Cisco Unified CM Administration Overview

Cisco Unified CM Administration, a web-based application, is the main administration and configuration interface for Cisco Unified Communications Manager. You can use Cisco Unified CM Administration to configure a wide range of items for your system including general system components, features, server settings, call routing rules, phones, end users, and media resources.

Configuration Menus

The configuration windows for Cisco Unified CM Administration are organized under the following menus:

• System—Use the configuration windows under this menu to configure general system settings such as server information, NTP settings, Date and Time groups, Regions, DHCP, LDAP integration, and enterprise parameters.

• Call Routing—Use the configuration windows under this tab to configure items related to how Cisco Unified Communications Manager routes calls, including route patterns, route groups, hunt pilots, dial rules, partitions, calling search spaces, directory numbers, and transformation patterns.

• Media Resources—Use the configuration windows under this tab to configure items such as media resource groups, conference bridges, annunciators, and transcoders.

• Advanced Features—Use the configuration windows under this tab to configure features such as voice-mail pilots, message waiting, and call control agent profiles.

• Device—Use the configuration windows under this tab to set up devices such as phones, IP phone services, trunks, gateways, softkey templates, and SIP profiles.

• Application—Use the configuration windows under this tab to download and install plug-ins such as Cisco Unified JTAPI, Cisco Unified TAPI, and the Cisco Unified Real-Time Monitoring Tool.
• User Management—Use the configuration windows under the User Management tab to configure end
users and application users for your system.

• Bulk Administration—Use the Bulk Administration Tool to import and configure large numbers of end
users or devices at a time.

• Help—Click this menu to access the online help system. The online help system contains documentation
that will assist you in configuring settings for the various configuration windows on your system.

Operating System Administration Overview

Use Cisco Unified Communications Operating System Administration to configure and manage your operating
system and perform the following administration tasks:

• Check software and hardware status
• Check and update IP addresses
• Ping other network devices
• Manage NTP servers
• Upgrade system software and options
• Manage node security, including IPsec and certificates
• Manage remote support accounts
• Restart the system

Operating System Status

You can check the status of various operating system components, including the following:

• Clusters and nodes
• Hardware
• Network
• System
• Installed software and options

Operating System Settings

You can view and update the following operating system settings:

• IP—Updates the IP addresses and DHCP client settings that you entered when the application was
installed.
• NTP Server settings—Configures the IP addresses of an external NTP server; adds an NTP server.
• SMTP settings—Configures the simple mail transfer protocol (SMTP) host that the operating system
will use for sending email notifications.

Operating System Security Configuration

You can manage security certificates and IPsec settings. From the **Security** menu, you can choose the following
security options:

• Certificate Management—Manages certificates and certificate signing requests (CSRs). You can display,
upload, download, delete, and regenerate certificates. Through certificate management, you can also
monitor the expiration dates of the certificates on the node.
• IPsec Management—Displays or updates existing IPsec policies; sets up new IPsec policies and associations.

Software Upgrades

You can upgrade the software version that is running on the operating system or to install specific software options, including Cisco Unified Communications Operating System locale installers, dial plans, and TFTP server files.

From the Install/Upgrade menu option, you can upgrade system software from either a local disc or a remote server. The upgraded software is installed on the inactive partition, and you can then restart the system and switch partitions, so the system starts running on the newer software version. For more information, see the Upgrade Guide for the Cisco Unified Communications Manager at http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-installation-guides-list.html.

Note

You must perform all software installations and upgrades through the software upgrade features that are included in the Cisco Unified Communications Operating System interface and the CLI. The system can upload and process only software that is Cisco Systems approved. You cannot install or use third-party or Windows-based software applications.

Services

The application provides the following operating system utilities:

• Ping—Checks connectivity with other network devices.

• Remote Support—Sets up an account that Cisco support personnel can use to access the system. This account automatically expires after the number of days that you specify.

CLI

You can access the CLI from the Operating System or through a secure shell connection to the server. For more information, see the Command Line Interface Reference Guide for Cisco Unified Communications Solutions at http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-maintenance-guides-list.html.

Cisco Unified Serviceability Overview

Cisco Unified Serviceability is a web-based troubleshooting tool that provides a host of services, alarms, and tools that assist administrators in managing their systems. Among the features that Cisco Unified Serviceability offers to administrators are:

• Start and Stop Services—Administrators can set up an assortment of services that help administrators manage their systems. For example, you can start the Cisco CallManager Serviceability RTMT service thereby allowing administrators to use the Real-Time Monitoring Tool to monitor the health of your system.
SNMP—SNMP facilitates the exchange of management information among network devices, such as nodes, routers, and so on. As part of the TCP/IP protocol suite, SNMP enables administrators to remotely manage network performance, find and solve network problems, and plan for network growth.

Alarms—Alarms provide information on the runtime status and state of your system, so that you can troubleshoot problems that are associated with your system.

Traces—Trace tools help you to troubleshooting issues with voice applications.

Cisco Serviceability Reporter—The Cisco Serviceability Reporter generates daily reports in Cisco Unified Serviceability.

SNMP—SNMP facilitates the exchange of management information among network devices, such as nodes, routers, and so on. As part of the TCP/IP protocol suite, SNMP enables administrators to remotely manage network performance, find and solve network problems, and plan for network growth.

CallHome—Configure the Cisco Unified Communications Manager Call Home feature, allowing Cisco Unified Communications Manager to communicate and send the diagnostic alerts, inventory, and other messages to the Smart Call Home back-end server.

Additional Administrative Interfaces

Using Cisco Unified Serviceability, you can start services that allow you to use the following additional administrative interfaces:

- Real-Time Monitoring Tool—The Real-Time Monitoring Tool is a web-based interface that helps you to monitor the health of your system. Using RTMT, you can view alarms, counters and reports that contain detailed information on the health of your system.

- Dialed Number Analyzer—The Dialed Number Analyzer is a web-based interface that helps administrators to troubleshoot issues with the dial plan.

- Cisco Unified CDR Analysis and Reporting—CDR Analysis and Reporting collects call details records showing the details of the calls that are placed on your system.

Cisco Unified Reporting Overview

The Cisco Unified Reporting web application generates consolidated reports for troubleshooting or inspecting cluster data. You can access the application at the Unified Communications Manager and Unified Communications Manager IM and Presence Service consoles.

This tool provides an easy way to take a snapshot of cluster data. The tool gathers data from existing sources, compares the data, and reports irregularities. When you generate a report in Cisco Unified Reporting, the report combines data from one or more sources on one or more servers into one output view. For example, you can view the following reports to help you administer your system:

- Unified CM Cluster Overview—View this report to get a snapshot of your cluster, including Cisco Unified Communications Manager and IM and Presence Service versions, server hostnames, and hardware details.
• Phone Feature List—View this report if you are configuring features. This report provides a list of which phones support which Cisco Unified Communications Manager features.

• Unified CM Phones Without Lines—View this report to see which phones in your cluster do not have a phone line.

Disaster Recovery System Overview

The Disaster Recovery System (DRS), which can be invoked from Cisco Unified Communications Manager Administration, provides full data backup and restore capabilities. The Disaster Recovery System allows you to perform regularly scheduled automatic or user-invoked data backups.

DRS restores its own settings (backup device settings and schedule settings) as part of the platform backup/restore. DRS backs up and restores the drfDevice.xml and drfSchedule.xml files. When the server is restored with these files, you do not need to reconfigure DRS backup device and schedule.

The Disaster Recovery System includes the following capabilities:

• A user interface for performing backup and restore tasks.

• A distributed system architecture for performing backup and restore functions.

• Scheduled backups.

• Archive backups to a physical tape drive or remote SFTP server.

Bulk Administration Tool Overview

In Cisco Unified CM Administration, uses the Bulk Administration menu and submenu options to configure entities in Unified Communications Manager through use of the Bulk Administration Tool.

The Unified Communications Manager Bulk Administration Tool (BAT), a web-based application, lets administrators perform bulk transactions to the Unified Communications Manager database. BAT lets you add, update, or delete a large number of similar phones, users, or ports at the same time. When you use Cisco Unified CM Administration, each database transaction requires an individual manual operation, while BAT automates the process and achieves faster add, update, and delete operations.

You can use BAT to work with the following types of devices and records:

• Add, update, and delete Cisco IP Phones, gateways, phones, computer telephony interface (CTI) ports, and H.323 clients

• Add, update, and delete users, user device profiles, Cisco Unified Communications Manager Assistant managers and assistants

• Add or delete Forced Authorization Codes and Client Matter Codes

• Add or delete call pickup groups

• Populate or depopulate the Region Matrix
• Insert, delete, or export the access list
• Insert, delete, or export remote destinations and remote destination profiles
• Add Infrastructure Devices

For details on how to use the Bulk Administration Tool, refer to the *Bulk Administration Guide for Cisco Unified Communications Manager*. 
Getting Started

• Sign In to Administrative Interfaces, on page 7
• Reset the Administrator or Security Password, on page 7
• Shut Down or Restart the System, on page 8

Sign In to Administrative Interfaces

Use this procedure to sign in to any of the administrative interfaces in your system.

Procedure

Step 1
Open the Unified Communications Manager interface in your web browser.

Step 2
Choose the administration interface from the Navigation drop-down list.

Step 3
Click Go.

Step 4
Enter your username and password.

Step 5
Click Login.

Reset the Administrator or Security Password

If you lose the administrator password and cannot access your system, use this procedure to reset the password.

Note
For password changes on IM and Presence nodes, stop the Cisco Presence Engine service in all IM and Presence nodes before resetting the administrator password. After the password reset, restart the Cisco Presence Engine service in all the nodes. Make sure that you perform this task during maintenance because you may face presence issues when the PE is stopped.

Before you begin
• You require physical access to the node on which you perform this procedure.
• At any point, when you are requested to insert CD or DVD media, you must mount the ISO file through the vSphere client for the VMWare server. See “Adding DVD or CD Drives to a Virtual Machine” https://www.vmware.com/support/ws5/doc/ws_disk_add_cd_dvd.html for guidance.

• The security password on all nodes in a cluster must match. Change the security password on all machines, or the cluster nodes will not communicate.

Procedure

Step 1  Sign in to the CLI on the publisher node with the following username and password:
   a) Username: pwrecovery
   b) Password: pwreset

Step 2  Press any key to continue.

Step 3  If you have a valid CD/DVD in the disk drive or you mounted an ISO file, remove it from the VMWare client.

Step 4  Press any key to continue.

Step 5  Insert a valid CD or DVD into the drive or mount the ISO file.

Note  For this test, you must use a disk or ISO file that is data only.

Step 6  After the system verifies the last step, you are prompted to enter one of the following options to continue:
   • Enter a to reset the administrator password.
   • Enter s to reset the security password.

Note  You must reset each node in a cluster after you change its security password. Failure to reboot the nodes causes system service problems and problems with the administration windows on the subscriber nodes.

Step 7  Enter the new password, and then reenter it to confirm.

The administrator credentials must start with an alphabetic character, be at least six characters long, and can contain alphanumeric characters, hyphens, and underscores.

Step 8  After the system verifies the strength of the new password, the password is reset, and you are prompted to press any key to exit the password reset utility.

Shut Down or Restart the System

Use this procedure if you need to shut down or restart your system, for example, after you make a configuration change.
Before you begin

If the server is forced to shutdown and restart from your virtual machine, the file system may become corrupted. Avoid a forced shutdown; instead, wait for the server to shutdown properly after this procedure or after you run `utils system shutdown` from the CLI.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>From Cisco Unified OS Administration, choose Settings &gt; Version.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>

PART II

Manage Users

• Manage User Access, on page 13
• Manage End Users, on page 33
• Manage Application Users, on page 43
CHAPTER 3

Manage User Access

• User Access Overview, on page 13
• User Access Prerequisites, on page 14
• User Access Configuration Task Flow, on page 14
• Set up a Remote Account, on page 23
• Standard Roles and Access Control Groups, on page 23

User Access Overview

You can manage user access to Cisco Unified Communications Manager by assigning your end users to access control groups that are associated to roles.

Roles and access control groups provide multiple levels of security to Cisco Unified Communications Manager. Each role defines a set of permissions for a specific resource within Cisco Unified Communications Manager. When you assign a role to an access control group and then assign end users to that access control group, you grant those end users all the access permissions that are defined by the role.

Upon installation Cisco Unified Communications Manager comes with predefined default roles that are assigned to predefined default access control groups. You can assign your end users to the default access control groups, or you can customize access settings by setting up new access control groups and roles.

Roles Overview

Users obtain system access privileges via the roles that are associated to the access control group of which the user is a member. Each role contains a set of permissions that is attached to a specific resource or application, such as Cisco Unified CM Administration or CDR Analysis and Reporting. For an application such as Cisco Unified CM Administration, the role may contain permissions that let you view or edit specific GUI pages in the application. There are three levels of permissions that you can assign to a resource or application:

• Read—Allows a user to view settings for a resource.
• Update—Allows a user to edit settings for a resource.
• No Access—If a user has neither Read or Update access, the user has no access to view or edit settings for a given resource.
Role Types
When provisioning users, you must decide what roles you want to apply and then assign users to an access control group that contains the role. There are two main types of roles in Cisco Unified Communications Manager:

• Standard roles—These are preinstalled default roles that are designed to meet the needs of common deployments. You cannot edit permissions for standard roles.

• Custom roles—Create custom roles when no standard roles have the privileges you need.

Access Control Groups
An access control group is a list of users and the roles that are assigned to those users. When you assign an end user, application user, or administrator user to an access control group, the user gains the access permissions of the roles that are associated to the group. You can manage system access by assigning users with similar access needs to an access control group with only the roles and permissions that they need.

There are two types of access control groups:

• Standard Access Control Groups—These are predefined default groups with role assignments that meet common deployment needs. You cannot edit the role assignments in a standard group. However, you can add and delete users, in addition to editing the User Rank requirement. For a list of standard access control groups, and their associated roles, see Standard Roles and Access Control Groups, on page 23.

• Custom Access Control Groups—Create your own access control groups when none of the standard groups contain the role permissions that meet your needs.

Related Topics
Standard Roles and Access Control Groups, on page 23

User Access Prerequisites
Make sure to review your user needs so that you know what level of access your users require. You will want to assign roles that have the access privileges your users require, but which do not provide access to systems that they should not be able to access.

Before you create new roles and access control groups, review the list of standard roles and access control groups to verify whether an existing access control group has the roles and access permissions that you need. For details, see Standard Roles and Access Control Groups, on page 23.

User Access Configuration Task Flow
Complete the following tasks to configure user access.

Before you begin
If you want to use default roles and access control groups then you can skip tasks for creating customized roles and access control groups. You can assign your users to the existing default access control groups.
Create a Custom Role

Use this procedure to create a new role with customized privileges. You may want to do this if there are no standard roles with the exact privileges that you need. There are two ways to create a role:

- Use the Add New button to create and configure the new role from scratch.
- Use the Copy button if an existing role has access privileges that are close to what you need. You can copy the privileges of the existing role to a new role that is editable.

**Procedure**

**Step 1**
In Cisco Unified CM Administration, click User Management > User Settings > Role.

**Step 2**
Do either of the following:

- To create a new role, click Add New. Choose the Application with which this role associates, and click Next.
- To copy settings from an existing role, click Find and open the existing role. Click Copy and enter a name for the new role. Click OK.

**Step 3**
Enter a Name and Description for the role.

**Step 4**
For each resource, check the boxes that apply:

- Check the Read check box if you want users to be able to view settings for the resource.
- Check the Update check box if you want users to be able to edit settings for the resource.
- Leave both check boxes unchecked to provide no access to the resource.

**Step 5**
Click Grant access to all or Deny access to all button to grant or remove privileges to all resources that display on a page for this role.

**Note**
If the list of resources displays on more than one page, this button applies only to the resources that display on the current page. You must display other pages and use the button on those pages to change the access to the resources that are listed on those pages.

---

**Create a Custom Role**

Use this procedure to create a new role with customized privileges. You may want to do this if there are no standard roles with the exact privileges that you need. There are two ways to create a role:

- Use the Add New button to create and configure the new role from scratch.
- Use the Copy button if an existing role has access privileges that are close to what you need. You can copy the privileges of the existing role to a new role that is editable.

**Procedure**

**Command or Action** | **Purpose**
--- | ---
Step 1 | Create a Custom Role, on page 15
Create custom roles if the default roles don't have the access permissions you need.
Step 2 | Create Access Control Group, on page 16
Create custom access control groups if the default groups don't have the role assignments you need.
Step 3 | Assign Users to Access Control Group, on page 18
Add or delete users from a standard or custom access control group.
Step 4 | Configure Overlapping Privilege Policy for Access Control Groups, on page 20
Optional. This setting is used if users are assigned to multiple access control groups with conflicting permissions.
Copy a Role

Perform the following procedure to create a new role by copying the settings from a standard role into a new role. Cisco Unified Communications Manager does not allow you to edit the privileges in a standard role, but you can edit the privileges in roles that you create.

Procedure

Step 1  In Cisco Unified Communications Manager Administration, click User Management > User Settings > Role.
Step 2  Click Find and select the role whose resources and privileges you want to copy.
Step 3  Click Copy.
Step 4  Enter the name of the new role and click OK. The Role Configuration window displays the settings of the new role. The privileges for the new role are the same as the privileges for the role you copied.
Step 5  For any of the resources in the new role, edit the privileges as follows:
- Check the Read check box to allow users to view the resource.
- Check the Update check box to allow users to edit the resource.
- To restrict access to the resource, leave both check boxes unchecked.
Step 6  Click Save.

What to do next

In order to assign the role to users, you must create a new access control group and assign the role to that group. Perform either of the following procedures to create a new access control group:

- Create Access Control Group, on page 16
- Copy Access Control Group, on page 17

Create Access Control Group

Use this procedure if you need to create a new access control group. You may want to do this if no standard group has the roles and access privileges you need. There are two ways to create a customized group:

- Use the Add New button to create and configure the new access control group from scatch.
- Use the Copy button if an existing group has role assignments that are close to what you need. You can copy the settings from the existing group to a new and editable group.
**Procedure**

**Step 1** In Cisco Unified CM Administration, choose **User Management > User Settings > Access Control Groups**.

**Step 2** Do either of the following:
   - To create a new group from scratch, click **Add New**.
   - To copy settings from an existing group, click **Find** and open the existing access control group. Click **Copy** and enter a name for the new group. Click **OK**.

**Step 3** Enter a **Name** for the access control group.

**Step 4** Click **Save**.

**Step 5** Assign roles to the access control group. The roles you select will be assigned to group members:
   a) From **Related Links**, select **Assign Role to Access Control Group**, and click **Go**.
   b) Click **Find** to search for existing roles.
   c) Check the roles that you want to add and click **Add Selected**.
   d) Click **Save**.

---

**What to do next**

**Assign Users to Access Control Group, on page 18**

---

**Copy Access Control Group**

Perform the following task to create a new access control group by copying the role settings from an existing access control group to a new group that can be edited.

**Procedure**

**Step 1** In Cisco Unified CM Administration, choose **User Management > User Settings > Access Control Groups**.

**Step 2** Click **Find** and select the access control group whose settings you want to copy.

**Step 3** Click **Copy**.

**Step 4** Enter a name for the new access control group and click **OK**.

**Step 5** Click **Save**.

---

**What to do next**

If you need to review and edit the roles assigned to the access control group:

**Assign Roles for Access Control Group, on page 17**

---

**Assign Roles for Access Control Group**

Use this procedure to assign roles for an access control group. If you copied the access control group settings from an existing group, you may also need to delete a role.
Users with full access, such as administrators, can assign roles or delete roles for access control groups. An access control group with assigned roles has access to all the resources that the role comprises.

**Note**
When you assign roles to an access control group, you should assign the Standard Unified CM Admin Users role to the access control group. This role enables the users to log into Unified CM Administration.

**Before you begin**
Perform either of the following tasks if you need to create a new access control group:

- Copy Access Control Group, on page 17
- Create Access Control Group, on page 16

**Procedure**

**Step 1** Choose User Management > User Settings > Access Control Group.
The Find and List Access Control Groups window appears.

**Step 2** Click Find and select the access control group for which you want to assign roles.
The Access Control Group Configuration window displays.

**Step 3** From the Related Links drop-down list, choose Assign Role to Access Control Group, and click Go.
The Role Assignment pane displays.

**Step 4** If you want to add new roles to the access control group, do the following:
   a) Click Assign Role to Group.
   b) Click Find to search the list of roles.
   c) Choose the roles that you want to add to this access control group.
   d) Click Add Selected.
The new role appears in the Role list box.

**Step 5** If you want to delete an assigned role from the access control group, do the following:
   a) In the Role list box, highlight the role that you want to delete.
   b) Click Delete Role Assignment.

