**Note**

Means reader take note. Notes contain helpful suggestions or references to material not covered in the document.

**Tip**

Means the following information will help you solve a problem. The tips information might not be troubleshooting or even an action, but could be useful information, similar to a Timesaver.

**Timesaver**

Means the described action saves time. You can save time by performing the action described in the paragraph.

**Caution**

Means reader be careful. In this situation, you might perform an action that could result in equipment damage or loss of data.

**Warning**

IMPORTANT SAFETY INSTRUCTIONS

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device.

**Cisco Unified Computing System Overview**

Cisco UCS has a unique architecture that integrates compute, data network access, and storage network access into a common set of components under a single-pane-of-glass management interface.

Cisco UCS fuses access layer networking and servers. This high-performance, next-generation server system provides a data center with a high degree of workload agility and scalability. The hardware and software components support Cisco's unified fabric, which runs multiple types of data center traffic over a single converged network adapter.
Architectural Simplification

The simplified architecture of Cisco UCS reduces the number of required devices and centralizes switching resources. By eliminating switching inside a chassis, network access-layer fragmentation is significantly reduced. Cisco UCS implements Cisco unified fabric within racks and groups of racks, supporting Ethernet and Fibre Channel protocols over 10 Gigabit Cisco Data Center Ethernet and Fibre Channel over Ethernet (FCoE) links. This radical simplification reduces the number of switches, cables, adapters, and management points by up to two-thirds. All devices in a Cisco UCS domain remain under a single management domain, which remains highly available through the use of redundant components.

Scalability

A single Cisco UCS domain supports multiple chassis and their servers, all of which are administered through one Cisco UCS Manager. For more detailed information about the scalability, speak to your Cisco representative.

Flexibility

A Cisco UCS domain allows you to quickly align computing resources in the data center with rapidly changing business requirements. This built-in flexibility is determined by whether you choose to fully implement the stateless computing feature. Pools of servers and other system resources can be applied as necessary to respond to workload fluctuations, support new applications, scale existing software and business services, and accommodate both scheduled and unscheduled downtime. Server identity can be abstracted into a mobile service profile that can be moved from server to server with minimal downtime and no need for additional network configuration. With this level of flexibility, you can quickly and easily scale server capacity without having to change the server identity or reconfigure the server, LAN, or SAN. During a maintenance window, you can quickly do the following:

- Deploy new servers to meet unexpected workload demand and rebalance resources and traffic.
- Shut down an application, such as a database management system, on one server and then boot it up again on another server with increased I/O capacity and memory resources.

Optimized for Server Virtualization

Cisco UCS has been optimized to implement VM-FEX technology. This technology provides improved support for server virtualization, including better policy-based configuration and security, conformance with a company's operational model, and accommodation for VMware's VMotion.

Cisco UCS Manager Overview

Cisco UCS Manager is embedded software that resides on the fabric interconnects, providing complete configuration and management capabilities for all of the components in the Cisco UCS system. This configuration information is replicated between the two fabric interconnects, providing a highly available solution for this critical function. The most common way to access UCS Manager for simple tasks is to use a Web browser to open the Java-based GUI. For command-line or programmatic operations against the system, a command-line interface (CLI) and an XML API are also included with the system.

The Cisco UCS Manager GUI provides role-based access control (RBAC) to allow multiple levels of users granular administrative rights to system objects. Users can be restricted to certain portions of the system based on locale, which corresponds to an optional organizational structure that can be created within the system. Users can also be classified based on their access levels or areas of expertise, such as “Storage Administrator,” “Server Equipment Administrator,” or “Read-Only”. RBAC allows the comprehensive capabilities of the
Cisco UCS Manager GUI to be properly shared across multiple individuals or teams within your organization in a flexible, secure manner.

Cisco UCS Manager provides unified, embedded management of all software and hardware components. Every instance of Cisco UCS Manager and all of the components managed by it form a domain. For organizations that deploy multiple Cisco UCS domains, Cisco UCS Central software provides a centralized user interface that allows you to manage multiple, globally distributed Cisco UCS domains with thousands of servers. Cisco UCS Central integrates with Cisco UCS Manager and utilizes it to provide global configuration capabilities for pools, policies, and firmware.
Introducing Cisco UCS Central

Cisco UCS Central provides scalable management solution for growing Cisco UCS environment. Cisco UCS Central simplifies the management of multiple Cisco UCS domains from a single management point through standardization, global policies and global ID pools. Cisco UCS Central does not replace Cisco UCS Manager, which is the policy driven management for single UCS domain. Instead Cisco UCS Central focuses on managing and monitoring the UCS domains on a global level, across multiple individual Cisco UCS Classic and Mini management domains worldwide.

Cisco UCS Central enables you to manage individual or groups of classic, mini or mixed Cisco UCS domains with the following:

- Centralized Inventory of all Cisco UCS components for a definitive view of the entire infrastructure and simplified integration with current Information Technology Infrastructure Library (ITIL) processes.
- Centralized, policy-based firmware upgrades that can be applied globally or selectively through automated schedules or as business workloads demand
- Global ID pooling to eliminate identifier conflicts
- Global administrative policies that enable both global and local management of the Cisco UCS domains
- An XML API, building on the Cisco UCS Manager XML API for easy integration into higher-level data center management frameworks
- Remote management to manage various end points in registered Cisco UCS domains

Cisco UCS Central does not reduce or change any local management capabilities of Cisco UCS Manager, such as its API. This allows you to continue using Cisco UCS Manager the same way as when you did not have Cisco UCS Central, and also allows all existing third party integrations to continue to operate without change.

