interface from Layer 2 configuration mode if it is a physical interface.

	Command or Action	Purpose
<b>Step 4</b>	<b>vrf forwarding</b> <i>vrf-name</i> <b>Example:</b> Switch (config-if)# vrf forwarding vrf-name	Configures VRF on the interface.
<b>Step 5</b>	<b>ipv6 address</b> <i>ip-address subnet-mask</i> <b>Example:</b> Switch (config-if)# ip address ip-address mask	Enters the IPv6 address for the interface.
<b>Step 6</b>	<b>ipv6 verify unicast source reachable-via rx allow-default</b> <b>Example:</b> Switch(config-if)# ipv6 verify unicast source reachable-via rx allow-default	Enables uRPF on the interface.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Switch(config-if)# end	Returns to privileged EXEC mode.

## Configuring the User Interface for Traceroute

### SUMMARY STEPS

1. **traceroute vrf** *vrf-name ipv6address*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>traceroute vrf</b> <i>vrf-name ipv6address</i> <b>Example:</b> Switch# traceroute vrf vrf-name ipv6address	Specifies the name of a VPN VRF in which to find the destination address.

## Configuring the User Interface for Telnet and SSH

### SUMMARY STEPS

1. **telnet** *ipv6-address/vrf vrf-name*
2. **ssh -l** *username -vrf vrf-name ipv6-host*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>telnet</b> <i>ipv6-address/vrf vrf-name</i> <b>Example:</b> Switch# telnet ipv6-address/vrf vrf-name	Connects through Telnet to an IPv6 host or address in the specified VRF.

	Command or Action	Purpose
Step 2	<b>ssh -l <i>username</i> -vrf <i>vrf-name</i> ipv6-host</b> <b>Example:</b> Switch# ssh -l username -vrf vrf-name ipv6-host	Connects through SSH to an IPv6 host or address in the specified VRF.

## Configuring the User Interface for NTP

### SUMMARY STEPS

1. **configure terminal**
2. **ntp server vrf *vrf-name* ipv6-host**
3. **ntp peer vrf *vrf-name* ipv6-host**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> # configure terminal	Enters global configuration mode.
Step 2	<b>ntp server vrf <i>vrf-name</i> ipv6-host</b> <b>Example:</b> (config)# ntp server vrf vrf-name ipv6-host	Configure the NTP server in the specified VRF.
Step 3	<b>ntp peer vrf <i>vrf-name</i> ipv6-host</b> <b>Example:</b> (config)# ntp peer vrf vrf-name ipv6-host	Configure the NTP peer in the specified VRF.

## Configuring IPv6 VRFs

### SUMMARY STEPS

1. **configure terminal**
2. **vrf definition *vrf-name***
3. **rd *route-distinguisher***
4. **address-family *ipv4* | *ipv6***
5. **route-target {*export* | *import* | *both*} *route-target-ext-community***
6. **exit-address-family**
7. **vrf definition *vrf-name***
8. **ipv6 multicast multitopology**
9. **address-family ipv6 multicast**
10. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>vrf definition vrf-name</b> <b>Example:</b> Switch(config)# vrf definition vrf-name	Names the VRF and enters VRF configuration mode.
<b>Step 3</b>	<b>rd route-distinguisher</b> <b>Example:</b> Switch(config-vrf)# rd route-distinguisher	(Optional) Creates a VRF table by specifying a route distinguisher. Enter either an Autonomous System number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y).
<b>Step 4</b>	<b>address-family ipv4   ipv6</b> <b>Example:</b> Switch(config-vrf)# address-family ipv4   ipv6	(Optional) IPv4 by default. Configuration MUST for IPv6.
<b>Step 5</b>	<b>route-target {export   import   both}</b> <i>route-target-ext-community</i> <b>Example:</b> Switch(config-vrf)# route-target {export   import   both} route-target-ext-community	Creates a list of import, export, or import and export route target communities for the specified VRF. Enter either an AS system number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y). <b>Note</b> This command is effective only if BGP is running.
<b>Step 6</b>	<b>exit-address-family</b> <b>Example:</b> Switch(config-vrf)# exit-address-family	Exits VRF address-family configuration mode and return to VRF configuration mode.
<b>Step 7</b>	<b>vrf definition vrf-name</b> <b>Example:</b> Switch(config)# vrf definition vrf-name	Enters VRF configuration mode.
<b>Step 8</b>	<b>ipv6 multicast multitopology</b> <b>Example:</b> Switch(config-vrf-af)# ipv6 multicast multitopology	Enables multicast specific RPF topology.
<b>Step 9</b>	<b>address-family ipv6 multicast</b> <b>Example:</b> Switch(config-vrf)# address-family ipv6 multicast	Enter multicast IPv6 address-family.
<b>Step 10</b>	<b>end</b> <b>Example:</b> Switch(config-vrf-af)# end	Returns to privileged EXEC mode.