**Step 6** Click Save.
The role assignments are added to the access control group in the database.

**What to do next**
Assign Users to Access Control Group, on page 18

**Assign Users to Access Control Group**

Add or delete users from a standard or custom access control group.
If you are syncing new users from a company LDAP Directory, and your rank hierarchy and access control groups are created with the appropriate permissions, you can assign the group to synced users as a part of the LDAP sync. For details on how to set up an LDAP directory sync, see the System Configuration Guide for Cisco Unified Communications Manager.

**Procedure**

**Step 1** Choose User Management > User Settings > Access Control Group. The Find and List Access Control Group window appears.

**Step 2** Click Find and select the access control group for which you want to update the list of users.

**Step 3** In the User section, click Find to display the list of users.

**Step 4** If you want to add end users or application users to the access control group, do the following:
   a) Click Add End Users to Access Control Group or Add App Users to Access Control Group.
   b) Select the users whom you want to add.
   c) Click Add Selected.

**Step 5** If you want to delete users from the access control group:
   a) Select the users whom you want to delete.
   b) Click Delete Selected.

**Step 6** Click Save.

**View User Privilege Report**

Perform the following procedure to view the User Privilege report for either an existing end user or an existing application user. The User Privilege report displays the access control groups, roles, and access privileges that are assigned to an end user or application user.

**Procedure**

**Step 1** In Cisco Unified CM Administration, perform either of the following steps:
   • For end users, choose User Management > End User.
   • For application users, choose User Management > Application User.

**Step 2** Click Find and select the user for whom you want to view access privileges

**Step 3** From the Related Links drop-down list, choose the User Privilege Report and click Go. The User Privilege window appears.
Configure Overlapping Privilege Policy for Access Control Groups

Configure how Cisco Unified Communications Manager handles overlapping user privileges that can result from access control group assignments. This is to cover situations where an end user is assigned to multiple access control groups, each with conflicting roles and privilege settings.

Procedure

Step 1
- In Cisco Unified CM Administration, choose System > Enterprise Parameters.

Step 2
- Under User Management Parameters, configure one of the following values for the Effective Access Privileges For Overlapping User Groups and Roles as follows:
  - **Maximum** — The effective privilege represents the maximum of the privileges of all the overlapping access control groups. This is the default option.
  - **Minimum** — The effective privilege represents the minimum of the privileges of all the overlapping access control groups.

Step 3
- Click Save.

Create Custom Help Desk Role Task Flow

Some companies want their help desk personnel to have privileges to be able to perform certain administrative tasks. Follow the steps in this task flow to configure a role and access control group for help desk team members that allows them to perform tasks such as adding a phone and adding an end user.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Create Custom Help Desk Role, on page 20</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Create Custom Help Desk Access Control Group, on page 21</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Assign Help Desk Role to Access Control Group, on page 21</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Assign Help Desk Members to Access Control Group, on page 22</td>
</tr>
</tbody>
</table>

Create Custom Help Desk Role

Perform this procedure to create a custom help desk role that you can assign to help desk members in your organization.
Procedure

Step 1  In Cisco Unified Communications Manager Administration, choose User Management > User Settings > Role.
Step 2  Click Add New.
Step 3  From the Application drop-down list, choose the application that you want to assign to this role. For example, Cisco CallManager Administration.
Step 4  Click Next.
Step 5  Enter the Name of the new role. For example, Help Desk.
Step 6  Under Read and Update Privileges select the privileges that you want to assign for help desk users. For example, if you want help desk members to be able to add users and phones, check the Read and Update check boxes for User web pages and Phone web pages.
Step 7  Click Save.

What to do next

Create Custom Help Desk Access Control Group, on page 21

Create Custom Help Desk Access Control Group

Before you begin

Create Custom Help Desk Role, on page 20

Procedure

Step 1  In Cisco Unified CM Administration, choose User Management > User Settings > Access Control Group.
Step 2  Click Add New.
Step 3  Enter a name for the access control group. For example, Help_Desk.
Step 4  Click Save.

What to do next

Assign Help Desk Role to Access Control Group, on page 21

Assign Help Desk Role to Access Control Group

Perform the following steps to configure the Help Desk access control group with the privileges from the Help Desk role.

Before you begin

Create Custom Help Desk Access Control Group, on page 21
Procedure

Step 1 In Cisco Unified CM Administration, choose User Management > User Settings > Access Control Group.
Step 2 Click Find and select the access control group that you created for Help Desk. The Access Control Group Configuration window displays.
Step 3 In the Related Links drop-down list box, choose the Assign Role to Access Control Group option and click Go. The Find and List Roles popup displays.
Step 4 Click the Assign Role to Group button.
Step 5 Click Find and select the Help Desk role.
Step 6 Click Add Selected.
Step 7 Click Save.

What to do next
Assign Help Desk Members to Access Control Group, on page 22

Assign Help Desk Members to Access Control Group

Before you begin
Assign Help Desk Role to Access Control Group, on page 21

Procedure

Step 1 In Cisco Unified CM Administration, choose User Management > User Settings > Access Control Group.
Step 2 Click Find and select the custom Help Desk access control group that you created.
Step 3 Perform either of the following steps:
   • If your help desk team members are configured as end users, click Add End Users to Group.
   • If your help desk team members are configured as application users, click Add App Users to Group.
Step 4 Click Find and select your help desk users.
Step 5 Click Add Selected.
Step 6 Click Save.
Cisco Unified Communications Manager assigns your help desk team members with the privileges of the custom help desk role that you created.

Delete Access Control Group

Use the following procedure to delete an access control group entirely.
Before you begin

When you delete an access control group, Cisco Unified Communications Manager removes all access control group data from the database. Ensure you are aware which roles are using the access control group.

Procedure

Step 1  Choose User Management > User Settings > Access Control Group.
        The Find and List Access Control Groups window appears.
Step 2  Find the access control group that you want to delete.
Step 3  Click the name of the access control group that you want to delete.
        The access control group that you chose appears. The list shows the users in this access control group in alphabetical order.
Step 4  If you want to delete the access control group entirely, click Delete.
        A dialog box appears to warn you that you cannot undo the deletion of access control groups.
Step 5  To delete the access control group, click OK or to cancel the action, click Cancel. If you click OK, Cisco Unified Communications Manager removes the access control group from the database.

Set up a Remote Account

Configure a remote account in the Unified Communications Manager so that Cisco support can temporarily gain access to your system for troubleshooting purposes.

Procedure

Step 1  From Cisco Unified Operating System Administration, choose Services > Remote Support.
Step 2  In the Account Name field, enter a name for the remote account.
Step 3  In the Account Duration field, enter the account duration in days.
Step 4  Click Save.
        The system generates an encrypted pass phrase.
Step 5  Contact Cisco support to provide them with the remote support account name and pass phrase.

Standard Roles and Access Control Groups

The following table summarizes the standard roles and access control groups that come preconfigured on Cisco Unified Communications Manager. The privileges for a standard role are configured by default. In addition, the access control groups that are associated with a standard role are also configured by default.
For both standard roles and the associated access control group, you cannot edit any of the privileges, or the role assignments.

CHAPTER 4

Manage End Users

• End User Overview, on page 33
• End User Management Tasks, on page 33

End User Overview

When administering an up and running system, you may need to make updates to the list of configured end users in your system. This includes:

• Setting up a new user
• Setting up a phone for a new end user
• Changing passwords or PINs for an end user
• Enable end users for IM and Presence Service

The End User Configuration window in Cisco Unified CM Administration allows you to add, search, display, and maintain information about Unified CM end users. You can also use the Quick User/Phone Add window to quickly configure a new end user and configure a new phone for that end user.

End User Management Tasks

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Configure User Templates, on page 34</td>

### Configure User Templates

Perform the following tasks to set up a user profile and feature group template. When you add a new end user, you can use the line and device settings to quickly configure the end user and any phones for the end user.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
</tbody>
</table>

**Configure Universal Line Template**

Universal Line Templates make it easy to apply common settings to newly assigned directory numbers. Configure different templates to meet the needs of different groups of users.

**Procedure**

**Step 1**
In Cisco Unified CM Administration, choose **User Management > User/Phone Add > Universal Line Template**.

**Step 2**
Click **Add New**.

**Step 3**
Configure the fields in the **Universal Line Template Configuration** window. See the online help for more information about the fields and their configuration options.

**Step 4**
If you are deploying Global Dial Plan Replication with alternate numbers expand the **Enterprise Alternate Number** and **+E.164 Alternate Number** sections and do the following:

a) Click the **Add Enterprise Alternate Number** button and/or **Add +E.164 Alternate Number** button.

b) Add the **Number Mask** that you want to use to assign to your alternate numbers. For example, a 4-digit extension might use 5XXXX as an enterprise number mask and 1972555XXXX as an +E.164 alternate number mask.

c) Assign the partition where you want to assign alternate numbers.

d) If you want to advertise this number via ILS, check the **Advertise Globally via ILS** check box. Note that if you are using advertised patterns to summarize a range of alternate numbers, you may not need to advertise individual alternate numbers.

e) Expand the **PSTN Failover** section and choose the **Enterprise Number** or **+E.164 Alternate Number** as the PSTN failover to use if normal call routing fails.

**Step 5**
Click **Save**.

**What to do next**
Configure Universal Device Template, on page 35

**Configure Universal Device Template**

Universal device templates make it easy to apply configuration settings to newly provisioned devices. The provisioned device uses the settings of the universal device template. You can configure different device templates to meet the needs of different groups of users. You can also assign the profiles that you’ve configured to this template.

**Before you begin**
Configure Universal Line Template, on page 35
Procedure

Step 1 In Cisco Unified CM Administration, choose User Management > User/Phone Add > Universal Device Template.

Step 2 Click Add New.

Step 3 Enter the following mandatory fields:
   a) Enter a Device Description for the template.
   b) Select a Device Pool type from the drop-down list.
   c) Select a Device Security Profile from the drop-down list.
   d) Select a SIP Profile from the drop-down list.
   e) Select a Phone Button Template from the drop-down list.

Step 4 Complete the remaining fields in the Universal Device Template Configuration window. For field descriptions, see the online help.

Step 5 Under Phone Settings, complete the following optional fields:
   a) If you configured a Common Phone Profile, assign the profile.
   b) If you configured a Common Device Configuration, assign the configuration.
   c) If you configured a Feature Control Policy, assign the policy.

Step 6 Click Save.

What to do next
Configure User Profiles, on page 36

Configure User Profiles

Assign universal line and universal device template to users through the User Profile. Configure multiple user profiles for different groups of users. You can also enable self-provisioning for users who use this service profile.

Before you begin
Configure Universal Device Template, on page 35

Procedure

Step 1 From Cisco Unified CM Administration, choose User Management > User/Phone Add > User Profile.

Step 2 Click Add New.

Step 3 Enter a Name and Description for the user profile.

Step 4 Assign a Universal Device Template to apply to users’ Desk Phones, Mobile and Desktop Devices, and Remote Destination/Device Profiles.

Step 5 Assign a Universal Line Template to apply to the phone lines for users in this user profile.

Step 6 If you want the users in this user profile to be able to use the self-provisioning feature to provision their own phones, do the following:
   a) Check the Allow End User to Provision their own phones check box.
b) In the Limit Provisioning once End User has this many phones field, enter a maximum number of phones the user is allowed to provision. The maximum is 20.

Step 7 Click Save.

What to do next
Configure Feature Group Template, on page 37

Configure Feature Group Template

Feature group templates aid in your system deployment by helping you to quickly configure phones, lines, and features for your provisioned users. If you are syncing users from a company LDAP directory, configure a feature group template with the User Profile and Service Profile that you want users synced from the directory to use. You can also enable the IM and Presence Service for synced users through this template.

Procedure

Step 1 In Cisco Unified CM Administration, choose User Management > User/Phone Add > Feature Group Template.
Step 2 Click Add New.
Step 3 Enter a Name and Description for the Feature Group Template.
Step 4 Check the Home Cluster check box if you want to use the local cluster as the home cluster for all users whom use this template.
Step 5 Check the Enable User for Unified CM IM and Presence check box to allow users whom use this template to exchange instant messaging and presence information.
Step 6 From the drop-down list, select a Services Profile and User Profile.
Step 7 Complete the remaining fields in the Feature Group Template Configuration window. Refer to the online help for field descriptions.
Step 8 Click Save.

What to do next
Add a new end user. If your system is integrated with a company LDAP directory, you can import the user directly from an LDAP directory. Otherwise, create the end user manually.

• Import an End User from LDAP, on page 37
• Add an End User Manually, on page 38

Import an End User from LDAP

Perform the following procedure to manually import a new end user from a company LDAP directory. If your LDAP synchronization configuration includes a feature group template with a user profile that includes universal line and device templates and a DN pool, the import process automatically configures the end user and primary extension.
Add an End User Manually

Perform the following procedure to add new end user and configure them with an access control group and a primary line extension.

Make sure that you have already set up an access control groups that has the role permissions to which you want to assign your user. For details, see the "Manage User Access“ chapter.

Before you begin

Verify that you have a user profile configured that includes a universal line template. If you need to configure a new extension, Cisco Unified Communications Manager uses the settings from the universal line template to configure the primary extension.
Procedure

Step 1  In Cisco Unified CM Administration, choose User Management > User/Phone Add > Quick User/Phone Add.

Step 2  Enter the User ID and Last Name.

Step 3  From the Feature Group Template drop-down list, select a feature group template.

Step 4  Click Save.

Step 5  From the User Profile drop-down list, verify that the selected user profile includes a universal line template.

Step 6  From the Access Control Group Membership section, click the + icon.

Step 7  From the User is a member of drop-down list, select an access control group.

Step 8  Under Primary Extension, click the + icon.

Step 9  From the Extension drop-down list, select a DN that displays as (available).

Step 10  If all line extensions display as (used), perform the following steps:

a) Click the New... button.

   The Add New Extension popup displays.

b) In the Directory Number field, enter a new line extension.

c) From the Line Template drop-down list, select a universal line template.

d) Click OK.

   Cisco Unified Communications Manager configures the directory number with the settings from the
   universal line template.

Step 11  (Optional) Complete any additional fields in the Quick User/Phone Add Configuration window.

Step 12  Click Save.

What to do next

Perform one of the following procedures to assign a phone to this end user:

- Add New Phone for End User, on page 39
- Move an Existing Phone to a End User, on page 40

Add New Phone for End User

Perform the following procedure to add a new phone for a new or existing end user. Make sure that the user profile for the end user includes a universal device template. Cisco Unified Communications Manager uses the universal device template settings to configure the phone.

Before you begin

Perform one of the following procedures to add an end user:

- Add an End User Manually, on page 38
- Import an End User from LDAP, on page 37
**Procedure**

**Step 1**  
In Cisco Unified CM Administration, choose **User Management > User/Phone Add > Quick/User Phone Add**.

**Step 2**  
Click **Find** and select the end user for whom you want to add a new phone.

**Step 3**  
Click the **Manage Devices**.  
The Manage Devices window appears.

**Step 4**  
Click **Add New Phone**.  
The Add Phone to User popup displays.

**Step 5**  
From the **Product Type** drop-down list, select the phone model.

**Step 6**  
From the **Device Protocol** drop-down list select SIP or SCCP as the protocol.

**Step 7**  
In the **Device Name** text box, enter the device MAC address.

**Step 8**  
From the **Universal Device Template** drop-down list, select a universal device template.

**Step 9**  
If the phone supports expansion modules, enter the number of expansion modules that you want to deploy.

**Step 10**  
If you want to use Extension Mobility to access the phone, check the **In Extension Mobility** check box.

**Step 11**  
Click **Add Phone**.  
The Add New Phone popup closes. Cisco Unified Communications Manager adds the phone to the user and uses the universal device template to configure the phone.

**Step 12**  
If you want to make additional edits to the phone configuration, click the corresponding Pencil icon to open the phone in the **Phone Configuration** window.

---

**Move an Existing Phone to a End User**

Perform this procedure to move an existing phone to a new or existing end user.

**Procedure**

**Step 1**  
In Cisco Unified CM Administration, choose **User Management > User/Phone Add > Quick/User Phone Add**.

**Step 2**  
Click **Find** and select the user to whom you want to move an existing phone.

**Step 3**  
Click the **Manage Devices** button.

**Step 4**  
Click the **Find a Phone to Move To This User** button.

**Step 5**  
Select the phone that you want to move to this user.

**Step 6**  
Click **Move Selected**.
### Change the End User PIN

**Procedure**

**Step 1** In Cisco Unified Communications Manager Administration, choose **User Management > End User**. The **Find and List Users** window appears.

**Step 2** To select an existing user, specify the appropriate filters in the **Find User Where** field, click **Find** to retrieve a list of users, and then select the user from the list. The **End User Configuration** window is displayed.

**Step 3** In the **PIN** field, double-click the existing PIN, which is encrypted, and enter the new PIN. You must enter at least the minimum number of characters that are specified in the assigned credential policy (1-127 characters).

**Step 4** In the **Confirm PIN** field, double-click the existing, encrypted PIN and enter the new PIN again.

**Step 5** Click **Save**.

**Note** You can login to Extension Mobility, Conference Now, Mobile Connect, and Cisco Unity Connection voicemail with the same end user PIN, if **End User Pin synchronization** checkbox is enabled in the **Application Server Configuration** window for Cisco Unity Connection. End users can use the same PIN to log in to Extension Mobility and to access their voicemail.

### Change the End User Password

You cannot change an end user password when LDAP authentication is enabled.

**Procedure**

**Step 1** In Cisco Unified Communications Manager Administration, choose **User Management > End User**. The **Find and List Users** window appears.

**Step 2** To select an existing user, specify the appropriate filters in the **Find User Where** field, click **Find** to retrieve a list of users, and then select the user from the list. The **End User Configuration** window is displayed.

**Step 3** In the **Password** field, double-click the existing password, which is encrypted, and enter the new password. You must enter at least the minimum number of characters that are specified in the assigned credential policy (1-127 characters).

**Step 4** In the **Confirm Password** field, double-click the existing, encrypted password and enter the new password again.

**Step 5** Click **Save**.
Create a Cisco Unity Connection Voice Mailbox

Before you begin

• You must configure Cisco Unified Communications Manager for voice messaging. For more information about configuring Cisco Unified Communications Manager to use Cisco Unity Connection, see the System Configuration Guide for Cisco Unified Communications Manager at:

• You must associate a device and a Primary Extension Number with the end user.

• You can use the import feature that is available in Cisco Unity Connection instead of performing the procedure that is described in this section. For information about how to use the import feature, see the User Moves, Adds, and Changes Guide for Cisco Unity Connection.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>In Cisco Unified Communications Manager Administration, choose User Management &gt; End User. The Find and List Users window appears.</td>

<td>Click Save. The mailbox is created. The link in the Related Links drop-down list changes to Edit Cisco Unity User in the End User Configuration window. In Cisco Unity Connection Administration, you can now view the user that you created. Note: After you integrate the Cisco Unity Connection user with the Cisco Unified Communications Manager end user, you cannot edit fields in Cisco Unity Connection Administration such as Alias (User ID in Cisco Unified CM Administration), First Name, Last Name, and Extension (Primary Extension in Cisco Unified CM Administration). You can only update these fields in Cisco Unified CM Administration.</td>
</tr>
</tbody>
</table>
Manage Application Users

Application Users Overview

The Application User Configuration window in Cisco Unified CM Administration allows the administrator to add, search, display, and maintain information about Cisco Unified Communications Manager application users.

Cisco Unified CM Administration includes the following application users by default:

- CCMAdministrator
- CCMSysUser
- CCMQRTSecureSysUser
- CCMQRTSysUser
- IPMASecureSysUser
- IPMASysUser
- WDSecureSysUser
- WDSysUser
- TabSyncSysUser
- CUCService

Note

Administrator users in the Standard CCM Super Users group can access Cisco Unified Communications Manager Administration, Cisco Unified Serviceability, and Cisco Unified Reporting with a single sign-on to one of the applications.
## Application Users Task Flow

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Add New Application User, on page 44</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>

</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Add Administrator User to Cisco Unity or Cisco Unity Connection, on page 45</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Change Application User Password, on page 46</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Manage Application User Password Credential Information, on page 46</td>
</tr>
</tbody>
</table>

### Add New Application User

#### Procedure

- **Step 1** In Cisco Unified CM Administration, choose User Management > Application User .
- **Step 2** Click Add New.
- **Step 3** Configure the fields in the Application User Configuration window. See the online help for information about the fields and their configuration options.
- **Step 4** Click Save.

#### What to do next

Associate Devices with Application Users, on page 45
Associate Devices with Application Users

Procedure

Step 1  From Cisco Unified CM Administration, choose User Management > Application User. The Find and List Users window appears.

Step 2  To select an existing user, specify the appropriate filters in the Find User Where field, select Find to retrieve a list of users, and then select the user from the list.

Step 3  In the Available Devices list, choose a device that you want to associate with the application user and click the Down arrow below the list. The selected device moves to the Controlled Devices list.

Note  To limit the list of available devices, click the Find more Phones or Find more Route Points button.

Step 4  If you click the Find more Phones button, the Find and List Phones window displays. Perform a search to find the phones to associate with this application user.

Repeat the preceding steps for each device that you want to assign to the application user.

