Communications, Services, Bias-free Language, and Additional Information

- To receive timely, relevant information from Cisco, sign up at Cisco Profile Manager.
- To get the business impact you're looking for with the technologies that matter, visit Cisco Services.
- To submit a service request, visit Cisco Support.
- To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit Cisco Marketplace.
- To obtain general networking, training, and certification titles, visit Cisco Press.
- To find warranty information for a specific product or product family, access Cisco Warranty Finder.

Documentation Feedback

To provide feedback about Cisco technical documentation, use the feedback form available in the right pane of every online document.

Cisco Bug Search Tool

Cisco Bug Search Tool (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.

Bias-Free Language

The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on standards documentation, or language that is used by a referenced third-party product.

RDMA Over Converged Ethernet (RoCE) Version 2

• RDMA Over Converged Ethernet (RoCE) v2, on page 1

RDMA Over Converged Ethernet (RoCE) v2

RDMA over Converged Ethernet version 2 (RoCEv2) is a network protocol that allows for Remote Direct Memory Access (RDMA) over Ethernet networks. It enables low-latency and high-bandwidth communication between servers or storage systems by leveraging the benefits of RDMA technology. RoCEv2 eliminates the need for traditional TCP/IP networking stack overhead, resulting in improved performance and reduced latency. It allows for efficient data transfers and enables applications to directly access remote memory, enhancing overall network efficiency and scalability. RoCEv2 is often used in data centers and high-performance computing environments to optimize network performance and accelerate data-intensive workloads.

RoCE v2 is supported on Windows, Linux, and ESXi platforms.

RDMA Over Converged Ethernet (RoCE) v2

Configuring SMB Direct with RoCE v2 in Windows

- Guidelines for Using SMB Direct support on Windows using RDMA over converged Ethernet (RoCE) v2, on page 3
- Overview of Configuring RoCE v2 Mode 1 and Mode 2 in Windows, on page 5
- Windows Requirements, on page 5
- Configuring Mode 1 on Cisco Intersight, on page 6
- Configuring SMB Direct Mode 1 on the Host System, on page 10
- Configuring Mode 2 on Cisco Intersight, on page 14
- Configuring Mode 2 on the Host System, on page 16
- Deleting the RoCE v2 Interface Using Cisco Intersight, on page 19

Guidelines for Using SMB Direct support on Windows using RDMA over converged Ethernet (RoCE) v2

General Guidelines and Limitations:

 Cisco Intersight Managed Mode support Microsoft SMB Direct with RoCE v2 on Microsoft Windows Server 2019 and later. Cisco recommends that you have all KB updates from Microsoft for your Windows Server release.

Note

- RoCE v2 is not supported on Microsoft Windows Server 2016.
- Refer to Windows Requirements for specific supported Operating System(OS).
- Cisco recommends you check UCS Hardware and Software Compatibility specific to your UCS Manager release to determine support for Microsoft SMB Direct with RoCE v2 on Microsoft Windows.
- Microsoft SMB Direct with RoCE v2 is supported only with Cisco UCS VIC 1400 Series, VIC 14000, and VIC 15000 Series adapters. It is not supported with UCS VIC 1200 Series and VIC 1300 Series adapters. SMB Direct with RoCE v2 is supported on all UCS Fabric Interconnects.

Note

RoCE v1 is not supported on Cisco UCS VIC 1400 Series, VIC 14000 Series, and VIC 15000 series adapters.

- RoCE v2 configuration is supported only between Cisco adapters. Interoperability between Cisco adapters and third party adapters is not supported.
- RoCE v2 supports two RoCE v2 enabled vNIC per adapter and four virtual ports per adapter interface, independent of SET switch configuration.
- RoCE v2 enabled vNIC interfaces must have the no-drop QoS system class enabled in Cisco Intersight Managed Mode domain profile.
- The RoCE Properties queue pairs setting must for be a minimum of four queue pairs and maximum number of queue pairs per adapter is 2048.
- The QoS No Drop class configuration must be properly configured on upstream switches such as Cisco Nexus 9000 series switches. QoS configurations will vary between different upstream switches.
- The maximum number of memory regions per rNIC interface is 131072.
- SMB Direct with RoCE v2 is supported on both IPv4 and IPv6.
- RoCE v2 cannot be used on the same vNIC interface as NVGRE, NetFlow, and VMQ features.
- RoCE v2 cannot be used with usNIC.
- RoCE v2 cannot be used with GENEVE offload.

MTU Properties:

- In older versions of the VIC driver, the MTU was derived from either a Cisco Intersight server profile
 or from the Cisco IMC vNIC MTU setting in standalone mode. This behavior varies for Cisco UCS VIC
 1400 Series, VIC 14000 Series, and VIC 15000 Series adapters, where MTU is controlled from the
 Windows OS Jumbo Packet advanced property.
- The RoCE v2 MTU value is always power-of-two and its maximum limit is 4096.
- RoCE v2 MTU is derived from the Ethernet MTU.
- RoCE v2 MTU is the highest power-of-two that is less than the Ethernet MTU. For example:
 - If the Ethernet value is 1500, then the RoCE v2 MTU value is 1024
 - If the Ethernet value is 4096, then the RoCE v2 MTU value is 4096
 - If the Ethernet value is 9000, then the RoCE v2 MTU value is 4096

Windows NDPKI Modes of Operation:

- Cisco's implementation of Network Direct Kernel Provider Interface (NDPKI) supports two modes of operation: Mode 1 and Mode 2. Implementation of Network Direct Kernel Provider Interface (NDKPI) differs in Mode 1 and Mode 2 of operation: Mode 1 is native RDMA, and Mode 2 involves configuration for the virtual port with RDMA. Cisco does not support NDPKI Mode 3 operation.
- The recommended default adapter policy for RoCE v2 Mode 1 is Win-HPN-SMBd.

- The recommended default adapter policy for RoCE v2 Mode 2 is MQ-SMBd.
- RoCE v2 enabled vNICs for Mode 2 operation require the QoS host control policy set to full.
- Mode 2 is inclusive of Mode 1: Mode 1 must be enabled to operate Mode 2.
- On Windows, the RoCE v2 interface supports both MSI & MSIx interrupts mode. Default interrupt mode is MSIx. Cisco recommends you avoid changing interrupt mode when the interface is configured with RoCE v2 properties.

Downgrade Limitations:

• Cisco recommends you remove the RoCE v2 configuration before downgrading to any non-supported firmware release. If the configuration is not removed or disabled, downgrade will fail.

Overview of Configuring RoCE v2 Mode 1 and Mode 2 in Windows

Configuration of RoCE v2 on the Windows platform requires first configuring RoCE v2 Mode 1, then configuring RoCE v2 Mode 2.

- To configure RoCE v2 Mode 1, you will:
 - Configure a no-drop class in System QoS policy. Platinum with CoS 5 is a default setting in Cisco Intersight domain profile.
 - Configure Mode 1 in Cisco Intersight by creating an Ethernet Adapter policy or using *Win-HPN-SMBd*, the default (pre-defined) configuration in Ethernet Adapter policy.
 - Configure Mode 1 on the host operating system.
- To configure RoCE v2 Mode 2, RoCE v2 Mode 1 must be configured first and you will:
 - Configure an Ethernet Adapter policy with VMMQ connection or use the *MQ-SMBd* default (pre-defined) configuration in Ethernet Adapter policy for Mode 2 in Cisco Intersight.
 - Configure Mode 2 on the host operating system.

Windows Requirements

Configuration and use of RDMA over Converged Ethernet for RoCE v2 in Windows Server requires the following:

- VIC Driver version 5.4.0.x or later
- Cisco UCS M5 B-Series and C-Series with Cisco UCS 1400 Series adapters.
- Cisco UCS M6 B-Series, C-Series, or X-Series servers with Cisco UCS VIC 1400, VIC 14000, or VIC 15000 series adapters.
- Cisco UCS M7 C-Series, or X-Series servers with Cisco UCS VIC 1400, VIC 14000, or VIC 15000 series adapters.

• Cisco UCS M8 C-Series servers with Cisco UCS VIC 1400, VIC 14000, or VIC 15000 series adapters.

Note

All Powershell commands or advanced property configurations are common across Windows 2019 and 2022 unless explicitly mentioned.

Configuring Mode 1 on Cisco Intersight

Use these steps to configure the RoCE v2 Mode 1 interface on Cisco Interisght.

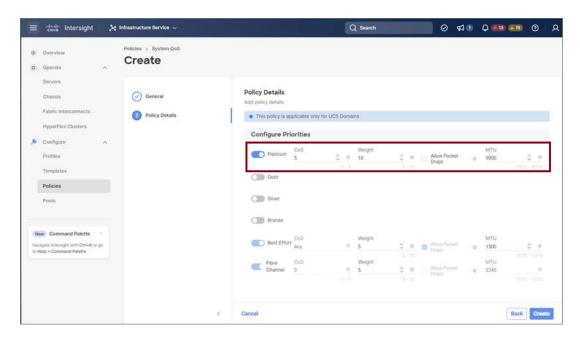

To avoid possible RDMA packet drops, ensure same no-drop COS is configured across the network. The following steps allows you to configure a no-drop class in System QoS policies and use it for RDMA supported interfaces.