Cisco UCS Central Features

The following table provides a list of features with brief description on the management capabilities of Cisco UCS Central:
For a full list of new features, see the Release Notes for Cisco UCS Central.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Centralized inventory</td>
<td>Cisco UCS Central automatically aggregates a global inventory of all registered Cisco UCS components, organized by domain, with customizable refresh schedules and provides even easier integration with ITIL processes, with direct access to the inventory through an XML interface.</td>
</tr>
<tr>
<td>Centralized fault summary</td>
<td>Cisco UCS Central enables you to view the status of all Cisco UCS infrastructure on the global fault summary panel, with a fault summary organized by domain and fault type. Also provides you the ability to view individual Cisco UCS Manager domains for greater fault detail and more rapid problem resolution. Drilling down on a fault launches the UCS Manager in context for a seamlessly integrated experience.</td>
</tr>
<tr>
<td>Centralized, policy-based firmware upgrades</td>
<td>You can download firmware updates automatically from the Cisco.com to a firmware library within Cisco UCS Central. Then schedule automated firmware updates, globally or selectively, based on your business requirements. Managing firmware centrally ensures compliance with IT standards and makes reprovisioning of resources a point-and-click operation.</td>
</tr>
<tr>
<td>Global ID pools</td>
<td>Cisco UCS Central eliminates identifier conflicts and ensures portability of software licenses. You are able to centralize the sourcing of all IDs, such as universal user IDs (UUIDs), MAC addresses, IP addresses, and worldwide names (WWNs), from global pools and gain real-time ID use summaries. Centralizing server identifier information makes it simple to move a server identifier between Cisco UCS domains anywhere in the world and reboot an existing workload to run on the new server.</td>
</tr>
<tr>
<td>Domain groups</td>
<td>Cisco UCS Central simplifies policy management by providing options to create domain groups and subgroups. A domain group is an arbitrary grouping of Cisco UCS domains that can be used to group systems into geographical or organizational groups. Each domain group can have up to five levels of domain sub groups. This provides you the ability to manage policy exceptions when administering large numbers of Cisco UCS domains. Each sub group has a hierarchical relationship with the parent domain group.</td>
</tr>
<tr>
<td>Global administrative policies</td>
<td>Cisco UCS Central helps you to ensure compliance and staff efficiency with global administrative policies. The global policies are defined at the domain group level and can manage anything in the infrastructure, from date and time and user authentication to equipment power and system event log (SEL) policies.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Global service profiles and templates</td>
<td>Global service profiles and templates in Cisco UCS Central enables fast and simplified infrastructure deployment and provides consistency of configurations throughout the enterprise. This feature enables global bare-metal workload mobility very similar to how hypervisor enables virtualized workload mobility.</td>
</tr>
<tr>
<td>Backup</td>
<td>Cisco UCS Central provides an automatic backup facility that enables quick and efficient backing up the configuration information of the registered Cisco UCS domains and the UCS Central configuration.</td>
</tr>
<tr>
<td>XML API</td>
<td>Cisco UCS Central, just like Cisco UCS Manager, has a high-level industry-standard XML API for interfacing with existing management frameworks and orchestration tools. The XML API for Cisco UCS Central Software is similar to the XML API for Cisco UCS Manager, making integration with high-level managers very fast.</td>
</tr>
<tr>
<td>Remote Management</td>
<td>Cisco UCS Central enables you to manage various end points in the registered Cisco UCS domains from one management point. You can manage chassis, servers, fabric interconnects, and fabric extenders from Cisco UCS Central GUI or CLI. You can also access tech support files for registered UCS domains from Cisco UCS Central.</td>
</tr>
</tbody>
</table>

Overview of Cisco UCS Central HTML 5 UI

Cisco UCS Central HTML5 based user interface provides flexibility and task based usability for your management purposes.

The dashboard provides a quick overview of components in the system. You can pin the components you use frequently and customize the dashboard to suit your operational requirements. You can click on any object on the dashboard to go to the related page in the system.

Using the HTML5 UI

Dashboard

You can pin dashboard widgets and customize the dashboard based on your operational requirements. The following describes the basic dashboard structure, and the navigation icons, for performing management tasks:
**Item** | **Description**
--- | ---
1 | Domain group navigation icon. Click to display domain group root and other domain groups in the system. You can click a domain group to launch the details page.
2 | Browse Tables icon. Click to display physical and logical inventory-related entities in the system such as: Equipment, Domains, Fabric Interconnects, Servers, Chassis, FEX, Hardware Components. Click any of these entities to launch related pages and view details.
3 | Organization navigation icon. Click to display org root and other sub organizations in the system. You can click the root, or any suborganization, to launch the details page for a selected organization.
4 | Profiles icon. Click to display a list of Service and Chassis Profiles and their Scope, Fault Level, and the associated Org. Click to view corresponding Profile details.
<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Templates icon. Click to display templates available in Cisco UCS Central such as Service Profiles, Chassis Profiles, vHBAs, and vNIC templates.</td>
</tr>
<tr>
<td>6</td>
<td>Policies icon. Click to display all the policies available in Cisco UCS Central. Click to view details of a policy from the Policies table.</td>
</tr>
<tr>
<td>7</td>
<td>LAN and SAN icon. Click to view details of VLANs, VLAN Groups and VSANs.</td>
</tr>
<tr>
<td>8</td>
<td>Identifiers icon. Click to view details of Identifiers, Pools, and ID Universe.</td>
</tr>
<tr>
<td>9</td>
<td>Schedules icon. Click to view details of Schedules in the system, Schedule Type, Start Date and Frequency.</td>
</tr>
<tr>
<td>10</td>
<td>Tag Management icon. Click to view Tags and Tag Types. Click a Tag to view the Tag Type, Multiple Tags Per Object, Value Type, and System-Based Tag.</td>
</tr>
<tr>
<td>11</td>
<td>Globalization tasks icon. Click to view Globalization Tasks, Globalization Type, and the Status of the globalization operation.</td>
</tr>
<tr>
<td>12</td>
<td>Search Categories icon. Click to search for an item in a specific category.</td>
</tr>
<tr>
<td>13</td>
<td>Spotlight Search bar. Type the name of a Pool, Policy, Tag Type, VLAN, VSAN, Equipment, Template, Domain, or other objects in Cisco UCS Central. The search result displays the top 10 matches and also provides a list of potential matches to the search term.</td>
</tr>
<tr>
<td>14</td>
<td>Dashboard widget. You can pin any widget on this dashboard. When you mouse over on the widget, other options are enabled on the widget menu bar.</td>
</tr>
</tbody>
</table>
| 15   | Actions bar. What do you want to do? You can Create, Schedule, Install, Export, and Import from here:  
  - Click the drop-down arrow to display available actions.  
  - Select a task, or type the task into the actions bar.  
  - Launch the dialog box to perform the task. |
<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
</table>
| 16   | **Profile Configuration** icon. Click to launch User Profile, or Change Password. You can perform the following actions:  
  • In the Basic tab, set Language preference.  
  • **Restore Tabs** to save the open tabs and access them directly when you back in to Cisco UCS Central. You can select one of the following options from the **Restore Tabs** drop-down menu:  
  • Prompt to restore tabs  
  • Automatically restore tabs  
  • Do not restore tabs  
  The Prompt to Restore Tabs option is enabled by default when you log in to Cisco UCS Central. If you select the Auto Restore option, the selected tabs are restored automatically when you log back in to Cisco UCS Central.  
  You can set User Roles from the **Roles** tab and set Locales from the **Locales** tab. |
| 17   | System Alerts icon. Click to display and navigate to Pending Activities, System Faults, Domain Faults, Events, Audit Logs, Core Dumps, and Internal Services. |
| 18   | System Tools icon. Click to display and navigate to Firmware Management, Backup & Restore, Export & Import, Tech Support, Image Library, Domain Management, Hardware Compatibility Reports, Unified KVM Launcher, Active Sessions, and Start Logging Session. |
| 19   | System Configuration icon. Click to display and navigate to System Profiles, System Policies, Users, Authentication, SNMP, Smart Call Home, and Licenses. |
| 20   | Help icon. Click to access online help. |
| 21   | Log out icon. Click to log out from the active Cisco UCS Central session. |
| 22   | Tab navigator. Allows you to navigate through the open tabs, or close all tabs at once. |
| 23   | Log out icon. Click to log out from the active Cisco UCS Central session. |
| 24   | Dashboard widgets library icon. Click to view available widgets. Click the widget to pin it to the dashboard. |
| 25   | Refresh icon. Click to refresh the information in all pinned widgets or table pages. |
| 26   | **Refresh, Pin, and Show Detail** icons. Click to perform these actions for a widget. |
Dashboard Widgets

