

Managing the Server

This chapter includes the following sections:

- Toggling the Locator LED, on page 1
- Toggling the Front Locator LED for the Chassis, on page 2
- Toggling the Locator LED for a Hard Drive, on page 2
- Clearing Personality Configuration, on page 3
- Selecting a Time Zone, on page 4
- Managing the Server Boot Order, on page 7
- Resetting the Server, on page 20
- Shutting Down the Server, on page 21
- Managing Server Power, on page 21
- Configuring Power Policies, on page 23
- Configuring Fan Policies, on page 35
- Configuring DIMM Black Listing, on page 38
- Configuring BIOS Settings, on page 39
- Secure Boot Certificate Management, on page 43
- Updating Firmware on Server Components, on page 47
- Viewing Product ID (PID) Catalog Details, on page 48
- Uploading and Activating a PID Catalog, on page 49
- Deleting a PID Catalog, on page 51
- Persistent Memory Module, on page 52

Toggling the Locator LED

Before you begin

You must log in with user or admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server # scope chassis	Enters chassis command mode.
Step 2	Server /chassis # set locator-led {on off}	Enables or disables the chassis locator LED.

	Command or Action	Purpose
Step 3	Server /chassis # commit	Commits the transaction to the system configuration.

This example disables the chassis locator LED and commits the transaction:

```
Server# scope chassis
Server /chassis # set locator-led off
Server /chassis *# commit
Server /chassis #
```

Toggling the Front Locator LED for the Chassis

This option is available only on some UCS C-Series servers.

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server # scope chassis	Enters chassis command mode.
Step 2	Server /chassis # set front-locator-led {on off}	Enables or disables the chassis locator LED.
Step 3	Server /chassis # commit	Commits the transaction to the system configuration.

Example

This example disables the chassis locator LED and commits the transaction:

```
Server# scope chassis
Server /chassis # set front-locator-led off
Server /chassis *# commit
Server /chassis #
```

Toggling the Locator LED for a Hard Drive

This action is available only on some UCS C-Series servers.

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server # scope chassis	Enters chassis command mode.
Step 2	Server/chassis # scope hdd	Enters hard disk drive (HDD) command mode.
Step 3	Server/chassis/hdd# locateHDD drivenum {1 2}	Where <i>drivenum</i> is the number of the hard drive whose locator LED you want to set. A value of 1 turns the LED on while a value of 2 turns the LED off.

Example

This example turns on the locator LED on HDD 2:

```
Server# scope chassis

Server /chassis # scope hdd

Server /chassis/hdd # locateHDD 2 1

HDD Locate LED Status changed to 1

Server /chassis/hdd # show

Name Status LocateLEDStatus

HDD1_STATUS present TurnOFF

HDD2_STATUS present TurnON

HDD3_STATUS absent TurnOFF

HDD4_STATUS absent TurnOFF

Server /chassis/hdd #
```

Clearing Personality Configuration

Before you begin

You must log in with admin privileges to perform this task.

Procedure

Step 1 Server # scope chassis

Enters chassis command mode.

Step 2 Server chassis # clear-personality

Clears the personality configuration.

Selecting a Time Zone

Selecting a Time Zone

Selecting a time zone helps you choose a local time zone so that you can view the local time rather than the default machine time. Cisco IMC Web UI and the CLI provide you options to choose and set a time zone of your choice.

Setting the time zone to your local time will apply the time zone variable to all the services that utilize the system timing. This impacts the logging information and is utilized in the following applications of the Cisco IMC:

- Fault summary and fault history logs
- Cisco IMC log
- rsyslog

When you set a local time, the timestamp on the applications that you can view are updated with the local time that you have chosen.

Selecting a Time Zone

Before you begin

You must log in with user or admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server # scope CIMC	Enters Cisco IMC command mode.
Step 2	Server /CIMC # timezone-select	Displays a list of continents and oceans.
Step 3	Enter the number corresponding to your continent or ocean.	A list of all the countries or regions of the chosen continent or ocean displays.
Step 4	Enter the number corresponding to the country or region that you want to set as your time zone.	If a country or a region has more than one time zones, a list of time zones in that country or region displays.
Step 5	Enter the number corresponding to time zone.	Is the above information OK? message appears.
Step 6	Enter 1.	Continue?[y N]: prompt appears.
Step 7	Enter \mathbf{y} if you want to set the chosen time zone.	The chosen time zone is set as the time zone for your Cisco IMC server.

This example sets the time zone:

42) St Maarten (Dutch part)

```
Server# scope CIMC
Server /CIMC # timezone-select
Please identify a location so that time zone rules can be set correctly.
Please select a continent or ocean.
1) Africa
2) Americas
3) Antarctica
4) Arctic Ocean
5) Asia
6) Atlantic Ocean
7) Australia
8) Europe
9) Indian Ocean
10) Pacific Ocean
#? 2
Please select a country whose clocks agree with yours.
1) Anguilla
2) Antigua & Barbuda
3) Argentina
4) Aruba
5) Bahamas
6) Barbados
7) Belize
8) Bolivia
9) Brazil
10) Canada
11) Caribbean Netherlands
12) Cayman Islands
13) Chile
14) Colombia
15) Costa Rica
16) Cuba
17) Curacao
18) Dominica
19) Dominican Republic
20) Ecuador
21) El Salvador
22) French Guiana
23) Greenland
24) Grenada
25) Guadeloupe
26) Guatemala
27) Guyana
28) Haiti
29) Honduras
30) Jamaica
31) Martinique
32) Mexico
33) Montserrat
34) Nicaragua
35) Panama
36) Paraguay
37) Peru
38) Puerto Rico
39) St Barthelemy
40) St Kitts & Nevis
41) St Lucia
```

```
43) St Martin (French part)
44) St Pierre & Miquelon
45) St Vincent
46) Suriname
47) Trinidad & Tobago
48) Turks & Caicos Is
49) United States
50) Uruguay
51) Venezuela
52) Virgin Islands (UK)
53) Virgin Islands (US)
#? 49
Please select one of the following time zone regions.
1) Eastern Time
2) Eastern Time - Michigan - most locations
3) Eastern Time - Kentucky - Louisville area
4) Eastern Time - Kentucky - Wayne County
5) Eastern Time - Indiana - most locations
6) Eastern Time - Indiana - Daviess, Dubois, Knox & Martin Counties
7) Eastern Time - Indiana - Pulaski County
8) Eastern Time - Indiana - Crawford County
9) Eastern Time - Indiana - Pike County
10) Eastern Time - Indiana - Switzerland County
11) Central Time
12) Central Time - Indiana - Perry County
13) Central Time - Indiana - Starke County
14) Central Time - Michigan - Dickinson, Gogebic, Iron & Menominee Counties
15) Central Time - North Dakota - Oliver County
16) Central Time - North Dakota - Morton County (except Mandan area)
17) Central Time - North Dakota - Mercer County
18) Mountain Time
19) Mountain Time - south Idaho & east Oregon
20) Mountain Standard Time - Arizona (except Navajo)
21) Pacific Time
22) Alaska Time
23) Alaska Time - Alaska panhandle
24) Alaska Time - southeast Alaska panhandle
25) Alaska Time - Alaska panhandle neck
26) Alaska Time - west Alaska
27) Aleutian Islands
28) Metlakatla Time - Annette Island
29) Hawaii
#? 8
The following information has been given:
        United States
        Eastern Time - Indiana - Crawford County
Is the above information OK?
1) Yes
2) No
#? 1
You have chosen to set timezone settings to:
        America/Indiana/Marengo
Continue?[y|N]: y
Timezone has been updated.
The local time now is: Sun Jun 1 02:21:15 2014 EST
Server /CIMC #
```

Managing the Server Boot Order

Server Boot Order

Using Cisco IMC, you can configure the order in which the server attempts to boot from available boot device types. In the legacy boot order configuration, Cisco IMC allows you to reorder the device types but not the devices within the device types. With the precision boot order configuration, you can have a linear ordering of the devices. In the web UI or CLI you can change the boot order and boot mode, add multiple devices under each device types, rearrange the boot order, set parameters for each device type.

