- [Storage Enclosure Operations](#), on page 14

## Storage Server Features and Components Overview

### Storage Server Features

The following table summarizes the Cisco UCS S3260 system features:

*Table 1: Cisco UCS S3260 System Features*

Feature	Description
Chassis	Four rack unit (4RU) chassis
Processors	<ul style="list-style-type: none"><li>• Cisco UCS S3260 M3 server nodes: Two Intel Xeon E5-2600 v2 Series processors inside each server node.</li><li>• Cisco UCS S3260 M4 server nodes: Two Intel Xeon E5-2600 v4 Series processors inside each server node.</li></ul>
Memory	Up to 16 DIMMs inside each server node.
Multi-bit error protection	This system supports multi-bit error protection.
Storage	The system has the following storage options:
Disk Management	The system supports up to two storage controllers: <ul style="list-style-type: none"><li>• One dedicated mezzanine-style socket for a Cisco storage controller card inside each server node</li></ul>

Feature	Description
RAID Backup	The supercap power module (SCPM) mounts to the RAID controller card.
PCIe I/O	The optional I/O expander provides two 8x Gen 3 PCIe expansion slots.
Network and Management I/O	<p>The system can have one or two system I/O controllers (SIOCs). These provide rear-panel management and data connectivity.</p> <ul style="list-style-type: none"> <li>• Two SFP+ 40 Gb ports each SIOC.</li> <li>• One 10/100/1000 Ethernet dedicated management port on each SIOC.</li> </ul> <p>The server nodes each have one rear-panel KVM connector that can be used with a KVM cable, which provides two USB, one VGA DB-15, and one serial DB-9 connector.</p>
Power	Two or four power supplies, 1050 W each (hot-swappable and redundant as 2+2).
Cooling	<p>Four internal fan modules that pull front-to-rear cooling, hot-swappable. Each fan module contains two fans.</p> <p>In addition, there is one fan in each power supply.</p>

### Front Panel Features

The following image shows the front panel features for the Cisco UCS S3260 system:

**Figure 1: Front Panel Features**

1	Operations panel	6	Temperature status LED
2	System Power button/LED	7	Power supply status LED

3	System unit identification button/LED	8	Network link activity LED
4	System status LED	9	Pull-out asset tag (not visible under front bezel)
5	Fan status LED	10	Internal-drive status LEDs

### Rear Panel Features

The following image shows the rear panel features for the Cisco UCS S3260 system:

**Figure 2: Front Panel Features**

### Disk Slots

1	<p>Server bay 1</p> <ul style="list-style-type: none"> <li>• (Optional) I/O expander, as shown (with Cisco UCS S3260 M4 server node only)</li> <li>• (Optional) server node</li> <li>• (Optional) drive expansion module</li> </ul>	8	Not used at this time
---	---	---	-----------------------

2	<p>Server bay 2</p> <ul style="list-style-type: none"> <li>• (Optional) server node (Cisco UCS S3260 M4 shown)</li> <li>(Optional) drive expansion module</li> </ul>	9	Not used at this time
3	<p>System I/O controller (SIOC)</p> <ul style="list-style-type: none"> <li>• SIOC 1 is required if you have a server node in server bay 1</li> <li>• SIOC 2 is required if you have server node in server bay 2</li> </ul>	10	<p>Solid state drive bays (up to four 2.5-inch SAS SSDs)</p> <ul style="list-style-type: none"> <li>• SSDs in bays 1 and 2 require a server node in server bay 1</li> <li>• SSDs in bays 3 and 4 require a server node in server bay 2</li> </ul>
4	<p>Power supplies (four, redundant as 2+2)</p>	11	<p>Cisco UCS S3260 M4 server node label (M4 SVRN)</p> <p><b>Note</b> This label identifies a Cisco UCS S3260 M4 server node. The Cisco UCS S3260 M3 server node does not have a label.</p>
5	<p>40-Gb SFP+ ports (two on each SIOC)</p>	12	<p>KVM console connector (one each server node).</p> <p>Used with a KVM cable that provides two USB, one VGA, and one serial connector</p>
6	<p>Chassis Management Controller (CMS) Debug Firmware Utility port (one each SIOC)</p>	13	<p>Server node unit identification button/LED</p>

7	10/100/1000 dedicated management port, RJ-45 connector (one each SIOC)	14	Server node power button
		15	Server node reset button (resets chipset in the server node)

## Storage Server Components

### Server Nodes

The Cisco UCS S3260 system consists of one or two server nodes, each with two CPUs, DIMM memory of 128, 256, or 512 GB, and a RAID card up to 4 GB cache or a pass-through controller. The server nodes can be one of the following:

- Cisco UCS S3260 M3 Server Node
- Cisco UCS S3260 M4 Server Node—This node might include an optional I/O expander module that attaches to the top of the server node.