Dashboard widgets allow you to customize the dashboard based on your operational requirements. Cisco UCS Central contains the following types of widgets:

Default Widgets

Default widgets are listed in the widgets library on the dashboard. Click the widgets library to pin the widget to the dashboard. The widgets library includes the following widgets:

• **Welcome to UCS Central!**—Displays introductory links and videos to get you started with Cisco UCS Central.

• **UCS Central Basics**—Displays basic concepts and flows for Cisco UCS Central.

• **Licenses**—Displays the total number of licenses and their status.

• **Backup & Restore**—Displays the current backup and restore status.

• **Config Export & Import**—Displays the current config export and import status.

• **Firmware Management**—Displays the total number of scheduled Firmware update jobs.

• **Inventory Status**—Displays the number of domains, FIs, servers, chassis, and FEX, as well as the overall status.

• **ID Universe**—Displays the number of IDs that are available or in conflict.

• **System Faults**—Displays the number of system faults with the top four severities.

  Click the Expand icon to view the Faults Log page for all system faults. Click on a fault icon to view the system faults with the selected severity pre-selected.

• **Domain Faults**—Displays the number of domain faults with the top four severities.

  Click the Expand icon to view the Faults Log page for all domain faults. Click on a fault icon to view the domain faults with the selected severity pre-selected.

• **Pending Activities**—Displays Pending activities. Some may need user acknowledgment.

• **Domains**—Displays current number of domains registered with Cisco UCS Central.

Table Summary Widgets

Table summary widgets displays the total number of items and the status for the following:

• **Domains**

• **Fabric Interconnects**

• **Servers**

• **Chassis**

• **FEX**

• **Service Profiles**

Up to two status bars can be displayed, with the top four errors displayed in each status bar.
Click the Expand icon to view the full table.

**Detailed Instance Summary Widgets**

Detailed instance summary widgets display the overall status and fault summary. Click the pin icon to create a widget for the following instances:

- Domain
- Domain Group
- Organization
- Fabric Interconnect
- Server
- Chassis
- FEX
- Service Profile

Click the Expand icon to view the full instance page. Click on a fault icon to view a faults window with the selected severity pre-selected.

**Instance Shortcut Widgets**

Shortcut widgets create a read-only link to a particular instance of a policy or template. Click the pin icon on an instance to create the widget.

### Adding Table Summary Widgets to the Dashboard

**Step 1**  
Click the **Search** icon and choose one of the following:

- Domains
- Fabric Interconnects
- Servers
- Chassis
- FEX
- Service Profiles

**Step 2**  
On the table page that displays, click the **Pin** icon.

**Step 3**  
Click the **Dashboard** link to view the new widget.

### Adding Instance Summary Widgets to the Dashboard

**Step 1**  
Click the **Search** icon and select one of the following:

- Domains
• Fabric Interconnects
• Servers
• Chassis
• FEX
• Service Profiles

Step 2  Click on an instance.
Step 3  On the instance page that displays, click the Pin icon.
Step 4  Click the Dashboard link to view the new widget.

Tab Navigator

The tab navigator appears on all screens, and allows you to navigate quickly through the tabs that you have opened. You can also close all tabs at once.

Using the Tab Navigator

Step 1  On the tab bar, click the drop-down on the far right.
A list of all currently opened tabs is displayed.

Step 2  Select the tab that you want to navigate to, or select Close All Tabs to close all of the tabs.
Note  You cannot close the dashboard tab.

Common User Interface Options

The following table describes user interface options:

<table>
<thead>
<tr>

### Behavior Changes in Release 2.0

#### Deprecation Announcements

- Cisco UCS Central no longer includes the Flex-based UI. The HTML5 UI is the only graphical interface available.

- The Statistics Management feature is deprecated and is no longer supported in Cisco UCS Central.

- After March 3, 2017, Cisco UCS Central version 1.4 or earlier will be unable to fetch the updated firmware image list from Cisco.com. If you are running Cisco UCS Central version 1.4 or earlier, you can manually download firmware images directly from Cisco.com and import them to Cisco UCS Central. To continue to have Cisco UCS Central fetch the available image data from Cisco.com and place the firmware image in the **Image Library**, Cisco recommends that you upgrade to Cisco UCS Central release 1.5 or later.

#### Feature Support

**Behavior Changes Based on Design**

- The Spotlight search bar replaces the search bar, and allows you to search for profiles, policies, pools, VLANS/VSANs, templates, domains, orgs, domain groups etc by their names, descriptions, and labels. Spotlight auto-completes the search field with suggestions as you type and displays the top 10 potential matches to the term you type.

- Icons in the Sidebar navigation menu enable direct and easy access to all objects in Cisco UCS Central. Browse tables, Organization navigation, and Domain group navigation are now part of Sidebar navigation.
• From the Organizations tree view, you can directly navigate to that org’s Profiles, Templates, Pools, Policies, and Permitted VLANs. The corresponding tab in the selected org is highlighted and opened when you click these objects.

• Cisco UCS Central 2.0 prevents you from deleting critical objects such as service profiles, domain groups, organizations, and service profile templates from the Cisco UCS Central GUI and the command line. When you attempt to delete any of these items from Cisco UCS Central, an error message with the potential impact displays.

• You must create the global service profile template before you can create a service profile.

• vNIC and vHBA Placement is now referred to as Interface Placement.

• Registration Policy is now referred to as Domain Group Qualification Policy.

• ID Range Qualification Policy is now referred to as ID Range Access Control Policy.

• There are no qualified IP addresses for ID Range Access Control Policy.

