Chapter 2

Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Revised February, 2016

See the following sections:

- About Unified Messaging with Exchange, page 2-1
- Task List for Configuring Unity Connection and Exchange for Unified Messaging, page 2-12
- Task List for Configuring Existing Unity Connection Users for Unified Messaging, page 2-16
- Exchange Servers Communication with Unity Connection, page 2-17
- Creating Unified Messaging Services Account in Active Directory and Granting Permissions, page 2-27
- Configuring Unified Messaging in Unity Connection, page 2-36
- Testing Unified Messaging Configuration, page 2-41

About Unified Messaging with Exchange

See the following sections:

- Accessing Exchange Email Using Text to Speech, page 2-1
- Accessing Exchange Calendars and Contacts in Unity Connection, page 2-2
- Synchronizing Voice Messages in Unity Connection and Exchange Mailboxes in Single Inbox, page 2-2

Accessing Exchange Email Using Text to Speech

Revised June 19, 2013

When Unity Connection is configured to allow access to Exchange email using text to speech, users have the option to hear their emails read to them when they sign in to Unity Connection by phone.

Note

Text to speech over Exchange 2016, Exchange 2013, Exchange 2007, and Exchange 2010 supports both the IPv4 and IPv6 addresses. However, the IPv6 address works only when Unity Connection platform is configured in Dual (IPv4/IPv6) mode. For more information on configuring IPv6 settings, see the
About Unified Messaging with Exchange

Unity Connection uses the IMAP protocol to access emails in Exchange so that the messages can be played using text to speech. By default, Exchange is not configured to allow IMAP access to messages. You must enable IMAP access on each Exchange server that contains emails that you want licensed Connection users to be able to access.

Accessing Exchange Calendars and Contacts in Unity Connection

When Unity Connection is configured to access Exchange calendars and contacts, Unity Connection users can do the following by phone:

- Hear a list of upcoming meetings (Outlook meetings only).
- Hear a list of the participants for a meeting.
- Send a message to the meeting organizer.
- Send a message to the meeting participants.
- Accept or decline meeting invitations (Outlook meetings only).
- Cancel a meeting (meeting organizers only).

Exchange 2007/2010 calendars and contacts support both the IPv4 and IPv6 addresses. However, the IPv6 address works only when Unity Connection platform is configured in Dual (IPv4/IPv6) mode.

Microsoft Outlook 2013 is not supported with Exchange 2003.

In addition, Unity Connection enables users to import Exchange contacts using the Unity Connection Messaging Assistant web tool. The contact information can then be used in rules that users create in the Cisco Unity Connection Personal Call Transfer Rules web tool and when users place outgoing calls using voice commands.

If you configure a Unity Connection user for access to the Exchange calendar, you cannot also configure the user for access to Cisco Unified MeetingPlace.

Synchronizing Voice Messages in Unity Connection and Exchange Mailboxes in Single Inbox

The synchronization of voice messages in Unity Connection and Exchange Mailboxes for single inbox (SIB) users supports both the IPv4 and IPv6 addresses.
About Unified Messaging with Exchange

Note
- When single inbox is configured, Outlook rules may or may not work for Single Inbox messages.

This section describes how synchronizing voice messages in Unity Connection and Exchange mailboxes works. See the following sections:

- Location for Voice Messages with Single Inbox Configuration, page 2-3
- Single Inbox with ViewMail for Outlook, page 2-4
- Single Inbox without ViewMail for Outlook or with Other Email Clients, page 2-4
- Synchronization of Transcription of Voice Messages between Unity Connection with Exchange Mailboxes, page 2-5
- How Message Routing Works Using SMTP Domain Name, page 2-9
- Where Deleted Messages Go, page 2-10
- Types of Unity Connection Messages Not Synchronized with Exchange, page 2-10
- Replication of Status Changes, page 2-10
- Disabling and Re-enabling Single Inbox Affecting the Synchronization of Unity Connection and Exchange Mailboxes, page 2-10
- Synchronization of Read/Heard Receipts, Delivery Receipts, and Non-delivery Receipts, page 2-11

Note
You may experience delay (in order of hours) in synchronization of voice messages from Exchange server to Connection while the Resynchronize All Single-Inbox Messages SysAgent task is running. It is recommended to run the Resynchronize All Single-Inbox Messages SysAgent task during off hours.

Location for Voice Messages with Single Inbox Configuration

All Unity Connection voice messages, including those sent from Cisco Unity Connection ViewMail for Microsoft Outlook, are first stored in Unity Connection and are immediately replicated to the Exchange mailbox for the recipient.

Note
When Connection is configured for Single Inbox to Exchange, where a Blackberry Enterprise Server is also integrated with the Exchange server to send voice mail out to Blackberry devices, there will be a 10-15 min delay between the time the voice mail hits Exchange before the notification is picked up by the BES. To resolve the above issue you need to install BES version 5.0.03 MR5 or later.
### Single Inbox with ViewMail for Outlook

Consider the following points if you want to use Outlook for sending, replying, and forwarding voicemails and to synchronize the voicemails with Unity Connection:

- **Install ViewMail for Outlook on user workstations.** If ViewMail for Outlook is not installed, the voicemails that are sent by Outlook are treated as .wav file attachments by Unity Connection. For more information on installing ViewMail for Outlook, see the *Release Notes for Cisco ViewMail for Microsoft Outlook* for the latest release at [http://www.cisco.com/en/US/products/ps6509/prod_release_notes_list.html](http://www.cisco.com/en/US/products/ps6509/prod_release_notes_list.html).

- **Make sure to add SMTP proxy addresses for unified messaging users in Unity Connection.** The SMTP proxy address of a user specified in Cisco Unity Connection Administration must match the Exchange/Office 365 email address specified in the unified messaging account in which single inbox is enabled.

- **Associate an email account of each user in the organization with a Unity Connection server domain.** The Outlook Inbox folder contains both voicemails and the other messages stored in Exchange/Office 365. The voicemails also appear in the Web Inbox of a user.

A single inbox user has a **Voice Outbox** folder added to the Outlook mailbox. Unity Connection voicemails sent from Outlook do not appear in the Sent Items folder.

*Note* Private messages cannot be forwarded.

### Single Inbox without ViewMail for Outlook or with Other Email Clients

If you use another email client to access Unity Connection voice messages in Exchange, or if you do not install ViewMail for Outlook:

- **The email client treats Unity Connection voice messages like emails with .wav file attachments.**

- **When a user replies to or forwards a Unity Connection voice message, the reply or forward also is treated like an email, even if the user attaches a .wav file.** Message routing is handled by Exchange, not by Unity Connection, so the message is never sent to the Unity Connection mailbox for the recipient.

- **Users cannot listen to secure voice messages.**

- **It may be possible to forward private voice messages.** (When users use ViewMail for Outlook, ViewMail for Outlook prevents private messages from being forwarded.)

*Note* If a voice message is sent to the user of Exchange 2003, it is immediately synchronized between Unity Connection and Exchange. The .wav file attachment is displayed both in Unity Connection Web Inbox and Outlook of Exchange 2003. In Outlook WebMail Access of Exchange 2003, the email shows the attachment symbol but when the email is opened, the .wav file attachment is not displayed. Both in Outlook and OWA of Exchange 2007, Exchange 2010, Exchange 2013, and Exchange 2016 the .wav file attachment is displayed in the email.
Accessing Secure Voice Messages in the Exchange Mailbox

To play secure Unity Connection voice messages in the Exchange mailbox, users must use Microsoft Outlook and Cisco Unity Connection ViewMail for Microsoft Outlook. Without ViewMail for Outlook installed, users accessing secure voice messages see only text in the body of a decoy message; the text briefly explains secure messages.

Synchronization of Transcription of Voice Messages between Unity Connection with Exchange Mailboxes

In Unity Connection, the system administrator enables the single inbox transcription functionality. To enable transcription of voice messages, users must configure the following services:

- **Unified Messaging Service**: To configure the Unified Messaging Service, see the Configuring Unified Messaging in Unity Connection, page 2-36 section.

Note that the following services are not supported with Unity Connection, if configured with single inbox:

- Synchronization of multiple forwarded messages.
- Synchronization of transcription for user voice messages with Exchange 2003.

In single inbox, the transcription of Voice Messages is synchronized with Exchange in the following ways:

- When sender sends voice mail to user through Web Inbox or touchtone conversation user interface and the user views voice mail through various email clients, then the transcription of voice messages are synchronized, as shown in the Table 2-1.

| Table 2-1 | When Sender Sends Voice Mail Through Web Inbox or Touchtone Conversation User Interface |
About Unified Messaging with Exchange

- When sender sends voice mail to Unity Connection user through ViewMail for Outlook and the Unity Connection user views voice mail through various email clients, then the transcription of voice messages are synchronized, as shown in the Table 2-2:

## About Unified Messaging with Exchange

- Synchronizing the transcription of voice messages, when the sender sends voice mail to Unity Connection through third-party email clients and the receiver views the voice mail through various clients.
  - The transcription of voice messages can be synchronized in either of the above mentioned scenarios.

When a sender sends a voice message to a SpeechView user, the received voice message is sent to the third-party external services for transcription. The transcription of the voice messages is sent back to Cisco Unity Connection. However, in case of any transcription failure, the third-party external service sends an error code to Connection. For more information on SpeechView transcription error codes, see “Managing SpeechView Transcription Error Code in Cisco Unity Connection 9.x” chapter of the System Administration Guide for Cisco Unity Connection, Release 9.x, available at http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/connection/9x/administration/guide/9xcucsagx/9xcucsag248.html.

For a Single Inbox (SIB) user with the SpeechView transcription service, when the **Hold till transcription received** option is enabled, the synchronization of a new voice message between Unity Connection and Exchange mailboxes will be done. The synchronization of new voice messages will be done only when Unity Connection receives the transcription of the voice message from the third-party external service. To enable the Hold till transcription received option; navigate to **Cisco Personal Communications Assistant > Message Assistant > Personal Options**.

If the **Hold till transcription received** option is enabled and Unity Connection receives time-out/failure transcription response from the third-party external service, then the voicemail will synchronize between Unity Connection and Exchange only when Unity Connection receives failure/time-out transcription response.

</tr>
</tbody>
</table>

---

**Note**

Voice messages received by Unity Connection, which are composed using ViewMail for Outlook have message body either with text or blank body.

- Synchronizing the transcription of voice messages, when the sender sends voice mail to Unity Connection through third-party email clients and the receiver views the voice mail through various clients.
  - The transcription of voice messages can be synchronized in either of the above mentioned scenarios.

When a sender sends a voice message to a SpeechView user, the received voice message is sent to the third-party external services for transcription. The transcription of the voice messages is sent back to Cisco Unity Connection. However, in case of any transcription failure, the third-party external service sends an error code to Connection. For more information on SpeechView transcription error codes, see “Managing SpeechView Transcription Error Code in Cisco Unity Connection 9.x” chapter of the System Administration Guide for Cisco Unity Connection, Release 9.x, available at http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/connection/9x/administration/guide/9xcucsagx/9xcucsag248.html.