Procedure

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Domain platform type, search or choose System QoS, and click Start.
- **Step 2** In the **General** page, enter the policy name and click **Next**, and then in the **Policy Details** page, configure the property setting for System QoS policy as follows:
 - For Priority, choose Platinum
 - For **Allow Packet Drops**, uncheck the check box.

Note

For more information on MTU field, see *MTU Properties* in Guidelines for Using SMB Direct support on Windows using RDMA over converged Ethernet (RoCE) v2, on page 3

Step 3 Click Create

Step 4 Associate the System QoS policy to the Domain Profile and deploy.

Note

For more information, see *Creating System QoS Policy* in Configuring Domain Policies and Configuring Domain Profiles.

The System QoS Policy is successfully created and deployed to the Domain Profile.

What to do next

Configure the server profile with RoCE v2 vNIC settings in LAN Connectivity policy.

Enabling Roce Settings in LAN Connectivity Policy

Use these steps to configure the RoCE v2 vNIC settings in Mode 1. In Cisco Intersight LAN Connectivity policy, you can enable the RoCE settings on **Ethernet QoS** policy and **Ethernet Adapter** policy for Mode 1 configuration as follows:

Procedure

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Server platform type, search or choose LAN Connectivity policy, and click Start.
- Step 2 In the policy General page, enter the policy name, select the Target Platform as UCS Server (Standalone) or UCS Server (FI-Attached), and click Next.
- Step 3 In the Policy Details page, click Add vNIC to create a new vNIC.
- **Step 4** In the **Add vNIC** page, follow the configuration parameters to enable the RoCE vNIC settings:
 - In the General section, provide a name for virtual ethernet interface.
 - In the **Consistent Device Naming (CDN)** section of the Standalone server or the **Failover** section of FI-attached server, do the following:
 - Click **Select Policy** link below the **Ethernet QoS**. Use the **Create New** button to create a new Ethernet QoS policy with the following property settings:
 - For MTU, choose or enter 1500, 4096, or 9000
 - For **Priority**, choose **Platinum** or **any no-drop**
 - For Class of Service, choose or enter 5

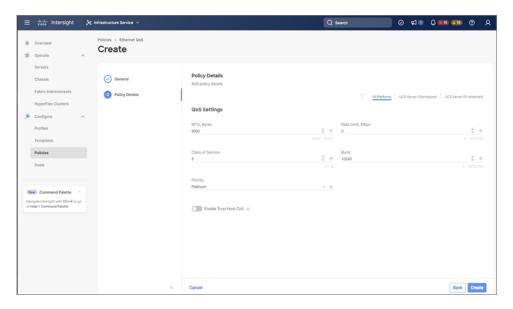

Note

This property is available only on Standalone servers.

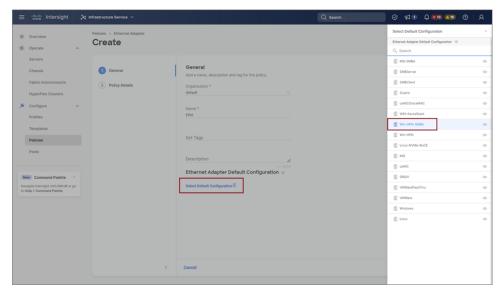

• Slide to **Enable Trust Host CoS** toggle button.

Note

This property is available only on Intersight Managed Mode servers.

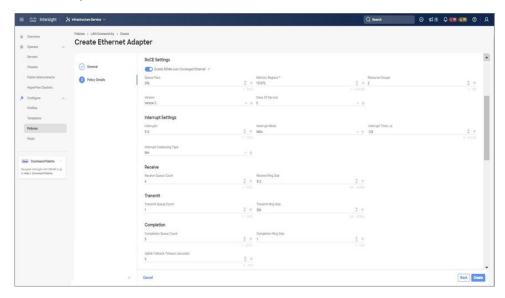

- Click **Select Policy** link below the **Ethernet Adapter**. Follow on to click Create an Ethernet Adapter Policy:
 - Use the Default Configuration: Click Create New to create a new policy. In the General page, enter the name of the policy and under Ethernet Adapter Default Configuration click Select Default Configuration to search and select Win-HPN-SMBd, the pre-defined Ethernet Adapter Default Configuration. Click Next and then Create.

- Configure RoCE Settings in the policy: Click Create New to create a new policy. In the General page, enter the name of the policy. Under Policy Details page on right pane, use the following property settings, then click Next, and then Create..
 - For Enable RDMA over Converged Ethernet, slide to enable.
 - For Queue Pairs, choose or enter 256
 - For Memory Regions, choose or enter 131072

- For **Resource Groups**, choose or enter 2
- For Version, select Version 2

• Click Add to add and save the new vNIC settings.

Note

All the fields with * are mandatory for creating LAN Connectivity Policy. Ensure they are filled out or selected with appropriate policies.

- **Step 5** Click **Create** to complete the LAN Connectivity policy with RoCE v2 property settings.
- **Step 6** Associate the LAN Connectivity policy to the server profile and deploy.

Note

For more information, see *Creating a LAN Connectivity Policy*, *Creating an Ethernet QoS Policy*, and *Creating an Ethernet Adapter Policy* in Configuring UCS Server Policies and Configuring UCS Server Profiles.

The LAN Connectivity policy with the Ethernet QoS policy and Ethernet Adapter policy vNIC setting is successfully created and the server profile is deployed to enable RoCE v2 configuration.

What to do next

Once the policy configuration for RoCE v2 is complete, reboot the server, and proceed with the RoCE v2 Mode 1 configuration of the host.

Configuring SMB Direct Mode 1 on the Host System

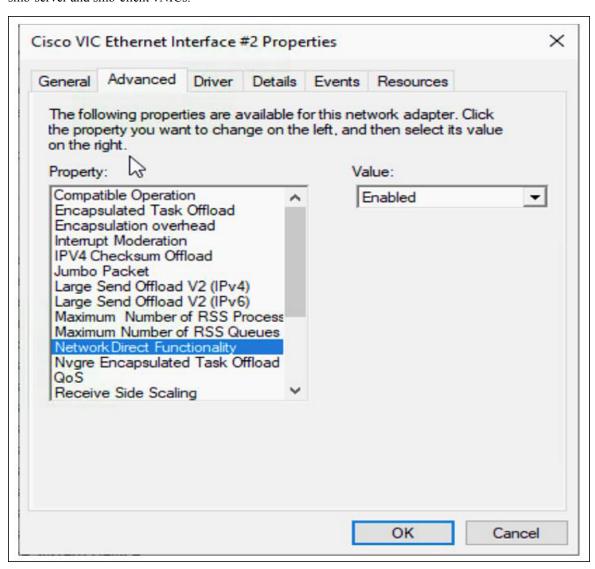

You will configure connection between smb-client and smb-server on two host interfaces. For each of these servers, smb-client and smb-server, configure the RoCE v2-enabled vNIC as described below.

Before you begin

Configure RoCE v2 for Mode 1 in Cisco Intersight.

Procedure

- **Step 1** In the Windows host, go to the Device Manager and select the appropriate Cisco VIC Internet Interface.
- Step 2 Go to Tools > Computer Management > Device Manager > Network Adapter > click on VIC Network Adapter > Properties > Advanced > Network Direct Functionality. Perform this operation for both the smb-server and smb-client vNICs.

Step 3 Verify that RoCE is enabled on the host operating system using PowerShell.

The Get-NetOffloadGlobalSetting command shows NetworkDirect is enabled.

PS C:\Users\Administrator> Get-NetOffloadGlobalSetting

ReceiveSideScaling : Enabled
ReceiveSegmentCoalescing : Enabled
Chimney : Disabled
TaskOffload : Enabled
NetworkDirect : Enabled
NetworkDirectAcrossIPSubnets : Blocked
PacketCoalescingFilter : Disabled

Note

If the NetworkDirect setting is showing as disabled, enable it using the command:

Set-NetOffloadGlobalSetting -NetworkDirect enabled

Step 4 Bring up Powershell and enter the command:

get-SmbClientNetworkInterface

```
PS C:\Users\Administrator>
PS C:\Users\Administrator>
Get-SmbClientNetworkInterface

Interface Index RSS Capable RDMA Capable Speed IpAddresses Friendly Name

14 True False 40 Gbps {10.37.60.162} vEthernet (vswitch)
26 True True 40 Gbps {10.37.60.158} vEthernet (vpl)
9 True True 40 Gbps {50.37.61.23} Ethernet 2
5 False False 40 Gbps {169.254.10.5} Ethernet (Kernel Debugger)
8 True False 40 Gbps {169.254.4.26} Ethernet 3

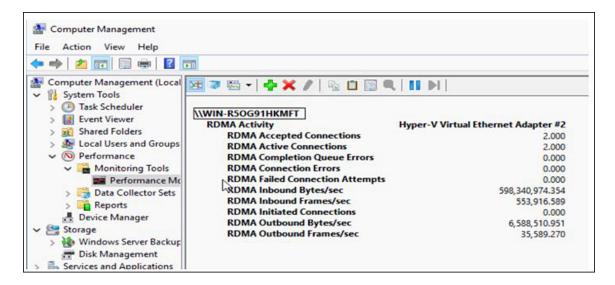

PS C:\Users\Administrator>
```