Step 5  If you click the Find more Route Points button, the Find and List CTI Route Points window displays. Perform a search to find the CTI route points to associate with this application user.

Repeat the preceding steps for each device that you want to assign to the application user.

Step 6  Click Save.

Add Administrator User to Cisco Unity or Cisco Unity Connection

If you are integrating Cisco Unified Communications Manager with Cisco Unity Connection 7.x or later, you can use the import feature that is available in Cisco Unity Connection 7.x or later instead of performing the procedure that is described in the this section. For information on how to use the import feature, see the User Moves, Adds, and Changes Guide for Cisco Unity Connection 7.x or later at http://www.cisco.com/c/en/us/support/unified-communications/unity-connection/products-maintenance-guides-list.html.

When the Cisco Unity or Cisco Unity Connection user is integrated with the Cisco Unified CM Application User, you cannot edit the fields. You can only update these fields in Cisco Unified Communications Manager Administration.

Cisco Unity and Cisco Unity Connection monitor the synchronization of data from Cisco Unified Communications Manager. You can configure the sync time in Cisco Unity Administration or Cisco Unity Connection Administration on the tools menu.

Before you begin

Ensure that you have defined an appropriate template for the user that you plan to push to Cisco Unity or Cisco Unity Connection.

The Create Cisco Unity User link displays only if you install and configure the appropriate Cisco Unity or Cisco Unity Connection software. See the applicable Cisco Unified Communications Manager Integration Guide.

Procedure

Step 1 From Cisco Unified CM Administration, choose User Management > Application User.
Step 2 To select an existing user, specify the appropriate filters in the Find User Where field, select Find to retrieve a list of users, and then select the user from the list.
Step 3 From the Related Links drop-down list, choose the Create Cisco Unity Application User link and click Go. The Add Cisco Unity User dialog displays.
Step 4 From the Application Server drop-down list, choose the Cisco Unity or Cisco Unity Connection server on which you want to create a Cisco Unity or Cisco Unity Connection user and click Next.
Step 5 From the Application User Template drop-down list, choose the template that you want to use.
Step 6 Click Save.
The administrator account gets created in Cisco Unity or Cisco Unity Connection. The link in Related Links changes to Edit Cisco Unity User in the Application User Configuration window. You can now view the user that you created in Cisco Unity Administration or Cisco Unity Connection Administration.

Change Application User Password

Procedure

Step 1 From Cisco Unified CM Administration, choose User Management > Application User. The Find and List Users window appears.
Step 2 To select an existing user, specify the appropriate filters in the Find User Where field, select Find to retrieve a list of users, and then select the user from the list.
The Application User Configuration window displays information about the chosen application user.
Step 3 In the Password field, double click the existing, encrypted password and enter the new password.
Step 4 In the Confirm Password field, double click the existing, encrypted password and enter the new password again.
Step 5 Click Save.

Manage Application User Password Credential Information

Perform the following procedure to manage credential information for an application user password. This allows you to perform administrative duties such as locking a password, applying a credential policy to a password, or viewing information such as the time of the last failed login attempt.
Procedure

Step 1  From Cisco Unified CM Administration, choose User Management > Application User. The Find and List Users window appears.

Step 2  To select an existing user, specify the appropriate filters in the Find User Where field, select Find to retrieve a list of users, and then select the user from the list. The Application User Configuration window displays information about the chosen application user.

Step 3  To change or view password information, click the Edit Credential button next to the Password field. The user Credential Configuration is displayed.

Step 4  Configure the fields on the Credential Configuration window. See the online help for more information about the fields and their configuration options.

Step 5  If you have changed any settings, click Save.
Manage Application User Password Credential Information

</tbody>
</table>

**Move an Existing Phone**

Perform the following procedure to move a configured phone to an end user.
Find an Actively Logged-In Device

The Cisco Extension Mobility and Cisco Extension Mobility Cross Cluster features keep a record of the devices to which users are actively logged in. For the Cisco Extension Mobility feature, the actively logged-in device report tracks the local phones that are actively logged in by local users; for the Cisco Extension Mobility Cross Cluster feature, the actively logged-in device report tracks the local phones that are actively logged in by remote users.

Unified Communications Manager provides a specific search window for searching for devices to which users are logged in. Follow these steps to search for a specific device or to list all devices for which users are actively logged in.

Procedure

Step 1 Choose Device > Phone.

Step 2 Select the Actively Logged In Device Report from the Related Links drop-down list in the upper right corner and click Go.

Step 3 To find all actively logged-in device records in the database, ensure the dialog box is empty and proceed to step 4.

To filter or search records:

a) From the first drop-down list, select a search parameter.

b) From the second drop-down list, select a search pattern.

c) Specify the appropriate search text, if applicable.

Note To add additional search criteria, click the (+) button. When you add criteria, the system searches for a record that matches all criteria that you specify. To remove criteria, click the (−) button to remove the last added criterion or click the Clear Filter button to remove all added search criteria.

Step 4 Click Find.

All matching records display. You can change the number of items that display on each page by choosing a different value from the Rows per Page drop-down list.

Step 5 From the list of records that display, click the link for the record that you want to view.
Find a Remotely Logged-In Device

The Cisco Extension Mobility Cross Cluster feature keeps a record of the devices to which users are logged in remotely. The Remotely Logged In Device report tracks the phones that other clusters own but that are actively logged in by local users who are using the EMCC feature.

Unified Communications Manager provides a specific search window for searching for devices to which users are logged in remotely. Follow these steps to search for a specific device or to list all devices for which users are logged in remotely.

Procedure

**Step 1** Choose Device > Phone.

**Step 2** Select Remotely Logged In Device from the Related Links drop-down list in the upper right corner and click Go.

**Step 3** To find all remotely logged-in device records in the database, ensure the dialog box is empty and proceed to step 4.

To filter or search records:

a) From the first drop-down list, select a search parameter.

b) From the second drop-down list, select a search pattern.

c) Specify the appropriate search text, if applicable.

**Note** To add additional search criteria, click the (+) button. When you add criteria, the system searches for a record that matches all criteria that you specify. To remove criteria, click the (−) button to remove the last added criterion or click the Clear Filter button to remove all added search criteria.

**Step 4** Click Find.

All matching records display. You can change the number of items that display on each page by choosing a different value from the Rows per Page drop-down list.

**Step 5** From the list of records that display, click the link for the record that you want to view.

**Note** To reverse the sort order, click the up or down arrow, if available, in the list header.

The window displays the item that you choose.

Remotely Lock a Phone

Some phones can be locked remotely. When you remotely lock a phone, the phone cannot be used until you unlock it.
If a phone supports the Remote Lock feature, a **Lock** button appears in the top right hand corner.

**Procedure**

**Step 1** Choose **Device > Phone**.

**Step 2** From the **Find and List Phones** window, enter search criteria and click **Find** to locate a specific phone.

A list of phones that match the search criteria displays.

**Step 3** Choose the phone for which you want to perform a remote lock.

**Step 4** On the **Phone Configuration** window, click **Lock**.

If the phone is not registered, a popup window displays to inform you that the phone will be locked the next time it is registered. Click **Lock**.

A **Device Lock/Wipe Status** section appears, with information about the most recent request, whether it is pending, and the most recent acknowledgement.

---

**Reset a Phone to Factory Defaults**

Some phones support a remote wipe feature. When you remotely wipe a phone, the operation resets the phone to its factory settings. Everything previously stored on the phone is wiped out.

If a phone supports the remote wipe feature, a **Wipe** button appears in the top right hand corner.

---

⚠️ **Caution**

This operation cannot be undone. You should only perform this operation when you are sure you want to reset the phone to its factory settings.

**Procedure**

**Step 1** Choose **Device > Phone**.

**Step 2** In the **Find and List Phones** window, enter search criteria and click **Find** to locate a specific phone.

A list of phones that match the search criteria displays.

**Step 3** Choose the phone for which you want to perform a remote wipe.

**Step 4** In the **Phone Configuration** window, click **Wipe**.

If the phone is not registered, a popup window displays to inform you that the phone will be wiped the next time it is registered. Click **Wipe**.

A **Device Lock/Wipe Status** section appears, with information about the most recent request, whether it is pending, and the most recent acknowledgment.
Search for Locked or Reset Devices

You can search for devices that have been remotely locked and/or remotely reset to factory default settings. Follow these steps to search for a specific device or to list all devices which have been remotely locked and/or remotely wiped.

Procedure

Step 1
Choose Device > Phone.
The Find and List Phones window displays. Records from an active (prior) query may also display in the window.

Step 2
Select the Phone Lock/Wipe Report from the Related Links drop-down list in the upper right corner of the window and click Go.

Step 3
To find all remotely locked or remotely wiped device records in the database, ensure that the text box is empty; go to Step 4.
To filter or search records for a specific device:
a) From the first drop-down list box, select the device operation type(s) to search.
b) From the second drop-down list box, select a search parameter.
c) From the third drop-down list box, select a search pattern.
d) Specify the appropriate search text, if applicable.

Note To add additional search criteria, click the + button. When you add criteria, the system searches for a record that matches all criteria that you specify. To remove criteria, click the – button to remove the last added criterion or click the Clear Filter button to remove all added search criteria.

Step 4
Click Find.
All matching records display. You can change the number of items that display on each page by choosing a different value from the Rows per Page drop-down list box.

Step 5
From the list of records that display, click the link for the record that you want to view.

Note To reverse the sort order, click the up or down arrow, if available, in the list header.
The window displays the item that you choose.

View LSC Status and Generate a CAPF Report for a Phone

Use this procedure to monitor Locally Significant Certificate (LSC) expiry information from within the Cisco Unified Communications Manager interface. The following search filters display the LSC information:

• LSC Expires—Displays the LSC expiry date on the phone.
• LSC Issued By—Displays the name of the issuer which can either be CAPF or third party.
• LSC Issuer Expires By—Displays the expiry date of the issuer.
The status of **LSC Expires** and **LSC Issuer Expires by** fields are set to “NA” when there is no LSC issued on a new device.

The status of **LSC Expires** and **LSC Issuer Expires by** fields are set to “Unknown” when the LSC is issued to a device before the upgrade to Cisco Unified Communications Manager 11.5(1).

**Procedure**

**Step 1**  
Choose Device > Phone.

**Step 2**  
From the first **Find Phone where** drop-down list, choose one of the following criteria:

- LSC Expires
- LSC Issued By
- LSC Issuer Expires By

From the second **Find Phone where** drop-down list, choose one of the following criteria:

- is before
- is exactly
- is after
- begins with
- contains
- ends with
- is exactly
- is empty
- is not empty

**Step 3**  
Click Find.

A list of discovered phones displays.

**Step 4**  
From the Related Links drop-down list, choose the **CAPF Report in File** and click Go.

The report gets downloaded.
Manage Device Firmware

- Device Firmware Updates Overview, on page 59
- Install a Device Pack or Individual Firmware, on page 60
- Remove Unused Firmware from the System, on page 61
- Set up Default Firmware for a Phone Model, on page 62
- Set the Firmware Load for a Phone, on page 62
- Using a Load Server, on page 63

Device Firmware Updates Overview

Device loads are the software and firmware for devices such as IP phones, telepresence systems, and others that are provisioned by and register to Cisco Unified Communications Manager. During installation or upgrade, Cisco Unified Communications Manager includes the latest loads available based on when the version of Cisco Unified Communications Manager was released. Cisco regularly releases updated firmware to introduce new features and software fixes and you may wish to update your phones to a newer load without waiting for a Cisco Unified Communications Manager upgrade that includes that load.

Before endpoints can upgrade to a new version of software, the files required by the new load must be made available for download at a location the endpoints have access to. The most common location is the Cisco UCM node with the Cisco TFTP service activated, called the “TFTP server”. Some phones also support using an alternate download location, called a “load server”.

If you want to get a list, view, or download files that already in the tftp directory on any server you can use the CLI command file list tftp to see the files in the TFTP directory, file view tftp to view a file, and file get tftp to get a copy of a file in the TFTP directory. For more information, see the Command Line Interface Reference Guide for Cisco Unified Communications Solutions. You may also use a web browser to download any TFTP file by going to the URL “http://<tftp_server>:6970/<filename>”.

Tip

You can apply a new load to a single device before configuring it as a systemwide default. This method is useful for testing purposes. Remember, however, that all other devices of that type use the old load until you update the systemwide defaults with the new load.
Install a Device Pack or Individual Firmware

Install a device package to introduce new phone types and upgrade the firmware for multiple phone models.

- Individual firmware for existing devices can be installed or upgraded with the following options: Cisco Options Package (COP) files—The COP file contains the firmware files and the database updates so when installed on Publisher, it updates the default firmware apart from installing the firmware files.
- Firmware files only—It is supplied in a zip file, contains individual device firmware files that should be manually extracted and uploaded to the appropriate directory on the TFTP servers.

Note

Refer to the README file for installation instructions that are specific to the COP or Firmware files package.

Procedure

Step 1 From Cisco Unified OS Administration, choose Software Upgrades > Install/Upgrade.
Step 2 Fill in the applicable values in the Software Location section and click Next.
Step 3 In the Available Software drop-down list, select the device package file and click Next.
Step 4 Verify that the MD5 value is correct, and then click Next.
Step 5 In the warning box, verify that you selected the correct firmware, and then click Install.
Step 6 Check that you received a success message.

Note Skip to Step 8 if you are rebooting the cluster.

Step 7 Restart the Cisco TFTP service on all nodes where the service is running.
Step 8 Reset the affected devices to upgrade the devices to the new load.
Step 9 From Cisco Unified CM Administration, choose Device > Device Settings > Device Defaults and manually change the name of the load file (for specific devices) to the new load.
Step 10 Click Save, and then reset the devices.
Step 11 Restart the Cisco Tomcat service on all cluster nodes.
Step 12 Do one of the following:

- If you are running 11.5(1)SU4 or lower, 12.0(1) or 12.0(1)SU1, reboot the cluster.
- If you are running an 11.5(x) release at 11.5(1)SU5 or higher, or any release higher at 12.0(1)SU2 or higher, reboot the Cisco CallManager service on the publisher node. However, if you are running the Cisco CallManager service on subscriber nodes only, you can skip this task.

Potential Issues with Firmware Installs

Here are some potential issues that you may run across after installing a device pack:
<table>
<thead>
<tr>
<th>Issue</th>
<th>Cause/Resolution</th>
</tr>
</thead>
</table>
| New devices won't register | This could occur due from a device type mismatch. This can be caused by:  
  • The device was added in the Phone Configuration window using the wrong device type. For example, Cisco DX80 was selected as the phone type instead of Cisco TelePresence DX80. Reconfigure the device with the correct device type.  
  • The Cisco CallManager service doesn't know about the new device type. In this case, restart the Cisco CallManager service on the publisher node. |
| Endpoints aren't upgrading to the new firmware | Possible reasons:  
  • The device pack wasn't installed on the TFTP server. As a result, the firmware isn't available for download by the phones.  
  • The Cisco TFTP service wasn't restarted after the install so the service doesn't know about the new files. Make sure to install the device pack on the TFTP server |
| Phone Configuration window in Cisco Unified CM Administration shows broken links where the icon image should be for a new device type | Restart the Cisco Tomcat service on all nodes from the CLI. |

### Remove Unused Firmware from the System

The **Device Load Management** window allows you to delete unused firmware (device loads) and associated files from the system to increase disk space. For example, you can delete unused loads before an upgrade to prevent upgrade failures due to insufficient disk space. Some firmware files may have dependent files that are not listed in the **Device Load Management** window. When you delete a firmware, the dependent files are also deleted. However, the dependent files are not deleted if they are associated with additional firmware.

---

**Note**

You must delete unused firmware separately for each server in the cluster.

---

**Before you begin**

**Caution**

Before you delete unused firmware, ensure that you are deleting the right loads. The deleted loads cannot be restored without performing a DRS restore of the entire cluster. We recommend that you take a backup before deleting the firmware.
Procedure

Step 1  From Cisco Unified OS Administration, choose Software Upgrades > Device Load Management.
Step 2  Specify the search criteria and click Find.
Step 3  Select the device load that you want to delete. You can select multiple loads if required.
Step 4  Click Delete Selected Loads.
Step 5  Click OK.

Set up Default Firmware for a Phone Model

Use this procedure to set the default firmware load for a specific phone model. When a new phone registers, Cisco Unified Communications Manager tries to send the default firmware to the phone, unless the phone configuration specifies has an overriding firmware load specified in the Phone Configuration window.

Note
For an individual phone, the setting of the Phone Load Name field in the Phone Configuration window overrides the default firmware load for that particular phone.

Before you begin
Make sure that the firmware is loaded onto the TFTP server.

Procedure

Step 1  In Cisco Unified CM Administration, choose Device > Device Settings > Device Defaults. The Device Defaults Configuration window appears displaying the default firmware loads for the various phone models that Cisco Unified Communications Manager supports. The firmware appears in the Load Information column.
Step 2  Under Device Type, locate the phone models for which you want to assign the default firmware.
Step 3  In the accompanying Load Information field, enter the firmware load.
Step 4  (Optional) Enter the default Device Pool and default Phone Template for that phone model.
Step 5  Click Save.

Set the Firmware Load for a Phone

Use this procedure to assign a firmware load for a specific phone. You may want to do this if you want to use a different firmware load than the default that is specified in the Device Defaults Configuration window.
If you wish to assign a version for many phones you can use the Bulk Administration Tool to configure the `Phone Load Name` field using a CSV file or query. For details, see the `Bulk Administration Guide for Cisco Unified Communications Manager`.

**Procedure**

**Step 1**
In Cisco Unified CM Administration, choose `Device > Phone`.

**Step 2**
Click `Find` and select an individual phone.

**Step 3**
In the `Phone Load Name` field, enter the name of the firmware. For this phone, the firmware load specified here overrides the default firmware load that is specified in the `Device Defaults Configuration` window.

**Step 4**
Complete any remaining fields in the `Phone Configuration` window. For help with the fields and their settings, see the online help.

**Step 5**
Click `Save`.

**Step 6**
Click `Apply Config` to push the changed fields to the phone.

---

**Using a Load Server**

If you want phones to download firmware updates from a server that is not the TFTP server you may configure a “load server” on the phone’s `Phone Configuration` page. A load server may be another Cisco Unified Communications Manager or a third-party server. A third-party server must be capable of providing any files the phone requests through HTTP on TCP Port 6970 (preferred) or the UDP-based TFTP protocol. Some phone models such as the DX family Cisco TelePresence devices only support HTTP for firmware updates.

If you wish to assign a load server for many phones you can use the Bulk Administration Tool to configure the `Load Server` field using a CSV file or query. For details, see the `Bulk Administration Guide for Cisco Unified Communications Manager`.

**Procedure**

**Step 1**
In Cisco Unified CM Administration, choose `Device > Phone`.

**Step 2**
Click `Find` and select an individual phone.

**Step 3**
In the `Load Server` field, enter the IP Address or hostname of the alternate server.

**Step 4**
Complete any remaining fields in the `Phone Configuration` window. For help with the fields and their settings, see the online help.

**Step 5**
Click `Save`.

**Step 6**
Click `Apply Config` to push the changed fields to the phone.
CHAPTER 8

Manage Infrastructure Devices

- Manage Infrastructure Overview, on page 65
- Manage Infrastructure Prerequisites, on page 65
- Manage Infrastructure Task Flow, on page 66

Manage Infrastructure Overview

This chapter provides tasks to manage network infrastructure devices such as switches and wireless access points as a part of the Location Awareness feature. When Location Awareness is enabled, the Cisco Unified Communications Manager database saves status information for the switches and access points in your network, including the list of endpoints that currently associate to each switch or access point.

The endpoint to infrastructure device mapping helps Cisco Unified Communications Manager and Cisco Emergency Responder to determine the physical location of a caller. For example, if a mobile client places an emergency call while in a roaming situation, Cisco Emergency Responder uses the mapping to determine where to send emergency services.

The Infrastructure information that gets stored in the database also helps you to monitor your infrastructure usage. From the Unified Communications Manager interface, you can view network infrastructure devices such as switches and wireless access points. You can also see the list of endpoints that currently associate to a specific access point or switch. If infrastructure devices are not being used, you can deactivate infrastructure devices from tracking.

Manage Infrastructure Prerequisites

You must configure the Location Awareness feature before you can manage wireless infrastructure within the Cisco Unified Communications Manager interface. For your wired infrastructure, the feature is enabled by default. For configuration details, see the following chapter:

"Location Awareness", System Configuration Guide for Cisco Unified Communications Manager.

