Cisco ME 3400E Ethernet Access Switch
Software Configuration Guide

Cisco IOS Release 12.2(44)EY

February 2009
CONTENTS

Preface xxxix
  Audience xxxix
  Purpose xxxix
  Conventions xl
  Related Publications xl
  Obtaining Documentation and Submitting a Service Request xli

CHAPTER 1

Overview 1-1
  Features 1-1
    Performance Features 1-2
    Management Options 1-3
    Manageability Features 1-3
    Availability Features 1-5
    VLAN Features 1-6
    Security Features 1-6
      Subscriber Security 1-6
      Switch Security 1-7
      Network Security 1-7
    Quality of Service and Class of Service Features 1-8
    Layer 2 Virtual Private Network Services 1-8
    Layer 3 Features 1-9
    Layer 3 VPN Services 1-9
    Monitoring Features 1-9
  Default Settings After Initial Switch Configuration 1-10
  Network Configuration Examples 1-13
    Multidwelling or Ethernet-to-the-Subscriber Network 1-14
    Layer 2 VPN Application 1-15
    Multi-VRF CE Application 1-16
  Where to Go Next 1-17

CHAPTER 2

Using the Command-Line Interface 2-1
  Understanding Command Modes 2-1
  Understanding the Help System 2-3
  Understanding Abbreviated Commands 2-3
Understanding no and default Forms of Commands  2-4
Understanding CLI Error Messages  2-4
Using Command History  2-4
   Changing the Command History Buffer Size  2-5
   Recalling Commands  2-5
   Disabling the Command History Feature  2-5
Using Editing Features  2-6
   Enabling and Disabling Editing Features  2-6
   Editing Commands through Keystrokes  2-6
   Editing Command Lines that Wrap  2-8
Searching and Filtering Output of show and more Commands  2-8
Accessing the CLI  2-9
   Accessing the CLI through a Console Connection or through Telnet  2-9

CHAPTER 3
Assigning the Switch IP Address and Default Gateway  3-1
Understanding the Boot Process  3-1
Assigning Switch Information  3-2
   Default Switch Information  3-3
   Understanding DHCP-Based Autoconfiguration  3-3
      DHCP Client Request Process  3-3
   Understanding DHCP-based Autoconfiguration and Image Update  3-4
      DHCP Autoconfiguration  3-5
      DHCP Auto-Image Update  3-5
      Limitations and Restrictions  3-5
Configuring DHCP-Based Autoconfiguration  3-6
   DHCP Server Configuration Guidelines  3-6
   Configuring the TFTP Server  3-6
   Configuring the DNS  3-7
   Configuring the Relay Device  3-7
   Obtaining Configuration Files  3-8
   Example Configuration  3-9
Configuring the DHCP Auto Configuration and Image Update Features  3-10
   Configuring DHCP Autoconfiguration (Only Configuration File)  3-11
   Configuring DHCP Auto-Image Update (Configuration File and Image)  3-12
   Configuring the Client  3-13
Manually Assigning IP Information  3-14
Checking and Saving the Running Configuration  3-14
CHAPTER 3

Modifying the Startup Configuration 3-16
  Default Boot Configuration 3-17
  Automatically Downloading a Configuration File 3-17
  Specifying the Filename to Read and Write the System Configuration 3-17
  Booting Manually 3-18
  Booting a Specific Software Image 3-18
  Controlling Environment Variables 3-19

Scheduling a Reload of the Software Image 3-21
  Configuring a Scheduled Reload 3-21
  Displaying Scheduled Reload Information 3-22

CHAPTER 4

Configuring Cisco IOS CNS Agents 4-1
  Understanding Cisco Configuration Engine Software 4-1
    Configuration Service 4-2
    Event Service 4-3
    NameSpace Mapper 4-3
  What You Should Know About the CNS IDs and Device Hostnames 4-3
    ConfigID 4-3
    DeviceID 4-4
    Hostname and DeviceID 4-4
    Using Hostname, DeviceID, and ConfigID 4-4
  Understanding Cisco IOS Agents 4-5
    Initial Configuration 4-5
    Incremental (Partial) Configuration 4-6
    Synchronized Configuration 4-6
  Configuring Cisco IOS Agents 4-6
    Enabling Automated CNS Configuration 4-6
    Enabling the CNS Event Agent 4-7
    Enabling the Cisco IOS CNS Agent 4-9
      Enabling an Initial Configuration 4-9
      Enabling a Partial Configuration 4-13
    Upgrading Devices with Cisco IOS Image Agent 4-14
      Prerequisites for the CNS Image Agent 4-14
      Restrictions for the CNS Image Agent 4-14
  Displaying CNS Configuration 4-15
CHAPTER 5

Administering the Switch 5-1
  Managing the System Time and Date 5-1
    Understanding the System Clock 5-2
    Understanding Network Time Protocol 5-2
  Configuring NTP 5-4
    Default NTP Configuration 5-4
    Configuring NTP Authentication 5-4
    Configuring NTP Associations 5-5
    Configuring NTP Broadcast Service 5-6
    Configuring NTP Access Restrictions 5-8
    Configuring the Source IP Address for NTP Packets 5-10
    Displaying the NTP Configuration 5-11
  Configuring Time and Date Manually 5-11
    Setting the System Clock 5-11
    Displaying the Time and Date Configuration 5-12
    Configuring the Time Zone 5-12
    Configuring Summer Time (Daylight Saving Time) 5-13
  Configuring a System Name and Prompt 5-14
    Default System Name and Prompt Configuration 5-15
    Configuring a System Name 5-15
  Understanding DNS 5-15
    Default DNS Configuration 5-16
    Setting Up DNS 5-16
    Displaying the DNS Configuration 5-17
  Creating a Banner 5-17
    Default Banner Configuration 5-17
    Configuring a Message-of-the-Day Login Banner 5-18
    Configuring a Login Banner 5-19
  Managing the MAC Address Table 5-19
    Building the Address Table 5-20
    MAC Addresses and VLANs 5-20
    Default MAC Address Table Configuration 5-21
    Changing the Address Aging Time 5-21
    Removing Dynamic Address Entries 5-22
    Configuring MAC Address Notification Traps 5-22
    Adding and Removing Static Address Entries 5-24
    Configuring Unicast MAC Address Filtering 5-25
    Disabling MAC Address Learning on a VLAN 5-26
    Displaying Address Table Entries 5-28
  Managing the ARP Table 5-28
CHAPTER 6  Configuring the Switch Alarms 6-1
  Configuring External Alarms 6-1
  Configuring Power Supply Alarms 6-3
    Power-Supply-Missing Alarms 6-4
    DC-Power-Supply Feed Alarms 6-4

CHAPTER 7  Configuring SDM Templates 7-1
  Understanding the SDM Templates 7-1
  Configuring the Switch SDM Template 7-2
    Default SDM Template 7-2
    SDM Template Configuration Guidelines 7-2
    Setting the SDM Template 7-3
    Displaying the SDM Templates 7-4

CHAPTER 8  Configuring Switch-Based Authentication 8-1
  Preventing Unauthorized Access to Your Switch 8-1
  Protecting Access to Privileged EXEC Commands 8-2
    Default Password and Privilege Level Configuration 8-2
    Setting or Changing a Static Enable Password 8-3
    Protecting Enable and Enable Secret Passwords with Encryption 8-3
    Disabling Password Recovery 8-5
    Setting a Telnet Password for a Terminal Line 8-6
    Configuring Username and Password Pairs 8-6
    Configuring Multiple Privilege Levels 8-7
      Setting the Privilege Level for a Command 8-8
      Changing the Default Privilege Level for Lines 8-9
      Logging into and Exiting a Privilege Level 8-9
  Controlling Switch Access with TACACS+ 8-9
    Understanding TACACS+ 8-10
    TACACS+ Operation 8-12
    Configuring TACACS+ 8-12
      Default TACACS+ Configuration 8-13
      Identifying the TACACS+ Server Host and Setting the Authentication Key 8-13
      Configuring TACACS+ Login Authentication 8-14
      Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services 8-16
      Starting TACACS+ Accounting 8-17
      Displaying the TACACS+ Configuration 8-17
  Controlling Switch Access with RADIUS 8-17
Understanding RADIUS 8-18
RADIUS Operation 8-19
Configuring RADIUS 8-20
  Default RADIUS Configuration 8-20
  Identifying the RADIUS Server Host 8-20
  Configuring RADIUS Login Authentication 8-23
  Defining AAA Server Groups 8-25
  Configuring RADIUS Authorization for User Privileged Access and Network Services 8-27
Starting RADIUS Accounting 8-28
Configuring Settings for All RADIUS Servers 8-29
Configuring the Switch to Use Vendor-Specific RADIUS Attributes 8-29
Configuring the Switch for Vendor-Proprietary RADIUS Server Communication 8-30
Displaying the RADIUS Configuration 8-31
Controlling Switch Access with Kerberos 8-32
  Understanding Kerberos 8-32
  Kerberos Operation 8-34
    Authenticating to a Boundary Switch 8-34
    Obtaining a TGT from a KDC 8-35
    Authenticating to Network Services 8-35
Configuring Kerberos 8-35
Configuring the Switch for Local Authentication and Authorization 8-36
Configuring the Switch for Secure Shell 8-37
  Understanding SSH 8-37
    SSH Servers, Integrated Clients, and Supported Versions 8-37
    Limitations 8-38
Configuring SSH 8-38
  Configuration Guidelines 8-38
  Setting Up the Switch to Run SSH 8-39
  Configuring the SSH Server 8-40
Displaying the SSH Configuration and Status 8-40
Configuring the Switch for Secure Copy Protocol 8-41
  Information About Secure Copy 8-41

**CHAPTER 9**

Configuring IEEE 802.1x Port-Based Authentication 9-1
  Understanding IEEE 802.1x Port-Based Authentication 9-1
  Device Roles 9-2
  Authentication Initiation and Message Exchange 9-3
  Ports in Authorized and Unauthorized States 9-4
  IEEE 802.1x Accounting 9-5
IEEE 802.1x Accounting Attribute-Value Pairs 9-5
IEEE 802.1x Host Mode 9-6
Using 802.1x Readiness Check 9-7
Using IEEE 802.1x with Port Security 9-7
Using IEEE 802.1x with VLAN Assignment 9-8
Configuring IEEE 802.1x Authentication 9-9
Default IEEE 802.1x Configuration 9-10
IEEE 802.1x Configuration Guidelines 9-11
  Maximum Number of Allowed Devices Per Port 9-11
Configuring 802.1x Readiness Check 9-11
Configuring IEEE 802.1x Violation Modes 9-12
Configuring IEEE 802.1x Authentication 9-13
Configuring the Switch-to-RADIUS-Server Communication 9-14
Configuring Periodic Re-Authentication 9-15
Manually Re-Authenticating a Client Connected to a Port 9-16
Changing the Quiet Period 9-16
Changing the Switch-to-Client Retransmission Time 9-17
Setting the Switch-to-Client Frame-Retransmission Number 9-18
Setting the Re-Authentication Number 9-18
Configuring the Host Mode 9-19
Resetting the IEEE 802.1x Configuration to the Default Values 9-20
Configuring IEEE 802.1x Accounting 9-20
Displaying IEEE 802.1x Statistics and Status 9-21

CHAPTER 10
Configuring Interfaces 10-1
Understanding Interface Types 10-1
  UNI, NNI, and ENI Port Types 10-2
  Port-Based VLANs 10-2
Switch Ports 10-3
  Access Ports 10-4
  Trunk Ports 10-4
  Tunnel Ports 10-4
Routed Ports 10-5
Ethernet Management Port 10-5
Switch Virtual Interfaces 10-5
EtherChannel Port Groups 10-6
Dual-Purpose Ports 10-6
Connecting Interfaces 10-7
Using Interface Configuration Mode 10-8
  Procedures for Configuring Interfaces 10-8
  Configuring a Range of Interfaces 10-9
  Configuring and Using Interface Range Macros 10-10
Using the Ethernet Management Port 10-12
  Understanding the Ethernet Management Port 10-12
  Supported Features on the Ethernet Management Port 10-14
  Configuring the Ethernet Management Port 10-14
  TFTP and the Ethernet Management Port 10-14
Configuring Ethernet Interfaces 10-15
  Default Ethernet Interface Configuration 10-15
  Configuring the Port Type 10-17
  Configuring Interface Speed and Duplex Mode 10-18
    Speed and Duplex Configuration Guidelines 10-18
    Setting the Interface Speed and Duplex Parameters 10-19
  Configuring a Dual-Purpose Port 10-21
  Configuring IEEE 802.3x Flow Control 10-23
  Configuring Auto-MDIX on an Interface 10-24
  Adding a Description for an Interface 10-25
Configuring Layer 3 Interfaces 10-25
Configuring the System MTU 10-27
Monitoring and Maintaining the Interfaces 10-29
  Monitoring Interface Status 10-29
  Clearing and Resetting Interfaces and Counters 10-30
  Shutting Down and Restarting the Interface 10-31

Chapter 11
Configuring Command Macros 11-1
  Understanding Command Macros 11-1
  Configuring Command Macros 11-1
    Default Command Macro Configuration 11-2
    Command Macro Configuration Guidelines 11-2
    Creating Command Macros 11-3
    Applying Command Macros 11-4
  Displaying Command Macros 11-5
CHAPTER 12
Configuring VLANs 12-1

Understanding VLANs 12-1
- Supported VLANs 12-3
- Normal-Range VLANs 12-3
- Extended-Range VLANs 12-4
- VLAN Port Membership Modes 12-4
- UNI-ENI VLANs 12-5

Creating and Modifying VLANs 12-7
- Default Ethernet VLAN Configuration 12-7
- VLAN Configuration Guidelines 12-8
- Creating or Modifying an Ethernet VLAN 12-9
- Assigning Static-Access Ports to a VLAN 12-11
- Creating an Extended-Range VLAN with an Internal VLAN ID 12-11
- Configuring UNI-ENI VLANs 12-12
  - Configuration Guidelines 12-12
  - Configuring UNI-ENI VLANs 12-13

Displaying VLANs 12-14

Configuring VLAN Trunks 12-14
- Trunking Overview 12-14
  - IEEE 802.1Q Configuration Considerations 12-15
  - Default Layer 2 Ethernet Interface VLAN Configuration 12-16
- Configuring an Ethernet Interface as a Trunk Port 12-16
  - Interaction with Other Features 12-16
  - Configuring a Trunk Port 12-17
  - Defining the Allowed VLANs on a Trunk 12-17
  - Configuring the Native VLAN for Untagged Traffic 12-19
- Configuring Trunk Ports for Load Sharing 12-19
  - Load Sharing Using STP Port Priorities 12-20
  - Load Sharing Using STP Path Cost 12-21

Configuring VMPS 12-23
- Understanding VMPS 12-23
  - Dynamic-Access Port VLAN Membership 12-24
- Default VMPS Client Configuration 12-25
- VMPS Configuration Guidelines 12-25
- Configuring the VMPS Client 12-25
  - Entering the IP Address of the VMPS 12-26
  - Configuring Dynamic-Access Ports on VMPS Clients 12-26
  - Reconfirming VLAN Memberships 12-27
  - Changing the Reconfirmation Interval 12-27
Changing the Retry Count 12-27
Monitoring the VMPS 12-28
Troubleshooting Dynamic-Access Port VLAN Membership 12-28
VMPS Configuration Example 12-28

CHAPTER 13
Configuring Private VLANs 13-1
Understanding Private VLANs 13-1
Types of Private VLANs and Private-VLAN Ports 13-2
IP Addressing Scheme with Private VLANs 13-4
Private VLANs across Multiple Switches 13-4
Private VLANs and Unicast, Broadcast, and Multicast Traffic 13-5
Private VLANs and SVIs 13-5
Configuring Private VLANs 13-6
Tasks for Configuring Private VLANs 13-6
Default Private-VLAN Configuration 13-6
Private-VLAN Configuration Guidelines 13-6
Secondary and Primary VLAN Configuration 13-7
Private-VLAN Port Configuration 13-8
Limitations with Other Features 13-9
Configuring and Associating VLANs in a Private VLAN 13-10
Configuring a Layer 2 Interface as a Private-VLAN Host Port 13-11
Configuring a Layer 2 Interface as a Private-VLAN Promiscuous Port 13-13
Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface 13-14
Monitoring Private VLANs 13-15

CHAPTER 14
Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling 14-1
Understanding 802.1Q Tunneling 14-1
Configuring 802.1Q Tunneling 14-4
Default 802.1Q Tunneling Configuration 14-4
802.1Q Tunneling Configuration Guidelines 14-4
Native VLANs 14-4
System MTU 14-5
802.1Q Tunneling and Other Features 14-5
Configuring an 802.1Q Tunneling Port 14-6
Understanding VLAN Mapping 14-7
Mapping Customer VLANs to Service-Provider VLANs 14-8
Configuring VLANMapping 14-9
Default VLAN Mapping Configuration 14-9
VLAN Mapping Configuration Guidelines 14-9
### Contents

**Chapter 14: Configuring VLAN Mapping**
- One-to-One Mapping 14-10
- Traditional QinQ on a Trunk Port 14-11
- Selective QinQ on a Trunk Port 14-12

**Understanding Layer 2 Protocol Tunneling** 14-12

**Configuring Layer 2 Protocol Tunneling** 14-15
- Default Layer 2 Protocol Tunneling Configuration 14-16
- Layer 2 Protocol Tunneling Configuration Guidelines 14-16
- Configuring Layer 2 Protocol Tunneling 14-17
- Configuring Layer 2 Tunneling for EtherChannels 14-19
  - Configuring the SP Edge Switch 14-19
  - Configuring the Customer Switch 14-21

**Monitoring and Maintaining Tunneling and Mapping Status** 14-23

### Chapter 15: Configuring STP

**Understanding Spanning-Tree Features** 15-1
- STP Overview 15-2
- Spanning-Tree Topology and BPDUs 15-3
- Bridge ID, Switch Priority, and Extended System ID 15-4
- Spanning-Tree Interface States 15-4
  - Blocking State 15-6
  - Listening State 15-6
  - Learning State 15-7
  - Forwarding State 15-7
  - Disabled State 15-7
- How a Switch or Port Becomes the Root Switch or Root Port 15-7
- Spanning Tree and Redundant Connectivity 15-8
- Spanning-Tree Address Management 15-9
- Accelerated Aging to Retain Connectivity 15-9
- Spanning-Tree Modes and Protocols 15-9
- Supported Spanning-Tree Instances 15-10
- Spanning-Tree Interoperability and Backward Compatibility 15-10
- STP and IEEE 802.1Q Trunks 15-11

**Configuring Spanning-Tree Features** 15-11
- Default Spanning-Tree Configuration 15-11
- Spanning-Tree Configuration Guidelines 15-12
- Enabling Spanning Tree on an ENI 15-13
- Changing the Spanning-Tree Mode 15-14
- Disabling Spanning Tree 15-15
Configuring the Root Switch 15-15
Configuring a Secondary Root Switch 15-17
Configuring Port Priority 15-17
Configuring Path Cost 15-19
Configuring the Switch Priority of a VLAN 15-20
Configuring Spanning-Tree Timers 15-21
  Configuring the Hello Time 15-21
  Configuring the Forwarding-Delay Time for a VLAN 15-22
  Configuring the Maximum-Aging Time for a VLAN 15-22
Displaying the Spanning-Tree Status 15-23

CHAPTER 16 Configuring MSTP 16-1
Understanding MSTP 16-2
  Multiple Spanning-Tree Regions 16-2
  IST, CIST, and CST 16-3
    Operations Within an MST Region 16-3
    Operations Between MST Regions 16-4
  IEEE 802.1s Terminology 16-5
  Hop Count 16-5
  Boundary Ports 16-6
  IEEE 802.1s Implementation 16-6
    Port Role Naming Change 16-7
    Interoperation Between Legacy and Standard Switches 16-7
    Detecting Unidirectional Link Failure 16-8
  Interoperability with IEEE 802.1D STP 16-8
Understanding RSTP 16-8
  Port Roles and the Active Topology 16-9
  Rapid Convergence 16-10
  Synchronization of Port Roles 16-11
  Bridge Protocol Data Unit Format and Processing 16-12
    Processing Superior BPDU Information 16-13
    Processing Inferior BPDU Information 16-13
  Topology Changes 16-13
Configuring MSTP Features 16-14
  Default MSTP Configuration 16-14
  MSTP Configuration Guidelines 16-15
  Specifying the MST Region Configuration and Enabling MSTP 16-16
  Configuring the Root Switch 16-17
  Configuring a Secondary Root Switch 16-18
Configuring REP

- Default REP Configuration
- REP Configuration Guidelines
- Configuring the REP Administrative VLAN
- Configuring REP Interfaces
- Setting Manual Preemption for VLAN Load Balancing
- Configuring SNMP Traps for REP

Monitoring REP

CHAPTER 19

Configuring Flex Links and the MAC Address-Table Move Update Feature

Understanding Flex Links and the MAC Address-Table Move Update
- Flex Links
- VLAN Flex Link Load Balancing and Support
- Flex Link Multicast Fast Convergence
  - Learning the Other Flex Link Port as the mrouter Port
  - Generating IGMP Reports
  - Leaking IGMP Reports
- MAC Address-Table Move Update

Configuring Flex Links and MAC Address-Table Move Update
- Default Configuration
- Configuration Guidelines
- Configuring Flex Links
- Configuring VLAN Load Balancing on Flex Links
- Configuring the MAC Address-Table Move Update Feature

Monitoring Flex Links and the MAC Address-Table Move Update

CHAPTER 20

Configuring DHCP Features and IP Source Guard

Understanding DHCP Features
- DHCP Server
- DHCP Relay Agent
- DHCP Snooping
- Option-82 Data Insertion
- Cisco IOS DHCP Server Database
- DHCP Snooping Binding Database

Configuring DHCP Features
- Default DHCP Configuration
- DHCP Snooping Configuration Guidelines
- Configuring the DHCP Server
- Configuring the DHCP Relay Agent

Configuring IGMP Snooping 22-6
   Default IGMP Snooping Configuration 22-6
   Enabling or Disabling IGMP Snooping 22-7
   Configuring a Multicast Router Port 22-7
   Configuring a Host Statically to Join a Group 22-8
   Enabling IGMP Immediate Leave 22-9
   Configuring the IGMP Leave Timer 22-9
   Configuring TCN-Related Commands 22-10
      Controlling the Multicast Flooding Time After a TCN Event 22-10
      Recovering from Flood Mode 22-11
      Disabling Multicast Flooding During a TCN Event 22-11
   Configuring the IGMP Snooping Querier 22-12
   Disabling IGMP Report Suppression 22-14
Displaying IGMP Snooping Information 22-14
Understanding Multicast VLAN Registration 22-15
   Using MVR in a Multicast Television Application 22-16
Configuring MVR 22-18
   Default MVR Configuration 22-18
   MVR Configuration Guidelines and Limitations 22-18
   Configuring MVR Global Parameters 22-19
   Configuring MVR on Access Ports 22-20
   Configuring MVR on Trunk Ports 22-22
Displaying MVR Information 22-23
Configuring IGMP Filtering and Throttling 22-23
   Default IGMP Filtering and Throttling Configuration 22-24
   Configuring IGMP Profiles 22-25
   Applying IGMP Profiles 22-26
   Setting the Maximum Number of IGMP Groups 22-26
   Configuring the IGMP Throttling Action 22-27
   Displaying IGMP Filtering and Throttling Configuration 22-29

CHAPTER 23
Configuring Port-Based Traffic Control 23-1
Configuring Storm Control 23-1
   Understanding Storm Control 23-1
   Default Storm Control Configuration 23-3
   Configuring Storm Control and Threshold Levels 23-3
### Configuring Protected Ports 23-5
- Default Protected Port Configuration 23-5
- Protected Port Configuration Guidelines 23-6
- Configuring a Protected Port 23-6

### Configuring Port Blocking 23-6
- Default Port Blocking Configuration 23-7
- Blocking Flooded Traffic on an Interface 23-7

### Configuring Port Security 23-8
- Understanding Port Security 23-8
  - Secure MAC Addresses 23-8
  - Security Violations 23-9
- Default Port Security Configuration 23-10
- Port Security Configuration Guidelines 23-10
- Enabling and Configuring Port Security 23-11
- Enabling and Configuring Port Security Aging 23-15
- Port Security and Private VLANs 23-16

### Displaying Port-Based Traffic Control Settings 23-17

## Chapter 24 Configuring CDP 24-1
### Understanding CDP 24-1
### Configuring CDP 24-2
- Default CDP Configuration 24-2
- Configuring the CDP Characteristics 24-2
- Disabling and Enabling CDP 24-3
- Disabling and Enabling CDP on an Interface 24-4

### Monitoring and Maintaining CDP 24-5

## Chapter 25 Configuring LLDP and LLDP-MED 25-1
### Understanding LLDP and LLDP-MED 25-1
- Understanding LLDP 25-1
- Understanding LLDP-MED 25-2

### Configuring LLDP and LLDP-MED 25-3
- Default LLDP Configuration 25-3
- Configuring LLDP Characteristics 25-4
- Disabling and Enabling LLDP Globally 25-5
- Disabling and Enabling LLDP on an Interface 25-5
- Configuring LLDP-MED TLVs 25-6

### Monitoring and Maintaining LLDP and LLDP-MED 25-8
CHAPTER 26 Configuring UDLD 26-1

Understanding UDLD 26-1
   Modes of Operation 26-1
   Methods to Detect Unidirectional Links 26-2

Configuring UDLD 26-3
   Default UDLD Configuration 26-4
   Configuration Guidelines 26-4
   Enabling UDLD Globally 26-5
   Enabling UDLD on an Interface 26-5
   Resetting an Interface Disabled by UDLD 26-6

Displaying UDLD Status 26-6

CHAPTER 27 Configuring SPAN and RSPAN 27-1

Understanding SPAN and RSPAN 27-1
   Local SPAN 27-2
   Remote SPAN 27-2

SPAN and RSPAN Concepts and Terminology 27-3
   SPAN Sessions 27-3
   Monitored Traffic 27-4
   Source Ports 27-5
   Source VLANs 27-6
   VLAN Filtering 27-6
   Destination Port 27-6
   RSPAN VLAN 27-7

SPAN and RSPAN Interaction with Other Features 27-8

Configuring SPAN and RSPAN 27-9
   Default SPAN and RSPAN Configuration 27-9

Configuring Local SPAN 27-10
   SPAN Configuration Guidelines 27-10
   Creating a Local SPAN Session 27-10
   Creating a Local SPAN Session and Configuring Ingress Traffic 27-12
   Specifying VLANs to Filter 27-14

Configuring RSPAN 27-15
   RSPAN Configuration Guidelines 27-15
   Configuring a VLAN as an RSPAN VLAN 27-16
   Creating an RSPAN Source Session 27-17
   Creating an RSPAN Destination Session 27-18
   Creating an RSPAN Destination Session and Configuring Ingress Traffic 27-19
   Specifying VLANs to Filter 27-21

Displaying SPAN and RSPAN Status 27-22
CHAPTER 28 Configuring RMON 28-1
  Understanding RMON 28-1
  Configuring RMON 28-2
    Default RMON Configuration 28-3
    Configuring RMON Alarms and Events 28-3
    Collecting Group History Statistics on an Interface 28-5
    Collecting Group Ethernet Statistics on an Interface 28-5
  Displaying RMON Status 28-6

CHAPTER 29 Configuring System Message Logging 29-1
  Understanding System Message Logging 29-1
  Configuring System Message Logging 29-2
    System Log Message Format 29-2
    Default System Message Logging Configuration 29-3
    Disabling Message Logging 29-4
    Setting the Message Display Destination Device 29-5
    Synchronizing Log Messages 29-6
    Enabling and Disabling Time Stamps on Log Messages 29-7
    Enabling and Disabling Sequence Numbers in Log Messages 29-8
    Defining the Message Severity Level 29-8
    Limiting Syslog Messages Sent to the History Table and to SNMP 29-10
    Enabling the Configuration-Change Logger 29-10
  Configuring UNIX Syslog Servers 29-12
    Logging Messages to a UNIX Syslog Daemon 29-12
    Configuring the UNIX System Logging Facility 29-12
  Displaying the Logging Configuration 29-13

CHAPTER 30 Configuring SNMP 30-1
  Understanding SNMP 30-1
    SNMP Versions 30-2
    SNMP Manager Functions 30-3
    SNMP Agent Functions 30-4
    SNMP Community Strings 30-4
    Using SNMP to Access MIB Variables 30-4
    SNMP Notifications 30-5
    SNMP ifIndex MIB Object Values 30-5
    MIB Data Collection and Transfer 30-6
Configuring SNMP  
- Default SNMP Configuration  
- SNMP Configuration Guidelines  
- Disabling the SNMP Agent  
- Configuring Community Strings  
- Configuring SNMP Groups and Users  
- Configuring SNMP Notifications  
- Setting the Agent Contact and Location Information  
- Limiting TFTP Servers Used Through SNMP  
- Configuring MIB Data Collection and Transfer  
- Configuring the Cisco Process MIB CPU Threshold Table  
- SNMP Examples  
- Displaying SNMP Status

CHAPTER 31  
Configuring Embedded Event Manager  
- Understanding Embedded Event Manager  
- Event Detectors  
- Embedded Event Manager Actions  
- Embedded Event Manager Policies  
- Embedded Event Manager Environment Variables  
- Configuring Embedded Event Manager  
- Registering and Defining an Embedded Event Manager Applet  
- Registering and Defining an Embedded Event Manager TCL Script  
- Displaying Embedded Event Manager Information

CHAPTER 32  
Configuring Network Security with ACLs  
- Understanding ACLs  
- Supported ACLs  
  - Port ACLs  
  - Router ACLs  
  - VLAN Maps  
- Handling Fragmented and Unfragmented Traffic  
- Configuring IPv4 ACLs  
  - Creating Standard and Extended IPv4 ACLs  
  - IPv4 Access List Numbers  
  - ACL Logging  
  - Creating a Numbered Standard ACL  
  - Creating a Numbered Extended ACL  
  - Resequencing ACEs in an ACL
### Configuring Input Policy Maps
- Configuring Input Policy Maps with Individual Policing 34-41
- Configuring Input Policy Maps with Aggregate Policing 34-45
- Configuring Input Policy Maps with Marking 34-49
- Configuring Per-Port Per-VLAN QoS with Hierarchical Input Policy Maps 34-51

### Configuring Output Policy Maps
- Configuring Output Policy Maps with Class-Based-Weighted-Queuing 34-57
- Configuring Output Policy Maps with Class-Based Shaping 34-58
- Configuring Output Policy Maps with Port Shaping 34-60
- Configuring Output Policy Maps with Class-Based Priority Queuing 34-61
- Configuring Output Policy Maps with Weighted Tail Drop 34-65

### Displaying QoS Information
- QoS Statistics 34-68

### Configuration Examples for Policy Maps
- QoS Configuration for Customer A 34-69
- QoS Configuration for Customer B 34-71
- Modifying Output Policies and Adding or Deleting Classification Criteria 34-72
- Modifying Output Policies and Changing Queuing or Scheduling Parameters 34-72
- Modifying Output Policies and Adding or Deleting Configured Actions 34-73
- Modifying Output Policies and Adding or Deleting a Class 34-74

---

### Configuring EtherChannels and Link-State Tracking
35-1

**Understanding EtherChannels** 35-1
- EtherChannel Overview 35-2
- Port-Channel Interfaces 35-3
- Port Aggregation Protocol 35-4
  - PAgP Modes 35-5
  - PAgP Interaction with Other Features 35-5
- Link Aggregation Control Protocol 35-6
  - LACP Modes 35-6
  - LACP Interaction with Other Features 35-7
- EtherChannel On Mode 35-7
- Load Balancing and Forwarding Methods 35-7

**Configuring EtherChannels** 35-9
- Default EtherChannel Configuration 35-10
- EtherChannel Configuration Guidelines 35-10
- Configuring Layer 2 EtherChannels 35-11
Enabling IPv4 Unicast Routing 36-17

Configuring RIP 36-17
  Default RIP Configuration 36-18
  Configuring Basic RIP Parameters 36-19
  Configuring RIP Authentication 36-20
  Configuring Split Horizon 36-21
  Configuring Summary Addresses 36-21

Configuring OSPF 36-22
  Default OSPF Configuration 36-24
    Nonstop Forwarding Awareness 36-25
  Configuring Basic OSPF Parameters 36-25
  Configuring OSPF Interfaces 36-26
  Configuring OSPF Network Types 36-27
    Configuring OSPF for Nonbroadcast Networks 36-27
    Configuring Network Types for OSPF Interfaces 36-28
  Configuring OSPF Area Parameters 36-29
  Configuring Other OSPF Parameters 36-31
  Changing LSA Group Pacing 36-32
  Configuring a Loopback Interface 36-33
  Monitoring OSPF 36-34

Configuring EIGRP 36-34
  Default EIGRP Configuration 36-36
    Nonstop Forwarding Awareness 36-37
  Configuring Basic EIGRP Parameters 36-37
  Configuring EIGRP Interfaces 36-38
  Configuring EIGRP Route Authentication 36-39
  Configuring EIGRP Stub Routing 36-40
  Monitoring and Maintaining EIGRP 36-41

Configuring BGP 36-42
  Default BGP Configuration 36-44
    Nonstop Forwarding Awareness 36-46
  Enabling BGP Routing 36-46
  Managing Routing Policy Changes 36-48
  Configuring BGP Decision Attributes 36-50
  Configuring BGP Filtering with Route Maps 36-52
  Configuring BGP Filtering by Neighbor 36-52
  Configuring Prefix Lists for BGP Filtering 36-54
  Configuring BGP Community Filtering 36-55
  Configuring BGP Neighbors and Peer Groups 36-56

Chapter 37 Configuring HSRP 37-1
   Understanding HSRP 37-1
   Multiple HSRP 37-3
   Configuring HSRP 37-4
      Default HSRP Configuration 37-4
      HSRP Configuration Guidelines 37-5
      Enabling HSRP 37-5
      Configuring HSRP Priority 37-6
      Configuring MHSRP 37-9
      Configuring HSRP Authentication and Timers 37-9
      Enabling HSRP Support for ICMP Redirect Messages 37-11
   Displaying HSRP Configurations 37-11

Chapter 38 Configuring Cisco IOS IP SLAs Operations 38-1
   Understanding Cisco IOS IP SLAs 38-1
      Using Cisco IOS IP SLAs to Measure Network Performance 38-3
      IP SLAs Responder and IP SLAs Control Protocol 38-4
      Response Time Computation for IP SLAs 38-4
      IP SLAs Operation Scheduling 38-5
      IP SLAs Operation Threshold Monitoring 38-5
   Configuring IP SLAs Operations 38-6
      Default Configuration 38-6
      Configuration Guidelines 38-6
      Configuring the IP SLAs Responder 38-7
      Analyzing IP Service Levels by Using the UDP Jitter Operation 38-8
      Analyzing IP Service Levels by Using the ICMP Echo Operation 38-11
   Monitoring IP SLAs Operations 38-13
## Chapter 39
### Configuring Enhanced Object Tracking

- Understanding Enhanced Object Tracking
- Configuring Enhanced Object Tracking Features
  - Default Configuration
  - Tracking Interface Line-Protocol or IP Routing State
  - Configuring a Tracked List
    - Configuring a Tracked List with a Boolean Expression
    - Configuring a Tracked List with a Weight Threshold
    - Configuring a Tracked List with a Percentage Threshold
  - Configuring HSRP Object Tracking
  - Configuring Other Tracking Characteristics
  - Configuring IP SLAs Object Tracking
- Monitoring Enhanced Object Tracking

## Chapter 40
### Configuring Ethernet OAM, CFM, and E-LMI

- Understanding Ethernet CFM
  - CFM Domain
  - Maintenance Points
  - CFM Messages
  - Crosscheck Function
  - SNMP Traps
  - IP SLAs Support for CFM
- Configuring Ethernet CFM
  - Default Ethernet CFM Configuration
  - Ethernet CFM Configuration Guidelines
  - Preparing the Ethernet CFM Network
  - Configuring Ethernet CFM Service
  - Configuring Ethernet CFM Crosscheck
  - Configuring IP SLAs CFM Operation
    - Manually Configuring an IP SLAs CFM Probe or Jitter Operation
    - Configuring an IP SLAs Operation with Endpoint Discovery
- Displaying Ethernet CFM Information
- Understanding the Ethernet OAM Protocol
  - OAM Features
  - OAM Messages
- Setting Up and Configuring Ethernet OAM
  - Default Ethernet OAM Configuration
  - Ethernet OAM Configuration Guidelines
Contents

Enabling Ethernet OAM on an Interface 40-16
Enabling Ethernet OAM Remote Loopback 40-17
Configuring Ethernet OAM Link Monitoring 40-18
Configuring Ethernet OAM Remote Failure Indications 40-21
Configuring Ethernet OAM Templates 40-21
Displaying Ethernet OAM Protocol Information 40-24
Enabling Ethernet Loopback 40-24
Understanding E-LMI 40-26
E-LMI Interaction with OAM Manager 40-27
CFM Interaction with OAM Manager 40-27
Configuring E-LMI 40-27
Default E-LMI Configuration 40-28
E-LMI and OAM Manager Configuration Guidelines 40-28
Configuring the OAM Manager 40-28
Enabling E-LMI 40-31
Ethernet OAM Manager Configuration Example 40-32
Provider-Edge Device Configuration 40-32
Customer-Edge Device Configuration 40-32
Displaying E-LMI and OAM Manager Information 40-33
Ethernet CFM and Ethernet OAM Interaction 40-33
Configuring Ethernet OAM Interaction with CFM 40-34
Configuring the OAM Manager 40-34
Enabling Ethernet OAM 40-35
Ethernet OAM and CFM Configuration Example 40-35

CHAPTER 41

Configuring IP Multicast Routing 41-1
Understanding Cisco’s Implementation of IP Multicast Routing 41-1
Understanding IGMP 41-2
IGMP Version 1 41-3
IGMP Version 2 41-3
Understanding PIM 41-3
PIM Versions 41-3
PIM Modes 41-4
PIM Stub Routing 41-4
IGMP Helper 41-5
Auto-RP 41-6
Bootstrap Router 41-6
Multicast Forwarding and Reverse Path Check 41-7
Contents

Changing the IGMP Query Timeout for IGMPv2 41-41
Changing the Maximum Query Response Time for IGMPv2 41-41
Configuring the Switch as a Statically Connected Member 41-42
Configuring Optional Multicast Routing Features 41-43
Configuring sdr Listener Support 41-43
  Enabling sdr Listener Support 41-43
  Limiting How Long an sdr Cache Entry Exists 41-44
Configuring an IP Multicast Boundary 41-44
Monitoring and Maintaining IP Multicast Routing 41-46
  Clearing Caches, Tables, and Databases 41-46
  Displaying System and Network Statistics 41-46
  Monitoring IP Multicast Routing 41-47

Chapter 42

Configuring MSDP 42-1

Understanding MSDP 42-1
  MSDP Operation 42-2
  MSDP Benefits 42-3
Configuring MSDP 42-3
  Default MSDP Configuration 42-4
  Configuring a Default MSDP Peer 42-4
  Caching Source-Active State 42-6
  Requesting Source Information from an MSDP Peer 42-8
  Controlling Source Information that Your Switch Originates 42-8
    Redistributing Sources 42-9
    Filtering Source-Active Request Messages 42-10
  Controlling Source Information that Your Switch Forwards 42-11
    Using a Filter 42-12
    Using TTL to Limit the Multicast Data Sent in SA Messages 42-13
  Controlling Source Information that Your Switch Receives 42-13
  Configuring an MSDP Mesh Group 42-15
  Shutting Down an MSDP Peer 42-15
  Including a Bordering PIM Dense-Mode Region in MSDP 42-16
  Configuring an Originating Address other than the RP Address 42-17
Monitoring and Maintaining MSDP 42-18
# Troubleshooting 43-1

- Recovering from a Software Failure 43-2
- Recovering from a Lost or Forgotten Password 43-3
  - Procedure with Password Recovery Enabled 43-4
  - Procedure with Password Recovery Disabled 43-6
- Preventing Autonegotiation Mismatches 43-8
- SFP Module Security and Identification 43-8
- Monitoring SFP Module Status 43-9
- Monitoring Temperature 43-9
- Using Ping 43-9
  - Understanding Ping 43-9
  - Using Ping 43-10
    - All Software Versions 43-10
    - Metro IP Access Image 43-11
    - Ping Responses 43-12
    - Summary 43-12
- Using Layer 2 Traceroute 43-12
  - Understanding Layer 2 Traceroute 43-13
  - Layer 2 Traceroute Usage Guidelines 43-13
  - Displaying the Physical Path 43-14
- Using IP Traceroute 43-14
  - Understanding IP Traceroute 43-14
  - Executing IP Traceroute 43-15
- Using TDR 43-16
  - Understanding TDR 43-16
  - Running TDR and Displaying the Results 43-16
- Using Debug Commands 43-17
  - Enabling Debugging on a Specific Feature 43-17
  - Enabling All-System Diagnostics 43-18
  - Redirecting Debug and Error Message Output 43-18
- Using the show platform forward Command 43-18
- Using the crashinfo File 43-21
- Using On-Board Failure Logging 43-21
  - Understanding OBFL 43-21
  - Configuring OBFL 43-22
  - Displaying OBFL Information 43-23
CHAPTER 44 Configuring Online Diagnostics 44-1
  Understanding Online Diagnostics 44-1
  Configuring Online Diagnostics 44-2
    Scheduling Online Diagnostics 44-2
    Configuring Health-Monitoring Diagnostics 44-3
  Running Online Diagnostic Tests 44-5
    Starting Online Diagnostic Tests 44-5
    Displaying Online Diagnostic Tests and Results 44-6

APPENDIX A Supported MIBs A-1
  MIB List A-1
  Using FTP to Access the MIB Files A-3

APPENDIX B Working with the Cisco IOS File System, Configuration Files, and Software Images B-1
  Working with the Flash File System B-1
    Displaying Available File Systems B-2
    Setting the Default File System B-3
    Displaying Information about Files on a File System B-3
    Changing Directories and Displaying the Working Directory B-3
    Creating and Removing Directories B-4
    Copying Files B-4
    Deleting Files B-5
    Creating, Displaying, and Extracting tar Files B-6
      Creating a tar File B-6
      Displaying the Contents of a tar File B-6
      Extracting a tar File B-7
    Displaying the Contents of a File B-8
  Working with Configuration Files B-8
    Guidelines for Creating and Using Configuration Files B-9
    Configuration File Types and Location B-9
    Creating a Configuration File By Using a Text Editor B-10
    Copying Configuration Files By Using TFTP B-10
      Preparing to Download or Upload a Configuration File By Using TFTP B-10
      Downloading the Configuration File By Using TFTP B-11
      Uploading the Configuration File By Using TFTP B-11
    Copying Configuration Files By Using FTP B-12
      Preparing to Download or Upload a Configuration File By Using FTP B-13
      Downloading a Configuration File By Using FTP B-13
      Uploading a Configuration File By Using FTP B-14
Copying Configuration Files By Using RCP  B-15
   Preparing to Download or Upload a Configuration File By Using RCP  B-16
   Downloading a Configuration File By Using RCP  B-17
   Uploading a Configuration File By Using RCP  B-18
Clearing Configuration Information  B-18
   Clearing the Startup Configuration File  B-19
   Deleting a Stored Configuration File  B-19
Replacing and Rolling Back Configurations  B-19
   Understanding Configuration Replacement and Rollback  B-19
   Configuration Replacement and Rollback Guidelines  B-20
   Configuring the Configuration Archive  B-21
   Performing a Configuration Replacement or Rollback Operation  B-22
Working with Software Images  B-23
   Image Location on the Switch  B-23
   tar File Format of Images on a Server or Cisco.com  B-24
Copying Image Files By Using TFTP  B-24
   Preparing to Download or Upload an Image File By Using TFTP  B-25
   Downloading an Image File By Using TFTP  B-26
   Uploading an Image File By Using TFTP  B-27
Copying Image Files By Using FTP  B-28
   Preparing to Download or Upload an Image File By Using FTP  B-28
   Downloading an Image File By Using FTP  B-29
   Uploading an Image File By Using FTP  B-31
Copying Image Files By Using RCP  B-32
   Preparing to Download or Upload an Image File By Using RCP  B-32
   Downloading an Image File By Using RCP  B-33
   Uploading an Image File By Using RCP  B-35

Preface

Audience

This guide is for the networking professional managing the Cisco Metro Ethernet (ME) 3400E Series Ethernet Access switch, hereafter referred to as the switch. We assume that you are familiar with the concepts and terminology of Ethernet and local area networking. If you are interested in more training and education in these areas, learning opportunities including training courses, self-study options, seminars, and career certifications programs are available on the Cisco Training & Events web page:

Purpose

The switch ships with one of these software images installed:

- The metro access image includes additional features such as IEEE 802.1Q tunneling, Layer 2 protocol tunneling, dynamic ARP inspection, and IP source guard.
- The metro IP access image adds Layer 3 functionality such as IP routing support for Routing Information Protocol (RIP), Open Shortest Path First (OSPF) Protocol, Border Gateway Protocol (BGP), and Enhanced Interior Gateway Routing Protocol (EIGRP), multiple VPN routing/forwarding on customer edge (multi-VRF-CE) devices, and IP multicast routing.

This guide provides procedures for using the commands that have been created or changed for use with the Cisco ME 3400E switch. It does not provide detailed information about these commands. For detailed information about these commands, see the Cisco ME 3400E Ethernet Access Switch Command Reference for this release. For information about the standard Cisco IOS commands, see the Cisco IOS documentation available from this URL:

This guide does not describe system messages you might encounter or how to install your switch. For more information, see the Cisco ME 3400 and ME 2400 Switch System Message Guide for this release and the Cisco ME 3400E Ethernet Access Switch Hardware Installation Guide.

For the latest documentation updates, see the release notes for this release.
Conventions

This publication uses these conventions to convey instructions and information:

Command descriptions use these conventions:

- Commands and keywords are in **boldface** text.
- Arguments for which you supply values are in *italic*.
- Square brackets ([ ]) mean optional elements.
- Braces ({ }) group required choices, and vertical bars ( | ) separate the alternative elements.
- Braces and vertical bars within square brackets ([{ | }]) mean a required choice within an optional element.

Interactive examples use these conventions:

- Terminal sessions and system displays are in `screen` font.
- Information you enter is in **boldface screen** font.
- Nonprinting characters, such as passwords or tabs, are in angle brackets (< >).

Notes, cautions, and timesavers use these conventions and symbols:

---

**Note**

Means *reader take note*. Notes contain helpful suggestions or references to materials not contained in this manual.

**Caution**

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Related Publications

These documents provide complete information about the switch and are available from this Cisco.com site:

---

**Note**

Before installing, configuring, or upgrading the switch, see these documents:

- For initial configuration information, see the “Configuring the Switch with the CLI-Based Setup Program” appendix in the hardware installation guide.
- For upgrading information, see the “Downloading Software” section in the release notes.

## Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What’s New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What’s New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
Overview

This chapter provides these topics about the Cisco Metro Ethernet (ME) 3400E Series Ethernet Access switch software:

- **Features**, page 1-1
- **Default Settings After Initial Switch Configuration**, page 1-10
- **Network Configuration Examples**, page 1-13
- **Where to Go Next**, page 1-17

In this document, IP refers to IP Version 4 (IPv4) unless otherwise specified.

Features

The switch ships with one of these software images installed:

- The metro access image includes additional features such as IEEE 802.1Q tunneling, Layer 2 protocol tunneling, dynamic ARP inspection, and IP source guard.
- The metro IP access image adds Layer 3 functionality such as IP routing support for Routing Information Protocol (RIP), Open Shortest Path First (OSPF) Protocol, Border Gateway Protocol (BGP), and Enhanced Interior Gateway Routing Protocol (EIGRP), Intermediate System-to-Intermediate System (IS-IS) dynamic routing, multiple VPN routing/forwarding on customer edge devices, (multi-VRF-CE), and IP multicast routing Protocol-Independent Multicast (PIM) sparse mode (SM) and dense mode (DM).

**Note**

Unless otherwise noted, all features described in this chapter and in this guide are supported on all images.

Some features noted in this chapter are available only on the cryptographic (that is, supports encryption) versions of the switch software image. You must obtain authorization to use this feature and to download the cryptographic version of the software from Cisco.com. For more information, see the release notes for this release.

The Cisco ME switch has two different types of interfaces by default: network node interfaces (NNIs) to connect to the service provider network and user network interfaces (UNIs) to connect to customer networks. Some features are supported only on one of these port types. You can also configure enhanced network interfaces (ENIs). An ENI is typically a user-network facing interface and has the same default configuration and functionality as UNIs, but can be configured to support protocol control packets for
Performance Features

- Autosensing of port speed and autonegotiation of duplex mode on all switch ports for optimizing bandwidth
- Automatic-medium-dependent interface crossover (auto-MDIX) capability on 10/100 and 10/100/1000 Mbps interfaces and on 10/100/1000 BASE-T/TX small form-factor pluggable (SFP) module interfaces that enables the interface to automatically detect the required cable connection type (straight-through or crossover) and to configure the connection appropriately
- Support for routed frames up to 1998 bytes, for frames up to 9000 bytes that are bridged in hardware, and for frames up to 2000 bytes that are bridged by software.
- IEEE 802.3x flow control on all ports (the switch does not send pause frames)
- EtherChannel for enhanced fault tolerance and for providing up to 8 Gbps (Gigabit EtherChannel) or 800 Mbps (Fast EtherChannel) full duplex of bandwidth between switches, routers, and servers
- Port Aggregation Protocol (PAgP) and Link Aggregation Control Protocol (LACP) for automatic creation of EtherChannel links (supported only on NNIs or ENIs)
- Forwarding of Layer 2 and Layer 3 packets at Gigabit line rate
- Per-port storm control for preventing broadcast, multicast, and unicast storms
- Port blocking on forwarding unknown Layer 2 unknown unicast, multicast, and bridged broadcast traffic
- Internet Group Management Protocol (IGMP) snooping for IGMP versions 1, 2, and 3 for efficiently forwarding multimedia and multicast traffic
- IGMP report suppression for sending only one IGMP report per multicast router query to the multicast devices (supported only for IGMPv1 or IGMPv2 queries)
- IGMP snooping querier support to configure switch to generate periodic IGMP General Query messages
Chapter 1 Overview

Features

- IGMP Helper to allow the switch to forward a host request to join a multicast stream to a specific IP destination address (requires the metro IP access image)
- Multicast VLAN registration (MVR) to continuously send multicast streams in a multicast VLAN while isolating the streams from subscriber VLANs for bandwidth and security reasons with support for 512 multicast entries on a switch
- MVR over trunk port (MVRoT) support to allow you to configure a trunk port as an MVR receiver port
- IGMP filtering for controlling the set of multicast groups to which hosts on a switch port can belong
- IGMP throttling for configuring the action when the maximum number of entries is in the IGMP forwarding table
- IGMP configurable leave timer to configure the leave latency for the network.
- Switch Database Management (SDM) templates for allocating system resources to maximize support for user-selected features

Management Options

- CLI—The Cisco IOS software supports desktop- and multilayer-switching features. You can access the CLI either by connecting your management station directly to the switch console port or by using Telnet from a remote management station. For more information about the CLI, see Chapter 2, “Using the Command-Line Interface.”
- Cisco Configuration Engine—The Cisco Configuration Engine is a network management device that works with embedded Cisco IOS CNS Agents in the switch software. You can automate initial configurations and configuration updates by generating switch-specific configuration changes, sending them to the switch, executing the configuration change, and logging the results. For more information about using Cisco IOS agents, see Chapter 4, “Configuring Cisco IOS CNS Agents.”
- SNMP—SNMP management applications such as CiscoWorks2000 LAN Management Suite (LMS) and HP OpenView. You can manage from an SNMP-compatible management station that is running platforms such as HP OpenView or SunNet Manager. The switch supports a comprehensive set of MIB extensions and four remote monitoring (RMON) groups. For more information about using SNMP, see Chapter 30, “Configuring SNMP.”

Manageability Features

Note

The encrypted Secure Shell (SSH) feature listed in this section is available only on the cryptographic versions of the switch software image.

- Support for DHCP for configuration of switch information (such as IP address, default gateway, hostname, and Domain Name System [DNS] and TFTP server names)
- DHCP relay for forwarding User Datagram Protocol (UDP) broadcasts, including IP address requests, from DHCP clients
- DHCP server for automatic assignment of IP addresses and other DHCP options to IP hosts
- DHCP-based autoconfiguration and image update to download a specified configuration a new image to a large number of switches
- Directed unicast requests to a DNS server for identifying a switch through its IP address and its corresponding hostname and to a TFTP server for administering software upgrades from a TFTP server
- Address Resolution Protocol (ARP) for identifying a switch through its IP address and its corresponding MAC address
- Unicast MAC address filtering to drop packets with specific source or destination MAC addresses
- Configurable MAC address scaling that allows disabling MAC address learning on a VLAN to limit the size of the MAC address table
- Cisco Discovery Protocol (CDP) Versions 1 and 2 for network topology discovery and mapping between the switch and other Cisco devices on the network (supported on NNIs by default, can be enabled on ENIs, not supported on UNIs)
- Link Layer Discovery Protocol (LLDP) and LLDP Media Endpoint Discovery (LLDP-MED) for interoperability with third-party IP phones (supported only on NNIs or ENIs)
- Support for the LLDP-MED location TLV that provides location information from the switch to the endpoint device
- Network Time Protocol (NTP) for providing a consistent time stamp to all switches from an external source
- Cisco IOS File System (IFS) for providing a single interface to all file systems that the switch uses
- In-band management access for up to 16 simultaneous Telnet connections for multiple CLI-based sessions over the network
- In-band management access for up to five simultaneous, encrypted Secure Shell (SSH) connections for multiple CLI-based sessions over the network (requires the cryptographic versions of the switch software).
- In-band management access through SNMP Versions 1, 2c, and 3 get and set requests
- Out-of-band management access through the switch console port to a directly attached terminal or to a remote terminal through a serial connection or a modem
- Out-of-band management access through the Ethernet management port to a PC
- User-defined command macros for creating custom switch configurations for simplified deployment across multiple switches
- Support for metro Ethernet operation, administration, and maintenance (OAM) IEEE 802.1ag Connectivity Fault Management (CFM), Ethernet Line Management Interface (E-LMI) on customer-edge and provider-edge switches, and IEEE 802.3ah Ethernet OAM discovery, link monitoring, remote fault detection, and remote loopback, and IEEE 802.3ah Ethernet OAM discovery, link monitoring, remote fault detection, and remote loopback Support for Ethernet loopback facility for testing connectivity to a remote device
- Configuration replacement and rollback to replace the running configuration on a switch with any saved Cisco IOS configuration file
- Source Specific Multicast (SSM) mapping for multicast applications to provide a mapping of source to allowing IGMPv2 clients to utilize SSM, allowing listeners to connect to multicast sources dynamically and reducing dependencies on the application
Availability Features

- UniDirectional Link Detection (UDLD) and aggressive UDLD for detecting and disabling unidirectional links on fiber-optic interfaces caused by incorrect fiber-optic wiring or port faults
- IEEE 802.1D Spanning Tree Protocol (STP) for redundant backbone connections and loop-free networks (supported by default on NNIs, can be enabled on ENIs, not supported on UNIs). STP has these features:
  - Up to 128 supported spanning-tree instances
  - Per-VLAN spanning-tree plus (PVST+) for balancing load across VLANs
  - Rapid PVST+ for balancing load across VLANs and providing rapid convergence of spanning-tree instances
- IEEE 802.1s Multiple Spanning Tree Protocol (MSTP) on NNIs or ENIs for grouping VLANs into a spanning-tree instance and for providing multiple forwarding paths for data traffic and load balancing and rapid per-VLAN Spanning-Tree plus (rapid-PVST+) based on the IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) for rapid convergence of the spanning tree by immediately transitioning root and designated port NNIs or spanning-tree enabled ENIs to the forwarding state
- Optional spanning-tree features available in PVST+, rapid-PVST+, and MSTP modes on NNIs and ENIs where spanning tree has been enabled:
  - Port Fast for eliminating the forwarding delay by enabling a spanning-tree port to immediately transition from the blocking state to the forwarding state
  - Bridge protocol data unit (BPDU) guard for shutting down Port Fast-enabled ports that receive BPDUs
  - BPDU filtering for preventing a Port Fast-enabled ports from sending or receiving BPDUs
  - Root guard for preventing switches outside the network core from becoming the spanning-tree root
  - Loop guard for preventing alternate or root port NNIs or ENIs from becoming designated ports because of a failure that leads to a unidirectional link
- Flex Link Layer 2 interfaces to back up one another as an alternative to STP for basic link redundancy in a nonloop network with preemptive switchover and bidirectional fast convergence, also referred to as the MAC address-table move update feature
- Flex Link Multicast Fast Convergence to reduce the multicast traffic convergence time after a Flex Link failure
- Link-state tracking to mirror the state of the ports that carry upstream traffic from connected hosts and servers, and to allow the failover of the server traffic to an operational link on another Cisco Ethernet switch
- Support for Resilient Ethernet Protocol (REP) for improved convergence times and network loop prevention without the use of spanning tree
- HSRP for Layer 3 router redundancy (requires metro IP access image)
- Equal-cost routing for link-level and switch-level redundancy (requires metro IP access image)
VLAN Features

- Support for up to 1005 VLANs for assigning users to VLANs associated with appropriate network resources, traffic patterns, and bandwidth
- Support for VLAN IDs in the full 1 to 4094 range allowed by the IEEE 802.1Q standard
- VLAN Query Protocol (VQP) for dynamic VLAN membership
- IEEE 802.1Q trunking encapsulation on all ports for network moves, adds, and changes; management and control of broadcast and multicast traffic; and network security by establishing VLAN groups for high-security users and network resources
- VLAN 1 minimization for reducing the risk of spanning-tree loops or storms by allowing VLAN 1 to be disabled on any individual VLAN trunk link. With this feature enabled, no user traffic is sent or received on the trunk. The switch CPU continues to send and receive control protocol frames.
- UNI-ENI isolated VLANs to isolate customer VLANs from VLANs of other customers on the same switch. Local switching does not occur among UNIs or ENIs on the switch that belong to the same UNI-ENI isolated VLAN.
- Private VLANs to address VLAN scalability problems, to provide a more controlled IP address allocation, and to allow Layer 2 ports to be isolated from ports on other switches
- Port security on a PVLAN host to limit the number of MAC addresses learned on a port, or define which MAC addresses may be learned on a port
- VLAN Flex Link Load Balancing to provide Layer 2 redundancy without requiring Spanning Tree Protocol (STP). A pair of interfaces configured as primary and backup links can load balance traffic based on VLAN.
- VLAN mapping (or VLAN ID translation) on trunk ports connected to a customer network to map customer VLANs (C-VLANs) to service-provider VLANs (S-VLANs)

Security Features

The switch provides security for the subscriber, the switch, and the network.

Subscriber Security

- By default, local switching is disabled among subscriber ports to ensure that subscribers are isolated.
- DHCP snooping to filter untrusted DHCP messages between untrusted hosts and DHCP servers
- DHCP Snooping Statistics show and clear commands to display and remove DHCP snooping statistics in summary or detail form
- IP source guard to restrict traffic on nonrouted interfaces by filtering traffic based on the DHCP snooping database and IP source bindings
- Dynamic ARP inspection to prevent malicious attacks on the switch by not relaying invalid ARP requests and responses to other ports in the same VLAN
Switch Security

Note
The Kerberos feature listed in this section is only available on the cryptographic version of the switch software.

- Password-protected access (read-only and read-write access) to management interfaces for protection against unauthorized configuration changes
- Configuration file security so that only authenticated and authorized users have access to the configuration file, preventing users from accessing the configuration file by using the password recovery process
- Multilevel security for a choice of security level, notification, and resulting actions
- Port security option for limiting and identifying MAC addresses of the stations allowed to access the port
- Port security aging to set the aging time for secure addresses on a port
- LLDP (Link Layer Discovery Protocol) and LLLDP-MED (Media Extensions)—Adds support for IEEE 802.1AB link layer discovery protocol for interoperability in multi-vendor networks. Switches exchange speed, duplex, and power settings with end devices such as IP Phones.
- UNI and ENI default port state is disabled
- Automatic control-plane protection to protect the CPU from accidental or malicious overload due to Layer 2 control traffic on UNIs or ENIs
- Configurable control plane security that provides service providers with the flexibility to drop customers control-plane traffic on a per-port, per-protocol basis. Allows configuring of ENI protocol control packets for CDP, STP, LLDP, (LACP, or PAgP.
- TACACS+, a proprietary feature for managing network security through a TACACS server
- RADIUS for verifying the identity of, granting access to, and tracking the actions of remote users through authentication, authorization, and accounting (AAA) services
- Kerberos security system to authenticate requests for network resources by using a trusted third party (requires the cryptographic version of the switch software)

Network Security

- Static MAC addressing for ensuring security
- Standard and extended IP access control lists (ACLs) for defining security policies in both directions on routed interfaces (router ACLs) and VLANs and inbound on Layer 2 interfaces (port ACLs)
- Extended MAC access control lists for defining security policies in the inbound direction on Layer 2 interfaces
- VLAN ACLs (VLAN maps) for providing intra-VLAN security by filtering traffic based on information in the MAC, IP, and TCP/UDP headers
- Source and destination MAC-based ACLs for filtering non-IP traffic
- IEEE 802.1x port-based authentication to prevent unauthorized devices (clients) from gaining access to the network. These features are supported:
  - VLAN assignment for restricting IEEE 802.1x-authenticated users to a specified VLAN
  - Port security for controlling access to IEEE 802.1x ports
Features

- IEEE 802.1x accounting to track network usage
- IEEE 802.1x readiness check to determine the readiness of connected end hosts before configuring IEEE 802.1x on the switch

Quality of Service and Class of Service Features

- Configurable control-plane queue assignment to assign control plane traffic for CPU-generated traffic to a specific egress queue.
- Cisco modular quality of service (QoS) command-line (MQC) implementation
- Classification based on IP precedence, Differentiated Services Code Point (DSCP), and IEEE 802.1p class of service (CoS) packet fields, ACL lookup, or assigning a QoS label for output classification
- Policing
  - One-rate policing based on average rate and burst rate for a policer
  - Two-color policing that allows different actions for packets that conform to or exceed the rate
  - Aggregate policing for policers shared by multiple traffic classes
  - Ingress two-rate, three-color policing for individual or aggregate policers
- Weighted tail drop (WTD) as the congestion-avoidance mechanism for managing the queue lengths and providing drop precedences for different traffic classifications
- Table maps for mapping DSCP, CoS, and IP precedence values
- Queuing and Scheduling
  - Shaped round robin (SRR) traffic shaping to mix packets from all queues to minimize traffic burst
  - Class-based traffic shaping to specify a maximum permitted average rate for a traffic class
  - Port shaping to specify the maximum permitted average rate for a port
  - Class-based weighted queuing (CBWFQ) to control bandwidth to a traffic class
  - WTD to adjust queue size for a specified traffic class
  - Low-latency priority queuing to allow preferential treatment to certain traffic
- Per-port, per-VLAN QoS to control traffic carried on a user-specified VLAN for a given interface. Beginning with IOS software release 12.2(25)SEG, you can use hierarchical policy maps for per-VLAN classification and apply the per-port, per-VLAN hierarchical policy maps to trunk ports.

Layer 2 Virtual Private Network Services

- IEEE 802.1Q tunneling enables service providers to offer multiple point Layer 2 VPN services to customers
- Layer 2 protocol tunneling to enable customers to control protocols such as BPDU, CDP, VTP, PAgP, LACP, and UDLD protocols to be tunneled across service-provider networks.
- VLAN mapping (or VLAN ID translation) on trunk ports connected to a customer network to map customer VLANs (C-VLANs) to service-provider VLANs (S-VLANs)
Layer 3 Features

Layer 3 features are only available when the switch is running the metro IP access image.

- HSRP Version 1 (HSRPv1) and HSRP Version 2 (HSRPv2) for Layer 3 router redundancy
- IP routing protocols for load balancing and for constructing scalable, routed backbones:
  - RIP Versions 1 and 2
  - OSPF
  - EIGRP
  - BGP Version 4
  - IS-IS dynamic routing
- IP routing between VLANs (inter-VLAN routing) for full Layer 3 routing between two or more VLANs, allowing each VLAN to maintain its own autonomous data-link domain
- Policy-based routing (PBR) for configuring defined policies for traffic flows
- Static IP routing for manually building a routing table of network path information
- Equal-cost routing for load balancing and redundancy
- Internet Control Message Protocol (ICMP) and ICMP Router Discovery Protocol (IRDP) for using router advertisement and router solicitation messages to discover the addresses of routers on directly attached subnets
- Protocol-Independent Multicast (PIM) for multicast routing within the network, allowing for devices in the network to receive the multicast feed requested and for switches not participating in the multicast to be pruned. Includes support for PIM sparse mode (PIM-SM), PIM dense mode (PIM-DM), and PIM sparse-dense mode
- Support for the SSM PIM protocol to optimize multicast applications, such as video
- Multicast Source Discovery Protocol (MSDP) for connecting multiple PIM-SM domains
- DHCP relay for forwarding UDP broadcasts, including IP address requests, from DHCP clients

Layer 3 VPN Services

These features are available only when the switch is running the metro IP access image.

- Multiple VPN routing/forwarding (multi-VRF) instances in customer edge devices (multi-VRF CE) to allow service providers to support multiple virtual private networks (VPNs) and overlap IP addresses between VPNs
- Multicast virtual routing and forwarding (VRF) Lite for configuring multiple private routing domains for network virtualization and virtual private multicast networks
- VRF and EIGRP compatibility

Monitoring Features

- Switch LEDs that provide port- and switch-level status
- Configurable external alarm inputs, as well as alarms to identify a missing or malfunctioning power supply or a power supply with no input.
Default Settings After Initial Switch Configuration

The switch is designed for plug-and-play operation; you only need to assign basic IP information to the switch and connect it to the other devices in your network. If you have specific network needs, you can change the interface-specific and system-wide settings.

For information about assigning an IP address by using the CLI-based setup program, see the hardware installation guide.

If you do not configure the switch at all, the Cisco ME 3400E switch operates with the default settings shown in Table 1-1.

Network Configuration Examples

This section provides network configuration concepts and includes examples of using the switch to create dedicated network segments and interconnecting the segments through Fast Ethernet and Gigabit Ethernet connections.

- “Multidwelling or Ethernet-to-the-Subscriber Network” section on page 1-14
- “Layer 2 VPN Application” section on page 1-15
- “Multi-VRF CE Application” section on page 1-16
Multidwelling or Ethernet-to-the-Subscriber Network

Metro Ethernet provides the access technology for service providers deploying voice, video, and Internet access services to metropolitan areas. The Metro Ethernet user-facing provider edge (UPE) switches provide economical bandwidth and the security and the QoS needed for these services.

Figure 1-1 shows a Gigabit Ethernet ring for a residential location, serving multitenant units by using Cisco ME 3400E Ethernet Access switches connected through 1000BASE-X SFP module ports. Cisco ME switches used as residential switches provide customers with high-speed connections to the service provider point-of-presence (POP).

Home access gateways are connected to the ME switches through UNIs or ENIs configured as 802.1Q trunks. Because the default behavior on these ports allows no local switching between the ports, the subscribers are protected from each other. UNIs also do not process control protocols from customers, so denial-of-service attacks are avoided. The Cisco ME switch also provides mechanisms such as port security and IP Source Guard to protect against MAC or IP spoofing. By using advanced access control lists, the service providers have granular control of the types of traffic to enter the network.

To provide differential QoS treatment for different types of traffic, the Cisco ME switch can identify, police, mark, and schedule traffic types based on Layer 2 to Layer 4 information. The Cisco modular QoS command-line interface (CLI), or MQC, on Cisco ME switches provides an efficient method of QoS configuration. You can configure a policer on ingress UNIs to ensure that a customer can send only the amount of bandwidth paid for. On egress NNIs, you can use four different queues to provide different levels of priority for different types of traffic. One queue can be assigned as a low-latency queue to provide expedited service for latency sensitive traffic such as voice. You can also configure a rate-limiter on the low-latency queues to prevent other queues from being deprived due to misconfiguration.

When an end station in one VLAN needs to communicate with an end station in another VLAN, a router or switch routes the traffic to the appropriate destination VLAN, providing inter-VLAN routing. VLAN access control lists (VLAN maps) provide intra-VLAN security and prevent unauthorized users from accessing critical pieces of the network. The routers also provide firewall services, Network Address Translation (NAT) services, voice-over-IP (VoIP) gateway services, and WAN and Internet access.
Layer 2 VPN Application

Enterprise customers need not only high bandwidth, but also the ability to extend their private network across the service provider’s shared infrastructure. With Ethernet in the WAN network, service providers can meet the bandwidth requirements of enterprise customers and use VPN features to extend customers’ networks.

Enterprise customers can use Layer 2 VPN to transparently move any type of traffic across a service-provider network, and create virtual pipes across the service provider infrastructure. In contrast to Layer 3 VPN service, Layer 2 VPN lowers operational expenses by minimizing enterprise user-facing provider edge (UPE) switch configuration and management. You can use Cisco ME 3400 switches to form Layer 2 VPNs so that customers at different locations can exchange information through a service-provider network without requiring dedicated connections.

In Figure 1-2, Cisco ME 3400E switches are used as UPEs in customer sites connected to customer-premises equipment (CPE) switches. The switches can tag customer traffic with the service-provider VLAN ID on top of the customer’s IEEE 802.1Q tag. By supporting double tags, the Cisco ME 3400 switch provides a virtual tunnel for each customer and prevents VLAN ID overlaps between customers. In addition to data-plane separation, the Cisco ME 3400E switch can also tunnel the customer’s control protocols. With Layer 2 protocol tunneling, the switch can encapsulate each customer’s control-plane traffic and send it transparently across the service-provider network.
See Chapter 14, “Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling,” for more information on configuring these features.

**Figure 1-2 Layer 2 VPN Configuration**

![Layer 2 VPN Configuration Diagram](image)

UPE = Cisco ME 3400 switch

### Multi-VRF CE Application

A VPN is a collection of sites sharing a common routing table. A customer site is connected to the service-provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table, called a VPN routing/forwarding (VRF) table. Multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices (multi-VRF CE) allows a service provider to support two or more VPNs with overlapping IP addresses.

Multi-VRF CE includes these devices:

- Customer edge (CE) devices provide customers access to the service-provider network over a data link to one or more provider edge routers. The CE device advertises the site’s local routes to the router and learns the remote VPN routes from the router. The Cisco ME 3400 switch can be a CE device.

- Provider edge (PE) routers exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv2, OSPF, or EIGRP. The PE is only required to maintain VPN routes for directly attached VPNs. It does not need to maintain all of the service-provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites.
Provider routers or core routers are any routers in the service provider network that do not attach to CE devices.

With multi-VRF CE, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. Multi-VRF CE extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

Figure 1-3 shows a configuration using Cisco ME 3400E switches as multiple virtual CEs. This scenario is suited for customers who have low bandwidth requirements for their VPN service, for example, small companies. In this case, multi-VRF CE support is required in the Cisco ME switches. Because multi-VRF CE is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.

See the “Configuring Multi-VRF CE” section on page 36-72 for more information about Multi-VRF-CE.

Where to Go Next

Before configuring the switch, review these sections for startup information:

- Chapter 2, “Using the Command-Line Interface”
- Chapter 3, “Assigning the Switch IP Address and Default Gateway”
- Chapter 4, “Configuring Cisco IOS CNS Agents”
Chapter 2

Using the Command-Line Interface

This chapter describes the Cisco IOS command-line interface (CLI) and how to use it to configure your Cisco ME 3400E Ethernet Access switch. It contains these sections:

- Understanding Command Modes, page 2-1
- Understanding the Help System, page 2-3
- Understanding Abbreviated Commands, page 2-3
- Understanding no and default Forms of Commands, page 2-4
- Understanding CLI Error Messages, page 2-4
- Using Command History, page 2-4
- Using Editing Features, page 2-6
- Searching and Filtering Output of show and more Commands, page 2-8
- Accessing the CLI, page 2-9

Understanding Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

When you start a session on the switch, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as `show` commands, which show the current configuration status, and `clear` commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

Table 2-1 describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode. The examples in the table use the hostname `Switch`. 
### Table 2-1 Command Mode Summary

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
<th>About This Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>Begin a session with your switch.</td>
<td>Switch&gt;</td>
<td>Enter <code>logout</code> or <code>quit</code>.</td>
<td>Use this mode to</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Change terminal settings.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Perform basic tests.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>• Display system information.</td>
</tr>
<tr>
<td>Privileged EXEC</td>
<td>While in user EXEC mode, enter the <code>enable</code> command.</td>
<td>Switch#</td>
<td>Enter <code>disable</code> to exit.</td>
<td>Use this mode to verify commands that you have entered. Use a password to protect access to this mode.</td>
</tr>
<tr>
<td>Global configuration</td>
<td>While in privileged EXEC mode, enter the <code>configure</code> command.</td>
<td>Switch(config)#</td>
<td>To exit to privileged EXEC mode, enter <code>exit</code> or <code>end</code>, or press <code>Ctrl-Z</code>.</td>
<td>Use this mode to configure parameters that apply to the entire switch.</td>
</tr>
<tr>
<td>VLAN configuration</td>
<td>While in global configuration mode, enter the <code>vlan vlan-id</code> command.</td>
<td>Switch(config-vlan)#</td>
<td>To exit to global configuration mode, enter the <code>exit</code> command. To return to privileged EXEC mode, press <code>Ctrl-Z</code> or enter <code>end</code>.</td>
<td>Use this mode to configure VLAN parameters.</td>
</tr>
<tr>
<td>Interface configuration</td>
<td>While in global configuration mode, enter the <code>interface</code> command (with a specific interface).</td>
<td>Switch(config-if)#</td>
<td>To exit to global configuration mode, enter <code>exit</code>. To return to privileged EXEC mode, press <code>Ctrl-Z</code> or enter <code>end</code>.</td>
<td>Use this mode to configure parameters for the Ethernet ports.</td>
</tr>
<tr>
<td>Line configuration</td>
<td>While in global configuration mode, specify a line with the <code>line vty</code> or <code>line console</code> command.</td>
<td>Switch(config-line)#</td>
<td>To exit to global configuration mode, enter <code>exit</code>. To return to privileged EXEC mode, press <code>Ctrl-Z</code> or enter <code>end</code>.</td>
<td>Use this mode to configure parameters for the terminal line.</td>
</tr>
</tbody>
</table>

For more detailed information on the command modes, see the command reference guide for this release.
Understanding the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command, as shown in Table 2-2.

Table 2-2 Help Summary

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>help</td>
<td>Obtain a brief description of the help system in any command mode.</td>
</tr>
<tr>
<td>abbreviated-command-entry?</td>
<td>Obtain a list of commands that begin with a particular character string.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>Switch# di?</td>
</tr>
<tr>
<td></td>
<td>dir disable disconnect</td>
</tr>
<tr>
<td>abbreviated-command-entry&lt;Tab&gt;</td>
<td>Complete a partial command name.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>Switch# sh conf&lt;tab&gt;</td>
</tr>
<tr>
<td></td>
<td>Switch# show configuration</td>
</tr>
<tr>
<td>?</td>
<td>List all commands available for a particular command mode.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; ?</td>
</tr>
<tr>
<td>command ?</td>
<td>List the associated keywords for a command.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; show ?</td>
</tr>
<tr>
<td>command keyword ?</td>
<td>List the associated arguments for a keyword.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>Switch(config)# cdp holdtime ?</td>
</tr>
<tr>
<td></td>
<td>&lt;10-255&gt; Length of time (in sec) that receiver must keep this packet</td>
</tr>
</tbody>
</table>

Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the show configuration privileged EXEC command in an abbreviated form:

Switch# show conf
Understanding no and default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to re-enable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

Understanding CLI Error Messages

Table 2-3 lists some error messages that you might encounter while using the CLI to configure your switch.

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Meaning</th>
<th>How to Get Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Ambiguous command: &quot;show con&quot;</td>
<td>You did not enter enough characters for your switch to recognize the command.</td>
<td>Re-enter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Incomplete command.</td>
<td>You did not enter all the keywords or values required by this command.</td>
<td>Re-enter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Invalid input detected at '^' marker.</td>
<td>You entered the command incorrectly. The caret (^) marks the point of the error.</td>
<td>Enter a question mark (?) to display all the commands that are available in this command mode. The possible keywords that you can enter with the command appear.</td>
</tr>
</tbody>
</table>

Using Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs as described in these sections:

- Changing the Command History Buffer Size, page 2-5 (optional)
- Recalling Commands, page 2-5 (optional)
- Disabling the Command History Feature, page 2-5 (optional)
Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. These procedures are optional.

Beginning in privileged EXEC mode, enter this command to change the number of command lines that the switch records during the current terminal session:

```
Switch# terminal history [size number-of-lines]
```

The range is from 0 to 256.

Beginning in line configuration mode, enter this command to configure the number of command lines the switch records for all sessions on a particular line:

```
Switch(config-line)# history [size number-of-lines]
```

The range is from 0 to 256.

Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in Table 2-4. These actions are optional.

<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Press Ctrl-P or the up arrow key.</td>
<td>Recall commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.</td>
</tr>
<tr>
<td>Press Ctrl-N or the down arrow key.</td>
<td>Return to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.</td>
</tr>
<tr>
<td>show history</td>
<td>While in privileged EXEC mode, list the last several commands that you just entered. The number of commands that appear is controlled by the setting of the terminal history global configuration command and the history line configuration command.</td>
</tr>
</tbody>
</table>

1. The arrow keys function only on ANSI-compatible terminals such as VT100s.

Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. These procedures are optional.

To disable the feature during the current terminal session, enter the terminal no history privileged EXEC command.

To disable command history for the line, enter the no history line configuration command.
Using Editing Features

This section describes the editing features that can help you manipulate the command line. It contains these sections:

- Enabling and Disabling Editing Features, page 2-6 (optional)
- Editing Commands through Keystrokes, page 2-6 (optional)
- Editing Command Lines that Wrap, page 2-8 (optional)

Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it, re-enable it, or configure a specific line to have enhanced editing. These procedures are optional.

To globally disable enhanced editing mode, enter this command in line configuration mode:

```
Switch (config-line)# no editing
```

To re-enable the enhanced editing mode for the current terminal session, enter this command in privileged EXEC mode:

```
Switch# terminal editing
```

To reconfigure a specific line to have enhanced editing mode, enter this command in line configuration mode:

```
Switch(config-line)# editing
```

Editing Commands through Keystrokes

Table 2-5 shows the keystrokes that you need to edit command lines. These keystrokes are optional.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Keystroke</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move around the command line to make changes or corrections.</td>
<td>Press Ctrl-B, or press the left arrow key.</td>
<td>Move the cursor back one character.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-F, or press the right arrow key.</td>
<td>Move the cursor forward one character.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-A.</td>
<td>Move the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-E.</td>
<td>Move the cursor to the end of the command line.</td>
</tr>
<tr>
<td></td>
<td>Press Esc B.</td>
<td>Move the cursor back one word.</td>
</tr>
<tr>
<td></td>
<td>Press Esc F.</td>
<td>Move the cursor forward one word.</td>
</tr>
<tr>
<td></td>
<td>Press Ctrl-T.</td>
<td>Transpose the character to the left of the cursor with the character located at the cursor.</td>
</tr>
<tr>
<td>Recall commands from the buffer and paste them in the command line. The switch provides a buffer with the last ten items that you deleted.</td>
<td>Press Ctrl-Y.</td>
<td>Recall the most recent entry in the buffer.</td>
</tr>
</tbody>
</table>
### Table 2-5 Editing Commands through Keystrokes (continued)

<table>
<thead>
<tr>
<th>Capability</th>
<th>Keystroke(^1)</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Press Esc Y.</td>
<td>Recall the next buffer entry. The buffer contains only the last 10 items that you have deleted or cut. If you press <strong>Esc Y</strong> more than ten times, you cycle to the first buffer entry.</td>
<td></td>
</tr>
<tr>
<td>Press the <strong>Delete</strong> or <strong>Backspace</strong> key.</td>
<td>Erase the character to the left of the cursor.</td>
<td></td>
</tr>
<tr>
<td>Press Ctrl-D.</td>
<td>Delete the character at the cursor.</td>
<td></td>
</tr>
<tr>
<td>Press Ctrl-K.</td>
<td>Delete all characters from the cursor to the end of the command line.</td>
<td></td>
</tr>
<tr>
<td>Press Ctrl-U or Ctrl-X.</td>
<td>Delete all characters from the cursor to the beginning of the command line.</td>
<td></td>
</tr>
<tr>
<td>Press Ctrl-W.</td>
<td>Delete the word to the left of the cursor.</td>
<td></td>
</tr>
<tr>
<td>Press Esc D.</td>
<td>Delete from the cursor to the end of the word.</td>
<td></td>
</tr>
<tr>
<td>Press Esc C.</td>
<td>Capitalize at the cursor.</td>
<td></td>
</tr>
<tr>
<td>Press Esc L.</td>
<td>Change the word at the cursor to lowercase.</td>
<td></td>
</tr>
<tr>
<td>Press Esc U.</td>
<td>Capitalize letters from the cursor to the end of the word.</td>
<td></td>
</tr>
<tr>
<td>Press Ctrl-V or Esc Q.</td>
<td>Designate a particular keystroke as an executable command, perhaps as a shortcut.</td>
<td></td>
</tr>
<tr>
<td>Press the <strong>Return</strong> key.</td>
<td>Scroll down one line.</td>
<td></td>
</tr>
<tr>
<td>Press the <strong>Space</strong> bar.</td>
<td>Scroll down one screen.</td>
<td></td>
</tr>
<tr>
<td>Press Ctrl-L or Ctrl-R.</td>
<td>Redisplay the current command line if the switch suddenly sends a message to your screen.</td>
<td></td>
</tr>
</tbody>
</table>

---

1. The arrow keys function only on ANSI-compatible terminals such as VT100s.
Searching and Filtering Output of show and more Commands

You can search and filter the output for `show` and `more` commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

To use this functionality, enter a `show` or `more` command followed by the pipe character (|), one of the keywords `begin`, `include`, or `exclude`, and an expression that you want to search for or filter out:

```
command | {begin | include | exclude} regular-expression
```

Expressions are case sensitive. For example, if you enter `| exclude output`, the lines that contain `output` are not displayed, but the lines that contain `Output` appear.

This example shows how to include in the output display only lines where the expression `protocol` appears:

```
Switch# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet0/1 is up, line protocol is down
GigabitEthernet0/2 is up, line protocol is up
```
Accessing the CLI

You can access the CLI through a console connection, through Telnet, or by using the browser.

Accessing the CLI through a Console Connection or through Telnet

Before you can access the CLI, you must connect a terminal or PC to the switch console port and power on the switch as described in the hardware installation guide that shipped with your switch. Then, to understand the boot process and the options available for assigning IP information, see Chapter 3, “Assigning the Switch IP Address and Default Gateway.”

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access. For more information, see the “Setting a Telnet Password for a Terminal Line” section on page 8-6.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem. For information about connecting to the console port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.

For information about configuring the switch for Telnet access, see the “Setting a Telnet Password for a Terminal Line” section on page 8-6. The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.

For information about configuring the switch for SSH, see the “Configuring the Switch for Secure Shell” section on page 8-37. The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.
Assigning the Switch IP Address and Default Gateway

This chapter describes how to create the initial switch configuration (for example, assigning the switch IP address and default gateway information) for the Cisco Metro Ethernet (ME) 3400E Ethernet Access switch by using a variety of automatic and manual methods. It also describes how to modify the switch startup configuration.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and to the Cisco IOS Software Documentation, 12.2 Mainline Release, Command References, Volume 1 of 3: Addressing and Services.

This chapter consists of these sections:
- Understanding the Boot Process, page 3-1
- Assigning Switch Information, page 3-2
- Checking and Saving the Running Configuration, page 3-14
- Modifying the Startup Configuration, page 3-16
- Scheduling a Reload of the Software Image, page 3-21

Note

Information in this chapter about configuring IP addresses and DHCP is specific to IP Version 4 (IPv4).

Understanding the Boot Process

To start your switch, you need to follow the procedures in the hardware installation guide about installing and powering on the switch and setting up the initial configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth) of the switch.

The normal boot process involves the operation of the boot loader software, which performs these functions:
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem. It tests the CPU DRAM and the portion of the flash device that makes up the flash file system.
Assigning Switch Information

You can assign IP information through the switch setup program, through a DHCP server, or manually. Use the switch setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password. It gives you the option of assigning a Telnet password (to provide security during remote management). For more information about the setup program, see the “Configuring the Switch with the CLI-Based Setup Program” appendix in the hardware installation guide.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

If you are using DHCP, do not respond to any of the questions in the setup program until the switch receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the switch configuration steps, manually configure the switch. Otherwise, use the setup program described previously.
These sections contain this configuration information:

- Default Switch Information, page 3-3
- Understanding DHCP-Based Autoconfiguration, page 3-3
- Manually Assigning IP Information, page 3-14

### Default Switch Information

Table 3-1 shows the default switch information.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>

<tr>
<td>Telnet password</td>
<td>No password is defined.</td>
</tr>
</tbody>
</table>

### Understanding DHCP-Based Autoconfiguration

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and a mechanism for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your switch (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch. However, you need to configure the DHCP server for various lease options associated with IP addresses. If you are using DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

The DHCP server for your switch can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your switch and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

### DHCP Client Request Process

When you boot your switch, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the switch. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.
Figure 3-1 shows the sequence of messages that are exchanged between the DHCP client and the DHCP server.

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the switch receives depends on how you configure the DHCP server. For more information, see the “Configuring the TFTP Server” section on page 3-6.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the switch accepts replies from a BOOTP server and configures itself, the switch broadcasts, instead of unicasts, TFTP requests to obtain the switch configuration file.

**Understanding DHCP-based Autoconfiguration and Image Update**

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more switches in a network. This helps ensure that each new switch added to a network receives the same image and configuration.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.
DHCP Autoconfiguration

DHCP autoconfiguration downloads a configuration file to one or more switches in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the switch. It does not overwrite the bootup configuration saved in the flash, until you reload the switch.

DHCP Auto-Image Update

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more switches in your network. The switch (or switches) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

Note
To enable a DHCP auto-image update on the switch, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the file) settings.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP-Based Autoconfiguration” section on page 3-6 and the “Configuring DHCP” section of the “IP addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.2.

After you install the switch in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the switch, and the new image is downloaded and installed on the switch. When you reboot the switch, the configuration is stored in the saved configuration on the switch.

Limitations and Restrictions

These are the limitations:

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.

Note
The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the `write memory` or `copy running-configuration startup-configuration` privileged EXEC command. Note that if the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.
Configuring DHCP-Based Autoconfiguration

These sections contain this configuration information:
- DHCP Server Configuration Guidelines, page 3-6
- Configuring the TFTP Server, page 3-6
- Configuring the DNS, page 3-7
- Configuring the Relay Device, page 3-7
- Obtaining Configuration Files, page 3-8
- Example Configuration, page 3-9

If your DHCP server is a Cisco device, see the “Configuring DHCP” section of the “IP Addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.2 for additional information about configuring DHCP.

DHCP Server Configuration Guidelines

Follow these guidelines if you are configuring a device as a DHCP server:

You should configure the DHCP server with reserved leases that are bound to each switch by the switch hardware address.

If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:
- IP address of the client (required)
- Subnet mask of the client (required)
- DNS server IP address (optional)
- Router IP address (default gateway address to be used by the switch) (required)

If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
- TFTP server name (required)
- Boot filename (the name of the configuration file that the client needs) (recommended)
- Hostname (optional)

Depending on the settings of the DHCP server, the switch can receive IP address information, the configuration file, or both.

If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the switch is not configured. If the router IP address or the TFTP server name are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

Configuring the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.
If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the switch attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, cisconet.cfg, hostname.config, or hostname.cfg, where hostname is the switch’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The network-config or the cisconet.cfg file (known as the default configuration files).
- The router-config or the ciscorr.cfg file (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the switch, or if it is to be accessed by the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. For more information, see the “Configuring the Relay Device” section on page 3-7. The preferred solution is to configure the DHCP server with all the required information.

**Configuring the DNS**

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same or on a different LAN as the switch. If it is on a different LAN, the switch must be able to access it through a router.

**Configuring the Relay Device**

You must configure a relay device, also referred to as a relay agent, when a switch sends broadcast packets that require a response from a host on a different LAN. Examples of broadcast packets that the switch might send are DHCP, DNS, and in some cases, TFTP packets. You must configure this relay device to forward received broadcast packets on an interface to the destination host.

If the relay device is a Cisco router, enable IP routing (ip routing global configuration command), and configure helper addresses by using the ip helper-address interface configuration command.

For example, in Figure 3-2, configure the router interfaces as follows:

On interface 10.0.0.2:

```bash
router(config-if)# ip helper-address 20.0.0.2
router(config-if)# ip helper-address 20.0.0.3
router(config-if)# ip helper-address 20.0.0.4
```

On interface 20.0.0.1

```bash
router(config-if)# ip helper-address 10.0.0.1
```
Assigning Switch Information

If the switch is acting as the relay device, configure the interface as a routed port. For more information, see the “Routed Ports” section on page 10-5 and the “Configuring Layer 3 Interfaces” section on page 10-25.

Figure 3-2 Relay Device Used in Autoconfiguration

Obtaining Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the switch and provided in the DHCP reply (one-file read method).

  The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot-up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).

  The switch receives its IP address, subnet mask, and the configuration filename from the DHCP server. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

  The switch receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the network-config or cisconet.cfg default configuration file. (If the network-config file cannot be read, the switch reads the cisconet.cfg file.)

  The default configuration file contains the hostnames-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the switch uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the switch uses the default Switch as its hostname.
After obtaining its hostname from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its hostname (hostname-config or hostname.cfg, depending on whether network-config or cisconet.cfg was read earlier) from the TFTP server. If the cisconet.cfg file is read, the filename of the host is truncated to eight characters.

If the switch cannot read the network-config, cisconet.cfg, or the hostname file, it reads the router-config file. If the switch cannot read the router-config file, it reads the ciscort.cfg file.

**Note**

The switch broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

### Example Configuration

*Figure 3-3* shows a sample network for retrieving IP information by using DHCP-based autoconfiguration.

*Table 3-2* shows the configuration of the reserved leases on the DHCP server.

</tbody>
</table>
DNS Server Configuration

The DNS server maps the TFTP server name tfipserver to IP address 10.0.0.3.

TFTP Server Configuration (on UNIX)

The TFTP server base directory is set to /tfipserver/work/. This directory contains the network-confg file used in the two-file read method. This file contains the hostname to be assigned to the switch based on its IP address. The base directory also contains a configuration file for each switch (switcha-confg, switchb-confg, and so forth) as shown in this display:

```
prompt> cd /tfipserver/work/
prompt> ls
network-confg
switcha-confg
switchb-confg
switchc-confg
switchd-confg

prompt> cat network-confg
ip host switcha 10.0.0.21
ip host switchb 10.0.0.22
ip host switchc 10.0.0.23
ip host switchd 10.0.0.24
```

DHCP Client Configuration

No configuration file is present on Switch A through Switch D.

Configuration Explanation

In Figure 3-3, Switch A reads its configuration file as follows:

- It obtains its IP address 10.0.0.21 from the DHCP server.
- If no configuration filename is given in the DHCP server reply, Switch A reads the network-confg file from the base directory of the TFTP server.
- It adds the contents of the network-confg file to its host table.
- It reads its host table by indexing its IP address 10.0.0.21 to its hostname (switcha).
- It reads the configuration file that corresponds to its hostname; for example, it reads switch1-confg from the TFTP server.

Switches B through D retrieve their configuration files and IP addresses in the same way.

Configuring the DHCP Auto Configuration and Image Update Features

Using DHCP to download a new image and a new configuration to a switch requires that you configure at least two switches: One switch acts as a DHCP and TFTP server. The client switch is configured to download either a new configuration file or a new configuration file and a new image file.

Cisco ME 3400E Ethernet Access Switch Software Configuration Guide

Chapter 3  Assigning the Switch IP Address and Default Gateway

Assigning Switch Information

Configuring DHCP Autoconfiguration (Only Configuration File)

Beginning in privileged EXEC mode, follow these steps to configure DHCP autoconfiguration of the TFTP and DHCP settings on a new switch to download a new configuration file.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ip dhcp poolname</td>
<td>Create a name for the DHCP Server address pool, and enter DHCP pool configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> bootfile filename</td>
<td>Specify the name of the configuration file that is used as a boot image.</td>
</tr>
<tr>
<td><strong>Step 4</strong> network network-number mask prefix-length</td>
<td>Specify the subnet network number and mask of the DHCP address pool.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).</td>
</tr>
<tr>
<td><strong>Step 5</strong> default-router address</td>
<td>Specify the IP address of the default router for a DHCP client.</td>
</tr>
<tr>
<td><strong>Step 6</strong> option 150 address</td>
<td>Specify the IP address of the TFTP server.</td>
</tr>
<tr>
<td><strong>Step 7</strong> exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> tftp-server flash:filename.text</td>
<td>Specify the configuration file on the TFTP server.</td>
</tr>
<tr>
<td><strong>Step 9</strong> interface interface-id</td>
<td>Specify the address of the client that will receive the configuration file.</td>
</tr>
<tr>
<td><strong>Step 10</strong> no switchport</td>
<td>Put the interface into Layer 3 mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong> ip address address mask</td>
<td>Specify the IP address and mask for the interface.</td>
</tr>
<tr>
<td><strong>Step 12</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 13</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to configure a switch as a DHCP server so that it will download a configuration file:

Switch# configure terminal
Switch(config)# ip dhcp pool pooll
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0
Switch(dhcp-config)# bootfile config-boot.text
Switch(dhcp-config)# default-router 10.10.10.1
Switch(dhcp-config)# option 150 10.10.1
default-router 10.10.1
Switch(dhcp-config)# exit
tftp-server flash:config-boot.text
Switch(config)# interface gigabitethernet1/0/4
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
Switch(config-if)# end
Configuring DHCP Auto-Image Update (Configuration File and Image)

Beginning in privileged EXEC mode, follow these steps to configure DHCP autoconfiguration to configure TFTP and DHCP settings on a new switch to download a new image and a new configuration file.

Note

Before following the steps in this table, you must create a text file (for example, autoinstall_dhcp) that will be uploaded to the switch. In the text file, put the name of the image that you want to download. This image must be a tar and not a bin file.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip dhcp pool name</td>
</tr>
<tr>
<td>Step 3</td>
<td>bootfile filename</td>
</tr>
<tr>
<td>Step 4</td>
<td>network network-number mask prefix-length</td>
</tr>
<tr>
<td>Step 5</td>
<td>default-router address</td>
</tr>
<tr>
<td>Step 6</td>
<td>option 150 address</td>
</tr>
<tr>
<td>Step 7</td>
<td>option 125 hex</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy tftp flash filename.txt</td>
</tr>
<tr>
<td>Step 9</td>
<td>copy tftp flash imagename.tar</td>
</tr>
<tr>
<td>Step 10</td>
<td>exit</td>
</tr>
<tr>
<td>Step 11</td>
<td>tftp-server flash:config.text</td>
</tr>
<tr>
<td>Step 12</td>
<td>tftp-server flash:imagename.tar</td>
</tr>
<tr>
<td>Step 13</td>
<td>tftp-server flash:filename.txt</td>
</tr>
<tr>
<td>Step 14</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 15</td>
<td>no switchport</td>
</tr>
<tr>
<td>Step 16</td>
<td>ip address address mask</td>
</tr>
<tr>
<td>Step 17</td>
<td>end</td>
</tr>
<tr>
<td>Step 18</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to configure a switch as a DHCP server so it downloads a configuration file:

```
Switch# config terminal
Switch(config)# ip dhcp pool p001
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0
Switch(dhcp-config)# bootfile config-boot.text
Switch(dhcp-config)# default-router 10.10.10.1
Switch(dhcp-config)# option 150 10.10.10.1
Switch(dhcp-config)# option 125 hex
0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f68.666370
```
Switch(dhcp-config)# exit
Switch(config)# tftp-server flash:config-boot.text
Switch(config)# tftp-server flash:-image-name-mz.122-44.3.SE.tar
Switch(config)# tftp-server flash:boot-config.text
Switch(config)# tftp-server flash: autoinstall_dhcp
Switch(config)# interface gigabitEthernet1/0/4
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
Switch(config-if)# end

Configuring the Client

Beginning in privileged EXEC mode, follow these steps to configure a switch to download a configuration file and new image from a DHCP server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>boot host dhcp</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>boot host retry timeout timeout-value</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>banner config-save ^C warning-message ^C</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show boot</td>
</tr>
</tbody>
</table>

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

Switch# configure terminal
Switch(config)# boot host dhcp
Switch(config)# boot host retry timeout 300
Switch(config)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to Nolonger Automatically Download Configuration Files at Reboot^C
Switch(config)# vlan 99
Switch(config-vlan)# interface vlan 99
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# show boot
BOOT path-list:
   Config file: flash:/config.text
   Private Config file: flash:/private-config.text
   Enable Break: no
   Manual Boot: no
   HELPER path-list:
   NVRAM/Config file
     buffer size: 32768
   Timeout for Config Download: 300 seconds
   Config Download via DHCP: enabled (next boot: enabled)
Manually Assigning IP Information

Beginning in privileged EXEC mode, follow these steps to manually assign IP information to a switch virtual interface (SVI). If the switch is running the metro IP access image, you can also manually assign IP information to a port if you first put the port into Layer 3 mode by using the no switchport command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: interface vlan vlan-id</td>
<td>Enter interface configuration mode, and enter the VLAN to which the IP information is assigned. The range is 1 to 4094; do not enter leading zeros.</td>
</tr>
<tr>
<td>Step 3: ip address ip-address subnet-mask</td>
<td>Enter the IP address and subnet mask.</td>
</tr>
<tr>
<td>Step 4: exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 5: ip default-gateway ip-address</td>
<td>Enter the IP address of the next-hop router interface that is directly connected to the switch where a default gateway is being configured. The default gateway receives IP packets with unresolved destination IP addresses from the switch.</td>
</tr>
<tr>
<td>Step 6: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7: show interfaces vlan vlan-id</td>
<td>Verify the configured IP address.</td>
</tr>
<tr>
<td>Step 8: show ip redirects</td>
<td>Verify the configured default gateway.</td>
</tr>
<tr>
<td>Step 9: copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the switch IP address, use the no ip address interface configuration command. If you are removing the address through a Telnet session, your connection to the switch will be lost. To remove the default gateway address, use the no ip default-gateway global configuration command.

For information on setting the switch system name, protecting access to privileged EXEC commands, and setting time and calendar services, see Chapter 5, “Administering the Switch.”

Checking and Saving the Running Configuration

You can check the configuration settings you entered or changes you made by entering this privileged EXEC command:

```
Switch# show running-config
Building configuration...

Current configuration : 2010 bytes

Modifying the Startup Configuration

These sections describe how to modify the switch startup configuration:

- **Default Boot Configuration**, page 3-17
- **Automatically Downloading a Configuration File**, page 3-17
- **Booting Manually**, page 3-18
- **Booting a Specific Software Image**, page 3-18

To store the configuration or changes you have made to your startup configuration in flash memory, enter this privileged EXEC command:

```
Switch# copy running-config startup-config
```

This command saves the configuration settings that you made. If you fail to do this, your configuration will be lost the next time you reload the system. To display information stored in the NVRAM section of flash memory, use the `show startup-config` or `more startup-config` privileged EXEC command.

For more information about alternative locations from which to copy the configuration file, see Appendix B, “Working with the Cisco IOS File System, Configuration Files, and Software Images.”
• Controlling Environment Variables, page 3-19

See also Appendix B, “Working with the Cisco IOS File System, Configuration Files, and Software Images,” for information about switch configuration files.

Default Boot Configuration

Table 3-3 shows the default boot configuration.

<table>
<thead>
<tr>
<th>Table 3-3 Default Boot Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feature</td>
</tr>
<tr>
<td>---------------------------------------</td>
</tr>
<tr>
<td>Operating system software image</td>
</tr>
<tr>
<td>Configuration file</td>
</tr>
</tbody>
</table>

Automatically Downloading a Configuration File

You can automatically download a configuration file to your switch by using the DHCP-based autoconfiguration feature. For more information, see the “Understanding DHCP-Based Autoconfiguration” section on page 3-3.

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the file config.text to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

Beginning in privileged EXEC mode, follow these steps to specify a different configuration filename:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>boot config-file flash:/file-url</td>
<td>Specify the configuration file to load during the next boot cycle. For file-url, specify the path (directory) and the configuration filename. Filenames and directory names are case sensitive.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Modifying the Startup Configuration

### Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show boot</td>
<td>Verify your entries. The <code>boot config-file</code> global configuration command changes the setting of the CONFIG_FILE environment variable.</td>
</tr>
</tbody>
</table>

### Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no boot config-file` global configuration command.

### Booting Manually

By default, the switch automatically boots; however, you can configure it to manually boot.

Beginning in privileged EXEC mode, follow these steps to configure the switch to manually boot during the next boot cycle:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>boot manual</code></td>
<td>Enable the switch to manually boot during the next boot cycle.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| `show boot`            | Verify your entries. The `boot manual` global command changes the setting of the MANUAL_BOOT environment variable. The next time you reboot the system, the switch is in boot loader mode, shown by the `switch:` prompt. To boot the system, use the `boot filesystem:file-url` boot loader command.  
  * For `filesystem:`, use `flash:` for the system board flash device.  
  * For `file-url`, specify the path (directory) and the name of the bootable image.  
  Filenames and directory names are case sensitive. |
| `copy running-config startup-config` | (Optional) Save your entries in the configuration file.                  |

To disable manual booting, use the `no boot manual` global configuration command.

### Booting a Specific Software Image

By default, the switch attempts to automatically boot the system using information in the BOOT environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory. However, you can specify a specific image to boot.
Beginning in privileged EXEC mode, follow these steps to configure the switch to boot a specific image during the next boot cycle:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>boot system filesystem:file-url</td>
</tr>
<tr>
<td></td>
<td>• For filesystem:, use flash: for the system board flash device.</td>
</tr>
<tr>
<td></td>
<td>• For file-url, specify the path (directory) and the name of the bootable image.</td>
</tr>
<tr>
<td></td>
<td>Filenames and directory names are case sensitive.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show boot</td>
</tr>
<tr>
<td></td>
<td>The <strong>boot system</strong> global command changes the setting of the BOOT environment variable.</td>
</tr>
<tr>
<td></td>
<td>During the next boot cycle, the switch attempts to automatically boot the system using information in the BOOT environment variable.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default setting, use the **no boot system** global configuration command.

**Controlling Environment Variables**

With a normally operating switch, you enter the boot loader mode only through a switch console connection configured for 9600 bps. Unplug and then reconnect the switch power cord. After the switch performs POST, the switch begins the autoboot process. The boot loader prompts the user for a break key character during the boot-up sequence, as shown in this example:

```
***** The system will autoboot in 5 seconds *****

Send a break key to prevent autobooting.
```

The break key character is different for each operating system.

- On a SUN workstation running UNIX, Ctrl-C is the break key.
- On a PC running Windows 2000, Ctrl-Break is the break key.

Cisco TAC has tabulated break keys for most common operating systems and provided an alternative break key sequence for terminal emulators that do not support the break keys. To view this table, see: [http://www.cisco.com/warp/public/701/61.html#how-to](http://www.cisco.com/warp/public/701/61.html#how-to)

When you enter the break key, the boot loader **switch:** prompt appears.

The switch boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader, or any other software running on the system, behaves. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.
Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not listed in this file; it has a value if it is listed in the file even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value. Many environment variables are predefined and have default values.

Environment variables store two kinds of data:

- Data that controls code, which does not read the Cisco IOS configuration file. For example, the name of a boot loader helper file, which extends or patches the functionality of the boot loader can be stored as an environment variable.

- Data that controls code, which is responsible for reading the Cisco IOS configuration file. For example, the name of the Cisco IOS configuration file can be stored as an environment variable.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.

Note
For complete syntax and usage information for the boot loader commands and environment variables, see the command reference for this release.

Table 3-4 describes the function of the most common environment variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Boot Loader Command</th>
<th>Cisco IOS Global Configuration Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOT</td>
<td>set BOOT filesystem:/file-url ...</td>
<td>boot system filesystem:/file-url ...</td>
</tr>
<tr>
<td></td>
<td>A semicolon-separated list of executable files to try to load and execute when automatically booting. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash file system.</td>
<td>Specifies the Cisco IOS image to load during the next boot cycle. This command changes the setting of the BOOT environment variable.</td>
</tr>
<tr>
<td>MANUAL_BOOT</td>
<td>set MANUAL_BOOT yes</td>
<td>boot manual</td>
</tr>
<tr>
<td></td>
<td>Decides whether the switch automatically or manually boots. Valid values are 1, yes, 0, and no. If it is set to no or 0, the boot loader attempts to automatically boot the system. If it is set to anything else, you must manually boot the switch from the boot loader mode.</td>
<td>Enables manually booting the switch during the next boot cycle and changes the setting of the MANUAL_BOOT environment variable. The next time you reboot the system, the switch is in boot loader mode. To boot the system, use the boot flash:filesystem:/file-url boot loader command, and specify the name of the bootable image.</td>
</tr>
<tr>
<td>CONFIG_FILE</td>
<td>set CONFIG_FILE flash:/file-url</td>
<td>boot config-file flash:/file-url</td>
</tr>
<tr>
<td></td>
<td>Changes the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.</td>
<td>Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration. This command changes the CONFIG_FILE environment variable.</td>
</tr>
</tbody>
</table>
Scheduling a Reload of the Software Image

You can schedule a reload of the software image to occur on the switch at a later time (for example, late at night or during the weekend when the switch is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all switches in the network).

Note
A scheduled reload must take place within approximately 24 days.

Configuring a Scheduled Reload

To configure your switch to reload the software image at a later time, use one of these commands in privileged EXEC mode:

- `reload in [hh:mm] [text]`
  
  This command schedules a reload of the software to take effect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.

- `reload at hh:mm [month day | day month] [text]`
  
  This command schedules a reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

Note
Use the `at` keyword only if the switch system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the switch. To schedule reloads across several switches to occur simultaneously, the time on each switch must be synchronized with NTP.

The `reload` command halts the system. If the system is not set to manually boot, it reboots itself. Use the `reload` command after you save the switch configuration information to the startup configuration (copy `running-config startup-config`).

If your switch is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the switch from entering the boot loader mode and thereby taking it from the remote user’s control.

If you modify your configuration file, the switch prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG_FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

This example shows how to reload the software on the switch on the current day at 7:30 p.m:

```
Switch# reload at 19:30
Reload scheduled for 19:30:00 UTC Wed Jun 5 1996 (in 2 hours and 25 minutes)
Proceed with reload? [confirm]
```
This example shows how to reload the software on the switch at a future time:

```
Switch# reload at 02:00 jun 20
Reload scheduled for 02:00:00 UTC Thu Jun 20 1996 (in 344 hours and 53 minutes)
Proceed with reload? [confirm]
```

To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.

### Displaying Scheduled Reload Information

To display information about a previously scheduled reload or to find out if a reload has been scheduled on the switch, use the `show reload` privileged EXEC command.

It displays reload information including the time the reload is scheduled to occur and the reason for the reload (if it was specified when the reload was scheduled).
CHAPTER 4

Configuring Cisco IOS CNS Agents

This chapter describes how to configure the Cisco IOS CNS agents on the Cisco ME 3400E switch.

Note

For complete configuration information for the Cisco Configuration Engine, see this URL on Cisco.com:

For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS Network Management Command Reference, Release 12.4 at this URL on Cisco.com:

This chapter consists of these sections:

- Understanding Cisco Configuration Engine Software, page 4-1
- Understanding Cisco IOS Agents, page 4-5
- Configuring Cisco IOS Agents, page 4-6
- Displaying CNS Configuration, page 4-15

Understanding Cisco Configuration Engine Software

The Cisco Configuration Engine is network management software that acts as a configuration service for automating the deployment and management of network devices and services (see Figure 4-1). Each Configuration Engine manages a group of Cisco devices (switches and routers) and the services that they deliver, storing their configurations and delivering them as needed. The Configuration Engine automates initial configurations and configuration updates by generating device-specific configuration changes, sending them to the device, executing the configuration change, and logging the results.

The Configuration Engine supports standalone and server modes and has these CNS components:

- Configuration service (web server, file manager, and namespace mapping server)
- Event service (event gateway)
- Data service directory (data models and schema)

In standalone mode, the Configuration Engine supports an embedded Directory Service. In this mode, no external directory or other data store is required. In server mode, the Configuration Engine supports the use of a user-defined external directory.
These sections contain this conceptual information:

- Configuration Service, page 4-2
- Event Service, page 4-3
- What You Should Know About the CNS IDs and Device Hostnames, page 4-3

**Configuration Service**

The Configuration Service is the core component of the Cisco Configuration Engine. It consists of a configuration server that works with Cisco IOS CNS agents on the switch. The Configuration Service delivers device and service configurations to the switch for initial configuration and mass reconfiguration by logical groups. Switches receive their initial configuration from the Configuration Service when they start up on the network for the first time.

The Configuration Service uses the CNS Event Service to send and receive configuration change events and to send success and failure notifications.

The configuration server is a web server that uses configuration templates and the device-specific configuration information stored in the embedded (standalone mode) or remote (server mode) directory.

Configuration templates are text files containing static configuration information in the form of CLI commands. In the templates, variables are specified using Lightweight Directory Access Protocol (LDAP) URLs that reference the device-specific configuration information stored in a directory.

The Cisco IOS agent can perform a syntax check on received configuration files and publish events to show the success or failure of the syntax check. The configuration agent can either apply configurations immediately or delay the application until receipt of a synchronization event from the configuration server.
Chapter 4 Configuring Cisco IOS CNS Agents

Understanding Cisco Configuration Engine Software

Event Service

The Cisco Configuration Engine uses the Event Service for receipt and generation of configuration events. The event agent is on the switch and facilitates the communication between the switch and the event gateway on the Configuration Engine.

The Event Service is a highly capable publish-and-subscribe communication method. The Event Service uses subject-based addressing to send messages to their destinations. Subject-based addressing conventions define a simple, uniform namespace for messages and their destinations.

NameSpace Mapper

The Configuration Engine includes the NameSpace Mapper (NSM) that provides a lookup service for managing logical groups of devices based on application, device or group ID, and event.

Cisco IOS devices recognize only event subject-names that match those configured in Cisco IOS software; for example, cisco.cns.config.load. You can use the namespace mapping service to designate events by using any desired naming convention. When you have populated your data store with your subject names, NSM changes your event subject-name strings to those known by Cisco IOS.

For a subscriber, when given a unique device ID and event, the namespace mapping service returns a set of events to which to subscribe. Similarly, for a publisher, when given a unique group ID, device ID, and event, the mapping service returns a set of events on which to publish.

What You Should Know About the CNS IDs and Device Hostnames

The Configuration Engine assumes that a unique identifier is associated with each configured switch. This unique identifier can take on multiple synonyms, where each synonym is unique within a particular namespace. The event service uses namespace content for subject-based addressing of messages.

The Configuration Engine intersects two namespaces, one for the event bus and the other for the configuration server. Within the scope of the configuration server namespace, the term ConfigID is the unique identifier for a device. Within the scope of the event bus namespace, the term DeviceID is the CNS unique identifier for a device.

Because the Configuration Engine uses both the event bus and the configuration server to provide configurations to devices, you must define both ConfigID and DeviceID for each configured switch.

Within the scope of a single instance of the configuration server, no two configured switches can share the same value for ConfigID. Within the scope of a single instance of the event bus, no two configured switches can share the same value for DeviceID.

ConfigID

Each configured switch has a unique ConfigID, which serves as the key into the Configuration Engine directory for the corresponding set of switch CLI attributes. The ConfigID defined on the switch must match the ConfigID for the corresponding switch definition on the Configuration Engine.

The ConfigID is fixed at startup time and cannot be changed until the device restarts, even if the switch hostname is reconfigured.
DeviceID

Each configured switch participating on the event bus has a unique DeviceID, which is analogous to the
switch source address so that the switch can be targeted as a specific destination on the bus. All switches
configured with the `cns config partial` global configuration command must access the event bus.
Therefore, the DeviceID, as originated on the switch, must match the DeviceID of the corresponding
switch definition in the Configuration Engine.

The origin of the DeviceID is defined by the Cisco IOS hostname of the switch. However, the DeviceID
variable and its usage reside within the event gateway adjacent to the switch.

The logical Cisco IOS termination point on the event bus is embedded in the event gateway, which in
turn functions as a proxy on behalf of the switch. The event gateway represents the switch and its
corresponding DeviceID to the event bus.

The switch declares its hostname to the event gateway immediately after the successful connection to
the event gateway. The event gateway couples the DeviceID value to the Cisco IOS hostname each time
this connection is established. The event gateway caches this DeviceID value for the duration of its
connection to the switch.

Hostname and DeviceID

The DeviceID is fixed at the time of the connection to the event gateway and does not change even when
the switch hostname is reconfigured.

When changing the switch hostname on the switch, the only way to refresh the DeviceID is to break the
connection between the switch and the event gateway. Enter the `no cns event` global configuration
command followed by the `cns event` global configuration command.

When the connection is re-established, the switch sends its modified hostname to the event gateway. The
event gateway redefines the DeviceID to the new value.

Caution

When using the Configuration Engine user interface, you must first set the DeviceID field to the
hostname value that the switch acquires after—not before—you use the `cns config initial` global
configuration command at the switch. Otherwise, subsequent `cns config partial` global configuration
command operations malfunction.

Using Hostname, DeviceID, and ConfigID

In standalone mode, when a hostname value is set for a switch, the configuration server uses the
hostname as the DeviceID when an event is sent on hostname. If the hostname has not been set, the event
is sent on the `cn=<value>` of the device.

In server mode, the hostname is not used. In this mode, the unique DeviceID attribute is always used for
sending an event on the bus. If this attribute is not set, you cannot update the switch.

These and other associated attributes (tag value pairs) are set when you run Setup on the Configuration
Engine.

Note

For more information about running the setup program on the Configuration Engine, see the
Configuration Engine setup and configuration guide at this URL on Cisco.com:
Understanding Cisco IOS Agents

The CNS event agent feature allows the switch to publish and subscribe to events on the event bus and works with the Cisco IOS agent. The Cisco IOS agent feature supports the switch by providing these features:

- Initial Configuration, page 4-5
- Incremental (Partial) Configuration, page 4-6
- Synchronized Configuration, page 4-6

Initial Configuration

When the switch first comes up, it attempts to get an IP address by broadcasting a DHCP request on the network. Assuming there is no DHCP server on the subnet, the distribution switch acts as a DHCP relay agent and forwards the request to the DHCP server. Upon receiving the request, the DHCP server assigns an IP address to the new switch and includes the TFTP server IP address, the path to the bootstrap configuration file, and the default gateway IP address in a unicast reply to the DHCP relay agent. The DHCP relay agent forwards the reply to the switch.

The switch automatically configures the assigned IP address on interface VLAN 1 (the default) and downloads the bootstrap configuration file from the TFTP server. Upon successful download of the bootstrap configuration file, the switch loads the file in its running configuration.

The Cisco IOS agents initiate communication with the Configuration Engine by using the appropriate ConfigID and EventID. The Configuration Engine maps the Config ID to a template and downloads the full configuration file to the switch.

Figure 4-2 shows a sample network configuration for retrieving the initial bootstrap configuration file by using DHCP-based autoconfiguration.

Figure 4-2  Initial Configuration Overview
Incremental (Partial) Configuration

After the network is running, new services can be added by using the Cisco IOS agent. Incremental (partial) configurations can be sent to the switch. The actual configuration can be sent as an event payload by way of the event gateway (push operation) or as a signal event that triggers the switch to initiate a pull operation.

The switch can check the syntax of the configuration before applying it. If the syntax is correct, the switch applies the incremental configuration and publishes an event that signals success to the configuration server. If the switch does not apply the incremental configuration, it publishes an event showing an error status. When the switch has applied the incremental configuration, it can write it to NVRAM or wait until signaled to do so.

Synchronized Configuration

When the switch receives a configuration, it can defer application of the configuration upon receipt of a write-signal event. The write-signal event tells the switch not to save the updated configuration into its NVRAM. The switch uses the updated configuration as its running configuration. This ensures that the switch configuration is synchronized with other network activities before saving the configuration in NVRAM for use at the next reboot.

Configuring Cisco IOS Agents

The Cisco IOS agents embedded in the switch Cisco IOS software allow the switch to be connected and automatically configured as described in the “Enabling Automated CNS Configuration” section on page 4-6. If you want to change the configuration or install a custom configuration, see these sections for instructions:

- Enabling the CNS Event Agent, page 4-7
- Enabling the Cisco IOS CNS Agent, page 4-9
- Upgrading Devices with Cisco IOS Image Agent, page 4-14

Enabling Automated CNS Configuration

To enable automated CNS configuration of the switch, you must first complete the prerequisites in Table 4-1. When you complete them, power on the switch. At the setup prompt, do nothing: The switch begins the initial configuration as described in the “Initial Configuration” section on page 4-5. When the full configuration file is loaded on your switch, you need to do nothing else.

<table>

</table>

**Note**  
For more information about running the setup program and creating templates on the Configuration Engine, see the *Cisco Configuration Engine Installation and Setup Guide, 1.5 for Linux* at this URL:  

### Enabling the CNS Event Agent

**Note**  
You must enable the CNS event agent on the switch before you enable the CNS configuration agent.
Beginning in privileged EXEC mode, follow these steps to enable the CNS event agent on the switch:

**Step 1**
configure terminal

Enter global configuration mode.

**Step 2**
cns event {hostname | ip-address} [port-number] [backup] [failover-time seconds] [keepalive seconds] [retry-count] [reconnect time] [source ip-address]

Enable the event agent, and enter the gateway parameters.

- For \{hostname | ip-address\}, enter either the hostname or the IP address of the event gateway.
- (Optional) For port number, enter the port number for the event gateway. The default port number is 11011.
- (Optional) Enter backup to show that this is the backup gateway. (If omitted, this is the primary gateway.)
- (Optional) For failover-time seconds, enter how long the switch waits for the primary gateway route after the route to the backup gateway is established.
- (Optional) For keepalive seconds, enter how often the switch sends keepalive messages. For retry-count, enter the number of unanswered keepalive messages that the switch sends before the connection is terminated. The default for each is 0.
- (Optional) For reconnect time, enter the maximum time interval that the switch waits before trying to reconnect to the event gateway.
- (Optional) For source ip-address, enter the source IP address of this device.

**Note** Though visible in the command-line help string, the encrypt and the clock-timeout time keywords are not supported.

**Step 3**
end

Return to privileged EXEC mode.

**Step 4**
show cns event connections

Verify information about the event agent.

**Step 5**
show running-config

Verify your entries.

**Step 6**
copy running-config startup-config

(Optional) Save your entries in the configuration file.

To disable the CNS event agent, use the no cns event {ip-address | hostname} global configuration command.

This example shows how to enable the CNS event agent, set the IP address gateway to 10.180.1.27, set 120 seconds as the keepalive interval, and set 10 as the retry count.

Switch(config)# cns event 10.180.1.27 keepalive 120 10
Enabling the Cisco IOS CNS Agent

After enabling the CNS event agent, start the Cisco IOS CNS agent on the switch. You can enable the Cisco IOS agent with these commands:

- The `cns config initial` global configuration command enables the Cisco IOS agent and initiates an initial configuration on the switch.
- The `cns config partial` global configuration command enables the Cisco IOS agent and initiates a partial configuration on the switch. You can then use the Configuration Engine to remotely send incremental configurations to the switch.

Enabling an Initial Configuration

Beginning in privileged EXEC mode, follow these steps to enable the CNS configuration agent and initiate an initial configuration on the switch:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>cns template connect name</code></td>
<td>Enter CNS template connect configuration mode, and specify the name of the CNS connect template.</td>
</tr>
<tr>
<td>3</td>
<td><code>cli config-text</code></td>
<td>Enter a command line for the CNS connect template. Repeat this step for each command line in the template.</td>
</tr>
<tr>
<td>4</td>
<td><code>exit</code></td>
<td>Repeat Steps 2 to 3 to configure another CNS connect template.</td>
</tr>
<tr>
<td>5</td>
<td><code>cns connect name [retries number] [retry-interval seconds] [sleep seconds] [timeout seconds]</code></td>
<td>Enter CNS connect configuration mode, specify the name of the CNS connect profile, and define the profile parameters. The switch uses the CNS connect profile to connect to the Configuration Engine.</td>
</tr>
</tbody>
</table>

- Enter the name of the CNS connect profile.
- (Optional) For `retries number`, enter the number of connection retries. The range is 1 to 30. The default is 3.
- (Optional) For `retry-interval seconds`, enter the interval between successive connection attempts to the Configuration Engine. The range is 1 to 40 seconds. The default is 10 seconds.
- (Optional) For `sleep seconds`, enter the amount of time before which the first connection attempt occurs. The range is 0 to 250 seconds. The default is 0.
- (Optional) For `timeout seconds`, enter the amount of time after which the connection attempts end. The default is 120.
### Step 7
**discover (controller controller-type | dlci [subinterface subinterface-number] | interface [interface-type] | line line-type)**

Specify the interface parameters in the CNS connect profile.

- For **controller controller-type**, enter the controller type.
- For **dlci**, enter the active data-link connection identifiers (DLCIs).
  
  (Optional) For **subinterface subinterface-number**, specify the point-to-point subinterface number that is used to search for active DLCIs.
- For **interface [interface-type]**, enter the type of interface.
- For **line line-type**, enter the line type.

### Step 8
**template name [ ... name]**

Specify the list of CNS connect templates in the CNS connect profile to be applied to the switch configuration. You can specify more than one template.

### Step 9
**exit**

Return to global configuration mode.

### Step 10
**hostname name**

Enter the hostname for the switch.

### Step 11
**ip route network-number**

(Optional) Establish a static route to the Configuration Engine whose IP address is `network-number`. 

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>**discover (controller controller-type</td>
<td>dlci [subinterface subinterface-number]</td>
</tr>
<tr>
<td><strong>template name [ ... name]</strong></td>
<td>Specify the list of CNS connect templates in the CNS connect profile.</td>
</tr>
<tr>
<td><strong>exit</strong></td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td><strong>hostname name</strong></td>
<td>Enter the hostname for the switch.</td>
</tr>
<tr>
<td><strong>ip route network-number</strong></td>
<td>(Optional) Establish a static route to the Configuration Engine whose IP address is <code>network-number</code>.</td>
</tr>
<tr>
<td>Command</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 13**

cns id *interface num* [dns-reverse | ipaddress | mac-address] [event] [image]

or

cns id {hardware-serial | hostname | string string | udi} [event] [image]

(Optional) Set the unique EventID or ConfigID used by the Configuration Engine.

* For *interface num*, enter the type of interface—for example, ethernet, group-async, loopback, or virtual-template. This setting specifies from which interface the IP or MAC address should be retrieved to define the unique ID.

* For {dns-reverse | ipaddress | mac-address}, enter dns-reverse to retrieve the hostname and assign it as the unique ID, enter ipaddress to use the IP address, or enter mac-address to use the MAC address as the unique ID.

* (Optional) Enter event to set the ID to be the event-id value used to identify the switch.

* (Optional) Enter image to set the ID to be the image-id value used to identify the switch.

**Note** If both the event and image keywords are omitted, the image-id value is used to identify the switch.

* For {hardware-serial | hostname string string | udi}, enter hardware-serial to set the switch serial number as the unique ID, enter hostname (the default) to select the switch hostname as the unique ID, enter an arbitrary text string for string string as the unique ID, or enter udi to set the unique device identifier (UDI) as the unique ID.
To disable the CNS Cisco IOS agent, use the `no cns config initial {ip-address | hostname} global configuration` command.

This example shows how to configure an initial configuration on a remote switch when the switch configuration is unknown (the CNS Zero Touch feature).

```
Switch(config)# cns template connect template-dhcp
Switch(config-tmpl-conn)# cli ip address dhcp
Switch(config-tmpl-conn)# exit
Switch(config)# cns template connect ip-route
Switch(config-tmpl-conn)# cli ip route 0.0.0.0 0.0.0.0 ${next-hop}
Switch(config-tmpl-conn)# exit
Switch(config)# cns connect dhcp
Switch(config-cna-conn)# discover interface gigabitethernet
Switch(config-cna-conn)# template template-dhcp
Switch(config-cna-conn)# template ip-route
Switch(config-cna-conn)# exit
Switch(config)# hostname RemoteSwitch
RemoteSwitch(config)# cns config initial 10.1.1.1 no-persist
```
This example shows how to configure an initial configuration on a remote switch when the switch IP address is known. The Configuration Engine IP address is 172.28.129.22.

```
Switch(config)# cns template connect template-dhcp
Switch(config-tmpl-conn)# cli ip address dhcp
Switch(config-tmpl-conn)# exit
Switch(config)# cns template connect ip-route
Switch(config-tmpl-conn)# cli ip route 0.0.0.0 0.0.0.0 ${next-hop}
Switch(config-tmpl-conn)# exit
Switch(config)# cns connect dhcp
Switch(config-cns-conn)# discover interface gigabitethernet
Switch(config-cns-conn)# template template-dhcp
Switch(config-cns-conn)# template ip-route
Switch(config-cns-conn)# exit
Switch(config)# hostname RemoteSwitch
RemoteSwitch(config)# ip route 172.28.129.22 255.255.255.255 11.11.11.1
RemoteSwitch(config)# cns id ethernet 0 ipaddress
RemoteSwitch(config)# cns config initial 172.28.129.22 no-persist
```

### Enabling a Partial Configuration

Beginning in privileged EXEC mode, follow these steps to enable the Cisco IOS agent and to initiate a partial configuration on the switch:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>cns config partial [ip-address</td>
<td>hostname]</td>
</tr>
<tr>
<td></td>
<td>[port-number] [source ip-address]</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- For {ip-address</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- (Optional) For port-number, enter the port number of the configuration server. The default port number is 80.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- (Optional) Enter source ip-address to use for the source IP address.</td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>Though visible in the command-line help string, the encrypt keyword is not supported.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show cns config stats</td>
<td>Verify information about the configuration agent.</td>
</tr>
<tr>
<td></td>
<td>or show cns config outstanding</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the Cisco IOS agent, use the no cns config partial [ip-address | hostname] global configuration command. To cancel a partial configuration, use the cns config cancel privileged EXEC command.
Upgrading Devices with Cisco IOS Image Agent

Administrators maintaining large networks of Cisco IOS devices need an automated mechanism to load image files onto large numbers of remote devices. Existing network management applications are useful to determine which images to run and how to manage images received from the Cisco online software center. Other image distribution solutions do not scale to cover thousands of devices and cannot distribute images to devices behind a firewall. The CNS image agent enables the managed device to initiate a network connection and request an image download allowing devices behind firewalls to access the image server.

You can use image agent to download one or more devices. The switches must have the image agent running on them.

Prerequisites for the CNS Image Agent

Confirm these prerequisites before upgrading one or more devices with image agent:

- Determine where to store the Cisco IOS images on a file server to make the image available to the other networking devices. If the CNS Event Bus is to be used to store and distribute the images, the CNS event agent must be configured.
- Set up a file server to enable the networking devices to download the new images using the HTTPS protocol.
- Determine how to handle error messages generated by image agent operations. Error messages can be sent to the CNS Event Bus or an HTTP or HTTPS URL.

Restrictions for the CNS Image Agent

During automated image loading operations you must try to prevent the Cisco IOS device from losing connectivity with the file server that is providing the image. Image reloading is subject to memory issues and connection issues. Boot options must also be configured to allow the Cisco IOS device to boot another image if the first image reload fails.

These other restrictions apply to the image agent running on a the switch:

- You can only download the tar image file. Downloading the bin image file is not supported.
- Only the immediate download option is supported. You cannot schedule a download to occur at a specified date and time.
- The Destination field in the Associate Image with Device window is not supported.

For more details, see your CNS IE2100 documentation and see the “File Management” section of the Cisco IOS Configuration Fundamentals Configuration Guide, Release 12.2.

Beginning in privileged EXEC mode, follow these steps to initiate the image agent to check for a new image and upgrade a device:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip host [ip-address] [hostname]</td>
</tr>
<tr>
<td>Step 3</td>
<td>cns trusted-server all-agents [hostname]</td>
</tr>
<tr>
<td>Step 4</td>
<td>no cns aaa enable cns event [ip-address] [port number]</td>
</tr>
</tbody>
</table>
Displaying CNS Configuration

You can use the privileged EXEC commands in Table 4-2 to display CNS configuration information.

Table 4-2   Displaying CNS Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show cns config connections</td>
<td>Displays the status of the CNS Cisco IOS agent connections.</td>
</tr>
<tr>
<td>show cns config outstanding</td>
<td>Displays information about incremental (partial) CNS configurations that have started but are not yet completed.</td>
</tr>
<tr>
<td>show cns config stats</td>
<td>Displays statistics about the Cisco IOS agent.</td>
</tr>
<tr>
<td>show cns event connections</td>
<td>Displays the status of the CNS event agent connections.</td>
</tr>
<tr>
<td>show cns event stats</td>
<td>Displays statistics about the CNS event agent.</td>
</tr>
<tr>
<td>show cns event subject</td>
<td>Displays a list of event agent subjects that are subscribed to by applications.</td>
</tr>
</tbody>
</table>
Administering the Switch

This chapter describes how to perform one-time operations to administer the Cisco ME 3400E Ethernet Access switch.

This chapter consists of these sections:

- Managing the System Time and Date, page 5-1
- Configuring a System Name and Prompt, page 5-14
- Creating a Banner, page 5-17
- Managing the MAC Address Table, page 5-19
- Managing the ARP Table, page 5-28

Managing the System Time and Date

You can manage the system time and date on your switch using automatic configuration, such as the Network Time Protocol (NTP), or manual configuration methods.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

These sections contain this configuration information:

- Understanding the System Clock, page 5-2
- Understanding Network Time Protocol, page 5-2
- Configuring NTP, page 5-4
- Configuring Time and Date Manually, page 5-11
Understanding the System Clock

The heart of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- NTP
- Manual configuration

The system clock can provide time to these services:

- User `show` commands
- Logging and debugging messages

The system clock keeps track of time internally based on Universal Time Coordinated (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed. For configuration information, see the “Configuring Time and Date Manually” section on page 5-11.

Understanding Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.
Cisco’s implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 5-1 shows a typical network example using NTP. Switch A is the NTP master, with Switches B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F.

If the network is isolated from the Internet, Cisco’s implementation of NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.
Configuring NTP

The switch does not have a hardware-supported clock and cannot function as an NTP master clock to which peers synchronize themselves when an external NTP source is not available. The switch also has no hardware support for a calendar. As a result, the ntp update-calendar and the ntp master global configuration commands are not available.

These sections contain this configuration information:

- Default NTP Configuration, page 5-4
- Configuring NTP Authentication, page 5-4
- Configuring NTP Associations, page 5-5
- Configuring NTP Broadcast Service, page 5-6
- Configuring NTP Access Restrictions, page 5-8
- Configuring the Source IP Address for NTP Packets, page 5-10
- Displaying the NTP Configuration, page 5-11

Default NTP Configuration

Table 5-1 shows the default NTP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTP authentication</td>
<td>Disabled. No authentication key is specified.</td>
</tr>
<tr>
<td>NTP peer or server associations</td>
<td>None configured.</td>
</tr>
<tr>
<td>NTP broadcast service</td>
<td>Disabled; no interface sends or receives NTP broadcast packets.</td>
</tr>
<tr>
<td>NTP access restrictions</td>
<td>No access control is specified.</td>
</tr>
<tr>
<td>NTP packet source IP address</td>
<td>The source address is set by the outgoing interface.</td>
</tr>
</tbody>
</table>

NTP is enabled on all interfaces by default. All interfaces receive NTP packets.

Configuring NTP Authentication

This procedure must be coordinated with the administrator of the NTP server; the information you configure in this procedure must be matched by the servers used by the switch to synchronize its time to the NTP server.

Beginning in privileged EXEC mode, follow these steps to authenticate the associations (communications between devices running NTP that provide for accurate timekeeping) with other devices for security purposes:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ntp authenticate</td>
<td>Enable the NTP authentication feature, which is disabled by default.</td>
</tr>
</tbody>
</table>
To disable NTP authentication, use the no ntp authenticate global configuration command. To remove an authentication key, use the no ntp authentication-key number global configuration command. To disable authentication of the identity of a device, use the no ntp trusted-key key-number global configuration command.

This example shows how to configure the switch to synchronize only to devices providing authentication key 42 in the device’s NTP packets:

Switch(config)# ntp authenticate
Switch(config)# ntp authentication-key 42 md5 aNiceKey
Switch(config)# ntp trusted-key 42

**Configuring NTP Associations**

An NTP association can be a peer association (this switch can either synchronize to the other device or allow the other device to synchronize to it), or it can be a server association (meaning that only this switch synchronizes to the other device, and not the other way around).

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ntp authentication-key number md5 value</td>
<td>Define the authentication keys. By default, none are defined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <strong>number</strong>, specify a key number. The range is 1 to 4294967295.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>md5</strong> specifies that message authentication support is provided using the message digest algorithm 5 (MD5).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For <strong>value</strong>, enter an arbitrary string of up to eight characters for the key.</td>
</tr>
</tbody>
</table>

The switch does not synchronize to a device unless both have one of these authentication keys, and the key number is specified by the ntp trusted-key key-number command.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ntp trusted-key key-number</td>
<td>Specify one or more key numbers (defined in Step 3) that a peer NTP device must provide in its NTP packets for this switch to synchronize to it.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>By default, no trusted keys are defined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For <strong>key-number</strong>, specify the key defined in Step 3.</td>
</tr>
</tbody>
</table>

This command provides protection against accidentally synchronizing the switch to a device that is not trusted.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntp authenticate</td>
</tr>
<tr>
<td>ntp authentication-key number</td>
</tr>
<tr>
<td>ntp trusted-key key-number</td>
</tr>
</tbody>
</table>

---

5-5

Cisco ME 3400E Ethernet Access Switch Software Configuration Guide
Beginning in privileged EXEC mode, follow these steps to form an NTP association with another device:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ntp peer ip-address [version number] [key keyid] [source interface] [prefer]</td>
<td>Configure the switch system clock to synchronize a peer or to be synchronized by a peer (peer association).</td>
</tr>
<tr>
<td>or ntp server ip-address [version number] [key keyid] [source interface] [prefer]</td>
<td>Configure the switch system clock to be synchronized by a time server (server association).</td>
</tr>
</tbody>
</table>

No peer or server associations are defined by default.

- For ip-address in a peer association, specify either the IP address of the peer providing, or being provided, the clock synchronization. For a server association, specify the IP address of the time server providing the clock synchronization.
- (Optional) For number, specify the NTP version number. The range is 1 to 3. By default, Version 3 is selected.
- (Optional) For keyid, enter the authentication key defined with the ntp authentication-key global configuration command.
- (Optional) For interface, specify the interface from which to pick the IP source address. By default, the source IP address is taken from the outgoing interface.
- (Optional) Enter the prefer keyword to make this peer or server the preferred one that provides synchronization. This keyword reduces switching back and forth between peers and servers.

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Step 2</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
<td>Verify your entries.</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>

You need to configure only one end of an association; the other device can automatically establish the association. If you are using the default NTP version (Version 3) and NTP synchronization does not occur, try using NTP Version 2. Many NTP servers on the Internet run Version 2.

To remove a peer or server association, use the no ntp peer ip-address or the no ntp server ip-address global configuration command.

This example shows how to configure the switch to synchronize its system clock with the clock of the peer at IP address 172.16.22.44 using NTP Version 2:

```
Switch(config)# ntp server 172.16.22.44 version 2
```

### Configuring NTP Broadcast Service

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP addresses of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, the information flow is one-way only.
The switch can send or receive NTP broadcast packets on an interface-by-interface basis if there is an NTP broadcast server, such as a router, broadcasting time information on the network. The switch can send NTP broadcast packets to a peer so that the peer can synchronize to it. The switch can also receive NTP broadcast packets to synchronize its own clock. This section provides procedures for both sending and receiving NTP broadcast packets.

Beginning in privileged EXEC mode, follow these steps to configure the switch to send NTP broadcast packets to peers so that they can synchronize their clock to the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to send NTP broadcast packets, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, user network interfaces (UNIs) and enhanced network interfaces (ENIs) are disabled, and network node interfaces (NNIs) are enabled.</td>
</tr>
</tbody>
</table>
| Step 4 ntp broadcast [version number] [key keyid] [destination-address] | Enable the interface to send NTP broadcast packets to a peer. By default, this feature is disabled on all interfaces.  
  • (Optional) For number, specify the NTP version number. The range is 1 to 3. If you do not specify a version, Version 3 is used.  
  • (Optional) For keyid, specify the authentication key to use when sending packets to the peer.  
  • (Optional) For destination-address, specify the IP address of the peer that is synchronizing its clock to this switch. |
| Step 5 end                                   | Return to privileged EXEC mode.                                         |
| Step 6 show running-config                   | Verify your entries.                                                   |
| Step 7 copy running-config startup-config    | (Optional) Save your entries in the configuration file.                |
| Step 8                                       | Configure the connected peers to receive NTP broadcast packets as described in the next procedure. |

To disable the interface from sending NTP broadcast packets, use the no ntp broadcast interface configuration command.

This example shows how to configure a port to send NTP Version 2 packets:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast version 2
```

Beginning in privileged EXEC mode, follow these steps to configure the switch to receive NTP broadcast packets from connected peers:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to receive NTP broadcast packets, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and enhanced network interfaces (ENIs) are disabled, and NNIs are enabled.</td>
</tr>
</tbody>
</table>
Managing the System Time and Date

Chapter 5  Administering the Switch

Managing the System Time and Date

To disable an interface from receiving NTP broadcast packets, use the `no ntp broadcast client` interface configuration command. To change the estimated round-trip delay to the default, use the `no ntp broadcastdelay` global configuration command.

This example shows how to configure a port to receive NTP broadcast packets:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast client
```

### Configuring NTP Access Restrictions

You can control NTP access on two levels as described in these sections:

- Creating an Access Group and Assigning a Basic IP Access List, page 5-8
- Disabling NTP Services on a Specific Interface, page 5-10

#### Creating an Access Group and Assigning a Basic IP Access List

Beginning in privileged EXEC mode, follow these steps to control access to NTP services by using access lists:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`ntp access-group {query-only</td>
</tr>
<tr>
<td></td>
<td><code>query-only</code>—Allows only NTP control queries.</td>
</tr>
<tr>
<td></td>
<td><code>serve-only</code>—Allows only time requests.</td>
</tr>
<tr>
<td></td>
<td><code>serve</code>—Allows time requests and NTP control queries, but does not allow the switch to synchronize to the remote device.</td>
</tr>
<tr>
<td></td>
<td><code>peer</code>—Allows time requests and NTP control queries and allows the switch to synchronize to the remote device.</td>
</tr>
</tbody>
</table>

For `access-list-number`, enter a standard IP access list number from 1 to 99.
The access group keywords are scanned in this order, from least restrictive to most restrictive:

1. **peer**—Allows time requests and NTP control queries and allows the switch to synchronize itself to a device whose address passes the access list criteria.

2. **serve**—Allows time requests and NTP control queries, but does not allow the switch to synchronize itself to a device whose address passes the access list criteria.

3. **serve-only**—Allows only time requests from a device whose address passes the access list criteria.

4. **query-only**—Allows only NTP control queries from a device whose address passes the access list criteria.

If the source IP address matches the access lists for more than one access type, the first type is granted.

If no access groups are specified, all access types are granted to all devices. If any access groups are specified, only the specified access types are granted.

To remove access control to the switch NTP services, use the `no ntp access-group {query-only | serve-only | serve | peer}` global configuration command.

This example shows how to configure the switch to allow itself to synchronize to a peer from access list 99. However, the switch restricts access to allow only time requests from access list 42:

```
Switch# configure terminal
Switch(config)# ntp access-group peer 99
Switch(config)# ntp access-group serve-only 42
Switch(config)# access-list 99 permit 172.20.130.5
Switch(config)# access-list 42 permit 172.20.130.6
```
Disabling NTP Services on a Specific Interface

NTP services are enabled on all interfaces by default.

Beginning in privileged EXEC mode, follow these steps to disable NTP packets from being received on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Enter interface configuration mode, and specify the interface to disable.</td>
</tr>
<tr>
<td>no shutdown</td>
<td>Disable NTP packets from being received on the interface.</td>
</tr>
<tr>
<td>ntp disable</td>
<td>Disable NTP packets from being received on the interface.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To re-enable receipt of NTP packets on an interface, use the no ntp disable interface configuration command.

Configuring the Source IP Address for NTP Packets

When the switch sends an NTP packet, the source IP address is normally set to the address of the interface through which the NTP packet is sent. Use the ntp source global configuration command when you want to use a particular source IP address for all NTP packets. The address is taken from the specified interface. This command is useful if the address on an interface cannot be used as the destination for reply packets.

Beginning in privileged EXEC mode, follow these steps to configure a specific interface from which the IP source address is to be taken:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ntp source type number</td>
<td>Specify the interface type and number from which the IP source address is taken.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The specified interface is used for the source address for all packets sent to all destinations. If a source address is to be used for a specific association, use the source keyword in the ntp peer or ntp server global configuration command as described in the “Configuring NTP Associations” section on page 5-5.
Displaying the NTP Configuration

You can use two privileged EXEC commands to display NTP information:

- `show ntp associations [detail]`
- `show ntp status`

For detailed information about the fields in these displays, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.2*.

Configuring Time and Date Manually

If no other source of time is available, you can manually configure the time and date after the system is restarted. The time remains accurate until the next system restart. We recommend that you use manual configuration only as a last resort. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

These sections contain this configuration information:

- Setting the System Clock, page 5-11
- Displaying the Time and Date Configuration, page 5-12
- Configuring the Time Zone, page 5-12
- Configuring Summer Time (Daylight Saving Time), page 5-13

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Beginning in privileged EXEC mode, follow these steps to set the system clock:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>clock set <a href="">hh:mm:ss</a> day month year</td>
</tr>
<tr>
<td>or</td>
<td>clock set <a href="">hh:mm:ss</a> month day</td>
</tr>
<tr>
<td></td>
<td>Manually set the system clock using one of these formats.</td>
</tr>
<tr>
<td></td>
<td>• For <code>hh:mm:ss</code>, specify the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone.</td>
</tr>
<tr>
<td></td>
<td>• For <code>day</code>, specify the day by date in the month.</td>
</tr>
<tr>
<td></td>
<td>• For <code>month</code>, specify the month by name.</td>
</tr>
<tr>
<td></td>
<td>• For <code>year</code>, specify the year (no abbreviation).</td>
</tr>
</tbody>
</table>

This example shows how to manually set the system clock to 1:32 p.m. on July 23, 2001:

```
Switch# clock set 13:32:00 23 July 2001
```
Displaying the Time and Date Configuration

To display the time and date configuration, use the `show clock [detail]` privileged EXEC command.

The system clock keeps an *authoritative* flag that shows whether the time is authoritative (believed to be accurate). If the system clock has been set by a timing source such as NTP, the flag is set. If the time is not authoritative, it is used only for display purposes. Until the clock is authoritative and the *authoritative* flag is set, the flag prevents peers from synchronizing to the clock when the peers’ time is invalid.

The symbol that precedes the `show clock` display has this meaning:

- *—Time is not authoritative.
- (blank)—Time is authoritative.
- .—Time is authoritative, but NTP is not synchronized.

Configuring the Time Zone

Beginning in privileged EXEC mode, follow these steps to manually configure the time zone:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>clock timezone <code>zone hours-offset</code> <code>[minutes-offset]</code></td>
<td>Set the time zone.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The `minutes-offset` variable in the `clock timezone` global configuration command is available for those cases where a local time zone is a percentage of an hour different from UTC. For example, the time zone for some sections of Atlantic Canada (AST) is UTC-3.5, where the 3 means 3 hours and .5 means 50 percent. In this case, the necessary command is `clock timezone AST -3 30`.

To set the time to UTC, use the `no clock timezone` global configuration command.
Configuring Summer Time (Daylight Saving Time)

Beginning in privileged EXEC mode, follow these steps to configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]</td>
<td>Configure summer time to start and end on the specified days every year.</td>
</tr>
<tr>
<td></td>
<td>Summer time is disabled by default. If you specify clock summer-time zone recurring without parameters, the summer time rules default to the United States rules.</td>
</tr>
<tr>
<td></td>
<td>• For zone, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For week, specify the week of the month (1 to 5 or last).</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For day, specify the day of the week (Sunday, Monday...).</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For month, specify the month (January, February...).</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For hh:mm, specify the time (24-hour format) in hours and minutes.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For offset, specify the number of minutes to add during summer time. The default is 60.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The first part of the clock summer-time global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

This example shows how to specify that summer time starts on the first Sunday in April at 02:00 and ends on the last Sunday in October at 02:00:

```
Switch(config)# clock summer-time PDT recurring 1 Sunday April 2:00 last Sunday October 2:00
```
Beginning in privileged EXEC mode, follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>clock summer-time zone date [month date year hh:mm month date year hh:mm [offset]]</td>
</tr>
<tr>
<td></td>
<td>or clock summer-time zone date [date month year hh:mm date month year hh:mm [offset]]</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

The first part of the `clock summer-time` global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

To disable summer time, use the `no clock summer-time` global configuration command.

This example shows how to set summer time to start on October 12, 2000, at 02:00, and end on April 26, 2001, at 02:00:

`Switch(config)# clock summer-time pdt date 12 October 2000 2:00 26 April 2001 2:00`

### Configuring a System Name and Prompt

You configure the system name on the switch to identify it. By default, the system name and prompt are `Switch`.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol `>` is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 and the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2.
These sections contain this configuration information:

- Default System Name and Prompt Configuration, page 5-15
- Configuring a System Name, page 5-15
- Understanding DNS, page 5-15

**Default System Name and Prompt Configuration**

The default switch system name and prompt is *Switch*.

**Configuring a System Name**

Beginning in privileged EXEC mode, follow these steps to manually configure a system name:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>hostname name</td>
<td>Manually configure a system name. The default setting is <em>switch</em>. The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters.</td>
</tr>
<tr>
<td>3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>4</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

When you set the system name, it is also used as the system prompt.

To return to the default hostname, use the **no hostname** global configuration command.

**Understanding DNS**

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as ping, telnet, connect, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a *com* domain name, so its domain name is cisco.com. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as ftp.cisco.com.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.
These sections contain this configuration information:

- Default DNS Configuration, page 5-16
- Setting Up DNS, page 5-16
- Displaying the DNS Configuration, page 5-17

**Default DNS Configuration**

Table 5-2 shows the default DNS configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled.</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

**Setting Up DNS**

Beginning in privileged EXEC mode, follow these steps to set up your switch to use the DNS:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip domain-name name</td>
<td>Define a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name). Do not include the initial period that separates an unqualified name from the domain name. At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td>Step 3 ip name-server server-address1 [server-address2 ... server-address6]</td>
<td>Specify the address of one or more name servers to use for name and address resolution. You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</td>
</tr>
<tr>
<td>Step 4 ip domain-lookup</td>
<td>(Optional) Enable DNS-based hostname-to-address translation on your switch. This feature is enabled by default. If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Creating a Banner

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner displays on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner also displays on all connected terminals. It appears after the MOTD banner and before the login prompts.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

These sections contain this configuration information:

- Default Banner Configuration, page 5-17
- Configuring a Message-of-the-Day Login Banner, page 5-18
- Configuring a Login Banner, page 5-19

Default Banner Configuration

The MOTD and login banners are not configured.
Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

Beginning in privileged EXEC mode, follow these steps to configure a MOTD login banner:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: banner motd \textit{c} message \textit{c}</td>
<td>Specify the message of the day. For \textit{c}, enter the delimiting character of your choice, for example, a pound sign (#), and press the \textbf{Return} key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. For \textit{message}, enter a banner message up to 255 characters. You cannot use the delimiting character in the message.</td>
</tr>
<tr>
<td>Step 3: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4: show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5: copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete the MOTD banner, use the \textbf{no banner motd} global configuration command.

This example shows how to configure a MOTD banner for the switch by using the pound sign (#) symbol as the beginning and ending delimiter:

\texttt{Switch(config)# banner motd #}
\texttt{This is a secure site. Only authorized users are allowed.}
\texttt{For access, contact technical support.}
\texttt{#}
\texttt{Switch(config)#}

This example shows the banner that appears from the previous configuration:

\texttt{Unix> telnet 172.2.5.4}
\texttt{Trying 172.2.5.4...}
\texttt{Connected to 172.2.5.4.}
\texttt{Escape character is '^]'.}

This is a secure site. Only authorized users are allowed.
For access, contact technical support.

User Access Verification
Password:
Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Beginning in privileged EXEC mode, follow these steps to configure a login banner:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>banner login $message $</td>
<td>Specify the login message.</td>
</tr>
<tr>
<td></td>
<td>For $, enter the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.</td>
</tr>
<tr>
<td></td>
<td>For message, enter a login message up to 255 characters. You cannot use the delimiting character in the message.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete the login banner, use the **no banner login** global configuration command.

This example shows how to configure a login banner for the switch by using the dollar sign ($) symbol as the beginning and ending delimiter:

```
Switch(config)# banner login $ 
Access for authorized users only. Please enter your username and password. $ 
Switch(config)#
```

Managing the MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address: a source MAC address that the switch learns and then ages when it is not in use.
- Static address: a manually entered unicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

**Note**

For complete syntax and usage information for the commands used in this section, see the command reference for this release.

These sections contain this configuration information:

- **Building the Address Table, page 5-20**
Building the Address Table

With multiple MAC addresses supported on all ports, you can connect any port on the switch to individual workstations, repeaters, switches, routers, or other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As stations are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 1, 9, and 10 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

When private VLANs are configured, address learning depends on the type of MAC address:

- Dynamic MAC addresses learned in one VLAN of a private VLAN are replicated in the associated VLANs. For example, a MAC address learned in a private-VLAN secondary VLAN is replicated in the primary VLAN.
- Static MAC addresses configured in a primary or secondary VLAN are not replicated in the associated VLANs. When you configure a static MAC address in a private VLAN primary or secondary VLAN, you should also configure the same static MAC address in all associated VLANs.

For more information about private VLANs, see Chapter 13, “Configuring Private VLANs.”
You can disable MAC address learning on a per-VLAN basis. Customers in a service provider network can tunnel a large number of MAC addresses through the network and fill up the available MAC address table space. You can control MAC address learning on a VLAN and manage the MAC address table space that is available on the switch by controlling which VLANs, and therefore which ports, can learn MAC addresses.

Before you disable MAC address learning, be sure that you are familiar with the network topology and the switch system configuration. Disabling MAC address learning on a VLAN could cause flooding in the network. See the “Disabling MAC Address Learning on a VLAN” section on page 5-26 for more information.

## Default MAC Address Table Configuration

Table 5-3 shows the default MAC address table configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
<tr>
<td>MAC address learning on VLANs</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

## Changing the Address Aging Time

Dynamic addresses are source MAC addresses that the switch learns and then ages when they are not in use. You can change the aging time setting for all VLANs or for a specified VLAN.

Setting too short an aging time can cause addresses to be prematurely removed from the table. Then when the switch receives a packet for an unknown destination, it floods the packet to all ports in the same VLAN as the receiving port. This unnecessary flooding can impact performance. Setting too long an aging time can cause the address table to be filled with unused addresses, which prevents new addresses from being learned. Flooding results, which can impact switch performance.

Beginning in privileged EXEC mode, follow these steps to configure the dynamic address table aging time:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>mac address-table aging-time [0</td>
<td>Set the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated.</td>
</tr>
<tr>
<td></td>
<td>10-1000000] [vlan vlan-id]</td>
<td>The range is 10 to 1000000 seconds. The default is 300. You can also enter 0, which disables aging. Static address entries are never aged or removed from the table. For vlan-id, valid IDs are 1 to 4094. Do not enter leading zeros.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

To return to the default value, use the `no mac address-table aging-time` global configuration command.

### Removing Dynamic Address Entries

To remove all dynamic entries, use the `clear mac address-table dynamic` command in privileged EXEC mode. You can also remove a specific MAC address (`clear mac address-table dynamic address mac-address`), remove all addresses on the specified physical port or port channel (`clear mac address-table dynamic interface interface-id`), or remove all addresses on a specified VLAN (`clear mac address-table dynamic vlan vlan-id`).

To verify that dynamic entries have been removed, use the `show mac address-table dynamic` privileged EXEC command.

### Configuring MAC Address Notification Traps

MAC address notification enables you to track users on a network by storing the MAC address activity on the switch. Whenever the switch learns or removes a MAC address, an SNMP notification can be generated and sent to the NMS. If you have many users coming and going from the network, you can set a trap interval time to bundle the notification traps and reduce network traffic. The MAC notification history table stores the MAC address activity for each hardware port for which the trap is enabled. MAC address notifications are generated for dynamic and secure MAC addresses; events are not generated for self addresses, multicast addresses, or other static addresses.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mac address-table aging-time</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Beginning in privileged EXEC mode, follow these steps to configure the switch to send MAC address notification traps to an NMS host:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type | Specify the recipient of the trap message.  
• For host-addr, specify the name or address of the NMS.  
• Specify traps (the default) to send SNMP traps to the host. Specify informs to send SNMP informs to the host.  
• Specify the SNMP version to support. Version 1, the default, is not available with informs.  
• For community-string, specify the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command.  
• For notification-type, use the mac-notification keyword. |

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp-server enable traps mac-notification</td>
<td>Enable the switch to send MAC address traps to the NMS.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac address-table notification</td>
<td>Enable the MAC address notification feature.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| mac address-table notification [interval value] | Enter the trap interval time and the history table size.  
• (Optional) For interval value, specify the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second.  
• (Optional) For history-size value, specify the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1. |

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 2 interface on which to enable the SNMP MAC address notification trap.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and enhanced network interfaces (ENIs) are disabled, and NNIs are enabled.</td>
<td></td>
</tr>
</tbody>
</table>
Managing the MAC Address Table

To disable the switch from sending MAC address notification traps, use the `no snmp-server enable traps mac-notification` global configuration command. To disable the MAC address notification traps on a specific interface, use the `no snmp trap mac-notification {added | removed}` interface configuration command. To disable the MAC address notification feature, use the `no mac address-table notification` global configuration command.

This example shows how to specify 172.20.10.10 as the NMS, enable the switch to send MAC address notification traps to the NMS, enable the MAC address notification feature, set the interval time to 60 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port.

```
Switch(config)# snmp-server host 172.20.10.10 traps private
Switch(config)# snmp-server enable traps mac-notification
Switch(config)# mac address-table notification interval 60
Switch(config)# mac address-table notification history-size 100
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# snmp trap mac-notification added
```

You can verify the previous commands by entering the `show mac address-table notification interface` and the `show mac address-table notification` privileged EXEC commands.

### Adding and Removing Static Address Entries

A static address has these characteristics:

- It is manually entered in the address table and must be manually removed.
- It can be a unicast or multicast address.
- It does not age and is retained when the switch restarts.

You can add and remove static addresses and define the forwarding behavior for them. The forwarding behavior defines how a port that receives a packet forwards it to another port for transmission. Because all ports are associated with at least one VLAN, the switch acquires the VLAN ID for the address from the ports that you specify. You can specify a different list of destination ports for each source port.

A packet with a static address that arrives on a VLAN where it has not been statically entered is flooded to all ports and not learned.

You add a static address to the address table by specifying the destination MAC unicast address and the VLAN from which it is received. Packets received with this destination address are forwarded to the interface specified with the `interface-id` option.
When you configure a static MAC address in a private-VLAN primary or secondary VLAN, you should also configure the same static MAC address in all associated VLANs. Static MAC addresses configured in a private-VLAN primary or secondary VLAN are not replicated in the associated VLAN. For more information about private VLANs, see Chapter 13, “Configuring Private VLANs.”

Beginning in privileged EXEC mode, follow these steps to add a static address:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>mac address-table static mac-addr vlan vlan-id interface interface-id</td>
</tr>
<tr>
<td></td>
<td>• For mac-addr, specify the destination MAC unicast address to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.</td>
</tr>
<tr>
<td></td>
<td>• For vlan-id, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094; do not enter leading zeros.</td>
</tr>
<tr>
<td></td>
<td>• For interface-id, specify the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels. For static multicast addresses, you can enter multiple interface IDs. For static unicast addresses, you can enter only one interface at a time, but you can enter the command multiple times with the same MAC address and VLAN ID.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show mac address-table static</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove static entries from the address table, use the no mac address-table static mac-addr vlan vlan-id [interface interface-id] global configuration command.

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet0/1

### Configuring Unicast MAC Address Filtering

When unicast MAC address filtering is enabled, the switch drops packets with specific source or destination MAC addresses. This feature is disabled by default and only supports unicast static addresses.

Follow these guidelines when using this feature:

- Multicast MAC addresses, broadcast MAC addresses, and router MAC addresses are not supported. If you specify one of these addresses when entering the mac address-table static mac-addr vlan vlan-id drop global configuration command, one of these messages appears:
  - % Only unicast addresses can be configured to be dropped
  - % CPU destined address cannot be configured as drop address
• Packets that are forwarded to the CPU are also not supported.

• If you add a unicast MAC address as a static address and configure unicast MAC address filtering, the switch either adds the MAC address as a static address or drops packets with that MAC address, depending on which command was entered last. The second command that you entered overrides the first command.

For example, if you enter the `mac address-table static mac-addr vlan vlan-id interface interface-id` global configuration command followed by the `mac address-table static mac-addr vlan vlan-id drop` command, the switch drops packets with the specified MAC address as a source or destination.

If you enter the `mac address-table static mac-addr vlan vlan-id drop` global configuration command followed by the `mac address-table static mac-addr vlan vlan-id interface interface-id` command, the switch adds the MAC address as a static address.

You enable unicast MAC address filtering and configure the switch to drop packets with a specific address by specifying the source or destination unicast MAC address and the VLAN from which it is received.

Beginning in privileged EXEC mode, follow these steps to configure the switch to drop a source or destination unicast static address:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> mac address-table static mac-addr vlan vlan-id drop</td>
<td>Enable unicast MAC address filtering and configure the switch to drop a packet with the specified source or destination unicast static address.</td>
</tr>
<tr>
<td></td>
<td>• For <code>mac-addr</code>, specify a source or destination unicast MAC address.</td>
</tr>
<tr>
<td></td>
<td>Packets with this MAC address are dropped.</td>
</tr>
<tr>
<td></td>
<td>• For <code>vlan-id</code>, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.</td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> show mac address-table static</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable unicast MAC address filtering, use the `no mac address-table static mac-addr vlan vlan-id` global configuration command.

This example shows how to enable unicast MAC address filtering and to configure the switch to drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

### Disabling MAC Address Learning on a VLAN

By default, MAC address learning is enabled on all VLANs on the switch. You can control MAC address learning on a VLAN to manage the available MAC address table space by controlling which VLANs, and therefore which ports, can learn MAC addresses. Before you disable MAC address learning be sure that you are familiar with the network topology and the switch system configuration. Disabling MAC address learning on a VLAN could cause flooding in the network.
Follow these guidelines when disabling MAC address learning on a VLAN:

- Use caution before disabling MAC address learning on a VLAN with a configured switch virtual interface (SVI). The switch then floods all IP packets in the Layer 2 domain.
- We recommend that you disable MAC address learning only in VLANs with two ports. If you disable MAC address learning on a VLAN with more than two ports, every packet entering the switch is flooded in that VLAN domain.
- You cannot disable MAC address learning on a VLAN that is used internally by the switch. If the VLAN ID that you enter is an internal VLAN, the switch generates an error message and rejects the command. To view internal VLANs in use, enter the `show vlan internal usage` privileged EXEC command.
- If you disable MAC address learning on a VLAN configured as a private-VLAN primary VLAN, MAC addresses are still learned on the secondary VLAN that belongs to the private VLAN and are then replicated on the primary VLAN. If you disable MAC address learning on the secondary VLAN, but not the primary VLAN of a private VLAN, MAC address learning occurs on the primary VLAN and is replicated on the secondary VLAN.
- You cannot disable MAC address learning on an RSPAN VLAN. The configuration is not allowed.
- If you disable MAC address learning on a VLAN that includes a secure port, MAC address learning is not disabled on that port. If you disable port security, the configured MAC address learning state is enabled.

Beginning in privileged EXEC mode, follow these steps to disable MAC address learning on a VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>no mac address-table learning vlan vlan-id</td>
</tr>
<tr>
<td></td>
<td>Disable MAC address learning on the specified VLAN. Valid VLAN IDs are 1 to 4094.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show mac address-table learning [vlan vlan-id]</td>
</tr>
<tr>
<td></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To reenable MAC address learning on a VLAN, use the `default mac address-table learning vlan vlan-id` global configuration command. You can also reenable MAC address learning on a VLAN by entering the `mac address-table learning vlan vlan-id` global configuration command. The first `(default)` command returns to a default condition and therefore does not appear in the output from the `show running-config` command. The second command causes the configuration to appear in the `show running-config` privileged EXEC command display.

This example shows how to disable MAC address learning on VLAN 200:

```bash
Switch(config)# no mac address-table learning vlan 200
```

You can display the MAC address learning status of all VLANs or a specified VLAN by entering the `show mac-address-table learning [vlan vlan-id]` privileged EXEC command.
Displaying Address Table Entries

You can display the MAC address table by using one or more of the privileged EXEC commands described in Table 5-4:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip igmp snooping groups</td>
<td>Displays the Layer 2 multicast entries for all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table address</td>
<td>Displays MAC address table information for the specified MAC address.</td>
</tr>
<tr>
<td>show mac address-table aging-time</td>
<td>Displays the aging time in all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table count</td>
<td>Displays the number of addresses present in all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table dynamic</td>
<td>Displays only dynamic MAC address table entries.</td>
</tr>
<tr>
<td>show mac address-table interface</td>
<td>Displays the MAC address table information for the specified interface.</td>
</tr>
<tr>
<td>show mac address-table learning</td>
<td>Displays MAC address learning status of all VLANs or the specified VLAN.</td>
</tr>
<tr>
<td>show mac address-table notification</td>
<td>Displays the MAC notification parameters and history table.</td>
</tr>
<tr>
<td>show mac address-table static</td>
<td>Displays only static MAC address table entries.</td>
</tr>
<tr>
<td>show mac address-table vlan</td>
<td>Displays the MAC address table information for the specified VLAN.</td>
</tr>
</tbody>
</table>

Managing the ARP Table

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called *address resolution*.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the `arpa` keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.2 documentation on Cisco.com.
Configuring the Switch Alarms

On the ME 3400E switch, you can configure external alarm inputs, as well as alarms to identify a missing or malfunctioning power supply or a power supply with no input.

- Configuring External Alarms, page 6-1
- Configuring Power Supply Alarms, page 6-3

Configuring External Alarms

You can connect up to four alarm inputs from external devices in your environment, such as a door, a temperature gauge, or a fire alarm, to the alarm input port on the switch front panel. Figure 6-1 shows the location of the alarm pinouts.

**Figure 6-1       Alarm Input Port Pinouts**

<table>
<thead>
<tr>
<th>Pin</th>
<th>Alarm connection</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Alarm 1 input</td>
<td>1</td>
<td></td>

<td></td>
</tr>
<tr>
<td>8</td>
<td>Alarm common</td>
<td>8</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For each alarm input, you can configure an open or closed circuit to trigger an alarm and configure the severity of the alarm. A triggered alarm generates an system message. If you enter a descriptive name for the alarm, that name is included in the system message. A triggered alarm also turns on the LED display (the LED is normally off, meaning no alarm). See the *Cisco ME-3400E Hardware Installation Guide* for information about the LEDs.
The alarm trigger setting is **open** or **closed**. If not set, the alarm is triggered when the circuit closes.

- Open means that the normal condition has current flowing through the contact (normally closed contact). The alarm is generated when the current stops flowing.
- Closed means that no current flows through the contact (normally open contact). The alarm is generated when current does flow.

You can set the alarm severity to **minor**, **major**, or **critical**. The severity is included in the alarm message and also sets the LED color when the alarm is triggered. The LED is amber for a minor alarm, red for a major alarm, and blinking red for a critical alarm. If not set, the default alarm severity is **minor**.

Beginning in privileged EXEC mode, follow these steps to configure alarm contacts.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> alarm-contact contact-number</td>
<td>(Optional) Configure a description for the alarm contact number.</td>
</tr>
<tr>
<td>description string</td>
<td>• The contact-number can be from 1 to 4.</td>
</tr>
<tr>
<td></td>
<td>• The description string can be up to 80 alphanumeric characters in</td>
</tr>
<tr>
<td></td>
<td>length and is included in any generated system messages.</td>
</tr>
<tr>
<td><strong>Step 3</strong> alarm-contact {contact-number</td>
<td>Configure the trigger and severity for an alarm contact number or for all</td>
</tr>
<tr>
<td></td>
<td>all} {severity {critical</td>
</tr>
<tr>
<td></td>
<td>trigger {closed</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show env alarm-contact</td>
<td>Show the configured alarm contacts.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete the alarm description, enter the **no alarm-contact contact-number description** privileged EXEC command. To set the alarm severity to **minor** (the default), enter the **no alarm-contact {contact-number | all} severity**. To set the alarm contact trigger to **closed** (the default), enter the **no alarm-contact {contact-number | all} trigger**.

To see the alarm configuration and status, enter the **show env alarm-contact** privileged EXEC command.

For more detailed information about the alarm commands, see the command reference for this release.

---

**Note**

The switch supports the CISCO-ENTITY-ALARM-MIB for these alarms.
This example configures alarm input 2 named door sensor to assert a major alarm when the door circuit is closed and then displays the status and configuration for all alarms:

```
Switch(config)# alarm-contact 2 description door sensor
Switch(config)# alarm-contact 2 severity major
Switch(config)# alarm-contact 2 trigger closed
Switch(config)# end
Switch(config)# show env alarm-contact
Switch# show env alarm-contact
ALARM CONTACT 1
  Status: not asserted
  Description: test_1
  Severity: critical
  Trigger: open
ALARM CONTACT 2
  Status: not asserted
  Description: door sensor
  Severity: major
  Trigger: closed
ALARM CONTACT 3
  Status: not asserted
  Description: flood sensor
  Severity: critical
  Trigger: closed
ALARM CONTACT 4
  Status: not asserted
  Description: 
  Severity: critical
  Trigger: closed
```

## Configuring Power Supply Alarms

Some switch models have two power supply slots that contain either AC- or DC- power supplies. The status and type of power supplied to each slot is shown by the switch LEDs. AC power supplies have corresponding AC-power inputs (AC 1 and AC 2), and DC-power supplies have two DC inputs (DC A and DC B).

The default power supply configuration is to have one power supply installed in slot 1 and the software configured for no power-supply dual. This suppresses any alarms triggered by not having two power supplies installed. When the switch is operating with two power supplies, we recommend you enter the power-supply dual global configuration command to trigger an alarm when one is missing or inoperable.

If you are using DC-power supplies, the most common practice is to have both DC inputs connected.

---

**Note**

The Cisco ME 3400EG-2CS-A switch does not support removable power supplies.

When the switch detects a power supply fault, it triggers an LED indicator and sends a system message. Power-supply alarm indications are sent when a power supply is missing, has no input, has insufficient output, or has a malfunctioning fan. Some of these alarm conditions are configurable.
Power-Supply-Missing Alarms

If you are operating the switch with a single power supply (AC or DC), you can suppress any alarm conditions associated with a missing power supply. Entering the `no power-supply dual` global configuration command (the default) specifies that only one power supply is expected to be present. Then the switch does not generate an alarm that a power supply is missing.

The `no power-supply dual` command controls only the sending of messages about the absence of a second power supply or the absence of input to the second power supply. The software detects whether a power supply is present and if there is an input voltage. When there is input, the software can detect if there is output voltage and if the fan is operating. These are possible conditions and results when only one power supply is expected:

- If only one power supply is present, no alarm is sent. However, if this power supply is connected to the AC input and is not receiving or sending power, a power supply fault message is sent.
- If two power supplies are present, and both are receiving and sending power, no message is sent.
- If two power supplies are present, and one is connected and operating and the other is not connected to the AC input, no message is sent.
- If two power supplies are present and both are connected to AC inputs, but only one is receiving or sending power, a power supply fault message is sent.

**Note**

The switch always sends an error message when an AC-power supply connected to an AC input is not receiving or outputting power.

If you operate the switch with two power supplies, enter the `power-supply dual` global configuration command to configure the switch to send a message when one power supply is missing.

DC-Power-Supply Feed Alarms

The two DC-power supply inputs are bridged internally and fed to both power supply slots. When one or two DC-power supplies are installed, if the switch does not detect both DC inputs, it generates an LED alarm and a system message. If you want to use only one DC input, you can enter the `no power-supply dual dc-feed` global configuration command to disable sending alarm messages when the second DC input is not present. This command is valid only when DC-power supplies are installed in the switch.

Regardless of how this command is configured, if the expected DC-power inputs (one or two) are present and a problem is detected in the power supply, a faulty power-supply message is generated.

Beginning in privileged EXEC mode, follow these steps to configure power supply alarm messages.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>`no</td>
<td>power-supply dual`</td>
</tr>
<tr>
<td></td>
<td>- Enter <code>no power-supply dual</code> to suppress alarm indications for a missing power supply. This is the default.</td>
</tr>
<tr>
<td></td>
<td>- Enter <code>power-supply dual</code> to enable alarm indications for both power supplies.</td>
</tr>
</tbody>
</table>
Chapter 6  Configuring the Switch Alarms

Configuring Power Supply Alarms

You can verify switch power supply settings by entering the show env power user EXEC command. For more information about the commands, see the command reference for this release.

This example shows how to suppress alarm indications when a single power supply is present and to verify the configuration:

```
Switch(config)# no power-supply dual
Switch(config)# end
Switch# show env power
POWER SUPPLY 1 is AC OK
   AC Input : OK
   Output  : OK
   Fan     : OK
POWER SUPPLY 2 is NOT PRESENT
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3 [no] power-supply dual dc-feed</td>
<td>Specify if an alarm is generated when only DC power supply is installed and only one DC power input is present.</td>
</tr>
<tr>
<td></td>
<td>• Enter no power-supply dual dc-feed to suppress alarm indications for a missing DC power supply input.</td>
</tr>
<tr>
<td></td>
<td>• Enter power-supply dual dc-feed to enable alarm indications when a single DC power supply input is present. This is the default.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show env power</td>
<td>Show the configured power supply alarm indications.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

You can verify switch power supply settings by entering the show env power user EXEC command. For more information about the commands, see the command reference for this release.

This example shows how to suppress alarm indications when a single power supply is present and to verify the configuration:

```
Switch(config)# no power-supply dual
Switch(config)# end
Switch# show env power
POWER SUPPLY 1 is AC OK
   AC Input : OK
   Output  : OK
   Fan     : OK
POWER SUPPLY 2 is NOT PRESENT
```
Configuring SDM Templates

This chapter describes how to configure the Switch Database Management (SDM) templates on the Cisco ME 3400E Ethernet Access switch. SDM template configuration is supported only when the switch is running the metro IP access image.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:
- Understanding the SDM Templates, page 7-1
- Configuring the Switch SDM Template, page 7-2
- Displaying the SDM Templates, page 7-4

Understanding the SDM Templates

If the switch is running the metro IP access image, you can use SDM templates to optimize system resources in the switch to support specific features, depending on how the switch is used in the network. The SDM templates allocate TCAM resources to support different features. You can select the default template to balance system resources or select the layer-2 template to support only Layer 2 features in hardware.

Note
Switches running the metro access image support only the layer-2 template

- Layer-2—The layer-2 template maximizes system resources for Layer 2 functionality and does not support routing. You should use this template when the switch is being used for Layer-2 forwarding. When you select the layer-2 template on a switch running the metro IP access image, any routing is done through software, which overloads the CPU and severely degrades routing performance.
- Default—The default template gives balance to all functions: Layer 2 and Layer 3 (routing). This template is available only on switches running the metro IP access image. If you do not use the default template when routing is enabled on the switch, any routing is done through software, which overloads the CPU and severely degrades routing performance.
Table 7-1 shows the approximate number of each resource supported in each of the two IPv4 templates for a switch running the metro IP access image. The values in the template are based on eight routed interfaces and approximately 1024 VLANs and represent the approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.

**Table 7-1 Approximate Number of Feature Resources Allowed by Each Template**

<table>
<thead>

**Configuring the Switch SDM Template**

These sections contain this configuration information:
- Default SDM Template, page 7-2
- SDM Template Configuration Guidelines, page 7-2
- Setting the SDM Template, page 7-3

**Default SDM Template**

The default template for a switch running the metro IP access image is the default template.

The default (and only) template supported on switches running the metro access image is the layer-2 template.

**SDM Template Configuration Guidelines**

Follow these guidelines when selecting and configuring SDM templates:
- You must reload the switch for the configuration to take effect.
- If you are using the switch for Layer 2 features only, select the layer-2 template.
• Do not use the default template if you do not have routing enabled on your switch. The `sdm prefer default` global configuration command prevents other features from using the memory allocated to unicast routing in the routing template.

• You should use the default template when you plan to enable routing on the switch. If you do not use the default template when routing is enabled, routing is done through software, which overloads the CPU and severely degrades routing performance.

## Setting the SDM Template

Beginning in privileged EXEC mode, follow these steps to use the SDM template to select a template on a switch running the metro IP access image:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> sdm prefer {default</td>
<td>Specify the SDM template to be used on the switch:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> reload</td>
<td>Reload the operating system.</td>
</tr>
</tbody>
</table>

After the system reboots, you can use the `show sdm prefer` privileged EXEC command to verify the new template configuration. If you enter the `show sdm prefer` command before you enter the `reload` privileged EXEC command, the `show sdm prefer` command shows the template currently in use and the template that will become active after a reload.

This is an example of an output display when you have changed the template to the layer-2 template and have not reloaded the switch:

```
Switch# show sdm prefer
The current template is "default" template.
The selected template optimizes the resources in the switch to support this level of features for 8 routed interfaces and 1024 VLANs.

number of unicast mac addresses: 5K
number of IPv4 IGMP groups + multicast routes: 1K
number of IPv4 unicast routes: 9K
  number of directly-connected IPv4 hosts: 5K
  number of indirect IPv4 routes: 4K
number of IPv4 policy based routing aces: 0.5K
number of IPv4/MAC qos aces: 0.5K
number of IPv4/MAC security aces: 1K
```

To return to the default template, use the `no sdm prefer` global configuration command.
This example shows how to configure a switch with the layer-2 template.

Switch(config)# sdm prefer layer-2
Switch(config)# end
Switch# reload
Proceed with reload? [confirm]

Displaying the SDM Templates

Use the `show sdm prefer` privileged EXEC command with no parameters to display the active template. This is an example of output from the `show sdm prefer` command, displaying the template in use:

```
Switch# show sdm prefer
The current template is "default" template.
The selected template optimizes the resources in the switch to support this level of features for 8 routed interfaces and 1024 VLANs.

number of unicast mac addresses:                  5K
number of IPv4 IGMP groups + multicast routes:    1K
number of IPv4 unicast routes:                    9K
  number of directly-connected IPv4 hosts:         5K
  number of indirect IPv4 routes:                 4K
number of IPv4 policy based routing aces:         0.5K
number of IPv4/MAC qos aces:                      0.5K
number of IPv4/MAC security aces:                 1K
```

This is an example of output from the `show sdm prefer layer-2` command:

```
Switch# show sdm prefer layer-2
"layer-2" template:
The selected template optimizes the resources in the switch to support this level of features for 8 routed interfaces and 1024 VLANs.

number of unicast mac addresses:                  8K
number of IPv4 IGMP groups:                      1K
number of IPv4 multicast routes:                  0
number of IPv4 unicast routes:                    0
number of IPv4 policy based routing aces:         0
number of IPv4/MAC qos aces:                      0.5K
number of IPv4/MAC security aces:                 1K
```
Configuring Switch-Based Authentication

This chapter describes how to configure switch-based authentication on the Cisco ME 3400E switch. This chapter consists of these sections:

- Preventing Unauthorized Access to Your Switch, page 8-1
- Protecting Access to Privileged EXEC Commands, page 8-2
- Controlling Switch Access with TACACS+, page 8-9
- Controlling Switch Access with RADIUS, page 8-17
- Controlling Switch Access with Kerberos, page 8-32
- Configuring the Switch for Local Authentication and Authorization, page 8-36
- Configuring the Switch for Secure Shell, page 8-37
- Configuring the Switch for Secure Copy Protocol, page 8-41

Preventing Unauthorized Access to Your Switch

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

- At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch. For more information, see the “Protecting Access to Privileged EXEC Commands” section on page 8-2.
- For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair. For more information, see the “Configuring Username and Password Pairs” section on page 8-6.
If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information. For more information, see the “Controlling Switch Access with TACACS+” section on page 8-9.

Protecting Access to Privileged EXEC Commands

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Security Command Reference, Release 12.2.

These sections contain this configuration information:

- Default Password and Privilege Level Configuration, page 8-2
- Setting or Changing a Static Enable Password, page 8-3
- Protecting Enable and Enable Secret Passwords with Encryption, page 8-3
- Disabling Password Recovery, page 8-5
- Setting a Telnet Password for a Terminal Line, page 8-6
- Configuring Username and Password Pairs, page 8-6
- Configuring Multiple Privilege Levels, page 8-7

Default Password and Privilege Level Configuration

Table 8-1 shows the default password and privilege level configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.</td>
</tr>
<tr>
<td>Enable secret password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file.</td>
</tr>
<tr>
<td>Line password</td>
<td>No password is defined.</td>
</tr>
</tbody>
</table>
Setting or Changing a Static Enable Password

The enable password controls access to the privileged EXEC mode. Beginning in privileged EXEC mode, follow these steps to set or change a static enable password:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>enable password <strong>password</strong></td>
<td>Define a new password or change an existing password for access to privileged EXEC mode. By default, no password is defined. For <strong>password</strong>, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do this: Enter abc. Enter Ctrl-v. Enter ?123. When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter abc?123 at the password prompt.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file. The enable password is not encrypted and can be read in the switch configuration file.</td>
</tr>
</tbody>
</table>

To remove the password, use the no enable password global configuration command.

This example shows how to change the enable password to l1u2c3k4y5. The password is not encrypted and provides access to level 15 (traditional privileged EXEC mode access):

```bash
Switch(config)# enable password l1u2c3k4y5
```

Protecting Enable and Enable Secret Passwords with Encryption

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the enable password or enable secret global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the enable secret command because it uses an improved encryption algorithm.

If you configure the enable secret command, it takes precedence over the enable password command; the two commands cannot be in effect simultaneously.
Beginning in privileged EXEC mode, follow these steps to configure encryption for enable and enable secret passwords:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>enable password [level level] {password</td>
</tr>
<tr>
<td> </td>
<td> </td>
</tr>
<tr>
<td> </td>
<td>(Optional) For level, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges).</td>
</tr>
<tr>
<td> </td>
<td>(Optional) For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
</tr>
<tr>
<td> </td>
<td>(Optional) For encryption-type, only type 5, a Cisco proprietary encryption algorithm, is available. If you specify an encryption type, you must provide an encrypted password—an encrypted password that you copy from another switch configuration.</td>
</tr>
<tr>
<td> </td>
<td><strong>Note</strong> If you specify an encryption type and then enter a clear text password, you cannot re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>service password-encryption</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

If both the enable and enable secret passwords are defined, users must enter the enable secret password. Use the level keyword to define a password for a specific privilege level. After you specify the level and set a password, give the password only to users who need to have access at this level. Use the privilege level global configuration command to specify commands accessible at various levels. For more information, see the “Configuring Multiple Privilege Levels” section on page 8-7.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

To remove a password and level, use the no enable password [level level] or no enable secret [level level] global configuration command. To disable password encryption, use the no service password-encryption global configuration command.
This example shows how to configure the encrypted password $1$FaD0$Xyti5Rkls3LoyxzS8 for privilege level 2:

```bash
Switch(config)# enable secret level 2 5 $1$FaD0$Xyti5Rkls3LoyxzS8
```

### Disabling Password Recovery

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

---

**Note**

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. We recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the XMODEM protocol. For more information, see the “Recovering from a Lost or Forgotten Password” section on page 43-3.

Beginning in privileged EXEC mode, follow these steps to disable password recovery:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>no service password-recovery</td>
<td>Disable password recovery. This setting is saved in an area of the flash memory that is accessible by the boot loader and the Cisco IOS image, but it is not part of the file system and is not accessible by any user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show version</td>
<td>Verify the configuration by checking the last few lines of the command output.</td>
</tr>
</tbody>
</table>

To re-enable password recovery, use the `service password-recovery` global configuration command.

---

**Note**

Disabling password recovery will not work if you have set the switch to boot manually by using the `boot manual` global configuration command. This command produces the boot loader prompt (`switch:`) after the switch is power cycled.
Setting a Telnet Password for a Terminal Line

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it now through the command-line interface (CLI).

Beginning in privileged EXEC mode, follow these steps to configure your switch for Telnet access:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Attach a PC or workstation with emulation software to the switch console port. The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.</td>
</tr>
<tr>
<td>Step 2</td>
<td>enable password &lt;password&gt;</td>
</tr>
<tr>
<td></td>
<td>Enter privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>line vty 0 15</td>
</tr>
<tr>
<td></td>
<td>Configure the number of Telnet sessions (lines), and enter line configuration mode. There are 16 possible sessions on a command-capable switch. The 0 and 15 mean that you are configuring all 16 possible Telnet sessions.</td>
</tr>
<tr>
<td>Step 5</td>
<td>password &lt;password&gt;</td>
</tr>
<tr>
<td></td>
<td>Enter a Telnet password for the line or lines. For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>show running-config</td>
</tr>
<tr>
<td></td>
<td>Verify your entries. The password is listed under the command line vty 0 15.</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the password, use the no password global configuration command.

This example shows how to set the Telnet password to let45me67in89:

```
Switch(config)# line vty 10
Switch(config-line)# password let45me67in89
```

Configuring Username and Password Pairs

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.
Beginning in privileged EXEC mode, follow these steps to establish a username-based authentication system that requests a login username and a password:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2 | username name [privilege level] {password encryption-type password} Enter the username, privilege level, and password for each user.  
- For name, specify the user ID as one word. Spaces and quotation marks are not allowed.  
- (Optional) For level, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access.  
- For encryption-type, enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow.  
- For password, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command. |
| Step 3 | line console 0 or line vty 0 15 Enter line configuration mode, and configure the console port (line 0) or the VTY lines (line 0 to 15). |
| Step 4 | login local Enable local password checking at login time. Authentication is based on the username specified in Step 2. |
| Step 5 | end Return to privileged EXEC mode. |
| Step 6 | show running-config Verify your entries. |
| Step 7 | copy running-config startup-config (Optional) Save your entries in the configuration file. |

To disable username authentication for a specific user, use the no username name global configuration command. To disable password checking and allow connections without a password, use the no login line configuration command.

**Configuring Multiple Privilege Levels**

By default, the Cisco IOS software has two modes of password security: user EXEC and privileged EXEC. You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

For example, if you want many users to have access to the clear line command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the configure command, you can assign it level 3 security and distribute that password to a more restricted group of users.