**Example**

This example shows how to configure VRFs:

```
Switch(config)# vrf definition red
Switch(config-vrf)# rd 100:1
Switch(config-vrf)# address family ipv6
Switch(config-vrf-af)# route-target both 200:1
Switch(config-vrf)# exit-address-family
Switch(config-vrf)# vrf definition red
Switch(config-if)# ipv6 multicast multitopology
Switch(config-if)# address-family ipv6 multicast
Switch(config-vrf-af)# end
Switch#
```

## Associating Interfaces to the Defined VRFs

**SUMMARY STEPS**

1. **interface** *interface-id*
2. **no switchport**
3. **vrf forwarding** *vrf-name*
4. **ipv6 enable**
5. **ipv6 address** *ip-address subnet-mask*
6. **show ipv6 vrf** [**brief** | **detail** | **interfaces**] [*vrf-name*]
7. **copy running-config startup-config**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Switch(config-vrf)# interface interface-id	Enters interface configuration mode and specify the Layer 3 interface to be associated with the VRF. The interface can be a routed port or SVI.
<b>Step 2</b>	<b>no switchport</b> <b>Example:</b> Switch(config-if)# no switchport	Removes the interface from configuration mode if it is a physical interface.
<b>Step 3</b>	<b>vrf forwarding</b> <i>vrf-name</i> <b>Example:</b> Switch(config-if)# vrf forwarding vrf-name	Associates the VRF with the Layer 3 interface.
<b>Step 4</b>	<b>ipv6 enable</b> <b>Example:</b> Switch(config-if)# ipv6 enable	Enable IPv6 on the interface.

	Command or Action	Purpose
<b>Step 5</b>	<b>ipv6 address</b> <i>ip-address subnet-mask</i>  <b>Example:</b> Switch(config-if)# ipv6 address ip-address subnet-mask	Enters the IPv6 address for the interface.
<b>Step 6</b>	<b>show ipv6 vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interfaces</b> ] [ <i>vrf-name</i> ]  <b>Example:</b> Switch# show ipv6 vrf [brief   detail   interfaces] [vrf-name]	Verifies the configuration. Displays information about the configured VRFs.
<b>Step 7</b>	<b>copy running-config startup-config</b>  <b>Example:</b> Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

**Example**

This example shows how to associate an interface to VRFs:

```
Switch(config-vrf)# interface ethernet0/1
Switch(config-if)# vrf forwarding red
Switch(config-if)# ipv6 enable
Switch(config-if)# ipv6 address 5000::72B/64
```

## Populate VRF with Routes via Routing Protocols

### Configuring VRF Static Routes

#### SUMMARY STEPS

1. **configure terminal**
2. **ipv6 route** [**vrf** *vrf-name*] *ipv6-prefix/prefix-length* {*ipv6-address* | **interface-type** *interface-number* [*ipv6-address*]}

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>ipv6 route</b> [ <b>vrf</b> <i>vrf-name</i> ] <i>ipv6-prefix/prefix-length</i> { <i>ipv6-address</i>   <b>interface-type</b> <i>interface-number</i> [ <i>ipv6-address</i> ]}  <b>Example:</b>	To configure static routes specific to VRF.