• Only the configuration export (all-config) and backup (full-state) options are used in Cisco UCS Central. Other backup types such as config logical and config system are not supported.
CHAPTER 4

Working with Cisco UCS Manager

• Cisco UCS Domains and Cisco UCS Central, on page 19
• Policies in Cisco UCS Central and Cisco UCS Domains, on page 26
• Domains and Domain Groups, on page 34
• Domain Group Qualification Policy, on page 36
• Organization, on page 36

Cisco UCS Domains and Cisco UCS Central

Cisco UCS Central provides centralized management capabilities to multiple Cisco UCS domains across one or more data centers. Cisco UCS Central works with Cisco UCS Manager to provide a scalable management solution for a growing Cisco UCS environment.

Cisco UCS Central does not reduce or change any local management capabilities of Cisco UCS Manager, such as its API. This allows you to continue using Cisco UCS Manager the same way you did before Cisco UCS Central. This also allows all existing third party integrations to continue to operate without change.

Registering Cisco UCS Domains

You can use a Fully Qualified Domain Name (FQDN) or IP address to register Cisco UCS domains in Cisco UCS Central.

To manage Cisco UCS Manager through Cisco UCS Central, you must register the Cisco UCS domains in Cisco UCS Central. You can register a Cisco UCS domain as a part of a domain group or as an ungrouped domain. When you have a domain group, all registered domains in the domain group can share common policies and other configurations.

During the initial registration process with Cisco UCS Central, all of the active Cisco UCS Manager GUI sessions are terminated.

Before registering a domain in Cisco UCS Central, do the following:
• Configure an NTP server and the correct time zone in both Cisco UCS Manager and Cisco UCS Central to ensure that they are in sync. If the time and date in the Cisco UCS domain and Cisco UCS Central are out of sync, the registration might fail.
• Obtain the hostname or IP address of Cisco UCS Central. You cannot use the same hostname for both Cisco UCS Central and Cisco UCS Manager. For standalone mode, use individual VM IP address.

• Obtain the shared secret that you configured when you deployed Cisco UCS Central.

---

**Note**

• Cisco recommends that you always register Cisco UCS domains using Cisco UCS Central’s Fully Qualified Domain Name (FQDN). If domains are registered with FQDN, any change in the Cisco UCS Central IP address is transparent to the domain.

• If Cisco UCS Central is deployed on RHEL 7.2 KVM, the first time you register a Cisco UCS domain, you must regenerate the certificate using the `set regenerate yes` command.

• If the registered Cisco UCS domains have a latency of greater than 300ms for a round trip from Cisco UCS Central, there might be some performance implications for the Cisco UCS domains.

• When you unregister a Cisco UCS domain from Cisco UCS Central the global service profiles become local service profiles in Cisco UCS Manager.

For more information about Changing Cisco UCS Central’s IP address, see Changing Cisco UCS Central IP Address.

---

**Warning**

You must upgrade to Cisco UCS Manager Release 2.1(2) or greater before registering with Cisco UCS Central. If you try to register earlier versions of Cisco UCS Manager, the registration will fail.

---

**Registering a Cisco UCS Domain in Cisco UCS Central**

**Before you begin**

• Configure an NTP server and set the correct time zone in both Cisco UCS Manager and Cisco UCS Central. If the timezone and date are different, the registration may fail.

• Enable HTTPS on Cisco UCS Manager before you register a domain with Cisco UCS Central.

To register using the Cisco UCS Central hostname, you must also configure a DNS server. The DNS record must be created properly, and the DNS configuration must be in place for both Cisco UCS Manager and Cisco UCS Central.

---

**Step 1**

In the **Actions** bar, type **Register Domain to UCS Central** and press Enter.

**Step 2**

On the **Domain to UCS Central** dialog box, on the **Basic** tab, enter the Cisco UCS domain hostname or IP address, username, and password.

**Step 3**

Choose the network interface for Cisco UCS Central that supports the format you selected for the Cisco UCS domain.

The following combinations are supported:
### Working with Cisco UCS Manager

#### Registering a Cisco UCS Domain in Cisco UCS Central

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

#### Step 4

On the **Policy Resolution Control** tab, choose whether the policy resolution will occur in locally in Cisco UCS Manager, or be globally controlled by Cisco UCS Central.

**Note** The policy resolution options in Cisco UCS Central are not supported on all versions of Cisco UCS Manager. If your Cisco UCS Manager version is earlier than the earliest supported release, the policy resolution screen may display the value as global even if it is not applicable.

</tbody>
</table>
### Domain Registration Management

On the Domain Management page, you can view the domain registrations and lost domains.

#### Domain Registrations

The **Domain Registrations** tab displays all Cisco UCS domains that you have attempted to register to Cisco UCS Central.

From this tab, you can do the following:

- Filter the Cisco UCS domains that are displayed.
- Delete Cisco UCS domains that failed to register.
- Retry the registration process.
- View the configuration status of the Cisco UCS domain.
- Unregister a successfully registered domain.

**Important**  
We recommend that you contact Cisco TAC before attempting to unregister a Cisco UCS domain.

#### Lost Domains

The **Lost Domains** tab displays all Cisco UCS domains that have lost connectivity. These domains may or may not be listed as **Registered**. You can delete these domains.
Unregistering a Cisco UCS Domain in Cisco UCS Central

Caution
If you want to unregister any registered Cisco UCS Domain in a production system, contact Cisco Technical Support.

When you unregister a Cisco UCS Domain from Cisco UCS Central:

• You can no longer manage the service profiles, policies, and other configuration for the Cisco UCS Domain from Cisco UCS Central.

• All global service profiles and policies become local and continue to operate as local entities. When you reregister the domain, the service profiles and policies remain local.

Note
You can also choose to remove the service profiles and policies entirely.

• Unregistering a Cisco UCS domain from Cisco UCS Central will be unsuccessful if you try to unregister immediately after registration, and you will be unable to perform remote operations. Cisco recommends that you check the Inventory status to move from In Progress to OK before you attempt to unregister again.

In a case where you choose certain policies to be resolved locally using the Policy Resolution Control feature in Cisco UCS Central, or when a Cisco UCS Domain is unregistered from Cisco UCS Central, the global settings/unnamed policies (such as QoS Settings, Discovery policies) stay as previously configured. You must manually change the policy details to the desired state.

Caution
Unregistering a Cisco UCS Domain has serious implications. You must not unregister the Cisco UCS Domain unless you choose to permanently not manage it from Cisco UCS Central.

Step 1
Click the System Tools icon and select Domain Management.

Step 2
On the Domain Management page, click the Domain Registration tab and choose the domain that you want to unregister.

Step 3
Click the Unregister Domain icon.

Step 4
Click Unregister Domain to continue.

Step 5
Choose the cleanup mode that you want to use:

• Deep Remove Global—Removes all policies inherited from the global configuration.

• Localize Global—Turns all global policies into local policies.

