## Information About LLDP

The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on standards documentation, or language that is used by a referenced third-party product.

## **LLDP**

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, switches, and controllers). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the device supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

## **LLDP Supported TLVs**

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. This protocol can advertise details such as configuration information, device capabilities, and device identity.

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- · System description TLV
- System capabilities TLV
- · Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV (IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV (IEEE 802.3 organizationally specific TLVs)

LLDP TLVs are used by Common Industrial Protocol, (CIP) in industrial automation applications. The switch supports the following CIP Identification TLVs:

- · Vendor Id
- Product Type
- Product Code
- Product Major Revision
- Product Minor Revision
- Product CIP Serial Number

For information about CIP, see CIP and MODBUS Configuration Guide, Cisco Catalyst IE3x00 Rugged, IE3400 Heavy Duty, and ESS3300 Series Switches.

The **show lldp neighbors detail tlv-dump** command displays LLDP TLVs. See Monitoring and Maintaining LLDP, on page 7 for more information about **show lldp** commands.

## **Default LLDP Configuration**

Table 1: Default LLDP Configuration

Feature	Default Setting
LLDP global state	Enabled
LLDP holdtime (before discarding)	120 seconds
LLDP timer (packet update frequency)	30 seconds
LLDP reinitialization delay	2 seconds
LLDP tlv-select	Enabled to send and receive all TLVs
LLDP interface state	Enabled
LLDP receive	Enabled

Feature	Default Setting
LLDP transmit	Enabled

# **Restrictions for LLDP**

- If the interface is configured as a tunnel port, LLDP is automatically disabled.
- If you first configure a network-policy profile on an interface, you cannot apply the **switchport voice vlan** command on the interface. If the **switchport voice vlan** *vlan-id* is already configured on an interface, you can apply a network-policy profile on the interface. This way the interface has the voice or voice-signaling VLAN network-policy profile applied on the interface.
- You cannot configure static secure MAC addresses on an interface that has a network-policy profile.
- When Cisco Discovery Protocol and LLDP are both in use within the same switch, it is necessary to disable LLDP on interfaces where Cisco Discovery Protocol is in use for power negotiation. LLDP can be disabled at interface level with the commands no lldp tlv-select power-management or no lldp transmit / no lldp receive.

# **Enabling LLDP**

#### **Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	lldp run	Enables LLDP globally on the device.
	Example:	
	Device(config)# 11dp run	
Step 4	interface interface-id	Specifies the interface on which you are
	Example:	enabling LLDP, and enter interface configuration mode.

Command or Action	Purpose
lldp transmit	Enables the interface to send LLDP packets.
Example:	
Device(config-if)# lldp transmit	
lldp receive	Enables the interface to receive LLDP packets.
Example:	
Device(config-if)# lldp receive	
end	Returns to privileged EXEC mode.
Example:	
Device(config-if)# end	
show lldp	Verifies the configuration.
Example:	
Device# show lldp	
copy running-config startup-config	(Optional) Saves your entries in the
Example:	configuration file.
Device# copy running-config startup-config	
	<pre>Ildp transmit Example:     Device(config-if)# lldp transmit  Ildp receive Example:     Device(config-if)# lldp receive  end Example:     Device(config-if)# end  show lldp Example:     Device# show lldp  copy running-config startup-config Example:     Device# copy running-config</pre>

# **Disabling LLDP**

The PROFINET protocol relies on LLDP for its functionality, and PROFINET is enabled by default on the switch. If you disable LLDP using the **no lldp run** command, followed by the **wr mem** and **reload** commands, on boot up PROFINET is globally enabled. PROFINET then re-enables LLDP automatically.

If you want to disable LLDP on the switch and maintain the configuration across reloads, you must also globally disable the PROFINET protocol. Follow these steps to disable both LLDP and PROFINET globally:

#### **Procedure**

#### **Step 1** configure terminal

**Example:** 

```
Device# configure terminal
```

Enters global configuration mode.

#### Step 2 no profinet

#### **Example:**

Device(config) # no profinet

Globally disables PROFINET.

#### Step 3 no lldp run

#### **Example:**

Device(config) # no lldp run

Globally disables LLDP.

#### Step 4 end

#### **Example:**

Device(config-if)# end

Returns to priviledged EXEC mode.

#### Step 5 write memory

#### **Example:**

Device# write memory

Saves the running configuration to the nonvolatile random-access memory (NVRAM).

#### Step 6 reload

#### Example:

Device# reload

Reloads the switch operating system.

#### **Example**

Device# configure terminal
Device(config)#no profinet
Device(config)#no lldp
Device(config)#end

Device#write memory Device#reload

# **Configuring LLDP Characteristics**

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP TLVs to send and receive.

Note

Steps 3 through 6 are optional and can be performed in any order.

#### **Procedure**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	• Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	lldp holdtime seconds  Example:	(Optional) Specifies the amount of time a receiving device should hold the information from your device before discarding it.
	Device(config)# 11dp holdtime 120	The range is 0 to 65535 seconds; the default is 120 seconds.
Step 4	<pre>lldp reinit delay Example:  Device(config) # 11dp reinit 2</pre>	(Optional) Specifies the delay time in seconds for LLDP to initialize on an interface.  The range is 2 to 5 seconds; the default is 2 seconds.
Step 5	<pre>lldp timer rate Example:  Device(config) # 11dp timer 30</pre>	(Optional) Sets the sending frequency of LLDP updates in seconds.  The range is 5 to 65534 seconds; the default is 30 seconds.

	Command or Action	Purpose
Step 6	<pre>interface interface-id Example:  Device(config) # interface gigabitethernet2/1</pre>	Specifies the interface on which you are enabling LLDP, and enters interface configuration mode.
Step 7	<pre>lidp tiv-select tlv  Example:  Device(config-if) # lldp tlv-select inventory management</pre>	(Optional) Specifies the LLDP TLVs to send or receive.  Note To disable LLDP TLVs, use the no lldp tlv-select tlv command.
Step 8	<pre>end Example: Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 9	show lldp Example:  Device# show lldp	Verifies the configuration.
Step 10	copy running-config startup-config  Example:  Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

# **Monitoring and Maintaining LLDP**

Commands for monitoring and maintaining LLDP.

Command	Description
clear lldp counters	Resets the traffic counters to zero.
clear lldp table	Deletes the LLDP neighbor information table.
show lldp	Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time before LLDP initializes on an interface.

Command	Description
show lldp entry entry-name	Displays information about a specific neighbor.
	You can enter an asterisk (*) to display all neighbors, or you can enter the neighbor name.
show lldp interface [interface-id]	Displays information about interfaces with LLDP enabled.
	You can limit the display to a specific interface.
show lldp neighbors [interface-id] [detail] [tlv-dump]	Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID.
	You can limit the display to neighbors of a specific interface or expand the display for more detailed information.
	The tlv-dump option displays LLDP TLV attributes.
show lldp traffic	Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.
show cip object lldp-management instance	Displays CIP LLDP management and data objects.
show cip object lldp-management class	
show cip object lldp-datatable instance <0-1000>	
show cip object lldp-datatable class