These sections contain this configuration information:

- Setting the Privilege Level for a Command, page 8-8
- Changing the Default Privilege Level for Lines, page 8-9
- Logging into and Exiting a Privilege Level, page 8-9
Setting the Privilege Level for a Command

Beginning in privileged EXEC mode, follow these steps to set the privilege level for a command mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>privilege mode level level command</td>
</tr>
<tr>
<td></td>
<td>• For mode, enter configure for global configuration mode, exec for EXEC mode, interface for interface configuration mode, or line for line configuration mode.</td>
</tr>
<tr>
<td></td>
<td>• For level, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. Level 15 is the level of access permitted by the enable password.</td>
</tr>
<tr>
<td></td>
<td>• For command, specify the command to which you want to restrict access.</td>
</tr>
<tr>
<td>Step 3</td>
<td>enable password level level password</td>
</tr>
<tr>
<td></td>
<td>• For level, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges.</td>
</tr>
<tr>
<td></td>
<td>• For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config or show privilege</td>
</tr>
<tr>
<td></td>
<td>The first command shows the password and access level configuration. The second command shows the privilege level configuration.</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the show ip traffic command to level 15, the show commands and show ip commands are automatically set to privilege level 15 unless you set them individually to different levels.

To return to the default privilege for a given command, use the no privilege mode level level command global configuration command.

This example shows how to set the configure command to privilege level 14 and define SecretPswd14 as the password users must enter to use level 14 commands:

```bash
Switch(config)# privilege exec level 14 configure
Switch(config)# enable password level 14 SecretPswd14
```
Changing the Default Privilege Level for Lines

Beginning in privileged EXEC mode, follow these steps to change the default privilege level for a line:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>line vty line</td>
<td>Select the virtual terminal line on which to restrict access.</td>
</tr>
<tr>
<td>3</td>
<td>privilege level level</td>
<td>Change the default privilege level for the line.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For level, the range is from 0 to 15. Level 1 is for normal user EXEC</td>
</tr>
<tr>
<td></td>
<td></td>
<td>mode privileges. Level 15 is the level of access permitted by the enable</td>
</tr>
<tr>
<td></td>
<td></td>
<td>password.</td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td>or</td>
<td>The first command shows the password and access level configuration.</td>
</tr>
<tr>
<td></td>
<td>show privilege</td>
<td>The second command shows the privilege level configuration.</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Users can override the privilege level you set using the privilege level line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the disable command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

To return to the default line privilege level, use the no privilege level line configuration command.

Logging into and Exiting a Privilege Level

Beginning in privileged EXEC mode, follow these steps to log in to a specified privilege level and to exit to a specified privilege level:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable level</td>
<td>Log in to a specified privilege level.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For level, the range is 0 to 15.</td>
</tr>
<tr>
<td>2</td>
<td>disable level</td>
<td>Exit to a specified privilege level.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For level, the range is 0 to 15.</td>
</tr>
</tbody>
</table>

Controlling Switch Access with TACACS+

This section describes how to enable and configure Terminal Access Controller Access Control System Plus (TACACS+), which provides detailed accounting information and flexible administrative control over authentication and authorization processes. TACACS+ is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.
For complete syntax and usage information for the commands used in this section, see the Cisco IOS Security Command Reference, Release 12.2.

These sections contain this configuration information:

- Understanding TACACS+, page 8-10
- TACACS+ Operation, page 8-12
- Configuring TACACS+, page 8-12
- Displaying the TACACS+ Configuration, page 8-17

Understanding TACACS+

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch. TACACS+ services are maintained in a database on a TACACS+ daemon typically running on a UNIX or Windows NT workstation. You should have access to and should configure a TACACS+ server before the configuring TACACS+ features on your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—individually. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers. A network access server provides connections to a single user, to a network or subnetwork, and to interconnected networks as shown in Figure 8-1.
TACACS+, administered through the AAA security services, can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.

  The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother’s maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- **Authorization**—Provides fine-grained control over user capabilities for the duration of the user’s session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

You need a system running the TACACS+ daemon software to use TACACS+ on your switch.
**TACACS+ Operation**

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

   TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
   - ACCEPT—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
   - REJECT—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
   - ERROR—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
   - CONTINUE—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
   - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
   - Connection parameters, including the host or client IP address, access list, and user timeouts

**Configuring TACACS+**

This section describes how to configure your switch to support TACACS+. At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting. A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

The **aaa authorization console** global configuration command that allows you to enable AAA and TACACS+ to work on the console port.
For information about the command, see this URL:

These sections contain this configuration information:
- Default TACACS+ Configuration, page 8-13
- Identifying the TACACS+ Server Host and Setting the Authentication Key, page 8-13
- Configuring TACACS+ Login Authentication, page 8-14
- Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services, page 8-16
- Starting TACACS+ Accounting, page 8-17

Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

Identifying the TACACS+ Server Host and Setting the Authentication Key

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.
Beginning in privileged EXEC mode, follow these steps to identify the IP host or host maintaining TACACS+ server and optionally set the encryption key:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> tacacs-server host</td>
<td>Identify the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.</td>
</tr>
</tbody>
</table>
| hostname [port integer] [timeout integer] [key string] | • For hostname, specify the name or IP address of the host.  
• (Optional) For port integer, specify a server port number. The default is port 49. The range is 1 to 65535.  
• (Optional) For timeout integer, specify a time in seconds the switch waits for a response from the daemon before it times out and declares an error. The default is 5 seconds. The range is 1 to 1000 seconds.  
• (Optional) For key string, specify the encryption key for encrypting and decrypting all traffic between the switch and the TACACS+ daemon. You must configure the same key on the TACACS+ daemon for encryption to be successful. |
| **Step 3** aaa new-model       | Enable AAA.                                        |
| **Step 4** aaa group server tacacs+ group-name | (Optional) Define the AAA server-group with a group name.  
This command puts the switch in a server group subconfiguration mode. |
| **Step 5** server ip-address  | (Optional) Associate a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group.  
Each server in the group must be previously defined in Step 2. |
| **Step 6** end                | Return to privileged EXEC mode.                    |
| **Step 7** show tacacs        | Verify your entries.                               |
| **Step 8** copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To remove the specified TACACS+ server name or address, use the no tacacs-server host hostname global configuration command. To remove a server group from the configuration list, use the no aaa group server tacacs+ group-name global configuration command. To remove the IP address of a TACACS+ server, use the no server ip-address server group subconfiguration command.

**Configuring TACACS+ Login Authentication**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named default). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to...
authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

Beginning in privileged EXEC mode, follow these steps to configure login authentication:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 aaa new-model</td>
<td>Enable AAA.</td>
</tr>
<tr>
<td>Step 3 aaa authentication login {default</td>
<td>list-name} method1 [method2...]</td>
</tr>
<tr>
<td></td>
<td>Create a login authentication method list.</td>
</tr>
<tr>
<td></td>
<td>• To create a default list that is used when a named list is not specified in the login authentication command, use the default keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.</td>
</tr>
<tr>
<td></td>
<td>• For list-name, specify a character string to name the list you are creating.</td>
</tr>
<tr>
<td></td>
<td>• For method1..., specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.</td>
</tr>
<tr>
<td></td>
<td>Select one of these methods:</td>
</tr>
<tr>
<td></td>
<td>• enable—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command.</td>
</tr>
<tr>
<td></td>
<td>• group tacacs+—Uses TACACS+ authentication. Before you can use this authentication method, you must configure the TACACS+ server. For more information, see the “Identifying the TACACS+ Server Host and Setting the Authentication Key” section on page 8-13.</td>
</tr>
<tr>
<td></td>
<td>• line—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the password password line configuration command.</td>
</tr>
<tr>
<td></td>
<td>• local—Use the local username database for authentication. You must enter username information in the database. Use the username password global configuration command.</td>
</tr>
<tr>
<td></td>
<td>• local-case—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the username name password global configuration command.</td>
</tr>
<tr>
<td></td>
<td>• none—Do not use any authentication for login.</td>
</tr>
<tr>
<td>Step 4 line [console</td>
<td>tty</td>
</tr>
</tbody>
</table>
Controlling Switch Access with TACACS+

To disable AAA, use the `no aaa new-model` global configuration command. To disable AAA authentication, use the `no aaa authentication login {default | list-name} method1 [method2...]` global configuration command. To either disable TACACS+ authentication for logins or to return to the default value, use the `no login authentication {default | list-name}` line configuration command.

Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

You can use the `aaa authorization` global configuration command with the `tacacs+` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec tacacs+ local` command sets these authorization parameters:

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
- Use the local database if authentication was not performed by using TACACS+.

Note: Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Beginning in privileged EXEC mode, follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>aaa authorization network tacacs+</code></td>
<td>Configure the switch for user TACACS+ authorization for all network-related service requests.</td>
</tr>
<tr>
<td><code>aaa authorization exec tacacs+</code></td>
<td>Configure the switch for user TACACS+ authorization if the user has privileged EXEC access. The <code>exec</code> keyword might return user profile information (such as <code>autocommand</code> information).</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
To disable authorization, use the `no aaa authorization {network | exec} method1` global configuration command.

### Starting TACACS+ Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

Beginning in privileged EXEC mode, follow these steps to enable TACACS+ accounting for each Cisco IOS privilege level and for network services:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>aaa accounting network start-stop tacacs+</code></td>
<td>Enable TACACS+ accounting for all network-related service requests.</td>
</tr>
<tr>
<td><code>aaa accounting exec start-stop tacacs+</code></td>
<td>Enable TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable accounting, use the `no aaa accounting {network | exec} {start-stop} method1...` global configuration command.

### Displaying the TACACS+ Configuration

To display TACACS+ server statistics, use the `show tacacs` privileged EXEC command.

### Controlling Switch Access with RADIUS

This section describes how to enable and configure the RADIUS, which provides detailed accounting information and flexible administrative control over authentication and authorization processes. RADIUS is facilitated through AAA and can be enabled only through AAA commands.

**Note**  
For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Security Command Reference, Release 12.2*. 

**Step 5**

```
show running-config
```

Verify your entries.

**Step 6**

```
copy running-config startup-config
```

(Optional) Save your entries in the configuration file.
These sections contain this configuration information:

- Understanding RADIUS, page 8-18
- RADIUS Operation, page 8-19
- Configuring RADIUS, page 8-20
- Displaying the RADIUS Configuration, page 8-31

Understanding RADIUS

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information. The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.
- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validate users and to grant access to network resources.
- Networks already using RADIUS. You can add a Cisco switch containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 8-2 on page 8-19.
- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 9, “Configuring IEEE 802.1x Port-Based Authentication.”
- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

RADIUS is not suitable in these network security situations:

- Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.
- Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.
- Networks using a variety of services. RADIUS generally binds a user to one service model.
RADIUS Operation

When a user attempts to log in and authenticate to a switch that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of these responses from the RADIUS server:
   a. ACCEPT—The user is authenticated.
   b. REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   c. CHALLENGE—A challenge requires additional data from the user.
   d. CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts
Configuring RADIUS

This section describes how to configure your switch to support RADIUS. At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used (such as TACACS+ or local username lookup), thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

You should have access to and should configure a RADIUS server before configuring RADIUS features on your switch.

These sections contain this configuration information:

- Default RADIUS Configuration, page 8-20
- Identifying the RADIUS Server Host, page 8-20 (required)
- Configuring RADIUS Login Authentication, page 8-23 (required)
- Defining AAA Server Groups, page 8-25 (optional)
- Configuring RADIUS Authorization for User Privileged Access and Network Services, page 8-27 (optional)
- Starting RADIUS Accounting, page 8-28 (optional)
- Configuring Settings for All RADIUS Servers, page 8-29 (optional)
- Configuring the Switch to Use Vendor-Specific RADIUS Attributes, page 8-29 (optional)
- Configuring the Switch for Vendor-Proprietary RADIUS Server Communication, page 8-30 (optional)

Default RADIUS Configuration

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

Identifying the RADIUS Server Host

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value
You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings. To apply these settings globally to all RADIUS servers communicating with the switch, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `radius-server key`. To apply these values on a specific RADIUS server, use the `radius-server host` global configuration command.

You can configure the switch to use AAA server groups to group existing server hosts for authentication. For more information, see the “Defining AAA Server Groups” section on page 8-25.

Beginning in privileged EXEC mode, follow these steps to configure per-server RADIUS server communication. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>aaa new-model</td>
<td>Enable AAA authentication.</td>
</tr>
</tbody>
</table>
Controlling Switch Access with RADIUS

To remove the specified RADIUS server, use the `no radius-server host hostname | ip-address` global configuration command.

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

```
Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Switch(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2
```

This example shows how to configure `host1` as the RADIUS server and to use the default ports for both authentication and accounting:

```
Switch(config)# radius-server host host1
```
Configuring RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named default). The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

Beginning in privileged EXEC mode, follow these steps to configure login authentication. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>aaa new-model</td>
<td>Enable AAA.</td>
</tr>
</tbody>
</table>
### Controlling Switch Access with RADIUS

**Step 3**

```
aaa authentication login {default | list-name} method1 [method2...]
```

Create a login authentication method list.

- To create a default list that is used when a named list is *not* specified in the `login authentication` command, use the `default` keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.

- For `list-name`, specify a character string to name the list you are creating.

- For `method1...`, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.

Select one of these methods:

- **enable**—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the `enable password` global configuration command.

- **group radius**—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server. For more information, see the “Identifying the RADIUS Server Host” section on page 8-20.

- **line**—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the `password password` line configuration command.

- **local**—Use the local username database for authentication. You must enter username information in the database. Use the `username name password` global configuration command.

- **local-case**—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the `username password` global configuration command.

- **none**—Do not use any authentication for login.

---

**Step 4**

```
line [console | tty | vty] line-number [ending-line-number]
```

Enter line configuration mode, and configure the lines to which you want to apply the authentication list.
To disable AAA, use the `no aaa new-model` global configuration command. To disable AAA authentication, use the `no aaa authentication login {default | list-name} method1 [method2...]` global configuration command. To either disable RADIUS authentication for logins or to return to the default value, use the `no login authentication {default | list-name}` line configuration command.

### Defining AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one.

You use the `server` group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional `auth-port` and `acct-port` keywords.
Beginning in privileged EXEC mode, follow these steps to define the AAA server group and associate a particular RADIUS server with it:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]</td>
</tr>
<tr>
<td></td>
<td>Specify the IP address or hostname of the remote RADIUS server host.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For auth-port port-number, specify the UDP destination port for authentication requests.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For acct-port port-number, specify the UDP destination port for accounting requests.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For timeout seconds, specify the time interval that the switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the radius-server timeout global configuration command setting. If no timeout is set with the radius-server host command, the setting of the radius-server timeout command is used.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For retransmit retries, specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The range is 1 to 1000. If no retransmit value is set with the radius-server host command, the setting of the radius-server retransmit global configuration command is used.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For key string, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius-server host command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa new-model</td>
</tr>
<tr>
<td></td>
<td>Enable AAA.</td>
</tr>
<tr>
<td>Step 4</td>
<td>aaa group server radius group-name</td>
</tr>
<tr>
<td></td>
<td>Define the AAA server-group with a group name.</td>
</tr>
<tr>
<td></td>
<td>This command puts the switch in a server group configuration mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>server ip-address</td>
</tr>
<tr>
<td></td>
<td>Associate a particular RADIUS server with the defined server group.</td>
</tr>
<tr>
<td></td>
<td>Repeat this step for each RADIUS server in the AAA server group.</td>
</tr>
<tr>
<td></td>
<td>Each server in the group must be previously defined in Step 2.</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>show running-config</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>
Chapter 8  Configuring Switch-Based Authentication

Controlling Switch Access with RADIUS

To remove the specified RADIUS server, use the `no radius-server host hostname | ip-address` global configuration command. To remove a server group from the configuration list, use the `no aaa group server radius group-name` global configuration command. To remove the IP address of a RADIUS server, use the `no server ip-address` server group configuration command.

In this example, the switch is configured to recognize two different RADIUS group servers (`group1` and `group2`). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```
Switch(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Switch(config)# aaa new-model
Switch(config)# aaa group server radius group1
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config-sg-radius)# exit
Switch(config)# aaa group server radius group2
Switch(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Switch(config-sg-radius)# exit
```

Configuring RADIUS Authorization for User Privileged Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

You can use the `aaa authorization network radius` global configuration command with the `radius` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec radius local` command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

**Note**

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Beginning in privileged EXEC mode, follow these steps to specify RADIUS authorization for privileged EXEC access and network services:

```
Command                  Purpose
----------------------------------------------------------------------------------------------
configure terminal        Enter global configuration mode.
aaa authorization network radius Configure the switch for user RADIUS authorization for all network-related service requests.
```
### Controlling Switch Access with RADIUS

**Chapter 8  Configuring Switch-Based Authentication**

#### To disable authorization, use the `no aaa authorization { network | exec } method1` global configuration command.

#### Starting RADIUS Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

Beginning in privileged EXEC mode, follow these steps to enable RADIUS accounting for each Cisco IOS privilege level and for network services:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td><code>aaa authorization exec radius</code> Configure the switch for user RADIUS authorization if the user has privileged EXEC access. The <code>exec</code> keyword might return user profile information (such as <code>autocommand</code> information).</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show running-config</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable accounting, use the `no aaa accounting { network | exec } { start-stop } method1...` global configuration command.

#### Table: Command and Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>aaa accounting network start-stop radius</code> Enable RADIUS accounting for all network-related service requests.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>aaa accounting exec start-stop radius</code> Enable RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show running-config</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure global communication settings between the switch and all RADIUS servers:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> radius-server key <em>string</em></td>
<td>Specify the shared secret text string used between the switch and all RADIUS servers. Note: The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td><strong>Step 3</strong> radius-server retransmit <em>retries</em></td>
<td>Specify the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.</td>
</tr>
<tr>
<td><strong>Step 4</strong> radius-server timeout <em>seconds</em></td>
<td>Specify the number of seconds a switch waits for a reply to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.</td>
</tr>
<tr>
<td><strong>Step 5</strong> radius-server deadtime <em>minutes</em></td>
<td>Specify the number of minutes a RADIUS server, which is not responding to authentication requests, to be skipped, thus avoiding the wait for the request to timeout before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.</td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong> show running-config</td>
<td>Verify your settings.</td>
</tr>
<tr>
<td><strong>Step 8</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting for the retransmit, timeout, and deadtime, use the no forms of these commands.

Configuring the Switch to Use Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named cisco-avpair. The value is a string with this format:

```
protocol : attribute sep value *
```

Protocol is a value of the Cisco protocol attribute for a particular type of authorization. Attribute and value are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and sep is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, this AV pair activates Cisco’s multiple named ip address pools feature during IP authorization (during PPP IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```
This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

This example shows how to specify an authorized VLAN in the RADIUS server database:

```
cisco-avpair= "tunnel-type(#64)=VLAN(13)"
cisco-avpair= "tunnel-medium-type(#65)=802 media(6)"
cisco-avpair= "tunnel-private-group-ID(#81)=vlanid"
```

This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
cisco-avpair= "mac:inacl#3=deny any any decnet-iv"
```

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:outacl#2=deny ip 10.10.10.10 0.0.255.255 any"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

Beginning in privileged EXEC mode, follow these steps to configure the switch to recognize and use VSAs:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>radius-server vsa send [accounting</td>
<td>Enable the switch to recognize and use VSAs as defined by RADIUS IETF</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attribute 26.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Optional) Use the accounting</td>
</tr>
<tr>
<td></td>
<td></td>
<td>keyword to limit the set of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>recognized vendor-specific</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attributes to only accounting</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attributes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Optional) Use the authentication keyword to limit the set of</td>
</tr>
<tr>
<td></td>
<td></td>
<td>recognized vendor-specific</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attributes to only authentication attributes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you enter this command</td>
</tr>
<tr>
<td></td>
<td></td>
<td>without keywords, both</td>
</tr>
<tr>
<td></td>
<td></td>
<td>accounting and</td>
</tr>
<tr>
<td></td>
<td></td>
<td>authentication vendor-specific attributes are used.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
<td>Verify your settings.</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

For a complete list of RADIUS attributes or more information about vendor-specific attribute 26, see the “RADIUS Attributes” appendix in the Cisco IOS Security Configuration Guide, Release 12.2.

### Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.
As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius-server` global configuration commands.

Beginning in privileged EXEC mode, follow these steps to specify a vendor-proprietary RADIUS server host and a shared secret text string:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`radius-server host {hostname</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>radius-server key string</code> Specify the shared secret text string used between the switch and the vendor-proprietary RADIUS server. The switch and the RADIUS server use this text string to encrypt passwords and exchange responses. <strong>Note</strong> The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show running-config</code> Verify your settings.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete the vendor-proprietary RADIUS host, use the `no radius-server host {hostname | ip-address} non-standard` global configuration command. To disable the key, use the `no radius-server key` global configuration command.

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of `rad124` between the switch and the server:

```
Switch(config)# radius-server host 172.20.30.15 nonstandard
Switch(config)# radius-server key rad124
```

**Displaying the RADIUS Configuration**

To display the RADIUS configuration, use the `show running-config` privileged EXEC command.
Controlling Switch Access with Kerberos

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party. To use this feature, the cryptographic (that is, supports encryption) version of the switch software must be installed on your switch. You must obtain authorization to use this feature and to download the cryptographic software files from Cisco.com. For more information, see the release notes for this release.

These sections contain this information:

- Understanding Kerberos, page 8-32
- Kerberos Operation, page 8-34
- Configuring Kerberos, page 8-35

For Kerberos configuration examples, see the “Kerberos Configuration Examples” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.2, at this URL:

For complete syntax and usage information for the commands used in this section, see the “Kerberos Commands” section in the “Security Server Protocols” chapter of the Cisco IOS Security Command Reference, Release 12.2, at this URL:

Note: In the Kerberos configuration examples and in the Cisco IOS Security Command Reference, Release 12.2, the trusted third party can be a Cisco ME switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

Understanding Kerberos

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the key distribution center (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited lifespan, are stored in user credential caches. The Kerberos server uses the tickets instead of usernames and passwords to authenticate users and network services.

Note: A Kerberos server can be a Cisco ME switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

The Kerberos credential scheme uses a process called single logon. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.
This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

In this software release, Kerberos supports these network services:
- Telnet
- rlogin
- rsh (Remote Shell Protocol)

Table 8-2 lists the common Kerberos-related terms and definitions:

### Table 8-2  Kerberos Terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.</td>
</tr>
<tr>
<td>Authorization</td>
<td>A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.</td>
</tr>
<tr>
<td>Credential</td>
<td>A general term that refers to authentication tickets, such as TGTs(^1) and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default lifespan of eight hours.</td>
</tr>
<tr>
<td>Instance</td>
<td>An authorization level label for Kerberos principals. Most Kerberos principals are of the form user@REALM (for example, <a href="mailto:smith@EXAMPLE.COM">smith@EXAMPLE.COM</a>). A Kerberos principal with a Kerberos instance has the form user/instance@REALM (for example, smith/admin@EXAMPLE.COM). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The Kerberos principal and instance names must be in all lowercase characters.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The Kerberos realm name must be in all uppercase characters.</td>
</tr>
<tr>
<td>KDC(^2)</td>
<td>Key distribution center that consists of a Kerberos server and database program that is running on a network host.</td>
</tr>
<tr>
<td>Kerberized</td>
<td>A term that describes applications and services that have been modified to support the Kerberos credential infrastructure.</td>
</tr>
<tr>
<td>Kerberos realm</td>
<td>A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The Kerberos realm name must be in all uppercase characters.</td>
</tr>
<tr>
<td>Kerberos server</td>
<td>A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services.</td>
</tr>
</tbody>
</table>
Controlling Switch Access with Kerberos

Chapter 8 Configuring Switch-Based Authentication

Kerberos Operation

A Kerberos server can be a Cisco ME switch that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

To authenticate to network services by using a Cisco ME switch as a Kerberos server, remote users must follow these steps:

1. Authenticating to a Boundary Switch, page 8-34
2. Obtaining a TGT from a KDC, page 8-35
3. Authenticating to Network Services, page 8-35

Authenticating to a Boundary Switch

This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.

Table 8-2 Kerberos Terms (continued)

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEYTAB⁵</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB⁴.</td>
</tr>
<tr>
<td>Principal</td>
<td>Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server.</td>
</tr>
<tr>
<td>Note</td>
<td>The Kerberos principal name must be in all lowercase characters.</td>
</tr>
<tr>
<td>Service credential</td>
<td>A credential for a network service. When issued from the KDC, this credential is encrypted with the password shared by the network service and the KDC. The password is also shared with the user TGT.</td>
</tr>
<tr>
<td>SRVTAB</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 or later Kerberos versions, SRVTAB is referred to as KEYTAB.</td>
</tr>
<tr>
<td>TGT</td>
<td>Ticket granting ticket that is a credential that the KDC issues to authenticated users. When users receive a TGT, they can authenticate to network services within the Kerberos realm represented by the KDC.</td>
</tr>
</tbody>
</table>

1. TGT = ticket granting ticket
2. KDC = key distribution center
3. KEYTAB = key table
4. SRVTAB = server table
If the decryption is successful, the user is authenticated to the switch.

If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.

**Obtaining a TGT from a KDC**

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a KDC and obtain a TGT from the KDC to access network services.

For instructions about how to authenticate to a KDC, see the “Obtaining a TGT from a KDC” section in the “Security Server Protocols” chapter of the *Cisco IOS Security Configuration Guide, Release 12.2*, at this URL:

**Authenticating to Network Services**

This section describes the third layer of security through which a remote user must pass. The user with a TGT must now authenticate to the network services in a Kerberos realm.

For instructions about how to authenticate to a network service, see the “Authenticating to Network Services” section in the “Security Server Protocols” chapter of the *Cisco IOS Security Configuration Guide, Release 12.2*, at this URL:

**Configuring Kerberos**

So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.

When you add or create entries for the hosts and users, follow these guidelines:

- The Kerberos principal name *must* be in all lowercase characters.
- The Kerberos instance name *must* be in all lowercase characters.
- The Kerberos realm name *must* be in all uppercase characters.

**Note**

A Kerberos server can be a Cisco ME switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.
To set up a Kerberos-authenticated server-client system, follow these steps:

- Configure the KDC by using Kerberos commands.
- Configure the switch to use the Kerberos protocol.

For instructions, see the “Kerberos Configuration Task List” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.2, at this URL:

### Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Beginning in privileged EXEC mode, follow these steps to configure the switch for local AAA:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>aaa new-model</td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa authentication login default local</td>
</tr>
<tr>
<td>Step 4</td>
<td>aaa authorization exec local</td>
</tr>
<tr>
<td>Step 5</td>
<td>aaa authorization network local</td>
</tr>
<tr>
<td>Step 6</td>
<td>username name [privilege level] {password encryption-type password}</td>
</tr>
<tr>
<td>Step 7</td>
<td>end</td>
</tr>
</tbody>
</table>
To disable AAA, use the `no aaa new-model` global configuration command. To disable authorization, use the `no aaa authorization {network | exec} method1` global configuration command.

## Configuring the Switch for Secure Shell

This section describes how to configure the Secure Shell (SSH) feature. To use this feature, you must install the cryptographic (encrypted) software image on your switch. You must obtain authorization to use this feature and to download the cryptographic software files from Cisco.com. For more information, see the release notes for this release.

These sections contain this information:

- Understanding SSH, page 8-37
- Configuring SSH, page 8-38
- Displaying the SSH Configuration and Status, page 8-40

For SSH configuration examples, see the “SSH Configuration Examples” section in the “Configuring Secure Shell” chapter of the *Cisco IOS Security Configuration Guide, Cisco IOS Release 12.2*, at this URL:

---

**Note**

For complete syntax and usage information for the commands used in this section, see the command reference for this release and the command reference for Cisco IOS Release 12.2 at this URL:

## Understanding SSH

SSH is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

This section consists of these topics:

- SSH Servers, Integrated Clients, and Supported Versions, page 8-37
- Limitations, page 8-38

### SSH Servers, Integrated Clients, and Supported Versions

The SSH feature has an SSH server and an SSH integrated client, which are applications that run on the switch. You can use an SSH client to connect to a switch running the SSH server. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client also works with the SSH server supported in this release and with non-Cisco SSH servers.
The switch supports an SSHv1 or an SSHv2 server.
The switch supports an SSHv1 client.
SSH supports the Data Encryption Standard (DES) encryption algorithm, the Triple DES (3DES) encryption algorithm, and password-based user authentication.
SSH also supports these user authentication methods:

- TACACS+ (for more information, see the “Controlling Switch Access with TACACS+” section on page 8-9)
- RADIUS (for more information, see the “Controlling Switch Access with RADIUS” section on page 8-17)
- Local authentication and authorization (for more information, see the “Configuring the Switch for Local Authentication and Authorization” section on page 8-36)

Note
This software release does not support IP Security (IPSec).

Limitations
These limitations apply to SSH:

- The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
- SSH supports only the execution-shell application.
- The SSH server and the SSH client are supported only on DES (56-bit) and 3DES (168-bit) data encryption software.
- The switch does not support the Advanced Encryption Standard (AES) symmetric encryption algorithm.

Configuring SSH

This section has this configuration information:

- Configuration Guidelines, page 8-38
- Setting Up the Switch to Run SSH, page 8-39 (required)
- Configuring the SSH Server, page 8-40 (required only if you are configuring the switch as an SSH server)

Configuration Guidelines

Follow these guidelines when configuring the switch as an SSH server or SSH client:

- An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.
- If you get CLI error messages after entering the `crypto key generate rsa` global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the `crypto key generate rsa` command. For more information, see the “Setting Up the Switch to Run SSH” section on page 8-39.
- When generating the RSA key pair, the message `No host name specified` might appear. If it does, you must configure a hostname by using the `hostname` global configuration command.
When generating the RSA key pair, the message No domain specified might appear. If it does, you must configure an IP domain name by using the ip domain-name global configuration command.

When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.

## Setting Up the Switch to Run SSH

Follow these steps to set up your switch to run SSH:

1. Download the cryptographic software image from Cisco.com. This step is required. For more information, see the release notes for this release.

2. Configure a hostname and IP domain name for the switch. Follow this procedure only if you are configuring the switch as an SSH server.

3. Generate an RSA key pair for the switch, which automatically enables SSH. Follow this procedure only if you are configuring the switch as an SSH server.

4. Configure user authentication for local or remote access. This step is required. For more information, see the “Configuring the Switch for Local Authentication and Authorization” section on page 8-36.

Beginning in privileged EXEC mode, follow these steps to configure a hostname and an IP domain name and to generate an RSA key pair. This procedure is required if you are configuring the switch as an SSH server.

### Command Purpose

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>hostname hostname</td>
<td>Configure a hostname for your switch.</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip domain-name domain_name</td>
<td>Configure a host domain for your switch.</td>
</tr>
<tr>
<td>Step 4</td>
<td>crypto key generate rsa</td>
<td>Enable the SSH server for local and remote authentication on the switch and generate an RSA key pair.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>We recommend that a minimum modulus size of 1024 bits.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When you generate RSA keys, you are prompted to enter a modulus length.</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>show ip ssh</td>
<td>Show the version and configuration information for your SSH server.</td>
</tr>
<tr>
<td></td>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>show ssh</td>
<td>Show the status of the SSH server on the switch.</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete the RSA key pair, use the `crypto key zeroize rsa` global configuration command. After the RSA key pair is deleted, the SSH server is automatically disabled.
### Configuring the SSH Server

Beginning in privileged EXEC mode, follow these steps to configure the SSH server:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command: configure terminal</th>
<th>Purpose</th>
<th>Enter global configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Command: ip ssh version [1</td>
<td>Purpose</td>
<td>(Optional) Configure the switch to run SSH Version 1 or SSH Version 2.</td>
</tr>
<tr>
<td></td>
<td>2]</td>
<td></td>
<td>1—Configure the switch to run SSH Version 1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>2—Configure the switch to run SSH Version 2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Command: ip ssh {timeout seconds</td>
<td>Purpose</td>
<td>Configure the SSH control parameters:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the connection is established, the switch uses the default time-out values of the CLI-based sessions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes.</td>
</tr>
<tr>
<td></td>
<td>authentication-retries number}</td>
<td></td>
<td>Repeat this step when configuring both parameters.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Command: end</td>
<td>Purpose</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Command: show ip ssh</td>
<td>Purpose</td>
<td>Show the version and configuration information for your SSH server.</td>
</tr>
<tr>
<td></td>
<td>or show ssh</td>
<td></td>
<td>Show the status of the SSH server connections on the switch.</td>
</tr>
<tr>
<td></td>
<td>Command: copy running-config startup-config</td>
<td>Purpose</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default SSH control parameters, use the no ip ssh {timeout | authentication-retries} global configuration command.

### Displaying the SSH Configuration and Status

To display the SSH server configuration and status, use one or more of the privileged EXEC commands in Table 8-3:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip ssh</td>
<td>Shows the version and configuration information for the SSH server.</td>
</tr>
<tr>
<td>show ssh</td>
<td>Shows the status of the SSH server.</td>
</tr>
</tbody>
</table>

Table 8-3  Commands for Displaying the SSH Server Configuration and Status
Configuring the Switch for Secure Copy Protocol

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

---

**Note**

When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Information About Secure Copy

To configure the Secure Copy feature, you should understand these concepts.

- The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
- A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the copy command. An authorized administrator can also do this from a workstation.

For more information on how to configure and verify SCP, see the “Secure Copy Protocol” chapter of the *Cisco IOS New Features, Cisco IOS Release 12.2*, at this URL:

CHAPTER 9

Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication on the Cisco ME 3400E Ethernet Access switch. As LANs extend to hotels, airports, and corporate lobbies and create insecure environments, 802.1x prevents unauthorized devices (clients) from gaining access to the network.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

Note

Some IEEE 802.1x (dot1x) commands are visible on the switch but are not supported. For a list of unsupported commands see Appendix C, “Unsupported Commands in Cisco IOS Release 12.2(44)EY.”

This chapter consists of these sections:

- Understanding IEEE 802.1x Port-Based Authentication, page 9-1
- Configuring IEEE 802.1x Authentication, page 9-9
- Displaying IEEE 802.1x Statistics and Status, page 9-21

Understanding IEEE 802.1x Port-Based Authentication

The IEEE 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Until the client is authenticated, IEEE 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

Note

CDP and STP are supported by default on network node interfaces (NNIs). You can enable CDP and STP on enhanced network interfaces (ENIs). User network nodes (UNIs) do not support CDP or STP.
These sections describe IEEE 802.1x port-based authentication:

- Device Roles, page 9-2
- Authentication Initiation and Message Exchange, page 9-3
- Ports in Authorized and Unauthorized States, page 9-4
- IEEE 802.1x Accounting, page 9-5
- IEEE 802.1x Accounting Attribute-Value Pairs, page 9-5
- IEEE 802.1x Host Mode, page 9-6
- Using 802.1x Readiness Check, page 9-7
- Using IEEE 802.1x with Port Security, page 9-7
- Using IEEE 802.1x with VLAN Assignment, page 9-8

### Device Roles

With IEEE 802.1x port-based authentication, the devices in the network have specific roles as shown in Figure 9-1.

**Figure 9-1  IEEE 802.1x Device Roles**

- **Client**—the device (workstation) that requests access to the LAN and switch services and responds to requests from the switch. The workstation must be running IEEE 802.1x-compliant client software such as that offered in the Microsoft Windows XP operating system. (The client is the supplicant in the IEEE 802.1x specification.)

*Note* To resolve Windows XP network connectivity and IEEE 802.1x authentication issues, read the Microsoft Knowledge Base article at this URL: [http://support.microsoft.com/support/kb/articles/Q303/5/97.ASP](http://support.microsoft.com/support/kb/articles/Q303/5/97.ASP)

- **Authentication server**—performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch whether or not the client is authorized to access the LAN and switch services. Because the switch acts as the proxy, the authentication service is transparent to the client. In this release, the RADIUS security system with Extensible Authentication Protocol (EAP) extensions is the only supported authentication server. It is available in Cisco Secure Access Control Server Version 3.0 or later. RADIUS operates in a client/server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.
Switch (edge switch or wireless access point)—controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. The switch includes the RADIUS client, which is responsible for encapsulating and decapsulating the EAP frames and interacting with the authentication server.

When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped, and the remaining EAP frame is re-encapsulated in the RADIUS format. The EAP frames are not modified during encapsulation, and the authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the server’s frame header is removed, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

**Authentication Initiation and Message Exchange**

The switch or the client can initiate authentication. If you enable authentication on a port by using the `dot1x port-control auto` interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client’s identity.

---

**Note**

If IEEE 802.1x is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated. For more information, see the “Ports in Authorized and Unauthorized States” section on page 9-4.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. For more information, see the “Ports in Authorized and Unauthorized States” section on page 9-4.

The specific exchange of EAP frames depends on the authentication method being used. Figure 9-2 shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.
Ports in Authorized and Unauthorized States

Depending on the switch port state, the switch can grant a client access to the network. The port starts in the unauthorized state. While in this state, the port disallows all incoming and outgoing traffic except for IEEE 802.1x, CDP, and STP packets. When a client is successfully authenticated, the port changes to the authorized state, allowing all traffic for the client to flow normally.

If a client that does not support IEEE 802.1x connects to an unauthorized IEEE 802.1x port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an IEEE 802.1x-enabled client connects to a port that is not running the IEEE 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the dot1x port-control interface configuration command and these keywords:

- **force-authorized**—disables IEEE 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client. This is the default setting.
- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.
- **auto**—enables IEEE 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.
If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

**IEEE 802.1x Accounting**

The IEEE 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. IEEE 802.1x accounting is disabled by default. You can enable IEEE 802.1x accounting to monitor this activity on IEEE 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log IEEE 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

**IEEE 802.1x Accounting Attribute-Value Pairs**

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is contained within the Acct-Input-Octets or the Acct-Output-Octets of a packet.)

You do not need to configure AV pairs. These are automatically sent by a switch that is configured for IEEE 802.1x accounting. Table 9-1 lists the AV pairs that might be sent by the switch:

<table>
<thead>
<tr>
<th>Attribute number</th>
<th>AV pair name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute[1]</td>
<td>User-Name</td>
</tr>
<tr>
<td>Attribute[4]</td>
<td>NAS-IP-Address</td>
</tr>
<tr>
<td>Attribute[5]</td>
<td>NAS-Port</td>
</tr>
<tr>
<td>Attribute[6]</td>
<td>NAS-Port-Type</td>
</tr>
<tr>
<td>Attribute[8]</td>
<td>Framed-IP-Address</td>
</tr>
<tr>
<td>Attribute[25]</td>
<td>Class</td>
</tr>
<tr>
<td>Attribute[30]</td>
<td>Called-Station-ID</td>
</tr>
<tr>
<td>Attribute[31]</td>
<td>Calling-Station-ID</td>
</tr>
</tbody>
</table>
You can view the AV pairs that are being sent by the switch by enabling the debug radius accounting or debug aaa accounting privileged EXEC commands. For more information about these commands, see the Cisco IOS Debug Command Reference, Release 12.2 at this URL:
http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122sup/122debug/

### IEEE 802.1x Host Mode

You can configure an IEEE 802.1x port for single-host or for multiple-hosts mode. In single-host mode (see Figure 9-1 on page 9-2), only one client can be connected to the IEEE 802.1x-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single IEEE 802.1x-enabled port. Figure 9-3 on page 9-7 shows IEEE 802.1x port-based authentication in a wireless LAN. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients. In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

With the multiple-hosts mode enabled, you can use IEEE 802.1x to authenticate the port and port security to manage network access for all MAC addresses, including that of the client.
Figure 9-3  Multiple Host Mode Example

Using 802.1x Readiness Check

The 802.1x readiness check monitors IEEE 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support IEEE 802.1x. You can use this feature to determine if the devices connected to the switch ports are IEEE 802.1x-capable. You use an alternate authentication for the devices that do not support IEEE 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the IEEE 802.1x timeout value.

For information on configuring the switch for the 802.1x readiness check, see the “Configuring 802.1x Readiness Check” section on page 9-11.

Using IEEE 802.1x with Port Security

You can configure an IEEE 802.1x port with port security in either single-host or multiple-hosts mode. (You also must configure port security on the port by using the `switchport port-security` interface configuration command.) When you enable port security and IEEE 802.1x on a port, IEEE 802.1x authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through an IEEE 802.1x port.

These are some examples of the interaction between IEEE 802.1x and port security on the switch:

- When a client is authenticated, and the port security table is not full, the client MAC address is added to the port security list of secure hosts. The port then proceeds to come up normally.
  
  When a client is authenticated and manually configured for port security, it is guaranteed an entry in the secure host table (unless port security static aging has been enabled).

  A security violation occurs if the client is authenticated, but the port security table is full. This can happen if the maximum number of secure hosts has been statically configured or if the client ages out of the secure host table. If the client address is aged, its place in the secure host table can be taken by another host.

  If the security violation is caused by the first authenticated host, the port becomes error-disabled and immediately shuts down.

  The port security violation modes determine the action for security violations. For more information, see the “Security Violations” section on page 23-9.
When you manually remove an IEEE 802.1x client address from the port security table by using the `no switchport port-security mac-address mac-address` interface configuration command, you should re-authenticate the IEEE 802.1x client by using the `dot1x re-authenticate interface interface-id` privileged EXEC command.

When an IEEE 802.1x client logs off, the port changes to an unauthenticated state, and all dynamic entries in the secure host table are cleared, including the entry for the client. Normal authentication then takes place.

If the port is administratively shut down, the port becomes unauthenticated, and all dynamic entries are removed from the secure host table.

You can configure the `dot1x violation-mode interface configuration command so that a port shuts down, generates a syslog error, or discards packets from a new device when it connects to an IEEE 802.1x-enabled port or when the maximum number of allowed devices have been authenticated. For more information see the “Maximum Number of Allowed Devices Per Port” section on page 9-11 and the command reference for this release.

For more information about enabling port security on your switch, see the “Configuring Port Security” section on page 23-8.

### Using IEEE 802.1x with VLAN Assignment

The RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

When configured on the switch and the RADIUS server, IEEE 802.1x with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if IEEE 802.1x authorization is disabled, the port is configured in its access VLAN after successful authentication.
- If IEEE 802.1x authorization is enabled but the VLAN information from the RADIUS server is not valid, the port returns to the unauthorized state and remains in the configured access VLAN. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, or a nonexistent or internal (routed port) VLAN ID.

- If IEEE 802.1x authorization is enabled and all information from the RADIUS server is valid, the port is placed in the specified VLAN after authentication.
- If the multiple-hosts mode is enabled on an IEEE 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.
- If IEEE 802.1x and port security are enabled on a port, the port is placed in the RADIUS server-assigned VLAN.
- If IEEE 802.1x is disabled on the port, it is returned to the configured access VLAN.

When the port is in the force authorized, the force unauthorized, the unauthorized, or the shutdown state, it is put into the configured access VLAN.

If an IEEE 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect.

The IEEE 802.1x with VLAN assignment feature is not supported on trunk ports or with dynamic-access port assignment through a VLAN Membership Policy Server (VMPS).
To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the `network` keyword to allow interface configuration from the RADIUS server.
- Enable IEEE 802.1x. (The VLAN assignment feature is automatically enabled when you configure IEEE 802.1x on an access port).
- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  - [64] Tunnel-Type = VLAN
  - [65] Tunnel-Medium-Type = 802
  - [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID

Attribute[64] must contain the value VLAN (type 13). Attribute[65] must contain the value 802 (type 6). Attribute[81] specifies the VLAN name or VLAN ID assigned to the IEEE 802.1x-authenticated user.

For examples of tunnel attributes, see the “Configuring the Switch to Use Vendor-Specific RADIUS Attributes” section on page 8-29.

### Configuring IEEE 802.1x Authentication

These sections contain this configuration information:

- Default IEEE 802.1x Configuration, page 9-10
- IEEE 802.1x Configuration Guidelines, page 9-11
- Configuring 802.1x Readiness Check, page 9-11 (optional)
- Configuring IEEE 802.1x Authentication, page 9-13 (required)
- Configuring the Switch-to-RADIUS-Server Communication, page 9-14 (required)
- Configuring Periodic Re-Authentication, page 9-15 (optional)
- Manually Re-Authenticating a Client Connected to a Port, page 9-16 (optional)
- Changing the Quiet Period, page 9-16 (optional)
- Changing the Switch-to-Client Retransmission Time, page 9-17 (optional)
- Setting the Switch-to-Client Frame-Retransmission Number, page 9-18 (optional)
- Setting the Re-Authentication Number, page 9-18 (optional)
- Configuring the Host Mode, page 9-19 (optional)
- Resetting the IEEE 802.1x Configuration to the Default Values, page 9-20 (optional)
- Configuring IEEE 802.1x Accounting, page 9-20 (optional)
Default IEEE 802.1x Configuration

Table 9-2 shows the default IEEE 802.1x configuration.

IEEE 802.1x Configuration Guidelines

These are the IEEE 802.1x authentication configuration guidelines:

- When IEEE 802.1x is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.
- The IEEE 802.1x protocol is supported on Layer 2 static-access ports and Layer 3 routed ports, but it is not supported on these port types:
  - Trunk port—If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.
  - Dynamic-access ports—If you try to enable IEEE 802.1x on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
  - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x on an EtherChannel port, an error message appears, and IEEE 802.1x is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable IEEE 802.1x on a port that is a SPAN or RSPAN destination port. However, IEEE 802.1x is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable IEEE 802.1x on a SPAN or RSPAN source port.
- You can configure any VLAN except an RSPAN VLAN or a private VLAN.
- The IEEE 802.1x with VLAN assignment feature is not supported on private-VLAN ports, trunk ports, or ports with dynamic-access port assignment through a VMPS.
- You can configure IEEE 802.1x on a private-VLAN port, but do not configure IEEE 802.1x with port security on private-VLAN ports.
- Before globally enabling IEEE 802.1x on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which IEEE 802.1x and EtherChannel are configured.

Maximum Number of Allowed Devices Per Port

This is the maximum number of devices allowed on an IEEE 802.1x-enabled port:

- In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.
- In multihost mode, only one IEEE 802.1x supplicant is allowed on the port, but an unlimited number of non-IEEE 802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

Configuring 802.1x Readiness Check

The 802.1x readiness check monitors IEEE 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support IEEE 802.1x. You can use this feature to determine if the devices connected to the switch ports are IEEE 802.1x-capable.
Chapter 9 Configuring IEEE 802.1x Port-Based Authentication

Configuring IEEE 802.1x Port-Based Authentication

The 802.1x readiness check is allowed on all ports that can be configured for IEEE 802.1x. The readiness check is not available on a port that is configured as `dot1x force-unauthorized`.

Follow these guidelines to enable the readiness check on the switch:

- The readiness check is typically used before IEEE 802.1x is enabled on the switch.
- If you use the `dot1x test eapol-capable` privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.
- When you configure the `dot1x test eapol-capable` command on an IEEE 802.1x-enabled port, and the link comes up, the port queries the connected client about its IEEE 802.1x capability. When the client responds with a notification packet, it is IEEE 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not IEEE 802.1x-capable. No syslog message is generated.
- The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

Beginning in privileged EXEC mode, follow these steps to enable the IEEE 802.1x readiness check on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>dot1x test eapol-capable [interface interface-id]</code> Enable the 802.1x readiness check on the switch. (Optional) For <code>interface-id</code> specify the port on which to check for IEEE 802.1x readiness. <strong>Note</strong> If you omit the optional <code>interface</code> keyword, all interfaces on the switch are tested.</td>
</tr>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> (Optional) Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>dot1x test timeout timeout</code> (Optional) Configure the timeout used to wait for EAPOL response. The range is from 1 to 65535 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code> (Optional) Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show running-config</code> (Optional) Verify your modified timeout values.</td>
</tr>
</tbody>
</table>

This example shows how to enable a readiness check on a switch to query a port. It also shows the response received from the queried port verifying that the device connected to it is IEEE 802.1x-capable:

```
switch# dot1x test eapol-capable interface gigabitethernet1/0/13

DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL capable
```

Configuring IEEE 802.1x Violation Modes

You can configure an IEEE 802.1x port so that it shuts down, generates a syslog error, or discards packets from a new device when:

- a device connects to an IEEE 802.1x-enable port
- the maximum number of allowed about devices have been authenticated on the port
Beginning in privileged EXEC mode, follow these steps to configure the security violation actions on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> aaa new-model</td>
<td>Enable AAA.</td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa authentication dot1x {default} method1</td>
<td>Create an IEEE 802.1x authentication method list.</td>
</tr>
<tr>
<td></td>
<td>To create a default list that is used when a named list is <em>not</em> specified in the authentication command, use the <strong>default</strong> keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.</td>
</tr>
<tr>
<td></td>
<td>For <strong>method1</strong>, enter the <strong>group radius</strong> keywords to use the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Though other keywords are visible in the command-line help string, only the <strong>group radius</strong> keywords are supported.</td>
</tr>
<tr>
<td><strong>Step 4</strong> interface interface-id</td>
<td>Specify the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> switchport mode access</td>
<td>Set the port to access mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> dot1x violation-mode {shutdown</td>
<td>restrict</td>
</tr>
<tr>
<td></td>
<td>• <strong>shutdown</strong>--Error disable the port.</td>
</tr>
<tr>
<td></td>
<td>• <strong>restrict</strong>--Generate a syslog error.</td>
</tr>
<tr>
<td></td>
<td>• <strong>protect</strong>--Drop packets from any new device that sends traffic to the port.</td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> show dot1x</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 9</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

### Configuring IEEE 802.1x Authentication

To configure IEEE 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

To allow VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the IEEE 802.1x AAA process:

**Step 1** A user connects to a port on the switch.

**Step 2** Authentication is performed.

**Step 3** VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.

**Step 4** The switch sends a start message to an accounting server.

**Step 5** Re-authentication is performed, as necessary.
The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.

The user disconnects from the port.

The switch sends a stop message to the accounting server.

Beginning in privileged EXEC mode, follow these steps to configure IEEE 802.1x port-based authentication:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>aaa new-model</td>
<td>Enable AAA.</td>
</tr>
<tr>
<td>3</td>
<td>aaa authentication dot1x {default} method1</td>
<td>Create an IEEE 802.1x authentication method list. To create a default list that is used when a named list is not specified in the <code>authentication</code> command, use the <code>default</code> keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports. For <code>method1</code>, enter the <code>group radius</code> keywords to use the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td>4</td>
<td>dot1x system-auth-control</td>
<td>Enable IEEE 802.1x authentication globally on the switch.</td>
</tr>
<tr>
<td>5</td>
<td>aaa authorization network {default} group radius</td>
<td>(Optional) Configure the switch for user RADIUS authorization for all network-related service requests, such as VLAN assignment.</td>
</tr>

</tbody>
</table>

**Configuring the Switch-to-RADIUS-Server Communication**

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.

Beginning in privileged EXEC mode, follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.
To delete the specified RADIUS server, use the `no radius-server host` command.

This example shows how to specify the server with IP address 172.20.39.46 as the RADIUS server, to use port 1612 as the authorization port, and to set the encryption key to `rad123`, matching the key on the RADIUS server:

```
Switch(config)# radius-server host 172.20.39.46 auth-port 1612 key rad123
```

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the `radius-server` command. If you want to configure these options on a per-server basis, use the `radius-server timeout`, `radius-server retransmit`, and the `radius-server key` command. For more information, see the “Configuring Settings for All RADIUS Servers” section.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

### Configuring Periodic Re-Authentication

You can enable periodic IEEE 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between re-authentication attempts is 3600.
Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 dot1x reauthentication</td>
<td>Enable periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td>Step 4 dot1x timeout reauth-period seconds</td>
<td>Set the number of seconds between re-authentication attempts. The range is 1 to 65535; the default is 3600 seconds. This command affects the behavior of the switch only if periodic re-authentication is enabled.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable periodic re-authentication, use the **no dot1x reauthentication** interface configuration command. To return to the default number of seconds between re-authentication attempts, use the **no dot1x timeout reauth-period** interface configuration command.

This example shows how to enable periodic re-authentication and set the number of seconds between re-authentication attempts to 4000:

```
Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000
```

**Manually Re-Authenticating a Client Connected to a Port**

You can manually re-authenticate the client connected to a specific port at any time by entering the **dot1x re-authenticate interface interface-id** privileged EXEC command. This step is optional. If you want to enable or disable periodic re-authentication, see the “Configuring Periodic Re-Authentication” section on page 9-15.

This example shows how to manually re-authenticate the client connected to a port:

```
Switch# dot1x re-authenticate interface gigabitethernet0/1
```

**Changing the Quiet Period**

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The **dot1x timeout quiet-period** interface configuration command controls the idle period. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a smaller number than the default.
Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> dot1x timeout quiet-period seconds</td>
<td>Set the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535 seconds; the default is 60.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default quiet time, use the **no dot1x timeout quiet-period** interface configuration command.

This example shows how to set the quiet time on the switch to 30 seconds:

```
Switch(config-if)# dot1x timeout quiet-period 30
```

### Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> dot1x timeout tx-period seconds</td>
<td>Set the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request. The range is 1 to 65535 seconds; the default is 30.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default retransmission time, use the **no dot1x timeout tx-period** interface configuration command.
This example shows how to set 60 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request:

```
Switch(config-if)# dot1x timeout tx-period 60
```

### Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP frame (assuming no response is received) to the client before restarting the authentication process.

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td></td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>dot1x max-reauth-req count</strong></td>
</tr>
<tr>
<td></td>
<td>Set the number of times that the switch sends an EAP frame to the client before restarting the authentication process. The range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>show dot1x interface interface-id</strong></td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default retransmission number, use the `no dot1x max-req` interface configuration command.

This example shows how to set 5 as the number of times that the switch sends an EAP request before restarting the authentication process:

```
Switch(config-if)# dot1x max-req 5
```

### Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.
Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 dot1x max-reauth-req count</td>
<td>Set the number of times that the switch restarts the authentication process before the port changes to the unauthorized state. The range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default re-authentication number, use the no dot1x max-reauth-req interface configuration command.

This example shows how to set 4 as the number of times that the switch restarts the authentication process before the port changes to the unauthorized state:

```
Switch(config-if)# dot1x max-reauth-req 4
```

### Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the dot1x port-control interface configuration command set to auto. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the port to which multiple hosts are indirectly attached, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 dot1x host-mode multi-host</td>
<td>Allow multiple hosts (clients) on an IEEE 802.1x-authorized port. Make sure that the dot1x port-control interface configuration command set is set to auto for the specified interface.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show dot1x interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Enter the dot1x host-mode single-host interface configuration command to set the interface to allow a single host on the port.

**Note** Although visible in the command-line interface help, the dot1x host-mode multi-domain interface configuration command is not supported. Configuring this command on an interface causes the interface to go into the error-disabled state.
To disable multiple hosts on the port, use the `no dot1x host-mode multi-host` interface configuration command.

This example shows how to enable IEEE 802.1x and to allow multiple hosts:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
```

### Resetting the IEEE 802.1x Configuration to the Default Values

Beginning in privileged EXEC mode, follow these steps to reset the IEEE 802.1x configuration to the default values. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Enter interface configuration mode, and specify the port to be configured.</td>
</tr>
<tr>
<td><code>dot1x default</code></td>
<td>Reset the configurable IEEE 802.1x parameters to the default values.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>show dot1x interface interface-id</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

### Configuring IEEE 802.1x Accounting

Enabling AAA system accounting with IEEE 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active IEEE 802.1x sessions are closed.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

```
Accounting message %s for session %s failed to receive Accounting Response.
```

When the stop message is not sent successfully, this message appears:

```
00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.
```

**Note** You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.
Beginning in privileged EXEC mode, follow these steps to configure IEEE 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 aaa accounting dot1x default</td>
<td>Enable IEEE 802.1x accounting using the list of all RADIUS servers.</td>
</tr>
<tr>
<td>start-stop group radius</td>
<td></td>
</tr>
<tr>
<td>Step 4 aaa accounting system default</td>
<td>(Optional) Enables system accounting (using the list of all RADIUS</td>
</tr>
<tr>
<td>start-stop group radius</td>
<td>servers) and generates system accounting reload event messages when the</td>
</tr>
<tr>
<td></td>
<td>switch reloads.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEc mode.</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `show radius statistics` privileged EXEC command to display the number of RADIUS messages that do not receive the accounting response message.

This example shows how to configure IEEE 802.1x accounting. The first command configures the RADIUS server, specifying 1813 as the UDP port for accounting:

```plaintext
Switch(config)# radius-server host 172.120.39.46 auth-port 1812 acct-port 1813 key rad123
Switch(config)# aaa accounting dot1x default start-stop group radius
Switch(config)# aaa accounting system default start-stop group radius
```

### Displaying IEEE 802.1x Statistics and Status

To display IEEE 802.1x statistics for all ports, use the `show dot1x all statistics` privileged EXEC command. To display IEEE 802.1x statistics for a specific port, use the `show dot1x statistics interface interface-id` privileged EXEC command.

To display the IEEE 802.1x administrative and operational status for the switch, use the `show dot1x all` privileged EXEC command. To display the IEEE 802.1x administrative and operational status for a specific port, use the `show dot1x interface interface-id` privileged EXEC command.

For detailed information about the fields in these displays, see the command reference for this release.
CHAPTER 10

Configuring Interfaces

This chapter defines the types of interfaces on the Cisco ME 3400E Ethernet Access switch and describes how to configure them.

- **Understanding Interface Types**, page 10-1
- **Using Interface Configuration Mode**, page 10-8
- **Using the Ethernet Management Port**, page 10-12
- **Configuring Ethernet Interfaces**, page 10-15
- **Configuring Layer 3 Interfaces**, page 10-25
- **Configuring the System MTU**, page 10-27
- **Monitoring and Maintaining the Interfaces**, page 10-29

For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and the online *Cisco IOS Interface Command Reference, Release 12.2*.

Understanding Interface Types

This section describes the different types of interfaces supported by the switch with references to chapters that contain more detailed information about configuring these interface types. The rest of the chapter describes configuration procedures for physical interface characteristics.

- **UNI, NNI, and ENI Port Types**, page 10-2
- **Port-Based VLANs**, page 10-2
- **Switch Ports**, page 10-3
- **Routed Ports**, page 10-5
- **Switch Ports**, page 10-3
- **Switch Virtual Interfaces**, page 10-5
- **EtherChannel Port Groups**, page 10-6
- **Dual-Purpose Ports**, page 10-6
- **Connecting Interfaces**, page 10-7
UNI, NNI, and ENI Port Types

The Cisco ME switch supports user-network interfaces (UNIs), network node interfaces (NNIs), and enhanced network interfaces (ENIs). UNIs are typically connected to a host, such as a PC or a Cisco IP phone. NNIs are typically connected to a router or to another switch. ENIs have the same functionality as UNIs, but can be configured to support protocol control packets for Cisco Discovery Protocol (CDP), Spanning-Tree Protocol (STP), Link Layer Discovery Protocol (LLDP), and EtherChannel Link Aggregation Control Protocol (LACP) or Port Aggregation Protocol (PAgP). By default, the 10/100 ports and the dual-purpose ports are configured as UNIs, and the SFP-only module uplink ports are configured as NNIs. No ports are ENIs by default.

**Note**

On the Cisco ME 3400E-24TS-M switch, the dual-purpose ports serve as the uplink ports and are NNIs by default.

If the switch is running the metro access image, only four ports on the switch can be configured as NNIs at one time. If the switch is running the metro IP access image, there is no limit to the number of NNIs that can be configured on the switch. All ports on the switch can be configured as UNIs or ENIs.

The default state for a UNI or ENI is administratively down to prevent unauthorized users from gaining access to other ports as you configure the switch. Traffic is not switched between these ports, and all arriving traffic at UNIs or ENIs must leave on NNIs to prevent a user from gaining access to another user’s private network. If it is appropriate for two or more UNIs or ENIs to exchange traffic within the switch, the UNIs and ENIs can be assigned to a community VLAN. See Chapter 12, “Configuring VLANs,” for instructions on how to configure community VLANs.

**Note**

Even though the default state for a UNI or ENI is shutdown, entering the `default interface interface-id` command changes the port to the enabled state.

The default status for an NNI is administratively up to allow a service provider remote access to the switch during initial configuration.

A port can be reconfigured from UNI to NNI or ENI and the reverse. When a port is reconfigured as another interface type, it inherits all the characteristics of that interface type. When you reconfigure a UNI or ENI to be an NNI, you must enable the port before it becomes active.

Changing the port type from UNI to ENI does not affect the administrative state of the port. If the UNI status is shut down, it remains shut down when reconfigured as an ENI; if the port is in a no shutdown state, it remains in the no shutdown state. At any time, all ports on the Cisco ME switch are either UNI, NNI, or ENI.

Port-Based VLANs

A VLAN is a switched network that is logically segmented by function, team, or application, without regard to the physical location of the users. For more information about VLANs, see Chapter 12, “Configuring VLANs.” Packets received on a port are forwarded only to ports that belong to the same VLAN as the receiving port. Network devices in different VLANs cannot communicate with one another without a Layer 3 device to route traffic between the VLANs.

VLAN partitions provide hard firewalls for traffic in the VLAN, and each VLAN has its own MAC address table. A VLAN comes into existence when a local port is associated with the VLAN ID or when a user creates VLAN ID.
To isolate VLANs of different customers in a service-provider network, the Cisco ME switch uses UNI-ENI VLANs. UNI-ENI VLANs isolate user network interfaces (UNIs) or enhanced network interfaces (ENIs) on the switch from UNIs or ENIs that belong to other customer VLANs. There are two types of UNI-ENI VLANs:

- **UNI-ENI isolated VLAN**—This is the default VLAN state for all VLANs created on the switch. Local switching does not occur among UNIs or ENIs on the switch that belong to the same UNI-ENI isolated VLAN.

- **UNI-ENI community VLAN**—Local switching is allowed among UNIs and ENIs on the switch that belong to the same UNI community VLAN. If UNIs or ENIs belong to the same customer, and you want to switch packets between the ports, you can configure the common VLAN as a UNI-ENI community VLAN.

**Note**  
Local switching takes place between ENIs and UNIs in the same community VLAN. Because you can enable spanning tree on ENIs, but not on UNIs, you should use caution when configuring ENIs and UNIs in the same community VLAN. UNIs are always in the forwarding state.

For more information about UNI VLANs, see the “UNI-ENI VLANs” section on page 12-5.

To configure VLANs, use the `vlan vlan-id` global configuration command to enter VLAN configuration mode. The VLAN configurations for VLAN IDs 1 to 1005 are saved in the VLAN database. Extended-range VLANs (VLAN IDs 1006 to 4094) are not added to the VLAN database. VLAN configuration is saved in the switch running configuration, and you can save it in the switch startup configuration file by entering the `copy running-config startup-config` privileged EXEC command.

Add ports to a VLAN by using the `switchport` interface configuration commands:

- Identify the interface.
- For a trunk port, set trunk characteristics, and if desired, define the VLANs to which it can belong.
- For an access port, set and define the VLAN to which it belongs.
- For a tunnel port, set and define the VLAN ID for the customer-specific VLAN tag. See Chapter 14, “Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling.”

### Switch Ports

Switch ports are Layer 2 only interfaces associated with a physical port. Switch ports belong to one or more VLANs. A switch port can be an access port, a trunk port, a private-VLAN port, or a tunnel port. You can configure a port as an access port or trunk port. You configure a private VLAN port as a host or promiscuous port that belongs to a private-VLAN primary or secondary VLAN. (Only NNIs can be configured as promiscuous ports.) You must manually configure tunnel ports as part of an asymmetric link connected to an IEEE 802.1Q trunk port. Switch ports are used for managing the physical interface and associated Layer 2 protocols and do not handle routing or bridging.

Configure switch ports by using the `switchport` interface configuration commands. Use the `switchport` command with no keywords to put an interface that is in Layer 3 mode into Layer 2 mode.

**Note**  
When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.
Understanding Interface Types

For detailed information about configuring access port and trunk port characteristics, see Chapter 12, “Configuring VLANs.” For more information about tunnel ports, see Chapter 14, “Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling.”

Access Ports

An access port belongs to and carries the traffic of only one VLAN. Traffic is received and sent in native formats with no VLAN tagging. Traffic arriving on an access port is assumed to belong to the VLAN assigned to the port. If an access port receives an IEEE 802.1Q tagged packet, the packet is dropped, and the source address is not learned. IEEE 802.1x can also be used for VLAN assignment.

Two types of access ports are supported:

- Static access ports are manually assigned to a VLAN.
- VLAN membership of dynamic access ports is learned through incoming packets. By default, a dynamic access port is a member of no VLAN, and forwarding to and from the port is enabled only when the VLAN membership of the port is discovered. UNIs begin forwarding packets as soon as they are enabled. Dynamic access ports on the switch are assigned to a VLAN by a VLAN Membership Policy Server (VMPS). The VMPS can be a Catalyst 6500 series switch; the Cisco ME switch cannot be a VMPS server. Dynamic access ports for VMPS are only supported on UNIs and ENIs.

Trunk Ports

An IEEE 802.1Q trunk port carries the traffic of multiple VLANs and by default is a member of all VLANs in the VLAN database. A trunk port supports simultaneous tagged and untagged traffic. An IEEE 802.1Q trunk port is assigned a default Port VLAN ID (PVID), and all untagged traffic travels on the port default PVID. All untagged traffic and tagged traffic with a NULL VLAN ID are assumed to belong to the port default PVID. A packet with a VLAN ID equal to the outgoing port default PVID is sent untagged. All other traffic is sent with a VLAN tag.

Although by default a trunk port is a member of multiple VLANs, you can limit VLAN membership by configuring an allowed list of VLANs for each trunk port. The list of allowed VLANs does not affect any other port but the associated trunk port. By default, all possible VLANs (VLAN ID 1 to 4094) are in the allowed list. A trunk port can become a member of a VLAN only if the VLAN is in the enabled state.

For more information about trunk ports, see Chapter 12, “Configuring VLANs.”

Tunnel Ports

Tunnel ports are used in IEEE 802.1Q tunneling to segregate the traffic of customers in a service-provider network from other customers who are using the same VLAN number. You configure an asymmetric link from a tunnel port on a service-provider edge switch to an IEEE 802.1Q trunk port on the customer switch. Packets entering the tunnel port on the edge switch, already IEEE 802.1Q-tagged with the customer VLANs, are encapsulated with another layer of an IEEE 802.1Q tag (called the metro tag), containing a VLAN ID unique in the service-provider network, for each customer. The double-tagged packets go through the service-provider network keeping the original customer VLANs separate from those of other customers. At the outbound interface, also a tunnel port, the metro tag is removed, and the original VLAN numbers from the customer network are retrieved.

Tunnel ports cannot be trunk ports or access ports and must belong to a VLAN unique to each customer.
Routed Ports

A routed port is a physical port that acts like a port on a router; it does not have to be connected to a router. A routed port is not associated with a particular VLAN, as is an access port. A routed port behaves like a regular router interface, except that it does not support VLAN subinterfaces. Routed ports can be configured with a Layer 3 routing protocol. A routed port is a Layer 3 interface only and does not support Layer 2 protocols, such as STP.

Configure routed ports by putting the interface into Layer 3 mode with the `no switchport` interface configuration command. Then assign an IP address to the port, enable routing, and assign routing protocol characteristics by using the `ip routing` and `router protocol` global configuration commands.

Note: Entering a `no switchport` interface configuration command shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost.

The number of routed ports that you can configure is not limited by software. However, the interrelationship between this number and the number of other features being configured might impact CPU performance because of hardware limitations. See the “Configuring Layer 3 Interfaces” section on page 10-25 for information about what happens when hardware resource limitations are reached.

For more information about IP unicast and multicast routing and routing protocols, see Chapter 36, “Configuring IP Unicast Routing” and Chapter 41, “Configuring IP Multicast Routing.”

Note: For full Layer 3 routing, you must have the metro IP access image installed on the switch.

Ethernet Management Port

The Ethernet management port, also referred to as the Fa0 or fastethernet0 port, is a Layer 3 host port to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management.

See the “Using the Ethernet Management Port” section on page 10-12 for more information.

Switch Virtual Interfaces

A switch virtual interface (SVI) represents a VLAN of switch ports as one interface to the routing or bridging function in the system. Only one SVI can be associated with a VLAN, but you need to configure an SVI for a VLAN only when you wish to route between VLANs or to provide IP host connectivity to the switch. By default, an SVI is created for the default VLAN (VLAN 1) to permit remote switch administration. Additional SVIs must be explicitly configured.

Note: You cannot delete interface VLAN 1.
SVIs provide IP host connectivity only to the system; in Layer 3 mode, you can configure routing across SVIs.

Although the switch supports a total of 1005 VLANs (and SVIs), the interrelationship between the number of SVIs and routed ports and the number of other features being configured might impact CPU performance because of hardware limitations. See the “Configuring Layer 3 Interfaces” section on page 10-25 for information about what happens when hardware resource limitations are reached.

SVIs are created the first time that you enter the `vlan` interface configuration command for a VLAN interface. The VLAN corresponds to the VLAN tag associated with data frames on an IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port. Configure a VLAN interface for each VLAN for which you want to route traffic, and assign it an IP address. For more information, see the “Manually Assigning IP Information” section on page 3-14.

---

**Note**

When you create an SVI, it does not become active until it is associated with a physical port.

---

SVIs support routing protocols. For more information about configuring IP routing, see Chapter 36, “Configuring IP Unicast Routing,” and Chapter 41, “Configuring IP Multicast Routing.”

---

**Note**

Routed ports (or SVIs) are supported only when the metro IP access image is installed on the switch.

---

### EtherChannel Port Groups

EtherChannel port groups treat multiple switch ports as one switch port. These port groups act as a single logical port for high-bandwidth connections between switches or between switches and servers. An EtherChannel balances the traffic load across the links in the channel. If a link within the EtherChannel fails, traffic previously carried over the failed link changes to the remaining links. You can group multiple trunk ports into one logical trunk port, group multiple access ports into one logical access port, group multiple tunnel ports into one logical tunnel port, or group multiple routed ports into one logical routed port. Most protocols operate over either single ports or aggregated switch ports and do not recognize the physical ports within the port group. Exceptions are the Cisco Discovery Protocol (CDP), Link Aggregation Control Protocol (LACP), and the Port Aggregation Protocol (PAgP), which operate only on physical NNI or ENI ports.

When you configure an EtherChannel, you create a port-channel logical interface and assign an interface to the EtherChannel. For Layer 3 interfaces, you manually create the logical interface by using the `interface port-channel` global configuration command. Then you manually assign an interface to the EtherChannel by using the `channel-group` interface configuration command. For Layer 2 interfaces, use the `channel-group` interface configuration command to dynamically create the port-channel logical interface. This command binds the physical and logical ports together. For more information, see Chapter 35, “Configuring EtherChannels and Link-State Tracking.”

---

### Dual-Purpose Ports

Each dual-purpose port is considered as a single interface with dual front ends (an RJ-45 connector and an SFP module connector). The dual front ends are not redundant interfaces; the switch activates only one connector of the pair.
By default, dual-purpose ports are user-network interfaces (UNIs) and SFP-only module ports are network node interfaces (NNIs). By default, the switch dynamically selects the dual-purpose port media type that first links up. However, you can use the `media-type` interface configuration command to manually select the RJ-45 connector or the SFP module connector. For information about configuring a dual-purpose port, see the “Configuring a Dual-Purpose Port” section on page 10-21.

Each dual-purpose port has two LEDs: one shows the status of the SFP module port, and one shows the status of the RJ-45 port. The port LED is on for whichever connector is active. For more information about the LEDs, see the hardware installation guide.

### Connecting Interfaces

Devices within a single VLAN can communicate directly through any switch. Ports in different VLANs cannot exchange data without going through a routing device. With a standard Layer 2 switch, ports in different VLANs have to exchange information through a router.

By default, the Cisco ME switch provides VLAN isolation between UNIs or ENIs. UNIs and ENIs cannot exchange traffic unless they are changed to NNIs or assigned to a UNI-ENI community VLAN.

By using the switch with routing enabled, when you configure both VLAN 20 and VLAN 30 with an SVI to which an IP address is assigned, packets can be sent from Host A to Host B directly through the switch with no need for an external router (Figure 10-1).

![Figure 10-1 Connecting VLANs with the Switch](image-url)

When the metro IP access image is running on the switch, routing can be enabled on the switch. Whenever possible, to maintain high performance, forwarding is done by the switch hardware. However, only IP Version 4 packets with Ethernet II encapsulation can be routed in hardware. The routing function can be enabled on all SVIs and routed ports. The switch routes only IP traffic. When IP routing protocol parameters and address configuration are added to an SVI or routed port, any IP traffic received from these ports is routed. For more information, see Chapter 36, “Configuring IP Unicast Routing,” Chapter 41, “Configuring IP Multicast Routing,” and Chapter 42, “Configuring MSDP.”
Using Interface Configuration Mode

The switch supports these interface types:

- Physical ports—switch ports, routed ports, UNIs, NNIs, and ENIs
- VLANs—switch virtual interfaces
- Port-channels—EtherChannel interfaces

You can also configure a range of interfaces (see the “Configuring a Range of Interfaces” section on page 10-9).

To configure a physical interface (port), specify the interface type, the module number, and the switch port number, and enter interface configuration mode.

- Type—Fast Ethernet (fastethernet or fa) for 10/100 Mbps Ethernet, Gigabit Ethernet (gigabitethernet or gi) for 10/100/1000 Mbps Ethernet ports, or small form-factor pluggable (SFP) module Gigabit Ethernet interfaces.
- Module number—The module or slot number on the switch (always 0 on the Cisco ME switch).
- Port number—The interface number on the switch. The port numbers always begin at 1, starting with the leftmost port when facing the front of the switch, for example, fastethernet 0/1 or gigabitethernet 0/1. If there is more than one interface type (for example, 10/100 ports and SFP module ports), the port numbers restart with the second interface type: gigabitethernet 0/1.

You can identify physical interfaces by physically checking the interface location on the switch. You can also use the `show` privileged EXEC commands to display information about a specific interface or all the interfaces on the switch. The remainder of this chapter primarily provides physical interface configuration procedures.

Procedures for Configuring Interfaces

These general instructions apply to all interface configuration processes.

**Step 1** Enter the `configure terminal` command at the privileged EXEC prompt:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#
```

**Step 2** Enter the `interface` global configuration command. Identify the interface type and the number of the connector. In this example, Fast Ethernet port 1 is selected:

```
Switch(config)# interface fastethernet0/1
Switch(config-if)#
```

**Note** You do not need to add a space between the interface type and interface number. For example, in the preceding line, you can specify either `fastethernet 0/1`, `fastethernet0/1`, `fa 0/1`, or `fa0/1`.

**Step 3** If you are configuring a UNI or ENI, enter the `no shutdown` interface configuration command to enable the interface:

```
Switch(config-if)# no shutdown
```
Step 4

Follow each `interface` command with the interface configuration commands that the interface requires. The commands that you enter define the protocols and applications that will run on the interface. The commands are collected and applied to the interface when you enter another interface command or enter `end` to return to privileged EXEC mode.

You can also configure a range of interfaces by using the `interface range` or `interface range macro` global configuration commands. Interfaces configured in a range must be the same type and must be configured with the same feature options.

Step 5

After you configure an interface, verify its status by using the `show` privileged EXEC commands listed in the “Monitoring and Maintaining the Interfaces” section on page 10-29.

Enter the `show interfaces` privileged EXEC command to see a list of all interfaces on or configured for the switch. A report is provided for each interface that the device supports or for the specified interface.

## Configuring a Range of Interfaces

You can use the `interface range` global configuration command to configure multiple interfaces with the same configuration parameters. When you enter the interface range configuration mode, all command parameters that you enter are attributed to all interfaces within that range until you exit this mode.

Beginning in privileged EXEC mode, follow these steps to configure a range of interfaces with the same parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface range <code>{port-range}</code></td>
<td>Specify the range of interfaces (VLANs or physical ports) to be configured, and enter interface range configuration mode.</td>
</tr>
<tr>
<td></td>
<td>• You can use the <code>interface range</code> command to configure up to five port ranges or a previously defined macro.</td>
</tr>
<tr>
<td></td>
<td>• In a comma-separated <code>port-range</code>, you must enter the interface type for each entry and enter spaces before and after the comma.</td>
</tr>
<tr>
<td></td>
<td>• In a hyphen-separated <code>port-range</code>, you do not need to re-enter the interface type, but you must enter a space before the hyphen.</td>
</tr>
<tr>
<td><strong>Step 3</strong> no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>You can now use the normal configuration commands to apply the configuration parameters to all interfaces in the range.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> show interfaces <code>[interface-id]</code></td>
<td>Verify the configuration of the interfaces in the range.</td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

When using the `interface range` global configuration command, note these guidelines:

- Valid entries for `port-range`:
  - `vlan vlan-ID - vlan-ID`, where the VLAN ID is 1 to 4094
  - `fastethernet module/[first port] - [last port]`, where the module is always 0
Chapter 10  Configuring Interfaces

Using Interface Configuration Mode

- **gigabitethernet** module/[first port] - {last port}, where the module is always 0
- **port-channel** port-channel-number - port-channel-number, where the port-channel-number is 1 to 48

**Note** When you use the **interface range** command with port channels, the first and last port channel number must be active port channels.

- The **interface range** command only works with VLAN interfaces that have been configured with the **interface vlan** command. The **show running-config** privileged EXEC command displays the configured VLAN interfaces. VLAN interfaces not displayed by the **show running-config** command cannot be used with the **interface range** command.
- All interfaces defined as in a range must be the same type (all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs), but you can enter multiple ranges in a command.

This example shows how to use the **interface range** global configuration command to set the speed on ports 1 and 2 to 100 Mbps:

```
Switch# configure terminal
Switch(config)# interface range fastethernet0/1 - 2
Switch(config-if-range)# no shutdown
Switch(config-if-range)# speed 100
```

This example shows how to use a comma to add different interface type strings to the range to enable Fast Ethernet ports 1 to 3 and Gigabit Ethernet ports 1 and 2 to receive IEEE 802.3x flow control pause frames:

```
Switch# configure terminal
Switch(config)# interface range fastethernet0/1 - 3, gigabitethernet0/1 - 2
Switch(config-if-range)# flowcontrol receive on
```

If you enter multiple configuration commands while you are in interface range mode, each command is executed as it is entered. The commands are not batched together and executed after you exit interface range mode. If you exit interface range configuration mode while the commands are being executed, some commands might not be executed on all interfaces in the range. Wait until the command prompt reappears before exiting interface range configuration mode.

**Configuring and Using Interface Range Macros**

You can create an interface range macro to automatically select a range of interfaces for configuration. Before you can use the **macro** keyword in the **interface range macro** global configuration command string, you must use the **define interface-range** global configuration command to define the macro.

Beginning in privileged EXEC mode, follow these steps to define an interface range macro:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>define interface-range macro_name interface-range</td>
</tr>
<tr>
<td></td>
<td>• The <strong>macro_name</strong> is a 32-character maximum character string.</td>
</tr>
<tr>
<td></td>
<td>• A macro can contain up to five comma-separated interface ranges.</td>
</tr>
<tr>
<td></td>
<td>• Each <strong>interface-range</strong> must consist of the same port type.</td>
</tr>
</tbody>
</table>
Use the **no define interface-range macro_name** global configuration command to delete a macro.

When using the **define interface-range** global configuration command, note these guidelines:

- Valid entries for **interface-range**:
  - `vlan vlan-ID - vlan-ID`, where the VLAN ID is 1 to 4094
  - `fastethernet module/[first port] - {last port}`, where the module is always 0
  - `gigabitethernet module/[first port] - {last port}`, where the module is always 0
  - `port-channel port-channel-number - port-channel-number`, where the `port-channel-number` is 1 to 48.

  **Note** When you use the interface ranges with port channels, the first and last port channel number must be active port channels.

- You must add a space between the first interface number and the hyphen when entering an **interface-range**. For example, `gigabitethernet0/1 - 2` is a valid range; `gigabitethernet0/1-2` is not a valid range.

- The VLAN interfaces must have been configured with the **interface vlan** command. The **show running-config** privileged EXEC command displays the configured VLAN interfaces. VLAN interfaces not displayed by the **show running-config** command cannot be used as **interface-ranges**.

- All interfaces defined as in a range must be the same type (all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs), but you can combine multiple interface types in a macro.

This example shows how to define an interface-range named `enet_list` to include ports 1 and 2 and to verify the macro configuration:

```plaintext
Switch# configure terminal
Switch(config)# define interface-range enet_list gigabitethernet0/1 - 2
Switch(config)# end
Switch# show running-config | include define
define interface-range enet_list GigabitEthernet0/1 - 2
```

**Step 3**
- **Command**: `no shutdown`
  - **Purpose**: Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.

**Step 4**
- **Command**: `interface range macro macro_name`
  - **Purpose**: Select the interface range to be configured using the values saved in the interface-range macro called `macro_name`. You can now use the normal configuration commands to apply the configuration to all interfaces in the defined macro.

**Step 5**
- **Command**: `end`
  - **Purpose**: Return to privileged EXEC mode.

**Step 6**
- **Command**: `show running-config | include define`
  - **Purpose**: Show the defined interface range macro configuration.

**Step 7**
- **Command**: `copy running-config startup-config`
  - **Purpose**: (Optional) Save your entries in the configuration file.
This example shows how to create a multiple-interface macro named *macro1* and assign all of the interfaces in the range to a VLAN:

```
Switch# configure terminal
Switch(config)# define interface-range macro1 fastethernet0/1 - 2, gigabitethernet0/1 - 2
Switch(config)# interface range macro macro1
Switch(config-if-range)# switchport access vlan 20
Switch(config-if-range)# no shut
Switch(config-if-range)# end
```

This example shows how to enter interface range configuration mode for the interface-range macro *enet_list*:

```
Switch# configure terminal
Switch(config)# interface range macro enet_list
Switch(config-if-range)#
```

This example shows how to delete the interface-range macro *enet_list* and to verify that it was deleted.

```
Switch# configure terminal
Switch(config)# no define interface-range enet_list
Switch(config)# end
Switch# show run | include define
Switch#
```

### Using the Ethernet Management Port

This section has this information:

- Understanding the Ethernet Management Port, page 10-12
- Supported Features on the Ethernet Management Port, page 10-14
- Configuring the Ethernet Management Port, page 10-14
- TFTP and the Ethernet Management Port, page 10-14

### Understanding the Ethernet Management Port

The Ethernet management port is port *Fa0* or *fastethernet0*, a Layer 3 host port to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management.

When connecting a PC to the Ethernet management port, you must assign an IP address. Connect the Ethernet management port to the PC as shown in Figure 10-2.
By default, the Ethernet management port is enabled. The switch cannot route packets from the Ethernet management port to a network port or receive routed packets from a network port.

Even though the Ethernet management port does not support routing, you might need to enable routing protocols on the port. For example, in Figure 10-3, you must enable routing protocols on the Ethernet management port when the PC is two or more hops away from the switch and the packets must pass through two or more Layer 3 devices to reach the PC.

In Figure 10-3, if the Ethernet management port and the network ports are associated with the same routing process, the routes are propagated in this manner:

- The routes from the Ethernet management port are propagated through the network ports to the network.
- The routes from the network ports are propagated through the Ethernet management port to the network.

Because routing is not supported between the Ethernet management port and the network ports, traffic cannot be sent or received between these ports. If traffic is sent or received, data packet loops occur between the ports, which disrupts the switch and network operation. Configure route filters to avoid routes between the Ethernet management port and the network ports and to prevent the loops.
Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SMNP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
- Speed—10 Mb/s, 100 Mb/s, and autonegotiation
- Duplex mode—Full, half, and autonegotiation
- Loopback detection
- Cisco Discovery Protocol (CDP)
- DHCP relay agent
- IPv4 access control lists (ACLs)
- Routing protocols

Caution

Before enabling a feature on the Ethernet management port, make sure that the feature is supported. If you try to configure an unsupported feature on the Ethernet Management port, the feature might not work properly, and the switch might fail.

Configuring the Ethernet Management Port

To specify the Ethernet management port in the CLI, enter `fastethernet0`.

To disable the port, use the `shutdown` interface configuration command. To enable the port, use the `no shutdown` interface configuration command.

You can monitor the Ethernet management port LED to determine the link status to the PC. The LED is green (on) when the link is active, and the LED is off when the link is down. The LED is amber when there is a POST failure.

To display the link status, use the `show interfaces fastethernet 0` privileged EXEC command.

TFTP and the Ethernet Management Port

Use the commands in Table 1 when using TFTP to download or upload a configuration file to the boot loader.
Table 1 Boot Loader Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp [ip_address]</td>
<td>Displays the currently cached ARP(^1) table when this command is entered without the ip_address parameter. Enables ARP to associate a MAC address with the specified IP address when this command is entered with the ip_address parameter.</td>
</tr>
<tr>
<td>mgmt_clr</td>
<td>Clears the statistics for the Ethernet management port.</td>
</tr>
<tr>
<td>mgmt_init</td>
<td>Starts the Ethernet management port.</td>
</tr>
<tr>
<td>mgmt_show</td>
<td>Displays the statistics for the Ethernet management port.</td>
</tr>
<tr>
<td>ping host_ip_address</td>
<td>Sends ICMP ECHO_REQUEST packets to the specified network host.</td>
</tr>
<tr>
<td>boot tftp:/file-url ...</td>
<td>Loads and boots an executable image from the TFTP server and enters the command-line interface. For more details, see the command reference for this release.</td>
</tr>
<tr>
<td>copy tftp:/source-file-url filesystem:/destination-file-url</td>
<td>Copies a Cisco IOS image from the TFTP server to the specified location. For more details, see the command reference for this release.</td>
</tr>
</tbody>
</table>

\(^1\) ARP = Address Resolution Protocol.

Configuring Ethernet Interfaces

These sections contain this configuration information:

- Default Ethernet Interface Configuration, page 10-15
- Configuring the Port Type, page 10-17
- Configuring Interface Speed and Duplex Mode, page 10-18
- Configuring a Dual-Purpose Port, page 10-21
- Configuring IEEE 802.3x Flow Control, page 10-23
- Configuring Auto-MDIX on an Interface, page 10-24
- Adding a Description for an Interface, page 10-25

Default Ethernet Interface Configuration

Table 10-2 shows the Ethernet interface default configuration for NNIs, and Table 10-3 shows the Ethernet interface default configuration for UNIs and ENIs. For more details on the VLAN parameters listed in the table, see Chapter 12, “Configuring VLANs.” For details on controlling traffic to the port, see Chapter 23, “Configuring Port-Based Traffic Control.”

Note To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the switchport interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which
the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

Chapter 10 Configuring Interfaces

Configuring Ethernet Interfaces

By default, all the 10/100 ports on the Cisco ME switch are configured as UNIs, and the SFP module ports are configured as NNIs. You can also configure the port type as ENI. An ENI has the same characteristics as a UNI, but it can be configured to support CDP, STP, LLDP, and Etherchannel LACP and PAgP.

You use the `port-type` interface configuration command to change the port types. If the switch is running the metro access image, only four ports on the switch can be configured as NNIs at one time. If the switch is running the metro IP access image, there is no limit to the number of NNIs that can be configured on the switch. All ports on the switch can be configured as UNIs or ENIs.

When a port is changed from an NNI to a UNI or ENI or the reverse, any features exclusive to the port type revert to the default configuration. For Layer 2 protocols, such as STP, CDP, and LLDP, the default for UNIs and ENIs is disabled (although they can be enabled on ENIs) and the default for NNIs is enabled.

**Note**

By default, the switch sends keepalive messages on UNIs and ENIs and does not send keepalive messages on NNIs. Changing the port type from UNI or ENI to NNI or from NNI to UNI or ENI has no effect on the keepalive status. You can change the keepalive state from the default setting by entering the `[no] keepalive` interface configuration command. If you enter the `keepalive` command with no arguments, keepalive packets are sent with the default time interval (10 seconds) and number of retries (5). Entering the `no keepalive` command disables keepalive packets on the interface.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port description</td>
<td>None defined.</td>
</tr>
<tr>
<td>Speed</td>
<td>Autonegotiate.</td>
</tr>
<tr>
<td>Duplex mode</td>
<td>Autonegotiate.</td>
</tr>
<tr>
<td>IEEE 802.3x flow control</td>
<td>Flow control is set to receive: off. It is always off for sent packets.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Configuring the Port Type**

By default, all the 10/100 ports on the Cisco ME switch are configured as UNIs, and the SFP module ports are configured as NNIs. You can also configure the port type as ENI. An ENI has the same characteristics as a UNI, but it can be configured to support CDP, STP, LLDP, and Etherchannel LACP and PAgP.

You use the `port-type` interface configuration command to change the port types. If the switch is running the metro access image, only four ports on the switch can be configured as NNIs at one time. If the switch is running the metro IP access image, there is no limit to the number of NNIs that can be configured on the switch. All ports on the switch can be configured as UNIs or ENIs.

When a port is changed from an NNI to a UNI or ENI, it inherits the configuration of the assigned VLAN, either in isolated or community mode. For more information about configuring UNI-ENI isolated and UNI-ENI community VLANs, see Chapter 12, “Configuring VLANs.”

When you change a port from NNI to UNI or ENI or the reverse, any features exclusive to the port type revert to the default configuration. For Layer 2 protocols, such as STP, CDP, and LLDP, the default for UNIs and ENIs is disabled (although they can be enabled on ENIs) and the default for NNIs is enabled.
Beginning in privileged EXEC mode, follow these steps to configure the port type on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify the interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong> port-type {eni</td>
<td>Change a port to an ENI, NNI, or UNI.</td>
</tr>
<tr>
<td>nni</td>
<td>uni}</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> show interfaces interface-id</td>
<td>Verify the interface IEEE 802.3x flow control settings.</td>
</tr>
<tr>
<td><strong>Step 7</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Entering the **no port-type** or **default port-type** interface configuration command returns the port to the default state: UNI for Fast Ethernet ports and NNI for Gigabit Ethernet ports.

This example shows how to change a port from a UNI to an NNI and save it to the running configuration.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet0/1
Switch(config-if)# port-type nni
Switch(config-if)# no shutdown
5d20h: %SYS-5-CONFIG_I: Configured from console by console
Switch(config-if)# end
Switch# copy running-config startup-config
```

**Configuring Interface Speed and Duplex Mode**

Ethernet interfaces on the switch operate at 10, 100, or 1000 Mbps and in either full- or half-duplex mode. In full-duplex mode, two stations can send and receive traffic at the same time. Normally, 10-Mbps ports operate in half-duplex mode, which means that stations can either receive or send traffic.

Switch models include combinations of Fast Ethernet (10/100-Mbps) ports, Gigabit Ethernet (10/100/1000-Mbps) ports, and small form-factor pluggable (SFP) module slots supporting SFP modules.

These sections describe how to configure the interface speed and duplex mode:

- **Speed and Duplex Configuration Guidelines**, page 10-18
- **Setting the Interface Speed and Duplex Parameters**, page 10-19

**Speed and Duplex Configuration Guidelines**

When configuring an interface speed and duplex mode, note these guidelines:

- You can configure interface speed on Fast Ethernet (10/100-Mbps) and Gigabit Ethernet (10/100/1000-Mbps) ports. You can configure Fast Ethernet ports to full-duplex, half-duplex, or to autonegotiate mode. You can configure Gigabit Ethernet ports to full-duplex mode or to autonegotiate. You also can configure Gigabit Ethernet ports to half-duplex mode if the speed is 10 or 100 Mbps. Half-duplex mode is not supported on Gigabit Ethernet ports operating at 1000 Mbps.
• With the exception of when 1000BASE-T SFP modules are installed in the SFP module slots, you cannot configure speed on SFP module ports, but you can configure speed to not negotiate (nonegotiate) if connected to a device that does not support autonegotiation.

However, when a 1000BASE-T SFP module is in the SFP module slot, you can configure speed as 10, 100, or 1000 Mbps, or auto, but not as nonegotiate.

On a 100BASE-FX SFP module, you cannot configure the speed as nonegotiate.

• You cannot configure duplex mode on SFP module ports; they operate in full-duplex mode except in these situations:
  – When a Cisco 1000BASE-T SFP module is in the SFP module slot, you can configure duplex mode to auto or full. Half-duplex mode is supported with the auto setting.
  – When a Cisco 100BASE-FX SFP module is in the SFP module slot, you can configure duplex mode to half or full. Although the auto keyword is available, it puts the interface in half-duplex mode (the default for this SFP module) because the 100BASE-FX SFP module does not support autonegotiation.

• If both ends of the line support autonegotiation, we highly recommend the default setting of auto negotiation.

• If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do not use the auto setting on the supported side.

• When STP is enabled and a port is reconfigured, the switch can take up to 30 seconds to check for loops. The port LED is amber while STP reconfigures. On the Cisco ME switch, STP is supported on NNIs by default and can be enabled on ENIs. UNIs do not support STP.

Caution
Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

Setting the Interface Speed and Duplex Parameters

Beginning in privileged EXEC mode, follow these steps to set the speed and duplex mode for a physical interface.

Note
On dual-purpose ports, changing the interface type by entering the media-type interface configuration command removes the speed and duplex configurations. See the “Configuring a Dual-Purpose Port” section on page 10-21 for information about speed and duplex setting on these ports.

<table>
<thead>
<tr>

</table>
### Configuring Ethernet Interfaces

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 4      | speed `{10 | 100 | 1000 | auto [10 | 100 | 1000] | nonegotiate}` | Enter the appropriate speed parameter for the interface:  
  - Enter 10, 100, or 1000 to set a specific speed for the interface.  
    The 1000 keyword is available only for 10/100/1000 Mbps ports or SFP module ports with a 1000BASE-T SFP module.  
  - Enter auto to enable the interface to autonegotiate speed with the connected device. If you use the 10, 100, or the 1000 keywords with the auto keyword, the port autonegotiates only at the specified speeds.  
  - The nonegotiate keyword is available only for SFP module ports. SFP module ports operate only at 1000 Mbps but can be configured to not negotiate if connected to a device that does not support autonegotiation.  
  
  **Note** When a Cisco 1000BASE-T SFP module is in the SFP module slot, the speed can be configured to 10, 100, 1000, or to auto, but not to nonegotiate.  
| 5      | duplex `{auto | full | half}` | Enter the duplex parameter for the interface.  
  Enable half-duplex mode (for interfaces operating only at 10 or 100 Mbps). You cannot configure half-duplex mode for interfaces operating at 1000 Mbps.  
  You can configure the duplex setting when the speed is set to auto.  
  This command is not available on SFP module ports with these exceptions:  
  - If a Cisco 1000BASE-T SFP module is inserted, you can configure duplex to auto or to full.  
  - If a Cisco 100BASE-FX SFP module is inserted, you can configure duplex to full or to half. Although the auto keyword is available, it puts the interface in half-duplex mode (the default).  
| 6      | end                                          | Return to privileged EXEC mode.  
| 7      | show interfaces `interface-id`               | Display the interface speed and duplex mode configuration.  
| 8      | copy running-config startup-config           | (Optional) Save your entries in the configuration file.  

Use the **no speed** and **no duplex** interface configuration commands to return the interface to the default speed and duplex settings (autonegotiate). To return all interface settings to the defaults, use the **default interface interface-id** interface configuration command.

This example shows how to set the interface speed to 10 Mbps and the duplex mode to half on a 10/100 Mbps port:

```bash
Switch# configure terminal  
Switch(config)# interface fastethernet0/3  
Switch(config-if)# no shutdown  
Switch(config-if)# speed 10  
Switch(config-if)# duplex half  
```

This example shows how to set the interface speed to 100 Mbps on a 10/100/1000 Mbps port:

```bash
Switch# configure terminal  
Switch(config)# interface gigabitethernet0/2  
Switch(config-if)# speed 100  
```
Configuring a Dual-Purpose Port

Some ports on the switches are dual-purpose ports that can be configured as 10/100/100 ports or as small form-factor pluggable (SFP) module ports. Each dual-purpose port is considered as a single interface with dual front ends (an RJ-45 connector and an SFP module connector).

Note

Even when operating at 10 or 100 Mbps, the dual-purpose ports (and the SFP-only module ports) use the frame size that is set with the `system mtu jumbo` global configuration command.

Each dual-purpose port is considered as a single interface with dual front ends (an RJ-45 connector and an SFP module connector). The dual front ends are not redundant interfaces; the switch activates only one connector of the pair.

By default, the dual-purpose ports are user-network interfaces (UNIs) and the SFP-only module ports are network node interfaces (NNIs).

Note

An exception is the Cisco ME 3400E-24TS-M switch, where the dual-purpose ports serve as the uplink ports and are NNIs by default.

If the switch is running the metro IP access image, you can configure any number of ports as NNIs. If the switch is running the metro access image, you can configure only four ports as NNIs.

By default, the switch dynamically selects the dual-purpose port media type that first links up. However, you can use the `media-type` interface configuration command to manually select the RJ-45 connector or the SFP-module connector. In `auto-select` mode, the switch gives preference to SFP mode if both copper and fiber-optic signals are simultaneously detected.

Beginning in privileged EXEC mode, follow these steps to select which dual-purpose media type to activate. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Specify the dual-purpose port to be configured, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>
To return to the default setting, use the `no media-type` interface configuration command.

Changing the interface type removes the speed and duplex configurations. The switch configures both media types to autonegotiate speed and duplex (the default). If you configure `auto-select`, you cannot configure the `speed` and `duplex` interface configuration commands.

When you configure `sfp` or `rj45` media type, the non-configured type is disabled, even if there is a connector installed in that interface and no connector in the configured one.

When the media type is `auto-select`, the switch uses these criteria to select the type:

- If only one connector is installed, that interface is active and remains active until the media is removed or the switch is reloaded.
- If you install both types of media in an enabled dual-purpose port, the switch selects the active link based on which type is installed first.
- If both media are installed in the dual-purpose port, and the switch is reloaded or the port is disabled and then reenabled through the `shutdown` and the `no shutdown` interface configuration commands, the switch gives preference to the SFP module interface.

See the `media-type` interface configuration command in the command reference for more information.

</table>
Configuring IEEE 802.3x Flow Control

IEEE 802.3x flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

Note

Ports can receive, but not send, pause frames.

You use the `flowcontrol` interface configuration command to set the interface’s ability to receive pause frames to on, off, or desired. The default state is off.

When set to desired, an interface can operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.

These rules apply to IEEE 802.3x flow control settings on the device:

- receive on (or desired): The port cannot send pause frames but can operate with an attached device that is required to or can send pause frames; the port can receive pause frames.
- receive off: IEEE 802.3x flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.

Note

For details on the command settings and the resulting IEEE 802.3x flow control resolution on local and remote ports, see the `flowcontrol` interface configuration command in the command reference for this release.

Beginning in privileged EXEC mode, follow these steps to configure IEEE 802.3x flow control on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Step 2</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the physical interface to be configured,</td>
</tr>
<tr>
<td>no shutdown</td>
<td>and enter interface configuration mode.</td>
</tr>
<tr>
<td>flowcontrol {receive}</td>
<td>Configure the IEEE 802.3x flow control mode for</td>
</tr>
<tr>
<td>{on</td>
<td>off</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show interfaces</td>
<td>Verify the interface IEEE 802.3x flow control</td>
</tr>
<tr>
<td>copy running-config</td>
<td>(Optional) Save your entries in the configuration</td>
</tr>
<tr>
<td></td>
<td>settings.</td>
</tr>
<tr>
<td></td>
<td>settings.</td>
</tr>
<tr>
<td></td>
<td>settings.</td>
</tr>
<tr>
<td></td>
<td>settings.</td>
</tr>
<tr>
<td></td>
<td>settings.</td>
</tr>
</tbody>
</table>

To disable IEEE 802.3x flow control, use the `flowcontrol receive off` interface configuration command.

This example shows how to enable IEEE 802.3x flow control on a port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# flowcontrol receive on
Switch(config-if)# end
```
Configuring Auto-MDI on an Interface

When automatic medium-dependent interface crossover (auto-MDI) is enabled on an interface, the interface automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting switches without the auto-MDI feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other switches or repeaters. With auto-MDI enabled, you can use either type of cable to connect to other devices, and the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.

Auto-MDI is enabled by default. When you enable auto-MDI, you must also set the speed and duplex on the interface to auto so that the feature operates correctly. Auto-MDI is supported on all 10/100 and 10/100/1000 Mbps interfaces and on Cisco 10/100/1000 BASE-T/ TX SFP module interfaces. It is not supported on 1000 BASE-SX or -LX SFP module interfaces.

Table 10-4 shows the link states that result from auto-MDI settings and correct and incorrect cabling.

Table 10-4 Link Conditions and Auto-MDI Settings

<table>
<thead>
<tr>
<th>Local Side Auto-MDI</th>
<th>Remote Side Auto-MDI</th>
<th>With Correct Cabling</th>
<th>With Incorrect Cabling</th>
</tr>
</thead>
<tbody>
<tr>
<td>On</td>
<td>On</td>
<td>Link up</td>
<td>Link up</td>
</tr>
<tr>
<td>On</td>
<td>Off</td>
<td>Link up</td>
<td>Link up</td>
</tr>
<tr>
<td>Off</td>
<td>On</td>
<td>Link up</td>
<td>Link up</td>
</tr>
<tr>
<td>Off</td>
<td>Off</td>
<td>Link up</td>
<td>Link down</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to configure auto-MDI on an interface:

1. `configure terminal` Enter global configuration mode
2. `interface interface-id` Specify the physical interface to be configured, and enter interface configuration mode.
3. `no shutdown` Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.
4. `speed auto` Configure the interface to autonegotiate speed with the connected device.
5. `duplex auto` Configure the interface to autonegotiate duplex mode with the connected device.
6. `mdix auto` Enable auto-MDI on the interface.
7. `end` Return to privileged EXEC mode.
8. `show controllers ethernet-controller interface-id phy` Verify the operational state of the auto-MDI feature on the interface.
9. `copy running-config startup-config` (Optional) Save your entries in the configuration file.

To disable auto-MDI, use the `no mdix auto` interface configuration command.
This example shows how to enable auto-MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# no shutdown
Switch(config-if)# speed auto
Switch(config-if)# duplex auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

Adding a Description for an Interface

You can add a description about an interface to help you remember its function. The description appears in the output of these privileged EXEC commands: `show configuration`, `show running-config`, and `show interfaces`.

Beginning in privileged EXEC mode, follow these steps to add a description for an interface:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>interface interface-id</td>
<td>Specify the interface for which you are adding a description, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>description string</td>
<td>Add a description (up to 240 characters) for an interface.</td>
</tr>
<tr>
<td></td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>show interfaces interface-id description</td>
<td>Verify your entry.</td>
</tr>
<tr>
<td></td>
<td>show running-config</td>
<td></td>
</tr>
<tr>
<td></td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no description` interface configuration command to delete the description.

This example shows how to add a description on a port and how to verify the description:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# description Connects to Marketing
Switch(config-if)# end
Switch# show interfaces gigabitethernet0/2 description
Interface Status Protocol Description
Gi 0/2 admin down down Connects to Marketing
```

Configuring Layer 3 Interfaces

The switch must be running the metro IP access image to support Layer 3 interfaces. The Cisco ME switch supports these types of Layer 3 interfaces:

- **SVIs**: You should configure SVIs for any VLANs for which you want to route traffic. SVIs are created when you enter a VLAN ID following the `interface vlan` global configuration command. To delete an SVI, use the `no interface vlan` global configuration command. You cannot delete interface VLAN 1.
Configuring Layer 3 Interfaces

Chapter 10      Configuring Interfaces

Configuring Layer 3 Interfaces

Note
When you create an SVI, it does not become active until it is associated with a physical port. For information about assigning Layer 2 ports to VLANs, see Chapter 12, “Configuring VLANs.”

- Routed ports: Routed ports are physical ports configured to be in Layer 3 mode by using the `no switchport` interface configuration command.
- Layer 3 EtherChannel ports: EtherChannel interfaces made up of routed ports. EtherChannel port interfaces are described in Chapter 35, “Configuring EtherChannels and Link-State Tracking.”

A Layer 3 switch can have an IP address assigned to each routed port and SVI. There is no defined limit to the number of SVIs and routed ports that can be configured in a switch. However, the interrelationship between the number of SVIs and routed ports and the number of other features being configured might have an impact on CPU usage because of hardware limitations. If the switch is using maximum hardware resources, attempts to create a routed port or SVI have these results:

- If you try to create a new routed port, the switch generates a message that there are not enough resources to convert the interface to a routed port, and the interface remains as a switch port.
- If you try to create an extended-range VLAN, an error message is generated, and the extended-range VLAN is rejected.
- If the switch attempts to boot up with a configuration that has more VLANs and routed ports than hardware can support, the VLANs are created, but the routed ports are shut down, and the switch sends a message that this was due to insufficient hardware resources.

All Layer 3 interfaces require an IP address to route traffic. This procedure shows how to configure an interface as a Layer 3 interface and how to assign an IP address to an interface.

**Note**
If the physical port is in Layer 2 mode (the default), you must enter the `no switchport` interface configuration command to put the interface into Layer 3 mode. Entering a `no switchport` command disables and then re-enables the interface, which might generate messages on the device to which the interface is connected. Furthermore, when you put an interface that is in Layer 2 mode into Layer 3 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

Beginning in privileged EXEC mode, follow these steps to configure a Layer 3 interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>`interface {{ fastethernet</td>
<td>gigabitethernet } interface-id}</td>
</tr>
<tr>
<td><code>no shutdown</code></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><code>no switchport</code></td>
<td>For physical ports only, enter Layer 3 mode.</td>
</tr>
<tr>
<td><code>ip address ip_address subnet_mask</code></td>
<td>Configure the IP address and IP subnet.</td>
</tr>
<tr>
<td><code>no shutdown</code></td>
<td>Enable the interface.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
To remove an IP address from an interface, use the `no ip address` interface configuration command.

This example shows how to configure a port as a routed port and to assign it an IP address:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 192.20.135.21 255.255.255.0
```

### Configuring the System MTU

The default maximum transmission unit (MTU) size for frames received and sent on all interfaces on the switch is 1500 bytes. You can increase the MTU size for all interfaces operating at 10 or 100 Mbps by using the `system mtu` global configuration command. You can increase the MTU size to support jumbo frames on all Gigabit Ethernet interfaces by using the `system mtu jumbo` global configuration command. You can change the MTU size for routed ports by using the `system mtu routing` global configuration command.

*Note: You cannot configure a routing MTU size that exceeds the system MTU size. If you change the system MTU size to a value smaller than the currently configured routing MTU size, the configuration change is accepted, but not applied until the next switch reset. When the configuration change takes effect, the routing MTU size automatically defaults to the new system MTU size.*

Gigabit Ethernet ports are not affected by the `system mtu` command. Fast Ethernet ports are not affected by the `system mtu jumbo` command because jumbo frames are not supported on 10/100 interfaces, including 100BASE-FX and 100BASE-BX SFP modules. If you do not configure the `system mtu jumbo` command, the setting of the `system mtu` command applies to all Gigabit Ethernet interfaces.

You cannot set the MTU size for an individual interface; you set it for all 10/100 or all Gigabit Ethernet interfaces on the switch. When you change the system MTU size, you must reset the switch before the new configuration takes effect. The `system mtu routing` command does not require a switch reset to take effect.

*Note: The system MTU setting is saved in the switch environmental variable in NVRAM and becomes effective when the switch reloads. The MTU settings you enter with the `system mtu` and `system mtu jumbo` commands are not saved in the switch IOS configuration file, even if you enter the `copy running-config startup-config` privileged EXEC command. Therefore, if you use TFTP to configure a new switch by using a backup configuration file and want the system MTU to be other than the default, you must explicitly configure the `system mtu` and `system mtu jumbo` settings on the new switch and then reload the switch.*
Frames sizes that can be received by the switch CPU are limited to 1998 bytes, no matter what value was entered with the `system mtu` or `system mtu jumbo` commands. Although frames that are forwarded are typically not received by the CPU, in some cases packets are sent to the CPU, such as traffic sent to control traffic, SNMP, Telnet, or routing protocols.

Because the switch does not fragment packets, it drops:

- switched packets larger than the packet size supported on the egress interface
- routed packets larger than the routing MTU value

For example, if the `system mtu` value is 1998 bytes and the `system mtu jumbo` value is 5000 bytes, packets up to 5000 bytes can be received on interfaces operating at 1000 Mbps. However, although a packet larger than 1998 bytes can be received on an interface operating at 1000 Mbps, if its destination interface is operating at 10 or 100 Mbps, the packet is dropped.

Routed packets are subjected to MTU checks on the sending ports. The MTU value used for routed ports is derived from the configured `system mtu` value (not the `system mtu jumbo` value). That is, the routed MTU is never greater than the system MTU for any VLAN. The routing protocols use the system MTU value when negotiating adjacencies and the MTU of the link. For example, the Open Shortest Path First (OSPF) protocol uses this MTU value before setting up an adjacency with a peer router. To view the MTU value for routed packets for a specific VLAN, use the `show platform port-asic mvid` privileged EXEC command.

If Layer 2 Gigabit Ethernet interfaces are configured to accept frames greater than the 10/100 interfaces, jumbo frames received on a Layer 2 Gigabit Ethernet interface and sent on a Layer 2 10/100 interface are dropped.

Beginning in privileged EXEC mode, follow these steps to change the MTU size for all 10/100 or Gigabit Ethernet interfaces:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> system mtu <code>bytes</code></td>
<td>(Optional) Change the MTU size for all interfaces on the switch that are operating at 10 or 100 Mbps. The range is 1500 to 1998 bytes; the default is 1500 bytes.</td>
</tr>
<tr>
<td><strong>Step 3</strong> system mtu jumbo <code>bytes</code></td>
<td>(Optional) Change the MTU size for all Gigabit Ethernet interfaces on the switch. The range is 1500 to 9000 bytes; the default is 1500 bytes.</td>
</tr>
<tr>
<td><strong>Step 4</strong> system mtu routing <code>bytes</code></td>
<td>(Optional) Change the system MTU for routed ports. The range is 1500 to the system MTU value, the maximum MTU that can be routed for all ports. Although larger packets can be accepted, they cannot be routed.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>Save your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Step 7</strong> reload</td>
<td>Reload the operating system.</td>
</tr>
</tbody>
</table>

If you enter a value that is outside the allowed range for the specific type of interface, the value is not accepted.
Once the switch reloads, you can verify your settings by entering the **show system mtu** privileged EXEC command.

This example shows how to set the maximum packet size for a Gigabit Ethernet port to 1800 bytes:

```plaintext
Switch(config)# system mtu jumbo 1800
Switch(config)# exit
Switch# reload
```

This example shows the response when you try to set Gigabit Ethernet interfaces to an out-of-range number:

```plaintext
Switch(config)# system mtu jumbo 25000
```

% Invalid input detected at '^' marker.

## Monitoring and Maintaining the Interfaces

These sections contain interface monitoring and maintenance information:

- Monitoring Interface Status, page 10-29
- Clearing and Resetting Interfaces and Counters, page 10-30
- Shutting Down and Restarting the Interface, page 10-31

## Monitoring Interface Status

Commands entered at the privileged EXEC prompt display information about the interface, including the versions of the software and the hardware, the configuration, and statistics about the interfaces. Table 10-5 lists some of these interface monitoring commands. (You can display the full list of **show** commands by using the **show ?** command at the privileged EXEC prompt.) These commands are fully described in the *Cisco IOS Interface Command Reference, Release 12.2*.

### Table 10-5  Show Commands for Interfaces

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces [interface-id]</td>
<td>Display the status and configuration of all interfaces or a specific interface.</td>
</tr>
<tr>
<td>show interfaces interface-id status [err-disabled]</td>
<td>Display interface status or a list of interfaces in an error-disabled state.</td>
</tr>
<tr>
<td>show interfaces [interface-id] switchport</td>
<td>Display administrative and operational status of switching mode. You can use this command to find out if a port is in routing or in switching mode.</td>
</tr>
<tr>
<td>show interfaces [interface-id] description</td>
<td>Display the description configured on an interface or all interfaces and the interface status.</td>
</tr>
<tr>
<td>show ip interface [interface-id]</td>
<td>Display the usability status of all interfaces configured for IP routing or the specified interface.</td>
</tr>
<tr>
<td>show interface [interface-id] stats</td>
<td>Display the input and output packets by the switching path for the interface.</td>
</tr>
</tbody>
</table>
Chapter 10  Configuring Interfaces

Monitoring and Maintaining the Interfaces

Table 10-5  Show Commands for Interfaces (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces [interface-id] transceiver [detail</td>
<td>dom-supported-list</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>show port-type [eni</td>
<td>nni</td>
</tr>
<tr>
<td>show running-config interface [interface-id]</td>
<td>Display the running configuration in RAM for the interface.</td>
</tr>
<tr>
<td>show version</td>
<td>Display the hardware configuration, software version, the names and sources of configuration files, and the boot images.</td>
</tr>
<tr>
<td>show controllers ethernet-controller interface-id phy</td>
<td>Display the operational state of the auto-MDIIX feature on the interface.</td>
</tr>
</tbody>
</table>

Clearing and Resetting Interfaces and Counters

Table 10-6 lists the privileged EXEC mode clear commands that you can use to clear counters and reset interfaces.

Table 10-6  Clear Commands for Interfaces

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear counters [interface-id]</td>
<td>Clear interface counters.</td>
</tr>
<tr>
<td>clear interface interface-id</td>
<td>Reset the hardware logic on an interface.</td>
</tr>
<tr>
<td>clear line [number</td>
<td>console 0</td>
</tr>
</tbody>
</table>

To clear the interface counters shown by the show interfaces privileged EXEC command, use the clear counters privileged EXEC command. The clear counters command clears all current interface counters from the interface unless you specify optional arguments that clear only a specific interface type from a specific interface number.
**Note**

The **clear counters** privileged EXEC command does not clear counters retrieved by using Simple Network Management Protocol (SNMP), but only those seen with the **show interface** privileged EXEC command.

---

**Shutting Down and Restarting the Interface**

Shutting down an interface disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface is not mentioned in any routing updates.

Beginning in privileged EXEC mode, follow these steps to shut down an interface:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`interface { vlan vlan-id</td>
<td>{ fastethernet</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>shutdown</code></td>
<td>Shut down an interface.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show running-config</code></td>
<td>Verify your entry.</td>
</tr>
</tbody>
</table>

Use the **no shutdown** interface configuration command to enable an interface.

To verify that an interface is disabled, enter the **show interfaces** privileged EXEC command. A disabled interface is shown as **administratively down** in the display.
Configuring Command Macros

This chapter describes how to configure and apply command macros on the Cisco ME 3400E switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:
- Understanding Command Macros, page 11-1
- Configuring Command Macros, page 11-1
- Displaying Command Macros, page 11-5

Understanding Command Macros

Command macros provide a convenient way to save and share common configurations. You can use command macros to enable features and settings based on the location of a switch in the network and for mass configuration deployments across the network.

Each command macro is a set of command-line interface (CLI) commands that you define. Command macros do not contain new CLI commands; they are simply a group of existing CLI commands.

When you apply a command macro on an interface, the CLI commands within the macro are configured on the interface. When the macro is applied to an interface, the existing interface configurations are not lost. The new commands are added to the interface and are saved in the running configuration file.

Configuring Command Macros

You can create a new command macro or use an existing macro as a template to create a new macro that is specific to your application. After you create the macro, you can apply it globally to a switch, to a switch interface, or to a range of interfaces.

These sections contain this configuration information:
- Default Command Macro Configuration, page 11-2
- Command Macro Configuration Guidelines, page 11-2
- Creating Command Macros, page 11-3
Default Command Macro Configuration

There are no command macros enabled.

Command Macro Configuration Guidelines

Follow these guidelines when configuring macros on your switch:

- When creating a macro, do not use the `exit` or `end` commands or change the command mode by using `interface interface-id`. This could cause commands that follow `exit`, `end`, or `interface interface-id` to execute in a different command mode.

- When creating a macro, all CLI commands should be in the same configuration mode.

- When creating a macro that requires the assignment of unique values, use the `parameter value` keywords to designate values specific to the interface. Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.

- Macro names are case sensitive. For example, the commands `macro name Sample-Macro` and `macro name sample-macro` will result in two separate macros.

- Some macros might contain keywords that require a parameter value. You can use the `macro global apply macro-name` global configuration command or the `macro apply macro-name` interface configuration command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.

- When a macro is applied globally to a switch or to a switch interface, all existing configuration on the interface is retained. This is helpful when applying an incremental configuration.

- If you modify a macro definition by adding or deleting commands, the changes are not reflected on the interface where the original macro was applied. You need to reapply the updated macro on the interface to apply the new or changed commands.

- You can use the `macro global trace macro-name` global configuration command or the `macro trace macro-name` interface configuration command to apply and debug a macro to find any syntax or configuration errors. If a command fails because of a syntax error or a configuration error, the macro continues to apply the remaining commands.

- Some CLI commands are specific to certain interface types. If a macro is applied to an interface that does not accept the configuration, the macro will fail the syntax check or the configuration check, and the switch will return an error message.

- Applying a macro to an interface range is the same as applying a macro to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.

- When you apply a macro to a switch or a switch interface, the macro name is automatically added to the switch or interface. You can display the applied commands and macro names by using the `show running-config` user EXEC command.

- When you apply a macro to a user network interface (UNI) or enhanced network interface (ENI), you must first enable the port. UNIs and ENIs are disabled by default.
Creating Command Macros

Beginning in privileged EXEC mode, follow these steps to create a command macro:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>macro name macro-name</td>
<td>Create a macro definition, and enter a macro name. A macro definition</td>
</tr>
<tr>
<td></td>
<td>can contain up to 3000 characters.</td>
</tr>
<tr>
<td></td>
<td>Enter the macro commands with one command per line. Use the @ character</td>
</tr>
<tr>
<td></td>
<td>to end the macro. Use the # character at the beginning of a line to</td>
</tr>
<tr>
<td></td>
<td>enter comment text within the macro.</td>
</tr>
<tr>
<td>(Optional) You can define</td>
<td>You can define keywords within a macro by using a help string to</td>
</tr>
<tr>
<td>keywords within a macro by</td>
<td>specify the keywords. Enter # macro keywords word to define the</td>
</tr>
<tr>
<td>using a help string to</td>
<td>keywords that are available for use with the macro. Separated by a</td>
</tr>
<tr>
<td>specify the keywords.</td>
<td>space, you can enter up to three help string keywords in a macro.</td>
</tr>
<tr>
<td></td>
<td>Macro names are case sensitive. For example, the commands macro name</td>
</tr>
<tr>
<td></td>
<td>Sample-Macro and macro name sample-macro will result in two separate</td>
</tr>
<tr>
<td></td>
<td>macros.</td>
</tr>
<tr>
<td>We recommend that you do</td>
<td>We recommend that you do not use the exit or end commands or change</td>
</tr>
<tr>
<td>not use the exit or end</td>
<td>the command mode by using interface interface-id in a macro. This</td>
</tr>
<tr>
<td>commands or change the</td>
<td>could cause any commands following exit, end, or interface</td>
</tr>
<tr>
<td>command mode by using</td>
<td>interface-id to execute in a different command mode. For best results,</td>
</tr>
<tr>
<td>interface interface-id in a</td>
<td>all commands in a macro should be in the same configuration mode.</td>
</tr>
<tr>
<td>macro.</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>Verify that the macro was created.</td>
</tr>
<tr>
<td>show parser macro name</td>
<td></td>
</tr>
</tbody>
</table>

The no form of the macro name global configuration command only deletes the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied.

This example shows how to create a macro that defines the switchport access VLAN and the number of secure MAC addresses and also includes two help string keywords by using # macro keywords:

```plaintext
Switch(config)# macro name test
switchport access vlan $VLANID
switchport port-security maximum $MAX
#macro keywords $VLANID $MAX
@`
## Applying Command Macros

Beginning in privileged EXEC mode, follow these steps to apply a command macro:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>macro global {apply</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>macro global description text</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>no shutdown</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>default interface interface-id</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>macro {apply</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>macro description text</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>show parser macro description [interface interface-id]</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
You can delete a global macro-applied configuration on a switch only by entering the `no` version of each command that is in the macro. You can delete a macro-applied configuration on an interface by entering the `default interface interface-id` interface configuration command.

This example shows how to apply the user-created macro called `snmp`, to set the hostname address to `test-server`, and to set the IP precedence value to 7:

```
Switch(config)# macro global apply snmp ADDRESS test-server VALUE 7
```

This example shows how to debug the user-created macro called `snmp` by using the `macro global trace` global configuration command to find any syntax or configuration errors in the macro when it is applied to the switch.

```
Switch(config)# macro global trace snmp VALUE 7
Applying command...'snmp-server enable traps port-security'
Applying command...'snmp-server enable traps linkup'
Applying command...'snmp-server enable traps linkdown'
Applying command...'snmp-server host'
%Error Unknown error.
Applying command...'snmp-server ip precedence 7'
```

This example shows how to apply the user-created macro called `desktop-config` and to verify the configuration.

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# macro apply desktop-config
Switch(config-if)# end
Switch# show parser macro description
Interface    Macro Description
------------------------
Gi0/2      desktop-config
```

This example shows how to apply the user-created macro called `desktop-config` and to replace all occurrences of VLAN 1 with VLAN 25:

```
Switch(config-if)# macro apply desktop-config vlan 25
```

---

**Displaying Command Macros**

To display the command macros, use one or more of the privileged EXEC commands in Table 11-1.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show parser macro</code></td>
<td>Displays all configured macros.</td>
</tr>
<tr>
<td><code>show parser macro name macro-name</code></td>
<td>Displays a specific macro.</td>
</tr>
<tr>
<td><code>show parser macro brief</code></td>
<td>Displays the configured macro names.</td>
</tr>
<tr>
<td><code>show parser macro description [interface interface-id]</code></td>
<td>Displays the macro description for all interfaces or for a specified interface.</td>
</tr>
</tbody>
</table>
Configuring VLANs

This chapter describes how to configure normal-range VLANs (VLAN IDs 1 to 1005) and extended-range VLANs (VLAN IDs 1006 to 4094) on the Cisco ME 3400E Ethernet Access switch. It includes information about VLAN membership modes, VLAN configuration modes, VLAN trunks, and dynamic VLAN assignment from a VLAN Membership Policy Server (VMPS).

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

The chapter consists of these sections:

- Understanding VLANs, page 12-1
- Creating and Modifying VLANs, page 12-7
- Displaying VLANs, page 12-14
- Configuring VLAN Trunks, page 12-14
- Configuring VMPS, page 12-23

Understanding VLANs

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any switch port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router, as shown in Figure 12-1. Because a VLAN is considered a separate logical network, it contains its own bridge MIB information and can support its own implementation of spanning tree. See Chapter 15, “Configuring STP.”
Figure 12-1 shows an example of VLANs segmented into logically defined networks.

**Figure 12-1  VLANs as Logically Defined Networks**

VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the switch is assigned manually on an interface-by-interface basis. When you assign switch interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

*Note*
The switch does not support VLAN Trunking Protocol (VTP).

Traffic between VLANs must be routed. Switches that are running the metro IP access image can route traffic between VLANs by using switch virtual interfaces (SVIs). To route traffic between VLANs, an SVI must be explicitly configured and assigned an IP address. For more information, see the “Switch Virtual Interfaces” section on page 10-5 and the “Configuring Layer 3 Interfaces” section on page 10-25.

This section includes these topics:
- Supported VLANs, page 12-3
- Normal-Range VLANs, page 12-3
- Extended-Range VLANs, page 12-4
- VLAN Port Membership Modes, page 12-4
- UNI-ENI VLANs, page 12-5
**Supported VLANs**

VLANs are identified with a number from 1 to 4094. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs. VLAN IDs greater than 1005 are extended-range VLANs and are not stored in the VLAN database.

Although the switch supports a total of 1005 (normal-range and extended-range) VLANs, the number of routed ports, SVIs, and other configured features affects the use of the switch hardware.

The switch supports per-VLAN spanning-tree plus (PVST+) or rapid PVST+ with a maximum of 128 spanning-tree instances. One spanning-tree instance is allowed per VLAN.

---

**Normal-Range VLANs**

Normal-range VLANs are VLANs with VLAN IDs 1 to 1005. You can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)

Configurations for VLAN IDs 1 to 1005 are written to the file `vlan.dat` (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The `vlan.dat` file is stored in flash memory.

---

**Caution**

You can cause inconsistency in the VLAN database if you try to manually delete the `vlan.dat` file. If you want to modify the VLAN configuration, use the commands described in these sections and in the command reference for this release.

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
- VLAN type (Ethernet, Fiber Distributed Data Interface [FDDI], FDDI network entity title [NET], TrBRF, or TrCRF, Token Ring, Token Ring-Net)
- VLAN state (active or suspended)
- Maximum transmission unit (MTU) for the VLAN
- Security Association Identifier (SAID)

---

**Note**

The switch supports only Ethernet VLANs. You can configure parameters for FDDI and Token Ring VLANs and view the results in the `vlan.dat` file, but these parameters are not used.
Understanding VLANs

- Bridge identification number for TrBRF VLANs
- Ring number for FDDI and TrCRF VLANs
- Parent VLAN number for TrCRF VLANs
- Spanning Tree Protocol (STP) type for TrCRF VLANs
- VLAN number to use when translating from one VLAN type to another
- Private VLAN. Configure the VLAN as a primary or secondary private VLAN. For information about private VLANs, see Chapter 13, “Configuring Private VLANs.”
- Remote SPAN VLAN. Configure the VLAN as the Remote Switched Port Analyzer (RSPAN) VLAN for a remote SPAN session. For more information on remote SPAN, see Chapter 27, “Configuring SPAN and RSPAN.”
- UNI-ENI VLAN configuration

For extended-range VLANs, you can configure only MTU, private VLAN, remote SPAN VLAN, and UNI-ENI VLAN parameters.

Note
This chapter does not provide configuration details for most of these parameters. For complete information on the commands and parameters that control VLAN configuration, see the command reference for this release.

Extended-Range VLANs

You can create extended-range VLANs (in the range 1006 to 4094) to enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any switchport commands that allow VLAN IDs. Extended-range VLAN configurations are not stored in the VLAN database, but they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file by using the copy running-config startup-config privileged EXEC command.

Note
Although the switch supports 4094 VLAN IDs, the actual number of VLANs supported is 1005.

VLAN Port Membership Modes

You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic that the port carries and the number of VLANs to which it can belong. Table 12-1 lists the membership modes and characteristics.
For more detailed definitions of access and trunk modes and their functions, see Table 12-4 on page 12-15.

When a port belongs to a VLAN, the switch learns and manages the addresses associated with the port on a per-VLAN basis. For more information, see the “Managing the MAC Address Table” section on page 5-19.

**UNI-ENI VLANs**

The Cisco ME switch is the boundary between customer networks and the service-provider network, with user network interfaces (UNIs) and enhanced interface interfaces (ENIs) connected to the customer side of the network. When customer traffic enters or leaves the service-provider network, the customer VLAN ID must be isolated from other customers’ VLAN IDs. You can achieve this isolation by several methods, including using private VLANs. On the Cisco ME switch, this isolation occurs by default by using UNI-ENI VLANs.
There are two types of UNI-ENI VLANs:

- **UNI-ENI isolated VLAN**—This is the default VLAN state for all VLANs created on the switch. Local switching does not occur among UNIs or ENIs on the switch that belong to the same UNI-ENI isolated VLAN. This configuration is designed for cases when different customers are connected to UNIs or ENIs on the same switch. However, switching is allowed among UNIs or ENIs on different switches even though they belong to the same UNI-ENI isolated VLAN.

- **UNI-ENI community VLAN**—Local switching is allowed among UNIs and ENIs on the switch that belong to the same community VLAN. If UNIs or ENIs belong to the same customer, and you want to switch packets between the ports, you can configure the common VLAN as a UNI-ENI community VLAN. There is no local switching between the ports in a UNI-ENI community VLAN and ports outside of the VLAN. The switch supports a combination of only eight UNIs and ENIs in a UNI-ENI community VLAN.

Note: Local switching takes place between ENIs and UNIs in the same community VLAN. Because you can enable spanning tree on ENIs, but not on UNIs, you should use caution when configuring ENIs and UNIs in the same community VLAN. UNIs are always in the forwarding state.

Network node interfaces (NNIs) are not affected by the type of UNI-ENI VLAN to which they belong. Switching can occur between NNIs and other NNIs or UNIs or ENIs on the switch or other switches that are part of the same VLAN, regardless of VLAN type.

In the configuration in Figure 12-2, if VLAN 10 is a UNI-ENI isolated VLAN and VLAN 20 is a UNI-ENI community VLAN, local switching does not take place among Fast Ethernet ports 1-4, but local switching can occur between Fast Ethernet ports 6-10. The NNIs in both VLAN 10 and VLAN 20 can exchange packets with the UNIs or ENIs in the same VLAN.

*Figure 12-2 UNI-ENI Isolated and Community VLANs in the Cisco ME Switch*

A UNI or ENI can be an access port, a trunk port, a private VLAN port, or an IEEE 802.1Q tunnel port. It can also be a member of an EtherChannel.

When a UNI or ENI configured as an IEEE 802.1Q trunk port belongs to a UNI-ENI isolated VLAN, the VLAN on the trunk is isolated from the same VLAN ID on a different trunk port or an access port. Other VLANs on the trunk port can be of different types (private VLAN, UNI-ENI community VLAN, and so on). For example, a UNI access port and one VLAN on a UNI trunk port can belong to the same UNI-ENI...
Creating and Modifying VLANs

You use VLAN configuration mode, accessed by entering the `vlan` global configuration command to create VLANs and to modify some parameters. You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

These sections contain VLAN configuration information:

- Default Ethernet VLAN Configuration, page 12-7
- VLAN Configuration Guidelines, page 12-8
- Creating or Modifying an Ethernet VLAN, page 12-9
- Assigning Static-Access Ports to a VLAN, page 12-11
- Creating an Extended-Range VLAN with an Internal VLAN ID, page 12-11
- Configuring UNI-ENI VLANs, page 12-12

For more efficient management of the MAC address table space available on the switch, you can control which VLANs learn MAC addresses by disabling MAC address learning on specific VLANs. See the “Disabling MAC Address Learning on a VLAN” section on page 5-26 for more information.

Default Ethernet VLAN Configuration

The switch supports only Ethernet interfaces. Table 12-2 shows the default configuration for Ethernet VLANs.

Note: On extended-range VLANs, you can change only the MTU size, the private VLAN, the remote SPAN, and the UNI-ENI VLAN configuration. All other characteristics must remain at the default conditions.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>1</td>
<td>1 to 4094.</td>
</tr>
<tr>
<td>Note</td>
<td></td>
<td>Extended-range VLANs (VLAN IDs 1006 to 4094) are not saved in the VLAN database.</td>
</tr>
<tr>
<td>VLAN name</td>
<td>VLANxxxx, where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number</td>
<td>No range</td>
</tr>
</tbody>
</table>

isolated VLAN. In this case, isolation occurs between the UNI access port and the VLAN on the UNI trunk port. Other access ports and other VLANs on the trunk port are isolated because they belong to different VLANs.

UNIs, ENIs, and NNIs are always isolated from ports on different VLANs.
Creating and Modifying VLANs

### VLAN Configuration Guidelines

Follow these guidelines when creating and modifying VLANs in your network:

- The switch supports 1005 VLANs.
- Normal-range Ethernet VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.
- The switch does not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic.
- VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database and in the switch running configuration file.
- Configuration options for VLAN IDs 1006 through 4094 (extended-range VLANs) are limited to MTU, RSPAN VLAN, private VLAN, and UNI-ENI VLAN. Extended-range VLANs are not saved in the VLAN database.
- Spanning Tree Protocol (STP) is enabled by default for only NNIs on all VLANs. You can configure STP on ENIs. NNIs and ENIs in the same VLAN are in the same spanning-tree instance. The switch supports 128 spanning-tree instances. If a switch has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining VLANs. If you have already used all available spanning-tree instances on a switch, adding another VLAN creates a VLAN on that switch that is not running spanning tree. If you have the default allowed list on the trunk ports of that switch (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent switches that all have run out of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of switches that have used up their allocation of spanning-tree instances.

If the number of VLANs on the switch exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your switch to map multiple VLANs to a single spanning-tree instance. For more information about MSTP, see Chapter 16, “Configuring MSTP.”

---

**Table 12-2 Ethernet VLAN Defaults and Ranges (continued)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Range</th>

Chapter 12  Configuring VLANs

Creating and Modifying VLANs

Note  MSTP is supported only on NNIs on ENIs on which STP has been enabled.

- Each routed port on the switch creates an internal VLAN for its use. These internal VLANs use extended-range VLAN numbers, and the internal VLAN ID cannot be used for an extended-range VLAN. If you try to create an extended-range VLAN with a VLAN ID that is already allocated as an internal VLAN, an error message is generated, and the command is rejected.
  - Because internal VLAN IDs are in the lower part of the extended range, we recommend that you create extended-range VLANs beginning from the highest number (4094) and moving to the lowest (1006) to reduce the possibility of using an internal VLAN ID.
  - Before configuring extended-range VLANs, enter the `show vlan internal usage` privileged EXEC command to see which VLANs have been allocated as internal VLANs.
  - If necessary, you can shut down the routed port assigned to the internal VLAN, which frees up the internal VLAN, and then create the extended-range VLAN and re-enable the port, which then uses another VLAN as its internal VLAN. See the “Creating an Extended-Range VLAN with an Internal VLAN ID” section on page 12-11.

- Although the switch supports a total of 1005 (normal-range and extended-range) VLANs, the number of routed ports, SVIs, and other configured features affects the use of the switch hardware. If you try to create an extended-range VLAN and there are not enough hardware resources available, an error message is generated, and the extended-range VLAN is rejected.

Creating or Modifying an Ethernet VLAN

To access VLAN configuration mode, enter the `vlan` global configuration command with a VLAN ID. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN. You can use the default VLAN configuration (Table 12-2) or enter commands to configure the VLAN.

Note  Extended-range VLANs use the default Ethernet VLAN characteristics and the MTU, the private VLAN, the RSPAN, and the UNI-ENI VLAN configurations are the only parameters you can change.

For more information about commands available in this mode, see the `vlan` command description in the command reference for this release. When you have finished the configuration, you must exit VLAN configuration mode for the configuration to take effect. To display the VLAN configuration, enter the `show vlan` privileged EXEC command.

The configurations of VLAN IDs 1 to 1005 are always saved in the VLAN database (vlan.dat file) with a VLAN number and name and in the switch running configuration file. Extended-range VLANs are not saved in the VLAN database; they are saved in the switch running configuration file. You can save the VLAN configuration in the switch startup configuration file by using the `copy running-config startup-config` privileged EXEC command.

Note  Before you create an extended-range VLAN, you can verify that the VLAN ID is not used internally by entering the `show vlan internal usage` privileged EXEC command. If the VLAN ID is used internally and you want to release it, go to the “Creating an Extended-Range VLAN with an Internal VLAN ID” section on page 12-11 before creating the extended-range VLAN.
Beginning in privileged EXEC mode, follow these steps to create or modify an Ethernet VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>vlan vlan-id</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>name vlan-name</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>mtu mtu-size</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>**show vlan {name vlan-name</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>copy running-config startup config</strong></td>
</tr>
</tbody>
</table>

To delete a VLAN, use the **no vlan vlan-id** global configuration command. You cannot delete VLAN 1 or VLANs 1002 to 1005.

⚠️ **Caution**

When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.

To return the VLAN name to the default settings, use the **no name** or **no mtu** VLAN configuration command.

This example shows how to create Ethernet VLAN 20, name it *test20*, and add it to the VLAN database:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# name test20
Switch(config-vlan)# end
```

This example shows how to create a new extended-range VLAN with all default characteristics, enter config-vlan mode, and save the new VLAN in the switch startup configuration file:

```
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config
```
Assigning Static-Access Ports to a VLAN

You can assign a static-access port to a VLAN.

**Note** If you assign an interface to a VLAN that does not exist, the new VLAN is created. (See the “Creating or Modifying an Ethernet VLAN” section on page 12-9.)

Beginning in privileged EXEC mode, follow these steps to assign a port to a VLAN in the VLAN database:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport mode access</td>
</tr>
<tr>
<td>Step 5</td>
<td>switchport access vlan vlan-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td>Step 7</td>
<td>show running-config interface interface-id</td>
</tr>
<tr>
<td>Step 8</td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td>Step 9</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return an interface to its default configuration, use the `default interface interface-id` interface configuration command.

This example shows how to configure a port as an access port in VLAN 2:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 2
Switch(config-if)# end
```

Creating an Extended-Range VLAN with an Internal VLAN ID

If you enter an extended-range VLAN ID that is already assigned to an internal VLAN, an error message appears, and the extended-range VLAN is rejected. To manually release an internal VLAN ID, you must temporarily shut down the routed port that is using the internal VLAN ID.
Beginning in privileged EXEC mode, follow these steps to release a VLAN ID that is assigned to an internal VLAN and to create an extended-range VLAN with that ID:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>show vlan internal usage</td>
</tr>
<tr>
<td></td>
<td>Display the VLAN IDs being used internally by the switch. If the VLAN ID that you want to use is an internal VLAN, the display shows the routed port that is using the VLAN ID. Enter that port number in Step 3.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify the interface ID for the routed port that is using the VLAN ID, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>shutdown</td>
</tr>
<tr>
<td></td>
<td>Shut down the port to release the internal VLAN ID.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>exit</td>
</tr>
<tr>
<td></td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>vlan vlan-id</td>
</tr>
<tr>
<td></td>
<td>Enter the new extended-range VLAN ID, and enter config-vlan mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>exit</td>
</tr>
<tr>
<td></td>
<td>Exit from config-vlan mode, and return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify the interface ID for the routed port that you shut down in Step 4, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>no shutdown</td>
</tr>
<tr>
<td></td>
<td>Re-enable the routed port. It will be assigned a new internal VLAN ID.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>copy running-config startup config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

**Configuring UNI-ENI VLANs**

By default, every VLAN configured on the switch is a UNI-ENI isolated VLAN. You can change VLAN configuration to that of a UNI-ENI community VLAN, a private VLAN, or an RSPAN VLAN. You can also change the configuration of one of these VLANs to the default of a UNI-ENI isolated VLAN.

**Configuration Guidelines**

These are the guidelines for UNI-ENI VLAN configuration:

- UNI-ENI isolated VLANs have no effect on NNI ports.
- A UNI-ENI community VLAN is like a traditional VLAN except that it can include no more than a combination of eight UNIs and ENIs.
- To change a VLAN type, first enter the `vlan vlan-id` global configuration command to enter VLAN configuration mode:
  - To change a VLAN from UNI-ENI isolated VLAN to a private VLAN, enter the `private-vlan` VLAN configuration command.
  - To change a UNI-ENI community VLAN to a private VLAN, you must first remove the community VLAN type by entering the `no uni-vlan` VLAN configuration command. Then enter the `private-vlan` VLAN configuration command.
  - To change a VLAN from a UNI-ENI isolated VLAN to an RSPAN VLAN, enter the `rspan-vlan` VLAN configuration command.
To change a UNI-ENI community VLAN to an RSPAN VLAN, you must first remove the community VLAN type by entering the `no uni-vlan` VLAN configuration command. Then enter the `rspan-vlan` VLAN configuration command.

To change a private VLAN to a UNI-ENI VLAN, you must first remove the private VLAN type by entering the `no private-vlan` VLAN configuration command. Then enter the `uni-vlan` VLAN configuration command.

To change an RSPAN VLAN to a UNI-ENI VLAN, you must first remove the RSPAN VLAN type by entering the `no rspan-vlan` VLAN configuration command. Then enter the `uni-vlan` VLAN configuration command.

- The switch supports a total of eight UNIs and ENIs in a community VLAN. You cannot configure a VLAN as a UNI-ENI community VLAN if more than eight UNIs and ENIs belong to the VLAN.
- If you attempt to add a UNI or ENI static access port to a UNI-ENI community VLAN that has a combination of eight UNIs and ENIs, the configuration is refused. If a UNI or ENI dynamic access port is added to a UNI-ENI community VLAN that has eight UNIs or ENIs, the port is error-disabled.
- Use caution when configuring ENIs and UNIs in the same community VLAN. Local switching takes place between the ENIs and UNIs in the community VLAN and ENIs can support spanning tree while UNIs do not.

### Configuring UNI-ENI VLANs

By default, every VLAN created on the switch is a UNI-ENI isolated VLAN. You can change the configuration to UNI-ENI community VLAN or to a private VLAN or RSPAN VLAN. For procedures for configuring private VLANs or RSPAN VLANs, see Chapter 13, “Configuring Private VLANs” and Chapter 27, “Configuring SPAN and RSPAN.”

Beginning in privileged EXEC mode, follow these steps to change the type of a UNI-ENI VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 vlan vlan-id</td>
<td>Enter a VLAN ID, and enter VLAN configuration mode. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN. By default, the VLAN is a UNI-ENI isolated VLAN.</td>
</tr>
<tr>
<td>Step 3 uni-vlan [community</td>
<td>Configure the UNI-ENI VLAN type.</td>
</tr>
<tr>
<td>isolated]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enter <strong>community</strong> to change from the default to a UNI-ENI community VLAN.</td>
</tr>
<tr>
<td></td>
<td>• Enter <strong>isolated</strong> to return to the default UNI-ENI isolated VLAN.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show vlan uni-vlan</td>
<td>Display UNI-ENI VLAN information. Enter <strong>type</strong> (optional) to see only the VLAN ID and type of UNI-ENI VLAN.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup config</td>
<td>(Optional) Save the configuration in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

Note: The available VLAN ID range for this command is 1 to 4094. VLAN 1 is always a UNI-ENI isolated VLAN; you cannot configure VLAN 1 as a UNI-ENI community VLAN. The reserved VLANs 1002 to 1005 are not Ethernet VLANs.
Displaying VLANs

Use the `no uni-vlan` VLAN configuration command to return to the default (UNI-ENI isolated VLAN). Entering `uni-vlan isolated` command has the same effect as entering the `no uni-vlan` VLAN configuration command. The `show vlan` and `show vlan vlan-id` privileged EXEC commands also display UNI-ENI VLAN information, but only UNI-ENI community VLANs appear. To display both isolated and community VLANs, use the `show vlan uni-vlan type` command.

Table 12-3 VLAN Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces [vlan vlan-id]</code></td>
<td>Display characteristics for all interfaces or for the specified VLAN configured on the switch.</td>
</tr>
<tr>
<td><code>show vlan [id vlan-id]</code></td>
<td>Display parameters for all VLANs or the specified VLAN on the switch.</td>
</tr>
<tr>
<td><code>show vlan [vlan-name] uni-vlan type</code></td>
<td>Display UNI-ENI isolated or UNI-ENI community VLANs by VLAN name.</td>
</tr>
<tr>
<td><code>show vlan uni-vlan</code></td>
<td>Display UNI-ENI community VLANs and associated ports on the switch.</td>
</tr>
<tr>
<td><code>show vlan uni-vlan type</code></td>
<td>Display UNI-ENI isolated and UNI-ENI community VLANs on the switch by VLAN ID.</td>
</tr>
</tbody>
</table>

For more details about the `show` command options and explanations of output fields, see the command reference for this release.

Configuring VLAN Trunks

These sections contain this conceptual information:

- Trunking Overview, page 12-14
- Default Layer 2 Ethernet Interface VLAN Configuration, page 12-16
- Configuring an Ethernet Interface as a Trunk Port, page 12-16
- Configuring Trunk Ports for Load Sharing, page 12-19

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet switch interfaces and another networking device such as a router or a switch. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network. The switch supports the IEEE 802.1Q industry-standard trunking encapsulation.
You can configure a trunk on a single Ethernet interface or on an EtherChannel bundle. For more information about EtherChannels, see Chapter 35, “Configuring EtherChannels and Link-State Tracking.”

Ethernet interfaces support different trunking modes (see Table 12-4). You can set an interface as trunking or nontrunking.

- If you do not intend to trunk across links, use the `switchport mode access` interface configuration command to disable trunking.
- To enable trunking, use the `switchport mode trunk` interface configuration command to change the interface to a trunk.

### Table 12-4 Layer 2 Interface Modes

<table>
<thead>
<tr>
<th>Mode</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switchport mode access</code></td>
<td>Puts the interface (access port) into permanent nontrunking mode and negotiates to convert the link into a nontrunk link. The interface becomes a nontrunk interface regardless of whether or not the neighboring interface is a trunk interface. This is the default mode.</td>
</tr>
<tr>
<td><code>switchport mode trunk</code></td>
<td>Puts the interface into permanent trunking mode and negotiates to convert the neighboring link into a trunk link. The interface becomes a trunk interface even if the neighboring interface is not a trunk interface.</td>
</tr>
<tr>
<td><code>switchport mode dot1q-tunnel</code></td>
<td>Configures the interface as a tunnel (nontrunking) port to be connected in an asymmetric link with an IEEE 802.1Q trunk port. The IEEE 802.1Q tunneling is used to maintain customer VLAN integrity across a service provider network. See Chapter 14, “Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling,” for more information on tunnel ports.</td>
</tr>
<tr>
<td><code>switchport mode private-vlan</code></td>
<td>Configure the interface as a private VLAN host or promiscuous port (only NNIs can be configured as promiscuous ports). For information about private VLANs, see Chapter 13, “Configuring Private VLANs.”</td>
</tr>
</tbody>
</table>

### IEEE 802.1Q Configuration Considerations

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

- In a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANs.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch. However, spanning-tree information for each VLAN is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

- Make sure that the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure that your network is loop-free before disabling spanning tree.

Default Layer 2 Ethernet Interface VLAN Configuration

Table 12-5 shows the default Layer 2 Ethernet interface VLAN configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface mode</td>
<td>switchport mode access</td>
</tr>
<tr>
<td>Allowed VLAN range</td>
<td>VLANs 1 to 4094</td>
</tr>
<tr>
<td>Default VLAN (for access ports)</td>
<td>VLAN 1</td>
</tr>
<tr>
<td>Native VLAN (for IEEE 802.1Q trunks)</td>
<td>VLAN 1</td>
</tr>
</tbody>
</table>

Configuring an Ethernet Interface as a Trunk Port

These sections contain this configuration information about trunk ports:

- Interaction with Other Features, page 12-16
- Defining the Allowed VLANs on a Trunk, page 12-17
- Configuring the Native VLAN for Untagged Traffic, page 12-19
- Configuring the Native VLAN for Untagged Traffic, page 12-19

Interaction with Other Features

Trunking interacts with other features in these ways:

- A trunk port cannot be a secure port.
- A trunk port cannot be a tunnel port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the switch propagates the setting that you entered to all ports in the group:
  - allowed-VLAN list.
  - STP port priority for each VLAN.
  - STP Port Fast setting.

Note STP is supported by default on NNIs, but must be enabled on ENIs. STP is not supported on UNIs.

- trunk status: if one port in a port group ceases to be a trunk, all ports cease to be trunks.
If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

### Configuring a Trunk Port

Beginning in privileged EXEC mode, follow these steps to configure a port as an IEEE 802.1Q trunk port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport mode trunk</td>
</tr>
<tr>
<td>Step 5</td>
<td>switchport access vlan vlan-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>switchport trunk native vlan vlan-id</td>
</tr>
<tr>
<td>Step 7</td>
<td>end</td>
</tr>
<tr>
<td>Step 8</td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td>Step 9</td>
<td>show interfaces interface-id trunk</td>
</tr>
<tr>
<td>Step 10</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return an interface to its default configuration, use the `default interface interface-id` interface configuration command. To reset all trunking characteristics of a trunking interface to the defaults, use the `no switchport trunk` interface configuration command. To disable trunking, use the `switchport mode access` interface configuration command to configure the port as a static-access port.

This example shows how to configure a port as an IEEE 802.1Q trunk with VLAN 33 as the native VLAN:

```bash
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet0/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk native vlan 33
Switch(config-if)# end
```

### Defining the Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk. To restrict the traffic a trunk carries, use the `switchport trunk allowed vlan remove vlan-list` interface configuration command to remove specific VLANs from the allowed list.
Chapter 12      Configuring VLANs

Configuring VLAN Trunks

Note

VLAN 1 is the default VLAN on all trunk ports in all Cisco switches, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. The VLAN 1 minimization feature allows you to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1. You do this by removing VLAN 1 from the allowed VLAN list.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), and Link Aggregation Control Protocol (LACP) in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port is added to VLAN 1, regardless of the `switchport trunk allowed` setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled and if the VLAN is in the allowed list for the port.

Beginning in privileged EXEC mode, follow these steps to modify the allowed list of an IEEE 802.1Q trunk:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>interface interface-id</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>no shutdown</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>switchport mode trunk</code></td>
</tr>
</tbody>
</table>
| **Step 5** | `switchport trunk allowed vlan {add | all | except | remove} vlan-list` | (Optional) Configure the list of VLANs allowed on the trunk.  
For explanations about using the `add`, `all`, `except`, and `remove` keywords, see the command reference for this release.  
The `vlan-list` parameter is either a single VLAN number from 1 to 4094 or a range of VLANs described by two VLAN numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated VLAN parameters or in hyphen-specified ranges.  
All VLANs are allowed by default. |
| **Step 6** | `end` | Return to privileged EXEC mode. |
| **Step 7** | `show interfaces interface-id switchport` | Verify your entries in the Trunking VLANs Enabled field of the display. |
| **Step 8** | `copy running-config startup-config` | (Optional) Save your entries in the configuration file. |

To return to the default allowed VLAN list of all VLANs, use the `no switchport trunk allowed vlan` interface configuration command.

This example shows how to remove VLAN 2 from the allowed VLAN list on a port:

```
Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport trunk allowed vlan remove 2
Switch(config-if)# end
```
Configuring the Native VLAN for Untagged Traffic

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the switch forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

Note

The native VLAN can be assigned any VLAN ID.

For information about IEEE 802.1Q configuration issues, see the “IEEE 802.1Q Configuration Considerations” section on page 12-15.

Beginning in privileged EXEC mode, follow these steps to configure the native VLAN on an IEEE 802.1Q trunk:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Define the interface that is configured as the IEEE 802.1Q trunk, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 switchport trunk native vlan vlan-id</td>
<td>Configure the VLAN that is sending and receiving untagged traffic on the trunk port. For vlan-id, the range is 1 to 4094.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show interfaces interface-id switchport</td>
<td>Verify your entries in the Trunking Native Mode VLAN field.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default native VLAN, VLAN 1, use the no switchport trunk native vlan interface configuration command.

If a packet has a VLAN ID that is the same as the sending port native VLAN ID, the packet is sent untagged; otherwise, the switch sends the packet with a tag.

Configuring Trunk Ports for Load Sharing

Load sharing divides the bandwidth supplied by parallel trunks that connect switches. To avoid loops, STP normally blocks all but one parallel link between switches. Using load sharing, you divide the traffic between the links according to the VLAN to which the traffic belongs.

You configure load sharing on trunk ports that have STP enabled by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same switch. For load sharing using STP path costs, each load-sharing link can be connected to the same switch or to two different switches. For more information about STP, see Chapter 15, “Configuring STP.”
Load Sharing Using STP Port Priorities

When two ports on the same switch form a loop, the switch uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel STP trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

Figure 12-3 shows two trunks connecting supported switches. In this example, the switches are configured as follows:

- VLANs 8 through 10 are assigned a port priority of 16 on Trunk 1.
- VLANs 3 through 6 retain the default port priority of 128 on Trunk 1.
- VLANs 3 through 6 are assigned a port priority of 16 on Trunk 2.
- VLANs 8 through 10 retain the default port priority of 128 on Trunk 2.

In this way, Trunk 1 carries traffic for VLANs 8 through 10, and Trunk 2 carries traffic for VLANs 3 through 6. If the active trunk fails, the trunk with the lower priority takes over and carries the traffic for all of the VLANs. No duplication of traffic occurs over any trunk port.

Beginning in privileged EXEC mode on Switch A, follow these steps to configure the network shown in Figure 12-3. Note that you can use any interface numbers; those shown are examples only.

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</tbody>
</table>
### Configuring VLAN Trunks

Follow the same steps on Switch B to configure the trunk port for Trunk 1 with a spanning-tree port priority of 16 for VLANs 8 through 10, and the configure trunk port for Trunk 2 with a spanning-tree port priority of 16 for VLANs 3 through 6.

#### Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

In Figure 12-4, Trunk ports 1 and 2 are configured as 100Base-T ports. These VLAN path costs are assigned:

- VLANs 2 through 4 are assigned a path cost of 30 on Trunk port 1.
- VLANs 8 through 10 retain the default 100Base-T path cost on Trunk port 1 of 19.
- VLANs 8 through 10 are assigned a path cost of 30 on Trunk port 2.
- VLANs 2 through 4 retain the default 100Base-T path cost on Trunk port 2 of 19.

</tbody>
</table>
Configuring VMPS

The VLAN Query Protocol (VQP) supports dynamic-access ports, which are not permanently assigned to a VLAN, but give VLAN assignments based on the MAC source addresses seen on the port.

Note
Only UNIs and ENIs can be configured as dynamic-access ports; NNIs cannot take part in VQP.

Each time an unknown MAC address is seen, the switch sends a VQP query to a remote VMPS; the query includes the newly seen MAC address and the port on which it was seen. The VMPS responds with a VLAN assignment for the port. The switch cannot be a VMPS server but can act as a client to the VMPS and communicate with it through VQP.

These sections contain this information:
- “Understanding VMPS” section on page 12-23
- “Default VMPS Client Configuration” section on page 12-25
- “VMPS Configuration Guidelines” section on page 12-25
- “Configuring the VMPS Client” section on page 12-25
- “Monitoring the VMPS” section on page 12-28
- “Troubleshooting Dynamic-Access Port VLAN Membership” section on page 12-28
- “VMPS Configuration Example” section on page 12-28

Understanding VMPS

Each time the client switch receives the MAC address of a new host, it sends a VQP query to the VMPS. When the VMPS receives this query, it searches its database for a MAC-address-to-VLAN mapping. The server response is based on this mapping and whether or not the server is in open or secure mode. In secure mode, the server shuts down the port when an illegal host is detected. In open mode, the server simply denies the host access to the port.
If the port is currently unassigned (that is, it does not yet have a VLAN assignment), the VMPS provides one of these responses:

- If the host is allowed on the port, the VMPS sends the client a vlan-assignment response containing the assigned VLAN name and allowing access to the host.
- If the host is not allowed on the port and the VMPS is in open mode, the VMPS sends an access-denied response.
- If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a port-shutdown response.

If the port already has a VLAN assignment, the VMPS provides one of these responses:

- If the VLAN in the database matches the current VLAN on the port, the VMPS sends an success response, allowing access to the host.
- If the VLAN in the database does not match the current VLAN on the port and active hosts exist on the port, the VMPS sends an access-denied or a port-shutdown response, depending on the secure mode of the VMPS.

If the switch receives an access-denied response from the VMPS, it continues to block traffic to and from the host MAC address. The switch continues to monitor the packets directed to the port and sends a query to the VMPS when it identifies a new host address. If the switch receives a port-shutdown response from the VMPS, it disables the port. The port must be manually re-enabled by using the CLI or SNMP.

Dynamic-Access Port VLAN Membership

A dynamic-access port can belong to only one VLAN with an ID from 1 to 4094. When the link comes up, the switch does not forward traffic to or from this port until the VMPS provides the VLAN assignment. The VMPS receives the source MAC address from the first packet of a new host connected to the dynamic-access port and attempts to match the MAC address to a VLAN in the VMPS database.

Note

Only UNIs or ENIs can be dynamic-access ports.

If there is a match, the VMPS sends the VLAN number for that port. If the client switch was not previously configured, it uses the domain name from the first VTP packet it receives on its trunk port from the VMPS. If the client switch was previously configured, it includes its domain name in the query packet to the VMPS to obtain its VLAN number. The VMPS verifies that the domain name in the packet matches its own domain name before accepting the request and responds to the client with the assigned VLAN number for the client. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS secure mode setting).

Multiple hosts (MAC addresses) can be active on a dynamic-access port if they are all in the same VLAN; however, the VMPS shuts down a dynamic-access port if more than 20 hosts are active on the port.

If the link goes down on a dynamic-access port, the port returns to an isolated state and does not belong to a VLAN. Any hosts that come online through the port are checked again through the VQP with the VMPS before the port is assigned to a VLAN.

Dynamic-access ports can be used for direct host connections, or they can connect to a network. A maximum of 20 MAC addresses are allowed per port on the switch. A dynamic-access port can belong to only one VLAN at a time, but the VLAN can change over time, depending on the MAC addresses seen.
Default VMPS Client Configuration

Table 12-6 shows the default VMPS and dynamic-access port configuration on client switches.

<table>
<thead>

<tr>
<td>Dynamic-access ports</td>
<td>None configured</td>
</tr>
</tbody>
</table>

VMPS Configuration Guidelines

These guidelines and restrictions apply to dynamic-access port VLAN membership:

- You should configure the VMPS before you configure ports as dynamic-access ports.
- IEEE 802.1x ports cannot be configured as dynamic-access ports. If you try to enable IEEE 802.1x on a dynamic-access (VQP) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
- Trunk ports cannot be dynamic-access ports, but you can enter the `switchport access vlan dynamic` interface configuration command for a trunk port. In this case, the switch retains the setting and applies it if the port is later configured as an access port.
- Dynamic-access ports cannot be monitor ports.
- Secure ports cannot be dynamic-access ports. You must disable port security on a port before it becomes dynamic.
- Private VLAN ports cannot be dynamic-access ports.
- Dynamic-access ports cannot be members of an EtherChannel group.
- Port channels cannot be configured as dynamic-access ports.

Configuring the VMPS Client

You configure dynamic VLANs by using the VMPS (server). The switch can be a VMPS client; it cannot be a VMPS server.
### Entering the IP Address of the VMPS

You must first enter the IP address of the server to configure the switch as a client.

Beginning in privileged EXEC mode, follow these steps to enter the IP address of the VMPS:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> (\text{vmps server } ipaddress) primary</td>
<td>Enter the IP address of the switch acting as the primary VMPS server.</td>
</tr>
<tr>
<td><strong>Step 3</strong> (\text{vmps server } ipaddress)</td>
<td>(Optional) Enter the IP address of the switch acting as a secondary VMPS server. You can enter up to three secondary server addresses.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show vmps</td>
<td>Verify your entries in the VMPS Domain Server field of the display.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Note** You must have IP connectivity to the VMPS for dynamic-access ports to work. You can test for IP connectivity by pinging the IP address of the VMPS and verifying that you get a response.

### Configuring Dynamic-Access Ports on VMPS Clients

**Caution** Dynamic-access port VLAN membership is for end stations or hubs connected to end stations. Connecting dynamic-access ports to other switches can cause a loss of connectivity.

Beginning in privileged EXEC mode, follow these steps to configure a dynamic-access port on a VMPS client switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface (interface-id)</td>
<td>Specify the switch port that is connected to the end station, and enter interface configuration mode. The port must be a UNI or an ENI.</td>
</tr>
<tr>
<td><strong>Step 3n</strong> no shutdown</td>
<td>Enable the port.</td>
</tr>
<tr>
<td><strong>Step 4</strong> port-type (\text{uni</td>
<td>eni})</td>
</tr>
<tr>
<td><strong>Step 5</strong> switchport mode access</td>
<td>Set the port to access mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> switchport access vlan dynamic</td>
<td>Configure the port as eligible for dynamic VLAN membership. The dynamic-access port must be connected to an end station.</td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> show interfaces (interface-id) switchport</td>
<td>Verify your entries in the Operational Mode field of the display.</td>
</tr>
<tr>
<td><strong>Step 9</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To return an interface to its default configuration, use the `default interface interface-id` interface configuration command. To reset the access mode to the default VLAN for the switch, use the `no switchport access vlan` interface configuration command.

**Reconfirming VLAN Memberships**

Beginning in privileged EXEC mode, follow these steps to confirm the dynamic-access port VLAN membership assignments that the switch has received from the VMPS:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>vmps reconfirm</td>
</tr>
<tr>
<td>Step 2</td>
<td>show vmps</td>
</tr>
</tbody>
</table>

**Changing the Reconfirmation Interval**

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes after which reconfirmation occurs.

Beginning in privileged EXEC mode, follow these steps to change the reconfirmation interval:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>vmps reconfirm minutes</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show vmps</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no vmps reconfirm` global configuration command.

**Changing the Retry Count**

Beginning in privileged EXEC mode, follow these steps to change the number of times that the switch attempts to contact the VMPS before querying the next server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>vmps retry count</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show vmps</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no vmps retry` global configuration command.
Monitoring the VMPS

You can display information about the VMPS by using the `show vmps` privileged EXEC command. The switch displays this information about the VMPS:

- VMPS VQP Version—the version of VQP used to communicate with the VMPS. The switch queries the VMPS that is using VQP Version 1.
- Reconfirm Interval—the number of minutes the switch waits before reconfirming the VLAN-to-MAC-address assignments.
- Server Retry Count—the number of times VQP resends a query to the VMPS. If no response is received after this many tries, the switch starts to query the secondary VMPS.
- VMPS domain server—the IP address of the configured VLAN membership policy servers. The switch sends queries to the one marked `current`. The one marked `primary` is the primary server.
- VMPS Action—the result of the most recent reconfirmation attempt. A reconfirmation attempt can occur automatically when the reconfirmation interval expired, or you can force it by entering the `vmps reconfirm` privileged EXEC command.

This is an example of output for the `show vmps` privileged EXEC command:

```
Switch# show vmps
VQP Client Status:
-------------------
VMPS VQP Version:   1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.86 (primary, current)
                       172.20.128.87

Reconfirmation status
---------------------
VMPS Action:         other
```

Troubleshooting Dynamic-Access Port VLAN Membership

The VMPS shuts down a dynamic-access port under these conditions:

- The VMPS is in secure mode, and it does not allow the host to connect to the port. The VMPS shuts down the port to prevent the host from connecting to the network.
- More than 20 active hosts reside on a dynamic-access port.

To disable and re-enable a disabled dynamic-access port, enter the `shutdown` interface configuration command followed by the `no shutdown` interface configuration command.

VMPS Configuration Example

Figure 12-5 shows a network with a VMPS server switch and VMPS client switches with dynamic-access ports. In this example, these assumptions apply:

- The VMPS server and the VMPS client are separate switches.
- The Catalyst 6500 series Switch A is the primary VMPS server.
- The Catalyst 6500 series Switch C and Switch J are secondary VMPS servers.
- End stations are connected to the clients, Switch B and Switch I.
- The database configuration file is stored on the TFTP server with the IP address 172.20.22.7.

**Figure 12-5 Dynamic Port VLAN Membership Configuration**
Configuring Private VLANs

This chapter describes how to configure private VLANs on the Cisco ME 3400E Ethernet Access switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

The chapter consists of these sections:
- Understanding Private VLANs, page 13-1
- Configuring Private VLANs, page 13-6
- Monitoring Private VLANs, page 13-15

Understanding Private VLANs

The private-VLAN feature addresses two problems that service providers face when using VLANs:
- Scalability: The switch supports up to 1005 active VLANs. If a service provider assigns one VLAN per customer, this limits the numbers of customers that the service provider can support.
- To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can waste the unused IP addresses and cause IP address management problems.

Using private VLANs addresses the scalability problem and provides IP address management benefits for service providers and Layer 2 security for customers.

These sections describe how private VLANs work:
- Types of Private VLANs and Private-VLAN Ports, page 13-2
- IP Addressing Scheme with Private VLANs, page 13-4
- Private VLANs across Multiple Switches, page 13-4
- Private VLANs and Unicast, Broadcast, and Multicast Traffic, page 13-5
- Private VLANs and SVIs, page 13-5
Types of Private VLANs and Private-VLAN Ports

Private VLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a primary VLAN and a secondary VLAN. A private VLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another. See Figure 13-1.

There are two types of secondary VLANs:

- Isolated VLANs—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.
- Community VLANs—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level. A community VLAN can include a combination of no more than eight user network interfaces (UNIs) and enhanced network interfaces (ENIs).

Private VLANs provide Layer 2 isolation between ports within the same private VLAN. Private-VLAN ports are access ports that are one of these types:

- Promiscuous—A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports that belong to the secondary VLANs associated with the primary VLAN.

Note

Promiscuous ports must be network node interfaces (NNIs). UNIs or ENIs cannot be configured as promiscuous ports.
Chapter 13 Configuring Private VLANs

Understanding Private VLANs

- **Isolated**—An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same private VLAN, except for the promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.

- **Community**—A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their private VLAN. No more than eight UNIs and ENIs can be community ports in the same community VLAN.

**Note**

Trunk ports carry traffic from regular VLANs and also from primary, isolated, and community VLANs.

Primary and secondary VLANs have these characteristics:

- **Primary VLAN**—A private VLAN has only one primary VLAN. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.

- **Isolated VLAN**—A private VLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.

- **Community VLAN**—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a private VLAN. Each community VLAN can include a combination of no more than eight UNIs and ENIs.

**Note**

The switch also supports UNI-ENI isolated VLANs and UNI-ENI community VLANs. When a VLAN is created, it is by default a UNI-ENI isolated VLAN. Traffic is not switched among UNIs and ENIs on a switch that belong to a UNI-ENI isolated VLAN. For more information on UNI-ENI VLANs, see Chapter 12, “Configuring VLANs.”

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community VLANs. Layer 3 gateways are typically connected to the switch through a promiscuous port. With a promiscuous port, you can connect a wide range of devices as access points to a private VLAN. For example, you can use a promiscuous port to monitor or back up all the private-VLAN servers from an administration workstation.

In a switched environment, you can assign an individual private VLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the private VLAN.

You can use private VLANs to control access to end stations in these ways:

- Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.

- Configure NNIs connected to default gateways and selected end stations (for example, backup servers) as promiscuous ports to allow all end stations access to a default gateway.
You can extend private VLANs across multiple devices by trunking the primary, isolated, and community VLANs to other devices that support private VLANs. To maintain the security of your private-VLAN configuration and to avoid other use of the VLANs configured as private VLANs, configure private VLANs on all intermediate devices, including devices that have no private-VLAN ports.

### IP Addressing Scheme with Private VLANs

Assigning a separate VLAN to each customer creates an inefficient IP addressing scheme:
- Assigning a block of addresses to a customer VLAN can result in unused IP addresses.
- If the number of devices in the VLAN increases, the number of assigned address might not be large enough to accommodate them.

These problems are reduced by using private VLANs, where all members in the private VLAN share a common address space, which is allocated to the primary VLAN. Hosts are connected to secondary VLANs, and the DHCP server assigns them IP addresses from the block of addresses allocated to the primary VLAN. Subsequent IP addresses can be assigned to customer devices in different secondary VLANs, but in the same primary VLAN. When new devices are added, the DHCP server assigns them the next available address from a large pool of subnet addresses.

### Private VLANs across Multiple Switches

As with regular VLANs, private VLANs can span multiple switches. A trunk port carries the primary VLAN and secondary VLANs to a neighboring switch. The trunk port treats the private VLAN as any other VLAN. A feature of private VLANs across multiple switches is that traffic from an isolated port in switch A does not reach an isolated port on Switch B. See Figure 13-2.

![Figure 13-2 Private VLANs across Switches](image_url)

- VLAN 100 = Primary VLAN
- VLAN 201 = Secondary isolated VLAN
- VLAN 202 = Secondary community VLAN
You must manually configure private VLANs on all switches in the Layer 2 network. If you do not configure the primary and secondary VLAN associations in some switches in the network, the Layer 2 databases in these switches are not merged. This can result in unnecessary flooding of private-VLAN traffic on those switches.

Private VLANs and Unicast, Broadcast, and Multicast Traffic

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In private VLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of the these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. Private-VLAN broadcast forwarding depends on the port sending the broadcast:
- An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
- A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
- A promiscuous port (only NNI) sends a broadcast to all ports in the private VLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).

Multicast traffic is routed or bridged across private-VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.

Private VLANs and SVIs

In a Layer 3 switch (a switch running the metro IP access image), a switch virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a private VLAN only through the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.
- If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
- If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire private VLAN.
Configuring Private VLANs

- Tasks for Configuring Private VLANs, page 13-6
- Default Private-VLAN Configuration, page 13-6
- Private-VLAN Configuration Guidelines, page 13-6
- Configuring and Associating VLANs in a Private VLAN, page 13-10
- Configuring a Layer 2 Interface as a Private-VLAN Host Port, page 13-11
- Configuring a Layer 2 Interface as a Private-VLAN Promiscuous Port, page 13-13
- Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface, page 13-14

Tasks for Configuring Private VLANs

To configure a private VLAN, follow these steps:

---

Step 1 Create the primary and secondary VLANs and associate them. See the “Configuring and Associating VLANs in a Private VLAN” section on page 13-10.

*Note* If the VLAN is not created already, the private-VLAN configuration process creates it.

Step 2 Configure interfaces to be isolated or community host ports, and assign VLAN membership to the host port. See the “Configuring a Layer 2 Interface as a Private-VLAN Host Port” section on page 13-11.

Step 3 Configure NNIs as promiscuous ports, and map the promiscuous ports to the primary-secondary VLAN pair. See the “Configuring a Layer 2 Interface as a Private-VLAN Promiscuous Port” section on page 13-13.

Step 4 If inter-VLAN routing will be used, configure the primary SVI, and map secondary VLANs to the primary. See the “Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface” section on page 13-14.

Step 5 Verify private-VLAN configuration.

---

Default Private-VLAN Configuration

No private VLANs are configured. Newly created VLANs are UNI-ENI isolated VLANs.

Private-VLAN Configuration Guidelines

Guidelines for configuring private VLANs fall into these categories:

- Secondary and Primary VLAN Configuration, page 13-7
- Private-VLAN Port Configuration, page 13-8
- Limitations with Other Features, page 13-9
Secondary and Primary VLAN Configuration

Follow these guidelines when configuring private VLANs:

- You use VLAN configuration mode to configure private VLANs. For more information about VLAN configuration, see the “Creating and Modifying VLANs” section on page 12-7.
- You must configure private VLANs on each device where you want private-VLAN ports.
- A private VLAN cannot be a UNI-ENI VLAN.
  - To change a UNI-ENI isolated VLAN (the default) to a private VLAN, enter the `private-vlan` VLAN configuration command; this overwrites the default isolated VLAN configuration.
  - To change a UNI-ENI community VLAN to a private VLAN, you must first enter the `no uni-vlan` VLAN configuration command to return to the default UNI isolated VLAN configuration.
- You cannot configure VLAN 1 or VLANs 1002 to 1005 as primary or secondary VLANs. Extended VLANs (VLAN IDs 1006 to 4094) can belong to private VLANs.
- A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it. An isolated or community VLAN can have only one primary VLAN associated with it.
- Although a private VLAN contains more than one VLAN, only one Spanning Tree Protocol (STP) instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.
- You can enable DHCP snooping on private VLANs. When you enable DHCP snooping on the primary VLAN, it is propagated to the secondary VLANs. If you configure DHCP on a secondary VLAN, the configuration does not take effect if the primary VLAN is already configured.
- If you enable IP source guard on private-VLAN ports, you must enable DHCP snooping on the primary VLAN.
- You can apply different quality of service (QoS) configurations to primary, isolated, and community VLANs.
- When the switch is running the metro IP access image and you configure private VLANs, sticky Address Resolution Protocol (ARP) is enabled by default, and ARP entries learned on Layer 3 private VLAN interfaces are sticky ARP entries. For security reasons, private VLAN port sticky ARP entries do not age out.

**Note** We recommend that you display and verify private-VLAN interface ARP entries.

Connecting a device with a different MAC address but with the same IP address displays a message and the ARP entry is not created. Because the private-VLAN port sticky ARP entries do not age out, you must manually remove private-VLAN port ARP entries if a MAC address changes.

- You can remove a private-VLAN ARP entry by using the `no arp ip-address` global configuration command.
- You can add a private-VLAN ARP entry by using the `arp ip-address hardware-address type` global configuration command.

- You can configure VLAN maps on primary and secondary VLANs (see the “Configuring VLAN Maps” section on page 32-29). However, we recommend that you configure the same VLAN maps on private-VLAN primary and secondary VLANs.
Chapter 13  Configuring Private VLANs

Configuring Private VLANs

When a frame is forwarded through Layer 2 within a private VLAN, the same VLAN map is applied at the receiving and sending sides. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the receiving side.

- For frames going upstream from a host port to a promiscuous port, the VLAN map configured on the secondary VLAN is applied.
- For frames going downstream from a promiscuous port to a host port, the VLAN map configured on the primary VLAN is applied.

To filter out specific IP traffic for a private VLAN, you should apply the VLAN map to both the primary and secondary VLANs.

- If the switch is running the metro IP access image, you can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.

- Although private VLANs provide host isolation at Layer 2, hosts can communicate with each other at Layer 3.

Private VLANs support these Switched Port Analyzer (SPAN) features:

- You can configure a private-VLAN port as a SPAN source port.
- You can use VLAN-based SPAN (VSPAN) on primary, isolated, and community VLANs or use SPAN on only one VLAN to separately monitor sent or received traffic.

Private-VLAN Port Configuration

Follow these guidelines when configuring private-VLAN ports:

- Promiscuous ports must be NNIs; UNIs and ENIs cannot be configured as promiscuous ports.
- Use only the private-VLAN configuration commands to assign ports to primary, isolated, or community VLANs. Layer 2 access ports assigned to the VLANs that you configure as primary, isolated, or community VLANs are inactive while the VLAN is part of the private-VLAN configuration. Layer 2 trunk interfaces remain in the STP forwarding state.
- Do not configure NNI ports that belong to a Port Aggregation Protocol (PAGP) or Link Aggregation Control Protocol (LACP) EtherChannel as private-VLAN ports. While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.
- Enable Port Fast and BPDU guard on NNI isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence (see Chapter 17, “Configuring Optional Spanning-Tree Features”). When enabled, STP applies the BPDU guard feature to all Port Fast-configured Layer 2 LAN ports. Do not enable Port Fast and BPDU guard on promiscuous ports.
- If you delete a VLAN used in the private-VLAN configuration, the private-VLAN ports associated with the VLAN become inactive.
- Private-VLAN ports can be on different network devices if the devices are trunk-connected and the primary and secondary VLANs have not been removed from the trunk.
- A community private VLAN can include no more than eight UNIs and ENIs. If you try to add more than eight, the configuration is not allowed. If you try to configure a VLAN that includes a combination of more than eight UNIs and ENIs as a community private VLAN, the configuration is not allowed.
Limitations with Other Features

When configuring private VLANs, remember these limitations with other features:

- When IGMP snooping is enabled on the switch (the default), the switch supports no more than 20 private-VLAN domains.
- A private VLAN cannot be a UNI-ENI isolated or UNI-ENI community VLAN. For more information about UNI-ENI VLANs, see Chapter 12, “Configuring VLANs.”
- Do not configure a remote SPAN (RSPAN) VLAN as a private-VLAN primary or secondary VLAN. For more information about SPAN, see Chapter 27, “Configuring SPAN and RSPAN.”
- Do not configure private-VLAN ports on interfaces configured for these other features:
  - dynamic-access port VLAN membership
  - PAgP (only NNIs or ENIs)
  - LACP (only NNIs or ENIs)
  - Multicast VLAN Registration (MVR)
- You can configure 802.1x port-based authentication on a private-VLAN port, but do not configure IEEE 802.1x with port security on private-VLAN ports.
- A private-VLAN host or promiscuous port cannot be a SPAN destination port. If you configure a SPAN destination port as a private-VLAN port, the port becomes inactive.
- If you configure a static MAC address on a promiscuous port in the primary VLAN, you must add the same static address to all associated secondary VLANs. If you configure a static MAC address on a host port in a secondary VLAN, you must add the same static MAC address to the associated primary VLAN. When you delete a static MAC address from a private-VLAN port, you must remove all instances of the configured MAC address from the private VLAN.

- Dynamic MAC addresses learned in one VLAN of a private VLAN are replicated in the associated VLANs. For example, a MAC address learned in a secondary VLAN is replicated in the primary VLAN. When the original dynamic MAC address is deleted or aged out, the replicated addresses are removed from the MAC address table.

- Configure Layer 3 VLAN interfaces only for primary VLANs.
# Configuring and Associating VLANs in a Private VLAN

Beginning in privileged EXEC mode, follow these steps to configure a private VLAN:

> **Note**  The `private-vlan` commands do not take effect until you exit VLAN configuration mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2**<br>vlan vlan-id | Enter VLAN configuration mode and designate or create a VLAN that will be the primary VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.  
> **Note** If the VLAN has been configured as a UNI-ENI community VLAN, you must enter the `no uni-vlan` VLAN configuration command before configuring a private VLAN. |
| **Step 3**<br>private-vlan primary | Designate the VLAN as the primary VLAN. |
| **Step 4**<br>exit | Return to global configuration mode. |
| **Step 5**<br>vlan vlan-id | (Optional) Enter VLAN configuration mode and designate or create a VLAN that will be an isolated VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.  
> **Note** If the VLAN has been configured as a UNI-ENI community VLAN, you must enter the `no uni-vlan` VLAN configuration command before configuring a private VLAN. |
| **Step 6**<br>private-vlan isolated | Designate the VLAN as an isolated VLAN. |
| **Step 7**<br>exit | Return to global configuration mode. |
| **Step 8**<br>vlan vlan-id | (Optional) Enter VLAN configuration mode and designate or create a VLAN that will be a community VLAN. The VLAN ID range is 2 to 1001 and 1006 to 4094.  
> **Note** If the VLAN has been configured as a UNI-ENI community VLAN, you must enter the `no uni-vlan` VLAN configuration command before configuring a private VLAN. |
| **Step 9**<br>private-vlan community | Designate the VLAN as a community VLAN. |
| **Step 10**<br>exit | Return to global configuration mode. |
| **Step 11**<br>vlan vlan-id | Enter VLAN configuration mode for the primary VLAN designated in Step 3. |
| **Step 12**<br>private-vlan association [add | remove] secondary_vlan_list | Associate the secondary VLANs with the primary VLAN. |
| **Step 13**<br>end | Return to privileged EXEC mode. |
| **Step 14**<br>show vlan private-vlan [type]  
  or  
  show interfaces status | Verify the configuration. |
| **Step 15**<br>copy running-config startup-config | (Optional) Save your entries in the switch startup configuration file. |

When you associate secondary VLANs with a primary VLAN, note this syntax information:

- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.
The `secondary_vlan_list` parameter can contain multiple community VLAN IDs but only one isolated VLAN ID.

- Enter a `secondary_vlan_list`, or use the `add` keyword with a `secondary_vlan_list` to associate secondary VLANs with a primary VLAN.
- Use the `remove` keyword with a `secondary_vlan_list` to clear the association between secondary VLANs and a primary VLAN.
- The `private-vlan association` VLAN configuration command does not take effect until you exit VLAN configuration mode.

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, to associate them in a private VLAN, and to verify the configuration. It assumes that VLANs 502 and 503 have previously been configured as UNI-ENI community VLANs:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# exit
Switch(config)# vlan 501
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 502
Switch(config-vlan)# no-uni vlan
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 503
Switch(config-vlan)# no-uni vlan
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan association 501-503
Switch(config-vlan)# end
Switch(config)# show vlan private vlan
Primary Secondary Type              Ports
------- --------- ----------------- ------------------------------------------
20      501       isolated
20      502       community
20      503       community
20      504       non-operational
```

### Configuring a Layer 2 Interface as a Private-VLAN Host Port

Beginning in privileged EXEC mode, follow these steps to configure a Layer 2 interface as a private-VLAN host port and to associate it with primary and secondary VLANs:

```
Note
Isolated and community VLANs are both secondary VLANs.
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Enter interface configuration mode for the Layer 2 interface to be configured.</td>
</tr>
</tbody>
</table>
### Configuring Private VLANs

This example shows how to configure an interface as a private-VLAN host port, associate it with a private-VLAN pair, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet0/22
Switch(config-if)# no shutdown
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 20 501
Switch(config-if)# end
Switch# show interfaces fastethernet0/22 switchport
Name: Fa0/22
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: dot1q
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Administrative private-vlan host-association: 20 501
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport mode private-vlan host</td>
</tr>
<tr>
<td>Step 5</td>
<td>switchport private-vlan host-association primary_vlan_id secondary_vlan_id</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td>Step 7</td>
<td>show interfaces [interface-id] switchport</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup config</td>
</tr>
</tbody>
</table>

This example shows how to configure an interface as a private-VLAN host port, associate it with a private-VLAN pair, and verify the configuration:
Configuring a Layer 2 Interface as a Private-VLAN Promiscuous Port

You can configure only NNIs as promiscuous ports. Beginning in privileged EXEC mode, follow these steps to configure a Layer 2 interface as a private-VLAN promiscuous port and map it to primary and secondary VLANs:

**Note** Isolated and community VLANs are both secondary VLANs.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>interface interface-id</code></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>switchport mode private-vlan promiscuous</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`switchport private-vlan mapping primary_vlan_id [add</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>end</code></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>show interfaces [interface-id] switchport</code></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><code>copy running-config startup config</code></td>
</tr>
</tbody>
</table>

When you configure a Layer 2 interface as a private-VLAN promiscuous port, note this syntax information:

- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.
- Enter a `secondary_vlan_list`, or use the `add` keyword with a `secondary_vlan_list` to map the secondary VLANs to the private-VLAN promiscuous port.
- Use the `remove` keyword with a `secondary_vlan_list` to clear the mapping between secondary VLANs and the private-VLAN promiscuous port.

