

## Configure Intercluster Peers

---

- [Intercluster Peers Overview](#), on page 1
- [Intercluster Peers Prerequisites](#), on page 1
- [Intercluster Peers Configuration Task Flow](#), on page 2
- [Intercluster Peering Interactions and Restrictions](#), on page 8

## Intercluster Peers Overview

Intercluster peering provides the ability for users in one cluster to communicate and subscribe to the presence of users in a different cluster within the same domain. For large deployments you can use intercluster peering to connect your remote IM and Presence clusters.

Intercluster peering is configured on the database publisher node of both the local and the remote cluster.

For sizing and performance recommendations for intercluster deployments, see the chapter "Collaboration Instant Messaging and Presence" in the *Cisco Collaboration System Solution Reference Network Designs (SRND)* at [http://www.cisco.com/c/en/us/td/docs/voice\\_ip\\_comm/uc\\_system/design/guides/UCgoList.html#48016](http://www.cisco.com/c/en/us/td/docs/voice_ip_comm/uc_system/design/guides/UCgoList.html#48016)

## Intercluster Peers Prerequisites

Before you configure IM and Presence Service intercluster peers in your network, note the following:

- Configure the system topology and assign your users as required for all clusters.
- For the intercluster peer connection to work properly, the following ports must be left open if there is a firewall between the two clusters:
  - 8443 (AXL)
  - 7400 (XMPP)
  - 5060 (SIP) Only if SIP federation is being used
- For intercluster deployments, you must deploy a minimum OVA of 15,000 users. It is possible to have different clusters running different OVA sizes so long as all clusters are running at least the 15,000 user OVA.

**Note** Intercluster peering is not supported when the IM and Presence Service is deployed on a Cisco Business Edition 6000 server.

## Intercluster Peers Configuration Task Flow

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<a href="#">Check User Provisioning, on page 2</a>	Verify that end users are correctly provisioned before you configure intercluster peers.
<b>Step 2</b>	<a href="#">Enable the Cisco AXL Web Service, on page 3</a>	The Cisco AXL Web Service must be active on all local and remote IM and Presence nodes. Use this procedure to verify the service is running.
<b>Step 3</b>	<a href="#">Enable the Sync Agent, on page 3</a>	Enable the Sync Agent on the database publisher node of each intercluster peer.
<b>Step 4</b>	<a href="#">Configure Intercluster Peers, on page 4</a>	Complete this task on the database publisher node in each cluster to set up intercluster peers.
<b>Step 5</b>	<a href="#">Verify the Intercluster Sync Agent is On, on page 6</a>	The Intercluster Sync Agent must be running on all nodes in the IM and Presence Service cluster. Use this procedure to verify that the Intercluster Sync Agent parameter is running.
<b>Step 6</b>	<a href="#">Verify Intercluster Peer Status, on page 6</a>	Verify that the intercluster peer configuration works.
<b>Step 7</b>	<a href="#">Update Intercluster Sync Agent Tomcat Trust Certificates, on page 7</a>	If the tomcat certificate status for an intercluster peer is out-of-sync, update the Tomcat trust certificate.

## Check User Provisioning

Use this procedure to verify that end users are correctly provisioned before you configure intercluster peers.

### Procedure

- Step 1** From Cisco Unified CM IM and Presence Administration, choose **Diagnostics > System Troubleshooter**. The System Troubleshooter runs.

- Step 2** In the **User Troubleshooter** section, verify that end users are correctly provisioned and that there are no duplicate or invalid users.
- 

#### What to do next

[Enable the Cisco AXL Web Service, on page 3](#)

## Enable the Cisco AXL Web Service

The Cisco AXL Web Service must be running on all local and remote IM and Presence cluster nodes. By default, this service is running. However, you can use this procedure to verify that the service is running.

**Note** When you enable the Cisco AXL Web Service, the system creates an intercluster application user with AXL permissions. You will need the username and password for the intercluster application user when you configure intercluster peers on the remote IM and Presence Service node.

---

#### Procedure

---

- Step 1** From Cisco Unified IM and Presence Serviceability, choose **Tools > Control Center - Feature Services**.
- Step 2** From the **Server** list, choose the node on which you want to reactivate services and click **Go**.
- Step 3** In the **Database and Admin Services** area, check the **Status** of the **Cisco AXL Web Service**.
- If the service is **Started**, no action is required.
  - If the service is **Not Running**, select the service and click **Restart**.
- Step 4** Repeat this procedure on all cluster nodes in the local and remote clusters.
- 

#### What to do next

[Enable the Sync Agent, on page 3](#)

## Enable the Sync Agent

The Cisco Sync Agent must be running on the database publisher node of each intercluster peer on the local and remote IM and Presence database publisher nodes.