For a Single Inbox (SIB) user with the SpeechView transcription service, when the **Hold till transcription received** option is enabled, the synchronization of a new voice message between Unity Connection and Exchange mailboxes will be done. The synchronization of new voice messages will be done only when Unity Connection receives the transcription of the voice message from the third-party external service. To enable the Hold till transcription received option; navigate to **Cisco Personal Communications Assistant > Message Assistant > Personal Options**.

If the **Hold till transcription received** option is enabled and Unity Connection receives time-out/failure transcription response from the third-party external service, then the voicemail will synchronize between Unity Connection and Exchange only when Unity Connection receives failure/time-out transcription response.
### About Unified Messaging with Exchange

**Note**

By default the **Hold till transcription received** option will be disabled.

---

**Transcription of Voice messages in Secure and Private Messages**

- **Secure Messages**: are stored only on the Unity Connection server. Secure messages are transcribed only if the user belongs to a class of service.
- **Private Messages**: The transcription of private messages is not supported.

---

**Synchronization with Outlook Folders**

Unity Connection synchronizes voice messages in the following Outlook folders with the Unity Connection Inbox folder for the user, so the messages are still visible in the Unity Connection Inbox folder:

- Subfolders under the Outlook Inbox folder
- Subfolders under the Outlook Deleted Items folder
- The Outlook Junk Email folder

Messages in the Outlook Deleted Items folder appear in the Unity Connection deleted items folder.

If the user moves voice messages (except secure voice messages) into Outlook folders that are not under the Inbox folder, the messages are moved to the deleted items folder in Unity Connection. The messages can still be played using ViewMail for Outlook because a copy still exists in the Outlook folder. If the user moves the messages back into the Outlook Inbox folder or into an Outlook folder that is synchronized with the Unity Connection Inbox folder, and:

- If the message is still in the deleted items folder in Unity Connection, the message is synchronized back into the Unity Connection Inbox for that user.
- If the message is not still in the deleted items folder in Unity Connection, the message is still playable in Outlook, but it is not resynchronized into Unity Connection.

Connection synchronizes voice messages in the Sent Items folder with the Exchange Sent Items folder for the user. However, the changes to the subject line, the priority, and the status (for example, from unread to read) are replicated from Connection to Exchange only on an hourly basis. When a user sends a voice message from Unity Connection to Exchange, or vice versa, the voice message in the Unity Connection Sent Items folder is unread and the voice message in the Exchange Sent Items folder is marked as read.

By default, the synchronization of voice messages in the Exchange Sent Items folder with the Connection Sent Items folder is not enabled. To enable the feature, change the **Sent Messages: Retention Period (in Days)** option to a value greater than zero. To change the Sent Messages:Retention Period(in Days) option, navigate to **System Settings > Advanced > Messaging > Sent Messages: Retention Period (in Days)** in Cisco Unity Connection Administration. (For information on each field, see **Help> This Page**).

**Note**

When a user sends the voice message to his or her voice mailbox, the voice message is not synchronized with the Exchange Sent Items folder. However, the voicemail remains in the Connection Sent Items folder.
Secure voice messages behave differently. When Unity Connection replicates a secure voice message to Exchange, it replicates only a decoy message that briefly explains secure messages; the only copy of the voice message remains on the Unity Connection server. When a user plays a secure message using ViewMail for Outlook, ViewMail retrieves the message from the Unity Connection server and plays it without ever storing the message in Exchange or on the computer of the user.

If the user moves a secure message to an Outlook folder that is not synchronized with the Unity Connection Inbox folder, the only copy of the voice message is moved to the deleted items folder in Unity Connection, and the message can no longer be played in Outlook. If the user moves the message back into the Outlook Inbox folder or into an Outlook folder that is synchronized with the Unity Connection Inbox folder, and:

- If the message is still in the deleted items folder in Unity Connection, the message is synchronized back into the Unity Connection Inbox for that user, and the message becomes playable again in Outlook.
- If the message is not still in the deleted items folder in Unity Connection, the message is not resynchronized into Unity Connection and can no longer be played in Outlook.

**How Message Routing Works Using SMTP Domain Name**

Unity Connection uses SMTP domain name to route messages between digitally networked Connection servers and to construct the SMTP address of the sender on outgoing SMTP messages. For each user, Unity Connection creates an SMTP address of <Alias>@<SMTP Domain>. This SMTP address is displayed on the Edit User Basics page for the user. Examples of outgoing SMTP messages that use this address format include messages sent by users on this server to recipients on other digitally networked Unity Connection servers and messages that are sent from the Unity Connection phone interface or Messaging Inbox and relayed to an external server based on the Message Actions setting of the recipient.

Unity Connection also uses the SMTP Domain to create sender VPIM addresses on outgoing VPIM messages, and to construct the From address for notifications that are sent to SMTP notification devices.

When Unity Connection is first installed, the SMTP Domain is automatically set to the fully qualified host name of the server.

Make sure that the SMTP domain of Unity Connection is different from the Corporate Email domain to avoid issues in message routing for Unity Connection.

Some scenarios in which you may encounter issues with the same domain are listed below:

- Routing of the voice messages between digitally networked Unity Connection servers
- Relaying of the messages
- Replying and Forwarding of the voice messages using ViewMail for Outlook
- Routing of the SpeechView messages to Cisco Unity Connection server
- Sending the SMTP message Notifications
- Routing of the VPIM messages

**Note**

Unity Connection requires a unique SMTP domain for every user, which is different from the corporate email domain. Due to same domain name configuration on Microsoft Exchange and Unity Connection, the users who are configured for Unified Messaging may face issues in adding recipient while composing, replying and forwarding of messages. For more information on resolving domain name configuration issues, see the Resolving SMTP Domain Name Configuration Issues, page 2-44 section.
Where Deleted Messages Go

By default, when a user deletes a voice message in Unity Connection, the message is sent to the Unity Connection deleted items folder and synchronized with the Outlook Deleted Items folder. When the message is deleted from the Unity Connection deleted items folder (the user can do this manually, or you can configure message aging to do it automatically), it is also deleted from the Outlook Deleted Items folder.

If you are adding the single-inbox feature to an existing system, and if you have configured Unity Connection to permanently delete messages without saving them in the deleted items folder, messages that users delete using the Web Inbox or the Unity Connection phone interface are still permanently deleted. However, messages that users delete using Outlook are only moved to the Deleted Items folder in Outlook, not permanently deleted. When Unity Connection synchronizes with Exchange, the message is moved to the Unity Connection deleted items folder; it is not permanently deleted. We recommend that you do one or both of the following:

- Configure message aging to permanently delete messages in the Unity Connection deleted items folder.
- Configure message quotas, so that Unity Connection prompts users to delete messages when their mailboxes approach a specified size.

When a user deletes a voice message from any Outlook folder, including the Outlook Inbox folder, the Deleted Items folder, or any subfolder, the message is moved to the deleted items folder in Unity Connection. No operation in Outlook will cause a message to be permanently deleted in Unity Connection.

Types of Unity Connection Messages Not Synchronized with Exchange

The following types of messages are not synchronized:

- Draft messages
- Messages configured for future delivery but not yet delivered
- Broadcast messages
- Unaccepted dispatch messages. When a dispatch message has been accepted by a recipient, it becomes a normal message and is synchronized with Exchange for the user who accepted it and deleted for all other recipients. Until someone on the distribution list accepts a dispatch message, the message waiting indicator for everyone on the distribution list will remain on, even when users have no other unread messages.

Replication of Status Changes

Status changes (for example, from unread to read), changes to the subject line, and changes to the priority are replicated from Unity Connection to Exchange and vice versa, as applicable.

Disabling and Re-enabling Single Inbox Affecting the Synchronization of Unity Connection and Exchange Mailboxes

When you configure unified messaging, you create one or more unified messaging services that define, among other things, which unified messaging features are enabled. You also create one or more unified messaging accounts for each user to associate the user with unified messaging services. You can disable single inbox in three ways:
• Entirely disable a unified messaging service in which single inbox is enabled. This disables all enabled unified messaging features (including single inbox) for all users that are associated with the service.
• Disable only the single inbox feature for a unified messaging service, which disables only the single inbox feature for all users that are associated with that service.
• Disable single inbox for a unified messaging account, which disables single inbox only for the associated user.

If you disable and later re-enable single inbox using any of these methods, Unity Connection resynchronizes the Unity Connection and Exchange mailboxes for the affected users. Note the following:

• If users delete messages in Exchange but do not delete the corresponding messages in Unity Connection while single inbox is disabled, the messages will be resynchronized into the Exchange mailbox when single inbox is re-enabled.
• If messages are hard deleted from Exchange (deleted from the Deleted Items folder) before single inbox is disabled, the corresponding messages that are still in the deleted items folder in Unity Connection when single inbox is re-enabled will be resynchronized into the Exchange Deleted Items folder.
• If users hard delete the messages in Unity Connection but do not delete the corresponding messages in Exchange while single inbox is disabled, the messages remain in Exchange when single inbox is re-enabled. Users must delete the messages from Exchange manually.
• If users change the status of messages in Exchange (for example, from unread to read) while single inbox is disabled, the status of Exchange messages will be changed to the current status of the corresponding Unity Connection messages when single inbox is re-enabled.
• When you re-enable single inbox, depending on the number of users associated with the service and the size of their Unity Connection and Exchange mailboxes, resynchronization for existing messages may affect synchronization performance for new messages.

**Synchronization of Read/Heard Receipts, Delivery Receipts, and Non-delivery Receipts**

Unity Connection can send heard/read receipts, delivery receipts, and non-delivery receipts to Unity Connection users who send voice messages. If the sender of a voice message is configured for single inbox, the applicable receipt is sent to the Unity Connection mailbox for the sender. The receipt is then synchronized into the Exchange mailbox for the sender.

Note the following.

• **Read/heard receipts**: When sending a voice message, a sender can request a read/heard receipt. If you do not want Unity Connection to respond to requests for read receipts, in Unity Connection Administration, uncheck the **Respond to Requests for Read Receipts** check box that appears on the Users > Users > Edit > Mailbox page and on the Templates > User Templates > Edit > Mailbox page.

• **Delivery receipts**: A sender can request a delivery receipt only when sending a voice message from ViewMail for Outlook. You cannot prevent Unity Connection from responding to a request for a delivery receipt.

• **Non-delivery receipts (NDR)**: A sender receives an NDR when a voice message cannot be delivered. If you do not want Unity Connection to send an NDR when a message cannot be delivered, in Unity Connection Administration, uncheck the **Send Non-Delivery Receipts for Message Failed Delivery** check box that appears on the Users > Users > Edit User Basics page and on the Templates > User Templates > Edit User Template Basics page.
Note the following about NDRs:

- When the sender accesses Unity Connection using the TUI, the NDR includes the original voice message, which allows the sender to resend the message at a later time or to a different recipient.
- When the sender accesses Unity Connection using Web Inbox, the NDR includes the original voice message, but the sender cannot resend it.
- When the sender uses ViewMail for Outlook to access Unity Connection voice messages that have been synchronized into Exchange, the NDR is a receipt that contains only an error code, not the original voice message, so the sender cannot resend the voice message.
- When the sender is an outside caller, NDRs are sent to Unity Connection users on the Undeliverable Messages distribution list. Verify that the Undeliverable Messages distribution list includes one or more users who regularly monitors and reroutes undelivered messages.

