Introduction to Cisco Prime Collaboration Deployment

Cisco Prime Collaboration Deployment is an application that is designed to assist in the management of Unified Communications (UC) applications. It allows you to perform tasks such as migration of older software versions of clusters to new virtual machines, fresh installs, and upgrades on existing clusters.

Cisco Prime Collaboration Deployment has four primary high-level functions:

• Migrate an existing cluster of UC servers to a new cluster (such as MCS 7800 to virtual or virtual to virtual)

• Perform operations on existing clusters (8.6(1) or later). Examples of these operations include:
  • Upgrade
  • Switch version
  • Restart

• Change IP addresses or hostnames in the cluster on existing Release 10.x clusters.

- All the IP addresses that are mentioned in this document applies only for the IPv4 address format.

• Fresh install a new Release 10.x or 11.x Unified Communications cluster

Note

Cisco Prime Collaboration Deployment features are only supported by specific software versions. For details on software versions that are compatible with each Cisco Prime Collaboration Deployment feature, see Supported Tasks for Applications and Versions, on page 24. For details on supported upgrade paths, see Upgrade Paths for Export Restricted and Unrestricted Software, on page 28.
Install Cisco Prime Collaboration Deployment

- System Requirements for Installation, page 3
- Browser Requirements, page 4
- IP Address Requirements, page 4
- Virtualization Software License Types, page 4
- Frequently Asked Questions About the Installation, page 5
- Preinstallation Tasks, page 6
- Begin Installation, page 14
- Install Cisco Prime Collaboration Deployment, page 14
- Postinstallation Tasks, page 18

System Requirements for Installation

As defined in the open virtualization format (OVA) that you must use to install Cisco Prime Collaboration Deployment, the following are the server requirements.

Table 1: Cisco Prime Collaboration Deployment Installation Server Requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product</td>
<td>Cisco Prime Collaboration Deployment</td>
</tr>
<tr>
<td>Version</td>
<td>11.5(3)</td>
</tr>
<tr>
<td>CPU</td>
<td>2 vCPUs</td>
</tr>
<tr>
<td>Memory</td>
<td>4 GB</td>
</tr>
<tr>
<td>Hard Drive</td>
<td>80 GB (one)</td>
</tr>
<tr>
<td>Licensing</td>
<td>Cisco Prime Collaboration Deployment does not require a license</td>
</tr>
</tbody>
</table>
Browser Requirements

Cisco Prime Collaboration Deployment provides a GUI interface that you can use to configure and manage the system. You can access the interfaces by using the browsers and operating systems listed here.

Note
Other browsers are not supported.

Cisco Prime Collaboration Deployment supports the following operating system browsers:

- Mozilla Firefox 42
- Mozilla Firefox ESR 38.4
- Google Chrome 46
- Microsoft Internet Explorer (IE) 9, 10, 11
- Apple Safari 7

From any user PC in your network, browse to a server that is running Cisco Prime Collaboration Deployment and log in with administrative privileges.

Note
Simultaneous login to Cisco Prime Collaboration Deployment Administration GUI by more than five users can affect performance. Limit the number of users and administrators that are logged in simultaneously.

Note
Cisco Prime Collaboration Deployment Administration does not support the buttons in your browser. Do not use the browser buttons (for example, the Back button) when you perform configuration tasks.

IP Address Requirements

You must configure the Cisco Prime Collaboration Deployment server to use static IP addressing to ensure that the server obtains a fixed IP address.

Virtualization Software License Types

The VMware vSphere ESXi license is required for the physical server with ESXi that hosts the Cisco Prime Collaboration Deployment virtual machine in addition to any additional physical servers with ESXi on which Cisco Prime Collaboration Deployment will operate. This includes virtual machines to which Cisco Prime Collaboration Deployment is migrating, installing, upgrading, or rebooting.
Cisco Prime Collaboration Deployment is not compatible with all license types of VMware vSphere ESXi, because some of these licenses do not enable required VMware APIs.

Note
Cisco Business Edition 6000 and Cisco Business Edition 7000 servers, which are originally shipped with Cisco Collaboration Systems Release (CSR) 11.0 or older software preload, are preinstalled with Cisco UC Virtualization Hypervisor. If you plan to use Cisco Prime Collaboration Deployment with application VMs on these servers, you must substitute a higher virtualization software feature level.

The following are compatible with Cisco Prime Collaboration Deployment:

- Cisco UC Virtualization Foundation (appears as “Foundation Edition” in vSphere Client)
- Cisco UC Virtualization Hypervisor Plus 6.0 or higher
- Evaluation mode license (for example, for lab deployments and not production use)

The following are not compatible with Cisco Prime Collaboration Deployment:

- Cisco UC Virtualization Hypervisor (appears as “Hypervisor Edition” in vSphere Client)
- VMware vSphere Hypervisor Edition

Frequently Asked Questions About the Installation

Review this section carefully before you begin the installation.

How much time does the installation require?

The entire Cisco Prime Collaboration Deployment installation process, excluding pre- and postinstallation tasks, takes approximately 30 minutes.

What usernames and passwords do I need to specify?

Note
The system checks your passwords for strength. For guidelines on creating a strong passwords, see “What Is a Strong Password?” below.

During the installation, you must specify the following usernames and passwords:

- Administrator account username and password
- Security password

You use the Administrator account username and password to log in to the following areas:

- Cisco Prime Collaboration Deployment GUI interface
- Command line interface

When you choose an administrator account username and password, follow these guidelines:
• Administrator account username—Must start with an alphabetic character and can contain alphanumeric characters, hyphens, and underscores.

• Administrator account password—Must be at least six characters long and can contain alphanumeric characters, hyphens, and underscores.

You can change the administrator account password or add a new administrator account by using the command line interface. For more information, see the “Command line interface for Cisco Prime Collaboration Deployment” section.

For the security password, the password must be at least six characters long and can contain alphanumeric characters, hyphens, and underscores.

**What is a strong password?**

The Installation wizard checks to ensure that you enter a strong password. To create a strong password, follow these recommendations:

• Mix uppercase and lowercase letters.
• Mix letters and numbers.
• Include hyphens and underscores.
• Remember that longer passwords are stronger and more secure than shorter ones.

Avoid the following types of passwords:

• Do not use recognizable words, such as proper names and dictionary words, even when combined with numbers.
• Do not invert recognizable words.
• Do not use word or number patterns, such as aaabbb, qwerty, zyxwvuts, 123321, and so on.
• Do not use recognizable words from other languages.
• Do not use personal information of any kind, including birthdays, postal codes, or names of children or pets.

**Note**

Ensure that the ESXi and cluster passwords (install/discovered/migration) are less than 16 characters.

**Can I install other software on the virtual machine?**

You cannot install or use unapproved third-party software applications. The system can upload and process only software that is Cisco approved.

You can use the CLI to perform approved software installations and upgrades.

**Preinstallation Tasks**

The following table contains a list of preinstallation tasks that you must perform to install Cisco Prime Collaboration Deployment.
Table 2: Preinstallation Tasks

<table>
<thead>
<tr>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 Read this entire chapter to familiarize yourself with the installation procedure.</td>
</tr>
<tr>
<td>Step 2 Verify that the server on which you plan to install Cisco Prime Collaboration Deployment is properly configured in the DNS.</td>
</tr>
<tr>
<td>Step 3 Record the configuration settings for the server that you plan to install.</td>
</tr>
</tbody>
</table>

Allow Network Traffic

This section describes the minimum required ports that you must configure to support the Cisco Prime Collaboration Deployment server. The following table provides a summary of the ports that you must configure on a corporate firewall. The port configurations that are listed in this table are based on default settings. If you change the default settings, you must update these configurations.

If other servers or ports are required on your network, you must allow for that traffic.

Note

Cisco Prime Collaboration Deployment migration requires the use of network file system (NFS) mounts on the ESXi host of the destination virtual machine. You may require additional protocols or ports. See the ESXi documentation at http://www.VMware.com for details.

Gather Information for Installation

Use the following table to record information about Cisco Prime Collaboration Deployment. You may not need to obtain all the information; gather only the information that is relevant to your system and network configuration.

---
**Note**

Because some of the fields are optional, they may not apply to your configuration.

---
**Caution**

You cannot change some of the fields after installation without reinstalling the software, so be sure to enter the values that you want. The last column in the table shows whether you can change a field after installation; if so, the applicable CLI command is shown.

### Table 5: Server Configuration Data

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can Entry Be Changed After Installation?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator ID</td>
<td>This field specifies the Administrator account user ID that you use for secure shell access to the CLI on Cisco Prime Collaboration Deployment.</td>
<td>No, you cannot change the entry after installation.</td>
</tr>
<tr>
<td>Administrator Password</td>
<td>This field specifies the password for the Administrator account, which you use for secure shell access to the CLI. You also use this password with the adminsftp user. You use the adminsftp user to access local backup files, upload server licenses, and so on. Ensure the password is at least six characters long; the password can contain alphanumeric characters, hyphens, and underscores.</td>
<td>Yes, you can change the entry after installation by running the following CLI command: set password user admin</td>
</tr>
<tr>
<td>Country</td>
<td>From the list, choose the applicable country for your installation.</td>
<td>Yes, you can change the entry after installation by running the following CLI command: set web-security</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td>Can Entry Be Changed After Installation?</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------</td>
</tr>
<tr>
<td>DHCP</td>
<td>Cisco requires that you choose No to the DHCP option. After you choose No, enter a hostname, IP address, IP mask, and gateway.</td>
<td>No, do not change the entry after installation.</td>
</tr>
<tr>
<td>DNS Enable</td>
<td>A DNS server resolves a hostname into an IP address or an IP address into a hostname. Cisco Prime Collaboration Deployment requires that you use a DNS server. Choose Yes to enable DNS.</td>
<td>No, do not change the entry after installation.</td>
</tr>
</tbody>
</table>
| DNS Primary       | Enter the IP address of the DNS server that you want to specify as the primary DNS server. Enter the IP address in dotted decimal format as ddd.ddd.ddd.ddd.                                                   | Yes, you can change the entry after installation by running the following CLI command: set network dns  
  set network gateway  
  show network eth0 detail |
| DNS Secondary (optional) | Enter the IP address of the DNS server that you want to specify as the optional secondary DNS server.                                                                                                      | Yes, you can change the entry after installation by running the following CLI command: set network dns  
  set network gateway  
  show network eth0 detail |
<p>| Gateway Address   | Enter the IP address of the network gateway. If you do not have a gateway, you must still set this field to 255.255.255.255. Without a gateway, you may limited to communicating only with devices on your subnet.             | Yes, you can change the entry after installation by running the following CLI command: set network gateway |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can Entry Be Changed After Installation?</th>
</tr>
</thead>
</table>
| Hostname    | Enter a hostname that is unique to your server.  
The hostname can consist of up to 64 characters and can contain alphanumeric characters and hyphens. The first character cannot be a hyphen.  
**Important** Do not change your hostname while any tasks are running. | Yes, you can change the entry after installation.  
*set network hostname* |
| IP Address  | Enter the IP address of your server.                                                                                                                                                                       | Yes, you can change the entry after installation.  
*set network ip eth0* |
| IP Mask     | Enter the IP subnet mask of this machine.                                                                                                                                                                  | Yes, you can change the entry after installation by using the following CLI command:  
*set network ip eth0* |
| Location    | Enter the location of the server.  
You can enter any location that is meaningful within your organization. Examples include the state or the city where the server is located.                                                              | Yes, you can change the entry after installation by using the following CLI command:  
*set web-security* |
| MTU Size    | The maximum transmission unit (MTU) represents the largest packet, in bytes, that this host will transmit on the network.  
Enter the MTU size in bytes for your network. If you are unsure of the MTU setting for your network, use the default value.  
The default value is 1500 bytes. | Yes, you can change the entry after installation by running the following CLI command:  
*set network mtu* |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Can Entry Be Changed After Installation?</th>
</tr>
</thead>
<tbody>
<tr>
<td>NTP Server</td>
<td>Enter the hostname or IP address of one or more Network Time Protocol (NTP) servers with which you want to synchronize. You can enter up to five NTP servers. <strong>Caution</strong> To avoid potential compatibility, accuracy, and network jitter problems, the external NTP servers that you specify for the primary node can be NTP v4 (version 4). If you are using IPv6 addressing, external NTP servers must be NTP v4.</td>
<td>Yes, you can change the entry after installation by running the following CLI command: <strong>utils ntp server</strong></td>
</tr>
<tr>
<td>Organization</td>
<td>Enter the name of your organization. <strong>Tip</strong> You can use this field to enter multiple organizational units. To enter more than one organizational unit name, separate the entries with a comma. For entries that already contain a comma, enter a backslash before the comma that is included as part of the entry.</td>
<td>Yes, you can change the entry after installation by running the following CLI command: <strong>set web-security</strong></td>
</tr>
<tr>
<td>Security Password</td>
<td>Enter your security password. The password must contain at least six alphanumeric characters. The password can contain hyphens and underscores, but it must start with an alphanumeric character. <strong>Note</strong> Save this password.</td>
<td>Yes, you can change the entry after installation by running the following CLI command: <strong>set password user security</strong></td>
</tr>
<tr>
<td>State</td>
<td>Enter the state in which the server is located.</td>
<td>Yes, you can change the entry after installation by running the following CLI command: <strong>set web-security</strong></td>
</tr>
</tbody>

Install Cisco Prime Collaboration Deployment

Extract the PCD_VAPP.OVA File

Cisco Prime Collaboration Deployment is delivered with Unified Communications Manager, through a new purchase or an entitled upgrade that you access through the Product Upgrade Tool (PUT).
If you specify physical delivery in PUT, you will receive a DVD that contains an ISO file. You run this file to get an OVA file, which contains a preinstalled Cisco Prime Collaboration Deployment inside a virtual machine.

If you specify eDelivery in PUT, you will receive a Cisco Prime Collaboration Deployment download link in the email that contains media and license links. This link points to an OVA file that contains a preinstalled Cisco Prime Collaboration Deployment inside a virtual machine.

**Procedure**

**Step 1**
Extract the PCD_VAPP.OVA from the pcd_vApp_UCOS_10.xxxxx.iso file. A new PCD_VAPP.OVA file is created. Verify the file size; ISO and OVA files do not have the same file size.

**Step 2**
Deploy the PCD_VAPP.OVA file in vCenter to install Cisco Prime Collaboration Deployment. If you are using the vSphere client, the name of this file may be PCD_VAPP.OVA. If you are using the VMware vSphere web client to deploy the file, you must first change the name to PCD_VAPP.ova (lowercase) before you deploy the file.

---

### Install the Virtual Machine

**Before You Begin**

- Download the OVA image.

- Read the "Preinstallation Tasks" section.

- Place a copy of the OVA on your local drive, depending on the installation type you are using.
<table>
<thead>
<tr>
<th>Installation Type</th>
<th>Filename</th>
<th>Used with ESXi Host Software Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>OVA</td>
<td>PCD_VAPP.OVA or PCD_VAPP.ova</td>
<td>4.1, 5.0, 5.5, and 6.0</td>
</tr>
</tbody>
</table>

**Note** The name of the OVA file depends on whether you are using vSphere client or VMware vSphere web client to deploy the file. For more information, see Extract the PCD_VAPP.OVA File, on page 14

- Determine the following information for creating a virtual machine for Cisco Prime Collaboration Deployment and mapping the required port groups:
  - A name for the new Cisco Prime Collaboration Deployment that is unique within the inventory folder and up to 80 characters.
  - The name of the host where the Cisco Prime Collaboration Deployment is to be installed in the inventory folder.
  - The name of the datastore in which the VM files is to be stored.
  - The names of the network port groups used for the VM.

**Procedure**

**Step 1** Log in to vCenter.

**Step 2** From the vSphere Client, choose **File > Deploy OVF Template**.

**Step 3** Specify the location of the OVA file and click **Next**.

The **OVF Template Details** window opens and the product information is displayed, including the size of the file and the size of the VM disk.

**Step 4** Click **Next**.

**Step 5** Enter the name of your VM and select the location where the OVA is to be deployed. Click **Next**.

**Step 6** Select the data center or cluster on which to install the OVA. Click **Next**.

**Step 7** Select the VM Storage Profile. Click **Next**.

**Step 8** Select the Disk Format. Click **Next**.

**Step 9** If necessary, select the network that the OVA uses for deployment. Click **Next**.

**Step 10** Review the options that you selected, and if no changes are required, click **Finish** to begin the OVA installation. After the installation is complete, the newly installed virtual machine appears in the selected location within vCenter.
Configure Cisco Prime Collaboration Deployment on the Virtual Machine

Cisco Prime Collaboration Deployment is installed as part of the OVA installation, but then you must configure it.

**Procedure**

**Step 1** From the vCenter window, open the console of your newly installed virtual machine.

**Step 2** Power on the virtual machine.
The installation begins automatically.

**Step 3** When you are asked if you have preexisting configuration information, click *Continue* to proceed. The Platform Installation Wizard screen appears.

**Step 4** Click *Proceed* to continue with the wizard.

**Step 5** Click *Continue* at the Basic Install screen.

**Step 6** In the Timezone Configuration screen, select your timezone and click *OK*.

**Step 7** Click *Continue* at the Auto Negotiation Configuration screen.

**Step 8** When asked if you want to change the MTU size from the OS default, click *No* to proceed.

**Step 9** For network configuration, you can choose to either set up a static network IP address for the node or to use Dynamic Host Configuration Protocol (DHCP). Static IP addresses are recommended. If you use DHCP, use static DHCP.

- If you have a DHCP server that is configured in your network and want to use DHCP, click *Yes*. The network restarts, and the Administrator Login Configuration window appears.
- If you want to configure a static IP address for the node, click *No*. The Static Network Configuration window appears.

**Step 10** If you chose not to use DHCP, enter your static network configuration values and click *OK*. The DNS Client Configuration window appears.

**Step 11** To enable DNS, click *Yes*, enter your DNS client information, and click *OK*. The network restarts by using the new configuration information, and the Administrator Login Configuration window appears.

**Step 12** Enter your Administrator username and password.

**Note** The Administrator username must start with an alphabetic character, be at least six characters long, and can contain alphanumeric characters, hyphens, and underscores. You will need the Administrator username to log in to Cisco Unified Communications Operating System Administration, the command line interface, and the Disaster Recovery System.

**Step 13** Enter the Certificate Information:

- Organization
- Unit
- Location
- State
• Country

**Step 14** Click **OK** to proceed.

**Step 15** Enter your Network Time Protocol (NTP) client configuration information. To test this configuration, click **Test**.

**Step 16** Click **Proceed** to configure the NTP.

**Step 17** When asked, enter your security password.

**Step 18** When the platform configuration is complete, click **OK** to complete the installation. The installation takes a few minutes to complete.

---

### Postinstallation Tasks

**Procedure**

**Step 1** Configure the backup settings. Remember to back up your Cisco Prime Collaboration Deployment data frequently. For details about how to set up a backup schedule, see [CLI Commands and Disaster Recovery System](#), on page 135.

**Step 2** Verify that you have a valid Network Time Protocol (NTP). To perform this check, log in to the Cisco Prime Collaboration Deployment CLI and run the command `utils ntp status`. 
Upgrade Cisco Prime Collaboration Deployment

• Upgrade Cisco Prime Collaboration Deployment Using CLI, page 19

Upgrade Cisco Prime Collaboration Deployment Using CLI

To upgrade the software version of Cisco Prime Collaboration Deployment, use the `utils system upgrade initiate` CLI command. There are four options, depending on where you have placed the new ISO file on an external filesystem or on Cisco Prime Collaboration Deployment itself.

Before You Begin

You must place the non-bootable ISO file on a network location or remote drive that is accessible from Cisco Prime Collaboration Deployment.

Procedure

Step 1

If you want to place the ISO on Cisco Prime Collaboration Deployment, upload it to the Cisco Prime Collaboration Deployment server `/upgrade` folder by performing the following steps:

   a) sftp adminsftp@<Cisco Prime Collaboration Deployment IP>
   b) cd upgrade
   c) put <name of iso file>

   Note: If you are using a remote file system, place the ISO file there. Be sure that it can be accessed through SFTP or FTP.

Step 2

Log on to the CLI interface of the Cisco Prime Collaboration Deployment server, and use the `utils system upgrade initiate` CLI command. You will be asked to choose an option, based on where your ISO is located.

Warning: Do not close this window without first canceling the upgrade.

1) Remote Filesystem via SFTP
2) Remote Filesystem via FTP
3) Local DVD/CD
4) Local Upload Directory
5) Quit
Please select an option (1-4 or "q"):

**Step 3** Perform one of the following steps:

- If the ISO file is in the `/upgrade` folder of Cisco Prime Collaboration Deployment, choose option 4.
- If the ISO file is on a remote file system, choose option 1 or 2, depending on whether you wish to use SFTP or FTP.

**Step 4** The system searches the directory for files to upgrade to and displays those filenames. Select the file that you wish to upgrade the Cisco Prime Collaboration Deployment system to by choosing the number of that file.

**Step 5** Indicate whether you want the system to automatically switch to the upgraded version if the upgrade is successful.

**Example:**

Automatically switch
versions if the upgrade is successful (yes/no): yes

**Step 6** Start the installation:

Start installation (yes/no): yes
The upgrade log is `install_log_2013-10-07.20.57.17.log`
Upgrading the system. Please wait...
10/07/2013 20:57:18 file_list.sh|Starting file_list.sh|<LVL::Info>
10/07/2013 20:57:18 file_list.sh|Parse argument
method=local_upload_dir|<LVL::Debug>
10/07/2013 20:57:18 file_list.sh|Parse argument source_dir=|<LVL::Debug>
dest_file=/var/log/install/downloaded_versions|<LVL::Debug>
The installation begins.

**Step 7** After the installation is complete, use the `show version active` CLI command to see the current version of your Cisco Prime Collaboration Deployment software.

**Example:**

Active Master Version: 11.0.x.xxxxx-xxxx
Active Version Installed Software Options:
No Installed Software Options Found.

Cisco Prime Collaboration Deployment Considerations

Cisco Prime Collaboration Deployment allows a user to perform tasks (such as migration or upgrade) on servers that are in the inventory.
<table>
<thead>
<tr>
<th>Step</th>
<th>Tasks</th>
</tr>
</thead>
</table>
| Step 1: Inventory Creation    | To perform any tasks, you must first have clusters in your inventory. To add a UC cluster that is already running UC applications to your inventory, click the open and close navigation button and choose the **Inventory > Clusters > Discovery Cluster** feature.  
To migrate an existing cluster to new virtual machines, click the open and close navigation button and choose **Inventory > Clusters > Define Migration Destination Cluster**. (See **Migration Task**, on page 36.)  
To install a new cluster, click the open and close navigation button and choose the **Inventory > Clusters > Define New UC Cluster** feature. (See **Install Task**, on page 57.)  
If you are migrating an existing cluster to a new virtual machine cluster, or installing a new cluster, you must first add the ESXi Hosts that contain those virtual machines to your inventory. To add an ESXi host, click the open and close navigation button and choose **Inventory > ESXi Hosts**. (See **Add an ESXi Host Server**, on page 32.) |
| Step 2: Create a Task         | You can create a task to perform an operation on a cluster in your inventory. During task creation, options allow you to:  
• Choose the cluster  
  **Note** This task depends on the type of cluster you require. For example, you may choose a discovered cluster or a migration cluster.  
• Determine when to run the task  
• Determine if the task should run independently or pause between steps  
To perform one of the following actions, select from these procedures:  
• To migrate from an existing cluster to a new cluster of VM machines, see **Migration Task**, on page 36.  
• To upgrade the Unified Communications Manager version of an existing cluster, see **Upgrade Task**, on page 47.  
• To switch the version of an existing cluster, see **Switch Versions Task**, on page 51.  
• To restart an existing cluster, see **Server Restart Task**, on page 53.  
• To change the hostname or IP address of one or more servers in an existing cluster, see **Readdress Task**, on page 55.  
• To create a new UC cluster from VM machines, see **Install Task**, on page 57. |
| Step 3: Monitor Tasks         | After a task is created, you can use the Monitoring window to view or track any task. You can also use this page to cancel, pause, or resume tasks.  
To view the tasks you created, see **Monitor Task Status**, on page 63. |
Network Address Translation Support

Cisco Prime Collaboration Deployment supports Network Access Translation (NAT). You can use Cisco Prime Collaboration Deployment in the following scenarios:

- When Cisco Prime Collaboration Deployment is in a local network or private network and application nodes are behind the NAT.
- When Cisco Prime Collaboration Deployment is behind the NAT and application nodes are in a private network.