Step 6
Click Unregister Domain.
Viewing Domain Registration Configuration Status

Step 1  Click the System Tools icon and choose Domain Management.
Step 2  Locate the domain that you want to view, and click Configuration Status.
        The Domain Registrations Configuration Status page displays the status of the registration.
Step 3  Click Close to close the window.

Changing Cisco UCS Central IP Address

Cisco recommends that you always register Cisco UCS domains using Cisco UCS Central's Fully Qualified Domain Name (FQDN). If domains are registered with FQDN, any change in the Cisco UCS Central IP address is transparent to the domain. Changing Cisco UCS Central's IP address is supported only when Cisco UCS Central has a Fully Qualified Domain Name (FQDN), and when the Cisco UCS domain is registered using a Cisco UCS Central domain name.

Note

• Changing Cisco UCS Central's hostname (FQDN) is not officially supported. However, if your business needs dictate that this be done, please engage Cisco Technical Support, so that we can evaluate accommodating this request.

• Changing Cisco UCS Central's IP address is not officially supported if Cisco UCS domains are registered using Cisco Cisco UCS Central's IP address. However, if your business needs dictate that this be done, please engage Cisco Technical Support, so that we can evaluate accommodating this request.

Step 1  Delete the existing Cisco UCS Central IP address from the DNS server for the hostname and enter the new IP address and the Cisco UCS Central hostname.
Step 2  On the virtual infrastructure management platform (for example, VMware vCenter), change the virtual network interface (VIF) to point to the new subnet.
Step 3  From the Cisco UCS Central VM console, change the IP address of the network interface.
Step 4  Launch Cisco UCS Central from the GUI using the hostname. If the Cisco UCS Central GUI is inaccessible, then restart pmon command from the Cisco UCS Central CLI.
Step 5  Verify the Cisco UCS Central registration status on the Cisco UCS Manager GUI.
Step 6  For a High Availability setup, IP addresses of both the nodes and the virtual IP can be changed only at the primary node as shown in the example below.

Example

The following example is for a standalone setup of a network interface.

Changing IP for a UCS Central system in Standalone mode:
Changing Cisco UCS Manager IP Address

You can change the Cisco UCS Manager IP address if Cisco UCS domains are registered to Cisco UCS Central through an IP address. Use the following steps to change the Cisco UCS Manager IP address:

**Before you begin**

Ensure that the Fabric Interconnects have connectivity to the new subnet.

**Step 1**
Delete the existing Cisco UCS Manager IP address from the DNS server for the hostname, and enter the new IP address and the same Cisco UCS Manager hostname.

**Step 2**
From the primary FI console, run the following commands:

**Example:**

```plaintext
UCS-A# scope fabric-interconnect a
UCS-A /fabric-interconnect # set out-of-band ip 10.193.190.61 netmask 255.255.255.0 gw 10.193.190.1
UCS-A /fabric-interconnect* # scope fabric-interconnect b
UCS-A /fabric-interconnect* # set out-of-band ip 10.193.190.62 netmask 255.255.255.0 gw 10.193.190.1
UCS-A /fabric-interconnect* # scope system
UCS-A /system* # set virtual-ip 10.193.190.60
UCS-A /system* # commit-buffer
```
Step 3  After running the commands shown above, launch Cisco UCS Manager using the hostname and verify that the registration status is not changed.

Step 4  Under service-reg in the Cisco Cisco UCS Central CLI, verify that the show clients commands point to the new IP address for the UCS Domain.

Step 5  (Optional) To check if the IP address is changed, launch Cisco UCS Manager GUI from Cisco UCS Central, and verify that the new IP address is updated in the UI.

You can perform an additional check by updating one of the global service profile labels from the Cisco UCS Central GUI and ensure that the updated label is pushed down to Cisco UCS Manager. You can also create new global service profiles or policies and push them down to Cisco UCS Manager to verify that the new IP address is updated in the UI.

---

**Policies in Cisco UCS Central and Cisco UCS Domains**

You can create and manage global policies in Cisco UCS Central and include them in service profiles or service profile templates for one or more Cisco UCS domains. The service profiles and service profile templates that include global policies can be either of the following:

- **Local service profiles or service profile templates** that are created and managed by Cisco UCS Manager in one Cisco UCS domain. You can only associate local service profiles with servers in that domain. When you include a global policy in a local service profile, Cisco UCS Manager makes a local read-only copy of that policy.

- **Global service profiles or service profile templates** that are created and managed by Cisco UCS Central. You can associate global service profiles with servers in one or more registered Cisco UCS domains.

You can only make changes to global policies in Cisco UCS Central. Those changes affect all service profiles and service profile templates that include the global policy. All global policies are read-only in Cisco UCS Manager.

You can configure all operational policies under a domain group using IPv6 addresses. These policies are located in the **Operations Management** tab of the Cisco UCS Central GUI.

This feature helps the Cisco UCS Manager to use an IPv6 address while importing these policies from Cisco UCS Central.

---

**Policy Resolution between Cisco UCS Manager and Cisco UCS Central**

**Policy Resolution Control**

For each Cisco UCS domain that you register with Cisco UCS Central, you can choose which application will manage certain policies and configuration settings. This policy resolution does not have to be the same for every Cisco UCS domain that you register with the same Cisco UCS Central.

You have the following options for resolving these policies and configuration settings:

- **Local**—The policy or configuration is determined and managed by Cisco UCS Manager.

- **Global**—The policy or configuration is determined and managed by Cisco UCS Central.
The following table contains a list of the policies and configuration settings that you can choose to have managed by either Cisco UCS Manager or Cisco UCS Central:

The policy resolution options in Cisco UCS Central are not supported on all versions of Cisco UCS Manager. If your Cisco UCS Manager version is earlier than the earliest supported release, the policy resolution screen may display the value as global even if it is not applicable.

In a case where you choose certain policies to be resolved locally using the Policy Resolution Control feature in Cisco UCS Central, or when a Cisco UCS Domain is unregistered from Cisco UCS Central, the global settings/unnamed policies (such as QoS Settings, Discovery policies) stay as previously configured. You must manually change the policy details to the desired state.

Unregistering a Cisco UCS Domain has serious implications. You must not unregister the Cisco UCS Domain unless you choose to permanently not manage it from Cisco UCS Central.

### Policies

To assign a policy or a Management IP pool/policy to a domain profile, click on the policy and then click on the drop-down list to select the policy you want to assign to a profile. You can assign the following policies to a domain:

- **QoS System Class** - Defines a configurable set of system classes that you can include in a QoS Policy.
- **Port Auto-Discovery Policy** - Determines whether Server Port Auto-Discovery enabled or disabled in Cisco UCS Central.
- **Hardware Change Discovery Policy** - Determines if a hardware replacement deep discovery is triggered automatically, or after user acknowledgement from Cisco UCS Central.
- **KMIP Certification Policy** - KMIP Certification Policy enables using Self-Encrypting Drives (SEDs) through key management servers. This policy aims to generate a certificate that will be used by CIMC to communicate with KMIP server to get the key. You can configure this policy to a domain if it is created in a global scope.

