

# Configure Failover

Revised: March 2015

To configure failover for Cisco Show and Share, refer to the *Failover Configuration Guide for Cisco Digital Media Suite 5.5 and 5.6* on Cisco.com:

<http://www.cisco.com/c/en/us/support/conferencing/show-share/products-installation-and-configuration-guides-list.html>

**Note**

Configuring Digital Signs Failover on a DMM running Release 5.5 and 5.6 is not supported.

The screenshot displays the Cisco Digital Media Manager web interface. At the top, there is a navigation bar with tabs for Dashboard, Failover, Settings, Security, Users, Alerts, Services, and Licensing. The main content area is titled 'Failover Configuration' and is divided into three sections:

- Digital Media Suite Cluster Settings:** Includes a 'Name' field and radio buttons for 'Set As Master' and 'Master FQDN'.
- Digital Media Manager Failover Settings:** Contains two columns: 'Management Interface' with fields for Primary FQDN, Secondary FQDN, and Virtual FQDN; and 'Replication Interface' with a dropdown menu (set to 'Crossover') and fields for Primary IP, Secondary IP, and Subnet Mask.
- Show and Share Failover Settings:** Mirrors the structure of the Digital Media Manager section.

At the bottom of the configuration area, there are 'Save' and 'Reset' buttons. A copyright notice at the very bottom reads: © 2003-2011, Cisco Systems, Inc. All rights reserved. Warnings and End-User License Agreement.