When you change the boot order configuration, Cisco IMC sends the configured boot order to BIOS the next time that server is rebooted. To implement the new boot order, reboot the server after you make the configuration change. The new boot order takes effect on any subsequent reboot. The configured boot order remains until the configuration is changed again in Cisco IMC or in the BIOS setup.

Note

The actual boot order differs from the configured boot order if either of the following conditions occur:

- BIOS encounters issues while trying to boot using the configured boot order.
- A user changes the boot order directly through BIOS.
- BIOS appends devices that are seen by the host but are not configured from the user.

Important

While upgrading Cisco UCS C220 M5 or C480 M5 servers to release 4.1(1x) under the following conditions:

- if you are upgrading from any release earlier than 4.0(4x)
- if Legacy Boot Mode is enabled and no Cisco IMC Boot Order is configured
- and, if the server is booting from Cisco HWRAID adapter

then, you should perform one of the following before upgrading:

- Run XML-API scripts and UCSCFG based scripts provided here.
 OR
- Manually configure the intended boot order through Cisco IMC GUI or CLI interfaces.

Note

When you create a new policy using the configure boot order feature, BIOS tries to map this new policy to the devices in the system. It displays the actual device name and the policy name to which it is mapped in the **Actual Boot Order** area. If BIOS cannot map any device to a particular policy in Cisco IMC, the actual device name is stated as **NonPolicyTarget** in the **Actual Boot Order** area.

Note

During Cisco IMC 2.0(x) upgrade, the legacy boot order is migrated to the precision boot order. The previous boot order configuration is erased and all device types configured before updating to 2.0 version are converted to corresponding precision boot device types and some dummy devices are created for the same device types. you can view these devices in the **Configured Boot Order** area in the web UI. To view these devices in the CLI, enter **show boot-device** command. During this the server's actual boot order is retained and it can be viewed under actual boot order option in web UI and CLI.

When you downgrade Cisco IMC prior to 2.0(x) verison the server's last legacy boot order is retained, and the same can be viewed under **Actual Boot Order** area. For example:

- If you configured the server in a legacy boot order in 2.0(x) version, upon downgrade a legacy boot order configuration is retained.
- If you configured the server in a precision boot order in 2.0(x), upon downgrade the last configured legacy boot order is retained.

Important

- Boot order configuration prior to 2.0(x) is referred as legacy boot order. If your running version is 2.0(x), then you cannot configure legacy boot order through web UI, but you can configure through CLI and XML API. In the CLI, you can configure it by using **set boot-order HDD,PXE** command. Even though, you can configure legacy boot order through CLI or XML API, in the web UI this configured boot order is not displayed.
- Legacy and precision boot order features are mutually exclusive. You can configure either legacy or precision boot order. If you configure legacy boot order, it disables all the precision boot devices configured. If you configure precision boot order, then it erases legacy boot order configuration.

Viewing the Boot Device Detail

Note

Do not change the boot order while the host is performing BIOS power-on self test (POST).

Before you begin

You must log in with user or admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # show boot-device [detail].	Displays the detailed information of the boot device.

This example displays the details of the created bootable device:

```
Server# scope bios
Server /bios # show boot-device
Boot Device Device Type Device State
                                                  Device Order
TestUSB
                   USB Enabled
TestPXE
                   PXE
                               Enabled
                                                  2
Server /bios # show boot-device detail
Boot Device TestUSB:
   Device Type: USB
   Device State: Enabled
   Device Order: 1
   Sub Type: HDD
Boot Device TestPXE:
   Device Type: PXE
   Device State: Enabled
   Device Order: 2
   Slot Id: L
   Port Number: 1
```

Configuring the Precision Boot Order

Note

Do not change the boot order while the host is performing BIOS power-on self test (POST).

Before you begin

Beginning with release 4.1(3b), Cisco IMC supports HTTP Boot Capability. HTTP Boot is supported in UEFI Boot Mode only.

You must log in with user or admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # create-boot-device [<i>device</i> name] [<i>device type</i>].	Creates a bootable device that BIOS chooses to boot. This can be one of the following:
		• HDD—Hard disk drive
		• PXE—PXE boot
		• SAN boot
		• iSCSI boot
		• SD Card

	Command or Action	Purpose	
		Note	SD card option is available only on some UCS C-Series servers.
		• USB	
		• Virtual	Media
		• PCHSto	orage
		• UEFISH	HELL
		• HTTP	
Step 3	Server /bios # scope boot-device created boot device name.	Enters the madevices.	nagement of the created bootable
Step 4	Server /bios /boot-device # set values	Specifies the property values for particular bootable device. You can set one or more of the following:	
		• cli— CLI options	
		• state— Whether the device will be visib by BIOS. By default the device is disable	
		Note	If enabled, the device will overwrite the legacy boot order configuration.
		• slot— Sl in.	lot id where the device is plugged
		• port— P	ort of the slot in which the device
			Logical unit in a slot where the spresent.
		• sub-type device ty	—Sub device type under a certain ype.
			The order of the device in the e list of devices.
			ess—MAC address of the network interface
		• iptype—	- IP type.
		Enter an or IPv6	y one of the required values: IPv4
		• ipconfig	-type— Type of IP Configuration.

	Command or Action	Purpose
		Enter any one of the required values: DHCP or Static
		• uri— URI path where all the OS iso and EFI files are located.
Step 5	Server /bios /boot-device # commit	Commits the transaction to the system configuration.

This example configures the boot order, creates a boot device, set the attributes of the new device and commit the transaction:

```
Server# scope bios
Server /bios # create boot-device TestPXE PXE
Server /bios # scope boot-device TestPXE
Server /bios /boot-device # set state Enabled
Server /bios /boot-device # set slot L
Server /bios /boot-device # set port 1
Server /bios /boot-device # set order 1
Server /bios /boot-device # commit
Enabling boot device will overwrite Legacy Boot Order configuration
Continue?[y|N]y
Server /bios /boot-device # y
Committing device configuration
Server /bios/boot-device # show detail
BTOS:
   BIOS Version: "C240M3.2.0.0.15 (Build Date: 03/16/2014)"
   Boot Order: (none)
   Boot Override Priority:
    FW Update/Recovery Status: None, OK
    UEFI Secure Boot: disabled
    Configured Boot Mode: None
   Actual Boot Mode: Legacy
    Last Configured Boot Order Source: CIMC
Server /bios/boot-device # show boot-device detail
Boot Device TestPXE:
   Device Type: PXE
   Device State: Enabled
    Device Order: 1
    Slot Id: L
    Port Number: 1
```

This example configures the boot order, creates a HTTP boot device for the IP type - **DHCP**, sets the attributes of the new device and commits the transaction:

```
Server# scope server 1
Server /server # scope bios
Server /server/bios # create boot-device HTTP-Test HTTP
Server /server/bios # scope boot-device HTTP-Test
Server /server/bios/boot-device # set status enabled
Server /server/bios/boot-device # set port 10
Server /server/server/bios /boot-device # set order 1
Server /server/bios /boot-device # set slot MLOM
Server /server/bios/boot-device # set iptype IPv4
```

```
Server /server/bios/boot-device # set macaddress 00:25:B5:00:01:2b
Server /server/bios/boot-device # set ipconfig-type DHCP
Server /server/bios/boot-device # set uri http://www.cloudboot.com:80/EFI/rhel_82_dvd.iso
Server /bios /boot-device # commit
Committing device configuration
Server /server/bios/boot-device # show detail
BBTOS:
   BIOS Version: server-name.2.0.7c.0.071620151216
    Backup BIOS Version: server-name.2.0.7c.0.071620151216

   IP Type: IPv6
   IP Config Type: Static
   URI: http://cisco.com/a.iso
    IP Address: 2001:420:5446:2014::330:12
    Netmask/IPV6 Prefix: 64
    Gateway: 2001:420:5446:2014::330:1
```

DNS Server: 2001:420:c0e0:1008::118
Server /server/bios/boot-device #

What to do next

Reboot the server to boot with your new boot order.