### Disk Slots

The Cisco UCS S3260 chassis has 4 rows of 14 disk slots on the HDD motherboard and 4 additional disk slots on the HDD expansion tray. The following image shows the disk arrangement for the 56 top-accessible, hot swappable 3.5-inch 6 TB or 4 TB 7200 rpm NL-SAS HDD drives. A disk slot has two SAS ports and each is connected a SAS expander in the chassis.

**Figure 3: Cisco UCS S3260 Top View**

The following image shows the Cisco UCS S3260 chassis with the 4 additional disk slots on the HDD expansion tray.

Figure 4: Cisco UCS 3260 with the HDD expansion tray (Rear View)

If you have two server nodes with two SIOCs, you will have the following functionality:

1. The top server node works with the left SIOC (Server Slot1 with SIOC1).
2. The bottom server works with the right SIOC (Server Slot 2 with SIOC2).

If you have one server node with two SIOCs, you can enable Server SIOC Connectivity functionality. Beginning with release 3.1(3), Cisco UCS S3260 system supports Server SIOC Connectivity functionality. Using this functionality, you can configure the data path through both the primary and auxiliary SIOCs when the chassis has single server and dual SIOCs set up.

### SAS Expanders

The Cisco UCS S3260 system has two SAS expanders that run in redundant mode and connect the disks at the chassis level to storage controllers on the servers. The SAS expanders provide two paths between a storage controller, and hence enable high availability. They provide the following functionality:

- Manage the pool of hard drives.
- Disk zone configuration of the hard drives to storage controllers on the servers.

The following table describes how the ports in each SAS expander are connected to the disks based on the type of deployment.

Port range	Connectivity
1-56	Top accessible disks
57-60	Disks in the HDD expansion tray.

**Note** The number of SAS uplinks between storage controller and SAS expander can vary based on the type of controller equipped in the server.

### Storage Enclosures

A Cisco UCS S3260 system has the following types of storage enclosures:

### Chassis Level Storage Enclosures

- **HDD motherboard enclosure**—The 56 dual port disk slots in the chassis comprise the HDD motherboard enclosure.
- **HDD expansion tray**—The 4 additional dual disk slots in the Cisco UCS S3260 system comprise the HDD expansion tray.

**Note** The HDD expansion tray is a field replaceable unit (FRU). The disks will remain unassigned upon insertion, and can be assigned to storage controllers. For detailed steps on how to perform disk zoning, see [Disk Zoning Policies, on page 9](#)

### Server level Storage Enclosures

Server level storage enclosures are pre-assigned dedicated enclosures to the server. These can be one of the following:

- **Rear Boot SSD enclosure**—This enclosure contains two 2.5 inch disk slots on the rear panel of the Cisco UCS S3260 system. Each server has two dedicated disk slots. These disk slots support SATA SSDs.
- **Server board NVMe enclosure**—This enclosure contains one PCIe NVMe controller.

**Note** In the Cisco UCS S3260 system, even though disks can be physically present on the two types of enclosures described above, from the host OS all the disks are viewed as part of one SCSI enclosure. They are connected to SAS expanders that are configured to run as single SES enclosure.

### Storage Controllers

#### Mezzanine Storage Controllers

The following table lists the storage controller type, firmware type, modes, sharing and OOB support for the various storage controllers.

**Table 2:**

Storage Controller Type	Firmware type	Modes	Sharing	OOB Support
UCSC-S3X60-R1GB	Mega RAID	HW RAID, JBOD	No	Yes
UCS-C3K-M4RAID	Mega RAID	HW RAID, JBOD	No	Yes
UCSC-S3X60-HBA	Initiator Target	Pass through	Yes	Yes
UCS-S3260-DHBA	Initiator Target	Pass through	Yes	Yes

#### Other storage controllers

**SW RAID Controller**—The servers in the Cisco UCS S3260 system support two dedicated internal SSDs embedded into the PCIe riser that is connected to the SW RAID Controller. This controller is supported on the Cisco C3000 M3 servers.

**NVMe Controller**—This controller is used by servers in the Cisco UCS S3260 system for inventory and firmware updates of NVMe disks.

For more details about the storage controllers supported in the various server nodes, see the related service note:

- [Cisco UCS C3X60 M3 Server Node For Cisco UCS S3260 Storage Server Service Note](#)
- [Cisco UCS C3X60 M4 Server Node For Cisco UCS S3260 Storage Server Service Note](#)

## Cisco UCS S3260 Storage Management Operations

The following table summarizes the various storage management operations that you can perform with the Cisco UCS Manager integrated Cisco UCS S3260 system.

