

VersaStack with VMware vSphere 6.7, Cisco UCS 4th Generation Fabric, and IBM FS9100 NVMe-accelerated Storage

Deployment Guide for VersaStack with VMware vSphere 6.7 U2, Cisco UCS Manager 4.0(4), and IBM Spectrum Virtualize 8.2.1

Last Updated: November 19, 2019

About the Cisco Validated Design Program

The Cisco Validated Design (CVD) Program consists of systems and solutions designed, tested, and documented to facilitate faster, more reliable, and more predictable customer deployments. For more information, go to:

<http://www.cisco.com/go/designzone>.

ALL DESIGNS, SPECIFICATIONS, STATEMENTS, INFORMATION, AND RECOMMENDATIONS (COLLECTIVELY, "DESIGNS") IN THIS MANUAL ARE PRESENTED "AS IS," WITH ALL FAULTS. CISCO AND ITS SUPPLIERS DISCLAIM ALL WARRANTIES, INCLUDING, WITHOUT LIMITATION, THE WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE. IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THE DESIGNS, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

THE DESIGNS ARE SUBJECT TO CHANGE WITHOUT NOTICE. USERS ARE SOLELY RESPONSIBLE FOR THEIR APPLICATION OF THE DESIGNS. THE DESIGNS DO NOT CONSTITUTE THE TECHNICAL OR OTHER PROFESSIONAL ADVICE OF CISCO, ITS SUPPLIERS OR PARTNERS. USERS SHOULD CONSULT THEIR OWN TECHNICAL ADVISORS BEFORE IMPLEMENTING THE DESIGNS. RESULTS MAY VARY DEPENDING ON FACTORS NOT TESTED BY CISCO.

Executive Summary

Cisco Validated Designs (CVDs) deliver systems and solutions that are designed, tested, and documented to facilitate and improve customer deployments. These designs incorporate a wide range of technologies and products into a portfolio of solutions that have been developed to address the business needs of the customers and to guide them from design to deployment.

Customers looking to deploy applications using shared data center infrastructure face a number of challenges. A recurrent infrastructure challenge is to achieve the levels of IT agility and efficiency that can effectively meet the company business objectives. Addressing these challenges requires having an optimal solution with the following key characteristics:

- Availability: Help ensure applications and services availability at all times with no single point of failure
- Flexibility: Ability to support new services without requiring underlying infrastructure modifications
- Efficiency: Facilitate efficient operation of the infrastructure through re-usable policies
- Manageability: Ease of deployment and ongoing management to minimize operating costs
- Scalability: Ability to expand and grow with significant investment protection
- Compatibility: Minimize risk by ensuring compatibility of integrated components
- Extensibility: Extensible platform with support for various management applications and configuration tools

Cisco and IBM have partnered to deliver a series of VersaStack solutions that enable strategic data center platforms with the above characteristics. VersaStack solution delivers an integrated architecture that incorporates compute, storage and network design best practices thereby minimizing IT risks by validating the integrated architecture to ensure compatibility between various components. The solution also addresses IT pain points by providing documented design guidance, deployment guidance and support that can be used in various stages (planning, designing and implementation) of a deployment.

The VersaStack solution, described in this CVD, delivers a Converged Infrastructure platform (CI) specifically designed for high-performance Virtual Server Infrastructure (VSI), which is a validated solution jointly developed by Cisco and IBM. In this deployment, IBM® FlashSystem 9100 combines the performance of flash and Non-Volatile Memory Express (NVMe) with the reliability and innovation of IBM FlashCore technology and the rich features of IBM Spectrum Virtualize. With the addition of Cisco UCS M5 servers including 2nd gen Intel Xeon Scalable processors and Cisco UCS 6400 series Fabric Interconnects, the solution provides superior compute performance and network throughput with 10/25/40/100GbE support for ethernet using Nexus 9000 series switches in the LAN and 32G support for fibre channel connectivity with the Cisco MDS 9000 portfolio of switches in the SAN.

The design showcases:

- Cisco UCS 6400 Series Fabric Interconnects (FI)
- Cisco UCS 5108 Blade Server chassis
- Cisco Unified Computing System (Cisco UCS) servers with 2nd gen Intel Xeon scalable processors
- Cisco Nexus 9336C-FX2 Switches running NX-OS mode
- Cisco MDS 9132T Fabric Switches
- IBM FlashSystem 9100 NVMe-accelerated Storage
- VMware vSphere 6.7 Update 2

Solution Overview

Introduction

VersaStack solution is a pre-designed, integrated and validated architecture for the data center that combines Cisco UCS servers, Cisco Nexus family of switches, Cisco MDS fabric switches, IBM Storage offerings into a single, flexible architecture. VersaStack is designed for high availability, with no single points of failure, while maintaining cost-effectiveness and flexibility in design to support a wide variety of workloads.

VersaStack designs can support different hypervisor options, bare metal servers and can also be sized and optimized based on customer workload requirements. The VersaStack design discussed in this document has been validated for resiliency (under fair load) and fault tolerance during system upgrades, component failures, and partial loss of power scenarios.

This document discusses the design of the high-performance VersaStack with flash and NVMe based solution. The solution is a predesigned, best-practice data center architecture with VMware vSphere built on the Cisco Unified Computing System (Cisco UCS). The solution architecture presents a robust infrastructure viable for a wide range of application workloads implemented as a Virtual Server Infrastructure (VSI).

Audience

The intended audience of this document includes, but is not limited to, sales engineers, field consultants, professional services, IT managers, architects, partner engineering, and customers who want to take advantage of an infrastructure built to deliver IT efficiency and enable IT innovation.

Purpose of this Document

This document provides step-by-step configuration and implementation guidelines for setting up VersaStack. The following design elements distinguish this version of VersaStack from previous models:

- Support for UCS 6454 Fabric Interconnects
- Support for VIC 1400 series adapter cards on UCS M5 servers
- Support for Cisco UCS C480 M5 ML Servers, not validated in this document
- Support for the Second Generation Intel® Xeon® Scalable processor (Cascade Lake) refresh and Intel® Optane™ Data Center persistent memory modules on UCS Intel-based M5 servers
- Improved memory RAS features on M5 servers
- IBM FlashSystem 9100 release 8.2.1.6
- Support for the Cisco UCS release 4.0(4c)
- Validation of 25GbE IP-based storage design with Nexus NX-OS switches supporting iSCSI based storage access
- Validation of VMware vSphere 6.7 U2
- 100 Gigabit per second Ethernet Connectivity
- 32 Gigabit per second Fibre Channel Connectivity

The design that will be implemented is discussed in the VersaStack with VMware vSphere 6.7 Design Guide found at:

https://www.cisco.com/c/en/us/td/docs/unified_computing/ucs/UCS_CVDs/versastack_vmw67_ibmfs9100_design.html

For more information on the complete portfolio of VersaStack solutions, please refer to the VersaStack guides:

<http://www.cisco.com/c/en/us/solutions/enterprise/data-center-designs-cloud-computing/versastack-designs.html>

Solution Design

Architecture

This VersaStack design aligns with the converged infrastructure configurations and best practices as identified in the previous VersaStack releases. The solution focuses on integration of IBM Flash System 9100 in to VersaStack architecture with Cisco UCS 4th Generation and support for VMware vSphere 6.7 U2.

The system includes hardware and software compatibility support between all components and aligns to the configuration best practices for each of these components. All core hardware components and software releases are listed and supported on the following lists:

http://www.cisco.com/en/US/products/ps10477/prod_technical_reference_list.html

and IBM Interoperability Matrix:

<http://www-03.ibm.com/systems/support/storage/ssic/interoperability.wss>

The system supports high availability at network, compute and storage layers such that no single point of failure exists in the design. The system utilizes 10/25/40/100 Gbps Ethernet jumbo-frame based connectivity combined with port aggregation technologies such as virtual port-channels (VPC) for non-blocking LAN traffic forwarding. A dual SAN 32Gbps environment provides redundant storage access from compute devices to the storage controllers.

Physical Topology

The VersaStack infrastructure satisfies the high-availability design requirements and is physically redundant across the network, compute and storage stacks. Figure 1 provides a high-level topology of the system connectivity.

To provide the compute to storage system connectivity, this design guides highlights two different storage connectivity options:

- Option 1: iSCSI based storage access through Cisco Nexus Fabric
- Option 2: FC based storage access through Cisco MDS Fabric

This VersaStack design utilizes Cisco UCS platform with Cisco UCS B200 M5 half-width blades and UCS C220 M5 servers connected and managed through Cisco UCS 6454 Fabric Interconnects and the integrated Cisco UCS manager. These high-performance servers are configured as stateless compute nodes where ESXi 6.7 U2 hypervisor is loaded using SAN (iSCSI and FC) boot. The boot disks to store ESXi hypervisor image and configuration along with the block based datastores to host application Virtual Machines (VMs) are provisioned on the IBM FS9100 storage array.

This design has following physical connectivity between the components of VersaStack:

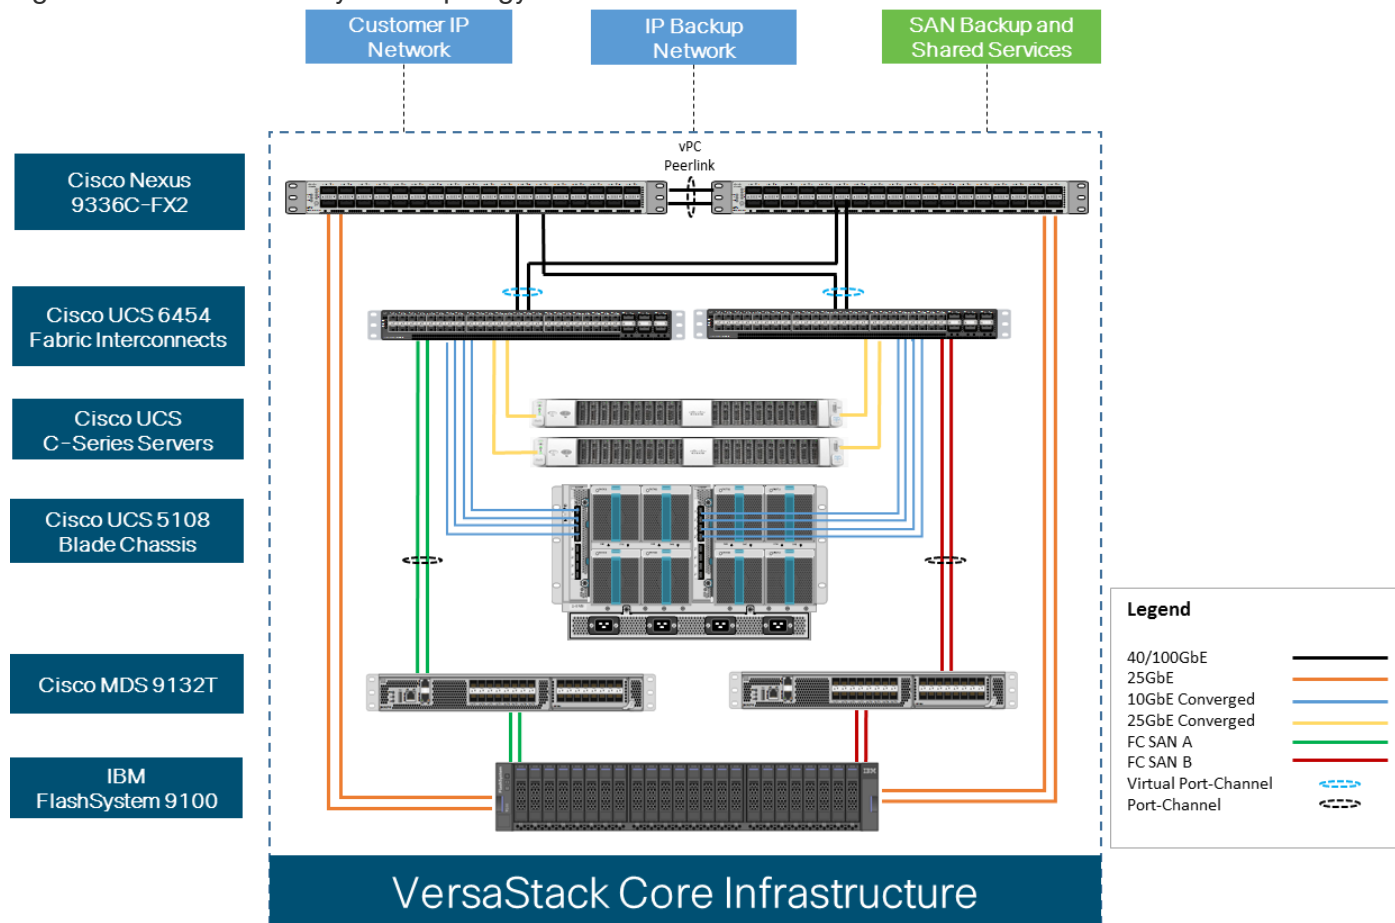

- 4 X 10 Gb Ethernet connections port-channelled between the Cisco UCS 5108 Blade Chassis and the Cisco UCS Fabric Interconnects
- 25 Gb Ethernet connections port-channelled between the Cisco UCS C-Series rackmounts and the Cisco UCS Fabric Interconnects
- 100 Gb Ethernet connections port-channelled between the Cisco UCS Fabric Interconnect and Cisco Nexus 9000s

- 32 Gb Fibre Channel connections port-channelled between the Cisco UCS Fabric Interconnect and Cisco MDS 9132T
- 16 Gb Fibre Channel connections between the Cisco MDS 9132T and IBM FS9100 storage array for fibre channel block storage access
- 25 Gb Ethernet connections between the Cisco Nexus 9000s and IBM FS9100 storage array for iSCSI block storage access

Any supported connectivity to existing customer IP and SAN Networks from the VersaStack core infrastructure is allowed.

Figure 1 VersaStack Physical Topology

This document guides customers through the low-level steps for deploying the base architecture. These procedures explain everything from physical cabling to network, compute, and storage device configurations.

For detailed information about the VersaStack design, see:

https://www.cisco.com/c/en/us/td/docs/unified_computing/ucs/UCS_CVDs/versastack_vmw67_ibmfs9100_design.html

Software Revisions

Table 1 lists the hardware and software versions used for the solution validation.

It is important to note that Cisco, IBM, and VMware have interoperability matrices that should be referenced to determine support for any specific implementation of VersaStack. See the following links for more information:

- [IBM System Storage Interoperation Center](#)
- [Cisco UCS Hardware and Software Interoperability Tool](#)
- [VMware Compatibility Guide](#)

Table 1 Hardware and Software Revisions

Layer	Device	Image	Comments
Compute	Cisco UCS Fabric Interconnects 6400 Series, Cisco UCS B-200 M5, Cisco UCS C-220 M5	4.0(4c)	Includes the Cisco UCS-IOM 2208XP, Cisco UCS Manager, Cisco UCS VIC 1440 and Cisco UCS VIC 1457
	Cisco nenic Driver	1.0.29.0	Ethernet driver for Cisco VIC
	Cisco fnic Driver	4.0.0.40	FCoE driver for Cisco VIC
Network	Cisco Nexus Switches	7.0(3)I7(6)	NXOS
	Cisco MDS 9132T	8.4(1)	FC switch firmware version
Storage	IBM FlashSystem 9100	8.2.1.6	Software version
Software	VMware vSphere ESXi	6.7 update 2	Software version
	VMware vCenter	6.7 update 2	Software version

Configuration Guidelines

This document provides details for configuring a fully redundant, highly available VersaStack configuration. Therefore, appropriate references are provided to indicate the component being configured at each step, such as 01 and 02 or A and B. For example, the Cisco UCS fabric interconnects are identified as FI-A or FI-B. This document is intended to enable customers and partners to fully configure the customer environment and during this process, various steps may require the use of customer-specific naming conventions, IP addresses, and VLAN schemes, as well as appropriate MAC addresses.

This document details network (Nexus and MDS), compute (Cisco UCS), virtualization (VMware) and related IBM FS9100 storage configurations (host to storage system connectivity).

Table 2 lists various VLANs, VSANs and subnets used to setup VersaStack infrastructure to provide connectivity between core elements of the design.

Table 2 VersaStack Infrastructure Configuration

VLAN Name	VLAN	Subnet	Usage
-----------	------	--------	-------

VLAN Name	VLAN	Subnet	Usage
IB-MGMT	11	192.168.160.0/22	Management VLAN to access and manage the servers
iSCSI-A	3161	10.29.161.0/24	iSCSI-A path for booting both B Series and C Series servers and datastore access
iSCSI-B	3162	10.29.162.0/24	iSCSI-B path for booting both B Series and C Series servers and datastore access
vMotion	3173	10.29.173.0/24	VMware vMotion traffic
Native-2	2	N/A	VLAN 2 used as Native VLAN instead of default VLAN (1)
VM Network	3174	10.29.174.0/24	VLAN to carry data traffic for both VM and bare-metal Servers
VSAN-A	101	N/A	Fabric A VSAN for FC Storage access
VSAN-B	102	N/A	Fabric B VSAN for FC Storage access

Physical Infrastructure

The information in this section is provided as a reference for cabling the equipment in VersaStack environment. To simplify the documentation, the architecture shown in Figure 2 is broken down into network, compute and storage related physical connectivity details.

This document assumes that the out-of-band management ports are plugged into an existing management infrastructure at the deployment site. These interfaces will be used in various configuration steps.

Customers can choose interfaces and ports of their liking but failure to follow the exact connectivity shown in figures below will result in changes to the deployment procedures since specific port information is used in various configuration steps

The Nexus 9336C-FX2 switches used in this design support 10/25/40/100 Gbps on all the ports. The switch supports breakout interfaces, each 100Gbps port on the switch can be split in to 4 X 25Gbps interfaces. The QSFP breakout cable has been leveraged to connect 25Gbps iSCSI ethernet ports on the FS9100 storage array to the 100Gbps QSFP port on the switch end. With this connectivity, IBM SFP transceiver on the FS9100 are not required.

Cisco UCS Connectivity to Nexus Switches

For physical connectivity details of Cisco UCS to the Cisco Nexus switches, refer to Figure 2.

Figure 2 Cisco UCS Connectivity to the Nexus Switches

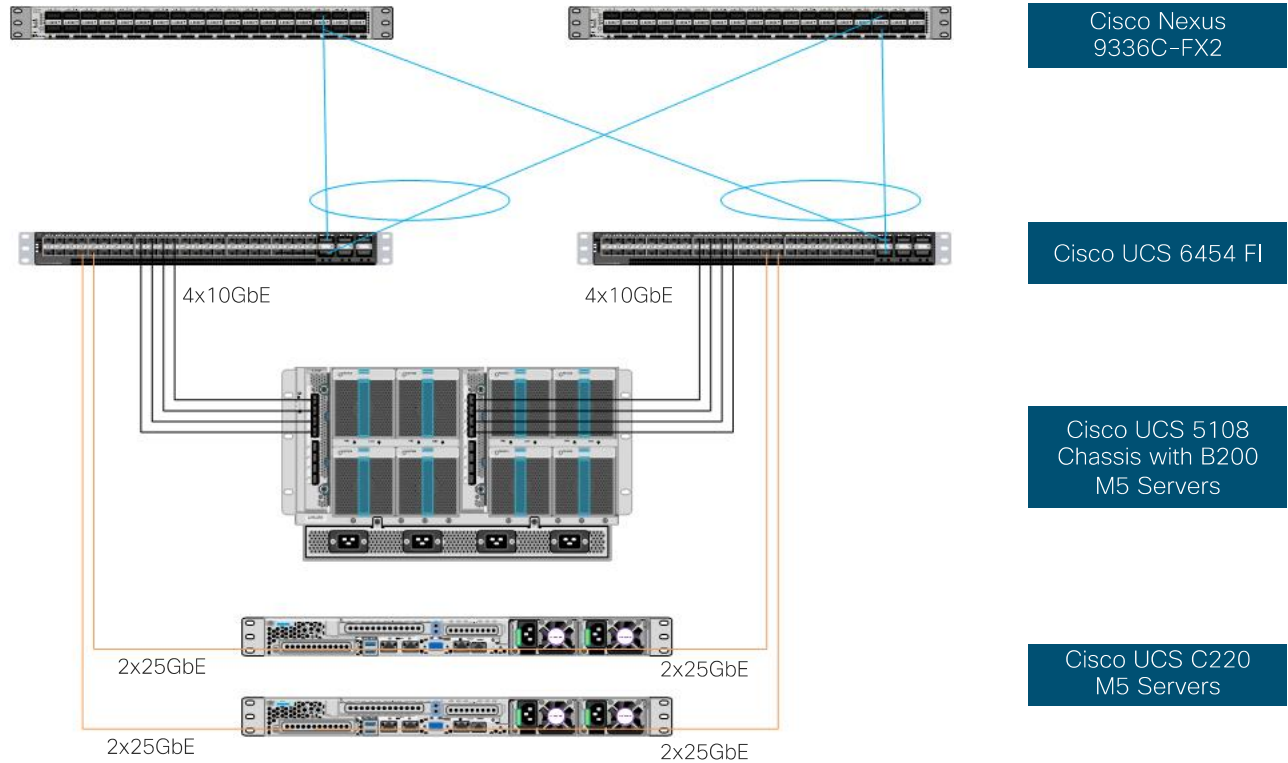

Table 3 Cisco UCS Connectivity to Nexus Switches

Local Device	Local Port	Connection	Remote Device	Remote Port
Cisco UCS Fabric Interconnect A	Eth1/17	10GbE	Cisco UCS Chassis FEX A	IOM 1/1

IBM FS9100 Node Canister 2	Port 1	16Gbps	Cisco MDS 9132T A	FC1/7
IBM FS9100 Node Canister 2	Port 2	16Gbps	Cisco MDS 9132T B	FC1/7
IBM FS9100 Node Canister 2	Port 3	16Gbps	Cisco MDS 9132T A	FC1/8
IBM FS9100 Node Canister 2	Port 4	16Gbps	Cisco MDS 9132T B	FC1/8

Network Configuration

The procedures in this section describe how to configure the Cisco Nexus switches for use in a base VersaStack environment. This procedure assumes the use of Nexus 9336C-FX2 switches running 7.0(3)I7(6) code. Configuration on a differing model of Nexus 9000 series switch should be comparable but may differ slightly with model and changes in NX-OS release. The Cisco Nexus 9336C-FX2 switch and NX-OS 7.0(3)I7(6) release were used in validation of this VersaStack solution, so steps will reflect this model and release.

Connectivity between the Nexus switches and IBM FS9100 for iSCSI access depends on the Nexus 9000 switch model used within the architecture. If any supported Nexus switch with 25Gbps capable SFP ports is used, breakout cable is not required and ports from the switch to IBM FS9100 can be connected directly using the SFP transceivers on both sides.

With Cisco Nexus 9000 release 7.0(3)I7(6), autonegotiation (40G/100G) is not supported on ports 1-6 and 33-36 on the Cisco Nexus 9336C-FX2 switch. If these ports are used for connectivity, port speed and duplex should be hard set at both ends of the connection.

Physical Connectivity

Physical cabling should be completed by following the diagram and table references in the previous sections.

Cisco Nexus 9000 Initial Configuration Setup

The steps provided in this section details for the initial Cisco Nexus 9336C-FX2 Switch setup. In this case, we are connected using a Cisco Terminal Server that is connected via the console port on the switch.

Cisco Nexus A

To set up the initial configuration for the first Cisco Nexus switch <nexus-A-hostname>, follow these steps:

On initial boot and connection to the serial or console port of the switch, the NX-OS setup should automatically start and attempt to enter Power on Auto Provisioning.

1. Configure the switch:

```
Abort Power On Auto Provisioning [yes - continue with normal setup, skip - bypass password and basic
configuration, no - continue with Power On Auto Provisioning] (yes/skip/no)[no]: yes

Disabling POAP.....Disabling POAP
```

```

poap: Rolling back, please wait... (This may take 5-15 minutes)

      ---- System Admin Account Setup ----

Do you want to enforce secure password standard (yes/no) [y]: Enter
Enter the password for "admin": <password>
Confirm the password for "admin": <password>
Would you like to enter the basic configuration dialog (yes/no): yes
Create another login account (yes/no) [n]: Enter
Configure read-only SNMP community string (yes/no) [n]: Enter
Configure read-write SNMP community string (yes/no) [n]: Enter
Enter the switch name: <nexus-A-hostname>
Continue with Out-of-band (mgmt0) management configuration? (yes/no) [y]: Enter
Mgmt0 IPv4 address: <nexus-A-mgmt0-ip>
Mgmt0 IPv4 netmask: <nexus-A-mgmt0-netmask>
Configure the default gateway? (yes/no) [y]: Enter
IPv4 address of the default gateway: <nexus-A-mgmt0-gw>
Configure advanced IP options? (yes/no) [n]: Enter
Enable the telnet service? (yes/no) [n]: Enter
Enable the ssh service? (yes/no) [y]: Enter
Type of ssh key you would like to generate (dsa/rsa) [rsa]: Enter
Number of rsa key bits <1024-2048> [1024]: Enter
Configure the ntp server? (yes/no) [n]: y
NTP server IPv4 address: <global-ntp-server-ip>
Configure default interface layer (L3/L2) [L2]: Enter
Configure default switchport interface state (shut/noshut) [noshut]: shut
Configure CoPP system profile (strict/moderate/lenient/dense/skip) [strict]: Enter
Would you like to edit the configuration? (yes/no) [n]: Enter

```

2. Review the configuration summary before enabling the configuration.

Cisco Nexus B

To set up the initial configuration for the second Cisco Nexus switch, follow these steps:

On initial boot and connection to the serial or console port of the switch, the NX-OS setup should automatically start and attempt to enter Power on Auto Provisioning.

1. Configure the switch:

```

Abort Power On Auto Provisioning [yes - continue with normal setup, skip - bypass password and basic
configuration, no - continue with Power On Auto Provisioning] (yes/skip/no) [no]: yes

Disabling POAP.....Disabling POAP

poap: Rolling back, please wait... (This may take 5-15 minutes)

      ---- System Admin Account Setup ----

Do you want to enforce secure password standard (yes/no) [y]: Enter
Enter the password for "admin": <password>
Confirm the password for "admin": <password>
Would you like to enter the basic configuration dialog (yes/no): yes
Create another login account (yes/no) [n]: Enter
Configure read-only SNMP community string (yes/no) [n]: Enter
Configure read-write SNMP community string (yes/no) [n]: Enter
Enter the switch name: <nexus-B-hostname>
Continue with Out-of-band (mgmt0) management configuration? (yes/no) [y]: Enter
Mgmt0 IPv4 address: <nexus-B-mgmt0-ip>
Mgmt0 IPv4 netmask: <nexus-B-mgmt0-netmask>
Configure the default gateway? (yes/no) [y]: Enter
IPv4 address of the default gateway: <nexus-B-mgmt0-gw>
Configure advanced IP options? (yes/no) [n]: Enter
Enable the telnet service? (yes/no) [n]: Enter
Enable the ssh service? (yes/no) [y]: Enter
Type of ssh key you would like to generate (dsa/rsa) [rsa]: Enter
Number of rsa key bits <1024-2048> [1024]: Enter
Configure the ntp server? (yes/no) [n]: y
NTP server IPv4 address: <global-ntp-server-ip>
Configure default interface layer (L3/L2) [L2]: Enter
Configure default switchport interface state (shut/noshut) [noshut]: shut
Configure CoPP system profile (strict/moderate/lenient/dense/skip) [strict]: Enter
Would you like to edit the configuration? (yes/no) [n]: Enter

```

2. Review the configuration summary before enabling the configuration.

Enable Appropriate Cisco Nexus 9000 Features and Settings

Enable Licenses

Cisco Nexus 9000 A and Cisco Nexus 9000 B

To license the Cisco Nexus switches, follow these steps:

1. Log in a admin.
2. Run the following commands:

```
config terminal  
feature uddl  
feature lacp  
feature vpc
```

Set Global Configurations

Cisco Nexus 9000 A and Cisco Nexus 9000 B

To set global configurations, follow these steps on both switches:

```
spanning-tree port type network default  
spanning-tree port type edge bpduguard default  
spanning-tree port type edge bpdufilter default  
port-channel load-balance src-dst l4port  
ip route 0.0.0.0/0 <ib-mgmt-vlan-gateway>  
copy run start
```

Setup NTP (optional)

The following procedure can be used to optionally enable the NTP service on the Nexus switches. The procedure includes the setup of NTP distribution on both the mgmt0 port and the in-band management VLAN. The interface-vlan feature and ntp commands are used to set this up. This procedure also assumes that the default VRF is used to route the in-band management VLAN.

Cisco Nexus 9000 A and Cisco Nexus 9000 B

1. Run the following commands

```
feature interface-vlan  
ntp server <global-ntp-server-ip> use-vrf management  
ntp master 3
```

Add NTP Distribution Interface

Cisco Nexus A

1. From the global configuration mode, run the following commands:

```
interface Vlan<IB-Mgmt VLAN id>  
ip address <switch-a-ntp-ip>/<ib-mgmt-vlan-netmask-length>
```

```
no shutdown
exit
ntp peer <switch-b-ntp-ip> use-vrf default
```

Cisco Nexus B

1. From the global configuration mode, run the following commands:

```
interface Vlan<IB-Mgmt VLAN id>
ip address <switch-b-ntp-ip>/<ib-mgmt-vlan-netmask-length>
no shutdown
exit
ntp peer <switch-a-ntp-ip> use-vrf default
```

Create VLANs for VersaStack IP Traffic

Cisco Nexus 9000 A and Cisco Nexus 9000 B

To create the necessary virtual local area networks (VLANs), follow this step on both switches:

1. From the global configuration mode, run the following commands:

```
vlan <IB-Mgmt VLAN id>
name IB-MGMT-VLAN
vlan <Native VLAN id>
name Native-VLAN
vlan <vMotion VLAN id>
name vMotion-VLAN
vlan <VM Traffic VLAN id>
name VM-Traffic-VLAN
vlan <iSCSI-A_VLAN_id>
name iSCSI-A-VLAN
vlan <iSCSI-B_VLAN id>
name iSCSI-B-VLAN
exit
copy run start
```

Configure Virtual Port Channel Domain

Cisco Nexus 9000 A

To configure vPC domain for switch A, follow these steps:

1. From the global configuration mode, create a new vPC domain:

```
vpc domain 10
```

2. Make the Nexus 9000A the primary vPC peer by defining a low priority value:

```
role priority 10
```

3. Use the management interfaces on the supervisors of the Nexus 9000s to establish a keepalive link:

```
peer-keepalive destination <Mgmt. IP address for Switch B> source <Mgmt. IP address for Switch A>
```

4. Enable the following features for this vPC domain:

```
peer-switch  
delay restore 150  
peer-gateway  
ip arp synchronize  
auto-recovery  
copy run start
```

Cisco Nexus 9000 B

To configure the vPC domain for switch B, follow these steps:

1. From the global configuration mode, create a new vPC domain:

```
vpc domain 10
```

2. Make the Nexus 9000A the primary vPC peer by defining a low priority value:

```
role priority 20
```

3. Use the management interfaces on the supervisors of the Nexus 9000s to establish a keepalive link:

```
peer-keepalive destination <Mgmt. IP address for Switch A> source <Mgmt. IP address for Switch B>
```

4. Enable the following features for this vPC domain:

```
peer-switch  
delay restore 150  
peer-gateway  
ip arp synchronize
```

```

auto-recovery
copy run start

```

Configure Network Interfaces for the vPC Peer Links

To configure the network interfaces for the vPC Peer links, follow these steps:

Cisco Nexus 9000 A

1. Define a port description for the interfaces connecting to vPC Peer <nexus-B-hostname>.

```

interface Eth1/33
description VPC Peer <Nexus-B Switch Name>:1/33
interface Eth1/34
description VPC Peer <Nexus-B Switch Name>:1/34

```

2. Apply a port channel to both vPC Peer links and bring up the interfaces.

```

interface Eth1/33,Eth1/34
channel-group 10 mode active
no shutdown

```

3. Define a description for the port-channel connecting to <nexus_B_hostname>.

```

interface Po10
description vPC peer-link

```

4. Make the port-channel a switchport and configure a trunk to allow in-band management, VM traffic, vMotion and the native VLAN.

```

switchport
switchport mode trunk
switchport trunk native vlan <Native VLAN id>
switchport trunk allowed vlan <IB-MGMT VLAN id>, <vMotion VLAN id>, <VM Traffic VLAN id>, <iSCSI-A
VLAN id>, <iSCSI-B VLAN id>

```

5. Make the port channel and associated interfaces spanning tree network ports.

```

spanning-tree port type network

```

6. Set port speed and duplex.

```

speed 100000

```

```
duplex full
no negotiate
```

7. Make this port-channel the VPC peer link and bring it up.

```
vpc peer-link
no shutdown
copy run start
```

Cisco Nexus 9000 B

1. Define a port description for the interfaces connecting to VPC Peer <nexus_A_hostname>.

```
interface Eth1/33
description VPC Peer <Nexus-A Switch Name>:1/33
interface Eth1/34
description VPC Peer <Nexus-A Switch Name>:1/34
```

2. Apply a port channel to both VPC Peer links and bring up the interfaces.

```
interface Eth1/33,Eth1/34
channel-group 10 mode active
no shutdown
```

3. Define a description for the port-channel connecting to <nexus_A_hostname>.

```
interface Po10
description vPC peer-link
```

4. Make the port-channel a switchport and configure a trunk to allow in-band management, VM traffic, vMotion and the native VLAN.

```
switchport
switchport mode trunk
switchport trunk native vlan <Native VLAN id>
switchport trunk allowed vlan <IB-MGMT VLAN id>, <vMotion VLAN id>, <VM Traffic VLAN id>, <iSCSI-A
VLAN id>, <iSCSI-B VLAN id>
```

5. Make the port channel and associated interfaces spanning tree network ports.

```
spanning-tree port type network
```

6. Set port speed and duplex.

```
speed 100000
duplex full
no negotiate
```

7. Make this port-channel the VPC peer link and bring it up.

```
vpc peer-link
no shutdown
copy run start
```

Configure Network Interfaces to Cisco UCS Fabric Interconnects

To configure the network interfaces for the Cisco UCS Fabric Interconnects, follow these steps:

Cisco Nexus 9000 A

1. Define a description for the port-channel connecting to <UCS Cluster Name>-A.

```
interface Po13
description <UCS Cluster Name>-A
```

2. Make the port-channel a switchport and configure a trunk to allow in-band management, VM traffic, vMotion, iSCSI and the native VLANs.

```
switchport
switchport mode trunk
switchport trunk native vlan <Native VLAN id>
switchport trunk allowed vlan <IB-MGMT VLAN id>, <vMotion VLAN id>, <VM Traffic VLAN id>, <iSCSI-A
VLAN id>, <iSCSI-B VLAN id>
```

3. Set port speed and duplex.

```
speed 100000
duplex full
no negotiate auto
```

4. Make the port channel and associated interfaces spanning tree edge ports.

```
spanning-tree port type edge trunk
```

5. Set the MTU to be 9216 to support jumbo frames.

```
mtu 9216
```

6. Make this a VPC port-channel and bring it up.

```
vpc 13
no shutdown
```

7. Define a port description for the interface connecting to <UCS Cluster Name>-A.

```
interface Eth1/31
description <UCS Cluster Name>-A:53
```

8. Apply it to a port channel and bring up the interface.

```
channel-group 13 force mode active
no shutdown
```

9. Define a description for the port-channel connecting to <UCS Cluster Name>-B.

```
interface Po14
description <UCS Cluster Name>-B
```

10. Make the port-channel a switchport and configure a trunk to allow in-band management, VM traffic, vMotion and the native VLANs.

```
switchport
switchport mode trunk
switchport trunk native vlan <Native VLAN id>
switchport trunk allowed vlan <IB-MGMT VLAN id>, <vMotion VLAN id>, <VM Traffic VLAN id>, <iSCSI-A
VLAN id>, <iSCSI-B VLAN id>
```

11. Set port speed.

```
speed 100000
duplex full
no negotiate auto
```

12. Make the port channel and associated interfaces spanning tree edge ports.

```
spanning-tree port type edge trunk
```

13. Set the MTU to be 9216 to support jumbo frames.

```
mtu 9216
```

14. Make this a VPC port-channel and bring it up.

```
vpc 14
no shutdown
```

- Define a port description for the interface connecting to <UCS Cluster Name>-B.

```
interface Eth1/32
description <UCS Cluster Name>-B:1/53
```

- Apply it to a port channel and bring up the interface.

```
channel-group 14 force mode active
no shutdown
copy run start
```

Cisco Nexus 9000 B

- Define a description for the port-channel connecting to <UCS Cluster Name>-B.

```
interface Po13
description <UCS Cluster Name>-A
```

- Make the port-channel a switchport and configure a trunk to allow in-band management, VM traffic, vMotion and the native VLANs.

```
switchport
switchport mode trunk
switchport trunk native vlan <Native VLAN id>
switchport trunk allowed vlan <IB-MGMT VLAN id>, <vMotion VLAN id>, <VM Traffic VLAN id>, <iSCSI-A
VLAN id>, <iSCSI-B VLAN id>
```

- Set port speed.

```
speed 100000
duplex full
no negotiate auto
```

- Make the port channel and associated interfaces spanning tree edge ports.

```
spanning-tree port type edge trunk
```

- Set the MTU to 9216 to support jumbo frames.

```
mtu 9216
```

6. Make this a VPC port-channel and bring it up.

```
vpc 13
no shutdown
```

7. Define a port description for the interface connecting to <UCS Cluster Name>-B.

```
interface Eth1/31
description <UCS Cluster Name>-A:1/54
```

8. Apply it to a port channel and bring up the interface.

```
channel-group 13 force mode active
no shutdown
```

9. Define a description for the port-channel connecting to <UCS Cluster Name>-A.

```
interface Po14
description <UCS Cluster Name>-B
```

10. Make the port-channel a switchport and configure a trunk to allow in-band management, VM traffic, vMotion and the native VLANs.

```
switchport
switchport mode trunk
switchport trunk native vlan <Native VLAN id>
switchport trunk allowed vlan <IB-MGMT VLAN id>, <vMotion VLAN id>, <VM Traffic VLAN id>, <iSCSI-A
VLAN id>, <iSCSI-B VLAN id>
```

11. Set port speed.

```
speed 100000
duplex full
no negotiate auto
```

12. Make the port channel and associated interfaces spanning tree edge ports.

```
spanning-tree port type edge trunk
```

13. Set the MTU to be 9216 to support jumbo frames.

```
mtu 9216
```

14. Make this a VPC port-channel and bring it up.

```
vpc 14
no shutdown
```

- Define a port description for the interface connecting to <UCS Cluster Name>-A.

```
interface Eth1/32
description <UCS Cluster Name>-B:1/54
```

- Apply it to a port channel and bring up the interface.

```
channel-group 14 force mode active
no shutdown
copy run start
```

Enable UDLD for Cisco UCS Interfaces

Enable aggressive unidirectional link detection (UDLD) on interfaces connected to Cisco UCS.

Cisco Nexus A and Cisco Nexus B

- From the global configuration mode, run either of the following commands depending on the connectivity:

```
interface Eth1/x

#For Copper cable or twinnax connections use the following command
udld aggressive

#For fibre optic connections use the following command
udld enable
```

Configure Network Interfaces Connected to IBM FS9100 iSCSI Ports (iSCSI Deployment)

This configuration step can be skipped if the UCS environment does not need access to storage using iSCSI.

To configure the network interfaces for IBM FS9100 iSCSI ports, follow these steps:

Cisco Nexus 9000 A & B

The 100Gbps design in this document uses a pair of Nexus 9336C-FX2 switches built with all ports being capable of the 100Gbps Quad Small Form Factor Pluggable Plus (QSFP+) type. The IBM FS9100 has 25GbpsSFP+ ports for iSCSI connectivity. The 100Gbps QSFP+ ports on the Nexus 9336C-FX2 switches in this design have been connected to the IBM FS9100 iSCSI ethernet SFP+ ports using a QSFP+ Breakout Cable.

Configuration of the QSFP+ ports will use the interface breakout command as shown in this example to turn the 100G interface Ethernet 1/11 into 4x25G interfaces on both the Nexus switches:

```
show running-config interface Ethernet1/11

interface Ethernet1/11
  no switchport

interface breakout module 1 port 11 map 25g-4x

show running-config interface Ethernet1/11/1-4

interface Ethernet1/11/1

interface Ethernet1/11/2

interface Ethernet1/11/3

interface Ethernet1/11/4
```

Connectivity between the Nexus switches and IBM FS9100 for iSCSI access depends on the Nexus 9000 switch model used within the architecture. If any supported Nexus switch with 25Gbps capable SFP ports is used, breakout cable is not required and ports from the switch to IBM FS9100 can be connected directly using the SFP transceivers on both sides.

Cisco Nexus 9000 A

1. Define a description for the Ethernet port connecting to <FS9100 Node1, P5>.

```
interface Ethernet1/11/1
description <FS9100-Node1-iSCSI-P5>
```

2. Make the Interface access port and configure the switchport access VLAN.

```
switchport mode access
switchport access vlan <iSCSI-A VLAN id>
```

3. Make the interface spanning normal.

```
spanning-tree port type edge
```

4. Set the MTU to be 9216 to support jumbo frames.

```
mtu 9216
no shutdown
copy run start
```

5. Define a description for the Ethernet port connecting to <FS9100 Node2, P5>.

```
interface Ethernet1/11/2
description <FS9100-Node2-iSCSI-P5>
```

6. Make the Interface a access port and configure the switchport access VLAN.

```
switchport mode access
switchport access vlan <iSCSI-A VLAN id>
```

7. Make the interface spanning normal.

```
spanning-tree port type edge
```

8. Set the MTU to be 9216 to support jumbo frames.

```
mtu 9216
no shutdown
copy run start
```

Cisco Nexus 9000 B

1. Define a description for the Ethernet port connecting to <FS9100 Node1, P6>.

```
interface Ethernet1/11/1
description <FS9100-Node1-iSCSI-P6>
```

2. Make the Interface access port and configure the switchport access VLAN.

```
switchport mode access
switchport access vlan <iSCSI-B VLAN id>
```

3. Make the interface spanning normal.

```
spanning-tree port type edge
```

4. Set the MTU to be 9216 to support jumbo frames.

```
mtu 9216
no shutdown
copy run start
```

5. Define a description for the Ethernet port connecting to <FS9100 Node1, P6>.

```
interface Ethernet1/11/2
description <FS9100-Node2-iSCSI-P6>
```

6. Make the Interface a access port and configure the switchport access VLAN.

```
switchport mode access
```

```
switchport access vlan <iSCSI-B VLAN id>
```

7. Make the interface spanning normal.

```
spanning-tree port type edge
```

8. Set the MTU to be 9216 to support jumbo frames.

```
mtu 9216
no shutdown
copy run start
```

Management Uplink into Existing Network Infrastructure

Depending on the available network infrastructure, several methods and features can be used to uplink the VersaStack Pod environment. If an existing Cisco Nexus environment is present, we recommend using vPCs to uplink the Cisco Nexus switches included in the VersaStack environment into the infrastructure. The following procedure can be used to create an uplink vPC to the existing environment.

Cisco Nexus 9000 A and B using Port Channel Example

To enable management access across the IP switching environment leveraging port channel in config mode run the following commands:

1. Define a description for the port-channel connecting to management switch.

```
interface po6
description IB-MGMT
```

2. Configure the port as an access VLAN carrying the InBand management VLAN traffic.

```
switchport
switchport mode access
switchport access vlan <IB-MGMT VLAN id>
```

3. Make the port channel and associated interfaces normal spanning tree ports.

```
spanning-tree port type normal
```

4. Make this a VPC port-channel and bring it up.

```
vpc 6
no shutdown
```

5. Define a port description for the interface connecting to the management plane.

```
interface Eth1/30
```

```
description IB-MGMT-SWITCH_uplink
```

6. Apply it to a port channel and bring up the interface.

```
channel-group 6 force mode active
no shutdown
```

7. Save the running configuration to start-up in both Nexus 9000s and run commands to look at port and port channel.

```
Copy run start
sh int eth1/30 br
sh port-channel summary
```

Switch Testing Commands

The following commands can be used to check for correct switch configuration:

Some of these commands need to run after further configuration of the VersaStack components are complete to see complete results.

```
show run
show vpc
show port-channel summary
show ntp peer-status
show cdp neighbors
show lldp neighbors
show udld neighbors
show run int
show int
```

Cisco MDS 9132T Configuration (FC Deployment)

This section explains how to configure the Cisco MDS 9000s for use in a VersaStack environment. Follow the steps precisely because failure to do so could result in an improper configuration.

If directly connecting storage to the Cisco UCS fabric interconnects or if only iSCSI storage access is required, skip this section.

Physical Connectivity

Follow the physical connectivity guidelines for VersaStack as explained in the section Physical Infrastructure.

VersaStack Cisco MDS Base Configuration

The following procedures describe how to configure the Cisco MDS switches for use in a base VersaStack environment. This procedure assumes you are using the Cisco MDS 9132T with NX-OS 8.3(1).

Cisco MDS 9132T A

To set up the initial configuration for the Cisco MDS A switch, <mds-A-hostname>, follow these steps:

On initial boot and connection to the serial or console port of the switch, the NX-OS setup should automatically start and attempt to enter Power on Auto Provisioning. Enter y to get to the System Admin Account Setup.

Cisco MDS 9132T A

1. Configure the switch using command line.

```

---- System Admin Account Setup ----

Do you want to enforce secure password standard (yes/no) [y]: Enter
Enter the password for "admin": <password>
Confirm the password for "admin": <password>

Would you like to enter the basic configuration dialog (yes/no): yes

Create another login account (yes/no) [n]: Enter

Configure read-only SNMP community string (yes/no) [n]: Enter

Configure read-write SNMP community string (yes/no) [n]: Enter

Enter the switch name : <mds-A-hostname>

Continue with Out-of-band (mgmt0) management configuration? (yes/no) [y]: Enter

Mgmt0 IPv4 address : <mds-A-mgmt0-ip>

Mgmt0 IPv4 netmask : <mds-A-mgmt0-netmask>

Configure the default gateway? (yes/no) [y]: Enter

IPv4 address of the default gateway : <mds-A-mgmt0-gw>

Configure advanced IP options? (yes/no) [n]: Enter

Enable the ssh service? (yes/no) [y]: Enter

Type of ssh key you would like to generate (dsa/rsa) [rsa]: Enter

Number of rsa key bits <1024-2048> [1024]: Enter

Enable the telnet service? (yes/no) [n]: Enter

Configure congestion/no_credit drop for fc interfaces? (yes/no) [y]: Enter

Enter the type of drop to configure congestion/no_credit drop? (con/no) [c]: Enter

Enter milliseconds in multiples of 10 for congestion-drop for logical-type edge
in range (<200-500>/default), where default is 500. [d]: Enter

Enable the http-server? (yes/no) [y]: Enter

Configure clock? (yes/no) [n]: Enter

```

```

Configure timezone? (yes/no) [n]: Enter
Configure summertime? (yes/no) [n]: Enter
Configure the ntp server? (yes/no) [n]: yes
NTP server IPv4 address : <nexus-A-mgmt0-ip>
Configure default switchport interface state (shut/noshut) [shut]: Enter
Configure default switchport trunk mode (on/off/auto) [on]: auto
Configure default switchport port mode F (yes/no) [n]: yes
Configure default zone policy (permit/deny) [deny]: Enter
Enable full zoneset distribution? (yes/no) [n]: Enter
Configure default zone mode (basic/enhanced) [basic]: Enter

```

2. Review the configuration summary before enabling the configuration.

Cisco MDS 9132T B

1. Configure the switch using command line.

```

---- System Admin Account Setup ----

Do you want to enforce secure password standard (yes/no) [y]: Enter
Enter the password for "admin": <password>
Confirm the password for "admin": <password>

2. Review the configuration summary before enabling the configuration.

Cisco MDS 9132T Initial Configuration Setup

To perform Cisco MDS Initial configuration, follow these steps:

Enable Licenses

Cisco MDS 9132T A and Cisco MDS 9132T B

To enable the correct features on the Cisco MDS switches, follow these steps:

1. Login as admin.
2. Run the following commands:

```

Configure terminal

feature npiv

feature fport-channel-trunk

feature lldp

device-alias mode enhanced

device-alias commit

```

Add Second NTP server

Cisco MDS 9132T A and Cisco MDS 9132T B

To configure the second NTP server, follow this step:

1. From the global configuration mode, run the following command:

```
ntp server <nexus-B-mgmt0-ip>
```

Configure Individual Ports

To configure Cisco MDS individual ports used for Cisco UCS and IBM FS9100 connectivity, follow these steps:

Cisco MDS 9132T A

To configure individual ports and port-channels for switch A, follow this step:

From the global configuration mode, run the following commands:

```
interface fcl/1
switchport description <ucs-clustername>-a:1/1
channel-group 1 force
no shutdown
exit

interface fcl/2
switchport description <ucs-clustername>-a:1/2
channel-group 1 force
no shutdown
exit

interface fcl/3
switchport description <ucs-clustername>-a:1/3
channel-group 1 force
no shutdown
exit

interface fcl/4
switchport description <ucs-clustername>-a:1/4
channel-group 1 force
no shutdown
exit

interface fcl/5
switchport description <FS9100-Node1-FC1>
switchport speed 16000
no shutdown
```

```
exit

interface fcl/6
switchport description <FS9100-Node1-FC3>
switchport speed 16000
no shutdown
exit

interface fcl/7
switchport description <FS9100-Node2-FC1>
switchport speed 16000
no shutdown
exit

interface fcl/8
switchport description <FS9100-Node2-FC3>
switchport speed 16000
no shutdown
exit

interface port-channel1
channel mode active
switchport description <ucs-clustername>-a
no shutdown
exit
```

Cisco MDS 9132T B

To configure individual ports and port-channels for switch B, follow this step:

From the global configuration mode, run the following commands:

```
interface fcl/1
switchport description <ucs-clustername>-b:1/1
channel-group 2 force
no shutdown
exit

interface fcl/2
```

```
switchport description <ucs-clustername>-b:1/2
channel-group 2 force
no shutdown
exit

interface fcl/3
switchport description <ucs-clustername>-b:1/3
channel-group 2 force
no shutdown
exit

interface fcl/4
switchport description <ucs-clustername>-b:1/4
channel-group 2 force
no shutdown
exit

interface fcl/5
switchport description <FS9100-Node1-FC2>
switchport speed 16000
no shutdown
exit

interface fcl/6
switchport description <FS9100-Node1-FC4>
switchport speed 16000
no shutdown
exit

interface fcl/7
switchport description <FS9100-Node2-FC2>
switchport speed 16000
no shutdown
exit

interface fcl/8
```

```

switchport description <FS9100-Node2-FC4>
switchport speed 16000
no shutdown
exit

interface port-channel2
channel mode active
switchport description <ucs-clustername>-b
no shutdown
exit

```

Create VSANs

Cisco MDS 9132T A

To create the necessary VSANs for fabric A and add ports to them, follow these steps:

From the global configuration mode, run the following commands:

```

vsan database
vsan <vsan-a-id>
vsan <vsan-a-id> name Fabric-A
exit
zone smart-zoning enable vsan <vsan-a-id>

vsan database
vsan <vsan-a-id> interface fc1/5
vsan <vsan-a-id> interface fc1/6
vsan <vsan-a-id> interface fc1/7
vsan <vsan-a-id> interface fc1/8
vsan <vsan-a-id> interface port-channell
exit

```

Cisco MDS 9132T B

To create the necessary VSANs for fabric B and add ports to them, follow these steps:

From the global configuration mode, run the following commands:

```

vsan database
vsan <vsan-b-id>
vsan <vsan-b-id> name Fabric-B

```

```
exit
zone smart-zoning enable vsan <vsan-b-id>
vsan database
vsan <vsan-b-id> interface fc1/5
vsan <vsan-b-id> interface fc1/6
vsan <vsan-b-id> interface fc1/7
vsan <vsan-b-id> interface fc1/8
vsan <vsan-b-id> interface port-channel2
exit
```

Initial Storage Configuration

IBM FlashSystem 9100

FlashSystem 9100 systems have specific connection requirements. Care must be taken to note the orientation of each node canister in the control enclosure.

The FlashSystem 9100 control enclosure contains two node canisters. A label on the control enclosure identifies each node canister and power supply unit (PSU). As Figure 6 shows, node canister 1 is on top and node canister 2 is on the bottom. Because the node canisters are inverted, the location of the ports and the port numbering are oriented differently on each node canister. It is important to remember this orientation when installing adapters and cables.

Figure 6 Orientation of the Node Canisters and PSUs

For example, Figure 7 shows the top node canister. On this canister, the PCIe slot and port numbering goes from right to left. PCIe adapter slot 1 contains a 4-port 16 Gbps Fibre Channel adapter, PCIe slot 2 contains a 2-port 25 Gbps iWARP Ethernet adapter, and PCIe slot 3 contains a 4-port 12 Gbps SAS adapter. The onboard Ethernet and USB ports are also shown.

Figure 7 Orientation of Ports on Node Canister 1

Figure 8 shows the bottom node canister. This node canister has the same type and number of adapters installed. However, on the bottom canister, the PCIe slot and port numbering goes from left to right.

Figure 8 Orientation of Ports on Node Canister 2

Four 10 Gb Ethernet ports on each node canister provide system management connections and iSCSI host connectivity. A separate technician port provides access to initialization and service assistant functions. Table 7 describes each port.

Table 7 Summary of Onboard Ethernet Ports

On board Ethernet Port	Speed	Function
1	10 Gbps	Management IP, Service IP, Host I/O
2	10 Gbps	Secondary Management IP, Host I/O
3	10 Gbps	Host I/O
4	10 Gbps	Host I/O
T	1 Gbps	Technician Port - DHCP/DNS for direct attach service management

The following connections are required for FlashSystem 9100 control enclosures:

- Each control enclosure requires two Ethernet cables to connect it to an Ethernet switch. One cable connects to port 1 of the top node canister, and the other cable connects to port 1 of the bottom node canister. For 10 Gbps ports, the minimum link speed is 1 Gbps. Both Internet Protocol Version 4 (IPv4) and Internet Protocol Version 6 (IPv6) are supported.
- To ensure system failover operations, Ethernet port 1 on each node canister must be connected to the same set of subnets. If used, Ethernet port 2 on each node canister must also be connected to the same set of subnets. However, the subnets for Ethernet port 1 do not have to be the same as Ethernet port 2.
- If you have more than one control enclosure in your system, the control enclosures communicate through their Fibre Channel ports.
- Each FlashSystem 9100 node canister also has three PCIe interface slots to support optional host interface adapters. The host interface adapters can be supported in any of the interface slots. Table 8 provides an overview of the host interface adapters.
- The 2-port SAS host interface adapter supports expansion enclosures. In total, FlashSystem 9100 control enclosures can have up to 20 chain-linked expansion enclosures, 10 per port.

Table 8 Summary of Supported Host Interface Adapters

Protocol	Feature	Ports	FRU part number	Quantity supported
16 Gbs Fibre Channel	AHB3	4	01YM333	0-3
25 Gbs Ethernet (RoCE)	AHB6	2	01YM283	0-3
25 Gbs Ethernet (iWARP)	AHB7	2	01YM285	0-3
12 Gb SAS Expansion	AHBA	4, but only 2 are active for SAS expansion chains.	01YM338	0-1

Each node canister within the control enclosure (I/O group) must be configured with the same host interface adapters.

Each node canister has four onboard 10 Gbps Ethernet ports. A node canister can also support up to three 2-port 25 Gbps Ethernet host interface adapters.

Table 9 lists the fabric types that can be used for communicating between hosts, nodes, and RAID storage systems. These fabric types can be used at the same time.

Table 9 Communications types

Communications type	Host to node	Node to storage system	Node to node
Fibre Channel SAN	Yes	Yes	Yes
iSCSI 10 Gbps Ethernet 25 Gbps Ethernet	Yes	Yes	No
iSER 25 Gbps Ethernet	Yes	No	No

The feature codes for the 16 Gbps Fibre Channel adapter, 25Gbps iWarp adapter, and the 25Gbps RoCE adapter each include standard SFP transceivers for each adapter. In this design the 25Gbps RoCE adapter has been leveraged for iSCSI connectivity and the ports are connected to the Cisco Nexus 9336C-FX2 switches using breakout cables, SFP transceivers are not required with this connectivity.

The 2-port 25 GB Ethernet adapter for iWARP and the 2-port 25GB Ethernet adapter for RDMA over Converged Ethernet (RoCE) both support iSER host attachment. However, RoCE and iWARP are not cross-compatible; therefore, it is important to use the adapter that matches the iSER implementation on your SAN if iSER is planned to be implemented in the future.

This document implements traditional iSCSI, iSER based iSCSI implementation can be configured with the support of iSER on Cisco VIC 1400 series when available with the future releases of Cisco UCS software.

IBM Service Support Representative (SSR) Configuration

To install the FlashSystem 9100 hardware, an IBM SSR must complete the following tasks:

You must complete the planning tasks and provide completed worksheets to the IBM SSR before they can proceed with installing and initializing your system.

- An IBM SSR unpacks and installs the AF7/AF8 control enclosures and any optional SAS expansion enclosures in the rack.

- Referring to the worksheets that you completed, the IBM SSR completes the cabling.

If the IBM SSR is aware of your intent to add the FlashSystem 9100 to an existing system, the IBM SSR installs the FlashSystem 9100 control enclosure for you but does not initialize a system on it. If you are planning on adding a FlashSystem 9100 control enclosure to an existing Storwize® V7000 system, inform the IBM SSR of this intention. In these cases, the IBM SSR installs the FlashSystem 9100 control enclosure for you, but does not initialize a system on it, because the existing system is already initialized.

After the hardware is installed, an IBM SSR connects a workstation to an AF7/AF8 control enclosure technician port and completes the following tasks:

- Configuring the system with a name, and management and service IP addresses.
- Logging in to the control enclosure using the management GUI and completing the system setup wizard using information from the customer-supplied worksheets.

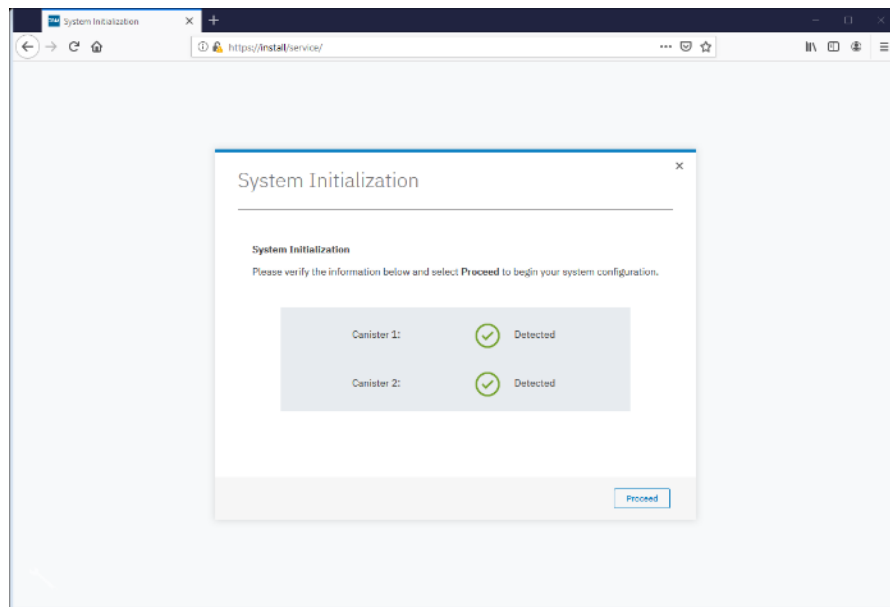

The SSR configuration steps are documented below.

Initialize the System

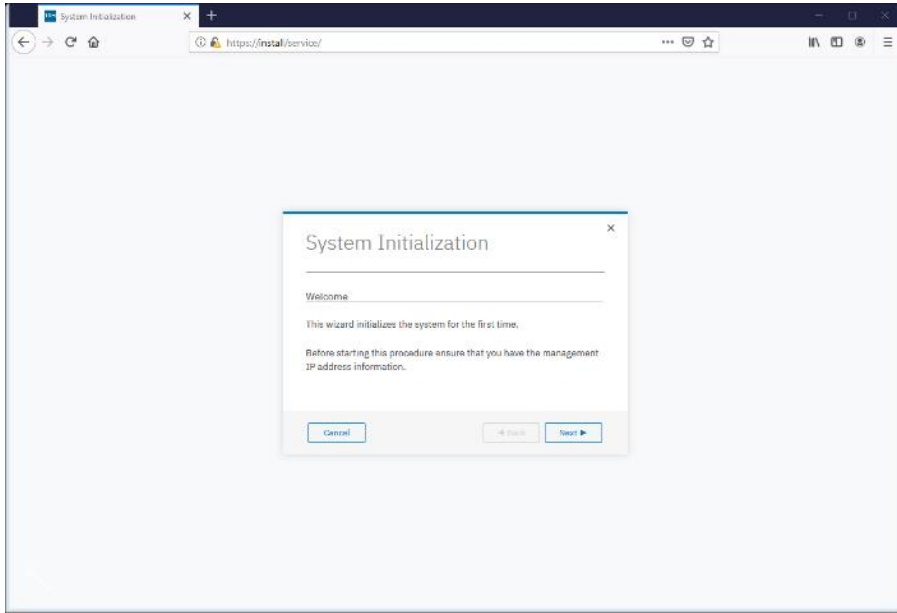

The initial configuration requires a workstation be locally attached to the Ethernet port labelled “T” on the Upper node canister in the FS9100 enclosure. “T” refers to Tech Port and will allocate an IP address to the connected workstation using DHCP and will redirect any DNS queries to the System Initialization page. This page shows the status of each node canister in the enclosure and will guide you through the initialization process.

To initialize the system, follow these steps:

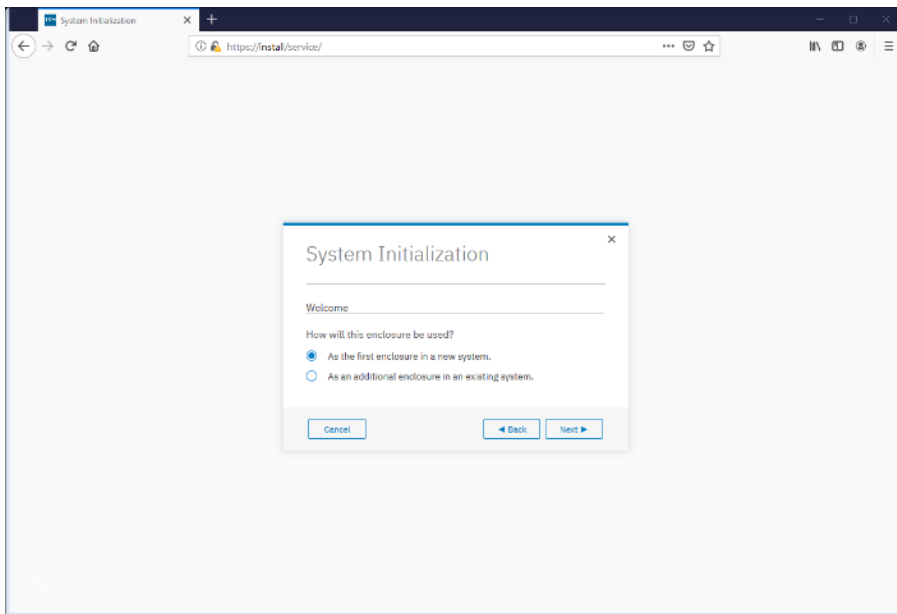

1. Ensure both node canisters have been detected and click Proceed.

2. Click Next through the Welcome screen.

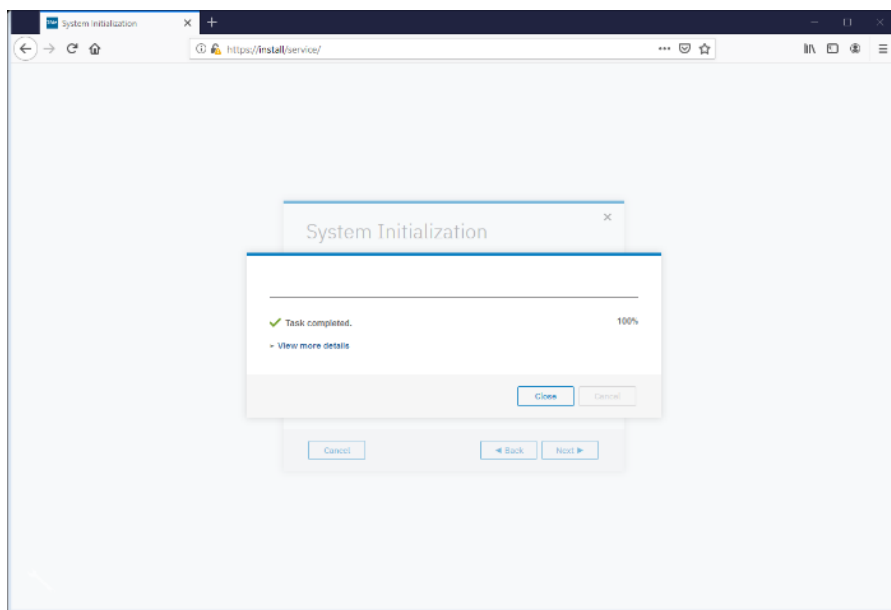

3. Select the option to define the enclosure as the first in a new system

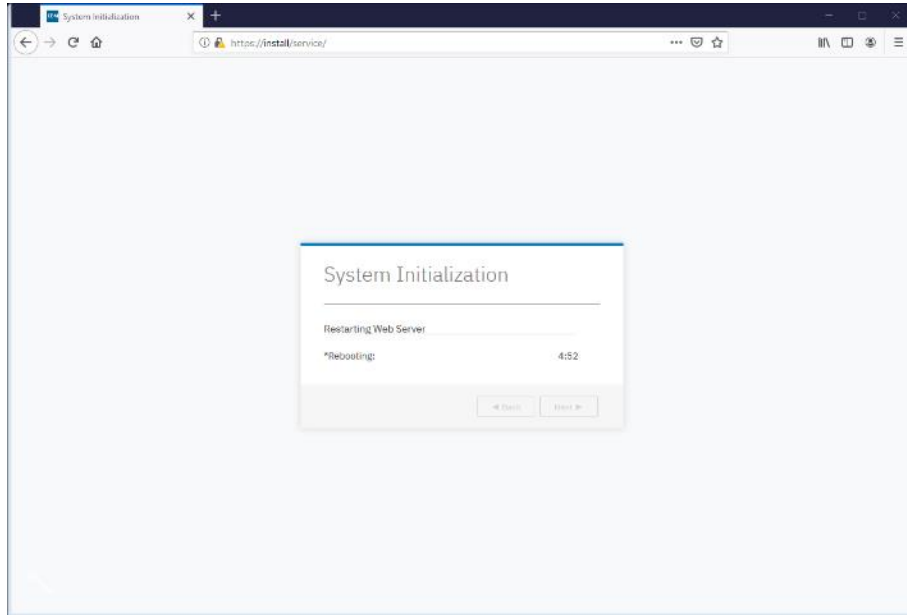

4. Enter the network details for the management interface for the new system. This IP address is sometimes referred to as the Management IP, or Cluster IP and will be used to manage the FS9100 system via the web interface or CLI via SSH.

5. Acknowledge the Task Completion message.

6. The initial configuration steps are now complete, and the system will now restart the Web Server.

Prepare FS9100 for Customer Environments

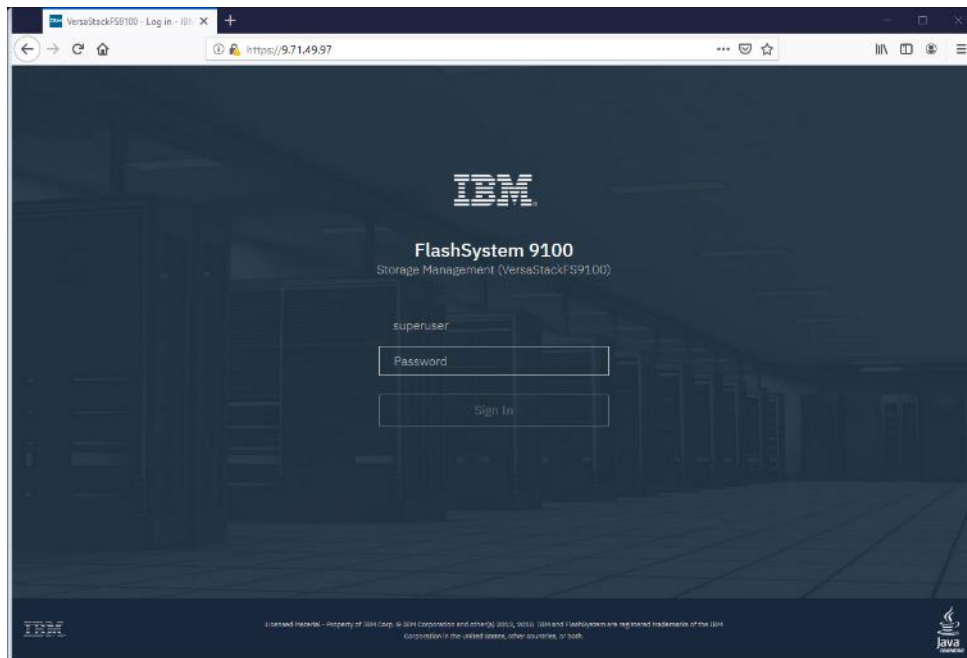

Now the Management IP is enabled, all future configuration steps are made with this interface.

To prepare the FS9100 for customer environments, follow these steps:

1. Log in using the default credentials:

Username: `superuser`

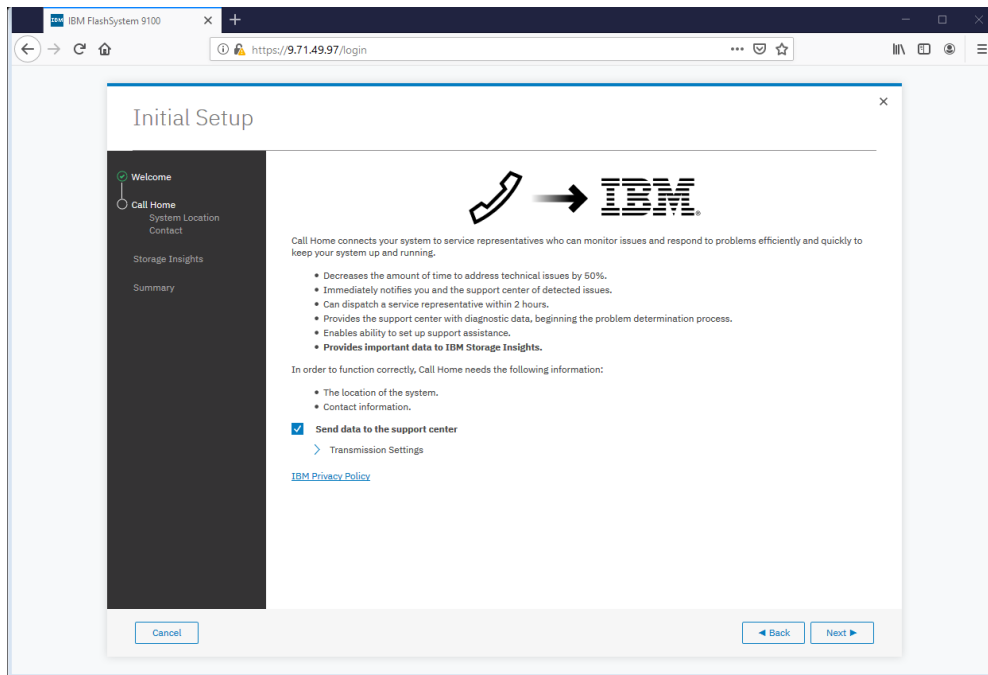

Password: `passw0rd`

2. Click Next to proceed through the configuration wizard.

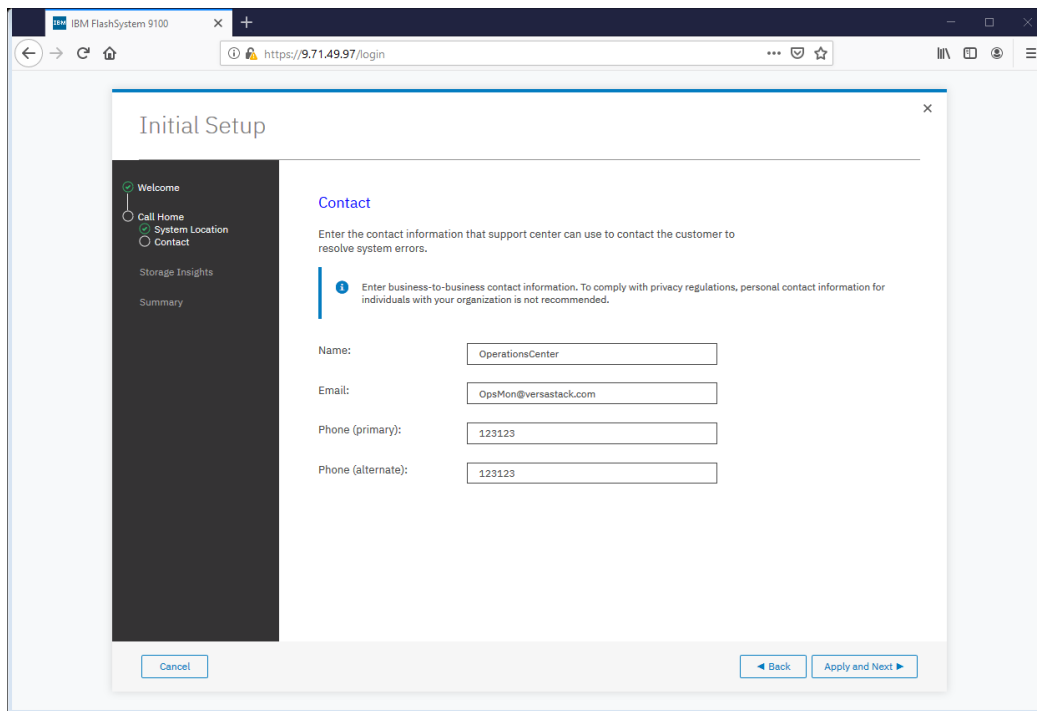

3. For optimal configuration, check the box to enable the Call Home feature.

4. Detail the System Location.

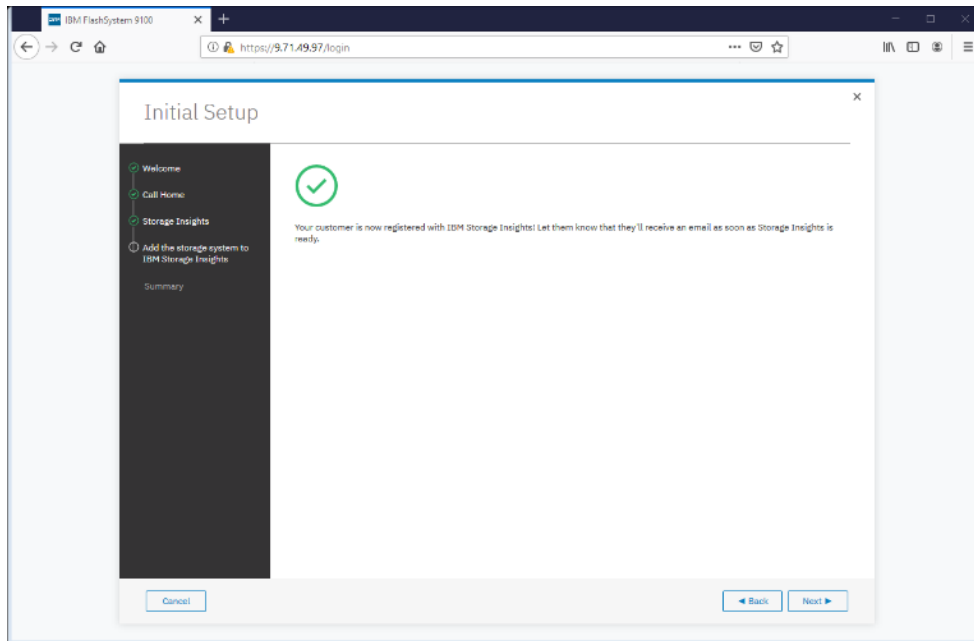

5. Specify the contact details.

6. Specify the customer's IBM ID and contact details.

7. Click Next to finalize the IBM Storage Insights registration.

8. Review the Initial Setup summary and click Finish.

9. Click Close to complete the Service Initialization.

Customer Configuration Setup Tasks via the GUI

After completing the initial tasks above, launch the management GUI and continue configuring the IBM FlashSystem 9100.

To configure the customer's tasks, follow these steps:

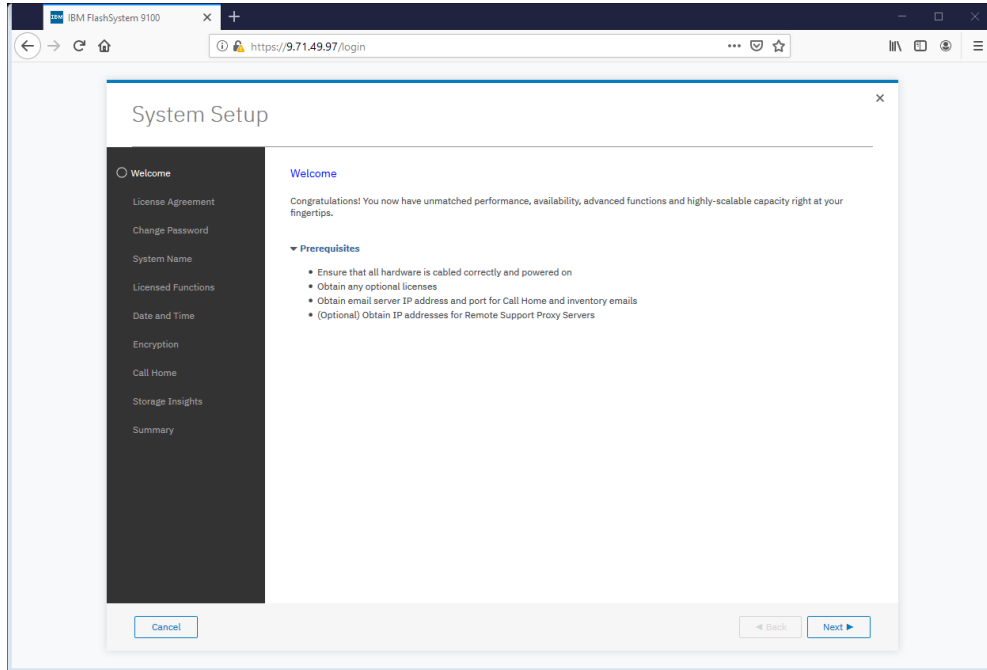

Following e-Learning module introduces the IBM FlashSystem 9100 management interface and provides an overview of the system setup tasks, including configuring the system, migrating and configuring storage, creating hosts, creating and mapping volumes, and configuring email notifications: [Getting Started](#)

1. Log into the management GUI using the cluster IP address configured above.

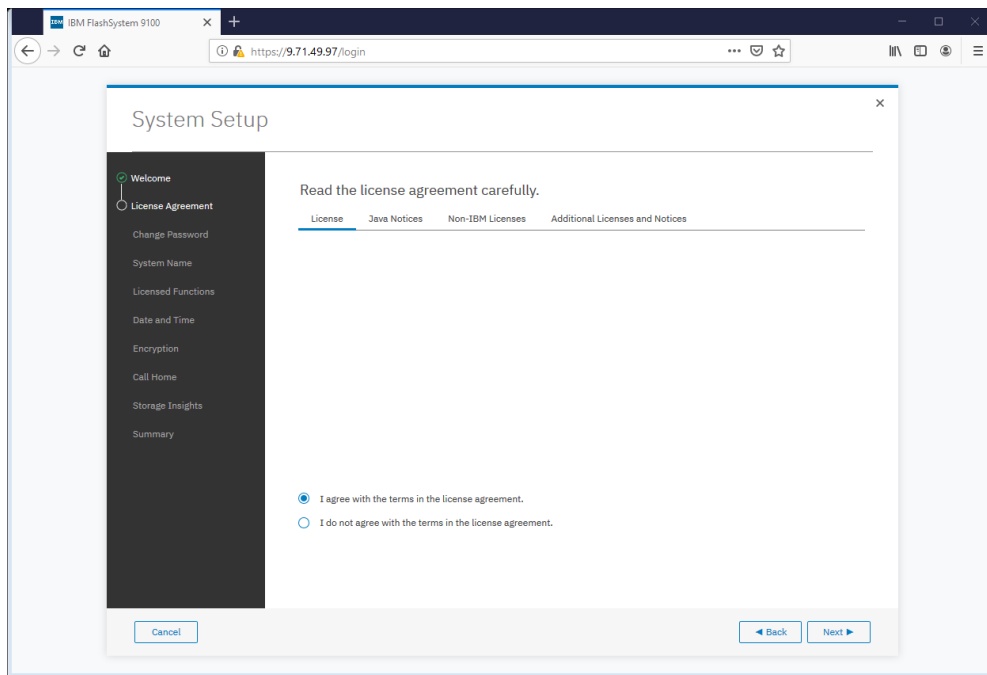

2. Log in using the default credentials:

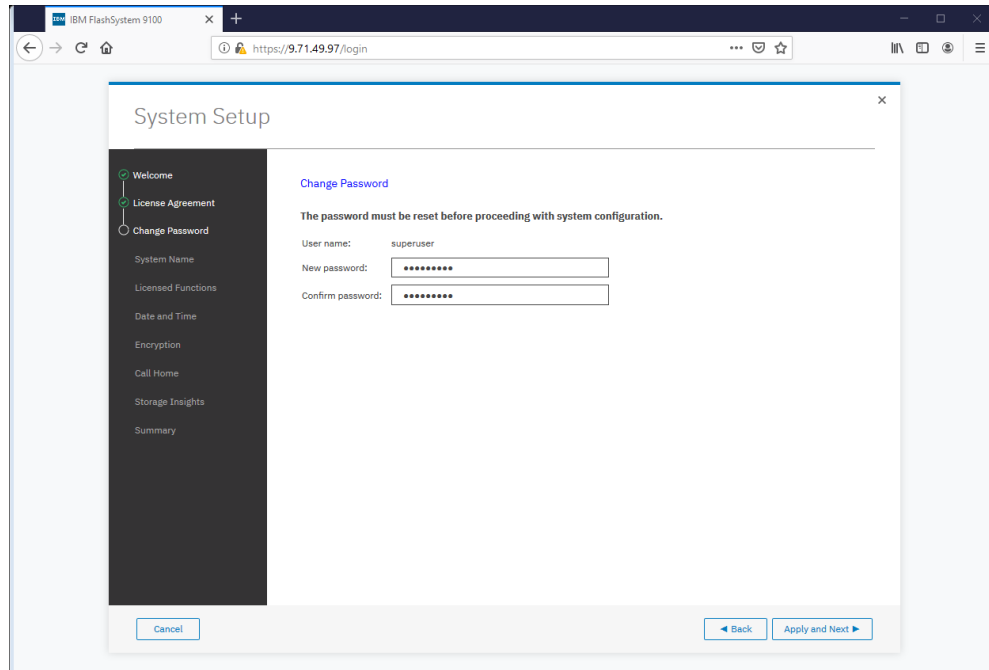

Username: `superuser`
Password: `passw0rd`
3. Click Next to skip the Welcome message.

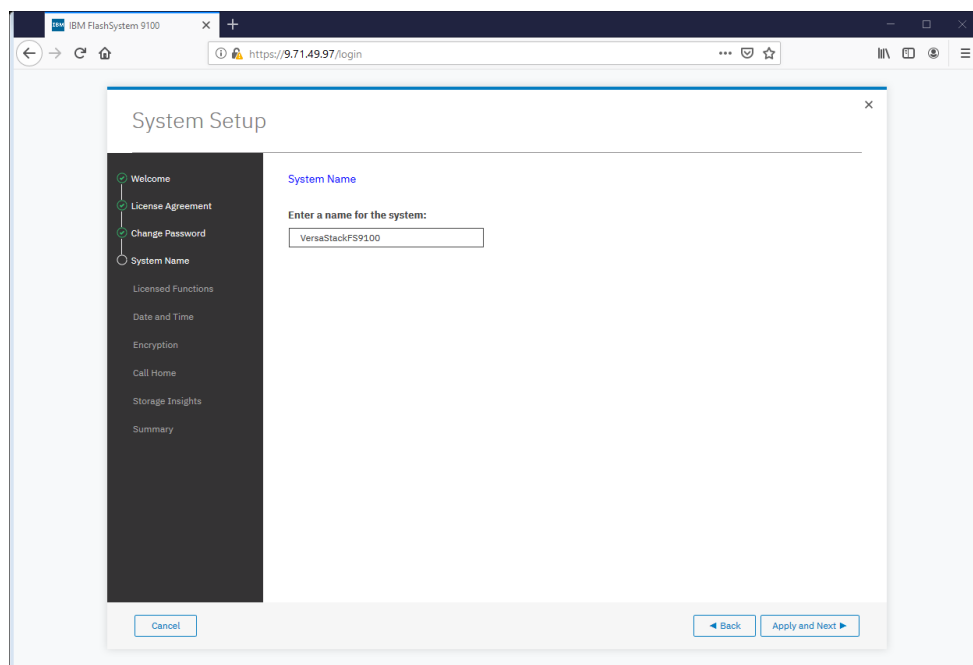

4. Read and accept the license agreement. Click Accept.

5. Define new credentials for the superuser user account.

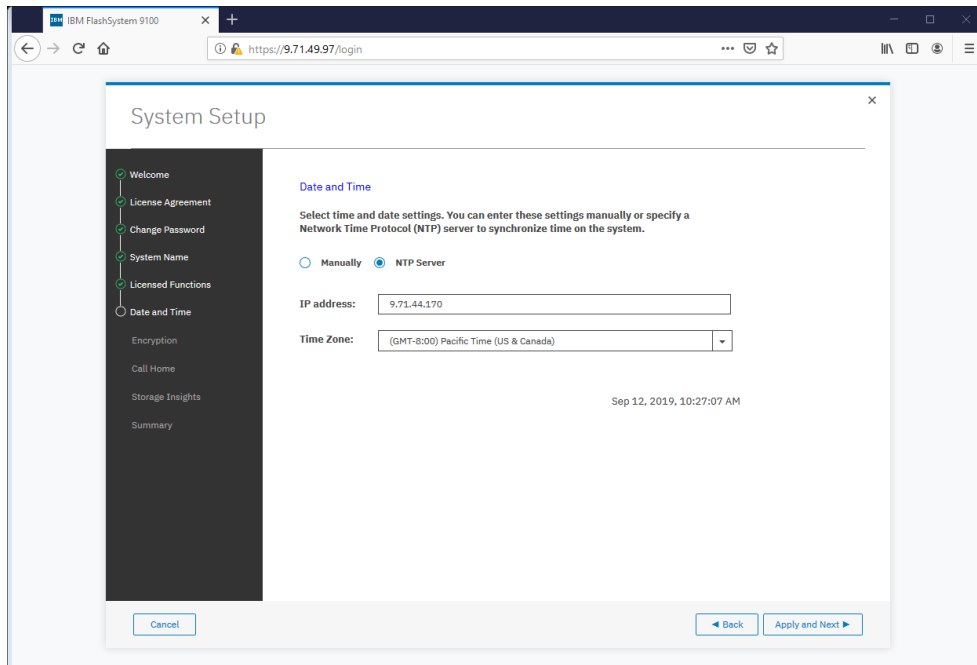

6. Enter the System Name and click Apply and Next to proceed.

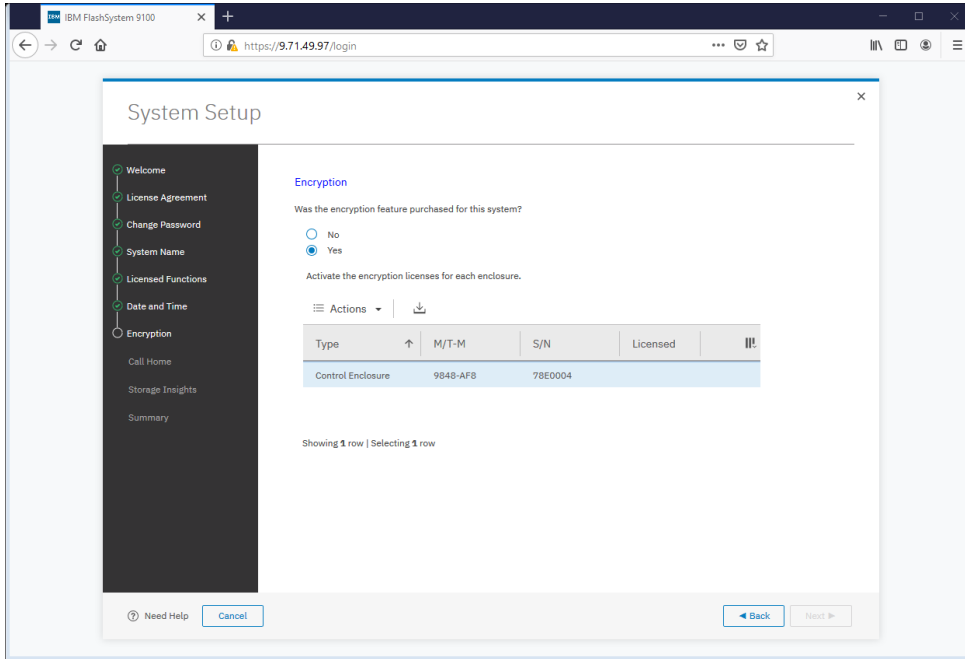

7. Enter the license details that was purchased for FlashCopy, Remote Mirroring, Easy Tier, and External Virtualization. Click Apply and Next to proceed.

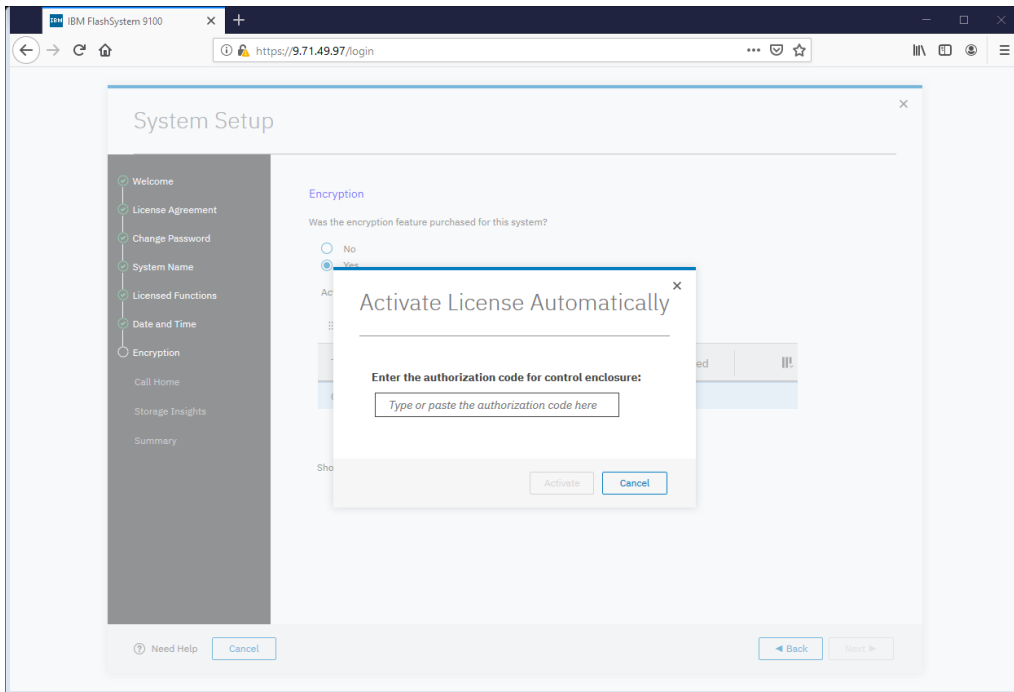

8. Configure the date and time settings, inputting NTP server details if available. Click Apply and Next to proceed.

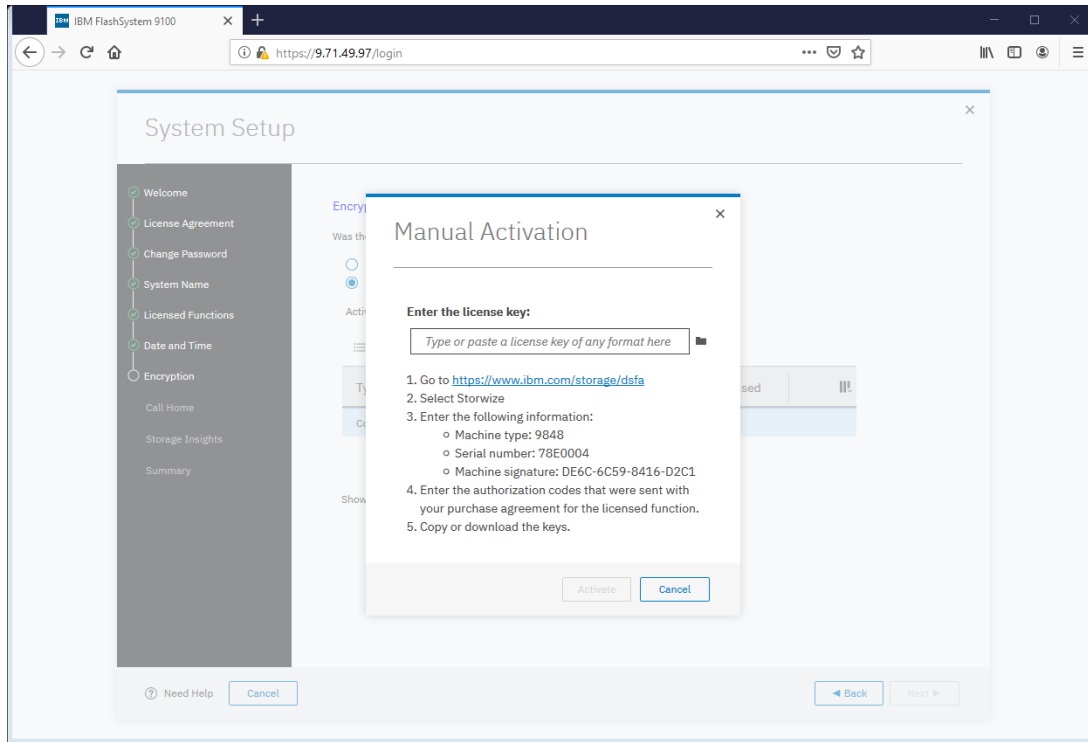

9. Enable the Encryption feature (or leave it disabled). Click Next to proceed.

10. If using the encryption, select either Manual or Automatic activation and enter the authorization code or license key accordingly.

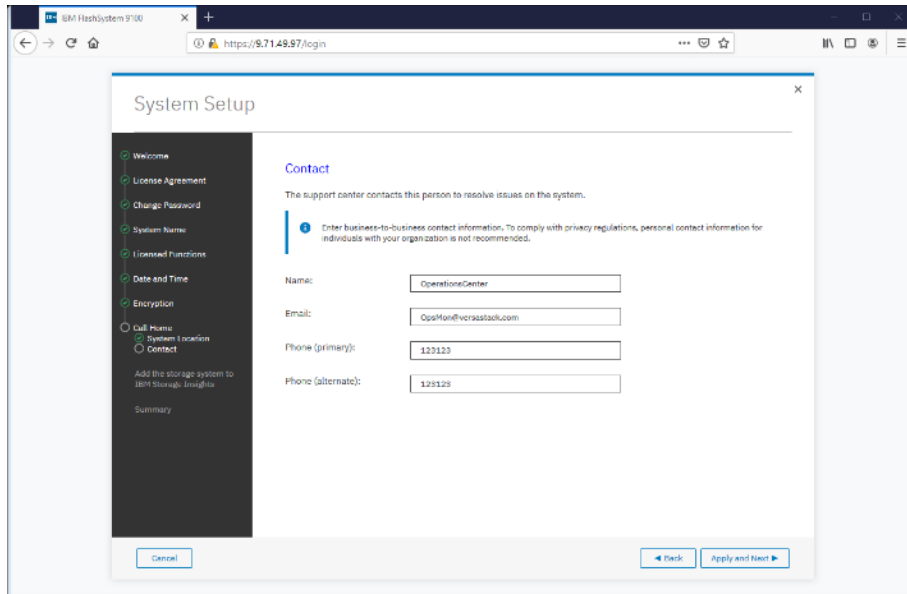

It is highly recommended to configure email event notifications which will automatically notify IBM support centers when problems occur.

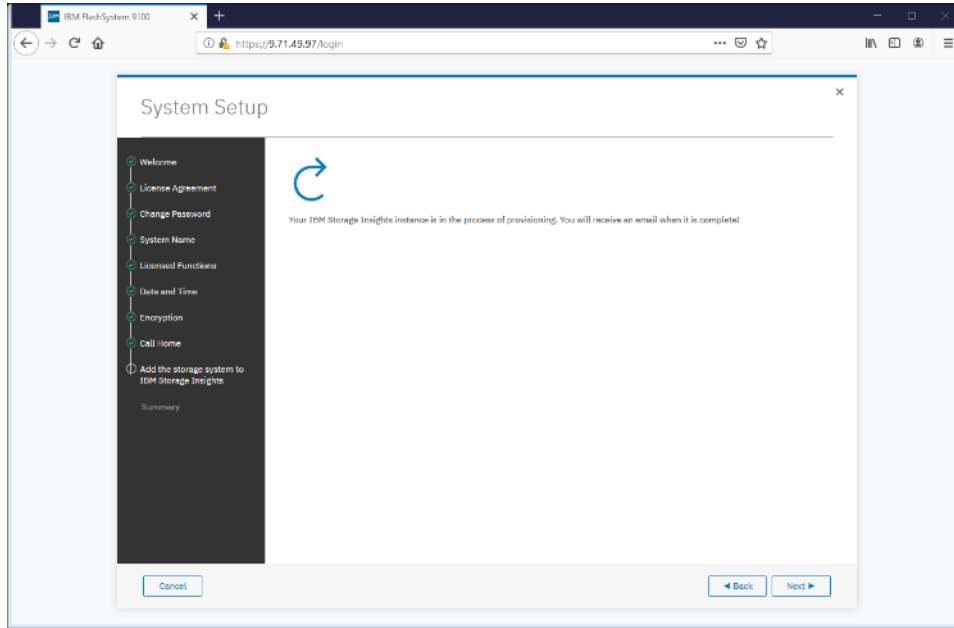

11. Enter the complete company name and address and then click Next.

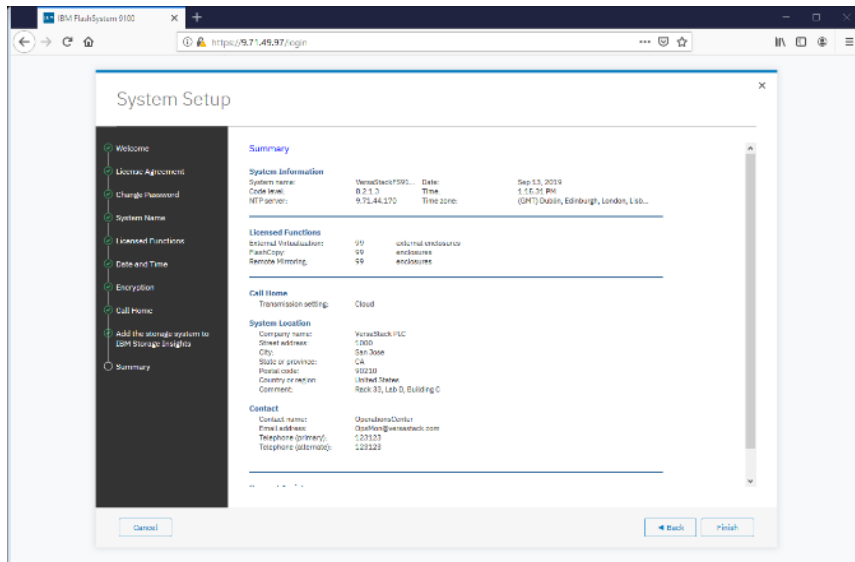

12. Enter the contact person for the support center calls. Click Apply and Next.

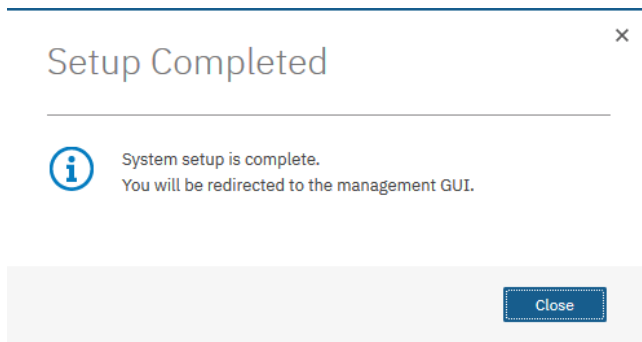

IBM Storage Insights is required to enable performance/health monitoring required by remote IBM Support representatives when assisting with any support issues.

13. Review the final summary page and click Finish to complete the System Setup wizard.

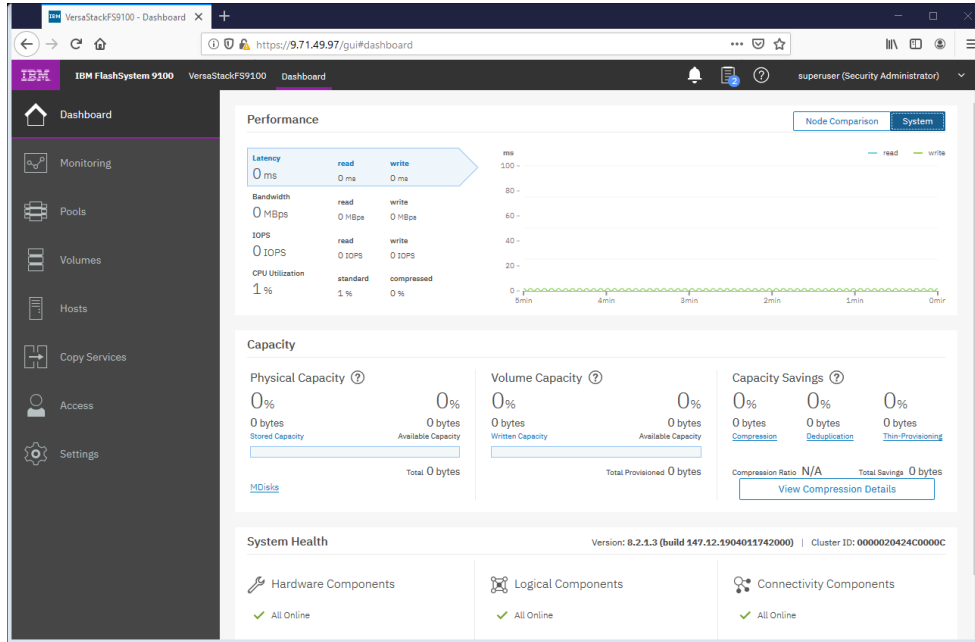

14. Setup Completed. Click Close.

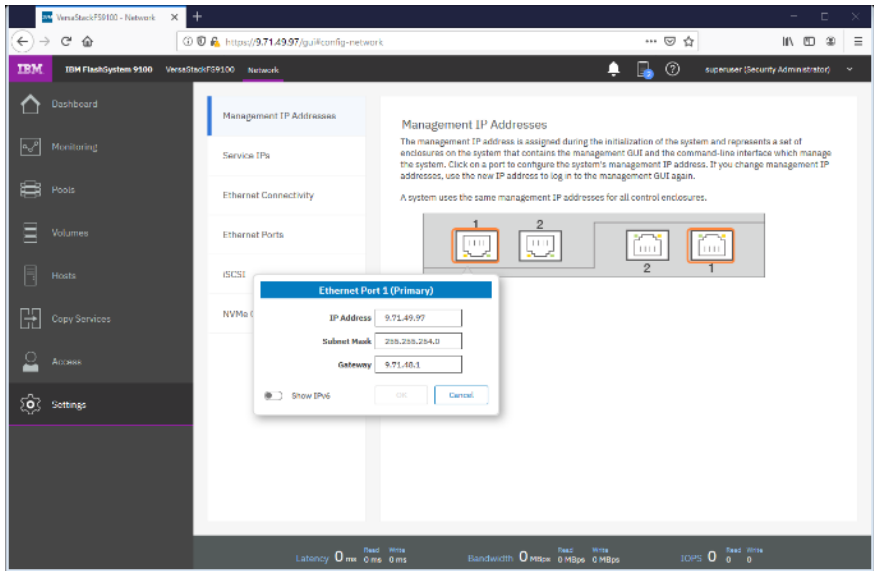

System Dashboard, and Post-Initialization Setup Tasks

To configure the necessary post-initialization setup tasks, follow these steps:

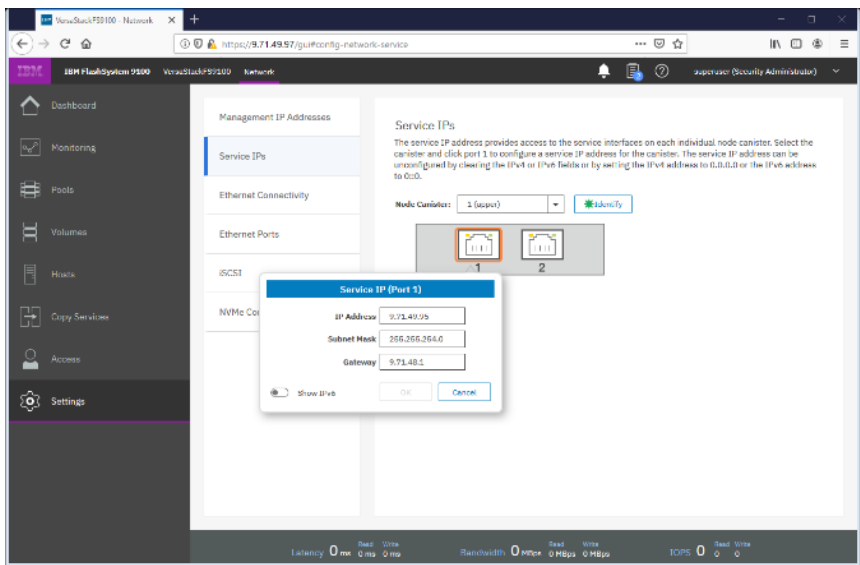

1. The System view of IBM FS9100 is now available, as shown below.

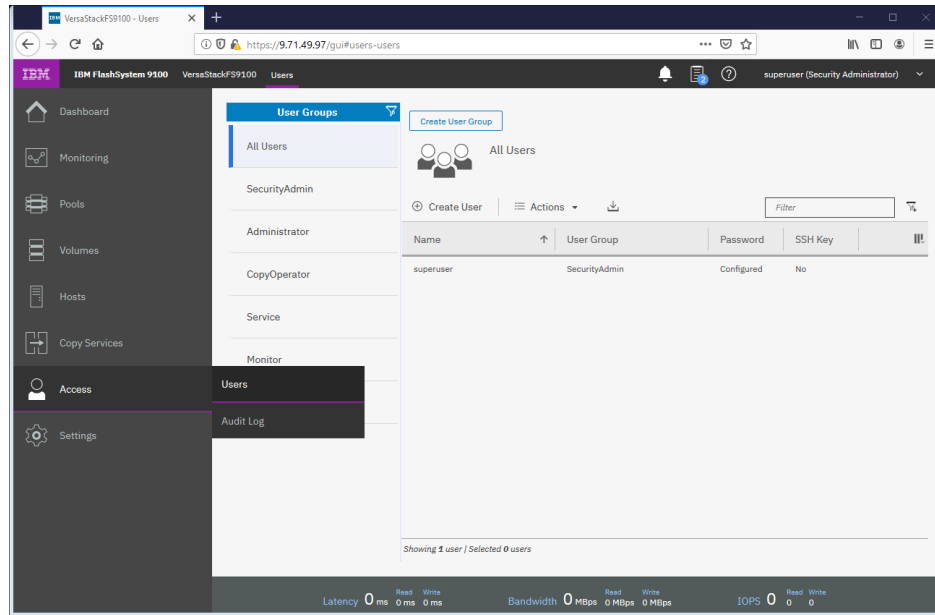

2. In the left side menu, hover over each of the icons on the Navigation Dock to become familiar with the options.
3. Verify the configured Management IP Address (Cluster IP) and configuring Service Assistant IP addresses for each node canister in the system.
4. On the Network screen, highlight the Management IP Addresses section. Then click the number 1 interface on the left-hand side to bring up the Ethernet port IP menu. If required, change the IP address if necessary and click OK.

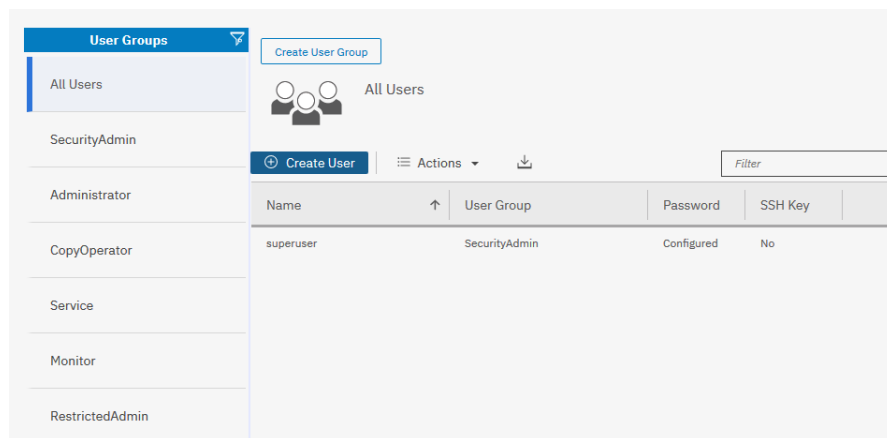

5. While still on the Network screen, select 1) Service IP Addresses from the list on the left and select each Node Canister Upper/Lower in turn, and change the IP address for port 1, click OK.

6. Repeat this process for port 1 on the other Node Canisters.

7. Click the Access icon from the Navigation Dock on the left and select Users to access the Users screen.

8. Select Create User.

9. Enter a new name for an alternative admin account. Leave the SecurityAdmin default as the User Group, and input the new password, then click Create. Optionally, an SSH Public Key generated on a Unix server through the command `ssh-keygen -t rsa` can be copied to a public key file and associated with this user through the Choose File button.

Consider using Remote Authentication (via LDAP) to centrally manage authentication, roles, and responsibilities. For more information on Remote Authentication, refer to Redbook: [Implementing the IBM System Storage SAN Volume Controller with IBM Spectrum Virtualize V8.2.1](#).

Create Storage Pools and Allocate Storage

Typically, the NVMe drives within the FlashSystem 9100 enclosure are grouped together into a Distributed RAID array (sometimes referred to as a Managed Disk or mdisk) and are added to a storage resource called a Storage Pool (sometimes referred to as Managed Disk Group or mdiskgrp). Volumes are then created within this storage pool and presented to the host(s) within the UCS chassis. Data from a UCS host is striped across multiple drives for performance, efficiency and redundancy.

Data Reduction Pools, SCSI UNMAP, and Data Deduplication

If enabling Data reduction on the pool during creation, the pool will be created as a Data Reduction Pool (DRP). Data Reduction Pools are a new type of storage pool, implementing techniques such as thin-provisioning, compression, and deduplication to reduce the amount of physical capacity required to store data.

When using modern operating systems that support SCSI UNMAP, the storage pool also enables the automatic de-allocation and reclaim capacity occupied by deleted data and, for the first time, enable this reclaimed capacity to be reused by other volumes in the pool.

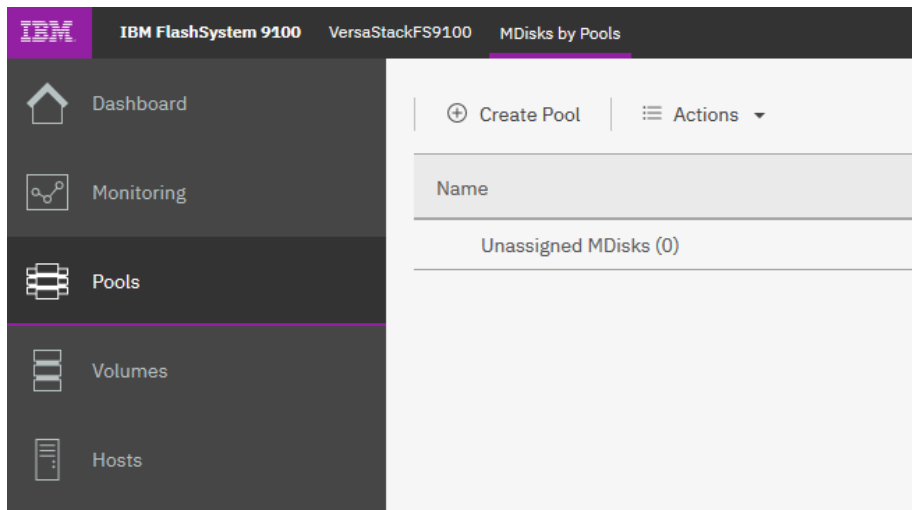

Data deduplication is one of the methods of reducing storage needs by eliminating redundant copies of data. Existing or new data is categorized into chunks that are examined for redundancy. If duplicate chunks are

detected, then pointers are shifted to reference a single copy of the chunk, and the duplicate data sets are then released.

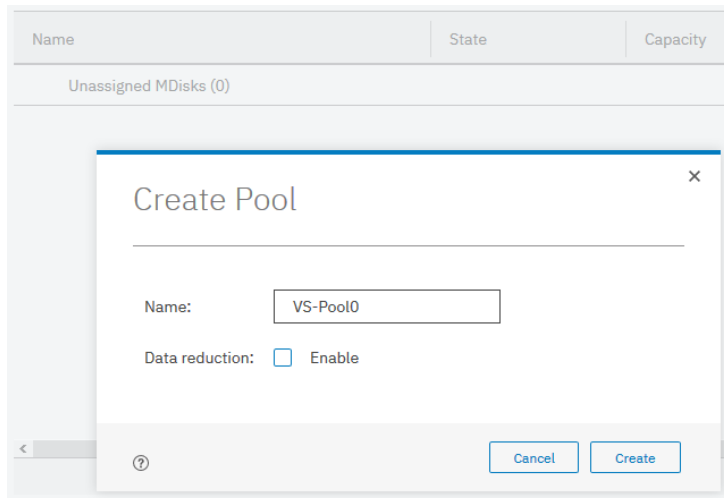

Deduplication has several benefits, such as storing more data per physical storage system, saving energy by using fewer disk drives, and decreasing the amount of data that must be sent across a network to another storage for backup replication and for disaster recovery.

However, these data savings come at a cost. There is a performance overhead when using DRPs when compared to traditional storage pools. And a percentage of the capacity of a DRP is reserved for system usage. For more information on Data Reduction Pools and techniques, refer to the Redbook publication: [Implementing the IBM System Storage SAN Volume Controller](#).

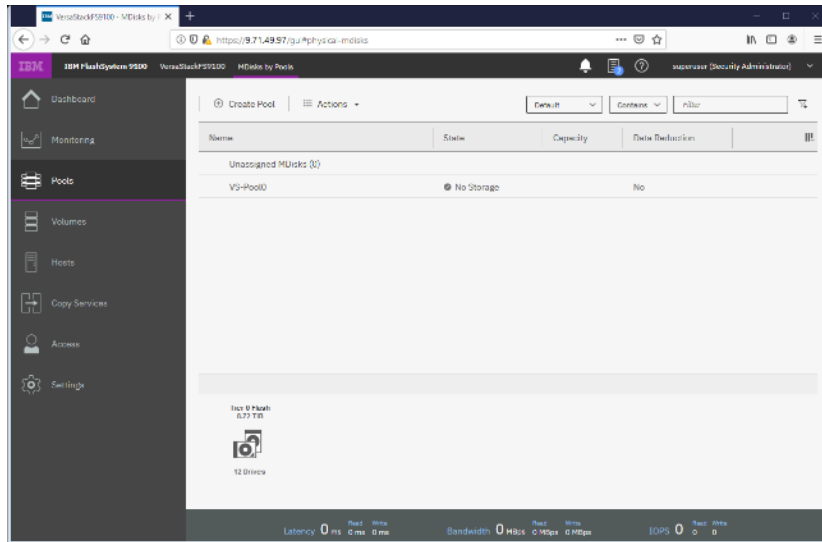

1. Select Pools from the Navigation Dock and select MDisk by Pools.

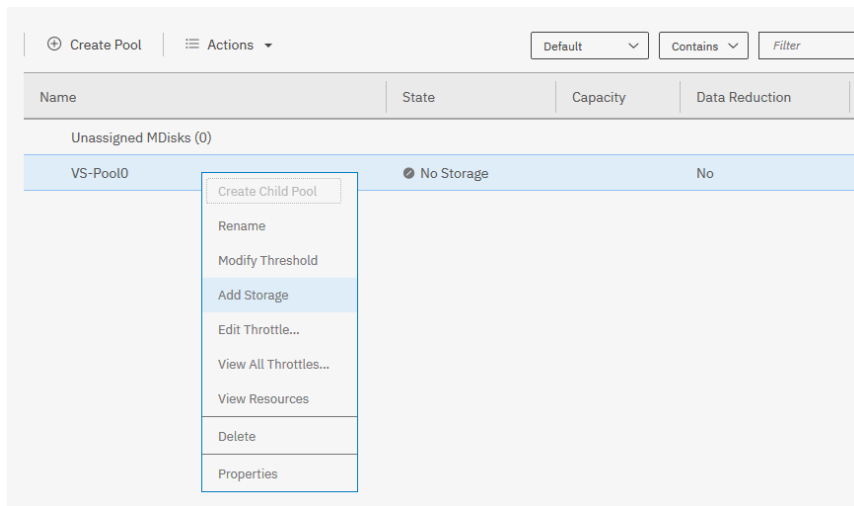

2. Click Create Pool and enter the name of the new storage pool. Click Create.

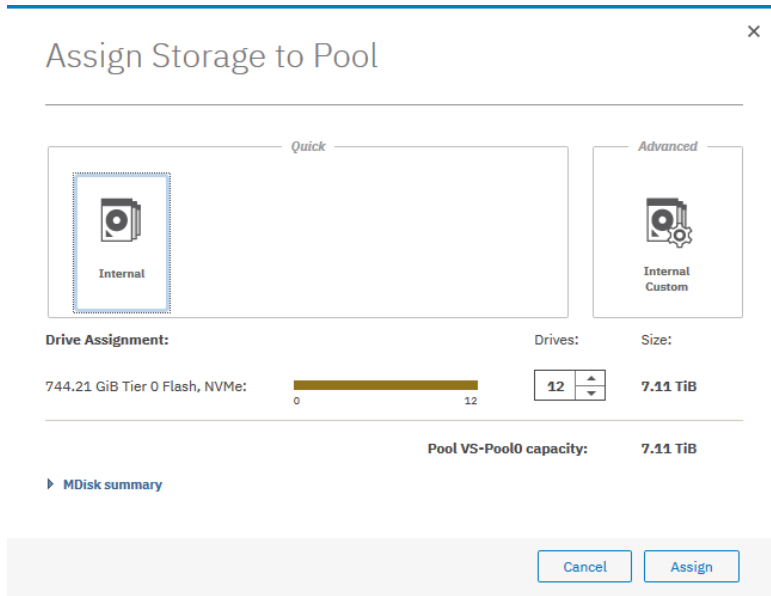

3. Identify the available drives along the bottom of the window

4. Right-click the new Pool and select Add Storage.

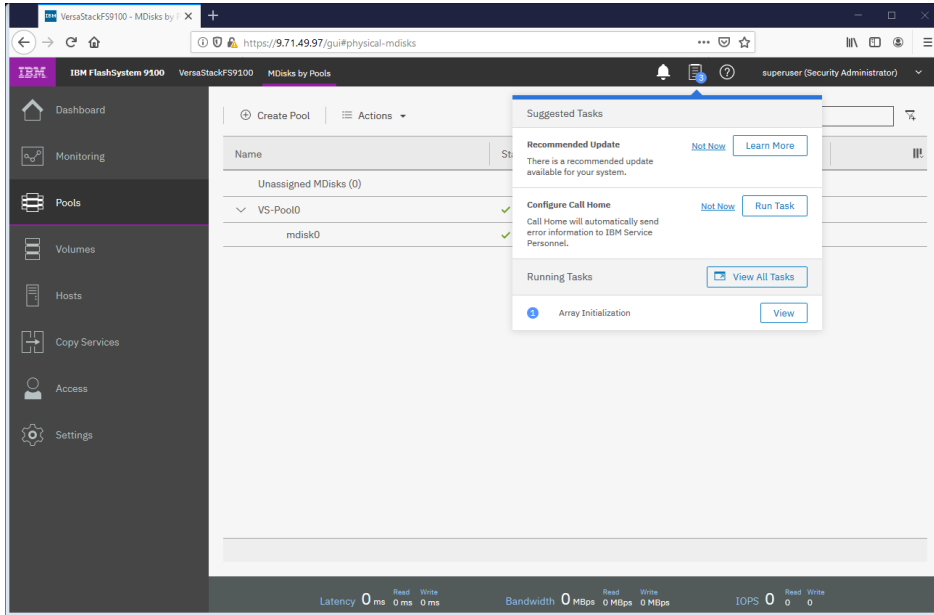

5. Select Internal to utilize drives within the enclosure, rather than from externally virtualized storage controllers.

6. The Managed Disk (`mdisk`) has now been created and allocated to the storage pool.

7. Reference the Running Tasks window to monitor the array initialization.

During the initialization, the array performance will be sub-optimal. Where possible, wait for the array initialization to complete before running resource intensive workloads.

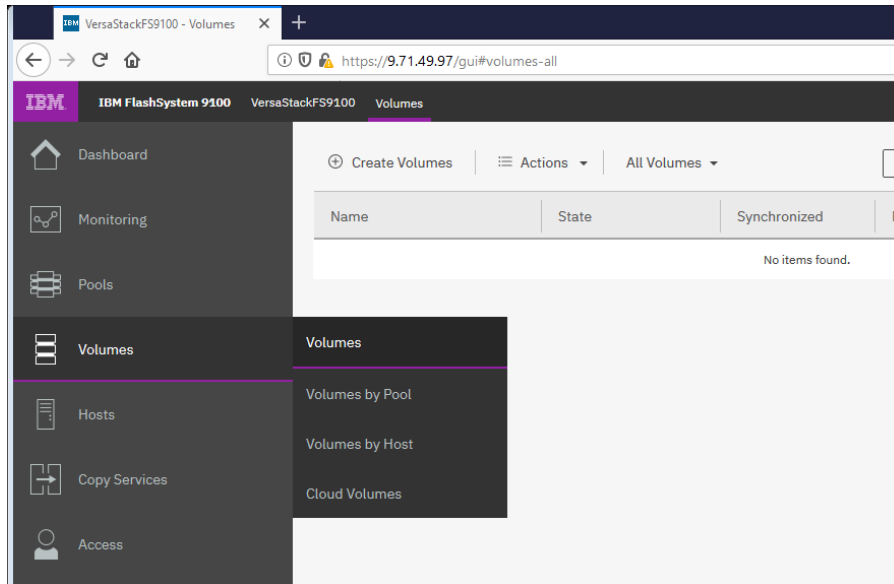

8. Select Internal, review the drive assignments and then select Assign.

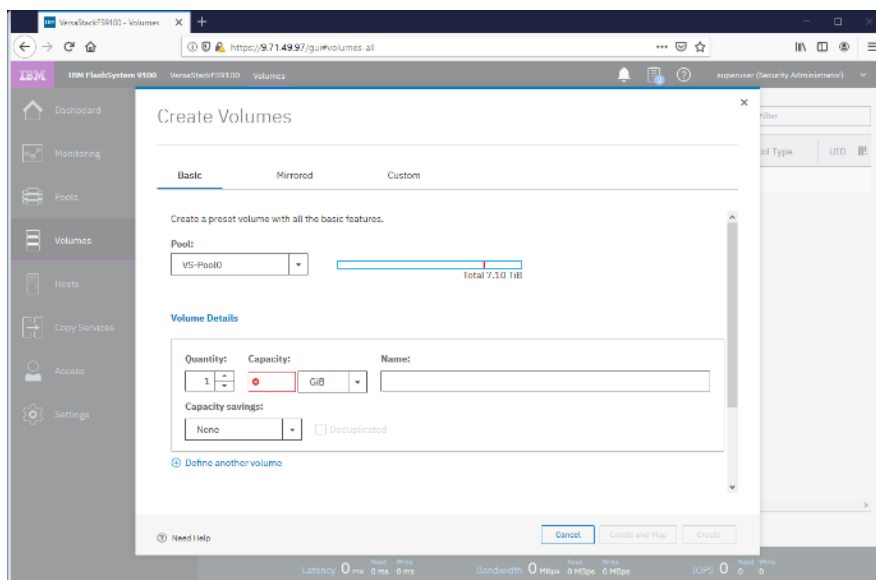

Depending on customer configuration, select Internal Custom to manually create tired storage pools grouping together disk by capabilities. In this deployment, Flash and Enterprise class disk are utilized for Silver pool and Nearline disks are utilized for Bronze storage pool.

9. Validate the pools are online and have the relevant storage assigned.

10. Select Volumes from the Navigation Dock and then select Volumes.

11. Click Create Volumes.

12. Define the volume characteristics, paying attention to any capacity saving, and/or high availability requirements, and specify a friendly name. Click Create.

13. Validate the created volumes.

Creating volumes will be explained in following sections of this document

IBM FS9100 iSCSI Configuration (iSCSI Deployment)

Cisco UCS configuration requires information about the iSCSI IQNs on IBM FS9100. Therefore, as part of the initial storage configuration, iSCSI ports are configured on IBM FS9100

This configuration step can be skipped if the UCS environment does not need to access storage environment using iSCSI.

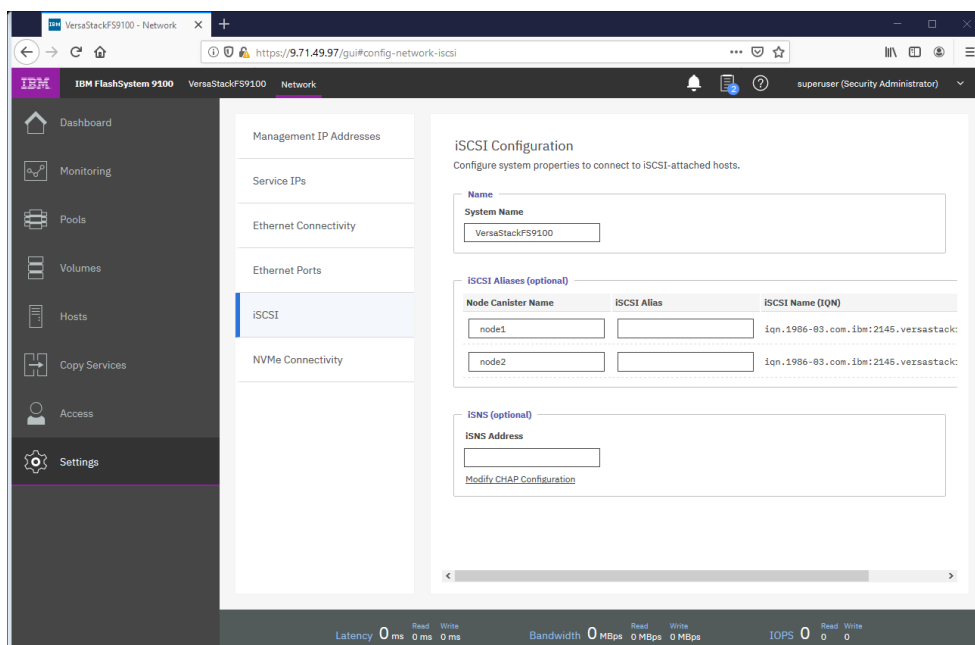

Two 25G ports from each of the IBM FS9100 node canisters are connected to each of Nexus 9336C-FX2 switches. These ports are configured as shown in Table 10 .

Table 10 IBM FS9100 iSCSI Interface Configuration

System	Port	Path	VLAN	IP address
Node canister 1	5	iSCSI-A	3161	10.29.161.249/24
Node canister 1	6	iSCSI-B	3162	10.29.162.249/24
Node canister 2	5	iSCSI-A	3161	10.29.161.250/24
Node canister 2	6	iSCSI-B	3162	10.29.162.250/24

To configure the IBM FS9100 system for iSCSI storage access, follow these steps:

1. Log into the IBM Management Interface GUI and navigate to Settings > Network.
2. Click the iSCSI icon and enter the system and node names as shown:

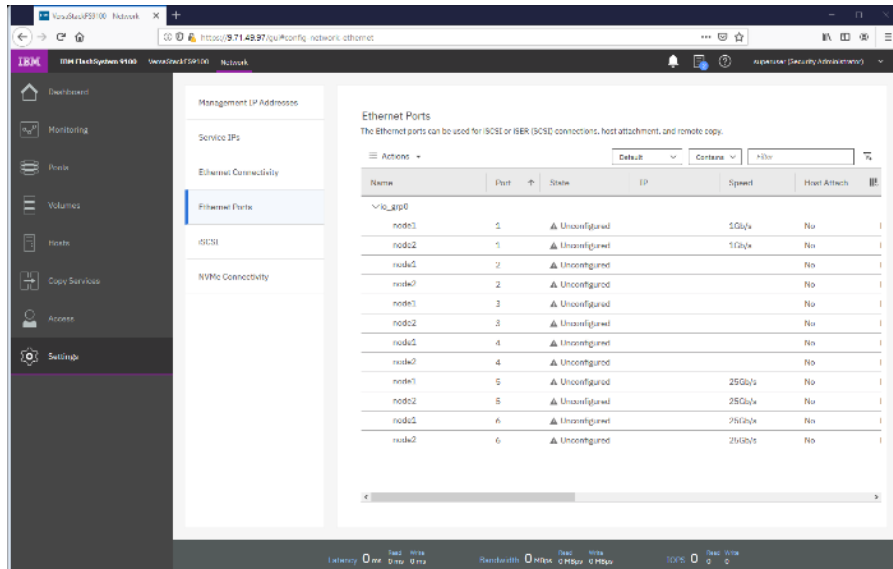

3. Note the resulting iSCSI Name (IQN) in the Table 11 to be used later in the configuration procedure

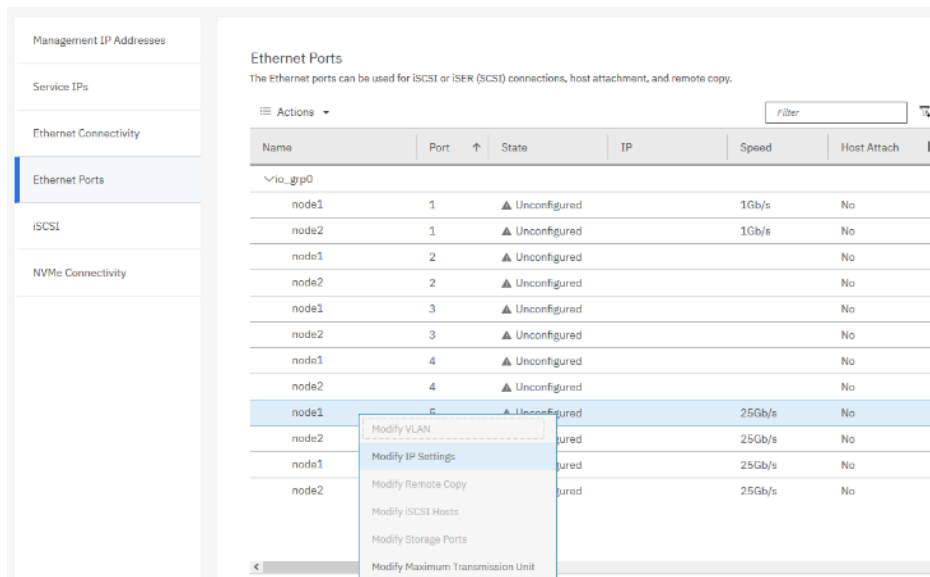

Table 11 IBM FS9100 IQN

Node	Example iSCSI name (IQN)
Node 1	iqn.1986-03.com.ibm:2145.versastack-fs9100.node1
Node 2	iqn.1986-03.com.ibm:2145.versastack-fs9100.node2

4. Click the Ethernet Ports icon

5. Click Actions and choose Modify iSCSI Hosts.

6. Make sure IPv4 iSCSI hosts field is set to enable – if not, change the setting to Enabled and click Modify.
7. If already set, click Cancel to close the configuration box.
8. For each of the four ports listed in Table 10 Table 10 , repeat steps 1-7 .
9. Right-click the appropriate port and choose Modify IP Settings.
10. Enter the IP address, Subnet Mask and Gateway information in Table 10 .

Modify Port 5 of Node node1 ✕

Modify Interface MTU

Use the `cfgportip` CLI command to set Jumbo Frames (MTU 9000). The default value of port MTU is 1500. An MTU of 9000 (jumbo frames) provides improved CPU utilization and increased efficiency by reducing the overhead and increasing the size of the payload.

To modify the interface MTU, follow these steps:

1. The MTU configuration can be verified using the command:

```
FS9100info lspportip <port number> | grep mtu
```

2. SSH to the IBM FS9100 management IP address and use following CLI command to set the MTU for ports 5 and 6 in the FS9100 in iogrp 0:

```
FS9100task cfgportip -mtu 9000 -iogrp 0 5  
FS9100task cfgportip -mtu 9000 -iogrp 0 6
```

This completes the initial configuration of the IBM systems. The next section explains the Cisco UCS configuration.

Cisco UCS Server Configuration

This section explains the Cisco UCS setup for VersaStack infrastructure. This section includes setup for both iSCSI as well as FC SAN boot and storage access.

If a customer environment does require implementing some of the storage protocols explained in this deployment guide, the relevant configuration sections can be skipped.

Cisco UCS Initial Configuration

This section provides detailed procedures for configuring the Cisco Unified Computing System (Cisco UCS) for use in a VersaStack environment. The steps are necessary to provision the Cisco UCS C-Series and B-Series servers and should be followed precisely to avoid configuration errors.

Cisco UCS 6454 A

To configure the Cisco UCS for use in a VersaStack environment, follow these steps:

1. Connect to the console port on the first Cisco UCS 6454 fabric interconnect.

```

Enter the configuration method. (console/gui) ? console
Enter the setup mode; setup newly or restore from backup.(setup/restore)? setup
You have chosen to setup a new Fabric interconnect? Continue? (y/n): y
Enforce strong password? (y/n) [y]: y
Enter the password for "admin": <password>
Confirm the password for "admin": <password>
Is this Fabric interconnect part of a cluster(select no for standalone)? (yes/no) [n]: yes
Which switch fabric (A/B) []: A
Enter the system name: <Name of the System>
Physical Switch Mgmt0 IP address: <Mgmt. IP address for Fabric A>
Physical Switch Mgmt0 IPv4 netmask: <Mgmt. IP Subnet Mask>
IPv4 address of the default gateway: <Default GW for the Mgmt. IP >
Cluster IPv4 address: <Cluster Mgmt. IP address>
Configure the DNS Server IP address? (yes/no) [n]: y
DNS IP address: <DNS IP address>
Configure the default domain name? (yes/no) [n]: y
Default domain name: <DNS Domain Name>
Join centralized management environment (UCS Central)? (yes/no) [n]: n
Apply and save configuration (select no if you want to re-enter)? (yes/no): yes

```

2. Wait for the login prompt to make sure that the configuration has been saved.

Cisco UCS 6454 B

To configure the second Cisco UCS Fabric Interconnect for use in a VersaStack environment, follow these steps:

1. Connect to the console port on the second Cisco UCS 6454 fabric interconnect.

```

Enter the configuration method. (console/gui) ? console
Installer has detected the presence of a peer Fabric interconnect. This
Fabric interconnect will be added to the cluster. Continue (y|n)? y
Enter the admin password for the peer Fabric interconnect: <Admin Password>
Connecting to peer Fabric interconnect... done
Retrieving config from peer Fabric interconnect... done
Peer Fabric interconnect Mgmt0 IPv4 Address: <Address provided in last step>
Peer Fabric interconnect Mgmt0 IPv4 Netmask: <Mask provided in last step>
Cluster IPv4 address          : <Cluster IP provided in last step>
Peer FI is IPv4 Cluster enabled. Please Provide Local Fabric Interconnect Mgmt0 IPv4 Address
Physical switch Mgmt0 IP address: < Mgmt. IP address for Fabric B>
Apply and save the configuration (select no if you want to re-enter)?
(yes/no): yes

```

2. Wait for the login prompt to make sure that the configuration has been saved.

Cisco UCS Setup

Log into Cisco UCS Manager

To log in to the Cisco Unified Computing System (UCS) environment, follow these steps:

1. Open a web browser and navigate to the Cisco UCS 6454 fabric interconnect cluster address.
2. Click the Launch UCS Manager link to launch the Cisco UCS Manager User Interface.
3. When prompted, enter admin as the username and enter the administrative password.
4. Click Login to log in to Cisco UCS Manager.

Upgrade Cisco UCS Manager Software to Version 4.0(4c)

This document assumes the use of Cisco UCS 4.0(4c). To upgrade the Cisco UCS Manager software and the UCS 6454 Fabric Interconnect software to version 4.0(4c), refer to [Cisco UCS Manager Install and Upgrade Guides](#).

Anonymous Reporting

To enable anonymous reporting, follow this step:

1. In the Anonymous Reporting window, select whether to send anonymous data to Cisco for improving future products. If you select **Yes**, enter the IP address of your SMTP Server. Click **OK**.

Anonymous Reporting

Cisco Systems, Inc. will be collecting feature configuration and usage statistics which will be sent to Cisco Smart Call Home server anonymously. This data helps us prioritize the features and improvements that will most benefit our customers.

If you decide to enable this feature in future, you can do so from the " Anonymous Reporting" in the Call Home settings under the Admin tab.

[View Sample Data](#)

Do you authorize the disclosure of this information to Cisco Smart CallHome?

Yes No

Don't show this message again.

Configure Cisco UCS Call Home

It is highly recommended by Cisco to configure Call Home in Cisco UCS Manager. Configuring Call Home will accelerate resolution of support cases. To configure Call Home, follow these steps:

1. In Cisco UCS Manager, click the Admin tab in the navigation pane on left.
2. Select All > Communication Management > Call Home.
3. Change the State to On.
4. Fill in all the fields according to your Management preferences and click Save Changes and OK to complete configuring Call Home.

The screenshot shows the Cisco UCS Manager web interface. On the left is a navigation pane with a blue sidebar containing icons for various management functions. The main content area is titled 'Communication Management / Call Home' and has several tabs: 'General', 'Profiles', 'Call Home Policies', 'System Inventory', 'Anonymous Reporting', 'Events', and 'FSM'. The 'General' tab is active. The configuration is organized into sections: 'Admin' (with 'State' and 'Throttling' radio buttons, and 'Switch Priority' dropdown), 'States', 'Contact Information' (with fields for Contact, Phone, Email, and Address), 'Ids' (with fields for Customer ID, Contract ID, and Site ID), 'Email Addresses' (with 'From' and 'Reply To' fields), and 'SMTP Server' (with 'Host' and 'Port' fields). All input fields are currently empty.

Add a Block of Management IP Addresses for KVM Access

To create a block of IP addresses for out of band (mgmt0) server Keyboard, Video, Mouse (KVM) access in the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the LAN tab in the navigation pane.
2. Expand Pools > root > IP Pools.
3. Right-click IP Pool `ext-mgmt` and choose Create Block of IPv4 Addresses.
4. Enter the starting IP address of the block, the number of IP addresses required, and the subnet and gateway information. Click OK.

Create Block of IPv4 Addresses

From :	<input type="text" value="192.168.163.181"/>	Size :	<input type="text" value="20"/>
Subnet Mask :	<input type="text" value="255.255.252.0"/>	Default Gateway :	<input type="text" value="192.168.160.1"/>
Primary DNS :	<input type="text" value="192.168.163.50"/>	Secondary DNS :	<input type="text" value="192.168.163.51"/>

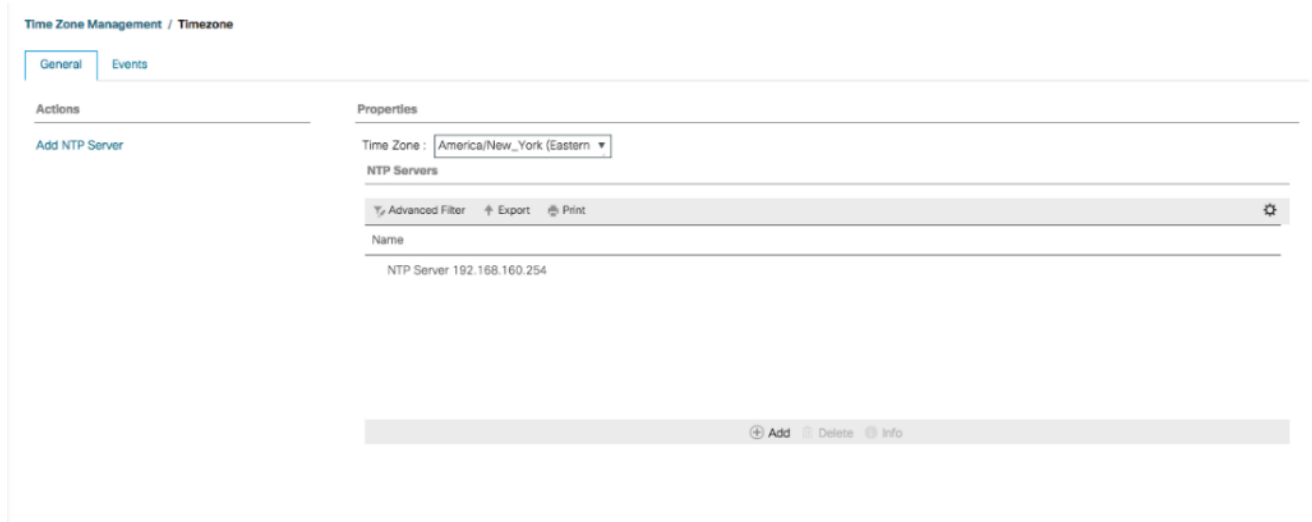

This block of IP addresses should be in the out of band management subnet.

5. Click OK.
6. Click OK in the confirmation message.

Synchronize Cisco UCS to NTP

To synchronize the Cisco UCS environment to the NTP server, follow these steps:

1. In Cisco UCS Manager, click the Admin tab in the navigation pane.
2. Select All > Timezone Management > Timezone.
3. In the Properties pane, select the appropriate time zone in the Timezone menu.
4. Click Save Changes, and then click OK.
5. Click Add NTP Server.
6. Enter <NTP Server IP Address> and click OK.
7. Click OK.

Add Additional DNS Server(s)

To add one or more additional DNS servers to the UCS environment, follow these steps:

1. In Cisco UCS Manager, click Admin.
2. Expand All > Communications Management.
3. Select DNS Management.
4. In the Properties pane, select Specify DNS Server.
5. Enter the IP address of the additional DNS server.

6. Click OK and then click OK again. Repeat this process for any additional DNS servers.

Add an Additional Administrator User

To add an additional locally authenticated Administrative user (flexadmin) to the Cisco UCS environment in case issues arise with the admin user, follow these steps:

1. In Cisco UCS Manager, click Admin.
2. Expand User Management > User Services > Locally Authenticated Users.
3. Right-click Locally Authenticated Users and select Create User.

4. In the Create User fields it is only necessary to fill in the Login ID, Password, and Confirm Password fields. Fill in the Create User fields according to your local security policy.
5. Leave the Account Status field set to **Active**.
6. Set Account Expires according to your local security policy.
7. Under Roles, select **admin**.
8. Leave Password Required selected for the **SSH Type** field.

Create User ? X

9. Click OK and then Click OK again to complete adding the user.

Enable Port Auto-Discovery Policy

To enable the port auto-discovery policy, follow these steps:

1. Setting the port auto-discovery policy enables automatic discovery of Cisco UCS B-Series chassis server ports.
2. In Cisco UCS Manager, click Equipment, select All > Equipment in the Navigation Pane, and select the Policies tab on the right.
3. Under Port Auto-Discovery Policy, set Auto Configure Server Port to Enabled.

The screenshot shows the Cisco UCS Manager interface. At the top, there are navigation tabs: Main Topology View, Fabric Interconnects, Servers, Thermal, Decommissioned, Firmware Management, Policies (selected), Faults, and Diagnostics. Below these are sub-tabs: Global Policies, Autoconfig Policies, Server Inheritance Policies, Server Discovery Policies, SEL Policy, Power Groups, Port Auto-Discovery Policy (selected), and Security. The 'Actions' section is empty. The 'Properties' section shows 'Owner' as 'Local' and 'Auto Configure Server Port' with radio buttons for 'Disabled' and 'Enabled', where 'Enabled' is selected.

4. Click Save Changes and then OK.

Enable Info Policy for Neighbor Discovery

Enabling the info policy enables Fabric Interconnect neighbor information to be displayed. To modify the info policy, follow these steps:

1. In Cisco UCS Manager, click Equipment, select All > Equipment in the Navigation Pane, and select the Policies tab on the right.
2. Under Global Policies, scroll down to Info Policy and select **Enabled** for Action.

Info Policy

Action : Disabled Enabled

3. Click Save Changes and then OK.
4. Under Equipment, select Fabric Interconnect A (primary). On the right, select the Neighbors tab. CDP information is shown under the LAN tab and LLDP information is shown under the LLDP tab.

Edit Chassis Discovery Policy

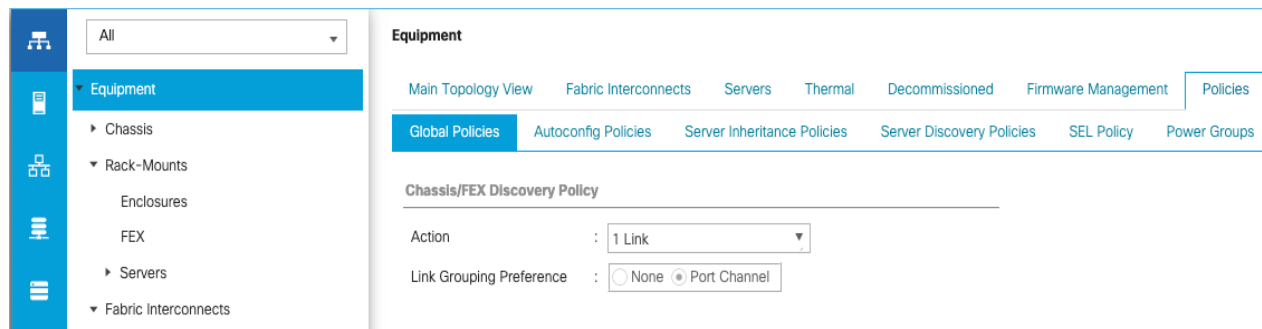

Setting the discovery policy simplifies the addition of B-Series Cisco UCS chassis and of additional fabric extenders for further C-Series connectivity. To modify the chassis discovery policy, follow these steps:

1. In Cisco UCS Manager, click the Equipment tab in the navigation pane and select Equipment from the list in the left pane.
2. In the right pane, click the Policies tab.
3. Under Global Policies, set the Chassis/FEX Discovery Policy to match the minimum the number of uplink ports that are cabled between any chassis IOM or fabric extender (FEX) and the fabric interconnects.

If varying numbers of links between chassis and the Fabric Interconnects will be used, leave Action set to 1 Link.

- On the 6454 Fabric Interconnects, the Link Grouping Preference is automatically set to Port Channel and is greyed out. On a 6300 Series or 6200 Series Fabric Interconnect, set the Link Grouping Preference to Port Channel. If Backplane Speed Preference appears, leave it set at 40G.

- If any changes have been made, Click Save Changes.
- Click OK.

Enable Server and Uplink Ports

To enable and verify server and uplink ports, follow these steps:

- In Cisco UCS Manager, click the Equipment tab in the navigation pane.
- Select Equipment > Fabric Interconnects > Fabric Interconnect A (primary) > Fixed Module.
- Expand Fixed Module.
- Expand and select Ethernet Ports.
- Select the ports that are connected to the Cisco UCS 5108 chassis and UCS C-Series servers, one by one, right-click and select Configure as Server Port.

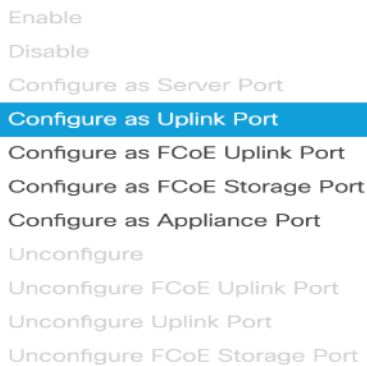

- Click Yes to confirm server ports and click OK.

- Verify that the ports connected to the UCS 5108 chassis and C-series servers are now configured as Server ports by selecting Fabric Interconnect A in the left and Physical Ports tab in the right pane.

Slot	Aggr. Port ID	Port ID	MAC	If Role	If Type	Overall Status	Admin State
1	0	17	00:DE:FB:FF:E8:B8	Server	Physical	↑ Up	↑ Enabled
1	0	18	00:DE:FB:FF:E8:B9	Server	Physical	↑ Up	↑ Enabled
1	0	19	00:DE:FB:FF:E8:BA	Server	Physical	↑ Up	↑ Enabled
1	0	20	00:DE:FB:FF:E8:BB	Server	Physical	↑ Up	↑ Enabled
1	0	21	00:DE:FB:FF:E8:BC	Server	Physical	↑ Up	↑ Enabled
1	0	22	00:DE:FB:FF:E8:BD	Server	Physical	↑ Up	↑ Enabled
1	0	23	00:DE:FB:FF:E8:BE	Server	Physical	↑ Up	↑ Enabled
1	0	24	00:DE:FB:FF:E8:BF	Server	Physical	↑ Up	↑ Enabled

- Select the ports that are connected to the Cisco Nexus 9336C-FX2 switches, one by one, right-click and select Configure as Uplink Port.

- Click Yes to confirm uplink ports and click OK.
- Verify that the uplink ports are now configured as Network ports by selecting Fabric Interconnect A in the left and Physical Ports tab in the right pane.
- Select Equipment > Fabric Interconnects > Fabric Interconnect B (subordinate) > Fixed Module.
- Repeat above steps to configure server and uplink ports on Fabric Interconnect B.

Acknowledge Cisco UCS Chassis and FEX

When the UCS FI ports are configured as server ports, UCS chassis is automatically discovered and may need to be acknowledged. To acknowledge all Cisco UCS chassis, follow these steps:

- In Cisco UCS Manager, click the Equipment tab in the navigation pane.
- Expand Chassis and select each chassis that is listed.
- Right-click each chassis and select Acknowledge Chassis.
- Click Yes and then click OK to complete acknowledging the chassis.
- If Nexus FEXes are part of the configuration, expand Rack Mounts and FEX.

6. Right-click each FEX that is listed and select Acknowledge FEX.
7. Click Yes and then click OK to complete acknowledging the FEX.

Enable Fibre Channel Ports (FC Deployment)

The FC port and uplink configurations can be skipped if the UCS environment does not need access to IBM storage using fibre channel.

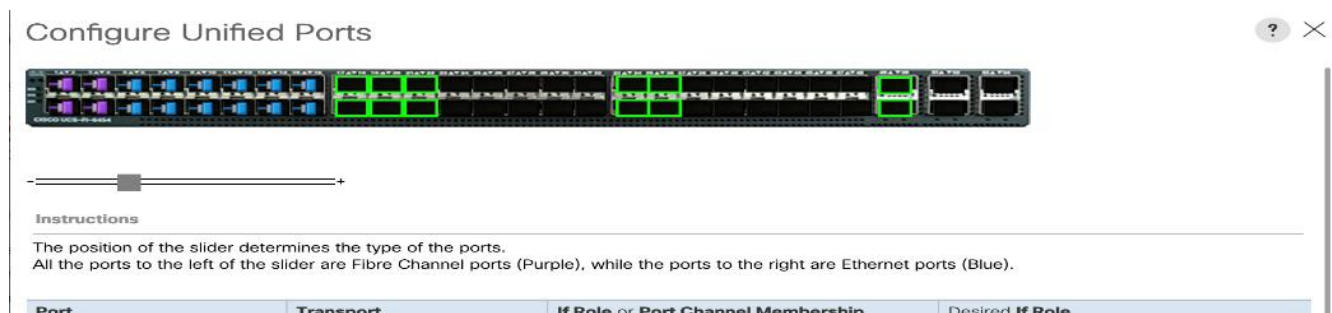

Fibre Channel port configurations differ between the 6454, 6332-16UP and the 6248UP Fabric Interconnects. All Fabric Interconnects have a slider mechanism within the Cisco UCS Manager GUI interface, but the fibre channel port selection options for the 6454 are from the first 8 ports starting from the first port and configured in increments of 4 ports from the left. For the 6332-16UP the port selection options are from the first 16 ports starting from the first port, and configured in increments of the first 6, 12, or all 16 of the unified ports. With the 6248UP, the port selection options will start from the right of the 32 fixed ports, or the right of the 16 ports of the expansion module, going down in contiguous increments of 2. The remainder of this section shows configuration of the 6454. Modify as necessary for the 6332-16UP or 6248UP.

To enable FC uplink ports, follow these steps.

This step requires a reboot. To avoid an unnecessary switchover, configure the subordinate Fabric Interconnect first.

1. In the Equipment tab, select the Fabric Interconnect B (subordinate FI in this example), and in the Actions pane, select Configure Unified Ports, and click Yes on the splash screen.
2. Within the Configured Fixed Ports pop-up window move the gray slider bar from the left to the right to select either 4 or 8 ports to be set as FC Uplinks.
3. Slide the lever to change the ports 1-4 to Fiber Channel. Click Finish followed by Yes to the reboot message. Click OK.

4. When the subordinate has completed reboot, repeat the procedure to configure FC ports on primary Fabric Interconnect. As before, the Fabric Interconnect will reboot after the configuration is complete.

Create VSAN for the Fibre Channel Interfaces

To configure the necessary virtual storage area networks (VSANs) for FC uplinks for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the SAN tab in the navigation pane.

2. Expand the SAN > SAN Cloud and select Fabric A.
3. Right-click VSANs and choose Create VSAN.
4. Enter `VSAN-A` as the name of the VSAN for fabric A.
5. Keep the Disabled option selected for FC Zoning.
6. Click the Fabric A radio button.
7. Enter 101 as the VSAN ID for Fabric A.
8. Enter 101 as the FCoE VLAN ID for fabric A. Click OK twice.

Create VSAN ? X

Name :

FC Zoning Settings

FC Zoning : Disabled Enabled

Do **NOT** enable local zoning if fabric interconnect is connected to an upstream FC/FCoE switch.

Common/Global Fabric A Fabric B Both Fabrics Configured Differently

You are creating a local VSAN in fabric A that maps to a VSAN ID that exists only in fabric A. A VLAN can be used to carry FCoE traffic and can be mapped to this VSAN.

Enter the VSAN ID that maps to this VSAN. Enter the VLAN ID that maps to this VSAN.

VSAN ID : FCoE VLAN :

9. In the SAN tab, expand SAN > SAN Cloud > Fabric-B.
10. Right-click VSANs and choose Create VSAN.
11. Enter `VSAN-B` as the name of the VSAN for fabric B.
12. Keep the Disabled option selected for FC Zoning.
13. Click the Fabric B radio button.
14. Enter 102 as the VSAN ID for Fabric B. Enter 102 as the FCoE VLAN ID for Fabric B. Click OK twice.

Create VSAN

Name :

FC Zoning Settings

FC Zoning : Disabled Enabled

Do **NOT** enable local zoning if fabric interconnect is connected to an upstream FC/FCoE switch.

Common/Global Fabric A Fabric B Both Fabrics Configured Differently

You are creating a local VSAN in fabric B that maps to a VSAN ID that exists only in fabric B.

A VLAN can be used to carry FCoE traffic and can be mapped to this VSAN.

Enter the VSAN ID that maps to this VSAN.

Enter the VLAN ID that maps to this VSAN.

FCoE VLAN :

Create Port Channels for the Fibre Channel Interfaces

To configure the necessary port channels for the Cisco UCS environment, follow these steps:

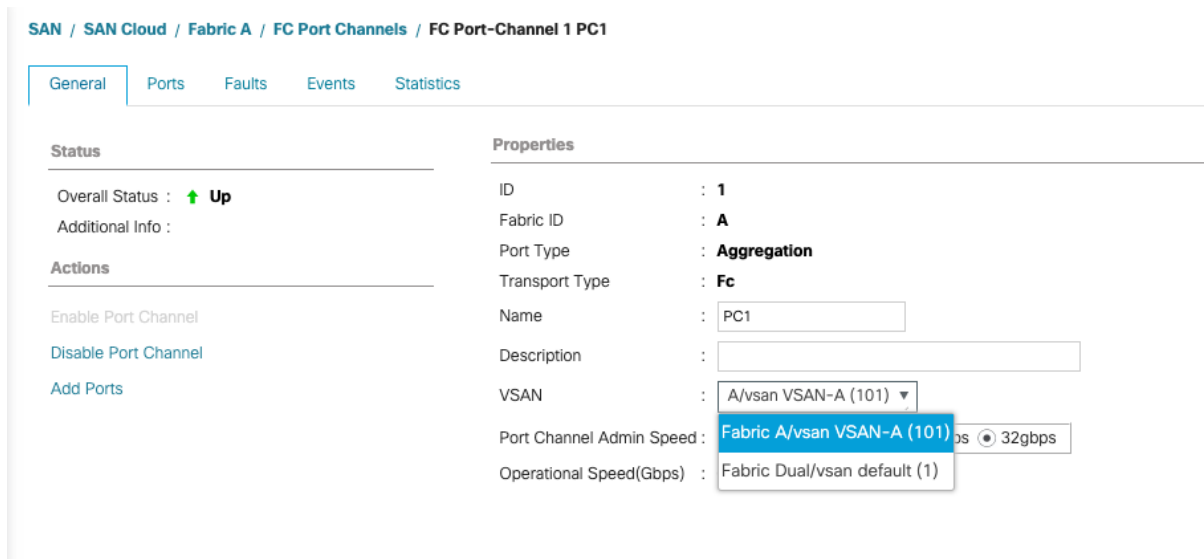

Fabric-A

1. In the navigation pane, under SAN > SAN Cloud, expand the Fabric A tree.
2. Right-click FC Port Channels and choose Create Port Channel.
3. Enter 1 for the port channel ID and Po1 for the port channel name.
4. Click Next then choose ports 1-4 and click >> to add the ports to the port channel. Click Finish.

5. Click OK.

6. Select FC Port-Channel 1 from the menu in the left pane and from the VSAN drop-down field, select VSAN 101 in the right pane.

7. Click Save Changes and then click OK.

Fabric-B

1. Click the SAN tab. In the navigation pane, under SAN > SAN Cloud, expand the Fabric B.

2. Right-click FC Port Channels and choose Create Port Channel.
3. Enter 2 for the port channel ID and Po2 for the port channel name. Click Next.
4. Choose ports 1-4 and click >> to add the ports to the port channel.
5. Click Finish, and then click OK.
6. Select FC Port-Channel 2 from the menu in the left pane and from the VSAN drop-down list, select VSAN 102 in the right pane.
7. Click Save Changes and then click OK.

To initialize a quick sync of the connections to the MDS switch, right-click the recently created port channels, disable port channel and then re-enable the port channel.

Create Port Channels for Ethernet Uplinks

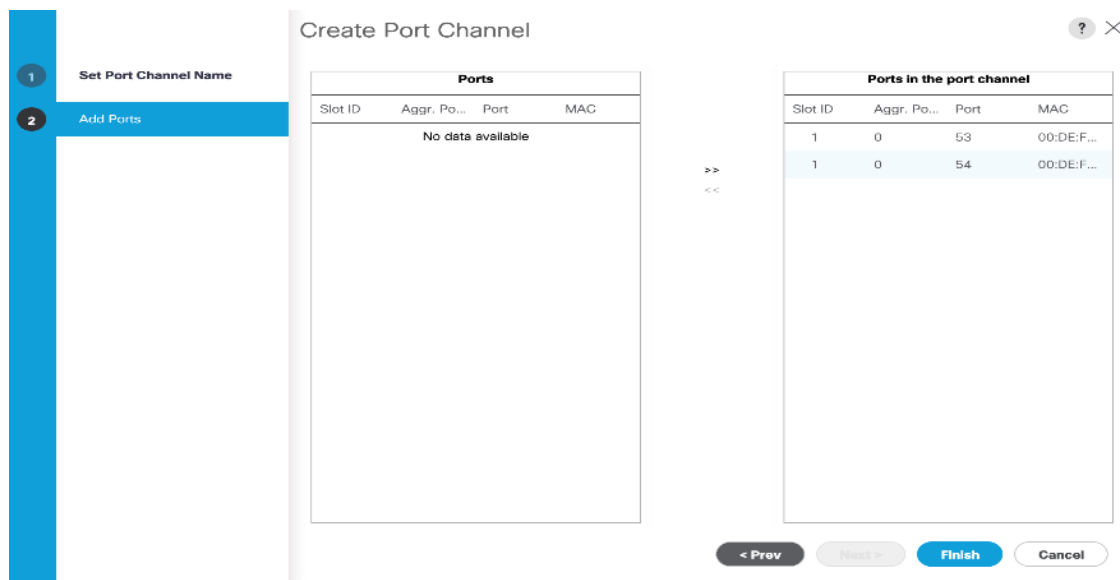

To configure the necessary Ethernet port channels out of the Cisco UCS environment, follow these steps:

In this procedure, two port channels are created one from each Fabric Interconnect (A and B) to both the Cisco Nexus 9336C-FX2 switches.

1. In Cisco UCS Manager, click the LAN tab in the navigation pane.
2. Under LAN > LAN Cloud, expand the Fabric A tree.
3. Right-click Port Channels and choose Create Port Channel.
4. Enter 13 as the unique ID of the port channel.
5. Enter Po13 as the name of the port channel and click Next.

6. Select the network uplink ports to be added to the port channel.
7. Click >> to add the ports to the port channel (53 and 54 in this design).

8. Click Finish to create the port channel and then click OK.
9. In the navigation pane, under LAN > LAN Cloud > Fabric A > Port Channels, select `Port-Channel 13`. Select 100 Gbps for the Admin Speed.
10. Click Save Changes and OK. After a few minutes, verify that the Overall Status is Up and the Operational Speed is correct.
11. In the navigation pane, under LAN > LAN Cloud, expand the Fabric B tree.
12. Right-click Port Channels and choose Create Port Channel.
13. Enter 14 as the unique ID of the port channel.
14. Enter `Po14` as the name of the port channel and click Next.
15. Select the network uplink ports (53 and 54 in this design) to be added to the port channel.
16. Click >> to add the ports to the port channel.
17. Click Finish to create the port channel and click OK.
18. In the navigation pane, under LAN > LAN Cloud > Fabric B > Port Channels, select `Port-Channel 14`. Select 100 Gbps for the Admin Speed.
19. Click Save Changes and OK. After a few minutes, verify that the Overall Status is Up and the Operational Speed is correct.

Add UDLD to Uplink Port Channels

To configure the unidirectional link detection (UDLD) on the Uplink Port Channels to the Nexus switches, follow these steps:

1. In Cisco UCS Manager, click LAN.

2. Expand Policies > LAN Cloud > UDLD Link Policy.
3. Right-click UDLD Link Policy and select Create UDLD Link Policy.
4. If the uplink cables to the Nexus switches are copper cables, name the Policy UDLD-Aggressive and select Enabled for the Admin State and Aggressive for the Mode. If the uplink cables to the Nexus switches are fibre optic cables, name the Policy UDLD-Normal Aggressive and select Enabled for the Admin State and Aggressive for the Mode. In the validation lab configuration, UDLD-Aggressive was created.

Create UDLD Link Policy ? ✕

Name :

Admin State : Enabled Disabled

Mode : Normal Aggressive

5. Click OK, then click OK again to complete creating the policy.

It is important that the Nexus switch port UDLD configurations (Aggressive or Normal) match the UCS port UDLD configurations.

6. Expand Policies > LAN Cloud > Link Profile.
7. Right-click Link Profile and select Create Link Profile.
8. Give the Link Profile the same name as the UDLD Link Policy above and select the UDLD Link Policy created above.

Create Link Profile ? ✕

Name :

UDLD Link Policy :

9. Click OK, then click OK again to complete creating the profile.
10. In the navigation pane, under LAN > LAN Cloud > Fabric A > Port Channels, expand Port-Channel 13.
11. Select the first Eth Interface under Port-Channel 13. From the drop-down list, select the Link Profile created above, click Save Changes and OK. Repeat this process for each Eth Interface under Port-Channel 13 and for each Eth Interface under Port-Channel 14 on Fabric B.

LAN / LAN Cloud / Fabric A / Port Channels / Port-Channel 13 vPC13 / Eth Interface 1/53

General		Faults	Events
Actions		Properties	
Delete	Enable Interface	Disable Interface	
ID	Slot ID	Fabric ID	Transport Type
: 53	: 1	: A	: Ether
Port	Membership	Link Profile	User Label
: sys/switch-A/slot-1/switch-ether/port-53	: Up	: UDLD-Aggressive ▼	: <input type="text"/>

To see that UDLD is set up correctly, log into each Nexus switch and type `show udld neighbors`.

Create MAC Address Pools

To configure the necessary MAC address pools for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the LAN tab in the navigation pane.
2. Select Pools > root.

In this procedure, two MAC address pools are created, one for each switching fabric.

3. Right-click MAC Pools under the root organization.
4. Select Create MAC Pool to create the MAC address pool.
5. Enter MAC-Pool-A as the name of the MAC pool.
6. Optional: Enter a description for the MAC pool.
7. Select the option Sequential for the Assignment Order field and click Next.

Create MAC Pool ? X

1 Define Name and Description

2 Add MAC Addresses

Name : MAC-Pool-A

Description :

Assignment Order : Default Sequential

< Prev Next > Finish Cancel

8. Click Add.
9. Specify a starting MAC address.

It is recommended to place 0A in the second last octet of the starting MAC address to identify all of the MAC addresses as Fabric A addresses. It is also recommended to not change the first three octets of the MAC address.

10. Specify a size for the MAC address pool that is sufficient to support the available blade or rack server resources. Remember that multiple Cisco VIC vNICs will be created on each server and each vNIC will be assigned a MAC address.

Create a Block of MAC Addresses ? X

First MAC Address : 00:25:B5:07:0A:00 Size : 64

To ensure uniqueness of MACs in the LAN fabric, you are strongly encouraged to use the following MAC prefix:
00:25:B5:xx:xx:xx

OK Cancel

11. Click OK and then click Finish.
12. In the confirmation message, click OK.
13. Right-click MAC Pools under the root organization.
14. Select Create MAC Pool to create the MAC address pool.

15. Enter `MAC-Pool-B` as the name of the MAC pool.
16. Optional: Enter a description for the MAC pool.
17. Select the Sequential Assignment Order and click Next.
18. Click Add.
19. Specify a starting MAC address.

It is recommended to place 0B in the second last octet of the starting MAC address to identify all the MAC addresses in this pool as fabric B addresses. It is also recommended to not change the first three octets of the MAC address.

20. Specify a size for the MAC address pool that is sufficient to support the available blade or rack server resources.

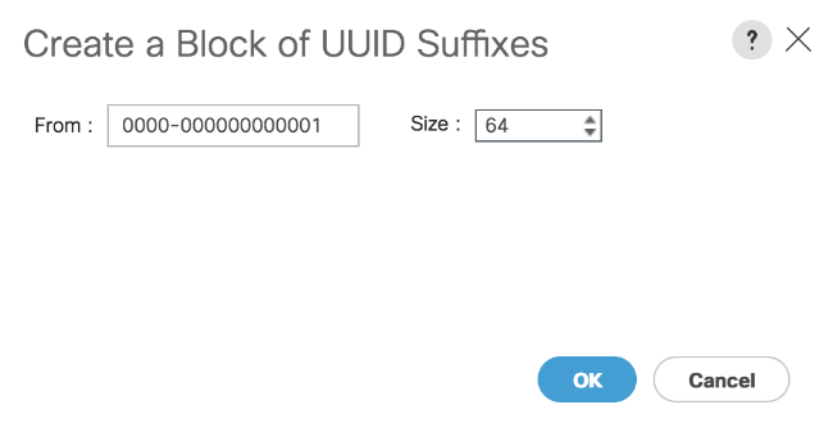

21. Click OK and then click Finish.
22. In the confirmation message, click OK.

Create UUID Suffix Pool

To configure the necessary universally unique identifier (UUID) suffix pool for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Pools > root.
3. Right-click UUID Suffix Pools and choose Create UUID Suffix Pool.
4. Enter `UUID-Pool` as the name of the UUID suffix pool.
5. Optional: Enter a description for the UUID suffix pool.
6. Keep the prefix at the derived option.
7. Change the Assignment Order to Sequential.
8. Click Next.

9. Click Add to add a block of UUIDs.
10. Keep the From field at the default setting.
11. Specify a size for the UUID block that is sufficient to support the available blade or rack server resources.

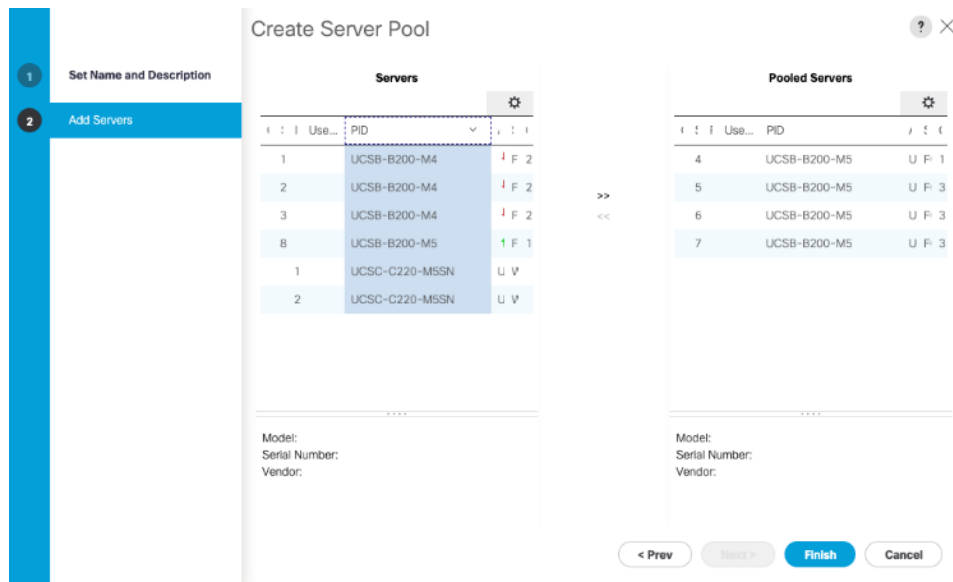

12. Click OK. Click Finish and then click OK.

Create Server Pool

To configure the necessary server pool for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Pools > root.
3. Right-click Server Pools and choose Create Server Pool.
4. Enter `Infra-Server-Pool1` as the name of the server pool.
5. Optional: Enter a description for the server pool.
6. Click Next.

7. Select at least two (or more) servers to be used for the setting up the VMware environment and click >> to add them to the Infra-Server-Pool server pool.
8. Click Finish and click OK.

If Cisco UCS C-Series servers are leveraged in the design, create storage pool by selecting the appropriate server models intended to be used.

Create a WWNN Address Pool for FC based Storage Access

This configuration step can be skipped if the UCS environment does not need to access storage environment using FC.

For FC boot as well as access to FC LUNs, create a World Wide Node Name (WWNN) pool by following these steps:

1. In Cisco UCS Manager, click the SAN tab in the navigation pane.
2. Select Pools > root.
3. Right-click WWNN Pools under the root organization and choose Create WWNN Pool to create the WWNN address pool.
4. Enter `wwnn-Pool` as the name of the WWNN pool.
5. Optional: Enter a description for the WWNN pool.
6. Select the Sequential Assignment Order and click Next.
7. Click Add.
8. Specify a starting WWNN address.

- Specify a size for the WWNN address pool that is sufficient to support the available blade or rack server resources. Each server will receive one WWNN.

Modifications of the WWNN block, as well as the WWPN and MAC Addresses, can convey identifying information for the Cisco UCS domain.

When there are multiple UCS domains sitting in adjacency, it is important that these blocks; the WWNN, WWPN, and MAC, hold differing values between each set. Modify the values accordingly to make them unique.

Create WWN Block ? X

From : Size :

To ensure uniqueness of WWNs in the SAN fabric, you are strongly encouraged to use the following WWN prefix:

20:00:00:25:b5:xx:xx:xx

- Click OK and click Finish.
- In the confirmation message, click OK.

Create a WWPN Address Pools for FC Based Storage Access

This configuration step can be skipped if the UCS environment does not need access to storage environment using FC.

If you are providing FC boot or access to FC LUNs, create a World Wide Port Name (WWPN) pool for each SAN switching fabric by completing the following steps:

- In Cisco UCS Manager, click the SAN tab in the navigation pane.
- Select Pools > root.
- Right-click WWPN Pools under the root organization and choose Create WWPN Pool to create the first WWPN address pool.
- Enter `WWPN-Pool-A` as the name of the WWPN pool.

5. Optional: Enter a description for the WWPN pool.
6. Select the Sequential Assignment Order and click Next.
7. Click Add.
8. Specify a starting WWPN address.

It is recommended to place 0A in the second last octet of the starting WWPN address to identify all of the WWPN addresses as Fabric A addresses.

9. Specify a size for the WWPN address pool that is sufficient to support the available blade or rack server resources. Each server's Fabric A vHBA will receive one WWPN from this pool.

Create WWN Block

12. Right-click WWPN Pools under the root organization and choose Create WWPN Pool to create the second WWPN address pool.
13. Enter `WWPN-Pool-B` as the name of the WWPN pool.
14. Optional: Enter a description for the WWPN pool.
15. Select the Sequential Assignment Order and click Next.
16. Click Add.
17. Specify a starting WWPN address.

It is recommended to place 0B in the second last octet of the starting WWPN address to identify all of the WWPN addresses as Fabric B addresses.

18. Specify a size for the WWPN address pool that is sufficient to support the available blade or rack server resources. Each server's Fabric B vHBA will receive one WWPN from this pool.

Create WWN Block

From : Size :

To ensure uniqueness of WWNs in the SAN fabric, you are strongly encouraged to use the following WWN prefix:

20:00:00:25:b5:xx:xx:xx

19. Click OK and click Finish.

20. In the confirmation message, click OK.

Create IQN Pools for iSCSI Boot and LUN Access (iSCSI Deployment)

This configuration step can be skipped if the UCS environment does not need access to storage using iSCSI.

To enable iSCSI boot and provide access to iSCSI LUNs, configure the necessary IQN pools in the Cisco UCS Manager by completing the following steps:

1. In the UCS Manager, select the SAN tab.
2. Select Pools > root.
3. Right-click IQN Pools under the root organization and choose Create IQN Suffix Pool to create the IQN pool.
4. Enter `Infra-IQN-Pool1` for the name of the IQN pool.
5. Optional: Enter a description for the IQN pool.
6. Enter `iqn.1992-08.com.cisco` as the prefix
7. Select the option Sequential for Assignment Order field. Click Next.

8. Click Add.
9. Enter an identifier with `ucs-host` as the suffix. Optionally a rack number or any other identifier can be added to the suffix to make the IQN unique within a DC.
10. Enter 1 in the From field.
11. Specify a size of the IQN block sufficient to support the available server resources. Each server will receive one IQN.
12. Click OK.

13. Click Finish. In the message box that displays, click OK.

Create IP Pools for iSCSI Boot and LUN Access (iSCSI Deployment)

This configuration step can be skipped if the UCS environment does not need access to storage using iSCSI.

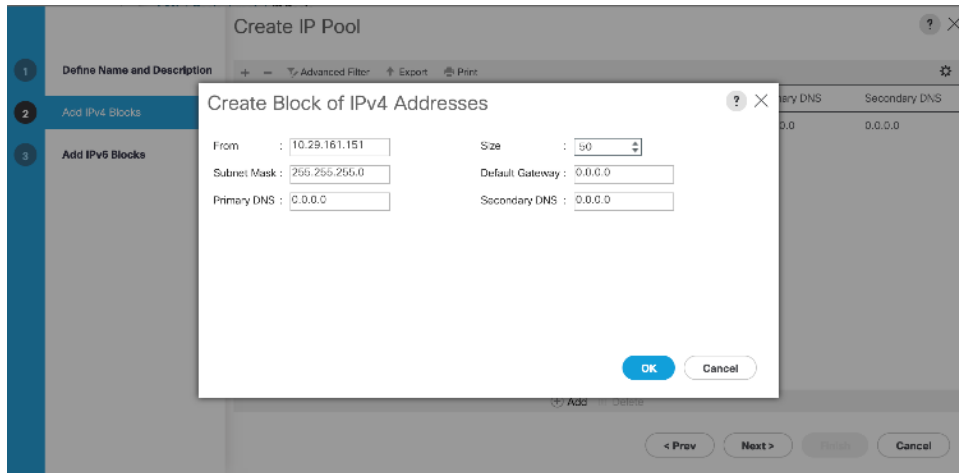

For enabling iSCSI storage access, these steps provide details for configuring the necessary IP pools in the Cisco UCS Manager:

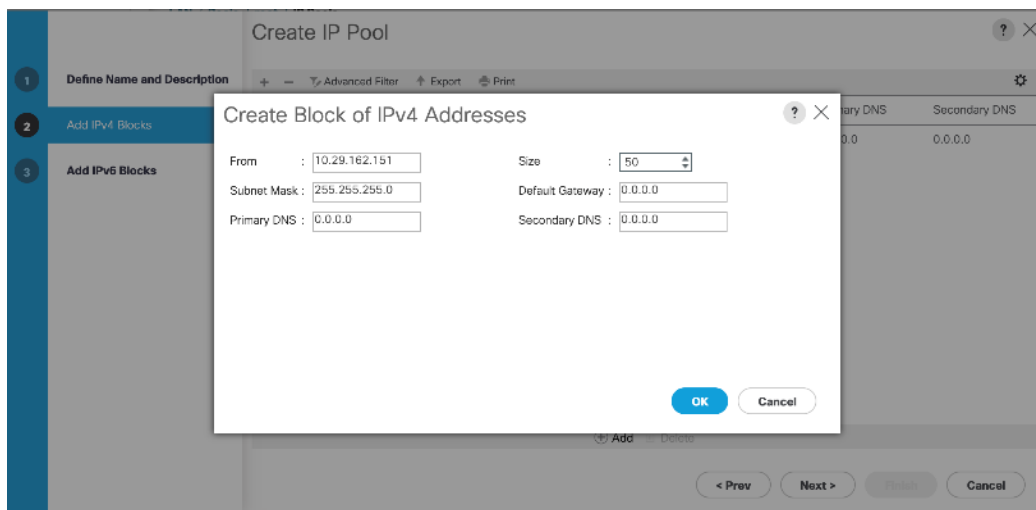

Two IP pools are created, one for each switching fabric.

1. In Cisco UCS Manager, select the LAN tab.
2. Select Pools > root.
3. Right-click IP Pools under the root organization and choose Create IP Pool to create the IP pool.
4. Enter `iSCSI-initiator-A` for the name of the IP pool.
5. Optional: Enter a description of the IP pool.
6. Select the option Sequential for the Assignment Order field. Click Next.

7. Click Add.
8. In the From field, enter the beginning of the range to assign an iSCSI IP addresses. These addresses are covered in Table 2 .
9. Enter the Subnet Mask.
10. Set the size with sufficient address range to accommodate the servers. Click OK.

11. Click Next and then click Finish.
12. Click OK in the confirmation message.
13. Right-click IP Pools under the root organization and choose Create IP Pool to create the IP pool.
14. Enter `iscsi-initiator-B` for the name of the IP pool.
15. Optional: Enter a description of the IP pool.
16. Select the Sequential option for the Assignment Order field. Click Next.
17. Click Add.
18. In the From field, enter the beginning of the range to assign an iSCSI IP addresses. These addresses are covered in Table 2 .
19. Enter the Subnet Mask.
20. Set the size with sufficient address range to accommodate the servers. Click OK.

21. Click Next and then click Finish.
22. Click OK in the confirmation message.

Create VLANs

To configure the necessary VLANs in the Cisco UCS Manager, follow these steps for all the VLANs listed in Table 12 :

Table 12 VLANs on Cisco UCS

VLAN Name	VLAN
IB-Mgmt	11
iSCSI-A*	3161
iSCSI-B*	3162
Out of Band Mgmt	3171
VM Traffic	3174
vMotion	3173
Native-2	2

*** iSCSI-A and iSCSI-B VLANs are required for iSCSI deployments only.**

1. In Cisco UCS Manager, click the LAN tab in the navigation pane.
2. Select LAN > LAN Cloud.
3. Right-click VLANs and choose Create VLANs.
4. Enter name from the VLAN Name column.
5. Keep the Common/Global option selected for the scope of the VLAN.
6. Enter the VLAN ID associated with the name.
7. Keep the Sharing Type as None.
8. Click OK and then click OK again.

Create VLANs

VLAN Name/Prefix :

Multicast Policy Name : [Create Multicast Policy](#)

Common/Global
 Fabric A
 Fabric B
 Both Fabrics Configured Differently

You are creating global VLANs that map to the same VLAN IDs in all available fabrics. Enter the range of VLAN IDs.(e.g. "2009-2019", "29,35,40-45", "23", "23,34-45")

VLAN IDs :

Sharing Type : None Primary Isolated Community

Check Overlap

OK

Cancel

9. Click Yes and then click OK twice.

10. Repeat these steps for all the VLANs in Table 12 .

Create Host Firmware Package

Firmware management policies allow the administrator to select the corresponding packages for a given server configuration. These policies often include packages for adapter, BIOS, board controller, FC adapters, host bus adapter (HBA) option ROM, and storage controller.

To create a firmware management policy for a given server configuration in the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root.
3. Right-click Host Firmware Packages and choose Create Host Firmware Package.
4. Enter `Infra-FW-Pack` as the name of the host firmware package.
5. Keep the Host Firmware Package as Simple.
6. Select the version 4.0(4c) for both the Blade and Rack Packages.
7. Click OK to create the host firmware package.
8. Click OK.

Create Host Firmware Package ? X

Set Jumbo Frames in Cisco UCS Fabric

Jumbo Frames are used in VersaStack for the iSCSI storage protocols. The normal best practice in VersaStack has been to set the MTU of the Best Effort QoS System Class in Cisco UCS Manager to 9216 for Jumbo Frames. In the Cisco UCS 6454 Fabric Interconnect the MTU for the Best Effort QoS System Class is fixed at normal and cannot be changed. Testing has shown that even with this setting of normal in the 6454, Jumbo Frames can pass through the Cisco UCS fabric without being dropped. The screenshot below is from Cisco UCS Manager on a 6454 Fabric Interconnect, where the MTU for the Best Effort class is not configurable. To configure jumbo frames in the Cisco UCS fabric in a 6300 or 6200 series Fabric Interconnect, follow these steps:

To configure jumbo frames in the Cisco UCS fabric, follow these steps:

1. In Cisco UCS Manager, click the LAN tab in the navigation pane.
2. Select LAN > LAN Cloud > QoS System Class.
3. In the right pane, click the General tab.
4. On the Best Effort row, enter 9216 in the box under the MTU column.
5. Click Save Changes in the bottom of the window.

LAN / LAN Cloud / QoS System Class

6. Click OK.

Create Local Disk Configuration Policy

When using an external storage system for OS boot, a local disk configuration for the Cisco UCS environment is necessary because the servers in the environment will not contain a local disk.

This policy should not be applied to the servers that contain local disks.

To create a local disk configuration policy for no local disks, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root.
3. Right-click Local Disk Config Policies and choose Create Local Disk Configuration Policy.
4. Enter `SAN-Boot` as the local disk configuration policy name.
5. Change the mode to No Local Storage.
6. Click OK to create the local disk configuration policy.

Create Local Disk Configuration Policy ? X

Name :

Description :

FlexFlash State : Disable Enable

If **FlexFlash State** is disabled, SD cards will become unavailable immediately.
Please ensure SD cards are not in use before disabling the FlexFlash State.

FlexFlash RAID Reporting State : Disable Enable

FlexFlash Removable State : Yes No No Change

If **FlexFlash Removable State** is changed, SD cards will become unavailable temporarily.
Please ensure SD cards are not in use before changing the FlexFlash Removable State.

7. Click OK again.

Create Network Control Policy for Cisco Discovery Protocol (CDP) and Link Layer Discovery Protocol (LLDP)

To create a network control policy that enables Link Layer Discovery Protocol (LLDP) on virtual network ports, follow these steps:

1. In Cisco UCS Manager, click the LAN tab in the navigation pane.
2. Select Policies > root.
3. Right-click Network Control Policies and choose Create Network Control Policy.
4. Enter `Enable-CDP-LLDP` as the policy name.
5. For CDP, select Enabled option.
6. For LLDP, scroll down and select Enabled for both Transit and Receive.

Create Network Control Policy

OK

Cancel

7. Click OK to create the network control policy.
8. Click OK.

Create Power Control Policy

To create a power control policy for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root.
3. Right-click Power Control Policies and choose Create Power Control Policy.
4. Enter `No-Power-Cap` as the power control policy name.
5. Change the power capping setting to No Cap.
6. Click OK to create the power control policy.
7. Click OK.

Create Power Control Policy

Name :

Description :

Fan Speed Policy :

Power Capping

If you choose **cap**, the server is allocated a certain amount of power based on its priority within its power group. Priority values range from 1 to 10, with 1 being the highest priority. If you choose **no-cap**, the server is exempt from all power capping.

No Cap cap

Cisco UCS Manager only enforces power capping when the servers in a power group require more power than is currently available. With sufficient power, all servers run at full capacity regardless of their priority.

OK

Cancel

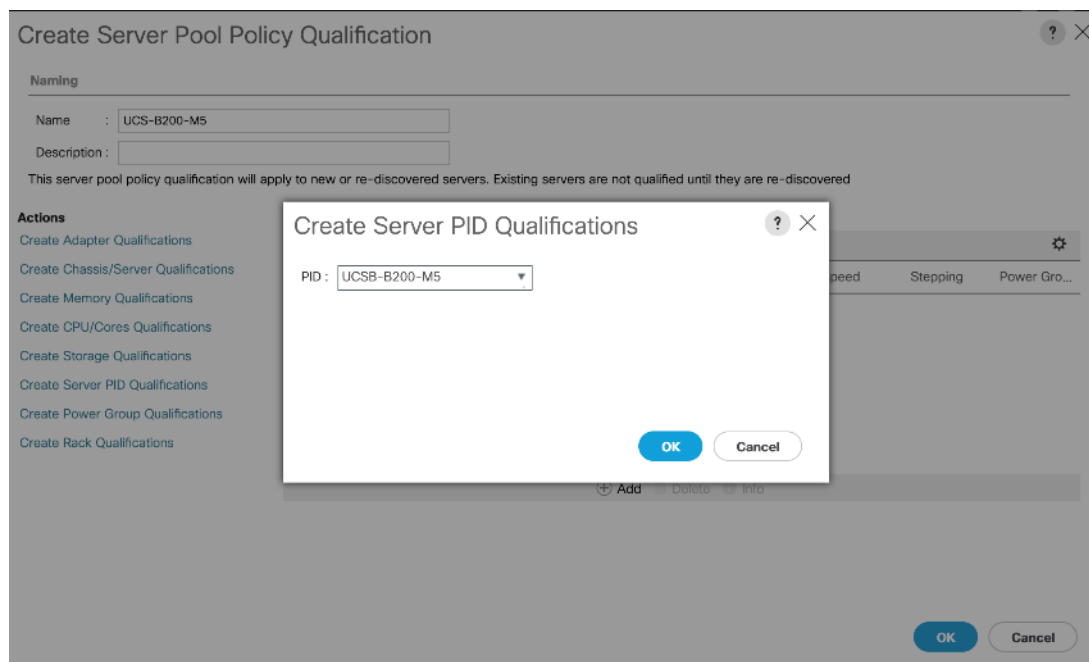

Create Server Pool Qualification Policy (Optional)

To create an optional server pool qualification policy for the Cisco UCS environment, follow these steps:

This example creates a policy for selecting a Cisco UCS B200-M5 server.

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root.
3. Right-click Server Pool Policy Qualifications and choose Create Server Pool Policy Qualification.
4. Enter UCSB-B200-M5 as the name for the policy.
5. Choose Create Server PID Qualifications.
6. Select UCSB-B200-M5 as the PID.

7. Click OK.
8. Click OK to create the server pool policy qualification.

The server pool qualification policy name and the PID values varies if the UCS C-Series or other B-Series server models are used, select appropriate values based on the server model being used.

Create Server BIOS Policy

To create a server BIOS policy for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root.
3. Right-click BIOS Policies and choose Create BIOS Policy.
4. Enter `Infra-Host-BIOS` as the BIOS policy name.

Create BIOS Policy

9. Scroll down to the remaining Processor options and select:
 - a. Processor C State -> Disabled
 - b. Processor C1E -> Disabled

- c. Processor C3 Report -> Disabled
- d. Processor C7 Report -> Disabled
- e. Energy Performance -> Performance

10. Click the RAS Memory tab, and select:

- a. LV DDR Mode -> Performance Mode

11. Click Save Changes to modify the BIOS policy.

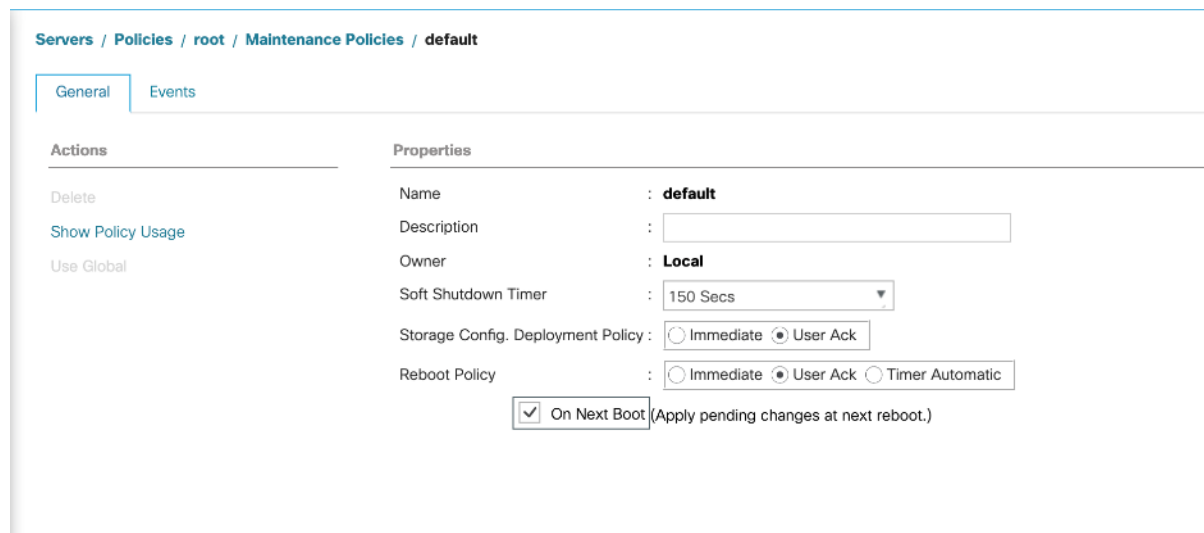

12. Click OK.

Update Default Maintenance Policy

To update the default Maintenance Policy, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root and then select Maintenance Policies > default.

3. Change the Reboot Policy to User Ack.
4. Check the box to enable On Next Boot
5. Click Save Changes.
6. Click OK to accept the change.

Create vNIC/vHBA Placement Policy

To create a vNIC/vHBA placement policy for the infrastructure hosts, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root.
3. Right-click vNIC/vHBA Placement Policies and choose Create Placement Policy.
4. Enter `Infra-Policy` as the name of the placement policy.
5. Click 1 and select Assigned Only.
6. Click OK and then click OK again.

Create Placement Policy ? X

Name :

Virtual Slot Mapping Scheme : Round Robin Linear Ordered

2	All	ethernet,fc
3	All	ethernet,fc
4	All	ethernet,fc

Create vNIC Templates

Eight different vNIC Templates are covered in Table 13 . Not all vNICs need to be created in all deployments. The vNICs templates covered below are for iSCSI vNICs, infrastructure (management, vMotion etc.) vNICs, and data vNICs (VM traffic) for VMware VDS. Refer to Usage column in Table 13 to see if a vNIC is needed for a particular ESXi host.

Table 13 NIC Templates and Associated VLANs

Name	Fabric ID	VLANs	Native VLAN	MAC Pool	Usage
vNIC_Mgmt_A	A	IB-Mgmt, Native-2	Native-2	MAC-Pool-A	All ESXi Hosts
vNIC_Mgmt_B	B	IB-Mgmt, Native-2	Native-2	MAC-Pool-B	All ESXi Hosts
vNIC_vMotion_A	A	vMotion	vMotion	MAC-Pool-A	All ESXi Hosts
vNIC_vMotion_B	A	vMotion	vMotion	MAC-Pool-B	All ESXi Hosts
vNIC_VM_A	A	VM Network	Native-2	MAC-Pool-A	All ESXi Hosts

Name	Fabric ID	VLANs	Native VLAN	MAC Pool	Usage
vNIC_VM_B	A	VM Network	Native-2	MAC-Pool-B	All ESXi Hosts
vNIC_iSCSI_A	A	iSCSI-A	iSCSI-A	MAC-Pool-A	iSCSI hosts only
vNIC_iSCSI_B	B	iSCSI-B	iSCSI-B	MAC-Pool-B	iSCSI hosts only

Create Management vNICs

For the vNIC_Mgmt_A Template, follow these steps:

1. In Cisco UCS Manager, click the LAN tab in the navigation pane.
2. Select Policies > root.
3. Right-click vNIC Templates.
4. Select Create vNIC Template.
5. Enter vNIC_Mgmt_A as the vNIC template name.
6. Keep Fabric A selected.
7. Optional: select the Enable Failover checkbox.

Selecting Failover can improve link failover time by handling it at the hardware level and can guard against any potential for NIC failure not being detected by the virtual switch.

8. Select Primary Template for the Redundancy Type.
9. Leave Peer Redundancy Template as <not set>

Redundancy Type and specification of Redundancy Template are configuration options to later allow changes to the Primary Template to automatically adjust onto the Secondary Template.

10. Under Target, make sure that the VM checkbox is not selected.
11. Select Updating Template as the Template Type.

17. Click OK to create the vNIC template.

18. Click OK.

To create the vNIC_VM_B Templates, follow these steps:

1. In the navigation pane, select the LAN tab.
2. Select Policies > root.
3. Right-click vNIC Templates.
4. Select Create vNIC Template
5. Enter vNIC_VM_B as the vNIC template name.
6. Select Fabric B.
7. Select Secondary Template for Redundancy Type.
8. From the Peer Redundancy Template drop-down list, select vNIC_VM_A.

With Peer Redundancy Template selected, MAC Pool will be the main configuration option left for this vNIC template.

9. Under Target, make sure the VM checkbox is not selected.

Create LAN Connectivity Policy

To configure the necessary Infrastructure LAN Connectivity Policy, follow these steps:

1. In Cisco UCS Manager, click LAN on the left.
2. Select LAN > Policies > root.
3. Right-click LAN Connectivity Policies.
4. Select Create LAN Connectivity Policy.

Use Infra-LAN-Pol as the name if hosts boot from FC only.

5. Enter `iSCSI-LAN-Policy` as the name of the policy.
6. Click the upper Add button to add a vNIC.
7. In the Create vNIC dialog box, enter `00-Mgmt-A` as the name of the vNIC.

The numeric prefix of “00-“ and subsequent increments on the later vNICs are used in the vNIC naming to force the device ordering through Consistent Device Naming (CDN). Without this, some operating systems might not respect the device ordering that is set within Cisco UCS.

8. Select the Use vNIC Template checkbox.
9. In the vNIC Template list, select 00-Mgmt-A.
10. In the Adapter Policy list, select VMWare.
11. Click OK to add this vNIC to the policy.

Add iSCSI vNICs in LAN Policy (iSCSI Deployment)

This configuration step can be skipped if the UCS environment does not need to access storage environment using iSCSI.

Follow these steps only if you are using iSCSI SAN access:

1. Verify the iSCSI base vNICs are already added as part of vNIC implementation.
2. Expand the Add iSCSI vNICs section to add the iSCSI boot vNICs.
3. Select Add in the Add iSCSI vNICs section.
4. Set the name to `iSCSI-A-vNIC`.
5. Select the `06-iSCSI-A` as Overlay vNIC.
6. Set the VLAN to `iSCSI-A (native)` VLAN.
7. Set the iSCSI Adapter Policy to default
8. Leave the MAC Address set to None.

16. Click OK.

Create FC SAN Connectivity Policies (FC Deployment)

This configuration step can be skipped if the UCS environment does not need to access storage environment using FC.

A SAN connectivity policy defines the vHBAs that will be created as part of a service profile deployment.

To configure the necessary FC SAN Connectivity Policies, follow these steps:

1. In Cisco UCS Manager, click the SAN tab in the navigation pane.
2. Select SAN > Policies > root.
3. Right-click SAN Connectivity Policies and choose Create SAN Connectivity Policy.
4. Enter `Infra-FC-po1` as the name of the policy.
5. Select WWNN-Pool from the drop-down list under World Wide Node Name.

Create SAN Connectivity Policy

Name : Description :

Create iSCSI Boot Policy (iSCSI Deployment)

This configuration step can be skipped if the UCS environment does not need to access storage environment using iSCSI.

This procedure applies to a Cisco UCS environment in which iSCSI interface on Controller A is chosen as the primary target.

To create boot the policy for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Policies > root.
3. Right-click Boot Policies and choose Create Boot Policy.
4. Enter `Boot-iSCSI-X-A` as the name of the boot policy.
5. Optional: Enter a description for the boot policy.
6. Keep the Reboot on Boot Order Change option cleared.
7. Expand the Local Devices drop-down list and select Add Remote CD/DVD.

8. Expand the iSCSI vNICs section and select Add iSCSI Boot.
9. In the Add iSCSI Boot dialog box, enter `iSCSI-A-vNIC`.
10. Click OK.
11. Select Add iSCSI Boot.
12. In the Add iSCSI Boot dialog box, enter `iSCSI-B-vNIC`.
13. Click OK.

Create Boot Policy

Name :

Description :

Reboot on Boot Order Change :

Enforce vNIC/vHBA/iSCSI Name :

Boot Mode : Legacy Uefi

WARNINGS:

The type (primary/secondary) does not indicate a boot order presence.

The effective order of boot devices within the same device class (LAN/Storage/iSCSI) is determined by PCIe bus scan order.

If **Enforce vNIC/vHBA/iSCSI Name** is selected and the vNIC/vHBA/iSCSI does not exist, a config error will be reported.

If it is not selected, the vNICs/vHBAs are selected if they exist, otherwise the vNIC/vHBA with the lowest PCIe bus scan order is used.

14. Click OK then OK again to save the boot policy.

Create FC Boot Policies (FC Deployment)

This configuration step can be skipped if the UCS environment does not need to access storage environment using FC.

This procedure applies to a Cisco UCS environment in which two FC interfaces are used on each of the FS9100 node canisters for host connectivity. This procedure captures a single boot policy which defines Fabric-A as the primary fabric. Customer can choose to create a second boot policy which can use Fabric-B as primary fabric to spread the boot-from-san traffic load on both the nodes in case of disaster recovery.

WWPN information from the IBM FS9100 node canisters is required to complete this section. This information can be found by logging into the IBM FS9100 management address using SSH and issuing the commands as captured below. The information can be recorded in Table 14 .

Since NPIV feature is enabled on the IBM FS9100 systems, the WWPN permitted for host communication can be different from the physical WWPN. Refer to the example below.

1. Verify the node_id of the FS9100 node canisters using the following command (node1 through node 2 in this example):

lsportfc