Task List for Configuring Unity Connection and Exchange for Unified Messaging

To configure one or more unified messaging features, complete the following tasks in the order presented.

2. *Cisco Unified Communications Manager Business Edition only:* Confirm that Unity Connection is licensed for single inbox. See the “Exchange Servers Communication with Unity Connection” section on page 2-17.

3. *If Unity Connection is integrated with an LDAP directory:* Review the current LDAP directory configurations to confirm that the Cisco Unified Communications Manager Mail ID field is synchronized with the LDAP mail field. During the integration process, this causes values in the LDAP mail field to appear in the Corporate Email Address field in Unity Connection.

Unified messaging requires that you enter the Exchange email address for each Unity Connection user. On the Unified Messaging Account page, each user can be configured to use either of the following values:

- The Corporate Email Address specified on the User Basics page
- The Email address specified on the Unified Messaging Account page

Automatically populating the Corporate Email Address field with the value of the LDAP mail field is easier than populating the email address field on the Unified Messaging Account page using Unity Connection Administration or the Bulk Administration Tool.

If the Cisco Unified CM Mail ID field is synchronized with the sAMAccountName instead of the mail field, consider changing the LDAP directory configurations. For more information, see the “Changing LDAP Directory Configurations” section in the “Integrating Cisco Unity Connection 9.x with an LDAP Directory” chapter in the System Administration Guide for Cisco Unity Connection Release 9.x, available at http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/connection/9x/administration/guide/9xcucsagx9xcucsag306.html#pgfId-1077313.
Chapter 2 Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Task List for Configuring Unity Connection and Exchange for Unified Messaging

4. If you are using single inbox and you want users to be able to use ViewMail for Outlook to send new voice messages, or to forward or reply to voice messages: Install Cisco Unity Connection ViewMail for Microsoft Outlook on user workstations. For more information on installing ViewMail for Outlook, see the Release Notes for Cisco Unity Connection ViewMail for Microsoft Outlook Release 8.5(x) at http://www.cisco.com/en/US/products/ps6509/prod_release_notes_list.html.

5. Decide whether you want Unity Connection to communicate with a specific Exchange 2016, Exchange 2013, Exchange 2010 or Exchange 2007 client access server or Exchange 2003 server, or you want Unity Connection to be able to search for and communicate with different Exchange servers as required. See the “Exchange Servers Communication with Unity Connection” section on page 2-17.

Note Unity Connection determines whether to use the HTTP or HTTPS protocol and whether to validate certificates based on settings in the applicable unified messaging service.

6. If you decided in Task 5. to allow Unity Connection to search for and communicate with different Exchange servers as required, and if Unity Connection is not already configured to use DNS, use the following CLI commands to configure DNS:

   – set network dns
   – set network dns options

We recommend that you configure Unity Connection to use the same DNS environment in which the Active Directory environment is publishing its records.

7. Confirm that all of the Exchange servers that Unity Connection will access are configured to use the desired authentication mode (basic, digest, or NTLM) and web-based protocol (HTTPS or HTTP). See the “Confirming Exchange Authentication and SSL Settings for Unity Connection” section on page 2-20.

Note If you want to configure SSL to encrypt the communication between Unity Connection and Exchange, configure Exchange to use HTTPS for the web-based protocol.

8. Create an Active Directory account to be used for Unity Connection unified messaging services, and grant the account the applicable permissions. See the “Creating Unified Messaging Services Account in Active Directory and Granting Permissions” section on page 2-27.

9. If you are using Exchange 2013 and Later: Configure EWS limits for the unified messaging users. See the “Removing EWS Limits from Exchange 2013 and Later” section on page 2-32.

10. If you are using Exchange 2010 SP2 RU4 and Later: Configure EWS limits for the unified messaging users. See the “Removing EWS Limits from Exchange 2010 Service Pack 2 RU4 and Later” section on page 2-33.

11. If you are using Exchange 2010 SP2 RU3 and Earlier Releases: Configure EWS limits for the unified messaging services account. See the “Removing EWS Limits from Exchange 2010 Service Pack 2 RU4 and Later” section on page 2-33.
Chapter 2  Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

 Task List for Configuring Unity Connection and Exchange for Unified Messaging

12. **If you are using Exchange 2003**: Enable the WebDav service. See the “Enabling WebDav Service on Exchange 2003 Servers” section on page 2-36.

13. **If you are using single inbox and users do not already have added SMTP proxy addresses**: Add proxy addresses to Unity Connection user accounts. For more information, see the “SMTP Proxy Addresses” section in the “Setting Up Features Controlled by User Account Settings in Cisco Unity Connection 9.x” chapter of the User Moves, Adds, and Changes Guide for Cisco Unity Connection Release 9.x, available at http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/connection/9x/user_mac/guide/9xcucmacx/9xcucmac040.html#pgfId-1330930.

14. Update class of service settings as required:

   "Cisco Unified Communications Manager Business Edition only: Unity Connection counts all users in a class of service in which single inbox is enabled as single inbox users even if they are not configured to use single inbox. For example, if a Unity Connection server is licensed for 200 single-inbox users, and if you have three classes of service in which single inbox is enabled, the total number of users assigned to those three classes of service cannot exceed 200 users. This is true even if you only configure 50 users to use single inbox.

   - Enable text-to-speech access to Exchange voice messages on one or more classes of service: check the **Allow Access to Advanced Features** check box on the applicable class of service page, and then check the **Allow Access to Exchange Email using Text to Speech (TTS)** check box.

15. **If classes of service for single-inbox users have Delete Messages Without Saving to Deleted Items Folder enabled**: We recommend that you configure message aging and/or message quotas. Otherwise, messages deleted from Outlook may never be permanently deleted from Unity Connection. For more information, see the “Synchronizing Voice Messages in Unity Connection and Exchange Mailboxes in Single Inbox” section on page 2-2.

16. Configure one or more Unity Connection unified messaging services. See the “Configuring Unified Messaging in Unity Connection” section on page 2-36.

17. **Selected configurations**: In either or both of the following configurations, upload SSL certificates on the Unity Connection server to encrypt communication between Unity Connection and Exchange and between Unity Connection and Active Directory:

   - If you configured Exchange to use HTTPS in Task 7, and configured unified messaging services to validate certificates for Exchange servers in Task 16.

   - If you configured Unity Connection to search for and communicate with different Exchange servers, to use LDAPS to communicate with domain controllers, and to validate certificates for domain controllers in Task 16.
Chapter 2 Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Task List for Configuring Unity Connection and Exchange for Unified Messaging

Caution

When you allow Unity Connection to search for and communicate with different Exchange servers, Unity Connection communicates with Active Directory servers using Basic authentication. By default, the user name and password of the unified messaging services account and all other communication between the Unity Connection and Active Directory servers is sent in clear text. If you want this data to be encrypted, in Task 16, you must configure unified messaging services to communicate with Active Directory domain controllers using the secure LDAP (LDAPS) protocol.

For more information, see the “Uploading CA Public Certificates for Exchange and Active Directory Servers” section on page 2-38.

18. Test the unified messaging services. See the “Testing Unified Messaging Services for Unity Connection” section on page 2-39.

19. Update Unity Connection user accounts:

   a. Single inbox and text to speech only: Update user settings to assign each user for whom single inbox or text to speech is enabled to a class of service in which single inbox or text to speech is enabled. See the following:

      - “Creating unified messaging accounts for Unity Connection users. See the Creating Unified Messaging Accounts to Link Unity Connection Users to Exchange Mailboxes, page 2-40 section.

   b. If you configured message aging and/or message quotas: Configure user accounts as applicable. For information on changing message aging settings for individual users, see the “Message Aging” section in the “Setting Up Features Controlled by User Account Settings in Cisco Unity Connection 9.x” chapter of the User Moves, Adds, and Changes Guide for Cisco Unity Connection Release 9.x at http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/connection/9x/user_mac/guide/9xcucmac040.html#pgfId-1276676.

20. Test unified messaging accounts for Unity Connection users. See the “Testing Unified Messaging Configuration” section on page 2-41.

21. Test the unified messaging configuration. See the following sections:

   - Viewing a Summary of the Configuration of Unified Messaging Accounts for Unity Connection, page 2-42

   - Testing System Configuration for Unified Messaging with Exchange and Unity Connection, page 2-43

   - Testing Access to Exchange Calendars, page 2-43
22. If Unity Connection voice messages are automatically being moved to the Outlook Junk Items folder: Change the Outlook configuration to add the sender of the voice message or the sender’s domain to the safe sender’s list. For more information, see Outlook Help.

23. To teach users how to use the Unity Connection calendar, refer them to the following:

Task List for Configuring Existing Unity Connection Users for Unified Messaging

After you configure unified messaging by following the “Task List for Configuring Unity Connection and Exchange for Unified Messaging” section on page 2-12, do the following tasks when you want to add unified messaging features for existing users.

1. Single inbox or TTS for Cisco Unified CMBE only: Ensure that you have sufficient licenses for the additional users. See the “Exchange Servers Communication with Unity Connection” section on page 2-17.

2. If you are using single inbox and you want users to be able to use ViewMail for Outlook to send new voice messages, or to forward or reply to voice messages: Add proxy addresses to Unity Connection user accounts. For more information, see the “SMTP Proxy Addresses” section in the “Setting Up Features Controlled by User Account Settings in Cisco Unity Connection 9.x” chapter of the User Moves, Adds, and Changes Guide for Cisco Unity Connection Release 9.x, available at http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/connection/9x/user_mac/guide/9xcucmacx/9xcucmac040.html#pgfId-1330930.

3. Update Unity Connection user accounts:
   a. Single inbox and text to speech only: Update user settings to assign each user for which single inbox or text to speech is enabled to a class of service in which single inbox or text to speech is enabled. See the following:

   - “Creating unified messaging accounts for Unity Connection users. See the Creating Unified Messaging Accounts to Link Unity Connection Users to Exchange Mailboxes, page 2-40 section.
b. If you configured message aging and/or message quotas: Configure user accounts as applicable. For information on changing message aging settings for individual users, see the “Message Aging” section in the “Setting Up Features Controlled by User Account Settings in Cisco Unity Connection 9.x” chapter of the *User Moves, Adds, and Changes Guide for Cisco Unity Connection Release 9.x* at 

For information on changing message quota settings for individual users, see the “Mailbox Size Quotas” section in the “Setting Up Features Controlled by User Account Settings in Cisco Unity Connection 9.x” chapter of the *User Moves, Adds, and Changes Guide for Cisco Unity Connection Release 9.x* at 

4. Test unified messaging accounts for Unity Connection users. See the “Testing Unified Messaging Configuration” section on page 2-41.