To support application nodes behind the NAT, Cisco Prime Collaboration Deployment tracks the private IP address and the NAT IP address. Use Cisco Prime Collaboration Deployment to specify the NAT IP address for deployment nodes and the application. Cisco Prime Collaboration Deployment uses the NAT IP address to communicate with the application node. However, when you configure a node using the platformConfig.xml file, the node uses its private address.

Configure Cisco Prime Collaboration Deployment Behind the NAT

When Cisco Prime Collaboration Deployment is behind the NAT and communicates with an application virtual machine or an ESXi host, the communication occurs using the NAT IP address.

Note

When Cisco Prime Collaboration Deployment is behind the NAT and application nodes are in a private network, the application nodes communicate with the NAT IP address.

Use the NAT Settings window in the Administration menu to set the NAT IP address for Cisco Prime Collaboration Deployment. The NAT IP address that you enter on this window does not appear on any window on the GUI.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose Administration &gt; NAT Settings. The NAT Settings window appears and is prepopulated with the hostname and the private IP address.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Enter the NAT IP address in the NAT IP field.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Save. The NAT IP address is saved as an entry in a configuration file on Cisco Prime Collaboration Deployment. This entry is used when the application nodes try to contact Cisco Prime Collaboration Deployment, then the...</td>
</tr>
</tbody>
</table>
application nodes read the configuration file to get the NAT IP address, and then try to communicate Cisco Prime Collaboration Deployment with that IP address.

**Step 4** (Optional) Click **Reset**.  
The NAT IP address is reset to the earlier saved NAT IP address.

---

**Supported Tasks for Applications and Versions**

You can use Cisco Prime Collaboration Deployment to perform various tasks for Unified Communications applications. The following tables list the tasks that Cisco Prime Collaboration Deployment supports for each application.

- Table 7: Supported Tasks for Cisco Unified Communications Manager (including Session Management Edition), on page 24
- Table 8: Supported Tasks for Cisco Unified Presence, on page 25
- Table 9: Supported Tasks for the IM and Presence Service, on page 26
- Table 10: Supported Tasks for Cisco Unified Contact Center Express, on page 26
- Table 11: Supported Tasks for Cisco Unity Connection, on page 27

---

**Note**  
The releases listed in the tables do not specify the Engineering Special (ES)/ Service Update (SU) versions. To identify supported ES/SU versions that you can upgrade or migrate to through Cisco Prime Collaboration Deployment, see the release notes of the corresponding product, such as IM and Presence, Cisco Unified Communications Manager, and Unity Connection.

---

**Note**  
Cisco Prime Collaboration Deployment supports the destination version 10.x and above for an upgrade or a migration. The application versions 10.x and above support virtualization. If the source version is 8.x or 9.x on virtual machine, the upgrade task can upgrade to 10.x and above. However, if the source version is 8.x or 9.x on MCS, the upgrade task is not supported.

A migrate cluster task can migrate to any of releases listed in the tables, irrespective of whether on MCS 7800 or virtual machine, to 10.x or higher version on a virtual machine.

### Cluster Inventory

You must add a cluster to the Cisco Prime Collaboration Deployment inventory before you can use it in a task. The Discover Cluster feature is used to add existing clusters to the inventory. To create a new cluster by migrating an old cluster to new virtual machines, click **Define Migration Destination Cluster**. To install a new cluster, click **Define New UC Cluster**.

#### Discover a Cluster

With the Discover Cluster feature, Cisco Prime Collaboration Deployment communicates with the servers that are already running Unified Communications applications and adds that cluster information into the Cisco Prime Collaboration Deployment inventory.

When you perform the Discover Cluster operation, the Cisco Prime Collaboration Deployment server communicates with the publisher of the cluster and retrieves the cluster information. Then, it communicates with each server, installs the `ciscocm.ucmap_platformconfig.cop` file on the server (to retrieve configuration information), and collects information about the hostname, IP, product type, and both active and inactive versions for that server.

---

**Note**  
When the publisher is behind the NAT, providing the private IP address of the publisher does not reach to the node. You must provide the proper IP address for successful node discovery.

For details on the supported applications, see "Supported Upgrade and Migration Tasks" in the Related Topics section.

---

**Note**  
If a cluster includes Cisco Unified Communications Manager and Cisco Unified Presence (Cisco Unified Communications and IM and Presence Service servers), the Cluster Discovery discovers the Cisco Unified Presence or IM and Presence Service nodes as part of the Cisco Unified Communications Manager cluster.

If you are upgrading IM and Presence Services nodes to a Maintenance Release (MR) or an Engineering Special (ES) Release and you are not upgrading Cisco Unified Communications Manager nodes, following rules apply:

<table>
<thead>
<tr>
<th>VMware vSphere ESXi on Host having VM of Cisco Unified Communications Manager or Another Application</th>
<th>Cisco Prime Collaboration Deployment Version Compatibility for VMware APIs</th>
</tr>
</thead>
</table>
| 6.0 | • No—For Release 11.5(1)  
• Yes—For Release 11.5(1) SU1 and later  

**Note** Cisco Prime Collaboration Deployment supports upgrades and migrations when the clusters are distributed across ESXi 5 and 6.
If you are using the Unified CM OS Admin interface for upgrade, you must upgrade the Cisco Unified Communications Manager publisher node and then upgrade the IM and Presence Services nodes to an MR or an ES Release.

If you are using the Cisco Prime Collaboration Deployment migration task, choose the Cisco Unified Communications Manager publisher node in addition to the IM and Presence Services nodes.

If you are using the Cisco Prime Collaboration Deployment upgrade task, you do not need to select the Cisco Unified Communications Manager publisher node if the first three digits of new version of IM and Presence Services match the first three digits of the currently installed version of Cisco Unified Communications Manager.

**Procedure**

**Step 1** From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Inventory > Clusters**. The Clusters window appears.

**Step 2** Click the Discover Cluster button to discover the existing clusters. The Discover Cluster wizard appears.

**Step 3** Enter details in the following fields:

- **Choose a Nickname for this Cluster**
- **Hostname/IP Address of Cluster Publisher**
  
  **Note** For a cluster that has both Unified Communications Manager and IM and Presence Service nodes, enter the hostname or IP address of the Cisco Unified Communications Manager publisher.

- **OS Admin Username**
- **OS Admin Password**
- **Enable NAT**

**Step 4** (Optional) Check the Enable NAT check box, and then click Next. During discovery, the `ciscocm.ucmap_platformconfig.cop` file is installed automatically on the active partition of all nodes in the cluster. This COP file is used for the cluster discovery process and does not affect Cisco Unified Communications Manager.

**Note** When a cluster is behind NAT, the application tries to establish communication with each node using its private address. So, the nodes are unreachable. A pop-up shows the unreachable nodes. Cisco Prime Collaboration Deployment generates a list of cluster nodes from the inventory of the publisher server. The list generation process may take several minutes to complete. After the list is generated, a confirmation message appears indicating the completion of the cluster discovery process.

**Step 5** Click **Edit** to add NAT IP address, and click **OK**. The Nat IP address is set for the hostname.

**Step 6** Click **Resume Discovery** to resume the discovery of unreachable nodes. Cisco Prime Collaboration Deployment retries to discover the cluster with the NAT IP address instead of the private IP address and to get the cluster details, such as version. The discovery is successful when the cluster details appear on the window.

**Step 7** Click **Next**.

**Step 8** (Optional) Click Assign Functions to assign functions to each of the cluster nodes.

**Note** The assignment of functions has no effect on the services that are to be activated. However, this information can be used to determine the default sequence of tasks.
The Assign Functions dialog box appears.

**Step 9** Click **Finish**.

The cluster appears in the **Clusters** window, showing the cluster name, the product and version, the cluster type as **Discovered**, and the discovery status.

**Note** It might take a few minutes to discover a cluster. After the discovery is complete, the information for each node in the cluster is listed in the **Cluster Inventory** window. If you cancel the discovery before it is complete, the data is lost and you will have to repeat the discovery procedure.

**Note** The following are the different statuses that appear for the **Discovery Status** field:

- **Contacting**—Indicates that Cisco Prime Collaboration Deployment is establishing communication with clusters.
- **Discovering**—Indicates that the cluster discovery is in process.
- **Successful**—Indicates that the cluster discovery is successful.
- **Node Unreachable**—Indicates that the cluster node is inaccessible.
- **Timeout**—Indicates that the duration that is configured for the cluster discovery is complete but no cluster was discovered.
- **Internal Error**—Indicates that cluster discovery is failed because of an incorrect NAT IP address.

**Related Topics**

- Supported Tasks for Applications and Versions, on page 24
- Upgrade Paths for Export Restricted and Unrestricted Software, on page 28

**Modify and View a Cluster**

You can select one or multiple virtual machines that you have added as nodes in a cluster to view and modify them.

**Note** The cluster nodes that you need to install appear as editable and have **Edit** and **Delete** links. The installed cluster nodes appear dimmed and you cannot edit or delete them.

**Note** When you add new nodes to the installed cluster, all fields on **Configure NTP Settings** page appear dimmed and are non-editable. The fields on the other pages will populate the values of the already installed nodes as the default. If needed, you can change the values for the newly added nodes.
Procedure

Step 1  Discover a cluster by following the Discover a Cluster procedure. See Discover a Cluster, on page 29.
Step 2  Check the check box of one of the discovered or newly installed clusters to choose a cluster, and click the Edit link.
Step 3  On the Edit Link window, view the details in the fields, and modify the details, as required.
Step 4  Click OK.

Add an ESXi Host Server

Important  When you add an ESXi host into Cisco Prime Collaboration Deployment, you mount the Cisco Prime Collaboration Deployment server as a network file system (NFS) mount on that host. In future, if you remove your Cisco Prime Collaboration Deployment machine, you should first delete the ESXi host from the Cisco Prime Collaboration Deployment so that it does not cause a stale NFS mount on that host.

To communicate with an ESXi host server, Cisco Prime Collaboration Deployment requires either root access to the ESXi software or a nonroot user with Host and Virtual Machine privileges enabled. The administrator creates a nonroot user with the specific permissions for Cisco Prime Collaboration Deployment tasks, such as power on and off and mounting ISO or floppy, for fresh install or migration. The length of the nonroot user password must be less than 16 characters.

Note  When you shut down a Cisco Prime Collaboration Deployment server, we recommend that you use the utils system shutdown CLI command.

Note  Make sure that the host with the Cisco Prime Collaboration Deployment VM and the host with the application VMs use the required Virtualization Software License. See Virtualization Software License Types, on page 4.

Procedure

Step 1  From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose Inventory > ESXi Hosts from the menu.
Step 2  Click Add ESXi Host.
Step 3  The Add Host Server dialog box appears. Enter the following information:
   a)  Hostname/IP Address
   b)  Root sign-in or sufficiently privileged nonroot sign-in
**Create a Migration Cluster**

**Before You Begin**
To create a migration task, perform the following procedure:

1. Discover the existing cluster you wish to migrate. See the "Discover a Cluster" procedure at Discover a Cluster, on page 29.

2. Define a migration cluster.

---

**Procedure**

**Step 1** From the Cisco Prime Collaboration Deployment application, select **Inventory > Cluster**.

**Step 2** Click **Define Migration Destination Cluster**.
The Define Migration Destination Cluster wizard appears.

**Step 3** In the Specify Clusters section, specify the name of the cluster, select the source UC cluster from the drop-down list. Enter a name in the Destination Cluster Name field and select one of the following Destination Network Settings options:

- To retain the default network options, select the **Use the source node network settings for all destination nodes** option.

- To modify the default network settings or enter new network options, select the **Enter new network settings for one or more destination nodes** option.

| Note | If you select the **Use the source node network settings for all destination nodes** option, same IP address appears for both the source node NAT IP and Dest NAT IP columns Assign Destination Cluster Nodes. If you select the **Enter new network settings for one or more destination nodes** option, only source hostname appears and not the destination hostname on the Assign Destination Cluster Nodes window. |

**Step 4** Click **Next**.
The Assign Destination Cluster Nodes window appears.

**Step 5** Click the Assign Destination Cluster Nodes button to select the destination virtual machine for each source node.

| Note | If DHCP is in use on your source node, the destination node will also be configured to use DHCP, and you will not have the option of changing your network settings in this wizard. |

c) Root password or nonroot password

**Step 4** Click **OK** to add the ESXi host.
The **Configure Destination Cluster** window appears.

**Step 6**
Select a virtual machine, click **Next Node** to go to the next node in the cluster, and select another virtual machine for the destination virtual machine, and click **Done**.

*Note* If there is more than one node in the cluster, repeat these steps - (assigning VM, and entering new IP/hostname settings, if needed) for each node in the source cluster.

**Step 7**
Click **Next**.

The **Configure NTP/SMTP Settings** window appears.

**Step 8**
Enter the Network Time Protocol (NTP) server settings to be applied to the migration nodes when the migration task runs, and optionally, enter the SMTP server settings.

*Important* In a proxy TFTP setup, if a network migration is performed "off-cluster", you need to manually configure the new hostname and IP address of that off-cluster in the proxy TFTP. Off-cluster refers to situations where TFTP functionality is being performed by a proxy that is not part of that specific Unified Communications Manager cluster. During a migration, that TFTP server (that is not part of the cluster) is not modified. If you want to change the hostname or IP address of that server, you must do it as a separate process and not with Cisco Prime Collaboration Deployment.

**Step 9**
Click **Next**.

The **Define DNS Settings** window appears.

**Step 10**
To change the DNS setting for a node, select the node or nodes from the table and click **Assign DNS Settings**.

Enter the primary and secondary DNS, then click **OK** to apply the changes.

*Important* You cannot change the domain name during a migration.

**Step 11**
Click **Finish**.

The changes are saved and a row is added to the clusters table to reflect the new migration cluster that you have created.

---

**Add New Cluster for Fresh Install**

**Procedure**

**Step 1**
From the Cisco Prime Collaboration Deployment application, select **Inventory > Clusters**.

**Step 2**
Click **Define New UC Cluster**.

The **Define Cluster** wizard appears.

**Step 3**
In the Specify Cluster Name section, enter the cluster name, and click **Next**.

The **Add Virtual Machines** window appears.

**Step 4**
Click **Add Node** to add nodes to the cluster.

The **Add Node** dialog box appears showing the list of the available VMs that are sorted by name and by host.

**Step 5**
On the **Add Node** window, enter the network settings for the node that you have added, choose the functions for the node, and choose a VM for this node. Select the VM that you wish to add and then enter the following information in the sections below the VM table:

a) In Network section, select either **Static IP Address** or **Use DHCP with reservations**. If you select the **Static IP Address** option, enter the hostname, IP Address, subnet mask, gateway, and NAT IP. If you
select **Use DHCP with reservations** option, enter the IP address that you have a reservation for on your DHCP server (associated with the MAC address for that VM) in addition to the hostname.

If you are adding a Cisco Unified Contact Center Express server, do not use DHCP for network settings.

**Note**  
*NAT IP* is an optional field. In Step 4, if you have selected a node that is behind NAT, enter the IP address in the **NAT IP** field, else leave this field blank. The value that you enter in this field appears in the **NAT IP** column. If the NAT IP address is associated with a port, you can enter port value which should be in the range of 1 to 65535.

b) From the **Products and Functions** list box, select a product.

c) In the Functions section, check the appropriate function check boxes for your VM.

**Note**  
- Check the **Publisher** check box for at least one node in the cluster that you have defined, for each application type.
- (Optional) Add a note about the functions that you have assigned in the **Notes** field below the **Publisher** field.

d) Click **OK**.

e) In Virtual Machines section, choose a VM for this node.

**Note**  
- Choose a new VM for fresh install clusters and that new VMs must be in turned off state.
- Do not install over an existing running Cisco Unified Communications Manager node. The installation must be a fresh VM that you create with the appropriate OVA for the application that you will install.

**Step 6**  
Click **OK**.  
The VM is added and is listed in the **Cluster Name** table.

**Step 7**  
(Optional) To add more nodes to the cluster, repeat steps 4 through 6.

**Step 8**  
Click **Next**.  
The **Configure Cluster Wide Settings** window appears.

**Step 9**  
Enter the OS administration credentials, application credentials, security password, SMTP settings, and certificate information for this cluster, and click **Next**.  
The **Configure DNS Settings** window appears.

**Step 10**  
(Optional) Add a DNS setting for a node, select the node, and click **Assign DNS Settings**.  
The Cisco Unified Contact Center Express application must use DNS.  
The **Configure NTP Settings** window appears.

**Step 11**  
Enter IP address of at least one NTP server.

**Note**  
- It is recommended that you define at least IP addresses of two NTP servers.
- If you are not using DNS, NTP server must be an IP address. If you are using DNS, NTP server can be an FQDN.

**Step 12**  
Click **Next**.  
The **Configure NIC Settings** window appears.

**Step 13**  
(Optional) Choose the server, and enter an MTU size between 552 and 1500, and click **Apply to Selected**.

**Step 14**  
Click **Next**.  
The **Configure Time Zones** window appears.

**Step 15**  
Select a node, choose the region and time zone from the **Region** and **Time Zones** list boxes, and click **Apply to Selected**.

**Step 16**  
Click **Finish**.
The new install cluster is listed on the Clusters screen, with a Cluster Type as **New Install**. The cluster is defined but is yet to be created. To install the cluster, create an install task. The install task uses the install cluster you have defined, and creates the cluster.

## Task Management

After you add your clusters and ESXi hosts to the Cisco Prime Collaboration Development inventory, you can create tasks to manage your clusters. Each task has the following common features:

- Each task is applied to a single cluster.
- The default sequence for each task (for example, what servers are affected and when) is applied based on the server functions you defined.
- The sequence of each task can be customized to fit your needs.
- Each task can be scheduled to start immediately or at a later date.
- Tasks can also be created without a specific start time. You can then manually start the task through the Monitoring page at the appropriate time.

Migration, install, and upgrade tasks require you to select one or more Cisco Option Packages (COP) or ISO files. You must download these files from Cisco.com and upload them to the Cisco Prime Collaboration Deployment server before you create the task. You can use any SFTP client to upload the files using the "adminsftp" account and the OS Administration password. Upload migration and .iso install files into the `/fresh_install` directory, and place upgrade .iso files or .cop files to be installed on an existing server in the `/upgrade` directory.

**Note**

Migration and install .iso files must be bootable.

## Migration Task

### Before You Begin

To perform cluster migration, the destination virtual machine must be ready for installation before you create the migration task. Be sure that the following steps are completed:

1. **VMware**—Deploy the hardware for the new cluster and install ESXi.

**Note**

Make sure that the host with the Cisco Prime Collaboration Deployment VM and the host with the application VMs use the required Virtualization Software License. See [Virtualization Software License Types](#), on page 4.

2. **ISO file**—Download the recommended OVA and ISO images for the target release, and use SFTP to send the ISO file to the Cisco Prime Collaboration Deployment server, `/fresh_install` directory.
3 **VMware**—Deploy the Cisco-recommended OVA to create the VMs for the destination nodes. Create the appropriate number of target virtual machines on your ESXi hosts (one new virtual machine for each server in the existing cluster) using the Cisco OVAs that you downloaded in Step 2. Configure the network settings on new VMs.

4 **Cisco Prime Collaboration Deployment GUI**—Add the ESXi Hosts that contain your virtual machines to the Cisco Prime Collaboration Deployment inventory. For information about adding an ESXi host to Cisco Prime Collaboration Deployment, see Add an ESXi Host Server, on page 32.

5 **Cisco Prime Collaboration Deployment GUI**—Ensure that you performed a cluster discovery for the existing cluster (source cluster) so that it appears in the Cluster Inventory. For information about cluster discovery, see Discover a Cluster, on page 29.

6 **Cisco Prime Collaboration Deployment GUI**—Create the migration cluster (click the open and close navigation button and choose Inventory > Clusters) to define the mapping between MCS source nodes and target virtual machines.

<table>
<thead>
<tr>
<th>Important</th>
</tr>
</thead>
<tbody>
<tr>
<td>When the migration cluster is created, you must indicate whether all destination nodes will maintain the same hostname or IP address, or whether some of these addresses will change.</td>
</tr>
</tbody>
</table>

- Using the source node settings for all destination nodes option is called a simple migration. See the migration flow chart for more information.
- Entering new network settings for one or more destination nodes is called a network migration. See the migration flow chart for more information.

7 **Cisco Prime Collaboration Deployment GUI**—Setup Email Notification (Optional)

- Click the open and close navigation button and choose Administration > Email Notification.
- When email notification is set up, the Cisco Prime Collaboration Deployment server emails the error conditions that may occur during the migration task.

8 **Cisco Prime Collaboration Deployment GUI**—Create the migration task.

9 Install the `ciscocm.migrate_export_10_0_1.sh_v1.1.cop.sgn` cop file on both IM and Presence publisher and subscriber nodes.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Prime Collaboration Deployment does not allow the change of host name during migration task.</td>
</tr>
</tbody>
</table>

**Special Considerations**

- If you are migrating a cluster that is security enabled, see CTL Update, on page 149 for special instructions. If you are performing a migration with network migration (where one or more hostnames or IP addresses change between the source and destination nodes), update the IP addresses or hostnames of destination nodes in your DNS server before you begin the migration task.
- You can specify a different NAT address for source and destination, so that the source is not abruptly shut down. If you want to perform a simple migration but need to specify different Network Address Translation (NAT) entries for source and destination, you must select "Network Migration" and provide the same details for source and destination (all hostnames and IP addresses).
Create a Migration Task

Follow these steps to create or edit a new migration task to simultaneously upgrade and migrate a cluster to new virtual machines.

Note the supported restricted and unrestricted paths. See “Supported Upgrade and Migration Tasks” and “Upgrade Paths for Export Restricted and Unrestricted Software” in the Related Topics section.

Procedure

**Step 1** Click the open and close navigation button and choose Task > Migrate.

**Step 2** Click the Add Migration Task. The Add Migration Task wizard appears.

**Step 3** From the Source UC Cluster drop-down list, select the cluster on which the nodes to be migrated from are located.

**Step 4** From the Destination Cluster drop-down list, select the destination cluster or migration map. The migration maps are associated with the source cluster you have selected. Click Next.

**Step 5** In the Choose Migration Files section, choose the ISO file you wish to install on the destination cluster by clicking Browse. The Choose a Migration File window opens. Select the ISO file from the list and click OK.

**Important** The ISO file is visible here only if it was placed in the directory under /fresh_install, uploaded through a standard SFTP client (Admin Name: adminsftp, Password: Administration password). For more information, see the task management information at the beginning of this section.

**Step 6** Click Next.

**Step 7** In the Set Start Time section, choose between scheduling a particular start time, starting the task immediately, or starting the task manually at some point in the future. Click Next.