This example shows how to configure an NNI as a private-VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 20 add 501-503
Switch(config-if)# end
```

Use the `show vlan private-vlan` or the `show interface status` privileged EXEC command to display primary and secondary VLANs and private-VLAN ports on the switch.
### Mapping Secondary VLANs to a Primary VLAN Layer 3 VLAN Interface

If the switch is running the metro IP access image and the private VLAN will be used for inter-VLAN routing, you configure an SVI for the primary VLAN and map secondary VLANs to the SVI.

**Note**

Isolated and community VLANs are both secondary VLANs.

Beginning in privileged EXEC mode, follow these steps to map secondary VLANs to the SVI of a primary VLAN to allow Layer 3 switching of private-VLAN traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface vlan primary_vlan_id</td>
</tr>
<tr>
<td></td>
<td>Enter interface configuration mode for the primary VLAN, and configure the VLAN as an SVI. The VLAN ID range is 2 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>private-vlan mapping [add</td>
</tr>
<tr>
<td></td>
<td>Map the secondary VLANs to the Layer 3 VLAN interface of a primary VLAN to allow Layer 3 switching of private-VLAN incoming traffic.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show interface private-vlan mapping</td>
</tr>
<tr>
<td></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

**Note**

The `private-vlan mapping` interface configuration command only affects private-VLAN traffic that is switched through Layer 3.

When you map secondary VLANs to the Layer 3 VLAN interface of a primary VLAN, note this syntax information:

- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs.
- Enter a `secondary_vlan_list`, or use the `add` keyword with a `secondary_vlan_list` to map the secondary VLANs to the primary VLAN.
- Use the `remove` keyword with a `secondary_vlan_list` to clear the mapping between secondary VLANs and the primary VLAN.

This example shows how to map the interfaces of VLANs 501 and 502 to primary VLAN 10, which permits routing of secondary VLAN incoming traffic from private VLANs 501 to 502:

```
Switch# configure terminal
Switch(config)# interface vlan 10
Switch(config-if)# private-vlan mapping 501-502
Switch(config-if)# end
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
---------- -------------- ------------------
vlan10    501            isolated
vlan10    502            community
```
Chapter 13      Configuring Private VLANs

Monitoring Private VLANs

Table 13-1 shows the privileged EXEC commands for monitoring private-VLAN activity.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces status</td>
<td>Displays the status of interfaces, including the VLANs to which they belong.</td>
</tr>
<tr>
<td>show vlan private-vlan [type]</td>
<td>Display the private-VLAN information for the switch.</td>
</tr>
<tr>
<td>show interface switchport</td>
<td>Display the private-VLAN configuration on interfaces.</td>
</tr>
<tr>
<td>show interface private-vlan mapping</td>
<td>Display information about the private-VLAN mapping for VLAN interfaces.</td>
</tr>
</tbody>
</table>

This is an example of the output from the `show vlan private-vlan` command:

```
Switch(config)# show vlan private-vlan
Primary Secondary Type Ports
------- --------- ----------------- ------------------------------------------
10      501       isolated          Fa0/1, Gi0/1, Gi0/2
10      502       community         Fa0/11, Fa0/12, Gi0/1
10      503       non-operational  
```
CHAPTER 14

Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Virtual private networks (VPNs) provide enterprise-scale connectivity on a shared infrastructure, often Ethernet-based, with the same security, prioritization, reliability, and manageability requirements of private networks. Tunneling is a feature designed for service providers who carry traffic of multiple customers across their networks and are required to maintain the VLAN and Layer 2 protocol configurations of each customer without impacting the traffic of other customers. The Cisco ME 3400E Ethernet Access switch supports IEEE 802.1Q tunneling and Layer 2 protocol tunneling. It also supports VLAN mapping (or VLAN ID translation) on trunk ports.

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

- Understanding 802.1Q Tunneling, page 14-1
- Configuring 802.1Q Tunneling, page 14-4
- Understanding VLAN Mapping, page 14-7
- Configuring VLAN Mapping, page 14-9
- Understanding Layer 2 Protocol Tunneling, page 14-12
- Configuring Layer 2 Protocol Tunneling, page 14-15
- Monitoring and Maintaining Tunneling and Mapping Status, page 14-23

Understanding 802.1Q Tunneling

Business customers of service providers often have specific requirements for VLAN IDs and the number of VLANs to be supported. The VLAN ranges required by different customers in the same service-provider network might overlap, and traffic of customers through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations and could easily exceed the VLAN limit (4096) of the 802.1Q specification.

Using the 802.1Q tunneling (QinQ) feature, service providers can use a single VLAN to support customers who have multiple VLANs. Customer VLAN IDs (C-VLANs) are preserved, and traffic from different customers is segregated within the service-provider network, even when they appear to be in the same VLAN. Using 802.1Q tunneling expands VLAN space by using a VLAN-in-VLAN hierarchy and retagging the tagged packets. A port configured to support 802.1Q tunneling is called a tunnel port. When you configure tunneling, you assign a tunnel port to a VLAN ID that is dedicated to tunneling.
Each customer requires a separate service-provider VLAN ID (S-VLAN), but that VLAN ID supports all of the customer’s VLANs. Configuring 802.1Q tunneling on a tunnel port is referred to as traditional QinQ.

Customer traffic tagged in the normal way with appropriate VLAN IDs comes from an 802.1Q trunk port on the customer device and into a tunnel port on the service-provider edge switch. The link between the customer device and the edge switch is asymmetric because one end is configured as an 802.1Q trunk port, and the other end is configured as a tunnel port. You assign the tunnel port interface to an access VLAN ID that is unique to each customer. See Figure 14-1.

By default, VLANs configured on the switch are user network interface-enhanced network interface (UNI-ENI) isolated VLANs. In a UNI-ENI isolated VLAN, 802.1Q tunneled access ports on the switch are isolated from each other. If you use the `uni-vlan community` VLAN configuration command to change a VLAN to a UNI-ENI community VLAN, local switching occurs between these ports. For more information about UNI-ENI VLANs, see Chapter 12, “Configuring VLANs.”

**Figure 14-1  802.1Q Tunnel Ports in a Service-Provider Network**

Packets coming from the customer trunk port into the tunnel port on the service-provider edge switch are normally 802.1Q-tagged with the appropriate VLAN ID. The tagged packets remain intact inside the switch and when they exit the trunk port into the service-provider network, they are encapsulated with another layer of an 802.1Q tag (called the metro tag) that contains the VLAN ID that is unique to the customer. The original customer 802.1Q tag is preserved in the encapsulated packet. Therefore, packets entering the service-provider network are double-tagged, with the outer (metro) tag containing the customer’s access VLAN ID, and the inner VLAN ID being that of the incoming traffic.

When the double-tagged packet enters another trunk port in a service-provider core switch, the outer tag is stripped as the switch processes the packet. When the packet exits another trunk port on the same core switch, the same metro tag is again added to the packet. Figure 14-2 shows the tag structures of the double-tagged packets.
Chapter 14  Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Understanding 802.1Q Tunneling

Note

Remove the Layer 2 protocol configuration from a trunk port because incoming encapsulated packets change that trunk port to error disabled. The outgoing encapsulated VTP (CDP and STP) packets are dropped on that trunk.

Figure 14-2  Original (Normal), 802.1Q, and Double-Tagged Ethernet Packet Formats

When the packet enters the trunk port of the service-provider egress switch, the outer tag is again stripped as the switch internally processes the packet. However, the metro tag is not added when the packet is sent out the tunnel port on the edge switch into the customer network. The packet is sent as a normal 802.1Q-tagged frame to preserve the original VLAN numbers in the customer network.

In Figure 14-1, Customer A was assigned VLAN 30, and Customer B was assigned VLAN 40. Packets entering the edge switch tunnel ports with 802.1Q tags are double-tagged when they enter the service-provider network, with the outer tag containing VLAN ID 30 or 40, appropriately, and the inner tag containing the original VLAN number, for example, VLAN 100. Even if both Customers A and B have VLAN 100 in their networks, the traffic remains segregated within the service-provider network because the outer tag is different. Each customer controls its own VLAN numbering space, which is independent of the VLAN numbering space used by other customers and the VLAN numbering space used by the service-provider network.

At the outbound tunnel port, the original VLAN numbers on the customer’s network are recovered. It is possible to have multiple levels of tunneling and tagging, but the switch supports only one level in this release.

If traffic coming from a customer network is not tagged (native VLAN frames), these packets are bridged or routed as normal packets. All packets entering the service-provider network through a tunnel port on an edge switch are treated as untagged packets, whether they are untagged or already tagged with 802.1Q headers. The packets are encapsulated with the metro tag VLAN ID (set to the access VLAN of the tunnel port) when they are sent through the service-provider network on an 802.1Q trunk port. The priority field on the metro tag is set to the interface class of service (CoS) priority configured on the tunnel port. (The default is zero if none is configured.)
Configuring 802.1Q Tunneling

- Default 802.1Q Tunneling Configuration, page 14-4
- 802.1Q Tunneling Configuration Guidelines, page 14-4
- 802.1Q Tunneling and Other Features, page 14-5
- Configuring an 802.1Q Tunneling Port, page 14-6

Default 802.1Q Tunneling Configuration

By default, 802.1Q tunneling is disabled because the default switchport mode is access. Tagging of 802.1Q native VLAN packets on all 802.1Q trunk ports is also disabled. By default, VLANs on the switch are UNI-ENI isolated VLANs.

802.1Q Tunneling Configuration Guidelines

When you configure 802.1Q tunneling, you should always use an asymmetrical link between the customer device and the edge switch, with the customer device port configured as an 802.1Q trunk port and the edge switch port configured as a tunnel port.

Assign tunnel ports only to VLANs that are used for tunneling.

Configuration requirements for native VLANs and for maximum transmission units (MTUs) are explained in these next sections.

Native VLANs

When configuring 802.1Q tunneling on an edge switch, you must use 802.1Q trunk ports for sending packets into the service-provider network. However, packets going through the core of the service-provider network can be carried through 802.1Q trunks, ISL trunks, or nontrunking links. When 802.1Q trunks are used in these core switches, the native VLANs of the 802.1Q trunks must not match any native VLAN of the nontrunking (tunneling) port on the same switch because traffic on the native VLAN would not be tagged on the 802.1Q sending trunk port.

See Figure 14-3. VLAN 40 is configured as the native VLAN for the 802.1Q trunk port from Customer X at the ingress edge switch in the service-provider network (Switch B). Switch A of Customer X sends a tagged packet on VLAN 30 to the ingress tunnel port of Switch B in the service-provider network, which belongs to access VLAN 40. Because the access VLAN of the tunnel port (VLAN 40) is the same as the native VLAN of the edge-switch trunk port (VLAN 40), the metro tag is not added to tagged packets received from the tunnel port. The packet carries only the VLAN 30 tag through the service-provider network to the trunk port of the egress-edge switch (Switch C) and is misdirected through the egress switch tunnel port to Customer Y.

These are some ways to solve this problem:

- Use ISL trunks between core switches in the service-provider network. Although customer interfaces connected to edge switches must be 802.1Q trunks, we recommend using ISL trunks for connecting switches in the core layer. The Cisco ME switch does not support ISL trunks.
- Use the `vlan dot1q tag native` global configuration command to configure the edge switch so that all packets going out an 802.1Q trunk, including the native VLAN, are tagged. If the switch is configured to tag native VLAN packets on all 802.1Q trunks, the switch accepts untagged packets, but sends only tagged packets.
Ensure that the native VLAN ID on the edge-switch trunk port is not within the customer VLAN range. For example, if the trunk port carries traffic of VLANs 100 to 200, assign the native VLAN a number outside that range.

**Figure 14-3 Potential Problem with 802.1Q Tunneling and Native VLANs**

System MTU

The default system MTU for traffic on the switch is 1500 bytes. You can configure Fast Ethernet ports to support frames larger than 1500 bytes by using the `system mtu` global configuration command. You can configure Gigabit Ethernet ports to support frames larger than 1500 bytes by using the `system mtu jumbo` global configuration command. Because the 802.1Q tunneling feature increases the frame size by 4 bytes when the metro tag is added, you must configure all switches in the service-provider network to be able to process maximum frames by increasing the switch system MTU size to at least 1504 bytes. The maximum allowable system MTU for Gigabit Ethernet interfaces is 9000 bytes; the maximum system MTU for Fast Ethernet interfaces is 1998 bytes.

**802.1Q Tunneling and Other Features**

Although 802.1Q tunneling works well for Layer 2 packet switching, there are incompatibilities between some Layer 2 features and Layer 3 switching.

**Note**

Layer 3 switching is supported only when the metro IP access image is running on the switch.
A tunnel port cannot be a routed port.

IP routing is not supported on a VLAN that includes 802.1Q tunnel ports. Packets received from a tunnel port are forwarded based only on Layer 2 information. If routing is enabled on a switch virtual interface (SVI) that includes tunnel ports, untagged IP packets received from the tunnel port are recognized and routed by the switch. Customers can access the internet through its native VLAN. If this access is not needed, you should not configure SVIs on VLANs that include tunnel ports.

Tunnel ports do not support IP access control lists (ACLs).

Layer 3 quality of service (QoS) ACLs and other QoS features related to Layer 3 information are not supported on tunnel ports. MAC-based QoS is supported on tunnel ports.

EtherChannel port groups are compatible with tunnel ports as long as the 802.1Q configuration is consistent within an EtherChannel port group.

UniDirectional Link Detection (UDLD) is supported on 802.1Q tunnel ports.

Port Aggregation Protocol (PAgP) and Link Aggregation Control Protocol (LACP) are supported only on 802.1Q tunnel ports that are network node interfaces (NNIs) or enhanced network interfaces (ENIs). UNIs do not support PAgP and LACP.

Loopback detection is supported on 802.1Q tunnel ports.

When an NNI or ENI port is configured as an 802.1Q tunnel port, spanning-tree bridge protocol data unit (BPDU) filtering is automatically enabled on the interface, and the Cisco Discovery Protocol (CDP) and the Layer Link Discovery Protocol (LLDP) are automatically disabled on the interface. UNIs do not support BPDU filtering, CDP, or LLDP.

In a UNI-ENI isolated VLAN, 802.1Q tunneled access ports are isolated from each other, but in a UNI-ENI community VLAN, local switching occurs between these ports. For more information about UNI-ENI VLANs, see Chapter 12, “Configuring VLANs.”

Configuring an 802.1Q Tunneling Port

Beginning in privileged EXEC mode, follow these steps to configure a port as an 802.1Q tunnel port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode for the interface to be configured as a tunnel port. This should be the edge port in the service-provider network that connects to the customer switch. Valid interfaces include physical interfaces and port-channel logical interfaces (port channels 1 to 48).</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 switchport access vlan vlan-id</td>
<td>Specify the default VLAN, which is used if the interface stops trunking. This VLAN ID is specific to the particular customer. Note If the VLAN is a UNI-ENI isolated VLAN, local switching does not occur between UNIs and ENIs on the switch. If the VLAN is a UNI-ENI community VLAN, local switching is allowed.</td>
</tr>
<tr>
<td>Step 5 switchport mode dot1q-tunnel</td>
<td>Set the interface as an 802.1Q tunnel port.</td>
</tr>
<tr>
<td>Step 6 exit</td>
<td>Return to global configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 14      Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Understanding VLAN Mapping

Another way to establish S-VLANs is to configure VLAN mapping (or VLAN ID translation) on trunk ports connected to a customer network to map customer VLANs to service-provider VLANs. Packets entering the port are mapped to a service provider VLAN (S-VLAN) based on the port number and the original customer VLAN-ID (C-VLAN) of the packet.

In a typical metro deployment, VLAN mapping takes place on user network interfaces (UNIs) or enhanced network interfaces (ENIs) that face the customer network. However, you are not prevented from configuring VLAN mapping on network node interfaces (NNIs).

Because the VLAN ID is mapped to the S-VLAN on ingress, on the ME-3400E all forwarding operations are performed by using S-VLAN information and not C-VLAN information.

Note: When you configure features on a port that has VLAN mapping configured, you always use the S-VLAN (translated VLAN) ID, not the customer VLAN-ID (C-VLAN).
On an interface configured for VLAN mapping, the specified C-VLAN packets are mapped to the specified S-VLAN when they enter the port. Symmetrical mapping back to the customer C-VLAN occurs when packets exit the port.

The switch supports these types of VLAN mapping on UNI trunk ports:

- One-to-one VLAN mapping occurs at the ingress and egress of the port and maps the customer C-VLAN ID in the 802.1Q tag to the service-provider S-VLAN ID. You can also specify that packets with all other VLAN IDs are dropped.

- Selective QinQ maps the specified customer VLANs entering the UNI to the specified S-VLAN ID. The S-VLAN is added to the incoming unmodified C-VLAN. You can also specify that traffic carrying all other customer VLAN IDs is dropped.

- Traditional 802.1Q tunneling (QinQ) performs all-to-one bundling of C-VLAN IDs to a single S-VLAN ID for the port. The S-VLAN is added to the incoming unmodified C-VLAN. You can configure the UNI as an 802.1Q tunnel port for traditional QinQ, or you can configure selective QinQ on trunk ports for a more flexible implementation. Mapping takes place at ingress and egress of the port. All packets on the port are bundled into the specified S-VLAN.

\[\text{Note}\]
Untagged packets enter the switch on the trunk native VLAN and are not mapped.

For quality of service (QoS), the switch has flexible mapping between C-CoS or C-DSCP and S-CoS and maps the inner CoS to the outer CoS for traffic with traditional QinQ or selective QinQ VLAN mapping. For more information, see the “802.1Q Tunneling CoS Mapping” section on page 34-9.

**Mapping Customer VLANs to Service-Provider VLANs**

Figure 14-4 shows a topology where a customer uses the same VLANs in multiple sites on different sides of a service-provider network. You map the customer VLAN IDs to service-provider VLAN IDs for packet travel across the service-provider backbone. The customer VLAN IDs are retrieved at the other side of the service-provider backbone for use in the other customer site. Configure the same set of VLAN mappings at a customer-connected port on each side of the service-provider network.

See the examples following the configuration steps for using one-to-one mapping, traditional QinQ, or selective QinQ to map customer VLANs 1 to 5 to service-provider VLANs.
Configuring VLAN Mapping

- Default VLAN Mapping Configuration, page 14-9
- VLAN Mapping Configuration Guidelines, page 14-9
- Configuring VLAN Mapping, page 14-10

Default VLAN Mapping Configuration

By default, no VLAN mapping is configured.

VLAN Mapping Configuration Guidelines

- Traditional QinQ uses 802.1Q tunnel ports; you configure one-to-one VLAN mapping and selective QinQ on 802.1Q trunk ports.
- To avoid mixing customer traffic, when you configure traditional Q-in-Q on a trunk port, you should configure the service provider S-VLAN ID as an allowed VLAN on the trunk port.
- On an ME-3400E interface configured for VLAN mapping, mapping to the S-VLAN occurs on traffic entering the switch. Therefore, when you configure other features on an interface configured for VLAN mapping, you should use the S-VLAN ID, except when configuring VLAN mapping and Ethernet E-LMI. When configuring E-LMI on an interface, use the C-VLAN when entering the `ethernet lmi ce-vlan map vlan-id` service instance configuration mode command.
- When you configure VLAN mapping on an EtherChannel, the mapping applies to all ports in the port channel.
Configuring VLAN Mapping

These procedures show how to configure each type of VLAN mapping on trunk ports. To verify your configuration, enter the show interfaces interface-id vlan mapping or show vlan mapping privileged EXEC commands. See the “Monitoring and Maintaining Tunneling and Mapping Status” section on page 14-23 for the syntax of these commands. For more information about all commands in this section, see the command reference for this release.

One-to-One Mapping

Beginning in privileged EXEC mode, follow these steps to configure one-to-one VLAN mapping to map a customer VLAN ID to a service-provider VLAN ID. You can use the default drop keywords to specify that traffic is dropped unless both the specified C-VLAN ID and S-VLAN ID combination is explicitly mapped.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport mode trunk</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport vlan mapping vlan-id translated-id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>switchport vlan mapping default drop</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td>Step 7</td>
<td>show vlan mapping</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no switchport vlan mapping vlan-id translated-id command to remove the VLAN mapping information. Entering no switchport vlan mapping all deletes all mapping configurations.
Chapter 14      Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

This example shows how to map VLAN IDs 1 to 5 in the customer network to VLANs 101 to 105 in the service-provider network as shown in Figure 14-4. You configure these same VLAN mapping commands for a port in Switch A and Switch B. The traffic on any other VLAN IDs is dropped.

Switch(config)# interface gigabithernte0/1
Switch(config-if)# switchport vlan mapping 1 101
Switch(config-if)# switchport vlan mapping 2 102
Switch(config-if)# switchport vlan mapping 3 103
Switch(config-if)# switchport vlan mapping 4 104
Switch(config-if)# switchport vlan mapping 4 105
Switch(config-if)# switchport vlan mapping default drop
Switch(config-if)# exit

In the previous example, at the ingress of the service-provider network, VLAN IDs 1 to 5 in the customer network are mapped to VLANs 101 to 105, respectively, inside of the service-provider network. At the egress of the service-provider network, VLANs 101 to 105 in the service-provider network are mapped to VLAN IDs 1 to 5, respectively, in the customer network.

**Traditional QinQ on a Trunk Port**

Beginning in privileged EXEC mode, follow these steps to configure VLAN mapping for traditional QinQ on a trunk port or tunneling by default. Configuring tunneling by default bundles all packets on the port into the configured S-VLAN.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>switchport mode trunk</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport trunk allowed vlan vlan-id</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>switchport vlan mapping default dot1q-tunnel outer vlan-id</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show interfaces interface-id vlan mapping</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no switchport vlan mapping tunnel default outer vlan-id command to remove the VLAN mapping configuration. Entering no switchport vlan mapping all deletes all mapping configurations.

This example shows how to bundle all traffic on the port to leave the switch with the S-VLAN ID of 100.

Switch(config)# interface gigabithernte0/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk allowed 100
Switch(config-if)# switchport vlan mapping default dot1q-tunnel 100
Switch(config-if)# exit
Selective QinQ on a Trunk Port

Beginning in privileged EXEC mode, follow these steps to configure VLAN mapping for selective QinQ on a trunk port. Note that you can configure one-to-one mapping and selective QinQ on the same interface, but you cannot use the same C-VLAN IDs in both configurations. You can use the `default drop` keywords to specify that traffic is dropped unless the specified C-VLAN ID and S-VLAN ID combination is explicitly mapped.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong> Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface interface-id</strong> Enter interface configuration mode for the interface connected to the service-provider network. You can enter a physical interface or an EtherChannel port channel.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>switchport mode trunk</strong> Configure the interface as a trunk port.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>switchport vlan mapping vlan-id dot1q-tunnel outer vlan-id</strong> Enter the VLAN IDs to be mapped:</td>
</tr>
<tr>
<td></td>
<td>• <code>vlan-id</code>—the customer VLAN ID (C-VLAN) entering the switch from the customer network. The range is from 1 to 4094. You can enter a string of VLAN-IDs.</td>
</tr>
<tr>
<td></td>
<td>• <code>outer-vlan-id</code>—Enter the outer VLAN ID (S-VLAN) of the service-provider network. The range is from 1 to 4094.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>switchport vlan mapping default drop</strong> (Optional) Specify that all packets on the port are dropped if they do not match the VLANs specified in Step 4.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>end</strong> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>show interfaces interface-id vlan mapping</strong> Verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>copy running-config startup-config</strong> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no switchport vlan mapping vlan-id dot1q-tunnel outer vlan-id` command to remove the VLAN mapping configuration. Entering `no switchport vlan mapping all` deletes all mapping configurations.

This example shows how to configure selective QinQ mapping on the port so that traffic with a C-VLAN ID of 1 to 5 enters the switch with an S-VLAN ID of 100. The traffic of any other VLAN IDs is dropped.

```
Switch(config)# interface gigabiethernet0/1
Switch(config-if)# switchport vlan mapping 1-5 dot1q-tunnel 100
Switch(config-if)# switchport vlan mapping drop default
Switch(config-if)# exit
```

Understanding Layer 2 Protocol Tunneling

Customers at different sites connected across a service-provider network need to use various Layer 2 protocols to scale their topologies to include all remote sites, as well as the local sites. STP must run properly, and every VLAN should build a proper spanning tree that includes the local site and all remote sites across the service-provider network. Cisco Discovery Protocol (CDP) must discover neighboring Cisco devices from local and remote sites. VLAN Trunking Protocol (VTP) must provide consistent VLAN configuration throughout all sites in the customer network that are participating in VTP.
The Cisco ME switch does not support VTP; CDP and STP are supported by default on NNIs and can be enabled on ENIs. However, Layer 2 protocol tunneling is supported on all ports on the switch.

When protocol tunneling is enabled, edge switches on the inbound side of the service-provider network encapsulate Layer 2 protocol packets with a special MAC address and send them across the service-provider network. Core switches in the network do not process these packets but forward them as normal packets. Layer 2 protocol data units (PDUs) for CDP, STP, or VTP cross the service-provider network and are delivered to customer switches on the outbound side of the service-provider network. Identical packets are received by all customer ports on the same VLANs with these results:

- Users on each of a customer’s sites can properly run STP, and every VLAN can build a correct spanning tree based on parameters from all sites and not just from the local site.
- CDP discovers and shows information about the other Cisco devices connected through the service-provider network.
- VTP provides consistent VLAN configuration throughout the customer network, propagating to all switches through the service provider that support VTP.

To provide interoperability with third-party vendors, you can use the Layer 2 protocol-tunnel bypass feature. Bypass mode transparently forwards control PDUs to vendor switches that have different ways of controlling protocol tunneling. You implement bypass mode by enabling Layer 2 protocol tunneling on the egress trunk port. When Layer 2 protocol tunneling is enabled on the trunk port, the encapsulated tunnel MAC address is removed and the protocol packets have their normal MAC address.

Layer 2 protocol tunneling can be used independently or can enhance 802.1Q tunneling. If protocol tunneling is not enabled on 802.1Q tunneling ports, remote switches at the receiving end of the service-provider network do not receive the PDUs and cannot properly run STP, CDP, and VTP. When protocol tunneling is enabled, Layer 2 protocols within each customer’s network are totally separate from those running within the service-provider network. Customer switches on different sites that send traffic through the service-provider network with 802.1Q tunneling achieve complete knowledge of the customer’s VLAN. If 802.1Q tunneling is not used, you can still enable Layer 2 protocol tunneling by connecting to the customer switch through access or trunk ports and enabling tunneling on the service-provider access or trunk port.

For example, in Figure 14-5, Customer X has four switches in the same VLAN, that are connected through the service-provider network. If the network does not tunnel PDUs, switches on the far ends of the network cannot properly run STP, CDP, and VTP. For example, STP for a VLAN on a switch in Customer X, Site 1, will build a spanning tree on the switches at that site without considering convergence parameters based on Customer X’s switch in Site 2. This could result in the topology shown in Figure 14-6.
In an SP network, you can use Layer 2 protocol tunneling to enhance the creation of EtherChannels by emulating a point-to-point network topology. When you enable protocol tunneling (PAgP or LACP) on the SP switch, remote customer switches receive the PDUs and can negotiate the automatic creation of EtherChannels.
For example, in Figure 14-7, Customer A has two switches in the same VLAN that are connected through the SP network. When the network tunnels PDUs, switches on the far ends of the network can negotiate the automatic creation of EtherChannels without needing dedicated lines. See the “Configuring Layer 2 Tunneling for EtherChannels” section on page 14-19 for instructions.

Figure 14-7  Layer 2 Protocol Tunneling for EtherChannels

Configuring Layer 2 Protocol Tunneling

You can enable Layer 2 protocol tunneling (by protocol) on the ports that are connected to the customer in the edge switches of the service-provider network. The service-provider edge switches connected to the customer switch perform the tunneling process. Edge-switch tunnel ports are connected to customer 802.1Q trunk ports. Edge-switch access ports are connected to customer access ports. The edge switches connected to the customer switch perform the tunneling process.

You can enable Layer 2 protocol tunneling on ports that are configured as access ports, tunnel ports, or trunk ports. The switch supports Layer 2 protocol tunneling for CDP, STP, and VTP. For emulated point-to-point network topologies, it also supports PAgP, LACP, and UDLD protocols. The switch does not support Layer 2 protocol tunneling for LLDP.

Caution

PAgP, LACP, and UDLD protocol tunneling is only intended to emulate a point-to-point topology. An erroneous configuration that sends tunneled packets to many ports could lead to a network failure.

When the Layer 2 PDUs that entered the service-provider inbound edge switch through a Layer 2 protocol-enabled port exit through the trunk port into the service-provider network, the switch overwrites the customer PDU-destination MAC address with a well-known Cisco proprietary multicast address (01-00-0c-cd-cd-d0). If 802.1Q tunneling is enabled, packets are also double-tagged; the outer tag is the customer metro tag, and the inner tag is the customer’s VLAN tag. The core switches ignore the inner tags and forward the packet to all trunk ports in the same metro VLAN. The edge switches on the outbound side restore the proper Layer 2 protocol and MAC address information and forward the packets to all Layer 2 protocol-enabled access ports, tunnel ports, and trunk ports in the same metro VLAN. Therefore, the Layer 2 PDUs remain intact and are delivered across the service-provider infrastructure to the other side of the customer network.

See Figure 14-5, with Customer X and Customer Y in access VLANs 30 and 40, respectively. Asymmetric links connect the customers in Site 1 to edge switches in the service-provider network. The Layer 2 PDUs (for example, BPDUs) coming into Switch B from Customer Y in Site 1 are forwarded to
the infrastructure as double-tagged packets with the well-known MAC address as the destination MAC address. These double-tagged packets have the metro VLAN tag of 40, as well as an inner VLAN tag (for example, VLAN 100). When the double-tagged packets enter Switch D, the outer VLAN tag 40 is removed, the well-known MAC address is replaced with the respective Layer 2 protocol MAC address, and the packet is sent to Customer Y on Site 2 as a single-tagged frame in VLAN 100.

You can also enable Layer 2 protocol tunneling on access ports on the edge switch connected to access or trunk ports on the customer switch. In this case, the encapsulation and decapsulation process is the same as described in the previous paragraph, except that the packets are not double-tagged in the service-provider network. The single tag is the customer-specific access VLAN tag.

These sections contain this configuration information:

- Default Layer 2 Protocol Tunneling Configuration, page 14-16
- Layer 2 Protocol Tunneling Configuration Guidelines, page 14-16
- Configuring Layer 2 Protocol Tunneling, page 14-17
- Configuring Layer 2 Tunneling for EtherChannels, page 14-19

### Default Layer 2 Protocol Tunneling Configuration

Table 14-1 shows the default Layer 2 protocol tunneling configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer 2 protocol tunneling</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Shutdown threshold</td>
<td>None set.</td>
</tr>
<tr>
<td>Drop threshold</td>
<td>None set.</td>
</tr>
<tr>
<td>CoS value</td>
<td>If a CoS value is configured on the interface for data packets, that value is the default used for Layer 2 PDUs. If none is configured, the default is 5.</td>
</tr>
</tbody>
</table>

### Layer 2 Protocol Tunneling Configuration Guidelines

These are some configuration guidelines and operating characteristics of Layer 2 protocol tunneling:

- The switch supports tunneling of CDP, STP, including multiple STP (MSTP), and VTP. Protocol tunneling is disabled by default but can be enabled for the individual protocols on 802.1Q tunnel ports, access ports, or trunk ports.

- The edge switches on the outbound side of the service-provider network restore the proper Layer 2 protocol and MAC address information and forward the packets to all Layer 2 protocol-enabled tunnel, access, and trunk ports in the same metro VLAN.

- For interoperability with third-party vendor switches, the switch supports a Layer 2 protocol-tunnel bypass feature. Bypass mode transparently forwards control PDUs to vendor switches that have different ways of controlling protocol tunneling. When Layer 2 protocol tunneling is enabled on ingress ports on a switch, egress trunk ports forward the tunneled packets with a special encapsulation. If you also enable Layer 2 protocol tunneling on the egress trunk port, this behavior is bypassed, and the switch forwards control PDUs without any processing or modification.
• The switch supports PAgP, LACP, and UDLD tunneling for emulated point-to-point network topologies. Protocol tunneling is disabled by default but can be enabled for the individual protocols on 802.1Q tunnel ports, access ports, or trunk ports.

• If you enable PAgP or LACP tunneling, we recommend that you also enable UDLD on the interface for faster link-failure detection.

• Loopback detection is not supported on Layer 2 protocol tunneling of PAgP, LACP, or UDLD packets.

• EtherChannel port groups are compatible with tunnel ports when the 802.1Q configuration is consistent within an EtherChannel port group.

• If an encapsulated PDU (with the proprietary destination MAC address) is received from a tunnel port or access or trunk port with Layer 2 tunneling enabled, the tunnel port is shut down to prevent loops. The port also shuts down when a configured shutdown threshold for the protocol is reached. You can manually re-enable the port (by entering a `shutdown` and a `no shutdown` command sequence). If errdisable recovery is enabled, the operation is retried after a specified time interval.

• Only decapsulated PDUs are forwarded to the customer network. The spanning-tree instance running on the service-provider network does not forward BPDUs to tunnel ports. CDP packets are not forwarded from tunnel ports.

• When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, shutdown threshold for the PDUs generated by the customer network. If the limit is exceeded, the port shuts down. You can also limit BPDU rate by using QoS ACLs and policy maps on a tunnel port.

• When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, drop threshold for the PDUs generated by the customer network. If the limit is exceeded, the port drops PDUs until the rate at which it receives them is below the drop threshold.

• Because tunneled PDUs (especially STP BPDUs) must be delivered to all remote sites so that the customer virtual network operates properly, you can give PDUs higher priority within the service-provider network than data packets received from the same tunnel port. By default, the PDUs use the same CoS value as data packets.

### Configuring Layer 2 Protocol Tunneling

Beginning in privileged EXEC mode, follow these steps to configure a port for Layer 2 protocol tunneling:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code></td>
<td>Enter interface configuration mode, and enter the interface to be configured as a tunnel port. This should be the edge port in the service-provider network that connects to the customer switch. Valid interfaces can be physical interfaces and port-channel logical interfaces (port channels 1 to 48).</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>no shutdown</code></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
</tbody>
</table>
## Configuring Layer 2 Protocol Tunneling

**Command**

| Step 4 | switchport mode access  
|        | or switchport mode dot1q-tunnel  
|        | or switchport mode trunk | Purpose |
|        | | Configure the interface as an access port, an 802.1Q tunnel port or a trunk port. The default switchport mode is access. |

| Step 5 | l2protocol-tunnel [cdp | stp | vtp] | Enable protocol tunneling for the desired protocol. If no keyword is entered, tunneling is enabled for all three Layer 2 protocols. |

| Step 6 | l2protocol-tunnel shutdown-threshold [cdp | stp | vtp] value | (Optional) Configure the threshold for packets-per-second accepted for encapsulation. The interface is disabled if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured. |

**Note** If you also set a drop threshold on this interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.

| Step 7 | l2protocol-tunnel drop-threshold [cdp | stp | vtp] value | (Optional) Configure the threshold for packets-per-second accepted for encapsulation. The interface drops packets if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured. |

If you also set a shutdown threshold on this interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

| Step 8 | exit | Return to global configuration mode. |

| Step 9 | errdisable recovery cause l2ptguard | (Optional) Configure the recovery mechanism from a Layer 2 maximum-rate error so that the interface is re-enabled and can try again. Errdisable recovery is disabled by default; when enabled, the default time interval is 300 seconds. |

| Step 10 | l2protocol-tunnel cos value | (Optional) Configure the CoS value for all tunneled Layer 2 PDUs. The range is 0 to 7; the default is the default CoS value for the interface. If none is configured, the default is 5. |

| Step 11 | end | Return to privileged EXEC mode. |

| Step 12 | show l2protocol | Display the Layer 2 tunnel ports on the switch, including the protocols configured, the thresholds, and the counters. |

| Step 13 | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

Use the `no l2protocol-tunnel [cdp | stp | vtp]` interface configuration command to disable protocol tunneling for one of the Layer 2 protocols or for all three. Use the `no l2protocol-tunnel shutdown-threshold [cdp | stp | vtp]` and the `no l2protocol-tunnel drop-threshold [cdp | stp | vtp]` commands to return the shutdown and drop thresholds to the default settings.

This example shows how to configure Layer 2 protocol tunneling for CDP, STP, and VTP and to verify the configuration.

```
Switch(config)# interface gigatether0/1  
Switch(config-if)# l2protocol-tunnel cdp

Chapter 14  Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Configuring Layer 2 Tunneling for EtherChannels

To configure Layer 2 point-to-point tunneling to facilitate the creation of EtherChannels, you need to configure both the SP edge switch and the customer switch.

Configuring the SP Edge Switch

Beginning in privileged EXEC mode, follow these steps to configure a SP edge switch for Layer 2 protocol tunneling for EtherChannels:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport mode dot1q-tunnel</td>
</tr>
<tr>
<td>Step 5</td>
<td>l2protocol-tunnel point-to-point [pagp</td>
</tr>
</tbody>
</table>

Caution

To avoid a network failure, make sure that the network is a point-to-point topology before you enable tunneling for PAgP, LACP, or UDLD packets.
Step 6

```
12protocol-tunnel shutdown-threshold [point-to-point [pagp | lacp | udld]] value
```

(Optional) Configure the threshold for packets-per-second accepted for encapsulation. The interface is disabled if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured.

**Note** If you also set a drop threshold on this interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.

Step 7

```
12protocol-tunnel drop-threshold [point-to-point [pagp | lacp | udld]] value
```

(Optional) Configure the threshold for packets-per-second accepted for encapsulation. The interface drops packets if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured.

**Note** If you also set a shutdown threshold on this interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

Step 8

```
no cdp enable
```

If the interface is an NNI, disable CDP on the interface. CDP is disabled by default on ENIs. UNIs do not support CDP.

Step 9

```
spanning-tree bpdufilter enable
```

If the interface is an NNI or ENI, enable BPDU filtering on the interface. UNIs do not support STP PBDU filtering.

Step 10

```
exit
```

Return to global configuration mode.

Step 11

```
errdisable recovery cause l2ptguard
```

(Optional) Configure the recovery mechanism from a Layer 2 maximum-rate error so that the interface is re-enabled and can try again. Errdisable recovery is disabled by default; when enabled, the default time interval is 300 seconds.

Step 12

```
l2protocol-tunnel cos value
```

(Optional) Configure the CoS value for all tunneled Layer 2 PDUs. The range is 0 to 7; the default is the default CoS value for the interface. If none is configured, the default is 5.

Step 13

```
end
```

Return to privileged EXEC mode.

Step 14

```
show l2protocol
```

Display the Layer 2 tunnel ports on the switch, including the protocols configured, the thresholds, and the counters.

Step 15

```
copy running-config startup-config
```

(Optional) Save your entries in the configuration file.

---

Use the **no l2protocol-tunnel [point-to-point [pagp | lacp | udld]]** interface configuration command to disable point-to-point protocol tunneling for one of the Layer 2 protocols or for all three. Use the **no l2protocol-tunnel shutdown-threshold [point-to-point [pagp | lacp | udld]]** and the **no l2protocol-tunnel drop-threshold [[point-to-point [pagp | lacp | udld]]** commands to return the shutdown and drop thresholds to the default settings.
Configuring the Customer Switch

After configuring the SP edge switch, begin in privileged EXEC mode and follow these steps to configure a customer switch for Layer 2 protocol tunneling for EtherChannels:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Enter the interface configuration mode. This should be the customer switch port.</td>
</tr>
<tr>
<td>3</td>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>4</td>
<td>switchport mode trunk</td>
<td>Enable trunking on the interface.</td>
</tr>
<tr>
<td>5</td>
<td>udld enable</td>
<td>Enable UDLD in normal mode on the interface.</td>
</tr>
<tr>
<td>6</td>
<td>channel-group channel-group-number mode desirable</td>
<td>Assign the interface to a channel group, and specify desirable for the PAgP mode if the interface is an NNI or ENI. For more information about configuring EtherChannels, see Chapter 35, “Configuring EtherChannels and Link-State Tracking.”</td>
</tr>
<tr>
<td>7</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>8</td>
<td>interface port-channel port-channel number</td>
<td>Enter port-channel interface mode.</td>
</tr>
<tr>
<td>9</td>
<td>shutdown</td>
<td>Shut down the interface.</td>
</tr>
<tr>
<td>10</td>
<td>no shutdown</td>
<td>Enable the interface.</td>
</tr>
<tr>
<td>11</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>12</td>
<td>show l2protocol</td>
<td>Display the Layer 2 tunnel ports on the switch, including the protocols configured, the thresholds, and the counters.</td>
</tr>
<tr>
<td>13</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no switchport mode trunk, the no udld enable, and the no channel group channel-group-number mode desirable interface configuration commands to return the interface to the default settings.

For EtherChannels, you need to configure both the SP edge switches and the customer switches for Layer 2 protocol tunneling. (See Figure 14-7 on page 14-15.)

This example shows how to configure the SP edge switch 1 and edge switch 2. VLANs 17, 18, 19, and 20 are the access VLANs, Gigabit Ethernet interfaces 1 and 2 are point-to-point tunnel ports with PAgP and UDLD enabled, the drop threshold is 1000, and Fast Ethernet interface 3 is a trunk port.

SP edge switch 1 configuration:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport access vlan 17
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# switchport access vlan 18
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
```

SP edge switch 2 configuration:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport access vlan 17
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# switchport access vlan 18
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
```
Chapter 14 Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Configuring Layer 2 Protocol Tunneling

Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface fastethernet0/3
Switch(config-if)# no shutdown
Switch(config-if)# switchport mode trunk

SP edge switch 2 configuration:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport access vlan 19
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# switchport access vlan 20
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000
Switch(config-if)# exit
Switch(config)# interface fastethernet0/3
Switch(config-if)# no shutdown
Switch(config-if)# switchport mode trunk

This example shows how to configure the customer switch at Site 1. Fast Ethernet interfaces 1, 2, 3, and 4 are set for 802.1Q trunking, UDLD is enabled, EtherChannel group 1 is enabled, and the port channel is shut down and then enabled to activate the EtherChannel configuration.

Switch(config)# interface fastethernet0/1
Switch(config-if)# no shutdown
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface fastethernet0/2
Switch(config-if)# no shutdown
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface fastethernet0/3
Switch(config-if)# no shutdown
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface fastethernet0/4
Switch(config-if)# no shutdown
Switch(config-if)# switchport mode trunk
Switch(config-if)# udld enable
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# exit
Switch(config)# interface port-channel 1
Switch(config-if)# shutdown
Switch(config-if)# no shutdown
Switch(config-if)# exit
Monitoring and Maintaining Tunneling and Mapping Status

Table 14-2 shows the privileged EXEC commands for monitoring and maintaining 802.1Q and Layer 2 protocol tunneling and VLAN mapping.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear l2protocol-tunnel counters</td>
<td>Clear the protocol counters on Layer 2 protocol tunneling ports.</td>
</tr>
<tr>
<td>show dot1q-tunnel</td>
<td>Display 802.1Q tunnel ports on the switch.</td>
</tr>
<tr>
<td>show dot1q-tunnel interface interface-id</td>
<td>Verify if a specific interface is a tunnel port.</td>
</tr>
<tr>
<td>show interfaces [interface interface-id] vlan mapping</td>
<td>Display VLAN mapping information for all interfaces or for the specified interface.</td>
</tr>
<tr>
<td>show l2protocol-tunnel</td>
<td>Display information about Layer 2 protocol tunneling ports.</td>
</tr>
<tr>
<td>show errdisable recovery</td>
<td>Verify if the recovery timer from a Layer 2 protocol-tunnel error disable state is enabled.</td>
</tr>
<tr>
<td>show l2protocol-tunnel interface interface-id</td>
<td>Display information about a specific Layer 2 protocol tunneling port.</td>
</tr>
<tr>
<td>show l2protocol-tunnel summary</td>
<td>Display only Layer 2 protocol summary information.</td>
</tr>
<tr>
<td>show platform vlan mapping</td>
<td>Display platform VLAN mapping information.</td>
</tr>
<tr>
<td>show vlan dot1q tag native</td>
<td>Display the status of native VLAN tagging on the switch.</td>
</tr>
<tr>
<td>show vlan mapping [interface-id]</td>
<td>Display VLAN mapping information for all interfaces or for the specified interface.</td>
</tr>
<tr>
<td>show vlan mapping usage</td>
<td>Display information about hardware resource usage on the switch devoted to VLAN mapping.</td>
</tr>
</tbody>
</table>

For detailed information about these displays, see the command reference for this release.
Chapter 14 Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling

Monitoring and Maintaining Tunneling and Mapping Status
CHAPTER 15

Configuring STP

This chapter describes how to configure the Spanning Tree Protocol (STP) on port-based VLANs on the Cisco ME 3400E Ethernet Access switch. The switch can use the per-VLAN spanning-tree plus (PVST+) protocol based on the IEEE 802.1D standard and Cisco proprietary extensions, or the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol based on the IEEE 802.1w standard. On the Cisco ME switch, STP is enabled by default on network node interfaces (NNIs). It is disabled by default, but can be enabled, on enhanced network interfaces (ENIs). User network interfaces (UNIs) on the switch do not participate in STP. UNIs and ENIs on which STP is not enabled immediately forward traffic when they are brought up.

For information about the Multiple Spanning Tree Protocol (MSTP) and how to map multiple VLANs to the same spanning-tree instance, see Chapter 16, “Configuring MSTP.” For information about other spanning-tree features such as Port Fast, root guard, and so forth, see Chapter 17, “Configuring Optional Spanning-Tree Features.”

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding Spanning-Tree Features, page 15-1
- Configuring Spanning-Tree Features, page 15-11
- Displaying the Spanning-Tree Status, page 15-23

Understanding Spanning-Tree Features

These sections contain this conceptual information:

- STP Overview, page 15-2
- Spanning-Tree Topology and BPDUs, page 15-3
- Bridge ID, Switch Priority, and Extended System ID, page 15-4
- Spanning-Tree Interface States, page 15-4
- How a Switch or Port Becomes the Root Switch or Root Port, page 15-7
- Spanning Tree and Redundant Connectivity, page 15-8
- Spanning-Tree Address Management, page 15-9
STP Overview

STP is a Layer 2 link management protocol that provides path redundancy while preventing loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. Multiple active paths among end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages. Switches might also learn end-station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network. Spanning-tree operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

The STP uses a spanning-tree algorithm to select one switch of a redundantly connected network as the root of the spanning tree. The algorithm calculates the best loop-free path through a switched Layer 2 network by assigning a role to each port based on the role of the port in the active topology:

- Root—A forwarding port elected for the spanning-tree topology
- Designated—A forwarding port elected for every switched LAN segment
- Alternate—A blocked port providing an alternate path to the root bridge in the spanning tree
- Backup—A blocked port in a loopback configuration

On the Cisco ME 3400E switch, only NNIs and ENIs on which STP has been enabled participate in STP. Active UNIs and ENIs on which STP is not enabled are always in the forwarding state. In this overview, STP ports can be any interfaces on other switches, but only NNIs or STP-enabled ENIs on a Cisco ME switch.

The switch that has all of its ports as the designated role or the backup role is the root switch. The switch that has at least one of its ports in the designated role is called the designated switch.

Spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning-tree algorithm recalculates the spanning-tree topology and activates the standby path. Switches send and receive spanning-tree frames, called bridge protocol data units (BPDUs), at regular intervals. The switches do not forward these frames but use them to construct a loop-free path. BPDUs contain information about the sending switch and its ports, including switch and MAC addresses, switch priority, port priority, and path cost. Spanning tree uses this information to elect the root switch and root port for the switched network and the root port and designated port for each switched segment.

When two ports on a switch are part of a loop, the spanning-tree port priority and path cost settings control which port is put in the forwarding state and which is put in the blocking state. The spanning-tree port priority value represents the location of a port in the network topology and how well it is located to pass traffic. The path cost value represents the media speed.
Spanning-Tree Topology and BPDUs

The stable, active spanning-tree topology of a switched network is controlled by these elements:

- The unique bridge ID (switch priority and MAC address) associated with each VLAN on each switch.
- The spanning-tree path cost to the root switch.
- The port identifier (port priority and MAC address) associated with each Layer 2 STP-enabled interface.

When the switches in a network are powered up, each functions as the root switch. Each switch sends a configuration BPDU through all of its ports, or on the Cisco ME switch, only through the STP-enabled ports. The BPDPUs communicate and compute the spanning-tree topology. Each configuration BPDU contains this information:

- The unique bridge ID of the switch that the sending switch identifies as the root switch
- The spanning-tree path cost to the root
- The bridge ID of the sending switch
- Message age
- The identifier of the sending interface
- Values for the hello, forward delay, and max-age protocol timers

When a switch receives a configuration BPDU that contains superior information (lower bridge ID, lower path cost, and so forth), it stores the information for that port. If this BPDU is received on the root port of the switch, the switch also forwards it with an updated message to all attached LANs for which it is the designated switch.

If a switch receives a configuration BPDU that contains inferior information to that currently stored for that port, it discards the BPDU. If the switch is a designated switch for the LAN from which the inferior BPDU was received, it sends that LAN a BPDU containing the up-to-date information stored for that port. In this way, inferior information is discarded, and superior information is propagated on the network.

A BPDU exchange results in these actions:

- One switch in the network is elected as the root switch (the logical center of the spanning-tree topology in a switched network).

  For each VLAN, the switch with the highest switch priority (the lowest numerical priority value) is elected as the root switch. If all switches are configured with the default priority (32768), the switch with the lowest MAC address in the VLAN becomes the root switch. The switch priority value occupies the most significant bits of the bridge ID, as shown in Table 15-1 on page 15-4.

- A root port is selected for each switch (except the root switch). This port provides the best path (lowest cost) when the switch forwards packets to the root switch.
• The shortest distance to the root switch is calculated for each switch based on the path cost.
• A designated switch for each LAN segment is selected. The designated switch incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port. For the Cisco ME switch, this only applies to NNIs or to ENIs on which STP has been specifically enabled.

All paths that are not needed to reach the root switch from anywhere in the switched network are placed in the spanning-tree blocking mode.

Bridge ID, Switch Priority, and Extended System ID

The IEEE 802.1D standard requires that each switch has a unique bridge identifier (bridge ID), which controls the selection of the root switch. Because each VLAN is considered as a different logical bridge with PVST+ and rapid PVST+, the same switch must have as many different bridge IDs as VLANs configured on it. Each VLAN on the switch has a unique 8-byte bridge ID. The two most-significant bytes are used for the switch priority, and the remaining six bytes are derived from the switch MAC address.

The switch supports the IEEE 802.1t spanning-tree extensions, and some of the bits previously used for the switch priority are now used as the VLAN identifier. The result is that fewer MAC addresses are reserved for the switch, and a larger range of VLAN IDs can be supported, all while maintaining the uniqueness of the bridge ID. As shown in Table 15-1, the two bytes previously used for the switch priority are reallocated into a 4-bit priority value and a 12-bit extended system ID value equal to the VLAN ID.

Table 15-1  Switch Priority Value and Extended System ID

<table>
<thead>
<tr>
<th>Switch Priority Value</th>
<th>Extended System ID (Set Equal to the VLAN ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 16</td>
<td>Bit 15</td>
</tr>
<tr>
<td>32768</td>
<td>16384</td>
</tr>
</tbody>
</table>

Spanning tree uses the extended system ID, the switch priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN.

Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN. For example, when you change the switch priority value, you change the probability that the switch will be elected as the root switch. Configuring a higher value decreases the probability; a lower value increases the probability. For more information, see the “Configuring the Root Switch” section on page 15-15, the “Configuring a Secondary Root Switch” section on page 15-17, and the “Configuring the Switch Priority of a VLAN” section on page 15-20.

Spanning-Tree Interface States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When an STP port transitions directly from nonparticipation in the spanning-tree topology to the forwarding state, it can create temporary data loops. Interfaces must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for forwarded frames that have used the old topology.
Each Layer 2 interface on a switch using spanning tree exists in one of these states:

- **Blocking**—The interface does not participate in frame forwarding.
- **Listening**—The first transitional state after the blocking state when the spanning tree determines that the interface should participate in frame forwarding.
- **Learning**—The interface prepares to participate in frame forwarding.
- **Forwarding**—The interface forwards frames.
- **Disabled**—The interface is not participating in spanning tree because of a shutdown port, no link on the port, or no spanning-tree instance running on the port.

![Diagram of Spanning-Tree Interface States](image)

**Note**

On a Cisco ME switch, UNIs are always in the forwarding state. ENIs in the default STP mode (disabled) are also in forwarding state, but you can enable STP on an ENI.

A port participating in spanning tree moves through these states:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled

**Figure 15-1** illustrates how an interface moves through the states.

When you power up the switch, spanning tree is enabled by default, and every NNI in the Cisco ME switch (and every ENI on which STP has been enabled), as well as any other port in other switches in the VLAN or network that are participating in spanning tree, goes through the blocking state and the transitory states of listening and learning. Spanning tree stabilizes each interface at the forwarding or blocking state.
UNIs are shut down by default, and when they are brought up, they immediately start forwarding traffic. ENIs act the same as UNIs unless you have specifically enabled STP on the port.

When the spanning-tree algorithm places a Layer 2 spanning-tree interface in the forwarding state, this process occurs:

1. The interface is in the listening state while spanning tree waits for protocol information to transition the interface to the blocking state.
2. While spanning tree waits the forward-delay timer to expire, it moves the interface to the learning state and resets the forward-delay timer.
3. In the learning state, the interface continues to block frame forwarding as the switch learns end-station location information for the forwarding database.
4. When the forward-delay timer expires, spanning tree moves the interface to the forwarding state, where both learning and frame forwarding are enabled.

**Blocking State**

A Layer 2 interface in the blocking state does not participate in frame forwarding. After initialization, a BPDU is sent to each switch interface, or to each switch STP port. A switch initially functions as the root until it exchanges BPDUs with other switches. This exchange establishes which switch in the network is the root or root switch. If there is only one switch in the network, no exchange occurs, the forward-delay timer expires, and the interface moves to the listening state. An interface participating in spanning tree always enters the blocking state after switch initialization.

An interface in the blocking state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs

**Listening State**

The listening state is the first state a Layer 2 interface enters after the blocking state. The interface enters this state when the spanning tree decides that the interface should participate in frame forwarding.

An interface in the listening state performs these functions:

- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Receives BPDUs
Learning State

A Layer 2 interface in the learning state prepares to participate in frame forwarding. The interface enters the learning state from the listening state.

An interface in the learning state performs these functions:
- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Learns addresses
- Receives BPDUs

Forwarding State

A Layer 2 interface in the forwarding state forwards frames. The interface enters the forwarding state from the learning state.

An interface in the forwarding state performs these functions:
- Receives and forwards frames received on the interface
- Forwards frames switched from another interface
- Learns addresses
- Receives BPDUs

Disabled State

A Layer 2 interface in the disabled state does not participate in frame forwarding or in the spanning tree. An interface in the disabled state is nonoperational.

A disabled interface performs these functions:
- Discards frames received on the interface
- Discards frames switched from another interface for forwarding
- Does not learn addresses
- Does not receive BPDUs

How a Switch or Port Becomes the Root Switch or Root Port

If all switches in a network are enabled with default spanning-tree settings, the switch with the lowest MAC address becomes the root switch. In Figure 15-2, Switch A is elected as the root switch because the switch priority of all the switches is set to the default (32768) and Switch A has the lowest MAC address. However, because of traffic patterns, number of forwarding interfaces, or link types, Switch A might not be the ideal root switch. By increasing the priority (lowering the numerical value) of the ideal switch so that it becomes the root switch, you force a spanning-tree recalculation to form a new topology with the ideal switch as the root.
When the spanning-tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be ideal. For instance, connecting higher-speed links to an interface that has a higher number than the root port can cause a root-port change. The goal is to make the fastest link the root port.

For example, assume that one port on Switch B is a Gigabit Ethernet link and that another port on Switch B (a 10/100 link) is the root port. Network traffic might be more efficient over the Gigabit Ethernet link. By changing the spanning-tree port priority on the Gigabit Ethernet port to a higher priority (lower numerical value) than the root port, the Gigabit Ethernet port becomes the new root port.

**Spanning Tree and Redundant Connectivity**

You can create a redundant backbone with spanning tree by connecting two switch interfaces that are participating in spanning tree to another device or to two different devices, as shown in Figure 15-3. Spanning tree automatically disables one interface but enables it if the other one fails. If one link is high-speed and the other is low-speed, the low-speed link is always disabled. If the speeds are the same, the port priority and port ID are added together, and spanning tree disables the link with the lowest value.

You can also create redundant links between switches by using EtherChannel groups. For more information, see Chapter 35, “Configuring EtherChannels and Link-State Tracking.”
Spanning-Tree Address Management

IEEE 802.1D specifies 17 multicast addresses, ranging from 0x00180C2000000 to 0x0180C2000010, to be used by different bridge protocols. These addresses are static addresses that cannot be removed.

Regardless of the spanning-tree state, each switch receives but does not forward packets destined for addresses between 0x0180C2000000 and 0x0180C2000010. If spanning tree is enabled, the CPU on the switch receives packets destined for 0x0180C2000000 and 0x0180C2000010. If spanning tree is disabled, the switch forwards those packets as unknown multicast addresses.

Accelerated Aging to Retain Connectivity

The default for aging dynamic addresses is 5 minutes, the default setting of the `mac address-table aging-time` global configuration command. However, a spanning-tree reconfiguration can cause many station locations to change. Because these stations could be unreachable for 5 minutes or more during a reconfiguration, the address-aging time is accelerated so that station addresses can be dropped from the address table and then relearned. The accelerated aging is the same as the forward-delay parameter value (`spanning-tree vlan vlan-id forward-time seconds` global configuration command) when the spanning tree reconfigures.

Because each VLAN is a separate spanning-tree instance, the switch accelerates aging on a per-VLAN basis. A spanning-tree reconfiguration on one VLAN can cause the dynamic addresses learned on that VLAN to be subject to accelerated aging. Dynamic addresses on other VLANs can be unaffected and remain subject to the aging interval entered for the switch.

Spanning-Tree Modes and Protocols

The switch NNIs and ENIs with STP enabled support these spanning-tree modes and protocols:

- **PVST+**—This spanning-tree mode is based on the IEEE 802.1D standard and Cisco proprietary extensions. It is the default spanning-tree mode used on most Ethernet port-based VLANs. The PVST+ runs on each VLAN on the switch up to the maximum supported, ensuring that each has a loop-free path through the network.

  The PVST+ provides Layer 2 load balancing for the VLAN on which it runs. You can create different logical topologies by using the VLANs on your network to ensure that all of your links are used but that no one link is oversubscribed. Each instance of PVST+ on a VLAN has a single root switch. This root switch propagates the spanning-tree information associated with that VLAN to all other switches in the network. Because each switch has the same information about the network, this process ensures that the network topology is maintained.

- **Rapid PVST+**—This spanning-tree mode is the same as PVST+ except that it uses a rapid convergence based on the IEEE 802.1w standard. This is the default spanning-tree mode for the Cisco ME switch NNIs. Rapid PVST+ is compatible with PVST+. To provide rapid convergence, the rapid PVST+ immediately deletes dynamically learned MAC address entries on a per-port basis upon receiving a topology change. By contrast, PVST+ uses a short aging time for dynamically learned MAC address entries.
Understanding Spanning-Tree Features

The rapid PVST+ uses the same configuration as PVST+ (except where noted), and the switch needs only minimal extra configuration. The benefit of rapid PVST+ is that you can migrate a large PVST+ install base to rapid PVST+ without having to learn the complexities of the MSTP configuration and without having to reprovision your network. In rapid-PVST+ mode, each VLAN runs its own spanning-tree instance up to the maximum supported.

- MSTP—This spanning-tree mode is based on the IEEE 802.1s standard. You can map multiple VLANs to the same spanning-tree instance, which reduces the number of spanning-tree instances required to support a large number of VLANs. The MSTP runs on top of the RSTP (based on IEEE 802.1w), which provides for rapid convergence of the spanning tree by eliminating the forward delay and by quickly transitioning root ports and designated ports to the forwarding state. You cannot run MSTP without RSTP.

The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. For more information, see Chapter 16, “Configuring MSTP.”

For information about the number of supported spanning-tree instances, see the next section.

Supported Spanning-Tree Instances

In PVST+ or rapid-PVST+ mode, the switch supports up to 128 spanning-tree instances.

In MSTP mode, the switch supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

Spanning-Tree Interoperability and Backward Compatibility

Table 15-2 lists the interoperability and compatibility among the supported spanning-tree modes in a network.

<table>
<thead>
<tr>
<th></th>
<th>PVST+</th>
<th>MSTP</th>
<th>Rapid PVST+</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVST+</td>
<td>Yes</td>
<td>Yes (with restrictions)</td>
<td>Yes (reverts to PVST+)</td>
</tr>
<tr>
<td>MSTP</td>
<td>Yes (with restrictions)</td>
<td>Yes</td>
<td>Yes (reverts to PVST+)</td>
</tr>
<tr>
<td>Rapid PVST+</td>
<td>Yes (reverts to PVST+)</td>
<td>Yes (reverts to PVST+)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

In a mixed MSTP and PVST+ network, the common spanning-tree (CST) root must be inside the MST backbone, and a PVST+ switch cannot connect to multiple MST regions.

When a network contains switches running rapid PVST+ and switches running PVST+, we recommend that the rapid-PVST+ switches and PVST+ switches be configured for different spanning-tree instances. In the rapid-PVST+ spanning-tree instances, the root switch must be a rapid-PVST+ switch. In the PVST+ instances, the root switch must be a PVST+ switch. The PVST+ switches should be at the edge of the network.
STP and IEEE 802.1Q Trunks

The IEEE 802.1Q standard for VLAN trunks imposes some limitations on the spanning-tree strategy for a network. The standard requires only one spanning-tree instance for all VLANs allowed on the trunks. However, in a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for each VLAN allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch uses PVST+ to provide spanning-tree interoperability. If rapid PVST+ is enabled, the switch uses it instead of PVST+. The switch combines the spanning-tree instance of the IEEE 802.1Q VLAN of the trunk with the spanning-tree instance of the non-Cisco 802.1Q switch.

However, all PVST+ or rapid-PVST+ information is maintained by Cisco switches separated by a cloud of non-Cisco 802.1Q switches. The non-Cisco 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

PVST+ is automatically enabled on IEEE 802.1Q trunks, and no user configuration is required. The external spanning-tree behavior on access ports is not affected by PVST+.

For more information on IEEE 802.1Q trunks, see Chapter 12, “Configuring VLANs.”

</table>

Spanning-Tree Configuration Guidelines

If more VLANs are defined than there are spanning-tree instances, you can enable PVST+ or rapid PVST+ on STP ports in only 128 VLANs on the switch. The remaining VLANs operate with spanning tree disabled. However, you can map multiple VLANs to the same spanning-tree instances by using MSTP. For more information, see Chapter 16, “Configuring MSTP.”

If 128 instances of spanning tree are already in use, you can disable spanning tree on STP ports in one of the VLANs and then enable it on the VLAN where you want it to run. Use the no spanning-tree vlan vlan-id global configuration command to disable spanning tree on a specific VLAN, and use the spanning-tree vlan vlan-id global configuration command to enable spanning tree on the desired VLAN.

Caution

Switches that are not running spanning tree still forward BPDUs that they receive so that the other switches on the VLAN that have a running spanning-tree instance can break loops. Therefore, spanning tree must be running on enough switches to break all the loops in the network; for example, at least one switch on each loop in the VLAN must be running spanning tree. It is not absolutely necessary to run spanning tree on all switches in the VLAN. However, if you are running spanning tree only on a minimal set of switches, an incautious change to the network that introduces another loop into the VLAN can result in a broadcast storm.
If you have already used all available spanning-tree instances on your switch, adding another VLAN creates a VLAN that is not running spanning tree on that switch. If you have the default allowed list on the trunk ports of that switch, the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that will not be broken, particularly if there are several adjacent switches that have all run out of spanning-tree instances. You can prevent this possibility by setting up allowed lists on the trunk ports of switches that have used up their allocation of spanning-tree instances. Setting up allowed lists is not necessary in many cases and can make it more labor-intensive to add another VLAN to the network.

Spanning-tree commands control the configuration of VLAN spanning-tree instances. You create a spanning-tree instance when you assign an STP port (an NNI or ENI with STP enabled) to a VLAN. The spanning-tree instance is removed when the last port is moved to another VLAN. You can configure switch and port parameters before a spanning-tree instance is created; these parameters are applied when the spanning-tree instance is created.

The switch supports PVST+, rapid PVST+, and MSTP, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run rapid PVST+, or all VLANs run MSTP.) For information about the different spanning-tree modes and how they interoperate, see the “Spanning-Tree Interoperability and Backward Compatibility” section on page 15-10.

**Caution**

Loop guard works only on point-to-point links. We recommend that each end of the link has a directly connected device that is running STP.

On the ME-3400E switch, when 1-to-1 VLAN mapping is enabled on an NNI or on an ENI on which STP is enabled, the STP instance applies to the service provider VLAN (S-VLAN) within the switch.

### Enabling Spanning Tree on an ENI

By default, spanning tree is enabled on all NNIs on the switch and disabled on ENIs. Beginning in privileged EXEC mode, follow these steps to enable spanning tree on an ENI:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify a UNI or ENI interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong> port-type eni</td>
<td>Configure the port as an ENI (if not already configured).</td>
</tr>
</tbody>
</table>
| **Step 5** spanning-tree | Enable spanning tree on the interface. The interface will belong to the switch spanning-tree instance along with NNIs in the VLAN.  
**Note** This command is visible only on ENIs. |
| **Step 6** end | Return to privileged EXEC mode. |
| **Step 7** show spanning-tree interface interface-id | Verify your entries. |
| **Step 8** copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To disable spanning tree on an ENI, enter the `no spanning-tree` interface command.
Changing the Spanning-Tree Mode.

The switch supports three spanning-tree modes: PVST+, rapid PVST+, or MSTP. By default, the switch runs the rapid PVST+ protocol on all NNIs and ENIs on which spanning tree is enabled.

Beginning in privileged EXEC mode, follow these steps to change the spanning-tree mode. If you want to enable a mode that is different from the default mode, this procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> spanning-tree mode</td>
<td>Configure a spanning-tree mode on STP ports on the switch.</td>
</tr>
<tr>
<td>(pvst</td>
<td>mst</td>
</tr>
<tr>
<td></td>
<td>• Select <strong>mst</strong> to enable MSTP (and RSTP). For more configuration</td>
</tr>
<tr>
<td></td>
<td>steps, see Chapter 16, “Configuring MSTP.”</td>
</tr>
<tr>
<td></td>
<td>• Select <strong>rapid-pvst</strong> to enable rapid PVST+ (the default setting).</td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>(Recommended only for rapid-PVST+ mode) Specify an STP port to configure, and enter interface configuration mode. Valid interfaces include physical NNIs or ENIs with spanning tree enabled, VLANs, and NNI or ENI port channels. The VLAN ID range is 1 to 4094. The port-channel range is 1 to 48.</td>
</tr>
<tr>
<td><strong>Step 4</strong> spanning-tree link-type point-to-point</td>
<td>(Recommended only for rapid-PVST+ mode) Specify that the link type for this port is point-to-point.</td>
</tr>
<tr>
<td></td>
<td>If you connect this port to a remote port through a point-to-point link and the local port becomes a designated port, the switch negotiates with the remote port and rapidly changes the local port to the forwarding state.</td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> clear spanning-tree detected-protocols</td>
<td>(Recommended only for rapid-PVST+ mode) If any port on the switch running spanning tree is connected to a port on a legacy IEEE 802.1D switch, restart the protocol migration process on the entire switch. This step is optional if the designated switch detects that this switch is running rapid PVST+.</td>
</tr>
<tr>
<td><strong>Step 7</strong> show spanning-tree summary</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>and show spanning-tree interface interface-id</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To return to the default setting, use the `no spanning-tree mode` global configuration command. To return the port to its default spanning-tree mode setting, use the `no spanning-tree link-type` interface configuration command.

## Disabling Spanning Tree

Spanning tree is enabled by default on all NNIs in VLAN 1 and in all newly created VLANs up to the spanning-tree limit specified in the “Supported Spanning-Tree Instances” section on page 15-10. Spanning tree is disabled on ENIs on the switch but can be enabled on a per-interface basis. Disable spanning tree only if you are sure there are no loops in the network topology.

**Caution**

When spanning tree is disabled and loops are present in the topology, excessive traffic and indefinite packet duplication can drastically reduce network performance.

Beginning in privileged EXEC mode, follow these steps to disable spanning-tree on a per-VLAN basis. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>no spanning-tree vlan vlan-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree vlan vlan-id</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To re-enable spanning-tree, use the `spanning-tree vlan vlan-id` global configuration command.

## Configuring the Root Switch

The switch maintains a separate spanning-tree instance for each active VLAN configured on it. A bridge ID, consisting of the switch priority and the switch MAC address, is associated with each instance. For each VLAN, the switch with the lowest bridge ID becomes the root switch for that VLAN.

To configure a switch to become the root for the specified VLAN, use the `spanning-tree vlan vlan-id root` global configuration command to modify the switch priority from the default value (32768) to a significantly lower value. When you enter this command, the software checks the switch priority of the root switches for each VLAN. Because of the extended system ID support, the switch sets its own priority for the specified VLAN to 24576 if this value will cause this switch to become the root for the specified VLAN.

If any root switch for the specified VLAN has a switch priority lower than 24576, the switch sets its own priority for the specified VLAN to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value as shown in Table 15-1 on page 15-4.)

**Note**

The `spanning-tree vlan vlan-id root` global configuration command fails if the value necessary to be the root switch is less than 1.
If your network consists of switches that both do and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

**Note**
The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.

Use the `diameter` keyword to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time, forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

**Note**
After configuring the switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the `spanning-tree vlan vlan-id hello-time`, `spanning-tree vlan vlan-id forward-time`, and the `spanning-tree vlan vlan-id max-age` global configuration commands.

Beginning in privileged EXEC mode, follow these steps to configure a switch to become the root for the specified VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>spanning-tree vlan vlan-id root primary [diameter net-diameter [hello-time seconds]]</td>
</tr>
<tr>
<td></td>
<td>Configure a switch to become the root for the specified VLAN.</td>
</tr>
<tr>
<td></td>
<td>- For <code>vlan-id</code>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <code>diameter net-diameter</code>, specify the maximum number of switches between any two end stations. The range is 2 to 7.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <code>hello-time seconds</code>, specify the interval in seconds between the generation of configuration messages by the root switch. The range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show spanning-tree detail</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no spanning-tree vlan vlan-id root` global configuration command.
Configuring a Secondary Root Switch

When you configure a switch as the secondary root, the switch priority is modified from the default value (32768) to 28672. The switch is then likely to become the root switch for the specified VLAN if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768 and therefore are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the `spanning-tree vlan vlan-id root primary` global configuration command.

Beginning in privileged EXEC mode, follow these steps to configure a switch to become the secondary root for the specified VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 spanning-tree vlan vlan-id root secondary [diameter net-diameter [hello-time seconds]]</td>
<td>Configure a switch to become the secondary root for the specified VLAN.</td>
</tr>
<tr>
<td></td>
<td>• For <code>vlan-id</code>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>diameter net-diameter</code>, specify the maximum number of switches between any two end stations. The range is 2 to 7.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>hello-time seconds</code>, specify the interval in seconds between the generation of configuration messages by the root switch. The range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td></td>
<td>Use the same network diameter and hello-time values that you used when configuring the primary root switch. See the “Configuring the Root Switch” section on page 15-15.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show spanning-tree detail</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no spanning-tree vlan vlan-id root` global configuration command.

Configuring Port Priority

If a loop occurs, spanning tree uses the port priority when selecting a spanning-tree port to put into the forwarding state. You can assign higher priority values (lower numerical values) to ports that you want selected first and lower priority values (higher numerical values) to ones that you want selected last. If all spanning-tree ports have the same priority value, spanning tree puts the port with the lowest interface number in the forwarding state and blocks the other interfaces.
Beginning in privileged EXEC mode, follow these steps to configure the port priority of a spanning-tree port. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td>Step 3</td>
<td>spanning-tree port-priority priority</td>
</tr>
<tr>
<td>Step 4</td>
<td>spanning-tree vlan vlan-id port-priority priority</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show spanning-tree interface interface-id</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Note: The show spanning-tree interface interface-id privileged EXEC command displays information only if the port is in a link-up operative state. Otherwise, you can use the show running-config interface privileged EXEC command to confirm the configuration.
To return to the default spanning-tree setting, use the `no spanning-tree [vlan vlan-id] port-priority` interface configuration command. For information on how to configure load sharing on trunk ports by using spanning-tree port priorities, see the “Configuring Trunk Ports for Load Sharing” section on page 12-19.

## Configuring Path Cost

The spanning-tree path cost default value is derived from the media speed of an interface (port running spanning tree or port channel of multiple ports running spanning tree). If a loop occurs, spanning tree uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all NNIs (or port channels) have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

Beginning in privileged EXEC mode, follow these steps to configure the cost of an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>spanning-tree cost cost</td>
</tr>
</tbody>
</table>
| **Step 4** | spanning-tree vlan vlan-id cost cost | Configure the cost for a VLAN. If a loop occurs, spanning tree uses the path cost when selecting a spanning-tree port to place into the forwarding state. A lower path cost represents higher-speed transmission.  
  - For `vlan-id`, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.  
  - For `cost`, the range is 1 to 200000000; the default value is derived from the media speed of the interface. |
| **Step 5** | end | Return to privileged EXEC mode. |
| **Step 6** | show spanning-tree interface interface-id | Verify your entries. |
| **Step 6** | show spanning-tree vlan vlan-id | |
| **Step 7** | copy running-config startup-config | (Optional) Save your entries in the configuration file. |
The `show spanning-tree interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

To return to the default setting, use the `no spanning-tree [vlan vlan-id] cost` interface configuration command. For information on how to configure load sharing on trunk ports by using spanning-tree path costs, see the “Configuring Trunk Ports for Load Sharing” section on page 12-19.

### Configuring the Switch Priority of a VLAN

You can configure the switch priority and make it more likely that the switch will be chosen as the root switch.

**Note**

Exercise care when using this command. For most situations, we recommend that you use the `spanning-tree vlan vlan-id root primary` and the `spanning-tree vlan vlan-id root secondary` global configuration commands to modify the switch priority.

Beginning in privileged EXEC mode, follow these steps to configure the switch priority of a VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `configure terminal` | Enter global configuration mode. |
| **Step 2**
| `spanning-tree vlan vlan-id priority priority` | Configure the switch priority of a VLAN. |
| | • For `vlan-id`, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. |
| | • For `priority`, the range is 0 to 61440 in increments of 4096; the default is 32768. The lower the number, the more likely the switch will be chosen as the root switch. |
| | Valid priority values are 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected. |
| **Step 3**
| `end` | Return to privileged EXEC mode. |
| **Step 4**
| `show spanning-tree vlan vlan-id` | Verify your entries. |
| **Step 5**
| `copy running-config startup-config` | (Optional) Save your entries in the configuration file. |

To return to the default setting, use the `no spanning-tree vlan vlan-id priority` global configuration command.
Chapter 15 Configuring STP

Configuring Spanning-Tree Timers

Table 15-4 describes the timers that affect the entire spanning-tree performance.

### Table 15-4  Spanning-Tree Timers

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hello timer</td>
<td>Controls how often the switch broadcasts hello messages to other switches.</td>
</tr>
<tr>
<td>Forward-delay timer</td>
<td>Controls how long each of the listening and learning states last before the</td>
</tr>
<tr>
<td></td>
<td>STP port begins forwarding.</td>
</tr>
<tr>
<td>Maximum-age timer</td>
<td>Controls the amount of time the switch stores protocol information received</td>
</tr>
<tr>
<td></td>
<td>on an STP port.</td>
</tr>
</tbody>
</table>

The sections that follow provide the configuration steps.

### Configuring the Hello Time

You can configure the interval between the generation of configuration messages by the root switch by changing the hello time.

**Note**

Exercise care when using this command. For most situations, we recommend that you use the `spanning-tree vlan vlan-id root primary` and the `spanning-tree vlan vlan-id root secondary` global configuration commands to modify the hello time.

Beginning in privileged EXEC mode, follow these steps to configure the hello time of a VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 spanning-tree vlan vlan-id hello-time seconds</td>
<td>Configure the hello time of a VLAN. The hello time is the interval between the generation of configuration messages by the root switch. These messages mean that the switch is alive.</td>
</tr>
<tr>
<td></td>
<td>• For <code>vlan-id</code>, you can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>• For <code>seconds</code>, the range is 1 to 10; the default is 2.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show spanning-tree vlan vlan-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no spanning-tree vlan vlan-id hello-time` global configuration command.
Configuring the Forwarding-Delay Time for a VLAN

Beginning in privileged EXEC mode, follow these steps to configure the forwarding-delay time for a VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree vlan vlan-id forward-time seconds</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree vlan vlan-id</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default setting, use the no spanning-tree vlan vlan-id forward-time global configuration command.

Configuring the Maximum-Aging Time for a VLAN

Beginning in privileged EXEC mode, follow these steps to configure the maximum-aging time for a VLAN. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree vlan vlan-id max-age seconds</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree vlan vlan-id</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default setting, use the no spanning-tree vlan vlan-id max-age global configuration command.
Displaying the Spanning-Tree Status

To display the spanning-tree status, use one or more of the privileged EXEC commands in Table 15-5:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree active</td>
<td>Displays spanning-tree information only on active spanning-tree interfaces.</td>
</tr>
<tr>
<td>show spanning-tree detail</td>
<td>Displays a detailed summary of interface information.</td>
</tr>
<tr>
<td>show spanning-tree interface</td>
<td>Displays spanning-tree information for the specified spanning-tree interface.</td>
</tr>
<tr>
<td></td>
<td>interface-id</td>
</tr>
<tr>
<td>show spanning-tree summary</td>
<td>Displays a summary of interface states or displays the total lines of the STP state section.</td>
</tr>
<tr>
<td>[totals]</td>
<td></td>
</tr>
</tbody>
</table>

You can clear spanning-tree counters by using the `clear spanning-tree [interface interface-id]` privileged EXEC command.

For information about other keywords for the `show spanning-tree` privileged EXEC command, see the command reference for this release.
Configuring MSTP

This chapter describes how to configure the Cisco implementation of the IEEE 802.1s Multiple STP (MSTP) on the Cisco ME 3400E Ethernet Access switch. On the Cisco ME switch, user network interfaces (UNIs) on the switch do not participate in STP and immediately forward traffic when they are brought up. STP is enabled by default on network node interfaces (NNIs), and can be also be enabled on enhanced network interfaces (ENIs). If STP is not enabled on an ENI, the interface always forwards traffic.

Note

The multiple spanning-tree (MST) implementation is a pre-standard implementation. It is based on the draft version of the IEEE standard.

The MSTP enables multiple VLANs to be mapped to the same spanning-tree instance, thereby reducing the number of spanning-tree instances needed to support a large number of VLANs. The MSTP provides for multiple forwarding paths for data traffic and enables load balancing. It improves the fault tolerance of the network because a failure in one instance (forwarding path) does not affect other instances (forwarding paths). The most common initial deployment of MSTP is in the backbone and distribution layers of a Layer 2 switched network. This deployment provides the highly available network required in a service-provider environment.

When the switch is in the MST mode, the Rapid Spanning Tree Protocol (RSTP), which is based on IEEE 802.1w, is automatically enabled. The RSTP provides rapid convergence of the spanning tree through explicit handshaking that eliminates the IEEE 802.1D forwarding delay and quickly transitions root ports and designated ports to the forwarding state.

Both MSTP and RSTP improve the spanning-tree operation and maintain backward compatibility with equipment that is based on the (original) 802.1D spanning tree, with existing Cisco-proprietary Multiple Instance STP (MISTP), and with existing Cisco per-VLAN spanning-tree plus (PVST+) and rapid per-VLAN spanning-tree plus (rapid PVST+). For information about PVST+ and rapid PVST+, see Chapter 15, “Configuring STP.” For information about other spanning-tree features such as Port Fast, UplinkFast, root guard, and so forth, see Chapter 17, “Configuring Optional Spanning-Tree Features.”

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.
This chapter consists of these sections:

- Understanding MSTP, page 16-2
- Understanding RSTP, page 16-8
- Configuring MSTP Features, page 16-14
- Displaying the MST Configuration and Status, page 16-27

**Understanding MSTP**

MSTP, which uses RSTP for rapid convergence, enables VLANs to be grouped into a spanning-tree instance, with each instance having a spanning-tree topology independent of other spanning-tree instances. This architecture provides multiple forwarding paths for data traffic, enables load balancing, and reduces the number of spanning-tree instances required to support a large number of VLANs.

These sections describe how the MSTP works:

- Multiple Spanning-Tree Regions, page 16-2
- IST, CIST, and CST, page 16-3
- Hop Count, page 16-5
- Boundary Ports, page 16-6
- IEEE 802.1s Implementation, page 16-6
- “Interoperability with IEEE 802.1D STP” section on page 16-8

For configuration information, see the “Configuring MSTP Features” section on page 16-14.

**Multiple Spanning-Tree Regions**

For switches to participate in multiple spanning-tree (MST) instances, you must consistently configure the switches with the same MST configuration information. A collection of interconnected switches that have the same MST configuration comprises an MST region as shown in Figure 16-1 on page 16-4.

The MST configuration controls to which MST region each switch belongs. The configuration includes the name of the region, the revision number, and the MST VLAN-to-instance assignment map. You configure the switch for a region by using the **spanning-tree mst configuration** global configuration command, after which the switch enters the MST configuration mode. From this mode, you can map VLANs to an MST instance by using the **instance** MST configuration command, specify the region name by using the **name** MST configuration command, and set the revision number by using the **revision** MST configuration command.

A region can have one member or multiple members with the same MST configuration; each member must be capable of processing RSTP bridge protocol data units (BPDUs). There is no limit to the number of MST regions in a network, but each region can support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.
IST, CIST, and CST

Unlike PVST+ and rapid PVST+ in which all the spanning-tree instances are independent, the MSTP establishes and maintains two types of spanning trees:

- An internal spanning tree (IST), which is the spanning tree that runs in an MST region.

  Within each MST region, the MSTP maintains multiple spanning-tree instances. Instance 0 is a special instance for a region, known as the internal spanning tree (IST). All other MST instances are numbered from 1 to 4094.

  The IST is the only spanning-tree instance that sends and receives BPDUs; all of the other spanning-tree instance information is contained in M-records, which are encapsulated within MSTP BPDUs. Because the MSTP BPDU carries information for all instances, the number of BPDUs that need to be processed by a switch to support multiple spanning-tree instances is significantly reduced.

  All MST instances within the same region share the same protocol timers, but each MST instance has its own topology parameters, such as root switch ID, root path cost, and so forth. By default, all VLANs are assigned to the IST.

  An MST instance is local to the region; for example, MST instance 1 in region A is independent of MST instance 1 in region B, even if regions A and B are interconnected.

- A common and internal spanning tree (CIST), which is a collection of the ISTs in each MST region, and the common spanning tree (CST) that interconnects the MST regions and single spanning trees.

  The spanning tree computed in a region appears as a subtree in the CST that encompasses the entire switched domain. The CIST is formed as a result of the spanning-tree algorithm running between switches that support the IEEE 802.1w, IEEE 802.1s, and IEEE 802.1D protocols. The CIST inside an MST region is the same as the CST outside a region.

For more information, see the “Operations Within an MST Region” section on page 16-3 and the “Operations Between MST Regions” section on page 16-4.

Note

The implementation of the IEEE 802.1s standard changes some of the terminology associated with MST implementations. For a summary of these changes, see Table 16-1 on page 16-5.

Operations Within an MST Region

The IST connects all the MSTP switches in a region. When the IST converges, the root of the IST becomes the IST master (shown in Figure 16-1 on page 16-4), which is the switch within the region with the lowest bridge ID and path cost to the CST root. The IST master also is the CST root if there is only one region within the network. If the CST root is outside the region, one of the MSTP switches at the boundary of the region is selected as the IST master.

When an MSTP switch initializes, it sends BPDUs claiming itself as the root of the CST and the IST master, with both of the path costs to the CST root and to the IST master set to zero. The switch also initializes all of its MST instances and claims to be the root for all of them. If the switch receives superior MST root information (lower bridge ID, lower path cost, and so forth) than currently stored for the port, it relinquishes its claim as the IST master.

During initialization, a region might have many subregions, each with its own IST master. As switches receive superior IST information, they leave their old subregions and join the new subregion that might contain the true IST master. Thus all subregions shrink, except for the one that contains the true IST master.
For correct operation, all switches in the MST region must agree on the same IST master. Therefore, any two switches in the region synchronize their port roles for an MST instance only if they converge to a common IST master.

**Operations Between MST Regions**

If there are multiple regions or legacy IEEE 802.1D switches within the network, MSTP establishes and maintains the CST, which includes all MST regions and all legacy STP switches in the network. The MST instances combine with the IST at the boundary of the region to become the CST.

The IST connects all the MSTP switches in the region and appears as a subtree in the CST that encompasses the entire switched domain, with the root of the subtree being the IST master. The MST region appears as a virtual switch to adjacent STP switches and MST regions.

Figure 16-1 shows a network with three MST regions and a legacy IEEE 802.1D switch (D). The IST master for region 1 (A) is also the CST root. The IST master for region 2 (B) and the IST master for region 3 (C) are the roots for their respective subtrees within the CST. The RSTP runs in all regions.

*Figure 16-1  MST Regions, IST Masters, and the CST Root*

---

*Figure 16-1* does not show additional MST instances for each region. Note that the topology of MST instances can be different from that of the IST for the same region.

Only the CST instance sends and receives BPDUs, and MST instances add their spanning-tree information into the BPDUs to interact with neighboring switches and compute the final spanning-tree topology. Because of this, the spanning-tree parameters related to BPDU transmission (for example,
hello time, forward time, max-age, and max-hops) are configured only on the CST instance but affect all MST instances. Parameters related to the spanning-tree topology (for example, switch priority, port VLAN cost, port VLAN priority) can be configured on both the CST instance and the MST instance. MSTP switches use Version 3 RSTP BPDUs or 802.1D STP BPDUs to communicate with legacy IEEE 802.1D switches. MSTP switches use MSTP BPDUs to communicate with MSTP switches.

IEEE 802.1s Terminology

Some MST naming conventions used in Cisco’s prestandard implementation have been changed to identify some internal or regional parameters. These parameters are significant only within an MST region, as opposed to external parameters that are relevant to the whole network. Because the CIST is the only spanning-tree instance that spans the whole network, only the CIST parameters require the external rather than the internal or regional qualifiers.

- The CIST root is the root switch for the unique instance that spans the whole network, the CIST.
- The CIST external root path cost is the cost to the CIST root. This cost is left unchanged within an MST region. Remember that an MST region looks like a single switch for the CIST. The CIST external root path cost is the root path cost calculated between these virtual switches and switches that do not belong to any region.
- The CIST regional root was called the IST master in the prestandard implementation. If the CIST root is in the region, the CIST regional root is the CIST root. Otherwise, the CIST regional root is the closest switch to the CIST root in the region. The CIST regional root acts as a root switch for the IST.
- The CIST internal root path cost is the cost to the CIST regional root in a region. This cost is only relevant to the IST, instance 0.

Table 16-1 compares the IEEE standard and the Cisco prestandard terminology.

Hop Count

The IST and MST instances do not use the message-age and maximum-age information in the configuration BPDU to compute the spanning-tree topology. Instead, they use the path cost to the root and a hop-count mechanism similar to the IP time-to-live (TTL) mechanism.

By using the spanning-tree mst max-hops global configuration command, you can configure the maximum hops inside the region and apply it to the IST and all MST instances in that region. The hop count achieves the same result as the message-age information (trigger a reconfiguration). The root switch of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count set to the
maximum value. When a switch receives this BPDU, it decrements the received remaining hop count by one and propagates this value as the remaining hop count in the BPDUs it generates. When the count reaches zero, the switch discards the BPDU and ages the information held for the port.

The message-age and maximum-age information in the RSTP portion of the BPDU remain the same throughout the region, and the same values are propagated by the region’s designated ports at the boundary.

Boundary Ports

In the Cisco prestandard implementation, a boundary port connects an MST region to a single spanning-tree region running RSTP, to a single spanning-tree region running PVST+ or rapid PVST+, or to another MST region with a different MST configuration. A boundary port also connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

**Note**

On the Cisco ME switch, only NNIs or STP-enabled ENIs can be MST ports. UNIs do not participate in STP.

There is no definition of a boundary port in the IEEE 802.1s standard. The IEEE 802.1Q-2002 standard identifies two kinds of messages that a port can receive: internal (coming from the same region) and external. When a message is external, it is received only by the CIST. If the CIST role is root or alternate, or if the external BPDU is a topology change, it could have an impact on the MST instances. When a message is internal, the CIST part is received by the CIST, and each MST instance receives its respective M-record. The Cisco prestandard implementation treats a port that receives an external message as a boundary port. This means a port cannot receive a mix of internal and external messages.

An MST region includes both switches and LANs. A segment belongs to the region of its designated port. Therefore, a port in a different region than the designated port for a segment is a boundary port. This definition allows two ports internal to a region to share a segment with a port belonging to a different region, creating the possibility of receiving both internal and external messages on a port.

The primary change from the Cisco prestandard implementation is that a designated port is not defined as boundary, unless it is running in an STP-compatible mode.

**Note**

If there is a legacy STP switch on the segment, messages are always considered external.

The other change from the prestandard implementation is that the CIST regional root switch ID field is now inserted where an RSTP or legacy IEEE 802.1Q switch has the sender switch ID. The whole region performs like a single virtual switch by sending a consistent sender switch ID to neighboring switches. In the example in Figure 16-1, switch C would receive a BPDU with the same consistent sender switch ID of root, whether or not A or B is designated for the segment.

**IEEE 802.1s Implementation**

The Cisco implementation of the IEEE MST standard includes features required to meet the standard, as well as some of the desirable prestandard functionality that is not yet incorporated into the published standard.
Port Role Naming Change

The boundary role is no longer in the final MST standard, but this boundary concept is maintained in Cisco’s implementation. However, an MST instance port at a boundary of the region might not follow the state of the corresponding CIST port. Two cases exist now:

- The boundary port is the root port of the CIST regional root—When the CIST instance port is proposed and is in sync, it can send back an agreement and move to the forwarding state only after all the corresponding MSTI ports are in sync (and thus forwarding). The MSTI ports now have a special master role.
- The boundary port is not the root port of the CIST regional root—The MSTI ports follow the state and role of the CIST port. The standard provides less information, and it might be difficult to understand why an MSTI port can be alternately blocking when it receives no BPDUs (MRecords). In this case, although the boundary role no longer exists, the show commands identify a port as boundary in the type column of the output.

Interoperation Between Legacy and Standard Switches

Because automatic detection of prestandard switches can fail, you can use an interface configuration command to identify prestandard ports. A region cannot be formed between a standard and a prestandard switch, but they can interoperate by using the CIST. Only the capability of load balancing over different instances is lost in that particular case. The CLI displays different flags depending on the port configuration when a port receives prestandard BPDUs. A syslog message also appears the first time a switch receives a prestandard BPU on a port that has not been configured for prestandard BPU transmission.

Figure 16-2 illustrates this scenario. Assume that A is a standard switch and B a prestandard switch, both configured to be in the same region. A is the root switch for the CIST, and thus B has a root port (BX) on segment X and an alternate port (BY) on segment Y. If segment Y flaps, and the port on BY becomes the alternate before sending out a single prestandard BPU, AY cannot detect that a prestandard switch is connected to Y and continues to send standard BPDUs. The port BY is thus fixed in a boundary, and no load balancing is possible between A and B. The same problem exists on segment X, but B might transmit topology changes.

![Figure 16-2 Standard and Prestandard Switch Interoperation](image)

Note

We recommend that you minimize the interaction between standard and prestandard MST implementations.
Detecting Unidirectional Link Failure

This feature is not yet present in the IEEE MST standard, but it is included in this Cisco IOS release. The software checks the consistency of the port role and state in the received BPDUs to detect unidirectional link failures that could cause bridging loops.

When a designated port detects a conflict, it keeps its role, but reverts to discarding state because disrupting connectivity in case of inconsistency is preferable to opening a bridging loop.

Figure 16-3 illustrates a unidirectional link failure that typically creates a bridging loop. Switch A is the root switch, and its BPDUs are lost on the link leading to switch B. RSTP and MST BPDUs include the role and state of the sending port. With this information, switch A can detect that switch B does not react to the superior BPDUs it sends and that switch B is the designated, not root switch. As a result, switch A blocks (or keeps blocking) its port, thus preventing the bridging loop.

Interoperability with IEEE 802.1D STP

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If this switch receives a legacy IEEE 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only IEEE 802.1D BPDUs on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MSTP BPDU (Version 3) associated with a different region, or an RSTP BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. Also, a switch might continue to assign a boundary role to a port when the switch to which this switch is connected has joined the region. To restart the protocol migration process (force the renegotiation with neighboring switches), use the `clear spanning-tree detected-protocols` privileged EXEC command.

If all the legacy switches on the link are RSTP switches, they can process MSTP BPDUs as if they are RSTP BPDUs. Therefore, MSTP switches send either a Version 0 configuration and TCN BPDUs or Version 3 MSTP BPDUs on a boundary port. A boundary port connects to a LAN, the designated switch of which is either a single spanning-tree switch or a switch with a different MST configuration.

Understanding RSTP

The RSTP takes advantage of point-to-point wiring and provides rapid convergence of the spanning tree. Reconfiguration of the spanning tree can occur in less than 1 second (in contrast to 50 seconds with the default settings in the IEEE 802.1D spanning tree), which is critical for networks carrying delay-sensitive traffic such as voice and video.
These sections describe how the RSTP works:

- Port Roles and the Active Topology, page 16-9
- Rapid Convergence, page 16-10
- Synchronization of Port Roles, page 16-11
- Bridge Protocol Data Unit Format and Processing, page 16-12

For configuration information, see the “Configuring MSTP Features” section on page 16-14.

**Port Roles and the Active Topology**

The RSTP provides rapid convergence of the spanning tree by assigning port roles and by learning the active topology. The RSTP builds upon the IEEE 802.1D STP to select the switch with the highest switch priority (lowest numerical priority value) as the root switch as described in the “Spanning-Tree Topology and BPDUs” section on page 15-3. Then the RSTP assigns one of these port roles to individual ports.

- **Root port**—Provides the best path (lowest cost) when the switch forwards packets to the root switch.
- **Designated port**—Connects to the designated switch, which incurs the lowest path cost when forwarding packets from that LAN to the root switch. The port through which the designated switch is attached to the LAN is called the designated port.
- **Alternate port**—Offers an alternate path toward the root switch to that provided by the current root port.
- **Backup port**—Acts as a backup for the path provided by a designated port toward the leaves of the spanning tree. A backup port can exist only when two ports are connected together in a loopback by a point-to-point link or when a switch has two or more connections to a shared LAN segment.
- **Disabled port**—Has no role within the operation of the spanning tree.

A port with the root or a designated port role is included in the active topology. A port with the alternate or backup port role is excluded from the active topology.

In a stable topology with consistent port roles throughout the network, the RSTP ensures that every root port and designated port immediately transition to the forwarding state while all alternate and backup ports are always in the discarding state (equivalent to blocking in 802.1D). The port state controls the operation of the forwarding and learning processes. Table 16-2 provides a comparison of IEEE 802.1D and RSTP port states.

**Table 16-2 Port State Comparison**

<table>
<thead>
<tr>
<th>Operational Status</th>
<th>STP Port State (IEEE 802.1D)</th>
<th>RSTP Port State</th>
<th>Is Port Included in the Active Topology?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enabled</td>

<tr>
<td>Disabled</td>
<td>Disabled</td>
<td>Discarding</td>
<td>No</td>
</tr>
</tbody>
</table>
To be consistent with Cisco STP implementations, this guide documents the port state as *blocking* instead of *discarding*. Designated ports start in the listening state.

**Rapid Convergence**

The RSTP provides for rapid recovery of connectivity following the failure of a switch, a switch port, or a LAN. It provides rapid convergence for edge ports, new root ports, and ports connected through point-to-point links as follows:

- **Edge ports**—If you configure a port as an edge port on an RSTP switch by using the `spanning-tree portfast` interface configuration command, the edge port immediately transitions to the forwarding state. An edge port is the same as a Port Fast-enabled port, and you should enable it only on ports that connect to a single end station.

- **Root ports**—If the RSTP selects a new root port, it blocks the old root port and immediately transitions the new root port to the forwarding state.

- **Point-to-point links**—If you connect a port to another port through a point-to-point link and the local port becomes a designated port, it negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology.

**Note**

On the Cisco ME switch, these ports are always NNIs or STP-enabled ENIs.

As shown in [Figure 16-4](#), Switch A is connected to Switch B through a point-to-point link, and all of the ports are in the blocking state. Assume that the priority of Switch A is a smaller numerical value than the priority of Switch B. Switch A sends a proposal message (a configuration BPDU with the proposal flag set) to Switch B, proposing itself as the designated switch.

After receiving the proposal message, Switch B selects as its new root port the port from which the proposal message was received, forces all nonedge ports to the blocking state, and sends an agreement message (a BPDU with the agreement flag set) through its new root port.

After receiving Switch B’s agreement message, Switch A also immediately transitions its designated port to the forwarding state. No loops in the network are formed because Switch B blocked all of its nonedge ports and because there is a point-to-point link between Switches A and B.

When Switch C is connected to Switch B, a similar set of handshaking messages are exchanged. Switch C selects the port connected to Switch B as its root port, and both ends immediately transition to the forwarding state. With each iteration of this handshaking process, one more switch joins the active topology. As the network converges, this proposal-agreement handshaking progresses from the root toward the leaves of the spanning tree.

The switch learns the link type from the port duplex mode: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. You can override the default setting that is controlled by the duplex setting by using the `spanning-tree link-type` interface configuration command.
Synchronization of Port Roles

When the switch receives a proposal message on one of its ports and that port is selected as the new root port, the RSTP forces all other ports to synchronize with the new root information.

The switch is synchronized with superior root information received on the root port if all other ports are synchronized. An individual port on the switch is synchronized if

- That port is in the blocking state.
- It is an edge port (a port configured to be at the edge of the network).

If a designated STP port is in the forwarding state and is not configured as an edge port, it transitions to the blocking state when the RSTP forces it to synchronize with new root information. In general, when the RSTP forces a port to synchronize with root information and the port does not satisfy any of the above conditions, its port state is set to blocking.

After ensuring all of the ports are synchronized, the switch sends an agreement message to the designated switch corresponding to its root port. When the switches connected by a point-to-point link are in agreement about their port roles, the RSTP immediately transitions the port states to forwarding. The sequence of events is shown in Figure 16-5.
Bridge Protocol Data Unit Format and Processing

The RSTP BPDU format is the same as the IEEE 802.1D BPDU format except that the protocol version is set to 2. A new one-byte Version 1 Length field is set to zero, which means that no version 1 protocol information is present. Table 16-3 shows the RSTP flag fields.

</tbody>
</table>

The sending switch sets the proposal flag in the RSTP BPDU to propose itself as the designated switch on that LAN. The port role in the proposal message is always set to the designated port.

The sending switch sets the agreement flag in the RSTP BPDU to accept the previous proposal. The port role in the agreement message is always set to the root port.
The RSTP does not have a separate topology change notification (TCN) BPDU. It uses the topology change (TC) flag to show the topology changes. However, for interoperability with 802.1D switches, the RSTP switch processes and generates TCN BPDU.

The learning and forwarding flags are set according to the state of the sending port.

**Processing Superior BPDU Information**

If a port receives superior root information (lower bridge ID, lower path cost, and so forth) than currently stored for the port, the RSTP triggers a reconfiguration. If the port is proposed and is selected as the new root port, RSTP forces all the other ports to synchronize.

If the BPDU received is an RSTP BPDU with the proposal flag set, the switch sends an agreement message after all of the other ports are synchronized. If the BPDU is an 802.1D BPDU, the switch does not set the proposal flag and starts the forward-delay timer for the port. The new root port requires twice the forward-delay time to transition to the forwarding state.

If the superior information received on the port causes the port to become a backup or alternate port, RSTP sets the port to the blocking state but does not send the agreement message. The designated port continues sending BPDUs with the proposal flag set until the forward-delay timer expires, at which time the port transitions to the forwarding state.

**Processing Inferior BPDU Information**

If a designated port receives an inferior BPDU (higher bridge ID, higher path cost, and so forth than currently stored for the port) with a designated port role, it immediately replies with its own information.

**Topology Changes**

This section describes the differences between the RSTP and the IEEE 802.1D in handling spanning-tree topology changes.

- **Detection**—Unlike IEEE 802.1D in which *any* transition between the blocking and the forwarding state causes a topology change, *only* transitions from the blocking to the forwarding state cause a topology change with RSTP (only an increase in connectivity is considered a topology change). State changes on an edge port do not cause a topology change. When an RSTP switch detects a topology change, it flushes the learned information on all of its nonedge ports except on those from which it received the TC notification.

- **Notification**—Unlike IEEE 802.1D, which uses TCN BPDUs, the RSTP does not use them. However, for 802.1D interoperability, an RSTP switch processes and generates TCN BPDUs.

- **Acknowledgement**—When an RSTP switch receives a TCN message on a designated port from an IEEE 802.1D switch, it replies with an 802.1D configuration BPDU with the TCA bit set. However, if the TC-while timer (the same as the topology-change timer in 802.1D) is active on a root port connected to an 802.1D switch and a configuration BPDU with the TCA bit set is received, the TC-while timer is reset.

  This behavior is only required to support IEEE 802.1D switches. The RSTP BPDUs never have the TCA bit set.

- **Propagation**—When an RSTP switch receives a TC message from another switch through a designated or root port, it propagates the change to all of its nonedge, designated ports and to the root port (excluding the port on which it is received). The switch starts the TC-while timer for all such ports and flushes the information learned on them.
• Protocol migration—For backward compatibility with IEEE 802.1D switches, RSTP selectively sends IEEE 802.1D configuration BPDUs and TCN BPDUs on a per-port basis.

When a port is initialized, the migrate-delay timer is started (specifies the minimum time during which RSTP BPDUs are sent), and RSTP BPDUs are sent. While this timer is active, the switch processes all BPDUs received on that port and ignores the protocol type.

If the switch receives an IEEE 802.1D BPDU after the port’s migration-delay timer has expired, it assumes that it is connected to an IEEE 802.1D switch and starts using only IEEE 802.1D BPDUs. However, if the RSTP switch is using IEEE 802.1D BPDUs on a port and receives an RSTP BPDU after the timer has expired, it restarts the timer and starts using RSTP BPDUs on that port.

<td>10 Mbps: 100.</td>
</tr>
</tbody>
</table>
For information about the supported number of spanning-tree instances, see the “Supported Spanning-Tree Instances” section on page 15-10.

**MSTP Configuration Guidelines**

- On the Cisco ME switch, MSTP is supported only on NNIs or ENIs on which STP has been enabled. You enable STP on an ENI by entering the `spanning-tree` interface configuration command. UNIs do not participate in MSTP.
- When you enable MST by using the `spanning-tree mode mst` global configuration command, RSTP is automatically enabled.
- For two or more switches to be in the same MST region, they must have the same VLAN-to-instance map, the same configuration revision number, and the same name.
- The switch supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.
- PVST+, rapid PVST+, and MSTP are supported, but only one version can be active at any time. (For example, all VLANs run PVST+, all VLANs run rapid PVST+, or all VLANs run MSTP.) For more information, see the “Spanning-Tree Interoperability and Backward Compatibility” section on page 15-10. For information on the recommended trunk port configuration, see the “Interaction with Other Features” section on page 12-16.
- You can manually configure the MST configuration (region name, revision number, and VLAN-to-instance mapping) on each switch within the MST region by using the command-line interface (CLI) or through the SNMP support.
- For load balancing across redundant paths in the network to work, all VLAN-to-instance mapping assignments must match; otherwise, all traffic flows on a single link.
- All MST boundary ports must be forwarding for load balancing between a PVST+ and an MST cloud or between a rapid-PVST+ and an MST cloud. For this to occur, the IST master of the MST cloud should also be the root of the CST. If the MST cloud consists of multiple MST regions, one of the MST regions must contain the CST root, and all of the other MST regions must have a better path to the root contained within the MST cloud than a path through the PVST+ or rapid-PVST+ cloud. You might have to manually configure the switches in the clouds.
- Partitioning the network into a large number of regions is not recommended. However, if this situation is unavoidable, we recommend that you partition the switched LAN into smaller LANs interconnected by routers or non-Layer 2 devices.

### Table 16-4 Default MSTP Configuration (continued)

<td>20 hops.</td>
</tr>
</tbody>
</table>

For information about the supported number of spanning-tree instances, see the “Supported Spanning-Tree Instances” section on page 15-10.
Specifying the MST Region Configuration and Enabling MSTP

For two or more switches to be in the same MST region, they must have the same VLAN-to-instance mapping, the same configuration revision number, and the same name.

A region can have one member or multiple members with the same MST configuration; each member must be capable of processing RSTP BPDUs. There is no limit to the number of MST regions in a network, but each region can support up to 65 spanning-tree instances. You can assign a VLAN to only one spanning-tree instance at a time.

Beginning in privileged EXEC mode, follow these steps to specify the MST region configuration and enable MSTP. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>spanning-tree mst configuration</td>
</tr>
<tr>
<td></td>
<td>Enter MST configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>instance instance-id vlan vlan-range</td>
</tr>
<tr>
<td></td>
<td>Map VLANs to an MST instance.</td>
</tr>
<tr>
<td></td>
<td>- For instance-id, the range is 0 to 4094.</td>
</tr>
<tr>
<td></td>
<td>- For vlan vlan-range, the range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>When you map VLANs to an MST instance, the mapping is incremental, and the VLANs specified in the command are added to or removed from the VLANs that were previously mapped.</td>
</tr>
<tr>
<td></td>
<td>To specify a VLAN range, use a hyphen; for example, instance 1 vlan 1-63 maps VLANs 1 through 63 to MST instance 1.</td>
</tr>
<tr>
<td></td>
<td>To specify a VLAN series, use a comma; for example, instance 1 vlan 10, 20, 30 maps VLANs 10, 20, and 30 to MST instance 1.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>name name</td>
</tr>
<tr>
<td></td>
<td>Specify the configuration name. The name string has a maximum length of 32 characters and is case sensitive.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>revision version</td>
</tr>
<tr>
<td></td>
<td>Specify the configuration revision number. The range is 0 to 65535.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show pending</td>
</tr>
<tr>
<td></td>
<td>Verify your configuration by displaying the pending configuration.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>exit</td>
</tr>
<tr>
<td></td>
<td>Apply all changes, and return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>spanning-tree mode mst</td>
</tr>
<tr>
<td></td>
<td>Enable MSTP. RSTP is also enabled.</td>
</tr>
<tr>
<td><strong>Caution</strong></td>
<td>Changing spanning-tree modes can disrupt traffic because all spanning-tree instances are stopped for the previous mode and restarted in the new mode.</td>
</tr>
<tr>
<td></td>
<td>You cannot run both MSTP and rapid PVST+ or both MSTP and PVST+ at the same time.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To return to the default MST region configuration, use the `no spanning-tree mst configuration` global configuration command. To return to the default VLAN-to-instance map, use the `no instance instance-id [vlan vlan-range]` MST configuration command. To return to the default name, use the `no name` MST configuration command. To return to the default revision number, use the `no revision` MST configuration command. To re-enable rapid PVST+, use the `no spanning-tree mode` or the `spanning-tree mode pvst` global configuration command.

This example shows how to enter MST configuration mode, map VLANs 10 to 20 to MST instance 1, name the region `region1`, set the configuration revision to 1, display the pending configuration, apply the changes, and return to global configuration mode:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 10-20
Switch(config-mst)# name region1
Switch(config-mst)# revision 1
Switch(config-mst)# show pending
Pending MST configuration
Name [region1]  
Revision 1  
Instance Vlans Mapped
-------- ---------------------
0 1-9,21-4094
1 10-20

Switch(config-mst)# exit
Switch(config)#
```

### Configuring the Root Switch

The switch maintains a spanning-tree instance for the group of VLANs mapped to it. A bridge ID, consisting of the switch priority and the switch MAC address, is associated with each instance. For a group of VLANs, the switch with the lowest bridge ID becomes the root switch.

To configure a switch to become the root, use the `spanning-tree mst instance-id root` global configuration command to modify the switch priority from the default value (32768) to a significantly lower value so that the switch becomes the root switch for the specified spanning-tree instance. When you enter this command, the switch checks the switch priorities of the root switches. Because of the extended system ID support, the switch sets its own priority for the specified instance to 24576 if this value will cause this switch to become the root for the specified spanning-tree instance.

If any root switch for the specified instance has a switch priority lower than 24576, the switch sets its own priority to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value as shown in Table 15-1 on page 15-4.)

If your network consists of switches that both do and do not support the extended system ID, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches running older software.

The root switch for each spanning-tree instance should be a backbone or distribution switch. Do not configure an access switch as the spanning-tree primary root.

Use the `diameter` keyword, which is available only for MST instance 0, to specify the Layer 2 network diameter (that is, the maximum number of switch hops between any two end stations in the Layer 2 network). When you specify the network diameter, the switch automatically sets an optimal hello time,
forward-delay time, and maximum-age time for a network of that diameter, which can significantly reduce the convergence time. You can use the `hello` keyword to override the automatically calculated hello time.

**Note**

After configuring the switch as the root switch, we recommend that you avoid manually configuring the hello time, forward-delay time, and maximum-age time through the `spanning-tree mst hello-time`, `spanning-tree mst forward-time`, and the `spanning-tree mst max-age` global configuration commands.

Beginning in privileged EXEC mode, follow these steps to configure a switch as the root switch. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>spanning-tree mst instance-id root primary</code></td>
</tr>
<tr>
<td></td>
<td><code>[diameter net-diameter [hello-time seconds]]</code></td>
</tr>
<tr>
<td></td>
<td>Configure a switch as the root switch.</td>
</tr>
<tr>
<td></td>
<td>• For <code>instance-id</code>, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>diameter net-diameter</code>, specify the maximum number of switches between any two end stations. The range is 2 to 7. This keyword is available only for MST instance 0.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>hello-time seconds</code>, specify the interval in seconds between the generation of configuration messages by the root switch. The range is 1 to 10 seconds; the default is 2 seconds.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show spanning-tree mst instance-id</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no spanning-tree mst instance-id root` global configuration command.

### Configuring a Secondary Root Switch

When you configure a switch with the extended system ID support as the secondary root, the switch priority is modified from the default value (32768) to 28672. The switch is then likely to become the root switch for the specified instance if the primary root switch fails. This is assuming that the other network switches use the default switch priority of 32768 and therefore are unlikely to become the root switch.

You can execute this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello-time values that you used when you configured the primary root switch with the `spanning-tree mst instance-id root primary` global configuration command.
Beginning in privileged EXEC mode, follow these steps to configure a switch as the secondary root switch. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| **Step 2** | spanning-tree mst instance-id root secondary [diameter net-diameter [hello-time seconds]] | Configure a switch as the secondary root switch.  
- For instance-id, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.  
- (Optional) For diameter net-diameter, specify the maximum number of switches between any two end stations. The range is 2 to 7. This keyword is available only for MST instance 0.  
- (Optional) For hello-time seconds, specify the interval in seconds between the generation of configuration messages by the root switch. The range is 1 to 10 seconds; the default is 2 seconds. Use the same network diameter and hello-time values that you used when configuring the primary root switch. See the “Configuring the Root Switch” section on page 16-17. |
| **Step 3** | end | Return to privileged EXEC mode. |
| **Step 4** | show spanning-tree mst instance-id | Verify your entries. |
| **Step 5** | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To return the switch to its default setting, use the **no spanning-tree mst instance-id root** global configuration command.

### Configuring Port Priority

If a loop occurs, the MSTP uses the port priority when selecting an STP port to put into the forwarding state. You can assign higher priority values (lower numerical values) to STP ports that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.
Beginning in privileged EXEC mode, follow these steps to configure the MSTP port priority of an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify an interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Valid interfaces include physical NNIs or ENIs with spanning tree enabled, VLANs, and NNI or ENI port channels. The VLAN ID range is 1 to 4094. The port-channel range is 1 to 48.</td>
<td>Note: If a physical interface is a UNI, before attempting to configure MST port priority, you must enter the \texttt{port-type nni} interface configuration command or configure the port as an ENI and enable spanning tree on the port. See “Enabling Spanning Tree on an ENI” section on page 15-13. If the interface is a VLAN, only ports with spanning tree enabled in the VLAN will run spanning tree. If the interface is a port channel, all members of the port channel must be NNIs or ENIs with spanning tree enabled.</td>
</tr>
<tr>
<td>Step 3 spanning-tree mst instance-id port-priority priority</td>
<td>Configure the port priority.</td>
</tr>
<tr>
<td>For \texttt{instance-id}, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094. For \texttt{priority}, the range is 0 to 240 in increments of 16. The default is 128. The lower the number, the higher the priority. The priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected.</td>
<td></td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show spanning-tree mst interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>or show spanning-tree mst instance-id</td>
<td></td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Note: The \texttt{show spanning-tree mst interface interface-id} privileged EXEC command displays information only if the port is in a link-up operative state. Otherwise, you can use the \texttt{show running-config interface} privileged EXEC command to confirm the configuration.

To return the interface to its default setting, use the \texttt{no spanning-tree mst instance-id port-priority} interface configuration command.
## Configuring Path Cost

The MSTP path cost default value is derived from the media speed of an STP port. If a loop occurs, the MSTP uses cost when selecting an interface to put in the forwarding state. You can assign lower cost values to STP ports that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, the MSTP puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.

Beginning in privileged EXEC mode, follow these steps to configure the MSTP cost of an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface &lt;interface-id&gt;</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>spanning-tree mst &lt;instance-id&gt; cost &lt;cost&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show spanning-tree mst interface &lt;interface-id&gt;</td>
</tr>
<tr>
<td>or</td>
<td>show spanning-tree mst &lt;instance-id&gt;</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
The `show spanning-tree mst interface interface-id` privileged EXEC command displays information only for ports that are in a link-up operative state. Otherwise, you can use the `show running-config` privileged EXEC command to confirm the configuration.

To return the interface to its default setting, use the `no spanning-tree mst instance-id cost` interface configuration command.

### Configuring the Switch Priority

You can configure the switch priority and make it more likely that the switch will be chosen as the root switch.

Exercise care when using this command. For most situations, we recommend that you use the `spanning-tree mst instance-id root primary` and the `spanning-tree mst instance-id root secondary` global configuration commands to modify the switch priority.

Beginning in privileged EXEC mode, follow these steps to configure the switch priority. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2  | `spanning-tree mst instance-id priority priority` Configure the switch priority.  

  - For `instance-id`, you can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.  

  - For `priority`, the range is 0 to 61440 in increments of 4096; the default is 32768. The lower the number, the more likely the switch will be chosen as the root switch. Priority values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.  

| Step 3  | `end` Return to privileged EXEC mode. |
| Step 4  | `show spanning-tree mst instance-id` Verify your entries. |
| Step 5  | `copy running-config startup-config` (Optional) Save your entries in the configuration file. |

To return the switch to its default setting, use the `no spanning-tree mst instance-id priority` global configuration command.
Configuring the Hello Time

You can configure the interval between the generation of configuration messages by the root switch by changing the hello time.

**Note**

Exercise care when using this command. For most situations, we recommend that you use the `spanning-tree mst instance-id root primary` and the `spanning-tree mst instance-id root secondary` global configuration commands to modify the hello time.

Beginning in privileged EXEC mode, follow these steps to configure the hello time for all MST instances. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>spanning-tree mst hello-time seconds</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show spanning-tree mst</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no spanning-tree mst hello-time` global configuration command.

Configuring the Forwarding-Delay Time

Beginning in privileged EXEC mode, follow these steps to configure the forwarding-delay time for all MST instances. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>spanning-tree mst forward-time seconds</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show spanning-tree mst</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>
To return the switch to its default setting, use the `no spanning-tree mst forward-time` global configuration command.

### Configuring the Maximum-Aging Time

Beginning in privileged EXEC mode, follow these steps to configure the maximum-aging time for all MST instances. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>spanning-tree mst max-age seconds</code> Configure the maximum-aging time for all MST instances. The maximum-aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration. For <code>seconds</code>, the range is 6 to 40; the default is 20.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show spanning-tree mst</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no spanning-tree mst max-age` global configuration command.

### Configuring the Maximum-Hop Count

Beginning in privileged EXEC mode, follow these steps to configure the maximum-hop count for all MST instances. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>spanning-tree mst max-hops hop-count</code> Specify the number of hops in a region before the BPDU is discarded, and the information held for a port is aged. For <code>hop-count</code>, the range is 1 to 255; the default is 20.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show spanning-tree mst</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return the switch to its default setting, use the `no spanning-tree mst max-hops` global configuration command.
Specifying the Link Type to Ensure Rapid Transitions

If you connect an STP port to another STP port through a point-to-point link and the local port becomes a designated port, the RSTP negotiates a rapid transition with the other port by using the proposal-agreement handshake to ensure a loop-free topology as described in the “Rapid Convergence” section on page 16-10.

By default, the link type is controlled from the duplex mode of the interface: a full-duplex port is considered to have a point-to-point connection; a half-duplex port is considered to have a shared connection. If you have a half-duplex link physically connected point-to-point to a single port on a remote switch running MSTP, you can override the default setting of the link type and enable rapid transitions to the forwarding state.

Beginning in privileged EXEC mode, follow these steps to override the default link-type setting. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Note</td>
<td>If a physical interface is a UNI, before attempting to configure MST port priority, you must enter the port-type nni interface configuration command or configure the port as an ENI and enable spanning tree on the port. See “Enabling Spanning Tree on an ENI” section on page 15-13.</td>
</tr>
<tr>
<td>Step 3</td>
<td>spanning-tree link-type point-to-point</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show spanning-tree mst interface interface-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the port to its default setting, use the no spanning-tree link-type interface configuration command.

Designating the Neighbor Type

A topology could contain both prestandard and IEEE 802.1s standard compliant devices. By default, ports can automatically detect prestandard devices, but they can still receive both standard and prestandard BPDUs. When there is a mismatch between a device and its neighbor, only the CIST runs on the interface.
You can choose to set a port to send only prestandard BPDUs. The prestandard flag appears in all the show commands, even if the port is in STP compatibility mode.

Beginning in privileged EXEC mode, follow these steps to override the default link-type setting. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>spanning-tree mst pre-standard</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show spanning-tree mst interface interface-id</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the port to its default setting, use the no spanning-tree mst prestandard interface configuration command.

### Restarting the Protocol Migration Process

A switch running MSTP supports a built-in protocol migration mechanism that enables it to interoperate with legacy 802.1D switches. If this switch receives a legacy 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only 802.1D BPDUs on that port. An MSTP switch also can detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or an RST BPDU (Version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives 802.1D BPDUs because it cannot detect whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

To restart the protocol migration process (force the renegotiation with neighboring switches) on the switch, use the clear spanning-tree detected-protocols privileged EXEC command.

To restart the protocol migration process on a specific interface, use the clear spanning-tree detected-protocols interface interface-id privileged EXEC command.
Displaying the MST Configuration and Status

To display the spanning-tree status, use one or more of the privileged EXEC commands in Table 16-5:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree mst configuration</td>
<td>Displays the MST region configuration.</td>
</tr>
<tr>
<td>show spanning-tree mst configuration digest</td>
<td>Displays the MD5 digest included in the current MSTCI.</td>
</tr>
<tr>
<td>show spanning-tree mst instance-id</td>
<td>Displays MST information for the specified instance.</td>
</tr>
<tr>
<td>show spanning-tree mst interface interface-id</td>
<td>Displays MST information for the specified interface.</td>
</tr>
</tbody>
</table>

For information about other keywords for the `show spanning-tree` privileged EXEC command, see the command reference for this release.
Chapter 17

Configuring Optional Spanning-Tree Features

This chapter describes how to configure optional spanning-tree features on the Cisco ME 3400E Ethernet Access switch. You can configure all of these features when your switch is running per-VLAN spanning-tree plus (PVST+). You can configure only the noted features when your switch is running the Multiple Spanning Tree Protocol (MSTP) or the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol. On the Cisco ME switch, STP is enabled by default on network node interfaces (NNIs). It is disabled by default, but can be enabled, on enhanced network interfaces (ENIs). User network interfaces (UNIs) on the switch do not participate in STP. UNIs and ENIs on which STP is not enabled immediately forward traffic when they are brought up.

For information on configuring the PVST+ and rapid PVST+, see Chapter 15, “Configuring STP.” For information about the Multiple Spanning Tree Protocol (MSTP) and how to map multiple VLANs to the same spanning-tree instance, see Chapter 16, “Configuring MSTP.”

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding Optional Spanning-Tree Features, page 17-1
- Configuring Optional Spanning-Tree Features, page 17-5
- Displaying the Spanning-Tree Status, page 17-11

Understanding Optional Spanning-Tree Features

These sections contain this conceptual information:

- Understanding Port Fast, page 17-2
- Understanding BPDU Guard, page 17-3
- Understanding BPDU Filtering, page 17-3
- Understanding EtherChannel Guard, page 17-3
- Understanding Root Guard, page 17-4
- Understanding Loop Guard, page 17-5
Understanding Port Fast

Port Fast immediately brings an STP port configured as an access or trunk port to the forwarding state from a blocking state, bypassing the listening and learning states.

By default, STP is enabled on NNIs and disabled on ENIs. UNIs do not support STP. If a port is a UNI, you can configure it as an STP port by changing the port type to NNI or ENI and entering the `port-type {nni | eni}` interface configuration command. For ENIs, you then need to enter the `spanning-tree` interface configuration command to configure the port as an STP port.

You can use Port Fast on STP ports connected to a single workstation or server, as shown in Figure 17-1, to allow those devices to immediately connect to the network, rather than waiting for the spanning tree to converge.

STP ports connected to a single workstation or server should not receive bridge protocol data units (BPDUs). An STP port with Port Fast enabled goes through the normal cycle of spanning-tree status changes when the switch is restarted.

Because the purpose of Port Fast is to minimize the time interfaces must wait for spanning tree to converge, it is effective only when used on STP ports connected to end stations. If you enable Port Fast on an interface connecting to another switch, you risk creating a spanning-tree loop.

UNIs are typically customer-facing ports and do not participate in the spanning tree of the service provider. However, if you configure a customer-facing port as an ENI and enable spanning tree, the ENI could become the spanning tree root port unless you configure root guard on the port. See the “Understanding Root Guard” section on page 17-4. A customer-facing ENI with STP enabled participates in the same spanning tree as the service-provider facing NNI.

Exercise caution when enabling STP on a customer-facing ENI.

You can enable this feature by using the `spanning-tree portfast` interface configuration or the `spanning-tree portfast default` global configuration command.

Figure 17-1 Port Fast-Enabled Interfaces
Understanding BPDU Guard

The BPDU guard feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

At the global level, you enable BPDU guard on Port Fast-enabled STP ports by using the `spanning-tree portfast bpduguard default` global configuration command. Spanning tree shuts down STP ports that are in a Port Fast-operational state if any BPDU is received on those ports. In a valid configuration, Port Fast-enabled STP ports do not receive BPDU. Receiving a BPDU on a Port Fast-enabled port signals an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the interface in the error-disabled state.

At the interface level, you enable BPDU guard on any STP port by using the `spanning-tree bpduguard enable` interface configuration command without also enabling the Port Fast feature. When the STP port receives a BPDU, it is put in the error-disabled state.

The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

You can enable the BPDU guard feature for the entire switch or for an interface.

Understanding BPDU Filtering

The BPDU filtering feature can be globally enabled on the switch or can be enabled per interface, but the feature operates with some differences.

At the global level, you can enable BPDU filtering on Port Fast-enabled STP ports by using the `spanning-tree portfast bpdufilter default` global configuration command. This command prevents interfaces that are in a Port Fast-operational state from sending or receiving BPDU. The interfaces still send a few BPDU at link-up before the switch begins to filter outbound BPDU. You should globally enable BPDU filtering on a switch so that hosts connected to these ports do not receive BPDU. If a BPDU is received on a Port Fast-enabled STP port, the interface loses its Port Fast-operational status, and BPDU filtering is disabled.

At the interface level, you can enable BPDU filtering on any STP port by using the `spanning-tree bpdufilter enable` interface configuration command without also enabling the Port Fast feature. This command prevents the interface from sending or receiving BPDU.

**Caution**

Enabling BPDU filtering on an STP port is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature for the entire switch or for an STP port.

Understanding EtherChannel Guard

You can use EtherChannel guard to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the switch STP ports are configured in an EtherChannel, but the interfaces on the other device are not. A misconfiguration can also occur if the channel parameters are not the same at both ends of the EtherChannel. For EtherChannel configuration guidelines, see the “EtherChannel Configuration Guidelines” section on page 35-10.
Understanding Optional Spanning-Tree Features

If the switch detects a misconfiguration on the other device, EtherChannel guard places the switch STP ports in the error-disabled state, and displays an error message.

You can enable this feature by using the `spanning-tree etherchannel guard misconfig` global configuration command.

Understanding Root Guard

The Layer 2 network of a service provider (SP) can include many connections to switches that are not owned by the SP. In such a topology, the spanning tree can reconfigure itself and select a customer switch as the root switch, as shown in Figure 17-2. You can avoid this situation by enabling root guard on SP switch interfaces that connect to switches in your customer’s network. If spanning-tree calculations cause an interface in the customer network to be selected as the root port, root guard then places the interface in the root-inconsistent (blocked) state to prevent the customer's switch from becoming the root switch or being in the path to the root.

If a switch outside the SP network becomes the root switch, the interface is blocked (root-inconsistent state), and spanning tree selects a new root switch. The customer’s switch does not become the root switch and is not in the path to the root.

If the switch is operating in multiple spanning-tree (MST) mode, root guard forces the interface to be a designated port. If a boundary port is blocked in an internal spanning-tree (IST) instance because of root guard, the interface also is blocked in all MST instances. A boundary port is an interface that connects to a LAN, the designated switch of which is either an 802.1D switch or a switch with a different MST region configuration.

Root guard enabled on an interface applies to all the VLANs to which the interface belongs. VLANs can be grouped and mapped to an MST instance.

You can enable this feature by using the `spanning-tree guard root` interface configuration command.

⚠️ Caution

Misuse of the root-guard feature can cause a loss of connectivity.
Understanding Loop Guard

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is enabled on the entire switched network. Loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

You can enable this feature by using the `spanning-tree loopguard default` global configuration command.

When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send BPDUs on root or alternate ports.

When the switch is operating in MST mode, BPDUs are not sent on nonboundary ports only if the interface is blocked by loop guard in all MST instances. On a boundary port, loop guard blocks the interface in all MST instances.

Configuring Optional Spanning-Tree Features

- Default Optional Spanning-Tree Configuration, page 17-5
- Optional Spanning-Tree Configuration Guidelines, page 17-6
- Enabling Port Fast, page 17-6 (optional)
- Enabling BPDU Guard, page 17-7 (optional)
- Enabling BPDU Filtering, page 17-8 (optional)
- Enabling EtherChannel Guard, page 17-9 (optional)
- Enabling Root Guard, page 17-10 (optional)
- Enabling Loop Guard, page 17-10 (optional)

Default Optional Spanning-Tree Configuration

Table 17-1 shows the default optional spanning-tree configuration. Only NNIs or ENIs with STP enabled participate in STP on the switch. UNIs and ENIs that have not been configured for STP are always in the forwarding state.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port Fast, BPDU filtering, BPDU guard</td>
<td>Globally disabled (unless they are individually configured per STP port).</td>
</tr>
<tr>
<td>EtherChannel guard</td>
<td>Globally enabled.</td>
</tr>
<tr>
<td>Root guard</td>
<td>Disabled on all STP ports.</td>
</tr>
<tr>
<td>Loop guard</td>
<td>Disabled on all STP ports.</td>
</tr>
</tbody>
</table>
Optional Spanning-Tree Configuration Guidelines

You can configure PortFast, BPDU guard, BPDU filtering, EtherChannel guard, root guard, or loop guard if your switch is running PVST+, rapid PVST+, or MSTP.

Optional spanning-tree configuration commands are not supported on UNIs or on ENIs on which STP has not been enabled.

## Enabling Port Fast

An STP port with the Port Fast feature enabled is moved directly to the spanning-tree forwarding state without waiting for the standard forward-time delay.

⚠️ **Caution**

Use Port Fast *only* when connecting a single end station to an access or trunk port. Enabling this feature on an interface connected to a switch or hub could prevent spanning tree from detecting and disabling loops in your network, which could cause broadcast storms and address-learning problems.

You can enable this feature if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable Port Fast. This procedure is optional.

<table>
<thead>
<tr>

Chapter 17  Configuring Optional Spanning-Tree Features

Configuring Optional Spanning-Tree Features

Note
You can use the `spanning-tree portfast default` global configuration command to globally enable the Port Fast feature on all nontrunking STP ports.

To disable the Port Fast feature, use the `spanning-tree portfast disable` interface configuration command.

Enabling BPDU Guard

When you globally enable BPDU guard on ports that are Port Fast-enabled (the ports are in a Port Fast-operational state), spanning tree continues to run on the ports. They remain up unless they receive a BPDU.

In a valid configuration, Port Fast-enabled interfaces do not receive BPDUs. Receiving a BPDU on a Port Fast-enabled interface signals an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the interface in the error-disabled state. The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

Caution
Configure Port Fast only on STP ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

You also can use the `spanning-tree bpdu-guard enable` interface configuration command to enable BPDU guard on any STP port without also enabling the Port Fast feature. When the interface receives a BPDU, it is put in the error-disabled state.

You can enable the BPDU guard feature if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to globally enable the BPDU guard feature. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 spanning-tree portfast bpdu-guard default</td>
<td>Globally enable BPDU guard. (By default, BPDU guard is disabled.)</td>
</tr>
<tr>
<td></td>
<td>Note  Globally enabling BPDU guard enables it only on STP ports; the command has no effect on ports that are not running STP.</td>
</tr>
</tbody>
</table>
## Configuring Optional Spanning-Tree Features

### To disable BPDU guard

Use the `no spanning-tree portfast bpduguard default` global configuration command.

You can override the setting of the `no spanning-tree portfast bpduguard default` global configuration command by using the `spanning-tree bpduguard enable` interface configuration command on an STP port.

---

### Enabling BPDU Filtering

When you globally enable BPDU filtering on Port Fast-enabled STP ports, it prevents interfaces that are in a Port Fast-operational state from sending or receiving BPDUs. The interfaces still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to these interfaces do not receive BPDUs. If a BPDU is received on a Port Fast-enabled STP port, the interface loses its Port Fast-operational status, and BPDU filtering is disabled.

**Caution**

Configure Port Fast only on STP ports that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation.

You can also use the `spanning-tree bpduguard enable` interface configuration command to enable BPDU filtering on any STP port without also enabling the Port Fast feature. This command prevents the STP port from sending or receiving BPDUs.

**Caution**

Enabling BPDU filtering on an STP port is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can enable the BPDU filtering feature if your switch is running PVST+, rapid PVST+, or MSTP.

---

### Command Summary

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 3 | `interface interface-id`       | Specify the interface connected to an end station, and enter interface configuration mode. If the interface is a UNI, before you enable Port Fast, you must change the port type to NNI or ENI to enable STP:  
- Enter the `port-type nni` interface configuration command to change the port to an NNI with STP enabled by default.  
- Or enter the `port-type eni` and `spanning-tree` interface configuration commands to configure the port as an ENI STP port. |
| Step 4 | `spanning-tree portfast`       | Enable the Port Fast feature.                                           |
| Step 5 | `end`                          | Return to privileged EXEC mode.                                         |
| Step 6 | `show running-config`          | Verify your entries.                                                    |
| Step 7 | `copy running-config startup-config` | (Optional) Save your entries in the configuration file.               |

To disable BPDU guard, use the `no spanning-tree portfast bpduguard default` global configuration command.

You can override the setting of the `no spanning-tree portfast bpduguard default` global configuration command by using the `spanning-tree bpduguard enable` interface configuration command on an STP port.
Beginning in privileged EXEC mode, follow these steps to globally enable the BPDU filtering feature. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree portfast bpdufilter default</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>spanning-tree portfast</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable BPDU filtering, use the **no spanning-tree portfast bpdufilter default** global configuration command.

You can override the setting of the **no spanning-tree portfast bpdufilter default** global configuration command by using the **spanning-tree bpdufilter enable** interface configuration command on an STP port.

### Enabling EtherChannel Guard

You can enable EtherChannel guard to detect an EtherChannel misconfiguration if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable EtherChannel guard. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>spanning-tree etherchannel guard misconfig</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show spanning-tree summary</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To disable the EtherChannel guard feature, use the `no spanning-tree etherchannel guard misconfig` global configuration command.

You can use the `show interfaces status err-disabled` privileged EXEC command to show which switch STP ports are disabled because of an EtherChannel misconfiguration. On the remote device, you can enter the `show etherchannel summary` privileged EXEC command to verify the EtherChannel configuration.

After the configuration is corrected, enter the `shutdown` and `no shutdown` interface configuration commands on the port-channel interfaces that were misconfigured.

### Enabling Root Guard

Root guard enabled on an STP port applies to all the VLANs to which the port belongs.

**Note**

You cannot enable both root guard and loop guard at the same time.

You can enable this feature if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable root guard on an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specify an interface to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>If the interface is a UNI, before you enable root guard, you must change the port type to NNI or ENI to enable STP:</td>
</tr>
<tr>
<td></td>
<td>• Enter the <code>port-type nni</code> interface configuration command to change the port to an NNI with STP enabled by default.</td>
</tr>
<tr>
<td></td>
<td>• Or enter the <code>port-type eni</code> and <code>spanning-tree</code> interface configuration commands to configure the port as an ENI STP port.</td>
</tr>
<tr>
<td><strong>Step 3</strong> spanning-tree guard root</td>
<td>Enable root guard on the STP port.</td>
</tr>
<tr>
<td></td>
<td>By default, root guard is disabled on all interfaces.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable root guard, use the `no spanning-tree guard` interface configuration command.

### Enabling Loop Guard

You can use loop guard to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. This feature is most effective when it is configured on the entire switched network. Loop guard operates only on STP ports that are considered point-to-point by the spanning tree.
Note

You cannot enable both loop guard and root guard at the same time.

You can enable this feature if your switch is running PVST+, rapid PVST+, or MSTP.

Beginning in privileged EXEC mode, follow these steps to enable loop guard. This procedure is optional.

To globally disable loop guard, use the `no spanning-tree loopguard default` global configuration command. You can override the setting of the `no spanning-tree loopguard default` global configuration command by using the `spanning-tree guard loop` interface configuration command on an NNI.

### Displaying the Spanning-Tree Status

To display the spanning-tree status, use one or more of the privileged EXEC commands in Table 17-2:

<table>
<thead>
<tr>
<th>Table 17-2 Commands for Displaying the Spanning-Tree Status</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
</tr>
<tr>
<td><code>show spanning-tree active</code> or <code>show spanning-tree mst</code></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><code>spanning-tree loopguard default</code></td>
</tr>
<tr>
<td><code>end</code></td>
</tr>
<tr>
<td><code>show running-config</code></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code> (Optional)</td>
</tr>
</tbody>
</table>

To globally disable loop guard, use the `no spanning-tree loopguard default` global configuration command. You can override the setting of the `no spanning-tree loopguard default` global configuration command by using the `spanning-tree guard loop` interface configuration command on an NNI.

You can clear spanning-tree counters by using the `clear spanning-tree [interface interface-id]` privileged EXEC command.

For information about other keywords for the `show spanning-tree` privileged EXEC command, see the command reference for this release.
Displaying the Spanning-Tree Status
CHAPTER 18

Configuring Resilient Ethernet Protocol

This chapter describes how to use Resilient Ethernet Protocol (REP) on the Cisco ME 3400E Ethernet Access switch. REP is a Cisco proprietary protocol that provides an alternative to Spanning Tree Protocol (STP) to control network loops, handle link failures, and improve convergence time. REP controls a group of ports connected in a segment, ensures that the segment does not create any bridging loops, and responds to link failures within the segment. REP provides a basis for constructing more complex networks and supports VLAN load balancing.

This chapter includes these sections:

- Understanding REP, page 18-1
- Configuring REP, page 18-6
- Monitoring REP, page 18-13

Understanding REP

One REP segment is a chain of ports connected to each other and configured with a segment ID. Each segment consists of standard (non-edge) segment ports and two user-configured edge ports. A switch can have no more than two ports that belong to the same segment, and each segment port can have only one external neighbor. A segment can go through a shared medium, but on any link only two ports can belong to the same segment. REP is supported only on Layer 2 trunk interfaces.

Figure 18-1 shows an example of a segment consisting of six ports spread across four switches. Ports E1 and E2 are configured as edge ports. When all ports are operational (as in the segment on the left), a single port is blocked, shown by the diagonal line. When there is a failure in the network, as shown in the diagram on the right, the blocked port returns to the forwarding state to minimize network disruption.
The segment shown in Figure 18-1 is an open segment; there is no connectivity between the two edge ports. The REP segment cannot cause a bridging loop and it is safe to connect the segment edges to any network. All hosts connected to switches inside the segment have two possible connections to the rest of the network through the edge ports, but only one connection is accessible at any time. If a failure causes a host to be unable to access its usual gateway, REP unblocks all ports to ensure that connectivity is available through the other gateway.

The segment shown in Figure 18-2, with both edge ports located on the same switch, is a ring segment. In this configuration, there is connectivity between the edge ports through the segment. With this configuration, you can create a redundant connection between any two switches in the segment.

REP segments have these characteristics:

- If all ports in the segment are operational, one port (referred to as the alternate port) is in the blocked state for each VLAN. If VLAN load balancing is configured, two ports in the segment control the blocked state of VLANs.
- If one or more ports in a segment is not operational, causing a link failure, all ports forward traffic on all VLANs to ensure connectivity.
- In case of a link failure, the alternate ports are unblocked as quickly as possible. When the failed link comes back up, a logically blocked port per VLAN is selected with minimal disruption to the network.
You can construct almost any type of network based on REP segments. REP also supports VLAN load-balancing, controlled by the primary edge port but occurring at any port in the segment.

REP has these limitations:

- You must configure each segment port; an incorrect configuration can cause forwarding loops in the networks.
- REP can manage only a single failed port within the segment; multiple port failures within the REP segment cause loss of network connectivity.
- You should configure REP only in networks with redundancy. Configuring REP in a network without redundancy causes loss of connectivity.

**Link Integrity**

REP does not use an end-to-end polling mechanism between edge ports to verify link integrity. It implements local link failure detection. When enabled on an interface, the REP Link Status Layer (LSL) detects its REP-aware neighbor and establishes connectivity within the segment. All VLANs are blocked on an interface until it detects the neighbor. After the neighbor is identified, REP determines which neighbor port should become the alternate port and which ports should forward traffic.

Each port in a segment has a unique port ID. The port ID format is similar to that used by the spanning tree algorithm: a port number (unique on the bridge), associated to a MAC address (unique in the network). When a segment port is coming up, its LSL starts sending packets that include the segment ID and the port ID. The port is declared as operational after it performs a three-way handshake with a neighbor in the same segment.

A segment port does not become operational if:

- No neighbor has the same segment ID.
- More than one neighbor has the same segment ID.
- The neighbor does not acknowledge the local port as a peer.
Understanding REP

Each port creates an adjacency with its immediate neighbor. Once the neighbor adjacencies are created, the ports negotiate to determine one blocked port for the segment, the alternate port. All other ports become unblocked. By default, REP packets are sent to a BPDU class MAC address. The packets can also be sent to the Cisco multicast address, which at present is used only to send blocked port advertisement (BPA) messages when there is a failure in the segment. The packets are dropped by devices not running REP.

Fast Convergence

Because REP runs on a physical link basis and not a per-VLAN basis, only one hello message is required for all VLANs, reducing the load on the protocol. We recommend that you create VLANs consistently on all switches in a given segment and configure the same allowed VLANs on the REP trunk ports. To avoid the delay introduced by relaying messages in software, REP also allows some packets to be flooded to a regular multicast address. These messages operate at the hardware flood layer (HFL) and are flooded to the whole network, not just the REP segment. Switches that do not belong to the segment treat them as data traffic. You can control flooding of these messages by configuring a dedicated administrative VLAN for the whole domain.

The estimated convergence recovery time is less than 200 ms for the local segment.

VLAN Load Balancing

One edge port in the REP segment acts as the primary edge port; the other as the secondary edge port. It is the primary edge port that always participates in VLAN load balancing in the segment. REP VLAN balancing is achieved by blocking some VLANs at a configured alternate port and all other VLANs at the primary edge port. When you configure VLAN load balancing, you can specify the alternate port in one of three ways:

- By entering the port ID of the interface. To identify the port ID of a port in the segment, enter the `show interface rep detail` interface configuration command for the port.
- By entering the neighbor offset number of a port in the segment, which identifies the downstream neighbor port of an edge port. The neighbor offset number range is –256 to +256; a value of 0 is invalid. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers indicate the secondary edge port (offset number -1) and its downstream neighbors.

**Note**

You configure offset numbers on the primary edge port by identifying a port’s downstream position from the primary (or secondary) edge port. You would never enter an offset value of 1 because that is the offset number of the primary edge port itself.

Figure 18-3 shows neighbor offset numbers for a segment where E1 is the primary edge port and E2 is the secondary edge port. The red numbers inside the ring are numbers offset from the primary edge port; the black numbers outside of the ring show the offset numbers from the secondary edge port. Note that you can identify all ports (except the primary edge port) by either a positive offset number (downstream position from the primary edge port) or a negative offset number (downstream position from the secondary edge port). If E2 became the primary edge port, its offset number would then be 1 and E1 would be -1.

- By entering the `preferred` keyword to select the port that you previously configured as the preferred alternate port with the `rep segment segment-id preferred` interface configuration command.
When the REP segment is complete, all VLANs are blocked. When you configure VLAN load balancing, it is triggered in one of two ways:

- You can manually trigger VLAN load balancing at any time by entering the `rep preempt segment segment-id` privileged EXEC command on the switch that has the primary edge port.
- You can configure a preempt delay time by entering the `rep preempt delay seconds` interface configuration command. After a link failure and recovery, VLAN load balancing begins after the configured preemption time period elapses. Note that the delay timer restarts if another port fails before the time has elapsed.

**Note**
When VLAN load balancing is configured, it does not start working until triggered by either manual intervention or a link failure and recovery.

When VLAN load balancing is triggered, the primary edge port then sends out a message to alert all interfaces in the segment about the preemption. When the message is received by the secondary edge port, it is reflected into the network to notify the alternate port to block the set of VLANs specified in the message and to notify the primary edge port to block the remaining VLANs.

You can also configure a particular port in the segment to block all VLANs. VLAN load balancing is initiated only by the primary edge port and is not possible if the segment is not terminated by an edge port on each end. The primary edge port determines the local VLAN load balancing configuration.

To reconfigure load balancing, you reconfigure the primary edge port. When you change the load balancing configuration, the primary edge port again waits for the `rep preempt segment` command or for the configured preempt delay period after a port failure and recovery before executing the new configuration. If you change an edge port to a regular segment port, the existing VLAN load balancing status does not change. Configuring a new edge port might cause a new topology configuration.

### Spanning Tree Interaction

REP does not interact with STP or with the Flex Link feature, but can coexist with both of them. A port that belongs to a segment is removed from spanning tree control and STP BPDUs are not accepted or sent from segment ports. Therefore, STP cannot run on a segment.
To migrate from an STP ring configuration to REP segment configuration, begin by configuring a single port in the ring as part of the segment and continue by configuring contiguous ports to minimize the number of segments. Each segment always contains a blocked port, so multiple segments means multiple blocked ports and a potential loss of connectivity. When the segment has been configured in both directions up to the location of the edge ports, you then configure the edge ports.

**REP Ports**

Ports in REP segments take one of three roles or states: Failed, Open, or Alternate.

- A port configured as a regular segment port starts as a failed port.
- Once the neighbor adjacencies are determined, the port transitions to alternate port state, blocking all VLANs on the interface. Blocked port negotiations occur and when the segment settles, one blocked port remains in the alternate role and all other ports become open ports.
- When a failure occurs in a link, all ports move to the failed state. When the alternate port receives the failure notification, it changes to the open state, forwarding all VLANs.

A regular segment port converted to an edge port, or an edge port converted to a regular segment port, does not always result in a topology change. If you convert an edge port into a regular segment port, VLAN load balancing is not implemented unless it has been configured. For VLAN load balancing, you must configure two edge ports in the segment.

A segment port that is reconfigured as a spanning tree port restarts according the spanning tree configuration. By default, this is a designated blocking port. If PortFast is configured or if STP is disabled, the port goes into the forwarding state.

**Configuring REP**

A segment is a collection of ports connected one to the other in a chain and configured with a segment ID. To configure REP segments, you should configure the REP administrative VLAN (or use the default VLAN 1) and then add the ports to the segment using interface configuration mode. You should configure two edge ports in the segment, with one of them the primary edge port and the other by default the secondary edge port. A segment has only one primary edge port. If you configure two ports in a segment as the primary edge port, for example ports on different switches, the REP selects one of them to serve as the segment primary edge port. You can also optionally configure where to send segment topology change notices (STCNs) and VLAN load balancing.

This section includes this information:

- Default REP Configuration, page 18-7
- REP Configuration Guidelines, page 18-7
- Configuring the REP Administrative VLAN, page 18-8
- Configuring REP Interfaces, page 18-9
- Setting Manual Preemption for VLAN Load Balancing, page 18-12
- Configuring SNMP Traps for REP, page 18-13
Default REP Configuration

REP is disabled on all interfaces. When enabled, the interface is a regular segment port unless it is configured as an edge port.

When REP is enabled, the sending of segment topology change notices (STCNs) is disabled, all VLANs are blocked, and the administrative VLAN is VLAN 1.

When VLAN load balancing is enabled, the default is manual preemption with the delay timer disabled. If VLAN load balancing is not configured, the default after manual preemption is to block all VLANs at the primary edge port.

REP Configuration Guidelines

Follow these guidelines when configuring REP:

- We recommend that you begin by configuring one port and then configure the contiguous ports to minimize the number of segments and the number of blocked ports.

- If more than two ports in a segment fail when no external neighbors are configured, one port goes into a forwarding state for the data path to help maintain connectivity during configuration. In the show rep interface privileged EXEC command output, the Port Role for this port shows as Fail Logical Open; the Port Role for the other failed port shows as Fail No Ext Neighbor. When the external neighbors for the failed ports are configured, the ports go through the alternate port state transitions and eventually go to an open state or remain as the alternate port, based on the alternate port election mechanism.

- REP ports must be Layer 2 ISL trunk ports.

- Be careful when configuring REP through a Telnet connection. Because REP blocks all VLANs until another REP interface sends a message to unblock it, you might lose connectivity to the switch if you enable REP in a Telnet session that accesses the switch through the same interface.

- You cannot run REP and STP or REP and Flex Links on the same segment or interface.

- If you connect an STP network to the REP segment, be sure that the connection is at the segment edge. An STP connection that is not at the edge could cause a bridging loop because STP does not run on REP segments. All STP BPDUs are dropped at REP interfaces.

- You must configure all trunk ports in the segment with the same set of allowed VLANs, or a misconfiguration occurs.

- If REP is enabled on two ports on a switch, both ports must be either regular segment ports or edge ports. REP ports follow these rules:
  - If only one port on a switch is configured in a segment, the port should be an edge port.
  - If two ports on a switch belong to the same segment, both ports must be edge ports or both ports must be regular segment ports.
  - If two ports on a switch belong to the same segment and one is configured as an edge port and one as a regular segment port (a misconfiguration), the edge port is treated as a regular segment port.

- REP interfaces come up in a blocked state and remains in a blocked state until notified that it is safe to unblock. You need to be aware of this to avoid sudden connection losses.

- REP sends all LSL PDUs in untagged frames on the native VLAN. The BPA message sent to the Cisco multicast address is sent on the administration VLAN, which is VLAN 1 by default.
Configuring REP

- REP ports cannot be configured as one of these port types:
  - SPAN destination port
  - Private VLAN port
  - Tunnel port
  - Access port
- REP ports must be network node interfaces (NNI). User-network interfaces (UNIs) or enhanced network interfaces (ENIs) cannot be REP ports.
- REP is supported on EtherChannels, but not on an individual port that belongs to an EtherChannel.
- There is a maximum of 64 REP segments per switch.

Configuring the REP Administrative VLAN

To avoid the delay introduced by relaying messages in software for link-failure or VLAN-blocking notification during load balancing, REP floods packets at the hardware flood layer (HFL) to a regular multicast address. These messages are flooded to the whole network, not just the REP segment. You can control flooding of these messages by configuring an administrative VLAN for the whole domain.

Follow these guidelines when configuring the REP administrative VLAN:

- If you do not configure an administrative VLAN, the default is VLAN 1.
- There can be only one administrative VLAN on a switch and on a segment. However, this is not enforced by software.
- The administrative VLAN cannot be the RSPAN VLAN.

Beginning in privileged EXEC mode, follow these steps to configure the REP administrative VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>rep admin vlan <code>vlan-id</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show interface [interface-id] rep detail</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup config</td>
</tr>
</tbody>
</table>

This example shows how to configure the administrative VLAN as VLAN 100 and verify the configuration by entering the show interface rep detail command on one of the REP interfaces:

```
Switch# configure terminal
Switch (conf)# rep admin vlan 100
Switch (conf-if)# end
```
18-9

Configuring REP

For REP operation, you need to enable it on each segment interface and identify the segment ID. This step is required and must be done before other REP configuration. You must also configure a primary and secondary edge port on each segment. All other steps are optional.

Beginning in privileged EXEC mode, follow these steps to enable and configure REP on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2&lt;br&gt;interface interface-id</td>
<td>Specify the interface, and enter interface configuration mode. The interface can be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 48.</td>
</tr>
<tr>
<td>Step 3&lt;br&gt;port-type nni</td>
<td>Configure the port as a network node interface (NNI).</td>
</tr>
<tr>
<td>Step 4&lt;br&gt;switchport mode trunk</td>
<td>Configure the interface as a Layer 2 trunk port.</td>
</tr>
</tbody>
</table>

Switch# show interface gigabitethernet0/1 rep detail
GigabitEthernet0/1 REP enabled
Segment-id: 2 (Edge)
PortID: 00010019E7144680
Preferred flag: No
Operational Link Status: TWOWAY

### Configuring REP

**Step 5**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rep segment segment-id [edge [primary]] [preferred]</code></td>
<td>Enable REP on the interface, and identify a segment number. The segment ID range is from 1 to 1024. These optional keywords are available.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>You must configure two edge ports, including one primary edge port for each segment.</td>
</tr>
<tr>
<td>- Enter <code>edge</code> to configure the port as an edge port. Entering <code>edge</code> without the <code>primary</code> keyword configures the port as the secondary edge port. Each segment has only two edge ports.</td>
<td></td>
</tr>
<tr>
<td>- (Optional) On an edge port, enter <code>primary</code> to configure the port as the primary edge port, the port on which you can configure VLAN load balancing.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Although each segment can have only one primary edge port, if you configure edge ports on two different switches and enter the <code>primary</code> keyword on both switches, the configuration is allowed. However, REP selects only one of these ports as the segment primary edge port. You can identify the primary edge port for a segment by entering the <code>show rep topology</code> privileged EXEC command.</td>
</tr>
<tr>
<td>- (Optional) Enter <code>preferred</code> to indicate that the port is the preferred alternate port or the preferred port for VLAN load balancing.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Configuring a port as preferred does not guarantee that it becomes the alternate port; it merely gives it a slight edge among equal contenders. The alternate port is usually a previously failed port.</td>
</tr>
</tbody>
</table>

**Step 6**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`rep stcn {interface interface-id</td>
<td>segment id-list</td>
</tr>
<tr>
<td>- Enter <code>interface interface-id</code> to designate a physical interface or port channel to receive STCNs.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>segment id-list</code> to identify one or more segments to receive STCNs. The range is 1 to 1024.</td>
<td></td>
</tr>
<tr>
<td>- Enter <code>stp</code> to send STCNs to STP networks.</td>
<td></td>
</tr>
</tbody>
</table>
### Command Purpose

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7</td>
<td>rep block port {id port-id</td>
<td>neighbor_offset</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter the id port-id to identify the alternate port by port ID. The port ID is automatically generated for each port in the segment. You can view interface port IDs by entering the show interface interface-id rep [detail] privileged EXEC command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter a neighbor_offset number to identify the alternate port as a downstream neighbor from an edge port. The range is from –256 to 256, with negative numbers indicating the downstream neighbor from the secondary edge port. A value of 0 is invalid. Enter -1 to identify the secondary edge port as the alternate port. See Figure 18-3 on page 18-5 for an example of neighbor offset numbering.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter preferred to select the regular segment port previously identified as the preferred alternate port for VLAN load balancing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter vlan vlan-list to block one VLAN or a range of VLANs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter vlan all to block all VLANs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note Because you enter this command at the primary edge port (offset number 1), you would never enter an offset value of 1 to identify an alternate port.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter the id port-id to identify the alternate port by port ID. The port ID is automatically generated for each port in the segment. You can view interface port IDs by entering the show interface interface-id rep [detail] privileged EXEC command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter a neighbor_offset number to identify the alternate port as a downstream neighbor from an edge port. The range is from –256 to 256, with negative numbers indicating the downstream neighbor from the secondary edge port. A value of 0 is invalid. Enter -1 to identify the secondary edge port as the alternate port. See Figure 18-3 on page 18-5 for an example of neighbor offset numbering.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter preferred to select the regular segment port previously identified as the preferred alternate port for VLAN load balancing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter vlan vlan-list to block one VLAN or a range of VLANs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter vlan all to block all VLANs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note Enter this command only on the REP primary edge port.</td>
</tr>
<tr>
<td>Step 8</td>
<td>rep preempt delay seconds</td>
<td>(Optional) You must enter this command and configure a preempt time delay if you want VLAN load balancing to automatically trigger after a link failure and recovery. The time delay range is 15 to 300 seconds. The default is manual preemption with no time delay.</td>
</tr>
<tr>
<td>Step 9</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10</td>
<td>show interface [interface-id] rep [detail]</td>
<td>Verify the REP interface configuration.</td>
</tr>
<tr>
<td>Step 11</td>
<td>copy running-config startup config</td>
<td>(Optional) Save your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

Enter the no form of each command to return to the default configuration. Enter the show rep topology privileged EXEC command to see which port in the segment is the primary edge port.

This example shows how to configure an interface as the primary edge port for segment 1, to send STCNs to segments 2 through 5, and to configure the alternate port as the port with port ID 0009001818D68700 to block all VLANs after a preemption delay of 60 seconds after a segment port failure and recovery.

```
Switch# configure terminal
Switch (conf)# interface gigabitethernet0/1
Switch (conf-if)# rep segment 1 edge primary
Switch (conf-if)# rep stcn segment 2-5
Switch (conf-if)# rep block port 0009001818D68700 vlan all
Switch (conf-if)# rep preempt delay 60
Switch (conf-if)# end
```
This example shows how to configure the VLAN blocking configuration shown in Figure 18-4. The alternate port is the neighbor with neighbor offset number 4. After manual preemption, VLANs 100 to 200 are blocked at this port, and all other VLANs are blocked at the primary edge port E1 (Gigabit Ethernet port 0/1).

Switch# configure terminal  
Switch (conf)# interface gigabitethernet0/1  
Switch (conf-if)# rep segment 1 edge primary  
Switch (conf-if)# rep block port 4 vlan 100-200  
Switch (conf-if)# end

Figure 18-4 Example of VLAN Blocking

Setting Manual Preemption for VLAN Load Balancing

If you do not enter the `rep preempt delay seconds` interface configuration command on the primary edge port to configure a preemption time delay, the default is to manually trigger VLAN load balancing on the segment. Be sure that all other segment configuration has been completed before manually preempting VLAN load balancing. When you enter the `rep preempt segment segment-id` command, a confirmation message appears before the command is executed because preemption can cause network disruption.

Beginning in privileged EXEC mode, follow these steps on the switch that has the segment primary edge port to manually trigger VLAN load balancing on a segment:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Step 2</strong></td>
</tr>
<tr>
<td><code>rep preempt segment segment-id</code></td>
<td>Manually trigger VLAN load balancing on the segment.</td>
</tr>
<tr>
<td></td>
<td>You will need to confirm the command before it is executed.</td>
</tr>
<tr>
<td><code>show rep topology</code></td>
<td>View REP topology information.</td>
</tr>
</tbody>
</table>
Configuring SNMP Traps for REP

You can configure the switch to send REP-specific traps to notify the SNMP server of link operational status changes and port role changes. Beginning in privileged EXEC mode, follow these steps to configure REP traps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2  snmp mib rep trap-rate value</td>
<td>Enable the switch to send REP traps, and set the number of traps sent per second. The range is from 0 to 1000. The default is 0 (no limit imposed; a trap is sent at every occurrence).</td>
</tr>
<tr>
<td>Step 3  end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4  show running-config</td>
<td>Verify the REP trap configuration.</td>
</tr>
<tr>
<td>Step 5  copy running-config startup config</td>
<td>(Optional) Save your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

To remove the trap, enter the no snmp mib rep trap-rate global configuration command.

This example configures the switch to send REP traps at a rate of 10 per second:

```
Switch(config)# snmp mib rep trap-rate 10
```

Monitoring REP

Use the privileged EXEC commands in Table 18-1 to monitor REP.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface [interface-id] rep [detail]</td>
<td>Displays REP configuration and status for a specified interface or for all interfaces.</td>
</tr>
<tr>
<td>show rep topology [segment segment_id] [archive] [detail]</td>
<td>Displays REP topology information for a segment or for all segments, including the primary and secondary edge ports in the segment.</td>
</tr>
</tbody>
</table>
Configuring Flex Links and the MAC Address-Table Move Update Feature

This chapter describes how to configure Flex Links, a pair of interfaces on the Cisco ME 3400E switch that are used to provide a mutual backup. It also describes how to configure the MAC address-table move update feature, also referred to as the Flex Links bidirectional fast convergence feature.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

The chapter consists of these sections:

- Understanding Flex Links and the MAC Address-Table Move Update, page 19-1
- Configuring Flex Links and MAC Address-Table Move Update, page 19-7
- Monitoring Flex Links and the MAC Address-Table Move Update, page 19-14

Understanding Flex Links and the MAC Address-Table Move Update

- Flex Links, page 19-1
- VLAN Flex Link Load Balancing and Support, page 19-2
- Flex Link Multicast Fast Convergence, page 19-3
- MAC Address-Table Move Update, page 19-6

Flex Links

Flex Links are a pair of a Layer 2 interfaces (switchports or port channels), where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP), allowing users to turn off STP and still provide basic link redundancy. Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on the switch. If the switch is running STP, it is not necessary to configure Flex Links because STP already provides link-level redundancy or backup.
Chapter 19  Configuring Flex Links and the MAC Address-Table Move Update Feature

Understanding Flex Links and the MAC Address-Table Move Update

Note

STP is enabled by default on network node interfaces (NNIs). It is disabled on enhanced network interfaces (ENIs), but you can enable it. STP is not supported on user network interfaces (UNIs).

You configure Flex Links on one Layer 2 interface (the active link) by assigning another Layer 2 interface as the Flex Link or backup link. When one of the links is up and forwarding traffic, the other link is in standby mode, ready to begin forwarding traffic if the other link shuts down. At any given time, only one of the interfaces is in the linkup state and forwarding traffic. If the primary link shuts down, the standby link starts forwarding traffic. When the active link comes back up, it goes into standby mode and does not forward traffic. STP is disabled on Flex Link interfaces.

In Figure 19-1, ports 1 and 2 on switch A are connected to uplink switches B and C. Because they are configured as Flex Links, only one of the interfaces is forwarding traffic; the other is in standby mode. If port 1 is the active link, it begins forwarding traffic between port 1 and switch B; the link between port 2 (the backup link) and switch C is not forwarding traffic. If port 1 goes down, port 2 comes up and starts forwarding traffic to switch C. When port 1 comes back up, it goes into standby mode and does not forward traffic; port 2 continues forwarding traffic.

You can also choose to configure a preemption mechanism, specifying the preferred port for forwarding traffic. In Figure 19-1, for example, you can configure the Flex Link pair with preemption mode so that after port 1 comes back up in the scenario, if it has greater bandwidth than port 2, port 1 begins forwarding after 60 seconds; and port 2 becomes the standby. You do this by entering the interface configuration switchport backup interface preemption mode bandwidth and switchport backup interface preemption delay commands.

Figure 19-1  Flex Links Configuration Example

If a primary (forwarding) link goes down, a trap notifies the network management stations. If the standby link goes down, a trap notifies the users.

Flex Links are supported only on Layer 2 ports and port channels, not on VLANs or Layer 3 ports.

VLAN Flex Link Load Balancing and Support

VLAN Flex Link load-balancing allows users to configure a Flex Link pair so that both ports simultaneously forward the traffic for some mutually exclusive VLANs. For example, if Flex Link ports are configured for 1-100 VLANs, the traffic of the first 50 VLANs can be forwarded on one port and the rest on the other port. If one of the ports fail, the other active port forwards all the traffic. When the failed port comes back up, it resumes forwarding traffic in the preferred vlans. This way, apart from providing the redundancy, this Flex Link pair can be used for load balancing. Also, Flex Link VLAN load-balancing does not impose any restrictions on uplink switches.
Flex Link Multicast Fast Convergence

Flex Link Multicast Fast Convergence reduces the multicast traffic convergence time after a Flex Link failure. This is implemented by a combination of these solutions:

- Learning the Other Flex Link Port as the mrouter Port, page 19-3
- Generating IGMP Reports, page 19-3
- Leaking IGMP Reports, page 19-4

Learning the Other Flex Link Port as the mrouter Port

In a typical multicast network, there is a querier for each VLAN. A switch deployed at the edge of a network has one of its Flex Link ports receiving queries. Flex Link ports are also always forwarding at any given time.

A port that receives queries is added as an mrouter port on the switch. An mrouter port is part of all the multicast groups learned by the switch. After a changeover, queries are received by the other Flex Link port. The other Flex Link port is then learned as the mrouter port. After changeover, multicast traffic then flows through the other Flex Link port. To achieve faster convergence of traffic, both Flex Link ports are learned as mrouter ports whenever either Flex Link port is learned as the mrouter port. Both Flex Link ports are always part of multicast groups.

Though both Flex Link ports are part of the groups in normal operation mode, all traffic on the backup port is blocked. So the normal multicast data flow is not affected by the addition of the backup port as an mrouter port. When the changeover happens, the backup port is unblocked, allowing the traffic to flow. In this case, the upstream multicast data flows as soon as the backup port is unblocked.

Generating IGMP Reports

When the backup link comes up after the changeover, the upstream new distribution switch does not start forwarding multicast data, because the port on the upstream router, which is connected to the blocked Flex Link port, is not part of any multicast group. The reports for the multicast groups were not forwarded by the downstream switch because the backup link is blocked. The data does not flow on this port, until it learns the multicast groups, which occurs only after it receives reports.

The reports are sent by hosts when a general query is received, and a general query is sent within 60 seconds in normal scenarios. When the backup link starts forwarding, to achieve faster convergence of multicast data, the downstream switch immediately sends proxy reports for all the learned groups on this port without waiting for a general query.
Leaking IGMP Reports

To achieve multicast traffic convergence with minimal loss, a redundant data path must be set up before the Flex Link active link goes down. This can be achieved by leaking only IGMP report packets on the Flex Link backup link. These leaked IGMP report messages are processed by upstream distribution routers, so multicast data traffic gets forwarded to the backup interface. Because all incoming traffic on the backup interface is dropped at the ingress of the access switch, no duplicate multicast traffic is received by the host. When the Flex Link active link fails, the access switch starts accepting traffic from the backup link immediately. The only disadvantage of this scheme is that it consumes bandwidth on the link between the distribution switches and on the backup link between the distribution and access switches. This feature is disabled by default and can be configured by using the `switchport backup interface interface-id multicast fast-convergence` command.

When this feature has been enabled at changeover, the switch does not generate the proxy reports on the backup port, which became the forwarding port.

Configuration Examples

This configuration example shows learning the other Flex Link port as the mrouter port when Flex Link is configured on GigabitEthernet 0/11 and GigabitEthernet 0/12. The example shows the output for the `show interfaces switchport backup` command:

```
Switch# configure terminal
Switch(config)# interface gigabitEthernet0/11
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport backup interface Gi0/12
Switch(config-if)# exit
Switch(config)# interface GigabitEthernet0/12
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# end
Switch# show interfaces switchport backup detail
Switch Backup Interface Pairs:
Active Interface Backup Interface State
GigabitEthernet0/11 GigabitEthernet0/12 Active Up/Backup Standby
Preemption Mode : off
Multicast Fast Convergence : Off
Bandwidth : 100000 Kbit (Gi0/11), 100000 Kbit (Gi0/12)
Mac Address Move Update Vlan : auto
```

This output shows a querier for VLANs 1 and 401, with their queries reaching the switch through GigabitEthernet 0/11:

```
Switch# show ip igmp snooping querier
Vlan  IP Address  IGMP Version  Port
-------------------------------------
 1  1.1.1.1      v2            Gi0/11
401 41.41.41.1  v2            Gi0/11
```
Understanding Flex Links and the MAC Address-Table Move Update Feature

This is output for the `show ip igmp snooping mrouter` command for VLANs 1 and 401:

```
Switch# show ip igmp snooping mrouter
Vlan  ports
----  -----
1     Gi1/0/11(dynamic), Gi0/12(dynamic)
401   Gi1/0/11(dynamic), Gi0/12(dynamic)
```

Similarly, both Flex Link ports are part of learned groups. In this example, GigabitEthernet 0/10 is a receiver/host in VLAN 1, which is interested in two multicast groups:

```
Switch# show ip igmp snooping groups
Vlan  Group  Type  Version  Port List
-----  ------  -----  --------  -----------------------
1      228.1.5.1  igmp  v2      Gi0/11, Gi0/12, Gi0/10
1      228.1.5.2  igmp  v2      Gi0/11, Gi0/12, Gi0/10
```

When a host responds to the general query, the switch forwards this report on all the mrouter ports. In this example, when a host sends a report for the group 228.1.5.1, it is forwarded only on GigabitEthernet 0/11, because the backup port GigabitEthernet 0/12 is blocked. When the active link, GigabitEthernet 0/11, goes down, the backup port, GigabitEthernet 0/12, begins forwarding.

As soon as this port starts forwarding, the switch sends proxy reports for the groups 228.1.5.1 and 228.1.5.2 on behalf of the host. The upstream router learns the groups and starts forwarding multicast data. This is the default behavior of Flex Link. This behavior changes when the user configures fast convergence using the `switchport backup interface gigabitEthernet 0/12 multicast fast-convergence` command. This example shows turning on this feature:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitEthernet0/11
Switch(config-if)# switchport backup interface gigabitEthernet0/12 multicast fast-convergence
Switch(config-if)# exit
Switch# show interfaces switchport backup detail
Switch Backup Interface Pairs:
Active Interface Backup Interface State
-------------------------------
GigabitEthernet0/11 GigabitEthernet0/12 Active Up/Backup Standby
Preemption Mode : off
Multicast Fast Convergence : On
Bandwidth : 100000 Kbit (Gi0/11), 100000 Kbit (Gi0/12)
Mac Address Move Update Vlan : auto
```

This output shows a querier for VLAN 1 and 401 with their queries reaching the switch through GigabitEthernet 0/11:

```
Switch# show ip igmp snooping querier
Vlan  IP  Address  IGMP  Version  Port
-----  ---  --------  -------  -----
1      1.1.1.1  v2       Gi0/11
401    41.41.41.1 v2       Gi0/11
```

This is output for the `show ip igmp snooping mrouter` command for VLAN 1 and 401:

```
Switch# show ip igmp snooping mrouter
Vlan  ports
----  -----
1     Gi0/11(dynamic), Gi0/12(dynamic)
401   Gi0/11(dynamic), Gi0/12(dynamic)
```
Similarly, both the Flex Link ports are a part of the learned groups. In this example, GigabitEthernet 0/10 is a receiver/host in VLAN 1, which is interested in two multicast groups:

```
Switch# show ip igmp snooping groups
Vlan  Group      Type  Version  Port List
-------  -------  -------  --------  ------------
 1   228.1.5.1   igmp    v2     G10/11, G10/12, G10/10
 1   228.1.5.2   igmp    v2     G11/0/11, G10/12, G10/10
```

Whenever a host responds to the general query, the switch forwards this report on all the mrouter ports. When you turn on this feature through the command-line port, and when a report is forwarded by the switch on GigabitEthernet 0/11, it is also leaked to the backup port GigabitEthernet 0/12. The upstream router learns the groups and starts forwarding multicast data, which is dropped at the ingress because GigabitEthernet 0/12 is blocked. When the active link, GigabitEthernet 0/11, goes down, the backup port, Gigabitethernet 0/12, begins forwarding. You do not need to send any proxy reports as the multicast data is already being forwarded by the upstream router. By leaking reports to the backup port, a redundant multicast path has been set up, and the time taken for the multicast traffic convergence is very minimal.

**MAC Address-Table Move Update**

The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence when a primary (forwarding) link goes down and the standby link begins forwarding traffic.

In Figure 19-3, switch A is an access switch, and ports 1 and 2 on switch A are connected to uplink switches B and D through a Flex Link pair. Port 1 is forwarding traffic, and port 2 is in the backup state. Traffic from the PC to the server is forwarded from port 1 to port 3. The MAC address of the PC has been learned on port 3 of switch C. Traffic from the server to the PC is forwarded from port 3 to port 1.

If the MAC address-table move update feature is not configured and port 1 goes down, port 2 starts forwarding traffic. However, for a short time, switch C keeps forwarding traffic from the server to the PC through port 3, and the PC does not get the traffic because port 1 is down. If switch C removes the MAC address of the PC on port 3 and relearns it on port 4, traffic can then be forwarded from the server to the PC through port 2.

If the MAC address-table move update feature is configured and enabled on the switches in Figure 19-3 and port 1 goes down, port 2 starts forwarding traffic from the PC to the server. The switch sends a MAC address-table move update packet from port 2. Switch C gets this packet on port 4 and immediately learns the MAC address of the PC on port 4, which reduces the reconvergence time.

You can configure the access switch, switch A, to send MAC address-table move update messages. You can also configure the uplink switches B, C, and D to get and process the MAC address-table move update messages. When switch C gets a MAC address-table move update message from switch A, switch C learns the MAC address of the PC on port 4. Switch C updates the MAC address table, including the forwarding table entry for the PC.

Switch A does not need to wait for the MAC address-table update. The switch detects a failure on port 1 and immediately starts forwarding server traffic from port 2, the new forwarding port. This change occurs in 100 milliseconds (ms). The PC is directly connected to switch A, and the connection status does not change. Switch A does not need to update the PC entry in the MAC address table.
Configuring Flex Links and MAC Address-Table Move Update

These sections contain this configuration information:
- Default Configuration, page 19-7
- Configuration Guidelines, page 19-8
- Configuring Flex Links, page 19-9
- Configuring VLAN Load Balancing on Flex Links, page 19-11
- Configuring the MAC Address-Table Move Update Feature, page 19-12

Default Configuration

The Flex Links are not configured, and there are no backup interfaces defined.
The preemption mode is off.
The preemption delay is 35 seconds.
Flex Link VLAN load-balancing is not configured.
The MAC address-table move update feature is not configured on the switch.

**Configuration Guidelines**

Follow these guidelines to configure Flex Links:

- You can configure up to 16 backup links.
- You can configure only one Flex Link backup link for any active link, and it must be a different interface from the active interface.
- An interface can belong to only one Flex Link pair. An interface can be a backup link for only one active link. An active link cannot belong to another Flex Link pair.
- Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links, and you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.
- A backup link does not have to be the same type (Fast Ethernet, Gigabit Ethernet, or port channel) as the active link. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.
- STP is disabled on Flex Link ports. If STP is configured on the switch, Flex Links do not participate in STP in all VLANs in which STP is configured. With STP not running, be sure that there are no loops in the configured topology.

---

**Note**

STP is available only on NNIs or ENIs.

Follow these guidelines to configure VLAN load balancing on the Flex Links feature:

- For Flex Link VLAN load balancing, you must choose the preferred VLANs on the backup interface.
- You cannot configure a preemption mechanism and VLAN load balancing for the same Flex Links pair.

Follow these guidelines to configure MAC address-table move update feature:

- You can enable and configure this feature on the access switch to *send* the MAC address-table move updates.
- You can enable and configure this feature on the uplink switches to *get* the MAC address-table move updates.
Configuring Flex Links

Beginning in privileged EXEC mode, follow these steps to configure a pair of Flex Links:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport backup interface interface-id</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show interface [interface-id] switchport backup</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup config</td>
</tr>
</tbody>
</table>

This example shows how to configure an interface with a backup interface and to verify the configuration:

```
Switch# configure terminal
Switch(conf)# interface fastethernet0/1
Switch(conf-if)# no shutdown
Switch(conf-if)# switchport backup interface fastethernet0/2
Switch(conf-if)# end
Switch# show interface switchport backup
Switch Backup Interface Pairs:

<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>FastEthernet0/1</td>
<td>FastEthernet0/2</td>
<td>Active Up/Backup Standby</td>
</tr>
<tr>
<td>FastEthernet0/3</td>
<td>FastEthernet0/4</td>
<td>Active Up/Backup Standby</td>
</tr>
<tr>
<td>Port-channel1</td>
<td>GigabitEthernet0/1</td>
<td>Active Up/Backup Standby</td>
</tr>
</tbody>
</table>
```

Beginning in privileged EXEC mode, follow these steps to configure a preemption scheme for a pair of Flex Links:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
</tbody>
</table>
Chapter 19  Configuring Flex Links and the MAC Address-Table Move Update Feature

Configuring Flex Links and the MAC Address-Table Move Update

This example shows how to configure the preemption mode as forced for a backup interface pair and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config)# interface gigabitethernet0/2
Switch(config)# switchport backup interface gigabitethernet0/2 preemption mode forced
Switch(config)# switchport backup interface gigabitethernet0/2 preemption delay 50
Switch(config)# end

Switch# show interface switchport backup detail
Active Interface Backup Interface State
-----------------------------------------------
GigabitEthernet0/1 GigabitEthernet0/2 Active Up/Backup Standby
Interface Pair: G10/1, G10/2
Preemption Mode: forced
Preemption Delay: 50 seconds
Bandwidth: 100000 Kbit (G10/1), 100000 Kbit (G10/2)
Mac Address Move Update Vlan: auto
```

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
</tr>
<tr>
<td>switchport backup interface interface-id</td>
</tr>
<tr>
<td>Purpose</td>
</tr>
<tr>
<td>Configure a physical Layer 2 interface (or port channel) as part of a Flex Link pair with the interface. When one link is forwarding traffic, the other interface is in standby mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
</tr>
<tr>
<td>switchport backup interface interface-id preemption mode {forced</td>
</tr>
<tr>
<td>Purpose</td>
</tr>
<tr>
<td>Configure a preemption mechanism and delay for a Flex Link interface pair. You can configure the preemption as:</td>
</tr>
<tr>
<td>• forced—the active interface always preempts the backup.</td>
</tr>
<tr>
<td>• bandwidth—the interface with the higher bandwidth always acts as the active interface.</td>
</tr>
<tr>
<td>• off—no preemption happens from active to backup.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 6</td>
</tr>
<tr>
<td>switchport backup interface interface-id preemption delay delay-time</td>
</tr>
<tr>
<td>Purpose</td>
</tr>
<tr>
<td>Configure the time delay until a port preempts another port.</td>
</tr>
<tr>
<td>Note Setting a delay time only works with forced and bandwidth modes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7</td>
</tr>
<tr>
<td>end</td>
</tr>
<tr>
<td>Purpose</td>
</tr>
<tr>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 8</td>
</tr>
<tr>
<td>show interface [interface-id] switchport backup</td>
</tr>
<tr>
<td>Purpose</td>
</tr>
<tr>
<td>Verify the configuration.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 9</td>
</tr>
<tr>
<td>copy running-config startup config</td>
</tr>
<tr>
<td>Purpose</td>
</tr>
<tr>
<td>(Optional) Save your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>
Configuring VLAN Load Balancing on Flex Links

Beginning in privileged EXEC mode, follow these steps to configure VLAN load balancing on Flex Links:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport backup interface interface-id prefer vlan vlan-range</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show interfaces [interface-id] switchport backup</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup config</td>
</tr>
</tbody>
</table>

In the following example, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

```
Switch(config)# interface gigabitEthernet 0/6
Switch(config-if)# switchport backup interface gigabitEthernet 0/8 prefer vlan 60,100-120
```

When both interfaces are up, gigabitethernet port 0/8 forwards traffic for VLANs 60 and 100 to 120 and gigabitethernet port 0/6 forwards traffic for VLANs 1 to 50.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface     Backup Interface     State
---------------------------------------------------------------
GigabitEthernet0/6   GigabitEthernet0/8   Active Up/Backup Standby

Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Link interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Link pair. In this example, if interface gigabitethernet port 0/6 goes down, gigabitethernet port 0/8 carries all VLANs of the Flex Link pair.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface     Backup Interface     State
---------------------------------------------------------------
GigabitEthernet0/6   GigabitEthernet0/8   Active Down/Backup Up

Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```
When a Flex Link interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface 0/6 comes up, VLANs preferred on this interface are blocked on the peer interface 0/8 and forwarded on 0/6.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface        Backup Interface        State
------------------------------------------------------------------------
GigabitEthernet0/6    GigabitEthernet0/8    Active Up/Backup Standby
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

```
Switch# show interfaces switchport backup detail
Switch Backup Interface Pairs:
Active Interface        Backup Interface        State
------------------------------------------------------------------------
FastEthernet 0/3       FastEthernet 0/4       Active Down/Backup Up
Vlans Preferred on Active Interface: 1-2, 5-4094
Vlans Preferred on Backup Interface: 3-4
Preemption Mode : off
Bandwidth : 10000 Kbit (Fa 0/3), 100000 Kbit (Fa0/4)
Mac Address Move Update Vlan : auto
```

## Configuring the MAC Address-Table Move Update Feature

This section contains this information:
- Configuring a switch to send MAC address-table move updates
- Configuring a switch to get MAC address-table move updates

Beginning in privileged EXEC mode, follow these steps to configure an access switch to send MAC address-table move updates:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no shutdown</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport backup interface interface-id</td>
</tr>
<tr>
<td>or</td>
<td>switchport backup interface interface-id mmu primary vlan vlan-id</td>
</tr>
</tbody>
</table>

**Command Purpose**

- **Step 1**: Enter global configuration mode.
- **Step 2**: Specify the interface, and enter interface configuration mode. The interface can be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 48.
- **Step 3**: Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.
- **Step 4**: Configure a physical Layer 2 interface (or port channel), as part of a Flex Link pair with the interface. The MAC address-table move update VLAN is the lowest VLAN ID on the interface.

When one link is forwarding traffic, the other interface is in standby mode.
### Configuring Flex Links and MAC Address-Table Move Update Feature

**To disable the MAC address-table move update feature,** use the `no mac address-table move update transmit` interface configuration command. To display the MAC address-table move update information, use the `show mac address-table move update` privileged EXEC command.

This example shows how to configure an access switch to send MAC address-table move update messages:

```
Switch# configure terminal
Switch(conf)# interface gigabitethernet0/1
Switch(conf-if)# switchport backup interface gigabitethernet0/2 mmu primary vlan 2
Switch(conf-if)# exit
Switch(conf)# mac address-table move update transmit
Switch(conf)# end
```

This example shows how to verify the configuration:

```
Switch# show mac-address-table move update
Switch-ID : 010b.4630.1780
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 1023/8320
Default/Current settings: Rcv Off/On, Xmt Off/On
Max packets per min : Rcv 40, Xmt 60
Rcv packet count : 5
Rcv conforming packet count : 5
Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last src-mac-address : 000b.462d.c502
Rcv last switch-ID : 0403.fd6a.8700
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : None
```

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong> mac address-table move update</td>
<td>Enable the access switch to send MAC address-table move updates to other switches in the network if the primary link goes down and the switch starts forwarding traffic through the standby link.</td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> show mac address-table move update</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 9</strong> copy running-config startup config</td>
<td>(Optional) Save your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>
Beginning in privileged EXEC mode, follow these steps to configure a switch to get and process MAC address-table move update messages:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>mac address-table move update receive</td>
<td>Enable the switch to get and process the MAC address-table move updates.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show mac address-table move update</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>copy running-config startup config</td>
<td>(Optional) Save your entries in the switch startup configuration file.</td>
</tr>
</tbody>
</table>

To disable the MAC address-table move update feature, use the **no mac address-table move update receive** configuration command. To display the MAC address-table move update information, use the **show mac address-table move update** privileged EXEC command.

This example shows how to configure a switch to get and process MAC address-table move update messages:

```
Switch# configure terminal
Switch(config)# mac address-table move update receive
Switch(config)# end
```

### Monitoring Flex Links and the MAC Address-Table Move Update

**Table 19-1** shows the privileged EXEC command for monitoring Flex Link configuration.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface [interface-id] switchport backup</td>
<td>Displays the Flex Link backup interface configured for an interface, or displays all Flex Links configured on the switch and the state of each active and backup interface (up or standby mode).</td>
</tr>
<tr>
<td>show mac address-table move update</td>
<td>Displays the MAC address-table move update information on the switch.</td>
</tr>
</tbody>
</table>
Configuring DHCP Features and IP Source Guard

This chapter describes how to configure DHCP snooping and option-82 data insertion, and the DHCP server port-based address allocation features on the Cisco ME 3400E Ethernet Access switch. It also describes how to configure the IP source guard feature.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release, and see the “DHCP Commands” section in the Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.2.

This chapter consists of these sections:
- Understanding DHCP Features, page 20-1
- Configuring DHCP Features, page 20-7
- Displaying DHCP Snooping Information, page 20-15
- Understanding IP Source Guard, page 20-15
- Configuring IP Source Guard, page 20-16
- Displaying IP Source Guard Information, page 20-19

**Understanding DHCP Features**

DHCP is widely used in LAN environments to dynamically assign host IP addresses from a centralized server, which significantly reduces the overhead of administration of IP addresses. DHCP also helps conserve the limited IP address space because IP addresses no longer need to be permanently assigned to hosts; only those hosts that are connected to the network consume IP addresses.

These sections contain this information:
- DHCP Server, page 20-2
- DHCP Relay Agent, page 20-2
- DHCP Snooping, page 20-2
- Option-82 Data Insertion, page 20-3
- Cisco IOS DHCP Server Database, page 20-6
- DHCP Snooping Binding Database, page 20-6

For information about the DHCP client, see the “Configuring DHCP” section of the “IP Addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.2.
Understanding DHCP Features

**DHCP Server**

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it can forward the request to one or more secondary DHCP servers defined by the network administrator.

**DHCP Relay Agent**

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on egress interfaces.

**DHCP Snooping**

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table. For more information about this database, see the “Displaying DHCP Snooping Information” section on page 20-15.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

---

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

An untrusted DHCP message is a message that is received from outside the network or firewall. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer’s switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

In a service-provider network, a trusted interface is connected to a port on a device in the same network. An untrusted interface is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:
- A packet from a DHCP server, such as a DHCPOFFER, DHCPACK, DHCPNAK, or DHCPLEASEQUERY packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCPRELEASE or DHCPDECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.

When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the `ip dhcp snooping information option allowed-trust` global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard can still be enabled on the aggregation switch while the switch receives packets with option-82 information on ingress untrusted interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

### Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

> **Note**

The DHCP option-82 feature is supported only when DHCP snooping is globally enabled and on the VLANs to which subscriber devices using this feature are assigned.

Figure 20-1 is an example of a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Cisco ME switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.
Understanding DHCP Features

When you enable the DHCP snooping information option 82 on the switch, this sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, `vlan-mod-port`, from which the packet is received. You can also configure the remote ID and circuit ID. For information on configuring these suboptions, see the "Enabling DHCP Snooping and Option 82" section on page 20-11.
- If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the option-82 field to the DHCP server.
- The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.
- The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields in Figure 20-2 do not change:

- Circuit ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Circuit ID type
  - Length of the circuit ID type
- Remote ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Remote ID type
  - Length of the circuit ID type
In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100 ports and small form-factor pluggable (SFP) module slots, port 3 is the Fast Ethernet 0/1 port, port 4 is the Fast Ethernet 0/2 port, and so forth. Port 27 is the SFP module slot 0/1, and so forth.

**Figure 20-2** shows the packet formats for the remote ID suboption and the circuit ID suboption when the default suboption configuration is used. The switch uses the packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option` global configuration command is entered.

**Figure 20-2  ** **Suboption Packet Formats**

**Figure 20-3** shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- Circuit-ID suboption fields
  - The circuit-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.
- Remote-ID suboption fields
  - The remote-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.
Figure 20-3  User-Configured Suboption Packet Formats

Circuit ID Suboption Frame Format (for user-configured string):

Remote ID Suboption Frame Format (for user-configured string):

Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.2.

DHCP Snooping Binding Database

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 8192 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum value that accounts for all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch keeps the file current by updating it when the database changes.
When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

This is the format of the file that has the bindings:

```
<?initial-checksum>  
TYPE DHCP-SNOOPING  
VERSION 1  
BEGIN  
<entry-1> <checksum-1>  
<entry-2> <checksum-1-2>  
...  
<entry-n> <checksum-1-2--n>  
END  
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The `initial-checksum` entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1  
TYPE DHCP-SNOOPING  
VERSION 1  
BEGIN  
192.1.168.1 3 0003.47d8.c91f 2BB6488E Fa1/0/4 21ae5fbb  
192.1.168.3 3 0003.44d6.c52f 2BB648EB Fa1/0/4 1bdb223f  
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Fa1/0/4 584a38f0  
END  
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:

- The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.
- An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).
- The interface in the entry no longer exists on the system.
- The interface is a routed interface or a DHCP snooping-trusted interface.