5. If Unity Connection voice messages are automatically being moved to the Outlook Junk Items folder: Change the Outlook configuration to add the sender of the voice message or the domain of the sender to the safe sender’s list. For more information, see Outlook Help.

**Exchange Servers Communication with Unity Connection**

When you add a unified messaging service, which defines the communication between Unity Connection and Exchange, you can choose whether you want Unity Connection to communicate directly with a specific Exchange server or you want Unity Connection to search for Exchange servers. The choice you make determines which Exchange mailboxes Unity Connection can access:

The choice you make determines which Exchange mailboxes Unity Connection can access:

- **If you select a specific Exchange 2007 client access server, Unity Connection can access all Exchange 2007 mailboxes in the Exchange organization, but cannot access Exchange 2010, Exchange 2013, or Exchange 2016 mailboxes.**
- **If you select a specific Exchange 2010 client access server, Unity Connection can access all Exchange 2010 and Exchange 2007 mailboxes in the Exchange organization, but cannot access Exchange 2013 or Exchange 2016 mailboxes.**
- **If you select a specific Exchange 2013 client access server, Unity Connection can access all Exchange 2013, Exchange 2010, and Exchange 2007 mailboxes in the Exchange organization, but cannot access Exchange 2016 mailboxes.**
- **If you select a specific Exchange 2016 client access server, Unity Connection can access all Exchange 2016, Exchange 2013, Exchange 2010, and Exchange 2007 mailboxes in the Exchange organization.**
- **If you select to allow Unity Connection to search for Exchange servers, then you need to select from the following two options:**
Note
In Cisco Unity Connection Administration interface, the options available for Exchange Server Type on the Unified Messaging Service page will be updated in 9.1(2) Service Update 5 to reflect the support for Exchange 2013 and Exchange 2016.

- If you select to allow Unity Connection to search for Exchange servers, you need to give permissions to the Exchange servers.

Note the following:
- If you want to choose a specific Exchange server when you add a unified messaging service, you may need to add more than one unified messaging service to allow Unity Connection to access all of the mailboxes in the Exchange organization. Table 2-3 explains when you need to add more than one unified messaging service.

Table 2-3 Adding Unified Messaging Services Based on Versions of Exchange

<table>
<thead>
<tr>
<th>Exchange Versions with Mailboxes That You Want Unity Connection to be Able to Access</th>
<th>Create the Following Unified Messaging Services</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

- If you choose to allow Unity Connection to search for Exchange servers, Unity Connection can automatically detect when you move mailboxes from one version of Exchange to another and can automatically update Unity Connection user settings.

- If you choose a specific Exchange server, Unity Connection can sometimes detect when you move mailboxes from one Exchange server to another, and can automatically access the Exchange mailbox in the new location. When Unity Connection cannot detect mailbox moves, you must manually update unified messaging services or unified messaging accounts:
  - **If you moved all of the Exchange mailboxes accessed by a unified messaging service:** Update the unified messaging service to access a different Exchange server.
  - **If you moved only some of the Exchange mailboxes accessed by a unified messaging service:** Update unified messaging account settings to use a unified messaging service that accesses mailboxes in the new location.
Table 2-4 identifies when Unity Connection can and cannot automatically detect mailbox moves between Exchange servers. For information on updating Unity Connection user settings when Unity Connection cannot detect mailbox moves, see the “Moving Microsoft Exchange Mailboxes for Cisco Unity Connection 9.x Unified Messaging Users” chapter.

<table>

</tr>
</tbody>
</table>

- If Unity Connection is not configured to use DNS, you must choose a specific Exchange server. If this does not allow you to access all of the Exchange mailboxes in the organization as described earlier in this section, you must create more than one unified messaging service.
- If you choose a specific Exchange server and that server stops functioning, Unity Connection cannot access any Exchange mailboxes. If you choose to allow Unity Connection to search for Exchange servers and if the Exchange server that Unity Connection is currently communicating with stops functioning, Unity Connection searches for another Exchange server and begins accessing mailboxes through that server.

**Confirming Exchange Authentication and SSL Settings for Unity Connection**

Confirm that the Exchange servers that Unity Connection will access are configured to use the desired authentication mode (basic, digest, or NTLM) and web-based protocol (HTTPS or HTTP). For information on which Exchange servers Unity Connection will access, see the “Exchange Servers Communication with Unity Connection” section on page 2-17.

Later in the task list, you will create one or more Unity Connection unified messaging services, and select the same authentication mode and web-based protocol that you specify in Exchange when you do the applicable procedures in this section.

Do the procedure in the applicable section:

- Confirming Exchange 2013/2016 Authentication and SSL Settings, page 2-21
- Confirming Exchange 2010 Authentication and SSL Settings, page 2-22
- Confirming Exchange 2007 Authentication and SSL Settings, page 2-24
- Confirming Exchange 2003 Authentication and SSL Settings, page 2-26
Confirming Exchange 2013/2016 Authentication and SSL Settings

To Confirm Exchange 2013/2016 Authentication and SSL Settings

Step 1
Decide which type of authentication (basic or NTLM) you want Unity Connection to use to sign in to Exchange 2016 or Exchange 2013 client access servers. You must configure the following servers to use the same type of authentication:

- All Exchange 2016 or Exchange 2013 client access servers.

Step 2
Decide whether you want the communication between Unity Connection and Exchange 2016 or Exchange 2013 client access servers to be SSL encrypted. If so, you must specify the same SSL setting on the following servers:

- All Exchange 2016 or Exchange 2013 client access servers.

Step 3
Sign in to a server that has access to the same Exchange 2016 or Exchange 2013 client access servers that Unity Connection has. Use an account that is a member of the local Administrators group.

Step 4
On the Windows Start menu, select Programs > Administrative Tools > Internet Information Services (IIS) Manager.

Step 5
For the first Exchange 2016 or Exchange 2013 client access server for which you want to confirm settings, in the left pane, expand <servername> > Sites > Default Website > EWS.

Step 6
Under Default Website, select Autodiscover.

Step 7
In the middle pane, in the IIS section, double-click Authentication.

Step 8
Confirm that the Status column says Enabled for the type of authentication that you want the unified messaging services account to use to sign in to Exchange client access servers. When you create a unified messaging services account, you will configure Unity Connection to use the same type of authentication. Unity Connection supports only the following types of authentication:

- Basic
- NTLM

Step 9
If you changed any settings, in the right pane, select Apply.

Step 10
In the left pane, select Autodiscover again.

Step 11
In the middle pane, double-click SSL Settings.

Step 12
If the Require SSL check box is checked:

- When you create a unified messaging service in Unity Connection, you must choose HTTPS for the web-based protocol.
- You must download SSL certificates from the Exchange server and install them on the Unity Connection server.

Step 13
If you changed any settings, in the right pane, select Apply.

Step 14
In the left pane, under Default Website, select EWS.

Step 15
In the middle pane, in the IIS section, double-click Authentication.

Step 16
Confirm that the Status column says Enabled for the type of authentication that you want the unified messaging services account to use to sign in to Exchange mailboxes. When you create a unified messaging services account, you will configure Unity Connection to use the same type of authentication.
The unified messaging services account must use the same type of authentication for EWS that you specified for autodiscover in Step 8.

Unity Connection supports only the following types of authentication:
- Basic
- NTLM

**Step 17** If you changed any settings, in the right pane, select **Apply**.

**Step 18** In the left pane, select **EWS** again.

**Step 19** In the middle pane, double-click **SSL Settings**.

**Step 20** If the **Require SSL** check box is checked:
- You must choose HTTPS for the web-based protocol when you create a unified messaging service in Unity Connection.
- You must download SSL certificates from the Exchange server and install them on the Unity Connection server.

The unified messaging services account must use the same SSL settings for EWS that you specified for autodiscover in Step 12.

**Step 21** If you changed any settings, in the right pane, select **Apply**.

**Step 22** Repeat Step 5 through Step 22 for the other Exchange 2016 or Exchange 2013 client access servers that Unity Connection can access.

**Step 23** Close IIS Manager.

### Confirming Exchange 2010 Authentication and SSL Settings

**To Confirm Exchange 2010 Authentication and SSL Settings**

**Step 1** Decide which type of authentication (basic, digest, or NTLM) you want Unity Connection to use to sign in to Exchange 2010 client access servers. You must configure the following servers to use the same type of authentication:
- All Exchange 2010 client access servers.
- All Exchange 2007 client access servers, if there are Exchange 2007 mailboxes that you want Unity Connection to be able to access.
- All Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.

**Step 2** Decide whether you want the communication between Unity Connection and Exchange 2010 client access servers to be SSL encrypted. If so, you must specify the same SSL setting on the following servers:
- All Exchange 2010 client access servers.
- All Exchange 2007 client access servers, if there are Exchange 2007 mailboxes that you want Unity Connection to be able to access.
• All Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.

**Step 3** Sign in to a server that has access to the same Exchange 2010 client access servers that Unity Connection has. Use an account that is a member of the local Administrators group.

**Step 4** On the Windows Start menu, select Programs > Administrative Tools > Internet Information Services (IIS) Manager.

**Step 5** For the first Exchange 2010 client access server for which you want to confirm settings, in the left pane, expand `<servername>` > Sites > Default Website.

**Step 6** Under Default Website, select Autodiscover.

**Step 7** In the middle pane, select Autodiscover again.

**Step 8** Confirm that the Status column says Enabled for the type of authentication that you want the unified messaging services account to use to sign in to Exchange client access servers. When you create a unified messaging services account, you will configure Unity Connection to use the same type of authentication. Unity Connection supports only the following types of authentication:

- Basic
- Digest
- NTLM

**Step 9** If you changed any settings, in the right pane, select Apply.

**Step 10** In the left pane, select Autodiscover again.

**Step 11** In the middle pane, double-click SSL Settings.

**Step 12** If the Require SSL check box is checked:

- When you create a unified messaging service in Unity Connection, you must choose HTTPS for the web-based protocol.
- You must download SSL certificates from the Exchange server and install them on the Unity Connection server.

**Step 13** If you changed any settings, in the right pane, select Apply.

**Step 14** In the left pane, under Default Website, select EWS.

**Step 15** In the middle pane, in the IIS section, double-click Authentication.

**Step 16** Confirm that the Status column says Enabled for the type of authentication that you want the unified messaging services account to use to sign in to Exchange mailboxes. When you create a unified messaging services account, you will configure Unity Connection to use the same type of authentication. Unity Connection supports only the following types of authentication:

- Basic
- Digest
- NTLM

**Step 17** If you changed any settings, in the right pane, select Apply.

**Step 18** In the left pane, select EWS again.

---

**Caution** The unified messaging services account must use the same type of authentication for EWS that you specified for autodiscover in Step 8.
Step 19  In the middle pane, double-click SSL Settings.

