

Route Map Commands

This chapter contains the following sections:

- [match ip address \(Policy Routing\)](#), on page 2
- [match ipv6 address \(Policy Routing\)](#), on page 3
- [route-map \(Policy Routing\)](#), on page 4
- [set ip next-hop](#), on page 6
- [set ipv6 next-hop](#), on page 7
- [show route-map](#), on page 8

match ip address (Policy Routing)

To match IP packets to perform IP policy routing, use the **match ip address** command in Route Map Configuration Mode. To move the **match ip address** entry, use the **no** form of this command.

Syntax

```
match ip address access-list extended-access-list-name
```

```
no match ip address access-list
```

Parameters

- **access-list** *extended-access-list-name*—Specifies an extended IP ACL.

Default Configuration

No the command is configured.

Command Mode

Route Map Configuration Mode

User Guidelines

The **match ip address** command allows you to policy route IP packets based on criteria that can be matched with an extended IP access list; for example, a protocol, protocol service, and source or destination IP address.

The ACL list specified by the *extended-access-list-name* argument cannot contain the following keywords:

- **time-range**
- **disable-port**
- **log-input**

Example

The example below gives how IPv4 Policy Base Routing is configured:

```
switchxxxxxx(config)# ip access-list extended acl1
switchxxxxxx(config-ip-al)# permit ip 176.212.0.0 00.255.255 any
switchxxxxxx(config-ip-al)# exit
switchxxxxxx(config)# route-map pbr
switchxxxxxx(config-route-map)# match ip address access-list acl1
switchxxxxxx(config-route-map)# set ip next-hop 173.23.13.20
switchxxxxxx(config-route-map)# exit
```

match ipv6 address (Policy Routing)

To match IPv6 packets to perform IPv6 policy routing, use the **match ipv6 address** command in Route Map Configuration Mode. To move the **match ipv6 address** entry, use the **no** form of this command.

Syntax

```
match ipv6 address access-list extended-access-list-name
```

```
no match ipv6 address access-list
```

Parameters

- **access-list** *extended-access-list-name*—Specifies an extended IPv6 access list.

Default Configuration

No the command is configured.

Command Mode

Route Map Configuration Mode

User Guidelines

The **match ipv6 address** command allows you to policy route IPv6 packets based on criteria that can be matched with an extended access list; for example, a protocol, protocol service, and source or destination IPv6 address.

The ACL list specified by the *extended-access-list-name* argument cannot contain the following keywords:

- **time-range**
- **disable-port**
- **log-input**

Example

The example below gives how IPv4 Policy Base Routing is configured:

```
switchxxxxxx(config)# ipv6 access-list acl1
switchxxxxxx(config-ip-al)# permit ipv6 3211:1297:: ::/32 any
switchxxxxxx(config-ip-al)# exit
switchxxxxxx(config)# route-map pbr
switchxxxxxx(config-route-map)# match ipv6 address access-list acl1
switchxxxxxx(config-route-map)# set ipv6 next-hop 3003:17ac::20
switchxxxxxx(config-route-map)# exit
switchxxxxxx(config-ip-al)# exit
```

route-map (Policy Routing)

To define the conditions for policy routing, use the **route-map** command in Global Configuration mode and the **match** and **set** commands in Route Map Configuration Mode. To delete an entry, use the **no** form of this command.

Syntax

```
route-map map-tag [sequence-number]
```

```
no route-map map-tag [sequence-number]
```

Parameters

- **map-tag**—A meaningful name for the route map. The redistribute router configuration command uses this name to reference this route map. Multiple route maps may share the same map tag name.
- **sequence-number**—Positive integer number that indicates the position a new route map will have in the list of route maps already configured with the same name. If the parameter is used with the **no** form of this command, the position of the route map should be deleted. If the parameter is omitted in the **route-map** command then a value of 10 is applied. If the parameter is omitted in the **no** format then all route maps sharing same map tag name are deleted.

Default Configuration

Conditions for policy routing is not configured.

Command Mode

Global Configuration mode

User Guidelines

Use the **route-map** command to enter route-map configuration mode. The purpose of the **route map** command is to define policy routing.

The **match** commands specify the conditions under which policy routing occurs and the **set** commands specify the routing actions to perform if the criteria enforced by the match commands are met:

- If a routed packet matches to an ACL with the permit action the packet is forwarded by the **set** command (policy based routing).
- If a routed packet matches to an ACL with the deny action the frame is forwarded by the Forwarding table (regular routing).

A route map can have several sections configured by separate **route-map** commands with the same map tag. When a routed packet is checked by a route map the first section which criteria is forced is applied. If there is no matched section the obvious shortest path using the Forwarding Table is applied.

