Installing the Appliance

The following sections describe how to install the Cisco MDE 1100 Series appliances:

- Installing the Cisco MDE 1100, page 2-1
- Installing the Cisco MDE 1125, page 2-12
- Where to Go Next, page 2-22

Note

Before you install, operate, or service the system, see the Regulatory Compliance and Safety Information for the Cisco MDE 1100 Series Appliances.

Warning

IMPORTANT SAFETY INSTRUCTIONS

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device.

Statement 1071

Warning

Only trained and qualified personnel must be allowed to install, replace, or service this equipment.

Statement 1030

Installing the Cisco MDE 1100

- Unpacking and Inspecting the Appliance, page 2-2
- Preparing for Installation, page 2-2
- Installing the Cisco MDE 1100 Into a Rack, page 2-4
- Connecting and Powering On the Cisco MDE 1100, page 2-7
Unpacking and Inspecting the Appliance

**Tip**
Keep the shipping container in case the appliance requires shipping in the future.

**Note**
The chassis is thoroughly inspected before shipment. If any damage occurred during transportation or any items are missing, contact your customer service representative immediately.

To inspect the shipment:

**Step 1**
Remove the appliance from its cardboard container—save all packaging material.

**Step 2**
Compare the shipment to the equipment list provided by your customer service representative and Figure 2-1. Verify that you have all items.

**Step 3**
Check for damage and report any discrepancies or damage to your customer service representative. Have the following information ready:
- Invoice number of shipper (see the packing slip)
- Model and serial number of the damaged unit
- Description of damage
- Effect of damage on the installation

**Figure 2-1  Shipping Box Contents**

Preparing for Installation

This section describes how to prepare for installation:
Installation Guidelines

When installing the appliance, follow these guidelines:

- Plan your site configuration and prepare the site before installing the appliance.
- Ensure that there is adequate space around the appliance to allow for servicing and for adequate airflow. The airflow in this appliance is from front to back.
- Ensure that the air-conditioning meets the thermal requirements listed in Appendix A, “Technical Specifications.”
- Ensure that the cabinet or rack meets the requirements listed in the “Rack Requirements” section on page 2-3.
- Ensure that the site power meets the power requirements listed in Appendix A, “Technical Specifications.” If available, you can use an uninterruptible power supply (UPS) to protect against power failures.
- Ensure that circuits are sized according to local and national codes. For North America, the power supply requires a 15-A circuit.

Warning

The plug-socket combination must be accessible at all times, because it serves as the main disconnecting device.

Statement 1019

Caution

Avoid UPS types that use ferroresonant technology. These UPS types can become unstable with systems such as the Cisco MDE, which can have substantial current draw fluctuations from fluctuating data traffic patterns.

Caution

To prevent loss of input power, ensure that the total maximum loads on the circuits supplying power to the appliance are within the current ratings for the wiring and breakers.

Rack Requirements

This section provides the requirements for the standard open racks, assuming an external ambient air temperature range of 32 to 95°F (0 to 35°C).

The rack must be of the following type:

- Standard 19-inch (48.3-cm) wide, four-post EIA rack, with mounting posts that conform to English universal hole spacing per section 1 of ANSI/EIA-310-D-1992.
- The rack post holes can be square or round when you use the supplied slide rails.
- The minimum vertical rack space per appliance must be one rack unit (RU), equal to 1.75 inches (4.45 cm).
Data Cable Recommendations

The MDE 1100 has two Gigabit Ethernet ports for data and ECDS software management. The Cisco Enterprise CDS 2.5 Quick Start Guide shows you how to configure a single interface for both data and ECDS management traffic.

For MDEs operating as a service engine, we recommend that you first configure the streaming interface as noted in the Quick Start Guide. You can later configure GigabitEthernet 0/0 and GigabitEthernet 0/1 as a port channel for maximum performance. This configuration requires a switch that supports port channeling.

See the Cisco ECDS 2.5 Software Configuration Guide for information about port channeling the interfaces.

Recommended Additional Equipment

The slide rails supplied by Cisco Systems do not require any tools for installation, but you might want to use a tape measure and level to help level the slide rails during installation.