Step 20  If the Require SSL check box is checked:

- You must choose HTTPS for the web-based protocol when you create a unified messaging service in Unity Connection.
- You must download SSL certificates from the Exchange server and install them on the Unity Connection server.

⚠️ **Caution**  The unified messaging services account must use the same SSL settings for EWS that you specified for autodiscover in Step 12.

Step 21  If you changed any settings, in the right pane, select Apply.

Step 22  If you have installed Exchange 2010 Service Pack 1 or later, skip to Step 23.

If you have not installed Exchange 2010 Service Pack 1 or later, edit the Exchange web.config files for EWS and for autodiscovery to match the settings in IIS Manager:

- For EWS, see “Enable or Disable SSL on Exchange Web Services Virtual Directories” on the Microsoft Technet website. Search on the document title.
- No comparable document exists for autodiscovery, but you can use the applicable procedure in the EWS document to edit the web.config file in the \Exchange Server\V14\ClientAccess\Autodiscover directory.

Step 23  Repeat Step 5 through Step 22 for the other Exchange 2010 client access servers that Unity Connection can access.

Step 24  Close IIS Manager.

---

### Confirming Exchange 2007 Authentication and SSL Settings

#### To Confirm Exchange 2007 Authentication and SSL Settings

**Step 1**  Decide which type of authentication (basic, digest, or NTLM) you want Unity Connection to use to sign in to Exchange 2007 client access servers. You must configure the following servers to use the same type of authentication:

- All Exchange 2007 client access servers.
- All Exchange 2010 client access servers, if there are Exchange 2010 mailboxes that you want Unity Connection to be able to access.
- All Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.

**Step 2**  Decide whether you want the communication between Unity Connection and Exchange 2007 client access servers to be SSL encrypted. If so, you must specify the same SSL setting on the following servers:

- All Exchange 2007 client access servers.
- All Exchange 2010 client access servers, if there are Exchange 2010 mailboxes that you want Unity Connection to be able to access.
All Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.

**Step 3** Sign in to a server that has access to the same Exchange 2007 client access servers as Unity Connection has. Use an account that is a member of the local Administrators group.

**Step 4** On the Windows Start menu, select Programs > Administrative Tools > Internet Information Services (IIS) Manager.

**Step 5** For the first Exchange 2007 server for which you want to confirm settings, in the left pane, expand <servername> > Sites > Default Website.

**Step 6** Under Default Website, right-click Autodiscover, and select Properties.

**Step 7** In the Autodiscover Properties dialog box, select the Directory Security tab.

**Step 8** In the Authentication and Access Control section, select Edit.

**Step 9** In the Authentication Methods dialog box, confirm that the check box is checked for the type of authentication that you want the unified messaging services account to use to find Exchange servers. When you create a unified messaging services account, you will configure Unity Connection to use the same type of authentication.

Unity Connection supports only the following types of authentication:

- Basic
- Digest
- NTLM

**Step 10** Select OK.

**Step 11** In the Secure Communications section, select Edit.

**Step 12** In the Secure Communications dialog box, if the Require Secure Channel (SSL) check box is checked:

- You must choose HTTPS for the web-based protocol when you create a unified messaging service in Unity Connection.
- You must download SSL certificates from the Exchange server and install them on the Unity Connection server.

**Step 13** Select OK twice.

**Step 14** In the left pane, under Default Website, right-click EWS, and select Properties.

**Step 15** In the EWS Properties dialog box, select the Directory Security tab.

**Step 16** In the Authentication and Access Control section, select Edit.

**Step 17** In the Authentication Methods dialog box, confirm that the check box is checked for the type of authentication that you want the unified messaging services account to use to find Exchange servers. When you create a unified messaging services account, you will configure Unity Connection to use the same type of authentication.

⚠️ **Caution** The unified messaging services account must use the same type of authentication for EWS that you specified for autodiscover in Step 9.

Unity Connection supports only the following types of authentication:

- Basic
- Digest
• NTLM

Step 18  Select OK.

Step 19  In the Secure Communications section, select Edit.

Step 20  In the Secure Communications dialog box, if the Require Secure Channel (SSL) check box is checked:

• You must choose HTTPS for the web-based protocol when you create a unified messaging service in Unity Connection.
• You must download SSL certificates from the Exchange server and install them on the Unity Connection server.

Caution  The unified messaging services account must use the same SSL settings for EWS that you specified for autodiscover in Step 12.

Step 21  Select OK twice.

Step 22  Repeat Step 5 through Step 21 for the other Exchange 2007 client access servers that Unity Connection can access.

Step 23  Close IIS Manager.

Confirming Exchange 2003 Authentication and SSL Settings

To Confirm Exchange 2003 Authentication and SSL Settings

Step 1  Decide which type of authentication (basic, digest, or NTLM) you want Unity Connection to use to sign in to Exchange 2003 servers.

If you are configuring Unity Connection to search for Exchange servers, you must configure the following servers to use the same type of authentication:

• All Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.
• All Exchange 2007 client access servers.
• All Exchange 2010 client access servers, if there are Exchange 2010 mailboxes that you want Unity Connection to be able to access.

If you are choosing specific Exchange servers, you do not need to configure all Exchange servers to use the same type of authentication. Each Exchange server is associated with a separate unified messaging service, so the Exchange authentication mode only needs to match the authentication mode for the corresponding unified messaging service.

Note  If you are choosing a specific Exchange 2003 front-end server, you may need to use basic authentication. For more information, on the Microsoft website, see the “Authentication Mechanisms for HTTP” in the Exchange Server 2003 section of the TechNet Library.

Step 2  Decide whether you want the communication between Unity Connection and Exchange 2007 client access servers to be SSL encrypted. If so, you must specify the same SSL setting on the following servers:
**Creating Unified Messaging Services Account in Active Directory and Granting Permissions**

Unity Connection accesses Exchange mailboxes using an Active Directory account called the unified messaging services account. After you create the account, you grant it the rights necessary for Unity Connection to perform operations on behalf of the user. For Exchange 2016, 2013, 2010, and 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.

- All Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.
- All Exchange 2007 client access servers.
- All Exchange 2010 client access servers, if there are Exchange 2010 mailboxes that you want Unity Connection to be able to access.

**Step 3** Sign in to a server that has access to the same Exchange 2003 servers as Unity Connection has. Use an account that is a member of the local Administrators group.

**Step 4** On the Windows Start menu, select **Programs > Administrative Tools > Internet Information Services (IIS) Manager**.

**Step 5** For the first Exchange 2003 server for which you want to confirm settings, in the left pane, expand `<servername> > Web Sites > Default Website`.

**Step 6** Under Default Website, right-click **Exchange**, and select **Properties**.

**Step 7** In the Exchange Properties dialog box, select the **Directory Security** tab.

**Step 8** In the Authentication and Access Control section, select **Edit**.

**Step 9** In the Authentication Methods dialog box, confirm that the check box is checked for the type of authentication that you want the unified messaging services account to use to sign in to Exchange servers. When you create a unified messaging service, you will configure Unity Connection to use the same type of authentication.

Unity Connection supports only the following types of authentication:

- Basic
- Digest
- NTLM

**Step 10** Select **OK**.

**Step 11** In the Secure Communications section, select **Edit**.

**Step 12** In the Secure Communications dialog box, if the **Require Secure Channel (SSL)** check box is checked:

- You must choose HTTPS for the web-based protocol when you create a unified messaging service in Unity Connection.
- You must download SSL certificates from the Exchange server and install them on the Unity Connection server.

**Step 13** Select **OK** twice.

**Step 14** Repeat **Step 5** through **Step 13** for the other Exchange 2003 servers that you want Unity Connection to be able to access.

**Step 15** Close IIS Manager.
Chapter 2 Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Creating Unified Messaging Services Account in Active Directory and Granting Permissions

2007, operations are performed through Exchange Web Services (EWS). For Exchange 2003, operations are performed through WebDav. These operations include uploading messages into Exchange mailboxes, tracking changes to the messages in Exchange, updating the messages with changes made in Unity Connection, deleting messages in Exchange when the messages are deleted in Unity Connection, tracking when messages are deleted in Exchange so they can be moved to the deleted items folder in Unity Connection, and so on.

See the following sections:
- Task list for Creating the Unified Messaging Services Account and Granting Permissions for Unity Connection, page 2-28
- Confirming that Local Computer Account is a Member of Windows Authorization Access Group on Client Access Servers (Exchange 2007 Only), page 2-29
- Granting Rights to Unified Messaging Services Account (Exchange 2007 Only), page 2-30
- Granting Permissions to the Unified Messaging Services Account (Exchange 2003 Only), page 2-32

Task list for Creating the Unified Messaging Services Account and Granting Permissions for Unity Connection

1. Create one or more domain user accounts in the Active Directory forest that includes the Exchange servers with which you want Unity Connection to communicate. Note the following:
   - Give the account a name that identifies it as the unified messaging services account for Unity Connection.
   - Do not create an Exchange mailbox for the account.

   Caution If you create a mailbox for the account, unified messaging will not function properly.

   - Do not add the account to any administrator group.
   - Do not disable the account, or Unity Connection cannot use it to access Exchange mailboxes.
   - Specify a password that satisfies the password-security requirements of your company.

   The password is encrypted with AES 128-bit encryption and stored in the Unity Connection database. The key that is used to encrypt the password is accessible only with root access, and root access is available only with assistance from Cisco TAC.

   - When you are configuring unified messaging for a Unity Connection cluster, Unity Connection automatically uses the same unified messaging services account for both Unity Connection servers.

   - When you are configuring unified messaging for intersite networking or for intrasite networking, you can use the same unified messaging services account for more than one Unity Connection server. However, this is not a requirement and does not affect functionality or performance.

2. If you are using Exchange 2007: For all client access servers, confirm that the local computer account is a member of the Windows Authorization Access group. See the “Confirming that Local Computer Account is a Member of Windows Authorization Access Group on Client Access Servers (Exchange 2007 Only)” section on page 2-29.
3. For each version of Exchange that you want Unity Connection to be able to access, do the procedure in the corresponding section:
   - Granting Rights to Unified Messaging Services Account (Exchange 2007 Only), page 2-30
   - Granting Permissions to the Unified Messaging Services Account (Exchange 2003 Only), page 2-32

**Confirming that Local Computer Account is a Member of Windows Authorization Access Group on Client Access Servers (Exchange 2007 Only)**

If you are configuring unified messaging for Unity Connection users whose Exchange mailboxes are homed on Exchange 2007 servers, do the following procedure to confirm that the local computer accounts for those servers are members of the Windows Authorization Access group, as they are by default. Do the procedure for all Exchange 2007 client access servers that Unity Connection can access.