**Step 8** In the Specify Migration Procedure section, you will see the default sequence for the migration task. If you wish, you can change the sequence of steps in the migration procedure. (For example, the default is to install each subscriber individually. You might want to change this to install more than one subscriber in a step.) You have the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pencil icon</td>
<td>Edit a step.</td>
</tr>
<tr>
<td>Page icon</td>
<td>Add a new step after the current step.</td>
</tr>
<tr>
<td>X mark</td>
<td>Delete the current step.</td>
</tr>
<tr>
<td></td>
<td>If you remove all the nodes from a step, the step is removed by default.</td>
</tr>
<tr>
<td></td>
<td>You cannot remove a step that contains the Publisher node.</td>
</tr>
<tr>
<td>Up arrow</td>
<td>Move the step up to be performed earlier.</td>
</tr>
<tr>
<td>Down arrow</td>
<td>Move the step down to be performed later.</td>
</tr>
</tbody>
</table>

• The Pencil icon opens up an Edit Step window. Add nodes to be migrated in this step from the list of available nodes. The available nodes are the ones that you chose for migration.
The step to which each node is assigned displays next to the node. If a node is not assigned to any step, it shows as unassigned.

When you assign all the nodes to a step, a default sequencing is available. You cannot proceed to the next step until you assign all the nodes.

The Pause task after step completes option pauses the task after completion of this step. You must manually start the next step to complete the task.

For more information about sequencing tasks, see the task management information at the beginning of this section.

Step 9 Click Next.
Step 10 In the Review section, you can review the selections that you made. You can also add notes to your new migration task.
Step 11 If there are no changes required, click Finish to add your new migration task.
Step 12 The new migration task appears in the table on the Migrate screen.

Important If you are performing a migration with network migration, the sequence automatically inserts a "ForcedPause" step into the sequence after all the servers are installed to allow the user to perform procedures. See the "Run a Migration Task" section for details on when manual procedures are needed. The "ForcedPause" step cannot be edited and moved, and it has no nodes assigned. This step is inserted before the source node shutdown step, because if CTL Updates or certificate management steps are required, these steps must be completed before the source node is shut down.

Related Topics

- Supported Tasks for Applications and Versions, on page 24
- Upgrade Paths for Export Restricted and Unrestricted Software, on page 28

Run a Migration Task

If you scheduled the task to start at a later date, or if you chose Manual Start, then the task is listed in the task list, but has not started yet. In this case, a validation button will be associated with the task. Click Validate to check the task before it runs. If there are any problems with the task (such as a missing ISO file, or VMs not in Off state), the validation will alert you, so the issues can be fixed before the task starts.

For a task that was scheduled to start, you can click the Start button to begin the task.

While the migration task is running, depending on the type of migration task, some user operations might be needed. For example, if you are performing a "migration with network migration," the sequence automatically inserts a "Forced Pause" into the sequence after all the servers have been installed. This will cause the migration task to pause after all the new servers are installed but before any of the source machines are shut down.

Consult the table below and the applicable Migration Procedure flow chart (see the "Migration Procedure Flow Charts" section) to determine if any user interaction will be needed during the migration task.
When the migration cluster is created, you must indicate whether all destination nodes will keep the same hostname or IP address, or if some of these addresses will be changing.

- Using the source node settings for the all destination nodes option is referred to as a “simple migration” in the "Migration Procedure Flow Charts" section.
- Entering new network settings for one or more destination nodes option is referred as “network migration” in the "Migration Procedure Flow Charts" section.

**Post Migration Tasks for IM and Presence Service**

If the migrated cluster contains IM and Presence Service nodes, and you are performing a network migration, these postinstallation tasks must be performed for any pre-Release 10.x IM and Presence Service cluster.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Configure certificates and certificate trust stores. If the old cluster had CA-signed certificates in any of the component trust stores, be aware that the components contain self-signed certificates on the migrated Release 10.x cluster. Also, the root and intermediate certificates of the Certificate Authority are not preserved in their respective trust stores. You should sign the certificates with the old Certificate Authority, similar to how it would have been done initially. For more information, see the Administration Guide for Cisco Unified Communications Manager Guide.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configure intercluster peers. If the old cluster had an intercluster peer relationship, you need to delete the configuration from all peer clusters. Once this is done, add the appropriate interclustering based on the network details of the new cluster. For example, Cluster A, Cluster B, and Cluster C are all intercluster peers. If Cluster A was migrated, then you should delete all interclustering configuration from the old Cluster A and likewise Cluster A from Cluster B and Cluster C and then add</td>
</tr>
<tr>
<td><strong>Command or Action</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Re-publish SIP Federation.</td>
<td>If the old cluster was front-ending SIP Interdomain with Microsoft OCS/Lync/AOL or SIP Intradomain federation with OCS/Lync, then your enterprise will need to re-publish the DNS-SRV of your federating domain to reflect the new network details. If the far side has SIP static routes configured instead of DNS-SRV based routing, then the SIP static routes need to be changed to reflect the new network address. Similarly, all intermediate network elements (including ASA or any other similar components that route or inspect traffic to the old cluster from the external federation entities) need to be re-configured for successful routing to the new cluster. For Interdomain configuration, see <em>Interdomain Federation for IM and Presence Service on Cisco Unified Communications Manager</em>. For Intradomain federation, see <em>Partitioned Intradomain Federation for IM and Presence Service on Cisco Unified Communications Manager</em>.</td>
</tr>
<tr>
<td>Re-publish XMPP Federation.</td>
<td>If the old cluster was front-ending XMPP Interdomain federation to any external XMPP servers, then your enterprise will need to republish your federating domain's DNS-SRV records to reflect the new network details. Refer to <em>Interdomain Federation for IM and Presence Service on Cisco Unified Communications Manager</em>.</td>
</tr>
<tr>
<td>Configure Cisco Jabber/Cisco Unified Personal Communicator connectivity.</td>
<td>Jabber or Unified Personal Communicator caches the hostname information from the old cluster and does not have new hostname information unless you are able to push the configuration to the desktop of the user, or that user manually enters one of the node names. A fail safe approach for users that are unassigned from the old cluster, and as a result are unable to log in, involves the user manually entering the hostname or IP address of one of the nodes in the new cluster (of which they were informed of prior to migration). In this scenario, the user's client finds the right home node by way of redirected login.</td>
</tr>
</tbody>
</table>

**Migration Procedure Flow Charts**

Use the following task flows as a guide to perform migration tasks.
Simple Migration

*Figure 1: Flow Chart for Simple Migration*

Note: Cisco Prime Collaboration Deployment does not support migration of Business Edition 5000 Appliance running on MCS 7828H3.
Pre Release 8.0.1 Unified CM Network Migration

Figure 2: Flow Chart for Pre Release 8.0.1 Unified Network Migration

1. Start Network Migration on PCD
2. Wait for the Task Status to equal Forced Pause
3. Resume the task
4. Wait for the task to finish
5. Start Post Network Migration Process on CUCM
6. Is the cluster in secure mode?
   - Yes: Perform CTL Client Update if hostname changed
     - Restart the Call Manager and TFTP services
     - Change TFTP IP address used by all endpoints
     - Complete Standard Post Network Migration Process
   - No: Change TFTP IP address used by all endpoints
     - Complete Standard Post Network Migration Process
Release 8.0.1 And Later Unified CM Network Migration

Figure 3: Flow Chart for Release 8.0.1 and later Unified CM Network Migration

Start Network Migration on PCD

Wait for the Task Status to equal Forced Pause

Start Network Migration Process on CUCM

Is the course in secure mode?

Yes

Perform CTL Client Update if hostname changed

Perform Bulk Certificate Management if hostname changed

Continue Network Migration on PCD

Resume the task

Wait for the task to finish

Start Post Network Migration Process on CUCM

Change TFTP IP addresses used by all endpoints

Complete Standard Post Network Migration Process

No

Perform CTL Client Update if hostname changed

Perform Bulk Certificate Management if hostname changed

Continue Network Migration on PCD

Resume the task

Wait for the task to finish

Start Post Network Migration Process on CUCM

Change TFTP IP addresses used by all endpoints

Complete Standard Post Network Migration Process
Recovery of Original Cluster

Use the following procedure when a cluster fails to migrate successfully, and some nodes are installed on the new cluster.

*Figure 4: Flow Chart for Recovery of Original Cluster*

Check the Status of the Cluster Manager Service on All Source Nodes

The steps below are used if a migration task fails when there were network migration changes on one or more nodes. Following the failure, you may need to perform some steps to get the old cluster nodes running again.
See the flow chart above for all steps to be followed. Below are detailed steps for running the CLI command to restart cluster manager on old nodes.

Perform the following steps manually on all subscriber nodes that were supposed to have network changes (for example, hostname, IP address, or both) after all old cluster nodes are up and running.

Use cases that may require the restart of Cluster manager on source nodes are:

**Use Case 1**
No hostname and no IP address change on Publisher, host name change on Subscriber
The user is required to check Cluster Manager service on source Subscriber

**Use Case 2**
No hostname and no IP address change on Publisher, IP address change on Subscriber
The user is required to check Cluster Manager service on source Subscriber

**Use Case 3**
No hostname and no IP address change on Publisher, hostname and IP address change on Subscriber
The user is required to check Cluster Manager service on source Subscriber

**Use Case 4**
No hostname change on Publisher, IP address change on Publisher, no hostname and no IP Subscriber
The user is required to check Cluster Manager service on source Publisher

**Procedure**

**Step 1**
Enter the following CLI command at the command prompt: `utils service list`. The following output appears:

```
Requesting service status, please wait...
System SSH [STARTED]
Cluster Manager [STOPPED]
```

**Step 2**
If Cluster Manager Service status is STOPPED, type the following command to start the service on the old subscriber node:

`utils service start Cluster Manager`

---

**Upgrade Task**

**Create an Upgrade Task**

Use the upgrade task to perform software version upgrades on a cluster. You can also use an upgrade task to install .cop files on all or a subset of servers in a cluster.

To know the supported applications, releases, and versions, see the see "Supported Upgrade and Migration Tasks" and "Upgrade Paths for Export Restricted and Unrestricted Software" in the Related Topics section.
Cisco Prime Collaboration Deployment uses the standard upgrade process, and therefore the standard validation rules are applied. For more information, see the application-specific documentation.

Note
• If you are using Cisco Prime Collaboration Deployment to upgrade Cisco Unified Communications Manager from Releases 6.1(5), 7.x, 8.x, 9.x, or 10.x to Release 10.5(2) or higher, you must disable the time synchronization between the VM instance and the ESXi. To disable the time synchronization issue, follow the instructions at the following URL:

  An alternative method is to configure the ESXi server and the Cisco Unified Communications Manager publisher node to point to the same NTP server.

Use the Add Upgrade Task wizard to create and edit upgrade tasks.

To create or edit a new upgrade task to automatically run on one or more clusters at scheduled times, follow these steps.

**Before You Begin**

1. Note the supported restricted and unrestricted paths. See “Supported Upgrade and Migration Tasks” and “Upgrade Paths for Export Restricted and Unrestricted Software” in the Related Topics section.

2. Perform a cluster discovery for the cluster that you wish to upgrade, so it appears in the Cluster Inventory. See Discover a Cluster, on page 29.

3. Download the ISO files you wish to upgrade to, and use SFTP to send this file to Cisco Prime Collaboration Deployment in the upgrade folder. If you are using the upgrade task to install a .cop file, upload the .cop file to the /upgrade folder using an SFTP client.

4. For the application servers in the cluster to be upgraded, ensure that the Platform Administrative Web Service is active on that server.

**Procedure**

**Step 1** Click the open and close navigation button and choose Task > Upgrade from the main menu.

**Step 2** Click Add Upgrade Task.

**Step 3** From the Cluster drop-down list, select the cluster on which the nodes to be upgraded are located.

**Step 4** From the Products drop-down list, select the products to be upgraded.

**Step 5** Select the nodes that are part of the upgrade from the list of nodes.

**Step 6** Click Next.

  *Note* The Next button is dimmed if no nodes are selected.

**Step 7** Click the respective Browse buttons to select the upgrade files from the file server.

*Note* The option to select upgrade files is available only for the selected product types and applications that are currently supported in the cluster.
Step 8  Select a valid upgrade file or files.
Note  Click the Show drop-down list to see all the available upgrade files on the file server.
Note  To create an upgrade task, while selecting ISO files, ensure that the ISO files are common across all the required SFTP servers which are associated to cluster nodes. If the ISO files are not common to all the required SFTP servers which are associated to cluster nodes, the valid files do not appear even though they are valid for upgrade. To view all the ISO files, from the Show drop-down list, choose All.

Step 9  Click Choose File.

Step 10  Click Next.
Note  The Next button is dimmed if no valid upgrade files are selected.

Step 11  Select the date and time when you want the upgrade task to begin. You have the following options to schedule upgrades:

- Select Schedule for a specific time to enter the date and time when you want the upgrade task to start. The start time that you set is based on the time zone of the Cisco Prime Collaboration Deployment server as denoted by the time zone that is displayed with this option.
  Note  If you schedule a task for a few minutes in the future, but do not save it until that scheduled time passes, then the task starts automatically.

- Select Start task manually to keep the task in a manual start.
  Note  If you choose to start the task manually, a task is created, but does not start until you click the Start task button on the Monitoring page, or the Start task link on the task page.

- Select Start task immediately upon completion of this wizard to start the task immediately after you click Finish.

- If you want the system to automatically switch to the new version, choose the option Upgrade Option to Automatically Switch to New Version after Successful Upgrade. Otherwise, the server, or servers, are upgraded but remain on the current version of software. In that case, you can schedule a switch version task to switch over to the upgraded version of software.

Step 12  Click Next.
Step 13  Specify the sequence of steps to complete the task. You have the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pencil icon</td>
<td>Edit a step.</td>
</tr>
<tr>
<td>Page icon</td>
<td>Add a new step after the current step.</td>
</tr>
<tr>
<td>X mark</td>
<td>Delete the current step. If you remove all the nodes from a step, the step is removed by default. You cannot remove a step that contains the publisher node.</td>
</tr>
<tr>
<td>Up arrow</td>
<td>Move the step up to be performed earlier.</td>
</tr>
<tr>
<td>Down arrow</td>
<td>Move the step down to be performed later.</td>
</tr>
</tbody>
</table>

- The Pencil icon opens up an Edit Step window. Add nodes to be upgraded in this step from the list of available nodes. The available nodes are the ones that you chose for an upgrade.
The step to which each node is assigned displays next to the node. If a node is not assigned to any step, it shows as unassigned.

- When you assign all the nodes to a step, a default sequencing is available. **Important**: You cannot proceed to next step until you assign all the nodes.

- The **Pause task after step completes** option pauses the task after completion of this step. Manually start the next step to complete the task.

**Step 14** Click **OK**.

**Step 15** Click **Next**.

**Note** The Next button remains enabled, which allows you to click to display any configuration errors.

**Step 16** See the **Review** section to verify the details of the task you created. You can add notes for the task, if necessary. The notes are saved with the task and are visible if the task is edited before completion.

**Step 17** Click **Finish** to schedule the task.

**Related Topics**

- Supported Tasks for Applications and Versions, on page 24
- Upgrade Paths for Export Restricted and Unrestricted Software, on page 28

## Reuse Sequence from Previous Task

The Reuse Sequence from Previous Task feature uses a previously defined task sequence in the task you are currently creating. This feature is useful for upgrade, restart, switch version, migration, and readdress tasks. It allows you to reuse a previously configured task sequence as opposed to having to rescript the sequence from scratch.

During task creation, the task wizard progresses to the sequence pane where a user can configure the ordering and pause characteristics. If there is a task in the system of similar type, the sequence from that task is presented as the default sequence.

In this case, a check box labeled **Use Last Configured Run Sequence** is visible just above the sequence table. You can check the box to use the sequence from the previous task or leave the box unchecked to use the default sequence that the system generates.

To be considered a task of similar type, the selected cluster, task type, and nodes in the task must match exactly. If multiple tasks meet the similar type criteria, the most recently created task is used and its sequence is presented as the default to the user.

In the case of an upgrade task, there is an additional requirement. The type of installation must be either ISO based or COP based. The COP and ISO installations can be performed with different sequencing.
Switch Versions Task

Create a Switch Versions Task

Use the switch versions task to automatically switch one or more nodes in a cluster to the upgraded or inactive version.

Use the Switch Versions Task wizard to create and edit switch versions tasks.

To know which applications and releases are supported for upgrade tasks, see “Supported Upgrade and Migration Tasks” and “Upgrade Paths for Export Restricted and Unrestricted Software” in the Related Topics section.

To create or edit a switch versions task to automatically switch one or more nodes in a cluster to the upgraded or inactive version at scheduled times, follow this procedure.

Note

The Automatic Switch version option is not available on clusters which contain Unity Connection nodes. For clusters with Cisco Unity Connection, create an upgrade task and then create a switch version task to switch to the new version. You can create the switch version task after the upgrade task runs successfully.

Before You Begin

1. Perform a cluster discovery for the cluster on which you want to switch versions, so that the cluster appears in the Cluster inventory. See Discover a Cluster, on page 29. If you previously used Cisco Prime Collaboration Deployment to upgrade or migrate a cluster, the cluster should already be in the inventory.

2. For each application server in the cluster, ensure that the Platform Administrative Web Service is active on that server.

Procedure

Step 1. Click the open and close navigation button and choose Tasks > Switch Versions from the main menu.

Step 2. Click Add Switch Versions Task.

Step 3. From the Cluster drop-down list, select the cluster on which you want to switch the versions.

Step 4. Select the version to which you want all the nodes to be switched.

Note: If there is more than one product, you can select the applicable versions of all the different products. You also can choose to switch the version for one product and to not switch the version for another product.

Step 5. Click Next.

Step 6. Select the date and time when you want the switch versions task to begin. You have the following options to schedule switch versions task:

- Select Schedule for a specific time to enter the date and time when you want the switch versions task to start. Any start time that you set is based on the time zone of the Cisco Prime Collaboration Deployment server as denoted by the time zone that is displayed with this option.

Note: If you schedule a task for a few minutes in the future, but do not save it until that scheduled time passes, then the task will start automatically.
• Select **Start task manually** to keep the task in a manual start.

• Select **Start task immediately upon completion of this wizard** to start the task immediately after you click **Finish**.

**Note** You can also start the task from the Monitoring page.

• If you want the server to automatically switch to the new version, check the check box next to **Automatically switch to new version after successful upgrade**.

**Step 7** Click **Next**.

**Step 8** Specify the sequence of steps to complete the task. You have the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pencil icon</td>
<td>Edit a step.</td>
</tr>
<tr>
<td>Page icon</td>
<td>Add a new step after the current step.</td>
</tr>
<tr>
<td>X mark</td>
<td>Delete the current step. If you remove all the nodes from a step, the step is removed by default. You cannot remove a step that contains the Publisher node.</td>
</tr>
<tr>
<td>Up arrow</td>
<td>Move the step up to be performed earlier.</td>
</tr>
<tr>
<td>Down arrow</td>
<td>Move the step down to be performed later.</td>
</tr>
</tbody>
</table>

• The Pencil icon opens an **Edit Step** window. Add the nodes on which the versions must be switched in this step from the list of available nodes. The available nodes are the ones that you chose for the switch version task.

• The step to which each node is assigned displays next to the node. If a node is not assigned to any step, it shows as unassigned.

• When you assign all the nodes to a step, a default sequencing is available.

**Important** You cannot proceed to next step until you assign all the nodes.

• The **Pause task after step completes** option pauses the task after completion of this step. You must manually start the next step to complete the task.

**Step 9** Click **OK**.

**Step 10** Click **Next**.

**Note** The **Next** button remains enabled, which allows the user to click to be informed of any configuration errors.

**Step 11** Use the **Review** section to verify the details of the task that you created. You can add notes for the task if required. The notes are saved with the task and are visible if the task is edited before completion.

**Step 12** Click **Finish** to schedule the task.
Server Restart Task

To know which applications and releases are supported for upgrade tasks, see “Supported Upgrade and Migration Tasks” and “Upgrade Paths for Export Restricted and Unrestricted Software” in the Related Topics section.

Create a Server Restart Task

Use the Restart Task wizard to create and edit restart tasks.

To create or edit a restart task to automatically restart one or more nodes in a cluster at scheduled times, follow this procedure.

Before You Begin

1. Perform a cluster discovery for the cluster you wish to restart, so that it appears in the Cluster inventory. See Discover a Cluster, on page 29.
2. For each application server in the cluster, ensure that the Platform Administrative Web Service is active on that server.
3. If you are using Cisco Prime Collaboration Deployment Readdress Task with virtual machine of an application, ensure that you follow the application's rules for changing IP and hostname—either one at a time or simultaneously.

Procedure

Step 1 Click the open and close navigation button and choose Task > Server Restart from the main menu.
Step 2 Click Add Server Restart Task.
The Add Restart Task wizard appears.
Step 3 From the Clusters drop-down list, select the cluster on which you want to restart the nodes.
Step 4 From the table, select the nodes to be restarted. If you do not select any nodes, you cannot continue.
Step 5 Click Next.
Step 6 Select the date and time when you want the server restart task to begin. You have the following options to schedule restart tasks:

- Select Schedule for a specific time to enter the date and time when you want the restart task to start. Any start time that you set is based on the time zone of the Cisco Prime Collaboration Deployment server.
Note If you schedule a task for a few minutes in the future, but do not save it until that scheduled time passes, then the task will start automatically.

- Select **Start the task manually** to keep the task in a manual start.

- Select **Start task immediately upon completion of the wizard** to start the task immediately after you click **Finish**.

  **Note** You can also start the task from the Monitoring page.

**Step 7** Click **Next**.

**Step 8** Specify the sequence of steps to complete the task. You have the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pencil icon</td>
<td>Edit a step.</td>
</tr>
<tr>
<td>Page icon</td>
<td>Add a new step after the current step.</td>
</tr>
<tr>
<td>X mark</td>
<td>Delete the current step.</td>
</tr>
<tr>
<td></td>
<td>If you remove all the nodes from a step, the step is removed by default.</td>
</tr>
<tr>
<td></td>
<td>You cannot remove a step that contains the Publisher node.</td>
</tr>
<tr>
<td>Up arrow</td>
<td>Move the step up to be prepared earlier.</td>
</tr>
<tr>
<td>Down arrow</td>
<td>Move the step down to be prepared later.</td>
</tr>
</tbody>
</table>

- The Pencil icon opens up an **Edit Step** window. In this step, add nodes to be restarted from the list of available nodes. The available nodes are the ones that you chose for a restart.

- The step to which each node is assigned appears next to the node. If a node is not assigned to any step, that node shows as unassigned.

- When you assign all the nodes to a step, a default sequencing is available.

  **Important** You cannot proceed to the next step until you assign all the nodes.

- The **Pause task after step completes** option pauses the task after completion of this step. You must manually start the next step to complete the task.

**Step 9** Click **OK**.

**Step 10** Click **Next**.

  **Note** The **Next** button remains enabled, which allows the user to click to be informed of any configuration errors.

**Step 11** See the **Review** section to verify the details of the task you created. You can add notes for the task if required. The notes are saved with the task and are visible if the task is edited before completion.

**Step 12** Click **Finish** to schedule the task.
Readdress Task

Create a Readdress Task

Use the readdress task change the hostname or IP address for one or more nodes in a cluster. To use the readdress feature, the servers must be Release 10.0 or later.

Note the difference between a hostname and a fully qualified domain name (FQDN) The network-level DNS default domain name of the node is combined with the hostname to form the FQDN for the node. For example, a node with hostname "cucm-server" and domain "example.com" has an FQDN of "imp-server.example.com."

Cisco Prime Collaboration Deployment does not support changing the FQDN, only hostnames.

Use the Readdress Task wizard to create and edit readdress tasks.