You must also install your network infrastructure. For details, see the hardware documentation that comes with your infrastructure devices such as wireless LAN controllers, access points, and switches.
Manage Infrastructure Task Flow

Complete the following tasks to monitor and manage your network infrastructure devices.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>View Status for Infrastructure Device, on page 66</td>
<td>Get the current status of a wireless access point or ethernet switch, including the list of associated endpoints.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Deactivate Tracking for Infrastructure Device, on page 66</td>
<td>If you have a switch or access point that is not being used, mark the device inactive. The system will stop updating the status or the list of associated endpoints for the infrastructure device.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Activate Tracking for Deactivated Infrastructure Devices, on page 67</td>
<td>Initiate tracking for an inactive infrastructure device. Cisco Unified Communications Manager begins updating the database with the status and the list of associated endpoints for the infrastructure device.</td>
</tr>
</tbody>
</table>

**View Status for Infrastructure Device**

Use this procedure to get the current status of an infrastructure device such as a wireless access point or an ethernet switch. Within the Cisco Unified Communications Manager interface, you can view the status for an access point or switch and see the current list of associated endpoints.

**Procedure**

1. In Cisco Unified CM Administration, choose Advanced Features > Device Location Tracking Services > Switches and Access Points.
2. Click Find.
3. Click on the switch or access point for which you want the status. The Switches and Access Point Configuration window displays the current status including the list of endpoints that currently associate to that access point or switch.

**Deactivate Tracking for Infrastructure Device**

Use this procedure to remove tracking for a specific infrastructure device such as a switch or access point. You may want to do this for switches or access points that are not being used.
If you remove tracking for an infrastructure device, the device remains in the database, but becomes inactive. Cisco Unified Communications Manager no longer updates the status for the device, including the list of endpoints that associate to the infrastructure device. You can view your inactive switches and access points from the Related Links drop-down in the Switches and Access Points window.

### Procedure

**Step 1** In Cisco Unified CM Administration, choose Advanced Features > Device Location Tracking Services > Switches and Access Points.

**Step 2** Click Find and select the switch or access point that you want to stop tracking.

**Step 3** Click Deactivate Selected.

### Activate Tracking for Deactivated Infrastructure Devices

Use this procedure to initiate tracking for an inactive infrastructure device that has been deactivated. Once the switch or access point becomes active, Cisco Unified Communications Manager begins to dynamically track the status, including the list of endpoints that associate to the switch or access point.

**Before you begin**

Location Awareness must be configured. For details, see the "Location Awareness" chapter of the System Configuration Guide for Cisco Unified Communications Manager.

**Procedure**

**Step 1** In Cisco Unified CM Administration, choose Advanced Features > Device Location Tracking Services > Switches and Access Points.

**Step 2** From Related Links, choose Inactive Switches and Access Points and click Go. The Find and List Inactive Switches and Access Points window displays infrastructure devices that are not being tracked.

**Step 3** Select the switch or access point for which you want to initiate tracking.

**Step 4** Click Reactivate Selected.
Activate Tracking for Deactivated Infrastructure Devices
PART IV

Manage the System

• Monitor System Status, on page 71
• View Usage Records, on page 77
• Manage Enterprise Parameters, on page 83
• Manage the Server, on page 87
Monitor System Status

- View Cluster Nodes Status, on page 71
- View Hardware Status, on page 71
- View Network Status, on page 72
- View Installed Software, on page 72
- View System Status, on page 72
- View IP Preferences, on page 73
- View Last Login Details, on page 73
- Ping a Node, on page 74
- Display Service Parameters, on page 74

View Cluster Nodes Status

Use this procedure to show information about the nodes in your cluster.

Procedure

Step 1 From Cisco Unified Operating System Administration, choose Show > Cluster.
Step 2 Review the fields in the Cluster window. See the online help for more information about the fields.

View Hardware Status

Use this procedure to show the hardware status and information about hardware resources in your system.

Procedure

Step 1 From the Cisco Unified Operating System Administration, select Show > Hardware.
Step 2 Review the fields in the Hardware Status window. See the online help for more information about the fields.
View Network Status

Use this procedure to show the network status of your system, such as ethernet and DNS information.

The network status information that is displayed depends on whether Network Fault Tolerance is enabled:

- If Network Fault Tolerance is enabled, Ethernet port 1 automatically manages network communications if Ethernet port 0 fails.
- If Network Fault Tolerance is enabled, network status information is displayed for the network ports Ethernet 0, Ethernet 1, and Bond 0.
- If Network Fault Tolerance is not enabled, status information is displayed for only Ethernet 0.

Procedure

Step 1
From Cisco Unified Operating System Administration, choose Show > Network.

Step 2
Review the fields in the Network Configuration window. See the online help for more information about the fields.

View Installed Software

Use this procedure to show information about software versions and installed software packages.

Procedure

Step 1
From Cisco Unified Operating System Administration, choose Show > Software.

Step 2
Review the fields in the Software Packages window. See the online help for more information about the fields.

View System Status

Use this procedure to show the overall system status, such as information about locales, up time, CPU use, and memory use.

Procedure

Step 1
From Cisco Unified Operating System Administration, choose Show > System.

Step 2
Review the fields in the System Status window. See the online help for more information about the fields.
View IP Preferences

Use this procedure to show a list of registered ports are available to the system.

**Procedure**

**Step 1**
From Cisco Unified Operating System Administration, choose **Show > IP Preferences**.

**Step 2**
(Optional) To filter or search records, perform one of the following tasks:
- From the first list, select a search parameter.
- From the second list, select a search pattern.
- Specify the appropriate search text, if applicable.

**Step 3**
Click **Find**.

**Step 4**
Review the fields that appear in the **System Status** window. See the online help for more information about the fields.

View Last Login Details

When end users (with either local and LDAP credentials) and administrators log in to web applications for Cisco Unified Communications Manager or IM and Presence Service, the main application window displays the last successful and unsuccessful login details.

Users logging in using SAML SSO feature can only view the last successful system login information. The user can refer to the Identity Provider (IdP) application to track the unsuccessful SAML SSO login information.

The following web applications display the login attempt information:
- Cisco Unified Communications Manager:
  - Cisco Unified CM Administration
  - Cisco Unified Reporting
  - Cisco Unified Serviceability
- IM and Presence Service
  - Cisco Unified CM IM and Presence Administration
  - Cisco Unified IM and Presence Reporting
  - Cisco Unified IM and Presence Serviceability

Only administrators can login and view the last login details for the following web applications in Cisco Unified Communications Manager:
- Disaster Recovery System
- Cisco Unified OS Administration
Ping a Node

Use the Ping Utility to ping another node in the network. These results can help you verify or troubleshoot device connectivity.

**Procedure**

**Step 1**  
From Cisco Unified Operating System Administration, choose Services > Ping.

**Step 2**  
Configure the fields on the Ping Configuration window. See the online help for more information about the fields and their configuration options.

**Step 3**  
Choose Ping.

The ping results are displayed.

Display Service Parameters

You may need to compare all service parameters that belong to a particular service on all servers in a cluster. You may also need to display only out-of-sync parameters (that is, service parameters for which values differ from one server to another) or parameters that have been modified from the suggested value.

Use the following procedure to display the service parameters for a particular service on all servers in a cluster.

**Procedure**

**Step 1**  
Choose System > Service Parameters.

**Step 2**  
From the Server drop-down list box, choose a server.

**Step 3**  
From the Service drop-down list box, choose the service for which you want to display the service parameters on all servers in a cluster.

**Note**  
The Service Parameter Configuration window displays all services (active or not active).

**Step 4**  
In the Service Parameter Configuration window that displays, choose Parameters for All Servers in The Related Links Drop-down List Box; then, click Go.

The Parameters for All Servers window displays. For the current service, the list shows all parameters in alphabetical order. For each parameter, the suggested value displays next to the parameter name. Under each parameter name, a list of servers that contain this parameter displays. Next to each server name, the current value for this parameter on this server displays.

For a given parameter, click on the server name or on the current parameter value to link to the corresponding service parameter window to change the value. Click Previous and Next to navigate between Parameters for All Servers windows.

**Step 5**  
If you need to display out-of-sync service parameters, choose Out of Sync Parameters for All Servers in the Related Links drop-down list box, then click Go.
The Out of Sync Parameters for All Servers window displays. For the current service, service parameters that have different values on different servers display in alphabetical order. For each parameter, the suggested value displays next to the parameter name. Under each parameter name, a list of servers that contain this parameter displays. Next to each server name, the current value for this parameter on this server displays.

For a given parameter, click the server name or the current parameter value to link to the corresponding service parameter window to change the value. Click Previous and Next to navigate between Out of Sync Parameters for All Servers windows.

**Step 6**

If you need to display service parameters that have been modified from the suggested value, choose Modified Parameters for All Servers in the Related Links drop-down list box; then, click Go.

The Modified Parameters for All Servers window displays. For the current service, service parameters that have values that differ from the suggested values display in alphabetical order. For each parameter, the suggested value displays next to the parameter name. Under each parameter name, a list of servers that have different values from the suggested values displays. Next to each server name, the current value for this parameter on this server displays.

For a given parameter, click the server name or the current parameter value to link to the corresponding service parameter window to change the value. Click Previous and Next to navigate between Modified Parameters for All Servers windows.
Display Service Parameters
CHAPTER 10

View Usage Records

- Usage Records Overview, on page 77
- Usage Report Tasks, on page 78

Usage Records Overview

Cisco Unified Communications Manager provides records that allow you to see how configured items are used in your system. Configured items include devices, as well as system-level settings such as device pools, date and time groups, and route plans.

Dependency Records

Use dependency records for the following purposes:

- Find information about system-level settings, such as servers, device pools, and date and time groups.
- Determine the records in the database that use other records. For example, you can determine which devices, such as CTI route points or phones, use a particular calling search space.
- Show dependencies between records before you delete any records. For example, before you delete a partition, use dependency records to see which calling search spaces (CSSs) and devices are associated with it. You can then reconfigure the settings to remove the dependency.

Route Plan Reports

The route plan report allows you to view either a partial or full list of numbers, routes, and patterns that are configured in the system. When you generate a report, you can access the configuration window for each item by clicking the entry in the Pattern/Directory Number, Partition, or Route Detail columns of the report.

In addition, the route plan report allows you to save report data into a .CSV file that you can import into other applications. The .CSV file contains more detailed information than the web pages, including directory numbers for phones, route patterns, pattern usage, device name, and device description.

Cisco Unified Communications Manager uses the route plan to route both internal calls and external public switched telephone network (PSTN) calls. Because you might have several records in your network, Cisco Unified Communications Manager Administration lets you locate specific route plan records on the basis of specific criteria.
Usage Report Tasks

View Route Plan Records

This section describes how to view route plan records. Because you might have several records in your network, Cisco Unified Communications Manager Administration lets you locate specific route plan records on the basis of specific criteria. Use the following procedure to generate customized route plan reports.

Procedure

**Step 1** Choose **Call Routing > Route Plan Report**.
Step 2
To find all records in the database, ensure the dialog box is empty and proceed to step 3.
To filter or search records
  a) From the first drop-down list box, select a search parameter.
  b) From the second drop-down list box, select a search pattern.
  c) Specify the appropriate search text, if applicable.

Step 3
Click **Find**.
All or matching records display. You can change the number of items that display on each page by choosing a different value from the Rows per Page drop-down list box.

Step 4
From the list of records that display, click the link for the record that you want to view.
The window displays the item that you choose.

---

**Save Route Plan Reports**

This section contains information on how to view route plan reports in a .csv file.

**Procedure**

Step 1
Choose **Call Routing > Route Plan Report**.

Step 2
Choose **View In File** from the **Related Links** drop-down list on the **Route Plan Report** window and click **Go**.
From the dialog box that appears, you can either save the file or import it into another application.

Step 3
Click **Save**.
Another window displays that allows you to save this file to a location of your choice.
**Note**
You may also save the file as a different file name, but the file name must include a .CSV extension.

Step 4
Choose the location in which to save the file and click **Save**. This action should save the file to the location that you designated.

Step 5
Locate the .CSV file that you just saved and double-click its icon to view it.

---

**Delete Unassigned Directory Numbers**

This section describes how to delete an unassigned directory number from the route plan report. Directory numbers get configured and removed in the Directory Number Configuration window of Cisco Unified Communications Manager Administration. When a directory number gets removed from a device or a phone gets deleted, the directory number still exists in the Cisco Unified Communications Manager database. To delete the directory number from the database, use the Route Plan Report window.
**Procedure**

**Step 1** Choose Call Routing > Route Plan Report.

**Step 2** In the Route Plan Report window, use the three drop-down lists to specify a route plan report that lists all unassigned DNs.

**Step 3** Three ways exist to delete directory numbers:

a) Click the directory number that you want to delete. When the Directory Number Configuration window displays, click Delete.

b) Check the check box next to the directory number that you want to delete. Click Delete Selected.

c) To delete all found unassigned directory numbers, click Delete All Found Items.

A warning message verifies that you want to delete the directory number.

**Step 4** To delete the directory number, click OK. To cancel the delete request, click Cancel.

---

**Update Unassigned Directory Numbers**

This section describes how to update the settings of an unassigned directory number from the route plan report. Directory numbers get configured and removed in the Directory Number Configuration window of Cisco Unified Communications Manager Administration. When a directory number gets removed from a device, the directory number still exists in the Cisco Unified Communications Manager database. To update the settings of the directory number, use the Route Plan Report window.

**Procedure**

**Step 1** Choose Call Routing > Route Plan Report.

**Step 2** In the Route Plan Report window, use the three drop-down lists to specify a route plan report that lists all unassigned DNs.

**Step 3** Click the directory number that you want to update.

**Note** You can update all the settings of the directory number except the directory number and partition.

**Step 4** Make the required updates such as calling search space or forwarding options.

**Step 5** Click Save.

The Directory Number Configuration window redisplay, and the directory number field is blank.
Dependency Records Task Flow

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configure Dependency Records, on page 81.</td>
<td>Use this procedure to enable or disable dependency records. This procedure runs at below-normal priority and may take time to complete due to dial plan size and complexity, CPU speed, and CPU requirements of other applications.</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 | View Dependency Records, on page 81. | After you enable dependency records, you can access them from the configuration windows on the interface. |

Configure Dependency Records

Use dependency records to view relationships between records in the Cisco Unified Communications Manager database. For example, before you delete a partition, use dependency records to see which calling search spaces (CSSs) and devices are associated with it.

Caution

Dependency records cause high CPU usage. This procedure runs at below-normal priority and may take time to complete due to dial plan size and complexity, CPU speed, and CPU requirements of other applications.

If you have dependency records enabled and your system is experiencing CPU usage issues, you can disable dependency records.

Procedure

Step 1

From Cisco Unified CM Administration, choose System > Enterprise Parameters.

Step 2

Scroll to the CCMAdmin Parameters section and from the Enable Dependency Records drop-down list, choose one of the following options:

- True—Enable dependency records.
- False—Disable dependency records.

Based on the option you choose, a dialog box appears with a message about the consequences of enabling or disabling the dependency records. Read the message before you click OK in this dialog box.

Step 3

Click OK.

Step 4

Click Save.

The Update Successful message appears confirming the change.

View Dependency Records

After you enable dependency records, you can access them from the configuration windows on the interface.
Before you begin
Configure Dependency Records, on page 81

Procedure

Step 1
From Cisco Unified CM Administration, navigate to the configuration window for the records that you want to view.

Example:
To view dependency records for a device pool, select System > Device Pool.

Note You cannot view dependency records from the Device Defaults and Enterprise Parameters Configuration windows.

Step 2
Click Find.

Step 3
Click one of the records.
The configuration window appears.

Step 4
From the Related Links list box, choose Dependency Records box, and click Go.

Note If you have not enabled the dependency records, the Dependency Records Summary window displays a message, not the information about the record.

The Dependency Records Summary window appears showing the records that are used by other records in the database.

Step 5
Select one of the following dependency record buttons in this window:

- Refresh—Update the window with current information.
- Close—Close the window without returning to the configuration window in which you clicked the Dependency Records link.
- Close and Go Back—Close the window and returns to the configuration window in which you clicked the Dependency Records link.
CHAPTER 11

 Manage Enterprise Parameters

- Enterprise Parameters Overview, on page 83

Enterprise Parameters Overview

Enterprise parameters provide default settings that apply to all devices and services across the entire cluster. For example, your system uses the enterprise parameters to set the initial values of its device defaults.

You cannot add or delete enterprise parameters, but you can update existing enterprise parameters. The configuration window lists enterprise parameters under categories; for example, CCMAdmin parameters, CCMUser parameters, and CDR parameters.

You can view detailed descriptions for enterprise parameters on the Enterprise Parameters Configuration window.

Caution

Many of the enterprise parameters do not require changes. Do not change an enterprise parameter unless you fully understand the feature that you are changing or unless the Cisco Technical Assistance Center (TAC) advises you on the change.

View Enterprise Parameter Information

Access information about enterprise parameters through embedded content in the Enterprise Parameter Configuration window.

Procedure

Step 1 From Cisco Unified CM Administration, choose System > Enterprise Parameters.
Step 2 Perform one of the following tasks:
   - To view the description of a particular enterprise parameter, click the parameter name.
   - To view the descriptions of all the enterprise parameters, click ?.
Update Enterprise Parameters

Use this procedure to open the Enterprise Parameter Configuration window and configure system-level settings.

⚠️ Caution

Many of the enterprise parameters do not require changes. Do not change an enterprise parameter unless you fully understand the feature that you are changing or unless the Cisco Technical Assistance Center (TAC) advises you on the change.

 Procedure

| Step 1 | From Cisco Unified CM Administration, choose System > Enterprise Parameters. |
| Step 2 | Choose the desired values for the enterprise parameters that you want to change. |
| Step 3 | Click Save. |

 What to do next

Apply Configuration to Devices, on page 84

Apply Configuration to Devices

Use this procedure to update all affected devices in the cluster with the settings you configured.

Before you begin

Update Enterprise Parameters, on page 84

 Procedure

| Step 1 | From Cisco Unified CM Administration, choose System > Enterprise Parameters. |
| Step 2 | Verify your changes, and then click Save. |
| Step 3 | Choose one of the following options: |
| | • Click Apply Config if you want your system to determine which devices to reboot. In some cases, a device may not need a reboot. Calls in progress may be dropped but connected calls will be preserved unless the device pool includes SIP trunks. |
| | • Click Reset if you want to reboot all devices in your cluster. We recommend that you perform this step during off-peak hours. |
| Step 4 | After you read the confirmation dialog, click OK. |
**Restore Default Enterprise Parameters**

Use this procedure if you want to reset the enterprise parameters to the default settings. Some enterprise parameters contain suggested values, as shown in the column on the configuration window; this procedure uses these values as the default settings.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>From Cisco Unified CM Administration, choose System &gt; Enterprise Parameters.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Click Set to Default.</td>
</tr>
<tr>
<td>Step 3</td>
<td>After you read the confirmation prompt, click OK.</td>
</tr>
</tbody>
</table>
CHAPTER 12

Manage the Server

• Manage the Server Overview, on page 87
• Server Deletion, on page 87
• Add Node to Cluster Before Install, on page 90
• View Presence Server Status, on page 91
• Hostname Configuration, on page 91

Manage the Server Overview

This chapter describes how to manage the properties of the Cisco Unified Communications Manager node, view the Presence Server status and configure a host name for the Unified Communications Manager server.

Server Deletion

This section describes how to delete a server from the Cisco Unified Communications Manager database and how to add a deleted server back to the Cisco Unified Communications Manager cluster.

In Cisco Unified Communications Manager Administration, you cannot delete the first node of the cluster, but you can delete subsequent nodes. Before you delete a subsequent node in the Find and List Servers window, Cisco Unified CM Administration displays the following message: “You are about to permanently delete one or more servers. This action cannot be undone. Continue?”. If you click OK, the server gets deleted from the Cisco Unified CM database and is not available for use.

Tip

When you attempt to delete a server from the Server Configuration window, a message that is similar to the one in the preceding paragraph displays. If you click OK, the server gets deleted from the Cisco Unified CM database and is not available for use.

Before you delete a server, consider the following information:

• Cisco Unified Communications Manager Administration does not allow you to delete the first node in the cluster, but you can delete any subsequent node.

• Cisco recommends that you do not delete any node that has Cisco Unified Communications Manager running on it, especially if the node has devices, such as phones, registered with it.
Although dependency records exist for the subsequent nodes, the records do not prevent you from deleting the node.

If any call park numbers are configured for Cisco Unified Communications Manager on the node that is being deleted, the deletion fails. Before you can delete the node, you must delete the call park numbers in Cisco Unified Communications Manager Administration.

If a configuration field in Cisco Unified Communications Manager Administration contains the IP address or host name for a server that you plan to delete, update the configuration before you delete the server. If you do not perform this task, features that rely on the configuration may not work after you delete the server; for example, if you enter the IP address or host name for a service parameter, enterprise parameter, service URL, directory URL, IP phone service, and so on, update this configuration before you delete the server.

If an application GUI, for example, Cisco Unity, Cisco Unity Connection, and so on, contains the IP address or host name for the server that you plan to delete, update the configuration in the corresponding GUIs before you delete the server. If you do not perform this task, features that rely on the configuration may not work after you delete the server.

The system may automatically delete some devices, such as MOH servers, when you delete a server.

Before you delete a node, Cisco recommends that you deactivate the services that are active on the subsequent node. Performing this task ensures that the services work after you delete the node.