To Confirm that Local Computer Account is a Member of the Windows Authorization Access Group on Client Access Servers (Exchange 2007 Only)

| Step 1 | Sign in to a server on which Active Directory Users and Computers is installed. Use an account that is a member of the Domain Admins group. |
| Step 2 | On the Windows Start menu, select Administrative Tools > Active Directory Users and Computers. |
| Step 3 | In the left pane, expand the name of a domain that contains Exchange 2007 client access servers that Unity Connection can access, and select Builtin. |
| Step 5 | In the Windows Authorization Access Group Properties dialog box, select the Members tab. |
| Step 6 | Select Add. |
| Step 7 | In the Select Users, Contacts, Computers, or Groups dialog box, select Object Types. |
| Step 8 | Check the Computers check box. |
| Step 9 | Select OK to close the Object Types dialog box. |
| Step 10 | On the Select Users, Contacts, Computers, or Groups dialog box, enter the names of all of the Exchange 2007 client access servers in the domain that you expanded in Step 3. |
| Step 11 | Select Check Names. |
| Step 12 | Select OK to close the Select Users, Contacts, Computers, or Groups dialog box. |
| Step 13 | Select OK to close the Windows Authorization Access Group Properties dialog box. |
| Step 14 | Repeat Step 3 through Step 13 for the other domains that contain Exchange 2007 client access servers that Unity Connection can access. |
Assigning the Application Impersonation Management Role to Unified Messaging Services Accounts (Exchange 2016, Exchange 2013 and Exchange 2010 Only)

To Assign the Application Impersonation Management Role to Unified Messaging Services Accounts (Exchange 2013 and Exchange 2010 Only)

Step 1
Sign in to a server on which Exchange Management Shell is installed. Sign in using either an account that is a member of the Enterprise Admins group or an account that has permission to grant permissions on Exchange objects in the configuration container.

Step 2
Run the following command in Exchange Management Shell to assign the Application Impersonation management role to the unified messaging services account for Exchange 2016, Exchange 2013 and Exchange 2010.

```
new-ManagementRoleAssignment -Name:RoleName -Role:ApplicationImpersonation -User:'Account'
```

where:
- `RoleName` is the name that you want to give the assignment, for example, Unity ConnectionUMServicesAcct. The name that you enter for `RoleName` appears when you run `get-ManagementRoleAssignment`.
- `Account` is the name of the unified messaging services account in domain\alias format.

Step 3
If you created more than one unified messaging services account, repeat Step 2 for the remaining accounts. Specify a different value for `RoleName` for each unified messaging services account.

Note
When configuring Unified Messaging service account for Exchange 2016, Exchange 2013 or Exchange 2010, you need to assign the Application Impersonation management role to the Unified Messaging service account.

Granting Rights to Unified Messaging Services Account (Exchange 2007 Only)

To Grant Rights to the Unified Messaging Services Account (Exchange 2007 Only)

Step 1
Sign in to a server on which Exchange Management Shell is installed. Sign in using either an account that is a member of the Enterprise Admins group or an account that has permission to grant rights on Exchange objects in the configuration container.

Step 2
Run the following commands in Exchange Management Shell to grant the required rights to the unified messaging services account for Exchange 2007:

```
Add-ADPermission -Identity (PermissionLevel).DistinguishedName -User (Get-User -Identity Account1 select-object).identity -ExtendedRights-Exch-EPI-Impersonation
Add-ADPermission -Identity (PermissionLevel).DistinguishedName -User (Get-User -Identity Account1 select-object).identity -ExtendedRights-Exch-EPI-May-Impersonate
```
Chapter 2 Configuring Cisco Unity 9.x with Microsoft Exchange for Unified Messaging

Creating Unified Messaging Services Account in Active Directory and Granting Permissions

Add-ADPermission -Identity (PermissionLevel).DistinguishedName -User (Get-User -Identity Account | select-object).identity -ExtendedRights Receive-As

where:

- **PermissionLevel** is determined by whether you want to grant the unified messaging services account rights to access individual servers or rights to access all Exchange 2007 servers in the organization:
  - To grant the unified messaging services account rights to access individual Exchange servers, replace **PermissionLevel** with:
    ```powershell
    Get-ExchangeServer -Identity ServerName
    ```
    where **ServerName** is the name of the Exchange 2007 server to which you want the unified messaging services account to have access.
  - To grant the unified messaging services account rights to access all Exchange 2007 servers in the Exchange organization, replace **PermissionLevel** with:
    ```powershell
    Get-OrganizationConfig
    ```
    For more information on the Add-ADPermission commandlet and the Identity parameter, see Exchange 2007 Help.

- **Account** is the name of the unified messaging services account in domain\alias format.

**Step 3** If you created more than one unified messaging services account, repeat **Step 2** for the remaining accounts.

**Step 4** If you set permissions on individual Exchange server in **Step 2** and you have more than one Exchange 2007 server, repeat **Step 1** through **Step 3** on the following servers:

- All other Exchange 2007 client access servers that Unity Connection can access.
- All Exchange 2007 mailbox servers that home mailboxes that you want Unity Connection to be able to access.

---

To Grant Unified Messaging Services Accounts the Permission to Sign In Locally (Exchange 2007 Only)

**Step 1** On an Exchange 2007 client access server that Unity Connection can access, sign in using an account that is a member of the local Administrators group.

**Step 2** On the Windows Start menu, select **Administrative Tools > Local Security Policy**.

**Step 3** In the left pane, expand **Local Policies**, and select **User Rights Assignment**.

**Step 4** In the right pane, right-click **Allow Log on Locally**, and select **Properties**.

**Step 5** In the **Allow Log on Locally Properties** dialog box, on the **Local Security Setting** tab, select **Add User or Group**.

**Step 6** On the Select Users, Computers, or Groups dialog box, enter the name of the unified messaging services account that you created in Task 1. of the “Task list for Creating the Unified Messaging Services Account and Granting Permissions for Unity Connection” section on page 2-28.

If intrasite networking or intersite networking is configured, and if you created more than one unified messaging services account, enter the names of the unified messaging services accounts for the Unity Connection servers that will access this Exchange 2007 client access server.

**Step 7** Select **Check Names**.

**Step 8** Select **OK** to close the **Select Users, Computers, or Groups** dialog box.

**Step 9** Select **OK** to close the **Allow Log on Locally Properties** dialog box.
Creating Unified Messaging Services Account in Active Directory and Granting Permissions

Step 10 Close Local Security Settings.
Step 11 Repeat Step 1 through Step 10 on the following servers:
- All other Exchange 2007 client access servers that Unity Connection can access.
- All Exchange 2007 mailbox servers that home mailboxes that you want Unity Connection to be able to access.

Granting Permissions to the Unified Messaging Services Account (Exchange 2003 Only)

To Grant Permissions to the Unified Messaging Services Account (Exchange 2003 Only)

Step 1 Sign in to a server on which Exchange System Manager is installed. Sign in using either an account that is a member of the Enterprise Admins group or an account that has permission to grant permissions on Exchange objects in the configuration container.
Step 2 On the Windows Start menu, select Programs > Microsoft Exchange > System Manager.
Step 3 In the left pane, expand Servers.
Step 4 Right-click the name of the Exchange server that contains mailboxes that will be accessed by Cisco Unity Connection, and select Properties.
Step 5 In the <Server name> Properties dialog box, select the Security tab.
Step 6 Select Add.
Step 7 In the Select Users, Computers, or Groups dialog box, in the Enter the Object Names to Select field, enter the name of the unified messaging services account.
Step 8 Select Check Names.
Step 9 Select OK to close the dialog box.
Step 10 In the <Server name> Properties dialog box, in the Group or User Names list, select the name of the unified messaging services account.
Step 11 In the Permissions For <Account name> list, check the Allow check box for the following permissions:
  - Send As
  - Receive As
  - Administer Information Store
Step 12 Select OK to close the <Server name> Properties dialog box.
Step 13 Repeat Step 4 through Step 12 for each additional Exchange server that you want to access.

Removing EWS Limits from Exchange 2013 and Later

Revised September 10, 2013
Chapter 2 Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Creating Unified Messaging Services Account in Active Directory and Granting Permissions

If any unified users’ Exchange mailboxes have more than 1000 messages, which includes voice messages and receipts, then enable the EWS paged view search functionality at Cisco Unity Connection. To enable the paged view functionality for messages, you must set the value of the 'System.Messaging.MbxSynch.MbxSynchUsePaging' parameter to 1.

Note
In case you are using 9.1.2 ES2 and later, make sure to enable the paged view search functionality. For more information on how to enable the paged view functionality, see the “To Remove EWS Limits from Exchange 2013 and later” section on page 2-33 section of this guide.

To Remove EWS Limits from Exchange 2013 and later

Step 1 Run the following CLI command:
run cuc dbquery unitydirdb execute procedure
csp_ConfigurationModifyBool(pFullName='System.Messaging.MbxSynch.MbxSynchUsePaging',pvalue =1)

Note
When a Cisco Unity Connection cluster is configured, you can run the command on publisher or subscriber server.

Step 2 To set the maximum limit of voice messages items that can be managed by Cisco Unity Connection with the Paged view search functionality, run the following CLI command:
run cuc dbquery unitydirdb execute procedure
csp_ConfigurationModify(pFullName='System.Messaging.MbxSynch.MbxSynchVoiceMailCountLimit', pvalue="newvalue")
where, new value specifies the value of the voicemails count limit that you can view after the paging parameter is enabled. Cisco Unity Connection by default manages the first 25000 voice messages per mailbox that avoid any delay in message synchronization between Unity Connection and Exchange server. This voicemail count limit can be increased maximum up to 75000.

Removing EWS Limits from Exchange 2010 Service Pack 2 RU4 and Later

Revised November 17, 2014
Microsoft has enabled the client throttling policy feature by default. If there is no throttling policy already configured, Microsoft Exchange applies a default policy to all users. The default throttling policy is tailored for end user’s load and not for an enterprise application like, Unity Connection using impersonation. If any Unity Connection users who are configured for unified messaging have mailboxes in Exchange 2010, configure the Exchange 2010 EWS limits for the unified messaging users mailbox by creating and applying a new mailbox policy to the unified messaging user mailbox account. If you do not configure EWS limits, messages may not be synchronized, and status changes (for example, from unread to read), changes to the subject line, and changes to the priority may not be replicated. In addition, attempts to access Exchange calendars and contacts may fail.

Note
Prior to Exchange 2010 SP2 RU4, the throttling limit was calculated against the calling account (In Our Case Service Account). Starting with, Exchange 2010 SP2 RU4, this limit has been changed. Now, the charges are counted against the target mailbox instead of the calling account.
To Configure EWS Limits from Exchange 2010 Service Pack 2 RU4 and Later

**Step 1**  
Sign in to a server on which Exchange Management Shell is installed. Sign in using either an account that is a member of the Enterprise Admins group or an account that has permission to grant permissions on Exchange objects in the configuration container.

**Step 2**  
Create a new policy with the following EWS connections where Exchange mailboxes have more than 1000 messages, which includes voice messages and receipts. For Exchange mailboxes having 10000 messages, then the new throttling policy will be:

```powershell
New-ThrottlingPolicy -Name "<ConnectionUnifiedMessagingServicesPolicy>" -EWSPercentTimeInCAS 300 -EWSPercentTimeInMailboxRPC 200 -EWSFindCountLimit 10000 -EWSPercentTimeinAD 100
```

where `ConnectionUnifiedMessagingServicesPolicy` is the name that you want to assign to the policy.