	Command or Action	Purpose
	Switch(config)# ipv6 route [vrf vrf-name] ipv6-prefix/prefix-length {ipv6-address   interface-type interface-number [ipv6-address]}	

**Example**

```
Switch(config)# ipv6 route vrf v6a 7000::/64 TenGigabitEthernet32 4000::2
```

## Configuring OSPFv3 Router Process

### SUMMARY STEPS

1. **configure terminal**
2. **router ospfv3 process-id**
3. **area area-ID [default-cot | nssa | stub]**
4. **router-id router-id**
5. **address-family ipv6 unicast vrf vrf-name**
6. **redistribute source-protocol [process-id] options**
7. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>router ospfv3 process-id</b>  <b>Example:</b> Switch(config)# router ospfv3 process-id	Enables OSPFv3 router configuration mode for the IPv6 address family.
<b>Step 3</b>	<b>area area-ID [default-cot   nssa   stub]</b>  <b>Example:</b> Switch(config-router)# area area-ID [default-cot   nssa   stub]	Configures the OSPFv3 area.
<b>Step 4</b>	<b>router-id router-id</b>  <b>Example:</b> Switch(config-router)# router-id router-id	Use a fixed router ID.
<b>Step 5</b>	<b>address-family ipv6 unicast vrf vrf-name</b>  <b>Example:</b> Switch(config-router)# address-family ipv6 unicast vrf vrf-name	Enters IPv6 address family configuration mode for OSPFv3 in VRF vrf-name

	Command or Action	Purpose
<b>Step 6</b>	<b>redistribute source-protocol</b> [ <i>process-id</i> ] <b>options</b> <b>Example:</b> Switch(config-router)# redistribute source-protocol [process-id] options	Redistributes IPv6 routes from one routing domain into another routing domain.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Switch(config-router)# end	Returns to privileged EXEC mode.

### Example

This example shows how to configure the OSPFv3 router process:

```
Switch(config-router)# router ospfv3 1
Switch(config-router)# router-id 1.1.1.1
Switch(config-router)# address-family ipv6 unicast
Switch(config-router-af)# exit-address-family
```

## Enabling OSPFv3 on an Interface

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *type-number*
3. **ospfv3** *process-id* **area** *area-ID* **ipv6** [**instance** *instance-id*]
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>type-number</i> <b>Example:</b> Switch(config-vrf)# interface <i>type-number</i>	Specifies an interface type and number, and places the switch in interface configuration mode.
<b>Step 3</b>	<b>ospfv3</b> <i>process-id</i> <b>area</b> <i>area-ID</i> <b>ipv6</b> [ <b>instance</b> <i>instance-id</i> ] <b>Example:</b> Switch(config-if)# ospfv3 <i>process-id</i> <b>area</b> <i>area-ID</i> <i>ipv6</i> [ <b>instance</b> <i>instance-id</i> ]	Enables OSPFv3 on an interface with IPv6 AF.
<b>Step 4</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Switch(config-if)# end	

### Example

This example show how to enable OSPFv3 on an interface:

```
Switch(config)# interface GigabitEthernet2/1
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 4000::2/64
Switch(config-if)# ipv6 enable
Switch(config-if)# ipv6 ospf 1 area 0
Switch(config-if)# end
```

## Configuring EIGRPv6 Routing Process

### SUMMARY STEPS

1. **configure terminal**
2. **router eigrp** *virtual-instance-name*
3. **address-family ipv6 vrf** *vrf-name* **autonomous-system** *autonomous-system-number*
4. **topology** {**base** | **topology-name** **tid** **number**
5. **exit-af****topology**
6. **eigrp router-id** *ip-address*
7. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>router eigrp</b> <i>virtual-instance-name</i> <b>Example:</b> Switch(config)# router eigrp virtual-instance-name	Configures the EIGRP routing process and enters router configuration mode.
<b>Step 3</b>	<b>address-family ipv6 vrf</b> <i>vrf-name</i> <b>autonomous-system</b> <i>autonomous-system-number</i> <b>Example:</b> Switch(config-router)# address-family ipv6 vrf vrf-name autonomous-system autonomous-system-number	Enables EIGRP IPv6 VRF-Lite and enters address family configuration mode.
<b>Step 4</b>	<b>topology</b> { <b>base</b>   <b>topology-name</b> <b>tid</b> <b>number</b> <b>Example:</b> Switch(config-router-af)# topology {base   topology-name tid number	Configures an EIGRP process to route IP traffic under the specified topology instance and enters address family topology configuration mode.