Operation	Description	See:
Disk Sharing for High Availability	The SAS expanders in the Cisco UCS S3260 system can manage the pool of drives at the chassis level. To share disks for high availability, perform the following: <ol style="list-style-type: none"> <li>1. Creating disk zoning policies.</li> <li>2. Creating disk slots and assigning ownership.</li> <li>3. Associating disks to chassis profile.</li> </ol>	"Disk Zoning Policies" section in this guide.
Storage Profiles, Disk Groups and Disk Group Configuration Policies	You can utilize Cisco UCS Manager's Storage Profile and Disk Group Policies for defining storage disks, disk allocation and management in the Cisco UCS S3260 system.	"Storage Profiles" section in the <i>Cisco UCS Manager Storage Management Guide, Release 3.1(2)</i> .
Storage Enclosure Operations	You can swap the HDD expansion tray with a server, or remove the tray if it was previously inserted.	"Removing Chassis Level Storage Enclosures" section in this guide.

# Disk Sharing for High Availability

## Disk Zoning Policies

You can assign disk drives to the server nodes using disk zoning. Disk zoning can be performed on the controllers in the same server or on the controllers on different servers. Disk ownership can be one of the following:

### Unassigned

Unassigned disks are those not visible to the server nodes.

### Dedicated

If this option is selected, you will need to set the values for the **Server** and **Controller** for the disk slot.

---

**Note** A disk is visible only to the assigned controller.

---

### Shared

Shared disks are those assigned to more than one controller. They are specifically used when the servers are running in a cluster configuration, and each server has its storage controllers in HBA mode.

---

**Note** Shared mode cannot be used under certain conditions when dual HBA controllers are used.

---

### Chassis Global Hot Spare

If this option is selected, you will need to set the value for the **Slot Range** for the disk.

---

**Important** Disk migration and claiming orphan LUNs: To migrate a disk zoned to a server (Server 1) to another server (Server 2), you must mark the virtual drive (LUN) as transport ready or perform a hide virtual drive operation. You can then change the disk zoning policy assigned for that disk. For more information on virtual drive management, see the *Disk Groups and Disk Configuration Policies* section of the [Cisco UCS Manager Storage Management Guide](#).

---

## Creating a Disk Zoning Policy

### Procedure

---

- Step 1** In the Navigation pane, click **Chassis**.
- Step 2** Expand **Policies > root**.
- Step 3** Right-click **Disk Zoning Policies** and choose **Create Disk Zoning Policy**.

**Step 4** In the **Create Disk Zoning Policy** dialog box, complete the following:

Name	Description
Name field	<p>The name of the policy.</p> <p>This name can be between 1 and 16 alphanumeric characters. You cannot use spaces or any special characters other than - (hyphen), _ (underscore), : (colon), and . (period), and you cannot change this name after the object is saved.</p>
Description field	<p>A description of the policy. Cisco recommends including information about where and when to use the policy.</p> <p>Enter up to 256 characters. You can use any characters or spaces except ` (accent mark), \ (backslash), ^ (carat), " (double quote), = (equal sign), &gt; (greater than), &lt; (less than), or ' (single quote).</p>
Preserve Config check box	<p>If this check box is selected, it preserves all configuration related information for the disks such as slot number, ownership, server assigned, controller assigned, and controller type.</p> <p><b>Note</b> By default the <b>Preserve Config</b> check box remains unchecked.</p>

In the **Disk Zoning Information** area, complete the following:

Name	Field
Name column	The name for the disk slot.
Slot Number column	The slot number for the disk.

Name	Field
<b>Ownership</b> column	<p>The slot ownership value. This can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Unassigned</b>—This option is selected by default. You can set the slot number in the <b>Slot Range</b> field.</li> <li>• <b>Dedicated</b>—If this option is selected, you will need to set the values for the <b>Server</b>, <b>Controller</b>, and <b>Slot Range</b> for the disk slot.</li> <li>• <b>Shared</b>—If this option is selected, you will need to set the values for the <b>Slot Range</b> and controller information such as server assigned, controller assigned, and controller type for the disk slot.</li> </ul> <p><b>Note</b> Shared mode cannot be used under certain conditions when dual HBA controllers are used. To view the conditions for <b>Shared</b> mode for Dual HBA controller, see <a href="#">Table 3: Limitations for Shared Mode for Dual HBA Controller</a>, on page 11.</p> <ul style="list-style-type: none"> <li>• <b>Chassis Global Hot Spare</b>—If this option is selected, you will need to set the value for the <b>Slot Range</b> for the disk.</li> </ul>
<b>Assigned to Server</b> column	The ID of the server that the disk is assigned.
<b>Assigned to Controller</b> column	The ID of the controller that the disk is assigned.
<b>Controller Type</b> column	The type for the controller. If the disk is either dedicated or shared, the controller type is always SAS.

**Table 3: Limitations for Shared Mode for Dual HBA Controller**

Server	HDD Tray	Controller	Shared mode Support
Cisco UCS S3260	No	Dual HBA	Not Supported
Cisco UCS S3260	HDD Tray	Dual HBA	Not Supported
Pre-Provisioned	HDD Tray	Dual HBA	Not Supported

## Creating Disk Slots and Assigning Ownership

After you create a disk zoning policy, you must create the disk slots, and assign ownership.