Refer to the Table 2-5 to have detailed description on the throttling policy parameters.

**Step 3**  
Apply the new policy to all the unified messaging user mailbox. For each user mailbox, run the following command:

```powershell
Set-ThrottlingPolicyAssociation -Identity "<ConnectionUnifiedMessagingusermailbox>" -ThrottlingPolicy "<ConnectionUnifiedMessagingServicesPolicy>"
```

where:

- `ConnectionUnifiedMessagingusermailbox` is the name of the user mailbox.
- `ConnectionUnifiedMessagingServicesPolicy` is the name of the policy that you created in Step 2.

**Step 4**  
Confirm that the mailbox is using the new policy:

```powershell
Get-ThrottlingPolicyAssociation -Identity "<ConnectionUnifiedMessagingusermailbox>" | findstr "ThrottlingPolicy"
```

**Step 5**  
On each Exchange 2010 server that has the CAS role, restart the Microsoft Exchange RPC Client Access service.

---

**Table 2-5**   
***Recommended Throttle Policy Parameter Values With 10000 Items in User’s Mailbox***

<table>
<thead>
<tr>
<th>Field</th>
<th>Policy Value To Be Used</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EWSPercentTimeInCAS</td>
<td>300</td>
<td>Specifies the percentage of a minute that an Exchange Web Services user can spend executing the client access server code (PercentTimeInCAS).</td>
</tr>
<tr>
<td>EWSPercentTimeInMailboxRPC</td>
<td>200</td>
<td>Specifies the percentage of a minute that an Exchange Web Services user can spend executing mailbox remote procedure call (RPC) requests (PercentTimeInMailboxRPC).</td>
</tr>
</tbody>
</table>
Chapter 2 Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Creating Unified Messaging Services Account in Active Directory and Granting Permissions

If any Unity Connection users who are configured for unified messaging have mailboxes in Exchange 2010, configure the Exchange 2010 EWS limits for the unified messaging service account by creating and applying a new mailbox policy to the unified messaging services account. If you do not configure EWS limits, messages may not be synchronized, and status changes (for example, from unread to read), changes to the subject line, and changes to the priority may not be replicated. In addition, attempts to access Exchange calendars and contacts may fail.

**Note**
Prior to Exchange 2010 Service Pack 1, EWS limits were off by default. If you have not yet installed Service Pack 1, which turns limits on by default, we still recommend that you do the following procedure. Otherwise, when you install Service Pack 1, Unity Connection functionality will be affected.

### To Configure EWS Limits from Exchange 2010 SP2 RU3 and Earlier Releases

#### Step 1
Sign in to a server on which Exchange Management Shell is installed. Sign in using either an account that is a member of the Enterprise Admins group or an account that has permission to grant permissions on Exchange objects in the configuration container.

#### Step 2
Create a new policy with unlimited EWS connections:

```
New-ThrottlingPolicy -Name "<ConnectionUnifiedMessagingServicesPolicy>"
-EWSMaxConcurrency $null -EWSMaxSubscriptions $null -EWSPercentTimeInCAS $null
-EWSPercentTimeInMailboxRPC $null -EWSFindCountLimit $null -EWSPercentTimeinAD $null
```

where **ConnectionUnifiedMessagingServicesPolicy** is the name that you want to assign to the policy.

#### Step 3
Apply the new policy to the unified messaging services account and the user mailbox:

```
Set-ThrottlingPolicyAssociation -Identity "<ConnectionUnifiedMessagingServicesAccount>"
-ThrottlingPolicy "<ConnectionUnifiedMessagingServicesPolicy>"
```

where:

<table>
<thead>
<tr>
<th>Field</th>
<th>Policy Value To Be Used</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EWSFindCountLimit</td>
<td>10000</td>
<td>Defines the maximum number of items from a FindItem or FindFolder operation that can exist in memory on the Client Access server at one time for one user. <strong>Note</strong> If in your deployment mailboxes have more than 10,000 messages, then you can adjust this parameter.</td>
</tr>
<tr>
<td>EWSPercentTimeinAD</td>
<td>100</td>
<td>Specifies the maximum amount of time that can be spent by a Client Access server when accessing Active Directory resources on behalf of a client account, per minute.</td>
</tr>
</tbody>
</table>
Configuring Unified Messaging in Unity Connection

- **ConnectionUnifiedMessagingServicesAccount** is the name of the account that you created in the “Creating Unified Messaging Services Account in Active Directory and Granting Permissions” section on page 2-27.

- **ConnectionUnifiedMessagingServicesPolicy** is the name of the policy that you created in Step 2.

---

**Note**

The Set-ThrottlingPolicyAssociation command is not supported with Exchange 2010 version 14.00.0639.021. The users having Exchange 2010 with version 14.00.0639.021 are not allowed to modify an existing throttling policy settings, hence the default policy gets applied here.

**Step 4**

Confirm that the mailbox is using the new policy:

```
Get-ThrottlingPolicyAssociation -Identity "<ConnectionUnifiedMessagingServicesAccount>" | findstr "ThrottlingPolicy"
```

**Step 5**

If you created more than one unified messaging services account, repeat Step 3 and Step 4 for the remaining accounts.

**Step 6**

On each Exchange 2010 server that has the CAS role, restart the Microsoft Exchange RPC Client Access service.

---

**Enabling WebDav Service on Exchange 2003 Servers**

If you want Unity Connection to access mailboxes on Exchange 2003 servers, you need to configure Internet Information Services to allow the WebDav service.

**To Enable the WebDav Service on Exchange 2003**

**Step 1**

Sign in to a server that has access to the same Exchange 2003 servers that the Unity Connection server has access to. Use an account that is a member of the local Administrators group.

**Step 2**

On the Windows Start menu, select Programs > Administrative Tools > Internet Information Services (IIS) Manager.

**Step 3**

For the first Exchange 2003 server for which you want to confirm settings, in the left pane, expand `<servername>` and select Web Service Extensions.

**Step 4**

In the right pane, for WebDAV, check the value of the Status column:

- If the value is Allowed, skip to Step 5.
- If the value is Prohibited, select Allow.

**Step 5**

Repeat Step 3 and Step 4 for the other Exchange 2003 servers that you want Unity Connection to be able to access.

**Step 6**

Close IIS Manager.

---

**Configuring Unified Messaging in Unity Connection**

See the following sections:
Creating a Unified Messaging Service in Unity Connection to Access Exchange

To Create a Unified Messaging Service to Access Exchange in Unity Connection

**Step 1**  
In Cisco Unity Connection Administration, expand **Unified Messaging** and select **Unified Messaging Services**.

**Step 2**  
On the Search Unified Messaging Services page, select **Add New**.

**Step 3**  
On the New Unified Messaging Service page, in the Type list, select **Exchange/BPOS -D** and check the **Enabled** check box to enable the service.

**Step 4**  
Enter the values of the required fields and select **Save**. (For information on each field, see **Help > This Page**).

For information on synchronization behavior if you later disable a unified messaging service for which single inbox is enabled, see the “Disabling and Re-enabling Single Inbox Affecting the Synchronization of Unity Connection and Exchange Mailboxes” section on page 2-10.

**Caution**  
When you select **Search for Exchange Servers**, Unity Connection communicates with Active Directory servers using Basic authentication regardless of the authentication method you selected in the **Web-Based Authentication Mode** list. As a result, the username and password of the unified messaging services account and all other communication between the Unity Connection and Active Directory servers is in clear text. If you want this data to be encrypted, you must select Secure LDAP (LDAPS) in the **Protocol Used to Communicate with Domain Controllers** list and upload certificates from the certification authority that issued the SSL certificates for Active Directory servers to both tomcat-trust and Connection-trust locations. See Task 17. in the “Task List for Configuring Unity Connection and Exchange for Unified Messaging” section on page 2-12.

**Note**  
If you selected **HTTPS** in the Web-Based Protocol list, or if you selected **Secure LDAP (LDAPS)** in the **Protocol Used to Communicate with Domain Controllers** list, you cannot test the configuration until after you have uploaded SSL certificates in Task 17. of the “Task List for Configuring Unity Connection and Exchange for Unified Messaging” section on page 2-12 because the security-related tests will fail.

**Step 5**  
If you are configuring Unity Connection to communicate with individual Exchange servers, repeat the steps to create additional unified messaging services as explained in the “Exchange Servers Communication with Unity Connection” section on page 2-17.
Uploading CA Public Certificates for Exchange and Active Directory Servers

When you created unified messaging services, if you selected the option to validate certificates for Exchange servers or for Active Directory domain controllers (DCs), you must upload the public certificates from the certification authority (CA) that signed the certificates on the Exchange servers and DCs. Otherwise, Unity Connection cannot communicate with Exchange servers or with DCs to find Exchange servers, and unified messaging functionality will not work. Do the following tasks:

1. **If you selected the option to validate certificates for Exchange servers, and if SSL certificates are not already installed on all of the following servers:** Get and install certificates:
   - Exchange 2007 client access servers, if there are Exchange 2007 mailboxes that you want Unity Connection to be able to access.
   - Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.

   In addition, if you selected the option to validate certificates for Active Directory domain controllers, and if SSL certificates are not already installed on your DCs, get and install certificates.

2. **If you used an external CA (for example, Verisign) to issue the SSL certificates installed on the servers listed in Task 1., and if you have the public certificates for the CA in .pem format:** Save the files to a network location accessible to the Unity Connection server. Then skip to Task 6.

3. **If you used Microsoft Certificate Services or Active Directory Certificate Services to issue the SSL certificates, or if you used an external CA and you do not have the public certificate for the CA in .pem format:** Download and install OpenSSL or another application that can convert public certificates to .pem format. Unity Connection cannot upload public certificates in other formats.

4. **If you used Microsoft Certificate Services to issue the SSL certificates:** Do the “To Save the Public Certificate for Microsoft Certificate Services or Active Directory Certificate Services to a File” section on page 2-38.

5. **If you used Microsoft Certificate Services, Active Directory Certificate Services, or an external CA, and if you do not have public certificates in .pem format:** Use the application that you downloaded in Task 3, to convert the public certificate to .pem format, and save the file to a network location accessible to the Unity Connection server.

6. Upload the public certificates to the Unity Connection server. See the “To Upload the Public Certificates to the Unity Connection Server” procedure on page 2-39.

**To Save the Public Certificate for Microsoft Certificate Services or Active Directory Certificate Services to a File**

---

**Step 1** Sign in to the server on which you installed Microsoft Certificate Services and issued SSL certificates for the following servers:

- Exchange 2007 client access servers, if there are Exchange 2007 mailboxes that you want Unity Connection to be able to access.
- Exchange 2003 servers, if any, on which there are mailboxes that you want Unity Connection to be able to access.
- Active Directory domain controllers that the Unity Connection server might access.