### Management IP

You can assign the following pools/policies from the **Management IP** pool:

- **Inband Policy** - Policy to configure the Inband IP address on a server directly, or through an Inband policy.
- **Outband Pool** - Sets the Management IP Pool created for Outband network management.
The Management IP tab in the Domain Configuration Settings window is enabled only when the registered Cisco UCS Domain is Cisco UCS Manager 3.1(3) and later. For all earlier Cisco UCS Manager releases, the Management IP tab is hidden.

### Consequences of Policy Resolution Changes

When you register a Cisco UCS domain, you configure policies for local or global resolution. The behavior that occurs when the Cisco UCS domain is registered or when that registration or configuration changes, depends upon several factors, including whether a domain group has been assigned or not.

The following table describes the policy resolution behavior you can expect for each type of policy.

<table>
<thead>

</tbody>
</table>

**Consequences of Service Profile Changes on Policy Resolution**

For certain policies, the policy resolution behavior is also affected by whether or not one or more service profiles that include that policy have been updated.

The following table describes the policy resolution behavior you can expect for those policies.
Cloning a Policy

Cisco UCS Central enables you to clone a policy with a new name, parent organization or domain group, and description if applicable, to help you make minor edits without having to create a new policy.

Before you begin

- You must have Create/Edit access to the policy.
- You can clone only one policy at a time.
- None of the 'oper' based properties are included in a cloned policy.

Domains and Domain Groups

Cloning is not enabled on the following:

- Schedules
- Pools
- Organizations
- Domain Groups
- Tag types
- VLANs
- VSANs

Caution

Step 1
In the Browse Tables icon, click Policies.

Step 2
Click the check box next to the policy you want to clone, and click on the Clone icon.

Step 3
Choose the Organization or Domain Group where you want to create the policy, and enter the Name for the cloned policy and optional Description.

The name is case sensitive.

Step 4
Click Clone.

When you clone a policy, you should click Evaluate to estimate the impact of the changes before saving the cloned policy. You cannot duplicate policy names when you clone a policy. All cloned policies must have a unique name.

Domains and Domain Groups

When you register a Cisco UCS Manager instance in Cisco UCS Central, that instance becomes an ungrouped domain in Cisco UCS Central. You must assign this domain to a domain group to start managing this domain using global policies in Cisco UCS Central.

Cisco UCS Central creates a hierarchy of Cisco UCS domain groups for managing multiple Cisco UCS domains.

- **Domain Group**— A group that contains multiple Cisco UCS domains. You can group similar Cisco UCS domains under one domain group for simpler management.

- **Ungrouped Domains**—When a new Cisco UCS domain is registered in Cisco UCS Central, it is added to the ungrouped domains. You can assign the ungrouped domain to any domain group.

If you have created a domain group policy, and a new registered Cisco UCS domain meets the qualifiers defined in the policy, it is automatically be placed under the domain group specified in the policy. If not, it is placed in the ungrouped domains category until the domain group is assigned to a domain group.

You can only assign each Cisco UCS domain to one domain group. You can assign or reassign membership of the Cisco UCS domains at any time. When you assign a Cisco UCS domain to a domain group, the Cisco UCS domain automatically inherits all management policies specified for the domain group.
Before adding a Cisco UCS domain to a domain group, make sure to change the policy resolution controls to local in the Cisco UCS domain. This avoids accidentally overwriting service profiles and maintenance policies specific to that Cisco UCS domain. Even when you have enabled auto discovery for the Cisco UCS domains, enabling local policy resolution protects the Cisco UCS domain from accidentally overwriting policies.

Creating or Editing a Domain Group

Step 1  In the Actions bar, type Create Domain Group and press Enter.
Step 2  In the Domain Group dialog box, click Basic and choose the Domain Group Location in which you want to create the domain group.
Step 3  Enter a Name and optional Description.
   The name is case sensitive.
Step 4  In Qualification, select the Qualification Policies that you want to use to identify the Cisco UCS Manager domains. All domains that meet the qualification policy are automatically added to the domain group.
Step 5  In Domains, select the Cisco UCS Manager domains that you want to add to the domain group.
Step 6  Click Create.

Adding a Domain to a Domain Group

Step 1  In the Actions bar, type Assign Domain to Domain Group.
Step 2  In the Domain to Domain Group dialog box, in the Domain drop-down, select the Cisco UCS Manager domain that you want to add to the domain group.
   Note  You can also select a domain, click the Operations icon, and select Assign Domain to Domain Group. In this case, the Cisco UCS Manager domain is pre-populated in the Domain drop-down.
Step 3  In the Domain Group Location drop-down, select domain group where you want to add the domain.
Step 4  Click Assign.

Managing Domain Group SNMP

Step 1  Click the Domain Group Navigation icon and choose a domain group.
Step 2  Click the Configuration icon and choose SNMP.
Step 3  In Basic, click Enabled, then enter the Community/User Name.
   Cisco UCS includes the SNMP v1 or v2c community name or the SNMP v3 username when it sends the trap to the SNMP host. This must be the same as the community or username that is configured in SNMP Traps.
Step 4  Enter the optional System Contact and System Location.
Domain Group Qualification Policy

Domain group qualification policy enables you to automatically place new Cisco UCS domains under domain groups. You can create qualifiers based on Owner, Site and IP Address of various Cisco UCS domains based on your management requirements. When you register a new Cisco UCS domain, Cisco UCS Central analyses the domain based on the pre defined qualifiers in the domain group qualification policy and places the domain under a specific domain group for management.

Creating or Editing a Domain Group Qualification Policy

Step 1 In the Actions bar, type Create Domain Group Qualification Policy and press Enter.
Step 2 In the Domain Group Qualification Policy dialog box, click Basic and choose the Organization in which you want to create the domain group qualification policy.
Step 3 Enter a Name and optional Description.
   The policy name is case sensitive.
Step 4 In Owner, enter the owner name and regex.
Step 5 In Site, enter the site name and regex.
Step 6 In IP Address, add the IP address ranges.
Step 7 Click Create.

Organization

The Organization page enables you to view logical entities created under an organization that exists in a registered Cisco UCS domain.

Click one of the following icons to launch the specific page.

- Service Profiles—Displays all service profiles in the organization.
- Service Profile Templates—Displays all service profile templates in the organization.
- Pools—Displays all pools in the organization.
- **Policies**—Displays all policies in the organization.
- **Permitted VLANs**—Displays VLANs permitted in the organization.