Before You Begin

- If you have not already done so, perform a cluster discovery for the cluster you wish to readdress, so that it appears in the Cluster inventory. See Discover a Cluster, on page 29.
- If you are using Cisco Prime Collaboration Deployment Readdress Task with virtual machine of an application, ensure that you follow the application's rules for changing IP and hostname—either one at a time or simultaneously.

Procedure

Step 1  Click the open and close navigation button and choose Task > Readdress from the main menu.
Step 2  Click Add Readdress Task.
Step 3  From the Cluster drop-down list, select the cluster on which you want to change the address of the nodes. Click View Nodes to view the Cluster nodes.
Step 4  Click Next.
Step 5  Click Edit next to a node to enter an alternate Hostname, IP Address, Subnet Mask or Gateway.
Note  If DHCP is configured for a cluster, you cannot edit using the readdress task.
Step 6  Click OK.
Step 7  Click Next.  
Important  When you click Next, Cisco Prime Collaboration Deployment performs a validation test automatically. If the test on a cluster fails, the error message describes the failed test. You can continue to create the tasks, but you must resolve the errors described or the task will fail.
Step 8  Select the date and time when you want the readdress task to begin. You have the following options to schedule readdress tasks:
  - Select Schedule for a specific time to enter the date and time when you want the readdress task to start. Any start time that you set is based on the time zone of the Cisco Prime Collaboration Deployment server as denoted by the time zone that is displayed with this option.
  Note  If you schedule a task for a few minutes in the future, but do not save it until that scheduled time passes, then the task will start automatically.
Select **Start task manually** to keep the task in a manual start.

Select **Start task immediately upon completion of wizard** to start the task immediately after you click **Finish**.

**Note** You can also start the task from the Monitoring page.

**Step 9** Click **Next**.

**Step 10** Specify the sequence of steps to complete the task. You have the following options here:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pencil icon</td>
<td>Edit a step.</td>
</tr>
<tr>
<td>Page icon</td>
<td>Add a new step after the current step.</td>
</tr>
<tr>
<td>Up arrow</td>
<td>Move the step up to be executed earlier.</td>
</tr>
<tr>
<td>Down arrow</td>
<td>Move the step down to be executed later.</td>
</tr>
</tbody>
</table>

- The Pencil icon opens up an **Edit Step** window. Add nodes to be readdressed in this step from the list of available nodes. The available nodes are the ones that you chose for a readdress.

**Note** IM and Presence Service nodes do not have an **Edit** button, since readdress is not supported on Cisco Prime Collaboration Deployment for IM and Presence Service servers.

- The step to which each node is assigned displays next to the node. If a node is not assigned to any step, it shows as unassigned.

- When you assign all the nodes to a step, there will be a default sequencing available.

**Important** You cannot proceed to next step until you assign all the nodes that were selected for this task.

- Cisco Prime Collaboration Deployment automatically inserts a Forced Pause after each sequence step in a Readdress task.

- For a readdress task, only one node can be assigned to each step. Multiple nodes cannot be combined and assigned in a single step.

**Step 11** Click **OK**.

**Step 12** Click **Next**.

**Note** The **Next** button remains enabled, which allows the user to click to be informed of any configuration errors.

**Step 13** See the **Review** section to verify the details of the task you created. You can add notes for the task if required. The notes are saved with the task and are visible if the task is edited before completion.

**Step 14** Click **Finish** to schedule the task.

---

**Run a Readdress Task**

If you scheduled the task to start at a later date, or if you chose Manual Start, then the task will be listed in the task list but will not start yet.
For a task that was scheduled for manual start, click the **Start** button that is associated with this task to begin the task.

While the readdress task is running, if there is more than one server to be readdressed in the task, some user operations are needed. The readdress task sequence automatically inserts a Forced Pause into the sequence after the address of a server is changed.

The forced pause allows you to perform manual steps, such as updating DNS entries and server entries on the Unified Communications publisher node interface (**System > Server**). It also allows you to check the phones associated with the server successfully registered. User needs to perform these steps before resuming the readdress task in the interface for other Unified Communications nodes as well. After the readdress task resumes, the system replicates the updates successfully.

For more information, see *Administration Guide for Cisco Unified Communications Manager*.

### Before You Begin

**Important**

Before running a readdress task, you may need to perform certain steps (for example, updating entries on the DNS server).

It is very important that you read *Administration Guide for Cisco Unified Communications Manager* before you run the readdress task.

### Post Readdress Task

When you determine that the server successfully changed the address, go to the Cisco Prime Collaboration Deployment GUI and click **Resume** to resume the task.

The Cisco Prime Collaboration Deployment server proceeds to the next server in the sequence to be readdressed. Repeat the steps of waiting for the forced pause, checking the server state, and resuming the task, when the server readdress is verified.

### Install Task

Use this task to fresh install a cluster containing Unified Communications Manager or IM and Presence Service servers. You cannot use this task to add a new server to an existing cluster.

### Create an Install Task

**Before You Begin**

1. **VMware**—Deploy the hardware for the new cluster and install ESXi

**Note**

Make sure that the host with the Cisco Prime Collaboration Deployment VM and the host with the application VMs use the required Virtualization Software License. See *Virtualization Software License Types*, on page 4.
2  ISO files—Download the necessary OVA and ISO images for target release, and use SFTP transfer the ISO files to the /fresh_install directory of Cisco Prime Collaboration Deployment.

Note
The ISO file must be bootable.

Note
Do not edit the file name of the bootable ISO that is being used for a PCD task.

3  VMware—Deploy Cisco-recommended OVA to create the VMs for the nodes to be installed. Create the appropriate number of target virtual machines on your ESXi hosts (one new virtual machine for each server to be installed in the cluster) using the Cisco OVAs that you downloaded in Step 2. Configure the network settings on new VMs.

4  Cisco Prime Collaboration Deployment GUI—Add the ESXi Hosts that contain your virtual machines to the Cisco Prime Collaboration Deployment inventory. For information about adding and ESXi host to Cisco Prime Collaboration Deployment, see Add an ESXi Host Server, on page 32.

5  Cisco Prime Collaboration Deployment GUI—Define the new installation cluster (click the open and close navigation button and choose Inventory > Clusters) to define the nodes to be installed, and their associated virtual machines. (See Add New Cluster for Fresh Install, on page 34.)

6  Cisco Prime Collaboration Deployment GUI—Setup Email Notification (Optional)
   • Click the open and close navigation button and choose Administration > Email Notification.
   • When email notification is set up, the Cisco Prime Collaboration Deployment server emails the error conditions that may occur during the migration task.

7  Cisco Prime Collaboration Deployment GUI—Create the Install task.

8  Be sure to enter the IP addresses or hostnames of the cluster nodes to be installed into your DNS server before you create the install task.

Add Install Task
Follow this procedure to automatically install one or more nodes in a cluster at scheduled times.

Procedure

Step 1  Click the open and close navigation button and choose Task > Install from the main menu.

Step 2  Click Add Install Task.
   Note  If you have no Install tasks, a Cluster Installation popup window appears with the prerequisites to run the wizard. Click Close to close the popup window.

Step 3  From the Installation Cluster drop-down list, select the cluster on which the nodes to be installation are located.

Step 4  Click Next.

Step 5  Click the respective Browse buttons to select the Unified Communications Manager Installation file and the Cisco Unified Presence Installation file from the server.
The ISO file is visible here only if it was placed in the directory under /fresh_install, uploaded through a standard SFTP client (Admin Name: adminsftp, Password: Administration password). For more information, see the task management information at the beginning of this section.

Note By default, only files that can be installed on the selected nodes are displayed. The option to select install files is available only for the selected product types and applications that are currently supported in the cluster.

Step 6 Click Choose File.
Step 7 Click Next.
Note The Next button is dimmed if no valid upgrade files are selected.

Step 8 Select the date and time when you want the upgrade task to begin. You have the following options to schedule upgrades:

- Select Schedule for a specific time to enter the date and time when you want the upgrade task to start. Any start time that you set is based on the time zone of the Cisco Prime Collaboration Deployment server as denoted by the time zone that is displayed with this option.
  Note If you schedule a task for a few minutes in the future, but do not save it until that scheduled time passes, then the task will start automatically.

- Select Start task manually to keep the task in a manual start.

- Select Start task immediately upon completion of this wizard to start the task immediately after you click Finish.
  Note You can also start the task from the Monitoring page.

Step 9 Click Next.
Step 10 Specify the sequence of steps to complete the task. You have the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pencil icon</td>
<td>Edit a step.</td>
</tr>
<tr>
<td>Page icon</td>
<td>Add a new step after the current step.</td>
</tr>
<tr>
<td>X mark</td>
<td>Delete the current step.</td>
</tr>
<tr>
<td></td>
<td>If you remove all the nodes from a step, the step is removed by default. You cannot remove a step that contains the Publisher node.</td>
</tr>
<tr>
<td>Up arrow</td>
<td>Move the step up to be performed earlier.</td>
</tr>
<tr>
<td>Down arrow</td>
<td>Move the step down to be performed later.</td>
</tr>
</tbody>
</table>

- The Pencil icon opens up an Edit Step window. Add nodes to be installed in this step from the list of available nodes. The available nodes are the ones that you chose to install in this cluster.

- The step to which each node is assigned displays next to the node. If a node is not assigned to any step, it shows as unassigned.

- When you assign all the nodes to a step, a default sequencing is available.
You cannot proceed to next step until you assign all the nodes.

• If you are installing Cisco Unified Communications Manager between Releases 10.0(1) and 10.5(1), the task is paused after publisher node is installed completely. You must enter details of subscriber nodes into the publisher node before you manually start the next step. Cisco Unified Communications Manager Release 10.5(2) onward does not pause during a fresh installation; the install task continues automatically.

Step 11 Click OK.
Step 12 Click Next.
   Note The Next button remains enabled, which allows the user to click to be informed of any Misconfiguration.
Step 13 See the Review section to verify the details of the task you created. You can add notes for the task if required. The notes are saved with the task and are visible if the task is edited before completion.
Step 14 Click Finish to schedule the install task.
   Important When you create a fresh install cluster with both Unified Communications Manager and IM and Presence Service nodes, be sure to indicate which IM and Presence server is the publisher. Later, when the task is running, and it pauses after the Unified Communications Manager publisher installation to allow for entry of the subscriber nodes into the Unified Communications Manager publisher (System > Server GUI menu), it is important that the IM and Presence Service publisher be the first IM and Presence Service server added to this list. This ensures that IM and Presence Service is installed as the first node.
   Note The Unified Communications Manager publisher requires that all subsequent servers in the cluster be added to the Cisco Unified Communications Manager Administration GUI, after the Publisher is installed. Because of this requirement, when you create an install task, Cisco Prime Collaboration Deployment automatically inserts a Forced Pause in the sequence steps after the Unified Communications Manager (Releases from 10.0(1) to 10.5(1)) publisher is installed.

Run an Install Task

If you scheduled a task to start at a later date or if you chose Manual Start, the task is listed in the Task list, but has not started yet. In this case, a validation button is associated with the install task. Click Validation to check the task before you run it. By running validation before you start the task, you are alerted to any potential problems with the task (such as a missing ISO file or VMs not in the Off state). You can then fix these issues before you start the task.

Note Clicking the Validation button will not start the task; this button only checks the resources to be used when the task starts.

For a task that was scheduled for manual start, click the Start button that is associated with this task to begin the task.

When a fresh install task includes more than just one server, some user interaction is required while the task is running. The installation task automatically installs the Unified Communications Manager publisher first, and then the task sequence will have a forced pause. This forced pause stops the install task to allow the user to go to the Unified Communications Manager GUI of the newly installed publisher, and add the other servers in the cluster into the System > Servers window. To define the subsequent nodes, click Add New and configure the server.
After all the subscribers to be installed in this cluster (Unified Communications Manager subscribers, IM and Presence Service publisher and IM and Presence Service subscribers) are added to the Unified Communications Manager publisher GUI, return to the Monitoring page in the Cisco Prime Collaboration Deployment GUI and click the **Resume** button for the install task to resume. The install task continues and installs the Unified Communications Manager or IM and Presence Service software on the subsequent server (or servers).

**Cancel Install Task**

Use this procedure to cancel a fresh install task or an existing installation in a migration task.

**Procedure**

**Step 1**
From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Task > Install** from the main menu.
The existing install tasks appear in the **Task List** section.

**Step 2**
Select an existing install task and click **Cancel**.

**Note**
If you cancel the currently running install task, you will have to delete the virtual machine and then recreate it.
The virtual machine of the selected install task turns off and the task status is displayed as **Canceled**.

**Post-Install Task**

After the install task, no further actions are required. The new cluster is ready for use.

**Edit and Expand Cluster Support**

If you deployed a Cisco Unified Communications Manager cluster, the Edit and Expand Cluster support feature in Cisco Prime Collaboration Deployment eliminates migration issues and barriers. You can perform the following actions:

- Add IM and Presence Service to an existing Unified Communications Manager cluster.
- Add new nodes to the existing cluster—for example, add subscriber nodes.
- Select nodes from a cluster to perform installation.

This feature works with only a previously installed 10.x or later system and uses the Fresh Install Task to add the nodes.

**Note**
After you add and install new nodes to an existing cluster, if you later perform the Discovery task, the entire cluster with the new nodes is discovered.
## Edit or Delete a New Install Cluster

Edit or delete an added new node that has not yet been installed. A node that has not been installed appears active.

### Procedure

**Step 1** From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Inventory > Clusters**.

**Step 2** Click a cluster that has the cluster type as **New Install** and click **Edit**.

**Step 3** In the Specify Cluster Name section, view the pre-populated cluster name, and click **Next**.

**Step 4** In the Add Virtual Machines section, select a node from the existing nodes, and click **Edit**. The **Add Node** window appears.

**Step 5** In the **Add Node** window, edit the node details, and click **OK**.

**Step 6** In the Configure Cluster Wide Settings section, edit the OS administration credentials, application credentials, security password, SMTP settings, and certificate information for all nodes of a cluster, as required, and click **Next**.

**Step 7** (Optional) In the Configure DNS Settings section, edit the DNS settings for the migration cluster nodes, and click **Next**.

**Note** If the previous nodes in the cluster have the same values for DNS and domain, then the value from the other nodes becomes the default value for the new nodes and is auto-populated. If the previous nodes have multiple values for DNS or domain, then no default value is applied.

**Step 8** In the Configure NTP Settings section, edit the configuration of the NTP servers for the nodes in a cluster, and click **Next**.

**Note** The changes you make in this section apply to publisher node only.

**Step 9** (Optional) In the Configure NIC Settings section, choose a server, and enter an MTU size between 552 and 1500, click **Apply to Selected**, and then click **Next**.

**Step 10** In the Configure Time Zones section, select a node, edit the region and time zone from the Region and Time Zones list boxes, click **Apply to Selected**, and then click **Finish**.

**Note** If the previous nodes in the cluster have the same values for time zone, then the value from the other nodes becomes the default value for the new nodes and is auto-populated. If the previous nodes have multiple values for time zone, then no default value is applied.

The changes are saved. You can install one or multiple nodes in a cluster. See [Add Install Task](#) on page 58 for details.

---

## Edit or Delete a Discovered Cluster

You can edit or delete a node that has not yet been installed. A node that has not been installed appears active and the installed nodes appear inactive.

**Note** After you add or install a new node, you cannot delete the node with this feature. You must delete the node from an existing installed cluster by using your application administration web page or the CLI.
Procedure

Step 1 From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose Inventory > Clusters.

Step 2 From the Cisco Prime Collaboration Deployment application, select Inventory > Clusters.

Step 3 Click a cluster that has the cluster type as Discovered and click Edit.

Step 4 In the Specify Cluster Name section, enter the cluster name, and click Next.
Note If the discovered cluster is already installed, the cluster name is non-editable.

Step 5 In the Add Virtual Machines section, select a node from the existing nodes that has not been installed, and click Edit.
The Add Node window appears.

Step 6 In the Add Node window, edit the node details, and click OK, and then click Next in the Add Virtual Machines section.
Note If you add a new node to an existing cluster, the new nodes cannot use the Publisher function.

Step 7 In the Configure Cluster Wide Settings section, view the OS administration credentials, application credentials, security password, SMTP settings, and certificate information for all nodes of a cluster and click Next.
Note The fields in this section are editable only if the cluster type is New Install.

Step 8 (Optional) In the Configure DNS Settings section, edit the DNS settings for the migration cluster nodes, and click Next.
Note If the previous nodes in the cluster have the same values for DNS and domain, then the value from the other nodes becomes the default value for the new nodes. If the previous nodes have multiple values for DNS or domain, then no default value is applied.

Step 9 In the Configure NTP Settings section, view the configuration of the NTP servers for the nodes in a cluster, and click Next.
Note The fields in this section are non-editable.

Step 10 (Optional) In the Configure NIC Settings section, edit the server details for the uninstalled nodes, enter an MTU size between 552 and 1500, and then click Next.

Step 11 In the Configure Time Zones section, select a node, edit the region and time zone from the Region and Time Zones list boxes, click Apply to Selected, and then click Finish.
Note If the previous nodes in the cluster have the same values for time zone, then the value from the other nodes becomes the default value for the new nodes. If the previous nodes have multiple values for time zone, then no default value is applied.
The changes are saved. You can install one or multiple nodes in a cluster. See Add Install Task, on page 58 for details.

Monitor Task Status

Use the Monitoring page to view the status of tasks in Cisco Prime Collaboration Deployment.
For a description of the information that is available through the Monitoring page, see Monitoring View Elements, on page 80.

**Procedure**

**Step 1** Click the Monitoring link on the main menu to view the Monitoring page.

**Step 2** The column on the left side of the Monitoring page lists each task and an icon that shows its current status. Also shown is the type of task (Migrate, Upgrade, Install, and so on), and the cluster nickname for the task. The task start time is also shown. Click the task in this left column to view the detailed data for that task in the panel on the right.

**Step 3** The upper right section of the page provides the following data:

- Status
- Start time
- Task data (for example: cluster nickname and ISO name)

Click View Log to see the detailed log messages for the task. If you see any errors or warnings in this log, refer to the Troubleshooting section more information.

In the upper right are buttons that you use to perform various operations on the task. For example, if the task is paused, click the Resume button to resume the task.

A button will appear if it is valid for the current state of the task. For example, after a task is finished, it will not have a Cancel button, but instead will have a Delete button (if you wish to remove the data for the task).

**Step 4** The bottom right section of the page provides detailed steps for the task, along with the status for that step. Click on the triangle that corresponds to a step to expand the step description. Each step also has a View Log link, to show the log messages for that step.

**Note** The Monitoring page refreshes automatically every 3 minutes. To deactivate automatic refresh, click the Disable button.

**Action Buttons on the Monitoring Page**

- **Start**—This button appears if a task is created with the "Start Task Manually" option. The task starts after you click the Start button.
- **Cancel**—Cancel the task. This button appears when a task is in the scheduled or running state. If the task has already started, this button does not undo any steps that are already complete, but it will stop the task as soon as possible.
- **Delete**—Delete the task from the system. This removes the task and all its history.
- **Resume**—This button appears when a task is in a paused state. It allows the user to resume the task at the next step.
- **Retry**—This button appears when the task is in a "Paused due to error" state. Clicking this button retries the last step of the task that failed because of an error.
**Automatic Refresh**

The Monitoring page refreshes automatically every 3 minutes. To deactivate automatic refresh, click the **Disable** button in the top left corner of the Monitoring page.

**Administration Tools**

**Email Notification**

The Email Notification feature sends email notifications to you that contain details about certain task events. You can choose whether the system sends emails for all standard task events (such as when task is scheduled, started, successful, paused, failed and canceled), or for only task errors. Emails are sent for all types of tasks—cluster discovery, upgrade, migration, switch version, restart, fresh install, and readdress.

You can choose to send an email notification to a user after the value that is configured in the **Warning Threshold for Approaching Log Rotation Overwrite(%)** field from the Audit Log Configuration window is reached. The email notification informs the user to take back up of the audit log files because they will be deleted or overwritten.

**When Email Is Sent**

If you choose to receive email notifications in **Standard mode**, an email message is sent when a task enters any of the following states:

- Scheduled
- Failed to Schedule
- Started
- Successful
- Failed
- Canceled
- Canceling
- Failed to Cancel
- Paused on Error
- Paused
- Paused – Required

If you choose to receive email notifications in **Error only mode**, an email message is sent when the task enters the following states:

- Failed to Schedule
- Failed
- Failed to Cancel
• Paused on Error

SFTP Datastore

The Cisco Prime Collaboration Deployment server serves as a local SSH File Transfer Protocol or Secure File Transfer Protocol (SFTP) server that is used to store the ISO and COP files to be used by upgrade, fresh install, and migrate tasks.

Note

These procedures describe how to place files on the Cisco Prime Collaboration Deployment server using Linux. You can push a file from a Linux machine for SFTP client.

Migration or Fresh Install Tasks

Follow this procedure to send the ISO file to the Cisco Prime Collaboration Deployment server using the adminsftp account and Cisco Prime Collaboration Deployment GUI (or CLI password with any SFTP client).

Procedure

Step 1  From a Linux shell, type `sftp adminsftp@<Cisco Prime Collaboration Deployment server>` and then provide the password (the same in both the CLI and GUI).

Step 2  Change the directory to the `fresh_install` directory.

Example:
From a Linux shell, type `cd fresh_install` and press Return.

Step 3  Upload the ISO file.

Example:
Type `put UCSInstall_UCOS_10.0.x.xxx.sgn.iso`.

Upgrade Task

Follow this procedure to use SFTP to upload ISO or COP files that will be used for upgrade tasks on the Cisco Prime Collaboration Deployment server.

Procedure

Step 1  From a Linux shell, type `sftp adminsftp@<Cisco Prime Collaboration Deployment server>` and then provide the password (the same in both the CLI and GUI).

Step 2  Change the directory to the `upgrade` directory.
Example:
From a Linux shell, type `cd upgrade` and press Return.

Step 3 Upload the ISO file or COP file.

Example:
Type `put UCSInstall_UCOS_10.0.x.xxx.sgn.iso`.

---

Verify or View an ISO Filename

Procedure

Step 1 From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Inventory > SFTP Servers and Datastore**.

Step 2 On this page, you can view and manage files that are stored on the SFTP datastore of this Cisco Prime Collaboration Deployment server. It displays the filename of the ISO and COP files that are stored on the server, and where they are located in the directory (for example: fresh_install or upgrade).

---

Delete ISO or COP Files

Use the following procedure to delete ISO or COP files on a Cisco Prime Collaboration Deployment SFTP server using the Cisco Prime Collaboration Deployment GUI.

Procedure

Step 1 Log in to Cisco Prime Collaboration Deployment.

Step 2 From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Inventory > SFTP Servers and Datastore**.

Step 3 Check the check box next to the ISO or COP file.

Step 4 Click **Delete**.

**Important** We recommend that you periodically delete ISO or COP files that are no longer needed to save space, especially before upgrading the Cisco Prime Collaboration Deployment server software.
Remote SFTP Server Support

The remote SFTP server support feature leverages Cisco Prime Collaboration Deployment for upgrades. Use of this feature avoids the issues that are caused by large application image files streamed over WAN that are only supported by Cisco Prime Collaboration Deployment 11.0(1) and later.

Examples of where this feature is useful are listed as follows:

- Geographically distributed deployments, such as multi-site distributed IP Telephony with multiple clusters at separate sites from the Cisco Prime Collaboration Deployment virtual machine.
- Clustering over WAN (CoW), where the application virtual machines are at different sites than the Cisco Prime Collaboration Deployment virtual machine.
- Deployments where Cisco Prime Collaboration Deployment is in central data center; however Cisco Unified Communications Manager clusters are remote over the WAN.