```
IBM_FlashSystem:VersaStack-FS9100:superuser>lsportfc
id fc_io_port_id port_id type port_speed node_id node_name WWPN nportid status attachment cluster_use adapter_location adapter_port_id
0 1 1 fc 16Gb 1 node1 5005076810110516 720020 active switch local_partner 1 1
1 2 2 fc 16Gb 1 node1 5005076810120516 C60040 active switch local_partner 1 2
2 3 3 fc 16Gb 1 node1 5005076810130516 720040 active switch local_partner 1 3
3 4 4 fc 16Gb 1 node1 5005076810140516 C60060 active switch local_partner 1 4
16 1 1 fc 16Gb 2 node2 500507681011050D 720060 active switch local_partner 1 1
17 2 2 fc 16Gb 2 node2 500507681012050D C60080 active switch local_partner 1 2
18 3 3 fc 16Gb 2 node2 500507681013050D 720080 active switch local_partner 1 3
19 4 4 fc 16Gb 2 node2 500507681014050D C600A0 active switch local_partner 1 4
```

2. Use the following command to record the WWPN corresponding to ports connected to the SAN fabric:

lstargetportfc -filtervalue host_io_permitted=yes

```
IBM_FlashSystem:VersaStack-FS9100:superuser>lstargetportfc -filtervalue host_io_permitted=yes
id WWPN wwnn port_id owning_node_id current_node_id nportid host_io_permitted virtualized protocol

To create boot policies for the Cisco UCS environment, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Choose Policies > root.
3. Right-click Boot Policies and choose Create Boot Policy.
4. Enter `Boot-Fabric-A` as the name of the boot policy.
5. Optional: Enter a description for the boot policy.
6. Keep the Reboot on the Boot Order Change check box unchecked.
7. Expand the Local Devices drop-down list and Choose Add Remote CD/DVD.
8. Expand the vHBAs drop-down list and Choose Add SAN Boot.

Create Boot Policy ? X

Set Uefi Boot Parameters

Create iSCSI Boot Service Profile Template (iSCSI Deployment)

Service profile template configuration for the iSCSI-based SAN access is covered in this section.

This section can be skipped if iSCSI boot is not implemented in the customer environment.

To create the service profile template, follow these steps:

1. In Cisco UCS Manager, click the Servers tab in the navigation pane.
2. Select Service Profile Templates > root.
3. Right-click root.
4. Select Create Service Profile Template to open the Create Service Profile Template wizard.
5. Enter `Infra-ESXi-iSCSI-Host` as the name of the service profile template. This service profile template is configured to boot from storage node 1 on fabric A.
6. Select the “Updating Template” option.
7. Under UUID, select `UUID_Pool` as the UUID pool.

Create Service Profile Template

You must enter a name for the service profile template and specify the template type. You can also specify how a UUID will be assigned to this template and enter a description.

Name :

The template will be created in the following organization. Its name must be unique within this organization.
Where : **org-root**

The template will be created in the following organization. Its name must be unique within this organization.
Type : Initial Template Updating Template

Specify how the UUID will be assigned to the server associated with the service generated by this template.
UUID

UUID Assignment:

The UUID will be assigned from the selected pool.
The available/total UUIDs are displayed after the pool name.

Optionally enter a description for the profile. The description can contain information about when and where the service profile should be used.

< Prev Next > **Finish** Cancel

8. Click Next.

Configure Storage Provisioning

To configure the storage provisioning, follow these steps:

1. If you have servers with no physical disks, click the Local Disk Configuration Policy tab and select the SAN-Boot Local Storage Policy. Otherwise, select the default Local Storage Policy.

Create Service Profile Template

Optionally specify or create a Storage Profile, and select a local disk configuration policy.

Specific Storage Profile Storage Profile Policy **Local Disk Configuration Policy**

Local Storage: **SAN-Boot** ▼

[Create Local Disk Configuration Policy](#)

Mode : **No Local Storage**

Protect Configuration : **Yes**

If **Protect Configuration** is set, the local disk configuration is preserved if the service profile is disassociated with the server. In that case, a configuration error will be raised when a new service profile is associated with that server if the local disk configuration in that profile is different.

FlexFlash

FlexFlash State : **Disable**

If **FlexFlash State** is disabled, SD cards will become unavailable immediately. Please ensure SD cards are not in use before disabling the FlexFlash State.

FlexFlash RAID Reporting State : **Disable**

FlexFlash Removable State : **No Change**

If **FlexFlash Removable State** is changed, SD cards will become unavailable temporarily. Please ensure SD cards are not in use before changing the FlexFlash Removable State.

< Prev Next > **Finish** Cancel

2. Click Next.

Configure Networking Options

To configure the network options, follow these steps:

1. Keep the default setting for Dynamic vNIC Connection Policy.
2. Select the “Use Connectivity Policy” option to configure the LAN connectivity.
3. Select `iSCSI-LAN-Po1icy` from the LAN Connectivity Policy drop-down list.
4. Select `IQN_Po01` in Initiator Name Assignment.

Create Service Profile Template

Optionally specify LAN configuration information.

- Click OK in the confirmation message to provision four VersaStack Service Profiles.

Adjust the number of Service Profile instances based on the actual customer deployment with intended number of ESXi servers needed.

Create FC Boot Service Profile Template (FC Deployment)

In this procedure, a service profile template is created to use FC Fabric A as primary boot path.

This section can be skipped if FC boot is not implemented in the customer environment.

To create service profile templates, follow these steps:

- In Cisco UCS Manager, click the Servers tab in the navigation pane.
- Choose Service Profile Templates > root.
- Right-click root and choose Create Service Profile Template. This opens the Create Service Profile Template wizard.
- Enter `Infra-ESXi-Host` as the name of the service profile template.
- Select the Updating Template option.
- Under UUID, select `UUID-Pool` as the UUID pool.
- Click Next.

Create Service Profile Template ? X

You must enter a name for the service profile template and specify the template type. You can also specify how a UUID will be assigned to this template and enter a description.

Name :

The template will be created in the following organization. Its name must be unique within this organization.
Where : **org-root**

The template will be created in the following organization. Its name must be unique within this organization.
Type : Initial Template Updating Template

Specify how the UUID will be assigned to the server associated with the service generated by this template.
UUID

UUID Assignment:

The UUID will be assigned from the selected pool.
The available/total UUIDs are displayed after the pool name.

Optionally enter a description for the profile. The description can contain information about when and where the service profile should be used.

Configure Storage Provisioning

1. Select the Local Disk Configuration Policy tab.
2. Select the SAN-Boot Local Storage Policy. This policy usage requires servers with no local HDDs.
3. Click Next.

Create Service Profile Template ? X

Optionally specify or create a Storage Profile, and select a local disk configuration policy.

Backup the Cisco UCS Manager Configuration

It is recommended to backup the Cisco UCS Configuration. For additional information, go to:

https://www.cisco.com/c/en/us/td/docs/unified_computing/ucs/ucs-manager/GUI-User-Guides/Admin-Management/4-0/b_Cisco_UCS_Admin_Mgmt_Guide_4-0/b_Cisco_UCS_Admin_Mgmt_Guide_4-0_chapter_01.html

Refer to the [Appendix](#) for example backup procedures

Add Servers

Additional server pools, service profile templates, and service profiles can be created under root or in organizations under the root. All the policies at the root level can be shared among the organizations. Any new physical blades can be added to the existing or new server pools and associated with the existing or new service profile templates.

Gather Necessary WWPN Information (FC Deployment)

After the Cisco UCS service profiles have been created, each infrastructure blade in the environment will be assigned certain unique configuration parameters. To proceed with the SAN configuration, this deployment specific information must be gathered from each Cisco UCS blade. Follow these steps:

- To gather the vHBA WWPN information, launch the Cisco UCS Manager GUI. In the navigation pane, click the Servers tab. Expand Servers > Service Profiles > root. Select each service profile and expand to see the vHBAs.
- Click vHBAs to see the WWPNs for both HBAs.

Servers / Service Profiles / root / Service Profile Infra-ESXi-Host-03 / vHBAs

Storage | FSM

Actions

- Change World Wide Node Name
- Modify vNIC/vHBA Placement
- Reset WWNN Address

IBM FS9100 iSCSI Storage Configuration (iSCSI Deployment)

This configuration step can be skipped if the UCS environment does not need access to storage using iSCSI.

As part of IBM FS9100 storage configuration, follow these steps:

1. Create ESXi boot Volumes (Boot LUNs for all the ESXi hosts)
2. Create Share Storage Volumes (for hosting VMs)
3. Map Volumes to Hosts

Table 17 List of Volumes for iSCSI on IBM FS9100*

Volume Name	Capacity (GB)	Purpose	Mapping
Infra-ESXi-iSCSI-Host-01	10	Boot LUN for the Host	Infra-ESXi-iSCSI-Host-01
Infra-ESXi-iSCSI-Host-02	10	Boot LUN for the Host	Infra-ESXi-iSCSI-Host-02
Infra-ESXi-iSCSI-Host-03	10	Boot LUN for the Host	Infra-ESXi-iSCSI-Host-03
Infra-ESXi-iSCSI-Host-04	10	Boot LUN for the Host	Infra-ESXi-iSCSI-Host-04
Infra-iSCSI-datastore-1	2000**	Shared volume to host VMs	All ESXi hosts: Infra-ESXi-iSCSI-Host-01 to Infra-ESXi-iSCSI-Host-04
Infra-iSCSI-datastore-2	2000**	Shared volume to host VMs	All ESXi hosts: Infra-ESXi-iSCSI-Host-01 to Infra-ESXi-iSCSI-Host-04
Infra-iSCSI-swap	500**	Shared volume to host VMware VM swap directory	All ESXi hosts: Infra-ESXi-iSCSI-Host-01 to Infra-ESXi-iSCSI-Host-04

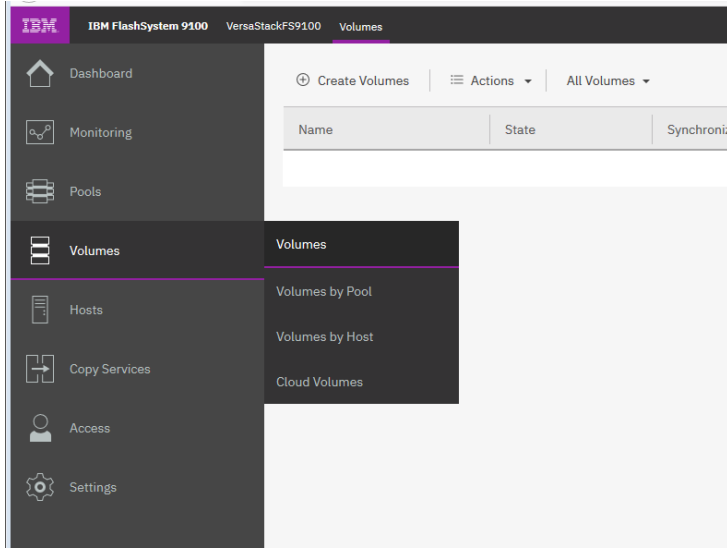

* Customers should adjust the names and values used for server and volumes names based on their deployment

** The volume size can be adjusted based on customer requirements

Create Volumes on the Storage System

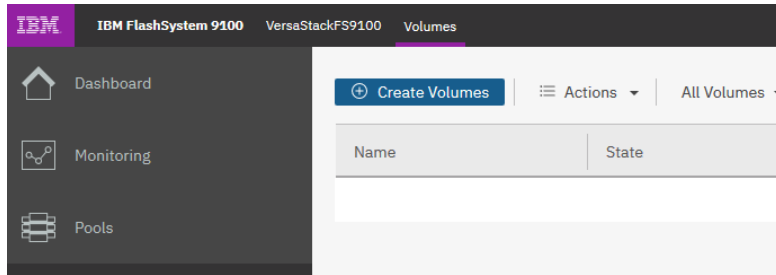

To create volumes on the storage system, follow these steps:

1. Log into the IBM FS9100 GUI and select the Volumes icon on the left screen and select Volumes

You will repeat the following steps to create and map the volumes shown in Table 17 .

2. Click Create Volumes as shown below.

3. Click Basic and then select the pool (vs-Pool10 in this example) from the drop-down list.
4. When creating single volumes, input quantity 1 and the capacity and name from Table 17 . Select `Thin-provisioned` for Capacity savings and enter the Name of the volume. Select I/O group `io_grp0`.
5. When creating multiple volumes in bulk enter the quantity required and review the Name field. The number value will be appended to the specified volume name.

IBM FS9100 and Spectrum Virtualize is optimized for environments with more than 30 volumes. Consider distributing Virtual Machines over multiple VMFS datastores for optimal performance.

 **Summary**

6. Click Create.

 During the volume creation, expand **view more details** to monitor the CLI commands utilized to create each volume. All commands run against the system by either the GUI or CLI will be stored in the Audit log, along with the associated user account and timestamp.

7. Repeat steps 1-6 to create all the required volumes and verify all the volumes have successfully been created as shown in the sample output below.

Create Host Cluster & Host objects

Host Cluster Shared & Private mappings

In traditional hypervisor environments such as VMware vSphere, each physical host requires access to the same shared datastores (or LUNs) in order to facilitate features such as vMotion, High Availability, Fault Tolerance. It is important for all ESXi hosts within a vSphere cluster to have identical access to LUNs presented from the FS9100.

The Host Clusters feature in IBM Spectrum Virtualize products introduces a way to simplify administration when mapping volumes to host environments that require shared storage.

It is recommended that a Host Cluster object be created for each vSphere Cluster visible in vCenter, and any ESXi hosts within the vSphere cluster be defined as individual host objects within FS9100. This ensures that volume access is consistent across all members of the cluster and any hosts that are subsequently added to the Host Cluster will inherit the same LUN mappings.

To create host clusters and objects, follow these steps:

1. Click Hosts then click Host Clusters.

2. Click Create Host Cluster.

3. Give the Host Cluster a friendly name.

Create Host Cluster

X

Name:

Optional: Select hosts to assign to a new host cluster. Any current volume mappings become the shared mappings for all the hosts in the host cluster.

i It is recommended that all hosts in a host cluster have access to the same I/O Groups.

Make Host Cluster

Add Hosts to Host Cluster

Create iSCSI Host Definitions

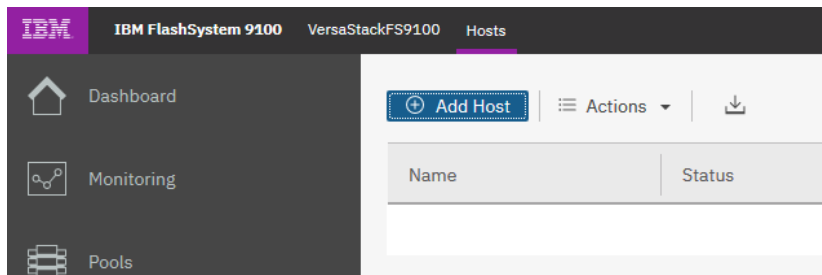

To create iSCSI host definitions, follow these steps:

1. Click Hosts and then Hosts from the navigation menu.

2. For each ESXi host (Table 16), follow these steps on the IBM FS9100 system:

- a. Click Add Host.

- b. Select `iSCSI` or `iSER (SCSI) Host`. Add the name of the host to match the ESXi service profile name from Table 17 . Type the IQN corresponding to the ESXi host from Table 16 and select the Host Cluster that we created in the previous step.

Add Host ✕

Required Fields

Name:

Host connections:

Host IQN: ⊕ ⊖

Optional Fields

CHAP authentication:

CHAP secret:

CHAP username:

Host type:

I/O groups:

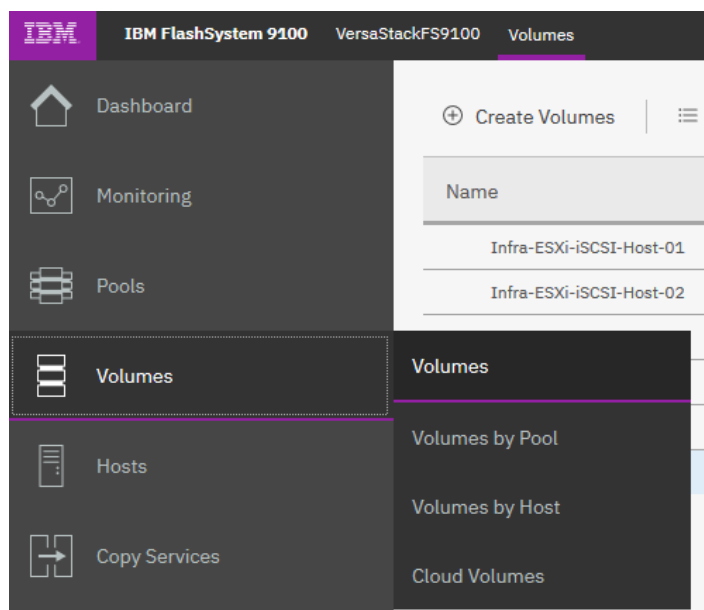

Host cluster:

3. Click Add.

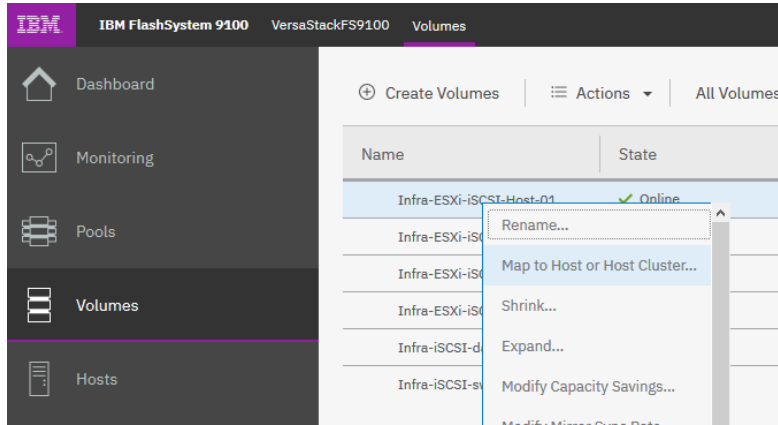

Map Volumes to Hosts and Host Cluster

To map volumes to hosts and clusters, follow these steps:

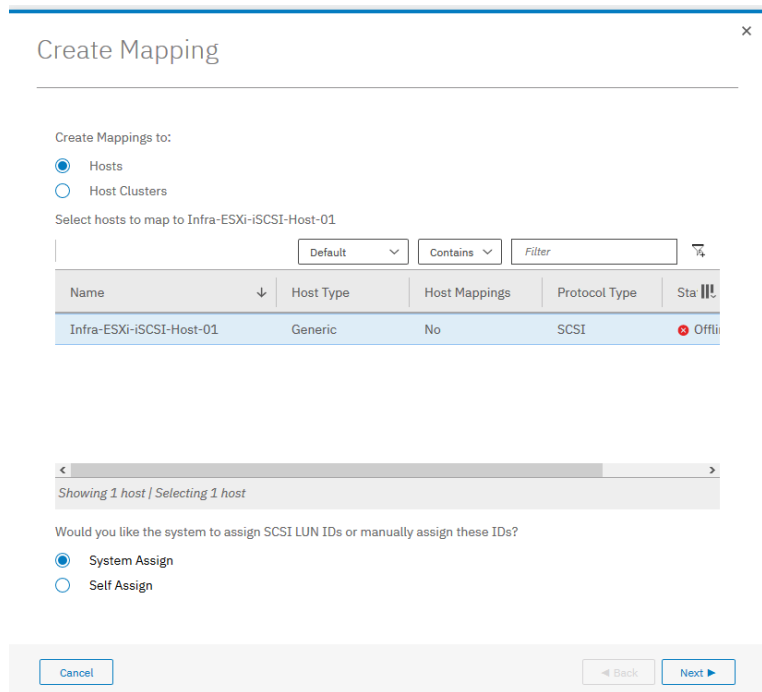

1. Now the Host Cluster and Host objects have been created, we need to map each LUN to the hosts.
2. Click Volumes.

3. Right-click the Boot LUN for each ESXi host in turn and choose Map to Host.

4. Select the Hosts radio button, and select the corresponding Host in the list and click Next

5. Click Map Volumes and when the process is complete, click Close.

Map Volumes to Infra-ESXi-iSCSI-Host-01: Summary x

- Any Shared host cluster mappings will be automatically inherited by any future ESXi hosts which are defined as members of the host cluster.

IBM FS9100 Fibre Channel Storage Configuration (FC Deployment)

This configuration step can be skipped if the UCS environment does not need access to storage using fibre channel.

As part of IBM FS9100 Fibre Channel storage configuration, follow these steps:

1. Setup Zoning on Cisco MDS switches
2. Setup Volumes on IBM FS9100
3. Map Volumes to Hosts

Create Device Aliases and SAN Zoning

The following steps will configure zoning for the WWPNs for the UCS hosts and the IBM FS9100 node canisters. WWPN information collected from the previous steps will be used in this section. Multiple zones will be created for servers in VSAN 101 on Switch A and VSAN 102 on Switch B.

The configuration below assumes 4 UCS services profiles have been deployed in this example. Customers can adjust the configuration according to their deployment size.

Cisco MDS - A Switch

To create device aliases for Fabric A that will be used to create zones, follow these steps:

The WWPNs recorded in Table 15 will be used in the next step. Replace the variables with actual WWPN values.

1. From the global configuration mode, run the following commands:

```
device-alias database

device-alias name Infra-ESXi-Host-01 pwwn <WWPN-Infra-ESXi-Host-1-A>

device-alias name Infra-ESXi-Host-02 pwwn <WWPN-Infra-ESXi-Host-2-A>

device-alias name Infra-ESXi-Host-03 pwwn <WWPN-Infra-ESXi-Host-3-A>

device-alias name Infra-ESXi-Host-04 pwwn <WWPN-Infra-ESXi-Host-4-A>

device-alias name FS9100-Node1-FC1 pwwn <WWPN-FS9100-Node1-FC1>

device-alias name FS9100-Node1-FC3 pwwn <WWPN-FS9100-Node1-FC3>

device-alias name FS9100-Node2-FC1 pwwn <WWPN-FS9100-Node2-FC1>

device-alias name FS9100-Node2-FC3 pwwn <WWPN-FS9100-Node2-FC3>

device-alias commit
```

2. Create the zones and add device-alias members for the 4 blades.

```

zone name Infra-ESXi-Host-01 vsan 101
member device-alias  Infra-ESXi-Host-01
member device-alias FS9100-Node1-FC1
member device-alias FS9100-Node1-FC3
member device-alias FS9100-Node2-FC1
member device-alias FS9100-Node2-FC3
!
zone name Infra-ESXi-Host-02 vsan 101
member device-alias  Infra-ESXi-Host-02
member device-alias FS9100-Node1-FC1
member device-alias FS9100-Node1-FC3
member device-alias FS9100-Node2-FC1
member device-alias FS9100-Node2-FC3
!
zone name Infra-ESXi-Host-03 vsan 101
member device-alias  Infra-ESXi-Host-03
member device-alias FS9100-Node1-FC1
member device-alias FS9100-Node1-FC3
member device-alias FS9100-Node2-FC1
member device-alias FS9100-Node2-FC3
!
zone name Infra-ESXi-Host-04 vsan 101
member device-alias  Infra-ESXi-Host-04
member device-alias FS9100-Node1-FC1
member device-alias FS9100-Node1-FC3
member device-alias FS9100-Node2-FC1
member device-alias FS9100-Node2-FC3
!

```

3. Add zones to zoneset.

```

zoneset name versastackzoneset vsan 101
    member Infra-ESXi-Host-01
    member Infra-ESXi-Host-02
    member Infra-ESXi-Host-03
    member Infra-ESXi-Host-04

```

4. Activate the zoneset.

```
zoneset activate name versastackzoneset vsan 101
```

Validate all the HBA's are logged into the MDS switch. The FS9100 nodes and the Cisco servers should be powered on. To start the Cisco servers from Cisco UCS Manager, select the server tab, then click Servers>Service>Profiles>root, and right-click service profile then select boot server.

5. Validate that all the powered-on system's HBAs are logged into the switch through the show zoneset command.

```
show zoneset active
```

```
VersaStack-MDS-A# sh zoneset active
zoneset name versastackzoneset vsan 101

```

6. Save the configuration.

```
copy run start
```

Cisco MDS - B Switch

- To create device aliases for Fabric B that will be used to create zones, follow these steps:

The WWPNs recorded in Table 15 will be used in the next step. Replace the variables with actual WWPN values.

1. From the global configuration mode, run the following commands:

```
device-alias database
device-alias name Infra-ESXi-Host-01 pwwn <WWPN-Infra-ESXi-Host-1-B>
device-alias name Infra-ESXi-Host-02 pwwn <WWPN-Infra-ESXi-Host-2-B>
device-alias name Infra-ESXi-Host-03 pwwn <WWPN-Infra-ESXi-Host-3-B>
device-alias name Infra-ESXi-Host-04 pwwn <WWPN-Infra-ESXi-Host-4-B>
device-alias name FS9100-Node1-FC2-NPIV pwwn <WWPN-FS9100-Node1-FC2>
device-alias name FS9100-Node1-FC4-NPIV pwwn <WWPN-FS9100-Node1-FC4>
device-alias name FS9100-Node2-FC2-NPIV pwwn <WWPN-FS9100-Node2-FC2>
device-alias name FS9100-Node2-FC4-NPIV pwwn <WWPN-FS9100-Node2-FC4>
device-alias commit
```

2. Create the zones and add device-alias members for the 4 blades.

```
zone name Infra-ESXi-Host-01 vsan 102
member device-alias Infra-ESXi-Host-01
member device-alias FS9100-Node1-FC2
member device-alias FS9100-Node1-FC4
member device-alias FS9100-Node2-FC2
member device-alias FS9100-Node2-FC4
!
zone name Infra-ESXi-Host-02 vsan 102
member device-alias Infra-ESXi-Host-02
member device-alias FS9100-Node1-FC2-NPIV
member device-alias FS9100-Node1-FC4-NPIV
```

```

member device-alias FS9100-Node2-FC2-NPIV
member device-alias FS9100-Node2-FC4-NPIV
!
zone name Infra-ESXi-Host-03 vsan 102
member device-alias Infra-ESXi-Host-03
member device-alias FS9100-Node1-FC2-NPIV
member device-alias FS9100-Node1-FC4-NPIV
member device-alias FS9100-Node2-FC2-NPIV
member device-alias FS9100-Node2-FC4-NPIV
!
zone name Infra-ESXi-Host-04 vsan 102
member device-alias Infra-ESXi-Host-04
member device-alias FS9100-Node1-FC2-NPIV
member device-alias FS9100-Node1-FC4-NPIV
member device-alias FS9100-Node2-FC2-NPIV
member device-alias FS9100-Node2-FC4-NPIV
!

```

3. Add zones to zoneset.

```

zoneset name versastackzoneset vsan 102
    member Infra-ESXi-Host-01
    member Infra-ESXi-Host-02
    member Infra-ESXi-Host-03
    member Infra-ESXi-Host-04

```

4. Activate the zoneset.

```
zoneset activate name versastackzoneset vsan 102
```

Validate all the HBA's are logged into the MDS switch. The FS9100 nodes and the Cisco servers should be powered on. To start the Cisco servers from Cisco UCS Manager, select the server tab, then click Servers→Service→Profiles→root, and right-click service profile then select boot server.

5. Validate that all the powered-on system's HBAs are logged into the switch through the show zoneset command.

```
show zoneset active
```

```

VersaStack-MDS-B# sh zoneset active
zoneset name versastackzoneset vsan 102

```

```

zone name Infra-ESXi-Host-01 vsan 102

```

6. Save the configuration.

```
copy run start
```

IBM FS9100 FC Configuration

As part of IBM FS9100 FC configuration, follow these steps:

1. Create ESXi boot Volumes (Boot LUNs for all the ESXi hosts).
2. Create Share Storage Volumes (for hosting VMs).

3. Map Volumes to Hosts.

 In this deployment example, there are four ESXi hosts. The volumes listed in Table 18 will be created in this process.

Table 18 List of FC Volumes on IBM FS9100*

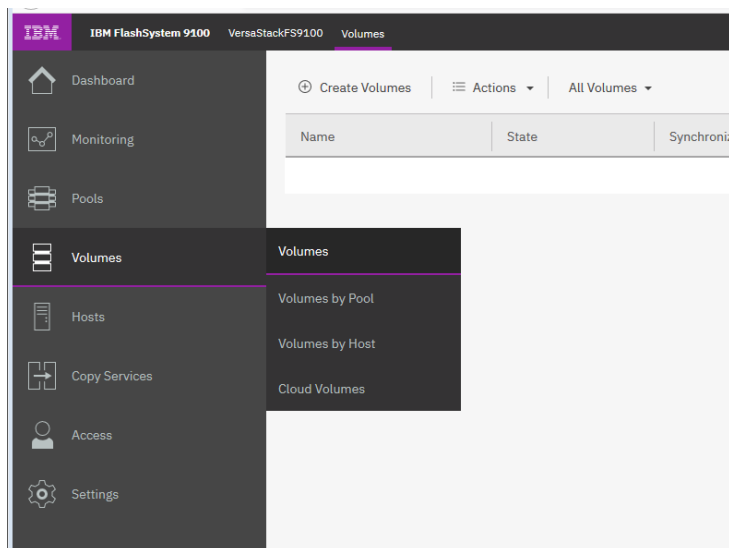

Volume Name	Capacity (GB)	Purpose	Mapping
Infra-ESXi-Host-01	10	Boot LUN for the Host	Infra-ESXi-Host-01
Infra-ESXi-Host-02	10	Boot LUN for the Host	Infra-ESXi-Host-02
Infra-ESXi-Host-03	10	Boot LUN for the Host	Infra-ESXi-Host-03
Infra-ESXi-Host-04	10	Boot LUN for the Host	Infra-ESXi-Host-04
Infra-datastore-1	2000*	Shared volume to host VMs	All ESXi hosts: Infra-ESXi-Host-01 to Infra-ESXi-Host-04
Infra-datastore-2	2000*	Shared volume to host VMs	All ESXi hosts: Infra-ESXi-Host-01 to Infra-ESXi-Host-04
Infra-swap	500*	Shared volume to host VMware VM swap directory	All ESXi hosts: Infra-ESXi-Host-01 to Infra-ESXi-Host-04

* Customers should adjust the names and values based on their environment.