</tr>
<tr>
<td>DHCP snooping binding database agent</td>
<td>Enabled in Cisco IOS software, requires configuration. This feature is operational only when a destination is configured.</td>
</tr>
</tbody>
</table>

1. The switch responds to DHCP requests only if it is configured as a DHCP server.
2. The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.
3. Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.

DHCP Snooping Configuration Guidelines

• You must globally enable DHCP snooping on the switch.
• DHCP snooping is not active until DHCP snooping is enabled on a VLAN.
• Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.
When you globally enable DHCP snooping on the switch, these Cisco IOS commands are not available until snooping is disabled. If you enter these commands, the switch returns an error message, and the configuration is not applied.

- `ip dhcp relay information check` global configuration command
- `ip dhcp relay information policy` global configuration command
- `ip dhcp relay information trust-all` global configuration command
- `ip dhcp relay information trusted` interface configuration command

Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. For example, you must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.

When configuring a large number of circuit IDs on a switch, consider the impact of lengthy character strings on the NVRAM or the flash memory. If the circuit-ID configurations, combined with other data, exceed the capacity of the NVRAM or the flash memory, an error message appears.

Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. For example, you must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.

If the DHCP relay agent is enabled but DHCP snooping is disabled, the DHCP option-82 data insertion feature is not supported.

If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust` interface configuration command.

If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.

Follow these guidelines when configuring the DHCP snooping binding database:

- Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.
- For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.
- To ensure that the lease time in the database is accurate, we recommend that NTP is enabled and configured. For more information, see the “Configuring NTP” section on page 5-4.
- If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

Do not enter the `ip dhcp snooping information option allowed-untrusted` command on an aggregation switch to which an untrusted device is connected. If you enter this command, an untrusted device might spoof the option-82 information.

You can display DHCP snooping statistics by entering the `show ip dhcp snooping statistics` user EXEC command, and you can clear the snooping statistics counters by entering the `clear ip dhcp snooping statistics` privileged EXEC command.

**Note**

Do not enable Dynamic Host Configuration Protocol (DHCP) snooping on RSPAN VLANs. If DHCP snooping is enabled on RSPAN VLANs, DHCP packets might not reach the RSPAN destination port.
Configuring the DHCP Server

The switch can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch but are not configured. These features are not operational.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.2.

Configuring the DHCP Relay Agent

Beginning in privileged EXEC mode, follow these steps to enable the DHCP relay agent on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>service dhcp</td>
<td>Enable the DHCP relay agent on your switch. By default, this feature is enabled.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the DHCP relay agent, use the no service dhcp global configuration command.

See the “Configuring DHCP” section of the “IP Addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.2 for these procedures:

- Checking (validating) the relay agent information
- Configuring the relay agent forwarding policy

Specifying the Packet Forwarding Address

If the DHCP server and the DHCP clients are on different networks or subnets and the switch is running the metro IP access image, you must configure the switch with the ip helper-address address interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the ip helper-address command can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface vlan vlan-id</td>
<td>Create a switch virtual interface by entering a VLAN ID, and enter interface configuration mode.</td>
</tr>
<tr>
<td>ip address ip-address subnet-mask</td>
<td>Configure the interface with an IP address and an IP subnet.</td>
</tr>
</tbody>
</table>
To remove the DHCP packet forwarding address, use the `no ip helper-address address` interface configuration command.

### Enabling DHCP Snooping and Option 82

Beginning in privileged EXEC mode, follow these steps to enable DHCP snooping on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip dhcp snooping</td>
<td>Enable DHCP snooping globally.</td>
</tr>
</tbody>
</table>
### Configuring DHCP Features

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td><code>ip dhcp snooping vlan vlan-range</code> Enable DHCP snooping on a VLAN or range of VLANs. The range is 1 to 4094. You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>ip dhcp snooping information option</code> Enable the switch to insert and remove DHCP relay information (option-82 field) in forwarded DHCP request messages to the DHCP server. This is the default setting.</td>
</tr>
<tr>
<td>Step 5</td>
<td>`ip dhcp snooping information option format remote-id [string ASCII-string</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>ip dhcp snooping information option allowed-untrusted</code> (Optional) If the switch is an aggregation switch connected to an edge switch, enable the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch. The default is disabled. Note You must enter this command only on aggregation switches that are connected to trusted devices.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>interface interface-id</code> Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 8</td>
<td><code>no shutdown</code> Enable the port, if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 9</td>
<td><code>ip dhcp snooping vlan vlan information option format-type circuit-id string ASCII-string</code> (Optional) Configure the circuit-ID suboption for the specified interface. Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces). The default circuit ID is the port identifier, in the format <code>vlan-mod-port</code>.</td>
</tr>
<tr>
<td>Step 10</td>
<td><code>ip dhcp snooping trust</code> (Optional) Configure the interface as trusted or untrusted. You can use the <code>no</code> keyword to configure an interface to receive messages from an untrusted client. The default is untrusted.</td>
</tr>
<tr>
<td>Step 11</td>
<td><code>ip dhcp snooping limit rate rate</code> (Optional) Configure the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured. Note We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN on which DHCP snooping is enabled.</td>
</tr>
</tbody>
</table>
To disable DHCP snooping, use the `no ip dhcp snooping` global configuration command. To disable DHCP snooping on a VLAN or range of VLANs, use the `no ip dhcp snooping vlan vlan-range` global configuration command. To disable the insertion and removal of the option-82 field, use the `no ip dhcp snooping information option` global configuration command. To configure an aggregation switch to drop incoming DHCP snooping packets with option-82 information from an edge switch, use the `no ip dhcp snooping information option allowed-untrusted` global configuration command.

This example shows how to enable DHCP snooping globally and on VLAN 10 and to configure a rate limit of 100 packets per second on a port:

```
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10
Switch(config)# ip dhcp snooping information option
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip dhcp snooping limit rate 100
```

### Enabling DHCP Snooping on Private VLANs

You can enable DHCP snooping on private VLANs. If DHCP snooping is enabled, the configuration is propagated to both a primary VLAN and its associated secondary VLANs. If DHCP snooping is enabled on the primary VLAN, it is also configured on the secondary VLANs.

If DHCP snooping is already configured on the primary VLAN and you configure DHCP snooping with different settings on a secondary VLAN, the configuration for the secondary VLAN does not take effect. You must configure DHCP snooping on the primary VLAN. If DHCP snooping is not configured on the primary VLAN, this message appears when you are configuring DHCP snooping on the secondary VLAN, such as VLAN 200:

```
2w5d:%DHCP_SNOOPING-4-DHCP_SNOOPING_PVLAN_WARNING:DHCP Snooping configuration may not take effect on secondary vlan 200. DHCP Snooping configuration on secondary vlan is derived from its primary vlan.
```

The `show ip dhcp snooping` privileged EXEC command output shows all VLANs, including primary and secondary private VLANs, on which DHCP snooping is enabled.

### Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the *Cisco IOS IP Configuration Guide, Release 12.2*. 

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 12 exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 13 ip dhcp snooping verify mac-address</td>
<td>(Optional) Configure the switch to verify that the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet. The default is to verify that the source MAC address matches the client hardware address in the packet.</td>
</tr>
<tr>
<td>Step 14 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 15 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 16 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Enabling the DHCP Snooping Binding Database Agent

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2  | ip dhcp snooping database Specify the URL for the database agent or the binding file by using one of these forms:  
|         |   - flash://filename  
|         |   - ftp://user:password@host/filename  
|         |   - http://[[username:password]@[ ]{host-ip]|host-ip]/[directory]  
|         |   - rcp://user@host/filename  
|         |   - tftp://host/filename |
| Step 3  | ip dhcp snooping database timeout seconds Specify when to stop the database transfer process after the binding database changes. The range is from 0 to 86400. Use 0 for an infinite duration. The default is 300 seconds (5 minutes). |
| Step 4  | ip dhcp snooping database write-delay seconds Specify the duration for which the transfer should be delayed after the binding database changes. The range is from 15 to 86400 seconds. The default is 300 seconds (5 minutes). |
| Step 5  | end Return to privileged EXEC mode. |
| Step 6  | ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds (Optional) Add binding entries to the DHCP snooping binding database. The vlan-id range is from 1 to 4904. The seconds range is from 1 to 4294967295. Enter this command for each entry that you add.  
|         | Note Use this command when you are testing or debugging the switch. |
| Step 7  | show ip dhcp snooping database [detail] Display the status and statistics of the DHCP snooping binding database agent. |
| Step 8  | copy running-config startup-config (Optional) Save your entries in the configuration file. |

To stop using the database agent and binding files, use the no ip dhcp snooping database global configuration command. To reset the timeout or delay values, use the ip dhcp snooping database timeout seconds or the ip dhcp snooping database write-delay seconds global configuration command.

To clear the statistics of the DHCP snooping binding database agent, use the clear ip dhcp snooping database statistics privileged EXEC command. To renew the database, use the renew ip dhcp snooping database privileged EXEC command.

To delete binding entries from the DHCP snooping binding database, use the no ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id privileged EXEC command. Enter this command for each entry that you delete.
Displaying DHCP Snooping Information

To display the DHCP snooping information, use one or more of the privileged EXEC commands in Table 20-2:

Table 20-2 Commands for Displaying DHCP Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip dhcp snooping</td>
<td>Displays the DHCP snooping configuration for a switch</td>
</tr>
<tr>
<td>show ip dhcp snooping binding</td>
<td>Displays only the dynamically configured bindings in the DHCP snooping binding database, also referred to as a binding table. 1</td>
</tr>
<tr>
<td>show ip dhcp snooping database</td>
<td>Displays the DHCP snooping binding database status and statistics.</td>
</tr>
<tr>
<td>show ip dhcp snooping statistics</td>
<td>Displays the DHCP snooping statistics in summary or detail form.</td>
</tr>
<tr>
<td>show ip source binding</td>
<td>Display the dynamically and statically configured bindings.</td>
</tr>
</tbody>
</table>

1. If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the manually configured bindings.

Understanding IP Source Guard

IP source guard is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings. You can use IP source guard to prevent traffic attacks caused when a host tries to use the IP address of its neighbor.

You can enable IP source guard when DHCP snooping is enabled on an untrusted interface. After IP source guard is enabled on an interface, the switch blocks all IP traffic received on the interface, except for DHCP packets allowed by DHCP snooping. A port access control list (ACL) is applied to the interface. The port ACL allows only IP traffic with a source IP address in the IP source binding table and denies all other traffic.

Note: As with other port ACLs, this port ACL takes precedence over any router ACLs or VLAN maps that affect the same interface.

The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IP source guard is supported only on Layer 2 ports, including access and trunk ports. You can configure IP source guard with source IP address filtering or with source IP and MAC address filtering.

These sections contain this information:

- Source IP Address Filtering, page 20-16
- Source IP and MAC Address Filtering, page 20-16
Source IP Address Filtering

When IP source guard is enabled with this option, IP traffic is filtered based on the source IP address. The switch forwards IP traffic when the source IP address matches an entry in the DHCP snooping binding database or a binding in the IP source binding table.

When a DHCP snooping binding or static IP source binding is added, changed, or deleted on an interface, the switch modifies the port ACL using the IP source binding changes, and re-applies the port ACL to the interface.

If you enable IP source guard on an interface on which IP source bindings (dynamically learned by DHCP snooping or manually configured) are not configured, the switch creates and applies a port ACL that denies all IP traffic on the interface. If you disable IP source guard, the switch removes the port ACL from the interface.

Source IP and MAC Address Filtering

When IP source guard is enabled with this option, IP traffic is filtered based on the source IP and MAC addresses. The switch forwards traffic only when the source IP and MAC addresses match an entry in the IP source binding table.

When IP source guard with source IP and MAC address filtering is enabled, the switch filters IP and non-IP traffic. If the source MAC address of an IP or non-IP packet matches a valid IP source binding, the switch forwards the packet. The switch drops all other types of packets except DHCP packets.

The switch uses port security to filter source MAC addresses. The interface can shut down when a port-security violation occurs.

Configuring IP Source Guard

These sections contain this configuration information:

- Default IP Source Guard Configuration, page 20-16
- IP Source Guard Configuration Guidelines, page 20-17
- Enabling IP Source Guard, page 20-17

Default IP Source Guard Configuration

By default, IP source guard is disabled.
IP Source Guard Configuration Guidelines

These are the configuration guides for IP source guard:

- You can configure static IP bindings only on nonrouted ports. If you enter the `ip source binding mac-address vlan vlan-id ip-address interface interface-id` global configuration command on a routed interface, this error message appears:
  
  Static IP source binding can only be configured on switch port.

- When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN to which the interface belongs.

- If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

  **Note** If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

- When IP source guard with source IP and MAC address filtering is enabled, DHCP snooping and port security must be enabled on the interface. You must also enter the `ip dhcp snooping information option` global configuration command and ensure that the DHCP server supports option 82. When IP source guard is enabled with MAC address filtering, the DHCP host MAC address is not learned until the host is granted a lease. When forwarding packets from the server to the host, DHCP snooping uses the option-82 data to identify the host port.

- When configuring IP source guard on interfaces on which a private VLAN is configured, port security is not supported.

- IP source guard is not supported on EtherChannels.

- You can enable this feature when IEEE 802.1x port-based authentication is enabled.

- If the number of ternary content addressable memory (TCAM) entries exceeds the maximum available, the CPU usage increases.

Enabling IP Source Guard

Beginning in privileged EXEC mode, follow these steps to enable and configure IP source guard on an interface.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no shutdown</td>
</tr>
</tbody>
</table>
Configuring IP Source Guard

Chapter 20 Configuring DHCP Features and IP Source Guard

Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip verify source</td>
<td>Enable IP source guard with source IP address filtering.</td>
</tr>
<tr>
<td>or ip verify source port-security</td>
<td>Enable IP source guard with source IP and MAC address filtering.</td>
</tr>
</tbody>
</table>

Note: When you enable both IP Source Guard and Port Security by using the `ip verify source port-security` interface configuration command, there are two caveats:

- The DHCP server must support option 82, or the client is not assigned an IP address.
- The MAC address in the DHCP packet is not learned as a secure address. The MAC address of the DHCP client is learned as a secure address only when the switch receives non-DHCP data traffic.

Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
</tbody>
</table>

Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip source binding mac-address vlan vlan-id ip-address interface interface-id</td>
<td>Add a static IP source binding. Enter this command for each static binding.</td>
</tr>
</tbody>
</table>

Step 7

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Step 8

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip verify source [interface interface-id]</td>
<td>Display the IP source guard configuration for all interfaces or for a specific interface.</td>
</tr>
</tbody>
</table>

Step 9

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip source binding [ip-address] [mac-address] [dhcp-snooping</td>
<td>static] [interface interface-id] [vlan vlan-id]</td>
</tr>
</tbody>
</table>

Step 10

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable IP source guard with source IP address filtering, use the `no ip verify source` interface configuration command.

To delete a static IP source binding entry, use the `no ip source` global configuration command.

This example shows how to enable IP source guard with source IP and MAC filtering on VLANs 10 and 11:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip verify source port-security
Switch(config-if)# exit
Switch(config)# ip source binding 0100.0022.0010 vlan 10 10.0.0.2 interface gigabitethernet1/0/1
Switch(config)# ip source binding 0100.0023.0002 vlan 11 10.0.0.4 interface gigabitethernet1/0/1
Switch(config)# end
```
Displaying IP Source Guard Information

To display the IP source guard information, use one or more of the privileged EXEC commands in Table 20-3:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip source binding</td>
<td>Display the IP source bindings on a switch.</td>
</tr>
<tr>
<td>show ip verify source</td>
<td>Display the IP source guard configuration on the switch.</td>
</tr>
</tbody>
</table>
Configuring Dynamic ARP Inspection

This chapter describes how to configure dynamic Address Resolution Protocol inspection (dynamic ARP inspection) on the Cisco ME 3400E switch. This feature helps prevent malicious attacks on the switch by not relaying invalid ARP requests and responses to other ports in the same VLAN.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:
- Understanding Dynamic ARP Inspection, page 21-1
- Configuring Dynamic ARP Inspection, page 21-5
- Displaying Dynamic ARP Inspection Information, page 21-14

Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker’s computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 21-1 shows an example of ARP cache poisoning.
Understanding Dynamic ARP Inspection

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic man-in-the-middle attack.

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets

Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the `ip arp inspection vlan vlan-range` global configuration command. For configuration information, see the “Configuring Dynamic ARP Inspection in DHCP Environments” section on page 21-7.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the `arp access-list acl-name` global configuration command. For configuration information, see the “Configuring ARP ACLs for Non-DHCP Environments” section on page 21-8. The switch logs dropped packets. For more information about the log buffer, see the “Logging of Dropped Packets” section on page 21-4.

---

(IC, MC)
Understanding Dynamic ARP Inspection

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the `ip arp inspection validate` global configuration command. For more information, see the “Performing Validation Checks” section on page 21-12.

Interface Trust States and Network Security

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `ip arp inspection trust` interface configuration command.

**Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

In Figure 21-2, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.

![Figure 21-2 ARP Packet Validation on a VLAN Enabled for Dynamic ARP Inspection](image-url)

Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.
Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches. For configuration information, see the “Configuring ARP ACLs for Non-DHCP Environments” section on page 21-8.

Note

Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

Rate Limiting of ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the `ip arp inspection limit` interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the `errdisable recovery` global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.

For configuration information, see the “Limiting the Rate of Incoming ARP Packets” section on page 21-10.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.
You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command. For configuration information, see the “Configuring the Log Buffer” section on page 21-12.

**Configuring Dynamic ARP Inspection**

These sections contain this configuration information:

- Default Dynamic ARP Inspection Configuration, page 21-5
- Dynamic ARP Inspection Configuration Guidelines, page 21-6
- Configuring Dynamic ARP Inspection in DHCP Environments, page 21-7 (required in DHCP environments)
- Configuring ARP ACLs for Non-DHCP Environments, page 21-8 (required in non-DHCP environments)
- Limiting the Rate of Incoming ARP Packets, page 21-10 (optional)
- Performing Validation Checks, page 21-12 (optional)
- Configuring the Log Buffer, page 21-12 (optional)

**Default Dynamic ARP Inspection Configuration**

Table 21-1 shows the default dynamic ARP inspection configuration.

<table>
<thead>
<tr>
<th>Feature</th>

<td>All denied or dropped ARP packets are logged.</td>
</tr>
</tbody>
</table>

Table 21-1  Default Dynamic ARP Inspection Configuration
Dynamic ARP Inspection Configuration Guidelines

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.
- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.
- Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses. For configuration information, see Chapter 20, “Configuring DHCP Features and IP Source Guard.”
- Dynamic ARP inspection is supported on access ports, trunk ports, EtherChannel ports, and private VLAN ports.

**Note**
Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

- A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.
  Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.
- The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.
  The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.
  If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.
- Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the `ip arp inspection limit none` interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.
- When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.
Configuring Dynamic ARP Inspection in DHCP Environments

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B as shown in Figure 21-2 on page 21-3. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

Note
Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses. For configuration information, see Chapter 20, “Configuring DHCP Features and IP Source Guard.”

For information on how to configure dynamic ARP inspection when only one switch supports the feature, see the “Configuring ARP ACLs for Non-DHCP Environments” section on page 21-8.

Beginning in privileged EXEC mode, follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

<table>

Chapter 21  Configuring Dynamic ARP Inspection

### Configuring Dynamic ARP Inspection

To disable dynamic ARP inspection, use the `no ip arp inspection vlan` global configuration command. To return the interfaces to an untrusted state, use the `no ip arp inspection trust` interface configuration command.

This example shows how to configure dynamic ARP inspection on Switch A in VLAN 1. You would perform a similar procedure on Switch B:

```
Switch(config)# ip arp inspection vlan 1
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip arp inspection trust
```

### Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 21-2 on page 21-3 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Step 10</td>
<td>show ip arp inspection statistics vlan <code>vlan-range</code></td>
</tr>
<tr>
<td>Step 11</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
Beginning in privileged EXEC mode, follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
</tbody>
</table>
| **Step 2** | **arp access-list acl-name** | Define an ARP ACL, and enter ARP access-list configuration mode. By default, no ARP access lists are defined.  

**Note** At the end of the ARP access list, there is an implicit **deny ip any mac any** command. |
| **Step 3** | **permit ip host sender-ip mac host sender-mac [log]** | Permit ARP packets from the specified host (Host 2).  
- For **sender-ip**, enter the IP address of Host 2.  
- For **sender-mac**, enter the MAC address of Host 2.  
- (Optional) Specify **log** to log a packet in the log buffer when it matches the access control entry (ACE). Matches are logged if you also configure the **matchlog** keyword in the **ip arp inspection vlan logging** global configuration command. For more information, see the “Configuring the Log Buffer” section on page 21-12. |
| **Step 4** | **exit** | Return to global configuration mode. |
| **Step 5** | **ip arp inspection filter arp-acl-name vlan vlan-range [static]** | Apply the ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.  
- For **arp-acl-name**, specify the name of the ACL created in Step 2.  
- For **vlan-range**, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.  
- (Optional) Specify **static** to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.  

If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.  

ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them. |
| **Step 6** | **interface interface-id** | Specify the Switch A interface that is connected to Switch B, and enter interface configuration mode. |
Chapter 21      Configuring Dynamic ARP Inspection

Configuring Dynamic ARP Inspection

To remove the ARP ACL, use the `no arp access-list` global configuration command. To remove the ARP ACL attached to a VLAN, use the `no ip arp inspection filter` command.

This example shows how to configure an ARP ACL called `host2` on Switch A, to permit ARP packets from Host 2 (IP address 1.1.1.1 and MAC address 0001.0001.0001), to apply the ACL to VLAN 1, and to configure port 1 on Switch A as untrusted:

```
Switch(config)# arp access-list host2
Switch(config-arp-acl)# permit ip host 1.1.1.1 mac host 1.1.1
Switch(config-arp-acl)# exit
Switch(config)# ip arp inspection filter host2 vlan 1
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# no ip arp inspection trust
```

Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

### Command Table

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td><code>no shutdown</code></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>8</td>
<td><code>no ip arp inspection trust</code></td>
<td>Configure the Switch A interface that is connected to Switch B as untrusted. By default, all interfaces are untrusted. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the <code>ip arp inspection vlan logging</code> global configuration command. For more information, see the “Configuring the Log Buffer” section on page 21-12.</td>
</tr>
<tr>
<td>9</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>10</td>
<td><code>show arp access-list [acl-name]</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td><code>show ip arp inspection vlan vlan-range</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>show ip arp inspection interfaces</code></td>
<td></td>
</tr>
<tr>
<td>11</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the ARP ACL, use the `no arp access-list` global configuration command. To remove the ARP ACL attached to a VLAN, use the `no ip arp inspection filter` command.
Note

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the `no ip arp inspection limit` interface configuration command, the interface reverts to its default rate limit.

For configuration guidelines for rate limiting trunk ports and EtherChannel ports, see the “Dynamic ARP Inspection Configuration Guidelines” section on page 21-6.

Beginning in privileged EXEC mode, follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
</tbody>
</table>
| Step 4 | ip arp inspection limit {rate pps [burst interval seconds] | none} | Limit the rate of incoming ARP requests and responses on the interface. The default rate is 15 pps on untrusted interfaces and unlimited on trusted interfaces. The burst interval is 1 second. The keywords have these meanings:  
  * For rate pps, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps.  
  * (Optional) For burst interval seconds, specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15.  
  * For rate none, specify no upper limit for the rate of incoming ARP packets that can be processed. |
| Step 5 | exit | Return to global configuration mode. |
| Step 6 | errdisable recovery cause arp-inspection interval interval | (Optional) Enable error recovery from the dynamic ARP inspection error-disable state. By default, recovery is disabled, and the recovery interval is 300 seconds. For interval interval, specify the time in seconds to recover from the error-disable state. The range is 30 to 86400. |
| Step 7 | exit | Return to privileged EXEC mode. |
| Step 8 | show ip arp inspection interfaces | Verify your settings. |
| Step 9 | show errdisable recovery | |
| Step 9 | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To return to the default rate-limit configuration, use the `no ip arp inspection limit` interface configuration command. To disable error recovery for dynamic ARP inspection, use the `no errdisable recovery cause arp-inspection` global configuration command.
Performing Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Beginning in privileged EXEC mode, follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip arp inspection validate</td>
<td>Perform a specific check on incoming ARP packets. By default, no checks are performed. The keywords have these meanings:</td>
</tr>
<tr>
<td>[[src-mac] [dst-mac] [ip]]</td>
<td>The keywords have these meanings:</td>
</tr>
<tr>
<td>Step 3 exit</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show ip arp inspection vlan</td>
<td>Verify your settings.</td>
</tr>
<tr>
<td>vlan-range</td>
<td></td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To disable checking, use the `no ip arp inspection validate [src-mac] [dst-mac] [ip]` global configuration command. To display statistics for forwarded, dropped, and MAC and IP validation failure packets, use the `show ip arp inspection statistics` privileged EXEC command.

Configuring the Log Buffer

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.
A log-buffer entry can represent more than one packet. For example, if an interface receives many packets on the same VLAN with the same ARP parameters, the switch combines the packets as one entry in the log buffer and generates a single system message for the entry.

If the log buffer overflows, it means that a log event does not fit into the log buffer, and the display for the `show ip arp inspection log` privileged EXEC command is affected. A -- in the display appears in place of all data except the packet count and the time. No other statistics are provided for the entry. If you see this entry in the display, increase the number of entries in the log buffer or increase the logging rate.

Beginning in privileged EXEC mode, follow these steps to configure the log buffer. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip arp inspection log-buffer { entries number</td>
</tr>
<tr>
<td></td>
<td>logs number interval seconds }</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Displaying Dynamic ARP Inspection Information

To display dynamic ARP inspection information, use the privileged EXEC commands described in Table 21-2.

Table 21-2 Commands for Displaying Dynamic ARP Inspection Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp access-list [acl-name]</td>
<td>Displays detailed information about ARP ACLs.</td>
</tr>
<tr>
<td>show ip arp inspection interfaces [interface-id]</td>
<td>Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.</td>
</tr>
<tr>
<td>show ip arp inspection vlan vlan-range</td>
<td>Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
</tbody>
</table>
To clear or display dynamic ARP inspection statistics, use the privileged EXEC commands in Table 21-3:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip arp inspection statistics</td>
<td>Clears dynamic ARP inspection statistics.</td>
</tr>
<tr>
<td>show ip arp inspection statistics [vlan vlan-range]</td>
<td>Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
</tbody>
</table>

For the `show ip arp inspection statistics` command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate failure count.

To clear or display dynamic ARP inspection logging information, use the privileged EXEC commands in Table 21-4:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the dynamic ARP inspection log buffer.</td>
</tr>
<tr>
<td>show ip arp inspection log</td>
<td>Displays the configuration and contents of the dynamic ARP inspection log buffer.</td>
</tr>
</tbody>
</table>

For more information about these commands, see the command reference for this release.
Configuring IGMP Snooping and MVR

This chapter describes how to configure Internet Group Management Protocol (IGMP) snooping on the Cisco ME 3400E Ethernet Access switch, including an application of local IGMP snooping, Multicast VLAN Registration (MVR). It also includes procedures for controlling multicast group membership by using IGMP filtering and procedures for configuring the IGMP throttling action.

Note

For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and the “IP Multicast Routing Commands” section in the Cisco IOS IP Command Reference, Volume 3 of 3: Multicast, Release 12.2.

This chapter consists of these sections:

- Understanding IGMP Snooping, page 22-1
- Configuring IGMP Snooping, page 22-6
- Displaying IGMP Snooping Information, page 22-14
- Understanding Multicast VLAN Registration, page 22-15
- Configuring MVR, page 22-18
- Displaying MVR Information, page 22-23
- Configuring IGMP Filtering and Throttling, page 22-23
- Displaying IGMP Filtering and Throttling Configuration, page 22-29

Note

You can either manage IP multicast group addresses through features such as IGMP snooping and MVR, or you can use static IP addresses.

Understanding IGMP Snooping

Layer 2 switches can use IGMP snooping to constrain the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. As the name implies, IGMP snooping requires the LAN switch to snoop on the IGMP transmissions between the host and the router and to keep track of multicast groups and member ports. When the switch receives an IGMP report from a host for a particular multicast group, the switch adds the host port number to the forwarding table entry; when it receives an IGMP Leave Group message from a host, it removes the host port from the table entry. It also periodically deletes entries if it does not receive IGMP membership reports from the multicast clients.
Understanding IGMP Snooping

For more information on IP multicast and IGMP, see RFC 1112 and RFC 2236.

The multicast router sends out periodic general queries to all VLANs. All hosts interested in this multicast traffic send join requests and are added to the forwarding table entry. The switch creates one entry per VLAN in the IGMP snooping IP multicast forwarding table for each group from which it receives an IGMP join request.

The switch supports IP multicast group-based bridging, rather than MAC-addressed based groups. With multicast MAC address-based groups, if an IP address being configured translates (aliases) to a previously configured MAC address or to any reserved multicast MAC addresses (in the range 224.0.0.xxx), the command fails. Because the switch uses IP multicast groups, there are no address aliasing issues.

The IP multicast groups learned through IGMP snooping are dynamic. However, you can statically configure multicast groups by using the `ip igmp snooping vlan vlan-id static ip_address interface interface-id` global configuration command. If you specify group membership for a multicast group address statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can consist of both user-defined and IGMP snooping-learned settings.

You can configure an IGMP snooping querier to support IGMP snooping in subnets without multicast interfaces because the multicast traffic does not need to be routed. For more information about the IGMP snooping querier, see the “Configuring the IGMP Snooping Querier” section on page 22-12.

If a port spanning-tree, a port group, or a VLAN ID change occurs, the IGMP snooping-learned multicast groups from this port on the VLAN are deleted.

These sections describe IGMP snooping characteristics:

- IGMP Versions, page 22-2
- Joining a Multicast Group, page 22-3
- Leaving a Multicast Group, page 22-5
- Immediate Leave, page 22-5
- IGMP Configurable-Leave Timer, page 22-5
- IGMP Report Suppression, page 22-5

**IGMP Versions**

The switch supports IGMP Version 1, IGMP Version 2, and IGMP Version 3. These versions are interoperable on the switch. For example, if IGMP snooping is enabled on an IGMPv2 switch and the switch receives an IGMPv3 report from a host, the switch can forward the IGMPv3 report to the multicast router.

Note

The switches support IGMPv3 snooping based only on the destination multicast MAC address. They do not support snooping based on the source MAC address or on proxy reports.

An IGMPv3 switch supports Basic IGMPv3 Snooping Support (BISS), which includes support for the snooping features on IGMPv1 and IGMPv2 switches and for IGMPv3 membership report messages. BISS constrains the flooding of multicast traffic when your network includes IGMPv3 hosts. It constrains traffic to approximately the same set of ports as the IGMP snooping feature on IGMPv2 or IGMPv1 hosts.
**Note**

IGMPv3 join and leave messages are not supported on switches running IGMP filtering or MVR.

An IGMPv3 switch can receive messages from and forward messages to a device running the Source Specific Multicast (SSM) feature. For more information about source-specific multicast with IGMPv3 and IGMP, see this URL:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtssm5t.htm

### Joining a Multicast Group

When a host connected to the switch wants to join an IP multicast group and it is an IGMP Version 2 client, it sends an unsolicited IGMP join message, specifying the IP multicast group to join. Alternatively, when the switch receives a general query from the router, it forwards the query to all ports in the VLAN. IGMP Version 1 or Version 2 hosts wanting to join the multicast group respond by sending a join message to the switch. The switch CPU creates a multicast forwarding-table entry for the group if it is not already present. The CPU also adds the interface where the join message was received to the forwarding-table entry. The host associated with that interface receives multicast traffic for that multicast group. See Figure 22-1.

**Figure 22-1  Initial IGMP Join Message**

Router A sends a general query to the switch, which forwards the query to ports 2 through 5, which are all members of the same VLAN. Host 1 wants to join multicast group 224.1.2.3 and multicasts an IGMP membership report (IGMP join message) to the group. The switch CPU uses the information in the IGMP report to set up a forwarding-table entry, as shown in Table 22-1, that includes the port numbers connected to Host 1 and the router.
Understanding IGMP Snooping

The switch hardware can distinguish IGMP information packets from other packets for the multicast group. The information in the table tells the switching engine to send frames addressed to the 224.1.2.3 multicast IP address that are not IGMP packets to the router and to the host that has joined the group.

If another host (for example, Host 4) sends an unsolicited IGMP join message for the same group (Figure 22-2), the CPU receives that message and adds the port number of Host 4 to the forwarding table as shown in Table 22-2. Note that because the forwarding table directs IGMP messages to only the CPU, the message is not flooded to other ports on the switch. Any known multicast traffic is forwarded to the group and not to the CPU.

Multicast-capable router ports are added to the forwarding table for every Layer 2 multicast entry. The switch learns of such ports through one of these methods:

- Snooping on IGMP queries and Protocol Independent Multicast (PIM) packets
- Statically connecting to a multicast router port with the `ip igmp snooping mrouter` global configuration command

### Table 22-1 IGMP Snooping Forwarding Table

<table>
<thead>

<th>Type of Packet</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>224.1.2.3</td>
<td>IGMP</td>
<td>1, 2, 5</td>
</tr>
</tbody>
</table>
Leaving a Multicast Group

The router sends periodic multicast general queries, and the switch forwards these queries through all ports in the VLAN. Interested hosts respond to the queries. If at least one host in the VLAN wishes to receive multicast traffic, the router continues forwarding the multicast traffic to the VLAN. The switch forwards multicast group traffic only to those hosts listed in the forwarding table for that IP multicast group maintained by IGMP snooping.

When hosts want to leave a multicast group, they can silently leave, or they can send a leave message. When the switch receives a leave message from a host, it sends a group-specific query to learn if any other devices connected to that interface are interested in traffic for the specific multicast group. The switch then updates the forwarding table for that MAC group so that only those hosts interested in receiving multicast traffic for the group are listed in the forwarding table. If the router receives no reports from a VLAN, it removes the group for the VLAN from its IGMP cache.

Immediate Leave

Immediate Leave is only supported on IGMP Version 2 hosts.

The switch uses IGMP snooping Immediate Leave to remove from the forwarding table an interface that sends a leave message without the switch sending group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Immediate Leave ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are simultaneously in use.

**Note**

You should only use the Immediate Leave feature on VLANs where a single host is connected to each port. If Immediate Leave is enabled in VLANs where more than one host is connected to a port, some hosts might inadvertently be dropped.

For configuration steps, see the “Enabling IGMP Immediate Leave” section on page 22-9.

IGMP Configurable-Leave Timer

You can configure the time that the switch waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 5000 milliseconds. The timer can be set either globally or on a per-VLAN basis. The VLAN configuration of the leave time overrides the global configuration.

For configuration steps, see the “Configuring the IGMP Leave Timer” section on page 22-9.

IGMP Report Suppression

**Note**

IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.
The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers.

If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression, all IGMP reports are forwarded to the multicast routers. For configuration steps, see the “Disabling IGMP Report Suppression” section on page 22-14.

Configuring IGMP Snooping

IGMP snooping allows switches to examine IGMP packets and make forwarding decisions based on their content.

- Default IGMP Snooping Configuration, page 22-6
- Enabling or Disabling IGMP Snooping, page 22-7
- Configuring a Multicast Router Port, page 22-7
- Configuring a Host Statically to Join a Group, page 22-8
- Enabling IGMP Immediate Leave, page 22-9
- Configuring the IGMP Leave Timer, page 22-9
- Configuring TCN-Related Commands, page 22-10
- Configuring the IGMP Snooping Querier, page 22-12
- Disabling IGMP Report Suppression, page 22-14

Default IGMP Snooping Configuration

Table 22-3 shows the default IGMP snooping configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP snooping</td>
<td>Enabled globally and per VLAN</td>
</tr>
<tr>
<td>Multicast routers</td>

</tr>
<tr>
<td>Multicast router learning (snooping) method</td>
<td>PIM</td>
</tr>
<tr>
<td>IGMP snooping Immediate Leave</td>
<td>Disabled</td>
</tr>
<tr>
<td>Static groups</td>
<td>None configured</td>
</tr>
<tr>
<td>TCN¹ flood query count</td>
<td>2</td>
</tr>
<tr>
<td>TCN query solicitation</td>
<td>Disabled</td>
</tr>
<tr>
<td>IGMP snooping querier</td>
<td>Disabled</td>
</tr>
<tr>
<td>IGMP report suppression</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

1. TCN = Topology Change Notification
Enabling or Disabling IGMP Snooping

By default, IGMP snooping is globally enabled on the switch. When globally enabled or disabled, it is also enabled or disabled in all existing VLAN interfaces. IGMP snooping is by default enabled on all VLANs, but can be enabled and disabled on a per-VLAN basis.

Global IGMP snooping overrides the VLAN IGMP snooping. If global snooping is disabled, you cannot enable VLAN snooping. If global snooping is enabled, you can enable or disable VLAN snooping.

Beginning in privileged EXEC mode, follow these steps to globally enable IGMP snooping on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip igmp snooping</td>
<td>Globally enable IGMP snooping in all existing VLAN interfaces.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To globally disable IGMP snooping on all VLAN interfaces, use the no ip igmp snooping global configuration command.

Beginning in privileged EXEC mode, follow these steps to enable IGMP snooping on a VLAN interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip igmp snooping vlan vlan-id</td>
<td>Enable IGMP snooping on the VLAN interface. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td>Note</td>
<td>IGMP snooping must be globally enabled before you can enable VLAN snooping.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable IGMP snooping on a VLAN interface, use the no ip igmp snooping vlan vlan-id global configuration command for the specified VLAN number.

Configuring a Multicast Router Port

To add a multicast router port (add a static connection to a multicast router), use the ip igmp snooping vlan mrouter global configuration command on the switch.

| Note                          | Static connections to multicast routers are supported only on switch ports. |
Beginning in privileged EXEC mode, follow these steps to enable a static connection to a multicast router:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip igmp snooping vlan vlan-id mrouter interface interface-id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show ip igmp snooping mrouter [vlan vlan-id]</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove a multicast router port from the VLAN, use the no ip igmp snooping vlan vlan-id mrouter interface interface-id global configuration command.

This example shows how to enable a static connection to a multicast router:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 mrouter interface gigabitethernet0/2
Switch(config)# end
```

### Configuring a Host Statically to Join a Group

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure a host on an interface.

Beginning in privileged EXEC mode, follow these steps to add a Layer 2 port as a member of a multicast group:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip igmp snooping vlan vlan-id static ip_address interface interface-id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show ip igmp snooping groups</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove the Layer 2 port from the multicast group, use the no ip igmp snooping vlan vlan-id static mac-address interface interface-id global configuration command.
This example shows how to statically configure a host on a port:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 105 static 224.2.4.12 interface gigabitethernet0/1
Switch(config)# end
```

### Enabling IGMP Immediate Leave

When you enable IGMP Immediate Leave, the switch immediately removes a port when it detects an IGMP Version 2 leave message on that port. You should only use the Immediate-Leave feature when there is a single receiver present on every port in the VLAN.

**Note**

Immediate Leave is supported only on IGMP Version 2 hosts.

Beginning in privileged EXEC mode, follow these steps to enable IGMP Immediate Leave:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;ip igmp snooping vlan vlan-id immediate-leave</td>
<td>Enable IGMP Immediate Leave on the VLAN interface.</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;show ip igmp snooping vlan vlan-id</td>
<td>Verify that Immediate Leave is enabled on the VLAN interface.</td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable IGMP Immediate Leave on a VLAN, use the `no ip igmp snooping vlan vlan-id immediate-leave` global configuration command.

This example shows how to enable IGMP Immediate Leave on VLAN 130:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 130 immediate-leave
Switch(config)# end
```

### Configuring the IGMP Leave Timer

Follow these guidelines when configuring the IGMP leave timer:

- You can configure the leave time globally or on a per-VLAN basis.
- Configuring the leave time on a VLAN overrides the global setting.
- The default leave time is 1000 milliseconds.
- The IGMP configurable leave time is only supported on hosts running IGMP Version 2.
- The actual leave latency in the network is usually the configured leave time. However, the leave time might vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.
Beginning in privileged EXEC mode, follow these steps to enable the IGMP configurable-leave timer:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip igmp snooping last-member-query-interval time</td>
</tr>
<tr>
<td>Step 3</td>
<td>ip igmp snooping vlan vlan-id last-member-query-interval time</td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show ip igmp snooping</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the `no ip igmp snooping last-member-query-interval` global configuration command to globally reset the IGMP leave timer to the default setting.

Use the `no ip igmp snooping vlan vlan-id last-member-query-interval` global configuration command to remove the configured IGMP leave-time setting from the specified VLAN.

### Configuring TCN-Related Commands

These sections describe how to control flooded multicast traffic during a TCN event:

- Controlling the Multicast Flooding Time After a TCN Event, page 22-10
- Recovering from Flood Mode, page 22-11
- Disabling Multicast Flooding During a TCN Event, page 22-11

### Controlling the Multicast Flooding Time After a TCN Event

You can control the time that multicast traffic is flooded after a TCH event by using the `ip igmp snooping tcn flood query count` global configuration command. This command configures the number of general queries for which multicast data traffic is flooded after a TCN event. Some examples of TCN events are the client changed its location and the receiver is on same port that was blocked but is now forwarding, and a port went down without sending a leave message.

If you set the TCN flood query count to 1 by using the `ip igmp snooping tcn flood query count` command, the flooding stops after receiving one general query. If you set the count to 7, the flooding of multicast traffic due to the TCN event lasts until 7 general queries are received. Groups are relearned based on the general queries received during the TCN event.
Beginning in privileged EXEC mode, follow these steps to configure the TCN flood query count:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip igmp snooping tcn flood query count count</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show ip igmp snooping</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default flooding query count, use the **no ip igmp snooping tcn flood query count** global configuration command.

### Recovering from Flood Mode

When a topology change occurs, the spanning-tree root sends a special IGMP leave message (also known as global leave) with the group multicast address 0.0.0.0. However, when you enable the **ip igmp snooping tcn query solicit** global configuration command, the switch sends the global leave message whether or not it is the spanning-tree root. When the router receives this special leave, it immediately sends general queries, which expedite the process of recovering from the flood mode during the TCN event. Leaves are always sent if the switch is the spanning-tree root regardless of this configuration command. By default, query solicitation is disabled.

Beginning in privileged EXEC mode, follow these steps to enable the switch sends the global leave message whether or not it is the spanning-tree root:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip igmp snooping tcn query solicit</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show ip igmp snooping</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default query solicitation, use the **no ip igmp snooping tcn query solicit** global configuration command.

### Disabling Multicast Flooding During a TCN Event

When the switch receives a TCN, multicast traffic is flooded to all the ports until two general queries are received. If the switch has many ports with attached hosts that are subscribed to different multicast groups, the flooding might exceed the capacity of the link and cause packet loss. You can use the **ip igmp snooping tcn flood** interface configuration command to control this behavior.
Beginning in privileged EXEC mode, follow these steps to disable multicast flooding on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code> Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>no shutdown</code> Enable the port, if necessary. By default, user network interfaces (UNIs) and enhanced network interfaces (ENIs) are disabled, and network node interfaces (NNIs) are enabled.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>no ip igmp snooping tcn flood</code> Disable the flooding of multicast traffic during a spanning-tree TCN event. By default, multicast flooding is enabled on an interface.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>exit</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>show ip igmp snooping</code> Verify the TCN settings.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To re-enable multicast flooding on an interface, use the `ip igmp snooping tcn flood` interface configuration command.

**Configuring the IGMP Snooping Querier**

Follow these guidelines when configuring the IGMP snooping querier:

- Configure the VLAN in global configuration mode.
- Configure an IP address on the VLAN interface. When enabled, the IGMP snooping querier uses the IP address as the query source address.
- If there is no IP address configured on the VLAN interface, the IGMP snooping querier tries to use the configured global IP address for the IGMP querier. If there is no global IP address specified, the IGMP querier tries to use the VLAN switch virtual interface (SVI) IP address (if one exists). If there is no SVI IP address, the switch uses the first available IP address configured on the switch. The first IP address available appears in the output of the `show ip interface` privileged EXEC command. The IGMP snooping querier does not generate an IGMP general query if it cannot find an available IP address on the switch.
- The IGMP snooping querier supports IGMP Versions 1 and 2.
- When administratively enabled, the IGMP snooping querier moves to the nonquerier state if it detects the presence of a multicast router in the network.
- When it is administratively enabled, the IGMP snooping querier moves to the operationally disabled state under these conditions:
  - IGMP snooping is disabled in the VLAN.
  - PIM is enabled on the SVI of the corresponding VLAN.
To enable the IGMP snooping querier feature in a VLAN, follow these steps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>ip igmp snooping querier</strong></td>
</tr>
<tr>
<td></td>
<td>Enable the IGMP snooping querier.</td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>ip igmp snooping querier ip_address</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Specify an IP address for the IGMP snooping querier. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier. <strong>Note</strong> The IGMP snooping querier does not generate an IGMP general query if it cannot find an IP address on the switch.</td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>ip igmp snooping querier query-interval interval-count</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Set the interval between IGMP queriers. The range is 1 to 18000 seconds.</td>
</tr>
<tr>
<td>Step 5</td>
<td><strong>ip igmp snooping querier tcn query [count count] [interval interval]</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Set the time between Topology Change Notification (TCN) queries. The count range is 1 to 10. The interval range is 1 to 255 seconds.</td>
</tr>
<tr>
<td>Step 6</td>
<td><strong>ip igmp snooping querier timer expiry timeout</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Set the length of time until the IGMP querier expires. The range is 60 to 300 seconds.</td>
</tr>
<tr>
<td>Step 7</td>
<td><strong>ip igmp snooping querier version version</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Select the IGMP version number that the querier feature uses. Select 1 or 2.</td>
</tr>
<tr>
<td>Step 8</td>
<td><strong>end</strong></td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 9</td>
<td><strong>show ip igmp snooping vlan vlan-id</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Verify that the IGMP snooping querier is enabled on the VLAN interface. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td>Step 10</td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to set the IGMP snooping querier source address to 10.0.0.64:

```
Switch# configure terminal
Switch(config)# ip igmp snooping querier 10.0.0.64
Switch(config)# end
```

This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:

```
Switch# configure terminal
Switch(config)# ip igmp snooping querier query-interval 25
Switch(config)# end
```

This example shows how to set the IGMP snooping querier timeout to 60 seconds:

```
Switch# configure terminal
Switch(config)# ip igmp snooping querier timer expiry 60
Switch(config)# end
```

This example shows how to set the IGMP snooping querier feature to version 2:

```
Switch# configure terminal
Switch(config)# no ip igmp snooping querier version 2
Switch(config)# end
```
Displaying IGMP Snooping Information

Disabling IGMP Report Suppression

**Note**

IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

IGMP report suppression is enabled by default. When it is enabled, the switch forwards only one IGMP report per multicast router query. When report suppression is disabled, all IGMP reports are forwarded to the multicast routers.

Beginning in privileged EXEC mode, follow these steps to disable IGMP report suppression:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>no ip igmp snooping report-suppression</code> Disable IGMP report suppression.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show ip igmp snooping</code> Verify that IGMP report suppression is disabled.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To re-enable IGMP report suppression, use the `ip igmp snooping report-suppression` global configuration command.

Displaying IGMP Snooping Information

You can display IGMP snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for IGMP snooping.

To display IGMP snooping information, use one or more of the privileged EXEC commands in Table 22-4.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip igmp snooping [vlan vlan-id]</code></td>
<td>Display the snooping configuration information for all VLANs on the switch or for a specified VLAN. (Optional) Enter <code>vlan vlan-id</code> to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>
| `show ip igmp snooping groups [count |dynamic |count] |user [count]]` | Display multicast table information for the switch or about a specific parameter:  
  - `count`—Display the total number of entries for the specified command options instead of the actual entries.  
  - `dynamic`—Display entries learned through IGMP snooping.  
  - `user`—Display only the user-configured multicast entries. |
Understanding Multicast VLAN Registration

Multicast VLAN Registration (MVR) is designed for applications using wide-scale deployment of multicast traffic across an Ethernet ring-based service-provider network (for example, the broadcast of multiple television channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast VLAN. It allows the single multicast VLAN to be shared in the network while subscribers remain in separate VLANs. MVR provides the ability to continuously send multicast streams in the multicast VLAN, but to isolate the streams from the subscriber VLANs for bandwidth and security reasons.

MVR assumes that subscriber ports subscribe and unsubscribe (join and leave) these multicast streams by sending out IGMP join and leave messages. These messages can originate from an IGMP Version-2-compatible host with an Ethernet connection. Although MVR operates on the underlying mechanism of IGMP snooping, the two features operate independently of each other. One can be enabled or disabled without affecting the behavior of the other feature. However, if IGMP snooping and MVR are both enabled, MVR reacts only to join and leave messages from multicast groups configured under MVR. Join and leave messages from all other multicast groups are managed by IGMP snooping.
Understanding Multicast VLAN Registration

Chapter 22 Configuring IGMP Snooping and MVR

The switch CPU identifies the MVR IP multicast streams and their associated IP multicast group in the switch forwarding table, intercepts the IGMP messages, and modifies the forwarding table to include or remove the subscriber as a receiver of the multicast stream, even though the receivers might be in a different VLAN from the source. This forwarding behavior selectively allows traffic to cross between different VLANs.

You can set the switch for compatible or dynamic mode of MVR operation:

- In compatible mode, multicast data received by MVR hosts is forwarded to all MVR data ports, regardless of MVR host membership on those ports. The multicast data is forwarded only to those receiver ports that MVR hosts have joined, either by IGMP reports or by MVR static configuration. IGMP reports received from MVR hosts are never forwarded from MVR data ports that were configured in the switch.

- In dynamic mode, multicast data received by MVR hosts on the switch is forwarded from only those MVR data and client ports that the MVR hosts have joined, either by IGMP reports or by MVR static configuration. Any IGMP reports received from MVR hosts are also forwarded from all the MVR data ports in the switch. This eliminates using unnecessary bandwidth on MVR data port links, which occurs when the switch runs in compatible mode.

Only Layer 2 ports take part in MVR. You must configure ports as MVR receiver ports. Only one MVR multicast VLAN per switch is supported.

Using MVR in a Multicast Television Application

In a multicast television application, a PC or a television with a set-top box can receive the multicast stream. Multiple set-top boxes or PCs can be connected to one subscriber port, which is a switch port configured as an MVR receiver port. Figure 22-3 is an example configuration. DHCP assigns an IP address to the set-top box or the PC. When a subscriber selects a channel, the set-top box or PC sends an IGMP report to Switch A to join the appropriate multicast. If the IGMP report matches one of the configured IP multicast group addresses, the switch CPU modifies the hardware address table to include this receiver port and VLAN as a forwarding destination of the specified multicast stream when it is received from the multicast VLAN. Uplink ports that send and receive multicast data to and from the multicast VLAN are called MVR source ports.
When a subscriber changes channels or turns off the television, the set-top box sends an IGMP leave message for the multicast stream. The switch CPU sends a MAC-based general query through the receiver port VLAN. If there is another set-top box in the VLAN still subscribing to this group, that set-top box must respond within the maximum response time specified in the query. If the CPU does not receive a response, it eliminates the receiver port as a forwarding destination for this group.

Without Immediate Leave, when the switch receives an IGMP leave message from a subscriber on a receiver port, it sends out an IGMP query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency. Enable the Immediate-Leave feature only on receiver ports to which a single receiver device is connected.

MVR eliminates the need to duplicate television-channel multicast traffic for subscribers in each VLAN. Multicast traffic for all channels is only sent around the VLAN trunk once—only on the multicast VLAN. The IGMP leave and join messages are in the VLAN to which the subscriber port is assigned.
These messages dynamically register for streams of multicast traffic in the multicast VLAN on the Layer 3 device. Switch B. The access layer switch, Switch A, modifies the forwarding behavior to allow the traffic to be forwarded from the multicast VLAN to the subscriber port in a different VLAN, selectively allowing traffic to cross between two VLANs.

IGMP reports are sent to the same IP multicast group address as the multicast data. The Switch A CPU must capture all IGMP join and leave messages from receiver ports and forward them to the multicast VLAN of the source (uplink) port, based on the MVR mode.

## Configuring MVR

- Default MVR Configuration, page 22-18
- MVR Configuration Guidelines and Limitations, page 22-18
- Configuring MVR Global Parameters, page 22-19
- Configuring MVR on Access Ports, page 22-20
- Configuring MVR on Trunk Ports, page 22-22

### Default MVR Configuration

Table 22-5 shows the default MVR configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVR</td>
<td>Disabled globally and per interface</td>
</tr>
<tr>
<td>Multicast addresses</td>
<td>None configured</td>
</tr>
<tr>
<td>Query response time</td>
<td>0.5 second</td>
</tr>
<tr>
<td>Multicast VLAN</td>
<td>VLAN 1</td>
</tr>
<tr>
<td>Mode</td>
<td>Compatible</td>
</tr>
<tr>
<td>Interface (per port)</td>
<td>Neither a receiver nor a source port</td>
</tr>
<tr>
<td>Immediate Leave</td>
<td>Disabled on all ports</td>
</tr>
</tbody>
</table>

### MVR Configuration Guidelines and Limitations

- Receiver ports on a switch can be in different VLANs, but they should not belong to the multicast VLAN.
- Trunk ports or access ports can be configured as receiver ports.
- The maximum number of multicast entries (MVR group addresses) that can be configured on a switch (that is, the maximum number of television channels that can be received) is 512.
- MVR multicast data received in the source VLAN and leaving from receiver ports has its time-to-live (TTL) decremented by 1 in the switch.
Because MVR on the switch uses IP multicast addresses instead of MAC multicast addresses, aliased IP multicast addresses are allowed on the switch. However, if the switch is interoperating with Catalyst 3550 or Catalyst 3500 XL switches, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).

- Do not configure MVR on private VLAN ports.
- MVR is not supported when multicast routing is enabled on a switch. If you enable multicast routing and a multicast routing protocol while MVR is enabled, MVR is disabled, and you receive a warning message. If you try to enable MVR while multicast routing and a multicast routing protocol are enabled, the operation to enable MVR is cancelled, and you receive an error message.
- MVR can coexist with IGMP snooping on a switch.
- MVR data received on an MVR receiver port is not forwarded to MVR source ports.
- MVR does not support IGMPv3 messages.

### Configuring MVR Global Parameters

You do not need to set the optional MVR parameters if you choose to use the default settings. If you do want to change the default parameters (except for the MVR VLAN), you must first enable MVR.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>configure terminal</strong></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>mvr</td>
<td>Enable MVR on the switch.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>mvr group ip-address [count]</td>
<td>Configure an IP multicast address on the switch or use the count parameter to configure a contiguous series of MVR group addresses (the range for count is 1 to 512; the default is 1). Any multicast data sent to this address is sent to all source ports on the switch and all receiver ports that have elected to receive data on that multicast address. Each multicast address would correspond to one television channel.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>mvr querytime value</td>
<td>(Optional) Define the maximum time to wait for IGMP report memberships on a receiver port before removing the port from multicast group membership. The value is in units of tenths of a second. The range is 1 to 100, and the default is 5 tenths or one-half second.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>mvr vlan vlan-id</td>
<td>(Optional) Specify the VLAN in which multicast data is received; all source ports must belong to this VLAN. The VLAN range is 1 to 1001 and 1006 to 4094. The default is VLAN 1.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>mvr mode {dynamic</td>
<td>compatible}</td>
</tr>
<tr>
<td></td>
<td>dynamic—Allows dynamic MVR membership on source ports.</td>
</tr>
<tr>
<td></td>
<td>compatible—is compatible with Catalyst 3500 XL and Catalyst 2900 XL switches and does not support IGMP dynamic joins on source ports.</td>
</tr>
<tr>
<td></td>
<td>The default is compatible mode.</td>
</tr>
</tbody>
</table>
Configuring MVR

**To return the switch to its default settings, use the** `no mvr [mode | group ip-address | querytime | vlan]` **global configuration commands.**

This example shows how to enable MVR, configure the group address, set the query time to 1 second (10 tenths), specify the MVR multicast VLAN as VLAN 22, and set the MVR mode as dynamic:

```
Switch(config)# mvr
Switch(config)# mvr group 228.1.2 3.4
Switch(config)# mvr querytime 10
Switch(config)# mvr vlan 22
Switch(config)# mvr mode dynamic
Switch(config)# end
```

You can use the `show mvr members` privileged EXEC command to verify the MVR multicast group addresses on the switch.

**Configuring MVR on Access Ports**

**Note**

For more information about access and trunk ports, see Chapter 10, “Configuring Interfaces”.

Beginning in privileged EXEC mode, follow these steps to configure Layer 2 MVR interfaces on access ports:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>mvr</code></td>
<td>Enable MVR on the switch.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Specify the Layer 2 port to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td><code>no shutdown</code></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
</tbody>
</table>

**Command Purpose**

**Step 7**

```
end
```

Return to privileged EXEC mode.

**Step 8**

```
show mvr or show mvr members
```

Verify the configuration.

**Step 9**

```
copy running-config startup-config
```

(Optional) Save your entries in the configuration file.
### Chapter 22  Configuring IGMP Snooping and MVR

#### Configuring MVR

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> mvr type {source</td>
<td>receiver}</td>
</tr>
<tr>
<td>- source—Configure uplink ports that receive and send multicast data as source ports. Subscribers cannot be directly connected to source ports. All source ports on a switch belong to the single multicast VLAN.</td>
<td></td>
</tr>
<tr>
<td>- receiver—Configure a port as a receiver port if it is a subscriber port and should only receive multicast data. It does not receive data unless it becomes a member of the multicast group, either statically or by using IGMP leave and join messages. Receiver ports cannot belong to the multicast VLAN.</td>
<td></td>
</tr>
</tbody>
</table>

The default configuration is as a non-MVR port. If you attempt to configure a non-MVR port with MVR characteristics, the operation fails.

| **Step 6** mvr vlan vlan-id group \[ip-address\] | (Optional) Statically configure a port to receive multicast traffic sent to the multicast VLAN and the IP multicast address. A port statically configured as a member of a group remains a member of the group until statically removed. |
| **Step 7** mvr immediate | (Optional) Enable the Immediate-Leave feature of MVR on the port. |
| **Step 8** end | Return to privileged EXEC mode. |
| **Step 9** show mvr | Verify the configuration. |
| show mvr interface or show mvr members | |
| **Step 10** copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To return the interface to its default settings, use the no mvr \{type | immediate | vlan vlan-id | group\} interface configuration commands.

This example shows how to configure a port as a receiver port, statically configure the port to receive multicast traffic sent to the multicast group address, configure Immediate Leave on the port, and verify the results.

```
Switch(config)# mvr
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# mvr type receiver
Switch(config-if)# mvr vlan 22 group 228.1.23.4
Switch(config-if)# mvr immediate
Switch(config)# end
Switch# show mvr interface
<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Mode</th>
<th>VLAN</th>
<th>Status</th>
<th>Immediate Leave</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gia0/2</td>
<td>RECEIVER</td>
<td>Trunk</td>
<td>201</td>
<td>ACTIVE/DOWN</td>
<td>DISABLED</td>
</tr>
</tbody>
</table>
```
Configuring MVR on Trunk Ports

Beginning in privileged EXEC mode, follow these steps to configure a trunk port as an MVR receiver port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>mvr</td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport mode trunk</td>
</tr>
<tr>
<td></td>
<td>mvr type receiver</td>
</tr>
<tr>
<td>Step 5</td>
<td>mvr vlan source-vlan-id receiver vlan receiver-vlan-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>mvr vlan vlan-id group ip-address receiver vlan-id</td>
</tr>
<tr>
<td>Step 7</td>
<td>end</td>
</tr>
<tr>
<td>Step 8</td>
<td>show mvr</td>
</tr>
<tr>
<td>Step 8</td>
<td>show mvr interface</td>
</tr>
<tr>
<td>Step 9</td>
<td>show mvr members</td>
</tr>
<tr>
<td>Step 10</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to configure a port as an MVR trunk receiver port, assign it to a VLAN, configure the port to be a static member of a group, and verify the results.

```
Switch(config)# mvr
Switch(config)# interface fastethernet 0/10
Switch(config)# switchport mode trunk
Switch(config)# mvr type receiver
Switch(config)# mvr vlan 100 receiver vlan 201
Switch(config)# mvr vlan 100 group 239.1.1.1 receiver vlan 201
Switch(config)# end
Switch# show mvr interface
```

To return the interface to its default settings, use the `no mvr [type | immediate | vlan vlan-id | group] interface configuration command`. 
Chapter 22  Configuring IGMP Snooping and MVR

Displaying MVR Information

You can display MVR information for the switch or for a specified interface. Beginning in privileged EXEC mode, use the commands in Table 22-6 to display MVR configuration:

Table 22-6  Commands for Displaying MVR Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mvr</td>
<td>Displays MVR status and values for the switch—whether MVR is enabled or disabled, the multicast VLAN, the maximum (512) and current (0 through 512) number of multicast groups, the query response time, and the MVR mode.</td>
</tr>
</tbody>
</table>
| show mvr interface [interface-id] [members [vlan vlan-id]] | Displays all MVR interfaces and their MVR configurations. When a specific interface is entered, displays this information:  
  - Type—Receiver or Source  
  - Mode—Access or Trunk  
  - VLAN—The MVR VLAN for the source port and the receiver VLAN for the receiver port  
  - Status—One of these:  
    - Active means the port is part of a VLAN.  
    - Up/Down means that the port is forwarding or nonforwarding.  
    - Inactive means that the port is not part of any VLAN.  
  - Immediate Leave—Enabled or Disabled  
If the members keyword is entered, displays all multicast group members on this port or, if a VLAN identification is entered, all multicast group members on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094. |
| show mvr members [ip-address] | Displays all receiver and source ports that are members of any IP multicast group or the specified IP multicast group IP address. |

Configuring IGMP Filtering and Throttling

In some environments, for example, metropolitan or multiple-dwelling unit (MDU) installations, you might want to control the set of multicast groups to which a user on a switch port can belong. You can control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan. You might also want to limit the number of multicast groups to which a user on a switch port can belong.

With the IGMP filtering feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual switch ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a switch port, the IGMP join report requesting the stream of IP multicast traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing. You can also set the maximum number of IGMP groups that a Layer 2 interface can join.
IGMP filtering controls only group-specific query and membership reports, including join and leave reports. It does not control general IGMP queries. IGMP filtering has no relationship with the function that directs the forwarding of IP multicast traffic. The filtering feature operates in the same manner whether IGMP or MVR is used to forward the multicast traffic.

IGMP filtering is applicable only to the dynamic learning of IP multicast group addresses, not static configuration.

With the IGMP throttling feature, you can set the maximum number of IGMP groups that a Layer 2 interface can join. If the maximum number of IGMP groups is set, the IGMP snooping forwarding table contains the maximum number of entries, and the interface receives an IGMP join report, you can configure an interface to drop the IGMP report or to replace the randomly selected multicast entry with the received IGMP report.

**Note**

IGMPv3 join and leave messages are not supported on switches running IGMP filtering.

These sections contain this configuration information:

- Default IGMP Filtering and Throttling Configuration, page 22-24
- Configuring IGMP Profiles, page 22-25 (optional)
- Applying IGMP Profiles, page 22-26 (optional)
- Setting the Maximum Number of IGMP Groups, page 22-26 (optional)
- Configuring the IGMP Throttling Action, page 22-27 (optional)

## Default IGMP Filtering and Throttling Configuration

Table 22-7 shows the default IGMP filtering configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP filters</td>
<td>None applied</td>
</tr>
<tr>
<td>IGMP maximum number of IGMP groups</td>
<td>No maximum set</td>
</tr>
<tr>
<td>IGMP profiles</td>
<td>None defined</td>
</tr>
<tr>
<td>IGMP profile action</td>
<td>Deny the range addresses</td>
</tr>
</tbody>
</table>

When the maximum number of groups is in forwarding table, the default IGMP throttling action is to deny the IGMP report. For configuration guidelines, see the “Configuring the IGMP Throttling Action” section on page 22-27.
Configuring IGMP Profiles

To configure an IGMP profile, use the `ip igmp profile` global configuration command with a profile number to create an IGMP profile and to enter IGMP profile configuration mode. From this mode, you can specify the parameters of the IGMP profile to be used for filtering IGMP join requests from a port.

When you are in IGMP profile configuration mode, you can create the profile by using these commands:

- **deny**: Specifies that matching addresses are denied; this is the default.
- **exit**: Exits from igmp-profile configuration mode.
- **no**: Negates a command or returns to its defaults.
- **permit**: Specifies that matching addresses are permitted.
- **range**: Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with a start and an end address.

The default is for the switch to have no IGMP profiles configured. When a profile is configured, if neither the **permit** nor **deny** keyword is included, the default is to deny access to the range of IP addresses.

Beginning in privileged EXEC mode, follow these steps to create an IGMP profile:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip igmp profile profile number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>permit</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>range ip multicast address</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show ip igmp profile profile number</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To delete a profile, use the **no ip igmp profile profile number** global configuration command.

To delete an IP multicast address or range of IP multicast addresses, use the **no range ip multicast address** IGMP profile configuration command.

This example shows how to create IGMP profile 4 allowing access to the single IP multicast address and how to verify the configuration. If the action was to deny (the default), it would not appear in the **show ip igmp profile** output display.

```
Switch(config)# ip igmp profile 4
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 229.9.9.0
Switch(config-igmp-profile)# end
Switch# show ip igmp profile 4
IGMP Profile 4
  permit
  range 229.9.9.0 229.9.9.0
```
Applying IGMP Profiles

To control access as defined in an IGMP profile, use the `ip igmp filter` interface configuration command to apply the profile to the appropriate interfaces. You can apply IGMP profiles only to Layer 2 access ports; you cannot apply IGMP profiles to routed ports or SVIs. You cannot apply profiles to ports that belong to an EtherChannel port group. You can apply a profile to multiple interfaces, but each interface can have only one profile applied to it.

Beginning in privileged EXEC mode, follow these steps to apply an IGMP profile to a switch port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>ip igmp filter profile number</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show running-config interface interface-id</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove a profile from an interface, use the `no ip igmp filter profile number` interface configuration command.

This example shows how to apply IGMP profile 4 to a port:

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip igmp filter 4
Switch(config-if)# end
```

Setting the Maximum Number of IGMP Groups

You can set the maximum number of IGMP groups that a Layer 2 interface can join by using the `ip igmp max-groups` interface configuration command. Use the `no` form of this command to set the maximum back to the default, which is no limit.

This restriction can be applied to Layer 2 ports only; you cannot set a maximum number of IGMP groups on routed ports or SVIs. You can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.
Beginning in privileged EXEC mode, follow these steps to set the maximum number of IGMP groups in the forwarding table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2  interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or a EtherChannel interface.</td>
</tr>
<tr>
<td>Step 3  no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4  ip igmp max-groups number</td>
<td>Set the maximum number of IGMP groups that the interface can join. The range is 0 to 4294967294. The default is to have no maximum set.</td>
</tr>
<tr>
<td>Step 5  end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6  show running-config interface interface-id</td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>Step 7  copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the maximum group limitation and return to the default of no maximum, use the `no ip igmp max-groups` interface configuration command.

This example shows how to limit to 25 the number of IGMP groups that a port can join.

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)# end
```

**Configuring the IGMP Throttling Action**

After you set the maximum number of IGMP groups that a Layer 2 interface can join, you can configure an interface to replace the existing group with the new group for which the IGMP report was received by using the `ip igmp max-groups action replace` interface configuration command. Use the `no` form of this command to return to the default, which is to drop the IGMP join report.

Follow these guidelines when configuring the IGMP throttling action:

- This restriction can be applied only to Layer 2 ports. You can use this command on a logical EtherChannel interface but cannot use it on ports that belong to an EtherChannel port group.
- When the maximum group limitation is set to the default (no maximum), entering the `ip igmp max-groups action [deny | replace]` command has no effect.
- If you configure the throttling action and set the maximum group limitation after an interface has added multicast entries to the forwarding table, the forwarding-table entries are either aged out or removed, depending on the throttling action.
  - If you configure the throttling action as `deny`, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out and the maximum number of entries is in the forwarding table, the switch drops the next IGMP report received on the interface.
  - If you configure the throttling action as `replace`, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the switch replaces a randomly selected entry with the received IGMP report.
To prevent the switch from removing the forwarding-table entries, you can configure the IGMP throttling action before an interface adds entries to the forwarding table.

Beginning in privileged EXEC mode, follow these steps to configure the throttling action when the maximum number of entries is in the forwarding table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify the physical interface to be configured, and enter interface configuration mode. The interface can be a Layer 2 port that does not belong to an EtherChannel group or an EtherChannel interface. The interface cannot be a trunk port.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no shutdown</td>
</tr>
<tr>
<td></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip igmp max-groups action {deny</td>
</tr>
<tr>
<td></td>
<td>When an interface receives an IGMP report and the maximum number of entries is in the forwarding table, specify the action that the interface takes:</td>
</tr>
<tr>
<td></td>
<td>• deny—Drop the report.</td>
</tr>
<tr>
<td></td>
<td>• replace—Replace the existing group with the new group for which the IGMP report was received.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show running-config interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default action of dropping the report, use the **no ip igmp max-groups action** interface configuration command.

This example shows how to configure a port to remove a randomly selected multicast entry in the forwarding table and to add an IGMP group to the forwarding table when the maximum number of entries is in the table.

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip igmp max-groups action replace
Switch(config-if)# end
```
Displaying IGMP Filtering and Throttling Configuration

You can display IGMP profile characteristics, and you can display the IGMP profile and maximum group configuration for all interfaces on the switch or for a specified interface. You can also display the IGMP throttling configuration for all interfaces on the switch or for a specified interface.

Use the privileged EXEC commands in Table 22-8 to display IGMP filtering and throttling configuration:

Table 22-8 Commands for Displaying IGMP Filtering and Throttling Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip igmp profile [profile number]</td>
<td>Displays the specified IGMP profile or all the IGMP profiles defined on the switch.</td>
</tr>
<tr>
<td>show running-config [interface interface-id]</td>
<td>Displays the configuration of the specified interface or the configuration of all interfaces on the switch, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface.</td>
</tr>
</tbody>
</table>
Configuring Port-Based Traffic Control

This chapter describes how to configure the port-based traffic control features on the Cisco ME 3400E Ethernet Access switch.

**Note**

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Configuring Storm Control, page 23-1
- Configuring Protected Ports, page 23-5
- Configuring Port Blocking, page 23-6
- Configuring Port Security, page 23-8
- Displaying Port-Based Traffic Control Settings, page 23-17

### Configuring Storm Control

- Understanding Storm Control, page 23-1
- Default Storm Control Configuration, page 23-3
- Configuring Storm Control and Threshold Levels, page 23-3

#### Understanding Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation or in the network configuration can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

Storm control uses one of these methods to measure traffic activity:
- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

**Note**
When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

The graph in Figure 23-1 shows broadcast traffic patterns on an interface over a given period of time. The example can also be applied to multicast and unicast traffic. In this example, the broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

![Figure 23-1 Broadcast Storm Control Example](image)

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

**Note**
Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the `storm-control` interface configuration commands to set the threshold value for each traffic type.
Default Storm Control Configuration

By default, unicast, broadcast, and multicast storm control are disabled on the switch interfaces; that is, the suppression level is 100 percent.

Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

Note

The ME 3400E switch does not require additional configuration to cause the switch storm-control counters to increment for small frames because the storm-control feature correctly handles small frames.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

Note

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Beginning in privileged EXEC mode, follow these steps to storm control and threshold levels:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td></td>
</tr>
<tr>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, user network interfaces (UNIs) and enhanced network interfaces (ENIs) are disabled, and network node interfaces (NNIs) are enabled.</td>
</tr>
</tbody>
</table>
Step 4

```
storm-control {broadcast | multicast | unicast} level {level [level-low] | bps bps [bps-low] | pps pps [pps-low]}
```

Configure broadcast, multicast, or unicast storm control. By default, storm control is disabled.

The keywords have these meanings:

- For `level`, specify the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is `0.00 to 100.00`.

- (Optional) For `level-low`, specify the falling threshold level as a percentage (up to two decimal places) of the bandwidth. **This value must be less than or equal to the rising suppression value.** The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is `0.00 to 100.00`.

If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.

- For `bps bps`, specify the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is `0.0 to 10000000000.0`.

- (Optional) For `bps-low`, specify the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is `0.0 to 10000000000.0`.

- For `pps pps`, specify the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is `0.0 to 10000000000.0`.

- (Optional) For `pps-low`, specify the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is `0.0 to 10000000000.0`.

For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.

Step 5

```
storm-control action {shutdown | trap}
```

Specify the action to be taken when a storm is detected. The default is to filter out the traffic and not to send traps.

- Select the `shutdown` keyword to error-disable the port during a storm.
- Select the `trap` keyword to generate an SNMP trap when a storm is detected.

Step 6

```
end
```

Return to privileged EXEC mode.

Step 7

```
show storm-control [interface-id] [broadcast | multicast | unicast]
```

Verify the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, broadcast storm control settings are displayed.

Step 8

```
copy running-config startup-config
```

(Optional) Save your entries in the configuration file.
To disable storm control, use the `no storm-control {broadcast | multicast | unicast} level` interface configuration command.

This example shows how to enable unicast storm control on a port with an 87-percent rising suppression level and a 65-percent falling suppression level:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# storm-control unicast level 87 65
```

This example shows how to enable broadcast address storm control on a port to a level of 20 percent. When the broadcast traffic exceeds the configured level of 20 percent of the total available bandwidth of the port within the traffic-storm-control interval, the switch drops all broadcast traffic until the end of the traffic-storm-control interval:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# storm-control broadcast level 20
```

### Configuring Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

**Note**

NNIs default to non-protected ports. Since UNIs and ENIs provide port isolation, protected port is not available on UNI and ENI ports. For more information about port types, see the “UNI, NNI, and ENI Port Types” section on page 10-2.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.
- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

These sections contain this configuration information:

- Default Protected Port Configuration, page 23-5
- Protected Port Configuration Guidelines, page 23-6
- Configuring a Protected Port, page 23-6

### Default Protected Port Configuration

The default is to have no protected ports defined.
Protected Port Configuration Guidelines

You can configure protected ports on a physical interface that is configured as an NNI (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

Do not configure a private-VLAN port as a protected port. Do not configure a protected port as a private-VLAN port. A private-VLAN isolated port does not forward traffic to other isolated ports or community ports. For more information about private VLANs, see Chapter 13, “Configuring Private VLANs.”

Configuring a Protected Port

Beginning in privileged EXEC mode, follow these steps to define a port as a protected port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport protected</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To disable protected port, use the no switchport protected interface configuration command.

This example shows how to configure a port as a protected port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport protected
Switch(config-if)# end
```

This example shows how to configure a FastEthernet port as a protected port.

```
Switch# configure terminal
Switch(config)# interface fastethernet 0/1
Switch(config-if)# port-type NNI
Switch(config-if)# no shutdown
Switch(config-if)# switchport protected
Switch(config-if)# end
```

Configuring Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.
These sections contain this configuration information:

- Default Port Blocking Configuration, page 23-7
- Blocking Flooded Traffic on an Interface, page 23-7

## Default Port Blocking Configuration

The default is to not block flooding of unknown multicast and unicast traffic out of a port, but to flood these packets to all ports.

## Blocking Flooded Traffic on an Interface

**Note** The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

Beginning in privileged EXEC mode, follow these steps to disable the flooding of multicast and unicast packets out of an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no shutdown</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport block multicast</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>switchport block unicast</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show interfaces interface-id switchport</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return the interface to the default condition where no traffic is blocked and normal forwarding occurs on the port, use the `no switchport block {multicast | unicast}` interface configuration commands.

This example shows how to block unicast and multicast flooding on a port:

```
Switch# configure terminal
Switch(config)# interface fastethernet0/1
Switch(config-if)# no shutdown
Switch(config-if)# switchport block multicast
Switch(config-if)# switchport block unicast
Switch(config-if)# end
```
Configuring Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

These sections contain this conceptual and configuration information:

・ Understanding Port Security, page 23-8
・ Default Port Security Configuration, page 23-10
・ Port Security Configuration Guidelines, page 23-10
・ Enabling and Configuring Port Security, page 23-11
・ Enabling and Configuring Port Security Aging, page 23-15
・ Port Security and Private VLANs, page 23-16

Understanding Port Security

- Secure MAC Addresses, page 23-8
- Security Violations, page 23-9

Secure MAC Addresses

You configure the maximum number of secure addresses allowed on a port by using the switchport port-security maximum value interface configuration command.

**Note**

If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

The switch supports these types of secure MAC addresses:

・ Static secure MAC addresses—These are manually configured by using the switchport port-security mac-address mac-address interface configuration command, stored in the address table, and added to the switch running configuration.
・ Dynamic secure MAC addresses—These are dynamically configured, stored only in the address table, and removed when the switch restarts.
・ Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.
You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration by enabling sticky learning. To enable sticky learning, enter the `switchport port-security mac-address sticky` interface configuration command. When you enter this command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

The maximum number of secure MAC addresses that you can configure on a switch is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. See Chapter 7, “Configuring SDM Templates.” This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

### Security Violations

It is a security violation when one of these situations occurs:

- The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.
- An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

- **protect**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.
  
  **Note:** We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- **restrict**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown**—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments. When a secure port is in the error-disabled state, you can bring it out of this state by entering the `errdisable recovery cause psecure-violation` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands. This is the default mode.
Table 23-1 shows the violation mode and the actions taken when you configure an interface for port security.

### Table 23-1 Security Violation Mode Actions

<table>
<thead>
<tr>
<th>Violation Mode</th>
<th>Traffic is forwarded</th>
<th>Sends SNMP trap</th>
<th>Sends syslog message</th>
<th>Displays error message</th>
<th>Violation counter increments</th>
<th>Shuts down port</th>
</tr>
</thead>
<tbody>
<tr>
<td>protect</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>restrict</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>shutdown</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

1. Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.
2. The switch returns an error message if you manually configure an address that would cause a security violation.

### Default Port Security Configuration

Table 23-2 shows the default port security configuration for an interface.

### Table 23-2 Default Port Security Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port security</td>
<td>Disabled on a port.</td>
</tr>
<tr>
<td>Sticky address learning</td>
<td>Disabled.</td>

<td>Shutdown. The port shuts down when the maximum number of secure MAC addresses is exceeded.</td>
</tr>
<tr>
<td>Port security aging</td>
<td>Disabled. Aging time is 0. Static aging is disabled. Type is absolute.</td>
</tr>
</tbody>
</table>

### Port Security Configuration Guidelines

- Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Fast EtherChannel or a Gigabit EtherChannel port group.
- A secure port cannot be a private-VLAN port.
- When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the `switchport voice` and `switchport priority extend` interface configuration commands has no effect.

When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.
When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

The switch does not support port security aging of sticky secure MAC addresses.

Table 23-3 summarizes port security compatibility with other port-based features.

**Table 23-3 Port Security Compatibility with Other Switch Features**

<table>
<thead>
<tr>
<th>Type of Port or Feature on Port</th>
<th>Compatible with Port Security</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trunk port</td>
<td>Yes</td>
</tr>
<tr>
<td>Dynamic-access port (a VLAN Query Protocol [VQP] port configured with the switchport access vlan dynamic interface configuration command)</td>
<td>No</td>
</tr>
<tr>
<td>Routed port</td>
<td>No</td>

</tbody>
</table>

**Enabling and Configuring Port Security**

Beginning in privileged EXEC mode, follow these steps to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 switchport mode {access</td>
<td>trunk}</td>
</tr>
<tr>
<td>Step 5 switchport port-security</td>
<td>Enable port security on the interface.</td>
</tr>
</tbody>
</table>
Configuring Port Security

### Step 6

**Command**

```
switchport port-security [maximum] value [vlan vlan-list | access]
```

**Purpose**

(Optional) Set the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch is set by the maximum number of available MAC addresses allowed in the system. This number is set by the active Switch Database Management (SDM) template. See Chapter 7, “Configuring SDM Templates.” This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

(Optional) `vlan`—set a per-VLAN maximum value.

Enter one of these options after you enter the `vlan` keyword:

- `vlan-list`—On a trunk port, you can set a per-VLAN maximum value on a range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.
- `access`—On an access port, specify the VLAN as an access VLAN.

### Step 7

**Command**

```
switchport port-security violation {protect | restrict | shutdown}
```

**Purpose**

(Optional) Set the violation mode, the action to be taken when a security violation is detected, as one of these:

- `protect`—When the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

  **Note** We do not recommend configuring the `protect` mode on a trunk port. The `protect` mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- `restrict`—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- `shutdown`—The interface is error-disabled when a violation occurs, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

  **Note** When a secure port is in the error-disabled state, you can bring it out of this state by entering the `errdisable recovery cause psecure-violation` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands.
To return the interface to the default condition as not a secure port, use the **no switchport port-security** interface configuration command. If you enter this command when sticky learning is enabled, the sticky secure addresses remain part of the running configuration but are removed from the address table. All addresses are now dynamically learned.

To return the interface to the default number of secure MAC addresses, use the **no switchport port-security maximum value** interface configuration command. To return the violation mode to the default condition (shutdown mode), use the **no switchport port-security violation {protocol | restrict}** interface configuration command.
To disable sticky learning on an interface, use the `no switchport port-security mac-address sticky` interface configuration command. The interface converts the sticky secure MAC addresses to dynamic secure addresses. However, if you have previously saved the configuration with the sticky MAC addresses, you should save the configuration again after entering the `no switchport port-security mac-address sticky` command, or the sticky addresses will be restored if the switch reboots.

Use the `clear port-security {all | configured | dynamic | sticky}` privileged EXEC command to delete from the MAC address table all secure addresses or all secure addresses of a specific type (configured, dynamic, or sticky) on the switch or on an interface.

To delete a specific secure MAC address from the address table, use the `no switchport port-security mac-address mac-address` interface configuration command.

To delete all dynamic secure addresses on an interface from the address table, enter the `no switchport port-security` interface configuration command followed by the `switchport port-security` command (to re-enable port security on the interface). If you use the `no switchport port-security mac-address sticky` interface configuration command to convert sticky secure MAC addresses to dynamic secure MAC addresses before entering the `no switchport port-security` command, all secure addresses on the interface except those that were manually configured are deleted.

You must specifically delete configured secure MAC addresses from the address table by using the `no switchport port-security mac-address mac-address` interface configuration command.

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 50
Switch(config-if)# switchport port-security mac-address sticky
```

This example shows how to configure a static secure MAC address on VLAN 3 on a port:

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 0000.02000.0004 vlan 3
```

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN, and to set the total maximum number of secure addresses to 10.

```
Switch(config)# interface FastEthernet0/1
Switch(config-if)# no shutdown
Switch(config-if)# switchport access vlan 21
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 10
Switch(config-if)# switchport port-security violation restrict
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0002
Switch(config-if)# switchport port-security mac-address 0000.0000.0003
Switch(config-if)# switchport port-security maximum 10 vlan access
```
Enabling and Configuring Port Security Aging

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

- **Absolute**—The secure addresses on the port are deleted after the specified aging time.
- **Inactivity**—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

Use this feature to remove and add devices on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of secure addresses on a per-port basis.

Beginning in privileged EXEC mode, follow these steps to configure port security aging:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no shutdown</td>
</tr>
<tr>
<td></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport port-security aging {static</td>
</tr>
<tr>
<td></td>
<td>Enable or disable static aging for the secure port, or set the aging time or type.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The switch does not support port security aging of sticky secure addresses.</td>
</tr>
<tr>
<td></td>
<td>Enter static to enable aging for statically configured secure addresses on this port.</td>
</tr>
<tr>
<td></td>
<td>For time, specify the aging time for this port. The valid range is from 0 to 1440 minutes.</td>
</tr>
<tr>
<td></td>
<td>For type, select one of these keywords:</td>
</tr>
<tr>
<td></td>
<td>- <strong>absolute</strong>—Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified lapses and are removed from the secure address list.</td>
</tr>
<tr>
<td></td>
<td>- <strong>inactivity</strong>—Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source addresses for the specified time period.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show port-security [interface interface-id] [address]</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable port security aging for all secure addresses on a port, use the **no switchport port-security aging time** interface configuration command. To disable aging for only statically configured secure addresses, use the **no switchport port-security aging static** interface configuration command.
This example shows how to set the aging time as 2 hours for the secure addresses on a port:

```bash
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport port-security aging time 120
```

This example shows how to set the aging time as 2 minutes for the inactivity aging type with aging enabled for the configured secure addresses on the interface:

```bash
Switch(config-if)# switchport port-security aging time 2
Switch(config-if)# switchport port-security aging type inactivity
Switch(config-if)# switchport port-security aging static
```

You can verify the previous commands by entering the `show port-security interface interface-id` privileged EXEC command.

### Port Security and Private VLANs

Port security allows an administrator to limit the number of MAC addresses learned on a port or to define which MAC addresses can be learned on a port.

Beginning in privileged EXEC mode, follow these steps to configure port security on a PVLAN host and promiscuous ports:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 switchport mode private-vlan {host</td>
<td>promiscuous}</td>
</tr>
<tr>
<td>Step 4 switchport port-security</td>
<td>Enable port security on the interface.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show port-security [interface interface-id] [address]</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

```bash
Switch(config)# interface GigabitEthernet 0/8
Switch(config-if)# switchport private-vlan mapping 2061 2201-2206,3101
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport port-security maximum 288
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security violation restrict
```

**Note**

Ports that have both port security and private VLANs configured can be labeled secure PVLAN ports. When a secure address is learned on a secure PVLAN port, the same secure address cannot be learned on another secure PVLAN port belonging to the same primary VLAN. However, an address learned on unsecure PVLAN port can be learned on a secure PVLAN port belonging to same primary VLAN.

Secure addresses that are learned on host port get automatically replicated on associated primary VLANs, and similarly, secure addresses learned on promiscuous ports automatically get replicated on all associated secondary VLANs. Static addresses (using mac-address-table static command) cannot be user configured on a secure port.
**Displaying Port-Based Traffic Control Settings**

The `show interfaces interface-id switchport` privileged EXEC command displays (among other characteristics) the interface traffic suppression and control configuration. The `show storm-control` and `show port-security` privileged EXEC commands display those storm control and port security settings.

To display traffic control information, use one or more of the privileged EXEC commands in Table 23-4.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces [interface-id] switchport</code></td>
<td>Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.</td>
</tr>
<tr>
<td>`show storm-control [interface-id] [broadcast</td>
<td>multicast</td>
</tr>
<tr>
<td><code>show port-security [interface interface-id]</code></td>
<td>Displays port security settings for the switch or for the specified interface, including the maximum allowed number of secure MAC addresses for each interface, the number of secure MAC addresses on the interface, the number of security violations that have occurred, and the violation mode.</td>
</tr>
<tr>
<td><code>show port-security [interface interface-id] address</code></td>
<td>Displays all secure MAC addresses configured on all switch interfaces or on a specified interface with aging information for each address.</td>
</tr>
<tr>
<td><code>show port-security interface interface-id vlan</code></td>
<td>Displays the number of secure MAC addresses configured per VLAN on the specified interface.</td>
</tr>
</tbody>
</table>
 CHAPTER 24

Configuring CDP

This chapter describes how to configure Cisco Discovery Protocol (CDP) on the Cisco ME 3400E Ethernet Access switch.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the “System Management Commands” section in the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

This chapter consists of these sections:
- Understanding CDP, page 24-1
- Configuring CDP, page 24-2
- Monitoring and Maintaining CDP, page 24-5

Understanding CDP

CDP is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches) and allows network management applications to discover Cisco devices that are neighbors of already known devices. With CDP, network management applications can learn the device type and the Simple Network Management Protocol (SNMP) agent address of neighboring devices running lower-layer, transparent protocols. This feature enables applications to send SNMP queries to neighboring devices.

CDP runs on all media that support Subnetwork Access Protocol (SNAP). Because CDP runs over the data-link layer only, two systems that support different network-layer protocols can learn about each other.

On the Cisco ME switch, CDP is enabled by default on network node interfaces (NNIs) and disabled by default on enhanced network interfaces (ENIs). It is not supported on user network interfaces (UNIs).

Each CDP-configured device sends periodic messages to a multicast address, advertising at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or holdtime information, which is the length of time a receiving device holds CDP information before discarding it. Each device also listens to the messages sent by other devices to learn about neighboring devices.

The switch supports CDP Version 2.
Configuring CDP

These sections contain this configuration information:

- Default CDP Configuration, page 24-2
- Configuring the CDP Characteristics, page 24-2
- Disabling and Enabling CDP, page 24-3
- Disabling and Enabling CDP on an Interface, page 24-4

Default CDP Configuration

Table 24-1 shows the default CDP configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDP global state</td>
<td>Enabled.</td>
</tr>
<tr>
<td>CDP interface state</td>
<td>Enabled only on NNIs; disabled on ENIs</td>
</tr>
<tr>
<td>CDP timer (packet update frequency)</td>
<td>60 seconds</td>
</tr>
<tr>
<td>CDP holdtime (before discarding)</td>
<td>180 seconds</td>
</tr>
<tr>
<td>CDP Version-2 advertisements</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

Note: CDP is not supported on UNIs.

Configuring the CDP Characteristics

You can configure the frequency of CDP updates, the amount of time to hold the information before discarding it, and whether or not to send Version-2 advertisements.

Beginning in privileged EXEC mode, follow these steps to configure the CDP timer, holdtime, and advertisement type.

```
Step 1  configure terminal
Enter global configuration mode.

Step 2  cdp timer seconds
(Optional) Set the transmission frequency of CDP updates in seconds.
The range is 5 to 254; the default is 60 seconds.

Step 3  cdp holdtime seconds
(Optional) Specify the amount of time a receiving device should hold the information sent by your device before discarding it.
The range is 10 to 255 seconds; the default is 180 seconds.

Step 4  cdp advertise-v2
(Optional) Configure CDP to send Version-2 advertisements.
This is the default state.
```

Note: Steps 2 through 4 are all optional and can be performed in any order.
Use the no form of the CDP commands to return to the default settings.

This example shows how to configure CDP characteristics.

```
Switch# configure terminal
Switch(config)# cdp timer 50
Switch(config)# cdp holdtime 120
Switch(config)# cdp advertise-v2
Switch(config)# end
```

For additional CDP show commands, see the “Monitoring and Maintaining CDP” section on page 24-5.

## Disabling and Enabling CDP

CDP is enabled by default on NNIs. It is disabled by default on ENIs but can be enabled.

**Note**

Cisco devices (such as Cisco IP Phones) regularly exchange CDP messages with connected devices. Disabling CDP can interrupt device connectivity.

Beginning in privileged EXEC mode, follow these steps to globally disable the CDP device discovery capability:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>step 2 no cdp run</td>
<td>Disable CDP.</td>
</tr>
<tr>
<td>step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to globally enable CDP when it has been disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>step 2 cdp run</td>
<td>Enable CDP after disabling it.</td>
</tr>
<tr>
<td>step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

This example shows how to globally enable CDP if it has been disabled.

```
Switch# configure terminal
Switch(config)# cdp run
Switch(config)# end
```
Disabling and Enabling CDP on an Interface

CDP is enabled by default on NNIs to send and to receive CDP information. You can enable CDP on ENIs, but it is not supported on UNIs. Beginning in privileged EXEC mode, follow these steps to disable CDP on a port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>no cdp enable</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to enable CDP on a port when it has been disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>cdp enable</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to enable CDP on a port when it has been disabled.

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# cdp enable
Switch(config-if)# end
```

This example shows how to change a UNI to an ENI and enable CDP on the port.

```
Switch# configure terminal
Switch(config)# interface fastethernet0/1
Switch(config-if)# port-type eni
Switch(config-if)# cdp enable
Switch(config-if)# end
```
Monitoring and Maintaining CDP

To monitor and maintain CDP on your device, perform one or more of these tasks, beginning in privileged EXEC mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear cdp counters</td>
<td>Reset the traffic counters to zero.</td>
</tr>
<tr>
<td>clear cdp table</td>
<td>Delete the CDP table of information about neighbors.</td>
</tr>
<tr>
<td>show cdp</td>
<td>Display global information, such as frequency of transmissions and the holdtime for packets being sent.</td>
</tr>
<tr>
<td>show cdp entry entry-name</td>
<td>Display information about a specific neighbor. You can enter an asterisk (*) to display all CDP neighbors, or you can enter the name of the neighbor about which you want information. You can also limit the display to information about the protocols enabled on the specified neighbor or information about the version of software running on the device.</td>
</tr>
<tr>
<td>show cdp interface [interface-id]</td>
<td>Display information about interfaces where CDP is enabled. You can limit the display to the interface about which you want information.</td>
</tr>
<tr>
<td>show cdp neighbors [interface-id] [detail]</td>
<td>Display information about neighbors, including device type, interface type and number, holdtime settings, capabilities, platform, and port ID. You can limit the display to neighbors of a specific interface or expand the display to provide more detailed information.</td>
</tr>
<tr>
<td>show cdp traffic</td>
<td>Display CDP counters, including the number of packets sent and received and checksum errors.</td>
</tr>
</tbody>
</table>
Configuring LLDP and LLDP-MED

This chapter describes how to configure the Link Layer Discovery Protocol (LLDP) and LLDP Media Endpoint Discovery (LLDP-MED) on the Cisco ME 3400E switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the “System Management Commands” section in the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

This chapter consists of these sections:
- Understanding LLDP and LLDP-MED, page 25-1

Understanding LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as TLVs. LLDP supported devices can use TLVs to receive and send information to their neighbors. Details such as configuration information, device capabilities, and device identity can be advertised using this protocol.
Understanding LLDP and LLDP-MED

LLDP is enabled by default on network node interfaces (NNIs). It is disabled on enhanced network interfaces (ENIs), but you can enable it. LLDP is not supported on user network interfaces (UNIs).

The switch supports these basic management TLVs. These are mandatory LLDP TLVs.

- Port description TLV
- System name TLV
- System description
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV ((IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV(IEEE 802.3 organizationally specific TLVs)

**Understanding LLDP-MED**

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as switches. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, and inventory management.

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV
  Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and what capabilities the device has enabled.

- Network policy TLV
  Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect into any switch, obtain its VLAN number, and then start communicating with the call control.

- Power management TLV
  Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows switches and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

- Inventory management TLV
  Allows an endpoint to transmit detailed inventory information about itself to the switch, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.
• Location TLV
  Provides location information from the switch to the endpoint device. The location TLV can send this information:
  - Civic location information
    Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.
  - ELIN location information
    Provides the location information of a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

**Configuring LLDP and LLDP-MED**

- Default LLDP Configuration, page 25-3
- Configuring LLDP Characteristics, page 25-4
- Disabling and Enabling LLDP Globally, page 25-5
- Disabling and Enabling LLDP on an Interface, page 25-5
- Configuring LLDP-MED TLVs, page 25-6

**Default LLDP Configuration**

Table 25-1 shows the default LLDP configuration. To change the default settings, use the LLDP global configuration and LLDP interface configuration commands.

<table>
<thead>
<tr>
<th>Feature</th>

Chapter 25  Configuring LLDP and LLDP-MED

Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, and the initialization delay time. You can also select the LLDP and LLDP-MED TLVs to be sent and received.

Beginning in privileged EXEC mode, follow these steps to configure these characteristics:

**Note**

Steps 2 through 5 are all optional and can be performed in any order.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 lldp holdtime seconds</td>
<td>(Optional) Specify the amount of time a receiving device should hold the information sent by your device before discarding it. The range is 0 to 65535 seconds; the default is 120 seconds.</td>
</tr>
<tr>
<td>Step 3 lldp reinit</td>
<td>(Optional) Specify the delay time in seconds for LLDP to initialize on any interface. The range is 2 to 5 seconds; the default is 2 seconds.</td>
</tr>
<tr>
<td>Step 4 lldp timer seconds</td>
<td>(Optional) Set the transmission frequency of LLDP updates in seconds. The range is 5 to 65534 seconds; the default is 30 seconds.</td>
</tr>
<tr>
<td>Step 5 lldp tlv-select</td>
<td>(Optional) Specify the LLDP TLVs to send or receive.</td>
</tr>
<tr>
<td>Step 6 lldp med-tlv-select</td>
<td>(Optional) Specify the LLDP-MED TLVs to send or receive.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the **no** form of each of the LLDP commands to return to the default setting.

This example shows how to configure LLDP characteristics.

```
Switch# configure terminal
Switch(config)# lldp holdtime 120
Switch(config)# lldp reinit 2
Switch(config)# lldp timer 30
Switch(config)# end
```

For additional LLDP **show** commands, see the “Monitoring and Maintaining LLDP and LLDP-MED” section on page 25-8.
Disabling and Enabling LLDP Globally

LLDP is disabled globally by default and is enabled on NNIs. It is disabled by default on ENIs, but can be enabled per interface. LLDP is not supported on UNIs.

Beginning in privileged EXEC mode, follow these steps to globally disable LLDP:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 no lldp run</td>
<td>Disable LLDP.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to enable LLDP-MED when it has been disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 lldp run</td>
<td>Enable LLDP.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

This example shows how to globally disable LLDP.

Switch# configure terminal
Switch(config)# no lldp run
Switch(config)# end

This example shows how to globally enable LLDP.

Switch# configure terminal
Switch(config)# lldp run
Switch(config)# end

Disabling and Enabling LLDP on an Interface

LLDP is disabled by default on all NNIs to send and to receive LLDP information. It is disabled by default on ENIs, but it can be enabled by entering the lldp transmit and lldp receive interface configuration commands. LLDP is not supported on UNIs.

Note: If the interface is configured as a tunnel port, LLDP is automatically disabled.

Beginning in privileged EXEC mode, follow these steps to disable LLDP on an interface.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface on which you are disabling LLDP, and enter interface configuration mode. The interface must be an NNI or ENI for the lldp commands to be available.</td>
</tr>
</tbody>
</table>
Configuring LLDP and LLDP-MED

Beginning in privileged EXEC mode, follow these steps to enable LLDP on an interface when it has been disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3 no lldp transmit</td>
<td>No LLDP packets are sent on the interface.</td>
</tr>
<tr>
<td>Step 4 no lldp receive</td>
<td>No LLDP packets are received on the interface.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to enable LLDP on an interface.

```plaintext
Switch# configure terminal
Switch(config)# interface GigabitEthernet1/0/1
Switch(config-if)# no shutdown
Switch(config-if)# port-type nni
Switch(config-if)# lldp transmit
Switch(config-if)# lldp receive
Switch(config-if)# end
```

**Configuring LLDP-MED TLVs**

By default, the switch only sends LLDP packets until it receives LLDP-MED packets from the end device. It will then send LLDP packets with MED TLVs as well. When the LLDP-MED entry has been aged out, it only sends LLDP packets again.

Using the `lldp` interface configuration command, you can configure the interface not to send the TLVs listed in Table 25-2.

<table>
<thead>
<tr>
<th>LLDP-MED TLV</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inventory-management</td>
<td>LLDP-MED inventory management TLV</td>
</tr>
<tr>
<td>location</td>
<td>LLDP-MED location TLV</td>
</tr>
</tbody>
</table>
Beginning in privileged EXEC mode, follow these steps to disable a TLV on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no lldp med-tlv-select tlv</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to enable a TLV on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>lldp med-tlv-select tlv</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to enable a TLV on an interface when it has been disabled.

```
Switch# configure terminal
Switch(config)# interface GigabitEthernet1/0/1
Switch(config-if)# lldp med-tlv-select inventory-management
Switch(config-if)# end
```
# Monitoring and Maintaining LLDP and LLDP-MED

To monitor and maintain LLDP and LLDP-MED on your device, perform one or more of these tasks, beginning in privileged EXEC mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear lldp counters</td>
<td>Reset the traffic counters to zero.</td>
</tr>
<tr>
<td>clear lldp table</td>
<td>Delete the LLDP table of information about neighbors.</td>
</tr>
<tr>
<td>show lldp</td>
<td>Display global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time for LLDP to initialize on an interface.</td>
</tr>
<tr>
<td>show lldp entry entry-name</td>
<td>Display information about a specific neighbor. You can enter an asterisk (*) to display all neighbors, or you can enter the name of the neighbor about which you want information.</td>

<td>Display information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID. You can limit the display to neighbors of a specific interface or expand the display to provide more detailed information.</td>
</tr>
<tr>
<td>show lldp traffic</td>
<td>Display LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.</td>
</tr>
</tbody>
</table>
Configuring UDLD

This chapter describes how to configure the UniDirectional Link Detection (UDLD) protocol on the Cisco ME 3400E Ethernet Access switch.

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding UDLD, page 26-1
- Configuring UDLD, page 26-3
- Displaying UDLD Status, page 26-6

Understanding UDLD

UDLD is a Layer 2 protocol that enables devices connected through fiber-optic or twisted-pair Ethernet cables to monitor the physical configuration of the cables and detect when a unidirectional link exists. All connected devices must support UDLD for the protocol to successfully identify and disable unidirectional links. When UDLD detects a unidirectional link, it disables the affected port and alerts you. Unidirectional links can cause a variety of problems, including spanning-tree topology loops.

Modes of Operation

UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD can detect unidirectional links due to misconnected ports on fiber-optic connections. In aggressive mode, UDLD can also detect unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and to misconnected ports on fiber-optic links.

In normal and aggressive modes, UDLD works with the Layer 1 mechanisms to learn the physical status of a link. At Layer 1, autonegotiation takes care of physical signaling and fault detection. UDLD performs tasks that autonegotiation cannot perform, such as detecting the identities of neighbors and shutting down misconnected ports. When you enable both autonegotiation and UDLD, the Layer 1 and Layer 2 detections work together to prevent physical and logical unidirectional connections and the malfunctioning of other protocols.

A unidirectional link occurs whenever traffic sent by a local device is received by its neighbor but traffic from the neighbor is not received by the local device.
In normal mode, UDLD detects a unidirectional link when fiber strands in a fiber-optic port are
mismatched and the Layer 1 mechanisms do not detect this misconnection. If the ports are connected
correctly but the traffic is one way, UDLD does not detect the unidirectional link because the Layer 1
mechanism, which is supposed to detect this condition, does not do so. In this case, the logical link is
considered undetermined, and UDLD does not disable the port.

When UDLD is in normal mode, if one of the fiber strands in a pair is disconnected, as long as
autonegotiation is active, the link does not stay up because the Layer 1 mechanisms detects a physical
problem with the link. In this case, UDLD does not take any action and the logical link is considered
undetermined.

In aggressive mode, UDLD detects a unidirectional link by using the previous detection methods. UDLD
in aggressive mode can also detect a unidirectional link on a point-to-point link on which no failure
between the two devices is allowed. It can also detect a unidirectional link when one of these problems
exists:

- On fiber-optic or twisted-pair links, one of the ports cannot send or receive traffic.
- On fiber-optic or twisted-pair links, one of the ports is down while the other is up.
- One of the fiber strands in the cable is disconnected.

In these cases, UDLD disables the affected port.

In a point-to-point link, UDLD hello packets can be considered as a heartbeat whose presence
guarantees the health of the link. Conversely, the loss of the heartbeat means that the link must be shut
down if it is not possible to re-establish a bidirectional link.

If both fiber strands in a cable are working normally from a Layer 1 perspective, UDLD in aggressive
mode detects whether those fiber strands are connected correctly and whether traffic is flowing
bidirectionally between the correct neighbors. This check cannot be performed by autonegotiation
because autonegotiation operates at Layer 1.

### Methods to Detect Unidirectional Links

UDLD operates by using two mechanisms:

- **Neighbor database maintenance**
  
  UDLD learns about other UDLD-capable neighbors by periodically sending a hello packet (also
called an advertisement or probe) on every active port to keep each device informed about its
neighbors.

  When the switch receives a hello message, it caches the information until the age time (hold time or
time-to-live) expires. If the switch receives a new hello message before an older cache entry ages,
the switch replaces the older entry with the new one.

  Whenever a port is disabled and UDLD is running, whenever UDLD is disabled on a port, or
whenever the switch is reset, UDLD clears all existing cache entries for the ports affected by the
configuration change. UDLD sends at least one message to inform the neighbors to flush the part of
their caches affected by the status change. The message is intended to keep the caches synchronized.

- **Event-driven detection and echoing**
  
  UDLD relies on echoing as its detection mechanism. Whenever a UDLD device learns about a new
neighbor or receives a resynchronization request from an out-of-sync neighbor, it restarts the
detection window on its side of the connection and sends echo messages in reply. Because this
behavior is the same on all UDLD neighbors, the sender of the echoes expects to receive an echo in
reply.
If the detection window ends and no valid reply message is received, the link might shut down, depending on the UDLD mode. When UDLD is in normal mode, the link might be considered undetermined and might not be shut down. When UDLD is in aggressive mode, the link is considered unidirectional, and the port is disabled.

If UDLD in normal mode is in the advertisement or in the detection phase and all the neighbor cache entries are aged out, UDLD restarts the link-up sequence to resynchronize with any potentially out-of-sync neighbors.

If you enable aggressive mode when all the neighbors of a port have aged out either in the advertisement or in the detection phase, UDLD restarts the link-up sequence to resynchronize with any potentially out-of-sync neighbor. UDLD shuts down the port if, after the fast train of messages, the link state is still undetermined.

Figure 26-1 shows an example of a unidirectional link condition.

**Figure 26-1  UDLD Detection of a Unidirectional Link**

Switch B successfully receives traffic from Switch A on this port. However, Switch A does not receive traffic from Switch B on the same port. If UDLD is in aggressive mode, it detects the problem and disables the port. If UDLD is in normal mode, the logical link is considered undetermined, and UDLD does not disable the interface.

**Configuring UDLD**

- Default UDLD Configuration, page 26-4
- Configuration Guidelines, page 26-4
- Enabling UDLD Globally, page 26-5
- Enabling UDLD on an Interface, page 26-5
- Resetting an Interface Disabled by UDLD, page 26-6
Default UDLD Configuration

Table 26-1 shows the default UDLD configuration.

Table 26-1 Default UDLD Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDLD global enable state</td>
<td>Globally disabled</td>
</tr>
<tr>
<td>UDLD per-port enable state for fiber-optic media</td>
<td>Disabled on all Ethernet fiber-optic ports</td>
</tr>
<tr>
<td>UDLD per-port enable state for twisted-pair (copper) media</td>
<td>Disabled on all Ethernet 10/100 and 1000BASE-TX ports</td>
</tr>
<tr>
<td>UDLD aggressive mode</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

Configuration Guidelines

- UDLD is not supported on ATM ports.
- A UDLD-capable port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another switch.
- When configuring the mode (normal or aggressive), make sure that the same mode is configured on both sides of the link.

⚠️ Caution

Loop guard works only on point-to-point links. We recommend that each end of the link has a directly connected device that is running STP.
## Enabling UDLD Globally

Beginning in privileged EXEC mode, follow these steps to enable UDLD in the aggressive or normal mode and to set the configurable message timer on all fiber-optic ports on the switch:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>udld {aggressive</td>
<td>enable</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
<td>This command affects fiber-optic ports only. Use the udld interface configuration command to enable UDLD on other port types. For more information, see the “Enabling UDLD on an Interface” section on page 26-5.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show udld</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable UDLD globally, use the **no udld enable** global configuration command to disable normal mode UDLD on all fiber-optic ports. Use the **no udld aggressive** global configuration command to disable aggressive mode UDLD on all fiber-optic ports.

## Enabling UDLD on an Interface

Beginning in privileged EXEC mode, follow these steps either to enable UDLD in the aggressive or normal mode or to disable UDLD on a port:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
<td>Specify the port to be enabled for UDLD, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, user network interfaces (UNIs) and enhanced network interfaces (ENIs) are disabled, and network node interfaces (NNIs) are enabled.</td>
</tr>
</tbody>
</table>
Chapter 26  Configuring UDLD

Displaying UDLD Status

To display the UDLD status for the specified port or for all ports, use the `show udld [interface-id]` privileged EXEC command.

For detailed information about the fields in the command output, see the command reference for this release.

Reseting an Interface Disabled by UDLD

Beginning in privileged EXEC mode, follow these steps to reset all ports disabled by UDLD:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>udld reset</code></td>
<td>Reset all ports disabled by UDLD.</td>
</tr>
<tr>
<td><code>show udld</code></td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

You can also bring up the port by using these commands:

- **The shutdown** interface configuration command followed by the `no shutdown` interface configuration command restarts the disabled port.
- **The no udld {aggressive | enable}** global configuration command followed by the `udld {aggressive | enable}` global configuration command re-enables the disabled ports.
- **The no udld port** interface configuration command followed by the `udld port [aggressive]` interface configuration command re-enables the disabled fiber-optic port.
- **The errdisable recovery cause udld** global configuration command enables the timer to automatically recover from the UDLD error-disabled state, and the `errdisable recovery interval interval` global configuration command specifies the time to recover from the UDLD error-disabled state.

Displaying UDLD Status

To display the UDLD status for the specified port or for all ports, use the `show udld [interface-id]` privileged EXEC command.

For detailed information about the fields in the command output, see the command reference for this release.

Command Purpose

| Step 4 | `udld port [aggressive]` | UDLD is disabled by default.  
|--------|--------------------------|-----------------------------|
|        | `udld port`—Enables UDLD in normal mode on the specified port.  
|        | `udld port aggressive`—Enables UDLD in aggressive mode on the specified port. |
|        | **Note** Use the `no udld port` interface configuration command to disable UDLD on a specified fiber-optic port.  
|        | For more information about aggressive and normal modes, see the “Modes of Operation” section on page 26-1. |

<table>
<thead>
<tr>
<th>Step 5</th>
<th><code>end</code></th>
<th>Return to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 6</td>
<td><code>show udld interface-id</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This chapter describes how to configure Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) on the Cisco ME 3400E Ethernet Access switch.

**Note**

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:

- Understanding SPAN and RSPAN, page 27-1
- Configuring SPAN and RSPAN, page 27-9
- Displaying SPAN and RSPAN Status, page 27-22

### Understanding SPAN and RSPAN

You can analyze network traffic passing through ports or VLANs by using SPAN or RSPAN to send a copy of the traffic to another port on the switch or on another switch that has been connected to a network analyzer or other monitoring or security device. SPAN copies (or mirrors) traffic received or sent (or both) on source ports or source VLANs to a destination port for analysis. SPAN does not affect the switching of network traffic on the source ports or VLANs. You must dedicate the destination port for SPAN use. Except for traffic that is required for the SPAN or RSPAN session, destination ports do not receive or forward traffic.

Only traffic that enters or leaves source ports or traffic that enters or leaves source VLANs can be monitored by using SPAN; traffic routed to a source VLAN cannot be monitored. For example, if incoming traffic is being monitored, traffic that gets routed from another VLAN to the source VLAN cannot be monitored; however, traffic that is received on the source VLAN and routed to another VLAN can be monitored.

You can use the SPAN or RSPAN destination port to inject traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) sensor appliance to a destination port, the IDS device can send TCP reset packets to close down the TCP session of a suspected attacker.
These sections contain this conceptual information:

- Local SPAN, page 27-2
- Remote SPAN, page 27-2
- SPAN and RSPAN Concepts and Terminology, page 27-3
- SPAN and RSPAN Interaction with Other Features, page 27-8

Local SPAN

Local SPAN supports a SPAN session entirely within one switch; all source ports or source VLANs and destination ports reside in the same switch. Local SPAN copies traffic from one or more source ports in any VLAN or from one or more VLANs to a destination port for analysis. For example, in Figure 27-1, all traffic on port 5 (the source port) is mirrored to port 10 (the destination port). A network analyzer on port 10 receives all network traffic from port 5 without being physically attached to port 5.

Remote SPAN

RSPAN supports source ports, source VLANs, and destination ports on different switches, enabling remote monitoring of multiple switches across your network. Figure 27-2 shows source ports on Switch A and Switch B. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches. The RSPAN traffic from the source ports or VLANs is copied into the RSPAN VLAN and forwarded over trunk ports carrying the RSPAN VLAN to a destination session monitoring the RSPAN VLAN. Each RSPAN source switch must have either ports or VLANs as RSPAN sources. The destination is always a physical port, as shown on Switch C in the figure.
SPAN and RSPAN Concepts and Terminology

This section describes concepts and terminology associated with SPAN and RSPAN configuration.

SPAN Sessions

SPAN sessions (local or remote) allow you to monitor traffic on one or more ports, or one or more VLANs, and send the monitored traffic to one or more destination ports.

A local SPAN session is an association of a destination port with source ports or source VLANs, all on a single network device. Local SPAN does not have separate source and destination sessions. Local SPAN sessions gather a set of ingress and egress packets specified by the user and form them into a stream of SPAN data, which is directed to the destination port.

RSPAN consists of at least one RSPAN source session, an RSPAN VLAN, and at least one RSPAN destination session. You separately configure RSPAN source sessions and RSPAN destination sessions on different network devices. To configure an RSPAN source session on a device, you associate a set of source ports or source VLANs with an RSPAN VLAN. The output of this session is the stream of SPAN packets that are sent to the RSPAN VLAN. To configure an RSPAN destination session on another device, you associate the destination port with the RSPAN VLAN. The destination session collects all RSPAN VLAN traffic and sends it out the RSPAN destination port.
An RSPAN source session is very similar to a local SPAN session, except for where the packet stream is directed. In an RSPAN source session, SPAN packets are relabeled with the RSPAN VLAN ID and directed over normal trunk ports to the destination switch.

An RSPAN destination session takes all packets received on the RSPAN VLAN, strips off the VLAN tagging, and presents them on the destination port. Its purpose is to present a copy of all RSPAN VLAN packets (except Layer 2 control packets) to the user for analysis.

There can be more than one source session and more than one destination session active in the same RSPAN VLAN. There can also be intermediate switches separating the RSPAN source and destination sessions. These switches need not be capable of running RSPAN, but they must respond to the requirements of the RSPAN VLAN (see the “RSPAN VLAN” section on page 27-7).

Traffic monitoring in a SPAN session has these restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.
- The switch supports up to two source sessions (local SPAN and RSPAN source sessions). You can run both a local SPAN and an RSPAN source session in the same switch. The switch supports a total of 66 source and RSPAN destination sessions.
- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports.
- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. When the metro IP access image in running on the switch, both switched and routed ports can be configured as SPAN sources and destinations.
- SPAN sessions do not interfere with the normal operation of the switch. However, an oversubscribed SPAN destination, for example, a 10-Mbps port monitoring a 100-Mbps port, can result in dropped or lost packets.
- When RSPAN is enabled, each packet being monitored is transmitted twice, once as normal traffic and once as a monitored packet. Therefore monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.
- You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.
- The switch does not support a combination of local SPAN and RSPAN in a single session. That is, an RSPAN source session cannot have a local destination port, an RSPAN destination session cannot have a local source port, and an RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same switch.

**Monitored Traffic**

SPAN sessions can monitor these traffic types:

- Receive (Rx) SPAN—The goal of receive (or ingress) SPAN is to monitor as much as possible all the packets received by the source interface or VLAN before any modification or processing is performed by the switch. A copy of each packet received by the source is sent to the destination port for that SPAN session.

  Packets that are modified because of routing or quality of service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied before modification.

  Features that can cause a packet to be dropped during receive processing have no effect on ingress SPAN; the destination port receives a copy of the packet even if the actual incoming packet is dropped. These features include IP standard and extended input access control lists (ACLs), ingress QoS policing, VLAN ACLs and egress QoS policing.
Chapter 27 Configuring SPAN and RSPAN

Understanding SPAN and RSPAN

- Transmit (Tx) SPAN—The goal of transmit (or egress) SPAN is to monitor as much as possible all the packets sent by the source interface after all modification and processing is performed by the switch. A copy of each packet sent by the source is sent to the destination port for that SPAN session. The copy is provided after the packet is modified.

  Packets that are modified because of routing—for example, with modified time-to-live (TTL), MAC-address, or QoS values—are duplicated (with the modifications) at the destination port.

  Features that can cause a packet to be dropped during transmit processing also affect the duplicated copy for SPAN. These features include IP standard and extended output ACLs and egress QoS policing.

- Both—In a SPAN session, you can also monitor a port or VLAN for both received and sent packets. This is the default.

The default configuration for local SPAN session ports is to send all packets untagged. SPAN also does not normally monitor bridge protocol data unit (BPDU) packets and Layer 2 protocols, such as Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), and Port Aggregation Protocol (PAgP).

However, when you enter the `encapsulation replicate` keywords when configuring a destination port, these changes occur:

- Packets are sent on the destination port with the same encapsulation—untagged or IEEE 802.1Q—that they had on the source port.
- Packets of all types, including BPDU and Layer 2 protocol packets, are monitored.

Therefore, a local SPAN session with encapsulation replicate enabled can have a mixture of untagged and IEEE 802.1Q tagged packets appear on the destination port.

Switch congestion can cause packets to be dropped at ingress source ports, egress source ports, or SPAN destination ports. In general, these characteristics are independent of one another. For example:

- A packet might be forwarded normally but dropped from monitoring due to an oversubscribed SPAN destination port.
- An ingress packet might be dropped from normal forwarding, but still appear on the SPAN destination port.
- An egress packet dropped because of switch congestion is also dropped from egress SPAN.

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the Rx monitor on port A and Tx monitor on port B. If a packet enters the switch through port A and is switched to port B, both incoming and outgoing packets are sent to the destination port. Both packets are the same (unless a Layer-3 rewrite occurs, in which case the packets are different because of the packet modification).

Source Ports

A source port (also called a monitored port) is a switched or routed port that you monitor for network traffic analysis. In a local SPAN session or RSPAN source session, you can monitor source ports or VLANs for traffic in one or both directions. The switch supports any number of source ports (up to the maximum number of available ports on the switch) and any number of source VLANs (up to the maximum number of VLANs supported). However, the switch supports a maximum of two sessions (local or RSPAN) with source ports or VLANs, and you cannot mix ports and VLANs in a single session.

A source port has these characteristics:

- It can be monitored in multiple SPAN sessions.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor.
Chapter 27   Configuring SPAN and RSPAN

Understanding SPAN and RSPAN

- It can be any port type—for example, EtherChannel, Fast Ethernet, Gigabit Ethernet, user network interface (UNI), network node interface (NNI), enhanced network interface (ENI) and so forth.
- For EtherChannel sources, you can monitor traffic for the entire EtherChannel or individually on a physical port as it participates in the port channel.
- It can be a routed port, an access port, or a trunk port.
- It cannot be a destination port.
- Source ports can be in the same or different VLANs.
- You can monitor multiple source ports in a single session.

Source VLANs

VLAN-based SPAN (VSPAN) is the monitoring of the network traffic in one or more VLANs. The SPAN or RSPAN source interface in VSPAN is a VLAN ID, and traffic is monitored on all the ports for that VLAN.

VSPAN has these characteristics:
- All active ports in the source VLAN are included as source ports and can be monitored in either or both directions.
- On a given port, only traffic on the monitored VLAN is sent to the destination port.
- If a destination port belongs to a source VLAN, it is excluded from the source list and is not monitored.
- If ports are added to or removed from the source VLANs, the traffic on the source VLAN received by those ports is added to or removed from the sources being monitored.
- You cannot use filter VLANs in the same session with VLAN sources.
- You can monitor only Ethernet VLANs.

VLAN Filtering

When you monitor a trunk port as a source port, by default, all VLANs active on the trunk are monitored. You can limit SPAN traffic monitoring on trunk source ports to specific VLANs by using VLAN filtering.
- VLAN filtering applies only to trunk ports.
- VLAN filtering applies only to port-based sessions and is not allowed in sessions with VLAN sources.
- When a VLAN filter list is specified, only those VLANs in the list are monitored on trunk ports.
- SPAN traffic coming from other port types is not affected by VLAN filtering; that is, all VLANs are allowed on other ports.
- VLAN filtering affects only traffic forwarded to the destination SPAN port and does not affect the switching of normal traffic.

Destination Port

Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports or VLANs and sends the SPAN packets to the user, usually a network analyzer.
A destination port has these characteristics:

- For a local SPAN session, the destination port must reside on the same switch as the source port. For an RSPAN session, it is located on the switch containing the RSPAN destination session. There is no destination port on a switch running only an RSPAN source session.

- When a port is configured as a SPAN destination port, the configuration overwrites the original port configuration. When the SPAN destination configuration is removed, the port reverts to its previous configuration. If a configuration change is made to the port while it is acting as a SPAN destination port, the change does not take effect until the SPAN destination configuration had been removed.

- If the port was in an EtherChannel group, it is removed from the group while it is a destination port. If the switch is running the metro IP access image and the port was a routed port, it is no longer a routed port.

- It can be any Ethernet physical port.

- It cannot be a secure port.

- It cannot be a source port.

- It cannot be an EtherChannel group or a VLAN.

- It can participate in only one SPAN session at a time (a destination port in one SPAN session cannot be a destination port for a second SPAN session).

- When it is active, incoming traffic is disabled. The port does not send any traffic except that required for the SPAN session. Incoming traffic is never learned or forwarded on a destination port.

- If incoming traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

- It does not participate in any of the Layer 2 protocols (STP, VTP, CDP, DTP, PagP).

- A destination port that belongs to a source VLAN of any SPAN session is excluded from the source list and is not monitored.

- The maximum number of destination ports in a switch is 64.

Local SPAN and RSPAN destination ports behave differently regarding VLAN tagging and encapsulation:

- For local SPAN, if the `encapsulation replicate` keywords are specified for the destination port, these packets appear with the original encapsulation (untagged or IEEE 802.1Q). If `encapsulation dot1q` is specified, packets appear with the IEEE 802.1Q encapsulation. If these keywords are not specified, packets appear in the untagged format. Therefore, the output of a local SPAN session with `encapsulation replicate` enabled can contain a mixture of untagged and IEEE 802.1Q tagged packets.

- For RSPAN, the original VLAN ID is lost because it is overwritten by the RSPAN VLAN identification. Therefore, all packets appear on the destination port as untagged.

**RSPAN VLAN**

The RSPAN VLAN carries SPAN traffic between RSPAN source and destination sessions. It has these special characteristics:

- All traffic in the RSPAN VLAN is always flooded.

- No MAC address learning occurs on the RSPAN VLAN.

- RSPAN VLAN traffic only flows on trunk ports.
• RSPAN VLANs must be configured in VLAN configuration mode by using the `remote-span` VLAN configuration mode command.
  
  – To change a VLAN from a UNI-ENI isolated VLAN (the default) to an RSPAN VLAN, enter the `rspan-vlan` VLAN configuration command.
  
  – To change a UNI-ENI community VLAN to an RSPAN VLAN, you must first remove the community VLAN type by entering the `no uni-vlan` VLAN configuration command.

• STP can run on RSPAN VLAN trunks but not on SPAN destination ports.

  **Note**  
  NNIs support STP by default and you can enable STP on ENIs. UNIs do not support STP.

• An RSPAN VLAN cannot be a private-VLAN primary or secondary VLAN.

It is normal to have multiple RSPAN VLANs in a network at the same time with each RSPAN VLAN defining a network-wide RSPAN session. That is, multiple RSPAN source sessions anywhere in the network can contribute packets to the RSPAN session. It is also possible to have multiple RSPAN destination sessions throughout the network, monitoring the same RSPAN VLAN and presenting traffic to the user. The RSPAN VLAN ID separates the sessions.

### SPAN and RSPAN Interaction with Other Features

SPAN interacts with these features:

• Routing—For switches that are running the metro IP access image, SPAN does not monitor routed traffic. RSPAN only monitors traffic that enters or exits the switch, not traffic that is routed between VLANs. For example, if a VLAN is being receive-monitored and the switch routes traffic from another VLAN to the monitored VLAN, that traffic is not monitored and is not received on the SPAN destination port.

• STP—A destination port does not participate in STP while its SPAN or RSPAN session is active. The destination port can participate in STP after the SPAN or RSPAN session is disabled. On a source port, SPAN does not affect the STP status. STP can be active on trunk ports carrying an RSPAN VLAN. However, only NNIs or ENIs can support STP; UNIs do not participate in STP.

• CDP—A SPAN destination port does not participate in CDP while the SPAN session is active. After the SPAN session is disabled, the port again participates in CDP. NNIs have CDP enabled by default and you can enable it on ENIs; UNIs do not participate in CDP.

• VLAN and trunking—You can modify VLAN membership or trunk settings for source or destination ports at any time. However, changes in VLAN membership or trunk settings for a destination port do not take effect until you remove the SPAN destination configuration. Changes in VLAN membership or trunk settings for a source port immediately take effect, and the respective SPAN sessions automatically adjust accordingly.

• EtherChannel—You can configure an EtherChannel group as a source port but not as a SPAN destination port. When a group is configured as a SPAN source, the entire group is monitored. If a physical port is added to a monitored EtherChannel group, the new port is added to the SPAN source port list. If a port is removed from a monitored EtherChannel group, it is automatically removed from the source port list.

A physical port that belongs to an EtherChannel group can be configured as a SPAN source port and still be a part of the EtherChannel. In this case, data from the physical port is monitored as it participates in the EtherChannel. However, if a physical port that belongs to an EtherChannel group
is configured as a SPAN destination, it is removed from the group. After the port is removed from the SPAN session, it rejoins the EtherChannel group. Ports removed from an EtherChannel group remain members of the group, but they are in the inactive or suspended state.

If a physical port that belongs to an EtherChannel group is a destination port and the EtherChannel group is a source, the port is removed from the EtherChannel group and from the list of monitored ports.

- Multicast traffic can be monitored. For sending and receiving port monitoring, only a single unedited packet is sent to the SPAN destination port. It does not reflect the number of times that the multicast packet is sent.

- A private-VLAN port cannot be a SPAN destination port.

- A secure port cannot be a SPAN destination port.

For SPAN sessions, do not enable port security on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable port security on any ports with monitored egress.

- An IEEE 802.1x port can be a SPAN source port. You can enable IEEE 802.1x on a port that is a SPAN destination port; however, IEEE 802.1x is disabled until the port is removed as a SPAN destination.

For SPAN sessions, do not enable IEEE 802.1x on ports with monitored sending when receive forwarding is enabled on the destination port. For RSPAN source sessions, do not enable IEEE 802.1x on any ports that are sending monitored.

## Configuring SPAN and RSPAN

- Default SPAN and RSPAN Configuration, page 27-9
- Configuring Local SPAN, page 27-10
- Configuring RSPAN, page 27-15

### Default SPAN and RSPAN Configuration

Table 27-1 shows the default SPAN and RSPAN configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPAN state (SPAN and RSPAN)</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Source port traffic to monitor</td>
<td>Both received and sent traffic (both).</td>
</tr>
<tr>
<td>Encapsulation type (destination port)</td>
<td>Native form (untagged packets).</td>
</tr>
<tr>
<td>Ingress forwarding (destination port)</td>
<td>Disabled</td>
</tr>
<tr>
<td>VLAN filtering</td>
<td>On a trunk interface used as a source port, all VLANs are monitored.</td>
</tr>
<tr>
<td>RSPAN VLANs</td>
<td>None configured. Default VLAN type is UNI-ENI isolated.</td>
</tr>
</tbody>
</table>
Configuring Local SPAN

- SPAN Configuration Guidelines, page 27-10
- Creating a Local SPAN Session, page 27-10
- Creating a Local SPAN Session and Configuring Ingress Traffic, page 27-12
- Specifying VLANs to Filter, page 27-14

SPAN Configuration Guidelines

- You can configure a total of two local SPAN sessions or RSPAN source sessions on each switch. You can have a total of 66 SPAN sessions (local, RSPAN source, and RSPAN destination) on a switch.
- For SPAN sources, you can monitor traffic for a single port or VLAN or a series or range of ports or VLANs for each session. You cannot mix source ports and source VLANs within a single SPAN session.
- The destination port cannot be a source port; a source port cannot be a destination port.
- You cannot have two SPAN sessions using the same destination port.
- When you configure a switch port as a SPAN destination port, it is no longer a normal switch port; only monitored traffic passes through the SPAN destination port.
- Entering SPAN configuration commands does not remove previously configured SPAN parameters. You must enter the no monitor session {session_number | all | local | remote} global configuration command to delete configured SPAN parameters.
- For local SPAN, outgoing packets through the SPAN destination port carry the original encapsulation headers—untagged or IEEE 802.1Q—if the encapsulation replicate or encapsulation dot1q keywords are specified. If the keywords are not specified, the packets are sent in native form. For RSPAN destination ports, outgoing packets are not tagged.
- You can configure a disabled port to be a source or destination port, but the SPAN function does not start until the destination port and at least one source port or source VLAN are enabled.
- You can limit SPAN traffic to specific VLANs by using the filter vlan keyword. If a trunk port is being monitored, only traffic on the VLANs specified with this keyword is monitored. By default, all VLANs are monitored on a trunk port.
- You cannot mix source VLANs and filter VLANs within a single SPAN session.

Creating a Local SPAN Session

Beginning in privileged EXEC mode, follow these steps to create a SPAN session and specify the source (monitored) ports or VLANs and the destination (monitoring) ports:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>no monitor session {session_number</td>
</tr>
</tbody>
</table>
### Chapter 27      Configuring SPAN and RSPAN

#### Configuring SPAN and RSPAN

**Step 3**  
```
monitor session session_number source
  {interface interface-id | vlan vlan-id} [, -] [both | rx | tx]
```

Specify the SPAN session and the source port (monitored port).

*For session_number, the range is 1 to 66.*

For *interface-id*, specify the source port or source VLAN to monitor.

- For source *interface-id*, specify the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (*port-channel* port-channel-number). Valid port-channel numbers are 1 to 48.
- For *vlan-id*, specify the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).

**Note**
A single session can include multiple sources (ports or VLANs), defined in a series of commands, but you cannot combine source ports and source VLANs in one session.

(Optional) [, -] Specify a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.

(Optional) Specify the direction of traffic to monitor. If you do not specify a traffic direction, the SPAN monitors both sent and received traffic.

- *both*—Monitor both received and sent traffic. This is the default.
- *rx*—Monitor received traffic.
- *tx*—Monitor sent traffic.

**Note**
You can use the `monitor session session_number source` command multiple times to configure multiple source ports.

**Step 4**  
```
monitor session session_number destination
  {interface interface-id [, -] [encapsulation\{dot1q | replicate\}]}
```

Specify the SPAN session and the destination port (monitoring port).

*For session_number, specify the session number entered in Step 3.*

**Note**
For local SPAN, you must use the same session number for the source and destination interfaces.

For *interface-id*, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.

(Optional) [, -] Specify a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.

(Optional) Enter `encapsulation dot1q` for IEEE 802.1Q encapsulation or `encapsulation replicate` to specify that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).

**Note**
You can use `monitor session session_number destination` command multiple times to configure multiple destination ports.

**Step 5**  
```
end
```

Return to privileged EXEC mode.
Chapter 27      Configuring SPAN and RSPAN

Configuring SPAN and RSPAN

To delete a SPAN session, use the `no monitor session session_number` global configuration command. To remove a source or destination port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command or the `no monitor session session_number destination interface interface-id` global configuration command. For destination interfaces, the `encapsulation replicate` keywords are ignored with the `no` form of the command.

This example shows how to set up SPAN session 1 for monitoring source port traffic to a destination port. First, any existing SPAN configuration for session 1 is deleted, and then bidirectional traffic is mirrored from source Gigabit Ethernet port 1 to destination Gigabit Ethernet port 2, retaining the encapsulation method.

```
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface gigabitethernet0/1
Switch(config)# monitor session 1 destination interface gigabitethernet0/2
Switch(config)# end
```

This example shows how to remove port 1 as a SPAN source for SPAN session 1:

```
Switch(config)# no monitor session 1 source interface gigabitethernet0/1
Switch(config)# end
```

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

```
Switch(config)# no monitor session 1 source interface gigabitethernet0/1 rx
```

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to destination Gigabit Ethernet port 2. The configuration is then modified to also monitor all traffic on all ports belonging to VLAN 10.

```
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source vlan 1 - 3 rx
Switch(config)# monitor session 2 destination interface gigabitethernet0/2
Switch(config)# monitor session 2 source vlan 10
Switch(config)# end
```

Creating a Local SPAN Session and Configuring Ingress Traffic

Beginning in privileged EXEC mode, follow these steps to create a SPAN session, to specify the source ports or VLANs and the destination ports, and to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

### Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show monitor [session session_number]</code></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### Step 7

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save the configuration in the configuration file.</td>
</tr>
</tbody>
</table>

To delete a SPAN session, use the `no monitor session session_number` global configuration command. To remove a source or destination port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command or the `no monitor session session_number destination interface interface-id` global configuration command. For destination interfaces, the `encapsulation replicate` keywords are ignored with the `no` form of the command.

This example shows how to set up SPAN session 1 for monitoring source port traffic to a destination port. First, any existing SPAN configuration for session 1 is deleted, and then bidirectional traffic is mirrored from source Gigabit Ethernet port 1 to destination Gigabit Ethernet port 2, retaining the encapsulation method.

```
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface gigabitethernet0/1
Switch(config)# monitor session 1 destination interface gigabitethernet0/2
Switch(config)# end
```

This example shows how to remove port 1 as a SPAN source for SPAN session 1:

```
Switch(config)# no monitor session 1 source interface gigabitethernet0/1
Switch(config)# end
```

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

```
Switch(config)# no monitor session 1 source interface gigabitethernet0/1 rx
```

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to destination Gigabit Ethernet port 2. The configuration is then modified to also monitor all traffic on all ports belonging to VLAN 10.

```
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source vlan 1 - 3 rx
Switch(config)# monitor session 2 destination interface gigabitethernet0/2
Switch(config)# monitor session 2 source vlan 10
Switch(config)# end
```

### Creating a Local SPAN Session and Configuring Ingress Traffic

Beginning in privileged EXEC mode, follow these steps to create a SPAN session, to specify the source ports or VLANs and the destination ports, and to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

### Note

See the “Creating a Local SPAN Session” section on page 27-10 for details about the keywords not related to ingress traffic.
## Configuring SPAN and RSPAN

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>no monitor session {session_number</td>
</tr>
<tr>
<td>Step 3</td>
<td>monitor session session_number source {interface interface-id</td>
</tr>
<tr>
<td>Step 4</td>
<td>monitor session session_number destination {interface interface-id [,,-] [encapsulation {dot1q</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show monitor [session session_number]</td>
</tr>
<tr>
<td></td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To delete a SPAN session, use the **no monitor session session_number** global configuration command. To remove a source or destination port or VLAN from the SPAN session, use the **no monitor session session_number source \{interface interface-id | vlan vlan-id\}** global configuration command or the **no monitor session session_number destination interface interface-id** global configuration command. For destination interfaces, the encapsulation and ingress options are ignored with the **no** form of the command.
This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor sent traffic on Gigabit Ethernet source port 1, and send it to destination Gigabit Ethernet port 2 with the same egress encapsulation type as the source port, and to enable incoming forwarding with IEEE 802.1Q encapsulation and VLAN 6 as the default ingress VLAN.

```
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source gigabitethernet0/1 rx
Switch(config)# monitor session 2 destination interface gigabitethernet0/2 encapsulation replicate ingress dot1q vlan 6
Switch(config)# end
```

### Specifying VLANs to Filter

Beginning in privileged EXEC mode, follow these steps to limit SPAN source traffic to specific VLANs:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>no monitor session {session_number</td>
<td>all</td>
</tr>
<tr>
<td></td>
<td>For <strong>session_number</strong>, the range is 1 to 66.</td>
</tr>
<tr>
<td></td>
<td>Specify <strong>all</strong> to remove all SPAN sessions, <strong>local</strong> to remove all local sessions, or <strong>remote</strong> to remove all remote SPAN sessions.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>monitor session session_number source</td>
<td>Specify the characteristics of the source port (monitored port) and</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>SPAN session.</td>
</tr>
<tr>
<td></td>
<td>For <strong>session_number</strong>, the range is 1 to 66.</td>
</tr>
<tr>
<td></td>
<td>For <strong>interface-id</strong>, specify the source port to monitor. The interface specified must already be configured as a trunk port.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>monitor session session_number filter vlan</td>
<td>Limit the SPAN source traffic to specific VLANs.</td>
</tr>
<tr>
<td>vlan-id [,, -]</td>
<td>For <strong>session_number</strong>, enter the session number specified in Step 3.</td>
</tr>
<tr>
<td></td>
<td>For <strong>vlan-id</strong>, the range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Use a comma (,) to specify a series of VLANs, or use a hyphen (-) to specify a range of VLANs. Enter a space before and after the comma; enter a space before and after the hyphen.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>monitor session session_number destination</td>
<td>Specify the SPAN session and the destination port (monitoring port).</td>
</tr>
<tr>
<td>[interface interface-id [,, -] [encapsulation {dot1q</td>
<td>replicate}]])</td>
</tr>
<tr>
<td></td>
<td>For <strong>interface-id</strong>, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.</td>
</tr>
<tr>
<td></td>
<td>(Optional) [,, -] Specify a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <strong>encapsulation dot1q</strong> or <strong>encapsulation replicate</strong> to specify IEEE 802.1Q encapsulation or that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
To monitor all VLANs on the trunk port, use the `no monitor session session_number filter` global configuration command.

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor traffic received on Gigabit Ethernet trunk port 2, and send traffic for only VLANs 1 through 5 and VLAN 9 to destination Gigabit Ethernet port 1.

```
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source interface gigabitethernet0/2 rx
Switch(config)# monitor session 2 filter vlan 1 - 5 , 9
Switch(config)# monitor session 2 destination interface gigabitethernet0/1
Switch(config)# end
```

### Configuring RSPAN

- RSPAN Configuration Guidelines, page 27-15
- Configuring a VLAN as an RSPAN VLAN, page 27-16
- Creating an RSPAN Source Session, page 27-17
- Creating an RSPAN Destination Session, page 27-18
- Creating an RSPAN Destination Session and Configuring Ingress Traffic, page 27-19
- Specifying VLANs to Filter, page 27-21

### RSPAN Configuration Guidelines

- All the items in the “SPAN Configuration Guidelines” section on page 27-10 apply to RSPAN.
- As RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.
- You can apply an output ACL to RSPAN traffic to selectively filter or monitor specific packets. Specify these ACLs on the RSPAN VLAN in the RSPAN source switches.
- For RSPAN configuration, you can distribute the source ports and the destination ports across multiple switches in your network.
- RSPAN does not support BPDU packet monitoring or other Layer 2 switch protocols.
- The RSPAN VLAN is configured only on trunk ports and not on access ports. To avoid unwanted traffic in RSPAN VLANs, make sure that the VLAN remote-span feature is supported in all the participating switches.
- Access ports on the RSPAN VLAN are put in the inactive state.
- RSPAN VLANs are included as sources for port-based RSPAN sessions when source trunk ports have active RSPAN VLANs. RSPAN VLANs can also be sources in SPAN sessions. However, since the switch does not monitor spanned traffic, it does not support egress spanning of packets on any RSPAN VLAN identified as the destination of an RSPAN source session on the switch.
- You can configure any VLAN as an RSPAN VLAN as long as these conditions are met:

#### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7</td>
<td>show monitor [session session_number] Verify the configuration.</td>
</tr>
<tr>
<td>show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config (Optional) Save the configuration in the configuration file.</td>
</tr>
</tbody>
</table>
The same RSPAN VLAN is used for an RSPAN session in all the switches.
- All participating switches support RSPAN.
- MAC address learning is not disabled on the RSPAN VLAN.

- We recommend that you configure an RSPAN VLAN before you configure an RSPAN source or a destination session.

**Configuring a VLAN as an RSPAN VLAN**

Create a new VLAN to be the RSPAN VLAN for the RSPAN session. You must create the RSPAN VLAN in all switches that will participate in RSPAN. You must configure RSPAN VLAN on source and destination switches and any intermediate switches.

To get an efficient flow of RSPAN traffic, manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

Beginning in privileged EXEC mode, follow these steps to create an RSPAN VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>Enter a VLAN ID to create a VLAN, or enter the VLAN ID of an existing VLAN, and enter VLAN configuration mode. The range is 2 to 1001 and 1006 to 4094. Note The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 through 1005 (reserved for Token Ring and FDDI VLANs). If you enter the VLAN ID of a UNI-ENI community VLAN, you must remove the community VLAN type by entering the no uni-vlan VLAN configuration command.</td>
</tr>
<tr>
<td>remote-span</td>
<td>Configure the VLAN as an RSPAN VLAN.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save the configuration in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the remote SPAN characteristic from a VLAN and convert it back to a UNI-ENI isolated VLAN, use the no remote-span VLAN configuration command.

This example shows how to create RSPAN VLAN 901.

```
Switch(config)# vlan 901
Switch(config-vlan)# remote span
Switch(config-vlan)# end
```
## Configuring SPAN and RSPAN

### Creating an RSPAN Source Session

Beginning in privileged EXEC mode, follow these steps to start an RSPAN source session and to specify the monitored source and the destination RSPAN VLAN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>no monitor session {session_number</td>
</tr>
<tr>
<td></td>
<td>Remove any existing RSPAN configuration for the session.</td>
</tr>
<tr>
<td></td>
<td>For session_number, the range is 1 to 66.</td>
</tr>
<tr>
<td></td>
<td>Specify all to remove all RSPAN sessions, local to remove all local sessions, or remote to remove all remote SPAN sessions.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>monitor session session_number source {interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify the RSPAN session and the source port (monitored port).</td>
</tr>
<tr>
<td></td>
<td>For session_number, the range is 1 to 66.</td>
</tr>
<tr>
<td></td>
<td>Enter a source port or source VLAN for the RSPAN session:</td>
</tr>
<tr>
<td></td>
<td>• For interface-id, specify the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel port-channel-number). Valid port-channel numbers are 1 to 48.</td>
</tr>
<tr>
<td></td>
<td>• For vlan-id, specify the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> A single session can include multiple sources (ports or VLANs), defined in a series of commands, but you cannot combine source ports and source VLANs in one session.</td>
</tr>
<tr>
<td></td>
<td>(Optional) [, -] Specify a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Specify the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic.</td>
</tr>
<tr>
<td></td>
<td>• both—Monitor both received and sent traffic.</td>
</tr>
<tr>
<td></td>
<td>• rx—Monitor received traffic.</td>
</tr>
<tr>
<td></td>
<td>• tx—Monitor sent traffic.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>monitor session session_number destination remote vlan vlan-id</td>
</tr>
<tr>
<td></td>
<td>Specify the RSPAN session and the destination RSPAN VLAN.</td>
</tr>
<tr>
<td></td>
<td>For session_number, enter the number defined in Step 3.</td>
</tr>
<tr>
<td></td>
<td>For vlan-id, specify the source RSPAN VLAN to monitor.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show monitor [session session_number] show running-config</td>
</tr>
<tr>
<td></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save the configuration in the configuration file.</td>
</tr>
</tbody>
</table>

To delete a SPAN session, use the **no monitor session session_number** global configuration command.
To remove a source port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command. To remove the RSPAN VLAN from the session, use the `no monitor session session_number destination remote vlan vlan-id` command.

This example shows how to remove any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination as RSPAN VLAN 901.

```
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface gigabitethernet0/1 tx
Switch(config)# monitor session 1 source interface gigabitethernet0/2 rx
Switch(config)# monitor session 1 source interface port-channel 12
Switch(config)# monitor session 1 destination remote vlan 901
Switch(config)# end
```

## Creating an RSPAN Destination Session

You configure the RSPAN destination session on a different switch; that is, not the switch on which the source session was configured.

Beginning in privileged EXEC mode, follow these steps to define the RSPAN VLAN on that switch, to create an RSPAN destination session, and to specify the source RSPAN VLAN and the destination port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;vlan vlan-id</td>
<td>Enter the VLAN ID of the RSPAN VLAN created from the source switch, and enter VLAN configuration mode. &lt;br&gt;<strong>Note</strong> If the VLAN is configured as a UNI-ENI community VLAN, you must remove the community VLAN type by entering the <code>no uni-vlan</code> VLAN configuration command.</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;remote-span</td>
<td>Identify the VLAN as the RSPAN VLAN.</td>
</tr>
<tr>
<td><strong>Step 4</strong>&lt;br&gt;exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong>&lt;br&gt;no monitor session {session_number</td>
<td>all</td>
</tr>
<tr>
<td><strong>Step 6</strong>&lt;br&gt;monitor session session_number source remote vlan vlan-id</td>
<td>Specify the RSPAN session and the source RSPAN VLAN. &lt;br&gt;For <code>session_number</code>, the range is 1 to 66. &lt;br&gt;For <code>vlan-id</code>, specify the source RSPAN VLAN to monitor.</td>
</tr>
</tbody>
</table>
Chapter 27 Configuring SPAN and RSPAN

Configuring SPAN and RSPAN

To delete a SPAN session, use the `no monitor session session_number` global configuration command.

To remove a destination port from the SPAN session, use the `no monitor session session_number destination interface interface-id` global configuration command. To remove the RSPAN VLAN from the session, use the `no monitor session session_number source remote vlan vlan-id`.

This example shows how to configure VLAN 901 as the source remote VLAN and port 1 as the destination interface:

```
Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface gigabitethernet0/1
Switch(config)# end
```

Creating an RSPAN Destination Session and Configuring Ingress Traffic

Beginning in privileged EXEC mode, follow these steps to create an RSPAN destination session, to specify the source RSPAN VLAN and the destination port, and to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

**Note** For details about the keywords not related to ingress traffic, see the “Creating an RSPAN Destination Session” section on page 27-18. This procedure assumes that the RSPAN VLAN has been configured.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7</td>
<td><code>monitor session session_number destination interface interface-id</code> Specify the RSPAN session and the destination interface. For <code>session_number</code>, enter the number defined in Step 6. <strong>Note</strong> In an RSPAN destination session, you must use the same session number for the source RSPAN VLAN and the destination port. For <code>interface-id</code>, specify the destination interface. The destination interface must be a physical interface. <strong>Note</strong> Though visible in the command-line help string, <code>encapsulation replicate</code> is not supported for RSPAN. The original VLAN ID is overwritten by the RSPAN VLAN ID, and all packets appear on the destination port as untagged.</td>
</tr>
<tr>
<td>Step 8</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 9</td>
<td><code>show monitor [session session_number]</code> <code>show running-config</code> Verify the configuration.</td>
</tr>
<tr>
<td>Step 10</td>
<td><code>copy running-config startup-config</code> (Optional) Save the configuration in the configuration file.</td>
</tr>
</tbody>
</table>

To delete a SPAN session, use the `no monitor session session_number` global configuration command. To remove a destination port from the SPAN session, use the `no monitor session session_number destination interface interface-id` global configuration command. To remove the RSPAN VLAN from the session, use the `no monitor session session_number source remote vlan vlan-id`.

This example shows how to configure VLAN 901 as the source remote VLAN and port 1 as the destination interface:

```
Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface gigabitethernet0/1
Switch(config)# end
```
To delete an RSPAN session, use the `no monitor session session_number` global configuration command. To remove a destination port from the RSPAN session, use the `no monitor session session_number destination interface interface-id [, -] [ingress {dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id}]}` global configuration command. The ingress options are ignored with the `no` form of the command.

This example shows how to configure VLAN 901 as the source remote VLAN in RSPAN session 2, to configure Gigabit Ethernet source port 2 as the destination interface, and to enable ingress forwarding on the interface with VLAN 6 as the default incoming VLAN.

```
Switch(config)# monitor session 2 source remote vlan 901
Switch(config)# monitor session 2 destination interface gigabitethernet0/2 ingress vlan 6
Switch(config)# end
```
## Specifying VLANs to Filter

Beginning in privileged EXEC mode, follow these steps to configure the RSPAN source session to limit RSPAN source traffic to specific VLANs:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>no monitor session {session_number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>monitor session session_number source interface interface-id</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>monitor session session_number filter vlan vlan-id [, -]</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>monitor session session_number destination remote vlan vlan-id</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show monitor [session session_number] show running-config</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To monitor all VLANs on the trunk port, use the `no monitor session session_number filter vlan` global configuration command.

This example shows how to remove any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor traffic received on trunk port 2, and send traffic for only VLANs 2 through 5 and 9 to destination RSPAN VLAN 902.

```
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source interface gigabitethernet0/2 rx
Switch(config)# monitor session 2 filter vlan 2 - 5 , 9
Switch(config)# monitor session 2 destination remote vlan 902
Switch(config)# end
```
Displaying SPAN and RSPAN Status

To display the current SPAN or RSPAN configuration, use the **show monitor** user EXEC command. You can also use the **show running-config** privileged EXEC command to display configured SPAN or RSPAN sessions.
Configuring RMON

This chapter describes how to configure Remote Network Monitoring (RMON) on the Cisco ME 3400E Ethernet Access switch.

RMON is a standard monitoring specification that defines a set of statistics and functions that can be exchanged between RMON-compliant console systems and network probes. RMON provides you with comprehensive network-fault diagnosis, planning, and performance-tuning information.

For complete syntax and usage information for the commands used in this chapter, see the “System Management Commands” section in the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

This chapter consists of these sections:

- Understanding RMON, page 28-1
- Configuring RMON, page 28-2
- Displaying RMON Status, page 28-6

Understanding RMON

RMON is an Internet Engineering Task Force (IETF) standard monitoring specification that allows various network agents and console systems to exchange network monitoring data. You can use the RMON feature with the Simple Network Management Protocol (SNMP) agent in the switch to monitor all the traffic flowing among switches on all connected LAN segments as shown in Figure 28-1.
The switch supports these RMON groups (defined in RFC 1757):

- **Statistics (RMON group 1)**—Collects Ethernet statistics (including Fast Ethernet and Gigabit Ethernet statistics, depending on the switch type and supported interfaces) on an interface.

- **History (RMON group 2)**—Collects a history group of statistics on Ethernet ports (including Fast Ethernet and Gigabit Ethernet statistics, depending on the switch type and supported interfaces) for a specified polling interval.

- **Alarm (RMON group 3)**—Monitors a specific management information base (MIB) object for a specified interval, triggers an alarm at a specified value (rising threshold), and resets the alarm at another value (falling threshold). Alarms can be used with events; the alarm triggers an event, which can generate a log entry or an SNMP trap.

- **Event (RMON group 9)**—Specifies the action to take when an event is triggered by an alarm. The action can be to generate a log entry or an SNMP trap.

Because switches supported by this software release use hardware counters for RMON data processing, the monitoring is more efficient, and little processing power is required.

### Configuring RMON

- **Default RMON Configuration**, page 28-3
- **Configuring RMON Alarms and Events**, page 28-3 (required)
- **Collecting Group History Statistics on an Interface**, page 28-5 (optional)
- **Collecting Group Ethernet Statistics on an Interface**, page 28-5 (optional)
Default RMON Configuration

RMON is disabled by default; no alarms or events are configured.

Configuring RMON Alarms and Events

You can configure your switch for RMON by using the command-line interface (CLI) or an SNMP-compatible network management station. We recommend that you use a generic RMON console application on the network management station (NMS) to take advantage of the RMON network management capabilities. You must also configure SNMP on the switch to access RMON MIB objects. For more information, see Chapter 30, “Configuring SNMP.”

Beginning in privileged EXEC mode, follow these steps to enable RMON alarms and events. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;rmon alarm number variable interval [absolute</td>
<td>Set an alarm on a MIB object.</td>
</tr>
<tr>
<td></td>
<td>delta]</td>
</tr>
<tr>
<td>rising-threshold value [event-number]</td>
<td>• For <em>number</em>, specify the alarm number. The range is 1 to 65535.</td>
</tr>
<tr>
<td>falling-threshold value [event-number]</td>
<td>• For <em>variable</em>, specify the MIB object to monitor.</td>
</tr>
<tr>
<td>[owner string]</td>
<td>• For <em>interval</em>, specify the time in seconds the alarm monitors the MIB variable. The range is 1 to 4294967295 seconds.</td>
</tr>
<tr>
<td></td>
<td>• Specify the <strong>absolute</strong> keyword to test each MIB variable directly. Specify the <strong>delta</strong> keyword to test the change between samples of a MIB variable.</td>
</tr>
<tr>
<td></td>
<td>• For <em>value</em>, specify a number at which the alarm is triggered and one for when the alarm is reset. The range for the rising threshold and falling threshold values is -2147483648 to 2147483647.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <em>event-number</em>, specify the event number to trigger when the rising or falling threshold exceeds its limit.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <em>owner string</em>, specify the owner of the alarm.</td>
</tr>
</tbody>
</table>
### Step 3

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>rmon event number [description string] [log] [owner string] [trap community]</td>
<td>Add an event in the RMON event table that is associated with an RMON event number.</td>
</tr>
<tr>
<td>- For number, assign an event number. The range is 1 to 65535.</td>
<td></td>
</tr>
<tr>
<td>- (Optional) For description string, specify a description of the event.</td>
<td></td>
</tr>
<tr>
<td>- (Optional) Use the log keyword to generate an RMON log entry when the event is triggered.</td>
<td></td>
</tr>
<tr>
<td>- (Optional) For owner string, specify the owner of this event.</td>
<td></td>
</tr>
<tr>
<td>- (Optional) For trap community, enter the SNMP community string used for this trap.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 4

event

Return to privileged EXEC mode.

### Step 5

show running-config

Verify your entries.

### Step 6

copy running-config startup-config

(Optional) Save your entries in the configuration file.

---

To disable an alarm, use the `no rmon alarm number` global configuration command on each alarm you configured. You cannot disable at once all the alarms that you configured. To disable an event, use the `no rmon event number` global configuration command. To learn more about alarms and events and how they interact with each other, see RFC 1757.

You can set an alarm on any MIB object. The following example configures RMON alarm number 10 by using the `rmon alarm` command. The alarm monitors the MIB variable `ifEntry.20.1` once every 20 seconds until the alarm is disabled and checks the change in the variable’s rise or fall. If the `ifEntry.20.1` value shows a MIB counter increase of 15 or more, such as from 100000 to 100015, the alarm is triggered. The alarm in turn triggers event number 1, which is configured with the `rmon event` command. Possible events can include a log entry or an SNMP trap. If the `ifEntry.20.1` value changes by 0, the alarm is reset and can be triggered again.

```
Switch(config)# rmon alarm 10 ifEntry.20.1 20 delta rising-threshold 15 1
falling-threshold 0 owner jjohnson
```

The following example creates RMON event number 1 by using the `rmon event` command. The event is defined as `High ifOutErrors` and generates a log entry when the event is triggered by the alarm. The user `jjones` owns the row that is created in the event table by this command. This example also generates an SNMP trap when the event is triggered.

```
Switch(config)# rmon event 1 log trap eventtrap description "High ifOutErrors" owner jjones
```
Collecting Group History Statistics on an Interface

You must first configure RMON alarms and events to display collection information.

Beginning in privileged EXEC mode, follow these steps to collect group history statistics on an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface on which to collect history, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, user network node interfaces (UNIs) and enhanced network interfaces (ENIs) are disabled, and network node interfaces (NNIs) are enabled.</td>
</tr>
<tr>
<td>Step 4 rmon collection history index [buckets bucket-number] [interval seconds] [owner ownername]</td>
<td>Enable history collection for the specified number of buckets and time period.</td>
</tr>
<tr>
<td></td>
<td>• For index, identify the RMON group of statistics. The range is 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For buckets bucket-number, specify the maximum number of buckets desired for the RMON collection history group of statistics. The range is 1 to 65535. The default is 50 buckets.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For interval seconds, specify the number of seconds in each polling cycle. The range is 1 to 3600. The default is 1800 seconds.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For owner ownername, enter the name of the owner of the RMON group of statistics.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 show rmon history</td>
<td>Display the contents of the switch history table.</td>
</tr>
<tr>
<td>Step 8 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable history collection, use the no rmon collection history index interface configuration command.

Collecting Group Ethernet Statistics on an Interface

Beginning in privileged EXEC mode, follow these steps to collect group Ethernet statistics on an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface on which to collect statistics, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>
Chapter 28    Configuring RMON

Displaying RMON Status

To disable the collection of group Ethernet statistics, use the no rmon collection stats index interface configuration command.

This example shows how to collect RMON statistics for the owner root:

Switch(config)# interface fastethernet0/1
Switch(config)# no shutdown
Switch(config-if)# rmon collection stats 2 owner root

Displaying RMON Status

To display the RMON status, use one or more of the privileged EXEC commands in Table 28-1:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show rmon</td>
<td>Displays general RMON statistics.</td>
</tr>
<tr>
<td>show rmon alarms</td>
<td>Displays the RMON alarm table.</td>
</tr>
<tr>
<td>show rmon events</td>
<td>Displays the RMON event table.</td>
</tr>
<tr>
<td>show rmon history</td>
<td>Displays the RMON history table.</td>
</tr>
<tr>
<td>show rmon statistics</td>
<td>Displays the RMON statistics table.</td>
</tr>
</tbody>
</table>

For information about the fields in these displays, see the “System Management Commands” section in the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.
CHAPTER 29

Configuring System Message Logging

This chapter describes how to configure system message logging on the Cisco ME 3400E Ethernet Access switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

This chapter consists of these sections:
- Understanding System Message Logging, page 29-1
- Configuring System Message Logging, page 29-2
- Displaying the Logging Configuration, page 29-13

Caution
Logging messages to the console at a high rate can cause high CPU utilization and adversely affect how the switch operates.

Understanding System Message Logging

By default, a switch sends the output from system messages and debug privileged EXEC commands to a logging process. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

Note
The syslog format is compatible with 4.3 BSD UNIX.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the console after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.
You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet or through the console port.

## Configuring System Message Logging

- System Log Message Format, page 29-2

## System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Messages appear in this format:

```
seq no:timestamp: %facility-severity-MNEMONIC:description
```

The part of the message preceding the percent sign depends on the setting of the `service sequence-numbers`, `service timestamps log datetime`, `service timestamps log datetime [localtime] [msec] [show-timezone]`, or `service timestamps log uptime` global configuration command.
Table 29-1 describes the elements of syslog messages.

**Table 29-1 System Log Message Elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq no:</td>
<td>Stamps log messages with a sequence number only if the <code>service sequence-numbers</code> global configuration command is configured.</td>
</tr>
<tr>
<td></td>
<td>For more information, see the “Enabling and Disabling Sequence Numbers in Log Messages” section on page 29-8.</td>
</tr>
<tr>
<td>timestamp formats:</td>
<td>Date and time of the message or event. This information appears only if the `service timestamps log [datetime</td>
</tr>
<tr>
<td>mm/dd hh:mm:ss or hh:mm:ss (short uptime) or d h (long uptime)</td>
<td>For more information, see the “Enabling and Disabling Time Stamps on Log Messages” section on page 29-7.</td>
</tr>
<tr>
<td>facility</td>
<td>The facility to which the message refers (for example, SNMP, SYS, and so forth). For a list of supported facilities, see Table 29-4 on page 29-13.</td>
</tr>
<tr>
<td>severity</td>
<td>Single-digit code from 0 to 7 that is the severity of the message. For a description of the severity levels, see Table 29-3 on page 29-9.</td>
</tr>
<tr>
<td>MNEMONIC</td>
<td>Text string that uniquely describes the message.</td>
</tr>
<tr>
<td>description</td>
<td>Text string containing detailed information about the event being reported.</td>
</tr>
</tbody>
</table>

This example shows a partial switch system message:

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

**Default System Message Logging Configuration**

Table 29-2 shows the default system message logging configuration.

**Table 29-2 Default System Message Logging Configuration**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>System message logging to the console</td>
<td>Enabled.</td>
</tr>
<tr>
<td>Console severity</td>
<td>Debugging (and numerically lower levels; see Table 29-3 on page 29-9).</td>
</tr>
<tr>
<td>Logging file configuration</td>
<td>No filename specified.</td>
</tr>
<tr>
<td>Logging buffer size</td>
<td>4096 bytes.</td>
</tr>
<tr>
<td>Logging history size</td>
<td>1 message.</td>
</tr>
<tr>
<td>Time stamps</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Beginning in privileged EXEC mode, follow these steps to disable message logging. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2  no logging console</td>
<td>Disable message logging.</td>
</tr>
<tr>
<td>Step 3  end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4  show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>or show logging</td>
<td></td>
</tr>
<tr>
<td>Step 5  copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The logging synchronous global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return. For more information, see the “Synchronizing Log Messages” section on page 29-6.

To re-enable message logging after it has been disabled, use the logging on global configuration command.
Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console. Beginning in privileged EXEC mode, use one or more of the following commands to specify the locations that receive messages. This procedure is optional.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>logging buffered [size]</td>
<td>Log messages to an internal buffer on the switch. The default buffer size is 4096. The range is 4096 to 2147483647 bytes. If the switch fails, the log file is lost unless you previously saved it to Flash memory. See Step 4.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should not be set to this amount.</td>
</tr>
<tr>
<td>3</td>
<td>logging host</td>
<td>Log messages to a UNIX syslog server host.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For host, specify the name or IP address of the host to be used as the syslog server. To build a list of syslog servers that receive logging messages, enter this command more than once. For complete syslog server configuration steps, see the “Configuring UNIX Syslog Servers” section on page 29-12.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For filename, enter the log message filename.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For max-file-size, specify the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For min-file-size, specify the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For severity-level-number</td>
</tr>
<tr>
<td>5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td>terminal monitor</td>
<td>Log messages to a nonconsole terminal during the current session.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.</td>
</tr>
<tr>
<td>7</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>8</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
The **logging buffered** global configuration command copies logging messages to an internal buffer. The buffer is circular, so newer messages overwrite older messages after the buffer is full. To display the messages that are logged in the buffer, use the **show logging** privileged EXEC command. The first message displayed is the oldest message in the buffer. To clear the contents of the buffer, use the **clear logging** privileged EXEC command.

To disable logging to the console, use the **no logging console** global configuration command. To disable logging to a file, use the **no logging file** [severity-level-number | type] global configuration command.

### Synchronizing Log Messages

You can synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

Beginning in privileged EXEC mode, follow these steps to configure synchronous logging. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
configure terminal | Enter global configuration mode. |
| **Step 2**  
line [console | vty] line-number [ending-line-number] | Specify the line to be configured for synchronous logging of messages. |
|  | • Use the **console** keyword for configurations that occur through the switch console port. |
|  | • Use the **line vty line-number** command to specify which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15. |
|  | You can change the setting of all 16 vty lines at once by entering: |
|  | **line vty 0 15** |
|  | Or you can change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter: |
|  | **line vty 2** |
|  | When you enter this command, the mode changes to line configuration. |
### Step 3: Configuring System Message Logging

**Command**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`logging synchronous [level {severity-level</td>
<td>all}</td>
</tr>
<tr>
<td>- (Optional) For <code>level severity-level</code>, specify the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2.</td>
<td></td>
</tr>
<tr>
<td>- (Optional) Specifying <code>level all</code> means that all messages are printed asynchronously regardless of the severity level.</td>
<td></td>
</tr>
<tr>
<td>- (Optional) For <code>limit number-of-buffers</code>, specify the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Step 5**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

**Step 6**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable synchronization of unsolicited messages and debug output, use the `no logging synchronous [level {severity-level | all} | limit number-of-buffers]` line configuration command.

### Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.

Beginning in privileged EXEC mode, follow these steps to enable time-stamping of log messages. This procedure is optional.

**Step 2**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>service timestamps log uptime</code> or <code>service timestamps log datetime [msec] [localtime] [show-timezone]</code></td>
<td>Enable log time stamps.</td>
</tr>
<tr>
<td>The first command enables time stamps on log messages, showing the time since the system was rebooted.</td>
<td></td>
</tr>
<tr>
<td>The second command enables time stamps on log messages. Depending on the options selected, the time stamp can include the date, time in milliseconds relative to the local time-zone, and the time zone name.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Step 4**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

**Step 5**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable time stamps for both debug and log messages, use the `no service timestamps` global configuration command.

This example shows part of a logging display with the `service timestamps log datetime` global configuration command enabled:

```
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```
This example shows part of a logging display with the `service timestamps log uptime` global configuration command enabled:

```
 00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
```

### Enabling and Disabling Sequence Numbers in Log Messages

Because there is a chance that more than one log message can have the same time stamp, you can display messages with sequence numbers so that you can unambiguously see a single message. By default, sequence numbers in log messages are not displayed.

Beginning in privileged EXEC mode, follow these steps to enable sequence numbers in log messages. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> service sequence-numbers</td>
<td>Enable sequence numbers.</td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable sequence numbers, use the `no service sequence-numbers` global configuration command.

This example shows part of a logging display with sequence numbers enabled:

```
000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

### Defining the Message Severity Level

You can limit messages displayed to the selected device by specifying the severity level of the message, which are described in Table 29-3.

Beginning in privileged EXEC mode, follow these steps to define the message severity level. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> logging console <code>level</code></td>
<td>Limit messages logged to the console.</td>
</tr>
<tr>
<td></td>
<td>By default, the console receives debugging messages and numerically lower levels (see Table 29-3 on page 29-9).</td>
</tr>
<tr>
<td><strong>Step 3</strong> logging monitor <code>level</code></td>
<td>Limit messages logged to the terminal lines.</td>
</tr>
<tr>
<td></td>
<td>By default, the terminal receives debugging messages and numerically lower levels (see Table 29-3 on page 29-9).</td>
</tr>
</tbody>
</table>
Step 4  
**logging trap** *level*  
Limit messages logged to the syslog servers.  
By default, syslog servers receive informational messages and numerically lower levels (see Table 29-3 on page 29-9).  
For complete syslog server configuration steps, see the “Configuring UNIX Syslog Servers” section on page 29-12.

Step 5  
**end**  
Return to privileged EXEC mode.

Step 6  
**show running-config**  
or **show logging**  
Verify your entries.

Step 7  
**copy running-config startup-config**  
(Optional) Save your entries in the configuration file.

**Note**  
Specifying a *level* causes messages at that level and numerically lower levels to appear at the destination.

To disable logging to the console, use the **no logging console** global configuration command. To disable logging to a terminal other than the console, use the **no logging monitor** global configuration command. To disable logging to syslog servers, use the **no logging trap** global configuration command.

Table 29-3 describes the *level* keywords. It also lists the corresponding UNIX syslog definitions from the most severe level to the least severe level.

<table>
<thead>
<tr>
<th>Level Keyword</th>
<th>Level</th>
<th>Description</th>
<th>Syslog Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>emergencies</td>
<td>0</td>
<td>System unstable</td>
<td>LOG_EMERG</td>
</tr>
<tr>
<td>alerts</td>
<td>1</td>
<td>Immediate action needed</td>
<td>LOG_ALERT</td>
</tr>
<tr>
<td>critical</td>
<td>2</td>
<td>Critical conditions</td>
<td>LOG_CRIT</td>
</tr>
<tr>
<td>errors</td>
<td>3</td>
<td>Error conditions</td>
<td>LOG_ERR</td>
</tr>
<tr>
<td>warnings</td>
<td>4</td>
<td>Warning conditions</td>
<td>LOG_WARNING</td>
</tr>
<tr>
<td>notifications</td>
<td>5</td>
<td>Normal but significant condition</td>
<td>LOG_NOTICE</td>
</tr>
<tr>
<td>informational</td>
<td>6</td>
<td>Informational messages only</td>
<td>LOG_INFO</td>
</tr>
<tr>
<td>debugging</td>
<td>7</td>
<td>Debugging messages</td>
<td>LOG_DEBUG</td>
</tr>
</tbody>
</table>

The software generates four other categories of messages:

- Error messages about software or hardware malfunctions, displayed at levels *warnings* through *emergencies*. These types of messages mean that the functionality of the switch is affected. For information on how to recover from these malfunctions, see the system message guide for this release.

- Output from the **debug** commands, displayed at the **debugging** level. Debug commands are typically used only by the Technical Assistance Center.

- Interface up or down transitions and system restart messages, displayed at the *notifications* level. This message is only for information; switch functionality is not affected.
Chapter 29 Configuring System Message Logging

Limiting Syslog Messages Sent to the History Table and to SNMP

If you enabled syslog message traps to be sent to an SNMP network management station by using the `snmp-server enable trap` global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level `warning` and numerically lower levels (see Table 29-3 on page 29-9) are stored in the history table even if syslog traps are not enabled.

Beginning in privileged EXEC mode, follow these steps to change the level and history table size defaults. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 logging history <code>level</code></td>
<td>Change the default level of syslog messages stored in the history file and sent to the SNMP server.</td>
</tr>
<tr>
<td></td>
<td>See Table 29-3 on page 29-9 for a list of <code>level</code> keywords.</td>
</tr>
<tr>
<td></td>
<td>By default, <code>warnings</code>, <code>errors</code>, <code>critical</code>, <code>alerts</code>, and <code>emergencies</code> messages are sent.</td>
</tr>
<tr>
<td>Step 3 logging history size <code>number</code></td>
<td>Specify the number of syslog messages that can be stored in the history table.</td>
</tr>
<tr>
<td></td>
<td>The default is to store one message. The range is 0 to 500 messages.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

1. Table 29-3 lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, emergencies equal 1, not 0, and critical equals 3, not 2.

When the history table is full (it contains the maximum number of message entries specified with the `logging history size` global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

To return the logging of syslog messages to the default level, use the `no logging history` global configuration command. To return the number of messages in the history table to the default value, use the `no logging history size` global configuration command.

Enabling the Configuration-Change Logger

You can enable a configuration logger to keep track of configuration changes made with the command-line interface (CLI). When you enter the `logging enable` configuration-change logger configuration command, the log records the session, the user, and the command that was entered to change the configuration. You can configure the size of the configuration log from 1 to 1000 entries (the default is 100). You can clear the log at any time by entering the `no logging enable` command followed by the `logging enable` command to disable and reenable logging.
Use the `show archive log config [all | number [end-number]] [user username [session number] number [end-number]] [statistics] [provisioning]` privileged EXEC command to display the complete configuration log or the log for specified parameters.

The default is that configuration logging is disabled.

For information about the commands, see the Cisco IOS Configuration Fundamentals and Network Management Command Reference, Release 12.3 T at this URL:

Beginning in privileged EXEC mode, follow these steps to enable configuration logging:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>archive</td>
<td>Enter archive configuration mode.</td>
</tr>
<tr>
<td>log config</td>
<td>Enter configuration-change logger configuration mode.</td>
</tr>
<tr>
<td>logging enable</td>
<td>Enable configuration change logging.</td>
</tr>
</tbody>
</table>
| logging size entries | (Optional) Configure the number of entries retained in the configuration log. The range is from 1 to 1000. The default is 100.  
**Note** When the configuration log is full, the oldest log entry is removed each time a new entry is entered. |
| end | Return to privileged EXEC mode. |
| show archive log config | Verify your entries by viewing the configuration log. |

This example shows how to enable the configuration-change logger and to set the number of entries in the log to 500.

```
Switch(config)# archive
Switch(config-archive)# log config
Switch(config-archive-log-cfg)# logging enable
Switch(config-archive-log-cfg)# logging size 500
Switch(config-archive-log-cfg)# end
```

This is an example of output for the configuration log:

```
Switch# show archive log config all
  idx  sess  user@line          Logged command
  38   11  unknown user@vty3  | no aaa authorization config-commands
  39   12  unknown user@vty3  | no aaa authorization network default group radius
  40   12  unknown user@vty3  | no aaa accounting dot1x default start-stop group
  radius
  41   13  unknown user@vty3  | no aaa accounting system default
  42    3  temi@vty3           | interface GigabitEthernet4/0/1
  43    3  temi@vty3           | switchport mode trunk
  44    4  temi@vty4           | exit
  45    5  temi@vty5           | interface FastEthernet5/0/1
  46    5  temi@vty5           | switchport mode trunk
  47    5  temi@vty5           | exit
```

This example shows how to enable the configuration-change logger and to set the number of entries in the log to 500.