	Command or Action	Purpose
<b>Step 5</b>	<b>exit-aftopology</b> <b>Example:</b> Switch(config-router-af-topology)# exit-aftopology	Exits address family topology configuration mode.
<b>Step 6</b>	<b>eigrp router-id <i>ip-address</i></b> <b>Example:</b> Switch(config-router)# eigrp router-id ip-address	Enables the use of a fixed router-id.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Switch(config-router)# end	Exits router configuration mode.

**Example**

This example shows how to configure an EIGRP routing process:

```
Switch(config)# router eigrp test
Switch(config-router)# address-family ipv6 unicast vrf b1 autonomous-system 10
Switch(config-router-af)# topology base
Switch(config-router-af-topology)# exit-af-topology
Switch(config-router)# eigrp router-id 2.3.4.5
Switch(config-router)# exit-address-family
```

**Configuring EBGpV6 Routing Process****SUMMARY STEPS**

1. **configure terminal**
2. **router bgp *as-number***
3. **neighbor *peer-group-name peer-group***
4. **neighbor {*ip-address* | *ipv6-address*[%] | *peer-group-name*} remote-as *autonomous-system-number* [*alternate-as autonomous-system-number* ...]**
5. **address-family ipv6 [*vrf vrf-name*] [*unicast* | *multicast* | *vpn6*]**
6. **neighbor *ipv6-address peer-group peer-group-name***
7. **neighbor {*ip-address* | *peer-group-name* | *ipv6-address*[%]} route-map *map-name* {in | out}**
8. **exit**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<b>router bgp</b> <i>as-number</i> <b>Example:</b> Switch(config)# router bgp as-number	Enters router configuration mode for the specified routing process.
Step 3	<b>neighbor</b> <i>peer-group-name peer-group</i> <b>Example:</b> Switch(config-router)# neighbor peer-group-name peer-group	Creates a multiprotocol BGP peer group.
Step 4	<b>neighbor</b> { <i>ip-address   ipv6-address[%]   peer-group-name</i> } <b>remote-as</b> <i>autonomous-system-number</i> [ <b>alternate-as</b> <i>autonomous-system-number ...</i> ] <b>Example:</b> Switch(config-router)# neighbor {ip-address   ipv6-address[%]   peer-group-name} remote-as autonomous-system-number [alternate-as autonomous-system-number ...]	Adds the IPv6 address of the neighbor in the specified autonomous system to the IPv6 multiprotocol BGP neighbor table of the local router.
Step 5	<b>address-family ipv6</b> [ <b>vrf</b> <i>vrf-name</i> ] [ <b>unicast   multicast   vpv6</b> ] <b>Example:</b> Switch(config-router)# address-family ipv6 [vrf vrf-name] [unicast   multicast   vpv6]	Specifies the IPv6 address family, and enters address family configuration mode. <ul style="list-style-type: none"> <li>• The unicast keyword specifies the IPv6 unicast address family. By default, the switch is placed in configuration mode for the IPv6 unicast address family if the unicast keyword is not specified with the address-family ipv6 command.</li> <li>• The multicast keyword specifies IPv6 multicast address prefixes.</li> </ul>
Step 6	<b>neighbor</b> <i>ipv6-address peer-group peer-group-name</i> <b>Example:</b> Switch(config-router-af)# neighbor ipv6-address peer-group peer-group-name	Assigns the IPv6 address of a BGP neighbor to a peer group.
Step 7	<b>neighbor</b> { <i>ip-address   peer-group-name   ipv6-address[%]</i> } <b>route-map</b> <i>map-name</i> { <b>in   out</b> } <b>Example:</b> Switch(config-router-af)# neighbor {ip-address   peer-group-name   ipv6-address[%]} route-map map-name {in   out}	Applies a route map to incoming or outgoing routes. Changes to the route map will not take effect for existing peers until the peering is reset or a soft reset is performed. Using the clear bgp ipv6 command with the soft and in keywords will perform a soft reset.
Step 8	<b>exit</b> <b>Example:</b> Switch(config-router-af)# exit	Exits address family configuration mode, and returns the router to router configuration mode.