Create Volumes on the Storage System

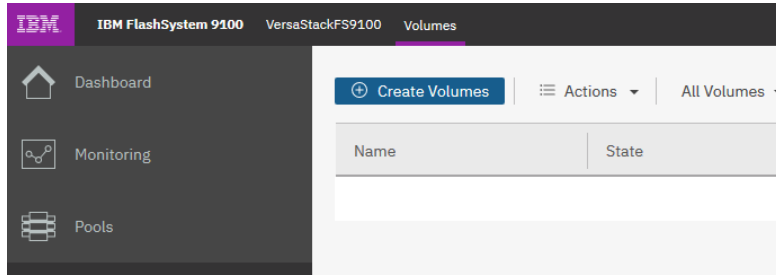

To create volumes on the storage system, follow these steps:

1. Log into the IBM FS9100 GUI and select the Volumes icon on the left screen and select Volumes.

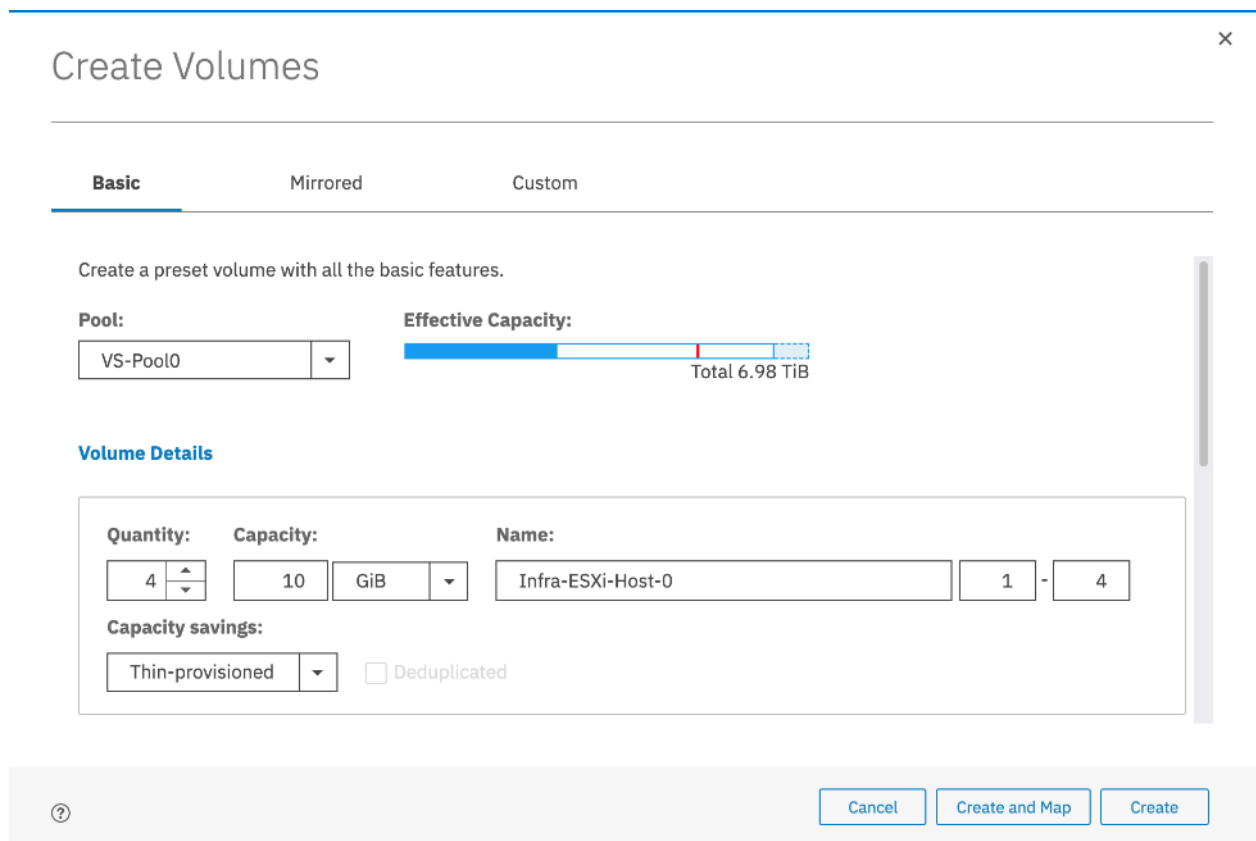

You will repeat the following steps to create and map the volumes shown in Table 18 .

2. Click Create Volumes as shown below.

3. Click Basic and then select the pool (VS-Pool0 in this example) from the drop-down list.
4. When creating single volumes, input quantity 1 and the capacity and name from Table 18. Select Thin-provisioned for Capacity savings and enter the Name of the volume. Select I/O group io_grp0.
5. When creating multiple volumes in bulk enter the quantity required and review the Name field. The number value will be appended to the specified volume name.

 IBM FS9100 and Spectrum Virtualize is optimized for environments with more than 30 volumes. Consider distributing Virtual Machines over multiple VMFS datastores for optimal performance.

6. Click Create.

During the volume creation, expand **view more details** to monitor the CLI commands utilized to create each volume. All commands run against the system by either the GUI or CLI will be stored in the Audit log, along with the associated user account and timestamp.

- Repeat steps 1-6 above to create all the required volumes and verify all the volumes have successfully been created as shown in the sample output below.

Name	State	Synchronized	Pool	Protocol Type	UID	Host Mappings	Capa
Infra-ESX-Host-01	Online		VS-Pool0	SCSI	6305076810830028B0000000000000...	Yes	
Infra-ESX-Host-02	Online		VS-Pool0	SCSI	6305076810830028B0000000000000...	Yes

Create Host Cluster & Host Objects

Host Cluster Shared & Private Mappings

In traditional hypervisor environments such as VMware vSphere, each physical host requires access to the same shared datastores (or LUNs) in order to facilitate features such as vMotion, High Availability, Fault Tolerance. It is important for all ESXi hosts within a vSphere cluster to have identical access to LUNs presented from the FS9100.

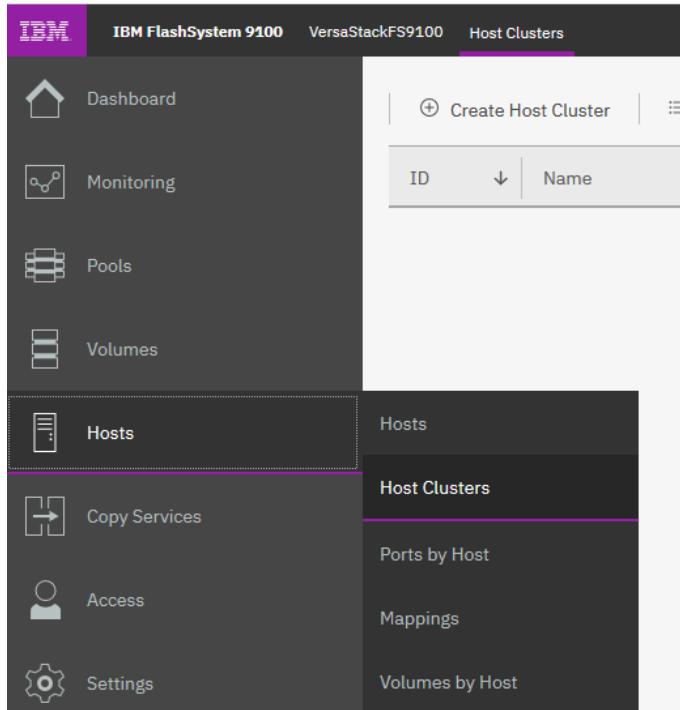

The Host Clusters feature in IBM Spectrum Virtualize products introduces a way to simplify administration when mapping volumes to host environments that require shared storage.

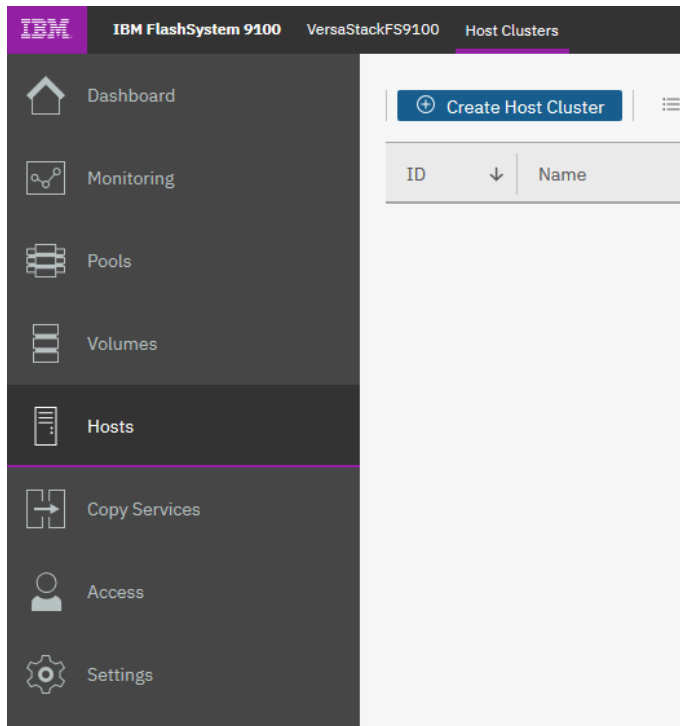

It is recommended that a Host Cluster object be created for each vSphere Cluster visible in vCenter, and any ESXi hosts within the vSphere cluster be defined as individual host objects within FS9100. This ensures that volume access is consistent across all members of the cluster and any hosts that are subsequently added to the Host Cluster will inherit the same LUN mappings.

To create host clusters and host objects, follow these steps:

- Click Hosts then click Host Clusters.

2. Click Create Host Cluster.

3. Give the Host Cluster a friendly name.

Create Host Cluster ×

Name:

Optional: Select hosts to assign to a new host cluster. Any current volume mappings become the shared mappings for all the hosts in the host cluster.

i It is recommended that all hosts in a host cluster have access to the same I/O Groups.

Need Help

◀ Back

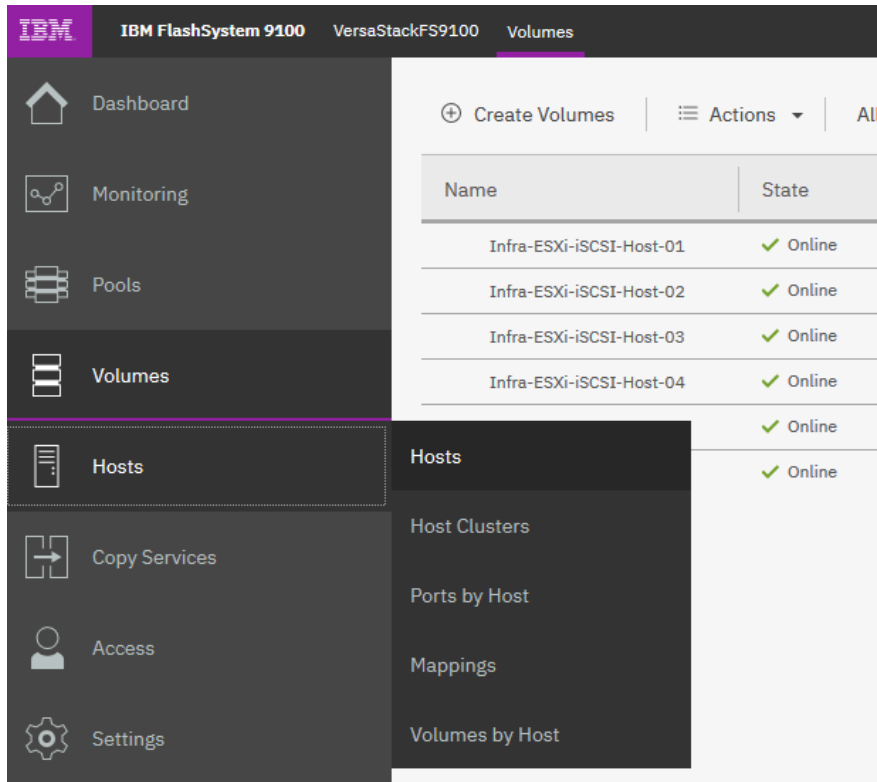

4. Review the summary and click Make Host Cluster

Create Host Cluster: Summary ×

An empty host cluster **VS-UCS01** will be created.

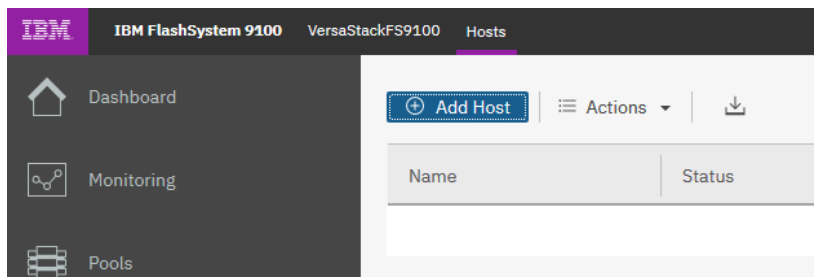

◀ Back

5. Click Hosts and then Hosts from the navigation menu.

For each ESXi host (Table 18), follow these steps on the IBM FS9100 system:

6. Click Add Host.

7. Select Fibre Channel (SCSI) . Add the name of the host to match the ESXi service profile name from Table 18 .
8. From the drop-down list, select both (Fabric A and B) WWPNs corresponding to the host in Table 15 .
9. Select the Host Cluster that we created in the previous step.

Add Host ✕

Host connections:

Host port (WWPN): ⊕ ⊖

⊕ ⊖

Optional Fields

Host type:

I/O groups:

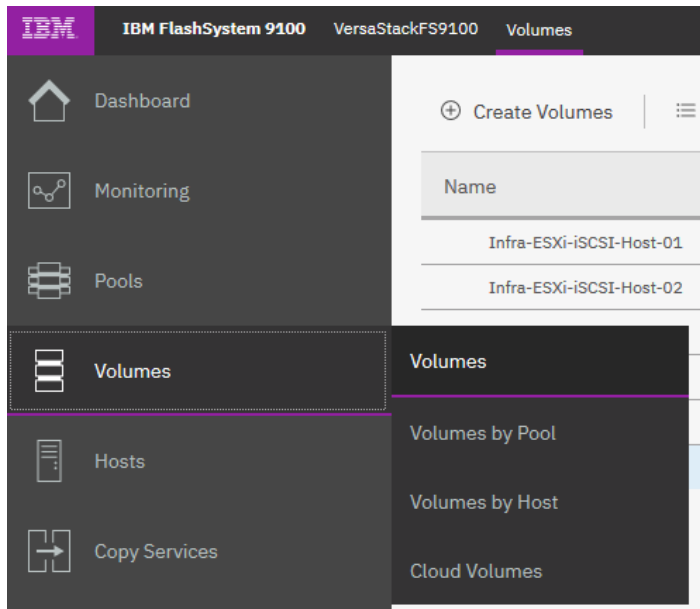

Host cluster:

10. Click Add.

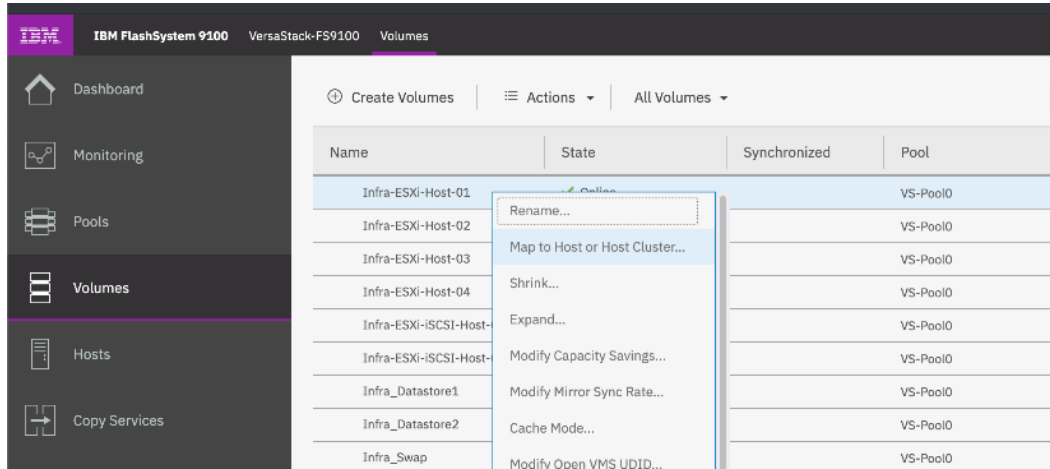

Map Volumes to Hosts and Host Cluster

To map volumes to hosts and host clusters, follow these steps:

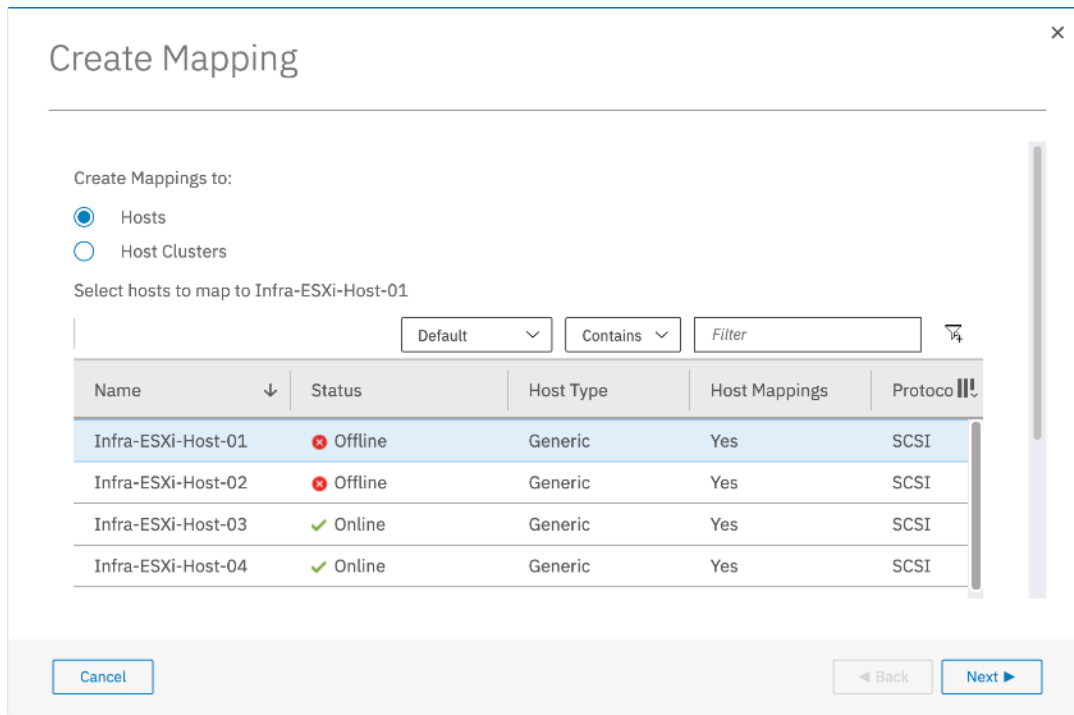

1. Click Volumes.

2. Right-click the Boot LUN for each ESXi host in turn and choose Map to Host.

3. Select the Hosts radio button and select the corresponding Host in the list and click Next.

4. Click Map Volumes and when the process is complete, click Close.

Map Volumes to Infra-ESXi-Host-01: Summary x

The following volumes will be mapped to Infra-ESXi-Host-01:

Name	SCSI ID	Caching I/O Group ID	New Mapping
Infra-ESXi-Host-01	0	0	New

Cancel

◀ Back

Map Volumes

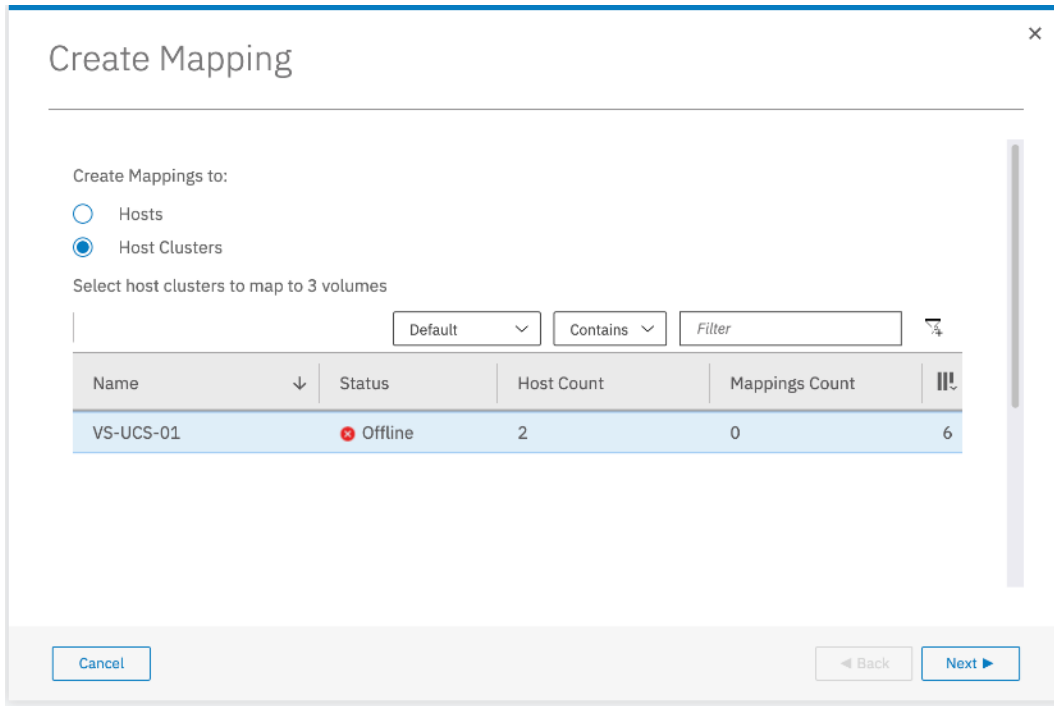

- Repeat above steps to map a Boot volume for each ESXi host in the cluster.
- When mapping shared volumes from Table 18 i.e. for shared VMFS datastores, right click on the volume in question (or select multiple volumes if mapping multiple LUNs) and select Map to Host or Host Cluster.

The screenshot shows a storage management interface with a table of volumes. The table has columns for Name, State, Synchronized, Pool, and Protocol Type. A context menu is open over the 'Infra_Datastore1' row, showing options like 'Rename...', 'Map to Host or Host Cluster...', 'Shrink...', 'Expand...', 'Modify Capacity Savings...', 'Modify Mirror Sync Rate...', 'Cache Mode...', 'Modify Open VMS UDID...', 'Remove Private Mappings...', 'View Mapped Hosts...', 'View Member MDisks...', 'Modify I/O Group...', and 'Cloud Volumes'.

RAW9	✓ Online			SCSI
RAW10	✓ Online			SCSI

Showing 42 volumes | Selecting 3 volumes (4.49 TiB)

- Select the Host Clusters radio button.

8. Review the summary and click Map Volumes to confirm.

9. Any Shared host cluster mappings will be automatically inherited by any future ESXi hosts which are defined as members of the host cluster.

VMware vSphere Setup for Cisco UCS Host Environment

VMware ESXi 6.7 U2

This section provides detailed instructions for installing VMware ESXi 6.7 U2 in the VersaStack UCS environment. After the procedures are completed, multiple ESXi hosts will be provisioned to host customer workloads.

Several methods exist for installing ESXi in a VMware environment. These procedures focus on how to use the built-in keyboard, video, mouse (KVM) console and virtual media features in Cisco UCS Manager to map remote installation media to individual servers and connect to their boot logical unit numbers (LUNs).

Log into Cisco UCS Manager

The IP KVM enables the administrator to begin the installation of the operating system (OS) through remote media. It is necessary to log into the UCS environment to run the IP KVM.

To log into the Cisco UCS environment, follow these steps:

1. Open a web browser and enter the IP address for the Cisco UCS cluster address. This step launches the Cisco UCS Manager application.
2. Under HTML, click the Launch UCS Manager link.
3. When prompted, enter `admin` as the user name and enter the administrative password.
4. To log in to Cisco UCS Manager, click Login.
5. From the main menu, click the Servers tab.
6. Select Servers > Service Profiles > root > Infra-ESXi-Host-01.

For iSCSI setup, the name of the profile will be Infra-ESXi-iSCSI-Host-0.1

7. Right-click `Infra-ESXi-Host-01` and select KVM Console.
8. If prompted to accept an Unencrypted KVM session, accept as necessary.
9. Open KVM connection to all the hosts by right-clicking the Service Profile and launching the KVM console
10. Boot each server by selecting Boot Server and clicking OK. Click OK again.

Install ESXi on the UCS Servers

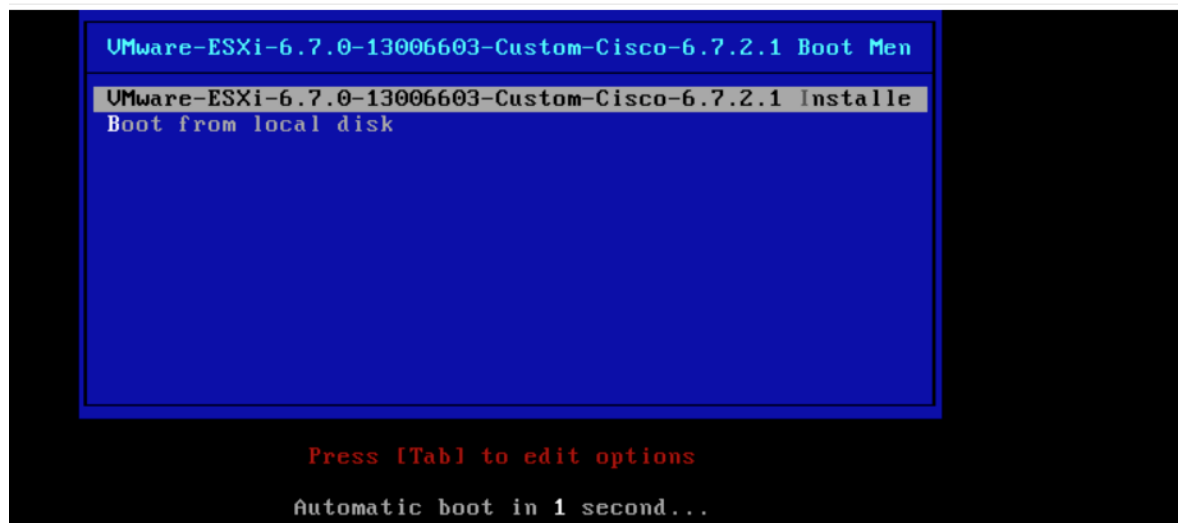

To install VMware ESXi to the boot LUN of the hosts, follow these steps on each host. The Cisco customer VMware ESXi image can be downloaded from:

<https://my.vmware.com/web/vmware/details?downloadGroup=OEM-ESXI67U2-CISCO&productId=742>

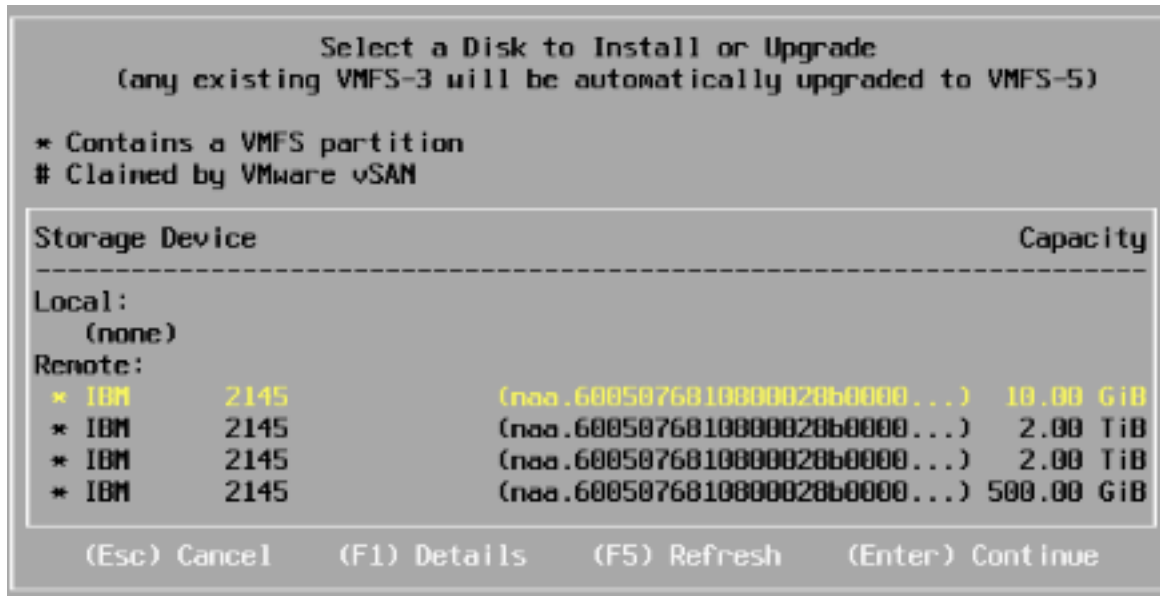

VMware ESXi will be installed on two Cisco UCS servers as part of the deployment covered in the following sections. The number of ESXi servers can vary based on the customer specific deployment.

1. In the KVM windows, click Virtual Media in the upper right of the screen.
2. Click Activate Virtual Devices.
3. If prompted to accept an Unencrypted KVM session, accept as necessary.
4. Click Virtual Media and select Map CD/DVD.
5. Browse to the ESXi installer ISO image file and click Open.
6. Click Map Device.
7. Click the KVM tab to monitor the server boot.
8. Reset the server by clicking Reset button. Click OK.
9. Select Power Cycle on the next window and click OK and OK again.
10. On reboot, the machine detects the presence of the boot LUNs (sample output below).
11. From the ESXi Boot Menu, select the ESXi installer.

12. After the installer has finished loading, press Enter to continue with the installation.
13. Read and accept the end-user license agreement (EULA). Press F11 to accept and continue.
14. Select the LUN that was previously set up and discovered as the installation disk for ESXi and press Enter to continue with the installation.

15. Select the appropriate keyboard layout and press Enter.
16. Enter and confirm the root password and press Enter.
17. The installer issues a warning that the selected disk will be repartitioned. Press F11 to continue with the installation.
18. After the installation is complete, press Enter to reboot the server.
19. Repeat the ESXi installation process for all the Service Profiles.

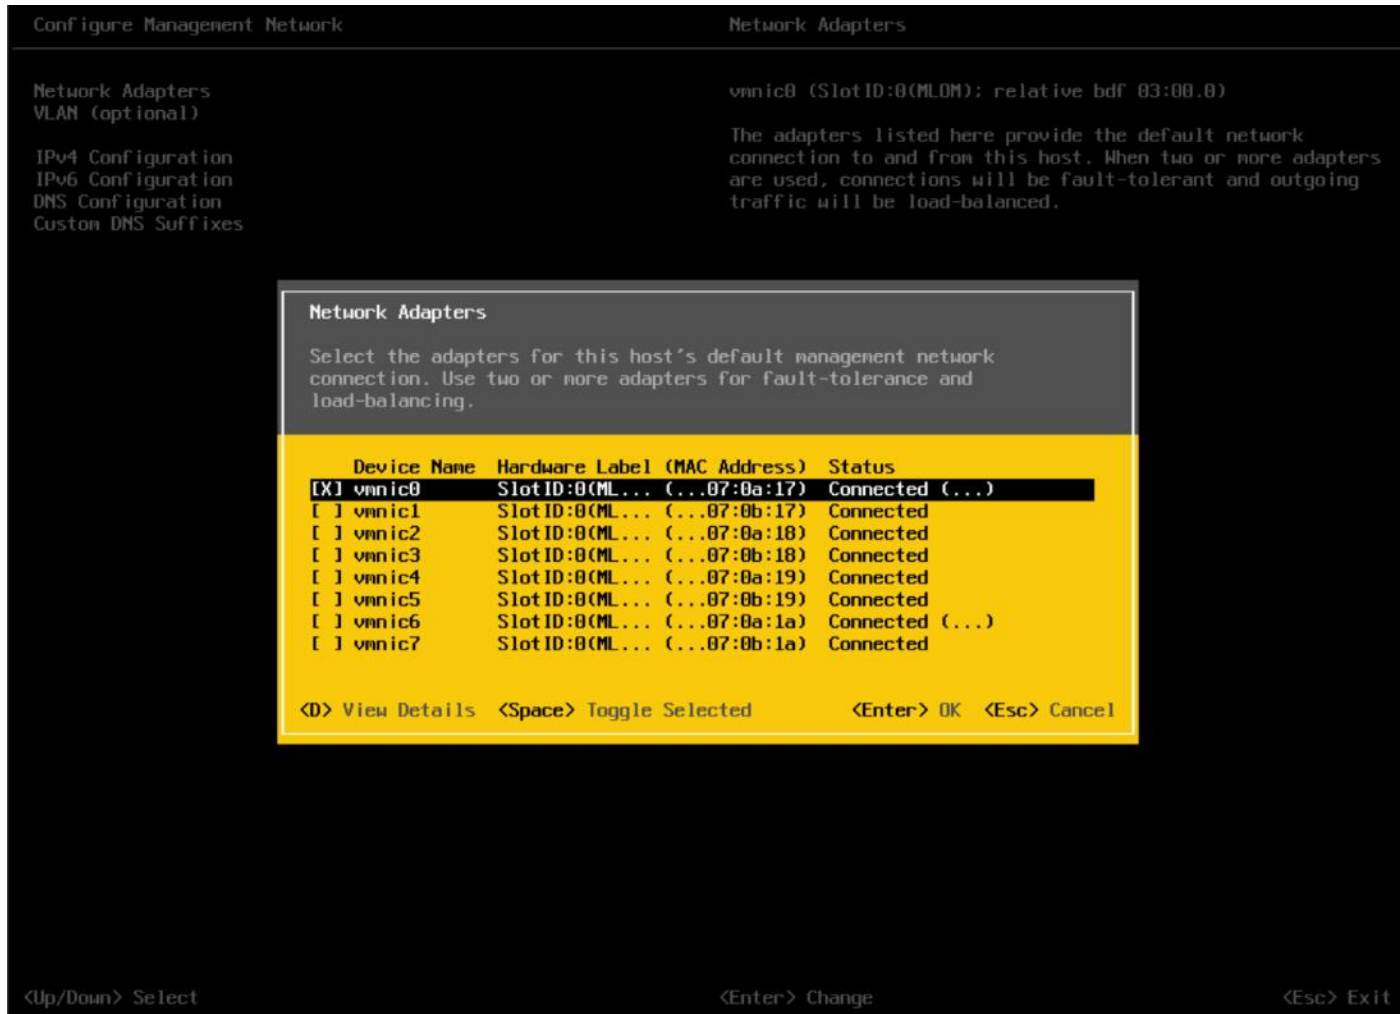

In this deployment, we used two UCS server blades for the VMware vSphere deployment.

Set Up Management Networking for ESXi Hosts

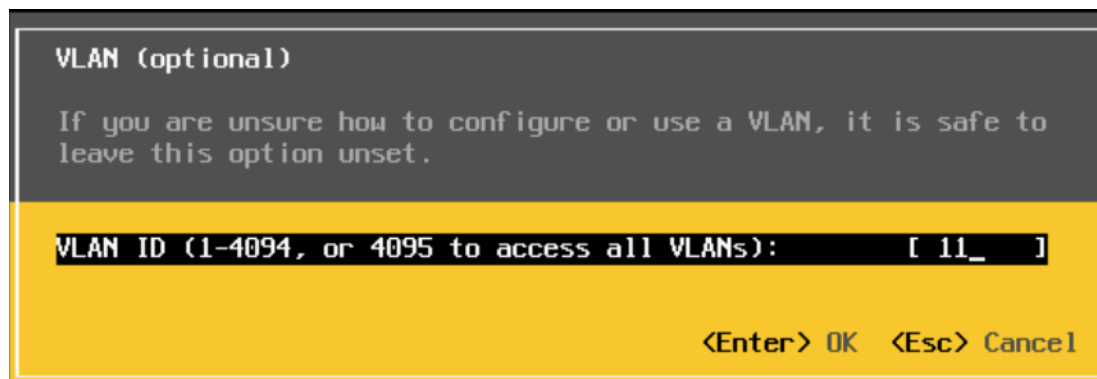

Adding a management network for each VMware host is necessary for managing the host. To add a management network for the VMware hosts, follow these steps on each ESXi host.

To configure the ESXi hosts with access to the management network, follow these steps:

1. After the server has finished post-installation rebooting, press F2 to customize the system.
2. Log in as root, enter the password chosen during the initial setup, and press Enter to log in.
3. Select the Configure Management Network option and press Enter.
4. Select Network Adapters
5. Select `vmnic0` (if it is not already selected) by pressing the Space Bar.

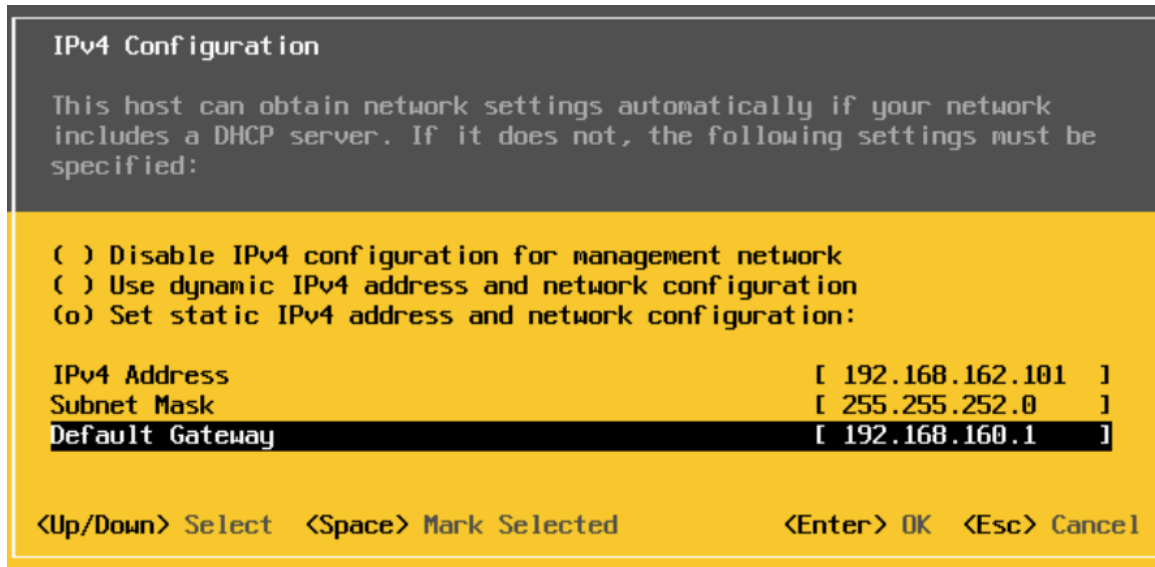

6. Press Enter to save and exit the Network Adapters window.
7. Select the VLAN (Optional) and press Enter.
8. Enter the <IB Mgmt VLAN> (11) and press Enter.

9. Select IPv4 Configuration and press Enter.

10. Select the Set Static IP Address and Network Configuration option by using the Space Bar.
11. Enter the IP address for managing the ESXi host.
12. Enter the subnet mask for the management network of the ESXi host.
13. Enter the default gateway for the ESXi host.

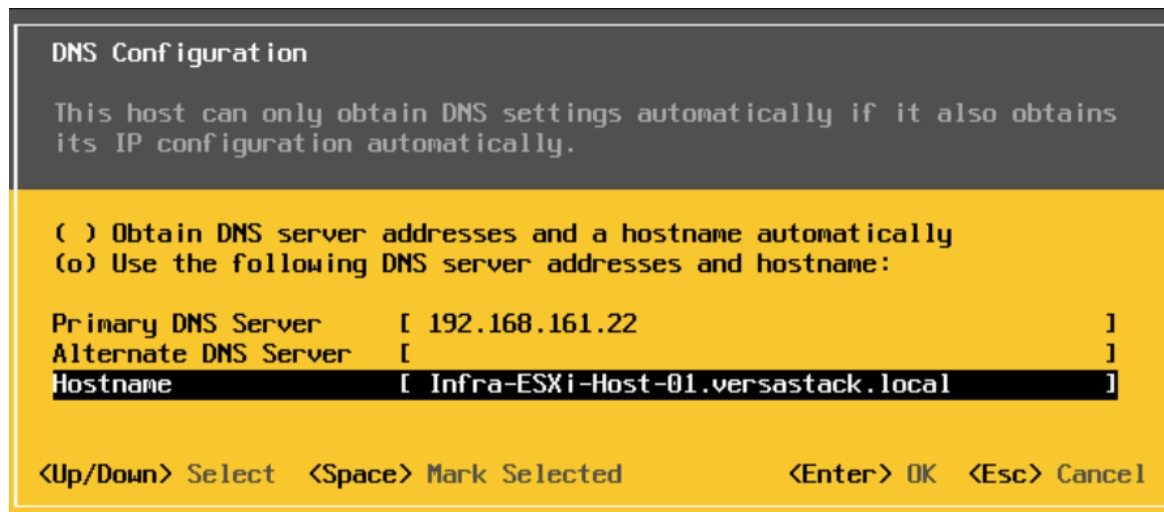

14. Press Enter to accept the changes to the IP configuration.
15. Select the IPv6 Configuration option and press Enter.
16. Using the Space Bar, select Disable IPv6 (restart required) and press Enter.
17. Select the DNS Configuration option and press Enter.

Because the IP address is assigned manually, the DNS information must also be entered manually.

18. Enter the IP address of the primary DNS server.
19. Optional: Enter the IP address of the secondary DNS server.
20. Enter the fully qualified domain name (FQDN) for the ESXi host.

21. Press Enter to accept the changes to the DNS configuration.
22. Press Esc to exit the Configure Management Network submenu.
23. Press Y to confirm the changes and reboot the host.
24. Repeat this procedure for all the ESXi hosts in the setup.

VMware vSphere Configuration

The vSphere configuration covered in this section is common to all the ESXi servers. In the procedure below, three shared datastores, two for hosting the VMs and another to host the VM swap files, will be mounted to all the ESXi servers. Customers can adjust the number and size of the shared datastores based on their particular deployments.

Log into VMware ESXi Hosts Using VMware vSphere Client

To log into the ESXi host using the VMware Host Client, follow these steps:

1. Open a web browser on the management workstation and navigate to the management IP address of the host.
2. Click Open the VMware Host Client.
3. Enter `root` for the user name.
4. Enter the root password configured during the installation process.
5. Click Login to connect.
6. Decide whether to join the VMware Customer Experience Improvement Program and click OK.
7. Repeat this process to log into all the ESXi hosts.

Install VMware Drivers for the Cisco Virtual Interface Card (VIC)

For the most recent versions, please refer to [Cisco UCS HW and SW Availability Interoperability Matrix](#). If a more recent driver is made available that is appropriate for VMware vSphere 6.7 U2, download and install the latest drivers.

To install VMware VIC Drivers on the ESXi hosts using esxcli, follow these steps:

1. Download and extract the following VIC Drivers to the Management workstation:

NFNIC Driver version 4.0.0.40:

<https://my.vmware.com/web/vmware/details?downloadGroup=DT-ESXi67-CISCO-NFNIC-40040&productId=742>

NENIC Driver version 1.0.29.0:

<https://my.vmware.com/web/vmware/details?downloadGroup=DT-ESXi67-CISCO-NENIC-10290&productId=742>

To install VIC Drivers on ALL the ESXi hosts, follow these steps:

1. From each Host Client, select Storage.
2. Right-click `datastore1` and select Browse.
3. In the Datastore browser, click Upload.
4. Navigate to the saved location for the downloaded VIC drivers and select `VMW-ESX-6.7.0-nenic-1.0.29.0-offline_bundle-12897497.zip`.
5. In the Datastore browser, click Upload.
6. Navigate to the saved location for the downloaded VIC drivers and select `VMW-ESX-6.7.0-nfnic-4.0.0.40-offline_bundle-14303978.zip`.
7. Click Open to upload the file to `datastore1`.
8. Make sure the file has been uploaded to both ESXi hosts.
9. Place each host into Maintenance mode if it isn't already.
10. Connect to each ESXi host through ssh from a shell connection or putty terminal.
11. Login as root with the root password.
12. Run the following commands on each host:

```
esxcli software vib update -d /vmfs/volumes/datastore1/VMW-ESX-6.7.0-nenic-1.0.29.0-offline_bundle-12897497.zip

esxcli software vib update -d /vmfs/volumes/datastore1/VMW-ESX-6.7.0-nfnic-4.0.0.40-offline_bundle-14303978.zip

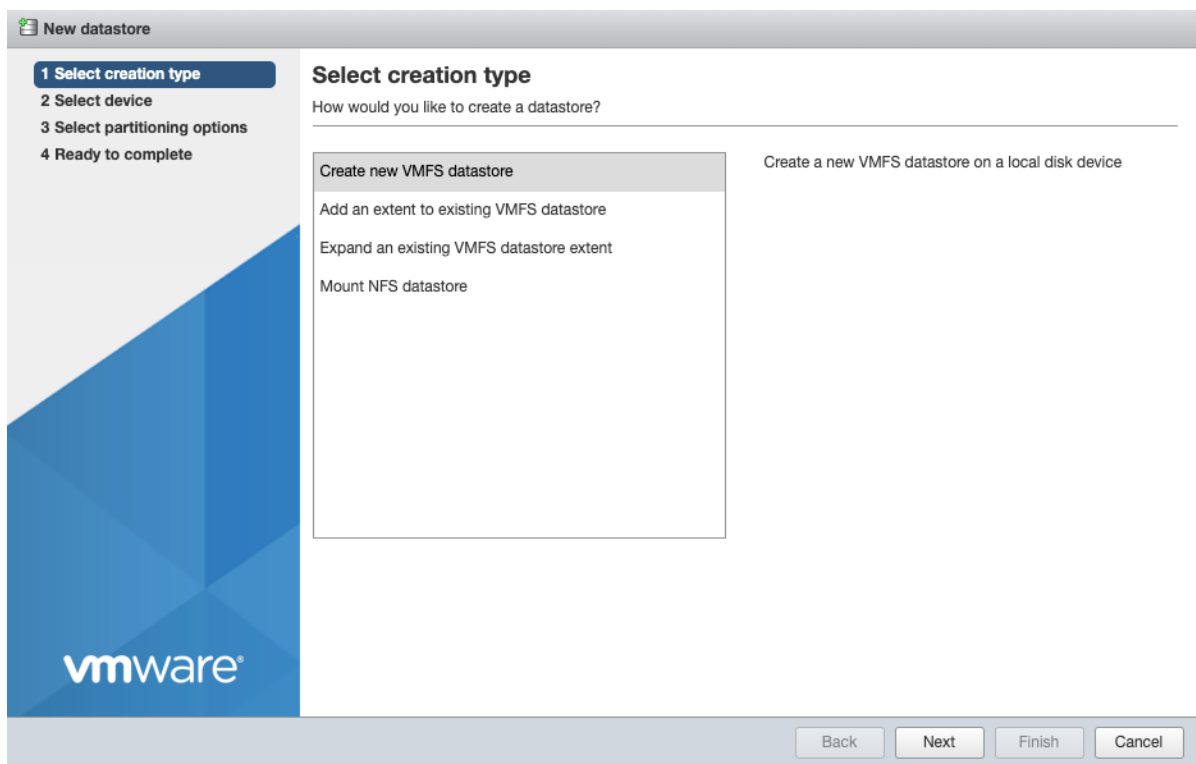

reboot
```

13. Log into the Host Client on each host once reboot is complete and exit Maintenance Mode.

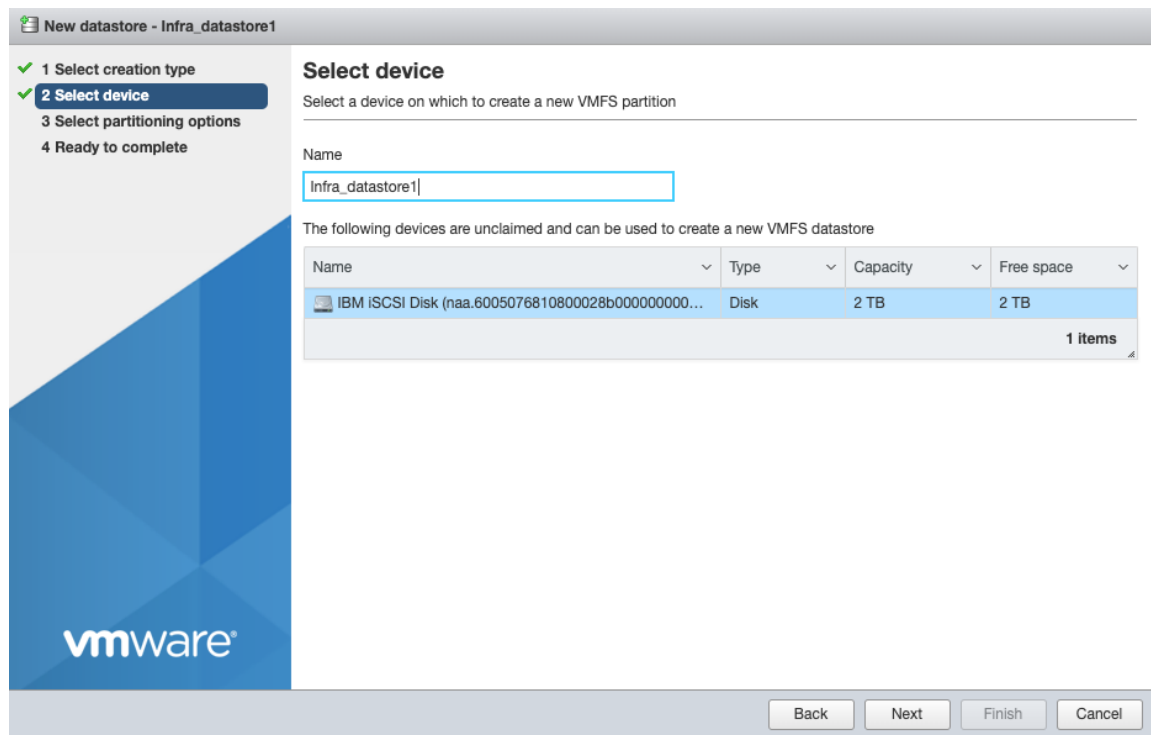

Mount Required Datastores

To mount the required datastores, follow these steps on each ESXi host:

1. From the Host Client, select Storage.
2. In the center pane, select the Datastores tab.
3. In the center pane, select New Datastore to add a new datastore.
4. In the New datastore popup, select Create new VMFS datastore.
5. Click Next.

6. Enter `Infra_datastore1` as the datastore name.
7. Verifying by using the size of the datastore LUN, select the LUN configured for VM hosting and click Next.

8. Accept default VMFS setting and Use full disk option to retain maximum available space.
9. Click Next
10. Verify the details and Click Finish.
11. In the center pane, select the Datastores tab.
12. In the center pane, select New Datastore to add a new datastore.
13. In the New datastore popup, select Create new VMFS datastore.
14. Click Next.
15. Enter `Infra_datastore2` as the datastore name.
16. Verifying by using the size of the datastore LUN, select the LUN configured for VM hosting and click Next.
17. Accept default VMFS setting and Use full disk option to retain maximum available space.
18. Click Next
19. Verify the details and Click Finish.
20. In the center pane, select the Datastores tab.
21. In the center pane, select New Datastore to add a new datastore.
22. In the New datastore popup, select Create new VMFS datastore.

23. Click Next.
24. Enter `Infra_swap` as the datastore name.
25. Verifying by using the size of the datastore LUN, select the LUN configured for VM hosting and click Next.
26. Accept default VMFS setting and Use full disk option to retain maximum available space.
27. Click Next
28. Verify the details and Click Finish.
29. The storage configuration should look similar to figure shown below.
30. Repeat these steps on all the ESXi hosts.

The screenshot shows the vSphere Storage configuration interface for host 'Infra-ESXi-Host-01.versastack.local'. The 'Datastores' tab is active, displaying a table with the following data:

Name	Drive Type	Capacity	Provisioned	Free	Type
datastore1	Non-SSD	2.5 GB	1.41 GB	1.09 GB	VMFS6
Infra_datastore1	Non-SSD	2 TB	815.34 GB	1.2 TB	VMFS6
Infra_datastore2	Non-SSD	2 TB	1.01 TB	1,015.83 GB	VMFS6
Infra_swap	Non-SSD	499.75 GB	76.13 GB	423.62 GB	VMFS6

Configure NTP on ESXi Hosts

To configure NTP on the ESXi hosts, follow these steps on each host:

1. From the Host Client, select Manage.
2. In the center pane, select Time & date.
3. Click Edit settings.
4. Make sure Use Network Time Protocol (enable NTP client) is selected.
5. Use the drop-down to select Start and stop with host.
6. Enter the NTP addresses in the NTP servers box separated by a comma, Nexus switch addresses can be entered if NTP service is configured on the switches.

Edit time configuration

Specify how the date and time of this host should be set.

Manually configure the date and time on this host

09/14/2019 10:46 AM

Use Network Time Protocol (enable NTP client)

NTP service startup policy	Start and stop manually ▼
NTP servers	<div style="border: 1px solid #add8e6; padding: 2px;">192.168.162.128, 192.168.162.129</div> <p style="font-size: small; margin-top: 5px;">Separate servers with commas, e.g. 10.31.21.2, fe00::2800</p>

7. Click Save to save the configuration changes.
8. Select Actions > NTP service > Start.
9. Verify that NTP service is now running and the clock is now set to approximately the correct time.

The NTP server time may vary slightly from the host time.

Move VM Swap File Location

To move the VM swap file location, follow these steps on each ESXi host:

1. From the Host Client, select Manage.
2. In the center pane, select Swap.
3. Click Edit settings.
4. Use the drop-down list to select `Infra_swap`. Leave all other settings unchanged.

Edit swap configuration	
Enabled	<input checked="" type="radio"/> Yes <input type="radio"/> No
Datastore	Infra_swap
Local swap enabled	<input checked="" type="radio"/> Yes <input type="radio"/> No
Host cache enabled	<input checked="" type="radio"/> Yes <input type="radio"/> No

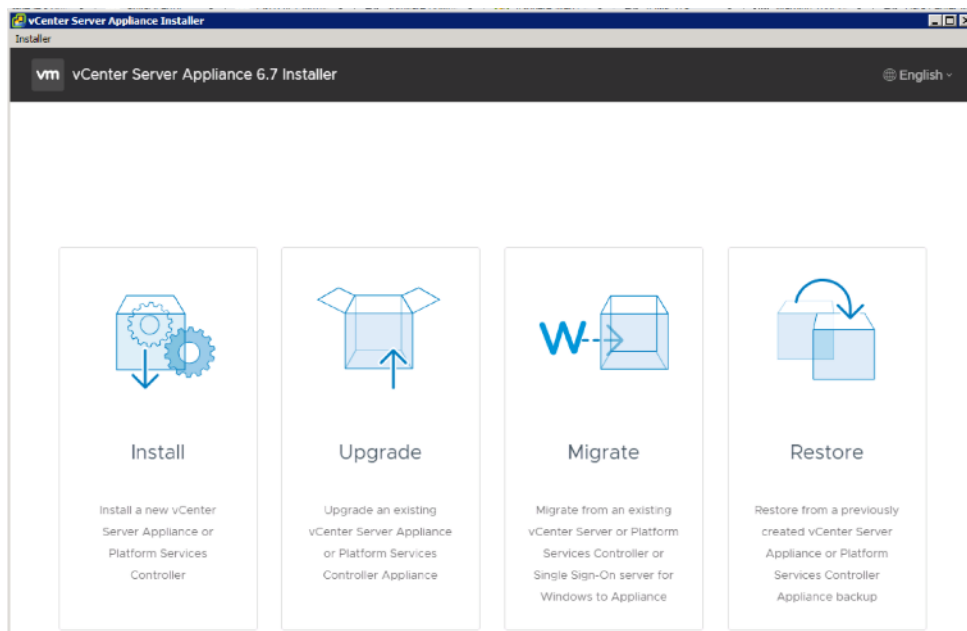

Save Cancel

5. Click Save to save the configuration changes.

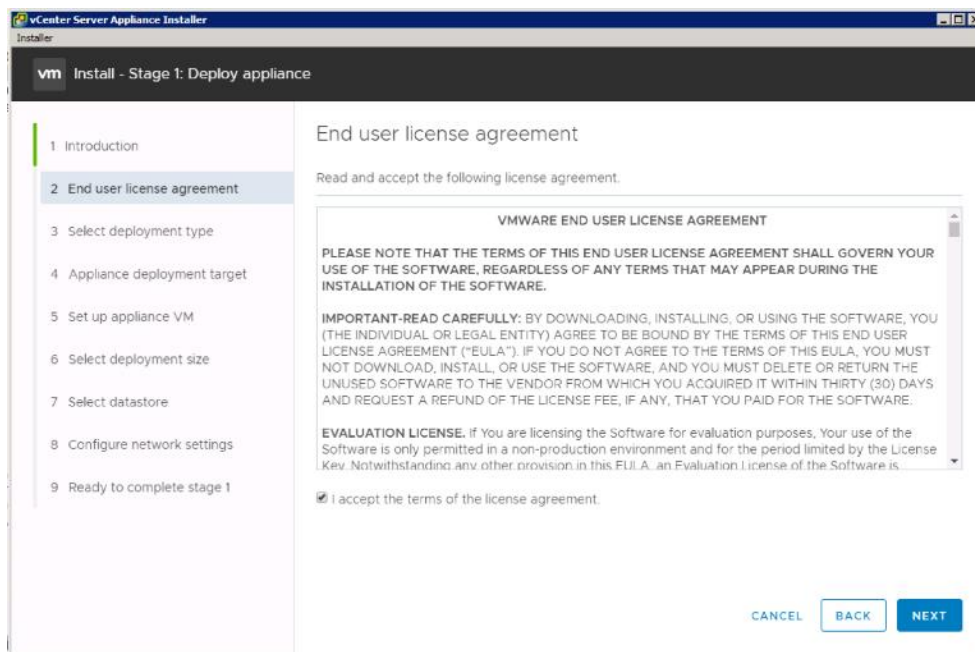

Deploy VMware vCenter Appliance 6.7 (Optional)

The VCSA deployment consists of 2 stages: install and configuration. To build the VMware vCenter virtual machine, follow these steps:

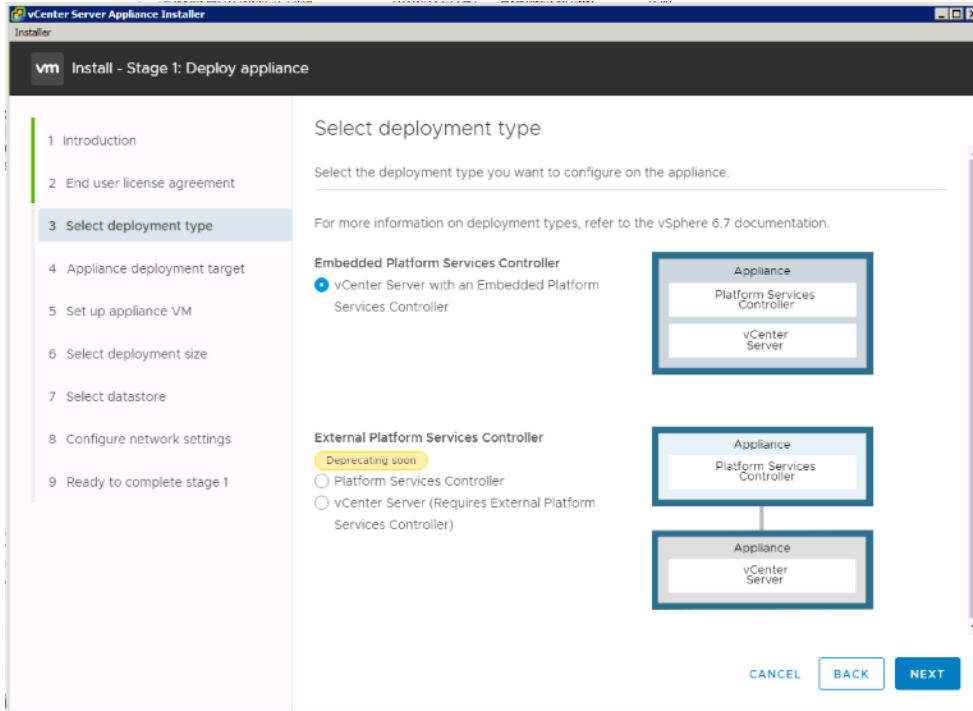

1. Download the VCSA ISO from VMware at <https://my.vmware.com/group/vmware/details?downloadGroup=VC67U2C&productId=742&rPid=35624>
2. Using ISO mounting software, mount the ISO image as a disk on the management workstation. (For example, with the Mount command in Windows Server 2012).
3. In the mounted disk directory, navigate to the vcsa-ui-installer > win32 directory and double-click installer.exe. The vCenter Server Appliance Installer wizard appears.

