RSA and Certificate Commands

This chapter contains the following sections:

crypto key generate dsa

The **crypto key generate dsa** Global Configuration mode command generates a DSA key pair for SSH Public-Key authentication.

Syntax

crypto key generate dsa

Default Configuration

The application creates a default key automatically.

Command Mode

Global Configuration mode

User Guidelines

The size of the created DSA key is 1024 bits

DSA keys are generated in pairs - one public DSA key and one private DSA key.

If the device already has DSA keys default or user defined, a warning is displayed with a prompt to replace the existing keys with new keys.

Erasing the startup configuration or returning to factory defaults automatically deletes the default keys and they are recreated during device initialization.

This command is not saved in the Running configuration file. However, the keys generated by this command are saved to the Running Configuration file.

Example

The following example generates a DSA key pair.

```
switchxxxxxx(config)# crypto key generate dsa
The SSH service is generating a private DSA key.
This may take a few minutes, depending on the key size.
.........
```

crypto key generate rsa

The **crypto key generate rsa** Global Configuration mode command generates RSA key pairs for SSH Public-Key Authentication.

Syntax

crypto key generate rsa

Default Configuration

The application creates a default key automatically.

Command Mode

Global Configuration mode

User Guidelines

The size of the created RSA key is 2048 bits

RSA keys are generated in pairs - one public RSA key and one private RSA key.

If the device already has RSA keys default or user defined, a warning is displayed with a prompt to replace the existing keys with new keys.

Erasing the startup configuration or returning to factory defaults automatically deletes the default keys and they are recreated during device initialization.

This command is not saved in the Running configuration file. However, the keys generated by this command are saved to the Running Configuration file.

Example

The following example generates RSA key pairs where a RSA key already exists.

```
switchxxxxxx(config)# crypto key generate rsa
Replace Existing RSA Key [y/n]? N
switchxxxxxx(config)#
```

crypto key import

The **crypto key import** Global Configuration mode command imports the DSA/RSA key pair.

Use the no form of the command to remove the user key and generate a new default in its place.

Syntax

crypto key import {dsa| rsa}

encrypted crypto key import {dsa| rsa}

no crypto key {**dsa| rsa**}

Default Configuration

DSA and RSA key pairs do not exist.

Command Mode

Global Configuration mode

User Guidelines

The imported key must follow the format defined in RFC 4716

DSA key size for import is between 512 bits and 1024 bits

RSA key size for import is between 1024 bits and 2048 bits

DSA/RSA keys are imported in pairs - one public DSA/RSA key and one private DSA/RSA key.

If the device already has DSA/RSA key keys, a warning is displayed with a prompt to replace the existing keys with new keys.

This command is saved in the Running Configuration file.

When using the **encrypted** key-word, the private key is imported in its encrypted form.

Example

```
switchxxxxxx(config)# encrypted crypto key import rsa
---- BEGIN SSH2 ENCRYPTED PRIVATE KEY ----
switchxxxxxx(config)# encrypted crypto key import rsa
---- BEGIN SSH2 ENCRYPTED PRIVATE KEY ----
Comment: RSA Private Key

show crypto key

The **show crypto key** Privileged EXEC mode command displays the device's SSH private and public keys for both default and user-defined keys.

Syntax

show crypto key [*mypubkey*] [**dsa| rsa**]

Parameters

- ***mypubkey***—Displays only the public key.
- **rsa**—Displays the RSA key.
- **dsa**—Displays the DSA key.

Command Mode

Privileged EXEC mode

User Guidelines

See **Keys and Certificates** for information on how to display and copy this key pair.

Example

The following example displays the SSH public DSA keys on the device.

```
switchxxxxxx# show crypto key mypubkey dsa
---- BEGIN SSH2 PUBLIC KEY ----
Comment: RSA Public Key
AAAAB3NzaC1yc2EAAAABIwAAAIEAzN31fu56KSEOZdrGVPIJHpAs8G8NDIkB