Example 1. The following example gives an example of a route map with one section. TCP packet sent to subnet 156.12.5.0/24 are passed to the next hop 56.1.1.1.

```
switchxxxxxx(config)# ip access-list extended pr-ac11
switchxxxxxx(config-ip-al)# permit tcp any any 156.12.5.0 0.0.0.255 any
switchxxxxxx(config-ip-al)# exit
switchxxxxxx(config)# route-map pbr
switchxxxxxx(config-route-map)# match ip address access-list pr-ac11
switchxxxxxx(config-route-map)# set ip next-hop 56.1.1.1
switchxxxxxx(config-route-map)# exit
switchxxxxxx(config)# interface vlan 1
switchxxxxxx(config-if)# ip policy route-map pbr
switchxxxxxx(config-if)# exit
```

Example 2. The following example gives an example of a route map with two sections. TCP packet sent to subnet 156.12.5.0/24 are passed to the next hop 56.1.1.1 and CP packet sent to subnet 156.122.5.0/24 are passed to the next hop 50.1.1.1.

```
switchxxxxxx(config)# ip access-list extended pr-ac11
switchxxxxxx(config-ip-al)# permit tcp any any 156.12.5.0 0.0.0.255 any
switchxxxxxx(config-ip-al)# exit
switchxxxxxx(config)# ip access-list extended pr-ac12
switchxxxxxx(config-ip-al)# permit tcp any any 156.122.5.0 0.0.0.255 any
switchxxxxxx(config-ip-al)# exit
switchxxxxxx(config)# route-map pbr 10
switchxxxxxx(config-route-map)# match ip address access-list pr-ac11
switchxxxxxx(config-route-map)# set ip next-hop 56.1.1.1
switchxxxxxx(config-route-map)# exit
switchxxxxxx(config)# route-map pbr 20
switchxxxxxx(config-route-map)# match ip address access-list pr-ac12
switchxxxxxx(config-route-map)# set ip next-hop 50.1.1.1
switchxxxxxx(config-route-map)# exit
switchxxxxxx(config)# interface vlan 1
switchxxxxxx(config-if)# ip policy route-map pbr
switchxxxxxx(config-if)# exit
```

set ip next-hop

To specify the IP address of the next hop policy routing, use the **set ip next-hop** command in Route Map Configuration Mode. To delete an entry, use the **no** form of this command.

Syntax

set ip next-hop *next-hop*

no set ip next-hop

Parameters

- *next-hop*—IPv4 address of the next hop router.

Default Configuration

This command is disabled by default.

Command Mode

Route Map Configuration Mode

User Guidelines

Use the **set ip next-hop** command to set the IP address of the next hop policy routing.

Example

In the following example sets IP address 192.168.30.1 as the next hop IP address:

```
switchxxxxxx(config)# route-map bpr
switchxxxxxx(config-route-map)# match ip address access-list acl
switchxxxxxx(config-route-map)# set ip next-hop 192.168.30.1
switchxxxxxx(config-route-map)# exit
```

set ipv6 next-hop

To specify the IPv6 address of the next hop policy routing, use the **set ipv6 next-hop** command in Route Map Configuration Mode. To delete an entry, use the **no** form of this command.

Syntax

```
set ipv6 next-hop next-hop
```

```
no set ipv6 next-hop
```

Parameters

- *next-hop*—IPv6 address of the next hop router or outgoing interface ID for a point-to-point outgoing interfaces.

Default Configuration

This command is disabled by default.

Command Mode

Route Map Configuration Mode

User Guidelines

Use the **set ip next-hop** command to set the IPv6 address of the next hop policy routing.

Examples

Example 1. In the following example sets IPv6 address **3003:17ac::20** as the next hop IPv6 address:

```
switchxxxxxx(config)# route-map pbr
switchxxxxxx(config-route-map)# match ipv6 address access-list acl1
switchxxxxxx(config-route-map)# set ipv6 next-hop 3003:17ac::20
switchxxxxxx(config-route-map)# exit
switchxxxxxx(config-ip-al)# exit
```

Example 2. In the following example sets interface tunnel1 as the next hop:

```
switchxxxxxx(config)# interface tunnel 1
switchxxxxxx(config-if)# tunnel source 132.1.1.1
switchxxxxxx(config-if)# tunnel destination 192.168.30.1
switchxxxxxx(config-if)# tunnel mode ipv6ip
switchxxxxxx(config-if)# exit
switchxxxxxx(config)# route-map bpr
switchxxxxxx(config-route-map)# match ipv6 address access-list acl
switchxxxxxx(config-route-map)# set ipv6 next-hop tunnel 1
switchxxxxxx(config-route-map)# exit
```

show route-map

To display route maps, use the **show route-map** command in Privileged EXEC mode.

Syntax

```
show route-map [map-name]
```

Parameters

- *map-name*—Name of a specific route map.

Default Configuration

Command Mode

Privileged EXEC mode

User Guidelines

Use the **show route-map** *map-name* command, to display one given route map.

Use the **show route-map** command, to display all configured route maps.

Example

The following is sample output from the show route-map command:

```
switchxxxxxx# show route-map
route-map POLICY-ROUTING, permit, sequence 10
  Match clauses:
    ip address access-lists: acl1
  Set clauses:
    ip next-hop: 192.12.34.5
route-map POLICY-ROUTING, permit, sequence 20
  Match clauses:
    ip address access-lists: acl2
  Set clauses:
    ip next-hop: 192.122.23.15
route-map POLICY-ROUTING-IPv6, permit, sequence 10
  Match clauses:
    ipv6 address access-lists: acl3
  Set clauses:
    ipv6 next-hop: 3003:17ac::20
route-map POLICY-ROUTING-IPv6, permit, sequence 20
  Match clauses:
    ipv6 address access-lists: acl4
  Set clauses:
    interface next-hop: tunnel 1
```