Step 5 Enter enable - netadapterrdma [-name] ["Ethernetname"]

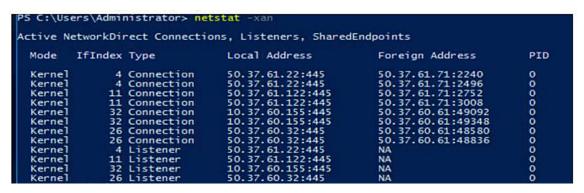

- **Step 6** Verify the overall RoCE v2 Mode 1 configuration at the Host as follows:
 - a) Use the Powershell command **netstat -xan** to verify the listeners in both the smb-client and smb-server Windows host; listeners will be shown in the command output.

```
PS C:\Users\Administrator>
PS C:\Users\Administrator> netstat -xan
Active NetworkDirect Connections, Listeners, SharedEndpoints
  Mode
          IfIndex Type
                                   Local Address
                                                            Foreign Address
                                                                                      PTD
                9 Listener
                                   50.37.61.23:445
10.37.60.158:445
  Kernel
                                                            NA
                                                                                      0
               26 Listener
                                                            NA
  Kernel
PS C:\Users\Administrator>
```

- b) Go to the smb-client server fileshare and start an I/O operation.
- c) Go to the performance monitor and check that it displays the RDMA activity.

Step 7 In the Powershell command window, check the connection entries with the **netstat -xan** output command to make sure they are displayed. You can also run **netstat -xan** from the command prompt. If the connection entry shows up in netstat-xan output, the RoCE v2 mode1 connections are correctly established between client and server.

Note

IP values are representative only.

Step 8 By default, Microsoft's SMB Direct establishes two RDMA connections per RDMA interface. You can change the number of RDMA connections per RDMA interface to one or any number of connections.

For example, to increase the number of RDMA connections to 4, type the following command in PowerShell:

```
PS C:\Users\Administrator> Set-ItemProperty -Path `
"HKLM:\SYSTEM\CurrentControlSet\Services\LanmanWorkstation\Parameters"
ConnectionCountPerRdmaNetworkInterface -Type DWORD -Value 4 -Force
```

Configuring Mode 2 on Cisco Intersight

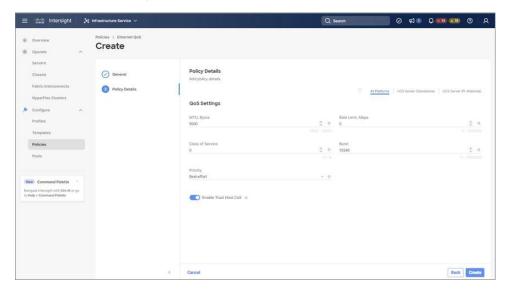

Use these steps to configure the RoCE v2 policies in Mode 2. In Cisco Intersight LAN Connectivity Policy, you can enable the RoCE settings on **Ethernet QoS** policy and **Ethernet Adapter** policy, and **VMMQ Adapter** policy for Mode 2 configuration as follows:

Before you begin

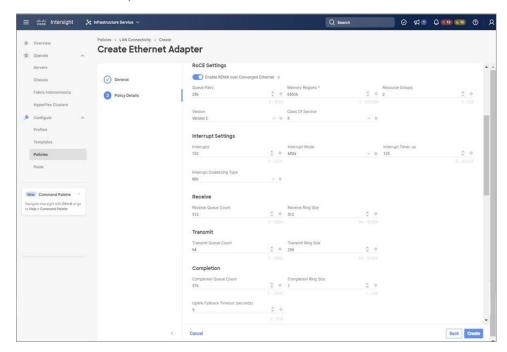

Configure RoCE v2 Policies in Mode 1.

Procedure

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Server platform type, search or choose LAN Connectivity policy, and click Start.
- Step 2 In the policy General page, enter the policy name, select the Target Platform as UCS Server (Standalone) or UCS Server (FI-Attached), and click Next.
- Step 3 In the Policy Details page, click Add vNIC to create a new vNIC.
- **Step 4** In the **Add vNIC** page, follow the configuration parameters to enable the RoCE vNIC settings:
 - a) In the **General** section, provide a name for virtual ethernet interface.
 - b) In the **Consistent Device Naming (CDN)** section of the Standalone server or the **Failover** section of FI-attached server, do the following:
 - Click **Select Policy** link below the **Ethernet QoS**. Use the **Create New** button to create a new Ethernet QoS policy with the following property settings:
 - For MTU, choose or enter 1500, 4096, or 9000
 - For **Priority**, choose or enter **Best-effort**
 - Enable Trust Host CoS, slide to enable

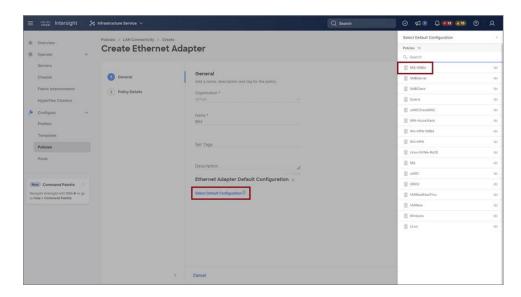

- Click **Select Policy** link below the **Ethernet Adapter**. Use **Create New** button to create a new Ethernet Adapter policy with the following property settings:
 - For Enable RDMA over Converged Ethernet, slide to enable.
 - For Queue Pairs, select or enter 256
 - For Memory Regions, select or enter 65536
 - For **Resource Groups**, select or enter 2
 - For Version, choose Version 2
 - For Class of Service, choose or enter 5

- In the **Connection** section, use the following property setting for VMQ Connection and to create VMMQ Adapter policy:
 - For connection, select VMQ.
 - Enable Virtual Machine Multi-Queue using slider button.
 - For Number of Sub vNICs, select or enter 4
 - For **VMMQ Adapter Policy**, click **Select Policy** link below the VMMQ Adapter Policy and do the following:
 - Click Create New to create a new policy. In the General page, enter the name of the policy
 and click Select Default Configuration to search and select MQ-SMBd, the pre-defined
 VMMQ Adapter default configuration.

Attention

Do not modify the pre-defined parameters under Policy Details page, retain the default settings.

Click Next and then Create.

Click Add to add and save the new vNIC settings.

Note

All the fields with * are mandatory and ensure it is filled out or selected with appropriate policies.

- **Step 5** Click **Create** to complete the LAN Connectivity policy with RoCE v2 property settings.
- **Step 6** Associate the LAN Connectivity policy to the server profile.

Note

For more information on *Creating an Ethernet QoS*, *Ethernet Adapter Policy*, and *VMMQ Adapter Policy*, see Configuring UCS Server Policies and Configuring UCS Server Profiles.

The LAN Connectivity Policy with Ethernet QoS Policy, Ethernet Adapter Policy, and VMMQ Adapter Policy are successfully created and deployed to enable RoCE v2 configuration.

What to do next

Once the policy configuration for RoCE v2 is complete, reboot the server and proceed with the RoCE v2 Mode 2 configuration on the host operating system.

Configuring Mode 2 on the Host System

This task uses Hyper-V virtualization software that is compatible with Windows Server 2019 and Windows Server 2022.

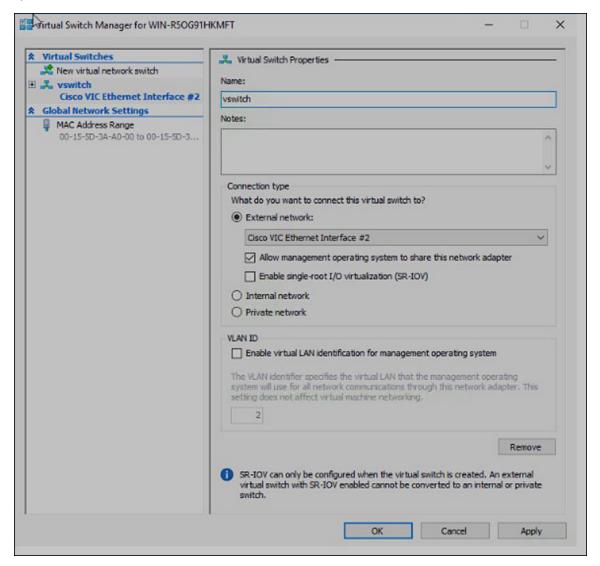

Follow the below procedure for the host operating system configuration for RoCEv2 Mode 2.

Before you begin

- Configure and confirm the connection for Mode 1 for both Cisco Intersight and Host.
- Configure Mode 2 in Cisco Intersight.

Procedure

- **Step 1** Go the Hyper-V switch manager.
- **Step 2** Create a new Virtual Network Switch (vswitch) for the RoCE v2-enabled Ethernet interface.
 - a) Choose External Network and select VIC Ethernet Interface 2 and Allow management operating system to share this network adapter.
 - b) Click **OK** to create the create the virtual switch.

Bring up the Powershell interface.