Table 2-1 lists supported components and part numbers.

<table>
<thead>
<tr>

Installing the Cisco MDE 1100 Into a Rack

This section describes how to install the appliance into a rack. The orientation in these instructions refers to a view from the front of the appliance.

⚠️ Caution

If the rack has wheels, ensure that the brakes are engaged or that the rack is otherwise stabilized.

To install the slide rails and the appliance into a rack:

### Step 1

Install the slide rails into the rack by doing the following:

**Tip**

Use two people to help keep the slide rails and appliance level during installation. Use a tape measure and level or count the holes in the rack posts to ensure that the slide rails and appliance are level.

- Align the slide-rail assembly inside the rack posts with the length-adjustment bracket (item 4) toward the rear of the rack (see Figure 2-2).
- Compress the length-adjustment bracket until the mounting pegs (item 6) and locking clips (item 5) on the slide-rail assembly engage the desired rack holes on the front and rear rack posts.
- Pull the inner slide rails on each assembly out toward the rack front until they hit the internal stops and lock in place.
Figure 2-2 Attaching a Slide-Rail Assembly

1. Attach the second slide-rail assembly to the opposite side of the rack. Ensure that the two slide-rail assemblies are level and at the same height with each other.

2. Pull the inner slide rails on each assembly out toward the rack front until they hit the internal stops and lock in place.

Tip
Optionally use the #2 Phillips screws that come with the slide rails to increase stability after installation. These screws can be installed on the front attachment bracket on each assembly, but are not required.

Step 2
Attach mounting brackets to the appliance:

a. Set a mounting bracket (item 3) on the side of the appliance, aligning its keyed holes over the pegs on the appliance (item 2). The plastic installation release clip (item 5) on the bracket should be toward the appliance front. See Figure 2-3.

b. Push the mounting bracket toward the appliance rear until the locking clip clicks over the appliance peg.

c. Attach the remaining mounting bracket to the opposite side of the appliance.

Tip
Optionally use the #1 Phillips screws that come with the slide rails to increase stability after installation. You can install two of these screws on each side of the appliance to more permanently attach the mounting brackets to each side of the appliance, but they are not required.
**Figure 2-3  Attaching Mounting Brackets to the Appliance**

1. Rear of appliance
2. Mounting peg (four)
3. Mounting bracket
4. Removal release clip
5. Installation release clip

**Step 3** Insert the appliance into the slide rails by doing the following:

a. Align the mounting brackets that are attached to the appliance sides with the front of the empty slide rails.

b. Push the appliance into the slide rails until it stops at the internal stops.

c. Push the plastic installation release clip on each mounting bracket toward the appliance rear (see item 4 in Figure 2-3), and then continue pushing the appliance into the rack until its front flanges touch the rack posts.

**Step 4** Attach the (optional) cable management arm (CMA) to the rear of the slide rails:

a. Slide the plastic clip on the right end of the CMA length-adjustment slider (item 2) into the rear of the right slide rail (item 1) until it clips onto the plastic retaining flange inside the slide rail. See Figure 2-4.

b. Expand the CMA length-adjustment slider (item 2) until its left end aligns with the rear of the left slide-rail assembly (item 3).

c. Slide the innermost CMA attachment clip (item 4) into the rear of the left slide rail (item 3) and clip it onto the CMA flange that is on the mounting bracket that is attached to the appliance.

d. Attach the two-hole slotted bracket (item 5) that is on the left end of the CMA length-adjustment slider to the left slide rail. Fit the two-hole slotted bracket over the two pegs inside the slide rail.

e. Attach the outermost CMA attachment clip (item 6) onto the CMA flange that is on the left slide rail.
Connecting and Powering On the Cisco MDE 1100

This section describes how to power on the appliance and assign an IP address to the appliance management port, which allows you to connect to the Cisco Integrated Management Controller (CIMC). By following this procedure, you are staging your appliance for deployment, deploying the hardware, and remotely configuring the ECDS first boot parameters.