Changes to the server configuration do not take effect until you restart Cisco Unified Communications Manager. For information on restarting the Cisco CallManager service, see the Cisco Unified Serviceability Administration Guide.

To ensure that database files get updated correctly, you must reboot the cluster after you delete a server, Presence, or application server.

After you delete the node, access Cisco Unified Reporting to verify that Cisco Unified Communications Manager removed the node from the cluster. In addition, access Cisco Unified Reporting, RTMT, or the CLI to verify that database replication is occurring between existing nodes; if necessary, repair database replication between the nodes by using the CLI.

---

**Note**

When a subscriber node is removed from a cluster, its certificates still exist in publisher and other nodes. Admin has to manually remove:

- the certificate of the subscriber node removed from the trust-store of the individual cluster members.
- the certificates of each of the other cluster members from the trust-store of the removed subscriber node.

---

**Delete Unified Communications Manager Node from Cluster**

Use this procedure to delete a Cisco Unified Communications Manager node from the cluster.
Delete IM and Presence Node From Cluster

Follow this procedure if you need to safely remove an IM and Presence Service node from its presence redundancy group and cluster.

Caution
Removing a node will cause a service interruption to users on the remaining node(s) in the presence redundancy group. This procedure should only be performed during a maintenance window.

Procedure

Step 1 On the Cisco Unified CM Administration > System > Presence Redundancy Groups page, disable High Availability if it is enabled.
Step 2 On the Cisco Unified CM Administration > User Management > Assign Presence Users page, unassign or move all the users off the node that you want to remove.
Step 3 To remove the node from its presence redundancy group, choose Not-Selected from the Presence Server drop down list on the presence redundancy group's Presence Redundancy Group Configuration page. Select OK when a warning dialog box indicates that services in the presence redundancy group will be restarted as a result of unassigning the node.

Note
You cannot delete the publisher node directly from a presence redundancy group. To delete a publisher node, first unassign users from the publisher node and delete the presence redundancy group completely.

However, you can add the deleted IM and Presence node back into the cluster. For more information on how to add the deleted nodes, see Add Deleted Server Back in to Cluster, on page 90. In this scenario, the DefaultCUPSubcluster is created automatically when the deleted publisher node is added back to the server in the System > Server screen in the Cisco Unified CM Administration console.

Step 4 In Cisco Unified CM Administration, delete the unassigned node from the System > Server. Click OK when a warning dialog box indicates that this action cannot be undone.
Step 5 Shut down the host VM or server for the node you have unassigned.
Step 6 Restart the Cisco XCP Router on all nodes.
Add Deleted Server Back in to Cluster

If you delete a subsequent node (subscriber) from Cisco Unified Communications Manager Administration and you want to add it back to the cluster, perform the following procedure.

**Procedure**

**Step 1**
In Cisco Unified Communications Manager Administration, add the server by choosing System > Server.

**Step 2**
After you add the subsequent node to Cisco Unified Communications Manager Administration, perform an installation on the server by using the disk that Cisco provided in the software kit for your version.

**Tip**
Make sure that the version that you install matches the version that runs on the publisher node. If the version that is running on the publisher does not match your installation file, choose the Upgrade During Install option during the installation process. For details, see the *Installation Guide for Cisco Unified Communications Manager and the IM and Presence Service*.

**Step 3**
After you install Cisco Unified CM, configure the subsequent node, as described in the installation documentation that supports your version of Cisco Unified CM.

**Step 4**
Access the Cisco Unified Reporting, RTMT, or the CLI to verify that database replication is occurring between existing nodes; if necessary, repair database replication between the nodes.

Add Node to Cluster Before Install

Use Cisco Unified Communications Manager Administration to add a new node to a cluster before installing the node. The server type you select when adding the node must match the server type you install.

You must configure a new node on the first node using Cisco Unified Communications Manager Administration before you install the new node. To install a node on a cluster, see the *Cisco Unified Communications Manager Installation Guide*.

For Cisco Unified Communications Manager Video/Voice servers, the first server you add during an initial installation of the Cisco Unified Communications Manager software is designated the publisher node. All subsequent server installations or additions are designated as subscriber nodes. The first Cisco Unified Communications Manager IM and Presence node you add to the cluster is designated the IM and Presence Service database publisher node.

**Note**
You cannot use Cisco Unified Communications Manager Administration to change the server type after the server has been added. You must delete the existing server instance, and then add the new server again and choose the correct server type setting.

**Procedure**

**Step 1**
Select System > Server.
The Find and List Servers window displays.

**Step 2**  
Click Add New.  
The Server Configuration - Add a Server window displays.

**Step 3**  
From the Server Type drop-down list box, choose the server type that you want to add, and then click Next.  
- CUCM Video/Voice  
- CUCM IM and Presence

**Step 4**  
In the Server Configuration window, enter the appropriate server settings.  
For server configuration field descriptions, see Server Settings.

**Step 5**  
Click Save.

---

### View Presence Server Status

Use Cisco Unified Communications Manager Administration to view the status of critical services and self-diagnostic test results for the IM and Presence Service node.

**Procedure**

**Step 1**  
Select System > Server.  
The Find and List Servers window appears.

**Step 2**  
Select the server search parameters, and then click Find.  
Matching records appear.

**Step 3**  
Select the IM and Presence server that is listed in the Find and List Servers window.  
The Server Configuration window appears.

**Step 4**  
Click on the Presence Server Status link in the IM and Presence Server Information section of the Server Configuration window.  
The Node Details window for the server appears.

---

### Hostname Configuration

The following table lists the locations where you can configure a host name for the Unified Communications Manager server, the allowed number of characters for the host name, and the recommended first and last characters for the host name. Be aware that, if you do not configure the host name correctly, some components in Unified Communications Manager, such as the operating system, database, installation, and so on, may not work as expected.
Table 2: Host Name Configuration in Cisco Unified Communications Manager

<table>
<thead>
<tr>
<th>Host Name Location</th>
<th>Allowed Configuration</th>
<th>Allowed Number of Characters</th>
<th>Recommended First Character for Host Name</th>
<th>Recommended Last Character for Host Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Name/ IP Address field System &gt; Server in Cisco</td>

<td>alphanumerical</td>
</tr>
<tr>
<td>Command Line Interface</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The host name must follow the rules for ARPANET host names. Between the first and last character of the host name, you can enter alphanumeric characters and hyphens.

Before you configure the host name in any location, review the following information:

- The Host Name/IP Address field in the Server Configuration window, which supports device-to-server, application-to-server, and server-to-server communication, allows you to enter an IPv4 address in dotted decimal format or a host name.

After you install the Unified Communications Manager publisher node, the host name for the publisher automatically displays in this field. Before you install a Unified Communications Manager subscriber node, enter either the IP address or the host name for the subscriber node in this field on the Unified Communications Manager publisher node.

In this field, configure a host name only if Unified Communications Manager can access the DNS server to resolve host names to IP addresses; make sure that you configure the Cisco Unified Communications Manager name and address information on the DNS server.

In addition to configuring Unified Communications Manager information on the DNS server, you enter DNS information during the Cisco Unified Communications Manager installation.

- During the installation of the Unified Communications Manager publisher node, you enter the host name, which is mandatory, and IP address of the publisher node to configure network information; that is, if you want to use static networking.
During the installation of a Unified Communications Manager subscriber node, you enter the hostname and IP address of the Unified Communications Manager publisher node, so that Unified Communications Manager can verify network connectivity and publisher-subscriber validation. Additionally, you must enter the host name and the IP address for the subscriber node. When the Unified Communications Manager installation prompts you for the host name of the subscriber server, enter the value that displays in the Server Configuration window in Cisco Unified Communications Manager Administration; that is, if you configured a host name for the subscriber server in the Host Name/IP Address field.

Manage SAML Single Sign-On

- SAML Single Sign-On Overview, on page 97
- Opt-In Control for Certificate-Based SSO Authentication for Cisco Jabber on iOS, on page 97
- SAML Single Sign-On Prerequisites, on page 98
- Manage SAML Single Sign-On, on page 98

SAML Single Sign-On Overview

Use SAML Single Sign-On (SSO) to access a defined set of Cisco applications after signing into one of those applications. SAML describes the exchange of security related information between trusted business partners. It is an authentication protocol used by service providers (such as Cisco Unified Communications Manager) to authenticate a user. With SAML, security authentication information is exchanged between an identity provider (IdP) and a service provider. The feature provides secure mechanisms to use common credentials and relevant information across various applications.

SAML SSO establishes a circle of trust (CoT) by exchanging metadata and certificates as part of the provisioning process between the IdP and the service provider. The service provider trusts user information of the IdP to provide access to the various services or applications.

The client authenticates against the IdP, and the IdP grants an Assertion to the client. The client presents the assertion to the service provider. Because a CoT established, the service provider trusts the assertion and grants access to the client.

Opt-In Control for Certificate-Based SSO Authentication for Cisco Jabber on iOS

This release of Cisco Unified Communications Manager introduces the opt-in configuration option to control Cisco Jabber on iOS SSO login behavior with an Identity provider (IdP). Use this option to allow Cisco Jabber to perform certificate-based authentication with the IdP in a controlled mobile device management (MDM) deployment.

You can configure the opt-in control through the SSO Login Behavior for iOS enterprise parameter in Cisco Unified Communications Manager.
Before you change the default value of this parameter, see the Cisco Jabber feature support and documentation at http://www.cisco.com/c/en/us/support/unified-communications/jabber-windows/tsd-products-support-series-home.html to ensure Cisco Jabber on iOS support for SSO login behavior and certificate-based authentication.

To enable this feature, see the Configure SSO Login Behavior for Cisco Jabber on iOS, on page 99 procedure.

**SAML Single Sign-On Prerequisites**

- DNS configured for the Cisco Unified Communications Manager cluster
- An identity provider (IdP) server
- An LDAP server that is trusted by the IdP server and supported by your system

The following IdPs using SAML 2.0 are tested for the SAML SSO feature:

- OpenAM 10.0.1
- Microsoft® Active Directory® Federation Services 2.0 (AD FS 2.0)
- PingFederate® 6.10.0.4
- F5 BIP-IP 11.6.0

The third-party applications must meet the following configuration requirements:

- The mandatory attribute “uid” must be configured on the IdP. This attribute must match the attribute that is used for the LDAP-synchronized user ID in Cisco Unified Communications Manager.

**Manage SAML Single Sign-On**

**Enable SAML Single Sign-On**

You cannot enable SAML SSO until the verify sync agent test succeeds.

**Before you begin**

- Ensure that user data is synchronized to the Unified Communications Manager database. For more information, see the System Configuration Guide for Cisco Unified Communications Manager at...
Verify that the Cisco Unified CM IM and Presence Service Cisco Sync Agent service successfully completed data synchronization. Check the status of this test by choosing Cisco Unified CM IM and Presence Administration > Diagnostics > System Troubleshooter. The “Verify Sync Agent has sync'ed over relevant data (e.g. devices, users, licensing information)” test indicates a test passed outcome if data synchronization successfully completed.

Ensure that at least one LDAP synchronized user is added to the Standard CCM Super Users group to enable access to Cisco Unified CM Administration. For more information, see the System Configuration Guide for Cisco Unified Communications Manager at http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-installation-and-configuration-guides-list.html.

To configure the trust relationship between the IdP and your servers, you must obtain the trust metadata file from your IdP and import it to all your servers.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>From Cisco Unified CM Administration, choose System &gt; SAML Single Sign-On.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Enable SAML SSO.</td>
</tr>
<tr>
<td>Step 3</td>
<td>After you see warning message to notify you that all server connections will be restarted, click Continue.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Browse to locate and upload the IdP metadata file.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Click Import IdP Metadata.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click Next.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Click Download Trust Metadata Fileset to download server metadata to your system.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Upload the server metadata on the IdP server.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Click Next to continue.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Choose an LDAP synchronized user with administrator rights from the list of valid administrator IDs.</td>
</tr>
<tr>
<td>Step 11</td>
<td>Click Run Test.</td>
</tr>
<tr>
<td>Step 12</td>
<td>Enter a valid username and password.</td>
</tr>
<tr>
<td>Step 13</td>
<td>Close the browser window after you see the success message.</td>
</tr>
<tr>
<td>Step 14</td>
<td>Click Finish and allow 1 to 2 minutes for the web applications to restart.</td>
</tr>
</tbody>
</table>

**Configure SSO Login Behavior for Cisco Jabber on iOS**

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>From Cisco Unified CM Administration, choose System &gt; Enterprise Parameters.</td>
</tr>
<tr>
<td>Step 2</td>
<td>To configure the opt-in control, in the SSO Configuration section, choose the Use Native Browser option for the SSO Login Behavior for iOS parameter.</td>
</tr>
</tbody>
</table>
The SSO Login Behavior for iOS parameter includes the following options:

- **Use Embedded Browser**—If you enable this option, Cisco Jabber uses the embedded browser for SSO authentication. Use this option to allow iOS devices prior to version 9 to use SSO without cross-launching into the native Apple Safari browser. This option is enabled by default.

- **Use Native Browser**—If you enable this option, Cisco Jabber uses the Apple Safari framework on an iOS device to perform certificate-based authentication with an Identity Provider (IdP) in the MDM deployment.

  **Note**  
  We don't recommend to configure this option, except in a controlled MDM deployment, because using a native browser is not as secure as the using the embedded browser.

---

**Enable SAML Single Sign-On on WebDialer After an Upgrade**

Follow these tasks to reactivate SAML Single Sign-On on Cisco WebDialer after an upgrade. If Cisco WebDialer is activated before SAML Single Sign-On is enabled, SAML Single Sign-On is not enabled on Cisco WebDialer by default.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Deactivate the Cisco WebDialer Service, on page 100</td>
<td>Deactivate the Cisco WebDialer web service if it is already activated.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Disable SAML Single Sign-On, on page 101</td>
<td>Disable SAML Single Sign-On if it is already enabled.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Activate the Cisco WebDialer Service, on page 101</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Enable SAML Single Sign-On, on page 98</td>
<td></td>
</tr>
</tbody>
</table>

**Deactivate the Cisco WebDialer Service**

Deactivate the Cisco WebDialer web service if it is already activated.

**Procedure**

1. From Cisco Unified Serviceability, choose **Tools > Service Activation**.
2. From the **Servers** drop-down list, choose the Cisco Unified Communications Manager server that is listed.
3. From **CTI Services**, uncheck the **Cisco WebDialer Web Service** check box.
4. Click **Save**.
What to do next
Disable SAML Single Sign-On, on page 101

Disable SAML Single Sign-On

Disable SAML Single Sign-On if it is already enabled.

Before you begin
Deactivate the Cisco WebDialer Service, on page 100

Procedure

From the CLI, run the command `utils sso disable`.

What to do next
Activate the Cisco WebDialer Service, on page 101

Activate the Cisco WebDialer Service

Before you begin
Disable SAML Single Sign-On, on page 101

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>From Cisco Unified Serviceability, choose Tools &gt; Service Activation.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>From the Servers drop-down list, choose the Unified Communications Manager server that is listed.</td>
</tr>
<tr>
<td>Step 3</td>
<td>From CTI Services, check the Cisco WebDialer Web Service check box.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Save.</td>
</tr>
<tr>
<td>Step 5</td>
<td>From Cisco Unified Serviceability, choose Tools &gt; Control Center - Feature Services to confirm that the CTI Manager service is active and is in start mode.</td>
</tr>
</tbody>
</table>

For WebDialer to function properly, the CTI Manager service must be active and in start mode.

What to do next
Enable SAML Single Sign-On, on page 98

Access the Recovery URL

Use the recovery URL to bypass SAML Single Sign-On and log in to the Cisco Unified Communications Manager Administration and Cisco Unified CM IM and Presence Service interfaces for troubleshooting. For
example, enable the recovery URL before you change the domain or hostname of a server. Logging in to the recovery URL facilitates an update of the server metadata.

**Before you begin**

- Only application users with administrative privileges can access the recovery URL.
- If SAML SSO is enabled, the recovery URL is enabled by default. You can enable and disable the recovery URL from the CLI. For more information about the CLI commands to enable and disable the recovery URL, see [Command Line Interface Guide for Cisco Unified Communications Solutions](#).

**Procedure**

In your browser, enter `https://hostname:8443/ssosp/local/login`.

---

**Update Server Metadata After a Domain or Hostname Change**

After a domain or hostname change, SAML Single Sign-On is not functional until you perform this procedure.

**Note**

If you are unable to log in to the SAML Single Sign-On window even after performing this procedure, clear the browser cache and try logging in again.

**Before you begin**

If the recovery URL is disabled, it does not appear for you to bypass the Single Sign-On link. To enable the recovery URL, log in to the CLI and execute the following command: `utils sso recovery-url enable`.

**Procedure**

**Step 1**

In the address bar of your web browser, enter the following URL:

`https://<Unified CM-server-name>`

where `<Unified CM-server-name>` is the hostname or IP address of the server.

**Step 2**

Click *Recovery URL to bypass Single Sign-On (SSO)*.

**Step 3**

Enter the credentials of an application user with an administrator role and click *Login*.

**Step 4**

From Cisco Unified CM Administration, choose *System > SAML Single Sign-On*.

**Step 5**

Click *Export Metadata* to download the server metadata.

**Step 6**

Upload the server metadata file to the IdP.

**Step 7**

Click *Run Test*.

**Step 8**

Enter a valid User ID and password.

**Step 9**

After you see the success message, close the browser window.
Manually Provision Server Metadata

To provision a single connection in your Identity Provider for multiple UC applications, you must manually provision the server metadata while configuring the Circle of Trust between the Identity Provider and the Service Provider. For more information about configuring the Circle of Trust, see the IdP product documentation.

The general URL syntax is as follows:

https://<SP FQDN>:8443/ssosp/saml/SSO/alias/<SP FQDN>

Procedure

To provision the server metadata manually, use the Assertion Customer Service (ACS) URL.

Example:

Sample ACS URL:<md:AssertionConsumerService
Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST"
Location="https://cucm.ucsso.cisco.com:8443/ssosp/saml/SSO/alias/cucm.ucsso.cisco.com"
index="0"/>

- Troubleshoot Certificate Errors, on page 118

Certificates Overview

Your system uses self-signed- and third-party-signed certificates. Certificates are used between devices in your system to securely authenticate devices, encrypt data, and hash the data to ensure its integrity from source to destination. Certificates allow for secure transfer of bandwidth, communication, and operations.

The most important part of certificates is that you know and define how your data is encrypted and shared with entities such as the intended website, phone, or FTP server.

When your system trusts a certificate, this means that there is a preinstalled certificate on your system which states it is fully confident that it shares information with the correct destination. Otherwise, it terminates the communication between these points.

In order to trust a certificate, trust must already be established with a third-party certificate authority (CA).

Your devices must know that they can trust both the CA and intermediate certificates first, before they can trust the server certificate presented by the exchange of messages called the secure sockets layer (SSL) handshake.
EC-based certificates for Tomcat are supported. This new certificate is called tomcat-ECDSA. For further information, see the Enhanced TLS Encryption on IM and Presence Service section of the Configuration and Administration of IM and Presence Service on Cisco Unified Communications Manager.

EC Ciphers on the Tomcat interface are disabled by default. You can enable them using the HTTPS Ciphers enterprise parameter on Cisco Unified Communications Manager or on IM and Presence Service. If you change this parameter the Cisco Tomcat service must be restarted on all nodes.

For further information on EC-based certificates see, ECDSA Support for Common Criteria for Certified Solutions in the Release Notes for Cisco Unified Communications Manager and IM and Presence Service.

### Third-Party Signed Certificate or Certificate Chain

Upload the certificate authority root certificate of the certificate authority that signed an application certificate. If a subordinate certificate authority signs an application certificate, you must upload the certificate authority root certificate of the subordinate certificate authority. You can also upload the PKCS#7 format certificate chain of all certificate authority certificates.

You can upload certificate authority root certificates and application certificates by using the same Upload Certificate dialog box. When you upload a certificate authority root certificate or certificate chain that contains only certificate authority certificates, choose the certificate name with the format certificate type-trust. When you upload an application certificate or certificate chain that contains an application certificate and certificate authority certificates, choose the certificate name that includes only the certificate type.

For example, choose `tomcat-trust` when you upload a Tomcat certificate authority certificate or certificate authority certificate chain; choose `tomcat` or `tomcat-ECDSA` when you upload a Tomcat application certificate or certificate chain that contains an application certificate and certificate authority certificates.

When you upload a CAPF certificate authority root certificate, it is copied to the CallManager-trust store, so you do not need to upload the certificate authority root certificate for CallManager separately.

Successful upload of third-party certificate authority signed certificate deletes a recently generated CSR that was used to obtain a signed certificate and overwrites the existing certificate, including a third-party signed certificate if one was uploaded.

The system automatically replicates tomcat-trust, CallManager-trust and Phone-SAST-trust certificates to each node in the cluster.