## Updating Organization Descriptions

After an organization is created, you can update the description.

<table>
<thead>
<tr>
<th>Step 1</th>
<th>In the <strong>Edit Organization</strong> dialog box, enter the <strong>Description</strong> for the organization.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click <strong>Save</strong>.</td>
</tr>
</tbody>
</table>
Tags and Tag Types

Cisco UCS Central uses tags to allow users to group objects outside of the Organization or Domain Group structures. You can use the following types of tags:

• System-defined tags—Tags that are defined by Cisco UCS Central. This includes the Maintenance Group tag, the Operating System for HCR tag, and the Adapter Driver for HCR tag.

• User-defined tags—Tags that are created by users but have specific values.

• Basic tags—Free text tags that can allow any value.

From the Tag Management page in the GUI, you can view all Tag Types that have been created in Cisco UCS Central. However, you can view only the Tags that are associated with an object and are in active use at any given time.

Creating a Tag Type

Only users with the Tag permission can create tag types.

Step 1  In the Actions bar, type Create Tag Type and press Enter.
Step 2  In the Basic tab, enter the Name and optional Description.
Step 3  Select a color to assign to the tag, or accept the default.
Step 4  Choose whether you want to allow this tag to be assigned more than once to the same object.
Step 5  Choose one of the following:
  • Free Text—Allows any text to be entered when the tag is assigned.
  • Predefined List—You can create a list of values, or add additional values to a list of values. When the tag is assigned, you choose one of the values from the list.

Click the Values tab to add the specific values.
Step 6  Click Create.

---

**Adding a Tag**

You can add tags to policies, logical resources such as service profiles and ID pools, and physical inventory components such as domains or servers.

---

**Step 1**  Navigate to the item that you want to tag.
**Step 2**  Click the Tag icon.
**Step 3**  In the Add Tag drop-down, select the tag type that you want to use.

**Note**  All user-defined tag types are displayed, but only system-defined tag types that can be applied to the specific object are listed. For example, you cannot apply a Maintenance Group tag type to a VLAN, so that tag type is hidden.

**Step 4**  Enter the values for the tag or select the tag value from the drop-down list.
**Step 5**  Click Add.
License Management

Overview

Cisco Smart licensing is simple, flexible and a smart way of procuring, deploying and managing licenses in your environment. For more information on smart licensing, see http://www.cisco.com/web/ordering/smart-software-licensing/index.html

You can have smart licensing and traditional licensing in your system at the same time. But only one type of licensing can be active. The following table describes the differences between traditional and smart licensing:

<table>
<thead>
<tr>
<th>Traditional Licensing</th>
<th>Smart Licensing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Licenses are associated with registered domains.</td>
<td>Dynamic licensing. Licenses are associated with products and transferable within the virtual account.</td>
</tr>
<tr>
<td>You must obtain a license and manually download and install it on each device in Cisco UCS Central.</td>
<td>No license installation is necessary. The device initiates an HTTPS call home session and requests the licenses that it is configured to use.</td>
</tr>
<tr>
<td>Licenses are associated with specific domains.</td>
<td>License pools are account-specific. Any device in your company can use them.</td>
</tr>
<tr>
<td>Licenses are not easily transferable from one device to another.</td>
<td>Licenses can be transferred between product instances without any software installation. You can transfer unused licenses from one virtual account to another.</td>
</tr>
</tbody>
</table>

Smart Licensing

Smart licenses are server based licenses. You will purchase, deploy and track licenses for servers instead of domains. Instead of registering individual products with license files or PAKs, Smart Licensing provides the option to create a pool of licenses that can be used across your company's portfolio.

Smart licensing uses Virtual Accounts, Product Instances and Registration Tokens to procure, deploy and manage licenses in your environment.
Virtual Accounts

Virtual accounts are collections of licenses and product instances. You can create virtual accounts in Cisco Smart Software Manager to organize the licenses for your company into logical entities. You can use virtual accounts to organize licenses by business unit, product type, IT group, or whatever makes sense for your organization. For example, if you segregate your company into different geographic regions, you can create a virtual account for each region to hold the licenses and product instances for that region.

All new licenses and product instances are placed in a virtual account. You choose the virtual account when you register a product instance. You can transfer existing licenses or product instances from one virtual account to another.

For more information on creating virtual accounts in Cisco Smart Software Manager, see http://www.cisco.com/web/ordering/smart-software-manager/docs/smart-software-manager-user-guide.pdf.

Product Instances

A Cisco UCS Central product instance has a unique device identifier (UDI) that is registered using a product instance registration token. You can register several instances of a product with a single registration token. Each product instance can have one or more licenses that reside in the same virtual account.

Registration Tokens

Registration tokens are stored in the Product Instance Registration Token Table that is associated with your smart account. After you enable Smart Licensing in Cisco UCS Central, you can generate a new token in a virtual account on the Smart Software Licensing portal to register in Cisco UCS Central.

For more information on creating virtual accounts in Cisco Smart Software Manager, see http://www.cisco.com/web/ordering/smart-software-manager/docs/smart-software-manager-user-guide.pdf.

Obtaining Licenses

To obtain licenses using smart licensing, you will have to do the following:

- Generate tokens in Cisco Smart Software Manager virtual accounts.
- Register licenses for product instances in Cisco UCS Central.

The following illustrations explains the smart licensing process:
The Smart Licensing 90-evaluation period starts when the product instance begins using the licensing feature. It is not renewable. When the evaluation period expires, the agent sends a notification to the platform.

Authorization requests can result in an Authorized or Out of Compliance (OOC) response, or in an error due to a communication failure. Authorization periods are renewed every 30 days as long as authorization requests return Authorized or Out of Compliance (OOC) responses. When the authorization period expires, the agent continues to retry renewal with authorization requests. If successful, a new authorization period starts. If ID cert renewal (authorization renewal) fails, the product instance moves to an Unidentified state and begins consuming the evaluation period.

### Enabling Smart Licensing

#### Before you begin

Make sure you have enabled Smart Call Home before enabling Smart Licensing. Enabling Smart Call Home includes the following:

- Specify a DNS server.
- Set up Smart Call Home.
- Make sure your Smart Call Home URL is correct. This is the URL the system uses to connect to the smart license server.
Although you must enable Smart Call Home, a Smart Call Home contract ID is not required to use Smart Licensing.

**Registering UCS Central Using a License Token**

**Before you begin**

Make sure Smart Licensing is enabled.

**Step 1**
Click the **System Configuration** icon and choose **Licenses**.

**Step 2**
Click **Enable Smart Software Licensing**.

System enables smart licensing and information related to traditional licensing is replaced by smart licensing related information.