Step 3 Configure the non-default vport and enable RDMA with the following Powershell commands:

add-vmNetworkAdapter -switchname vswitch -name vp1 -managementOS enable-netAdapterRdma -name "vEthernet (vp1)"

```
PS C:\Users\Administrator>
PS C:\Users\Administrator> add-vmNetworkAdapter -switchName vswitch -name vp1 -managementOS
PS C:\Users\Administrator> enable-netAdapterRdma -name "vEthernet (vp1)"
PS C:\Users\Administrator>
```

a) Configure set-switch using the following Powershell command.

```
\verb|new-vmswitch| - \verb|name| setswitch| - \verb|netAdapterName| \verb|`Ethernet| x'' - \verb|enableEmbeddedTeam| \$true| \\
```

This creates the switch. Use the following to display the interfaces:

```
get-netadapterrdma
add-vmNetworkAdapter -switchname setswtch -name svp1
```

You will see the new vport when you again enter

get-netadapterrdma

b) Add a vport.

```
add-vmNetworkAdapter -switchname setswtch -name svp1
```

You will see the new vport when you again enter

```
get-netadapterrdma
```

c) Enable the RDMA on the vport:

```
enable-netAdapterRdma -name "vEthernet (svp1)"
```

- **Step 4** Configure the IPV4 addresses on the RDMA enabled vport in both servers.
- **Step 5** Create a share in smb-server and map the share in the smb-client.
 - a) For smb-client and smb-server in the host system, configure the RoCE v2-enabled vNIC as described above.
 - b) Configure the IPV4 addresses of the primary fabric and sub-vNICs in both servers, using the same IP subnet and same unique vlan for both.
 - c) Create a share in smb-server and map the share in the smb-client.
- **Step 6** Verify the Mode 2 configuration.
 - a) Use the Powershell command *netstat -xan* to display listeners and their associated IP addresses.

```
PS C:\Users\Administrator>
PS C:\Users\Administrator>
PS C:\Users\Administrator> netstat -xan

Active NetworkDirect Connections, Listeners, SharedEndpoints

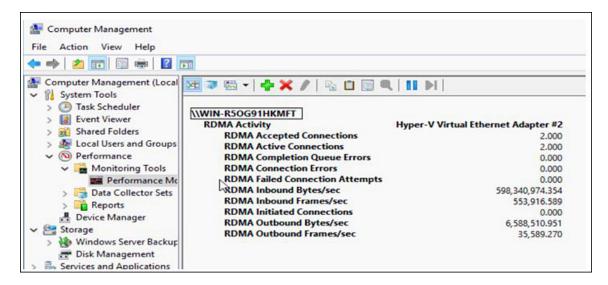

Mode IfIndex Type Local Address Foreign Address PID

Kernel 9 Listener 50.37.61.23:445 NA 0

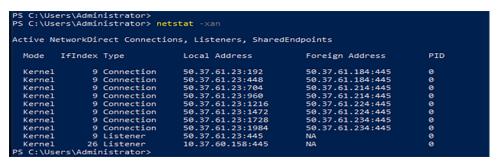

Kernel 26 Listener 10.37.60.158:445 NA 0

PS C:\Users\Administrator>
```

b) Start any RDMA I/O in the file share in smb-client.

c) Issue the *netstat -xan* command again and check for the connection entries to verify they are displayed.

What to do next

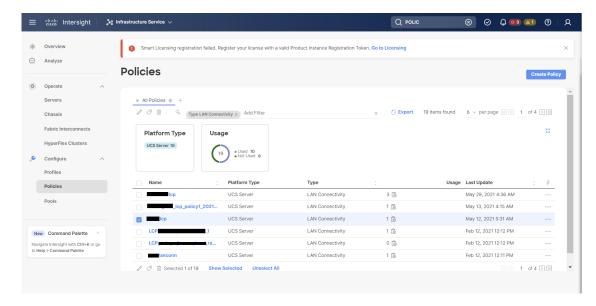

Troubleshoot any items if necessary.

Deleting the RoCE v2 Interface Using Cisco Intersight

Use these steps to remove the RoCE v2 interface.

Procedure

- Step 1 Navigate to CONFIGURE > Policies. In the Add Filter field, select Type: LAN Connectivity.
- Step 2 Select the appropriate LAN Connectivity policy created for RoCE V2 configuration and use the delete icon on the top or bottom of the policy list.
- **Step 3** Click **Delete** to delete the policy.

Step 4 Upon deleting the RoCE v2 configuration, re-deploy the server profile and reboot the server.

Configuring NVMeoF with RoCEv2 in Linux

- Guidelines for using NVMe over Fabrics (NVMeoF) with RoCE v2 on Linux, on page 21
- Linux Requirements, on page 22
- Configuring RoCE v2 for NVMeoF on Cisco Intersight, on page 22
- Configuring RoCE v2 for NVMeoF on the Host System, on page 26
- Setting Up Device Mapper Multipath, on page 30
- Deleting the RoCE v2 Interface Using Cisco Intersight, on page 30

Guidelines for using NVMe over Fabrics (NVMeoF) with RoCE v2 on Linux

General Guidelines and Limitations:

- Cisco recommends you check UCS Hardware and Software Compatibility to determine support for NVMeoF. NVMeoF is supported on Cisco UCS B-Series, C-Series, and X-Series servers.
- NVMe over RDMA with RoCE v2 is supported with the Cisco UCS VIC 1400, VIC 14000, and VIC 15000 Series adapters.
- When creating RoCE v2 interfaces, use Cisco Intersight provided Linux-NVMe-RoCE adapter policy.
- In the Ethernet Adapter policy, do not change values of Queue Pairs, Memory Regions, Resource Groups, and Priority settings other than to Cisco provided default values. NVMeoF functionality may not be guaranteed with different settings for Queue Pairs, Memory Regions, Resource Groups, and Priority.
- When configuring RoCE v2 interfaces, use both the enic and enic_rdma binary drivers downloaded from Cisco.com and install the matched set of enic and enic_rdma drivers. Attempting to use the binary enic_rdma driver downloaded from Cisco.com with an inbox enic driver will not work.
- RoCE v2 supports maximum two RoCE v2 enabled interfaces per adapter.
- Booting from an NVMeoF namespace is not supported.
- Layer 3 routing is not supported.
- RoCE v2 does not support bonding.
- Saving a crashdump to an NVMeoF namespace during a system crash is not supported.

- NVMeoF cannot be used with usNIC, VxLAN, VMQ, VMMQ, NVGRE, GENEVE Offload, and DPDK features.
- Cisco Intersight does not support fabric failover for vNICs with RoCE v2 enabled.
- The Quality of Service (QoS) no drop class configuration must be properly configured on upstream switches such as Cisco Nexus 9000 series switches. QoS configurations will vary between different upstream switches.
- Spanning Tree Protocol (STP) may cause temporary loss of network connectivity when a failover or failback event occurs. To prevent this issue from occurring, disable STP on uplink switches.

Linux Requirements

Configuration and use of RoCEv2 in Linux requires the following:

- · InfiniBand kernel API module ib core
- nvme-cli package
- Minimum VIC firmware 5.1(2x) or later for IPv6 support
- Cisco UCS B-series, Cisco UCS C-series, and Cisco UCS X-series servers with Cisco UCS VIC 1400 or Cisco UCS VIC 15000 Series adapters
- A storage array that supports NVMeoF connection
- eNIC driver version 4.0.0.10-802.34 or later and enic rdma driver version 1.0.0.10-802.34 or later

Note

Ubuntu 24.04.1 with kernel 6.8.0-51-generic starts supporting RoCE v2 from eNIC driver version 4.8.0.0-1128.4 and enic_rdma driver version 1.8.0.0-1128.4.

Configuring RoCE v2 for NVMeoF on Cisco Intersight

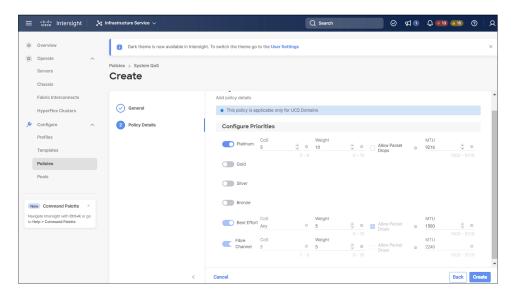

Use these steps to configure the RoCE v2 interface on Cisco Intersight.

To avoid possible RDMA packet drops, ensure same no-drop COS is configured across the network. The following steps allows you to configure a no-drop class in System QoS policies and use it for RDMA supported interfaces.

Procedure

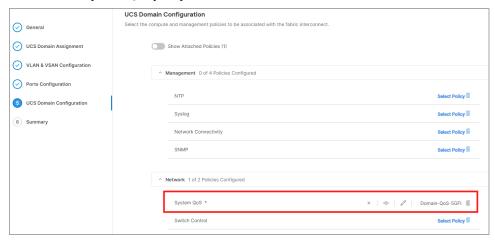

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Domain platform type, search or choose System QoS, and click Start.
- Step 2 In the General page, enter the policy name and click **Next**, and then in the **Policy Details** page, configure the property setting for System QoS policy as follows:

- For Priority, choose Platinum
- For Allow Packet Drops, uncheck the check box.
- For MTU, set the value as 9216.