### Example

This example shows how to configure EBRIPv6:

```
Switch(config)# router bgp 2
Switch(config-router)# bgp router-id 2.2.2.2
Switch(config-router)# bgp log-neighbor-changes
Switch(config-router)# no bgp default ipv4-unicast
Switch(config-router)# neighbor 2500::1 remote-as 1
Switch(config-router)# neighbor 4000::2 remote-as 3
Switch(config-router)# address-family ipv6 vrf b1
Switch(config-router-af)# network 2500::/64
Switch(config-router-af)# network 4000::/64
Switch(config-router-af)# neighbor 2500::1 remote-as 1
Switch(config-router-af)# neighbor 2500::1 activate
Switch(config-router-af)# neighbor 4000::2 remote-as 3
Switch(config-router-af)# neighbor 4000::2 activate
Switch(config-router-af)# exit-address-family
```

## Additional Information for VRF-lite

### VPN Co-existence Between IPv4 and IPv6

Backward compatibility between the “older” CLI for configuring IPv4 and the “new” CLI for IPv6 exists. This means that a configuration might contain both CLI. The IPv4 CLI retains the ability to have on the same interface, an IP address defined within a VRF as well as an IPv6 address defined in the global routing table.

For example:

```
vrf definition red
 rd 100:1
 address family ipv6
 route-target both 200:1
 exit-address-family
!
ip vrf blue
 rd 200:1
 route-target both 200:1
!
interface Ethernet0/0
 vrf forwarding red
 ip address 50.1.1.2 255.255.255.0
 ipv6 address 4000::72B/64
!
interface Ethernet0/1
 vrf forwarding blue
 ip address 60.1.1.2 255.255.255.0
 ipv6 address 5000::72B/64
```

In this example, all addresses (v4 and v6) defined for Ethernet0/0 refer to VRF red whereas for Ethernet0/1, the IP address refers to VRF blue but the ipv6 address refers to the global IPv6 routing table.

# Verifying VRF-lite Configuration

## Displaying IPv4 VRF-lite Status

To display information about VRF-lite configuration and status, perform one of the following tasks:

Command	Purpose
Switch# <b>show ip protocols vrf</b> <i>vrf-name</i>	Displays routing protocol information associated with a VRF.
Switch# <b>show ip route vrf</b> <i>vrf-name</i> [ <b>connected</b> ] [ <i>protocol</i> ] [ <i>as-number</i> ] [ <b>list</b> ] [ <b>mobile</b> ] [ <b>odr</b> ] [ <b>profile</b> ] [ <b>static</b> ] [ <b>summary</b> ] [ <b>supernets-only</b> ]	Displays IP routing table information associated with a VRF.
Switch# <b>show ip vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interfaces</b> ] [ <i>vrf-name</i> ]	Displays information about the defined VRF instances.
Switch# <b>bidir vrf</b> <i>instance-name a.b.c.d</i>   <b>active</b>   <b>bidirectional</b>   <b>count</b>   <b>interface</b>   <b>proxy</b>   <b>pruned</b>   <b>sparse</b>   <b>ssm</b>   <b>static</b>   <b>summary</b>	Displays information about the defined VRF instances.