Modifying the Attributes of a Boot Device

Note

Do not change the boot order while the host is performing BIOS power-on self test (POST).

Before you begin

You must log in with user or admin privileges to perform this task.

	Command or Action	Purpose	
Step 1	Server# scope bios	Enters the BIOS command mode.	
Step 2	Server/bios#scope boot-device created boot device name.	Enters the management of the created bootable devices.	
Step 3	Server /bios /boot-device # set state {Enabled Disabled}.	Enables or disables the device. The default state is disabled.	
		Note If enabled, the device will overwrite the legacy boot order configuration.	
Step 4	Server/bios/boot-device* # set order {Index 1-50}.	Specifies the order of booting for particular device in the device list. Enter a number between 1 and 50 based on the total number of created device.	
		When you set the boot device order individually, it is not assured that the order appears in the way it was set. So, it is recommended that to set the order for multiple devices in a single execution, use re-arrange-boot-device command.	
Step 5	Server /bios /boot-device* # set port {value 1-255 }.	Specifies the port of the slot in which the device is present. Enter a number between 1 and 255.	

	Command or Action	Purpose
Step 6	Server/server/bios/boot-device* # set iptype {value IPv4 IPv6}.	Specifies the IP type for the device.
Step 7	Server/server/bios/boot-device* # set macaddress {value }.	Sets the MAC address of the network ethernet interface.
Step 8	Server /server/bios /boot-device* # set ipconfig-type {value DHCP Static }.	Specifies the IP configuration type for the device.
Step 9	Server /server/bios /boot-device* # set uri {value }.	Specifies the URI path where all the OS iso and EFI files are located.
Step 10	Server /bios /boot-device* # commit	Commits the transaction to the system configuration.

This example modifies the attributes of an existing device:

```
Server# scope bios

Server /bios *# scope boot-device scu-device-hdd

Server /bios/boot-device # set status enabled

Server /bios/boot-device *# set order 2

Server /bios/boot-device *# set port 1

Server /bios/boot-device *# commit

Enabling boot device will overwrite boot order Level 1 configuration

Continue?[y|N]y

Server /bios/boot-device #
```

This example modifies the attributes of an existing HTTP boot device:

```
Server# scope server 1
Server /server # scope bios
Server /server/bios *# scope boot-device http-test
Server /server/bios/boot-device # show detail
Boot Device http-test:
   Device Type: HTTP
    Device State: Disabled
   Device Order: 3
   Slot Id: 1
   Port Number: 10
   MAC Address: 00:25:B5:00:01:2b
   IP Type: IPv4
   IP Config Type: DHCP
   URI: http://www.cloudboot.com:80/EFI/rhel 82 dvd.iso
Server /server/bios/boot-device # set iptype IPv6
Server /server/bios/boot-device *# set slot 34
Server /server/server/bios /boot-device # set order 1
Server /server/bios/boot-device *# set macaddress 00:25:B5:00:01:2c
Server /server/bios/boot-device *# set uri http://www.cloudboot.com:80/dvd.iso
Server /server/bios/boot-device *# commit
Server /server/bios/boot-device # show detail
Boot Device http-test:
   Device Type: HTTP
   Device State: Disabled
   Device Order: 3
```

```
Slot Id: 34
Port Number: 10
MAC Address: 00:25:B5:00:01:2c
IP Type: IPv6
IP Config Type: DHCP
URI: http://www.cloudboot.com:80/dvd.iso
Server /server/bios/boot-device #
```

Rearranging Device Boot Order

Note

Do not change the boot order while the host is performing BIOS power-on self test (POST).

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # rearrange boot-device[device name]:[position].	Rearranges the selected boot devices in a single execution.

Example

This example rearranges the selected boot devices:

```
Server# scope bios

Server /bios # rearrange-boot-device TestPXE:1,TestUSB:2

Server /bios # show boot-device

Boot Device Device Type Device State Device Order

TestPXE PXE Disabled 1

TestUSB USB Disabled 2

Server /bios #
```

Re-Applying the Boot Order Configuration

Note

Do not change the boot order while the host is performing BIOS power-on self test (POST).

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # re-apply.	Re-applies the boot order to BIOS, if the last configured boot order source is BIOS

Example

This example re-applies the boot order to BIOS:

```
Server# scope bios
Server /bios # re-apply
Server /bios #
```

What to do next

Reboot the host after reapplying the boot order to BIOS.

Deleting an Existing Boot Device

Note

Do not change the boot order while the host is performing BIOS power-on self test (POST).

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server/bios#remove-boot-device device name	Deletes the particular device from the boot order.

Example

This example deletes the selected device from the device list:

```
Server# scope bios
Server /bios # remove-boot-device scu-device-hdd
Server /bios #
```

Overview to UEFI Secure Boot

You can use Unified Extensible Firmware Interface (UEFI) secure boot to ensure that all the EFI drivers, EFI applications, option ROM or operating systems prior to loading and execution are signed and verified for authenticity and integrity, before you load and execute the operating system. You can enable this option using either web UI or CLI. When you enable UEFI secure boot mode, the boot mode is set to UEFI mode and you cannot modify the configured boot mode until the UEFI boot mode is disabled.

Note

If you enable UEFI secure boot on a nonsupported OS, on the next reboot, you cannot boot from that particular OS. If you try to boot from the previous OS, an error is reported and recorded the under system software event in the web UI. You must disable the UEFI secure boot option using Cisco IMC to boot from your previous OS.

Important

Also, if you use an unsupported adapter, an error log event in Cisco IMC SEL is recorded. The error messages is displayed that says:

System Software event: Post sensor, System Firmware error. EFI Load Image Security Violation. [0x5302] was asserted .

UEFI secure boot is supported on the following components:

Components	Types
Supported OS	• Windows Server 2019
	• Windows Server 2016
	• ESX 6.7
	• ESX 6.5
	• ESXi 7.0
	• Linux
Broadcom PCI adapters	 5709 dual and quad port adapters 57712 10GBASE-T adapter 57810 CNA 57712 SFP port

Enabling UEFI Secure Boot Mode

Procedure

	Command or Action	Purpose		
Step 1	Server# scope bios	Enters t	he BIOS command mode.	
Step 2	Server/ BIOS # set secure-boot enable disable	Enables	Enables or disables UEFI secure boot.	
		Note	If enabled, the boot mode is set to UEFI secure boot mode. You cannot modify configure boot mode until UEFI secure boot mode is disabled.	
		Note	In case of RFD (Reset Factory Default), you must re-enable UEFI Secure Boot.	

Example

This example enables UEFI secure boot mode and commits the transaction

Server# scope bios
Server /bios # set secure-boot enable
Setting Value : enable
Commit Pending.
Server /bios *# commit

```
UEFI Secure boot state changed successfully. Execute 'show detail' command to check the current status Server /bios \#
```

What to do next

Reboot the server to have your configuration boot mode settings take place.

Disabling UEFI Secure Boot

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server/ BIOS # set secure-boot enable disable	Enables or disables UEFI secure boot.

Example

This example disables UEFI secure boot mode and commits the transaction

```
Server# scope bios

Server /bios # set secure-boot disable

Setting Value : enable

Commit Pending.

Server /bios *# commit

UEFI Secure boot state changed successfully. Execute 'show detail' command to check the current status

Server /bios #
```

What to do next

Reboot the server to have your configuration boot mode settings take place.

Viewing the Actual Server Boot Order

The actual server boot order is the boot order actually used by the BIOS when the server last booted. The actual boot order can differ from the boot order configured in Cisco IMC.

	Command or Action	Purpose
Step 1	Server# scope bios	Enters bios command mode.
Step 2	Server /bios # show actual-boot-order [detail]	Displays the boot order actually used by the BIOS when the server last booted.