These SFTP servers used for the upgrade of Cisco Unified Communications Manager are same as the SFTP servers that are used for the upgrade of Cisco Unified Communications Manager. Following is the list of the supported SFTP servers that are used for the upgrade:

- Open SSH
- Cygwin
- Titan

**Note** The remote SFTP server support is available for upgrade task only and no other task types, including the migration task.

Add Remote SFTP server

**Procedure**

**Step 1** From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose Inventory > SFTP Servers and Datastore.

The SFTP Servers/Datastore table on this window shows the PCD details by default.

**Step 2** From the SFTP Servers/Datastore table, click Add Server.

The Add SFTP Server window appears.

**Step 3** In the Address and access credentials section, enter values in the IP / Host Name, Username, and Password fields.

**Step 4** In the Path to Datastore Directory on Server section, click a Add Directory button to add a value in the Directory field.

**Note** For an upgrade, ensure that a directory includes .iso datastore files.

**Step 5** (Optional) In the Additional Information section, enter description in the Description field.

**Step 6** Click Add.
If the SFTP server is not added, you get any of the following error messages:

- **Connection Timeout**—Indicates that the connection to SFTP server failed due to timeout.
- **Login Failure**—Indicates that the login to the SFTP server failed.
- **Directory Not Found**—Indicates that the directory that you selected is not found on the SFTP server.
- **Directory Already Entered**—Indicates that the directory that you selected already exists in the list of directories. You can view the list of available directories by clicking the Add Directory button.
- **Directory Already Exists**—Indicates that the directory that you entered already exists in the list of the SFTP servers.
- **Mandatory Fields Missed**—Indicates that you did not enter values in the mandatory fields.
- **Mentioned Server Could Not Be Located**—Indicates that the server that you entered is not configured with DNS. This error message appears if you enter host name instead of IP address.

The SFTP Servers/Datastore table shows the remote SFTP server that you added. The SFTP/Datastore Files table shows the list of files from the remote SFTP server and from Cisco Prime Collaboration Deployment. In addition, the existing Cisco Prime Collaboration Deployment server is added automatically and the files in the upgrade and fresh_install folders in the Cisco Prime Collaboration Deployment server appear by default in the SFTP/Datastore Files table.

---

### Associate Nodes to Remote SFTP Server

#### Before You Begin

- Add an SFTP server.
- Ensure that the cluster node you choose to associate to an SFTP server is not in the **Scheduled**, **Running**, or **Wait_for_manual_start** states.

#### Procedure

**Step 1** From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Inventory > Clusters**. The Clusters window appears.

**Step 2** Click **Discover Cluster** button to search for the existing clusters. To discover a cluster, see the Discover a Cluster, on page 29 procedure.

**Step 3** From the available cluster nodes in the **Cluster Nodes** table, click **Edit** for a cluster node. The Edit Node window appears.

**Step 4** From the SFTP Server drop-down list, choose an SFTP server. By default, this field shows the localhost option as the SFTP Server.

**Step 5** Click OK.
The SFTP server is associated with the cluster node that you selected and the details appear in the SFTP Server column of the Cluster Nodes table.

**Edit Remote SFTP Server**

For the existing remote SFTP server, you can edit the details, such as username, password, or description. You can also add multiple directories to the remote SFTP server while editing other field values.

**Before You Begin**

- Ensure that a cluster node is not associated with remote SFTP server directory that you choose to edit.
- Ensure that no upgrade task is associated with the SFTP server.

**Procedure**

**Step 1**  
From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose Inventory > SFTP Servers and Datastore. The SFTP Servers/Datastore table on this window shows the PCD details by default.

**Step 2**  
From the available SFTP servers in the SFTP Servers/Datastore table, click Edit for an SFTP server. The Edit SFTP Server window appears.

**Step 3**  
Edit the values for the fields in the Address and access credentials, Path to Datastore Directory on Server, and Additional Information sections. In Path to Datastore Directory on Server section, by clicking the Add Directory button, you can edit an existing directory and also add multiple directories.

**Step 4**  
Click Save.

**Delete Remote SFTP Server**

You can delete one or multiple remote SFTP servers that are available in the Cisco Prime Collaboration Deployment application. However, you cannot delete any datastore.

**Before You Begin**

- Ensure that no upgrade task is associated and running with the cluster node that uses the SFTP server that you choose to delete.
- Disassociate the cluster nodes from the SFTP server that you choose to delete.

**Note**  
You can disassociate a cluster node even if no upgrade task is associated and running with the cluster node that uses the SFTP server that you selected to delete.

- Ensure to change the node association of the SFTP server, which you choose to delete, from remote/external SFTP server to the localhost SFTP server.
If you do not change the node association from remote/external SFTP server to the localhost SFTP server, the association of cluster nodes changes to the localhost SFTP server from the remote SFTP server and the remote SFTP server that you selected is deleted.

**Procedure**

**Step 1**  
From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Inventory > SFTP Servers and Datastore**.  
The SFTP Servers/Datastore table on this window shows the PCD details by default.

**Step 2**  
From the available SFTP servers in the SFTP Servers/Datastore table, check the check box of one or multiple remote SFTP servers that you want to delete.

**Step 3**  
Click **Delete**.

**Delete Local SFTP/Datastore ISO files**

You can delete ISO and COP files from the SFTP server running locally in the Cisco Prime Collaboration Deployment virtual machine. However, you cannot delete ISO files from the remote SFTP server.

**Before You Begin**

Ensure that the SFTP and datastore ISO files that you choose to delete are not associated with the upgrade in these states— **Scheduled**, **Running**, or **Wait_for_manual_start**.

**Procedure**

**Step 1**  
From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Inventory > SFTP Servers and Datastore**.  
The SFTP Servers/Datastore table on this window shows the PCD details by default.

**Step 2**  
From the available SFTP and datastore files in the SFTP/Datastore Files table, check the check box of one or multiple remote SFTP and datastore files that you want to delete.  
**Note** You cannot delete remote SFTP files.

**Step 3**  
Click **Delete**.

**Disk Space Warning Level**

Use this feature to view and configure a disk space warning level for tasks through the **Disk Space Warning Level Configuration** window. When the available disk space value drops below the value that you assign as the warning level disk space, the system warns you that it is running out of disk space to perform tasks.
Configure Disk Space Warning Level

Use this procedure to configure the available disk space threshold where the system warns you that it is running out of disk space to perform tasks.

**Note**

Disk space warning level is applicable and is validated for migration and install tasks. This level is also validated each time you log in to Cisco Prime Collaboration Deployment.

**Procedure**

**Step 1**
From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose **Administration > Disk Space Warning Level**.
The **Disk Space Warning Level** window appears showing the total disk space and the available disk space.

**Step 2**
View the total disk space and the available disk space in the **Total Disk Space (GB)** and **Available Disk Space (GB)** fields.

**Step 3**
Enter the value that you want to assign for the **Warning Level Disk Space (GB)** field.
You can click the information link to check if the space value you entered is available for use on the server.

**Step 4**
Click Save.

**Step 5**
(Optional) Click Reset.
The page is reset with the default values.

Audit Log Configuration

Use this feature to configure audit logs through Cisco Prime Collaboration Deployment interface for local and remote syslog servers. The audit logs are sent to the syslog server in the TCP mode. You can configure audit logs through the **Audit Log Configuration** window and perform the following tasks:

- Configure application audit event levels
- Configure remote Syslog server name or IP address
- Enable or disable audit logs
- Enable or disable log rotation
- Configure maximum number of files
- Configure file size
- Configure warning threshold level for log rotation

Configure Audit Logs

Use this procedure to configure audit logs for local and remote syslog server through the Cisco Prime Collaboration Deployment application.
Procedure

Step 1 From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose Administration > Audit Log Configuration.

Step 2 Choose one of the options from the Application Audit Event Level drop down list to configure an audit level.

Step 3 Enter the name of remote syslog server or the IP address for the Remote Syslog Server Name / IP field so that the audit logs are logged into this remote server.

Step 4 (Optional) Check or uncheck the Enable Local Audit Log check box to enable or disable the local audit log.
   • When you check this field, the audit events are logged in the local server. When you uncheck this field, audit events are not logged in the local server.
   • When you check this field, the Enable Log Rotation field becomes active.

Step 5 (Optional) Check or uncheck the Enable Log Rotation check box to enable or disable the log rotation.
   Note You can configure this field if Enable Local Audit Log is enabled.
   When you check this field, you can configure the Maximum No of Files, Maximum File Size(MB), and Warning Threshold for Approaching Log Rotation Overwrite(%) fields. When you uncheck the Enable Local Audit Log field, the default values of these fields are not applicable as they are inactive.

Step 6 Enter an integer value for the Maximum No of Files field to configure the maximum number of files that can be created on the server.

Step 7 Enter a value for the Maximum File Size (MB) field to configure the maximum file size of each log that is created on the server.

Step 8 Enter the warning threshold value for the Warning Threshold for Approaching Log Rotation Overwrite(%) field.

Step 9 Click Save.

Step 10 (Optional) Click Reset. The page is reset with the default values.

Customized Logon Message

Use this feature to display the alerts or warning messages while signing in to the Cisco Prime Collaboration Deployment application. You can configure the alerts or warning messages through the Customized Logon Message window and perform the following tasks:
   • Upload a file with customized login message
   • Enable user acknowledgment

Configure Customized Logon Message

Use this procedure to configure customized logon messages when a user signs into the Cisco Prime Collaboration Deployment application.
Procedure

Step 1 From the Cisco Prime Collaboration Deployment application, click the open and close navigation button and choose Administration > Customized Logon Message.

Step 2 For the Upload File field, browse to the location of file that includes the customized logon message.

Step 3 (Optional) Check or uncheck the Require User Acknowledgement check box to enable or disable user acknowledgment for the file that the user receives. If this field is enabled, users get an acknowledgment as an alert message on the Cisco Prime Collaboration Deployment sign-in page after they sign out for the first time from the same web browser instance.

Step 4 Click Upload File.

The file with the customized logon message is uploaded and a pop-up appears showing the file upload status.

Step 5 (Optional) Click Delete.

The file with the customized logon message is deleted and a pop-up appears showing the file deletion status.

FIPS 140-2 Compliance

FIPS, or Federal Information Processing Standard, is a U.S. and Canadian government certification standard that defines requirements that cryptographic modules must follow. A cryptographic module is a set of hardware, software, and/or firmware that implements approved security functions (including cryptographic algorithms and key generation) and is contained within the cryptographic boundary.

Certain versions of Unified Communications Manager are FIPS 140-2 compliant, in accordance with the U.S. National Institute of Standards (NIST), and can operate in FIPS mode, level 1 compliance. Cisco Prime Collaboration Deployment meets FIPS 140-2 requirements by using Cisco-verified libraries.

For details on EnhancedSecurityMode, see EnhancedSecurityMode Support, on page 74.

Note

- Elliptic Curve Digital Signature Algorithm (ECDSA) ciphers are not supported in Cisco Prime Collaboration Deployment. Hence, during TLS connection, the server does not negotiate the ECDSA certificates even though the `show cert list own` CLI command may show the ECDSA self-signed certificate.
- All the nodes of a cluster should either be FIPS or non-FIPS.

EnhancedSecurityMode Support

Once you enable EnhancedSecurityMode, the following system enhancements are enabled by default:

- Stricter credential policy is implemented for user passwords and password changes
- TCP becomes the default protocol for remote audit logging
- FIPS mode is enabled

Enabling EnhancedSecurityMode does not enable these features by default and you have to configure them separately.

- Remote audit logging—All audit logs and event syslogs should be saved both locally and to a remote syslog server.
- System logging—All system events such as CLI logins and incorrect password attempts must be logged and saved.

**Credential Policy for EnhancedSecurityMode**

Once the EnhancedSecurityMode is enabled, a stricter credential policy for password changes is implemented automatically for Cisco Prime Collaboration Deployment. This mode uses the following default requirements for password changes:

- Password length should be between 14 to 127 characters.
- Password should have at least 1 lowercase, 1 uppercase, 1 digit and 1 special character.
- Any of the previous 24 passwords cannot be reused.
- Minimum age of the password is 1 day and Maximum age of the password is 60 days.
- Any newly generated password's character sequence should differ by at least 4 characters from the old password's character sequence.

Once this mode is enabled, the system enforces a stricter credential policy for all password changes automatically.

**EnhancedSecurityMode Requirements for Platform Cisco Prime Collaboration Deployment**

As part of EnhancedSecurityMode requirement, audit framework is introduced in Cisco Prime Collaboration Deployment. The audit framework includes audit activities, which are both in local server and remote server. The login sessions are limited for each user based on the CLI command configuration in the EnhancedSecurityMode.

**Note**

By default, auditing is not enabled in Cisco Prime Collaboration Deployment. If you wish to have audit logs, you can enable auditing with or without being in FIPS mode or EnhancedSecurityMode.

**Audit Framework and Audit Activities**

As part of audit framework, you can configure logging audit details from the Cisco Prime Collaboration Deployment application.

You can configure these details from the following options:
If you configure audit logs for any of the above options, the updates made in the field values trigger an audit log into the local server or remote syslog server. Examples of audit log activities include enabling log rotation, configuring maximum number of files and file size, and configuring addition and modification of log files.

EnhancedSecurityMode Requirements for Platform Cisco Prime Collaboration Deployment

You can use the command line interface (CLI) to enable EnhancedSecurityMode in Cisco Prime Collaboration Deployment. To enable this mode, create a status file and run the scripts for applications. The applications read the status file and respond accordingly when the system is restarted.

For Cisco Prime Collaboration Deployment to work in EnhancedSecurityMode, following requirements are met:

- Sign in banner appears prior to interface sign-in prompt
- The Department of Defense (DoD) sign-in banner appears prior to console sign-in prompts
- File Transfer Protocol Secure (FTPS) or File Transfer Protocol (FTP) service and SSH are configured with the DoD sign-in banner
- The banner appears on the screen until a user signs on for further access
- Audit tools are secured from unauthorized modification
- Audit records are used through reports
- New password is verified, as per EnhancedSecurityMode credential policy, when a user changes password

Note For credential policy for EnhancedSecurityMode, see Credential Policy for EnhancedSecurityMode, on page 75.

Re-encryption through AES

The encryption and decryption of application passwords is done in the platformConfig.xml file. During installation, the application password is re-encrypted through the Advanced Encryption Standard (AES) algorithm and is saved in the platformConfig.xml file.
Limited Number of Sign-in Sessions

An administrator can configure the sign-in session limit for each user. A user can sign in to the Cisco Prime Collaboration Deployment application through multiple windows and web browsers up to the configured number of sign-in sessions. If a user exceeds the limit of configured the number of sign-in sessions, an error message appears on the sign-in page and the user is not allowed to sign in.

An administrator can configure the limit of sign-in sessions through the following CLI command:

```
set session maxlimit <value>
```

Where the default value is 10 and maximum value is 100.

---

**Note**

When users exceed the limit of configured number of sign-in sessions, they must sign out from the application in that session and sign in to another session. In case the session closes due to abrupt exit from web browser, users need to restart the Tomcat server on Cisco Prime Collaboration Deployment to allow sign-in to the new session.
Limited Number of Sign-in Sessions
## Cisco Prime Collaboration Deployment

### Administrative Interface Elements

- Common Administrative Interface Elements, page 79
- Monitoring View Elements, page 80
- Tasks View Elements, page 84
- Inventory View Elements, page 113
- Administration View Elements, page 122

## Common Administrative Interface Elements

The following elements are common to all views in the Cisco Prime Collaboration Deployment administration interface.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open and close navigation button</td>
<td>Provides you access to navigate to menus, which appear in a vertical pane. Click this button view and hide the menus. <strong>Note</strong> When you sign in to the application for the first time, a transparent grey screen appears indicating this button. This screen also shows a pop-up message to turn off the indication.</td>
</tr>
<tr>
<td>Search and Indexing</td>
<td>Displays the search text box to allow search in the application. It also displays the options Cisco Prime Collaboration Deployment as index. <strong>Note</strong> To view the search option, click the open and close navigation button.</td>
</tr>
<tr>
<td>About</td>
<td>Provides the version of the Cisco Prime Collaboration Deployment. This setting also includes copyright and trademark information.</td>
</tr>
<tr>
<td>Logout</td>
<td>Exits from the server.</td>
</tr>
<tr>
<td>Help</td>
<td>Provides context-sensitive help information.</td>
</tr>
</tbody>
</table>
### Monitoring View Elements

After a task is scheduled, you can monitor, and control the tasks by using the Monitoring page.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Queue</td>
<td>A list of all the tasks contained in Cisco Prime Collaboration Deployment. This list can include any of the following tasks:</td>
</tr>
<tr>
<td></td>
<td>• Scheduled</td>
</tr>
<tr>
<td></td>
<td>• Canceled</td>
</tr>
<tr>
<td></td>
<td>• Started</td>
</tr>
<tr>
<td></td>
<td>• Paused</td>
</tr>
<tr>
<td></td>
<td>• Paused due to Error</td>
</tr>
<tr>
<td></td>
<td>• Successful</td>
</tr>
<tr>
<td></td>
<td>• Failed</td>
</tr>
<tr>
<td></td>
<td>• Upgrade Tasks</td>
</tr>
<tr>
<td></td>
<td>• Switch Version Tasks</td>
</tr>
<tr>
<td></td>
<td>• Server Restart Tasks</td>
</tr>
<tr>
<td></td>
<td>• Readdress Tasks</td>
</tr>
<tr>
<td></td>
<td>• Install Tasks</td>
</tr>
<tr>
<td></td>
<td>• Migrate Tasks</td>
</tr>
<tr>
<td></td>
<td>Click one of the tasks in the Task Queue to open the details for that task in the right top panel.</td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Task status</td>
<td></td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>The top right portion of the Monitoring page shows the following information for a given task:</td>
</tr>
<tr>
<td></td>
<td>• Status</td>
</tr>
<tr>
<td></td>
<td>• Start time</td>
</tr>
<tr>
<td></td>
<td>• Task data (for example: cluster data)</td>
</tr>
<tr>
<td></td>
<td>To see details about the task, click on the View Log link.</td>
</tr>
<tr>
<td></td>
<td>The following are the possible statuses for tasks:</td>
</tr>
<tr>
<td></td>
<td>• Successful—Indicates that the task has finished without errors.</td>
</tr>
<tr>
<td></td>
<td>• Started—Indicates that the task is currently running.</td>
</tr>
<tr>
<td></td>
<td>• Scheduled—Indicates that the task has been scheduled, but has not yet started.</td>
</tr>
<tr>
<td></td>
<td>• Manual Start—Indicates that the task is waiting to be started (user created the task with the &quot;Start Task Manually&quot; option).</td>
</tr>
<tr>
<td></td>
<td>• Canceled—Indicates that the user chose not to run the task.</td>
</tr>
<tr>
<td></td>
<td>• Paused—Indicates that the task is in a paused state waiting for feedback.</td>
</tr>
<tr>
<td></td>
<td>• Paused due To Error—Indicates that the task is in a paused state due to an error in the system.</td>
</tr>
<tr>
<td></td>
<td>• Failed—Indicates that the task has stopped because of an error.</td>
</tr>
<tr>
<td></td>
<td>• Failed to Schedule—Indicates that the task was not scheduled, due to an error that occurred.</td>
</tr>
<tr>
<td></td>
<td>• Failed to Cancel—Indicates that the user tried unsuccessfully to cancel the task. This typically happens when the task is in a final state (no actions are left to cancel).</td>
</tr>
<tr>
<td></td>
<td>• Canceling—Indicates that the user canceled the task, but the task is in a state that will take a long time to cancel. The task may be in this state for an hour or more if the task being canceled is an installation or migration task (during the install-new-server phase).</td>
</tr>
<tr>
<td></td>
<td>Possible messages and actions in a <strong>Successful Status</strong> state:</td>
</tr>
<tr>
<td></td>
<td>• Task completed successfully</td>
</tr>
<tr>
<td></td>
<td>• Delete—Deletes the task data permanently</td>
</tr>
<tr>
<td></td>
<td>Possible actions in a <strong>Started</strong> state:</td>
</tr>
<tr>
<td></td>
<td>• Cancel—Cancels the selected task</td>
</tr>
<tr>
<td></td>
<td>• Delete—Deletes the selected task permanently</td>
</tr>
<tr>
<td></td>
<td>Possible actions in a <strong>Scheduled</strong> state:</td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Start Task button</td>
<td>Starts task running for Scheduled tasks</td>
</tr>
<tr>
<td>Edit button</td>
<td>Opens Edit dialog for Scheduled tasks</td>
</tr>
<tr>
<td>Pause button</td>
<td>Pauses Running tasks (at next step)</td>
</tr>
<tr>
<td>Resume button</td>
<td>Resumes task at next step for Paused and Paused (Error) tasks</td>
</tr>
<tr>
<td>Cancel button</td>
<td>Cancels Scheduled, Running, Paused, and Paused (Error) tasks</td>
</tr>
<tr>
<td>Delete button</td>
<td>Deletes Scheduled, Canceled, Successful, and Failed tasks</td>
</tr>
</tbody>
</table>

Possible actions in a **Waiting for Manual Start** state:

- **Start**—Starts the task (You will see this button only if the Manual Start option was chosen when the task was created)
- **Delete**—Deletes the selected task permanently

Possible actions in a **Paused** state (a task enters this state if the user set up the task to pause at this step):

- **Resume**—Task will continue at the next step
- **Cancel**—Cancels the selected task
- **Delete**—Deletes the selected task permanently

Possible actions in a **Paused Due To Errors** state (a task will enter this state, because the system detected an error at this step):

- **Resume**—Task will continue at the next step. (Before resuming, user should look at the error in the view log and correct the problem that caused the error, or else the task will fail.) If the error message says “Failed due to validation,” the task will revalidate and start from the first step when you click Resume. Otherwise, the task will start from the next step.
- **Cancel**—Cancels the selected task
- **Delete**—Deletes the selected task permanently

Possible action in a **Failed Status** state:

- **Delete**—Deletes the selected task permanently

Cisco Prime Collaboration Deployment Administrative Interface Elements

Upgrade View
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choose Cluster page</td>
<td>From the Choose Cluster page, select the cluster and product from the drop-down lists (All products is the default option for Products). Once you have selected the cluster, the list of nodes appears in the Cluster Nodes table.</td>
</tr>
<tr>
<td>Choose Upgrade File page</td>
<td>From the Choose Upgrade File page, select the upgrade file for each product being upgraded. You will have the option of selecting files only for the product type you selected on the Choose Cluster page.</td>
</tr>
<tr>
<td>Set Start Time and Upgrade Options page</td>
<td>From the Set Start Time and Upgrade Options page, select a start time for the task. Note The time specified is based on the Cisco Prime Collaboration Deployment server time, not the time zone of the selected cluster. You have the option of setting the start time for a specific time, starting the task manually, or setting the task to begin immediately upon completion of the wizard. You also have the option of automatically switching to a new version following a successful upgrade.</td>
</tr>
<tr>
<td>Specify Run Sequence page</td>
<td>From the Specify Run Sequence, specify the sequence in which the upgrade will be processed on the servers. You change the sequence of steps by clicking the up and down arrows of a particular step. You can also add or delete a step, or edit an existing step. Select the Use Last Configured Run Sequence box if you want to reuse the previous sequence. By default, each node is sequenced into its own step.</td>
</tr>
<tr>
<td>Review page</td>
<td>The Review page provides a summary of the options you have selected in the previous steps. The nodes listed in the Nodes field are view-only—you cannot select them. You can add notes to the Notes field for future reference.</td>

<td><strong>Failed status:</strong></td>
<td>• View Details—Navigates to the monitoring page showing all the tasks available.</td>
</tr>
<tr>
<td></td>
<td>• Delete—Deletes the selected task permanently</td>
</tr>
</tbody>
</table>

**Show**

Allows you to filter restart tasks by status, by selecting one of the following options from the drop-down list:

- Quick Filter—To filter the tasks based on the status
- All—To show all the tasks available
- Scheduled—To show the tasks that are scheduled
- Canceled—To show the tasks that are canceled
- Running—To show the tasks that are started
- Paused—To show the tasks that are paused
- Paused due To Error—Indicates that the task is in a paused state due to an error in the system
- Successful—To show the tasks that are successful
- Failed—To show the tasks that failed

**Filter**

Select a status and click Filter to set a search rule at the bottom of the search window.