**Renewing Authorization**

License authorization is used to show if you have enough licenses for your system, or if you are out of compliance. Authorization is renewed automatically by the Smart Licensing agent every 30 days, provided the network is up and Cisco UCS Central can reach the Smart License server.

If authorization is not renewed for 90 days, the authorization will expire.
Step 3 Select **Renew Authorization Now**.

Renewing Registration

The agent automatically renews the Smart Software Licensing registration certificate or the ID certificate every six months. Certification lasts for one year. If Cisco UCS Central cannot communicate with the Smart License Server, it may fail to renew the certificate. If this occurs, the certification will revert to evaluation state after one year.

Step 1 Click the **System Configuration** icon and choose **Licenses**.
Step 2 In the Cisco UCS Central **Smart Software Licensing** panel, click the **Tools** menu.
Step 3 Select **Renew Registration Now**.

Deregistering Smart Software Licensing

When you deregister a product instance from Smart Software Licensing, the product will not be associated with the license. The product will be removed from the list of registered products for the associated virtual account. You can use the license to register another product, or reregister a product that has been deregistered.

Step 1 Click the **System Configuration** icon and choose **Licenses**.
Step 2 In the Cisco UCS Central **Smart Software Licensing** panel, click the **Tools** menu.
Step 3 Select **Deregister** to remove Cisco UCS Central from Smart Software Manager.

Disabling Smart Software Licensing

If you disable Smart Software Licensing, Cisco UCS Central automatically returns to the Traditional Licensing mode.

**Note**

Only one licensing mode is supported at a time.

Step 1 Click the **System Configuration** icon and choose **Licenses**.
Step 2 In the Cisco UCS Central **Smart Software Licensing** panel, click the **Action** menu.
Step 3 Select **Disable Smart Software Licensing**.

Traditional Licensing

Traditional PAK-based licensing uses domain-based licenses instead of the product-based license that Smart Licensing offers. You can manage domain licenses through the Cisco UCS Central GUI or CLI.
Obtaining a 120 day grace period to evaluate Cisco UCS Central at no cost. The grace period is measured from the day you register your first Cisco UCS domain and is stored in the system. Unregistering a domain from the system does not reset the grace period. For example, if you register a domain, use 40 days of the grace period, and then unregister after 40 days, the system records the 40 days in association with that domain. If you register this Cisco UCS domain again, the grace period for the domain resumes and indicates that you have used 40 days.

You must obtain and install a valid domain license before the grace period expires. If you do not the system generates multiple faults as a reminder to procure a license.

Obtaining a Traditional License

**Before you begin**

Obtain the Product Authorization Key (PAK) from the claim certification or other proof of purchase documentation.

---

**Step 1**

On the menu bar, click **System Configuration** icon and select **Licenses**.

This launches a **License** information page.

**Step 2**

Click **UCS Central GUID** link and copy the GUID to your clipboard.

The GUID is unique to each Cisco UCS Central instance for obtaining licenses.

**Step 3**

Click **Cisco SWIFT** to open the Product License Registration portal.

Videos on this page provide information on software licensing features and operations.

**Step 4**

Login and click **Continue to Product License Registration**.

**Step 5**

On the **Product License Registration** page, enter the PAK in the **Get New Licenses** field and click **Fulfill**.

**Step 6**

On the **Assign SKUs to Devices** page, check the **Quantity Available** checkbox next to the PAK that you entered.

**Step 7**

Enter the GUID in the **GUID** field, and click **Assign**.

**Step 8**

Click **Next**.

**Step 9**

On the **Review** page, enter your email address, select the user ID, and check the **License Agreement** checkbox.

**Step 10**

Click **Get License**.

Cisco sends you the license zip file by email. The license file is digitally signed to authorize use on only the specified Cisco UCS domain.

**Caution**

After you obtain the license file, you must not tamper with the license code. Any manual edits from your part breaks the tamper proof, and disables the license.

---

**What to do next**

Unzip the license file and install it.
Downloading a License from a Local File System

Before you begin
To download a license from the local file system to Cisco UCS Central, make sure you have the following:

- A Cisco product license saved it to your local system.
- Administrative permission for Cisco UCS Central to perform this task.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Click the System Configuration icon and choose Licenses. This launches the License information page.</td>
</tr>
<tr>
<td>2</td>
<td>Click Install License.</td>
</tr>
<tr>
<td>3</td>
<td>Click Local</td>
</tr>
<tr>
<td>4</td>
<td>In the Filename dialog box, type the full path and the name of the license. If you do not know the exact path to the folder where the license is located, click Choose File to navigate and select the file.</td>
</tr>
<tr>
<td>5</td>
<td>Click Install. Cisco UCS Central downloads the license.</td>
</tr>
</tbody>
</table>

Downloading a License from a Remote File System

Before you begin
To download a license from a remote location to Cisco UCS Central, make sure you have the following:

- A Cisco product license saved it to a remote location.
- The username and password required to access an FTP, SCP, or SFTP server if necessary.
- Administrative permission for Cisco UCS Central to perform this task.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Click the System Configuration icon and select Licenses. This launches a License information page.</td>
</tr>
<tr>
<td>2</td>
<td>Click Install License.</td>
</tr>
<tr>
<td>3</td>
<td>In the Download License dialog box, click Remote.</td>
</tr>
<tr>
<td>4</td>
<td>Select the protocol to use to communicate with the remote server.</td>
</tr>
</tbody>
</table>
Installing a License

Make sure the license is downloaded in Cisco UCS Central.

**Step 1**
On the menu bar, click System Configuration icon and choose Licenses.

**Step 2**
Click the Install icon.

Launches the License Install dialog box.

**Step 3**
In the License Install dialog box, select Local or Remote file location, enter required information and select the license file.

**Step 4**
Click Install.

The Overall License Status column displays the status of the installation. When you initiate the installation, the status in this column displays Install-pending. After the license is installed, the status changes to Installed.

Deleting a Traditional License

You can delete a traditional license that is not associated with a registered UCS domain, from Cisco UCS Central. If you want to delete a license that is associated to a UCS domain, make sure to unregister the domain before deleting the license. When you delete a license, the system automatically adjusts the available license count.

**Important**
Deleting a license from Cisco UCS Central removes only the license file from the system. If you try to download the same license after deleting it from the system, you might encounter a download license error. So when you delete a license, you must delete the associated download task for that license.

**Step 1**
Click the System Configuration icon and choose Licenses.
This launches a **License** information page.

**Step 2**  
Select the license you want to uninstall.

**Step 3**  
Click **Delete**.

**Step 4**  
Click **Yes** in the confirmation dialog box.  
The license file is deleted from Cisco UCS Central.