Tip

See the Cisco ECDS 2.5 Quick Start Guide for information about configuring ECDS during first boot.

- Attaching the Cables to the Appliance, page 2-7
- Configuring CIMC Network Settings and Password, page 2-8
- Configuring CIMC Remote Access Settings, page 2-10

Attaching the Cables to the Appliance

Attach a power cord to each power supply in your appliance, and then attach the power cord to a grounded AC power outlet. See the “Power Specifications” section on page A-2 for power specifications. Power is supplied to the service processor in standby power mode. Verify power status by looking at the Power Status LED on the front panel (see Figure 1-3):
[Step 2] Connect to your network by using the 10/100 Ethernet RJ-45 ports (see Figure 1-2). This is the device management port that allows you to connect to the CIMC.

[Step 3] Connect to appliance management console using one of the following methods:

- The front panel KVM console connector using the supplied KVM cable. See the “KVM Cable” section on page B-1 for details.
- The rear panel VGA and USB ports.

**Note**

You cannot use the front panel console connector VGA and the rear panel VGA at the same time. If you are connected to one VGA connector and you then connect a video device to the other connector, the first VGA connector is disabled. Reactivate the first VGA connector by rebooting the appliance.

- The rear panel serial connector (DB9) using a terminal emulation program (9600 baud, 8N1). If you later enable the Serial-over-LAN feature in CIMC, you will no longer be able to access the console through this connector.

### Configuring CIMC Network Settings and Password

**Caution**

DO NOT change the NIC mode or NIC redundancy settings. Changing these settings may cause severe performance degradation.

**Note**

Disconnect any external USB devices (such as drives and keyboards) before powering on the appliance. Your appliance may not boot with devices connected to the external USB ports.

**Step 1** Press and release the **Power** button to apply AC power and boot the appliance (see Figure 1-1).

**Step 2** During bootup, press **F8** when prompted to open the CIMC Configuration Utility. This utility allows you to make changes to the network settings and to reset the default CIMC password. See Figure 2-5.

**Note**

You can use DHCP on the device management interface. Allow the appliance to boot and to obtain network settings from your DHCP server. The new IP and MAC addresses are displayed on the Cisco logo screen during subsequent boots. However, we recommend using static IP settings.
Step 3  
To define static network settings, enter values in the following fields:
  
  - DHCP Enabled—Remove the check mark from this box to use static settings.
  - CIMC IP—Enter the IP address for the appliance in this field.
  - Subnet Mask—Enter the subnet mask for the appliance in this field.
  - Gateway—Enter the gateway for the appliance in this field.

Step 4  
Change the default CIMC password:
  
a. Use the Up/Down arrow keys to move the insertion point to Default password under Default User.

  b. Type the new password.

  c. Type the password again in the Reenter password field.

Step 5  
Press **F10** to save your changes.

---

**Note**  
Changes to the settings take effect after approximately 45 seconds. Refresh the view with **F5** to verify the new settings.

After the appliance has been assigned an IP address, you can use that address in a browser to access the CIMC GUI management system.
Configuring CIMC Remote Access Settings

Enabling the remote access settings allows you to open an SSH session to the CIMC interface and access the device command line interface. You can also access the ECDS command line interface from the SSH session by entering the `connect host` command. This will enable you to remotely perform the initial configuration of your MDE.

Refer the *Cisco Enterprise CDS 2.5 Quick Start Guide* for information about the initial configuration of ECDS.

---

**Step 1**
Access the CIMC GUI (Figure 2-6. Use the IP address you configured in the “Configuring CIMC Network Settings and Password” section on page 2-8).

https://<cimc_ip_address>

*Figure 2-6  CMC GUI Login*

---

**Step 2**
Login to the CIMC GUI.

The default username for the appliance is `admin`.

The default password for the appliance is `password` (unless you changed it in the “Configuring CIMC Network Settings and Password” section on page 2-8).

**Step 3**
On the Server tab, click **Remote Presence**, as shown in *Figure 2-7*. 
Step 4  Click the **Serial over LAN** tab, as shown in Figure 2-8.