**Delete**

Click the checkbox next to the task and click the Delete button at the top of the table. You can also click Delete under the Actions column for the task you wish to delete.

**Add Server Restart Task button**

Opens the Add Server Restart Task wizard.

**Note**

You can also open the Add Server Restart Task wizard by selecting Edit in the Actions column for a particular server restart task.

For information about how to add a server restart task, see "Create a Restart Task".

</tbody>
</table>
| Choose Cluster page             | From the Choose Cluster page, select the cluster from the drop-down list. Click View Nodes to the nodes associated with this cluster. The View UC Cluster Nodes dialog box opens, listing the nodes in a table that identifies the following:  
  • Hostname  
  • IP Address  
  • Product  
  • Role  
  The View UC Cluster Nodes dialog box is not editable. Click Close to return to the Choose Cluster page.                                                                                             |
| Enter New Hostnames/IP Addresses page | From the Enter New Hostnames/IP Addresses page, click Edit under the Actions column to open the Edit Hostname/IP Address dialog box. This dialog box allows you to enter a new hostname or IP address for the cluster nodes to be readdressed. You have the option of using DHCP or a static IP address.     |
| Set Start Time page             | From the Set Start Time page, select a start time for the task.  
  Note: The time specified is based on the Cisco Prime Collaboration Deployment server time, not the time zone of the selected cluster.  
  You have the option of setting the start time for a specific time, starting the task manually, or setting the task to begin immediately upon completion of the wizard.  
  You can use this page to also enable the re-address option. Check the Pause before network verification substeps to allow external changes check box if you wish to introduce a pause between the re-address and the network change verification substeps upon changing the subnet or gateway. During this pause, you can make the necessary network changes to the virtual machine configuration, such as VLAN.  
  Note: After you make the changes, resume the task to complete the verification.                                                                                                           |
| Set Run Sequence page           | From the Set Run Sequence page, specify the sequence in which the readdress is processed on the servers. The sequence of the steps is changed by clicking the up and down arrows of a particular step. You can also add or delete a step, or edit an existing step.  
  Check the Use Last Configured Run Sequence check box if you want to reuse the previous sequence.  
  By default, each node is sequenced into its own step. The Revert to Default button returns the steps to this original state.                                                                 |
| Review page                     | The Review page provides a summary of the options you have selected in the previous steps. The nodes listed in the Nodes field are view-only; you cannot select them.  
  You can add notes to the Notes field for future reference.                                                                                                                                  |

</table>
Setting | Description
--- | ---
Choose Source and Destination Clusters page | From the Choose Source and Destination Clusters page, select the source UC cluster from the drop-down list. After you select the source cluster, you select the destination cluster from the drop-down list and the nodes from the Node Mapping from Source to Destination Cluster table.

Choose Upgrade Files page | From the Choose Upgrade File page, select the upgrade file for each product being upgraded. You will only have the option of selecting files for the product type you selected on the Choose Cluster page.

Set Start Time page | From the Set Start Time page, select a start time for the task.

**Note** The time specified is based on the Cisco Prime Collaboration Deployment server time, not the timezone of the selected cluster. You have the option of setting the start time for a specific time, starting the task manually, or setting the task to begin immediately upon completion of the wizard.

Specify Migration Procedure page | From the Specify Migration Procedure page, specify the sequence in which the migration is processed on the servers. You can change the sequence of the steps by clicking the up and down arrows of a particular step. You can also add or delete a step, or edit an existing step.

By default, each node is sequenced into its own step. The Revert to Default button returns the steps to this original state.

Review page | The Review page provides a summary of the options you have selected in the previous steps. The nodes listed in the Nodes field are view-only; you cannot select them.

You can add notes to the Notes field for future reference.

| Discovery Status| Shows the discovery status of a cluster. This field shows one of the following discovery statuses:  
  • Contacting  
  • Discovering  
  • Successful  
  • Node Unreachable  
  • Timeout  
  • Internal Error |
| Actions         | Includes the following options:                                              
  • **Edit**—Edit an added new node that has not yet been installed  
  • **Delete**—Delete an added new node that has not yet been installed |
| Show            | Allows you to filter cluster tasks by status, by selecting one of the following options from the drop-down list:  
  • All—To show all the available clusters  
  • Discovered—To show the clusters that are scheduled  
  • New Install—To show the cluster that newly installed  
  • Migration—To show the clusters that are migrated |
| Filter          | Select a status and click **Filter** to set a search rule at the bottom of the search window. |
| Discover Cluster button | Click this button so that Cisco Prime Collaboration Deployment communicates with the servers that are already running Unified Communications applications and adds that cluster information into the Cisco Prime Collaboration Deployment inventory |

**Define Migration Destination Cluster**  
For information on how to create a migration cluster, see [Create a Migration Cluster](#), on page 33.
Enter details for the following fields to configure a destination cluster for a migration task:

- **Source Cluster**—From the drop-down list, select a source UC cluster.
- **View Nodes**—Click this link to view the available cluster nodes.
- **Active Versions**—Shows the active versions of the source UC cluster.
- **Destination Cluster Nickname**—Enter a nickname for the destination cluster.
- **Destination Network Settings**—Choose one of the following options:
  - **Use the source node network settings for all destination nodes**—Choose this option to retain the default network options.
  - **Enter new network settings for one or more destination nodes**—Choose this option to modify the default network settings or enter new network options.

**Note** If you select the **Use the source node network settings for all destination nodes** option, same IP address appears for both the source node NAT IP and Dest NAT IP columns on the Assign Destination Cluster Nodes window. If you select the **Enter new network settings for one or more destination nodes** option, only source hostname appears and not the destination hostname on the Assign Destination Cluster Nodes window.

### Setting | Description
---|---
Configure Cluster Wide Settings window | Enter details for the fields of the following sections:

**OS Administration Credentials**
- **Username**—Enter user name of the OS administrator.
- **Password**—Enter password of the user name.
- **Confirm Password**—Re-enter the same password that you entered in the **Password** field.

**Application Credentials**
- **Username**—Enter user name of the application user.
- **Password**—Enter password of the user name.
- **Confirm Password**—Re-enter the same password that you entered in the **Password** field.

**Security Password**
- **Password**—Enter the security password for the cluster.
- **Confirm Password**—Re-enter the same password that you entered in the **Password** field.

**SMTP Settings** (Optional)
- **SMTP Server**—Enter the IP address of the SMTP server.

**Certificate Information**
- **Organization**—Enter the name of the organization of which the certificate is being used.
- **Unit**—Enter the number of certificates being used.
- **Location**—Enter the location where the certificate is being used.
- **State**—Enter the state where the certificate is being used.
- **Country**—From the drop-down list, select the country where the certificate is being used.

Configure DNS Settings window | (Optional) From the available hosts added along with the functions, check a node to configure DNS setting for a node and click **Assign DNS Settings**.
To configure the Network Time Protocol, enter details of at least one NTP server in the following fields. If you are not using DNS, NTP server must be an IP address. If you are using DNS, NTP server can be an FQDN.

- NTP Server 1
- NTP Server 2
- NTP Server 3
- NTP Server 4
- NTP Server 5

**Note** It is recommended that you define at least IP addresses of two NTP servers

(OPTIONAL) Enter details for the following fields:

- Hostname, Functions, and MTU size column—From the available servers, check the check box for a server.
- MTU Size—Enter an MTU size between 552 and 1500 and click **Apply to Selected**.
- **Apply to Selected**—Click this button to apply the MTU size for the selected host.
- **Apply Default MTU**—Click this button to apply the default value of MTU size for the selected host.

Enter details for the following fields to specify the time zone for each cluster node:

- Region—From the drop-down list, select the region for the cluster node.
- Time Zone—From the drop-down list, select the time zone of the selected region.
- **Apply to Selected**—Click this button to apply the time zone changes for each cluster node.

</tr>
</tbody>
</table>
|                               | **Note**  
|                               | • When you check this field, the audit events are logged in the local server. When you uncheck this field, audit events are not logged in the local server.                                                                 |
|                               | • When you check this field, the **Enable Log Rotation** field becomes active.                                                                                                                                             |
| Enable Log Rotation           | Check or uncheck this check box to enable or disable the log rotation.                                                                                                                                                       |
|                               | **Note**  
|                               | • You can configure this field if the **Enable Local Audit Log** field is enabled.                                                                                                                                           |
|                               | • After you enable this field, you can configure the **Maximum No of Files**, **Maximum File Size(MB)**, and **Warning Threshold for Approaching Log Rotation Overwrite(%)** fields. When you uncheck the **Enable Local Audit Log** field, the default values of these fields are not applicable as they are not active. |
| Maximum No of Files           | Enter an integer value for the **Maximum No of Files** field to configure the maximum number of files that can be created on the server.                                                                                       |
|                               | After you check the **Enable Log Rotation** field, you can configure the value for **Maximum No of Files** field. Once the number of files reaches the configured value, the log rotation process starts. In the log rotation process, all the log files are deleted and rewritten from the log file number 1. |
|                               | **Note**  
|                               | The value for this field must be in the range of 1 to 5000.                                                                                                                                                                 |
| Maximum File Size(MB)         | Enter a value for the **Maximum File Size (MB)** field to configure the maximum file size of each log that is created on the server.                                                                                           |
|                               | **Note**  
|                               | The value for this field must be in the range of 1 to 10.                                                                                                                                                                   |
Customized Logon Message Configuration

</tbody>
</table>
Customized Logon Message Configuration
CHAPTER 6

Cisco Prime Collaboration Deployment Configuration and Administration

- Services, page 129
- Limitations and Restrictions, page 133

Services

After the installation of the Cisco Prime Collaboration Deployment platform, most services start automatically. You can configure services by setting service parameters for each service. If necessary, for example, for troubleshooting purposes, you may need to stop, start, or restart a service. You can perform these tasks by using the CLI on the Cisco Prime Collaboration Deployment platform.

Cisco Prime Collaboration Deployment Service

This service supports the Cisco Prime Collaboration Deployment application interface. This service must be active for the Cisco Prime Collaboration Deployment application to work correctly. It is active by default.

Performance and Monitoring Services

Cisco Log Partition Monitoring Tool

The Cisco Log Partition Monitoring Tool service supports the Log Partition Monitoring feature, which monitors the disk usage of the log partition on the Cisco Prime Collaboration Deployment platform by using configured thresholds and a polling interval.

Cisco RIS Data Collector

The Real-Time Information Server (RIS) maintains real-time information, such as critical alarms generated.

Cisco AMC Service

The Alert Manager and Collector (AMC) service allows you to retrieve real-time information that exists on the server.
Cisco Audit Event Service

The Cisco Audit Event Service monitors and logs any configuration change to the Cisco Prime Collaboration Deployment platform by a user or as a result of the user action.

SOAP-Log Collection APIs Service

The Cisco SOAP-Log Collection APIs service allows you to collect log files and to schedule collection of log files on a remote SFTP server. Examples of log files that you can collect include syslog, core dump files, Cisco application trace files.

SOAP-Performance Monitoring APIs Service

The Cisco SOAP-Performance Monitoring APIs service allows you to use performance monitoring counters for various applications through SOAP APIs; for example, you can monitor memory information per service and CPU usage.

Backup and Restore Services

Cisco DRF Master

The Cisco Disaster Recovery Framework (DRF) Master Agent service supports the DRF Master Agent, which works with the CLI to schedule backups, perform restorations, view dependencies, check status of jobs, and cancel jobs, if necessary. The Cisco DRF Master Agent also provides the storage medium for the backup and restoration process.

Cisco DRF Local

The Cisco DRF Local service supports the Cisco DRF Local Agent, which performs the work for the DRF Master Agent. Components register with the Cisco DRF Local Agent to use the disaster recovery framework. The Cisco DRF Local Agent runs commands that it receives from the Cisco DRF Master Agent. Cisco DRF Local Agent sends the status, logs, and command results to the Cisco DRF Master Agent.

SFTP

Cisco Prime Collaboration Deployment runs a Secure File Transfer Protocol (SFTP) server locally.

System Services

CDP

Cisco Delivery Protocol (CDP) advertises the voice application to other network management applications, so the network management application can perform network management tasks for the voice application.

Cisco Trace Collection Servlet

The Cisco Trace Collection Servlet, along with the Cisco Trace Collection Service, supports trace collection and allows users to view traces. If you stop this service, you cannot collect or view traces on the Cisco Prime Collaboration Deployment platform.

For SysLog Viewer and trace and log collection, the Cisco Trace Collection Servlet and the Cisco Trace Collection Service must run on the server.
Cisco Trace Collection Service

The Cisco Trace Collection Service, along with the Cisco Trace Collection Servlet, supports trace collection and allows users to view traces. If you stop this service, you cannot collect or view traces on the Cisco Prime Collaboration Deployment platform.

For SysLog Viewer and trace and log collection, the Cisco Trace Collection Servlet and the Cisco Trace Collection Service must run on the server.

Tip
If necessary, to reduce the initialization time, we recommend that you restart the Cisco Trace Collection Service before restarting the Cisco Trace Collection Servlet.

Platform Services

Cisco Tomcat

The Cisco Tomcat service supports the web server.

Cisco Tomcat Stats Servlet

The Cisco Tomcat Stats servlet collects the Tomcat statistics.

Platform Administrative Web Service

The Platform Administrative Web service is a SOAP API that can be activated on Cisco Unified Communications Manager, Cisco Unified Presence, IM and Presence Service, Cisco Unified Contact Center Express, or Cisco Unity Connection systems, to allow the Cisco Prime Collaboration Deployment server to upgrade the system.

SNMP Master Agent

This service, which acts as the agent protocol engine, provides authentication, authorization, access control, and privacy functions that relate to Simple Network Management Protocol (SNMP) requests.

Tip
After you complete SNMP configuration in the CLI, you must restart the SNMP Master Agent service.

MIB2 Agent

The Management Information Base (MIB2) Agent service provides SNMP access to variables, which are defined in RFC 1213, that read and write variables; for example, system and interfaces.

Host Resources Agent

This service provides SNMP access to host information, such as storage resources, process tables, and installed software base. This service implements the HOST-RESOURCES-MIB.

System Application Agent

This service provides SNMP access to the applications that are installed and running on the system. This service implements the SYSAPPL-MIB.
Cisco CDP Agent

This service uses the Cisco Discovery Protocol to provide SNMP access to network connectivity information on the Cisco Prime Collaboration Deployment platform. This service implements the CISCO-CDP-MIB.

Cisco Syslog Agent

This service supports gathering of syslog messages that various components generate. This service implements the CISCO-SYSLOG-MIB.

Cisco Certificate Expiry Monitor

This service periodically checks the expiration status of certificates that the system generates and sends notification when a certificate gets close to its expiration date.

Working with Services

To start, stop, activate, or restart services or to configure service parameters for services on the Cisco Prime Collaboration Deployment platform, you must use the CLI. You can start, stop, activate, or refresh only one service at a time.

When a service is stopping, you cannot start it until after the service is stopped. Also, when a service is starting, you cannot stop it until after the service is started.

The following services are activated by default after you install the Cisco Prime Collaboration Deployment platform.

- Cisco AMC Service
- Cisco Audit Event Service
- Cisco CDP
- Cisco CDP Agent
- Cisco Certificate Expiry Monitor
- Cisco DRF Local
- Cisco DRF Master
- Cisco Log Partition Monitoring Tool
- Cisco Platform Manager Service
- Cisco RIS Data Collector
- Cisco Syslog Agent
- Cisco Tomcat
- Cisco Tomcat Stats Servlet
- Cisco Trace Collection Servlet
- Host Resources Agent
The following services are stopped by default after you install the Cisco Prime Collaboration Deployment platform.

- Cisco Trace Collection Service
- SOAP-Log Collection APIs
- SOAP-Performance Monitoring APIs

Some changes to service parameters may cause system failure. We recommend that you do not make any changes to service parameters unless you fully understand the feature that you are changing or unless the Cisco Technical Assistance Center (TAC) specifies the changes.

The following table shows the commands that you need to work with services on the Cisco Prime Collaboration Deployment platform.

**Table 13: Service CLI Commands**

<table>
<thead>
<tr>
<th>Task</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display a list of services and service status</td>
<td><code>utils service list</code></td>
</tr>
<tr>
<td>Activate a service</td>
<td><code>utils service activate</code></td>
</tr>
<tr>
<td>Stop a service</td>
<td><code>utils service stop servicename</code></td>
</tr>
<tr>
<td>Start a service</td>
<td><code>utils service start servicename</code></td>
</tr>
<tr>
<td>Restart a service</td>
<td><code>utils service restart servicename</code></td>
</tr>
</tbody>
</table>

**Limitations and Restrictions**

- Cisco Prime Collaboration Deployment is not a diagnostic tool. An error message appears on the task list page if a task fails; however, you should use your usual set of tools and procedures to diagnose and correct the problem.

- The SOAP services do not replace the existing OS Administration and CLI upgrade processes. You can still upgrade your servers by using the application GUIs or CLI commands. Cisco Prime Collaboration Deployment is another way to upgrade, restart, or switch versions on the application servers.

- No localization is available for Cisco Prime Collaboration Deployment. The localization is available in English only (including time and date formats).
CLI Commands and Disaster Recovery System

- CLI Commands on Cisco Prime Collaboration Deployment, page 135

CLI Commands on Cisco Prime Collaboration Deployment

The main functions of Cisco Prime Collaboration Deployment (such as creating migration, upgrade, and other tasks) are supported through the Cisco Prime Collaboration Deployment GUI interface. You can use the GUI interface to create a specific task and schedule the time to perform the task. The GUI interface also reports the status of tasks.

For other operations, such as upgrading the software on the Cisco Prime Collaboration Deployment server and performing a DRS backup, use the Cisco Prime Collaboration Deployment CLI, which is similar to the CLI on Cisco Unified Communications Manager Release 10.x.

Use the CLI on Cisco Prime Collaboration Deployment to perform the following tasks:

- View or get log files
- Administer a DRS backup device, and perform a data backup or restore
- Upgrade the Cisco Prime Collaboration Deployment software
- Change the hostname, IP address, or password on the Cisco Prime Collaboration Deployment
- Perform diagnostic commands on the Cisco Prime Collaboration Deployment system

The most common CLI operations and commands are for viewing logs and performing DRS backups.

Getting Cisco Prime Collaboration Deployment Logs

When you troubleshoot problems on the Cisco Prime Collaboration Deployment server, it is often necessary to view the main application log.

CLI command: `file get activelog tomcat/logs/ucmap/log4j/*`

The Cisco Prime Collaboration Deployment main application log contains the following information:

- Representational state transfer (REST) requests from the browser
- Simple Object Access Protocol (SOAP) requests to UC servers
- Database requests
• Scheduler events (scheduled, started, failed, and so on)
• Specific job events (tasks, task actions, and nodes)
• Exceptions and errors

DRS on Cisco Prime Collaboration Deployment

The Disaster Recovery System (DRS) can be administered and invoked from the Cisco Prime Collaboration Deployment CLI. DRS allows you to perform user-invoked data backups of the data on your Cisco Prime Collaboration Deployment (the server clusters you have discovered, and scheduled and completed tasks). You can also choose to set up regularly scheduled automatic backups. The DRS feature has the following functions:

• CLI commands for performing backup and restore tasks
• The ability to schedule backups ahead of time, or run backups manually immediately
• The ability to archive backups to a remote SFTP server

DRS restores its own settings (backup device settings and schedule settings) as part of the platform backup and restore.

⚠️ Important

While you restore your data, the hostname, server IP address, and Cisco Prime Collaboration Deployment software version on the machine to which you are restoring the data must be the same as they were on the server on which you performed the backup.

DRS CLI Commands

Below is a list of the CLI commands that you can use to configure and perform backup and restore operations through DRS.

• `utils disaster_recovery status <operation>` (An example of `operation` is Backup or Restore).
• `utils disaster_recovery device list`
• `utils disaster_recovery device add`
• `utils disaster_recovery device delete`
• `utils disaster_recovery schedule add`
• `utils disaster_recovery schedule delete`
• `utils disaster_recovery schedule enable`
• `utils disaster_recovery schedule disable`
• `utils disaster_recovery schedule list`
• `utils disaster_recovery backup` — Starts a manual backup by using the features that are configured in the DRS interface.
• `utils disaster_recovery restore` — Starts a restore, and requires parameters for backup location, filename, and features to restore.
• `utils disaster_recovery show_backupfiles` — Shows existing backup files.
• `utils disaster_recovery cancel_backup`
Create a DRS Backup of the Server

Before You Begin
If you are using a location on your network to back up your Cisco Prime Collaboration Deployment, ensure the following points:

1. You must have access to an SFTP server to configure a network storage location. The Disaster Recovery system supports only SFTP servers that are configured with an IPv4 address or hostname/FQDN.
2. The account that you use to access the SFTP server must have write permission for the selected path.

You can also back up your Cisco Prime Collaboration Deployment to a local disk; however, this method is not recommended, because of the amount of space that is required on the Cisco Prime Collaboration Deployment disk to store the backup files.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Add the backup device. Run the following command: `utils disaster_recovery device add network`  
Example:  
`utils disaster_recovery device add network` device1 /backupdir/pcdbk 10.94.155.76 adminname2 |
| 2    | To verify that the device was set up correctly, run the following CLI command: `disaster_recovery device list`. |
| 3    | Run a backup using the following command:  
`utils disaster_recovery backup network PCD device_name` where device_name is the name of the backup device that was defined in Step 1.  
Example:  
`utils disaster_recovery backup network PCD device1` |
| 4    | Check the status of the backup using the following CLI command:  
`utils disaster_recovery status backup`. Use this command to see the status of your backup. The backup is complete when Percentage Complete is 100, and all components show “SUCCESS.” |
Important Notes on Backup and Restore

**Note**  
When you restore your Cisco Prime Collaboration Deployment data, ensure that the Cisco Prime Collaboration Deployment software version that is installed on your server matches the version of the backup file that you want to restore.

**Note**  
When you perform a DRS restore operation to migrate data to a new server, you must assign the new server the identical IP address and hostname that the old server used. Additionally, if DNS was configured when the backup was taken, then the same DNS configuration must be present before you perform a restore operation.

**Note**  
We recommend that you perform a fresh installation of Cisco Prime Collaboration Deployment on your virtual machine before you restore the data.

Restore a Backup to Cisco Prime Collaboration Deployment

**Note**  
This procedure is optional.

**Procedure**

**Step 1**  
Because a fresh install of the VM is recommended before the restore, you will need to add a backup device, so the system can retrieve the files from there. Configure the backup device by using the `utils disaster_recovery device add network` command.

**Example:**
```
utils disaster_recovery device add network device1 /backupdir/pcdbk 10.94.155.76 adminname2
```
Specify the device from which you want to restore a backup file.

**Step 2**  
List the backup files by using the following CLI command: `utils disaster_recovery show_backupfiles`

**Example:**
```
admin: utils disaster_recovery show_backupfiles device1
```
The `show_backupfiles` command shows which backups are available to be restored. Backups are named by date and the time the backup was performed.

**Step 3**  
Start the restore operation by running the following CLI command: `utils disaster_recovery restore network`

**Example:**
```
admin:utils disaster_recovery restore network b7k-vmb031 2013-10-30-15-40-54 device1
```
When you are prompted to enter the features to restore, enter PCD. Enter the comma separated features you wish to restore. Valid features for server B7K-VMB031 are PCD:PCD.
Step 4  Check the status of the restore by using the following CLI command: `utils disaster_recovery status restore`. While the restore process is running, you can check the status of the current restore job.