This example displays the actual boot order of the legacy boot order from the last boot:

Server# scope bios
Server /bios # show actual-boot-order

Boot Order	Type	Boot Device
1	CD/DVD	CD-ROM
2	CD/DVD	Cisco Virtual CD/DVD 1.18
3	Network Device (PXE)	Cisco NIC 23:0.0
4	Network Device (PXE)	MBA v5.0.5 Slot 0100
5	Network Device (PXE)	MBA v5.0.5 Slot 0101
6	Network Device (PXE)	MBA v5.0.5 Slot 0200
7	Network Device (PXE)	MBA v5.0.5 Slot 0201
8	Network Device (PXE)	Cisco NIC 22:0.0
9	Internal EFI Shell	Internal EFI Shell
10	FDD	Cisco Virtual HDD 1.18
11	FDD	Cisco Virtual Floppy 1.18

Server /bios #

This example displays the actual boot order of precision boot order from the last boot:

Server /bios # show actual-boot-order			
Boot Order	Boot Device	Device Type	Boot Policy
1	IBA GE Slot 0201 v1398	PXE	TestPXE
2	IBA GE Slot 0200 v1398	PXE	NonPolicyTarget
3	IBA GE Slot 0202 v1398	PXE	NonPolicyTarget
4	IBA GE Slot 0203 v1398	PXE	NonPolicyTarget
5	"UEFI: Built-in EFI Shell "	EFI	NonPolicyTarget
Server /bio	s #		

Resetting the Server

Important

If any firmware or BIOS updates are in progress, do not reset the server until those tasks are complete.

Before you begin

You must log in with user or admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.
Step 2	Server /chassis # power hard-reset	After a prompt to confirm, resets the server.

This example resets the server:

```
Server# scope chassis Server /chassis # power hard-reset This operation will change the server's power state. Continue?[y|N]
```

Shutting Down the Server

Important

If any firmware or BIOS updates are in progress, do not shut down the server until those tasks are complete.

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis mode.
Step 2	Server /chassis # power shutdown	Shuts down the server.

Example

The following example shuts down the server:

```
Server# scope chassis
Server /chassis # power shutdown
```

Managing Server Power

Powering On the Server

Note

If the server was powered off other than through the Cisco IMC, the server will not become active immediately when powered on. In this case, the server will enter standby mode until the Cisco IMC completes initialization.

Important

If any firmware or BIOS updates are in progress, do not change the server power until those tasks are complete.

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters the chassis command mode.
Step 2	Server /chassis # power on	Turns on the server.
Step 3	At the prompt, enter y to confirm.	Turns on the server.

Example

This example shows how to turn on the server:

```
Server# scope chassis Server /chassis # power on Warning: System is already powered ON, this action is ineffective. Do you want to continue?[y|N]\mathbf{y}
```

Powering Off the Server

Important

If any firmware or BIOS updates are in progress, do not power off the server until those tasks are complete.

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.
Step 2	Server /chassis # power off	Turns off the server.

Example

This example turns off the server:

Power Cycling the Server

Important

If any firmware or BIOS updates are in progress, do not power cycle the server until those tasks are complete.

Before you begin

You must log in with user or admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.
Step 2	Server /chassis # power cycle	Power cycles the server.

Example

This example power cycles the server:

```
Server# scope chassis
Server /chassis # power cycle
```

Configuring Power Policies

Power Capping

Important

This section is valid only for some UCS C-Series servers.

Power capping determines how server power consumption is actively managed. When you enable power capping option, the system monitors power consumption and maintains the power below the allocated power limit. If the server cannot maintain the power limit or cannot bring the platform power back to the specified

power limit within the correction time, power capping performs actions that you specify in the **Action** field under the **Power Profile** area.

Once power capping is enabled, you can configure multiple power profiles to either have standard or advanced power profiles with defined attributes. If you choose a standard power profile, you can set the power limit, correction time, corrective-action, suspend period, hard capping, and policy state (if enabled). If you choose an advanced power profile, in addition to the attributes of the standard power profile, you can also set the domain specific power limits, safe throttle level, and ambient temperature based power capping attributes.

Note

The following changes are applicable for Cisco UCS C-Series release 2.0(13) and later:

- After upgrading to the 2.0(13) release, power characterization automatically runs during the first host power on. Subsequent characterization runs only if initiated as described in section Run Power Characterization section.
- Also, when a server is power cycled and there is a change to the CPU or DIMM configurations, power
 characterization automatically runs on first host boot. For any other hardware change like PCIe adapters,
 GPU or HDDs, power characterization does not run. The characterized power range is modified depending
 on the components present after the host power cycle.

The **Run Power Characterization** option in the **Power Cap Configuration** Tab of the Web UI power cycles the host and starts power characterization.

Setting Power Redundancy Policy

Before you begin

You must log in as a user with admin privileges to perform this action.

	Command or Action	Purpose
Step 1	Server # scope sensor	Enters sensor command.
Step 2	Server/sensor#scope psu-redundancy-policy	Enters psu redundancy policy command.
Step 3	Server /sensor/psu-redundancy-policy #set psu-redundancy-policyvalue	Choose one of the following redundancy value that you want to set: • non-redundant - N, the available PSU output capacity, equals the number of PSUs installed, where PSU failure or grid failure is not supported. • N+1 - N, the available PSU output capacity, equals the number of PSUs installed minus 1 (N-1), where the single PSU failure is supported, but grid failure is not supported.

	Command or Action	Purpose
		• grid - N, the available PSU output capacity, equals half the number of PSUs installed (N/2), where N PSU failure or grid failure is supported. This policy implies that the you have connected N number of PSUs to one feed and the other N number of PSUs to another feed.
Step 4	Server /sensor/psu-redundancy-policy* #commit	Commits the transaction to the server.
Step 5	(Optional) Server /sensor/psu-redundancy-policy #show detail	Displays the power redundancy status.

This example shows how to set power redundancy for the server:

```
Server / #scope sensor
Server /sensor #scope psu-redundancy-policy
Server /sensor/psu-redundancy-policy # set psu-redundancy-policy grid
Server /sensor/psu-redundancy-policy* # commit
Server /sensor/psu-redundancy-policy # show detail
PSU Redundancy Policy: grid
Server /sensor/psu-redundancy-policy #
```

Enabling Power Characterization

This option is available only on some Cisco UCS C-Series servers.

Before you begin

You must log in with admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.
Step 2	Server /chassis # scope power-cap-config	Enters power cap command mode.
Step 3	Server /chassis # run-pow-char-at-boot	Runs the power characterization at boot.
Step 4	Server /chassis # commit	Commits the transaction to the system.

Example

This example shows how to automatically invoke power characterization during a host reboot:

```
Server# scope chassis
Server /chassis# scope power-cap-config
Server /chassis /power-cap-config # run-pow-char-at-boot
Server /chassis /power-cap-config* # commit
Server /chassis/power-cap-config #
```

Configuring the Power Cap Policy

This option is available only on some Cisco UCS C-Series servers.

Before you begin

You must log in with admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.
Step 2	Server /chassis # scope power-cap-config	Enters power cap command mode.
Step 3	Server /chassis /power-cap-config# set pow-cap-enable {yes no}	Enables or disables the capping of power to the server.
Step 4	Server /chassis /power-cap-config# commit	Commits the transaction to the system configuration.

Example

This example shows how to enable the power capping policy:

```
Server# scope chassis
Server /chassis# scope power-cap-config
Server /chassis /power-cap-config # set pow-cap-enable yes
Server /chassis /power-cap-config* # commit
Server /chassis/power-cap-config #
```

Checking the Power Cap Range

This option is available only on some Cisco UCS C-Series servers.

Before you begin

You must log in with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Chassis power-cap-config # show detail	Dislpays details of the power cap range.

Command or Action	Purpose
	Platform Min (Allow-Throttle) - This is the lower power limit for the chassis when CPU throttling is enabled. To use this as the platform minimum, set the allow-throttle field to enabled in the standard or advanced power-profile scope.
	Platform Min (Efficient) - This is the lower power limit for the chassis when the CPU throttling is disabled.
	CPU Min (Allow-Throttle) - This is the lower power limit for the CPU domain when throttling is enabled. To use this as the CPU minimum, set the allow-throttle field to enabled in the standard or advanced power-profile scope.
	CPU Min (Efficient) - This is the lower power limit for the CPU domain when throttling is disabled.

```
Power Characterization Enabled: yes
Power Capping: yes
Power Characterization Status: Completed
Platform Min (Allow-Throttle) (W): 164
Platform Min (Efficient) (W): 286
Platform Max (W): 582
Memory Min (W): 2
Memory Max (W): 5
CPU Min (Allow-Throttle) (W): 64
CPU Min (Efficient) (W): 177
CPU Max (W): 330
```

Configuring Standard Power Profile

This option is available only on some Cisco UCS C-Series servers.