```
Switch(config)# archive
Switch(config-archive)# log config
Switch(config-archive-log-cfg)# logging enable
Switch(config-archive-log-cfg)# logging size 500
Switch(config-archive-log-cfg)# end
```

This is an example of output for the configuration log:

```
Switch# show archive log config all
  idx  sess  user@line          Logged command
  38   11  unknown user@vty3  | no aaa authorization config-commands
  39   12  unknown user@vty3  | no aaa authorization network default group radius
  40   12  unknown user@vty3  | no aaa accounting dot1x default start-stop group
  radius
  41   13  unknown user@vty3  | no aaa accounting system default
  42    3  temi@vty3           | interface GigabitEthernet4/0/1
  43    3  temi@vty3           | switchport mode trunk
  44    4  temi@vty4           | exit
  45    5  temi@vty5           | interface FastEthernet5/0/1
  46    5  temi@vty5           | switchport mode trunk
  47    5  temi@vty5           | exit
```
Configuring UNIX Syslog Servers

The next sections describe how to configure the UNIX server syslog daemon and how to define the UNIX system logging facility.

Logging Messages to a UNIX Syslog Daemon

Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server. This procedure is optional.

Log in as root, and perform these steps:

**Note**

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX `man syslogd` command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

**Step 1**

Add a line such as the following to the file `/etc/syslog.conf`:

```
local7.debug /usr/adm/logs/cisco.log
```

The `local7` keyword specifies the logging facility to be used; see Table 29-4 on page 29-13 for information on the facilities. The `debug` keyword specifies the syslog level; see Table 29-3 on page 29-9 for information on the severity levels. The syslog daemon sends messages at this level or at a more severe level to the file specified in the next field. The file must already exist, and the syslog daemon must have permission to write to it.

**Step 2**

Create the log file by entering these commands at the UNIX shell prompt:

```
$ touch /var/log/cisco.log
$ chmod 666 /var/log/cisco.log
```

**Step 3**

Make sure the syslog daemon reads the new changes:

```
$ kill -HUP `cat /etc/syslog.pid`
```

For more information, see the `man syslog.conf` and `man syslogd` commands on your UNIX system.

Configuring the UNIX System Logging Facility

When sending system log messages to an external device, you can cause the switch to identify its messages as originating from any of the UNIX syslog facilities.

Beginning in privileged EXEC mode, follow these steps to configure UNIX system facility message logging. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>logging host</td>
<td>Log messages to a UNIX syslog server host by entering its IP address.</td>
</tr>
<tr>
<td></td>
<td>To build a list of syslog servers that receive logging messages, enter this command more than once.</td>
</tr>
</tbody>
</table>
Displaying the Logging Configuration

To remove a syslog server, use the `no logging host` global configuration command, and specify the syslog server IP address. To disable logging to syslog servers, enter the `no logging trap` global configuration command.

Table 29-4 lists the UNIX system facilities supported by the software. For more information about these facilities, consult the operator’s manual for your UNIX operating system.

To display the logging configuration and the contents of the log buffer, use the `show logging` privileged EXEC command. For information about the fields in this display, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.2*. 
Chapter 29  Configuring System Message Logging

Displaying the Logging Configuration
Configuring SNMP

This chapter describes how to configure the Simple Network Management Protocol (SNMP) on the Cisco ME 3400E Ethernet Access switch.

Understanding SNMP

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a MIB. The SNMP manager can be part of a network management system (NMS) such as CiscoWorks. The agent and MIB reside on the switch. To configure SNMP on the switch, you define the relationship between the manager and the agent.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change. A manager can get a value from an agent or store a value into the agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to a manager’s requests to get or set data.

An agent can send unsolicited traps to the manager. Traps are messages alerting the SNMP manager to a condition on the network. Traps can mean improper user authentication, restarts, link status (up or down), MAC address tracking, closing of a TCP connection, loss of connection to a neighbor, or other significant events.

Although the switch does not support the Cisco Data Collection MIB, you can use the command-line interface to periodically transfer selected MIB data to specified NMS stations. Starting with this release, you can also configure a Cisco Process MIB CPU threshold table.
These sections contain this conceptual information:

- SNMP Versions, page 30-2
- SNMP Manager Functions, page 30-3
- SNMP Agent Functions, page 30-4
- SNMP Community Strings, page 30-4
- Using SNMP to Access MIB Variables, page 30-4
- SNMP Notifications, page 30-5
- SNMP ifIndex MIB Object Values, page 30-5
- MIB Data Collection and Transfer, page 30-6

**SNMP Versions**

This software release supports these SNMP versions:

- SNMPv1—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.
- SNMPv2C—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.
- SNMPv3—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:
  - Message integrity—ensuring that a packet was not tampered with in transit
  - Authentication—determining that the message is from a valid source
  - Encryption—mixing the contents of a package to prevent it from being read by an unauthorized source.

  **Note**
  To select encryption, enter the `priv` keyword. This keyword is available only when the cryptographic (encrypted) software image is installed.

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent’s MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval mechanism and more detailed error message reporting to management stations. The bulk retrieval mechanism retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.
SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which the user resides. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security mechanism is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.

Table 30-1 identifies the characteristics of the different combinations of security models and levels.

<table>
<thead>
<tr>
<th>Model</th>
<th>Level</th>
<th>Authentication</th>
<th>Encryption</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMPv1</td>
<td>noAuthNoPriv</td>
<td>Community string</td>
<td>No</td>
<td>Uses a community string match for authentication.</td>
</tr>
<tr>
<td>SNMPv2C</td>
<td>noAuthNoPriv</td>
<td>Community string</td>
<td>No</td>
<td>Uses a community string match for authentication.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>noAuthNoPriv</td>
<td>Username</td>
<td>No</td>
<td>Uses a username match for authentication.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>authNoPriv</td>
<td>MD5 or SHA</td>
<td>No</td>
<td>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.</td>
</tr>
<tr>
<td>SNMPv3</td>
<td>authPriv</td>
<td>MD5 or SHA</td>
<td>DES</td>
<td>Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Provides DES 56-bit encryption in addition to authentication based on the CBC-DES (DES-56) standard.</td>
</tr>
</tbody>
</table>

You must configure the SNMP agent to use the SNMP version supported by the management station. Because an agent can communicate with multiple managers, you can configure the software to support communications using SNMPv1, SNMPv2C, or SNMPv3.

**SNMP Manager Functions**

The SNMP manager uses information in the MIB to perform the operations described in Table 30-2.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get-request</td>
<td>Retrieves a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieves a value from a variable within a table.¹</td>
</tr>
<tr>
<td>get-bulk-request</td>
<td>Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.</td>
</tr>
<tr>
<td>get-response</td>
<td>Replies to a get-request, get-next-request, and set-request sent by an NMS.</td>
</tr>
<tr>
<td>set-request</td>
<td>Stores a value in a specific variable.</td>
</tr>
<tr>
<td>trap</td>
<td>An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.</td>
</tr>
</tbody>
</table>

¹ With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.

² The get-bulk command only works with SNMPv2 or later.
SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- Get a MIB variable—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.
- Set a MIB variable—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.

The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.

SNMP Community Strings

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the switch, the community string definitions on the NMS must match at least one of the three community string definitions on the switch.

A community string can have one of these attributes:

- Read-only (RO)—Gives read access to authorized management stations to all objects in the MIB except the community strings, but does not allow write access
- Read-write (RW)—Gives read and write access to authorized management stations to all objects in the MIB, but does not allow access to the community strings

Using SNMP to Access MIB Variables

An example of an NMS is the CiscoWorks network management software. CiscoWorks 2000 software uses the switch MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in Figure 30-1, the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in get-request, get-next-request, and set-request format.

For information on supported MIBs and how to access them, see Appendix A, “Supported MIBs.”
SNMP Notifications

SNMP allows the switch to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword traps refers to either traps or informs, or both. Use the `snmp-server host` command to specify whether to send SNMP notifications as traps or informs.

**Note**

SNMPv1 does not support informs.

Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be re-sent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the switch and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be re-sent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Therefore, traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the switch is a concern and notification is not required, use traps.

SNMP ifIndex MIB Object Values

In an NMS, the IF-MIB generates and assigns an interface index (ifIndex) object value that is a unique number greater than zero to identify a physical or a logical interface. When the switch reboots or the switch software is upgraded, the switch uses this same value for the interface. For example, if the switch assigns a port 2 an ifIndex value of 10003, this value is the same after the switch reboots.

The switch uses one of the values in Table 30-3 to assign an ifIndex value to an interface:

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>ifIndex Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVI1</td>
<td>1–4999</td>
</tr>
<tr>
<td>EtherChannel</td>
<td>5000–5012</td>
</tr>
<tr>
<td>Loopback</td>
<td>5013–5077</td>
</tr>
<tr>
<td>Tunnel</td>
<td>5078–5142</td>
</tr>
<tr>
<td>Physical (such as Gigabit Ethernet or SFP2-module interfaces)</td>
<td>10000–14500</td>
</tr>
<tr>
<td>Null</td>
<td>14501</td>
</tr>
</tbody>
</table>

1. **SVI** = switch virtual interface
2. **SFP** = small form-factor pluggable

**Note**

The switch might not use sequential values within a range.
MIB Data Collection and Transfer

To configure periodic transfer MIB data from a device to a specified NMS, you group data from multiple MIBs into list and configure a polling interval. All MIB objects in the list are polled at the specified interval, and the data is transferred to the specified NMS at a configured transfer interval. The periodic data collection and transfer mechanism is referred to as the bulk-statistics feature.

To configure bulk statistics, you use a bulk-statistics object list to specify the SNMP object types to be monitored and a bulk-statistics schema to specify the instances of the objects to be collected. You can specify MIBs, MIB tables, MIB objects, and object indices by using a series of object identifiers (OIDs).

- A bulk-statistics object list is a user-specified set of MIB objects that share the same MIB index identified by a user-specified name.
- A bulk-statistics schema is identified by a user-specified name and includes the name of the object list, the instance to be retrieved for objects in the object list, and the polling interval.

After you configure the data to be collected, a single virtual bulk-statistics file is created with all the collected data. You can specify how the file is transferred to the NMS (FTP, RCP, or TFTP), how often the file is transferred (the default is 30 minutes), and a secondary destination if the primary NMS is not available. The transfer-interval time is also the collection-interval time. After the collection interval ends, the bulk-statistics file is frozen, and a new local bulk-statistics file is created to store new data. The frozen file is transferred to the specified destination and then deleted (unless you configure the device to keep the file in memory for a specified time period). You can configure the switch to send an SNMP notification to the NMS if a transfer is not successful and to enter a syslog message on the local device.

<tr>
<td>SNMPv3 authentication</td>
<td>If no keyword is entered, the default is the noauth (noAuthNoPriv) security level.</td>
</tr>
<tr>
<td>SNMP notification type</td>
<td>If no type is specified, all notifications are sent.</td>
</tr>
</tbody>
</table>

¹. This is the default at switch startup when the startup configuration does not have any snmp-server global configuration commands.

SNMP Configuration Guidelines

If the switch starts and the switch startup configuration has at least one snmp-server global configuration command, the SNMP agent is enabled.

An SNMP group is a table that maps SNMP users to SNMP views. An SNMP user is a member of an SNMP group. An SNMP host is the recipient of an SNMP trap operation. An SNMP engine ID is a name for the local or remote SNMP engine.

When configuring SNMP, follow these guidelines:

- When configuring an SNMP group, do not specify a notify view. The snmp-server host global configuration command autogenerates a notify view for the user and then adds it to the group associated with that user. Modifying the group’s notify view affects all users associated with that group. See the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 for information about when you should configure notify views.

- To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides.

- Before you configure remote users for a particular agent, configure the SNMP engine ID, using the snmp-server engineID global configuration with the remote option. The remote agent’s SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.

- When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.

- If a local user is not associated with a remote host, the switch does not send informs for the auth (authNoPriv) and the priv (authPriv) authentication levels.

- Changing the value of the SNMP engine ID has important side effects. A user’s password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of the engine ID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the snmp-server user username global configuration command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.
Disabling the SNMP Agent

Beginning in privileged EXEC mode, follow these steps to disable the SNMP agent:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 no snmp-server</td>
<td>Disable the SNMP agent operation.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

The `no snmp-server` global configuration command disables all running versions (Version 1, Version 2C, and Version 3) on the device. No specific Cisco IOS command exists to enable SNMP. The first `snmp-server` global configuration command that you enter enables all versions of SNMP.

Configuring Community Strings

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the switch. Optionally, you can specify one or more of these characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent
- A MIB view, which defines the subset of all MIB objects accessible to the given community
- Read and write or read-only permission for the MIB objects accessible to the community
Beginning in privileged EXEC mode, follow these steps to configure a community string on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>snmp-server community string [view view-name] [ro</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Note** To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).

To remove a specific community string, use the no snmp-server community string global configuration command.
This example shows how to assign the string *comaccess* to SNMP, to allow read-only access, and to specify that IP access list 4 can use the community string to gain access to the switch SNMP agent:

```
Switch(config)# snmp-server community comaccess ro 4
```

### Configuring SNMP Groups and Users

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the switch. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

Beginning in privileged EXEC mode, follow these steps to configure SNMP on the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server engineID {local engineid-string | remote ip-address [udp-port port-number] engineid-string}</td>
</tr>
</tbody>
</table>
|         |         | - The *engineid-string* is a 24-character ID string with the name of the copy of SNMP. You need not specify the entire 24-character engine ID if it has trailing zeros. Specify only the portion of the engine ID up to the point where only zeros remain in the value. For example, to configure an engine ID of 123400000000000000000000, you can enter this: `snmp-server engineID local 1234`
|         |         | - If you select *remote*, specify the *ip-address* of the device that contains the remote copy of SNMP and the optional User Datagram Protocol (UDP) port to use for storing data on the remote device. The default is 162. |
Chapter 30  Configuring SNMP

Step 3

**Command**

```
snmp-server group groupname {v1 | v2c | v3 {auth | noauth | priv}} [read readview] [write writeview] [notify notifyview] [access access-list]
```

**Purpose**

Configure a new SNMP group on the remote device.

- For `groupname`, specify the name of the group.
- Specify a security model:
  - `v1` is the least secure of the possible security models.
  - `v2c` is the second least secure model. It allows transmission of informs and integers twice the normal width.
  - `v3`, the most secure, requires you to select an authentication level:
    - `auth`—Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication.
    - `noauth`—Enables the noAuthNoPriv security level. This is the default if no keyword is specified.
    - `priv`—Enables Data Encryption Standard (DES) packet encryption (also called `privacy`).

**Note**

The `priv` keyword is available only when the cryptographic software image is installed.

- (Optional) Enter `read readview` with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent.
- (Optional) Enter `write writeview` with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent.
- (Optional) Enter `notify notifyview` with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap.
- (Optional) Enter `access access-list` with a string (not to exceed 64 characters) that is the name of the access list.
Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the switch generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Switches can have an unlimited number of trap managers.

Note

Many commands use the word traps in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword traps refers to either traps, informs, or both. Use the snmp-server host global configuration command to specify whether to send SNMP notifications as traps or informs.

Table 30-5 describes the supported switch traps (notification types). You can enable any or all of these traps and configure a trap manager to receive them.

<table>
<thead>
<tr>
<th>Notification Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bgp</td>
<td>Generates Border Gateway Protocol (BGP) state change traps. This option is only available when the metro IP access image is installed.</td>
</tr>
<tr>
<td>bridge</td>
<td>Generates STP bridge MIB traps.</td>
</tr>
</tbody>
</table>
Table 30-5 Switch Notification Types (continued)

<table>
<thead>
<tr>
<th>Notification Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bulkstat collection transfer</td>
<td>Generates a trap when an unsuccessful data collection or data transfer occurs or when the bulkstats file reaches the maximum size.</td>
</tr>
<tr>
<td>config</td>
<td>Generates a trap for SNMP configuration changes.</td>
</tr>
<tr>
<td>copy-config</td>
<td>Generates a trap for SNMP copy configuration changes.</td>
</tr>
<tr>
<td>cpu threshold</td>
<td>Generates a trap for CPU threshold violations</td>
</tr>
<tr>
<td>entity</td>
<td>Generates a trap for SNMP entity changes.</td>
</tr>
<tr>
<td>envmon</td>
<td>Generates environmental monitor traps. You can enable any or all of these environmental traps: fan, shutdown, status, supply, temperature.</td>
</tr>
<tr>
<td>ethernet</td>
<td>Generates an SNMP Ethernet trap.</td>
</tr>
<tr>
<td>flash</td>
<td>Generates SNMP FLASH notifications.</td>
</tr>
<tr>
<td>hsrp</td>
<td>Generates a trap for Hot Standby Router Protocol (HSRP) changes.</td>
</tr>
<tr>
<td>ipmulticast</td>
<td>Generates a trap for IP multicast routing changes.</td>
</tr>
<tr>
<td>mac-notification</td>
<td>Generates a trap for MAC address notifications.</td>
</tr>
<tr>
<td>msdp</td>
<td>Generates a trap for Multicast Source Discovery Protocol (MSDP) changes.</td>
</tr>
<tr>
<td>ospf</td>
<td>Generates a trap for Open Shortest Path First (OSPF) changes. You can enable any or all of these traps: Cisco specific, errors, link-state advertisement, rate limit, retransmit, and state changes.</td>
</tr>
<tr>
<td>pim</td>
<td>Generates a trap for Protocol-Independent Multicast (PIM) changes. You can enable any or all of these traps: invalid PIM messages, neighbor changes, and rendezvous point (RP)-mapping changes.</td>
</tr>
</tbody>
</table>
| port-security | Generates SNMP port security traps. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0, which means that there is no rate limit. **Note** When you configure a trap by using the notification type **port-security**, configure the port security trap first, and then configure the port security trap rate:  
  
  * **snmp-server enable traps port-security**  
  * **snmp-server enable traps port-security trap-rate** *rate*  

| rtr | Generates a trap for the SNMP Response Time Reporter (RTR). |
| snmp | Generates a trap for SNMP-type notifications for authentication, cold start, warm start, link up or link down. |
| storm-control | Generates a trap for SNMP storm-control. You can also set a maximum trap rate per minute. The range is from 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence). |
| stpx | Generates SNMP STP Extended MIB traps. |
| syslog | Generates SNMP syslog traps. |
| tty | Generates a trap for TCP connections. This trap is enabled by default. |
| vlan-membership | Generates a trap for SNMP VLAN membership changes. |
| vlancreate | Generates SNMP VLAN created traps. |
| vlandelete | Generates SNMP VLAN deleted traps. |
Chapter 30  Configuring SNMP

Note

Though visible in the command-line help strings, the cpu [threshold], flash insertion, flash removal, fru-ctrl, and vtp keywords are not supported. The snmp-server enable informs global configuration command is not supported. To enable the sending of SNMP inform notifications, use the snmp-server enable traps global configuration command combined with the snmp-server host host-addr informs global configuration command.

You can use the snmp-server host global configuration command to a specific host to receive the notification types listed in Table 30-5.

Beginning in privileged EXEC mode, follow these steps to configure the switch to send traps or informs to a host:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server engineID remote ip-address engineid-string</td>
</tr>
<tr>
<td>Step 3</td>
<td>snmp-server user username {remote host [udp-port port]} {v1 [access access-list]</td>
</tr>
<tr>
<td>Step 4</td>
<td>snmp-server group groupname {v1</td>
</tr>
</tbody>
</table>
Chapter 30  Configuring SNMP

Configuring SNMP

Step 5

```
snmp-server host host-addr [informs | traps] [version {1 | 2c | 3} {auth | noauth | priv}] [community-string [notification-type]]
```

Specify the recipient of an SNMP trap operation.

- For host-addr, specify the name or Internet address of the host (the targeted recipient).
- (Optional) Enter informs to send SNMP informs to the host.
- (Optional) Enter traps (the default) to send SNMP traps to the host.
- (Optional) Specify the SNMP version (1, 2c, or 3). SNMPv1 does not support informs.
- (Optional) For Version 3, select authentication level auth, noauth, or priv.

**Note**  The priv keyword is available only when the cryptographic software image is installed.

- For community-string, when version 1 or version 2c is specified, enter the password-like community string sent with the notification operation. When version 3 is specified, enter the SNMPv3 username.

**Note**  The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.

- (Optional) For notification-type, use the keywords listed in Table 30-5 on page 30-12. If no type is specified, all notifications are sent.

Step 6

```
snmp-server enable traps notification-types
```

Enable the switch to send traps or informs and specify the type of notifications to be sent. For a list of notification types, see Table 30-5 on page 30-12, or enter `snmp-server enable traps ?`

To enable multiple types of traps, you must enter a separate `snmp-server enable traps` command for each trap type.

**Note**  When you configure a trap by using the notification type `port-security`, configure the port security trap first, and then configure the port security trap rate:

- `snmp-server enable traps port-security`
- `snmp-server enable traps port-security trap-rate rate`

Step 7

```
snmp-server trap-source interface-id
```

(Optional) Specify the source interface, which provides the IP address for the trap message. This command also sets the source IP address for informs.

Step 8

```
snmp-server queue-length length
```

(Optional) Establish the message queue length for each trap host. The range is 1 to 1000; the default is 10.

Step 9

```
snmp-server trap-timeout seconds
```

(Optional) Define how often to resend trap messages. The range is 1 to 1000; the default is 30 seconds.

Step 10

```
end
```

Return to privileged EXEC mode.

Step 11

```
show running-config
```

Verify your entries.

Step 12

```
copy running-config startup-config
```

(Optional) Save your entries in the configuration file.
Chapter 30      Configuring SNMP

Configuring SNMP

The `snmp-server host` command specifies which hosts receive the notifications. The `snmp-server enable trap` command globally enables the mechanism for the specified notification (for traps and informs). To enable a host to receive an inform, you must configure an `snmp-server host informs` command for the host and globally enable informs by using the `snmp-server enable traps` command.

To remove the specified host from receiving traps, use the `no snmp-server host` global configuration command. The `no snmp-server host` command with no keywords disables traps, but not informs, to the host. To disable informs, use the `no snmp-server host informs` global configuration command. To disable a specific trap type, use the `no snmp-server enable traps notification-types` global configuration command.

Setting the Agent Contact and Location Information

Beginning in privileged EXEC mode, follow these steps to set the system contact and location of the SNMP agent so that these descriptions can be accessed through the configuration file:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2  snmp-server contact text</td>
<td>Set the system contact string.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>snmp-server contact Dial System Operator at beeper 21555</code>.</td>
</tr>
<tr>
<td>Step 3  snmp-server location text</td>
<td>Set the system location string.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td><code>snmp-server location Building 3/Room 222</code>.</td>
</tr>
<tr>
<td>Step 4  end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5  show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6  copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Limiting TFTP Servers Used Through SNMP

Beginning in privileged EXEC mode, follow these steps to limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2  snmp-server tftp-server-list</td>
<td>Limit TFTP servers used for configuration file copies through</td>
</tr>
<tr>
<td>access-list-number</td>
<td>SNMP to the servers in the access list.</td>
</tr>
<tr>
<td></td>
<td>For <code>access-list-number</code>, enter an IP standard access list numbered</td>
</tr>
<tr>
<td></td>
<td>from 1 to 99 and 1300 to 1999.</td>
</tr>
</tbody>
</table>
Chapter 30      Configuring SNMP

Configuring SNMP

Configuring MIB Data Collection and Transfer

This section includes basic configuration for MIB data collection. For more information, see the Periodic MIB Data Collection and Transfer Mechanism feature module at this URL:

Beginning in privileged EXEC mode, follow these steps to configure a bulk-statistics object list and schema options:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>Step 3</td>
<td>access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td>Create a standard access list, repeating the command as many times as necessary.</td>
</tr>
<tr>
<td></td>
<td>• For access-list-number, enter the access list number specified in Step 2.</td>
</tr>
<tr>
<td></td>
<td>• The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>• For source, enter the IP address of the TFTP servers that can access the switch.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For source-wildcard, enter the wildcard bits, in dotted decimal notation, to be applied to the source. Place ones in the bit positions that you want to ignore.</td>
</tr>
<tr>
<td></td>
<td>Recall that the access list is always terminated by an implicit deny statement for everything.</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>snmp-server mib bulkstat object-list list-name</td>
</tr>
<tr>
<td></td>
<td>Define an SNMP bulk-statistics object list, and enter bulk-statistics object-list configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>add {object-name</td>
</tr>
<tr>
<td></td>
<td>Add a MIB object to the bulk-statistics object list.</td>
</tr>
<tr>
<td></td>
<td>• For object-name, enter the name of the MIB object to add to the list. You can enter only object names from the Interfaces MIB or the Cisco Committed Access Rate MIB.</td>
</tr>
<tr>
<td></td>
<td>• For oid, enter the Object ID of the MIB object to add to the list.</td>
</tr>
<tr>
<td></td>
<td>All the objects in an object-list must be in the same MIB index, but the objects need not belong to the same MIB table. Repeat the command until all objects to be monitored are added.</td>
</tr>
<tr>
<td>Step 4</td>
<td>exit</td>
</tr>
<tr>
<td></td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>snmp-server mib bulkstat schema schema-name</td>
</tr>
<tr>
<td></td>
<td>Name the SNMP bulk statistics schema, and enter bulk-statistics schema configuration mode.</td>
</tr>
</tbody>
</table>
### Chapter 30  Configuring SNMP

**Configuring SNMP**

This example configures a bulk-statistics object list and schema:

```
Switch(config)# snmp mib bulkstat object-list ifMIB
Switch(config-bulk-objects)# add 1.3.6.1.2.1.2.1.2.2.2.1.1 1
Switch(config-bulk-objects)# add ifName
Switch(config-bulk-objects)# exit
Switch(config)# snmp mib bulkstat schema testschema
Switch(config-bulk-sc)# object-list ifMIB
Switch(config-bulk-sc)# instance wild oil 1
Switch(config-bulk-sc)# poll-interval 1
Switch(config-bulk-sc)# exit
```

Beginning in privileged EXEC mode, follow these steps to configure bulk-statistics transfer options:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server mib bulkstat transfer transfer-id</td>
<td>Identify the transfer configuration with a name, and enter bulk-statistics transfer configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> buffer-size bytes</td>
<td>(Optional) Specify the maximum size for the bulk-statistics data file in bytes. The range is from 1024 to 2147483647 bytes; the default is 2048 bytes.</td>
</tr>
<tr>
<td><strong>Step 4</strong> format {bulkBinary</td>
<td>bulkASCII</td>
</tr>
<tr>
<td><strong>Step 5</strong> schema schema-name</td>
<td>Specify the bulk-statistics schema to be transferred. Repeat this command for as many schemas as desired. You can associate multiple schemas with a transfer configuration.</td>
</tr>
</tbody>
</table>
### Command Line Interface (CLI) Commands

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td><code>transfer-interval minutes</code></td>
<td>(Optional) Specify the length of time that the system should collect MIB data before attempting the transfer operation. The valid range is from 1 to 2147483647 minutes; the default is 30 minutes. The transfer interval is the same as the collection interval.</td>
</tr>
<tr>
<td>7</td>
<td><code>url primary URL</code></td>
<td>Specify the NMS (host) that the bulk-statistics file should be transferred to and the protocol to use for transfer (FTP, RCP, or TFTP). You also can optionally enter the <code>url secondary</code> command to specify a backup transfer destination.</td>
</tr>
<tr>
<td>8</td>
<td><code>retry number</code></td>
<td>(Optional) Specify the number of transmission retries. The range is from 1 to 100; the default is 0 (no retries).</td>
</tr>
<tr>
<td>9</td>
<td><code>retain minutes</code></td>
<td>(Optional) Specify how long the bulk-statistics file should be kept in system memory. The valid range is 0 to 20000 minutes; the default is 0 (the file is deleted immediately after a successful transfer).</td>
</tr>
<tr>
<td>10</td>
<td><code>enable</code></td>
<td>Begin the bulk-statistics data collection and transfer process for this configuration. You must enter this command to start periodic collection and transfer.</td>
</tr>
<tr>
<td>11</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>12</td>
<td><code>show mib bulk transfer</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>13</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Enter the `no enable` bulk statistics transfer configuration mode command to stop the collection process. Enter the `enable` command again to restart the operation. Every time you restart the process with the `enable` command, data is collected in a new bulk-statistics file.

This is an example of configuring the bulk-statistics transfer and enabling the collection process:

```
Switch(config)# snmp mib bulkstat transfer testtransfer
Switch(config-bulk-tr)# format schemaASCII
Switch(config-bulk-tr)# buffer-size 2147483647
Switch(config-bulk-tr)# schema testschema1
Switch(config-bulk-tr)# schema testschema2
Switch(config-bulk-tr)# transfer-interval 1
Switch(config-bulk-tr)# url primary tftp://host//folder/bulkstat1
Switch(config-bulk-tr)# retain 20
Switch(config-bulk-tr)# retry 2
Switch(config-bulk-tr)# enable
Switch(config-bulk-tr)# exit
```

Enter the `show snmp mib bulk transfer` privileged EXEC command to view the configured transfer operation.

### Configuring the Cisco Process MIB CPU Threshold Table

You can use the CLI to configure the Cisco Process MIB CPU threshold table.

**Note** For commands for configuring the Cisco Process MIB CPU threshold table, see the *Cisco IOS Commands Master List, Release 12.4*, at this URL:

Beginning in privileged EXEC mode, follow these steps to configure a CPU threshold table:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| 2    | process cpu statistics limit entry-percentage number [size seconds] | Set the process entry limit and the size of the history table for CPU utilization statistics.  
- For entry-percentage number, enter the percentage (1 to 100) of CPU utilization that a process must use to become part of the history table.  
- (Optional) For size seconds, set the duration of time in seconds for which CPU statistics are stored in the history table. The range is from 5 to 86400 seconds; the default is 600. |
| 3    | process cpu threshold type (total | process | interrupt) rising percentage interval seconds [falling percentage interval seconds] | Set CPU threshold notification types and values.  
- Set the threshold type to total CPU utilization, CPU process utilization, or CPU interrupt utilization.  
- For rising percentage, enter the percentage (1 to 100) of CPU resources that triggers a CPU threshold notification when exceeded.  
- For interval seconds, enter the duration of the CPU threshold violation in seconds (5 to 86400) that must be met to trigger a CPU threshold notification. The default is 5 seconds.  
- (Optional) Set a falling percentage interval seconds that, when usage falls below this level for the configured interval, triggers a CPU threshold notification. The percentage must be equal to or less than the rising percentage. The default is for the falling percentage to be the same value as the rising percentage. |
| 4    | end | Return to privileged EXEC mode. |
| 5    | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

**SNMP Examples**

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string public. This configuration does not cause the switch to send any traps.

```plaintext
Switch(config)# snmp-server community public
```

This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string public. The switch also sends MAC notification traps to the hosts 192.180.1.111 and 192.180.1.33 using SNMPv1 and to the host 192.180.1.27 using SNMPv2C. The community string public is sent with the traps.

```plaintext
Switch(config)# snmp-server community public  
Switch(config)# snmp-server enable traps mac-notification  
Switch(config)# snmp-server host 192.180.1.27 version 2c public  
Switch(config)# snmp-server host 192.180.1.111 version 1 public  
Switch(config)# snmp-server host 192.180.1.33 public
```
This example shows how to allow read-only access for all objects to members of access list 4 that use the community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2C to the host cisco.com using the community string public.

```
Switch(config)# snmp-server community comaccess ro 4
Switch(config)# snmp-server enable traps snmp authentication
Switch(config)# snmp-server host cisco.com version 2c public
```

This example shows how to send Entity MIB traps to the host cisco.com. The community string is restricted. The first line enables the switch to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous commands for the host cisco.com.

```
Switch(config)# snmp-server enable traps entity
Switch(config)# snmp-server host cisco.com restricted entity
```

This example shows how to enable the switch to send all traps to the host myhost.cisco.com using the community string public:

```
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

This example shows how to associate a user with a remote host and to send auth (authNoPriv) authentication-level informs when the user enters global configuration mode:

```
Switch(config)# snmp-server engineID remote 192.180.1.27 0000063000100a1c0b4011b
Switch(config)# snmp-server group authgroup v3 auth
Switch(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5 mypassword
Switch(config)# snmp-server user authuser authgroup v3 auth md5 mypassword
Switch(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server inform retries 0
```

This example shows how to enable SNMP notifications to provide information on the transfer status of the periodic MIB data collection and transfer mechanism (bulk statistics):

```
Switch(config)# snmp-server enable traps bulkstat
Switch(config)# snmp-server host 192.180.1.27 informs version 2 public bulkstat
```

This example shows how to enable SNMP notifications to provide information on the Cisco Process MIB CPU threshold table:

```
Switch(config)# snmp-server enable traps cpu threshold
Switch(config)# snmp-server host 192.180.1.27 informs version 2 public cpu
```
Displaying SNMP Status

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the show snmp privileged EXEC command. You also can use the other privileged EXEC commands in Table 30-6 to display SNMP information. For information about the fields in the displays, see the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

Table 30-6 Commands for Displaying SNMP Information

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>show snmp</td>
<td>Displays SNMP statistics.</td>
</tr>
<tr>
<td>show snmp engineID [local</td>
<td>remote]</td>
</tr>
<tr>
<td>show snmp group</td>
<td>Displays information on each SNMP group on the network.</td>
</tr>
<tr>
<td>show snmp mib bulk transfer</td>
<td>Displays transfer status of files generated by the Periodic MIB Data Collection and Transfer Mechanism (bulk statistics feature).</td>
</tr>
<tr>
<td>show snmp pending</td>
<td>Displays information on pending SNMP requests.</td>
</tr>
<tr>
<td>show snmp sessions</td>
<td>Displays information on the current SNMP sessions.</td>
</tr>
<tr>
<td>show snmp user</td>
<td>Displays information on each SNMP user name in the SNMP users table.</td>
</tr>
</tbody>
</table>
Configuring Embedded Event Manager

This chapter describes how to use the embedded event manager (EEM) to monitor and manage the Cisco ME 3400E Ethernet Access switch and how to configure it.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the Cisco IOS Configuration Fundamentals and Network Management Command Reference, Release 12.3T. For complete configuration information, see the Cisco IOS Network Management Configuration Guide, Release 12.4T.

This chapter consists of these sections:
- Understanding Embedded Event Manager, page 31-1
- Configuring Embedded Event Manager, page 31-4
- Displaying Embedded Event Manager Information, page 31-6

Understanding Embedded Event Manager

The embedded event manager (EEM) monitors key system events and then acts on them though a set policy. This policy is a programmed script that you can use to customize a script to invoke an action based on a given set of events occurring. The script generates actions such as generating custom syslog or Simple Network Management Protocol (SNMP) traps, invoking CLI commands, forcing a failover, and so forth. The event management capabilities of EEM are useful because not all event management can be managed from the switch and because some problems compromise communication between the switch and the external network management device. Network availability is improved if automatic recovery actions are performed without rebooting the switch.

Figure 31-1 shows the relationship between the EEM server, the core event publishers (event detectors), and the event subscribers (policies). The event publishers screen events and when there is a match on an event specification that is provided by the event subscriber. Event detectors notify the EEM server when an event occurs. The EEM policies then implement recovery based on the current state of the system and the actions specified in the policy for the given event.
Understanding Embedded Event Manager

These sections contain this conceptual information:

- Event Detectors, page 31-2
- Embedded Event Manager Actions, page 31-3
- Embedded Event Manager Policies, page 31-4
- Embedded Event Manager Environment Variables, page 31-4

Event Detectors

EEM software programs known as event detectors determine when an EEM event occurs. Event detectors are separate systems that provide an interface between the agent being monitored, for example SNMP, and the EEM policies where an action can be implemented.

EEM allows these event detectors:

- Application-specific event detector—Allows any EEM policy to publish an event.
- IOS CLI event detector—Generates policies based on the commands entered through the CLI.
- GOLD event detector—Publishes an event when a GOLD failure event is detected on a specified card and subcard.
- Counter event detector—Publishes an event when a named counter crosses a specified threshold.
- Interface counter event detector—Publishes an event when a generic Cisco IOS interface counter for a specified interface crosses a defined threshold. A threshold can be specified as an absolute value or an incremental value. For example, if the incremental value is set to 50 an event would be published when the interface counter increases by 50.
• None event detector– Publishes an event when the `event manager run` CLI command executes an EEM policy. EEM schedules and runs policies on the basis on an event specification within the policy itself. An EEM policy must be manually identified and registered before the `event manager run` command executes.

• Online insertion and removal event detector–Publishes an event when a hardware insertion or removal (OIR) event occurs.

• Resource threshold event detector– Generates policies based on global platform values and thresholds. Includes resources such as CPU utilization and remaining buffer capacity. Applies only to the master switch.

• SNMP event detector– Allows a standard SNMP MIB object to be monitored and an event to be generated when the object matches specified values or crosses specified thresholds.

• Syslog event detector– Allows for screening syslog messages for a regular expression pattern match. The selected messages can be further qualified, requiring that a specific number of occurrences be logged within a specified time. A match on a specified event criteria triggers a configured policy action.

• Timer event detector
  Publishes events for these timers:
  – An absolute-time-of-day timer publishes an event when a specified absolute date and time occurs.
  – A countdown timer publishes an event when a timer counts down to zero.
  – A watchdog timer publishes an event when a timer counts down to zero. The timer automatically resets itself to its initial value and starts to count down again.
  – A CRON timer publishes an event by using a UNIX standard CRON specification to define when the event is to be published. A CRON timer never publishes events more than once per minute.

• Watchdog event detector (IOSWDSysMon). This detector applies only to the master switch.
  Publishes an event when one of these events occurs:
  – CPU utilization for a Cisco IOS process crosses a threshold.
  – Memory utilization for a Cisco IOS process crosses a threshold.
  Two events can be monitored at the same time, and the event publishing criteria requires that one or both events cross their specified thresholds.

### Embedded Event Manager Actions

EEM provides actions that occur in response to an event. EEM supports these actions:

• Modifying a named counter.
• Publishing an application-specific event.
• Generating an SNMP trap.
• Generating prioritized syslog messages.
• Reloading the Cisco IOS software.
Embedded Event Manager Policies

EEM can monitor events and provide information, or take corrective action when the monitored events occur or a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs.

There are two types of EEM policies: an applet or a script. An applet is a simple policy that is defined within the CLI configuration. It is a concise method for defining event screening criteria and the actions to be taken when that event occurs. Scripts are defined on the networking device by using an ASCII editor. The script is then copied to the networking device and registered with EEM. You use EEM to write and implement your own policies using the EEM policy tool command language (TCL) script.

Cisco enhancements to TCL in the form of keyword extensions facilitate the development of EEM policies. These keywords identify the detected event, the subsequent action, utility information, counter values, and system information.

For complete information on configuring EEM policies and scripts, see the Cisco IOS Network Management Configuration Guide, Release 12.4T.

Embedded Event Manager Environment Variables

EEM uses environment variables in EEM policies. These variables are defined in a EEM policy tool command language (TCL) script by running a CLI command and the `event manager environment` command. These environment variables can be defined in EEM:

- User-defined variables
  Defined by the user for a user-defined policy.
- Cisco-defined variables
  Defined by Cisco for a specific sample policy.
- Cisco built-in variables (available in EEM applets)
  Defined by Cisco and can be read-only or read-write. The read-only variables are set by the system before an applet starts to execute. The single read-write variable, `_exit_status`, allows you to set the exit status for policies triggered from synchronous events.

Cisco-defined environment variables and Cisco system-defined environment variables might apply to one specific event detector or to all event detectors. Environment variables that are user-defined or defined by Cisco in a sample policy are set by using the `event manager environment` global configuration command. You must defined the variables in the EEM policy before you register the policy.

For information about the environmental variables that EEM supports, see the Cisco IOS Network Management Configuration Guide, Release 12.4T.

Configuring Embedded Event Manager

- Registering and Defining an Embedded Event Manager Applet, page 31-5
- Registering and Defining an Embedded Event Manager TCL Script, page 31-6

For complete information about configuring embedded event manager, see the Cisco IOS Network Management Configuration Guide, Release 12.4T.
Registering and Defining an Embedded Event Manager Applet

Beginning in privileged EXEC mode, perform this task to register an applet with EEM and to define the EEM applet using the event applet and action applet configuration commands.

**Note**

Only one event applet command is allowed in an EEM applet. Multiple action applet commands are permitted. If you do not specify the no event and no action commands, the applet is removed when you exit configuration mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> event manager applet applet-name</td>
<td>Register the applet with EEM and enter applet configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 3** event snmp oid oid-value get-type {exact | next} entry-op {gt | ge | eq | ne | lt | le} entry-val entry-val [exit-comb {or | land}] [exit-op {gt | ge | eq | ne | lt | le}] [exit-val exit-val] [exit-time exit-time-val] poll-interval poll-int-val | Specify the event criteria that causes the EEM applet to run.  
(Optional) Exit criteria. If exit criteria are not specified, event monitoring is re-enabled immediately. |
| **Step 4** action label syslog [priority priority-level] msg msg-text | Specify the action when an EEM applet is triggered. Repeat this action to add other CLI commands to the applet.  
- (Optional) The priority keyword specifies the priority level of the syslog messages. If selected, you need to define the priority-level argument.  
- For msg-text, the argument can be character text, an environment variable, or a combination of the two. |
| **Step 5** end                                | Exit applet configuration mode and return to privileged EXEC mode.       |

This example shows the output for EEM when one of the fields specified by an SNMP object ID crosses a defined threshold:

```
Switch(config-applet)# event snmp oid 1.3.6.1.4.1.9.9.48.1.1.1.6.1 get-type exact entry-op lt entry-val 5120000 poll-interval 10
```

These examples show actions that are taken in response to an EEM event:

```
Switch(config-applet)# action 1.0 syslog priority critical msg "Memory exhausted; current available memory is $snmp_oid_val bytes"
```

Switch (config-applet)# action 2.0 force-switchover
Registering and Defining an Embedded Event Manager TCL Script

Beginning in privileged EXEC mode, perform this task to register a TCL script with EEM and to define the TCL script and policy commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 1</strong> show event manager environment [all</td>
<td>variable-name]</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> event manager environment variable-name string</td>
<td>Configure the value of the specified EEM environment variable. Repeat this step for all the required environment variables.</td>
</tr>
<tr>
<td><strong>Step 4</strong> event manager policy policy-file-name [type system] [trap]</td>
<td>Register the EEM policy to be run when the specified event defined within the policy occurs.</td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Exit global configuration mode and return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

This example shows the sample output for the `show event manager environment` command:

```
Switch# show event manager environment all
No.  Name                          Value
1    _cron_entry                   0-59/2 0-23/1 * * 0-6
2    _show_cmd                     show ver
3    _syslog_pattern               .*UPDOWN.*Ethernet1/0.*
4    _config_cmd1                  interface Ethernet1/0
5    _config_cmd2                  no shut
```

This example shows a CRON timer environment variable, which is assigned by the software, to be set to every second minute, every hour of every day:

```
Switch (config)# event manager environment_cron_entry 0-59/2 0-23/1 * * 0-6
```

This example shows the sample EEM policy named `tm_cli_cmd.tcl` registered as a system policy. The system policies are part of the Cisco IOS image. User-defined TCL scripts must first be copied to flash memory:

```
Switch (config)# event manager policy tm_cli_cmd.tcl type system
```

Displaying Embedded Event Manager Information

To display information about EEM, including EEM registered policies and EEM history data, see the *Cisco IOS Configuration Fundamentals and Network Management Command Reference, Release 12.3T.*
This chapter describes how to configure network security on the Cisco ME 3400E Ethernet Access switch by using access control lists (ACLs), which are also referred to in commands and tables as access lists.

Information in this chapter about IP ACLs is specific to IP Version 4 (IPv4).

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release, see the “Configuring IP Services” section in the “IP Addressing and Services” chapter of the Cisco IOS IP Configuration Guide, Release 12.2, and the Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.2.

This chapter consists of these sections:

- Understanding ACLs, page 32-1
- Configuring IPv4 ACLs, page 32-6
- Creating Named MAC Extended ACLs, page 32-26
- Configuring VLAN Maps, page 32-29
- Using VLAN Maps with Router ACLs, page 32-35
- Displaying IPv4 ACL Configuration, page 32-39

Understanding ACLs

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide...
which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies permit or deny and a set of conditions the packet must satisfy in order to match the ACE. The meaning of permit or deny depends on the context in which the ACL is used.

The switch supports IPv4 ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs. For more information, see the “Understanding QoS” section on page 34-1.

These sections contain this conceptual information:

- Supported ACLs, page 32-2
- Handling Fragmented and Unfragmented Traffic, page 32-5

**Supported ACLs**

The switch supports three applications of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. The switch does not support port ACLs in the outbound direction. You can apply only one IP access list and one MAC access list to a Layer 2 interface.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound). The switch must be running the metro IP access image to support router ACLs.
- VLAN ACLs or VLAN maps access-control all packets (forwarded and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

You can use input port ACLs, router ACLs, and VLAN maps on the same switch. However, a port ACL takes precedence over a router ACL or VLAN map.

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACL exist in an switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IPv4 packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IPv4 packets are filtered by the router ACL. Other packets are not filtered.
Understanding ACLs

When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IPv4 packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IPv4 packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

If IEEE 802.1Q tunneling is configured on an interface, any IEEE 802.1Q encapsulated IPv4 packets received on the tunnel port can be filtered by MAC ACLs, but not by IP v4 ACLs. This is because the switch does not recognize the protocol inside the IEEE 802.1Q header. This restriction applies to router ACLs, port ACLs, and VLAN maps. For more information about IEEE 802.1Q tunneling, refer to Chapter 14, “Configuring IEEE 802.1Q Tunneling, VLAN Mapping, and Layer 2 Protocol Tunneling.”

Port ACLs

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces and can be applied only on interfaces in the inbound direction. These access lists are supported on Layer 2 interfaces:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs associated with all inbound features configured on a given interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs are used to control access to a network or to part of a network. Figure 32-1 is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the inbound direction.
Understanding ACLs

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

Router ACLs

If the switch is running the metro IP access image, you can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

One ACL can be used with multiple features for a given interface, and one feature can use multiple ACLs. When a single router ACL is used by multiple features, it is examined multiple times.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.
Chapter 32 Configuring Network Security with ACLs

Understanding ACLs

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. However, router ACLs are supported in both directions. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network. In Figure 32-1, ACLs applied at the router input allow Host A to access the Human Resources network, but prevent Host B from accessing the same network.

VLAN Maps

VLAN ACLs or VLAN maps can access-control all traffic. You can apply VLAN maps to all packets that are routed into or out of a VLAN or are forwarded within a VLAN in the switch. VLAN maps are used for security packet filtering and are not defined by direction (input or output).

You can configure VLAN maps to match Layer 3 addresses for IPv4 traffic.

All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map. Figure 32-2 shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

**Figure 32-2 Using VLAN Maps to Control Traffic**

![Figure 32-2 Using VLAN Maps to Control Traffic](image)

**Handling Fragmented and Unfragmented Traffic**

IPv4 packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some ACEs do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IPv4 packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.
• Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

Consider access list 102, configured with these commands, applied to three fragmented packets:

Switch(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Switch(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Switch(config)# access-list 102 permit tcp any host 10.1.1.2
Switch(config)# access-list 102 deny tcp any any

In the first and second ACEs in the examples, the eq keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

• Packet A is a TCP packet from host 10.2.2.2., port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

• Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).

Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

• Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

Configuring IPv4 ACLs

Configuring IP v4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers. The process is briefly described here. For more detailed information on configuring ACLs, see the “Configuring IP Services” section in the “IP Addressing and Services” chapter of the Cisco IOS IP Configuration Guide, Release 12.2. For detailed information about the commands, see the Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.2.

The switch does not support these Cisco IOS router ACL-related features:

• Non-IP protocol ACLs (see Table 32-1 on page 32-8) or bridge-group ACLs
• IP accounting
• Inbound and outbound rate limiting (except with QoS ACLs)
• Reflexive ACLs or dynamic ACLs
• ACL logging for port ACLs and VLAN maps
These are the steps to use IP ACLs on the switch:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create an ACL by specifying an access list number or name and the access conditions.</td>
</tr>
<tr>
<td>2</td>
<td>Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.</td>
</tr>
</tbody>
</table>

These sections contain this configuration information:
- Creating Standard and Extended IPv4 ACLs, page 32-7
- Applying an IPv4 ACL to a Terminal Line, page 32-18
- Applying an IPv4 ACL to an Interface, page 32-19
- Hardware and Software Treatment of IP ACLs, page 32-20
- Troubleshooting ACLs, page 32-21
- IPv4 ACL Configuration Examples, page 32-22

Creating Standard and Extended IPv4 ACLs

This section describes IP ACLs. An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:
- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

These sections describe access lists and how to create them:
- IPv4 Access List Numbers, page 32-8
- ACL Logging, page 32-8
- Creating a Numbered Standard ACL, page 32-9
- Creating a Numbered Extended ACL, page 32-10
- Resequencing ACEs in an ACL, page 32-14
- Creating Named Standard and Extended ACLs, page 32-14
- Using Time Ranges with ACLs, page 32-16
- Including Comments in ACLs, page 32-18
IPv4 Access List Numbers

The number you use to denote your IPv4 ACL shows the type of access list that you are creating. Table 32-1 lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

Table 32-1 Access List Numbers

<table>
<thead>
<tr>
<th>Access List Number</th>
<th>Type</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–99</td>
<td>IP standard access list</td>
<td>Yes</td>
</tr>
<tr>
<td>100–199</td>
<td>IP extended access list</td>
<td>Yes</td>
</tr>
<tr>
<td>200–299</td>
<td>Protocol type-code access list</td>
<td>No</td>
</tr>
<tr>
<td>300–399</td>
<td>DECnet access list</td>
<td>No</td>
</tr>
<tr>
<td>400–499</td>
<td>XNS standard access list</td>
<td>No</td>
</tr>
<tr>
<td>500–599</td>
<td>XNS extended access list</td>
<td>No</td>
</tr>
<tr>
<td>600–699</td>
<td>AppleTalk access list</td>
<td>No</td>
</tr>
<tr>
<td>700–799</td>
<td>48-bit MAC address access list</td>
<td>No</td>
</tr>
<tr>
<td>800–899</td>
<td>IPX standard access list</td>
<td>No</td>
</tr>
<tr>
<td>900–999</td>
<td>IPX extended access list</td>
<td>No</td>
</tr>
<tr>
<td>1000–1099</td>
<td>IPX SAP access list</td>
<td>No</td>
</tr>
<tr>
<td>1100–1199</td>
<td>Extended 48-bit MAC address access list</td>
<td>No</td>
</tr>
<tr>
<td>1200–1299</td>
<td>IPX summary address access list</td>
<td>No</td>
</tr>
<tr>
<td>1300–1999</td>
<td>IP standard access list (expanded range)</td>
<td>Yes</td>
</tr>
<tr>
<td>2000–2699</td>
<td>IP extended access list (expanded range)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Note
In addition to numbered standard and extended IPv4 ACLs, you can also create standard and extended named IPv4 ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

ACL Logging

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the logging console commands controlling the syslog messages.

Note
Because routing is done in hardware and logging is done in software, if a large number of packets match a permit or deny ACE containing a log keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.
The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

Creating a Numbered Standard ACL

Beginning in privileged EXEC mode, follow these steps to create a numbered standard ACL:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| 2    | access-list access-list-number {deny | permit} source [source-wildcard] [log] | Define a standard IPv4 access list by using a source address and wildcard. The access-list-number is a decimal number from 1 to 99 or 1300 to 1999. Enter deny or permit to specify whether to deny or permit access if conditions are matched. The source is the source address of the network or host from which the packet is being sent specified as:  
   - The 32-bit quantity in dotted-decimal format.  
   - The keyword any as an abbreviation for source and source-wildcard of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard.  
   - The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. (Optional) The source-wildcard applies wildcard bits to the source. (Optional) Enter log to cause an informational logging message about the packet that matches the entry to be sent to the console. |
| 3    | end | Return to privileged EXEC mode. |
| 4    | show access-lists [number | name] | Show the access list configuration. |
| 5    | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

Use the no access-list access-list-number global configuration command to delete the entire ACL. You cannot delete individual ACEs from numbered access lists.

Note When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.
This example shows how to create a standard ACL to deny access to IP host 171.69.198.102, permit access to any others, and display the results.

```
Switch (config)# access-list 2 deny host 171.69.198.102
Switch (config)# access-list 2 permit any
Switch(config)# end
Switch# show access-lists
Standard IP access list 2
  10 deny 171.69.198.102
  20 permit any
```

The switch always rewrites the order of standard access lists so that entries with host matches and entries with matches having a don’t care mask of 0.0.0.0 are moved to the top of the list, above any entries with non-zero don’t care masks. Therefore, in show command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to terminal lines (see the “Applying an IPv4 ACL to a Terminal Line” section on page 32-18), to interfaces (see the “Applying an IPv4 ACL to an Interface” section on page 32-19), or to VLANs (see the “Configuring VLAN Maps” section on page 32-29).

### Creating a Numbered Extended ACL

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

Some protocols also have specific parameters and keywords that apply to that protocol.

These IP protocols are supported (protocol keywords are in parentheses in bold):

- Authentication Header Protocol (ahp),
- Enhanced Interior Gateway Routing Protocol (eigrp),
- Encapsulation Security Payload (esp),
- generic routing encapsulation (gre),
- Internet Control Message Protocol (icmp),
- Internet Group Management Protocol (igmp),
- any Interior Protocol (ip),
- IP in IP tunneling (ipinip),
- KA9Q NOS-compatible IP over IP tunneling (nos),
- Open Shortest Path First routing (ospf),
- Payload Compression Protocol (pcp),
- Protocol Independent Multicast (pim),
- Transmission Control Protocol (tcp),
- User Datagram Protocol (udp).

**Note**  
ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

For more details on the specific keywords for each protocol, see these command references:

- *Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.2*
- *Cisco IOS IP Command Reference, Volume 3 of 3: Multicast, Release 12.2*

**Note**  
The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Supported parameters can be grouped into these categories: TCP, UDP, ICMP, IGMP, or other IP.
Beginning in privileged EXEC mode, follow these steps to create an extended ACL:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>access-list access-list-number {deny</td>
<td>permit} protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [fragments] [log] [log-input] [time-range time-range-name] [dscp dscp]</td>
</tr>
</tbody>
</table>

**Note**: If you enter a dscp value, you cannot enter tos or precedence. You can enter both a tos and a precedence value with no dscp.

- The **source** is the number of the network or host from which the packet is sent.
- The **source-wildcard** applies wildcard bits to the source.
- The **destination** is the network or host number to which the packet is sent.
- The **destination-wildcard** applies wildcard bits to the destination.

Source, source-wildcard, destination, and destination-wildcard can be specified as:

- The 32-bit quantity in dotted-decimal format.
- The keyword **any** for 0.0.0.0 255.255.255.255 (any host).
- The keyword **host** for a single host 0.0.0.0.

The other keywords are optional and have these meanings:

- **precedence**—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: routine (0), priority (1), immediate (2), flash (3), flash-override (4), critical (5), internet (6), network (7).
- **fragments**—Enter to check non-initial fragments.
- **tos**—Enter to match by type of service level, specified by a number from 0 to 15 or a name: normal (0), max-reliability (2), max-throughput (4), min-delay (8).
- **log**—Enter to create an informational logging message to be sent to the console about the packet that matches the entry or **log-input** to include the input interface in the log entry.
- **time-range**—For an explanation of this keyword, see the “Using Time Ranges with ACLs” section on page 32-16.
- **dscp**—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values.
### Configuring IPv4 ACLs

#### Step 2b

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list access-list-number {deny</td>
<td>permit} protocol any any [precedence precedence] [tos tos] [fragments] [log] [log-input] [time-range time-range-name] [dscp dscp]<code>&lt;br&gt; or &lt;br&gt;</code>access-list access-list-number {deny</td>
</tr>
</tbody>
</table>

#### Step 2c

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list access-list-number {deny</td>
<td>permit} udp source source-wildcard [operator port] destination destination-wildcard [operator port] [precedence precedence] [tos tos] [fragments] [log] [log-input] [time-range time-range-name] [dscp dscp]`</td>
</tr>
</tbody>
</table>
Use the `no access-list access-list-number` global configuration command to delete the entire access list. You cannot delete individual ACEs from numbered access lists.

This example shows how to create and display an extended access list to deny Telnet access from any host in network 171.69.198.0 to any host in network 172.20.52.0 and to permit any others. (The `eq` keyword after the destination address means to test for the TCP destination port number equaling Telnet.)

```
Switch(config)# access-list 102 deny tcp 171.69.198.0 0.0.0.255 172.20.52.0 0.0.0.255 eq telnet
Switch(config)# access-list 102 permit tcp any any
Switch(config)# end
Switch# show access-lists
Extended IP access list 102
  10 deny tcp 171.69.198.0 0.0.0.255 172.20.52.0 0.0.0.255 eq telnet
  20 permit tcp any any
```

After an ACL is created, any additions (possibly entered from the terminal) are placed at the end of the list. You cannot selectively add or remove access list entries from a numbered access list.

**Note** When you are creating an ACL, remember that, by default, the end of the access list contains an implicit deny statement for all packets if it did not find a match before reaching the end.
After creating a numbered extended ACL, you can apply it to terminal lines (see the “Applying an IPv4 ACL to a Terminal Line” section on page 32-18), to interfaces (see the “Applying an IPv4 ACL to an Interface” section on page 32-19), or to VLANs (see the “Configuring VLAN Maps” section on page 32-29).

Resequencing ACEs in an ACL

Sequence numbers for the entries in an access list are automatically generated when you create a new ACL. You can use the `ip access-list resequence` global configuration command to edit the sequence numbers in an ACL and change the order in which ACEs are applied. For example, if you add a new ACE to an ACL, it is placed at the bottom of the list. By changing the sequence number, you can move the ACE to a different position in the ACL.

For more information about the `ip access-list resequence` command, see this URL:

Creating Named Standard and Extended ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

*Note*

The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines and limitations before configuring named ACLs:
- Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name. VLAN maps also accept a name.
- A standard ACL and an extended ACL cannot have the same name.
- Numbered ACLs are also available, as described in the “Creating Standard and Extended IPv4 ACLs” section on page 32-7.
- You can use standard and extended ACLs (named or numbered) in VLAN maps.

Beginning in privileged EXEC mode, follow these steps to create a standard ACL using names:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip access-list standard name</td>
<td>Define a standard IPv4 access list using a name, and enter access-list configuration mode.</td>
</tr>
</tbody>
</table>

*Note* The name can be a number from 1 to 99.
To remove a named standard ACL, use the `no ip access-list standard name` global configuration command.

Beginning in privileged EXEC mode, follow these steps to create an extended ACL using names:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>ip access-list extended name</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`{deny</td>
</tr>
<tr>
<td>           `[destination [destination-wildcard]</td>
<td>host destination</td>
</tr>
<tr>
<td>           <code>[host destination—A destination and destination wildcard of </code>destination 0.0.0.0<code>.</code></td>
<td></td>
</tr>
<tr>
<td>           any—A source and source wildcard or destination and destination wildcard of <code>0.0.0.0 255.255.255.255</code>.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>end</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>`show access-lists [number</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

To remove a named extended ACL, use the `no ip access-list extended name` global configuration command.

When you are creating standard extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use `no permit` and `no deny` access-list configuration mode commands to remove entries from a named ACL.
This example shows how you can delete individual ACEs from the named access list `border-list`:

```
Switch(config)# ip access-list extended border-list
Switch(config-ext-nacl)# no permit ip host 10.1.1.3 any
```

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

After creating a named ACL, you can apply it to interfaces (see the “Applying an IPv4 ACL to an Interface” section on page 32-19) or to VLANs (see the “Configuring VLAN Maps” section on page 32-29).

### Using Time Ranges with ACLs

You can selectively apply extended ACLs based on the time of day and week by using the `time-range` global configuration command. First, define a time-range name and set the times and the dates or the days of the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect, for example, during a specified time period or on specified days of the week. The `time-range` keyword and argument are referenced in the named and numbered extended ACL task tables in the previous sections, the “Creating Standard and Extended IPv4 ACLs” section on page 32-7, and the “Creating Named Standard and Extended ACLs” section on page 32-14.

These are some of the many possible benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).
- You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.

Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the TCAM. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

**Note**

The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock. For more information, see the “Managing the System Time and Date” section on page 5-1.

Beginning in privileged EXEC mode, follow these steps to configure a time-range parameter for an ACL:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>time-range time-range-name</code></td>
<td>Assign a meaningful name (for example, <code>workhours</code>) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.</td>
</tr>
</tbody>
</table>
Chapter 32      Configuring Network Security with ACLs

Configuring IPv4 ACLs

Step 3

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `absolute [start time date] [end time date]` | Specify when the function it will be applied to is operational.  
| `periodic day-of-the-week hh:mm to [day-of-the-week] hh:mm` | - You can use only one `absolute` statement in the time range. If you configure more than one absolute statement, only the one configured last is executed.  
| `periodic [weekdays | weekend | daily] hh:mm to hh:mm` | - You can enter multiple `periodic` statements. For example, you could configure different hours for weekdays and weekends.  

Step 4

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Step 5

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show time-range</code></td>
<td>Verify the time-range configuration.</td>
</tr>
</tbody>
</table>

Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Repeat the steps if you want multiple items in effect at different times. To remove a configured time-range limitation, use the `no time-range time-range-name` global configuration command.

This example shows how to configure time ranges for `workhours` and to configure January 1, 2006 as a company holiday and to verify your configuration.

```
Switch(config)# time-range workhours
Switch(config-time-range)# periodic weekdays 8:00 to 12:00
Switch(config-time-range)# periodic weekdays 13:00 to 17:00
Switch(config-time-range)# exit
Switch(config)# time-range new_year_day_2006
Switch(config-time-range)# absolute start 00:00 1 Jan 2006 end 23:59 1 Jan 2006
Switch(config-time-range)# end
Switch# show time-range

time-range entry: new_year_day_2003 (inactive)
  absolute start 00:00 01 January 2006 end 23:59 01 January 2006
  time-range entry: workhours (inactive)
    periodic weekdays 8:00 to 12:00
    periodic weekdays 13:00 to 17:00

To apply a time-range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.

```
Switch(config)# access-list 188 deny tcp any any time-range new_year_day_2006
Switch(config)# access-list 188 permit tcp any any time-range workhours
Switch(config)# end
Switch# show access-lists

Extended IP access list 188
  10 deny tcp any any time-range new_year_day_2006 (inactive)
  20 permit tcp any any time-range workhours (inactive)
```

This example uses named ACLs to permit and deny the same traffic.

```
Switch(config)# ip access-list extended deny_access
Switch(config-ext-nacl)# deny tcp any any time-range new_year_day_2006
Switch(config-ext-nacl)# exit
Switch(config)# ip access-list extended may_access
Switch(config-ext-nacl)# permit tcp any any time-range workhours
Switch(config-ext-nacl)# end
Switch# show ip access-lists

Extended IP access list deny_access
  10 deny tcp any any time-range new_year_day_2006 (inactive)
Extended IP access list may_access
  10 permit tcp any any time-range workhours (inactive)
```
Including Comments in ACLs

You can use the **remark** keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the `access-list access-list number remark remark` global configuration command. To remove the remark, use the `no` form of this command.

In this example, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```
Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith through
Switch(config)# access-list 1 deny 171.69.3.13
```

For an entry in a named IP ACL, use the `remark` access-list configuration command. To remove the remark, use the `no` form of this command.

In this example, the Jones subnet is not allowed to use outbound Telnet:

```
Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp host 171.69.2.88 any eq telnet
```

Applying an IPv4 ACL to a Terminal Line

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

For procedures for applying ACLs to interfaces, see the “Applying an IPv4 ACL to an Interface” section on page 32-19. For applying ACLs to VLANs, see the “Configuring VLAN Maps” section on page 32-29.

Beginning in privileged EXEC mode, follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;line [console</td>
<td>vty] line-number</td>
</tr>
<tr>
<td></td>
<td>• console—Specify the console terminal line. The console port is DCE.</td>
</tr>
<tr>
<td></td>
<td>• vty—Specify a virtual terminal for remote console access.</td>
</tr>
<tr>
<td></td>
<td>The line-number is the first line number in a contiguous group that you want to configure when the line type is specified. The range is from 0 to 16.</td>
</tr>
<tr>
<td><strong>Step 3</strong>&lt;br&gt;access-class access-list-number [in</td>
<td>out]</td>
</tr>
</tbody>
</table>
To remove an ACL from a terminal line, use the `no access-class access-list-number { in | out }` line configuration command.

### Applying an IPv4 ACL to an Interface

This section describes how to apply IPv4 ACLs to network interfaces. You can apply an ACL to either outbound or inbound Layer 3 interfaces. You can apply ACLs only to inbound Layer 2 interfaces. Note these guidelines:

- When controlling access to an interface, you can use a named or numbered ACL.
- If you apply an ACL to a Layer 2 interface that is a member of a VLAN, the Layer 2 (port) ACL takes precedence over an input Layer 3 ACL applied to the VLAN interface or a VLAN map applied to the VLAN. Incoming packets received on the Layer 2 port are always filtered by the port ACL.
- If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic. You do not have to enable routing to apply ACLs to Layer 2 interfaces.
- When private VLANs are configured, you can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.

**Note**

By default, the router sends Internet Control Message Protocol (ICMP) unreachable messages when a packet is denied by an access group. These access-group denied packets are not dropped in hardware but are bridged to the switch CPU so that it can generate the ICMP-unreachable message.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>ip access-group { access-list-number</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To remove the specified access group, use the `no ip access-group {access-list-number | name} {in | out}` interface configuration command.

This example shows how to apply access list 2 to a port to filter packets entering the port:

```bash
Switch(config)# interface gigabitethernet0/1
Router(config-if)# ip access-group 2 in
```

**Note**

When you apply the `ip access-group` interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the `ip icmp rate-limit unreachable` global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

**Hardware and Software Treatment of IP ACLs**

ACL processing is primarily accomplished in hardware, but requires forwarding of some traffic flows to the CPU for software processing. If the hardware reaches its capacity to store ACL configurations, packets are sent to the CPU for forwarding. The forwarding rate for software-forwarded traffic is substantially less than for hardware-forwarded traffic.

**Note**

If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch, then only the traffic in that VLAN arriving on that switch is affected (forwarded in software). Software forwarding of packets might adversely impact the performance of the switch, depending on the number of CPU cycles that this consumes.

For router ACLs, other factors can cause packets to be sent to the CPU:

- Using the `log` keyword
- Generating ICMP unreachable messages

When traffic flows are both logged and forwarded, forwarding is done by hardware, but logging must be done by software. Because of the difference in packet handling capacity between hardware and software, if the sum of all flows being logged (both permitted flows and denied flows) is of great enough bandwidth, not all of the packets that are forwarded can be logged.

If router ACL configuration cannot be applied in hardware, packets arriving in a VLAN that must be routed are routed in software. If ACLs cause large numbers of packets to be sent to the CPU, the switch performance can be negatively affected.
When you enter the `show ip access-lists` privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the `show access-lists hardware counters` privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

Router ACLs function as follows:

- The hardware controls permit and deny actions of standard and extended ACLs (input and output) for security access control.
- If `log` has not been specified, the flows that match a `deny` statement in a security ACL are dropped by the hardware if `ip unreachables` is disabled. The flows matching a `permit` statement are switched in hardware.
- Adding the `log` keyword to an ACE in a router ACL causes a copy of the packet to be sent to the CPU for logging only. If the ACE is a `permit` statement, the packet is still switched and routed in hardware.

### Troubleshooting ACLs

If this ACL manager message appears and `[chars]` is the access-list name,

```
ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]
```

The switch has insufficient resources to create a hardware representation of the ACL. The resources include hardware memory and label space but not CPU memory. A lack of available logical operation units or specialized hardware resources causes this problem. Logical operation units are needed for a TCP flag match or a test other than `eq` (ne, gt, lt, or range) on TCP, UDP, or SCTP port numbers.

Use one of these workarounds:

- Modify the ACL configuration to use fewer resources.
- Rename the ACL with a name or number that alphanumerically precedes the ACL names or numbers.

To determine the specialized hardware resources, enter the `show platform layer4 acl map` privileged EXEC command. If the switch does not have available resources, the output shows that index 0 to index 15 are not available.

For more information about configuring ACLs with insufficient resources, see CSCsq63926 in the Bug Toolkit.

For example, if you apply this ACL to an interface:

```
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
```

And if this message appears:

```
ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]
```

The flag-related operators are not available. To avoid this issue,

- Move the fourth ACE before the first ACE by using `ip access-list resequence` global configuration command:

```
permit tcp source source-wildcard destination destination-wildcard
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
```
or

- Rename the ACL with a name or number that alphanumerically precedes the other ACLs (for example, rename ACL 79 to ACL 1).

You can now apply the first ACE in the ACL to the interface. The switch allocates the ACE to available mapping bits in the Opselect index and then allocates flag-related operators to use the same bits in the TCAM.

IPv4 ACL Configuration Examples

This section provides examples of configuring and applying IPv4 ACLs. For detailed information about compiling ACLs, see the Cisco IOS Security Configuration Guide, Release 12.2 and to the Configuring IP Services” section in the “IP Addressing and Services” chapter of the Cisco IOS IP Configuration Guide, Release 12.2.

Figure 32-3 shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing confidential payroll data. All users can access Server A, but Server B has restricted access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

*Figure 32-3  Using Router ACLs to Control Traffic*

Server A
Benefits

Port 2

Server B
Payroll

Port 1

Human Resources
172.20.128.0-31

Accounting
172.20.128.64-95
This example uses a standard ACL to filter traffic coming into Server B from a port, permitting traffic only from Accounting's source addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic coming out of routed Port 1 from the specified source address.

```
Switch(config)# access-list 6 permit 172.20.128.64 0.0.0.31
Switch(config)# end
Switch# show access-lists
Standard IP access list 6
  10 permit 172.20.128.64, wildcard bits 0.0.0.31
Switch(config)# interface gigabite thernet0/1
Switch(config-if)# ip access-group 6 out
```

This example uses an extended ACL to filter traffic coming from Server B into a port, permitting traffic from any source address (in this case Server B) to only the Accounting destination addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic going into routed Port 1, permitting it to go only to the specified destination addresses. Note that with extended ACLs, you must enter the protocol (IP) before the source and destination information.

```
Switch(config)# access-list 106 permit ip any 172.20.128.64 0.0.0.31
Switch(config)# end
Switch# show access-lists
Extended IP access list 106
  10 permit ip any 172.20.128.64 0.0.0.31
Switch(config)# interface gigabite thernet0/1
Switch(config-if)# ip access-group 106 in
```

### Numbered ACLs

In this example, network 36.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 36.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 36.0.0.0 subnets. The ACL is applied to packets entering a port.

```
Switch(config)# access-list 2 permit 36.48.0.3
Switch(config)# access-list 2 deny 36.48.0.0 0.0.255.255
Switch(config)# access-list 2 permit 36.0.0.0 0.255.255.255
Switch(config)# interface gigabite thernet0/1
Switch(config-if)# ip access-group 2 in
```

### Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

```
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 gt 1023
Switch(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Switch(config)# access-list 102 permit icmp any any
Switch(config)# interface gigabite thernet0/1
Switch(config-if)# ip access-group 102 in
```

For another example of using an extended ACL, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.
SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The established keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 is the interface that connects the router to the Internet.

```
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 established
Switch(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group 102 in
```

**Named ACLs**

This example creates a standard ACL named `internet_filter` and an extended ACL named `marketing_group`. The `internet_filter` ACL allows all traffic from the source address 1.2.3.4.

```
Switch(config)# ip access-list standard Internet_filter
Switch(config-ext-nacl)# permit 1.2.3.4
Switch(config-ext-nacl)# exit
```

The `marketing_group` ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

```
Switch(config)# ip access-list extended marketing_group
Switch(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Switch(config-ext-nacl)# deny tcp any any
Switch(config-ext-nacl)# permit icmp any any
Switch(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Switch(config-ext-nacl)# deny ip any any log
Switch(config-ext-nacl)# exit
```

The `Internet_filter` ACL is applied to outgoing traffic and the `marketing_group` ACL is applied to incoming traffic on a Layer 3 port.

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 2.0.5.1 255.255.255.0
Switch(config-if)# ip access-group Internet_filter out
Switch(config-if)# ip access-group marketing_group in
```

**Time Range Applied to an IP ACL**

This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m. (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).

```
Switch(config)# time-range no-http
Switch(config)# periodic weekdays 8:00 to 18:00
!
Switch(config)# time-range udp-yes
Switch(config)# periodic weekend 12:00 to 20:00
```
## Commented IP ACL Entries

In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```plaintext
Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith workstation through
Switch(config)# access-list 1 deny 171.69.3.13
```

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

```plaintext
Switch(config)# access-list 100 remark Do not allow Winter to browse the web
Switch(config)# access-list 100 deny host 171.69.3.85 any eq www
Switch(config)# access-list 100 remark Do not allow Smith to browse the web
Switch(config)# access-list 100 deny host 171.69.3.13 any eq www
```

In this example of a named ACL, the Jones subnet is not allowed access:

```plaintext
Switch(config)# ip access-list standard prevention
Switch(config-std-nacl)# remark Do not allow Jones subnet through
Switch(config-std-nacl)# deny 171.69.0.0 0.0.0.255
```

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

```plaintext
Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp 171.69.0.0 0.0.0.255 any eq telnet
```

## ACL Logging

Two variations of logging are supported on router ACLs. The `log` keyword sends an informational logging message to the console about the packet that matches the entry; the `log-input` keyword includes the input interface in the log entry.

In this example, standard named access list `stan1` denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the `log` keyword.

```plaintext
Switch(config)# ip access-list standard stan1
Switch(config-std-nacl)# deny 10.1.1.0 0.0.0.255 log
Switch(config-std-nacl)# permit any log
Switch(config-std-nacl)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group stan1 in
Switch(config-if)# end
Switch# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Console logging: level debugging, 37 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 37 messages logged
  File logging: disabled
  Trap logging: level debugging, 39 message lines logged
```
Creating Named MAC Extended ACLs

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Note
You cannot apply named MAC extended ACLs to Layer 3 interfaces.

For more information about the supported non-IP protocols in the `mac access-list extended` command, see the command reference for this release.
Chapter 32  Configuring Network Security with ACLs

Creating Named MAC Extended ACLs

Note
Though visible in the command-line help strings, appletalk is not supported as a matching condition for the deny and permit MAC access-list configuration mode commands.

Beginning in privileged EXEC mode, follow these steps to create a named MAC extended ACL:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>mac access-list extended name</td>
</tr>
<tr>
<td>Step 3</td>
<td>{deny</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show access-lists [number</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no mac access-list extended name global configuration command to delete the entire ACL. You can also delete individual ACEs from named MAC extended ACLs.

This example shows how to create and display an access list named mac1, denying only EtherType DECnet Phase IV traffic, but permitting all other types of traffic.

Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)# deny any any decnet-iv
Switch(config-ext-macl)# permit any
Switch(config-ext-macl)# end
Switch # show access-lists
Extended MAC access list mac1
  10 deny any any decnet-iv
  20 permit any
Applying a MAC ACL to a Layer 2 Interface

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

- If you apply an ACL to a Layer 2 interface that is a member of a VLAN, the Layer 2 (port) ACL takes precedence over an input Layer 3 ACL applied to the VLAN interface or a VLAN map applied to the VLAN. Incoming packets received on the Layer 2 port are always filtered by the port ACL.
- You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.
- A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.

Beginning in privileged EXEC mode, follow these steps to apply a MAC access list to control access to a Layer 2 interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>mac access-group {name} {in}</td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show mac access-group [interface interface-id]</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove the specified access group, use the no mac access-group {name} interface configuration command.

This example shows how to apply MAC access list mac1 to a port to filter packets entering the port:

```
Switch(config)# interface gigabitethernet0/2
Router(config-if)# mac access-group mac1 in
```

Note: The mac access-group interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

After receiving a packet, the switch checks it against the inbound ACL. If the ACL permits it, the switch continues to process the packet. If the ACL rejects the packet, the switch discards it. When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied and permits all packets. Remember this behavior if you use undefined ACLs for network security.
Configuring VLAN Maps

This section describes how to configure VLAN maps, which is the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

Note
For complete syntax and usage information for the commands used in this section, see the command reference for this release.

To create a VLAN map and apply it to one or more VLANs, perform these steps:

Step 1
Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN. See the “Creating Standard and Extended IPv4 ACLs” section on page 32-7 and the “Creating a VLAN Map” section on page 32-30.

Step 2
Enter the `vlan access-map` global configuration command to create a VLAN ACL map entry.

Step 3
In access-map configuration mode, optionally enter an `action—forward` (the default) or `drop`—and enter the `match` command to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended).

Note
If the VLAN map has a match clause for a type of packet (IP or MAC) and the map action is drop, all packets that match the type are dropped. If the VLAN map has no match clause and the configured action is drop, then all IP and Layer 2 packets are dropped.

Step 4
Use the `vlan filter` global configuration command to apply a VLAN map to one or more VLANs.

These sections contain this configuration information:

- VLAN Map Configuration Guidelines, page 32-29
- Creating a VLAN Map, page 32-30
- Applying a VLAN Map to a VLAN, page 32-33
- Using VLAN Maps in Your Network, page 32-33

VLAN Map Configuration Guidelines

- If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.
- Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.
Creating a VLAN Map

Each VLAN map consists of an ordered series of entries. Beginning in privileged EXEC mode, follow these steps to create, add to, or delete a VLAN map entry:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>vlan access-map name [number]</code></td>
<td>Create a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map. When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. Entering this command changes to access-map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>`action [drop</td>
<td>forward]`</td>
</tr>
</tbody>
</table>
### Configuring VLAN Maps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td><code>match \[ip | mac\] address \{name | number\} \{name | number\}</code></td>
<td>Match the packet (using either the IP or MAC address) against one or more standard or extended access lists. Note that packets are only matched against access lists of the correct protocol type. IP packets are matched against standard or extended IP access lists. Non-IP packets are only matched against named MAC extended access lists.</td>
</tr>
<tr>
<td>5</td>
<td><code>end</code></td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>6</td>
<td><code>show running-config</code></td>
<td>Display the access list configuration.</td>
</tr>
<tr>
<td>7</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no vlan access-map name` global configuration command to delete a map.

Use the `no vlan access-map name number` global configuration command to delete a single sequence entry from within the map.

Use the `no action` access-map configuration command to enforce the default action, which is to forward.

VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match.

### Examples of ACLs and VLAN Maps

These examples show how to create ACLs and VLAN maps that for specific purposes.

#### Example 1

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the `ip1` ACL (TCP packets) would be dropped. You first create the `ip1ACL` to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

```bash
Switch(config)# ip access-list extended ip1
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 10
Switch(config-access-map)# match ip address ip1
Switch(config-access-map)# action drop
```

This example shows how to create a VLAN map to permit a packet. ACL `ip2` permits UDP packets and any packets that match the `ip2` ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

```bash
Switch(config)# ip access-list extended ip2
Switch(config-ext-nacl)# permit udp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 20
Switch(config-access-map)# match ip address ip2
Switch(config-access-map)# action forward
```
Example 2

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists `igmp-match` and `tcp-match`, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

```plaintext
Switch(config)# access-list 101 permit udp any any
Switch(config)# ip access-list extended igmp-match
Switch(config-ext-nacl)# permit igmp any any
Switch(config)# ip access-list extended tcp-match
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map drop-ip-default 10
Switch(config-access-map)# match ip address 101
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 20
Switch(config-access-map)# match ip address igmp-match
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 30
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward
```

Example 3

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists `good-hosts` and `good-protocols`, the map will have the following results:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets with decnet-iv or vines-ip protocols
- Drop all other non-IP packets
- Forward all IP packets

```plaintext
Switch(config)# mac access-list extended good-hosts
Switch(config-ext-nacl)# permit host 0000.0c00.0111 any
Switch(config-ext-nacl)# permit host 0000.0c00.0211 any
Switch(config-ext-nacl)# exit
Switch(config)# mac access-list extended good-protocols
Switch(config-ext-nacl)# permit any any decnet-ip
Switch(config-ext-nacl)# permit any any vines-ip
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map drop-mac-default 10
Switch(config-access-map)# match mac address good-hosts
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-mac-default 20
Switch(config-access-map)# match mac address good-protocols
Switch(config-access-map)# action forward
```
Example 4

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists tcp-match and good-hosts from Examples 2 and 3, the map will have the following results:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets

```
Switch(config)# vlan access-map drop-all-default 10
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-all-default 20
Switch(config-access-map)# match mac address good-hosts
Switch(config-access-map)# action forward
```

Applying a VLAN Map to a VLAN

Beginning in privileged EXEC mode, follow these steps to apply a VLAN map to one or more VLANs:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 vlan filter mapname vlan-list list</td>
<td>Apply the VLAN map to one or more VLAN IDs.</td>
</tr>
<tr>
<td></td>
<td>The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around the comma and hyphen are optional.</td>
</tr>
<tr>
<td>Step 3 show running-config</td>
<td>Display the access list configuration.</td>
</tr>
<tr>
<td>Step 4 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the VLAN map, use the `no vlan filter mapname vlan-list list` global configuration command.

This example shows how to apply VLAN map 1 to VLANs 20 through 22:

```
Switch(config)# vlan filter map 1 vlan-list 20-22
```

Using VLAN Maps in Your Network

- [Wiring Closet Configuration](#), page 32-33
- [Denying Access to a Server on Another VLAN](#), page 32-34

Wiring Closet Configuration

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classification ACL. In Figure 32-4, assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be access-controlled at the traffic entry point, Switch A.
If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not forward it to Switch B.

First, define the IP access list `http` that permits (matches) any TCP traffic on the HTTP port.

```
Switch(config)# ip access-list extended http
Switch(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Switch(config-ext-nacl)# exit
```

Next, create VLAN access map `map2` so that traffic that matches the `http` access list is dropped and all other IP traffic is forwarded.

```
Switch(config)# vlan access-map map2 10
Switch(config-access-map)# match ip address http
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# ip access-list extended match_all
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map2 20
Switch(config-access-map)# match ip address match_all
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
```

Then, apply VLAN access map `map2` to VLAN 1.

```
Switch(config)# vlan filter map2 vlan 1
```

### Denying Access to a Server on Another VLAN

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts (see Figure 32-5):

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.
Chapter 32 Configuring Network Security with ACLs

Using VLAN Maps with Router ACLs

This example shows how to deny access to a server on another VLAN by creating the VLAN map \texttt{SERVER1} that denies access to hosts in subnet 10.1.2.0/8, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map \texttt{SERVER1} to VLAN 10.

**Step 1** Define the IP ACL that will match the correct packets.

\begin{verbatim}
Switch(config)# ip access-list extended SERVER1_ACL
Switch(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Switch(config-ext-nacl)# exit
\end{verbatim}

**Step 2** Define a VLAN map using this ACL that will drop IP packets that match \texttt{SERVER1_ACL} and forward IP packets that do not match the ACL.

\begin{verbatim}
Switch(config)# vlan access-map SERVER1_MAP
Switch(config-access-map)# match ip address SERVER1_ACL
Switch(config-access-map)# action drop
Switch(config)# vlan access-map SERVER1_MAP 20
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
\end{verbatim}

**Step 3** Apply the VLAN map to VLAN 10.

\begin{verbatim}
Switch(config)# vlan filter SERVER1_MAP vlan-list 10.
\end{verbatim}

---

**Using VLAN Maps with Router ACLs**

To access control routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces. If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

**Note**

When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.
If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

These sections contain information about using VLAN maps with router ACLs:

- VLAN Maps and Router ACL Configuration Guidelines, page 32-36
- Examples of Router ACLs and VLAN Maps Applied to VLANs, page 32-37

### VLAN Maps and Router ACL Configuration Guidelines

These guidelines are for configurations where you need to have an router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.

The switch hardware provides one lookup for security ACLs for each direction (input and output); therefore, you must merge a router ACL and a VLAN map when they are configured on the same VLAN. Merging the router ACL with the VLAN map might significantly increase the number of ACEs.

If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.
- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:
  
  ```
  permit...
  permit...
  permit...
  deny ip any any
  or
  deny...
  deny...
  deny...
  permit ip any any
  ```
- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.
- Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use `don’t care` bits in the IP address, whenever possible.

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.
Examples of Router ACLs and VLAN Maps Applied to VLANs

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet’s path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

**ACLs and Switched Packets**

Figure 32-6 shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded are only subject to the VLAN map of the input VLAN.

**Figure 32-6 Applying ACLs on Switched Packets**

**ACLs and Routed Packets**

Figure 32-7 shows how ACLs are applied on routed packets. For routed packets, the ACLs are applied in this order:

1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN
Using VLAN Maps with Router ACLs

ACLs and Multicast Packets

Figure 32-8 shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN.

The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map (VLAN 10 map in Figure 32-8) drops the packet, no destination receives a copy of the packet.
Displaying IPv4 ACL Configuration

You can display the ACLs that are configured on the switch, and you can display the ACLs that have been applied to interfaces and VLANs.

When you use the `ip access-group` interface configuration command to apply ACLs to a Layer 2 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in Table 32-2 to display this information.

### Table 32-2 Commands for Displaying Access Lists and Access Groups

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show access-lists [number</td>
<td>Displays the contents of one or all current IP and MAC address access lists or a specific access list (numbered or named).</td>
</tr>
<tr>
<td>name]`</td>
<td></td>
</tr>
<tr>
<td>`show ip access-lists [number</td>
<td>Displays the contents of all current IP access lists or a specific IP access list (numbered or named).</td>
</tr>
<tr>
<td>name]`</td>
<td></td>
</tr>
<tr>
<td><code>show ip interface interface-id</code></td>
<td>Displays detailed configuration and status of an interface. If IP is enabled on the interface and ACLs have been applied by using the <code>ip access-group</code> interface configuration command, the access groups are included in the display.</td>
</tr>
<tr>
<td><code>show running-config [interface interface-id]</code></td>
<td>Displays the contents of the configuration file for the switch or the specified interface, including all configured MAC and IP access lists and which access groups are applied to an interface.</td>
</tr>
<tr>
<td><code>show mac access-group [interface interface-id]</code></td>
<td>Displays MAC access lists applied to all Layer 2 interfaces or the specified Layer 2 interface.</td>
</tr>
</tbody>
</table>

You can also display information about VLAN access maps or VLAN filters. Use the privileged EXEC commands in Table 32-3 to display VLAN map information.

### Table 32-3 Commands for Displaying VLAN Map Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vlan access-map [mapname]</code></td>
<td>Shows information about all VLAN access-maps or the specified access map.</td>
</tr>
<tr>
<td>`show vlan filter [access-map name</td>
<td>vlan vlan-id]`</td>
</tr>
</tbody>
</table>
This chapter describes the control-plane security feature in the Cisco ME 3400E Ethernet Access switch. In any network, Layer 2 and Layer 3 switches exchange control packets with other switches in the network. The Cisco ME switch, which acts as a transition between the customer network and the service-provider network, uses control-plane security to ensure that the topology information between the two networks is isolated. This mechanism protects against a possible denial-of-service attack from another customer network.

This chapter includes these sections:
- Understanding Control-Plane Security, page 33-1
- Configuring Control-Plane Security, page 33-6
- Monitoring Control-Plane Security, page 33-6

Understanding Control-Plane Security

In the Cisco ME switch, ports configured as network node interfaces (NNIs) connect to the service-provider network. The switch communicates with the rest of the network through these ports, exchanging protocol control packets as well as regular traffic. Other ports on the Cisco ME switch are user network interfaces (UNIs) that are used as customer-facing ports. Each port is connected to a single customer, and exchanging network protocol control packets between the switch and the customer is not usually required. Most Layer 2 protocols are not supported on UNIs. To protect against accidental or intentional CPU overload, the Cisco ME switch provides control-plane security automatically by dropping or rate-limiting a predefined set of Layer 2 control packets and some Layer 3 control packets for UNIs.

You can also configure a third port type, an enhanced network interface (ENI). An ENI, like a UNI, is a customer-facing interface. By default on an ENI, Layer 2 control protocols, such as Cisco Discovery Protocol (CDP), Spanning-Tree Protocol (STP), Link Layer Discovery Protocol (LLDP) are disabled. On ENIs, unlike UNIs, you can enable these protocols. When configuring ENIs in port channels, you can also enable Link Aggregation Control Protocol (LACP), and Port Aggregation Protocol (PAgP). ENIs drop or rate-limit the protocol packets, depending on whether the protocol is enabled or disabled on the interface. For all other control protocols on ENIs, the switch drops or rate-limits packets the same way as it does for UNIs.

Control-plane security is supported on a port for Layer 2 control packets and non-IP packets with router MAC addresses, regardless of whether the port is in routing or nonrouting mode. (A port is in routing mode when global IP routing is enabled and the port is configured with the no switchport interface configuration command or is associated with a VLAN that has an active switch virtual interface [SVI].) These packets are either dropped or rate-limited, depending upon the Layer 2 protocol configuration. For
Layer 3 control packets, on a port in routing mode (whether or not a Layer 3 service policy is attached), control-plane security supports rate-limiting only Internet Group Management Protocol (IGMP) control packets. For Layer 3 packets, on a port in nonrouting mode (whether or not a Layer 2 service policy is attached), only IP packets with router MAC addresses are dropped.

These types of control packets are dropped or rate-limited:

- Layer 2 protocol control packets:
  - Control packets that are always dropped on UNIs and ENIs, such as Dynamic Trunking Protocol (DTP) packets and some bridge protocol data units (BPDUs).
  - Control packets that are dropped by default but can be enabled or tunneled, such as CDP, STP, LLDP, VLAN Trunking Protocol (VTP), UniDirectional Link Detection (UDLD) Protocol, LACP, and PAgP packets. When enabled, these protocol packets are rate-limited and tunneled through the switch.
  - Control or management packets that are required by the switch, such as keepalive packets. These control packets are processed by the CPU but are rate-limited to normal and safe limits to prevent CPU overload.

- Non-IP packets with router MAC addresses

- IP packets with router MAC addresses

- IGMP control packets that are enabled by default and need to be rate-limited. However, when IGMP snooping and IP multicast routing are disabled, the packets are treated like data packets, and no policers are assigned to them.

The switch uses policing to accomplish control-plane security by either dropping or rate-limiting Layer 2 control packets. If a Layer 2 protocol is enabled on a UNI or ENI port or tunneled on the switch, those protocol packets are rate-limited; otherwise control packets are dropped.

By default, some protocol traffic is dropped by the CPU, and some is rate-limited. Table 33-1 shows the default action and the action taken for Layer 2 protocol packets when the feature is enabled or when Layer 2 protocol tunneling is enabled for the protocol. Note that some features cannot be enabled on UNIs, and not all protocols can be tunneled (shown by dashes). If Layer 2 protocol tunneling is enabled for any of the supported protocols (CDP, STP, VTP, LLDP, LACP, PAgP, or UDLD), the switch Layer 2 protocol tunneling protocol uses the rate-limiting policer on every port. If UDLD is enabled on a port or UDLD tunneling is enabled, UDLD packets are rate-limited.

### Understanding Control-Plane Security

The switch automatically allocates 27 control-plane security policers for CPU protection. At system bootup, it assigns a policer to each port numbered 0 to 26. The policer assigned to a port determines if the protocol packets arriving on the port are rate-limited or dropped. On the ME 3400E-24TS switch, a policer of 26 means a drop policer and is a global policer; any traffic type shown as 26 on any port is dropped. A policer of a value of 0 to 25 means that a rate-limiting policer is assigned to the port for the protocol. The policers 0 to 23 are logical identifiers for Fast Ethernet ports 1 to 24; policers 24 and 25 refer to Gigabit Ethernet ports 1 and 2, respectively. A policer value of 255 means that no policer is assigned to a protocol.

For the ME 3400EG-12CS and ME 3400EG-2CS switches, a policer of 4 means a drop policer. A traffic type shown as 4 on a port is dropped. A policer value of 0 to 3 means that a rate-limiting policer is assigned to the port for the protocol.

To see what policer actions are assigned to the protocols on an interface, enter the `show platform policer cpu interface interface-id` privileged EXEC command.

Note: Unless otherwise indicated, the examples are for an ME 3400E-24TS switch.

¹ Layer 2 protocol traffic is rate-limited when Layer 2 protocol tunneling is enabled for any protocol on any port.
This example shows the default policer configuration for a UNI. Because the port is Fast Ethernet 1, the identifier for rate-limited protocols is 0; a display for Fast Ethernet port 5 would display an identifier of 4. The Policier Index refers to the specific protocol. The ASIC number shows when the policer is on a different ASIC.

Because UNIs do not support STP, CDP, LLDP, LACP, and PAgP, these packets are dropped (physical policer of 26). These protocols are disabled by default on ENIs as well, but you can enable them. When enabled on ENIs, the control packets are rate limited and a rate-limiting policer is assigned to the port for these protocols (physical policer of 22).

Configuring Control-Plane Security

CPU protection is enabled by default and CPU policers are pre-allocated. You can configure only the rate-limiting threshold. The configured threshold applies to all supported control protocols on all UNIs and ENIs. It also applies to STP, CDP, LLDP, LACP, and PAgP when the protocol is enabled on an ENI.

**Note**

During normal Layer 2 operation, you cannot ping the switch through a UNI or ENI. This restriction does not apply to NNIs. See the “Using Ping” section on page 43-10 for ways to enable ping in a test situation.

Beginning in privileged EXEC mode, follow these steps to set the threshold rate for CPU protection:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>policer cpu uni rate</td>
</tr>
<tr>
<td></td>
<td>Configure the CPU protection policing threshold rate. The range is from 8000 to 409500 bits per second (b/s). The default, if none is configured, is 160000 b/s.</td>
</tr>
<tr>
<td></td>
<td>The configured rate applies to all supported and enabled control protocols on all UNIs and ENIs</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show policer cpu uni-eni rate</td>
</tr>
<tr>
<td></td>
<td>Verify the configured CPU policer rate.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default threshold rate, use the **no policer cpu uni** global configuration command.

This example shows how to set the CPU protection threshold to 10000 b/s and to verify the configuration.

```
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policer cpu uni 10000
Switch(config)# end
Switch# show policer cpu uni-eni rate
CPU UNI/ENI port police rate = 10000 bps
```

Monitoring Control-Plane Security

You can monitor control-plane security settings and statistics on the switch or on an interface, and you can clear these statistics at any time by using the privileged EXEC commands in Table 33-2. For more information about the commands, see the command reference for this release.

Configuring QoS

This chapter describes how to configure quality of service (QoS) by using the modular QoS command-line interface (CLI), or MQC, commands on the Cisco ME 3400E Ethernet Access switch. With QoS, you can provide preferential treatment to certain types of traffic at the expense of others. When QoS is not configured, the switch offers best-effort service to each packet, regardless of the packet contents or size. It sends the packets without any assurance of reliability, delay bounds, or throughput. MQC provides a comprehensive hierarchical configuration framework for prioritizing or limiting specific streams of traffic.

For more information about Cisco IOS MQC commands, see the “Cisco IOS Quality of Service Solutions Command Reference” at this site:

For complete syntax and usage information for the platform-specific commands used in this chapter, see the command reference for this release.

- Understanding QoS, page 34-1
- Configuring QoS, page 34-30
- Displaying QoS Information, page 34-68
- Configuration Examples for Policy Maps, page 34-69

Understanding QoS

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

When you configure the QoS feature, you can select specific network traffic, prioritize it according to its relative importance, and use traffic-management techniques to provide preferential treatment. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

Figure 34-1 shows the MQC model.
Basic QoS includes these actions.

- Packet classification organizes traffic on the basis of whether or not the traffic matches a specific criteria. When a packet is received, the switch identifies all key packet fields: class of service (CoS), Differentiated Services Code Point (DSCP), or IP precedence. The switch classifies the packet based on this content or based on an access-control list lookup. For more information, see the “Classification” section on page 34-5.

- Packet policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. You can configure a committed information rate (CIR) and peak information rate (PIR) and set actions to perform on packets that conform to the CIR and PIR (conform-action), packets that conform to the PIR, but not the CIR (exceed-action), and packets that exceed the PIR value (violate-action). For more information, see the “Policing” section on page 34-15.

- Packet prioritization or marking evaluates the classification and policer information to determine the action to take. All packets that belong to a classification can be remarked. When you configure a policer, packets that meet or exceed the permitted bandwidth requirements (bits per second) can be conditionally passed through, dropped, or reclassified. For more information, see the “Marking” section on page 34-20.

- Congestion management uses queuing and scheduling algorithms to queue and sort traffic that is leaving a port. The switch supports these scheduling and traffic-limiting features: class-based weighted fair queuing (CBWFQ), class-based traffic shaping, port shaping, and class-based priority queuing. You can provide guaranteed bandwidth to a particular class of traffic while still servicing other traffic queues. For more information, see the “Congestion Management and Scheduling” section on page 34-22.

- Queuing on the switch is enhanced with the weighted tail-drop (WTD) algorithm, a congestion-avoidance mechanism. WTD differentiates traffic classes and regulates the queue size (in number of packets) based on the classification. For more information, see the “Congestion Avoidance and Queuing” section on page 34-27.

Modular QoS CLI

Modular QoS CLI (MQC) allows users to create traffic policies and attach these policies to interfaces. A traffic policy contains a traffic class and one or more QoS features. You use a traffic class to classify traffic, and the QoS features in the traffic policy determine how to treat the classified traffic.

Modular QoS CLI configuration includes these steps:

Step 1 Define a traffic class.

Use the `class-map [match-all | match-any] class-map-name` global configuration command to define a traffic class and to enter class-map configuration mode. A traffic class contains three elements: a name, an instruction on how to evaluate the configured `match` commands (if more than one match command is configured in the class map), and a series of `match` commands.

- You name the traffic class in the `class-map` command line to enter class-map configuration mode.
- You can optionally include keywords to evaluate these match commands by entering `class-map match-any` or `class-map match-all`. If you specify `match-any`, the traffic being evaluated must match one of the specified criteria. If you specify `match-all`, the traffic being evaluated must match all of the specified criteria. A `match-all` class map can contain only one match statement, but a `match-any` class map can contain multiple match statements.

Note If you do not enter `match-all` or `match-any`, the default is to match all.

- You use the `match` class-map configuration commands to specify criteria for classifying packets. If a packet matches the specified criteria, that packet is considered a member of the class and is forwarded according to the QoS specifications set in the traffic policy. Packets that fail to meet any of the matching criteria are classified as members of the default traffic class.

Step 2 Create a traffic policy to associate the traffic class with one or more QoS features.

You use the `policy-map policy-map-name` global configuration command to create a traffic policy and to enter policy-map configuration mode. A traffic policy defines the QoS features to associate with the specified traffic class. A traffic policy contains three elements: a name, a traffic class (specified with the `class` policy-map configuration command), and the QoS policies configured in the class.

- You name the traffic policy in the `policy-map` command line to enter policy-map configuration mode.
- In policy-map configuration mode, enter the name of the traffic class used to classify traffic to the specified policy, and enter policy-map class configuration mode.
- In policy-map class configuration mode, you can enter the QoS features to apply to the classified traffic. These include using the `set`, `police`, or `police aggregate` commands for input policy maps or the `bandwidth`, `priority`, `queue-limit` or `shape average` commands for output policy maps.

Note A packet can match only one traffic class within a traffic policy. If a packet matches more than one traffic class in the traffic policy, the first traffic class defined in the policy is used. To configure more than one match criterion for packets, you can associate multiple traffic classes with a single traffic policy.

Step 3 Attach the traffic policy to an interface.

You use the `service-policy` interface configuration command to attach the policy map to an interface for packets entering or leaving the interface. You must specify whether the traffic policy characteristics should be applied to incoming or outgoing packets. For example, entering the `service-policy output`
class1 interface configuration command attaches all the characteristics of the traffic policy named class1 to the specified interface. All packets leaving the specified interface are evaluated according to the criteria specified in the traffic policy named class1.

Input and Output Policies

Policy maps are either input policy maps or output policy maps, attached to packets as they enter or leave the switch by service policies applied to interfaces. Input policy maps perform policing and marking on received traffic. Policed packets can be dropped or reduced in priority (marked down) if they exceed the maximum permitted rates. Output policy maps perform scheduling and queuing on traffic as it leaves the switch.

Input policies and output policies have the same basic structure; the difference is in the characteristics they regulate. Figure 34-2 shows the relationship of input and output policies.

You can configure a maximum of 256 policy maps.

The number of configurable policer profiles on the ME-3400 is 254; the number of supported policer instances on the ME-3400E is 1024 minus 1 more than the number of interfaces on the switch. On a 24-port switch, the number of available policer instances is 999. You can use a policer profile in multiple instances.

You can apply one input policy map and one output policy map to an interface.

You can configure 45 ingress policers per port.

**Figure 34-2 Input and Output Policy Relationship**

Input Policy Maps

Input policy map classification criteria include matching a CoS, a DSCP, or an IP precedence value or matching an access control list (ACL) or VLAN ID (for per-port, per-VLAN QoS). Input policy maps can have any of these actions:

- Setting or marking a CoS, a DSCP, an IP precedence, or QoS group value
- Individual policing
- Aggregate policing

Only input policies provide matching on access groups or VLAN IDs, and only output policies provide matching on QoS groups. You can assign a QoS group number in an input policy and match it in the output policy. The class class-default is used in a policy map for any traffic that does not explicitly match any other class in the policy map. Input policy maps do not support queuing and scheduling keywords, such as bandwidth, queue-limit, priority, and shape average.
An input policy map can have a maximum of 32 classes, one of which is **class-default**. You can configure a maximum of 31 classes in an input policy.

### Output Policy Maps

Output policy map classification criteria include matching a CoS, a DSCP, an IP precedence, or a QoS group value. Output policy maps can have any of these actions:

- Queuing (**queue-limit**)
- Scheduling (**bandwidth**, **priority**, and **shape average**)

Output policy maps do not support matching of access groups. You can use QoS groups as an alternative by matching the appropriate access group in the input policy map and setting a QoS group. In the output policy map, you can then match the QoS group. See the “Classification Based on QoS Groups” section on page 34-11 for more information.

Output policies do not support marking or policing (except in the case of priority with policing). There is no egress packet marking on the switch (no **set** command in an output policy).

The class **class-default** is used in a policy map for any traffic that does not explicitly match any other class in the policy map. There can be a maximum of four classes in the output policy map (including class-default) because egress ports have a maximum of four queues.

An output policy map attached to an egress port can match only the packets that have already been matched by an input policy map attached to the ingress port for the packets. You can attach an output policy map to any or all ports on the switch. The switch supports configuration and attachment of a unique output policy map for each port. However, these output policy maps can contain only three unique configurations of queue limits. These three unique queue-limit configurations can be included in as many output policy maps as there are ports on the switch. There are no limitations on the configurations of bandwidth, priority, or shaping.

You can configure the output policy classification criteria for CPU-generated traffic by using the **cpu traffic qos** [**cos** value | **dscp** value | **precedence** value | **qos-group** value] global configuration command.

### Classification

Classification distinguishes one kind of traffic from another by examining the fields in the packet header. When a packet is received, the switch examines the header and identifies all key packet fields. A packet can be classified based on an ACL, on the DSCP, the CoS, or the IP precedence value in the packet, or by the VLAN ID. **Figure 34-3** has examples of classification information carried in a Layer 2 or a Layer 3 IP packet header, using six bits from the deprecated IP type of service (ToS) field to carry the classification information.

- On ports configured as Layer 2 IEEE 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN. Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value, called the User Priority bits, in the three most-significant bits, and the VLAN ID value in the 12 least-significant bits. Other frame types cannot carry Layer 2 CoS values. Layer 2 CoS values range from 0 to 7.
- Layer 3 IP packets can carry either an IP precedence value or a DSCP value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values. IP precedence values range from 0 to 7. DSCP values range from 0 to 63.
- Output remarking is based on the Layer 2 or Layer 3 marking type, marking value and packet type.

Class Maps

As explained previously, you use an MQC class map to name a specific traffic flow (or class) and to isolate it from all other traffic. A class map defines the criteria used to match against a specific traffic flow to further classify it. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. When you enter the class-map command with a class-map name, the switch enters the class-map configuration mode. In this mode, you define the match criterion for the traffic by using the match class-map configuration command. After a packet is matched against the class-map criteria, it is acted on by the associated action specified in a policy map.
You can match more than one criterion for classification. You can also create a class map that requires that all matching criteria in the class map be in the packet header by using the `class map match-all class-map name` global configuration command to enter class map configuration mode.

---

**Note**
You can configure only one match entry in a **match-all** class map.

You can use the `class map match-any class-map name` global configuration command to define a classification with any of the listed criteria.

---

**Note**
If you do not enter **match-all** or **match-any**, the default is to match all. A match-all class map cannot have more than one classification criterion (match statement). A class map with no match condition has a default of **match all**.

---

### The match Command

To configure the type of content used to classify packets, you use the `match` class-map configuration command to specify the classification criteria. If a packet matches the configured criteria, it belongs to a specific class and is forwarded according to the specified policy. For example, you can use the `match` class-map command with CoS, IP DSCP, and IP precedence values. These values are referred to as **markings** on a packet. You can also match an access group a QoS group, or a VLAN ID or ID range for per-port, per-VLAN QoS.

- For an input policy map, you cannot configure an IP classification (**match ip dscp**, **match ip precedence**, **match ip acl**) and a non-IP classification (**match cos** or **match mac acl**) in the same policy map or class map.
- When an input policy map with only Layer 2 classification is attached to a routed port or a switch port containing a routed switch virtual interface (SVI), the service policy acts only on switching eligible traffic and not on routing eligible traffic.
- On an 802.1Q tunnel port, you can use only an input policy map with Layer 2 classification based on MAC ACLs to classify traffic. Input policy maps with Layer 3 classification match Layer 2 CoS classification, or per-port, per-VLAN policies are not supported on tunnel ports.
- In an output policy map, no two class maps can have the same classification criteria, that is, the same match qualifiers and values.

This example shows how to create a class map **example** to define a class that matches any of the listed criteria. In this example, if a packet is received with the DSCP equal to 32 or a 40, the packet is identified (classified) by the class map.

```
Switch(config)# class-map match-any example
Switch(config-cmap)# match ip dscp 32
Switch(config-cmap)# match ip dscp 40
Switch(config-cmap)# exit
```

### Classification Based on Layer 2 CoS

You can use the `match` command to classify Layer 2 traffic based on the CoS value, which ranges from 0 to 7.

---

**Note**
A **match cos** command is supported only on Layer 2 802.1Q trunk ports.
This example shows how to create a class map to match a CoS value of 5:

```
Switch(config)# class-map premium
Switch(config-cmap)# match cos 5
Switch(config-cmap)# exit
```

### Classification Based on IP Precedence

You can classify IPv4 traffic based on the packet IP precedence values, which range from 0 to 7. This example shows how to create a class map to match an IP precedence value of 4:

```
Switch(config)# class-map sample
Switch(config-cmap)# match ip precedence 4
Switch(config-cmap)# exit
```

### Classification Based on IP DSCP

When you classify IPv4 traffic based on IP DSCP value, and enter the `match ip dscp` class-map configuration command, you have several classification options:

- Entering a specific DSCP value (0 to 63).
- Using the Default service, which corresponds to an IP precedence and DSCP value of 0. The default per-hop behavior (PHB) is usually best-effort service.
- Using Assured Forwarding (AF) by entering the binary representation of the DSCP value. AF sets the relative probability that a specific class of packets is forwarded when congestion occurs and the traffic does not exceed the maximum permitted rate. AF per-hop behavior provides delivery of IP packets in four different AF classes: AF11-13 (the highest), AF21-23, AF31-33, and AF41-43 (the lowest). Each AF class could be allocated a specific amount of buffer space and drop probabilities, specified by the binary form of the DSCP number. When congestion occurs, the drop precedence of a packet determines the relative importance of the packet within the class. An AF41 provides the best probability of a packet being forwarded from one end of the network to the other.
- Entering Class Selector (CS) service values of 1 to 7, corresponding to IP precedence bits in the ToS field of the packet.
- Using Expedited Forwarding (EF) to specify a low-latency path. This corresponds to a DSCP value of 46. EF services use priority queuing to preempt lower priority traffic classes.

This display shows the available classification options:

```
Switch(config-cmap)# match ip dscp ?
<0-63>  Differentiated services codepoint value
af11     Match packets with AF11 dscp (001010)
af12     Match packets with AF12 dscp (001100)
af13     Match packets with AF13 dscp (001110)
af21     Match packets with AF21 dscp (010010)
af22     Match packets with AF22 dscp (010100)
af23     Match packets with AF23 dscp (010110)
af31     Match packets with AF31 dscp (011010)
af32     Match packets with AF32 dscp (011100)
af33     Match packets with AF33 dscp (011110)
af41     Match packets with AF41 dscp (100010)
af42     Match packets with AF42 dscp (100100)
af43     Match packets with AF43 dscp (100110)
cs1      Match packets with CS1(precedence 1) dscp (001000)
cs2      Match packets with CS2(precedence 2) dscp (010000)
cs3      Match packets with CS3(precedence 3) dscp (011000)
cs4      Match packets with CS4(precedence 4) dscp (100000)
cs5      Match packets with CS5(precedence 5) dscp (101000)
```

802.1Q Tunneling CoS Mapping

The ME-3400E supports VLAN mapping from the customer VLAN-ID (C-VLAN) to a service-provider VLAN-ID (S-VLAN). See the “Understanding VLAN Mapping” section on page 14-7. For QoS, the switch can set the service-provider CoS (S-CoS) from either the customer CoS (C-CoS) or the customer DSCP (C-DSCP) value, and can map the inner CoS to the outer CoS for any traffic with traditional 802.1Q tunneling (QinQ) or selective QinQ VLAN mapping. This default allows copying the customer CoS into the service provider network.

The ME-3400E supports C-CoS to S-CoS propagation for traditional QinQ and for selective QinQ on trunk ports. This is the default behavior and does not require configuration. When you configure traditional QinQ or selective QinQ on Layer 2 trunk ports using 1-to-2 VLAN mapping, the switch also allows setting the S-CoS from C-DSCP.

For traffic entering the switch on 802.1Q tunnel ports or trunk ports configured for VLAN mapping, the switch has the ability to examine the customer packet header and set the service-provider CoS value (S-CoS) from either the customer CoS value or the customer DSCP value.

There are no command-line interface changes in the ME-3400E for configuring CoS matching, but implementation on 802.1Q mapped ports is handled in this way:

- On interfaces configured for 802.1Q tunneling (on tunnel or trunk ports) or selective 802.1Q (on trunk ports), the CoS value of the VLAN tag (inner VLAN or C-VLAN) received on the interface (C-CoS) is automatically reflected in the tunnel VLAN tag (outer VLAN or S-VLAN) by default.
- The set cos policy-map class configuration commands always apply to the outer-most VLAN tag after processing is complete, that is the S-VLAN-ID. For example, in 802.1Q tunnels, entering a set cos command changes only the CoS value of the outer tag of the encapsulated packet.
- When you configure a policy by entering the match dscp class map configuration command and you enter the set cos policy-map class configuration command for QinQ and selective QinQ mapping interfaces, a DSCP match sets the outer CoS of the encapsulated value.
- You can set DSCP based on matching the outer VLAN.
- If you enter the match cos command on interfaces configured for traditional QinQ or for selective QinQ mapping, the match is to the outer CoS, which is the reflected inner Cos (C-CoS).

Classification Based on QoS ACLs

Packets can also be classified in input policy maps based on an ACL lookup. The ACL classification is communicated to an output policy by assigning a QoS group or number in the input policy map. To classify based on ACL lookup, you first create an IP or MAC ACL. Configure a class map and use the `match access-group { acl-number | acl name }` class-map configuration command, and attach the class map to a policy map.

Note

You cannot configure `match access-group` for an output policy map.
You can use IP standard, IP extended, or Layer 2 MAC ACLs to define a group of packets with the same characteristics (a class). You use the `access-list` global configuration command to configure IP ACLs to classify IP traffic based on Layer 3 and Layer 4 parameters. You use the `mac access-list extended` global configuration command to configure Layer 2 MAC ACLs to classify IP and non-IP traffic based on Layer 2 parameters.

**Note**
You cannot match IP fragments against configured IP extended ACLs to enforce QoS. IP fragments are sent as best-effort. IP fragments are denoted by fields in the IP header.

You can use only ACLs with a permit action in a `match access-group` command. ACLs with a deny action are never matched in a QoS policy.

**Note**
Only one access-group is supported per class for an input policy map.

### Classification Based on QoS Groups

A QoS group is an internal label used by the switch to identify packets as members of a specific class. The label is not part of the packet header and is restricted to the switch that sets the label. QoS groups provide a way to tag a packet for subsequent QoS action without explicitly marking (changing) the packet. You can then communicate an ACL match from an input policy map to an output policy map.

A QoS group is identified at ingress and used at egress; it is assigned in an input policy to identify packets in an output policy. See Figure 34-3. The QoS groups help aggregate different classes of input traffic for a specific action in an output policy.

**Figure 34-4 QoS Groups**

You can use QoS groups to aggregate multiple input streams across input classes and policy maps for the same QoS treatment on the egress port. Assign the same QoS group number in the input policy map to all streams that require the same egress treatment, and match to the QoS group number in the output policy map to specify the required queuing and scheduling actions.

You can also use QoS groups to identify traffic entering a particular interface if the traffic must be treated differently at the output based on the input interface.

You can use QoS groups to configure per-port, per-VLAN QoS output policies on the egress interface for bridged traffic on the VLAN. Assign a QoS group number to a VLAN on the ingress interface by configuring a per-port, per-VLAN input policy. Then use the same QoS-group number for classification at the egress. Because the VLAN of bridged traffic does not change during forwarding through the switch, the QoS-group number assigned to the ingress VLAN can be used on the egress interface to identify the same VLAN.

You can use the `cpu traffic qos [cos value | dscp value | precedence value | qos-group value]` global configuration command to configure a QoS group number for CPU-generated traffic.

Independently you can assign QoS-group numbers at the ingress to any combination of interfaces, VLANs, traffic flows, and aggregated traffic. To assign QoS-group numbers, configure a QoS group marking in an input policy map, along with any other marking or policing actions required in the input
policy map for the same service class. This allows the input marking and policing functions to be
decoupled from the egress classification function if necessary because only the QoS group must be used
for egress classification.

To communicate an ACL classification to an output policy, you assign a QoS number to specify packets
at ingress. This example identifies specific packets as part of QoS group 1 for later processing in an
output policy:

```
Switch(config)# policy-map in-gold-policy
Switch(config-pmap)# class in-class1
Switch(config-pmap-c)# set qos-group 1
Switch(config-cmap-c)# exit
Switch(config-cmap)# exit
```

You use the `set qos-group` command only in an input policy. The assigned QoS group identification is
subsequently used in an output policy with no mark or change to the packet. You use the `match
qos-group` in the output policy.

**Note**

You cannot configure `match qos-group` for an input policy map.

This example creates an output policy to match the QoS group created in the input policy map
`in-gold-policy`. Traffic internally tagged as `qos-group 1` is identified and processed by the output policy.

```
Switch(config)# class-map out-class1
Switch(config-cmap)# match qos-group 1
Switch(config-cmap)# exit
```

The switch supports a maximum of 100 QoS groups.

### Classification Based on VLAN IDs

With classification based on VLAN IDs, you can apply QoS policies to frames carried on a
user-specified VLAN for a given interface. You can use hierarchical policy maps for per-VLAN
classification on trunk ports. Per-VLAN classification is not required on access ports because access
ports carry traffic for a single VLAN. If you try to attach an input per-port, per VLAN hierarchical policy
to a port that is not a trunk port, the configuration is rejected.

The switch supports two policy levels: a parent level and a child level. With the QoS parent-child
structure, you can reference a child policy in a parent policy to provide additional control of a specific
traffic type. For per-port, per-VLAN QoS, the parent-level class map specifies only the VLAN match
criteria, and the child-level class maps provide more detailed classification for frames matching the
parent-level class map. You can configure multiple service classes at the parent level to match different
combinations of VLANs, and you can apply independent QoS policies to each parent service class using
any child policy map.

**Note**

A per-port, per-VLAN parent-level class map supports only a child-policy association; it does not allow
any actions to be configured. In addition, for a parent-level class map, you cannot configure an action or
a child-policy association for the class `class-default`.

Per-port, per-VLAN QoS has these limitations:

- You can apply a per-port, per-VLAN hierarchical policy map only to trunk ports.
- You can configure classification based on VLAN ID only in the parent level of a per-port, per-VLAN
  hierarchical policy map.
Understanding QoS

When the child policy map attached to a VLAN or set of VLANs contains only Layer 3 classification (match ip dscp, match ip precedence, match IP ACL), you must be careful to ensure that these VLANs are not carried on any port other than the one on which this per-port, per-VLAN policy is attached. Not following this restriction could result in improper QoS behavior for traffic ingressing the switch on these VLANs.

We also recommend that you restrict VLAN membership on the trunk ports to which the per-port, per-VLAN is applied by using the switchport trunk allowed vlan interface configuration command. Overlapping VLAN membership between trunk ports that have per-port, per-VLAN policies with Layer 3 classification could also result in unexpected QoS behavior.

In this example, the class maps in the child-level policy map specify matching criteria for voice, data, and video traffic, and the child policy map sets the action for input policing each type of traffic. The parent-level policy map specifies the VLANs to which the child policy maps are applied on the specified port.

Switch(config)# class-map match-any dscp-1 data
Switch(config-cmap)# match ip dscp 1
Switch(config-cmap)# exit
Switch(config)# class-map match-any dscp-23 video
Switch(config-cmap)# match ip dscp 23
Switch(config-cmap)# exit
Switch(config)# class-map match-any dscp-63 voice
Switch(config-cmap)# match ip dscp-63
Switch(config-cmap)# exit
Switch(config)# class-map match-any customer-1-vlan
Switch(config-cmap)# match vlan 10 0
Switch(config-cmap)# match vlan 20 0
Switch(config-cmap)# match vlan 30 0
Switch(config-cmap)# exit

Switch(config)# policy-map child policy-1
Switch(config-pmap)# class dscp-63 voice
Switch(config-pmap-c)# police cir 10000000 bc 50000
Switch(config-pmap-c)# conform-action set-cos-transmit 5
Switch(config-pmap-c)# exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class dscp-1 data
Switch(config-pmap-c)# set cos 0
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class dscp-23 video
Switch(config-pmap-c)# set cos 4
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# set ip precedence 4
Switch(config-pmap-c)# exit

Switch(config)# policy-map parent-customer-1
Switch(config-pmap)# class customer-1-vlan
Switch(config-pmap-c)# service-policy ingress-policy-1

Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# service-policy input customer-1-ingress
Switch(config-pmap-c)# exit

You can also enter the match criteria as match vlan 100 200 300 with the same result.

Switch(config)# policy-map child policy-1
Switch(config-pmap)# class dscp-63 voice
Switch(config-pmap-c)# police cir 10000000 bc 50000
Switch(config-pmap-c)# conform-action set-cos-transmit 5
Switch(config-pmap-c)# exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class dscp-1 data
Switch(config-pmap-c)# set cos 0
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class dscp-23 video
Switch(config-pmap-c)# set cos 4
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# set ip precedence 4
Switch(config-pmap-c)# exit

Switch(config)# policy-map parent-customer-1
Switch(config-pmap)# class customer-1-vlan
Switch(config-pmap-c)# service-policy ingress-policy-1
Switch(config-pmap-c)# exit

Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# service-policy input customer-1-ingress
Switch(config-pmap-c)# exit

Note: Each per-port, per-VLAN parent policy class, except class-default, can have a child policy association.
See the “Configuring Per-Port Per-VLAN QoS with Hierarchical Input Policy Maps” section on page 34-51 for configuration information, including configuration guidelines and limitations.

### Table Maps

You can use table maps to manage a large number of traffic flows with a single command. You can specify table maps in `set` commands and use them as mark-down mapping for the policers. You can also use table maps to map an incoming QoS marking to a replacement marking without having to configure a large number of explicit matches and sets. Table maps are used only in input policy maps.

Table maps can be used to:

- Correlate specific CoS, DSCP, or IP precedence values to specific CoS, DSCP, or IP precedence values
- Mark down a CoS, DSCP, or IP precedence value
- Assign defaults for unmapped values

A table map includes one of these default actions:

- `default default-value`—applies a specific default value (0 to 63) for all unmapped values
- `default copy`—maps all unmapped values to the equivalent value in another qualifier
- `default ignore`—makes no changes for unmapped values

This example creates a table to map specific CoS values to DSCP values. The `default` command maps all unmapped CoS values to a DSCP value of 63.

```
Switch(config)# table-map cos-dscp-tablemap
Switch(config-tablemap)# map from 5 to 46
Switch(config-tablemap)# map from 6 to 56
Switch(config-tablemap)# map from 7 to 57
Switch(config-tablemap)# default 63
Switch(config-tablemap)# exit
```

The switch supports a maximum of 256 unique table maps. You can enter up to 64 different `map from–to` entries in a table map. These table maps are supported on the switch:

- DSCP to CoS
- DSCP to precedence
- DSCP to DSCP
- CoS to DSCP
- CoS to precedence
- CoS to CoS
- Precedence to CoS
- Precedence to DSCP
- Precedence to precedence

Table maps modify only one parameter (CoS, IP precedence, or DSCP, whichever is configured) and are only effective when configured with a `set` command in a policy map or with a `violate-action` in a policy function. Individual policers also support the `violate-action` command, but aggregate policers do not support table maps with violate-action.

Table maps are not supported in output policy maps. For more information, see the “Configuring Table Maps” section on page 34-38.
Policing

After a packet is classified, you can use policing as shown in Figure 34-5 to regulate the class of traffic. The policing function limits the amount of bandwidth available to a specific traffic flow or prevents a traffic type from using excessive bandwidth and system resources. A policer identifies a packet as in or out of profile by comparing the rate of the inbound traffic to the configuration profile of the policer and traffic class. Packets that exceed the permitted average rate or burst rate are out of profile or nonconforming. These packets are dropped or modified (marked for further processing), depending on the policer configuration.

Policing is used primarily on receiving interfaces. You can attach a policy map with a policer only in an input service policy. The only policing allowed in an output policy map is in priority classes. See the “Unconditional Priority Policing” section on page 34-20.

Figure 34-5 Policing of Classified Packets

These sections describe the types of policing supported on the switch:

- **Individual Policing**, page 34-15
- **Aggregate Policing**, page 34-17
- **Unconditional Priority Policing**, page 34-20

**Individual Policing**

Individual policing applies only to input policy maps. In policy-map configuration mode, you enter the `class` command followed by class-map name, and enter policy-map class configuration mode.

The ME-3400E switch supports 1-rate, 2-color ingress policing and 2-rate, 3-color policing for individual or aggregate policing.

For 1-rate, 2-color policing, you use the `police` policy-map class configuration command to define the policer, the committed rate limitations of the traffic, committed burst size limitations of the traffic, and the action to take for a class of traffic that is below the limits (`conform-action`) and above the limits (`exceed-action`). If you do not specify burst size (bc), the system calculates an appropriate burst size value. The calculated value is appropriate for most applications. For more information, see the “Attaching a Traffic Policy to an Interface” section on page 34-39.
When you configure a 2-rate policer, in addition to configuring the committed information rate (CIR) for updating the first token bucket, you also configure the peak information rate (PIR) at which the second token bucket is updated. If you do not configure a PIR, the policer is a standard 1-rate, 2-color policer.

For 2-rate, 3-color policing, you can then optionally set actions to perform on packets that conform to the specified CIR and PIR (conform-action), packets that conform to the PIR, but not the CIR (exceed-action), and packets that exceed the PIR value (violate-action).

- If you set the CIR value equal to the PIR, a traffic rate that is less than or equal to the CIR is in the conform range. Traffic that exceeds the CIR is in the violate range.
- If you set the PIR greater than the CIR, a traffic rate less than the CIR is in the conform range. A traffic rate that exceeds the CIR but is less than or equal to the PIR is in the exceed range. A traffic rate that exceeds the PIR is in the violate range.
- If you do not configure a PIR, the policer is configured as a 1-rate, 2-color policer.

Setting the burst sizes too low can reduce throughput in situations with bursty traffic. Setting burst sizes too high can allow too high a traffic rate.

The ME-3400E supports byte counters for byte-level statistics for conform, exceed, and violate classes in the `show policy-map interface` privileged EXEC command output.

To make the policy map effective, you attach it to a physical port by using the `service-policy input` interface configuration command. Policing is done only on received traffic, so you can only attach a policer to an input service policy.

This is an example of basic policing for all traffic received with a CoS of 4. The first value following the `police` command limits the average traffic rate to 10,000,000 bits per second (bps); the second value represents the additional burst size (10 kilobytes). The policy is assigned to Fast Ethernet port 1.

```
Switch(config)# class-map video-class
Switch(config-cmap)# match cos 4
Switch(config-cmap)# exit
Switch(config)# policy-map video-policy
Switch(config-pmap)# class video-class
Switch(config-pmap-c)# police 10000000 10000
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy input video-policy
Switch(config-if)# exit
```

You can use the `conform-action`, `exceed-action`, and `violate-action` policy-map class configuration commands or the `conform-action`, `exceed-action`, and `violate-action` policy-map class police configuration commands to specify the action to be taken when the packet conforms to or exceeds the specified traffic rates. Conform, exceed, and violate actions are to drop the packet, to send the packet without modifications, to set a new CoS, DSCP, or IP precedence value, or to set a QoS group value for classification at the egress.

You can configure each marking action by using explicit values, table maps, or a combination of both. Table maps list specific traffic attributes and map (or convert) them to other attributes.

You can configure multiple conform, exceed, and violate actions simultaneously for each service class. If you do not configure a `violate-action`, by default the violate class is assigned the same action as the `exceed-action`.
After you create a table map, you configure a policy-map policer to use the table map.

**Note**

When you use a table map in an input policy map, the protocol type for the **from**–**action** in the table map must be the same as the protocol type of the associated classification. For example, if a class map represents IP classification, the **from**–**type** action in the table map must be either **dscp** or **precedence**. If the class map represents a non-IP classification, the **from**–**type** action in the table map must be **cos**.

To configure multiple actions in a class, you can enter multiple conform, exceed, or violate action entries in policy-map class policy configuration mode, as in this example:

```plaintext
Switch(config)# policy-map map1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# police 100000 500000
Switch(config-pmap-c-police)# conform-action set-cos-transmit 4
Switch(config-pmap-c-police)# conform-action set-dscp-transmit dscp table conform-dscp-to-dscp-mutation
Switch(config-pmap-c-police)# conform-action set-qos-transmit 10
Switch(config-pmap-c-police)# exceed-action set-cos-transmit 2
Switch(config-pmap-c-police)# exceed-action set-dscp-transmit dscp table exceed-dscp-to-dscp-mutation
Switch(config-pmap-c-police)# exceed-action set-qos-transmit 20
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
```

**Aggregate Policing**

Aggregate policing applies only to input policy maps. An aggregate policer differs from an individual policer because it is shared by multiple traffic classes within a policy map. The ME-3400E switch supports 1-rate, 2-color ingress policing and 2-rate, 3-color policing for aggregate policing.

You can use the **policer aggregate** global configuration command to set a policer for all traffic received or sent on a physical interface. When you configure an aggregate policer, you can configure specific burst sizes and conform and exceed actions. If you do not specify burst size (**bc**), the system calculates an appropriate burst size value. The calculated value is appropriate for most applications.

When you configure a 2-rate policer, in addition to configuring the committed information rate (CIR) for updating the first token bucket, you also configure the peak information rate (PIR) at which the second token bucket is updated. If you do not configure a PIR, the policer is a standard 1-rate, 2-color policer.

For 2-rate, 3-color policing, you can then optionally set actions to perform on packets that conform to the specified CIR and PIR (**conform-action**), packets that conform to the PIR, but not the CIR (**exceed-action**), and packets that exceed the PIR value (**violate-action**).

**Note**

If the conform action is set to drop, the exceed and violate actions are automatically set to drop. If the exceed action is set to drop, the violate action is automatically set to drop.

- If you set the CIR value equal to the PIR, a traffic rate that is less than or equal to the CIR is in the conform range. Traffic that exceeds the CIR is in the violate range.
- If you set the PIR greater than the CIR, a traffic rate less than the CIR is in the conform range. A traffic rate that exceeds the CIR but is less than or equal to the PIR is in the exceed range. A traffic rate that exceeds the PIR is in the violate range.
- If you do not configure PIR, the policer is configured as a 1-rate, 2-color policer.
Setting the burst sizes too low can result in less traffic than expected. Setting burst sizes too high can result in more traffic than expected.

You can configure multiple conform, exceed, and violate actions simultaneously for each service class. You can use the `conform-action`, `exceed-action`, and `violate-action` policy-map class configuration commands or the `conform-action`, `exceed-action`, and `violate-action` policy-map class police configuration commands to specify the action to be taken when the packet conforms to or exceeds the specified traffic rates. Conform, exceed, and violate actions are to drop the packet, to send the packet without modifications, to set a new CoS, DSCP, or IP precedence value, or to set a QoS group value for classification at the egress.

**Note**

If the conform action is set to drop, the exceed and violate actions are automatically set to drop. If the exceed action is set to drop, the violate action is automatically set to drop.

You can configure each marking conform, exceed, or violate action by using explicit values, using table maps, or using a combination of both. If you do not configure a `violate-action`, by default the violate class is assigned the same action as the `exceed-action`.

Table maps list specific traffic attributes and map (or convert) them to other attributes. Table maps are not supported for `violate-action` for aggregate policing unless you configure a table map for exceed-action and no explicit action is configured for violate action.

After you create a table map, you configure a policy-map policer to use the table map.

**Note**

When you use a table map in an input policy map, the protocol type for the `from`–action in the table map must be the same as the protocol type of the associated classification. For example, if a class map represents IP classification, the `from`–type action in the table map must be either `dscp` or `precedence`. If the class map represents a non-IP classification, the `from`–type action in the table map must be `cos`.

You can configure multiple conform, exceed, and violate actions simultaneously for an aggregate policer as parameters in the `policer aggregate` global configuration command, but you must enter the actions in a particular order. See the configuration guideline in the “Configuring Input Policy Maps with Aggregate Policing” section on page 34-45.

After you configure the aggregate policer, you create a policy map and an associated class map, associate the policy map with the aggregate policer, and apply the service policy to a port.

**Note**

Only one policy map can use any specific aggregate policer. Aggregate policing cannot be used to aggregate traffic streams across multiple interfaces. It can be used only to aggregate traffic streams across multiple classes in a policy map attached to an interface and aggregate streams across VLANs on a port in a per-port, per-VLAN policy map.

After you configure the policy map and policing actions, attach the policy to an ingress port by using the `service-policy` interface configuration command.

The class maps in this example refer to access lists.

```
Switch(config)# policer aggregate aggl cir 23000 bc 10000 conform-action set-dscp-transmit 46 exceed-action drop
Switch(config)# class-map testclass
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# class-map videoclass
Switch(config-cmap)# match access-group 2
Switch(config-cmap)# exit
```
Switch(config)# policy-map testexample
Switch(config-pmap)# class testclass
Switch(config-pmap-c)# police aggregate agg1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class video-class
Switch(config-pmap-c)# police aggregate agg1
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy input testexample
Switch(config-if)# exit

For configuration information, see the “Configuring Input Policy Maps with Aggregate Policing” section on page 34-45.

You can also use aggregate policing to regulate traffic streams across VLANs, as in this example:

Switch(config)# policer aggregate agg1 cir 23000 bc 10000 conform-action set-dscp-transmit af31 set-cos-transmit 3 exceed-action set-dscp-transmit af11 set-cos-transmit 1
Switch(config)# class-map video-provider-1
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# class-map video-provider-2
Switch(config-cmap)# match access-group 2
Switch(config-cmap)# exit
Switch(config)# class-map match-any customer1-provider-100
Switch(config-cmap)# match vlan 100
Switch(config-cmap)# exit
Switch(config)# class-map match-any customer1-provider-200
Switch(config-cmap)# match vlan 200
Switch(config-cmap)# exit
Switch(config)# policy-map child-policy-1
Switch(config-pmap)# class video-provider-1
Switch(config-pmap-c)# set dscp af41
Switch(config-pmap-c)# exit
Switch(config)# class class-default
Switch(config-pmap-c)# police aggregate agg1
Switch(config-pmap-c)# exit
Switch(config)# policy-map child-policy-2
Switch(config-pmap)# class video-provider-2
Switch(config-pmap-c)# set dscp cs4
Switch(config-pmap-c)# exit
Switch(config)# class class-default
Switch(config-pmap-c)# police aggregate agg1
Switch(config-pmap-c)# exit
Switch(config)# policy-map customer-1-ingress
Switch(config-pmap)# class customer1-provider-100
Switch(config-pmap-c)# service-policy child-policy-1
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# service-policy input customer-1-ingress
Switch(config-pmap-c)# exit
Unconditional Priority Policing

Priority policing applies only to output policy maps. You can use the `priority` policy-map class configuration command in an output policy map to designate a low-latency path, or class-based priority queuing, for a specific traffic class. With strict priority queuing, the packets in the priority queue are scheduled and sent until the queue is empty, at the expense of other queues. Excessive use of high-priority queuing can create congestion for lower priority traffic.

To eliminate this congestion, you can use the priority with police feature (priority policing) to reduce the bandwidth used by the priority queue and allocate traffic rates on other queues. Priority with police is the only form of policing supported in output policy maps.

**Note**

You can configure 1-rate, 2-color policers for output policy maps with priority. You cannot configure 2-rate, 3-color policers for output policies.

See also the “Configuring Output Policy Maps with Class-Based Priority Queuing” section on page 34-61.

**Note**

You cannot configure a policer committed burst size for an unconditional priority policer. Any configured burst size is ignored.

This example shows how to use the `priority` with `police` commands to configure `out-class1` as the priority queue, with traffic going to the queue limited to 20,000,000 bps so that the priority queue never uses more than that. Traffic above that rate is dropped. This allows other traffic queues to receive some port bandwidth, in this case a minimum bandwidth guarantee of 500,000 and 200,000 kbps. The class `class-default` queue gets the remaining port bandwidth.

```plaintext
Switch(config)# policy-map policy1
Switch(config-pmap)# class out-class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# police 200000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class2
Switch(config-pmap-c)# bandwidth 500000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class3
Switch(config-pmap-c)# bandwidth 200000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# exit
```

Marking

You can use packet marking in input policy maps to set or modify the attributes for traffic belonging to a specific class. After network traffic is organized into classes, you use marking to identify certain traffic types for unique handling. For example, you can change the CoS value in a class or set IP DSCP or IP precedence values for a specific type of traffic. These new values are then used to determine how the traffic should be treated. You can also use marking to assign traffic to a QoS group within the switch.

Traffic marking is typically performed on a specific traffic type at the ingress port. The marking action can cause the CoS, DSCP, or precedence bits to be rewritten or left unchanged, depending on the configuration. This can increase or decrease the priority of a packet in accordance with the policy used
in the QoS domain so that other QoS functions can use the marking information to judge the relative and absolute importance of the packet. The marking function can use information from the policing function or directly from the classification function.

You can specify and mark traffic by using the set commands in a policy map for all supported QoS markings (CoS, IP DSCP, IP precedence, and QoS groups). A set command unconditionally marks the packets that match a specific class. You then attach the policy map to an interface as an input policy map.

You can also mark traffic by using the set command with table maps. Table maps list specific traffic attributes and maps (or converts) them to another attribute. A table map establishes a to-from relationship for the attribute and defines the change to be made.

You can simultaneously configure actions to modify DSCP, precedence, and COS markings in the packet for the same service along with QoS group marking actions. You can use the QoS group number defined in the marking action for egress classification.

**Note**
When you use a table map in an input policy map, the protocol type of the from-type action in the table map must be the same as the protocol type of the associated classification. For example, if a class map represents an IP classification, the from-type action in the table map must be either dscp or precedence. If the class map represents a non-IP classification, the from-type action in the table map must be cos.

After you create a table map, you configure a policy map to use the table map. See the “Congestion Management and Scheduling” section on page 34-22. Figure 34-6 shows the steps for marking traffic.

**Figure 34-6 Marking of Classified Traffic**

This example uses a policy map to remark a packet. The first marking (the set command) applies to the QoS default class map that matches all traffic not matched by class AF31-AF33 and sets all traffic to an IP DSCP value of 1. The second marking sets the traffic in classes AF31 to AF33 to an IP DSCP of 3.

```
Switch(config)# policy-map Example
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set ip dscp 1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class AF31-AF33
Switch(config-pmap-c)# set ip dscp 3
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy input Example
Switch(config-if)# exit
```

**Marking and Queuing CPU-Generated Traffic**

You can mark the CPU-generated traffic by entering the cpu traffic qos global configuration command. You can use this command to mark the CPU-generated control plane packets with CoS, DSCP and IP precedence values. You can also use QoS groups to mark the CPU-generated traffic with a qos-group number. See “Classification Based on QoS Groups” on page -11.

The output policy map that is attached to each port determines the output queue for CPU-generated traffic when traffic is sent through that port. Using the cpu traffic qos global configuration command, you can match the QoS parameter values to an output policy-map and assign them to a specific queue,
or perform other actions on the CPU-generated traffic. The default egress queue value is 2. However, if there is no output policy attached to the port, the CPU-generated traffic is sent through the first non-priority queue defined in the output policy map. You can also mark native VLAN traffic and tag it by entering the `vlan dot1q tag native` global configuration command.

When you configure the `cpu traffic qos` marking for Ethernet or IP traffic, the control plane traffic that the CPU generates is marked with the values that you specify. All control plane traffic is marked with these values, except for Connectivity Fault Management (CFM) traffic. Cisco IOS IP Service Level Agreements (SLAs) traffic that uses the CFM layer for transacting the messages is not affected, but IP SLAs traffic that uses UDP or other networking protocols is affected by this feature.

### Congestion Management and Scheduling

MQC provides several related mechanisms to control outgoing traffic flow. These mechanisms are implemented in output policy maps to control output traffic queues. The scheduling stage holds packets until the appropriate time to send them to one of the four traffic queues. Queuing assigns a packet to a particular queue based on the packet class, and is enhanced by the WTD algorithm for congestion avoidance. You can use different scheduling mechanisms to provide a guaranteed bandwidth to a particular class of traffic while also serving other traffic in a fair way. You can limit the maximum bandwidth that can be consumed by a particular class of traffic and ensure that delay-sensitive traffic in a low-latency queue is sent before traffic in other queues.

The switch supports these scheduling mechanisms:

- **Traffic shaping**
  
  You use the `shape average` policy map class configuration command to specify that a class of traffic should have a maximum permitted average rate. You specify the maximum rate in bits per second.

- **Class-based-weighted-fair-queuing (CBWFQ)**
  
  You can use the `bandwidth` policy-map class configuration command to control the bandwidth allocated to a specific class. Minimum bandwidth can be specified as a bit rate or a percentage of total bandwidth or of remaining bandwidth.

- **Priority queuing or class-based priority queuing**
  
  You use the `priority` policy-map class configuration command to specify the priority of a type of traffic over other types of traffic. You can specify strict priority for the high-priority traffic and allocate any excess bandwidth to other traffic queues, or specify priority with unconditional policing of high-priority traffic and allocate the known remaining bandwidth among the other traffic queues.

  – To configure strict priority, use only the `priority` policy-map class configuration command to configure the priority queue. Use the `bandwidth remaining percent` policy-map class configuration command for the other traffic classes to allocate the excess bandwidth in the desired ratios.

  – To configure priority with unconditional policing, configure the priority queue by using the `priority` policy-map class configuration command and the `police` policy-map class configuration command to unconditionally rate-limit the priority queue. In this case, you can configure the other traffic classes with `bandwidth` or `shape average`, depending on requirements.

These sections contain additional information about scheduling:

- **Traffic Shaping**, page 34-23
- **Class-Based Weighted Fair Queuing**, page 34-24
- **Priority Queuing**, page 34-26
Traffic Shaping

Traffic shaping is a traffic-control mechanism similar to traffic policing. While traffic policing is used in input policy maps, traffic shaping occurs as traffic leaves an interface. The switch can apply class-based shaping to classes of traffic leaving an interface and port shaping to all traffic leaving an interface. Configuring a queue for traffic shaping sets the maximum bandwidth or peak information rate (PIR) of the queue.

**Note**
You cannot configure traffic shaping (shape average) and CBWFQ (bandwidth) or priority queuing (priority) for the same class in an output policy map. You cannot configure traffic shaping for a traffic class when strict priority (priority without police) is configured for another class within the output policy-map.

Class-Based Shaping

Class-based shaping uses the shape average policy-map class configuration command to limit the rate of data transmission as the number of bits per second to be used for the committed information rate for a class of traffic. The switch supports separate queues for three classes of traffic. The fourth queue is always the default queue for class class-default, unclassified traffic.

**Note**
In the Cisco ME switch, configuring traffic shaping also automatically sets the minimum bandwidth guarantee or committed information rate (CIR) of the queue to the same value as the PIR.

This example shows how to configure traffic shaping for outgoing traffic on a Fast Ethernet port so that outclass1, outclass2, and outclass3 get a maximum of 50, 20, and 10 Mbps, respectively, of the available port bandwidth. The class class-default at a minimum gets the remaining bandwidth.

```plaintext
Switch(config)# policy-map out-policy
Switch(config-pmap)# class classout1
Switch(config-pmap-c)# shape average 50000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class classout2
Switch(config-pmap-c)# shape average 20000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class classout3
Switch(config-pmap-c)# shape average 10000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastetheren 0/1
Switch(config-if)# service-policy output out-policy
Switch(config-if)# exit
```

Port Shaping

To configure port shaping (a transmit port shaper), create a policy map that contains only a default class, and use the shape average command to specify the maximum bandwidth for a port.

This example shows how to configure a policy map that shapes a port to 90 Mbps, allocated according to the out-policy policy map configured in the previous example. The service-policy policy map class command is used to create a child policy to the parent.

```plaintext
Switch(config)# policy-map out-policy-parent
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# shape average 90000000
Switch(config-pmap-c)# service-policy out-policy
Switch(config-pmap-c)# exit
```
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy output out-policy-parent
Switch(config-if)# exit

Parent-Child Hierarchy

The switch also supports parent policy levels and child policy levels for traffic shaping. The QoS parent-child structure is used for specific purposes where a child policy is referenced in a parent policy to provide additional control of a specific traffic type.

The first policy level, the parent level, is used for port shaping, and you can specify only one class of type class-default within the policy. This is an example of a parent-level policy map:

Switch(config)# policy-map parent
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# shape average 50000000
Switch(config-pmap-c)# exit

The second policy level, the child level, is used to control a specific traffic stream or class, as in this example:

Switch(config)# policy-map child
Switch(config-pmap)# class class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit

Note

The total of the minimum bandwidth guarantees (CIR) for each queue of the child policy cannot exceed the total port-shape rate.

This is an example of a parent-child configuration:

Switch(config)# policy-map parent
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# shape average 50000000
Switch(config-pmap-c)# service-policy child
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy output parent
Switch(config-if)# exit

Class-Based Weighted Fair Queuing

You can configure class-based weighted fair queuing (CBWFQ) to set the relative precedence of a queue by allocating a portion of the total bandwidth that is available for the port. You use the bandwidth policy-map class configuration command to set the output bandwidth for a class of traffic as a rate (kilobits per second), a percentage of total bandwidth, or a percentage of remaining bandwidth.

Note

When you configure bandwidth in a policy map, you must configure all rates in the same format, either a configured rate or a percentage. The total of the minimum bandwidth guarantees (CIR) for each queue of the policy cannot exceed the total speed of the parent.

- When you use the bandwidth policy-map class configuration command to configure a class of traffic as an absolute rate (kilobits per second) or a percentage of total bandwidth, this represents the minimum bandwidth guarantee (CIR) for that traffic class. This means that the traffic class gets
Understanding QoS

at least the bandwidth indicated by the command, but is not limited to that bandwidth. Any excess bandwidth on the port is allocated to each class in the same ratio in which the CIR rates are configured.

**Note** You cannot configure bandwidth as an absolute rate or a percentage of total bandwidth when strict priority (priority without police) is configured for another class in the output policy.

- When you use the `bandwidth` policy-map class configuration command to configure a class of traffic as a percentage of remaining bandwidth, this represents the portion of the excess bandwidth of the port that is allocated to the class. This means that the class is allocated bandwidth only if there is excess bandwidth on the port, and if there is no minimum bandwidth guarantee for this traffic class.

**Note** You can configure bandwidth as percentage of remaining bandwidth only when strict priority (priority without police) is configured for another class in the output policy map.

For more information, see the “Configuring Output Policy Maps with Class-Based-Weighted-Queuing” section on page 34-57.

**Note** You cannot configure bandwidth and traffic shaping (shape average) or priority queuing (priority) for the same class in an output policy map.

This example shows how to set the precedence of output queues by setting bandwidth in kilobits per second. The classes `outclass1`, `outclass2`, and `outclass3` and class-default get a minimum of 40000, 20000, 10000, and 10000 kbps. Any excess bandwidth is divided among the classes in the same proportion as the CIR rated.

```
Switch(config)# policy-map out-policy
Switch(config-pmap)# class outclass1
Switch(config-pmap-c)# bandwidth 40000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass2
Switch(config-pmap-c)# bandwidth 20000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass3
Switch(config-pmap-c)# bandwidth 10000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# bandwidth 10000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet 0/1
Switch(config-if)# service-policy output out-policy
Switch(config-if)# exit
```

**Note** When you configure CIR bandwidth for a class as an absolute rate or percentage of the total bandwidth, any excess bandwidth remaining after servicing the CIR of all the classes in the policy map is divided among the classes in the same proportion as the CIR rates. If the CIR rate of a class is configured as 0, that class is also not eligible for any excess bandwidth and as a result receives no bandwidth.
This example shows how to allocate the excess bandwidth among queues by configuring bandwidth for a traffic class as a percentage of remaining bandwidth. The class `outclass1` is given priority queue treatment. The other classes are configured to get percentages of the excess bandwidth if any remains after servicing the priority queue: `outclass2` is configured to get 50 percent, `outclass3` to get 20 percent, and the class `class-default` to get the remaining 30 percent.

```
Switch(config)# policy-map out-policy
Switch(config-pmap)# class outclass1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass2
Switch(config-pmap-c)# bandwidth remaining percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass3
Switch(config-pmap-c)# bandwidth remaining percent 20
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet 0/1
Switch(config-if)# service-policy output out-policy
Switch(config-if)# exit
```

**Priority Queuing**

You can use the `priority` policy-map class configuration command to ensure that a particular class of traffic is given preferential treatment. With strict priority queuing, the priority queue is constantly serviced. All packets in the queue are scheduled and sent until the queue is empty. Priority queuing allows traffic for the associated class to be sent before packets in other queues are sent.

**Note**

You should exercise care when using the `priority` command. Excessive use of strict priority queuing might cause congestion in other queues.

The switch supports strict priority queuing or priority used with the `police` policy-map command.

- **Strict priority queuing** (priority without police) assigns a traffic class to a low-latency queue to ensure that packets in this class have the lowest possible latency. When this is configured, the priority queue is continually serviced until it is empty, possibly at the expense of packets in other queues.

  **Note**

  You cannot configure priority without policing for a traffic class when traffic shaping or CBWFQ are configured for another class in the same output policy map.

- You can use priority with the `police` policy-map command, or unconditional priority policing, to reduce the bandwidth used by the priority queue. This is the only form of policing that is supported in output policy maps. Using this combination of commands configures a maximum rate on the priority queue, and you can use the `bandwidth` and `shape average` policy-map commands for other classes to allocate traffic rates on other queues.

  **Note**

  When priority is configured in an output policy map without the `police` command, you can only configure the other queues for sharing by using the `bandwidth remaining percent` policy-map command to allocate excess bandwidth.
Priority queuing has these restrictions:

- You can associate the `priority` command with a single unique class for all attached output polices on the switch.
- You cannot configure priority and any other scheduling action (shape average or bandwidth) in the same class.
- You cannot configure priority queuing for the `class-default` of an output policy map.

For more information, see the “Configuring Output Policy Maps with Class-Based Priority Queuing” section on page 34-61.

This example shows how to configure the class `out-class1` as a strict priority queue so that all packets in that class are sent before any other class of traffic. Other traffic queues are configured so that `out-class2` gets 50 percent of the remaining bandwidth and `out-class3` gets 20 percent of the remaining bandwidth. The class `class-default` receives the remaining 30 percent with no guarantees.

```bash
Switch(config)# policy-map policy1
Switch(config-pmap)# class out-class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class2
Switch(config-pmap-c)# bandwidth remaining percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class3
Switch(config-pmap-c)# bandwidth remaining percent 20
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 0/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# exit
```

This example shows how to use the `priority` with `police` commands to configure `out-class1` as the priority queue, with traffic going to the queue limited to 20000000 bps so that the priority queue will never use more than that. Traffic above that rate is dropped. The other traffic queues are configured to use 50 and 20 percent of the bandwidth that is left, as in the previous example.

```bash
Switch(config)# policy-map policy1
Switch(config-pmap)# class out-class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# police 200000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class2
Switch(config-pmap-c)# bandwidth percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class3
Switch(config-pmap-c)# bandwidth percent 20
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 0/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# exit
```

**Congestion Avoidance and Queuing**

Congestion avoidance uses algorithms such as tail drop to control the number of packets entering the queuing and scheduling stage to avoid congestion and network bottlenecks. The switch uses weighted tail drop (WTD) to manage the queue sizes and provide a drop precedence for traffic classifications. You
set the queue size limits depending on the markings of the packets in the queue. Each packet that travels through the switch can be assigned to a specific queue and threshold. For example, specific DSCP or CoS values can be mapped to a specific egress queue and threshold.

WTD is implemented on traffic queues to manage the queue size and to provide drop precedences for different traffic classifications. As a frame enters a particular queue, WTD uses the packet classification to subject it to different thresholds. If the total destination queue size is greater than the threshold of any reclassified traffic, the next frame of that traffic is dropped.

Figure 34-7 shows an example of WTD operating on a queue of 1000 frames. Three drop percentages are configured: 40 percent (400 frames), 60 percent (600 frames), and 100 percent (1000 frames). These percentages mean that traffic reclassified to the 40-percent threshold is dropped when the queue depth exceeds 400 frames, traffic reclassified to 60 percent is dropped when the queue depth exceeds 600 frames, and traffic up to 400 frames can be queued at the 40-percent threshold, up to 600 frames at the 60-percent threshold, and up to 1000 frames at the 100-percent threshold.

In this example, CoS values 6 and 7 have a greater importance than the other CoS values, and they are assigned to the 100-percent drop threshold (queue-full state). CoS values 4 and 5 are assigned to the 60-percent threshold, and CoS values 0 to 3 are assigned to the 40-percent threshold.

If the queue is already filled with 600 frames, and a new frame arrives containing CoS values 4 and 5, the frame is subjected to the 60-percent threshold. When this frame is added to the queue, the threshold would be exceeded, so the switch drops it.

WTD is configured by using the `queue-limit` policy-map class command. The command adjusts the queue size (buffer size) associated with a particular class of traffic. You specify the threshold as the number of packets, where each packet is a fixed unit of 256 bytes. You can specify different queue sizes for different classes of traffic (CoS, DSCP, precedence, or QoS group) in the same queue. Setting a queue limit establishes a drop threshold for the associated traffic when congestion occurs.

You cannot configure queue size by using the `queue-limit` policy-map class command without first configuring a scheduling action (bandwidth, shape average, or priority). The only exception to this is when you configure queue-limit for the `class-default` of an output policy map.

The switch supports up to three unique queue-limit configurations across all output policy maps. Within an output policy map, only four queues (classes) are allowed, including the class default. Each queue has three thresholds defined. Only three unique threshold value configurations are allowed on the switch. However, multiple policy maps can share the same queue-limits. When two policy maps share a queue-limit configuration, all threshold values must be the same for all the classes in both policy maps.

For more information, see the “Configuring Output Policy Maps with Class-Based-Weighted-Queuing” section on page 34-57.
This example configures class A to match DSCP values and a policy map, PM1. The DSCP values of 30 and 50 are mapped to unique thresholds (32 and 64, respectively). The DSCP values of 40 and 60 are mapped to the maximum threshold of 112 packets.

```
Switch(config)# class-map match-any classA
Switch(config-cmap)# match ip dscp 30 40 50 60
Switch(config-cmap)# exit
Switch(config)# policy-map PM1
Switch(config-pmap)# class classA
Switch(config-pmap-c)# bandwidth percent 50
Switch(config-pmap-c)# queue-limit 112
Switch(config-pmap-c)# queue-limit dscp 30 32
Switch(config-pmap-c)# queue-limit dscp 50 64
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 0/1
Switch(config-if)# service-policy output PM1
Switch(config-if)# exit
```

You can use these same queue-limit values in multiple output policy maps on the switch. However, changing one of the queue-limit values in a class creates a new, unique queue-limit configuration. You can attach only three unique queue-limit configurations in output policy maps to interfaces at any one time. If you attempt to attach an output policy map with a fourth unique queue-limit configuration, you see this error message:

```
QoS: Configuration failed. Maximum number of allowable unique queue-limit configurations exceeded.
```

**Note**

When you configure a queue limit for a class in an output policy map, all other output policy maps must use the same qualifier type and qualifier value format. Only the queue-limit threshold values can be different. For example, when you configure class A queue limit thresholds for dscp 30 and dscp 50 in policy map PM1, and you configure class A queue limits in policy map PM2, you must use dscp 30 and dscp 50 as qualifiers. You cannot use dscp 20 and dscp 40. The threshold values can be different, but different threshold values creates a new queue-limit configuration.

By default, the total amount of buffer space is divided equally among all ports and all queues per port, which is adequate for many applications. You can decrease the queue size for latency-sensitive traffic or increase the queue size for bursty traffic.

**Note**

When you use the `queue-limit` command to configure queue thresholds for a class, the WTD thresholds must be less than or equal to the queue maximum threshold. A queue size configured with no qualifier must be larger than any queue sizes configured with qualifiers.

When you configure queue limit, the range for the number of packets is from 16 to 544, in multiples of 16, where each packet is a fixed unit of 256 bytes.

**Note**

For optimal performance, we strongly recommend that you configure the queue-limit to 272 or less.

Queue bandwidth and queue size (queue limit) are configured separately and are not interdependent. You should consider the type of traffic being sent when you configure bandwidth and queue-limit:

- A large buffer (queue limit) can better accommodate bursty traffic without packet loss, but at the cost of increased latency.
- A small buffer reduces latency but is more appropriate for steady traffic flows than for bursty traffic.
• Very small buffers are typically used to optimize priority queuing. For traffic that is priority queued, the buffer size usually needs to accommodate only a few packets; large buffer sizes that increase latency are not usually necessary. For high-priority latency-sensitive packets, configure a relatively large bandwidth and relatively small queue size.

Note

These restrictions apply to WTD qualifiers:

• You cannot configure more than two threshold values for WTD qualifiers (cos, dscp, precedence, qos-group) by using the queue-limit command. However, there is no limit to the number of qualifiers that you can map to these thresholds. You can configure a third threshold value to set the maximum queue by using the queue-limit command with no qualifiers.

• A WTD qualifier in the queue-limit command must be the same as at least one match qualifier in the associated class map.

This example shows how to configure bandwidth and queue limit so that out-class1, out-class2, out-class3, and class-default get a minimum of 40, 20, 10 and 10 percent of the traffic bandwidth, respectively. The corresponding queue-sizes are set to 48, 32, 16 and 272 (256-byte) packets:

Switch(config)# policy-map out-policy
Switch(config-pmap)# class outclass1
Switch(config-pmap-c)# bandwidth percent 40
Switch(config-pmap-c)# queue-limit 48
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass2
Switch(config-pmap-c)# bandwidth percent 20
Switch(config-pmap-c)# queue-limit 32
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass3
Switch(config-pmap-c)# bandwidth percent 10
Switch(config-pmap-c)# queue-limit 16
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# bandwidth percent 10
Switch(config-pmap-c)# queue-limit 272
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 0/1
Switch(config-if)# service-policy output out-policy
Switch(config-if)# exit

You can configure and attach as many output policy maps as there are switch ports, but only three unique queue-limit configurations are allowed. When another output policy map uses the same queue-limit and class configurations, even if the bandwidth percentages are different, it is considered to be the same queue-limit configuration.

Configuring QoS

Before configuring QoS, you must have a thorough understanding of these factors:

• The types of applications used and the traffic patterns on your network.

• Traffic characteristics and needs of your network. Is the traffic bursty? Do you need to reserve bandwidth for voice and video streams?

• Bandwidth requirements and speed of the network.
These sections describe how to classify, police, and mark incoming traffic, and schedule and queue outgoing traffic. Depending on your network configuration, you must perform one or more of these tasks.

- Default QoS Configuration, page 34-31
- QoS Configuration Guidelines, page 34-31
- Using ACLs to Classify Traffic, page 34-32
- Using Class Maps to Define a Traffic Class, page 34-36
- Configuring Table Maps, page 34-38
- Attaching a Traffic Policy to an Interface, page 34-39
- Configuring Input Policy Maps, page 34-40
- Configuring Output Policy Maps, page 34-55

**Default QoS Configuration**

There are no policy maps, class maps, table maps, or policers configured. At the egress port, all traffic goes through a single default queue that is given the full operational port bandwidth. The default size of the default queue is 160 (256-byte) packets.

The packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode without any rewrites and classified as best effort without any policing.

**QoS Configuration Guidelines**

- You can configure QoS only on physical ports.
- On a port configured for QoS, all traffic received through the port is classified, policed, and marked according to the input policy map attached to the port. On a trunk port configured for QoS, traffic in all VLANs received through the port is classified, policed, and marked according to the policy map attached to the port. If a per-port, per-VLAN policy map is attached, traffic on the trunk port is classified, policed, and marked for the VLANs specified in the parent-level policy, according to the child policy map associated with each VLAN.
- If you have EtherChannel ports configured on your switch, you must configure QoS classification, policing, mapping, and queuing on the individual physical ports that comprise the EtherChannel. You must decide whether the QoS configuration should match on all ports in the EtherChannel.
- Control traffic (such as spanning-tree bridge protocol data units [BPDUs] and routing update packets) received by the switch are subject to all ingress QoS processing.
- You are likely to lose data when you change queue settings; therefore, try to make changes when traffic is at a minimum.
When you try to attach a new policy to an interface and this brings the number of policer instances to more than 1024 minus 1 more than the number of interfaces on the switch, you receive an error message, and the configuration fails.

When you try to attach new policy to an interface and this brings the number of policer profiles to more than 254, you receive an error message, and the configuration fails. A profile is a combination of commit rate, peak rate, commit burst, and peak burst. You can attach one profile to multiple instances, but if one of these characteristics differs, the policer is considered to have a new profile.

You can attach a maximum of 45 policer instances to a port.

If the number of internal QoS labels exceeds 254, you receive an error message.

Table maps are not supported for violate-action for aggregate policing unless you configure a table map for exceed-action and no explicit action is configured for violate-action. For both individual and aggregate policers, if you do not configure a violate-action, by default the violate class is assigned the same action as the exceed-action.

If double-tagged packets are received on a trunk or 802.1Q tunnel interface, these packets can be classified on DSCP and IP precedence along with other parameters, but you cannot set DSCP or IP precedence on the outgoing packets. You can set CoS on the outgoing packets.

See the configuration sections for specific QoS features for more configuration guidelines related to each feature.

**Using ACLs to Classify Traffic**

You can classify IP traffic by using IP standard or IP extended ACLs. You can classify IP and non-IP traffic by using Layer 2 MAC ACLs. For more information about configuring ACLs, see Chapter 32, “Configuring Network Security with ACLs.”

Follow these guidelines when configuring QoS ACLs:

- You cannot match IP fragments against configured IP extended ACLs to enforce QoS. IP fragments are sent as best-effort. IP fragments are denoted by fields in the IP header.
- The switch supports only one access group per class in an input policy map.
- You cannot configure match-access group in an output policy map.

These sections describe how to create QoS ACLs:

- “Creating IP Standard ACLs” section on page 34-33
- “Creating IP Extended ACLs” section on page 34-34
- “Creating Layer 2 MAC ACLs” section on page 34-35
Creating IP Standard ACLs

Beginning in privileged EXEC mode, follow these steps to create an IP standard ACL for IP traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>access-list access-list-number permit source [source-wildcard]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>or</td>
<td>ip access-list standard name</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show access-lists</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To delete an access list, use the no access-list access-list-number global configuration command.

This example shows how to allow access for only those hosts on the three specified networks. The wildcard bits apply to the host portions of the network addresses.

```
Switch(config)# access-list 1 permit 192.5.255.0 0.0.0.255
Switch(config)# access-list 1 permit 128.88.0.0 0.0.255.255
Switch(config)# access-list 1 permit 36.0.0.0 0.0.0.255
```
Creating IP Extended ACLs

Beginning in privileged EXEC mode, follow these steps to create an IP extended ACL for IP traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2  | access-list access-list-number permit protocol \{source source-wildcard destination destination-wildcard\} [precedence precedence] [tos tos] [dscp dscp] Create an IP extended ACL. Repeat the step as many times as necessary.  
  - For access-list-number, enter the access list number. The range is 100 to 199 and 2000 to 2699.  
  - Always use the permit keyword for ACLs used as match criteria in QoS policies. QoS policies do not match deny ACLs.  
  - For protocol, enter the name or number of an IP protocol. Use the question mark (?) to see a list of available protocols. To match any Internet protocol (including ICMP, TCP, and UDP), enter ip.  
  - The source is the number of the network or host sending the packet.  
  - The source-wildcard applies wildcard bits to the source.  
  - The destination is the network or host number receiving the packet.  
  - The destination-wildcard applies wildcard bits to the destination.  
  You can specify source, destination, and wildcards as:  
  - The 32-bit quantity in dotted-decimal format.  
  - The keyword any for 0.0.0.0 255.255.255.255 (any host).  
  - The keyword host for a single host 0.0.0.0.  
  Other keywords are optional and have these meanings:  
  - precedence—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: routine (0), priority (1), immediate (2), flash (3), flash-override (4), critical (5), internet (6), network (7).  
  - tos—Enter to match by type of service level, specified by a number from 0 to 15 or a name: normal (0), max-reliability (2), max-throughput (4), min-delay (8).  
  - dscp—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values. |
|         | or ip access-list extended name Define an extended IPv4 access list using a name, and enter access-list configuration mode. The name can be a number from 100 to 199. In access-list configuration mode, enter permit protocol \{source source-wildcard destination destination-wildcard\} [precedence precedence] [tos tos] [dscp dscp] as defined in Step 2. |
| Step 3  | end Return to privileged EXEC mode. |
| Step 4  | show access-lists Verify your entries. |
| Step 5  | copy running-config startup-config (Optional) Save your entries in the configuration file. |

To delete an access list, use the no access-list access-list-number global configuration command.
This example shows how to create an ACL that permits IP traffic from any source to any destination that has the DSCP value set to 32:

Switch(config)# access-list 100 permit ip any any dscp 32

This example shows how to create an ACL that permits IP traffic from a source host at 10.1.1.1 to a destination host at 10.1.1.2 with a precedence value of 5:

Switch(config)# access-list 100 permit ip host 10.1.1.1 host 10.1.1.2 precedence 5

### Creating Layer 2 MAC ACLs

Beginning in privileged EXEC mode, follow these steps to create a Layer 2 MAC ACL for non-IP traffic:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>mac access-list extended name</td>
<td>Create a Layer 2 MAC ACL by specifying the name of the list and enter extended MAC ACL configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>permit [host src-MAC-addr mask</td>
<td>any</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>5</td>
<td>show access-lists</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td></td>
<td>[access-list-number</td>
<td>access-list-name]</td>
</tr>
<tr>
<td>6</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete an access list, use the `no mac access-list extended access-list-name` global configuration command.

This example shows how to create a Layer 2 MAC ACL with two `permit` statements. The first statement allows traffic from the host with MAC address 0001.0000.0001 to the host with MAC address 0002.0000.0001. The second statement allows only Ethertype XNS-IDP traffic from the host with MAC address 0001.0000.0002 to the host with MAC address 0002.0000.0002.

Switch(config)# mac access-list extended maclist1
Switch(config-ext-macl)# permit 0001.0000.0001 0.0.0 0002.0000.0001 0.0.0
Switch(config-ext-macl)# permit 0001.0000.0002 0.0.0 0002.0000.0002 0.0.0 xns-idp
Switch(config-ext-macl)# exit
Using Class Maps to Define a Traffic Class

You use the **class-map** global configuration command to name and to isolate a specific traffic flow (or class) from all other traffic. A class map defines the criteria to use to match against a specific traffic flow to further classify it. Match statements can include criteria such as an ACL, CoS value, DSCP value, IP precedence values QoS group values, or VLAN IDs. You define match criterion with one or more **match** statements entered in the class-map configuration mode.

Follow these guidelines when configuring class maps:

- A **match-all** class map cannot have more than one classification criterion (one match statement), but a **match-any** class map can contain multiple match statements.
- The **match cos** and **match vlan** commands are supported only on Layer 2 802.1Q trunk ports.
- You use a class map with the **match vlan** command in the parent policy in input hierarchical policy maps for per-port, per-VLAN QoS on trunk ports. A policy is considered a parent policy map when it has one or more of its classes associated with a child policy map. Each class within a parent policy map is called a parent class. You can configure only the **match vlan** command in parent classes. You cannot configure the **match vlan** command in classes within the child policy map.
- For an input policy map, you cannot configure an IP classification (**match ip dscp**, **match ip precedence**, **match ip acl**) and a non-IP classification (**match cos** or **match mac acl**) in the same policy map or class map. For a per-port, per-VLAN hierarchical policy map, this applies to the child policy map.
- You cannot configure **match qos-group** for an input policy map.
- In an output policy map, no two class maps can have the same classification criteria; that is, the same match qualifiers and values.
- The maximum number of class maps on the switch is 256.

Beginning in privileged EXEC mode, follow these steps to create a class map and to define the match criterion to classify traffic:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>class-map [match-all</td>
<td>match-any] class-map-name</td>
</tr>
</tbody>
</table>

- (Optional) Use the **match-all** keyword to perform a logical-AND of all matching statements under this class map. All match criteria in the class map must be matched.
- (Optional) Use the **match-any** keyword to perform a logical-OR of all matching statements under this class map. One or more match criteria must be matched.
- For **class-map-name**, specify the name of the class map.

If no matching statements are specified, the default is **match-all**.

**Note** A **match-all** class map cannot have more than one classification criterion (match statement).
This example shows how to create access list 103 and configure the class map called \textit{class1}. The \textit{class1} has one match criterion, which is access list 103. It permits traffic from any host to any destination that matches a DSCP value of 10.

\begin{verbatim}
Switch(config)# access-list 103 permit any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
\end{verbatim}

This example shows how to create a class map called \textit{class2}, which matches incoming traffic with DSCP values of 10, 11, and 12.

\begin{verbatim}
Switch(config)# class-map match-any class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
\end{verbatim}

Use the \texttt{no} form of the appropriate command to delete an existing class map or remove a match criterion.
This example shows how to create a class map called \textit{class3}, which matches incoming traffic with IP-precedence values of 5, 6, and 7:

\begin{verbatim}
Switch(config)# class-map match-any class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
\end{verbatim}

This example shows how to create a parent class-map called \textit{parent-class}, which matches incoming traffic with VLAN IDs in the range from 30 to 40.

\begin{verbatim}
Switch(config)# class-map match-any parent-class
Switch(config-cmap)# match vlan 30-40
Switch(config-cmap)# exit
\end{verbatim}

### Configuring Table Maps

You can configure table maps to manage a large number of traffic flows with a single command. You use table maps to correlate specific DSCP, IP precedence and CoS values to each other, to mark down a DSCP, IP precedence, or CoS value, or to assign default values. You can specify table maps in \textbf{set} commands and use them as mark-down mapping for the policers.

These table maps are supported on the switch:

- DSCP to CoS, precedence, or DSCP
- CoS to DSCP, precedence, or CoS
- Precedence to CoS, DSCP, or precedence

Note these guidelines when configuring table maps:

- The switch supports a maximum of 256 unique table maps.
- The maximum number of map statements within a table map is 64.
- Table maps cannot be used in output policy maps.
- Table maps are not supported for \textbf{violate-action} for aggregate policing unless you configure a table map for exceed-action and no explicit action is configured for violate-action.

Beginning in privileged EXEC mode, follow these steps to create a table map:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 table-map table-map-name</td>
<td>Create a table map by entering a table-map name and entering table-map configuration mode.</td>
</tr>
<tr>
<td>Step 3 map from \textit{from-value} to \textit{to-value}</td>
<td>Enter the mapping values to be included in the table. For example, if the table map is a DSCP-to-CoS table map, the \textit{from-value} would be the DSCP value and the \textit{to_value} would be the CoS value. Both ranges are from 0 to 63. Enter this command multiple times to include all the values that you want to map.</td>
</tr>
</tbody>
</table>
Chapter 34  Configuring QoS

Conﬁguring QoS

To delete a table map, use the no table-map table-map-name global conﬁguration command.

This example shows how to create a DSCP-to-CoS table map. A complete table would typically include additional map statements for the higher DSCP values. The default of 4 in this table means that unmapped DSCP values will be assigned a CoS value of 4.

Switch(config)# table-map dscp-to-cos
Switch(config-tablemap)# map from 1 to 1
Switch(config-tablemap)# map from 2 to 1
Switch(config-tablemap)# map from 3 to 1
Switch(config-tablemap)# map from 4 to 2
Switch(config-tablemap)# map from 5 to 2
Switch(config-tablemap)# map from 6 to 3
Switch(config-tablemap)# default 4
Switch(config-tablemap)# end
Switch# show table-map dscp-to-cos

Attaching a Traffic Policy to an Interface

You use the service-policy interface conﬁguration command to attach a trafﬁc policy to an interface and to specify the direction in which the policy should be applied: either an input policy map for incoming trafﬁc or an output policy map for outgoing trafﬁc. Input and output policy maps support different QoS features. See the “Conﬁguring Input Policy Maps” section on page 34-40 and the “Conﬁguring Output Policy Maps” section on page 34-55 for restrictions on input and output policy maps.

You can attach a service policy only to a physical port. You can attach only one input policy map and one output policy map per port.

Beginning in privileged EXEC mode, follow these steps to attach a policy map to a port:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global conﬁguration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the port to attach to the policy map, and enter interface conﬁguration mode. Valid interfaces are physical ports.</td>
</tr>
</tbody>
</table>
Configuring QoS

Chapter 34  Configuring QoS

To remove the policy map and port association, use the `no service-policy { input | output } policy-map-name` interface configuration command.

### Configuring Input Policy Maps

Policy maps specify which traffic class to act on and what actions to take. All traffic that fails to meet matching criteria of a traffic class belongs to the default class. Input policy maps regulate traffic entering the switch. In an input policy, you can match CoS, DSCP, IP precedence, ACLs, or VLAN IDs and configure individual policing, aggregate policing, or marking to a CoS, DSCP, IP precedence, or QoS group value.

Follow these guidelines when configuring input policy maps:

- You can attach only one input policy map per port.
- The maximum number of policy maps configured on the switch is 256.
- The total number of configurable policer profiles on the ME-3400 is 254; the total number of supported policer instances on the ME-3400E is 1024 minus one more than the total number of interfaces on the switch. On a 24-port switch, the number of available policer instances is 999. You can use a policer profile in multiple instances.
- The maximum number of classes in each input policy map is 32, including `class-default`.
- The number of input policy maps that can be attached in a switch is limited by the availability of hardware resources. If you attempt to attach an input policy map that causes any hardware resource limitation to be exceeded, the configuration fails.
- After you have attached a single-level policy map to an interface by using the `service-policy input` interface configuration command, you can modify the policy without detaching it from the interface. You can add or delete classification criteria, add or delete classes, add or delete actions, or change the parameters of the configured actions (policers, rates, mapping, marking, and so on). This also applies to changing criteria for the child policy of a hierarchical policy map, as in a per-port per-VLAN hierarchical policy map.

For the parent policy of a hierarchical policy map, you cannot add or delete a class at the parent level if the policy map is attached to an interface. You must detach the policy from the interface, modify the policy, and then re-attach it to the interface.

- You can configure a maximum 2-level hierarchical policy map as an input policy map only with VLAN-based classification at the parent level and no VLAN-based classification at the child level.
- When an input policy map with only Layer 2 classification is attached to a routed port or a switch port containing a routed SVI, the service policy acts only on switching eligible traffic and not on routing eligible traffic.
- On an 802.1Q tunnel port, you can use only an input policy map with Layer 2 classification based on MAC ACLs to classify traffic. Input policy maps with Layer 3 classification or with Layer 2 classification based on CoS or VLAN ID are not supported on tunnel ports.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>`service-policy { input</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>show policy-map interface [interface-id]</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
• Input policy maps support policing and marking, not scheduling or queuing. You cannot configure bandwidth, priority, queue-limit, or shape average in input policy maps.

These sections describe how to configure different types of input policy maps:
• Configuring Input Policy Maps with Individual Policing, page 34-41
• Configuring Input Policy Maps with Aggregate Policing, page 34-45
• Configuring Input Policy Maps with Marking, page 34-49
• Configuring Per-Port Per-VLAN QoS with Hierarchical Input Policy Maps, page 34-51

Configuring Input Policy Maps with Individual Policing

You use the police policy-map class configuration command to configure individual policers to define the committed rate limitations, committed burst size limitations of the traffic, and the action to take for a class of traffic.

Follow these guidelines when configuring individual policers:
• Policing is supported only on input policy maps.
• The switch supports a maximum of 229 policers. (228 user-configurable policers and 1 policer reserved for internal use).
• You can configure up to 45 policers on a port.
• When you use a table map for police exceed-action in an input policy map, the protocol type of the map from type of action must be the same as the protocol type of the associated classification. For example, if the associated class map represents an IP classification, the map from type of action that references the table map must be dscp or precedence. If the associated class map represents a non-IP classification, the map from type of action that references the table map must be cos.
• 2-rate, 3-color policing is supported only on input policy maps; 1-rate, 2-color policing is supported on both input and output policy maps.
• The number of policer instances on the switch can be 1024 minus 1 more than the number interfaces. The switch supports a maximum of 254 policer profiles.
• If you do not configure a violate-action, by default the violate class is assigned the same action as the exceed-action.
Beginning in privileged EXEC mode, follow these steps to create an input policy map with individual 2-rate, 3-color policing:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>policy-map policy-map-name</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>class {class-map-name</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>police {rate-bps</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Chapter 34 Configuring QoS

Configuring QoS

Step 5

(Optional) Enter the action to be taken on packets, depending on whether or not they conform to the CIR and PIR.

- (Optional) For **conform-action**, specify the action to perform on packets that conform to the CIR and PIR. The default is **transmit**.
- (Optional) For **exceed-action**, specify the action to perform on packets that conform to the PIR but not the CIR. The default is **drop**.
- (Optional) For **violate-action**, specify the action to perform on packets that exceed the PIR. The default is **drop**.
- (Optional) For **action**, specify one of these actions to perform on the packets:
  - **drop**—Drop the packet.
  - **set-cos-transmit** cos-value—Enter a new CoS value to be assigned to the packet, and send the packet. The range is from 0 to 7.
  - **set-dscp-transmit** dscp-value—Enter a new IP DSCP value to be assigned to the packet, and send the packet. The range is from 0 to 63. You can also enter a mnemonic name for a commonly used value.
  - **set-prec-transmit** precedence-value—Enter a new IP precedence value to be assigned to the packet, and send the packet. The range is from 0 to 7.
  - **set-qos-transmit** qos-group-value—Identify a qos-group to be used at egress to specify packets. The range is from 0 to 99.
  - **transmit**—Send the packet without altering it.

**Note** If the conform action is set to **drop**, the exceed and violate actions are automatically set to **drop**. If the exceed action is set to **drop**, the violate action is automatically set to **drop**.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>conform-action</td>
<td>(Optional) Enter the action to be taken on packets, depending on whether or not they conform to the CIR and PIR.</td>
</tr>
<tr>
<td>exceed-action</td>
<td>(Optional) For <strong>conform-action</strong>, specify the action to perform on packets that conform to the CIR and PIR. The default is <strong>transmit</strong>.</td>
</tr>
<tr>
<td>violate-action</td>
<td>(Optional) For <strong>exceed-action</strong>, specify the action to perform on packets that conform to the PIR but not the CIR. The default is <strong>drop</strong>.</td>
</tr>
<tr>
<td>action</td>
<td>(Optional) For <strong>violate-action</strong>, specify the action to perform on packets that exceed the PIR. The default is <strong>drop</strong>.</td>
</tr>
<tr>
<td>set-cos-transmit</td>
<td>(Optional) For <strong>action</strong>, specify one of these actions to perform on the packets:</td>
</tr>
<tr>
<td>set-dscp-transmit</td>
<td>- <strong>dro</strong>—Drop the packet.</td>
</tr>
<tr>
<td>set-prec-transmit</td>
<td>- <strong>set-cos-transmit</strong> cos-value—Enter a new CoS value to be assigned to the packet, and send the packet. The range is from 0 to 7.</td>
</tr>
<tr>
<td>set-qos-transmit</td>
<td>- <strong>set-dscp-transmit</strong> dscp-value—Enter a new IP DSCP value to be assigned to the packet, and send the packet. The range is from 0 to 63. You can also enter a mnemonic name for a commonly used value.</td>
</tr>
<tr>
<td>transmit</td>
<td>- <strong>set-prec-transmit</strong> precedence-value—Enter a new IP precedence value to be assigned to the packet, and send the packet. The range is from 0 to 7.</td>
</tr>
<tr>
<td></td>
<td>- <strong>set-qos-transmit</strong> qos-group-value—Identify a qos-group to be used at egress to specify packets. The range is from 0 to 99.</td>
</tr>
<tr>
<td></td>
<td>- <strong>transmit</strong>—Send the packet without altering it.</td>
</tr>
</tbody>
</table>

**Note** You can enter a single conform-action as part of the command string following the police command. You can also press Enter after the **police** command to enter policy-map class police configuration mode, where you can enter multiple actions. In policy-map class police configuration mode, you must enter an action to take.

Step 6

**exit**

Return to policy-map configuration mode.

Step 7

**exit**

Return to global configuration mode.

Step 8

**interface** interface-id

Enter interface configuration mode for the interface to which you want to attach the policy.

Step 9

**service-policy input** policy-map-name

Attach the policy map (created in Step 2) to the ingress interface.

Step 10

**end**

Return to privileged EXEC mode.
Chapter 34  Configuring QoS

After you have created an input policy map, you attach it to an interface in the input direction. See the “Attaching a Traffic Policy to an Interface” section on page 34-39.

Use the no form of the appropriate command to delete an existing policy map, class map, or policer.

This example shows how to configure 2-rate, 3-color policing using policy-map configuration mode.

```
Switch(config)# class-map cos-4
Switch(config-cmap)# match cos 4
Switch(config-cmap)# exit
Switch(config)# policy-map in-policy
Switch(config-pmap)# class cos-4
Switch(config-pmap-c)# police cir 5000000 pir 8000000 conform-action transmit exceed-action set-dscp-transmit 24 violate-action drop
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy input in-policy
Switch(config-if)# exit
```

This example shows how to create the same configuration using policy-map class police configuration mode.

```
Switch(config)# class-map cos-4
Switch(config-cmap)# match cos 4
Switch(config-cmap)# exit
Switch(config)# policy-map in-policy
Switch(config-pmap)# class cos-4
Switch(config-pmap-c)# police 10000000 1000000
Switch(config-pmap-c-police)# conform-action transmit
Switch(config-pmap-c-police)# exceed-action set-dscp-transmit 24
Switch(config-pmap-c-police)# violate-action drop
Switch(config-pmap-c-police)# end
```

This example shows how to create a traffic classification with a CoS value of 4, create a policy map, and attach it to an ingress port. The average traffic rate is limited to 10000000 b/s with a burst size of 10000 bytes:

```
Switch(config)# class-map video-class
Switch(config-cmap)# match cos 4
Switch(config-cmap)# exit
Switch(config)# policy-map video-policy
Switch(config-pmap)# class video-class
Switch(config-pmap-c)# police 10000000 10000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy input video-policy
Switch(config-if)# exit
```

This example shows how to create policy map with a conform action of set dscp and a default exceed action.

```
Switch(config)# class-map in-class-1
Switch(config-cmap)# match dscp 14
Switch(config-cmap)# exit
Switch(config)# policy-map in-policy
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show policy-map [policy-name]</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>interface</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
This example shows how to use policy-map class police configuration mode to set multiple conform actions and an exceed action. The policy map sets a committed information rate of 23000 bits per second (bps) and a conform burst size of 10000 bytes. The policy map includes multiple conform actions (for DSCP and for Layer 2 CoS) and an exceed action.

This example shows how to use policy-map class police configuration mode to set exceed action mark-down using table-maps. The policy map sets a committed information rate of 23000 bps and a conform burst-size of 10000 bytes. The policy map includes the default conform action (transmit) and the exceed action to mark the Layer 2 CoS value based on the table map and to mark IP DSCP to af41.

Configuring Input Policy Maps with Aggregate Policing

You use the `policer aggregate` global configuration command to configure an aggregate policer. An aggregate policer is shared by multiple traffic classes within the same policy map. You define the aggregate policer, create a policy map, associate a class map with the policy map, associate the policy map with the aggregate policer, and apply the service policy to a port.

Follow these guidelines when configuring aggregate policers:

- Aggregate policing is supported only on input policy maps.
- The switch supports a maximum of 229 policers associated with ports (228 user-configurable policers and 1 policer reserved for internal use). You can configure up to 45 policers on a port.
- The maximum number of configured aggregate policers is 256.
• The number of policer instances on the switch can be 1024 minus 1 more than the total number interfaces on the switch. The switch supports a maximum of 254 policer profiles.

• If you do not configure a violate-action, by default the violate class is assigned the same action as the exceed-action.

• Only one policy map can use any specific aggregate policer. Aggregate policing cannot be used to aggregate streams across multiple interfaces. You can use aggregate policing only to aggregate streams across multiple classes in a policy map attached to an interface and to aggregate traffic streams across VLANs on a port in a per-port, per-VLAN policy map.

• When you use a table map for police exceed-action in an input policy map, the protocol type of the map from type of action must be the same as the protocol type of the associated classification. For example, if the associated class map represents an IP classification, the map from type of action that references the table map must be either dscp or precedence. If the associated class map represents a non-IP classification, the map from type of action that references the table map must be cos.

• Table maps are not supported for violate-action for aggregate policing unless a table map is configured for exceed-action and no explicit action is configured for violate-action.

You can configure multiple conform, exceed, and violate actions simultaneously for an aggregate policer as parameters in the policer aggregate global configuration command, but you must enter the actions in this order:

• conform-action must be followed by drop or transmit or by set actions in this order:
  
  set-qos-transmit
  set-dscp-transmit or set-prec-transmit
  set-cos-transmit

• exceed-action must be followed by drop or transmit or by set actions in this order:
  
  set-qos-transmit
  set-dscp-transmit or set-prec-transmit
  set-cos-transmit

• violate-action must be followed by drop or transmit or by set actions in this order:
  
  set-qos-transmit
  set-dscp-transmit or set-prec-transmit
  set-cos-transmit

**Note**

You do not configure aggregate policer conform-action, exceed-action, and violate-action in policy-map class police configuration mode; you must enter all actions in a string. Consequently, if you enter multiple conform, exceed, and violate actions, the command can become quite long, in which case it might be truncated and difficult to read.
Beginning in privileged EXEC mode, follow these steps to create a 2-rate, 3-color aggregate policer:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2**<br>policer aggregate aggregate-policer-name (rate-bps | Define the policer parameters that can be applied to multiple traffic classes within the same policy map.<br>  
- For **aggregate-policer-name**, specify the name of the aggregate policer.  
- For **rate-bps**, specify average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.  
- For **cir cir-bps**, specify a committed information rate (CIR) at which the first token bucket is updated in bits per second (b/s). The range is 8000 to 1000000000.  
- For **burst-bytes** (optional), specify the normal burst size in bytes. The range is 8000 to 1000000.  
- (Optional) For **bc conform-burst**, specify the conformed burst used by the first token bucket for policing. The range is 8000 to 1000000 bytes.  
- (Optional) For **pir pir-bps**, specify the peak information rate at which the second token bucket for policing is updated. The range is 8000 to 1000000000 bytes. If you do not enter a **pir pir-bps**, the policer is configured as a 1-rate, 2-color policer.  
- For **be peak-burst**, specify the peak burst size used by the second token bucket. The range is 8000 to 1000000 bytes. The default is internally calculated based on the user configuration.  
- (Optional) For **conform-action**, specify the action to take on packets that conform to the CIR. The default is to send the packet.  

**Note** If the conform action is set to **drop**, the exceed and violate actions are automatically set to **drop**. If the exceed action is set to **drop**, the violate action is automatically set to **drop**.

- (Optional) For **exceed-action**, specify the action to take on packets that exceed the CIR. The default is to drop the packet.  
- (Optional) For **violate-action**, specify the action to take on packets that exceed the CIR. The default is to drop the packet.  

See the command reference for this release or the “Configuring Input Policy Maps with Individual Policing” section on page 34-41 for definitions of the action keywords.  

**Note** You cannot configure table maps for **violate-action** for aggregate policing unless a table map is configured for **exceed-action** and no explicit action is configured for **violate-action**. |
| set-cos-transmit cos_value | set-dscp-transmit dscp_value | set-precedence precedence_value | set-cos-transmit cos_value | set-dscp-transmit dscp_value | set-precedence precedence_value | set-qos-transmit qos-group_value | transmit |
| set-cos-transmit cos_value | set-dscp-transmit dscp_value | set-precedence precedence_value | set-qos-transmit qos-group_value | transmit |
| [exceed-action drop | [set-cos-transmit cos_value | [set-dscp-transmit dscp_value | [set-precedence precedence_value | [set-qos-transmit qos-group_value | transmit] |
| [set-cos-transmit cos_value | [set-dscp-transmit dscp_value | [set-precedence precedence_value | [set-qos-transmit qos-group_value | transmit] |
| [set-cos-transmit cos_value | [set-dscp-transmit dscp_value | [set-precedence precedence_value | [set-qos-transmit qos-group_value | transmit] |
| [set-cos-transmit cos_value | [set-dscp-transmit dscp_value | [set-precedence precedence_value | [set-qos-transmit qos-group_value | transmit] |
| [set-cos-transmit cos_value | [set-dscp-transmit dscp_value | [set-precedence precedence_value | [set-qos-transmit qos-group_value | transmit] |
| [set-cos-transmit cos_value | [set-dscp-transmit dscp_value | [set-precedence precedence_value | [set-qos-transmit qos-group_value | transmit] |
| [set-cos-transmit cos_value | [set-dscp-transmit dscp_value | [set-precedence precedence_value | [set-qos-transmit qos-group_value | transmit] |
| Step 3<br>policy-map policy-map-name | Create a policy map by entering the policy map name, and enter policy-map configuration mode. |
Chapter 34 Configuring QoS

Configuring QoS

After you have created an aggregate policer, you attach it to an ingress port. See the “Attaching a Traffic Policy to an Interface” section on page 34-39.

To remove the specified aggregate policer from a policy map, use the **no police aggregate aggregate-policer-name** policy map configuration mode. To delete an aggregate policer and its parameters, use the **no policer aggregate aggregate-policer-name** global configuration command.

This example shows how to create an aggregate policer and attach it to multiple classes within a policy map. The policy map is attached to an ingress port.

```
Switch(config)# policer aggregate example 10900000 80000 conform-action transmit exceed-action drop violate-action drop
Switch(config)# class-map testclass1
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# class-map testclass2
Switch(config-cmap)# match access-group 2
Switch(config-cmap)# exit
Switch(config)# policy-map testexample
Switch(config-pmap)# class testclass
Switch(config-pmap-c)# policer aggregate example
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# class testclass2
Switch(config-pmap-c)# policer aggregate example
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# interface fastethernet0/1
Switch(config-if)# service-policy input testexample
Switch(config-if)# exit
```

This example shows how to create a 2-rate, 3-color aggregate policer and attach it to multiple classes within a policy map. The policy map is attached to an ingress port.

```
Switch(config)# policer aggregate example cir 10900000 pir 80000000 conform-action transmit exceed-action drop violate-action drop
Switch(config)# class-map testclass1
Switch(config-cmap)# match access-group 1
```
Switch(config-cmap)# exit
Switch(config)# class-map testclass2
Switch(config-cmap)# match access-group 2
Switch(config-cmap)# exit
Switch(config)# policy-map testexample
Switch(config-pmap)# class testclass
Switch(config-pmap-c)# police aggregate example
Switch(config-pmap-c)# exit
Switch(config-pmap)# class testclass2
Switch(config-pmap-c)# police aggregate example
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastether0/1
Switch(config-if)# service-policy input testexample
Switch(config-if)# exit

Configuring Input Policy Maps with Marking

You use the `set` policy-map class configuration command to set or modify the attributes for traffic belonging to a specific class. Follow these guidelines when configuring marking in policy maps:

- You can configure a maximum of 100 QoS groups on the switch.
- When you use a table map for marking in an input policy map, the protocol type of the map from type of action must be the same as the protocol type of the associated classification. For example, if the associated class map represents an IP classification, the `map from` type of action that references the table map must be either `dscp` or `precedence`. If the associated class map represents a non-IP classification, the `map from` type of action that references the table map must be `cos`.

Beginning in privileged EXEC mode, follow these steps to create an input policy map that marks traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>policy-map policy-map-name</td>
</tr>
<tr>
<td></td>
<td>Create a policy map by entering the policy map name, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>class [class-map-name</td>
</tr>
<tr>
<td></td>
<td>Enter a class-map name, or class-default to match all unclassified packets, and enter policy-map class configuration mode.</td>
</tr>
<tr>
<td></td>
<td>If you enter a class-map name, you must have already created the class map by using the class-map global configuration command.</td>
</tr>
</tbody>
</table>
### Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td><code>set qos-group value</code></td>
<td>Mark traffic by setting a new value in the packet, specifying a table map, or specifying a QoS group.</td>
</tr>
<tr>
<td></td>
<td>and/or</td>
<td>- For <code>qos-group value</code>, identify a QoS group to be used at egress to identify specific packets. The range is from 0 to 99.</td>
</tr>
<tr>
<td></td>
<td>`set cos [cos_value</td>
<td>cos [table table-map-name]</td>
</tr>
<tr>
<td></td>
<td>`set [ip] dscp [dscp_value</td>
<td>cos [table table-map-name]</td>
</tr>
<tr>
<td></td>
<td>`set [ip] precedence [precedence_value</td>
<td>cos [table table-map-name]</td>
</tr>
<tr>
<td>5</td>
<td><code>exit</code></td>
<td>Return to policy-map configuration mode.</td>
</tr>
<tr>
<td>6</td>
<td><code>exit</code></td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>7</td>
<td><code>interface interface-id</code></td>
<td>Enter interface configuration mode for the interface to which you want to attach the policy.</td>
</tr>
<tr>
<td>8</td>
<td><code>service-policy input policy-map-name</code></td>
<td>Attach the policy map (created in Step 2) to the ingress interface.</td>
</tr>
<tr>
<td>9</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>10</td>
<td><code>show policy-map [policy-map-name [class class-map-name]]</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>11</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no` form of the appropriate command to delete a policy map or table map or remove an assigned CoS, DSCP, precedence, or QoS-group value.

This example uses a policy map to remark a packet. The first marking (the `set` command) applies to the QoS default class map that matches all traffic not matched by class `AF31-AF33` and sets all traffic to an IP DSCP value of 1. The second marking sets the traffic in classes AF31 to AF33 to an IP DSCP of 3.

```bash
Switch(config)# policy-map Example
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set ip dscp 1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class AF31-AF33
Switch(config-pmap-c)# set ip dscp 3
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy input Example
Switch(config-if)# exit
```
Configuring Per-Port Per-VLAN QoS with Hierarchical Input Policy Maps

Per-port, per-VLAN QoS allows classification based on VLAN IDs for applying QoS for frames received on a given interface and VLAN. This is achieved by using a hierarchical policy map, with a parent policy and a child policy.

Note these guidelines and limitations when configuring per-port, per-VLAN QoS:

- The feature is supported only by using a two-level hierarchical input policy map, where the parent level defines the VLAN-based classification, and the child level defines the QoS policy to be applied to the corresponding VLAN or VLANs.

- You can configure multiple service classes at the parent level to match different combinations of VLANs, and you can apply independent QoS policies to each parent-service class using any child policy map.

- A policy is considered a parent policy map when it has one or more of its classes associated with a child policy map. Each class within a parent policy-map is called a parent-class. In parent classes, you can configure only the `match vlan` class-map configuration command. You cannot configure the `match vlan` command in classes within the child policy map.

- A per-port, per-VLAN parent level class map supports only a child-policy association; it does not allow any actions to be configured. For a parent-level class map, you cannot configure an action or a child-policy association for the class `class-default`.

- You cannot configure a mixture of Layer 2 and Layer 3 classification (`match ip dscp`, `match ip precedence`, `match IP ACLs`), take care to ensure that these VLANs are not carried on any other port besides the one on which the per-port, per-vlan policy is attached. Not following this rule could result in improper QoS behavior for traffic ingressing the switch on these VLANs.

- We also recommend that you restrict VLAN membership on the trunk ports to which the per-port, per-VLAN is applied by using the `switchport trunk allowed vlan` interface configuration command. Overlapping VLAN membership between trunk ports that have per-port, per-VLAN policies with Layer 3 classification could also result in unexpected QoS behavior.

Configuring per-port, per-VLAN QoS includes these tasks:

- Creating Child-Policy Class Maps, page 34-52
- Creating Parent-Policy Class Maps, page 34-53
- Creating Child Policy Maps, page 34-53
- Creating a Parent Policy Map, page 34-54
- Attaching a Parent Policy Map to an Interface, page 34-54
Creating Child-Policy Class Maps

Beginning in privileged EXEC mode, follow these steps to create one or more child-policy class maps:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>class-map [match-all</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note</td>
</tr>
<tr>
<td>Step 3</td>
<td>match {access-group acl-index-or-name</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
</tbody>
</table>
### Configuring QoS

#### Creating Parent-Policy Class Maps

Beginning in privileged EXEC mode, follow these steps to create one or more parent-policy class maps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| 2    | class-map match-any parent-class-map-name | Create a **match-any** class map for the parent policy, and enter class-map configuration mode.  
**Note** You can enter **match-all** or not enter either **match-any** or **match-all** (to default to **match-all**) if you are going to match only one VLAN ID. |
| 3    | match vlan vlan-id | Define the VLAN or VLANs on which to classify traffic.  
For **vlan-id**, specify a VLAN ID, a series of VLAN IDs separated by a space, or a range of VLANs separated by a hyphen to be used in a parent policy map for per-port, per-VLAN QoS on a trunk port. The VLAN ID range is 1 to 4094.  
You can also enter the **match vlan** command multiple times to match multiple VLANs. |
| 4    | end | Return to privileged EXEC mode. |
| 5    | show class-map | Verify your entries. |
| 6    | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

#### Creating Child Policy Maps

Beginning in privileged EXEC mode, follow these steps to create one or more child policy maps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>policy-map child-policy-map-name</td>
<td>Create a child policy map by entering the policy map name, and enter policy-map configuration mode.</td>
</tr>
</tbody>
</table>
| 3    | class (child-class-map-name | Enter a child class-map name or **class-default** to match all unclassified packets, and enter policy-map class configuration mode.  
Use the **police** policy-map class configuration command to configure policers and the action to take for a class of traffic, or use the **set** policy-map class configuration command to mark traffic belonging to the class.  
| 4    | end | Return to privileged EXEC mode. |
| 5    | show policy-map [child-policy-map-name [class class-map-name]] | Verify your entries. |
| 6    | copy running-config startup-config | (Optional) Save your entries in the configuration file. |
Chapter 34  Configuring QoS

Creating a Parent Policy Map

Beginning in privileged EXEC mode, follow these steps to create a parent policy map and attach it to an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>policy-map <em>parent-policy-map-name</em></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>class <em>parent-class-map-name</em></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>service policy <em>child-policy-map-name</em></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show policy-map [<strong>parent-policy-map-name</strong> [class <strong>class-map-name</strong>]]</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Attaching a Parent Policy Map to an Interface

Beginning in privileged EXEC mode, follow these steps to create attach the parent policy map to an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface <em>interface-id</em></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>switchport mode trunk</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport trunk allowed vlan <em>vlan-list</em></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>service-policy input <em>parent-policy-map-name</em></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show policy-map interface [<strong>interface-id</strong>]</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This is an example of using multiple parent classes to classify matching criteria for voice and video on customer VLANs.