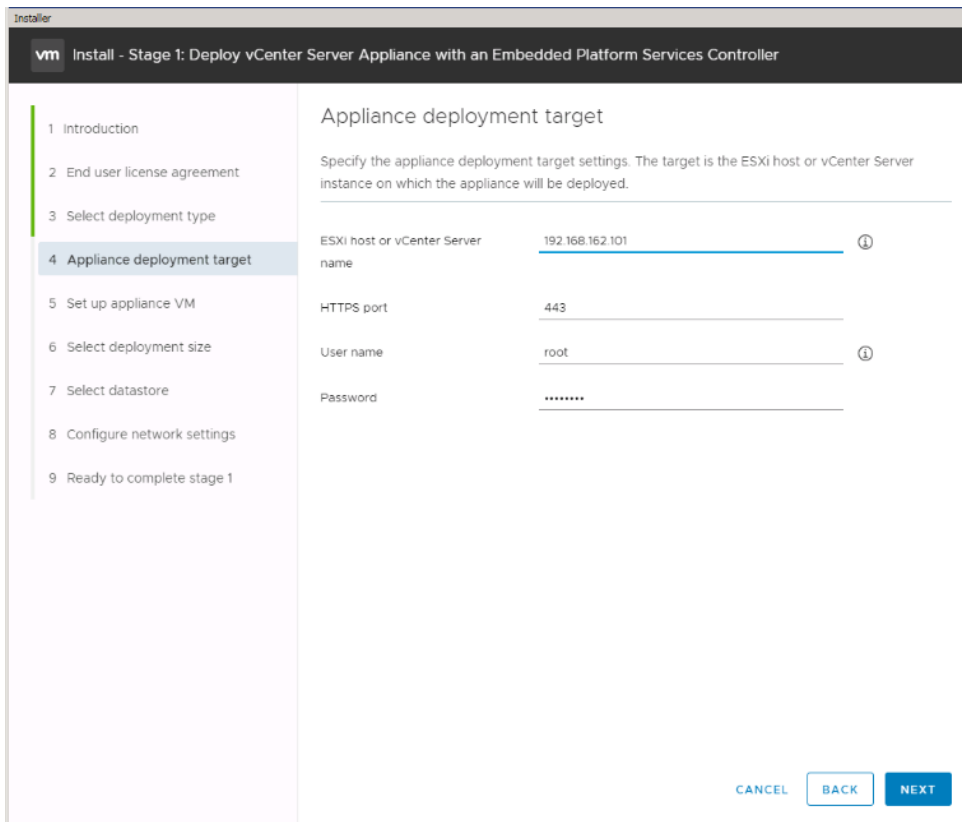

4. Click Install to start the vCenter Server Appliance deployment wizard.
5. Click Next in the Introduction section.
6. Read and accept the license agreement and click Next.

7. In the “Select deployment type” section, select vCenter Server with an Embedded Platform Services Controller and click Next.

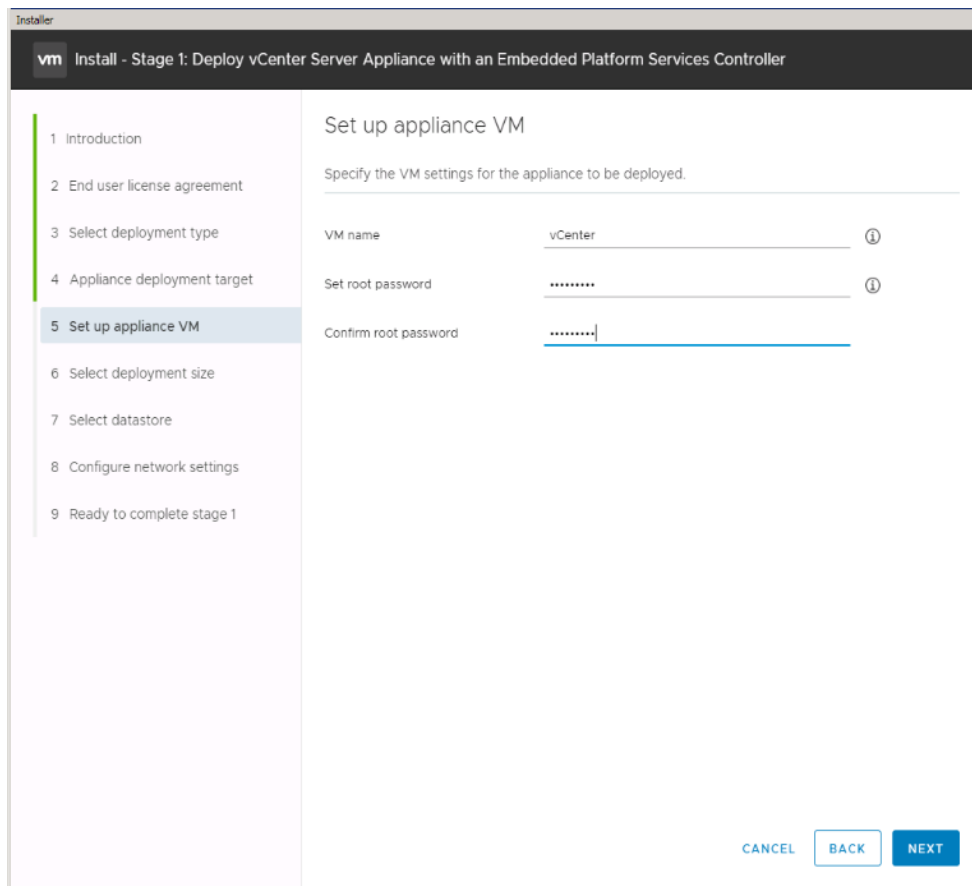

8. In the “Appliance deployment target”, enter the ESXi host name or IP address for the first configured VSI host, User name and Password. Click Next.

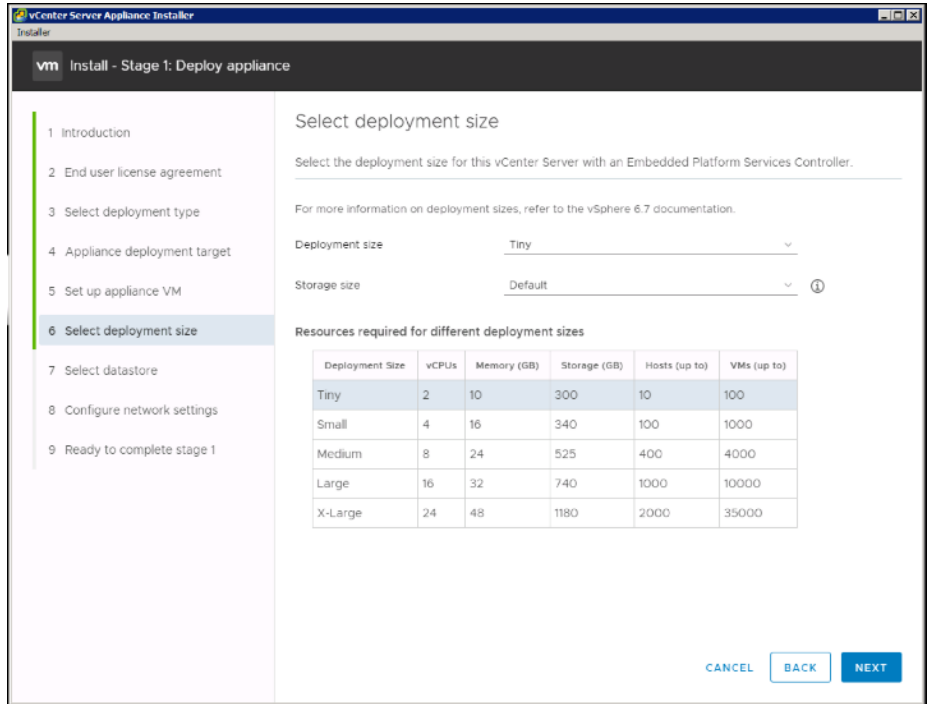

9. Click Yes to accept the certificate.

10. Enter the Appliance name and password details in the “Set up appliance VM” section. Click Next.

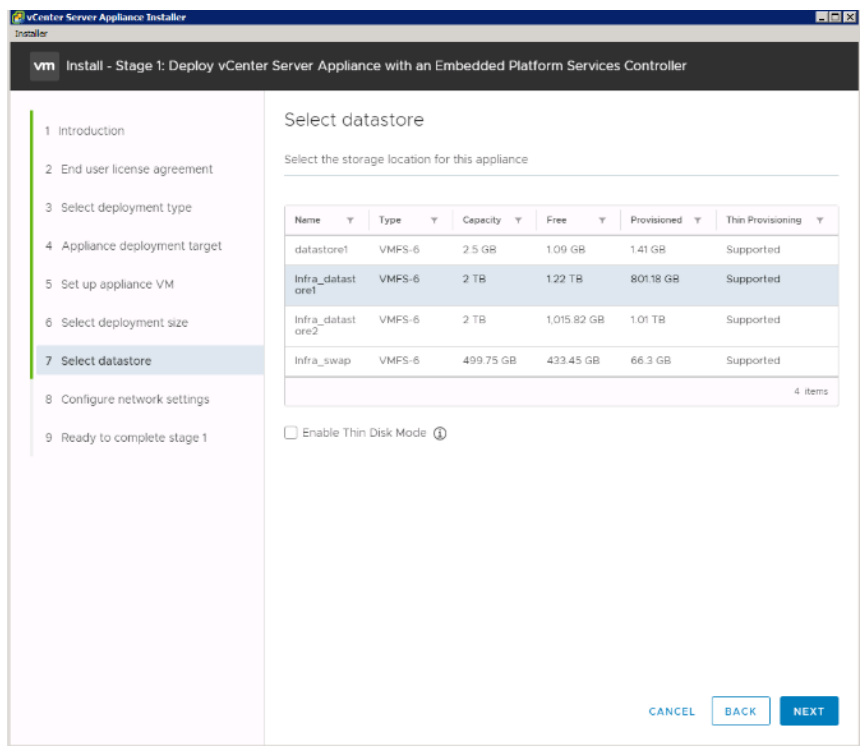

11. In the “Select deployment size” section, Select the deployment size and Storage size. For example, “Tiny” Deployment size was selected in this CVD.

12. Click Next.

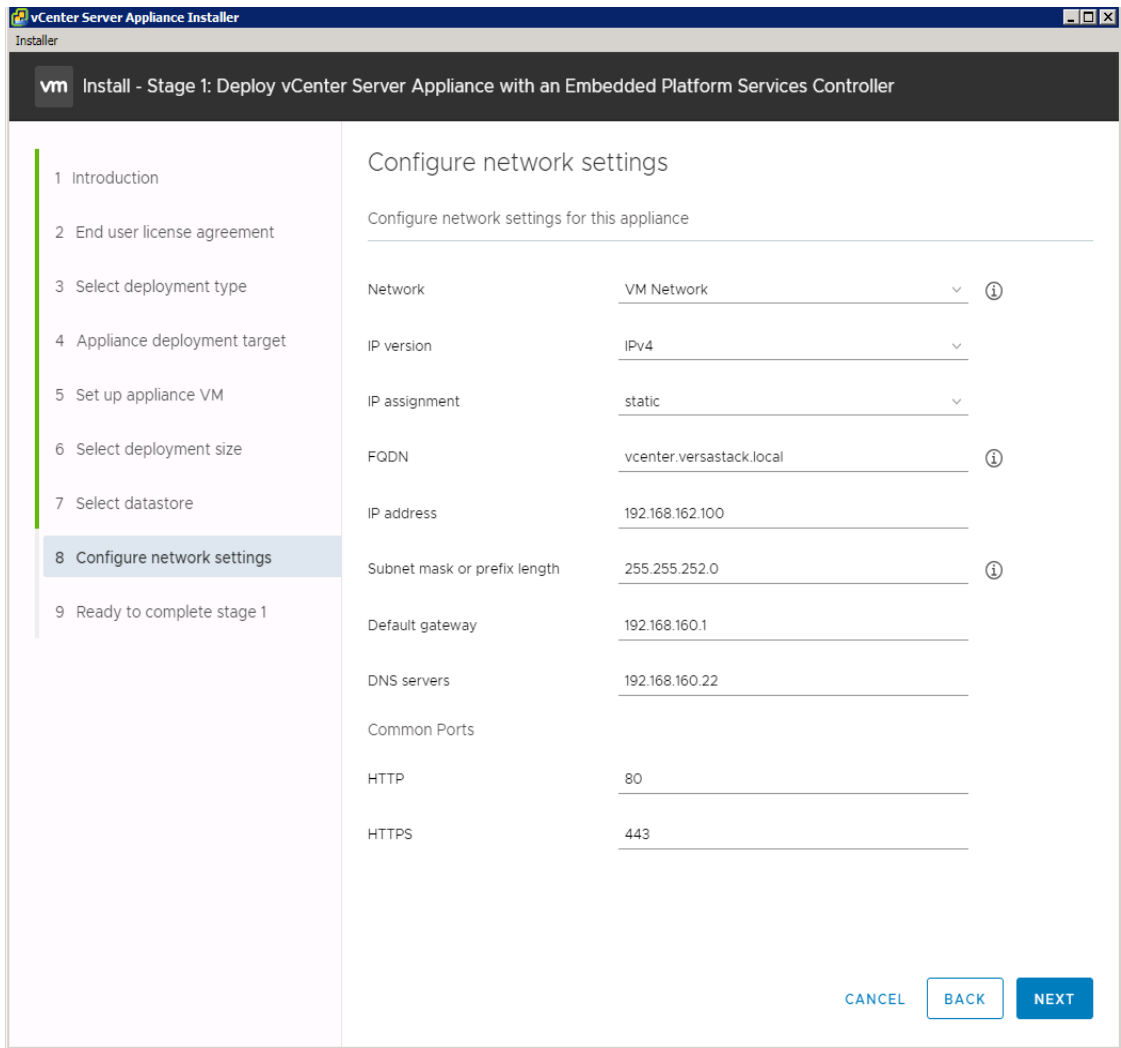

13. Select preferred datastore e.g. the "Infra_datastore1" was created previously.

14. Click Next.

15. In the "Network Settings" section, configure the following settings:

- a. Choose a Network: VM Network
- b. IP version: IPV4
- c. IP assignment: static
- d. System name: <vcenter-fqdn> (optional)
- e. IP address: <vcenter-ip>
- f. Subnet mask or prefix length: <vcenter-subnet-mask>
- g. Default gateway: <vcenter-gateway>
- h. DNS Servers: <dns-server>

- 16. Click Next.
- 17. Review all values and click Finish to complete the installation.
- 18. The vCenter appliance installation will take a few minutes to complete.
- 19. Click Continue to proceed with stage 2 configuration.

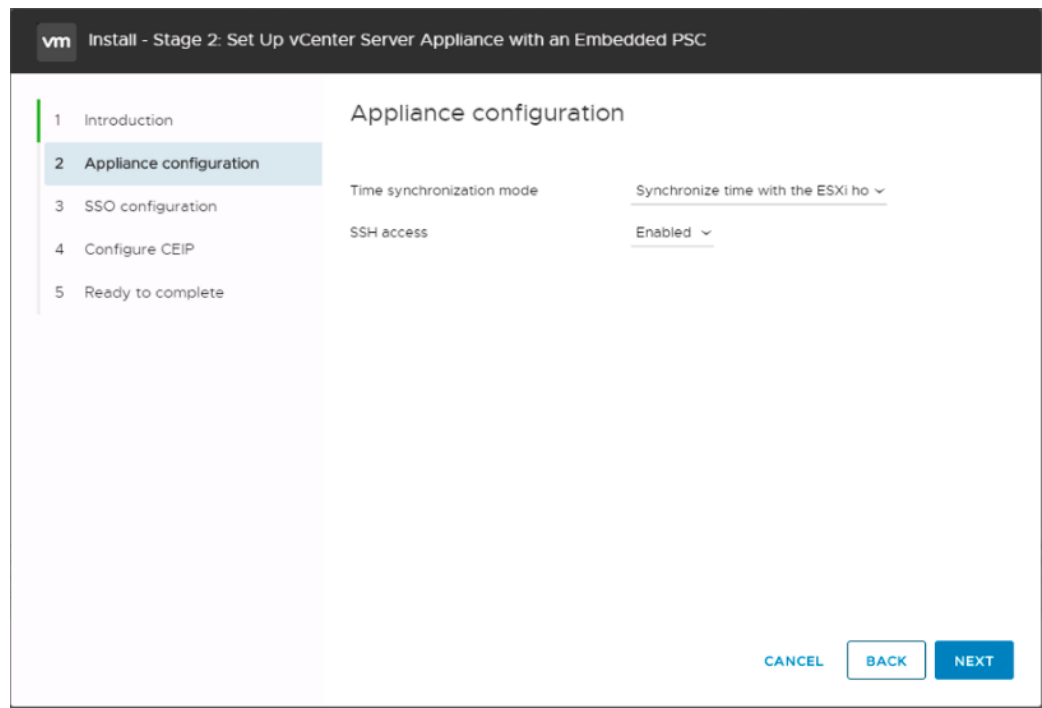

20. Click Next.

21. In the Appliance Configuration, configure the below settings:

- a. Time Synchronization Mode: Synchronize time with the ESXi host.

 **Since the ESXi host has been configured to synchronize the time with an NTP server, vCenter time can be synced to ESXi host. Customer can choose a different time synchronization setting.**

- b. SSH access: Enabled.

22. Click Next.

23. Complete the SSO configuration as shown below.

24. Click Next.

25. If preferred, select Join the VMware's Customer Experience Improvement Program (CEIP).

26. Click Next.

27. Review the configuration and click Finish.

28. Click OK.

29. Make note of the access URL shown in the completion screen.

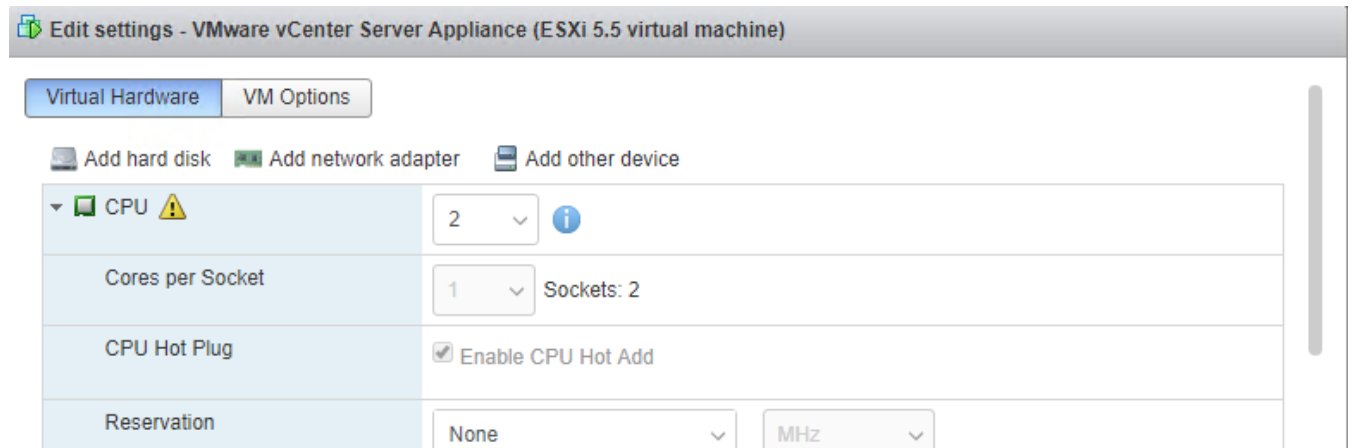

30. Click Close.

Adjust vCenter CPU Settings

If a vCenter deployment size of Small or larger was selected in the vCenter setup, it is possible that the VCSA's CPU setup does not match the UCS server CPU hardware configuration. Cisco UCS B200 and C220 servers are 2-socket servers. In this validation, the Small deployment size was selected and vCenter was setup for a 4-socket server. This setup will cause issues in the VMware ESXi cluster Admission Control. To resolve the Admission Control issue, follow these steps:

1. Open a web browser on the management workstation and navigate to the `Infra-esxi-host-01` management IP address.
2. Click Open the VMware Host Client.
3. Enter root for the user name.
4. Enter the root password.

5. Click Login to connect.
6. In the center pane, right-click the vCenter VM and select Edit settings.
7. In the Edit settings window, expand CPU and check the value of Sockets is not greater than 2.

8. If the number of Sockets is greater than 2, it will need to be adjusted. Click Cancel.
9. If the number of Sockets needs to be adjusted:
10. Right-click the vCenter VM and select Guest OS > Shut down. Click Yes on the confirmation.
11. Once vCenter is shut down, right-click the vCenter VM and select Edit settings.
12. In the Edit settings window, expand CPU and change the Cores per Socket value to make the Sockets value 2.
13. Click Save.
14. Right-click the vCenter VM and select Power > Power on. Wait approximately 10 minutes for vCenter to come up.

Set Up VMware vCenter Server

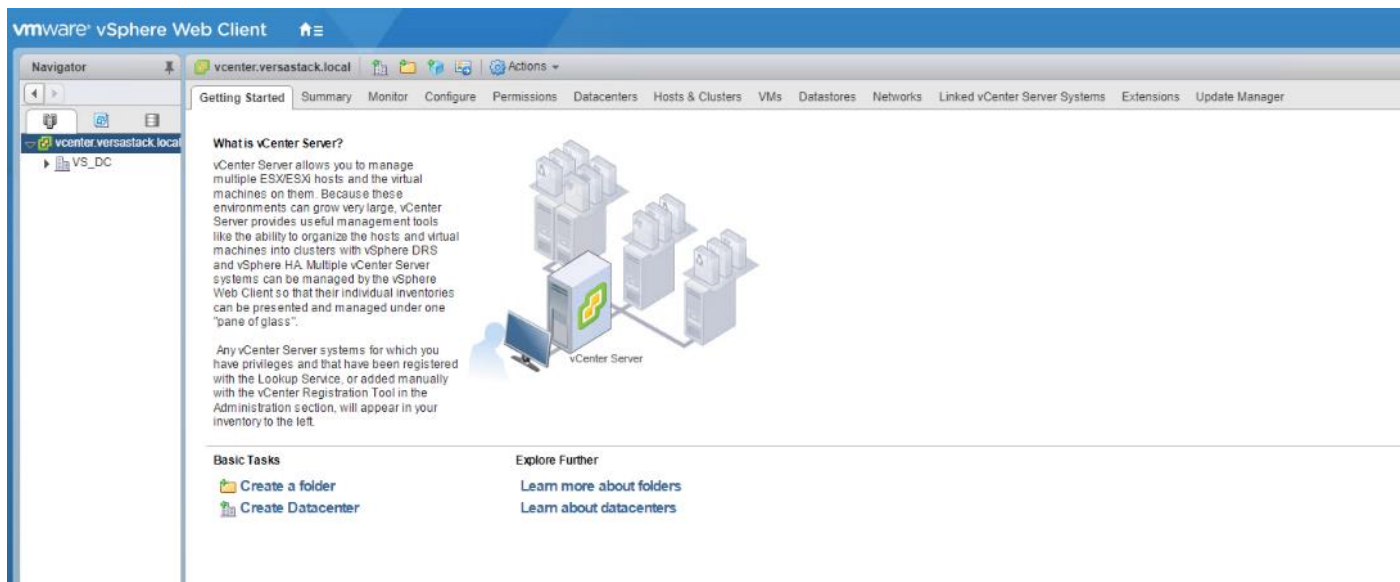

To setup the VMware vCenter Server, follow these steps:

1. Using a web browser, navigate to <https://<vcenter-ip>/vsphere-client>.

The VMware vSphere HTML5 Client is fully featured in vSphere 6.7U2 and can be used for setting up the vCenter if preferred by the customer. However, the Web Client is used in this document.

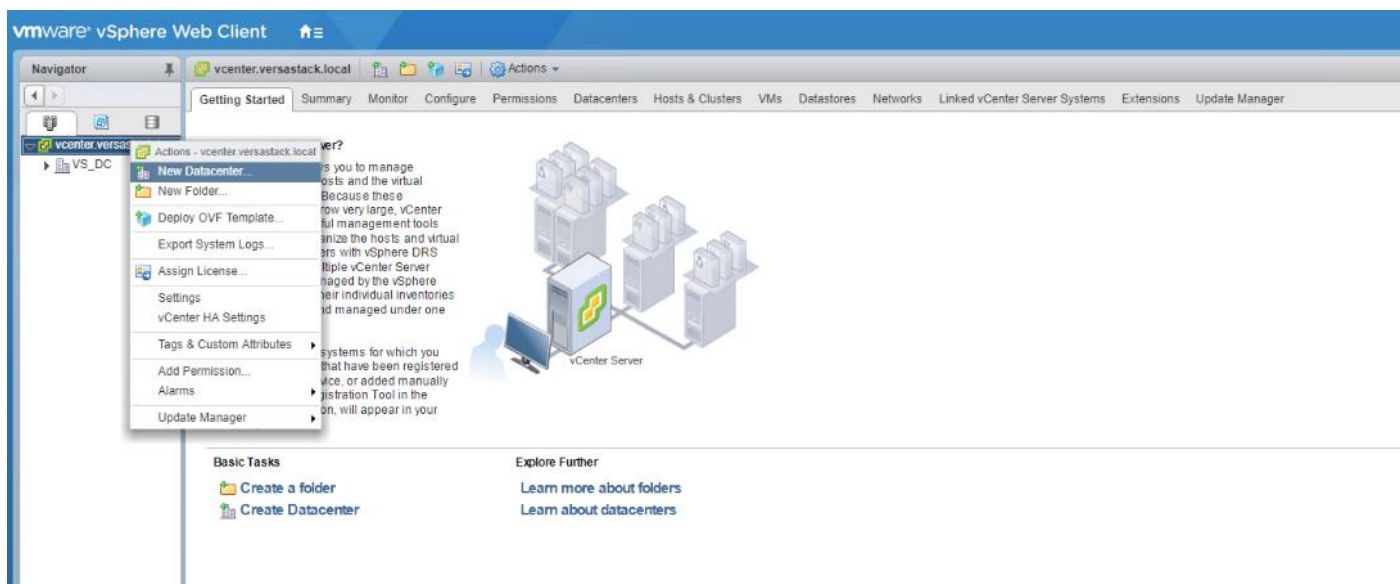

2. If the link is available, click Download Enhanced Authentication Plugin. Install the same by double-clicking the downloaded file.
3. Log in using the Single Sign-On username (administrator@vsphere.local) and password created during the vCenter installation.

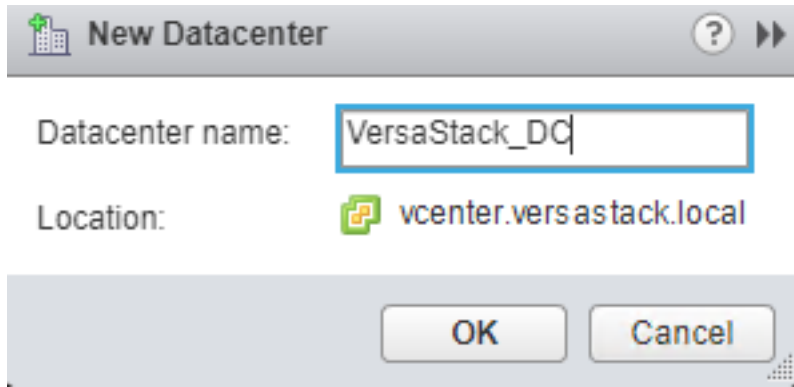

Setup Data Center, Cluster, DRS and HA for ESXi Nodes

If a new data center is needed for the VersaStack, follow these steps on the vCenter:

1. Connect to the vSphere Web Client and click Hosts and Clusters from the left side Navigator window or the Hosts and Clusters icon from the Home center window
2. From Hosts and Clusters:
3. Right-click the vCenter icon and from the drop-down list select New Datacenter.

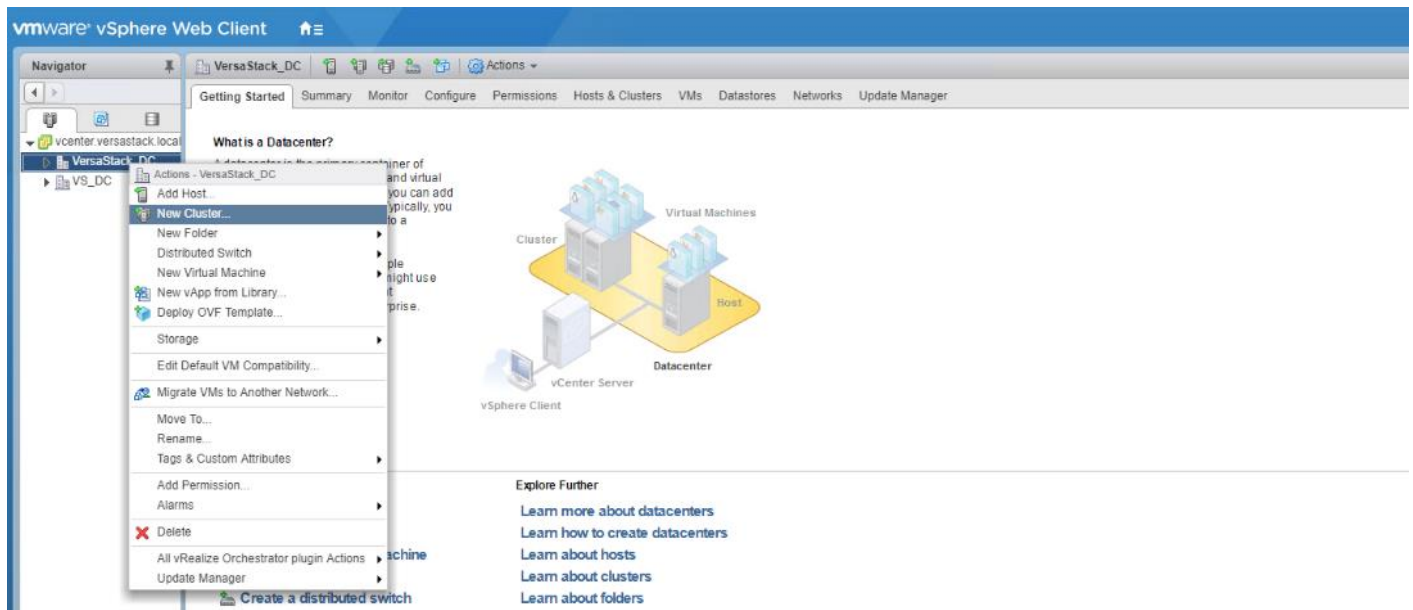

4. From the New Datacenter pop-up dialogue enter in a Datacenter name and click OK.

Add the VMware ESXi Hosts Using the VMware vSphere Web Client

To add the VMware ESXi Hosts using the VMware vSphere Web Client, follow these steps:

1. From the Hosts and Clusters tab, right-click the new or existing Datacenter within the Navigation window, and from the drop-down list select New Cluster.

2. Enter a name for the new cluster, select the DRS and HA checkmark boxes, leaving all other options with defaults.

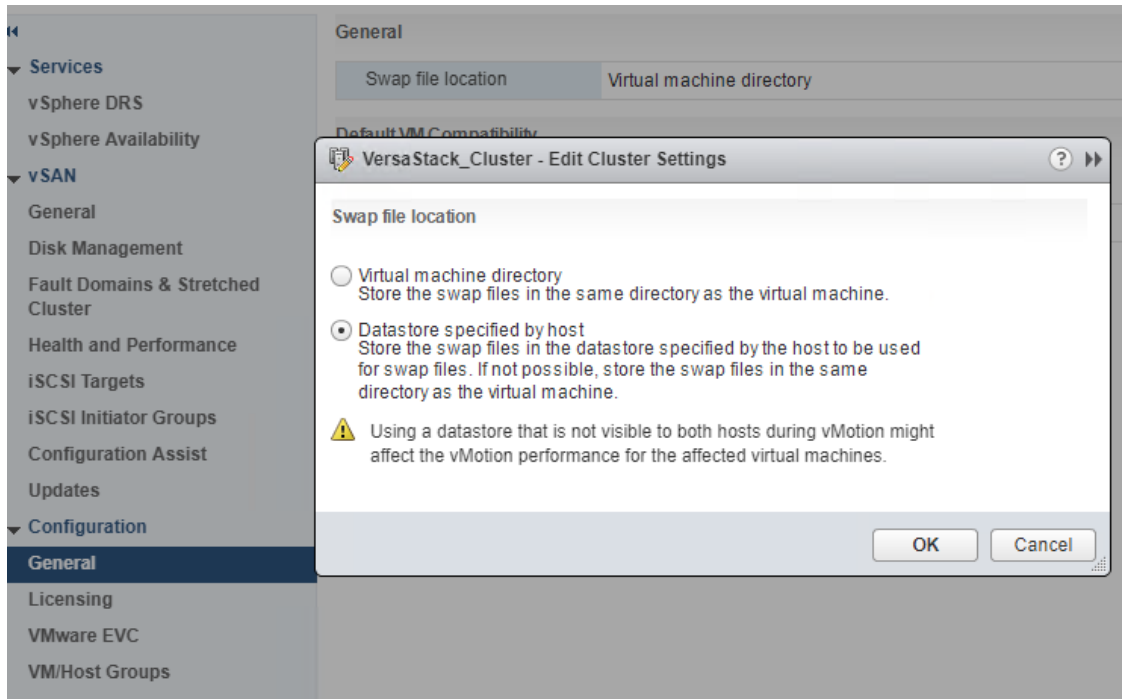

New Cluster	
Name	VersaStack_Cluster
Location	VersaStack_DC
DRS	<input checked="" type="checkbox"/> Turn ON
Automation Level	Fully automated
Migration Threshold	Conservative ——— Aggressive
vSphere HA	<input checked="" type="checkbox"/> Turn ON
Host Monitoring	<input checked="" type="checkbox"/> Enable host monitoring
Admission Control	<input checked="" type="checkbox"/> Enable admission control
VM Monitoring	
VM Monitoring Status	Disabled Overrides for individual VMs can be set from the VM Overrides page from Manage Settings area.
Monitoring Sensitivity	Low ——— High
EVC	Disable
vSAN	<input type="checkbox"/> Turn ON

OK Cancel

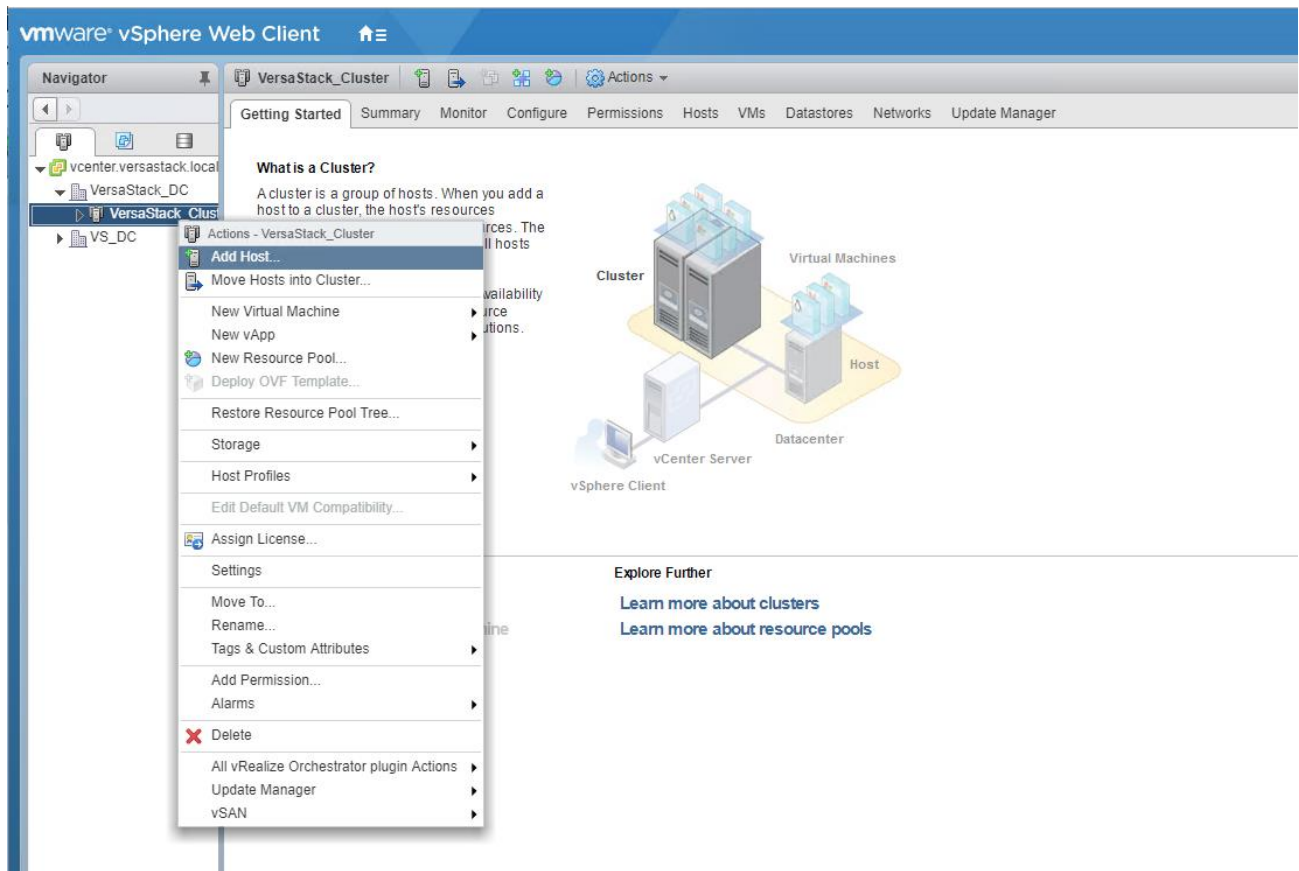

If mixing Cisco UCS B or C-Series M2, M3 or M4 servers within a vCenter cluster, it is necessary to enable VMware Enhanced vMotion Compatibility (EVC) mode. For more information about setting up EVC mode, refer to [Enhanced vMotion Compatibility \(EVC\) Processor Support](#).

3. Click OK to create the cluster.
4. Expand "VersaStack_DC".
5. Right-click "VersaStack_Cluster" and select Settings.
6. Select Configuration > General in the list and select Edit to the right of General.
7. Select Datastore specified by host and click OK.

8. Right-click the newly created cluster and from the drop-down list select the Add Host.

9. Enter the IP or FQDN of the first ESXi host and click Next.

Add Host

Enter the name or IP address of the host to add to vCenter Server.

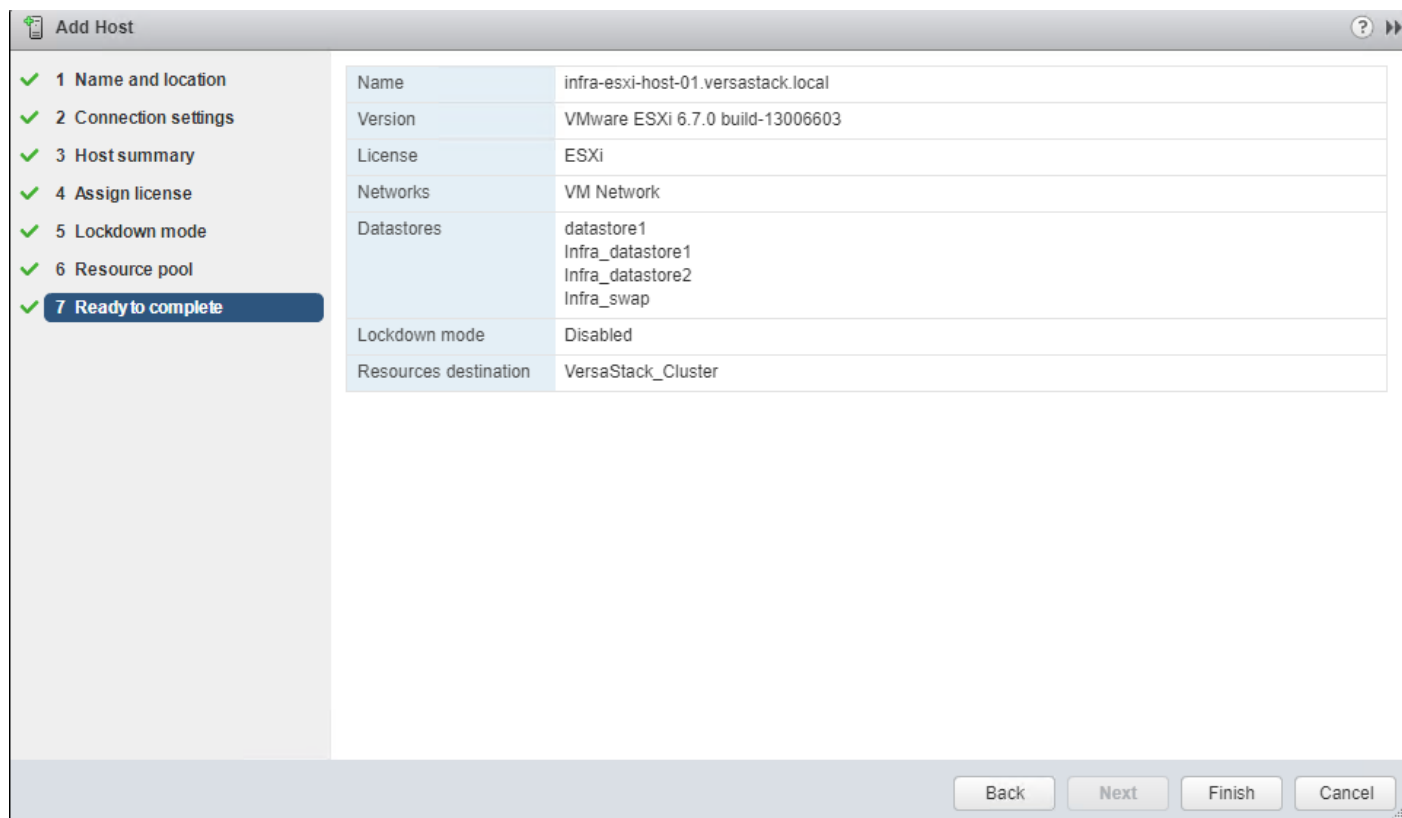

Host name or IP address:

Location:

Type:

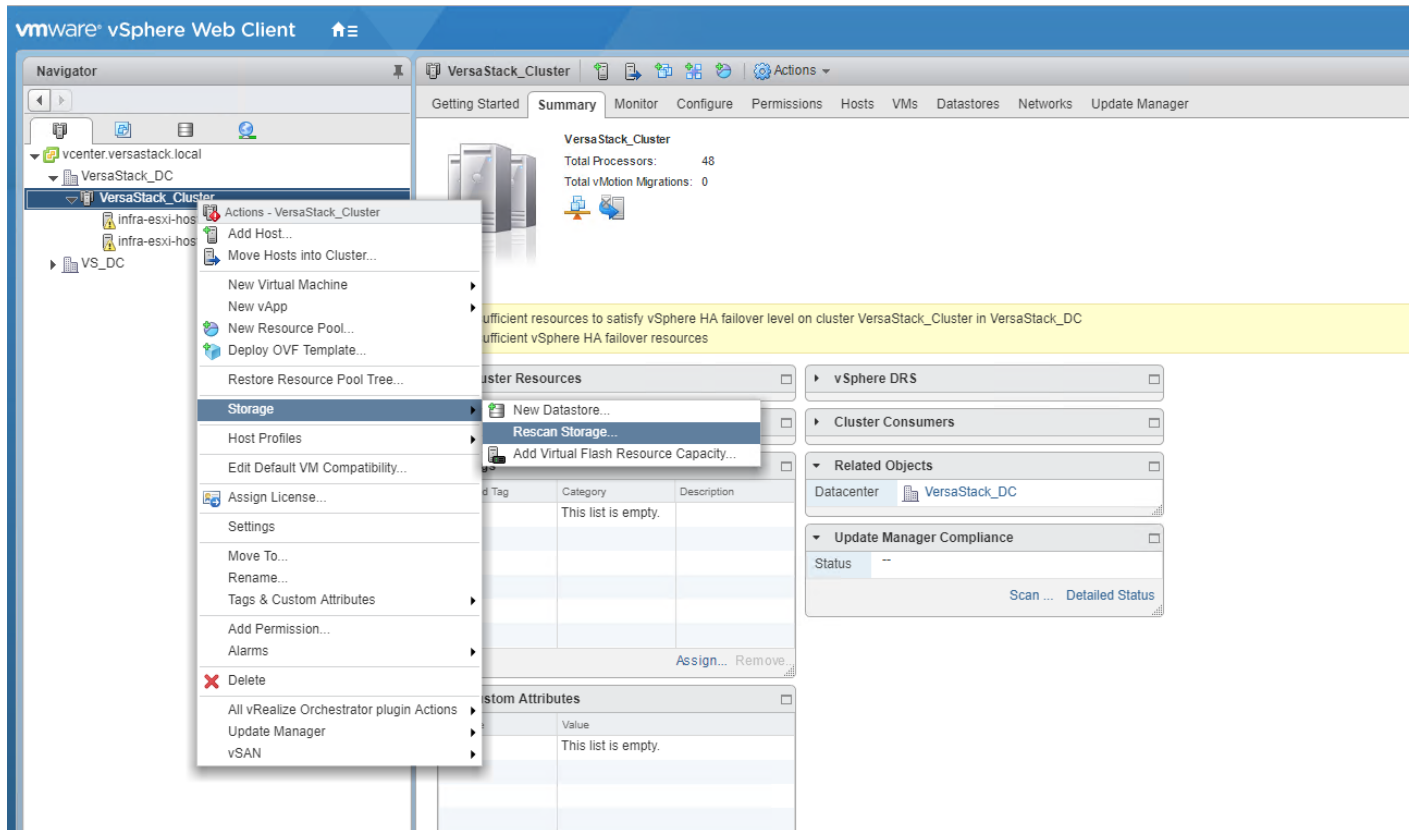

Back Next Finish Cancel

10. Enter root for the User Name, provide the password set during initial setup and click Next.
11. Click Yes in the Security Alert pop-up to confirm the host's certificate.
12. Click Next past the Host summary dialogue.
13. Provide a license by clicking the green + icon under the License title, select an existing license, or skip past the Assign license dialogue by clicking Next.
14. Leave lockdown mode Disabled within the Lockdown mode dialogue window and click Next.
15. Skip past the Resource pool dialogue by clicking Next.
16. Confirm the Summary dialogue and add the ESXi host to the cluster by clicking Next.

17. Repeat steps 1-16 for each ESXi host to be added to the cluster.

18. In vSphere, in the left pane right-click the newly created cluster, and under Storage click Rescan Storage.

19. Click OK on the Rescan Storage popup window.

ESXi Dump Collector Setup for iSCSI Hosts (iSCSI Configuration Only)

ESXi hosts booted with iSCSI need to be configured with ESXi dump collection. The Dump Collector functionality is supported by the vCenter but is not enabled by default on the vCenter Appliance.

Make sure the account used to login is Administrator@vsphere.local (or a system admin account).

To setup the ESXi dump collector for iSCSI hosts, follow these steps:

1. In the vSphere web client, select Home.
2. In the center pane, click System Configuration.
3. In the left-hand pane, select Services and select VMware vSphere ESXi Dump Collector.
4. In the Actions menu, choose Start.
5. In the Actions menu, click Edit Startup Type.
6. Select Automatic.
7. Click OK.

8. Select Home > Hosts and Clusters.
9. Expand the Data Center and Cluster.
10. For each ESXi host, right-click the host and select Settings. Scroll down and select Security Profile. Scroll down to Services and select Edit. Select SSH and click Start. Click OK.
11. SSH to each ESXi hosts and use root for the user id and the associated password to log into the system. Type the following commands to enable dump collection:

```
[root@Infra-ESXi-Host-01:~] esxcli system coredump network set --interface-name vmk0 --server-ipv4
192.168.162.100 --server-port 6500

[root@Infra-ESXi-Host-01:~] esxcli system coredump network set --enable true

[root@Infra-ESXi-Host-01:~] esxcli system coredump network check

Verified the configured netdump server is running
```

12. Optional: Turn off SSH on the host servers.

Configure ESXi Networking

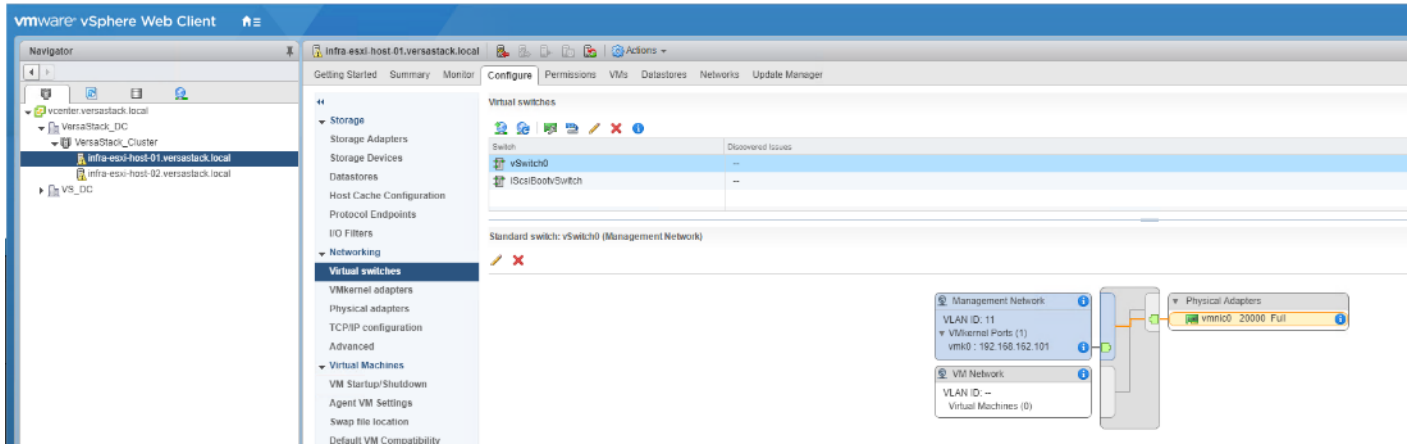

This section covers the virtual switch (vSwitch) setup for Management, vMotion and iSCSI storage traffic and vSphere Distributed Switch (vDS) for application traffic.

Update Management vSwitch0 Configuration

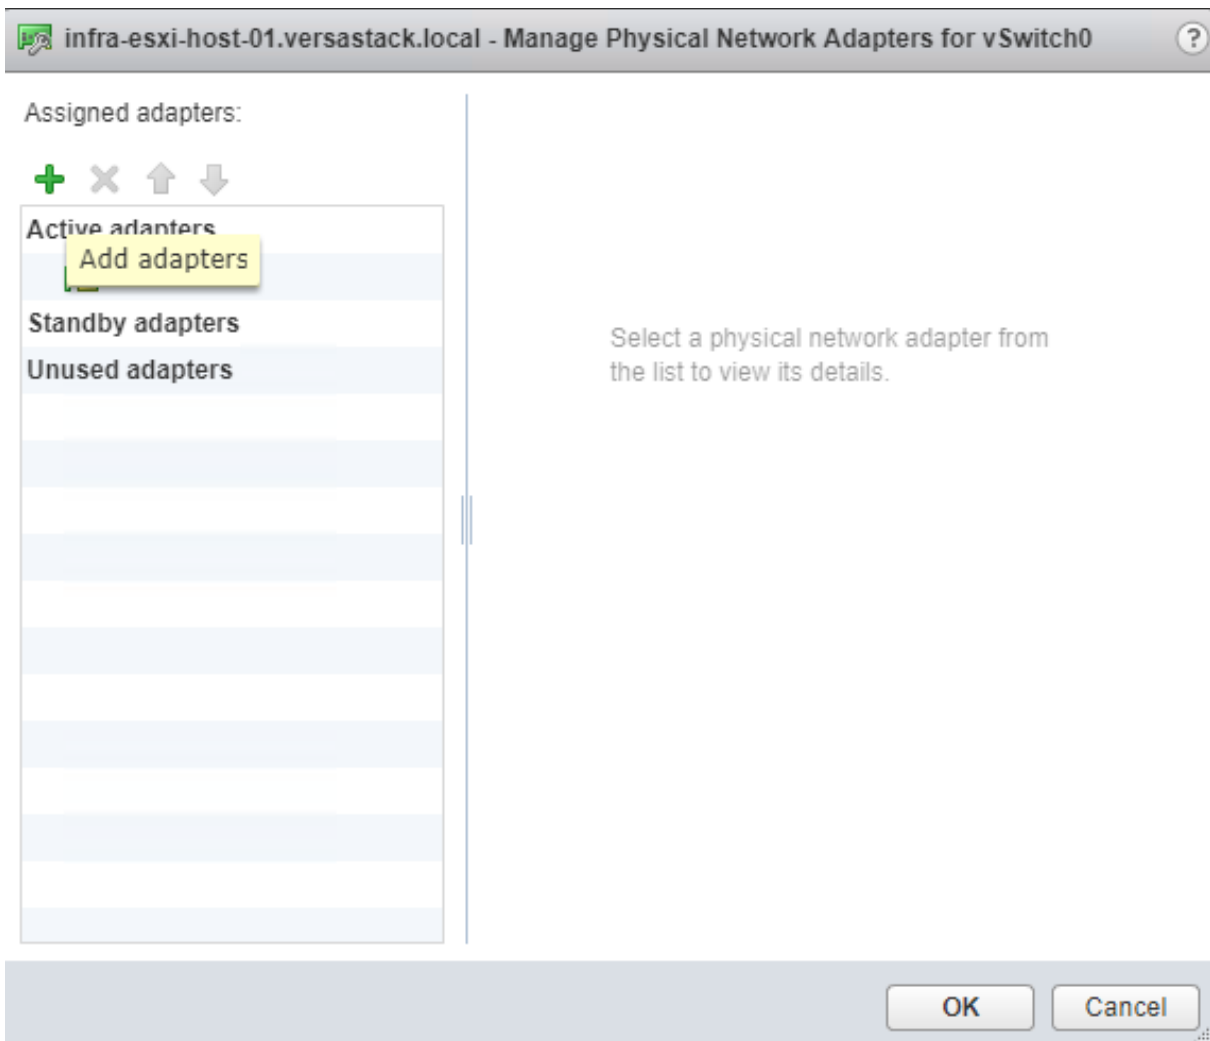

This design uses a separate vSwitch for management using two uplink vNICs with Active/Passive Failover for the port group and routing based on originating port ID for load balancing at the vSwitch level. Traffic from each vNIC take different paths across fabric to enable redundancy and load balancing.