Before you begin

- Power capping must be enabled.
- You must log in with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.

	Command or Action	Purpose
Step 2	Server /chassis # scope power-cap-config	Enters power cap command mode.
Step 3	Server /chassis /power-cap-config# set pow-cap-enable {yes no}	Enables or disables the power capping capability of the system.
Step 4	Server /chassis /power-cap-config# scope power-profile standard	Enters the standard command mode of a power profile
Step 5	Server /chassis /power-cap-config# set allow-throttle yes no	Enables or disables the system to maintain the power limit by forcing the processor to use the throttling state (T-state) and memory throttle.
Step 6	Server /chassis /power-cap-config# set corr-time value	Sets the correction time in which the platform power should be brought back to the specified power limit before taking the action specified in the Action mode.
		The range is from 3 and 600 seconds. The default is 3 seconds.
Step 7	Server /chassis /power-cap-config# set except-action alert shutdown	Specifies the action to be performed if the specified power limit is not maintained within the correction time. This can be one of the following:
		• Alert—Logs the event to the Cisco IMC SEL.
		• Shutdown —Gracefully shuts down the host.
		• None—No actions are taken.
Step 8	Server /chassis /power-cap-config# set hard-cap yes no	Enables or disables the system to maintain the power consumption below the specified power limit.
Step 9	Server /chassis /power-cap-config# set	Specifies the power limit.
	pow-limit value	Enter a value within the specified range.
Step 10	Server /chassis /power-cap-config# set susp-pd {h:m-h:m /All,Mo,Tu,We,Th,Fr,Sa,Su.}	Specifies the time period that the power capping profile is not active.
Step 11	Server /chassis /power-cap-config# commit	Commits the transaction to the system.

This example shows how to configure standard power profile:

Server# scope chassis

```
Server /chassis# scope power-cap-config
Server /chassis /power-cap-config # set pow-cap-enable yes
Server /chassis /power-cap-config* # commit
Server /chassis/power-cap-config # scope power-profile advance
Server /chassis/power-cap-config # set allow-throttle yes
Server /chassis/power-cap-config* # set corr-time 6
Server /chassis/power-cap-config* \# set except-action alert
Server /chassis/power-cap-config* # set hard-cap yes
Server /chassis/power-cap-config* # set pow-limit 360
Server /chassis/power-cap-config* # set susp-pd 1:30-2:30|All
Server /chassis/power-cap-config* # commit
Server /chassis/power-cap-config # show detail
Power Cap Config:
   Power Characterization Enabled: yes
   Power Capping: no
    Power Characterization Status: Completed
   Platform Min (Allow-Throttle) (W): 164
   Platform Min (Efficient) (W): 290
   Platform Max (W): 581
   Memory Min (W): 2
   Memory Max (W): 5
    CPU Min (Allow-Throttle) (W): 64
    CPU Min (Efficient)(W): 177
   CPU Max (W): 330
```

Configuring Advanced Power Profile Settings

You can configure these settings only on some UCS C-Series servers.

Before you begin

- You must enable power capping.
- You must log in with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server # scope chassis	Enters chassis command mode.
Step 2	Server /chassis # scope power-cap-config	Enters power cap command mode.
Step 3	Server /chassis /power-cap-config # set pow-cap-enable {yes no}	Enables or disables the power capping capability of the server.
Step 4	Server /chassis /power-cap-config # commit	Commits the transaction to the system.
Step 5	Server /chassis /power-cap-config # scope power-profile advanced	Enters the advance command mode of a power profile.
Step 6	Server /chassis /power-cap-config/power-profile # set allow-throttle {yes no}	Enables or disables the system to maintain the power limit by forcing the processor to use the throttling state (T-state) and memory throttle.

	Command or Action	Purpose
Step 7	Server /chassis /power-cap-config/power-profile # set corr-time value	Sets the maximum time to take corrective actions in order to bring the platform back to the specified power limit before taking the actions specified in the Action mode.
		The range is from 3 and 600 seconds. The default is 3 seconds.
Step 8	Server /chassis	Specifies the power limit for the CPU.
	/power-cap-config/power-profile # set cpu-power-limit value	Enter power in watts within the range specified.
Step 9	Server /chassis /power-cap-config/power-profile # set except-action {alert shutdown}	Specifies the action to be performed if the specified power limit is not maintained within the correction time. This can be one of the following:
		• Alert—Reports the event to the Cisco IMC SEL.
		• Shutdown —Gracefully shuts down the host.
		• None—No actions are taken.
Step 10	Server /chassis /power-cap-config/power-profile # set hard-cap {yes no}	Enables or disables the system to maintain the power consumption below the specified power limit.
Step 11	Server /chassis	Specifies the power limit for the memory.
	/power-cap-config/power-profile # set mem-pow-limit value	Enter power in watts within the range specified.
Step 12	Server /chassis /power-cap-config/power-profile # set fail-safe-timeout value	Specifies a safe throttle policy when the power capping functionality is impacted internal faults such as missing power readings for platforms or CPUs.
		The range is from 1 and 10 seconds.
Step 13	Server /chassis /power-cap-config/power-profile # set plat-safe-Tlvl value	Specifies the throttling level for the platform in percentage.
		The range is from 0 and 100.
Step 14	Server /chassis	Specifies the inlet temperature sensor.
	/power-cap-config/power-profile # set plat-temp <i>value</i>	Enter value in Celsius.
Step 15	Server /chassis	Specifies the power limit.
	/power-cap-config/power-profile # set pow-limit <i>value</i>	Enter power in watts within the range specified.

	Command or Action	Purpose
Step 16	Server /chassis /power-cap-config/power-profile # set susp-pd {h:m-h:m /All,Mo,Tu,We,Th,Fr,Sa,Su.}	Specifies the time period that the power capping profile will not be active.
Step 17	Server /chassis/power-cap-config/power-profile # set thermal-power-limit value	Specifies the power limit to be maintained. Enter power in watts within the range specified.
Step 18	Server /power-cap-config/power-profile # commit	Commits the transaction to the system configuration.

This example shows how to configure the advance power profile setting:

```
Server# scope chassis
Server /chassis# scope power-cap-config
Server /chassis /power-cap-config # set pow-cap-enable yes
Server /chassis /power-cap-config* # commit
Server /chassis/power-cap-config # scope power-profile advanced
Server /chassis/power-cap-config/power-profile # set allow-throttle yes
Server /chassis/power-cap-config/power-profile* # set corr-time 6
Server /chassis/power-cap-config/power-profile*# set cpu-power-limit 259
Server /chassis/power-cap-config/power-profile* # set except-action alert
Server /chassis/power-cap-config/power-profile* # set hard-cap yes
Server /chassis/power-cap-config/power-profile* # set mem-pow-limit 259
Server /chassis/power-cap-config/power-profile* # set fail-safe-timeout 10
Server /chassis/power-cap-config/power-profile* # set plat-safe-Tlvl 50
Server /chassis/power-cap-config/power-profile* # set plat-temp 35
Server /chassis/power-cap-config/power-profile* # set pow-limit 360
Server /chassis/power-cap-config/power-profile* # set susp-pd 1:30-2:30|All
Server /chassis/power-cap-config/power-profile* # set thermal-power-limit 354
Server /chassis/power-cap-config/power-profile* # commit
Server /chassis/power-cap-config/power-profile #
```

Resetting the Power Profiles to Defaults

This option is available only on some Cisco UCS C-Series servers.

Before you begin

You must log in with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.
Step 2	Server /chassis # scope power-cap-config	Enters power cap command mode.

	Command or Action	Purpose
Step 3	Server /chassis # reset-power-profile-to-defaults	Resets the power profile settings to factory-default values and disables power capping.
Step 4	Server /chassis # commit	Commits the transaction to the system.