Step 3 Click Create.

Step 4 Associate the System QoS policy to the Domain Profile.

Note

For more information, see *Creating System QoS Policy* in Configuring Domain Policies and Configuring Domain Profiles.

The System QoS Policy is successfully created and deployed to the Domain Profile.

What to do next

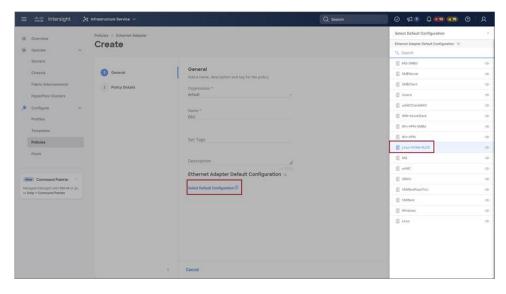

Configure the server profile with RoCE v2 vNIC settings in LAN Connectivity policy.

Enabling RoCE Settings in LAN Connectivity Policy

Use the following steps to configure the RoCE v2 vNIC. In Cisco Intersight LAN Connectivity policy, you can enable the RoCE settings on **Ethernet Adapter policy** for Linux configuration as follows:

Procedure

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Server platform type, search or choose LAN Connectivity policy, and click Start.
- Step 2 In the policy General page, enter the policy name, select the Target Platform as UCS Server (Standalone) or UCS Server (FI-Attached), and click Next.
- **Step 3** In the **Policy Details** page, click **Add vNIC** to create a new vNIC.
- **Step 4** In the **Add vNIC** page, follow the configuration parameters to enable the RoCE v2 vNIC:
 - a) In the **General** section, provide a name for virtual ethernet interface.
 - b) In the **Consistent Device Naming (CDN)** section of the Standalone server or the **Failover** section of FI-attached server, do the following:
 - Click Select Policy under Ethernet Adapter.
 - In the Select Policy window, click Create New to create an Ethernet Adapter policy.
 - On the **General** page, enter the policy name and click **Select Default Configuration**. Search and select **Linux-NVMe-RoCE** in the Default Configuration window and click **Next**.
 - On the Policy Details, verify the default configuration parameters for RoCE and click Create.

• Click **Add** to save the setting and add the new vNIC.

Note

All the fields with * are mandatory and ensure it is filled out or selected with appropriate policies.

Step 5 Click **Create** to complete the LAN Connectivity policy with RoCE v2 settings.

Step 6 Associate the LAN Connectivity policy to the Server Profile.

Note

For more information, see *Creating a LAN Connectivity Policy* and *Creating an Ethernet Adapter Policy* in Configuring UCS Server Policies and Configuring UCS Server Profiles.

The LAN Connectivity Policy with the Ethernet Adapter policy vNIC setting is successfully created and deployed to enable RoCE v2 configuration.

What to do next

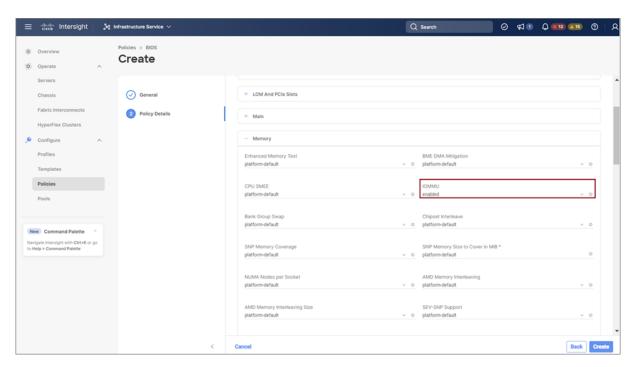

Once the policy configuration for RoCE v2 is complete, proceed to enable IOMMU in the BIOS policy.

Enabling an IOMMU BIOS Settings

Use the following steps to configure the server profile with the RoCE v2 vNIC and enable the IOMMU BIOS policy before enabling the IOMMU in the Linux kernel.

Procedure

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Server platform type, search or choose BIOS, and click Start.
- Step 2 On the General page, enter the policy name and click Next.
- **Step 3** On the **Policy Details** page, configure the following BIOS:
 - a) Select All Platforms.
 - b) Expand the **Memory** group.
 - c) In the **IOMMU** drop-down list, select the BIOS value **enabled** for setting IOMMU configuration.

- Step 4 Click Create.
- **Step 5** Associate the BIOS policy to the server profile and reboot the server.

Note

For more information, see *Creating a BIOS Policy* in Configuring Server Policies and Configuring Server Profile.

The BIOS Policy is successfully created and deployed on the server profile.

What to do next

Configure RoCE v2 for NVMeoF on the Host System.

Configuring RoCE v2 for NVMeoF on the Host System

Before you begin

Configure the Server Profile with RoCE v2 vNIC and the IOMMU enabled BIOS policy.

Procedure

- Step 1 Open the /etc/default/grub file for editing.
- Step 2 Add intel iommu=on to the end of GRUB CMDLINE LINUX.

```
sample /etc/default/grub configuration file after adding intel_iommu=on:
# cat /etc/default/grub
GRUB_TIMEOUT=5
GRUB_DISTRIBUTOR="$(sed 's, release .*$,,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_TERMINAL_OUTPUT="console"
GRUB_CMDLINE_LINUX="crashkernel=auto rd.lvm.lv=rhel/root rd.lvm.lv=rhel/swap biosdevname=1
    rhgb quiet intel_iommu=on
GRUB_DISABLE_RECOVERY="true"
```

Step 3 After saving the file, generate a new grub.cfg file.

For Legacy boot:

```
# grub2-mkconfig -o /boot/grub2/grub.cfg
```

For UEFI boot:

- # grub2-mkconfig -o /boot/grub2/efi/EFI/redhat/grub.cfg
- **Step 4** Reboot the server. You must reboot your server for the changes to take after enabling IOMMU.
- Step 5 Verify the server is booted with intel iommu=on option.

```
cat /proc/cmdline | grep iommu
```

Note its inclusion at the end of the output.

```
[root@localhost basic-setup]# cat /proc/cmdline | grep iommu
BOOT_IMAGE=/vmlinuz-3.10.0-957.27.2.el7.x86_64 root=/dev/mapper/rhel-root ro crashkernel=auto
rd.lvm.lv=rhel/root rd.lvm.lv=rhel/swap rhgb quiet intel_iommu=on LANG=en_US.UTF-8
```

What to do next

Download the enic and enic_rdma drivers.

Installing Cisco enic and enic_rdma Drivers

The enic_rdma driver requires enic driver. When installing enic and enic_rdma drivers, download and use the matched set of enic and enic_rdma drivers on Cisco.com. Attempting to use the binary enic_rdma driver downloaded from Cisco.com with an inbox enic driver, will not work.

Procedure

Step 1 Install the enic and enic rdma rpm packages:

```
# rpm -ivh kmod-enic-<version>.x86_64.rpm kmod-enic rdma-<version>.x86_64.rpm
```

Note

During enic_rdma installation, the enic_rdmalibnvdimm module may fail to install on RHEL 7.7 because the nvdimm-security.conf dracut module needs spaces in the add_drivers value. For workaround, please follow the instruction from the following links:

https://access.redhat.com/solutions/4386041

https://bugzilla.redhat.com/show_bug.cgi?id=1740383

- **Step 2** The enic_rdma driver is now installed but not loaded in the running kernel. Reboot the server to load enic_rdma driver into the running kernel.
- **Step 3** Verify the installation of enic_rdma driver and RoCE v2 interface:

```
[root@localhost ~]# dmesg | grep enic_rdma
[     3.137083] enic_rdma: Cisco VIC Ethernet NIC RDMA Driver, ver 1.2.0.28-877.2
2 init
[     3.242663] enic 0000:1b:00.1 eno6: enic_rdma: FW v3 RoCEv2 enabled
[     3.284856] enic 0000:1b:00.4 eno9: enic_rdma: FW v3 RoCEv2 enabled
[     16.441662] enic 0000:1b:00.1 eno6: enic_rdma: Link UP on enic_rdma_0
[     16.458754] enic 0000:1b:00.4 eno9: enic_rdma: Link UP on enic_rdma_1
```

Step 4 Load the nyme-rdma kernel module:

```
# modprobe nvme-rdma
```

After server reboot, nvme-rdma kernel module is unloaded. To load nvme-rdma kernel module every server reboot, create nvme_rdma.conf file using:

```
# echo nvme rdma > /etc/modules-load.d/nvme rdma.conf
```

Note

For more information about enic_rdma after installation, use the **rpm** -**q** -**1 kmod-enic_rdma** command to extract the README file.

What to do next

Discover targets and connect to NVMe namespaces. If your system needs multipath access to the storage, go to the section for Setting Up Device Mapper Multipath, on page 30.

Discovering the NVMe Target

Use this procedure to discover the NVMe target and connect NVMe namespaces.

Before you begin

Install **nvme-cli** version 1.6 or later if it is not installed already.

Note

Skip to Step 2 below if nvme-cli version 1.7 or later is installed.