**Note**  Enabling Serial over LAN disables console access through the serial port on the rear of the appliance.

Step 5  Check the Enabled checkbox and choose 9600 bps from the Baud Rate list.

Step 6  Click **Save Changes**.
Installing the Cisco MDE 1125

This section describes how to install the Cisco MDE 1125 UCS server:

- Unpacking and Inspecting the Server, page 2-12
- Preparing for Installation, page 2-2
- Installing the Cisco MDE 1100 Into a Rack, page 2-4
- Initially Setting up the Server, page 2-18
- Managing System BIOS and CIMC Firmware, page 2-21
- Updating the BIOS and CIMC Firmware, page 2-21

Note
Before you install, operate, or service a server, review the Regulatory Compliance and Safety Information for Cisco UCS C-Series Servers for important safety information.

Warning
IMPORTANT SAFETY INSTRUCTIONS

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device.

Statement 1071

SAVE THESE INSTRUCTIONS.

Unpacking and Inspecting the Server

Caution
When handling internal server components, wear an ESD strap and handle modules by the carrier edges only.

Tip
Keep the shipping container in case the server requires shipping in the future.

Note
The chassis is thoroughly inspected before shipment. If any damage occurred during transportation or any items are missing, contact your customer service representative immediately.

To inspect the shipment:

Step 1
Remove the server from its cardboard container and save all packaging material.

Step 2
Compare the shipment to the equipment list provided by your customer service representative and Figure 2-1. Verify that you have all items.

Step 3
Check for damage and report any discrepancies or damage to your customer service representative. Have the following information ready:
Preparing for Server Installation

This section provides information about preparing for server installation, and it includes the following topics:

- Installation Guidelines, page 2-3
- Rack Requirements, page 2-3
- Equipment Requirements, page 2-14
- Slide Rail Adjustment Range, page 2-15

Installation Guidelines

⚠️ Warning

To prevent the system from overheating, do not operate it in an area that exceeds the maximum recommended ambient temperature of: 40° C (104° F).

Statement 1047
Warning

The plug-socket combination must be accessible at all times, because it serves as the main disconnecting device.
Statement 1019

Warning

This product relies on the building’s installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than: 250 V, 15 A.
Statement 1005

Warning

Installation of the equipment must comply with local and national electrical codes.
Statement 1074

When you are installing a server, use the following guidelines:

- Plan your site configuration and prepare the site before installing the server. See the Cisco UCS Site Preparation Guide for the recommended site planning tasks.
- Ensure that there is adequate space around the server to allow for servicing the server and for adequate airflow. The airflow in this server is from front to back.
- Ensure that the air-conditioning meets the thermal requirements listed in Appendix A, “Technical Specifications.”
- Ensure that the cabinet or rack meets the requirements listed in the “Rack Requirements” section on page 2-3.
- Ensure that the site power meets the power requirements listed in Appendix A, “Technical Specifications.” If available, you can use an uninterruptible power supply (UPS) to protect against power failures.

Caution

Avoid UPS types that use ferroresonant technology. These UPS types can become unstable with systems such as the Cisco UCS, which can have substantial current draw fluctuations from fluctuating data traffic patterns.

Rack Requirements

This section provides the requirements for the standard open racks.

The rack must be of the following type:

- A standard 19-in. (48.3-cm) wide, four-post EIA rack, with mounting posts that conform to English universal hole spacing, per section 1 of ANSI/EIA-310-D-1992.
- The rack post holes can be square .38-inch (9.6 mm), round .28-inch (7.1 mm), #12-24 UNC, or #10-32 UNC when you use the supplied slide rails.
- The minimum vertical rack space per server must be one RU, equal to 1.75 in. (44.45 mm).

Equipment Requirements

The slide rails supplied by Cisco Systems for this server do not require tools for installation. The inner rails (mounting brackets) are pre-attached to the sides of the server.
Slide Rail Adjustment Range

The slide rails for this server have an adjustment range of 24 to 36 inches (610 to 914 mm).

Installing the Cisco MDE 1125 In a Rack

This section describes how to install the server in a rack.