This example shows how to reset the power profile to the default settings:

```
Server# scope chassis
Server /chassis# scope power-cap-config
Server /chassis /power-cap-config # reset-power-profile-to-defaults
Server /chassis /power-cap-config* # commit
Server /chassis/power-cap-config #
```

Viewing the Power Capping Configuration

This option is available only on some Cisco UCS C-Series servers.

Before you begin

You must log in with admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server # scope chassis	Enters chassis command mode.
Step 2	Server /chassis # scope power-cap-config	Enters power cap configuration command mode.
Step 3	Server/chassis/power-cap-config # show detail	Displays information about the power characterization.

Example

This example shows how to view information about the power cap configuration:

```
Server #scope chassis
Server/chassis # scope power-cap-config
Server /chassis/power-cap-config # show detail
Power Cap Config:
    Power Characterization Enabled: yes
    Power Capping: no
    Power Characterization Status: Completed
    Platform Min (Allow-Throttle) (W): 164
    Platform Min (Efficient) (W): 290
    Platform Max (W): 581
    Memory Min (W): 2
    Memory Max (W): 5
```

```
CPU Min (Allow-Throttle) (W): 64
CPU Min (Efficient) (W): 177
CPU Max (W): 330
Server /chassis/power-cap-config #
```

Viewing the Power Statistics

This option is available only on some UCS C-Series servers.

Before you begin

You must log in with admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server # scope chassis	Enters chassis command mode.
Step 2	Server /chassis # show power-monitoring	Displays the power used by the server, CPU, and memory since the last time it was rebooted.

Example

This example shows how to view the power statistics of an individual domain:

Configuring the Power Restore Policy

The power restore policy determines how power is restored to the server after a chassis power loss.

Before you begin

You must log in with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server # Scope CIMC	Enters the Cisco IMC command mode.
Step 2	Server /CIMC # Scope power-restore-policy	Enters the power restore policy command mode.

	Command or Action	Purpose
Step 3	Server /CIMC/power-restore-policy # set policy {power-off power-on restore-last-state}	Specifies the action to be taken when chassis power is restored. Select one of the following:
		• power-off—Server power will remain off until manually turned on. This is the default action.
		• power-on—Server power will be turned on when chassis power is restored.
		• restore-last-state—Server power will return to the state before chassis power was lost.
		When the selected action is power-on , you can select a delay in the restoration of power to the server.
Step 4	(Optional) Server /CIMC/power-restore-policy # set delay {fixed random}	Specifies whether server power will be restored after a fixed or random time. The default is fixed . This command is accepted only if the power restore action is power-on .
Step 5	(Optional) Server /CIMC/power-restore-policy # set delay-value delay	Specifies the delay time in seconds. The range is 0 to 240; the default is 0.
Step 6	Server /CIMC/power-restore-policy # commit	Commits the transaction to the system configuration.

This example sets the power restore policy to power-on with a fixed delay of 180 seconds (3 minutes) and commits the transaction:

```
Server# scope CIMC

Server /CIMC # Scope power-restore-policy
Server /CIMC/power-restore-policy # set policy power-on
Server /CIMC/power-restore-policy *# commit
Server /CIMC/power-restore-policy # set delay fixed
Server /CIMC/power-restore-policy *# set delay-value 180
Server /CIMC/power-restore-policy *# commit
Server /CIMC/power-restore-policy # show detail
Power Restore Policy:
    Power Restore Policy: power-on
    Power Delay Type: fixed
    Power Delay Value(sec): 180

Server /CIMC/power-restore-policy #
```

Configuring Fan Policies

Fan Control Policies

Fan Control Policies enable you to control the fan speed to bring down server power consumption and noise levels. Prior to these fan policies, the fan speed increased automatically when the temperature of any server component exceeded the set threshold. To ensure that the fan speeds were low, the threshold temperatures of components are usually set to high values. While this behavior suited most server configurations, it did not address the following situations:

• Maximum CPU performance

For high performance, certain CPUs must be cooled substantially below the set threshold temperature. This required very high fan speeds which resulted in higher power consumption and increased noise levels.

• Low power consumption

To ensure the lowest power consumption, fans must run very slowly, and in some cases, stop completely on servers that support it. But slow fan speeds resulted in servers overheating. To avoid this situation, it is necessary to run fans at a speed that is moderately faster than the lowest possible speed.

With the introduction of fan policies, you can determine the right fan speed for the server, based on the components in the server. In addition, it allows you to configure the fan speed to address problems related to maximum CPU performance and low power consumption.

Following are the fan policies that you can choose from:

- **Balanced**—This setting can cool almost any server configuration, but may not be suitable for servers with PCIe cards as these cards overheat easily.
- Low Power—This setting is ideal for minimal configuration servers that do not contain any PCIe cards.
- **High Power**—This policy is ideal for servers that contain PCIe cards that overheat easily and have high temperatures.
- Maximum Power—This setting can be used for server configurations that required extremely high fan speeds. This policy is ideal for servers that contain PCIe cards that overheat easily and have very high temperatures.
- Acoustic—This setting can be used for configuring the fan noise level, thereby enabling noise reduction in the servers.

Application of this policy might result in performance throttling impacting system performance. If excessive thermal or performance events are recorded in the event logs, select a standard fan control policy like **Low Power**, which is a non-disruptive change.

Note

This option is available only on Cisco UCS C220 M5, C240 SD M5, C240 M5, C220 M6, C240 M6, C245 M6, C225 M6 servers. For these servers, **Acoustic** is the default fan policy.

For other servers, default fan policy depends on the server configuration and the number of PCIe cards present in the server.

Note

For Cisco UCS M5 servers, although you set a fan policy in Cisco IMC, the actual speed that the fan runs at is determined by the configuration requirements of the server. PCIe cards are tagged with minimum fan speed depending on thermal requirements. If the server is equipped with these PCIe cards, you cannot configure the fan policy, which go below the tagged requirement.

The **Configuration Status** displays the status of the configured fan policy in Cisco UCS M5 servers. This can be one of the following:

- SUCCESS —The selected fan policy matches the actual fan speed that runs on the server.
- PENDING —The configured fan policy is not in effect yet. This can be due to one of the following:
 - The server is powered off
 - The BIOS POST is not complete
- FAN POLICY OVERRIDE—Overrides the specified fan speed with the actual speed determined by the configuration requirements of the server.

Note

- For Cisco UCS C220 M7, C240 M7, C220 M6, C240 M6, UCS C220 M5, C240 M5, C240 SD M5, C125 M5, C480 M5, C480-M5ML, Applied fan policy depends on the PCIe cards present in the server.
- For Cisco UCS C225 M6 and C245 M6, **Applied fan policy** depends on the PCIe cards or a specific CPU type present in the server.

Configuring a Fan Policy

The fan policy determines the cooling requirements for your server. Prior to setting the fan policy, you must determine if your server includes PCIe cards that overheat easily.

Before you begin

You must log in with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters the chassis command mode.
Step 2	Server /chassis # scope fan-policy	Enters the fan policy command mode.
Step 3	Server /chassis/fan-policy # set fan-policy	Sets the fan policy for the server. It can be one of the following:
		• Balanced—This setting can cool almost any server configuration, but may not be suitable for servers with PCIe cards as these cards overheat easily.
		• Low Power—This setting is ideal for minimal configuration servers that do not contain any PCIe cards.
		• High Power —This policy is ideal for servers that contain PCIe cards that overheat easily and have high temperatures.
		• Maximum Power—This setting can be used for server configurations that required extremely high fan speeds. This policy is ideal for servers that contain PCIe cards that overheat easily and have very high temperatures.
		• Acoustic—This setting can be used for configuring the fan noise level, thereby enabling noise reduction in the servers.
		Application of this policy might result in performance throttling impacting system performance. If excessive thermal or performance events are recorded in the event logs, select a standard fan control policy like Low Power , which is a non-disruptive change.