Configure the IP address on the RoCE v2 interface and make sure the interface can ping the target IP.

Procedure

Step 1 Create an nyme folder in /etc, then manually generate host nqn.

```
# mkdir /etc/nvme
# nvme gen-hostnqn > /etc/nvme/hostnqn
```

Step 2 Create a settos.sh file and run the script to set priority flow control (PFC) in IB frames.

Note

To avoid failure of sending NVMeoF traffic, you must create and run this script after every server reboot.

Step 3 Discover the NVMe target by entering the following command.

```
nvme discover --transport=rdma --traddr=<IP address of transport target port>
```

For example, to discover the target at 50.2.85.200:

```
# nvme discover --transport=rdma --traddr=50.2.85.200

Discovery Log Number of Records 1, Generation counter 2
====Discovery Log Entry 0=====

trtype: rdma
adrfam: ipv4
subtype: nvme subsystem
treq: not required
portid: 3
trsvcid: 4420
subnqn: nqn.2010-06.com.purestorage:flasharray.9a703295ee2954e
traddr: 50.2.85.200
rdma_prtype: roce-v2
rdma_qptype: connected
rdma_cms: rdma-cm
rdma_pkey: 0x0000
```

Note

To discover the NVMe target using IPv6, put the IPv6 target address next to the traddr option.

Step 4 Connect to the discovered NVMe target by entering the following command.

```
\label{lem:nvme} \mbox{nvme connect --transport=rdma --traddr=<IP address of transport target port>> -n < \mbox{subnqn value from nvme discover}>
```

For example, to discover the target at 50.2.85.200 and the subnqn value found above:

```
# nvme connect --transport=rdma --traddr=50.2.85.200 -n
nqn.2010-06.com.purestorage:flasharray.9a703295ee2954e
```

Note

To connect to the discovered NVMe target using IPv6, put the IPv6 target address next to the traddr option.

Step 5 Use the **nyme list** command to check mapped namespaces:

Setting Up Device Mapper Multipath

If your system is configured with Device Mapper multipathing (DM Multipath), use the following steps to set up Device Mapper multipath.

Procedure

- **Step 1** Install the device-mapper-multipath package if it is not installed already
- **Step 2** Enable and start multipathd:

```
# mpathconf --enable --with multipathd y
```

Step 3 Edit the etc/multipath.conf file to use the following values :

```
defaults {
        polling_interval
        path_selector
                                 "queue-length 0"
        path_grouping_policy
                                 multibus
        fast_io_fail_tmo
                                 10
        no path retry
                                 0
        features
                                 0
        dev loss tmo
                                 60
        user_friendly_names
                                 yes
```

Step 4 Flush with the updated multipath device maps.

```
# multipath -F
```

Step 5 Restart multipath service:

systemctl restart multipathd.service

Step 6 Rescan multipath devices:

multipath -v2

Step 7 Check the multipath status:

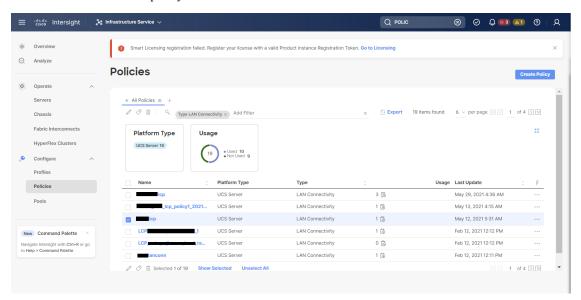

multipath -ll

Deleting the RoCE v2 Interface Using Cisco Intersight

Use these steps to remove the RoCE v2 interface.

Procedure

- Step 1 Navigate to CONFIGURE > Policies. In the Add Filter field, select Type: LAN Connectivity.
- Step 2 Select the appropriate LAN Connectivity policy created for RoCE V2 configuration and use the delete icon on the top or bottom of the policy list.
- **Step 3** Click **Delete** to delete the policy.

Step 4 Upon deleting the RoCE v2 configuration, re-deploy the server profile and reboot the server.

Deleting the RoCE v2 Interface Using Cisco Intersight

Configuring NVMeoF with RoCEv2 in ESXi

- Guidelines for using NVMe over Fabrics (NVMeoF) with RoCE v2 on ESXi, on page 33
- ESXi Requirements, on page 34
- Configuring RoCE v2 for NVMeoF on Cisco Intersight, on page 34
- NENIC Driver Installation, on page 38
- ESXi NVMe RDMA Host Side Configuration, on page 38
- Deleting the RoCE v2 Interface Using Cisco Intersight, on page 46

Guidelines for using NVMe over Fabrics (NVMeoF) with RoCE v2 on ESXi

General Guidelines and Limitations:

- Cisco recommends you to check the UCS Hardware and Software Compatibility to determine support for NVMeoF. NVMeoF is supported on Cisco UCS B-Series, C-Series, and X-Series servers.
- Nonvolatile Memory Express (NVMe) over RDMA with RoCE v2 is currently supported only with Cisco VIC 15000 Series adapters.
- When creating RoCE v2 interfaces, use Cisco recommended Queue Pairs, Memory Regions, Resource Groups, and Class of Service settings. NVMeoF functionality may not be guaranteed with different settings for Queue Pairs, Memory Regions, Resource Groups, and Class of Service.
- RoCE v2 supports maximum two RoCE v2 enabled interfaces per adapter.
- Booting from an NVMeoF namespace is not supported.
- Layer 3 routing is not supported.
- Saving a crashdump to an NVMeoF namespace during a system crash is not supported.
- NVMeoF cannot be used with usNIC, VxLAN, VMQ, VMMQ, NVGRE, GENEVE Offload, ENS, and DPDK features.
- Cisco Intersight does not support fabric failover for vNICs with RoCE v2 enabled.
- The Quality of Service (QoS) no drop class configuration must be properly configured on upstream switches such as Cisco Nexus 9000 series switches. QoS configurations will vary between different upstream switches.

• During the failover or failback event, the Spanning Tree Protocol (STP) can result temporary loss of network connectivity. To prevent this connectivity issue, disable STP on uplink switches.

Downgrade Guidelines: Remove the RoCEv2 configuration first and then downgrade to the release version lower than Cisco UCS Manager release 4.2(3b) version.

ESXi Requirements

Configuration and use of RoCE v2 in ESXi requires the following:

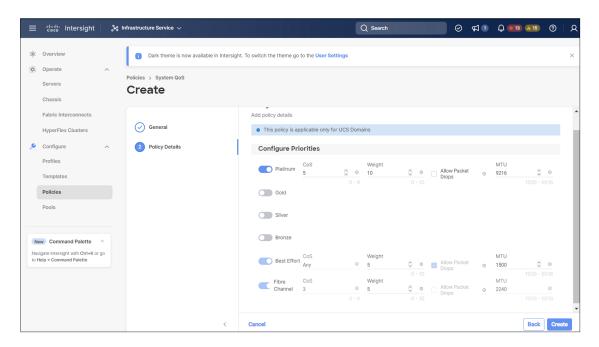

- VMWare ESXi version 7.0 Update 3.
- Cisco UCS Manager Release 4.2(3b) or later versions.
- VIC firmware 5.2(3x) or later versions.
- The driver version, *nenic-2.0.4.0-10EM.700.1.0.15843807.x86_64.vib* that provides both standard eNIC and RDMA support with the Cisco UCS Manager 4.2(3b) release package.
- A storage array that supports NVMeoF connection.

Configuring RoCE v2 for NVMeoF on Cisco Intersight

Use these steps to configure the RoCE v2 interface on Cisco Intersight.

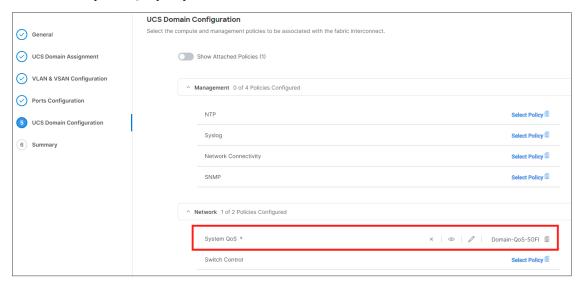

To avoid possible RDMA packet drops, ensure same no-drop COS is configured across the network. The following steps allows you to configure a no-drop class in System QoS policies and use it for RDMA supported interfaces.

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Domain platform type, search or choose System QoS, and click Start.
- Step 2 In the General page, enter the policy name and click **Next**, and then in the **Policy Details** page, configure the property setting for System QoS policy as follows:
 - For **Priority**, choose **Platinum**
 - For **Allow Packet Drops**, uncheck the check box.
 - For MTU, set the value as 9216.

Step 3 Click Create.

Step 4 Associate the System QoS policy to the Domain Profile.

Note

For more information, see *Creating System QoS Policy* in Configuring Domain Policies and Configuring Domain Profiles.

The System QoS Policy is successfully created and deployed to the Domain Profile.