⚠️ Warning

To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:

- This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
- When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
- If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.

Statement 1006

To install the slide rails and the server into a rack:

Step 1

Open the front securing latch (see Figure 2-10). The end of the slide-rail assembly marked “FRONT” has a spring-loaded securing latch that must be open before you can insert the mounting pegs into the rack-post holes.

- a. On the rear side of the securing-latch assembly, hold open the clip marked “PULL.”
- b. Slide the spring-loaded securing latch away from the mounting pegs.
- c. Release the clip marked “PULL” to lock the securing latch in the open position.

![Figure 2-10 Front Securing Latch](image)
Step 2  Install the slide rails onto the rack:

a. Position a slide-rail assembly inside the two left-side rack posts (see Figure 2-2).

Use the “FRONT” and “REAR” markings on the slide-rail assembly to orient the assembly correctly with the front and rear rack posts.

b. Position the front mounting pegs so that they enter the desired front rack-post holes from the front.

Note

The mounting pegs that protrude through the rack-post holes are designed to fit round or square holes, or smaller #10-32 round holes when the mounting peg is compressed. If your rack has #10-32 rack-post holes, align the mounting pegs with the holes and then compress the spring-loaded pegs to expose the #10-32 inner peg.

c. Expand the length-adjustment bracket until the rear mounting pegs protrude through the desired holes in the rear rack post.

Use your finger to hold the rear securing latch open when you insert the rear mounting pegs to their holes. When you release the latch, it wraps around the rack post and secures the slide-rail assembly.

Figure 2-11  Attaching a Slide-Rail Assembly

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

d. Attach the second slide-rail assembly to the opposite side of the rack. Ensure that the two slide-rail assemblies are level and at the same height with each other.

e. Pull the inner slide rails on each assembly out toward the rack front until they hit the internal stops and lock in place.

Step 3  Insert the server into the slide rails:
Note: The inner rails are pre-attached to the sides of the server at the factory. You can order replacement inner rails if these are damaged or lost (Cisco PID UCSC-RAIL1-I).

a. Align the inner rails that are pre-attached to the server sides with the front ends of the empty slide rails.

b. Push the server into the slide rails until it stops at the internal stops.

c. Push in the plastic release clip on each inner rail (labelled PUSH), and then continue pushing the server into the rack until its front latches engage the rack posts.

**Step 4** Attach the (optional) cable management arm (CMA) to the rear of the slide rails:

Note: The CMA is designed for mounting on either the right or left slide rails. These instructions describe an installation to the rear of the right slide rails, as viewed from the rear of server.

a. Slide the plastic clip on the inner CMA arm over the flange on the mounting bracket that attached to the side of the server. See Figure 2-4.

Note: Whether you are mounting the CMA to the left or right slide rails, be sure to orient the engraved marking, “UP” so that it is always on the upper side of the CMA. See Figure 2-4.

b. Slide the plastic clip on the outer CMA arm over the flange on the slide rail. See Figure 2-4.

c. Attach the CMA retaining bracket to the left slide rail. Slide the plastic clip on the bracket over the flange on the end of the left slide rail. See Figure 2-4.

Initially Setting up the Server

This section includes the following topics:

- Connecting and Powering On the Server (Standalone Mode), page 2-18
- Managing NIC Modes and NIC Redundancy Settings, page 2-20

Connecting and Powering On the Server (Standalone Mode)

This section describes how to power on the server, assign an IP address, and connect to server management when using the server in standalone mode.

Note

The server is shipped with a default NIC mode called Shared LOM, default NIC redundancy is active-active, and DHCP is enabled. Shared LOM mode enables the two 1-Gb Ethernet ports to access the Cisco Integrated Management Interface (CIMC). If you want to use the 1-Gb Ethernet dedicated management port, or a port on a Cisco UCS P81E Virtual Interface Card (VIC) to access the CIMC, you must first connect to the server and change the NIC mode as described in Step 3 of the following procedure. In that step, you can also change the NIC redundancy and set static IP settings.