You can upload a directory trust certificate to tomcat-trust, which is required for the DirSync service to work in secure mode.
Third-Party Certificate Authority Certificates

To use an application certificate that a third-party certificate authority issues, you must obtain both the signed application certificate and the certificate authority root certificate from the certificate authority or PKCS#7 certificate chain (distinguished encoding rules [DER]), which contains both the application certificate and certificate authority certificates. Retrieve information about obtaining these certificates from your certificate authority. The process varies among certificate authorities. The signature algorithm must use RSA encryption.

Cisco Unified Communications Operating System generates CSRs in privacy enhanced mail (PEM) encoding format. The system accepts certificates in DER and PEM encoding formats and PKCS#7 Certificate chain in PEM format. For all certificate types except certificate authority proxy function (CAPF), you must obtain and upload a certificate authority root certificate and an application certificate on each node.

For CAPF, obtain and upload a certificate authority root certificate and an application certificate only on the first node. CAPF and Unified Communications Manager CSRs include extensions that you must include in your request for an application certificate from the certificate authority. If your certificate authority does not support the ExtensionRequest mechanism, you must enable the X.509 extensions, as follows:

• The CAPF CSR uses the following extensions:

  X509v3 Extended Key Usage:
  TLS Web Server Authentication
  X509v3 Key Usage:
  Digital Signature, Certificate Sign

• The CSRs for Tomcat and Tomcat-ECDSA, use the following extensions:

  Note Tomcat or Tomcat-ECDSA does not require the key agreement or IPsec end system key usage.

  X509v3 Extended Key Usage:
  TLS Web Server Authentication, TLS Web Client Authentication, IPSec End System
  X509v3 Key Usage:
  Digital Signature, Key Encipherment, Data Encipherment, Key Agreement

• The CSRs for IPsec use the following extensions:

  X509v3 Extended Key Usage:
  TLS Web Server Authentication, TLS Web Client Authentication, IPSec End System
  X509v3 Key Usage:
  Digital Signature, Key Encipherment, Data Encipherment, Key Agreement

• The CSRs for Unified Communications Manager use the following extensions:

  X509v3 Extended Key Usage:
  TLS Web Server Authentication, TLS Web Client Authentication
  X509v3 Key Usage:
  Digital Signature, Key Encipherment, Data Encipherment, Key Agreement
You can generate a CSR for your certificates and have them signed by a third party certificate authority with a SHA256 signature. You can then upload this signed certificate back to Unified Communications Manager, allowing Tomcat and other certificates to support SHA256.

**Show Certificates**

Use the Show Certificates to view certificate and trust store details that belong to your system. You can view the Common Name, Type, Key Type, Distribution, Issued By, Expiration date and also the description of the certificates.

**Procedure**

**Step 1** From Cisco Unified OS Administration, choose **Security > Certificate Management**.

**Step 2** Click **Find**.

**Step 3** To view certificate or trust store details, click the common name of the certificate.

**Step 4** Click **Close** to close the pop-up window and return to the **Certificate List** page.

**Download Certificates**

Use the download certificates task to have a copy of your certificate or upload the certificate when you submit a CSR request.

**Procedure**

**Step 1** From Cisco Unified OS Administration, choose **Security > Certificate Management**.

**Step 2** Specify search criteria and then click **Find**.

**Step 3** Choose the required file name and Click **Download**.

**Install Intermediate Certificates**

To install an intermediate certificate, you must install a root certificate first and then upload the signed certificate. This step is required only if the certificate authority provides a signed certificate with multiple certificates in the certificate chain.
**Procedure**

**Step 1** From Cisco Unified OS Administration, click **Security > Certificate Management**.

**Step 2** Click **Upload Certificate / Certificate Chain**.

**Step 3** Choose the appropriate trust store from the **Certificate Purpose** drop-down list to install the root certificate.

**Step 4** Enter the description for the certificate purpose selected.

**Step 5** Choose the file to upload by performing one of the following steps:

- In the **Upload File** text box, enter the path to the file.
- Click **Browse** and navigate to the file; then click **Open**.

**Step 6** Click **Upload**.

**Step 7** Access the Cisco Unified Intelligence Center URL using the FQDN after you install the customer certificate. If you access the Cisco Unified Intelligence Center using an IP address, you will see the message “Click here to continue”, even after you successfully install the custom certificate.

**Note** TFTP service should be deactivated and later activated when a Tomcat certificate is uploaded. Else, the TFTP continues to offer the old cached self-signed tomcat certificate.

---

**Delete a Trust Certificate**

A trusted certificate is the only type of certificate that you can delete. You cannot delete a self-signed certificate that is generated by your system.

---

**Caution** Deleting a certificate can affect your system operations. It can also break a certificate chain if the certificate is part of an existing chain. Verify this relationship from the username and subject name of the relevant certificates in the **Certificate List** window. You cannot undo this action.

---

**Procedure**

**Step 1** From Cisco Unified OS Administration, choose **Security > Certificate Management**.

**Step 2** Use the **Find** controls to filter the certificate list.

**Step 3** Choose the filename of the certificate.

**Step 4** Click **Delete**.

**Step 5** Click **OK**.

**Note** If you delete the , “tomcat-trust”, “CallManager-trust”, or “Phone-SAST-trust” certificate type, the certificate is deleted across all servers in the cluster.
Regenerate a Certificate

We recommend you to regenerate certificates before they expire. You will receive warnings in RTMT (Syslog Viewer) and an email notification when the certificates are about to expire.

However, you can also regenerate an expired certificate. Perform this task after business hours, because you must restart phones and reboot services. You can regenerate only a certificate that is listed as type “cert” in Cisco Unified OS Administration.

⚠️ Caution
Regenerating a certificate can affect your system operations. Regenerating a certificate overwrites the existing certificate, including a third-party signed certificate if one was uploaded.

Procedure

Step 1
From Cisco Unified OS Administration, choose Security > Certificate Management.

Enter search parameters to find a certificate and view its configuration details. The system displays the records that match all the criteria in the Certificate List window.

Click Regenerate button in certificate details page, a self-signed certificate with the same key length is regenerated.

Click Generate Self-Signed Certificate to regenerate a self-signed certificate with a new key length of 3072 or 4096.

Step 2
Configure the fields on the Generate New Self-Signed Certificate window. See online help for more information about the fields and their configuration options.

Step 3
Click Generate.

Step 4
Restart all services that are affected by the regenerated certificate.

Step 5
Rerun the CTL client (if configured) after you regenerate the CAPF, ITLRecovery Certificates or CallManager Certificates.

Note
When Tomcat is regenerated,
- Restart CallManager service else, the CallManager service on port 5090/5091 (for SIP Oauth) continues to present old Tomcat Certificates causing issues with TLS
- Deactivate and activate the TFTP service else, the TFTP continues to offer the old cached self-signed tomcat certificate.

Note
After you regenerate certificates, you must perform a system backup so that the latest backup contains the regenerated certificates. If your backup does not contain the regenerated certificates and you perform a system restoration task, you must manually unlock each phone in your system so that the phone can register.
Certificate Names and Descriptions

The following table describes the system security certificates that you can regenerate and the related services that must be restarted. For information about regenerating the TFTP certificate, see the Cisco Unified Communications Manager Security Guide at http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-maintenance-guides-list.html.

Table 3: Certificate Names and Descriptions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Related Services</th>
</tr>
</thead>
<tbody>
<tr>
<td>tomcat</td>
<td>This self-signed root certificate is generated during installation for the HTTPS node.</td>
<td>Tomcat, CallManager Service and TFTP</td>
</tr>
<tr>
<td>tomcat-ECDSA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ipsec</td>
<td>This self-signed root certificate is generated during installation for IPsec connections with MGCP and H.323 gateways.</td>
<td>Cisco Disaster Recovery System (DRS) Local and Cisco DRF Master DR Backup and Restore services</td>
</tr>
<tr>
<td>CallManager</td>
<td></td>
<td>CallManager, CAPF, Phone Verification and CTI</td>
</tr>
<tr>
<td>CallManager-ECDSA</td>

<td></td>
</tr>
<tr>
<td>CAPF</td>
<td>The system copies this root certificate to your node or to all nodes in the cluster after you complete the Cisco client configuration.</td>
<td>CallManager and CAPF</td>
</tr>
<tr>
<td>TVS</td>
<td>This is a self-signed root certificate.</td>
<td>Phone/Endpoints - ITL files</td>
</tr>
</tbody>
</table>

Upload Certificate or Certificate Chain

Upload any new certificates or certificate chains that you want your system to trust.

Procedure

Step 1 From Cisco Unified OS Administration, choose Security > Certificate Management.
Step 2 Click Upload Certificate/Certificate Chain.
Step 3 Choose the certificate name from the Certificate Purpose drop-down list.
Step 4 Choose the file to upload by performing one of the following steps:
   • In the Upload File text box, enter the path to the file.
• Click **Browse**, navigate to the file, and then click **Open**.

**Step 5**
To upload the file to the server, click **Upload File**.

**Note**
Restart the affected service after uploading the certificate. When the server comes back up you can access the CCMAdmin or CCMUser GUI to verify your newly added certificates in use.

---

## Manage Third-Party Certificate Authority Certificates

This task flow provides an overview of the third-party certificate process, with references to each step in the sequence. Your system supports certificates that a third-party certificate authority issues with a PKCS #10 certificate signing request (CSR).

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> Generate a Certificate Signing Request, on page 113</td>
<td>Generate a Certificate Signing Request (CSR) which is a block of encrypted text that contains certificate application information, public key, organization name, common name, locality, and country. A certificate authority uses this CSR to generate a trusted certificate for your system.</td>
</tr>
<tr>
<td><strong>Step 2</strong> Download a Certificate Signing Request, on page 113</td>
<td>Download the CSR after you generate it and have it ready to submit to your certificate authority.</td>
</tr>
<tr>
<td><strong>Step 3</strong> See your certificate authority documentation.</td>
<td>Obtain application certificates from your certificate authority.</td>
</tr>
<tr>
<td><strong>Step 4</strong> See your certificate authority documentation.</td>
<td>Obtain a root certificate from your certificate authority.</td>
</tr>
<tr>
<td><strong>Step 5</strong> Add Certificate Authority-Signed CAPF Root Certificate to the Trust Store, on page 114</td>
<td>Add the root certificate to the trust store. Perform this step when using a certificate authority-signed CAPF certificate.</td>
</tr>
<tr>
<td><strong>Step 6</strong> Upload Certificate or Certificate Chain, on page 111</td>
<td>Upload the certificate authority root certificate to the node.</td>
</tr>
<tr>
<td><strong>Step 7</strong> If you updated the certificate for CAPF or Cisco Unified Communications Manager, generate a new CTL file.</td>
<td>See the Cisco Unified Communications Manager Security Guide at <a href="http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-maintenance-guides-list.html">http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-maintenance-guides-list.html</a>. Rerun the CTL client (if configured) after you upload the third-party signed CAPF or CallManager certificate.</td>
</tr>
</tbody>
</table>
**Generate a Certificate Signing Request**

Generate a Certificate Signing Request (CSR) which is a block of encrypted text that contains certificate application information, public key, organization name, common name, locality, and country. A certificate authority uses this CSR to generate a trusted certificate for your system.

If you generate a new CSR, you overwrite any existing CSRs.

**Procedure**

**Step 1**  
From Cisco Unified OS Administration, choose **Security > Certificate Management**.

**Step 2**  
Click **Generate CSR**.

**Step 3**  
Configure fields on the **Generate Certificate Signing Request** window. See the online help for more information about the fields and their configuration options.

**Step 4**  
Click **Generate**.

**Download a Certificate Signing Request**

Download the CSR after you generate it and have it ready to submit to your certificate authority.

**Procedure**

**Step 1**  
From Cisco Unified OS Administration, choose **Security > Certificate Management**.

**Step 2**  
Click **Download CSR**.

**Step 3**  
Choose the certificate name from the **Certificate Purpose** drop-down list.

**Step 4**  
Click **Download CSR**.

**Step 5**  
(Optional) If prompted, click **Save**.

---

**Step 8**  
**Restart a Service, on page 114**  
Restart the services that are affected by the new certificate. For all certificate types, restart the corresponding service (for example, restart the Cisco Tomcat service if you updated the Tomcat or Tomcat-ECDSA certificate).
Add Certificate Authority-Signed CAPF Root Certificate to the Trust Store

Add the root certificate to the Unified Communications Manager trust store when using a Certificate Authority-Signed CAPF Certificate.

Procedure

Step 1  From Cisco Unified OS Administration, choose Security > Certificate Management.
Step 2  Click Upload Certificate/Certificate Chain.
Step 3  In the Upload Certificate/Certificate Chain popup window, choose CallManager-trust from the Certificate Purpose drop-down list and browse to the certificate authority-signed CAPF root certificate.
Step 4  Click Upload after the certificate appears in the Upload File field.

Restart a Service

Use this procedure if your system requires that you restart any feature or network services on a particular node in your cluster.

Procedure

Step 1  Depending on the service type that you want to restart, perform one of the following tasks:
      • Choose Tools > Control Center - Feature Services.
      • Choose Tools > Control Center - Network Services.
Step 2  Choose your system node from the Server drop-down list, and then click Go.
Step 3  Click the radio button next to the service that you want to restart, and then click Restart.
Step 4  After you see the message that indicates that the restart will take some time, click OK.

Certificate Revocation through Online Certificate Status Protocol

Unified Communications Manager provisions the OCSP for monitoring certificate revocation. System checks for the certificate status to confirm validity at scheduled intervals and every time there is, a certificate uploaded.

The Online Certificate Status Protocol (OCSP) helps administrators manage their system's certificate requirements. When OCSP is configured, it provides a simple, secure, and automated method to check certificate validity and revoke expired certificates in real-time.

For FIPS deployments with Common Criteria mode enabled, OCSP also helps your system comply with Common Criteria requirements.
Validation Checks

Unified Communications Manager checks the certificate status and confirms validity.

The certificates are validated as follows:

• Unified Communications Manager uses the Delegated Trust Model (DTM) and checks the Root CA or Intermediate CA for the OCSP signing attribute. The Root CA or the Intermediate CA must sign the OCSP Certificate to check the status. If the delegated trust model fails, Unified Communications Manager falls back to the Trust Responder Model (TRP) and uses a designated OCSP response signing certificate from an OCSP server to validate certificates.

  
  
  Note  
  OCSP Responder must be running to check the revocation status of the certificates.

• Enable OCSP option in the Certificate Revocation window to provide the most secure means of checking certificate revocation in real-time. Choose from options to use the OCSP URI from a certificate or from the configured OCSP URI. For more information on manual OCSP configuration, see Configure Certificate Revocation via OCSP.

  
  
  Note  
  In case of leaf certificates, TLS clients like syslog, FileBeat, SIP, ILS, LBM, and so on send OCSP requests to the OCSP responder and receives the certificate revocation response in real-time from the OCSP responder.

One of the following status is returned for the certificate once the validations are performed and the Common Criteria mode is ON.

• **Good** -- The good state indicates a positive response to the status inquiry. At a minimum, this positive response indicates that the certificate is not revoked, but does not necessarily mean that the certificate was ever issued or that the time at which the response was produced is within the certificate's validity interval. Response extensions may be used to convey additional information on assertions made by the responder regarding the status of the certificate such as positive statement about issuance, validity, etc.

• **Revoked** -- The revoked state indicates that the certificate has been revoked (either permanently or temporarily (on hold)).

• **Unknown** -- The unknown state indicates that the OCSP responder doesn't know about the certificate being requested.

  
  
  Note  
  In Common Criteria mode, the connection fails in both Revoked as well as Unknown case whereas the connection would succeed in Unknown response case when Common Criteria is not enabled.

Certificate Monitoring Task Flow

Complete these tasks to configure the system to monitor certificate status and expiration automatically.
Configure Certificate Monitor Notifications

Configure automated certificate monitoring for Unified Communications Manager or the IM and Presence Service. The system periodically checks the status of certificates and emails you when a certificate is approaching expiration.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Configure automatic certificate monitoring. The system periodically checks certificate statuses and emails you when a certificate is approaching expiration.</td>
</tr>
<tr>
<td>Configure Certificate Monitor Notifications, on page 116</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configure the OCSP so that the system revokes expired certificates automatically.</td>
</tr>
<tr>
<td>Configure Certificate Revocation via OCSP, on page 117</td>
<td></td>
</tr>
</tbody>
</table>

Note

The **Cisco Certificate Expiry Monitor** network service must be running. This service is enabled by default, but you can confirm the service is running in Cisco Unified Serviceability by choosing **Tools > Control Center - Network Services** and verifying that the **Cisco Certificate Expiry Monitor Service** status is Running.

Procedure

Step 1 Log in to Cisco Unified OS Administration (for Unified Communications Manager certificate monitoring) or Cisco Unified IM and Presence Administration (for IM and Presence Service certificate monitoring).

Step 2 Choose **Security > Certificate Monitor**.

Step 3 In the **Notification Start Time** field, enter a numeric value. This value represents the number of days before certificate expiration where the system starts to notify you of the upcoming expiration.

Step 4 In the **Notification Frequency** fields, enter the frequency of notifications.

Step 5 Optional. Check the **Enable E-mail notification** check box to have the system send email alerts of upcoming certificate expirations.

Step 6 Check the **Enable LSC Monitoring** check box to include LSC certificates in the certificate status checks.

Step 7 In the **E-mail IDs** field, enter the email addresses where you want the system to send notifications. You can enter multiple email addresses separated by a semicolon.

Step 8 Click **Save**.
What to do next

Configure the Online Certificate Status Protocol (OCSP) so that the system revokes expired certificates automatically. For details, see Configure Certificate Revocation via OCSP, on page 117

Configure Certificate Revocation via OCSP

Enable the Online Certificate Status Protocol (OCSP) to check certificate status regularly and to revoke expired certificates automatically.

Before you begin

Make sure that your system has the certificates that are required for OCSP checks. You can use Root or Intermediate CA certificates that are configured with the OCSP response attribute or you can use a designated OCSP signing certificate that has been uploaded to the tomcat-trust.

Procedure

Step 1 Log in to Cisco Unified OS Administration (for Unified Communications Manager certificate revocation) or Cisco Unified IM and Presence Administration (for IM and Presence Service certificate revocation).

Step 3 Check the Enable OCSP check box, and perform one of the following tasks:

- If you want to specify an OCSP responder for OCSP checks, select the Use configured OCSP URI button and enter the URI of the responder in the OCSP Configured URI field.
- If the certificate is configured with an OCSP responder URI, select the Use OCSP URI from Certificate button.

Step 4 Check the Enable Revocation Check check box.

Step 5 Complete the Check Every field with the interval period for revocation checks.

Step 6 Click Save.

Step 7 Optional. If you have CTI, IPsec or LDAP links, you must also complete these steps in addition to the above steps to enable OCSP revocation support for those long-lived connections:

a) From Cisco Unified CM Administration, choose System > Enterprise Parameters.

b) Under Certificate Revocation and Expiry, set the Certificate Validity Check parameter to True.

c) Configure a value for the Validity Check Frequency parameter.

Note The interval value of theEnable Revocation Check parameter in the Certificate Revocation window takes precedence over the value of the Validity Check Frequency enterprise parameter.

d) Click Save.
Troubleshoot Certificate Errors

Before you begin

If you encounter an error when you attempt to access Unified Communications Manager services from an IM and Presence Service node or IM and Presence Service functionality from a Unified Communications Manager node, the source of the issue is the tomcat-trust certificate. The error message Connection to the Server cannot be established (unable to connect to Remote Node) appears on the following Serviceability interface windows:

• Service Activation
• Control Center - Feature Services
• Control Center - Network Services

Use this procedure to help you resolve the certificate error. Start with the first step and proceed, if necessary. Sometime, you may only have to complete the first step to resolve the error; in other cases, you have to complete all the steps.

Procedure

Step 1 From Cisco Unified OS Administration, verify that the required tomcat-trust certificates are present: Security > Certificate Management.

If the required certificates are not present, wait 30 minutes before checking again.

Step 2 Choose a certificate to view its information. Verify that the content matches with the corresponding certificate on the remote node.

Step 3 From the CLI, restart the Cisco Intercluster Sync Agent service: utils service restart Cisco Intercluster Sync Agent.

Step 4 After the Cisco Intercluster Sync Agent service restarts, restart the Cisco Tomcat service: utils service restart Cisco Tomcat.

Step 5 Wait 30 minutes. If the previous steps do not address the certificate error and a tomcat-trust certificate is present, delete the certificate. After you delete the certificate, you must manually exchange it by downloading the Tomcat and Tomcat-ECDSA certificate for each node and uploading it to its peers as a tomcat-trust certificate.

Step 6 After the certificate exchange is complete, restart Cisco Tomcat on each affected server: utils service restart Cisco Tomcat.
Manage Bulk Certificates

Use bulk certificate management if you want to share a set of certificates between clusters. This step is required for system functions that require established trust between clusters, such as extension mobility cross cluster.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Export Certificates</td>
<td>This procedure creates a PKCS12 file that contains certificates for all nodes in the cluster.</td>
</tr>
<tr>
<td>Step 2 Import Certificates</td>
<td>Import the certificates back into the home and remote (visiting) clusters.</td>
</tr>
</tbody>
</table>

**Export Certificates**

This procedure creates a PKCS12 file that contains certificates for all nodes in the cluster.