What to do next

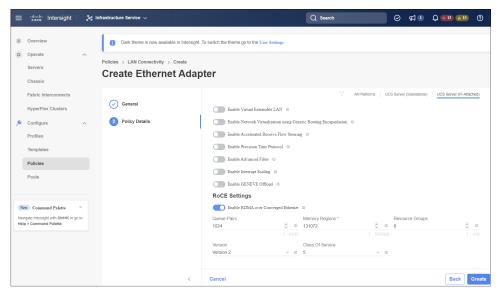

Configure the server profile with RoCE v2 vNIC settings in LAN Connectivity policy.

Enabling Roce Settings in LAN Connectivity Policy

Use the following steps to configure the RoCE v2 vNIC. In Cisco Intersight LAN Connectivity policy, you can enable the RoCE settings on **Ethernet Adapter policy** for Linux configuration as follows:

- Step 1 Navigate to CONFIGURE > Policies. Click Create Policy, select UCS Server platform type, search or choose LAN Connectivity policy, and click Start.
- Step 2 In the policy General page, enter the policy name, select the Target Platform as UCS Server (Standalone) or UCS Server (FI-Attached), and click Next.
- **Step 3** In the **Policy Details** page, click **Add vNIC** to create a new vNIC.
- **Step 4** In the **Add vNIC** page, follow the configuration parameters to enable the RoCE v2 vNIC:
 - a) In the **General** section, provide a name for virtual ethernet interface.
 - b) Incase of a Standalone server, click the **Consistent Device Naming (CDN)** or click the **Failover** of a FI-attached server, and do the following:
 - Click Select Policy under Ethernet Adapter.
 - In the Select Policy window, click Create New to create an Ethernet Adapter policy.
 - In the General page of the Ethernet Adapter Policy, enter the policy name and click Next.
 - In the **Policy Details** page of the Ethernet Adapter Policy, modify the following property setting:
 - RoCE Settings
 - For Enable RDMA over Converged Ethernet, slide to enable and set the RoCE on this
 virtual interface.
 - For Queue Pairs, select or enter 1024
 - For Memory Regions, select or enter 131072
 - For **Resource Groups**, select or enter 8
 - For Version, select Version 2
 - For Class of Service, select 5
 - Interrupt Settings
 - For **Interrupts**, select or enter **256**.
 - For Interrupt mode, select MSIx.
 - For Interrupt Timer, us, select 125.
 - For **Interrupt Coalescing Type**, select **Min**.
 - Receive Settings
 - For **Receive Queue Count**, select or enter 1.
 - For **Receiving Ring Size**, select or enter **512**.

- Transmit Settings
 - For **Transmit Queue Count**, select or enter 1.
 - For Transmit Ring Size, select or enter 256.
- Completion Settings
 - For Completion Queue Count, select or enter 2.
 - For Completion Ring Size, select or enter 1.
 - For Uplink Failback Timeout(seconds), select or enter 5
- Click **Create** to create an Ethernet Adapter Policy with the above defined settings.

• Click Add to save the setting and add the new vNIC.

Note

All the fields with * are mandatory and ensure it is filled out or selected with appropriate policies.

- **Step 5** Click **Create** to complete the LAN Connectivity policy with RoCE v2 settings.
- **Step 6** Associate the LAN Connectivity policy to the Server Profile.

Note

For more information, see *Creating a LAN Connectivity Policy* and *Creating an Ethernet Adapter Policy* in Configuring UCS Server Policies and Configuring UCS Server Profiles.

The LAN Connectivity Policy with the Ethernet Adapter policy vNIC setting is successfully created and deployed to enable RoCE v2 configuration.

What to do next

Once the policy configuration for RoCE v2 is complete, configure RoCE v2 for NVMeoF on the Host System.

NENIC Driver Installation

Before you begin

The Ethernet Network Interface Card (eNIC) Remote Direct Memory Access (RDMA) driver requires nenic driver.

Procedure

Step 1 Copy the eNIC vSphere Installation Bundle (VIB) or offline bundle to the ESXi server.

Step 2 Use the command to install nenic driver:

```
esxcli software vib install -v {VIBFILE}
or
esxcli software vib install -d {OFFLINE BUNDLE}
```

Example:

```
esxcli software vib install -v /tmp/nenic-2.0.4.0-10EM.700.1.0.15843807.x86 64.vib
```

Note

Depending on the certificate used to sign the VIB, you may need to change the host acceptance level. To do this, use the command:

```
esxcli software acceptance set --level=<level>
```

Depending on the type of VIB installed, you may need to put ESX into maintenance mode. This can be done through the client, or by adding the *--maintenance-mode* option to the above *esxcli*.

What to do next

Configure the Host side for ESXi NVMe RDMA.

ESXi NVMe RDMA Host Side Configuration

NENIC RDMA Functionality

One of the major difference between RDMA on Linux and ESXi is listed below:

• In ESXi, the physical interface (vmnic) MAC is not used for RoCEv2 traffic. Instead, the VMkernel port (vmk) MAC is used.

Outgoing RoCE packets use the vmk MAC in the Ethernet source MAC field, and incoming RoCE packets use the vmk MAC in the Ethernet destination mac field. The vmk MAC address is a VMware MAC address assigned to the vmk interface when it is created.

 In Linux, the physical interface MAC is used in source MAC address field in the ROCE packets. This Linux MAC is usually a Cisco MAC address configured to the VNIC using UCS Manager.

If you ssh into the host and use the exxcli network ip interface list command, you can see the MAC address.

```
vmk0
  Name: vmk0
  MAC Address: 2c:f8:9b:a1:4c:e7
  Enabled: true
  Portset: vSwitch0
  Portgroup: Management Network
  Netstack Instance: defaultTcpipStack
   VDS Name: N/A
  VDS UUID: N/A
   VDS Port: N/A
  VDS Connection: -1
   Opaque Network ID: N/A
   Opaque Network Type: N/A
  External ID: N/A
  MTU: 1500
  TS0 MSS: 65535
  RXDispQueue Size: 2
   Port ID: 67108881
```

You must create a vSphere Standard Switch to provide network connectivity for hosts, virtual machines, and to handle VMkernel traffic. Depending on the connection type that you want to create, you can create a new vSphere Standard Switch with a VMkernel adapter, only connect physical network adapters to the new switch, or create the switch with a virtual machine port group.

Create Network Connectivity Switches

Use these steps to create a vSphere Standard Switch to provide network connectivity for hosts, virtual machines, and to handle VMkernel traffic.

Before you begin

Ensure you have nenic drivers. Download and install nenic drivers before proceeding with below steps:

- **Step 1** In the vSphere Client, navigate to the host.
- Step 2 On the Configure tab, expand Networking and select Virtual Switches.
- Step 3 Click on Add Networking.

The available network adapter connection types are:

Vmkernel Network Adapter

Creates a new VMkernel adapter to handle host management traffic

Physical Network Adapter

Adds physical network adapters to a new or existing standard switch.

· Virtual Machine Port Group for a Standard Switch

Creates a new port group for virtual machine networking.

- **Step 4** Select connection type **Vmkernel Network Adapter**.
- Step 5 Select New Standard Switch and click Next.
- **Step 6** Add physical adapters to the new standard switch.
 - a) Under Assigned Adapters, select New Adapters.
 - b) Select one or more adapters from the list and click **OK**. To promote higher throughput and create redundancy, add two or more physical network adapters to the Active list.
 - c) (Optional) Use the up and down arrow keys to change the position of the adapter in the Assigned Adapters list.
 - d) Click Next.
- **Step 7** For the new standard switch you just created for the VMadapter or a port group, enter the connection settings for the adapter or port group.
 - a) Enter a label that represents the traffic type for the VMkernel adapter.
 - b) Set a VLAN ID to identify the VLAN the VMkernel uses for routing network traffic.
 - c) Select IPV4 or IPV6 or both.
 - d) Select an MTU size from the drop-down menu. Select Custom if you wish to enter a specific MTU size. The maximum MTU size is 9000 bytes.

Note

You can enable Jumbo Frames by setting an MTU greater than 1500.

e) After setting the TCP/IP stack for the VMkernel adapter, select a TCP/IP stack.

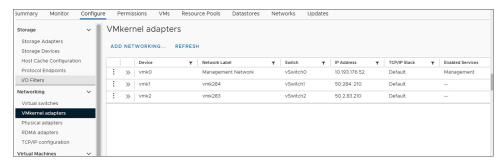

To use the default TCP/IP stack, select it from the available services.

Note

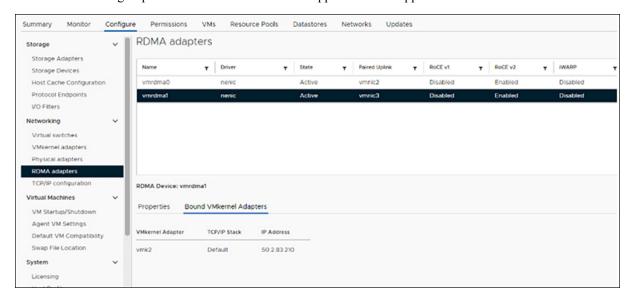

Be aware that the TCP/IP stack for the VMkernel adapter cannot be changed later.