To initially set up the server:

Step 1

Attach a supplied power cord to each power supply in your server, and then attach the power cord to a grounded AC power outlet. See Appendix A, “Technical Specifications” for power specifications.

Wait for approximately two minutes to let the server boot in standby power during the first bootup.

You can verify power status by looking at the Power Status LED (see “Status LEDs” section on page 1-4):

- Off—There is no AC power present in the server.
- Amber—The server is in standby power mode. Power is supplied only to the CIMC and some motherboard functions.
- Green—The server is in main power mode. Power is supplied to all server components.

Note

During bootup, the server beeps once for each USB device that is attached to the server. Even if there are no external USB devices attached, there is a short beep for each virtual USB device such as a virtual floppy drive, CD/DVD drive, keyboard, or mouse. A beep is also emitted if a USB device is hot-plugged or hot-unplugged during BIOS power-on self test (POST), or while you are accessing the BIOS Setup utility or the EFI shell.

Step 2

Connect a USB keyboard and VGA monitor by using the supplied KVM cable connected to the KVM connector on the front panel (see “Appliance Front Panel” section on page 1-2).
Note
Alternatively, you can use the VGA and USB ports on the rear panel. However, you cannot use the front panel VGA and the rear panel VGA at the same time. If you are connected to one VGA connector and you then connect a video device to the other connector, the first VGA connector is disabled.

Step 3  Set NIC mode, NIC redundancy, and choose whether to enable DHCP or set static network settings:

a. Press the **Power** button to boot the server. Watch for the prompt to press F8.

b. During bootup, press **F8** when prompted to open the BIOS CIMC Configuration Utility.

c. Set the NIC mode to your choice for which ports to use to access the CIMC for server management (see “Status LEDs” section on page 1-4 for port identification):

   - Dedicated—The 1-Gb Ethernet management port is used to access the CIMC. You must select NIC redundancy **None** and select IP settings.
   - Shared LOM (default)—The two 1-Gb Ethernet ports are used to access the CIMC. This is the factory default setting, along with Active-active NIC redundancy and DHCP enabled.
   - Cisco Card—The ports on an installed Cisco UCS P81E VIC are used to access the CIMC. You must select a NIC redundancy and IP setting.

Note
The Cisco Card NIC mode is currently supported only with a Cisco UCS P81E VIC (N2XX-ACPCI01) that is installed in PCIe slot 1. See also Special Considerations for Cisco UCS P81E Virtual Interface Card (N2XX-ACPCI01), page 3-33.

d. Use this utility to change the NIC redundancy to your preference. This server has three possible NIC redundancy settings:

   - None—The Ethernet ports operate independently and do not fail over if there is a problem.
   - Active-standby—If an active Ethernet port fails, traffic fails over to a standby port.
   - Active-active—All Ethernet ports are utilized simultaneously.

e. Choose whether to enable DHCP for dynamic network settings, or to enter static network settings.
Chapter 2      Installing the Appliance

Installing the Cisco MDE 1125

Note
Before you enable DHCP, your DHCP server must be preconfigured with the range of MAC addresses for this server. The MAC address is printed on a label on the rear of the server. This server has a range of six MAC addresses assigned to the CIMC. The MAC address printed on the label is the beginning of the range of six contiguous MAC addresses.

f. (Optional) Use this utility to make VLAN settings, and to set a default CIMC user password.

Note
Changes to the settings take effect after approximately 45 seconds. Refresh with F5 and wait until the new settings appear before you reboot the server in the next step.

g. Press F10 to save your settings and reboot the server.

Note
If you chose to enable DHCP, the dynamically assigned IP and MAC addresses are displayed on the console screen during bootup.

Step 4
Connect to the CIMC for server management. Connect Ethernet cables from your LAN to the server, using the ports that you selected by your NIC Mode setting in Step 3. The Active-active and Active-passive NIC redundancy settings require you to connect to two ports.

Step 5
Use a browser and the IP address of the CIMC to connect to the CIMC Setup Utility. The IP address is based upon the settings that you made in Step 3 (either a static address or the address assigned by your DHCP server).

Note
The default user name for the server is admin. The default password is password.