### Procedure

- Step 1** In the Navigation pane, click **Chassis**.
- Step 2** Expand **Policies > root > Disk Zoning Policies**, and select the disk zoning policy that you want to add disk slots.
- Step 3** In the Work pane, under **Actions**, click **Add Slots to Policy**.
- Step 4** In the **Add Slots to Policy** dialog box, complete the following:

Name	Description
Ownership check box	<p>The ownership for the disk slot. This can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Unassigned</b>—This option is selected by default. You can set the slot number in the <b>Slot Range</b> field.</li> <li>• <b>Dedicated</b>—If this option is selected, you will need to set the values for the <b>Server</b>, <b>Controller</b>, and <b>Slot Range</b> for the disk slot.</li> <li>• <b>Shared</b>—If this option is selected, you will need to set the values for the <b>Slot Range</b> and controller information such as server assigned, controller assigned, and controller type for the disk slot.</li> </ul> <p><b>Note</b> Shared mode cannot be used under certain conditions when dual HBA controllers are used. To view the conditions for <b>Shared</b> mode for Dual HBA controller, see <a href="#">Table 3: Limitations for Shared Mode for Dual HBA Controller</a>, on page 11.</p> <ul style="list-style-type: none"> <li>• <b>Chassis Global Hot Spare</b>—If this option is selected, you will need to set the value for the <b>Slot Range</b> for the disk.</li> </ul>

- Step 5** Click **OK**.

## Associating Disk Zoning Policies to Chassis Profile

### Procedure

- Step 1** In the **Navigation** pane, click **Chassis**.
- Step 2** Expand **Chassis > Chassis Profiles**.
- Step 3** Expand the node for the organization where you want to create the chassis profile.
- If the system does not include multitenancy, expand the **root** node.

- Step 4** Right-click the organization and select **Create Chassis Profile**.
- Step 5** In the **Identify Chassis Profile** page, specify the name for the chassis profile, and click **Next**.
- Step 6** (Optional) In the **Maintenance Policy** page, specify the name for the maintenance policy, and click **Next**.
- Step 7** In the **Chassis Assignment** page, select **Select existing Chassis** under **Chassis Assignment**, and then select the chassis that you want to associate with this chassis profile. Click **Next**.
- Step 8** In the **Disk Zoning** page, specify the disk zoning policy that you want to associate with this chassis profile.
- Step 9** Click **Finish**.

## Disk Migration

Before you can migrate a disk zoned from one server to another, you must mark the virtual drive(LUN) as transport ready or perform a hide virtual drive operation. This will ensure that all references from the service profile have been removed prior to disk migration. For more information on virtual drives, please refer to the "virtual drives" section in the *Cisco UCS Manager Storage Management Guide, Release 3.1*

### Procedure

- Step 1** In the Navigation pane, click **Equipment > Chassis > Servers**.
- Step 2** Choose the Sever where you want to perform disk migration.
- Step 3** In the Work pane, click the **Inventory** tab.
- Step 4** Click the **Storage** subtab.
- Step 5** Click the **LUNs** subtab.
- Step 6** Choose the storage controller where you want to prepare the virtual drives for migration to another server.
- Step 7** Choose the disk that you want to migrate.
- Step 8** In the **Actions** area, choose one of the following:

Name	Description
<b>Rename</b>	Click on this link to rename your disk.
<b>Delete</b>	Click on this link to delete your disk.
<b>Set Transportation Ready</b>	Click on this link for the safe migration of the virtual drive from one server to another.  <b>Note</b> All virtual drives on a disk group must be marked as hidden before migrating or unassigning the disks from a server node.

Name	Description
<b>ClearTransportation Ready</b>	Click on this link to set the state of the virtual drive to no longer be transport ready.
<b>Hide Virtual Drive</b>	<p>Click on this option for the safe migration of the virtual drive from one server to another.</p> <p><b>Note</b> All virtual drives on a disk group must be marked as hidden before migrating or unassigning the disks from a server node.</p>
<b>Unhide Virtual Drive</b>	Click on this link to unhide the virtual drive and enable IO operations.

## Storage Enclosure Operations

### Removing Chassis Level Storage Enclosures

You can remove the storage enclosure corresponding to HDD expansion tray in Cisco UCS Manager after it is physically removed. You cannot remove server level or any other chassis level storage enclosures.

#### Procedure

- Step 1** In the **Navigation** pane, click **Equipment**.
- Step 2** Expand **Chassis > Servers > Storage Enclosures**.
- Step 3** Choose the storage enclosure that you want to remove.
- Step 4** In the **Actions** area, click **Remove Enclosure**.