**Procedure**

1. From Cisco Unified OS Administration, choose **Security > Bulk Certificate Management**.
2. Configure the settings for a TFTP server that both the home and remote clusters can reach. See the online help for information about the fields and their configuration options.
3. Click **Save**.
4. Click **Export**.
5. In the **Bulk Certificate Export** window, choose **All** for the **Certificate Type** field.
6. Click **Export**.
7. Click **Close**.
When the bulk certificate export is performed, the certificates are then uploaded to the remote cluster as follows:

- CAPF certificate gets uploaded as a CallManager-trust
- Tomcat certificate gets uploaded as a Tomcat-trust
- CallManager certificate gets uploaded as a CallManager-trust
- CallManager certificate gets uploaded as a Phone-SAST-trust
- ITLRecovery certificate gets uploaded as a PhoneSast-trust and CallManager-trust

The above steps are performed when certificates are self-signed and there is no common trust in another cluster. If there is a common trust or the same signer then the export of ALL certificates is not needed.

---

**Import Certificates**

Import the certificates back into the home and remote (visiting) clusters.

---

**Note**

Import of certificate using bulk certificate management causes phones to reset.

---

**Before you begin**

Before the Import button appears, you must complete the following activities:

- Export the certificates from at least two clusters to the SFTP server.
- Consolidate the exported certificates.

---

**Procedure**

1. From Cisco Unified OS Administration, choose **Security > Bulk Certificate Management > Import > Bulk Certificate Import**.
2. From the **Certificate Type** drop-down list, choose **All**.
3. Choose **Import**.
When the bulk certificate import is performed, the certificates are then uploaded to the remote cluster as follows:

- CAPF certificate gets uploaded as a CallManager-trust
- Tomcat certificate gets uploaded as a Tomcat-trust
- CallManager certificate gets uploaded as a CallManager-trust
- CallManager certificate gets uploaded as a Phone-SAST-trust
- ITLRecovery certificate gets uploaded as a PhoneSast-trust and CallManager-trust

The following types of certificates determines phones that are restarted:

- Callmanager - ALL phones only IF TFTP service is activated on the node the certificate belongs.
- TVS - SOME phones based on Callmanager group membership.
- CAPF - ALL phones only IF CAPF is activated.
Manage Security

Import Certificates
Manage IPsec Policies

- IPsec Policies Overview, on page 123
- Configure IPsec Policies, on page 123
- Manage IPsec Policies, on page 124

**IPsec Policies Overview**

IPsec is a framework that ensures private, secure communications over IP networks through the use of cryptographic security services. IPsec policies are used to configure IPsec security services. The policies provide varying levels of protection for most traffic types in your network. You can configure IPsec policies to meet the security requirements of a computer, organizational unit (OU), domain, site, or global enterprise.

**Configure IPsec Policies**

- Because any changes that you make to an IPsec policy during a system upgrade will be lost, do not modify or create IPsec policies during an upgrade.
- IPsec requires bidirectional provisioning, or one peer for each host (or gateway).
- When you provision the IPSec policy on two Unified Communications Manager nodes with one IPsec policy protocol set to “ANY” and the other IPsec policy protocol set to “UDP” or “TCP”, the validation can result in a false negative if run from the node that uses the “ANY” protocol.
- IPsec, especially with encryption, affects the performance of your system.

**Procedure**

**Note**

Step 1  From Cisco Unified OS Administration, choose **Security > IPSec Configuration**.
Step 2  Click **Add New**.
Step 3  Configure the fields on the **IPSEC Policy Configuration** window. See the online help for more information about the fields and their configuration options.
Step 4  Click Save.

Step 5  (Optional) To validate IPsec, choose Services > Ping, check the Validate IPsec check box, and then click Ping.

Manage IPsec Policies

Because any changes that you make to an IPsec policy during a system upgrade are lost, do not modify or create IPsec policies during an upgrade.

Caution

Any changes that you make to the existing IPsec certificate because of hostname, domain, or IP address changes require you to delete the IPsec policies and recreate them, if certificate names are changed. If certificate names are unchanged, then after importing the remote node's regenerated certificate, the IPsec policies must be disabled and enabled.

Procedure

Step 1  From Cisco Unified OS Administration, choose Security > IPSEC Configuration.

Step 2  To display, enable, or disable a policy, follow these steps:
   a)  Click the policy name.
   b)  To enable or disable the policy, check or uncheck the Enable Policy check box.
   c)  Click Save.

Step 3  To delete one or more policies, follow these steps:
   a)  Check the check box next to each policy that you want to delete.
       You can click Select All to select all policies or Clear All to clear all the check boxes.
   b)  Click Delete Selected.
Manage Credential Policies

- Credential Policy and Authentication, on page 125
- Configure a Credential Policy, on page 126
- Configure a Credential Policy Default, on page 126
- Monitor Authentication Activity, on page 127
- Configuring Credential Caching, on page 128

Credential Policy and Authentication

The authentication function authenticates users, updates credential information, tracks and logs user events and errors, records credential change histories, and encrypts or decrypts user credentials for data storage.

The system always authenticates application user passwords and end user PINs against the Unified Communications Manager database. The system can authenticate end user passwords against the corporate directory or the database.

If your system is synchronized with the corporate directory, either the authentication function in Unified Communications Manager or lightweight directory access protocol (LDAP) can authenticate the password:

- With LDAP authentication enabled, user passwords and credential policies do not apply. These defaults are applied to users that are created with directory synchronization (DirSync service).

- When LDAP authentication is disabled, the system authenticates user credentials against the database. With this option, you can assign credential policies, manage authentication events, and administer passwords. End users can change passwords and PINs through the phone user interfaces.

Credential policies do not apply to operating system users or CLI users. These administrators use standard password verification procedures that the operating system supports.

After users are configured in the database, the system stores a history of user credentials in the database to prevent users from entering previous information when users are prompted to change their credentials.

JTAPI and TAPI Support for Credential Policies

Because the Cisco Unified Communications Manager Java telephony applications programming interface (JTAPI) and telephony applications programming interface (TAPI) support the credential policies that are assigned to application users, developers must create applications that respond to the password expiration, PIN expiration, and lockout return codes for credential policy enforcement.
Applications use an API to authenticate with the database or corporate directory, regardless of the authentication model that an application uses.

Configure a Credential Policy

Credential policies apply to application users and end users. You assign a password policy to end users and application users and a PIN policy to end users. The Credential Policy Default Configuration lists the policy assignments for these groups. When you add a new user to the database, the system assigns the default policy. You can change the assigned policy and manage user authentication events.

Procedure

Step 1 From Cisco Unified CM Administration, choose User Management > User Settings > Credential Policy.
Step 2 Perform one of the following steps:
   - Click Find and select an existing credential policy.
   - Click Add New to create a new credential policy.
Step 3 Complete the fields in the Credential Policy Configuration window. See the online help for more information about the fields and their configuration settings.
Step 4 Click Save.

Configure a Credential Policy Default

At installation, Cisco Unified Communications Manager assigns a static default credential policy to user groups. It does not provide default credentials. Your system provides options to assign new default policies and to configure new default credentials and credential requirements for users.

Procedure

Step 1 In Cisco Unified CM Administration, choose User Management > User Settings > Credential Policy Default.
Step 2 From the Credential Policy drop-down list box, choose the credential policy for this group.
Step 3 Enter the password in both the Change Credential and Confirm Credential configuration windows.
Step 4 Check the User Cannot Change check box if you do not want your users to be able to change this credential.
Step 5 Check the User Must Change at Next Login check box if you want to use this credential as a temporary credential that an end user must change the next time that they login.

Note Please note that, if you check this box, your users are unable to change PIN using Personal Directory service.
Step 6  If you do not want the credential to expire, check the **Does Not Expire** check box.

Step 7  Click **Save**.

---

## Monitor Authentication Activity

The system shows the most current authentication results, such as last hack attempt time, and counts for failed logon attempts.

The system generates log file entries for the following credential policy events:

- Authentication success
- Authentication failure (bad password or unknown)
- Authentication failure because of
  - Administrative lock
  - Hack lock (failed logon lockouts)
  - Expired soft lock (expired credential)
  - Inactive lock (credential not used for some time)
  - User must change (credential set to user must change)
  - LDAP inactive (switching to LDAP authentication and LDAP not active)
- Successful user credential updates
- Failed user credential updates

---

**Note**

If you use LDAP authentication for end user passwords, LDAP tracks only authentication successes and failures.

All event messages contain the string “ims-auth” and the user ID that is attempting authentication.

---

### Procedure

**Step 1**  From Cisco Unified CM Administration, choose **User Management > End Users**.

**Step 2**  Enter search criteria, click **Find**, and then choose a user from the resulting list.

**Step 3**  Click **Edit Credential** to view the user's authentication activity.

---

**What to do next**

You can view log files with the Cisco Unified Real-Time Monitoring Tool (Unified RTMT). You can also collect captured events into reports. For detailed steps about how to use Unified RTMT, see the *Cisco Unified Administration Guide for Cisco Unified Communications Manager and IM and Presence Service Release 11.5(1)*.
Configuring Credential Caching

Enable credential caching to increase system efficiency. Your system does not have to perform a database lookup or invoke a stored procedure for every single login request. An associated credential policy is not enforced until the caching duration expires.

This setting applies to all Java applications that invoke user authentication.

**Procedure**

**Step 1** From Cisco Unified CM Administration, choose System > Enterprise Parameters.

**Step 2** Perform the following tasks as needed:

- Set the Enable Caching enterprise parameter to True. With this parameter enabled, Cisco Unified Communications Manager uses cached credentials for up to 2 minutes.
- Set the Enable Caching enterprise parameter to False to disable caching, so that the system does not use cached credentials for authentication. The system ignores this setting for LDAP authentication. Credential caching requires a minimal amount of additional memory per user.

**Step 3** Click Save.
PART VI

Disaster Recovery

• Backup the System, on page 131
• Restore the System, on page 141
Backup the System

• Backup Overview, on page 131
• Backup Prerequisites, on page 131
• Backup Task Flow, on page 132
• Backup Interactions and Restrictions, on page 137

Backup Overview

Cisco recommends performing regular backups. You can use the Disaster Recovery System (DRS) to do a full data backup for all servers in a cluster. You can set up automatic backups or invoke a backup at any time.

The Disaster Recovery System performs a cluster-level backup, which means that it collects backups for all servers in a Cisco Unified Communications Manager cluster to a central location and archives the backup data to physical storage device. Backup files are encrypted and can be opened only by the system software.

DRS restores its own settings (backup device settings and schedule settings) as part of the platform backup/restore. DRS backs up and restores the drfDevice.xml and drfSchedule.xml files. When the server is restored with these files, you do not need to reconfigure DRS backup device and schedule.

When you perform a system data restoration, you can choose which nodes in the cluster you want to restore.

The Disaster Recovery System includes the following capabilities:

• A user interface for performing backup and restore tasks.
• A distributed system architecture for performing backup functions.
• Scheduled backups or manual (user-invoked) backups.
• It archives backups to a remote sftp server.

Backup Prerequisites

• Make sure that you meet the version requirements:
  • All Cisco Unified Communications Manager cluster nodes must be running the same version of the Cisco Unified Communications Manager application.
• All IM and Presence Service cluster nodes must be running the same version of the IM and Presence Service application.

• The software version saved in the backup file must match the version that is running on the cluster nodes.

The entire version string must match. For example, if the IM and Presence database publisher node is at version 11.5.1.10000-1, then all IM and Presence subscriber nodes must be 11.5.1.10000-1, and the backup file must also be must be 11.5.1.10000-1. If you try to restore the system from a backup file that does not match the current version, the restore will fail. Ensure that you backup the system whenever you upgrade the software version so that the version saved in the backup file matches the version that is running on the cluster nodes.

• Be aware the DRS encryption depends on the cluster security password. When running the backup, DRS generates a random password for encryption and then encrypts the random password with the cluster security password. If the cluster security password ever gets changed between the backup and this restore, you will need to know what the password was at the time of the backup in order to use that backup file to restore your system or take a backup immediately after the security password change/reset.

• If you want to back up to a remote device, make sure that you have an SFTP server set up. For more information on the available SFTP servers, see SFTP Servers for Remote Backups, on page 138

## Backup Task Flow

Complete these tasks to configure and run a backup. Do not perform any OS Administration tasks while a backup is running. This is because Disaster Recovery System blocks all OS Administration requests by locking platform API. However, Disaster Recovery System does not block most CLI commands, because only the CLI-based upgrade commands use the Platform API locking package.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Configure Backup Devices, on page 133 Specify the devices on which to back up data.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Estimate Size of Backup File, on page 134 Estimate size of backup file created on the SFTP device.</td>
</tr>
</tbody>
</table>
| **Step 3**        | Choose one of the following options: Create a backup schedule to back up data on a schedule. Optionally, run a manual backup.  
- Configure a Scheduled Backup, on page 134  
- Start a Manual Backup, on page 135 |
| **Step 4**        | View Current Backup Status, on page 136 Optional. Check the Status of the Backup. While a backup is running, you can check the status of the current backup job. |
| **Step 5**        | View Backup History, on page 137 Optional. View Backup History |
Configure Backup Devices

You can configure up to 10 backup devices. Perform the following steps to configure the location where you want to store backup files.

Before you begin

- Ensure you have write access to the directory path in the SFTP server to store the backup file.
- Ensure that the username, password, server name, and directory path are valid as the DRS Master Agent validates the configuration of the backup device.

Note

Schedule backups during periods when you expect less network traffic.

Procedure

Step 1
From Disaster Recovery System, select Backup > Backup Device.

Step 2
In the Backup Device List window, do either of the following:

- To configure a new device, click Add New.
- To edit an existing backup device, enter the search criteria, click Find, and Edit Selected.
- To delete a backup device, select it in the Backup Device list and click Delete Selected.

You cannot delete a backup device that is configured as the backup device in a backup schedule.

Step 3
Enter a backup name in the Backup Device Name field.

The backup device name contains only alphanumeric characters, spaces ( ), dashes (-) and underscores (_). Do not use any other characters.

Step 4
In the Select Destination area, under Network Directory perform the following:

- In the Host name/IP Address field, enter the hostname or IP address for the network server.
- In the Path name field, enter the directory path where you want to store the backup file.
- In the User name field, enter a valid username.
- In the Password field, enter a valid password.

- From the Number of backups to store on Network Directory drop-down list, choose the required number of backups.

Step 5
Click Save.

What to do next

Estimate Size of Backup File, on page 134
Estimate Size of Backup File

Cisco Unified Communications Manager will estimate the size of the backup tar, only if a backup history exists for one or more selected features.

The calculated size is not an exact value but an estimated size of the backup tar. Size is calculated based on the actual backup size of a previous successful backup and may vary if the configuration changed since the last backup.

You can use this procedure only when the previous backups exist and not when you back up the system for the first time.

Follow this procedure to estimate the size of the backup tar that is saved to a SFTP device.

Procedure

Step 1  From the Disaster Recovery System, select **Backup > Manual Backup**.
Step 2  In the **Select Features** area, select the features to back up.
Step 3  Click **Estimate Size** to view the estimated size of backup for the selected features.

What to do next

Perform one of the following procedures to backup your system:

- Configure a Scheduled Backup, on page 134
- Start a Manual Backup, on page 135

Configure a Scheduled Backup

You can create up to 10 backup schedules. Each backup schedule has its own set of properties, including a schedule for automatic backups, the set of features to back up, and a storage location.

Be aware that your backup .tar files are encrypted by a randomly generated password. This password is then encrypted by using the cluster security password and gets saved along with the backup .tar files. You must remember this security password or take a backup immediately after the security password change or reset.

Caution

Schedule backups during off-peak hours to avoid call processing interruptions and impact to service.

Before you begin

Configure Backup Devices, on page 133

Procedure

Step 1  From the Disaster Recovery System, choose **Backup Scheduler**.
Step 2  In the **Schedule List** window, do one of the following steps to add a new schedule or edit an existing schedule.
• To create a new schedule, click Add New.
• To configure an existing schedule, click the name in the Schedule List column.

Step 3
In the scheduler window, enter a schedule name in the Schedule Name field.
Note You cannot change the name of the default schedule.

Step 4
Select the backup device in the Select Backup Device area.

Step 5
Select the features to back up in the Select Features area. You must choose at least one feature.

Step 6
Choose the date and time when you want the backup to begin in the Start Backup at area.

Step 7
Choose the frequency at which you want the backup to occur in the Frequency area. The frequency can be set to Once Daily, Weekly, and Monthly. If you choose Weekly, you can also choose the days of the week when the backup will occur.
Tip To set the backup frequency to Weekly, occurring Tuesday through Saturday, click Set Default.

Step 8
To update these settings, click Save.

Step 9
Choose one of the following options:
• To enable the selected schedules, click Enable Selected Schedules.
• To disable the selected schedules, click Disable Selected Schedules.
• To delete the selected schedules, click Delete Selected.

Step 10
To enable the schedule, click Enable Schedule.
The next backup occurs automatically at the time that you set.
Note Ensure that all servers in the cluster are running the same version of Cisco Unified Communications Manager or Cisco IM and Presence Service and are reachable through the network. Servers that are not reachable at the time of the scheduled backup will not get backed up.

What to do next
Perform the following procedures:
• Estimate Size of Backup File, on page 134
• (Optional) View Current Backup Status, on page 136

Start a Manual Backup

Before you begin
• Ensure that you use a network device as the storage location for the backup files. Virtualized deployments of Unified Communications Manager do not support the use of tape drives to store backup files.
• Ensure that all cluster nodes have the same installed version of Cisco Unified Communications Manager or IM and Presence Service.
• The backup process can fail due to non availability of space on a remote server or due to interruptions in the network connectivity. You need to start a fresh backup after addressing the issues that caused the backup to fail.

• Ensure that there are no network interruptions.

• Configure Backup Devices, on page 133

• Estimate Size of Backup File, on page 134

• Make sure that you have a record of the cluster security password. If the cluster security password changes after you complete this backup, you will need to know the password or you will not be able to use the backup file to restore your system.

Note While a backup is running, you cannot perform any tasks in Cisco Unified OS Administration or Cisco Unified IM and Presence OS Administration because Disaster Recovery System locks the platform API to block all requests. However, Disaster Recovery System does not block most CLI commands because only the CLI-based upgrade commands use the Platform API locking package.

Procedure

Step 1 From the Disaster Recovery System, select Backup > Manual Backup.
Step 2 In the Manual Backup window, select a backup device from the Backup Device Name area.
Step 3 Choose a feature from the Select Features area.
Step 4 Click Start Backup.

What to do next
(Optional) View Current Backup Status, on page 136

View Current Backup Status

Perform the following steps to check the status of the current backup job.

Caution Be aware that if the backup to the remote server is not completed within 20 hours, the backup session times out and you must begin a fresh backup.

Procedure

Step 1 From the Disaster Recovery System, select Backup > Current Status.
Step 2 To view the backup log file, click the log filename link.
Step 3 To cancel the current backup, click Cancel Backup.
The backup cancels after the current component completes its backup operation.

---

**What to do next**

View Backup History, on page 137

---

**View Backup History**

Perform the following steps to view the backup history.

**Procedure**

**Step 1**
From the Disaster Recovery System, select **Backup > History**.

**Step 2**
From the **Backup History** window, you can view the backups that you have performed, including filename, backup device, completion date, result, version, features that are backed up, and failed features.

**Note**
The **Backup History** window displays only the last 20 backup jobs.

---

**Backup Interactions and Restrictions**

**Backup Restrictions**

The following restrictions apply to backups:

**Table 4: Backup Restrictions**

<table>
<thead>
<tr>
<th>Restriction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cluster Security Password</td>
<td>We recommend that you run a backup whenever you change the cluster security password. Backup encryption uses the cluster security password to encrypt data on the backup file. If you edit the cluster security password after a backup file is created, you will not be able to use that backup file to restore data unless you remember the old password.</td>
</tr>
</tbody>
</table>
The Disaster Recovery System (DRS) uses an SSL-based communication between the Master Agent and the Local Agent for authentication and encryption of data between the Cisco Unified Communications Manager cluster nodes. DRS makes use of the IPsec certificates for its Public/Private Key encryption. Be aware that if you delete the IPSEC truststore(hostname.pem) file from the Certificate Management pages, then DRS will not work as expected. If you delete the IPSEC-trust file manually, you must ensure that you upload the IPSEC certificate to the IPSEC-trust. For more details, see the “Certificate management” section in the Security Guide for Cisco Unified Communications Manager at http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-maintenance-guides-list.html.