This example shows how to display multicast route table information within a VRF instance:

```
Switch# show ip mroute 226.0.0.2
IP Multicast Routing Table
Flags: S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
L - Local, P - Pruned, R - RP-bit set, F - Register flag,
T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
U - URD, I - Received Source Specific Host Report,
Z - Multicast Tunnel, z - MDT-data group sender,
Y - Joined MDT-data group, y - Sending to MDT-data group,
G - Received BGP C-Mroute, g - Sent BGP C-Mroute,
N - Received BGP Shared-Tree Prune, n - BGP C-Mroute suppressed,
Q - Received BGP S-A Route, q - Sent BGP S-A Route,
V - RD & Vector, v - Vector, p - PIM Joins on route,
x - VxLAN group, c - PFP-SA cache created entry
Outgoing interface flags: H - Hardware switched, A - Assert winner, p - PIM Join
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

(*, 226.0.0.2), 00:01:17/stopped, RP 1.1.1.1, flags: SJCF
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list:
    Vlan100, Forward/Sparse, 00:01:17/00:02:36

(5.0.0.11, 226.0.0.2), 00:01:17/00:01:42, flags: FT
  Incoming interface: Vlan5, RPF nbr 0.0.0.0
  Outgoing interface list:
    Vlan100, Forward/Sparse, 00:01:17/00:02:36
```

## Displaying IPv6 VRF-lite Status

To display information about VRF-lite configuration and status, perform one of the following tasks:

Command	Purpose
	Displays routing protocol information associated with a VRF.
Switch# <b>show ipv6 mfib vrf</b> <i>instance-name</i> <i>a.b.c.d</i>   <b>active</b>   <b>all</b>   <b>count</b>   <b>linkscope</b>   <b>route</b>   <b>summary</b>   <b>update-sets</b>   <b>verbose</b>	Displays information about the defined VRF instances.

This example shows how to display multicast route table information within a VRF instance:

```

show ipv6 mroute vrf vrf1 FF05:ABCD:0:0:0:0:0:1
Multicast Routing Table
Flags: S - Sparse, B - Bidir Group, s - SSM Group,
C - Connected, L - Local, I - Received Source Specific Host Report,
P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
J - Join SPT, Y - Joined MDT-data group,
y - Sending to MDT-data group

g - BGP signal originated, G - BGP Signal received,
N - BGP Shared-Tree Prune received, n - BGP C-Mroute suppressed,
q - BGP Src-Active originated, Q - BGP Src-Active received
E - Extranet
Timers: Uptime/Expires
Interface state: Interface, State

(*, FF05:ABCD::1), 00:06:22/never, RP 1010:ABCD::10, flags: SCJ
Incoming interface: Port-channel33
RPF nbr: FE80::2E31:24FF:FE06:134A
Immediate outgoing interface list:
TenGigabitEthernet4/0/18, Forward, 00:06:22/never

(3232:ABCD::2, FF05:ABCD::1), 00:04:54/00:02:16, flags: SJT
Incoming interface: Port-channel33
RPF nbr: FE80::2E31:24FF:FE06:134A
Inherited outgoing interface list:
TenGigabitEthernet4/0/18, Forward, 00:06:22/never
    
```

The following example displays the output of **show ipv6 mfib** command.

```

Switch# show ipv6 mfib vrf vrf1 FF05:ABCD:0:0:0:0:0:1
Entry Flags:      C - Directly Connected, S - Signal, IA - Inherit A flag,
                  ET - Data Rate Exceeds Threshold, K - Keepalive
                  DDE - Data Driven Event, HW - Hardware Installed
                  ME - MoFRR ECMP entry, MNE - MoFRR Non-ECMP entry, MP - MFIB
                  MoFRR Primary, RP - MRIB MoFRR Primary, P - MoFRR Primary
                  MS - MoFRR Entry in Sync, MC - MoFRR entry in MoFRR Client.
I/O Item Flags:  IC - Internal Copy, NP - Not platform switched,
                  NS - Negate Signalling, SP - Signal Present,
                  A - Accept, F - Forward, RA - MRIB Accept, RF - MRIB Forward,
                  MA - MFIB Accept, A2 - Accept backup,
                  RA2 - MRIB Accept backup, MA2 - MFIB Accept backup

Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kbits per second
Other counts:      Total/RPF failed/Other drops
I/O Item Counts:   FS Pkt Count/PS Pkt Count
    
```

```

VRF testvrf1

# Configuration Examples for VRF-lite

## Configuration Example for IPv4 VRF-lite

OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The example commands show how to configure the CE switch S8 and include the VRF configuration for switches S20 and S11 and the PE router commands related to traffic with switch S8. Commands for configuring the other switches are not included but would be similar.

Figure 2: VRF-lite Configuration Example

## Configuring Switch S8

On switch S8, enable routing and configure VRF.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# ip vrf v11
Switch(config-vrf)# rd 800:1
Switch(config-vrf)# route-target export 800:1
Switch(config-vrf)# route-target import 800:1
Switch(config-vrf)# exit
Switch(config)# ip vrf v12
Switch(config-vrf)# rd 800:2
Switch(config-vrf)# route-target export 800:2
Switch(config-vrf)# route-target import 800:2
Switch(config-vrf)# exit
```