- f) Configure IPV4 and/or IPV6 settings.
- Step 8 On the Ready to Complete page, click Finish.
- **Step 9** Check the VMkernel ports for the VM Adapters or port groups with NVMe RDMA in the vSphere client, as shown in the Results below.

The VMkernel ports for the VM Adapters or port groups with NVMe RDMA are shown below.

The VRDMA Port groups created with NVMeRDMA supported vmnic appear as below.

What to do next

Create vmhba ports on top of vmrdma ports.

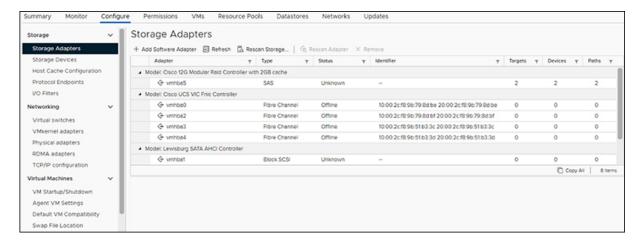

Create VMVHBA Ports in ESXi

Use the following steps for creating vmhba ports on top of the vmrdma adapter ports.

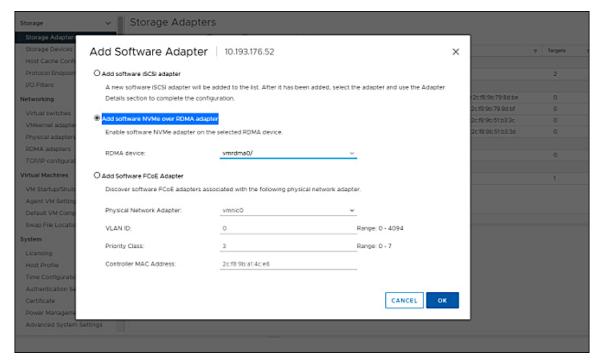

Before you begin

Create the adapter ports for storage connectivity.

- **Step 1** Go to vCenter where your ESXi host is connected.
- Step 2 Click on Host>Configure>Storage adapters.

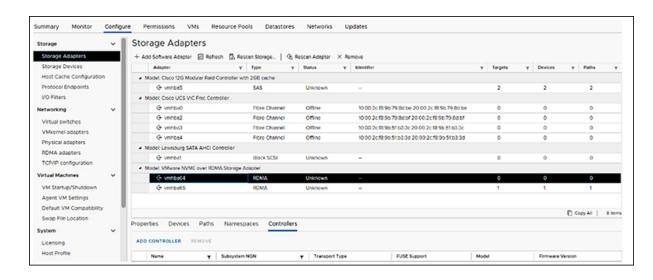

Step 3 Click +Add Software Adapter. The following dialog box will appear.

- **Step 4** Select **Add software NVMe over RDMA adapter** and the vmrdma port you want to use.
- Step 5 Click OK

The vmhba ports for the VMware NVMe over RDMA storage adapter will be shown as in the example below

Displaying vmnic and vmrdma Interfaces

ESXi creates a vmnic interface for each nenic VNIC configured to the host.

Before you begin

Create Network Adapters and VHBA ports.

Procedure

- **Step 1** Use **ssh** to access the host system.
- **Step 2** Enter **esxcfg-nics -1** to list the vmnics on ESXi.

esxcli network nic list

Step 3 Use esxcli rdma device list to list the vmrdma devices. When the enic driver registers with ESXi the RDMA device for a RDMA capable VNIC, ESXi creates a vmrdma device and links it to the corresponding vmnic.

Step 4 Use **esxcli rdma device protocol list** to check the protocols supported by the vmrdma interface.

For enic, RoCE v2 is the only protocol supported from this list. The output of this command should match the RoCEv2 configuration on the VNIC.

Step 5 Use esxcli nvme adapter list to list the NVMe adapters and the vmrdma and vmnic interfaces it is configured on.

Step 6 All vmhbas in the system can be listed using esxcli storage core adapter list. The vmhba configured over RDMA.

Note

For vmhba64 and vmhba65, you may observe that the driver's Link State displays *link-n/a* instead of *Online*. This is a known issue in ESXi 7.0 Update 3. For more information, see ESXi.

NVMe Fabrics and Namespace Discovery

This procedure is performed through the ESXi command line interface.

Before you begin

Create and configure NVMe on the adapter's VMHBAs. The maximum number of adapters is two, and it is a best practice to configure both for fault tolerance.

Procedure

Step 1 Check and enable NVMe on the vmrdma device.

esxcli nvme fabrics enable -p RDMA -d vmrdma0

The system should return a message showing if NVMe is enabled.

Step 2 Discover the NVMe fabric on the array by entering the following command:

esxcli nvme fabrics discover -a vmhba64 -l transport address

figure with esxcli nvme fabrics discover -a vmhba64 -1 50.2.84.100

The output will list the following information: Transport Type, Address Family, Subsystem Type, Controller ID, Admin Queue, Max Size, Transport Address, Transport Service ID, and Subsystem NQN

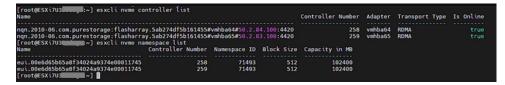

You will see output on the NVMe controller.

Step 3 Perform NVMe fabric interconnect.

esxcli nvme fabrics discover -a vmhba64 -l transport_address p Transport Service ID -s Subsystem NQN

- **Step 4** Repeat steps 1 through 4 to configure the second adapter.
- **Step 5** Verify the configuration.
 - a) Display the controller list to verify the NVMe controller is present and operating.

esxcli nvme controller list RDMA -d vmrdma0

b) Verify that the fabric is enabled on the controller through the adapter, and verify the controller is accessible through the port on the adapter.

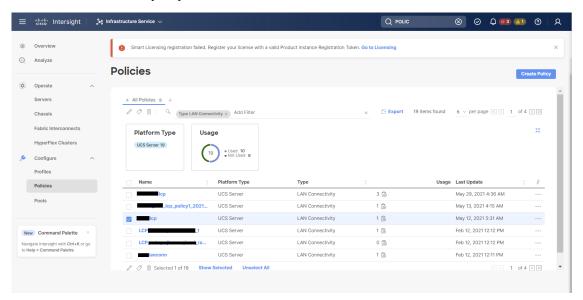

```
[root@ESXiUCSA:~] esxcli nvme fabrics enable -p RDMA -d vmrdma0
NVMe already enabled on vmrdma0
[root@ESXiUCSA:~] esxcli nvme fabrics discover -a vmhba64 -1 50.2.84.100
Transport Type Address Family Subsystem Type Controller ID Admin Queue Max Size Transport
Address Transport Service ID Subsystem NQN
RDMA
              IPV4
                              NVM
                                              65535
                                                             31
50.2.84.100
                4420
nq.210-06.com.purestorage:flasharray:2dp1239anjk1484
[root@ESXiUCSA:~] esxcli nvme fabrics discover -a vmhba64 -1 50.2.84.100 p 4420 -s
nq.210-06.com.purestorage:flasharray:2dp1239anjk1484
Controller already connected
```

Deleting the RoCE v2 Interface Using Cisco Intersight

Use these steps to remove the RoCE v2 interface.

Procedure

- Step 1 Navigate to CONFIGURE > Policies. In the Add Filter field, select Type: LAN Connectivity.
- Step 2 Select the appropriate LAN Connectivity policy created for RoCE V2 configuration and use the delete icon on the top or bottom of the policy list.
- **Step 3** Click **Delete** to delete the policy.

Step 4 Upon deleting the RoCE v2 configuration, re-deploy the server profile and reboot the server.

Known Issues

- Windows, on page 47
- Linux, on page 48
- ESXi, on page 48

Windows

Symptom	Conditions	Workaround
On VIC 1400 Series adapters, the neNIC driver for Windows 2019 can be installed on Windows 2016 and the Windows 2016 driver can be installed on Windows 2019. However, this is an unsupported configuration.	Case 1: Installing Windows 2019 nenic driver on Windows 2016 succeeds-but on Windows 2016 RDMA is not supported. Case 2: Installing Windows 2016 nenic driver on Windows 2019 succeeds-but on Windows 2019 RDMA comes with default disabled state, instead of enabled state.	The driver binaries for Windows 2016 and Windows 2019 are in folders that are named accordingly. Install the correct binary on the platform that is being built/upgraded.

Linux

Symptom	Conditions	Workaround
When sending high bandwidth NVMe traffic on some Cisco Nexus 9000 switches, the switch port that connected to the storage sometimes reaches the max PFC peak and does not automatically clear the buffers. In Nexus 9000 switches, the nxos command "show hardware internal buffer info pkt-stats input peak" shows that the Peak_cell or PeakQos value for the port reaches more than 1000.	will drop.	 Log into the switch. Locate the port that connected to the storage and shut down the port using "shutdown" command Execute the following commands one by one: # clear counters # clear qos statistics Run no shutdown on the port that was shut down.

ESXi

Symptom	Conditions	Workaround
When using the command esxcli storage core adapter list to list the vmhba, the Driver's Link State for vmhba64 and vmhba65 rdma ports displays <i>Link-n/a</i> instead of <i>Online</i> .	This is a known issue in ESXi 7.0 Update 3.	None