#### Procedure

---

- Step 1** From Cisco Unified IM and Presence Serviceability, choose **Tools > Control Center - Network Services**.
- Step 2** From the **Server** drop-down list box, choose the IM and Presence database publisher node and click **Go**.
- Step 3** Under **IM and Presence Services**, verify that the **Cisco Sync Agent** status is **Running**.
- Step 4** If the service is not running, select the service and click **Restart**.

**Step 5** Repeat this procedure in each cluster

---

### What to do next

After the Cisco Sync Agent completes the user sync from Cisco Unified Communications Manager, [Configure Intercluster Peers, on page 4](#)

## Configure Intercluster Peers

Use this procedure on the database publisher node for both the local and remote cluster to set up an intercluster peer relationship.

### Before you begin

- Confirm that the Sync Agent has completed the user synchronization from Cisco Unified Communications Manager on the local and remote cluster. If you configure the intercluster peer connection before the Sync Agent completes the user sync, the status of the intercluster peer connection displays as **Failed**.
- Make sure that you have the AXL username and password for the intercluster application user on the remote IM and Presence Service node.

### Procedure

---

**Step 1** In Cisco Unified CM IM and Presence Administration, choose **Presence > Inter-Clustering**.

**Step 2** Click **Add New**.

**Step 3** In the **Peer Address** field, enter the node name of the remote cluster's database publisher node. This field may be an IP address, hostname or FQDN, but must match the actual node name that defines the server.

- Note**
- To verify the type of address the node name uses, log in to the Cisco Unified CM IM and Presence Administration on the remote cluster and choose **System > Presence Topology**. This window displays the node name and server details for each cluster node.
  - Split-brain scenario may occur in a cluster that is part of multicluster environment. For example, there is a cluster A, and its multicluster peers are cluster B, C, D, and E. Nodes in cluster A must be able to reach DNS during split-brain scenario, because they have to communicate with other clusters B, C, D, and E in a multicluster environment during split-brain scenario.

During split-brain scenario, If the nodes in cluster A cannot reach DNS then the IP addresses of A,B,C,D, and E cluster nodes should be set as node names, and NOT the hostnames and FQDNs.

If the nodes in cluster A,B,C,D, and E are defined with FQDNs or hostnames, and they are not able to reach DNS during split-brain scenario, then service outages such as loss of IM Presence updates and loss of IM history occurs between clusters A and B,C,D,E.

**Step 4** Enter the AXL credentials.

**Step 5** Select the preferred **Protocol** for SIP communication.

**Note** Cisco recommends that you use **TCP** (the default setting) as the intercluster trunk transport for all IM and Presence Service clusters. You can change this setting if it suits your network configuration and security needs.

**Step 6** Click **Save**.

**Step 7** Check your notifications in the top right of the GUI header. If a notification advises you to restart the **Cisco XCP Router**, then do the following. Otherwise, you can skip this step:

- a) From Cisco Unified IM and Presence Serviceability, choose **Tools > Control Center - Network Services**.
- b) From the **Server** drop-down list box, choose an IM and Presence node and click **Go**.
- c) Select **Cisco XCP Router** and click **Restart**.
- d) Repeat these steps on all cluster nodes

**Step 8** Repeat this procedure on the database publisher node of each remote peer cluster.

**Tip** If you choose **TLS** as the intercluster transport protocol, the IM and Presence Service attempts to automatically exchange certificates between intercluster peers to establish a secure TLS connection. IM and Presence Service indicates whether the certificate exchange is successful in the intercluster peer status section.

---

#### What to do next

[Verify the Intercluster Sync Agent is On, on page 6](#)

## Restart the XCP Router Service

Restart the Cisco XCP Router service on all nodes in the local cluster, as well as all nodes in the remote cluster.

#### Before you begin

[Configure Intercluster Peers, on page 4](#)

#### Procedure

---

**Step 1** From Cisco Unified IM and Presence Serviceability, choose **Tools > Control Center - Network Services**.

**Step 2** From the **Server** list, choose the node on which you want to reactivate services and click **Go**.

**Step 3** In the **IM and Presence Services** area, select **Cisco XCP Router**.

**Step 4** Click **Restart**.

---

#### What to do next

[Verify the Intercluster Sync Agent is On, on page 6](#)

## Verify the Intercluster Sync Agent is On

The Intercluster Sync Agent network service synchronizes user information between intercluster peers. Use this procedure to confirm that the service is running on all cluster nodes in each intercluster peer.

### Procedure

- 
- Step 1** From Cisco Unified IM and Presence Serviceability, choose **Tools > Control Center - Network Services**.
  - Step 2** From the **Server** menu, choose an IM and Presence Service node and click **Go**.
  - Step 3** Confirm that the **Cisco Intercluster Sync Agent** displays a status of **Running**.
  - Step 4** If the service is not running, select the service and click **Start**.
  - Step 5** Repeat this procedure for all cluster nodes on each intercluster peer.
- 

### What to do next

[Verify Intercluster Peer Status, on page 6](#)

## Verify Intercluster Peer Status

Use this procedure to confirm that your intercluster peer configurations are working properly.