Do not administer any data on the Cisco Prime Collaboration Deployment server until the command shows as one hundred percent complete. This can take several minutes, depending on the amount of data that is being restored.

What to Do Next

After you restore your data, perform a system restart on the Cisco Prime Collaboration Deployment server to initialize the database.

The Cisco Prime Collaboration Deployment server will lose contact with ESXi hosts during the reinstallation. You may have to add ESXi hosts back into Cisco Prime Collaboration Deployment after a restore operation.
CLI Commands for EnhancedSecurityMode and FIPS Mode

- CLI Commands for EnhancedSecurityMode, page 141
- CLI Commands for FIPS Mode, page 142
- User Account and Sign-in Attempts on CLI and Interface, page 144
- Configure Remote Audit Logging for Platform Logs, page 144
- Platform CLI Commands for Security in EnhancedSecurityMode, page 146

CLI Commands for EnhancedSecurityMode

Use the following CLI commands for EnhancedSecurityMode:

- admin:utils EnhancedSecurityMode
- utils EnhancedSecurityMode disable
- utils EnhancedSecurityMode enable
- utils EnhancedSecurityMode status

Configure EnhancedSecurityMode

An administrator can use this procedure on Cisco Prime Collaboration Deployment to configure EnhancedSecurityMode. When this mode is enabled, the following system enhancements are updated automatically:

- Stricter credential policy for password changes is implemented
- TCP becomes the default protocol for remote audit logging
- FIPS mode is enabled
Procedure

Step 1 Log in to the Command Line Interface.
Step 2 Run the `utils EnhancedSecurityMode status` command to confirm whether Enhanced Security Mode is enabled.
Step 3 To configure Enhanced Security Mode, run one of the following commands on a node:
  - To enable this mode, run the `utils EnhancedSecurityMode enable` command.
  - To disable this mode, run the `utils EnhancedSecurityMode disable` command.

CLI Commands for Enhanced Security Mode and FIPS Mode

Use the following CLI commands for Enhanced Security Mode on Cisco Prime Collaboration Deployment:

- `utils EnhancedSecurityMode status` — to confirm whether Enhanced Security Mode is enabled.
- `utils EnhancedSecurityMode enable` — to enable Enhanced Security Mode.
- To configure Enhanced Security Mode, run one of the following commands on a node:
  - To enable this mode, run the `utils EnhancedSecurityMode enable` command.
  - To disable this mode, run the `utils EnhancedSecurityMode disable` command.

CLI Commands for FIPS Mode

Use the following CLI commands for FIPS mode on Cisco Prime Collaboration Deployment:

- `utils fips enable` — Enable FIPS mode. For details, see the Enable FIPS Mode, on page 142 procedure.
- `utils fips disable` — Disable FIPS mode. For details, see the Disable FIPS Mode, on page 143 procedure.
- `utils fips status` — Provide the details whether FIPS mode is enabled or disabled on a server.

Note

The disaster recovery system CLI commands are supported in FIPS mode. For details on these commands, see the CLI Commands and Disaster Recovery System chapter of the Cisco Prime Collaboration Deployment Administration Guide at http://www.cisco.com/c/en/us/support/unified-communications/unified-communications-manager-callmanager/products-maintenance-guides-list.html.

Enable FIPS Mode

You can enable the FIPS mode through CLI.

Caution

Before you enable FIPS mode, we strongly recommend that you perform a system backup. If FIPS checks fail at start-up, the system halts and requires a recovery CD to be restored.

Procedure

Step 1 Start a CLI session.
Step 2 In the CLI, enter `utils fips enable`
The following prompts appear:
admin:utils fips enable

Security Warning : The operation will regenerate certificates for

1) Tomcat
2) IPsec

Any third party CA signed certificates that have been uploaded for the above components will need to be re-uploaded.
***********************************************************************************************
This will change the system to FIPS mode and will reboot.
***********************************************************************************************
Do you want to continue (yes/no) ?

Step 3

Enter yes.
The following message appears:

Generating certificates... Setting FIPS mode in operating system.
FIPS mode enabled successfully.
***********************************************************************************************
It is highly recommended that after your system restarts that a system backup is performed.
***********************************************************************************************
The system will reboot in a few minutes.

Cisco Prime Collaboration Deployment reboots automatically.

---

**Disable FIPS Mode**

You can disable FIPS mode through the CLI using the following procedure:

**Procedure**

**Step 1**
Start a CLI Session.

**Step 2**
In the CLI, enter `utils fips disable`
The following prompts appear:

admin:utils fips disable

Security Warning : The operation will regenerate certificates for

1) Tomcat
2) IPsec

Any third party CA signed certificates that have been uploaded for the above components will need to be re-uploaded.
***********************************************************************************************
This will change the system to NON-FIPS mode and will reboot.
*****************************************************************************
Do you want to continue (yes/no) ?

Step 3 Enter yes.
Cisco Prime Collaboration Deployment reboots and is restored to non-FIPS mode.

Note Certificates and SSH key are regenerated automatically, in accordance with FIPS requirements.

User Account and Sign-in Attempts on CLI and Interface

Following table lists the scenarios when a user signs in to the Cisco Prime Collaboration Deployment application or CLI and the result of sign in attempts:

<table>
<thead>
<tr>
<th>User Sign-in Scenario</th>
<th>Result of Sign-in Attempt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sign-in with the valid credentials</td>
<td>Sign-in is successful and the application home page is accessible</td>
</tr>
<tr>
<td>Sign-in with invalid credentials</td>
<td>Sign-in fails</td>
</tr>
<tr>
<td>Sign-in after exceeded number of attempts on the application</td>
<td>Account is locked after three consecutive unsuccessful attempts</td>
</tr>
<tr>
<td>Sign-in after exceeded number of attempts on the CLI</td>
<td>CLI sign-in fails due to locked account even though the user types in the correct password</td>
</tr>
<tr>
<td>Sign-in to the application after the lockout period expires</td>
<td>After 5 minutes of lockout period, the application is available for you to sign-in</td>
</tr>
<tr>
<td>Sign-in to CLI after the lockout period expires</td>
<td>After 5 minutes of lockout period expiry, the account gets unlocked and you can sign-in to the CLI</td>
</tr>
<tr>
<td>Sign-in to the application when the account is locked due to inactivity</td>
<td>Account gets locked due to inactivity of the session</td>
</tr>
<tr>
<td>Sign-in to the application after account lockout, which is caused due to inactivity, is resolved</td>
<td>Sign-in is successful</td>
</tr>
</tbody>
</table>

Configure Remote Audit Logging for Platform Logs

Complete the following tasks to add remote audit logging support for platform audit logs, remote support logs, and csv files. For these types of logs, the FileBeat client and logstash server are used.
Before You Begin

Ensure that you have set up an external logstash server.

Procedure

**Step 1** Configure the FileBeat client with the external logstash server details, such as IP addresses, ports, and file types. For procedure, see Configure Logstash Server Information, on page 145.

**Step 2** Enable the FileBeat client for remote audit logging. For procedure, see Configure the FileBeat Client, on page 145.

---

Configure Logstash Server Information

Use this procedure to configure the FileBeat client with the external logstash server information, such as IP address, port number, and downloadable file types.

**Before You Begin**

Make sure that you have set up your external logstash server.

**Procedure**

**Step 1** Log in to the Command Line Interface.

**Step 2** Run the `utils FileBeat configure` command.

**Step 3** Follow the prompts to configure the logstash server details.

---

Configure the FileBeat Client

Use this procedure to enable or disable the FileBeat client for uploads of platform audit logs, remote support logs, and csv files.

**Procedure**

**Step 1** Log in to the Command Line Interface.

**Step 2** Run the `utils FileBeat status` command to confirm whether the FileBeat client is enabled.

**Step 3** Run one of the following commands:

- To enable the client, run the `utils FileBeat enable` command.
- To disable the client, run the `utils FileBeat disable` command.

**Step 4** Repeat this procedure on each node.
Note: Do not run any of these commands on all nodes simultaneously.

**Platform CLI Commands for Security in EnhancedSecurityMode**

When EnhancedSecurityMode is enabled, an administrator can restrict the following options to prevent unauthorized access:

- View audit log
- Download audit log
- Delete audit log
- Enable or disable audit demon

The administrator can restrict the above options by running the following platform CLI commands:

- `file view activelog <audit log file name>`
- `file get activelog <audit log file name>`
- `file delete activelog <audit log file name>`
- `file dump activelog <audit log file name>`
- `file tail activelog <audit log file name>`
- `file search activelog <audit log file name> <search string>`
- `file view inactivelog <audit log file name>`
- `file get inactivelog <audit log file name>`
- `file delete inactivelog <audit log file name>`
- `file dump inactivelog <audit log file name>`
- `file tail inactivelog <audit log file name>`
- `file search inactivelog <audit log file name> <search string>`
- `utils auditd enable`
- `utils auditd disable`
- `utils auditd status`

Where, `<audit log file name>` can be one of the following audit log files:

- `:/var/log/active/audit/AuditApp`
- `:/var/log/active/audit/vos`
- `:/var/log/inactive/audit/AuditApp`
- `:/var/log/inactive/audit/vos`
In a non-EnhancedSecurityMode, the group ownership is ccmsyslog when the permission is 640. However, as part of EnhancedSecurityMode requirement, the file permission is modified to 600 with file group ownership by root. Hence, by default, the files saved at the /var/log/active/syslog location are changed to the permission of 600 with the ownership to root.
### CTL Update

- More Information, page 149
- Bulk Certificate Management, page 149

### More Information

### Bulk Certificate Management

Bulk certificate management must be performed manually on both source nodes and destination nodes. The source nodes and destination nodes must be up and running at this point. Phones are registered with the source nodes.
Procedure

**Step 1** On the Destination Cluster Publisher, navigate to Cisco Unified Operating System Administration and choose Security > Bulk Certificate Management.

**Step 2** Define the Central Secure File Transfer Protocol (SFTP) server IP address, port, user, password, and directory.

**Step 3** Use the Export button to export all Trivial File Transfer Protocol (TFTP) certificates from the destination cluster to the central SFTP server.

**Step 5** Define the Central SFTP server with same parameters that you used in Step 2.

**Step 6** Click Export to export all TFTP certificates from source cluster to the central SFTP server.

**Step 7** Click Consolidate to consolidate all the TFTP certificates on the central SFTP server. You can perform this step on either the source or destination cluster, using the Bulk Certificate Management interface.

**Step 8** On the Source cluster, click Bulk Certificate Import to import the TFTP certificates from the central SFTP server.

**Step 9** On the Destination cluster, click Bulk Certificate Import to import the TFTP certificates from the central SFTP server.

**Step 10** Use Dynamic Host Configuration Protocol (DHCP) option 150 to point the phones to the new destination cluster TFTP server.

Upon reset or power cycle, the phones will download the new destination cluster ITL file and attempt to authenticate the new Initial Trust List (ITL) file signature with the certificates in the existing ITL file.

No certificate in the existing ITL file can be used to authenticate the signature, so the phone requests the signer's certificate from the old Trust Verification Service (TVS) server on the source cluster.

The phone sends this request to the source cluster TVS service on TCP port 2445.

The bulk certificate exchange in Steps 1 through 9 provides the TVS service in the source cluster with the TFTP certificate on the destination cluster that signed the new ITL file.

TVS returns the certificate to the phone, which allows the phone to authenticate the signature and replace the old ITL file with the newly downloaded ITL file.

The phone can now download and authenticate the signed configuration files from the new destination cluster.

Best Practices

• Cluster Discovery, page 151
• Upgrades, page 152
• ESXi Host, page 152
• Migration and Installation Virtual Machines, page 152
• Premigration, page 152
• Postmigration, page 153
• Task Validation, page 154
• Cisco Prime Collaboration Deployment Shutdown, page 154
• Monitoring Tasks, page 154
• Managing Files in the SFTP Datastore, page 154
• Using Cisco Prime Collaboration Deployment with Clustering Over WAN, page 155
• Sequence During Migration, page 155
• Server Readdress, page 155
• Fresh Install Publishers and Subscribers, page 155
• Fresh Install of a Unified CM and IM and Presence Cluster, page 155
• Email Notification, page 156
• Test Email, page 156

Cluster Discovery

During cluster discovery, a small Cisco Options Package (COP) file is installed on the servers that are being discovered. For this reason, ensure that before you initiate a discovery, no upgrades or COP file installations are in progress on the servers in the cluster that you want to discover.
Upgrades

When you initiate an upgrade of an application server (Cisco Unified Communications Manager, IM and Presence Service, Cisco Unified Contact Center Express, or Cisco Unity Connection) from the Cisco Prime Collaboration Deployment Upgrade task, the upgrade works in the same manner as upgrades that are initiated by the Unified Communications application GUI or CLI. As a result, we recommend that you follow the same preupgrade procedures and postupgrade verifications as you would directly from the application server GUI.

ESXi Host

Ensure that the virtual machines that you use for migrations or fresh installations reside on an ESXi host that was entered into the Cisco Prime Collaboration Deployment system. That ESXi host should not allow Disaster Recovery System (DRS) or vSphere vMotion.

Migration and Installation Virtual Machines

Always create virtual machines (VMs) for new clusters using the appropriate Open Virtualization Format (OVA) for the unified communications application that you will install. Do not use an existing VM as a destination VM for migration (use a newly-created VM). After a failed migration, if Cisco Prime Collaboration Deployment had started to install the new VM, you must delete this VM and create a new one using the proper OVA.

Note

If you have to configure a VMware in various ESXi host servers, ensure that you enter a unique name for ESXi host servers and avoid using the default name from OVA.

Premigration

Source Cluster

- We recommend that you run a full backup by using Disaster Recovery System (DRS) on the cluster.
- We recommend that you check the size of the TFTP folder on the TFTP server. If a number of firmware endpoint COP files was installed on the TFTP server, and if the size of the TFTP directory on the TFTP server is larger than 2.5 GB, we strongly recommend that you delete any large unused firmware files in the /usr/local/cm/tftp directory.

The following procedures describe how to check TFTP space usage, and if necessary, how to remove TFTP files on the TFTP server (source node) before you perform a migration using Cisco Prime Collaboration Deployment.
Check TFTP Directory Disk Usage

Procedure

Step 1 Log in using the CLI.
Step 2 Enter the following command: `admin:show diskusage tftp`.
Step 3 Check the disk usage output for the following line: `/usr/local/cm/tftp/`. (Disk-usage information appears at the end of the output.)
Step 4 Check the size of the `/usr/local/cm/tftp` directory.

**Note** We recommend that the size not exceed 2.5 GB. If it does, reduce the size by deleting some files (see procedure below). Before you delete those files, copy them to another server as a backup in case you need them in the future.

Delete TFTP Files

Procedure

Step 1 Log in to the Cisco Unified Operating System Administration GUI on the TFTP server.
Step 2 Navigate to Software Upgrades and select TFTP File Management.
Step 3 Click Find to see a list of TFTP files.
Step 4 Check the check box of the TFTP file that you want to delete. To delete multiple files, check multiple check boxes.
Step 5 Click Delete Selected.
Step 6 After you delete the files, check the disk usage again using the above procedure.

What to Do Next

**Note** If the cluster has more than one TFTP server, perform these procedures on every TFTP server.

Postmigration

Follow these postmigration best practices:

- Check endpoints
• Check database replication, for example:

```
admin:show perf query class "Number of Replicates Created and State of Replication" -->query class :
- Perf class (Number of Replicates Created and State of Replication)
  has instances and values:
  ReplicateCount -> Number of Replicates Created = 676
  ReplicateCount -> Replicate_State = 2
```

The following list shows the possible values for Replicate_State:

• 0—Replication Not Started. Either no subscribers exist, or the Database Layer Monitor service is not running and has not been running since the subscriber was installed.
• 1—Replicates were created, but their count is incorrect.
• 2—Replication is good.
• 3—Replication is bad in the cluster.
• 4—Replication setup did not succeed.

## Task Validation

If a task is scheduled to start manually or start at a later time, the Validate button appears and you can run validation on the task manually. We recommend that you run the validation on a task before the start (you can run the validation anytime before the start), to identify problems such as missing virtual machines, communication issues, or missing ISO files. When the validation is run, a popup window opens with a list of validation problems. If no problems are found, the following message appears: "All validation tests passed."

## Cisco Prime Collaboration Deployment Shutdown

For best results, to shut down the Cisco Prime Collaboration Deployment server, use the command `utils server shutdown`. Failure to do so can result in Network File System (NFS) mount issues on the ESXi hosts.

## Monitoring Tasks

Use the Monitoring GUI page to view the status of your tasks. Click the task in the left column, and the task details appear on the right. Each step in the task (export, install, and so on) appears in the Task Status table below the details section. Click the arrow next to any step to see additional details for that step. Some steps may have several task actions within them. Scroll down to see all the actions and their status.

## Managing Files in the SFTP Datastore

The SFTP datastore page shows the ISO and COP files that were transferred to the Cisco Prime Collaboration Deployment server through SFTP. To place a file on the Cisco Prime Collaboration Deployment server, for
use in a migration, install or upgrade task, use an SFTP client and log in as admin.sftp (use the administrator password as your password).

When you connect to the Cisco Prime Collaboration Deployment server, upload ISO files to be used by a migration or install task into the /fresh_install folder. Upload COP files to the /upgrade folder.

After a task is complete, if the ISO is not needed for another task, we recommend that you delete the ISO file from the SFTP datastore to conserve space on your Cisco Prime Collaboration Deployment server. If there are too many ISO files in the SFTP datastore when the Cisco Prime Collaboration Deployment is upgraded or a DRS backup is restored, the Cisco Prime Collaboration Deployment server may run out of space.

Using Cisco Prime Collaboration Deployment with Clustering Over WAN

A minimum bandwidth of 100 Mbps is recommended if the Cisco Prime Collaboration Deployment server and other Unified Communications application nodes are communicating over a WAN.

Sequence During Migration

When you create a migration task, the default sequence is presented, which has one server in each install step. You can use the editing tools in the sequence screen to place more than one server in a step. For best results, include no more than six servers in any one step.

Server Readdress

With the Server Readdress feature, the system inserts a forced pause after each server readdress. Verify that the server was successfully changed and that the phones reregistered before you continue to the next readdress step.

Fresh Install Publishers and Subscribers

When a fresh install task (new UC cluster) includes more than one server, the Cisco Prime Collaboration Deployment system automatically installs the Unified Communications Manager publisher first, and then inserts a forced pause following the publisher installation. During the pause, you can go to the Unified Communications Manager GUI of the newly installed publisher and add the other cluster servers into the System > Servers GUI. After all the subscribers to be installed in this cluster (Unified Communications Manager subscribers, IM and Presence publishers and subscribers) are added to the Unified Communications Manager publisher GUI, the user can click the Resume button on the Cisco Prime Collaboration Deployment Monitoring page to resume the fresh install task.

Fresh Install of a Unified CM and IM and Presence Cluster

When you create a fresh install with both Unified Communications Manager and IM and Presence Service nodes, you must indicate which IM and Presence Service server is the publisher. After the Unified Communications Manager publisher install, the task pauses. This pause allows the subscriber install nodes to
enter into the Unified Communications Manager Publisher (System > Server GUI page). The IM and Presence Service publisher must be the first IM and Presence server that is added to this list. This step ensures that the IM and Presence Service publisher is installed as the first node.

Email Notification

If a task encounters an error, the task is paused to wait for user intervention. Also, some tasks pause automatically in the task sequence to allow for manual interaction. We recommend that you set up email notification (Standard option) before you run any tasks in order to be notified of pauses or errors that may require your attention when the task runs.

Test Email

When setting up email notification, click the Send Test email button to verify that the Cisco Prime Collaboration Deployment mail system can send email to your mail server. Check that the test email was received. Perform this test before you run tasks.
Increase Disk Space for Migrations

If one Cisco Prime Collaboration Deployment server is used to migrate a large number of Unified Communications Manager servers concurrently, the Cisco Prime Collaboration Deployment disk can run low on space, and this can cause migration tasks to fail. If you plan to use a Cisco Prime Collaboration Deployment system to migrate several servers concurrently, you can use this procedure to increase the disk size.
**Procedure**

**Step 1** Shut down the Cisco Prime Collaboration Deployment server by logging in to the Cisco Prime Collaboration Deployment CLI and entering the `utils system shutdown` command.

**Step 2** After the Cisco Prime Collaboration Deployment server shuts down, go to **ESXi host** and increase the disk size for the virtual machine on which the Cisco Prime Collaboration Deployment server resides.

**Step 3** Restart the Cisco Prime Collaboration Deployment server.

**Step 4** To view how much disk space is available on the Cisco Prime Collaboration Deployment server, run the CLI command `show status` on the Cisco Prime Collaboration Deployment server.

---

**General Troubleshooting Issues**

**View Step-By-Step Log of Events**

Use the View Log buttons on the Monitoring dashboard to see a step-by-step log of Cisco Prime Collaboration Deployment events.

**Access Cisco Prime Collaboration Deployment Logs**

Obtain additional details by accessing Cisco Prime Collaboration Deployment logs using CLI commands. For example:

`file get activelog tomcat/logs/ucmap/log4j/*`

**Check For Problems Before You Start a Task**

Use the Validate button to check for problems before starting a task. When the validation process identifies problems, click the View Log button to see more detail.

**Node Information Mismatches**

Some mismatches between node information that is stored in Cisco Prime Collaboration Deployment and the actual node can be fixed automatically (for example, active versions). Other information will require a rediscovery to correct the problem.

**Verify Communication Between Servers**

Use the network capture CLI command to verify communication between servers (for example, to confirm that packets are being sent to and received by the correct ports).

---

**Errors Seen in View Log**

The View Log button on the Monitoring dashboard can be used to see a step by step log of Cisco Prime Collaboration Deployment events during the task. When viewing the log, there may be events or errors that are shown. Some of the more common errors, and possible actions to correct those errors, are shown below:
Node Connection and Contact Issues

Error messages:

• “The network diagnostic service indicates node {0} has a network issue. The network settings cannot be changed until the network issue is resolved.”

• “The node could not be located.”

• “The node could not be contacted.”

Possible actions to correct node connection and contact issues:

• Check the network settings and firewall settings for the indicated node and ensure that the Cisco Prime Collaboration Deployment server can communicate with the node.

• Check to see if the node is powered off, if the node name is misspelled, or if the node is inaccessible.

Other Connection Issues

Error message:

• “The switch version status could not be determined. Please manually verify that the switch version completed.”

Possible actions to correct issues:

During a switch version task, if the server does not respond in a fixed amount of time, this message may appear even if the task is successful. You see this error, log in to the CLI for the server that is not responding and run the show version active command to see if the switch version was successful. For example, a switch version on a Cisco Unified Contact Center Express server can take more than 60 minutes.

Node Response

Error messages:

• “The node did not respond within the expected time frame.”

• “The upgrade service for node {0} did not send back the expected response. This is assumed to be a failure. However, this can also happen when network connectivity is temporarily lost. Please manually verify the upgrade status on node {0} before proceeding.”

Possible actions to correct issues:

These messages are usually seen during a task (install, upgrade, and so on), when the new node does not contact the Cisco Prime Collaboration Deployment server within a specified amount of time. For an upgrade, this time is 8 hours, so when one of these error messages appear, it may indicate that the task failed. However, these error messages can also indicate that there were network issues during the upgrade (or install) that prevented the server from contacting Cisco Prime Collaboration Deployment. For this reason, you see one of these messages, log in to the server that is not responding (using the CLI) and run the show version active command to see if the upgrade was successful.