Configure the loopback and physical interfaces on switch S8. Fast Ethernet interface 3/5 is a trunk connection to the PE. Interfaces 3/7 and 3/11 connect to VPNs:

```
Switch(config)# interface loopback1
Switch(config-if)# vrf forwarding v11
Switch(config-if)# ip address 8.8.1.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface loopback2
Switch(config-if)# vrf forwarding v12
Switch(config-if)# ip address 8.8.2.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface FastEthernet3/5
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface FastEthernet3/8
Switch(config-if)# switchport access vlan 208
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface FastEthernet3/11
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit
```

Configure the VLANs used on switch S8. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for VRF for the VPNs that include switch S11 and switch S20, respectively:

```
Switch(config)# interface Vlan10
Switch(config-if)# vrf forwarding v11
Switch(config-if)# ip address 38.0.0.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface Vlan20
Switch(config-if)# vrf forwarding v12
Switch(config-if)# ip address 83.0.0.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface Vlan118
Switch(config-if)# vrf forwarding v12
Switch(config-if)# ip address 118.0.0.8 255.255.255.0
```

```
Switch(config-if)# exit

Switch(config)# interface Vlan208
Switch(config-if)# vrf forwarding v11
Switch(config-if)# ip address 208.0.0.8 255.255.255.0
Switch(config-if)# exit
```

### Configure OSPF routing in VPN1 and VPN2:

```
Switch(config)# router ospf 1 vrf v11
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit
Switch(config)# router ospf 2 vrf v12
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit
```

### Configure BGP for CE to PE routing:

```
Switch(config)# router bgp 800
Switch(config-router)# address-family ipv4 vrf v12
Switch(config-router-af)# redistribute ospf 2 match internal
Switch(config-router-af)# neighbor 83.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 83.0.0.3 activate
Switch(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Switch(config-router-af)# exit
```

```
Switch(config-router)# address-family ipv4 vrf v11
Switch(config-router-af)# redistribute ospf 1 match internal
Switch(config-router-af)# neighbor 38.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 38.0.0.3 activate
Switch(config-router-af)# network 8.8.1.0 mask 255.255.255.0
Switch(config-router-af)# end
```

## Configuring Switch S20

### Configure S20 to connect to CE:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface Fast Ethernet 0/7
Switch(config-if)# no switchport
Switch(config-if)# ip address 208.0.0.20 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# end
```

## Configuring Switch S11

### Configure S11 to connect to CE:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface Gigabit Ethernet 0/3
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface Vlan118
```

```
Switch(config-if)# ip address 118.0.0.11 255.255.255.0
Switch(config-if)# exit
```

```
Switch(config)# router ospf 101
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# end
```

### Configuring the PE Switch S3

On switch S3 (the router), these commands configure only the connections to switch S8:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip vrf v1
Router(config-vrf)# rd 100:1
Router(config-vrf)# route-target export 100:1
Router(config-vrf)# route-target import 100:1
Router(config-vrf)# exit

Router(config)# ip vrf v2
Router(config-vrf)# rd 100:2
Router(config-vrf)# route-target export 100:2
Router(config-vrf)# route-target import 100:2
Router(config-vrf)# exit