### Procedure

- 
- Step 1** In **Cisco Unified CM IM and Presence Administration**, choose **Presence > Inter-Clustering**.
  - Step 2** Choose the peer address from the search criteria menu.
  - Step 3** Click **Find**.
  - Step 4** In the Intercluster Peer Status window:
    - a) Verify that there are check marks beside each of the result entries for the intercluster peer.
    - b) Make sure that the **Associated Users** value equals the number of users on the remote cluster.
    - c) If you chose **TLS** as the intercluster transport protocol, the **Certificate Status** item displays the status of the TLS connection, and indicates if IM and Presence Service successfully exchanged security certificates between the clusters. If the certificate is out-of-sync, you need to manually update the tomcat-trust certificate (as described in this module). For any other certificate exchange errors, check the Online Help for a recommended action.
  - Step 5** Run the System Troubleshooter:
    - a) From Cisco Unified CM IM and Presence Administration, choose **Diagnostics > System Troubleshooter**.
    - b) In the **Inter-Clustering Troubleshooter** section, verify that there are check marks beside the status of each of the intercluster peer connection entries.
- 

### What to do next

[Update Intercluster Sync Agent Tomcat Trust Certificates, on page 7](#)

## Update Intercluster Sync Agent Tomcat Trust Certificates

If a connection error appears occurs on the local cluster, and the corrupt Tomcat trust certificates are associated with the remote cluster, use this procedure to update the Tomcat trust certificate.

If the tomcat certificate status for an intercluster peer is out-of-sync, you must update the Tomcat trust certificate. In an intercluster deployment, this error can occur if you reuse an existing intercluster peer configuration to point to a new remote cluster. This error can also occur in a fresh IM and Presence Service installation, if you change the IM and Presence Service host or domain name, or if you regenerate the Tomcat certificate.

### Procedure

---

**Step 1** In **Cisco Unified CM IM and Presence Administration**, choose **Presence > Inter-Clustering**.

**Step 2** Click **Force Sync** to synchronize certificates with the remote cluster.

**Step 3** In the confirmation window that displays, choose **Also resync peer's Tomcat certificates**.

**Step 4** Click **OK**.

**Note** If there are any certificates that have not synced automatically, go to the Intercluster Peer Configuration window. All certificates marked with an X are the missing certificates which you need to copy manually.

---

## Delete Intercluster Peer Connections

Use this procedure if you want to remove an intercluster peer relationship.

### Procedure

---

**Step 1** Log in to the IM and Presence Service database publisher node.

**Step 2** From Cisco Unified CM IM and Presence Administration, choose **Presence > Inter-Clustering**.

**Step 3** Click **Find** and select the intercluster peer that you want to remove.

**Step 4** Click **Delete**.

**Step 5** Restart the **Cisco XCP Router**:

- Log in to Unified IM and Presence Serviceability and choose **Tools > Control Center - Network Services**.
- From the **Server** list, choose the database publisher node and click **Go**.
- Under **IM and Presence Services**, select **Cisco XCP Router** and click **Restart**.

**Step 6** Repeat these steps on the peer cluster.

**Note** If you are removing an intercluster peer from an intercluster network with multiple clusters, you must repeat this procedure for each peer cluster that remains in the intercluster network. This means that, on the cluster that is being removed, there will be as many cycles of **Cisco XCP Router** restarts as there are peer cluster connections that are being broken.

---

## Intercluster Peering Interactions and Restrictions

Feature	Interactions and Restrictions
Cisco Business Edition 6000	Intercluster peering is not supported when the IM and Presence Service is deployed on a Cisco Business Edition 6000 server.
Cluster Limit	With intercluster peering, you can deploy up to 30 IM and Presence Service clusters in the intercluster mesh, irrespective of whether those clusters are centralized or decentralized.
Intercluster Sync Agent resource shortage in multi cluster deployment	<p>ICSA requires more resources in multi cluster deployment with large number of clusters. In case you face any issues with ICSA or SRM due to resource shortage. We recommend you to change the below mentioned Cisco SIP Proxy Service Parameters from default value of 20 to a new value of 10.</p> <ul style="list-style-type: none"> <li>• Maximum no. of processes</li> <li>• Maximum no. of spare processes</li> <li>• Maximum no. of processes</li> </ul> <p>Restart the SIP Proxy Service for the changes to take effect.</p> <p>Restart SRM and ICSA services.</p>
Intercluster Sync Agent and DNS	Intercluster Sync Agent uses DNS to resolve all CUCM and IM&P servers listed in peer cluster's tomcat certificate (SAN entries). If the DNS resolution fails, Intercluster Sync Agent will not connect to the remote peer.