**Step 2** On the Windows Start menu, select Programs > Administrative Tools > Certification Authority.

**Step 3** In the left pane of the Certification Authority MMC, right-click the server name, and select Properties.
Chapter 2 Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Configuring Unified Messaging in Unity Connection

Step 4 In the <servername> Properties dialog box, on the General tab, select View Certificate.
Step 5 In the Certificate dialog box, select the Details tab.
Step 6 On the Details tab, select Copy to File.
Step 7 On the Welcome to the Certificate Export Wizard page, select Next.
Step 8 On the Export File Format page, select Next to accept the default value of DER Encoded Binary X.509 (.CER).
Step 9 On the File to Export page, specify the full path of the public certificate, including a location that is accessible to the Unity Connection server, and a file name.
Step 10 Select Next.
Step 11 On the Completing the Certificate Export Wizard page, select Finish.
Step 12 Select OK three times to close a message box and two dialog boxes.
Step 13 Close the Certification Authority MMC.
Step 14 If you issued SSL certificates for all of the servers listed in Step 1 using the same installation of Microsoft Certificate Services, you are finished with this procedure. Return to the task list for this section.

To Upload the Public Certificates to the Unity Connection Server

Step 1 In Cisco Unified Operating System Administration, expand Security menu and select Certificate Management.
Step 2 Select Upload Certificate.
Step 3 In the Certificate Name list, select tomcat-trust.
Step 4 (Optional) Enter a description in the Description field and select Browse.
Step 5 Browse to the location where you saved the public certificates in .pem format, and select one of the converted certificates.
Step 6 Select Upload File.
Step 7 Repeat Step 2 through Step 6, but select Unity Connection-trust in the Certificate Name list.
Step 8 If you have public certificates from more than one certification authority, repeat Step 2 through Step 7 for the remaining certificates.

Testing Unified Messaging Services for Unity Connection

To Test Unified Messaging Services for Unity Connection

Step 1 In Cisco Unity Connection Administration, expand Unified Messaging, then select Unified Messaging Services.
Chapter 2 Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Creating Unified Messaging Accounts to Link Unity Connection Users to Exchange Mailboxes

This section contains the following sections:

- Unified Messaging Accounts and User Accounts Related in Unity Connection, page 2-40
- Creating Unified Messaging Accounts for Unity Connection, page 2-40

Unified Messaging Accounts and User Accounts Related in Unity Connection

Unified messaging accounts tie Unity Connection users to unified messaging services. Unified messaging accounts are separate objects from user accounts:

- When you create a user account, Unity Connection does not automatically create a unified messaging account for that user.
- You can create more than one unified messaging account for a user, but a user's unified messaging accounts cannot have overlapping features. For example, you cannot create two unified messaging accounts for the same user that both enable single inbox.

Creating multiple unified messaging accounts for a user is one way to control access to unified messaging features. For example, if you want all users to have single inbox but only a few users to have text-to-speech access to Exchange email, you can create two unified messaging services. One activates single inbox and the other activates TTS. You then create unified messaging accounts for all users to give them access to single inbox, and you create a second unified messaging account for the users who you want to have TTS.

- When you add a unified messaging account, the associated user account is updated with a reference to the unified messaging account. The user account does not contain the information on the unified messaging account.
- When you delete a user account, all unified messaging accounts for that user are also deleted. However, when you delete a unified messaging account, the corresponding user account is not deleted. The user account is updated only to remove the reference to the unified messaging account.

Creating Unified Messaging Accounts for Unity Connection

Do the following procedure to create one or more unified messaging accounts for Unity Connection users using Unity Connection Administration. You can also create large numbers of unified messaging accounts using the Bulk Administration Tool. For more information, see the “Using the Cisco Unity Connection 9.x Bulk Administration Tool” appendix in the User Moves, Adds, and Changes Guide for Cisco Unity Connection Release 9.x at http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/connection/9x/user_mac/guide/9xcamacx/9xcucmacappa.html.
Each unified messaging account is associated with a user, but a unified messaging account is a separate object in the Unity Connection database. If you delete a unified messaging account, the associated user account is not deleted.

**To Create Unified Messaging Accounts to Link Unity Connection Users to Exchange Mailboxes**

**Step 1** In Cisco Unity Connection Administration, expand Users and select Users.

**Step 2** On the Search Users page, select the alias of a user.

**Step 3** On the Edit User Basics page, on the Edit menu, select Unified Messaging Accounts.

**Step 4** On the Unified Messaging Accounts page, select Add New.

**Step 5** On the New Unified Messaging Account page, in the Unified Messaging Service list, select the name of the service that you want to use for this user.

**Step 6** Enter the values of the required fields and select Save. (For information on each field, see Help> This Page).

If the unified messaging service that you selected specifies an Exchange server (instead of automatically searching for Exchange servers), and if users are using TTS to access email in Exchange 2003, you must also select an option in the Account Information (Used Only for Exchange 2003 TTS) section and, if applicable, specify a value for the User ID field.

For information on synchronization behavior if you later disable single inbox in a unified messaging account, see the “Disabling and Re-enabling Single Inbox Affecting the Synchronization of Unity Connection and Exchange Mailboxes” section on page 2-10.

**Step 7** To check the configuration for the user, select Test. The Task Execution Results window appears with the test results. If any part of the test fails, verify the configuration for Exchange, Active Directory, Unity Connection, and the Unity Connection user.

**Step 8** Repeat the steps for all remaining users.

**Testing Unified Messaging Configuration**

See the following sections:

- Testing Unified Messaging Accounts for Unity Connection, page 2-42
- Viewing a Summary of the Configuration of Unified Messaging Accounts for Unity Connection, page 2-42
- Testing System Configuration for Unified Messaging with Exchange and Unity Connection, page 2-43
- Testing Access to Exchange Calendars, page 2-43
- Resolving SMTP Domain Name Configuration Issues, page 2-44
Testing Unified Messaging Accounts for Unity Connection

Do the following procedure to test one or more of the unified messaging accounts that you created in the “Creating Unified Messaging Accounts to Link Unity Connection Users to Exchange Mailboxes” section on page 2-40.

To Test User Access to Exchange for Individual Cisco Unity Connection Users

Step 1 In Cisco Unity Connection Administration, expand Users, then select Users. On the Search Users page, select the alias of a user who is configured for one or more unified messaging features for Exchange.

Step 3 On the Edit Unified Messaging Account page, select Test.

Step 4 Review the results, resolve problems, if any, and re-run the test until no more problems are found.

Viewing a Summary of the Configuration of Unified Messaging Accounts for Unity Connection

You can view a summary of the configuration for all of the unified messaging accounts on a Unity Connection server, including:

- Current status of Unity Connection configuration settings for each unified messaging account, which indicates whether consistency problems with Unity Connection settings prevent unified messaging from functioning correctly. When you select the status icon for a unified messaging account, the Unified Messaging Account page appears, and the status area of the page lists both problems and possible problems, if any.

  You can also test whether a unified messaging account has connectivity with other servers using the Test Connectivity button on the Unified Messaging Account page.

- The alias of the user associated with the account. When you select the alias for a unified messaging account, the Edit Unified Messaging Account page appears, and the status area of the page lists problems and possible problems, if any.

- The display name of the user associated with the unified messaging account.

- The name of the unified messaging service that is associated with the unified messaging account. When you select the service name, the Unified Messaging Services page appears with the settings for the service.

- The current unified messaging settings for each unified messaging account.

To View a Summary of the Configuration of Unified Messaging Accounts for Cisco Unity Connection

Step 1 In Cisco Unity Connection Administration, expand Unified Messaging, then select Unified Messaging Account Status.

Step 2 To sort by the values in a column in ascending order, select the heading for the column. To sort in descending order, select the heading again.
Chapter 2  Configuring Cisco Unity Connection 9.x with Microsoft Exchange for Unified Messaging

Testing Unified Messaging Configuration

Step 3  To display the Unified Messaging Accounts page for an account, select the icon or the value of the Alias column in the applicable row.

Step 4  To display the Unified Messaging Services page for an account, select the value of the UM Services column in the applicable row.

Testing System Configuration for Unified Messaging with Exchange and Unity Connection

You can run a Unity Connection system test that includes tests of the unified messaging configuration and that provides summary data on configuration problems, if any, for example, the number of accounts assigned to a specified unified messaging service that has configuration problems.

To Check System Configuration, Including Unified Messaging Configuration for Cisco Unity Connection

Step 1  In Cisco Unity Connection Administration, expand Tools, then select Task Management.

Step 2  On the Task Definitions page, select Check System Configuration.

Step 3  Select Run Now.

Step 4  Select Refresh to display links to the latest results.

Step 5  Review the results, resolve problems, if any, and re-run the Check System Configuration task until no more problems are found.

Testing Access to Exchange Calendars

To Test Access to Exchange Calendars

Step 1  Sign in to Outlook.

Step 2  On the Go menu, select Calendar.

Step 3  On the File menu, select New > Meeting Request.

Step 4  Enter values in the required fields to schedule a new meeting for the current time, and invite a user who has an account on Unity Connection.

Step 5  Select Send.

Step 6  Sign in to the Unity Connection mailbox of the user that you invited to the Outlook meeting in Step 4.

Step 7  If the user account is configured for speech access, say Play Meetings.

If the user account is not configured for speech access, press 6, and then follow the prompts to list meetings.

Unity Connection reads the information about the Exchange meeting.
Resolving SMTP Domain Name Configuration Issues

Revised September, 2013

When a single inbox user receives a voice message, it is synchronized from Cisco Unity Connection to Microsoft Exchange. The email address of sender/recipient has Unity Connection domain name, for example, userid@CUC-hostname. Due to this, email clients like Microsoft Outlook or IBM Lotus Notes adds the Cisco Unity Connection address as "recent contacts" in the address book. When a user replies to an email or adds recipient while composing an email, the user can enter/select the Cisco Unity Connection address, which may lead to NDR. In case you desire when the voice message is synchronized for single inbox users from Connection to Exchange, the email address of sender/recipient is displayed as the corporate email address, for example, userid@corp-hostname.

To Resolve the SMTP Domain Name Configuration Issues

Step 1 In Cisco Unity Connection Administration, expand System Settings > SMTP Configuration, then select Smart Host.

Step 2 On the Smart Host page, in the Smart Host field, enter the IP address or fully qualified domain name of the SMTP smart host server and select Save.

Note Microsoft Exchange server can be used as a smart host.

Step 4 In Cisco Unity Connection Administration, expand System Settings and select General Configuration.

Step 5 On the General Configuration page, in the When a recipient cannot be found list, select Relay message to smart host so that if the Recipient is not found, the message is sent to the smart host and select Save.

Step 6 In Cisco Unity Connection Administration, expand Users > Edit > Message Actions. Select the Accept the message option from the Voicemail drop-down list. Make sure to select the Relay the message option from the Email, Fax, and receipt drop-down lists.

Step 7 Setup a recipient policy on Exchange Server such that the Unity Connection alias resolves to the corporate email Id.