To update the management vSwitch0 configuration, follow these steps:

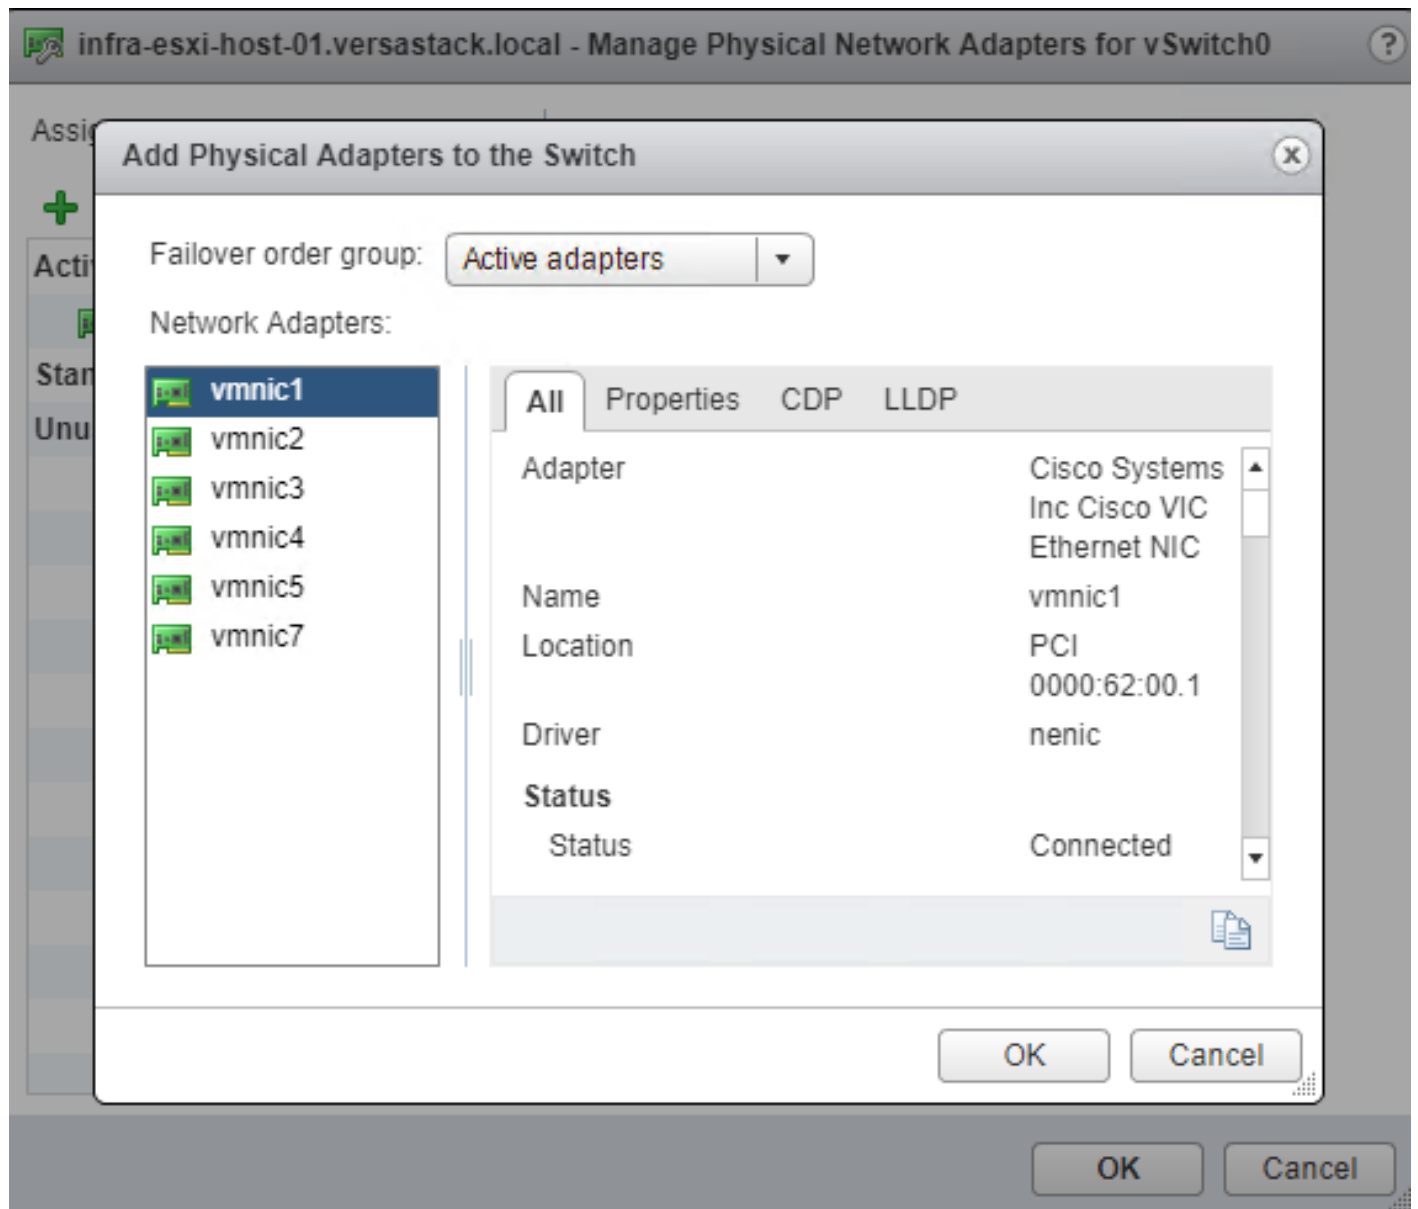

1. Using a web browser, browse to vCenter's IP address. Login to vCenter. From vSphere Web Client, navigate to the datacenter and cluster where the host resides.
2. Select the ESXi host `infra-esxi-host-01`. On the right windowpane, click the Configure Tab. Navigate to Networking > Virtual switches and select vSwitch0 from the Virtual Switches list. Click the Manage physical adapter (third icon) to open the Manage Physical Network Adapters for vSwitch0 window.

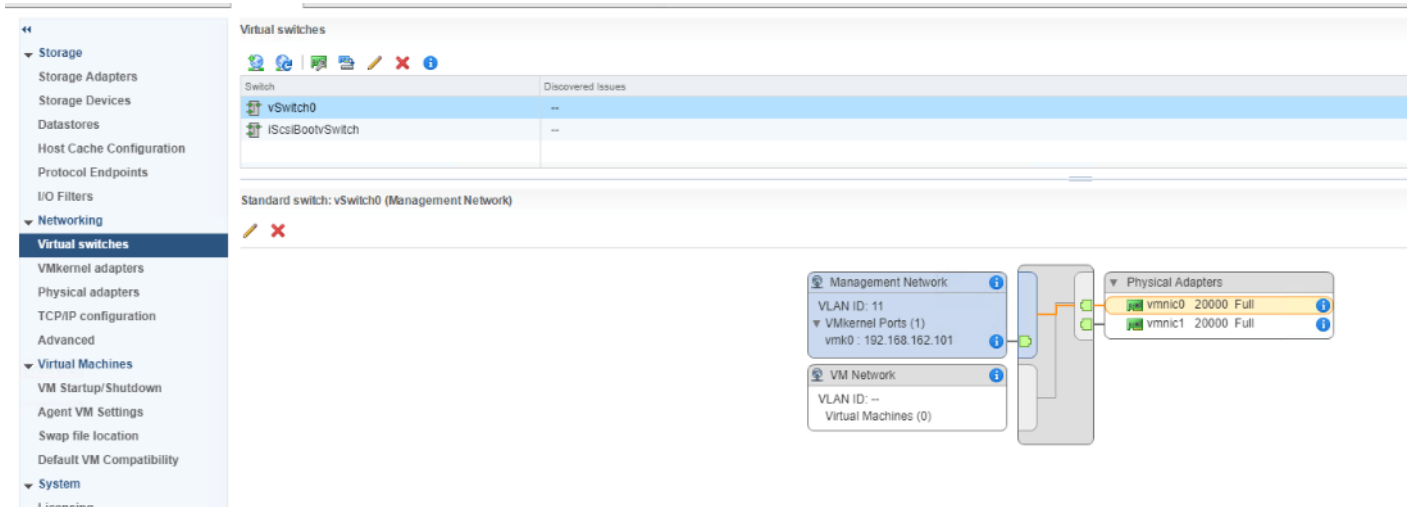

3. Click the green [+] to add a second Adapter. Select an unused vmnic from the list of Network Adapters.

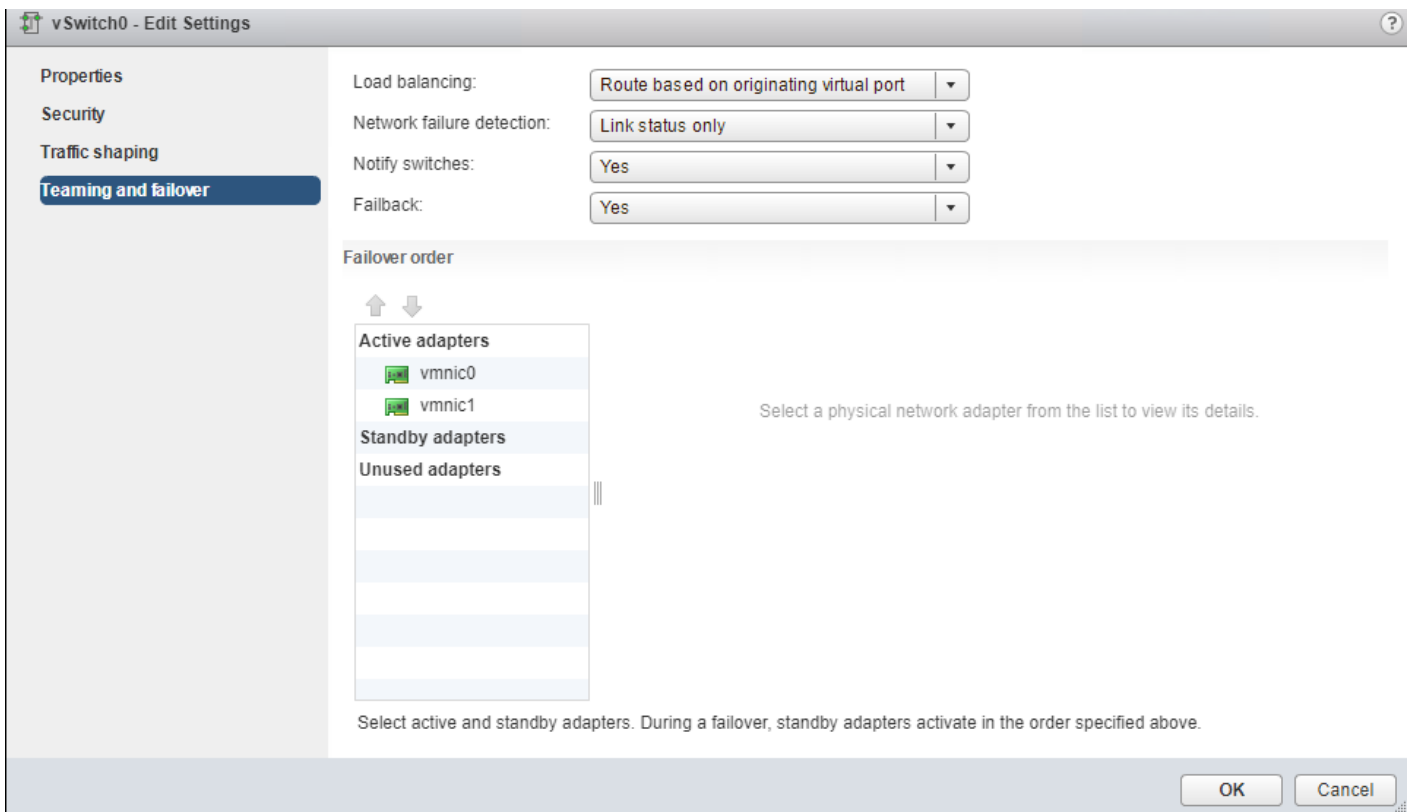

4. Select `vmnic1` and click OK to add the vmnic as a second Active adapter to vSwitch0.

5. Click OK to commit the change.

6. While the vSwitch0 of the host still selected, click the Edit Settings icon (5th icon) to open the Edit settings window.
7. Under Teaming and failover, verify the load balancing and failover configuration. Both vmnics should be listed as uplinks under Active adapters.

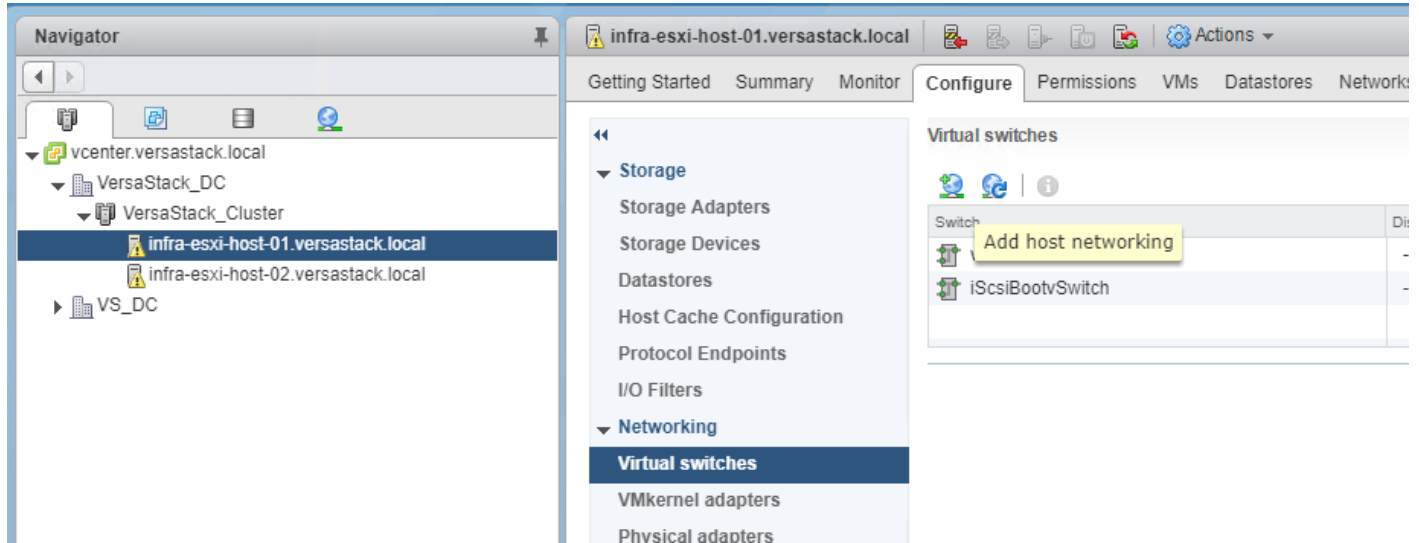

8. Repeat steps 1–7 for all the ESXi hosts in the Cluster.

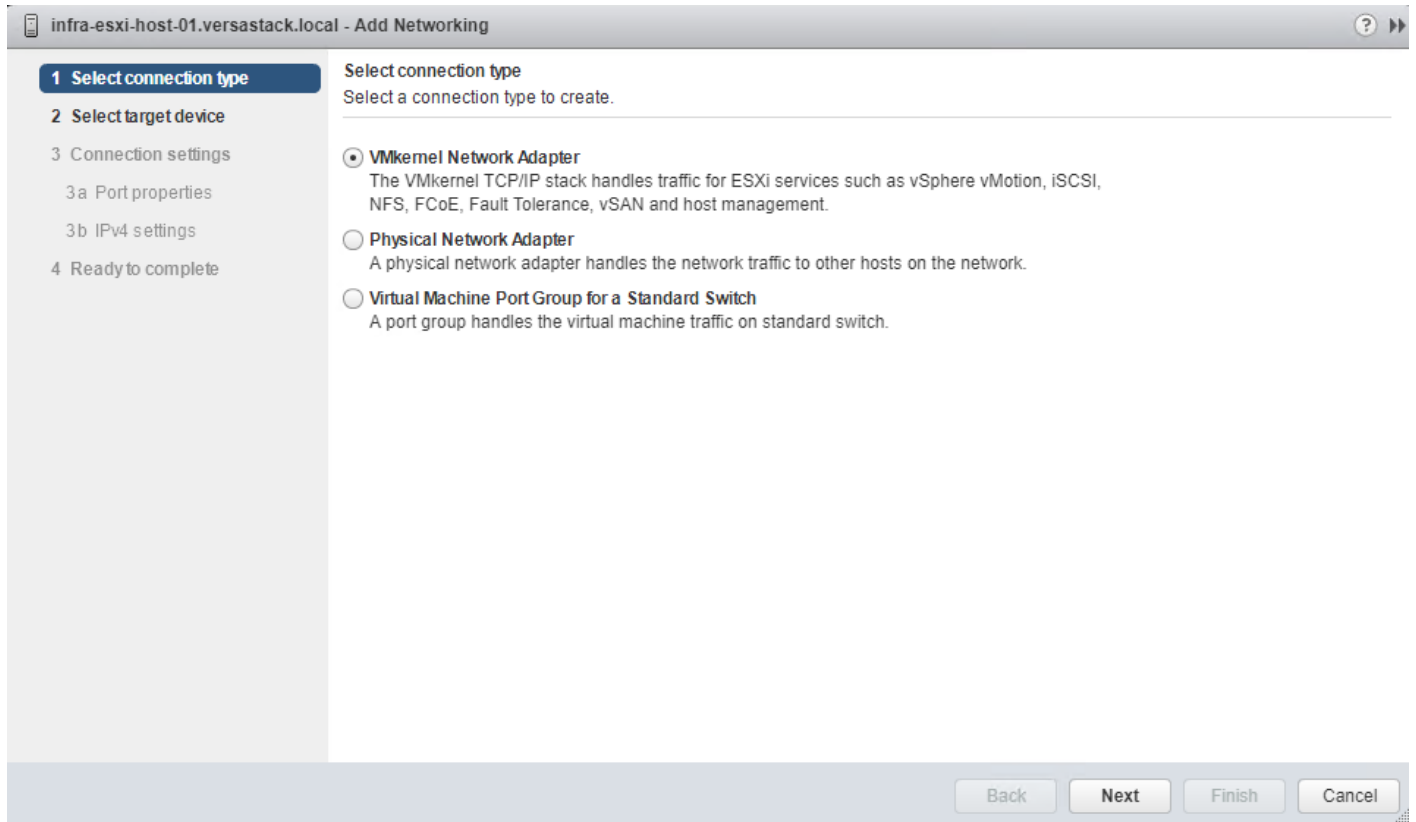

Create vSwitch1 for vMotion

This design uses a separate vSwitch for vMotion with two uplink vNICs. To create and setup vSwitch1 for vMotion, follow these steps:

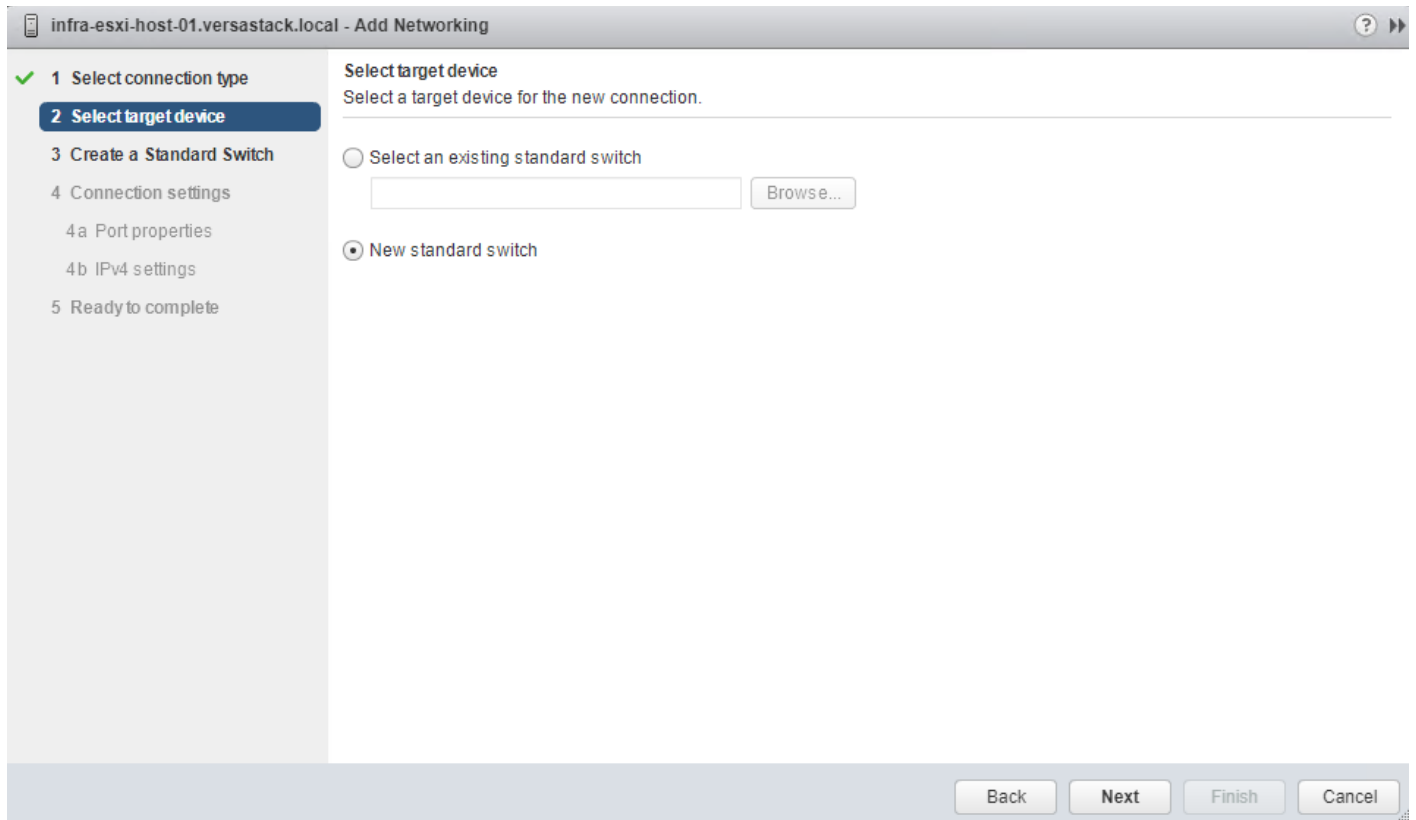

1. Using a web browser, browse to vCenter's IP address. Login to vCenter. From vSphere Web Client, navigate to the datacenter and cluster where the host resides
2. Select the host `infra-esxi-host-01`. On the right windowpane, select the Configure Tab. Navigate to Networking > Virtual Switches. Click the Add host networking icon (1st icon).

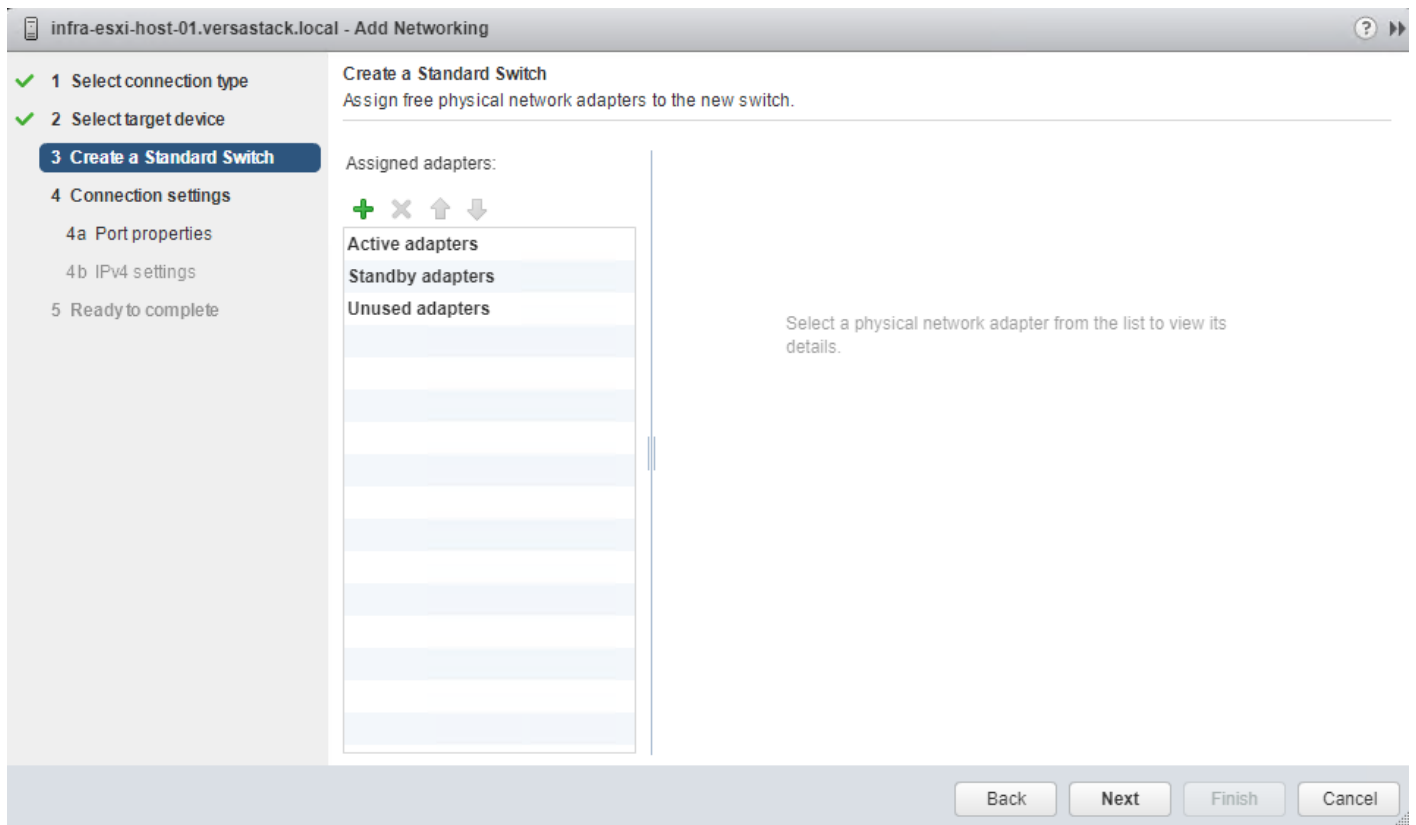

3. Leave VMkernel Network Adapter selected within Select connection type of the Add Networking pop-up window that is generated and click Next.

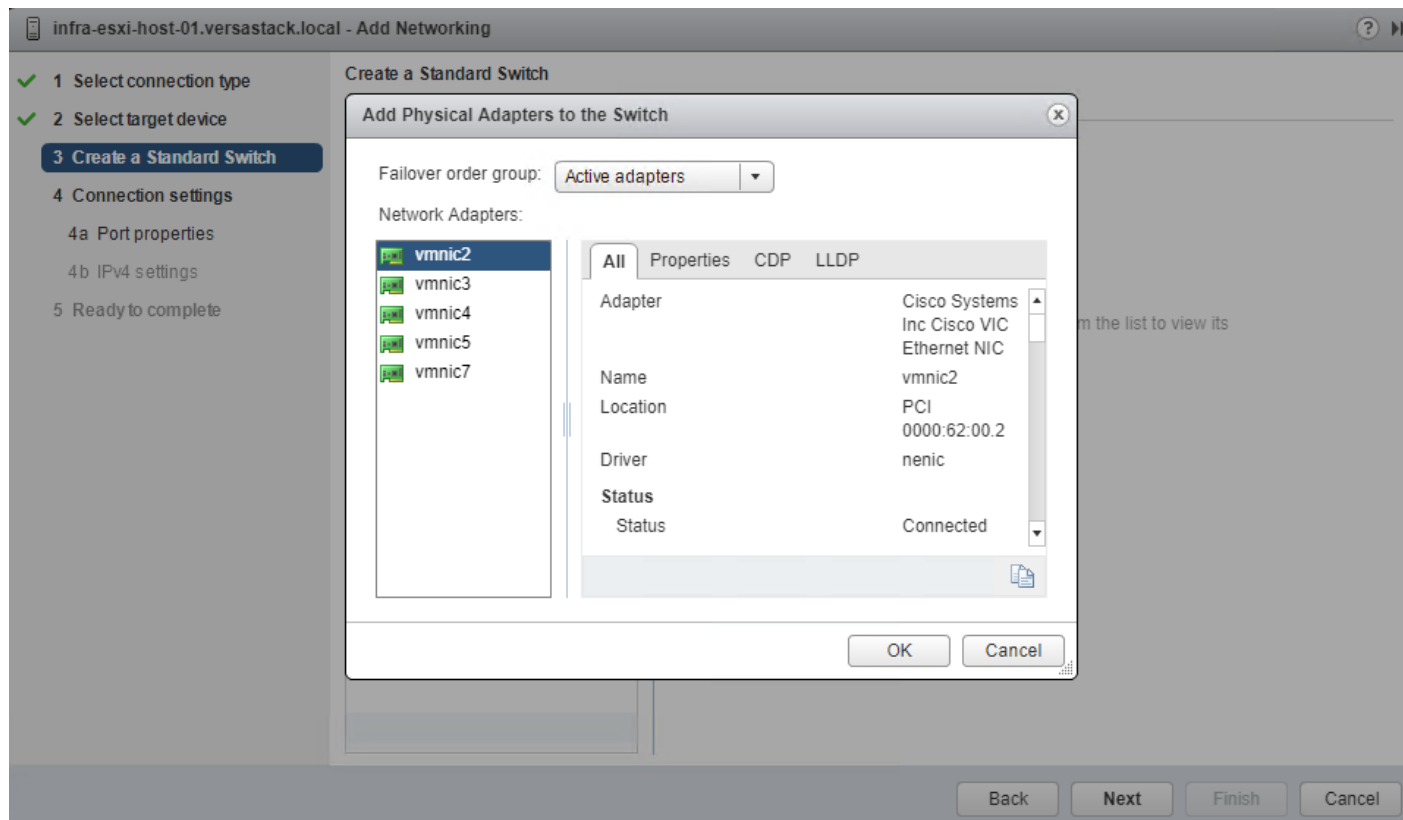

4. Select New Standard switch and click Next.

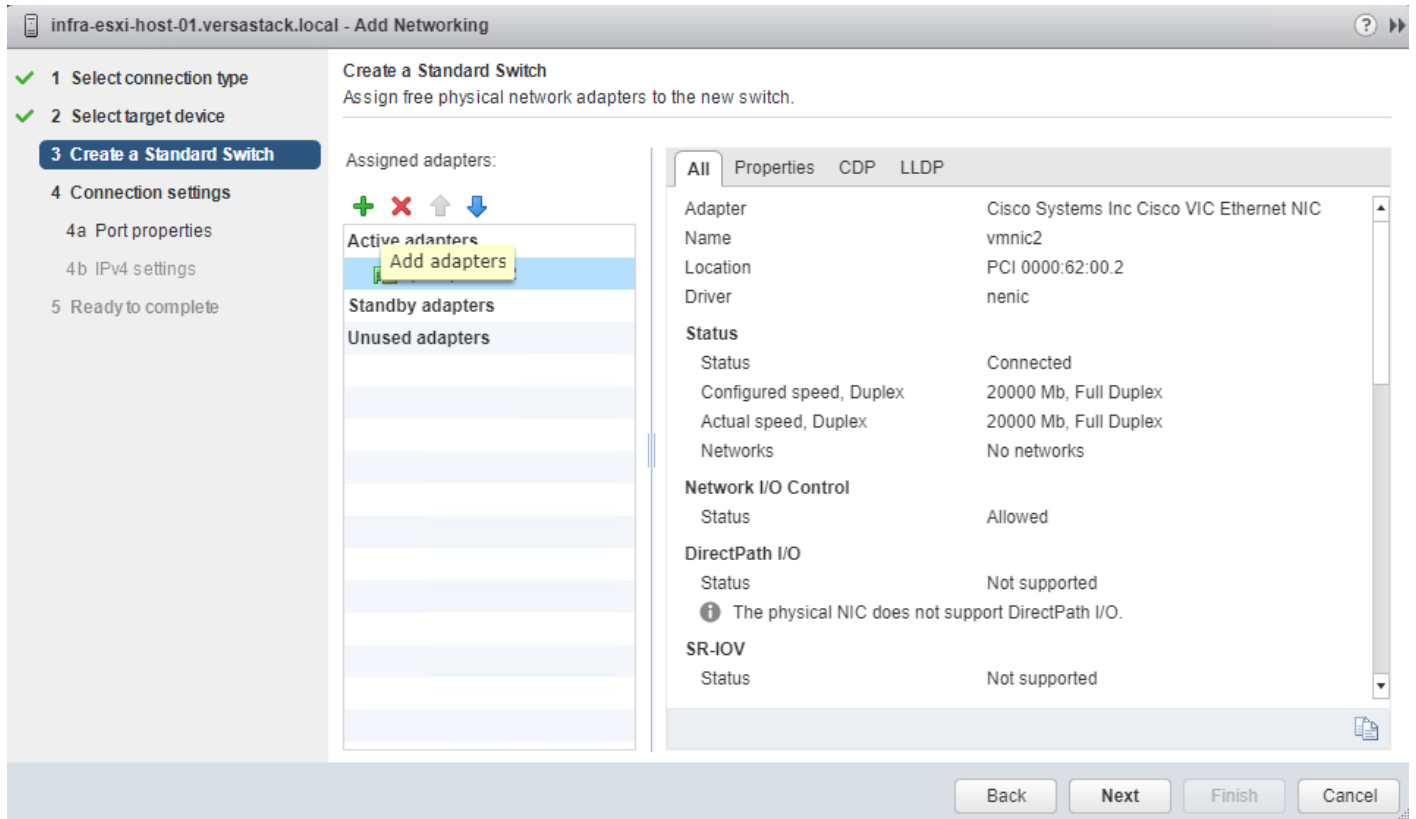

5. Within Select target device, click the New standard switch option, and click Next.

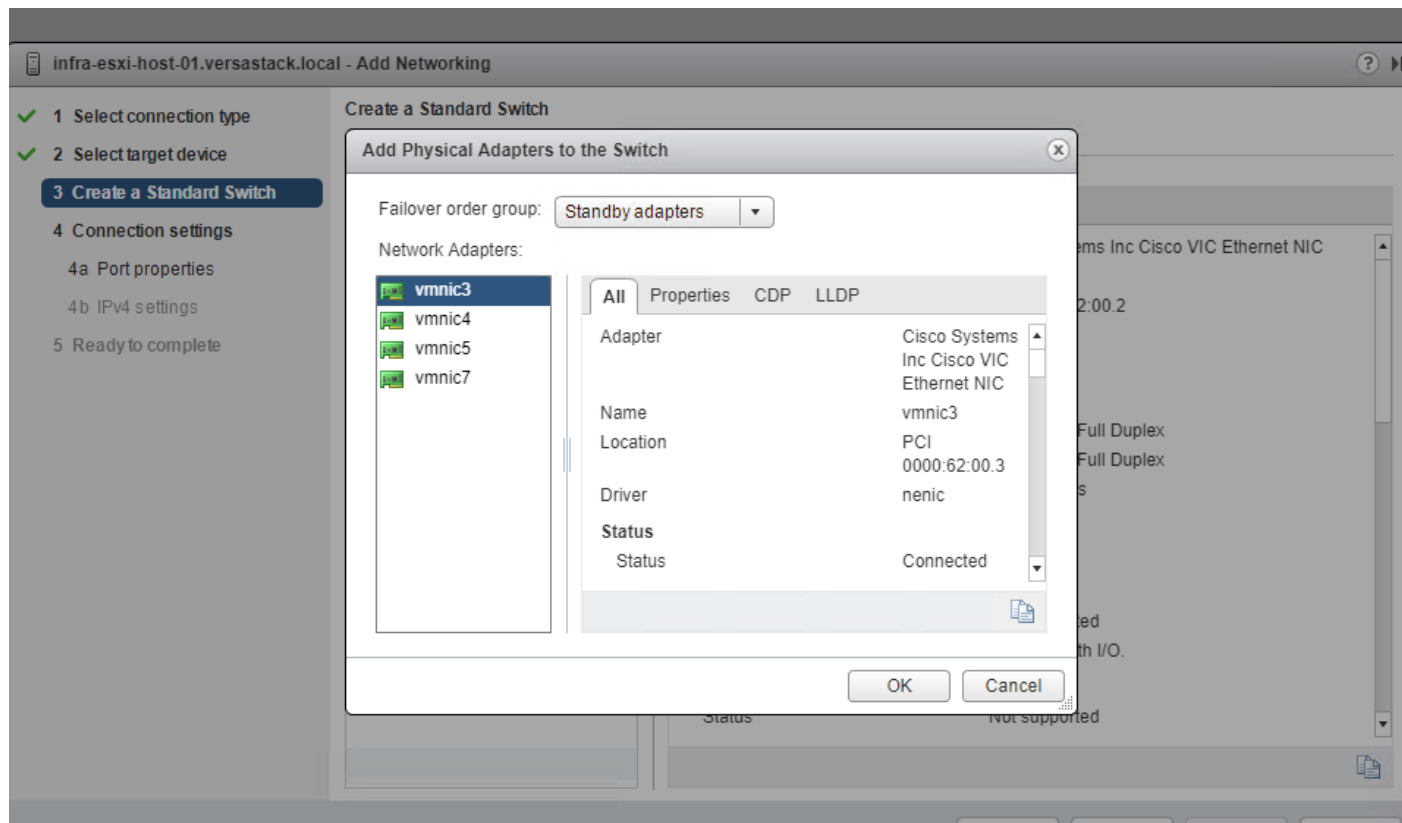

6. Within the Create Standard Switch dialogue press the green + icon below Assigned adapters.

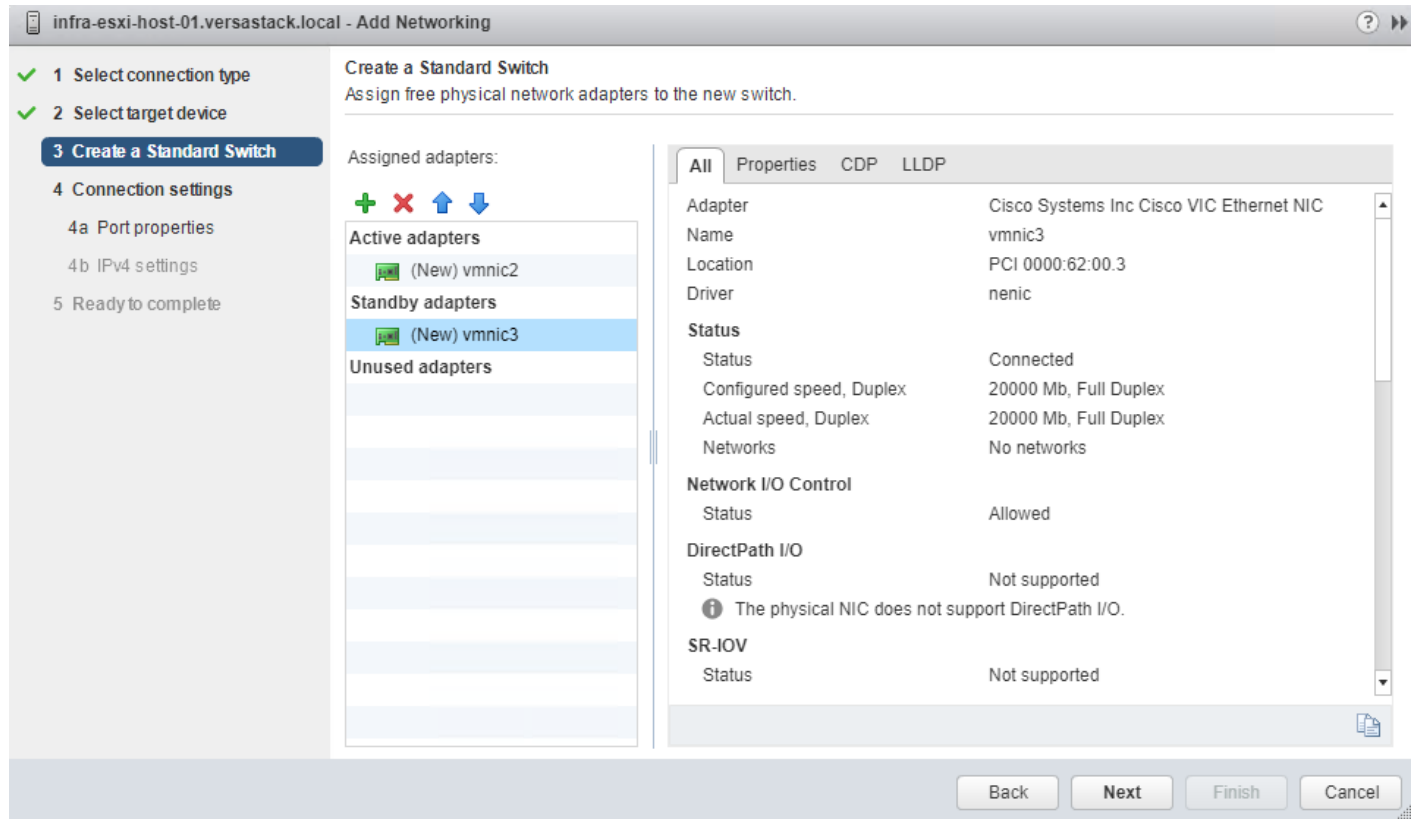

7. Select vmnic2 within the Network Adapters and click OK.

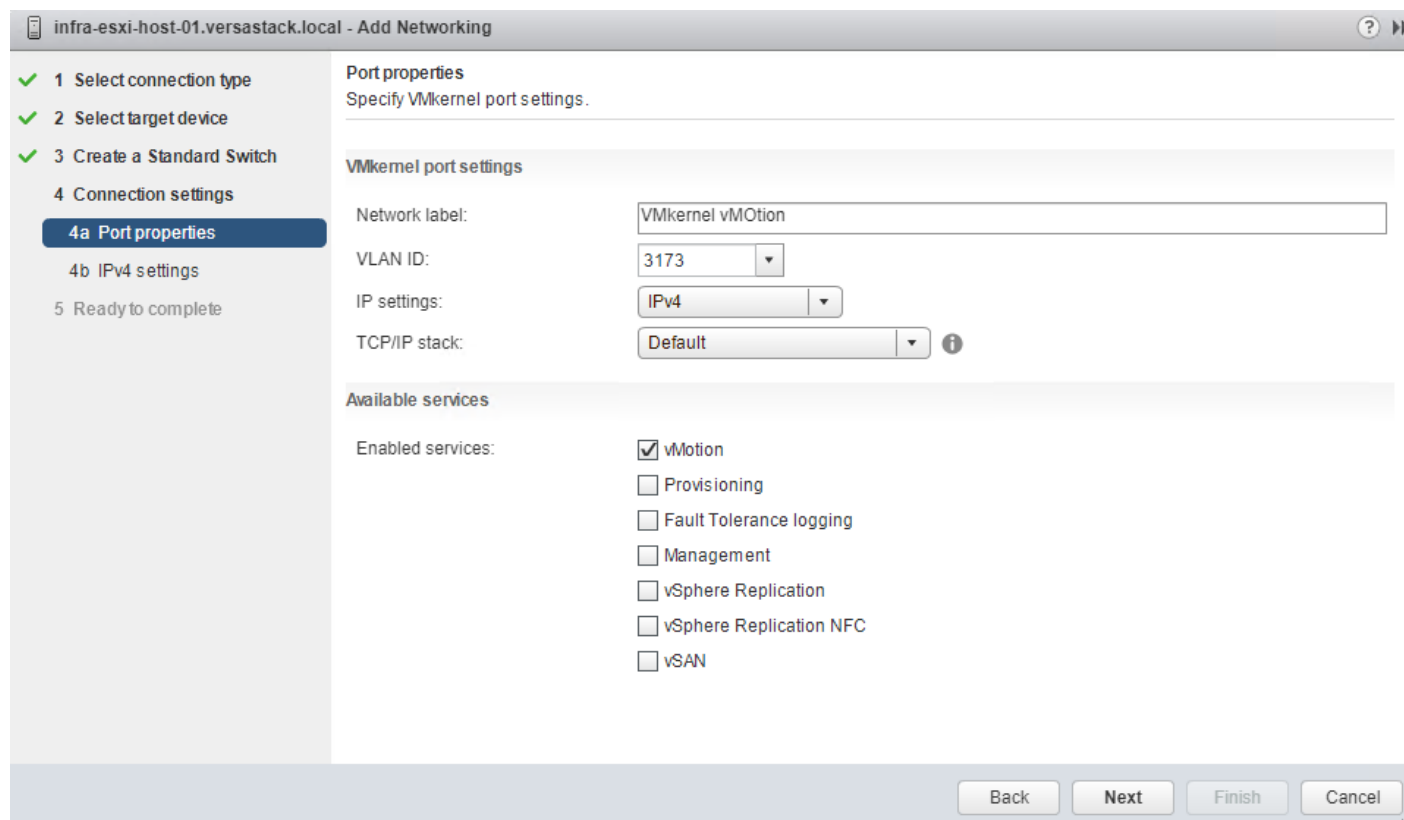

8. While still in the Create a Standard Switch dialogue, click the green + icon one more time.

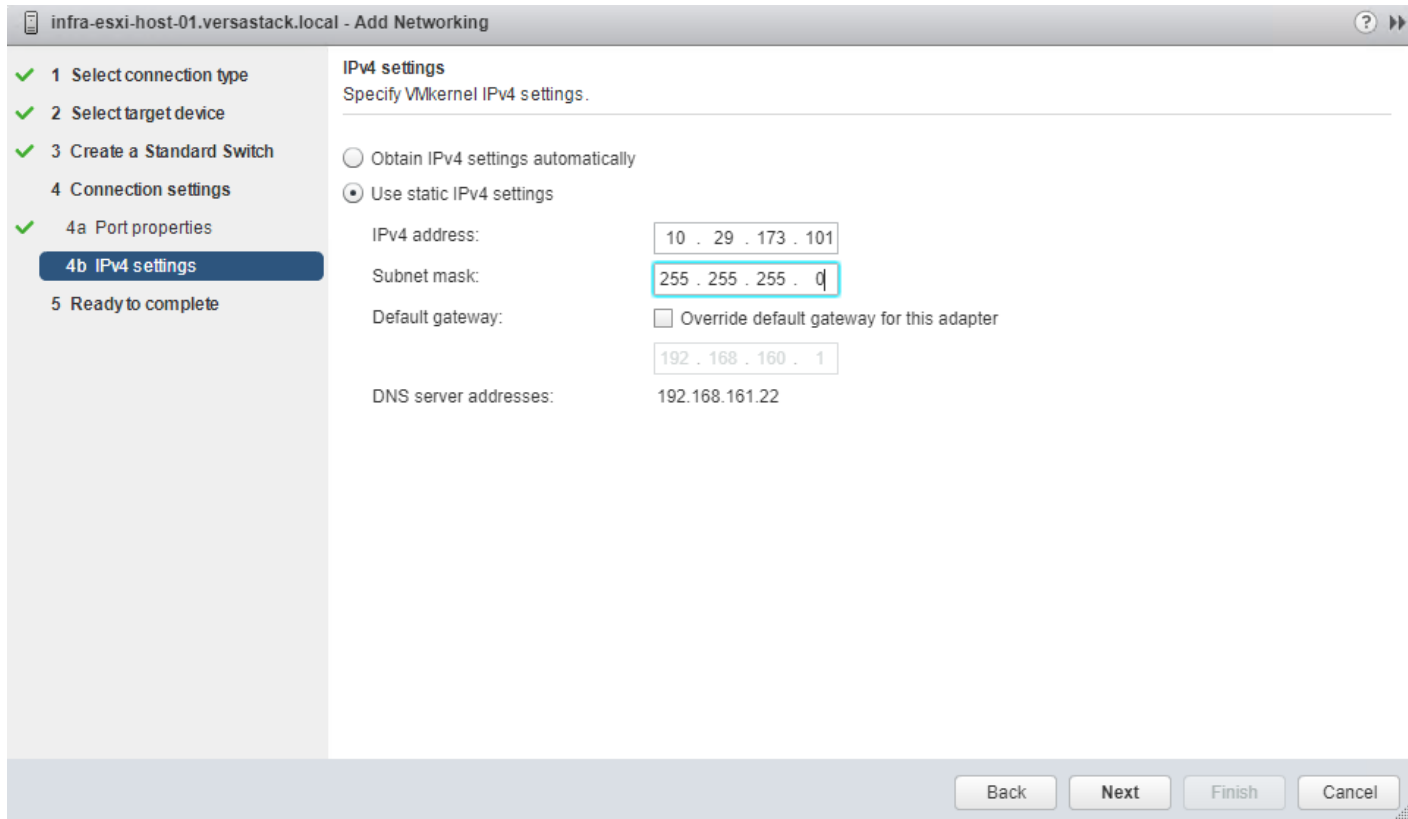

9. Select vmnic3, and from the Failover order group drop-down list, select Standby adapters. Click OK.

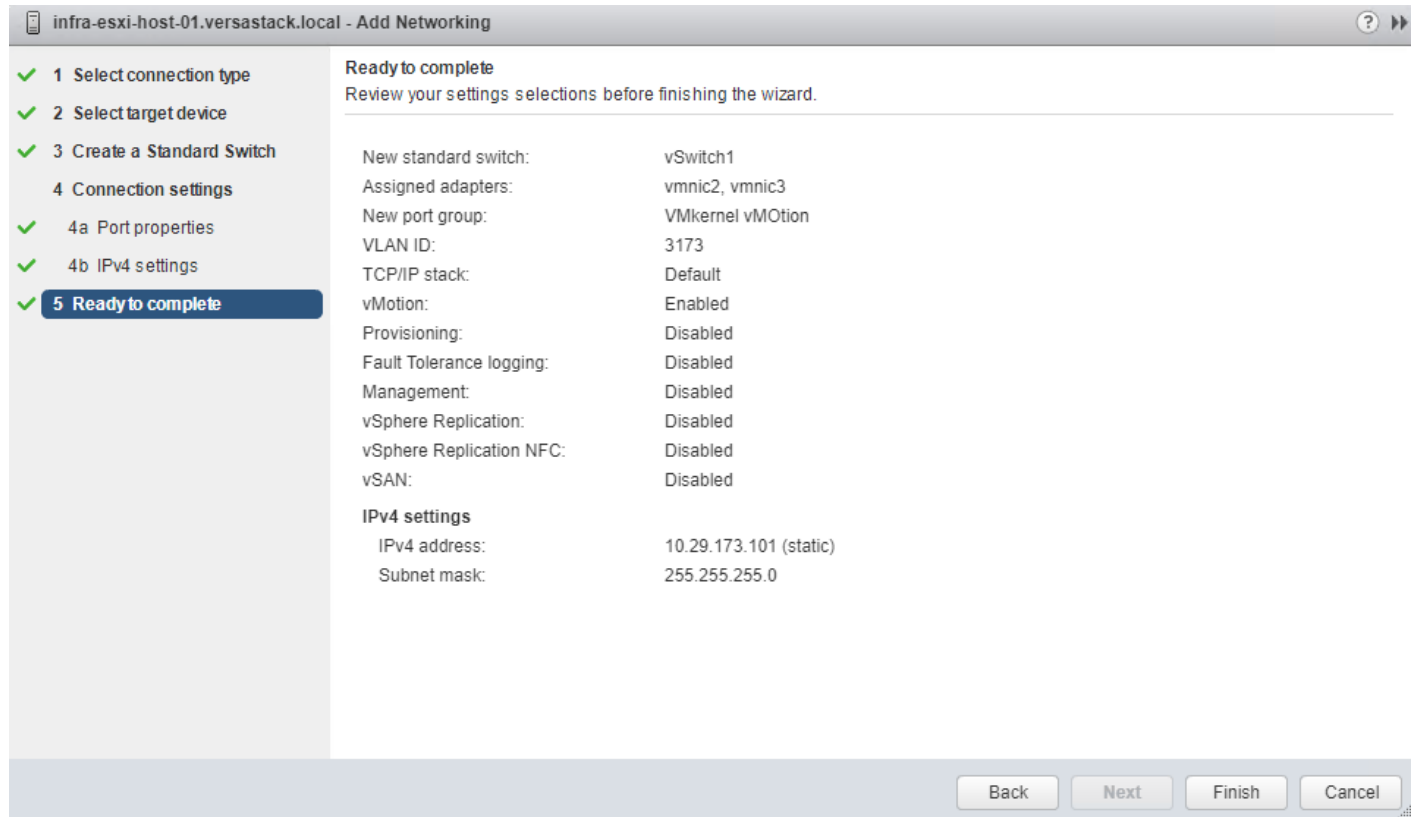

10. Click Next.

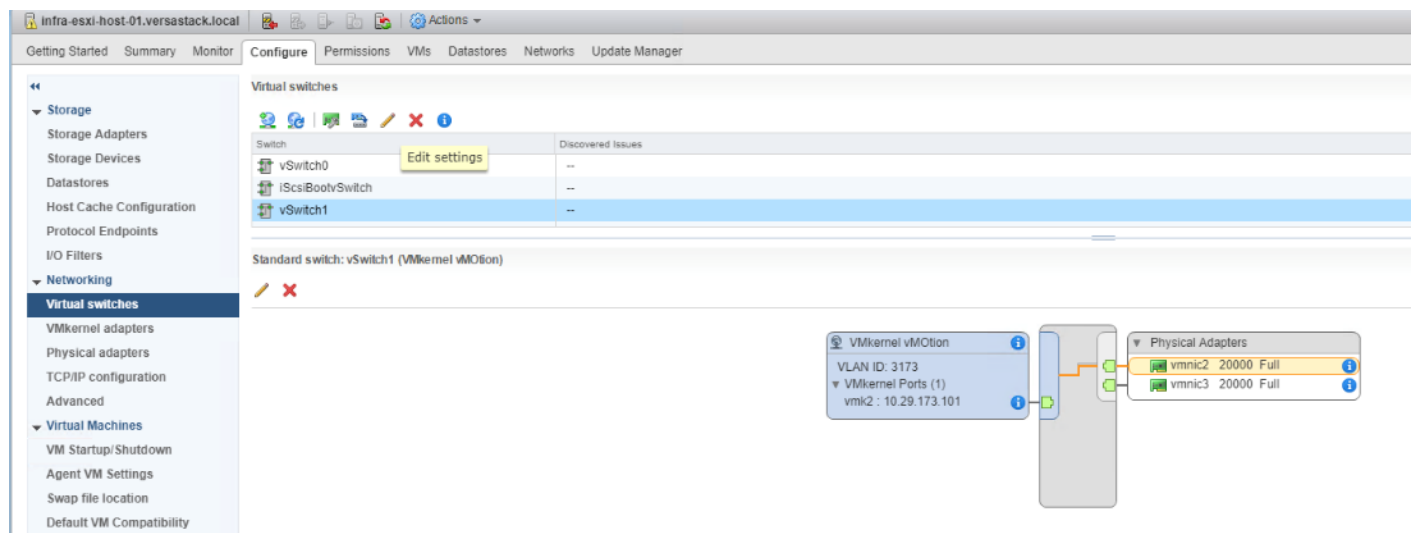

11. Within Port properties under Connection settings, set the Network label to be VMkernel vMotion, set the VLAN ID to the value for <vMotion VLAN id>, and checkmark vMotion traffic under Available services. Click Next.

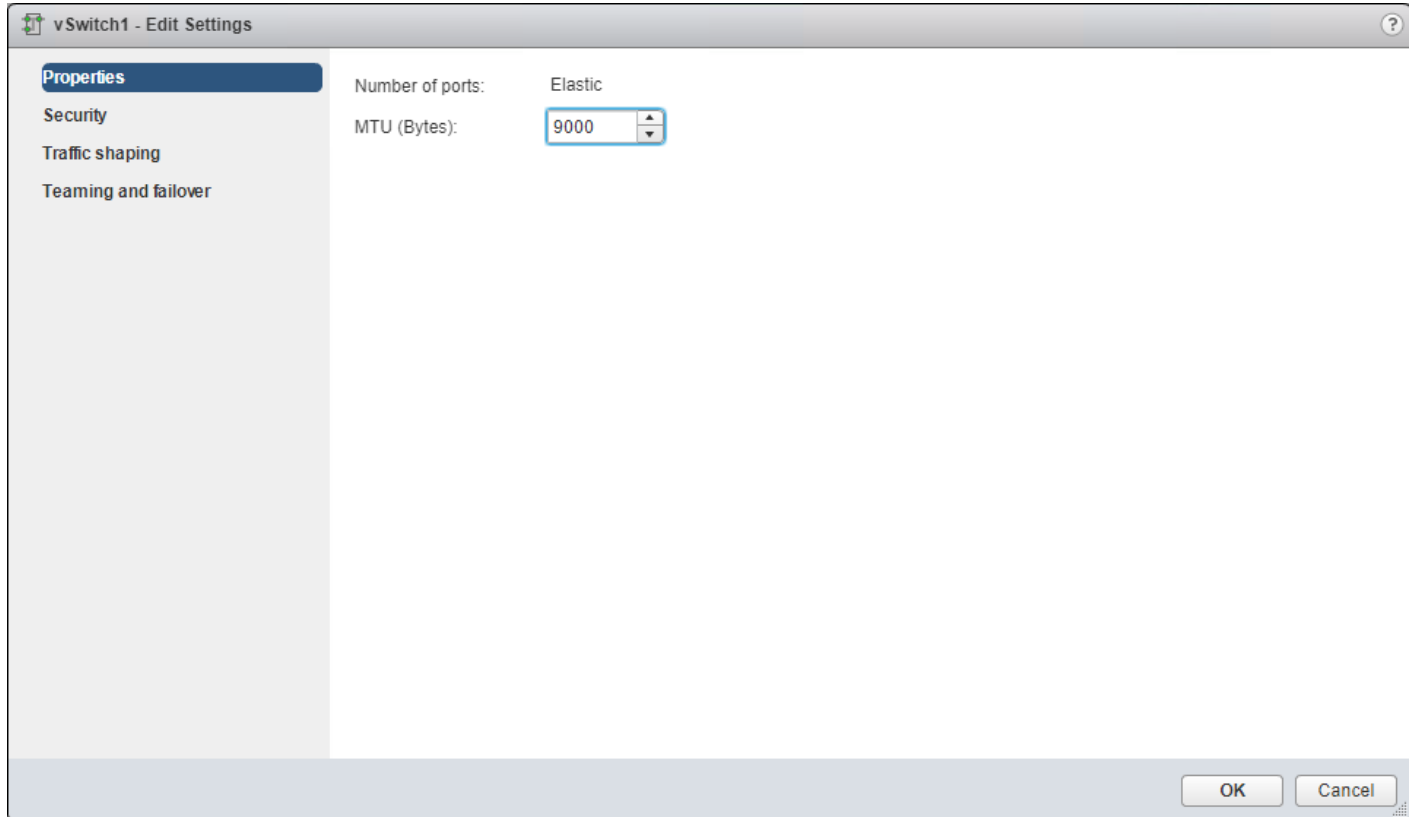

12. Enter <vMotion IP Address> in the field for IPv4 address, and <vMotion Subnet Mask> for the Subnet mask. Click Next.

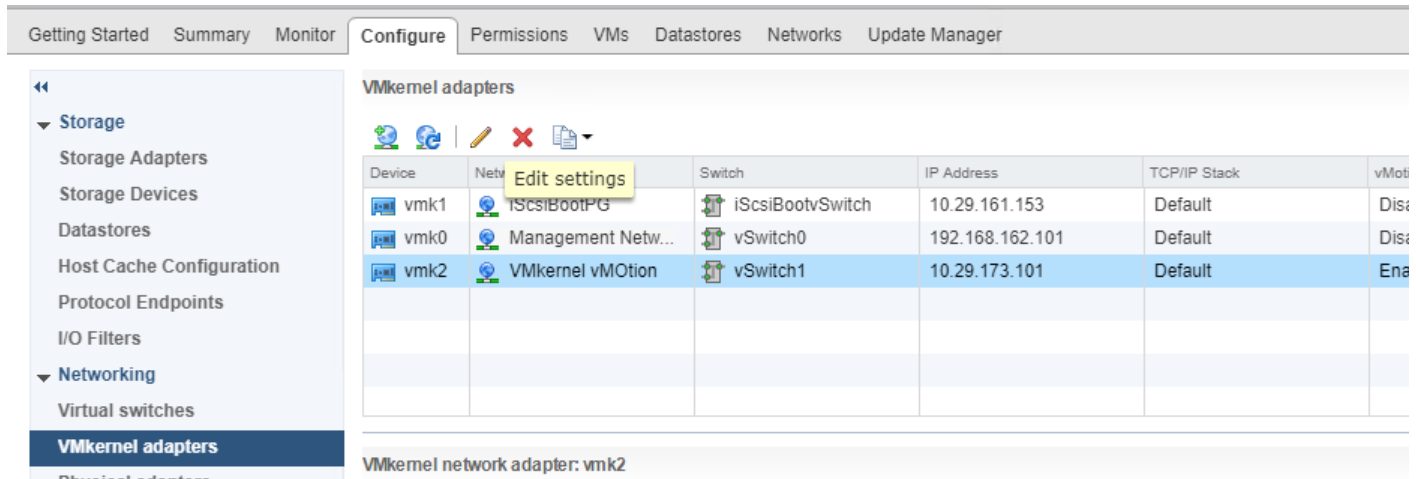

13. Confirm the values shown on the Ready to complete summary page and click Finish to create the vSwitch and VMkernel for vMotion.
14. Within the Configure tab for the host, under Networking -> Virtual switches, make sure that vSwitch1 is selected, and click on the pencil icon under the Virtual Switches title to edit the vSwitch properties to adjust the MTU for the vMotion vSwitch.