</tbody>
</table>

**SFTP Servers for Remote Backups**

To back up data to a remote device on the network, you must have an SFTP server that is configured. For internal testing, Cisco uses the SFTP Server on Cisco Prime Collaboration Deployment (PCD) which is provided by Cisco, and which is supported by Cisco TAC. Refer to the following table for a summary of the SFTP server options:

Use the information in the following table to determine which SFTP server solution to use in your system.

**Table 5: SFTP Server Information**

<table>
<thead>
<tr>
<th>SFTP Server</th>
<th>Information</th>
</tr>
</thead>
</table>
| SFTP Server on Cisco Prime Collaboration Deployment | This server is the only SFTP server that is provided and tested by Cisco, and fully supported by Cisco TAC.  
Version compatibility depends on your version of Unified Communications Manager and Cisco Prime Collaboration Deployment. See the Cisco Prime Collaboration Deployment Administration Guide before you upgrade its version (SFTP) or Unified Communications Manager to ensure that the versions are compatible. |
| SFTP Server from a Technology Partner   | These servers are third party provided and third party tested. Version compatibility depends on the third party test. See the Technology Partner page if you upgrade their SFTP product and/or upgrade Unified Communications Manager for which versions are compatible:  
https://marketplace.cisco.com |
<table>

<td>Version compatibility is on a best effort basis to establish compatible SFTP versions and Unified Communications Manager versions.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> These products have not been tested by Cisco and we cannot guarantee functionality. Cisco TAC does not support these products. For a fully tested and supported SFTP solution, use Cisco Prime Collaboration Deployment or a Technology Partner.</td>
</tr>
</tbody>
</table>

**Cipher Support**

For Unified Communications Manager 11.5, Unified Communications Manager advertises the following CBC and CTR ciphers for SFTP connections:

- aes128-cbc
- 3des-cbc
- aes128-ctr
- aes192-ctr
- aes256-ctr

**Note** Make sure that the backup SFTP Server supports one of these ciphers to communicate with Unified Communications Manager.

From Unified Communications Manager 12.0 release onwards, CBC ciphers are not supported. Unified Communications Manager supports and advertises only the following CTR ciphers:

- aes256-ctr
- aes128-ctr
- aes192-ctr

**Note** Make sure that the backup SFTP Server supports one of these CTR ciphers to communicate with Unified Communications Manager.
Chapter 19

Restore the System

- Restore Overview, on page 141
- Restore Prerequisites, on page 142
- Restore Task Flow, on page 142
- Data Authentication, on page 150
- Alarms and Messages, on page 152
- Restore Interactions and Restrictions, on page 155
- Troubleshooting, on page 156

Restore Overview

The Disaster Recovery System (DRS) provides a wizard to walk you through the process of restoring your system.

The backup files are encrypted and only the DRS system can open them to restore the data. The Disaster Recovery System includes the following capabilities:

- A user interface for performing restore tasks.
- A distributed system architecture for performing restore functions.

Master Agent

The system automatically starts the Master Agent service on each node of the cluster, but the Master Agent is functional only on the publisher node. The Master Agents on the subscriber nodes do not perform any functions.

Local Agents

The server has a Local Agent to perform backup and restore functions.

Each node in a Cisco Unified Communications Manager cluster, including the node that contains the Master Agent, must have its own Local Agent to perform backup and restore functions.
By default, a Local Agent automatically gets started on each node of the cluster, including IM and Presence nodes.

Restore Prerequisites

- Make sure that you meet the version requirements:
  - All Cisco Unified Communications Manager cluster nodes must be running the same version of the Cisco Unified Communications Manager application.
  - All IM and Presence Service cluster nodes must be running the same version of the IM and Presence Service application.
  - The version saved in the backup file must match the version that is running on the cluster nodes.

The entire version string must match. For example, if the IM and Presence database publisher node is at version 11.5.1.10000-1, then all IM and Presence subscriber nodes must be 11.5.1.10000-1, and the backup file must also be must be 11.5.1.10000-1. If you try to restore the system from a backup file that does not match the current version, the restore will fail.

- Make sure that the IP address, hostname, DNS configuration and deployment type for the server matches the IP address, hostname, DNS configuration and deployment type that are stored on the backup file.

- If you have changed the cluster security password since the backup was run, make sure that you have a record of the old password, or the restore will fail.

Restore Task Flow

During the restore process, do not perform any tasks with Cisco Unified Communications Manager OS Administration or Cisco Unified IM and Presence OS Administration.

<table>

</tbody>
</table>

**Restore the First Node Only**

If you are restoring the first node after a rebuild, you must configure the backup device.

This procedure is applicable to the Cisco Unified Communications Manager First Node, also known as the publisher node. The other Cisco Unified Communications Manager nodes and all the IM and Presence Service nodes are considered as secondary nodes or subscribers.

**Before you begin**

If there is an IM and Presence Service node in the cluster, ensure that it is running and accessible when you restore the first node. This is required so that a valid backup file can be found during the procedure.

**Procedure**

Step 1 From the Disaster Recovery System, choose **Restore > Restore Wizard**.

Step 2 In the **Restore Wizard Step 1** window, select the appropriate backup device to restore.

Step 3 Click **Next**.

Step 4 In the **Restore Wizard Step 2** window, select the backup file you want to restore.

*Note* The backup filename indicates the date and time that the system created the backup file.

Step 5 Click **Next**.

Step 6 In the **Restore Wizard Step 3** window, click **Next**.

Step 7 Choose the features that you want to restore.

*Note* The features that you have selected for backup will be displayed.

Step 8 Select the node to restore.

Step 9 Click **Restore** to restore the data.

Step 10 Click **Next**.
Step 11 When you are prompted to select the nodes to restore, choose only the first node (the publisher).

Caution Do not select the subsequent (subscriber) nodes in this condition as this will result in failure of the restore attempt.

Step 12 (Optional) From the Select Server Name drop-down list, select the subscriber node from which you want to restore the publisher database. Ensure that the subscriber node that you chose is in-service and connected to the cluster.

The Disaster Recovery System restores all non database information from the backup file and pulls the latest database from the chosen subscriber node.

Note This option appears only if the backup file that you selected includes the CCMDB database component. Initially, only the publisher node is fully restored, but when you perform Step 14 and restart the subsequent cluster nodes, the Disaster Recovery System performs database replication and fully synchronizes all cluster node databases. This ensures that all cluster nodes are using current data.

Step 13 Click Restore.

Step 14 Your data is restored on the publisher node. Depending on the size of your database and the components that you choose to restore, the system can require a few hours to restore.

Note Restoring the first node restores the whole Cisco Unified Communications Manager database to the cluster. This may take up to several hours based on number of nodes and size of database that is being restored. Depending on the size of your database and the components that you choose to restore, the system can require a few hours to restore.

Step 15 When the Percentage Complete field on the Restore Status window, shows 100%, restart the server. Restart of all the nodes in the cluster is required in case of restoring only to the first node. Ensure that you restart the first node before you restart the subsequent nodes. For information about how to restart the server, see the What to Do Next section.

Note If you are restoring a Cisco Unified Communications Manager node only, the Cisco Unified Communications Manager and IM and Presence Service cluster must be restarted.

If you are restoring an IM and Presence Service Publisher node only, the IM and Presence Service cluster must be restarted.

What to do next

• (Optional) To view the status of the restore, see Check Restore Job Status, on page 150

• To restart a node, see Restart a Node, on page 149

Restore Subsequent Cluster Node

This procedure is applicable to the Cisco Unified Communications Manager subscriber (subsequent) nodes only. The first Cisco Unified Communications Manager node installed is the publisher node. All other Cisco Unified Communications Manager nodes, and all IM and Presence Service nodes are subscriber nodes.
Follow this procedure to restore one or more Cisco Unified Communications Manager subscriber nodes in the cluster.

**Before you begin**

Before you perform a restore operation, ensure that the hostname, IP address, DNS configuration, and deployment type of the restore matches the hostname, IP address, DNS configuration, and deployment type of the backup file that you want to restore. Disaster Recovery System does not restore across different hostnames, IP addresses, DNS configurations and deployment types.

Ensure that the software version that is installed on the server matches the version of the backup file that you want to restore. Disaster Recovery System supports only matching software versions for restore operations. If you are restoring the subsequent nodes after a rebuild, you must configure the backup device.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>

</table>

**What to do next**

- (Optional) To view the status of the restore, see [Check Restore Job Status, on page 150](#)
• To restart a node, see Restart a Node, on page 149

# Restore Cluster in One Step After Publisher Rebuilds

Depending on the size of your database and the components that you choose to restore, the system can require a few hours to restore. Follow this procedure to restore the entire cluster in one step if the publisher has already been rebuilt or freshly installed.

**Procedure**

**Step 1**
From the Disaster Recovery System, select **Restore > Restore Wizard**.

**Step 2**
In the **Restore Wizard Step 1** window **Select Backup Device** area, choose the backup device from which to restore.

**Step 3**
Click **Next**.

**Step 4**
In the **Restore Wizard Step 2** window, select the backup file that you want to restore.

The backup filename indicates the date and time that the system created the backup file.

Choose only the backup file of the cluster from which you want to restore the entire cluster.

**Step 5**
Click **Next**.

**Step 6**
In the **Restore Wizard Step 3** window, select the features that you want to restore.

The screen displays only those features that were saved to the backup file.

**Step 7**
Click **Next**.

**Step 8**
In the **Restore Wizard Step 4** window, click **One-Step Restore**.

This option appears on **Restore Wizard Step 4** window only if the backup file selected for restore is the backup file of the cluster and the features chosen for restore includes the feature(s) that is registered with both publisher and subscriber nodes. For more information, see Restore the First Node Only, on page 143 and Restore Subsequent Cluster Node, on page 144.

**Note**
If a status message indicates that *Publisher has failed to become cluster aware. Cannot start one-step restore*, you need to restore the publisher node and then the subscriber node. See the Related topics for more information.

This option allows the publisher to become cluster aware and will take five minutes to do so. Once you click on this option, a status message displays as “Please wait for 5 minutes until Publisher becomes cluster aware and do not start any backup or restore activity in this time period”.

After the delay, if the publisher becomes cluster aware, a status message displays as “Publisher has become cluster aware. Please select the servers and click on Restore to start the restore of entire cluster”.

After the delay, if the publisher has not become cluster aware, a status message displays as "Publisher has failed to become cluster aware. Cannot start one-step restore. Please go ahead and do a normal two-step restore." To restore the whole cluster in two-step (publisher and then subscriber), perform the steps mentioned in Restore the First Node Only, on page 143 and Restore Subsequent Cluster Node, on page 144.

**Step 9**
When you are prompted to choose the nodes to restore, choose all the nodes in the cluster.
The Disaster Recovery System restores the Cisco Unified Communications Manager database (CCMDB) on subsequent nodes automatically when you restore a first node. This may take up to several hours based on number of nodes and size of that database that is being restored.

**Step 10**  
Click **Restore**.  
Your data is restored on all the nodes of the cluster.

**Step 11**  
When the **Percentage Complete** field on the **Restore Status window** shows 100%, restart the server. Restart of all the nodes in the cluster is required in case of restoring only to the first node. Ensure that you restart the first node before you restart the subsequent nodes. For information about how to restart the server, see the What to Do Next section.

---

**What to do next**

- (Optional) To view the status of the restore, see **Check Restore Job Status**, on page 150
- To restart a node, see **Restart a Node**, on page 149

**Related Topics**

- **Restore the First Node Only**, on page 143
- **Restore Subsequent Cluster Node**, on page 144

---

**Restore Entire Cluster**

If a major hard drive failure or upgrade occurs, or in the event of a hard drive migration, you have to rebuild all nodes in the cluster. Follow these steps to restore an entire cluster.

If you are doing most other types of hardware upgrades, such as replacing a network card or adding memory, you do not need to perform this procedure.

**Procedure**

**Step 1**  
From Disaster Recovery System, select **Restore > Restore Wizard**.

**Step 2**  
In the **Select Backup Device** area, select the appropriate backup device to restore.

**Step 3**  
Click **Next**.

**Step 4**  
In the **Restore Wizard Step 2** window, select the backup file you want to restore.  
**Note**  
The backup filename indicates the date and time that the system created the backup file.

**Step 5**  
Click **Next**.

**Step 6**  
In the **Restore Wizard Step 3** window, click **Next**.

**Step 7**  
In the **Restore Wizard Step 4** window, select all the nodes when prompted to choose restore nodes.

**Step 8**  
Click **Restore** to restore the data.

The Disaster Recovery System restores the Cisco Unified Communications Manager database (CCMDB) on subsequent nodes automatically when you restore a first node. This may take up to several hours based on number of nodes and size of that database.  
Data is restored on the all the nodes.
During the restore process, do not perform any tasks with Cisco Unified Communications Manager Administration or User Options. Depending on the size of your database and the components that you choose to restore, the system can require a few hours to restore.

**Step 9**  
Restart the server once the restoration process is completed. See the What to Do Next section for more information about how to restart the server.

**Note**  
Make sure that you restart the first node before you restart the subsequent nodes.

After the first node has restarted and is running the restored version of Cisco Unified Communications Manager, restart the subsequent nodes.

**Step 10**  
Replication will be setup automatically after cluster reboot. Check the Replication Status value on all nodes by using the “utils dbreplication runtimestate” CLI command as described in the *Command Line Interface Reference Guide for Cisco Unified Communications Solutions*. The value on each node should equal 2.

**Note**  
Database replication on the subsequent nodes may take enough time to complete after the subsequent node restarts, depending on the size of the cluster.

**Tip**  
If replication does not set up properly, use the "utils dbreplication rebuild" CLI command as described in the *Command Line Interface Reference Guide for Cisco Unified Communications Solutions*.

---

**What to do next**

- (Optional) To view the status of the restore, see Check Restore Job Status, on page 150
- To restart a node, see Restart a Node, on page 149

---

**Restore Node Or Cluster to Last Known Good Configuration**

Follow this procedure to restore node or cluster to last known good configuration.

**Before you begin**

- Ensure that the restore file contains the hostname, IP address, DNS configuration, and deployment type that is configured in the backup file.
- Ensure that the Cisco Unified Communications Manager version installed on the server matches the version of the backup file that you want to restore.
- Ensure this procedure is used only to restore node to a last known good configuration.

**Procedure**

**Step 1**  
From the Disaster Recovery System, choose Restore > Restore Wizard.

**Step 2**  
In the Select Backup Device area, select the appropriate backup device to restore.

**Step 3**  
Click Next.
Step 4  In the **Restore Wizard Step 2** window, select the backup file you want to restore.

*Note*  The backup filename indicates the date and time that the system created the backup file.

Step 5  Click **Next**.

Step 6  In the **Restore Wizard Step 3** window, click **Next**.

Step 7  Select the appropriate node, when prompted to choose restore nodes.

  Data is restored on the chosen nodes.

Step 8  Restart all nodes in the cluster. Restart the first Cisco Unified Communications Manager node before restarting the subsequent Cisco Unified Communications Manager nodes. If the cluster also has Cisco IM and Presence nodes, restart the first Cisco IM and Presence node before restarting the subsequent IM and Presence nodes. See the **What to Do Next** section for more information.

### Restart a Node

You must restart a node after you restore data.

If you are restoring a publisher node (first node), you must restart the publisher node first. Restart subscriber nodes only after the publisher node has restarted and is successfully running the restored version of the software.

---

**Note**

Do not restart IM and Presence subscriber nodes if the CUCM publisher node is offline. In such cases, the node services will fail to start because the subscriber node is unable to connect to the CUCM publisher.

---

**Caution**

This procedure causes the system to restart and become temporarily out of service.

Perform this procedure on every node in the cluster that you need to restart.

### Procedure

Step 1  From Cisco Unified OS Administration, select **Settings > Version**.

Step 2  To restart the node, click **Restart**.

Step 3  Replication will be setup automatically after cluster reboot. Check the Replication Status value on all nodes by using the `utils dbreplication runtimestate` CLI command. The value on each node should be equal 2. See the Related Topics section below to find information about CLI commands.

If replication does not set up properly, use the `utils dbreplication reset` CLI command as described in the *Command Line Reference Guide for Cisco Unified Communications Solutions*. See the Related Topics section below to find information about CLI commands.

*Note*  Database replication on the subsequent nodes may take several hours to complete after the subsequent nodes restart, depending on the size of the cluster.
What to do next

(Optional) To view the status of the restore, see Check Restore Job Status, on page 150.

Check Restore Job Status

Follow this procedure to check the restore job status.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>From the Disaster Recovery System, select Restore &gt; Current Status.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>In the Restore Status window, click the log filename link to view the restore status.</td>
</tr>
</tbody>
</table>

View Restore History

Perform the following steps to view the restore history.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>From Disaster Recovery System, choose Restore &gt; History.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>From the Restore History window, you can view the restores that you have performed, including filename, backup device, completion date, result, version, features that were restored, and failed features. The Restore History window displays only the last 20 restore jobs.</td>
</tr>
</tbody>
</table>

Data Authentication

Trace Files

The following trace file locations are used during troubleshooting or while collecting the logs.

Trace files for the Master Agent, the GUI, each Local Agent, and the JSch library get written to the following locations:

- For the Master Agent, find the trace file at platform/drf/trace/drfMA0*
- For each Local Agent, find the trace file at platform/drf/trace/drfLA0*
- For the GUI, find the trace file at platform/drf/trace/drfConfLib0*
- For the JSch, find the trace file at platform/drf/trace/drfJSch*
Command Line Interface

The Disaster Recovery System also provides command line access to a subset of backup and restore functions, as shown in the following table. For more information on these commands and on using the command line interface, see the Command Line Interface Reference Guide for Cisco Unified Communications Solutions at http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-command-reference-list.html.

## Alarms and Messages

The Disaster Recovery System issues alarms for various errors that could occur during a backup or restore procedure. The following table provides a list of Cisco Disaster Recovery System alarms.

**Table 7: Disaster Recovery System Alarms and Messages**

<table>
<thead>
<tr>
<th>Alarm Name</th>
<th>Description</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRFBackupDeviceError</td>
<td>DRF backup process has problems accessing device.</td>
<td>DRS backup process encountered errors while it was accessing device.</td>
</tr>
<tr>
<td>DRFBackupFailure</td>
<td>Cisco DRF Backup process failed.</td>
<td>DRS backup process encountered errors.</td>
</tr>
<tr>
<td>DRFBackupInProgress</td>
<td>New backup cannot start while another backup is still running</td>
<td>DRS cannot start new backup while another backup is still running.</td>
</tr>
<tr>
<td>DRFInternalProcessFailure</td>
<td>DRF internal process encountered an error.</td>
<td>DRS internal process encountered an error.</td>
</tr>
<tr>
<td>DRFLA2MAFailure</td>
<td>DRF Local Agent cannot connect to Master Agent.</td>
<td>DRS Local Agent cannot connect to Master Agent.</td>
</tr>

</table>
Restore Interactions and Restrictions

Restore Restrictions

The following restrictions apply to using Disaster Recovery System to restore Cisco Unified Communications Manager or IM and Presence Service

Table 8: Restore Restrictions

<table>
<thead>
<tr>
<th>Restriction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export Restricted</td>
<td>You can restore the DRS backup from a restricted version only to a restricted version and the backup from an unrestricted version can be restored only to an unrestricted version. Note that if you upgrade to the U.S. export unrestricted version of Cisco Unified Communications Manager, you will not be able to later upgrade to or be able to perform a fresh install of the U.S. export restricted version of this software</td>
</tr>
<tr>
<td>Platform Migrations</td>
<td>You cannot use the Disaster Recovery System to migrate data between platforms (for example, from Windows to Linux or from Linux to Windows). A restore must run on the same product version as the backup. For information on data migration from a Windows-based platform to a Linux-based platform, see the Data Migration Assistant User Guide.</td>
</tr>
<tr>
<td>HW Replacement and Migrations</td>
<td>When you perform a DRS restore to migrate data to a new server, you must assign the new server the identical IP address and hostname that the old server used. Additionally, if DNS was configured when the backup was taken, then the same DNS configuration must be present prior to performing a restore. For more information about replacing a server, refer to the Replacing a Single Server or Cluster for Cisco Unified Communications Manager guide. In addition, you must run the Certificate Trust List (CTL) client after a hardware replacement. You must run the CTL client if you do not restore the subsequent node (subscriber) servers. In other cases, DRS backs up the certificates that you need. For more information, see the “Installing the CTL Client” and “Configuring the CTL Client” procedures in the Cisco Unified Communications Manager Security Guide.</td>
</tr>
<tr>
<td>Extension Mobility Cross Cluster</td>
<td>Extension Mobility Cross Cluster users who are logged in to a remote cluster at backup shall remain logged in after restore.</td>
</tr>
</tbody>
</table>
Troubleshooting

DRS Restore to Smaller Virtual Machine Fails

**Problem**
A database restore may fail if you restore an IM and Presence Service node to a VM with smaller disks.

**Cause**
This failure occurs when you migrate from a larger disk size to a smaller disk size.

**Solution**
Deploy a VM for the restore from an OVA template that has 2 virtual disks.