	Command or Action	Purpose	
		Note	This option is available only on Cisco UCS C220 M5, C240 SD M5, C240 M5, C220 M6, C240 M6, C245 M6, C225 M6 servers. For these servers, Acoustic is the default fan policy.
			For other servers, default fan policy depends on the server configuration and the number of PCIe cards present in the server.
Step 4	Server /chassis/fan-policy # set aggressive-coolingno\yes	Use this option	on to enable aggressive cooling.
Step 5	Server /chassis/fan-policy # commit	Commits the	changes to the server.

This example shows how to set the fan policy to maximum power for a server:

```
server # scope chassis
server /chassis # scope fan-policy
server /chassis/fan-policy # set fan-policy maximum-power
server /chassis/fan-policy # set aggressive-cooling yes
server /chassis/fan-policy* # commit
server /chassis/fan-policy # show detail
   Fan Policy: maximum-power
   Applied Fan Policy: Max Power
   Configuration Status: SUCCESS
server /chassis/fan-policy #
```

Configuring DIMM Black Listing

DIMM Black Listing

In Cisco IMC, the state of the Dual In-line Memory Module (DIMM) is based on SEL event records. A DIMM is marked bad if the BIOS encounters a non-correctable memory error or correctable memory error with 16000 error counts during memory test execution during BIOS post. If a DIMM is marked bad, it is considered a non-functional device.

If you enable DIMM blacklisting, Cisco IMC monitors the memory test execution messages and blacklists any DIMM that encounters memory errors at any given point of time in the DIMM SPD data. This allows the host to map out those DIMMs.

DIMMs are mapped out or blacklisted only when Uncorrectable errors occur. When a DIMM gets blacklisted, other DIMMs in the same channel are ignored or disabled, which means that the DIMM is no longer considered bad.

Note

DIMMs do not get mapped out or blacklisted for 16000 Correctable errors.

Enabling DIMM Black Listing

Before you begin

You must be logged in as an administrator.

Procedure

	Command or Action	Purpose
Step 1	Server# scope dimm-blacklisting /	Enters the DIMM blacklisting mode.
Step 2	Server /dimm-blacklisting # set enabled {yes no}	Enables or disables DIMM blacklisting.
Step 3	Server /dimm-blacklisting* # commit	Commits the transaction to the system configuration.

Example

The following example shows how to enable DIMM blacklisting:

```
Server# scope dimm-blacklisting
Server /dimm-blacklisting # set enabled yes
Server /dimm-blacklisting* # commit
Server /dimm-blacklisting #
Server /dimm-blacklisting # show detail

DIMM Blacklisting:
    Enabled: yes
```

Configuring BIOS Settings

Viewing BIOS Status

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.

	Command or Action	Purpose
Step 2	Server /bios # show detail	Displays details of the BIOS status.

The BIOS status information contains the following fields:

Name	Description
BIOS Version	The version string of the running BIOS.
Boot Order	The legacy boot order of bootable target types that the server will attempt to use.
Boot Override Priority	This can be None, or HV.
FW Update/Recovery Status	The status of any pending firmware update or recovery action.
UEFI Secure Boot	Enables or Disables UEFI secure boot.
Configured Boot Mode	The boot mode in which h BIOS will try to boot the devices.
Actual Boot Mode	The actual boot mode in which BIOS booted the devices.
Last Configured Boot Order Source	The last configured boot order source by BIOS.

Configuring BIOS Settings

Before you begin

You must log in with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # scope intotalmmywww.pafmmdwcsokanywwmmgmat	Enters the settings command mode. For descriptions and information about the options for each BIOS setting, see the following topic: BIOS Parameters by Server Model You must commit the changes between each setting type. Server /bios/ # commit

This example configures the BIOS to enable the USB legacy support and commits the transaction:

```
Server# scope bios
Server /bios # scope input-output
Server /bios/input-output # set UsbLegacySupport enabled
Server /bios/input-output *# commit
Changes to BIOS set-up parameters will require a reboot.
Do you want to reboot the system?[y|N] n
Changes will be applied on next reboot.
Server /bios/input-output #
```

Restoring BIOS Defaults

Before you begin

You must log in as a user with admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # bios-setup-default	Restores BIOS default settings. This command initiates a reboot.

Example

This example restores BIOS default settings:

```
Server# scope bios Server /bios # bios-setup-default This operation will reset the BIOS set-up tokens to factory defaults. All your configuration will be lost. Changes to BIOS set-up parameters will initiate a reboot. Continue?[y|N]\mathbf{y}
```

Entering BIOS Setup

Before you begin

- The server must be powered on.
- You must log in as a user with admin privileges to perform this task.

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # enter-bios-setup	Enters BIOS setup on reboot.

Example

This example enables you to enter BIOS setup:

```
Server# scope bios Server /bios # enter-bios-setup This operation will enable Enter BIOS Setup option. Host must be rebooted for this option to be enabled. Continue?[y \mid N]y
```

Restoring BIOS Manufacturing Custom Defaults

In instances where the components of the BIOS no longer function as desired, you can restore the BIOS set up tokens to the manufacturing default values.

Note

This action is only available for some C-Series servers.

Before you begin

- You must log in with admin privileges to perform this task.
- The server must be powered off.

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server /bios # restore-mfg-defaults	Restores the set up tokens to the manufacturing default values.

Example

This example shows how to restore the BIOS set up tokens to the manufacturing default values:

```
Server \# scope bios

Server /bios \# restore-mfg-defaults

This operation will reset the BIOS set-up tokens to manufacturing defaults.

The system will be powered on.

Continue? [y|n] N

Server /bios \#
```

Secure Boot Certificate Management

Beginning with 4.2(2a) release, Cisco IMC allows you to upload up to ten certificates for configured secure HTTP Boot device. You can also delete and upload a new certificate for the specific boot device configured. Cisco IMC allows you to upload up to ten root CA Certificates.

Viewing Secure Boot Certificate

Before you begin

You must log in with admin privileges to perform this task. log in as admin

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server / bios # scope secure-boot-certificate certificate_ID	where, <i>certificate_ID</i> is the ID assigned by Cisco IMC.
Step 3	Server / bios / secure-boot-certificate # show detail	Certificate detail is displayed.

Example

This examples shows how to view secure boot certificate detail:

```
server # scope bios
server / bios # scope secure-boot-certificate 3
server /bios/secure-boot-certificate # show detail
Secure Boot CA Certificate:
   Certificate ID: 3
   Serial Number: 04
   Subject Country Code (CC): XX
    Subject State (S): XX
    Subject Locality (L): XX
   Subject Organization (0): XX
   Subject Organizational Unit (OU): XX
   Subject Common Name (CN): *.XX
    Issuer Country Code (CC): XX
    Issuer State (S): XX
    Issuer Locality (L): XX
    Issuer Organization (0): XX
    Issuer Organizational Unit (OU): XX
    Issuer Common Name (CN): .XX
   Valid From: Month Date Time Stamp 20xx GMT
   Valid To: Month Date Time_Stamp 20xx GMT
```

Uploading Secure Boot Certificate Using Paste Option

Before you begin

You must log in with admin privileges to perform this task. log in as admin

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server / bios # scope secure-boot-certificate certificate_ID	where, <i>certificate_ID</i> is the ID assigned by Cisco IMC.
		If a certificate is already uploaded to this ID, then you can only view the details of the certificate. To verify the status, you may use show detail command.
Step 3	Server / bios / secure-boot-certificate # upload-paste-secure-boot-certificate	You are prompted to paste the certificate. Please paste your certificate here, when finished, press CTRL+D

Once the certificate is successfully uploaded, following message is displayed:

Secure Boot Certificate pasted successfully.