15. Enter 9000 in the Properties dialogue for the vSwitch1 – Edit Settings pop-up that appears. Click OK to apply the change.

16. Click the VMkernel adapters under Networking for the host, and with the VMkernel for vMotion (vmk2) selected, click the pencil icon to edit the VMkernel settings.

17. Click the NIC settings in the vmk2 – Edit Settings pop-up window that appears and enter 9000 for the MTU value to use for the VMkernel. Click OK to apply the change.

- Repeat steps 1-17 for each host being added to the cluster, changing the vMotion VMkernel IP to an appropriate unique value for each host.

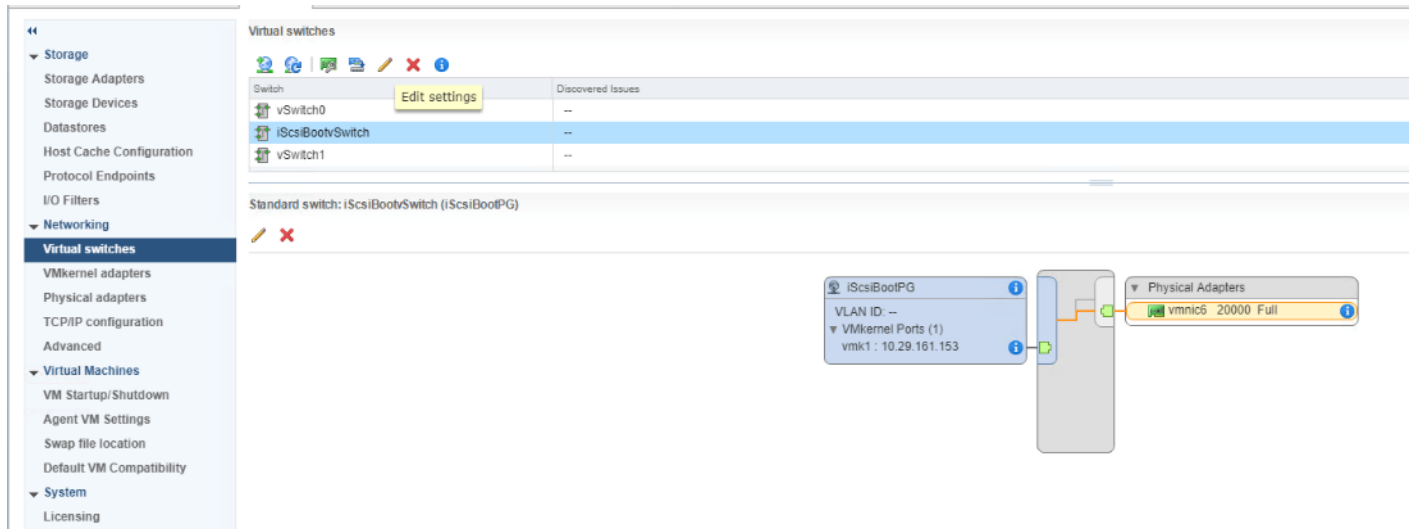

Configure iSCSI Adapters (iSCSI Deployment Only)

The base ESXi installation will set up one vmkernel adapter for the iSCSI boot, with a generated vSwitch named `iScsiBootvSwitch`. vSwitch changes will be needed, as well as the creation of a second vmkernel adapter used for the B side iSCSI boot. To make the vSwitch changes and create the vmkernel adapter, follow these steps for each host:

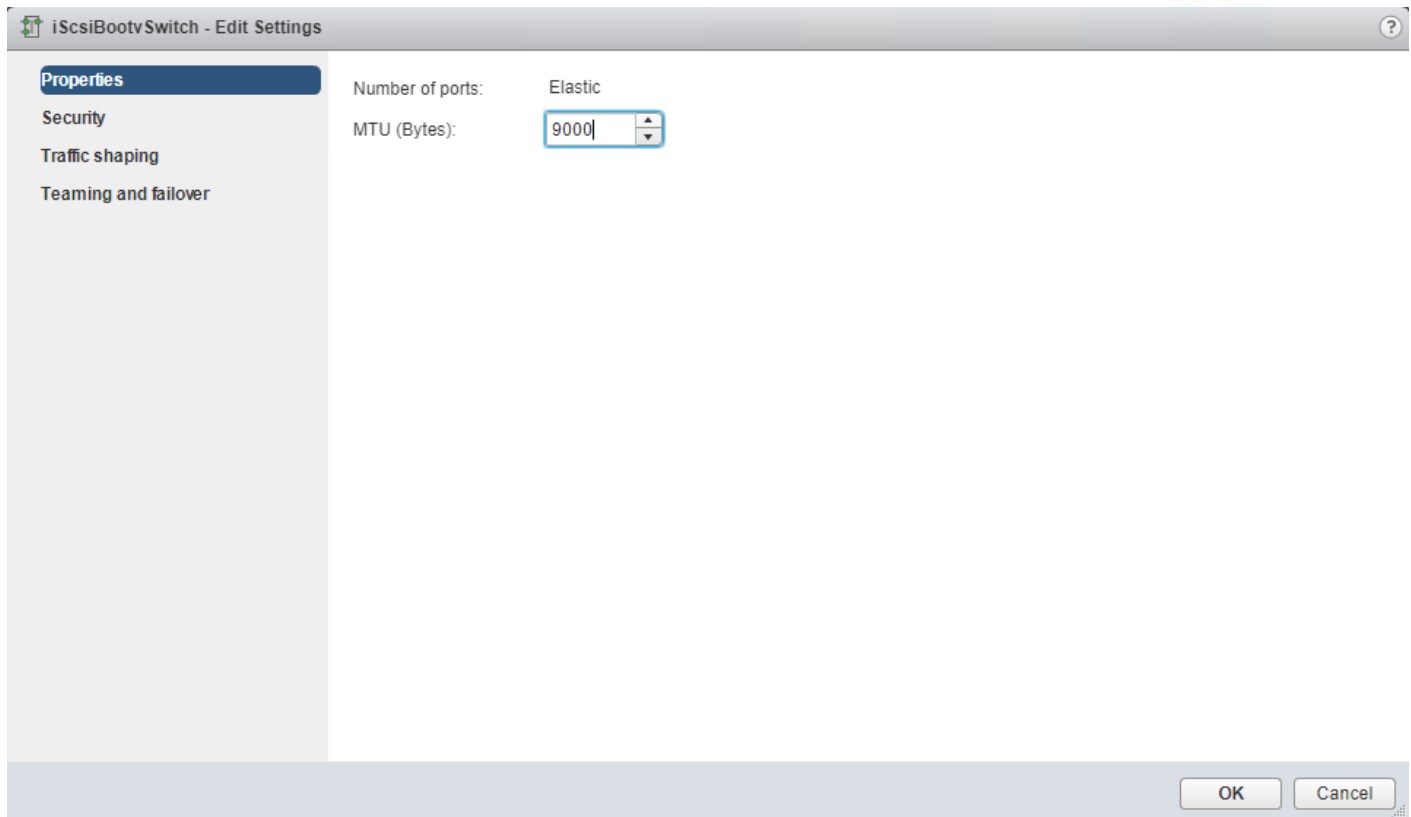

Adjust iSCSI A vSwitch MTU

To adjust iSCSI A vSwitch MTU, follow these steps:

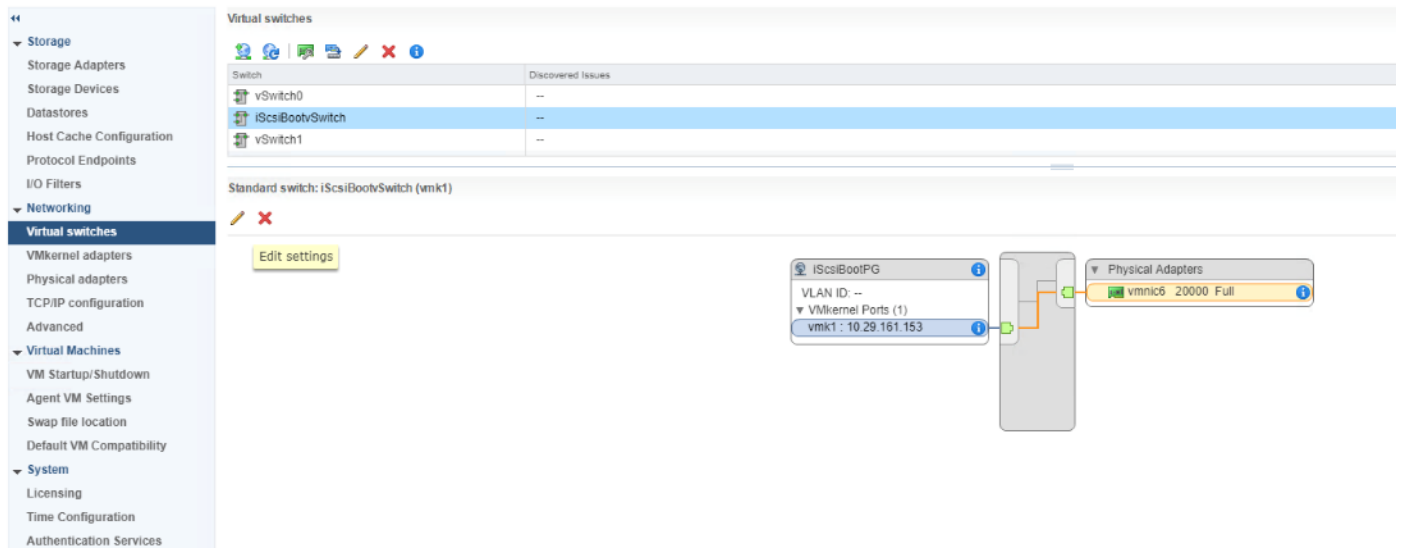

- From the vSphere Web Client, select the installed iSCSI host, click the Configure tab, and select the Virtual switches section from the Networking section on the left.
- Select the `iScsiBootvSwitch` and click the pencil icon to open up Edit settings for the vSwitch.

3. Within the Properties section, change the MTU from 1500 to 9000 and click OK to save the changes.

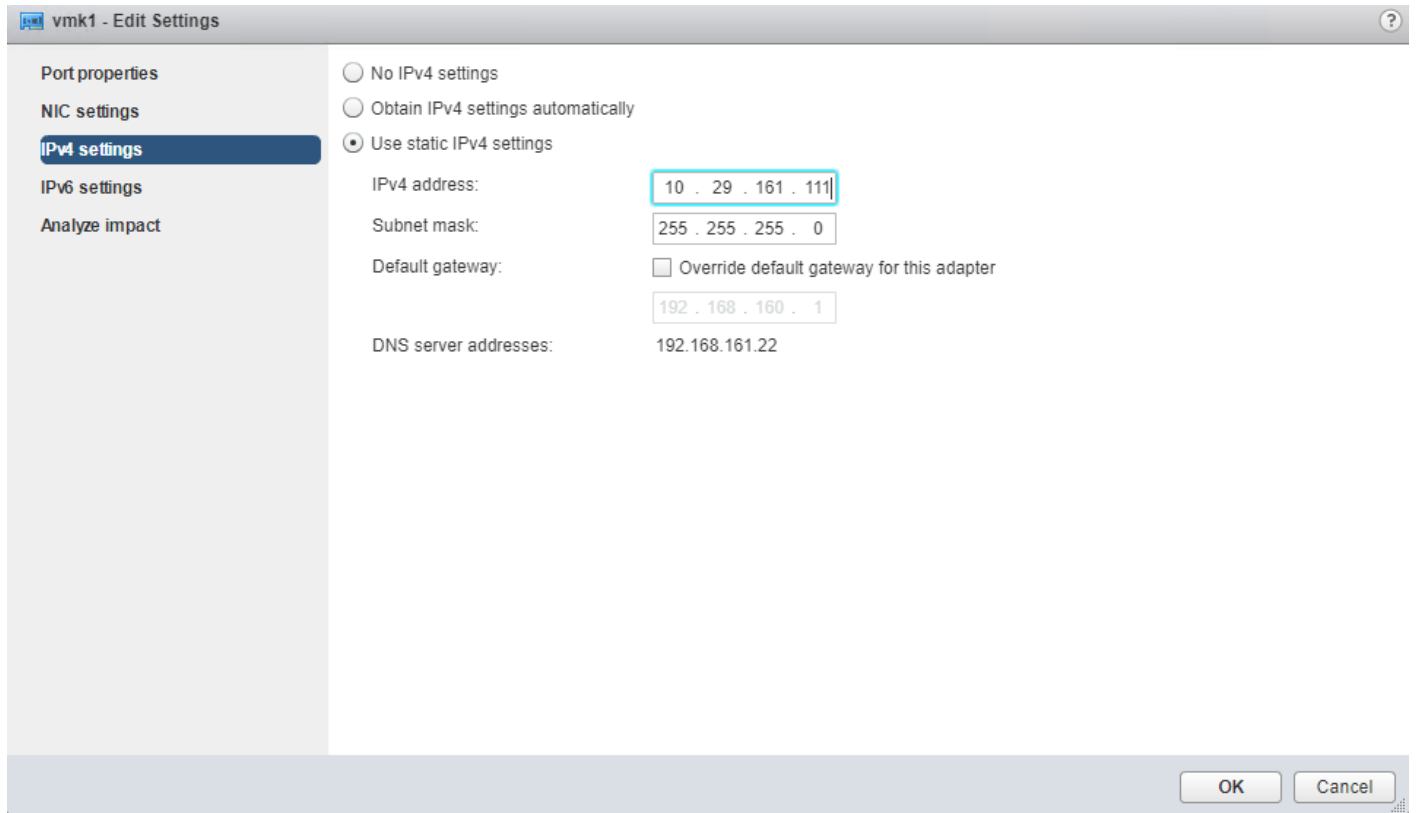

4. Click the vmk1 entry within the `iScsiBootPG` and select the pencil icon on the left to edit the settings of the vmkernel adapter.

5. Select NIC settings on the left side of the Edit Settings window and adjust the MTU from 1500 to 9000.

6. Click the IPv4 settings for vmk1 and change the IPv4 settings from the Cisco UCS Manager iSCSI-initiator-A assigned IP to one that is not in the IP block.

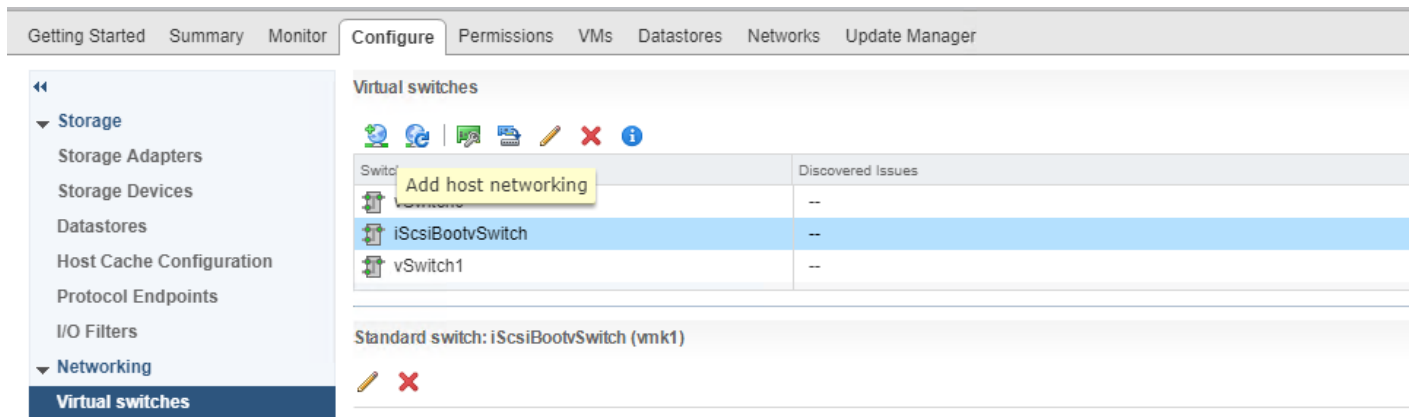

7. Click OK to apply the changes to the vmkernel adapter.

Create iSCSI B vSwitch and vmkernel Adapter

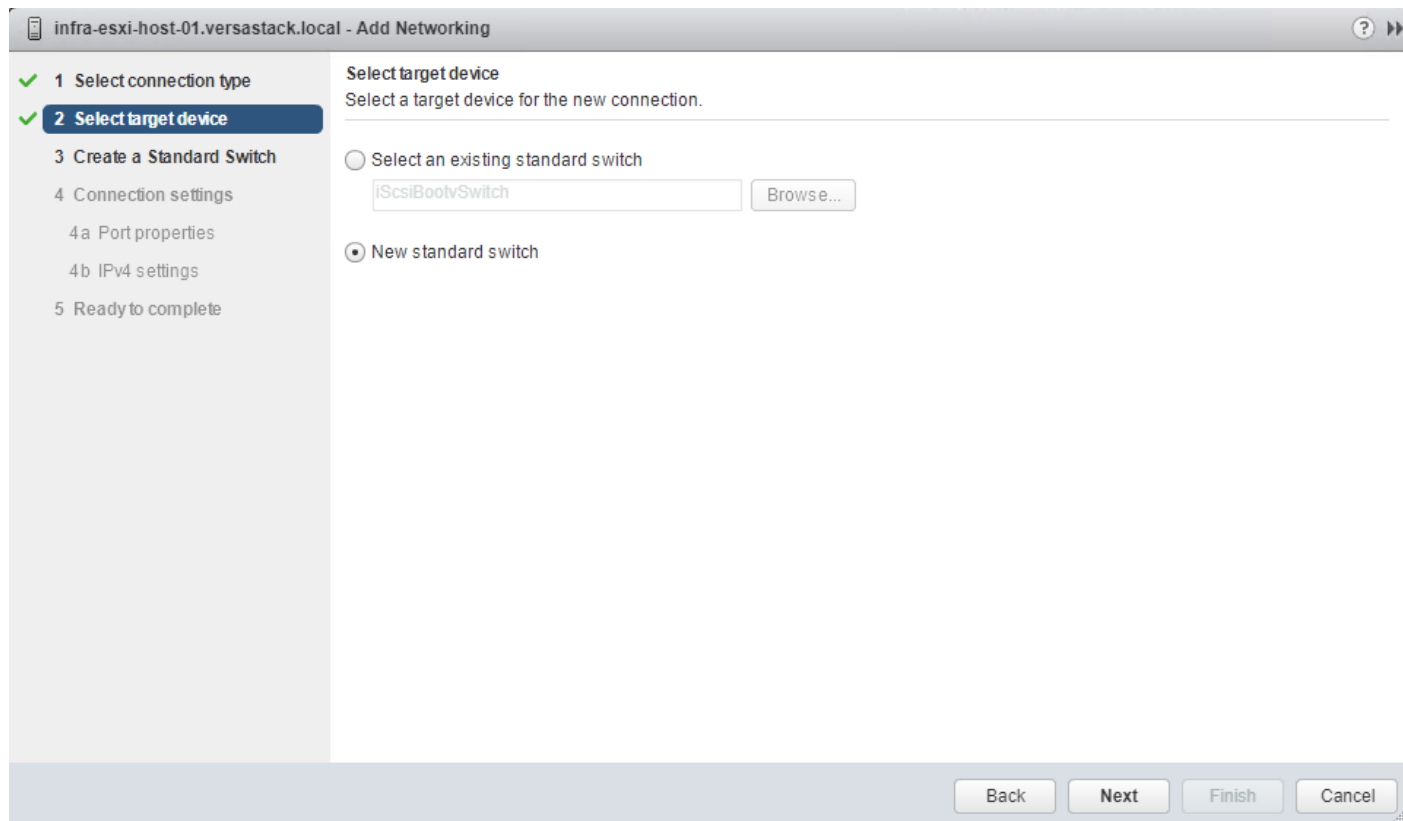

To create the iSCSI B vSwitch and vmkernel adapter, follow these steps:

1. Click the Add host networking icon under Virtual switches.

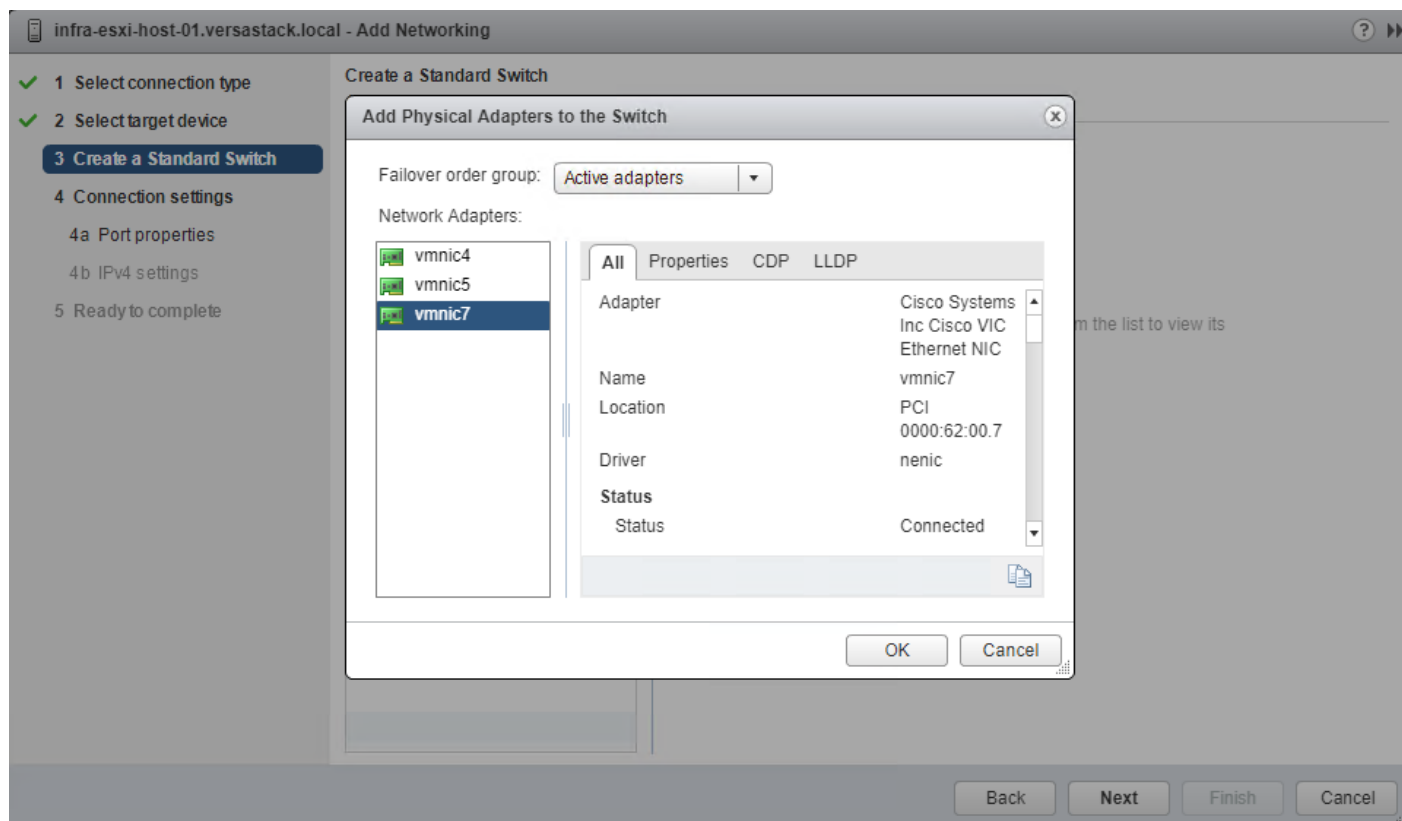

2. Leave VMkernel Network Adapter selected and click Next.

3. Change the Select target device option to New standard switch and click Next.

4. Click the green plus icon under Assigned adapters and select vmnic7 from the listed adapters in the resulting window.

5. Click OK to add the vmnic to the vSwitch and click Next.
6. (Optional) Enter a relevant name for the Network label.

infra-esxi-host-01.versastack.local - Add Networking

7. Click Next.

8. Change the option for IPv4 settings to Use static IPv4 settings and enter valid IP and subnet mask information that is outside of the `iSCSI-initiator-B` pool.

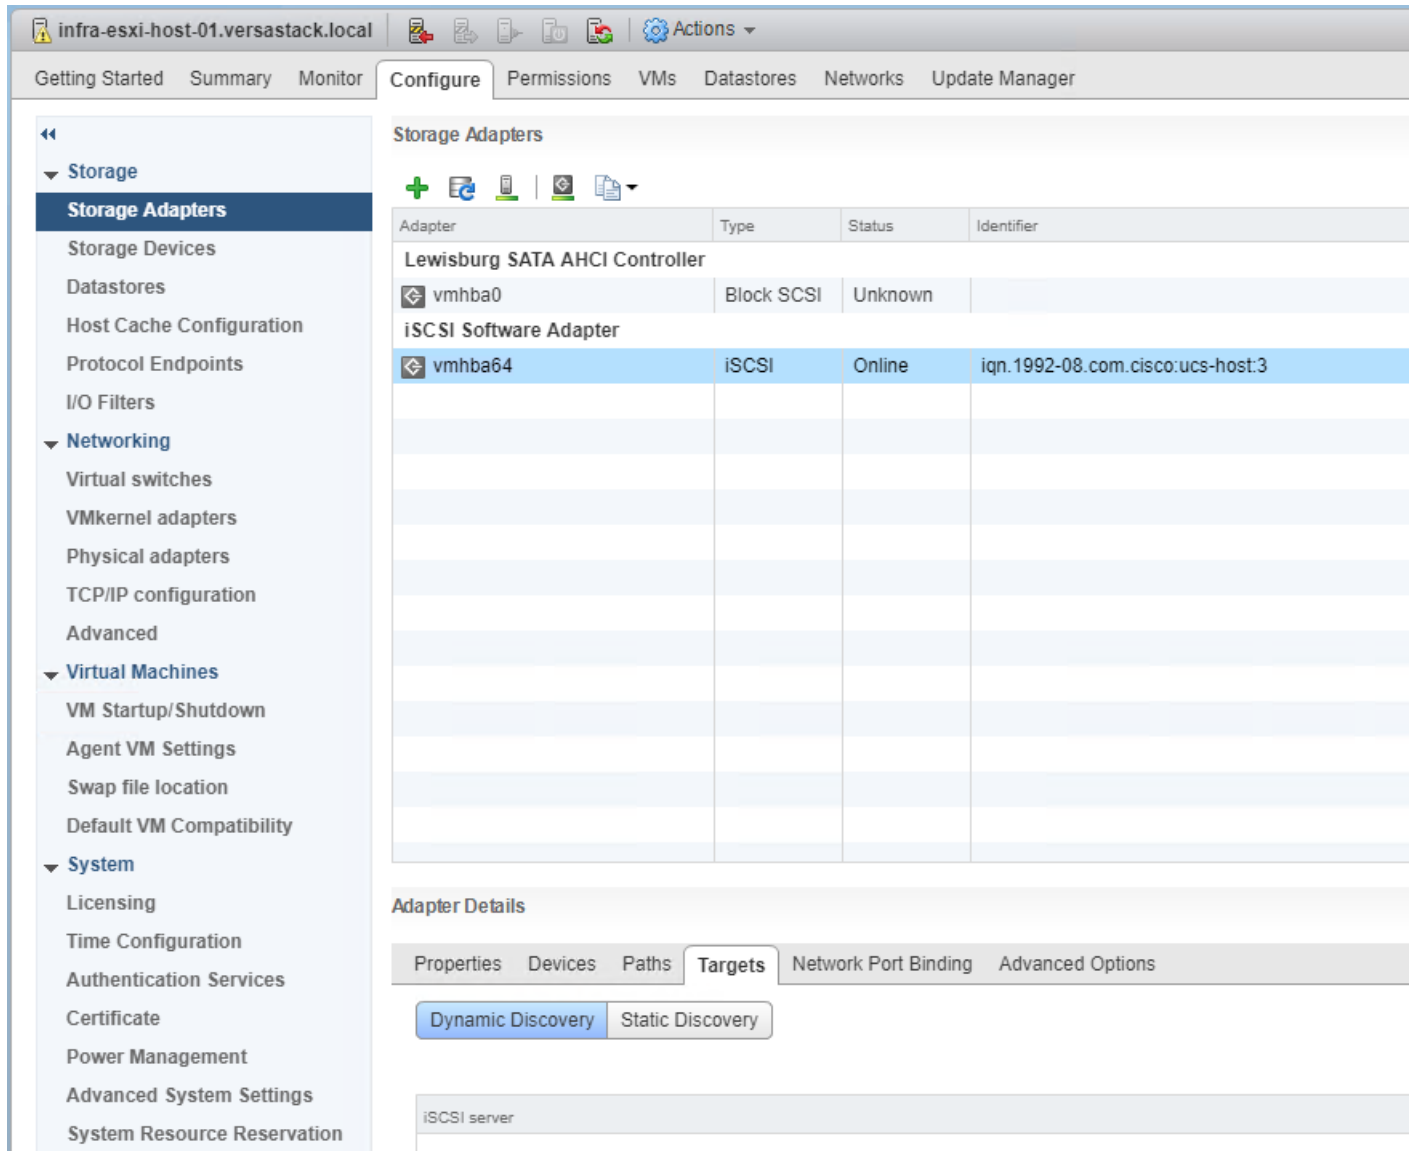

9. Click Next and click Finish in the resulting Summary window.

Setup iSCSI Multipathing

To setup the iSCSI multipathing on the ESXi hosts, follow these steps:

1. From the vSphere Web Client, select the host and select the Configure tab within the host view.
2. Select Storage Adapters from within the Storage section and vmhba64 under the iSCSI Software Adapter listing.
3. Select the Targets tab under the Adapter Details.

4. With Dynamic Discovery selected, click Add.
5. Enter the first iSCSI interface IP address for IBM FS9100 Node 1 storage from Table 10 and click OK.

vmhba64 - Add Send Target Server ?

Create a VMware vDS for Application and Production Networks

Production networks will be configured on a VMware vDS to allow additional configuration, as well as consistency between hosts. To configure the VMware vDS, click the right-most icon within the Navigation window, and follow these steps:

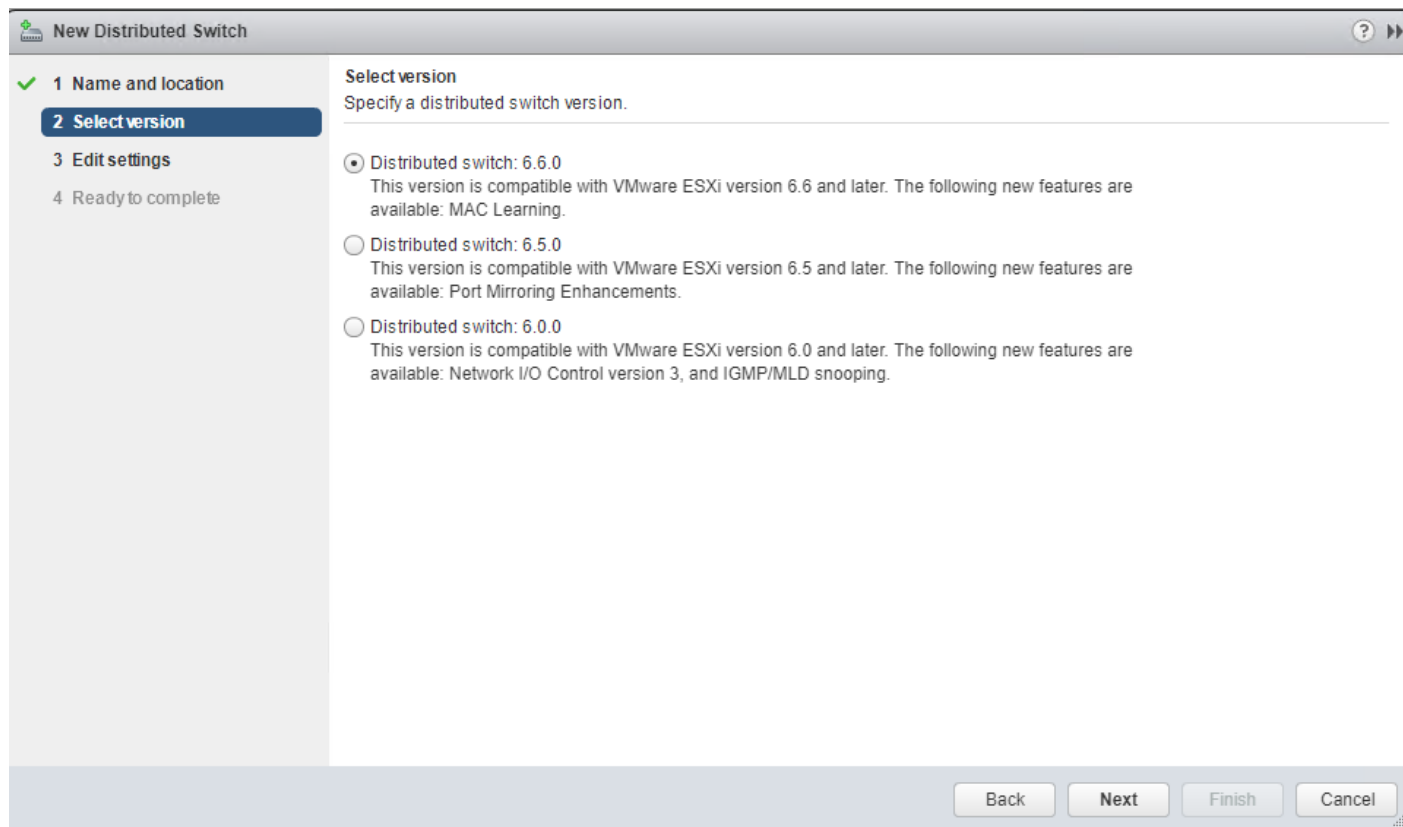

1. Right-click the Datacenter (VersaStack_DC in the example screenshot below), select from the drop-down list Distributed Switch > New Distributed Switch.

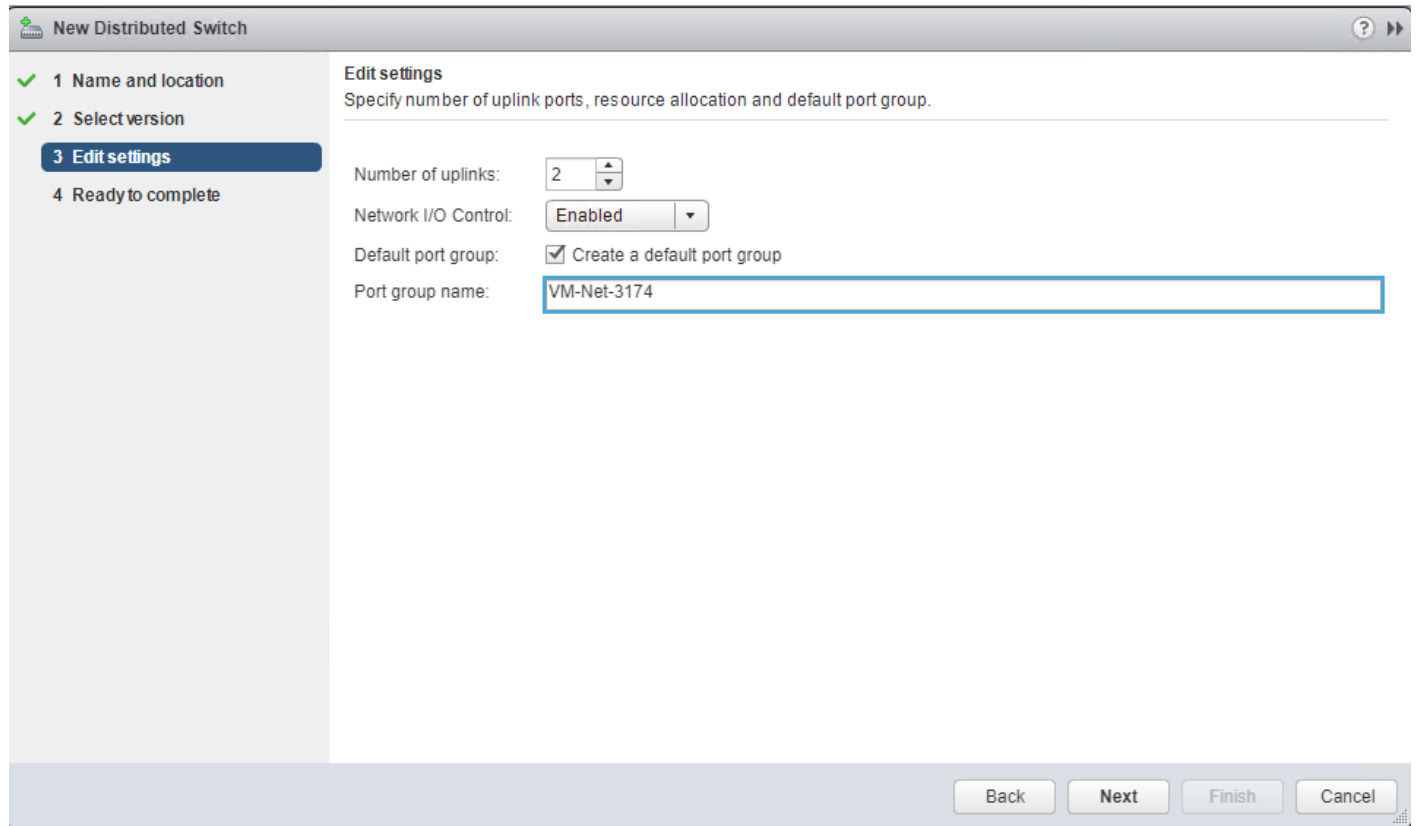

2. Provide a relevant name for the Name field and click Next.

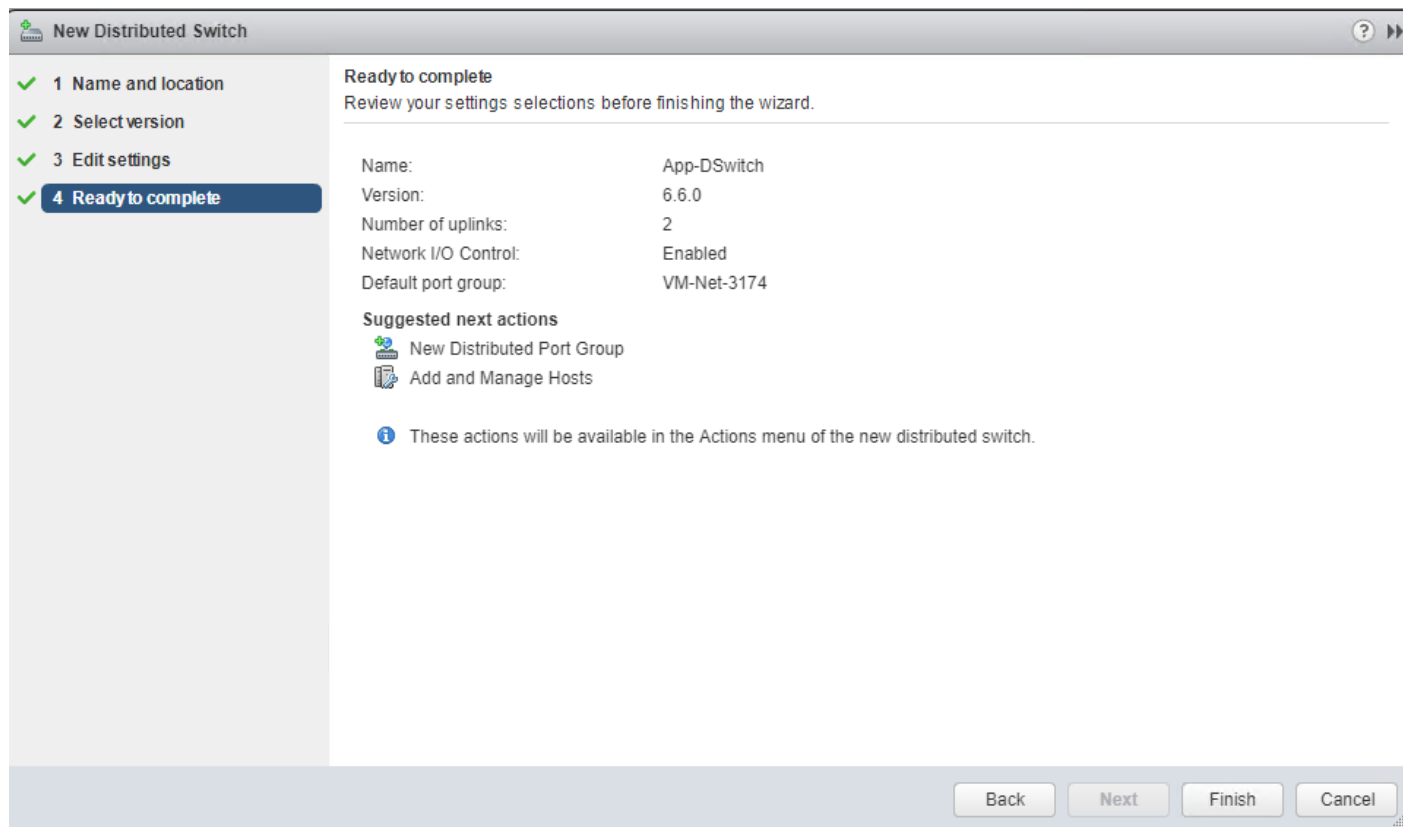

3. Leave the version selected as Distributed switch: 6.6.0 and click Next.

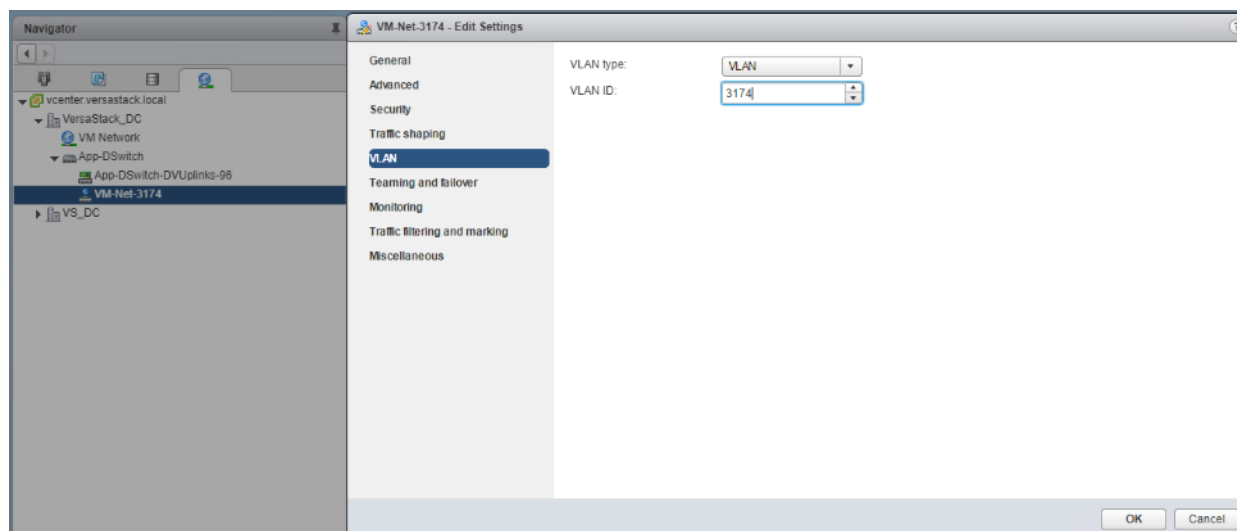

4. Change the Number of uplinks from 4 to 2. If VMware Network I/O Control is to be used for Quality of Service, Leave Network I/O Control Enabled. Otherwise, Disable Network I/O Control. Enter VM-Net-3174 for the name of the default Port group to be created. Click Next.

5. Review the summary in the Ready to complete page and click Finish to create the vDS.

6. Right-click the newly created `App-DSwitch` vDS by selecting the Networking sub-tab of Hosts and Clusters of the Navigator window, and select Settings > Edit Settings...
7. Click the Advanced option for the Edit Settings window and change the MTU from 1500 to 9000.
8. Click OK to save the changes.
9. Right-click the `VM-Net-3174` Distributed Port Group, and select Edit Settings...
10. Click VLAN, changing VLAN type from None to VLAN, and enter in the appropriate VLAN number for the first application network.

The application Distributed Port Groups will not need to adjust their NIC Teaming as they will be Active/Active within the two vNICs uplinks associated to the App-DSwitch, using the default VMware Route based on originating virtual port load balancing algorithm.

11. Click OK to save the changes.
12. Right-Click the App-DSwitch, selecting Distributed Port Group > New Distributed Port Group... for any additional application networks to be created, setting the appropriate VLAN for each new Distributed Port Group.

Add the ESXi Hosts to the vDS

With the vDS and the distributed port groups created within the vDS in place, the ESXi hosts will be added to the vDS.

To add the ESXi Hosts to the vDS, follow these steps:

1. Within the Networking sub-tab of Hosts and Clusters of the Navigator window, right-click the vDS and select Add and Manage Hosts...

What is a Distributed Switch?

A distributed switch acts as a single virtual switch across all associated hosts. This allows virtual machines to maintain consistent network configuration as they migrate across hosts.

Distributed virtual networking configuration consists of three parts. The first part takes place at the datacenter level, where distributed switches are created, and hosts and distributed port groups are added to distributed switches. The second part takes place at the host level, where host ports and networking services are associated with distributed switches either through individual host networking configuration or using host profiles. The third part takes place at the virtual machine level, where virtual machine NICs are connected to distributed port groups either through individual virtual machine NIC configuration or by migrating virtual machine networking from the distributed switch itself.

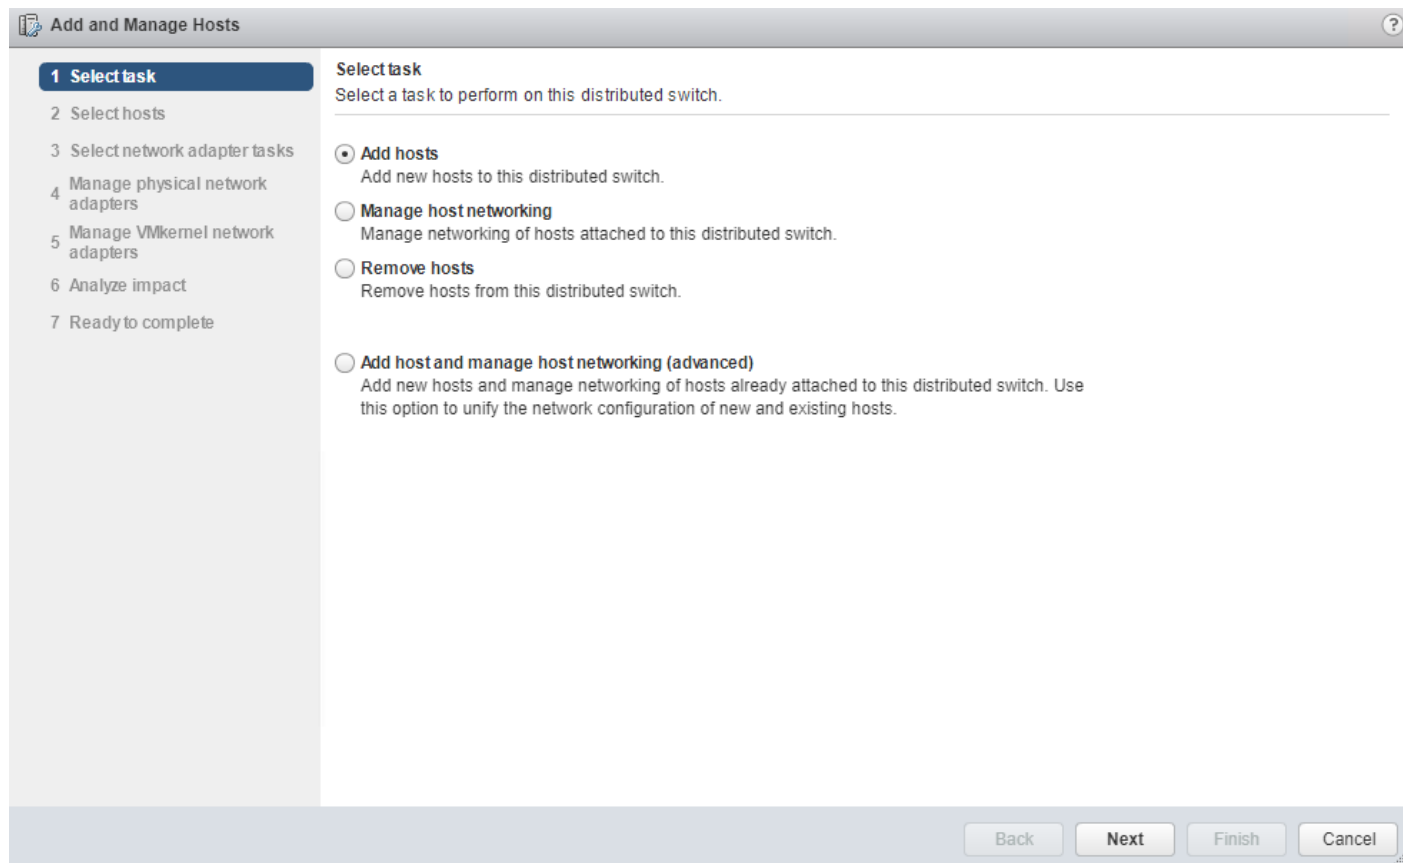

Basic Tasks

- [Add and manage hosts](#)
- [Manage this distributed switch](#)
- [Create a new port group](#)

VersaStack Configuration Backups

Cisco UCS Backup

Automated backup of the Cisco UCS domain is important for recovery of the Cisco UCS Domain from issues ranging from catastrophic failure to human error. There is a native backup solution within Cisco UCS that allows local or remote backup using FTP/TFTP/SCP/SFTP as options and is detailed below.

Backups created can be a binary file containing the Full State, which can be used for a restore to the original or a replacement pair of fabric interconnects. Alternately this XML configuration file consisting of All configurations, just System configurations, or just Logical configurations of the Cisco UCS Domain. For scheduled backups, options will be Full State or All Configuration, backup of just the System or Logical configurations can be manually initiated.

To schedule the backup, follow these steps within the Cisco UCS Manager GUI:

1. Select Admin within the Navigation pane and select All.
2. Click the Policy Backup & Export tab within All.
3. For a Full State Backup, All Configuration Backup, or both, specify the following:
 - a. Hostname : <IP or FQDN of host that will receive the backup>
 - b. Protocol: [FTP/TFTP/SCP/SFTP]
 - c. User: <account on host to authenticate>
 - d. Password: <password for account on host>
 - e. Remote File: <full path and filename prefix for backup file>

Cisco Nexus and MDS Backups

The configuration of the Cisco Nexus 9000 and MDS 9000 switches can be backed up manually at any time with the copy command, but automated backups can be put in place with the NX-OS feature scheduler. An example of setting up automated configuration backups of one of the VersaStack 9336C-FX2 switches is shown below:

```
AA10-9336-FX2-A# conf t
Enter configuration commands, one per line. End with CNTL/Z.
AA10-9336-FX2-A(config)# feature scheduler
AA10-9336-FX2-A(config)# scheduler logfile size 1024
AA10-9336-FX2-A(config)# scheduler job name backup-cfg
AA10-9336-FX2-A(config-job)# copy running-config tftp://192.168.160.242/9336/$(SWITCHNAMW)-
cfg.$(TIMESTAMP) vrf management
AA10-9336-FX2-A(config-job)# exit
AA10-9336-FX2-A(config)# scheduler schedule name daily
AA10-9336-FX2-A(config-schedule)# job name backup-cfg
AA10-9336-FX2-A(config-schedule)# time daily 2:00
AA10-9336-FX2-A(config-schedule)# end
```

Show the job that has been setup:

```
AA10-9336-FX2-A# show scheduler job
Job Name: backup-cfg
-----
copy running-config tftp://192.168.160.242/9336/$(SWITCHNAMW)-cfg.$(TIMESTAMP) vrf management
=====
AA10-9336-FX2-A# show scheduler schedule
Schedule Name      : daily
-----
User Name          : admin
Schedule Type      : Run every day at 2 Hrs 0 Mins
Last Execution Time : Yet to be executed
-----
      Job Name          Last Execution Status
-----
backup-cfg             -NA-
```

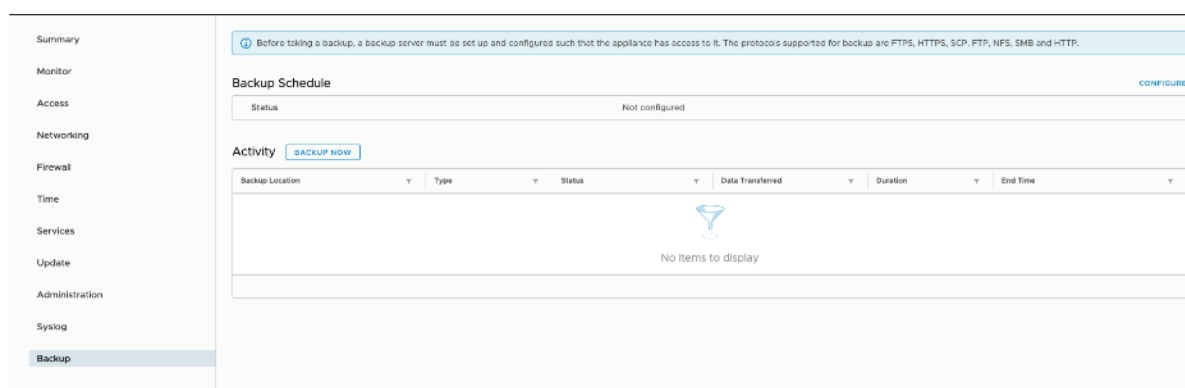

For detailed information about the scheduler, go to:

http://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus9000/sw/7-x/system_management/configuration/guide/b_Cisco_Nexus_9000_Series_NX-OS_System_Management_Configuration_Guide_7x/b_Cisco_Nexus_9000_Series_NX-OS_System_Management_Configuration_Guide_7x_chapter_01010.html

VMware VCSA Backup

Basic backup of the vCenter Server Appliance is also available within the native capabilities of the VCSA, though within the default solution this is manually initiated for each backup operation. To create a backup, follow these steps:

1. Connect to the VCSA Console at <https://<VCSA IP>:5480>
2. Click Backup In the left side menu.

3. Click Configure to open up the Backup Appliance Dialogue.
4. Fill in all the fields based on your requirement.

Create Backup Schedule

Backup location ⓘ

Backup server credentials

User name

Password

Schedule ⓘ : P.M.

Encrypt backup (optional)

Encryption Password

Confirm Password

Number of backups to retain

Retain all backups

Retain last backups

Data

<input checked="" type="checkbox"/> Inventory and configuration	616 MB
<input checked="" type="checkbox"/> Stats, Events, and Tasks	54 MB

5. Review and click CREATE to create the backup schedule.

About the Authors

Sreenivasa Edula, Technical Marketing Engineer, UCS Data Center Solutions Engineering, Cisco Systems, Inc.

Sreeni is a Technical Marketing Engineer in the UCS Data Center Solutions Engineering team focusing on converged and hyper-converged infrastructure solutions, prior to that he worked as a Solutions Architect at EMC Corporation. He has experience in Information Systems with expertise across Cisco Data Center technology portfolio, including DC architecture design, virtualization, compute, network, storage and cloud computing.

Warren Hawkins, Virtualization Test Specialist for IBM Spectrum Virtualize, IBM

Working as part of the development organization within IBM Storage, Warren Hawkins is also a speaker and published author detailing best practices for integrating IBM Storage offerings into virtualized infrastructures. Warren has a background in supporting Windows and VMware environments working in second-line and third-line support in both public and private sector organizations. Since joining IBM in 2013, Warren has played a crucial part in customer engagements and, using his field experience, has established himself as the Test Lead for the IBM Spectrum Virtualize™ product family, focusing on clustered host environments.