```
Switch(config)# class-map match-any video
Switch(config-cmap)# match ip dscp af41
Switch(config-cmap)# exit
Switch(config)# class-map match-any voice
Switch(config-cmap)# match ip dscp ef
Switch(config-cmap)# exit
```
```plaintext
Switch(config)# class-map match-any customer1-vlan
Switch(config-cmap)# match vlan 100-105
Switch(config-cmap)# exit
Switch(config)# class-map match-any customer2-vlan
Switch(config-cmap)# match vlan 110-120
Switch(config-cmap)# exit

Switch(config)# policy-map child-policy-1
Switch(config-pmap)# class voice
Switch(config-pmap-c)# police cir 10000000 bc 50000
Switch(config-pmap-c-police)# conform-action set-cos-transmit 5
Switch(config-pmap-c-police)# exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# class video
Switch(config-pmap-c)# set cos 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set cos 0
Switch(config-pmap-c)# exit

Switch(config)# policy-map child-policy-2
Switch(config-pmap)# class voice
Switch(config-pmap-c)# police cir 5000000
Switch(config-pmap-c-police)# conform-action set-cos-transmit 5
Switch(config-pmap-c-police)# exceed-action drop
Switch(config-pmap-c-police)# exit
Switch(config-pmap-c)# class video
Switch(config-pmap-c)# police cir 40000000
Switch(config-pmap-c-police)# conform-action set-cos-transmit 4
Switch(config-pmap-c-police)# exceed-action set-cos-transmit 1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set cos 0
Switch(config-pmap-c)# exit

Switch(config)# policy-map uni-parent
Switch(config-pmap)# class customer1-vlan
Switch(config-pmap-c)# service-policy child-policy-1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class customer2-vlan
Switch(config-pmap-c)# service-policy child-policy-2
Switch(config-pmap-c)# exit

Switch(config)# interface fastethernet0/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk allowed vlan 100-105, 110-120
Switch(config-if)# service-policy input uni-parent
Switch(config-pmap-c)# exit
```

### Configuring Output Policy Maps

You use output policy maps to manage congestion avoidance, queuing, and scheduling of packets leaving the switch. The switch has four egress queues, and you use output policy maps to control the queue traffic. You configure shaping, queue-limit, and bandwidth on these queues. You can use high priority...
Configuring QoS

Configuring QoS

Policing is not supported on output policy maps, except when configuring priority with police for class-based priority queuing. Output policy map classification criteria are matching a CoS, DSCP, or IP precedence value or a QoS group.

Follow these guidelines when configuring output policy maps on physical ports:

- You can configure and attach as many output policy maps as there are ports on the switch. Multiple output policy maps can use the same queue-limit configuration. However, these policy maps can have only three unique queue-limit configurations.

- Output policy maps can have a maximum of four classes, including the class **class-default**.

- All output policy maps must have the same number of defined class-maps defined, either 1, 2, or 3.

- All output policy maps must use the same set of classes, although the actions for each class can differ for each output policy map.

- In a child policy map, the **class-default** supports all output policy map actions except **priority** and **police**. Action restrictions for **class-default** are the same as for other classes except that a queue limit configuration for **class-default** does not require a scheduling action.

- To classify based on criteria at the output, the criteria must be established at the input. You can establish criteria at the input through classification only when you configure only policing and not marking, or through explicit marking when you configure any marking (policing with **conform** or **exceed** marking or unconditional **set** marking).

- You cannot configure class-based priority queuing under the class **class-default** in an output policy map.

- In an output policy map, unless priority queuing is configured, the class default receives a minimum bandwidth guarantee equal to the unconfigured bandwidth on the port.

- After you have attached an output policy map to an interface by using the **service-policy** interface configuration command, you can change only the parameters of the configured actions (rates, percentages, and so on) or add or delete classification criteria of the class map while the policy map is attached to the interface. To add or delete a class or action, you must detach the policy map from all interfaces, modify it, and then reattach it to interfaces.

**Note**

If you anticipate that you might need three classes in a policy map, you should define three classes when you create the policy map, even if you are not ready to use all three at that time. You cannot add a class to a policy map after it has been attached to an interface.

- When at least one output policy map is attached to a active port, other active ports without output policy maps attached might incorrectly schedule and incorrectly order traffic that uses the same classes as the attached output policy maps. We recommend attaching output policy maps to all ports that are in use. We also recommend putting any unused ports in the shutdown state by entering the **shutdown** interface configuration command. For example, if you attach an output policy map that shapes DSCP 23 traffic to a port, DSCP traffic that is sent out of any other port without a policy map attached could be incorrectly scheduled or ordered incorrectly with respect to other traffic sent out of the same port.

- We strongly recommended that you disable port speed autonegotiation when you attach an output policy map to a port to prevent the port from autonegotiating to a rate that would make the output policy map invalid. You can configure a static port speed by using the **speed** interface configuration command. If an output policy-map is configured on a port that is set for autonegotiation and the speed autonegotiates to a value that invalidates the policy, the port is put in the error-disabled state.
You can attach only one output policy map per port.

The maximum number of policy maps configured on the switch is 256.

These sections describe how to configure different types of output policy maps:

- Configuring Output Policy Maps with Class-Based-Weighted-Queuing, page 34-57
- Configuring Output Policy Maps with Class-Based Shaping, page 34-58
- Configuring Output Policy Maps with Port Shaping, page 34-60
- Configuring Output Policy Maps with Class-Based Priority Queuing, page 34-61
- Configuring Output Policy Maps with Weighted Tail Drop, page 34-65

### Configuring Output Policy Maps with Class-Based-Weighted-Queuing

You use the `bandwidth` policy-map class configuration command to configure class-based weighted fair queuing (CBWFQ). CBWFQ sets the relative precedence of a queue by allocating a portion of the total bandwidth that is available for the port.

Follow these guidelines when configuring CBWFQ:

- When configuring bandwidth in a policy map, all rate configurations must be in the same format, either a configured rate or a percentage.
- The total rate of the minimum bandwidth guarantees for each queue of the policy cannot exceed the total speed for the interface.
- You cannot configure CBWFQ (bandwidth) and traffic (shape average) or priority queuing (priority) for the same class in an output policy map.
- You cannot configure bandwidth as an absolute rate or a percentage of total bandwidth when strict priority (priority without police) is configured for another class map.
- You can configure bandwidth as a percentage of remaining bandwidth only when strict priority (priority without police) is configured for another class in the output policy map.
- When you configure CIR bandwidth for a class as an absolute rate or a percentage of total bandwidth, any excess bandwidth that remains after servicing the CIR of all classes in the policy map is divided among the classes the same proportion as the CIR rates. If you configure the CIR rate of a class to be 0, that class is not eligible for any excess bandwidth and will receive no bandwidth.

Beginning in privileged EXEC mode, follow these steps to use CBWFQ to control bandwidth allocated to a traffic class by specifying a minimum bandwidth as a bit rate or a percentage:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>policy-map policy-map-name</code></td>
<td>Create a policy map by entering the policy map name, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>`class {class-map-name</td>
<td>class-default}`</td>
</tr>
</tbody>
</table>
Configuring QoS

Chapter 34

Configuring QoS

After you have created an output policy map, you attach it to an egress port. See the “Attaching a Traffic Policy to an Interface” section on page 34-39.

Use the no form of the appropriate command to delete an existing policy map, class map, or bandwidth configuration.

This example shows how to set the precedence of a queue by allocating 25 percent of the total available bandwidth to the traffic class defined by the class map:

Switch(config)# policy-map gold_policy
Switch(config-pmap)# class out_class-1
Switch(config-pmap-c)# bandwidth percent 25
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# service-policy output gold_policy
Switch(config-if)# exit

Configuring Output Policy Maps with Class-Based Shaping

You use the shape average policy-map class configuration command to configure traffic shaping.

Class-based shaping is a control mechanism that is applied to classes of traffic leaving an interface and uses the shape average command to limit the rate of data transmission used for the committed information rate (CIR) for the class.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td>bandwidth {rate</td>
</tr>
<tr>
<td></td>
<td>• Enter a rate to set bandwidth in kilobits per second. The range is from 64 to 1000000.</td>
</tr>
<tr>
<td></td>
<td>• Enter percent value to set bandwidth as a percentage of the total bandwidth. The range is 1 to 100 percent.</td>
</tr>
<tr>
<td></td>
<td>• Enter remaining percent value to set bandwidth as a percentage of the remaining bandwidth. The range is 1 to 100 percent. This keyword is valid only when strict priority (priority without police) is configured for another class in the output policy map.</td>
</tr>
<tr>
<td></td>
<td>You must specify the same units in each bandwidth configuration in an output policy (absolute rates or percentages). The total guaranteed bandwidth cannot exceed the total available rate.</td>
</tr>
<tr>
<td>Step 5</td>
<td>exit</td>
</tr>
<tr>
<td>Step 6</td>
<td>exit</td>
</tr>
<tr>
<td>Step 7</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 8</td>
<td>service-policy output policy-map-name</td>
</tr>
<tr>
<td>Step 9</td>
<td>end</td>
</tr>
<tr>
<td>Step 10</td>
<td>show policy-map [policy-map-name [class class-map-name]]</td>
</tr>
<tr>
<td>Step 11</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
Follow these guidelines when configuring class-based shaping:

- Configuring a queue for traffic shaping sets the maximum bandwidth or peak information rate (PIR) of the queue. In the Cisco ME switch, configuring traffic shaping automatically also sets the minimum bandwidth guarantee or CIR of the queue to the same value as the PIR.

- You cannot configure CBWFQ (bandwidth) or priority queuing (priority) and traffic (shape average) for the same class in an output policy map.

- You cannot configure traffic shaping for a traffic class when strict priority (priority without police) is configured for another class within the output policy-map.

Beginning in privileged EXEC mode, follow these steps to use class-based shaping to configure the maximum permitted average rate for a class of traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 policy-map policy-map-name</td>
<td>Create a policy map by entering the policy map name, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td>Step 3 class [class-map-name</td>
<td>Enter a child class-map name or class-default to match all unclassified packets, and enter policy-map class configuration mode.</td>
</tr>
<tr>
<td></td>
<td>class-default]</td>
</tr>
<tr>
<td>Step 4 shape average target bps</td>
<td>Specify the average class-based shaping rate. For target bps, specify the average bit rate in bits per second. The range is from 64000 to 1000000000.</td>
</tr>
<tr>
<td>Step 5 exit</td>
<td>Return to policy-map configuration mode.</td>
</tr>
<tr>
<td>Step 6 exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 7 interface interface-id</td>
<td>Enter interface configuration mode for the interface to which you want to attach the policy.</td>
</tr>
<tr>
<td>Step 8 service-policy output policy-map-name</td>
<td>Attach the policy map (created in Step 2) to the egress interface.</td>
</tr>
<tr>
<td>Step 9 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10 show policy-map [policy-map-name [class class-map-name]]</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 11 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

After you have created an output policy map, you attach it to an egress port. See the “Attaching a Traffic Policy to an Interface” section on page 34-39.

Use the no form of the appropriate command to delete an existing policy map or class map or to delete a class-based shaping configuration.

This example shows how to configure traffic shaping for outgoing traffic on a Fast Ethernet port so that outclass1, outclass2, and outclass3 get a maximum of 50, 20, and 10 Mb/s of the available port bandwidth. The class class-default gets the remaining bandwidth.

```
Switch(config)# policy-map out-policy
Switch(config-pmap)# class outclass1
Switch(config-pmap-c)# shape average 50000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass2
Switch(config-pmap-c)# shape average 20000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class outclass3
```
Switch(config-pmap-c)# shape average 10000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy output out-policy
Switch(config-if)# exit

### Configuring Output Policy Maps with Port Shaping

Port shaping is applied to all traffic leaving an interface. It uses a policy map with only class default when the maximum bandwidth for the port is specified by using the `shape average` command. A child policy can be attached to the class-default in a hierarchical policy map format to specify class-based actions for the queues on the shaped port.

The total of the minimum bandwidth guarantees (CIR) for each queue of the child policy cannot exceed the total port shape rate.

Beginning in privileged EXEC mode, follow these steps to use port shaping to configure the maximum permitted average rate for a class of traffic:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>policy-map <code>policy-map-name</code></td>
</tr>
<tr>
<td>Step 3</td>
<td>class class-default</td>
</tr>
<tr>
<td>Step 4</td>

<tr>
<td>Step 12</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

After you have created the hierarchical output policy map, you attach it to an egress port. See the “Attaching a Traffic Policy to an Interface” section on page 34-39.

Use the no form of the appropriate command to delete an existing hierarchical policy map, to delete a port shaping configuration, or to remove the policy map from the hierarchical policy map.
This example shows how to configure port shaping by configuring a hierarchical policy map that shapes a port to 90 Mbps, allocated according to the out-policy policy map configured in the previous example.

```
Switch(config)# policy-map out-policy-parent
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# shape average 90000000
Switch(config-pmap-c)# service-policy out-policy
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet0/1
Switch(config-if)# service-policy output out-policy-parent
Switch(config-if)# exit
```

### Configuring Output Policy Maps with Class-Based Priority Queuing

You can use the `priority` policy-map class configuration command to ensure that a particular class of traffic is given preferential treatment. With strict priority queuing, the priority queue is constantly serviced; all packets in the queue are scheduled and sent until the queue is empty. Excessive use of the priority queues can possibly delay packets in other queues and create unnecessary congestion.

You can configure strict priority queuing (priority without police), or you can configure an unconditional priority policer (priority with police). Follow these guidelines when configuring priority queuing:

- You can associate the `priority` command with a single unique class for all attached output policies on the switch.
- When you configure a traffic class as a priority queue, you can configure only `police` and `queue-limit` as other queuing actions for the same class. You cannot configure `bandwidth` or `shape average` with priority queues in the same class.
- You cannot associate the `priority` command with the `class-default` of the output policy map.

### Configuring Priority Without Police

Follow these guidelines when configuring strict priority queuing (priority without police):

- You cannot configure priority queuing without policing for a traffic class when class-based shaping (`shape average`) or CBWFQ (`bandwidth`) is configured for another class within the output policy-map.
- When you configure priority queuing without policing for a traffic class, you can only configure the other queues for sharing by using the `bandwidth remaining percent` policy-map class configuration command to allocate excess bandwidth. This command does not guarantee the allocated bandwidth, but does ensure the rate of distribution.

Beginning in privileged EXEC mode, follow these steps to configure a strict priority queue:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Configure classes</strong></td>
</tr>
<tr>
<td>class-map class-map-name</td>
<td>Create classes for three egress queues. Enter match conditions classification for each class.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Configure policy map</strong></td>
</tr>
<tr>
<td>policy-map policy-map-name</td>
<td>Create a policy map by entering the policy map name, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>Configure priority class</strong></td>
</tr>
<tr>
<td>class class-map-name</td>
<td>Enter the name of the priority class (created by using the `class-map global configuration command), and enter policy-map class configuration mode for the priority class.</td>
</tr>
</tbody>
</table>
**Configuring QoS**

After you have created an output policy map, you attach it to an egress port. See the "Attaching a Traffic Policy to an Interface" section on page 34-39.

Use the **no** form of the appropriate command to delete an existing policy map or class map or to cancel strict priority queuing for the priority class or the bandwidth setting for the other classes.

This example shows how to configure the class **out-class1** as a strict priority queue so that all packets in that class are sent before any other class of traffic. Other traffic queues are configured so that **out-class-2** gets 50 percent of the remaining bandwidth and **out-class3** gets 20 percent of the remaining bandwidth. The class **class-default** receives the remaining 30 percent with no guarantees.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class out-class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class2
Switch(config-pmap-c)# bandwidth remaining percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class3
Switch(config-pmap-c)# bandwidth remaining percent 20
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# exit
```

### Command Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>priority</strong> Set the strict scheduling priority for this class. <strong>Note</strong> Only one unique class map on the switch can be associated with a <strong>priority</strong> command. You cannot configure priority along with any other queuing action (<strong>bandwidth</strong> or <strong>shape average</strong>).</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>exit</strong> Exit policy-map class configuration mode for the priority class.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>class class-map-name</strong> Enter the name of a nonpriority class, and enter policy-map class configuration mode for that class.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>bandwidth remaining percent value</strong> Set output bandwidth limits for the policy-map class as a percentage of the remaining bandwidth. The range is 1 to 100 percent.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>exit</strong> Exit policy-map class configuration mode for the class</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><strong>exit</strong> Return to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td><strong>interface interface-id</strong> Enter interface configuration mode for the interface to which you want to attach the policy.</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td><strong>service-policy output policy-map-name</strong> Attach the policy map (created in Step 3) to the egress interface.</td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td><strong>end</strong> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td><strong>show policy-map</strong> Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td><strong>copy running-config startup-config</strong> <em>(Optional)</em> Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring Priority With Police

You can use the priority with police feature and configure an unconditional priority policer to limit the bandwidth used by the priority queue and allocate bandwidth or shape other queues. Follow these guidelines when configuring priority with police:

- You cannot configure a policer committed burst size for an unconditional priority policer even though the keyword is visible in the CLI help. Any configured burst size is ignored when you try to attach the output service policy.

- The allowed police rate range is 64000 to 1000000000 bps, even though the range that appears in the CLI help is 8000 to 1000000000. You cannot attach an output service policy with an out-of-range rate.

- You cannot configure priority with policing for a traffic class when bandwidth remaining percent is configured for another class in the same output policy map.

- You can configure 1-rate, 2-color policers for output policies with priority. You cannot configure 2-rate, 3-color policers for output policies.

Beginning in privileged EXEC mode, follow these steps to configure priority with police:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> class-map class-map-name</td>
<td>Create classes for three egress queues. Enter match conditions classification for each class.</td>
</tr>
<tr>
<td><strong>Step 3</strong> policy-map policy-map-name</td>
<td>Create a policy map by entering the policy map name, and enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> class class-map-name</td>
<td>Enter the name of the priority class (created by using the class-map global configuration command), and enter policy-map class configuration mode for the priority class.</td>
</tr>
<tr>
<td><strong>Step 5</strong> priority</td>
<td>Configure this class as the priority class. Note Only one unique class map on the switch can be associated with a priority command.</td>
</tr>
<tr>
<td><strong>Step 6</strong> police rate-bps</td>
<td>Define a policer for the priority class of traffic. Note When you use the police command with the priority command in an output policy, the police rate range and the CIR range is 64000 to 1000000000 bps, even though the range that appears in the CLI help is 8000 to 1000000000. You cannot attach an output service policy with an out-of-range rate.</td>
</tr>
<tr>
<td><strong>Step 6</strong> cir cir-bps</td>
<td>Define a policer for the priority class of traffic. Note Although visible in the command-line help string, the burst-size option is not supported in output policy maps. You cannot attach an output service policy map that has a configured burst size.</td>
</tr>
</tbody>
</table>
## Chapter 34  Configuring QoS

### Configuring QoS

After you have created an output policy map, you attach it to an egress port. See the “Attaching a Traffic Policy to an Interface” section on page 34-39.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>conform-action [transmit]</td>
<td>(Optional) Enter the action to be taken on packets that conform to the CIR. If no action is entered, the default action is to send the packet. <strong>Note</strong> You can enter a single conform-action as part of the command string following the <em>police</em> command. You can also enter a carriage return after the <em>police</em> command and enter policy-map class police configuration mode to enter the conform-action. When the <em>police</em> command is configured with priority in an output policy map, only the default conform-action of <em>transmit</em> is supported. Although visible in the command-line help string, the other police conform actions are not supported in output policy maps.</td>
</tr>
<tr>
<td>8</td>
<td>exceed-action [drop]</td>
<td>(Optional) Enter the action to be taken for packets that do not conform to the CIR. If no action is entered, the default action is to drop the packet. <strong>Note</strong> You can enter a single exceed-action as part of the command string following the <em>police</em> command. You can also enter a carriage return after the <em>police</em> command and enter policy-map class police configuration mode to enter the exceed-action. When the <em>police</em> command is configured with priority in an output policy map, only the default exceed-action of <em>drop</em> is supported. Although visible in the command-line help string, the other police exceed actions are not supported in output policy maps.</td>
</tr>
<tr>
<td>9</td>
<td>exit</td>
<td>Exit policy-map class configuration mode for the priority class.</td>
</tr>
<tr>
<td>10</td>
<td>class class-map-name</td>
<td>Enter the name of the first nonpriority class, and enter policy-map class configuration mode for that class.</td>
</tr>
<tr>
<td>11</td>
<td>bandwidth {rate</td>
<td>percent value}</td>
</tr>
<tr>
<td></td>
<td>or shape average target bps</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>exit</td>
<td>Return to policy-map configuration mode.</td>
</tr>
<tr>
<td>13</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>14</td>
<td>interface interface-id</td>
<td>Enter interface configuration mode for the interface to which you want to attach the policy.</td>
</tr>
<tr>
<td>15</td>
<td>service-policy output policy-map-name</td>
<td>Attach the policy map (created in Step 3) to the egress interface.</td>
</tr>
<tr>
<td>16</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>17</td>
<td>show policy-map</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>18</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Use the no form of the appropriate command to delete an existing policy map or class map or to cancel the priority queuing or policing for the priority class or the bandwidth setting for the other classes.

This example shows how to use the priority with police commands to configure out-class1 as the priority queue, with traffic going to the queue limited to 20000000 bps so that the priority queue never uses more than that. Traffic above that rate is dropped. The other traffic queues are configured as in the previous example.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class out-class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# police 20000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class2
Switch(config-pmap-c)# bandwidth percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class out-class3
Switch(config-pmap-c)# bandwidth percent 20
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# exit
```

### Configuring Output Policy Maps with Weighted Tail Drop

Weighted tail drop (WTD) adjusts the queue size (buffer size) associated with a traffic class. You configure WTD by using the queue-limit policy-map class configuration command.

Follow these guidelines when configuring WTD:

- Configuring WTD with the queue-limit command is supported only when you first configure a scheduling action, such as bandwidth, shape average, or priority. The exception to this is when you are configuring queue-limit in the class-default.
- You can configure and attach as many output policy maps as there are ports. Multiple output policy maps can use the same queue-limit configuration. However, these policy maps can have only three unique queue-limit configurations.
- You can use the queue-limit command to configure the queue-limit for CPU-generated traffic.
- When you use the queue-limit command to configure queue thresholds for a class, the WTD thresholds must be less than or equal to the queue maximum threshold. A queue size configured with no qualifier must be larger than any queue sizes configured with qualifiers.
- You cannot configure more than two unique threshold values for the WTD qualifiers (cos, dscp, precedence, or qos-group) in the queue-limit command. However, there is no limit to the number of qualifiers that you can map to those thresholds. You can configure a third unique threshold value to set the maximum queue, using the queue-limit command with no qualifiers.
- A WTD qualifier in the queue-limit command must be the same as at least one match qualifier in the associated class map.
- In an output policy map, when you configure a queue-limit for a unique class, all other output policy maps must use the same format of qualifier type and qualifier value. Only queue-limit threshold values can be different. For example, when you configure class A queue-limit thresholds for dscp 30 and dscp 50 in policy-map1, and you configure class A queue-limits in policy-map 2, you must use dscp 30 and dscp 50 as qualifiers. You cannot use dscp 20 and dscp 40. The threshold values can be different, but different threshold values would create a new unique queue-limit configuration.
Beginning in privileged EXEC mode, follow these steps to use WTD to adjust the queue size for a traffic class:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>policy-map <strong>policy-map-name</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>class **{class-map-name</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>bandwidth **{rate</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>queue-limit **{cos **value</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>exit</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>exit</td>
</tr>
</tbody>
</table>
After you have created an output policy map, you attach it to an egress port. See the “Configuring Output Policy Maps” section on page 34-55.

Use the no form of the appropriate command to delete an existing policy map or class map or to delete a WTD configuration.

This example shows a policy map with a specified bandwidth and queue size. Traffic that is not DSCP 30 or 10 is assigned a queue limit of 112 packets. Traffic with a DSCP value of 30 is assigned a queue-limit of 48 packets, and traffic with a DSCP value of 10 is assigned a queue limit of 32 packets. All traffic not belonging to the class traffic is classified into class-default, which is configured with 10 percent of the total available bandwidth and a large queue size of 256 packets.

Switch(config)# policy-map gold-policy
Switch(config-pmap)# class traffic
Switch(config-pmap-c)# bandwidth percent 50
Switch(config-pmap-c)# queue-limit 112
Switch(config-pmap-c)# queue-limit dscp 30 48
Switch(config-pmap-c)# queue-limit dscp 10 32
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# bandwidth percent 10
Switch(config-pmap-c)# queue-limit 256
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# service-policy output gold-policy
Switch(config-if)# exit

Command | Purpose
---|---
**Step 8** interface interface-id | Enter interface configuration mode for the interface to which you want to attach the policy.
**Step 9** service-policy output policy-map-name | Attach the policy map (created in Step 2) to the egress interface.  
*Note* If you try to attach an output policy map that contains a fourth queue-limit configuration, you see an error message, and the attachment is not allowed.
**Step 10** end | Return to privileged EXEC mode.
**Step 11** show policy-map [policy-map-name [class class-map-name]] | Verify your entries.
**Step 12** copy running-config startup-config | (Optional) Save your entries in the configuration file.
Displaying QoS Information

To display QoS information, use one or more of the privileged EXEC commands in Table 34-2. For explanations about available keywords, see the command reference for this release.

Table 34-2  Commands for Displaying Standard QoS Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show class-map [class-map-name]</td>
<td>Display QoS class-map information for all class maps or the specified class map.</td>
</tr>
<tr>
<td>show policer aggregate [aggregate-policer-name]</td>
<td>Display information about all aggregate policers or the specified aggregate policer.</td>
</tr>
<tr>
<td>show policy-map [policy-map-name</td>
<td>Display QoS policy map information for the specified policy map name, interface, input or output policy maps, or policy-map class.</td>
</tr>
<tr>
<td>show policy-map [policy-map-name</td>
<td>Interface [interface-id] [input</td>
</tr>
<tr>
<td>show cpu traffic qos</td>
<td>Display the QoS marking values for CPU-generated traffic.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Display the configured class maps, policy maps, table maps, and aggregate policers.</td>
</tr>
<tr>
<td>show table-map [table-map-name]</td>
<td>Display information for all configured table maps or the specified table map.</td>
</tr>
</tbody>
</table>

QoS Statistics

There are several ways to display QoS input and output policy-map statistics.

For input policy maps, you can use the show policy-map interface [interface-id] privileged EXEC command to display per-class per-policer conform and exceed statistics. Policer conform statistics are the number of packets that conform to the configured policer profile; policer exceed statistics are the number of packets that exceed the configured policer profile. The switch does not support per-class classification statistics, but you can determine these statistics by configuring policing at line rate for the class. In this case, no packets exceed the configured policer profile, and the policer conform statistics would equal the class classification statistics.

This output also includes byte-level statistics for conform, exceed, and violate classes.

Another way to view input QoS statistics is in the output of the show platform qos statistics interface [interface-id] privileged EXEC command. The per-port frame statistics are sorted by the DSCP and CoS values of the incoming frames on the port. These statistics do not provide any information about the MQC input policy map configured on the interface.

For output policy maps, you can use the show policy-map interface [interface-id] command to display per-class classification statistics that show the total number of packets that match the specified class. This count includes the total number of packets that are sent and dropped for that class. You can use the same command to view the per-class tail drop statistics.
Configuration Examples for Policy Maps

This section includes configuration examples for configuring QoS policies on the Cisco ME switch, including configuration limitations and restrictions. The sections are broken into different configurations actions that a customer might do. Each section provides the exact sequence of steps that you must follow for successful configuration or modification.

These sections are included:
- QoS Configuration for Customer A, page 34-69
- QoS Configuration for Customer B, page 34-71
- Modifying Output Policies and Adding or Deleting Classification Criteria, page 34-72
- Modifying Output Policies and Changing Queueing or Scheduling Parameters, page 34-72
- Modifying Output Policies and Adding or Deleting Configured Actions, page 34-73
- Modifying Output Policies and Adding or Deleting a Class, page 34-74

QoS Configuration for Customer A

This section provides examples of the initial configuration and activation of QoS policies for a customer switch. Input and output QoS service policies are configured based on the requirements and attached to relevant ports.

In the initial configuration for Customer A, Fast Ethernet ports 1 through 24 are user network interfaces (UNIs) and are disabled by default. Gigabit Ethernet ports 1 and 2 are network node interfaces (NNIs) and are enabled by default.

This is the overall sequence for initial configuration:
- Configure classes and policies.
- Shut down all active ports.
- Attach policies to ports to be activated.
- Take the ports out of the shut-down state.
- Leave unused ports shut down.

Note these restrictions for configuring output policies:
- You can define up to three classes in the output policy map.
- The defined classes must be the same as other output policy maps.
- The number of defined classes in each output policy map must be same.
- You must assign an action to each class; that is, there can be no empty class.
- Each class configuration must be based on the classification/marking done in the input policy-map.

This example configures classes for input service policies and defines three classes of service: gold, silver, and bronze. Because a match-any classification (the default) can have only single classification criterion, the match-any classification is used so that you can add classification criteria in the future.

Switch# config terminal
Switch(config)# class-map match-any gold-in
Switch(config-cmap)# match ip dscp af11
Switch(config-cmap)# exit
Switch(config)# class-map match-any silver-in
Switch(config-cmap)# match ip dscp af21
This example shows how to configure an input policy map that marks the gold class and polices the silver class to 50 Mb/s and the bronze class to 20 Mb/s.

Switch(config)# policy-map input-all
Switch(config-pmap)# class gold-in
Switch(config-pmap-c)# set ip dscp af43
Switch(config-pmap-c)# exit
Switch(config-pmap)# class silver-in
Switch(config-pmap-c)# police 50000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class bronze-in
Switch(config-pmap-c)# police 20000000
Switch(config-pmap-c)# exit

This example configures classes for output service policies with three classes of service: gold, silver, and bronze. The gold class is configured to match the marked value in the input service policy. Because a match-all classification (the default) can have only single classification criterion, the match-any classification is used so that you can add classification criteria in the future.

Switch(config)# config terminal
Switch(config)# class-map match-any gold-out
Switch(config-cmap)# match ip dscp af43
Switch(config-cmap)# exit
Switch(config)# class-map match-any silver-out
Switch(config-cmap)# match ip dscp af21
Switch(config-cmap)# exit
Switch(config)# class-map match-any bronze-out
Switch(config-cmap)# match ip dscp af31
Switch(config-cmap)# exit

This example configures one output service policy to be applied to both Gigabit Ethernet NNIs, providing priority with rate-limiting to the gold class, class-based shaping for the silver class, and a minimum bandwidth guarantee of 10 percent to the bronze class.

Switch(config)# policy-map output-g1-2
Switch(config-pmap)# class gold-out
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# police 50000000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class silver-out
Switch(config-pmap-c)# shape average 200000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class bronze-out
Switch(config-pmap-c)# bandwidth percent 10
Switch(config-pmap-c)# exit

This example configures a second output service policy to be applied to Fast Ethernet UNIs 1 to 8, providing strict priority to the gold class and distributing the remaining bandwidth in the desired proportions over the remaining classes.

Switch(config)# policy-map output1-8
Switch(config-pmap)# class gold-out
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# class silver-out
Switch(config-pmap-c)# bandwidth remaining percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class bronze-out
Switch(config-pmap-c)# bandwidth remaining percent 20
This example attaches the input and output service policies to the Gigabit Ethernet ports and activates them.

```
Switch(config)# interface range gigabitethernet0/1-2
Switch(config-if-range)# service-policy input input-all
Switch(config-if-range)# service-policy output output-g1-2
Switch(config-if-range)# no shutdown
Switch(config-if-range)# exit
```

This example attaches the input and output service policies to Fast Ethernet ports 1 to 8 and activates them.

```
Switch(config)# interface range fastethernet0/1 – 8
Switch(config-if-range)# service-policy input input-all
Switch(config-if-range)# service-policy output output1-8
Switch(config-if-range)# no shutdown
Switch(config-if-range)# exit
```

### QoS Configuration for Customer B

This section provides examples for configuring and activating QoS policies on the switch for a new set of customers without affecting the current customers. Input and output QoS service policies are configured based on the requirements and attached to relevant ports. The example uses an existing input policy-map and configures a new output policy map for the new customers.

In the initial configuration for Customer B, Fast Ethernet ports 1 through 8 are UNIs and are active. Fast Ethernet ports 9 through 24 are UNIs and are shut down. Gigabit Ethernet ports 1 and 2 are NNIs and are enabled by default.

This is the overall sequence of initial configuration:
- Define any new required output policies.
- Attach input and output policies to ports to be activated.
- Take the ports out of the shut-down state.

Note these restrictions when configuring output policies:
- You can define up to three classes in the output policy map.
- The defined classes must be the same as other output policy maps.
- The number of defined classes in each output policy map must be same.
- You must assign an action to each class; that is, there can be no empty class.
- Each class configuration must be based on the classification/marking done in the input policy-map.

This example configures a third output service policy to be attached to Fast Ethernet UNIs 9 through 12, providing a minimum guaranteed bandwidth of 50 Mb/s to the gold class, 20 Mb/s to the silver class, and 10 Mb/s to the bronze class:

```
Switch(config)# policy-map output9-12
Switch(config-pmap)# class gold-out
Switch(config-pmap-c)# bandwidth 50000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class silver-out
Switch(config-pmap-c)# bandwidth 20000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class bronze-out
Switch(config-pmap-c)# bandwidth 10000
```
Switch(config-pmap-c)# exit

This example attaches the output policy for Fast Ethernet ports 9 through 12 and activates the ports:

Switch# config terminal
Switch(config)# interface range fastethernet0/9-12
Switch(config-if-range)# service-policy input input-all
Switch(config-if-range)# service-policy output output9-12
Switch(config-if-range)# no shutdown
Switch(config-if-range)# exit

Modifying Output Policies and Adding or Deleting Classification Criteria

This section provides examples of updating an existing set of output policy maps to add or delete classification criteria. The modification might be required due to a change in the service provisioning requirements or a change in the input service policy map. You can make the change without shutting down any port.

In the initial configuration, Fast Ethernet ports 1 through 12 are UNIs and are active. Fast Ethernet ports 13 through 24 are UNIs and are shut down. Gigabit Ethernet ports 1 and 2 are NNIs and are enabled by default.

This is the overall sequence of initial configuration:

- Change the configured class map for an input service policy.
- Change the configured class map for an output service policy.

This example modifies classes for an input service policy by adding classification criteria to the silver-in class to also match dscp cs5. This is required for the output policy-map to match to dscp cs5.

Switch(config)# class-map match-any silver-in
Switch(config-cmap)# match ip dscp af21
Switch(config-cmap)# match ip dscp cs5
Switch(config-cmap)# exit

This example modifies classes for an output service policy, adding classification criteria to the silver-out class to also match dscp cs5. This adds dscp cs5 to the silver-out class on all configured and attached output service policies. The dscp cs5 flow now receives the same queuing and scheduling treatment as the silver-out class.

Switch# config terminal
Switch(config)# class-map match-any silver-out
Switch(config-cmap)# match ip dscp af21
Switch(config-cmap)# match ip dscp cs5
Switch(config-cmap)# exit

You should use the same procedure when deleting a match statement associated with a configured class.

Modifying Output Policies and Changing Queuing or Scheduling Parameters

This section provides examples of updating an existing set of output policy maps to modify the parameters of the configured queuing and scheduling actions. The modification in the output policy map might be required due to a change in the service provisioning requirements. You can make the change without shutting down any port.

In the initial configuration, Fast Ethernet ports 1 through 12 are UNIs and are active. Fast Ethernet ports 13 through 24 are UNIs and are shut down. Gigabit Ethernet ports 1 and 2 are NNIs and are enabled by default.
The requirement is to change the action parameters.

Note these restrictions when configuring output policies:

- You can define up to three classes in the output policy map.
- The defined classes must be the same as other output policy maps.
- The number of defined classes in each output policy map must be same.
- You must assign an action to each class; that is, there can be no empty class.
- Each class configuration must be based on the classification or marking done in the input policy-map.

This example modifies the third output service policy servicing Fast Ethernet UNIs 8 through 12 by providing minimum guaranteed bandwidth of 40 Mb/s to the gold class (changed from 50 Mb/s), 30 Mb/s to the silver class (changed from 20 Mb/s), and 20 Mb/s to the bronze class (changed from 10 Mbps).

```
Switch(config)# policy-map output9-12
Switch(config-pmap)# class gold-out
Switch(config-pmap-c)# bandwidth 40000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class silver-out
Switch(config-pmap-c)# bandwidth 30000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class bronze-out
Switch(config-pmap-c)# bandwidth 20000
Switch(config-pmap-c)# exit
```

### Modifying Output Policies and Adding or Deleting Configured Actions

This section provides examples of updating an existing set of output policy maps to add or delete queuing and scheduling actions. The modification in the output policy map might be required due to a change in the service provisioning requirements. You can make the change without shutting down ports that are not configured with the output policy map to be modified. But you must shut down the ports that are configured with that output policy map. Customers not using this output policy map are not affected.

In the initial configuration, Fast Ethernet ports 1 through 12 are UNIs and are active. Fast Ethernet ports 13 through 24 are UNIs and are shut down. Gigabit Ethernet ports 1 and 2 are NNIs and are enabled by default.

This is the overall sequence of configuration:

- Shut down all active ports carrying the policy to be modified.
- Detach the output policy from all ports to which it is attached.
- Make modifications to the output policy.
- Reattach the output policy to the appropriate ports.
- Take the ports out of the shutdown state.

Note these restrictions for configuring output policies:

- You can define up to three classes in the output policy map.
- The defined classes must be the same as other output policy maps.
- The number of defined classes in each output policy map must be same.
- You must assign an action to each class; that is, there can be no empty class.
- Each class configuration must be based on the classification/marking done in the input policy-map.
These steps shut down all ports carrying the output policy, in this case only the Gigabit Ethernet ports.

```
Switch(config)# interface range gigabitEthernet0/1-2
Switch(config-if-range)# shutdown
Switch(config-if-range)# exit
```

These steps detach the output policy to be modified, in this case the one configured on the Gigabit Ethernet ports:

```
Switch(config)# interface range gigabitEthernet0/1-2
Switch(config-if-range)# no service-policy output output-g1-2
Switch(config-if-range)# exit
```

These steps modify the output service policy servicing the Gigabit Ethernet NNIs. Instead of providing a minimum bandwidth guarantee of 10 percent to the bronze class, the policy is modified to provide class-based shaping to 100000 bps.

```
Switch(config)# policy-map output-g1-2
Switch(config-pmap)# class bronze-out
Switch(config-pmap-c)# no bandwidth percent 10
Switch(config-pmap-c)# shape average 100000
Switch(config-pmap-c)# exit
```

These steps reattach the output policy to the Gigabit Ethernet ports:

```
Switch(config)# interface range gigabitethernet0/1-2
Switch(config-if-range)# service-policy output output9-12
Switch(config-if-range)# exit
```

These steps activate all Gigabit Ethernet ports:

```
Switch(config)# interface range gigabitethernet0/1-2
Switch(config-if-range)# no shutdown
Switch(config-if-range)# exit
```

### Modifying Output Policies and Adding or Deleting a Class

This section provides examples of updating an existing set of output policy maps to add or delete entire classes. The modification in the output policy map might be required due to a change in the service provisioning requirements or a change in the input service policy. To make this change, you must shut down all active ports on the switch. For this kind of update to any output policy map, all customers could potentially be affected. To avoid this, we recommend that you consider possible future upgrades when you configure classes in output service policies.

In the initial configuration, Fast Ethernet ports 1 through 12 are UNIs and are active. Fast Ethernet ports 13 through 24 are UNIs and are shut down. Gigabit Ethernet ports 1 and 2 are NNIs and are enabled by default.

This is the overall sequence of configuration:

- Shut down all active ports.
- Detach the output policies from all Fast Ethernet and Gigabit Ethernet ports.
- Delete the class.
- Reattach the output policies to the Fast Ethernet and Gigabit Ethernet ports.
- Take the Fast Ethernet and Gigabit Ethernet ports out of the shutdown state.
These steps shut down all active and applicable Fast Ethernet and Gigabit Ethernet ports:

```
Switch(config)# interface range gigabitethernet0/1-2, fastethernet0/1-12
Switch(config-if-range)# shutdown
Switch(config-if-range)# exit
```

These steps detach all output policies from the affected Fast Ethernet and Gigabit Ethernet ports:

```
Switch(config)# interface range fastethernet0/1-8
Switch(config-if-range)# no service-policy output output1-8
Switch(config-if-range)# exit

Switch(config)# interface range fastethernet0/9-12
Switch(config-if-range)# no service-policy output output9-12
Switch(config-if-range)# exit

Switch(config)# interface range gigabitethernet0/1-2
Switch(config-if-range)# no service-policy output output-g1-2
Switch(config-if-range)# exit
```

These steps delete a class from all output policy maps and input policy maps; the input policy can be left attached or can be detached:

```
Switch(config)# policy-map output1-8
Switch(config-pmap)# no class bronze-out
Switch(config-pmap-c)# exit
Switch(config)# policy-map output9-12
Switch(config-pmap)# no class bronze-out
Switch(config-pmap-c)# exit
Switch(config)# policy-map output-g1-2
Switch(config-pmap)# no class bronze-out
Switch(config-pmap-c)# exit
Switch(config)# policy-map input-all
Switch(config-pmap)# no class bronze-in
Switch(config-pmap-c)# exit
```

These steps reattach all policies to the Fast Ethernet and Gigabit Ethernet ports:

```
Switch(config)# interface range fastethernet0/1-8
Switch(config-if-range)# service-policy output output1-8
Switch(config-if-range)# exit

Switch(config)# interface range fastethernet0/9-12
Switch(config-if-range)# service-policy output output9-12
Switch(config-if-range)# exit

Switch(config)# interface range gigabitethernet0/1-2
Switch(config-if-range)# service-policy output output9-12
Switch(config-if-range)# exit
```

These steps activate all applicable Fast Ethernet and Gigabit Ethernet ports:

```
Switch(config)# interface range gigabitethernet0/1-2, fastethernet0/1-12
Switch(config-if-range)# no shutdown
Switch(config-if-range)# exit
```

You should use the same procedure when adding a class to an attached output service policy.

**Note**

Problems can occur if you do not follow the previous sequence.
When a policy map is attached to an interface, all traffic that does not explicitly match the configured class maps within the policy map should go through the default queue (class class-default). However, in some cases, traffic that does not explicitly match the output policy-map classes could go through more than one queue. This queuing problem can occur when you do not follow the previous procedure and do not attach an output policy to all active ports.

For example, consider this case where only two ports are configured with an output policy and we want to delete a class in the output policy.

**Shut down two ports:**

```
Switch(config)# interface range fastethernet0/1-2
Switch(config-if-range)# shutdown
Switch(config-if-range)# exit
```

**Detach the output policy from both ports:**

```
Switch(config)# interface range fastEthernet0/1-2
Switch(config-if)# no service-policy output output1-2
Switch(config-if)# exit
```

**Delete a class in the output policy:**

```
Switch(config)# policy-map output1-2
Switch(config-pmap)# no class bronze-out
Switch(config-pmap-c)# exit
```

**Attach the output policy to only one port and not to the other:**

```
Switch(config)# interface FastEthernet0/1
Switch(config-if)# service-policy output output1-2
Switch(config-if)# exit
```

**Enable both ports:**

```
Switch(config)# interface range fastethernet0/1-2
Switch(config-if-range)# no shutdown
Switch(config-if-range)# exit
```

At this point, when traffic leaves Fast Ethernet port 2, instead of going through a single default-queue, it goes through the same number of queues as there are classes defined in the output policy-map attached to Fast Ethernet port 1. In this case, it would be three. In some cases, packets for a flow out of Fast Ethernet port 2 might be reordered if a flow splits across more than one queue. You can avoid this problem by leaving ports in a shut-down state until you attach an output policy.
Configuring EtherChannels and Link-State Tracking

This chapter describes how to configure EtherChannels on Layer 2 and Layer 3 ports on the Cisco ME 3400E Ethernet Access switch. EtherChannel provides fault-tolerant high-speed links between switches, routers, and servers. You can use it to increase the bandwidth between the wiring closets and the data center, and you can deploy it anywhere in the network where bottlenecks are likely to occur. EtherChannel provides automatic recovery for the loss of a link by redistributing the load across the remaining links. If a link fails, EtherChannel redirects traffic from the failed link to the remaining links in the channel without intervention. This chapter also describes how to configure link-state tracking.

Note
For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

This chapter consists of these sections:
- Understanding EtherChannels, page 35-1
- Configuring EtherChannels, page 35-9

Understanding EtherChannels

- EtherChannel Overview, page 35-2
- Port-Channel Interfaces, page 35-3
- Port Aggregation Protocol, page 35-4
- Link Aggregation Control Protocol, page 35-6
- EtherChannel On Mode, page 35-7
- Load Balancing and Forwarding Methods, page 35-7
EtherChannel Overview

An EtherChannel consists of individual Fast Ethernet or Gigabit Ethernet links bundled into a single logical link as shown in Figure 35-1.

![Figure 35-1  Typical EtherChannel Configuration](image)

The EtherChannel provides full-duplex bandwidth of up to 800 Mbps between your switch and another switch or host for Fast EtherChannel on a switch with 24 Fast Ethernet ports. For Gigabit EtherChannel, you can configure up to 8 Gbps (8 ports of 1 Gbps), depending on the number of supported Gigabit Ethernet interfaces.

**Note**

Only network node interfaces (NNIs) and enhanced network interfaces (ENIs) support Link Aggregation Control Protocol (LACP) or Port Aggregation Protocol (PAgP). Use the `port-type {eni | nni}` interface configuration command to configure a port as an ENI or NNI. The switch must be running the metro IP access image to allow configuring of more than four ports as NNIs.

Each EtherChannel can consist of up to eight compatibly configured Ethernet ports. All ports in each EtherChannel must be configured as either Layer 2 or Layer 3 ports. The number of EtherChannels is limited to 48. For more information, see the “EtherChannel Configuration Guidelines” section on page 35-10. The EtherChannel Layer 3 ports are made up of routed ports. Routed ports are physical ports configured to be in Layer 3 mode by using the `no switchport` interface configuration command. For more information, see the Chapter 10, “Configuring Interfaces.”
You can configure an EtherChannel in one of these modes: Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or On mode. PAgP and LACP are available only on NNIs and ENIs. Configure both ends of the EtherChannel in the same mode:

- When you configure one end of an EtherChannel in either PAgP or LACP mode, the system negotiates with the other end of the channel to determine which ports should become active. Incompatible ports are suspended.

- When you configure an EtherChannel in the on mode, no negotiations take place. The switch forces all compatible ports to become active in the EtherChannel. The other end of the channel (on the other switch) must also be configured in the on mode; otherwise, packet loss can occur.

The local port is put into an independent state and continues to carry data traffic as would any other single link. The port configuration does not change, but the port does not participate in the EtherChannel.

If a link within an EtherChannel fails, traffic previously carried over that failed link changes to the remaining links within the EtherChannel. A trap is sent for a failure, identifying the switch, the EtherChannel, and the failed link. Inbound broadcast and multicast packets on one link in an EtherChannel are blocked from returning on any other link of the EtherChannel.

**Port-Channel Interfaces**

When you create an EtherChannel, a port-channel logical interface is involved:

- With Layer 2 ports, use the **channel-group** interface configuration command to dynamically create the port-channel logical interface.

  You also can use the `interface port-channel port-channel-number` global configuration command to manually create the port-channel logical interface, but then you must use the `channel-group channel-group-number` command to bind the logical interface to a physical port. The `channel-group-number` can be the same as the `port-channel-number`, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

- With Layer 3 ports, you should manually create the logical interface by using the `interface port-channel` global configuration command followed by the `no switchport` interface configuration command. Then you manually assign an interface to the EtherChannel by using the **channel-group** interface configuration command.

For both Layer 2 and Layer 3 ports, the **channel-group** command binds the physical port and the logical interface together as shown in Figure 35-2.

Each EtherChannel has a port-channel logical interface numbered from 1 to 48. This port-channel interface number corresponds to the one specified with the **channel-group** interface configuration command.
After you configure an EtherChannel, configuration changes applied to the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port to which you apply the configuration. To change the parameters of all ports in an EtherChannel, apply the configuration commands to the port-channel interface.

**Port Aggregation Protocol**

The Port Aggregation Protocol (PAgP) is a Cisco-proprietary protocol that can be run only on Cisco switches and on those switches licensed by vendors to support PAgP. PAgP facilitates the automatic creation of EtherChannels by exchanging PAgP packets between Ethernet ports.

*Note*

PAgP is only available on network node interfaces (NNIs) and enhanced network interfaces (ENIs).

By using PAgP, the switch learns the identity of partners capable of supporting PAgP and the capabilities of each port. It then dynamically groups similarly configured ports into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, PAgP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, PAgP adds the group to the spanning tree as a single switch port.
**PAgP Modes**

Table 35-1 shows the user-configurable EtherChannel PAgP modes for the `channel-group` interface configuration command on an NNI or ENI.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Places a port into a passive negotiating state in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. This setting minimizes the transmission of PAgP packets.</td>
</tr>
<tr>
<td>desirable</td>
<td>Places a port into an active negotiating state in which the port starts negotiations with other ports by sending PAgP packets.</td>
</tr>
</tbody>
</table>

Switch ports exchange PAgP packets only with partner ports configured in the `auto` or `desirable` modes. Ports configured in the `on` mode do not exchange PAgP packets.

Both the `auto` and `desirable` modes enable ports to negotiate with partner ports to form an EtherChannel based on criteria such as port speed and, for Layer 2 EtherChannels, trunking state and VLAN numbers.

Ports can form an EtherChannel when they are in different PAgP modes as long as the modes are compatible. For example:

- A port in the `desirable` mode can form an EtherChannel with another port that is in the `desirable` or `auto` mode.
- A port in the `auto` mode can form an EtherChannel with another port that is in the `desirable` mode.
- A port in the `auto` mode cannot form an EtherChannel with another port that is also in the `auto` mode because neither port starts PAgP negotiation.

If your switch is connected to a partner that is PAgP-capable, you can configure the switch port for nonsilent operation by using the `non-silent` keyword. If you do not specify `non-silent` with the `auto` or `desirable` mode, silent mode is assumed.

Use the silent mode when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. An example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port connected to a silent partner prevents that switch port from ever becoming operational. However, the silent setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.

**PAgP Interaction with Other Features**

Cisco Discovery Protocol (CDP) sends and receives packets over the physical ports in the EtherChannel.

| Note | PAgP and CDP are only available on NNIs and ENIs. User network interfaces (UNIs) do not support PAgP or CDP. |

Trunk ports send and receive PAgP protocol data units (PDUs) on the lowest numbered VLAN.
In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel.

PAgP sends and receives PAgP PDUs only from ports that are up and have PAgP enabled for the auto or desirable mode.

### Link Aggregation Control Protocol

The LACP is defined in IEEE 802.3ad standard and enables Cisco switches to manage Ethernet channels between switches that conform to the standard. LACP facilitates the automatic creation of EtherChannels by exchanging LACP packets between Ethernet ports.

*Note*

LACP is available only on NNIs and ENIs.

By using LACP, the switch learns the identity of partners capable of supporting LACP and the capabilities of each port. It then dynamically groups similarly configured ports into a single logical link (channel or aggregate port). Similarly configured ports are grouped based on hardware, administrative, and port parameter constraints. For example, LACP groups the ports with the same speed, duplex mode, native VLAN, VLAN range, and trunking status and type. After grouping the links into an EtherChannel, LACP adds the group to the spanning tree as a single switch port.

### LACP Modes

Table 35-2 shows the user-configurable EtherChannel LACP modes for the `channel-group` interface configuration command on an NNI or ENI.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>Places a port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.</td>
</tr>
<tr>
<td>passive</td>
<td>Places a port into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation. This setting minimizes the transmission of LACP packets.</td>
</tr>
</tbody>
</table>

Both the `active` and `passive` LACP modes enable ports to negotiate with partner ports to an EtherChannel based on criteria such as port speed and, for Layer 2 EtherChannels, trunking state and VLAN numbers.

Ports can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- A port in the `active` mode can form an EtherChannel with another port that is in the `active` or `passive` mode.
- A port in the `passive` mode cannot form an EtherChannel with another port that is also in the `passive` mode because neither port starts LACP negotiation.
LACP Interaction with Other Features

The CDP sends and receives packets over the physical ports in the EtherChannel. Trunk ports send and receive LACP PDUs on the lowest numbered VLAN.

In Layer 2 EtherChannels, the first port in the channel that comes up provides its MAC address to the EtherChannel. If this port is removed from the bundle, one of the remaining ports in the bundle provides its MAC address to the EtherChannel.

LACP sends and receives LACP PDUs only from ports that are up and have LACP enabled for the active or passive mode.

EtherChannel On Mode

EtherChannel on mode can be used to manually configure an EtherChannel. The on mode forces a port to join an EtherChannel without negotiations. It can be useful if the remote device does not support PAgP or LACP. With the on mode, a usable EtherChannel exists only when both ends of the link are configured in the on mode.

Note
For UNIs, the only available mode is on.

Ports that are configured in the on mode in the same channel group must have compatible port characteristics, such as speed and duplex. Ports that are not compatible are suspended, even though they are configured in the on mode.

Caution
You should use care when using the on mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

Load Balancing and Forwarding Methods

EtherChannel balances the traffic load across the links in a channel by reducing part of the binary pattern formed from the addresses in the frame to a numerical value that selects one of the links in the channel. EtherChannel load balancing can use MAC addresses or IP addresses, source or destination addresses, or both source and destination addresses. The selected mode applies to all EtherChannels configured on the switch. You configure the load balancing and forwarding method by using the port-channel load-balance global configuration command.

With source-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source-MAC address of the incoming packet. Therefore, to provide load balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel.

With destination-MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the destination-host MAC address of the incoming packet. Therefore, packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.
On the ME-3400E switch, load distribution based on the destination host MAC address supports only four ports per EtherChannel. When you configure EtherChannel destination-MAC address load balancing, the traffic is balanced only among four ports in the channel group. If you configure more than four ports in an EtherChannel with destination host MAC address load distribution, only four of the ports receive distributed traffic. This limitation does not apply to the other load distribution methods.

With source-and-destination MAC address forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on both the source and destination MAC addresses. This forwarding method, a combination source-MAC and destination-MAC address forwarding methods of load distribution, can be used if it is not clear whether source-MAC or destination-MAC address forwarding is better suited on a particular switch. With source-and-destination MAC-address forwarding, packets sent from host A to host B, host A to host C, and host C to host B could all use different ports in the channel.

With source-IP-address-based forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the EtherChannel based on the source-IP address of the incoming packet. Therefore, to provide load-balancing, packets from different IP addresses use different ports in the channel, but packets from the same IP address use the same port in the channel.

With destination-IP-address-based forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the EtherChannel based on the destination-IP address of the incoming packet. Therefore, to provide load-balancing, packets from the same IP source address sent to different IP destination addresses could be sent on different ports in the channel. But packets sent from different source IP addresses to the same destination IP address are always sent on the same port in the channel.

With source-and-destination IP address-based forwarding, when packets are forwarded to an EtherChannel, they are distributed across the ports in the EtherChannel based on both the source and destination IP addresses of the incoming packet. This forwarding method, a combination of source-IP and destination-IP address-based forwarding, can be used if it is not clear whether source-IP or destination-IP address-based forwarding is better suited on a particular switch. In this method, packets sent from the IP address A to IP address B, from IP address A to IP address C, and from IP address C to IP address B could all use different ports in the channel.

Different load-balancing methods have different advantages, and the choice of a particular load-balancing method should be based on the position of the switch in the network and the kind of traffic that needs to be load-distributed. In Figure 35-3, an EtherChannel of four workstations communicates with a router. Because the router is a single-MAC-address device, source-based forwarding on the switch EtherChannel ensures that the switch uses all available bandwidth to the router. The router is configured for destination-based forwarding because the large number of workstations ensures that the traffic is evenly distributed from the router EtherChannel.

Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going only to a single MAC address, using the destination-MAC address always chooses the same link in the channel. Using source addresses or IP addresses might result in better load balancing.
Configuring EtherChannels

- Default EtherChannel Configuration, page 35-10
- EtherChannel Configuration Guidelines, page 35-10
- Configuring Layer 2 EtherChannels, page 35-11 (required)
- Configuring Layer 3 EtherChannels, page 35-14 (required)
- Configuring EtherChannel Load Balancing, page 35-17 (optional)
- Configuring the PAgP Learn Method and Priority, page 35-18 (optional)
- Configuring LACP Hot-Standby Ports, page 35-19 (optional)

**Note**
Make sure that the ports are correctly configured. For more information, see the “EtherChannel Configuration Guidelines” section on page 35-10.

**Note**
After you configure an EtherChannel, configuration changes applied to the port-channel interface apply to all the physical ports assigned to the port-channel interface, and configuration changes applied to the physical port affect only the port to which you apply the configuration.
**Default EtherChannel Configuration**

Table 35-3 shows the default EtherChannel configuration.

**EtherChannel Configuration Guidelines**

If improperly configured, some EtherChannel ports are automatically disabled to avoid network loops and other problems. Follow these guidelines to avoid configuration problems:

- Do not try to configure more than 48 EtherChannels on the switch.
- Configure a PAgP EtherChannel including only NNIs or only ENIs.
- Configure a LACP EtherChannel including only NNIs or only ENIs.
- Configure all ports in an EtherChannel to operate at the same speeds and duplex modes.
- All ports in an EtherChannel must be the same type, either UNI, NNI, or ENI. You cannot mix port types in an EtherChannel.
- On UNIs, the EtherChannel mode must always be configured to on.
- Enable all ports in an EtherChannel. A port in an EtherChannel that is disabled by using the shutdown interface configuration command is treated as a link failure, and its traffic is transferred to one of the remaining ports in the EtherChannel. UNIs and ENIs are disabled by default. NNIs are enabled by default.
- When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, you must also make the changes to all ports in the group:
  - Allowed-VLAN list
  - Spanning-tree path cost for each VLAN
  - Spanning-tree port priority for each VLAN
  - Spanning-tree Port Fast setting
Note: Spanning Tree Protocol is only supported on NNIs or ENIs on which it has been specifically enabled.

- Do not configure a port to be a member of more than one EtherChannel group.
- Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch. Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

Note: PAgP and LACP are only available on NNIs and ENIs.

- If the switch is running the metro access image, you can have only four NNIs on the switch at the same time; therefore, only four ports in an EtherChannel can support LACP and PAgP at the same time. If the switch is running the metro IP access image, there is no limit to the number of NNIs that can be configured on the switch.
- Do not configure a Switched Port Analyzer (SPAN) destination port as part of an EtherChannel.
- Do not configure a secure port as part of an EtherChannel or the reverse.
- Do not configure a private-VLAN port as part of an EtherChannel.
- Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x on an EtherChannel port, an error message appears, and 802.1x is not enabled.
- If EtherChannels are configured on switch interfaces, remove the EtherChannel configuration from the interfaces before globally enabling 802.1x on a switch by using the `dot1x system-auth-control` global configuration command.
- For Layer 2 EtherChannels:
  - Assign all ports in the EtherChannel to the same VLAN, or configure them as trunks. Ports with different native VLANs cannot form an EtherChannel.
  - If you configure an EtherChannel from trunk ports, verify that the trunking mode is the same on all the trunks. Inconsistent trunk modes on EtherChannel ports can have unexpected results.
  - An EtherChannel supports the same allowed range of VLANs on all the ports in a trunking Layer 2 EtherChannel. If the allowed range of VLANs is not the same, the ports do not form an EtherChannel even when PAgP is set to the `auto` or `desirable` mode.
  - NNIs or ENIs with different spanning-tree path costs can form an EtherChannel if they are otherwise compatibly configured. Setting different spanning-tree path costs does not, by itself, make ports incompatible for the formation of an EtherChannel.
- For Layer 3 EtherChannels, assign the Layer 3 address to the port-channel logical interface, not to the physical ports in the channel.

### Configuring Layer 2 EtherChannels

You configure Layer 2 EtherChannels by assigning ports to a channel group with the `channel-group` interface configuration command. This command automatically creates the port-channel logical interface.
Beginning in privileged EXEC mode, follow these steps to assign a Layer 2 Ethernet port to a Layer 2 EtherChannel. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>

<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td></td>
<td>Specify a physical port, and enter interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Valid interfaces include physical ports.</td>
</tr>
<tr>
<td></td>
<td>For a PAgP EtherChannel, you can configure up to eight ports of the same type and speed for the same group.</td>
</tr>
<tr>
<td></td>
<td>For a LACP EtherChannel, you can configure up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> If the interface is a UNI, you must enter the <strong>port-type</strong> {eni</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no shutdown</td>
</tr>
<tr>
<td></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport mode {access</td>
</tr>
<tr>
<td></td>
<td>Assign all ports as static-access ports in the same VLAN, or configure them as trunks.</td>
</tr>
<tr>
<td></td>
<td>If you configure the port as a static-access port, assign it to only one VLAN. The range is 1 to 4094.</td>
</tr>
</tbody>
</table>
To remove a port from the EtherChannel group, use the `no channel-group` interface configuration command.
Chapter 35      Configuring EtherChannels and Link-State Tracking

Configuring EtherChannels

This example shows how to configure an EtherChannel. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the PAgP mode desirable:

```
Switch# configure terminal
Switch(config)# interface range fastethernet0/1 -2
Switch(config-if-range)# port-type nni
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable non-silent
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel. It assigns two ports as static-access ports in VLAN 10 to channel 5 with the LACP mode active:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

Configuring Layer 3 EtherChannels

To configure Layer 3 EtherChannels, you create the port-channel logical interface and then put the Ethernet ports into the port-channel as described in the next two sections.

Creating Port-Channel Logical Interfaces

When configuring Layer 3 EtherChannels, you should first manually create the port-channel logical interface by using the `interface port-channel` global configuration command. Then you put the logical interface into the channel group by using the `channel-group` interface configuration command.

```
Note
To move an IP address from a physical port to an EtherChannel, you must delete the IP address from the physical port before configuring it on the port-channel interface.
```

Beginning in privileged EXEC mode, follow these steps to create a port-channel interface for a Layer 3 EtherChannel. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2 interface port-channel `port-channel-number` | Specify the port-channel logical interface, and enter interface configuration mode.  
  For `port-channel-number`, the range is 1 to 48. |
To remove the port-channel, use the `no interface port-channel port-channel-number` global configuration command.

This example shows how to create the logical port channel 5 and assign 172.10.20.10 as its IP address:

\[
\text{Switch# configure terminal} \\
\text{Switch(config)# interface port-channel 5} \\
\text{Switch(config-if)# no switchport} \\
\text{Switch(config-if)# ip address 172.10.20.10 255.255.255.0} \\
\text{Switch(config-if)# end}
\]

### Configuring the Physical Interfaces

Beginning in privileged EXEC mode, follow these steps to assign an Ethernet port to a Layer 3 EtherChannel. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify a physical port, and enter interface configuration mode. Valid interfaces include physical ports. For a PAgP EtherChannel, you can configure up to eight ports of the same type and speed for the same group. For a LACP EtherChannel, you can configure up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. Note If the interface is a UNI, you must enter the port-type {eni</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 no ip address</td>
<td>Ensure that there is no IP address assigned to the physical port.</td>
</tr>
<tr>
<td>Step 5 no switchport</td>
<td>Put the port into Layer 3 mode.</td>
</tr>
</tbody>
</table>
Chapter 35  Configuring EtherChannels and Link-State Tracking

### Configuring EtherChannels

#### Step 6

**Command**

```
channel-group channel-group-number mode 
  { auto [non-silent] | desirable [non-silent] | on } |
  { active | passive }
```

**Purpose**

Assign the port to a channel group, and specify the PAgP or the LACP mode.

For `channel-group-number`, the range is 1 to 48. This number must be the same as the `port-channel-number` (logical port) configured in the “Creating Port-Channel Logical Interfaces” section on page 35-14.

**Note**  For UNIs, the only available mode is `on`.

For `mode`, select one of these keywords:

- **auto**—Enables PAgP only if a PAgP device is detected. It places the port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation.
- **desirable**—Unconditionally enables PAgP. It places the port into an active negotiating state, in which the port starts negotiations with other ports by sending PAgP packets.
- **on**—Forces the port to channel without PAgP or LACP. With the `on` mode, a usable EtherChannel exists only when a port group in the `on` mode is connected to another port group in the `on` mode.
- **non-silent**—(Optional) If your switch is connected to a partner that is PAgP capable, configure the switch port for nonsilent operation when the port is in the `auto` or `desirable` mode. If you do not specify `non-silent`, silent is assumed. The silent setting is for connections to file servers or packet analyzers. This setting allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission.
- **active**—Enables LACP only if a LACP device is detected. It places the port into an active negotiating state in which the port starts negotiations with other ports by sending LACP packets.
- **passive**—Enables LACP on the port and places it into a passive negotiating state in which the port responds to LACP packets that it receives, but does not start LACP packet negotiation.

For information on compatible modes for the switch and its partner, see the “PAgP Modes” section on page 35-5 and the “LACP Modes” section on page 35-6.

#### Step 7

**end**  

Return to privileged EXEC mode.

#### Step 8

**show running-config**  

Verify your entries.

#### Step 9

**copy running-config startup-config**  

(Optional) Save your entries in the configuration file.
This example shows how to configure an EtherChannel. It assigns two ports to channel 5 with the LACP mode active:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet0/1 -2
Switch(config-if-range)# no ip address
Switch(config-if-range)# no switchport
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

### Configuring EtherChannel Load Balancing

This section describes how to configure EtherChannel load balancing by using source-based or destination-based forwarding methods. For more information, see the “Load Balancing and Forwarding Methods” section on page 35-7.

Beginning in privileged EXEC mode, follow these steps to configure EtherChannel load balancing. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> port-channel load-balance</td>
<td>Configure an EtherChannel load-balancing method.</td>
</tr>
<tr>
<td>(dst-ip</td>
<td>dst-mac</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>dst-ip</strong> — Load distribution is based on the destination-host IP address.</td>
<td></td>
</tr>
<tr>
<td><strong>dst-mac</strong> — Load distribution is based on the destination-host MAC address of the incoming packet.</td>
<td></td>
</tr>
</tbody>
</table>

**Note** When you enter the dst-mac keyword, the traffic is balanced only among four ports in the channel group. If you configure more than four ports in an EtherChannel with destination host MAC address load distribution, only four of the ports receive distributed traffic. This limitation does not apply to the other load distribution methods.

| **Step 3** end                        | Return to privileged EXEC mode.                                         |
| **Step 4** show etherchannel load-balance | Verify your entries.                                                |
| **Step 5** copy running-config startup-config | (Optional) Save your entries in the configuration file. |
To return EtherChannel load balancing to the default configuration, use the `no port-channel load-balance` global configuration command.

**Configuring the PAgP Learn Method and Priority**

Network devices are classified as PAgP physical learners or aggregate-port learners. A device is a physical learner if it learns addresses by physical ports and directs transmissions based on that knowledge. A device is an aggregate-port learner if it learns addresses by aggregate (logical) ports. The learn method must be configured the same at both ends of the link.

Note

PAgP is available only on NNIs and ENIs.

When a device and its partner are both aggregate-port learners, they learn the address on the logical port-channel. The device sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.

PAgP cannot automatically detect when the partner device is a physical learner and when the local device is an aggregate-port learner. Therefore, you must manually set the learning method on the local device to learn addresses by physical ports. You also must set the load-distribution method to source-based distribution, so that any given source MAC address is always sent on the same physical port.

You also can configure a single port within the group for all transmissions and use other ports for hot standby. The unused ports in the group can be swapped into operation in just a few seconds if the selected single port loses hardware-signal detection. You can configure which port is always selected for packet transmission by changing its priority with the `pagp port-priority` interface configuration command. The higher the priority, the more likely that the port will be selected.

Note

The switch supports address learning only on aggregate ports even though the `physical-port` keyword is provided in the CLI. The `pagp learn-method` command and the `pagp port-priority` command have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports.

When the link partner to the switch is a physical learner, we recommend that you configure the Cisco ME switch as a physical-port learner by using the `pagp learn-method physical-port` interface configuration command. Set the load-distribution method based on the source MAC address by using the `port-channel load-balance src-mac` global configuration command. The switch then sends packets to the physical learner switch using the same port in the EtherChannel from which it learned the source address. Use the `pagp learn-method` command only in this situation.

Beginning in privileged EXEC mode, follow these steps to configure your switch as a PAgP physical-port learner and to adjust the priority so that the same port in the bundle is selected for sending packets. This procedure is optional.
## Configuring EtherChannels

To return the priority to its default setting, use the `no pagp port-priority` interface configuration command. To return the learning method to its default setting, use the `no pagp learn-method` interface configuration command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| Step 2  | `interface interface-id` Specify the port for transmission, and enter interface configuration mode.  

**Note** If the interface is a UNI, you must enter the `port-type {eni | nni}` interface configuration command before configuring LACP. |

| Step 3  | `pagp learn-method physical-port` Select the PAgP learning method.  

By default, `aggregation-port learning` is selected, which means the switch sends packets to the source by using any of the ports in the EtherChannel. With aggregate-port learning, it is not important on which physical port the packet arrives.  

Select `physical-port` to connect with another switch that is a physical learner. Make sure to configure the `port-channel load-balance` global configuration command to `src-mac` as described in the “Configuring EtherChannel Load Balancing” section on page 35-17.  

The learning method must be configured the same at both ends of the link.  

**Note** If the interface is a UNI, you must enter the `port-type {eni | nni}` interface configuration command before configuring PAgP. |

| Step 4  | `pagp port-priority priority` Assign a priority so that the selected port is chosen for packet transmission.  

For `priority`, the range is 0 to 255. The default is 128. The higher the priority, the more likely that the port will be used for PAgP transmission. |

| Step 5  | `end` Return to privileged EXEC mode. |
| Step 6  | `show running-config` or `show pagp channel-group-number internal` Verify your entries. |

| Step 7  | `copy running-config startup-config` (Optional) Save your entries in the configuration file. |

To return the priority to its default setting, use the `no pagp port-priority` interface configuration command. To return the learning method to its default setting, use the `no pagp learn-method` interface configuration command.

### Configuring LACP Hot-Standby Ports

When enabled, LACP tries to configure the maximum number of LACP-compatible ports in a channel, up to a maximum of 16 ports. Only eight LACP links can be active at one time. The software places any additional links in a hot-standby mode. If one of the active links becomes inactive, a link that is in the hot-standby mode becomes active in its place.
Note

LACP is only available on NNIs and ENIs.

If you configure more than eight links for an EtherChannel group, the software automatically decides which of the hot-standby ports to make active based on the LACP priority. The software assigns to every link between systems that operate LACP a unique priority made up of these elements (in priority order):

- LACP system priority
- System ID (a combination of the LACP system priority and the switch MAC address)
- LACP port priority
- Port number

In priority comparisons, numerically lower values have higher priority. The priority decides which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Ports are considered for active use in aggregation in link-priority order starting with the port attached to the highest priority link. Each port is selected for active use if the preceding higher priority selections can also be maintained. Otherwise, the port is selected for standby mode.

You can change the default values of the LACP system priority and the LACP port priority to affect how the software selects active and standby links. For more information, see the “Configuring the LACP System Priority” section on page 35-20 and the “Configuring the LACP Port Priority” section on page 35-21.

Configuring the LACP System Priority

You can configure the system priority for all of the EtherChannels that are enabled for LACP by using the `lacp system-priority` global configuration command. You cannot configure a system priority for each LACP-configured channel. By changing this value from the default, you can affect how the software selects active and standby links.

You can use the `show etherchannel summary` privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

Beginning in privileged EXEC mode, follow these steps to configure the LACP system priority. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>lacp system-priority <code>priority</code></td>
</tr>
<tr>
<td></td>
<td>Configure the LACP system priority.</td>
</tr>
<tr>
<td></td>
<td>For <code>priority</code>, the range is 1 to 65535. The default is 32768.</td>
</tr>
<tr>
<td></td>
<td>The lower the value, the higher the system priority.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>show lacp sys-id</td>
</tr>
<tr>
<td></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To return the LACP system priority to the default value, use the `no lacp system-priority` global configuration command.

### Configuring the LACP Port Priority

By default, all ports use the same port priority. If the local system has a lower value for the system priority and the system ID than the remote system, you can affect which of the hot-standby links become active first by changing the port priority of LACP EtherChannel ports to a lower value than the default. The hot-standby ports that have lower port numbers become active in the channel first. You can use the `show etherchannel summary` privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag).

**Note**

If LACP is not able to aggregate all the ports that are compatible (for example, the remote system might have more restrictive hardware limitations), all the ports that cannot be actively included in the EtherChannel are put in the hot-standby state and are used only if one of the channeled ports fails.

Beginning in privileged EXEC mode, follow these steps to configure the LACP port priority. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| Step 2  | interface interface-id | Specify the port to be configured, and enter interface configuration mode.  
**Note** If the interface is a UNI, you must enter the `port-type {eni | nni}` interface configuration command before configuring LACP. |
| Step 3  | lacp port-priority priority | Configure the LACP port priority.  
For `priority`, the range is 1 to 65535. The default is 32768. The lower the value, the more likely that the port will be used for LACP transmission. |
| Step 4  | end | Return to privileged EXEC mode. |
| Step 5  | show running-config or show lacp [channel-group-number] internal | Verify your entries. |
| Step 6  | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To return the LACP port priority to the default value, use the `no lacp port-priority` interface configuration command.
Displaying EtherChannel, PAgP, and LACP Status

To display EtherChannel, PAgP, and LACP status information, use the privileged EXEC commands described in Table 35-4:

Table 35-4  Commands for Displaying EtherChannel, PAgP, and LACP Status

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show etherchannel [channel-group-number {detail</td>
<td>port</td>
</tr>
<tr>
<td>`show pagp [channel-group-number] {counters</td>
<td>internal</td>
</tr>
<tr>
<td>`show lacp [channel-group-number] {counters</td>
<td>internal</td>
</tr>
</tbody>
</table>

You can clear PAgP channel-group information and traffic counters by using the `clear pagp {channel-group-number counters | counters}` privileged EXEC command.

You can clear LACP channel-group information and traffic counters by using the `clear lacp {channel-group-number counters | counters}` privileged EXEC command.

For detailed information about the fields in the displays, see the command reference for this release.

Understanding Link-State Tracking

Link-state tracking, also known as trunk failover, is a feature that binds the link state of multiple interfaces. For example, link-state tracking provides redundancy in the network when used with Flex Links. If the link is lost on the primary interface, connectivity is transparently switched to the secondary interface.

As shown in Figure 35-4, switches that could be Cisco ME3400E switches are used as user-facing provider edge (UPE) switches in a customer site at the edge of the provider network connected to a customer premises equipment (CPE) switch. The UPE switches are connected to the provider edge (PE) switches in the service provider (SP) network. Customer devices, such as clients, connected to the CPE switch have multiple connections to the SP network. This configuration ensures that the traffic flow is balanced from the customer site to the SP and the reverse. Ports connected to the CPE are referred to as downstream ports, and ports connected to PE switches are referred to as upstream ports.

- UPE switch A provides links to the CPE through link-state group 1. Port 1 and port 2 are connected to the CPE. Port 3 and port 4 are connected to PE switch A through link-state group 1.
- UPE switch B provides links to the CPE through link-state group 2. Port 1 and port 2 are connected to CPE. Port 3 and 4 are connected to PE switch A through link-state group 2.
Chapter 35 Configuring EtherChannels and Link-State Tracking

Understanding Link-State Tracking

Figure 35-4 Typical Link-State Tracking Configuration

When you enable link-state tracking on the switch, the link state of the downstream ports is bound to the link state of one or more of the upstream ports. After you associate a set of downstream ports to a set of upstream ports, if all of the upstream ports become unavailable, link-state tracking automatically puts the associated downstream ports in an error-disabled state. This causes the CPE primary interface to failover to the secondary interface.

If the PE switch fails, the cables are disconnected, or the link is lost, the upstream interfaces can lose connectivity. When link-state tracking is not enabled and the upstream interfaces lose connectivity, the link states of the downstream interfaces remain unchanged. The CPE is not aware that upstream connectivity has been lost and does not failover to the secondary interface.

An interface can be an aggregation of ports (an EtherChannel), a single physical port in access or trunk mode, or routed ports. These interfaces can be bundled together, and each downstream interface can be associated with a single group consisting of multiple upstream interfaces, referred to as a link-state group.

In a link-state group, the link state of the downstream interfaces is dependent on the link state of the upstream interfaces. If all of the upstream interfaces in a link-state group are in the link-down state, the associated downstream interfaces are forced into the link-down state. If any one of the upstream interfaces in the link-state group in the link-up state, the associated downstream interfaces can change to or remain in a link-up state.

For example, in Figure 35-4, downstream interfaces 1 and 2 on UPE switch A are defined in link-state group 1 with upstream interfaces 3 and 4. Similarly, downstream interfaces 1 and 2 on UPE switch B are defined in link-state group 2 with upstream interfaces 3 and 4.

If the link is lost on upstream interface 3, the link states of downstream interfaces 1 and 2 do not change. If upstream interface 4 also loses link, downstream interfaces 1 and 2 change to the link-down state. The CPE switch stops forwarding traffic to PE switch A and starts to forward traffic to PE switch B.
You can recover a downstream interface link-down condition by removing the failed downstream port from the link-state group. To recover multiple downstream interfaces, disable the link-state group.

Configuring Link-State Tracking

- Default Link-State Tracking Configuration, page 35-24
- Link-State Tracking Configuration Guidelines, page 35-24
- Configuring Link-State Tracking, page 35-24

Default Link-State Tracking Configuration

There are no link-state groups defined, and link-state tracking is not enabled for any group.

Link-State Tracking Configuration Guidelines

- An interface that is defined as an upstream interface cannot also be defined as a downstream interface in the same or a different link-state group. The reverse is also true.
- An interface cannot be a member of more than one link-state group.
- You can configure only two link-state groups per switch.

Configuring Link-State Tracking

Beginning in privileged EXEC mode, follow these steps to configure a link-state group and to assign an interface to a group:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 link state track number</td>
<td>Create a link-state group, and enable link-state tracking. The group number can be 1 to 2; the default is 1.</td>
</tr>
<tr>
<td>Step 3 interface interface-id</td>
<td>Specify a physical interface or range of interfaces to configure, and enter interface configuration mode. Valid interfaces include switch ports in access or trunk mode (IEEE 802.1q), routed ports, or multiple ports bundled into an EtherChannel interface (static or LACP), also in trunk mode.</td>
</tr>
<tr>
<td>Step 4 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 5 link state group [number] {upstream</td>
<td>downstream}</td>
</tr>
<tr>
<td>Step 6 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Displaying Link-State Tracking Status

Use the `show link state group` command to display the link-state group information. Enter this command without keywords to display information about all link-state groups. Enter the group number to display information specific to the group. Enter the detail keyword to display detailed information about the group.

This is an example of output from the `show link state group 1` command:

```
Switch> show link state group 1

Link State Group: 1 Status: Enabled, Down

Upstream Interfaces : Fa0/15(Dwn) Fa0/16(Dwn)
Downstream Interfaces : Fa0/11(Dis) Fa0/12(Dis) Fa0/13(Dis) Fa0/14(Dis)
```

This is an example of output from the `show link state group detail` command:

```
Switch> show link state group detail

(Up):Interface up    (Dwn):Interface Down    (Dis):Interface disabled

Link State Group: 1 Status: Enabled, Down
Upstream Interfaces : Fa0/15(Dwn) Fa0/16(Dwn)
Downstream Interfaces : Fa0/11(Dis) Fa0/12(Dis) Fa0/13(Dis) Fa0/14(Dis)

Link State Group: 2 Status: Enabled, Down
Upstream Interfaces : Fa0/15(Dwn) Fa0/16(Dwn) Fa0/17(Dwn)
Downstream Interfaces : Fa0/11(Dis) Fa0/12(Dis) Fa0/13(Dis) Fa0/14(Dis)

(Up):Interface up    (Dwn):Interface Down    (Dis):Interface disabled
```

For detailed information about the fields in the display, see the command reference for this release.

Configuring IP Unicast Routing

This chapter describes how to configure IP Version 4 (IPv4) unicast routing on the Cisco ME 3400E Ethernet Access switch.

Note
Routing is supported only on switches that are running the metro IP access image.

For more detailed IPv4 unicast configuration information, see the Cisco IOS IP Configuration Guide, Release 12.2 For complete syntax and usage information for the commands used in this chapter, see these command references:

- Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.2
- Cisco IOS IP Command Reference, Volume 3 of 3: Multicast, Release 12.2

This chapter consists of these sections:

- Understanding IP Routing, page 36-2
- Steps for Configuring Routing, page 36-3
- Configuring IP Addressing, page 36-3
- Enabling IPv4 Unicast Routing, page 36-17
- Configuring RIP, page 36-17
- Configuring OSPF, page 36-22
- Configuring EIGRP, page 36-34
- Configuring BGP, page 36-42
- Configuring ISO CLNS Routing, page 36-62
- Configuring Multi-VRF CE, page 36-72
- Configuring Protocol-Independent Features, page 36-86
- Monitoring and Maintaining the IP Network, page 36-100

Note
When configuring routing parameters on the switch to allocate system resources to maximize the number of unicast routes allowed, you should use the sdm prefer default global configuration command to set the Switch Database Management (sdm) feature to balance resource. The Layer-2 template does not support routing and forces any routing to be done through software. This overloads the CPU and severely
degrades routing performance. For more information on the SDM templates, see Chapter 7, “Configuring SDM Templates” or see the `sdm prefer` command in the command reference for this release.

**Understanding IP Routing**

In an IP network, each subnetwork is mapped to an individual VLAN. However, network devices in different VLANs cannot communicate with one another without a Layer 3 device (router) to route traffic between the VLAN, referred to as inter-VLAN routing. You configure one or more routers to route traffic to the appropriate destination VLAN.

Figure 36-1 shows a basic routing topology. Switch A is in VLAN 10, and Switch B is in VLAN 20. The router has an interface in each VLAN.

![Figure 36-1 Routing Topology Example](image)

When Host A in VLAN 10 needs to communicate with Host B in VLAN 10, it sends a packet addressed to that host. Switch A forwards the packet directly to Host B, without sending it to the router.

When Host A sends a packet to Host C in VLAN 20, Switch A forwards the packet to the router, which receives the traffic on the VLAN 10 interface. The router checks the routing table, finds the correct outgoing interface, and forwards the packet on the VLAN 20 interface to Switch B. Switch B receives the packet and forwards it to Host C.

**Types of Routing**

Routers and Layer 3 switches can route packets in three different ways:

- **By using default routing**—sending traffic with a destination unknown to the router to a default outlet or destination.
- **By using preprogrammed static routes for the traffic**
  Static unicast routing forwards packets from predetermined ports through a single path into and out of a network. Static routing does not automatically respond to changes in the network and therefore, might result in unreachable destinations.
- **By dynamically calculating routes by using a routing protocol**
  Dynamic routing protocols are used by routers to dynamically calculate the best route for forwarding traffic. Routing protocols supported by the switch are Routing Information Protocol (RIP), Border Gateway Protocol (BGP), Open Shortest Path First (OSPF) protocol, Enhanced IGRP (EIGRP), and System-to-Intermediate System (IS-IS).
Steps for Configuring Routing

By default, IPv4 routing is disabled on the switch, and you must enable it before routing can take place. For detailed IP routing configuration information, see the Cisco IOS IP Configuration Guide, Release 12.2

In the following procedures, the specified interface must be one of these Layer 3 interfaces:

- A routed port: a physical port configured as a Layer 3 port by using the `no switchport` interface configuration command.
- A switch virtual interface (SVI): a VLAN interface created by using the `interface vlan vlan_id` global configuration command and by default a Layer 3 interface.
- An EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the `interface port-channel port-channel-number` global configuration command and binding the Ethernet interface into the channel group. For more information, see the “Configuring Layer 3 EtherChannels” section on page 35-14.

**Note**
The switch does not support tunnel interfaces for unicast routed traffic.

All Layer 3 interfaces on which routing will occur must have IP addresses assigned to them. See the “Assigning IP Addresses to Network Interfaces” section on page 36-5.

**Note**
A Layer 3 switch can have an IP address assigned to each routed port and SVI. The number of routed ports and SVIs that you can configure is not limited by software. However, the interrelationship between this number and the number and volume of features being implemented might have an impact on CPU utilization because of hardware limitations. To support IPv4 routing, use the `sdm prefer default` global configuration command.

Configuring IPv4g routing consists of several main procedures:

- To support VLAN interfaces, create and configure VLANs on the switch, and assign VLAN membership to Layer 2 interfaces. For more information, see Chapter 12, “Configuring VLANs.”
- Configure Layer 3 interfaces.
- Enable IPv4 routing on the switch.
- Assign IPv4 addresses to the Layer 3 interfaces.
- Enable selected routing protocols on the switch.
- Configure routing protocol parameters (optional).

Configuring IP Addressing

IP routing requires that Layer 3 network interfaces are assigned IP addresses to enable the interfaces and to allow communication with the hosts on interfaces that use IP. These sections describe how to configure various IP addressing features. Assigning IP addresses to the interface is required; the other procedures are optional.

- Default Addressing Configuration, page 36-4
- Assigning IP Addresses to Network Interfaces, page 36-5
- Configuring Address Resolution Methods, page 36-7
- Routing Assistance When IP Routing is Disabled, page 36-10
- Configuring Broadcast Packet Handling, page 36-12
- Monitoring and Maintaining IP Addressing, page 36-16

## Default Addressing Configuration

</tbody>
</table>
Assigning IP Addresses to Network Interfaces

An IP address identifies a location to which IP packets can be sent. An interface can have one primary IP address. A mask identifies the bits that denote the network number in an IP address. When you use the mask to subnet a network, the mask is referred to as a subnet mask. To receive an assigned network number, contact your Internet service provider.

Beginning in privileged EXEC mode, follow these steps to assign an IP address and a network mask to a Layer 3 interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>no switchport</td>
</tr>
<tr>
<td>Step 5</td>
<td>ip address ip-address subnet-mask</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use of Subnet Zero

Subnetting with a subnet address of zero is strongly discouraged because of the problems that can arise if a network and a subnet have the same addresses. For example, if network 131.108.0.0 is subnetted as 255.255.255.0, subnet zero would be written as 131.108.0.0, which is the same as the network address.

You can use the all ones subnet (131.108.255.0) and even though it is discouraged, you can enable the use of subnet zero if you need the entire subnet space for your IP address.

Beginning in privileged EXEC mode, follow these steps to enable subnet zero:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip subnet-zero</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the **no ip subnet-zero** global configuration command to restore the default and disable the use of subnet zero.
Classless Routing

By default, classless routing behavior is enabled on the switch when it is configured to route. With classless routing, if a router receives packets for a subnet of a network with no default route, the router forwards the packet to the best supernet route. A supernet consists of contiguous blocks of Class C address spaces used to simulate a single, larger address space and is designed to relieve the pressure on the rapidly depleting Class B address space.

In Figure 36-2, classless routing is enabled. When the host sends a packet to 120.20.4.1, instead of discarding the packet, the router forwards it to the best supernet route. If you disable classless routing and a router receives packets destined for a subnet of a network with no network default route, the router discards the packet.

![Figure 36-2 IP Classless Routing](image)

In Figure 36-3, the router in network 128.20.0.0 is connected to subnets 128.20.1.0, 128.20.2.0, and 128.20.3.0. If the host sends a packet to 120.20.4.1, because there is no network default route, the router discards the packet.

![Figure 36-3 No IP Classless Routing](image)
To prevent the switch from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing behavior.

Beginning in privileged EXEC mode, follow these steps to disable classless routing:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>no ip classless</td>
<td>Disable classless routing behavior.</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
<td>Verify your entry.</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entry in the configuration file.</td>
</tr>
</tbody>
</table>

To restore the default and have the switch forward packets destined for a subnet of a network with no network default route to the best supernet route possible, use the `ip classless` global configuration command.

**Configuring Address Resolution Methods**

You can control interface-specific handling of IP by using address resolution. A device using IP can have both a local address or MAC address, which uniquely defines the device on its local segment or LAN, and a network address, which identifies the network to which the device belongs. To communicate with a device on Ethernet, the software must learn the MAC address of the device. The process of learning the MAC address from an IP address is called address resolution. The process of learning the IP address from the MAC address is called reverse address resolution.

The switch can use these forms of address resolution:

- Address Resolution Protocol (ARP) is used to associate IP address with MAC addresses. Taking an IP address as input, ARP learns the associated MAC address and then stores the IP address/MAC address association in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests or replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP).

- Proxy ARP helps hosts with no routing tables learn the MAC addresses of hosts on other networks or subnets. If the switch (router) receives an ARP request for a host that is not on the same interface as the ARP request sender, and if the router has all of its routes to the host through other interfaces, it generates a proxy ARP packet giving its own local data link address. The host that sent the ARP request then sends its packets to the router, which forwards them to the intended host.

The switch also uses the Reverse Address Resolution Protocol (RARP), which functions the same as ARP does, except that the RARP packets request an IP address instead of a local MAC address. Using RARP requires a RARP server on the same network segment as the router interface. Use the `ip rarp-server address` interface configuration command to identify the server.

For more information on RARP, see the *Cisco IOS Configuration Fundamentals Configuration Guide, Release 12.2*.

You can perform these tasks to configure address resolution:

- Define a Static ARP Cache, page 36-8
- Set ARP Encapsulation, page 36-9
- Enable Proxy ARP, page 36-9
Define a Static ARP Cache

ARP and other address resolution protocols provide dynamic mapping between IP addresses and MAC addresses. Because most hosts support dynamic address resolution, you usually do not need to specify static ARP cache entries. If you must define a static ARP cache entry, you can do so globally, which installs a permanent entry in the ARP cache that the switch uses to translate IP addresses into MAC addresses. Optionally, you can also specify that the switch respond to ARP requests as if it were the owner of the specified IP address. If you do not want the ARP entry to be permanent, you can specify a timeout period for the ARP entry.

Beginning in privileged EXEC mode, follow these steps to provide static mapping between IP addresses and MAC addresses:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| **Step 2** | arp ip-address hardware-address type | Globally associate an IP address with a MAC (hardware) address in the ARP cache, and specify encapsulation type as one of these:  
  - arpa—ARP encapsulation for Ethernet interfaces  
  - snap—Subnetwork Address Protocol encapsulation for Token Ring and FDDI interfaces  
  - sap—HP’s ARP type |
| **Step 3** | arp ip-address hardware-address type [alias] | (Optional) Specify that the switch respond to ARP requests as if it were the owner of the specified IP address. |
| **Step 4** | interface interface-id | Enter interface configuration mode, and specify the interface to configure. |
| **Step 5** | no shutdown | Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled. |
| **Step 6** | arp timeout seconds | (Optional) Set the length of time an ARP cache entry will stay in the cache. The default is 14400 seconds (4 hours). The range is 0 to 2147483 seconds. |
| **Step 7** | end | Return to privileged EXEC mode. |
| **Step 8** | show interfaces [interface-id] | Verify the type of ARP and the timeout value used on all interfaces or a specific interface. |
| **Step 9** | show arp | View the contents of the ARP cache. |
| **Step 10** | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To remove an entry from the ARP cache, use the `no arp ip-address hardware-address type` global configuration command. To remove all nonstatic entries from the ARP cache, use the `clear arp-cache` privileged EXEC command.
Set ARP Encapsulation

By default, Ethernet ARP encapsulation (represented by the `arpa` keyword) is enabled on an IP interface. You can change the encapsulation methods to SNAP if required by your network.

Beginning in privileged EXEC mode, follow these steps to specify the ARP encapsulation type:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Step 3: no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
</tbody>
</table>
| Step 4: arp {arp | snap} | Specify the ARP encapsulation method:  
  - `arpa`—Address Resolution Protocol  
  - `snap`—Subnetwork Address Protocol |
| Step 5: end             | Return to privileged EXEC mode.              |
| Step 6: show interfaces [interface-id] | Verify ARP encapsulation configuration on all interfaces or the specified interface. |
| Step 7: copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To disable an encapsulation type, use the `no arp arpa` or `no arp snap` interface configuration command.

Enable Proxy ARP

By default, the switch uses proxy ARP to help hosts learn MAC addresses of hosts on other networks or subnets.

Beginning in privileged EXEC mode, follow these steps to enable proxy ARP if it has been disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Step 3: no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4: ip proxy-arp</td>
<td>Enable proxy ARP on the interface.</td>
</tr>
<tr>
<td>Step 5: end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6: show ip interface [interface-id]</td>
<td>Verify the configuration on the interface or all interfaces.</td>
</tr>
<tr>
<td>Step 7: copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable proxy ARP on the interface, use the `no ip proxy-arp` interface configuration command.
Routing Assistance When IP Routing is Disabled

These mechanisms allow the switch to learn about routes to other networks when it does not have IP routing enabled:

- Proxy ARP, page 36-10
- Default Gateway, page 36-10
- ICMP Router Discovery Protocol (IRDP), page 36-10

Proxy ARP

Proxy ARP, the most common method for learning about other routes, enables an Ethernet host with no routing information to communicate with hosts on other networks or subnets. The host assumes that all hosts are on the same local Ethernet and that they can use ARP to learn their MAC addresses. If a switch receives an ARP request for a host that is not on the same network as the sender, the switch evaluates whether it has the best route to that host. If it does, it sends an ARP reply packet with its own Ethernet MAC address, and the host that sent the request sends the packet to the switch, which forwards it to the intended host. Proxy ARP treats all networks as if they are local and performs ARP requests for every IP address.

Proxy ARP is enabled by default. To enable it after it has been disabled, see the “Enable Proxy ARP” section on page 36-9. Proxy ARP works as long as other routers support it.

Default Gateway

Another method for locating routes is to define a default router or default gateway. All nonlocal packets are sent to this router, which either routes them appropriately or sends an IP Control Message Protocol (ICMP) redirect message back, defining which local router the host should use. The switch caches the redirect messages and forwards each packet as efficiently as possible. A limitation of this method is that there is no means of detecting when the default router has gone down or is unavailable.

Beginning in privileged EXEC mode, follow these steps to define a default gateway (router) when IP routing is disabled:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip default-gateway ip-address</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>show ip redirects</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
</tbody>
</table>

*Step 1* Enter global configuration mode.

*Step 2* Set up a default gateway (router).

*Step 3* Return to privileged EXEC mode.

*Step 4* Display the address of the default gateway router to verify the setting.

*Step 5* (Optional) Save your entries in the configuration file.

Use the no ip default-gateway global configuration command to disable this function.

ICMP Router Discovery Protocol (IRDP)

Router discovery allows the switch to dynamically learn about routes to other networks using IRDP. IRDP allows hosts to locate routers. When operating as a client, the switch generates router discovery packets. When operating as a host, the switch receives router discovery packets. The switch can also
listens to Routing Information Protocol (RIP) routing updates and use this information to infer locations of routers. The switch does not actually store the routing tables sent by routing devices; it merely keeps track of which systems are sending the data. The advantage of using IRDP is that it allows each router to specify both a priority and the time after which a device is assumed to be down if no further packets are received.

Each device discovered becomes a candidate for the default router, and a new highest-priority router is selected when a higher priority router is discovered, when the current default router is declared down, or when a TCP connection is about to time out because of excessive retransmissions.

The only required task for IRDP routing on an interface is to enable IRDP processing on that interface. When enabled, the default parameters apply. You can optionally change any of these parameters.

Beginning in privileged EXEC mode, follow these steps to enable and configure IRDP on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 ip irdp</td>
<td>Enable IRDP processing on the interface.</td>
</tr>
<tr>
<td>Step 5 ip irdp multicast</td>
<td>(Optional) Send IRDP advertisements to the multicast address (224.0.0.1) instead of IP broadcasts. Note This command allows for compatibility with Sun Microsystems Solaris, which requires IRDP packets to be sent out as multicasts. Many implementations cannot receive these multicasts; ensure end-host ability before using this command.</td>
</tr>
<tr>
<td>Step 6 ip irdp holdtime seconds</td>
<td>(Optional) Set the IRDP period for which advertisements are valid. The default is three times the maxadvertinterval value. It must be greater than maxadvertinterval and cannot be greater than 9000 seconds. If you change the maxadvertinterval value, this value also changes.</td>
</tr>
<tr>
<td>Step 7 ip irdp maxadvertinterval seconds</td>
<td>(Optional) Set the IRDP maximum interval between advertisements. The default is 600 seconds.</td>
</tr>
<tr>
<td>Step 8 ip irdp minadvertinterval seconds</td>
<td>(Optional) Set the IRDP minimum interval between advertisements. The default is 0.75 times the maxadvertinterval. If you change the maxadvertinterval, this value changes to the new default (0.75 of maxadvertinterval).</td>
</tr>
<tr>
<td>Step 9 ip irdp preference number</td>
<td>(Optional) Set a device IRDP preference level. The allowed range is $-2^{31}$ to $2^{31}$. The default is 0. A higher value increases the router preference level.</td>
</tr>
<tr>
<td>Step 10 ip irdp address address [number]</td>
<td>(Optional) Specify an IRDP address and preference to proxy-advertise.</td>
</tr>
<tr>
<td>Step 11 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 12 show ip irdp</td>
<td>Verify settings by displaying IRDP values.</td>
</tr>
<tr>
<td>Step 13 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
If you change the `maxadvertinterval` value, the `holdtime` and `minadvertinterval` values also change, so it is important to first change the `maxadvertinterval` value, before manually changing either the `holdtime` or `minadvertinterval` values.

Use the `no ip irdp` interface configuration command to disable IRDP routing.

### Configuring Broadcast Packet Handling

After configuring an IP interface address, you can enable routing and configure one or more routing protocols, or you can configure the way the switch responds to network broadcasts. A broadcast is a data packet destined for all hosts on a physical network. The switch supports two kinds of broadcasting:

- A directed broadcast packet is sent to a specific network or series of networks. A directed broadcast address includes the network or subnet fields.
- A flooded broadcast packet is sent to every network.

You can also limit broadcast, unicast, and multicast traffic on Layer 2 interfaces by using the `storm-control` interface configuration command to set traffic suppression levels. For more information, see Chapter 23, “Configuring Port-Based Traffic Control.”

Routers provide some protection from broadcast storms by limiting their extent to the local cable. Bridges (including intelligent bridges), because they are Layer 2 devices, forward broadcasts to all network segments, thus propagating broadcast storms. The best solution to the broadcast storm problem is to use a single broadcast address scheme on a network. In most modern IP implementations, you can set the address to be used as the broadcast address. The switch supports several addressing schemes for forwarding broadcast messages.

- Enabling Directed Broadcast-to-Physical Broadcast Translation, page 36-12
- Forwarding UDP Broadcast Packets and Protocols, page 36-13
- Establishing an IP Broadcast Address, page 36-14
- Flooding IP Broadcasts, page 36-15

### Enabling Directed Broadcast-to-Physical Broadcast Translation

By default, IP-directed broadcasts are not forwarded; they are dropped to make routers less susceptible to denial-of-service attacks. You can enable forwarding of IP-directed broadcasts on an interface where the broadcast becomes a physical (MAC-layer) broadcast. Only those protocols configured by using the `ip forward-protocol` global configuration command are forwarded.

You can specify an access list to control which broadcasts are forwarded. Only those IP packets permitted by the access list are eligible to be translated from directed broadcasts to physical broadcasts. For more information on access lists, see Chapter 32, “Configuring Network Security with ACLs.”

Beginning in privileged EXEC mode, follow these steps to enable forwarding of IP-directed broadcasts on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>interface <code>interface-id</code></td>
<td>Enter interface configuration mode, and specify the interface to configure.</td>
</tr>
<tr>
<td>Command</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>no shutdown</strong></td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>ip directed-broadcast [access-list-number]</strong></td>
</tr>
<tr>
<td>Step 5</td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td>Step 6</td>
<td>**ip forward-protocol {udp [port]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td><strong>end</strong></td>
</tr>
<tr>
<td>Step 8</td>
<td><strong>show ip interface [interface-id]</strong></td>
</tr>
<tr>
<td></td>
<td>or <strong>show running-config</strong></td>
</tr>
<tr>
<td>Step 9</td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
</tbody>
</table>

Use the **no ip directed-broadcast** interface configuration command to disable translation of directed broadcast to physical broadcasts. Use the **no ip forward-protocol** global configuration command to remove a protocol or port.

**Forwarding UDP Broadcast Packets and Protocols**

User Datagram Protocol (UDP) is an IP host-to-host layer protocol that provides a low-overhead, connectionless session between two end systems and does not provide for acknowledgment of received datagrams. Network hosts occasionally use UDP broadcasts to find address, configuration, and name information. If such a host is on a network segment that does not include a server, UDP broadcasts are normally not forwarded. You can configure an interface on a router to forward certain classes of broadcasts to a helper address. You can use more than one helper address per interface.

You can specify a UDP destination port to control which UDP services are forwarded. You can specify multiple UDP protocols. You can also specify the Network Disk (ND) protocol, which is used by older diskless Sun workstations and the network security protocol SDNS.

By default, both UDP and ND forwarding are enabled if a helper address has been defined for an interface. The description for the **ip forward-protocol** interface configuration command in the *Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.2* lists the ports that are forwarded by default if you do not specify any UDP ports.

If you do not specify any UDP ports when you configure the forwarding of UDP broadcasts, you are configuring the router to act as a BOOTP forwarding agent. BOOTP packets carry DHCP information.
Beginning in privileged EXEC mode, follow these steps to enable forwarding UDP broadcast packets on an interface and specify the destination address:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are</td>
</tr>
<tr>
<td>Step 4 ip helper-address address</td>
<td>Enable forwarding and specify the destination address for forwarding</td>
</tr>
<tr>
<td>Step 5 exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 6 ip forward-protocol {udp [port]</td>
<td>nd</td>
</tr>
<tr>
<td>Step 7 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 8 show ip interface [interface-id]</td>
<td>Verify the configuration on the interface or all interfaces.</td>
</tr>
<tr>
<td>or show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 9 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no ip helper-address interface configuration command to disable the forwarding of broadcast packets to specific addresses. Use the no ip forward-protocol global configuration command to remove a protocol or port.

**Establishing an IP Broadcast Address**

The most popular IP broadcast address (and the default) is an address consisting of all ones (255.255.255.255). However, the switch can be configured to generate any form of IP broadcast address.

Beginning in privileged EXEC mode, follow these steps to set the IP broadcast address on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the interface to configure.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 ip broadcast-address ip-address</td>
<td>Enter a broadcast address different from the default, for example 128.1.255.255.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show ip interface [interface-id]</td>
<td>Verify the broadcast address on the interface or all interfaces.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
To restore the default IP broadcast address, use the `no ip broadcast-address` interface configuration command.

**Flooding IP Broadcasts**

You can allow IP broadcasts to be flooded throughout your internetwork in a controlled fashion by using the database created by the bridging STP. Using this feature also prevents loops. To support this capability, bridging must be configured on each interface that is to participate in the flooding. If bridging is not configured on an interface, the interface can receive broadcasts but it never forwards the broadcasts it receives, and the router never uses that interface to send broadcasts received on a different interface.

Packets that are forwarded to a single network address using the IP helper-address mechanism can be flooded. Only one copy of the packet is sent on each network segment.

To be considered for flooding, packets must meet these criteria. (Note that these are the same conditions used to consider packet forwarding using IP helper addresses.)

- The packet must be a MAC-level broadcast.
- The packet must be an IP-level broadcast.
- The packet must be a TFTP, DNS, Time, NetBIOS, ND, or BOOTP packet, or a UDP specified by the `ip forward-protocol udp` global configuration command.
- The time-to-live (TTL) value of the packet must be at least two.

A flooded UDP datagram is given the destination address specified with the `ip broadcast-address` interface configuration command on the output interface. The destination address can be set to any address so it might change as the datagram propagates through the network. The source address is never changed. The TTL value is decremented.

When a flooded UDP datagram is sent out an interface (and the destination address possibly changed), the datagram is handed to the normal IP output routines and is, therefore, subject to access lists, if they are present on the output interface.

Beginning in privileged EXEC mode, follow these steps to use the bridging spanning-tree database to flood UDP datagrams:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip forward-protocol spanning-tree</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the `no ip forward-protocol spanning-tree` global configuration command to disable the flooding of IP broadcasts.

In the switch, the majority of packets are forwarded in hardware; most packets do not go through the switch CPU. For those packets that do go to the CPU, you can speed up spanning tree-based UDP flooding by a factor of about four to five times by using turbo-flooding. This feature is supported over Ethernet interfaces configured for ARP encapsulation.
Beginning in privileged EXEC mode, follow these steps to increase spanning-tree-based flooding:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode</td>
</tr>
<tr>
<td>ip forward-protocol turbo-flood</td>
<td>Use the spanning-tree database to speed up flooding of UDP datagrams.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entry.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entry in the configuration file.</td>
</tr>
</tbody>
</table>

To disable this feature, use the `no ip forward-protocol turbo-flood` global configuration command.

### Monitoring and Maintaining IP Addressing

When the contents of a particular cache, table, or database have become or are suspected to be invalid, you can remove all its contents by using the `clear` privileged EXEC commands.

**Table 36-2 Commands to Clear Caches, Tables, and Databases**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear arp-cache</td>
<td>Clear the IP ARP cache and the fast-switching cache.</td>
</tr>
<tr>
<td>clear host {name</td>
<td>*}</td>
</tr>
<tr>
<td>clear ip route {network</td>
<td>mask</td>
</tr>
</tbody>
</table>

You can display specific statistics, such as the contents of IP routing tables, caches, and databases; the reachability of nodes; and the routing path that packets are taking through the network.

**Table 36-3 Commands to Display Caches, Tables, and Databases**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp</td>
<td>Display the entries in the ARP table.</td>
</tr>
<tr>
<td>show hosts</td>
<td>Display the default domain name, style of lookup service, name server hosts, and the cached list of hostnames and addresses.</td>
</tr>
<tr>
<td>show ip aliases</td>
<td>Display IP addresses mapped to TCP ports (aliases).</td>
</tr>
<tr>
<td>show ip arp</td>
<td>Display the IP ARP cache.</td>
</tr>
<tr>
<td>show ip interface [interface-id]</td>
<td>Display the IP status of interfaces.</td>
</tr>
<tr>
<td>show ip irdp</td>
<td>Display IRDP values.</td>
</tr>
<tr>
<td>show ip masks address</td>
<td>Display the masks used for network addresses and the number of subnets using each mask.</td>
</tr>
<tr>
<td>show ip redirects</td>
<td>Display the address of a default gateway.</td>
</tr>
<tr>
<td>show ip route [address</td>
<td>mask</td>
</tr>
<tr>
<td>show ip route summary</td>
<td>Display the current state of the routing table in summary form.</td>
</tr>
</tbody>
</table>
Enabling IPv4 Unicast Routing

By default, the switch is in Layer 2 switching mode and IP routing is disabled. To use the Layer 3 capabilities of the switch, you must enable IP routing.

Beginning in privileged EXEC mode, follow these steps to enable IP routing:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ip routing</td>
<td>Enable IP routing.</td>
</tr>
<tr>
<td>router ip_routing_protocol</td>
<td>Specify an IP routing protocol. This step might include other commands, such as specifying the networks to route with the network (RIP) router configuration command. For information on specific protocols, see sections later in this chapter and to the Cisco IOS IP Configuration Guide, Release 12.2.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no ip routing global configuration command to disable routing.

This example shows how to enable IP routing using RIP as the routing protocol:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# router rip
Switch(config-router)# network 10.0.0.0
Switch(config-router)# end

You can now set up parameters for the selected routing protocols as described in these sections:

- Configuring RIP, page 36-17
- Configuring OSPF, page 36-22
- Configuring EIGRP, page 36-34
- Configuring BGP, page 36-42
- Configuring ISO CLNS Routing, page 36-62
- Configuring Multi-VRF CE, page 36-72
- Configuring Protocol-Independent Features, page 36-86 (optional)

Configuring RIP

The Routing Information Protocol (RIP) is an interior gateway protocol (IGP) used in small, homogeneous networks. It is a distance-vector routing protocol that uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. You can find detailed information about RIP in IP Routing Fundamentals, published by Cisco Press.
Using RIP, the switch sends routing information updates (advertisements) every 30 seconds. If a router does not receive an update from another router for 180 seconds or more, it marks the routes served by that router as unusable. If there is still no update after 240 seconds, the router removes all routing table entries for the non-updating router.

RIP uses hop counts to rate the value of different routes. The hop count is the number of routers that can be traversed in a route. A directly connected network has a hop count of zero; a network with a hop count of 16 is unreachable. This small range (0 to 15) makes RIP unsuitable for large networks.

If the router has a default network path, RIP advertises a route that links the router to the pseudonetwork 0.0.0.0. The 0.0.0.0 network does not exist, but is treated by RIP as a network to implement default routing. The switch advertises the default network if a default was learned by RIP or if the router has a gateway of last resort and RIP is configured with a default metric. RIP sends updates to the interfaces in specified networks. If an interface’s network is not specified, it is not advertised in any RIP update.

These sections contain this configuration information:

- Default RIP Configuration, page 36-18
- Configuring Basic RIP Parameters, page 36-19
- Configuring RIP Authentication, page 36-20
- Configuring Split Horizon, page 36-21

### Default RIP Configuration

</tr>
<tr>
<td></td>
<td>• Invalid: 180 seconds.</td>
</tr>
<tr>
<td></td>
<td>• Hold-down: 180 seconds.</td>
</tr>
<tr>
<td></td>
<td>• Flush: 240 seconds.</td>
</tr>
</tbody>
</table>
Configuring RIP

To configure RIP, you enable RIP routing for a network and optionally configure other parameters. On the Cisco ME 3400E switch, RIP configuration commands are ignored until you configure the network number.

Beginning in privileged EXEC mode, follow these steps to enable and configure RIP:

1. **configure terminal**
   - Enter global configuration mode.

2. **ip routing**
   - Enable IP routing. (Required only if IP routing is disabled.)

3. **router rip**
   - Enable a RIP routing process, and enter router configuration mode.

4. **network network number**
   - Associate a network with a RIP routing process. You can specify multiple network commands. RIP routing updates are sent and received through interfaces only on these networks.
   - **Note**: You must configure a network number for RIP commands to take effect.

5. **neighbor ip-address**
   - (Optional) Define a neighboring router with which to exchange routing information. This step allows routing updates from RIP (normally a broadcast protocol) to reach nonbroadcast networks.

6. **offset list [access-list number | name] [in | out] offset [type number]**
   - (Optional) Apply an offset list to routing metrics to increase incoming and outgoing metrics to routes learned through RIP. You can limit the offset list with an access list or an interface.

7. **timers basic update invalid holdown flush**
   - (Optional) Adjust routing protocol timers. Valid ranges for all timers are 0 to 4294967295 seconds.
     - **update**—The time between sending routing updates. The default is 30 seconds.
     - **invalid**—The timer after which a route is declared invalid. The default is 180 seconds.
     - **holdown**—The time before a route is removed from the routing table. The default is 180 seconds.
     - **flush**—The amount of time for which routing updates are postponed. The default is 240 seconds.

8. **version {1 | 2}**
   - (Optional) Configure the switch to receive and send only RIP Version 1 or RIP Version 2 packets. By default, the switch receives Version 1 and 2 but sends only Version 1.
   - You can also use the interface commands **ip rip {send | receive} version {1 | 2}** to control what versions are used for sending and receiving on interfaces.

---

**Table 36-4 Default RIP Configuration (continued)**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Validate-update-source</td>
<td>Enabled.</td>
</tr>
<tr>
<td>Version</td>
<td>Receives RIP Version 1 and 2 packets; sends Version 1 packets.</td>
</tr>
</tbody>
</table>
### Configuring RIP

To turn off the RIP routing process, use the `no router rip` global configuration command.

To display the parameters and current state of the active routing protocol process, use the `show ip protocols` privileged EXEC command. Use the `show ip rip database` privileged EXEC command to display summary address entries in the RIP database.

#### Configuring RIP Authentication

RIP Version 1 does not support authentication. If you are sending and receiving RIP Version 2 packets, you can enable RIP authentication on an interface. The key chain specifies the set of keys that can be used on the interface. If a key chain is not configured, no authentication is performed, not even the default. Therefore, you must also perform the tasks in the “Managing Authentication Keys” section on page 36-99.

The switch supports two modes of authentication on interfaces for which RIP authentication is enabled: plain text and MD5. The default is plain text.

Beginning in privileged EXEC mode, follow these steps to configure RIP authentication on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Enter interface configuration mode, and specify the interface to configure.</td>
</tr>
<tr>
<td>no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>ip rip authentication key-chain name-of-chain</td>
<td>Enable RIP authentication.</td>
</tr>
<tr>
<td>ip rip authentication mode [text</td>
<td>md5]</td>
</tr>
</tbody>
</table>
To restore clear text authentication, use the `no ip rip authentication mode` interface configuration command. To prevent authentication, use the `no ip rip authentication key-chain` interface configuration command.

### Configuring Split Horizon

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature can optimize communication among multiple routers when links are broken.

**Note**

In general, Cisco does not recommend disabling split horizon unless you are certain that your application requires it to properly advertise routes.

Beginning in privileged EXEC mode, follow these steps to disable split horizon on the interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Enter interface configuration mode, and specify the interface to configure.</td>
</tr>
<tr>
<td><code>no shutdown</code></td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td><code>ip address ip-address subnet-mask</code></td>
<td>Configure the IP address and IP subnet.</td>
</tr>
<tr>
<td><code>no ip split-horizon</code></td>
<td>Disable split horizon on the interface.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>show ip interface interface-id</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To enable the split horizon mechanism, use the `ip split-horizon` interface configuration command.

### Configuring Summary Addresses

To configure an interface running RIP to advertise a summarized local IP address pool on a network access server for dial-up clients, use the `ip summary-address rip` interface configuration command.

**Note**

If split horizon is enabled, neither autosummary nor interface IP summary addresses are advertised.
Beginning in privileged EXEC mode, follow these steps to set an interface to advertise a summarized local IP address and to disable split horizon on the interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 ip address ip-address subnet-mask</td>
<td>Configure the IP address and IP subnet.</td>
</tr>
<tr>
<td>Step 5 ip summary-address rip ip address ip-network mask</td>
<td>Configure the IP address to be summarized and the IP network mask.</td>
</tr>
<tr>
<td>Step 6 no ip split horizon</td>
<td>Disable split horizon on the interface.</td>
</tr>
<tr>
<td>Step 7 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 8 show ip interface interface-id</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 9 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable IP summarization, use the `no ip summary-address rip` router configuration command.

In this example, the major net is 10.0.0.0. The summary address 10.2.0.0 overrides the autosummary address of 10.0.0.0 so that 10.2.0.0 is advertised out interface Gigabit Ethernet port 2, and 10.0.0.0 is not advertised. If the interface is in Layer 2 mode (the default), you must enter a `no switchport` interface configuration command before entering the `ip address` interface configuration command.

**Note** If split horizon is enabled, neither autosummary nor interface summary addresses (those configured with the `ip summary-address rip` router configuration command) are advertised.

```bash
Switch(config)# router rip
Switch(config-router)# interface gi0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.1.5.1 255.255.255.0
Switch(config-if)# ip summary-address rip 10.2.0.0 255.255.0.0
Switch(config-if)# no ip split-horizon
Switch(config-if)# exit
Switch(config)# router rip
Switch(config-router)# network 10.0.0.0
Switch(config-router)# neighbor 2.2.2.2 peer-group mygroup
Switch(config-router)# end
```

**Configuring OSPF**

Open Shortest Path First (OSPF) is an Interior Gateway Protocol (IGP) designed expressly for IP networks, supporting IP subnetworking and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets.

This section briefly describes how to configure OSPF. For a complete description of the OSPF commands, see the “OSPF Commands” chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2.*
Note

OSPF classifies different media into broadcast, nonbroadcast multiaccess (NBMA), or point-to-point networks. Broadcast and nonbroadcast networks can also be configured as point-to-multipoint networks. The switch supports all these network types.

The Cisco implementation conforms to the OSPF Version 2 specifications with these key features:

- Definition of stub areas is supported.
- Routes learned through any IP routing protocol can be redistributed into another IP routing protocol. At the intradomain level, this means that OSPF can import routes learned through EIGRP and RIP. OSPF routes can also be exported into RIP.
- Plain text and MD5 authentication among neighboring routers within an area is supported.
- Configurable routing interface parameters include interface output cost, retransmission interval, interface transmit delay, router priority, router dead and hello intervals, and authentication key.
- Virtual links are supported.
- Not-so-stubby-areas (NSSAs) per RFC 1587 are supported.

OSPF typically requires coordination among many internal routers, area border routers (ABRs) connected to multiple areas, and autonomous system boundary routers (ASBRs). The minimum configuration would use all default parameter values, no authentication, and interfaces assigned to areas. If you customize your environment, you must ensure coordinated configuration of all routers.

These sections contain this configuration information:

- Default OSPF Configuration, page 36-24
- Nonstop Forwarding Awareness, page 36-25
- Configuring OSPF Interfaces, page 36-26
- Configuring OSPF Network Types, page 36-27
- Configuring OSPF Area Parameters, page 36-29
- Configuring Other OSPF Parameters, page 36-31
- Changing LSA Group Pacing, page 36-32
- Configuring a Loopback Interface, page 36-33
- Monitoring OSPF, page 36-34

Chapter 36 Configuring IP Unicast Routing

Configuring OSPF

The OSPF NSF Awareness feature is supported for IPv4 in the metro IP access image. When the neighboring router is NSF-capable, the Layer 3 switch continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router crashing and the backup RP taking over, or while the primary RP is manually reloaded for a non-disruptive software upgrade.

This feature cannot be disabled. For more information on this feature see the OSPF Nonstop Forwarding (NSF) Awareness Feature Guide at this URL:

Configuring Basic OSPF Parameters

Enabling OSPF requires that you create an OSPF routing process, specify the range of IP addresses to be associated with the routing process, and assign area IDs to be associated with that range.

Beginning in privileged EXEC mode, follow these steps to enable OSPF:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>router ospf process-id</td>
<td>Enable OSPF routing, and enter router configuration mode. The process ID is an internally used identification parameter that is locally assigned and can be any positive integer. Each OSPF routing process has a unique value.</td>
</tr>
<tr>

</tbody>
</table>

1. NSF = Nonstop forwarding
2. OSPF NSF awareness is enabled for IPv4 on switches running the metro IP access image
To terminate an OSPF routing process, use the `no router ospf process-id` global configuration command.

This example shows how to configure an OSPF routing process and assign it a process number of 109:

```
Switch(config)# router ospf 109
Switch(config-router)# network 131.108.0.0 255.255.255.0 area 24
```

### Configuring OSPF Interfaces

You can use the `ip ospf` interface configuration commands to modify interface-specific OSPF parameters. You are not required to modify any of these parameters, but some interface parameters (hello interval, dead interval, and authentication key) must be consistent across all routers in an attached network. If you modify these parameters, be sure all routers in the network have compatible values.

**Note**

The `ip ospf` interface configuration commands are all optional.

Beginning in privileged EXEC mode, follow these steps to modify OSPF interface parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1: <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2: <code>interface interface-id</code></td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Step 3: <code>no shutdown</code></td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4: <code>ip ospf cost</code></td>
<td>(Optional) Explicitly specify the cost of sending a packet on the interface.</td>
</tr>
<tr>
<td>Step 5: <code>ip ospf retransmit-interval seconds</code></td>
<td>(Optional) Specify the number of seconds between link state advertisement transmissions. The range is 1 to 65535 seconds. The default is 5 seconds.</td>
</tr>
<tr>
<td>Step 6: <code>ip ospf transmit-delay seconds</code></td>
<td>(Optional) Set the estimated number of seconds to wait before sending a link state update packet. The range is 1 to 65535 seconds. The default is 1 second.</td>
</tr>
<tr>
<td>Step 7: <code>ip ospf priority number</code></td>
<td>(Optional) Set priority to help find the OSPF designated router for a network. The range is from 0 to 255. The default is 1.</td>
</tr>
<tr>
<td>Step 8: <code>ip ospf hello-interval seconds</code></td>
<td>(Optional) Set the number of seconds between hello packets sent on an OSPF interface. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td>Step 9: <code>ip ospf dead-interval seconds</code></td>
<td>(Optional) Set the number of seconds after the last device hello packet was seen before its neighbors declare the OSPF router to be down. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 4 times the hello interval.</td>
</tr>
<tr>
<td>Step 10: <code>ip ospf authentication-key key</code></td>
<td>(Optional) Assign a password to be used by neighboring OSPF routers. The password can be any string of keyboard-entered characters up to 8 bytes in length. All neighboring routers on the same network must have the same password to exchange OSPF information.</td>
</tr>
</tbody>
</table>
Use the no form of these commands to remove the configured parameter value or return to the default value.

### Configuring OSPF Network Types

OSPF classifies different media into the three types of networks by default:

- Broadcast networks (Ethernet, Token Ring, and FDDI)
- Nonbroadcast multiaccess (NBMA) networks (Switched Multimegabit Data Service [SMDS], Frame Relay, and X.25)
- Point-to-point networks (High-Level Data Link Control [HDLC], PPP)

You can also configure network interfaces as either a broadcast or an NBMA network and as point-to-point or point-to-multipoint, regardless of the default media type.

### Configuring OSPF for Nonbroadcast Networks

Because many routers might be attached to an OSPF network, a designated router is selected for the network. If broadcast capability is not configured in the network, the designated router selection requires special configuration parameters. You need to configure these parameters only for devices that are eligible to become the designated router or backup designated router (in other words, routers with a nonzero router priority value).
Beginning in privileged EXEC mode, follow these steps to configure routers that interconnect to nonbroadcast networks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> router ospf process-id</td>
<td>Configure an OSPF routing process and enter router configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> neighbor ip-address [priority number] [poll-interval seconds]</td>
<td>Specify an OSPF neighbor with neighbor parameters as required.</td>
</tr>
<tr>
<td></td>
<td>• ip-address—Enter the interface IP address of the OSPF neighbor.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) priority number—Specify the router priority value of the nonbroadcast neighbor associated with the IP address. The range is 0 to 255; the default is 0.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) poll-interval seconds—Specify a number that represents the poll interval time (in seconds). This value should be much larger than the hello interval. The range is 0-4294967295; the default is 120 seconds (2 minutes).</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> show ip ospf [process-id]</td>
<td>Display OSPF-related information.</td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

On point-to-multipoint, nonbroadcast networks, you then use the `neighbor` router configuration command to identify neighbors. Assigning a cost to a neighbor is optional.

**Configuring Network Types for OSPF Interfaces**

You can configure network interfaces as either broadcast or NBMA and as point-to-point or point-to-multipoint, regardless of the default media type.

An OSPF point-to-multipoint interface is defined as a numbered point-to-point interface with one or more neighbors. On point-to-multipoint broadcast networks, specifying neighbors is optional. When you configure an interface as point-to-multipoint when the media does not support broadcast, you should use the `neighbor` command to identify neighbors.

Beginning in privileged EXEC mode, follow these steps to configure OSPF network type for an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td><strong>Step 3</strong> no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
</tbody>
</table>
Use the no form of the `ip ospf network` command to return to the default network type for the media.

### Configuring OSPF Area Parameters

You can optionally configure several OSPF area parameters. These parameters include authentication for password-based protection against unauthorized access to an area, stub areas, and not-so-stubby-areas (NSSAs). **Stub areas** are areas into which information on external routes is not sent. Instead, the area border router (ABR) generates a default external route into the stub area for destinations outside the autonomous system (AS). An NSSA does not flood all LSAs from the core into the area, but can import AS external routes within the area by redistribution.
Route summarization is the consolidation of advertised addresses into a single summary route to be advertised by other areas. If network numbers are contiguous, you can use the `area range` router configuration command to configure the ABR to advertise a summary route that covers all networks in the range.

**Note**

The OSPF `area` router configuration commands are all optional.

Beginning in privileged EXEC mode, follow these steps to configure area parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>router ospf process-id</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>area area-id authentication</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>area area-id authentication message-digest</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>area area-id stub [no-summary]</code></td>
</tr>
</tbody>
</table>
| Step 6  | `area area-id nssa [no-redistributed] [default-information originate] [no-summary]` | (Optional) Defines an area as a not-so-stubby-area. Every router within the same area must agree that the area is NSSA. Select one of these keywords:  
  - `no-redistributed`—Select when the router is an NSSA ABR and you want the `redistribute` command to import routes into normal areas, but not into the NSSA.  
  - `default-information originate`—Select on an ABR to allow importing type 7 LSAs into the NSSA.  
  - `no-redistributed`—Select to not send summary LSAs into the NSSA. |
| Step 7  | `area area-id range address mask` | (Optional) Specify an address range for which a single route is advertised. Use this command only with area border routers. |
| Step 8  | `end` | Return to privileged EXEC mode. |
| Step 9  | `show ip ospf [process-id]` | Display information about the OSPF routing process in general or for a specific process ID to verify configuration. |
|         | `show ip ospf [process-id [area-id]] database` | Display lists of information related to the OSPF database for a specific router. |
| Step 10 | `copy running-config startup-config` | (Optional) Save your entries in the configuration file. |

Use the `no` form of these commands to remove the configured parameter value or to return to the default value.
Configuring Other OSPF Parameters

You can optionally configure other OSPF parameters in router configuration mode.

- Route summarization: When redistributing routes from other protocols as described in the “Using Route Maps to Redistribute Routing Information” section on page 36-90, each route is advertised individually in an external LSA. To help decrease the size of the OSPF link state database, you can use the `summary-address` router configuration command to advertise a single router for all the redistributed routes included in a specified network address and mask.

- Virtual links: In OSPF, all areas must be connected to a backbone area. You can establish a virtual link in case of a backbone-continuity break by configuring two Area Border Routers as endpoints of a virtual link. Configuration information includes the identity of the other virtual endpoint (the other ABR) and the nonbackbone link that the two routers have in common (the transit area). Virtual links cannot be configured through a stub area.

- Default route: When you specifically configure redistribution of routes into an OSPF routing domain, the route automatically becomes an autonomous system boundary router (ASBR). You can force the ASBR to generate a default route into the OSPF routing domain.

- Domain Name Server (DNS) names for use in all OSPF `show` privileged EXEC command displays makes it easier to identify a router than displaying it by router ID or neighbor ID.

- Default Metrics: OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. The metric is calculated as `ref-bw` divided by bandwidth, where `ref` is 10 by default, and bandwidth (`bw`) is specified by the `bandwidth` interface configuration command. For multiple links with high bandwidth, you can specify a larger number to differentiate the cost on those links.

- Administrative distance is a rating of the trustworthiness of a routing information source, an integer between 0 and 255, with a higher value meaning a lower trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored. OSPF uses three different administrative distances: routes within an area (intraarea), routes to another area (interarea), and routes from another routing domain learned through redistribution (external). You can change any of the distance values.

- Passive interfaces: Because interfaces between two devices on an Ethernet represent only one network segment, to prevent OSPF from sending hello packets for the sending interface, you must configure the sending device to be a passive interface. Both devices can identify each other through the hello packet for the receiving interface.

- Route calculation timers: You can configure the delay time between when OSPF receives a topology change and when it starts the shortest path first (SPF) calculation and the hold time between two SPF calculations.

- Log neighbor changes: You can configure the router to send a syslog message when an OSPF neighbor state changes, providing a high-level view of changes in the router.

Beginning in privileged EXEC mode, follow these steps to configure these OSPF parameters:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>router ospf process-id</td>
<td>Enable OSPF routing, and enter router configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>summary-address address mask</td>
<td>(Optional) Specify an address and IP subnet mask for redistributed routes so that only one summary route is advertised.</td>
</tr>
</tbody>
</table>
### Configuring OSPF

#### Changing LSA Group Pacing

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, check-summing, and aging functions for more efficient router use. This feature is enabled by default with a 4-minute default pacing interval, and you will not usually need to modify this parameter. The optimum group pacing interval is inversely proportional to the number of LSAs the router is refreshing, check-summing, and aging. For example, if you have approximately 10,000 LSAs in the database, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

Beginning in privileged EXEC mode, follow these steps to configure OSPF LSA pacing:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4</td>
<td>area area-id virtual-link router-id [hello-interval seconds] [retransmit-interval seconds] [trans] [[authentication-key key]</td>
</tr>
<tr>
<td>Step 5</td>
<td>default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]</td>
</tr>
<tr>
<td>Step 6</td>
<td>ip ospf name-lookup</td>
</tr>
<tr>
<td>Step 7</td>
<td>ip auto-cost reference-bandwidth ref-bw</td>
</tr>
<tr>
<td>Step 8</td>
<td>distance ospf ([inter-area dist1] [inter-area dist2] [external dist3])</td>
</tr>
<tr>
<td>Step 9</td>
<td>passive-interface type number</td>
</tr>
<tr>
<td>Step 10</td>
<td>timers throttle ospf spf-delay spf-holdtime spf-wait</td>
</tr>
<tr>
<td></td>
<td>• spf-delay—Delay between receiving a change to SPF calculation. The range is from 1 to 600000, milliseconds.</td>
</tr>
<tr>
<td></td>
<td>• spf-holdtime—Delay between first and second SPF calculation. The range is from 1 to 600000 in milliseconds.</td>
</tr>
<tr>
<td></td>
<td>• spf-wait—Maximum wait time in milliseconds for SPF calculations. The range is from 1 to 600000 in milliseconds.</td>
</tr>
<tr>
<td>Step 11</td>
<td>ospf log-adj-changes</td>
</tr>
<tr>
<td>Step 12</td>
<td>end</td>
</tr>
<tr>
<td>Step 13</td>
<td>show ip ospf [process-id [area-id]] database</td>
</tr>
<tr>
<td>Step 14</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To return to the default value, use the `no timers lsa-group-pacing` router configuration command.

### Configuring a Loopback Interface

OSPF uses the highest IP address configured on the interfaces as its router ID. If this interface is down or removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces. If a loopback interface is configured with an IP address, OSPF uses this IP address as its router ID, even if other interfaces have higher IP addresses. Because loopback interfaces never fail, this provides greater stability. OSPF automatically prefers a loopback interface over other interfaces, and it chooses the highest IP address among all loopback interfaces.

Beginning in privileged EXEC mode, follow these steps to configure a loopback interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface loopback 0</td>
<td>Create a loopback interface, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 ip address address mask</td>
<td>Assign an IP address to this interface.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show ip interface</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no interface loopback 0` global configuration command to disable the loopback interface.
Monitoring OSPF

You can display specific statistics such as the contents of IP routing tables, caches, and databases.

Table 36-6 lists some of the privileged EXEC commands for displaying statistics. For more show ip ospf database privileged EXEC command options and for explanations of fields in the resulting display, see the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2.

**Table 36-6 Show IP OSPF Statistics Commands**

</tbody>
</table>

Configuring EIGRP

Enhanced IGRP (EIGRP) is a Cisco proprietary enhanced version of the IGRP. EIGRP uses the same distance vector algorithm and distance information as IGRP; however, the convergence properties and the operating efficiency of EIGRP are significantly improved.

The convergence technology employs an algorithm referred to as the Diffusing Update Algorithm (DUAL), which guarantees loop-free operation at every instant throughout a route computation and allows all devices involved in a topology change to synchronize at the same time. Routers that are not affected by topology changes are not involved in recomputations.

IP EIGRP provides increased network width. With RIP, the largest possible width of your network is 15 hops. Because the EIGRP metric is large enough to support thousands of hops, the only barrier to expanding the network is the transport-layer hop counter. EIGRP increments the transport control field only when an IP packet has traversed 15 routers and the next hop to the destination was learned through EIGRP.
EIGRP has these four basic components:

- **Neighbor discovery and recovery** is the process that routers use to dynamically learn of other routers on their directly attached networks. Routers must also discover when their neighbors become unreachable or inoperative. Neighbor discovery and recovery is achieved by periodically sending small hello packets. As long as hello packets are received, the neighbor is alive and functioning. When this status is determined, the neighboring routers exchange routing information.

- **The reliable transport protocol** is responsible for guaranteed, ordered delivery of EIGRP packets to all neighbors. It supports intermixed transmission of multicast and unicast packets. Some EIGRP packets must be sent reliably, and others need not be. For efficiency, reliability is provided only when necessary. For example, on a multiaccess network that has multicast capabilities, it is not necessary to send hellos reliably to all neighbors individually. Therefore, EIGRP sends a single multicast hello with an indication in the packet informing the receivers that the packet need not be acknowledged. Other types of packets (such as updates) require acknowledgment, which is shown in the packet. To ensure low convergence time, the reliable transport sends multicast packets quickly when there are unacknowledged packets pending.

- **The DUAL finite state machine** handles the decision process for all route computations. It tracks all routes advertised by all neighbors and uses the distance information (known as a metric) to select efficient, loop-free paths. DUAL selects routes to be inserted into a routing table based on feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to a destination that is guaranteed not to be part of a routing loop.

  When there are no feasible successors, but there are neighbors advertising the destination, a recomputation must occur to determine a new successor. The amount of time it takes to recompute the route affects the convergence time. When a topology change occurs, DUAL tests for feasible successors to avoid unnecessary recomputation.

- **The protocol-dependent modules** are responsible for network layer protocol-specific tasks. An example is the IP EIGRP module, which is responsible for sending and receiving EIGRP packets that are encapsulated in IP. It is also responsible for parsing EIGRP packets and informing DUAL of the new information received. Routing decisions are stored in the IP routing table. EIGRP also redistributes routes learned by other IP routing protocols.

These sections contain this configuration information:

- Default EIGRP Configuration, page 36-36
- Configuring Basic EIGRP Parameters, page 36-37
- Configuring EIGRP Interfaces, page 36-38

<tr>
<td>Variance</td>
<td>1 (equal-cost load balancing).</td>
</tr>
</tbody>
</table>

1. NSF = Nonstop Forwarding
2. EIGRP NSF awareness is enabled for IPv4 on switches running the metro IP access image.
To create an EIGRP routing process, you must enable EIGRP and associate networks. EIGRP sends updates to the interfaces in the specified networks. If you do not specify an interface network, it is not advertised in any EIGRP update.

**Nonstop Forwarding Awareness**

The EIGRP NSF Awareness feature is supported for IPv4 in the metro IP access image. When the neighboring router is NSF-capable, the Layer 3 switch continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

This feature cannot be disabled. For more information on this feature, see the *EIGRP Nonstop Forwarding (NSF) Awareness Feature Guide* at this URL: http://www.cisco.com/en/US/products/sw/iosswrel/ps1839/products_feature_guide09186a0080160010.html

**Configuring Basic EIGRP Parameters**

Beginning in privileged EXEC mode, follow these steps to configure EIGRP. Configuring the routing process is required; other steps are optional:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>router eigrp autonomous-system</code></td>
<td>Enable an EIGRP routing process, and enter router configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td><code>network network-number</code></td>
<td>Associate networks with an EIGRP routing process. EIGRP sends updates</td>
</tr>
<tr>
<td>4</td>
<td><code>eigrp log-neighbor-changes</code></td>
<td>(Optional) Enable logging of EIGRP neighbor changes to monitor routing</td>
</tr>
<tr>
<td>5</td>
<td><code>metric weights tos k1 k2 k3 k4 k5</code></td>
<td>(Optional) Adjust the EIGRP metric. Although the defaults have been</td>
</tr>
<tr>
<td></td>
<td></td>
<td>carefully set to provide excellent operation in most networks, you can</td>
</tr>
<tr>
<td></td>
<td></td>
<td>adjust them.</td>
</tr>
<tr>
<td>6</td>
<td>`offset list [access-list number</td>
<td>name] [in</td>
</tr>
<tr>
<td>7</td>
<td><code>no auto-summary</code></td>
<td>(Optional) Disable automatic summarization of subnet routes into network-</td>
</tr>
<tr>
<td>8</td>
<td><code>ip summary-address eigrp autonomous-system-number address mask</code></td>
<td>(Optional) Configure a summary aggregate.</td>
</tr>
<tr>
<td>9</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Caution** Setting metrics is complex and is not recommended without guidance from an experienced network designer.
Configuring EIGRP

Other optional EIGRP parameters can be configured on an interface basis.

Beginning in privileged EXEC mode, follow these steps to configure EIGRP interfaces:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 ip bandwidth-percent eigrp percent</td>
<td>(Optional) Configure the percentage of bandwidth that can be used by EIGRP on an interface. The default is 50 percent.</td>
</tr>
<tr>
<td>Step 5 ip summary-address eigrp autonomous-system-number address mask</td>
<td>(Optional) Configure a summary aggregate address for a specified interface (not usually necessary if auto-summary is enabled).</td>
</tr>
<tr>
<td>Step 6 ip hello-interval eigrp autonomous-system-number seconds</td>
<td>(Optional) Change the hello time interval for an EIGRP routing process. The range is 1 to 65535 seconds. The default is 60 seconds for low-speed NBMA networks and 5 seconds for all other networks.</td>
</tr>
<tr>
<td>Step 7 ip hold-time eigrp autonomous-system-number seconds</td>
<td>(Optional) Change the hold time interval for an EIGRP routing process. The range is 1 to 65535 seconds. The default is 180 seconds for low-speed NBMA networks and 15 seconds for all other networks.</td>
</tr>
<tr>
<td>Step 8 no ip split-horizon eigrp autonomous-system-number</td>
<td>(Optional) Disable split horizon to allow route information to be advertised by a router out any interface from which that information originated.</td>
</tr>
<tr>
<td>Step 9 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Use the no forms of these commands to disable the feature or return the setting to the default value.
Chapter 36  Configuring IP Unicast Routing

Configuring EIGRP

EIGRP route authentication provides MD5 authentication of routing updates from the EIGRP routing protocol to prevent the introduction of unauthorized or false routing messages from unapproved sources.

Beginning in privileged EXEC mode, follow these steps to enable authentication:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>3</td>
<td>no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>4</td>
<td>ip authentication mode eigrp autonomous-system md5</td>
<td>Enable MD5 authentication in IP EIGRP packets.</td>
</tr>
<tr>
<td>5</td>
<td>ip authentication key-chain eigrp autonomous-system key-chain</td>
<td>Enable authentication of IP EIGRP packets.</td>
</tr>
<tr>
<td>6</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>7</td>
<td>key chain name-of-chain</td>
<td>Identify a key chain and enter key-chain configuration mode. Match the name configured in Step 4.</td>
</tr>
<tr>
<td>8</td>
<td>key number</td>
<td>In key-chain configuration mode, identify the key number.</td>
</tr>
<tr>
<td>9</td>
<td>key-string text</td>
<td>In key-chain key configuration mode, identify the key string.</td>
</tr>
<tr>
<td>10</td>
<td>accept-lifetime start-time {infinite</td>
<td>duration seconds}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The start-time and end-time syntax can be either hh:mm:ss Month date year or hh:mm:ss date Month year. The default is forever with the default start-time and the earliest acceptable date as January 1, 1993. The default end-time and duration is infinite.</td>
</tr>
<tr>
<td>11</td>
<td>send-lifetime start-time {infinite</td>
<td>duration seconds}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The start-time and end-time syntax can be either hh:mm:ss Month date year or hh:mm:ss date Month year. The default is forever with the default start-time and the earliest acceptable date as January 1, 1993. The default end-time and duration is infinite.</td>
</tr>
<tr>
<td>12</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Use the **no** forms of these commands to disable the feature or to return the setting to the default value.

### Configuring EIGRP Stub Routing

The EIGRP stub routing feature reduces resource utilization by moving routed traffic closer to the end user. In a network using EIGRP stub routing, the only allowable route for IP traffic to the user is through a switch that is configured with EIGRP stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote routers to use EIGRP and to configure only the switch as a stub. Only specified routes are propagated from the switch. The switch responds to all queries for summaries, connected routes, and routing updates.

**Note**

EIGRP stub routing only advertises connected or summary routes from the routing tables to other switches in the network. The switch uses EIGRP stub routing at the access layer to eliminate the need for other types of routing advertisements. If you try to configure multi-VRF-CE and EIGRP stub routing at the same time, the configuration is not allowed.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In **Figure 36-4**, switch B is configured as an EIGRP stub router. Switches A and C are connected to the rest of the WAN. Switch B advertises connected, static, redistribution, and summary routes to switch A and C. Switch B does not advertise any routes learned from switch A (and the reverse).

**Figure 36-4**  **EIGRP Stub Router Configuration**

For more information about EIGRP stub routing, see “Configuring EIGRP Stub Routing” part of the *Cisco IOS IP Configuration Guide, Volume 2 of 3: Routing Protocols, Release 12.2* from the Cisco.com page under **Documentation > Cisco IOS Software > 12.2 Mainline > Configuration Guides**.

<table>
<thead>
<tr>

<tr>
<td></td>
<td></td>
<td>spoke router.</td>
</tr>
<tr>
<td>7</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Enter the `show ip eigrp neighbor detail` privileged EXEC command from the distribution router to verify the configuration.

### Monitoring and Maintaining EIGRP

You can delete neighbors from the neighbor table. You can also display various EIGRP routing statistics. Table 36-8 lists the privileged EXEC commands for deleting neighbors and displaying statistics. For explanations of fields in the resulting display, see the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2*.

Configuring BGP

The Border Gateway Protocol (BGP) is an exterior gateway protocol used to set up an interdomain routing system for loop-free exchanges of routing information between autonomous systems. Autonomous systems are made up of routers that operate under the same administration and that run Interior Gateway Protocols (IGPs), such as RIP or OSPF, within their boundaries and that interconnect by using an Exterior Gateway Protocol (EGP). BGP Version 4 is the standard EGP for interdomain routing in the Internet.

You can find detailed information about BGP in *Internet Routing Architectures*, published by Cisco Press, and in the “Configuring BGP” chapter in the *Cisco IOS IP and IP Routing Configuration Guide*. For details about BGP commands and keywords, see the “IP Routing Protocols” part of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2*. For a list of BGP commands that are visible but not supported by the switch, see Appendix C, “Unsupported Commands in Cisco IOS Release 12.2(44)EY.”

Routers that belong to the same autonomous system (AS) and that exchange BGP updates run *internal BGP* (IBGP), and routers that belong to different autonomous systems and that exchange BGP updates run *external BGP* (EBGP). Most configuration commands are the same for configuring EBGP and IBGP. The difference is that the routing updates are exchanged either between autonomous systems (EBGP) or within an AS (IBGP). Figure 36-5 shows a network that is running both EBGP and IBGP.

![Figure 36-5 EBGP, IBGP, and Multiple Autonomous Systems](image-url)

Before exchanging information with an external AS, BGP ensures that networks within the AS can be reached by defining internal BGP peering among routers within the AS and by redistributing BGP routing information to IGPs that run within the AS, such as IGRP and OSPF.

Routers that run a BGP routing process are often referred to as BGP *speakers*. BGP uses the Transmission Control Protocol (TCP) as its transport protocol (specifically port 179). Two BGP speakers that have a TCP connection to each other for exchanging routing information are known as *peers* or *neighbors*. In Figure 36-5, Routers A and B are BGP peers, as are Routers B and C and Routers C and D. The routing information is a series of AS numbers that describe the full path to the destination network. BGP uses this information to construct a loop-free map of autonomous systems.
The network has these characteristics:

- Routers A and B are running EBGP, and Routers B and C are running IBGP. Note that the EBGP peers are directly connected and that the IBGP peers are not. As long as there is an IGP running that allows the two neighbors to reach one another, IBGP peers do not have to be directly connected.

- All BGP speakers within an AS must establish a peer relationship with each other. That is, the BGP speakers within an AS must be fully meshed logically. BGP4 provides two techniques that reduce the requirement for a logical full mesh: confederations and route reflectors.

- AS 200 is a transit AS for AS 100 and AS 300—that is, AS 200 is used to transfer packets between AS 100 and AS 300.

BGP peers initially exchange their full BGP routing tables and then send only incremental updates. BGP peers also exchange keepalive messages (to ensure that the connection is up) and notification messages (in response to errors or special conditions).

In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (the autonomous system path), and a list of other path attributes. The primary function of a BGP system is to exchange network reachability information, including information about the list of AS paths, with other BGP systems. This information can be used to determine AS connectivity, to prune routing loops, and to enforce AS-level policy decisions.

A router or switch running Cisco IOS does not select or use an IBGP route unless it has a route available to the next-hop router and it has received synchronization from an IGP (unless IGP synchronization is disabled). When multiple routes are available, BGP bases its path selection on attribute values. See the “Configuring BGP Decision Attributes” section on page 36-50 for information about BGP attributes.

BGP Version 4 supports classless interdomain routing (CIDR) so you can reduce the size of your routing tables by creating aggregate routes, resulting in supernets. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes.

                             | - Route maps: None applied to a peer.                                           
                             | - Send community attributes: None sent to neighbors.                           
                             | - Shutdown or soft reconfiguration: Not enabled.                                
                             | - Timers: keepalive: 60 seconds; holdtime: 180 seconds.                         
                             | - Update source: Best local address.                                            
                             | - Weight: Routes learned through BGP peer: 0; routes sourced by the local router: 32768. |
| NSF¹ Awareness           | Disabled². Allows Layer 3 switches to continue forwarding packets from a neighboring NSF-capable router during hardware or software changes. |
| Route reflector          | None configured.                                                               |
| Synchronization (BGP and IGP) | Enabled.                                                                    |
| Table map update         | Disabled.                                                                     |
| Timers                   | Keepalive: 60 seconds; holdtime: 180 seconds.                                  |

1. NSF = Nonstop Forwarding
2. BGP NSF Awareness can be enabled for IPv4 on switches with the metro IP access image by enabling Graceful Restart.
Nonstop Forwarding Awareness

The BGP NSF Awareness feature is supported for IPv4 in the metro IP access image. To enable this feature with BGP routing, you need to enable Graceful Restart. When the neighboring router is NSF-capable, and this feature is enabled, the Layer 3 switch continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

For more information, see the BGP Nonstop Forwarding (NSF) Awareness Feature Guide at this URL:

Enabling BGP Routing

To enable BGP routing, you establish a BGP routing process and define the local network. Because BGP must completely recognize the relationships with its neighbors, you must also specify a BGP neighbor. BGP supports two kinds of neighbors: internal and external. Internal neighbors are in the same AS; external neighbors are in different autonomous systems. External neighbors are usually adjacent to each other and share a subnet, but internal neighbors can be anywhere in the same AS.

The switch supports the use of private AS numbers, usually assigned by service providers and given to systems whose routes are not advertised to external neighbors. The private AS numbers are from 64512 to 65535. You can configure external neighbors to remove private AS numbers from the AS path by using the neighbor remove-private-as router configuration command. Then when an update is passed to an external neighbor, if the AS path includes private AS numbers, these numbers are dropped.

If your AS must pass traffic through it from another AS to a third AS, it is important to be consistent about the routes it advertises. If BGP advertises a route before all routers in the network learn about the route through the IGP, the AS might receive traffic that some routers can not yet route. To prevent this from happening, BGP must wait until the IGP has propagated information across the AS so that BGP is synchronized with the IGP. Synchronization is enabled by default. If your AS does not pass traffic from one AS to another AS, or if all routers in your autonomous systems are running BGP, you can disable synchronization, which allows your network to carry fewer routes in the IGP and allows BGP to converge more quickly.

Beginning in privileged EXEC mode, follow these steps to enable BGP routing, establish a BGP routing process, and specify a neighbor:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip routing</td>
</tr>
<tr>
<td>Step 3</td>
<td>router bgp autonomous-system</td>
</tr>
<tr>
<td>Step 4</td>
<td>network network-number [mask network-mask] [route-map route-map-name]</td>
</tr>
</tbody>
</table>
### Configuring BGP

Use the `no router bgp autonomous-system` global configuration command to remove a BGP AS. Use the `no network network-number router configuration command to remove the network from the BGP table.

Use the `no neighbor {ip-address | peer-group-name} remote-as number` router configuration command to remove a neighbor. Use the `no neighbor {ip-address | peer-group-name} remove-private-as` router configuration command to include private AS numbers in updates to a neighbor. Use the `synchronization` router configuration command to re-enable synchronization.

These examples show how to configure BGP on the routers in Figure 36-5.

**Router A:**

```
Switch(config)# router bgp 100
Switch(config-router)# neighbor 129.213.1.1 remote-as 200
```

<table>

Router B:
Switch(config)# router bgp 200
Switch(config-router)# neighbor 129.213.1.2 remote-as 100
Switch(config-router)# neighbor 175.220.1.2 remote-as 200

Router C:
Switch(config)# router bgp 200
Switch(config-router)# neighbor 175.220.212.1 remote-as 200
Switch(config-router)# neighbor 192.208.10.1 remote-as 300

Router D:
Switch(config)# router bgp 300
Switch(config-router)# neighbor 192.208.10.2 remote-as 200

To verify that BGP peers are running, use the `show ip bgp neighbors` privileged EXEC command. This is the output of this command on Router A:

```
Switch# show ip bgp neighbors
BGP neighbor is 129.213.1.1, remote AS 200, external link
BGP version 4, remote router ID 175.220.212.1
BGP state = established, table version = 3, up for 0:10:59
Last read 0:00:29, hold time is 180, keepalive interval is 60 seconds
Minimum time between advertisement runs is 30 seconds
Received 2828 messages, 0 notifications, 0 in queue
Sent 2826 messages, 0 notifications, 0 in queue
Connections established 11; dropped 10
```

Anything other than `state = established` means that the peers are not running. The remote router ID is the highest IP address on that router (or the highest loopback interface). Each time the table is updated with new information, the table version number increments. A table version number that continually increments means that a route is flapping, causing continual routing updates.

For exterior protocols, a reference to an IP network from the `network` router configuration command controls only which networks are advertised. This is in contrast to Interior Gateway Protocols (IGPs), such as EIGRP, which also use the `network` command to specify where to send updates.

For detailed descriptions of BGP configuration, see the “IP Routing Protocols” part of the *Cisco IOS IP Configuration Guide, Release 12.2*. For details about specific commands, see the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2*. See Appendix C, “Unsupported Commands in Cisco IOS Release 12.2(44)EY,” for a list of BGP commands that are visible but not supported by the switch.

**Managing Routing Policy Changes**

Routing policies for a peer include all the configurations that might affect inbound or outbound routing table updates. When you have defined two routers as BGP neighbors, they form a BGP connection and exchange routing information. If you later change a BGP filter, weight, distance, version, or timer, or make a similar configuration change, you must reset the BGP sessions so that the configuration changes take effect.
There are two types of reset, hard reset and soft reset. The switch supports a soft reset without any prior configuration when both BGP peers support the soft route refresh capability, which is advertised in the OPEN message sent when the peers establish a TCP session. A soft reset allows the dynamic exchange of route refresh requests and routing information between BGP routers and the subsequent re-advertisement of the respective outbound routing table.

- When soft reset generates inbound updates from a neighbor, it is called *dynamic inbound soft reset*.
- When soft reset sends a set of updates to a neighbor, it is called *outbound soft reset*.

A soft inbound reset causes the new inbound policy to take effect. A soft outbound reset causes the new local outbound policy to take effect without resetting the BGP session. As a new set of updates is sent during outbound policy reset, a new inbound policy can also take effect.

**Table 36-10 Advantages and Disadvantages of Hard and Soft Resets**

<table>
<thead>
<tr>
<th>Type of Reset</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hard reset</td>
<td>No memory overhead</td>
<td>The prefixes in the BGP, IP, and FIB tables provided by the neighbor are lost. Not recommended.</td>
</tr>
<tr>
<td>Outbound soft reset</td>
<td>No configuration, no storing of routing table updates</td>
<td>Does not reset inbound routing table updates.</td>
</tr>
<tr>
<td>Dynamic inbound soft reset</td>
<td>Does not clear the BGP session and cache routing table updates and has no memory overhead</td>
<td>Both BGP routers must support the route refresh capability.</td>
</tr>
</tbody>
</table>

Beginning in privileged EXEC mode, follow these steps to learn if a BGP peer supports the route refresh capability and to reset the BGP session:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | show ip bgp neighbors   | Display whether a neighbor supports the route refresh capability. When supported, this message appears for the router:  
  *Received route refresh capability from peer.*                                         |
| Step 2 | clear ip bgp {* | address | peer-group-name} | Reset the routing table on the specified connection.  
  - Enter an asterisk (*) to specify that all connections be reset.  
  - Enter an IP address to specify the connection to be reset.  
  - Enter a peer group name to reset the peer group. |
| Step 3 | clear ip bgp {* | address | peer-group-name} soft out | (Optional) Perform an outbound soft reset to reset the inbound routing table on the specified connection. Use this command if route refresh is supported.  
  - Enter an asterisk (*) to specify that all connections be reset.  
  - Enter an IP address to specify the connection to be reset.  
  - Enter a peer group name to reset the peer group. |
| Step 4 | show ip bgp             | Verify the reset by checking information about the routing table and about BGP neighbors. |
| Step 4 | show ip bgp neighbors   |                                                                         |
Chapter 36      Configuring IP Unicast Routing

Configuring BGP Decision Attributes

When a BGP speaker receives updates from multiple autonomous systems that describe different paths to the same destination, it must choose the single best path for reaching that destination. The decision is based on the value of attributes that the update contains and other BGP-configurable factors. The selected path is entered into the BGP routing table and propagated to its neighbors.

When a BGP peer learns two EBGP paths for a prefix from a neighboring AS, it chooses the best path and inserts that path in the IP routing table. If BGP multipath support is enabled and the EBGP paths are learned from the same neighboring autonomous systems, multiple paths are installed in the IP routing table. Then, during packet switching, per-packet or per-destination load balancing is performed among the multiple paths. The maximum-paths router configuration command controls the number of paths allowed.

These factors summarize the order in which BGP evaluates the attributes for choosing the best path:

1. If the path specifies a next hop that is inaccessible, drop the update. The BGP next-hop attribute, automatically determined by the software, is the IP address of the next hop that is going to be used to reach a destination. For EBGP, this is usually the IP address of the neighbor specified by the neighbor remote-as router configuration command. You can disable next-hop processing by using route maps or the neighbor next-hop-self router configuration command.

2. Prefer the path with the largest weight (a Cisco proprietary parameter). The weight attribute is local to the router and not propagated in routing updates. By default, the weight attribute is 32768 for paths that the router originates and zero for other paths. You can use access lists, route maps, or the neighbor weight router configuration command to set weights.

3. Prefer the route with the highest local preference. Local preference is part of the routing update and exchanged among routers in the same AS. The default value of the local preference attribute is 100. You can set local preference by using the bgp default local-preference router configuration command or by using a route map.

4. Prefer the route that was originated by BGP running on the local router.

5. Prefer the route with the shortest AS path.

6. Prefer the route with the lowest origin type. An interior route or IGP is lower than a route learned by EGP, and an EGP-learned route is lower than one of unknown origin or learned in another way.

7. Prefer the route with the lowest multi-exit discriminator (MED) metric attribute if the neighboring AS is the same for all routes considered. You can configure the MED by using route maps or by using the default-metric router configuration command. When an update is sent to an IBGP peer, the MED is included.

8. Prefer the external (EBGP) path over the internal (IBGP) path.

9. Prefer the route that can be reached through the closest IGP neighbor (the lowest IGP metric). This means that the router will prefer the shortest internal path within the AS to reach the destination (the shortest path to the BGP next-hop).

10. If these conditions are all true, insert the route for this path into the IP routing table:
    • Both the best route and this route are external.
    • Both the best route and this route are from the same neighboring autonomous system.
    • Maximum-paths is enabled.

11. If multipath is not enabled, prefer the route with the lowest IP address value for the BGP router ID. The router ID is usually the highest IP address on the router or the loopback (virtual) address, but might be implementation-specific.
Beginning in privileged EXEC mode, follow these steps to configure some decision attributes:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>router bgp autonomous-system</td>
<td>Enable a BGP routing process, assign it an AS number, and enter router configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>bgp best-path as-path ignore</td>
<td>(Optional) Configure the router to ignore AS path length in selecting a route.</td>
</tr>
<tr>
<td>4</td>
<td>neighbor {ip-address</td>
<td>peer-group-name} next-hop-self</td>
</tr>
<tr>
<td>5</td>
<td>neighbor {ip-address</td>
<td>peer-group-name} weight weight</td>
</tr>
<tr>
<td>6</td>
<td>default-metric number</td>
<td>(Optional) Set a MED metric to set preferred paths to external neighbors. All routes without a MED will also be set to this value. The range is 1 to 4294967295. The lowest value is the most desirable.</td>
</tr>
<tr>
<td>7</td>
<td>bgp bestpath med missing-as-worst</td>
<td>(Optional) Configure the switch to consider a missing MED as having a value of infinity, making the path without a MED value the least desirable path.</td>
</tr>
<tr>
<td>8</td>
<td>bgp always-compare med</td>
<td>(Optional) Configure the switch to compare MEDs for paths from neighbors in different autonomous systems. By default, MED comparison is only done among paths in the same AS.</td>
</tr>
<tr>
<td>9</td>
<td>bgp bestpath med confed</td>
<td>(Optional) Configure the switch to consider the MED in choosing a path from among those advertised by different subautonomous systems within a confederation.</td>
</tr>
<tr>
<td>10</td>
<td>bgp deterministic med</td>
<td>(Optional) Configure the switch to consider the MED variable when choosing among routes advertised by different peers in the same AS.</td>
</tr>
<tr>
<td>11</td>
<td>bgp default local-preference value</td>
<td>(Optional) Change the default local preference value. The range is 0 to 4294967295; the default value is 100. The highest local preference value is preferred.</td>
</tr>
<tr>
<td>12</td>
<td>maximum-paths number</td>
<td>(Optional) Configure the number of paths to be added to the IP routing table. The default is to only enter the best path in the routing table. The range is from 1 to 8. Having multiple paths allows load balancing among the paths.</td>
</tr>
<tr>
<td>13</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>14</td>
<td>show ip bgp</td>
<td>Verify the reset by checking information about the routing table and about BGP neighbors.</td>
</tr>
<tr>
<td>15</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no form of each command to return to the default state.
Configuring BGP Filtering with Route Maps

Within BGP, you can use route maps to control and to modify routing information and to define the conditions by which routes are redistributed between routing domains. See the “Using Route Maps to Redistribute Routing Information” section on page 36-90 for more information about route maps. Each route map has a name that identifies the route map (map tag) and an optional sequence number.

Beginning in privileged EXEC mode, follow these steps to use a route map to disable next-hop processing:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>route-map map-tag [permit</td>
<td>Create a route map, and enter route-map configuration mode.</td>
</tr>
<tr>
<td></td>
<td>deny]</td>
</tr>
<tr>
<td>set ip next-hop ip-address</td>
<td>(Optional) Set a route map to disable next-hop processing</td>
</tr>
<tr>
<td></td>
<td>• In an inbound route map, set the next hop of matching routes to</td>
</tr>
<tr>
<td></td>
<td>be the neighbor peering address, overriding third-party next hops.</td>
</tr>
<tr>
<td></td>
<td>• In an outbound route map of a BGP peer, set the next hop to the</td>
</tr>
<tr>
<td></td>
<td>peering address of the local router, disabling the next-hop</td>
</tr>
<tr>
<td></td>
<td>calculation.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show route-map [map-name]</td>
<td>Display all route maps configured or only the one specified to verify</td>
</tr>
<tr>
<td></td>
<td>configuration.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no route-map map-tag command to delete the route map. Use the no set ip next-hop ip-address command to re-enable next-hop processing.

Configuring BGP Filtering by Neighbor

You can filter BGP advertisements by using AS-path filters, such as the as-path access-list global configuration command and the neighbor filter-list router configuration command. You can also use access lists with the neighbor distribute-list router configuration command. Distribute-list filters are applied to network numbers. See the “Controlling Advertising and Processing in Routing Updates” section on page 36-98 for information about the distribute-list command.

You can use route maps on a per-neighbor basis to filter updates and to modify various attributes. A route map can be applied to either inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates. On both inbound and outbound updates, matching is supported based on AS path, community, and network numbers. Autonomous-system path matching requires the match as-path access-list route-map command, community-based matching requires the match community-list route-map command, and network-based matching requires the ip access-list global configuration command.
Beginning in privileged EXEC mode, follow these steps to apply a per-neighbor route map:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>router bgp autonomous-system</code></td>
<td>Enable a BGP routing process, assign it an AS number, and enter router configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>`neighbor {ip-address</td>
<td>peer-group name} `</td>
</tr>
<tr>
<td></td>
<td><code>distribute-list</code> {access-list-number \ name}</td>
<td></td>
</tr>
<tr>
<td></td>
<td>`{in</td>
<td>out}`</td>
</tr>
<tr>
<td></td>
<td><code>Note</code></td>
<td>You can also use the <code>neighbor prefix-list</code> router configuration command to filter updates, but you cannot use both commands to configure the same BGP peer.</td>
</tr>
<tr>
<td>4</td>
<td>`neighbor {ip-address</td>
<td>peer-group name} `</td>
</tr>
<tr>
<td></td>
<td>`route-map map-tag {in</td>
<td>out}`</td>
</tr>
<tr>
<td>5</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td><code>show ip bgp neighbors</code></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>7</td>
<td><code>copy running-config startup-config</code></td>
<td><em>(Optional)</em> Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no neighbor distribute-list` command to remove the access list from the neighbor. Use the `no neighbor route-map map-tag` router configuration command to remove the route map from the neighbor.

Another method of filtering is to specify an access list filter on both incoming and outbound updates, based on the BGP autonomous system paths. Each filter is an access list based on regular expressions. (See the “Regular Expressions” appendix in the *Cisco IOS Dial Technologies Command Reference, Release 12.2* for more information on forming regular expressions.) To use this method, define an autonomous system path access list, and apply it to updates to and from particular neighbors.

Beginning in privileged EXEC mode, follow these steps to configure BGP path filtering:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>ip as-path access-list access-list-number</code></td>
<td>Define a BGP-related access list.</td>
</tr>
<tr>
<td></td>
<td>`{permit</td>
<td>deny} as-regular-expressions`</td>
</tr>
<tr>
<td>3</td>
<td><code>router bgp autonomous-system</code></td>
<td>Enter BGP router configuration mode.</td>
</tr>
<tr>
<td>4</td>
<td>`neighbor {ip-address</td>
<td>peer-group name} `</td>
</tr>
<tr>
<td></td>
<td><code>filter-list</code> {access-list-number \ name}</td>
<td></td>
</tr>
<tr>
<td></td>
<td>`{in</td>
<td>out</td>
</tr>
<tr>
<td>5</td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td><code>show ip bgp neighbors [paths regular-expression]</code></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td>7</td>
<td><code>copy running-config startup-config</code></td>
<td><em>(Optional)</em> Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring Prefix Lists for BGP Filtering

You can use prefix lists as an alternative to access lists in many BGP route filtering commands, including the `neighbor distribute-list` router configuration command. Filtering by a prefix list involves matching the prefixes of routes with those listed in the prefix list, as when matching access lists. When there is a match, the route is used. Whether a prefix is permitted or denied is based upon these rules:

- An empty prefix list permits all prefixes.
- An implicit deny is assumed if a given prefix does not match any entries in a prefix list.
- When multiple entries of a prefix list match a given prefix, the sequence number of a prefix list entry identifies the entry with the lowest sequence number.

By default, sequence numbers are generated automatically and incremented in units of five. If you disable the automatic generation of sequence numbers, you must specify the sequence number for each entry. You can specify sequence values in any increment. If you specify increments of one, you cannot insert additional entries into the list; if you choose very large increments, you might run out of values.

You do not need to specify a sequence number when removing a configuration entry. `Show` commands include the sequence numbers in their output.

Before using a prefix list in a command, you must set up the prefix list. Beginning in privileged EXEC mode, follow these steps to create a prefix list or to add an entry to a prefix list:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** | `ip prefix-list list-name [seq seq-value] deny | permit network/len [ge ge-value] [le le-value]` Create a prefix list with an optional sequence number to `deny` or `permit` access for matching conditions. You must enter at least one `permit` or `deny` clause.  
  - `network/len` is the network number and length (in bits) of the network mask.  
  - (Optional) `ge` and `le` values specify the range of the prefix length to be matched. The specified `ge-value` and `le-value` must satisfy this condition: `len < ge-value < le-value < 32` |
| **Step 3** | `ip prefix-list list-name seq seq-value deny | permit network/len [ge ge-value] [le le-value]` (Optional) Add an entry to a prefix list, and assign a sequence number to the entry. |
| **Step 4** | `end` Return to privileged EXEC mode. |
| **Step 5** | `show ip prefix list [detail | summary] name [network/len] [seq seq-num] [longer] [first-match]` Verify the configuration by displaying information about a prefix list or prefix list entries. |
| **Step 6** | `copy running-config startup-config` (Optional) Save your entries in the configuration file. |

To delete a prefix list and all of its entries, use the `no ip prefix-list list-name` global configuration command. To delete an entry from a prefix list, use the `no ip prefix-list seq seq-value` global configuration command. To disable automatic generation of sequence numbers, use the `no ip prefix-list sequence number` command; to reenable automatic generation, use the `ip prefix-list sequence number` command. To clear the hit-count table of prefix list entries, use the `clear ip prefix-list` privileged EXEC command.
Configuring BGP Community Filtering

One way that BGP controls the distribution of routing information based on the value of the COMMUNITIES attribute. A community is a group of destinations that share some common attribute. Each destination can belong to multiple communities. AS administrators can define to which communities a destination belongs. By default, all destinations belong to the general Internet community. The community is identified by the COMMUNITIES attribute, an optional, transitive, global attribute in the numerical range from 1 to 4294967200. These are some predefined, well-known communities:

- **internet**—Advertise this route to the Internet community. All routers belong to it.
- **no-export**—Do not advertise this route to EBGP peers.
- **no-advertise**—Do not advertise this route to any peer (internal or external).
- **local-as**—Do not advertise this route to peers outside the local autonomous system.

Based on the community, you can control which routing information to accept, prefer, or distribute to other neighbors. A BGP speaker can set, append, or modify the community of a route when learning, advertising, or redistributing routes. When routes are aggregated, the resulting aggregate has a COMMUNITIES attribute that contains all communities from all the initial routes.

You can use community lists to create groups of communities to use in a match clause of a route map. As with an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

To set the COMMUNITIES attribute and match clauses based on communities, see the `match community-list` and `set community` route-map configuration commands in the “Using Route Maps to Redistribute Routing Information” section on page 36-90.

By default, no COMMUNITIES attribute is sent to a neighbor. You can specify that the COMMUNITIES attribute be sent to the neighbor at an IP address by using the `neighbor send-community` router configuration command.

Beginning in privileged EXEC mode, follow these steps to create and to apply a community list:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** ip community-list community-list-number {permit | deny} community-number | Create a community list, and assign it a number.  
  - The `community-list-number` is an integer from 1 to 99 that identifies one or more permit or deny groups of communities.  
  - The `community-number` is the number configured by a `set community` route-map configuration command. |
| **Step 3** router bgp autonomous-system      | Enter BGP router configuration mode.                                     |
| **Step 4** neighbor {ip-address | peer-group name} send-community            | Specify that the COMMUNITIES attribute be sent to the neighbor at this IP address. |
| **Step 5** set comm-list list-num delete     | (Optional) Remove communities from the community attribute of an inbound or outbound update that match a standard or extended community list specified by a route map. |
| **Step 6** exit                             | Return to global configuration mode.                                     |
### Configuring BGP Neighbors and Peer Groups

Often many BGP neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and to make updating more efficient. When you have configured many peers, we recommend this approach.

To configure a BGP peer group, you create the peer group, assign options to the peer group, and add neighbors as peer group members. You configure the peer group by using the `neighbor` router configuration commands. By default, peer group members inherit all the configuration options of the peer group, including the remote-as (if configured), version, update-source, out-route-map, out-filter-list, out-dist-list, minimum-advertisement-interval, and next-hop-self. All peer group members also inherit changes made to the peer group. Members can also be configured to override the options that do not affect outbound updates.

To assign configuration options to an individual neighbor, specify any of these router configuration commands by using the neighbor IP address. To assign the options to a peer group, specify any of the commands by using the peer group name. You can disable a BGP peer or peer group without removing all the configuration information by using the `neighbor shutdown` router configuration command.

Beginning in privileged EXEC mode, use these commands to configure BGP peers:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>router bgp autonomous-system</code> Enter BGP router configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>neighbor peer-group-name peer-group</code> Create a BGP peer group.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>neighbor ip-address peer-group peer-group-name</code> Make a BGP neighbor a member of the peer group.</td>
</tr>
<tr>
<td>Step 5</td>
<td>`neighbor [ip-address</td>
</tr>
<tr>
<td>Step 6</td>
<td>`neighbor [ip-address</td>
</tr>
<tr>
<td>Step 7</td>
<td>`neighbor [ip-address</td>
</tr>
<tr>
<td>Step 8</td>
<td>`neighbor [ip-address</td>
</tr>
</tbody>
</table>
### Step 9
**Command**: `neighbor {ip-address | peer-group-name} update-source interface`  
**Purpose**: (Optional) Allow internal BGP sessions to use any operational interface for TCP connections.

### Step 10
**Command**: `neighbor {ip-address | peer-group-name} ebgp-multihop`  
**Purpose**: (Optional) Allow BGP sessions, even when the neighbor is not on a directly connected segment. The multihop session is not established if the only route to the multihop peer’s address is the default route (0.0.0.0).

### Step 11
**Command**: `neighbor {ip-address | peer-group-name} local-as number`  
**Purpose**: (Optional) Specify an AS number to use as the local AS. The range is 1 to 65535.

### Step 12
**Command**: `neighbor {ip-address | peer-group-name} advertisement-interval seconds`  
**Purpose**: (Optional) Set the minimum interval between sending BGP routing updates.

### Step 13
**Command**: `neighbor {ip-address | peer-group-name} maximum-prefix maximum [threshold]`  
**Purpose**: (Optional) Control how many prefixes can be received from a neighbor. The range is 1 to 4294967295. The `threshold` (optional) is the percentage of maximum at which a warning message is generated. The default is 75 percent.

### Step 14
**Command**: `neighbor {ip-address | peer-group-name} next-hop-self`  
**Purpose**: (Optional) Disable next-hop processing on the BGP updates to a neighbor.

### Step 15
**Command**: `neighbor {ip-address | peer-group-name} password string`  
**Purpose**: (Optional) Set MD5 authentication on a TCP connection to a BGP peer. The same password must be configured on both BGP peers, or the connection between them is not made.

### Step 16
**Command**: `neighbor {ip-address | peer-group-name} route-map map-name {in | out}`  
**Purpose**: (Optional) Apply a route map to incoming or outgoing routes.

### Step 17
**Command**: `neighbor {ip-address | peer-group-name} send-community`  
**Purpose**: (Optional) Specify that the COMMUNITIES attribute be sent to the neighbor at this IP address.

### Step 18
**Command**: `neighbor {ip-address | peer-group-name} timers keepalive holdtime`  
**Purpose**: (Optional) Set timers for the neighbor or peer group.  
- The `keepalive` interval is the time within which keepalive messages are sent to peers. The range is 1 to 4294967295 seconds; the default is 60.  
- The `holdtime` is the interval after which a peer is declared inactive after not receiving a keepalive message from it. The range is 1 to 4294967295 seconds; the default is 180.

### Step 19
**Command**: `neighbor {ip-address | peer-group-name} weight weight`  
**Purpose**: (Optional) Specify a weight for all routes from a neighbor.

### Step 20
**Command**: `neighbor {ip-address | peer-group-name} distribute-list {access-list-number | name} {in | out}`  
**Purpose**: (Optional) Filter BGP routing updates to or from neighbors, as specified in an access list.

### Step 21
**Command**: `neighbor {ip-address | peer-group-name} filter-list access-list-number {in | out | weight weight}`  
**Purpose**: (Optional) Establish a BGP filter.

### Step 22
**Command**: `neighbor {ip-address | peer-group-name} version value`  
**Purpose**: (Optional) Specify the BGP version to use when communicating with a neighbor.

### Step 23
**Command**: `neighbor {ip-address | peer-group-name} soft-reconfiguration inbound`  
**Purpose**: (Optional) Configure the software to start storing received updates.

### Step 24
**Command**: `end`  
**Purpose**: Return to privileged EXEC mode.
Chapter 36 Configuring IP Unicast Routing

### Configuring BGP

To disable an existing BGP neighbor or neighbor peer group, use the `neighbor shutdown` router configuration command. To enable a previously existing neighbor or neighbor peer group that had been disabled, use the `no neighbor shutdown` router configuration command.

### Configuring Aggregate Addresses

Classless interdomain routing (CIDR) enables you to create aggregate routes (or supernets) to minimize the size of routing tables. You can configure aggregate routes in BGP either by redistributing an aggregate route into BGP or by creating an aggregate entry in the BGP routing table. An aggregate address is added to the BGP table when there is at least one more specific entry in the BGP table.

Beginning in privileged EXEC mode, use these commands to create an aggregate address in the routing table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>router bgp autonomous-system Enter BGP router configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>aggregate-address address mask Create an aggregate entry in the BGP routing table. The aggregate route is advertised as coming from the AS, and the atomic aggregate attribute is set to indicate that information might be missing.</td>
</tr>
<tr>
<td>Step 4</td>
<td>aggregate-address address mask as-set (Optional) Generate AS set path information. This command creates an aggregate entry following the same rules as the previous command, but the advertised path will be an AS_SET consisting of all elements contained in all paths. Do not use this keyword when aggregating many paths because this route must be continually withdrawn and updated.</td>
</tr>
<tr>
<td>Step 5</td>
<td>aggregate-address address-mask summary-only (Optional) Advertise summary addresses only.</td>
</tr>
<tr>
<td>Step 6</td>
<td>aggregate-address address mask suppress-map map-name (Optional) Suppress selected, more specific routes.</td>
</tr>
<tr>
<td>Step 7</td>
<td>aggregate-address address mask advertise-map map-name (Optional) Generate an aggregate based on conditions specified by the route map.</td>
</tr>
<tr>
<td>Step 8</td>
<td>aggregate-address address mask attribute-map map-name (Optional) Generate an aggregate with attributes specified in the route map.</td>
</tr>
<tr>
<td>Step 9</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10</td>
<td>show ip bgp neighbors [advertised-routes] Verify the configuration.</td>
</tr>
<tr>
<td>Step 11</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To delete an aggregate entry, use the `no aggregate-address address mask` router configuration command. To return options to the default values, use the command with keywords.
Configuring Routing Domain Confederations

One way to reduce the IBGP mesh is to divide an autonomous system into multiple subautonomous systems and to group them into a single confederation that appears as a single autonomous system. Each autonomous system is fully meshed within itself and has a few connections to other autonomous systems in the same confederation. Even though the peers in different autonomous systems have EBGP sessions, they exchange routing information as if they were IBGP peers. Specifically, the next hop, MED, and local preference information is preserved. You can then use a single IGP for all of the autonomous systems.

To configure a BGP confederation, you must specify a confederation identifier that acts as the autonomous system number for the group of autonomous systems. Beginning in privileged EXEC mode, use these commands to configure a BGP confederation:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>router bgp autonomous-system</td>
</tr>
<tr>
<td>Step 3</td>
<td>bgp confederation identifier autonomous-system</td>
</tr>
<tr>
<td>Step 4</td>
<td>bgp confederation peers autonomous-system [autonomous-system ...]</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show ip bgp neighbor</td>
</tr>
<tr>
<td></td>
<td>show ip bgp network</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Configuring BGP Route Reflectors

BGP requires that all of the IBGP speakers be fully meshed. When a router receives a route from an external neighbor, it must advertise it to all internal neighbors. To prevent a routing information loop, all IBGP speakers must be connected. The internal neighbors do not send routes learned from internal neighbors to other internal neighbors.

With route reflectors, all IBGP speakers need not be fully meshed because another method is used to pass learned routes to neighbors. When you configure an internal BGP peer to be a route reflector, it is responsible for passing IBGP learned routes to a set of IBGP neighbors. The internal peers of the route reflector are divided into two groups: client peers and nonclient peers (all the other routers in the autonomous system). A route reflector reflects routes between these two groups. The route reflector and its client peers form a cluster. The nonclient peers must be fully meshed with each other, but the client peers need not be fully meshed. The clients in the cluster do not communicate with IBGP speakers outside their cluster.

When the route reflector receives an advertised route, it takes one of these actions, depending on the neighbor:

- A route from an external BGP speaker is advertised to all clients and nonclient peers.
- A route from a nonclient peer is advertised to all clients.
- A route from a client is advertised to all clients and nonclient peers. Hence, the clients need not be fully meshed.
Usually a cluster of clients have a single route reflector, and the cluster is identified by the route reflector router ID. To increase redundancy and to avoid a single point of failure, a cluster might have more than one route reflector. In this case, all route reflectors in the cluster must be configured with the same 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster. All the route reflectors serving a cluster should be fully meshed and should have identical sets of client and nonclient peers.

Beginning in privileged EXEC mode, use these commands to configure a route reflector and clients:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>router bgp autonomous-system</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>neighbor ip-address</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>bgp cluster-id cluster-id</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>no bgp client-to-client reflection</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show ip bgp</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Configuring Route Dampening**

Route flap dampening minimizes the propagation of flapping routes across an internetwork. A route is considered to be flapping when it is repeatedly available, then unavailable, then available, then unavailable, and so on. When route dampening is enabled, a numeric penalty value is assigned to a route when it flaps. When a route’s accumulated penalties reach a configurable limit, BGP suppresses advertisements of the route, even if the route is running. The reuse limit is a configurable value that is compared with the penalty. If the penalty is less than the reuse limit, a suppressed route that is up is advertised again.

Dampening is not applied to routes that are learned by IBGP. This policy prevents the IBGP peers from having a higher penalty for routes external to the AS.

Beginning in privileged EXEC mode, use these commands to configure BGP route dampening:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>router bgp autonomous-system</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>bgp dampening</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>bgp dampening half-life reuse suppress max-suppress [route-map map]</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
</tbody>
</table>
To disable flap dampening, use the no bgp dampening router configuration command without keywords. To set dampening factors back to the default values, use the no bgp dampening router configuration command with values.

### Monitoring and Maintaining BGP

You can remove all contents of a particular cache, table, or database. This might be necessary when the contents of the particular structure have become or are suspected to be invalid.

You can display specific statistics, such as the contents of BGP routing tables, caches, and databases. You can use the information to get resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device’s packets are taking through the network.

Table 36-8 lists the privileged EXEC commands for clearing and displaying BGP. For explanations of the display fields, see the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2.

### Table 36-11 IP BGP Clear and Show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip bgp address</td>
<td>Reset a particular BGP connection.</td>
</tr>
<tr>
<td>clear ip bgp *</td>
<td>Reset all BGP connections.</td>
</tr>
<tr>
<td>clear ip bgp peer-group tag</td>
<td>Remove all members of a BGP peer group.</td>
</tr>
<tr>
<td>show ip bgp prefix</td>
<td>Display peer groups and peers not in peer groups to which the prefix has been advertised. Also display prefix attributes such as the next hop and the local prefix.</td>
</tr>
<tr>
<td>show ip bgp cidr-only</td>
<td>Display all BGP routes that contain subnet and supernet network masks.</td>
</tr>
<tr>
<td>show ip bgp community [community-number] [exact]</td>
<td>Display routes that belong to the specified communities.</td>
</tr>
<tr>
<td>show ip bgp community-list community-list-number [exact-match]</td>
<td>Display routes that are permitted by the community list.</td>
</tr>
<tr>
<td>show ip bgp filter-list access-list-number</td>
<td>Display routes that are matched by the specified AS path access list.</td>
</tr>
</tbody>
</table>
Chapter 36 Configuring IP Unicast Routing

Configuring ISO CLNS Routing

The International Organization for Standardization (ISO) Connectionless Network Service (CLNS) protocol is a standard for the network layer of the Open System Interconnection (OSI) model. Addresses in the ISO network architecture are referred to as network service access point (NSAP) addresses and network entity titles (NETs). Each node in an OSI network has one or more NETs. In addition, each node has many NSAP addresses.

When you enable connectionless routing on the switch by using the `clns routing` global configuration command, the switch makes only forwarding decisions, with no routing-related functionality. For dynamic routing, you must also enable a routing protocol. The switch supports the Intermediate System-to-Intermediate System (IS-IS) dynamic routing protocols for ISO CLNS networks: IS-IS supports two levels of routing: `station routing` (within an area) and `area routing` (between areas).

The key difference between the ISO IGRP and IS-IS NSAP addressing schemes is in the definition of area addresses. Both use the system ID for Level 1 routing (routing within an area). However, they differ in the way addresses are specified for area routing. An ISO IGRP NSAP address includes three separate fields for routing: the `domain`, `area`, and `system ID`. An IS-IS address includes two fields: a single continuous `area` field (comprising the domain and area fields) and the `system ID`.

For more detailed information about ISO CLNS, see the Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Configuration Guide, Release 12.2. For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Command Reference, Release 12.2, use the IOS command reference master index, or search online.

---

**Table 36-11 IP BGP Clear and Show Commands (continued)**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip bgp inconsistent-as</code></td>
<td>Display the routes with inconsistent originating autonomous systems.</td>
</tr>
<tr>
<td><code>show ip bgp regexp regular-expression</code></td>
<td>Display the routes that have an AS path that matches the specified regular expression entered on the command line.</td>
</tr>
<tr>
<td><code>show ip bgp</code></td>
<td>Display the contents of the BGP routing table.</td>
</tr>
<tr>
<td><code>show ip bgp neighbors [address]</code></td>
<td>Display detailed information on the BGP and TCP connections to individual neighbors.</td>
</tr>
<tr>
<td>`show ip bgp neighbors [address] [advertised-routes regular-expression</td>
<td>Display routes learned from a particular BGP neighbor.</td>
</tr>
<tr>
<td><code>show ip bgp paths</code></td>
<td>Display all BGP paths in the database.</td>
</tr>
<tr>
<td><code>show ip bgp peer-group [tag] [summary]</code></td>
<td>Display information about BGP peer groups.</td>
</tr>
<tr>
<td><code>show ip bgp summary</code></td>
<td>Display the status of all BGP connections.</td>
</tr>
</tbody>
</table>

You can also enable the logging of messages generated when a BGP neighbor resets, comes up, or goes down by using the `bgp log-neighbor changes` router configuration command.
Configuring IS-IS Dynamic Routing

IS-IS is an ISO dynamic routing protocol. Enabling IS-IS requires that you create an IS-IS routing process and assign it to a specific interface, rather than to a network. You can specify more than one IS-IS routing process per Layer 3 switch or router by using the multiarea IS-IS configuration syntax. You then configure the parameters for each instance of the IS-IS routing process.