Router(config)# ip cef
Router(config)# interface Loopback1
Router(config-if)# vrf forwarding v1
Router(config-if)# ip address 3.3.1.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Loopback2
Router(config-if)# vrf forwarding v2
Router(config-if)# ip address 3.3.2.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Fast Ethernet3/0.10
Router(config-if)# encapsulation dot1q 10
Router(config-if)# vrf forwarding v1
Router(config-if)# ip address 38.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Fast Ethernet3/0.20
Router(config-if)# encapsulation dot1q 20
Router(config-if)# vrf forwarding v2
Router(config-if)# ip address 83.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# router bgp 100

```

## Configuration Example for IPv6 VRF-lite

The following topology illustrates how to use OSPFv3 for CE-PE routing.

**Figure 3: VRF-lite Configuration Example**

### Configuring CE1 Switch

```

ipv6 unicast-routing
vrf definition v1
 rd 100:1
 !
address-family ipv6
 exit-address-family
 !

vrf definition v2
 rd 200:1
 !
address-family ipv6
 exit-address-family
 !

interface Vlan100
 vrf forwarding v1
 ipv6 address 1000:1::1/64
 ospfv3 100 ipv6 area 0
 !

interface Vlan200
 vrf forwarding v2
 ipv6 address 2000:1::1/64
 ospfv3 200 ipv6 area 0
 !

interface GigabitEthernet 1/0/1
 switchport access vlan 100
 end

interface GigabitEthernet 1/0/2
 switchport access vlan 200
 end

interface GigabitEthernet 1/0/24
 switchport trunk encapsulation dot1q

```

```

switchport mode trunk
end

router ospfv3 100
router-id 10.10.10.10
!
address-family ipv6 unicast vrf v1
redistribute connected
area 0 normal
exit-address-family
!

router ospfv3 200
router-id 20.20.20.20
!
address-family ipv6 unicast vrf v2
redistribute connected
area 0 normal
exit-address-family
!

```

### Configuring PE Switch

```

ipv6 unicast-routing

vrf definition v1
rd 100:1
!
address-family ipv6
exit-address-family
!

vrf definition v2
rd 200:1
!
address-family ipv6
exit-address-family
!

interface Vlan600
vrf forwarding v1
no ipv6 address
ipv6 address 1000:1::2/64
ospfv3 100 ipv6 area 0
!

interface Vlan700
vrf forwarding v2
no ipv6 address
ipv6 address 2000:1::2/64
ospfv3 200 ipv6 area 0
!

interface Vlan800
vrf forwarding v1
ipv6 address 3000:1::7/64
ospfv3 100 ipv6 area 0
!

interface Vlan900
vrf forwarding v2
ipv6 address 4000:1::7/64
ospfv3 200 ipv6 area 0
!

interface GigabitEthernet 1/0/1

```

```

switchport trunk encapsulation dot1q
switchport mode trunk
exit

interface GigabitEthernet 1/0/2
switchport trunk encapsulation dot1q

switchport mode trunk
exit

router ospfv3 100
router-id 30.30.30.30
!
address-family ipv6 unicast vrf v1
redistribute connected
area 0 normal
exit-address-family
!
address-family ipv6 unicast vrf v2
redistribute connected
area 0 normal
exit-address-family
!

```

### Configuring CE2 Switch

```

ipv6 unicast-routing

vrf definition v1
rd 100:1
!
address-family ipv6
exit-address-family
!

vrf definition v2
rd 200:1
!
address-family ipv6
exit-address-family
!

interface Vlan100
vrf forwarding v1

ipv6 address 1000:1::3/64
ospfv3 100 ipv6 area 0
!

interface Vlan200
vrf forwarding v2
ipv6 address 2000:1::3/64
ospfv3 200 ipv6 area 0
!

interface GigabitEthernet 1/0/1
switchport access vlan 100
end

interface GigabitEthernet 1/0/2
switchport access vlan 200
end

interface GigabitEthernet 1/0/24

```

```
switchport trunk encapsulation dot1q
switchport mode trunk
end

router ospfv3 100
router-id 40.40.40.40
!
address-family ipv6 unicast vrf v1
redistribute connected
area 0 normal
exit-address-family
!

router ospfv3 200
router-id 50.50.50.50
!
address-family ipv6 unicast vrf v2
redistribute connected

area 0 normal
exit-address-family
!
```