Unable to Mount Datastore

Error message:

• "Unable to mount datastore xxx_NFS on ESXi host <hostname>. "

Cisco Prime Collaboration Deployment Troubleshooting

Errors Seen in View Log
Possible actions to correct the issue:
This error occurs when your Network File System (NFS) Datastore has an issue. Datastore issues can occur when Cisco Prime Collaboration Deployment is shut down unexpectedly. When this error occurs, check the ESXi host and unmount the old NFS mount. Then delete and add back the ESXi host to Cisco Prime Collaboration Deployment.

Unable to Add ESXi Host to Inventory
Possible cause:
This error may be caused by a networking issue with the vSwitch on the ESXi host.
Possible actions to correct the issue:
• Ping the host and verify connectivity by entering the following CLI command: `utils network ping hostname`.
• Verify that the license for the ESXi host is valid. A demo license is not supported.
• Be aware that you need root access to the ESXi host. Use the root username and password when adding ESXi host credentials.
• Be aware that if you are using network address translation (NAT), Cisco Prime Collaboration Deployment and all nodes in the clusters must be behind the same NAT to ensure successful communication between Cisco Prime Collaboration and the nodes.

Unable to Power On Virtual Machine
Error message:
• “Unable to power on the VM named xxx on ESXi host xxxxxxx.”
Possible actions to correct issue:
Check the ESXi host that the VM resides on. From the Tasks and Events tab, check the time stamp for when Cisco Prime Collaboration Deployment tried to power on the VM. Determine whether too many VMs are already on that host. If that is the case, you may need to power off a VM that is not being used for this cluster.

The Power State of a Virtual Machine
Error message:
• “The power state of VM xxxxx in ESXi host XX.XX.X.XX needs to be OFF. The task is now paused.”
Possible actions to correct issue:
VMs that are to be used in a destination cluster for a migration task, or for a new cluster installation, must be in the OFF state. If you receive this error message, check the named VM. If it is not off, power it off. Then, retry or resume the task.

Username and/or Password Not Valid
Error message:
• “The username and/or password is not valid.”
Possible actions to correct the issue:
Correct the administrator name and password for this server in the cluster page. You can then rediscover this node.

**Platform Administrative Web Services (PAWS)**

**Error messages:**
- "The Platform Administrative Web Services (PAWS) is not available."
- "Unable to access node {0} via the Platform Administrative Web Services (PAWS) interface."

**Possible actions to correct issues:**
Ensure that the server is reachable, and that the PAWS service is active on the node. When you use Cisco Prime Collaboration Deployment to perform an upgrade, switch version, or restart task on an application server (for example, to upgrade a Unified Communications Manager server), the Platform Administrative Web Service on the application must be active. Otherwise, the Cisco Prime Collaboration Deployment server cannot communicate with the Unified Communications Manager application server.

**(0) VMs Named {1} Were Located on ESXi Host {2}**

**Error message:**
- "0 VMs named {1} were located on ESXi host {2}.

**Possible actions to correct issue:**
Check that the virtual machine named still exists on the ESXi host. Sometimes VMs are moved to another ESXi host, and if this is the case, the ESXi host that holds the VM must be added into the Cisco Prime Collaboration Deployment server.

**Power State of VM {0} in ESXi Host {1} Needs to Be OFF**

**Error message:**
- "The power state of VM {0} in ESXi host {1} needs to be OFF."

**Possible actions to correct the issue:**
In order for Cisco Prime Collaboration Deployment to be installed on or migrate to a VM, the power state of the target VMs must be OFF.

**CLI Command Timed Out**

**Error message:**
- "CLI command timed out for node {0}."

**Possible actions to correct issue:**
Check for networking, connection, or password issues with the node. Also check to see if another operation was in progress (for example, a COP file install) during the time that the command timed out.

**Task Paused Due to Validation Issues**

**Error message:**
- "Task paused due to validation issues"
Possible actions to correct the issue:

Before it runs a task, the Cisco Prime Collaboration Deployment server will run validation checks to ensure that VMs to be used are available, that the ISO file can be found, and so on. This message indicates that one or more of the validation checks failed. See the log file for more information about which validations failed.

Lock Errors

Most products allow only one change at a time (for example, you cannot modify Network Time Protocol settings while an upgrade is in progress). If a request is made while the node is locked, then a lock message with the following information is displayed:

- The name of the resource that was locked
- The ID of the process that locked the resource
- The hostname of the node

You can typically wait a few minutes and try again. For more details, use the node CLI to identify the exact process based on the provided process ID and hostname.

NFS Datastores

Exceptions and Other NFS-Related Issues

Review the Cisco Prime Collaboration Deployment logs for any exceptions or other NFS-related issues.

Use VMware vSphere

Use VMware vSphere to verify that NFS datastores are available.

Unmount and Remount All Current Datastores

When you restart it, Cisco Tomcat unmounts all current datastores and attempts to remount them.

Pause States on Monitor Page

Task Is Waiting for Manual Intervention

Certain tasks, such as migration or readress, pause at a point that human intervention may be required. In those tasks, the Cisco Prime Collaboration Deployment system inserts a Forced Pause. When the task reaches this point, the task is paused and a message appears on the Monitoring page. Perform manual steps as needed, and then click the Resume button when you are ready to resume the task.

Task Paused Due to Validation Issues

When this message is displayed, click the View log link to view more detail on which validations failed.
**Task Paused Due to Task Action Failures**

When this message is displayed, click the **View log** link to view more detail on which tasks failed.

---

**Scheduling**

**Verify Scheduled Date**

If a task was scheduled but did not start, verify the scheduled date.

**Validation Tests**

When a task starts, Prime Collaboration Deployment runs a series of validation tests. A validation failure pauses the task.

**Determine Why a Task Has Been Paused**

Use the **View Log** button to see why a task is paused (for example, validation failure, a requested or required pause, one or more nodes failed on a particular step, and so on).

**Canceled Tasks**

Some steps cannot be canceled after they are started (for example, restarting a server). If you cancel the task, it remains in the Canceling state until the step is finished.

---

**Server Connectivity**

**Verify Connectivity**

Use the **utils network ping** and **traceroute** CLI commands to verify connectivity.

**Verify Forward and Reverse DNS Lookups**

Use the **utils network host** CLI command to verify forward and reverse DNS lookups.

**Platform Administrative Web Services**

Ensure that Platform Administrative Web Services are activated on nodes that are being upgraded, restarted, and switch versioned.

**Verify That Ports Are Open**

Verify that the ports listed in the **Port Usage** guide are open (for example, verify that the NFS and SOAP call-back ports are not being blocked by other network devices).

---

**Task Failure Due to Restart**

The success or failure of each of the following tasks depends on the Prime Collaboration Deployment server being able to get a response from every server in the cluster during the task. If connectivity to the servers is
lost, or if the Prime Collaboration server reboots during a task, the task might show a failure even though it may have completed successfully.

**Installation Task Failure**

**Problem**
The success or failure of each step in the install task depends on the Prime Collaboration Deployment server being able to get a response from every server in the cluster during the installation.

**Possible Cause**
If the Prime Collaboration server reboots during the install task, the installation might show a failure, even though it may have completed successfully.

The following table describes the steps to identify if the task completed successfully on the application server, and, if it did not, how to recover from this type of failure.

**Solution**

Table 14: Example Deployment: Multinode Cluster Deployment

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
</table>
| The failure occurs during installation on the first node | **1** You must create a new fresh-install task with the same cluster nodes.  
 *Note* In the case of Unified Communications products such as Cisco Unified Communications Manager and IM and Presence Service, Cisco Prime Collaboration Deployment does not support an install task that installs a subsequent node separately from the cluster.  
**2** Check the status of the VM on the ESXi host that is associated with the destination cluster. If any VMs were powered on and installed, delete those VMs and redeploy the OVA.  
*Note* For more information, see topics relating to install tasks. |
Then

1. Log in to the failed Unified Communications VM node, such as Cisco Unified Communications Manager, and manually verify the installation status. For more information, see Unified Communications product documentation.

2. Create a new install task with all new cluster nodes. You must restart the installation process by deleting all installed VMs, redeploying the recommended OVA to create new VMs, and creating a new install task.

   Note: If VM names are changed from previous configuration, you must add a new fresh install cluster, create a new fresh install task, and then run the task.

3. Check the status of the VM on the ESXi host that is associated with the destination cluster. If any VMs were powered on and installed, delete those VMs and redeploy the OVA.

   Note: For more information, see topics relating to install tasks.

### Upgrade Task Failure

**Problem**

The success or failure of each step in the upgrade task depends on the Prime Collaboration Deployment server being able to get a response from every server in the cluster during the upgrade.

**Possible Cause**

If the Prime Collaboration server reboots during an upgrade task, the upgrade might show a failure even though the upgrade may have completed successfully.

The following table describes the steps to determine whether the task completed successfully on the application server and, if it did not, how to recover from this type of failure.
### Solution

**Table 15: Example Deployment: Multinode Cluster Deployment**

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
</table>
| The failure occurs during upgrade on the first node | 1. Check task status on the **Monitoring** page to see which steps were successful and which steps failed.  
2. Log in to the first Unified Communications VM node, such as Cisco Unified Communications Manager. Check the software version and upgrade status to verify whether this node was upgraded to a new version. For more information, see Unified Communications product documentation.  
3. If the upgrade on the first node is successful, you can create a new upgrade task with the subsequent node.  
4. If the upgrade on the first node is unsuccessful, you can create a new upgrade task with all nodes.  
5. If the upgrade task was configured with automatic switch version, check the status of the active and inactive partitions on the Unified Communications product node. If the automatic switch version was unsuccessful on the Unified Communications product node, perform a switch version. For more information, see Unified Communications product documentation. |

**Note** If the switch version is required, this must be done before you a new upgrade task with subsequent nodes with a new upgrade task that is configure with auto-switch version.

**Note** If you create an upgrade task to install a COP file, verify COP-file installation status directly on the Unified Communications node.
Then If

1. Log in to the failed Unified Communications VM node, such as Cisco Unified Communications Manager. Check the software version and upgrade status to verify whether this node was upgraded to a new version. For more information, see Unified Communications product documentation.

   **Note** If the subsequent node shows the correct new version, you do not need to recreate an upgrade task on Prime Collaboration Deployment.

2. If the subsequent node shows the new version in the inactive partition, the old version in active partition, and the upgrade task was configured to switch version automatically, you must either perform the automatic switch version manually on the Cisco Unified Communications Manager node or use Prime Collaboration Deployment to create a switch version task.

3. If the upgrade task was configured with automatic switch version and the subsequent node does not show the version correctly, perform a switch version. See Unified Communications product documentation more detail.

   **Note** If you created an upgrade task to install a COP file, verify COP-file installation status directly on the Unified Communications node.

---

### Migration Task Failure

**Problem**

The success or failure of each step in the migration task depends on the Prime Collaboration Deployment server being able to get a response from every server in the cluster during the migration.

**Possible Cause**

If the Prime Collaboration server reboots during the migration task, the migration might show a failure even though it may have completed successfully.

**Solution**

If the migration task fails after Prime Collaboration Deployment loses connectivity, we recommend that you restart the entire migration process. To restart the migration task, you must create a new task. If your deployment is a multinode cluster, follow this procedure:
1. Check the task status on the **Monitoring** page to find out which steps were successful and which steps failed.

2. If the source node was shut down, you must power on the node manually.

   **Note**
   Repeat this step for all source nodes that were shut down.

3. Delete the failed migration task.

4. Delete the destination migration cluster that is associated with the failed migration task.

   **Note**
   You do not need to delete the source cluster.

5. Check the status of the VM on the ESXi host that is associated with the destination cluster. If any VMs were powered on and installed, delete those VMs and redeploy the OVA.

   **Note**
   For more information, see topics relating to migration tasks.

---

**Switch Version Task Failure**

**Problem**

The success or failure of each step in the switch version task depends on the Prime Collaboration Deployment server being able to get a response from every server in the cluster during the switch version.

**Possible Cause**

If the Prime Collaboration server reboots during the switch version task, the switch version might show a failure even though the switch version may have completed successfully.

The following table describes the steps to determine whether the task completed successfully on the application server, and, if it did not, how to recover from this type of failure.
## Solution

### Table 16: Example Deployment: Multinode Cluster Deployment

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>The failure occurs during switch version on the first node</td>
<td>1. Log in to the first Unified Communications VM node (for example, Cisco Unified Communications Manager) and manually check the software version in both the active and inactive partitions. For more information, see Unified Communications product documentation.</td>
</tr>
<tr>
<td></td>
<td>2. If the first node still shows the old version in the active partition but the new version in the inactive partition, create a new switch version task with the same nodes on Prime Collaboration and run the task again.</td>
</tr>
<tr>
<td>The switch version is successful on the first node but fails on any of the subsequent nodes after Prime Collaboration Deployment loses connectivity</td>
<td>1. Log in to the subsequent Unified Communications VM node (for example, Cisco Unified Communications Manager). Check the software and switch version status to verify that the subsequent node is up and running with the correct version.</td>
</tr>
<tr>
<td></td>
<td>2. If the subsequent node shows the correct new version in the active partition, you do not need to recreate a switch version task on Prime Collaboration Deployment.</td>
</tr>
<tr>
<td></td>
<td>3. If the subsequent node shows the new version in the inactive partition and the old version in active partition, the switch version was not successful on the subsequent node. You can either perform a switch version manually on the subsequent node or create a new switch version task on the subsequent node on Prime Collaboration Deployment.</td>
</tr>
</tbody>
</table>

## Readdress Task Failure

### Problem

The success or failure of each step in the readdress task depends on the Prime Collaboration Deployment server being able to get a response from every server in the cluster.
Possible Cause

If the Prime Collaboration server reboots during the readdress task, you may be notified of a failure even though the readdress may have completed successfully.

The following table describes the steps to determine whether the task completed successfully on the application server, and, if it did not, how to recover from this type of failure.

Solution

Table 17: Example Deployment: Multinode Cluster Deployment

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>The failure occurs during readdress on the first node</td>
<td>1  Log in to the first Unified Communications VM node (for example, Cisco Unified Communications Manager) and verify that network settings were successfully changed. For more information, see Unified Communications product documentation.</td>
</tr>
<tr>
<td></td>
<td>2  After you verify that network settings were successfully changed on the first node, create a new readdress task on the subsequent node on Prime Collaboration Deployment and run this task. If network settings were not successfully changed on the first node, create a new readdress task with both nodes on Prime Collaboration Deployment and run the task again.</td>
</tr>
</tbody>
</table>
Server Restart Task Failure

Problem
The success or failure of each step in the server restart task depends on the Prime Collaboration Deployment server being able to get a response from every server in the cluster during the server restart.

Possible Cause
If the Prime Collaboration server reboots during server restart, the server restart might show a failure, even though the server restart may have completed successfully.

The following table describes the steps to determine whether the task completed successfully on the application server, and, if it did not, how to recover from this type of failure.

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
</table>
| The readdress task is successful on the first node but fails on any of the subsequent nodes after Prime Collaboration Deployment loses connectivity | 1. Log in to the first Unified Communications VM node (for example, Cisco Unified Communications Manager) and verify that network settings were successfully changed. For more information, see Unified Communications product documentation.  
2. After verifying that network settings were successfully changed on the first node, you do not need to create a new readdress task on the first node on Prime Collaboration Deployment. However, you do need to create a new readdress task on the subsequent nodes. If network settings were not successfully changed on the first node, create a new readdress task with the first node and subsequent nodes on Prime Collaboration Deployment and run the new task.  
3. If network settings were successfully changed, update cluster discovery for this cluster to make sure that Prime Collaboration Deployment has the correct network settings.  
   1. Go to the Clusters screen and click the triangle to show the nodes in the cluster.  
   2. Check the network settings to ensure that the Cluster Nodes table shows the new network settings (for example, hostname).  
   3. If the correct network settings are not displayed, click the Refresh Node link for each node in the cluster. |
**Solution**

**Table 18: Example deployment: Multi-node cluster deployment**

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>The failure occurs during server restart on the first node</td>
<td>1  Log in to the first Unified Communications VM node (for example, Cisco Unified Communications Manager) and manually check the status of the restart.</td>
</tr>
<tr>
<td></td>
<td>2  If the first node did not get restarted, recreate a new server restart task with all nodes and run the task again.</td>
</tr>
<tr>
<td>The server restart is successful on the first node but fails on any of the subsequent nodes after Prime Collaboration Deployment loses connectivity</td>
<td>1  Log in to the second Unified Communications VM node (for example, Cisco Unified Communications Manager) and manually check the status of restart.</td>
</tr>
<tr>
<td></td>
<td>2  If the subsequent node restarted successfully, there is no need to recreate a new server restart task. If the subsequent node did not restart, create a new server restart task on the subsequent node only.</td>
</tr>
</tbody>
</table>

**Task Scheduling**

**Task Scheduled but Not Started**

If a task was scheduled but did not start, verify the scheduled date.

**Validation Failure**

When a task starts, a series of validation tests are run. A validation failure pauses the task.

**Reasons for a Task Pause**

Click the **View Log** button to see why a task was paused (for example, validation failure, a pause was requested or required, one or more nodes failed on a particular step, and so on).

**Tasks That Cannot Be Canceled**

Some tasks cannot be canceled once started (for example, restart of a server or installation of a server node). If the task is canceled, it remains in the Canceling state until the step is finished.
Task Timeouts

Manually Verify Results
All Cisco Prime Collaboration Deployment tasks have built-in timeouts ranging from 30 minutes to 10 hours, depending on the type of task and product. If Cisco Prime Collaboration Deployment does not receive the expected results within that time frame, Cisco Prime Collaboration Deployment signals an error, even if the actual process succeeded. Users must manually verify the results and ignore any false negatives.

Rereadress Times Out
During rereadress, if a VLAN change is required, Cisco Prime Collaboration Deployment does not receive updates for the nodes. As a result, the rereadress eventually times out even though the actual rereadress process succeeded.

Resource Issues Slowing Down the Nodes
Use VMware vSphere to verify that no resource issues are slowing down the nodes. Disk, CPU, and memory issues can cause slower than normal logins, which can cause connectivity timeout issues during cluster discovery.

Network Congestion
Because large files are sent across the network during upgrades, installations, and migrations, network congestion can cause tasks to take longer than usual.

Upgrade Migration and Installation

Virtual Machine Does Not Boot
If a VM does not boot using the mounted install ISO during migration or installation, verify the VM boot order in the Basic Input/Output System (BIOS). We recommend that only freshly created VMs that use the official Cisco Open Virtualization Format (OVF) files.

VM Cannot Be Located
If a VM cannot be located, make sure vMotion is turned off.

Upgrade File List Is Blank
If the list of ISO files for upgrade is blank, the reason might be that one or more servers in the cluster you are upgrading have an existing upgrade that is stuck. The file list shows as blank because the Unified Communications Manager-side upgrade process was stuck. Therefore, no files are valid, because no upgrades can be done. If you attempt an upgrade from the application server CLI, you may see the message “The resource lock platform.api.network.address is currently locked.”

To resolve this problem, reboot your Unified Communications Manager server.
Upgrade ISO or COP File Is Not Displayed in the Task Wizard

If an upgrade ISO or COP file is not displayed in the task wizard, verify that the file was uploaded into the correct directory on the Prime Collaboration Deployment Server. To confirm the location of the file, click open and close navigation button and choose the Inventory > SFTP Servers and Datastore menu option. The directory that is in use is usually listed at the top of the task wizard.

Upgrade ISO File Must Be Valid for All Nodes

An upgrade ISO file must be valid for all nodes in the task in order to be listed in the wizard. If the upgrade ISO file is not listed, verify that the task contains the publisher or that the publisher was already upgraded.

Release 10.x and Older Products

Most Release 10.x and older products report only generic upgrade and installation failure messages. Users must access the failed node directly and diagnose the problem by using traditional tools and processes that are specific to that product (for example, use the Unified Real-Time Monitoring Tool or the CLI to view upgrade logs).

Run a New Task When Current Task in Canceling State

Rerun Fresh Install Task

The following procedure provides the high-level steps for rerunning a new task when the current task is in the process of being canceled. For more detailed information, see topics relating to task management.

Procedure

**Step 1** View the task log to verify the status of the most recent task.
- a) If the VM is powered on and the fresh install task is still in progress, power off the VM, delete it, and redeploy the OVA to create a new VM. You can use the same name for the new VM.
- b) If the VM is powered off and the fresh install was not started on the VM, leave the VM powered off.

**Step 2** Check the cluster to verify if any nodes in the cluster were updated with the active version and discovery status.
- • If any nodes were updated with the new version or discovery status, create a new cluster with a new name, including the same VMs and installation settings.
- • If any nodes in the cluster were not updated, reuse the cluster when recreating a fresh install task.

**Step 3** Create and run a new install task.
Rerun Migration Task

The following procedure provides the high-level steps for rerunning a migration task for the same source and destination clusters when the current migration task is in the process of being canceled. For more detailed information, see topics relating to task management.

Procedure

**Step 1** View the task log to verify the status of the most recent task.

a) If the VM is powered on and the migration task is still in progress on the destination VM, power off the destination VM, delete it, and redeploy the OVA to create a new destination VM. You can use the same name for the new VM.

b) If the VM is powered off and the migration was not started on the VM, leave the VM powered off.

**Step 2** Check the node status on the source cluster before running a new task.

- If the source node is powered off, power on the source node and make sure it is in a running state before rerunning a migration task.
- In the case of network migration, the source node can remain powered on.

**Step 3** You do not need to rerun cluster discovery on the source node.

**Step 4** Check the destination cluster to ensure that no nodes were updated with active version or discovery status.

- If any nodes in the destination cluster were updated with the new version of application or discovery status, create a new migration destination cluster by giving it a new name with the same source cluster and select the same destination VM. If any nodes in the destination cluster have been updated with the new version of application or discovery status, create a new migration destination cluster by giving it a new name with the same source cluster and select the same destination VMs.
- If any nodes in the destination cluster were not updated with the new version of application or discovery status, you may be able to reuse the migration destination cluster later when creating a new migration task. If this is not possible, recreate a migration destination cluster with a new name.

**Step 5** Create a new migration task with the same source cluster and new destination cluster.

**Step 6** Start running the new task.

Version Validity

Install or migrate Cisco Prime Collaboration Deployment if the version validity is True for the Restricted or Unrestricted version of Cisco Prime Collaboration Deployment.

Table 19: Supported Tasks based on Version Validity

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
<th>Version Validity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Export Restricted (K9)</td>
<td>Export Restricted (K9)</td>
<td>True</td>
</tr>
</tbody>
</table>
ISO File Does Not Get Loaded Or Not Recognized During Migration

When you create a migration task to upgrade and migrate a cluster to new virtual machines, the task extracts the information from the old servers and starts the virtual machines. In case, the ISO file either does not get loaded or is not recognized, perform the following steps:

1. On Cisco Unified Communications Manager virtual machine, verify the correct ESXi BIOS boot order of the Cisco Unified Communications Manager virtual machine. For example, CDROM, removeable devices, hard disk drive (HDD), and network boot from VMXNET3.

2. Verify the ESXi host of Cisco Unified Communications Manager virtual machine by using ESXi Foundation or Standard or higher.

   **Note**
   Hypervisor edition does not enable ESXi APIs that Cisco Prime Collaboration Deployment requires.

3. Verify that Cisco Prime Collaboration Deployment has root access to ESXi host.

4. Verify that the NFS mount is stable.

   - If ISO file does not mount to virtual machine from NFS, check `ESXihost > config > storage (datastore) > storage (datastore)`.

   **Note**
   If the datastore is inactive, you need to reconnect it.

   - To force reconnection of NFS mount, through Cisco Prime Collaboration Deployment, remove the ESXi host and add it again. Then, rerun the migrate task.