To manage the server, see the Cisco UCS C-Series Rack-Mount Server Configuration Guide or the Cisco UCS C-Series Rack-Mount Server CLI Configuration Guide for instructions on using those interfaces. The links to these documents are in the C-Series documentation roadmap:

Managing NIC Modes and NIC Redundancy Settings

This server has the following NIC mode settings that you can choose from:

• Dedicated—The 1-Gb Ethernet dedicated management port is used to access the CIMC. You must select NIC redundancy None and select IP setting.

• Shared LOM (default)—The two 1-Gb Ethernet ports are used to access the CIMC. This is the factory default setting, along with Active-active NIC redundancy and DHCP enabled.

• Cisco Card—The ports on an installed Cisco UCS P81E VIC are used to access the CIMC. You must select a NIC redundancy and IP setting.

Note
The Cisco Card NIC mode is currently supported only with a Cisco UCS P81E VIC (N2XX-ACPCI01) that is installed in PCIe slot 1. See also Special Considerations for Cisco UCS P81E Virtual Interface Card (N2XX-ACPCI01), page 3-33.
This server has the following NIC redundancy settings that you can choose from:

- None—The Ethernet ports operate independently and do not fail over if there is a problem.
- Active-standby—If an active Ethernet port fails, traffic fails over to a standby port.
- Active-active—All Ethernet ports are utilized simultaneously.

**Managing System BIOS and CIMC Firmware**

This section includes information about the system BIOS:

- Updating the BIOS and CIMC Firmware, page 2-21
- Accessing the System BIOS, page 2-22

**Updating the BIOS and CIMC Firmware**

---

**Caution**

When you upgrade the BIOS firmware, you must also upgrade the CIMC firmware to the same version or the server will not boot. Do not power off the server until the BIOS and CIMC firmware are matching or the server will not boot.

Cisco provides the Cisco Host Upgrade Utility to assist with simultaneously upgrading the BIOS, CIMC, and other firmware to compatible levels.

The server uses firmware obtained from and certified by Cisco. Cisco provides release notes with each firmware image. There are several methods for updating the firmware:

- **Recommended method for systems running firmware level 1.2 or later**: Use the Cisco Host Upgrade Utility to simultaneously upgrade the CIMC, BIOS, LOM, LSI storage controller, and Cisco UCS P81E VIC firmware to compatible levels.
  
  See the *Cisco Host Upgrade Utility Quick Reference Guide* for your firmware level at the documentation roadmap link below.

- **Note**  
  Your system firmware must be at minimum level 1.2 to use the Cisco Host Upgrade Utility. If your firmware is prior to level 1.2, you must use the methods below to update the BIOS and CIMC firmware individually.

- You can upgrade the BIOS using the EFI interface, or upgrade from a Windows or Linux platform.  
  See the *Cisco UCS C-Series Rack-Mount Server BIOS Upgrade Guide*.

- You can upgrade the CIMC and BIOS firmware by using the CIMC GUI interface.  
  See the *Cisco UCS C-Series Rack-Mount Server Configuration Guide*.

- You can upgrade the CIMC and BIOS firmware by using the CIMC CLI interface.  
  See the *Cisco UCS C-Series Rack-Mount Server CLI Configuration Guide*.

Accessing the System BIOS

To change the BIOS settings for your server:

Tip

Detailed instructions are also printed on the BIOS screens.

Step 1
Enter the BIOS setup utility by pressing the F2 key when prompted during bootup.

Note
The version and build of the current BIOS are displayed on the Main page of the utility.

Step 2
Use the arrow keys to select the BIOS menu page.

Step 3
Highlight the field to be modified by using the arrow keys.

Step 4
Press Enter to select the field that you want to change, and then modify the value in the field.

Step 5
Press the right arrow key until the Exit menu screen is displayed.

Step 6
Follow the instructions on the Exit menu screen to save your changes and exit the setup utility (or Press F10). Exit without saving changes by pressing Esc.

Where to Go Next

Proceed to Chapter 3, “Operating and Maintaining the Appliance.”