BrIi2IuwMVJuak5M098=
---- END SSH2 PUBLIC KEY ----
Public Key Fingerprint: 6f:93:ca:01:89:6a:de:6e:ee:c5:18:82:b2:10:bc:1e
```

crypto certificate generate

The **crypto certificate generate** Global Configuration mode command generates a self-signed certificate for HTTPS.

Syntax

crypto certificate *number* **generate** [**key-generate** [*length*]] [**cn** *common- name*] [**ou** *organization-unit*] [**or** *organization*] [**loc** *location*] [**st** *state*] [**cu** *country*] [**duration** *days*]

Parameters

- ***number***—Specifies the certificate number. (Range: 1–2)
- **key-generate rsa** *length*—Regenerates SSL RSA key and specifies the key length.(Supported lengths: 2048 (bits) or 3092 (bits))

  The following elements can be associated with the key. When the key is displayed, they are also displayed.

  cn *common- name*—Specifies the fully qualified device URL or IP address. (Length: 1–64 characters). If unspecified, defaults to the lowest IP address of the device (when the certificate is generated).

  ou *organization-unit*—Specifies the organization-unit or department name. (Length: 1–64 characters)

  or *organization*—Specifies the organization name. (Length: 1–64 characters)

  loc *location*—Specifies the location or city name. (Length: 1–64 characters)

  st *state*—Specifies the state or province name. (Length: 1–64 characters)

  cu *country*—Specifies the country name. (Length: 2 characters)

  duration *days*—Specifies the number of days a certification is valid. (Range: 30–1095)

Default Configuration

If the **key-generate** parameter is not used the certificate is generated using the existing key.

The default SSL's RSA key length is 2048.

The default SSL's EC key length is 256.

If **cn** *common- name* is not specified, it defaults to the device's lowest static IPv6 address (when the certificate is generated), or to the device's lowest static IPv4 address if there is no static IPv6 address, or to 0.0.0.0 if there is no static IP address.

If **duration** *days* is not specified, it defaults to 730 days.

Command Mode

Global Configuration mode

User Guidelines

If the specific certificate key does not exist, you must use the parameter **key-generate**.

If both certificates 1 and 2 have been generated, use the **ip https certificate** command to activate one of them.

See **Keys and Certificates** for information on how to display and copy this key pair.

Erasing the startup configuration or returning to factory defaults automatically deletes the default keys and they are recreated during device initialization.

Example

The following example generates a self-signed certificate for HTTPS whose key length is 2048 bytes.

```
switchxxxxxx(config)# crypto certificate 1 generate key-generate 2048
```

crypto certificate request

The **crypto certificate request** Privileged EXEC mode command generates and displays a certificate request for HTTPS.

Syntax

crypto certificate *number* **request** *[***cn** *common- name*] [**ou** *organization-unit*] [**or** *organization*] [**loc** *location*] [**st** *state*] [**cu** *country]*

Parameters

- ***number***—Specifies the certificate number. (Range: 1–2)
- The following elements can be associated with the key. When the key is displayed, they are also displayed.

  cn *common- name*—Specifies the fully qualified device URL or IP address. (Length: 1–64 characters). If unspecified, defaults to the lowest IP address of the device (when the certificate is generated).

  ou *organization-unit*—Specifies the organization-unit or department name. (Length: 1–64 characters)

  or *organization*—Specifies the organization name. (Length: 1–64 characters)

  loc *location*—Specifies the location or city name. (Length: 1–64 characters)

  st *state*—Specifies the state or province name. (Length: 1–64 characters)

  cu *country*—Specifies the country name. (Length: 2 characters)

Default Configuration

If **cn common-name** is not specified, it defaults to the device's lowest static IPv6 address (when the certificate is generated), or to the device's lowest static IPv4 address if there is no static IPv6 address, or to 0.0.0.0 if there is no static IP address.

Command Mode

Privileged EXEC mode

User Guidelines

Use this command to export a certificate request to a Certification Authority. The certificate request is generated in Base64-encoded X.509 format.

Before generating a certificate request, first generate a self-signed certificate using the **crypto cerificate generate** command to generate the keys. The certificate fields must be re-entered.

After receiving the certificate from the Certification Authority, use the **crypto cerificate import** command to import the certificate into the device. This certificate replaces the self-signed certificate.

Example

The following example displays the certificate request for HTTPS.

```
switchxxxxxx# crypto certificate 1 request
-----BEGIN CERTIFICATE REQUEST-----
```

```

-----END CERTIFICATE REQUEST-----
```

crypto certificate import

The **crypto certificate import** Global Configuration mode command imports a certificate signed by a Certification Authority for HTTPS. In addition, the relevant key-pair can also be imported.

Use the no form of the command to delete the user-defined keys and certificate.

Syntax

crypto certificate *number* **import**

encrypted crypto certificate *number* **import**

no crypto certificate *number*

Parameters

- ***number***—Specifies the certificate number. (Range: 1–2).

Command Mode

Global Configuration mode

User Guidelines

Certificate needs to be imported from PEM encoding/file extension

To end the session (return to the command line to enter the next command), enter a blank line.

The imported certificate must be based on a certificate request created by the **crypto cerificate request** command.

If only the certificate is imported, and the public key found in the certificate does not match the device's SSL key, the command fails. If both the public key and the certificate are imported, and the public key found in the certificate does not match the imported key, the command fails.

This command is saved in the Running configuration file.

When using the encrypted form of the command, only the private key must be in encrypted format.

Example 1 - The following example imports a certificate signed by the Certification Authority for HTTPS.

```
switchxxxxxx(config)# crypto certificate 1 import
Please paste the input now, add a period (.) on a separate line after the input,and press
Enter.

show crypto certificate

The **show crypto certificate** Privileged EXEC mode command displays the device SSL certificates and key-pair for both default and user defined keys.

Syntax

show crypto certificate [mycertificate] [*number*]

Parameters

- ***number***—Specifies the certificate number. (Range: 1,2)
- **mycertificate**—Specifies that only the certificate will be displayed

Default Configuration

displays both keys.

Command Mode

Privileged EXEC mode

Examples

The following example displays SSL certificate # 1 present on the device and the key-pair.

```
switchxxxxxx# show crypto certificate 1
Certificate 1:
Certificate Source: Default