Example

server # scope bios

This examples shows how to upload a secure boot certificate using paste option:

```
server / bios # scope secure-boot-certificate 3
server /bios/secure-boot-certificate # upload-paste-secure-boot-certificate
Please paste your certificate here, when finished, press CTRL+D.

----END CERTIFICATE---Secure Boot Certificate pasted successfully.

What to do next

You may verify the certificate details using the **show detail** command.

Uploading Secure Boot Certificate From Remote Location

Before you begin

- You must log in with admin privileges to perform this task. log in as admin
- Ensure that the generated certificate is of type server.
- The following certificate formats are supported:
 - crt
 - • .cer
 - • .pem

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server / bios # scope secure-boot-certificate certificate_ID	where, <i>certificate_ID</i> is the ID assigned by Cisco IMC.
		If a certificate is already uploaded to this ID, then you can only view the details of the certificate. To verify the status, you may use show detail command.
Step 3	Server / bios / secure-boot-certificate # upload-remote-secure-boot-certificate tftp ftp sftp scp http IP_address/Hostname Remote_server_path_filename	where, • tftp, ftp, sftp, scp, http are protocols for the file transfer • Server IP Address or Hostname—The IP address or hostname of the server on which the certificate file should be stored. • Path and Filename—The path and filename Cisco IMC should use when uploading the file to the remote server.

Command or Action	Purpose
	Depending on the file transfer protocol, you may be prompted to enter username and password

Once the certificate is successfully uploaded, following message is displayed:

Secure Boot Certificate uploaded successfully

Example

This examples shows how to upload a secure boot certificate using remote location option (with scp file transfer protocol):

```
server # scope bios
server / bios # scope secure-boot-certificate 3
server /bios/secure-boot-certificate # upload-remote-secure-boot-certificate scp 10.10.10.10
/home/username/certificate.pem
Server (RSA) key fingerprint is xx:xx:8b:36:5a:53:14:d3:85:d0:xx:xx:e0:xx:24:51
Do you wish to continue? [y/N]y
Username: username
Password: password
Secure Boot Certificate uploaded successfully
```

What to do next

You may verify the certificate details using the **show detail** command.

Deleting a Secure Boot Certificate

Before you begin

You must log in with admin privileges to perform this task. log in as admin

Procedure

	Command or Action	Purpose
Step 1	Server# scope bios	Enters the BIOS command mode.
Step 2	Server / bios # scope secure-boot-certificate certificate_ID	where, <i>certificate_ID</i> is the ID assigned by Cisco IMC.
Step 3	Server / bios / secure-boot-certificate # delete-secure-boot-certificate	Type y and press Enter to confirm.

Following message is displayed:

Secure Boot Certificate - ID is deleted

This examples shows how to delete a secure boot certificate:

```
server \# scope bios server / bios \# scope secure-boot-certificate 3 Server /bios/secure-boot-certificate \# delete-secure-boot-certificate Do you want to delete the existing secure boot certificate? [y|N]y Secure Boot Certificate - 3 is deleted
```

Updating Firmware on Server Components

Important

If any firmware or BIOS updates are in progress, do not reset the server until those tasks are complete.

Before you begin

You must log in with user or admin privileges to perform this task.

Server must be powered off.

Procedure

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters chassis command mode.
Step 2	Server /chassis # scope firmware	Enters firmware command mode.
Step 3	Server /chassis/firmware # show detail	Displays the firmware update required on some components message.
Step 4	Server /chassis/firmware # update-all	Updates the firmware on the server components.

Example

This example resets the server:

```
Server# scope chassis
Server /chassis # scope firmware
Server /chassis / firmware # show detail

Firmware update required on some components,
please run update-all (under chassis/firmware scope).

Server /chassis / firmware # update-all
```

Viewing Product ID (PID) Catalog Details

Procedure

	Command or Action	Purpose
Step 1	Server # scope chassis	Enters chassis command mode.
Step 2	Server /chassis # show cpu-pid	Displays the CPU PID details.
Step 3	Server /chassis # show dimm-pid	Displays the memory PID details.
Step 4	Server /chassis # show pciadapter-pid	Displays the PCI adapters PID details.
Step 5	Server /chassis # show hdd-pid	Displays the HDD PID details.

Example

This example shows how to create view PID details

```
Server # scope chassis
Viewing CPU PID details
Server /chassis # show cpu-pid

Server /chassis #

Uploading and Activating a PID Catalog

Caution

BMC reboots automatically once a PID catalog is activated.

You must reboot the server after activating a PID catalog.

Before you begin

You must log in as a user with admin privileges to perform this task.

	Command or Action	Purpose
Step 1	Server# scope chassis	Enters the chassis command mode.
Step 2	Server# /chassis scope pid-catalog	Enters the PID catalog command mode.
Step 3	Server /chassis/pid-catalog # upload-pid-catalog remote-protocol IP Address PID Catalog file	Specifies the protocol to connect to the remote server. It can be one of the following types: • TFTP • FTP • SFTP • SCP

	Command or Action	Purpose • HTTP	
		Note	The Cisco UCS C-Series server now supports fingerprint confirmation of the server when you update firmware through a remote server. This option is available only if you choose SCP or SFTP as the remote server type.
			If you chose SCP or SFTP as the remote server type while performing this action, a prompt with the message Server (RSA) key fingerprint is <server_finger_print_id> Do you wish to continue? Click y or n depending on the authenticity of the server fingerprint.</server_finger_print_id>
			The fingerprint is based on the host's public key and helps you to identify or verify the host you are connecting to.
Step 4	(Optional) Server# /chassis/pid-catalog show detail	Displays the	e status of the upload.
Step 5	Server#/chassis/pid-catalog activate	Activates th	ne uploaded PID catalog.
Step 6	Server#/chassis/pid-catalog show detail	Displays the	e status of the activation.

This example uploads and activates the PID catalog:

Current Activated Version: 2.0(12.78).01

```
Server # scope chassis
Server /chassis # scope pid-catalog
Uploading PID Catalog
Server /chassis/pid-catalog # upload-pid-catalog tftp 10.10.10.10 pid-ctlg-2_0_12_78_01.tar.gz
upload-pid-catalog initialized.
Please check the status using "show detail".
Server /chassis/pid-catalog #
Server /chassis/pid-catalog # show detail
   Upload Status: Upload Successful
    Activation Status: Please Activate Catalog
    Current Activated Version: N/A
Activating the uploaded PID catalog
Server /chassis/pid-catalog # activate
Successfully activated PID catalog
Server /chassis/pid-catalog # show detail
    Upload Status:
    Activation Status: Activation Successful
```

Server /chassis/pid-catalog #

Deleting a PID Catalog

Caution

BMC reboots automatically once a PID catalog is deleted.

You must reboot the server after deleting a PID catalog.

Before you begin

You must log in as a user with admin privileges to perform this task.

Procedure

	Command or Action	Purpose	
Step 1	Server# scope chassis	Enters the chassis command mode.	
Step 2	Server#/chassis scopepid-catalog	Enters the PID catalog command mode.	
Step 3	Server /chassis/pid-catalog # delete	Enter y at the confirmation prompt to delete the PID catalog.	
		Note You can delete a PID catalog only if it has been previously updated and activated.	
Step 4	(Optional) Server# /chassis/pid-catalog show detail	Displays the status of the PID catalog.	

Example

This example uploads and activates the PID catalog:

```
Server # scope chassis

Server /chassis # scope pid-catalog

Server /chassis/pid-catalog # delete

CIMC will be automatically rebooted after successful deletion of the uploaded catalog file.

Once this is complete, a host reboot will be required for the catalog changes to be reflected in

the BIOS and host Operating System Continue?[y|N]y

Server /chassis/pid-catalog # show detail

PID Catalog:

Upload Status: N/A

Activation Status: N/A

Current Activated Version: 4.1(0.41)

Server /chassis/pid-catalog #
```

Persistent Memory Module

Persistent Memory Modules

Cisco UCS C-Series Release 4.0(4) introduces support for the Intel[®] Optane[™] Data Center persistent memory modules on the UCS M5 servers that are based on the Second Generation Intel[®] Xeon[®] Scalable processors. These persistent memory modules can be used only with the Second Generation Intel[®] Xeon[®] Scalable processors.

Persistent memory modules are non-volatile memory modules that bring together the low latency of memory and the persistence of storage. Data stored in persistent memory modules can be accessed quickly compared to other storage devices, and is retained across power cycles.

For detailed information about configuring persistent memory modules, see the Cisco UCS: Configuring and Managing Intel® Optane™ Data Center Persistent Memory Modules Guide.