Small IS-IS networks are built as a single area that includes all the routers in the network. As the network grows larger, it is usually reorganized into a backbone area made up of the connected set of all Level 2 routers from all areas, which is in turn connected to local areas. Within a local area, routers know how to reach all system IDs. Between areas, routers know how to reach the backbone, and the backbone routers know how to reach other areas.

Routers establish Level 1 adjacencies to perform routing within a local area (station routing). Routers establish Level 2 adjacencies to perform routing between Level 1 areas (area routing).

A single Cisco router can participate in routing in up to 29 areas and can perform Level 2 routing in the backbone. In general, each routing process corresponds to an area. By default, the first instance of the routing process configured performs both Level 1 and Level 2 routing. You can configure additional router instances, which are automatically treated as Level 1 routers. You must configure the parameters for each instance of the IS-IS routing process individually.

For IS-IS multiarea routing, you can configure only one process to perform Level 2 routing, although you can define up to 29 Level 1 areas for each Cisco unit. If Level 2 routing is configured on any process, all additional processes are automatically configured as Level 1. You can configure this process to perform Level 1 routing at the same time. If Level 2 routing is not desired for a router instance, remove the Level 2 capability using the `is-type` global configuration command. Use the `is-type` command also to configure a different router instance as a Level 2 router.

Note

For more detailed information about IS-IS, see the “IP Routing Protocols” chapter of the *Cisco IOS IP Configuration Guide, Release 12.2*. For complete syntax and usage information for the commands used in this section, see the *Cisco IOS IP Command Reference, Release 12.2*.

This section briefly describes how to configure IS-IS routing. It includes this information:

- Default IS-IS Configuration, page 36-63
- Nonstop Forwarding Awareness, page 36-64
- Configuring IS-IS Global Parameters, page 36-66
- Configuring IS-IS Interface Parameters, page 36-69

Default IS-IS Configuration

<table>

</tbody>
</table>

1. NSF = Nonstop Forwarding
2. IS-IS NSF awareness is enabled for IPv4 on switches running the metro IP access image.

Nonstop Forwarding Awareness

The integrated IS-IS NSF Awareness feature is supported for IPv4 in the metro IP access image. The feature allows customer premises equipment (CPE) routers that are NSF-aware to help NSF-capable routers perform nonstop forwarding of packets. The local router is not necessarily performing NSF, but its awareness of NSF allows the integrity and accuracy of the routing database and link-state database on the neighboring NSF-capable router to be maintained during the switchover process.

This feature is automatically enabled and requires no configuration. For more information on this feature, see the Integrated IS-IS Nonstop Forwarding (NSF) Awareness Feature Guide at this URL: http://www.cisco.com/en/US/products/sw/iosswrel/ps1839/products_white_paper09186a00801541c7.shtml

Enabling IS-IS Routing

To enable IS-IS, you specify a name and NET for each routing process. You then enable IS-IS routing on the interface and specify the area for each instance of the routing process.
Beginning in privileged EXEC mode, follow these steps to enable IS-IS and specify the area for each instance of the IS-IS routing process:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>clns routing</td>
</tr>
</tbody>
</table>
| **Step 3** | router isis [area tag] | Enable the IS-IS routing for the specified routing process and enter IS-IS routing configuration mode.  
(Optional) Use the *area tag* argument to identify the area to which the IS-IS router is assigned. You must enter a value if you are configuring multiple IS-IS areas.  
The first IS-IS instance configured is Level 1-2 by default. Later instances are automatically Level 1. You can change the level of routing by using the *is-type* global configuration command. |
| **Step 4** | net network-entity-title | Configure the NETs for the routing process. If you are configuring multiarea IS-IS, specify a NET for each routing process. You can specify a name for a NET and for an address. |
| **Step 5** | is-type {level-1 | level-1-2 | level-2-only} | (Optional) You can configure the router to act as a Level 1 (station) router, a Level 2 (area) router for multi-area routing, or both (the default):  
* level-1—act as a station router only  
* level-1-2—act as both a station router and an area router  
* level 2—act as an area router only |
| **Step 6** | exit | Return to global configuration mode. |
| **Step 7** | interface interface-id | Specify an interface to route IS-IS, and enter interface configuration mode.  
If the interface is not already configured as a Layer 3 interface, enter the *no switchport* command to put it into Layer 3 mode. |
| **Step 8** | no shutdown | Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled. |
| **Step 9** | ip router isis [area tag] | Configure an IS-IS routing process for ISO CLNS on the interface and attach an area designator to the routing process. |
| **Step 10** | clns router isis [area tag] | Enable ISO CLNS on the interface. |
| **Step 11** | ip address ip-address-mask | Define the IP address for the interface. An IP address is required on all interfaces in an area enabled for IS-IS if any one interface is configured for IS-IS routing. |
| **Step 12** | end | Return to privileged EXEC mode. |
| **Step 13** | show isis [area tag] database detail | Verify your entries. |
| **Step 14** | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

To disable IS-IS routing, use the **no router isis area-tag** router configuration command.
This example shows how to configure three routers to run conventional IS-IS as an IP routing protocol. In conventional IS-IS, all routers act as Level 1 and Level 2 routers (by default).

### Router A

```
Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000a.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit
```

### Router B

```
Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000b.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit
```

### Router C

```
Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000c.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit
```

### Configuring IS-IS Global Parameters

These are some optional IS-IS global parameters that you can configure:

- You can force a default route into an IS-IS routing domain by configuring a default route controlled by a route map. You can also specify other filtering options configurable under a route map.
- You can configure the router to ignore IS-IS LSPs that are received with internal checksum errors or to purge corrupted LSPs, which causes the initiator of the LSP to regenerate it.
- You can assign passwords to areas and domains.
- You can create aggregate addresses that are represented in the routing table by a summary address (route-summation). Routes learned from other routing protocols can also be summarized. The metric used to advertise the summary is the smallest metric of all the specific routes.
- You can set an overload bit.
You can configure the LSP refresh interval and the maximum time that an LSP can remain in the router database without a refresh.

You can set the throttling timers for LSP generation, shortest path first computation, and partial route computation.

You can configure the switch to generate a log message when an IS-IS adjacency changes state (up or down).

If a link in the network has a maximum transmission unit (MTU) size of less than 1500 bytes, you can lower the LSP MTU so that routing will still occur.

The partition avoidance router configuration command prevents an area from becoming partitioned when full connectivity is lost among a Level1-2 border router, adjacent Level 1 routers, and end hosts.

Beginning in privileged EXEC mode, follow these steps to configure IS-IS parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>clns routing</td>
</tr>
<tr>
<td>Step 3</td>
<td>router isis</td>
</tr>
<tr>
<td>Step 4</td>
<td>default-information originate [route-map map-name]</td>
</tr>
<tr>
<td>Step 5</td>
<td>ignore-lsp-errors</td>
</tr>
<tr>
<td>Step 6</td>
<td>area-password password</td>
</tr>
<tr>
<td>Step 7</td>
<td>domain-password password</td>
</tr>
<tr>
<td>Step 8</td>
<td>summary-address address mask [level-1</td>
</tr>
<tr>
<td>Step 9</td>
<td>set-overload-bit [on-startup {seconds</td>
</tr>
</tbody>
</table>

- (Optional) on-startup—sets the overload bit only on startup. If on-startup is not specified, the overload bit is set immediately and remains set until you enter the no set-overload-bit command. If on-startup is specified, you must enter a number of seconds or wait-for-bgp.

- seconds—When the on-startup keyword is configured, causes the overload bit to be set upon system startup and remain set for this number of seconds. The range is from 5 to 86400 seconds.

- wait-for-bgp—When the on-startup keyword is configured, causes the overload bit to be set upon system startup and remain set until BGP has converged. If BGP does not signal IS-IS that it is converged, IS-IS will turn off the overload bit after 10 minutes.
### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 10</strong></td>
<td><code>lsp-refresh-interval seconds</code> (Optional) Set an LSP refresh interval in seconds. The range is from 1 to 65535 seconds. The default is to send LSP refreshes every 900 seconds (15 minutes).</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td><code>max-lsp-lifetime seconds</code> (Optional) Set the maximum time that LSP packets remain in the router database without being refreshed. The range is from 1 to 65535 seconds. The default is 1200 seconds (20 minutes). After the specified time interval, the LSP packet is deleted.</td>
</tr>
</tbody>
</table>
| **Step 12** | `lsp-gen-interval [level-1 | level-2]` `lsp-max-wait [lsp-initial-wait lsp-second-wait]` (Optional) Set the IS-IS LSP generation throttling timers:  
  - `lsp-max-wait`—the maximum interval (in seconds) between two consecutive occurrences of an LSP being generated. The range is 1 to 120, the default is 5.  
  - `lsp-initial-wait`—the initial LSP generation delay (in milliseconds). The range is 1 to 10000; the default is 50.  
  - `lsp-second-wait`—the hold time between the first and second LSP generation (in milliseconds). The range is 1 to 10000; the default is 5000. |
| **Step 13** | `spf-interval [level-1 | level-2]` `spf-max-wait [spf-initial-wait spf-second-wait]` (Optional) Sets IS-IS shortest path first (SPF) throttling timers:  
  - `spf-max-wait`—the maximum interval between consecutive SFPs (in seconds). The range is 1 to 120, the default is 10.  
  - `spf-initial-wait`—the initial SPF calculation after a topology change (in milliseconds). The range is 1 to 10000; the default is 5500.  
  - `spf-second-wait`—the holdtime between the first and second SPF calculation (in milliseconds). The range is 1 to 10000; the default is 5500. |
| **Step 14** | `prc-interval` `prc-max-wait` `[prc-initial-wait prc-second-wait]` (Optional) Sets IS-IS partial route computation (PRC) throttling timers:  
  - `prc-max-wait`—the maximum interval (in seconds) between two consecutive PRC calculations. The range is 1 to 120; the default is 5.  
  - `prc-initial-wait`—the initial PRC calculation delay (in milliseconds) after a topology change. The range is 1 to 10,000; the default is 2000.  
  - `prc-second-wait`—the holdtime between the first and second PRC calculation (in milliseconds). The range is 1 to 10,000; the default is 5000. |
| **Step 15** | `log-adjacency-changes [all]` (Optional) Set the router to log IS-IS adjacency state changes. Enter all to include all changes generated by events that are not related to the Intermediate System-to-Intermediate System Hellos, including End System-to-Intermediate System PDUs and link state packets (LSPs). |
| **Step 16** | `lsp-mtu size` (Optional) Specify the maximum LSP packet size in bytes. The range is 128 to 4352; the default is 1497 bytes.  
  - **Note** If any link in the network has a reduced MTU size, you must change the LSP MTU size on all routers in the network. |
| **Step 17** | `partition avoidance` (Optional) Causes an IS-IS Level 1-2 border router to stop advertising the Level 1 area prefix into the Level 2 backbone when full connectivity is lost among the border router, all adjacent level 1 routers, and end hosts. |
| **Step 18** | `end` Return to privileged EXEC mode. |
Configuring ISO CLNS Routing

To disable default route generation, use the `no default-information originate` router configuration command. Use the `no area-password` or `no domain-password` router configuration command to disable passwords. To disable LSP MTU settings, use the `no lsp mtu` router configuration command. To return to the default conditions for summary addressing, LSP refresh interval, LSP lifetime, LSP timers, SFP timers, and PRC timers, use the `no` form of the commands. Use the `no partition avoidance` router configuration command to disable the output format.

Configuring IS-IS Interface Parameters

You can optionally configure certain interface-specific IS-IS parameters, independently from other attached routers. However, if you change some values from the defaults, such as multipliers and time intervals, it makes sense to also change them on multiple routers and interfaces. Most of the interface parameters can be configured for level 1, level 2, or both.

These are some interface level parameters you can configure:

- The default metric on the interface, which is used as a value for the IS-IS metric and assigned when there is no quality of service (QoS) routing performed.

- The hello interval (length of time between hello packets sent on the interface) or the default hello packet multiplier used on the interface to determine the hold time sent in IS-IS hello packets. The hold time determines how long a neighbor waits for another hello packet before declaring the neighbor down. This determines how quickly a failed link or neighbor is detected so that routes can be recalculated. Change the hello-multiplier in circumstances where hello packets are lost frequently and IS-IS adjacencies are failing unnecessarily. You can raise the hello multiplier and lower the hello interval correspondingly to make the hello protocol more reliable without increasing the time required to detect a link failure.

- Other time intervals:
  - Complete sequence number PDU (CSNP) interval. CSNPs are sent by the designated router to maintain database synchronization
  - Retransmission interval. This is the time between retransmission of IS-IS LSPs for point-to-point links.
  - IS-IS LSP retransmission throttle interval. This is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs are re-sent on point-to-point links. This interval is different from the retransmission interval, which is the time between successive retransmissions of the same LSP

- Designated router election priority, which allows you to reduce the number of adjacencies required on a multiaccess network, which in turn reduces the amount of routing protocol traffic and the size of the topology database.

- The interface circuit type, which is the type of adjacency desired for neighbors on the specified interface

- Password authentication for the interface

**Command**  | **Purpose**
---|---
Step 19  | show clns  
Verify your entries.
Step 20  | copy running-config startup-config  
(Optional) Save your entries in the configuration file.

To disable default route generation, use the `no default-information originate` router configuration command. Use the `no area-password` or `no domain-password` router configuration command to disable passwords. To disable LSP MTU settings, use the `no lsp mtu` router configuration command. To return to the default conditions for summary addressing, LSP refresh interval, LSP lifetime, LSP timers, SFP timers, and PRC timers, use the `no` form of the commands. Use the `no partition avoidance` router configuration command to disable the output format.
Beginning in privileged EXEC mode, follow these steps to configure IS-IS interface parameters:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>isis metric default-metric [level-1</td>
</tr>
</tbody>
</table>
| Step 5  | isis hello-interval {seconds | minimal} [level-1 | level-2] | (Optional) Specify the length of time between hello packets sent by the switch. By default, a value three times the hello interval seconds is advertised as the holdtime in the hello packets sent. With smaller hello intervals, topological changes are detected faster, but there is more routing traffic.  
- *minimal*—causes the system to compute the hello interval based on the hello multiplier so that the resulting hold time is 1 second.  
- *seconds*—the range is from 1 to 65535. The default is 10 seconds. |
| Step 6  | isis hello-multiplier multiplier [level-1 | level-2] | (Optional) Specify the number of IS-IS hello packets a neighbor must miss before the router should declare the adjacency as down. The range is from 3 to 1000. The default is 3. Using a smaller hello-multiplier causes fast convergence, but can result in more routing instability. |
| Step 7  | isis csnp-interval seconds [level-1 | level-2] | (Optional) Configure the IS-IS complete sequence number PDU (CSNP) interval for the interface. The range is from 0 to 65535. The default is 10 seconds. |
| Step 8  | isis retransmit-interval seconds | (Optional) Configure the number of seconds between retransmission of IS-IS LSPs for point-to-point links. The value you specify should be an integer greater than the expected round-trip delay between any two routers on the network. The range is from 0 to 65535. The default is 5 seconds. |
| Step 9  | isis retransmit-throttle-interval milliseconds | (Optional) Configure the IS-IS LSP retransmission throttle interval, which is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs will be re-sent on point-to-point links. The range is from 0 to 65535. The default is determined by the isis lsp-interval command. |
| Step 10 | isis priority value [level-1 | level-2] | (Optional) Configure the priority to use for designated router election. The range is from 0 to 127. The default is 64. |
Chapter 36 Configuring IP Unicast Routing

Configuring ISO CLNS Routing

To return to the default settings, use the no forms of the commands.

Monitoring and Maintaining IS-IS

You can remove all contents of a CLNS cache or remove information for a particular neighbor or route. You can display specific CLNS or IS-IS statistics, such as the contents of routing tables, caches, and databases. You can also display information about specific interfaces, filters, or neighbors.

Table 36-13 lists the privileged EXEC commands for clearing and displaying ISO CLNS and IS-IS routing. For explanations of the display fields, see the Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Command Reference, Release 12.2, use the Cisco IOS command reference master index, or search online.

Table 36-13 ISO CLNS and IS-IS Clear and Show Commands

Configuring Multi-VRF CE

Virtual Private Networks (VPNs) provide a secure way for customers to share bandwidth over an ISP backbone network. A VPN is a collection of sites sharing a common routing table. A customer site is connected to the service-provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table, called a VPN routing/forwarding (VRF) table.

The switch supports multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices (multi-VRF CE). Multi-VRF CE allows a service provider to support two or more VPNs with overlapping IP addresses.

These sections contain this information:

- Understanding Multi-VRF CE, page 36-73
- Default Multi-VRF CE Configuration, page 36-75
- Multi-VRF CE Configuration Guidelines, page 36-75
- Configuring VRFs, page 36-76
- Configuring VRF-Aware Services, page 36-77
- Configuring a VPN Routing Session, page 36-80
- Configuring BGP PE to CE Routing Sessions, page 36-81
Understanding Multi-VRF CE

Multi-VRF CE is a feature that allows a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. Multi-VRF CE uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but an interface cannot belong to more than one VRF at any time.

**Note**

Multi-VRF CE interfaces must be Layer 3 interfaces.

Multi-VRF CE includes these devices:

- Customer edge (CE) devices provide customers access to the service-provider network over a data link to one or more provider edge routers. The CE device advertises the site's local routes to the router and learns the remote VPN routes from it. The Cisco ME 3400 switch can be a CE.

- Provider edge (PE) routers exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv2, OSPF, or EIGRP. The PE is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE to maintain all of the service-provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE router can be associated with a single VRF if all of these sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CEs, a PE router exchanges VPN routing information with other PE routers by using internal BGP (IBGP).

- Provider routers or core routers are any routers in the service provider network that do not attach to CE devices.

With multi-VRF CE, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. Multi-VRF CE extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

_Figure 36-6_ shows a configuration using Cisco ME switches as multiple virtual CEs. This scenario is suited for customers who have low bandwidth requirements for their VPN service, for example, small companies. In this case, multi-VRF CE support is required in the Cisco ME switches. Because multi-VRF CE is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.
When the CE switch receives a command to add a Layer 3 interface to a VRF, it sets up the appropriate mapping between the VLAN ID and the policy label (PL) in multi-VRF-CE-related data structures and adds the VLAN ID and PL to the VLAN database.

When multi-VRF CE is configured, the Layer 3 forwarding table is conceptually partitioned into two sections:

- The multi-VRF CE routing section contains the routes from different VPNs.
- The global routing section contains routes to non-VPN networks, such as the Internet.

VLAN IDs from different VRFs are mapped into different policy labels, which are used to distinguish the VRFs during processing. If no route is found in the multi-VRF CE section of the Layer 3 forwarding table, the global routing section is used to determine the forwarding path. For each new VPN route learned, the Layer 3 setup function retrieves the policy label by using the VLAN ID of the ingress port and inserts the policy label and new route to the multi-VRF CE routing section. If the packet is received from a routed port, the port internal VLAN ID number is used; if the packet is received from an SVI, the VLAN number is used.

This is the packet-forwarding process in a multi-VRF-CE-enabled network:

- When the switch receives a packet from a VPN, the switch looks up the routing table based on the input policy label number. When a route is found, the switch forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. Then it performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input policy label to look up the correct VPN routing table. If a route is found, it forwards the packet within the VPN.

To configure VRF, you create a VRF table and specify the Layer 3 interface associated with the VRF. Then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the provider's backbone. The multi-VRF CE network has three major components:

- VPN route target communities—lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- Multiprotocol BGP peering of VPN community PE routers—propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
• VPN forwarding—transports all traffic between all VPN community members across a VPN service-provider network.

Default Multi-VRF CE Configuration

Table 36-14 shows the default VRF configuration.

Table 36-14  Default VRF Configuration

<table>

<td>5000</td>
</tr>
<tr>
<td>Forwarding table</td>
<td>The default for an interface is the global routing table.</td>
</tr>
</tbody>
</table>

Multi-VRF CE Configuration Guidelines

These are considerations when configuring VRF in your network:

• A switch with multi-VRF CE is shared by multiple customers, and each customer has its own routing table.
• Because customers use different VRF tables, the same IP addresses can be reused. Overlapped IP addresses are allowed in different VPNs.
• Multi-VRF CE lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. Each customer has its own VLAN.
• Multi-VRF CE does not support all MPLS-VRF functionality. It does not support label exchange, LDP adjacency, or labeled packets.
• For the PE router, there is no difference between using multi-VRF CE or using multiple CEs. In Figure 36-6, multiple virtual Layer 3 interfaces are connected to the multi-VRF CE device.
• The switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. The SVIs can be connected through an access port or a trunk port.
• A customer can use multiple VLANs as long as they do not overlap with those of other customers. A customer’s VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
• The switch supports one global network and up to 26 VRFs.
• Most routing protocols (BGP, OSPF, RIP, EIGRP, and static routing) can be used between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
  – BGP does not require multiple algorithms to communicate with multiple CEs.
  – BGP is designed for passing routing information between systems run by different administrations.
  – BGP makes it easy to pass attributes of the routes to the CE.
• Multi-VRF CE does not affect the packet switching rate.
• If no VRFs are configured, up to 105 policies can be configured.
• If even one VRF is configured than 41 policies can be configured.
• If more than 41 policies are configured then VRF cannot be configured.
• VRF and private VLANs are mutually-exclusive. You cannot enable VRF on a private VLAN. Similarly, you cannot enable private VLAN on a VLAN with VRF configured on the VLAN interface.
• VRF and policy-based routing (PBR) are mutually-exclusive on a switch interface. You cannot enable VRF when PBR is enabled on an interface. In contrast, you cannot enable PBR when VRF is enabled on an interface.

Configuring VRFs

Beginning in privileged EXEC mode, follow these steps to configure one or more VRFs. For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2  ip routing</td>
<td>Enable IP routing.</td>
</tr>
<tr>
<td>Step 3  ip vrf vrf-name</td>
<td>Name the VRF, and enter VRF configuration mode.</td>
</tr>
<tr>
<td>Step 4  rd route-distinguisher</td>
<td>Create a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y)</td>
</tr>
<tr>
<td>Step 5  route-target { export</td>
<td>import</td>
</tr>
<tr>
<td>Step 6  import map route-map</td>
<td>(Optional) Associate a route map with the VRF.</td>
</tr>
<tr>
<td>Step 7  interface interface-id</td>
<td>Specify the Layer 3 interface to be associated with the VRF, and enter interface configuration mode. The interface can be a routed port or SVI.</td>
</tr>
<tr>
<td>Step 8  no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 9  ip vrf forwarding vrf-name</td>
<td>Associate the VRF with the Layer 3 interface.</td>
</tr>
<tr>
<td>Step 10 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 11 show ip vrf [brief</td>
<td>detail</td>
</tr>
<tr>
<td>Step 12 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no ip vrf vrf-name global configuration command to delete a VRF and to remove all interfaces from it. Use the no ip vrf forwarding interface configuration command to remove an interface from the VRF.
Configuring VRF-Aware Services

IP services can be configured on global interfaces, and these services run within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.

VRF-Aware services are implemented in platform-independent modules. VRF means multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:
- The user can ping a host in a user-specified VRF.
- ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.

These services are VRF-Aware:
- ARP
- Ping
- Simple Network Management Protocol (SNMP)
- Hot Standby Router Protocol (HSRP)
- Unicast Reverse Path Forwarding (uRPF)
- Syslog
- Traceroute
- FTP and TFTP

User Interface for ARP

Beginning in privileged EXEC mode, follow these steps to configure VRF-aware services for ARP. For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip arp vrf vrf-name</td>
<td>Display the ARP table in the specified VRF.</td>
</tr>
</tbody>
</table>

User Interface for PING

Beginning in privileged EXEC mode, follow these steps to configure VRF-aware services for ping. For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ping vrf vrf-name ip-host</td>
<td>Display the ARP table in the specified VRF.</td>
</tr>
</tbody>
</table>
User Interface for SNMP

Beginning in privileged EXEC mode, follow these steps to configure VRF-aware services for SNMP. For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server trap authentication vrf</td>
<td>Enable SNMP traps for packets on a VRF.</td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server engineID remote &lt;host&gt; vrf &lt;vpn instance&gt; &lt;engine-id string&gt;</td>
<td>Configure a name for the remote SNMP engine on a switch.</td>
</tr>
<tr>
<td><strong>Step 4</strong> snmp-server host &lt;host&gt; vrf &lt;vpn instance&gt; traps &lt;community&gt;</td>
<td>Specify the recipient of an SNMP trap operation and specify the VRF table to be used for sending SNMP traps.</td>
</tr>
<tr>
<td><strong>Step 5</strong> snmp-server host &lt;host&gt; vrf &lt;vpn instance&gt; informs &lt;community&gt;</td>
<td>Specify the recipient of an SNMP inform operation and specify the VRF table to be used for sending SNMP informs.</td>
</tr>
<tr>
<td><strong>Step 6</strong> snmp-server user &lt;user&gt; &lt;group&gt; remote &lt;host&gt; vrf &lt;vpn instance&gt; &lt;security model&gt;</td>
<td>Add a user to an SNMP group for a remote host on a VRF for SNMP access.</td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

User Interface for HSRP

HSRP support for VRFs ensures that HSRP virtual IP addresses are added to the correct IP routing table. Beginning in privileged EXEC mode, follow these steps to configure VRF-aware services for HSRP. For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>

User Interface for Traceroute

Beginning in privileged EXEC mode, follow these steps to configure VRF-aware services for traceroute. For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>traceroute vrf vrf-name ipaddress</td>
<td>Specify the name of a VPN VRF in which to find the destination address.</td>
</tr>
</tbody>
</table>

User Interface for FTP and TFTP

So that FTP and TFTP are VRF-aware, you must configure some FTP/TFTP CLIs. For example, if you want to use a VRF table that is attached to an interface, say E1/0, you need to configure the CLI `ip [t]ftp source-interface E1/0` to inform [t]ftp to use a specific routing table. In this example, the VRF table is used to look up the destination IP address. These changes are backward-compatible and do not affect existing behavior. That is, you can use the source-interface CLI to send packets out a particular interface even if no VRF is configured on that interface.

To specify the source IP address for FTP connections, use the `ip ftp source-interface` show mode command. To use the address of the interface where the connection is made, use the `no` form of this command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip ftp source-interface interface-type interface-number</td>
<td>Specify the source IP address for FTP connections.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

To specify the IP address of an interface as the source address for TFTP connections, use the `ip tftp source-interface` show mode command. To return to the default, use the `no` form of this command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip tftp source-interface interface-type interface-number</td>
<td>Specify the source IP address for TFTP connections.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Configuring a VPN Routing Session

Routing within the VPN can be configured with any supported routing protocol (RIP, OSPF, EIGRP, or BGP) or with static routing. The configuration shown here is for OSPF, but the process is the same for other protocols.
Beginning in privileged EXEC mode, follow these steps to configure OSPF in the VPN:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>router ospf process-id vrf vrf-name</td>
</tr>
<tr>
<td>Step 3</td>
<td>log-adjacency-changes</td>
</tr>
<tr>
<td>Step 4</td>
<td>redistribute bgp autonomous-system-number subnets</td>
</tr>
<tr>
<td>Step 5</td>
<td>network network-number area area-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td>Step 7</td>
<td>show ip ospf process-id</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no router ospf process-id vrf vrf-name global configuration command to disassociate the VPN forwarding table from the OSPF routing process.

### Configuring BGP PE to CE Routing Sessions

Beginning in privileged EXEC mode, follow these steps to configure a BGP PE to CE routing session:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>router bgp autonomous-system-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>network network-number mask network-mask</td>
</tr>
<tr>
<td>Step 4</td>
<td>redistribute ospf process-id match internal</td>
</tr>
<tr>
<td>Step 5</td>
<td>network network-number area area-id</td>
</tr>
<tr>
<td>Step 6</td>
<td>address-family ipv4 vrf vrf-name</td>
</tr>
<tr>
<td>Step 7</td>
<td>neighbor address remote-as as-number</td>
</tr>
<tr>
<td>Step 8</td>
<td>neighbor address activate</td>
</tr>
<tr>
<td>Step 9</td>
<td>end</td>
</tr>
<tr>
<td>Step 10</td>
<td>show ip bgp [ipv4] [neighbors]</td>
</tr>
<tr>
<td>Step 11</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Use the no router bgp autonomous-system-number global configuration command to delete the BGP routing process. Use the command with keywords to delete routing characteristics.
## Multi-VRF CE Configuration Example

Figure 36-7 is a simplified example of the physical connections in a network similar to that in Figure 36-6. OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The examples following the illustration show how to configure a Cisco ME 3400 switch as CE Switch A, and the VRF configuration for customer switches D and F. Commands for configuring CE Switch C and the other customer switches are not included but would be similar. The example also includes commands for configuring traffic to Switch A for a Catalyst 6000 or Catalyst 6500 switch acting as a PE router.

![Figure 36-7](image-url)  
**Figure 36-7  Multi-VRF CE Configuration Example**

### Configuring Switch A

On Switch A, enable routing and configure VRF.

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# ip vrf v11
Switch(config-vrf)# rd 800:1
Switch(config-vrf)# route-target export 800:1
Switch(config-vrf)# route-target import 800:1
Switch(config-vrf)# exit
Switch(config)# ip vrf v12
Switch(config-vrf)# rd 800:2
Switch(config-vrf)# route-target export 800:2
Switch(config-vrf)# route-target import 800:2
Switch(config-vrf)# exit
```
Configure the loopback and physical interfaces on Switch A. Gigabit Ethernet port 1 is a trunk connection to the PE. Fast Ethernet ports 8 and 11 connect to VPNs:

Switch(config)# interface loopback1
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 8.8.1.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface loopback2
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 8.8.2.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface gigabitethernet0/5
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface fastethernet0/8
Switch(config-if)# no shutdown
Switch(config-if)# switchport access vlan 208
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface fastethernet0/11
Switch(config-if)# no shutdown
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Configure the VLANs used on Switch A. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for the VPNs that include Switch F and Switch D, respectively:

Switch(config)# interface vlan10
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 38.0.0.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface vlan20
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 83.0.0.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface vlan118
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 118.0.0.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface vlan208
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 208.0.0.8 255.255.255.0
Switch(config-if)# exit

Configure OSPF routing in VPN1 and VPN2.

Switch(config)# router ospf 1 vrf v11
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit
Switch(config)# router ospf 2 vrf v12
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit

Configure BGP for CE to PE routing.
Switch(config)# router bgp 800
Switch(config-router)# address-family ipv4 vrf vl2
Switch(config-router-af)# redistribute ospf 2 match internal
Switch(config-router-af)# neighbor 83.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 83.0.0.3 activate
Switch(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Switch(config-router-af)# exit

Switch(config-router)# address-family ipv4 vrf vl1
Switch(config-router-af)# redistribute ospf 1 match internal
Switch(config-router-af)# neighbor 38.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 38.0.0.3 activate
Switch(config-router-af)# network 8.8.1.0 mask 255.255.255.0
Switch(config-router-af)# end

Configuring Switch D

Switch D belongs to VPN 1. Configure the connection to Switch A by using these commands.
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface fastethernet0/2
Switch(config-if)# no shutdown
Switch(config-if)# no switchport
Switch(config-if)# ip address 208.0.0.20 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

Configuring Switch F

Switch F belongs to VPN 2. Configure the connection to Switch A by using these commands.
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface fastethernet0/1
Switch(config-if)# no shutdown
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface vlan118
Switch(config-if)# ip address 118.0.0.11 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# end
Configuring the PE Switch B

On Switch B (the PE router), these commands configure only the connections to the CE device, Switch A.

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip vrf v1
Router(config-vrf)# rd 100:1
Router(config-vrf)# route-target export 100:1
Router(config-vrf)# route-target import 100:1
Router(config-vrf)# exit

Router(config)# ip vrf v2
Router(config-vrf)# rd 100:2
Router(config-vrf)# route-target export 100:2
Router(config-vrf)# route-target import 100:2
Router(config-vrf)# exit

Router(config)# ip cef
Router(config)# interface Loopback1
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 3.3.1.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Loopback2
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 3.3.2.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface gigabitethernet0.10
Router(config-if)# encapsulation dot1q 10
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 38.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface gigabitethernet0.20
Router(config-if)# encapsulation dot1q 20
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 83.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# router bgp 100
Router(config-router)# address-family ipv4 vrf v2
Router(config-router-af)# neighbor 83.0.0.8 remote-as 800
Router(config-router-af)# neighbor 83.0.0.8 activate
Router(config-router-af)# network 3.3.1.2 mask 255.255.255.0
Router(config-router-af)# exit
Router(config-router)# address-family ipv4 vrf v1
Router(config-router-af)# neighbor 38.0.0.8 remote-as 800
Router(config-router-af)# neighbor 38.0.0.8 activate
Router(config-router-af)# network 3.3.1.0 mask 255.255.255.0
Router(config-router-af)# end
Displaying Multi-VRF CE Status

You can use the privileged EXEC commands in Table 36-15 to display information about multi-VRF CE configuration and status.

Table 36-15 Commands for Displaying Multi-VRF CE Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip protocols vrf vrf-name</td>
<td>Display routing protocol information associated with a VRF.</td>
</tr>
<tr>
<td>show ip route vrf vrf-name [connected] [protocol [as-number]] [list] [mobile] [odr] [profile] [static] [summary] [supernets-only]</td>
<td>Display IP routing table information associated with a VRF.</td>
</tr>
<tr>
<td>show ip vrf [brief</td>
<td>detail</td>
</tr>
</tbody>
</table>

For more information about the information in the displays, refer to the *Cisco IOS Switching Services Command Reference, Release 12.2*.

Configuring Protocol-Independent Features

This section describes how to configure IP routing protocol-independent features. For a complete description of the IP routing protocol-independent commands in this chapter, see the “IP Routing Protocol-Independent Commands” chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2*.

These sections contain this configuration information:

- Configuring Cisco Express Forwarding, page 36-86
- Configuring the Number of Equal-Cost Routing Paths, page 36-88
- Configuring Static Unicast Routes, page 36-88
- Specifying Default Routes and Networks, page 36-89
- Using Route Maps to Redistribute Routing Information, page 36-90
- Configuring Policy-Based Routing, page 36-94
- Filtering Routing Information, page 36-97
- Managing Authentication Keys, page 36-99

Configuring Cisco Express Forwarding

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology used to optimize network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. CEF is less CPU-intensive than fast switching route caching, allowing more CPU processing power to be dedicated to packet forwarding. In dynamic networks, fast switching cache entries are frequently invalidated because of routing changes, which can cause traffic to be process switched using the routing table, instead of fast switched using the route cache. CEF use the Forwarding Information Base (FIB) lookup table to perform destination-based switching of IP packets.
The two main components in CEF are the distributed FIB and the distributed adjacency tables.

- The FIB is similar to a routing table or information base and maintains a mirror image of the forwarding information in the IP routing table. When routing or topology changes occur in the network, the IP routing table is updated, and those changes are reflected in the FIB. The FIB maintains next-hop address information based on the information in the IP routing table. Because the FIB contains all known routes that exist in the routing table, CEF eliminates route cache maintenance, is more efficient for switching traffic, and is not affected by traffic patterns.

- Nodes in the network are said to be adjacent if they can reach each other with a single hop across a link layer. CEF uses adjacency tables to prepend Layer 2 addressing information. The adjacency table maintains Layer 2 next-hop addresses for all FIB entries.

Because the switch uses Application Specific Integrated Circuits (ASICS) to achieve Gigabit-speed line rate IP traffic, CEF forwarding applies only to the software-forwarding path, that is, traffic that is forwarded by the CPU.

CEF is enabled globally by default. If for some reason it is disabled, you can re-enable it by using the `ip cef` global configuration command.

The default configuration is CEF enabled on all Layer 3 interfaces. Entering the `no ip route-cache cef` interface configuration command disables CEF for traffic that is being forwarded by software. This command does not affect the hardware forwarding path. Disabling CEF and using the `debug ip packet detail` privileged EXEC command can be useful to debug software-forwarded traffic. To enable CEF on an interface for the software-forwarding path, use the `ip route-cache cef` interface configuration command.

Caution: Although the `no ip route-cache cef` interface configuration command to disable CEF on an interface is visible in the CLI, we strongly recommend that you do not disable CEF on interfaces except for debugging purposes.

Beginning in privileged EXEC mode, follow these steps to enable CEF globally and on an interface for software-forwarded traffic if it has been disabled:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>ip cef</td>
<td>Enable CEF operation.</td>
</tr>
<tr>
<td>3</td>
<td>interface interface-id</td>
<td>Enter interface configuration mode, and specify the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>4</td>
<td>no shutdown</td>
<td>Enable the interface if necessary. By default, UNIs and ENIs are disabled and NNIs are enabled.</td>
</tr>
<tr>
<td>5</td>
<td>ip route-cache cef</td>
<td>Enable CEF on the interface for software-forwarded traffic.</td>
</tr>
<tr>
<td>6</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>7</td>
<td>show ip cef</td>
<td>Display the CEF status on all interfaces.</td>
</tr>
<tr>
<td>8</td>
<td>show cef linecard [detail]</td>
<td>Display CEF-related interface information.</td>
</tr>
<tr>
<td>9</td>
<td>show cef interface [interface-id]</td>
<td>Display detailed CEF information for all interfaces or the specified interface.</td>
</tr>
<tr>
<td>10</td>
<td>show adjacency</td>
<td>Display CEF adjacency table information.</td>
</tr>
<tr>
<td>11</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring the Number of Equal-Cost Routing Paths

When a router has two or more routes to the same network with the same metrics, these routes can be thought of as having an equal cost. The term parallel path is another way to see occurrences of equal-cost routes in a routing table. If a router has two or more equal-cost paths to a network, it can use them concurrently. Parallel paths provide redundancy in case of a circuit failure and also enable a router to load balance packets over the available paths for more efficient use of available bandwidth.

Although the router automatically learns about and configures equal-cost routes, you can control the maximum number of parallel paths supported by an IP routing protocol in its routing table.

Beginning in privileged EXEC mode, follow these steps to change the maximum number of parallel paths installed in a routing table from the default:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>router {bgp</td>
<td>rip</td>
</tr>
<tr>
<td>maximum-paths maximum</td>
<td>Set the maximum number of parallel paths for the protocol routing table. The range is from 1 to 8; the default is 4 for most IP routing protocols, but only 1 for BGP.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show ip protocols</td>
<td>Verify the setting in the Maximum path field.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no maximum-paths router configuration command to restore the default value.

Configuring Static Unicast Routes

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

Beginning in privileged EXEC mode, follow these steps to configure a static route:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ip route prefix mask {address</td>
<td>interface} [distance]</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show ip route</td>
<td>Display the current state of the routing table to verify the configuration.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no ip route prefix mask {address | interface} global configuration command to remove a static route.
The switch retains static routes until you remove them. However, you can override static routes with dynamic routing information by assigning administrative distance values. Each dynamic routing protocol has a default administrative distance, as listed in Table 36-16. If you want a static route to be overridden by information from a dynamic routing protocol, set the administrative distance of the static route higher than that of the dynamic protocol.

**Table 36-16 Dynamic Routing Protocol Default Administrative Distances**

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Default Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected interface</td>
<td>0</td>
</tr>
<tr>
<td>Static route</td>
<td>1</td>
</tr>
<tr>
<td>Enhanced IRGP summary</td>
<td>5</td>
</tr>
<tr>
<td>External BGP</td>
<td>20</td>
</tr>
<tr>
<td>Internal Enhanced IGRP</td>
<td>90</td>
</tr>
<tr>
<td>IGRP</td>
<td>100</td>
</tr>
<tr>
<td>OSPF</td>
<td>110</td>
</tr>
<tr>
<td>Internal BGP</td>
<td>200</td>
</tr>
<tr>
<td>Unknown</td>
<td>225</td>
</tr>
</tbody>
</table>

Static routes that point to an interface are advertised through RIP, IGRP, and other dynamic routing protocols, whether or not static `redistribute` router configuration commands were specified for those routing protocols. These static routes are advertised because static routes that point to an interface are considered in the routing table to be connected and hence lose their static nature. However, if you define a static route to an interface that is not one of the networks defined in a network command, no dynamic routing protocols advertise the route unless a `redistribute` static command is specified for these protocols.

When an interface goes down, all static routes through that interface are removed from the IP routing table. When the software can no longer find a valid next hop for the address specified as the forwarding router’s address in a static route, the static route is also removed from the IP routing table.

**Specifying Default Routes and Networks**

A router might not be able to learn the routes to all other networks. To provide complete routing capability, you can use some routers as smart routers and give the remaining routers default routes to the smart router. (Smart routers have routing table information for the entire internetwork.) These default routes can be dynamically learned or can be configured in the individual routers. Most dynamic interior routing protocols include a mechanism for causing a smart router to generate dynamic default information that is then forwarded to other routers.

If a router has a directly connected interface to the specified default network, the dynamic routing protocols running on that device generate a default route. In RIP, it advertises the pseudonetwork 0.0.0.0.

A router that is generating the default for a network also might need a default of its own. One way a router can generate its own default is to specify a static route to the network 0.0.0.0 through the appropriate device.
Beginning in privileged EXEC mode, follow these steps to define a static route to a network as the static default route:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>ip default-network network number</td>
<td>Specify a default network.</td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>show ip route</td>
<td>Display the selected default route in the gateway of last resort display.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no ip default-network network number` global configuration command to remove the route.

When default information is passed through a dynamic routing protocol, no further configuration is required. The system periodically scans its routing table to choose the optimal default network as its default route. In IGRP networks, there might be several candidate networks for the system default. Cisco routers use administrative distance and metric information to set the default route or the gateway of last resort.

If dynamic default information is not being passed to the system, candidates for the default route are specified with the `ip default-network` global configuration command. If this network appears in the routing table from any source, it is flagged as a possible choice for the default route. If the router has no interface on the default network, but does have a path to it, the network is considered as a possible candidate, and the gateway to the best default path becomes the gateway of last resort.

### Using Route Maps to Redistribute Routing Information

The switch can run multiple routing protocols simultaneously, and it can redistribute information from one routing protocol to another. Redistributing information from one routing protocol to another applies to all supported IP-based routing protocols.

You can also conditionally control the redistribution of routes between routing domains by defining enhanced packet filters or route maps between the two domains. The `match` and `set` route-map configuration commands define the condition portion of a route map. The `match` command specifies that a criterion must be matched. The `set` command specifies an action to be taken if the routing update meets the conditions defined by the match command. Although redistribution is a protocol-independent feature, some of the `match` and `set` route-map configuration commands are specific to a particular protocol.

One or more `match` commands and one or more `set` commands follow a `route-map` command. If there are no `match` commands, everything matches. If there are no `set` commands, nothing is done, other than the match. Therefore, you need at least one `match` or `set` command.

**Note**

A route map with no `set` route-map configuration commands is sent to the CPU, which causes high CPU utilization.
You can also identify route-map statements as **permit** or **deny**. If the statement is marked as a deny, the packets meeting the match criteria are sent back through the normal forwarding channels (destination-based routing). If the statement is marked as permit, set clauses are applied to packets meeting the match criteria. Packets that do not meet the match criteria are forwarded through the normal routing channel.

You can use the BGP route map **continue** clause to execute additional entries in a route map after an entry is executed with successful match and set clauses. You can use the **continue** clause to configure and organize more modular policy definitions so that specific policy configurations need not be repeated within the same route map. The switch supports the **continue** clause for outbound policies. For more information about using the route map **continue** clause, see the BGP Route-Map Continue Support for an Outbound Policy feature guide for Cisco IOS Release 12.4(4)T at this URL:

**Note**

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one **match** route-map configuration command and one **set** route-map configuration command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> route-map <strong>map-tag</strong> **[permit</td>
<td>deny]** <strong>[sequence number]</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong> match as-path <strong>path-list-number</strong></td>
<td>Match a BGP AS path access list.</td>
</tr>
<tr>
<td><strong>Step 4</strong> match community-list <strong>community-list-number</strong> <strong>[exact]</strong></td>
<td>Match a BGP community list.</td>
</tr>
<tr>
<td><strong>Step 5</strong> match ip address **{access-list-number</td>
<td>access-list-name}** **[..access-list-number</td>
</tr>
<tr>
<td><strong>Step 6</strong> match metric <strong>metric-value</strong></td>
<td>Match the specified route metric. The <strong>metric-value</strong> can be an EIGRP metric with a specified value from 0 to 4294967295.</td>
</tr>
<tr>
<td><strong>Step 7</strong> match ip next-hop **{access-list-number</td>
<td>access-list-name}** **[..access-list-number</td>
</tr>
<tr>
<td><strong>Step 8</strong> match tag <strong>tag value</strong> <strong>[..tag-value]</strong></td>
<td>Match the specified tag value in a list of one or more route tag values. Each can be an integer from 0 to 4294967295.</td>
</tr>
</tbody>
</table>
### Configuring Protocol-Independent Features

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>

</tr>
</tbody>
</table>
| 11   | `match route-type {local | internal | external [type-1 | type-2]}` | Match the specified `route-type`:  
  - `local`—Locally generated BGP routes.  
  - `internal`—OSPF intra-area and interarea routes or EIGRP internal routes.  
  - `external`—OSPF external routes (Type 1 or Type 2) or EIGRP external routes.                                                                 |
| 12   | `set dampening half-life reuse suppress max-suppress-time` | Set BGP route dampening factors.                                                                                                                                                                           |
| 13   | `set local-preference value`                 | Assign a value to a local BGP path.                                                                                                                                                                     |
| 14   | `set origin {igp | egp as | incomplete}`      | Set the BGP origin code.                                                                                                                                                                                  |
| 15   | `set as-path {tag | prepend as-path-string}`  | Modify the BGP autonomous system path.                                                                                                                                                                   |
| 16   | `set level {level-1 | level-2 | level-1-2 | stub-area | backbone}` | Set the level for routes that are advertised into the specified area of the routing domain. The `stub-area` and `backbone` are OSPF NSSA and backbone areas.                                            |
| 17   | `set metric metric value`                    | Set the metric value to give the redistributed routes (for EIGRP only). The `metric value` is an integer from -294967295 to 294967295.                                                                  |
| 18   | `set metric bandwidth delay reliability loading mtu` | Set the metric value to give the redistributed routes (for EIGRP only):  
  - `bandwidth`—Metric value or IGRP bandwidth of the route in kilobits per second in the range 0 to 4294967295  
  - `delay`—Route delay in tens of microseconds in the range 0 to 4294967295.  
  - `reliability`—Likelihood of successful packet transmission expressed as a number between 0 and 255, where 255 means 100 percent reliability and 0 means no reliability.  
  - `loading`—Effective bandwidth of the route expressed as a number from 0 to 255 (255 is 100 percent loading).  
  - `mtu`—Minimum maximum transmission unit (MTU) size of the route in bytes in the range 0 to 4294967295. |
| 19   | `set metric-type {type-1 | type-2}`           | Set the OSPF external metric type for redistributed routes.                                                                                                                                               |
| 20   | `set metric-type internal`                   | Set the multi-exit discriminator (MED) value on prefixes advertised to external BGP neighbor to match the IGP metric of the next hop.                                                                     |
To delete an entry, use the `no route-map map tag` global configuration command or the `no match` or `no set` route-map configuration commands.

You can distribute routes from one routing domain into another and control route distribution.

Beginning in privileged EXEC mode, follow these steps to control route redistribution. Note that the keywords are the same as defined in the previous procedure.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>router {bgp</td>
<td>rip</td>
</tr>
<tr>
<td>3</td>
<td>redistribute protocol [process-id] [level-1</td>
<td>level-1-2</td>
</tr>
<tr>
<td>4</td>
<td>default-metric number</td>
<td>Cause the current routing protocol to use the same metric value for all redistributed routes (BGP, RIP and OSPF).</td>
</tr>
<tr>
<td>5</td>
<td>default-metric bandwidth delay reliability loading mtu</td>
<td>Cause the EIGRP routing protocol to use the same metric value for all non-EIGRP redistributed routes.</td>
</tr>
<tr>
<td>6</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>7</td>
<td>show route-map</td>
<td>Display all route maps configured or only the one specified to verify configuration.</td>
</tr>
<tr>
<td>8</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable redistribution, use the `no` form of the commands.

The metrics of one routing protocol do not necessarily translate into the metrics of another. In these situations, an artificial metric is assigned to the redistributed route. Uncontrolled exchanging of routing information between different routing protocols can create routing loops and seriously degrade network operation.

If you have not defined a default redistribution metric that replaces metric conversion, some automatic metric translations occur between routing protocols:

- RIP can automatically redistribute static routes. It assigns static routes a metric of 1 (directly connected).
- Any protocol can redistribute other routing protocols if a default mode is in effect.
Configuring Policy-Based Routing

You can use policy-based routing (PBR) to configure a defined policy for traffic flows. By using PBR, you can have more control over routing by reducing the reliance on routes derived from routing protocols. PBR can specify and implement routing policies that allow or deny paths based on:

- Identity of a particular end system
- Application
- Protocol

You can use PBR to provide equal-access and source-sensitive routing, routing based on interactive versus batch traffic, or routing based on dedicated links. For example, you could transfer stock records to a corporate office on a high-bandwidth, high-cost link for a short time while transmitting routine application data such as e-mail over a low-bandwidth, low-cost link.

With PBR, you classify traffic using access control lists (ACLs) and then make traffic go through a different path. PBR is applied to incoming packets. All packets received on an interface with PBR enabled are passed through route maps. Based on the criteria defined in the route maps, packets are forwarded (routed) to the appropriate next hop.

- If packets do not match any route map statements, all set clauses are applied.
- If a statement is marked as permit and the packets do not match any route-map statements, the packets are sent through the normal forwarding channels, and destination-based routing is performed.
- For PBR, route-map statements marked as deny are not supported.

For more information about configuring route maps, see the “Using Route Maps to Redistribute Routing Information” section on page 36-90.

You can use standard IP ACLs to specify match criteria for a source address or extended IP ACLs to specify match criteria based on an application, a protocol type, or an end station. The process proceeds through the route map until a match is found. If no match is found, normal destination-based routing occurs. There is an implicit deny at the end of the list of match statements.

If match clauses are satisfied, you can use a set clause to specify the IP addresses identifying the next hop router in the path.

For details about PBR commands and keywords, see the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.2. For a list of PBR commands that are visible but not supported by the switch, see Appendix C, “Unsupported Commands in Cisco IOS Release 12.2(44)EY.”

PBR Configuration Guidelines

Before configuring PBR, you should be aware of this information:

- Multicast traffic is not policy-routed. PBR applies to only to unicast traffic.
- You can enable PBR on a routed port or an SVI.
- The switch does not support route-map deny statements for PBR.
- You can apply a policy route map to an EtherChannel port channel in Layer 3 mode, but you cannot apply a policy route map to a physical interface that is a member of the EtherChannel. If you try to do so, the command is rejected. When a policy route map is applied to a physical interface, that interface cannot become a member of an EtherChannel.
- You can define a maximum of 246 IP policy route maps on the switch.
You can define a maximum of 512 access control entries (ACEs) for PBR on the switch.

When configuring match criteria in a route map, follow these guidelines:

- Do not match ACLs that permit packets destined for a local address. PBR would forward these packets, which could cause ping or Telnet failure or route protocol flapping.
- Do not match ACLs with deny ACEs. Packets that match a deny ACE are sent to the CPU, which could cause high CPU utilization.

To use PBR, you must first enable the default template by using the `sdm prefer default` global configuration command. PBR is not supported with the Layer 2 template. For more information on the SDM templates, see Chapter 7, “Configuring SDM Templates.”

VRF and PBR are mutually-exclusive on a switch interface. You cannot enable VRF when PBR is enabled on an interface. In contrast, you cannot enable PBR when VRF is enabled on an interface.

The number of TCAM entries used by PBR depends on the route map itself, the ACLs used, and the order of the ACLs and route-map entries.

Policy-based routing based on packet length, IP precedence and TOS, set interface, set default next hop, or set default interface are not supported. Policy maps with no valid set actions or with set action set to `Don’t Fragment` are not supported.

### Enabling PBR

By default, PBR is disabled on the switch. To enable PBR, you must create a route map that specifies the match criteria and the resulting action if all of the match clauses are met. Then, you must enable PBR for that route map on an interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

PBR can be fast-switched or implemented at speeds that do not slow down the switch. Fast-switched PBR supports most match and set commands. PBR must be enabled before you enable fast-switched PBR. Fast-switched PBR is disabled by default.

Packets that are generated by the switch, or local packets, are not normally policy-routed. When you globally enable local PBR on the switch, all packets that originate on the switch are subject to local PBR. Local PBR is disabled by default.
Beginning in privileged EXEC mode, follow these steps to configure PBR:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>route-map map-tag [permit] [sequence number]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>match ip address {access-list-number</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>set ip next-hop ip-address [...ip-address]</td>
</tr>
<tr>
<td>Step 5</td>
<td>exit</td>
</tr>
<tr>
<td>Step 6</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 7</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 8</td>
<td>ip policy route-map map-tag</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 9</td>
<td>ip route-cache policy</td>
</tr>
<tr>
<td>Step 10</td>
<td>exit</td>
</tr>
</tbody>
</table>
Use the `no route-map map-tag` global configuration command or the `no match` or `no set` route-map configuration commands to delete an entry. Use the `no ip policy route-map map-tag` interface configuration command to disable PBR on an interface. Use the `no ip route-cache policy` interface configuration command to disable fast-switching PBR. Use the `no ip local policy route-map map-tag` global configuration command to disable policy-based routing on packets originating on the switch.

### Filtering Routing Information

You can filter routing protocol information by performing the tasks described in this section.

**Note**  
When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

### Setting Passive Interfaces

To prevent other routers on a local network from dynamically learning about routes, you can use the `passive-interface` router configuration command to keep routing update messages from being sent through a router interface. When you use this command in the OSPF protocol, the interface address you specify as passive appears as a stub network in the OSPF domain. OSPF routing information is neither sent nor received through the specified router interface.

In networks with many interfaces, to avoid having to manually set them as passive, you can set all interfaces to be passive by default by using the `passive-interface default` router configuration command and manually setting interfaces where adjacencies are desired.

Beginning in privileged EXEC mode, follow these steps to configure passive interfaces:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2  `router {bgp</td>
<td>rip</td>
</tr>
<tr>
<td>Step 3  <code>passive-interface interface-id</code></td>
<td>Suppress sending routing updates through the specified Layer 3 interface.</td>
</tr>
<tr>
<td>Step 4  <code>passive-interface default</code></td>
<td>(Optional) Set all interfaces as passive by default.</td>
</tr>
</tbody>
</table>
Chapter 36 Configuring IP Unicast Routing

Configuring Protocol-Independent Features

Use a network monitoring privileged EXEC command such as `show ip ospf interface` to verify the interfaces that you enabled as passive, or use the `show ip interface` privileged EXEC command to verify the interfaces that you enabled as active.

To re-enable the sending of routing updates, use the `no passive-interface interface-id` router configuration command. The `default` keyword sets all interfaces as passive by default. You can then configure individual interfaces where you want adjacencies by using the `no passive-interface` router configuration command. The `default` keyword is useful in Internet service provider and large enterprise networks where many of the distribution routers have more than 200 interfaces.

Controlling Advertising and Processing in Routing Updates

You can use the `distribute-list` router configuration command with access control lists to suppress routes from being advertised in routing updates and to prevent other routers from learning one or more routes. When used in OSPF, this feature applies to only external routes, and you cannot specify an interface name.

You can also use a `distribute-list` router configuration command to avoid processing certain routes listed in incoming updates. (This feature does not apply to OSPF.)

Beginning in privileged EXEC mode, follow these steps to control the advertising or processing of routing updates:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`router {bgp</td>
</tr>
<tr>
<td>Step 3</td>
<td>`distribute-list {access-list-number</td>
</tr>
<tr>
<td>Step 4</td>
<td>`distribute-list {access-list-number</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the `no distribute-list in` router configuration command to change or cancel a filter. To cancel suppression of network advertisements in updates, use the `no distribute-list out` router configuration command.
Filtering Sources of Routing Information

Because some routing information might be more accurate than others, you can use filtering to prioritize information coming from different sources. An administrative distance is a rating of the trustworthiness of a routing information source, such as a router or group of routers. In a large network, some routing protocols can be more reliable than others. By specifying administrative distance values, you enable the router to intelligently discriminate between sources of routing information. The router always picks the route whose routing protocol has the lowest administrative distance. Table 36-16 on page 36-89 shows the default administrative distances for various routing information sources.

Because each network has its own requirements, there are no general guidelines for assigning administrative distances.

Beginning in privileged EXEC mode, follow these steps to filter sources of routing information:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>router {bgp</td>
</tr>
<tr>
<td>Step 3</td>
<td>distance weight {ip-address {ip-address mask}}</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show ip protocols</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove a distance definition, use the no distance router configuration command.

Managing Authentication Keys

Key management is a method of controlling authentication keys used by routing protocols. Not all protocols can use key management. Authentication keys are available for EIGRP and RIP Version 2.

Before you manage authentication keys, you must enable authentication. See the appropriate protocol section to see how to enable authentication for that protocol. To manage authentication keys, define a key chain, identify the keys that belong to the key chain, and specify how long each key is valid. Each key has its own key identifier (specified with the key number key chain configuration command), which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use.

You can configure multiple keys with lifetimes. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in order from lowest to highest, and uses the first valid key it encounters. The lifetimes allow for overlap during key changes. Note that the router must know these lifetimes.
Beginning in privileged EXEC mode, follow these steps to manage authentication keys:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>key chain name-of-chain</td>
<td>Identify a key chain, and enter key chain configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>key number</td>
<td>Identify the key number. The range is 0 to 2147483647.</td>
</tr>
<tr>
<td>4</td>
<td>key-string text</td>
<td>Identify the key string. The string can contain from 1 to 80 uppercase and lowercase alphanumeric characters, but the first character cannot be a number.</td>
</tr>
<tr>
<td>5</td>
<td>accept-lifetime start-time {infinite</td>
<td>end-time</td>
</tr>
<tr>
<td>6</td>
<td>send-lifetime start-time {infinite</td>
<td>end-time</td>
</tr>
<tr>
<td>7</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>8</td>
<td>show key chain</td>
<td>Display authentication key information.</td>
</tr>
<tr>
<td>9</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the key chain, use the no key chain name-of-chain global configuration command.

**Monitoring and Maintaining the IP Network**

You can remove all contents of a particular cache, table, or database. You can also display specific statistics. Use the privileged EXEC commands in Table 36-17 to clear routes or display status:

**Table 36-17 Commands to Clear IP Routes or Display Route Status**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip route {network [mask</td>

<td>Display all route maps configured or only the one specified.</td>
</tr>
</tbody>
</table>
Configuring HSRP

This chapter describes how to use Hot Standby Router Protocol (HSRP) on the Cisco ME3400E Ethernet Access switch to provide routing redundancy for routing IP traffic without being dependent on the availability of any single router. The switch must be running the metro IP access image to support HSRP.

For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and the Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.2.

This chapter consists of these sections:

- Understanding HSRP, page 37-1
- Configuring HSRP, page 37-4
- Displaying HSRP Configurations, page 37-11

Understanding HSRP

HSRP is Cisco’s standard method of providing high network availability by providing first-hop redundancy for IP hosts on an IEEE 802 LAN configured with a default gateway IP address. HSRP routes IP traffic without relying on the availability of any single router. It enables a set of router interfaces to work together to present the appearance of a single virtual router or default gateway to the hosts on a LAN. When HSRP is configured on a network or segment, it provides a virtual Media Access Control (MAC) address and an IP address that is shared among a group of configured routers. HSRP allows two or more HSRP-configured routers to use the MAC address and IP network address of a virtual router. The virtual router does not exist; it represents the common target for routers that are configured to provide backup to each other. One of the routers is selected to be the active router and another to be the standby router, which assumes control of the group MAC address and IP address should the designated active router fail.

Note

Routers in an HSRP group can be any router interface that supports HSRP, including routed ports and switch virtual interfaces (SVIs) on the switch.
Understanding HSRP

HSRP provides high network availability by providing redundancy for IP traffic from hosts on networks. In a group of router interfaces, the active router is the router of choice for routing packets; the standby router is the router that takes over the routing duties when an active router fails or when preset conditions are met.

HSRP is useful for hosts that do not support a router discovery protocol and cannot switch to a new router when their selected router reloads or loses power. When HSRP is configured on a network segment, it provides a virtual MAC address and an IP address that is shared among router interfaces in a group of router interfaces running HSRP. The router selected by the protocol to be the active router receives and routes packets destined for the group’s MAC address. For n routers running HSRP, there are n + 1 IP and MAC addresses assigned.

HSRP detects when the designated active router fails, and a selected standby router assumes control of the Hot Standby group’s MAC and IP addresses. A new standby router is also selected at that time. Devices running HSRP send and receive multicast UDP-based hello packets to detect router failure and to designate active and standby routers. When HSRP is configured on an interface, Internet Control Message Protocol (ICMP) redirect messages are disabled by default for the interface.

You can configure multiple Hot Standby groups among switches that are operating in Layer 3 to make more use of the redundant routers. To do so, specify a group number for each Hot Standby command group you configure for an interface. For example, you might configure an interface on switch 1 as an active router and one on switch 2 as a standby router and also configure another interface on switch 2 as an active router with another interface on switch 1 as its standby router.

Figure 37-1 shows a segment of a network configured for HSRP. Each router is configured with the MAC address and IP network address of the virtual router. Instead of configuring hosts on the network with the IP address of Router A, you configure them with the IP address of the virtual router as their default router. When Host C sends packets to Host B, it sends them to the MAC address of the virtual router. If for any reason, Router A stops transferring packets, Router B responds to the virtual IP address and virtual MAC address and becomes the active router, assuming the active router duties. Host C continues to use the IP address of the virtual router to address packets destined for Host B, which Router B now receives and sends to Host B. Until Router A resumes operation, HSRP allows Router B to provide uninterrupted service to users on Host C’s segment that need to communicate with users on Host B’s segment and also continues to perform its normal function of handling packets between the Host A segment and Host B.
Figure 37-1  Typical HSRP Configuration

Multiple HSRP

The switch supports Multiple HSRP (MHSRP), an extension of HSRP that allows load sharing between two or more HSRP groups. You can configure MHSRP to achieve load balancing and to use two or more standby groups (and paths) from a host network to a server network. In Figure 37-2, half the clients are configured for Router A, and half the clients are configured for Router B. Together, the configuration for Routers A and B establishes two HSRP groups. For group 1, Router A is the default active router because it has the assigned highest priority, and Router B is the standby router. For group 2, Router B is the default active router because it has the assigned highest priority, and Router A is the standby router. During normal operation, the two routers share the IP traffic load. When either router becomes unavailable, the other router becomes active and assumes the packet-transfer functions of the router that is unavailable.

See the “Configuring MHSRP” section on page 37-9 for the example configuration steps.

Note

For MHSRP, you need to enter the **standby preempt** interface configuration command on the HSRP interfaces so that if a router fails and then comes back up, preemption restores load sharing.
Default HSRP Configuration

Table 37-1 shows the default HSRP configuration.

<table>

**HSRP Configuration Guidelines**

- HSRP can be configured on a maximum of 32 VLAN or routing interfaces.
- In the procedures, the specified interface must be one of these Layer 3 interfaces:
  - Routed port: a physical port configured as a Layer 3 port by entering the `no switchport` interface configuration command.
  - SVI: a VLAN interface created by using the `interface vlan vlan_id` global configuration command and by default a Layer 3 interface.
  - Etherchannel port channel in Layer 3 mode: a port-channel logical interface created by using the `interface port-channel port-channel-number` global configuration command and binding the Ethernet interface into the channel group. For more information, see the “Configuring Layer 3 EtherChannels” section on page 35-14.
- All Layer 3 interfaces must have IP addresses assigned to them. See the “Configuring Layer 3 Interfaces” section on page 10-25.

**Enabling HSRP**

The `standby ip` interface configuration command activates HSRP on the configured interface. If an IP address is specified, that address is used as the designated address for the Hot Standby group. If no IP address is specified, the address is learned through the standby function. You must configure at least one Layer 3 port on the LAN with the designated address. Configuring an IP address always overrides another designated address currently in use.

When the `standby ip` command is enabled on an interface and proxy ARP is enabled, if the interface’s Hot Standby state is active, proxy ARP requests are answered using the Hot Standby group MAC address. If the interface is in a different state, proxy ARP responses are suppressed.

Beginning in privileged EXEC mode, follow these steps to create or enable HSRP on a Layer 3 interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code> Enter interface configuration mode, and enter the Layer 3 interface on which you want to enable HSRP.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>no shutdown</code> Enable the port, if necessary. By default, user network interfaces (UNIs) and enhanced network interfaces (ENIs) are disabled, and network node interfaces (NNIs) are enabled.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>no switchport</code> If necessary, disable Layer 2 switching on the port to enable the Layer 3 interface.</td>
</tr>
</tbody>
</table>
# Configuring HSRP

## Command

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 5** | `standby [group-number] ip [ip-address [secondary]]` | Create (or enable) the HSRP group using its number and virtual IP address.  
  - (Optional) `group-number`—The group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.  
  - (Optional on all but one interface) `ip-address`—The virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.  
  - (Optional) `secondary`—The IP address is a secondary hot standby router interface. If neither router is designated as a secondary or standby router and no priorities are set, the primary IP addresses are compared and the higher IP address is the active router, with the next highest as the standby router. |
| **Step 6** | `end` | Return to privileged EXEC mode. |
| **Step 7** | `show standby [interface-id [group]]` | Verify the configuration. |
| **Step 8** | `copy running-config startup-config` | (Optional) Save your entries in the configuration file. |

Use the `no standby [group-number] ip [ip-address]` interface configuration command to disable HSRP. This example shows how to activate HSRP for group 1 on an interface. The IP address used by the hot standby group is learned by using HSRP.

### Note

This procedure is the minimum number of steps required to enable HSRP. Other configuration is optional.

Switch# configure terminal  
Switch(config)# interface gigabitethernet0/1  
Switch(config-if)# no switchport  
Switch(config-if)# standby 1 ip  
Switch(config-if)# end  
Switch# show standby

## Configuring HSRP Priority

The `standby priority`, `standby preempt`, and `standby track` interface configuration commands are all used to set characteristics for finding active and standby routers and behavior regarding when a new active router takes over.

When configuring HSRP priority, follow these guidelines:

- Assigning a priority allows you to select the active and standby routers. If preemption is enabled, the router with the highest priority becomes the active router. If priorities are equal, the current active router does not change.

- The highest number (1 to 255) represents the highest priority (most likely to become the active router).
When setting the priority, preempt, or both, you must specify at least one keyword (priority, preempt, or both).

The priority of the device can change dynamically if an interface is configured with the standby track command and another interface on the router goes down.

The standby track interface configuration command ties the router hot standby priority to the availability of its interfaces and is useful for tracking interfaces that are not configured for HSRP. When a tracked interface fails, the hot standby priority on the device on which tracking has been configured decreases by 10. If an interface is not tracked, its state changes do not affect the hot standby priority of the configured device. For each interface configured for hot standby, you can configure a separate list of interfaces to be tracked.

The standby track interface-priority interface configuration command specifies how much to decrement the hot standby priority when a tracked interface goes down. When the interface comes back up, the priority is incremented by the same amount.

When multiple tracked interfaces are down and interface-priority values have been configured, the configured priority decrements are cumulative. If tracked interfaces that were not configured with priority values fail, the default decrement is 10, and it is noncumulative.

When routing is first enabled for the interface, it does not have a complete routing table. If it is configured to preempt, it becomes the active router, even though it is unable to provide adequate routing services. To solve this problem, configure a delay time to allow the router to update its routing table.

Beginning in privileged EXEC mode, use one or more of these steps to configure HSRP priority characteristics on an interface:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
<td>Enter interface configuration mode, and enter the HSRP interface on which you want to set priority.</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4</td>
<td>standby [group-number] priority priority [preempt [delay delay]]</td>
<td>Set a priority value used in choosing the active router. The range is 1 to 255; the default priority is 100. The highest number represents the highest priority.</td>
</tr>
</tbody>
</table>

- (Optional) group-number—The group number to which the command applies.
- (Optional) preempt—Select so that when the local router has a higher priority than the active router, it assumes control as the active router.
- (Optional) delay—Set to cause the local router to postpone taking over the active role for the shown number of seconds. The range is 0 to 3600 (1 hour); the default is 0 (no delay before taking over).

Use the no form of the command to restore the default values.
### Command Purpose

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>standby [group-number] [priority priority] preempt [delay delay]</strong></td>
<td>Configure the router to <strong>preempt</strong>, which means that when the local router has a higher priority than the active router, it assumes control as the active router.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) <strong>group-number</strong>—The group number to which the command applies.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) <strong>priority</strong>—Enter to set or change the group priority. The range is 1 to 255; the default is 100.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) <strong>delay</strong>—Set to cause the local router to postpone taking over the active role for the number of seconds shown. The range is 0 to 3600 (1 hour); the default is 0 (no delay before taking over).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Use the <strong>no</strong> form of the command to restore the default values.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>standby [group-number] track type number [interface-priority]</strong></td>
<td>Configure an interface to track other interfaces so that if one of the other interfaces goes down, the device’s Hot Standby priority is lowered.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) <strong>group-number</strong>—The group number to which the command applies.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>type</strong>—Enter the interface type (combined with interface number) that is tracked.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>number</strong>—Enter the interface number (combined with interface type) that is tracked.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) <strong>interface-priority</strong>—Enter the amount by which the hot standby priority for the router is decremented or incremented when the interface goes down or comes back up. The default value is 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>end</strong></td>
<td>Return to privileged EXEC mode.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show running-config</strong></td>
<td>Verify the configuration of the standby groups.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>copy running-config startup-config</strong></td>
<td>(Optional) Save your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>

Use the **no standby [group-number] priority priority [preempt [delay delay]]** and **no standby [group-number] [priority priority] preempt [delay delay]** interface configuration commands to restore default priority, preempt, and delay values.

Use the **no standby [group-number] track type number [interface-priority]** interface configuration command to remove the tracking.

This example activates a port, sets an IP address and a priority of 120 (higher than the default value), and waits for 300 seconds (5 minutes) before attempting to become the active router:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# no switchport
Switch(config-if)# standby ip 172.20.128.3
Switch(config-if)# standby priority 120 preempt delay 300
Switch(config-if)# end
```
Configuring **MHSRP**

To enable MHSRP and load balancing, you configure two routers as active routers for their groups, with virtual routers as standby routers. This example shows how to enable the MHSRP configuration shown in **Figure 37-2**. You need to enter the `standby preempt` interface configuration command on each HSRP interface so that if a router fails and comes back up, the preemption occurs and restores load balancing.

Router A is configured as the active router for group 1, and Router B is configured as the active router for group 2. The HSRP interface for Router A has an IP address of 10.0.0.1 with a group 1 standby priority of 110 (the default is 100). The HSRP interface for Router B has an IP address of 10.0.0.2 with a group 2 standby priority of 110.

Group 1 uses a virtual IP address of 10.0.0.3 and group 2 uses a virtual IP address of 10.0.0.4.

**Router A Configuration**

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.0.0.1 255.255.255.0
Switch(config-if)# standby 1 ip 10.0.0.3
Switch(config-if)# standby 1 priority 110
Switch(config-if)# standby 1 preempt
Switch(config-if)# standby 2 ip 10.0.0.4
Switch(config-if)# standby 2 preempt
Switch(config-if)# end
```

**Router B Configuration**

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.0.0.2 255.255.255.0
Switch(config-if)# standby 1 ip 10.0.0.3
Switch(config-if)# standby 1 preempt
Switch(config-if)# standby 2 ip 10.0.0.4
Switch(config-if)# standby 2 priority 110
Switch(config-if)# standby 2 preempt
Switch(config-if)# end
```

Configuring **HSRP Authentication and Timers**

You can optionally configure an HSRP authentication string or change the hello-time interval and holdtime.

When configuring these attributes, follow these guidelines:

- The authentication string is sent unencrypted in all HSRP messages. You must configure the same authentication string on all routers and access servers on a cable to ensure interoperability. Authentication mismatch prevents a device from learning the designated Hot Standby IP address and timer values from other routers configured with HSRP.

- Routers or access servers on which standby timer values are not configured can learn timer values from the active or standby router. The timers configured on an active router always override any other timer settings.

- All routers in a Hot Standby group should use the same timer values. Normally, the *holdtime* is greater than or equal to 3 times the *helloTime*.
Beginning in privileged EXEC mode, use one or more of these steps to configure HSRP authentication and timers on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id Enter interface configuration mode, and enter the HSRP interface on which you want to set authentication.</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4</td>
<td>standby [group-number] authentication string (Optional) authentication string—Enter a string to be carried in all HSRP messages. The authentication string can be up to eight characters in length; the default string is cisco. (Optional) group-number—The group number to which the command applies.</td>
</tr>
<tr>
<td>Step 5</td>
<td>standby [group-number] timers hellotime holdtime (Optional) Configure the time between hello packets and the time before other routers declare the active router to be down. group-number—The group number to which the command applies. hellotime—The hello interval in seconds. The range is from 1 to 255; the default is 3 seconds. holdtime—The time in seconds before the active or standby router is declared to be down. The range is from 1 to 255; the default is 10 seconds.</td>
</tr>
<tr>
<td>Step 6</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>show running-config Verify the configuration of the standby groups.</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no standby [group-number] authentication string interface configuration command to delete an authentication string. Use the no standby [group-number] timers hellotime holdtime interface configuration command to restore timers to their default values.

This example shows how to configure word as the authentication string required to allow Hot Standby routers in group 1 to interoperate:

```bash
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# no switchport
Switch(config-if)# standby 1 authentication word
Switch(config-if)# end
```

This example shows how to set the timers on standby group 1 with the time between hello packets at 5 seconds and the time after which a router is considered down to be 15 seconds:

```bash
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# no switchport
Switch(config-if)# standby 1 ip
Switch(config-if)# standby 1 timers 5 15
Switch(config-if)# end
```
Enabling HSRP Support for ICMP Redirect Messages

ICMP (Internet Control Message Protocol) redirect messages are automatically enabled on interfaces configured with HSRP. This feature filters outgoing ICMP redirect messages through HSRP, in which the next hop IP address might be changed to an HSRP virtual IP address. ICMP is a network layer Internet protocol that provides message packets to report errors and other information relevant to IP processing. ICMP provides diagnostic functions, such as sending and directing error packets to the host.

When the switch is running HSRP, make sure hosts do not discover the interface (or real) MAC addresses of routers in the HSRP group. If a host is redirected by ICMP to the real MAC address of a router and that router later fails, packets from the host are lost.

For more information, see the Cisco IOS IP Configuration Guide, Release 12.2.

Displaying HSRP Configurations

From privileged EXEC mode, use this command to display HSRP settings:

```
show standby [interface-id [group]] [brief] [detail]
```

You can display HSRP information for the whole switch, for a specific interface, for an HSRP group, or for an HSRP group on an interface. You can also specify whether to display a concise overview of HSRP information or detailed HSRP information. The default display is `detail`. If there are a large number of HSRP groups, using the `show standby` command without qualifiers can result in an unwieldy display.

This is an example of output from the `show standby` privileged EXEC command, displaying HSRP information for two standby groups (group 1 and group 100):

```
Switch# show standby
VLAN1 - Group 1
   Local state is Standby, priority 105, may preempt
   Hello-time 3 holdtime 10
   Next hello sent in 00:00:02.182
   Hot standby IP address is 172.20.128.3 configured
   Active router is 172.20.128.1 expires in 00:00:09
   Standby router is local
   Standby virtual mac address is 0000.0c07.ac01
   Name is bbb
VLAN1 - Group 100
   Local state is Active, priority 105, may preempt
   Hello-time 3 holdtime 10
   Next hello sent in 00:00:02.262
   Hot standby IP address is 172.20.138.51 configured
   Active router is local
   Standby router is unknown expired
   Standby virtual mac address is 0000.0c07.ac64
   Name is test
```
Configuring Cisco IOS IP SLAs Operations

This chapter describes how to use Cisco IOS IP Service Level Agreements (SLAs) on the Cisco ME 3400E Ethernet Access switch. Cisco IP SLAs is a part of Cisco IOS software that allows Cisco customers to analyze IP service levels for IP applications and services by using active traffic monitoring—the generation of traffic in a continuous, reliable, and predictable manner—for measuring network performance. With Cisco IOS IP SLAs, service provider customers can measure and provide service level agreements, and enterprise customers can verify service levels, verify outsourced service level agreements, and understand network performance. Cisco IOS IP SLAs can perform network assessments, verify quality of service (QoS), ease the deployment of new services, and assist with network troubleshooting.

Note

Full Cisco IP SLAs functionality is supported only on switches that are running the metro IP access or metro access image. Switches running the metro base image, such as the ME 2400, support only IP SLAs responder functionality and must be configured with another device that supports full IP SLAs functionality.

For more information about IP SLAs, see the Cisco IOS IP SLAs Configuration Guide, Release 12.4T at this URL:

For command syntax information, see the command reference at this URL:

This chapter consists of these sections:

- Understanding Cisco IOS IP SLAs, page 38-1
- Configuring IP SLAs Operations, page 38-6
- Monitoring IP SLAs Operations, page 38-13

Understanding Cisco IOS IP SLAs

Cisco IOS IP SLAs sends data across the network to measure performance between multiple network locations or across multiple network paths. It simulates network data and IP services and collects network performance information in real time. Cisco IOS IP SLAs generates and analyzes traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLAs operations can be used for troubleshooting, for problem analysis, and for designing network topologies.
Understanding Cisco IOS IP SLAs

Depending on the specific Cisco IOS IP SLAs operation, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLAs packets have configurable IP and application layer options such as source and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs is Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs collects a unique subset of these performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)
- Path (per hop)
- Connectivity (directional)
- Server or website download time

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like CiscoWorks Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products. You can find more details about network management products that use Cisco IOS IP SLAs at this URL:

http://www.cisco.com/go/ipsla

Using IP SLAs can provide these benefits:

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
  - Measures the jitter, latency, or packet loss in the network.
  - Provides continuous, reliable, and predictable measurements.
- IP service network health assessment to verify that the existing QoS is sufficient for new IP services.
- Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).
- Troubleshooting of network operation by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.
- Multiprotocol Label Switching (MPLS) performance monitoring and network verification (if the switch supports MPLS)

This section includes this information about IP SLAs functionality:

- Using Cisco IOS IP SLAs to Measure Network Performance, page 38-3
- IP SLAs Responder and IP SLAs Control Protocol, page 38-4
- Response Time Computation for IP SLAs, page 38-4
- IP SLAs Operation Scheduling, page 38-5
- IP SLAs Operation Threshold Monitoring, page 38-5
Understanding Cisco IOS IP SLAs

Using Cisco IOS IP SLAs to Measure Network Performance

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices. Figure 38-1 shows how IP SLAs begins when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation, it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

Figure 38-1 Cisco IOS IP SLAs Operation

To implement IP SLAs network performance measurement, you need to perform these tasks:

1. Enable the IP SLAs responder, if required.
2. Configure the required IP SLAs operation type.
3. Configure any options available for the specified operation type.
4. Configure threshold conditions, if required.
5. Schedule the operation to run, then let the operation run for a period of time to gather statistics.
6. Display and interpret the results of the operation using the Cisco IOS CLI or a network management system (NMS) system with SNMP.

For more information about IP SLAs operations, see the operation-specific chapters in the Cisco IOS IP SLAs Configuration Guide at this URL:

Note

The switch does not support IP SLAs Voice over IP (VoIP) service levels using the gatekeeper registration delay operations measurements. Before configuring any IP SLAs application, you can use the `show ip sla application` privileged EXEC command to verify that the operation type is supported on your software image.
IP SLAs Responder and IP SLAs Control Protocol

The IP SLAs responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLAs request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLAs Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond. Only a Cisco IOS device can be a source for a destination IP SLAs Responder.

Note

The IP SLAs responder can be a Cisco IOS Layer 2, responder-configurable switch, such as a Catalyst 2960 or Cisco ME 2400 switch or a Cisco ME 3400 switch running the metro base image. The responder does not need to support full IP SLAs functionality.

Figure 38-1 shows where the Cisco IOS IP SLAs responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLAs operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLAs packet, or when the specified time expires. MD5 authentication for control messages is available for added security.

You do not need to enable the responder on the destination device for all IP SLAs operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP). You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

Response Time Computation for IP SLAs

Switches and routers can take tens of milliseconds to process incoming packets due to other high priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimizes these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLAs test packets use time stamping to minimize the processing delays.

When the IP SLAs responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

Figure 38-2 demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt level to allow for greater accuracy.
An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.

**IP SLAs Operation Scheduling**

When you configure an IP SLAs operation, you must schedule the operation to begin capturing statistics and collecting error information. You can schedule an operation to start immediately or to start at a certain month, day, and hour. You can use the pending option to set the operation to start at a later time. The pending option is an internal state of the operation that is visible through SNMP. The pending state is also used when an operation is a reaction (threshold) operation waiting to be triggered. You can schedule a single IP SLAs operation or a group of operations at one time.

You can schedule several IP SLAs operations by using a single command through the Cisco IOS CLI or the CISCO RTTMON-MIB. Scheduling the operations to run at evenly distributed times allows you to control the amount of IP SLAs monitoring traffic. This distribution of IP SLAs operations helps minimize the CPU utilization and thus improves network scalability.

For more details about the IP SLAs multioperations scheduling functionality, see the “IP SLAs—Multiple Operation Scheduling” chapter of the *Cisco IOS IP SLAs Configuration Guide* at this URL:

**IP SLAs Operation Threshold Monitoring**

To support successful service level agreement monitoring, you must have mechanisms that notify you immediately of any possible violation. IP SLAs can send SNMP traps that are triggered by events such as these:

- Connection loss
- Timeout
- Round-trip time threshold
- Average jitter threshold
- One-way packet loss
- One-way jitter
• One-way mean opinion score (MOS)
• One-way latency

An IP SLAs threshold violation can also trigger another IP SLAs operation for further analysis. For example, the frequency could be increased or an ICMP path echo or ICMP path jitter operation could be initiated for troubleshooting.

Determining the type of threshold and the level to set can be complex, and depends on the type of IP service being used in the network. For more details on using thresholds with Cisco IOS IP SLAs operations, see the “IP SLAs—Proactive Threshold Monitoring” chapter of the Cisco IOS IP SLAs Configuration Guide at this URL:

Configuring IP SLAs Operations

This section does not include configuration information for all available operations as the configuration information details are included in the Cisco IOS IP SLAs Configuration Guide. It does include several operations as examples, including configuring the responder, configuring UDP jitter operation, which requires a responder, and configuring ICMP echo operation, which does not require a responder. For details about configuring other operations, see the Cisco IOS IP SLAs Configuration Guide at this URL:

This section includes this information:
• Default Configuration, page 38-6
• Configuration Guidelines, page 38-6
• Configuring the IP SLAs Responder, page 38-7
• Analyzing IP Service Levels by Using the UDP Jitter Operation, page 38-8
• Analyzing IP Service Levels by Using the ICMP Echo Operation, page 38-11

Default Configuration

No IP SLAs operations are configured.

Configuration Guidelines

For information on the IP SLAs commands, see the Cisco IOS IP SLAs Command Reference, Release 12.4T command reference at this URL:

For detailed descriptions and configuration procedures, see the Cisco IOS IP SLAs Configuration Guide, Release 12.4T at this URL:

Note that not all of the IP SLAs commands or operations described in this guide are supported on the switch. The switch supports IP service level analysis by using UDP jitter, UDP echo, HTTP, TCP connect, ICMP echo, ICMP path echo, ICMP path jitter, FTP, DNS, and DHCP, as well as multiple operation scheduling and proactive threshold monitoring. It does not support IP SLAs VoIP service levels using the gatekeeper registration delay operations measurements.
Before configuring any IP SLAs application, you can use the `show ip sla application` privileged EXEC command to verify that the operation type is supported on your software image. This is an example of the output from the command:

```
Switch# show ip sla application
IP SLAs
Version: 2.2.0 Round Trip Time MIB, Infrastructure Engine-II
Time of last change in whole IP SLAs: 22:17:39.117 UTC Fri Jun
Estimated system max number of entries: 15801

Estimated number of configurable operations: 15801
Number of Entries configured     : 0
Number of active Entries         : 0
Number of pending Entries        : 0
Number of inactive Entries       : 0

Supported Operation Types
Type of Operation to Perform: 802.1agEcho
Type of Operation to Perform: 802.1agJitter
Type of Operation to Perform: dhcp
Type of Operation to Perform: dns
Type of Operation to Perform: echo
Type of Operation to Perform: ftp
Type of Operation to Perform: http
Type of Operation to Perform: jitter
Type of Operation to Perform: pathEcho
Type of Operation to Perform: pathJitter
Type of Operation to Perform: tcpConnect
Type of Operation to Perform: udpEcho

IP SLAs low memory water mark: 21741224
```

### Configuring the IP SLAs Responder

The IP SLAs responder is available only on Cisco IOS software-based devices, including some Layer 2 switches that do not support full IP SLAs functionality, such as the Catalyst 2960 or the Cisco ME 2400 switch or a Cisco ME 3400 switch running the metro base image. Beginning in privileged EXEC mode, follow these steps to configure the IP SLAs responder on the target device (the operational target):

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>`ip sla responder {tcp-connect</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code></td>
</tr>
</tbody>
</table>
Chapter 38      Configuring Cisco IOS IP SLAs Operations

Configuring IP SLAs Operations

To disable the IP SLAs responder, enter the `no ip sla responder` global configuration command. This example shows how to configure the device as a responder for the UDP jitter IP SLAs operation in the next procedure:

```
Switch(config)# ip sla responder udp-echo 172.29.139.134 5000
```

Analyzing IP Service Levels by Using the UDP Jitter Operation

Jitter means interpacket delay variance. When multiple packets are sent consecutively 10 ms apart from source to destination, if the network is behaving correctly, the destination should receive them 10 ms apart. But if there are delays in the network (like queuing, arriving through alternate routes, and so on) the arrival delay between packets might be more than or less than 10 ms with a positive jitter value meaning that the packets arrived more than 10 ms apart. If the packets arrive 12 ms apart, positive jitter is 2 ms; if the packets arrive 8 ms apart, negative jitter is 2 ms. For delay-sensitive networks, positive jitter values are undesirable, and a jitter value of 0 is ideal.

In addition to monitoring jitter, the IP SLAs UDP jitter operation can be used as a multipurpose data gathering operation. The packets IP SLAs generates carry packet sending and receiving sequence information and sending and receiving time stamps from the source and the operational target. Based on these, UDP jitter operations measure this data:

- Per-direction jitter (source to destination and destination to source)
- Per-direction packet-loss
- Per-direction delay (one-way delay)
- Round-trip delay (average round-trip time)

Because the paths for the sending and receiving of data can be different (asymmetric), you can use the per-direction data to more readily identify where congestion or other problems are occurring in the network.

The UDP jitter operation generates synthetic (simulated) UDP traffic and sends a number of UDP packets, each of a specified size, sent a specified number of milliseconds apart, from a source router to a target router, at a given frequency. By default, ten packet-frames, each with a payload size of 10 bytes are generated every 10 ms, and the operation is repeated every 60 seconds. You can configure each of these parameters to best simulate the IP service you want to provide.

To provide accurate one-way delay (latency) measurements, time synchronization, such as that provided by NTP, is required between the source and the target device. Time synchronization is not required for the one-way jitter and packet loss measurements. If the time is not synchronized between the source and target devices, one-way jitter and packet loss data is returned, but values of 0 are returned for the one-way delay measurements provided by the UDP jitter operation.

Before you configure a UDP jitter operation on the source device, you must enable the IP SLAs responder on the target device (the operational target).
Beginning in privileged EXEC mode, follow these steps to configure UDP jitter operation on the source device:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip sla operation-number</strong></td>
</tr>
<tr>
<td></td>
<td>Create an IP SLAs operation, and enter IP SLAs configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>udp-jitter</strong> {destination-ip-address</td>
</tr>
<tr>
<td></td>
<td>Configure the IP SLAs operation as a UDP jitter operation, and enter UDP jitter configuration mode.</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>• destination-port—Specify the destination port number in the range from 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) source-ip {ip-address</td>
</tr>
<tr>
<td></td>
<td>• (Optional) source-port port-number—Specify the source port number in the range from 1 to 65535. When a port number is not specified, IP SLAs chooses an available port.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) control—Enable or disable sending of IP SLAs control messages to the IP SLAs responder. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs responder.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) num-packets number-of-packets—Enter the number of packets to be generated. The range is 1 to 6000; the default is 10.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) interval inter-packet-interval—Enter the interval between sending packets in milliseconds. The range is 1 to 6000; the default value is 20 ms.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>frequency seconds</strong></td>
</tr>
<tr>
<td></td>
<td>(Optional) Set the rate at which a specified IP SLAs operation repeats. The range is from 1 to 604800 seconds; the default is 60 seconds.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td></td>
<td>Exit UDP jitter configuration mode, and return to global configuration mode.</td>
</tr>
</tbody>
</table>
### Step 6

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip sla monitor schedule</strong>&lt;br&gt;  <strong>operation-number</strong> [<strong>life</strong> [<strong>forever</strong></td>
<td>Configure the scheduling parameters for an individual IP SLAs operation.&lt;br&gt;  - <strong>operation-number</strong>—Enter the RTR entry number.&lt;br&gt;  - (Optional) <strong>life</strong>—Set the operation to run indefinitely (<strong>forever</strong>) or for a specific number of <strong>seconds</strong>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour).&lt;br&gt;  - (Optional) <strong>start-time</strong>—Enter the time for the operation to begin collecting information:&lt;br&gt;    - To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. If no month is entered, the default is the current month.&lt;br&gt;    - Enter <strong>pending</strong> to select no information collection until a start time is selected.&lt;br&gt;    - Enter <strong>now</strong> to start the operation immediately.&lt;br&gt;    - Enter <strong>after hh:mm:ss</strong> to show that the operation should start after the entered time has elapsed.&lt;br&gt;  - (Optional) <strong>ageout seconds</strong>—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is from 0 to 2073600 seconds, the default is 0 seconds (never ages out).&lt;br&gt;  - (Optional) <strong>recurring</strong>—Set the operation to automatically run every day.</td>
</tr>
<tr>
<td><strong>end</strong></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>show ip sla configuration</strong>&lt;br&gt;  <strong>[operation-number]</strong></td>
<td>(Optional) Display configuration values, including all defaults for all IP SLAs operations or a specified operation.</td>
</tr>
<tr>
<td><strong>copy running-config startup-config</strong></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable the IP SLAs operation, enter the no **ip sla operation-number** global configuration command. This example shows how to configure a UDP jitter IP SLAs operation:

```
Switch(config)# ip sla 10
Switch(config-ip-sla)# udp-jitter 172.29.139.134 5000
Switch(config-ip-sla-jitter)# frequency 30
Switch(config-ip-sla-jitter)# exit
Switch(config)# ip sla schedule 5 start-time now life forever
Switch(config)# end
Switch# show ip sla configuration 10
IP SLAs, Infrastructure Engine-II.
```

Analyzing IP Service Levels by Using the ICMP Echo Operation

The ICMP echo operation measures end-to-end response time between a Cisco device and any devices using IP. Response time is computed by measuring the time taken between sending an ICMP echo request message to the destination and receiving an ICMP echo reply. Many customers use IP SLAs ICMP-based operations, in-house ping testing, or ping-based dedicated probes for response time measurements between the source IP SLAs device and the destination IP device. The IP SLAs ICMP echo operation conforms to the same specifications as ICMP ping testing, and the two methods result in the same response times.

Note
This operation does not require the IP SLAs responder to be enabled.

Beginning in privileged EXEC mode, follow these steps to configure an ICMP echo operation on the source device:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

Configuring Enhanced Object Tracking

This chapter describes how to configure enhanced object tracking on the Cisco ME 3400E switch. This feature provides a more complete alternative to the Hot Standby Routing Protocol (HSRP) tracking mechanism, which allows you to track the line-protocol state of an interface. If the line protocol state of an interface goes down, the HSRP priority of the interface is reduced and another HSRP device with a higher priority becomes active. The enhanced object tracking feature separates the tracking mechanism from HSRP and creates a separate, standalone tracking process that can be used by processes other than HSRP. This allows tracking other objects in addition to the interface line-protocol state.

A client process, such as HSRP or Gateway Local Balancing Protocol (GLBP), can register an interest in tracking objects and request notification when the tracked object changes state. This feature increases the availability and speed of recovery of a routing system and decreases outages and outage duration.

For more information about enhanced object tracking and the commands used to configure it, see this URL:

The chapter includes these sections:
- Understanding Enhanced Object Tracking, page 39-1
- Configuring Enhanced Object Tracking Features, page 39-2
- Monitoring Enhanced Object Tracking, page 39-10

Understanding Enhanced Object Tracking

Each tracked object has a unique number that is specified in the tracking command-line interface (CLI). Client processes use this number to track a specific object. The tracking process periodically polls the tracked object for value changes and sends any changes (as up or down values) to interested client processes, either immediately or after a specified delay. Several clients can track the same object, and can take different actions when the object changes state.

You can also track a combination of objects in a list by using either a weight threshold or a percentage threshold to measure the state of the list. You can combine objects using Boolean logic. A tracked list with a Boolean “AND” function requires that each object in the list be in an up state for the tracked object to be up. A tracked list with a Boolean “OR” function needs only one object in the list to be in the up state for the tracked object to be up.
Configuring Enhanced Object Tracking Features

- Default Configuration, page 39-2
- Tracking Interface Line-Protocol or IP Routing State, page 39-2
- Configuring a Tracked List, page 39-3
- Configuring HSRP Object Tracking, page 39-7
- Configuring Other Tracking Characteristics, page 39-8
- Configuring IP SLAs Object Tracking, page 39-8

Default Configuration

No type of object tracking is configured.

Tracking Interface Line-Protocol or IP Routing State

You can track either the interface line protocol state or the interface IP routing state. When you track the IP routing state, these three conditions are required for the object to be up:

- IP routing must be enabled and active on the interface.
- The interface line-protocol state must be up.
- The interface IP address must be known.

If all three of these conditions are not met, the IP routing state is down.

Beginning in privileged EXEC mode, follow these steps to track the line-protocol state or IP routing state of an interface:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>track object-number interface-id line-protocol</td>
<td>(Optional) Create a tracking list to track the line-protocol state of an interface and enter tracking configuration mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The object-number identifies the tracked object and can be from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The interface interface-id is the interface being tracked.</td>
</tr>
<tr>
<td>3</td>
<td>delay [up seconds [down seconds]]</td>
<td>(Optional) Specify a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
<tr>
<td>4</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>5</td>
<td>track object-number interface-id ip routing</td>
<td>(Optional) Create a tracking list to track the IP routing state of an interface, and enter tracking configuration mode. IP-route tracking tracks an IP route in the routing table and the ability of an interface to route IP packets.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The object-number identifies the tracked object and can be from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The interface interface-id is the interface being tracked.</td>
</tr>
<tr>
<td>6</td>
<td>delay [up seconds [down seconds]]</td>
<td>(Optional) Specify a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
</tbody>
</table>
Chapter 39 Configuring Enhanced Object Tracking

Configuring Enhanced Object Tracking Features

This example configures the tracking of an interface line-protocol state and verifies the configuration:

Switch(config)# track 33 interface gigabitethernet 1/0/1 line-protocol
Switch(config-track)# end
Switch# show track 33
Track 33
Interface GigabitEthernet1/0/1 line-protocol
Line protocol is Down (hw down)
1 change, last change 00:18:28

Step 7
end
Return to privileged EXEC mode.

Step 8
show track object-number
Verify that the specified objects are being tracked.

Step 9
copy running-config startup-config
(Optional) Save your entries in the configuration file.

Configuring a Tracked List

You can configure a tracked list of objects with a Boolean expression, a weight threshold, or a percentage threshold. A tracked list contains one or more objects. An object must exist before it can be added to the tracked list.

- You configure a Boolean expression to specify calculation by using either “AND” or “OR” operators.
- When you measure the tracked list state by a weight threshold, you assign a weight number to each object in the tracked list. The state of the tracked list is determined by whether or not the threshold was met. The state of each object is determined by comparing the total weight of all objects against a threshold weight for each object.
- When you measure the tracked list by a percentage threshold, you assign a percentage threshold to all objects in the tracked list. The state of each object is determined by comparing the assigned percentages of each object to the list.
Configuring Enhanced Object Tracking Features

Chapter 39      Configuring Enhanced Object Tracking

Configuring a Tracked List with a Boolean Expression

Configuring a tracked list with a Boolean expression enables calculation by using either “AND” or “OR” operators. For example, when tracking two interfaces using the “AND” operator, up means that both interfaces are up, and down means that either interface is down.

Beginning in privileged EXEC mode, follow these steps to configure a tracked list of objects with a Boolean expression:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>track track-number list boolean [and</td>
</tr>
<tr>
<td></td>
<td>Configure a tracked list object, and enter tracking configuration mode. The track-number can be from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td>• boolean—Specify the state of the tracked list based on a Boolean calculation.</td>
</tr>
<tr>
<td></td>
<td>• and—Specify that the list is up if all objects are up or down if one or more objects are down.</td>
</tr>
<tr>
<td></td>
<td>• or—Specify that the list is up if one object is up or down if all objects are down.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>object object-number [not]</td>
</tr>
<tr>
<td></td>
<td>Specify the object to be tracked. The range is from 1 to 500. The keyword not negates the state of the object, which means that when the object is up, the tracked list detects the object as down.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>delay {up seconds [down seconds]</td>
</tr>
<tr>
<td></td>
<td>(Optional) Specify a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show track object-number</td>
</tr>
<tr>
<td></td>
<td>Verify that the specified objects are being tracked.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no track track-number global configuration command to delete the tracked list.

This example configures track list 4 with a Boolean AND expression that contains two objects with one object state negated. If the list is up, the list detects that object 2 is down:

```
Switch(config)# track 4 list boolean and
Switch(config-track)# object 1
Switch(config-track)# object 2 not
Switch(config-track)# exit
```
Configuring a Tracked List with a Weight Threshold

To track by weight threshold, configure a tracked list of objects, specify that weight is used as the threshold, and configure a weight for each of its objects. The state of each object is determined by comparing the total weight of all objects that are up against a threshold weight for each object.

You cannot use the Boolean “NOT” operator in a weight threshold list.

Beginning in privileged EXEC mode, follow these steps to configure a tracked list of objects by using a weight threshold and to configure a weight for each object:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| Step 2  | track track-number list threshold weight | Configure a tracked list object and enter tracking configuration mode. The track-number can be from 1 to 500.  
  - threshold—Specify the state of the tracked list based on a threshold.  
  - weight—Specify that the threshold is based on weight. |
| Step 3  | object object-number [weight weight-number] | Specify the object to be tracked. The range is from 1 to 500. The optional weight weight-number specifies a threshold weight for the object. The range is from 1 to 255.  
  **Note** An object must exist before you can add it to a tracked list. |
| Step 4  | threshold weight {up number | [down number]} | Specify the threshold weight.  
  - up number—The valid range is from 1 to 255.  
  - down number—(Optional) The range depends on the number selected for the up number. If you configure the up number as 25, the range shown for the down number is 0 to 24. |
| Step 5  | delay {up seconds [down seconds] | [up seconds] down seconds} | (Optional) Specify a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds. |
| Step 6  | end | Return to privileged EXEC mode. |
| Step 7  | show track object-number | Verify that the specified objects are being tracked. |
| Step 8  | copy running-config startup-config | (Optional) Save your entries in the configuration file. |

Use the `no track track-number` global configuration command to delete the tracked list.

The example configures track list 4 to track by weight threshold. If object 1 and object 2 are down, then track list 4 is up because object 3 satisfies the up threshold value of up 30. But if object 3 is down, both objects 1 and 2 must be up in order to satisfy the threshold weight.

```
Switch(config)# track 4 list threshold weight
Switch(config-track)# object 1 weight 15
Switch(config-track)# object 2 weight 20
Switch(config-track)# object 3 weight 30
Switch(config-track)# threshold weight up 30 down 10
Switch(config-track)# exit
```

This configuration can be useful if object 1 and object 2 represent two small bandwidth connections and object 3 represents one large bandwidth connection. The configured **down 10** value means that once the tracked object is up, it will not go down until the threshold value is equal to or lower than 10, which in this example means that all connections are down.
Configuring a Tracked List with a Percentage Threshold

To track by percentage threshold, configure a tracked list of objects, specify that a percentage will be used as the threshold, and specify a percentage for all objects in the list. The state of the list is determined by comparing the assigned percentage of each object to the list.

You cannot use the Boolean “NOT” operator in a percentage threshold list.

Beginning in privileged EXEC mode, follow these steps to configure a tracked list of objects by using a percentage threshold:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>track track-number list threshold percentage</td>
</tr>
<tr>
<td></td>
<td>Configure a tracked list object and enter tracking configuration mode. The track-number can be from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td>• threshold—Specify the state of the tracked list based on a threshold.</td>
</tr>
<tr>
<td></td>
<td>• percentage—Specify that the threshold is based on percentage.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>object object-number</td>
</tr>
<tr>
<td></td>
<td>Specify the object to be tracked. The range is from 1 to 500.</td>
</tr>
<tr>
<td></td>
<td>Note An object must exist before you can add it to a tracked list.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>threshold percentage {up number</td>
</tr>
<tr>
<td></td>
<td>Specify the threshold percentage.</td>
</tr>
<tr>
<td></td>
<td>• up number—The valid range is from 1 to 100.</td>
</tr>
<tr>
<td></td>
<td>• down number—(Optional) The range depends on the number selected for the up number. If you configure the up number as 25, the range shown for the down number is 0 to 24.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>delay {up seconds [down seconds]</td>
</tr>
<tr>
<td></td>
<td>(Optional) Specify a period of time in seconds to delay communicating state changes of a tracked object. The range is from 1 to 180 seconds.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show track object-number</td>
</tr>
<tr>
<td></td>
<td>Verify that the specified objects are being tracked.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Use the no track track-number global configuration command to delete the tracked list.

This example configures tracked list 4 with three objects and a specified percentages to measure the state of the list:

```
Switch(config)# track 4 list threshold percentage
Switch(config-track)# object 1
Switch(config-track)# object 2
Switch(config-track)# object 3
Switch(config-track)# threshold percentage up 51 down 10
Switch(config-track)# exit
```
## Configuring HSRP Object Tracking

Beginning in privileged EXEC mode, follow these steps to configure a standby HSRP group to track an object and change the HSRP priority based on the object state:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** track object-number { interface interface-id { line-protocol | (Optional) Create a tracking list to track the configured state and enter tracking configuration mode.  
  ip routing | ip route ip-address/prefix-length | metric threshold | reachability | list boolean { and | or | threshold | weight | percentage } } }                          | - The object-number range is from 1 to 500.  
- Enter interface interface-id to select an interface to track.  
- Enter line-protocol to track the interface line protocol state or enter ip routing to track the interface IP routing state.  
- Enter ip route ip-address/prefix-length to track the state of an IP route.  
- Enter metric threshold to track the threshold metric or enter reachability to track if the route is reachable.  
   The default up threshold is 254 and the default down threshold is 255.  
- Enter list to track objects grouped in a list. Configure the list as described on the previous pages.  
  - For boolean, see the “Configuring a Tracked List with a Boolean Expression” section on page 39-4  
  - For threshold weight, see the “Configuring a Tracked List with a Weight Threshold” section on page 39-5  
  - For threshold percentage, see the “Configuring a Tracked List with a Percentage Threshold” section on page 39-6 |
| **Step 3** exit                                                       | Return to global configuration mode.                                                        |
| **Step 4** interface interface-id                                      | Enter interface configuration mode.                                                         |
| **Step 5** standby [group-number] ip [ip-address [secondary]]          | Create (or enable) the HSRP group by using its number and virtual IP address.              |
  |                                                                       | - (Optional) group-number—Enter a group number on the interface for which HSRP is being enabled. The range is 0 to 255; the default is 0. If there is only one HSRP group, you do not need to enter a group number.  
  |                                                                       | - (Optional on all but one interface) ip-address—Specify the virtual IP address of the hot standby router interface. You must enter the virtual IP address for at least one of the interfaces; it can be learned on the other interfaces.  
  |                                                                       | - (Optional) secondary—Specify that the IP address is a secondary hot standby router interface. If this keyword is omitted, the configured address is the primary IP address. |
You can also use the enhanced object tracking for tracking other characteristics.

- You can track the reachability of an IP route by using the `track ip route reachability` global configuration command.
- You can use the `track ip route metric threshold` global configuration command to determine if a route is above or below threshold.
- You can use the `track resolution` global configuration command to change the metric resolution default values for routing protocols.
- You can use the `track timer` tracking configuration command to configure the tracking process to periodically poll tracked objects.

Use the `show track` privileged EXEC command to verify enhanced object tracking configuration.

For more information about enhanced object tracking and the commands used to configure it, see this URL:

### Configuring IP SLAs Object Tracking

Cisco IOS IP Service Level Agreements (IP SLAs) is a network performance measurement and diagnostics tool that uses active monitoring by generating traffic to measure network performance. Cisco IP SLAs operations collects real-time metrics that you can use for network troubleshooting, design, and analysis.

For more information about Cisco IP SLAs on the switch, see Chapter 38, “Configuring Cisco IOS IP SLAs Operations.” For IP SLAs command information see theCisco IOS IP SLAs Command Reference, Release 12.4T at this URL:

Object tracking of IP SLAs operations allows clients to track the output from IP SLAs objects and use this information to trigger an action. Every IP SLAs operation maintains an SNMP operation return-code value, such as **OK** or **OverThreshold**, that can be interpreted by the tracking process. You can track two aspects of IP SLAs operation: state and reachability. For state, if the return code is **OK**, the track state is up; if the return code is not **OK**, the track state is down. For reachability, if the return code is **OK** or **OverThreshold**, reachability is up; if not **OK**, reachability is down.

Beginning in privileged EXEC mode, follow these steps to track the state of an IP SLAs operation or the reachability of an IP SLAs IP host:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>track object-number rtr operation-number state</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>delay {up seconds [down seconds]</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>exit</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>track object-number rtr operation-number reachability</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>delay {up seconds [down seconds]</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>show track object-number</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

This example shows how to configure and display IP SLAs state tracking:

```
Switch(config)# track 2 200 state
Switch(config)# end
Switch# show track 2
Track 2
Response Time Reporter 1 state
State is Down
  1 change, last change 00:00:47
Latest operation return code: over threshold
Latest RTT (milliseconds) 4
Tracked by:
  HSRP Ethernet0/1 3
```
This example output shows whether a route is reachable:

```
Switch(config)# track 3 500 reachability
Switch(config)# end
Switch# show track 3
Track 3
   Response Time Reporter 1 reachability
      Reachability is Up
         1 change, last change 00:00:47
         Latest operation return code: over threshold
         Latest RTT (milliseconds) 4
         Tracked by:
            HSRP Ethernet0/1 3
```

### Monitoring Enhanced Object Tracking

Use the privileged EXEC or User EXEC commands in Table 39-1 to display enhanced object tracking information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip route track table</td>
<td>Display information about the IP route track table.</td>
</tr>
<tr>
<td>show track [object-number]</td>
<td>Display information about the all tracking lists or the specified list.</td>
</tr>
<tr>
<td>show track brief</td>
<td>Display a single line of tracking information output.</td>
</tr>
<tr>
<td>show track interface [brief]</td>
<td>Display information about tracked interface objects.</td>
</tr>
<tr>
<td>show track ip [object-number]</td>
<td>Display information about tracked IP-route objects.</td>
</tr>
<tr>
<td>show track resolution</td>
<td>Display the resolution of tracked parameters.</td>
</tr>
<tr>
<td>show track timers</td>
<td>Display tracked polling interval timers.</td>
</tr>
</tbody>
</table>
Ethernet Operations, Administration, and Maintenance (OAM) is a protocol for installing, monitoring, and troubleshooting Ethernet networks to increase management capability within the context of the overall Ethernet infrastructure. The Cisco ME 3400E switch supports IEEE 802.1ag Connectivity Fault Management (CFM), Ethernet Local Management Interface (E-LMI), and IEEE 802.3ah Ethernet OAM discovery, link monitoring, remote fault detection, and remote loopback. It also supports IP Service Level Agreements (SLAs) for CFM. Ethernet OAM manager controls the interworking between any two of the protocols (CFM, E-LMI, and OAM).

This chapter provides information about configuring CFM, E-LMI, and the Ethernet OAM protocol. For complete command and configuration information for CFM, see the Cisco IOS feature module at this URL:

For E-LMI configuration and commands see this URL:

For complete syntax of the Ethernet OAM manager commands used in this chapter to configure CFM and E-LMI interaction, see the command reference for this release.

For complete command and configuration information for the Ethernet OAM protocol, see the Cisco IOS feature module at this URL:

For documentation for the CFM and Ethernet OAM commands, see this URL:

Understanding Ethernet CFM

Ethernet CFM is an end-to-end per-service-instance (per VLAN) Ethernet layer OAM protocol that includes proactive connectivity monitoring, fault verification, and fault isolation. End-to-end can be provider-edge-to-provider-edge (PE-to-PE) device or customer-edge-to-customer-edge (CE-to-CE) device. Ethernet CFM, as specified by IEEE 802.1ag, is the standard for Layer 2 ping, Layer 2 traceroute, and end-to-end connectivity check of the Ethernet network.

Unlike CFM, other metro-Ethernet OAM protocols are not end-to-end technologies. For example, IEEE 802.3ah OAM is a single-hop and per-physical-wire protocol and is not end-to-end or service aware. E-LMI is confined between the user provider-edge (UPE) and the CE device and relies on CFM for reporting status of the metro-Ethernet network to the customer-edge device.

These sections contain conceptual information about Ethernet CFM:

- CFM Domain, page 40-2
- Maintenance Points, page 40-3
- CFM Messages, page 40-4
- Crosscheck Function, page 40-4
- SNMP Traps, page 40-4
- IP SLAs Support for CFM, page 40-5

CFM Domain

A CFM maintenance domain is a management space on a network that is owned and operated by a single entity and defined by a set of ports internal to it, but at its boundary. You assign a unique maintenance level (from 0 to 7) to define the hierarchical relationship between domains. The larger the domain, the higher the level. For example, as shown in Figure 40-1, a service-provider domain would be larger than an operator domain and might have a maintenance level of 6, while the operator domain maintenance level is 3 or 4.

As shown in Figure 40-2, domains cannot intersect or overlap because that would require management by more than one entity, which is not allowed. Domains can touch or nest (if the outer domain has a higher maintenance level than the nested domain). Nesting domains is useful when a service provider contract with one or more operators to provide Ethernet service. Each operator has its own maintenance domain and the service provider domain is a superset of the operator domains. Maintenance levels of nesting domains should be communicated among the administering organizations. CFM exchanges messages and performs operations on a per-domain basis.
Maintenance Points

A maintenance point is a demarcation point on an interface that participates in CFM within a maintenance domain. Maintenance points drop all lower-level frames and forward all higher-level frames. There are two types of maintenance points:

- Maintenance end points (MEPs) are inward-facing points at the edge of the domain that define the boundary and confine CFM messages within these boundaries. Inward facing means that they communicate through the relay function side, not the wire side (connected to the port). A MEP sends and receives CFM frames through the relay function. It drops all CFM frames of its level or lower that come from the wire side. For CFM frames from the relay side, it processes the frames at its level and drops frames at a lower level. The MEP transparently forwards all CFM frames at a higher level, regardless of whether they are received from the relay or wire side. CFM runs at the provider maintenance level (UPE-to-UPE), specifically with inward-facing MEPs at the user network interface (UNI).
Understanding Ethernet CFM

Note

A UNI in the context of CFM and OAM manager is not the same as a UNI port type. The CFM UNI can be a UNI, an enhanced network interface (ENI), or a network node interface (NNI) port type. The control-plane security feature on the switch rate-limits all incoming CFM messages only on UNI and ENI port types.

- Maintenance intermediate points (MIPs) are internal to a domain, not at the boundary, and respond to CFM only when triggered by traceroute and loopback messages. They forward CFM frames received from MEPs and other MIPs, drop all CFM frames at a lower level, and forward all CFM frames at a higher level, regardless of whether they are received from the relay or wire side.

If port on which the MEP is configured is blocked by Spanning-Tree Protocol (STP), the port cannot receive or transmit CFM messages. If a port on which a MIP is configured is blocked by STP, the port cannot receive or respond to messages from the relay function side, but can receive and respond to CFM messages from the wire side.

CFM Messages

CFM uses standard Ethernet frames distinguished by EtherType or (for multicast messages) by MAC address. All CFM messages are confined to a maintenance domain and to a service-provider VLAN (S-VLAN). These CFM messages are supported:

- Continuity Check (CC) messages—multicast heartbeat messages exchanged periodically between MEPs that allow MEPs to discover other MEPs within a domain and allow MIPs to discover MEPs. CC messages are configured to a domain or VLAN.
- Loopback messages—unicast frames transmitted by a MEP at administrator request to verify connectivity to a particular maintenance point, indicating if a destination is reachable. A loopback message is similar to an Internet Control Message Protocol (ICMP) ping message.
- Traceroute messages—multicast frames transmitted by a MEP at administrator request to track the path (hop-by-hop) to a destination MEP. Traceroute messages are similar in concept to UDP traceroute messages.

Note

In the Cisco ME switch, the control-plane security feature rate-limits all incoming CFM messages by applying a per port policer to them. See Chapter 33, “Configuring Control-Plane Security” for more information.

Crosscheck Function

The crosscheck function is a timer-driven post-provisioning service verification between dynamically configured MEPs (using crosscheck messages) and expected MEPs (by configuration) for a service. It verifies that all endpoints of a multipoint service are operational. The crosscheck function is performed only one time and is initiated from the command-line interface (CLI).

SNMP Traps

The MEPs generate two types of SNMP traps: CC traps and crosscheck traps. Supported CC traps are MEP up, MEP down, cross-connect (a service ID does not match the VLAN), loop, and configuration error. The crosscheck traps are service up, MEP missing (an expected MEP is down), and unknown MEP.
IP SLAs Support for CFM

The switch supports CFM with IP Service Level Agreements (SLAs), which provides the ability to gather Ethernet layer network performance metrics. Available statistical measurements for the IP SLAs CFM operation include round-trip time, jitter (interpacket delay variance), and packet loss. You can schedule multiple IP SLAs operations and use Simple Network Management Protocol (SNMP) trap notifications and syslog messages for proactive threshold violation monitoring.

For more information about IP SLAs, see Chapter 38, “Configuring Cisco IOS IP SLAs Operations.”

IP SLAs integration with CFM gathers Ethernet layer statistical measurements by sending and receiving Ethernet data frames between CFM MEPs. Performance is measured between the source MEP and the destination MEP. Unlike other IP SLAs operations that provide performance metrics for only the IP layer, IP SLAs with CFM provides performance metrics for Layer 2.

You can manually configure individual Ethernet ping or jitter operations. You can also configure an IP SLAs automatic Ethernet operation that queries the CFM database for all MEPs in a given maintenance domain and VLAN. The operation then automatically creates individual Ethernet ping or jitter operations based on the discovered MEPs.

For more information about IP SLAs operation with CFM, see the IP SLAs for Metro-Ethernet feature module at this URL:

Configuring Ethernet CFM

Configuring Ethernet CFM requires preparing the network and configuring services. You can optionally configure and enable crosschecking.

- Default Ethernet CFM Configuration, page 40-5
- Ethernet CFM Configuration Guidelines, page 40-6
- Preparing the Ethernet CFM Network, page 40-6
- Configuring Ethernet CFM Service, page 40-7
- Configuring Ethernet CFM Crosscheck, page 40-8
- Configuring IP SLAs CFM Operation, page 40-9

Default Ethernet CFM Configuration

CFM is globally disabled.

CFM is enabled on all interfaces. A port can be configured as a flow point (MIP/MEP), a transparent port, or disabled (CFM disabled). By default, ports are transparent ports until configured as MEP, MIP, or disabled.

There are no MEPs or MIPs configured.
Ethernet CFM Configuration Guidelines

- CFM is not supported and cannot be configured on routed ports.
- CFM is supported on EtherChannel port channels. You can configure an EtherChannel port channel as MEP or MIP. However, CFM is not supported on individual ports that belong to an EtherChannel and you cannot add a CFM port to an EtherChannel group.
- You cannot configure CFM on VLAN interfaces.
- You cannot configure CFM on an EoMPLS port.
- CFM is not supported on private VLAN ports. The configuration is allowed, but does not take affect.

Preparing the Ethernet CFM Network

Beginning in privileged EXEC mode, follow these steps to prepare the network for Ethernet CFM:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>ethernet cfm traceroute cache [size entries</td>
<td>(Optional) Configure the CFM traceroute cache. You can set a maximum cache size or hold time.</td>
</tr>
<tr>
<td></td>
<td>hold-time minutes]</td>
<td>• (Optional) For size, enter the cache size in number of entry lines. The range is from 1 to 4095; the default is 100 lines.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• (Optional) For hold-time, enter the maximum cache hold time in minutes. The range is from 1 to 65535; the default is 100 minutes.</td>
</tr>
<tr>
<td>Step 3</td>
<td>ethernet cfm domain domain-name level level-id</td>
<td>Define a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7.</td>
</tr>
<tr>
<td>Step 4</td>
<td>mep archive-hold-time minutes</td>
<td>(Optional) Set the number of minutes that data from a missing maintenance end point (mep) is kept before it is purged. The range is 1 to 65535; the default is 100 minutes.</td>
</tr>
<tr>
<td>Step 5</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td>interface interface-id</td>
<td>Specify a physical interface or a port channel to configure, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>ethernet cfm mip level level-id</td>
<td>Configure an operator-level maintenance intermediate point (MIP) for the domain level-ID defined in Step 3.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong> If you plan to configure a MEP at level 7 on this interface, do not use this command to configure a MIP on the interface.</td>
</tr>
<tr>
<td>Step 8</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
</tbody>
</table>
### Configuring Ethernet CFM Service

Beginning in privileged EXEC mode, follow these steps to set up service for Ethernet CFM:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal | Enter global configuration mode. |
| **Step 2**
ethernet cfm domain *domain-name level level-id* | Define a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7. |
| **Step 3**
service *csi-id vlan vlan-id* | Define a universally unique customer service instance (CSI) and VLAN ID within the maintenance domain. |
| *csi-id*—a string of no more than 100 characters that identifies the CSI. |
| *vlan-id*—VLAN range is from 1 to 4095. You cannot use the same VLAN ID for more than one domain at the same level. |
| **Step 4**
exit | Return to global configuration mode. |
| **Step 5**
ethernet cfm enable | Globally enable CFM. |
| **Step 6**
interface *interface-id* | Specify a physical interface or a port channel to configure, and enter interface configuration mode. |

Use the **no** versions of the commands to remove the configuration or return to the default configurations.
Configuring Ethernet CFM

### Configuring Ethernet CFM Crosscheck

Beginning in privileged EXEC mode, follow these steps to configure Ethernet CFM crosscheck:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>ethernet cfm mep crosscheck start-delay delay</td>
<td>Configure the number of seconds that the device waits for remote MEPs to come up before the crosscheck is started. The range is 1 to 65535; the default is 30 seconds.</td>
</tr>
<tr>
<td>3</td>
<td>ethernet cfm domain domain-name level level-id</td>
<td>Define a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7.</td>
</tr>
</tbody>
</table>

Use the no form of each command to remove a configuration or to return to the default settings.

### Command Purpose

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>ethernet cfm mip level level-id</td>
<td>Configure a customer level or service-provider level maintenance intermediate point (MIP) for the interface. The MIP level range is 0 to 7.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td>If you plan to configure a MEP at level 7 on this interface, do not use this command to configure a MIP on the interface.</td>
</tr>
<tr>
<td>8</td>
<td>ethernet cfm mep level level-id [inward] mpid identifier vlan vlan-id</td>
<td>Configure maintenance end points (MEPs), for different maintenance levels. The MEP level range is 0 to 7.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Specify the end point in the inward direction.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For mpid identifier, enter a maintenance end point identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• For vlan vlan-id, enter the service provider VLAN ID or IDs as a VLAN-ID (1 to 4095), a range of VLAN-IDs separated by a hyphen, or a series of VLAN IDs separated by comma.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td>Repeat the command for different level IDs.</td>
</tr>
<tr>
<td>9</td>
<td>exit</td>
<td>Return to global configuration mode.</td>
</tr>
<tr>
<td>10</td>
<td>snmp-server enable traps ethernet cfm cc [mep-up] [mep-down] [config] [loop] [cross-connect]</td>
<td>(Optional) Enable Ethernet CFM continuity check traps.</td>
</tr>
<tr>
<td>11</td>
<td>snmp-server enable traps ethernet cfm crosscheck [mep-unknown] [mep-missing] [service-up]</td>
<td>(Optional) Enable Ethernet CFM crosscheck traps.</td>
</tr>
<tr>
<td>12</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>13</td>
<td>show ethernet cfm {domain</td>
<td>maintenance-points}</td>
</tr>
<tr>
<td>14</td>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>15</td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring Ethernet CFM

Use the `no` form of each command to remove a configuration or to return to the default settings.

### Configuring IP SLAs CFM Operation

You can manually configure an individual IP SLAs Ethernet ping or jitter echo operation or you can configure IP SLAs Ethernet operation with endpoint discovery. You can also configure multiple operation scheduling. For accurate one-way delay statistics, the clocks on the endpoint switches must be synchronized. You can configure the endpoint switches with Network Time Protocol (NTP) so that the switches are synchronized to the same clock source.

For more information about configuring IP SLAs Ethernet operation, see the *IP SLAs for Metro-Ethernet* feature module at this URL: http://www.cisco.com/en/US/products/ps6922/products_feature_guide09186a00807d72f5.html

For detailed information about configuring IP SLAs operations, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4T* at this URL: http://www.cisco.com/en/US/products/ps6441/products_configuration_guide_book09186a0080707055.html

For detailed information about IP SLAs commands, see the command reference at this URL: http://www.cisco.com/en/US/products/ps6441/products_command_reference_book09186a008049739b.html
This section includes these procedures:
- Manually Configuring an IP SLAs CFM Probe or Jitter Operation, page 40-10
- Configuring an IP SLAs Operation with Endpoint Discovery, page 40-12

## Manually Configuring an IP SLAs CFM Probe or Jitter Operation

Beginning in privileged EXEC mode, follow these steps to manually configure an IP SLAs Ethernet echo (ping) or jitter operation:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip sla operation-number</td>
</tr>
<tr>
<td></td>
<td>Create an IP SLAs operation, and enter IP SLAs configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ethernet echo mpid identifier domain domain-name vlan vlan-id</td>
</tr>
<tr>
<td></td>
<td>Configure the IP SLAs operation as an echo (ping) or jitter operation, and enter IP SLAs Ethernet echo configuration mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter echo for a ping operation or jitter for a jitter operation.</td>
</tr>
<tr>
<td></td>
<td>• For mpid identifier, enter a maintenance endpoint identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191.</td>
</tr>
<tr>
<td></td>
<td>• For domain domain-name, enter the CFM domain name.</td>
</tr>
<tr>
<td></td>

</tbody>
</table>

---

To remove an IP SLAs operation, enter the `no ip sla operation-number` global configuration command.
Understanding the Ethernet OAM Protocol

The Ethernet OAM protocol for installing, monitoring, and troubleshooting Metro Ethernet networks and Ethernet WANs relies on an optional sublayer in the data link layer of the OSI model. Normal link operation does not require Ethernet OAM. You can implement Ethernet OAM on any full-duplex point-to-point or emulated point-to-point Ethernet link for a network or part of a network (specified interfaces).

OAM frames, called OAM protocol data units (OAM PDUs) use the slow protocol destination MAC address 0180.c200.0002. They are intercepted by the MAC sublayer and cannot propagate beyond a single hop within an Ethernet network. Ethernet OAM is a relatively slow protocol, with a maximum transmission rate of 10 frames per second, resulting in minor impact to normal operations. However, when you enable link monitoring, because the CPU must poll error counters frequently, the number of required CPU cycles is proportional to the number of interfaces that must be polled.

Ethernet OAM has two major components:

- The OAM client establishes and manages Ethernet OAM on a link and enables and configures the OAM sublayer. During the OAM discovery phase, the OAM client monitors OAM PDUs received from the remote peer and enables OAM functionality. After the discovery phase, it manages the rules of response to OAM PDUs and the OAM remote loopback mode.

The OAM sublayer presents two standard IEEE 802.3 MAC service interfaces facing the superior and inferior MAC sublayers. It provides a dedicated interface for the OAM client to pass OAM control information and PDUs to and from the client. It includes these components:

- The control block provides the interface between the OAM client and other OAM sublayer internal blocks.
- The multiplexer manages frames from the MAC client, the control block, and the parser and passes OAM PDUs from the control block and loopback frames from the parser to the subordinate layer.
- The parser classifies frames as OAM PDUs, MAC client frames, or loopback frames and sends them to the appropriate entity: OAM PDUs to the control block, MAC client frames to the superior sublayer, and loopback frames to the multiplexer.

### OAM Features

These OAM features are defined by IEEE 802.3ah:

- **Discovery** identifies devices in the network and their OAM capabilities. It uses periodic OAM PDUs to advertise OAM mode, configuration, and capabilities; PDU configuration; and platform identity. An optional phase allows the local station to accept or reject the configuration of the peer OAM entity.

- **Link monitoring** detects and indicates link faults under a variety of conditions and uses the event notification OAM PDU to notify the remote OAM device when it detects problems on the link. Error events include when the number of symbol errors, the number of frame errors, the number of frame errors within a specified number of frames, or the number of error seconds within a specified period exceed a configured threshold.

- **Remote failure indication** conveys a slowly deteriorating quality of an OAM entity to its peers by communicating these conditions: Link Fault means a loss of signal, Dying Gasp means an unrecoverable condition, and Critical Event means an unspecified vendor-specific critical event. The switch can receive and process but not generate Link Fault or Critical Event OAM PDUs. It can generate Dying Gasp OAM PDUs to show when Ethernet OAM is disabled, the interface is shut down, the interface enters the error-disabled state, or the switch is reloading. It also supports Dying Gasp PDUs based on loss of power.

- **Remote loopback mode** to ensure link quality with a remote peer during installation or troubleshooting. In this mode, when the switch receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same port. The link appears to the user to be in the up state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

Another way to test connectivity, to ensure that a remote device is reachable, is to configure Ethernet loopback. See the “Enabling Ethernet Loopback” section on page 40-24.

### OAM Messages

Ethernet OAM messages or PDUs are standard length, untagged Ethernet frames between 64 and 1518 bytes. They do not go beyond a single hop and have a maximum transmission rate of 10 OAM PDUs per second. Message types are information, event notification, loopback control, or vendor-specific OAM PDUs.
Setting Up and Configuring Ethernet OAM

- Default Ethernet OAM Configuration, page 40-16
- Ethernet OAM Configuration Guidelines, page 40-16
- Enabling Ethernet OAM on an Interface, page 40-16
- Enabling Ethernet OAM Remote Loopback, page 40-17
- Configuring Ethernet OAM Link Monitoring, page 40-18
- Configuring Ethernet OAM Remote Failure Indications, page 40-21
- Configuring Ethernet OAM Templates, page 40-21

Default Ethernet OAM Configuration

Ethernet OAM is disabled on all interfaces. When Ethernet OAM is enabled on an interface, link monitoring is automatically turned on. Remote loopback is disabled. No Ethernet OAM templates are configured.

Ethernet OAM Configuration Guidelines

- The switch does not support monitoring of egress frames sent with cyclic redundancy code (CRC) errors. The `ethernet oam link-monitor transmit crc` interface-configuration or template-configuration commands are visible but are not supported on the switch. The commands are accepted, but are not applied to an interface.
- For a remote failure indication, the switch does not generate Link Fault or Critical Event OAM PDUs. However, if these PDUs are received from a link partner, they are processed. The switch supports generating and receiving Dying Gasp OAM PDUs when Ethernet OAM is disabled, the interface is shut down, the interface enters the error-disabled state, or the switch is reloading. The switch can also generate and receive Dying Gasp PDUs based on loss of power. The PDU includes a reason code to indicate why it was sent.
- The switch does not support Ethernet OAM on ports that belong to an EtherChannel.

Enabling Ethernet OAM on an Interface

Beginning in privileged EXEC mode, follow these steps to enable Ethernet OAM on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Define an interface to configure as an OAM interface, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 ethernet oam</td>
<td>Enable Ethernet OAM on the interface.</td>
</tr>
</tbody>
</table>
Chapter 40 Configuring Ethernet OAM, CFM, and E-LMI

Setting Up and Configuring Ethernet OAM

### Enabling Ethernet OAM Remote Loopback

You must enable Ethernet OAM remote loopback on an interface for the local OAM client to initiate OAM remote loopback operations. Changing this setting causes the local OAM client to exchange configuration information with its remote peer. Remote loopback is disabled by default.

Remote loopback has these limitations:
- Internet Group Management Protocol (IGMP) packets are not looped back.
- You cannot configure Ethernet OAM remote loopback on ISL ports or ports that belong to an EtherChannel.
- If dynamic ARP inspection is enabled, ARP or reverse ARP packets are not looped or dropped.

Beginning in privileged EXEC mode, follow these steps to enable Ethernet OAM remote loopback on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Define an interface to configure as an OAM interface, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>
Setting Up and Configuring Ethernet OAM

Use the `no ethernet oam remote-loopback {supported | timeout seconds}` interface configuration command to disable remote loopback support or remove the timeout setting.

Configuring Ethernet OAM Link Monitoring

You can configure high and low thresholds for link-monitoring features. If no high threshold is configured, the default is `none` — no high threshold is set. If you do not set a low threshold, it defaults to a value lower than the high threshold.

Beginning in privileged EXEC mode, follow these steps to configure Ethernet OAM link monitoring on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Define an interface, and enter interface configuration mode.</td>
</tr>
<tr>
<td><code>ethernet oam link-monitor supported</code></td>
<td>Enable the interface to support link monitoring. This is the default.</td>
</tr>
<tr>
<td></td>
<td>You need to enter this command only if it has been disabled by previously entering the <code>no ethernet oam link-monitor supported</code> command.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Command</td>
</tr>
<tr>
<td>--------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>ethernet oam link-monitor symbol-period</td>
</tr>
<tr>
<td></td>
<td>{threshold {high {high symbols</td>
</tr>
<tr>

</tr>
</tbody>
</table>
### Setting Up and Configuring Ethernet OAM

**Chapter 40  Configuring Ethernet OAM, CFM, and E-LMI**

#### Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 7**
ethernet oam link-monitor frame-secs
{threshold \{high \{high-frames | none\} | low \{low-frames\}\}| window milliseconds} |
(Optional) Configure high and low thresholds for the frame-secs error that triggers an error-frame-secs link event.
- Enter `threshold high high-frames` to set a high error frame-secs threshold in number of seconds. The range is 1 to 900. The default is none.
- Enter `threshold high none` to disable the high threshold if it was set. This is the default.
- Enter `threshold low low-frames` to set a low threshold in number of frames. The range is 1 to 900. The default is 1.
- Enter `window frames` to set the a polling window size in number of milliseconds. The range is 100 to 9000; each value is a multiple of 100 milliseconds. The default is 1000.

| **Step 8**
ethernet oam link-monitor receive-crc
{threshold \{high \{high-frames | none\} | low \{low-frames\}\}| window milliseconds} |
(Optional) Configure thresholds for monitoring ingress frames received with cyclic redundancy code (CRC) errors for a period of time.
- Enter `threshold high high-frames` to set a high threshold for the number of frames received with CRC errors. The range is 1 to 65535 frames.
- Enter `threshold high none` to disable the high threshold.
- Enter `threshold low low-frames` to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.
- Enter `window milliseconds` to set the a window and period of time during which frames with CRC errors are counted. The range is 10 to 1800 and represents the number of milliseconds in multiples of 100. The default is 100.

| **Step 9**
[no] ethernet link-monitor on |
(Optional) Start or stop (when the `no` keyword is entered) link-monitoring operations on the interface. Link monitoring operations start automatically when support is enabled.

| **Step 10**
end |
Return to privileged EXEC mode.

| **Step 11**
show ethernet oam status [interface interface-id] |
Verify the configuration.

| **Step 12**
copy running-config startup-config |
(Optional) Save your entries in the configuration file.

---

The `ethernet oam link-monitor transmit-crc
{threshold \{high \{high-frames | none\} | low \{low-frames\}\}| window milliseconds}` command is visible on the switch and you are allowed to enter it, but it is not supported. Enter the `no` form of the commands to disable the configuration. Use the `no` form of each command to disable the threshold setting.
Configuring Ethernet OAM Remote Failure Indications

You can configure an error-disable action to occur on an interface if one of the high thresholds is exceeded, if the remote link goes down, if the remote device is rebooted, or if the remote device disables Ethernet OAM on the interface.

Beginning in privileged EXEC mode, follow these steps to enable Ethernet OAM remote-failure indication actions on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>ethernet oam remote-failure {critical-event</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show ethernet oam status [interface interface-id]</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

The switch does not generate Link Fault or Critical Event OAM PDUs. However, if these PDUs are received from a link partner, they are processed. The switch supports sending and receiving Dying Gasp OAM PDUs with reason codes when Ethernet OAM is disabled, the interface is shut down, the interface enters the error-disabled state, or the switch is reloading. It can also respond to and generate, Dying Gasp PDUs based on loss of power. Enter the no ethernet remote-failure {critical-event | dying-gasp | link-fault} action command to disable the remote failure indication action.

Configuring Ethernet OAM Templates

You can create a template for configuring a common set of options on multiple Ethernet OAM interfaces. The template can be configured to monitor frame errors, frame-period errors, frame-second errors, received CRS errors, and symbol-period errors and thresholds. You can also set the template to put the interface in error-disabled state if any high thresholds are exceeded. These steps are optional and can be performed in any sequence or repeated to configure different options.
Beginning in privileged EXEC mode, follow these steps to configure an Ethernet OAM template and to associate it with an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>template template-name</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ethernet oam link-monitor receive-crc {threshold [high [high-frames</td>
</tr>
<tr>
<td></td>
<td>window milliseconds</td>
</tr>
<tr>
<td></td>
<td>• Enter threshold high high-frames to set a high threshold for the number of frames received with CRC errors. The range is 1 to 65535 frames.</td>
</tr>
<tr>
<td></td>
<td>• Enter threshold high none to disable the high threshold.</td>
</tr>
<tr>
<td></td>
<td>• Enter threshold low low-frames to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.</td>
</tr>
<tr>
<td></td>
<td>• Enter window milliseconds to set the a window and period of time during which frames with CRC errors are counted. The range is 10 to 1800 and represents the number of milliseconds in multiples of 100. The default is 100.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ethernet oam link-monitor symbol-period {threshold [high [high symbols</td>
</tr>
<tr>
<td></td>
<td>window symbols</td>
</tr>
<tr>
<td></td>
<td>• Enter threshold high high-symbols to set a high threshold in number of symbols. The range is 1 to 65535.</td>
</tr>
<tr>
<td></td>
<td>• Enter threshold high none to disable the high threshold.</td>
</tr>
<tr>
<td></td>
<td>• Enter threshold low low-symbols to set a low threshold in number of symbols. The range is 0 to 65535. It must be lower than the high threshold.</td>
</tr>
<tr>
<td></td>
<td>• Enter window symbols to set the window size (in number of symbols) of the polling period. The range is 1 to 65535 symbols.</td>
</tr>
</tbody>
</table>
### Step 5

**Command**

```
ethernet oam link-monitor frame {threshold {high {high-frames | none} | low {low-frames}}} | window milliseconds
```

**Purpose**

(Optional) Configure high and low thresholds for error frames that trigger an error-frame link event.

- Enter `threshold high high-frames` to set a high threshold in number of frames. The range is 1 to 65535. You must enter a high threshold.
- Enter `threshold high none` to disable the high threshold.
- Enter `threshold low low-frames` to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.
- Enter `window milliseconds` to set the a window and period of time during which error frames are counted. The range is 10 to 600 and represents the number of milliseconds in a multiple of 100. The default is 100.

### Step 6

**Command**

```
ethernet oam link-monitor frame-period {threshold {high {high-frames | none} | low {low-frames}}} | window frames
```

**Purpose**

(Optional) Configure high and low thresholds for the error-frame period that triggers an error-frame-period link event.

- Enter `threshold high high-frames` to set a high threshold in number of frames. The range is 1 to 65535. You must enter a high threshold.
- Enter `threshold high none` to disable the high threshold.
- Enter `threshold low low-frames` to set a low threshold in number of frames. The range is 0 to 65535. The default is 1.
- Enter `window frames` to set the a polling window size in number of frames. The range is 1 to 65535; each value is a multiple of 10000 frames. The default is 1000.

### Step 7

**Command**

```
ethernet oam link-monitor frame-seconds {threshold {high {high-seconds | none} | low {low-seconds}}} | window milliseconds
```

**Purpose**

(Optional) Configure frame-seconds high and low thresholds for triggering an error-frame-seconds link event.

- Enter `threshold high high-seconds` to set a high threshold in number of seconds. The range is 1 to 900. You must enter a high threshold.
- Enter `threshold high none` to disable the high threshold.
- Enter `threshold low low-frames` to set a low threshold in number of frames. The range is 1 to 900. The default is 1.
- Enter `window frames` to set the a polling window size in number of frames. The range is 100 to 9000; each value is a multiple of 100 milliseconds. The default is 1000.
Displaying Ethernet OAM Protocol Information

You can use the privileged EXEC commands in Table 40-3 to display Ethernet OAM protocol information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ethernet oam discovery [interface interface-id]</td>
<td>Displays discovery information for all Ethernet OAM interfaces or the specified interface.</td>
</tr>
<tr>
<td>show ethernet oam statistics [interface interface-id]</td>
<td>Displays detailed information about Ethernet OAM packets.</td>
</tr>
<tr>
<td>show ethernet oam status [interface interface-id]</td>
<td>Displays Ethernet OAM configuration for all interfaces or the specified interface.</td>
</tr>
<tr>
<td>show ethernet oam summary</td>
<td>Displays active Ethernet OAM sessions on the switch.</td>
</tr>
</tbody>
</table>

Enabling Ethernet Loopback

In addition to Ethernet OAM remote loopback (see the “Enabling Ethernet OAM Remote Loopback” section on page 40-17), you can alternately use the ethernet loopback facility supported interface configuration command to configure per-port loopbacks for testing connectivity across multiple switches. A facility loopback puts the port into a loopback state where the link is up but the line protocol is down for regular traffic. The switch loops back all received traffic.

By default, no loopbacks are configured.
Chapter 40  Configuring Ethernet OAM, CFM, and E-LMI

Enabling Ethernet Loopback

Ethernet loopback has these characteristics:

- You can configure Ethernet loopback only on physical ports; not on VLANs or port channels.
- You can configure one loopback per port and a maximum of two loopbacks on the switch.
- A port event, such as a shutdown or change from a switchport to a routed port, causes the port to end the loopback.
- You cannot configure SPAN and loopback on the switch at the same time. If you try to configure SPAN on any port while loopback is configured, you receive an error message.
- If a port is a Flex Link port or belongs to an EtherChannel, it cannot be put into a loopback state. If loopback is active, you cannot add a port to a Flex Link or EtherChannel.
- The port loopback function shares hardware resources with the VLAN mapping feature. If not enough TCAM resources are available because of VLAN-mapping configuration, when you attempt to configure loopback, you receive an error message, and the configuration is not allowed.

Beginning in privileged EXEC mode, follow these steps to enable Ethernet facility loopback on an interface:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ethernet loopback facility [mac-address {swap</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>ethernet loopback {start interface-id</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show ethernet loopback [interface-id]</td>
</tr>
<tr>
<td></td>
<td>show interface interface-id, show interface status, show log</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To stop an active loopback session on an interface or to stop all active loopback sessions, enter the `ethernet loopback stop {interface-id | all}` privileged EXEC command. To remove the Ethernet facility loopback configuration, enter the `no ethernet loopback` interface configuration command.

This example shows how to configure an Ethernet loopback to swap the MAC source and destination addresses and never time out and to start the loopback process. You must confirm the command before loopback starts.

```
Switch(config)# interface gigabitethernet 0/1
Switch(config-if)# ethernet loopback facility mac-address swap timeout none supported
Switch(config-if)# end
Switch# ethernet loopback start gigabitethernet 0/1
This is an intrusive loopback.
Therefore, while you test Ethernet connectivity, you will be unable to pass traffic across that link.
Proceed with Local Loopback? [confirm]
```

This is the output from the `show ethernet loopback` privileged EXEC command for the previous configuration:

```
Switch# show ethernet loopback
=====================================  
Loopback Session 0 : Interface Gi0/1  
Direction : facility                  
Type : port                           
Status : configured                   
MAC Mode : swap                       
Time out : none.                      
```

### Understanding E-LMI

Ethernet Local Management Interface (E-LMI) is a protocol between the customer-edge (CE) device and the provider-edge (PE) device. It runs only on the PE-to-CE UNI link and notifies the CE device of connectivity status and configuration parameters of Ethernet services available on the CE port. E-LMI interoperates with an OAM protocol, such as CFM, that runs within the provider network to collect OAM status. CFM runs at the provider maintenance level (UPE to UPE with inward-facing MEPs at the UNI). E-LMI relies on the OAM Ethernet Infrastructure to interwork with CFM for end-to-end status of Ethernet virtual connections (EVCs) across CFM domains.

OAM manager, which streamlines interaction between any two OAM protocols, handles the interaction between CFM and E-LMI. This interaction is unidirectional, running only from OAM manager to E-LMI on the UPE side of the switch. Information is exchanged either as a result of a request from E-LMI or triggered by OAM when it received notification of a change from the OAM protocol. This type of information is relayed:

- EVC name and availability status
- Remote UNI name and status
- Remote UNI counts

You can configure Ethernet virtual connections (EVCs), service VLANs, UNI ids (for each CE-to-PE link), and UNI count and attributes. You need to configure CFM to notify the OAM manager of any change to the number of active UNIs and or the remote UNI ID for a given S-VLAN domain.

You can configure the switch as either the customer-edge device or the provider-edge device.
E-LMI Interaction with OAM Manager

No interactions are required between E-LMI and OAM manager on the CE side. On the UPE side, OAM manager defines an abstraction layer that relays data collected from OAM protocols (in this case CFM) running within the metro network to the E-LMI switch. The information flow is unidirectional (from OAM manager to the E-LMI) but is triggered in one of two ways:

- Synchronous data flow triggered by a request from the E-LMI
- Asynchronous data flow triggered by OAM manager when it receives notification from CFM that the number of remote UNIs has changed

This data includes:

- EVC name and availability status (active, not active, partially active, or not defined)
- Remote UNI name and status (up, disconnected, administratively down, excessive FCS failures, or not reachable)
- Remote UNI counts (the total number of expected UNIs and the actual number of active UNIs)

The asynchronous update is triggered only when the number of active UNIs has changed.

CFM Interaction with OAM Manager

When there is a change in the number of active UNIs or remote UNI ID for a given S-VLAN or domain, CFM asynchronously notifies the OAM manager. A change in the number of UNIs might (or might not) cause a change in EVC status. OAM manager calculates EVC status given the number of active UNIs and the total number of associated UNIs.

---

**Note**

If crosscheck is disabled, no SNMP traps are sent when there is a change in the number of UNIs.

Configuring E-LMI

For E-LMI to work with CFM, you configure Ethernet virtual connections (EVCs), Ethernet service instances (EFPs), and E-LMI customer VLAN mapping. Most of the configuration occurs on the PE switch on the interfaces connected to the CE device. On the CE switch, you only need to enable E-LMI on the connecting interface. Note that you must configure some OAM parameters, for example, EVC definitions, on PE devices on both sides of a metro network.

This section includes this information:

- Default E-LMI Configuration, page 40-28
- E-LMI and OAM Manager Configuration Guidelines, page 40-28
- Configuring the OAM Manager, page 40-28
- Enabling E-LMI, page 40-31
- Ethernet OAM Manager Configuration Example, page 40-32
Default E-LMI Configuration

Ethernet LMI is globally disabled by default. When enabled, the switch is in provider-edge (PE) mode by default.

When you globally enable E-LMI by entering the `ethernet lmi global` global configuration command, it is automatically enabled on all interfaces. You can also enable or disable E-LMI per interface to override the global configuration. The E-LMI command that is given last is the command that has precedence.

There are no EVCs, EFP service instances, or UNIs defined.

UNI bundling service is bundling with multiplexing.

E-LMI and OAM Manager Configuration Guidelines

OAM manager is an infrastructural element and requires two interworking OAM protocols, in this case CFM and E-LMI. For OAM to operate, the PE side of the connection must be running CFM and E-LMI.

- E-LMI is not supported on routed ports, EtherChannel port channels or ports that belong to an EtherChannel, private VLAN ports, IEEE 802.1Q tunnel ports.
- You cannot configure E-LMI on VLAN interfaces.
- When you enable E-LMI globally or on an interface, the switch is in PE mode by default, You must enter the `ethernet lmi ce` global configuration command to enable the switch or interface in customer-edge mode.
- When the switch is configured as a CE device, the `service instance` and `ethernet uni` interface commands are visible but not supported.

Configuring the OAM Manager

Beginning in privileged EXEC mode, follow these steps to configure OAM manager on a PE switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ethernet cfm domain <em>domain-name</em> <em>level</em> <em>level-id</em></td>
<td>Define a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7.</td>
</tr>
<tr>
<td><strong>Step 3</strong> service <em>csi-id</em> vlan <em>vlan-id</em></td>
<td>Define a universally unique customer service instance (CSI) and VLAN ID within the maintenance domain.</td>
</tr>
<tr>
<td></td>
<td>• <em>csi-id</em>—a string of no more than 100 characters that identifies the CSI.</td>
</tr>
<tr>
<td></td>
<td>• <em>vlan-id</em>—VLAN range is from 1 to 4095. You cannot use the same VLAN ID for more than one domain at the same level.</td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Return to global configuration mode.</td>
</tr>
</tbody>
</table>
### Step 5

**Command:** `ethernet evc evc-id`  
**Purpose:** Define an Ethernet virtual connection (evc), and enter evc configuration mode. The identifier can be up to 100 characters in length.

### Step 6

**Command:** `oam protocol cfm svlan vlan-id domain domain-name`  
**Purpose:** Configure the EVC OAM protocol as CFM, and identify the service provider VLAN-ID (S-VLAN-ID) for the CFM domain maintenance level as configured in Steps 2 and 3.  
**Note:** If the CFM domain does not exist, the command is rejected, and an error message appears.

### Step 7

**Command:** `uni count value`  
**Purpose:** (Optional) Set the UNI count for the EVC. The range is 2 to 1024; the default is 2.  
If the command is not entered, the service defaults to a point-to-point service. If you enter a value of 2, you have the option to select point-to-multipoint service. If you configure a value of 3 or greater, the service is point-to-multipoint.  
**Note:** You should know the correct number of maintenance end points in the domain. If you enter a value greater than the actual number of end points, the UNI status will show as partially active even if all end points are up; if you enter a uni count less than the actual number of end points, status might show as active, even if all end points are not up.

### Step 8

**Command:** `exit`  
**Purpose:** Return to global configuration mode.

### Step 9

Repeat Steps 2 to 5 for other CFM domains that you want OAM manager to monitor.

### Step 10

**Command:** `interface interface-id`  
**Purpose:** Specify a physical interface connected to the CE device, and enter interface configuration mode.

### Step 11

**Command:** `service instance efp-identifier ethernet [evc-id]`  
**Purpose:** Configure an Ethernet service instance (EFP) on the interface, and enter ethernet service configuration mode.  
- The EFP identifier is a per-interface service identifier that does not map to a VLAN. The EFP identifier range is 1 to 4967295.  
- (Optional) Enter an `evc-id` to attach an EVC to the EFP.

### Step 12

**Command:** `ethernet lmi ce-vlan map {vlan-id | any | default | untagged}`  
**Purpose:** Configure an E-LMI customer VLAN-to-EVC map for a particular UNI. The keywords have these meanings:  
- For `vlan vlan-id`, enter the customer VLAN ID or IDs to map to as single VLAN-ID (1 to 4094), a range of VLAN-IDs separated by a hyphen, or a series of VLAN IDs separated by commas.  
- Enter `any` to map all VLANs (untagged or 1 to 4094).  
- Enter `default` to map the default EFP. You can use `default` keyword only if you have already mapped the service instance to a VLAN or group of VLANs.  
- Enter `untagged` to map untagged VLANS.
### Command

<table>
<thead>
<tr>
<th>Step 13</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>exit</td>
<td></td>
<td>Return to interface configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 14</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ethernet uni id name</td>
<td></td>
<td>Configure an Ethernet UNI ID. The name should be unique for all the UNIs that are part of a given customer service instance and can be up to 64 characters in length. When a UNI id is configured on a port, that ID is used as the default name for all MEPs configured on the port, unless a name is explicitly configured for a given MEP.</td>
</tr>
</tbody>
</table>

**Note** This command is required on all ports that are directly connected to CE devices. If the specified ID is not unique on the device, an error message appears.

<table>
<thead>
<tr>
<th>Step 15</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ethernet uni {bundle [all-to-one]</td>
<td>multiplex}</td>
<td>(Optional) Set UNI bundling attributes:</td>
</tr>
</tbody>
</table>
- If you enter bundle <cr>, the UNI supports bundling without multiplexing (only one EVC with one or multiple VLANs be mapped to it). |
- If you enter bundle all-to-one, the UNI supports a single EVC and all VLANs are mapped to that EVC. |
- If you enter multiplex, the UNI supports multiplexing without bundling (one or more EVCs with a single VLAN mapped to each EVC). |

If you do not configure bundling attributes, the default is bundling with multiplexing (one or more EVCs with one or more VLANs mapped to each EVC).

<table>
<thead>
<tr>
<th>Step 16</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 17</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ethernet service evc {detail</td>
<td>id evc-id</td>
<td>interface interface-id}</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 18</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>

Use the no forms of the commands to delete an EVC, EFP, or UNI ID, or to return to default configurations.

**Note** If you configure, change, or remove a UNI service type, EVC, EFP, or CE-VLAN configuration, all configurations are checked to make sure that the configurations match (UNI service type with EVC or EFP and CE-VLAN configuration). The configuration is rejected if the configurations do not match.
Enabling E-LMI

You can enable E-LMI globally or on an interface and you can configure the switch as a PE or a CE device. Beginning in privileged EXEC mode, follow these steps to enable for E-LMI on the switch or on an interface. Note that the order of the global and interface commands determines the configuration. The command that is entered last has precedence.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ethernet lmi global</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>ethernet lmi ce</strong></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>interface interface-id</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>ethernet lmi interface</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>**ethernet lmi (n391 value</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><strong>show ethernet lmi evc</strong></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
</tbody>
</table>

Use the **no ethernet lmi** global configuration command to globally disable E-LMI. Use the **no** form of the **ethernet lmi** interface configuration command with keywords to disable E-LMI on the interface or to return the timers to the default settings.
Use the `show ethernet lmi` commands to display information that was sent to the CE from the status request poll. Use the `show ethernet service` commands to show current status on the device.

**Ethernet OAM Manager Configuration Example**

This is a simple example of configuring CFM and E-LMI with OAM manager on a PE device and on a CE device. You can configure the switch as either the PE device or the CE device.

**Provider-Edge Device Configuration**

This example shows a sample configuration of OAM manager, CFM, and E-LMI on the PE device:

```
Switch# config t
Switch(config)# ethernet cfm domain Top level 7
Switch(config)# ethernet cfm domain Provider level 4
Switch(config-ether-cfm)# service customer_1 vlan 101
Switch(config-ether-cfm)# mep crosscheck mpid 404 vlan 101
Switch(config-ether-cfm)# exit
Switch(config)# ethernet cfm domain Operator_level 2
Switch(config-ether-cfm)# service operator_1 vlan 101
Switch(config-ether-cfm)# exit
Switch(config)# ethernet cfm enable
Switch(config)# ethernet evc test1
Switch(config-evc)# oam protocol cfm svlan 101 domain Provider
Switch(config-evc)# exit
Switch(config)# ethernet evc 101
Switch(config-evc)# uni count 3
Switch(config-evc)# oam protocol cfm svlan 101 domain Operator
Switch(config-evc)# exit
Switch(config)# ethernet lmi global
Switch(config)# interface gigabitethernet 1/0/2
Switch(config-if)# ethernet cfm mip level 7
Switch(config-if)# ethernet cfm mep level 4 mpid 200 vlan 200
Switch(config-if)# service instance 101 ethernet test1
Switch(config-if-srv)# ethernet lmi ce-vlan map 101
Switch(config-if-srv)# exit
Switch(config-if)# exit
Switch(config)# ethernet cfm cc enable level 2-4 vlan 101
Switch(config)# exit
```

**Customer-Edge Device Configuration**

This example shows the commands necessary to configure E-LMI on the CE device. The switch can be configured as the CE device. The example enables E-LMI globally, but you can also enable it only on a specific interface. However, if you do not enter the `ethernet lmi ce` global configuration command, the interface will be in PE mode by default.

```
Switch# config t
Switch(config)# ethernet lmi global
Switch(config)# ethernet lmi ce
Switch(config)# exit
```
Note

For E-LMI to work, any VLANs used on the PE device must also be created on the CE device. Create a VLAN by entering the `vlan vlan-id` global configuration command on the CE device, where the `vlan-ids` match those on the PE device and configure these VLANs as allowed VLANs by entering the `switchport trunk allowed vlan vlan-ids` interface configuration command. Allowed VLANs can receive and send traffic on the interface in tagged format when in trunking mode.

Displaying E-LMI and OAM Manager Information

You can use the privileged EXEC commands in Table 40-4 to display E-LMI or OAM manager information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show ethernet lmi evc [detail evc-id [interface interface-id]</td>
<td>map interface type number]`</td>
</tr>
<tr>
<td><code>show ethernet lmi parameters interface interface-id</code></td>
<td>Displays Ethernet LMI interface parameters sent to the CE from the status request poll.</td>
</tr>
<tr>
<td><code>show ethernet lmi statistics interface interface-id</code></td>
<td>Displays Ethernet LMI interface statistics sent to the CE from the status request poll.</td>
</tr>
<tr>
<td><code>show ethernet lmi uni map interface [interface-id]</code></td>
<td>Displays information about the E-LMI UNI VLAN map sent to the CE from the status request poll.</td>
</tr>
<tr>
<td>`show ethernet service evc {detail</td>
<td>id evc-id</td>
</tr>
<tr>
<td>`show ethernet service instance {detail</td>
<td>id efp-identifier interface interface-id</td>
</tr>
<tr>
<td><code>show ethernet service interface [interface-id] [detail]</code></td>
<td>Displays information about OAM manager interfaces.</td>
</tr>
</tbody>
</table>

Ethernet CFM and Ethernet OAM Interaction

You can also configure the OAM Manager infrastructure for interaction between CFM and Ethernet OAM. When the Ethernet OAM Protocol is running on an interface that has CFM MEPs configured, Ethernet OAM informs CFM of the state of the interface. Interaction is unidirectional from the Ethernet OAM to the CFM Protocol, and the only information exchanged is the user network interface port status.

The Ethernet OAM Protocol notifies CFM when these conditions occur:

- Error thresholds are crossed at the local interface.

  CFM responds to the notification by sending a port status of `Local_Excessive_Errors` in the Port StatusType Length Value (TLV).
Ethernet OAM receives an OAMPDU from the remote side showing that an error threshold is exceeded on the remote endpoint. CFM responds to the notification by sending a port status of Remote_Excessive_Errors in the Port Status TLV.

- The local port is set into loopback mode.
  CFM responds by sending a port status of Test in the Port Status TLV.
- The remote port is set into loopback mode.
  CFM responds by sending a port status of Test in the Port Status TLV.

This section includes this information:

- Configuring Ethernet OAM Interaction with CFM, page 40-34
- Ethernet OAM and CFM Configuration Example, page 40-35

For more information about CFM and interaction with Ethernet OAM, see the Ethernet Connectivity Fault Management feature module at this URL:

### Configuring Ethernet OAM Interaction with CFM

For Ethernet OAM to function with CFM, you must configure an Ethernet Virtual Circuit (EVC) and the OAM manager, and associate the EVC with CFM. You must use an inward facing MEP for interaction with the OAM manager.

**Note**

If you configure, change, or remove a UNI service type, EVC, Ethernet service instance, or CE-VLAN configuration, all configurations are verified to ensure that the UNI service types match the EVC configuration and that Ethernet service instances are matched with the CE-VLAN configuration. Configurations are rejected if the pairs do not match.

### Configuring the OAM Manager

Beginning in privileged EXEC mode, follow these steps to configure the OAM manager on a PE device:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> ethernet cfm domain domain-name</td>
<td>Define a CFM domain, set the domain level, and enter</td>
</tr>
<tr>
<td>level level-id</td>
<td>ethernet-cfm configuration mode for the domain. The</td>
</tr>
<tr>
<td></td>
<td>maintenance level number range is 0 to 7.</td>
</tr>
<tr>
<td><strong>Step 3</strong> service csi-id vlan vlan-id</td>
<td>Define a universally unique customer service instance (CSI)</td>
</tr>
<tr>
<td></td>
<td>and VLAN ID within the maintenance domain.</td>
</tr>
<tr>
<td></td>
<td>• csi-id—String of no more than 100 characters that</td>
</tr>
<tr>
<td></td>
<td>identifies the CSI.</td>
</tr>
<tr>
<td></td>
<td>• vlan-id—VLAN range is from 1 to 4095. You cannot</td>
</tr>
<tr>
<td></td>
<td>use the same VLAN ID for more than one domain at the same level.</td>
</tr>
</tbody>
</table>
Enabling Ethernet OAM

Beginning in privileged EXEC mode, follow these steps to enable Ethernet OAM on an interface.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Define an interface to configure as an Ethernet OAM interface and enter interface configuration mode.</td>
</tr>
</tbody>
</table>
| 3      | ethernet oam [max-rate oampdus | min-rate seconds | mode | active | passive | timeout seconds] | Enable Ethernet OAM on the interface
|        |                                              | • (Optional) Enter max-rate oampdus to set the maximum rate (per second) to send OAM PDUs. The range is 1 to 10 PDUs per second; the default is 10. |
|        |                                              | • (Optional) Enter min-rate seconds to set the minimum rate in seconds. The range is 1 to 10 seconds. |
|        |                                              | • (Optional) Set the OAM client mode as active or passive. The default is active. |
|        |                                              | • (Optional) Enter timeout seconds to set the time after which a device declares the OAM peer to be nonoperational and resets its state machine. The range is 2 to 30 seconds; the default is 5 seconds. |
| 4      | end                                          | Return to privileged EXEC mode.                                          |
| 5      | copy running-config startup-config           | (Optional) Save your entries in the configuration file.                 |
| 6      | show ethernet cfm maintenance points remote  | (Optional) Display the port states as reported by Ethernet OAM.          |

Ethernet OAM and CFM Configuration Example

These are example configurations of the interworking between Ethernet OAM and CFM in a sample service provider network with a provider-edge switch connected to a customer edge switch at each endpoint. You must configure CFM, E-LMI, and Ethernet OAM between the customer edge and the provider edge switch.
Ethernet CFM and Ethernet OAM Interaction

Chapter 40  Configuring Ethernet OAM, CFM, and E-LMI

Customer-edge switch 1 (CE1) configuration:

Switch# config t
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# port-type nni
Switch(config-if)# switchport trunk allowed vlan 10
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# exit

Provider-edge switch 1 (PE1) configuration:

Switch# config t
Switch(config)# interface fastethernet1/0/20
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet cfm mip level 7
Switch(config-if)# ethernet cfm mep level 4 mpid 100 vlan 10
Switch(config-if)# ethernet uni id 2004-20
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# service instance 10 ethernet BLUE
Switch(config-if-srv)# ethernet lmi ce-vlan map 10
Switch(config-if-srv)# exit

Provider-edge switch 2 (PE2) configuration:

Switch# config t
Switch(config)# interface gigabitethernet1/1/20
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet cfm mip level 7
Switch(config-if)# ethernet cfm mep level 4 mpid 101 vlan 10
Switch(config-if)# ethernet uni id 2004-20
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# service instance 10 ethernet BLUE
Switch(config-if-srv)# ethernet lmi ce-vlan map 10
Switch(config-if-srv)# exit

Customer-edge switch 2 (CE2) configuration:

Switch# config t
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# port-type nni
Switch(config-if)# switchport trunk allowed vlan 10
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# exit

These are examples of the output showing provider-edge switch port status of the configuration. Port status shows as **UP** at both switches.

Switch PE1:

Switch# show ethernet cfm maintenance points remote
MPID  Level  Mac Address    Vlan  PortState  InGressPort     Age(sec)  Service ID
101 * 4  0015.633f.6900 10   UP        Gi1/1/1         27       blue

Switch PE2:

Switch# show ethernet cfm maintenance points remote
MPID  Level  Mac Address    Vlan  PortState  InGressPort     Age(sec)  Service ID
100 * 4  0012.00a3.3780 10   UP        Gi1/1/1         8        blue

Total Remote MEPs: 1
This example shows the outputs when you start remote loopback on CE1 (or PE1). The port state on the remote PE switch shows as Test and the remote CE switch goes into error-disable mode.

Switch# ethernet oam remote-loopback start interface gigabitEthernet 0/1
This is a intrusive loopback.
Therefore, while you test Ethernet OAM MAC connectivity, you will be unable to pass traffic across that link.
Proceed with Remote Loopback? [confirm]

Switch PE1:
Switch# show ethernet cfm maintenance points remote
MPID  Level Mac Address    Vlan PortState InGressPort     Age(sec) Service ID
101 * 4     0015.633f.6900 10   UP        Gi1/1/1         27       blue

Switch PE2:
Switch# show ethernet cfm maintenance points remote
MPID  Level Mac Address    Vlan PortState InGressPort     Age(sec) Service ID
100 * 4     0012.00a3.3780 10   TEST      Gi1/1/1         8        blue
Total Remote MEPs: 1

In addition, if you shut down the CE1 interface that connects to PE1, the remote PE2 port will show a PortState of Down.
Configuring IP Multicast Routing

This chapter describes how to configure IP multicast routing on the Cisco ME 3400E Ethernet Access switch. IP multicasting is a more efficient way to use network resources, especially for bandwidth-intensive services such as audio and video. IP multicast routing enables a host (source) to send packets to a group of hosts (receivers) anywhere within the IP network by using a special form of IP address called the IP multicast group address. The sending host inserts the multicast group address into the IP destination address field of the packet, and IP multicast routers and multilayer switches forward incoming IP multicast packets out all interfaces that lead to members of the multicast group. Any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group receive the message.

To use this feature, the switch must be running the metro IP access image.

Note
For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS IP Command Reference, Volume 3 of 3: Multicast, Release 12.2.

This chapter consists of these sections:

- Configuring IP Multicast Routing, page 41-8
- Configuring Advanced PIM Features, page 41-33
- Configuring Optional IGMP Features, page 41-36
- Configuring Optional Multicast Routing Features, page 41-43
- Monitoring and Maintaining IP Multicast Routing, page 41-46

For information on configuring the Multicast Source Discovery Protocol (MSDP), see Chapter 42, “Configuring MSDP.”

Understanding Cisco’s Implementation of IP Multicast Routing

The switch supports these protocols to implement IP multicast routing:
- Internet Group Management Protocol (IGMP) is used among hosts on a LAN and the routers (and multilayer switches) on that LAN to track the multicast groups of which hosts are members.
- Protocol-Independent Multicast (PIM) protocol is used among routers and multilayer switches to track which multicast packets to forward to each other and to their directly connected LANs.
According to IPv4 multicast standards, the MAC destination multicast address begins with 0100:5e and is appended by the last 23 bits of the IP address. On the Cisco ME switch, if the multicast packet does not match the switch multicast address, the packets are treated in this way:

- If the packet has a multicast IP address and a unicast MAC address, the packet is forwarded in software. This can occur because some protocols on legacy devices use unicast MAC addresses with multicast IP addresses.
- If the packet has a multicast IP address and an unmatched multicast MAC address, the packet is dropped.

This section contains this information:

- Understanding IGMP, page 41-2
- Understanding PIM, page 41-3

Understanding IGMP

To participate in IP multicasting, multicast hosts, routers, and multilayer switches must have the IGMP operating. This protocol defines the querier and host roles:

- A querier is a network device that sends query messages to discover which network devices are members of a given multicast group.
- A host is a receiver that sends report messages (in response to query messages) to inform a querier of a host membership.

A set of queriers and hosts that receive multicast data streams from the same source is called a multicast group. Queriers and hosts use IGMP messages to join and leave multicast groups.

Any host, regardless of whether it is a member of a group, can send to a group. However, only the members of a group receive the message. Membership in a multicast group is dynamic; hosts can join and leave at any time. There is no restriction on the location or number of members in a multicast group. A host can be a member of more than one multicast group at a time. How active a multicast group is and what members it has can vary from group to group and from time to time. A multicast group can be active for a long time, or it can be very short-lived. Membership in a group can constantly change. A group that has members can have no activity.

IP multicast traffic uses group addresses, which are class D addresses. The high-order bits of a Class D address are 1110. Therefore, host group addresses can be in the range 224.0.0.0 through 239.255.255.255. Multicast addresses in the range 224.0.0.0 to 240.0.0.255 are reserved for use by routing protocols and other network control traffic. The address 224.0.0.0 is guaranteed not to be assigned to any group.

IGMP packets are sent using these IP multicast group addresses:

- IGMP general queries are destined to the address 224.0.0.1 (all systems on a subnet).
- IGMP group-specific queries are destined to the group IP address for which the switch is querying.
- IGMP group membership reports are destined to the group IP address for which the switch is reporting.
- IGMP Version 2 (IGMPv2) leave messages are destined to the address 224.0.0.2 (all-multicast-routers on a subnet). In some old host IP stacks, leave messages might be destined to the group IP address rather than to the all-routers address.
IGMP Version 1

IGMP Version 1 (IGMPv1) primarily uses a query-response model that enables the multicast router and multilayer switch to find which multicast groups are active (have one or more hosts interested in a multicast group) on the local subnet. IGMPv1 has other processes that enable a host to join and leave a multicast group. For more information, see RFC 1112.

IGMP Version 2

IGMPv2 extends IGMP functionality by providing such features as the IGMP leave process to reduce leave latency, group-specific queries, and an explicit maximum query response time. IGMPv2 also adds the capability for routers to elect the IGMP querier without depending on the multicast protocol to perform this task. For more information, see RFC 2236.

Understanding PIM

PIM is called protocol-independent: regardless of the unicast routing protocols used to populate the unicast routing table, PIM uses this information to perform multicast forwarding instead of maintaining a separate multicast routing table.

PIM is defined in RFC 2362, Protocol-Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification. PIM is defined in these Internet Engineering Task Force (IETF) Internet drafts:

- Protocol Independent Multicast (PIM): Motivation and Architecture
- Protocol Independent Multicast (PIM), Dense Mode Protocol Specification
- Protocol Independent Multicast (PIM), Sparse Mode Protocol Specification
- draft-ietf-idmr-igmp-v2-06.txt, Internet Group Management Protocol, Version 2
- draft-ietf-pim-v2-dm-03.txt, PIM Version 2 Dense Mode

This section includes this information about PIM:

- PIM Versions, page 41-3
- PIM Modes, page 41-4
- PIM Stub Routing, page 41-4
- IGMP Helper, page 41-5
- Auto-RP, page 41-6
- Bootstrap Router, page 41-6
- Multicast Forwarding and Reverse Path Check, page 41-7

PIM Versions

PIMv2 includes these improvements over PIMv1:

- A single, active rendezvous point (RP) exists per multicast group, with multiple backup RPs. This single RP compares to multiple active RPs for the same group in PIMv1.
- A bootstrap router (BSR) provides a fault-tolerant, automated RP discovery and distribution mechanism that enables routers and multilayer switches to dynamically learn the group-to-RP mappings.
Sparse mode and dense mode are properties of a group, as opposed to an interface. We strongly recommend sparse-dense mode, as opposed to either sparse mode or dense mode only.

- PIM join and prune messages have more flexible encoding for multiple address families.
- A more flexible hello packet format replaces the query packet to encode current and future capability options.
- Register messages to an RP specify whether they are sent by a border router or a designated router.
- PIM packets are no longer inside IGMP packets; they are standalone packets.

**PIM Modes**

PIM can operate in dense mode (DM), sparse mode (SM), or in sparse-dense mode (PIM DM-SM), which handles both sparse groups and dense groups at the same time.

**PIM DM**

PIM DM builds source-based multicast distribution trees. In dense mode, a PIM DM router or multilayer switch assumes that all other routers or multilayer switches forward multicast packets for a group. If a PIM DM device receives a multicast packet and has no directly connected members or PIM neighbors present, a prune message is sent back to the source to stop unwanted multicast traffic. Subsequent multicast packets are not flooded to this router or switch on this pruned branch because branches without receivers are pruned from the distribution tree, leaving only branches that contain receivers.

When a new receiver on a previously pruned branch of the tree joins a multicast group, the PIM DM device detects the new receiver and immediately sends a graft message up the distribution tree toward the source. When the upstream PIM DM device receives the graft message, it immediately puts the interface on which the graft was received into the forwarding state so that the multicast traffic begins flowing to the receiver.

**PIM SM**

PIM SM uses shared trees and shortest-path-trees (SPTs) to distribute multicast traffic to multicast receivers in the network. In PIM SM, a router or multilayer switch assumes that other routers or switches do not forward multicast packets for a group, unless there is an explicit request for the traffic (join message). When a host joins a multicast group using IGMP, its directly connected PIM SM device sends PIM join messages toward the root, also known as the RP. This join message travels router-by-router toward the root, constructing a branch of the shared tree as it goes.

The RP keeps track of multicast receivers. It also registers sources through register messages received from the source’s first-hop router (designated router [DR]) to complete the shared tree path from the source to the receiver. When using a shared tree, sources must send their traffic to the RP so that the traffic reaches all receivers.

Prune messages are sent up the distribution tree to prune multicast group traffic. This action permits branches of the shared tree or SPT that were created with explicit join messages to be torn down when they are no longer needed.

**PIM Stub Routing**

The PIM stub routing feature reduces resource usage by moving routed traffic closer to the end user.
In a network using PIM stub routing, the only allowable route for IP traffic to the user is through a switch that is configured with PIM stub routing. PIM passive interfaces are connected to Layer 2 access domains, such as VLANs, or to interfaces that are connected to other Layer 2 devices. Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM passive interfaces do not send or process any received PIM control packets.

When using PIM stub routing, you should configure the distribution and remote routers to use IP multicast routing and configure only the switch as a PIM stub router. The switch does not route transit traffic between distribution routers. You also need to configure a routed uplink port on the switch. The switch uplink port cannot be used with SVIs. If you need PIM for an SVI uplink port, you should upgrade to the IP services feature set.

You must also configure EIGRP stub routing when configuring PIM stub routing on the switch. For more information, see the “Configuring EIGRP Stub Routing” section on page 36-40.

The redundant PIM stub router topology is not supported. The redundant topology exists when there is more than one PIM router forwarding multicast traffic to a single access domain. PIM messages are blocked, and the PIM assert and designated router election mechanisms are not supported on the PIM passive interfaces. Only the nonredundant access router topology is supported by the PIM stub feature. By using a nonredundant topology, the PIM passive interface assumes that it is the only interface and designated router on that access domain.

In Figure 41-1, Switch A routed uplink port 25 is connected to the router and PIM stub routing is enabled on the VLAN 100 interfaces and on Host 3. This configuration allows the directly connected hosts to receive traffic from multicast source 200.1.1.3. See the “Configuring PIM Stub Routing” section on page 41-12 for more information.

**Figure 41-1 PIM Stub Router Configuration**

![Diagram of PIM Stub Router Configuration](image)

**IGMP Helper**

PIM stub routing moves routed traffic closer to the end user and reduces network traffic. You can also reduce traffic by configuring a stub router (switch) with the IGMP helper feature.

You can configure a stub router (switch) with the `igmp helper help-address` interface configuration command to enable the switch to send reports to the next-hop interface. Hosts that are not directly connected to a downstream router can then join a multicast group sourced from an upstream network. The IGMP packets from a host wanting to join a multicast stream are forwarded upstream to the next-hop device when this feature is configured. When the upstream central router receives the helper IGMP reports or leaves, it adds or removes the interfaces from its outgoing interface list for that group.
Auto-RP

This proprietary feature eliminates the need to manually configure the RP information in every router and multilayer switch in the network. For Auto-RP to work, you configure a Cisco router or multilayer switch as the mapping agent. It uses IP multicast to learn which routers or switches in the network are possible candidate RPs to receive candidate RP announcements. Candidate RPs periodically send multicast RP-announce messages to a particular group or group range to announce their availability.

Mapping agents listen to these candidate RP announcements and use the information to create entries in their Group-to-RP mapping caches. Only one mapping cache entry is created for any Group-to-RP range received, even if multiple candidate RPs are sending RP announcements for the same range. As the RP-announce messages arrive, the mapping agent selects the router or switch with the highest IP address as the active RP and stores this RP address in the Group-to-RP mapping cache.

Mapping agents periodically multicast the contents of their Group-to-RP mapping cache. Thus, all routers and switches automatically discover which RP to use for the groups they support. If a router or switch fails to receive RP-discovery messages and the Group-to-RP mapping information expires, it switches to a statically configured RP that was defined with the `ip pim rp-address` global configuration command. If no statically configured RP exists, the router or switch changes the group to dense-mode operation.

Multiple RPs serve different group ranges or serve as hot backups of each other.

Bootstrap Router

PIMv2 BSR is another method to distribute group-to-RP mapping information to all PIM routers and multilayer switches in the network. It eliminates the need to manually configure RP information in every router and switch in the network. However, instead of using IP multicast to distribute group-to-RP mapping information, BSR uses hop-by-hop flooding of special BSR messages to distribute the mapping information.

The BSR is elected from a set of candidate routers and switches in the domain that have been configured to function as BSRs. The election mechanism is similar to the root-bridge election mechanism used in bridged LANs. The BSR election is based on the BSR priority of the device contained in the BSR messages that are sent hop-by-hop through the network. Each BSR device examines the message and forwards out all interfaces only the message that has either a higher BSR priority than its BSR priority or the same BSR priority, but with a higher BSR IP address. Using this method, the BSR is elected.

The elected BSR sends BSR messages with a TTL of 1. Neighboring PIMv2 routers or multilayer switches receive the BSR message and multicast it out all other interfaces (except the one on which it was received) with a TTL of 1. In this way, BSR messages travel hop-by-hop throughout the PIM domain. Because BSR messages contain the IP address of the current BSR, the flooding mechanism enables candidate RPs to automatically learn which device is the elected BSR.

Candidate RPs send candidate RP advertisements showing the group range for which they are responsible to the BSR, which stores this information in its local candidate-RP cache. The BSR periodically advertises the contents of this cache in BSR messages to all other PIM devices in the domain. These messages travel hop-by-hop through the network to all routers and switches, which store the RP information in the BSR message in their local RP cache. The routers and switches select the same RP for a given group because they all use a common RP hashing algorithm.
Multicast Forwarding and Reverse Path Check

With unicast routing, routers and multilayer switches forward traffic through the network along a single path from the source to the destination host whose IP address appears in the destination address field of the IP packet. Each router and switch along the way makes a unicast forwarding decision, using the destination IP address in the packet, by looking up the destination address in the unicast routing table and forwarding the packet through the specified interface to the next hop toward the destination.

With multicasting, the source is sending traffic to an arbitrary group of hosts represented by a multicast group address in the destination address field of the IP packet. To decide whether to forward or drop an incoming multicast packet, the router or multilayer switch uses a reverse path forwarding (RPF) check on the packet as follows and shown in Figure 41-2:

1. The router or multilayer switch examines the source address of the arriving multicast packet to decide whether the packet arrived on an interface that is on the reverse path back to the source.
2. If the packet arrives on the interface leading back to the source, the RPF check is successful and the packet is forwarded to all interfaces in the outgoing interface list (which might not be all interfaces on the router).
3. If the RPF check fails, the packet is discarded.

Some multicast routing protocols maintain a separate multicast routing table and use it for the RPF check. However, PIM uses the unicast routing table to perform the RPF check. Figure 41-2 shows port 2 receiving a multicast packet from source 151.10.3.21. Table 41-1 shows that the port on the reverse path to the source is port 1, not port 2. Because the RPF check fails, the multilayer switch discards the packet. Another multicast packet from source 151.10.3.21 is received on port 1, and the routing table shows this port is on the reverse path to the source. Because the RPF check passes, the switch forwards the packet to all port in the outgoing port list.

**Figure 41-2  RPF Check**

**Table 41-1  Routing Table Example for an RPF Check**

<table>
<thead>
<tr>

</tr>
<tr>
<td>204.1.16.0/24</td>
<td>Fast Ethernet 0/2</td>
</tr>
</tbody>
</table>
PIM uses both source trees and RP-rooted shared trees to forward datagrams (described in the “PIM DM” section on page 41-4 and the “PIM SM” section on page 41-4). The RPF check is performed differently for each:

- If a PIM router or multilayer switch has a source-tree state (that is, an (S,G) entry is present in the multicast routing table), it performs the RPF check against the IP address of the source of the multicast packet.
- If a PIM router or multilayer switch has a shared-tree state (and no explicit source-tree state), it performs the RPF check on the RP address (which is known when members join the group).

Sparse-mode PIM uses the RPF lookup function to decide where it needs to send joins and prunes:

- (S,G) joins (which are source-tree states) are sent toward the source.
- (*,G) joins (which are shared-tree states) are sent toward the RP.

Dense-mode PIM uses only source trees and use RPF as previously described.

PIMv1 and PIMv2 Interoperability

The Cisco PIMv2 implementation provides interoperability and transition between Version 1 and Version 2, although there might be some minor problems.

You can upgrade to PIMv2 incrementally. PIM Versions 1 and 2 can be configured on different routers and multilayer switches within one network. Internally, all routers and multilayer switches on a shared media network must run the same PIM version. Therefore, if a PIMv2 device detects a PIMv1 device, the Version 2 device downgrades itself to Version 1 until all Version 1 devices have been shut down or upgraded.

PIMv2 uses the BSR to discover and announce RP-set information for each group prefix to all the routers and multilayer switches in a PIM domain. PIMv1, together with the Auto-RP feature, can perform the same tasks as the PIMv2 BSR. However, Auto-RP is a standalone protocol, separate from PIMv1, and is a proprietary Cisco protocol. PIMv2 is a standards track protocol in the IETF. We recommend that you use PIMv2. The BSR mechanism interoperates with Auto-RP on Cisco routers and multilayer switches. For more information, see the “Auto-RP and BSR Configuration Guidelines” section on page 41-10.

When PIMv2 devices interoperate with PIMv1 devices, Auto-RP should have already been deployed. A PIMv2 BSR that is also an Auto-RP mapping agent automatically advertises the RP elected by Auto-RP. That is, Auto-RP sets its single RP on every router or multilayer switch in the group. Not all routers and switches in the domain use the PIMv2 hash function to select multiple RPs.

Dense-mode groups in a mixed PIMv1 and PIMv2 region need no special configuration; they automatically interoperate.

Sparse-mode groups in a mixed PIMv1 and PIMv2 region are possible because the Auto-RP feature in PIMv1 interoperates with the PIMv2 RP feature. Although all PIMv2 devices can also use PIMv1, we recommend that the RPs be upgraded to PIMv2. To ease the transition to PIMv2, we have these recommendations:

- Use Auto-RP throughout the region.
- Configure sparse-dense mode throughout the region.

If Auto-RP is not already configured in the PIMv1 regions, configure Auto-RP. For more information, see the “Configuring Auto-RP” section on page 41-24.

Multicast Routing Configuration Guidelines

- PIMv1 and PIMv2 Interoperability, page 41-9
- Auto-RP and BSR Configuration Guidelines, page 41-10
Auto-RP and BSR Configuration Guidelines

There are two approaches to using PIMv2. You can use Version 2 exclusively in your network or migrate to Version 2 by employing a mixed PIM version environment.

- If your network is all Cisco routers and multilayer switches, you can use either Auto-RP or BSR.
- If you have non-Cisco routers in your network, you must use BSR.
- If you have Cisco PIMv1 and PIMv2 routers and multilayer switches and non-Cisco routers, you must use both Auto-RP and BSR. If your network includes routers from other vendors, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 device. Ensure that no PIMv1 device is located in the path between the BSR and a non-Cisco PIMv2 device.
- Because bootstrap messages are sent hop-by-hop, a PIMv1 device prevents these messages from reaching all routers and multilayer switches in your network. Therefore, if your network has a PIMv1 device in it and only Cisco routers and multilayer switches, it is best to use Auto-RP.
- If you have a network that includes non-Cisco routers, configure the Auto-RP mapping agent and the BSR on a Cisco PIMv2 router or multilayer switch. Ensure that no PIMv1 device is on the path between the BSR and a non-Cisco PIMv2 router.
- If you have non-Cisco PIMv2 routers that need to interoperate with Cisco PIMv1 routers and multilayer switches, both Auto-RP and a BSR are required. We recommend that a Cisco PIMv2 device be both the Auto-RP mapping agent and the BSR. For more information, see the “Using Auto-RP and a BSR” section on page 41-32.

Configuring Basic Multicast Routing

You must enable IP multicast routing and configure the PIM version and the PIM mode. Then the software can forward multicast packets, and the switch can populate its multicast routing table.

Note

To enable IP multicast routing, the switch must be running the metro IP access image.

You can configure an interface to be in PIM dense mode, sparse mode, or sparse-dense mode. The switch populates its multicast routing table and forwards multicast packets it receives from its directly connected LANs according to the mode setting. You must enable PIM in one of these modes for an interface to perform IP multicast routing. Enabling PIM on an interface also enables IGMP operation on that interface.

Note

If you enable PIM on multiple interfaces and most of these interfaces are not part of the outgoing interface list, when IGMP snooping is disabled the outgoing interface might not be able to sustain line rate for multicast traffic because of the extra, unnecessary replication.

In populating the multicast routing table, dense-mode interfaces are always added to the table. Sparse-mode interfaces are added to the table only when periodic join messages are received from downstream devices or when there is a directly connected member on the interface. When forwarding from a LAN, sparse-mode operation occurs if there is an RP known for the group. If so, the packets are encapsulated and sent toward the RP. When no RP is known, the packet is flooded in a dense-mode fashion. If the multicast traffic from a specific source is sufficient, the receiver’s first-hop router might send join messages toward the source to build a source-based distribution tree.

By default, multicast routing is disabled, and there is no default mode setting. This procedure is required.
Beginning in privileged EXEC mode, follow these steps to enable IP multicasting, to configure a PIM version, and to configure a PIM mode. This procedure is required.

Configuring IP Multicast Routing

To disable multicasting, use the `no ip multicast-routing distributed` global configuration command. To return to the default PIM version, use the `no ip pim version` interface configuration command. To disable PIM on an interface, use the `no ip pim` interface configuration command.

Configuring PIM Stub Routing

The PIM Stub routing feature supports multicast routing between the distribution layer and the access layer. It supports two types of PIM interfaces, uplink PIM interfaces, and PIM passive interfaces. A routed interface configured with the PIM passive mode does not pass or forward PIM control traffic, it only passes and forwards IGMP traffic.

PIM Stub Routing Configuration Guidelines

- Before configuring PIM stub routing, you must have IP multicast routing configured on both the stub router and the central router. You must also have PIM mode (dense-mode, sparse-mode, or dense-sparse-mode) configured on the uplink interface of the stub router.
- The PIM stub router does not route the transit traffic between the distribution routers. Unicast (EIGRP) stub routing enforces this behavior. You must configure unicast stub routing to assist the PIM stub router behavior. For more information, see the “Configuring EIGRP Stub Routing” section on page 36-40.
- Only directly connected multicast (IGMP) receivers and sources are allowed in the Layer 2 access domains. The PIM protocol is not supported in access domains.
- The redundant PIM stub router topology is not supported.

Enabling PIM Stub Routing

Beginning in privileged EXEC mode, follow these steps to enable PIM stub routing on an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface on which you want to enable PIM stub routing, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 ip pim passive</td>
<td>Configure the PIM stub feature on the interface.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5 show ip pim interface</td>
<td>Display the PIM stub that is enabled on each interface.</td>
</tr>
<tr>
<td>Step 6 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable PIM stub routing on an interface, use the `no ip pim passive` interface configuration command.
In this example, IP multicast routing is enabled, Switch A PIM uplink port 25 is configured as a routed uplink port with spare-dense-mode enabled. PIM stub routing is enabled on the VLAN 100 interfaces and on Gigabit Ethernet port 20 in Figure 41-1:

Switch(config)# ip multicast-routing distributed
Switch(config)# interface GigabitEthernet0/25
Switch(config-if)# no switchport
Switch(config-if)# ip address 3.1.1.2 255.255.255.0
Switch(config-if)# ip pim sparse-dense-mode
Switch(config-if)# exit
Switch(config)# interface vlan100
Switch(config-if)# ip pim passive
Switch(config-if)# exit
Switch(config)# interface GigabitEthernet0/20
Switch(config-if)# ip pim passive
Switch(config-if)# exit
Switch(config)# interface vlan100
Switch(config-if)# ip address 100.1.1.1 255.255.255.0
Switch(config-if)# ip pim passive
Switch(config-if)# exit
Switch(config)# interface GigabitEthernet0/20
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.1.1.1 255.255.255.0
Switch(config-if)# ip pim passive
Switch(config-if)# end

To verify that PIM stub is enabled for each interface, use the `show ip pim interface` privileged EXEC command:

Switch# show ip pim interface
Address Interface Ver/ Nbr Query DR DR
Mode Count Intvl Prior
3.1.1.2 GigabitEthernet0/25 v2/SD 1 30 1 3.1.1.2
100.1.1.1 Vlan100 v2/P 0 30 1 100.1.1.1
10.1.1.1 GigabitEthernet0/20 v2/P 0 30 1 10.1.1.1

Use these privileged EXEC commands to display information about PIM stub configuration and status:

- `show ip pim interface` displays the PIM stub that is enabled on each interface.
- `show ip igmp detail` displays the interested clients that have joined the specific multicast source group.
- `show ip igmp mroute` verifies that the multicast stream forwards from the source to the interested clients.

### Configuring Source-Specific Multicast

This section describes how to configure source-specific multicast (SSM). For a complete description of the SSM commands in this section, refer to the “IP Multicast Routing Commands” chapter of the *Cisco IOS IP Command Reference, Volume 3 of 3: Multicast*. To locate documentation for other commands that appear in this chapter, use the command reference master index, or search online.

The SSM feature is an extension of IP multicast in which datagram traffic is forwarded to receivers from only those multicast sources that the receivers have explicitly joined. For multicast groups configured for SSM, only SSM distribution trees (no shared trees) are created.
SSM Components Overview

SSM is a datagram delivery model that best supports one-to-many applications, also known as broadcast applications. SSM is a core networking technology for the Cisco implementation of IP multicast solutions targeted for audio and video broadcast application environments. The switch supports these components that support the implementation of SSM:

- Protocol independent multicast source-specific mode (PIM-SSM)
  PIM-SSM is the routing protocol that supports the implementation of SSM and is derived from PIM sparse mode (PIM-SM).
- Internet Group Management Protocol version 3 (IGMPv3)
  To run SSM with IGMPv3, SSM must be supported in the Cisco IOS router, the host where the application is running, and the application itself.

How SSM Differs from Internet Standard Multicast

The current IP multicast infrastructure in the Internet and many enterprise intranets is based on the PIM-SM protocol and Multicast Source Discovery Protocol (MSDP). These protocols have the limitations of the Internet Standard Multicast (ISM) service model. For example, with ISM, the network must maintain knowledge about which hosts in the network are actively sending multicast traffic.

The ISM service consists of the delivery of IP datagrams from any source to a group of receivers called the multicast host group. The datagram traffic for the multicast host group consists of datagrams with an arbitrary IP unicast source address S and the multicast group address G as the IP destination address. Systems receive this traffic by becoming members of the host group.

Membership in a host group simply requires signalling the host group through IGMP version 1, 2, or 3. In SSM, delivery of datagrams is based on (S, G) channels. In both SSM and ISM, no signalling is required to become a source. However, in SSM, receivers must subscribe or unsubscribe to (S, G) channels to receive or not receive traffic from specific sources. In other words, receivers can receive traffic only from (S, G) channels to which they are subscribed, whereas in ISM, receivers need not know the IP addresses of sources from which they receive their traffic. The proposed standard approach for channel subscription signalling use IGMP include mode membership reports, which are supported only in IGMP version 3.

SSM IP Address Range

SSM can coexist with the ISM service by applying the SSM delivery model to a configured subset of the IP multicast group address range. Cisco IOS software allows SSM configuration for the IP multicast address range of 224.0.0.0 through 239.255.255.255. When an SSM range is defined, existing IP multicast receiver applications do not receive any traffic when they try to use an address in the SSM range (unless the application is modified to use an explicit (S, G) channel subscription).

SSM Operations

An established network, in which IP multicast service is based on PIM-SM, can support SSM services. SSM can also be deployed alone in a network without the full range of protocols that are required for interdomain PIM-SM (for example, MSDP, Auto-RP, or bootstrap router [BSR]) if only SSM service is needed.
If SSM is deployed in a network already configured for PIM-SM, only the last-hop routers support SSM. Routers that are not directly connected to receivers do not require support for SSM. In general, these not-last-hop routers must only run PIM-SM in the SSM range and might need additional access control configuration to suppress MSDP signalling, registering, or PIM-SM shared tree operations from occurring within the SSM range.

Use the `ip pim ssm` global configuration command to configure the SSM range and to enable SSM. This configuration has the following effects:

- For groups within the SSM range, (S, G) channel subscriptions are accepted through IGMPv3 include-mode membership reports.
- PIM operations within the SSM range of addresses change to PIM-SSM, a mode derived from PIM-SM. In this mode, only PIM (S, G) join and prune messages are generated by the router, and no (S, G) rendezvous point tree (RPT) or (*, G) RPT messages are generated. Incoming messages related to RPT operations are ignored or rejected, and incoming PIM register messages are immediately answered with register-stop messages. PIM-SSM is backward-compatible with PIM-SM unless a router is a last-hop router. Therefore, routers that are not last-hop routers can run PIM-SM for SSM groups (for example, if they do not yet support SSM).
- No MSDP source-active (SA) messages within the SSM range are accepted, generated, or forwarded.

**IGMPv3 Host Signalling**

In IGMPv3, hosts signal membership to last-hop routers of multicast groups. Hosts can signal group membership with filtering capabilities with respect to sources. A host can either signal that it wants to receive traffic from all sources sending to a group except for some specific sources (called exclude mode), or that it wants to receive traffic only from some specific sources sending to the group (called include mode).

IGMPv3 can operate with both ISM and SSM. In ISM, both exclude and include mode reports are applicable. In SSM, only include mode reports are accepted by the last-hop router. Exclude mode reports are ignored.

**Configuration Guidelines**

**Legacy Applications Within the SSM Range Restrictions**

Existing applications in a network predating SSM do not work within the SSM range unless they are modified to support (S, G) channel subscriptions. Therefore, enabling SSM in a network can cause problems for existing applications if they use addresses within the designated SSM range.

**Address Management Restrictions**

Address management is still necessary to some degree when SSM is used with Layer 2 switching mechanisms. Cisco Group Management Protocol (CGMP), IGMP snooping, or Router-Port Group Management Protocol (RGMP) support only group-specific filtering, not (S, G) channel-specific filtering. If different receivers in a switched network request different (S, G) channels sharing the same group, they do not benefit from these existing mechanisms. Instead, both receivers receive all (S, G) channel traffic and filter out the unwanted traffic on input. Because SSM can re-use the group addresses in the SSM range for many independent applications, this situation can lead to decreased traffic filtering in a switched network. For this reason, it is important to use random IP addresses from the SSM range for an application to minimize the chance for re-use of a single address within the SSM range between different applications. For example, an application service providing a set of television channels should,
even with SSM, use a different group for each television (S, G) channel. This setup guarantees that multiple receivers to different channels within the same application service never experience traffic aliasing in networks that include Layer 2 switches.

**IGMP Snooping and CGMP Limitations**

IGMPv3 uses new membership report messages that might not be correctly recognized by older IGMP snooping switches.

For more information about switching issues related to IGMP (especially with CGMP), refer to the “Configuring IGMP Version 3” section of the “Configuring IP Multicast Routing” chapter.

**State Maintenance Limitations**

In PIM-SSM, the last hop router continues to periodically send (S, G) join messages if appropriate (S, G) subscriptions are on the interfaces. Therefore, as long as receivers send (S, G) subscriptions, the shortest path tree (SPT) state from the receivers to the source is maintained, even if the source does not send traffic for longer periods of time (or even never).

This case is opposite to PIM-SM, where (S, G) state is maintained only if the source is sending traffic and receivers are joining the group. If a source stops sending traffic for more than 3 minutes in PIM-SM, the (S, G) state is deleted and only re-established after packets from the source arrive again through the RPT. Because no mechanism in PIM-SSM notifies a receiver that a source is active, the network must maintain the (S, G) state in PIM-SSM as long as receivers are requesting receipt of that channel.

**Configuring SSM**

Beginning in privileged EXEC mode, follow these steps to configure SSM:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>**ip pim ssm [default</td>
</tr>
<tr>
<td>Step 2</td>
<td><strong>interface type number</strong> Select an interface that is connected to hosts on which IGMPv3 can be enabled, and enter the interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>**ip pim {sparse-mode</td>
</tr>
<tr>
<td>Step 4</td>
<td><strong>ip igmp version 3</strong> Enable IGMPv3 on this interface. The default version of IGMP is set to Version 2.</td>
</tr>
</tbody>
</table>

**Monitoring SSM**

Use the commands in **Table 41-3** to monitor SSM.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show ip igmp groups detail</strong> Display the (S, G) channel subscription through IGMPv3.</td>
<td></td>
</tr>
<tr>
<td><strong>show ip mroute</strong> Display whether a multicast group supports SSM service or whether a source-specific host report was received.</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Source Specific Multicast Mapping

The Source Specific Multicast (SSM) mapping feature supports SSM transition when supporting SSM on the end system is impossible or unwanted due to administrative or technical reasons. You can use SSM mapping to leverage SSM for video delivery to legacy STBs that do not support IGMPv3 or for applications that do not use the IGMPv3 host stack.

This section covers these topics:

- Configuration Guidelines and Restrictions, page 41-17
- SSM Mapping Overview, page 41-17
- Configuring SSM Mapping, page 41-19
- Monitoring SSM Mapping, page 41-22

Configuration Guidelines and Restrictions

SSM mapping configuration guidelines:

- Before you configure SSM mapping, enable IP multicast routing, enable PIM sparse mode, and configure SSM. For information on enabling IP multicast routing and PIM sparse mode, see the “Default Multicast Routing Configuration” section on page 41-8.
- Before you configure static SSM mapping, you must configure access control lists (ACLs) that define the group ranges to be mapped to source addresses. For information on configuring an ACL, see Chapter 32, “Configuring Network Security with ACLs.”
- Before you can configure and use SSM mapping with DNS lookups, you must be able to add records to a running DNS server. If you do not already have a DNS server running, you need to install one. You can use a product such as Cisco Network Registrar. Go to this URL for more information: http://www.cisco.com/warp/public/cc/pd/nemnsw/nerr/index.shtml

SSM mapping restrictions:

- The SSM mapping feature does not have all the benefits of full SSM. Because SSM mapping takes a group join from a host and identifies this group with an application associated with one or more sources, it can only support one such application per group. Full SSM applications can still share the same group as in SSM mapping.
- Enable IGMPv3 with care on the last hop router when you rely solely on SSM mapping as a transition solution for full SSM. When you enable both SSM mapping and IGMPv3 and the hosts already support IGMPv3 (but not SSM), the hosts send IGMPv3 group reports. SSM mapping does not support these IGMPv3 group reports, and the router does not correctly associate sources with these reports.

SSM Mapping Overview

In a typical STB deployment, each TV channel uses one separate IP multicast group and has one active server host sending the TV channel. A single server can send multiple TV channels, but each to a different group. In this network environment, if a router receives an IGMPv1 or IGMPv2 membership report for a particular group, the report addresses the well-known TV server for the TV channel associated with the multicast group.

When SSM mapping is configured, if a router receives an IGMPv1 or IGMPv2 membership report for a particular group, the router translates this report into one or more channel memberships for the well-known sources associated with this group.
When the router receives an IGMPv1 or IGMPv2 membership report for a group, the router uses SSM mapping to determine one or more source IP addresses for the group. SSM mapping then translates the membership report as an IGMPv3 report and continues as if it had received an IGMPv3 report. The router then sends PIM joins and continues to be joined to these groups as long as it continues to receive the IGMPv1 or IGMPv2 membership reports, and the SSM mapping for the group remains the same.

SSM mapping enables the last hop router to determine the source addresses either by a statically configured table on the router or through a DNS server. When the statically configured table or the DNS mapping changes, the router leaves the current sources associated with the joined groups.

Go to this URL for additional information on SSM mapping:

**Static SSM Mapping**

With static SSM mapping, you can configure the last hop router to use a static map to determine the sources that are sending to groups. Static SSM mapping requires that you configure ACLs to define group ranges. Then you can map the groups permitted by those ACLs to sources by using the **ip igmp static ssm-map** global configuration command.

You can configure static SSM mapping in smaller networks when a DNS is not needed or to locally override DNS mappings. When configured, static SSM mappings take precedence over DNS mappings.

**DNS-Based SSM Mapping**

You can use DNS-based SSM mapping to configure the last hop router to perform a reverse DNS lookup to determine sources sending to groups. When DNS-based SSM mapping is configured, the router constructs a domain name that includes the group address and performs a reverse lookup into the DNS. The router looks up IP address resource records and uses them as the source addresses associated with this group. SSM mapping supports up to 20 sources for each group. The router joins all sources configured for a group (see **Figure 41-3**).
The SSM mapping mechanism that enables the last hop router to join multiple sources for a group can provide source redundancy for a TV broadcast. In this context, the last hop router provides redundancy using SSM mapping to simultaneously join two video sources for the same TV channel. However, to prevent the last hop router from duplicating the video traffic, the video sources must use a server-side switchover mechanism. One video source is active, and the other backup video source is passive. The passive source waits until an active source failure is detected before sending the video traffic for the TV channel. Thus, the server-side switchover mechanism ensures that only one of the servers is actively sending video traffic for the TV channel.

To look up one or more source addresses for a group that includes G1, G2, G3, and G4, you must configure these DNS records on the DNS server:

```
  IN A source-address-2
  IN A source-address-n
```

Refer to your DNS server documentation for more information about configuring DNS resource records, and go to this URL for additional information on SSM mapping:

**Configuring SSM Mapping**

- Configuring Static SSM Mapping, page 41-20 (required)
- Configuring DNS-Based SSM Mapping, page 41-20 (required)
- Configuring Static Traffic Forwarding with SSM Mapping, page 41-21 (optional)
Configuring Static SSM Mapping

Beginning in privileged EXEC mode, follow these steps to configure static SSM mapping:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip igmp ssm-map enable</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td>Step 3</td>
<td>no ip igmp ssm-map query dns</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td>Step 4</td>
<td>ip igmp ssm-map static access-list source-address</td>
</tr>
<tr>
<td></td>
<td>The ACL supplied for access-list defines the groups to be mapped to the source IP address entered for the source-address.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td>Step 5</td>
<td>Repeat Step 4 to configure additional static SSM mappings, if required.</td>
</tr>
<tr>
<td>Step 6</td>
<td>end</td>
</tr>
<tr>
<td>Step 7</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 8</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

Go to this URL to see SSM mapping configuration examples:

Configuring DNS-Based SSM Mapping

To configure DNS-based SSM mapping, you need to create a DNS server zone or add records to an existing zone. If the routers that are using DNS-based SSM mapping are also using DNS for other purposes, you should use a normally configured DNS server. If DNS-based SSM mapping is the only DNS implementation being used on the router, you can configure a false DNS setup with an empty root zone or a root zone that points back to itself.

Beginning in privileged EXEC mode, follow these steps to configure DNS-based SSM mapping:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip igmp ssm-map enable</td>
</tr>
</tbody>
</table>
### Configuring Static Traffic Forwarding with SSM Mapping

Use static traffic forwarding with SSM mapping to statically forward SSM traffic for certain groups.

Beginning in privileged EXEC mode, follow these steps to configure static traffic forwarding with SSM mapping:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface type number</td>
</tr>
</tbody>
</table>
| | Select an interface on which to statically forward traffic for a multicast group using SSM mapping, and enter interface configuration mode.  
| | Static forwarding of traffic with SSM mapping works with either DNS-based SSM mapping or statically configured SSM mapping. |
| **Step 3** | ip igmp static-group group-address source ssm-map |
| | Configure SSM mapping to statically forward a (S, G) channel from the interface.  
| | Use this command if you want to statically forward SSM traffic for certain groups. Use DNS-based SSM mapping to determine the source addresses of the channels. |
| **Step 4** | show running-config |
| | Verify your entries. |
| **Step 5** | copy running-config startup-config |
| | (Optional) Save your entries in the configuration file. |
Monitoring SSM Mapping

Use the privileged EXEC commands in Table 41-4 to monitor SSM mapping.

Table 41-4  SSM Mapping Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip igmp ssm-mapping</td>
<td>Display information about SSM mapping.</td>
</tr>
<tr>
<td>show ip igmp ssm-mapping group-address</td>
<td>Display the sources that SSM mapping uses for a particular group.</td>
</tr>
<tr>
<td>show ip igmp groups [group-name</td>
<td>group-address</td>
</tr>
<tr>
<td>show host</td>
<td>Display the default domain name, the style of name lookup service, a list of name server hosts, and the cached list of hostnames and addresses.</td>
</tr>
<tr>
<td>debug ip igmp group-address</td>
<td>Display the IGMP packets received and sent and IGMP host-related events.</td>
</tr>
</tbody>
</table>

Go to this URL to see SSM mapping monitoring examples:

Configuring a Rendezvous Point

You must have an RP if the interface is in sparse-dense mode and if you want to treat the group as a sparse group. You can use several methods, as described in these sections:

- Manually Assigning an RP to Multicast Groups, page 41-22
- Configuring Auto-RP, page 41-24 (a standalone, Cisco-proprietary protocol separate from PIMv1)
- Configuring PIMv2 BSR, page 41-28 (a standards track protocol in the Internet Engineering Task Force (IETF))

You can use Auto-RP, BSR, or a combination of both, depending on the PIM version you are running and the types of routers in your network. For more information, see the “PIMv1 and PIMv2 Interoperability” section on page 41-9 and the “Auto-RP and BSR Configuration Guidelines” section on page 41-10.

Manually Assigning an RP to Multicast Groups

This section explains how to manually configure an RP. If the RP for a group is learned through a dynamic mechanism (such as Auto-RP or BSR), you need not perform this task for that RP.

Senders of multicast traffic announce their existence through register messages received from the source’s first-hop router (designated router) and forwarded to the RP. Receivers of multicast packets use RPs to join a multicast group by using explicit join messages. RPs are not members of the multicast group; rather, they serve as a meeting place for multicast sources and group members.

You can configure a single RP for multiple groups defined by an access list. If there is no RP configured for a group, the multilayer switch treats the group as dense and uses the dense-mode PIM techniques.
Beginning in privileged EXEC mode, follow these steps to manually configure the address of the RP. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip pim rp-address ip-address [access-list-number] [override]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show running-config</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove an RP address, use the **no ip pim rp-address ip-address [access-list-number] [override]** global configuration command.

This example shows how to configure the address of the RP to 147.106.6.22 for multicast group 225.2.2.2 only:

```
Switch(config)# access-list 1 permit 225.2.2.2 0.0.0.0
Switch(config)# ip pim rp-address 147.106.6.22 1
```
Configuring Auto-RP

Auto-RP uses IP multicast to automate the distribution of group-to-RP mappings to all Cisco routers and multilayer switches in a PIM network. It has these benefits:

- It is easy to use multiple RPs within a network to serve different group ranges.
- It provides load splitting among different RPs and arrangement of RPs according to the location of group participants.
- It avoids inconsistent, manual RP configurations on every router and multilayer switch in a PIM network, which can cause connectivity problems.

---

**Note**

If you configure PIM in sparse mode or sparse-dense mode and do not configure Auto-RP, you must manually configure an RP as described in the “Manually Assigning an RP to Multicast Groups” section on page 41-22.

---

**Note**

If routed interfaces are configured in sparse mode, Auto-RP can still be used if all devices are configured with a manual RP address for the Auto-RP groups.

These sections describe how to configure Auto-RP:

- Setting up Auto-RP in a New Internetwork, page 41-24 (optional)
- Adding Auto-RP to an Existing Sparse-Mode Cloud, page 41-24 (optional)
- Preventing Join Messages to False RPs, page 41-26 (optional)
- Filtering Incoming RP Announcement Messages, page 41-27 (optional)

For overview information, see the “Auto-RP” section on page 41-6.

### Setting up Auto-RP in a New Internetwork

If you are setting up Auto-RP in a new internetwork, you do not need a default RP because you configure all the interfaces for sparse-dense mode. Follow the process described in the “Adding Auto-RP to an Existing Sparse-Mode Cloud” section on page 41-24. However, omit Step 3 if you want to configure a PIM router as the RP for the local group.

### Adding Auto-RP to an Existing Sparse-Mode Cloud

This section contains some suggestions for the initial deployment of Auto-RP into an existing sparse-mode cloud to minimize disruption of the existing multicast infrastructure.
Beginning in privileged EXEC mode, follow these steps to deploy Auto-RP in an existing sparse-mode cloud. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Verify that a default RP is already configured on all PIM devices and the IP in the sparse-mode</td>
</tr>
<tr>
<td></td>
<td>network. It was previously configured with the <code>ip pim rp-address</code> global configuration</td>
</tr>
<tr>
<td></td>
<td>command.</td>
</tr>
<tr>
<td></td>
<td>This step is not required for spare-dense-mode environments.</td>
</tr>
<tr>
<td></td>
<td>The selected RP should have good connectivity and be available across the network. Use this RP</td>
</tr>
<tr>
<td></td>
<td>for the global groups (for example 224.x.x.x and other global groups). Do not reconfigure the</td>
</tr>
<tr>
<td></td>
<td>group address range that this RP serves. RPs dynamically discovered through Auto-RP take</td>
</tr>
<tr>
<td></td>
<td>precedence over statically configured RPs. Assume that it is desirable to use a second RP for the</td>
</tr>
<tr>
<td></td>
<td>local groups.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip pim send-rp-announce</code></td>
<td>Configure another PIM device to be the candidate RP for local groups.</td>
</tr>
<tr>
<td><code>interface-id</code></td>
<td>- For <code>interface-id</code>, enter the interface type and number that identifies the RP address. Valid</td>
</tr>
<tr>
<td><code>scope ttl group-list</code></td>
<td>interfaces include physical ports, port channels, and VLANs.</td>
</tr>
<tr>
<td><code>access-list-number</code></td>
<td>- For <code>scope ttl</code>, specify the time-to-live value in hops. Enter a hop count that is high enough</td>
</tr>
<tr>
<td><code>interval seconds</code></td>
<td>so that the RP-announce messages reach all mapping agents in the network. There is no default</td>
</tr>
<tr>
<td></td>
<td>setting. The range is 1 to 255.</td>
</tr>
<tr>
<td></td>
<td>- For <code>group-list access-list-number</code>, enter an IP standard access list number from 1 to 99. If</td>
</tr>
<tr>
<td></td>
<td>no access list is configured, the RP is used for all groups.</td>
</tr>
<tr>
<td></td>
<td>- For <code>interval seconds</code>, specify how often the announcement messages must be sent. The default</td>
</tr>
<tr>
<td></td>
<td>is 60 seconds. The range is 1 to 16383.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>`access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]`</td>
</tr>
<tr>
<td></td>
<td>- For <code>access-list-number</code>, enter the access list number specified in Step 3.</td>
</tr>
<tr>
<td></td>
<td>- The <code>deny</code> keyword denies access if the conditions are matched. The <code>permit</code> keyword permits</td>
</tr>
<tr>
<td></td>
<td>access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>- For <code>source</code>, enter the multicast group address range for which the RP should be used.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For <code>source-wildcard</code>, enter the wildcard bits in dotted decimal notation to be</td>
</tr>
<tr>
<td></td>
<td>applied to the source. Place ones in the bit positions that you want to ignore.</td>
</tr>
<tr>
<td></td>
<td>Recall that the access list is always terminated by an implicit deny statement for everything.</td>
</tr>
</tbody>
</table>
To remove the PIM device configured as the candidate RP, use the `no ip pim send-rp-announce interface-id` global configuration command. To remove the switch as the RP-mapping agent, use the `no ip pim send-rp-discovery` global configuration command.

This example shows how to send RP announcements out all PIM-enabled interfaces for a maximum of 31 hops. The IP address of port 1 is the RP. Access list 5 describes the group for which this switch serves as RP:

```
Switch(config)# ip pim send-rp-announce gigabitethernet0/1 scope 31 group-list 5
Switch(config)# access-list 5 permit 224.0.0.0 15.255.255.255
```

### Preventing Join Messages to False RPs

Find whether the `ip pim accept-rp` command was previously configured throughout the network by using the `show running-config` privileged EXEC command. If the `ip pim accept-rp` command is not configured on any device, this problem can be addressed later. In those routers or multilayer switches already configured with the `ip pim accept-rp` command, you must enter the command again to accept the newly advertised RP.

To accept all RPs advertised with Auto-RP and reject all other RPs by default, use the `ip pim accept-rp auto-rp` global configuration command. This procedure is optional.

If all interfaces are in sparse mode, use a default-configured RP to support the two well-known groups 224.0.1.39 and 224.0.1.40. Auto-RP uses these two well-known groups to collect and distribute RP-mapping information. When this is the case and the `ip pim accept-rp auto-rp` command is configured, another `ip pim accept-rp` command accepting the RP must be configured as follows:

```
Switch(config)# ip pim accept-rp 172.10.20.1 1
Switch(config)# access-list 1 permit 224.0.1.39
Switch(config)# access-list 1 permit 224.0.1.40
```
Filtering Incoming RP Announcement Messages

You can add configuration commands to the mapping agents to prevent a maliciously configured router from masquerading as a candidate RP and causing problems.

Beginning in privileged EXEC mode, follow these steps to filter incoming RP announcement messages. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip pim rp-announce-filter rp-list access-list-number group-list access-list-number</td>
</tr>
<tr>
<td>Step 3</td>
<td>access-list access-list-number {deny</td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To remove a filter on incoming RP announcement messages, use the **no ip pim rp-announce-filter rp-list access-list-number [group-list access-list-number]** global configuration command.
Chapter 41  Configuring IP Multicast Routing

Configuring IP Multicast Routing

This example shows a sample configuration on an Auto-RP mapping agent that is used to prevent candidate RP announcements from being accepted from unauthorized candidate RPs:

Switch(config)# ip pim rp-announce-filter rp-list 10 group-list 20
Switch(config)# access-list 10 permit host 172.16.5.1
Switch(config)# access-list 10 permit host 172.16.2.1
Switch(config)# access-list 20 deny 239.0.0.0 0.0.255.255
Switch(config)# access-list 20 permit 224.0.0.0 15.255.255.255

In this example, the mapping agent accepts candidate RP announcements from only two devices, 172.16.5.1 and 172.16.2.1. The mapping agent accepts candidate RP announcements from these two devices only for multicast groups that fall in the group range of 224.0.0.0 to 239.255.255.255. The mapping agent does not accept candidate RP announcements from any other devices in the network. Furthermore, the mapping agent does not accept candidate RP announcements from 172.16.5.1 or 172.16.2.1 if the announcements are for any groups in the 239.0.0.0 through 239.255.255.255 range. This range is the administratively scoped address range.

Configuring PIMv2 BSR

These sections describe how to set up BSR in your PIMv2 network:

- Defining the PIM Domain Border, page 41-28 (optional)
- Defining the IP Multicast Boundary, page 41-29 (optional)
- Configuring Candidate BSRs, page 41-30 (optional)
- Configuring Candidate RPs, page 41-31 (optional)

For overview information, see the “Bootstrap Router” section on page 41-6.

Defining the PIM Domain Border

As IP multicast becomes more widespread, the chance of one PIMv2 domain bordering another PIMv2 domain is increasing. Because these two domains probably do not share the same set of RPs, BSR, candidate RPs, and candidate BSRs, you need to constrain PIMv2 BSR messages from flowing into or out of the domain. Allowing these messages to leak across the domain borders could adversely affect the normal BSR election mechanism and elect a single BSR across all bordering domains and co-mingle candidate RP advertisements, resulting in the election of RPs in the wrong domain.

Beginning in privileged EXEC mode, follow these steps to define the PIM domain border. This procedure is optional.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>3</td>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>4</td>
<td>ip pim bsr-border</td>
<td>Define a PIM bootstrap message boundary for the PIM domain. Enter this command on each interface that connects to other bordering PIM domains. This command instructs the switch to neither send or receive PIMv2 BSR messages on this interface as shown in Figure 41-4.</td>
</tr>
<tr>
<td>5</td>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
To remove the PIM border, use the `no ip pim bsr-border` interface configuration command.

**Figure 41-4 Constricting PIMv2 BSR Messages**

**Defining the IP Multicast Boundary**

You define a multicast boundary to prevent Auto-RP messages from entering the PIM domain. You create an access list to deny packets destined for 224.0.1.39 and 224.0.1.40, which carry Auto-RP information.

Beginning in privileged EXEC mode, follow these steps to define a multicast boundary. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>access-list access-list-number deny source [source-wildcard]</td>
<td>Create a standard access list, repeating the command as many times as necessary.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
</tbody>
</table>
Configuring IP Multicast Routing

Configuring IP Multicast Routing

To remove the boundary, use the `no ip multicast boundary` interface configuration command.

This example shows a portion of an IP multicast boundary configuration that denies Auto-RP information:

```
Switch(config)# access-list 1 deny 224.0.1.39
Switch(config)# access-list 1 deny 224.0.1.40
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip multicast boundary 1
```

Configuring Candidate BSRs

You can configure one or more candidate BSRs. The devices serving as candidate BSRs should have good connectivity to other devices and be in the backbone portion of the network.

Beginning in privileged EXEC mode, follow these steps to configure your switch as a candidate BSR. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1:</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2:</td>
<td></td>
</tr>
<tr>
<td>ip pim bsr-candidate interface-id hash-mask-length [priority]</td>
<td>Configure your switch to be a candidate BSR.</td>
</tr>
<tr>
<td>• For <code>interface-id</code>, enter the interface on this switch from which the BSR address is derived to make it a candidate. This interface must be enabled with PIM. Valid interfaces include physical ports, port channels, and VLANs.</td>
<td></td>
</tr>
<tr>
<td>• For <code>hash-mask-length</code>, specify the mask length (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash correspond to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) For <code>priority</code>, enter a number from 0 to 255. The BSR with the larger priority is preferred. If the priority values are the same, the device with the highest IP address is selected as the BSR. The default is 0.</td>
<td></td>
</tr>
<tr>
<td>Step 3:</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4:</td>
<td></td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5:</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove this device as a candidate BSR, use the `no ip pim bsr-candidate` global configuration command.
This example shows how to configure a candidate BSR, which uses the IP address 172.21.24.18 on a port as the advertised BSR address, uses 30 bits as the hash-mask-length, and has a priority of 10.

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# ip address 172.21.24.18 255.255.255.0
Switch(config-if)# ip pim sparse-dense-mode
Switch(config-if)# ip pim bsr-candidate gigabitethernet0/2 30 10
```

### Configuring Candidate RPs

You can configure one or more candidate RPs. Similar to BSRs, the RPs should also have good connectivity to other devices and be in the backbone portion of the network. An RP can serve the entire IP multicast address space or a portion of it. Candidate RPs send candidate RP advertisements to the BSR. When deciding which devices should be RPs, consider these options:

- In a network of Cisco routers and multilayer switches where only Auto-RP is used, any device can be configured as an RP.
- In a network that includes only Cisco PIMv2 routers and multilayer switches and with routers from other vendors, any device can be used as an RP.
- In a network of Cisco PIMv1 routers, Cisco PIMv2 routers, and routers from other vendors, configure only Cisco PIMv2 routers and multilayer switches as RPs.

Beginning in privileged EXEC mode, follow these steps to configure your switch to advertise itself as a PIMv2 candidate RP to the BSR. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip pim rp-candidate interface-id [group-list access-list-number]</strong></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>**access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong></td>
</tr>
</tbody>
</table>

Recall that the access list is always terminated by an implicit deny statement for everything.
Configuring IP Multicast Routing

To remove this device as a candidate RP, use the `no ip pim rp-candidate interface-id` global configuration command.

This example shows how to configure the switch to advertise itself as a candidate RP to the BSR in its PIM domain. Standard access list number 4 specifies the group prefix associated with the RP that has the address identified by a port. That RP is responsible for the groups with the prefix 239.

```
Switch(config)# ip pim rp-candidate gigabitethernet0/2 group-list 4
Switch(config)# access-list 4 permit 239.0.0.0 0.255.255.255
```

Using Auto-RP and a BSR

If there are only Cisco devices in your network (no routers from other vendors), there is no need to configure a BSR. Configure Auto-RP in a network that is running both PIMv1 and PIMv2.

If you have non-Cisco PIMv2 routers that need to interoperate with Cisco PIMv1 routers and multilayer switches, both Auto-RP and a BSR are required. We recommend that a Cisco PIMv2 router or multilayer switch be both the Auto-RP mapping agent and the BSR.

If you must have one or more BSRs, we have these recommendations:

- Configure the candidate BSRs as the RP-mapping agents for Auto-RP. For more information, see the “Configuring Auto-RP” section on page 41-24 and the “Configuring Candidate BSRs” section on page 41-30.
- For group prefixes advertised through Auto-RP, the PIMv2 BSR mechanism should not advertise a subrange of these group prefixes served by a different set of RPs. In a mixed PIMv1 and PIMv2 domain, have backup RPs serve the same group prefixes. This prevents the PIMv2 DRs from selecting a different RP from those PIMv1 DRs, due to the longest match lookup in the RP-mapping database.

Beginning in privileged EXEC mode, follow these steps to verify the consistency of group-to-RP mappings. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

```
Step 1
show ip pim rp [[group-name | group-address] | mapping]
```

- On any Cisco device, display the available RP mappings.
  - (Optional) For `group-name`, specify the name of the group about which to display RPs.
  - (Optional) For `group-address`, specify the address of the group about which to display RPs.
  - (Optional) Use the `mapping` keyword to display all group-to-RP mappings of which the Cisco device is aware (either configured or learned from Auto-RP).

```
Step 2
show ip pim rp-hash group
```

- On a PIMv2 router or multilayer switch, confirm that the same RP is the one that a PIMv1 system chooses.
  - For `group`, enter the group address for which to display RP information.
Monitoring the RP Mapping Information

To monitor the RP mapping information, use these commands in privileged EXEC mode:

- `show ip pim bsr` displays information about the elected BSR.
- `show ip pim rp-hash group` displays the RP that was selected for the specified group.
- `show ip pim rp [group-name | group-address | mapping]` displays how the switch learns of the RP (through the BSR or the Auto-RP mechanism).

Troubleshooting PIMv1 and PIMv2 Interoperability Problems

When debugging interoperability problems between PIMv1 and PIMv2, check these in the order shown:

1. Verify RP mapping with the `show ip pim rp-hash` privileged EXEC command, making sure that all systems agree on the same RP for the same group.
2. Verify interoperability between different versions of DRs and RPs. Make sure the RPs are interacting with the DRs properly (by responding with register-stops and forwarding decapsulated data packets from registers).

Configuring Advanced PIM Features

- Understanding PIM Shared Tree and Source Tree, page 41-33
- Delaying the Use of PIM Shortest-Path Tree, page 41-35 (optional)
- Modifying the PIM Router-Query Message Interval, page 41-36 (optional)

Understanding PIM Shared Tree and Source Tree

By default, members of a group receive data from senders to the group across a single data-distribution tree rooted at the RP. Figure 41-5 shows this type of shared-distribution tree. Data from senders is delivered to the RP for distribution to group members joined to the shared tree.
If the data rate warrants, leaf routers (routers without any downstream connections) on the shared tree can use the data distribution tree rooted at the source. This type of distribution tree is called a shortest-path tree or source tree. By default, the software switches to a source tree upon receiving the first data packet from a source.

This process describes the move from a shared tree to a source tree:

1. A receiver joins a group; leaf Router C sends a join message toward the RP.
2. The RP puts a link to Router C in its outgoing interface list.
3. A source sends data; Router A encapsulates the data in a register message and sends it to the RP.
4. The RP forwards the data down the shared tree to Router C and sends a join message toward the source. At this point, data might arrive twice at Router C, once encapsulated and once natively.
5. When data arrives natively (unencapsulated) at the RP, it sends a register-stop message to Router A.
6. By default, reception of the first data packet prompts Router C to send a join message toward the source.
7. When Router C receives data on (S,G), it sends a prune message for the source up the shared tree.
8. The RP deletes the link to Router C from the outgoing interface of (S,G). The RP triggers a prune message toward the source.

Join and prune messages are sent for sources and RPs. They are sent hop-by-hop and are processed by each PIM device along the path to the source or RP. Register and register-stop messages are not sent hop-by-hop. They are sent by the designated router that is directly connected to a source and are received by the RP for the group.

Multiple sources sending to groups use the shared tree.

You can configure the PIM device to stay on the shared tree. For more information, see the “Delaying the Use of PIM Shortest-Path Tree” section on page 41-35.
## Delaying the Use of PIM Shortest-Path Tree

The change from shared to source tree happens when the first data packet arrives at the last-hop router (Router C in Figure 41-5). This change occurs because the `ip pim spt-threshold` global configuration command controls that timing.

The shortest-path tree requires more memory than the shared tree but reduces delay. You might want to postpone its use. Instead of allowing the leaf router to immediately move to the shortest-path tree, you can specify that the traffic must first reach a threshold.

You can configure when a PIM leaf router should join the shortest-path tree for a specified group. If a source sends at a rate greater than or equal to the specified kbps rate, the multilayer switch triggers a PIM join message toward the source to construct a source tree (shortest-path tree). If the traffic rate from the source drops below the threshold value, the leaf router switches back to the shared tree and sends a prune message toward the source.

You can specify to which groups the shortest-path tree threshold applies by using a group list (a standard access list). If a value of 0 is specified or if the group list is not used, the threshold applies to all groups.

Beginning in privileged EXEC mode, follow these steps to configure a traffic rate threshold that must be reached before multicast routing is switched from the source tree to the shortest-path tree. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td>Create a standard access list.</td>
</tr>
<tr>
<td></td>
<td>• For <code>access-list-number</code>, the range is 1 to 99.</td>
</tr>
<tr>
<td></td>
<td>• The <code>deny</code> keyword denies access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>• The <code>permit</code> keyword permits access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>• For <code>source</code>, specify the multicast group to which the threshold will apply.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>source-wildcard</code>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</td>
</tr>
<tr>
<td></td>
<td>Recall that the access list is always terminated by an implicit deny statement for everything.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`ip pim spt-threshold {kbps</td>
</tr>
<tr>
<td></td>
<td>Specify the threshold that must be reached before moving to shortest-path tree (spt).</td>
</tr>
<tr>
<td></td>
<td>• For <code>kbps</code>, specify the traffic rate in kilobits per second. The default is 0 kbps.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Because of switch hardware limitations, 0 kbps is the only valid entry even though the range is 0 to 4294967.</td>
</tr>
<tr>
<td></td>
<td>• Specify <code>infinity</code> if you want all sources for the specified group to use the shared tree, never switching to the source tree.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>group-list access-list-number</code>, specify the access list created in Step 2. If the value is 0 or if the group-list is not used, the threshold applies to all groups.</td>
</tr>
</tbody>
</table>
Modifying the PIM Router-Query Message Interval

PIM routers and multilayer switches send PIM router-query messages to find which device will be the DR for each LAN segment (subnet). The DR is responsible for sending IGMP host-query messages to all hosts on the directly connected LAN.

With PIM DM operation, the DR has meaning only if IGMPv1 is in use. IGMPv1 does not have an IGMP querier election process, so the elected DR functions as the IGMP querier. With PIM SM operation, the DR is the device that is directly connected to the multicast source. It sends PIM register messages to notify the RP that multicast traffic from a source needs to be forwarded down the shared tree. In this case, the DR is the device with the highest IP address.

Beginning in privileged EXEC mode, follow these steps to modify the router-query message interval. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step 3</td>
<td>no shutdown</td>
</tr>
<tr>
<td>Step 4</td>
<td>ip pim query-interval seconds</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Step 6</td>
<td>show ip igmp interface [interface-id]</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default setting, use the **no ip pim query-interval [seconds]** interface configuration command.

Configuring Optional IGMP Features

<td>60 seconds on all interfaces.</td>
</tr>
<tr>
<td>IGMP maximum query response time</td>
<td>10 seconds on all interfaces.</td>
</tr>
<tr>
<td>Multilayer switch as a statically connected member</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

Configuring the Switch as a Member of a Group

You can configure the switch as a member of a multicast group and discover multicast reachability in a network. If all the multicast-capable routers and multilayer switches that you administer are members of a multicast group, pinging that group causes all these devices to respond. The devices respond to IGMP echo-request packets addressed to a group of which they are members. Another example is the multicast trace-route tools provided in the software.

Caution

Performing this procedure might impact the CPU performance because the CPU will receive all data traffic for the group address.

Beginning in privileged EXEC mode, follow these steps to configure the switch to be a member of a group. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNI is enabled.</td>
</tr>
</tbody>
</table>
Configuring Optional IGMP Features

Chapter 41 Configuring IP Multicast Routing

Configuring Optional IGMP Features

To cancel membership in a group, use the `no ip igmp join-group group-address` interface configuration command.

This example shows how to enable the switch to join multicast group 255.2.2.2:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip igmp join-group 255.2.2.2
```

Controlling Access to IP Multicast Groups

The switch sends IGMP host-query messages to find which multicast groups have members on attached local networks. The switch then forwards to these group members all packets addressed to the multicast group. You can place a filter on each interface to restrict the multicast groups that hosts on the subnet serviced by the interface can join.

Beginning in privileged EXEC mode, follow these steps to filter multicast groups allowed on an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>ip igmp join-group</code></td>
<td>Configure the switch to join a multicast group.</td>
</tr>
<tr>
<td></td>
<td><code>group-address</code></td>
<td>By default, no group memberships are defined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For <code>group-address</code>, specify the multicast IP address in dotted decimal notation.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>show ip igmp interface</code></td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To cancel membership in a group, use the `no ip igmp join-group group-address` interface configuration command.

This example shows how to enable the switch to join multicast group 255.2.2.2:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip igmp join-group 255.2.2.2
```

**Controlling Access to IP Multicast Groups**

The switch sends IGMP host-query messages to find which multicast groups have members on attached local networks. The switch then forwards to these group members all packets addressed to the multicast group. You can place a filter on each interface to restrict the multicast groups that hosts on the subnet serviced by the interface can join.

Beginning in privileged EXEC mode, follow these steps to filter multicast groups allowed on an interface. This procedure is optional.

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>interface interface-id</code></td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>no shutdown</code></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>ip igmp access-group</code></td>
<td>Specify the multicast groups that hosts on the subnet serviced by an interface can join.</td>
</tr>
<tr>
<td></td>
<td><code>access-list-number</code></td>
<td>By default, all groups are allowed on an interface.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For <code>access-list-number</code>, specify an IP standard access list number.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The range is 1 to 99.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>exit</code></td>
<td>Return to global configuration mode.</td>
</tr>
</tbody>
</table>
To disable groups on an interface, use the `no ip igmp access-group` interface configuration command.

This example shows how to configure hosts attached to a port as able to join only group 255.2.2.2:

```
Switch(config)# access-list 1 255.2.2.2 0.0.0.0
Switch(config-if)# interface gigabitethernet0/1
Switch(config-if)# ip igmp access-group 1
```

### Changing the IGMP Version

By default, the switch uses IGMP Version 2, which provides features such as the IGMP query timeout and the maximum query response time.

All systems on the subnet must support the same version. The switch does not automatically detect Version 1 systems and switch to Version 1. You can mix Version 1 and Version 2 hosts on the subnet because Version 2 routers or switches always work correctly with IGMPv1 hosts.

Configure the switch for Version 1 if your hosts do not support Version 2.

Beginning in privileged EXEC mode, follow these steps to change the IGMP version. This procedure is optional.

Configuring Optional IGMP Features

Chapter 41 Configuring IP Multicast Routing

41-40

Cisco ME 3400E Ethernet Access Switch Software Configuration Guide

To return to the default setting, use the `no ip igmp version` interface configuration command.

### Modifying the IGMP Host-Query Message Interval

The switch periodically sends IGMP host-query messages to discover which multicast groups are present on attached networks. These messages are sent to the all-hosts multicast group (224.0.0.1) with a time-to-live (TTL) of 1. The switch sends host-query messages to refresh its knowledge of memberships present on the network. If, after some number of queries, the software discovers that no local hosts are members of a multicast group, the software stops forwarding multicast packets to the local network from remote origins for that group and sends a prune message upstream toward the source.

The switch elects a PIM designated router (DR) for the LAN (subnet). The DR is the router or multilayer switch with the highest IP address for IGMPv2. For IGMPv1, the DR is elected according to the multicast routing protocol that runs on the LAN. The designated router is responsible for sending IGMP host-query messages to all hosts on the LAN. In sparse mode, the designated router also sends PIM register and PIM join messages toward the RP router.

Beginning in privileged EXEC mode, follow these steps to modify the host-query interval. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>interface interface-id</code> Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>no shutdown</code> Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>ip igmp query-interval seconds</code> Configure the frequency at which the designated router sends IGMP host-query messages. By default, the designated router sends IGMP host-query messages every 60 seconds to keep the IGMP overhead very low on hosts and networks. The range is 1 to 65535.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6</td>
<td><code>show ip igmp interface [interface-id]</code> Verify your entries.</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no ip igmp query-interval` interface configuration command.
Changing the IGMP Query Timeout for IGMPv2

If you are using IGMPv2, you can specify the period of time before the switch takes over as the querier for the interface. By default, the switch waits twice the query interval controlled by the `ip igmp query-interval` interface configuration command. After that time, if the switch has received no queries, it becomes the querier.

You can configure the query interval by entering the `show ip igmp interface interface-id` privileged EXEC command.

Beginning in privileged EXEC mode, follow these steps to change the IGMP query timeout. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 <code>interface interface-id</code></td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 <code>no shutdown</code></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 <code>ip igmp querier-timeout seconds</code></td>
<td>Specify the IGMP query timeout. The default is 60 seconds (twice the query interval). The range is 60 to 300.</td>
</tr>
<tr>
<td>Step 5 <code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 <code>show ip igmp interface [interface-id]</code></td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 <code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To return to the default setting, use the `no ip igmp querier-timeout` interface configuration command.

Changing the Maximum Query Response Time for IGMPv2

If you are using IGMPv2, you can change the maximum query response time advertised in IGMP queries. The maximum query response time enables the switch to quickly detect that there are no more directly connected group members on a LAN. Decreasing the value enables the switch to prune groups faster.

Beginning in privileged EXEC mode, follow these steps to change the maximum query response time. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 <code>interface interface-id</code></td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 <code>no shutdown</code></td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 <code>ip igmp query-max-response-time seconds</code></td>
<td>Change the maximum query response time advertised in IGMP queries. The default is 10 seconds. The range is 1 to 25.</td>
</tr>
</tbody>
</table>
Configuring Optional IGMP Features

To return to the default setting, use the `no ip igmp query-max-response-time` interface configuration command.

### Configuring the Switch as a Statically Connected Member

Sometimes there is either no group member on a network segment or a host cannot report its group membership by using IGMP. However, you might want multicast traffic to go to that network segment. These are ways to pull multicast traffic down to a network segment:

- Use the `ip igmp join-group` interface configuration command. With this method, the switch accepts the multicast packets in addition to forwarding them. Accepting the multicast packets prevents the switch from fast switching.

- Use the `ip igmp static-group` interface configuration command. With this method, the switch does not accept the packets itself, but only forwards them. This method enables fast switching. The outgoing interface appears in the IGMP cache, but the switch itself is not a member, as evidenced by lack of an `L` (local) flag in the multicast route entry.

Beginning in privileged EXEC mode, follow these steps to configure the switch itself to be a statically connected member of a group (and enable fast switching). This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td>Step 4 ip igmp static-group group-address</td>
<td>Configure the switch as a statically connected member of a group. By default, this feature is disabled.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 6 show ip igmp interface [interface-id]</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To remove the switch as a member of the group, use the `no ip igmp static-group group-address` interface configuration command.
Configuring Optional Multicast Routing Features

- Configuring sdr Listener Support, page 41-43 (optional)—for MBONE multimedia conference session and set up
- Configuring an IP Multicast Boundary, page 41-44 (optional)—to control bandwidth utilization.

Configuring sdr Listener Support

The MBONE is the small subset of Internet routers and hosts that are interconnected and capable of forwarding IP multicast traffic. Other multimedia content is often broadcast over the MBONE. Before you can join a multimedia session, you need to know what multicast group address and port are being used for the session, when the session is going to be active, and what sort of applications (audio, video, and so forth) are required on your workstation. The MBONE Session Directory Version 2 (sdr) tool provides this information. This freeware application can be downloaded from several sites on the World Wide Web, one of which is http://www.video.ja.net/mice/index.html.

SDR is a multicast application that listens to a well-known multicast group address and port for Session Announcement Protocol (SAP) multicast packets from SAP clients, which announce their conference sessions. These SAP packets contain a session description, the time the session is active, its IP multicast group addresses, media format, contact person, and other information about the advertised multimedia session. The information in the SAP packet is displayed in the SDR Session Announcement window.

Enabling sdr Listener Support

By default, the switch does not listen to session directory advertisements.

Beginning in privileged EXEC mode, follow these steps to enable the switch to join the default session directory group (224.2.127.254) on the interface and listen to session directory advertisements. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify the interface to be enabled for sdr, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>ip sdr listen</td>
<td>Enable sdr listener support.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To disable sdr support, use the **no ip sdr listen** interface configuration command.
Limiting How Long an sdr Cache Entry Exists

By default, entries are never deleted from the sdr cache. You can limit how long the entry remains active so that if a source stops advertising SAP information, old advertisements are not needlessly kept.

Beginning in privileged EXEC mode, follow these steps to limit how long an sdr cache entry stays active in the cache. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip sdr cache-timeout minutes</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default setting, use the no ip sdr cache-timeout global configuration command. To delete the entire cache, use the clear ip sdr privileged EXEC command.

To display the session directory cache, use the show ip sdr privileged EXEC command.

Configuring an IP Multicast Boundary

Administratively-scoped boundaries can be used to limit the forwarding of multicast traffic outside of a domain or subdomain. This approach uses a special range of multicast addresses, called administratively-scoped addresses, as the boundary mechanism. If you configure an administratively-scoped boundary on a routed interface, multicast traffic whose multicast group addresses fall in this range can not enter or exit this interface, thereby providing a firewall for multicast traffic in this address range.

Multicast boundaries and TTL thresholds control the scoping of multicast domains; however, TTL thresholds are not supported by the switch. You should use multicast boundaries instead of TTL thresholds to limit the forwarding of multicast traffic outside of a domain or a subdomain.

Figure 41-6 shows that Company XYZ has an administratively-scoped boundary set for the multicast address range 239.0.0.0/8 on all routed interfaces at the perimeter of its network. This boundary prevents any multicast traffic in the range 239.0.0.0 through 239.255.255.255 from entering or leaving the network. Similarly, the engineering and marketing departments have an administratively-scoped boundary of 239.128.0.0/16 around the perimeter of their networks. This boundary prevents multicast traffic in the range of 239.128.0.0 through 239.128.255.255 from entering or leaving their respective networks.
You can define an administratively-scoped boundary on a routed interface for multicast group addresses. A standard access list defines the range of addresses affected. When a boundary is defined, no multicast data packets are allowed to flow across the boundary from either direction. The boundary allows the same multicast group address to be reused in different administrative domains.

The IANA has designated the multicast address range 239.0.0.0 to 239.255.255.255 as the administratively-scoped addresses. This range of addresses can then be reused in domains administered by different organizations. The addresses would be considered local, not globally unique.

Beginning in privileged EXEC mode, follow these steps to set up an administratively-scoped boundary. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]</td>
</tr>
<tr>
<td></td>
<td>- For access-list-number, the range is 1 to 99.</td>
</tr>
<tr>
<td></td>
<td>- The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.</td>
</tr>
<tr>
<td></td>
<td>- For source, enter the number of the network or host from which the packet is being sent.</td>
</tr>
<tr>
<td></td>
<td>- (Optional) For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</td>
</tr>
<tr>
<td></td>
<td>Recall that the access list is always terminated by an implicit deny statement for everything.</td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Specify the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> no shutdown</td>
<td>Enable the port, if necessary. By default, UNIs and ENIs are disabled, and NNIs are enabled.</td>
</tr>
<tr>
<td><strong>Step 5</strong> ip multicast boundary access-list-number</td>
<td>Configure the boundary, specifying the access list you created in Step 2.</td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
To remove the boundary, use the `no ip multicast boundary` interface configuration command.
This example shows how to set up a boundary for all administratively-scoped addresses:

```
Switch(config)# access-list 1 deny 239.0.0.0 0.255.255.255
Switch(config)# access-list 1 permit 224.0.0.0 15.255.255.255
Switch(config)# interface gigabit ethernet0/1
Switch(config-if)# ip multicast boundary 1
```

### Monitoring and Maintaining IP Multicast Routing

- Clearing Caches, Tables, and Databases, page 41-46
- Displaying System and Network Statistics, page 41-46
- Monitoring IP Multicast Routing, page 41-47

### Clearing Caches, Tables, and Databases

You can remove all contents of a particular cache, table, or database. Clearing a cache, table, or database might be necessary when the contents of the particular structure are or suspected to be invalid.

You can use any of the privileged EXEC commands in Table 41-6 to clear IP multicast caches, tables, and databases:

**Table 41-6 Commands for Clearing Caches, Tables, and Databases**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear ip igmp group</code></td>
<td>Delete entries from the IGMP cache.</td>
</tr>
<tr>
<td><code>clear ip mroute</code></td>
<td>Delete entries from the IP multicast routing table.</td>
</tr>
<tr>
<td><code>clear ip pim auto-rp</code></td>
<td>Clear the Auto-RP cache.</td>
</tr>
<tr>
<td><code>clear ip sdr</code></td>
<td>Delete the Session Directory Protocol Version 2 cache or an sdr cache entry.</td>
</tr>
</tbody>
</table>

### Displaying System and Network Statistics

You can display specific statistics, such as the contents of IP routing tables, caches, and databases.

**Note**

This release does not support per-route statistics.

You can display information to learn resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device’s packets are taking through the network.
You can use any of the privileged EXEC commands in Table 41-7 to display various routing statistics:

**Table 41-7  Commands for Displaying System and Network Statistics**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ping [group-name</td>
<td>group-address]</td>
</tr>
<tr>
<td>show ip igmp groups [group-name</td>
<td>group-address</td>
</tr>
<tr>
<td>show ip igmp interface [type number]</td>
<td>Display multicast-related information about an interface.</td>
</tr>
<tr>
<td>show ip mcache [group</td>
<td>source]</td>
</tr>
<tr>
<td>show ip mpacket [source-address</td>
<td>name] [group-address</td>
</tr>
<tr>
<td>show ip mroute [group-name</td>
<td>group-address] [source</td>
</tr>
<tr>
<td>show ip pim interface [type number] [count]</td>
<td>Display information about interfaces configured for PIM.</td>
</tr>
<tr>
<td>show ip pim neighbor [type number]</td>
<td>List the PIM neighbors discovered by the switch.</td>
</tr>
<tr>
<td>show ip pim rp [group-name</td>
<td>group-address]</td>
</tr>
<tr>
<td>show ip rpf [source-address</td>
<td>name]</td>
</tr>
</tbody>
</table>

**Monitoring IP Multicast Routing**

You can use the privileged EXEC commands in Table 41-8 to monitor IP multicast routers, packets, and paths:

**Table 41-8  Commands for Monitoring IP Multicast Routing**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>mINFO [hostname</td>
<td>address] [source-address</td>
</tr>
<tr>
<td>mSTAT source [destination] [group]</td>
<td>Display IP multicast packet rate and loss information.</td>
</tr>
<tr>
<td>mTRACE source [destination] [group]</td>
<td>Trace the path from a source to a destination branch for a multicast distribution tree for a given group.</td>
</tr>
</tbody>
</table>
Configuring MSDP

This chapter describes how to configure the Multicast Source Discovery Protocol (MSDP) on the Cisco ME 3400E Ethernet Access switch. The MSDP connects multiple Protocol-Independent Multicast sparse-mode (PIM-SM) domains.

MSDP is not fully supported in this software release because of a lack of support for Multicast Border Gateway Protocol (MBGP), which works closely with MSDP. However, it is possible to create default peers that MSDP can operate with if MBGP is not running.

To use this feature, the switch must be running the metro IP access image.

For complete syntax and usage information for the commands used in this chapter, see the Cisco IOS IP Command Reference, Volume 3 of 3: Multicast, Release 12.2.

This chapter consists of these sections:

- Understanding MSDP, page 42-1
- Configuring MSDP, page 42-3
- Monitoring and Maintaining MSDP, page 42-18

Understanding MSDP

MSDP allows multicast sources for a group to be known to all rendezvous points (RPs) in different domains. Each PIM-SM domain uses its own RPs and does not depend on RPs in other domains. An RP runs MSDP over the Transmission Control Protocol (TCP) to discover multicast sources in other domains.

An RP in a PIM-SM domain has an MSDP peering relationship with MSDP-enabled devices in another domain. The peering relationship occurs over a TCP connection, primarily exchanging a list of sources sending to multicast groups. The TCP connections between RPs are achieved by the underlying routing system. The receiving RP uses the source lists to establish a source path.

The purpose of this topology is to have domains discover multicast sources in other domains. If the multicast sources are of interest to a domain that has receivers, multicast data is delivered over the normal, source-tree building mechanism in PIM-SM. MSDP is also used to announce sources sending to a group. These announcements must originate at the domain’s RP.

MSDP depends heavily on the Border Gateway Protocol (BGP) or MBGP for interdomain operation. We recommend that you run MSDP in RPs in your domain that are RPs for sources sending to global groups to be announced to the Internet.
Figure 42-1 shows MSDP operating between two MSDP peers. PIM uses MSDP as the standard mechanism to register a source with the RP of a domain. When MSDP is configured, this sequence occurs.

When a source sends its first multicast packet, the first-hop router (designated router or RP) directly connected to the source sends a PIM register message to the RP. The RP uses the register message to register the active source and to forward the multicast packet down the shared tree in the local domain. With MSDP configured, the RP also forwards a source-active (SA) message to all MSDP peers. The SA message identifies the source, the group the source is sending to, and the address of the RP or the originator ID (the IP address of the interface used as the RP address), if configured.

Each MSDP peer receives and forwards the SA message away from the originating RP to achieve peer reverse-path flooding (RPF). The MSDP device examines the BGP or MBGP routing table to discover which peer is the next hop toward the originating RP of the SA message. Such a peer is called an RPF peer (reverse-path forwarding peer). The MSDP device forwards the message to all MSDP peers other than the RPF peer. For information on how to configure an MSDP peer when BGP and MBGP are not supported, see the “Configuring a Default MSDP Peer” section on page 42-4.

If the MSDP peer receives the same SA message from a non-RPF peer toward the originating RP, it drops the message. Otherwise, it forwards the message to all its MSDP peers.

The RP for a domain receives the SA message from an MSDP peer. If the RP has any join requests for the group the SA message describes and if the (*,G) entry exists with a nonempty outgoing interface list, the domain is interested in the group, and the RP triggers an (S,G) join toward the source. After the (S,G) join reaches the source’s DR, a branch of the source tree has been built from the source to the RP in the remote domain. Multicast traffic can now flow from the source across the source tree to the RP and then down the shared tree in the remote domain to the receiver.
## MSDP Benefits

MSDP has these benefits:

- It breaks up the shared multicast distribution tree. You can make the shared tree local to your domain. Your local members join the local tree, and join messages for the shared tree never need to leave your domain.

- PIM sparse-mode domains can rely only on their own RPs, decreasing reliance on RPs in another domain. This increases security because you can prevent your sources from being known outside your domain.

- Domains with only receivers can receive data without globally advertising group membership.

- Global source multicast routing table state is not required, saving memory.

## Configuring MSDP

- Default MSDP Configuration, page 42-4
- Configuring a Default MSDP Peer, page 42-4 (required)

Configuring an Originating Address other than the RP Address, page 42-17 (optional)

Default MSDP Configuration

MSDP is not enabled, and no default MSDP peer exists.

Configuring a Default MSDP Peer

In this software release, because BGP and MBGP are not supported, you cannot configure an MSDP peer on the local switch by using the \texttt{ip msdp peer} global configuration command. Instead, you define a default MSDP peer (by using the \texttt{ip msdp default-peer} global configuration command) from which to accept all SA messages for the switch. The default MSDP peer must be a previously configured MSDP peer. Configure a default MSDP peer when the switch is not BGP- or MBGP-peering with an MSDP peer. If a single MSDP peer is configured, the switch always accepts all SA messages from that peer.

Figure 42-2 shows a network in which default MSDP peers might be used. In Figure 42-2, a customer who owns Switch B is connected to the Internet through two Internet service providers (ISPs), one owning Router A and the other owning Router C. They are not running BGP or MBGP between them. To learn about sources in the ISP’s domain or in other domains, Switch B at the customer site identifies Router A as its default MSDP peer. Switch B advertises SA messages to both Router A and Router C but accepts SA messages only from Router A or only from Router C. If Router A is first in the configuration file, it is used if it is running. If Router A is not running, only then does Switch B accept SA messages from Router C. This is the default behavior without a prefix list.

If you specify a prefix list, the peer is a default peer only for the prefixes in the list. You can have multiple active default peers when you have a prefix list associated with each. When you do not have any prefix lists, you can configure multiple default peers, but only the first one is the active default peer as long as the router has connectivity to this peer and the peer is alive. If the first configured peer fails or the connectivity to this peer fails, the second configured peer becomes the active default, and so on.

The ISP probably uses a prefix list to define which prefixes it accepts from the customer’s router.
Beginning in privileged EXEC mode, follow these steps to specify a default MSDP peer. This procedure is required.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>&lt;br&gt;configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong>&lt;br&gt;`ip msdp default-peer ip-address</td>
<td>name [prefix-list list]`</td>
</tr>
<tr>
<td></td>
<td>• For `ip-address</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For <code>prefix-list list</code>, enter the list name that specifies the peer to be the default peer only for the listed prefixes. You can have multiple active default peers when you have a prefix list associated with each.</td>
</tr>
<tr>
<td></td>
<td>When you enter multiple <code>ip msdp default-peer</code> commands with the <code>prefix-list</code> keyword, you use all the default peers at the same time for different RP prefixes. This syntax is typically used in a service provider cloud that connects stub site clouds.</td>
</tr>
<tr>
<td></td>
<td>When you enter multiple <code>ip msdp default-peer</code> commands without the <code>prefix-list</code> keyword, a single active peer accepts all SA messages. If that peer fails, the next configured default peer accepts all SA messages. This syntax is typically used at a stub site.</td>
</tr>
</tbody>
</table>
Configuring MSDP

To remove the default peer, use the `no ip msdp default-peer ip-address | name` global configuration command.

This example shows a partial configuration of Router A and Router C in Figure 42-2. Each of these ISPs have more than one customer (like the customer in Figure 42-2) who use default peering (no BGP or MBGP). In that case, they might have similar configurations. That is, they accept SAs only from a default peer if the SA is permitted by the corresponding prefix list.

Router A

```
Router(config)# ip msdp default-peer 10.1.1.1
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

Router C

```
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

Caching Source-Active State

By default, the switch does not cache source/group pairs from received SA messages. When the switch forwards the MSDP SA information, it does not store it in memory. Therefore, if a member joins a group soon after a SA message is received by the local RP, that member needs to wait until the next SA message to hear about the source. This delay is known as join latency.

If you want to sacrifice some memory in exchange for reducing the latency of the source information, you can configure the switch to cache SA messages.
Beginning in privileged EXEC mode, follow these steps to enable the caching of source/group pairs. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip msdp cache-sa-state [list access-list-number]</td>
</tr>
<tr>
<td>Step 3</td>
<td>access-list access-list-number {deny</td>

<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

**Note**

An alternative to this command is the ip msdp sa-request global configuration command, which causes the switch to send an SA request message to the MSDP peer when a new member for a group becomes active. For more information, see the next section.

To return to the default setting (no SA state is created), use the no ip msdp cache-sa-state global configuration command.

This example shows how to enable the cache state for all sources in 171.69.0.0/16 sending to groups 224.2.0.0/16:

```
Switch(config)# ip msdp cache-sa-state 100
Switch(config)# access-list 100 permit ip 171.69.0.0 0.255.255 224.2.0.0 0.0.255.255
```
### Requesting Source Information from an MSDP Peer

Local RPs can send SA requests and get immediate responses for all active sources for a given group. By default, the switch does not send any SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member waits to receive the next periodic SA message.

If you want a new member of a group to learn the active multicast sources in a connected PIM sparse-mode domain that are sending to a group, configure the switch to send SA request messages to the specified MSDP peer when a new member joins a group. The peer replies with the information in its SA cache. If the peer does not have a cache configured, this command has no result. Configuring this feature reduces join latency but sacrifices memory.

Beginning in privileged EXEC mode, follow these steps to configure the switch to send SA request messages to the MSDP peer when a new member joins a group and wants to receive multicast traffic. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip msdp sa-request {ip-address</td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
</tr>
<tr>
<td>Step 4</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>

To return to the default setting, use the **no ip msdp sa-request \{ip-address | name\}** global configuration command.

This example shows how to configure the switch to send SA request messages to the MSDP peer at 171.69.1.1:

```
Switch(config)# ip msdp sa-request 171.69.1.1
```

### Controlling Source Information that Your Switch Originates

You can control the multicast source information that originates with your switch:

- Sources you advertise (based on your sources)
- Receivers of source information (based on knowing the requestor)

For more information, see the “Redistributing Sources” section on page 42-9 and the “Filtering Source-Active Request Messages” section on page 42-10.
Redistributing Sources

SA messages originate on RPs to which sources have registered. By default, any source that registers with an RP is advertised. The A flag is set in the RP when a source is registered, which means the source is advertised in an SA unless it is filtered.

Beginning in privileged EXEC mode, follow these steps to further restrict which registered sources are advertised. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</tbody>
</table>
### Configuring MSDP

#### Filtering Source-Active Request Messages

By default, only switches that are caching SA information can respond to SA requests. By default, such a switch honors all SA request messages from its MSDP peers and supplies the IP addresses of the active sources.

However, you can configure the switch to ignore all SA requests from an MSDP peer. You can also honor only those SA request messages from a peer for groups described by a standard access list. If the groups in the access list pass, SA request messages are accepted. All other such messages from the peer for other groups are ignored.

To remove the filter, use the `no ip msdp redistribute` global configuration command.

---

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>`access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]<code>or</code>access-list access-list-number {deny</td>
</tr>
</tbody>
</table>
| | | • For `access-list-number`, the range is 1 to 99 for standard access lists and 100 to 199 for extended lists. Enter the same number created in Step 2.  
| | | • The `deny` keyword denies access if the conditions are matched. The `permit` keyword permits access if the conditions are matched.  |
| | | • For `protocol`, enter `ip` as the protocol name.  |
| | | • For `source`, enter the number of the network or host from which the packet is being sent.  |
| | | • For `source-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.  |
| | | • For `destination`, enter the number of the network or host to which the packet is being sent.  |
| | | • For `destination-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.  |
| | | Recall that the access list is always terminated by an implicit deny statement for everything. |
| **Step 4** | `end` | Return to privileged EXEC mode. |
| **Step 5** | `show running-config` | Verify your entries. |
| **Step 6** | `copy running-config startup-config` | (Optional) Save your entries in the configuration file. |
Chapter 42 Configuring MSDP

Beginning in privileged EXEC mode, follow these steps to configure one of these options. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip msdp filter-sa-request</strong> ip-address</td>
</tr>
<tr>
<td></td>
<td>name</td>
</tr>
<tr>
<td></td>
<td><strong>ip msdp filter-sa-request</strong> {ip-address</td>
</tr>
<tr>
<td></td>
<td>name} list access-list-number</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>access-list</strong> access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td>permit} source [source-wildcard]</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>show running-config</strong></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><strong>copy running-config startup-config</strong></td>
</tr>
</tbody>
</table>

To return to the default setting, use the **no ip msdp filter-sa-request** {ip-address \ name} global configuration command.

This example shows how to configure the switch to filter SA request messages from the MSDP peer at 171.69.2.2. SA request messages from sources on network 192.4.22.0 pass access list 1 and are accepted; all others are ignored.

```
Switch(config)# ip msdp filter sa-request 171.69.2.2 list 1
Switch(config)# access-list 1 permit 192.4.22.0 0.0.0.255
```

**Controlling Source Information that Your Switch Forwards**

By default, the switch forwards all SA messages it receives to all its MSDP peers. However, you can prevent outgoing messages from being forwarded to a peer by using a filter or by setting a time-to-live (TTL) value. These methods are described in the next sections.
## Using a Filter

By creating a filter, you can perform one of these actions:

- Filter all source/group pairs
- Specify an IP extended access list to pass only certain source/group pairs
- Filter based on match criteria in a route map

Beginning in privileged EXEC mode, follow these steps to apply a filter. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**ip msdp sa-filter out ip-address</td>
</tr>
<tr>
<td></td>
<td>or **ip msdp sa-filter out {ip-address</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>**access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong></td>
</tr>
</tbody>
</table>
Chapter 42  Configuring MSDP

Configuring MSDP

To remove the filter, use the `no ip msdp sa-filter out {ip-address | name} [list access-list-number] [route-map map-tag]` global configuration command.

This example shows how to allow only (S,G) pairs that pass access list 100 to be forwarded in an SA message to the peer named `switch.cisco.com`:

```
Switch(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet0/1
Switch(config)# ip msdp sa-filter out switch.cisco.com list 100
Switch(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.20 0 0.0.255.255
```

Using TTL to Limit the Multicast Data Sent in SA Messages

You can use a TTL value to control what data is encapsulated in the first SA message for every source. Only multicast packets with an IP-header TTL greater than or equal to the `ttl` argument are sent to the specified MSDP peer. For example, you can limit internal traffic to a TTL of 8. If you want other groups to go to external locations, you must send those packets with a TTL greater than 8.

Beginning in privileged EXEC mode, follow these steps to establish a TTL threshold. This procedure is optional.

```
Step 1 configure terminal
Step 2 ip msdp ttl-threshold {ip-address | name} ttl
Step 3 end
Step 4 show running-config
Step 5 copy running-config startup-config
```

To return to the default setting, use the `no ip msdp ttl-threshold {ip-address | name}` global configuration command.

Controlling Source Information that Your Switch Receives

By default, the switch receives all SA messages that its MSDP RPF peers send to it. However, you can control the source information that you receive from MSDP peers by filtering incoming SA messages. In other words, you can configure the switch to not accept them.
You can perform one of these actions:
- Filter all incoming SA messages from an MSDP peer
- Specify an IP extended access list to pass certain source/group pairs
- Filter based on match criteria in a route map

Beginning in privileged EXEC mode, follow these steps to apply a filter. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>ip msdp sa-filter in ip-address</td>
</tr>
<tr>
<td></td>
<td>name</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>ip msdp sa-filter in (ip-address</td>
</tr>
<tr>
<td></td>
<td>name)</td>
</tr>
<tr>
<td></td>
<td>list access-list-number</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>ip msdp sa-filter in (ip-address</td>
</tr>
<tr>
<td></td>
<td>name)</td>
</tr>
<tr>
<td></td>
<td>route-map map-tag</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>access-list access-list-number {deny</td>
</tr>
<tr>
<td></td>
<td>permit} protocol source source-wildcard</td>
</tr>
<tr>
<td></td>
<td>destination destination-wildcard</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>end</td>
</tr>
<tr>
<td>Step 5</td>
<td>show running-config</td>
</tr>
<tr>
<td>Step 6</td>
<td>copy running-config startup-config</td>
</tr>
</tbody>
</table>
To remove the filter, use the `no ip msdp sa-filter in {ip-address | name} [list access-list-number] [route-map map-tag]` global configuration command.

This example shows how to filter all SA messages from the peer named `switch.cisco.com`:

```
Switch(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet0/1
Switch(config)# ip msdp sa-filter in switch.cisco.com
```

### Configuring an MSDP Mesh Group

An MSDP mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among one another. Any SA messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group. Thus, you reduce SA message flooding and simplify peer-RPF flooding. Use the `ip msdp mesh-group` global configuration command when there are multiple RPs within a domain. It is especially used to send SA messages across a domain. You can configure multiple mesh groups (with different names) in a single switch.

Beginning in privileged EXEC mode, follow these steps to create a mesh group. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code> Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`ip msdp mesh-group name {ip-address</td>
</tr>
<tr>
<td></td>
<td>By default, the MSDP peers do not belong to a mesh group.</td>
</tr>
<tr>
<td></td>
<td>• For <code>name</code>, enter the name of the mesh group.</td>
</tr>
<tr>
<td></td>
<td>• For `ip-address</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>end</code> Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>show running-config</code> Verify your entries.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>copy running-config startup-config</code> (Optional) Save your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Repeat this procedure on each MSDP peer in the group.</td>
</tr>
</tbody>
</table>

To remove an MSDP peer from a mesh group, use the `no ip msdp mesh-group name {ip-address | name}` global configuration command.

### Shutting Down an MSDP Peer

If you want to configure many MSDP commands for the same peer and you do not want the peer to become active, you can shut down the peer, configure it, and later bring it up. When a peer is shut down, the TCP connection is terminated and is not restarted. You can also shut down an MSDP session without losing configuration information for the peer.
Beginning in privileged EXEC mode, follow these steps to shut down a peer. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip msdp shutdown peer-name</td>
<td>Administratively shut down the specified MSDP peer without losing configuration information. For peer-name, enter the IP address or name of the MSDP peer to shut down.</td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Return to privileged EXEC mode</td>
</tr>
<tr>
<td>Step 4 show running-config</td>
<td>Verify your entries.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

To bring the peer back up, use the **no ip msdp shutdown peer-name** global configuration command. The TCP connection is reestablished.

### Including a Bordering PIM Dense-Mode Region in MSDP

You can configure MSDP on a switch that borders a PIM sparse-mode region with a dense-mode region. By default, active sources in the dense-mode region do not participate in MSDP.

**Note** We do not recommend using the **ip msdp border sa-address** global configuration command. It is better to configure the border router in the sparse-mode domain to proxy-register sources in the dense-mode domain to the RP of the sparse-mode domain and have the sparse-mode domain use standard MSDP procedures to advertise these sources.

Beginning in privileged EXEC mode, follow these steps to configure the border router to send SA messages for sources active in the dense-mode region to the MSDP peers. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip msdp border sa-address interface-id</td>
<td>Configure the switch on the border between a dense-mode and sparse-mode region to send SA messages about active sources in the dense-mode region. For interface-id, specify the interface from which the IP address is derived and used as the RP address in SA messages. The IP address of the interface is used as the Originator-ID, which is the RP field in the SA message.</td>
</tr>
<tr>
<td>Step 3 ip msdp redistribute list access-list-name</td>
<td>Configure which (S,G) entries from the multicast routing table are advertised in SA messages. For more information, see the “Redistributing Sources” section on page 42-9.</td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Return to privileged EXEC mode</td>
</tr>
</tbody>
</table>
Configuring MSDP

Note that the `ip msdp originator-id` global configuration command also identifies an interface to be used as the RP address. If both the `ip msdp border sa-address` and the `ip msdp originator-id` global configuration commands are configured, the address derived from the `ip msdp originator-id` command specifies the RP address.

To return to the default setting (active sources in the dense-mode region do not participate in MSDP), use the `no ip msdp border sa-address interface-id` global configuration command.

### Configuring an Originating Address other than the RP Address

You can allow an MSDP speaker that originates an SA message to use the IP address of the interface as the RP address in the SA message by changing the Originator ID. You might change the Originator ID in one of these cases:

- If you configure a logical RP on multiple switches in an MSDP mesh group.
- If you have a switch that borders a PIM sparse-mode domain and a dense-mode domain. If a switch borders a dense-mode domain for a site, and sparse-mode is being used externally, you might want dense-mode sources to be known to the outside world. Because this switch is not an RP, it would not have an RP address to use in an SA message. Therefore, this command provides the RP address by specifying the address of the interface.

Beginning in privileged EXEC mode, follow these steps to allow an MSDP speaker that originates an SA message to use the IP address on the interface as the RP address in the SA message. This procedure is optional.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip msdp originator-id interface-id</code></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>end</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show running-config</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

If both the `ip msdp border sa-address` and the `ip msdp originator-id` global configuration commands are configured, the address derived from the `ip msdp originator-id` command specifies the address of the RP.

To prevent the RP address from being derived in this way, use the `no ip msdp originator-id interface-id` global configuration command.
Monitoring and Maintaining MSDP

To monitor MSDP SA messages, peers, state, or peer status, use one or more of the privileged EXEC commands in Table 42-1:

<table>
<thead>
<tr>
<th>Table 42-1 Commands for Monitoring and Maintaining MSDP</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>debug ip msdp [peer-address</td>
</tr>
<tr>
<td>name]</td>
</tr>
<tr>
<td>show ip msdp count [autonomous-system-number]</td>
</tr>
<tr>
<td>show ip msdp peer [peer-address</td>
</tr>
<tr>
<td>name]</td>
</tr>
<tr>
<td>source-address</td>
</tr>
<tr>
<td>show ip msdp sa-cache [group-name</td>
</tr>
<tr>
<td>source-name</td>
</tr>
</tbody>
</table>

To clear MSDP connections, statistics, or SA cache entries, use the privileged EXEC commands in Table 42-2:

<table>
<thead>
<tr>
<th>Table 42-2 Commands for Clearing MSDP Connections, Statistics, or SA Cache Entries</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Command</strong></td>
</tr>
<tr>
<td>clear ip msdp peer peer-address</td>
</tr>
<tr>
<td>name</td>
</tr>
<tr>
<td>name</td>
</tr>
<tr>
<td>name</td>
</tr>
</tbody>
</table>
Troubleshooting

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the Cisco ME 3400E switch.

You can use the command-line interface (CLI) to identify and solve problems.

Additional troubleshooting information related to hardware is provided in the hardware installation guide.

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the *Cisco IOS Command Summary, Release 12.2*.

- Recovering from a Software Failure, page 2
- Recovering from a Lost or Forgotten Password, page 3

Note Recovery procedures require that you have physical access to the switch.

- Using the crashinfo File, page 21
- Using On-Board Failure Logging, page 21
Recovering from a Software Failure

Switch software can be corrupted during an upgrade, by downloading the wrong file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

This procedure uses boot loader commands and TFTP to recover from a corrupted or wrong image file. The recovery procedure requires that you have physical access to the switch.

---

**Step 1** From your PC, download the software image tar file (`image_filename.tar`) from Cisco.com.

The Cisco IOS image is stored as a bin file in a directory in the tar file. For information about locating the software image files on Cisco.com, see the release notes.

**Step 2** Extract the bin file from the tar file.

- If you are using Windows, use a zip program that can read a tar file. Use the zip program to navigate to and extract the bin file.
- If you are using UNIX, follow these steps:

  1. Display the contents of the tar file by using the `tar -tvf <image_filename.tar>` UNIX command.

     ```bash
     switch% tar -tvf image_filename.tar
     ```

  2. Locate the bin file, and extract it by using the `tar -xvf <image_filename.tar> <image_filename.bin>` UNIX command.

     ```bash
     switch% tar -xvf image_filename.tar image_filename.bin
     x image_filename/image_filename.bin, 3970586 bytes, 7756 tape blocks
     ```

  3. Verify that the bin file was extracted by using the `ls -l <image_filename.bin>` UNIX command.

     ```bash
     switch% ls -l image_filename.bin
     -rw-r--r--   1 boba      3970586 Apr 21 12:00 image_filename/image_filename.bin
     ```

**Step 3** Connect your PC to the switch Ethernet management port.

**Step 4** Unplug the switch power cord.

**Step 5** Press the **Mode** button, and at the same time, reconnect the power cord to the switch.

You can release the **Mode** button a second or two after the LED above port 1 goes off. Several lines of information about the software appear with instructions:

```
The system has been interrupted prior to initializing the flash file system. The following commands will initialize the flash file system, and finish loading the operating system software#
```

```
flash_init
boot
```

**Step 6** Initialize the flash file system:

```
switch: flash_init
```

**Step 7** Connect the switch to a TFTP server through the Ethernet management port.

**Step 8** Start the file transfer by using TFTP.

  a. Specify the IP address of the TFTP server:

     ```bash
     switch: set ip_addr ip_address/mask
     ```

  b. Specify the default router:

     ```bash
     switch: set default_router ip_address
     ```
Step 9  Copy the software image from the TFTP server to the switch:

\[ \text{switch: } \texttt{copy tftp://ip_address/filesystem:/source-file-url flash:image_filename.bin} \]

Step 10  Boot up the newly downloaded Cisco IOS image.

\[ \text{switch: } \texttt{boot flash:image_filename.bin} \]

Step 11  Use the `archive download-sw` privileged EXEC command to download the software image to the switch or to the switch stack.

Step 12  Use the `reload` privileged EXEC command to restart the switch and to verify that the new software image is operating properly.

Step 13  Delete the `flash:image_filename.bin` file from the switch.

---

**Recovering from a Lost or Forgotten Password**

The default configuration for the switch allows an end user to recover from a lost password by interrupting the boot process during power-on and by entering a new password.

**Note**

On these switches, a system administrator can disable some of the functionality of password recovery by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

Disabling password recovery provides configuration file security by preventing unauthorized users from accessing the configuration file.

The Cisco ME switch boot loader uses break-key detection to stop the automatic boot sequence for the password recovery purpose.

**Note**

The break key character is different for each operating system.

On a SUN work station running UNIX, Ctrl-C is the break key.

On a PC running Windows XP or 2000, Ctrl-Break is the break key.

Cisco TAC has tabulated break keys for most common operating systems and an alternative break key sequence for those terminal emulators that do not support the break keys. To see that list go to: http://www.cisco.com/warp/public/701/61.html#how-to

These sections describes how to recover a forgotten or lost switch password:

- Procedure with Password Recovery Enabled, page 4
- Procedure with Password Recovery Disabled, page 6

You enable or disable password recovery by using the `service password-recovery` global configuration command.
Follow the steps in this procedure if you have forgotten or lost the switch password.

**Step 1** Connect a terminal or PC with terminal-emulation software to the switch console port.

**Step 2** Set the line speed on the emulation software to 9600 baud.

**Step 3** Power off the switch. Reconnect the power cord to the switch.

**Step 4** After the switch performs POST, the switch begins the autoboot process. The boot loader prompts the user for a break key character during the boot-up sequence, as shown in this example:

```
***** The system will autoboot in 5 seconds *****

Send a break key to prevent autobooting.
```

You must enter the break key on the console terminal within 5 seconds of receiving the message that the system will autoboot. The System LED flashes green until the break key is accepted. After the break key is accepted, the System LED turns off until after the switch boots.

Several lines of information about the software appear with instructions, informing you if the password recovery procedure has been disabled or not.

- If you see a message that begins with this:

```
The system has been interrupted, or encountered an error during initialization of the flash filesystem. The following commands will initialize the flash filesystem, and finish loading the operating system software:
```

```
flash_init
load_helper
boot
```

proceed to the “Procedure with Password Recovery Enabled” section on page 4, and follow the steps.

- If you see a message that begins with this:

```
The password-recovery mechanism has been triggered, but is currently disabled.
```

proceed to the “Procedure with Password Recovery Disabled” section on page 6, and follow the steps.

**Step 5** After recovering the password, reload the switch:

```
Switch> reload
Proceed with reload? [confirm] y
```

---

**Procedure with Password Recovery Enabled**

If the password-recovery mechanism is enabled, this message appears:

```
The system has been interrupted, or encountered an error during initialization of the flash filesystem. The following commands will initialize the flash filesystem, and finish loading the operating system software:
```

```
flash_init
load_helper
boot
```
Step 1  Initialize the flash file system:

```
switch: flash_init
```

Step 2  If you had set the console port speed to anything other than 9600, it has been reset to that particular speed. Change the emulation software line speed to match that of the switch console port.

Step 3  Load any helper files:

```
switch: load_helper
```

Step 4  Display the contents of flash memory:

```
switch: dir flash:
```

The switch file system appears:

```
Directory of flash:
  11  -rwx        5825   Mar 01 1993 22:31:59  config.text
  18  -rwx         720   Mar 01 1993 02:21:30  vlan.dat
```

16128000 bytes total (10003456 bytes free)

Step 5  Rename the configuration file to config.text.old. This file contains the password definition.

```
switch: rename flash:config.text flash:config.text.old
```

Step 6  Boot the system:

```
switch: boot
```

You are prompted to start the setup program. Enter N at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

Step 7  At the switch prompt, enter privileged EXEC mode:

```
Switch> enable
```

Step 8  Rename the configuration file to its original name:

```
Switch# rename flash:config.text.old flash:config.text
```

Step 9  Copy the configuration file into memory:

```
Switch# copy flash:config.text system:running-config
```

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

Step 10 Enter global configuration mode:

```
Switch# configure terminal
```

Step 11 Change the password:

```
Switch (config)# enable secret password
```

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.
Step 12 Return to privileged EXEC mode:

Switch (config)# exit
Switch#

Step 13 Write the running configuration to the startup configuration file:

Switch# copy running-config startup-config

The new password is now in the startup configuration.

Note This procedure is likely to leave your switch virtual interface in a shutdown state. You can identify this interface by entering the `show running-config` privileged EXEC command. To re-enable the interface, enter the `interface vlan vlan-id` global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the `no shutdown` command.

Step 14 Reload the switch:

Switch# reload

---

### Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

Caution Returning the switch to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup switch and VLAN configuration files.

Note Disabling password recovery provides configuration file security by preventing unauthorized users from accessing the configuration file.

- If you enter n (no), the normal boot process continues as if the break key had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:
  
  Press Enter to continue........

- If you enter y (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

Step 1 Elect to continue with password recovery and lose the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? Y
**Step 2**  Load any helper files:
Switch: `load_helper`

**Step 3**  Display the contents of flash memory:
`switch: dir flash:`

The switch file system appears:

```
Directory of flash:

16128000 bytes total (10003456 bytes free)
```

**Step 4**  Boot the system:
Switch: `boot`

You are prompted to start the setup program. To continue with password recovery, enter N at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

**Step 5**  At the switch prompt, enter privileged EXEC mode:
Switch> `enable`

**Step 6**  Enter global configuration mode:
`Switch# configure terminal`

**Step 7**  Change the password:
`Switch (config)# enable secret password`

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

**Step 8**  Return to privileged EXEC mode:
`Switch (config)# exit`
`Switch#`

**Step 9**  Write the running configuration to the startup configuration file:
`Switch# copy running-config startup-config`

The new password is now in the startup configuration.

---

**Note**  This procedure is likely to leave your switch virtual interface in a shutdown state. You can identify this interface by entering the `show running-config` privileged EXEC command. To re-enable the interface, enter the `interface vlan vlan-id` global configuration command, and specify the VLAN ID of the shutdown interface. With the switch in interface configuration mode, enter the `no shutdown` command.

**Step 10**  You must now reconfigure the switch. If the system administrator has the backup switch and VLAN configuration files available, you should use those.
Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the switch settings for speed (10, 100, and 1000 Mbps, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize switch performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

**Note**

If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the switch, the switch software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

**Note**

The security error message references the GBIC_SECURITY facility. The switch supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces. For more information about error messages, see the system message guide for this release.

If you are using a non-Cisco SFP module, remove the SFP module from the switch, and replace it with a Cisco module. After inserting a Cisco SFP module, use the `errdisable recovery cause gbic-invalid` global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the switch brings the interface out of the error-disabled state and retries the operation. For more information about the `errdisable recovery` command, see the command reference for this release.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and re-insert the SFP module. If it continues to fail, the SFP module might be defective.
Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the `show interfaces transceiver` privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the `show interfaces transceiver` command in the command reference for this release.

Monitoring Temperature

The Cisco ME switch monitors the temperature conditions. The switch also uses the temperature information to control the fans. The temperature value is the temperature in the switch (not the external temperature). Enter the `show env temperature` privileged EXEC command to see if the temperature is okay or faulty.

The `show env all` command displays the temperature value, state, and thresholds.

This is an example of the output from the `show env temperature` command:

```
Switch# show env temperature
TEMPERATURE is OK
```

This is an example of the output from the `show env all` command:

```
Switch# show env all
FAN PS 1 is OK
FAN PS 2 is OK
TEMPERATURE is OK
Temperature Value: 23 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 66 Degree Celsius
Red Threshold : 74 Degree Celsius
POWER SUPPLY 1 is DC OK
POWER SUPPLY 2 is DC OK
ALARM CONTACT 1 is not asserted
ALARM CONTACT 2 is not asserted
ALARM CONTACT 3 is not asserted
ALARM CONTACT 4 is not asserted
```

For more information, see the command reference for this release.

Using Ping

These sections contain this information:

- Understanding Ping, page 9
- Using Ping, page 9

Understanding Ping

The Cisco ME switch supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply.
The Cisco ME switch also provides the Control Plane Security feature, which by default drops ping response packets received on user network interfaces (UNIs) or enhanced network interfaces (ENIs). However, methods are available to ping successfully from the switch to a host connected to a UNI or ENI.

Control Plane Security does not drop ping response packets to or from network node interfaces (NNIs), and no special configuration is required to enable pings to or from hosts connected to NNIs.

### Using Ping

Beginning in privileged EXEC mode, use the `ping` command to ping another device on the network from the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`ping [host</td>
<td>Ping a remote host by supplying the hostname or IP network address.</td>
</tr>
<tr>
<td>address]</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Though other protocol keywords are available with the <code>ping</code> command,</td>
</tr>
<tr>
<td></td>
<td>they are not supported in this release.</td>
</tr>
</tbody>
</table>

**Note**

Ping is not supported on a UNI or ENI configured as an IEEE 802.1Q tunnel port.

Ping is supported on NNIs on all software images.

It is important to note that the software images available for the switch provide different options for pinging a host connected to a UNI or ENI:

- Metro IP access image that supports IP routing
- Metro access image

The next sections apply to both access ports and trunk ports.

### All Software Versions

For all software images for the Cisco ME switch, you can use a Layer 3 service policy to enable pings from the switch to a host connected to a UNI or ENI.

**Note**

For a switch running the metro IP access image, IP routing is not enabled by default and does not have to be enabled to use a Layer 3 service policy.

This example is one possible configuration:

```
switch# configure terminal
switch(config)# access list 101 permit ip any any
switch(config)# class-map match-any ping-class
switch(config-cmap)# match access-group 101
switch(config-cmap)# exit
switch(config)# policy-map ping-policy
switch(config-pmap)# class ping-class
switch(config-pmap-c)# police 1000000
switch(config-pmap-c)# exit
```
Metro IP Access Image

When your switch is running the metro IP access image, you can use any of these methods:

- Apply a Layer 3 service policy to a UNI or ENI.
- Enable IP routing globally and ping from a switch virtual interface (SVI).
- Enable IP routing and ping from a routed port.

For a sample configuration of how to add a Layer 3 service policy to a UNI or ENI, see the “All Software Versions” section.

For examples using IP routing and pinging from an SVI or a routed port, see the next sections.

IP Routing and SVI

IP routing is only supported when the switch is running the metro IP access image.

You can use this configuration to enable IP routing and enable pings from an SVI to a host connected to a UNI or ENI.

```
Switch# configure terminal
Switch(config)# ip routing
Switch(config)# int fa0/1
Switch(config-if)# switchport access vlan 2
Switch(config-if)# no shutdown
Switch(config-if)# int vlan 2
Switch(config-if)# ip address 192.168.1.1 255.255.255.0
Switch(config-if)# end
```

```
Switch# ping 192.168.1.2
```

With this configuration, a host with an IP address of 192.168.1.2 can be pinged from the switch.

IP Routing and Routed Port

You can use this configuration to enable IP routing, change a switchport to a routed port, and permit pings from the switch to a connected host:

```
switch# configure terminal
switch(config)# int fa0/1
switch(config-if)# no switchport
switch(config-if)# ip address 192.168.1.1 255.255.255.0
switch(config-if)# no shutdown
switch(config-if)# exit
switch(config)# ip routing
switch(config)# end
```

```
switch# ping 192.168.1.2
```
Ping Responses

This response is typical of a successful ping to a host:

```
Switch# ping 72.20.52.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.20.52.3, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
```

An unsuccessful ping results in this message:

```
Switch# ping 72.20.52.3
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 172.20.52.3, timeout is 2 seconds:
.
.
.
.
.
Success rate is 0 percent (0/5)
```

Summary

Keep these guidelines in mind while pinging:

- IP routing is available only with the metro IP access image and is disabled by default.
- To ping a host in a different IP subnetwork from the switch, you must have IP routing configured to route between the subnets, and a static route to the destination might also be appropriate. If you need to enable or configure IP routing, see Chapter 36, “Configuring IP Unicast Routing.”
- All software versions can use a Layer 3 service policy to permit pings to and from a host connected to a UNI or ENI. For more information about policy maps, see the “Input and Output Policies” section on page 34-4.

If your switch is running the metro IP access image, use one of these methods to ping a host connected to a UNI or ENI:

- Use a Layer 3 service policy to permit pings to and from a host connected to a UNI or ENI.
- Enable global IP routing and configure a port as a routed port by using the `no switchport` interface configuration command.
- Enable global IP routing, create an SVI, and assign an IP address to it. For more information about SVIs, see the “Switch Virtual Interfaces” section on page 10-5.

To end a ping session, simultaneously press and release the Ctrl, Shift, and 6 keys, and then press the X key.

Using Layer 2 Traceroute

- Understanding Layer 2 Traceroute, page 13
- Layer 2 Traceroute Usage Guidelines, page 13
- Displaying the Physical Path, page 14
Understanding Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. It finds the path by using the MAC address tables of the switches in the path. When the switch detects a device in the path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

**Note**  
Layer 2 traceroute is available only on NNIs.

The switch can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

Layer 2 Traceroute Usage Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.

**Note**  
CDP is enabled by default on NNIs. You can enable CDP on ENIs, but UNIs do not support CDP.

For a list of switches that support Layer 2 traceroute, see the “Layer 2 Traceroute Usage Guidelines” section on page 13. If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices. For more information about enabling CDP, see Chapter 24, “Configuring CDP.”

- A switch is reachable from another switch when you can test connectivity by using the **ping** privileged EXEC command. All switches in the physical path must be reachable from each other.

- The maximum number of hops identified in the path is ten.

- You can enter the **traceroute mac** or the **traceroute mac ip** privileged EXEC command on a switch that is not in the physical path from the source device to the destination device. All switches in the path must be reachable from this switch.

- The **traceroute mac** command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

- The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the switch uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

  - If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
Using IP Traceroute

Understanding IP Traceroute

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your switches can participate as the source or destination of the traceroute privileged EXEC command and might or might not appear as a hop in the traceroute command output. If the switch is the destination of the traceroute, it is displayed as the final destination in the output. Intermediate switches do not show up in the output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate switch is a multilayer switch that is routing a particular packet, this switch shows up as a hop in the output.

The traceroute privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of this message.
To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP port-unreachable error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

**Executing IP Traceroute**

Beginning in privileged EXEC mode, follow this step to trace that the path packets take through the network:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>traceroute ip host</td>
<td>Trace the path that packets take through the network.</td>
</tr>
</tbody>
</table>

**Note**

Though other protocol keywords are available with the `traceroute` privileged EXEC command, they are not supported in this release.

This example shows how to perform a `traceroute` to an IP host:

```
Switch# traceroute ip 171.9.15.10
Type escape sequence to abort.
Tracing the route to 171.69.115.10

1 172.2.52.1 0 msec 0 msec 4 msec
2 172.2.1.203 12 msec 8 msec 0 msec
3 171.9.16.6 4 msec 0 msec 0 msec
4 171.9.4.5 0 msec 4 msec 0 msec
5 171.9.121.34 0 msec 4 msec 4 msec
6 171.9.15.9 120 msec 132 msec 128 msec
7 171.9.15.10 12 msec 128 msec 128 msec
Switch#
```

The display shows the hop count, IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

**Table 43-1 Traceroute Output Display Characters**

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>The probe timed out.</td>
</tr>
<tr>
<td>?</td>
<td>Unknown packet type.</td>
</tr>
<tr>
<td>A</td>
<td>Administratively unreachable. Usually, this output means that an access list is blocking traffic.</td>
</tr>
</tbody>
</table>
To end a trace in progress, enter the escape sequence (Ctrl-^ X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys, and then press the X key.

### Using TDR

- Understanding TDR, page 16
- Running TDR and Displaying the Results, page 16

### Understanding TDR

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

On the Cisco ME switch, TDR is supported only on the copper Ethernet 10/100 ports or on dual-purpose ports configured as 10/100/100 ports by using the RJ-45 connector.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a switch
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

### Running TDR and Displaying the Results

To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command:

To display the results, enter the `show cable-diagnostics tdr interface interface-id` privileged EXEC command. For a description of the fields in the display, see the command reference for this release.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>H</td>
<td>Host unreachable.</td>
</tr>
<tr>
<td>N</td>
<td>Network unreachable.</td>
</tr>
<tr>
<td>P</td>
<td>Protocol unreachable.</td>
</tr>
<tr>
<td>Q</td>
<td>Source quench.</td>
</tr>
<tr>
<td>U</td>
<td>Port unreachable.</td>
</tr>
</tbody>
</table>

To end a trace in progress, enter the escape sequence (Ctrl-^ X by default). Simultaneously press and release the Ctrl, Shift, and 6 keys, and then press the X key.
Using Debug Commands

- Enabling Debugging on a Specific Feature, page 17
- Enabling All-System Diagnostics, page 18
- Redirecting Debug and Error Message Output, page 18

Caution
Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

Note
For complete syntax and usage information for specific debug commands, see the command reference for this release.

Enabling Debugging on a Specific Feature

All debug commands are entered in privileged EXEC mode, and most debug commands take no arguments. For example, beginning in privileged EXEC mode, enter this command to enable the debugging for Switched Port Analyzer (SPAN):

```
Switch# debug span-session
```

The switch continues to generate output until you enter the no form of the command.

If you enable a debug command and no output appears, consider these possibilities:

- The switch might not be properly configured to generate the type of traffic that you want to monitor. Use the show running-config command to check its configuration.
- Even if the switch is properly configured, it might not generate the type of traffic that you want to monitor during the particular period that debugging is enabled. Depending on the feature you are debugging, you can use commands such as the TCP/IP ping command to generate network traffic.

To disable debugging of SPAN, enter this command in privileged EXEC mode:

```
Switch# no debug span-session
```

Alternately, in privileged EXEC mode, you can enter the undebug form of the command:

```
Switch# undebug span-session
```

To display the state of each debugging option, enter this command in privileged EXEC mode:

```
Switch# show debugging
```

Note
TDR is supported only on the copper Ethernet 10/100 ports or on dual-purpose ports configured as 10/100/100 ports by using the RJ-45 connector.
Enabling All-System Diagnostics

Beginning in privileged EXEC mode, enter this command to enable all-system diagnostics:

Switch# debug all

Caution

Because debugging output takes priority over other network traffic, and because the debug all privileged EXEC command generates more output than any other debug command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific debug commands.

The no debug all privileged EXEC command disables all diagnostic output. Using the no debug all command is a convenient way to ensure that you have not accidentally left any debug commands enabled.

Redirecting Debug and Error Message Output

By default, the network server sends the output from debug commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

Note

Be aware that the debugging destination you use affects system overhead. Logging messages to the console produces very high overhead, whereas logging messages to a virtual terminal produces less overhead. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see Chapter 29, “Configuring System Message Logging.”

Using the show platform forward Command

The output from the show platform forward privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Note

For more syntax and usage information for the show platform forward command, see the switch command reference for this release.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the switch ASICs. However, packet forwarding information can also be helpful in troubleshooting.
This is an example of the output from the `show platform forward` command on Gigabit Ethernet port 1 in VLAN 5 when the packet entering that port is addressed to unknown MAC addresses. The packet should be flooded to all other ports in VLAN 5.

Switch# `show platform forward gigabitethernet0/1 vlan 5 1.1.1 2.2.2 ip 13.1.1.1 13.2.2.2 udp 10 20`
Global Port Number:24, Asic Number:5
Src Real Vlan Id:5, Mapped Vlan Id:5

Using the crashinfo File

The crashinfo file saves information that helps Cisco technical support representatives to debug problems that caused the Cisco IOS image to fail (crash). The switch writes the crash information to the console at the time of the failure, and the file is created the next time you boot the Cisco IOS image after the failure (instead of while the system is failing).

The information in the file includes the Cisco IOS image name and version that failed, a list of the processor registers, and a stack trace. You can provide this information to the Cisco technical support representative by using the `show tech-support` privileged EXEC command.

All crashinfo files are kept in this directory on the flash file system:

```
flash:/crashinfo/crashinfo_n
```

where `n` is a sequence number.

Each new crashinfo file that is created uses a sequence number that is larger than any previously existing sequence number, so the file with the largest sequence number describes the most recent failure. Version numbers are used instead of a timestamp because the switches do not include a real-time clock. You cannot change the name of the file that the system will use when it creates the file. However, after the file is created, you can use the `rename` privileged EXEC command to rename it, but the contents of the renamed file will not be displayed by the `show tech-support` privileged EXEC command. You can delete crashinfo files by using the `delete` privileged EXEC command.

You can display the most recent crashinfo file (that is, the file with the highest sequence number at the end of its filename) by entering the `show tech-support` privileged EXEC command. You also can access the file by using any command that can copy or display files, such as the `more` or the `copy` privileged EXEC command.

Using On-Board Failure Logging

You can use the on-board-failure logging (OBFL) feature to collect information about the switch. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot switch problems.

This section has this information:

- Understanding OBFL, page 21
- Configuring OBFL, page 22
- Displaying OBFL Information, page 23

Understanding OBFL

By default, OBFL is enabled. It collects information about the switch and small form-factor pluggable (SFP) modules. The switch stores this information in the flash memory:

- CLI commands—Record of the OBFL CLI commands that are entered on a switch
- Environmental data—Unique device identifier (UDI) information for a switch and for all the connected devices: the product identification (PID), the version identification (VID), and the serial number
- Message—Record of the hardware-related system messages generated by a switch
- Temperature—Temperature of a switch
• Uptime data—Time when a switch starts, the reason the switch restarts, and the length of time the switch has been running since it last restarted
• Voltage—System voltages of a switch

Note
The Cisco ME 3400EG-2CS-A switch does not support voltage monitoring.

You should manually set the system clock, or configure it by using Network Time Protocol (NTP). When the switch is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the switch fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled switch is restarted, there is a 10-minute delay before logging of new data begins.

### Configuring OBFL

To enable OBFL, use the `hw-module module logging onboard [message level level]` global configuration command. Use the `message level level` parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.

To copy the OBFL data to the local network or a specific file system, use the `copy logging onboard module 1 destination` privileged EXEC command.

Caution
We recommend that you keep OBFL enabled and that you do not remove the data stored in the flash memory.

Beginning in privileged EXEC mode, follow these steps to enable and configure OBFL. Note that OBLF is enabled by default; you need to enable it only if it has been disabled.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
| Step 2 | `hw-module module [slot-number] logging onboard [message level]` | Enable OBFL on the switch. You can specify these optional parameters:  
  • (Optional) `slot-number`—The slot number is always 1 and is not relevant for the ME-3400E.  
  • (Optional) `message level`—Specify the severity level of messages to be generated and stored. The range is from 1 to 7, with 1 being the most severe. |
| Step 3 | `end` | Return to privileged EXEC mode. |
| Step 4 | `copy logging onboard module [slot-number] destination` | (Optional) Copy the OBFL data to the local network or a specific file system.  
  • (Optional) `slot-number`—The slot number is always 1 and is not relevant for the ME-3400E.  
  • `destination`—See the `copy logging onboard module` command for destination options. |
To disable OBFL, use the no hw-module module 1 logging onboard [message level] global configuration command.

To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the clear logging onboard privileged EXEC command.

For more information about the commands in this section, see the command reference for this release.

### Displaying OBFL Information

To display the OBFL information, use one or more of the privileged EXEC commands in Table 43-2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show logging onboard clilog</td>
<td>Display the OBFL CLI commands that were entered on a switch.</td>
</tr>
<tr>
<td>show logging onboard environment</td>
<td>Display the UDI information for a standalone switch and for all the connected FRU devices: the PID, the VID, and the serial number.</td>
</tr>
<tr>
<td>show logging onboard message</td>
<td>Display the hardware-related messages generated by a switch.</td>
</tr>
<tr>
<td>show logging onboard temperature</td>
<td>Display the temperature of a switch.</td>
</tr>
<tr>
<td>show logging onboard uptime</td>
<td>Display the time when a switch starts, the reason the switch restarts, and the length of time that the switch has been running since it last restarted.</td>
</tr>
<tr>
<td>show logging onboard voltage</td>
<td>Display the system voltages of a switch.</td>
</tr>
</tbody>
</table>

These are examples of output from the show logging onboard commands:

```
Switch# show logging onboard clilog
--------------------------------------------------------------------------------
CLI LOGGING SUMMARY INFORMATION
--------------------------------------------------------------------------------
COUNT COMMAND
--------------------------------------------------------------------------------
   1 hw-module logging onboard
   1 hw-module module logging onboard message level 7
   4 show logging onboard
   1 show logging onboard message
   1 show logging onboard summary
```

No historical data to display

For more information about using the commands in Table 43-2 and for examples of OBFL data, see the command reference for this release.
Configuring Online Diagnostics

This chapter describes how to configure the online diagnostics on the Cisco ME 3400E switch.

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release.

- Understanding Online Diagnostics, page 44-1
- Configuring Online Diagnostics, page 44-2
- Running Online Diagnostic Tests, page 44-5

Understanding Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the switch while the switch is connected to a live network. The online diagnostics contain packet switching tests that monitor different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Table 44-1 lists the diagnostic test IDs and names. For information about test attributes, see the output from the show diagnostic content privileged EXEC command.

<table>
<thead>
<tr>
<th>Test ID Number</th>
<th>Test Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>TestPortAsicStackPortLoopback</td>
</tr>
<tr>
<td>2</td>
<td>TestPortAsicLoopback</td>
</tr>
<tr>
<td>3</td>
<td>TestPortAsicCam</td>
</tr>
<tr>
<td>4</td>
<td>TestPortAsicRingLoopback</td>
</tr>
<tr>
<td>5</td>
<td>TestMicRingLoopback</td>
</tr>
<tr>
<td>6</td>
<td>TestPortAsicMem</td>
</tr>
</tbody>
</table>
Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics.

- On-demand diagnostics run from the CLI.
- Scheduled diagnostics run at user-designated intervals or at specified times when the switch is connected to a live network.
- Health-monitoring runs in the background.

## Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

- Scheduling Online Diagnostics, page 44-2
- Configuring Health-Monitoring Diagnostics, page 44-3

## Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis. Use the no form of this command to remove the scheduling. For detailed information about this command, see the command reference for this release.

Beginning in privileged EXEC mode, follow these steps to schedule online diagnostics:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
| 2    | diagnostic schedule test \{name | test-id | test-id-range | all | basic | non-disruptive\} \{daily hh:mm | on mm dd yyyy hh:mm | weekly day-of-week hh:mm\} | Schedule on-demand diagnostic tests for a specific day and time. When specifying the tests to be scheduled, use these options:  
  - name—Name of the test that appears in the show diagnostic content command output. See Table 44-1.  
  - test-id—ID number of the test that appears in the show diagnostic content command output. See Table 44-1.  
  - test-id-range—A range of test ID numbers separated by a hyphen or commas.  
  - all—All of the diagnostic tests.  
  - basic—Basic on-demand diagnostic tests.  
  - non-disruptive—Nondisruptive health-monitoring tests. You can schedule the tests for these time periods:  
  - Daily—Use the daily \( hh:mm \) parameter.  
  - Specific day and time—Use the on \( mm dd yyyy hh:mm \) parameter.  
  - Weekly—Use the weekly \( day-of-week hh:mm \) parameter. |
Chapter 44  Configuring Online Diagnostics

Configuring Online Diagnostics

Use the `no diagnostic schedule test {name | test-id | test-id-range | all | basic | non-disruptive} {daily hh:mm | on mm dd yyyy hh:mm | weekly day-of-week hh:mm}` global configuration command to remove the scheduled tests.

This example shows how to schedule diagnostic testing for a specific day and time and verify the schedule:

Switch(config)# diagnostic schedule test 1 on Dec 4 2008 10:22
Switch(config)# end

Switch# show diagnostic schedule

Current Time = 10:21:24 UTC Thu Dec 4 2008

Diagnostic:

Schedule #1:
   To be run on December 4 2008 10:22
   Test ID(s) to be executed: 1.

At the scheduled time, the switch runs the test:

Switch#
Dec  4 10:21:59.492: %DIAG-6-SCHED_RUNNING: : Performing Scheduled Online Diagnostic...
Dec  4 10:21:59.492: %DIAG-6-TEST_RUNNING: : Running TestPortAsicStackPortLoopback(ID=1) ..
Dec  4 10:22:00.498: %DIAG-6-TEST_OK: : TestPortAsicStackPortLoopback(ID=1) has completed successfully
Dec  4 10:22:00.498: %DIAG-6-SCHED_COMPLETE: : Scheduled Online Diagnostic is completed

For more examples, see the “Examples” section for the `diagnostic schedule test` command in the command reference for this release.

Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing while a switch is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the switch to generate a syslog message because of a test failure, and enable a specific test.

By default, health monitoring is disabled. When enabled, the switch generates a syslog message when a test fails.

Beginning in privileged EXEC mode, follow these steps to configure and enable the health-monitoring diagnostic tests:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
### Command and Purpose

| Step 2 | **diagnostic monitor interval test** {name \ test-id \ test-id-range \ all} hh:mm:ss milliseconds day | Configure the health-monitoring interval of the specified tests. Specify the tests by using one of these parameters:
- **name**—Name of the test that appears in the `show diagnostic content` command output. See Table 44-1.
- **test-id**—ID number of the test that appears in the `show diagnostic content` command output. See Table 44-1.
- **test-id-range**—A range of test ID numbers separated by a hyphen or commas.
- **all**—All of the diagnostic tests.
When specifying the interval, set these parameters:
- **hh:mm:ss**—Monitoring interval in hours, minutes, and seconds. The range for **hh** is 0 to 24, and the range for **mm** and **ss** is 0 to 60.
- **milliseconds**—Monitoring interval in milliseconds (ms). The range is from 0 to 999.
- **day**—Monitoring interval in number of days. The range is from 0 to 20.

| Step 3 | **diagnostic monitor syslog** | (Optional) Configure the switch to generate a syslog message when a health-monitoring test fails.

| Step 4 | **diagnostic monitor threshold test** {name \ test-id \ test-id-range \ all} failure count count | (Optional) Set the failure threshold for the health-monitoring tests. Specify the tests by using one of these parameters:
- **name**—Name of the test that appears in the `show diagnostic content` command output. See Table 44-1.
- **test-id**—ID number of the test that appears in the `show diagnostic content` command output. See Table 44-1.
- **test-id-range**—A range of test ID numbers separated by a hyphen or commas.
- **all**—All of the diagnostic tests.
The range for the failure threshold **count** is 0 to 99.

| Step 5 | **diagnostic monitor test** {name \ test-id \ test-id-range \ all} | Enable the specified health-monitoring tests. Specify the tests by using one of these parameters:
- **name**—Name of the test that appears in the `show diagnostic content` command output. See Table 44-1.
- **test-id**—ID number of the test that appears in the `show diagnostic content` command output. See Table 44-1.
- **test-id-range**—ID numbers of the tests that appear in the `show diagnostic content` command output.
- **all**—All of the diagnostic tests.

| Step 6 | **end** | Return to privileged EXEC mode.

| Step 7 | **show diagnostic** {content \ post \ result \ schedule \ status \ switch} | Display the online diagnostic test results and the supported test suites. See the “Displaying Online Diagnostic Tests and Results” section on page 44-6 for more information.
To disable online diagnostic testing and return to the default settings, use these commands:

- To disable online diagnostic testing, use the `no diagnostic monitor test {name | test-id | test-id-range | all}` global configuration command.
- To return to the default health-monitoring interval, use the `no diagnostic monitor interval test {name | test-id | test-id-range | all}` global configuration command.
- To configure the switch to not generate a syslog message when the health-monitoring test fails, use the `no diagnostic monitor syslog` global configuration command.
- To return to the default failure threshold, use the `no diagnostic monitor threshold test {name | test-id | test-id-range | all} failure count count` global configuration command.

This example shows how to configure a health-monitoring test:

```
Switch(config)# diagnostic monitor threshold test 1 failure count 50
Switch(config)# diagnostic monitor interval test TestPortAsicRingLoopback
```

### Running Online Diagnostic Tests

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see the tests configured for the switch and the tests that have already run.

- Starting Online Diagnostic Tests, page 44-5
- Displaying Online Diagnostic Tests and Results, page 44-6

### Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

**Note**

After starting the tests, you cannot stop the testing process.
Running Online Diagnostic Tests

This example shows how to start a diagnostic test by using the test name:

```
Switch# diagnostic start test TestPortAsicRingLoopback
```

This example shows how to start a no-disruptive diagnostic test:

```
Switch# diagnostic start test non-disruptive
Switch#
*Mar 3 19:34:02.680: %DIAG-6-TEST_RUNNING: : Running TestPortAsicStackPortLoopback(ID=1) ..
*Mar 3 19:34:03.687: %DIAG-6-TEST_OK: : TestPortAsicStackPortLoopback(ID=1) has completed successfully
```

This example shows how to start all of the basic diagnostic tests:

```
Switch# diagnostic start test all
```

Displaying Online Diagnostic Tests and Results

You can display the configured online diagnostic tests and review the test results by using the privileged EXEC `show` commands in Table 44-2.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show diagnostic content</code></td>
<td>Displays the online diagnostics configured for a switch.</td>
</tr>
<tr>
<td><code>show diagnostic status</code></td>
<td>Displays the running diagnostic tests.</td>
</tr>
<tr>
<td><code>show diagnostic result</code> [detail</td>
<td>test {name</td>
</tr>
<tr>
<td><code>show diagnostic switch</code> [detail]</td>
<td>Displays the online diagnostics test results.</td>
</tr>
<tr>
<td><code>show diagnostic schedule</code></td>
<td>Displays the online diagnostics test schedule.</td>
</tr>
<tr>
<td><code>show diagnostic post</code></td>
<td>Displays the POST results. (The output is the same as the <code>show post</code> command output.)</td>
</tr>
</tbody>
</table>

Table 44-2  Commands for Diagnostic Test Configuration and Results
This is an example of the output from the `show diagnostic result` command:

```
Switch# show diagnostic result
        : SerialNo : FOC122SU4CY

Overall diagnostic result: PASS

Test results: (. = Pass, F = Fail, U = Untested)
1) TestPortAsicStackPortLoopback ---> .
2) TestPortAsicLoopback -----------> U
3) TestPortAsicCam --------------> U
4) TestPortAsicRingLoopback -------> U
5) TestMicRingLoopback -----------> U
6) TestPortAsicMem --------------> U
```

This is an example of the output from the `show diagnostic post` command:

```
Switch# show diagnostic post
Stored system POST messages:

Switch 1
--------

POST: CPU MIC register Tests : Begin
POST: CPU MIC register Tests : End, Status Passed

POST: PortASIC Memory Tests : Begin
POST: PortASIC Memory Tests : End, Status Passed

POST: CPU MIC interface Loopback Tests : Begin
POST: CPU MIC interface Loopback Tests : End, Status Passed

POST: PortASIC RingLoopback Tests : Begin
POST: PortASIC RingLoopback Tests : End, Status Passed

POST: Thermal, Fan Tests : Begin
POST: Thermal, Fan Tests : End, Status Passed

POST: PortASIC CAM Subsystem Tests : Begin
POST: PortASIC CAM Subsystem Tests : End, Status Passed

POST: PortASIC Port Loopback Tests : Begin
POST: PortASIC Port Loopback Tests : End, Status Passed

POST: EMAC Loopback Tests : Begin
POST: EMAC Loopback Tests : End, Status Passed
```

For more examples of other `show diagnostic` command outputs, see the “Examples” section of the `show diagnostic` command in the command reference for this release.
Supported MIBs

This appendix lists the supported management information base (MIBs) for this release on the Cisco ME 3400E Ethernet Access switch. It contains these sections:

- MIB List, page A-1
- Using FTP to Access the MIB Files, page A-3

MIB List

- BRIDGE-MIB (RFC1493)

  Note: The BRIDGE-MIB supports the context of a single VLAN. By default, SNMP messages using the configured community string always provide information for VLAN 1. To obtain the BRIDGE-MIB information for other VLANs, for example VLAN x, use this community string in the SNMP message: configured community string @x.

- CISCO-CABLE-DIAG-MIB
- CISCO-CDP-MIB
- CISCO-CONFIG-COPY-MIB
- CISCO-CONFIG-MAN-MIB
- CISCO-DHCP-SNOOPING-MIB
- CISCO-ENTITY-ALARM-MIB
- CISCO-ENTITY-FRU-CONTROL-MIB
- CISCO-ENTITY-VENDORTYPE-OID-MIB
- CISCO-ENVMON-MIB
- CISCO-ERR-DISABLE-MIB
- CISCO-ETHER-CFM-MIB
- CISCO-ETHERNET-ACCESS-MIB
- CISCO-FLASH-MIB (Flash memory on all switches is modeled as removable flash memory.)
- CISCO-FTP-CLIENT-MIB
- CISCO-HSRP-MIB
Note: Layer 3 MIBs are available only when the metro IP access image is running on the switch.

- CISCO-HSRP-EXT-MIB (partial support)
- CISCO-IGMP-FILTER-MIB
- CISCO-IMAGE-MIB
- CISCO-IPSLA-ETHERNET-MIB

Note: Available only when the metro IP access image is running on the switch.

- CISCO-L2L3-INTERFACE-CONFIG-MIB
- CISCO-LAG-MIB
- CISCO-MAC-NOTIFICATION-MIB
- CISCO-MEMORY-POOL-MIB
- CISCO-PAE-MIB
- CISCO-PAGP-MIB
- CISCO-PING-MIB
- CISCO-PORT-QOS-MIB (the cportQosStats Table returns the values from the octets and packet counters, depending on switch configuration)
- CISCO-PRODUCTS-MIB
- CISCO-PROCESS-MIB
- CISCO-RTTMON-MIB
- CISCO-SMI-MIB
- CISCO-STACKMAKER-MIB
- CISCO-STP-EXTENSIONS-MIB
- CISCO-SYSLOG-MIB
- CISCO-TC-MIB
- CISCO-TCP-MIB
- CISCO-UDLD-MIB
- CISCO-VLAN-IFTABLE-RELATIONSHIP-MIB
- CISCO-VLAN-MEMBERSHIP-MIB
- CISCO-VTP-MIB
- ENTITY-MIB
- ETHERLIKE-MIB
- IEEE8021-PAE-MIB
- IEEE8023-LAG-MIB
- IF-MIB (In and out counters for VLANs are not supported.)
- IGMP-MIB
- INET-ADDRESS-MIB
Appendix A      Supported MIBs

Using FTP to Access the MIB Files

You can obtain each MIB file by using this procedure:

Step 1 Make sure that your FTP client is in passive mode.

Note Some FTP clients do not support passive mode.

Step 2 Use FTP to access the server ftp.cisco.com.

Step 3 Log in with the username anonymous.

Step 4 Enter your e-mail username when prompted for the password.

Step 5 At the ftp> prompt, change directories to /pub/mibs/v1 and /pub/mibs/v2.
Step 6 Use the get MIB_filename command to obtain a copy of the MIB file.
Working with the Cisco IOS File System, Configuration Files, and Software Images

This appendix describes how to manipulate the Cisco ME 3400E Ethernet Access switch flash file system, how to copy configuration files, and how to archive (upload and download) software images to a switch.

Note
For complete syntax and usage information for the commands used in this chapter, see the switch command reference for this release and the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2.

This appendix consists of these sections:
- Working with the Flash File System, page B-1
- Working with Configuration Files, page B-8
- Working with Software Images, page B-23

Working with the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software image and configuration files. The default flash file system on the switch is named flash:

These sections contain configuration information:
- Displaying Available File Systems, page B-2
- Setting the Default File System, page B-3
- Displaying Information about Files on a File System, page B-3
- Creating and Removing Directories, page B-4
- Copying Files, page B-4
- Deleting Files, page B-5
- Creating, Displaying, and Extracting tar Files, page B-6
- Displaying the Contents of a File, page B-8
Displaying Available File Systems

To display the available file systems on your switch, use the `show file systems` privileged EXEC command as shown in this example.

```
Switch# show file systems
File Systems:
 Size(b)   Free(b)   Type    Flags   Prefixes
* 15998976   5135872  flash    rw     flash:
   -         -     opaque    rw     bs:
   -         -     opaque    rw     vb:
 524288    520138   nvram    rw     nvram:
   -         -     network   rw     tftp:
   -         -     opaque    rw     null:
   -         -     opaque    rw     system:
   -         -     opaque    ro     xmodem:
   -         -     opaque    ro     ymodem:
```

### Table B-1  `show file systems` Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size(b)</td>
<td>Amount of memory in the file system in bytes.</td>
</tr>
<tr>
<td>Free(b)</td>
<td>Amount of free memory in the file system in bytes.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of file system.</td>
</tr>
<tr>
<td></td>
<td><strong>flash</strong>—The file system is for a flash memory device.</td>
</tr>
<tr>
<td></td>
<td><strong>nvram</strong>—The file system is for a NVRAM device.</td>
</tr>
<tr>
<td></td>
<td><strong>opaque</strong>—The file system is a locally generated pseudo file system (for example, the <code>system</code>) or a download interface, such as brimux.</td>
</tr>
<tr>
<td></td>
<td><strong>unknown</strong>—The file system is an unknown type.</td>
</tr>
<tr>
<td>Flags</td>
<td>Permission for file system.</td>
</tr>
<tr>
<td></td>
<td><strong>ro</strong>—read-only.</td>
</tr>
<tr>
<td></td>
<td><strong>rw</strong>—read/write.</td>
</tr>
<tr>
<td></td>
<td><strong>wo</strong>—write-only.</td>
</tr>
<tr>
<td>Prefixes</td>
<td>Alias for file system.</td>
</tr>
<tr>
<td></td>
<td><strong>flash</strong>—Flash file system.</td>
</tr>
<tr>
<td></td>
<td><strong>nvram</strong>—NVRAM.</td>
</tr>
<tr>
<td></td>
<td><strong>null</strong>—Null destination for copies. You can copy a remote file to null to find its size.</td>
</tr>
<tr>
<td></td>
<td><strong>rcp</strong>—Remote Copy Protocol (RCP) network server.</td>
</tr>
<tr>
<td></td>
<td><strong>system</strong>—Contains the system memory, including the running configuration.</td>
</tr>
<tr>
<td></td>
<td><strong>tftp</strong>—TFTP network server.</td>
</tr>
<tr>
<td></td>
<td><strong>xmodem</strong>—Obtain the file from a network machine by using the Xmodem protocol.</td>
</tr>
<tr>
<td></td>
<td><strong>ymodem</strong>—Obtain the file from a network machine by using the Ymodem protocol.</td>
</tr>
</tbody>
</table>
Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the `cd filesystem:` privileged EXEC command. You can set the default file system to omit the `filesystem:` argument from related commands. For example, for all privileged EXEC commands that have the optional `filesystem:` argument, the system uses the file system specified by the `cd` command.

By default, the default file system is `flash:`.

You can display the current default file system as specified by the `cd` command by using the `pwd` privileged EXEC command.

Displaying Information about Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command.

To display information about files on a file system, use one of the privileged EXEC commands in Table B-2:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dir [/all] [filesystem:][filename]</code></td>
<td>Display a list of files on a file system.</td>
</tr>
<tr>
<td><code>show file systems</code></td>
<td>Display more information about each of the files on a file system.</td>
</tr>
<tr>
<td><code>show file information file-url</code></td>
<td>Display information about a specific file.</td>
</tr>
<tr>
<td><code>show file descriptors</code></td>
<td>Display a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.</td>
</tr>
</tbody>
</table>

Changing Directories and Displaying the Working Directory

Beginning in privileged EXEC mode, follow these steps to change directories and display the working directory.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Step 1 dir filesystem:</code></td>
<td>Display the directories on the specified file system. For <code>filesystem:</code>, use <code>flash:</code> for the system board flash device.</td>
</tr>
<tr>
<td><code>Step 2 cd new_configs</code></td>
<td>Change to the directory of interest. The command example shows how to change to the directory named <code>new_configs</code>.</td>
</tr>
<tr>
<td><code>Step 3 pwd</code></td>
<td>Display the working directory.</td>
</tr>
</tbody>
</table>
Creating and Removing Directories

Beginning in privileged EXEC mode, follow these steps to create and remove a directory:

### Step 1
**Command:** dir filesystem:  
**Purpose:** Display the directories on the specified file system.  
For filesystem:, use flash: for the system board flash device.

### Step 2
**Command:** mkdir old_configs  
**Purpose:** Create a new directory.  
The command example shows how to create the directory named old_configs.  
Directory names are case sensitive.  
Directory names are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

### Step 3
**Command:** dir filesystem:  
**Purpose:** Verify your entry.

To delete a directory with all its files and subdirectories, use the `delete /force /recursive filesystem:file-url` privileged EXEC command.

Use the `/recursive` keyword to delete the named directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the `/force` and `/recursive` keywords for deleting old software images that were installed by using the `archive download-sw` command but are no longer needed.

For filesystem, use flash: for the system board flash device. For file-url, enter the name of the directory to be deleted. All the files in the directory and the directory are removed.

⚠️ **Caution**  
When files and directories are deleted, their contents cannot be recovered.

Copying Files

To copy a file from a source to a destination, use the `copy source-url destination-url` privileged EXEC command. For the source and destination URLs, you can use running-config and startup-config keyword shortcuts. For example, the `copy running-config startup-config` command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (xmodem:, ymodem:) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, and tftp: and have these syntaxes:

- **FTP**—`ftp:[][//username [password]@location][directory][filename]`
- **RCP**—`rcp:[][//username@location][directory][filename]`
- **TFTP**—`tftp:[][//location][directory][filename]`
In addition, the Secure Copy Protocol (SCP) provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools. See the “Configuring the Switch for Secure Copy Protocol” section on page 8-41.

Local writable file systems include flash:.

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the `copy flash: flash:` command is invalid)

For specific examples of using the `copy` command with configuration files, see the “Working with Configuration Files” section on page B-8.

To copy software images either by downloading a new version or by uploading the existing one, use the `archive download-sw` or the `archive upload-sw` privileged EXEC command. For more information, see the “Working with Software Images” section on page B-23.

### Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the `delete [force] [recursive] [filesystem:]file-url` privileged EXEC command.

Use the `recursive` keyword for deleting a directory and all subdirectories and the files contained in it. Use the `force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the `force` and `recursive` keywords for deleting old software images that were installed by using the `archive download-sw` command but are no longer needed.

If you omit the `filesystem:` option, the switch uses the default device specified by the `cd` command. For `file-url`, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

When files are deleted, their contents cannot be recovered.

This example shows how to delete the file `myconfig` from the default flash memory device:

```bash
Switch# delete myconfig
```
Creating, Displaying, and Extracting tar Files

You can create a tar file and write files into it, list the files in a tar file, and extract the files from a tar file as described in the next sections.

**Note**

Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files.

Creating a tar File

To create a tar file and write files into it, use this privileged EXEC command:

```
archive tar /create destination-url flash:/file-url
```

For `destination-url`, specify the destination URL alias for the local or network file system and the name of the tar file to create. These options are supported:

- For the local flash file system, the syntax is `flash:`
- For the FTP, the syntax is `ftp:[//username[:password]@location]/directory]/tar-file.tar`
- For the RCP, the syntax is `rcp:[//username@location]/directory]/tar-file.tar`
- For the TFTP, the syntax is `tftp:[//location]/directory]/tar-file.tar`

The `tar-file.tar` is the tar file to be created.

For `flash:/file-url`, specify the location on the local flash file system from which the new tar file is created. You can also specify an optional list of files or directories within the source directory to write to the new tar file. If none are specified, all files and directories at this level are written to the newly created tar file.

This example shows how to create a tar file. This command writes the contents of the `new-configs` directory on the local flash device to a file named `saved.tar` on the TFTP server at 172.20.10.30:

```
Switch# archive tar /create tftp:172.20.10.30/saved.tar flash:/new-configs
```

Displaying the Contents of a tar File

To display the contents of a tar file on the screen, use this privileged EXEC command:

```
archive tar /table source-url
```

For `source-url`, specify the source URL alias for the local or network file system. These options are supported:

- For the local flash file system, the syntax is `flash:`
- For the FTP, the syntax is `ftp:[//username[:password]@location]/directory]/tar-file.tar`
For the RCP, the syntax is
\texttt{rcp://[//username@location]/directory]/tar-filename.tar}

For the TFTP, the syntax is
\texttt{tftp://[//location]/directory]/tar-filename.tar}

The \texttt{tar-filename.tar} is the tar file to display.

This example shows how to display the contents of a switch tar file that is in flash memory:

\begin{verbatim}
Switch# archive tar /table flash:image-name.tar
info (219 bytes)
image-name/ (directory)
image-name/html/ (directory)
image-name/html/foo.html (0 bytes)
image-name/image-name.bin (4527884 bytes)
image-name/info (346 bytes)
info (110 bytes)
\end{verbatim}

\textbf{Extracting a tar File}

To extract a tar file into a directory on the flash file system, use this privileged EXEC command:

\texttt{archive tar /xtract source-url flash:/file-url [dir/file...]}\newline

For \texttt{source-url}, specify the source URL alias for the local file system. These options are supported:

- For the local flash file system, the syntax is \texttt{flash:}
- For the FTP, the syntax is \texttt{ftp://[//username[:password@]location]/directory]/tar-filename.tar}
- For the RCP, the syntax is \texttt{rcp://[//username@location]/directory]/tar-filename.tar}
- For the TFTP, the syntax is \texttt{tftp://[//location]/directory]/tar-filename.tar}

The \texttt{tar-filename.tar} is the tar file from which to extract files.

For \texttt{flash:/file-url [dir/file...]}, specify the location on the local flash file system into which the tar file is extracted. Use the \texttt{dir/file...} option to specify an optional list of files or directories within the tar file to be extracted. If none are specified, all files and directories are extracted.

This example shows how to extract the contents of a tar file located on the TFTP server at 172.20.10.30. This command extracts just the \texttt{new-configs} directory into the root directory on the local flash file system. The remaining files in the \texttt{saved.tar} file are ignored.

\begin{verbatim}
Switch# archive tar /xtract tftp://172.20.10.30/saved.tar flash:/new-configs
\end{verbatim}
Displaying the Contents of a File

To display the contents of any readable file, including a file on a remote file system, use the `more [\ascii | /binary | /ebcdic] file-url` privileged EXEC command:

This example shows how to display the contents of a configuration file on a TFTP server:

```
Switch# more tftp://serverA/hampton/savedconfig
!
! Saved configuration on server
!
version 11.3
service timestamps log datetime localtime
service linenumber
service udp-small-servers
service pt-vty-logging
!
<output truncated>
```

Working with Configuration Files

This section describes how to create, load, and maintain configuration files.

Configuration files contain commands entered to customize the function of the Cisco IOS software. A way to create a basic configuration file is to use the `setup` program or to enter the `setup` privileged EXEC command. For more information, see Chapter 3, “Assigning the Switch IP Address and Default Gateway.”

You can copy (download) configuration files from a TFTP, FTP, or RCP server to the running configuration or startup configuration of the switch. You might want to perform this for one of these reasons:

- To restore a backed-up configuration file.
- To use the configuration file for another switch. For example, you might add another switch to your network and want it to have a configuration similar to the original switch. By copying the file to the new switch, you can change the relevant parts rather than recreating the whole file.
- To load the same configuration commands on all the switches in your network so that all the switches have similar configurations.

You can copy (upload) configuration files from the switch to a file server by using TFTP, FTP, or RCP. You might perform this task to back up a current configuration file to a server before changing its contents so that you can later restore the original configuration file from the server.

The protocol you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.

These sections contain this configuration information:

- Guidelines for Creating and Using Configuration Files, page B-9
- Configuration File Types and Location, page B-9
- Creating a Configuration File By Using a Text Editor, page B-10
- Copying Configuration Files By Using TFTP, page B-10
- Copying Configuration Files By Using FTP, page B-12
Guidelines for Creating and Using Configuration Files

Creating configuration files can aid in your switch configuration. Configuration files can contain some or all of the commands needed to configure one or more switches. For example, you might want to download the same configuration file to several switches that have the same hardware configuration.

Use these guidelines when creating a configuration file:

- We recommend that you connect through the console port for the initial configuration of the switch. If you are accessing the switch through a network connection instead of through a direct connection to the console port, keep in mind that some configuration changes (such as changing the switch IP address or disabling ports) can cause a loss of connectivity to the switch.
- If no password has been set on the switch, we recommend that you set one by using the `enable secret secret-password` global configuration command.

### Note

The `copy {ftp: | rcp: | tftp:} system:running-config` privileged EXEC command loads the configuration files on the switch as if you were entering the commands at the command line. The switch does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration might not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, copy the configuration file directly to the startup configuration (by using the `copy {ftp: | rcp: | tftp:} nvr:ram:startup-config` privileged EXEC command), and reload the switch.

Configuration File Types and Location

Startup configuration files are used during system startup to configure the software. Running configuration files contain the current configuration of the software. The two configuration files can be different. For example, you might want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration but not save the configuration by using the `copy running-config startup-config` privileged EXEC command.

The running configuration is saved in DRAM; the startup configuration is stored in the NVRAM section of flash memory.
Creating a Configuration File By Using a Text Editor

When creating a configuration file, you must list commands logically so that the system can respond appropriately. This is one method of creating a configuration file:

**Step 1**  Copy an existing configuration from a switch to a server.

For more information, see the “Downloading the Configuration File By Using TFTP” section on page B-11, the “Downloading a Configuration File By Using FTP” section on page B-13, or the “Downloading a Configuration File By Using RCP” section on page B-17.

**Step 2**  Open the configuration file in a text editor, such as vi or emacs on UNIX or Notepad on a PC.

**Step 3**  Extract the portion of the configuration file with the desired commands, and save it in a new file.

**Step 4**  Copy the configuration file to the appropriate server location. For example, copy the file to the TFTP directory on the workstation (usually /tftpboot on a UNIX workstation).

**Step 5**  Make sure the permissions on the file are set to world-read.

Copying Configuration Files By Using TFTP

You can configure the switch by using configuration files you create, download from another switch, or download from a TFTP server. You can copy (upload) configuration files to a TFTP server for storage.

These sections contain this configuration information:

- Preparing to Download or Upload a Configuration File By Using TFTP, page B-10
- Downloading the Configuration File By Using TFTP, page B-11
- Uploading the Configuration File By Using TFTP, page B-11

Preparing to Download or Upload a Configuration File By Using TFTP

Before you begin downloading or uploading a configuration file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the /etc/inetd.conf file contains this line:

  tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot

  Make sure that the /etc/services file contains this line:

  tftp 69/udp

  **Note**  You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inetd process and restart it, or enter a **fastboot** command (on the SunOS 4.x) or a **reboot** command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the **ping** command.
• Ensure that the configuration file to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).
• For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.
• Before uploading the configuration file, you might need to create an empty file on the TFTP server. To create an empty file, enter the `touch filename` command, where `filename` is the name of the file you will use when uploading it to the server.
• During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.

**Downloading the Configuration File By Using TFTP**

To configure the switch by using a configuration file downloaded from a TFTP server, follow these steps:

**Step 1** Copy the configuration file to the appropriate TFTP directory on the workstation.

**Step 2** Verify that the TFTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using TFTP” section on page B-10.

**Step 3** Log into the switch through the console port or a Telnet session.

**Step 4** Download the configuration file from the TFTP server to configure the switch.

Specify the IP address or hostname of the TFTP server and the name of the file to download.

Use one of these privileged EXEC commands:

- `copy tftp://[[/location]/directory]/filename system:running-config`
- `copy tftp://[[/location]/directory]/filename nvram:startup-config`

The configuration file downloads, and the commands are executed as the file is parsed line-by-line.

This example shows how to configure the software from the file `tokyo-config` at IP address 172.16.2.155:

```
Switch# copy tftp://172.16.2.155/tokyo-config system:running-config
Configure using tokyo-config from 172.16.2.155? [confirm] y
Booting tokyo-config from 172.16.2.155:!!! [OK - 874/16000 bytes]
```

**Uploading the Configuration File By Using TFTP**

To upload a configuration file from a switch to a TFTP server for storage, follow these steps:

**Step 1** Verify that the TFTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using TFTP” section on page B-10.

**Step 2** Log into the switch through the console port or a Telnet session.

**Step 3** Upload the switch configuration to the TFTP server. Specify the IP address or hostname of the TFTP server and the destination filename.

Use one of these privileged EXEC commands:

- `copy system:running-config tftp://[[/location]/directory]/filename`
- `copy nvram:startup-config tftp://[[/location]/directory]/filename`
The file is uploaded to the TFTP server.

This example shows how to upload a configuration file from a switch to a TFTP server:

```
Switch# copy system:running-config tftp://172.16.2.155/tokyo-config
Write file tokyo-config on host 172.16.2.155? [confirm] y
#
Writing tokyo-config!!! [OK]
```

### Copying Configuration Files By Using FTP

You can copy configuration files to or from an FTP server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server.

When you copy a configuration file from the switch to a server by using FTP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `copy` command if a username is specified.
- The username set by the `ip ftp username username` global configuration command if the command is configured.
- Anonymous.

The switch sends the first valid password in this list:

- The password specified in the `copy` command if a password is specified.
- The password set by the `ip ftp password password` global configuration command if the command is configured.
- The switch forms a password named `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured hostname, and `domain` is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept your FTP write request.

Use the `ip ftp username` and `ip ftp password` commands to specify a username and password for all copies. Include the username in the `copy` command if you want to specify only a username for that copy operation.

If the server has a directory structure, the configuration file is written to or copied from the directory associated with the username on the server. For example, if the configuration file resides in the home directory of a user on the server, specify that user's name as the remote username.

For more information, see the documentation for your FTP server.

These sections contain this configuration information:

- Preparing to Download or Upload a Configuration File By Using FTP, page B-13
- Downloading a Configuration File By Using FTP, page B-13
- Uploading a Configuration File By Using FTP, page B-14
Preparing to Download or Upload a Configuration File By Using FTP

Before you begin downloading or uploading a configuration file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the ping command.

- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the show users privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the ip ftp username username global configuration command during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the copy command if you want to specify a username for only that copy operation.

- When you upload a configuration file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

Downloading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using FTP:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Verify that the FTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using FTP” section on page B-13.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td>Step 3</td>
<td>configure terminal Enter global configuration mode on the switch. This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).</td>
</tr>
<tr>
<td>Step 4</td>
<td>ip ftp username username (Optional) Change the default remote username.</td>
</tr>
<tr>
<td>Step 5</td>
<td>ip ftp password password (Optional) Change the default password.</td>
</tr>
<tr>
<td>Step 6</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>copy ftp://[username[:password]@]location][directory][filename] system:running-config or copy ftp://[username[:password]@]location][directory][filename] nvram:startup-config Using FTP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
</tbody>
</table>
This example shows how to copy a configuration file named `host1-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 and to load and run those commands on the switch:

```
Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]
Switch#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. The software copies the configuration file `host2-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 to the switch startup configuration.

```
Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp:nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config:![OK]
[OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by ftp from 172.16.101.101
```

### Uploading a Configuration File By Using FTP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using FTP:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Verify that the FTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using FTP” section on page B-13.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td>Step 3 <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 4 <code>ip ftp username username</code></td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>Step 5 <code>ip ftp password password</code></td>
<td>(Optional) Change the default password.</td>
</tr>
</tbody>
</table>
This example shows how to copy the running configuration file named `switch2-confg` to the `netadmin1` directory on the remote host with an IP address of 172.16.101.101:

```plaintext
Switch# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/switch2-confg
Write file switch2-confg on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#
```

This example shows how to store a startup configuration file on a server by using FTP to copy the file:

```plaintext
Switch# configure terminal
Switch(config)# ip ftp username netadmin2
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy nvram:startup-config ftp://[username[:password]@]location/directory/ 
Remote host[]? 172.16.101.101
Name of configuration file to write [switch2-confg]?
Write file switch2-confg on host 172.16.101.101?[confirm]
! [OK]
```

### Copying Configuration Files By Using RCP

The RCP provides another method of downloading, uploading, and copying configuration files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

The RCP requires a client to send a remote username with each RCP request to a server. When you copy a configuration file from the switch to a server, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `copy` command if a username is specified.
- The username set by the `ip rcmd remote-user name username` global configuration command if the command is configured.
Preparing to Download or Upload a Configuration File By Using RCP

Before you begin downloading or uploading a configuration file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username` global configuration command to be used during all copy operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the RCP username. Include the username in the `copy` command if you want to specify a username for only that copy operation.
- When you upload a file to the RCP server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the `.rhosts` file for the remote user on the RCP server. For example, suppose that the switch contains these configuration lines:

  ```
  hostname Switch1
  ip rcmd remote-username User0
  ```

  If the switch IP address translates to `Switch1.company.com`, the `.rhosts` file for User0 on the RCP server should contain this line:

  ```
  Switch1.company.com Switch1
  ```

  For more information, see the documentation for your RCP server.
### Working with Configuration Files

#### Downloading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to download a configuration file by using RCP:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using RCP” section on page B-16.</td>
</tr>
<tr>
<td>2</td>
<td></td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>Enter global configuration mode. This step is required only if you override the default remote username (see Steps 4 and 5).</td>
</tr>
<tr>
<td>4</td>
<td></td>
<td>(Optional) Specify the remote username.</td>
</tr>
<tr>
<td>5</td>
<td></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>6</td>
<td></td>
<td>Using RCP, copy the configuration file from a network server to the running configuration or to the startup configuration file.</td>
</tr>
</tbody>
</table>

This example shows how to copy a configuration file named `host1-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 and load and run those commands on the switch:

```
Switch# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config::!|OK|
Switch#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

This example shows how to specify a remote username of `netadmin1`. Then it copies the configuration file `host2-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin1
Switch(config)# end
Switch# copy rcp://netadmin1@172.16.101.101/host2-config nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config::!|OK|
[OK]
Switch#
%SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by rcp from 172.16.101.101
```
Uploading a Configuration File By Using RCP

Beginning in privileged EXEC mode, follow these steps to upload a configuration file by using RCP:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using RCP” section on page B-16.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>This step is required only if you override the default remote username (see Steps 4 and 5).</td>
</tr>
<tr>
<td>ip rcmd remote-username username</td>
<td>(Optional) Specify the remote username.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Using RCP, copy the configuration file from a switch running or startup configuration file to a network server.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Using RCP, copy the configuration file from a switch running or startup configuration file to a network server.</td>
</tr>
</tbody>
</table>

This example shows how to copy the running configuration file named switch2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```bash
Switch# copy system:running-config rcp://netadmin1@172.16.101.101/switch2-config
Write file switch-conf on host 172.16.101.101?[confirm] Building configuration...[OK] Connected to 172.16.101.101 Switch#
```

This example shows how to store a startup configuration file on a server:

```bash
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin2
Switch(config)# end
Switch# copy nvram:startup-config rcp:
Remote host[?]: 172.16.101.101
Name of configuration file to write [switch2-conf]? Write file switch2-conf on host 172.16.101.101?[confirm] ![OK]
```

Clearing Configuration Information

You can clear the configuration information from the startup configuration. If you reboot the switch with no startup configuration, the switch enters the setup program so that you can reconfigure the switch with all new settings.
Clearing the Startup Configuration File

To clear the contents of your startup configuration, use the `erase nvram:` or the `erase startup-config` privileged EXEC command.

⚠️ Caution
You cannot restore the startup configuration file after it has been deleted.

Deleting a Stored Configuration File

To delete a saved configuration from flash memory, use the `delete flash:filename` privileged EXEC command. Depending on the setting of the `file prompt` global configuration command, you might be prompted for confirmation before you delete a file. By default, the switch prompts for confirmation on destructive file operations. For more information about the `file prompt` command, see the *Cisco IOS Command Reference for Release 12.2*.

⚠️ Caution
You cannot restore a file after it has been deleted.

Replacing and Rolling Back Configurations

The configuration replacement and rollback feature replaces the running configuration with any saved Cisco IOS configuration file. You can use the rollback function to roll back to a previous configuration.

These sections contain this information:

- Understanding Configuration Replacement and Rollback, page B-19
- Configuration Replacement and Rollback Guidelines, page B-20
- Configuring the Configuration Archive, page B-21
- Performing a Configuration Replacement or Rollback Operation, page B-22

Understanding Configuration Replacement and Rollback

- Archiving a Configuration, page B-19
- Replacing a Configuration, page B-20
- Rolling Back a Configuration, page B-20

Archiving a Configuration

The configuration archive provides a mechanism to store, organize, and manage an archive of configuration files. The `configure replace` privileged EXEC command increases the configuration rollback capability. As an alternative, you can save copies of the running configuration by using the `copy running-config destination-url` privileged EXEC command, storing the replacement file either locally or remotely. However, this method lacks any automated file management. The configuration replacement and rollback feature can automatically save copies of the running configuration to the configuration archive.

You use the `archive config` privileged EXEC command to save configurations in the configuration archive by using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. You can specify
how many versions of the running configuration are kept in the archive. After the maximum number of files are saved, the oldest file is automatically deleted when the next, most recent file is saved. The show archive privileged EXEC command displays information for all the configuration files saved in the configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the configure replace command, is in any of these file systems: FTP, HTTP, RCP, TFTP.

Replacing a Configuration

The configure replace privileged EXEC command replaces the running configuration with any saved configuration file. When you enter the configure replace command, the running configuration is compared with the specified replacement configuration, and a set of configuration differences is generated. The resulting differences are used to replace the configuration. The configuration replacement operation is usually completed in no more than three passes. To prevent looping behavior no more than five passes are performed.

You can use the copy source-url running-config privileged EXEC command to copy a stored configuration file to the running configuration. When using this command as an alternative to the configure replace target-url privileged EXEC command, note these major differences:

- The copy source-url running-config command is a merge operation and preserves all the commands from both the source file and the running configuration. This command does not remove commands from the running configuration that are not present in the source file. In contrast, the configure replace target-url command removes commands from the running configuration that are not present in the replacement file and adds commands to the running configuration that are not present.

- You can use a partial configuration file as the source file for the copy source-url running-config command. You must use a complete configuration file as the replacement file for the configure replace target-url command.

Rolling Back a Configuration

You can also use the configure replace command to roll back changes that were made since the previous configuration was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the configuration rollback capability reverts to a specific configuration based on a saved configuration file.

If you want the configuration rollback capability, you must first save the running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes by using the configure replace target-url command.

You can specify any saved configuration file as the rollback configuration. You are not limited to a fixed number of rollbacks, as is the case in some rollback models.

Configuration Replacement and Rollback Guidelines

- Make sure that the switch has free memory larger than the combined size of the two configuration files (the running configuration and the saved replacement configuration). Otherwise, the configuration replacement operation fails.

- Make sure that the switch also has sufficient free memory to execute the configuration replacement or rollback configuration commands.
• Certain configuration commands, such as those pertaining to physical components of a networking device (for example, physical interfaces), cannot be added or removed from the running configuration.
  – A configuration replacement operation cannot remove the `interface interface-id` command line from the running configuration if that interface is physically present on the device.
  – The `interface interface-id` command line cannot be added to the running configuration if no such interface is physically present on the device.

• When using the `configure replace` command, you must specify a saved configuration as the replacement configuration file for the running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the `copy running-config destination-url` command).

Note: If you generate the replacement configuration file externally, it must comply with the format of files generated by Cisco IOS devices.

### Configuring the Configuration Archive

Using the `configure replace` command with the configuration archive and with the `archive config` command is optional but offers significant benefit for configuration rollback scenarios. Before using the `archive config command`, you must first configure the configuration archive. Starting in privileged EXEC mode, follow these steps to configure the configuration archive:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>archive</code></td>
<td>Enter archive configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>path url</code></td>
<td>Specify the location and filename prefix for the files in the configuration archive.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>maximum number</code></td>
<td>(Optional) Set the maximum number of archive files of the running configuration to be saved in the configuration archive.</td>
</tr>
<tr>
<td><code>number</code></td>
<td><code>number</code>—Maximum files of the running configuration file in the configuration archive. Valid values are from 1 to 14. The default is 10.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Before using this command, you must first enter the <code>path archive configuration</code> command to specify the location and filename prefix for the files in the configuration archive.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>time-period minutes</code></td>
<td>(Optional) Set the time increment for automatically saving an archive file of the running configuration in the configuration archive.</td>
</tr>
<tr>
<td><code>minutes</code></td>
<td><code>minutes</code>—Specify how often, in minutes, to automatically save an archive file of the running configuration in the configuration archive.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Verify the configuration.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Performing a Configuration Replacement or Rollback Operation

Beginning in privileged EXEC mode, follow these steps to replace the running configuration file with a saved configuration file:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>archive config</td>
<td>(Optional) Save the running configuration file to the configuration archive.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Enter the <strong>path</strong> archive configuration command before using this command.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Make necessary changes to the running configuration.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>exit</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>configure replace target-url [list] [force] [time seconds] [nolock]</td>
<td>Replace the running configuration file with a saved configuration file.</td>
</tr>
<tr>
<td></td>
<td><strong>target-url</strong>—URL (accessible by the file system) of the saved configuration file that is to replace the running configuration, such as the configuration file created in Step 2 by using the <strong>archive config</strong> privileged EXEC command.</td>
</tr>
<tr>
<td></td>
<td><strong>list</strong>—Display a list of the command entries applied by the software parser during each pass of the configuration replacement operation. The total number of passes also appears.</td>
</tr>
<tr>
<td></td>
<td><strong>force</strong>—Replace the running configuration file with the specified saved configuration file without prompting you for confirmation.</td>
</tr>
<tr>
<td></td>
<td><strong>time seconds</strong>—Specify the time (in seconds) within which you must enter the <strong>configure confirm</strong> command to confirm replacement of the running configuration file. If you do not enter the <strong>configure confirm</strong> command within the specified time limit, the configuration replacement operation is automatically stopped. (In other words, the running configuration file is restored to the configuration that existed before you entered the <strong>configure replace</strong> command).</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> You must first enable the configuration archive before you can use the <strong>time seconds</strong> command line option.</td>
</tr>
<tr>
<td></td>
<td><strong>nolock</strong>—Disable the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replacement operation.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>configure confirm</td>
<td>(Optional) Confirm replacement of the running configuration with a saved configuration file.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Use this command only if the <strong>time seconds</strong> keyword and argument of the <strong>configure replace</strong> command are specified.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Working with Software Images

This section describes how to archive (download and upload) software image files, which contain the system software, the Cisco IOS code, and the embedded device manager software.

Instead of using the copy privileged EXEC command or the archive tar privileged EXEC command, we recommend using the archive download-sw and archive upload-sw privileged EXEC commands to download and upload software image files.

You can download a switch image file from a TFTP, FTP, or RCP server to upgrade the switch software. For information about upgrading your switch by using a TFTP server, see the release notes.

You can replace the current image with the new one or keep the current image in flash memory after a download.

You upload a switch image file to a TFTP, FTP, or RCP server for backup purposes. You can use this uploaded image for future downloads to the same switch or to another of the same type.

The protocol that you use depends on which type of server you are using. The FTP and RCP transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because FTP and RCP are built on and use the TCP/IP stack, which is connection-oriented.

These sections contain this configuration information:

- Image Location on the Switch, page B-23
- tar File Format of Images on a Server or Cisco.com, page B-24
- Copying Image Files By Using TFTP, page B-24
- Copying Image Files By Using FTP, page B-28
- Copying Image Files By Using RCP, page B-32

For a list of software images and the supported upgrade paths, see the release notes for your switch.

Image Location on the Switch

The Cisco IOS image is stored as a .bin file in a directory that shows the version number. A subdirectory contains the files needed for web management. The image is stored on the system board flash memory (flash:).

You can use the show version privileged EXEC command to see the software version that is currently running on your switch. In the display, check the line that begins with System image file is... It shows the directory name in flash memory where the image is stored.

You can also use the dir filesystem: privileged EXEC command to see the directory names of other software images that you might have stored in flash memory.
Appendix B      Working with the Cisco IOS File System, Configuration Files, and Software Images

Working with Software Images

tar File Format of Images on a Server or Cisco.com

Software images located on a server or downloaded from Cisco.com are provided in a tar file format, which contains these files:

- An info file, which serves as a table of contents for the tar file
- One or more subdirectories containing other images and files, such as Cisco IOS images

This example shows some of the information contained in the info file. Table B-3 provides additional details about this information:

```plaintext
version_suffix: image-name  
version_directory: image-name
image_system_type_id: 0x00000000
image_name: image-name .bin
ios_image_file_size: 4526592
total_image_file_size: 4526592
image_feature: LAYER_2|MIN_DRAM_MEG=64
image_family: family
stacking_number: 1.11
board_ids: 0x00000029
info_end:
```

Note

Disregard the stacking_number field. It does not apply to the switch.

<table>
<thead>
<tr>

Copying Image Files By Using TFTP

You can download a switch image from a TFTP server or upload the image from the switch to a TFTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes; this uploaded image can be used for future downloads to the same or another switch of the same type.
Preparing to Download or Upload an Image File By Using TFTP

Before you begin downloading or uploading an image file by using TFTP, do these tasks:

- Ensure that the workstation acting as the TFTP server is properly configured. On a Sun workstation, make sure that the /etc/inetd.conf file contains this line:
  ```
  tftp dgram udp wait root /usr/etc/in.tftpd in.tftpd -p -s /tftpboot
  ```
  Make sure that the /etc/services file contains this line:
  ```
  tftp 69/udp
  ```

  **Note** You must restart the inetd daemon after modifying the /etc/inetd.conf and /etc/services files. To restart the daemon, either stop the inetd process and restart it, or enter a `fastboot` command (on the SunOS 4.x) or a `reboot` command (on Solaris 2.x or SunOS 5.x). For more information on the TFTP daemon, see the documentation for your workstation.

- Ensure that the switch has a route to the TFTP server. The switch and the TFTP server must be in the same subnet if you do not have a router to route traffic between subnets. Check connectivity to the TFTP server by using the `ping` command.

- Ensure that the image to be downloaded is in the correct directory on the TFTP server (usually /tftpboot on a UNIX workstation).

- For download operations, ensure that the permissions on the file are set correctly. The permission on the file should be world-read.

- Before uploading the image file, you might need to create an empty file on the TFTP server. To create an empty file, enter the `touch filename` command, where `filename` is the name of the file you will use when uploading the image to the server.

- During upload operations, if you are overwriting an existing file (including an empty file, if you had to create one) on the server, ensure that the permissions on the file are set correctly. Permissions on the file should be world-write.
Appendix B  Working with the Cisco IOS File System, Configuration Files, and Software Images

Working with Software Images

# Downloading an Image File By Using TFTP

You can download a new image file and replace the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 3 to download a new image from a TFTP server and overwrite the existing image. To keep the current image, go to Step 3.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td></td>
<td>Copy the image to the appropriate TFTP directory on the workstation. Make sure the TFTP server is properly configured; see the “Preparing to Download or Upload an Image File By Using TFTP” section on page B-25.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>archive download-sw /overwrite /reload tftp://[location]/[directory]/image-name.tar</code></td>
</tr>
<tr>
<td></td>
<td>• The <code>/overwrite</code> option overwrites the software image in flash memory with the downloaded image.</td>
</tr>
<tr>
<td></td>
<td>• The <code>/reload</code> option reloads the system after downloading the image unless the configuration has been changed and not been saved.</td>
</tr>
<tr>
<td></td>
<td>• For <code>/location</code>, specify the IP address of the TFTP server.</td>
</tr>
<tr>
<td></td>
<td>• For <code>/directory/image-name.tar</code>, specify the directory (optional) and the image to download. Directory and image names are case sensitive.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>archive download-sw /leave-old-sw /reload tftp://[location]/[directory]/image-name.tar</code></td>
</tr>
<tr>
<td></td>
<td>• The <code>/leave-old-sw</code> option keeps the old software version after a download.</td>
</tr>
<tr>
<td></td>
<td>• The <code>/reload</code> option reloads the system after downloading the image unless the configuration has been changed and not been saved.</td>
</tr>
<tr>
<td></td>
<td>• For <code>/location</code>, specify the IP address of the TFTP server.</td>
</tr>
<tr>
<td></td>
<td>• For <code>/directory/image-name.tar</code>, specify the directory (optional) and the image to download. Directory and image names are case sensitive.</td>
</tr>
</tbody>
</table>

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the `/overwrite` option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.

**Note** If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.
If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough space to install the new image and keep the current running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image on the system board flash device (flash://). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the `/leave-old-sw` keyword), you can remove it by entering the `delete /force /recursive filesystem://file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old image. All the files in the directory and the directory are removed.

⚠ **Caution**

For the download and upload algorithms to operate properly, do not rename image names.

### Uploading an Image File By Using TFTP

You can upload an image from the switch to a TFTP server. You can later download this image to the switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to a TFTP server:

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Make sure the TFTP server is properly configured; see the “Preparing to Download or Upload an Image File By Using TFTP” section on page B-25.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Log into the switch through the console port or a Telnet session.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Upload the currently running switch image to the TFTP server.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>archive upload-sw tftp://location/directory/image-name.tar</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- For <code>location</code>, specify the IP address of the TFTP server.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- For <code>/directory/image-name.tar</code>, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The <code>image-name.tar</code> is the name of the software image to be stored on the server.</td>
<td></td>
</tr>
</tbody>
</table>

The `archive upload-sw` privileged EXEC command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

⚠ **Caution**

For the download and upload algorithms to operate properly, do not rename image names.
Copying Image Files By Using FTP

You can download a switch image from an FTP server or upload the image from the switch to an FTP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the switch or another switch of the same type.

**Note**
Instead of using the `copy` privileged EXEC command or the `archive tar` privileged EXEC command, we recommend using the `archive download-sw` and `archive upload-sw` privileged EXEC commands to download and upload software image files.

These sections contain this configuration information:

- Preparing to Download or Upload an Image File By Using FTP, page B-28
- Downloading an Image File By Using FTP, page B-29
- Uploading an Image File By Using FTP, page B-31

Preparing to Download or Upload an Image File By Using FTP

You can copy images files to or from an FTP server.

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy an image file from the switch to a server by using FTP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a username is specified.
- The username set by the `ip ftp username username` global configuration command if the command is configured.
- Anonymous.

The switch sends the first valid password in this list:

- The password specified in the `archive download-sw` or `archive upload-sw` privileged EXEC command if a password is specified.
- The password set by the `ip ftp password password` global configuration command if the command is configured.
- The switch forms a password named `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured hostname, and `domain` is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from you.

Use the `ip ftp username` and `ip ftp password` commands to specify a username and password for all copies. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.
If the server has a directory structure, the image file is written to or copied from the directory associated with the username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user’s name as the remote username.

Before you begin downloading or uploading an image file by using FTP, do these tasks:

- Ensure that the switch has a route to the FTP server. The switch and the FTP server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the FTP server by using the `ping` command.

- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current FTP username is the one that you want to use for the FTP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new FTP username by using the `ip ftp username username` global configuration command. The new username will be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and you do not need to set the FTP username. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username for that operation only.

- When you upload an image file to the FTP server, it must be properly configured to accept the write request from the user on the switch.

For more information, see the documentation for your FTP server.

### Downloading an Image File By Using FTP

You can download a new image file and overwrite the current image or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 7 to download a new image from an FTP server and overwrite the existing image. To keep the current image, go to Step 7.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Verify that the FTP server is properly configured by referring to the “Preparing to Download or Upload an Image File By Using FTP” section on page B-28.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).</td>
</tr>
<tr>
<td><code>ip ftp username username</code></td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td><code>ip ftp password password</code></td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Working with Software Images

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the /overwrite option, the download algorithm removes the existing image on the flash device, whether or not it is the same as the new one, downloads the new image, and then reloads the software.

Note

If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the /overwrite option.

If you specify the /leave-old-sw, the existing files are not removed. If there is not enough space to install the new image and keep the running image, the download process stops, and an error message is displayed.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td>archive download-sw /overwrite /reload</td>
<td>Download the image file from the FTP server to the switch, and overwrite the current image.</td>
</tr>
<tr>
<td>ftp://[[username[:password]@location]/directory]/image-name.tar</td>
<td></td>
</tr>
<tr>
<td>• The /overwrite option overwrites the software image in flash memory with the downloaded image.</td>
<td></td>
</tr>
<tr>
<td>• The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.</td>
<td></td>
</tr>
<tr>
<td>• For /username[:password], specify the username and password; these must be associated with an account on the FTP server. For more information, see the “Preparing to Download or Upload an Image File By Using FTP” section on page B-28.</td>
<td></td>
</tr>
<tr>
<td>• For @location, specify the IP address of the FTP server.</td>
<td></td>
</tr>
<tr>
<td>• For directory/image-name.tar, specify the directory (optional) and the image to download. Directory and image names are case sensitive.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td>archive download-sw /leave-old-sw /reload</td>
<td>Download the image file from the FTP server to the switch, and keep the current image.</td>
</tr>
<tr>
<td>ftp://[[username[:password]@location]/directory]/image-name.tar</td>
<td></td>
</tr>
<tr>
<td>• The /leave-old-sw option keeps the old software version after a download.</td>
<td></td>
</tr>
<tr>
<td>• The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.</td>
<td></td>
</tr>
<tr>
<td>• For /username[:password], specify the username and password. These must be associated with an account on the FTP server. For more information, see the “Preparing to Download or Upload an Image File By Using FTP” section on page B-28.</td>
<td></td>
</tr>
<tr>
<td>• For @location, specify the IP address of the FTP server.</td>
<td></td>
</tr>
<tr>
<td>• For directory/image-name.tar, specify the directory (optional) and the image to download. Directory and image names are case sensitive.</td>
<td></td>
</tr>
</tbody>
</table>
The algorithm installs the downloaded image onto the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old image during the download process (you specified the /leave-old-sw keyword), you can remove it by entering the delete /force /recursive filesystem:/file-url privileged EXEC command. For filesystem, use flash: for the system board flash device. For file-url, enter the directory name of the old software image. All the files in the directory and the directory are removed.

⚠️ Caution
For the download and upload algorithms to operate properly, do not rename image names.

### Uploading an Image File By Using FTP

You can upload an image from the switch to an FTP server. You can later download this image to the same switch or to another switch of the same type.

Use the upload feature only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an FTP server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Verify that the FTP server is properly configured by referring to the “Preparing to Download or Upload a Configuration File By Using FTP” section on page B-13.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td>This step is required only if you override the default remote username or password (see Steps 4, 5, and 6).</td>
</tr>
<tr>
<td>ip ftp username username</td>
<td>(Optional) Change the default remote username.</td>
</tr>
<tr>
<td>Step 5</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>ip ftp password password</td>
<td>(Optional) Change the default password.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Upload the currently running switch image to the FTP server.</td>
</tr>
<tr>
<td>archive upload-sw</td>
<td>Upload the currently running switch image to the FTP server.</td>
</tr>
<tr>
<td>ftp://[//username[:password]@[/location][/directory]/image-name.tar]</td>
<td>• For //username:password, specify the username and password. These must be associated with an account on the FTP server. For more information, see the “Preparing to Download or Upload an Image File By Using FTP” section on page B-28.</td>
</tr>
<tr>
<td></td>
<td>• For @location, specify the IP address of the FTP server.</td>
</tr>
<tr>
<td></td>
<td>• For /directory/image-name.tar, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive. The image-name.tar is the name of the software image to be stored on the server.</td>
</tr>
</tbody>
</table>
The **archive upload-sw** command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

**Caution**

For the download and upload algorithms to operate properly, do **not** rename image names.

## Copying Image Files By Using RCP

You can download a switch image from an RCP server or upload the image from the switch to an RCP server.

You download a switch image file from a server to upgrade the switch software. You can overwrite the current image with the new one or keep the current image after a download.

You upload a switch image file to a server for backup purposes. You can use this uploaded image for future downloads to the same switch or another of the same type.

**Note**

Instead of using the **copy** privileged EXEC command or the **archive tar** privileged EXEC command, we recommend using the **archive download-sw** and **archive upload-sw** privileged EXEC commands to download and upload software image files.

These sections contain this configuration information:

- Preparing to Download or Upload an Image File By Using RCP, page B-32
- Downloading an Image File By Using RCP, page B-33
- Uploading an Image File By Using RCP, page B-35

### Preparing to Download or Upload an Image File By Using RCP

RCP provides another method of downloading and uploading image files between remote hosts and the switch. Unlike TFTP, which uses User Datagram Protocol (UDP), a connectionless protocol, RCP uses TCP, which is connection-oriented.

To use RCP to copy files, the server from or to which you will be copying files must support RCP. The RCP copy commands rely on the rsh server (or daemon) on the remote system. To copy files by using RCP, you do not need to create a server for file distribution as you do with TFTP. You only need to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, RCP creates it for you.

RCP requires a client to send a remote username on each RCP request to a server. When you copy an image from the switch to a server by using RCP, the Cisco IOS software sends the first valid username in this list:

- The username specified in the **archive download-sw** or **archive upload-sw** privileged EXEC command if a username is specified.
- The username set by the **ip rcmd remote-username username** global configuration command if the command is entered.
The remote username associated with the current TTY (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the `username` command, the switch software sends the Telnet username as the remote username.

The switch hostname.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the image file is written to or copied from the directory associated with the remote username on the server. For example, if the image file resides in the home directory of a user on the server, specify that user's name as the remote username.

Before you begin downloading or uploading an image file by using RCP, do these tasks:

- Ensure that the workstation acting as the RCP server supports the remote shell (rsh).
- Ensure that the switch has a route to the RCP server. The switch and the server must be in the same subnetwork if you do not have a router to route traffic between subnets. Check connectivity to the RCP server by using the `ping` command.
- If you are accessing the switch through the console or a Telnet session and you do not have a valid username, make sure that the current RCP username is the one that you want to use for the RCP download. You can enter the `show users` privileged EXEC command to view the valid username. If you do not want to use this username, create a new RCP username by using the `ip rcmd remote-username username` global configuration command to be used during all archive operations. The new username is stored in NVRAM. If you are accessing the switch through a Telnet session and you have a valid username, this username is used, and there is no need to set the RCP username. Include the username in the `archive download-sw` or `archive upload-sw` privileged EXEC command if you want to specify a username only for that operation.
- When you upload an image to the RCP to the server, it must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose the switch contains these configuration lines:

  ```
  hostname Switch1
  ip rcmd remote-username User0
  ```

  If the switch IP address translates to `Switch1.company.com`, the .rhosts file for User0 on the RCP server should contain this line:

  ```
  Switch1.company.com Switch1
  ```

  For more information, see the documentation for your RCP server.

### Downloading an Image File By Using RCP

You can download a new image file and replace or keep the current image.

Beginning in privileged EXEC mode, follow Steps 1 through 6 to download a new image from an RCP server and overwrite the existing image. To keep the current image, go to Step 6.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload an Image File By Using RCP” section on page B-32.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
</tbody>
</table>
### Working with Software Images

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>configure terminal Enter global configuration mode. This step is required only if you override the default remote username (see Steps 4 and 5).</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip rcmd remote-username <em>username</em> (Optional) Specify the remote username.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
| **Step 6** | archive download-sw /overwrite /reload rcp:[[[//|username@|location|directory|image-name.tar] Download the image file from the RCP server to the switch, and overwrite the current image.  
- The /overwrite option overwrites the software image in flash memory with the downloaded image.  
- The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.  
- For /username, specify the username. For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. For more information, see the “Preparing to Download or Upload an Image File By Using RCP” section on page B-32.  
- For @location, specify the IP address of the RCP server.  
- For /directory/image-name.tar, specify the directory (optional) and the image to download. Directory and image names are case sensitive. |
| **Step 7** | archive download-sw /leave-old-sw /reload rcp:[[[//|username@|location|directory|image-name.tar] Download the image file from the RCP server to the switch, and keep the current image.  
- The /leave-old-sw option keeps the old software version after a download.  
- The /reload option reloads the system after downloading the image unless the configuration has been changed and not been saved.  
- For /username, specify the username. For the RCP copy request to execute, an account must be defined on the network server for the remote username. For more information, see the “Preparing to Download or Upload an Image File By Using RCP” section on page B-32.  
- For @location, specify the IP address of the RCP server.  
- For /directory/image-name.tar, specify the directory (optional) and the image to download. Directory and image names are case sensitive. |

The download algorithm verifies that the image is appropriate for the switch model and that enough DRAM is present, or it aborts the process and reports an error. If you specify the /overwrite option, the download algorithm removes the existing image on the flash device whether or not it is the same as the new one, downloads the new image, and then reloads the software.
If the flash device has sufficient space to hold two images and you want to overwrite one of these images with the same version, you must specify the `/overwrite` option.

If you specify the `/leave-old-sw`, the existing files are not removed. If there is not enough room to install the new image an keep the running image, the download process stops, and an error message is displayed.

The algorithm installs the downloaded image onto the system board flash device (flash:). The image is placed into a new directory named with the software version string, and the BOOT environment variable is updated to point to the newly installed image.

If you kept the old software during the download process (you specified the `/leave-old-sw` keyword), you can remove it by entering the `delete /force /recursive filesystem:/file-url` privileged EXEC command. For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the directory name of the old software image. All the files in the directory and the directory are removed.

For the download and upload algorithms to operate properly, do not rename image names.

### Uploading an Image File By Using RCP

You can upload an image from the switch to an RCP server. You can later download this image to the same switch or to another switch of the same type.

The upload feature should be used only if the web management pages associated with the embedded device manager have been installed with the existing image.

Beginning in privileged EXEC mode, follow these steps to upload an image to an RCP server:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Verify that the RCP server is properly configured by referring to the “Preparing to Download or Upload an Image File By Using RCP” section on page B-32.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Log into the switch through the console port or a Telnet session.</td>
</tr>
<tr>
<td>Step 3 <code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 4 <code>ip rcmd remote-username username</code></td>
<td>(Optional) Specify the remote username.</td>
</tr>
</tbody>
</table>
### Command Purpose

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
<th>Return to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 6</td>
<td>archive upload-sw</td>
<td>Upload the currently running switch image to the RCP server.</td>
</tr>
<tr>
<td></td>
<td>rcp:[[[[username@]location]directory]image-name.tar]</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For /username, specify the username; for the RCP copy request to execute, an account must be defined on the network server for the remote username. For more information, see the “Preparing to Download or Upload an Image File By Using RCP” section on page B-32.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For @location, specify the IP address of the RCP server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• For /directory/image-name.tar, specify the directory (optional) and the name of the software image to be uploaded. Directory and image names are case sensitive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• The image-name.tar is the name of software image to be stored on the server.</td>
</tr>
</tbody>
</table>

The **archive upload-sw** privileged EXEC command builds an image file on the server by uploading these files in order: info, the Cisco IOS image, and the web management files. After these files are uploaded, the upload algorithm creates the tar file format.

⚠️ **Caution**

For the download and upload algorithms to operate properly, do not rename image names.
Unsupported Commands in Cisco IOS Release 12.2(44)EY

This appendix lists some of the command-line interface (CLI) commands that appear when you enter the question mark (?) at the Cisco Metro Ethernet (ME) 3400E Ethernet Access switch prompt but are not supported in this release, either because they are not tested or because of switch hardware limitations. This is not a complete list. The unsupported commands are listed by software feature and command mode.

Access Control Lists

Unsupported Privileged EXEC Commands

access-enable [host] [timeout minutes]
access-template [access-list-number | name] [dynamic-name] [source] [destination] [timeout minutes]

Unsupported Global Configuration Commands

access-list rate-limit acl-index {precedence | mask prec-mask}
access-list dynamic extended

ARP Commands

Unsupported Global Configuration Commands

arp ip-address hardware-address smds
arp ip-address hardware-address srp-a
arp ip-address hardware-address srp-b
Unsupported Interface Configuration Commands

- arp probe
- ip probe proxy

Boot Loader Commands

Unsupported User EXEC Command

- verify

Unsupported Global Configuration Command

- boot buffersize

Debug Commands

- debug dot1x feature
- debug platform cli-redirection main
- debug platform configuration
- debug qos

Embedded Event Manager

Unsupported Privileged EXEC Commands

- event manager update user policy [policy-filename | group [group name expression]] | | repository [url location]

Parameters are not supported for this command:

- event manager run [policy name] | <paramater1>|... <paramater15>|

Unsupported Global Configuration Commands

- no event manager directory user repository [url location]
- event manager applet [applet-name] maxrun
Unsupported Commands in Applet Configuration Mode

```plaintext
no event interface name [interface-name] parameter [counter-name] entry-val [entry counter value] entry-op {gt | ge | eq | ne | lt | le} [entry-type {increment | rate | value} [exit-val exit value] exit-op {gt | ge | eq | ne | lt | le} exit-type { increment | rate | value}][average-factor <average-factor-value>]
```

```
no trigger

tag
```

HSRP

Unsupported Global Configuration Commands

```
interface Async
interface BVI
interface Dialer
interface Group-Async
interface Lex
interface Multilink
interface Virtual-Template
interface Virtual-Tokenring
```

Unsupported Interface Configuration Commands

```
mtu
standby mac-refresh seconds
standby use-bia
```

IEEE 802.1x

Unsupported Global Configuration Command

```
dot1x critical
```

Unsupported Interface Configuration Commands

```
dot1x auth-fail
dot1x control-direction
dot1x critical
```
dot1x host-mode multi-domain
dot1x mac-auth-bypass
dot1x pae

Note
The switch does not support the IEEE 802.1x MAC authentication bypass or guest VLAN features.

Unsupported Privileged EXEC Commands

clear dot1x
clear eap sessions
show eap

Unsupported Global Configuration Command

dot1x critical {eapol | recovery delay ms}

Unsupported Interface Configuration Commands

dot1x auth-fail {max-attempts number| vlan vlan-id}
dot1x control-direction {both | in}
dot1x critical {recovery action reinitialize | vlan vlan-id}
dot1x control-direction {both | in}
dot1x mac-auth-bypass
dot1x mac-reauth-req
dot1x pae
dot1x timeout rate-limit period

IGMP Snooping Commands

Unsupported Global Configuration Commands

ip igmp snooping source-only-learning
Interface Commands

Unsupported Privileged EXEC Commands

```
show interfaces [interface-id | vlan vlan-id] [crb | fair-queue | irb | mac-accounting | precedence | irb | random-detect | rate-limit | shape]
```

Unsupported Global Configuration Commands

```
interface tunnel
```

Unsupported Interface Configuration Commands

```
transmit-interface type number
```

IP Multicast Routing

Unsupported Privileged EXEC Commands

```
clear ip rtp header-compression [type number]
clear ip dvmrp route commands
debug ip dvmrp commands
The debug ip packet command displays packets received by the switch CPU. It does not display packets that are hardware-switched.
The debug ip mcache command affects packets received by the switch CPU. It does not display packets that are hardware-switched.
The debug ip mpacket [detail] [access-list-number [group-name-or-address]] command affects only packets received by the switch CPU. Because most multicast packets are hardware-switched, use this command only when you know that the route will forward the packet to the CPU.
debug ip pim atm
show frame-relay ip rtp header-compression [interface type number]
show ip dvmrp route commands
The show ip mcache command displays entries in the cache for those packets that are sent to the switch CPU. Because most multicast packets are switched in hardware without CPU involvement, you can use this command, but multicast packet information is not displayed.
The show ip mpacket commands are supported but are only useful for packets received at the switch CPU. If the route is hardware-switched, the command has no effect because the CPU does not receive the packet and cannot display it.
show ip pim vc [group-address | name] [type number]
show ip rtp header-compression [type number] [detail]
Unsupported Global Configuration Commands

All `ip dvmrp` commands

- `ip multicast-routing vrf vrf-name`
- `ip pim accept-rp {address | auto-rp} [group-access-list-number]`
- `ip pim message-interval seconds`
- `ip pim register-rate-limit`

Unsupported Interface Configuration Commands

- `frame-relay ip rtp header-compression [active | passive]`
- `frame-relay map ip ip-address dlci [broadcast] compress`
- `frame-relay map ip ip-address dlci rtp header-compression [active | passive]`
- All `ip dvmrp` commands
- `ip igmp helper-address ip-address`
- `ip multicast helper-map {group-address | broadcast} {broadcast-address | multicast-address} extended-access-list-number`
- `ip multicast rate-limit {in | out} [video | whiteboard] [group-list access-list] [source-list access-list] kbps`
- `ip multicast ttl-threshold ttl-value` (instead, use the `ip multicast boundary access-list-number` interface configuration command)
- `ip multicast use-functional`
- `ip pim minimum-vc-rate pps`
- `ip pim multipoint-signalling`
- `ip pim nbma-mode`
- `ip pim vc-count number`
- `ip rtp compression-connections number`
- `ip rtp header-compression [passive]`

IP Unicast Routing

Unsupported Privileged EXEC or User EXEC Commands

- `clear ip accounting [checkpoint]`
- `clear ip bgp address flap-statistics`
- `clear ip bgp prefix-list`
- `debug ip cef stats`
- `show cef [drop | not-cef-switched]`
show ip accounting [checkpoint] [output-packets | access-violations]
show ip bgp dampened-paths
show ip bgp inconsistent-as
show ip bgp regexp regular expression
show ip prefix-list regular expression
show ipv6 (all)

Unsupported Global Configuration Commands

ip accounting-list ip-address wildcard
ip as-path access-list
ip accounting-transits count
ip cef accounting [per-prefix] [non-recursive]
ip cef traffic-statistics [load-interval seconds] [update-rate seconds]
ip flow-aggregation
ip flow-cache
ip flow-export
ip gratuitous-arps
ip local
ip prefix-list
ip reflexive-list
router egp
router-isis
router iso-igrp
router mobile
router odr
router static

Unsupported Interface Configuration Commands

dampening
ip load-sharing [per-packet]
ip accounting
ip load-sharing [per-packet]
ip mtu bytes
ip verify
ip unnumbered type number
All ip security commands
Unsupported BGP Router Configuration Commands

- address-family vpnv4
- default-information originate
- neighbor advertise-map
- neighbor allowas-in
- neighbor default-originate
- neighbor description
- network backdoor
- table-map

Unsupported VPN Configuration Commands

- All

Unsupported Route Map Commands

- match route-type for policy-based routing (PBR)
- set as-path { tag | prepend as-path-string }
- set automatic-tag
- set dampening half-life reuse suppress max-suppress-time
- set default interface interface-id [interface-id.....]
- set interface interface-id [interface-id.....]
- set ip default next-hop ip-address [ip-address.....]
- set ip destination ip-address mask
- set ip precedence value
- set ip qos-group
- set metric-type internal
- set origin
- set metric-type internal
- set tag tag-value

MAC Address

Unsupported Privileged EXEC Commands

- show mac-address-table
- show mac-address-table address
show mac-address-table aging-time
show mac-address-table count
show mac-address-table dynamic
show mac-address-table interface
show mac-address-table multicaset
show mac-address-table notification
show mac-address-table static
show mac-address-table vlan
show mac address-table multicast

**Note**  Use the `show ip igmp snooping groups` privileged EXEC command to display Layer 2 multicast address-table entries for a VLAN.

### Unsupported Global Configuration Commands

mac-address-table aging-time
mac-address-table notification
mac-address-table static

### Miscellaneous

### Unsupported User EXEC Commands

verify

### Unsupported Privileged EXEC Commands

archive config
file verify auto
remote command all
show archive config
show archive log
show cable-diagnostics prbs
show power inline
test cable-diagnostics prbs
Unsupported Global Configuration Commands

- exception crashinfo
- errdisable detect cause dhcp-rate-limit
- errdisable recovery cause dhcp-rate-limit
- errdisable recovery cause unicast flood
- l2protocol-tunnel global drop-threshold
- power inline consumption default wattage
- service compress-config
- stack-mac persistent timer
- track object-number rtr

Unsupported show platform Commands

- show platform ip unicast vrf {compaction | tcam-label}
- show platform ipv6 unicast
- show platform tb

MSDP

Unsupported Privileged EXEC Commands

- show access-expression
- show exception
- show location
- show pm LINE
- show smf [interface-id]
- show subscriber-policy [policy-number]
- show template [template-name]

Unsupported Global Configuration Commands

- ip msdp default-peer ip-address | name [prefix-list list] (Because BGP/MBGP is not supported, use the ip msdp peer command instead of this command.)
NetFlow

Unsupported Global Configuration Commands

ip flow-aggregation cache
ip flow-cache entries
ip flow-export

QoS

Unsupported Global Configuration Command

priority-list

Unsupported Interface Configuration Command

priority-group

Unsupported policy-map Class Police Configuration Mode Command

conform-color class-map police configuration

RADIUS

Unsupported Global Configuration Commands

aaa authentication feature default enable
aaa authentication feature default line
aaa nas port extended
radius-server attribute nas-port
radius-server configure
radius-server extended-portnames
SNMP

Unsupported Global Configuration Commands

- `snmp-server enable informs`
- `snmp-server ifindex persist`

Spanning Tree

Unsupported Global Configuration Command

- `spanning-tree pathcost method {long | short}`
- `spanning-tree transmit hold-count`

Unsupported Interface Configuration Command

- `spanning-tree stack-port`

Storm Control

Note

Although visible in the command line interface, commands for configuring small-frame thresholds are not needed on the switch because the existing broadcast storm disable feature correctly handles small frames.

Unsupported Global Configuration Command

- `errdisable detect cause small-frame`
- `errdisable recovery cause small-frame`

Unsupported Interface Configuration Command

- `small-frame violation rate`
VLAN

Unsupported Global Configuration Command

```
vlan internal allocation policy {ascending | descending}
```

Unsupported User EXEC Commands

```
show running-config vlan
show vlan ifindex
```
